HP-10 NIB??? on eBay

*Message #1 Posted by **Gordon** on 25 Nov 2003, 6:21 p.m.*

Looking at the real pics of this HP-10 it does look very good but is definitely used quite a lot. BUT MoHPC pics are added to give the impression it really is new!
Dave, this one needs to be dealt with!

Dump ROM of a HP17BII?

*Message #1 Posted by **Marc** on 25 Nov 2003, 6:03 p.m.*

Is it possible to dump the ROM of this calculator? Thanks.

Re: Dump ROM of a HP17BII?

*Message #2 Posted by **Randy Sloyer** on 25 Nov 2003, 6:22 p.m.,*
in response to message #1 by Marc

Yes it is. It requires a 48 series machine to receive the IR output.

Process is identical to that of the 42S. See http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=266 for details.

Just map the 42S keys mentioned to the same physical 17B/17Bii keys and have fun and don't miss a block.

Several hours and a sore finger later, you'll have your image.

Accu packs

*Message #1 Posted by **Matthias** on 25 Nov 2003, 4:36 p.m.*

Today I was in a store called "AccuDoc". I wanted to know the price of a rebuild of a HP-41 accu pack and the accu pack of a HP 110. As I put the HP-41 accu on the table he told me immediatly to put it back into my bag.. Many people asked before, but the batteries are no more available as he told me. For the HP 110 accu pack: There are 3 lead cells in it.. Price for a rebuilt: arround $80... A little bit to much for me, cause I do not use the calculator. Buy anyway: Does someone has a working accu pack left for me?

Matthias

Re: Accu packs

*Message #2 Posted by **Juergen (CH)** on 25 Nov 2003, 5:21 p.m.,*
in response to message #1 by Matthias

If you do not use the calc, why do you need a working battery pack?

Re: Accu packs

*Message #3 Posted by **Chan Tran** on 25 Nov 2003, 6:46 p.m.,*
in response to message #2 by Juergen (CH)

I used the rechargable battery in the 41 before but now I use only alkaline. I see no need for the rechargable as the alkaline last a long time. When I use the card reader and/or the wand the battery life is shorter but not anything outrageous. If I use the card reader a lot because I am writing some programs and do lots of testing then I would find some way to power the calculator with AC power instead.

Re: Accu packs

*Message #4 Posted by **David Smith** on 25 Nov 2003, 9:51 p.m.,*
in response to message #1 by Matthias

The 75 maH 1/2N cells for the 41C pack were only made by Sanyo. They stopped supplying them a couple of years ago. Most people today use 1/3AAA NiMH cells. They are close to, but smaller than, the original size and require some additional shim material for a proper fit.

49g+ screen flash

*Message #1 Posted by **Helge Gabert** on 25 Nov 2003, 10:19 a.m.*

Does anybody know what to do about the annoying screen flashes (bottom line) on the 49g+? ROM is 1.2. Does upgrading to 1.22 help? Thanks.

Re: 49g+ screen flash

*Message #2 Posted by **bmclaurin** on 25 Nov 2003, 10:26 a.m.,*
in response to message #1 by Helge Gabert

No, 1.22 doesn't help. I tried this myself last night. My understanding is that the flicker is caused by the unit going into a low power state about 1-2 seconds after each keypress while it waits for the next keypress. Somehow, it misses a screen refresh while making this transition. If you have the digital clock (with seconds) display turned on, it makes the problem more noticeable because the power state recycles pretty much with each clock tick. Turning the clock display off should at least reduce the amount of flickering, but it will not eliminate it. I am hopeful that this issue will be resolved in a future ROM update, but 1.22 doesn't do it.

Re: 49g+ screen flash

*Message #3 Posted by **Paul Brogger** on 25 Nov 2003, 11:26 a.m.,*
in response to message #1 by Helge Gabert

ROM 1.22 seemed to help, but not cure.

There's been much discussion of this on COMP.SYS.HP48 .

Pressing ON and then up-arrow at the same time seems to stop it, for some reason.

I'm not sure what command or feature is invoked with that keypress pattern. It may be related to printing, and IIRC, you'll want the "print via wire" flag (-34) set.

I *think* that's it, anyway.

HP-15C (11C/34C/42S/etc) Arguably Useful Mini-Challenge

*Message #1 Posted by **Valentin Albillo** on 24 Nov 2003, 11:16 a.m.*

Hi all,

After some months of comforting absence, here's a new Arguably Useful Mini-Challenge for the HP-15C.You can also use other HP models such as the HP-11C, HP-34C, HP42S, etc, though my solutions and timing will be particularized explicitly for the HP-15C.

The challenge has practical applications, and goes like this:

The Challenge

Write a subroutine (LBL A ... RTN) that given an integer N (where N > 0) in the display, it will return to the display the value of f(N), where:

```
f(N) =  1 x 3 x 5 x ... x (2*N-3) x (2*N-1)

        <------------ N terms ------------>
```

thus, for instance, if N = 4 then

```
f(4) = 1 x 3 x 5 x 7 = 105
```

The main design goal for the routine is for it to be ***as fast as possible***, (specially for large N, such as N > 30) and subject to that, to be as short as possible, to minimize resources (registers, flags, etc) used or have some other desirable properties.

Under the conditions given, there's a solution for the HP-15C in just 12 steps (counting LBL A and RTN) which takes 2.7 seconds for N = 52.

I'll give my solutions within 2 days or so, discussing the relative advantages of each. Meanwhile, let's see what you can do with your trusty HP and your ingenuity. **:-)**

Best regards from V.

Edited: 24 Nov 2003, 11:23 a.m.

Re: HP-15C (11C/34C/42S/etc) Arguably Useful Mini-Challenge

*Message #2 Posted by **Pascal** on 24 Nov 2003, 12:19 p.m.,*
in response to message #1 by Valentin Albillo

Well, taking your function f(n) = 1 * 3 * 5 * ... * (2*n-3) * (2*n-1)

one can see that it's related to the factorial.... somehow :-)

Lets put it differently:

```
        n
       ---
f(n) = | | (2x-1)
       x=1

        (2n)!
     = ----------
         n
        ---
        | |(2x)
        x=1

     = (2n)! / g(x)

where g(x) = x! * 2^x

Putting this together gives

f(n) = (2n)! / (2^n * n!)

So:

LBL A
STO 0
2
*
x!
2
RCL 0
y^x
LAST X
x!
*
/
RTN
```

OK, that's 13 steps.... but be it :-)

regards Pascal

Re: HP-15C (11C/34C/42S/etc) Arguably Useful Mini-Challenge

*Message #3 Posted by **Stephan (Germany)** on 24 Nov 2003, 12:23 p.m.,*
in response to message #2 by Pascal

I came to the same expression. But on a 15C evaluation for N=52 will fail due to 2*52 > 69 which is the maximum integer x! can handle. Still thinking, will post when I found another way.

Regards, Stephan

12345 to delete

Re: HP-15C Mini-Challenge - Valid solution, but too slow

*Message #4 Posted by **Stephan (Germany)** on 24 Nov 2003, 12:47 p.m.,*
in response to message #1 by Valentin Albillo

Considering that (2*52)! cant be evaluated by a 15C I found a solution in 11 steps.

f LBL A STO 0 2 * RCL 0 f Px,y 2 RCL 0 y^x / RTN

Unfortunately it is too slow (about 8 to 9 seconds for N=52). Still trying to improve.

Regards, Stephan

12345 to delete

Re: HP-15C:Fast(???), but limited (Nmax=34)

*Message #5 Posted by **Tizedes Csaba** on 24 Nov 2003, 5:07 p.m.,*
in response to message #1 by Valentin Albillo

I don't saw other solutions yet, this is my solution:

```
LBL B
ENTER
ENTER
+
x!
x<>y
x!
LSTx
2
x<>y
y^x
*
/
RTN
```

This is use the following equality:

1*3*5*...*(2*N-3)*(2*N-1)=(2*N)!/(2*4*6*...*(2*N-2)*(2*N))=(2*N)!/(2^N*(1*2*3*...*(N-1)*N))=(2*N)!/(2^N*N!)

Running times: (I measured 3 times, then calculated average times)

```
N=4     2.36s
N=34    3.09s
```

Only three problems with this solution:

1. Too long (14 steps with LBL and RTN)
2. Too slow
3. Limited by N=34 (because (2*N)!)

But I'm working... ;)

Csaba

Re: HP-15C:Slow, but not limited by N

*Message #6 Posted by **Tizedes Csaba** on 24 Nov 2003, 5:26 p.m.,*
in response to message #5 by Tizedes Csaba

```
LBL C
ENTER
+
LSTx
Py,x
LSTx
2
x<>y
```

```
y^x
/
RTN
```

11 steps, N=52 -> 9.39s

Csaba

Re: HP-15C:Faster...

*Message #7 Posted by **Tizedes Csaba** on 24 Nov 2003, 6:38 p.m.,*
in response to message #6 by Tizedes Csaba

```
LBL A
2
x<>y
y^x
LSTx
.
5
-
x!
*
pi
sqrt(x)
/
RTN
```

14 steps, N=52 -> 4.02s

Csaba

This is use the following equality:

1*3*5*...*(2*N-3)*(2*N-1) = 2^N*GAMMA(N+1/2)/SQRT(PI)

Re: HP-15C: An approximately solution...

*Message #8 Posted by **Tizedes Csaba** on 24 Nov 2003, 9:13 p.m.,*
in response to message #7 by Tizedes Csaba

I was played with Stirling-formula, and then Wallis-product, and I maked this approximately solution:

```
LBL D
2
x<>y
y^x
LSTx
x!
LSTx
pi
*
sqrt
/
*
RTN
```

13 steps, N=52 -> 2.69s

Error at N=4 +3.2%, at N=60 +0.2%

Csaba

Re: HP-15C:Faster...

*Message #9 Posted by **Stefan Katletz** on 25 Nov 2003, 8:33 a.m.,*
in response to message #7 by Tizedes Csaba

By storing the two constants (0.5 and sqrt(PI)) in two registers (before running the program) one gains two lines and a little bit of time. But it still not the 2.7s ....

Re: HP-15C:Faster...

*Message #10 Posted by **Tizedes Csaba** on 25 Nov 2003, 12:32 p.m.,*
in response to message #9 by Stefan Katletz

Thank you, Stefan, I wrote it, and I tryed:

```
LBL E
2
x<>y
y^x
LSTx
RCL-9
x!
*
RCL/8
RTN

.5 STO 9
sqrt(pi) STO 8
```

10 steps, N=52 -> 3.54s (Hmm...)

Csaba

Re: HP-15C (11C/34C/42S/etc) Arguably Useful Mini-Challenge

*Message #11 Posted by **Brent** on 24 Nov 2003, 6:30 p.m.,*
in response to message #1 by Valentin Albillo

I'm thinking of some way to put this in tha calc but I'm not a math person.

(N+1)x (N+2)x (N+3)x ... x (N+N)---------- 2^N

It seems you can get rid of a bunch of internal stuff if you can do it.

Re: HP-15C (11C/34C/42S/etc) Arguably Useful Mini-Challenge

*Message #12 Posted by **Brent** on 24 Nov 2003, 6:34 p.m.,*
in response to message #11 by Brent

Sorry, I guess I don't know how to format the form properly.

2^N should be in the denominator.

14 step solution HP41

*Message #13 Posted by **Gene** on 24 Nov 2003, 8:56 p.m.,*
in response to message #1 by Valentin Albillo

Might be really bad (haven't read below). 14 steps includes LBL and RTN.

LBL 01 ENTER ST + X 1 + FACT X<>Y FACT 2 LASTX Y^X * / RTN

An odd double factorial, eh?

Re: What's with the " 1 + " ?

*Message #14 Posted by **Paul Brogger** on 25 Nov 2003, 3:44 p.m.,*
in response to message #13 by Gene

I figure the factorial formula is:

```
(2N)! / (N! * 2**N)
```

Am I missing something?

Also, removing "1 +" from yours, and using "ST + x" rather than the two-step "2 *" in mine (below) brings us both to 12 steps, with the same formula.

Where I got my stuff from

*Message #15 Posted by **Gene** on 25 Nov 2003, 7:07 p.m.,*
in response to message #13 by Gene

Found my formula here:

http://www.research.att.com/cgi-bin/access.cgi/as/njas/sequences/eisA.cgi?Anum=A001147

and

http://mathworld.wolfram.com/DoubleFactorial.html

Note that the second link shows for (5) on the right side the (2N+1)!/((2^N)*N!) formula. That's what I used.

Re: Where I got my stuff from

*Message #16 Posted by **Paul Brogger** on 25 Nov 2003, 7:40 p.m.,*
in response to message #15 by Gene

Well, let's try one . . .

For the example, n=4, the result has to equal 1 x 3 x 5 x 7 (the first four successive odd numbers multiplied together) or 105.

```
 (2*4+1)! / (2**4 * 4!)
=      9! / (16 * 24)
= 362,880 / 384
=     945.

  (2*4)! / (2**4 * 4!)
=     8! / (16 * 24)
= 40,320 / 384
=    105.
```

It's interesting that your formula seems to produce the same sequence of values, but they're "off by one". That is, if your formula is "g" and mine "p", then it appears that g(n) = p(n+1).

(I've got to get home, but I'll be playing with this some more. If I've got something wrong in the above, do set me straight!)

Not Fair !!

*Message #17 Posted by **Tom Sherman** on 25 Nov 2003, 9:02 a.m.,*
in response to message #1 by Valentin Albillo

Valentin's daughter would take out her Sharp 1350 and quickly write something like this:

10 INPUT "Number of terms =";N

20 A=1

30 X=1

40 FOR I=1 TO N

50 A=A*X

60 X=X+2

70 NEXT I

80 PRINT A

90 END

Execution time for N=52 on the HP-71B is a little over 2 seconds.

The rest of us would be left wondering why anyone would program in RPN anymore. Answer: it is fun, and more satisfying, because it is harder and takes much more time out of an otherwise dull evening.

I think that the above scheme can be done using a loop counter, index register, STO* or RCL* to save steps, etc., but it is too many years since I have done RPN programming to remember.

Tom

Brute Force

*Message #18 Posted by **Victor Koechli** on 25 Nov 2003, 9:56 a.m.,*
in response to message #17 by Tom Sherman

Alright, if you're going brute force, here you are:

<< DUP + 1 DUP ROT FOR i i * 2 STEP >>

.552s (HP-48SX), .367s (HP-49G, approx mode), .875s (HP-49G, exact mode). Works for n up to 202 (approx mode).

At least you can see how compact RPL is. Certainly not exactly what Valentin was asking for, though. I keep testing with my 15C...

Cheers, Victor 12345

Re: Brute Force

*Message #19 Posted by **Arnaud Amiel** on 25 Nov 2003, 10:14 a.m.,*

in response to message #18 by Victor Koechli

And 0.1837 approx abd 0.2065 exact on a 49g+

Arnaud

Force, but not brute...

*Message #20 Posted by **Tizedes Csaba** on 25 Nov 2003, 11:32 a.m.,*
in response to message #18 by Victor Koechli

```
PROD.EQ
<< -> n
   << n DUP 2 * SWAP PERM 2 n ^ / >>
>>

TEST.PRG
<< TICKS 52 PROD.EQ TICKS >>
```

I measured three times, and I modified the TEST.PRG:

```
TEST.PRG
<< TICKS 52 TICKS >>
```

The difference of running times (the real running time): 0.225s, on my 48SX.

Csaba

Re: Force, but not brute... CASIO FX-850P

*Message #21 Posted by **Tizedes Csaba** on 25 Nov 2003, 11:51 a.m.,*
in response to message #20 by Tizedes Csaba

```
1 N=52:BEEP:FORI=1TO100:PERM=NPR(2*N,N)/2^N:NEXT:BEEP
```

Running time: A=19.51s

```
1 N=52:BEEP:FORI=1TO10000:NEXT:BEEP
```

Running time: B=26.68s

The result: A/100-B/10000=0.192s

Csaba

LN(...*...*...) -> ...+...+...

*Message #22 Posted by **Tizedes Csaba** on 25 Nov 2003, 4:21 p.m.,*
in response to message #20 by Tizedes Csaba

```

DUP's and ROT's

*Message #23 Posted by **Tom Sherman** on 25 Nov 2003, 3:06 p.m.,*
in response to message #18 by Victor Koechli

Victor,

This is beautiful. But I feel like a DUP, my brain quite ROTated, just looking at it. Nice job!

Cheers,

Tom

Re: Not Fair !!

*Message #24 Posted by **Valentin Albillo** on 25 Nov 2003, 11:05 a.m.,*
in response to message #17 by Tom Sherman

Hi, Tom:

Tom posted:

"Valentin's daughter would take out her Sharp 1350 and quickly write something like this:"

Actually, she *did*.

:-)

She took out her SHARP 1350 (which I presented to her a few months ago), and produced the following:

```
10 INPUT "N = "; N:
   A = 1:
   FOR I = 1 TO 2*N - 1 STEP 2:
       A = A * I:
   NEXT I:
   PRINT A:
   END
```

which is only *one* (multi-statement) line of BASIC and uses STEP 2 to automatically increment the multiplier, thus avoiding any extra auxiliary variables. It executes fast, too, 1.5 seconds for N = 60, which is the limit for f(N) < 10^100.

... and I agree, it just isn't fair ... :-)

Best regards from V. and L.

Re: Not Fair !!

*Message #25 Posted by **Victor Koechli** on 25 Nov 2003, 11:17 a.m.,*
in response to message #24 by Valentin Albillo

You must be quite happy with your daughter! Well done! Cheers, Victor

Re: Not Fair !!

*Message #26 Posted by **Valentin Albillo** on 25 Nov 2003, 11:38 a.m.,*
in response to message #25 by Victor Koechli

Thanks a lot, Victor !

The equivalent HP-15C's RPN "loop" version, as Tom described, would be something like this:

```
   LBL A
```

```
STO I
STO+I
 1
LBL 0
DSE I
RCL*I
DSE I
GTO 0
RTN
```

which works Ok for N=1 to N=60. It certainly will look less "intuitive" or "clear" to any non-RPN fan, mefears ! :-)

Best regards from V.

A+ for L.

*Message #27 Posted by **Tom Sherman** on 25 Nov 2003, 12:34 p.m.,*
in response to message #26 by Valentin Albillo

Hi Valentin,

Please tell your daughter that this old retired prof. gives her an A+.

And thanks to you for the RPN loop listing.

Cheers,

Tom

OK, Valentin; and what is your solution??? [NO TEXT]

Buying HP48GX or HP49G+???

*Message #1 Posted by **Mark** on 24 Nov 2003, 11:05 a.m.*

I have found a place to buy 1 HP48GX, and I'm thinking if it's a better Idea than buying a 49G+. I have yet 3 hp48GX. They are so good machines... What about having one more? What do you think?

Re: Buying HP48GX or HP49G+???

*Message #2 Posted by **Ron Ross** on 24 Nov 2003, 11:30 a.m.,*
in response to message #1 by Mark

Since you have 3 48GX's (each with a typical lifespan of 10 years HARD USE), I would suggest a new 49G+ in a couple of months after all the bugs have been worked out.

Now if this were your 1st Hp, I might suggest the Hp48GX as I feel it is probably better made than the newer 49G+ (but I haven't yet got my grubby hands on a 49G+ yet either).

My $0.02 worth.

Business Pac for hp48GX

*Message #1 Posted by **Marc** on 24 Nov 2003, 10:05 a.m.*

What do you think about the Business Pac of CalcPro? Thanks for the answer.

Re: Business Pac for hp48GX

*Message #2 Posted by **Frank Travis** on 24 Nov 2003, 1:55 p.m.,*
in response to message #1 by Marc

I have the Business Pac for HP 48GX. It is nice. However, if you want maximum business computation functionality, it is not as good as the no longer made HP 17BII and HP 19BII calculators. I do not have an HP 17BII+ (The HP 19BII+ should be available in a few months). Two places that might still have the original HP 17BII and HP 19BII are Calcpro website www.calcpro.com phone (541) 752-8414 and International Calculator website www.internationalcalculator.com phone (407) 898-0081 I have bought the two models mentioned (plus many other calculators and accessories) from these two places. I do not know if they are still in stock. Call them when you get a chance. Good luck.

Re: HP 49G+ ROM version

*Message #1 Posted by **Ernie Malaga** on 24 Nov 2003, 3:29 a.m.*

Hi all. I've been trying to find information about the "|" operator (vertical bar), but the manuals don't even mention it. Can any of you enlighten me?

Thanks.

-Ernie

Re: HP 49G+ ROM version

*Message #2 Posted by **JasonG** on 24 Nov 2003, 3:42 a.m.,*
in response to message #1 by Ernie Malaga

Hi there,

IIRC, the | operator is called 'where', so that you can define the value of a variable in an expression. FOr example: y=m*x+c | m=2

I could, of course, be completely wrong, so I claim no responsibility for damage caused to your calculator (or anything else) by using this possibly wrong information. :-)

!7bii+ vs other HP calcs

*Message #1 Posted by **Brent** on 23 Nov 2003, 8:31 p.m.*

On my 17bii+ I put PI on the stack and multiply by 100 and then divide by 100. I put PI on the stack again and subtract. I get 2.1E-13. None of my other HP calcs do this--I get zero. Why?

Re: !7bii+ vs other HP calcs

*Message #2 Posted by **Fred** on 23 Nov 2003, 10:09 p.m.,*
in response to message #1 by Brent

Please explain to me how this is a useful calculation....

but it has to due with the internal significant digits the calculator maintains and round off errors during calculations in the least significant digits....

Re: 17bii+ vs other HP calcs

*Message #3 Posted by **David Brunell** on 23 Nov 2003, 10:58 p.m.,*
in response to message #1 by Brent

Sheesh, even my 1973-vintage TI SR-20 desktop scientific gives an answer of zero for pi*100/100-pi.

Maybe you should be happy to have a pi key on a financial calculator at all. :) Doing a quick survey here, none of the other HP financials that I have contain a pi key.

Re: 17bii+ vs other HP calcs

*Message #4 Posted by **Brent** on 24 Nov 2003, 12:05 a.m.,*
in response to message #3 by David Brunell

OK, It does it even if I multiply PI by 1 and then put PI in the stack and subtract. It shouldn't do it. It should be just zero. I don't know why or how I stumbled on it, but it just seems odd to me. The other calculators (11c, 48GX) don't do it. The 17bii+ gives a non zero number (2.1E-13), and I don't care whether it's a financial calculator or not--it shouldn't do it.

Re: 17bii+ vs other HP calcs

*Message #5 Posted by **David Brunell** on 24 Nov 2003, 1:28 a.m.,*
in response to message #4 by Brent

I have no idea what the internal architecture of the 17bii+ is, but I'd be willing to bet that the error is due to the calculator doing some unnecessary BCD-to-binary conversions.

On hp's web site, the calculator is listed as having "memory capacity unlimited within available memory." What the hell is that supposed to mean?

Maybe they should also state that accuracy is "unlimited within available significant digits." ;)

Re: 17BII gives 0

*Message #6 Posted by **Graham Wilson** on 24 Nov 2003, 6:50 a.m.,*
in response to message #4 by Brent

My 17BII gives 0 like the other "old" HP calcs. Does the bii+ use the BII ROM in hardware emulation?

Re: 17bii+ vs other HP calcs

*Message #7 Posted by **Valentin Albillo** on 24 Nov 2003, 9:22 a.m.,*
in response to message #4 by Brent

Hi,

I guess the trouble is caused by improper binary to decimal conversions and back in the emulator. Older HP calcs did use BCD, which allows for exact representation of base-10, decimal quantities such as 0.1, while 0.1 is a periodic, never-ending fraction in binary (base-2).

As a simple test, just try to calculate Pi*1-Pi in your trusty Windows XP standard calculator applet (Scientific mode). You should get a 0, but actually you get instead:

```
[Pi] [*] [1] [-] [Pi] [=]

          -> 3,13705055260829694636963159425 62e-38
```

Close, but no cigar ! Pi + 0 - Pi gives the same result.

Best regards from V.

Re: 17bii+ vs other HP calcs

*Message #8 Posted by **Frank Wales** on 25 Nov 2003, 8:30 p.m.,*
in response to message #7 by Valentin Albillo

Well, I infer from this that either there is a stupid bug in the low-level routines that emulate the BCD-type arithmetic operations done in hardware on the older machines, or HP have finally decided that binary floating point is good enough for financial calculators (and maybe even for all of them -- has this been tried on the 49G+?).

Personally, I'm hoping it's a bug, and not a policy change, since the latter would indicate that HP had misplaced their understanding of the need for consistency of operation. Which would be sad.

Other tests

*Message #9 Posted by **Tizedes Csaba** on 24 Nov 2003, 9:32 a.m.,*
in response to message #1 by Brent

Hello,

my favorite test is the next:

3 [ENTER] [y^x] 27 [-]

And the test for PI:

355 [ENTER] 113 [/] [PI] [-]

Csaba

Re: Other tests

*Message #10 Posted by **Joe** on 24 Nov 2003, 9:58 a.m.,*
in response to message #9 by Tizedes Csaba

I'm not biting.

Re: Other tests

*Message #11 Posted by **Namir Shammas** on 24 Nov 2003, 10:17 a.m.,*
in response to message #9 by Tizedes Csaba

The operations 355 / 113 gives an good approximation for Pi that typically has the following error:

(355 / 113 - pi) / pi * 1E+09 = 84.xxx

Namir

Re: Other tests

*Message #12 Posted by **GE (France)** on 24 Nov 2003, 5:11 p.m.,*
in response to message #11 by Namir Shammas

Another test would be :

355 [Enter] 113 / [Enter] SIN + SIN

Which is quite close to zero. 48GX gives -2.06E-13, a nice PC1262 could probably do better as the result obtained from Maple (for instance) is about -3.16E-21.

Re: !7bii+ vs other HP calcs

*Message #13 Posted by **Scuba Diver** on 24 Nov 2003, 1:33 p.m.,*
in response to message #1 by Brent

Hi Brent!

Just wondering; what are your thoughts of the 17BII+? Is the keyboard the same as the 10BII, or is it better quality than that?

Now that the 17BII+ is out, I find the ebay prices for 17BIIs has dropped; would you suggest that I get a backup 17BII while I can, or should I pick up a +?

B.

Re: !7bii+ vs other HP calcs

*Message #14 Posted by **Brent** on 24 Nov 2003, 1:53 p.m.,*
in response to message #13 by Scuba Diver

I only have a 12c so I can't tell you anything about the other business calcs. It seems like a pretty good calculator but it has kind of a hollow or tinny feel to it. The eqation SOLVE part is nice. I wish they would make the 33s equation solver the same way. You can use names for variables and input values via softkeys. The 33s will only allow you to use A thru Z for variables (I think). I would go ahead and get the 17bii+ if I were you. It works fine, but it just doesn't have that feeling that you are holding a valuable piece of equipment.

HP 41, 67 and 97 fuel tube for reader

*Message #1 Posted by **Michel Beaulieu** on 23 Nov 2003, 8:30 p.m.*

I repaired all my 2 card reader i have with modeling fuel hose as it is suggest here and there. After the installation, all my card reader works well for about 25 cards and after that i can hear a hirssing noise when card pass throught the reader and finally a lot of error occurs. I look in the reader and the fuel lind tend to slip on the shaft and finally touch the card reader body and friction occurs. I replace the fuel hose and try it again. works well and then the noise come back. I try to "superglue" the rubber on the shaft but the silicone line dissolved! i try other glue but the tube lost is perfect roud shape.

I also try o ring but i have the same problem in less passes...

What can i do to prevent slowly sliding of the wheel on the shaft?

Another one : what is the method to clear/clean cut these fuel line all around at 90 degree?

Thanks Michel

Edited: 23 Nov 2003, 8:33 p.m.

Tubing is too large

*Message #2 Posted by **Mike** on 23 Nov 2003, 8:49 p.m.,*
in response to message #1 by Michel Beaulieu

I believe you are using to large of an inside diameter. A good fit should require the tube to have to stretch to fit over the shaft. I have repired over 50 of these using this method and have never had to use any glue.

Try some tubing with a smaller inside diameter.

Re: Tubing is too large

*Message #3 Posted by **Dave** on 23 Nov 2003, 9:23 p.m.,*
in response to message #2 by Mike

Orange surgical tubing of the correct OD works well too, the texture provides good gripping for the cards.

Re: Tubing is too large

*Message #4 Posted by **David Smith** on 24 Nov 2003, 12:18 p.m.,*
in response to message #3 by Dave

Many surgical tubings are made of natural rubber. They tend to go bad after a while. I have silicone tubing readers that were repaired over 15 years ago and are still working fine.

Re: Tubing is too large

*Message #5 Posted by **Michel Beaulieu** on 24 Nov 2003, 6:45 p.m.,*
in response to message #4 by David Smith

Where can i find this kind of tubing? Thanks Michel

Re: Tubing is too large

*Message #6 Posted by **Katie** on 24 Nov 2003, 9:07 p.m.,*
in response to message #5 by Michel Beaulieu

I agree, silicone rubber tubing is the best stuff. Here's my old post on this.....

I've done many card reader repairs trying various materials (o-rings, rubber feet and different kinds of tubing). I've made all of these work, but by far the best one and the one probably closest to the original that I've found is silicone rubber tubing 1/4" OD x 1/8" ID. It fits on the gear shaft perfectly without the need to glue it on and provides plenty of contact area with the card (unlike the o-rings).

This is readily available from Small Parts Inc. www.smallparts.com (800) 220-4242. They sell 10 feet of this (enough to repair 1000 card readers!) for $24 (part # 210005 http://www.smallparts.com/products/descriptions/2100+.cfm). BTW, they also sell the 1/8" Delrin balls (4 of them) used in the card reader in case you loose them while doing the repair (25 for $1.45, part # BDLR-2 http://www.smallparts.com/products/descriptions/bdlr.cfm) -- I've never seen these disintegrate, however.

Edited: 24 Nov 2003, 9:15 p.m.

Re: Tubing is too large

*Message #7 Posted by **David Smith** on 25 Nov 2003, 12:51 p.m.,*
in response to message #5 by Michel Beaulieu

Small Parts tubing is way too expensive (but easy to get). Most hobby shops sell it either by the foot or prepackaged in 3 foot lengths for around 2 bucks. The thing to watch out for is to get some that is perfectly round and has the hole well centered. Bring a magnifying glass and check.

HP-48* Question?

*Message #1 Posted by **Roy Haller** on 23 Nov 2003, 7:24 p.m.*

Does a USB adapter vs. the Serial Port adapter exist? Or is Infa Red simpler?

Edited: 23 Nov 2003, 7:33 p.m.

Re: HP-48* Question?

*Message #2 Posted by **Victor Koechli** on 24 Nov 2003, 2:43 a.m.,*
in response to message #1 by Roy Haller

I am successfully using a keyspan USA-19 USB-to-serial adapter for attaching my HPs (48SX, 48GX, 49G) to my iBook. I'm using Kermit or Xmodem to communicate witch the calcs (using ZTerm). I can even use VirtualPC if I have to do a ROM upgrade on the 49G (I don't know how to do that from the Mac, where the necessary software does not exists).

Note, however, that the USA-19 is not even a full serial adapter, but merely what they call a 'PDA Adapter'. It's cheap and does the job.

Hope this answers your question. Kind regards, Victor

Are older 12c's as high quality as 15c's?

*Message #1 Posted by **Josh P** on 23 Nov 2003, 6:16 p.m.*

HP Museum describes the 10c's construction as follows: "Previous HP's had a flexible sheet under the keyboard to protect the electronics from minor spills and dirt. The 10C series took this further by having a single large sheet of film under the keyboard that wrapped around the electronics and overlapped at the back. This sheet consisted of three bonded layers: the outer layers were nonconductive, but the center layer was conductive. There was also an inner conductive film surrounding the main circuit board. These films gave the CMOSC chips a high degree of electrostatic protection."

Were the 12c's made during the same time period ('80's) put together as well as the other Voyagers? Maybe the engineering Voyager's were designed to survive harsher conditions than those used by the business folks?

Edited: 23 Nov 2003, 7:38 p.m.

Re: Are older 12c's as high quality as 15c's?

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 23 Nov 2003, 8:46 p.m.,*
in response to message #1 by Josh P

I have a HP-12C with the flexible circuit board and a protective "envelope" around all circuit. Is very well made, build in 1983 in USA. I had a identically well made HP-15C made in Brazil back in 1983 (bought new, sold in 1989 to buy a 42S). These old ones have in the battery compartment two single foiled springs.

The newer HP-15C and 11C that I have doesn't have the protective "envelope", and the circuit board is rigid with the chips, display and keyboard alltogether. These newer ones have in the battery compartment a helical spring in one side and a golden squared contact in the another side.

The HP-12C suffered several other modifications, that I don't know yet.

In short, the first "Voyagers" are all the same quality. The entire line followed the same modifications (I heard that the 12C ones where the first to be "upgraded") until they take the 10C, 11C, 15C out of busines... :(

Anyone to confirm this?

Best regards,

Nelson

*Message #2 Posted by **Neson M. Sicuro (Brazil)** on 23 Nov 2003, 3:06 p.m.,*
in response to message #1 by Emmanuel, France

I think that it is a good old SCAM.

Nelson

Re: Curious auctions on ebay

*Message #3 Posted by **Namir Shammas** on 23 Nov 2003, 3:36 p.m.,*
in response to message #1 by Emmanuel, France

Emmanuel,

The auction is selling you INFORMATION on how to get these calculators free. I have written the seller many times asking him to send me these calculators (since they cost him nothing anyway!!!!!) and that I'd pay for shipping! Of course I never hear from the seller.

Don't waste your money!!!!!!!!

Namir

These are illegal auctions

*Message #4 Posted by **Mike** on 23 Nov 2003, 4:11 p.m.,*
in response to message #1 by Emmanuel, France

Illegal, in the sense of against ebay policies. eBay will delete any such auction (for info only), when they are reported.

Watch it disappear within 48 hours. Report it to ebay here: ebay policies

There are many reasons why this is against ebay policies. For one, the info stears customers away from ebay. That is a clear violation. Another is that it is a "misleading" title. There really aren't any FREE calculators.

You will also notice that he is spelling FREE with spaces like F R E E so he can avoid ebay catching him. If you report him, they will be deleted.

If everyone would search for these auctions and report them, they would all be removed. They are usually very quickly removed.

These are essentially SCAMS.

Edited: 23 Nov 2003, 4:32 p.m.

See... They are gone already

*Message #5 Posted by **Mike** on 23 Nov 2003, 7:10 p.m.,*
in response to message #1 by Emmanuel, France

They are gone already!

I bookmarked these items, to see how long it would take for them to disappear. They are already gone.

Like I said, report these SCAM auctions and ebay deletes them, as quick as they are reported.

Like Arnold, he'll be back

*Message #6 Posted by **Patrick** on 23 Nov 2003, 8:15 p.m.,*
in response to message #5 by Mike

I've seen this guy's ads appear on eBay for over a year now. Whether the latest crop has been cut down doesn't mean very much. You watch... he'll be back very soon, and he'll spell "FREE" a different way each time (F R E E, $FR E E, F REE, ...).

BTW... if you look at the guy's eBay feedback you'll find that he has considerable positive feedback. Of course, they could all be his friends for all we know.

So, report him again

*Message #7 Posted by **Mike** on 23 Nov 2003, 8:51 p.m.,*
in response to message #6 by Patrick

Just search for his auctions by his name or some other method of spotting these kind of ads.

Report the ad and within 24 hours it will be gone again. Make a game of it.
http://www.msdsite.com/images/smile.gif

Re: So, (don't) report him again

*Message #8 Posted by **Thomas Radtke** on 24 Nov 2003, 6:15 a.m.,*
in response to message #7 by Mike

There are many ways to waste your time;). Sadly, ebay is in a position where they don't need to protect bidders automatically but sit back and wait for responses. Even then they do not remove aucconts of those who failed to maintain the least possible decency.

Thomas

Re: So, (don't) report him again

*Message #9 Posted by **TR** on 24 Nov 2003, 6:17 a.m.,*
in response to message #8 by Thomas Radtke

'aucconts' should be 'accounts', obviously:(.

Re: See... They are gone already

*Message #10 Posted by **Namir Shammas** on 23 Nov 2003, 8:22 p.m.,*
in response to message #5 by Mike

Mike,

You are very right!! That was fast on eBay's behalf!

Namir

Why won't HP stop the guy on ebay selling PDF of 12c manual?

*Message #11 Posted by **Gene** on 23 Nov 2003, 9:14 p.m.,*
in response to message #10 by Namir Shammas

Seems like that is an auction that should be canned.

Re: Why won't HP stop the guy on ebay selling PDF of 12c manual?

*Message #12 Posted by **Nelson M. Sicuro (Brazil)** on 23 Nov 2003, 9:24 p.m.,*
in response to message #11 by Gene

Here in Brazil is even worst, they sell the HP-12C simulator for PC/Palm for $1, in the www.mercadolivre.com.br auction site. Is terribly anoying! Dozens of auctions.... Is really a shame! Even the HP-41, 48 and 49 emulators!!!

Just browse it in the "Calculadoras" section (in portuguese, you can use the www.babelfish.altavista.com to translate)

Best regards,

Nelson

Or let's get the Museum to buy it!

*Message #13 Posted by **Patrick** on 24 Nov 2003, 2:53 a.m.,*
in response to message #11 by Gene

What if we each contributed a bit to Dave and have him buy it and put it up on this site!

I'm sure there's a hole in this idea somewhere....

Re: Or let's get the Museum to buy it!

*Message #14 Posted by **Arnaud Amiel** on 24 Nov 2003, 4:36 a.m.,*
in response to message #13 by Patrick

Actually the PDF manual for the 12C platinum is available on hp's site. I would guess it is quite applicable to the non platinum.

Arnaud

Re: Curious auctions on ebay

*Message #15 Posted by **gifron** on 24 Nov 2003, 12:32 a.m.,*
in response to message #1 by Emmanuel, France

I emailed a buyer once to find out what the scam was. I was told that you are instructed to contact mfrs., representing yourself as a retailer, and stating that you need a sample for evaluation purposes, or some such thing.

I don't know if it was this same seller, as I have seen two or three different ones. I figure they are all selling the same thing.

HP-85B internal information?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 23 Nov 2003, 2:42 p.m.*

Hi all,

Anyone knows anything of the internals of the HP-85B computer/calculator? What is its processor/instruction set? Any ROM dumps? I'm thinking about a HP-85B emulator, does anyone knows if this exists?

Best regards,

Nelson

Re: HP-85B internal information?

*Message #2 Posted by **Gordon** on 23 Nov 2003, 3:57 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Here is an excellent series 80 web site with ROM images and documentation available:
http://www.series80.org/

Re: HP-85B internal information?

*Message #3 Posted by **Vassilis Prevelakis** on 25 Nov 2003, 7:02 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

The processor instruction set is described in the HP-85 Assembler ROM Manual which is included in the MoHPC CDROM (roms/85asmrom.pdf)

To the best of my knowledge there is no emulator for any Series 80 computer. The processor architecture is quite strange and even writing machine language programs is non trivial.

Re: HP-85B internal information?

*Message #4 Posted by **Valentin Albillo** on 25 Nov 2003, 7:53 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi, Vassilis:

Vassilis posted:

"The processor architecture is quite strange and even writing machine language programs is non trivial."

Why, Vassilis, writing machine language programs is *never* trivial ! :-) At least for us, puny humans !

I've written machine language programs for quite a variety of CPUs, from the ZX-81 (aka Timex Sinclair 1000 in the US) onwards, and it was never 'trivial', specially if you had to assemble the code by hand, translating opcodes to hexadecimal and manually calculating the jump offsets, as was the case with the ZX-81 before the first rudimentary assemblers did appear.

I did also write a sizable number of 'machine language' routines for the HP-85, implementing a number of new BASIC keywords and frankly, though not exactly trivial, it wasn't that difficult either. The processor's architecture is not so much 'strange' as unique, with its large 8-byte CPU 'registers' and BCD arithmetic.

I remember distinctly it all was very exciting and enjoyable and you felt great when your newly assembled BASIC keyword would perform as expected (or else crash the machine altogether).

Some people went even further: a friend of mine did write a chess program for the HP-85 which made use of a number of chess-specific BASIC keywords written in assembler to generate all legal moves and search/evaluate the tree at assembly speeds. People at HP were amazed when we showed it to them, and used it at trade show demonstrations to help boost sales. And some HP-written assembly-language programs made incredibly amusing and addictive video games, I still fondly remember BATS and MAZE.

The assembly programming model was very similar to that of the HP-75C and HP-71B, you needed to define parse tables, text tables, polls tables, error messages tables, etc, then code your keywords, which usually made a large number of calls to operating system entry points in ROM (specially for parsing), so you didn't need to reinvent the wheel.

I still keep a number of HP-85 'machine language' listings, spefically written for didactic purposes, to be explained in a number of HP-85 programming courses I taught at the time.

Best regards from V.

in response to message #4 by Valentin Albillo

Hi, Valentin

I'm very interested in learn all I can about the HP-85B (I don't have one). I am a assembler programmer too (6502, Z80, x86, PIC) and started also with a ZX-81 "clone" here in Brazil (and a HP-15C :).

I want to know the assembler instructions and other hardware things (I/O, memory map, ROM dumps?) to *try* to build an emulator.

Is its processor in the saturn family processors?

Thank you very much

Nelson

Hi, Nelson:

Nelson posted:

"I am a assembler programmer too (6502, Z80, x86, PIC) and started also with a ZX-81 "clone" here in Brazil (and a HP-15C :)."

Same here, more or less, except I never wrote anything for the legendary 6502 (but then I did for the HP-85's CPU)

"I want to know the assembler instructions and other hardware things (I/O, memory map, ROM dumps?) to *try* to build an emulator. Is its processor in the saturn family processors? "

No, it's not a 'Saturn' but a 'Capricorn'. If I remember correctly, the Capricorn series does include the HP-85, HP-86, HP-87, and HP-75 families. Among other things, this means that if you can get an Assembler ROM and/or its Manual for *any* of the above models, you're all set up. The Assembler ROM for the HP-86/87 is a lot easier. For the HP-85, there were both an Assembler ROM and a software assembler available on data cartridge. This software assembler was a complex BASIC program plus the STOREBIN binary, which provided the STOREBIN keyword necessary to add the required header to the assembled file and store it on the tape. You would then load it into memory with the standard LOADBIN keyword (the STOREBIN binary also had the SCRATCHBIN keyword, necessary in order to remove the loaded binary from memory to try another). I did all my assembly programming for the HP-85 using this software assembler, it was rather usable if not exactly fast.

Good luck with your HP-85 emulation and

Best regards from V.

*Message #2 Posted by **Juan J** on 23 Nov 2003, 11:19 a.m.,*
in response to message #1 by Valentin Albillo

Hello Valentin,

Excellent photos. Could you please help me with a question?

I just got a 15C in a flea market for $40. Put in new batterires and it is running fine. It passed the self-tests and the PCB (I took it apart just to see how it was on the inside) was in good condition but it smells like it has been stored in a moist place for a while. You have voiced concerns about HPs' durability recently, particularly Voyagers.

My question: can a Voyager stand long term high-humidity storage without any damage? Is there anything to do about it? Thanks in advance for your advice.

Regarding the Sharp, a friend's father had one of these, to complement his HP-67. Later he bought an HP-85 and no longer needed them. Sadly, we never saw the Sharp again.

Juan J

in response to message #2 by Juan J

Wipe out any mould or deposits with a damp cloth and allow the unit to dry slowly at 35 deg C. i.e. very warm but not hot, for about 1 week. It does take that long for moisture to migrate out of the epoxy plasic

used for integrated circuits.
Enjoy the calc!

in response to message #2 by Juan J

Hola, Juan:

Juan posted:

"You have voiced concerns about HPs' durability recently, particularly Voyagers."

Yes, but only in the long term, say 40-50 years. Most existing Voyagers are now 20+ years old, so they've still 20-30 additional working years left in them, IMHO.

"can a Voyager stand long term high-humidity storage without any damage? Is there anything to do about it?"

I've never seen or heard of a Voyager ruined by humidity, but I guess that's a possibility. I'd suggest you open up the machine, and place it on a very mildly warm surface (the external top of a refrigerator is ideal, it's always very comfortably warm, but never hot) for a week or so. Humidity will dissapear that way. After that, keep the calculator for a while in a box surrounded by Silica Gel dessicant mini-bags, they will take care of any remaining humidity.

I always keep my calculators stored with dessicant mini-bags like those, it keeps them dry whatever the external circumstances.

Best regards from V.

*Message #5 Posted by **Juan J** on 23 Nov 2003, 10:53 p.m.,*
in response to message #4 by Valentin Albillo

Hola Valentin, como estas?

What I did was to take the calc apart and use a hot air blower to "dry" whatever moiture there was inside the calculator, for about 30 minutes. Then I allowed the pieces to cool down and once they were cold I put the calculator together again. Put in baterries, ran the self-tests and the machine is working fine. I even tried ione of mi favorite intergrate stress tests, so to speak, the sine integral, and the 15C passed it.

Noww the 15C is in one of those HP leather cases (the original slip case is still too moist and looks worn) designed for clamshells, which has a small package of silica gel.

Thanks for your advice and, if your time allows, I will continue asking about the 15C. So far I've been unable to use some of its features without the manual nearby. I got a bit too much used to both the Advantage Pac user interface and the 48's Matrix Writer.

A little bit off-topic, about your proverb (or it was Angel?) about the nature of truth, there is a latin one, Simplex Sigillus Veritas, Which translates to Simplicity is the sign of truth or, in Spanish, "La sencillez es el signo de la verdad."

Juan

Hola, Juan J:

Juan J posted:

"Hola Valentin, como estas?"

Muy bien, gracias, ¿ y tu ? [Fine, thanks, what about you ?]

"What I did was to take the calc apart and use a hot air blower to "dry" whatever moiture there was inside the calculator, for about 30 minutes."

While obviously having to wait just 30 minutes seems preferable to 1 week, I still stick to my original advice, of applying very 'soft' heat (top of a refrigerator being the ideal) for a long time, instead of stronger heat for a relatively short time. Humidity will evaporate without the slightest chance of damaging any component, as the recommended temperature limits are never exceeded or even approached. I'm not so sure a hot air blower will not dangerously approach the upper limits at times.

Bear in mind that even if the 'instant' temperature is within limits, the fact that you're applying heat continuosly in a small zone means that the 'average' temperature will rise well above the 'instant' one. You can easily test this by letting your finger stay in contact with a sheet of paper as it comes out of a laserjet printer: even if the sheet isn't hot enough to burn you by a quick contact, if will burn you if you let your finger remain in touch with the outgoing sheet for more than a couple seconds, as the heat just keeps building up.

"Thanks for your advice and, if your time allows, I will continue asking about the 15C."

You're welcome.

"So far I've been unable to use some of its features without the manual nearby."

Try and get one, then. They're sold on Ebay all the time at very affordable prices. I got a brand new, spiral one (the best for easy reference) a few months ago for less than US $20.

"A little bit off-topic, about your proverb (or it was Angel?)"

None of us, it was mentioned by Andy Agui.

Best regards from V.

Re: HP & SHARP

*Message #13 Posted by **Valentin Albillo** on 24 Nov 2003, 5:34 a.m.,*
in response to message #9 by Pierre Brial

Hi, Pierre:

Pierre posted:

"Great pictures. The light is perfect. Can we have technical details on how they were made ?"

Thanks for your appreciation, but though I am quite an accomplished amateur photographer, have some great hardware and many thousands of excellent pictures in my portfolio, these 'great' calculator pictures were made making *no* use at all of either the great hardware or the great experience ! Matter of fact, I'd rather have you thinking they're 'great' instead of ruining your appreciation of them by telling exactly how they were made. :-)

"For me the two calcs you show are the best ever produced for the ratio power/wheight."

Well, I pictured the SHARP PC-1260, but the PC-1262 is actually better and boasts 10 Kb RAM instead of 4 Kb in the exact same packaging.

"Nowaydays, calculator manufacturer are no longer concerned about this ratio, and programmable calculators are no longer "pocketable"

Indeed. People may like HP48/49 calculators a lot, but they're certainly massive: large, weighty. They can't compete with the Voyagers or SHARP PC-12xx models at all. You can easily fit not one but even two such at a time in your shirt pocket. Try that with an HP48/49 ! :-)

Best regards from V.

HP-9G

*Message #1 Posted by **rsenzer** on 22 Nov 2003, 10:57 p.m.*

I just purchased an HP-9G. I found one bug initially and phone it into HP this week. Customer representative said that HP would send me a new unit. Friday night, I found another bug and e-mailed the information to HP with the associated case id.

The first bug is: ln(2+2*10^(-9)) - ln(2) returns a negative number;

The second bug is: 7/6 [F<>D] [ENTER] does not convert decimal to the fraction, "7/6" where [F<>D] refers to the fraction-to-decimal decimal-to-fraction shifted toggle key.

The first bug existed in early models of the HP-30S, but it had been fixed a long time ago. The second bug does not exist on the HP-30S.

HP's customer service response was excellent, once I got past the detour to an HP service center somewhere in India that apparently handled HP Pavilion computer models.

A side note:

So how did I know I had travelled to India? ... the accent was the first clue, but when you're put on hold and the rock music is accompanied by a sitar, you know you aren't in Kansas anymore.

Re: HP-9G

*Message #2 Posted by **CalcKidd** on 24 Nov 2003, 8:11 a.m.,*

> *I tried this equation on my 49G+ and got .000000001. My 9G also got a negative number (1.908 x 10^-10).*

My "genuine HP" scientific models all return 1 x 10^(-9) (1E-9), while the business models return 0.000000001, no matter if fewer decimal digits are specified. Are business "peeps" assumed to be unfamiliar with scientific notation?

No negative numbers, though, which, BTW, 1.908 x 10^(-10) is not... ;-)

"rsenzer", what was the negative number?

Karl

Re: HP-9G

*Message #4 Posted by **rsenzer** on 25 Nov 2003, 1:50 a.m.,*
in response to message #3 by Karl Schneider

Hi Karl,

The same result as reported by CalcKidd. From the context of the message and thread, I concluded that CalcKidd was referring to the magnitude and verifying that he also got a negative number from the calculation. Of course, I had seen that number already.

The number per the display is: -1.908214929*10^(-10)

As stated in the original message, early HP-30S models had a similar problem.

OT: Sharp PC-1270 - An interesting non-HP

*Message #1 Posted by **Mike** on 22 Nov 2003, 7:31 p.m.*

This Sharp pocket computer is very interesting. It was manufactured with the sole purpose of being programmed with custom ROM. These were mainly used by businesses with very specialized purposes. The one below was originally used to calculate car liscense plate fees.

It does nothing, without a program memory. Most have ROM but you can get these with RAM. If you have a RAM module, these can be made very useful by reprogramming them.

I have reprogrammed this one to simply return the function key name, when the key is pressed. Now that I know the process, I'm going reprogram it for something more useful. http://www.msdsite.com/images/smile.gif

Click image for description of process http://www.msdsite.com/vcomp/sharp/1270/1270.jpg

in response to message #1 by Mike

Hi,

For anyone interested, here's the SHARP PC-1270 BASIC Compiler manual (in PDF format, 55 pages, 140 Kb):

Sharp PC-1270 BASIC Compiler V3.3

Best regards from V.

But where can you get the compiler

*Message #3 Posted by **Mike** on 22 Nov 2003, 7:59 p.m.,*
in response to message #2 by Valentin Albillo

Thanks, I already have a copy of the compiler manual.

The compiler is nice for large programs. I just program in BASIC, since I can't find a compiler. PROMSoft does not sell the compiler and Sharp has discontinued that product.

Anyone have a compiler or know where one can be obtained?

hp75 VisiCalc external display question

*Message #1 Posted by **andy** on 22 Nov 2003, 6:02 p.m.*

I am wondering how to change the external display on hp75 visicalc. When I first received the module a few months ago it displayed 32 columns which worked nicely using the 82163a video interface.

I ran visicalc today and for some reason its displaying at 80 columns now and I'm not sure what I've done to change it. Any ideas?

thanks,

Andy

80 columns on an 82163A?

*Message #2 Posted by **Mike** on 22 Nov 2003, 8:30 p.m.,*
in response to message #1 by andy

I'm confused. The 82163A is only a 32 column device. The real question is how are you getting 80 columns on a 32 column device?

Edited: 22 Nov 2003, 8:34 p.m.

Re: hp75 VisiCalc external display question

*Message #3 Posted by **Andy** on 22 Nov 2003, 9:12 p.m.,*
in response to message #1 by andy

sorry I don't have a good answer to getting 80 columns out of an 82163a other then I'm not. I noticed the display was not correct when using my 82163a so I switched my 75 over to link+ (using the hpil/isa card) which acts as an 80 column device and visicalc displayed properly.

Since that posting, I've switched the visicalc module to another 75 which was freshly reset. The default mode appears to be 32 columns.

Andy

There is no 80 column mode

*Message #4 Posted by **Mike** on 22 Nov 2003, 9:49 p.m.,*
in response to message #3 by Andy

The 82163A is 32 colunm mode only. There is no 80 column mode with the 163A.

Edited: 23 Nov 2003, 12:55 p.m.

Re: There is no 80 column mode

*Message #5 Posted by **David Smith** on 23 Nov 2003, 3:01 p.m.,*
in response to message #4 by Mike

Visicalc was formatting 80 column lines and sending it to a 32 column display.

Re: hp75 VisiCalc external display question

*Message #6 Posted by **Emmanuel, France** on 23 Nov 2003, 7:06 a.m.,*
in response to message #1 by andy

```
HP82163 video interface provides 32 columns only.
You need an HP92198A HP-IL 80-Column Video Interface.
It was made by Mountain Computer, Inc. (MC00701A).
```

Re: hp75 VisiCalc external display question

*Message #7 Posted by **Achim Buschendorf** on 23 Nov 2003, 10:35 a.m.,*
in response to message #1 by andy

Hello Andy,

you can set the dimension of the video display with the following BASIC commands: VLENGTH n and VWIDTH m. The defaults are VLENGTH 16 and VWIDTH 32.

Regards, Achim

Re: hp75 VisiCalc external display question

*Message #8 Posted by **andy** on 23 Nov 2003, 3:01 p.m.,*
in response to message #7 by Achim Buschendorf

Thanks Achim!

Those are the commands I was looking for. VLENGTH and VWIDTH appear to be commands specific to VisiCalc and these allow you to set the display dimensions. Somehow one of my 75's got set to 80 columns (probably while experimenting with a program off the swap discs).

For everyone else...I'm sorry that I was unclear.

Thanks for all the help everyone. One day maybe I can find a VisiCalc manual...all I have right now is the quick reference guide.

Andy

request for help with my 48sx on key

*Message #1 Posted by **db(martinez,california)** on 22 Nov 2003, 3:25 p.m.*

The on key to my 48sx is not operating in many of it's uses but it works fine for others. The calculator has had a cushy life. I bought it in 91 and it has spent most of its life in an enviornmental case. The on key feels like new. I hope someone has a fix. Here are the main faults and other points:

To turn the calculator on it is necesasary to push and hold another button while pressing the on key.

To turn it off you must take out a battery of a moment because >on does not work.

There is no "continue" because <on doesn't do anything.

ATTN does not function.

It is not possible to darken or lighten the screen using on+ or on-.

It fails the keyboard test and does not beep at the on key.

However:

As i said; it can be turned on with the on key as long as one or more of most of the other keys are pressed and held first. The right cursor does not work for this but the other three do. Most numbers help it turn on but not the 9. It turns on if you press the < then the on but not the other way around and nothing goes with the > key.

The a-f-on reset works.

The tests which are started by pressing the on and one of the top row all start, but as i said, it fails the keyboard test when it gets down to the on key.

Thanks for the help. - d

Re: request for help with my 48sx on key

*Message #2 Posted by **Victor Koechli** on 24 Nov 2003, 11:22 a.m.,*
in response to message #1 by db(martinez,california)

The 48 series seems to have a contact problem between the main PCB and the keyboard. There have been several posts about this recently. Supposedly the ON key will work if you press on the metal bezel above (or below?) the C key. If your HP-48SX exhibits that behaviour, only disassembling it could solve it.

Of course you could also have a broken trace somewhere. The consequences would be the same.

Someone else have another idea? Regards, Victor

OT: Manuals wanted on Sharp PC-1250A

*Message #1 Posted by **Bill (Smithville, NJ)** on 22 Nov 2003, 3:24 p.m.*

I know that many of the forumn members also appreciate & collect the small Sharp PC calculators/basic computers, so am hoping someone can help me.

I recently picked up a Sharp PC-1250A with the CE-125 micro-cassette/printer. It works great and is fun to play around with.

Does anyone have any extra manuals for this unit/printer they'd be willing to either copy or part with?

If someone could loan me the manuals, I'd be happy to scan them and return the originals. There doesn't seem to be any manuals on the Net other than the Tandy/Radio Shack ones.

E-mail me at bjhnot@vpes.com. Just remove the "not".

If this is considered too far off topic, then use 12345 to delete.

I have a 1251 manual

*Message #2 Posted by **Mike** on 22 Nov 2003, 7:27 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I have a PC-1251 manaul which should be the same for what you need. I will look into copying it. The problem is that I don't want to break the spine so it won't be a great copy. But it will give you what you need. The manual is also 225 pages and will take me a while to get to it.

Interesting that you should post this. I was just about to post a PC-1270 post.

Re: I have a 1251 manual

*Message #3 Posted by **Bill (Smithville, NJ)** on 22 Nov 2003, 9:13 p.m.,*
in response to message #2 by Mike

Thanks Mike. I appreciate it. It's a shame Sharp didn't spiral bound their manuals. No hurry on the copy. I'm mostly interested in the commands for the mirco-cassette drive. The CE-125 makes for a nice compact basic computer, printer & mass storage. I `like the fact that the printer is thermal and is same width as the HP-41 printer.

My first forlay into handheld computers was the Sharp PC-1500 with the 4-pen plotter. Had a great time with it many years ago. Saw one at a flea market this year and picked it up with plotter for almost nothing. Unforturnately, I don't know of any source for the pens. I've tried cutting down some metal ball point refils with a little success - but it's pretty messy.

It's a shame that there's really very little scanned documentation for the Sharp computers.

Thanks again, Mike, for your help. 12345

Cassette commands

*Message #4 Posted by **Mike** on 22 Nov 2003, 10:03 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

You may have already figured out how to use the cassette drive.

Switch to Remote OFF, allows you to control the tape like a normal tape recorder with the buttons.

Switch to Remote ON, allows the computer to control the tape. However, you must pre-select the operation desired. All tape commands to is allow the motor to turn. So, say you want to CSAVE "program". You would:

```
1) Set REMOTE to OFF
2) Rewind tape to beginning, or position tape
3) Set REMOTE to ON
4) Push down the RECORD button
5) Issue the CSAVE "program" command.  The tape will move and the program
will be saved.  Tape stops automagically.

To CLOAD:
1) Set REMOTE to OFF
2) Rewind tape to beginning
3) Set REMOTE to ON
4) Push down the PLAY button
5) Issue the CLOAD "program" command.  The tape will move and the program
will be loaded.  Tape stops automagically.

Commands

CSAVE "filename"
CSAVE "filename", "password"
CSAVE ,"password"
CLOAD "filename"
CLOAD? "filename" (this command is to compare programs on tape to memory)
MERGE "filename"
INPUT # "filename"
INPUT # "filename", var list
INPUT # var list
PRINT # "filename"
PRINT # "filename", var list
PRINT # var list
```

SHARP PDF manuals [OT]

*Message #5 Posted by **Valentin Albillo** on 23 Nov 2003, 1:45 a.m.,*
in response to message #3 by Bill (Smithville, NJ)

Hi, Bill:

Bill posted:

"It's a shame that there's really very little scanned documentation for the Sharp computers."

Not so. Remember that several TRS-80 Pocket Computers are *exact* clones of some SHARP models, 100% *identical* in functionality and all but one, also cosmetically except for the TRS-80 logo instead of SHARP's.

Taking that into account, here you are, a few SHARP PDF manuals:

TRS-80 PC-1 = SHARP PC-1211, 1212, 1210

Owner's Manual

Printer/Cassette Interface Manual

Service Manual

TRS-80 PC-2 = SHARP PC-1500, 1500A

Owner's Manual

Technical Reference Manual

Assembly Language Manual

Printer/Plotter/Cassette Interface Manual

Service Manual

TRS-80 PC-3 = SHARP PC-1250A, 1251

Owner's Manual

SHARP PC-1401 = SHARP EL-5500 = SHARP EL-5500II

SHARP PC-1401 Instruction Manual (English) and System Book (German)

Many of these manuals are also 99.9% or more adequate for a great many other SHARP models, such as the PC-1402, 1403, 1245, 1246, 1247, 1252, 1260, 1261, 1262, etc, etc.

Best regards from V.

Re: SHARP PDF manuals [OT]

*Message #6 Posted by **Bill (Smithville, NJ)** on 24 Nov 2003, 9:59 a.m.,*
in response to message #5 by Valentin Albillo

Hi Valentin,

You're right - the Tandy/Radio Shack is a re-branded Sparp. But Radio Shack always had a habit of making small changes so that their computers (also applies to their re-braded casios) were a little different from the original. The PC-2 and 1500 had very different keyboard layouts but basically the same functions.

The real question would be - if I dumped the ROM from a Tandy and a Sharp - how different would they be? Be an interesting exercise. I'm assuming one could PEEK the ROM memory and dump it to a file.

Thanks again for all your help. 12345

Re: I have...Pens?

*Message #7 Posted by **jimc** on 24 Nov 2003, 2:51 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

What kind of pens are they? There may be some instrumentation warehouses that may be able to assist.

With a bit more information, I may be able to find you a source for the pens. (A picture would be most helpful)

PTA-4000

*Message #9 Posted by **Tizedes Csaba** on 24 Nov 2003, 7:07 p.m.,*
in response to message #8 by Mike

In the middle of '80s was a pocket computer in Hungary, named 'PTA-4000'. That was the hungarian license of SHARP's PC-1500.

It has an expanded version, the 'PTA-4000+16'. This calc build with +16KByte RAM. See the follows:

http://www.rskey.org/detail.asp?manufacturer=H%EDrad%E1stechnika&model=PTA-4000

Re: OT: Manuals wanted on Sharp PC-1250A

*Message #10 Posted by **Valentin Albillo** on 22 Nov 2003, 8:03 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi, Bill:

I suppose you already know this but just in case you don't, the Tandy TRS-80 PC-3 handheld is an *exact* clone of the SHARP PC-1251 pocket computer, which is just *nearly identical* to the SHARP PC-1250A you own, so the manual for the first will be 99.9% what you need.

You can download the TRS-80 PC-3 manual, in PDF format (5.1 Mb), here:

TRS-80 PC-3 Owner's Manual

and it certainly will be what you're looking for.

Best regards from V.

Re: OT: Manuals wanted on Sharp PC-1250A

*Message #11 Posted by **Bill (Smithville, NJ)** on 22 Nov 2003, 9:39 p.m.,*
in response to message #10 by Valentin Albillo

Thanks Valentin,

I did download the PC-3 manual and you're right - it's very similar. But I guess I;m always interested to know if there are any commands unique to the 1250. I'm also looking for some sample programs that would make use of the micro cassette tape drive.

On the side of the CE-125 interface unit is a jack labeled 'IN'. Do you know what this was for - audio in to the computer or to the tape? There would be no way to control it.

It's a great little, fun, system - especially with the tape and printer - very compact. 12345

Re: OT: Manuals wanted on Sharp PC-1250A

*Message #12 Posted by **Valentin Albillo** on 22 Nov 2003, 10:16 p.m.,*
in response to message #11 by Bill (Smithville, NJ)

Hi, Bill:

Bill posted:

"But I guess I;m always interested to know if there are any commands unique to the 1250."

I'm pretty sure there's none. The 1250, 1250A and 1251 seem to be nearly identical. Matter of fact, all SHARP models have either the identical BASIC dialect or else upwards compatible, with very few, obvious exceptions and extensions (4- or 2-line display versus 1-line display, etc).

"On the side of the CE-125 interface unit is a jack labeled 'IN'. Do you know what this was for - audio in to the computer or to the tape? There would be no way to control it."

I don't have the CE-125 interface so I can't tell for sure, but seems to me most probable that it is audio-in for the tape, not the computer.

"It's a great little, fun, system - especially with the tape and printer - very compact."

Certainly. The best model of this series is the SHARP PC-1262 (see pic at bottom). Same form factor, dimensions and weight, but 10 Kb RAM (vs. 4 Kb), 40 Kb ROM (vs. 24 Kb) and 2-line display (vs. 1-line). An amazingly capable and small machine (HP-15C size approx.). And fast, too !

Best regards from V.

SHARP PC-1262 (dimensions: 135x70x10 mm, weight = 115 gr)

```
Does the PC-1250 have an HELP key (available after SHIFT HELP)?
My PC-1251 has one.
```

Help?

*Message #14 Posted by **Mike** on 23 Nov 2003, 10:45 a.m.,*
in response to message #13 by Emmanuel, France

What do you mean HELP? I have both the 1250 and the 1251 and I don't find any HELP or any mention of it in the manual.

There is a RESERVE function (on both), that can be setup to display information after pressing SHIFT. Is that what you mean?

I believe the only difference between the 1250 and the 1251 is RAM size.

Re: Help?

*Message #15 Posted by **Emmanuel, France** on 23 Nov 2003, 11:40 a.m.,*
in response to message #14 by Mike

```
Please accept my apologies.
It's not PC-1251 but on PC-1261.
```

Both have help

*Message #16 Posted by **Mike** on 23 Nov 2003, 12:53 p.m.,*
in response to message #15 by Emmanuel, France

The only difference, I believe, is RAM. 4K on the 1260 and 8K on the 1261.

HELP!!! HP-75C flashing dashes and dots

*Message #1 Posted by **aam Morey** on 22 Nov 2003, 12:06 p.m.*

For some reason when I turned on my HP-75C today the display just flashed a series of dots and dashes and then it turned off. PLEASE help me with this problem. I just purchased the machine and it was working fine until today. The problem seems unexplainable to me. Thanks.

-Adam ratinacage2002@yahoo.com

Re: HELP!!! HP-75C flashing dashes and dots

*Message #2 Posted by **Tom Sherman** on 22 Nov 2003, 12:50 p.m.,*
in response to message #1 by aam Morey

Adam,

Have you tried taking the battery pack(s) out and running it just on the AC adapter? The HP-75 can be powered that way without harm. If the batteries are dead (in spite of charging them), the unit may exhibit the behavior you have described, but should run OK with the batteries removed.

Hope it works for you.

Tom

Re: HELP!!! HP-75C flashing dashes and dots

*Message #3 Posted by **Adam Morey** on 22 Nov 2003, 1:01 p.m.,*
in response to message #2 by Tom Sherman

No, the computer does the same exact thing when hooked up to the power supply. I also charged the batteries and it is doing the same thing.

Re: HELP!!! HP-75C flashing dashes and dots

*Message #4 Posted by **Tom Sherman** on 22 Nov 2003, 2:45 p.m.,*
in response to message #3 by Adam Morey

Just a shot in the dark, as I don't know what's going on: disconnect the AC, take the batteries out, press the ATTN key once or twice, then reconnect to the AC (but without the batteries) and say some prayers or incantations when you try the ATTN again.

Best of luck, Adam. Can anyone else help?

Tom

HHP Portable EPROM for HP-41

*Message #1 Posted by **Jeff** on 21 Nov 2003, 8:32 p.m.*

I recently purchased a HHP Portable EPROM unit housed in a card reader housing. Upon startup, the unit displays "Working" then says -ALLFAX-. I would like to know more about this unit and the EPROM inserted into it. The unit also came with a Overlay for the HP-41. I have posted at the following address the listing of the functions in this EPROM: http://www.elknet.net/mitchbrent/jdfam/HHPPORTABLEEPROM.DOC If you know any information or are interested in exploring this EPROM with me, please contact me. Best Regards, Jeff

Re: HHP Portable EPROM for HP-41

*Message #2 Posted by **Emmanuel, France** on 22 Nov 2003, 3:13 p.m.,*
in response to message #1 by Jeff

```
Dear Jeff,
Your HHP Portable Eprom is a 32K Eprom Box.

You can only have 4 size configurations:
4K (one 2764 for L8 & one 2732 for U2)
8K (one 2764 for L8 & one 2732 for U2)
16K (one 27128 for L8 & one 2732 for U2)
32K (one 27256 for L8 and one 2764 for U2)
2732, 2764, 27128 and 27256 are Eproms.

You have 2 DIP switches:
one for memory size & L8 chip type
one for port address

When you open your HHP-PE (remove the 4 screws on HP-41 side), you have something like
that:

 --------------
|   _________  |
|  |   L8    | |
|  |_________| |
|             |
|  |1 2 3 4 |  |_______
|                      |
|  |1 2 3 4 |          |
|   _________          |
|  |   U2    |         |
|  |_________|  _______|
|_____________|

The top DIP switch defines the memory size and L8 type of chip used as shown in the table
below.

The bottom DIP switch defines the port address desired for the Eprom memory.

    MEMORY SIZE   L8 CHIP TYPE
SW   1   2   3         4
    --- --- ---       ---
4K   +   +   +    + for 2764
8K   -   +   +      or 27128
```

```
16K  -   -   +
32K  -   -   -    - for 27256

            PORT  ADDRESS
SW          1   2   3   4
           --- --- --- ---
port 1      -   +   +   +
port 2      -   +   -   +
port 3      -   -   +   +
port 4      -   -   -   -

SW for switch
+  for up
-  for down

To be continued...
```

HP JUNK! Scanner (printer.....) etc.

*Message #1 Posted by **Michael Meyer** on 21 Nov 2003, 7:05 p.m.*

I just returned an HP 5550C scanner that I've wasted 6 months trying to get to work right. Long story short, the software was never right, and HP took it off the market quickly without ever fixing the software. Even their support people "couldn't figure it out" except to say there was a "software" problem. Same problem years ago with a 720C printer. (Why make it actually work? Just come out with the next model.)

New printer models come out a dizzying pace. Not only does HP not support the older models, they never even fix the major bugs! Just look at problems other people report!

So sad... that I lovingly and proudly collect "HP's", and yet have to abandon the brand today.

My next attempt will be a Visioneer XP 450... supposed to scan at 20 sheets per minute. I've never had trouble with my Strobe scanners... other than Windows no longer supporting the serial interfaces. (I just bought new interfaces, and still use my Strobe(s) daily.)

(Any advice on a document-feeding scanner is welcome!)

I miss HP.

Michael

Me too!

*Message #2 Posted by **Mike** on 21 Nov 2003, 7:13 p.m.,*
in response to message #1 by Michael Meyer

I have a HP 4570 scanner that doesn't work right too. It's a software issue too.

It's supposed to scan multiple pages into a single PDF document. But whenever I try to scan a 2nd page, it overwrites the first. I can't get multiple pages into a single document.

Edited: 21 Nov 2003, 7:14 p.m.

Re: Me too!

*Message #3 Posted by **David Ramsey** on 22 Nov 2003, 4:54 p.m.,*
in response to message #2 by Mike

So far, my 4670 scanner has been working beautifully (OK, the first one died the first day I had it, but the second one's OK), scanning multiple pages into a single PDF under Mac OS X.

Sort of work

*Message #4 Posted by **Mike** on 22 Nov 2003, 7:56 p.m.,*
in response to message #3 by David Ramsey

I have 4 options to scan a document.

1) Text and Graphics (as image) (1 bit, 8 bit, 24 bit) 2) Text (as image) (1 bit, 8 bit, 24 bit) 3) Editable Text (8 bit, 24 bit) 4) Editable Text with Graphics (8 bit, 24 bit)

If I scan Text or Text and Graphics, as images, it won't put more than 1 scan into a document.

If I scan Editable Text or Editable Text with Graphics it does put multiple pages into the document.

Seems like the first two options should allow multiple pages as well. The reason I want to use the 1st two options is that it has a b/w option and images are much smaller. 3 and 4 only have options of 8 bit gray and 24 bit color.

Do you have options 1 and 2 and can you scan multiple pages into a document with those settings?

Re: Sort of work

*Message #5 Posted by **David Ramsey** on 23 Nov 2003, 1:40 p.m.,*
in response to message #4 by Mike

The Mac OS X software is different from the Windows software, so I moved the USB cable from the scanner over to my Windows box and installed the HP software.

I was able to set Text and Graphics, as images, 1 bit per pixel, and scan 3 pages into a document which I then saved as PDF. Worked fine.

What, precisely, happens when you try to do this?

Here is what happens

*Message #6 Posted by **Mike** on 24 Nov 2003, 8:23 p.m.,*
in response to message #5 by David Ramsey

Everything looks like it is working fine. I get a prompt that asks if I want to scan another page, I put a new page up and say "yes". It scans again and then asks the same question.

When I'm done and open the PDF, it only has one page; the last one.

Wierd!

As a test, I opened Acrobat 4.0 and used the "Import->Scan", I can scan multiple pages into a document. I just can't do it by using the HP Director control panel.

Edited: 24 Nov 2003, 8:52 p.m.

Re: Here is what happens

*Message #7 Posted by **Victor Koechli** on 25 Nov 2003, 2:30 a.m.,*
in response to message #6 by Mike

So what? Just use Acrobat for scanning and throw that HP piece-of-junk software in the rubbish bin.

Cheers, Victor

Problem Solved: Thanks Dave

*Message #8 Posted by **Mik** on 25 Nov 2003, 1:49 p.m.,*
in response to message #5 by David Ramsey

Thanks a lot. You have solved my problem.

I just tried your method and it works gread. My problem was I was choosing my destination as "Adobe Acrobat 4.0". So, I was trying to scan directly into a PDF document.

But when I switched the destination to "save to file" and saved as PDF, it worked great.

Thanks a lot.

Mike

Re: HP JUNK! Scanner (printer.....) etc.

*Message #9 Posted by **Katie** on 21 Nov 2003, 9:38 p.m.,*
in response to message #1 by Michael Meyer

Michael,

Although certainly not great software-wise, I have an HP officejet d145 all-in-one that does a pretty good job at scanning multiple-page documents. I've used it to scan many hundreds of calculator manual pages with almost no miss-feeds or jams. The printer is also of fairly high-quality for a relatively cheap inkjet. They don't make it any longer of course, although they do have similar models like the officejet 7110.

That said, the software could be a lot better. It does occasionally cause Win2K to crash and picks up the fax line in the middle of a phone call. It could also be enhanced, easily, to allow double-sided scanning. The copier will do 2-sided to 2-sided copying but for no good reason, they restrict the scanning to one-sided only.

I may have gotten lucky with the particular unit that I bought, but overall it's been a reliable work horse for me (knock on wood!).

-Katie

Re: HP JUNK! Scanner (printer.....) etc.

*Message #10 Posted by **Les Bell [Sydney]** on 21 Nov 2003, 10:55 p.m.,*
in response to message #1 by Michael Meyer

Same here. I bought a low-end Scanjet 2200C to augment an old Umax scanner I passed to my kids. The thing makes alarming plastic-on-plastic clanking noises when scanning, and the software is counter-intuitive, except perhaps to a completely clueless newbie. The main interface doesn't even let me specify scan resolution!

I was gratified to notice that the scanning software in Red Hay Linux 9 recognised the scanner, and provides much more sophisticated control over the scanning process.

I miss HP, too!

Best,

--- Les [http://www.lesbell.com.au]

HP is not alone in this. About 12 years ago I found a very serious bug in the PL/I compiler for the IBM AS/400, reported it to IBM, and it was never fixed. Shortly afterwards, PL/I disappeared as an option for AS/400 programmers.

Sheesh.

-Ernie

Those printers are the best that HP ever made.

Now scanners are a different story. I had a sheet feed that lasted about six months. Not very much use either. I started getting horrible lines in the scans.

Then just to be masochist I bought a 5200C scanner. I scanned about 50-60 images with it. Then it started acting up. It wouldn't scan. I would unplug it and plug it back in. Sometimes this would make it work.

One day after doing the plug trick about 20 times I gave up and threw it in the garbage.

I will **never** buy an HP Scanner again!

Chris

12345

OK. It looks like HP gets one more try....

*Message #14 Posted by **Michael Meyer** on 23 Nov 2003, 2:10 p.m.,*
in response to message #1 by Michael Meyer

WELL... I've looked at alternatives. The 7110 all in one has the same document feeder as the 5550C scanner, as well as a printer built in.

I never disliked the scanner's hardware; it just would stop unexpectedly, scan pages as black, scan half pages, etc.

Maybe the software in the all-in-one will work better.

I also decided that having copy and fax abilities while my computer is doing uninterruptable stuff like burning a DVD might be a good idea.

Anyway, thanks for the advice, and I'll give it one more try.

Michael

I bought a 7130-- does 2 sides!

*Message #15 Posted by **Michael Meyer** on 23 Nov 2003, 6:04 p.m.,*
in response to message #14 by Michael Meyer

I sprung for a 7130. It has a photo card reader, but more importantly, it comes with the two-sided feature that scans and copies and prints 2 sides.

HP gets a fortune for the ink, though....

Michael

Re: I bought a 7130-- does 2 sides!

*Message #16 Posted by **Katie** on 23 Nov 2003, 7:18 p.m.,*
in response to message #15 by Michael Meyer

Michael,

The 7130 looks like it's identical to the d145 that I have; but mine doesn't do double-sided scanning only double-sided copying and printing, so it looks like they must have made some software changes. Hopefully they took the time to improve the reliability of the software too.

The virtual photo contact sheet/enlargement order processing feature is a hoot!

I'd love to hear more on this after you use it for a while.

-Katie

Katie-- you're right! Bummer.

*Message #17 Posted by **Michael Meyer** on 24 Nov 2003, 7:08 p.m.,*
in response to message #16 by Katie

Hi Katie, et. al.,

Well.... the scanner does only scan one side. So far, it's much slower than my last scanner. I can "scan to" my Paperport desktop, or use WIA within paperport. Using the Windows Image

Acquisition, the scanner resets between each page!!! sending the scanner mechanism loudly back and forth!

And, I haven't been able to get the software to load the TWAIN drivers!!!!

More problems.

Michael

Re: Katie-- you're right! Bummer.

*Message #18 Posted by **Katie** on 24 Nov 2003, 9:40 p.m.,*
in response to message #17 by Michael Meyer

Michael,

That stinks! I'm getting about 5 (8.5 x 11) pages/minute at 300 dpi 24 bit color through the feeder. The TWAIN interface brings up the HP preview/scnning tool called "HP Image Viewer - HP officeJet d series Scan 2.0". Perhaps this same software will work on your machine. I also have no problem using the "scan to" feature, it goes right into Paint Shop Pro, for example.

I feel bad for recomending this. Maybe you should return it, get a d145 on ebay and pocket the change.

-Katie

Re: Katie-- you're right! Bummer.

*Message #19 Posted by **Michael Meyer** on 24 Nov 2003, 9:42 p.m.,*
in response to message #18 by Katie

Katie,

Don't feel bad. I'd been looking at these already. I'm going to try to install the "corporate" drivers first, then the whole thing if necessary. Might install the Twain stuff. I like the unit overall, even if it scans slowly.

Michael

Two different designs of the 82120A rechargeable battery pack

*Message #1 Posted by **Jon** on 21 Nov 2003, 6:55 p.m.*

I have two different battery packs for the HP-41 calculators, both are part number 82120A but they are very different. I have repaired the oldest one with serial number 2203S. With new 1/3AAA batteries it works just fine. I have taken some notes of the charging circuit and I see it is very similar to the classic series chargers. It has one circuit to charge the batteries and another one to keep the calculator working. The plug has three pins and one separated connector. When connected to the 9V transformer the connector doesn´t make contact with the third pin and both circuits work separately. When not plugged the third pin makes contact and the batteries feed the calculator. The newest one has original cells and works fine. Serial number is 3112S. But it has two pins in the plug. It seems that it works like spices or Woodstock calculators, so it can be dangerous for the calculator if it is being charged and any cell fails. It seems that HP modified it to reduce costs. Can anybody confirm my impression?. Does anybody know if charging times are the same for both designs?.

Re: Two different designs of the 82120A rechargeable battery pack

*Message #2 Posted by **Randy Sloyer** on 21 Nov 2003, 8:40 p.m.,*
in response to message #1 by Jon

Jon, good detective work. The 3-pin version is similar to the classics circuit. Perhaps after the failure lessons of the Woodstocks, they went back to what worked. But, I suspect the kapton film that acted as both an insulator and conductor had reliability, manufacturing or cost issues. So, out goes the safe circuit for a lower cost, easier to manufacture 2-pin unit.

But, unlike the Woodstocks, the 2-pin version 82120A has a 6.4 volt zener diode across the battery so that should be the maximum voltage the calculator will ever see. The only problem with the design is that there is no series current limiting device. When the batteries begin to fail and no longer present a low impedance to the source, the zener diode alone provides the load. Yes, it prevents the calculator from frying but leave it on charge long enough and the diode will fail due to overheating. Ask me how I know... At least they short when they fail and you have a dead battery pack but the calculator survives.

Charging times for both versions are the same.

Re: Two different designs of the 82120A rechargeable battery pack

*Message #3 Posted by **David Smith** on 22 Nov 2003, 12:54 p.m.,*
in response to message #1 by Jon

Actually, the three pin version is not as good or safe as the later version. It can glitch the power when the plug is mated. Also it can overvoltage the calculator if the cells open up or go bad... the later version has a protection zener (which I install in all the old versions when I rebuild them). Both units seem to pump about 12-15 ma into the cells.

A 3-pin question

*Message #4 Posted by **Randy Sloyer** on 22 Nov 2003, 2:29 p.m.,*
in response to message #3 by David Smith

David, thank you, thats very good information. Have you ever had/heard of a situation where you end up with the dreaded MEMORY LOST message when plugging the charger in? I recently experienced this with a 3-pin pack and dismissed it to the pack having shifted and loosing connection with the calculator. Sounds like my assumption was incorrect?

Re: A 3-pin question

*Message #5 Posted by **David Smith** on 23 Nov 2003, 3:03 p.m.,*
in response to message #4 by Randy Sloyer

Sounds like the switch glitch hitch. Usually the cap in the machine will keep the machine running through the transient, but you know how glitchy glitches can be...

Strange HP48GX Undo behavior

*Message #1 Posted by **GE (France)** on 21 Nov 2003, 5:51 p.m.*

Hello wizards,

Sorry the 48GX is not a vintage machine, but the behavior when mixing the 'CON' (create a constant matrix) and the UNDO capability is quite surprising. ([Enter] is a press of the ENTER key) :

1. Type : {2 3} [Enter] 5 [Enter] CON [Enter] (UNDO) you get back both parameters of CON.

2. Type : {2 3} [Enter] 5 CON [Enter] (UNDO) you get back only {2 3}.

Can anyone shed some light on this ?

Re: Strange HP48GX Undo behavior

*Message #2 Posted by **James M. Prange** on 21 Nov 2003, 8:27 p.m.,*
in response to message #1 by GE (France)

I hope so. The first thing that the ENTER operation (either explicit or implicit) does, assuming that last stack saves are enabled, is save a copy of the current stack for use by the LeftShift STACK (last stack) operation in the 48SX/S, or UNDO as it's labeled in the other RPL calculators.

Note that by default, last stack saves, last command lines saves, and last arguments saves are enabled, but they can be disabled by menu keys in the LeftShift MODES MISC menu, and last argument saves can also be disabled by setting flag -55. For the rest of this post, I'll assume that they're all enabled.

Maybe a bit on explicit/implicit ENTER is in order. Pressing the ENTER key is an explicit ENTER. When in "immediate entry" mode (both the ALG and PRG indicators are absent from the status area), many keys, such as +, SIN, or the CON menu key, do an ENTER operation before executing the key or menu object; these are "implicit ENTERs".

> Quote:
>
> 1. Type : {2 3} [Enter] 5 [Enter] CON [Enter] (UNDO) you get back both parameters of CON.

In this first example, when the last ENTER was done, the 5 was already on the stack in level 1, so it was in the saved last stack. CON was in the command line, so the CON command line can be recovered by the RightShift CMD (last command lines) operation. For that matter, up to four last command lines are saved, so the {2 3} and 5 command lines can also be recovered. You can use RightShift ARG (the LASTARG command) to enter both arguments to CON, { 2 3 } and 5, into the stack.

> Quote:
>
> 2. Type : {2 3} [Enter] 5 CON [Enter] (UNDO) you get back only {2 3}.

In this example, the 5 wasn't on the the stack yet when the last ENTER was done; it was still in the command line followed by CON, so UNDO wouldn't put it back on the stack. If you want to retrieve it, you can use RightShift CMD to retrieve the command line 5 CON, or you can use RightShift ARG (the LASTARG command) to enter both arguments to CON into the stack.

In both of these cases, I take it that CON was typed into the command line with the calculator in "program entry" mode (the PRG but not the ALG indicator in the status area), so it didn't cause any implicit ENTER; the last keypress of ENTER put it on the stack and caused it to be executed.

If you had done:

```
LeftShift {} 2 SPC 3 CursorRight 5 ENTER MTH MATR MAKE CON
```

Then the { 2 3 } and 5 would be already on the stack before pressing the CON menu key (which would cause an implicit ENTER), so would be recovered by UNDO. {2 3}5 would be available as a last command line, and { 2 3 } and 5 would be entered into the stack by LASTARG. But since CON was never on the command line, it can't be retrieved by the last command lines operation.

If you had done:

```
LeftShift {} 2 SPC 3 CursorRight 5 MTH MATR MAKE CON
```

Then { 2 3 } and 5 wouldn't be on the stack yet when the implicit ENTER caused by pressing the CON menu key was started, so they wouldn't be recoverable by UNDO, but the {2 3}5 command line could be retrieved by the last command lines operation, and the LASTARG command would enter { 2 3 } and 5 into the stack.

So your 48GX is behaving exactly as intended, and in my opinion, as long as you understand it, it's a good design.

Regards,
James

Green LED's?

*Message #1 Posted by **Katie** on 21 Nov 2003, 5:08 p.m.*

Although this is somewhat off topic, I know that this is the best place to pose my question -- all the experts are here!

Quite often on ebay and elsewhere you see people that advertise their old calculator as having a "Green LED" display. Invariably (always, actually) these are not green LED display calculators, but some form of vacuum florescent display -- the seller has no idea what a Green LED is, no doubt.

Anyway, my question is this: Did any manufacturer ever make a calculator with a real green LED display (or yellow for that matter)? If I remember correctly, 7-segment LED displays were available in green and yellow before 1980 when most calculator manufacturers switched to LCD displays.

Thanks,

-Katie

Re: Green LED's?

in response to message #1 by Katie

Great question, Katie!!!! When I stop and think about it, I've had the same experience.... I can't think of any true LED displays that weren't red.... I know my Sinclair has a purple lens, but I think it's still a RRREEEEDDDD LEEEEDDDDD <grin>).

I'll look through my collection and see what I find. I still owe you a favor, BTW... (though still haven't gotten my circuit to work....)

Regards

Re: Green LED's?

*Message #4 Posted by **Katie** on 22 Nov 2003, 12:22 a.m.,*
in response to message #3 by Trent Moseley

That's pretty amazing and must have been quite expensive, are you sure it's really an LED display? According to this article http://www.spectrum.ieee.org/WEBONLY/publicfeature/jun03/med.html the yellow LED was only invented in 1970. Although the red LED was invented in 1962 it took 7 or 8 years before it got into commercial products.

Re: Green LED's?

in response to message #1 by Katie

I had an old 4 banger desk unit with sq root, % and 1 memory register, can't remember the name. It had white or very light yellow LED's that were viewed through a blue display cover.

Re: Green LED's?

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Nov 2003, 10:00 a.m.,*
in response to message #1 by Katie

Katie: I think I haven´t seen any "real green LED" calculators, I could remember that green LEDs were anything but common before 1980 (of course in my country, but also in most USA and european electronics magazines I was subscribed to). Even the "activity" or "power on" LED in commercial computers (i.e.: Data General, IBM, Compaq, Bull), disk drives (Shugart, Seagate, Fujitsu), early PCs, floppy drives were usually red until 1988 and even later.

I assume that the higher cost and, for portable equipment, power budget could have been barriers for massive adoption of non-red LED. I vaguely remember something about GaAsP vs. GaP processes that may also have something to do with cost and availabity.

As the light wavelength relates with the voltage drop in LEDs by means of the equation E=hf, where E is the energy in electron volt units, h is Planck constant andf is the frequency, it follows that green (and yellow) LEDs have a higher operating voltage than red ones. While the greater eye sensibility for green may reduce operating currents, I think that the voltage issue may have been a factor preventing a faster adoption for portable electronics.

Re: Green LED's?

*Message #9 Posted by **Katie** on 22 Nov 2003, 1:29 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

I do have one calculator that uses 3 yellow LED's -- 3mm size single devices, it's the Kosmos I. I think that this calculator dates to around 1978. But what I'm really looking for is a calculator that used a yellow or green 7-segment display.

Edited: 22 Nov 2003, 1:30 p.m.

Re: Green LED's?

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Nov 2003, 4:23 p.m.,*
in response to message #9 by Katie

Yes, things were the way you stated. Individual LED lamps and single digit seven-segment displays were usually red, and the same happened for the multiplexed, n-digit "display sticks" used in portable electronic devices. By the time non-red LED lamps and non-multiplexed displays started to be more common (~1980?), most calculators were shifting to LCD's, featuring also more meaningful status indicators and even alphanumeric output.

I also have (many, many times) seen and heard about "green LED" displays which in fact were fluorescent types. Also (at least here) many people confuses "quartz crystal" (for time reference) with "liquid crystal", and journalists or TV reporters write and talk all the time about "liquid quartz" devices (sic).

*Message #11 Posted by **David Smith** on 22 Nov 2003, 12:57 p.m.,*
in response to message #1 by Katie

TI made some green and yellow LED calculators. They were for market test purposes only and never sold to the public or let out of TI control. A friend of mine snagged several of them from a trash can. There was even an LCD SR-51.

Re: Green LED's?

*Message #12 Posted by **David Smith** on 22 Nov 2003, 12:59 p.m.,*
in response to message #11 by David Smith

Forgot to mention the green LED Compuchron watches.

Even rarer were the orange and yellow ones. The yellow LEDs in particular were not very bright or even in their illumination. Compuchron pulled them off the market rather quickly.

TI green/yellow LED calculator

I have not seen him in many years. He moved out to the west coast after leaving TI... I don't know where. He stored a lot of his electronics with me before he left so I got to play with them. Then he came back for his goodies (bummer). If he turns up, I'll send him your way.

Re: Green LED's?

*Message #18 Posted by **Tom (UK)** on 24 Nov 2003, 12:23 p.m.,*
in response to message #1 by Katie

Katie,

I think it's just physics. Red LEDs don't need as much forward bias (as someone else said) and I think they are also much better at turning electrons into photons, the GaAs LEDs are even better and HP were a leading supplier. As the LEDs were a big drain on the battery then red LEDs were the the only sensible choice. There is also the fact that Yellow and Green LEDs came on the market at prices that could be used just when makers were turning to LCDs for calculators. I also see many ads for 'green LED' that turn out to be the short lived VFDs period of calcs.

But more recent consumer products (pocket computers and mobile phones) usually have Greenish or Yellowish backlighting, I assume these are LEDs, I suppose Red LEDs would not provide enough contrast with an LCD screen.

HTH Tom.

Strange handling fees

*Message #1 Posted by **Matthias Wehrli** on 21 Nov 2003, 7:17 a.m.*

As you all know I very often deal with U.S: sellers and my experiences are very good. But now I have to tell you about a U.S. seller you have to take care (Neal M., yes I do write his name in here in this forum!): I got some HP-48 software from him last month. The shipping was $17 what is ok. But now read slowly: This seller demanded $18 for handling!!! I asked him if the parcel is golden but he answered me the following reasons:

1. "I calculate my handling fees to cover all my expenses, including fees imposed by ebay and Paypal." --> As I know ebay doesn´t allows to push away their feed to the bidder, expekt it is remarket in the auction. It was not.

2. "An additional source of expenses that the S/H covers is time to address bidders' questions, time involved in preparing the listing to look as it is supposed to, time to go to the post office to send it, etc." --> Since when do sellers calculate the time for answering questions and for listing up the auction in their handling fee? That´s very arrogant. I never asked the seller a question, so he as no right to add this fee!

I accept, that there is a fee for handling: the parcel and the padding is not free. But this is arround $5, and not $18. Also the words "Ask before bidding" does NOT allows sellers to do this!

Matthias

Re: Strange handling fees

*Message #2 Posted by **Tom (UK)** on 21 Nov 2003, 7:29 a.m.,*
in response to message #1 by Matthias Wehrli

I think he is pulling a fast one. You are quite right to say ebay does not allow sellers to pass on the listing fees to the buyer. As far as the time to put up the listing and answering questions goes, it's a nice try to get more money from you but you could say there are buyers fees for:

The time taken to ask the questions

Time in bidding on items

Time taken to read his and other listings

etc etc.

In any case fees over and above direct costs to the seller (like postage) should not be added unless listed in detail in the ebay listing.

PS ebay are missing out on their fees by this method of recoving costs outside the bid amount so they probably don't like this either...

PPS I've stopped using ebay because of people like this (and worse) and the fact that second hand (camera gear) in shops is the same price (or cheaper) than ebay and comes with a guarantee.

Re: Strange handling fees

*Message #3 Posted by **Thibaut** on 21 Nov 2003, 8:12 a.m.,*
in response to message #1 by Matthias Wehrli

Huuuuh... Matthias, I hope you received the pacs you purchased, before you flame me on the forum ;-)

Re: Strange handling fees

*Message #4 Posted by **CalcKidd** on 21 Nov 2003, 8:37 a.m.,*
in response to message #3 by Thibaut

Thibaut... Your shiping fee was $18...though I know it's more for shipping overseas.

Re: Strange handling fees

*Message #5 Posted by **thibaut.be** on 22 Nov 2003, 2:36 a.m.,*
in response to message #4 by CalcKidd

... yes, because I oblige my buyers to have shipped by registered mail.

The fees I ask for seem somehow higher because the € is quite expensive nowadays, about $ 1.2 for 1 €.

Re: Strange handling fees

*Message #6 Posted by **Massimo Gnerucci (Italy)** on 21 Nov 2003, 8:49 a.m.,*
in response to message #1 by Matthias Wehrli

This happens, once in a while.

Some of them go on counting how many minutes they spent at the Post Office queue, the unbearable amount of time they had to throw away compiling customs' papers, that they have a better use of their lifetime, etc.

I wonder why they sell on eBay then...

My last rip-off is going on right now: I predicted the amount to ship from USA to Italy, the reply was more than the doubled amount, when the box was delivered it was stamped for less than my first forecast.

Answers to my refund request? Go figure...

Use feedback if seller is unresponsive (but do this on the 90th day). I know: this is not the same as your money back...

Greetings,
Massimo

Basic

*Message #1 Posted by **Pierre Brial** on 20 Nov 2003, 9:58 p.m.*

Hello,

I like to program in Basic, but as far as I know, there is no longer any calculator in production which use this language.

Is there a Basic emulator for Hp48/49 ?

All the Best

Pierre

Re: Basic

*Message #2 Posted by **Tom Sherman** on 20 Nov 2003, 10:34 p.m.,*
in response to message #1 by Pierre Brial

Pierre,

Dare I say it? The TI-83, TI-86, and TI-89 all use dialects of BASIC -- not quite as nice (in my opinion) as what you are probably used to, however. Also the HP-39G has a form of BASIC. Variable names on the TI-83 and HP-39G are limited to a single letter, which can be restricting.

Tom

Re: Basic

*Message #3 Posted by **Roberto Flores** on 20 Nov 2003, 11:23 p.m.,*
in response to message #1 by Pierre Brial

Hi Pierre...

Buy an old HP200LX, a CF card and adapter, load your favorite version of Basic for DOS (gwbasic, QBasic, Quick Basic) and you are all set up! You can even disable the built-in applications on the 200LX and have over 600K available for your DOS applications.

I found this much more convenient than running a DOS emulator on a PocketPC.

Regards;

Roberto

Re: Basic

*Message #7 Posted by **Valentin Albillo** on 21 Nov 2003, 4:29 a.m.,*
in response to message #1 by Pierre Brial

Hi, Pierre:

Here in my country (Spain) there are still a number of BASIC language handhelds (calculators) available for sale at department stores, mainly CASIOs.

But if I were you, I'd try and get an HP-71B in eBay or using the Classified section in this very site. You can get decent ones for low prices, from $50 to $100 in most cases. That is cheaper than main street prices for CASIOs, and it goes without saying that HP-71B's BASIC is several orders or magnitude better than most any other handheld BASICs available now or ever.

For instance, you'll get full I/O and device control abilities, recursive subprograms with parameter passing and local variables (and environment), multi-line user-defined functions (also recursive and multi-parameter), passing parameters by value or reference, full file system in RAM with multiple, independent programs, and inmense expandability: external ROMs such as the Math ROM, the FORTH/Assembler ROM (write your own machine-language subprograms and extend the built-in BASIC language with new keywords created by yourself), the HP-41C/FORTH ROM, the Text Editor ROM, the HP-IL ROM, ... and RAM modules which can be used to extend internal RAM to in excess of 400 Kb, plus last but not least, a manual CALCulator mode which will show intermediate results, automatically open and close parentheses, and can backtrack any calculation (for instance, after 3+4*5 has partially evaluated first to 3+20, then to 23, you can still go back ("undo") to 3+20, then to 3+4*5). Most features from the above list can't be found in any other BASIC handheld, none really compares.

While at it, you should also consider getting its Math ROM, if possible. It extends the BASIC language with lots of new BASIC keywords implementing a great many math commands and extra functionality (complex numbers, matrix operations, root finding, integration, polynomial roots, Fourier transforms, gamma function, hyperbolics, base conversions, utility keywords, etc)

Best regards from V.

in response to message #7 by Valentin Albillo

```
Right. I'm not a specialist, just an user.
I think Casio or Sharp approach is not so expensive.

A positive point:
For instance, my Sharp PC-1360s use a CE-126P or my Texas Instruments TI-74s a CI-7
connected to my sound card.
From PC you can play the file (.wav) you want and load it on your pocket.
You can record and transform the program into a file (.wav) too.
I tested a grabbed audio cdr with several tracks on PC and also on a portable cd player
linked to a pocket via its audio interface.
You can easily find help on Sharp, Casio or TI forums.
Some of those pockets has internal (dis)assembler and compiler.

A negative point:
Casio FX-850P, 880P or 890P (I use this previous one in 3 versions: FX-890P, Z1 and Z1-
GR)
need to  access to PC through FA-6 interface (serial and parallel) or Pocket Link 800
serial);
and Sharp PC-E500 via Transfile Link (serial).
Rare and not cheap interfaces.

However HP-71B alone is just a pocket with 17K RAM (Casio FX-880P has 32K, FX-890P
256K, ...).
But with an HP-IL module and an HP82973A HP-IL/PC interface, it becomes stupendous and
powerful.
I like both Casio/Sharp/Texas and HP pocket computers.
I don't say that I'm right, just I give my poor point of view.
```

Re: Basic HP-71 emu

in response to message #1 by Pierre Brial

Try this excellent DOS HP-71 Emulator.
You need a ROM image.

Thank you...

*Message #12 Posted by **Pierre Brial** on 23 Nov 2003, 9:58 p.m.,*
in response to message #1 by Pierre Brial

... for all the answers.

I already own some Sharps, but I wondered if it was possible to use basic on modern calculators.

I know it is possible to emulate Basic on Psion or Pocket PC, but I prefer *Calculators*, I mean a device that I don't have to change batteries every day...

All the best

Pierre

DEMO HP-95LX Demonstration

*Message #1 Posted by **Jeff** on 20 Nov 2003, 8:09 p.m.*

Does any one know any thing about this card for the HP-95LX? What kind of software is on it? What is something like this worth? Item # F1000-80039

Re: DEMO HP-95LX Demonstration

*Message #2 Posted by **Raymond Del Tondo** on 21 Nov 2003, 12:46 a.m.,*
in response to message #1 by Jeff

AFAIR it's an endless looping demo for use in store display, and like most of these demos, shows you the features of the LX...

It's a nice to have thing, but of no real use;-)

Raymond

How long do i leave HP-75C charging?

*Message #1 Posted by **Adam** on 20 Nov 2003, 6:14 p.m.*

Does anyone know how long the batteries for the hp-75c must charge for?

Re: How long do i leave HP-75C charging?

*Message #2 Posted by **Tom Sherman** on 20 Nov 2003, 8:56 p.m.,*
in response to message #1 by Adam

For the original equipment NiCad cells, the manual says eight hours from complete discharge to full charge, but you won't damage the cells if you let them charge longer than that. If your cells have greater capacity (in milliamp hours) than the originals, then you would want to give them more than eight hours. If you have NiCad cells, let them discharge completely every once in a while.

HP-IL mass storage - opinions needed

*Message #1 Posted by **Pavel Korensky** on 20 Nov 2003, 3:57 p.m.*

Hello,

during last couple of days (or, better to say, couple of nights), I coded the basic layer of the modern mass storage, which I am building from parts saved from old HP-IL cassette drive.

Situation is as follows. The microcontroller react to most HP-IL commands and succesfully mimic the HP-IL mass storage on the HP-IL bus (it is possible to format it with NEWM and write/read data for example with WRTP).

Of course, there are some minor bugs and everything is not yet implemented.

Mainly, the mass storage itself is not implemented (I am using the 64KB external RAM of the microcontroller for testing).

I already got the 64MB MMC card which will be used as a permanent mass storage. When I will start to write the software for MMC card, I must make one basic decision. To FAT or not to FAT, it is a question. :-)

Normally, the MMC cards are preformatted as a DOS/Win harddisk, with partition table and FAT system. This mean, that they are normally readable/writable by a PC, if the card reader is attached to the system (USB, CF adapter etc.)

For HP-IL compatible storage, it is possible to create 500 DOS files, each 128KB long and implement the LIF file system inside each file. The file without LIF file system will behave like empty, unformatted tape.

Or, there is a second option. Discard the original format of the MMC card and read/write/erase the card on block/sector base.

Each approach has its pros and cons.

FAT system Pros: "tapes" are normally readable and writable by PC and it should be simple to write some PC software which will decode the LIF file system inside those files.

FAT system Cons: the software in the microcontroller must be very complex, because it will be necessary to implement the whole FAT system inside the microcontroller. It is not a trivial task, especially for memory cards (a lot of caching is necessary, because it is not possible to simply rewrite the sector on the card here and there).

Sector use Pros: simple implementation, probably much faster access.

Sector use Cons: it is not possible to read/write card in PC without special driver. Someone must write the driver for the Windows and/or Linux.

Which implementation I should use ? Let's discuss about it.

Re: HP-IL mass storage - opinions needed

*Message #2 Posted by **Giuseppe Marullo** on 20 Nov 2003, 4:39 p.m.,*
in response to message #1 by Pavel Korensky

Pavel, I am more than interested into your project, not specifically the memory storage emulation but the hpil handling. I would like to build the HPIL sniffer using a pic too, I need to decide if interfacing with the hpil is feasible or not using a 16f877 and/or a 56f800.

Could you please contact me at giuseppe.marullo@iname.com ?

About FAT implementations, there is one for the PIC 18f + MMC/SD at:

http://www.compsys1.com/workbench/On_top_of_the_Bench/MMC_Project/mmc_project.html

They support reading and writing on a SD with FAT16 support. There is beta (working) code for pic+picbasic+SecuredDigital.

About the windows driver, you could add a USB support, using a 50 bucks development kit, it provides you usb->serial port or usb->parallel port emulation, with custom h/w identification and easy driver setup. This could be optional, normal users could use rs232 comms.

TIA,

Giuseppe Marullo

Re: HP-IL mass storage - opinions needed

*Message #3 Posted by **Pavel Korensky** on 20 Nov 2003, 4:59 p.m.,*
in response to message #2 by Giuseppe Marullo

I know this PIC page. But it is a commercial solution :-(

Also, I think (I did not saw their code) that the solution is mainly oriented for MMC/SD reading or writing (like many other solutions used for MP3 players or data loggers). This is totally different from mass storage approach, where the rewriting is the main problem.

The USB is a nice option, but it will not solve the driver problem. If I will use the block/sector approach, we will need the FILESYSTEM driver. Not the interface driver. Those are two different things. You need the interface driver for connection to the PC and filesystem driver for reading and writing files to the card.

If you need to build the HP-IL sniffer, it is easy. Just solder the IL chip to PIC to something like 16F876, set the IL chip to LA=1 TA=1 and every frame will initiate interrupt. Read frame, send it to PC (via UART) for decoding and echo it. Simply read R1 and R2, send them to UART, write R2 back.

And analyzer is finished. You just need to interpret the frames in some Visual Basic piece of code on PC side.

Or, you can do the decoding in microcontroller (this is the way I am doing it) and send the results as ASCII messages to UART and look at them via some terminal program.

I will send you the C routines via e-mail.

Re: HP-IL mass storage - opinions needed

*Message #4 Posted by **Giuseppe Marullo** on 20 Nov 2003, 5:42 p.m.,*
in response to message #3 by Pavel Korensky

Pavel, thank you for the answer, I will gladly take a look. If you have a schematic handy, please send it too.

>The USB is a nice option, but it will not solve the driver >problem. If I will use the block/sector approach, we will >need the FILESYSTEM driver. Not the interface driver. You could use the serial cable and/or USB option to talk to your mcu using a pc program (user program). Your mcu could then read/write implementing the correct abstraction level, so you could use the track/sector approach.

On the other hand, if you write the MMC directly from a pc, you could read it from the mcu itself (no pc connection), obviously you need to implement at least FAT16 handling.

Best of both worlds would be you using the FAT16 AND a cable to exchange data with the pc without removing the MMC.

Santa Claus time soon...

Giuseppe Marullo

Re: HP-IL mass storage - opinions needed

*Message #5 Posted by **Christoph Klug** on 21 Nov 2003, 3:11 a.m.,*
in response to message #1 by Pavel Korensky

Dear Pavel,

gratulation for your actual results about IL-mass storage. Please give me your post address, as I told you by email I have some parts for your project....

Please enlarge the 128Kbyte DOS file size (compatible to cass-tape) to the greater memory amount of the HP9114A IL-Disk-Drive (compatible to floppy). This would be nice for user of the HP41 EXT-IL module (this enlarges the address space of the HP41 system to use the complete floppy) and alos for HP71 and HP75 user. Better have some less enlarged files than 500 different virtual tapes.

Please implement two or some more IL-Massstorage units to your system. Like the IL CMT-RAM-DISK which emulates one, two or fore drives at same time. Than we able to copy files from one drive to an other and use different drives for special applications...

For the file format on the MMC card I would prefer the sector solution with much faster speed. Fast mass storage would be a really nice feature for handheld products like HP41 or HP71 and have a higher prijority than file exchange with PC applications.

Because on PC side we have EMU41 : This is able to transfer files from your IL-mass storage unit to the PC world, furthermore EMU41 includes a own virtal mass storage drive, and we able to exchange files between your real IL drive and the virtual drive of EMU41.

Generally your IL-Mass storage project expands´and enlarges the existing HP41 system, also the virtual EMU41 system, and your solution is also compatible to existing HEPAX or RAM-BOX and to future MLDL devices :-)))

Best wishes from Germany - Christoph Klug

Re: HP-IL mass storage - opinions needed

*Message #6 Posted by **Veli-Pekka Nousiainen** on 21 Nov 2003, 4:50 a.m.,*
in response to message #1 by Pavel Korensky

Definately FAT16 (possibly FAT32, too) for greater compatibility. You may easily read the card on PC=(Win,Linux) or Mac via a reader (or a direct port on a new laptop). Also you can use the same card in a iPAQ, 49g+, digicamera, Nokia phone (MMC only), etc... # VPN #

Re: HP-IL mass storage - opinions needed

*Message #7 Posted by **J-F Garnier** on 22 Nov 2003, 6:28 a.m.,*
in response to message #1 by Pavel Korensky

Hi Pavel,

I would prefer to have a FAT system and LIF images, do we could exchange LIF images with PC (there are LIF image on this site). LIF image size can be 640kb. Some HP41 modules (e.g. Ext-HPIL) manages the full 640kb space.

An idea would be that your system checks all files for LIF image format (look at 1st 256 bytes), and reflects all these files as mass storage units on HPIL (so non-LIF image files would be ignored on HPIL side). HPIL handles up to 30 devices, so 30*640kb would make 19Mb on line!

In my opinion, access speed is not an issue with HPIL (especially with HP41 as controller).

Jean-Francois

Re: HP-IL mass storage - opinions needed

*Message #8 Posted by **Pavel Korensky** on 22 Nov 2003, 1:12 p.m.,*
in response to message #7 by J-F Garnier

Jean-Francois,

it is a nice idea. Christoph also suggested that the device should emulate multiple mass-storage units.

I just need to figure out, how to do it. The IL chip is supposed to work only as one unit (there can be only one IL address in the chip register 4) and only messages that belongs to the device with this address or common messages will interrupt the processor. At least in my current design. Of course, it is possible to capture all messages (chip in analyzer mode) and decode the IL commands in software, but I am affraid that it will be slow.

Re: HP-IL mass storage - opinions needed

*Message #9 Posted by **J-F Garnier** on 23 Nov 2003, 4:45 a.m.,*
in response to message #8 by Pavel Korensky

This is exactly what I'm doing in Emu41 and Emu71: I catch all HP-IL messages (IL chip always in listen state), and manage the virtual devices by software. Speed is really not an issue with the HP41 as controler...

HP49+. SD memory card

*Message #1 Posted by **Hugh Wong** on 20 Nov 2003, 3:41 p.m.*

I got a 16MB SD memory card for my HP49+. I can copy all the "alg" objects on to it but cannot copy library files for the HP49 nor HP49 files created by an application program and if it copies, the file manager will show error and cannot purge the object unless I purge from command line (such as:- :3: objectname purge). Besides, if I turn the HP49+ on and going into file manager, select SD, the hour glass comes up but will not read the SD Card, but if I slide the card out and re-insert it again, the HP49+ sees it right away.Any explanation of this problem ?

Hugh

Re: HP49+. SD memory card

*Message #2 Posted by **Veli-Pekka Nousiainen** on 20 Nov 2003, 3:47 p.m.,*
in response to message #1 by Hugh Wong

Have you upgraded to ROM 1.22? I also expect a ROM 1.24 before XMas from HP. I think that the SD will need adjustments even after that upgrade. FAT32 dupport would great! You may use PC card reader to store your libs (from PC) or you may store your { libs } inside a list. Note that while programs can be run directly from port 3, libraries must installed in a lower port to be active. Also note that some PC names like "49LIBS" need strings around the name for the calc to RCL from the card. # VPN #

Voyager Question for Valentin Albillo

*Message #1 Posted by **Brian Smith** on 20 Nov 2003, 10:09 a.m.*

Valentin, I enjoy reading your posts about the Voyager's. I was wondering if you had a website that contains some of the things you have written about them. I'd like to read more, but it gets frustrating searching through all the archives trying to find things.

Sounds like you own at least a few. I was wondering if you have encountered any problems with them? My 11c has been reliable so far and is in perfect condition, but it's almost 20 years old so I'm sure it's days are numbered. Thanks.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #2 Posted by **Valentin Albillo** on 21 Nov 2003, 5:34 a.m.,*
in response to message #1 by Brian Smith

Hi, Brian:

Brian posted:

"Valentin, I enjoy reading your posts about the Voyager's."

Well, thank you very much, I'm glad you do.

"I was wondering if you had a website that contains some of the things you have written about them. I'd like to read more, but it gets frustrating searching through all the archives trying to find things."

I've been thinking about creating a web site to make publicly available the *hundreds* of programs, articles, quality photographs, historic-PPC-times letters, and tons and tons and tons of materials I do have, mainly related to HP (75%) and SHARP handhelds (25%). I would really love to share all of this with interested people, specially as most of it is absolutely unpublished elsewhere.

However, there are two serious problems to overcome: first of all, documenting and preparing all of this in web form will take a lot of effort, scanning, retyping, testing, etc. I don't have so much free time at the moment to do it. Nevertheless, a great deal of it is already in web form and could be published right now but then we're stuck with problem two, namely I don't have enough free web space to host all of this. My computer chess site has only 5 Mb or so free space available, and the rest of my sites are also smallish. I would need some kind people to freely host my materials, and that would take a sizable number of megabytes. So far I've had no offers, so this web project may take a long while to get the green light, if ever.

Meanwhile, you just might be interested in some of my articles [all of them do include a program, full documentation and examples] that are already available on the web, namely:

HP Voyager Series:

Long Live the HP-11C!

Long Live the HP-12C!

HP-12C Tried & Tricky Trigonometrics

HP-12C's Serendipitous Solver

Long Live the HP-15C!

HP-15C Nth-degree Polynomial Fitting

Long Live the Advantage ROM!

Other HP handhelds:

HP-41/42 Othello/Reversi Game

HP-67 Chess Playing Program

Packing Long Integers for the HP 71B (Assembler)

A short, HP-related tale, *in memoriam* of Sir Isaac Newton

Time Voyager

A chess-related program (TP source code included)

Mater: A simple Mate-Searching Program

There are also a sizable number of postings from mine to this very Forum and some of them do include routines and 'challenges' for Voyagers and other models. I don't have them available so you'll need to search the Archives if interested.

Sounds like you own at least a few. I was wondering if you have encountered any problems with them? My 11c has been reliable so far and is in perfect condition, but it's almost 20 years old so I'm sure it's days are numbered.

I own a respectable number of Voyagers, indeed (though not nearly as many as Patrick), from a couple HP-10C to five HP-15C. All of them I like in their own way. Were it easily available and relatively cheap, the HP-10C would be the absolutely ideal simple-yet-powerful RPN calculator for everyone to always have one at hand, from housewives to examinees.

As for problems, I've *never*, ever had even the slightest hint of a problem or malfunction with any of the Voyagers I've used. The best example is the first one I got, a USA-made HP-11C presented to me by my close friend Fernando del Rey 23+ years ago. I've used this machine endlessly, it's been with me while I was with the Foreign Legion at the Sahara Desert, it's stood all kinds of rough conditions, yet not only does it work flawlessly, but it even looks like new ! And only 3 battery changes in those 23+ years, the third set still going strong ! :-)

Your 11C has its days numbered, but everyone and everything does, from the Universe to the humblest bacteria. I'd bet that 10-15 years from now your 11C will be absolutely fine and dandy, if properly taken care of as I'm sure you do.

Best regards from V.

in response to message #6 by Gene

Hi, Gene

If you mean my "Bridge-It" game program for the HP-12C, it's included in the "Long Live the HP-12C!" article mentioned (and linked) in my original post.

Else, please specify what game are you referring to.

Thanks and best regards from V.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #8 Posted by **Rafael Millán** on 21 Nov 2003, 8:47 a.m.,*
in response to message #2 by Valentin Albillo

Hello Valentín:

We met in a few meetings of Madrid PPC members, about twenty years ago. You may even remember.

> Quote:
>
> *I would need some kind people to freely host my materials, and that would take a sizable number of megabytes.*

I have 20-25 MB of spare web space that perhaps you could use. You can contact me at fulano@hispavista.com. This address is already flooded with spam, but I will pick out your reply.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #9 Posted by **Valentin Albillo** on 21 Nov 2003, 9:21 a.m.,*
in response to message #8 by Rafael Millán

Hello, Rafael:

Thanks a lot for your kind and generous offer, but the problem is 20-25 Mb is probably insufficient to hold the main parts together.

I could, of course, distribute the load between several sites, but that would generate an inordinate amount of extra bookkeeping and administration work for me, keeping track of what is where, plus it would be a mess for visitors having to deal with a number of quite different links to access the various materials. The graphic materials in particular (scans and photographs) take the lion's share.

So, for the moment being, I prefer to try and find a single site with enough room (100 Mb or so, initially) before commiting to splitting it all amongst smaller sites. Anyway, if I can't find any such hosting within a reasonable time lapse (several months), I might as well accept your offer if it still holds by then.

Again, thanks a lot and best regards from V.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #10 Posted by **Rafael Millán** on 21 Nov 2003, 12:07 p.m.,*
in response to message #9 by Valentin Albillo

Mmm, do you think those 20-25 MB plus 50 MB of ftp space would suffice? 20 MB for html pages (mainly text and light images) is plenty of space, if heavier items were in a linked ftp directory.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #11 Posted by **Valentin Albillo** on 22 Nov 2003, 8:19 p.m.,*
in response to message #10 by Rafael Millán

Hi, Rafael:

Thanks again, Rafael, but I'd prefer to have everything available at a single, web site. I've dealt with ftp servers in the recent past to distribute some files related to my other hobbies, and it was always an administrative chore, plus many users did have problems with proxies, firewalls, and the like, so I'm somewhat wary of using them. Classifying and converting all materials to web format is already too much work, so I am reluctant of anything that could introduce extra, administrative or maintenance work.

Perhaps I'll be able to get a large account (100 Mb) eventually, next year, and so most of it will see the light.

Anyway, thank you very much for your kind offering and

Best regards from V.

Re: Voyager Question for Valentin Albillo [LONG]

*Message #12 Posted by **RMillán** on 24 Nov 2003, 5:28 p.m.,*
in response to message #11 by Valentin Albillo

Ok, I didn't think it was difficult to use the ftp space from web pages, and I suddenly remembered that I have those 50 MB sleeping from when I joined my current ISP...

Anyway, don't forget to announce when your site is finally up.

Saludos, RM.

TI-59 ROM

*Message #1 Posted by **HrastProgrammer** on 20 Nov 2003, 7:48 a.m.*

I know, I know, this is an HP forum but, regarding the fact that there haven't been very much use of some TI forums so far, I am posting this question to a forum which is full of experienced users with great knowledge.

So, I decided to (try to) make an TI-59 emulator, either for PC or HP-48/49. At first, it seems like an impossible task due to the lack of information but, during the time, things were getting a little better. I found some info, either from the Web and some other sources, including the patent #4153937 about TI-59. This patent even includes the whole ROM dump of TMC0582/0583 and TMC0571 ROM chips. So, what is the problem? I downloaded this patent from the US Patent Office in TIFF format. I decided to retype the ROM contents into the text file for further manipulation but I am unable to do this correctly because image quality is not very good and some digits aren't recognizeable. So, it is pretty useless :-(

I am wondering if someone has a better copy or knows some other way for obtaining the ROM dump? I have a real TI-59 but, AFAIK, it isn't possible to dump the ROM contents without expensive equipment.

Best regards.

P.S. If this isn't appropriate for this forum then delete a post with 12345 ...

Re: TI-59 ROM

in response to message #1 by HrastProgrammer

There are already some emulators available for the TI-59 series. Here is where to find some and the package probably contain the ROM you are looking for :

http://www.gemtree.com/prog_all.htm

and there :

http://n3times.com/vertigo/ (java emulator with printer !)

and there :

http://www.zanchetta.net/pocketPC/ (for pocket PC!)

Michel

Edited: 20 Nov 2003, 8:06 a.m.

Re: TI-59 ROM

*Message #3 Posted by **HrastProgrammer** on 20 Nov 2003, 9:03 a.m.,*
in response to message #2 by Michel Beaulieu

I know them - they aren't emulators but simulators because they don't emulate the TMC0501 CPU and aren't based on the TI-59 ROM image ...

Re: TI-59 ROM

*Message #4 Posted by **Joerg Woerner** on 20 Nov 2003, 9:39 a.m.,*
in response to message #1 by HrastProgrammer

Pretty cool ;-))

The TMC0501 was developed before the TI-59, it was used already with the SR-50.

I maintain a list of the calculator relevant TI patents here: http://www.datamath.org/Patents.htm

You should start with the US3900722, it explains the 13-bit Instruction word and the CPU-internal decoding PLA's.

All products with the TMC0501 are featured here: http://www.datamath.org/Story/TI-59_Birthday.htm

And - if necessary - schematics of the SR-50 and TI-59 are available...

Regards, Joerg

Re: TI-59 ROM

*Message #5 Posted by **HrastProgrammer** on 20 Nov 2003, 12:32 p.m.,*
in response to message #4 by Joerg Woerner

Hello Joerg,

I have schematics and TI-59 service manual, as well as US3900722 patent so TMC0501 instruction set is pretty clear to me, although there are some instructions which I don't understand at the moment but this is not the major problem. The problem is low quality of ROM dump so it cannot be used for retyping. Do you have a copy of US4153937 patent? If you do, could you see if you can recognize all characters in the ROM dump ...

Best regards.

Re: TI-59 ROM

*Message #6 Posted by **Dave** on 20 Nov 2003, 2:15 p.m.,*
in response to message #5 by HrastProgrammer

I downloaded a PDF copy of the patent. The PDF image of the ROM dump is poor quality for an OCR. If you need a copy of this PDF I can email it to you, but you probably have the same copy...

Dave

Re: TI-59 ROM (dumping)

*Message #7 Posted by **Bill Wiese** on 20 Nov 2003, 4:51 p.m.,*
in response to message #5 by HrastProgrammer

Hi Hrast!

Keep up the good work!

Do you have a link to the patent PDF??? Love to see it, learn more about the system & CPU architecture...

I've always been interested in the inner foibles of the TI5X calculators. Had one (still do somewhere) when I was in high school til I got my 41C. I was aware of some TI PPC Notes (Maurice Swinnen?? if I recall, ran it) and heard of the mysterious HIR registers and that SBR 239 w/Master Lib. Module did some funky stuff - speedups, etc. I think the TIs had more 'dark secrets' than HPs - perhaps because the HP user community was maybe more outgoing/communicative and had some friendly relations w/HP.

I think OCR extraction from a poorly printed copy may be very problematic to get a running system even if you started w/a 100% perfect emulator. Even the HP emulators whose ROMs were "patent-extracted" (35/45, maybe 41) got a few things wrong until cleaned up or an electronic extraction (or Peter Monta's "photo extraction"!) was performed.

It might be best to electrically extract data from the ROMs if they are separate/external from the CPU. I vaguely recall that the external ROMs are some kind of serial ROMs.

I've dumped various serial ROMs (Microwire and SPI) in the past using a DOS PC running some C code and talking thru the parallel LPT port for I/O. For quick & dirty one-time thing, writing DOS code for PC will avoid issues w/Windows low-level port access, timing, etc. If clock times are not critical this kinda quick hack might work nicely.

Given possible NMOS/PMOS technologies here, you might need some isolation, level converters, non-5VDC power supply, etc. At least you have some indication of what a ROM dump SHOULD look like: at least you're not totally in the dark, that's a big help to know that you're not getting garbage!

BTW: Does the TMC0501 have any internal ROM inside? Or is it a straight CPU? Hope it's the latter ;)

It's been awhile but IIRC, the TI calc CPUs apparently had some PLA (programmed logic array) areas not only for LED state use but also used for instruction decode/microcode - apparently this allowed instruction set optimization, fitting the right instructions into a limited opcode space. So having generic TMC0501 info might not help the specific TI58 case - but perhaps the ROM dump in the patent would reveal these features.

I always wondered if the external ROM module (i.e, where Master Library Module goes) is capable of running machine code or if it's just user code.

Re: TI-59 ROM (dumping)

*Message #8 Posted by **HrastProgrammer** on 21 Nov 2003, 1:56 a.m.,*
in response to message #7 by Bill Wiese

Hi Bill,

Yes I have all those patents and they are very useful. You can download most copies of TI PPC Notes from http://www.rskey.org/tippc.htm and the list is growing ... thaaaaaaaaaaanks Gene :-) There you will find everything about HIR registers, firmware, fast mode, graphics mode, hexadecimal codes and other things.

I tried ECR (Eye-Character Recognition) from the printed copy of the patent but this was unsuccessful for many characters. As you said, it is enough to have only one bad byte to make an emulator not working.

TMC0501 is a pure CPU without the ROM inside. TI-59 ROMs consisted of 4 parts:

```
TMC0582: First 2.5KWord ROM (addresses #0000..#09FF)
TMC0583: Second 2.5KWord ROM (addresses #0A00..#0FFF)
TMC0571: Last 1KWord ROM (addresses #1000..#13FF)
```

TI ROM-Word consists of 13-bits. These ROMs are soldered on the PCB as a separate chips.

There is also an TMC0541 ROM which contains 5000 bytes (not words). Funny about this ROM is that it is BCD-addressed e.g. the CPU is addressing it via an 4-digit BCD counter register (#0000..#4999). It is plugged into a module port. AFAIK, it is not possible to run machine code from TMC0541 (bytes vs. words).

Both TMC0582 and 0583 are further containing 8 eight-byte RAM registers and 16 8-byte ROM constants each (part of it containing user-code for statistical and other functions and the other are constants used in trigonometrical and logarithmical operations). I think that TI refers them as SCOMs (Scanning ROMs) in the patents. They have also some additional functions, like driving the display and scanning the keyboard.

All those ROMs are addressed serialy. I have some documentation and timing diagrams if you are interested. A few diagrams can be found on Datamath http://www.datamath.org/Sci/WEDGE/TI-59.htm as well ... thanks Joerg (please correct any mistakes which I eventually made in the above text).

Best regards.

Re: TI-59 ROM (dumping)

*Message #9 Posted by **Bill Wiese** on 21 Nov 2003, 2:10 p.m.,*
in response to message #8 by HrastProgrammer

Hrast...

Thanks for the links - didn't know some of that was hiding on Joerg's TI Datamath site. And thanks esp for the links to the TI PPC Notes! Hoorah... brings back memories of the "good ole days"... ;)

Weird that the addressing of the external ROM modules was in BCD format - perhaps that allowed for less (faster?) parsing/ processing of arguments to GTO nnn and SBR nnn ?

Character recognition: if you have access to several (or a wide variety of scanners) and OCR software packages (using different OCR engines - sometimes several packages use the same OCR core engine) scan the printed ROM dump using each of these. Try different page orientations (slight tilt might greatly affect accuracy). Once you get a collection of scans converted to ASCII text use a DIFF utility to point out & help resolve differences. Still no guarantee, but might be a help.

Any checksums? ;)

Regards, Bill Wiese San Jose CA

The hope is that...

*Message #10 Posted by **Gene** on 21 Nov 2003, 9:19 p.m.,*
in response to message #9 by Bill Wiese

We will soon have a complete set of the TI PPC Notes in PDF form to go along with the HP PPC Journal.

There are also plans to scan about 90-100 TI Library programs and make them available.

I'm grateful to those doing the scanning and providing the help. It has been one of my "dreams" to make sure that the TI side of our "friendly competition" didn't get lost into history.

Enjoy. Gene

*Message #11 Posted by **HrastProgrammer** on 22 Nov 2003, 2:22 a.m.,*
in response to message #9 by Bill Wiese

Hi Bill,

I don't think that any kind of scanners and OCR can recover the ROM dump from the patent. I would be ready to retype it by hand from the copy but the more I am looking at it, the more I am convinced that it is not a problem of just a bad copy. I think that the problem lies in the line printer which has been used at TI for printing a dump. Maybe this was done intentionally ...

Greetings.

Ah, Southwest Tech Products (SWTPC): I recall they offered a 'math coprocessor' board for their computers. The board used a Nat'l Semiconductor MM57109, which was a calculator chip with a bus interface. It was a COPS400 variant. Kinda funny to take a capable 8-bit CPU and offload the floating-pt/transcendental work to a less efficient 4 bitter.

Methinks this was an encapsulated "black box" hardware solution to the problem of not many folks being able to write floating-point/transcendental code.

Wonder if they were trying to "drive" the '57109 (with some support code) with TI module code??

BTW: if Nat'l didn't change their algorithms on the '57109 from what they used on their other sci calculators, the accuracy is not too impressive ;) My old Nat'l "Mathemetician" calc (an RPN calc w/3 (?) level stack) wasn't too great: 4.5digit log & trig accuracy...

HP-65 (67) clutch fix-- and a thank you.

*Message #1 Posted by **Michael Meyer** on 19 Nov 2003, 11:09 p.m.*

Hi all!

I just got my first HP-65. After washing the non-electronics in the sink and repairing the card reader roller.... the clutch washer disintegrated.

I looked around the workshop and spied a sprayer tube from a WD-40 can. Sure enough-- right inside and outside diameter!! A little piece of it with some glue, and it's as good as new.

Bummer. The card reader didn't work. I realized that it was reading, but not writing cards. Then I remembered the leaf switches. Cleaned and adjusted... it works perfectly. A quick battery rebuild, and the calculator is like new again!!

Thanks to the Forum for all the advice over the years. It was enough to get this beautiful baby working again!!!

I sure do love those RED LLLLEEEDDDD's!!!!!

*Message #4 Posted by **Frederic** on 19 Nov 2003, 11:03 a.m.,*
in response to message #3 by Marx Pio

Sure, that the reason why i said to him :

"Ok, I take your calculator, but only for a loan .... only for a loan for a long time ...."

I would like to show him the power of this calculator, and after to give it to him again. But I am only used to use a HP41C and a HP32SII.

And the power of the HP48GX is too for me !!!!

I know that he bought it a few years ago and didn't use it a lot. He knows that I enjoy using old HP calculators, but this one is maybe too recent ....

Re: Giving an HP48GX

*Message #5 Posted by **Brandon** on 19 Nov 2003, 7:57 p.m.,*
in response to message #3 by Marx Pio

I gave mine away (actually, loaned indefinitely). For a college math student, the 49g series is MUCH better... symbolic integration, exact answers and superior speeds amongst other improvements come in handy. True it doesn't have the huge, oddly placed enter key that you guys live for, but that and the crappier keyboard don't really bother me all that much. I guess I'm too young to appreciate the 48gx (or any calculator that doesn't do all the work for me ;)

in response to message #2 by Arnaud Amiel

I'd have to concur with Arnaud - the capabilities of the HP-48GX are amazing. I bought one back in the spring, because it was looking like it would be the last decent RPN/RPL calculator out of HP. It was initially overwhelming, compared to my HP-25, HP-15, and HP-32SII. But stick with it, and before you know it you'll be loading libraries, adding RAM cards, etc. Much to my wife's chagrin, I use mine as a PDA (see hpcalc.org). I don't need no stinkin' stylus!

I actually bought the PIM card for my 48GX. Thinking about it now I really don't know why, As you can load software that does the same thing. The card was also quite expensive for what it does. I guess my thought was that with the card I wouldn't use any of the RAM for the PIM program.

It's better to buy a RAM card and then load a program from the www.hpcalc.org than buy a PIM card. # VPN #

Re: HP48GX as a PIM

*Message #16 Posted by **Masao Kinoshita** on 20 Nov 2003, 11:56 a.m.,*
in response to message #15 by Veli-Pekka Nousiainen

AFAIK, the RAM for Sparcom's PIM software needs to be all "merged" memory, i.e., not bank switched. 256 KB is not that much memory! Also, the sorting routine for the contact directory seems to be quite inefficient memory-wise. IIRC, the manual says it requires as much free memory as the directory takes for the alphabetical sorting to take place correctly. My memo section, which sorts also, crashed once and now I keep most of my Notes in the native tree as "notes" programs.

FYI, the calender portion was basically bundled onto the HP 48SX serial interface diskette.

I'm not recommending this PIM to new users for serious use today; but back over a decade ago, it was quite impressive. Much better than the HP 41 Time Module, which of course goes back another ten years and was itself quite impressive in its heyday. :-)

*Message #18 Posted by **James M. Prange** on 20 Nov 2003, 4:25 p.m.,*

in response to message #17 by Veli-Pekka Nousiainen

I expect that that goes back to before there was an hpcalc.org. Reading a book, the Goodies Disks (via snail mail) from EduCalc, a long-distance by-the-minute phone call to a BBS, Do-It-Myself, or buying a floppy disk or ROM card was how I got programs. Considering the prices for "Genuine HP" RAM cards, some of the "Write-Once ROM" cards didn't look so bad, although I much preferred getting an application on a floppy disk, and the Do-It-Myself method is always a lot more satisfying (at least when I can stretch my expertise that far).

Regards,
James

Exactly the reason I got the PIM card. HP RAM was wayyyy expensive and using up the internal RAM for a PIM was not what I wanted to do.

I do now regret buying the card.

As soon as I have some HP stuff cash available I will pick up a Klotz card and exchange that with the PIM and then download a PIM from hpcalc.org. I have already looked at them.

Chris

Re: HP48GX as a PIM

*Message #20 Posted by **James M. Prange** on 22 Nov 2003, 5:13 a.m.,*
in response to message #19 by Chris(FLA)

Yes, the RAM cards were very expensive, but I bought the Equation Library ROM card and a 128KB RAM card anyway. Having done that, I'm very reluctant to sacrifice a slot for an application on a ROM card. After all, I expect that the applications on most ROM cards don't take up anywhere near the whole 128KB, so I think it better to put any applications on the RAM card, and, if necessary, purge what I'm not using to install something else from the PC.

With the 49g+, I can now have about 3 times as much on my SD card as I could have on my PC's HD drive back when I first got the 48SX. Is it possible that I'll ever run out of room on the 128MB SD card? But then too, I wondered the same thing about that humongous 40MB HD drive back then. But at least I'll never have to try to fit Microsoft bloatware on the SD card, so I guess it should be enough for a long time to come.

Regards,
James

At the time the only RAM cards I knew about were from HP. We all know what they cost(ouch).

I didn't know about the Klotz RAM cards. I will most likely get a 1 meg card from them and then just....I don't know what I will do with the PIM card. Throw it in my old hardware box I guess.

manual

*Message #1 Posted by **Sanjeev p** on 19 Nov 2003, 12:29 a.m.*

hello sir i got one hp 21s calculator and lost manual so how can i get the manual? and also i want current price of that thanking u

Re: manual (hp21S)

*Message #2 Posted by **Charlie O.** on 20 Nov 2003, 9:42 a.m.,*
in response to message #1 by Sanjeev p

I bought a 21S last night and seached the web and this site and found very little info. A couple of manuals were on ebay that seem to sell for more than the calc. Why is isn't there more coverage? Just because it's algebraic?

I managed to get it to power up using the info in my 32sii manual and ran the tests using the same keys.

I bought it for the case and battery door but it is too nice to cannablize.

The 21S isn't even included in the museum CD.

Help repairing a Digital Cassette Tape

*Message #1 Posted by **Philip** on 18 Nov 2003, 10:27 p.m.*

I have Digital Cassette Tape to be used in the 82161A Tape Drive that appears to be broken. I can't tell if the tape came apart at the end or somewhere in the middle. Does anyone have suggestions on how to repair or splice these things?

Thanks

Re: Help repairing a Digital Cassette Tape

*Message #2 Posted by **Victor Koechli** on 19 Nov 2003, 2:09 a.m.,*
in response to message #1 by Philip

Hmmm, I've never had to repair one (so far). I can't think of any other means than splicing the tape, just like an ordinary audio cassette (you know, that rectangular pre-CD-thing that could not even handle MP3 ;-))). I can think of two problems:

- If the tape is broken at the beginning, there is an index hole in the tape that the drive can 'see' with an optical sensor (there's a little mirror in the cassette for this purpose). Be sure not to obscure this hole, or to make a new one, if you have to cut it out.

- I don't know how much of the tape's total length you can cut out before running into problems. My guess is that the INITIALIZE command assumes a fixed tape length to hold a fixed number of records. Therefore, cut out as little tape as you can, but as much as necessary in order to avoid defective records.

As your tape is broken, you probably have no alternative than trying to splice it anyway. Good luck, and keep us informed.

Cheers, Victor

PS If you want, I can have a look into the drive's manual once I get home. This will only be in 10 hours, however (I just got to work...)

in response to message #3 by Diego Diaz

Thank you, Diego, for that excellent article! Actually, I think it should be moved to the 'articles' section, possibly along with additional information from Tony Duell concerning the pressure pad.

Do you have an idea how much of the tape's total length can be sacrificed before it gets too short? Or is tere an alternative NEWM command that allows for shorter-than-normal tapes? If so, it would not always be necessary to replace the entire tape, but you could easily splice it after cutting out the damaged section.

Kind regards, Victor

*Message #5 Posted by **Diego Diaz** on 19 Nov 2003, 8:39 a.m.,*
in response to message #4 by Victor Koechli

Hi Victor,

Unfortunately I can't tell how much "spare" tape is in the mini-cassette, I'd bet it won't be too much though.

I simply try to make my "rebuilt" as close as possible to original specs.

There is BTW an inacurracy in my article, I told about "constant angular speed" of the reel, it should be far more precise to say that the "sum of the angular speeds of both reels" is what the 82161A tape speed control cares about. Anyhow, that makes no difference from a user (fixer) point of view.

Cheers.

HP-49G+ -- A Look Inside . . .

*Message #1 Posted by **Paul Brogger** on 18 Nov 2003, 4:33 p.m.*

I was able to get my HP-49G+ apart and take a few pictures -- I thought I'd share them with you all.

The first one shows the two halves not quite fully separated, and the IR lens removed.

The upper, dark section is the inside of the bottom case half. The battery compartment is to the left, and the wires connect the AAA and backup batteries and a large electrolytic capacitor to the main board. The small silvery rectangle near the top is a piece of conductive foam serving as the negative battery contact with the PCB. The larger black circle is where the buzzer is mounted, the smaller concentric circles to its upper left are the reset switch (a springy rubber contact).

The lower half shows the front case half, with the LCD board on the left covered by self-stick foil-backed paper. (It's actually aluminum-colored -- it looks coppery in these pictures, for some reason.) The main (CPU/key/SD) board is on the right.

The IR lens is thin and flexible, and pops out easily, but would probably be hard to get back in without taking apart the case halves (at least partially).

The second picture shows the electronics a bit more closely. A capacitor is glued to the main board with a smear of red-orange goo, and the reset contact is some gold fingers interleaved near the blue jumper wire.

The main board connects to the LCD board via: 1) a mylar (?) ribbon that runs across the calculator, just to the right of the coppery-looking shielding, and 2) a series of solder connections along two edges of what looks like a rectangular extension of the LCD board, near the bottom of the picture.

The square black chip above & to the right is marked "ARM" -- the other two I haven't looked at too closely. There's another pad of conductive foam attached to the SD card slot assembly.

The third image shows most of the self-stick paper/foil backing peeled away from the LCD board, exposing what appears to be two blobs of black stuff apparently sealing two LCD controller chips on the board.

Also visible are the IR sender & receiver, and the USB mini-B socket.

This view gives a good idea how the thing is put together -- the two posts are what I drilled to free up the top end, and otherwise it's only a series of plastic tabs around the edge that lock into the bottom case. After "topping" the posts, the two halves snapped apart quite easily.

BTW, the black accent that surrounds the calculator face is actually applied, and the calculator front and "side bumper" are actually one piece. Don't pry upward on the black accent, as it's just decoration and won't get you anywhere.

Re: HP-49G+ -- A Look Inside . . .

*Message #2 Posted by **David Brunell** on 18 Nov 2003, 4:56 p.m.,*
in response to message #1 by Paul Brogger

Thanks for the photos and description. It looks like you would have to drill out another 16 or so posts in order to get at the keyboard. Do you have any intention of going that far? I'm wondering if perhaps some of the keyboard reliability problems may be due to contamination on the production floor.

Re: HP-49G+ -- A Look Inside . . .

*Message #3 Posted by **Brandon** on 18 Nov 2003, 7:31 p.m.,*
in response to message #2 by David Brunell

I'd only open up the keyboard part once the calculator is dead (is this one?) because only the posts are holding it together (at least that's how it was on the 49g)... once you drill them out, your keyboard will REALLY suck when there's nothing holding it in place :)

Re: HP-49G+ -- A Look Inside . . .

*Message #4 Posted by **Paul Brogger** on 19 Nov 2003, 2:59 a.m.,*
in response to message #2 by David Brunell

I am considering it.

No, this one is not dead -- it survived the "operation" fine. One key is that I didn't try to pull the self-stick aluminized paper completely off, as it's in contact with the LCD edge of the mylar ribbon connecting the two circuit boards. I think that, were I to try to take the paper off, the ribbon connector may well come with it.

I have taken apart and reassembled a Pioneer keyboard. It is held together with heat stakes, too. I had to press the layers together in place while re-melting the original rivet heads (which had been sliced off at PCB level) back onto the truncated posts. It seemed successful, but I wonder about long-term durability.

I'm going to try a hot needle or other pointed object for my next Pioneer keyboard reassembly. (I've a 42s disassembled, and am awaiting the arrival of a conductive ink pen so I can re-create some of the worn-out contact pads on the latex "dimple sheet".) I'm hoping I can melt and displace enough of the posts' plastic centers that I can create new mushroom heads.

But this approach apparently wouldn't work with the 49G+, as the posts seem already to be hollow. Those hollow posts may, however, admit small, wide-head screws with insulating washers (if I could find such . . .)

I am curious about *what* (if any noticeable) difference exists between the keys that don't register so well and those that do. I did notice on this particular example that the LCD board wasn't held in place nearly as well as it might be -- some of its posts were too short or hadn't been melted over, and it rocked slightly, corner-to-corner, with the case halves separated. (While that may be evidence of an early production quirk, I don't think this particular manufacturing flaw accounts for any of this unit's reluctant keys.) If I could restore misplaced or contaminated key contacts *and* successfully reinstall the PCBs, it might demonstrate a cure for some of the problems being reported with early units.

Meanwhile, back in the land of the living, the "warranty cure" should be available to most anyone experiencing keyboard troubles. I recommend you make use of that cure, as a fully-functioning 49G+ is a fine thing to have!

Paul.. Couldn't get the chip numbers from your pix.

Could you post all the text on the ARM CPU please? And maybe the other non-glue chips too?

Thanks, Bill Wiese San Jose CA

Re: HP-49G+ -- Chip Numbers . . .

*Message #6 Posted by **Paul Brogger** on 21 Nov 2003, 11:09 a.m.,*
in response to message #5 by Bill Wiese

Here they are -- at least as clearly as I captured them when I had the thing open.

I'm not sure I want to open it too many times, but if you want me to try to clean off the tops of the chips and clarify anything next time, put in your requests now.

I am curious about just how the ARM chip is mounted. Is it likely to have a pin array on the bottom, as do the Intel CPU's I've dismantled?

Re: HP-49G+ -- Chip Numbers . . .

*Message #7 Posted by **Monte Dalrymple** on 21 Nov 2003, 1:12 p.m.,*
in response to message #6 by Paul Brogger

Yes, it's a ball grid array package.

That particular Samsung device happens to have a two-channel USB host controller, three UART channels and eight 10bit ADC channels that we can't get at because of the BGA package...

Oh, and it's an ARM920T processor core...

Monte

Re: Samsung Device

*Message #8 Posted by **Paul Brogger** on 21 Nov 2003, 4:30 p.m.,*
in response to message #7 by Monte Dalrymple

Thanks for sharing the details.

Is BGA a surface-mount technology, or is there an array of holes drilled through the PCB? (If the latter, I wonder how that's positioned vis-a-vis the keyboard contacts which I presume are etched on the other side? I guess I may have to dismantle it further, someday . . .)

Also, what is it, exactly, that "we can't get at"? The ADC channels, or everything you mentioned? We can't get at them because, in this particular package, the pads on the actual chip aren't connected to external pins?

Just curious . . .

Re: Samsung Device

*Message #9 Posted by **Monte Dalrymple** on 21 Nov 2003, 4:47 p.m.,*
in response to message #8 by Paul Brogger

With BGA the package actually has little solder bumps on it that melt and attach to the circuit board during assembly (a special case of surface mount). They are very fine pitch and unless the signals are brought out to a point on an outer layer of the circuit board they are essentially invisible. Hence my comment about being unavailable. Of course, all of those lands visible in the photos might actually connect to something useful, but it would take a fair amount of detective work to figure that out. Note that this chip is used in the new iPAQs also...

Monte

HP42S=Hp17Bii but different ROM¿

*Message #1 Posted by **Marc** on 18 Nov 2003, 3:47 p.m.*

That's my question Thanks

Re: HP42S=Hp17Bii but different ROM¿

*Message #2 Posted by **Randy Sloyer** on 18 Nov 2003, 4:22 p.m.,*
in response to message #1 by Marc

Yes, you are 100% correct. Circuit board, passive components, case, keyboard sheets, everything but the keytops and ROM. You can also add the 27S so that:

17B = 17Bii = 27S = 42S

The only very fine detail of difference is that when the 17Bii moved with production to Indonesia, they changed the molded keys to printed keys. AFAIK, the 42S and 27S all have the nicer molded keys.

So the $64,000 question: Why did they drop the 42S in 1995 and continue to produce the 17Bii until 2002? IMO, they did not what to harm 48 sales.

Not exactly...

*Message #3 Posted by **Raymond Del Tondo** on 18 Nov 2003, 7:18 p.m.,*
in response to message #2 by Randy Sloyer

... the 17BII has more ROM. Or, in other words, the 17BII has an additional ROM chip, which features the language-specific messages.

Raymond

Re: Not exactly... Well almost....

*Message #4 Posted by **Randy Sloyer** on 18 Nov 2003, 7:40 p.m.,*
in response to message #3 by Raymond Del Tondo

Only the international version units. The standard ABA english units do not have the addition rom chip.

Re: Not exactly...

*Message #5 Posted by **HrastProgrammer** on 19 Nov 2003, 1:22 a.m.,*
in response to message #3 by Raymond Del Tondo

HP-42S is probably intended to have the second ROM, too, starting at the address #20000. That's why the misterious XFCN instruction exists:

```
128EB   =xXFCN
128EB 1F00002   D1=(5) #20000
```

```
128F2 143        A=DAT1 A
128F5 34F3CA5    LC(5) #5AC3F
128FC 8A6        ?A#C A
128FF 90         GOYES L_12908
12901 8F50002    GOSBVL #20005
12908   L_12908
12908 8C8FA3     GOLONG #16402
```

HP-49G+ anomaly with 'CR'.

*Message #1 Posted by **r. d. bärtschiger.** on 18 Nov 2003, 3:28 p.m.*

I have discovered what may be an anomaly with 'CR' on the HP-49G+. In order to demonstrate this anomaly I will describe six different procedures, please bear with me. You may want to hold your 49g+ close to your ear while you do the following.

1.) Enter CR then press and hold the enter key for about a second. Did the calculator beep?

2. Enter CR then press and release the enter key as quickly as possible. Did the calculator Beep?

3.) Open the CATalog and scroll to CR. Press and hold the OK key for about a second. Did the calculator beep?

4.) Again find CR in the catalog. This time press and release the OK key as quickly as possible. Did the calculator beep?

5.) Create the following program and duplicate it a number of times on the stack:

\<< CR \>>

Now press and hold the EVAL key for about a second. Did the calculator beep?

6.) Then press and release the EVAL key as quickly as possible. Did the calculator beep?

7.) The answers I get are: Yes, No, Yes, No, Yes & Yes. Should the calculator really beep when it executes a CR? And in any event why does it react differently depending on how the executing key press is applied?

rdb.

Re: HP-49G+ anomaly with 'CR'.

*Message #2 Posted by **Raymond Del Tondo** on 18 Nov 2003, 7:14 p.m.,*
in response to message #1 by r. d. bärtschiger.

Maybe a problem with the key buffer ?

Perhaps the Xtra-Long-Hold gimmick isn't defined correctly there...

Raymond

Re: HP-49G+ anomaly with 'CR'.

*Message #3 Posted by **James M. Prange** on 18 Nov 2003, 8:30 p.m.,*
in response to message #1 by r. d. bärtschiger.

Well, it's not something new on the 49g+; essentially the same behaviour occurs on the 48SX, except of course that the 48SX lacks the catalogue. And it's not just CR, but all of the print commands. Notice that it doesn't

actually send the CR until after you've released the key. I suppose that it beeps because it unexpectedly finds a key pressed when it tries to print.

Regards,
James

Re: HP-49G+ anomaly with 'CR'.

*Message #4 Posted by **r. d. bärtschiger.** on 18 Nov 2003, 8:36 p.m.,*
in response to message #3 by James M. Prange

Then why does the 49G+ beep when it encounters a 'CR' in a running program?

rdb.

Re: HP-49G+ anomaly with 'CR'.

*Message #5 Posted by **James M. Prange** on 19 Nov 2003, 2:40 a.m.,*
in response to message #4 by r. d. bärtschiger.

Because a key is down when the CR tries to execute? I tried inserting a CR into a few programs without getting any beep from them, but just \<< CR \>> by itself, or CR as the first object in a program, does beep when I press the EVAL key on the 49g+. On the 48GX, this doesn't happen unless I intentionally hold the key down longer than normal. I expect that the "problem" is that on the 49g+, the program executes so fast that I don't have time to release the EVAL key before it tries executing the command. Maybe the fact that I have to press harder than "normal" on the 49g+ influences how fast I can release the key. With the program \<< .1 WAIT CR \>>, I don't get the beep with a normal keypress. Personally, I'd rather ignore this "problem" than have HP add a delay at the beginning of each print command.

But I am a bit curious about why the print commands beep when a key is down, but not the XMIT command (even when using the IR port) for instance.

If I use PR1 to print a string too long to fit on a single line, and hold the key down, then it prints out the first line and beeps. When I release the key, the rest of the string is printed. That it prints out the first line tells me that the "CR" ("print line and leave head at right", actually character 4) was sent while the key was still down.

The 48SX and 48GX seem to behave the same, so I continued experimenting with them. Using the INPRT program to capture the "Red Eye" IR stream does indeed confirm that the first line, beginning with the switch to ECMA 94 and ending with character 4, is sent while the key is down. If it can send that much, why the beep and delay in sending the rest of the string?

But with the CR command, with the key held down, it just beeps, and the character 4 isn't sent until after the key is released.

Switching to serial IR for printing and using the SRECV command to capture the print stream, the entire string is sent out while the key is held down, and then it beeps if the key is still down when it finishes sending. With the CR command, the line termination string is sent while the key is still down, and then it beeps. Printing by wire to either another calculator's SRECV or an actual serial printer shows the same behavior.

I really doesn't see a reasonable explanation for why it should behave this way. Maybe you've noticed a "bug" that's been in the ROM since the 48SX, but that nobody found objectionable until the 48g+'s extra speed made it so noticeable.

Maybe someone at comp.sys.hp48 has an answer? Should we take this discussion there?

Regards,
James

Calc for imaginary numbers & matrix operations

*Message #1 Posted by **Joe Edwards** on 18 Nov 2003, 3:26 p.m.*

Could someone recommend a few good choices for a calc. that can perform large matrix operations and easily handle imaginary numbers? I would hope to come up with multiple solutions, including a large (graphical type) and small (handheld size) calculator. Thank you.

Re: Calc for imaginary numbers & matrix operations

*Message #2 Posted by **Victor Koechli** on 18 Nov 2003, 4:46 p.m.,*
in response to message #1 by Joe Edwards

Given the filter criteria and your desire for multiple suggestions, I'd say:

- HP 48/49 series (graphing) for really large matrices, as these have large memories and some of them are expandable. Best models in this class are the 48GX (128KB) and the new 49G+ (1.2MB), both expandable.

- HP 42S if it has to be more portable. Only limited graphics and 7K of memory, however. And possibly a higher price...

Hope this helps. Regards, Victor

Re: Calc for imaginary numbers & matrix operations

*Message #3 Posted by **Joe Edwards** on 19 Nov 2003, 7:34 a.m.,*
in response to message #2 by Victor Koechli

How do the older machines such as a 41c/v/x or a 15c handle in comparison. What are the size and speed limitations for matrices and imag. numbers? Thanks.

Re: Calc for imaginary numbers & matrix operations

*Message #4 Posted by **Namir Shammas** on 19 Nov 2003, 9:29 p.m.,*
in response to message #3 by Joe Edwards

Ed,

Unless you have mega years to kill, the HP48GX can handle complex calculations much easier since it has more memory and is a more advanced calculator. The HP15C was HP's first calculator that had built in complex math support. The calculator's memory IS limited by comparison to the HP48GX or HP49G.

Namir

Re: Calc for imaginary numbers & matrix operations

*Message #5 Posted by **Joe Edwards** on 20 Nov 2003, 6:55 a.m.,*

in response to message #4 by Namir Shammas

What is the largest matrix that a 48GX or 49g+ can handle?

Also, I don't mean to ruffle feathers here, (but many folks here are very knowledgeable in the calc field, so I trust your opinions) but how does a TI 89 compare in regards to imag numbers and matrices?

Joe

Re: Calc for imaginary numbers & matrix operations

*Message #6 Posted by **Victor Koechli** on 20 Nov 2003, 7:25 a.m.,*
in response to message #5 by Joe Edwards

They take 8 Bytes per real element, plus some small overhead (15 Bytes) per matrix. If you fill all available memory with one single matrix, you'll get (approx.)

- 127x127 in a 48G+ or standard GX (128kB RAM)
- 180x180 in a 49G or a GX with 128kB merged RAM in port 1 (256kB total RAM)
- 191x191 in a 48SX (!) with 256kB merged RAM in port 1 (288kB total RAM)

The big surpise here is of course that the old 48SX can take the largest matrices due to its highest possible merged RAM. However, the SX is lacking many of the later models' features, like list processing or the 49G's CAS. Complex elements take 16 Bytes.

I don't know about TIs, but I'm sure someone else does.

Kind regards, Victor

Re: Calc for imaginary numbers & matrix operations

*Message #7 Posted by **Mark Ordal** on 20 Nov 2003, 9:38 a.m.,*
in response to message #6 by Victor Koechli

It looks as if a TI Voyage200 can do a single matrix of up to about 115x115. I haven't seen documentation on it yet, but a few experiments point to 10 bytes per element for arrays of floats (plus, of course, a few bytes of overhead). Unlike an HP48/49, the TI uses less storage if the array consists entirely of integers (that is, 4 bytes per element, plus a few bytes of overhead).

Arrays of complex numbers with floating point components take about 20 byes per (complex) element plus some overhead. So it looks as if the Voyage200 could do a single 81x81 matrix of all complex elements.

So far as I know, the TI-89, 92, 92+ and Voyage200 all have the same amount of RAM---they differ only in the amount of Flash memory, builtin apps, physical size, battery size (4xAA vs 4xAAA) and (in the case of the TI-89) display size.

--Mark

Re: Calc for imaginary numbers & matrix operations

*Message #8 Posted by **Veli-Pekka Nousiainen** on 20 Nov 2003, 11:09 a.m.,*
in response to message #7 by Mark Ordal

The TI's are extremely slow on huge matrices, but in practical situations they are ok. Try a 32*32 real number matrix inversion on TI 89/V200 and on a 48G/49G. You don't need the 49g+ to beat the TI in numerical matrix operations. # VPN #

HP42

*Message #1 Posted by **Sheileen** on 18 Nov 2003, 4:41 a.m.*

I was wondering can anyone help me. My HP 42 calculator stopped working. I changed the batteries and it still doesn't work. Has anyone any ideas what I could possibly do now to get it to work?

Re: HP42

*Message #2 Posted by **Victor Koechli** on 18 Nov 2003, 5:33 a.m.,*
in response to message #1 by Sheileen

There have been several posts related to this problem recently. Try a system reset first (ON+C), if this doesn't help, try a memory clear (ON+A+F). If this doesn't help either, remove the batteries and shorten the two battery contacts with a coin for a few seconds. Preferably be grounded while doing this to prevent possible, although unlikely, damage from ESD. This should get your calc up and running again.

Good luck, and keep us informed! Victor

Please HELP !!! My W&W-RAMBOX II crashed - I lost its soft operating system !

*Message #1 Posted by **Werner** on 18 Nov 2003, 2:57 a.m.*

Dear HP friends and MLDL experts,

can anyone of you help me here ?

I had a FATAL accident with my most important and beloved device, my urgently needed HP-41 MLDL-RAMBOX, I am really a bit desperate. Certainly the OS crashed and I do not know how to recover it ! :-((((

Yesterday I certainly killed the soft OS of my W&W RAMBOX of my HP-41CY. It is a built-in 64k W&W RAMBOX II which supports two 32k blocks of page 8-F, “Rambox a“ and “Rambox b“. Per software command PG<> you can switch between the blocks. Yesterday I used my HEPAX module which normally identifies and uses the visible RAMBOX-RAM as 8 HEPAX RAM pages. In the past this always worked fine (although it may not be common to use both, RAMBOX and HEPAX at the same time, but by this you can use the HEPAX functionality and have full 32k access).

This time unfortunately a conflict happened the HP-41 to freeze. I had to briefly remove the battery and make a master clear after that. Further I made a “Rambox Clear“. After that I had lost the 4k soft operating system (page 8) of my second RAMBOX block “b“ which is normally secure from being erased.

Formerly I have had no problems because HEPAX and RAMBOX seemed to coexist very well. But maybe I used a critical slot configuration with my plug-in modules, so the HP-41 froze after HEPAX installation. Maybe some self-mapping by the HEPAX after its installation may have mapped the RAMBOX “b“ OS into another page and there it was not safe against being erased by the Rambox master clear (the RAMBOX soft OS is located at page 8, there I had plugged in my HEPAX module in order to temporarily deactivate it for giving full 32k access to the HEPAX RAM management which normally works well. Troughout the initializing process, the HEPAX is located at page 8 very briefly, there it deactivates the 4k RAMBOX OS and after that it maps itself into page 6, thus giving free all 32k of Quasi-ROM).

This is my explanation of the fatal accident, but maybe I am wrong.

I do not believe that the RAMBOX hardware is defect. I had made a full check of every single bit of the 64k by some stored checksum program maybe a week ago. The RAM and the OS “a“ and “b“ were all working properly. I also did nothing wrong with plugging the modules. I always secured that there were NO hot-plugins, so normally the hardware was not endangered. So I believe I “only“ killed the software.

When I want to switch from “Rambox a“ to “Rambox b“ by using PG<>, nothing happens anymore. It always remains “Rambox a“ which you can check by CAT 2. This 32k (28k+4k soft OS) block is working properly.

So, what can I do here ?

1) I have not yet had the opportunity to back up the OS ROM code of the RAMBOX (because of this damn lack of spare time :-( ). So I lost the ROM code “Rambox b“ which is certainly quite similar to “Rambox a“ but with very little modifications. Does anyone of you have the ROM images “a“/“b“ of the W&W-RAMBOX II OS ?

2) How can I reload the soft OS into the second block of the RAMBOX RAM ? So how can I recover the software

to again being able to access the other 32k block of RAM ?

Certainly this is a tough problem. I hope so much that someone of you can help me in my fatal and sad situation !!!

Thanks and best regards from Germany,

Werner

in response to message #1 by Werner

Hallo Werner,

ein paar der Leute hier haben einen CY (Christoph, Matthias,...). Wenn die HEPAX Mass Storage Funktionen ERAMCO-kompatibel sind, sollte es also kein Problem sein, den B-Block wieder einzuladen

wenn ich mich recht erinnere, gibt es beim CY bzw. der eingebauten RAMBox auch einen 'verzahnten' Modus ('PG01'), also abwechselnd Seiten von Bank 1 und 2 sichtbar zu machen, PG8 von Bk 0, PG9 von Bk 1, PG10 von Bk 0, etc...

Auf diese Weise kannst Du jedenfalls mit Software der einen Bank Software in die andere Bank laden. Aber das weisst Du ja schon;-)

Grüße,

Raymond

Hallo Raymond,

Die Hepax und Ram-Box rom-image formate sind leider nicht kompatibel. Siehe hierzu auch meine Dokumentation zu EMU41 mit der Files von Hepax zu Ram-Box bzw. umgekerht konvertiert werden können.

Weiterhin hat W&W einen Schreibschutz implementiert, der verhindert, dass ein rom-image vom RAM-Box Betriebssystem erstellt werden kann :-(

Grüße - Christoph Klug

Hallo Christoph,

hmm, das mit dem Kopierschutz ist mir bekannt. Aber es gab ja auch andere kompatible COPYROM Funktionen, zum Beispiel von oder über ERAMCO.

Auch mit dem Profiset kann man ein W&W OS kopieren;-) Allerdings muss man es dann auch mit der entsprechenden Funktion des Profiset wieder einlesen. Kann sein, dass die Profiset-Funktion (SAVEBL,GETBL) das gleiche Format verwenden wie HEPAX.

Abgeshen davon hat Werner ja noch mindestens eine Kopie des W&W OS . Vielleicht kann ein findiger Programmierer ja einfach den Kopierschutz deaktivieren? Hinweis: Ist nicht sehr schwer;-)

Andere Möglichkeit: Einfach ein ROM-Image laden, welches eine Funktion wie COPYBL enthält, die nicht auf Kopierschutz achtet. Dann das OS damit kopieren. Geht immer.

Grüße,

Raymond

nicht schwer

Hallo Raymond,

das W&W Betriebssystem mittels einem anderen Betriebssystem wegzuspeichern habe ich in der Vergangenheit schon gemacht : Ich verwende dazu ein Zeprom mit dem Eramco Betriebssystem.

Damit konnte ich auch schon zwei RAM-Box Systeme im Kartenlesergehäuse reaktivieren. Diese waren jedoch per Dipschalter bankgeswitcht. Beim HP41CY (mit Bankswitching per Software) dürfte die Prozedur schwieriger werden ?

Die Deaktivierung des W&W RAM-Box Kopierschutzes wäre doch eine angemessene Aufgabe für dich :-)))

Herzliche Grüße - Christoph

in response to message #3 by Christoph Klug

I've never used a RAMBOX but that of course won't stop me from giving my comon-sense aproach to this:-

"Q-ROM is Q-ROM is Q-ROM"

So the HEPAX should be able to utilize the RAMBOX-RAM, and the RAMBOX should be able to utilize the HEPAX RAM..

This, I'm afraid, won't help our friend Werner.

Best,

AM

Re: Please HELP !!! My W&W-RAMBOX II crashed - THANK YOU !

*Message #9 Posted by **Werner** on 20 Nov 2003, 12:19 a.m.,*
in response to message #2 by Raymond Del Tondo

Hello dear friends,

first of all I would like to thank you so much for your support and help, Raymond, Mike, Angel and Christoph! (with Christoph I already had some email exchange on this issue)

I appreciate your valuable advice very much and hope to finally find my HP-41CY completely recovered with the help of your information. I will try different of your ideas.

Angel, concerning your remark on Q-ROM and some other advice on copying the OS bank1-version: Yes, I can duplicate it to any another page at the first bank by using the HEPAX, I had already tried. There it should be compatible to W&W-Q-ROM format because it is a fully-functional 4k mcode set. In that sense Q-ROM is indeed equal to Q-ROM. But if you use the HEPAX not for internal duplication but for export to an IL mass storage device (or e.g. to virtual mass storage of PC/EMU41) it may have a different format compared to those files being exportet by W&W or Eramco (But that could be translated on a PC) ?

My problem here is more or less to address the bank 2 of the RAMBOX for copying the OS (the copy-protection will certainly not be the major problem due to this switch option, which you fortunately told me about).

BTW, thank you, Mike, for your info on the code differences between the "A" and "B"-ROMs !

Raymonds advice on using the bank interleaved functions PG01/PG10 instead of PG<> is a very good idea ! I had tried these functions but I got a strange result. In both switching states, i.e. at pg01 as well as at pg10, I "see" the OS version "A" at page 8 (via CAT2, still I have to check HEPAX multifunction #2 to ensure this result -I cannot do just here at the moment because just now I am not at home where my HP-41CY is lying around).

But isn't that strange ? I would have expected to get OS-"A" at pg 8 with pg01, but not any OS at pg 8 with pg10. What do you think on this strange behaviour ?

What I would like to check next would be to load programs or ROMS into pg01 pages and then switch to pg10. Then doing Copy again. Maybe I succeed to address memory space at bank 2 via the interleaved pg organisation of pg01/pg10. We will see.

I really hope that at the end I can be happy again ... happy to have a fully-functional RAMBOX for future activities ... we will see. I will keep you informed on news.

Thank you and with my best regards,

Werner

Could you please continue this conversation in english ...

*Message #13 Posted by **Mike (Stgt)** on 19 Nov 2003, 2:04 p.m.,*
in response to message #1 by Werner

Hi Werner!

That happend too to my 41CY several years ago. But I had already copies of the RAM-Box on a LIF-disk (the copy pretending routine of W&W just looks if the second character - at nFFD - of the ROM-ID is W). A phone call to W&W revealed a hidden feature of the 41CY: under the insulating foil in the bat compartment is a dipswitch which allows to write-protect page 8. As your "set a" is still OK I hope this helps.

Here the delta between RAMbox a and b:

```
SUPERC - CMS FILE/LINE/WORD/BYTE/SFOR COMPARE UTILITY - V3.01  (11/22/95)
```

```
NEW:  RAMBXX   HPMCLIST         OLD:  RAMBXY   HPMCLIST

             LISTING OUTPUT SECTION (LINE COMPARE)

 ID       SOURCE LINES              TYPE  LEN N-LN# O-LN#
     ----+----1----+----2----
                                    MAT=   78

HP-41C HP-15C & complex numbers

*Message #1 Posted by **Vincent Weber** on 18 Nov 2003, 12:22 a.m.*

Hi all,

After reading so much praise of the HP-15C in these columns, I had a good look by myself using the (excellent) simulator by Lygea on PocketPC (Pocket15C). My conclusion is that, yes, the HP-15C was a very finely design machine - elegant, compact, with well integrated and powerful features. It is true that for 3 long years, from the birth of the HP-15C (1982) to the Advantage and CCD modules for the HP-41C (1985), the HP-15C was the only device able to handle matrixes natively in a usable way ! However, when comparing HP-15C with HP-41C with Advantage module, I find that:

1) As Valentin already described it in a very good article, the matrix features of the Advantage module outshine by far the ones of the HP-15C (even though the HP-15C has some nice touches, so that matrix descriptors on the stack). As surprising as it may seem to the supporters of the idea that on the 15C all features are readily available on the keyboard, very often the HP-41C matrix routines require less keystrokes than their HP-15C counterpart: I especially think of matrix edition. Even in so-called 'USER' mode, the HP-15C requires 3 keystrokes to enter a new element (such as '1 STO A' while the HP-41C requires only 2 ('1 R/S'). In addition, handling complex matrixes on the HP-15C requires to manually transform them back and forth in matrix/real forms - an operation transparently handled in the Advantage ROM.

2) The SOLVE and INTEGRATE features are identical,

3) The CFIT program is much more powerful and flexible than the simple linear regression available on the HP-15C,

4) The Advantage ROM does not have hyperbolics, combinations and permutations, generalized factorial, and random number generator. Well, it is a pity, but the first three items are very easy to program, while the fourth one is quite useless (except to program games...). No big deal.

5) The HP-15C has recall arithmetics. It is an interesting feature, but it is quite easy to emulate on the HP-41C in 3 steps instead of one (i.e. RCL+ 32 is equivalent to X<>32, STO+ 32, X<>32, even if it is less elegant).

6) The HP-15C has direct line addressing. I would not want to use this feature, as it opens the door for messing up your programs very quickly (modify one line and you have to modify them all !).

7) The HP-15C has all 12 conditionals. It is a very nice touch, although it can be easily overcome by swaping the numbers to compare, let alone the fact that I do not think that remembering instructions as 'TEST x' is very elegant.

8) We now come to the *one* big superiority of the HP-15C: the fine integration of complex numbers. As Valentin pointed out, even the 42S is not able to have 4 different complex numbers on the stack, while the 15C can. At first glance, the complex functions of the Advantage module really pale in comparison of those of the 15C: On the 15C, these functions are optimized at the firmware level, do not require any register, are fast (well, as fast as the HP-15C can be), are integrated with all real functions (even reverse trigonometrics, which is not available on the '41 !). However, on second thoughts, I find this to be more cosmetics than of real use. Who really need to perform complex arithmetics ? Electrical/Eletronics engineers ? I don't think so. I studied electronics and I never used complex numbers on a calculator. Reason, I think, is that in electronics you would perform your reasonning in a

symbolic manner on paper, and use your calculator as a numerical application to compute the value of a resistance, a phase, an amplitude, whatever - which only involves real numbers. Furthermore, complex numbers in Electronics are mostly used in their polar form (amplitude and phase) - a painful operation on the HP-15C, as you need to convert polar-form number into rectangular form to perform all operations, and then back into polar form to see the results. Only the 42S & 48 series are able to do this. I think complex numbers are more useful in matrixes, to solve systems of equations - which the Advantage module performs far better than the 15C.

I would not trade-off this nice, but secondary to me, features for the core advantages of the 41C:

1) Alphanumerics: not only can the HP-41C display mnemonics instead of key codes, but also have alpha prompts and messages in programs through the alpha-register. Most important, you can handle a large libray of programs with global labels which you can name the way you like, rather than being restricted to 'A-E' '0-9' and '.0-.9'. I find this unvaluable.

2) Expandabiliy: I can use the '41CX emulator as a financial calculator (as I happen to be studying finance) - even a securities module with the Black-Schole equation pricing of an option is there ! Let alone Statistics, Avionics, synthetics programming with the CCD module... No machine had ever had such flexibility.

3) User keyboard: those who complain that the 41C is poorly designed because you have to type the name of the function you want to call obviously never used it: The 41C was designed to be customized by the user. Therefore, instead of trying to put everything on the keyboard like the 15C does, the 41C puts minimum, common operations on the keyboard, leaving it beautifully simple, and leaves it for you to assign your favourites functions to your favourite keys. Overlays can show you what they are, but it is still workable to do without overlay as if you press and hold the key, it would show the assigned function name, than return to 'NULL' after a while with no execution. A *very* clever design. A really pity that the (otherwise excellent) 42S chose custom menus over the user keyboard.

4) Memory: the extended memory made the 41 the very first PDA ever - even before the Psion 1 ! It can be used to store files and matrixes. A real must.

5) Speed: Altough reputed slow, the 41 was still about twice faster than the 15C...

As a conclusion, I would say that it is just amazing than a 1979-designed machine was so flexible. It could survive the more advanced features of the 34C and the 15C with its expandability; it could even resist the 28C/28S birth (a 1987 HP sales book was advertising both 41CV/X and 28S on equal grounds, and the 41CX was actually more expensive than the 28S !). HP discontinued the '41 series only with the birth of the 48SX, the only machine that could take over by inheriting -some- of its expandability... and even the 48 left 41 users with a lof of regrets !

Cheers,

Vincent

Re: HP-41C HP-15C & complex numbers

*Message #2 Posted by **Patrick** on 18 Nov 2003, 1:50 a.m.,*
in response to message #1 by Vincent Weber

There is no doubt that the 41C family was and is much more powerful than the 15C. For me, though, there is something of an imaginary line. On one side of this line are the applications which are best suited to a calculator, on the other a computer. In my mind, the 15C is the most usable and powerful device on the calculator side of this line. It is small and pocketable, is elegant to look at, provides most of its functions on the keyboard and not through menus, and is not hamstrung by the villany of short lived batteries. As a bonus, it provides substantial power when needed. It is an extremely pleasurable device to use, IMO.

Today, I choose to do things with a computer when the job is more complicated than what a 15C can handle. I

have owned a 41C since a month or so of its introduction but never find myself wanting to reach for it, other than to ogle it for historical sentiment. On the other hand, I have a 15C on every one of my working desktops.

in response to message #2 by Patrick

Interestingly enough this reasoning will apply much better to the 48 and 49 machines than to the 41.

IMHO the 41 didn't cross this imaginary line, but it bent it!

Best, ÁM.

Re: Mr. Weber's EXEMPLARY review [LONG]

*Message #5 Posted by **Victor Koechli** on 18 Nov 2003, 5:45 a.m.,*
in response to message #4 by deleted

Two more things to add to this:

- Writing a 'matrix editor' so you can enter numbers into a matrix on the 15C by simply pressing R/S is easy:

```
LBL 0
u STO A  (press STO A while in USER mode)
R/S
GTO 0
```

- I'm surprised to hear that the 42S should be unable to have 4 complex numbers on the stack. I'll have to check that when I get home tonight, but AFAIK, you can have 4 objects of *any* kind on the 42's stack. Anyone like to comment?

Cheers, Victor

A correction & a comment

*Message #6 Posted by **Valentin Albillo** on 18 Nov 2003, 5:58 a.m.,*
in response to message #5 by Victor Koechli

Hi, Victor:

Victor posted:

```
LBL 0
u STO A  (press STO A while in USER mode)
R/S
GTO 0
```

Your routine, simple as it is, has a nasty bug. When the very last element of the matrix is stored, the [u STO A] instruction will *skip* the next step, i.e. it will skip the [R/S] and go on executing the [GTO O], while resetting the row-column indexes back to 1 at the same time. Thus it doesn't stop as intended, but rather stores the same value (the last element's) *over* the value of the first element, then stops. So, you end up with your first element having been overwritten by the last element, unnoticed to you :-)

*" I'm surprised to hear that the 42S should be unable to have 4 complex numbers on the stack. I'll have to check that when I get home tonight, but AFAIK, you can have 4 objects of *any* kind on the 42's stack. Anyone like to comment?"*

It's bad wording. It's not that you can't *have* 4 complex numbers on the stack. You can, of course. The correct wording is that you can't *enter* 4 complex numbers on the stack, as you need two stack registers, X and Y, to enter a complex number into X proper, and that would send your previously entered complex number now in the T register into oblivion.

That's not the case for the HP-15C because it does have a full, 4-level+LastX parallel stack and thus you can enter a full complex number into both X registers without disturbing the T registers at all.

Best regards from V.

Re: Mr. Albillo's CONSTRUCTIVE comments [LONG]

*Message #7 Posted by **Vincent Weber** on 18 Nov 2003, 5:54 a.m.,*
in response to message #4 by deleted

Dear Mr Albillo,

Two small comments:

1-So far I have really appreciated your deep knowledge and your style on this forum, and I appreciated this part of your post, which is helping me to learn more. I thank you for that.

2-Given your contemptous, arrogant and unfriendly tone, it seems that your emotional intelligence is way below you IQ. I advise you to read "People's skills", if you heard of it - you seem to need it urgently. Please focus on the chapter about giving negative feed-back. Perhaps your knowledge is due to the fact that you spend too much time with machines and not enough with human beings ?

I fully agree with you: please don't waste time on me or on any other idiot you may find on this forum. We do not deserve your lights - the same way that you do not deserve our esteem.

Yours sincerely,

V. Weber

Geek spotted here!

in response to message #4 by deleted

I'm just simply amazed at the comptent and disdain you use to literally attack someone posting a debatable, but complete and documented opinion. Hey, it's just an *opinion* !

IMHO, you definitly need to spend less time with obsolete hardware, and spend some more with your friends and family - if you have any.

Being aggressive and even sometimes vulgar will never help your credibility. In short, get a life.

Re: Mr. Albillo's arogancy

*Message #9 Posted by **HrastProgrammer** on 18 Nov 2003, 7:42 a.m.,*
in response to message #4 by deleted

This is none of my bussines but it seems that Mr. Albillo has just crossed a line of nice and civilized manners. I haven't read such an arrogant post in this forum for a long time. I appreciated some of his posts in the past because they contained information and facts which were useful for me. He obviously knows very much about HP calculators and it is very nice from him to share this knowledge with the rest of us. But I am not sure if we want him to share his arrogance with us. It is obvious that Mr. Albillo takes every opinion as a personal attack on him and his favourite calculators (especially HP-15C). I read his posts about new HP calculators such as HP-49G+ ... it looks like a personal battle between him and HP. So what if HP-49G+ is not good enough? I simply won't use it and this is the end.

Is HP-15C the best calculator on the earth? For V.A. it surely is but for the others perhaps it is not. "HP-15C is the best" is not a fact, it is just a personal opinion. Do I like HP-15C? Yes, I do. Can I live without one? Of course, because I can do everything HP-15C can do in some other way and using some other techniques on HP-41C, HP-42S, HP-71B or HP-48GX. Four complex numbers cannot be entered on the HP-42S stack. So what? I can store two of them, enter the other two and recall the stored ones. Big deal. Or I can use my HP-48GX. Does it have the ability to have four complex numbers on the stack. It has, not 4 but almost 7000 complex numbers on the stack. Does it make it better than HP-15C? For me, it certainly does. For someone else, it doesn't have to be so.

I don't see Mr. Weber's post as something so bad to say that "I've had enough of you". In fact, I don't see his post bad at all. He simply described some of his opinions and arguments. Nice to read. Perhaps I don't agree with some of his claims but so what? He has all the rights to express his opinions in this forum as long as they are about HP calculators and as long as he don't attack or insult anyone. Then comes Mr. Albillo who is "certainly wasting his time trying to maintain a meaningful e-conversation". Well, Mr. Albillo, you really don't have to waste your time on this forum with such posts - just go and make something else.

Best regards.

P.S. I don't know Mr. Weber - I just wanted to point to something which seems wrong to me.

Grow Up

It's amazing (!)

*Message #12 Posted by **Valentin Albillo** on 18 Nov 2003, 8:01 a.m.,*
in response to message #1 by Vincent Weber

It's amazing ...

... the irrational attitudes some people incur towards me.

I make a derogatory (but rationalized and documented) comment on the *technical* abilities and sheer lack of objectiveness *in reviewing some devices* that some person evidences, without ever saying a word (or even subtly mentioning) any other aspects of said person's private life or attitude towards life in general, which I profoundly ignore and couldn't care less, and all I get are *personal* (not "technical") attacks, in the most derogatory terms possible, with bold statements about my "emotional IQ", my "social abilities", hastily quantizing the "time I spend with my friends and family", the "obsolescence of the hardware I deal with" ...

... which of course *none* of the persons uttering such has the *slightest* idea about whatsoever. In other words, a completely irrational, venomous attack, which only tries to pathetically retaliate some alleged "offence" by gratuitously and furiously trying to hurt the alleged 'offender', which is even kindly 'invited' to leave the forum.

Well, sorry but it just doesn't succeed. We have some proverb in Spain which roughly translated reads

```
"It doesn't offend he who wants, but he who can".
```

... and I get no offence from such blind, irrational attacks, coming from people that know not a thing about me. I guess all you utter them because you would feel 'vindicated' if I had no life, or were a social misfit, surrounded by old HP-15Cs all alone in my dark room.

Well, I've got news for you, because regrettably (for you, it seems), I *do* have an extremely successful social life, have a wonderful family life as well, participate in a lot of Internet forums and all kinds of intellectual and artistic activities (just search the web for "Valentin Albillo") and am surrounded by state-of-the-art hardware and software you can't even begin to imagine, in an extremely sunny and enjoyable place. Does ESA and Cisco ring a bell ? Or else you don't even know what I'm talking about ?

I'll comment no more on this off-topic issue here, at all, but anyway, it wasn't my intention to offend anyone, and if I've done so, I duly apologize. But next time, it there ever should be a next time, please stick to *technical* attacks or defences to 'revenge' alleged *technical* offences and leave the family, life, and everything else out of the question, ok ? It's just bad style and does nothing to support your points ... ;-)

Best regards from V.

Is this what your dusty life is all about?

*Message #13 Posted by **HP-Calc-Collector** on 18 Nov 2003, 8:16 a.m.,*
in response to message #12 by Valentin Albillo

Mr Albillo The Great,

It appears you are having some bad days, or at least I guess so, because the combination of your arrogance, comptent, and pure aggressivity are very bad symptoms of a downgrading need-a-life undertaker.

I will not even list the *technical* inaccuracies you keep repeating, like an old man speaking to his mirror. That's sad enough as is.

In case you don't notice, neither me nor the readers of this great forum are the least interested in you whoopa-dupa hardware environment, your living place within some corruption-ridden country, or your

soooooo-interresting participation in other forums.

Come on, life is not limited to old calculators, even great little machines as the HP-15C. Try the real life (where real geniuses are often incredibly modest and friendly personnalities), for once, instead of making yourself publicly pathetic.

Let's keep the high level?

*Message #14 Posted by **Nelson M. Sicuro (Brazil)** on 18 Nov 2003, 8:45 a.m.,*
in response to message #13 by HP-Calc-Collector

Hey, people, c'mon! Let's get the high level here! I live in a much corrupted country, this doesn't make me a bad person!

I read several posts of the highest level from this people that are *personally* and *anonymously* atacking our fellow V.A. Ok, we must be patient with others, as we all don't know everything of everything.

My *personal opinion*, I don't think is polite to call indirectly other people 'dumb', nor offent the caller in a personal level without arguments, not knowing him.

There are several 'polarized' discussions of one or other calculator (let's talk about RED LED?), is all matters of personal taste. I would love to have a RED LED HP-42S... (I'll build one some day)

I'm not a expert in the mathematics field, but I like it very much and I keep learning, in special in this excellent forum!

Best regards to all,

Nelson

*Message #16 Posted by **David Brunell** on 18 Nov 2003, 12:48 p.m.,*
in response to message #15 by R Lion

Any country which has a system of taxation that allows politicians to take money from some people and use it to buy votes from others is "corruption ridden." That includes every country I know of, including my home country, the USA. Sadly, it wasn't always that way here.

I, as an electrical engineer, utilize complex numbers quite frequently, in both polar and rectangular form. Often, I will need to do a few quick calculations on the stack if I am analyzing a small circuit. Here, the 42S or 48 series is preferable to the 15C and 41C since the former allow both real and complex parts to be visible simultaneously. (I admit to using my TI-92 most of the time for these calculations however.)

I think there are polite and impolite ways to disagree with someone, and most of what has been posted in this thread so far is impolite. If you have strong emotions against someone's point of view, it is better to just let it slide than to resort to inflamed rhetoric and personal attacks.

Regards,

David

Re: It's amazing (!)

*Message #21 Posted by **Vincent Weber** on 18 Nov 2003, 8:47 a.m.,*
in response to message #12 by Valentin Albillo

Mr Albillo,

If you are such a sociable person, you probably know that on a forum, you are not judged on what you are, but on what you display. And I can ensure you that what you display is pretty nasty. No personal attacks ? Let me laugh. Your post is full on assumptions about my education & background, and is litterally filled with hatred. What don't you go and read it again ?

Anyway, if you want to focus on technical issues, it is fine with me. Your agressivity was the first thing I noticed in your post, but on second reading, I found that besides the tone, your statements are also very debatable.

Probably living a deep love story with your HP-15C, you seem to have interpreted my post as "The HP-15C is lousy" while the essence of my message was clearly "The HP-15C is a very fine machine, with quite a few nice advantages over the 41C, but the 41C owner can overcome these". Since you wrote litterally on July 21st "There's almost nothing you could do with a real or emulated (not simulated) HP-15C that you won't be able to do with this emulated 41C", you obviously have radically changed ideas in the past three months, given the space you devote to (passionnately) demonstrate the hidden depth of this "almost nothing".

Besides, you take the "geek" approach while I was taking the "user" approach, which of course leads to some miscommunication. Examples:

"You're comparing a built-in *microcoded feature* versus an *RPN program*. That's not fair."

Yes, it is very true. Yes, the microcode features are far more optimized than RPN programs, I have noticed this, despite my mental disabibilities, thank you. So what ?? Does it change the fact that, from a USER perspective, MEDIT and CFIT are more user-friendly ? My point is not to be "fair", this is not a war against your beloved HP-15C, which I love too. The thing is, the user does not care of whether the routines he uses are optimized or not. He will care only as far as speed is concerned - and despite its great optimization, speed is not the 15C's main asset anyway, right ?

"Very easy to program ? With full accuracy for all the x range ? You're utterly misinformed, please do yourself a favor and read "Mathematics Written in Sand" by Mr. Kahan. A little mathematical and algorithmical culture will do you well".

On www.rskey.org, there is a fairly good '41 program to compute the Gamma function. It may not be as precise than the one for the HP-15C, though, I agree. And so what ? Again, from a USER perspective, I do not care that much if I miss one decimal on the Gamma function. You will tell me that it is because I do not use the Gamma function often and you will be right. Does it justify your agressivity ? As for "my mathematical and algoritmical culture", thanks for caring. FYI - I developped alone a Nortel voice/video/data network simulator for SITA/Equant (the largest telecommunication network in the world) 7 years ago, which is still used as a corporate standard today. The tool computes all routes & network metrics with one-bit precision and uses artificial intelligence techniques to build the topology in a couple of minutes on a simple PC, which the native Nortel tool could not achieve on a high-end workstation in hours So, I believe that I know a little more about algorithms and optimization that you may think. Before you judge people with contempt I suggest that you try to know them first.

"And, quite useless ? A random number generator ? Really, this is the point when I'm thinking I'm wasting my time with you, as you seem so painfully uninformed of all things mathematic. I could give you dozens of random number generator's applications, both real-life and theoretical, but this is not the place for it.Do

your homework, read a little, and get informed yourself, I'm not doing it for you."

There are indeed many such applications, which I am well aware of, thanks again for caring about my education. Personnally, I just don't need this on a *programmable calculator*, because the range of applications I use nowadays (matrixes, statistics, finance) do not require it. It seems that it makes me sub-human for you. Sorry !

"Good reasoning. The fact that you don't want to use a feature, because you're afraid of it or you don't see its potential, automatically means that feature is useless. For anyone. Banned out of existence. Counts for nothing. I like your style. Your reviews are great. You should consider doing some reviews of TI models, SHARP models, etc. BASIC ? Who needs BASIC ? It opens the door to spaghetti code ... Ugh !"

This sounds as if I had stated "All the pigs who are using direct line addressing should be shot at once". Mr Albillo, you definitely know how to write; the next step for you would be to learn how to read... (You see, it is not difficult to be sarcastic and nasty: I can do it too !).

"That's it. I've had enough of you. I'm certainly wasting my time trying to maintain a meaningful e-conversation with you as you're so painfully devoid of the minimum required knowledge and objectivity to rationally discuss the matters at issue."

All, please note that this is an "answer" to my comments in the use of complex numbers in electronics. Besides the insults, I do not see any argumented answer. Perphaps Mr. Albillo is an expert in electronics, and my opinion on complex numbers is so grossly ridiculous that every engineer would agree with it ? I guess that in your mind, the electronics engineer who posted recently that he has no use for a complex stack is also an idiot, then. Because of course, you are THE expert in everything - mathematics, electronics and real world applications ?

"As I said before, I like your reviewing style. Fair, knowledgeable, objective, comprehensive ... chapeau !"

...And I really enjoy yours: Argumented, constructive, pleasant, respectful of others' points of view: bellissimo !

Your sincerely,

V.W.

The last of these "comments" is the worst. (I found the tone of many of your other comments to be offensive, but have limited myself to quoting the most egregious.) Had Mr. Weber himself behaved in an obnoxious or condescending manner I would have had no problem with you reponding in kind, regardless of whether the technical points he made were right or wrong. But his was a polite and friendly note, and there was no excuse for your vicious response even if he were 100% wrong and you were 100% right.

My disagreement is not with your technical issues but with the insulting manner in which you choose to present them. In the disputes you've had with others here on the Forum I've often agreed more with your positions than with the positions of some of the others. However, I find that I hold those others in higher regard than I hold you. Why do you suppose that is?

I am saddened

*Message #23 Posted by **bill platt** on 18 Nov 2003, 11:44 a.m.,*
in response to message #12 by Valentin Albillo

Hello Valentin, Hello Vincent,

I am more deeply saddened by this episode than perhaps I would have expected. During the relatively brief period over which I have followed this forum, I have been delighted by the sense of cooperation and sharing, Sure, there have been occasional flames, and some "interlopers" coming in to stir up off-topic trouble. But these moments have been rare.

By and large, this forum has been a remarkable achievement--an international cast of characters, ever-

changing, yet ever-present. A sense of community. A sense of, "If I give something here, I will receive even more, but it feels good to give here, so I'll keep giving."

And we have personality! Valentin, the sometimes fiesty mathematiitian; Luiz, the warm and generous Brazilian, with words of encouragement for those with a hardware problem; Nelson, the amazing hardware guy...Wlodek, the legend; Hrast, Christophe, Miendert---these guys make *real* amazing things, and most of us just listen in awe! Randy, the professional hardware expert who has the time and patience to give us help...Norm, NORM!, life would not be the same without him! (He even writes songs.....) And there are so many others---it would be 50 pages to recognize all the personalities here, and the nice things they have done (thanks Katie for helping me with a bad scan of an HP45).... And it would be sad if either Vincent or Valentin departed...they both have interesting things to say.

SO,

I do think Valentin went too personal and cutting---but I hope it was just one of those "lost in translation" episodes...remember, some of our favorite contributors are not english first.... Or maybe it's like when you tell a sarcasm on the phone or with your head turned---it comes out all wrong without the face to belie the sarcasm!

I do hope we can see things patched up here.

And to look at this in perspective, there are other forums out there that are rude, lewd, obnoxious word-sewers. We have never had such depths as you find, for example,, at

http://www.ppi2pass.com/w-agora_eef/view.php?site=eforums&bn=eforums_eef&key=1069091623&first=1069174345&last=1068761617

Hoping for a resulotion of this conflict (and approriate apologies)

Best regards,

Bill

in response to message #23 by bill platt

Bill, you have said exactly what I was wanting to say but was struggling as to how to say it - I have also found the recent events very sad, in particular, as up to now I have always looked on this forum as one of the last bastions of civilised discussion, in a world which rapidly becomes more uncivilised, where people were capable of disagreeing with each other without resorting to personal attacks.

Like you, Bill, I hope that matters can be resolved.

Best, James

Re: I am saddened

*Message #25 Posted by **Vincent Weber** on 19 Nov 2003, 5:18 a.m.,*
in response to message #23 by bill platt

Hi Bill,

Thanks for your kind and wise words. I am also saddened, all the more that I used to have a lot of respect for Valentin's posts. I actually love both HP-41C and HP-15C, in fact, I own one 41CV and

one 41CX, but I am not lucky enough to own any module or a HP-15C. I purchased a nice Ipaq 1940 PocketPC, where I can run both an HP-41 emulator with all modules and an HP-15C simulator from Lygea. I wanted to choose once for all which one to use, and tried to persuade myself that I would not need the HP-15C with all the functionality of the 41C; hence my post to show that the HP-41C owner can live without the nice touches on the HP-15C. My goal was actually to be challenged, I would have loved a constructive reply to tell me "You should use the 15C instead" - that's a nice verbal game. When I saw that the first reply was from Valentin, I was really excited to read it ! My joy was short, though. I felt really insulted a first time, and a second time shortly after ("It's amazing !"), when Valentin refused to take any kind of responsability whatsoever in what happened, and put all the blame to others. Out of anger, I replied to him in the same kind of tone which he used with me, not to take revenge, but in the hope that this would trigger some positive reaction and that he would realize that such behaviour is not acceptable.

I have cooled down now, and I would like to tell Valentin that I am sorry both for giving him the impression that I was looking down on the HP-15C, and then for imitating his behaviour, which was not the smartest thing to do.

I also would like to tell him that, should he realize his own mistake and apologize to me in a brief, yet sincere note, his apology will be immediately and cheerfully accepted with no fuss, and I will feel proud and honored to share opinions and ideas with such a knowledgeable person. Otherwise, well, what to do, I will just have to accept the fact that our value systems are too different for us to communicate, and I will focus on other people on this forum, who, I must say, are generally very polite and pleasant to interact with. Thanks to all of you who posted a positive note.

Cheers,

Vincent

Re: I am saddened

in response to message #25 by Vincent Weber

Hi, Vincent:

Vincent posted:

"I also would like to tell him that, should he realize his own mistake and apologize to me in a brief, yet sincere note, his apology will be immediately and cheerfully accepted with no fuss, and I will feel proud and honored to share opinions and ideas with such a knowledgeable person"

Thanks for your soothing message and measured words, all the more welcome as, in all honesty, I must state that no matter what particular technicalities were involved, the general tone of my reply to your original post wasn't up to the standards that must be observed between civilized, well-mannered people, and so I must sincerely apologize for any and all distress it may have caused you, because, although no offence was really intended on my part, it certainly could be construed as a blatant case of disrespect, an unfortunate state of affairs for which I'm deeply sorry.

That said, I'm the one who will be most honored to share knowledge and personal experiences with you, which can only result in our mutual enrichment. Again, thanks for your kind words and most amiable attitude and please accept once again my heartfelt apologies.

Also, to all those forum's members who kindly offered their valuable opinions and did their best to calm things down, thank you very much, your support is greatly appreciated and played a key part in helping us settle things down.

Best regards from Valentin Albillo.

Massimo

Many thanks Valentin.

*Message #28 Posted by **Vincent Weber** on 19 Nov 2003, 7:42 a.m.,*
in response to message #26 by Valentin Albillo

Dear Valentin,

I would like to deeply thank you for your kind and heartwarming words. As far as I am concerned, the issue is closed, and I am most honored to have the opportunity to discuss with you on this forum.

If you wish so and of course if you have the time, we could kick-off our discussion on two topics:

1) What do you think could be the limitations of the Lygea Pocket15C simulator (not emalator) vs. the orginal 15C ? The advantages are clear: mnemonics alpha display, light speed, 999 program steps, each matrix has the full 64 registers, display of full stack... the drawbacks are less clear to me. I suspect they might have to do with the precision of some operations. Since I own a PocketPC with Pocket15C, I could test such operations...

2) How to give the 41C the missing features from the 15C ? Any good complex stack implementation ? The RPN functions from the Advantage ROM are not really satisfactory (2-level stack, slow, no reverse trigonometrics - although Z^1/N gives *ALL* the roots of a complex number, which even the 48 does not do !); the 'CA' application from the PPC ROM is interesting, but it is a slow RPN implementation, with an "infinite" stack a-la 48 which does not allow T register replication; I don't know of any other implementation. I recently had a look at the AEC ROM, which does a good job a M-Code hyperbolics, and can also translate algebraic expressions into programs, almost like the 32SII - although not integrated with a solver, too bad. I like the 41 because I am amazed of how versatile and time-resistant a 1979 machine can be; I like the 15C for its best "power/volume" ratio and its classy design.

Cheers,

Vincent

Re: Many thanks Valentin [LONG]

*Message #29 Posted by **Valentin Albillo** on 19 Nov 2003, 10:41 a.m.,*
in response to message #28 by Vincent Weber

Hi again, Vincent:

Vincent posted:

"I would like to deeply thank you for your kind and heartwarming words. As far as I am concerned, the issue is closed, and I am most honored to have the opportunity to discuss with you on this forum."

Thanks to you for kindly accepting my apologies, the honor is mine indeed. Now, let's quickly forget this most unpleasant affair and move on :-)

"1) What do you think could be the limitations of the Lygea Pocket15C simulator (not emalator) vs. the orginal 15C ? The advantages are clear: mnemonics alpha display, light speed, 999 program steps, each matrix has the full 64 registers, display of full stack... the drawbacks are less clear to me. I suspect they might have to do with the precision of some operations."

Regrettably, I haven't had the opportunity to try Lygea's simulator so I can't comment on its strengths and weaknesses (apart from the backlabel's info :-) Accuracy should probably be greater, as it surely uses Double precision, i.e.: 17 significant digits, versus the 13-digit internal, 10-digit external available on the 15C. If it then rounds those 17 digits back to 10, *all* of them should be correct. That's *not* the case with the real 15C, where such operations as 3^201 is off by *two* counts in the last place (worst case known. See "Advanced Functions" manual).

Things I would look for include checking if absolutely all (400+) functions available in the 15C are indeed implemented, and with the exact same behavior. For instance, if you want to try a few:

- Does the display blink continuously when some operation results in overflow ? If yes, does "backarrow" stop the blinking ? Does CF 9 stop the blinking ? Does any other key or operation stop the blinking ? Does SF 9 start the blinking again ?
- When running a program, do "user STO" and "user RCL" automatically skip the next step when the last element is processed ?
- When running a program, does MATRIX 7 (Frobenius norm) automatically skip the next step if the contents of the X register is *not* a matrix descriptor ?
- When running a program, does SOLVE automatically skip the next step if no root was found ? Does INTEGRATE skip the next step if the final value didn't meet the precision requirements after reaching the internal maximum iteration limit ?
- Do all complex multi-valued functions have the same branch cuts as in the HP-15C ? Check square root, exp, log, and hyperbolics
- Do the results agree with the real 15C for inverses, determinants and system solutions for singular or very nearly singular matrices ? I would try all the examples in "Advanced Functions", just to be sure
- Does the random number generator mimic the results of the one in the real 15C ? If not, does it pass the Spectral Test (as the real 15C does) ?
- Does [Pi] [STO #RAN] [RCL #RAN] produce 0.3141592654 ? Same with 9.999999999E99, -9.999999999E99, 9.999999999E-99, -9.999999999E-99

- Does line number branching work the same as in the real 15C ? I would check with out-of-range, negative, and non-integer values in I.
- Does GTO I work correctly when I contains a matrix descriptor ?
- if you are in complex mode, can you store a matrix descriptor in both the real X-register *and* the imaginary X-register ? What does it do if you then press [+] or [-] ?
- Are both RCL DIM (i) and RCL DIM I legal instructions ? What do they do ?

I know you don't have a real HP-15C for checking these questions, but do check them on your simulator, if you want to, and we can compare results afterwards.

"2) How to give the 41C the missing features from the 15C ? Any good complex stack implementation ?"

I wrote a very good one as part of an HP-41C Solutions Book published locally (Matematica Avanzada). It's never been published elsewhere, but regrettably I don't have a copy of the book right now. I know I *do* have the original listings and documentation, but they're buried in a 4-feet stack of old listings and calculator docs and materials, and it would take some time to search for it, then retyping it all in a word processor. I'll do it, eventually, but it will take some time. I remember it accurately implemented an RPN complex stack just as a user would expect it, including all functions and functionalities, even complex store and recall, programmability, anything. It was a large, carefully crafted program and it certainly delivered the goods. I found it superior in usability to even the HP-15C's native complex mode, as it offered important extra functionality, such as complex storage/recall. It also had a novel and imaginative solution for conveniently implementing complex numbers entry and display.

"I like the 41 because I am amazed of how versatile and time-resistant a 1979 machine can be; I like the 15C for its best "power/volume" ratio and its classy design."

After all is said and done, the 41C is the best machine, no question. But the comparison will never be fair, as they simply aren't in the same league and besides, they weren't designed to compete but to complement each other. Matter of fact, many an HP-41C owner would also buy an HP-15C as well, to carry along all the time, whatever the place.

As a pure number-crunching calculator (not computer, not system, not expandable, not essentially programmable, ultra-pocketable, rugged, batteries last forever, highest quality keyboard and display), the HP-15C is arguably the best, all places, all times. As an essentially programmable, ultra-advanced calculator-cum-computer (expandable, configurable, customizable, portable, powerful, groundbreaking) the HP-41 is best, no question.

... and nevertheless, it doesn't really matter, as most any contemporary SHARP models (and even some CASIOs) can run rings around them both ... ;-) No flames, please, just kidding ! :-)

Best regards from V.

Matematica Avanzada?

Valentin,

If you finally succeed digging out your originals, I'd be more that interested! I'm not an expert on high level math, but have a deep fondness for those areas I studied while in college, many moons ago.

The HP solutions book is a good start, but in many respects it leaves quite some room for improvement. What a shame hp never took real advantage (pun intended) of the Advantage ROM! Anyway, as I said I'd love to see your programs - and of course, documentation in Spanish won't be a bit of a problem :-)

Best wishes y saludos, Angel

Hola, Angel:

Angel posted:

"If you finally succeed digging out your originals, I'd be more that interested! I'm not an expert on high level math, but have a deep fondness for those areas I studied while in college, many moons ago."

Thanks for your interest in my programs, and in Mathematics in general as well. Seems we share at least two main hobbies ...

"The HP solutions book is a good start, but in many respects it leaves quite some room for improvement."

Indeed ! Not just "some room" but cathedral-size room, at least for mathematical topics. I still remember the dreadful programs in the original Math ROM for the HP-41C. When I heard that ROM announced, I was all too eager and excited to lay my hands on one, assuming it would be full of quality, highly optimized programs and algorithms. Well, it was so bad as to be nearly unusable, it wasn't optimized but very nearly "pessimized". In short, I thought it was so bad that I gave it for free to somebody, not wanting to waste up a worthwhile port with that sloppy, unlovingly-written rubbish.

Solution Books for math topics weren't much good either, and HP Spain did know that, because both Fernando del Rey and me were all too happy to let them know, so they commisioned us to write several Solution Books to be published locally. I remember three: "HP-34C Advanced Mathematics", "HP-34C Physics & Chemistry Solutions" and "HP-41C Advanced Mathematics". They each had some 20-25 high-quality, ultra-optimized user code programs, *lovingly* written by Fernando (50%) and me (50%), with full documentation and examples. I still have one of these books, namely "HP-34C Advanced Mathematics" (courtesy of Fernando del Rey, I sent my one-and-only copy down under, to Australian's PPC Melbourne Chapter), but also keep the original listings and documentation for all of them. If only I would find them ! ... :-(

"What a shame hp never took real advantage (pun intended) of the Advantage ROM!"

Yes, HP was already showing signs of decadence back then, but Grapevine did publish a number of very interesting books and leaflets on the Advantage ROM. I happen to own three:

- Using your Advantage ROM: Statics for Students"

- Using your Advantage ROM: Electrical Circuits for Students"

- Using your Advantage ROM: Computer Science"

The last one did include a long, complex program to try and simulate most HP-16C functionalities on a 41C, quite successfully by the way.

"Anyway, as I said I'd love to see your programs - and of course, documentation in Spanish won't be a bit of a problem :-)"

If I can locate them and get some scraps of free time, I'll make them publicly available, but the documentation will have to be in English, to make them more easily accessible for a wider, international audience.

Muchas gracias por tu interes, y saludos. No viviras por Madrid, verdad ?

in response to message #31 by Valentin Albillo

Valentin,

I'm also *fine* with English documentation, as a matter of fact, it is probably better.

I was wondering whether you ever came across the AECROM module? The reason why I mention it is because its hyperbolics MCODE functions. I've been meaning to get my MCODE scalpo and extirpate them from the AECROM and into my SANDROM, which I'm now extending to an 8k-module, and thus will have plenty of math functions.

I know they make use of the 41 internal routines, so supposedly they should retain the same internal precision as the EXP (and LN for the inverses) functions, albeit I suppose this gets impacted by the repetitive calling of them? (I'm showing my ignorance here). This touches upon something I've been wondering for a while: what's a good method to evaluate/check the calculation precision?

I'll work on this a little tonight, will keep you posted.

Best, AM

PS. Aun siendo de Madrid (c/San Bernardo para ser precisos) me temo que actualmente vivo bastante lejos: cerca de Karlsruhe, en Alemania... nadie es perfecto :-)

Valentin,

I would be very very interested in seeing your chemistry and physics applications materials for the 34C. I understand that you don't have the actual booklets, but any format, compressed text files, copies on regular paper sent in an envelope requiring stamps (I would gladly pay postage, etc.). I am no mathematician nor programmer by any stretch of anyone's imagination, but these materials perhaps I can really use.

Re: Matematica Avanzada?

*Message #34 Posted by **Valentin Albillo** on 22 Nov 2003, 8:13 p.m.,*
in response to message #33 by Ed Look

Hi, Ed:

Thanks for your interest, but the problem is, not only I don't have the actual printed Solution Books, but further I don't have the originals exactly located ! I know I still have them, but 'buried' among many other articles, papers, magazines, etc, etc, in a 4- or 5-feet stack at home. It will be a major task organizing and classifying all that information, then I would need to translate them into English (as the original documentation is in Spanish), then retype or scan them in orden to make them distributable in electronic format.

Regrettably I can't allocate the time all of this would require right now, but if I ever manage to do it all, they will be made publicly available and I'll post a note in this forum to let you know.

Again, thanks for your interest and

Best regards from V.

*Message #35 Posted by **Ed Look** on 22 Nov 2003, 9:22 p.m.,*
in response to message #34 by Valentin Albillo

Valentin, no problem. I don't use the 34C much anymore for any real work, anyway; I thought perhaps I could easily translate them to my 32SII (much similarity between those two in many ways).

Puedo leer un poco espanol. Actualmente, estudie espanol desde el grado seis hasta universidad... pero no puedo hablar espanol no mas... solamente puedo leer y escribir un poco. Si encontraria los materiales in el futuro, yo los aceptaria alegremente.

Okay... no more Spanish tonight. That was too long ago. (Sorry!) (Pain inside cranium...)

Re: Matematica Avanzada?

*Message #36 Posted by **Angel Martin** on 23 Nov 2003, 3:23 p.m.,*
in response to message #31 by Valentin Albillo

Well, it's done: from now on the SANDBOX ROM will include the three main Hyperbolic functions and their inverses.

It looks like I could locate and transcribe the code from the AECROM, which in turn uses internal mainframe routines.

Riding on this fortunate success, I took upon writing a new MCODE function to calculate the roots of a quadratic equation: ax^2 + bx + c =0

The user inputs a,b,c in the stack, the results are left in Y and X, as the two real roots (Z contains 1) or as the real and imaginary parts of the conjugated comlpex roots (Z contains -1).

Another function also implemented is for the constant (not the function) Gamma de Euler, i.e. 5,772156649 E-01, as it shows up relatively frequently.

Any suggestions for further MATH functions or routines, anyone?

Best,

AM

*Message #37 Posted by **Vincent Weber** on 19 Nov 2003, 11:47 p.m.,*
in response to message #29 by Valentin Albillo

Hi Valentin

" Thanks to you for kindly accepting my apologies, the honor is mine indeed. Now, let's quickly forget this most unpleasant affair and move on :-)"

My pleasure. Yes, let's move on ! :-)

"That's *not* the case with the real 15C, where such operations as 3^201 is off by *two* counts in the last place (worst case known. See "Advanced Functions" manual)".

Unfortunately, I do not own a real 15C.I have been searching for one for month in Singapore... I managed to get one 41CV, one 41CX, one 42S and one 32SII. 15C, niet - probably the owners are too attached to it to sell it... ;) I don't own the "Advanced functions" either - it does not seem to be available on the Internet... So, we will complement each other: I will tell you the behaviour of Pocket15C, and you will be able to compare it with the real behaviour :)

3x201 answers 7.968419666E95 on Pocket15C, and 7.96841966626E95 on my 48GX. It seems that the first 10 digits are correct then ?

"Does the display blink continuously when some operation results in overflow ? If yes, does "backarrow" stop the blinking ? Does CF 9 stop the blinking ? Does any other key or operation stop the blinking ? Does SF 9 start the blinking again ?"

The display does not blink: as explicitely documented by Lygea, the digits turns red instead. However, the behaviour seems to be the same than on the real 15C, i.e. both "backarraw" and CF 9 get the digit back to black, while SF9 get them back to red.

"When running a program, do "user STO" and "user RCL" automatically skip the next step when the last element is processed ?"

I have tried the following programs:

User STO --------

001 f LBL A 002 3 003 ENTER 004 3 005 f DIM A 006 f MATRIX 1 007 f LBL 0 008 R/S 009 USER STO A 010 GTO 0 011 1 012 2 013 3 014 RTN

After inputing 9 elements, the program exists the "infinite" loops and displays "123" which I believe is the expected behaviour.

USER RCL (lauched immediately after 'USER STO') --------

001 f LBL A 002 f MATRIX 1 003 f LBL 0 004 f PSE 005 USER RCL A 006 GTO 0 007 1 008 2 009 3 010 RTN

Same bahaviour - the program successfully exists the loop.

"When running a program, does MATRIX 7 (Frobenius norm) automatically skip the next step if the contents of the X register is *not* a matrix descriptor ?"

I have tried the following programs (assuming A holds a 3x3 matrix as in the previous example):

001 f LBL A 002 RCL MATRIX A 003 f MATRIX 7 004 1 005 2 006 g RTN

Output: 12

001 f LBL A 002 0 003 f MATRIX 7 004 1 005 2 006 g RTN

Output: 2

Again it seems that the behaviour is correct.

"When running a program, does SOLVE automatically skip the next step if no root was found ? Does INTEGRATE skip the next step if the final value didn't meet the precision requirements after reaching the internal maximum iteration limit ?"

For SOLVE, I tried the following:

001 f LBL A 002 g X^2 003 1 004 + 005 g RTN

(f(x)=x^2+1, not likely to find *any* root unless the solver has been upgraded to a complex one ;))

Then:

006 f LBL B 007 f SOLVE A 008 1 009 2 010 RTN

The output is the expected "2". If I suppres the "g X^2" step in A, i.e. if I solve for X+1=0, I get "12" as an output for B.

For INTEGRATE:

I failed to reproduce this with a few examples. I am not too sure on how to get such a 'difficult' function to integrate for the 15C... Any idea ?

"Do all complex multi-valued functions have the same branch cuts as in the HP-15C ? Check square root, exp, log, and hyperbolics"

"1 ENTER f I sqrt g ->P" (in RAD modes) gives sqrt(sqrt(2)) as module and PI/8 for the principal root of 1+i = sqrt(2)*exp(i*PI/4). I would say that this is the expected behaviour ?

"1 PI 4 / f I EXP g ->P" (in RAD modes) gives the expected e as module, and PI/4 as argument.

"1 ENTER f I g LOG" gives the expected LOG(Sqrt(2)) as a real part, and PI/4/LN(10) as the imaginary part: LOG(1+i) = LOG(sqrt(2)*EXP(i*PI/4)) = LOG(sqrt(2)) + LN(EXP(i*PI/4))/LN(10) = LOG(sqrt(2) + PI/4/LN(10).

"1 ENTER f I f HYP SIN" gives the same results as with using the definition: (exp(x) - exp(-x))/2

"Do the results agree with the real 15C for inverses, determinants and system solutions for singular or very nearly singular matrices ? I would try all the examples in "Advanced Functions", just to be sure"

I can't comment on that, but I can try whatever examples you have. If I'm not wrong, that was done once on this newsgroup with correct results.

"Does the random number generator mimic the results of the one in the real 15C ? If not, does it pass the Spectral Test (as the real 15C does) ?"

I cannot comment about the results on the 15C. As for the spectral test, I heard of it, but I have no time right now to try it :)

"Does [Pi] [STO #RAN] [RCL #RAN] produce 0.3141592654 ? Same with 9.999999999E99, -9.999999999E99, 9.999999999E-99, -9.999999999E-99"

With PI, the result in 0.314159265; the others triggers an overflow (numbers become red), and the answer is either 1.0 or -1.0. Do we have a pitfall here ?

"Does line number branching work the same as in the real 15C ? I would check with out-of-range, negative, and non-integer values in I."

The bahaviour seems to be proper. Out-of-range values triggers an 'Error 4'.

"Does GTO I work correctly when I contains a matrix descriptor ?"

This does not trigger an error, but do be honest, I am not 100% sure of what this is supposed to do ?

"if you are in complex mode, can you store a matrix descriptor in both the real X-register *and* the imaginary X-register ? What does it do if you then press [+] or [-] ?"

RCL MATRIX A f I triggers an "Error 1"... I have tried that in the beginning hoping that this would have the same bahaviour as the 42S to create a complex matrix, and was disappointed when I saw that the only way to create complex matrix is to transform them from 'real' matrixes. Do you mean that this is actually supposed to work ? (forgive my

ignorance - please keep in mind that I could not find a real 15C and that this simulator is all that I have !").

"Are both RCL DIM (i) and RCL DIM I legal instructions ? What do they do ?"

Both of them are legal. Assuming I contains a 3x3 matrix descriptor, RCL DIM I gives the dimensions of the matrix on the stack (3 and 3), while RCL DIM (i) gives 65, which I strongly suspect to be the number of registers used by the matrix + 1 (65 as a fixed-sized in the case of Pocket15C).

"I wrote a very good one as part of an HP-41C Solutions Book published locally (Matematica Avanzada). It's never been published elsewhere, but regrettably I don't have a copy of the book right now. I know I *do* have the original listings and documentation, but they're buried in a 4-feet stack of old listings and calculator docs and materials, and it would take some time to search for it, then retyping it all in a word processor. I'll do it, eventually, but it will take some time. I remember it accurately implemented an RPN complex stack just as a user would expect it, including all functions and functionalities, even complex store and recall, programmability, anything. It was a large, carefully crafted program and it certainly delivered the goods. I found it superior in usability to even the HP-15C's native complex mode, as it offered important extra functionality, such as complex storage/recall. It also had a novel and imaginative solution for conveniently implementing complex numbers entry and display"

I am looking forward to see it. Congrats ! :)

"... and nevertheless, it doesn't really matter, as most any contemporary SHARP models (and even some CASIOs) can run rings around them both ... ;-) No flames, please, just kidding ! :-)"

Actually, I have seen some many people bashing Casio here... while I do esteem Casio ! My first machine was a Casio fx-8000G in high-school, and was doing a good job. Casio has been innovating in may ways: in 1982, the fx-602p, while not as powerful as the HP41, was faster, with a real LCD screen; the FX-702P in 1981 was a faster competitor to the Sharp PC-1211; in 1985, Casio simply revolutionnized the market by creating the first graphing calculator (the FX-7000G) with a large screen, together with the first programmable formula-based calculator (the FX-4000P, which is an adorable little thing that I have in my collection). Speed and quality of screens were key assests to Casio in the 80's. HP28C/S came only 1/2 years later, with half of the size of the screen, and were very expansive. During my school days, the usual path was to have a Casio in high-school and to move to the prestigious new HP-48SX, which was actually my first beloved HP. It is only recently that I started to discover the virtues of older machines, such as the 41,15, and 42 :) In comparison, TI did not innovate much: With the expection of the TI-59, a prestigious machine with modules (in 1977 !) which was litterally killed by the HP-41, TI was down until the '90s (I do not think of the TI-66 as a serious rival to the HPs, and the TI-88 project was cancelled). And the machines of the '90s were actually copies of Casio (think of the TI-81, so simular to the Casio FX-7000G... 5 years later !). Only their TI-92 could 'beat' the HP48, but I do not call this a calculator anymore, given the volume and weight :) They are finally dominating the market with the TI-89, a fine but overkill machine, which is actually very recent (1998). So, long live Casio ! My 2 cents :) Cheers, Vincent

in response to message #37 by Vincent Weber

To my opinion Sharp BASIC and editor is more flexible than that of CASIO. I have CASIO FX-702P and Sharp PC1261 and PC1500. Naturally HP 71B and 75C are my preferred "pocket" PC (75C is a little bit too big for my shirt pocket, I use 16C instead, I wish I had not sold my 15C, I wish HP would make 15C Platinum - or should it be "Gold") My TI was (IIRC) old LED model SR-56 or something. I still can use it as a window-door stop. # VPN #

Real HP-15C results [LONG]

*Message #39 Posted by **Valentin Albillo** on 21 Nov 2003, 6:28 a.m.,*
in response to message #37 by Vincent Weber

Hi, Vincent:

Vincent posted:

"So, we will complement each other: I will tell you the behaviour of Pocket15C, and you will be able to compare it with the real behaviour :)

That's exactly the idea ... :-) Let's see:

"3x201 answers 7.968419666E95 on Pocket15C, and 7.96841966626E95 on my 48GX. It seems that the first 10 digits are correct then ?"

Correct.

"The display does not blink: as explicitely documented by Lygea, the digits turns red instead. However, the behaviour seems to be the same than on the real 15C, i.e. both "backarraw" and CF 9 get the digit back to black, while SF9 get them back to red."

OK.

[*"user STO [...] I have tried the following programs [...] which I believe is the expected behaviour"*

Correct.

"MATRIX 7 (Frobenius norm) [...]I have tried the following programs [...] Again it seems that the behaviour is correct."

Indeed.

"SOLVE [...] I tried the following [...]"

Again, correct.

"INTEGRATE [...] I failed to reproduce this with a few examples. I am not too sure on how to get such a 'difficult' function to integrate for the 15C... Any idea ?

Yes, you can define a "non-integrable" function (using *random numbers*, precisely ! :-) See ? They can be useful in a calculator for things other than games :-), that will fail all convergence tests thus making INTEGRATE exhaust all its allowed iterations, but it would need to evaluate your quite-complicated, random-based function 65,536 times or more, which would mean an *awful* lot of time. I suggest

we give it a miss for now.

"complex branch cuts [...]"

All your many examples (thank you) give exactly the very same results, so Ok.

"inverses, determinants and system solutions for singular or very nearly singular matrices"

I suggested you could try the examples in "Advanced Functions" but since it seems you don't have a copy and typing them here would be somewhat tiring and error prone, I suggest we leave this 'parked' for now.

"random number generator"

I really don't expect them to agree at all, it would be unreasonable except in an exact emulator. The important thing would be that Lygea's RNG would pass the Spectral Test, but that you wouldn't be able to easily test in the simulator itself. It would then be a matter of whether Lygea says as much in their documentation, or else asking Lygea directly.

"Does [Pi] [STO #RAN] [RCL #RAN] produce 0.3141592654 ? Same with 9.999999999E99, -9.999999999E99, 9.999999999E-99, -9.999999999E-99 [...] With PI, the result in 0.314159265; the others triggers an overflow (numbers become red), and the answer is either 1.0 or -1.0. Do we have a pitfall here ?"

Yes, we do. The real HP-15C never gives an error, and RCL RAN# gives 0.9999999999 (ten '9') for the E99 ones, and 0.0000000000 (ten '0') for the E-99 ones. No numeric argument will ever give an error, no matter its value. All arguments are simply 'scaled' to be between 0 (included) and 1 (not included).

"line number branching [...] The bahaviour seems to be proper. Out-of-range values triggers an 'Error 4'."

Ok.

"Does GTO I work correctly when I contains a matrix descriptor ?" [...] This does not trigger an error, but do be honest, I am not 100% sure of what this is supposed to do ?"

If I contains the matrix descriptor for matrix A, then GTO I should go to LBL A, likewise with B,C,D,and E.

*"if you are in complex mode, can you store a matrix descriptor in both the real X-register *and* the imaginary X-register ? [...] Do you mean that this is actually supposed to work ?*

No, it isn't. It was kind of a *negative* test, to see if the simulator would do something that the real HP-15C doesn't (but presumably could). So, correct behavior again.

"RCL DIM (i) and RCL DIM I [...]"

Correct again. It gives 19 instead of 65 on a just-reset HP-15C, but it corresponds to the present allocation, like the 65 does in your simulator.

Conclusion:

All in all, I think your simulator does pass most compatibility tests with flying colors, better than I expected. However, it does seem likely (to me) that it won't give the exact same results for these operations:

- Inverse, determinant, and system solving for *exactly* singular or very nearly singular matrices.

  This has to be tested, but I fully expect different results, based on the proprietary things the real 15C does with these kinds of matrices and the fact that the simulator actually works to significantly greater precision.

- Random number generator.

  This most likely doesn't mimic the one in the HP-15C and the only 'important' thing is whether it passes the Spectral test (as the real HP-15C's RNG actually does) or not. This can most likely be ascertained by asking Lygea's directly.

- Extra-precision, non-documented features

  The real HP-15C does perform some Sigma-Plus and Sigma-Minus operations and related statistics with extra precision, and this can be cleverly exploited in very specific user programs, as the one featured in "Advanced Functions" to accurately solve a most difficult case of 2nd-degree equation. I don't think that such program would run in your simulator, it would be necessary to key it in and see what the output is.

- Miscellaneous functions

  We've seen that STO RAN# and RCL RAN# do not work the same as they do in the real HP-15C for some arguments, and there are probably many other functions and features that could be tested as well. I'm thinking about Py,x and Cy,x for certain values of x and y, and other such cases, like Sin and Cos of *extremely* large arguments, where the internal argument reduction modulus 360 or 2*Pi could be computed differently in the real HP-15C and the simulator, etc.

Given enough time, it would be interesting to create an "HP-15C Simulators' Test Suite", comprising a certain number of specific calculations, programs, routines, and behavior that would be tried on any aspiring HP-15C simulator to give it a 'degree' of compatibility. Such tests do exist for compiler languages, Java and BASIC for instance, and are extensively used for standardization, normalization and certification.

I'd say that Lygea's simulator gets probably a 95% compatibility or better, and the remaining 5% is not all that important, anyway.

Thanks for this most interesting exchange and

Best regards from V.

*Message #40 Posted by **Vincent Weber** on 23 Nov 2003, 9:42 p.m.,*

in response to message #39 by Valentin Albillo

Hi Valentin,

Great that this testing helped you to conclude that Lygea's job is not that bad :) Actually I like their program very much. There are a couple of things I do not like with it, though, among which: 1) Holding 'SST' and 'BST' keys does not automatically scroll the program steps, as in the real HP-15C. This is documented by Lygea, but they do not explain why they did not implement this nice, yet simple to code, feature. 2) They did not use the freedom that a simulator gives over an emulator to make the registers complex and to 'STO' and 'RCL' complex numbers in one instruction (which would increase the interest of the complex implementation tremendously). 3) Their 'Help' file is nice, but somehow too succint for somebody like me who never had a chance to own a real 15C with manuals. 4) There is no possibility to import/export program (apart from the possibility of manually copying the memory image file from your PocketPC to another one, or to/from a PC).

Apart from these weaknesses, this is a very neat program.

For integrating a function with random numbers, yes, I see why it should give you problems... :) First, probably such a function is not continuous (?) and I vaguely remember from my math courses that a non-continuous function could still be integrated, but under specific conditions to make the Riemman or Cauchy sums converge....

Btw - I know that on the 15C flag 8 is for complex mode and Flag 9 for overflow. Do flags 0-7 have specific meaning ? Especially: is there a '41 equivalent of the useful 41 features to detect if a the user is performing numerical input (I think it is flag 22 if I remember correctly), so that you could easily program an interactive solver that would either set the value for a variable or solve for it depending on whether or not you are typing a number ? This is where I think Lygea' help file falls short - there is no description of flags whatsoever.

Cheers,

Vincent

Re: Real HP-15C results [LONG]

*Message #41 Posted by **Valentin Albillo** on 24 Nov 2003, 10:32 a.m.,*
in response to message #40 by Vincent Weber

Hi, Vincent:

Vincent posted:

"Do flags 0-7 have specific meaning ? Especially: is there a '41 equivalent of the useful 41 features to detect if a the user is performing numerical input (I think it is flag 22 if I remember correctly)"

Regrettably the answers are "no" and "no". Flags 0-7 are "user flags", devoid of any special significance to the system which never uses them at all, while flags 8-9 are "system flags", used for complex mode and overflow signaling as you're well aware.

So, there aren't any system flags which will detect numerical (or otherwise) input, a la 41C (the HP-67/97 also had some flag support for this feature as well, where flag 3 would be set for data entry).

Ah, and by the way, check your e-mail ... :-)

Best regards from V.

Performance Tests?

*Message #42 Posted by **Patrick** on 22 Nov 2003, 6:34 p.m.,*
in response to message #37 by Vincent Weber

Hi Vincent

I admit I haven't read your detailed posting carefully, but I was wondering if you have undertaken any benchmarks comparing the 15C simulator against the real thing? Of course, it would depend on the PPC hardware upon which you performed the test, but would still be interesting to me.

Cheers, Patrick

Re: Performance Tests?

*Message #43 Posted by **Vincent Weber** on 23 Nov 2003, 9:31 p.m.,*
in response to message #42 by Patrick

Hi Patrick,

Such a benchmark would actually be irrelevant, as the simulator is so fast that every operation gives an *immediate* answer. Even solving for a root in an equation gives an answer as if it was a mere addition. This is due to the fact that the program does not emulate the hardware, but code every operation natevely - which is a real piece of cake for any PPC... That's the advantage of a simulator over an emulator (together with the extra memory and the alphanumeric display of program steps).

Cheers,

Vincent

Re: Many thanks Valentin.

in response to message #12 by Valentin Albillo

Well it seems that we have gone off the topic: the HP 15C is a clever machine, but not the best, that is just and opinion and the hp 15C, cannot answer many problems,like the reductment of mass, in the transcision of matter to plasma occurs, with the increasement of speed.

I understand Mr. Albillo, Spanish is (in my opinion,one of the best language to describe science, therefore the technical knowledge that mister Albillo possessed.

But they also taugh us something (Spanish citizens) in the schools:

" la verdad pure y sencilla, es raramente pura y pocas veces sencilla,. He alli el dicho: Yo solo se que no se nada"

Trans:

" the pure and simple truth, is rarely pure and not always simple, therefore the cry: I just know, that nothing I know"...

I think Bill Platt in this thread put it best when he said that our forum has personality. I would say that we have personality plus.

Such passions are admirable, but we must realize that email allows us certain liberties that face to face discussions would not. Let's all be grownups, shake hands and let us agree to disagree. Using email, there never will be a final word, it will be a never ending thread, belittling to both writers and readers.

My enjoyment of a quality product is lifted by the passion that both of you have for your respective machines. THAT is what HP calcs are about.

Let's try to cool it

*Message #50 Posted by **Dave Hicks** on 18 Nov 2003, 2:42 p.m.,*
in response to message #1 by Vincent Weber

Hi everyone,

I attached this to the top post in this thread though it's not a reply to any particular person. Also, I have a cold at the moment so my head isn't clear enough to know "who started it".

I've been hiding in my cave working on a new version of the forum software so I haven't been following the forum closely for some time. (And if any of you are waiting a long time for an email response, I'm sorry about that but my inbox has gotten awfully deep lately - I'll try to catch up soon.)

Let's try to remember that these are all opinions and opinions will vary. Something like the Advantage Pac which was an option to update an older top-of-the-line calculator to be more competitive with newer models is, I think, an inherently controversial product. Obviously in some ways the older but higher end device will be more powerful but in other ways, the add-on is likely to seem a little kludgy.

Let's also allow for the difficulties in translation. I once mentioned that someone here (for whom English is not his primary language) was using aliases to do some "disguised self-promotion" (and I also referred to it as "mostly harmless".) He emailed me demanding to know why his self-promotion was "disgusting" compared to other people on this forum. "Disguised" vs. "Disgusting": VERY similar-looking words with VERY different meanings. I have a feeling that a lot of forum battles come from similar misunderstandings.

Back in Junior high school my friend and lab partner in Chemistry was a guy from Israel who, whenever he lost an argument, said in a loud voice "You See?!" I always laughed but at the end of the term, he got an "A" and I got a "B". The professor admitted that I had higher test scores but he said "Most of the time when you guys come to me to settle your arguments, he's right so I think you just don't understand it quite as well even though you test better." Fortunately my friend was enough of a friend to explain his arguing style to the teacher, at which point the teacher realized that just about every discussion he had with us was the reverse of what he thought it was ... oops ;-)

Even if you think someone has crossed the line, please try to nudge the discussion back to technical and friendly.

By the way, the main feature of the new forum software will be to allow accounts. At first it will be just an option that will make the forum more convenient but I can flip a switch and make them required or to send any posts made without an account through me and/or other moderators for approval. I intend to leave this switch "off" for now but I can turn it on if either the spam or people posting under multiple aliases get to be "too much".

Hello Dave (ah 2001...), In short let me say that accounts are not necessarily a good idea. Did anyone ask for this ? Just MHO.

Accounts

*Message #55 Posted by **Dave Hicks** on 18 Nov 2003, 6:57 p.m.,*

in response to message #54 by GE (France)

Over the last couple of years I've had some direct suggestions for accounts. There have also been other situations, which have suggested accounts as a solution (or at least something that would help): spam, people posting under a bunch of names (one person once made up 17 names to attack someone here), and a troll posting under the same name as a regular (intentionally.)

Mostly I'm creating accounts to have a fall-back solution to spam. At the moment we're getting 1-4 spams per day and keeping them out of most people's sight by other means but the current methods won't scale well if the spammers ramp up their efforts. For now (and maybe forever), the accounts will be optional because I prefer not to put blocks in the way of first-time posters. However, some spammers have made it clear that they're willing to abuse wide-open forums so I need a good future potential counter-measure if their volume gets to be too much for the current counter-measures. I did some reading before coding and I don't know of a more effective way to slow spam. Simple measures like IP banning no longer work because persistent forum spammers are becoming like email spamers - they set up an ISP account and spam everyone before they get cut off. Then they just set up somewhere else.

Accounts will also make the forum more convenient - once you login, you won't have to type your name, email and password to post/edit/delete. You'll have the option to have a private email address to which people can email using the forum software without seeing your actual email address. (Or you can have no email address visible/usable, or you can use an obscured address just as you can now.) You will need to provide a real/working email address for registration but this does not have to be the same one that you make visible in the forum. (If you chose to make one visible at all.)

What are your concerns about accounts?

Accounts ? If this is the only solution... :(

*Message #58 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2003, 8:13 a.m.,*
in response to message #55 by Dave Hicks

Hi, all;

I'd keep myself away of the last events; no judgement, instead I have my own understanding and opinions.

If the sort of irregular events becomes unacceptable and begins to keep good people away from this heavenly place, I'd agree on placing an "account for posting". If they are somehow rare or sparse as they are now, I think it's fine. At least others will understand that the great majority won't accept these events without a fierce complaining. Please, I am keeping myself away of the events themselves because in many situations, cultural differences may become a problem when taken "as is". And even family matters may cause unnecessary discussion.

About accounts: I think that reading should be kept as free as it is, just posting should be allowed only for those who sign in. This way, anyone that wants to "visit before signing" would have the chance to know how good it is sharing his/her own experiences with ones who do the same.

Again, Dave, thank you for all your effort keeping this place as "clean and neat" as it is. I think I share the same enthusiasm as many others who want to keep it as it is.

My 2¢.

Re: Accounts

*Message #60 Posted by **Valentin Albillo** on 19 Nov 2003, 9:07 a.m.,*
in response to message #55 by Dave Hicks

Hi, David:

I agree with Luiz: reading posts should be free for all, no account or registering required, but posting should require a previously created account, with the user having to provide a real e-mail address where his/her initial password would be sent. Fake address = no password received.

Only users with an existing account and subject to a login procedure would be allowed to post. This would all but eliminate all spam and anonymous trolls doing their things. It would also help reduce the multiple-alias-for-the-one-and-only poster problem, etc.

Should it be not possible to allow free reading while requiring login for posting, I would opt for accounts and login in both cases.

Thanks for your efforts to improve this wonderful forum and for your disinterested and unpaid for hospitality.

Best regards from V.

Re: Accounts (Humorous)

*Message #63 Posted by **Paul Brogger** on 19 Nov 2003, 11:02 a.m.,*
in response to message #61 by Victor Koechli

Captain Zener would have to get his own email address?

Maybe, should a "registered" user choose to use a pseudonym for humorous effect, his/her actual id or email address could be included subtly, in parentheses somewhere in the message (if not the thread summary line).

Pseudonyms can be used for good as well as for ill -- the Forum would lose something special if it were to absolutely prohibit the occasional post "from" a celebrity, famous figure, or obviously fictitions persona.

Re: Accounts (Humorous)

*Message #64 Posted by **Matthieu** on 19 Nov 2003, 11:38 a.m.,*
in response to message #63 by Paul Brogger

Yes, Norm is very important for this forum! And he needs multiple means for 'being Norm'.

Some people just make the forum discussion more vivid by posting a polarizing - but NOT offending and NOT personally aggressive - thesis. Just in the way Norm does. This can create a very interesting controversial discussion from the others that often also has a high technical content.

But of course such a contributor cannot do this always by using his real name because everyone knows that, e.g., Norm would never believe ‘HP-34C is a calculator that does look like a Sharp 1500’. But if he wants to initiate a controverse discussion 'someone else' has to kick in this thesis for him (it's just an example, sorry, Norm that I used your name).

Norm, we need you … !

One further argument: Some people might be afraid to ask a 'silly' technical or mathematical question and like to ask this as a disguised guest, e.g. with some alias like 'calc_friend'. He may be afraid that other people here may disrespect him, so being excluded from future serious discussions. And since yesterday we know that this fear may be legitimate …

So, if not abused and if used in a good sense for the forum, a small number if incognito posts should be allowed ...

1234 to delete

(please delete it if you think this is complete nonsense !)

*Message #66 Posted by **Thibaut.be** on 19 Nov 2003, 10:18 a.m.,*
in response to message #55 by Dave Hicks

Amazingly this forum is, though well known and highly frequented, not that much spammed, and most important of all, not polluted by deliberate flaming or whatsoever.

Actually this is the 4th time I've seen "serious" interpersonnal issue. I suggest that we submit a file to the Guiness Book of records, at least for the less flamed forum !

I have been visiting this site since 1998 and have always appreciate the comments of the visitors, obviously people sharing a common passion. But I was amazed by the people's politeness, willing to help, and experience. I have learned a lot mon my calculators udring all this time and I'm sure there's a lot Istill need to know.

For all this, my warmest thanks to Dave who definitely hit a very high target in terms of standards.

To anwser the question, I'd be in favour in a non mandatory account solution. Using an account would just consolidate the credibility of the existing and active visitors, while new guests will be keen on participating without an account. Should spamming and flaming be more recurrent, then we could shift to a mandatory account policy.

My 2c ...

in response to message #55 by Dave Hicks

> Quote:
>
> BUT if we need to give our real addresses here, doesn't that draw spammers as a super-magnet?

When/if you register an account, you can provide up to two email addresses. The first is a real email address that is required but is used ONLY to complete the registration process. It is never shown or used for anything else. For the second address, you have the options of: using a real email address but not allowing anyone to see it (logged-in members can email via the forum software but without seeing the address), OR using a munged but visible address, OR using no address at all. (The latter two are the options that you have now.) The intent of the first option is to make the forum *less* of a spam magnet.

> Quote:
>
> I agree with Luiz: reading posts should be free for all, no account or registering required, but posting should require a previously created account, with the user having to provide a real e-mail address where his/her initial password would be sent. Fake address = no password received.

No account is ever required for reading even if I set the most "closed" options. For someone only reading the forum, the only change they will see is that next to " Search / Personalize Display" at the top, there will also be "login / accounts" which can be ignored for reading. Initially, you won't even have to go there to post, but if you do login, you'll see the name, email, and password fields disappear from the forums (until/unless you log out again.) Initially, creating an account and logging in for posting will be purely optional. It may stay that way forever or it could become required (but still only for posting). Or it can be set such that people who post without an account don't see their posts appear until a moderator has approved them. But again, unless we have increasing problems, accounts will stay completely optional.

(Oh and accounts are free. I have no intention of ever charging money for them nor is there any facility for payment built into the software.)

> Quote:
>
> Norm!

Hey no-one's attacking Norm! :-) I admit though that if I ever set the most "closed" option, I don't know how Norm will be able to post as various people without allowing the same for spammers and trolls. I'll take a look at that but may delay it till a later release since I plan not to use the most closed option any time soon. If it's only Norm, the simplest solution might be for me to set up several accounts for him. (But then what if the *real* Carly wants to sign up ;-))

Re: Combined account responses

*Message #69 Posted by **GE (France)** on 19 Nov 2003, 5:32 p.m.,*
in response to message #68 by Dave Hicks

Hello, First of all I must say again that this place is totally wonderful and that you Dave are making it work. Perfection is just that : no flashy devices, no dumb colors, it just WORKS.

Why are accounts irrelevant ? Because any troll/spammer can create a 'real' email address someplace just to register here and you won't ever know she's a dog. Also if you are lucky enough to have chilfren you know that the one way to ban bad behavior is not to lock doors but to explain and convince. Also, I feel pride in seeing this forum nearly free of the usual Internet garbage/bragging/spelling mistakes/name calling etc WITHOUT any thought police at work.

Second, what if one wants to post a quick answer and/or has no plan to come back ? Put any obstacle in between and the occasional poster won't give a damn.

Third, accounts may lead to the infamous "please give me a low number Richard" disease. Those with old accounts, with many posts, would be tempted to post more, less thoughtful messages, and might despise newbies (and even overuse commas ??).

Of course the tide is coming, and we don't know what you must do to clean things behind the scene, but maybe we could just keep things as they are. After all, past the excellent platform you've set up, the most important thing here is the content.

Also, I feel pride in seeing this forum nearly free of the usual Internet garbage/bragging/spelling mistakes/name calling etc WITHOUT any thought police at work.

I'm hoping that it will slow them down and send some elsewhere though. I don't know how to explain to a spammer that he should please stop now. One spammer has been spamming this forum (and others) for over a year now. He comes from different ISPs so *they* "get it" but he/she doesn't.

Lately, we're also getting spammed by scripts. (I can tell because no person could type 4 spams per second.) I don't know how bad all this is going to get. If there's a better defense I'd love to hear about it.

By the way, spam is already being deleted by the "thought police". As I said, we are now getting several in a typical day. I hope that doesn't destroy any illusions about this forum. It shouldn't because these people are just using big lists of forums just like email spammers do. There's nothing personal. I just don't see a need for the top 4 posts on the forum each morning to be advertisements for a company looking for people to post ads on forums ("All you have to do is type ads like this one!!!") followed by replies as to how stupid this is.

(Which the spammer won't see anyway.)

> Quote:
>
> Second, what if one wants to post a quick answer and/or has no plan to come back ? Put any obstacle in between and the occasional poster won't give a damn.

Granted. This is why I don't really relish doing this. However, the furthest I would probably go is to set it up so a person without an account can post but it's viewed by a human moderator first. The UI will be just as now - only there will be delay for the message for the message to appear. (Also I have an option to automatically set new accounts to be moderated in this way so if people do create accounts just to spam, that can be controlled as well. So far, open forums are getting spammed far more than closed ones but time will tell.)

> Quote:
>
> Third, accounts may lead to the infamous "please give me a low number Richard" disease. Those with old accounts, with many posts, would be tempted to post more, less thoughtful messages, and might despise newbies (and even overuse commas ??).

I'm not sure exactly what you mean here but your name is your account and the software doesn't track post counts.

The human element

*Message #71 Posted by **Patrick** on 20 Nov 2003, 1:35 a.m.,*
in response to message #70 by Dave Hicks

When you register for certain services online now (such as an eBay account) they show you a little picture which contains some numbers and ask you to type the numbers into a box right next to the picture. Scripts can't read pictures, so this is a good way to cut out the spam automation, I would think.

Have no idea how available such technology is and whether it is free or must be purchased.

Re: The human element

*Message #72 Posted by **Dave Hicks** on 20 Nov 2003, 11:11 p.m.,*
in response to message #71 by Patrick

I've looked at CAPTCHAs (Completely Automated Public Turing test to tell Computers and Humans Apart). At this point I'm going to keep watching them but I probably won't have one in the next release. Most of the better ones don't seem to be available outside universities (unless you make a research grant perhaps?) and some of the simpler ones have been solved to 80-90% accuracy by AI programs.

Also most assume that humans can see well, which is not always true.

*Message #74 Posted by **James M. Prange** on 20 Nov 2003, 1:12 a.m.,*
in response to message #73 by Wayne Brown

Well, Norm does seem to be rather a special case. But seriously, I'd love to have Carly participate in the forum. Norm could always use an alternate spelling of someone's true name when posting a spoof.

Re: Accounts

*Message #75 Posted by **James M. Prange** on 20 Nov 2003, 1:07 a.m.,*
in response to message #55 by Dave Hicks

Well, I hope that posting about the new-fangled RPL calculators doesn't make me a "troll".

Of course I don't see most of the spam.

Regarding the identity that a poster uses, I do tend to take the post more seriously if the name seems real, but I do realize that some may have perfectly legitimate reasons for not revealing their true identities.

What I do find objectionable is when the same poster uses more than one identity in a single forum or newsgroup.

As for accounts, my only concern is that it may put off some newcomers who would be welcome here. If accounts do become necessary, please make it so that lurkers may still read the forum, and we only have to log in to post something.

Regards,
James

Re: Let's try to cool it

*Message #76 Posted by **Juan J** on 18 Nov 2003, 7:17 p.m.,*
in response to message #54 by GE (France)

It has saddened me too, to see how a review became such a bitter exchange. A while ago I wrote about how easy it is to say anything under an alias and how disrespectful it can be to others, especially in such a civilized forum like this. Pretty much the same thing it was, a far off-base comment from an unidentified (I mean, no e-mail address) contributor which became much the same exchange I've seen. I even suggested Dave to make the e-mail address field mandatory; this seemed too much. Eventually, the "offender" identified himself and wrote a sort of apology.

More recently, I praised Valentin's intelligence, but noted that as smart as he is, sometimes he kind of "crosses the line" (and in a rude manner) when he speaks his mind. After reading Dave's story about his

Israeli friend, I think that language subtleties aside, there are ways to say things, to make your point/statement quite clear, without hurting your audience or setting off a war. Now I insist. A wise man knows how to share his wisdom without disrespecting his audience; it is also wise to make your point in a polite manner. No offense intended, Valentin.

In my opinion, Vincent Weber was just expressing his point of view about how the 15C and the 41C deal with matrices and complex numbers. That there were things he may have not considered or known about, or that a second opinion was what he expected, well, was quite probably his intention when he wrote his post. But then came Valentin's reply, an angry exchange and finally, so to speak, the icing on the cake, the anonynous offender, who does not deserve respect of any kind (not mine at least) for his words.

About how Valentin says things, I have already commented. Now Mr. HP-Calc-Collector, the anonymous contributor who made things worse by making the exchange personal. Probably he thought that making rude statements wins debates. But in the end it turns to be like the asp that stung a knight when Arthur and Moerdred met with their armies at Camlan; the knight thought it was an attack, pulled off his sword and when the battle that ensued was over there were only Arthur and Moerdred left. Should we feel offended by a person that behaves like this? I think not. Anonymous offenders who think that winning arguments is matter of being rude or tread with personal details simply don't belong here. And don't deserve our respect.

I like to think of this forum as a (very) civilized one with valuable contributors from everywhere and with with very diverse backgrounds, where matters are discussed, points of view expressed and questions answered; a pleasant place in the Net to participate in, don't you think? Why not trying to keep it the way it is, and has been?

Limbic vs. Gray Matter content....

*Message #77 Posted by **Michael Meyer** on 18 Nov 2003, 10:53 p.m.,*
in response to message #76 by Juan J

An ongoing theme in science fiction writing is the issue of whether pure logic is better than logic with emotion. The general conclusion (in both Vulcans and androids) is that emotion is what gives meaning to logic.

I'm amazed, as a psychiatrist, at how separate these two entities are in the brain. The lower, older structures (including the limbic system) appear to be the exclusive location of emotion, where the gray matter appears to involve storage and intellect without emotion.

Other animals appear to have the same sort of limbic system as humans (can you name a human emotion a dog can't show?). I've seen humans with defective intellect and intact emotion (mental retardation) and vice-versa (borderline personality disorder).

The people on the board, in my opinion, have tremendous intellect. I'm glad there's a passion for this interest as well, as it gives it meaning.

Many here are the top of their fields. (Ever put a bunch of experts in the same room? One expert I know flunked his board exams by arguing with the examiners he probably knew more than they did...)

Just a reminder that the people on this forum have a great knowledge and great passion as well... tempers are bound to flare from time to time.

Everyone count to ten, listen to Dave Hicks (who is kind enough to let us be guests on his system), and keep providing us with top-notch intellectual information.

I'd like to add that I've seen very little flaming all-in-all over the years... maybe a little was due as a matter of human discourse. <grin> We'll probably see some again some day too. But for now...

On with the forum. And remember... the doctor is watching you.... (it sounded good, anyway).

FOR STATS HP-67 RULES!

*Message #1 Posted by **Trent Moseley** on 17 Nov 2003, 11:03 p.m.*

I love to stir up discussion. But for standard deviation anyway this seems to be the case and perhaps in other ways too. I must also say that it was through this forum that the "gummy" wheel got fixed.

tm

Re: FOR STATS HP-67 RULES!

*Message #2 Posted by **Arnaud Amiel** on 18 Nov 2003, 5:51 a.m.,*
in response to message #1 by Trent Moseley

For stats the 49 (+ or not) rules, afew tests have been added from the 48 and you can install STAT49PRO that adds all the basic tests you would ever need unless you are a real statistician. Of course input method through matrices might be a bit more cumbersome, but it is easy to update and the matrix writter is fast. And there is no gummy wheel, just the keyboard.

HP-41 back sticker difference

*Message #1 Posted by **Michel Beaulieu** on 17 Nov 2003, 8:57 p.m.*

I look at my 2 HP-41CV back sticker and i found a logo i don't know the meaning : On my Fullnut this logo is not present but on my 41-CV halfnut there is a kind of "impeller" or a kind of disk with the inscription "871B" in the lower right corner. Does this means someting for somenone?

I'm looking closely to my 2 CV to see some differences i can count. I also found that the key feeling is smooter and the clic is less "loud" on the halfnut than the fullnut; is it true of just because my halfunt has more mileage!

I did a CAT 0 at the same time on the 2 CV and the fullnut finish the listing before the halfnut (the 2 calculators are "memory lost" before the "benchmark"). Is the fullnut faster than the halfnut?

Is there some kind of program i can run on them and see some difference between the 2 CV version or bug present on one only?

I just receive, result of a trade, my first halfnut so that's why i seems so curious about small details ;-)

Thanks!

Michel

in response to message #1 by Michel Beaulieu

Don't know anything about the 41's but if the keypresses feel softer due to miles;), there should be differencies between the keys. I noticed this on my heavily used 18C; the 'equals' key has actually a significantly different feel. Do your 41's keys all feel the same?

Thomas

Re: HP-41 back sticker difference

*Message #4 Posted by **Michel Beaulieu** on 18 Nov 2003, 8:10 p.m.,*
in response to message #3 by Thomas Radtke

Yes they feel all the same.

in response to message #4 by Michel Beaulieu

Then your concern about wear might not be justified. Just enjoy your 41:).

Thomas

Re: HP-41 back sticker difference

*Message #6 Posted by **Johnny Billquist** on 24 Nov 2003, 4:20 p.m.,*
in response to message #1 by Michel Beaulieu

The keys did change slightly over the years, so I'm not surprised if they feel different.

The speed of a HP-41 is not an exact science. The frequency is made from discrete components, and not a chrystal. So different individuals might differ as much as 30%. On the fullnuts you can change a capacitor to increase the speed. The halfnuts were a bit more tricky, as well as not being so forgiving to frequency increases.

But basic speed comparision might show anyone being faster, depending on the individual.

Posible HP-49G+ bug using DOLIST.

*Message #1 Posted by **r. d. bärtschiger.** on 17 Nov 2003, 3:39 p.m.*

I have just noticed what may be a bug on the hp-49g+. To duplicate it try the following:

```
1.)     Navigate to an empty directory. If your calculator does not have an empty directory,
then create one. You can purge it later.

2.)     Place a number on the stack, a 5 for instance. This number is not actually needed,
it will only be used as a place holder.

3.)     Execute VARS, this will place an empty pair of curly braces on the stack, { }

4.)     Place a 1 on the stack.

5.)     Place this program on the stack, \<< DTAG \>>

6.)     Execute this command, DOLIST

7.)     The stack should now contain:

        2:      5.00
        1:      { }

8.)     Execute OBJ\->

9.)     The stack should now contain:

        3:      5.00
        2:
        1:      1.00

10.)    According to the result the 'empty list' contained one item. That one item is
on stack level 2. However what is shown on level two is a 'blank' item.
The 5 is on level 3.

11.)    Normally executing OBJ\-> on an empty list results in a zero on level one with
the list having been deleted.
```

If the above is tried on an hp-48gx, the execution of DOLIST causes an error.

Any comments?

rdb.

Re: Posible HP-49G+ bug using DOLIST.

*Message #2 Posted by **Raymond Del Tondo** on 17 Nov 2003, 6:22 p.m.,*
in response to message #1 by r. d. bärtschiger.

Hi,

even Emu48 with a 49G ROM (1.19-6) gives "DOLIST Error: Invalid Dimension" .

So this may be new (and could be a side effect of other fixes again;-)

Raymond

15C Display Repair

*Message #1 Posted by **gifron** on 17 Nov 2003, 11:29 a.m.*

A coworker has a 15C in which one of the segments works intermittently. Is this likely just an insecure connection? Is it a pretty easy fix?

Re: 15C Display Repair

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 2:05 p.m.,*
in response to message #1 by gifron

I fixed several Voyager-type calculators (11C, 12C, 15C) but there are two types of internal assembly: the newer ones are the most dificult to access the display, as the PCB is "riveted" with plastic pins on the case. To clean the display contacts I had to remove all 41 plastic rivets. The display worked but the keyboard became "noisy" (loose keys, as I cannot put enough pressure when re-melted the rivets).

The older ones the display/chips are separated from the keyboard, it was very easy to clean them. Just take care with the keyboard contacts, as they can be a little loose when closing the case and the keyboard doesn't work.

Good luck!

Nelson

Re: 15C Display Repair

*Message #3 Posted by **John** on 18 Nov 2003, 3:39 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Nelson, You said that "the newer ones are the most dificult to access the display..."

I was wondering, when would you guess that they made this change to the "newer ones?" I'm looking to pick up a used 15c. Would you recommend I find an older one because it's easier to repair? Maybe it doesn't really matter? Just want to find the most reliable Voyager possible.

Thanks.

Re: 15C Display Repair

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 18 Nov 2003, 7:01 p.m.,*
in response to message #3 by John

The problem is that if you have a older model, you NEED a older display, and vice-versa. The display mountings are different... If the first two digits of the serial number (plus 60 is the year of fabrication) are equal, I think that there is no problem. The displays of the 11C, 12C and 15C (and I think 16C and 10C also) of the SAME year may be identical, and you can buy a cheap 12C (of same year) to use its display. I've done that two times, one compatible, other not (different years), and I discovered these display differences.

My HP-15C of 1987 (s/n 2723Bxxxxx) display is the same one of my HP-11C (s/n 2644Bxxxxx) but are different of my 12C (s/n 2808Axxxxx) and the oldest one is a 12C (s/n 2317Axxxxx, its display is the easyest to replace).

If your 15C have one helical spring on the battery compartment in only one side and a fixed gold contact on the other side, it is the hardest to replace the LCD. If it has two simple folded springs, it is the older and easyer to replace.

I already counted three diffent displays, all incompatible with each other. Take care when searching a replace!

Good luck

Nelson

Voyager LCD variations

*Message #5 Posted by **Randy Sloyer** on 18 Nov 2003, 8:25 p.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Nelson,

You are correct: The entire Voyager line (10/11/12/15/16) used the same displays, but not always at the same time. So, I would like to add the statement: "Most of the time". This is especially true as you found out with later model 12C's. They where always the first to change methods, the 11 and 15's followed. I've started to track the versions and serial numbers, but I don't have enough data yet for it to be useful.

I must disagree with you about the easiest version to find. It has been my experience that the older the unit, the harder it is to find a display for it. Volumes did not start to build for a few years after introduction so there are fewer old units. I'll bet there are 1000 new 12C's out there for every single older USA unit.

I have been able to identify three different versions with two being somewhat compatible. I refer to them as "fine pitch" and "coarse pitch".

The earliest version is the unit with separate keyboard and logic board parts. These can be identified by the springs in the battery compartment - straight contacts on either side, no spring. These are the hardest to find and to work with. The LCD is a "fine pitch" version that is held in place with the metal frame. It is positioned poorly by the frame.

I think due to the cost of manufacture, they re-engineered the unit to be one circuit board. This is where the coil spring on the left side of the battery box appeared for the first time. The same "fine pitch" display was used, but it was mounted by means of two-sided tape to an intermediate plastic carrier. The carrier had two indexing pins which made the job of properly aligning LCD as we say, "A piece of cake". Now that the LCD sat further away from the circuit board, the zebra connection strips got longer.

At this point, I would like to say that these two "fine pitch" versions are compatible. If you have a fine pitch LCD on a carrier and need one without, a little UN-DU (heptane) will pop it off for you. The same is true in opposite, if you need one with a carrier, you'll have it on the broken one, just remove the broken one and stick the carrier-less one back on. Just examine the LCD position on the carrier before removing, it will match up in the Y direction, you'll just need to center it in X. Use the proper length zebras.

Somewhere around date code 28 (1988), they redesigned the circuit board (again) and changed the spacing and width of the connections on the LCD. I suspect the desire was to ease alignment problems in assembly. These are what I refer to as the "coarse pitch" version. This one is VERY easy to find, just get a throw-away Chinese 12C and you're set. Yes, the LCD version used in the 3 volt units works just fine. I have only seen 11, 12 and 15C's with this version. These are VERY easy to change out and almost never have missing segments since the pads are so much larger, a drop to the floor will not cause misalignment.

I believe the 10C was only built in the two board version but I have not been able to verify. I know the 16C was built in both (I own 2 as I was a software geek first) but never made it to a coarse pitch version as it died a premature death.

Hope that helps.

Re: Voyager LCD variations

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 19 Nov 2003, 5:56 a.m.,*
in response to message #5 by Randy Sloyer

I didn't know that the production amount of the earlier models was smaller than the new ones.

The "fine" pitch contacts LCD of the earlier ones have 56 contacts, and is 1:2 multiplexed (the lower contacts and upper contacts have distinct common1-2 backplanes, can be used as 1:4 multiplex), and is the one with best contrast and no "shadows" on it. The "coarse" one have 30 contacts, and is 1:3 multiplexed and have "shadows" of the segments (you can see the "off" segments if you look at a shallow angle)

I'm trying to build a "timeline" of the voyager models and variations, but I don't have much information also.

I noticed that the "flex board, fine lcd" ones (earlier) have a 2 or 3 chip assembly (11C and 12C, 15C resp.) and I have two "one board, fine lcd" (11C, 15C) that uses the same chips (2, 3 resp.). I have a 12C "one board, coarse lcd" that uses a single chip. I thing that it was the big change on the voyager line, a cpu/ram/rom/lcd controller on one chip instead of cpu + lcd controller/rom + ram (15C).

I also discovered that on the 2/3 chip version the rom CAN be extracted, with logic analyser of some sort (or a parallel port with an adapter on PC and a good DOS software). The CPU is almost the same as of the HP-41CV halfnut (differs only on the clock/voltage). I plan to build a voyager's emulator as soon I get the rom out of my 11C/12C/15C.

I plan some day to build a site with pictures of the voyagers, but I haven't much time now...

Best regards,

Nelson

Re: Voyager LCD variations

*Message #7 Posted by **gifron** on 25 Nov 2003, 9:39 a.m.,*
in response to message #5 by Randy Sloyer

I have a 15C with a missing segment (sixth character from the left, bottom segment). I have cleaned the board contacts and the zebras with alcohol and eraser, to no avail. I did not clean the display-end of the zebras, as they are adhered to the display, and I didn't know if I could

peel them off without damage.

The zebras seem to be making contact, except for the hard to overlook fact that the segment is missing. I have discovered that a very, very light flexing of the board causes the segment to activate. Is this another instance of the rubber getting old? Do I just need to replace the lower Zebra with one from a newer 12C? Having read the other posts, I'm aware of the differences in the displays, this one having the indexing pins on the plastic carrier - Are the zebras all the same?

Thanks again, Randy for your previous helps.

Edited: 25 Nov 2003, 9:40 a.m.

Re: Voyager LCD variations

*Message #8 Posted by **Nelson M. Sicuro (Brazil)** on 25 Nov 2003, 10:13 a.m.,*
in response to message #7 by gifron

The "zebras" aren't equal, the earlier models (those with flexible circuit board) are thinner than the new ones. If the missing segment activates with a light "twist" on the PCB, you may have a bad contact in one trace of the PCB. I found also that the mounting of the LCD is a little "tricky", when you put the mounting in place the "zebras" can be a little bent and when I tested it I found several missing segments. At first I cleaned all contacts, to find later that the bent zebras are the guilty...

Good luck!

Nelson

Re: Voyager LCD variations

*Message #9 Posted by **gifron** on 25 Nov 2003, 11:32 a.m.,*
in response to message #8 by Nelson M. Sicuro (Brazil)

Thanks for the comments, Nelson. Yes, one has to be careful to keep the zebras straight. The same missing segment was there both before, and after, my repair efforts. I also inspected all the traces with a lighted 10X magnifier, and they all look good.

My actual question about the zebras being the same is, are they the same between models, assuming they have the same display type, as mentioned in the earlier posts by Randy and others. I would think they would be. That is, a thicker zebra from a 12C would work in a 15C which also utilizes the thicker zebra. Or to put it another way, are all voyager "thick zebras" the same?

Also, can I remove the zebra without being careful about how I position it in reassembly? My assumption is that all the dark sections are identically conductive, with the light sections being nonconductive.

Re: Voyager LCD variations

*Message #10 Posted by **Nelson M. Sicuro (Brazil)** on 25 Nov 2003, 4:20 p.m.,*
in response to message #9 by gifron

Do you tried to swap the upper "zebra" with the lower?

I think that the conductive area of it is the thin dark layer inside.

If the "zebras" from other HP-1xC are from the same size, it will work.

Try to test with another display if you can (if you can get another to pull the "zebras" out, get its display also if it is the same pinout). Some trace in the glass of the display may be defective.

Best regards,

Nelson

Weird HP-48G problem

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 9:49 a.m.*

Hi all,

I have a HP-48G that has a problem with the "ON" key. It doens't work 'alone' (on/off) but WORKS on the auto-tests. I cannot switch it on or off (only by the "OFF" command) and only turns it on by the soft-reset (ON+C).

Anyone have seen this problem?

Thanks!

Nelson

Re: Weird HP-48G problem

*Message #2 Posted by **Victor Koechli** on 17 Nov 2003, 10:07 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Seems that the key itself works, but isn't recognized by the calc during 'normal' operation. Have you installed any libraries that could interfere with the ON key? Have you tried memory clear?

Cheers, Victor

Re: Weird HP-48G problem

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 10:17 a.m.,*
in response to message #2 by Victor Koechli

I just acquired this calculator (used, described with this problem and a missing line on the display) and put new batteries. No libraries, no software loaded, just plain "Memory Clear" condition.

Regards

Nelson

Re: Weird HP-48G problem

*Message #4 Posted by **adem ordna** on 17 Nov 2003, 11:02 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

It is not the on-C that is making it work it is the pressure at the top of the key pad that is making it work. Press on the bezel above the C key, and I'll bet the on button will work at that point. I have not seen the inside of the 48 but my guess is that is where the Keyboard connects to the main board. (correct me if I am wrong please)

Only LCD HP-48G problem now, ON key fixed

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 12:19 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

I disassembled it and cleaned the keyboard contacts, and now all keys work just fine. I also cleaned all LCD contacts but there is a horizontal line missing (#32, if I counted right). There isn't any corrosion or internal leakage. The calculator works fine, pass all self-tests.

I had this kind of LCD problem when I tryed to replace the old LCD from my HP-42S with one (identical) from a 'deceased' HP-17B. The "new" display has a missing column. Tryed to clean it in all ways I could imagine... I just put back the old one (some black spots on the left) and the column was there... I looked on the display carefully and can't see any imperfection. Bad luck...

This HP-48G was cosmetically perfect, noone tryed to opened it (before me) and there wasn't any battery leakage.

Any tip on how to fix this LCD problem?

Thank you all!

Re: Did you clean the rubber contact strips?

*Message #6 Posted by **Paul Brogger** on 17 Nov 2003, 1:36 p.m.,*
in response to message #5 by Nelson M. Sicuro (Brazil)

My experience with Pioneers is that any foreign matter (even dust) on the rubbery contact strips that carry the PCB signals onto the LCD edges will result in one or more missing segments.

Those strips have been called "zebra strips", as the early ones used to be black & white striped -- black conductor stripes with white insulators in between. The Pioneer ones tend to be uniformly gray, but I assume there are mutually isolated conductive layers or channels molded in which connect the PCB traces to the almost invisible contacts on the LCD.

If you haven't already, make sure the rubber strips are absolutely clean and free of lint, dust & whatever, while assembling the PCB/LCD/front case. Also, flipping one of those strips end-for-end, or swapping them top & bottom, will isolate a bad contact strip from a PCB or LCD problem.

Re: Did you clean the rubber contact strips?

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 1:44 p.m.,*
in response to message #6 by Paul Brogger

On the 42S I tryed clean, swap, exchange with the other strip pair from 17B, no success. With the original LCD, it works, so I discard the strips/PCB contacts as a guilty. I think that is some bad contact/track on the LCD, but it is invisible.

On the 48G, I cleaned also, but I haven't another display/strips to exchange.

I already fixed several other display problems with just cleaning, but this two eluded me...

Best regards!

Nelson

Re: Aren't there TWO strips in the 48?

*Message #8 Posted by **Paul Brogger** on 17 Nov 2003, 2:06 p.m.,*

in response to message #7 by Nelson M. Sicuro (Brazil)

I would think that swapping the upper and lower strips (I'm assuming there are two) in the 48G should help narrow the list of possible problems.

If, after swapping, the same pixel row is not displaying, that would implicate the PCB or LCD. If, however, a different row or column or annunciator is affected, then a strip would likely be to blame.

Re: Aren't there TWO strips in the 48?

*Message #9 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 2:44 p.m.,*
in response to message #8 by Paul Brogger

I don't swapped the strips, I'll try later. But I don't like to open/close it often, the metal clips that hold the PCB with the case/LCD are too thin and can be broken (as on my 42S...)

I'll try to check the tracks on the PCB also. I don't know if the display of the 48G is "partitioned" with 2 halves controlled by different pins (the 42S is 131x16, but the LCD controller is 66x32, 2 partitions plus symbols). On the 42S I'm shure that is the LCD, on the 48S I'm thinking of the PCB or controller chip, as the missing line is a horizontal one of the entire extent of the display (if the display is partitioned, this is covered by 2 lines).

Best regards,

Nelson

Re: Consider building a "jig"

*Message #10 Posted by **Paul Brogger** on 17 Nov 2003, 4:08 p.m.,*
in response to message #9 by Nelson M. Sicuro (Brazil)

re: twisting the metal tabs too many times . . .

You might consider building a "jig" -- a fixture that holds the pieces together and applies enough pressure for testing, thereby avoiding metal fatigue.

Randy Sloyer, I think, uses one for work on Pioneers -- I assume something similar could be built for 48G's. It needs to stay clear of the display (so you can see what's going on), press the PCB without shorting traces together (insulate its points of contact), and apply even pressure throughout the PCB/LCD/keyboard contact area. Not easy, but not impossible. (Easy for ME to say!)

Anyway, it sounds as if such a device has helped Randy -- I suppose it might help you, if you do a lot of work on 48G's. (Just a suggestion . . .)

Re: Consider building a "jig"

*Message #11 Posted by **Nelson M. Sicuro (Brazil)** on 17 Nov 2003, 4:57 p.m.,*
in response to message #10 by Paul Brogger

It is really a good idea! I'm fixing calcs that I buy cheap (non-working), fix them for my collection or to sell later. Most of them is Voyagers and Pioneers, this 48G is the first one. Is amazing how resistant those cals are!

I do repairs on my spare time and don't have a dedicated space (yet) to do it. I'm

planning to build a more sofisticated "equipment" to fix the calcs, a ultrasonic washer, this "jig" to press the displays (adjustable to more than one calculator serie?) and get some conductive paint, among other things...

Best regards,

Nelson

Hp12c Platinum

*Message #1 Posted by **Pierre Brial** on 17 Nov 2003, 6:11 a.m.*

Hello,

The Hp12C Platinum has received here some cricticism about software problem. But how is quality compared to golden Hp12C ?

By Hp12C quality I mean :

- built tought

- highly readable display

- traditional Hp keyboard (with the key-click)

When one doesn't face a bug, is the platinum fastest than the gold one ?

In fact the only minus I find for the golden Hp12c is the slowness of programs.

Last question : is there somewhere on the net a large picture of the 12c Platinum ?

All the best

Pierre

TI-30 Manual Humor from 1976

*Message #1 Posted by **Ben Salinas** on 16 Nov 2003, 11:49 p.m.*

No, this post is not glorifying the 1976 TI-30.

I was actually discussing HP calculators with a friend just right now, and I was telling him about the "click" which I have never felt. I then realized, well maybe the TI-30 that I took from my grandmother's house has that same click, so I took it out, and tried punching a few buttons.

It most definitely does not have the click (even pressing a button for an instant will cause it to register 2 or 3 presses) I took the manual out of its incredibley ugly case in order to find the date it was made. I started reading, and one of its features reads:

"Algebraic mode of entry allows you to enter mathematical sequences in the same order that they are algebraically stated"

This is quite obviously a stab at RPN (as by 76, HP had a good many calculators out).

I read on and found this:

"Disposable battery power source provides independence from AC power supplies. You can take weeks of computing power with you wherever you go by simply carrying a few spare batteries."

This is obviously a stab at the rechargeable batteries of the HP's of the time. I showed this to my friend (who perfers his TI's) and he was amazed.

I just found it interesting the ways that companies can make a bad feature sound good.

-Ben

Re: TI-30 Manual Humor from 1976

*Message #2 Posted by **rsenzer** on 17 Nov 2003, 1:20 a.m.,*
in response to message #1 by Ben Salinas

Hi Ben,

The nice thing about the TI-30 was that it was cheap. TI had much higher quality calculators of superior construction at the time. I have a TI-58C with excellent tactile feedback, although I believe that this is a model that was produced a bit later.

In the TI-30, TI was hardly attempting to compete with HP. It was going after the student market for a basic calculator. This model was roughly the equivalent of an HP-6S or CASIO-fx260 today. It could handle basic scientific calculations for "Science 101" classes.

Re: TI-30 Manual Humor from 1976

*Message #3 Posted by **james (uk)** on 17 Nov 2003, 2:01 p.m.,*
in response to message #2 by rsenzer

My first programmable (way back in 1979) was a TI-58 which I still have but the keyboard is very poor, difficult to use quickly and after five or six years a couple of the keys became very unreliable - had to press very hard to register and then they tended to register 2 or 3 times.

Had the same problems with a TI-30 except that the keys became defective much quicker.

Best, James

Re: TI-30 Manual Humor from 1976

*Message #4 Posted by **Victor Koechli** on 18 Nov 2003, 3:08 a.m.,*
in response to message #3 by james (uk)

Woah, you were lucky, then. I had my TI-59 for a year, and by then 40% of its keys were bouncy and/or needed high pressure to register, plus the card reader was partially broken (it didn't sense anymore when a card was through and just kept on running).

I had it fixed, still under warranty, sold it, and bought a HP-41CV. It has seen heavy use, but it's still working perfectly. Quality really makes a difference.

Cheers, Victor

Re: TI-30 Manual Humor from 1976

*Message #5 Posted by **Karl Schneider** on 17 Nov 2003, 3:04 a.m.,*
in response to message #1 by Ben Salinas

My first calc was a TI-30 from about 1977 or '78.

Ben stated:

> Quote:
>
> *I took the manual out of its incredibley ugly case...*

It was denim-colored, as I remember...

> Quote:
>
> *"Disposable battery power source provides independence from AC power supplies. You can take weeks of computing power with you wherever you go by simply carrying a few spare batteries."*
>
> *This is obviously a stab at the rechargeable batteries of the HP's of the time.*

Interesting. Mine came with a rechargable 9V battery that quickly lost its ability to accept and retain a charge. I started using disposable 9V cells.

One day, I found myself in electronics class when another cell died. I hooked the TI-30 up to a DC power supply outputting 9.0 V measured by a multimeter. The display started going screwy shortly thereafter, and the TI ended up in the garbage, replaced a year later by a Casio LCD model. I'm still not quite sure what I did wrong; maybe the DC wasn't "clean" (steady).

Re: TI-30 Manual Humor from 1976

*Message #6 Posted by **Michael Meyer** on 17 Nov 2003, 12:38 p.m.,*
in response to message #5 by Karl Schneider

The TI's reversed their red and black wires... black is positive on many models. Might have been the reason yours blew out.

The TI-30 was the best selling LED calculator of all time. Obviously there was a method to their madness.

My TI-59 still works fine (after card reader repair, of course). Still, I always hated the algebraic entry, and despite years of using the TI-59, RPN was still easy to pick up and use again. Still, the 59 was powerful, and I wrote every computer science assignment twice: once for the mainframe, once for the TI-59. It could do anything that was assigned. (1980)

Michael

Re: TI-30 Manual Humor from 1976

*Message #7 Posted by **Bill Wiese** on 17 Nov 2003, 1:59 p.m.,*
in response to message #1 by Ben Salinas

Ahh, TI30.

Got my TI30 in summer of 1977 (summer of 6th grade). We were on vacation and my dad saw it on sale at Safeway in La Grande, Oregon for $25.95 - it came with a "Student Math Kit" textbook w/some interesting stuff. (That's where I found out about Stirling's Approx. for factorial/gamma... lotta fun.)

It was to replace an APF Scientific. My dad and I were in a ham radio class; he HATED to use shifted functions (never bothered me!). And the APF didn't have base-10 log/10^x functions so there was an extra step involved there too.

My TI30 keyboard (and my TI58's) never bounced. Pretty happy w/em. But not HP :)

But even then I couldn't resist playing w/the HP demos at the store...

in response to message #1 by Ben Salinas

Are you familiar with the Mach Number problem which appeared in the HP-67 and HP-97 manuals as a difficult equation which provided justification for choosing RPN over AOS? The accompanying writeup in those manuals emphasized the need to solve the Mach Number problem from the inside out.

Users did not have to work from the inside out to calculate the Mach number on the TI-30 or other AOS machines manufactured by TI. They only needed to have faith in the implementation of the parentheses routines and enter parentheses for brackets, braces and parentheses, remember that the square root must come at the very end, remember that you must add real multiply's where there are implied multiply's, and remember to add an equal after the last large closing bracket to multiply the value in the large outside brackets by five. If they watched the display as they proceeded they would even see most of the intermediate results mentioned in the writeups in the HP-67 and HP-97 manuals! So, the AOS user simply enters the equation in his machine as written and, voila, without any agonizing or analysis to decide where to start the problem, the answer appears

in the display. The AOS sequence requires 73 steps. The RPN sequence requires 67 steps on the HP-67, but only 66 on the HP-41 where the square root key is not a second function.

AOS solves the problem the inside out, not because the user asks it to, but because that is how it must be done. With RPN the user must examine the equation and find the proper inside point at which to begin. With AOS the machine essentially does the thinking for the user. Higher order languages such as BASIC and FORTRAN also do the thinking for the user when algebraic expressions are entered.

The reason tbe Mach Number problem solves so nicely on the TI-30 is that the problem does not require pending operations or pairs of parentheses that exceed what the machine allows. The really curious aspect of the selection of the Mach Number equation to demonstrate the power of RPN is that the equation is of the exact level of difficulty which permitted straightforward solution by the least capable of the machines in the TI inventory at the time. If one wishes to make RPN machines look better than the AOS machines in evaluating algebraic expresions one must propose a problem which overwhelms the pending operations capabilities of the AOS machines. All of the above reinforces my impression that whoever selected the Mach Number problem as an example of why RPN was better than AOS really didn't understand AOS. Of course, that isn't very surprising because most dedicated AOS users really don't understand RPN. There really aren't many true "bilinguals".

Re: TI-30 Manual Humor from 1976

*Message #10 Posted by **r. d. bärtschiger.** on 22 Nov 2003, 3:47 p.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

It is not necessary to start in the middle of the equation and work your way out when using RPN. This restriction exists only when using a stack with a finite size where the number of levels available is less than that required by the problem at hand. If you are using a calculator with an unlimited stack, such as that on an HP-48GX, you can start at the left side and move from left to right, using the RPN stack flow chart as given on page 46, in 'Appendix A Stack Algorithm and Flow Chart', of the HP-45 Owner's Handbook.

If you use an HP-48GX to solve this problem you will need 65 keystrokes and 5 stack levels.

keys	keystrokes	total keystrokes	highest stack level
5 enter	2	2	1
1 enter	2	4	2
.2 enter	3	7	3
350 enter	4	11	4
661.5 /	6	17	5
ls x^2	2	19	4
*	1	20	3
+	1	21	2
3.5 y^x	4	25	3
1 -	2	27	3
1 enter	2	29	3
6.875 eex 6 x/- enter	9	38	4

```
25500 *                 6          44                 5
-                       1          45                 3
5.2686 x/- y^x          8          53                 4
*                       1          54                 3
1 +                     2          56                 3
.286 y^x                5          61                 3
1 -                     2          63                 3
*                       1          64                 2
sqrt                    1          65                 1
```

65 total keystrokes, five stack levels needed.

rdb.

new hp49g user needs help

*Message #1 Posted by **Grahm Satterwhite** on 16 Nov 2003, 9:12 p.m.*

I have been a TI guy since i started using a graphing calculator but decided it was time for a change. Anyway I have been doing some surveying work and cant for the life of me figure out how to enter degrees, minutes, and seconds into the 49g. I'm sure the button is stareing me in the face but I just cant see it. anyway, any help is appreciated. Grahm Satterwhite

Re: new hp49g user needs help

*Message #2 Posted by **Brent** on 16 Nov 2003, 11:30 p.m.,*
in response to message #1 by Grahm Satterwhite

Enter it so it looks like a decimal, i.e. 45^35'30" looks like 45.3530. If you want to convert it to dsecimal degrees go to the time menu and use soft key HMS->. If you want to change it back to DMS use ->HMS. Calculations need to be done in decimal degrees.

Re: new hp49g user needs help

*Message #3 Posted by **Brent** on 16 Nov 2003, 11:47 p.m.,*
in response to message #2 by Brent

Use the red shift key and then the 9 key. choose "tools" and then scroll down until you see ->HMS or HMS->. Those are the ones you want. If you need it a bunch you need to create your own routine to call that function.

.raw to text

*Message #1 Posted by **karl gruber** on 16 Nov 2003, 8:00 p.m.*

Is there a program to convert a "Virtual HP-41" .raw file to a text file?

Best,

Karl HP-41

Re: .raw to text

*Message #2 Posted by **Mike (Stgt)** on 17 Nov 2003, 11:03 a.m.,*
in response to message #1 by karl gruber

What kind of text would you like? Only hex presentation or as a program listing? If hex is sufficient use TextPad and define suffix RAW as binary.

If you need a listing first look for such a tool (there is one for conversion/bar code/do everything from ... [sorry, my brain]). If you can't find such a tool, make one of your own: Take emu41 from JF Garnier, look for the ROM image of Extended IO, define the RAW file as input to virtual HP-IL device DOSLINK, read in 7 bytes a time and store them i a XM register file, convert it to a program file, read it to main memory and - here we go - print it.

Simple, isn't it? In a similar way I made yesterday a routine to convert OUTP output to a RAW file. Works.

Ciao.....Mike

Re: .raw to text

*Message #3 Posted by **Richard Garner** on 17 Nov 2003, 12:12 p.m.,*
in response to message #1 by karl gruber

Karl,

If you go to Warren Furlow's web site and click on the emulator section, close to the bottom of the page you will see "User Code Utility" and "User Code GUI" the GUI is a Windows interface for the utility that will automate the conversions from Text, RAW, BIN, HEX and Barcode. I have used it and it does a good job of converting. I would still look over the program text after each conversion. I have found that it will drop the END statement or change it to LBL 12 from time to time.

An HP-XX2050 parody

*Message #1 Posted by **Michael Meyer** on 16 Nov 2003, 5:53 p.m.*

(Note: the Hewlett-Packard Personal Computer Digest published a story about a hand-held calculator, the HP-XX2050 in the year 2025. Here is my updated version, with apologies to Gordon Dickson.)

Walter Jensen, a middle-level management executive, in the year 2025, had just left his meeting in Omaha, Nebraska, and was on his way to a conference in Saint Louis, Missouri (via Detroit, Michigan), hand-carrying some very secret and valuable commercial information stored in his pocket computer. The day had been a long one, and the pressures of business in the twenty-first century were severe (even with the high doses of antidepressants he was taking). After spending four hours going through several security checkpoints, and waiting through two hours of flight delays, he finally squeezed into the only open seat remaining aboard the DC-9 remake (as no new planes had been designed for many years). He wanted to take a nap, but the seat was so cramped and uncomfortable as to make this impossible. Additionally, he was still trying to recover from the nasty virus he got during his last business flight due to the unclean recirculating air. He was just starting to relax some, when he noticed the plane was already descending. An irritable and clearly overworked flight attendant appeared in the aisle. “Our apologies to our passengers. A computer glitch has forced us to land at Chicago O’Hare. The computer shows that we aren’t actually airborne. Have a nice day.” After an hour of circling in a holding pattern, the plane landed. After a 30-minute wait on the hot tarmac, a gate finally opened up. It was nice to breathe some cooler air.

Walter, upon deplaning, tried to speak with one of the few airline employees, but they were all too busy at their computer terminals, with long lines of tired and impatient travelers. So, Walter remembered his new HP-XX2050 should also be of some help with this sort of situation! He smiled as he pulled it from his pocket, remembering how easy it looked to use at the store display. Walter had thought the key layout was completely inefficient, but it sure looked slick, and besides, it had “HP” on the corner. After several attempts at finding the right keys to press, he tried to get online to make new flight reservations, but the flimsy thing kept reporting, “The wireless network is temporarily unavailable. Please try again.” After several attempts, his HP-XX2050 locked-up, requiring a lengthy re-boot. “Hmm,” Walter thought, “I can try to interface with one of the “pay” internet terminals!” He looked for some time, finally finding an unused computer terminal at the far end of the airport. After entering his payment information, he connected his XX2050 to the terminal. The device went blank. Nothing. The main terminal reported, “Sorry, cannot communicate with device.” Walter made several more attempts, finally receiving a different error message. “Your device uses Smartmedia memory. This terminal only supports XD memory. Please contact your hardware manufacturer.” Walter remembered how his father had spoken fondly of his early HP calculators and how reliable and well built they had been. Frustrated, Walter disconnected the HP-2050, knocking out the batteries in the process. When he replaced the batteries, the screen said, “memory lost”. Walter’s face took on a horrified look as he realized that all of his vital business documents had been erased as well. Without them, his entire business trip was ruined. In shock, Walter eventually realized that he still needed to somehow get back home.

With one last attempt, Walter tried the wireless network. Finally getting online, he followed the cumbersome process of logging onto the airline web site. He had to press each key up to four times to enter each letter! The device keys kept “bouncing”, entering the same letter multiple times. Walter eventually entered his ticket information, and a screen appeared saying, “We hope you enjoyed your flight. Your luggage is waiting for you at Los Angeles LAX. You will need to pay a retrieval fee upon claiming your luggage as it was 3mm over allowed dimensions. Have a nice day.”

After throwing his HP-XX2050 in the trash, Walter decided that the dirty carpet of the airport floor wasn’t such a

bad place to spend the night after all. “Maybe someone will notice me missing,” he remembered thinking as he finally passed out from exhaustion. Walter was startled awake moments later by an airport security guard. “Sorry, you can’t lay down here. Try the lounge down the hall past the next two security points.”

Screech!! (not even half a Beep)

Quality of 1982 15c vs. 1988 15c

*Message #1 Posted by **Jim B** on 16 Nov 2003, 10:00 a.m.*

I was just wondering if the 15c's made around 1988 or '89 (toward the end of the Voyagers production run) were made as high quality as the earliest ones? I was basically wondering if HP started cutting corners as time went on, or if all the 15c's were made exactly the same (and as high in quality) thru 1989?

Edited: 17 Nov 2003, 12:29 p.m. after one or more responses were posted

IMO, quality (fit and finish) was the same.

Re: early 15c vs. late 15c

in response to message #1 by Jim B

As near as I can tell, the major cost-cutting on the Voyager series didn't occur until around 1994. I have two 12c's, one from 1993 and the other from 1995, both made in Singapore. The '93 unit has double-shot keys and is otherwise every bit as good as the early Voyagers, while the '95 model has painted-on legends. The blue g-function legends are nearly impossible to read.

*Message #4 Posted by **jose goncalves (Brasil)** on 16 Nov 2003, 7:12 p.m.,*
in response to message #3 by David Brunell

Talking about cutting corners, is it possible that HP went through the same internal revision process of the 12C ? I remember that the first 12C had 3 chips, then only 2 and then only one, even before Kinpo. The LCD assembly went through a major revision also.

I don´t have that many 15C to disassemble and check and, for sure, the 15C didn´t last that long in production, anyway.

Re: early 15c vs. late 15c

*Message #5 Posted by **Randy Sloyer** on 16 Nov 2003, 11:43 p.m.,*
in response to message #4 by jose goncalves (Brasil)

Yes, the last 15C's to be built had one chip. They very much followed the evolution of the 12C.

Re: early 15c vs. late 15c

*Message #6 Posted by **Erin C** on 19 Nov 2003, 7:52 p.m.,*
in response to message #5 by Randy Sloyer

So, is it better to have 3 chips or does it mean nothing? Is the 1 chip 15c just as good? Besides this, weren't they made exactly the same? I have used both and can't tell if the keyboards or lcd's are any different? I would have to think that a newer 15c would last longer, just because it is newer and therefore its parts won't degrade as soon as the earlier 15c's.

33S situation is getting ugly...

*Message #1 Posted by **CME750** on 15 Nov 2003, 9:07 p.m.*

..and no, I'm not talking about the keyboard.

The best-known forum for Professional Engineering exam candidates is at:

http://www.ppi2pass.com/w-agora_eef/index.php?bn=eforums_eef

Check it out. People are gearing up for the 2004 exams, which are the first to be affected by the new NCEES calculator restrictions. PE and PLS candidates across the country are coming to the shocked realization that:

(1) They will *not* be allowed to use their trusty HP48s or their new HP49s

(2) HP currently cannot provide *any* NCEES-compliant RPN scientific calculator

(3) Older NCEES-compliant models, like the 32Sii, now cost hundreds of dollars

(4) There is *no* firm timetable for the introduction of the HP33S

Needless to say, a lot of people are unhappy with NCEES, but also with HP.

There's been plenty of 33S bashing on this forum. Well, at the same time there are many engineers and surveyors who are desperate for *any* basic, reasonably priced RPN scientific. Even if it has an ugly keyboard.

Re: 33S situation is getting ugly...

*Message #2 Posted by **Brent** on 15 Nov 2003, 11:10 p.m.,*
in response to message #1 by CME750

Just took it and yes my 48GX helped alot. Hopefully you can get your hand on a 33s by April. If you are taking the Civil Engineering exam, make sure you have Manning's Eqn in the solver for all kinds of channels- in terms of depth, width, etc. It's a time saver.

CME750 posted:

*"There's been plenty of 33S bashing on this forum. Well, at the same time there are many engineers and surveyors who are desperate for *any* basic, reasonably priced RPN scientific. Even if it has an ugly keyboard."*

Forgive me in advance, but there's something I think I don't fully understand, namely your *"There are many*

*engineers and surveyors who are desperate for *any* basic, reasonable priced RPN scientific"* statement.

How can that be ? I still remember the times when I was a young student, with very little money to spare, yet I managed to buy first an HP-25, then an HP-67, which took a considerable effort and a lot of trade and work on my part to get the $$ required to purchase it. I guess many of this forum's readers have endured similar experiences.

Now the question is, why are your 'engineers and surveyors' so 'desperate' ? If they are, indeed, can't they resort to get an HP-15C, say, from eBay ? I know they aren't exactly cheap, but you can get one for, say $175-225, and that's pretty comparable with the original price, augmented by inflation, that an HP-67 commanded 26 years ago. If 'poor' students like me could do it at the time, why can't present 'engineers and surveyors' ?

In other words, if people are really so 'desperate', stop sticking to your money like mad, stop waiting for such weird, ugly, underdeveloped products as the 33S (which might as well get banished from the exams if someone discovers it has A-Z on the keyboard), and spend that money on a nifty HP-15C or 41CV out of eBay, this MoHP Classified, or whatever. It'll end your 'desperation' once and for all, and you'll be glad you did, now, and many years from now.

Best regards from V.

If you don't mind waiting a little longer...

*Message #4 Posted by **Tony David Potter** on 15 Nov 2003, 11:56 p.m.,*
in response to message #3 by Valentin Albillo

Just a few observations:

1. HP contracts Kinpo to make the new HP-12C Platinum. 2. A few months after it's release, a new calculator, the Aurora FN1000, comes out (also by Kinpo) that's functionally equivalent to the HP-12C. It's price point is less than one-third that of the HP-12C Platinum. 3. HP contracts Kinpo to make the new HP-33S. 4. A few months after it's release...

Might be too much to hope for, but might we see a RPN Scientific calculator, a few months after the release of the 33S, with the functionality of the 33S (or 32SII) with a more traditional keyboard and at a $20-30 price point?

Just a thought. Tony David Potter (33333 erases.)

Re: If you don't mind waiting a little longer...

*Message #5 Posted by **Brent** on 16 Nov 2003, 12:39 a.m.,*
in response to message #4 by Tony David Potter

Well, I have run out of memory with just three survey programs on my 32sii, and the same goes for the 11c. The 33s would be very nice for Surveyors and engineers for the PE exam. I saw a post that said there is no way to use up all the memory. While it might be difficult, I could have certainly used alot of it for the exam. The 41CX is good for surveying (if you have the chip) but the eqn solver probably isn't as good as the 33s. Hell, Bring all the legal calculators you have- I did. 48GX for Hydraulics and surveying, the 12c for engineering economics and 11c for GP.

An interesting idea Tony, Chinese cloning

*Message #6 Posted by **NH** on 16 Nov 2003, 12:44 a.m.,*
in response to message #4 by Tony David Potter

That's an interesting idea Tony, and maybe you are right.

So your scenario is that Kinpo comes out with some of the classics (32S, 32Sii) because HP is not smart enough to do it themselves.

Did you know that Chinese businesses, stereotypically, are masterful copycats of other people's designs and ideas? Whereas USA business typically has enough pride that they wont copy, a company like Kinpo just wants the money and would copy gladly.

That's an excellent, excellent idea, and I hope your scenario comes true. Hey..... they could even make HP-34C !! With RED LED's HUBBA HUBBA OOOWEEEE BAAAAAAYBEEEE gimme dem RED LED's * pant pant pant *

wouldn't it be interesting if our favorite swear word (Kinpo) became the knight in shining armour to save us all and restore our hopes? (esp at $30 a unit, yeah, ooowee babeeeee). In point of fact, I designed a product that was cranked out many thousands at a time, and was sold for thousands of dollars a unit also. The chinese got jealous of the profit margins, and came out with a clone. They even cloned the "cut trace solder a jumper" reworks on the circuit boards (!!!!) :o| This went on for quite awhile and eventually the USA company used lawyers to make them stop. The Chinese company then offered to the USA company to make the product for them, as a low-cost manufacturing partner .....

Reminds me of COMPAQ

*Message #7 Posted by **rsenzer** on 16 Nov 2003, 12:48 a.m.,*
in response to message #4 by Tony David Potter

If I recall, it was COMPAQ, the company acquired by HP, that created the first clone of the IBM PC. This feat was accomplished relatively quickly because the original PC was a non-proprietary design.

A similar trend may occur in calculators as HP outsources the product. On the other hand, perhaps this is HP's strategy. If many overseas companies start building RPN models, HP can just select the one it desires and slap the HP name on it. Then, it can concentrate on its primary business of slapping the HP label on other outsourced electronic and computer products.

Re: Reminds me of COMPAQ...

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Nov 2003, 12:49 p.m.,*
in response to message #7 by rsenzer

Just to say that, while I most admire the "classic" HP excellence of the 1970's and 1980's calculator models; I had worked with many of the Compaq "first 10 years" products, and I may say there was also quality and innovation on them, indeed.

The word "Compaq" is a combination of "compatibility", "portability" and "quality"; the main attributes for their first product. I have installed and repaired such units for years, and have been able to appreciate the attention given to details as the usage of perforated "fiche" boards to shave some weight; the shock absorbers for hard disks; the backup fuse located in the power connector; the appearance of a plasma display in the Portable III; the flexible, foldable motherboard on the LTE386 notebook (1990), adapted from aerospace technology; and many advanced features on servers like RAID controllers (1989); or autonomous remote-management adapters (1991, with their own battery, modem and voice synthesizer for spoken alarms), etc. While some of that quality may be lost (a sign of current times, perhaps?), there are still many quality features in their products.

As per service, I was amazed when I read my first Compaq Service Advisories, where, for instance,

technical personnel was instructed to look for a defective link in the leather carrying case of some models; to prevent possible slipage of the carrying belt with consequential damages for the computer and/or the user... Service centers were paid between U$S 50 and U$S 80 per event, to encourage them to detect and exchange the belt link... an attitude not many maufacturers had at the time (1990)!

Yes...but $175-225 seems like a lot of money for a calculator which is only intended for use on one or two exams.

Most of the engineers and surveyors in question already own an HP48, which has been the closest thing to an industry-standard calculator over the past 10 years or so. The 48 cost less and does more than an old 15C, or any of the other fondly-remembered collectibles discussed on this forum.

But the 48 and 49 were recently banned for use on PE/PLS exams. So people who have been out of the calculator market for years now need to find an RPN alternative specifically for exam use. They are understandably shocked to learn that the only available options, as of today, are in the $200 range.

Actually...

Gene: Actually, HP-67's sold for $450 back in 1977 dollars. The price level has nearly tripled since then. Try an equivalent today of $1200. That makes HP-15c's etc. bought on ebay a bargain.

It also makes the 49G+ an incredible bargain.

*Message #11 Posted by **Thomas Radtke** on 16 Nov 2003, 7:07 a.m.,*
in response to message #1 by CME750

Don't take this as offense; It seems that dedication to a certain entry format turns into an unhealthy addiction. What you may win by using RPN is lost by using a keyboard like the one of the 33S, in terms of speed. I would always prefer my 20S or even my fx81p over using such a toy. In addition, from what we heard in this group, the device has apparently been designed so careless that you probably have to expect serious bugs in the software. And thats the best reason for not using it in the exams.

Thomas

Re: 33S situation is getting ugly...

*Message #12 Posted by **CME750** on 16 Nov 2003, 1:23 p.m.,*
in response to message #11 by Thomas Radtke

Software bugs? There are really only two major complaints about the 33S on this forum:

(1) the keyboard is goofy (which is true)

(2) the firmware appears to be nearly identical to that of the 32Sii

Point 2 is a significant drawback, since it means that the 33S will not be able to effectively use much of its memory. On the other hand, the 32Sii firmware was not buggy, and so there is no reason to suspect that the 33S firmware will be buggy either.

Re: 33S situation is getting ugly...

*Message #13 Posted by **Thomas Radtke** on 17 Nov 2003, 4:42 a.m.,*
in response to message #12 by CME750

I was only speculating. But you're wrong about the 32SII, there were buggy units (I have one of it) as there were several other HP calcs with bugs on early releases even when HP put more effort in them. Why should I expect to get a good calculator when the design already looks like it has not been made for professional use?

I would not dare to say that the firmware is nearly identical to the one of the 32SII. It's more likely rewritten from scratch. But then, it doesn't really matter. Doing modifications on a more than 10 year old software is always dangerous:).

Thomas

Re: 33S situation is getting ugly...

*Message #14 Posted by **Raymond Del Tondo** on 17 Nov 2003, 7:46 a.m.,*
in response to message #13 by Thomas Radtke

>Doing modifications on a more than 10 year old software is always dangerous: >

It depends. If the software sources are well documented *and* the programmer knows what to do then the risk is small.

Of course the above assumption contains two unknowns:-)

Raymond

If it were me, I'd tell NCEES to stuff their exam and HP to stuff their cowcatcher and find a career that didn't

require me to operate under such constraints.

But I'm just that way. ;)

NCEES to Blame, not HP

*Message #17 Posted by **Jeff** on 17 Nov 2003, 7:17 a.m.,*
in response to message #1 by CME750

I don't see why anyone should be unhappy with hp (aside from the oft discussed issues surrounding the 33S itself). It is not up to hp to make a calculator that meets with the approval of NCEES. I'd place the blame squarely on the paranoid, asinine NCEES for taking away the tools that engineers and surveyors use in their daily jobs over the silly worry that someone will type the questions and answers into their calculator, or beam answers via IR to their buddy across the room.

Edited: 17 Nov 2003, 9:08 a.m.

Re: NCEES to Blame, not HP - Absolutely!

*Message #18 Posted by **J.C. Randerson** on 17 Nov 2003, 11:24 a.m.,*
in response to message #17 by Jeff

The NCEES is an organization of delusional Luddites who would like to turn back the clock. There should be an alternative organization to license engineers that is more technologically oriented. This is 2003, not 1903 or 1803!

J.C. Randerson

Re: NCEES to Blame, not TI - Absolutely!

*Message #19 Posted by **CME750** on 17 Nov 2003, 2:26 p.m.,*
in response to message #18 by J.C. Randerson

Owners of TI graphing calculators are also affected by the NCEES ban, and they are also critical of NCEES. But they are not nearly as upset as HP owners, and they are not mad at TI. Why not?

Because a TI83 or TI89 user can go to any discount store (Walmart, Kmart, Target), or to any office store (Staples, Office Depot), or to any consumer electronics store (Good Guys, Best Buy), or to any number of internet sites, and pick up an adequate, NCEES-compliant TI scientific calculator for less than $20. Brand new, in the box, with warranty. Problem solved.

Does an HP48 or 49 user have similar alternatives for an RPN scientific calculator? Sorry. The only choices are: (1) try your luck at Ebay, where it may be possible to obtain an old used HP for $200 or so, or (2) simply get a $20 TI as described above and reprogram yourself away from RPN.

HP has produced boatloads of fine, NCEES-compliant scientific models in the past, starting with the HP35 and ending with the 32Sii. But somewhere along the line, they dropped the ball: the 32Sii has been discontinued for more than a year and a half, and the 33S is still vaporware.

As a result, people are unhappy with HP, not just with NCEES. TI and Casio and Sharp are unscathed.

HP deserves criticism, from RPN users

*Message #20 Posted by **CME750** on 18 Nov 2003, 12:45 p.m.,*
in response to message #17 by Jeff

<<It is not up to hp to make a calculator that meets with the approval of NCEES.>>

The great irony here is that HP **does** make scientific calculators that meet with the approval of NCEES.

The current-model HP-9S (~$15) and HP-9G (~$40) have both been explicitly granted the NCEES "seal of approval". The current-model HP-30S (~$20) also appears to meet NCEES criteria. Same with the HP-6S (~$10) and the HP-20S (~$40), which have been discontinued but are still available at low cost if you look around.

The problem is that none of these models have RPN. So HP's current product line includes three different inexpensive, NCEES-compliant algebraic scientific calculators -- but no RPN equivalents. Users accustomed to RPN are not happy with this situation, or with HP.

what is your favorite (YOUR OWN) RPN program?

*Message #1 Posted by **bill platt** on 15 Nov 2003, 3:50 p.m.*

I post this question because it will hopefully help to give us all a better idea of:

a: what sorts of things we use our calculators for,

b: why RPN is good (or why keystoke programming in general)

c: why BASIC and other methods are good (Valentin, please feel free to post your favorite non RPN, too!:-))

Be sure that you describe a program that *you yourself* wrote--not something you got out of a book, or modified from someone else. It *has* to be your very own thing.

And it does not have to be big. It does not have to be complex. It it doesn't have to be THE one (we change our minds and perceptions with time, right!). And it does not have to be your latest (mine isn't). But it has to be satisfying--or really effective in your mind (tell us why).

So here goes: my favorite (for the time being) is one that I wrote to compute the 2nd moment of areas of arbitrary rectangular sections, along with adding known arbitrary shapes with known area, centroid, and fundamental 2nd moment about centroid, t oa set of other known shapes or rectangles. In this case, I discovered later that there was some sort of program in the calculator manual that did this--but I didn't bother to look, and I knew what I wanted! and besides, it is *sooooo* much more satisfying to give it a try all on ones own occasionally....

The reason this is such a satisfying program is that if you do mechanical design, and you need to know what the bending stress will be of some arbitrary set of parts, you need to know the "inertia" or "second moment of area" and the "Section modulus" of that section. While yes, I also wrote a spreadsheet program that does this task, the calculator is both "safer" in a way (no cells to mangle etc), but also portable, fast, there with pencil and paper as you are sketching and playing with ideas....And to have it programmed in, rather than doing it by hand, save lots of time! If yo uhave never done this computation, it goes like this:

Area y A*y A*y^2 I

Area2 y2 A2*y2 A2*y2^2 I2

Sum A Sum Ay (SumAy^2)+(Sum I)= Ib

SumAy / sUMA = Y'

Ib - (A*Y'^2) = I about centroid.

Z = section modulus = I / (max fiber - centroid position).

So, you can see that there is a lot of button pressing!

Further, in RPN, it programmed very smoothly--not very different from doing the problem by hand (except all the registers). So, that was satisfying.

Maybe I'll post the code later---but you don't have to post your code---better to get us talking about what we are doing first, not yet how we do it.

Basically, I have a "clear" routine (which is handy for preserving the contents of registers that are in use in other programs--rather than clearing the whole machine's registers), a "rectangles" entry routine, a "summing for I and Z" routine, and a routine for input of known sections (which always must be followed with the "summing" routine).

Best regards, and looking forward to hearing some fun stories!

-Bill Platt

in response to message #1 by bill platt

My favourite is my drilling fluids rheology program. When I was an engineer on the drilling rigs in the 80's, we had slide rules to calculate pressure drops, viscosities, and flow regimes. Using my trusty HP, I wrote a program using a procedure that I continue to use today - that is, define the parameters the user may wish to change, and attach them to a a Lbl instruction. In this way the user could examine several what if scenarios. It forced me to examine a structured programming sequence. To do it though, required over 600 steps. I was grateful for the continuous memory!

While I was using this program (in about 1/5 the time my fellow engineers were doing it using the company supplied slide rules) I was able to finish my am reports, complete with calculations for solids, weight up requirements, and relevant costs. At the time, it was a marvelous time saver.

Sure, its old tech. But then, so are Louis Armstrong's recordings....That doesn't mean it is any less relevant today. Any open minded person can enjoy it!

*Message #5 Posted by **jimc** on 17 Nov 2003, 2:33 p.m.,*
in response to message #4 by Jim Chumbley

Hi Jim. Thanks for your post.

I used a 41 CX, and I reduced the size of the memory registers to less than 50 at start up so I had extra room for all of it. (its kind of fuzzy now, but I believe that this was one of my first errors) - anyway, I did this in about the first ten steps. Since some of the calculations were to be used separately, I wrote some external programs that were called into the main program. As the program grew, I tried to pare it down to where I could manage it.

Therefore, the large number of steps were about 1 program that used around 300 steps, and the other 10 or so programs using the remainder. Not technically one program, however, the external programs (or subroutines) were fairly useless without the main program, as the main program had the constants (prices, etc) that were "seeded" into the memory. This was one of those decisions that at first blush seemed sound, but upon reflection was fraught with difficulty.

Like I said in the original post, I learned a lot writing the program, however the fundamentals were sound enough that I continue to use them today. I am no longer a drilling guy - so I have had no use for the program. I planned on posting it to the 'net, but over the years it has gotten buried.....However, this thread has re-awakened my interest in digging through my old textbooks.

Favorite RPN (and BASIC) programs [LONG]

*Message #6 Posted by **Valentin Albillo** on 15 Nov 2003, 11:25 p.m.,*
in response to message #1 by bill platt

Hi, Bill:

These are a few of my choicest ones for assorted HP handhelds (no SHARPs on sight):

HP-25:

```
  WHAT: Numerical solution of 1st-order Differential
        Equations using a 3rd-order Runge-Kutta method

  WHY:  Because at the time, it seemed next to impossible
        to fit such a program on the meager HP-25's 49 steps,
        having to call your f(x) three times with different
        arguments and returning to different locations
        in a machine without GOSUB capability, while still
        leaving enough free steps to define your f(x).

        My approach was clever enough that it inspired my
        close friend Fernando del Rey to try and improve it
        to a 4th-order RK method, which succeeded in
        calling f(x) *four* times, and still left 10 steps
        or so for your f(x). To this day I still consider
        it the most amazing program I've ever seen.
```

HP-67:

WHAT: Elliptical Filter Design

WHY: Elliptical Filters were superior to any other standard filters in that they can be of lower degree for a given specs, as they do have true minimax properties. Designing them requires elliptic trigonometric functions (instead of the usual circular ones) and computing them with the required accuracy and fast enough was a real challenge in the slow HP-67's 224 steps. I had to design quite clever algorithms to accomplish it all, but in the end my program would compute high-pass, low-pass, band-pass and band-stop elliptic filters, would compute the zeros and poles and would plot the graphics and all other data relevant to the design.

HP-41C:

WHAT: 8x8 Othello (aka Reversi) game, the user playing against the HP-41C, which played a reasonably challenging game at a reasonably fast speed, while graphically printing the board, checking your moves for legality, being able to play against itself, and finally announcing the winner.

WHY: Because at the time noone had attempted to program such a complicated board game on a 41C. It required several Memory Modules (no Quad Module or 41CV then) and extremely impressed everyone who saw it, so much so that local HP used it to increase sales at local trade shows, as a demo, and it finally got to the hands of HP Corvallis, who where equally impressed. They wrote me a letter telling me so, and asking for my written permission to use and publish it as they saw fit, which I obligued. They then wrote a second 'thankyou' letter including a printed 'Outstanding Achievement' Diploma, redeemable for some expensive 41C peripherals. I still keep it. 'Othello' was also a sensation when I submitted it for publication in the legendary Australian PPC Technical Notes, where it appeared. Oddly, it had been previously submitted to PPC proper, but Richard Nelson gave it a miss.

HP-12C:

WHAT: Trigonometric functions package

WHY: Because noone else had written an acceptable package which implemented all six trigonometric functions for the HP-12C under serious, strict requirements of accuracy and speed. Some people had tried before and after, but hastily and carelessly implementing a bunch of run-of-the-mill Taylor Series expansions doesn't quite cut it and is bound to offer poor accuracy and unacceptable running times or even outright errors for large arguments or arguments near extremes, i.e.: it's not the same computing arc tan(100000000) than arc tan(1), and it's not the same computing arc sin(0.99999) than arc sin(0.1). My program succeeds in delivering accurate results for extended ranges at the fastest speeds and it does so for all six functions in a single 99-step program.

WHAT: Polynomial root finder and evaluator

WHY: Because this very small, 37 step program, succeded in using the financial functions available in the HP-12C well above and beyond their intended uses to provide the best and fastest polynomial root finder and evaluator among all Voyager series models (HP-15C included) and even faster than any pure RPN programs for the HP-41C. It could find any and all real roots of an Nth-degree polynomial, without any iterations in user code, and it could directly evaluate the polynomial for some given arguments, also without using any user code loops.

HP-15C:

WHAT: Computing E up to 208 digits

WHY: I haven't written that many programs for the HP-15C but this I consider particularly worthy. While it is possible to compute E to more than 400 digits on the 15C, my program was intended to do it using matrix functions and matrix techniques, as a way of demonstrating what they could do. So, it made a good use of matrix addition to update the running total, and a novel use of the matrix Frobenius Norm operation to detect termination, as well as scalar matrix division to normalize the final result. You don't see matrix operations being used like this that often.

HP-71B:

WHAT: Chess - Solving mate problems in N moves

WHY: Because it actually solved any chess problem of the 'White to play and mate in N moves' kind, in pure BASIC with no help from assembly language routines, using the powerful technique of *recursive* user defined functions that HP-71B's ultra-advanced BASIC language allows. There's also a neat trick on my part, defining and using variables *local* to the functions, which is something apparently not possible. The resulting program is quite complex, implements a full legal-move generator and recursive move-tree generator and evaluator and works for any number of moves N, subject only to time and memory constraints.

WHAT: Scramble

WHY: Because it implements a really challenging and enjoyable *video* game on the smallish HP-71B display. It uses a number of commands contained in my 4 Kb compilation of LEX words and succeeds in creating a very entertaining game in just a dozen lines of BASIC, with several levels of difficulty and an assortment of tunnels and obstacles that the user can add to easily, for extra-fun.

Best regards from V.

Hola Valentin,

I remember fondly playing Othello on my 41 back then, it was (and still is) a truly amazing feat, one that best showcased the 41 system advantages so I wasn't surprised when HP acknowledged it as such. At least then they could recognize a masterpiece when they saw one.

Since you're an avid Chess aficionado (I'd dare to say you probably exceed such grading), I was wondering if you ever came across a full chess program written on the 41 by a Belgium gentleman by the name of Claude Roeltgen? He managed to create such an ingenious program that I'll always regard this as another incredible achievement. Mind you, it is painfully slow! but again, that's not the point at all.

I dissected the program to see how some things were done. It has synthetics galore, using precompiled GTOS to jump to non-existing labels (to save program lines), amazing manipulation of multi-byte instructions being used separately depending on the jump distance, etc.

Let me know by mail If you're curious, I'll be glad to send you a copy on mag cards.

Best wishes,, AM.

Link to Valentin's Othello program for the HP41

http://www.rskey.org/gene/calcgene/othello.htm

One of my favorite games. Changed to not require a card reader by inserting the storing of needed constants at the start of the program.

Enjoy!

Actually, it's 'Othello 2'

*Message #9 Posted by **Valentin Albillo** on 17 Nov 2003, 4:46 a.m.,*
in response to message #8 by Gene Wright

Hi, Gene:

Thanks for your kind words and for featuring some of my game programs on your excellent site, but as you fully state in the heading, the program you feature there is not the original 'Othello' I was referring to, but a later version, 'Othello 2'. Matter of fact, 'Othello' was never published in PPC, because Richard Nelson did not deem it proper. He published instead 'Othello 2', at a much later date. The original Othello was published earlier in PPC Technical Notes, and eventually, at the request of HP Corvallis themselves, it was fully documented and submitted to the HP-41C's Users Library.

Anyway, what's the difference ? Isn't 'Othello 2 ' an improved version of original 'Othello', better in all respects ? Well, yes and no. On the one hand, it's a much more complex program, features two levels of play, and so can play better at times. On the other hand, the original Othello was much more elegant, did a lot in significantly fewer program steps, and didn't require a card reader at all, being capable of running in less RAM without external initialization. In other words, O1 was the real gem, IMHO, innovative, elegant and streamlined, a programmer's dream come true, while O2 was clumsier, less elegant, and didn't really make the point, as its only redeeming feature, a better level of play, required significant extra resources, didn't play that much better, and was slower by an order of magnitude or more, so it was pretty useless as a demo and you'd need a lot of patience to play against its 'improved' level, thus greatly diminishing the awe factor and the enjoyment.

Besides having a look at O2, available at your site, I'll heartily suggest anyone interested to try and get

the original Othello as well. *That* is the program I consider one of my very best.

Best regards from V.

Available?

Valentín, thanks for your kind words in referring to my 4th order Runge-Kutta program for the HP-25. I certainly wouldn't have done it, had I not been inspired by your 3rd degree program. It's certainly one of the favourite programs I ever wrote, especially since I did now owe an HP-25 myself, and I wrote and ran the program "in my head", but had to wait until we both tried it together in your machine and it ran perfectly on the first try! I don't think I have achieved such a feat (first try perfect run) in my programming life ever again.

Funny thing is that there is an amazingly similar program in the software library here at the museum, and that one leaves 12 steps to code the function. But I think my program required less external initialization and no precautions to not alter the LAST X register between steps. I wish I had an HP-25 to try and compare both versions.

I also have very fond memories of a program I wrote on the HP-67 to solve systems of up to 7 linear equations in seven unknowns. This must have been 1977, and I was in engineering school (I was a classmate of Valentín). There was one particular day that I was not inspired solving a tough mechanics problem during a final exam. So I did it by brute force, which meant taking all the forces and momentum to set up a system of exactly seven linear equations which I solved with my handy HP-67. Of course, the teacher had no clue that such thing as a programmable calculator existed, so he thought my correct results had simply been copied from someone else. I had to show him that I had solved it with the calculator and he wasn't too happy with my method, but he could do nothing but give me a minimal pass grade. Oh well, at least my trusty 67 saved me from a flunked final!

But I think my program required less external initialization and no precautions to not alter the LAST X register between steps. I wish I had an HP-25 to try and compare both versions."

I'm not sure if "funny" is the correct word here. When I first saw that program in the software library at the museum, it made me very suspicious. I remember submitting your original program to PPC, PPC TN, and many particular individuals at the time (25 years ago), but if I recall correctly, it never got published (RN strikes again ! :-)

However, facts are that it got somewhat disseminated, and I've always wondered if the person who 'wrote' and submitted the program actually in this forum's Library could perhaps get some 'inspiration' in a copy of your original. If that's not the case, my apologies, but both programs seem far too similar that a 'lucky coincidence' seems unlikely. Even if it were, yours would pre-date the other one by decades.

Best regards from V.

*Message #17 Posted by **Fred Lusk (CS)** on 19 Nov 2003, 10:21 p.m.,*
in response to message #6 by Valentin Albillo

Bill…

I can be just as long with my post, or even longer :-)

My favorite programs are ones I have written myself while I was in school or as part of my work as a civil engineer. This is not because I claim my programs are better than anyone else's--though I think my best programs are very good--it's because of the time I spent researching the subject of each program and the time I spent actually making the program work. There is great pleasure in both the learning and the accomplishment, and they're useful in my work. Of course, my wife doesn't understand the attraction one bit, but then I don't understand some of what she likes. Good thing we keep our mouths shut about these eccentricities!

In high school and college I wrote simple programs for my HP-55, the best one was probably an

interpolation program for finding all of the contour lines between two spot elevations (think topographic maps). I wrote this for my Engineering Graphics course.

Later in college I bought an HP-34C and wrote several nice programs for different engineering subjects. I even wrote a 34C program on the fly during my Hydrology final to solve a complicated iteration…I listed the formulas, the program steps, my initial guesses, and the result, and I explained how the SOLVE feature worked (my professor used an HP-45 so I knew my approach would be OK)…I finished the test after only 45 minutes and ended up with the highest grade…the second person out took another hour. He was totally blown away when I told him what I had done. Of course, he used a TI!

However, my best programs are for the 41/42S series. I started with an HP-41CV and replaced it a couple of years later with an HP-41CX. I added an Advantage ROM the day they arrived at Lewis & Lewis in Ventura, CA (remember when local dealers actually knew something?). I have an HP-32SII and an HP-48G+, but my calculator of choice now - as it has been for 15 years - is my HP-42S.

I have written a number of interchangeable solution programs for hydraulics that are similar to the Time Value of Money program in the original HP-41C Solutions Book (I think that's the name), including: (1) HW (Hazen-Williams for pressure pipes) (2) MEQ (Mannings for pressure pipes) (3) SD/SWR (Mannings for open channel flow in pipes) (4) CANAL (Mannings for open channel flow in a rectangular, triangular, and trapezoidal channels) I also have several HP-42S solver routines that I use for simple interchangeable solutions where I don't need annotated results.

I use these four (and others) on both the 41 and 42S. Programs (1) and (2) also include an overlapping interchangeable solution for the continuity equation (Q=AV). I say "overlapping" because flow rate and pipe diameter are shared by both equations and I use a toggle to determine which equation to use to solve these variables. Program (1) is my most used program over the years. I wrote it about 20 years ago while my wife was having an ultra-sound before our first daughter was born. I actually "wrote" it in my head (I had no paper) and transcribed the 200+ steps when I got home. My memory was much better back then! Program (3) solves sewer flows in gpm and storm drain flows in cfs. Program (4) is interesting because I use the same iteration subroutine for two of the variables. A flag determines which one to iterate.

(5) My favorite program in terms of cleverness is probably FEET, the Feet-Inches-Fractions program I posted here a couple of years ago. For those of you who live metric (and I wish I was one), this may seem unimportant. But, to those of us who have to calculate this stuff, this program is a god-send. I wrote it nearly 20 years ago for a co-worker. The core of the program (the fraction reduction) was adapated from the PPC ROM. I later discovered a simpler way to handle other parts of the program, but I haven't gotten around to finishing the last 10% so I can post the improved version. In any event, y'all may find the original program interesting.

Other programs I wrote for the 41 and/or the 42S and that I use frequently include: (6) VINT (Vector Interpolation) - this is useful for interpolating between rows or columns in a table based on "index values." I wrote this to interpolate the tables in "Circular Concrete Tanks Without Prestressing" and "Rectangular Concrete Tanks" (both by the Portland Cement Association). (7) NGAS (Natural Gas Flow Calculations) - this program solves the isothermal-compressible flow equation for upstream or downstream pressures in one reach of a natural gas system. I have more general Excel and Mathcad versions that handle multiple pipes, but this is good for things like checking the service lateral to a natural gas engine. (8) HYDR (Rational Method Hydrology) - this program solves single basin hydrology using the Rational (Irrational???) Method using either the Kirpich or FAA equations for Time of Concentration.

My last HP-42S program I will describe is a program I wrote a couple of years ago for a basic Statistics class. I had never taken a stat course and was self taught for the things I needed and use (mainly linear regression). I signed up for a lower division, math-oriented stat class at the local junior college (believe it or not, there are non-math-oriented stat classes…my wife took one in college…it was very qualitative with only a little bit of math). Anyway, my class was taught by my old high school physics teacher, who was

still sharp as a tack at age 77±. He was (I think) one semester away from his PhD in Psychology when WWII intervened, but was expert in many areas…except calculators (TI). He wanted to know why I was there, and I told him it was to pester him! Of course, I had an unfair advantage since I had more math behind me than any of the other students (he took me off the grading curve). Since it usually took me only 15-20 minutes to do each 90 minute mid-term, I had lots of time to kill. After a test on chi-squares and contingency tables, I wrote a nifty little 77-step program that makes great use of the HP-42S's matrix capabilities. The best part was it gave a great excuse to tease him about his affinity for TIs. As an aside, when I was a senior in high school, my American Government teacher asked me to determine the correlation between standardized reading scores and class scores for his group of students. My HP-55 was able to handle the regression for about 175 individual data points (student scores). I remember pointing out to my physics teacher that his SR-51 (I think) was internally crippled because TI limited n to 99 data points. He was not amused.

My favorite program by others is CAVES for the HP-41, though I haven't played it in quite a while. It's the ONLY program that got my wife to actually want to use my calculator. She was a child development major in college and never had a need for a real calculator.

I have also played OTHELLO, and remember it as a very good program.

Now you know the rest of the story.

Fred

Same here with my wife. She really enjoyed that game and played it for many hours. She also used the 11C I got her that she mainly used for work to figure out sales tax % on orders she would take. Still have the 11C and it is in mint condition. Running on the same batteries for 18+ years. I asked her recently if I could have the 11C and I received a direct and stern NO!

I taught her RPN in about an hour one day and she was hooked. I had to get her the 11C, my 41 kept growing legs and moving. She is an HP'er. She says the same thing I do when I have to use an AOS calculator. "How do you use this thing", "This is too hard to use", "Where is an RPN HP when I need it", and I wrote many a program on a TI-59 before I found the HP world and the simplistic beauty of RPN.

Chris

*Message #19 Posted by **Trent Moseley** on 15 Nov 2003, 11:38 p.m.,*
in response to message #1 by bill platt

Bill-

It's a long, long, story, back to slide rule days. It is mainly about astronomy (my avocation). When I got my mail order HP-25C I thought I died and went to heaven. But in my profession at that time it was all about TVM. It also became cruch time: I had to learn RPN. I wrote programs to suit my personal needs (regarding TVM this was before the 12C). All the info I took was from old textbooks. I then blew my wad on the 67. Wow! The upshot is I like to take ideas or formuals and put them down in RPN. Footnote: I bought a 48GX, could not figure out RPL and gave it to my wife's nephew. I now have tons of stuff in the 15C and 42S. Another PS: I bought a 16C from Educalc. I still dont't know what its all about (I even have Grapevine's "Easy Course") so I do my checkbook on it.

My favorite RPN program is the one I wrote in 1976 for the (stillborn) National Semiconductor NS-7100, which was not an RPN machine, because HP still held active patents then, but rather it was an algebraic machine.

My favorite RPN program is the Hewlett-Packard RPN-mode emulator I wrote using the NS-7100's own keyboard language. It had a stack that was nine registers high!

Nat'l Semi & HP patents on RPN

in response to message #20 by Jim Chumbley

Jim --

Was National Semiconductor later able to reach an agreement regarding RPN? I seem to remember, about 1977-79, NS had a "Mathmetician" model that used RPN with a 3-level stack.

The quality of construction did not measure up to HP.

Re: Nat'l Semi & HP patents on RPN

*Message #22 Posted by **Jim Chumbley** on 17 Nov 2003, 9:43 a.m.,*
in response to message #21 by Karl Schneider

I'm sorry, Karl, but I don't know the answer to that question, although it bothered me at the time. If I remember correctly, the Mathematician was the only RPN machine NS ever produced, and there is a chance that it was withdrawn because of some back-channel, not-for-publication warning to National from Hewlett-Packard.

On the even darker side, we should remember that National Semiconductor was at that time an absolutely gigantic supplier of semiconductors, especially analog ones, and could well have been HP's largest supplier of semiconductors, although I'm not sure of this. In addition, National made quite a number of unique analog ICs, which may have been part of a number of HP's instrumentation products.

A real patent war would not have been good for either company.

*Message #23 Posted by **Katie Wasserman** on 17 Nov 2003, 1:50 p.m.,*

in response to message #22 by Jim Chumbley

National Semiconductor (also manufactured under the name Novus) made several RPN calculators, not just the Mathematician. I've got 5 of them that use RPN:

```
3-level stack:
Mathematician
Mathematician PR (programmable)

4-level stack:
4640
Scientist
Scientist PR (programmable)
```

Also, I think that the Novus 3500 was RPN too.

in response to message #23 by Katie Wasserman

Thanks Katie!

I had a Novus Scientist (I think) that used RPN back in the late 79's (sheesh, I'm getting old). It was a HP-21 knock off. I don't remember too much about it, other than it KINDA looked like a 21, but had lousy tactile feedback with little rectangular rubber/plastic keys and chewed through batteries like nobody's business. (was it a 9 volt?) Anyways, I sold it to a business major for 50 bux. I think I paid 75 for it. I put the 50 dollars towards a 21.

Do you have a link to a picture of it?

Non HP RPN

*Message #27 Posted by **Paul Brogger** on 17 Nov 2003, 2:12 p.m.,*
in response to message #21 by Karl Schneider

Coincidentally, I found one of these at the thrift store last week -- working, MWOB (mint, without box) condition. It has a 3-level stack from the user perspective, without T, without automatic duplication of the Z value during stack drop, and without any "roll" function. I had tried one of these in '76, before giving in and buying my first HP (-21), and had discarded it long ago.

The stack is also utilized in "internal" calculations of logs, trig functions, etc., and as a result the manual is the most interesting part: it's got something like 7 of its 32 pages with diagrams devoted to explanations of whether & when to rely on maintenance of the Y & Z values after performing each of the higher mathematical operations. All in all, it illustrates in dramatic terms just how valuable are the extra design elements and internal registers of H-P's implementations.

And it still has the "Made in Hong Kong" label on the back, and, yes, feels even cheesier that the original TI-30 (if that's possible)! (I'm still wondering whether to "eBay" it . . .)

Re: what is your favorite (YOUR OWN) RPN program?

> a: what sorts of things we use our calculators for,

consulting new users, toying around, years ago computer science studies lists and queues simulation in the 48.

>b: why RPN is good (or why keystoke programming in >general)

HP-71B Is best, RPN is good. You see the intermediate answers aas well. ROL calcs with 'Algebraic' on stack give even more versatility.

>c: why BASIC and other methods are good

in a good BASIC (like th 71B) it easier to handle different types of files and records (fields witheen records) than using storage registers or lists of strings. The Commands can also be enhanced to take a different number of arguments. With Forth/Assembler and Saturn achitecture you get all the possible ways of calculating. The only thing missign might be the VisiCalc ROM from the 75C calculator. Now _that_ was a piece of gold.

> Be sure that you describe a program that *you yourself* > wrote--not something you got out of a book, or modified > from someone else. It *has* to be your very own thing.

71B & Foth/Assember: cracking the Secure bit for a desperate customer using a small ML program. The IDS where great and woth every grand.

49G I wrote the STARTEQW for a Custom to be used with the EQW, pure UserRPL

49G also an APPS enhancement that also added numbers to the custom list members (uses a message handler)

I can't recall my 25 and 41CV/CX programs anymore

wait-a-minute, on STaK pages there is still a number of our newsletter from 1992. There I introduce some new 48GX commands programmed in the 48S model to make the old model more compatible.

Then there are literally thousands of small routines and example which you could find with Google or dig out of the brains of the Finnish HP 48/49 users...:-D

There also a few commercial products for the 71B, 48GX, and 49G

Finally there is a small error message translation library FINLIB49, which can be founf here: www.radixoy.com

I surely have forgotten many nice routines Could it be something like this for the 41CV: ('=super T)

00 LBL'1-2-1

01 .02 @ line one of the code

02 %T @ line 2 of the code

03 END

Yoiks!

I am embarassed sometimes to post or even just read here (or comp.sys.hp48) because I used to be so proud of myself if I could make the simplest program work on my old 34C. I tended to try to automate the summing of data points, linear regression, pop out the slope and intercept and if I had to worry a bit about the shape or scatter of my "line", put in an extra step for the correlation coefficient. Later on, I just modified it to get max, min, and mean on a set of numbers. Not anything like what I read here, but boy it streamlines my life... a little bit, anyway. Well, there was that time I got it give me voltages from the Nernst equation, simpler job, and boy, that was a looooong time ago.

:o

My favorite self written program ia one which calculates the weight and balance for a Beechcraft King Air 200.

It was actually approved by the FAA, for air taxi use.

Best, Karl HP-41 Hoarder

*Message #32 Posted by **Ben Salinas** on 16 Nov 2003, 11:27 p.m.,*
in response to message #1 by bill platt

Well, I have a few decent programs for my 32sii (none of the decent ones are typed up) For a long while I was on a game kick, so I programmed a number guessing game (where you guess a random number and it tells you if you are too high or too low), and I got into making stop animation (yes, on the 32sii... you are very limited on the types of characters, and it eats up a lot of memory because for each frame you have to enter an equation)

I also wrote a program, which probably is the most useful of all my programs, to do gas problems. It would do gas problems in torrs, mm Hg, and atmospheres. This was the first time I used flags. My other useful program was incredibley unuseful. I wrote a program that would calculate standard deviation. I know that that is a built in feature (now).

Finally, is my Tic Tac Toe program. I started programming it in December of last year, and have several different releases, all of which are unreleased. Basically, I will think of a more efficient way of programming it, and restart. I would always run out of memory before getting to the data entry part of the program, but now that I have discovered inderect referencing, it will be much easier. I should have enough room to even include AI.

-Ben

*Message #33 Posted by **Ed Look** on 17 Nov 2003, 12:13 a.m.,*
in response to message #32 by Ben Salinas

This is what I mean! See, you programmed the various gas laws, hey, I'll even bet you saved "R" to ten or twelve digits in some register after you calculated it out for yourself since no entry level textbook gives it you for more than four or five digits, and probably played with various permutations of the form of the equations.

A "basic" (NOT LOW end) calculator like the 32SII is more suited to actually making a student familiarize himself with the equations unlike a more features-loaded model, like any company's graphing calcs, which tend to already prerecord such equations in their libraries. Of course, I'm sure even copies of keystroke programmed equations are available for photocopy or download somewhere, but even doing that forces the person to actually go through the program steps!

the importance of keystroke programming

*Message #34 Posted by **Ben Salinas** on 17 Nov 2003, 9:15 a.m.,*
in response to message #33 by Ed Look

Exactly,

Another example of this is when we were covering bases in digital electronics (a required course), and

my teacher taught us how to convert bases, and would ask us questions about converting all bases, not just hex,decimal, octal, and binary, so I wrote a program that would convert any base into any other base. I asked my teacher if I could use it, and he said, "If you understand it well enough to write a program, then of course you can use it."

Another reason I like keystroke programming: It is quick to use -Ben

in response to message #34 by Ben Salinas

Have you perhaps seen the article on page 12 of HP Key Notes, Vol. 3 No. 2, May 1979 right column? There were a couple of corrections to this program which were listed in Vol. 3 No. 3 P. 10 & Vol. 4 No. 1 P. 2. Just thought you might be interested in how someone else did this to compare it with your own program.

No, I have not seen that. Is it some sort of base conversion program, or what? -ben

Re: the importance of keystroke programming

*Message #37 Posted by **r. d. bärtschiger.** on 17 Nov 2003, 7:07 p.m.,*
in response to message #36 by Ben Salinas

Yes, it is an all base number conversion program. Quoting from the program description as given by the author, Cass R. Lewart:

"Here is my program that converts an integer argument from any base to any base in only 49 steps. I saw a description of a similar program in the Users' Library (00409D) but it required 135 steps. I think that many KEY NOTES readers will be interested in this one."

The program listed was written for the HP-67.

My 15C program from the '80s

*Message #38 Posted by **Karl Schneider** on 17 Nov 2003, 3:44 a.m.,*
in response to message #1 by bill platt

In the mid-1980's, I maintained several Fortran 77 software programs that ran on Sperry-Univac mainframes. The software was written to provide large line-printer post-mortem memory dumps when execution failed for some reason.

Sperry utilized 36-bit words, with integers negated by ones-complement. Words of memory were listed as 12-digit octal strings. This practice differed from that of IBM (32-bit words) and CDC (60-bit words), which, I believe, also favored twos-complement.

Anyway, I got tired of manually deciphering 12-digit octal values in the PMD listings to find the value of a

floating-point variable at the time of program termination. So, I wrote a program for my 15C to do so.

The program accepted the 12-digit octal values in two parts -- the 3-digit signed exponent followed by the 9-digit signed mantissa. It checked for any digit larger than 7, stopping with a blinking display if it found one. After a number of seconds, it calculated the correct floating-point decimal value of the encoded word.

Recently, I got a 16C, and see that I could have written a slicker program using its capabilities -- e.g., setting word size and octal mode, extracting bits. A program for the 16C would allow entry of the word as a single string, refusing to accept extra digits or anything other than 0-7. Also, the integer conversions were built in, which leads me to an interesting footnote:

Among RPN HP calculators, only the 16C, to my knowledge, has built-in processing of ones-complement signed integers in addition to unsigned and twos-complement. The Pioneers and RPL models support only twos-complement, and the HP-41 Advantage ROM supports only unsigned integers.

in response to message #1 by bill platt

My favourite program was written for my 1st HP, a 11C. I managed to program the roots solution of $y = ax^2 + bx + c$ without using any register (only the stack).

Not a big deal actually, but at that time I was 14 and I thought challenging and evidence of mastering the stack not to use any register.

This impressed the "TI clan" of my schoolmates (HP were 2 or 3 times more expensive than TI's at that time and only a few of us had the privilege of pesessing one) who found something "magic" on HP calculators to do so as such a challenge was just impossible to them.

Newton’s Law of Cooling My favorite program actually makes use of the solver in the 42s. I used this program often when I was an instrument tech for a chemical plant. I normally used it to determine how good of condition or well the heat exchangers were working and if they needed cleaning. Right after an exchanger was cleaned or worked on, I would check it out by using Newton’s Law of Cooling to find out its heating constant. Since this is a two stage problem the solver is better than a program for this type of application.

I would take temperature readings at 5 minutes, find the time constant and predict the time for 10 minutes out (to verify my time constant). Every couple of weeks I would recheck the time constant of the reactor and if it started to degrade or slow in its heating cycle, I knew the Heat exchanger was failing. This allowed the maintenance dept. a better cycle of repair than just a 6 month cycle, fix it whether it needed it or not (which is what was used before). Often the heat exchanger would degrade after 4 months but sometimes they might last 8-12 months, but maintenance did not want to fix what wasn’t broke. Documentation always made the crew feel better, knowing the system they were going to fix, needed fixing. I myself worked on these systems located in a pit a couple times. NO ONE wanted to fix a working heat exchanger!

The Solver allows for any temperature and/or time scale (just stay in the same units). It works great at predicting future temperatures or time constants. And the 42s allows long variable names, which is great for looking at this program years later and still knowing what each variable is for.

LBL”COOL” MVAR”TF” FINAL TEMP MVAR”Ti” INITIAL TEMP MVAR”TA” AMBIENT “surrounding

or supplied" TEMP MVAR"K" TIME CONSTANT MVAR"TIME" TIME RCL"Ti' RCL"TA" - RCL"K" RCL"TIME" X E^X X RCL"TA" + RCL"TF" - END

Here is the formula listed: (Ti-TA)e^(K x TIME) + TA = TF

*Message #41 Posted by **Jim Chumbley** on 17 Nov 2003, 10:39 a.m.,*
in response to message #1 by bill platt

May I mention one more RPN program, which is more in keeping with the spirit of the other entries than my NS program was?

In 1970, I had to analyze the time in decimal hours that operators spent exercizing various machines being subjected to reliability testing. This irksome task required the efforts of two technicians working full time.

I persuaded the company to buy an HP-9100A, with printer, plotter, and (the nowadays apparently forgotten accessory) a mark/sense card reader. The card reader read IBM punch-card sized cards that had been marked in pencil. The placement of the pencil marks could be interpreted by the 9100, and the engineer could define these to mean anything he wanted.

I wanted it to mean time. So I designed the cards and had them printed and introduced them to the operators, explaining how to convert time in h-m-s to binary-coded entries in pencil marks on each card. This was, shall we say, somewhat less successfully received than I had hoped. Not to worry! I backed off, had the operators write down in numbers the time information needed and asked their supervisors to convert to markings on the cards. We were amazed to find that they quickly learned to make the conversions from h-m-s to binary-coded entries in their heads and to finish the marking of the cards in 20-30 minutes.

They sent each day's cards to me (from all three shifts) and I zipped them through the mark/sense card reader. The 9100 completed the analysis with finished reports. All this on a tiny little 40-lb. machine the size of a Selectric typewriter with 196 programming steps, 16 registers, and 1 flag--Oh, how I needed just 1 more flag! It had only a 3-register non-automatic stack.

And lastly, the key that was so badly misnamed in later machines as "Enter" was simply labelled with an arrow pointing "Up." And this key, while double key length, was placed vertically rather than horizontally. Look at the numeric keypad on your PC's keyboard.

Even now when I write RPN programs for my 41CX I still write "Up" for this function. Think about it for a second, and you'll realize that those of us who raised such a howl in 1972 about the HP-35 having this key labelled "Enter" were right. Nothing is being "enter"ed. It is being raised "up" from the x-reg to the y-reg. Maybe the reason that it was not called "Up" on the HP-35 was because that key had to be horizontal to fit in the keyboard.

And to think that now we have good HP customers who mourn the lack on the 49g+ of a double-width, horizontal "Enter" key. Horse-feathers! Shame on you young whipper-snappers! I want a double-height, vertical "Up" key!

Thanks for letting me tell two stories.

in response to message #42 by bill platt

Ok, I was remembering one episode...

I was with my family on the beach, and we are playing a card game called "Truco". Normally the points are counted with a box of matches, but in that time we haven't any! I was with my brand new HP-42S (it was 1990 then) and I wrote a little program on the 42S, to sum our points...

I'm not a engineer nor mathematician, I'm a computer programmer and I learned to program on a HP-15C (and a small Sinclar ZX-81 compatible computer) back in 1983. That "Truco" program was not any fancy algorithm, but I used menus and the score was showing on screen for both teams - and wrote it "on the fly" in about 15 minutes, while waiting my turn to enter in the game...

They where impressed, and was very fun!

My 2¢... ;)

Nelson

I have written a complete compressible flow function table solver, including classic 1D flow functions, normal shock tables, rayleigh flow and fanno flow functions.

It includes a "Preprocessor" that allows choosing between air, combustion products, steam (assumed to be an ideal gas in this case) and, subsequently, automatically selects the correct gas properties in the background.

It also allows entering a random gas via a molocular weight and specific heat ratio.

In the preprocessor, left shifting the gas selections initializes for metric units, a straight hit on the selection keys initialize for english units.

I have also included a method for "extracting" a desired expression for the chosen function, for easy subsitution to the stack in a format which makes using that chosen particular expression with the built-in equation solver easy. This allows for (fairly) seamless reverse use of the table, as well.

THAT one is my favorite.

Taking a close 2nd place is a similiar program that I wrote that calculates the ISA standard atmosphere given an altitude, then allows solving for the unknown air speed given one of the three following air speeds: true, corrected or calibrated air speed (in knots).

No, I'm not that bored, I really need these for my job.

With all of the computing available now relative to 15-20 years ago, there is still NO substitute to having such power in one (hand held) flexible package.

I go way back to the 67, the TI58 (ugh), then the 41s, then the 48s, and now the 49s. Love(d) programming ALL of them.

I'm showing my age a little bit...

Re: what is your favorite (YOUR OWN) RPN program?

*Message #45 Posted by **Larry Corrado, USA (WI)** on 17 Nov 2003, 10:54 p.m.,*
in response to message #1 by bill platt

My favorite RPN calculator program was one I wrote in about 1977, for my HP-25. I was fascinated with the concept of random numbers, and the idea of computing (pseudo) random numbers. I found a simple algorithm that essentially kept cubing a real number and extracting the first digit in the tenths place as random. I was curious as to whether this could pass a simple frequency test. Thus, I wrote a 49-step program for my HP-25 that kept track of how many times each of the digits between 0 and 9 were generated in a test run.

One of the main problems I encountered was storing the 10 counters needed (one for each digit), with only 8 registers available. My solution, interesting for me, a novice programmer, was storing counts for three digits in one register by using the three lowest-order integer positions for one digit, the next three positions for the second digit, and the next three places for the third digit. I was thus able to keep count of all 10 digits in four registers, with a maximum of 999 for any one counter.

I recall leaving the machine running for hours at a time, testing tens of thousands of digits in the process. After a number of trial runs, I found that the digits appeared to be evenly distributed as expected.

Fond memories…

Regards to all. Larry

*Message #46 Posted by **David Brunell** on 18 Nov 2003, 5:21 p.m.,*
in response to message #1 by bill platt

If you will include RPL programs in your survey, then the one I am most proud of is my Smith Chart Companion, which I presented at the 1992 RF Expo (USA). From the abstract:

The Smith chart is a very useful tool for the analysis of transmission line problems as well as the design of high-frequency amplifiers. Its utility lies in the fact that the relationships between complex impedances and reflection coefficients are represented in an intuitive, graphical way. The price paid for this graphical technique is poor accuracy and interpolation headaches reminiscent of slide rule days. The Smith Chart Companion software has been designed to offload the computational tasks to a programmable calculator while maintaining the graphical ease of use inherent in the chart itself.

I'd be happy to send anyone interested a copy of the software.

From BASIC to RPL [long]

*Message #47 Posted by **Tizedes Csaba** on 18 Nov 2003, 7:34 p.m.,*
in response to message #1 by bill platt

Some of my favourite programs (all of it written by myself):

When I was young, I wrote a little BASIC program for my CASIO FX-850P. It was a molar-mass calculator. It had two vectors: M$() contained the symbols of elements (M$(1)="H",...), and M() contained atomic weights of elements, in same order.

When I typed the chemical formula, this program transferred that to a string, what was an evaluable formula to calculate molar-mass:

"CuSO4.5H2O" -> "M(29)+M(14)+M(8)*4+5*(M(1)*2+M(8))" then I used 'VALF()' function to evaluate it.

I wrote a tip calculator for my HP48SX. I never used it... :)

I wrote a Venus-calendar to my girlfriend. She's favourite planet is Venus, and she want to know, when and where it visible.

The orbits of Venus and Earth are good approximate with circles. This program use "linear" estimation of orbits, and calculates famous points of thats, and calculates the phase of Venus for any day. (It's not a really program, it's some of equations only...for my 48SX.)

I wrote a little program to calculate settle-velocity of gold-grains in the Duna (Duna is the largest river of Hungary) for HP32SII.

I wrote a partial derivative program for any variable for HP32SII. [I posted it to 'Program Library', but this site not freshed yet. It use statistical registers and 'i' to make calculations. All of other registers are free. This program calculates partial derivative numerically and works with SOLVER and with INTEGRATE.]

I wrote some equations to my mother, to optimize she's egg-incubator 'economically'. (What is the good egg? Chicken, duck, goose or maybe guinea fowl???)

In the University (some weeks ago) I wrote a little program, what maked some additional calculations of sterilyzing-time of tomato sauce. It uses idealized spherical preserving jar geometry, and used Fourier-series with four elements. When program ended, I transferred the result to my PC, and the presentation maked on it. OBSESSION :9

And finally a BASIC program for my CASIO: I wrote a program to calculate how many cucumbers we can to push to a preserving jar. It was important, because we had got some jars, and we don't know how many kilograms of cucumber we have need.

The program was not worked. We cutted little discs from paper, and drawed circles with some diameter like jars, and we try to put discs into the circles, then we calculated the approximated mass of cucumbers.

And many-many, what I liked... :)

Csaba

Ps.: I wrote a little counter program for Z80 microprocessor in assembly, many-many years ago. It counts up to 255 digits on the screen. On my ENTERPRISE 128 (that was my first HOME COMPUTER!) it counted to 1e6 about 24 seconds. Hmm... That was wonderful...! :)

Re: HP 15 C - small typo, I guess

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2003, 11:27 p.m.,*
in response to message #2 by bill platt

Hi, Stefan and Bill;

just a small remark over Bill's explanation:

- [f][(i)] allows you to temporarily "see" the imaginary part of the complex number in the X-register; if the HP15C is not in complex mode, [f][(i)] returns an [Error 3] message;
- as Bill mentioned correctly, I consider [g][SF]8 as the most "natural" sequence to activate complex mode in the HP15C, because it does not change existing stack contents; [f][I] (upper case "I", beside (i) function in the keyboard) also activates complex mode, but this sequence alters stack contents; and the third possible sequence to activate complex mode in the HP15C is [f][Re<>Im] (real exchanges imaginary), that changes only X-register contents.

Just my 2¢.

Best regards.

Luiz (Brazil)

Differences?

*Message #1 Posted by **Matthias** on 15 Nov 2003, 2:52 p.m.*

Can somebody tell me the difference between the following HP-41 modules?

GMAC I - GMAC II - GMAC III AstroRom I - AstroRom II Buderus 1 - Buderus 2 - Buderus 3 - Buderus 4 Speed Machine I - Speed Maching II

Re: Differences?

*Message #2 Posted by **Wlodek Mier-Jedrzejowicz** on 16 Nov 2003, 10:31 p.m.,*
in response to message #1 by Matthias

Matthias, what do you mean by "difference" between: >GMAC I - GMAC II - GMAC III AstroRom I - AstroRom II >Buderus 1 - Buderus 2 - Buderus 3 - Buderus 4 >Speed Machine I - Speed Maching II

An obvious difference is that they have different name labels on them :-)

The different names represent modules that did different jobs. Are you saying that all 4 names (GMAC, AstroRom, Buderus, Speed Machine) refer to modules that did nearly identical jobs? They did not, though some of what they did does overlap.

In some cases you needed 2, 3 or 4 modules, to provide a complete set of functions for a particular task. I think that was the case with the GMAC modules - can anyone here confirm it? In other cases, the differently numbered modules did different jobs for a particular application and you bought the one you needed.

Sorry that this is vague, but that's why I am asking what your question really means :-)

Regards,

Wlodek

Re: Differences?

*Message #3 Posted by **Matthias** on 17 Nov 2003, 6:24 a.m.,*
in response to message #2 by Wlodek Mier-Jedrzejowicz

For example I have a AstroROM I and a AstroRom II, both with the same manual. Why?

Second example: GMac I-III. I have them all, but their template has the same key overlay exept that the template is white, gray and black...

Re: Differences?

*Message #4 Posted by **David Smith** on 17 Nov 2003, 12:01 p.m.,*
in response to message #1 by Matthias

I would suspect that they are different revisions of the same code with bugs fixed and mayby minor functionality changes.

Re: Differences?

*Message #5 Posted by **Ángel Martin** on 18 Nov 2003, 5:43 a.m.,*
in response to message #1 by Matthias

What about comparing the functions on them? I mean number of functions and their names, which shouldn't require much knowledge of the actual application.

Or what about checking whether they have the same XROM id#? Are all versions 4k ROMS, or maybe version III is the addition of I and II?

In this way you can start to figure out what makes them different, or what makes them the same...

I'm sure you'll let us all know your findings!

Best, ÁM

Re: Differences?

*Message #6 Posted by **Wlodek Mier-Jedrzejowicz** on 19 Nov 2003, 12:16 a.m.,*
in response to message #5 by Ángel Martin

Hi again, and thanks Matthias for explaining. Now I see that you were asking what the differences between the various GMAC modules were, then what the differences between different AstroRoms were, and so on. I had thought you were asking about the differences between GMAC, AstroRom, etc.

As David Smith and Angel Martin wrote, it seems most likely that these are different versions of one module. But in some cases, a complete application did not fit in one HP-41 module, and a company would sell two or even more modules, and you had to plug all of them into a 41 to use that application. In other cases you could buy and use only one module from a set, if you only needed some functions, not the full application. Either way, there might be only one manual for the full set, but it would explain the different modules.

Yes, please do tell us when you find the details!

Wlodek

Does anyone know if the 19Bii+ will be out in time for Christmas?...

*Message #1 Posted by **Jim** on 15 Nov 2003, 3:54 a.m.*

I've seen December AND January. TIA

Re: Does anyone know if the 19Bii+ will be out in time for Christmas?...

*Message #2 Posted by **Scuba Diver** on 15 Nov 2003, 11:58 a.m.,*
in response to message #1 by Jim

To be honest, I wouldn't hold my breath.

During a recent visit to the HP website, I learned that there will be 11 calculators in the HP line. They currently have 10 calcs in production, and they announce on the site that there is one more graphing calculator to come (the 39G+).

So, I think that they might have dropped the 19BII+, and I will be disappointed if that's indeed the case.

If anyone has heard anyting different, please let me know! B.

HP 41 ROM pac keyboard overlays

*Message #1 Posted by **Jerry Pfile** on 14 Nov 2003, 10:49 p.m.*

Hi,

Would anyone be good enough to tell me if the following HP 41 Pac origonally came with keyboard overlays. If so, how many with each:

00041-15019 Thermal and Transport Science 00041-15002 Statistics 00041-15020 Machine Design

Thanks in advance,

Jerry

Re: HP 41 ROM pac keyboard overlays

*Message #2 Posted by **Randy Sloyer** on 15 Nov 2003, 3:28 a.m.,*
in response to message #1 by Jerry Pfile

AFAIK, none.

Re: HP 41 ROM pac keyboard overlays

*Message #3 Posted by **Jerry Pfile** on 16 Nov 2003, 1:39 a.m.,*
in response to message #2 by Randy Sloyer

Thanks Randy

Problem with HP49+, conn4x

*Message #1 Posted by **Hugh Wong** on 14 Nov 2003, 6:47 p.m.*

Hi, My HP49+ has some problem connecting to the HP conn4x software. 1st. when I turn on the HP49+ and do the right-shift, -> arrow key combination, the HP49+ will say Await- server-comd and will not say Xmodem-server, and conn4x cannot find the HP49+; but sometimes the right-shift,-> keys will make the HP49+ display Xmodem Server, in that case, the conn4x may find the HP. By trial and error, I found that the " alpha, right-shift, -> " keys will definitly bring the Xmodem Server message on, but the Conn4x may still not find the HP. Does anybody encounter the same problem ? Furthermore, if I go to i/o menu and set the transfer parameter to Xmodem and select OK, next time I go to i/o - transfer, again, kermit parameter is automatic reset back. Is this a HP49+ hardware problem or "conn4x" problem ? All other function on the HP49+ seems OK.

Hugh

Re: Problem with HP49+, conn4x

33S MANUAL HAS DISAPPEARED!

*Message #1 Posted by **Steve Ramsey** on 14 Nov 2003, 3:26 p.m.*

Just took a quick glance at the hp website...and I can no longer find the manual for the 33S! A search for "33S" yields not a trace of anything resembling a calculator. As I see it, motivation for this could be anything from "Why are we posting a manual for a calculator that can't currently be bought?" to "Those people that post to The Museum of HP Calculators Forum are right, we've got to totally redesign this thing!" Commence wild speculation.

While you're at it, consider these facts: -HP still holds the copyright for the HP 42S's ROM -The HP 42S is capable of handling 32k of RAM -The HP 42S uses a two-line display -The latest information indicates that the HP 33S will have 32k of RAM and a (underutilized) two-line display

Ah, if only.....

Ciao, Steve

Re: 33S MANUAL HAS DISAPPEARED!

*Message #2 Posted by **Namir Shammas** on 14 Nov 2003, 3:42 p.m.,*
in response to message #1 by Steve Ramsey

Steve,

I found the HP33s manual "again" at:

http://h20015.www2.hp.com/en/taskPageSelect.jhtml?reg=&plc=&lc=en&cc=us&prodId=hp33sscien370806&pagetype=manual&docparent=manual

Trying to find it using the regular search is like trying to find Saddam Hussein!!!

*Message #10 Posted by **Brent** on 16 Nov 2003, 5:46 p.m.,*
in response to message #3 by Steve Ramsey

Now it's gone completely. Even the link posted in a previous message is no longer valid.

33S Manual has reappeared

*Message #11 Posted by **Mike Sebastian (Texas)** on 16 Nov 2003, 7:27 p.m.,*
in response to message #10 by Brent

http://h20015.www2.hp.com/content/common/manuals/c00043313/c00043313.pdf

It is now located under the HP 30S product information pages.

The amazing travelling manual....

*Message #12 Posted by **james(UK)** on 17 Nov 2003, 2:09 p.m.,*
in response to message #11 by Mike Sebastian (Texas)

Doesn't give you much faith that HP have any clue as to what they are doing when they can't even keep their manuals in one place!!!

Re: 33S MANUAL .... It's My fault

*Message #13 Posted by **Norm** on 15 Nov 2003, 2:05 a.m.,*
in response to message #1 by Steve Ramsey

It's my fault the HP-33S manual disappeared.

I was speaking to a senior HP executive and told him calculators should not be shaped like a Chevron gas station sign. Also, I told him that HP-34C was the best calculator HP ever made.

He said they would immediately scrub the entire HP-33S program and divert the entire HP calculator engineering department to making retro-nostalgic red LED calculators that work like classic calculators.

No doubt he got the HP-33S manual pulled at the same time.

Statistics bug?

*Message #1 Posted by **Alan Dalkey** on 14 Nov 2003, 1:54 p.m.*

I'm doing the following on an HP11C: 147 sigma plus, 181 sigma plus, 211 sigma plus, 114 sigma plus.

Then I take the standard deviation: s = 41.97

Then I remove the last entry: 114 sigma minus.

Then I try to get the standard deviation again: s = error 2

If do 147 sigma plus, 181 sigma plus, 211 sigma plus, s then I get 32.02.

Is it me or the calculator?

Me too

*Message #2 Posted by **james (UK)** on 14 Nov 2003, 2:24 p.m.,*
in response to message #1 by Alan Dalkey

s = error3 for my 34C; s= error2 for my 12C and OUT OF RANGE for the 41CV!

Double D'oh.....

*Message #3 Posted by **james (UK)** on 14 Nov 2003, 2:54 p.m.,*
in response to message #1 by Alan Dalkey

Just realised - after getting s for the 4 numbers, 0 needs to be put into the stack before entering 114 so when you sigma-minus y=0 and x=114 rather than y=41.97 (old s) and x=114 otherwise when it recalculates s(x) it also tries to recalculate s(y) using sum of y squared which is now a negative due to subtracting the square of the apparent fourth y of 41.97 which then results in the poor old machine trying to take the square root of a negative number.

Ahh User Error as usual

*Message #4 Posted by **Alan Dalkey** on 14 Nov 2003, 5:26 p.m.,*
in response to message #3 by james (UK)

I see what's going on.

Thanks James!

Re: Statistics bug?

*Message #5 Posted by **Trent Moseley** on 14 Nov 2003, 3:15 p.m.,*
in response to message #1 by Alan Dalkey

It's the calc. I posted this problem on the Forum some months ago. Of the ones I own this problem occurs on the 11C, 12C, 15C, and the 42S. On the 25C, 67, and the 32iiS, NO error message, but the correct answer: 32.02.

tm

Re: Statistics bug?

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 14 Nov 2003, 3:38 p.m.,*
in response to message #1 by Alan Dalkey

My HP-15C and my HP-41CV does well, both shows for the SDEV=32.0208, no error. I cannot try on my 11C as its display is broken :((HP-15C s/n 2723B12245, HP-41CV s/n 2214B03932)

Triple D'oh!

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 14 Nov 2003, 3:44 p.m.,*
in response to message #6 by Nelson M. Sicuro (Brazil)

As our friend James said, is the Y value on the sigma(-) operation... I was clearing the display before inserting the 114 sigma(-), and it worked... if I don't clear the X before typing the 114, the HP-15C shows "Error 2"...

Re: Triple D'oh!

*Message #8 Posted by **james (UK)** on 14 Nov 2003, 4:25 p.m.,*
in response to message #7 by Nelson M. Sicuro (Brazil)

Hi Gang

It's always the little things - reminds me of the hours I spent gazing at FORTRAN listings wondering why the program didn't work and someone would look over my shoulder and point out the ',' that should have been a '.'

My apologies in advance for the formatting - can't work out how to get a superscript 2 for the squares or a sigma sign so please read x2 as x-squared and E as sigma.

The apparent bug results from the fact that the standard deviation function operates on two variables, x and y. Every time you key E+ the calculator accumulates Ex, Ey, Exy, Ex2 and Ey2. When E- is keyed the calculator makes the appropriate adjustment to Ex, Ey, Exy, Ex2 and Ey2. If you are only using one variable, the y-register should be cleared first before starting so that y (and Ey, Exy, and Ey2) will always be equal to 0. The apparent bug arises when, having called s, which returns both s(x) in the x register and s(y) in the y register, you then enter, in this case, the 4th x (114) which pushes s(x) into the y register and key E- then the calculator will in making the appropriate adjustments to Ex, Ey, Exy, Ex2 and Ey2 subtract the square of s(x) from the current Ey2 which was 0 and now becomes -s(x)2. When you recalculate s, s(x) can be calculated but s(y) can't be calculated as it now involves trying to take the square root of a negative number and the apprpriate error message is displayed – in the case of the 34C, error3. Extract from the 34C handbook “A nonzero number in the y-register during one-variable calculations of s, r, L.R. may result in a display of Error3”.

s(y) = square root of {[n Ey2 - (Ey)2]/n(n-1)}.

With my 12C, 34C and 41CV there is no error display provided that I am careful to ensure that after getting s(x) I key 0 [ENTER] before keying the 4th x (114) and E-.

I'm now off to try and make peace with my HPs for ever doubting them!

Best

James

Re: Statistics bug?

*Message #9 Posted by **Trent Moseley** on 14 Nov 2003, 5:08 p.m.,*
in response to message #6 by Nelson M. Sicuro (Brazil)

Using Alan's keystrokes on my 15C (serial 2242A17848) I get "Error 2". I consider it a "bug" when you are forced to load a "0" into the stack. After all on the 25C, 67, and the 32Sii loading in a "0" is not necessary and you do get the correct answer.

tm

Puzzled by 67

*Message #10 Posted by **james(uk)** on 14 Nov 2003, 5:37 p.m.,*
in response to message #9 by Trent Moseley

Hi Trent

The behaviour of the 67 intrigues me as it appears (from what I can find) to operate in the same way as the 12C, 34C, 41CV et al, ie when you calculate s it computes both s(x) and s(y) and therefore unless y is set to 0 for the data pair to be deleted, E- will result in s(y) being the square root of a negative number.

From a look at the 25 manual on the MoHPC CDs and the spec sheet on the 25C page on the museum the problem won't occur with the 25C as it doesn't appear to have full two variable statistical functions and only calculates s(x) - according to the manual the only quantities it accumulates are Ex, Ex2, Exy and Ey but not Ey2 therefore no s(y).

As to the 32Sii (of which I have no experience) a response to the thread a few months ago indicated that s(y) was a separate function to s(x) so calculating s(x) wouldn't give rise to any error message.

But the 67 baffles me.....

Best

James

Re: Puzzled by 67

*Message #11 Posted by **Trent Moseley** on 14 Nov 2003, 9:24 p.m.,*
in response to message #10 by james(uk)

James (UK),

I agree. I've got the handbooks out HP-67 pgs. 113-114 and HP-15C pgs.53-54 and Appendix A pg.206. Will try to figure it out. But the fact remains that the 67 comes up with the correct answer without all that "0" imput rigmarole.

tm

Re: Puzzled by 67

*Message #12 Posted by **r. d. bärtschiger.** on 17 Nov 2003, 7:17 p.m.,*
in response to message #11 by Trent Moseley

This may or may not be of some help.

According to the HP-67 manual:

"The number that you keyed into the X-register is preserved in the LAST X register, while the number in the stack Y-register remains in the Y-register."

rdb.

Re: Puzzled by 67

*Message #13 Posted by **Victor Koechli** on 18 Nov 2003, 3:14 a.m.,*
in response to message #12 by r. d. bärtschiger.

The same should also apply to the other 4-level stack models (15C, 41, 42S): The stack lift is locked after Sigma+, so entering just one number will not raise the stack and leave Y what is was before. If you press 0 ENTER before beginning summation of your data, all of these calcs should behave the same and not cause problems with SDEV or MEAN.

Cheers, Victor

Re: Puzzled by 67

*Message #14 Posted by **Trent Moseley** on 15 Nov 2003, 6:51 p.m.,*
in response to message #10 by james(uk)

James-

I can't figure out why the 67 doesn't have this bug. Its too bad they didn't use its algorithm for the Voyager series and the 42S.

tm

Re: Puzzled by 67

*Message #15 Posted by **james (uk)** on 16 Nov 2003, 4:53 a.m.,*
in response to message #14 by Trent Moseley

Hi Trent

Thanks for the update - it's interesting that they changed the algorithm - I wonder why? Presumably the 67 must decide that if Ey2 becomes negative you are working with only the x variable. Out of interest, what does it return for s(y) in such a situation?

Best, James

Re: Puzzled by 67

*Message #16 Posted by **Trent Moseley** on 17 Nov 2003, 6:59 p.m.,*
in response to message #15 by james (uk)

James -

After going through the same steps in Alan's original example, the X reg shows 32.02 and th Y reg 34.27 and zero in the Z and T regs. Storage reg s4 has Ex, s5 has Ex2, s6 has -41.97 (the negative value of the sd the orininal four values), s7 has -1761.58 which is the negative value of 41.97 squared, s8 has -4784.72 i'm not sure what that is, and 3 (n) in s9.

Trent

Re: Puzzled by 67

*Message #17 Posted by **james summers (uk)** on 25 Nov 2003, 8:20 a.m.,*
in response to message #16 by Trent Moseley

Hi Trent

Thanks for the update - I've been trying to work out what the y reg figure of 34.27 represents but with no luck - maybe I should get a 67 (any reason will do as justification!)

It seems to be picking up s(y) as a y value when E- is performed so stack lift can't be disabled so I guess it must have some code that decides that if s(y)2 is negative you are only working with x values and therefore doesn't bother with trying to take the square root which would produce an error flag. I wonder why they didn't carry this routine over to the later machines.

Best, James

Re: Puzzled by 67

*Message #18 Posted by **Trent Moseley** on 25 Nov 2003, 5:42 p.m.,*
in response to message #17 by james summers (uk)

James,

Sounds reasonable. I'm going to fool around with it some more this weekend.

Trent

Built-in stats on the HP-41

*Message #19 Posted by **Karl Schneider** on 16 Nov 2003, 2:46 p.m.,*
in response to message #1 by Alan Dalkey

The cause of the unexpected result obtained by Alan Dalkey (subj: "Statistics Bug?") on an 11C (and others on the 15C and 41C) has been adequately explained. The root cause is that these units perform summation and calculations on ordered-pair variables, even when only single-variable data is being entered. Models that provide separate operations for calculating mean and standard deviation for x and y (e.g., 32Sii) can avoid this problem.

(Another logical solution is to have separate "modes" for two-variable and single-variable statistics. Certain models by Casio and TI handle the stat/regression task more elegantly than many HP models, in my estimation. In fact, I can name at least five things I don't like about the stat functionality on the HP-15C, but at least it's there. Many of the shortcomings stem from a lack of keyboard space.)

Alan's "finding" revealed something I didn't know about the HP-41. I had assumed that it had only single-variable stats, because it had only "MEAN" (arithmetic mean average)and "SDEV" (sample standard deviation) built-in. Thus, the "OUT OF RANGE" message found by "james(uk)" was surprising -- if HP put two-variable stats in the HP-41, why didn't they add the necessary named-function regression routines?

The cynical answer might be in the HP-41 "Stat Pac" (which I have). Using Sigma-plus and Sigma-minus, the Stat Pac adds the missing regression-analysis functions as RPN programs for linear-, logarithmic-, expenential-, and power-. BTW, using the Stat Pac regression programs will change the stat registers from the default R11-R16 to R10-R15.

The HP-42S took this one better, adding a "best-fit" option.

Two-variable statistical summation built-in, with regression-analysis as an extra-cost option! Had HP planned that all along?

Re: Built-in stats on the HP-41

*Message #20 Posted by **Trent Moseley** on 17 Nov 2003, 10:41 p.m.,*
in response to message #19 by Karl Schneider

Karl -

But you leave out of your discussion the HP-67.

tm

Re: Built-in stats on the HP-41

*Message #21 Posted by **Karl Schneider** on 18 Nov 2003, 4:29 a.m.,*
in response to message #20 by Trent Moseley

Trent posted:

> Quote:
>
> *Karl -*
>
> *But you leave out of your discussion the HP-67.*
>
> *tm*

I don't *have* a 67; I've only seen pictures of one. Thus, I don't know what's different about it, other than what you have posted several times on this topic.

Perhaps the 67 is an exception, but stat calculations tend to be kinda screwy on the traditional HP RPN machines. Calculations automatically performed using "stack-clutter" inputs is the real culprit. Here's a list of shortcomings on the 11C/15C:

1. (x-data) ENTER (y-data) E+ adds x-data to Y-summation, and vice-versa.

2. No "frequency" function for multiple occurrences of a data point.

3. No x-data estimator, weighted mean, or population standard deviation.

4. y-data estimator also calculates "r" every time, and vice-versa.

5. Risk of calculation errors with inadvertent garbage data.

Granted, if one knows the math and summations, there are fairly easy workarounds for most of these. Also, there just wasn't enough keyboard space to provide the missing functionality -- much had to be "doubled up". Still, there is potential for "user consternation".

SANDBOX: the Sequel

*Message #1 Posted by **Ángel Martin** on 14 Nov 2003, 3:19 a.m.*

Hi there,

Work is in progress to extend the SANDBOX to an 8k ROM.

As it is, I'll have to redesign the current 4k page to make the function grouping more logical, after adding the new ones (ROMSUM, RAMED, RCLMATH, and many more...).

There's still some "space available" and I'll like to ask for your contributions. You're more than welcome to send me your 'favorite' function for inclusion!

So go ahead and crank up the MCODE machine, your code will "feel" great in the SandBox. Wouldn't it be grand if we made it a group effort? [Who knows, we might even call it "PPC-II ROM"]

Best, ÁM.

Re: SANDBOX: the Sequel

*Message #2 Posted by **Meindert Kuipers** on 14 Nov 2003, 4:31 a.m.,*
in response to message #1 by Ángel Martin

Send me your email address and I will send you the disassembly listing of my own MLROM, which I always use in combination with CCD and DAVID ASSEMBLER. I do have documentation, but printed only and I have yet to scan it.

HP49+ , HP48, HP49

*Message #1 Posted by **Hugh Wong** on 13 Nov 2003, 1:44 p.m.*

Hi,

Anybody know how to transfer HP48 data to HP49+ via the infared port ? Are they competiable ? How can I transfer some spreadsheet data from one to another ? I tried the PC as an intermidiate transfer device using HP's PC link but the HP49 or HP49+ cannot download the file from the PC. Please help

Hugh

Re: HP49+ , HP48, HP49

*Message #2 Posted by **Brandon** on 13 Nov 2003, 10:24 p.m.,*
in response to message #1 by Hugh Wong

I couldn't transfer between the two, but I can't remember if it was because of the different file headers or because they couldn't see eachother. I'm loaning out my 48gx, so I can't check now.

Re: HP49+ , HP48, HP49

*Message #3 Posted by **Jeff** on 13 Nov 2003, 10:35 p.m.,*
in response to message #1 by Hugh Wong

This has been discussed at comp.sys.hp48.
Try this thread, this thread and this one. Apparently IR transfer is not possible. Transfer via computer is possible, but requires some file manipulations using either emu49 and/or other methods.

Re: HP 33s

*Message #3 Posted by **Paul Brogger** on 13 Nov 2003, 5:33 p.m.,*
in response to message #1 by Dave Falkenberg

I was just talking to HP Calculator Support (about a 49G+) and asked about the 33s. Company line (as of yesterday) is, "Anything that's been announced is still subject to change" and regarding its release date, " ... sometime late 2003, early 2004 ... ".

Re: HP 33s

*Message #4 Posted by **Brandon** on 13 Nov 2003, 10:21 p.m.,*
in response to message #3 by Paul Brogger

yeah... we all hope the ugly V-shaped keyboard is subject to change :)

Re: HP 33s

*Message #5 Posted by **Ken Emmens** on 21 Nov 2003, 5:15 a.m.,*
in response to message #4 by Brandon

Yes, the HP33S keyboard is not the most inspired design in the world but hey, does it really matter? I'm going to buy a 33S to use it in my work, not to use it as some sort of adornment or to leave it lying around to impress others. As long as it does its job I'll be satisfied. In my humble opinion we're lucky to be even getting a reasonably decent replacement for the HP 32SII. Forget about what the thing looks like and think about all the extra program memory you've been given compared to the HP32SII. Personally, I can't wait to buy one.

Re: HP 33s

*Message #6 Posted by **CME750** on 21 Nov 2003, 4:41 p.m.,*
in response to message #5 by Ken Emmens

I expect to get a 33S too (primarily for exam use). But don't get too excited about "all the extra program memory you've been given compared to the HP32SII." In practice, it will be very difficult

to actually load more than 1-2KB of programs into that 31KB space. This is better than the 32SII, but not nearly as good as you might have expected.

The problem is with the labels. You need a distinct label at the start of each program, and at branches, loops, and subroutines. On the 32SII and 33S, you can't GOTO line numbers; you have to reference a label. The 32SII provided 26 labels (A-Z) for this purpose. Complex programs, such as those in Chapters 15 and 16 of the 32SII manual, can easily use 5, 10, or 15 labels.

It appears that the 33S will have only the same 26 labels found in the 32SII. And like the 32SII, the labels cannot be duplicated between programs. So the limited quota of labels will be used up fast. If you're careful to avoid label duplication, you might be able to install 2 or 3 complex programs in the 33S, as opposed to one in the 32SII.

Not sure what all the memory of the 33S is good for. Can't use it for programs, because there aren't enough labels. Can't use it for data, because the 33S will only have 33 storage registers, same as the 32SII. I suppose you could store a very large number of equations.

Re: HP 33s

*Message #7 Posted by **Ken Emmens** on 22 Nov 2003, 1:22 a.m.,*
in response to message #6 by CME750

You are correct in what you say about the limited number of labels available to write programs, but I still think the 33S is a good improvement on the 32SII.

One method that may assist in getting around the label limitation would be to combine similar programs into one larger program. Those "sub-programs" could then share any common subroutines and consequently avoid the "DUPLICAT. LBL" error message that occurs when all the labels have been used up.

Although I have not used it because I have never had the need (the 33S is likely to change that though because of its larger memory), indirect addressing (using (i)) would be an efficient way to control program subroutine branching under such circumstances. The HP32SII Owners Manual has good coverage of that technique in Chapter 13.

The restricted number of labels does offer one benefit - the encouragement of economical program design, and the mental challenge / stimulation of achieving that outcome. And who knows? - maybe the HP33S is the precursor to the HP33SII with thousands of labels and gigabytes of memory and download/upload capabilities and an easy to use enhanced Basic programming language and super-long-life batteries and, gasp, a normal keyboard. Wow, wouldn't that be something? Here's hoping.

Re: HP 33s

*Message #8 Posted by **CME750** on 25 Nov 2003, 2:31 a.m.,*
in response to message #7 by Ken Emmens

One ugly, but potentially effective, way to cut down on label use on the 33S is as follows.

Let's say you have a dozen distinct programs. Start with LBL A and enter Program 1, ending with RTN. Then enter Program 2, ending with RTN. Follow with Programs 3 to 12. All of the programs end with RTN, but none begin with labels (except for the first one). In this case, all 12 programs are associated with LBL A.

So how do you select a specific program? You have to note the line number where each

program begins. So Program 1 begins at line A0001. Maybe Program 2 begins at line A0083, Program 3 at line A0154, and so on.

If you wanted Program 2, you could start it by pressing GTO . A0083 R/S. For Program 3, you would hit GTO . A0154 R/S. The GTO . command moves the program pointer, even when you are not in program entry mode. So you can control the line number at which a program starts running, even without labels.

The obvious downside is that it would be difficult to remember the right code for starting each program. You would probably need a "cheat sheet" listing the appropriate line numbers. Furthermore, if you edited one program, the line numbers for all the following programs would change.

Confirmed that this works on a 32SII. Based on the online manual, the 33S should be similar (except that line numbers contain 4 digits on the 33S and only 2 digits on the 32SII).

*Message #9 Posted by **Ben Salinas** on 22 Nov 2003, 7:47 p.m.,*
in response to message #6 by CME750

In a purely theoretical sense, with 32kb of memory you could emulate more subroutines. It would be terribly inneficient in terms of memory, but with 32kb, who cares

Imagine this. We have routine A. At the begining of A there is one subroutine, which can be accessed by a GTO. After that subroutine is complete, it will have a RTN. After the RTN, there is a second, entirely different subroutine, which can be accessed by a XEQ (which doesnt stop at a RTN, I believe...). As long as the first subroutine does not mess with any of the variables for the second subroutine, then you would be fine

Of course it would be terribly inneficient, and incredibley complex to code. I guess you could also have it do some simple subroutines separated by conditional tests, or if you say

Input Z 1 x=y? a command

Would that leave the Z and 1 on the stack, or are they consumed.

A final theoretical method would be if you had subroutines which began the same, you could have it break if it reaches a specified number.

Say we would like to have subroutine A1 and A2. A1 and A2 start with the same 5 commands, but after those 5 commands, A1 should break, and A2 continue. Given a variable Z, you can set it to 1 if you want to run A1 and 2 if you want to run A2 (or a flag, or something of the like). After the five commands are ran, have a conditional test to check if Z=1, and if it does, have it RTN. After A1, are the commands for A2.

Just a few thoughts

-ben

Looking for HP Journal article

*Message #1 Posted by **james (UK)** on 13 Nov 2003, 8:40 a.m.*

Hi y'all

Anyone know if W Kahan's paper "Personal Calculator has Key to Solve Any Equation f(x) = 0" which appeared in the HP Journal 30 #12 (Dec 1979) pp20-26 (and deals with the 34C) is available on the 'net?

Extract from his paper "Mathematics Written in Sand":

"Euphoric at the sucess of the HP-38E, Dennis Harms' manager, Stan Mintz, humoured us by granting permission to devise a calculator with a [SOLVE] key, despite that no marketing survey had revealed any demand for such a thing, and subject to one proviso: mindful of his struggles with integrals in college, he charged us to devise an [INTEGRATE] key too. Thus was the HP-34C born."

in response to message #10 by james (uk)

Hi James

I am in the midst of writing an article about HP Solve. Take a look at this thread for background. I'm hoping that HPCC Journal will accept it. I would appreciate any insights you might get in reading Dr. Kahan's wonderful articles.

Regards, Patrick

Re: Many thanks

*Message #12 Posted by **Namir Shammas** on 13 Nov 2003, 8:41 p.m.,*
in response to message #11 by Patrick

I am testing a comprehensive algorithm that solves the root of an equation using an enhanced version of Newton's method. The algoritthm I am working on handles the cases were basic Newton will fail:

1. The guess is near a maximum or minimum point. 2. The function looks like a strechted S with two somwhat parallel extremes (a variant of tanh(x) for example). In this case, the guess cycles back and forth.

I am using Excel's VBA to test the algorithm (you can alway store intermeidate values in the spreadsheet). I feel that to solve case 2 I need to use the basic Bisection method to ensure convergence and move away from relying on slopes (which got us into trouble in the first place).

Namir

*Message #15 Posted by **John** on 15 Nov 2003, 9:13 p.m.,*
in response to message #1 by james (UK)

Does anyone know if there are any HP Journal Articles about how the HP Calculators (41, Voyagers, 28s, 32s or even the 48's) are manufactured and how they were designed? I saw one about the 11c and was wondering there were more? I can't seem to get enought of this information. I am very interested in learning how these calculators are put together, from the ground up. And, if there are articles, how would I go about obtaining them?

Thanks.

The MoHPC CD set or DVD has scans...

*Message #16 Posted by **Karl W. Schneider** on 16 Nov 2003, 3:52 p.m.,*

10B with problem

*Message #1 Posted by **CalcKidd** on 13 Nov 2003, 8:31 a.m.*

I just got a used 10B with a faulty ON/C/OFF button.

When I press it, nothing happens Though, all the other buttons work just fine.

However, if I take the batteries out, make contact with the (+) and (-) terminals for a bit, put the batteries back in, and press the ON button - the calc fires up.

But... the button won't work after this unless I take the batteries out again and do everything all over again.

Any ideas?

It's just a 10B and I may take it apart to study it anyway.

Thanks...

Re: 10B with problem

*Message #2 Posted by **Randy Sloyer** on 13 Nov 2003, 7:14 p.m.,*
in response to message #1 by CalcKidd

Press above the I/YR key while trying to turn it on. If it works, it's a loose connection between the logic board and keyboard connector. Common Pioneer problem.

If that doesn't work, it's possibly a shorted key. Fatal problem for a Pioneer. Keyboard replacement is not a fun thing. Easiest way to diagnose is to hook it up to a power supply and check the current. If it immediately goes to 50 ua or more, you have a shorted key :o(

HP33E

*Message #1 Posted by **Paul Marin** on 13 Nov 2003, 4:20 a.m.*

I've just aquired my bosses old HP33E and the battery hasn't been used for for 3 years. I'm running it on the charger, but still no life in it. Is there a new equivelant rechargable battery available today on the market, that isnt HP?

CAn anyone help me.

Paul (Australia)

Re: HP33E

*Message #2 Posted by **Thibaut.be** on 13 Nov 2003, 6:15 a.m.,*
in response to message #1 by Paul Marin

If you can manage to desolidarize the batteries from the metallic pac, replace them with 2 AA cells. Positive goes on top left siden you have the calculator in your hands, back side in front of you, battery compartiment on the top side.

Re: HP33E

*Message #3 Posted by **Paul Marin** on 13 Nov 2003, 6:39 a.m.,*
in response to message #2 by Thibaut.be

So does this mean that this unit runs on 3 volts, using 2 AA batteries?

Paul

Re: HP33E

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 13 Nov 2003, 7:53 a.m.,*
in response to message #3 by Paul Marin

It runs on 2 AA NiCd cells, 1.25V each (2.5V), you can replace them with 2 NiMH cells. I don't know if you can put 2 simple alkaline AA cells or Zinc ones. If you do so, DON'T USE THE CHARGER!!

Regards,

Nelson

Re: HP33E

*Message #5 Posted by **Thibaut.be** on 13 Nov 2003, 8:38 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

It works perfectly with 2 A batteries. After all these provide with 1.3 or 1.4 V most of the time, so

you're connected more often with 2.6 or 2.8 volts. Not a big deal.

And of course Nelson is totally right : do not connect your calculator with the adapter while running on standard batteries !

Re: HP33E

*Message #6 Posted by **db(martinez,california)** on 13 Nov 2003, 9:08 p.m.,*
in response to message #5 by Thibaut.be

.....and do not use the charger without having good rechargable batteries in place and making good contact. Other people who are much smarter than me have said here that you can fry the calc by doing that.

Re: HP33E

*Message #7 Posted by **Paul Marin** on 14 Nov 2003, 8:04 a.m.,*
in response to message #6 by db(martinez,california)

I've put in two AA alkaline batteries just to see if the unit works, and it does. Now I'm buying the Ni-cad batteries you've all suggested. Thanks guys for all your help.

Must appreciated

Ciao

Paul

HP42S or HP49G+

*Message #1 Posted by **Marc** on 13 Nov 2003, 2:10 a.m.*

Hello, I have the option to buy an hp42S or a 49g+. which one for me , an engineer is the best? Have 3 48 and 2 32SII. Thanks

Re: HP42S or HP49G+

*Message #2 Posted by **Marc** on 13 Nov 2003, 2:11 a.m.,*
in response to message #1 by Marc

wanted to say that i'm an electronic engineer

Re: HP42S or HP49G+

*Message #3 Posted by **Joesph** on 13 Nov 2003, 2:39 a.m.,*
in response to message #2 by Marc

That depends on what you are interested in. I personally like the HP42S very much - what are your preferences? Ease of use, build quality, etc. Its a personal thing.

Re: HP42S or HP49G+

*Message #4 Posted by **Victor Koechli** on 13 Nov 2003, 2:43 a.m.,*
in response to message #1 by Marc

Buy both if you can. If you can't, buy them both anway. If you really can't, it depends on whether your current calcs are suficient for your needs (which is probably the case, since you have 3 48's). If they are, get the 42S if the price is anywhere near reasonable. It's one of the finest and most sought after HPs ever made, very potent and with tons of functions, while in a package the size of your 32SII. And you can still buy a 49G+ next year if you feel like it, but who knows when you will have the occasion to acquire a 42S again (especially if the price is good).

If you need a calc with even more power that your 48, get the 49G+. Does anyone know whether it has the equation library from the 48G/G+/GX built in?

Cheers, Victor

Re: HP42S or HP49G+

*Message #5 Posted by **Veli-Pekka Nousiainen** on 13 Nov 2003, 3:55 a.m.,*
in response to message #4 by Victor Koechli

no, use eql49 libraries from:

http://www.hpcalc.org/details.php?id=3181

VPN

PS: I would always prefer the I/O capable model 1st, in this case the 49g+ (regardless of the good things in the 42S)

Re: HP42S or HP49G+ and external keyboard hp 48GX

*Message #6 Posted by **Marc** on 13 Nov 2003, 6:49 a.m.,*
in response to message #5 by Veli-Pekka Nousiainen

I know that the 49G+ is very powerful,but is too big, I prefer the 42S but very expensive. I have created an external keyboard gor HP48GX, I uploaded it in HPcalc, but i don't see it, it is in hp-network.com.

VPN, where are you from? I'm curious. Bye and thanks PD is it correct buying an hp42S for 325€?

Re: HP42S or HP49G+ and external keyboard hp 48GX

*Message #7 Posted by **Victor Koechli** on 13 Nov 2003, 10:30 a.m.,*
in response to message #6 by Marc

It's certainly not a bargain. If it's OK depends on what comes with it. If you are a collector and the unit is complete with original box, manuals etc. and in a very good, like new state, then it would be OK. Otherwise, you should probably try to get a cheaper one (I have, however, not checked prices recently). I would, beacause I'm a fan, but mostly a user and not a collector, so I don't care for the box or worry about a scratch somewhere, as long as it works OK.

Alternatively, buy a 49G+ for half the price. I know, it's a big machine, but it does almost everything, and fast, and it communicates with the outside world, as Veli-Pekka pointed out.

Cheers, Victor

VPN, where are you from?

32E Error 9

*Message #1 Posted by **Ron** on 13 Nov 2003, 1:25 a.m.*

I have a 32E which seems to work well. However, when running the self test, it is inconsistent in the final display. Sometimes it shows all zeros, sometimes just a minus, sometimes it shows the full display for a fraction of a second before going back to the previous entry, etc... Often though (about every other time), it shows ERROR 9, and occasionally (rarely) ERROR 0.

After I finally got up the courage to POP it apart, I found that it is solderless. I cleaned all the chip and switch contacts, and reassembled. There has been no change.

Everything else looks pretty good. Any help will be greatly appreciated.

Thanx.

Re: 32E; Check engine light

*Message #2 Posted by **Ron** on 13 Nov 2003, 8:57 p.m.,*
in response to message #1 by Ron

I have found out that ERROR 9 simply means it failed the self test. So this seems like the CHECK ENGINE light in my car; the only thing wrong with it that the check engine light is on. In this case, the calc seems to work fine; the only thing wrong with it is that it fails the self test. Anyway, for the sake of completeness, I still would like it to pass the test.

Volunteer(s) for scanning needed - again

*Message #1 Posted by **Gene** on 12 Nov 2003, 7:13 p.m.*

Some of you may remember an effort several people made to get my copy of the "debugged" JPC ROM online for the 71B. Some of you may also remember a post from several months ago about a large stack of HP User Library programs I had that I hoped to get scanned and online.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=28693

Well, my volunteer has decided that he doesn't have time to do the scanning of these after all, so I'm looking for another person who could help by scanning these into PDF files.

Any volunteers?

Gene

P.S. The efforts to get the TI PPC Notes online is moving along and so is the effort to get the TI calculator manuals online too. If you REALLY want to see some of those, drop me an email.

Re: Volunteer(s) for scanning needed - again

*Message #2 Posted by **David Ramsey** on 13 Nov 2003, 1:07 a.m.,*
in response to message #1 by Gene

How many pages are we talking about?

#pages

*Message #3 Posted by **Gene** on 13 Nov 2003, 7:40 a.m.,*
in response to message #2 by David Ramsey

Figure 100 HP User Library programs x 6-8 pages each. Double sided. They also have magnetic card packets attached to the first page.

Not an easy task, but take a look at the long list of programs and you'll see why I'm hoping to get them done.

There's a similar list of TI58/59 programs someone is scanning too.

The TI PPC Notes are also on a list.

Gene

Re: #pages

*Message #4 Posted by **David Ramsey** on 13 Nov 2003, 11:50 a.m.,*
in response to message #3 by Gene

Well, I do have this shiny new HP-4670 scanner, so I guess I'd be willing to take a crack at it. I assume things are in no rush and if it took several weeks to get all 600-800 pages that would be OK.

Re: Volunteer(s) for scanning needed - again

*Message #5 Posted by **Victor Koechli** on 13 Nov 2003, 2:02 a.m.,*
in response to message #1 by Gene

I could try to contribute german TI 58/59 manuals if you like. What software is best for doing that? I have Windows 2k at my office and Mac OSX at home (has built-in PDF).

Cheers, Victor

Manuals

*Message #6 Posted by **Joerg Woerner** on 13 Nov 2003, 6:42 a.m.,*
in response to message #1 by Gene

Hello Gene,

Some weeks ago Texas Instruments granted me the permission to make the elder, scanned manuals on my Datamath Calculator Museum available for the public. If you check the www.datamath.org/Manuals.htm page you'll notice that I placed already 50 manuals there.

Next issue is webspace, here I received from Viktor T.Toth an offer to use parts of his webserver.

Please send me a list of the manuals you own and we'll discuss the next steps. Another good place to locate manuals is maintained by Katie Wasserman.

Greetings, Joerg

Miller-Rabin Primality Test for HP-42S

*Message #1 Posted by **Erik Ehrling (Sweden)** on 12 Nov 2003, 4:16 p.m.*

Hi!

This is a short note to tell that I have just added an implementation of the Miller-Rabin Primality Test for the HP-42S to my homepage. (By a partial implementation of addition, subtraction and multiplication of double size integers it can handle primality tests for any integer up to 999 999 999 999.)

Best regards,
Erik Ehrling (Sweden)

top program. i like it!

i have tried to implement this on the 15c (and others). the difficult bit (as you've noticed) is a*b mod n. do you use the complex number just as a convenient holder or can complex be used to help the precision (eg single precision c1*c2 requires double precision working. in practice the machines use all their internals if they can).

you can do the a*b mod n in binary. i tried it, but calculators take all day (literally) so i abandoned the idea.

Hi!

Interesting to hear that someone else has been struggling with the same problem!

First I didn't realise the problems with calculating a*b mod n, headed for a straight implementation and ran

into trouble, but also got frustrated enough to not be able to put it away...

I use complex numbers mainly as a place holder, but for both addition and subtraction they come in handy for the calculation as well. The real part of the complex number is used to represent the higher (i.e. larger than 1e12) portion of the integer, while the imaginary part represented the lower portion (i.e. a normal precision integer).

As I only needed to deal with positive integers I realised that I could subtract 1e12 from one of the lower parts (i.e. the imaginary part of one of the terms) before adding the two long (complex) numbers together. Then I could check if the lower part of their sum was negative. If it was negative then I just added 1e12 to it again, otherwise I added 1 to the higher (real) part of the sum. (This is done on line 297-315 in the code).

Subtraction uses a variant of the same technique (line 284-296 in the code).

Multiplication was worse. However I only needed to multiply two normal length integers giving a double length product. For this purpose I divided a in two "small" halves a_hi and a_lo and similarly b into b_hi and b_lo. The higher portion here holds the part of the number that is larger than 1e6 and the lower portion holds the part that is smaller than 1e6. Having split a and b in higher and smaller part their double length product can be calculated. The higher (double length) part of a*b can be calculated as a_hi*b_hi + int((a_hi*b_lo + a_lo*b_hi / 1e6)) and the lower part can be calculated as a_lo * b_lo + (a_hi*b_lo + a_lo*b_hi mod 1e6). (The multiplication is made on line 229-283 in the code)

The last step, when a*b is finally calculated (represented as a double length integer), is to determine what the product is mod n. Here I realised that the HP-42S actually calculates very large numbers mod n absolutely correctly (e.g. 1e20 mod 999 999 999 961). So I simply used the rule that (i + j) mod n = ((i mod n) + (j mod n)) mod n. In this case this translates into (if i is the larger part of a*b and j the smaller part) --> a*b mod n = (((i * 1e12) mod n) + j mod n)) mod n. (This is done on line 195-228 in the code).

I guess the same technique could be used on the HP-15C. Program length might be an issue, though (even if some hundred bytes of PRM? are just for program encapsulation as to preserve the stack). On the other hand this means that implementing Miller-Rabin on the HP-15C would be much more of a challenge than on the HP-42S :-)

Best regards, Erik Ehrling (Sweden)

*Message #4 Posted by **hugh** on 13 Nov 2003, 8:46 p.m.,*
in response to message #3 by Erik Ehrling (Sweden)

i was on the same road. the 42s is saved by the mod function being able to handle large numbers. without a mod function (that works), i was stuck trying to find a way to calculate, ahi*bhi*B^2 (mod n) and the cross-product term * B (mod n). maybe i could call a*b (mod n) recursively?

in the end i left it using its own precision, but of course this means i can only verify numbers up to 6 digits (or so). consequently i dropped rounds 7 and 11.

here is my original effort: http://www.voidware.com/calcs/hp15c.htm

I think there is a way around this. Actually I implemented the a*b mod n slightly different first, not relying on the mod function being able to handle large numbers. The idea that I came across in an excellent paper ("http://home.pipeline.com/~hbaker1/AB-mod-N.html") was to calculate a*b/n in normal precision giving a floating point approximation. By then calculating a*b - int(a*b/n) * n in double length using the floating point approximation of a*b/n then this is max +/-n from a*b mod n so the result can be checked and n added/subtracted accordingly. Voila!

i see. you are still stuck with doing a*b - q*n in double prevision though. unless there's some way to get the low bits of a*b from a calculator.

RAM = RAM ?

*Message #1 Posted by **Matthieu T. Vandamme** on 12 Nov 2003, 3:05 p.m.*

Hi HP experts,

does anyone have an experience in RAM effectiveness of program lines (programm effectivity per byte) in different HP calcs ?

E.g. I would be interested in HP42S, HP32Sii, HP48SX/GX, HP49G, HP71B and HP41C/V/X.

- HP32Sii needs 1.5 Bytes minimum per program line. Does this also apply for a HP42s ?

- for example HP41C and HP42S are quite similar concerning their program language and both are using the basic 41C commands:

Does this mean that in average the ratio (bytes/command) is equal for HP41 and HP42 ?

What about the "extra(beyond 41CV)" functions being implemented in the HP42S ? Do they also need only 1 or 2 bytes per command or do they need significantly more (e.g. due to lack of byte table space). Does in average a HP41 XROM command (from plugin ROM module) need the same byte amount like an HP42S "extra" function ?

- What about HP48, HP49, if compared to HP42S and HP41C ? How many (bytes/command) do they need ?

To conclude: Is RAM = RAM ?

What is a 7 kByte RAM of a HP42S compared to a 2.2 kByte RAM of a HP41C. Is it 3.18x ? Or only 2x (for example)?

Can a 128 kByte RAM of a HP48GX hold 58 times as much "program capacity(efficiency)" as 2.2kByte-HP41CV ?

What about the HP71B and the HP75C/D ?

Regards and thanks, Matthieu

Re: RAM = RAM ?

*Message #2 Posted by **Richard Garner** on 12 Nov 2003, 4:30 p.m.,*
in response to message #1 by Matthieu T. Vandamme

It has been awhile sense I have read the 41C manuals, but. As far as I can remember, on the 41C/CV/CX all single function commands need only 1 byte of space and multi function commands take 2 to 3 bytes. Numbered labels need 1 byte, but lettered needs 2 bytes. Numbered goto commands need 1 byte up to 10 and 2 bytes there after and lettered goto commands take 2 bytes. Numbered XEQ commands take 1 byte up to 10 and 2 there after, and lettered XEQ commands take 3 bytes. The same should hold for the 42S sense it is a pocket

sized version on the 41CX with extra memory and functions. I know that others here will check me and tell you if I am wrong.

Re: RAM = RAM ?

*Message #3 Posted by **Veli-Pekka Nousiainen** on 13 Nov 2003, 4:11 a.m.,*
in response to message #1 by Matthieu T. Vandamme

The newer [and newer] models with huge RAM give/take more memory. I usually count the HP 25 as 1, HP 41 as 1.5 and HP 42/75 as 2, the HP 71/48 as 2.5 and the new models with flash-pointers (HP 49G(+)/48gII) as 3, bytes per keyword. Remember that a 4-level stack has autocopy from T, but may "overflow" to force you to use STOrage, etc..

The languages are different and therefore it's difficult to do a general analysis, but the new models have [usually] so much more RAM to compensate (not 41C - only CV/CX - compared to older models AND definately not 28C, only 28S or 48/49 compared to 41CV/CX), that they "win" every time.

Note that PC connectivity, extra cards, internal FlashRAM, etc features can greatly enhance the memory capacity/limitation.

The speed of the new hp 49g+ is great for usability (and for # binary loops) # VPN #

Re: RAM = RAM ?

*Message #4 Posted by **James M. Prange** on 14 Nov 2003, 5:20 p.m.,*
in response to message #1 by Matthieu T. Vandamme

Well, this doesn't completely answer your question by a long shot, but 48SX commands and 48GX commands "inherited" from the 48SX take 2.5 bytes each because they're really 5-nibble addresses. Commands new to the 48GX take 5.5 bytes each because they're really XLIB commands. Other objects and the various program structures have a variety of sizes.

Anyway, in general, when comparing different operating systems, don't assume that more memory means that you can have proportionally larger programs.

Regards,
James

in response to message #1 by Matthieu T. Vandamme

Thank you all for your helpful answers !

BTW, I found out that the HP-48 needs 3 registers (of HP-41 size) to save one real numerical variable. Normally I would expect only 8/7=1.14x but it is 3x as much as a HP-41 needs. Is this true ?

Best, Matthieu

in response to message #5 by Matthieu T. Vandamme

I don't know about the 41, but on the RPL calculators, most real numbers are stored as a 5-nibble prolog,

3-nibble exponent, 12-nibble mantissa, and 1-nibble sign, so that's 21 nibbles, or 84 bits. A few reals, integer values from -9 through +9, can be stored as 5-nibble ROM addresses. Extended reals (used for some internal calculations) have a 5-nibble prolog, 5-nibble exponent, 15-nibble mantissa, and 1-nibble sign, for a total of 26 nibbles, or 104 bits.

The mantissa and exponent are BCD of course. A real's exponent can be -499 to + 499, with negative exponents represented by 1000 - exponent. Similarly, an extended real's exponent can be -49999 to +49999, with negative exponents represented by 100000 - exponent.

The sign nibble is 0 for positive or 9 for negative.

For storage (that is, outside of the Saturn processor), either temporary or long-term, the concept of a "register" doesn't really apply to the 48. Objects of various types and sizes are simply stored one after the other in memory, with every object using a whole number of nibbles.

Keep in mind that the RPL calculators' stack is really a stack of 5-nibble pointers to objects elsewhere in memory. If I "make another copy" of a real number with DUP, OVER, or PICK for example, it just looks like I've made another copy of the real number; what I've actually done is made another copy of the 5-nibble pointer to the real. All of the stack manipulation commands work with these pointers, never with the objects themselves.

Regards,
James

> Thanks, Paul! That explains why doing "mem" on the 48 does not return what I would expect, after a "DUP"

Umm, actually, I'm James, but no matter. Yes, there's a lot of "smoke and mirrors" behind the RPL magic. Quite a bit more than I've thoroughly investigated.

Having the stack of pointers only does sometimes conserve memory, and perhaps more important, it allows the stack manipulation commands to be fast. And objects in temporary memory are left where they are until a "garbage collection" is done, at which time objects still referenced by pointers are packed next to each other to recover the memory used up by unreferenced objects.

A few other things that sometimes cause unexpected results from MEM are the last stack, last arguments, and last command lines saves.

One of the subtle things about the RPL calculators' memory usage is that if you have any pointer to any object within a composite object (a list, algebraic, or program), then the entire composite is kept in memory. For example, if you generate a list "on the stack" (really in temporary memory), and use GET to extract one element from it, then the entire list is kept in temporary memory for the sake of the pointer to that one element. Similarly, if an object from a program is left on the stack, then the entire program is referenced. NEWOB on the element makes it a new object in temporary memory, with a new pointer to it, so as long as the original composite or any element of it isn't referenced by any other pointer, it's eligible for overwriting at the next "garbage collection". Storing the element in a global or port (but not local) variable, or including it in another composite or an array, also makes it a new object and discards the pointer into the original composite.

But if the element of the composite isn't really an object, but a pointer itself, as in the case of a whole number -9 to +9, then the pointer is copied to the stack, instead of using a pointer into the composite.

Note that if the composite was stored in a global variable, the memory was used anyway. But if I recall a list from a global variable, extract one element from it, and purge the global variable, then the list is copied into temporary memory for the sake of the pointer, so I've only recovered a few bytes as long as I keep the pointer.

Regards,
James

HP41 Bank Switching question

*Message #1 Posted by **Meindert Kuipers** on 12 Nov 2003, 11:12 a.m.*

I am busy implementing bank switching in my MLDL2000, and that looks pretty good right now. The problem is that I am running out of space in the chosen CPLD (256 macrocells), and the next step is a much more expensive device.

AFAIK the HEPAX module is the only one using all 4 banks in a page. Is there any knowledge of other modules supporting more than 2 pages? I could than make an exception for HEPAX and have 4 banks in one particular page, while all other pages support 2 banks. A limitation would be that HEPAX would work in one particular page. Would this be a problem for any intended users of the MLDL2000?

A more general note: Bank Switching is the last features that I need to fully test in the design. I am busy prototyping and all looks well. Will start working on the final PCB layout soon.

Meindert

Re: HP41 Bank Switching question

*Message #2 Posted by **Ángel Martin** on 14 Nov 2003, 2:55 a.m.,*
in response to message #1 by Meindert Kuipers

Meindert,

I know of no other module or device using more than 2 banks. The HEPAX appears to have been the sole exception in this, as with a few other aspects more (it broke many 41-world barriers).

I see no issues with having it at a fixed address, as long as it still only uses one page.

In fact, "all the others" probably amounts to just one (the Advantage ROM), or how could your MLDL deal with the IR_Printer module and the CX_Functions??

Maybe I'm missing some bank-switched ROMS; after all Zengrange implemented support for bank-switched into their Zeproms, but I'm not aware of anybody who actually used such functionality.

Best, ÁM.

48GX stack too big?

*Message #1 Posted by **Dave Shaffer** on 12 Nov 2003, 11:02 a.m.*

I don't have the manual handy, so this may have a trivial solution.

I noticed my 48GX seemed to be slowing down as I used it. At some point it dawned on me that the stack had hundreds of numbers on it. I'm guessing that the internal bookkeeping to pop the stack each time I enter something is slowing down the whole machine. When I cleaned out the stack by deleting one value at a time (lots of back-arrow key presses!), it seems "better."

Is this normal? Is there a single "empty the stack" command? Is there anything I should be doing as I calculate to keep the stack at a reasonable size?

I agree with some other comments that a stack bigger than 4 or 5 is unnecessary. Can I put it in a limited stack mode?

Re: 48GX stack too big?

*Message #2 Posted by **Randy** on 12 Nov 2003, 11:05 a.m.,*
in response to message #1 by Dave Shaffer

L-shift DEL wipes the entire stack. I usually do that when I pick one up and start to use it.

AFAIK you can't limit the stack. Might be some way in ML.

Of course you could always get the 42S emulator...

Re: 48GX stack too big?

*Message #3 Posted by **Victor Koechli** on 12 Nov 2003, 11:21 a.m.,*
in response to message #2 by Randy

If you'd limit the stack size, the consequences for the calculator would be fatal. The stack you see in the display is *the* RPL system data stack, used troughout the machine by all RPL routines, internal and user made. If you'd limit its size to e.g. 4, like it has been suggested many times, you couldn't even add 1 to (2x-y) anymore, because internally, symbolics are taken apart ("exploded") into meta-objects and then reassembled. Thus, everything in the HP 18/28/48/49 depends on an infinite stack. It's an essential part of the RPL system.

Just hit CLEAR (CLR on the 48SX) or the DEL key once in a while, or whenever you're done with some calculation, and you'll be fine. Alternatively, you could install HPSauce which always displays the stack depth in the status line... ;-)

Cheers, Victor

32Sii 2 var eqn solver not working

*Message #1 Posted by **rbaird1@ihug.com.au** on 12 Nov 2003, 12:33 a.m.*

Hey guys. Can anyone - maybe Ben - tell me if there is a bug in the 2 var eqn solver program for the 32Sii listed in the software section? (http://www.hpmuseum.org/software/322var.htm)

If I add a LBL A to the start I get the checksum of EA51

The comments on the page with the program say the results will be stored in X and Y, but the program does not contain a STO Y instruction so I assume something is wrong.

Running it with A=1 B=1 C=3 G=2 H=-1 I=3 gives 3.0 for X and (predictably) 0.0 for Y (expected X=2 Y=1)

Re: 32Sii 2 var eqn solver not working

*Message #2 Posted by **Eamonn** on 12 Nov 2003, 3:12 a.m.,*
in response to message #1 by rbaird1@ihug.com.au

Looks like there is an error in the listing. Line 35 should be "STO Y".

After changing line 35 to "STO Y", the x value is stored in the X location on the stack and also in the x storage register, accessed with RCL X. The y value is stored in the Y location on the stack and also stored in the Y storage register, accessed with RCL Y.

Re: 32Sii 2 var eqn solver not working

*Message #3 Posted by **Ben Salinas** on 12 Nov 2003, 7:28 p.m.,*
in response to message #1 by rbaird1@ihug.com.au

Yeah, I found a mistake in the version I typed up. That was before I understood almost anything on the 32sii (i was perplexed at how I could store more than 1 program in it at a time since i didnt know about labels, and was amazed a few weeks later when i found teh "if's" (x?y))

Those programs are currently extremely inefficient (I also did not know about teh STO+ and RCL+ and the likes), but the theory is there -ben

32S Won't Power Up

*Message #1 Posted by **gifron** on 11 Nov 2003, 11:46 p.m.*

I just pulled out my 32S. I worked great when I last had it out - Several months back (stored w/o batteries). I installed good batteries, and nothing happened :^[

What to do??!!

Re: New Problem...

*Message #2 Posted by **gifron** on 12 Nov 2003, 1:13 a.m.,*
in response to message #1 by gifron

Okay - Got it to come on, and think I have figured out the problem. It seems that the lower heat stakes have relaxed over time, and are no longer holding the case together tightly. After it finbally came on, only a few of the keys worked, and only while pushing them really hard. A little more experimenting, and I found that if I apply pressure above the "8" key, most of the other buttons work - the x and / still require a little heavier pressure, and the + and - still don't work.

This seems like an odd explanation though, since these can be taken apart by destroying the heat stakes, and then snapped back together and they work fine. Hmmm...

I wonder if all the contacts are just dirty..?

Any suggestions?

Re: Pioneer keyboards

*Message #3 Posted by **Randy Sloyer** on 12 Nov 2003, 2:20 a.m.,*
in response to message #2 by gifron

Heat stakes are not your problem. Dirt is not your problem. Age is the problem.

You'll find the sweet spot to actually be above the 1/x key. The keyboard connector has lost contact with the logic board. The far right column of keys is at the far end of the connector, right below the 1/x key. It is not making contact.

The problem is the foam pad that holds the two in contact has lost it's spring. You'll have to open the unit and shim the pad if the problem persists. Sometimes the pad is installed out of position making the problem worse. You can remove the pad without damage and reposition if you soak it first with UN-DU (heptane). Let it dry out before reinstalling.

Many times they'll be fine for months after flexing the case or pushing on the bezel in the right spot.

Re: Pioneer keyboards

*Message #4 Posted by **gifron** on 12 Nov 2003, 10:15 a.m.,*

in response to message #3 by Randy Sloyer

Bingo, Randy! You hit the sweet spot, where all the keys work easily, and the tests pass. Can't seem to make a permanent difference yet though - I'll keep working on it. I sure don't want to take it apart.

Thank you.

Re: Pioneer keyboards

*Message #5 Posted by **Ed Look** on 12 Nov 2003, 7:07 p.m.,*
in response to message #4 by gifron

My goodness! Sounds like a 34C, except you have to squeeze all over the place!

HP-IL story continues...

*Message #1 Posted by **Pavel Korensky** on 11 Nov 2003, 9:05 p.m.*

Couple of days ago, I mentioned here that I got an old rusty HP82161A unit.

I disassembled it, carefully washed the PCBs in warm soap water and I let them dry.

When everything was dry, I desoldered the HP-IL parts (IC, transformer, inductor, capacitors, resistors etc.) and I put them on a prototyping board. I attached this board to my ATMega103 development board, wrote a piece of software and BINGO - I have a nice HP-IL analyzer which is attached to my PC notebook via RS-232 connection. Software is not yet completely finished (I need to implement all HP-IL message tables), but it seems that both IC and transformer are working. The transformer seems a bit dirty, but it works.

During this week, I should receive the 64MB MMC card. When I will have it, I will start to implement the mass storage which will mimic the HP82161A. In the first design, it will be necessary to use the RS-232 port for "tape exchange". There would be 500 "tapes" available on 64MB card, each tape will have name and the LIF files will be stored inside normal DOS/FAT files. This way, it will be possible to write some PC software for LIF files organisation (something like "select those HP-41 files and copy them to file TAPE01 on MMC).

Re: HP-IL story continues...

*Message #2 Posted by **Christoph Klug** on 12 Nov 2003, 5:29 a.m.,*
in response to message #1 by Pavel Korensky

Dear Pavel,

please go on with your work about Hp-IL Mass storage Unit. Also add an battery power supply for portabel applications. Your system would be a nice extension for I/O-Board and IL2000 system (hardware interfacing / measurement / data logging).

If you need, I can make available some IL-Transformers and IL-Chips for your project :-)

Best wishes from Germany - Christoph Klug

Re: HP-IL story continues...

*Message #3 Posted by **Pavel Korensky** on 12 Nov 2003, 4:15 p.m.,*
in response to message #2 by Christoph Klug

Yes, there will be the battery power supply.

I do not need the IL parts. At least not until I will fry the chip which I desoldered from HP82161A. :-)

But, there is another problem. I am planning to release all schematics, sources etc. as a Open Hardware. But the IL chips and transformers are hard to find and it is strange to start the design description with something like "1. Find a broken HP-IL unit and desolder the IL chip and transformer from it...."

I can imagine, that I can duplicate the IL chip (with minor modifications - only digital inputs) in form of CPLD. But I am a terrible analog desinger and I can't figure out, how to design the replacement for a transformer.

Did you tried to develop some analog front-end with optocouplers and/or operational amplifiers ?

Re: HP-IL story continues - request for comments

in response to message #3 by Pavel Korensky

Today, I wrote some more software and I have one question.

What features do you want to have in Analyzer mode ?

Currently, I am capturing HP-IL messages and the microcontroller is doing the analysis on message level (message classes, data bytes etc.) and it is sending the informations to the PC via RS-232.

Anyone have some ideas what the analyzer should do ? Triggering on some message ? Higher level decoding (printer, mass storage etc.) ?

Way to go, man! was(HP-IL story continues - RFC)

*Message #5 Posted by **Giuseppe Marullo** on 13 Nov 2003, 3:26 a.m.,*
in response to message #4 by Pavel Korensky

Pavel, short form of my comment: see title

Long form: BEWARE: I have yet to see a single printed page about the 41 manuals, so don't flame me too much if you read something completely wrong. I am a rookie here.

HPIL serial dump A HPIL->RS232 "stupid" converter is good, I am interested in building one by myself, but if you have one ready, I will gladly beta test it for you (building one by myself, maybe using a Z8 Encore, a pic or a isopod board. This will avoid me to buy a second HP-41. A bi-directional link would be a plus.

Christoph, please contact me off list, I leave you the guess about what :))

HPIL Sniffer As a sniffer project, you could mimic the features of already available network sniffers, one of the clever one is (was) Expert Sniffer from NAI (formerly Network General). It let you see the same packet of data with different "meanings", one every level, from phisical to application level. It goes even further, diagnosing potential problems, starting from syntoms. Obviously, it is a pricey software, you could simply display the lowest level. Contact me offlist, I could try to write some Windoze code to display frames graphically.

PC CARD "EMULATION" One of the most interesting project I see is a "emulation" of the PC card, so you could connect your 41CV using a serial/usb cable to the laptop without having an ancient ISA bus. One plus could be a support by both EMU41 and the "other forbidden on this site emulator" that should be able to support serial communication with low overhead. Dealing with the serial port is feasible both for DOS applications and windows, so you could bypass problems related to windoze drivers. This is not the same as having the HPIL->RS232 module, obviously. Another choice is USB support, but you could not support dos applications (not easily I suppose). A USB->RS232 should (or better could) do the trick for those that don't have serial ports.

HPIL->YOUNAMEITSTANDARD GATEWAY This could be seen as a gateway to use I2C

devices for example. It should be feasible with standard like II2, 1 wire, S.N.A.P. etc.

Isolation & portability : better have it, no dubt.

HPIL CONNECTORS Yes they are a problem, but please avoid DIN, usually they don't have .1 spaced terminals (protoboarding) and the boxing is way difficult. Conecting and disconnecting them stresses the board and it is not easy to build cables.

Maybe a better reasoning is to find a scheme where you don't have to put transformers for every peripheral you put in the bus, something like a bridge (a gateway) between the current loop of actual hp41 peripherals (they already have transformers) and the *new* hpil/ng, where the long distance and low noise are not so important.

Is not possible to separate the standard from the media? If so, maybe the phisical connection could it be quite different from the original hpil. HPIL over TCP/IP?

There is no need (and indeed a lot of problems) trying to keep the same connectors, AFAIK they are not available.

HPIL CHIP Emulating it is excellent, but this is not the only problem, we need to find a suitable replacement for the transformers too. The chips is somewhat available, but what about the transformers?

I would gladly contribute about what I know, as long it is a hobby paced project, and it is in the GPL or low profit spirit.

If appropriate, I could setup a portal where this kind of discussions are held, just not to poison the forum too much with low level details.

Thank you,

Giuseppe Marullo

*Message #6 Posted by **James MacPhail** on 12 Nov 2003, 6:41 p.m.,*
in response to message #3 by Pavel Korensky

An optocoupler receiver sounds like a good idea to me; however you (probably) still want a transformer for transmitter isolation, so maybe two of those is easier. I suspect there are a few people with the equipment to help figure out an easy to make (or buy) pulse transformer replacement.

Another problem will be the connectors... Perhaps someone should establish a standard alternate connector, then only one adapter is necessary? I'd consider one of the readily available configurations of mini-DIN connector (similar to a PS/2 keyboard connector), but a DE-9 would likely be cheaper.

Once you add up the problems of obtaining connectors, the IL chip, and transformers, maybe you end up saying you need to scavenge all the parts?

Good luck!

Re: HP-IL story continues...

*Message #7 Posted by **Pavel Korensky** on 12 Nov 2003, 7:28 p.m.,*
in response to message #6 by James MacPhail

This is a question. Is it really necessary to isolate the trasceiver ? We are not talking about development of some commercially manufactured industrial bus. We are talking about the possibility to play with legacy equipment.

The total isolation was perfectly valid during the days when HP developed and manufactured the HP-IL devices. Those devices was used in various environments etc.

But today ? I can imagine the HP-IL loop on the table of some collector, hobbyist or in some area where devices are supposed to do one thing, do it reliably and forever.

The connectors are a problem, you are right. On the other side, you have both types of connectors on each HP-IL cable. So, doing the HP-IL/MiniDIN convertor is cheap and simple. Or better, we can use RJ-45/RJ-11 connectors. They are cheap, you do not need a soldering iron for connecting them to the cable and you can use them also for +5V power distribution.

Maybe I am a bit biased. :-) The main reason for my effort is to have fun and to be able to use my HP-41 in modern environment (like printing the TRACE to my PC, be able to read some old programs from some kind of mass storage or to be able to emulate modules which are too expensive for me on EBay).

Re: HP-IL special parts

*Message #8 Posted by **Christoph Klug** on 13 Nov 2003, 3:10 a.m.,*
in response to message #7 by Pavel Korensky

Dear Pavel,

as I told you, I can make available IL-Terminals, IL-transformers and IL-Chips to your HP-IL Mass Storage Unit project. I have some of them in my stock and I need not all of them for completing the rebuild HP-IL/PC Interface Card or the hardware interfacing projects I/O-Board and IL2000 System.

Therefore your project seems to be a nice and advanced application to give some of my parts a new home - soldered to your pcb :-)))

Best wishes from Germany - Christoph

> Quote:
>
> Is it really necessary to isolate the transceiver?

I'd guess that if the receivers are fully opto-isolated, then you may not need to isolate the transmitter. Though I would suggest having transmitter protection against short circuits and short to ground and +/-12V (or more)

In the case where the item is some instrument that has other connections to the outside world, then there is the risk that the unisolated transmitter will affect the local ground voltage, distorting measurements, etc.

Using other pins on the loop connector to supply power would help establish a common ground

to avoid transmitter/receiver common mode problems. I think it would be a good option for a low power digital system, but it could interfere with sensitive analog measurements. Those could have their own power supply, and if necessary, could be internally isolated from the IL circuitry.

RJ connectors might be a reasonable choice. I find the limited configurations of sockets is a nuisance, and you don't have much choice with the cable, but it is cheap, and twisted pair.

For breadboarding (though one can use flying leads, so I don't feel this is a big problem myself), an 0.050" ribbon cable onto which connectors are crimped is particularly convenient, and gives the choice of easy conversion between dual row headers or DIP plugs (easy breadboarding) and D connectors (cheap, panel mount, and also solder/PCB versions). Long runs can be made with twisted pair/shielded cable.

I suppose this stuff is useful to think about, but until you get close to having a working IL chip replacement, and a quantity of devices to put it in, it may be best to scavenge parts, get some from Christoph, etc. and work on the more immediate/interesting problems.

No Division -I'd like to see this calculator

*Message #1 Posted by **Bill (Smithville, NJ)** on 11 Nov 2003, 3:27 p.m.*

I've been reviewing the status of various silly rules on acceptable calculators that various schools, tests, etc. have come up with. I ran across the following:

"SAICA does not have a list of calculators that are allowed to be taken into the exam room. The onus is on you to make sure that it does not contain the full alphabet and is not programmable. You basically need a calculator that can add, subtract, multiply and subtract. Examinations Officer "

So... your calculator doesn't need division.....

And oh yes - just remove one of the letters of the alphabet (I'd select "Z") and you're home free.

Re: No Division -I'd like to see this calculator

*Message #2 Posted by **Joerg Woerner** on 12 Nov 2003, 7:44 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Bill,

You are a HP-Fan - you know Corvus.

Corvus ? Yes the HP-35 clone called Corvus 500.

Aaahhh - you remember! Corvus was the sales brand of Mostek - the chipmaker of the early HP calculators.

I guess they want a remake of this calculator:

Red LED, 6-digits, no multiplication, no division, just plain addition and subtraction. And a fixed decimal point. Okay, let us add one memory. Best would be a contious memory implemented in P-MOS logic. It is soooo power hungry.

You know this cutie ? Just visit it here: http://www.datamath.org/Related/Corvus/CheckMaster.htm

Greetings from the "other" calculator museum,

Joerg

Re: No Division -I'd like to see this calculator

*Message #3 Posted by **Bill (Smithville, NJ)** on 12 Nov 2003, 7:56 a.m.,*
in response to message #2 by Joerg Woerner

Hi Joerg,

I had forgotten about the check book calculators. Thanks for reminding me of the Corvus Checkmaster.

Was it really that power hungry that it took 6 AAA's? You'd only be using it when you balanced the checkbook. I would guess they wanted to achieve several months of use - thus the large number of batteries.

You have a nice museum site and some very interesting calculators.

Re: No Division -I'd like to see this calculator

*Message #4 Posted by **Joerg Woerner** on 13 Nov 2003, 6:46 a.m.,*
in response to message #3 by Bill (Smithville, NJ)

Hello Bill,

The Checkmaster draws 3mA from the batteries - in the OFF-position of the switch. This is 72mAh per day or 14 days per set of batteries. No, they don't sell calculators - they sell batteries. Or was it Xerox-paper or Gilette blades, or printer ink...

Regards, Joerg

MIT Chemistry Course Accepts HP-42s But not HP-32SII

*Message #1 Posted by **Bill (Smithville, NJ)** on 11 Nov 2003, 3:07 p.m.*

Just ran across the following MIT Department of Chemistry web site: "Examples of Acceptable Calculators for 5.111 and 5.112 Fall 2003":

http://web.mit.edu/5.111/www/Fall03/calculator.html

Forturantely for the students - the HP-42S is listed as acceptable but not the HP-32SII.

I always wonder how they make the determination that Calculator XX is acceptable but Calculator YY is not.

Re: MIT Chemistry Course Accepts HP-42s But not HP-32SII

*Message #3 Posted by **Valentin Albillo** on 12 Nov 2003, 11:00 a.m.,*
in response to message #2 by Dave

Dave posted: *" I seems so limited in capabilities"*

I beg your pardon, but do you actually mean: *"I seem so limited in capabilities"* or else *"It seems so limited in capabilities"* ? :-)

Now seriously, the 32SII is a wonderful calculator in many aspects, its only killer drawback being it has an utterly preposterous, ultra-small amount of user's RAM, just 384 bytes ! :-(:-(:-(

As every line in a program takes a minimum of 1.5 bytes, this means only a theoretical maximum of 256 lines is feasible. But many other features and functions take a lot more. Real numbers other than small integers take 9.5 bytes per number (1234 for instance would require that amount instead of the typical 4 bytes in most other calculators). "Integrate" requires 140 bytes, plus the bytes taken by your function or equation, plus any necessary setup.

Thus, we sadly find that many other earlier calculators can run rings around the 32SII in terms of feasible programming tasks, such as the HP-15C from HP and most any SHARP programmable handhelds, even the humblest. This unfortunate situation wasn't new: the HP28S was also released with a breathtaking array of advanced, even revolutionary, capabilites, yet only 2 Kb RAM which for that machine amounted to next to nothing.

Best regards from V.

in response to message #4 by Massimo Gnerucci (Italy)

Massimo posted: *"That was the 28C, HP28S first incarnation... ehm... plastification(?) ;-)"*

Certainly, certainly, a typo on my part. The most obfuscated word I can think of instead of "incarnation" or "plastification" would be "transmogrification" :-)

I saw an HP-28C as soon as it was released and, frankly, was absolutely unimpressed. With that little RAM, new (at the time) RPL language ("transmogrified RPN") and primitive symbolic capabilities it seemed to me more of a 'toy' than a professional instrument as the 41 was. I didn't buy one at the time and still have none though I later acquired an HP28S.

Best regards from V.

Off-topic: vocabulary error

"**Plastification**" is not a word. I believe that you both meant "**plasticization**".

Bruce.

Re: Off-topic: vocabulary error

*Message #7 Posted by **Ed Look** on 12 Nov 2003, 10:51 p.m.,*
in response to message #6 by W. B. Maguire II

Forgive me and allow me to weigh in here.

While it is true that even an up to date (American) English dictionary may not have [imaginary] "plastification", I think the intended meaning is different from the [real] "plasticization": the latter refers to a(n increase) change in elastic, mechanical properties of a material whereas I believe Massimo may mean a (degradation) change in quality.

Even back in the sixth grade (and for me, that's a while) a classmate and I, after looking at some new products in the five-n-dime, lamented, "As man invents, everything gets more plastic!" We both understood that he didn't mean polymers or resins; he meant the loss of quality, as to a child, the relative (to metals, etc.) inability to withstand manhandling of items manufactured in some plastics led to his observation!

Upshot: if it ain't a word, it oughtta be. ;)

Memory limitations at model introduction

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 12 Nov 2003, 1:21 p.m.,*
in response to message #3 by Valentin Albillo

32 S II: memory is a severe limitation and the model (sadly) was never upgraded (even the 33 S, having more physical RAM, seems not to be able to take advantage of it)

28 C: Upgraded as "new" model, 28 S. 2 KBy was too little memory.

48 G: Upgraded as 48 G+ (While I don't like RPL machines, I concede that a 48 G is rather useable with "only" 32 KBy)

41 C: Upgraded as "new" model, 41 CV, but the original was of course expandable with Memory Modules, Quad RAM, etc... In my opinion, the original 41 C, with only 64 registers (448 bytes... not far from the 32 S II capacity) was useable but somehow limited until you added extra RAM.

Granted: Less than half a kilobyte was more reasonable in 1980 (41C) than in 2000 (32 S II), and the 41C is more efficient in RAM usage.

It seems that the case for "undersized memory" happened many times in the past.

Just my $ 0.02

*Message #9 Posted by **bill platt** on 12 Nov 2003, 11:12 a.m.,*
in response to message #2 by Dave

It is the *only * RPN scientific machine produced since the early 90's, and it has all the features (as well as some new ones) as the 11c (and the 34c generally, as well) and enough memory to do many useful programs. And, most functions are only one or two keypresses away. What's not to like? It used to be $59.95 and small and compact. No, it's no 15-c, but it is close enough for most hand calculation tasks!

In short, it was the only RPN machine on the market for the last decade!

Regards,

Bill

Re: MIT Chemistry Course Accepts HP-42s But not HP-32SII

*Message #10 Posted by **Dave** on 12 Nov 2003, 3:42 p.m.,*
in response to message #9 by bill platt

Yeah, just because it was the only one does not make it good. I think some of this boards fascination with the 32SII led to the 33S design choices...

It went to the old 67 style cluttered keypad

Perception that memory access or amount is unimportant

Oh well, I hope HP has future design plans around superior calculator designs.....

Edited: 12 Nov 2003, 3:43 p.m.

32sii

*Message #11 Posted by **bill platt** on 12 Nov 2003, 4:06 p.m.,*
in response to message #10 by Dave

Hi Dave,

I agree that being the only one does not make it good. However, from my own experience, it seemed quite good at the time:

1981: bought 11c for $130 great machine. a marvel.

1995: lost 11c so bought the 32sii. Cost: $60. same amount of program lines. 33 registers instead of 21. All 12 comparisons rather than 8. Alphanumeric prompting. Storage registers alphabetic. Equations, solve (both in equ and rpn) integrate (both in eqn and rpn). Dynamic memory allocation. Vastly improved memory and program management. Downside: keyboard layout not as perfect as the 11c. Felt less expensive (but was!). Could have been much more, at the same price, considering the technology at the time. But when designed (late 80's) may have been unattainable.

So, for an 11c user, the 32sii was a definite upgrade. But as I have read Valentin's posts, (and earlier when a German co-worker showed me a Sharp) I now realize that I could have got much more for my money at the time (95) buying a sharp.

Dave (which Dave?) wrote:

> Quote:
>
> ...I think some of this boards [*sic*] fascination with the 32SII led to the 33S design choices...

Do you really think that the opinions of a literal handful of people on this site influenced HP-33s design choices? That would speak wonders about the influence and power of MoHPC Forum participants. Although I doubt it, I wish it *were* so! Maybe we could counteract the inane influences of the marketing department!

;-)

Bruce.

Re: MIT Chemistry Course Accepts HP-42s But not HP-32SII

*Message #13 Posted by **jonstot** on 16 Nov 2003, 2:34 p.m.,*
in response to message #12 by W. B. Maguire II

My own 'fascination' with the 32SII has very little to do with its programming capability. In fact, I don't believe I've written a program for any of my HP calculators since the first Mac was released ('84, I believe). But I love my 32SII and use it practically every working day. Why the fascination? Simple: ergonomics, esthetics, and RPN. It's small(ish), lightweight, fits in my shirt pocket, it has the old HP-quality feel to the keypad, the color scheme is perfect, it has all the functions I need, and it's RPN (God rest its unappreciated soul). Alas, my 32SII is on its last legs and I'm beginning to panic, what with nothing comparable available now. 33S? You gotta be kidding! And the new graphing calculators leave me unimpressed - too big, too ugly, too complicated for what I need. Now I'm trying to muster the courage to buy a "new in the box" 32SII that will cost as much as an entry-level desktop computer.

Re: MIT Chemistry Course Accepts HP-42s But not HP-32SII

*Message #14 Posted by **Ed Look** on 16 Nov 2003, 6:55 p.m.,*
in response to message #13 by jonstot

Now, I love my 32SII and use it as my main machine (I don't take it anywhere, though, especially given the outrageous prices people ask for it) because it is so much like the 34C. But I think that either the 48G series or 49G series calcs could do, though terribly complicated and more than you might want or need, as they are still RPN with (now an infinite) stack. You don't have registers anymore, but is that too different from storing in a variable? If you do program and use indirect addressing, it could be a pain, but since you don't, it may be more economical than paying a ransom for a 32SII, cute as it is.

A possible solution Hp17Bii

*Message #15 Posted by **Ron Ross** on 17 Nov 2003, 8:32 a.m.,*
in response to message #13 by jonstot

This calculator can be set to RPN, has better stats, More RAM (7 K), and a great Solver. And it has the same keyboard and basic layout as your present Hp32s.

Downside. No Trig, but can be implemented via solver, but not as good as the 32s for a scientific.

And they are still relatively cheap and well made (I doubt if the newest Hp17Bii+ is much better than the Hp10Bii, but I hope for Hp's sake that it is). If the newer Hp17Bii+ is a good quality calculator, it is now on the market to replace (and therefore deflate the value) the Hp17Bii.

Re: MIT Chemistry Course Accepts HP-42s But not HP-32SII

My guess is that, in the case of the 32Sii vs. 42S, the "examining board" saw the 26 letters of the alphabet printed on the keyboard face of the former, but not on the latter.

Far too simple

*Message #2 Posted by **Valentin Albillo** on 11 Nov 2003, 11:53 a.m.,*
in response to message #1 by Statistics

You can't simply ask for "the best calculator ever built", because there are many specialized calculators for special needs, which really don't compare.

Just for instance, there are financial calculators (HP-12, Sharp PC-1421), scientific calculators (HP-15C, Sharp PC-1350), graphic calculators (HP48/49), computer science calculators (HP-16C), statistical calculators, etc, etc.

IMHO, you can't meaningfully compare a Financial HP-12C calculator versus a Computer Science HP-16C, or the HP-16C versus the HP42S, they're really very different beasts and its kinda comparing apples with oranges.

Thus, I'd suggest that you modify your request to specify cathegories as well: Best Financial Calculator, Best Scientific Calculator, Best Graphic Calculator, etc, etc.

Even so, probably it wouldn't be fair comparing vintage machines versus newer ones: Is an HP42S better than an HP-65 ? Isn't that unfair to the HP-65 ? But I won't go into that ...

Best regards from V.

Re: Far too simple

*Message #3 Posted by **Statistics** on 11 Nov 2003, 12:03 p.m.,*
in response to message #2 by Valentin Albillo

Valentin, you are completely right! Sorry!

I already have changed the formulation. Hope it's alright now ...

Thank you for your advice, best regards, S.

##

For those who read the thread and do not know about what has been discussed here, here is my explanation:

I had asked for

1) the best calculator ever built (your own subjective/personal opinion)

2) your favorite calc

3) if not identical: Why is your favorite not the best calc ? (this may be different although not in general: e.g. "your favorite is the hp-12c because you are a banker, but the best calc is the hp-49g+")

But see Valentin's concerns regarding the formulation of the question. And indeed he is right, so I have changed the text of the voting request.

Edited: 11 Nov 2003, 12:24 p.m.

Re: ### Please vote: WHICH is the BEST CALCULATOR ever built ?

*Message #4 Posted by **Dave** on 11 Nov 2003, 12:05 p.m.,*
in response to message #1 by Statistics

1) What is the best calculator ever built ? (give 1 or more with ranking)

Only one that can be the best is the HP-41 series

2) What is your favorite calculator ?

Why ask after my first answer - the HP-41 series

3) If 1) not equal 2): Why isn't the best calc your favorite ? :-)

Boy these are silly questions - do not accept any other answer other than the obvious - the HP-41 series DUH!

4) Why is the chosen calc the best? (main reason(s) only)

It led the way in many ways and was basically infinitly expandable and was a calculator and not a computational instrument (ie no CAS)

It was fun and has never been topped as a calculator...

Who said we were congenial????

Again .. accept no substitutes or imitations... The Hp-41 series rules and will never be subplanted as the best calculating system ever!

Controversy is welcome.

There is no controversy as there is only one right answer!

IMHO, the HP 65 was the greatest calculator ever built. No other calculator, AFAIK, got BANNED by the FSU Chemistry department for use on exams.

*Message #6 Posted by **Masao Kinoshita** on 11 Nov 2003, 2:58 p.m.,*
in response to message #5 by Masao Kinoshita

IMHO, the HP 65 was the greatest calculator ever built. No other calculator, AFAIK, got BANNED by the FSU Chemistry department for use on exams.

*** The HP 65 was just plain AWESOME in its day!!! *** Later calculators may have been more powerful, e.g. HP 67, HP 41CVX, HP 48SX/GX, but they just did not have the same awe inspiring feeling of the HP 65.

Hp-42s is the BEST ever !!!

*Message #7 Posted by **Ray F.Dutta** on 12 Nov 2003, 9:54 a.m.,*
in response to message #4 by Dave

My choice:

absolutely clear: Hp-42S is much better than everything, than Hp-48, Hp-49, Hp-71b !

It is even MUCH better than the good Hp-41cx !!! (Dave, I cannot understand your extreme vote before although Hp-41 is also a good machine)

WHY ? Because ...

MORE SPEED: Hp42s is 10 times faster than the Hp-41cx

MORE FUNCTIONALITY: 64 kByte of ROM, the Hp-41cx has only 24 kByte of ROM (so do NOT come with the argument of plug-in ROMs ! Hp42s has already all important ROMs implemented !)

MORE RAM: 32 kByte are possible, with Hp-41cx only 6,5 kByte (including 2x XMemory!)

SMALLER FOOTPRINT: Although much better as described above, it is much smaller than Hp-41cx !

Edited: 12 Nov 2003, 12:01 p.m.

Re: Hp-42s is the BEST ever !!!

*Message #8 Posted by **Dave** on 13 Nov 2003, 8:57 a.m.,*
in response to message #7 by Ray F.Dutta

Excuse me, but what good is the increased memory capacity when one has to enter EVERYTHING by keystrokes and there is no way to backup programs?????? Yes the 42S is nice, but it is severely crippled for real use due to this limitation.

Re: Hp-42s is the BEST ever !!!

*Message #9 Posted by **Ray Dutta** on 13 Nov 2003, 9:55 a.m.,*
in response to message #8 by Dave

Yeah, but the Hp-41 is VERY limited at other places!!

It is as slow crook ... !!! You can use it as calc but not really as programmable because technical calculations are too slow.

And ... What is 2200 Bytes ? And if you have XMem, the additional 4200 is only RAMDISK, so you cannot use it as real program space!!

The Hp-42s can be expanded to 32000 Bytes ... WOW!

...and the worst screen I've ever seen (no text)

*Message #11 Posted by **Ray** on 13 Nov 2003, 12:29 p.m.,*
in response to message #10 by R Lion (España)

Why is the screen the worst ???? I cannot understand ! Look at the ridiculous Hp-41 "screen", 12 digits with 14 segments :-)))). That's much much worse then the great complex number double line display of the Hp-42s.

Ok, forget the graphing. But the rest is good compared to others...

Re: ...and the worst screen I've ever seen (no text)

*Message #12 Posted by **Nelson M. Sicuro (Brazil)** on 13 Nov 2003, 1:23 p.m.,*
in response to message #11 by Ray

The contrast and glare of the HP-42S display is terrible! (the old ones, at least. I have a HP-17BII that uses the same display, but its contrast is much better, the one with a stepped bezel). The capacity and resolution is fine.

For the best contrast ever, I vote for the HP-15C and second the HP-41CV.

Regards,

Nelson

in response to message #11 by Ray

> Quote:
>
> Why is the screen the worst ???? I cannot understand !

I said that because the contrast: if you adjust it for working on the table, you will see nothing with the calc in hands. But, in spite of it, I think is one of the best calcs in the world.

in response to message #1 by Statistics

You could ask what calculator would you take with you (and you can take only one) if you were in a scenario which required some sort of back-up computational device should your main computer go down, say being in an ocean crossing yaught or an orbiting space station. This puts the emphasis on functionality and reliability over aesthetics. Even though I find my personal choice to be as sexy as it is capable.

There can be only one ...

Re: an interesting variation...

*Message #17 Posted by **Arnaud Amiel** on 12 Nov 2003, 3:23 a.m.,*
in response to message #16 by hbanner

In that case it would have to be a slide rule as it has to be small enough not consume any power as I don't know how long I will be stranded and has to survive a nuclear blast. I don't see any hp or other fitting the bill.

Arnaud

in response to message #19 by Raymond Del Tondo

The Curta RULES.

As much as I like my 67 and the 34C the feeling of calculating on the Curta is just sweet.

It feels great looks great needs no batteries and...

you have to *think* to use it

Thanks Malcolm

Re: an interesting variation...

*Message #21 Posted by **Arnaud Amiel** on 13 Nov 2003, 8:31 a.m.,*
in response to message #19 by Raymond Del Tondo

I wish I had a Curta, they seem great but not easy to come by except on ebay where they are not cheap. However, I guess that however well built they are, they must be much easier to break than a slide rule and I guess it is much harder to calculate logs or trigs with them.

in response to message #16 by hbanner

How about one of those old hand crank jobs. This is going back a stretch - I remember back in the late fifties or early sixties a salesman came to our office trying to sell a small device made in of all places Liechtenstein! You cranked it backwards to do division. It was small, say about 6 inches wide, 8 inches deep and the height of about 2 inches in front sloping to about 4 inches at the rear. I wonder who made it.

tm

*Message #26 Posted by **Victor Koechli** on 12 Nov 2003, 11:10 a.m.,*
in response to message #1 by Statistics

Easy:

Favourite: 15C, because of everything.

Best ever: 48GX (overall), 49G (functionality). Probably 49G+ will surpass them both, but I haven't seen it yet. Prime criterium is functionality

Why #1 <> #2: See above.

Yet another 2 cents, Victor

Re: ### FAVORITE

*Message #27 Posted by **Frank** on 12 Nov 2003, 11:38 a.m.,*
in response to message #1 by Statistics

1) the best calculator ever built (your own subjective/personal opinion)

HP-48GX, because it does so much, feels so good, and has the best documentation and programming flexibility.

HP-32Sii, because of its very satisfying ergonomics.

HP-15C, because of it's incredible balance of size, power and simplicity.

2) your favorite calc

HP-16C

3) if not identical: Why is your favorite not the best calc ?

There's nothing else quite like a 16C, and for what it does there's nothing better, but it's not quite general-purpose.

Re: ### FAVORITE

*Message #28 Posted by **Norm** on 12 Nov 2003, 2:48 p.m.,*
in response to message #27 by Frank

Why the HP-34C of course. Because its the best, that's why!

HEY my buddy Ralph is over here, he says add his vote on also. He votes for HP-34C.

Oh, my girlfriend Linda, she says definitely HP-34C, add her vote too.

Wait, Ernie next door, he says be sure to tally another vote for HP-34C.

Oh and then Great-Aunt Edna just spoke up from her rocking chair, she says definitely HP-34C.

Be sure to count their votes also.

Re: ### Please vote: Which is YOUR FAVOURITE CALCULATOR ?

*Message #29 Posted by **Raymond Del Tondo** on 12 Nov 2003, 2:16 p.m.,*
in response to message #1 by Statistics

1) HP-48GX of course, then HP-41 series

2) your favorite calc HP-48GX/G+ , then HP-41CX

Both of them are the best HP calcs regarding the user interface, programming capabilities, expanding, interfacing (ok, the 71B, too;-), documentation, and keyboard reliability & ergonomics .

My 2 Euro-Cents...

Raymond (HP calc user/programmer since ca. 1980)

My vote

*Message #30 Posted by **R Lion (España)** on 12 Nov 2003, 3:55 p.m.,*
in response to message #1 by Statistics

The best calc ever made: 48GX & 15C

The first one if you need a "special", "sophisticated" calculator. The second one if you want a numeric scientific calculator.

Re: ### Please vote: Which is YOUR FAVOURITE CALCULATOR ?

*Message #31 Posted by **Stefan Vorkoetter** on 12 Nov 2003, 4:48 p.m.,*
in response to message #1 by Statistics

Best: Toss up between three: HP-41CX, HP-42S, and HP-34C.

Favorite: HP-34C. Why? I don't know, but I own one of each of the above (and a 32E and 19C as well), and the 34C is the one that I always use.

Re: ### Please vote: Which is YOUR FAVOURITE CALCULATOR ?

*Message #32 Posted by **Ed Look** on 12 Nov 2003, 11:02 p.m.,*
in response to message #31 by Stefan Vorkoetter

Stefan, to me, it's the ease of using it. Having had it for decades, I know every label on every button.

Also, despite the preferences of some for menus instead of extra shifted labels on keys, I think it is faster to make keystrokes using shifted label keys, as on that wondrous 34C. Too bad mine is, well, showing its age. For that reason, I use mainly the 32SII, which to me is a very similar calculator, one reason why I now love that one almost a much. I bought a 48G before the 32SII; when I finally got the 32SII, I was amazed at how "34C-like" it was!

INTERMEDIARY RESULT

*Message #33 Posted by **Statistics** on 13 Nov 2003, 3:13 a.m.,*
in response to message #1 by Statistics

Here is a first INTERMEDIARY RESULT:

BEST* calc ever:

1) HP-48GX (4)

1) HP-34C (4)

1) HP-41 series (4)

4) HP-15C (2)

4) HP-32SII (2)

4) HP-42S (2)

7) HP-49G/G+ (1)

7) HP-67 (1)

7) HP-65 (1)

7) HP-200LX (1)

7) HP-16C (1)

7) TI-Little Prof (1)

*) as most answered on "best calc ever" and not on "my favorite", I used this as listing criterion.

THE TIMELESS HP-41 SYSTEM

*Message #36 Posted by **Werner** on 14 Nov 2003, 2:02 a.m.,*
in response to message #34 by HrastProgrammer

Dear “HP”(=HrastProgrammer),

yes, of course the HP-48GX is really an admirable machine! Nevertheless, I personally prefer the HP-41 as the No.1. Although it is an older machine based on more ancient technology, I do not think that it is less powerful than a HP-48GX.

So my question:

Is a HP-48GX still really more powerful than a tuned halfnut HP-41CX (using synth. programming and mcode – I know, also a HP48 can utilize such expanded ways of programming), if the following plug-in RAM’s/ROM’s/extensions are also completely or partly connected (or their ROM images have been loaded into an MLDL-RAM) ? :

Double-X-Memory-Module, bank-switched 16k-ZEPROM's, a RAMBOX/MLDL (e.g. W&W or Eramco or HP-41CY, etc. with 32k or 64k or 128k, e.g. with full soft-bank-switching access), HEPAX-Module, CCD-ROM, PPC-ROM, ZENROM, Sandbox-ROM, DAVID Assembler, Forth ROM, Advantage ROM, Wand, Card Reader, IL with periphery and advanced I/O processing like by the IL2000 solution from Christoph Klug.

In the near future the HP-41 System will hopefully be further extended by Meindert Kuiper’s MLDL2000 including very large RAM space for ML+UL+Data+ROM-Images and USB PC interconnection. Internal use of 4-times bank-switching would lead to a huge address space especially if you take into account the high RAM efficiency of HP-41 program language.

With ML/MCode you can fully exploit the internal 13-digit accuracy and can define very fast macros, e.g. for fast large scale vector and matrix transforms or for a fast and convenient HP42S-like complex arithmetic implementation.

Further, the HP-41 System has to be seen in an environment of flanking great and fast emulators like EMU41, Warren Furlow’s V*41, your HP-41E, which can run on a modern 3GHz notebook. In combination with Jean-Francois Garnier’s extremely fast HP-IL emulator EMU41, real and virtual (emulated) IL/41 worlds are perfectly merged into one single domain with all available periphery and ROM resources. It further supports the HP-41 with a sort of ultra-fast “HP-41 Workstation/Docking-Station” that utilizes the same HP-41 language for software development (also perhaps with a nice assembler surface on a PC) and for high-complex or long-term calculations. Such a mixed calc-emu-environment is right according to the motto “hardware – software – it’s all the same” …

The benefit of such a calculator-workstation combination can be illustrated by the following example: E.g. use a real HP-41CX to key in the routines, further use it for data collecting and for full mobile use. And, e.g., use it for a coarse 10 parameter evaluation in, e.g., one minute runtime, then when you have found the parameter space of further interest use your fast emulator/”HP41 workstation” on your notebook-PC and do the same calculation with 20,000 detailed parameters also in one minute only (indeed, an EMU41 or a

HP41E on a 3GHz machine is about 2000 times faster than a normal HP-41 !). The nice RPN program code can exactly be reused on the HP41 calculator and on the “HP41-workstation”.

To conclude:

If you add all these great technical and highly efficiently designed supplements from a decade (1979-1990) of extremely dedicated enthusiasm from user groups like PPC and CCD and from professional third-party companies like VM Electronics, Zengrange, W&W, Eramco, CMT, and if you add great today’s developments - like MLDL2000, IL2000, ROM hardware emulators, HP41 software emulators, the virtual IL loop from EMU41 - to the “Good-Old-HP-41”, then I think that the HP-41 with its “clean”, easy and flexible user interface and internal architecture is THE unbeatable system in the world of HP calculators.

I think that it cannot be beaten neither by a HP-48GX nor by a HP-49G/G+ although especially the HP-48GX with SysRPL and a lot more is really an admirable handheld computing device.

In my personal opinion, the HP-48GX is ranking directly after the HP-41-System as the No.2. HP-48GX has to share its place with the also great HP-71B-System being a superb IL controller and having also wonderful extensions (like Math, Forth, Assembler, etc.).

All other non-open calculators like HP-42S, HP-32*, HP-15C, HP-34C cannot be compared to the classes of open machines and full systems like HP-48, HP-49, HP-71, HP-75, and HP-41. This group is a class-of-its-own, the handheld computing class. It is separated from the class of pure calculators as is the HP-42S. The HP-42S for instance is of course a marvellous and complex machine, but it is “only” a calculator.

Best regards from Germany,

Werner

P.S.: BTW, please further support your HP-41E, not only your nice HP-41X, because the "E" is a great emulator, too. It is extremely fast on a modern notebook, you can do multi-run calculations with highest complexity in near zero time. Please implement a virtual IL loop as already done in EMU41. I think you already did some emulation of IL but as far as I know you have not yet implemented it in your HP-41E ?

I just printed your message and hung it on the blackboard,. It is *phenomenal*, thanks for your super summary!

Best, ÁM.

PS. Ordered a wooden frame for it already! :-)

Re: THE TIMELESS HP-41 SYSTEM

*Message #38 Posted by **Werner** on 15 Nov 2003, 4:16 a.m.,*
in response to message #37 by Ángel Martin

Angel,

thank you very much for your kind words, I am pleased to hear that from you!

These remarks also refreshed the good feeling that I am not allone with my opinion, although it was already clear to me that there are many HP enthusiasts around who also think that the original technical design of the HP-41 and its further successive evolution over many years has set a standard for handhelds, even more if you look at it as a complete system.

HrastProgrammer, also thank you for your kind comments! Yes, I can understand you well that everyone has his own preferences, my preferences concerning the HP-41 are of couse also characterized by the 1980's decade throughout which I was infected by the "41-virus". The reason for this "41-epidemic" was of course the birth of the new personal computing age (all young guys wanted to play with programmables) but - I believe - ALSO the "heavyweight" of the HP-41 technical design.

Thanks and best regards,

Werner

P.S.: Hrastprogrammer, do you intend to implement HP-IL to your HP-41E ?

Re: THE TIMELESS HP-41 SYSTEM

*Message #39 Posted by **HrastProgrammer** on 16 Nov 2003, 2:23 a.m.,*
in response to message #38 by Werner

Hrastprogrammer, do you intend to implement HP-IL to your HP-41E ?

Not at the moment, I am afraid. I implemented HP-IL in HP-71X for HP-48/49 and it works very well. Perhaps I will implement HP-IL for HP-41X, too (when I will have some time).

I don't work on HP-41E for Windows anymore. It was my developer platform while I have been working on HP-41 emulator for HP-48/49. When I decided to implement some feature in HP-41X, firstly I implemented it in HP-41E for Windows and then reimplement for HP-48/49.

Sorry ...

P.S. Perhaps V41 will have HP-IL support in the future?

Re: THE TIMELESS HP-41 SYSTEM

*Message #40 Posted by **Werner** on 16 Nov 2003, 6:06 a.m.,*
in response to message #39 by HrastProgrammer

Thanks for your answer! Yes, I understand. One has to focus, one cannot do everything as often there is not enough spare time for all those nice projects. It would have been a very good thing because your HP-41E is one of the most powerful and fastest, but I understand ...

You are right, V41 and EMU41 also belong to this group of as powerful PC based emulators and I am happy to have the V41 and the full IL-version from Jean-Francois.

Regards,

Werner

Re: THE TIMELESS HP-41 SYSTEM

*Message #41 Posted by **HrastProgrammer** on 17 Nov 2003, 2:26 a.m.,*
in response to message #40 by Werner

It would have been a very good thing because your HP-41E is one of the most powerful and fastest, but I understand

And it has the most advanced debugger of all 41 emulators. I have an internal (2.00) version and I can mail it to you if you want. It doesn't have HP-IL support and there are perhaps some bugs but it could be interesting to play with it for a little. With no technical support, of course, because currently I really don't have time to work on it :-)

HP-41E Emulator

*Message #42 Posted by **Werner** on 17 Nov 2003, 7:12 p.m.,*
in response to message #41 by HrastProgrammer

Oh yes ... ! :-)

I would be happy if you could send me your 2.0 internal version of your great HP-42E ! It doesn't matter if there are some bugs and that there is no technical support. Any extra item that helps me to step a bit forward is always very welcome! And the good debugger is an important advantage.

At the moment I also have the problem of having no time for this hobby due to my job but I hope that in the future I will find time to realize some ideas for mcode routines. I hope that then I can give something back to the helpful and friendly HP community ... :-) (hopefully!).

Can you send me the emulator to my email address given above (...gmx.de) ? That would be very kind of you!

Thank you very much and best regards,

Werner

Very difficult decision between the 34C and the 41CV/CX - by a whisker I guess my favorite is the HP34C because it's just so darn attractive - nice size, looks like I want an HP to look (the keys shout HP at you), that lovely red led display (aaargh I'm turning into Norm!) - there's just something so appealing about it.

However, I'm also a great fan of the 41 - my first HP - and I think that it is unsurpassed as a calculating system when you consider user definable keyboard, alphanumeric programming, rom pacs, the HP-IL interface, card reader or bar code input, etc (plus it doesn't chew batteries like the 34C although a 41 with a red led display (and the high keys) gets my mouth watering) and to top it all, it's also got that HP look (and you just want to pick it up and calculate something, anything, just for the sheer pleasure of using a quality tool) - something that all its successors, other than the Voyagers, lack.

Best

James

FINAL RESULT

*Message #49 Posted by **Statistics** on 14 Nov 2003, 12:04 p.m.,*

in response to message #1 by Statistics

Here is the FINAL RESULT: (nevertheless, if anyone still likes to vote I will update this result later).

As there was more ranking info at the last inputs, I decided to give points: 3 pts for ranking #1, 2 pts for ranking #2, 1 pt for ranking #3, no points for #4...

Calc ranking in points:

1) HP-41C/V/X (20)

2) HP-48GX (17)

3) HP-34C (12)

4) HP-71B (7)

4) HP-15C (7)

4) HP-42S (7)

7) HP-49G/G+ (6)

8) HP-32S/Sii (5)

9) HP-67 (3)

9) HP-65 (3)

9) HP-16C (3)

9) HP-200LX (3)

9) TI-Litt.Prof (3)

48sx and 41cv app pac manuals

*Message #1 Posted by **art blick** on 11 Nov 2003, 9:59 a.m.*

I recently found a 48sx with a Topcon fc-48 survey card and tds 256k ram card at a flea market. Where can I get the manual(s) for the application pac and ram card?

Included was a 41cv with the following modules: surveying 1 math/stat strc anal x

Are there manuals available for any of these?

I need to replace the spring/contact in the 41's battery pack. Any suggestions for a source?

thank you for any help, art

Re: 48sx and 41cv app pac manuals

*Message #2 Posted by **murfmaster** on 13 Nov 2003, 2:31 p.m.,*
in response to message #1 by art blick

I would just suggest that you go to Google and search for hp41cx stuff and look at those pages.

Re: 48sx and 41cv app pac manuals

*Message #3 Posted by **art blick** on 13 Nov 2003, 2:52 p.m.,*
in response to message #2 by murfmaster

Thanks for the info. I'll give it a shot.

I thought I had gotten lucky when I found the calculators. The 48 was just locked up, and when I rebooted, it came to life. The 41 is in pretty bad shape, but after a little cleaning, it's presentable. Only problem was, when I tried to use the software that was included, I realized I didn't have a clue....sorta typical for us old folks <grin>.

Thanks again for the lead

HP Calculator

*Message #1 Posted by **K. Ethiraj Reddy** on 11 Nov 2003, 9:21 a.m.*

Dear Sir, My brother is a Astrologer He wants a calculator with following functions, 1. Placidus House Calculation. 2. Plants Positions. 3. siderial time Calculators,

If the above product is avalable please send me the details immediatly

Regards,

K.Ethiraj Reddy

ROTFLMAO! Excellent K. Ethiraj! (n/t)

in response to message #1 by K. Ethiraj Reddy

Hi K.,

There are a number of astrological programs available in this very Museum of HP, namely:

```
HP-67 Astrology Solution Book (ported to HP-41C)
          Astro 1 - Mean Obliquity of Ecliptic & GST
          Astro 2 - Moon Asc Node, Nutation, Vernal Pt
          Astro 3 - Local Siderial Time, Geocent Lat
          Horoscope Construction
          House Cusps - Campanus Methods
          House Cusps - Koch Methods
          House Cusps - Placidus Method
          House Cusps - Regiomontanus Methods
          House Cusps - Topocentric Methods
          Mundoscope, Campanus
          Mundoscope, Regiomontanus
```

follow this link and scroll down till you find the individual links for each program.

They seem to be available in its original form for the HP-67, and here you'll find the 41C versions, translated automatically using the card reader, so you could run them using either an HP-67, HP-97, HP-41C, HP-41CV, HP-41CX, or an HP-42S.

Best regards from V.

Let me get this straight

You need to find an HP calculator with a random number generator. This is all you need to give you results with the required acuracy for the tasks you mention.

Astrology and Mathematics

*Message #7 Posted by **Tom Sherman** on 13 Nov 2003, 9:55 a.m.,*
in response to message #1 by K. Ethiraj Reddy

The founder of modern trigonometry, including the spherical trigonometry used for positional astronomy, was Johann Muller (known as Regiomontanus), who was an astrologer as well as a genius of mathematics and astronomy. Johann Kepler (of elliptical orbits and Kepler's Laws)was an impassioned astrologer. Isaac Newton had some interest, but was mostly absorbed with alchemy and theology instead.

Astrology has to use the same mathematics as conventional astronomy to predict the movements of the planets, moon, sun, and stars. You and I may reasonably doubt that the movements of the celestial bodies should be interpreted in terms of human destinies, but it is not unreasonable that people of all times might do so. Think of the effects of diurnal cycles and of the seasons upon all life and upon the wind and weather. And modern cosmology and general relativity suggest that the properties of any microcosm are related to the macrocosm as a whole -- that even the inertial mass of the pen in your hand or the molecules in your body is related to the existence of the whole universe around us.

Sounds like a sermon, but sometimes the stars carry me away.

Tom

Humor: Eavesdropping at KinHPo ...

*Message #1 Posted by **Valentin Albillo** on 11 Nov 2003, 7:56 a.m.*

Hi all, here's some fragments on an alleged discussion at KinHPo's, not so long ago:

```
P.: But J., we need to do something about this, it's plain frustrating
    for the user, having 32 K RAM and being unable to use it ! It just
    doesn't make sense ! Why on Earth would we include a 32 Kb RAM chip
    in the new HP33S and let the user unable to use it ?

J.: We're including that dreaded 32 Kb chip because it's the *cheapest*
    one available. Any bigger or smaller and they cost more, because of
    obsolescence issues. Besides, Marketing said that it would look
    good in the specs sheet, as a sales point. And what d'you mean
    'unable to use it' ? Isn't the chip included or what ? As long as
    it is, they can't sue us.

P.: It is, but we haven't changed the original firmware ... out of those
    32 K, you can use *less* than 1 % for your data, variables and such !
    Not to mention matrices: not only does it lack matrix support in
    firmware, but the user can't write  software to cater for it, as he
    can't even fit matrices that the venerable HP-15C ate for breakfast,
    20 years ago, and in just 0.5 Kb ! It's preposterous !

J.: So what ? At least they can use it for programs, or its internal
    workings or whatever, right ?

P.: But that's hardly so. As it is, the user's got just 26 labels, which
    can't be duplicated and reused, and any non-trivial program will
    need at least a few. With just 26 labels for 32 K, and as we don't
    allow branching to numbered steps, there would need to be more
    than 1 Kb worth of program lines between consecutive labels, on the
    average !

J.: Big deal !

P.: But J., this means you'll run out of labels long before you can use
    that much memory. We actually need to upgrade the firmware, J., to
    provide indirect access to more data registers, more labels, or at
    least let the user re-use the labels or branch to any step ! We did
    it on the HP-34C, eons ago, it even had *automatic* memory allocation
    between program and data, and it only had 210 bytes of RAM, for
    crying out loud !

J.: We-Don't-Change-The-Firmware !! Changing the firmware does *cost*
    money and so reduces any profits this thing can make us, which I
    doubt, so We-Do-Nothing, is that clear ?  Besides, we can always say
    those blasted 32 Kb are used internally, to maximize efficiency or
    remove memory restrictions, or whatever !

P.: But that's not true, J.! The original 32SII firmware was so starved
    for memory that most advanced functions would easily run short of it.
    That's why the Integrate function wouldn't work together with Solve,
    the reverse being true as well, unlike such primitive models as the
    34C, which would indeed allow that. Users know this, and having so
    much RAM they'd logically expect that this restrictions are removed,
    so they can integrate implicit functions or find roots of functions
    defined by integrals. For heaven's sake, the 34C did it, the 15C did
```

```
    it, everyone and his uncle did it ... but the new, 32Kb-33S doesn't !!
    And there's no reason why we don't remove this restriction !

J.: Read my lips, P.: There-Is-A-Reason, and I'm getting real *sick* with
    you don't getting it: any such improvements require some firmware
    changes, big or small. Any firmware changes does cost us money,
    big or small. And any extra costs reduce our profits, big time ...

P.: But the users deserve ...

J.: ... and it goes without saying that if profits aren't as expected,
    *your* head and mine will be up on a pole fast. This is *not* a
    charity, but a profit-driven corporation. C.'s company policy is
    crystal-clear: we must maximize profits, and every department has
    some profitability goals to meet. Do you really think we're making
    any big money selling these RPN things that noone wants ? Do you think
    that it will sell "like mad", despite that stupid phone-like aspect
    and rushed algebraic mode that Marketing forced upon us, to try and
    attract some unsuspecting students ? Would you imagine many a
    respectable engineer or valued professional being caught *dead*
    using something like THIS ?

P.: ... no, not really ...

J.: Well then, stop pestering me with your RAMs and ROMs and firmwares
    and see if you can get some big order for these things. Go !
```

Best regards from V.

ROTFLMAO! Excellent Valentin! (n/t)

HP 48GX: where's the Order command?

*Message #1 Posted by **Bill in Dayton** on 10 Nov 2003, 9:17 p.m.*

I'm trying to switch from a 48SX to 48GX. Does anyone know if the GX has a command to reorder the programs in a directory? On the SX it was [memory][order] after making a list.

The [memory][move]command on the GX only seems to be able to move programs to another directory. Thanks.

Edited: 10 Nov 2003, 9:22 p.m.

Long term storage of calcs.

*Message #1 Posted by **Graham Wilson** on 10 Nov 2003, 9:05 p.m.*

Hi all

Does anyone have any tips about the long term storage of HP calculators? I have a couple of spare machines that I am keeping as backups.

Is it better to remove the batteries (assuming programs are backed up onto paper or PC)?

Is it better to store unused uncharged rechargeable battery packs (such as NiMH or NiCd) in a fridge to increase their life?

Thanks
GW

Yes and yes.

Re: Long term storage of calcs.

*Message #3 Posted by **unspellable** on 10 Nov 2003, 9:37 p.m.,*
in response to message #2 by David Ramsey

Speaking as a reliability engineer, I would say you should power up the calculator for a few minutes once every other month or so to keep the dielectric formed in any electrolytic capacitors the calculator may have. Between power ups, remove the batteries.

Re: Long term storage of calcs.

*Message #4 Posted by **Paul Marin** on 13 Nov 2003, 6:45 a.m.,*
in response to message #1 by Graham Wilson

Just a question, while you're on the topic of re-chargables. I have n old 33E, which has a battery which will not charge. What can I buy to replace it? Any solutions?

Any ideas grateful

Paul

Re: Long term storage of calcs.

*Message #5 Posted by **David Smith** on 13 Nov 2003, 1:34 p.m.,*
in response to message #4 by Paul Marin

Take your old pack down to the local Batteries Plus, Batteries, Etc or any similar battery store. For a rather reasonable fee, they will take it apart and rebuild it with new cells. I use 1800 maH NiMH cells in all my calculators. They are compatible with the charger and will run the machine for three times as long as the originals (as long as you charge them for three times as long).

HP 49G+

*Message #1 Posted by **Andreas Archenti, Stockholm** on 10 Nov 2003, 5:19 p.m.*

Hi HP-friends.

I have a problem.. My HP 49G+ will not start any more, it's says "Try to recover memory? Yes or Now". all over again...

I have tried all basic things "at least thats what i think", Reset button etc.

Any ideas, can it be the batteries ?

greatfull for any ideas

Best regards Andreas

Re: HP 49G+

*Message #2 Posted by **r. d. bärtschiger.** on 10 Nov 2003, 5:25 p.m.,*
in response to message #1 by Andreas Archenti, Stockholm

When this happened to my HP-49G+, I removed all the batteries, main & back-up, for about 15 minutes. After this the calculator functioned properly. May or may not work with yours.

rdb.

Re: HP 49G+

*Message #3 Posted by **Tom Scott** on 10 Nov 2003, 7:55 p.m.,*
in response to message #1 by Andreas Archenti, Stockholm

My 49G+ did the same thing when the batteries got low (I think) and I didn't notice. A paperclip reset gave me the "Recover Memory? Yes or No" message. I said yes and it apparently recovered everything and put it in a new directory.

Tom Scott

Re: HP 49G+

*Message #4 Posted by **Jim Chumbley** on 11 Nov 2003, 12:51 p.m.,*
in response to message #1 by Andreas Archenti, Stockholm

I had the same problem, especially under ROM 1.20. When the machine asks for a response to "...Memory? Yes/No" I found that the YES key, F6, was locked. I tried first pressing the F5 key and then the F6 key, and that worked for me.

Re: HP 49G+

*Message #5 Posted by **Andreas Archenti, Stockholm** on 11 Nov 2003, 4:48 p.m.,*
in response to message #4 by Jim Chumbley

Hi friends, I think my problem is solved "for now", I removed all batteries, main & back-up, for the night. Then I changed them for new and made a reset... After this the calculator functioned properly.

Maybe there is a softwere flag that needed to be reseted befor it could start upp again ??

I want to tank all help full peapoles on this great forum romanum!!

Have a great day to you all Andreas

(42S) Why an AIP & no AFP?

*Message #1 Posted by **Sean McNamee** on 10 Nov 2003, 3:39 p.m.*

The AIP cmd on the wonderful 42s puts the Integer Part into the Alpha reg, but there is no cooresponding Fractional Part cmd. I'm going to write it, if there's no built-in method.

Re: (42S) Why an AIP & no AFP?

*Message #2 Posted by **Raymond Del Tondo** on 10 Nov 2003, 5:52 p.m.,*
in response to message #1 by Sean McNamee

Just do FP, then 1E2 * , then AIP ;-) Depending on the decimal places you want adjust the multiplicator. If the 42S had something like MANT, it would be even easier.

Raymond

Re: (42S) Why an AIP & no AFP?

*Message #3 Posted by **Valentin Albillo** on 12 Nov 2003, 7:57 a.m.,*
in response to message #1 by Sean McNamee

Sean posted: *" Why an AIP & no AFP?"*

AIP is an utility function taken from the Advantage ROM, included just for convenience. Its intended use is to quickly and effortlessly append a subindex extracted from the first part of a control number in nnn.mmm format to some matrix element in the Alpha register, for displaying or printing, such as "A(2)= 27.1023". Sample fragment of code (HP-41C, Advantage ROM):

```
50 LBLC           loop to retrieve and display each coefficient
51 MRIJ           recalls the current value of the index
52 "A"            begins to form the prompt to display each coefficient
53 AIP            ... appends the index to the prompt
54 "|-="          ... completes the prompt
55 MRR+           retrieves the value of the current coefficient from the vector
56 ARCL X         ... appends the value of the coefficient to the prompt
57 PROMPT         shows the value to the user and waits for execution to resume
58 FC? 10         are we done showing all coefficients ?
59 GTO C          not yet, go back to display the next coefficient
```

Without AIP you'd need to disturb the control number (23.037) to take its integer part, change the display to FIX 0 and no decimal point, alpha-recall the resulting contents of X to append the first part of the control number to the alpha register, and then probably restore the previous FIX-n display, and RDN, LASTX to restore the control number to its previous state. Instead, a single AIP removes all that drudgery, doesn't disturb LASTX, and makes constructing alpha prompts that much more simple.

As it is, AFP does not exist, but if it did, it would proably do the same with the *second* part of the control number, i.e.: with 23.037 in the X register, some hypothetic AFP would append 37 to the contents of the Alpha register. That probably isn't what you intended.

Best regards from V.

AFP

Was Re: Therapy: Please repeat after me . . .

*Message #1 Posted by **Valentin Albillo** on 10 Nov 2003, 1:10 p.m.*

Paul Brogger posted:

"Therapy: Please repeat after me ... H-P is producing several RPN models again ... "

KINPO is producing several RPN models ...

"The new models, whatever their quirks, represent attempts to respond to customer requests ... "

The new models, whatever their quirks, do NOT represent attempts to respond to customer requests but pathetic attempts to still milk some profits from the dying RPN cow at the least possible cost. They merely copy-paste older models, blindly, inefficiently, so they do not take advantage of the much more modern hardware at all (HP33S's 32Kb RAM, yet only 26 data registers), and besides they do introduce careless bugs (HP12CP 'GOTO'-bug, etc).

"There are positives and negatives associated with everything -- just because the new models don't live up to the old company's standards in all ways, they still have their worthy attributes ... "

There are positives and negatives associated with everything -- but the new models don't live up to the old company's standards in ANY ways whatsoever, they merely copy-paste attributes without any innovation at all, even the ultra-logical ones, yet with degraded quality and usually bug-ridden, no attention to detail or Q&A at all despite the premium price.

"I should resolve to see progress as well as shortcomings, and to balance the one with the other ... "

I will see progress when there IS progress. As of now, I only see shortcomings, so there's no possible balance and further they want me to pay dearly for it.

"I am an H-P calculator addict. I cannot cure my devotion to their old models, I can only control it."

I am NOT an HP calculator addict at all. I'm addicted to nothing whatsoever in this world, and re calculators, I only like and collect worthwhile, quality machines, be they HP, SHARP, Casio, or whatever. I really pity real addicts, that are fully blinded by their mindless addiction and simply cannot see the true facts even if they're painfully obvious to any objective mind.

The moment KinHPo does produce a worthwhile machine, I'll get it. Meanwhile I refuse to surrender to the defeatish view that we must be obligued to KinHPo for the low-quality items it's producing, and thus we must express our thanks by purchasing said lowly-but-expensive items, lest KinHPo would cease production, horror, shock !!

Some years ago, I was indeed indebted to HP's USA-based engineer teams, as they would go to extreme lengths to deliver the absolutely very best, no compromises. They would charge an extremely hefty premium price, but they would deliver, in spades. To these incredible people I'm indebted for life, and I don't regret any of the many cents I spent acquiring their wonderful products.

This I cannot say at all about the current offerings, and such a person as me won't degrade to beg for some lousy

taiwanese-produced RPN crumbs to calm my RPN hunger. I won't worship this false idol, but you can do as you see fit.

Ah, and thanks a lot for your 'well-meant Therapy', but If you think that mocking my rational stand in this theme requires it, perhaps it's you who's in need of major therapy yourself, to cure that serious and blinding addiction you've got.

Best regards from V.

Paul Brogger posted:

"By the way, I've got a SHARP PC-1360 on the way, based entirely upon your recommendation. If it isn't everything you promised, I don't know whether I'll be able to forgive you!"

Let's hope that you'll find it acceptable, then. Anyway, though the SHARP PC-1360 is an extremely fine vintage machine, its layout is not that of an standard scientific calculator, but a BASIC-language pocket computer. This means you won't find a [SIN] key or a [LOG] key, say; you must spell them out on the command line, so you don't do

```
30 [SIN]
```

but instead

```
[S][I][N] 30 [ENTER]
```

There are a number of SHARP models that do indeed feature the best of both worlds, featuring BASIC-language programming and full algebraic expressions evaluation plus a numeric keypad which includes calculator-type keys (SIN, etc) and calculator-style evaluation (30, SIN), so that you can use the operating style that best suits the situation and your mood. One such a model would be the SHARP PC-1403H, that also features 32 Kb of RAM (fully usable, unlike the HP33S') and a 24-char alphanumeric display.

Nevertheless, your SHARP PC-1360 is far better, IMHO. It has a wonderful 4-line x 24-char display, bot alphanumeric and 32x150 graphics, pixel-addressable so you can do very fancy displays and menus (even with icons, Windows-style), has full I/O, can drive a printer/plotter with a full set of BASIC commands (including CIRCLE, labels, etc), and can accept up to 64 K RAM expansion. It's also user-programmable in machine language (PEEK, POKE, CALL). A wonderful machine, indeed, if you're even a little 'hacker' you'll have an extremely good time controlling external devices with it and writing lightning-fast machine-code routines.

As for the lack of calculator-type keys like [SIN], you can assign keys on the keyboard to perform any

function or expression you want, when prefixed with DEF, so you'll be able to assign, say "SIN" to some key for faster execution.

Congratulations on your purchase. I hope you'll give it a fair chance and will actually study its possibilities and get fully used to it in order to make a fair judgment. But I want to help as well, so as a bonus to express my appreciation for your brave attempt to break your limits and broaden your knowledge, please post a valid e-mail address (if briefly) and I'll send you my Othello program for your SHARP PC-1360. It uses menus, takes full advantage of the graphics display by showing the 8x8 board at all times, will accept entries either by coordinates or using a graphics cursor, can suggest hints, offers several openings and playing strategies (including a randomized one than guarantees the program will never play the same way), keeps the score, checks for illegal moves, and will do the final counting and announce the winner, all in less than 100 lines of pure BASIC.

It needs at least 8K to run, but it makes an impressive demo of the machine's capabilities, can teach some interesting programming techniques (such as keeping the strategy in an ever-shrinking string array and custom-graphics creation), and last but not least, offers an interesting playing challenge as well. :-)

Best regards from V.

*Message #4 Posted by **Paul Brogger** on 11 Nov 2003, 12:40 p.m.,*
in response to message #3 by Valentin Albillo

Thanks for your information and offer of help.

I looked at all the models mentioned in your previous post -- the one full of links to various SHARP models.

The 1460's do look more calculator-like and shirt-pocket-portable. In fact, the 1360 was the first of either type (IIRC, 1350/60 or 1460/1/2) that I found for what seemed like a good price on eBay.

I suspect that the lack of an off-unit storage option will be a hindrance at first (and any pursuit of such on my part will be a sure indication of continued interest).

I look forward to an email exchange.

I've included a near-valid email address with every single post I put up here -- just take the "NoHormel" out of the email address in the link above, and fire away. (I mangle it in what seems to me to be a pretty obvious manner in a so far successful attempt at avoidng spam.) BTW, The Hormel Co. is the maker of the widely-loathed "Spam" meat product for which unwanted email has been named. (If you already knew that, I'm sorry if I sound condescending.)

in response to message #1 by Valentin Albillo

Hi Valentin,

I bought some extra 20s calculators some time ago--because I felt that, in the long run, the algebraic logic was less of a problem than the potential of having a bad keyboard. In other words, I don't mind using algebraic--especially a nice one like that 20s has (swap, last, 10 storage registers, keystroke programming)--if it means

that the buttons are good, the machine is reliable, and the results can be trusted and verified by good documentation etc.

You are right about the false idol business. If I had my druthers, I guess I would start a new calculator company--and build them in Europe or Canada, where there are dedicated workers willing to produce a good product, less liablity and business/CEO bloat, and ultimately more interest in the business community in making things. Unfortunately, in the US, there is no interest in making things anymore--the financial markets shy away from manufacturing.

(Norm: your comments too, please)

So, that is what is so special about the HP's we know: they are the last in a long line of great American ingenuity in the industrial age. The new HPCOMPQ or whatever is not the same, and we should vote with our pocketbook.

Regards,

Bill

*Message #6 Posted by **Michael Meyer** on 10 Nov 2003, 10:15 p.m.,*
in response to message #1 by Valentin Albillo

Am I addicted?

I have no desire to purchase calculators just for the sake of buying....and I turn down opportunities daily. I'm a collector, and I'd add the newer HP's only if I could purchase them for what they're worth to me... (not much).

But I love the antiques. I have gone to some lengths to complete a collection of HP models up until and including the Pioneer series. And I have trouble going to bed at night if I've received a non-functional HP in the mail that I know I can repair....

Well, I guess I'll get back to basics here in defining "addiction":

I very much enjoy and get a euphoria from the restoration and use of the beautiful machines of the past. I definitely have a degree of "craving", and even some "withdrawal" when I haven't enjoyed the hobby for awhile. Still, I enjoy the whole realm of the collection: obtaining, restoring, and then learning to use each model. I'll even pull a different machine off the shelf and play with it for several days. Luiz calls them, "his babies", and they do have special meaning to me.

I'll propose that not all "addictions" are unhealthy, but it may simply be a bastardized use of the term; most of us are "addicted" to love, family, etc.

(BTW, I think one of the biggest addictions in modern days is the addiction to refined carbohydrates: sugar. But that's another topic.)

I applaud anyone who is free of all addiction, but I would propose that some are healthy. But again, it may simply be my definition. Would "obsession" be better?

I do have a couple of cheaper, newer HP's in the collection, if nothing else to historically document the decline in quality over the years. They were gifts-- non-functional upon receipt.

If addiction is a blind obsession, then hopefully I'm not addicted. But, is a purposeful and historical collection an addiction? If so, I'm not alone... example being the very site we're on.

I'm not trying to be contrary; just commenting on the term. I'm still missing some key machines, but I have to wait until the time and price is right.

Michael

Just as I was saying . . .

*Message #7 Posted by **Paul Brogger** on 10 Nov 2003, 10:30 p.m.,*
in response to message #6 by Michael Meyer

The good, philosophical doctor (with the fine license plate) wrote:

"*... I'm still missing some key machines, but I have to wait until the time and price is right.*"

I rest my case. Repeat again, "I am an H-P calculator addict. I cannot cure my devotion to their old models, I can only control it."

;^)

*Message #8 Posted by **Juan J** on 10 Nov 2003, 11:55 p.m.,*
in response to message #6 by Michael Meyer

When referring to Oppenheimer, the late Edward Teller used to say that while he did not question his knowlegde, he did question his loyalty and judgement. The quote is not exactly literal, and no offense is intended, but this comment has come to my mind lately when reading Valentin's posts.

Your arguments are good and your reasoning is remarkably solid, Valentin. As one of the contributors wrote, I would much like to attend a lecture of yours in Mathematics. Your knowledge is certainly valuable. But...

"Addict" is a very delicate word to use, and care should be taken with it. Maybe I am wrong, but most of us take pleasure in dealing with our machines, have fond memories about them, enjoy using and repairing them, among other things. And we all prefer RPN when it comes to dealing with a calculator. Yes, it was an efficient way of using limited memory space; yes, it provided intermediate answers that enabled us to track our calculator results better and yes, it is becoming a thing of the past. Yes, calculations can be made a thoudand times faster on a PC. And yes, HP as we knew it is gone. But a user turned into collector is no freak hunting after every HP calculator he/she finds, and is definitely not a person who deserves pity (which in turn, is another word to be used with caution.)

If me or any other RPN/HP enthusiast likes to collect, restore and enjoy, it is because we choose to do it, be it because of nostalgia, efficiency or whatever reason. From our point view, it is a nice activity or hobby or pastime, you name it. And nobody should label other people's likes using words that can become harsh if used without proper caution.

A wise man/woman always knows when to behave properly. And how to state his/her position both carefully and tactfully. We all know what happened to Teller and Oppenheimer, and we all know better than that.

*Message #9 Posted by **Paul Brogger** on 11 Nov 2003, 12:43 a.m.,*
in response to message #8 by Juan J

I think I was the first person to use "addict" in connection with this discussion -- and it's not the first time I've caused offense with ill-considered humor.

Please accept my apologies, any who may have taken my "cute remarks" as an affront.

'Addict' ?

*Message #10 Posted by **Valentin Albillo** on 11 Nov 2003, 5:32 a.m.,*
in response to message #8 by Juan J

Hi, Juan J:

Juan J posted: *"'Addict' is a very delicate word to use, and care should be taken with it [...] nobody should label other people's likes using words that can become harsh if used without proper caution."*

First of all, thanks for your mesurate, non-flaming reply. Things can always be discussed politely and there's never any excuse to resort to personal attacks, and this forum's contributors and contributions are the finest example I know of.

That said, as Mr. Paul Brogges has already admitted, he was the one who mentioned the term "addict", not me, implying that I was one, even if it was an unsuccessful attempt at humor. Now, for me, "addict" is indeed a very strong word which has nothing to do with me, but might be applied to a number of HP fans, see these dictionary definitions and judge by yourself:

```
ad·dic·tion

    1. Compulsive physiological and psychological need
       for a habit-forming substance

    2. The condition of being habitually or compulsively
       occupied with or or involved in something

 Source: The American Heritage® Dictionary of the English
         Language, Fourth Edition
         Copyright © 2000 by Houghton Mifflin Company.

    1: being abnormally dependent on something that is
       psychologically or physically habit-forming

    2: an abnormally strong craving

 Source: WordNet ® 1.6, © 1997 Princeton University
```

I honestly think that (2) and (2) above do apply to many, many, many HP fans, in relation with their calculators. They spend an inordinate amount of time using them, collecting them, repairing them, talking about them, reading news and forums related to them, buying books about them, scanning eBay and adds sections for them, browsing the Internet for anything on them, and eagerly posting and reading any topics related to them. Can you see the pattern ?

Anyway, my definition of "addict" and "addiction" is probably stronger than the one in the dictionaries. For me, an addict is a person whose rational judgment is strongly biased by the addiction itself, to the point where the person can no longer see objective truths if they contradict the object of his/her addiction, and will invent whatever excuses and reasonings he/she finds comfortable with to justify it, even if they don't make any rational sense. Such a person loses objectivity, is 'blinded', and will even take decisions that are objectively wrong as long as they fit with the addiction, truth and sound insight take second place.

That, I don't want to become.

Best regards from V.

*Message #11 Posted by **Michael Meyer** on 11 Nov 2003, 2:15 p.m.,*
in response to message #10 by Valentin Albillo

Valentin,

I see your point. Defined in terms of loss of judgment, "addiction" is a bad state for collectors.... (see some of the insane prices paid in the past for these calculators. I'm glad, as a collector, that we're in a bit of a lull right now on eBay).

It's how I functionally define the difference between mania and hypomania: loss of judgment.

In the milder definitions; one of a compulsion, I fit it to a degree. I certainly spend some time on it, but it doesn't consume me, and hopefully hasn't clouded my judgment.

Well, maybe a little. <grin> I'll always be an open-minded skeptic. (I was born in Missouri, USA... "SHOW ME.")

Be well, Michael

Just found this new 35S prototype;)

*Message #1 Posted by **Thomas Radtke** on 10 Nov 2003, 12:36 p.m.*

http://www.creationindigital.com/album_pic.php?pic_id=192

- full metal case w/ some design elements from earlier models, locked by just one screw (to clean the interior from Cola, read on) - very small and slim - pcb mounted on rubber sockets to survive heavy shocks - best ever color scheme borrowed from 20S - memory limited stack (32kB? more anyone?) - two-line display - extended keystroke programming similar to 32SII functionality, new: messages appear above the input prompt; some other minor modifications were made to allow for a tiny user interface - programs can be assign to three CuSTom keys - root solver with further developed CAS, minimizes the use of the secand algo (hi Linda;), interface exactly the same as on 18C - Levenberg-Marquardt model fitting - MENU key toggles anti-boring full-screen menu and stack view - introduces some 'delay' functions e.g., pressing MENU >=1s gets you back to the menu root - menu tree contains the complete functionality for statictics (incl. hypothesis tests), matrix and vector calculations, equation solver etc., some often used functions are also on the keypad - OO operators to be used on any datatype - introduces the 'Set' datatype including intersection, union, A\B etc. - full range of coordinate systems including geodesic (degree,min,sec) system - IrDA and USB - speech generator, '5' key w/ vertical bar, braille pattern on some operator keys (not shown;) - plasic keys mounted on a matrix; seperated from capacitive sensor layer by a protective sheet resistant to Cola, US-beer and other agressive chemicals - increased availability by omitting Minehunter game - Optionally available cowcatcher to be mounted at the top of the calc for use on track; make sure to have your seat aligned accordingly

Beside some new features, this calc assembles the power of the 48/49 series plus extras and the ease-of-use of an 32S(II) into a truly pocket sized quality designer case where form perfectly follows function. Took three days to design:). Non-destructive comments welcome.

Thomas (beeing bored and having way too much time)

in response to message #1 by Thomas Radtke

If the HP35S becomes a reality, I'll be buying one! It really sounds like what some of us were hoping the 33S would be. So much so, that I can't help but wonder if the "photo" of the 35S isn't just someone's 3D rendering of what a pocket-sized HP calculator OUGHT TO BE!

The large ENTER key seems particularly suspicious to me.

Oh well, I can only hope that this is the real deal. (-:

Re: Just found this new 35S prototype;) re: x^2 key

*Message #3 Posted by **Bill Wiese** on 10 Nov 2003, 2:06 p.m.,*
in response to message #2 by Mark Ordal

Hi... Please please have an [x^2] (x-squared) key - with it as the main (unshifted) function.

My 32S has sqrt(x) as the primary func, w/x^2 as a shifted func, which is not a keystroke saver: sqrt(x) should be the shifted func.

Bill Wiese

*Message #8 Posted by **Juan J** on 11 Nov 2003, 12:10 a.m.,*
in response to message #7 by Graham

Could a clock/timer function be added? Like the good old 41CX time functions?

Re: Just found this new 35S prototype;)

*Message #9 Posted by **Arnaud Amiel** on 11 Nov 2003, 4:01 a.m.,*
in response to message #7 by Graham

Given that the majority of customers target for this kind of clac would be high school students, could you please add a cowcatcher design, brand recognition is very important for the youth market. And could you please also make sure that the calc can be openned as it would be all too easy for the young ones to fiddle with it and break it. Call it 33s to show that it is not as upmarket as the 35s and I will buy it.

Arnaud

Re: Just found this new 35S prototype;)

*Message #10 Posted by **Thomas Radtke** on 11 Nov 2003, 8:15 a.m.,*
in response to message #9 by Arnaud Amiel

Hi Arnaud,

you mean it should _not_ be possible to open it and you're right of course. Well, your ideas are really great. Such machines would sell like hot cakes. Back to reality, I don't think the 33S will have too much success. The younger people can impossibly be so much targeted on non-ergonomic devices. But then there are some quite strange cell phones too. Hmmm...we'll see.

Thomas

Not bad, Tom! But...

*Message #11 Posted by **Karl Schneider** on 11 Nov 2003, 12:12 a.m.,*
in response to message #1 by Thomas Radtke

--- I have some questions:

1. I see nothing about graphing, despite the hi-res display. If it isn't why use 4 buttons for directional-arrow functions?

2. How does "CPLX" work?

-- 32Sii: "Just Plus? No, *Simon Says* Complex Plus"

-- 42S: "C->R and R->C"

-- 28C/S: "A full menu -- C->R; R->C; Re; Im; Conj; Sign; Mag; R->P; P->R; Abs; Neg; Arg"

3. Why is "Hyp" so prominent and not adjacent to the trigonometrics?

That product-design biz ain't so easy, is it? ;-)

Re: Not bad, Tom! But...

*Message #12 Posted by **Thomas Radtke** on 11 Nov 2003, 8:00 a.m.,*
in response to message #11 by Karl Schneider

Hi Karl,

the CPLX button is needed when there is no explicit complex datatype (how should the software decide whether there are four reals or two complex on the stack?). Might not be true on the 35S:). Up'n'down is for stack navigation.

You're completely right, the product design should certainly take more time than a few days:). But in the end I will never be in a position to bring such a device to the market.

Thomas

Re: Not bad, Tom! But...

*Message #13 Posted by **Nelson M. Sicuro (Brazil)** on 11 Nov 2003, 10:11 a.m.,*
in response to message #12 by Thomas Radtke

I still prefer the usage of complex numbers of the HP-15C and the functions that 'decide' if a result can be a complex one of the HP-42S. The only 'complex' function is the one that you can enter a complex number, like the I on the 15C, using a complex stack (full 4 entry)...

Can this design be modified to the 'landscape' HP-15C-ish format??

Regards,

Nelson

Re: Not bad, Tom! But...

*Message #14 Posted by **Valentin Albillo** on 11 Nov 2003, 10:44 a.m.,*
in response to message #13 by Nelson M. Sicuro (Brazil)

Nelson posted:

"The only 'complex' function is the one that you can enter a complex number, like the I on the 15C, using a complex stack (full 4 entry)..."

The HP-71B/Math ROM also does it quite well:

```
COMPLEX Z, V
Z = (2,3)*(4,5)/(6,7) + SIN((1,1)) - EXP((2,5)^(3,2))
V = SQR(Z) + SINH(Z) * LOG(Z)/TANH(Z) - ABS(Z)
PRINT POLAR(Z), RECT(Z), CONJ(Z), PROJ(Z)

COMPLEX SHORT A(10,10), B(10,10)
MAT A = ((2,5))
MAT B = A*A
MAT PRINT USING 'C(2D.D,2D.D,"i")'; A

COMPLEX X(40,40), Y(40,40), Z(40,40)
MAT X = SYS(Y,Z)
```

```
IF Z # (0,0) THEN CALL XREFINE(Z, (1E-5, 1E-5)) ELSE 'DONE'

DESTROY ALL @ OPTION BASE 1 @ DIM P(6) @ COMPLEX R(5)
MAT INPUT P
MAT R=PROOT(P)
MAT DISP R
```

By the way, "complex stack (full 4 entry)" should be " ... plus complex LastX"

Best regards from V.

Re: Not bad, Tom! But...

*Message #15 Posted by **Nelson M. Sicuro (Brazil)** on 11 Nov 2003, 11:14 a.m.,*
in response to message #14 by Valentin Albillo

Yes, I forgot the LastX...

The entry format of the 71C is great for a computer-like calculator, but for a numeric calculator (7 segment display?) the 15C is very good. I don't know the complex functions of the (?) Math Pack (/?) for the HP-41 is better or not.

P.S.

I have all three (15C, 42S, 41CV), and the best keyboard is a mix of the mechanics of the 41CV and the 42C's layout with the "landscape" orientation of the 15C, with 2 shifts and less menus, in my humble opinion... I don't have any fancy 3D-rendering software to do a visual on it, I'll try some day on Photoshop...

Best regards,

Nelson

Re: Not bad, Tom! But...

*Message #16 Posted by **Valentin Albillo** on 11 Nov 2003, 11:36 a.m.,*
in response to message #15 by Nelson M. Sicuro (Brazil)

Hi, Nelson:

Both the Math ROM and the Advantage ROM complex functions are implemented in user code (RPN), as a 2-level stack and thus can't compare at all with the HP-15C's native ones. The only classical machine that compares is the 42S, though it can't enter 4 complex numbers on the stack at a time directly, which the HP-15C can.

Assuming you haven't got an HP-71B, you really should. They're very affordable, even on eBay, and it's a very pleasant, inmensely powerful machine, with a keyboard second to none. If you can get one with extra RAM and a Math ROM, that's a winning combination. A Forth/Assembler ROM would top it all ...

Best regards from V.

Re: Not bad, Tom! But...

*Message #17 Posted by **Thomas Radtke** on 11 Nov 2003, 2:24 p.m.,*
in response to message #15 by Nelson M. Sicuro (Brazil)

Hi Nelson,

would love to see your 'landscape' solution since I like these designs too. However, I do not own one and don't know if they are usable in single-hand action which would be important for me (coffee mug in one hand and no space left on the desk, that is;).

Thomas

Re: Not bad, Tom! But...

*Message #18 Posted by **Nelson M. Sicuro (Brazil)** on 11 Nov 2003, 3:06 p.m.,*
in response to message #17 by Thomas Radtke

I'll try to design one, I just haven't much time now.

I use my HP-15C mostly in my desk, but with only one hand isn't much good. If you use it as a "gamepad", holding with two hands and pressing the keyboard with your thumbs, is very good!

Best regards,

Nelson

HP95LX/200LX IR reception

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 9 Nov 2003, 9:57 p.m.*

Hi to all,

I need to know if the IR receptor of the HP-95LX or/and HP-200LX have the capability of receive RED-EYE HP printer format. I know that they can transmit. I'm planning to build a software to "read" print-outs from my HP-42S and HP-17BII to read their ROMs. I cannot use another way right now, as the only IR receivers that I have is on the palmtops, I don't have any HP-48xx calculator.

Thanks!

Nelson

Re: HP95LX/200LX IR reception

*Message #2 Posted by **Bill Smith** on 10 Nov 2003, 12:44 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

I'm not sure i exactly understand your question, but will give it a shot.

There are several programs at SUPER for the IR port. One of them causes the 200LX to emulate an HP "red eye" (i think the 82240B). I will look through my own collection and see if this can be dug up, should you not be able to find it on the web any more.

best regards, bill

in response to message #2 by Bill Smith

I'm searching a way to the 200LX (or 95LX) to receive IR printings from the HP-42S and 17BII "emulating" a printer. If I can get enough info on how the IR works I can do a program myself in assembler or Turbo Pascal to it. If is already a program that do that, it'll save some time.

Best regards,

Nelson

Re: HP95LX/200LX IR reception

*Message #4 Posted by **Bill Smith** on 10 Nov 2003, 9:11 p.m.,*
in response to message #2 by Bill Smith

After looking through a couple programs, i think i agree with Mikes post. the program i recalled was for printing to a red eye.

i do recall reading posts a few years back, and running some trials of my own. i used a 41 with the IR module, and was able to filter using a couple escape sequences some of the goobledygook from a PRP to a file on the 200LX which seemed sorta useful, until i suddenly had a 82164A which worked straight up.

best of luck

bill

Re: HP95LX/200LX IR reception

*Message #5 Posted by **Mike (Stgt)** on 10 Nov 2003, 4:21 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

AFAIK there is a program from Thomas Rundel to print a screen shot of the 200LX to an IR-printer. But up to today I did not find a program neither for the 200LX nor the 95LX to receive the IR signal from "Blinky" (the IR printer ROM for the HP-41) or the Pioneer calculators. If you find some or do one on your own, pls let me know (see at http://ourworld.compuserve.com/homepages/NutEm/nutem.htm#re). BTW, I asked some experts and none did bite the hook, one even doubts if the timers of the 200LX are stable enough to decode a one-way IR transmision. There is an article in this HP-museum which advices to use the sound card of a PC as stable timer.

Ciao.....Mike

HP-75 power adaptor

*Message #1 Posted by **Adam** on 9 Nov 2003, 9:04 p.m.*

does anyone know where i can get a power supply ac adaptor for an HP-75?

-adam

Re: HP-75 power adaptor

*Message #2 Posted by **Tom Sherman** on 9 Nov 2003, 9:31 p.m.,*
in response to message #1 by Adam

Adam,

It is the same as for the HP-71 or HP-41 or their printers, etc: HP 82059D battery charger. There are usually many available on eBay for $10-15.

If you have old battery packs, keep them. They can be re-built with new cells. See the articles at the HP Museum.

Tom

Re: HP-75 power adaptor

*Message #3 Posted by **db(martinez,california)** on 9 Nov 2003, 10:11 p.m.,*
in response to message #2 by Tom Sherman

There are is an overabundance of that model right now on ebay, with boxes. Some guy must have found a trailer load. Search for hp calculator adapter.

Re: HP-75 power adaptor

*Message #4 Posted by **Adam** on 9 Nov 2003, 10:46 p.m.,*
in response to message #3 by db(martinez,california)

The HP-75C uses an Hp-82041B/C/D adaptor according to this site and the Hp-82041A that is on ebay should not be used. So i guess im looking for an Hp-82041B/C/D.

Re: HP-75 power adaptor

*Message #5 Posted by **Tom Sherman** on 10 Nov 2003, 9:13 a.m.,*
in response to message #4 by Adam

Adam,

Look on eBay for alexandracarter selling the "HP Calculator 82059D Charger" @ $9.95 plus $4 shipping, or for anyone else selling the HP 82059D. You won't go wrong: it fits the 41, 71, 75, and

all sorts of peripherals.

I don't know where this 82041 number came from -- perhaps it was an early number that HP assigned to it. But 82059D is what you want today.

Tom

Calculators used in firefighting

*Message #1 Posted by **Renato** on 9 Nov 2003, 5:19 p.m.*

This ebay auction for a HP-71B includes:
"US Forest service Notebook Guide for using HP-71B for calculating Fire behavior".
It also includes four modules, two labeled "SINGAPORE FIRE BEHAVIOR", and two labeled "SINGAPORE FIRE DANGER RATING".

This auction for a TI-59 includes a software module labeled "FIRE BEHAVIOR NFDRS".

Both came in a hard case, with matching printers and accessories.

Looks like US National Forest Service used calculators for firefighting, and they contracted custom software development from HP and TI.

Does anyone know anything about it ? It is not quite interesting as the HPs in space, but a very interesting usage of calculators. Must have been replaced by a ruggedized notebook in a hard case - can you imagine a firefighter having to deal with a Windows crash while working at a California forest fire ? Ouch...

Try an HP-33S for firefighting.

*Message #2 Posted by **NH** on 10 Nov 2003, 3:23 a.m.,*
in response to message #1 by Renato

Try an HP-33S for firefighting. It would make a good shovel because if you mount it to the end of a wooden handle, its kind of shaped like one.

Re: Calculators used in firefighting

*Message #3 Posted by **James-n-Tx** on 10 Nov 2003, 8:57 a.m.,*
in response to message #1 by Renato

Check the following site for more information on National Fire Danger Rating System

http://www.seawfo.noaa.gov/fire/olm/nfdrs.htm

It is more for pre-planning, establishing when to implement burn bans, increasing staffing level, ect. It takes into account the temperature, humidity, moisture content of the fuel (brush), amount of fuel.

I have never seen one used on the front lines but the only fires I have been involved in are East Texas woods fires. No comparison to the fires in California.

Calculators are also used for hydraulics calculations on pumper operations, friction loss, pressure at the nozzle, ect.

James, Captain, Grapeland VFD

HP 17BII Plus

*Message #1 Posted by **Post a New Message** on 9 Nov 2003, 2:23 p.m.*

I was about to make a move on it but I saw that the thing got trashed on several Amazon reviews. Whats the consensus here, is this calculator really a piece of crap?

Re: HP 17BII Plus

*Message #2 Posted by **Raymond Del Tondo** on 9 Nov 2003, 4:25 p.m.,*
in response to message #1 by Post a New Message

If you have a chance to try it in the store, just do it, and build your own opinion;-)

Raymond

Re: HP 17BII Plus

*Message #3 Posted by **Scuba Diver** on 10 Nov 2003, 11:33 a.m.,*
in response to message #2 by Raymond Del Tondo

Well, I contacted HP Canada to find out where I could try one. The 17BII+, 48GII and 49G+ will only be available via special order through Staples Business Depot.

So, the closest thing to trying a 17BII+ is the 10BII!

I was thinking about ordering one, but I'd really rather hear from some others users first, so if anyone has any insights, please share them!

Is the keyboard any better than the 10BIIs?

B.

Re: HP 17BII Plus

*Message #4 Posted by **Veli-Pekka Nousiainen** on 14 Nov 2003, 6:08 a.m.,*
in response to message #3 by Scuba Diver

The new keyboards have a tactile feedback, but they do make a lot of noise (can't use in a library) despite the short comings they are much faster/have more memory or both (49g+, 17BII, 12C Platinum) # VPN #

Hepax Rom Box on ebay

*Message #1 Posted by **Emmanuel, France** on 9 Nov 2003, 8:05 a.m.*

I have some experience but it's the first time I see this sort of Eprom Box for HP-41. I think how to program its 27C256. Please visit: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3056777108&category=11713

Re: Hepax Rom Box on ebay

*Message #2 Posted by **TI-joe59** on 9 Nov 2003, 9:26 a.m.,*
in response to message #1 by Emmanuel, France

Maybe this can help:

Another hepax rombox showed up at ebay already in August, see

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=11713&item=3041863180

An hp expert/collector (?, I think he is one, his ebay alias is "hp-collector") won the auction, so he is certainly able to give you all the technical information you still need...

Re: Hepax Rom Box on ebay

*Message #3 Posted by **Matthias** on 9 Nov 2003, 10:56 a.m.,*
in response to message #2 by TI-joe59

Emmanuel and I are very familiar.. He has seen my item on our meeting in September... I won the unit and you can see it on my homepage.

Matthias

Re: Hepax Rom Box on ebay

*Message #4 Posted by **TD** on 9 Nov 2003, 1:46 p.m.,*
in response to message #3 by Matthias

what the hell is a hepax rombox? is it worth to bid on the item? price is already high, 80 bucks or so

Re: Hepax Rom Box on ebay

*Message #5 Posted by **Raymond Del Tondo** on 9 Nov 2003, 4:21 p.m.,*
in response to message #4 by TD

Depends. It's a 16K EPROM box for the HP-41, and for a collector, it can be nice to have;-)
Judging from the design, it's at least twenty years old.

Raymond

Re: Hepax Rom Box on ebay

*Message #6 Posted by **Emmanuel, France** on 9 Nov 2003, 4:27 p.m.,*

Pioneer model question?

*Message #1 Posted by **Mike Brady (San Francisco, USA)** on 8 Nov 2003, 11:45 p.m.*

Given the serial number is stamped on the back of the calculator's case, is it also stamped inside the calculator? Cause, I've come upon a unit where the outside serial number is physically gouged out. Since HP kept records of owners and their serial numbers, might this unit be stolen or what? Any comments?

Re: Pioneer model question?

*Message #2 Posted by **John Limpert** on 9 Nov 2003, 1:47 a.m.,*
in response to message #1 by Mike Brady (San Francisco, USA)

I would be suspicious. I can't think of a legitimate reason for someone to erase the serial number. There are ways of recovering a defaced serial number if it's stamped into metal. They probably wouldn't work on plastic.

Re: Pioneer model question?

*Message #3 Posted by **Raymond Del Tondo** on 9 Nov 2003, 5:20 a.m.,*
in response to message #2 by John Limpert

Hello,

I've seen various HP calcs with scratched serial numbers. In most cases these are returned and later remarketed units.

Raymond

Re: Pioneer Serial Numbers

*Message #4 Posted by **Randy Sloyer** on 9 Nov 2003, 8:04 a.m.,*
in response to message #1 by Mike Brady (San Francisco, USA)

There are no identifying numbers inside Pioneers. The serial number on the case back is the only one.

I have seen several with obscured serial numbers as well, I believe Raymond is correct that HP did this with returned units that were later resold.

Re: Pioneer Serial Numbers

*Message #5 Posted by **John Stewart** on 10 Nov 2003, 6:18 a.m.,*
in response to message #4 by Randy Sloyer

I was in sales at HP Canada for 19 years so got to see many things. Wes Pulling was for a long time the service manager for the calculator group. In many cases the customer got only his original case returned, but everything inside had been replaced. As a result S/N's may not match.

The Character "S" in the middle of the S/N indicates built in Singapore. If the character is "A" then it is

built in America.

I have a 67, 75 & two 71B's. HPIL on one of the 71B's includes a mag tape, 9114B & interface to a PC. One of the 71B's has a 96K RAM from Handheld Products. I use it to keep track of my bicycle miles.

Just now beginning to have keypad problems with the 67 which I have used since 1975. Anyone have some ideas?

Cheers, John Stewart

Re: Pioneer Serial Numbers

*Message #6 Posted by **Veli-Pekka Nousiainen** on 14 Nov 2003, 6:16 a.m.,*
in response to message #4 by Randy Sloyer

They are most probably warranty repair units. HP does not sell used goods. Sometimes you may stumble on a blank serial. Keep it - it's a collectors item. Some workers did not engarve the serial (by mistake...or lazyness/lack of time?).

Help with HP-42S

*Message #1 Posted by **Steve in Seattle** on 8 Nov 2003, 9:43 p.m.*

Help. My father just gave me a 1985 HP-42S calculator. The batteries were dead so I put in new 1.5 volt batteries and all it does is constantly beep which I think it is suppose to do when there is an error. Is there a way of resetting the calculator. I keep trying to put the new batteries in and it keep doing the same thing,... beeping. The only way to get it to stop is pull the batteries out. Thanks Steve in Seattle

Re: Help with HP-42S

*Message #2 Posted by **Raymond Del Tondo** on 8 Nov 2003, 10:14 p.m.,*
in response to message #1 by Steve in Seattle

Are you sure it is an HP-42S ?

Could there be a stuck key, which forces the beep?

Raymond

Re: Help with HP-42S

*Message #3 Posted by **Steve Mathews** on 8 Nov 2003, 10:21 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond I am positive its an HP-42S RPN Scientific calculator. I checked the buttons and they all seem to be depresssing and springing back out. Thanks for the response.

Re: Help with HP-42S

*Message #4 Posted by **John Limpert** on 8 Nov 2003, 10:53 p.m.,*
in response to message #3 by Steve Mathews

Try removing the batteries and briefly short circuit the battery terminals inside the calculator with a piece of wire.

It's safer...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2003, 11:05 p.m.,*
in response to message #4 by John Limpert

... keeping the batteries in the compartment while briefly shorting the calculator's terminals. If this procedure is briefly executed, as John mentioned, the batteries will not be damaged and no more than 4.5 Volts will be applied to the batteries terminals. This way, the chances for an ESD (ElectroStatic Discharge) and consequent damage to the calculator are fairly reduced.

Just an additional information.

Luiz (Brazil)

Re: Help with HP-42S

*Message #6 Posted by **Steve in Seattle** on 9 Nov 2003, 12:16 a.m.,*
in response to message #4 by John Limpert

Thanks John. You sure it won't hurt the calculator??

Re: Help with HP-42S

*Message #7 Posted by **John Limpert** on 9 Nov 2003, 1:28 a.m.,*
in response to message #6 by Steve in Seattle

It shouldn't cause any problems.

I double-checked the HP-42S Owner's Handbook. Here is what it says:

Now turn the calculator back on. If it does not function, you might have taken too long to change the batteries or inadvertently turned the calculator on while the batteries were out. *Remove the batteries* again and lightly press a coin against both battery contacts in the calculator *for a few seconds*. Put the batteries back in and turn the calculator on. It should display **Memory Clear**.

Thanks for the Help with HP-42S

*Message #8 Posted by **Steve in Seattle** on 9 Nov 2003, 3:26 a.m.,*
in response to message #7 by John Limpert

Thanks a lot John I really appreciate the help. I will give it as try.

If I am not wrong...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2003, 10:56 p.m.,*
in response to message #3 by Steve Mathews

Hi, Steve;

some time ago, one of our contributors mentioned this sort of symptom, and in his case (was it Randy Sloyer?) it was necessary to resolder the RAM chip.

I cannot tell you for sure, but that's what came to my mind right now. This is sort of a "final solution", but may bring your 42S back to life. These pioneers (HP27S, 42S and 17B/BII) are quite fearless, and they generally survive to soldering.

Opening the case is another story, and many guys in here have the skills and experience to share, if you wanna try it.

Success!

Luiz (Brazil)

HP-42S Help from Luiz

*Message #10 Posted by **Steve in Seattle** on 9 Nov 2003, 12:25 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Thanks Luiz Trying to take it apart and soldering it is probably over my head. Is there someplace we could send it in for repairs?? I think I will try the battery terminal short curcuit first.

Re: HP-42S Help from Luiz

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 9 Nov 2003, 12:54 a.m.,*
in response to message #10 by Steve in Seattle

Hi, Steve;

I read here some guys mentioning a sort of "repair center", not an HP repair center, that offers service for some HP calculators. Both HP41 and HP42S are included.

The fact is that (sadly) HP no longer offers service for the HP42S. The only way is trying the "off-line" repair centers. I myself repaired some HP42S, and I also upgraded at least five units to 32KBytes RAM. That's why I remember reading about the continuous beep. BTW, to those interested on this sort of upgrading, I found compatible 32KRAM chips in some "ancient" HD boards. No, they are not MFM units, instead some 170MBytes to 480MBytes IDE units. I'm collecting the HD's and related chips ID's so I can further search for their characteristics.

I'm sure you'll find people closer to you that will help you in any way you need. Anyway, be sure that I'd help as well, but as I mentioned, my spare time is "none". I think I'll be ready to get my daily HP-related activities back after the mid December, while I'm resuming some HP-related activities in the course.

I'm just resting for a while as I'm writing a brief tutorial (in Portuguese) related to LaTeX instalation and use in a Linux environment. And it's already 3:50 AM in Brazil. I'm taking a nap and getting back to the keyboard in a few hours, if you don't mind.

Success!

Luiz (Brasil)

Re: HP-42S Help from Luiz

*Message #12 Posted by **Graham Wilson** on 9 Nov 2003, 2:51 a.m.,*
in response to message #10 by Steve in Seattle

Steve
You might want to investigate Fixthatcalc.com:
http://www.fixthatcalc.com/
if none of the suggestions work.
I haven't sent any repairs to Fixthatcalc, so can't give a recommendation. Perhaps others who have used them can give feedback.
Hope you get it working -- the 42S is a great machine.
GW

Re: If I am not wrong...

*Message #13 Posted by **Erik Ehrling (Sweden)** on 9 Nov 2003, 4:14 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

This behaviour - where the 42S beeps constantly - is exactly the same problem as I had when upgrading one of my 42S's to 32K RAM. The reason then was that one of the legs of the new RAM

chip was not soldered sufficiently.

So, if nothing else helps, I would suggest attempting a 32K upgrade :-) (Probably, Randy Sloyer could help you with that if you feel uncomfortable opening up the calc yourself).

Best regards, Erik Ehrling (Sweden)

Re: Help with HP-42S

*Message #14 Posted by **Mike Brady (San Francisco, USA)** on 9 Nov 2003, 12:47 a.m.,*
in response to message #1 by Steve in Seattle

I'm no expert, but I remember reading in the archives that when the HP-42S calculator goes into it's beeping mode, it can mean one of two things:

First: the calculator has a self protecting and anoying feature, as it sounds off automatically (beeping) warning you that my batteries are low and I need changing now! before I loose my continous memory and you loose your mind. Persistant little bastard thinks it's a smoke detector!!! Actually, when the calculator is off, it can detect a low-battery condition and an internal system flag is set which will make the calculator beep non-stop. So make sure you have some FRESH batteries handy, Silver Oxide batteries, i.e. Energizer's 357/303 also known as "357BP" or Duracell's D303/357B are best, or FRESH alkaline Duracell's PAX76A675AB also known as "76A" will do too. Also make sure the battery terminals are free of any corrosion or hand oils, handle the batteries by their edge, use a little alcohole and Q-Tip to clean the battery contacts and faces if you fingered them.

Any way: Resetting the Calculator is simple and it does not matter if the calculator is ON or OFF: Simply hold down the EXIT key while you press and release the SQUARE ROOT key once, then release the EXIT key. Repeat if necessary. That should stop the beeping and the display will show either "Machine Reset" in the top line's Y registry or in your case "Memory Clear", since it's been without power for a long time. Press the EXIT key to clear the display and your ready to go.

Also: If you unknowingly turned the calculator ON while the batteries were out, the calculator can misbehave. Remove the batteries and lightly press a coin against both battery contacts in the calculator for a few seconds. Put the batteries back in and turn ON the calculator. The display should say "Memory Clear". Reset the calculator as needed.

Second: is your calculator could have an open connection somewhere inside, maybe between the LCD and the PCB, and it will need servicing. One of the guys receintly posted his story of having to re-solder his do-it-yourself 32K memory chip exchange upgrade in order to stop his calculator from beeping, as he was not able to reset his calculator after his first soldering job. After re-soldering, he corrected an unknown bad solder connection and was able to get his calculator to comply with the above reset procedure.

I think the following is still valid. You can contact Calculator Support: Hewlett-Packard, Calculator Support, 1000 N.E. Circle Blvd., Corvallis, OR 97330, USA, (503) 757-2004, 8:00 a.m. to 3:00 p.m. Pacific Time, Monday through Friday

Edited: 9 Nov 2003, 3:23 p.m. after one or more responses were posted

Re: Help with HP-42S

*Message #15 Posted by **Steve Mathews** on 9 Nov 2003, 11:00 a.m.,*
in response to message #14 by Mike Brady (San Francisco, USA)

Mike Brady Thanks for the great help Mike, San Francisco. is a great town with lots of smart people. Oh, by the way, thats where I was born. Thanks again.

Re: Thanks to Everyone for Help with HP-42S

*Message #16 Posted by **Steve in Seattle** on 9 Nov 2003, 6:03 p.m.,*
in response to message #15 by Steve Mathews

I have tried everybody's suggestions, bought new batteries, did the reset buttons by pushing down on the exit key and the squareroot sign key, shorted the battery terminals with and without batteries installed and it still beeps. Just a wonderful thanks to everyone for the suggestions. Great website you got here with responsive smart people all over the world. Maybe my last resort is to contact Randy Sloyer for repairs. Does anybody have his email address? Otherwise I will be selling it on EBAY ID (smatgo2pv) and buying a new one.

Steve in Seattle, The Boeing Engineer.

HP-42S Repairs

*Message #17 Posted by **Randy Sloyer** on 9 Nov 2003, 6:44 p.m.,*
in response to message #16 by Steve in Seattle

DON'T SELL IT!!

I just caught up with this thread and would like to clarify some points in Mike's post:

1) The 42S does not have a smoke detector feature. There is no beeping alarm to warn of low battery voltage. I don't know where he might have read that, but it just ain't so. The low battery alarm is an annunciator on the LCD, it does not beep. It is also not terribly reliable either. Just ask anyone who does a lot of I/R printing. The 42S will prevent you from printing due to a low battery but the low battery annunciator never comes on until it's too late to save memory contents in many cases.

2) On and SQR ROOT together do a soft reset with no loss of memory contents. It's only useful when you have a run-away looping program. A hard reset can be done holding down the E+ and XEQ keys together and then pressing the ON key. If that doesn't work, the of course the coin reset trick is the best way to start at ground zero.

3) A loss in connection between the logic board and LCD? Huh? What does that have to do with a beeping machine? Dead pixels maybe...

It has been my experience that a beeping 42S has a fractured solder connection on the external ram chip, typically pin 14 or 15, or that the ram is bad. It is the power-up self test that detects the loss of external ram and starts the beeping. A very simple test is to press on the back of the calculator directly behind the 4 and 5 keys then try turning it on while you press. If it powers up okay, you've got a cracked ram connection.

Dave has been kind enough to list a link to my website here in the "Repairs & Batteries" section. As it is my policy not to solicit repair work, I leave it to you to you to click through and find the details if you want outside help. If you know it's the ram connections and you're comfortable with resoldering a surface mount device, there is a very good piece in the Articles section on how to open a Pioneer by Paul Brogger.

PS: Are you the Boeing Steve I skied with in NZ back in '85?

Re: HP-42S Repairs

*Message #18 Posted by **Steve in Seattle** on 9 Nov 2003, 8:24 p.m.,*
in response to message #17 by Randy Sloyer

Randy Your the man, the hard reset did it. No I am not the Steve you went skiing with. You just saved me the cost of a repair or a new calculator. Thankyou so much for great advice. I'm a Mechanical Engineer at Boeing and if you are ever in Seattle, I'll buy you a beer. Steve Mathews At Boeing Thanks again.

Re: HP-42S Repairs

*Message #19 Posted by **Randy Sloyer** on 9 Nov 2003, 8:42 p.m.,*
in response to message #18 by Steve in Seattle

The Steve I skied with was a Boeing Structural Engineer. I guess the world isn't THAT small!

I would not discount the possibility that one or more of the ram connections are fractured. The power-up beeping is a sure sign. They do tend to be intermittent. Squeezing the case may restore the connection for days, weeks, months, who knows how long. It's one of the more difficult problems to find as you need at least 5 to 10X magnification to see the cracks.

Check out the used 42S prices on eBay, I think you'll find you'll want to keep yours in good running condition.

Re: HP-42S Repairs

*Message #20 Posted by **richard** on 10 Nov 2003, 10:01 a.m.,*
in response to message #19 by Randy Sloyer

I couldn't resist adding a cheer to all of the above! I'm a 42s guy and have had the beeps once (after a calc was in checked luggage when flying). It was while ago so I was able to call HP service in the UK and was very nicely told about removing the batteries and shorting the contacts. It worked...though the "Memory Clear" message was not a happy sight.

Generally, I change the batteries once a year whether they need it or not...unless the total voltage is still right up above 4.5v. Checking batteries occasionally with a voltmeter, which is easiest to do while they are still in the calculator, has spared me any similar problems for a long time. I have discovered batteries with a total voltage around 3v still working the calc. nicely.

I think I've only seen the low-battery indicator twice in 10 years or so. The first time I just casually worked on (I was in the field surveying) and changed the batteries at the end of the day. The next time, on a different calc., I didn't even have time to switch it off before it went blank and lost its memory. This probably has more to do with the batteries than the calc., though, so now I always use good batteries.

The 42-s is a truly great machine...under rated, even...because of its Achilles' heel: when you have to re-program it.

Many thanks for the thread above,

Richard (in Athens)

HP33S Manual Is Here!!!

*Message #1 Posted by **Katie** on 8 Nov 2003, 3:43 p.m.*

Big news! The long awaited HP 33S manual is now on HP's web site, so the calculator can't be far behind!

It's sort of a disappointment in that it's a near exact 32SII clone with 32K bytes (that's right BYTES!) of memory. But you can only use that memory for programs and equations, not registers (not even indirectly). The extra memory doesn't even allow for nested subroutines beyond the 32SII limit of 7. In algebraic mode you get 13 levels of nested parenthesis and you can use complex numbers in them -- a nice touch! And programs can be written in either algebraic mode or RPN (looks like that translate into RPN to run them, they say that they run slower in algebraic mode).

No I/O, same flags as on the 32SII, same BASE stuff, same STAT stuff. Built-in constants look good and a much welcomed (at least to me) integer divide and remainder function are new.

It uses 2xCR2032 batteries, one backs up the other when you change them so there's little chance of memory loss (good thing with all that memory).

The manual looks very complete and so far I haven't seen any mistakes. Lots of examples!

Here's your bedtime reading....

http://h20015.www2.hp.com/en/taskPageSelect.jhtml?reg=&plc=&lc=en&cc=us&prodId=hp33sscien370806&pagetype=manual&docparent=manual

*Message #2 Posted by **Ben Salinas** on 8 Nov 2003, 3:53 p.m.,*
in response to message #1 by Katie

I had just found this about 5 minutes before you posted (i was looking for a module for the 49g+ and noticed the 33s was listed in the support) So, apparently there is a HP 33s font. I wonder if HP will release it. It would be very helpful when typing out programs Still waiting for the other files to download... I really wish my internet was faster -ben

Re: HP33S Manual Is Here!!!

*Message #3 Posted by **Gene** on 8 Nov 2003, 4:33 p.m.,*
in response to message #2 by Ben Salinas

I imagine we'll be able to get any fonts for calculators released. HP is very responsive these days.

The new 49G+/48GII font is available. I'm sure any other future calculator fonts HP uses will be too.

Good times appear to be coming.

The eternally pessimistic can keep using their 34c's. :-)

Gene

Re: HP33S Manual Is Here!!!

*Message #4 Posted by **Gordon Dyer** on 9 Nov 2003, 10:06 a.m.,*
in response to message #3 by Gene

Gene, can you post a link to where we can obtain the new 49g+ font?
Thanks.

It was handed out at HHC2003...

*Message #5 Posted by **Gene** on 9 Nov 2003, 1:18 p.m.,*
in response to message #4 by Gordon Dyer

I have it, and I'll try to put it on my comcast webspace and post a link. My hope is that each new machine will have a font going forward...that would REALLY contribute to users being able to write material for it.

Try this:

*Message #6 Posted by **Gene** on 9 Nov 2003, 2:15 p.m.,*
in response to message #5 by Gene

http://home.comcast.net/~genela/49GPLUS.TTF

That ought to work, but ...

Worked, but I had to CTRL-CLICK the file in OSX

*Message #7 Posted by **Gene** on 9 Nov 2003, 2:17 p.m.,*
in response to message #6 by Gene

Clicking directly on the link opened the file up in my browser, but in IE I woudl think you could choose to download the link and it should come down to the PC.

Re: HP33S Manual Is Here!!!

*Message #8 Posted by **Frank B. (Germany)** on 8 Nov 2003, 4:25 p.m.,*
in response to message #1 by Katie

And here is the HP-39G+ manual.

Frank.

...and here's typical flaw:-))

*Message #9 Posted by **Raymond Del Tondo** on 8 Nov 2003, 7:02 p.m.,*
in response to message #8 by Frank B. (Germany)

Thanks for the link.

But it's typical: In the German and the English version of the 39G+ manual pdf, on page V-2 (Vorwort) resp. P-2 (Preface), secondlast paragraph, you can see that they don't even know how to write their name !

The words are: "Copyright 2003 Hewlette-Packard Development Company, L.P"

BTW, it's the page where they state that they're not responsible for any errors in the manual (LOL:-)))

Raymond

Re: ...and here's typical flaw:-))

*Message #10 Posted by **Frank K** on 8 Nov 2003, 7:15 p.m.,*

in response to message #13 by Namir Shammas

hey does the manual say why the keyboard is shaped like a cowcatcher ?

Re: HP33S Manual Is Here!!!

*Message #15 Posted by **Katie** on 8 Nov 2003, 10:56 p.m.,*
in response to message #14 by Norm

Norm, Yes they do explain the need for the cowcatcher design in the manual. Here's the excerpt...

Quote:

Engineers at Hewlett Packard have put great effort into the overall design of this precision instrument. For example, many hours of effort went into the format of the "cowcatcher" keypad layout. Aside from making sure users were kept on their toes when entering data, the primary goal was to facilitate easy repair of your new HP33S calculator.

The repair division had been using the rail of mainline Burlington Northern railroad tracks to "fix" improperly closing cases on the earlier "Pioneer" series calculators. The same repair technique applies to this next generation of HP calculators and engineers wanted to make sure that cows would not get in the way of a speedy remedy for a malfunctioning device.

Re: HP33S Manual Is Here!!!

*Message #18 Posted by **Mike Brady (San Francisco, USA)** on 9 Nov 2003, 1:32 a.m.,*
in response to message #13 by Namir Shammas

That's not a cowcatcher, it a car's radiator grill. And nobody, but nobody, in this country would design such a ugly thing. If someone gave out an award for a truely bad industrial design, we'd have a winner! I'm sorry, but HP behavior reminds me of FORD's advertised policy of Rollover Value !!! Have You Rolled Over A FORD Lately?

Edited: 9 Nov 2003, 1:36 a.m.

Re: HP33S Manual Is Here!!!

*Message #19 Posted by **Ben Salinas** on 8 Nov 2003, 8:45 p.m.,*
in response to message #1 by Katie

At first I was amazed that they put all the RPN stuff together, and left the algebraic for an apendix. Then i realized they did that only so they would not have to totally rewrite the manual. Many of the examples, and most of the advanced features sections were all from the 32sii manual (i reread it just a few weeks ago) There is a bit of new stuff in there, but at least it has 31kb of memory -ben

Re: HP33S Manual Is Here!!!

*Message #20 Posted by **Valentin Albillo** on 9 Nov 2003, 2:06 a.m.,*

in response to message #1 by Katie

Katie posted:

"It's sort of a disappointment in that it's a near exact 32SII clone with 32K bytes (that's right BYTES!) of memory. But you can only use that memory for programs and equations, not registers (not even indirectly)."

Let's see if I've understood it correctly ... are you saying that KinHPo has 'upgraded' the 32SII with an amazing 32 Kbytes of RAM, yet you can't have more than 26 or so data registers, so that you can handle matrices only up to 5x5 !?

Because most of my vintage SHARPs, even models much smaller in size than the 33S, can easily define in excess of 1,000 data registers or matrix elements (10 Kb), my incredibly small Casio FX-7500G (easily the smallest calc I own, despite its 8 lines x 16 char graphics screen) can allocate as many as 526 memories (3.9 Kb), and even my superb, 20-year old HP-15C (0.5 Kb) can handle 8x8 matrices.

If true, this does nothing but reinforce my point: there's no enjoyment nor pride in owning such a calculator, as we are painfully aware of just how little thought and effort have been invested in creating it.

Do you think the great HP engineer teams of the past, which painstakingly fine-tuned every feature of the calcs they designed to ensure utterly optimum performance for their intended professional customers, would've ever designed something like this ? 32 Kb for programs, yet no I/O and you can handle just 25-30 data elements ? Wouldn't have they felt completely ashamed if such a glaring case of bad engineering and careless design had slipped by ?

I rest my case: the former valued, respected, professional customers that we once were have yet again been absolutely neglected by KinHPo, which will only strive to maximize their profits by releasing sub-sub-optimal products, where noone has invested any time at all to try and improve neither features nor quality. It was easier to copy-paste the 32SII ROM and manual, add a little here and there, and that's all. So the user cannot use those 32 Kb for data ? Who cares ? After all, neither could the HP-12C Platinum user use those 400 bytes for extra registers. We're including a 32 Kb RAM chip because it costs next to nothing nowadays, but making firmware modifications so the user can actually use it *does* cost money, so there you are, take it or leave it.

Proud of owning such a state-of-the-art, quality product ? Enjoyment ?

Not me. This only adds insult to injury.

Best regards from V.

A masterful short essay, Valentin...

*Message #21 Posted by **Karl Schneider** on 9 Nov 2003, 3:08 a.m.,*
in response to message #20 by Valentin Albillo

Valentin --

That really "hit the nail on the head" and "cut through the cr@p" (or any other similar idiomatic expression).

Based on what I've been reading here, I have no inclination to reward "KinHPo" by purchasing any of these "upgrades". Consider:

12C Platinum -- Slower TVM algorithm despite presumably faster processor; extra RAM but no practical means of using it; no improvement to limited programming capabilities; algebraic mode added without parentheses.

49G+ -- Terrible quality control and buggy ROM.

33S -- Bizarre stylized keyboard; much extra RAM but no practical means of using it; failure to address limitations of predecessor 32Sii (e.g., "pidgin" complex-number functionality and no built-in matrix functionality) that were not limitations in the long-discontinued 15C and 42S.

What's the chance of a well-done new product?

Valentin is absolutely right -- they simply took the predecessor products and tacked on a few things in a slipshod fashion, using updated hardware, but without "sweating the details".

==========

BTW, Valentin, on an unrelated topic:

I appreciate your offer of assistance with the 71B. It may be a while before I ask for some.

I don't plan to take the time to become a real expert. Instead, I just want to learn my way around it, write and download a few programs to run, and generally see what it's all about.

Best,

-- Karl Schneider

I disagree, Valentin

*Message #22 Posted by **Gene** on 9 Nov 2003, 7:40 a.m.,*
in response to message #20 by Valentin Albillo

I look at it this way.

The entire project took perhaps 12 months. In that short time period, HP appears to have said:

"Wow, since the 32SII was discontinued, we haven't had a product at that price/performance point. What can we do in the next 12 months to remedy that?...Let's make a 33S. It will be the same functionality as the 32SII. What size memory chips are available? ... If they are the same price, let's drop in the 32K chip...perhaps our users can make use of it."

The modifications you mention WOULD in fact have required massive changes to the internals of the 33s.

It would not have been done in 12 months...particularly given the large # of tasks underway (49G+, 48GII, others).

Want something new and completely different? Be patient.

The 33S will be selling for a lot less than the discontinued 32SII on ebay. People can have the functionality of the 32SII, probably faster (I dont' know) and have it for a lot less.

Oh, by the way, there's a lot more memory than the 32SII for programs.

Gene

Re: I disagree, Valentin

*Message #23 Posted by **Victor Koechli** on 9 Nov 2003, 10:05 a.m.,*
in response to message #22 by Gene

IIRC, it took HP 9 months from the beginning of the project to production of the first HP 28C protoype. That was an entirely new calculator. So, 12 months to release an already existing calculator with minor modifications sounds not impressive to me.

I think Valentin is right: They put the least possible effort in this product, which is probably almost zero...

Just my 2 cents, Victor

Different times...

*Message #24 Posted by **Gene** on 9 Nov 2003, 1:21 p.m.,*
in response to message #23 by Victor Koechli

HP had a boatload of people working on the 28C, and according to the HP Journal article, it took much more than 9 months.

They do not today. A great deal is outsourced. They also have reissued/redone the 12c platinum, the 17BII+, the 49G+, the 48GII, and according to manuals found on HP's website, a 39G+ and 33S. Not to mention the rumored high-end finance machine.

That's a lot for the small amount of resources they have.

Again, half-full or rip-off, gone-to-the-dogs, Engineer-hating half-empty?

Gene

Re: Different times...

*Message #25 Posted by **Victor Koechli** on 10 Nov 2003, 1:24 a.m.,*
in response to message #24 by Gene

Hmmm... My memory was wrong, then. This happens once you're old enough :-(Besides, I'm not unhappy at all. I thought, like many probably did, that HP had abandoned the calculator business forever, and the relaunch of new calculators comes as a positive surprise to me. I'm especially speaking of the 49G+ which improves all that we didn't like on the 49G.

OTOH, judging from the papers, the 33S doesn't impress me so far. Not a lot of effort sems to have gone into its development. That's actually what I wanted to say. See, we're spoiled by the degree of perfection a 15C can offer. A lot of us had probably hoped that a successor of the 32Sii would be more like a 15C, or 42S. But it's, as you say, different times. The amount of resources that go into the development of calculators appears to be only a fraction of what it used to be.

Then again, judging from the 32S/Sii prices on ebay, these calcs aren't sooo bad even just the way they are...

Chers, Victor

*Message #26 Posted by **Ben Salinas** on 9 Nov 2003, 11:29 a.m.,*
in response to message #22 by Gene

Personally, I think that HP is not making their new products for those who already have 40 calculators.

At least based on the color schemes, and addition of Algebraic mode, it seems to me that they are trying to get a foot into the student market. The 33s will fill a niche.

Go to the store today and try to find a programmable scientific calculator. Better yet, try and find an RPN calculator. How about finding a scientific calculator that can actually take numbers above 10^99. I am pretty certain that you will not find a current scientific calculator that will do it.

They are aiming this product at the youth, who don't have the all-powerful HP-15c, or 42s, or 41cv. They are aiming it at my generation, and I am going to buy one as soon as the are released. The 32sii that I call my own really belongs to my school, so as soon as I graduate (next year), I will no longer have a good scientific calculator.

I still have hope for the 33s. If you notice in the product specs released on the HP website, there is a direct reference to the types of keys. "The Material of The Key Top : Plastic"

Furthermore, there obviously was some work on the ROM, and for that I have much thanks. On my 32sii, I very often use the curve fitting features, but not every function is linear.

It is also quite obvious that they have adapted the calculator since the first picture was released. Notice they moved the "ALG" and "RPN" key. Personally, I believe this will be a decent calculator It will not compare to the 41, or the 15, or the 42, but notice who HP has to compete with now. There are no longer companies making good sturdy calculators. If you want a scientific calculator now, you can buy a TI-30 or its like, a Casio (which is probably the best that you can buy today), a Sharp 4 function, or one of those free "pocket calculators". I believe that with the proper marketing (such as sending some models to high schools because it is teachers who have the most influence on the calculators that kids buy), that the HP33s can have the market.

I know it will have the market in Texas. My school is planning on buying 20 or so as soon as they come out for our UIL team.

in response to message #29 by Massimo Gnerucci (Italy)

I wonder how long the "busy" indicator will be on for? If is was well engineered from a software standpoint [which is a big question] it should run pretty fast. They seemed to have traded space for faster execution time [or maybe just for bad programming]. Although the manual gives no explicit list of how much memory each instruction takes up the program examples show it now uses 3 bytes minimum per instruction with (all?) numbers taking up 12 bytes!

I'm not at all sure what they put in all those bytes, but they sure have a lot of room for more functions, etc.. Also I'm really curious about this keyboard symbol/ascii listing. Does this hint at some sort of printer interface?

Re: Annunciators

*Message #31 Posted by **Arnaud Amiel** on 11 Nov 2003, 3:25 a.m.,*
in response to message #30 by Katie

I believe an hp33s font should be available somewhere to help write docs. ASCII Ma (Taiwanese Chinese so it comes from Kimpo)on the left is the ASCII code. I don't know what the item column is and as far as I am concerned it could be removed. Symbol is what the font will display when you use this character. So you can show the key press in your documents. ZiYuan on the right is the usual character associated with that ASCII code. Now I just need the font and a 33s. Please hp-Kimpo soon!

Arnaud

. . . and concern grows . . .

*Message #32 Posted by **Paul Brogger** on 10 Nov 2003, 5:00 p.m.,*
in response to message #1 by Katie

I poked around in an attempt to assuage my worst fear concerning the 33s: that the two-line display isn't supported or used in the manner that we (especially 42s users) might expect.

The only thing that seems to offer hope is the discussion of COMPLEX mode, and how the imaginary part, in Y, is displayed on the first line, with the real part in the second line (X). (That's *still* kludgy enough, given there are 14 digits to play with . . .)

That would lead me to believe that Y is generally displayed above, and X below, as I would hope. (I would also hope that two lines of program are displayed, not one, while in program mode.)

Well, I haven't actually READ the whole thing, but some keyword searches haven't turned up much else. There doesn't seem to be any explicit statement of whether Y is generally displayed above, in addition to X below. I didn't notice any extension of the programming capabilities to utilize the two displays rather than one. (Somebody, help me!)

There is, however, page 2-3, which explains that the X<>Y key is often used twice in succession, to briefly view the value in register Y and return it . . .

I can pretty much write off the cowcatcher as a bad marketing idea, and 26 registers with 32K program memory as a hasty approach to adding something without drastically changing the 32sII code base. But if the hyped two-line display is really a one-line display with another line for *whatever*, well that will be another enormous bummer!

I worried about this when I first saw the product sheet, and hope is fading fast . . . I may have to join the complainers with this one.

Re: Don't worry, it's there!

*Message #33 Posted by **Victor Koechli** on 10 Nov 2003, 7:59 p.m.,*
in response to message #32 by Paul Brogger

Just refer to page 2-2 of the 33S manual:

The X and Y–Registers are what you see except when a menu, a message, or a program line is being displayed.

Nothing is said, however, about two program lines being visible when reviewing a program. Much more severe is the fact that there are only 26 variables (plus the six statistics variables) and only 26 lables to fill 32kBytes of memory! I have used a lot more labels in my HP-41 programs that couldn't be nearly as large...

Cheers, Victor

Re: Thanks for locating that . . .

*Message #34 Posted by **Chicken Little (Paul B.)** on 10 Nov 2003, 8:54 p.m.,*
in response to message #33 by Victor Koechli

Well, I guess it's not quite as bad as I feared.

I notice that immediately below the diagram with the two "displayed" registers in bold outline, it says 'The most "recent" number is in the X-register: *this is the number you see in the display*'. [Emphasis theirs, but I concur.] Apparently that graphic is one of the few changes made -- and the text hasn't exactly been gone over with a fine-toothed comb.

I noticed elsewhere that the VIEW command (e.g., "VIEW X") apparently causes "X=" to be put in the upper line, and the X value in the lower. (I wondered, if *that's* all they're doing with that upper line . . .)

H-P, please forgive my concern. Never should I have doubted ye! ;^)

Remember...

*Message #35 Posted by **Gene** on 10 Nov 2003, 10:30 p.m.,*
in response to message #34 by Chicken Little (Paul B.)

My guess is HP said something like this:

"We're really moving the 32SII to a new package and aren't going to be making many changes to it at all. We can't sell the old one because we can't make them any more. We face a choice guys...the cost of a 2K chip is the same (within pennies) as a 32K ram chip...which do we put in?"

They went with the 32K ram. Will it be entirely useful? I don't know...I expect perhaps not.

But, it is there to try to use.

If HP reads this, perhaps next time they decide to use the 2K chip.

Lot of people here are of the "half empty" type. Try thinking "half-full" at least once a day. You'll live longer. :-)

As usual, you're right on.

*Message #36 Posted by **Paul Brogger** on 11 Nov 2003, 2:44 p.m.,*
in response to message #35 by Gene

I used to think of myself as generally having a "half-full" kind of outlook -- I'll have to ponder that . . .

Yes, I'm sure that "more" sounded better than "some" for the same price.

Bottom line: "more" than 390 bytes is all I wanted (storage-wise, at least) in a successor to the 32S/SII. No sense getting worked up about the program vs. variable space being out of balance, so long as there's more of the former than there used to be.

No doubt we'll be in-lining even lengthy subroutines to conserve labels!

Maybe the 33sII will allow for two-character labels and variable names?

-- Paul B.

I'm the "half full" type in most things, but not where HP is concerned. It seems to me like they've thrown away the half-full glass altogether and replaced it with a nearly-empty, leaky

paper cup, and hired a pack of lying weasels to convince us it's a brim-full crystal decanter.

If it sounds like I view HP with cynicism, distrust and contempt then you're getting the right impression. Over the past couple of years I've come to assume at the outset that *anything* HP does is a cheat or a swindle of some kind, and the onus is on them to prove me wrong.

in response to message #34 by Chicken Little (Paul B.)

I haven't checked yet, but maybe not only the calculator, but also the manual was more or less coiped from the 32Sii? That would explain these incosistencies. I mean, why should they rewrite the manual if the calc is essentially the same? And in the 32Sii, only the x register is displayed...

Just another 2 cents, Victor

New cells for the 41C´s battery pack

*Message #1 Posted by **Jon** on 8 Nov 2003, 10:56 a.m.*

I have repaired a dead battery pack 82120A. I have used new 1/3AAA NiMH cells (150mAh). I have charged it for three hour with the adapter 82059D and it works just fine. I have charged just three hours because I know the rechargeable cells are very sensitive to overcharge. I would like to know how long must I keep it charging for a full charge. I think original cells are 1/2N NiCd (75 mAh aprox.) so the total charge time should be the double. Does anybody know the recommended charging time for the original battery pack?.

Thanks in advance

Jon

82120A charging rates and 1/3AAA cells

*Message #2 Posted by **Randy Sloyer** on 8 Nov 2003, 6:08 p.m.,*
in response to message #1 by Jon

The 82120A manual says 12 to 16 hours for a full charge.

With respect to the 1/3AAA cells, Gold Peak says 16 ma for 16 hours. It just so happens the charge rate of the 82120A is 16 ma. So 16 hours should yield a fully charged pack.

They will typically reach 5.80 volts open circuit when fully charged. I have seen no cell heating (checked with I/R thermometer) after 24 to 36 hours so I would not be overly concerned about overcharging. I charged one for a week once to see what would happen - it seemed to decrease its capacity until it went through two or three discharge charge cycles - it now seems fine and maintains a 16 ma discharge rate for about 10-12 hours.

HP-IL Sniffer

*Message #1 Posted by **Giuseppe Marullo** on 8 Nov 2003, 9:23 a.m.*

Hi all, I just received a 41CX, a DEVILROM plus a EXT I/O rom. I have a 80160A adapter too (another one is possible).

Just wondering which are the "System requirements" to run a HP-IL sniffer on a second calculator. Could I simply grab another 41C with some mem expansion or it is mandatory to use at least a CV. I have seen somewhere that thare are 110+ registers as memory requirement, so at least I need a 41C with some memory. Are there other ways to have a HP-IL sniffer that is not the usual pc card?

Thanks in advance,

Giuseppe Marullo

Re: HP-IL Sniffer

*Message #2 Posted by **Raymond Del Tondo** on 8 Nov 2003, 6:43 p.m.,*
in response to message #1 by Giuseppe Marullo

Hi,

I think it would be easier to use an HP-71B as the sniffer, since it's a bit difficult to have 2 HP-41's in the same loop.

However, since it's a loop, your sender gets back what it submits, so your sniffer could be your first HP-41;-)

Regards,

Raymond

Re: HP-IL Sniffer

*Message #3 Posted by **Giuseppe Marullo** on 8 Nov 2003, 9:12 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond, thanks for your answer. It is not clear to me how to interact with the bus while at the same time use the calculator as a sniffer. Would it be much simple (and cheaper) to have another one that is performing this task (if this is possible with a C/CV).

About the HP-71, maybe is cheaper to get a 75, that has a standard hpil port. I don't remember which is best at hpil stuff between the two.

Giuseppe Marullo

Re: HP-IL Sniffer

*Message #4 Posted by **Raymond Del Tondo** on 8 Nov 2003, 10:11 p.m.,*
in response to message #3 by Giuseppe Marullo

Hi Giuseppe,

for HP-IL functionality beyond the standard protocol maybe Christoph Klug and Jean-Francois Garnier are the persons who may have the answers;-)

AFAIK the HP-71 has the most advanced HP-IL implementation ever made.

Regards,

Raymond

Re: HP-IL Sniffer

*Message #5 Posted by **Giusepe Marullo** on 8 Nov 2003, 10:36 p.m.,*
in response to message #4 by Raymond Del Tondo

Raymond, I have already contacted Christoph, and ordered his manuals :)

Actually it seems that a HP-71 is rather expensive compared with a 75. Which could be a reasonable price for both? The 71 does not have a HP-IL port/module, so you must add its price, while in the 75 it should be standard, am I right?

BTW, I have both devilrom and ext i/o rom, so it is natural to place both on different 41 and have one "sniff" the other' operations. They were not cheap by my standard, better use them.

Giuseppe Marullo

Re: HP-IL Sniffer

*Message #6 Posted by **Vassilis Prevelakis** on 9 Nov 2003, 1:31 a.m.,*
in response to message #1 by Giuseppe Marullo

Yes you can use a second 41 as a sniffer but you need the HP-IL Development ROM. This is because the ROM on the 41 IL module assumes that the 41 is a controller. In contrast the IL Dev ROM software is desinged for sniffing. You can get the Dev ROM manual from the MoHPC CDROM.

I have actually used this combination and its very powerful.

Having said that, the 71B is the best IL controller made so using this machine is probably a better idea.

*Message #7 Posted by **Giuseppe Marullo** on 9 Nov 2003, 11:14 a.m.,*
in response to message #6 by Vassilis Prevelakis

Thanks Vassilis, so you would purchase a 71 as a sniffer? Anyone knows which is a right price for it, in good shape and with or without hp-il interface?

Re: HP-IL Sniffer running on PC

*Message #8 Posted by **Christoph Klug** on 10 Nov 2003, 3:33 a.m.,*

in response to message #7 by Giuseppe Marullo

Dear HP-IL enthusiasts,

remember that it is also possible to use a PC with EMU41 or the new EMU71 plus HP-IL/PC interface card for monitoring the interface loop. Using the PC you get one or two virtual handhelds plus much more advanced features....

Best wishes from Germany - Christoph Klug

Re: HP-IL Sniffer running on PC

*Message #9 Posted by **Giuseppe Marullo** on 10 Nov 2003, 12:57 p.m.,*
in response to message #8 by Christoph Klug

Christoph, the problem is that the pc board is rather expensive, and you win another piece of history,---> the PC. My current pc does not have a ISA slot, so I should equip my 41CX with a heavy peripheral!

I am searching for such a board anyway, but a USB porting of the board would be greatly appreciated.

Giuseppe Marullo

Re: HP-IL Sniffer

*Message #10 Posted by **Mike (Stgt)** on 10 Nov 2003, 4:59 p.m.,*
in response to message #1 by Giuseppe Marullo

As Vassilis already sayed, an HP-41 (even an old 41C) with a "Devil"-ROM is sufficient as IL-sniffer. Just start MONITOR on it before you switch on an other controler in the loop. That's all. BTW, what are you going to do? Just currious <G>.

Ciao.....Mike

Re: HP-IL Sniffer

*Message #11 Posted by **Giuseppe Marullo** on 10 Nov 2003, 6:20 p.m.,*
in response to message #10 by Mike (Stgt)

Hi Mike, just wanted to learn from scratch a programmable calculator, just as I did *several* years ago, with a ti-59.

Anyway it started as a cool terminal to be used to setup a minisumo robot on the dojo. I don't want to use a laptop, there are a lot of people around and actually *nobody* knows the 41 around the people I know (within my same age). Now, the more I dig, the more I would like to do.

At first, I will try to drive my robot using a HPIL->RS232 interface, then maybe a home made HPIL->GPIO or a HPIL->RS232, but the smallest possible.

Another interesting project would it be using a pic to emulate some rom, I have found an interesting kit that is able to read files from a FAT32 SD card, using a pic.

I don't have any software to preserve, so my point of view is VERY different from most, if not all of you. Maybe others would build something very different.

Who knows, I am still missing the CX "basic" manuals...go figure. there is no guarantee that I will go much further than 2 ENTER 2 + stuff.

Re: HP-IL Sniffer

*Message #12 Posted by **Mike (Stgt)** on 12 Nov 2003, 9:21 a.m.,*
in response to message #11 by Giuseppe Marullo

2 ENTER 2 + stuff is "User Language", I suppose you go for MCode <G>

Ciao.....Mike

Warning: HP-49G+ display may get damaged

*Message #1 Posted by **Ernie Malaga** on 8 Nov 2003, 6:22 a.m.*

The leather pouch that comes with the 49G+ is very nice, but the metal (magnetic) clasp can damage the delicate surface of the display.

When you put the calculator in the pouch and press the clasp to close it, you are exerting pressure over the display's bottom portion. In order to avoid damage, put the calculator backwards (facing the back of the pouch). That will protect the display.

-Ernie

*Message #3 Posted by **Ed Look** on 8 Nov 2003, 9:42 p.m.,*
in response to message #1 by Ernie Malaga

I saved the bubblepack material and cut out the outline of the calculator, without as little of the side areas as possible and inserted that into the leatherette pouch. This provides, I think, enough protection against accidentally damaging the display when closing the clasp. As for the potential scratch, I think the paint along the edge of the display is more at risk for being scratched than the face of the display itself.

Ah, the old zipper cases!

Re: Warning: HP-49G+ display may get damaged

> Ah, the old zipper cases!

I miss the type of pouch that came with the HP-65, with a velcro clasp. When I bought a 67 (which came with the typical -- and oversized -- artificial pouch), I made it a point to buy from HP an HP-65 pouch to use instead.

But the zipper cases worked well too.

I'd caution you that putting a plastic cover on top of the plastic display may scratch BOTH surfaces.

-Ernie

Re: Warning: HP-49G+ display may get damaged

*Message #6 Posted by **Ed Look** on 9 Nov 2003, 11:47 p.m.,*
in response to message #5 by Ernie Malaga

Ordinarily, I'd say you're right. But in this case, the cutout (edges sanded down first with a fine grade sandpaper) is held snugly by the pouch itself and since there's no motion inside especially when the calculator is in it (it's a snug fit, as I'm sure you see), I don't foresee any scratching of the plastic screen. Remember also that the contours of the blisterpack cutout make it rest on the edges of the calculator offsetting it from the calculator a little bit and that the screen is recessed about almost a millimeter or so below the edges. I'm using it as a shield against inadvertent hits against the screen while in the pouch.

Ed, I took your advise a while back and did the same thing to my calculator. It works great, thank you

Re: Warning: HP-49G+ display may get damaged

*Message #8 Posted by **Ed Look** on 12 Nov 2003, 11:09 p.m.,*
in response to message #7 by Eddie

Oh, don't thank me, at least not ultimately. I first saw this trick, I think on the comp.sys.hp48 newsgroup in a post by, at the time, a high school kid! Probably was related to Ben Salinas.

For my (all too) soft 48G gray nylon case, I also glued (taped, now, I think as the glue didn't really hold) a slightly thicker and stiffer piece of plastic on the cutout over the screen area of my 48G(/G+).

Re: Be careful in describing what you ask for ...

*Message #9 Posted by **Paul Brogger** on 10 Nov 2003, 9:20 a.m.,*
in response to message #3 by Ed Look

Make that ***nylon*** zippered cases.

I've found a couple of early LED TI's recently, with original cases. Their aluminum-toothed zippers seem designed *for the purpose* of chewing on plastic finishes.

BTW, in all communication about desired features, I think it's best to be as expicitly clear and complete as possible. Keep in mind that you engineers are dealing with a culture gap if you're communicating with H-P product designers (read: marketing), and that *they're* dealing with both language and culture differences in transmuting specifications into product.

For example, I imagine someone wrote somewhere, not too long ago, "It needs to have plastic, not rubber keys; and they need to have a tactile 'click' when they're pressed." Good specifications, but something about a connection between the tactile feedback in the action of closing the key contacts may have been left out . . .

Storage Case Alternative

*Message #10 Posted by **Paul Brogger** on 10 Nov 2003, 2:10 p.m.,*
in response to message #1 by Ernie Malaga

The 49G+ storage case is nice, but it doesn't leave room for much other than the calculator.

For the active, modern, on-the-go graphing calculator user, consider this: Office Depot (in my area, at least) is clearing out zip-up Mead "FiveStar" TI calculator pouches with a sorta-rigid external case, an internal elasticized calculator pocket with velcro-closed, TI-logo-emblazoned cover flap, and (on the opposite side) a pen loop and a funky pad of pseudo-graph/note paper. (Only $1.44 .)

After cutting the stitching to remove the velcro and cover flap, replacing the supplied notepad with a decent spiral-bound item, and inserting a nice Parker gel pen, I've got more than a calculator -- I've got a calculator *use and support system*. ;^)

(Actually, it's bulkier, but more complete. Unfortunately, it won't quite store the USB cable too. Time will tell if I actually make use of it . . .)

Re: Storage Case Alternative

*Message #11 Posted by **Ed Look** on 11 Nov 2003, 2:56 a.m.,*
in response to message #10 by Paul Brogger

Actually, Paul, I went to buy one at Staples a month or so ago. They looked nice. I'm not sure how it fits the 49G+, as at the time, all I had was a 48G and it did fit, but too snugly. I feared long term damage from pressure on the calculator case, so I didn't get it. It was cheap, too (not $1.44, but still quite cheap). I think it really was meant to fit the TI-83 only.

Re: Storage Case Alternative?

*Message #12 Posted by **Paul Brogger** on 11 Nov 2003, 6:55 p.m.,*
in response to message #11 by Ed Look

Yeah, I ended up cutting out the internal elastic pouch entirely, and velcro-ing the 49G+ to the inside front cover. It fits there nicely, and the pad & pen are included, but when closed up, the whole thing looks a *little too pocketbook-ish* for my taste. (I'm just not that secure! ;^))

So, this little experiment may well turn out a minor bust -- we'll see what turns up next.

Re: Storage Case Alternative?

*Message #13 Posted by **Ed Look** on 11 Nov 2003, 10:29 p.m.,*
in response to message #12 by Paul Brogger

Well, I suppose they'll be glad I'm posting this, but I found out that CalcPro still sells, at ten bucks a pop, which is probably worth it, the gray soft cases for the 48G series calculators.

I have just tried it with my 49G+ in my 48G's case- it works, may just ever so slightly too snugly. If you worry about protecting the LCD screen, some thin piece of stiff polymeric material (like blisterpack stuff) or like the walls of the thinner pencil boxes they sell for elementary school kids, cut to size, ought to be inserted in the case and placed between the front of the calculator and the inside of the case.

I have also seen some guys, I forget whether it was here or comp.sys.hp48, a long time ago, suggest getting one of the smaller plastic toolboxes from Sears and stuffing foam rubber in to hold the calculator. I like the protection afforded by the box, but am not thrilled by it because it is, after all a large 13 inch or so box.

Re: Storage Case Alternative

*Message #14 Posted by **rsenzer** on 11 Nov 2003, 10:46 p.m.,*
in response to message #10 by Paul Brogger

Perhaps the purse section at the department store, etc. might yield an appropriate case. Or an inappropriate case, depending upon your taste. ...

Re: Stores that have bags to fit graphing calculators

*Message #15 Posted by **Frank Travis** on 12 Nov 2003, 10:22 a.m.,*
in response to message #14 by rsenzer

I have found large padded cases (some of them designed for camera equipment) from the following stores:

Kmart Wal-Mart Kohl's Various camera stores.

They provide plenty of room and protection for my HP 48 series (SX/GX/G/G+) graphing calculators. The cases are generally priced between $10 and $20. I measured the dimensions of an HP 48G as 7" long, 3 1/4" wide, and 3/4" deep.

Help with HP-97S needed

*Message #1 Posted by **Holger Weihe** on 8 Nov 2003, 2:57 a.m.*

Hello,

yesterday I got an HP-97S. :-) Unfortunately I can't get it to work. When the power is connected, the Low-power-LED goes on. When I additionally insert a battery-pack, the LED goes out again. (The battery isn't good, but my other HP-97 works fine with it).

Switching the calculator on causes a short flash of a zero (or similar) at the last digit. After that nothing else happens.

Is this behaviour known to anyone of you? Where can I start? I took the calculator apart and cleaned the contacts of the switches etc, but that didn't help. Could it be a problem of the connector pins between Mainboard and Keyboard part?

Another thing: The HP-97S came with a plastic device (seller called it HP-Console) that holds the calc and the Interface box. The main screws of calc and box are longer than normal to fix them with the console. Is this console a standard HP part?

Thanks!

Holger

Re: Help with HP-97S needed

*Message #2 Posted by **Katie** on 8 Nov 2003, 11:36 a.m.,*
in response to message #1 by Holger Weihe

I've never seen the plastic holder that you've described, I don't think that it was made by HP.

You might want to try a good (newly rebuilt) battery pack in the 97S or better still, an external DC power supply. The 97S draws slightly more power than the plain 97 does because of the interface pod. It's only about 30 ma more, but that might be enough to drop the voltage on the batteries enough to cause the display to shut down.

Re: Help with HP-97S needed

*Message #3 Posted by **Holger Weihe** on 8 Nov 2003, 6:14 p.m.,*
in response to message #2 by Katie

Thanks, Katie and David!

I'll try an external DC supply first before rebuilding the battery. (I hope I won't toast it... :-))

If it doesn't work, I think there was a service manual on the museum dvd, but probably it will be to high for my rudimental electronics skills...

Holger

Re: Help with HP-97S needed

*Message #4 Posted by **David Smith** on 8 Nov 2003, 12:39 p.m.,*
in response to message #1 by Holger Weihe

Generally, you need a good battery in an HP97 for it to operate properly. Some machines can get by without one (if no printer or card reader is used), but many will be totally dead without one.

Further help with HP-97S needed

*Message #5 Posted by **Holger Weihe** on 9 Nov 2003, 1:16 p.m.,*
in response to message #1 by Holger Weihe

Hello,

By now I have tried to run the HP97 with the AC-cable connected and an additional 5 volts DC supply at the battery connectors. Nothing happend. I increased the voltage until at about 8 volts the display went on (showing a mutaded zero at the right side). The printer moved. But the calc doesn't respond to any keypresses. By the sound of the printer I got the impression that it is stuck somehow. Could this prevent the HP-97S from properly starting?

When running it without DC supply, the printer makes some humming sounds when I press the paper-feed button. But it doesn't seem to move.

Any advice what I should try know?

Thanks!

Holger

Re: Further help with HP-97S needed

*Message #6 Posted by **David Smith** on 9 Nov 2003, 3:26 p.m.,*
in response to message #5 by Holger Weihe

Yes, a bad printer can cause the machine to lock up. When powered on, the machine wants to see the head in the HOME position. Some firmware versions even cycle the print head whenver the machine is powered up. If the printer is jammed it will stay dark or say ERROR.

Re: Further help with HP-97S needed

*Message #7 Posted by **Katie** on 9 Nov 2003, 5:17 p.m.,*
in response to message #5 by Holger Weihe

Holger,

Don't crank up the voltage on the external DC supply, 5.0 - 6.0 should be fine. Is the supply able to provide enough current? The printer and card reader need quite a lot maybe 500 ma to 1 A peak. Even with neither of those running but just the display, it will use up to 250 - 300 ma. If your supply can't provide enough current, it may very well sound like your printer is stuck. Did you try turning the printer gears by hand to see if it is in fact stuck?

-Katie

Re: Further help with HP-97S needed

*Message #8 Posted by **Holger Weihe** on 10 Nov 2003, 2:08 p.m.,*
in response to message #5 by Holger Weihe

Thanks, again!

My DC supply can deliver 2.5A, that should not be the problem. Nevertheless I bought some new cells today and will build up a good battery pack. Then I will have a closer look to the printer. Checking the resistors and diodes there should also be possible for me. I don't have an osciloscope, but my DMM can measure frequencies. Maybe that'll help to follow some signals after I studied the service manual. (If I understand enough of it...)

I'll come back to the forum when I succeed, or when I am able to ask more detailed questions... :-)

Holger

Does 48G have a "CAT" (49G+) or "CATALOG" (28C/S) -like feature?

*Message #1 Posted by **Paul Brogger** on 7 Nov 2003, 11:54 a.m.*

I've been using the "CAT" (commands CATALOG) menu on my 49G+ regularly, and recall the "CATALOG" feature of my 28S.

I've poked around on my 48G (but haven't dug out the manual ...) and can't find any similar list of available commands. Does the 48G even have such a list?

(It's probably somewhere obvious, but I'm missing it.)

Noz built-in...

*Message #2 Posted by **Raymond Del Tondo** on 7 Nov 2003, 6:25 p.m.,*
in response to message #1 by Paul Brogger

...some years ago I started to make a CAT like in the HP-38G, with a master-detail browser and function categories, etc. , but it was too slow to use seriously it.

You could program your personal CAT easily using a list of lists of each command/fcn, then feeding it into a browser, like CHOOSE, or the SpeedBrowser (recommended), and on the highlighted item, you could apply a call to USAG, which exists as G/GX version, too.

So far for the theory.

Maybe something similar like CAT exists on hpcalc.org , I dunno. If not, maybe someone will do it. We could start a mini challenge, who develops the smallest *and* fastest version.

Too bad I don't have the time right now (ORACLE upgrade), else I would start immediately:-) Maybe in two weeks, if there'll still need...

Raymond

49g+ first impressions...

*Message #1 Posted by **harryb** on 7 Nov 2003, 5:26 a.m.*

I picked up the 49g+ from the local uni bookshop today, and after paying them I opened the box on their counter (in the event something was wrong with the unit and I could just get my money back there and then - it was a special order so its not like they could replace it).

Firtsly I examined the unit: top left hand corner rubber foot was partially disintegrated; hp badge on front was stuck slightly askew; unit felt very light, less dense to what I am accustomed to with the 48GX and 49g at home.

After inserting the batteries, I ran the diagnostics and everything checked out. The display initially felt somewhat convex even though it's totally flat and flush with the surface plane. Ran through some calculations and operations to get a feel for the response and was pleasantly surprised. It felt very snappy, considerably faster than the 48gx and the 49g. The keyboard was fine, although it does require above average pressure to get the tactile feedback. Once you get used to it its fine. I noticed the intermittent flickering on the bottom 2 pixel rows of the screen. This can be distracting as it occurs with the frequency of a hearbeat. Its something else one has to accustom themselves to, but it is not as bad as it sounds.

The case was a surprise. It looks rather upmarket. The manuals seem to get sadder with each incarnation - how much could it cost - across each unit sold to hire a writer for a couple of months to jazz up the manuals?

I finally took the unit and left the bookshop, heading for the cafeteria for some more investigation. In case you're wondering, I was not particularly fazed about the rubber foot and from reading this newsgroup I gather that a ROM upgrade is going to correct the "hearbeat".

My overall impression is that the calculator division at HP rushed this product out unashamedly. The flickering is simply unacceptable for a product of this generation. The skewed orientation of the logo is an ironic testimony of the evolution of hp philosophy since Carly took the reins. Perhaps Fred (Valdez) is to blame. Whatever the case is, people like myself with a long history of ownership of hp computing products (and I'm talking hp67 here) have a preconception that I suspect cannot be fulfilled any longer.

Would I recommend you buy it? Certainly! Compared to what's out there it's a great computing device that is superior to its predecessors. The quality control is not what one would expect from hp or any other company of that nature, however.

It's all about RESPECT

*Message #2 Posted by **Valentin Albillo** on 7 Nov 2003, 6:05 a.m.,*
in response to message #1 by harryb

harryb posted:

"People like myself with a long history of ownership of hp computing products (and I'm talking hp67 here) have a preconception that I suspect cannot be fulfilled any longer."

[harryb, please notice this reply does not address you *personally*, but all of us people interested in HP calcs]

Oh yes it can. It's only many such people are sadly missing the target: instead of wasting your hard-earned money in such Chinese-junk, defective products, released by a company that no longer shows the slightest trace of RESPECT for their long-time loyal, professional, knowledgeable customers, you'd rather be advised to instead shift your targets to the really truly excellent vintage machines of the past, such as classic HPs and SHARPs, among others, which despite 20+ years having elapsed, still can run rings in quality and usability around any abortion KinHPo throws down on us.

Some would argue that modern models are much more powerful than vintage ones. First of all, that's absolutely debatable, as it fully depends on the intended uses and how well does the particular machine fit those uses. Me, I have no use for CAS on a calculator at all, whatsoever.

Secondly, there's the vital 'enjoyment' factor. We used to fully ENJOY former HP machines when they were released, and we did ANYTHING, including selling the former one or fasting on water and bread for several months [hello, Tapani] in order to get the cash to buy the new machine, because we KNEW that it would be a wonderful achievement, state-of-the-art handheld computing device. There was always the 'I want more RAM' or 'I want more speed', but everyone was delighted with the HP-65, the HP-25, the HP-67, the HP-15C, the HP-41. No sacrifice was too big as we KNEW it was well worth it, absolutely.

We were DELIGHTED, with capitals, for lack of a better word. Those of you who, like me, have been through the 25, 67, 41, fully know the experience and can relate to that heart-and-mind enthralling FEELING.

Now, can any of you say the same about any of the new KinHPo offerings ? Are you DELIGHTED with them ? Do they raise goose bumps ? Do you feel ecstatic ? Do you feel you've got a truly quality item that you're proud to own and to show everyone, no matter the cost ?

Or on the contrary, are you trying hard to get used to that dreaded keyboard, and inventing excuses to justify it doesn't work as reliably and ergonomically as it should ? And that nasty flicker ? That 'hollow' feeling ? The manuals ? The umpteenth ROM upgrade which cures a bunch of bugs and introduces yet anothers ? Can you trust the results ? Can you enumerate the nasty bugs the HP-67 had ? And those of the HP-15C ? Would you consider the HP-41C bugs (which opened the door to synthetic programming) to be nasty ? What about the HP-41C Owner's Handbook ? And the 4-colour, spiral HP-67 Owner's Handbook ? What about the HP-15C's keyboard ? What about ENJOYMENT and PRIDE, when users where considered outstanding professionals and valued customers, and RESPECTED like such ?

Me, I'll take disrespect from NOBODY, and much less pay for it.

Can you say the same ? What new excuse will you come up with ?

Best regards from V.

Re: It's all about RESPECT

*Message #3 Posted by **Gene** on 7 Nov 2003, 7:40 a.m.,*
in response to message #2 by Valentin Albillo

Hi Valentin. Couple of thoughts:

1) "Can you trust the results?"

Gene: Certainly, especially for all non-CAS functions. Since you say you have no need for a CAS, you would have no concerns at all about what the calculator returns.

2) DIsplay flicker?

Gene: My guess is this has to do with powering down the ARM processor into some sort of rest state. It

happens about 1.5 seconds after you press ENTER for example. Someone has posted a fix (Pressing ON uparrow) that makes this go away. I just can't believe people are so fixed on this. Who would have ever guessed a slight flicker primarily on the bottom row of the display would be such a show-stopper indicating HP would never again make anything worth owning!

3) Hollow feeling?

Gene: Well, as industry gets more and more advanced, functions can be put into smaller and smaller spaces. I guess HP could have put some lead into parts of the case. That would have stopped these complaints, but that would make no sense.

4) Rom upgrades?

Gene: The 49G+ is probably 50X more complex (or more) than the 41c. The 41c had BAD rom bugs the first time it was out too. Remember not saving X to LASTX when doing a SIGMA+ operation? Technology allows these to be fixed without having to send the machine back to the factory. I consider it a good compromise...more functionality/complexity carries a risk. If I dont' want any bugs, I can go back and use a much less complex machine, I guess.

5) Delighted with the kinpo offering?

Gene: The people to whom I have shown my 49G+ and 48GII HAVE in fact thought they looked great. They are amazed at what these machines can do...things one cannot do with an HP67, HP34C or HP41c.

6) Keyboard?

Gene: It certainly appears that early machines have keyboard problems. It ALSO appears (Harryb stated this specifically) that his keyboard does NOT have these problems. The problem appears to have been corrected. People who bought very early who have keyboard complaints have a remedy too.

Summary?

Are there things I wish HP would improve? Sure, of course. I wish the manuals were at the 99% complete level. I wish they had fewer mistakes, grammar and otherwise.

I do not see things with the doom and gloom you present.

I see the glass as almost full.

Some see it not quite full and feel ripped off.

Cordially, Gene :-)

HP49G+ is a JOKE

*Message #4 Posted by **Linda** on 7 Nov 2003, 12:11 p.m.,*
in response to message #3 by Gene

Gene: I can only support Valentin, he is COMPLETELY right!

A graphing calculator is ABSOLUTELY NONSENSE ! It is for pupils (maybe students, but only because the do not have any money to spend) that make their first steps in analysis and algebra, it is not for engineers, not for professionals.

For example you cannot see any details of a functional curve on such a coarse and small LCD display. There are even no numbers at the axes. Imagine a 3D plot! That is a JOKE ! It is like a text editor on a

cell phone (with 10 number keys), absolutely ridiculous. It is a TOY only ! Not a serious instrument !

Not only graphics, also algebra/analytical calculus: Such a HP49G+ is only a toy if compared to MATHEMATICA, MAPLE, MATLAB. If you once have used Mathematica or Matlab (high complexity but indeed easy to use!), you can only laugh on toys like HP49G+. And HP49G+ speed is 1000 times slower than Mathematica and Matlab on my 1.2 GHz subnotebook (imagine if you had a 3 GHz notebook!).

I would say the HP49G+ is only the afterglow of an ending history, the history of the technical calculator. They will die out very soon and be replaced by strong software packets that can be installed on a handheld multimedia device as will be the PDA of the next generation. Such an item will have all the office software, mp3 music tank, personal photo galery, built-in digital camera, built-in cell phone, built-in internet via wireless LAN, built-in GPS with maps, and much more.

Maybe having these different options like plug-in modules (remember the HP-41 plug-in concept with user flexibility). Such a PDA will have calc emulators that you want to have AND IT CAN HAVE SOFTWARE LIKE MATHEMATICA/MATLAB.

As HP49G+ is not a serious, a professional instrument but only a toy to play with, better take the HP-41CX to play with. It is much more FUN! Valentin is completely right here!

Linda

Re: HP49G+ is a JOKE

*Message #5 Posted by **Tom Scott** on 7 Nov 2003, 12:46 p.m.,*
in response to message #4 by Linda

You may be right that the 49G+ is mostly a "toy" but for me, that's what all my calculators are. As you say, with modern scientific/math software, complex problems can be more easily solved and displayed graphically with a computer. However, even though I enjoy the quality feel of my HP=67s, HP42s, etc., I still enjoy "playing" with the 49G+ because it has so many more features. Of course many of these features could be programed into the earlier models but often it's nice to have them at your fingertips (so to speak). I find my biggest use of calculators is using them as I read various technical journals to double check certain numbers and answer questions of my own. For this purpose, the 49G+ with it's built-in constants library, etc. is very handy.

Tom Scott

Graphing Calculators

*Message #6 Posted by **Tom Sherman** on 7 Nov 2003, 2:49 p.m.,*
in response to message #4 by Linda

Not to say that the small screen on a graphing calculator is as nice as a full-size computer monitor, nor that the functionality approaches that of Mathematica, but:

1) Details of any part of the graph can be examined by use of the Zoom feature.

2) The coordinates of any point on the graph can be seen by using the Trace mode.

3) Many interesting studies can be made. For example, it is illuminating for a student (or a retired college professor) to see how closely a Taylor series approximates a function such as the sine curve

as the number of terms in the polynomial is increased. A web plot of a non-linear system approaching chaos can be made. The exponential flux of materials through a multi-compartment system can be investigated. Etc. etc.

It doesn't have to be a toy unless that is what you want it to be.

This is a separate issue from whether or not anyone should consider that calculators made by Kinpo, such as the 49G+, have any relation to the HP represented in this Museum. HP calculators could be becoming like designer jeans: somebody else makes them, HP just puts its logo on them, sometimes getting them crooked at that.

Tom

Re: HP49G+ is a JOKE

*Message #7 Posted by **HrastProgrammer** on 8 Nov 2003, 1:37 a.m.,*
in response to message #4 by Linda

A graphing calculator is ABSOLUTELY NONSENSE ! It is for pupils (maybe students, but only because the do not have any money to spend) that make their first steps in analysis and algebra, it is not for engineers, not for professionals.

Sorry to say this, but if you don't know how to use a graphing calculator then don't use it, but don't make negative comments about it. They are built for the real professionals who know how to use and program them. I am sick of people who are constantly praising their old calculators because they are so simple and intuitive to use. For me, HP-48GX is the best calculator HP ever made. And it is simple to use as HP-41C. I also love old calculators, like HP-41C, HP-42S and HP-71B, very much. I fact, I love all of them so much that I emulated HP-41C/CV/CX/42S/71B on my new and extremly powerful HP-48GX. And I still don't know which of them is the best because each of them is the best for some particular thing. And, believe me, I know what I am talking about. I love HP-49G a little less because of the poor keyboard and display but not because it is a graphing calculator.

So, Linda and all the others, stop shitting about HP-48S/SX/G/G+/GX and HP-49G/G+ if you are not capable to understand them and use them properly. Just return to your old toys (perhaps you can find one on eBay for >500 USD). Or use Mathematica because there is nothing wrong about it.

I agree that HP-49G+ has some flaws but this is due to a quality control and some bad design desicions ... not because it is a graphing calculator.

Could not let it pass... (brief appearance so far)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2003, 10:45 p.m.,*
in response to message #7 by HrastProgrammer

Hi, Hrast; good reading your posts again.

After about ten days without reading the MoHPC messages (shame on me...), I read some late posts and I found myself nostalgic: where have they gone, those tech chats we used to find here at tons? Well, maybe it's a sign of the times: new calcs, new subjects. For these days I'm in a rush teaching Linux (basic), IBM-PC based architecture and connectivity and Interface Design, and spare time is something I'm begging for...

I can't help myself, Hrast: I must agree with you in many aspects. If "ancient" technology prevails, no tech development is required, no design engineers are needed, and we would simply

see the old stuff being sold as new, and the only new achievement would be the brand new "coat". I think that we should not close our eyes to the new and simply keep the past technology, because both new and old technology can coexist. Any of us that have already dealt with vacuum tubes know what I'm talking about. Some weeks ago, I saw an announcement where an IBM-PC compatible mainboard was shown with a built-in sound system where a vacuum tube is used as the output stage. I saw it in a flash, but that announcement made me remember that some of the most expensive, professional CD players used to have vacuum-tube based analog circuits. What to say? The fact is that we do not see this sort of "course of action" in some companies, that are only in search for profit, profit and profit. In these companies (would HP be elected this way?), R&D dept. is a waste of money, what matters is sales, no matter what to sale. If one can sale the same product all the time, that's profit. If the existing product needs improvement and redesign, that's waste. Anyway, I'd not throw away my solid-state, digitally controlled sound system (with home-built output stage and sound boxes) for a vacuum-tube based sound system, even if vinyl players are included. I like the way CD's "sound". In time: no low-quality, 128K MP3, please.

I developed many stuff with the help of RPL-based machines. I program them as well (user RPL only, no SYS RPL neither machine coded SW), as I also plot small graphs so I can have an idea of what's going on in some situations. The only thing I have not done yet is extensively using a computer-based math SW. I tried MathLab at the university because the teacher suggested it was useful for neural net applications. I felt it somehow boring and I asked the teacher if I could implement all neural net applications (learning database) in an HP49G. He simply told me: "If you can do so..."

And I did it. With small routines. The complete listings were about half a "letter-size" page, Helvetica 10 font. The routines were slow, but worked perfectly fine. And I neither used a computer, nor an specific SW; instead, a US$190 graphing calculator. Oh, yes: I still have the "Electronics International", where the HP41CV is announced at 325 bux! (June 2 1981 issue, p.231)

Just to add my points of view.

Best regards.

Luiz (Brazil)

in response to message #8 by Vieira, Luiz C. (Brazil)

Hi, Luiz, interesting: I'm also a Brazilian and took the same reaction when was asked to implement the BackPropagation algorithim (I don't know how to write this in English). I just implemented it in my HPGX !

Lets talk about AI and calculators -my passion! Artur

Re: Implementing AI routines ... and message to all

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2003, 9:46 p.m.,*
in response to message #10 by Artur

Hi, Artur;

I sent you an e-mail.

Please, folks, forgive me. I'm taking all measures in order to get back soon, and I'm sometimes reading posts in a 6- do 10-day checking basis.

I'm setting up some stuff, and after I'm up to go, I'll post about some stuff I've promised. which includes:

- Tandberg TCD 300 maintenance data;
- Load Flow program for the HP42S and some former HP41's listings;
- Collecting data, Data acquisition, Linux and HP calculators (Hey, Tony Duell; I think I need some guidance here about the best way to collect data (HW) and show it graphically in Linux. Have you done something like this? GTK, TK/Tcl, C-routines, whatever... Anyone else with related data or interest?).
- if applicable, AI and Neural Network with RPL-based calculators (is there an easy, low memory consuming way to do this in an RPN-based calculator?), after Artur's call.

I'm feeling I'm getting back "home" (here) soon...

Cheers, to all.

Luiz (Brazil)

Classic HP is like a good old bottle of wine

*Message #14 Posted by **Linda** on 8 Nov 2003, 7:01 a.m.,*
in response to message #13 by Norm

;-) .BTW, the HP-34C is indeed a great machine ... And the HP-41, and the HP-15C (e.g./there are more of course ...)

BTW, a good "feeling", a good keyboard CANNOT be emulated by any emulator in the world, neither on PC nor on PDA. So it seems to be a good choice to cover both worlds, to use a complex multimedia machine (small PC or future PDA) - of course also incorporating a good emulator of a great classic HP - and to own and use a great classic calculator that conserves the feeling of real thrill.

Valentin wrote: "We were DELIGHTED, with capitals, for lack of a better word. Those of you who, like me, have been through the 25, 67, 41, fully know the experience and can relate to that heart-and-mind enthralling FEELING [...] What about ENJOYMENT and PRIDE [...]"

Yes, that's it, Valentin, you've got it! One cannot add any further word to it ...!

OK, maybe still one sentence: Life is too short to drink a red win for 1.5 bucks a bottle, and life is too short to spend a huge amount of your valuable spare time to handle a suboptimal*) device ...

P.S.: --- LONG P.S. ----

*) a typical example for a very suboptimal device is the HP-49G+: HP (i.e. the new "Compaq-HP-Agilent" shareholder value oriented company") tried to implement an over-complex functionality in a device, in order to become the "calculator of the calculators". But "HP" failed. "HP" had to fail. Because such a complexity (submenus over submenus) is on the one hand no longer efficiently adressable via human interface (only if you spend all your spare time in learning and not forgetting to use it) and on the other hand not meeting professional demands.

Will there be any engineer or researcher, writing a long routine for complex calculus on a tipsy 49G-calcy, then downloading it to PC, converting/re-writing the code on a PC, then at last displaying/printing convenient plots with Matlab or Origin ;-) ?

I think this is no professional way of working. For solving real mathematical problems all researchers, physicists and engineers I know only use the professional software on a PC or notebook but NEVER an overloaded plastic toy. Sometimes you see an HP-48 or so on their desk but they only use them for "1 enter 1 +" or "sin(pi)".

But if they see your HP-15C or your HP-41CX on your desk, their faces brighten and they say ... "oh, you still use such a great old HP calc? ... Yes, they were great ... I am missing them"

Edited: 8 Nov 2003, 11:22 a.m.

yeah right on, red wine = red LED's

*Message #15 Posted by **Norm** on 8 Nov 2003, 2:31 p.m.,*
in response to message #14 by Linda

Linda, I like your posts. They are refreshing. By the way RED LED's can be considered

similar to your vintage RED WINE..... either is a prize. They are so crisp and intriguing to look at. In a word, RED LED's are FUN.

Know what's pathetic? Any corporation could restart the production of a cool looking display like that. Just the same one from before.... but with modern low-power LED technology so the batteries would last a long time.

Hey they could go multi-color, they could do a field of LED pixels. There's all sorts of things they could build that would be inspired and intriguing (grey LCD is boring in comparison to the original red LED's).

The reason they don't take a leap is because these are not the inspired and visionary innovators who built the originals. These are corporate rot, parasites and fakers, who are feasting upon the fruits of the original visionaries. The originals are long gone.

The fakers remain to feast upon the labors of the original inventors, and that's about all the huge corporation and their excessive take home pay, all created thru the original people with a vision. But they can't build what the original guys built. They just build a bunch of trash until we are tired of them. Finally it takes some other company to proceed in their place (I believe Agilent would be that company, a company that could restart the building of calculators that technical and academic professionals would be proud to use).

Other examples would be Boeing Co. (after building somethign so cool as the original 747 in the 70's, complete with 'James Bond' spiral staircase, now they can't be bothered to try anything clever and new, not even so much as that near-sonic cruiser, they just want to knock out more 737's for Southwest Airlines, yawwwn).

How about Cessna corporation, building that same old Cessna 172 for beginning aviation..... designed in the 1930's ?!? It sure was. Engine and everything. After 70 years, can't be bothered to innovate, only the original people did that.

Everywhere you look, overpaid business/marketeer types carefully eliminate the products we want to buy, and offer us something ghastly instead. Was talking with a gal who agree'd with me and had her own story..... she had been trampling thru all the stores trying to find a ladies LCD wristwatch, an elegant, thin, chrome-type of thing. They were all over the place in the past. Men had bigger watches, ladies had the thin ones. All she can find is "sports" ladies watches, that are big hulking black plastic things. It was an obvious coup of the marketeers, to eliminate what she wanted to buy..... but she did win out at the end..... the models that were suppressed by the marketeers.... well she found a few on the internet! The internet is the one way that we can try to get around these berzerk marketeers who discontinue what we want.... if you look real real hard, there often is still some supplier somewhere, then you don't patronize these mega-corporations who tried to shut off the flow of good product.

Re: yeah right on, Sorry Norm, I gotta disagree

*Message #16 Posted by **jimc** on 8 Nov 2003, 3:46 p.m.,*
in response to message #15 by Norm

Norm, usually I agree with you, but this time you went just a little too far. Your aircraft industry analogy was right on, except when you said:

"How about Cessna corporation, building that same old Cessna 172 for beginning aviation..... designed in the 1930's ?!? It sure was. Engine and everything. After 70 years, can't be bothered to innovate, only the original people did that."

This is one of the reasons we covet the old HP's. The previous incarnations of the HP calc. was diluted in the quest for innovation and "gizmos" to make more money. I think you were referring to the evolution of the product rather than the complete re-designing/re-inventing. While each generation was improved, there came a time when the suits ruled the gears - thats when Kinpo came in to the equation.

I suspect that if the mfg of the 172 were cut off tomorrow, you'd find a "172 Museum" where people would be doing what we do here. Bash Boeing, but I think Cessna is sticking with a winner...kind of what I'd like to see HP do.

*Message #17 Posted by **Norm** on 8 Nov 2003, 8:46 p.m.,*
in response to message #16 by jimc

Actually I like a lot about the Cessna 172, but it was designed in the 1930's (? at least that's the rumor) and so was the engine.

I like the high-wing airplane. The 172 allows you to ride along and see the ground very well, and the wing tends to provide you with shade. It's also nice for doing the walkaround inspection (terrible in a crosswind however, high-wing can tip the whole thing over).

Say you like high wing. Even so, it has a mild pitch instability because the mass of the plane is hanging well below the wing. The resulting symptoms are called "pitch cycles". It would be so easy to put in a little electronic system to eliminate the pitch cycles..... and the whole thing could cost about $500 or less, and make it much nicer to fly. But then.... that would require *gasp* innovation! Can't have that !!

*Message #18 Posted by **bill platt** on 9 Nov 2003, 3:13 p.m.,*
in response to message #17 by Norm

My father owned a Cessna 172 in the 1960's--he sold it around 1970. It was the older fast-back style with the more upright vertical tail. He had tricycle gear, no wheelpants, and got about 25 mpg at something like 90 or 100 knots. I can just barely remember it, but he even flew us to vacation in Canada, and he took some xcontinet trips in it.

It cost him USD $10,000. His number was N7500T. I remember because every airplane I ever drew when I was little had that number on it :-)

He still has all the cool slide rules, the VOR-TAC stuff, the pee-in-a-bucket set-up etc.

Anyway, one day it was blowing really hard, so he went down to Fair____ airfield (now called Balt. Wash Int'l) and there he found his airplane flying itself--a few inches off the ground--against the tie-downs!. He said it was pretty amazing to see!

I am an engineer and I find that using a graphic calc, I usually get a good understanding of my system faster than the time it would take me to go back to my desk or boot my PC. Of course when I want the details I use a PC but in my work I do spend as much time getting a rough understanding of systems behaviours (calc) as getting into the details.

Hi there

Linda wrote: 'A graphing calculator is ABSOLUTELY NONSENSE ! It is for pupils (maybe students, but only because the do not have any money to spend) that make their first steps in analysis and algebra, it is not for engineers, not for professionals.'

Well, as an engineer, and a professional, I have to disagree most strongly. I use Matlab, Octave, Mathematica, Mathcad AND a variety of calculators, both graphing and plain scientific, and I really have to say that the calculators most definitely have their place.

Mathematica et al are certainly very powerful and good to use (once you learn how!) but they are often far more than is needed. Some calculations often need to be carried out 'in the field' and a laptop is usually just too much hassle. You may think that ~$700 for a laptop and $1200 for Mathematica, $1000 for Matlab (and $0 for Octave, but that's another discussion) or any similar setup is 'peanuts' but _my_ employer (a large UK electronic engineering employer) won't pay that sort of money for something that won't be used to it's full potential. I have to agree with them actually...if I show that using a modern, powerful, graphing calculator can't make the grade then my boss will happily sign the requisition for Mathematica but I doubt if waiting 10 minutes for my shiney new 49g+ would be a good reason. Mind you, I also regularly use a slide rule (I have a few!) and thoroughly enjoy using them. Again, they have their place and used in that situation they excel. Unlike Excel. :-)

Don said: 'A squid eating dough in a polyethelene bag is fast and bulbous, got me?'

And he's right you know. :-)

Hey, Norm! Thanks for mentioning! (my regards to Captain Zener, please)

So far, not much from what I've been reading about. The last news were from one other contributor asking about the "2 disease" and your supporting reply.

Have you read this post of mine? I'm a lot interested on going "in deep"! As many subjects as possible, "2 disease" included. Any tips, tricks and valuable ideas? Don't you have any schematics?

Best regards, Norm. Be well!

Luiz (Brazil)

Valentin, Kudos to your posting. I may not have expressed it with such vehement clarity but I do suscribe to the spirit of your text.

I don't know, perhaps it's got something to do with generational changes, and shifting of percieved and/or real value. Whatever reasons we had to react how we did are well gone these days. Not saying it was better, just that it was.

But whatever is is, I still regard our way (as weird as it could feel to others) as the most pleasurable of all:-Unfortunately it's bound to make us feel the new fads as disrespect!

Best wishes,

AM.

Indeed. You have encapsulated what I feel on a bad day. When I zoom out and see what products out there, aside from calculators, have maintained a high standard of quality I am reminded that very few have. I look at my wrist and see a faithful Rolex Sea Dweller that I purchased 20 years ago still ticking perfectly, but everywhere else I look I see the irrevocable law of economics that has supplanted the leadership of so many companies out there - make as much profit as possible by delivering the least possible.

Why should Carly, and I say Carly because no other leader at HP has so fundamentally changed the culture

at HP, invest in this product line when there are far more viable income streams associated with production and sales of paper and other consumables. Why make a fine calculator key that costs $1 when you can make one for $0.20 that does a reasonable job? The key (pardon the unintended pun) is in the spread of profit.

Old dinosaurs like us (I'm 38) who once had the romantic affair with HP products must realize that HP does not exist anymore, nor likely will it ever exist again. The economic models simply will prevent it. We must bite the bullet and either purchase a product that makes our stomach churn or head towards TI. Unfortunately, my love for RPN has always been a factor in not heading TI's way.

If you desire the sort of timeless quality of product that the old HP had I suggest you look towards other companies like B&O, Rolex, etc. They do not make calculators, but they do make products that "meet real needs and provide lasting value". Their business model will ensure that quality will never be comromised for market share (I have never seen an economy Rolex).

The old HP is dead. It will never return. That we must accept. It does not prevent us from dreaming, however: a scaled down port of Mathematica running on a PDA device would solve (pardon the pun) our problems. Most of them anyhow. Unlikely that Mr Wolfram would be interested despite the obvious new markets that such a port would create. Perhaps if we all beseeched him he would consider it. Who knows how the mind of a mathematical genius works?

Thus we must await for the suitable hardware that will make Mathematica physically portable in the sense that a calculator is portable. I suspect a high end tablet device with a small form factor designed by Apple (the PC company that has demonstrated the most commitment to innovation and integrity - here, here Mr Jobs!) running the excellent OSX OS and Mathematica would be the computing device that we could comfortably migrate to. Think of writing equations on the screen and manipulating OpenGL graphics! Let HP turn into some GE clone and totally ignore their products. Except for the paper for the HP Laserprinter of course...

Excellent? Certainly not. After fiddling with OS X since its release, I got so sick of it that downgraded to 9.2.1. OS X (10.2.6) gave me nothing but trouble and was full of bugs. For example, I used to get the same file listed two or even three times in Finder windows. That and crashes and freezes (so much for protected memory and preemptive multitasking). Since I went back to OS 9, the problems have ALL gone away.

"Excellent" is hardly the word I'd use to describe X. Not only is it bloatware, but it turns my 350 MHz G4 into a slug, crawling oh-so-slowly instead of flying.

Really.

-Ernie

in response to message #31 by Ernie Malaga

Without this morphing from nostalgic and sometimes hopeless rants on a once faultless company that made legendary products to a discussion on the merits of Apple's OS X, I must say that since OS X.2 and particularly X.3 the OS is excellent. And I say this with the experience of having been involved in virtually every aspect of PC/workstation use from Win 3 to XP, from Finder 4 to X.3 and from Irix 2.4 to 6.5. The OS is now very stable and very fast. Truly, the first incarnation of OS X was really a beta version and suitable only for hardcore enthusiasts (should not have been for sale). But since then it has matured beautifully and performs head and shoulders above all other OS's in performance, security and stability. My G4 workstation has not crashed for over 8 months (of daily use including testing all sorts of downloaded apps) and has never been virally infected (never had to use any anti-viral tools).

Mac OS X is trash

Anyone can call anything "excellent," but that just doesn't make it so. OS X has gone the way of the bloatware. When installing it on a Mac, you are never given a choice as to which components you want to install -- it's either all or nothing (unlike versions <= 9). And since I have absolutely no use for iPhoto and iMovie and other iNonsense, I have to delete useful stuff from the disk only so I can update the OS that contains useless junk. Then I have to go through the installed products and delete those I don't need, and restore the good files I had to delete beforehand in order to make room.

The problem of bloatware isn't particular to the Mac. It's a trend in which all software manufacturers participate. In fact, Microsoft was probably the first bloatware developer.

> Quote:
>
> And I say this with the experience of having been involved in virtually every aspect of PC/workstation use from Win 3 to XP, from Finder 4 to X.3 and from Irix 2.4 to 6.5.

Most participants in this forum probably have similar qualifications, so I'm not impressed.

> Quote:
>
> But since then it has matured beautifully and performs head and shoulders above all other OS's in performance, security and stability.

I call that wishful thinking. My personal experience is diametrally opposite. OS X performance is about 40% of OS 9. As I mentioned in my earlier post, I have just downgraded from 10.2.6 to 9.2.1, and have noticed a _sharp_ increase in performance. As far as the so-called "stability", I wish I had jotted down the dates and times my Mac crashed under X. I'm positive it would make an impressively long list.

> Quote:

> My G4 workstation has not crashed for over 8 months (of daily use including testing all sorts of downloaded apps) and has never been virally infected (never had to use any anti-viral tools).

Your claim has no merit unless you describe your system. Mine is a 350 MHz G4 with 256 MB RAM and it crashed under X almost every day. Since I went to 9.2.1 (about three weeks ago) it hasn't crashed even once.

I must stand by my comments.

OT: Mac OS X is trash

*Message #34 Posted by **John Limpert** on 8 Nov 2003, 4:13 p.m.,*
in response to message #33 by Ernie Malaga

Funny, my Mac running Mac OS X hasn't crashed for many months. It used to crash almost every day with Mac OS 9.X. It's a PowerMac G4 450 MHz DP with 768 MB of RAM. It crashed a few times with Mac OS X 10.0. Subsequent releases of Mac OS X have been rock solid.

I like the installer. I want it to just shut up and install everything.

You might check your system for bad RAM. One of Apple's faults is their refusal to support parity-checked or ECC RAM. A flakey DIMM can look like buggy software.

Mac OS X is _NOT_ trash

*Message #35 Posted by **harryb** on 8 Nov 2003, 5:55 p.m.,*
in response to message #33 by Ernie Malaga

Wow Ernie... I guess you must have had some bad experiences... With the Mac OS.

Incidentally, have you considered using the option feature of the installer where you can choose which OS components are installed (from printer drivers to language support, from BSD subsystems to additional applications)? It's easy to miss I guess..

As for my experience, I only wanted to contextualise - not to impress. I do realize what type of person would have owned and loved a HP. And I do realize that I am in the company of some esteemed enthusiasts.

However, I do USE these OS's daily for professional reasons and can comment with the confidence and conviction of someone who has had to deal with many frustrating crashes and who will not resort to the accomplished IT manager (who just prefers to reformat, reinstall OS and reload back-up) until many a post-midnight hour has passed. I have NEVER had to do this on an OS X machine. When I use the term "excellent" it is with no exaggeration, I assure you, it is with gratitude.

The G4 that I'm speaking of is a 2 year old second generation 800Mhz with 1Gb RAM.

In your records have you been able to note what was the cause most often in the crashes?

I guess you could say that. As far as I'm concerned, things started going downhill with System 7.6 which, IMHO, was the buggiest and least stable of them all. OS 8 was much better, but then it started slipping again.

> Quote:
>
> Incidentally, have you considered using the option feature of the installer where you can choose which OS components are installed (from printer drivers to language support, from BSD subsystems to additional applications)? It's easy to miss I guess..

It must be. I've never seen it, and I have installed OS X several times on the same machine during my attempts to fix the unstability problem.

> Quote:
>
> The G4 that I'm speaking of is a 2 year old second generation 800Mhz with 1Gb RAM.

Both you and John have better CPUs than mine. I suppose OS X shouldn't be recommended on weakling Macs like mine, in spite of Apple's blessing of all G4s for OS X usage.

> Quote:
>
> In your records have you been able to note what was the cause most often in the crashes?

There's no pattern, except that in all cases it was OS X in the background. I thought about the RAM chips possibility, but that wouldn't explain why now that I have 9.2.1 the crashes have stopped.

It can't be a virus either -- I've reformatted the hard disk at least twice, reinstalling things after that.

It would be better to stop this off-topic thread before the first ripe tomato hits us on the face. If you want to continue it in email, my address is "kajzero AT earthlink DOT net".

I have to disagree with Ernie Malaga's comment:

"I suppose OS X shouldn't be recommended on weakling Macs like mine, in spite of Apple's blessing of all G4s for OS X usage."

I've been running OSX (10.0, 10.1, & 10.2.8) on a lowly Revision A iBook---the first generation iBook, with 300 MHz G3 and 288 M of memory. OSX works great! No crashes or lockups since the "second public beta" (aka 10.0).

Note that I don't have the original hard drive in it: as soon as my one year warranty was up, I replaced the original 3.1 G drive with a 30 G Toshiba.

Actually, with the "Customize" button, you can indeed elect not to install large portions of the system-- although admittedly the iApps are not listed as options.

The cumulative size of all the latest iApps (iDVD, iPhoto, iMovie, and iTunes-- is well under two gigabytes. A complete all-options OS X install _with_ the developer tools is < 5 gigabytes. Are you really so hard up for hard disk space that this is a significant issue?

I confess I don't understand the nostalgic attachment people have to OS 9 and earlier versions. I've worked with Macs since the day they were introduced. OS X doesn't crash like OS 9. OS X doesn't lock up the whole computer while I hold a menu down. With OS X, I can actually use the computer to do something else while a long compile or download is going on (you could under OS 9, technically, but the response would be so sluggish I generally wouldn't bother).

I can carp about things I don't like in OS X, either, but I'd never go back.

I suppose it's for the same reason some people get nostalgic about an old neighborhood, an old car... or an old HP calculator.

In my case, however, it's not nostalgia, but practicality. OS X gave me grief while OS 9 didn't. Just that.

Although I agree with the thrust of your comments, I wouldn't have chosen Bang & Olufsen or Rolex as comparable to the HP quality of old. To me, they're both "lifestyle" brands that command a significant premium price for the quality of the product that you get, and neither represents the best in their respective markets, IMHO.

They also seem to attract disdain from at least some quarters in a way that I never encountered for the classic HP machines.

> Quote:
>
> (I have never seen an economy Rolex)

I believe they're called 'Tudor'.

While I've found some companies that I think make pretty good products that offer lasting value (Eton shirts, Canon cameras, Leatherman knives), the only ones whose products gave me the HP-of-old feeling are Mercedes-Benz and Loewe. Oddly enough, both German companies. Unless I'm mistaken, Germany was HP's second-biggest market for calculators; probably just coincidence, though.

I bought a Rolex in 1976 for over $1000. It needed $400 repair and cleaning 10 years later and 5 years ago it stopped working due to a problem with the crown. Estimate to repair and clean $585. Thank you very much, but the quality escapes me, but timelessness it has a plenty. However, the idea was to tell the time with a little style. Lots of style, not much time. On the topic of HP calculators, my HP-35 bought in 1973 still works, no repair, and has only need two new batteries over its life. Not bad.

Re: HP returning to making quality calculators (LONG)

*Message #42 Posted by **Frank Travis** on 7 Nov 2003, 3:57 p.m.,*
in response to message #1 by harryb

I have seen messages from other persons stating that they would pay 30% (or even more) to get the HP

keyboard, etc. quality of old. I bought my first HP 48SX in July 1992 from the now defunct Educalc (no relation to current Educalc.net) from $274 and some cents. It lasted for nearly six years before it finally stopped working (one of the very few HP calculators I have purchased that ever went bad). But there was no problem with the keyboard. A couple of weeks before my HP 48SX died (in February on 1998) I purchased an HP 48GX from the now defunct Calculating Edge for about $200. It is still working fine to this day.

When I found that some of the plug-in application cards (mainly Sparcom/DaVinci) designed for the HP 48SX did not totally work properly on the HP 48GX I tried to find out where I could get a working HP 48 SX. I purchased a working HP 48SX calculator for $100 from Don O'Rourke of International Calculator in Orlando, Florida website www.internationalcalculator.com I have since gotten two more working HP 48SX calculators (and copies of the old HP 48SX manuals, both two piece spiral bound and one-piece square shaped) from Ebay auctions, for a similar amount. A high school or college student can not afford the prices that a working professional (scientist, surveyor, computer programmer, engineer, etc.) can. HP might want to have reasonabley priced calculators for the education market and higher priced models for working professionals. I saw a message from a surveyor a few months ago that he could not wait to purchase an HP 49G+ when it became available. Dedicated surveying devices such as the Allegro, SMI Titan, and TDS Ranger are $2,000 and up. See websites www.smi.com and www.tdsway.com

Some persons feel that general purpose use PDAs will replace calculators. To me PDAs will be the dominant handheld that is used. However, calculators will still have a niche market. Also, some PDAs cost up to $800. No calculator sold new in the last 25 years (including HP 41C/CV/CX, HP 28C and HP 28S--not calculators sold as collectors items/antiques) cost that much. HP needs to know what persons want in future HP calculators. I have been sending them e-mail which is being forwarded to their Product Development persons. To meet the automobile competition from Europe (mainly Germany) and Asia (mainly Japan), U.S. manufacturers GM, Ford, and Chrysler (now Daimler-Chrysler) increased product quality. HP can do the same. But HP needs feedback from a lot of calculator users.

11C Problems

*Message #1 Posted by **John Rodriguez** on 6 Nov 2003, 8:59 p.m.*

Anybody have an idea how to fix my beloved 11C? (Actually, my beloved's beloved 11C; I have a 15C.) Here's the scoop:

1. Calculator turns on by pressing any of these keys: ON, f, g, STO, RCL.

2. When f is pushed with calculator on, "f" does not appear in the display. None of the f functions work, i.e., I cannot change from SCI to ENG. "g", however, does appear in the display when g is pressed, and g functions correctly, i.e., I can change RAD to GRAD.

3. No multi-digit number can be entered. If you try to enter 45, first 4.0000 will appear, then 5.0000 will appear.

4. All functions seem to be working, meaning multiplication, addition, subtraction, CHS, exp(x), sin, and so on.

Calculator fails the +, x, / tests with Error 9.

Thanks for any advice!

Re: 11C Problems

*Message #2 Posted by **Karl Schneider** on 7 Nov 2003, 1:48 a.m.,*
in response to message #1 by John Rodriguez

John --

The 15C manual says simply that, if "Error 9" is obtained for the self-test, the calculator requires service.

However, it also says that if the user wants to continue using the calc, a memory reset (ON/-) should be done.

Re: 11C Problems

*Message #3 Posted by **Renato** on 7 Nov 2003, 2:49 p.m.,*
in response to message #1 by John Rodriguez

I´d start by doing a memory reset (ON - Minus). Then I would try a keyboard test (ON - Divide)

Maybe changing batteries would help also.

Good luck,

Renato

Re: 11C Problems

*Message #4 Posted by **David Smith** on 7 Nov 2003, 3:17 p.m.,*
in response to message #1 by John Rodriguez

The ultimate HP10/11/12/15/16 reset is to short across the outside of the battery string for a second or so with a wire or paper clip while the batteries are in the machine (and YES it says this in the manual).

Another very likely problem is some kind of internal short or (often invisible) contamination on the circuit board. Clean it well with 91%+ isopropyl alcohol. Keep it off the display window or you will get a white stain.

Can 49G do cramer's rule

*Message #1 Posted by **Fred Miller** on 6 Nov 2003, 6:47 p.m.*

I was wondering if the 49g has a function for solveing cramer's rule. Meaning you could enter in the system of equations and pick the one you want to solve for and it performs cramer's rule on the manipulated matrix. I know you can use det() but then you have to take the determinate twice and divid blaa blaa blaa. If it is possible or if there is a program that will do it and anyone knows it would be greatly appreciated

Re: Can 49G do cramer's rule

*Message #2 Posted by **Namir Shammas** on 6 Nov 2003, 7:01 p.m.,*
in response to message #1 by Fred Miller

Cramer's rule is SOOOO inefficient that it is taught for historical purposes and is practical ONLY for solving two (and maybe three) equations. The HP49G can do LU decomposition, QR decomposition, and SVD. These methods rule over Cramer's rule (no pun intended)!!

Namir

Re: Can 49G do cramer's rule

*Message #3 Posted by **Ed** on 6 Nov 2003, 8:05 p.m.,*
in response to message #2 by Namir Shammas

Just use SOLVE command.

3: [x+y=5 x-y=1] 2: [x y] 1: SOLVE

Can handle as many equations as you need. After gettign the array of equations, you can just use LNAME command to get all variables (2:..)

Re: Can 49G do cramer's rule

*Message #4 Posted by **Karl Schneider** on 7 Nov 2003, 1:57 a.m.,*
in response to message #2 by Namir Shammas

Namir stated:

> Quote:
>
> Cramer's rule is SOOOO inefficient that it is taught for historical purposes and is practical ONLY for solving two (and maybe three) equations.

The 20S has Cramer's Rule built in for solving a system of 3 linear equations (called "3 bY 3") -- use "LOAD" to copy it from the calc's ROM into user program memory. However, I'm not sure how the function can be easily used to solve a system of 2 equations, because some determinants would be zero.

If you are interested...

*Message #5 Posted by **Raul L (España)** on 7 Nov 2003, 2:40 a.m.,*
in response to message #4 by Karl Schneider

... I could mail you a little RPL program that given the system matrix, it gives you the Cramer's determinants.

*Message #6 Posted by **Namir Shammas** on 7 Nov 2003, 7:04 p.m.,*
in response to message #4 by Karl Schneider

Most Numerical Analysis books will not even mention Cramer's rule anymore! The method is so wastefull of CPU effort (for 4 equations and more) that people who crunch numbers will frown upon using it. The LU decomp is the current method of preference.

Actually, Randy can be contracted to do this service for you; you can check his website. The link is found in this Museum.

Re: 48G memory expansion, is it possible?

*Message #4 Posted by **Erik Ehrling (Sweden)** on 7 Nov 2003, 11:07 a.m.,*
in response to message #1 by spencer

I have used www.cynox.de for upgrading several of my HP48G/GX's and have always been satisfied with the result. (Once the keyboard overlay was not fitted perfectly after the upgrade but they fixed that for free and I only had to pay for the shipping costs one way).

They also have several interesting options for the HP48G, one being a 1.2MB module - which upgrades the HP48G to have as much memory as you would have in the HP48GX with both a 128K and a 1MB card installed - another option being a double speed module - which in reality gives about 50% increase in speed.

There are some drawbacks with the speed upgrade, e.g. the clock goes faster as well and batteries last shorter time, but all in all I find a 1.2MB + double speed upgrade worthwhile! (It should cost around 110 Euro + postage)

Best regards, Erik Ehrling (Sweden)

Re: 48G memory expansion -- key is how you open the calculator.

*Message #5 Posted by **Paul Brogger** on 7 Nov 2003, 11:50 a.m.,*
in response to message #1 by spencer

I've done a couple. 128K is easy.

256K is doable, but the lazy way I did it (trying to solder-bridge the upper memory chip pins to those on the lower chip) didn't last long at all. If you do 256K, find some way to firmly connect the second memory chip's pins to those of the first.

I've heard of three methods of opening the calculator:

1. taking off the keyboard overlay to get at the tops of some internal "heat stakes" (plastic posts with melted, mushroomed ends that hold the front & back of the calculator together);

2. cutting the heat stakes from behind the IR lens and from within the battery compartment; and

3. somehow (?) just prying the thing apart.

I don't trust the first to leave the keyboard face fully intact, and can't believe the third leaves no marks on the case. (There are probably people who will dispute these assumptions.) The only one I've tried is the second, and there are several web sites with descriptions of how to do it. It does require that holes be cut into the back case, but in places that are usually hidden, so I think it is the best alternative.

Re: 48G memory expansion -- key is how you open the calculator.

>
> 3. somehow (?) just prying the thing apart

It appears to me that Cynox uses the first alternative. If you look carefully between the keyboard overlay and the edge at the top you can barely see the tops of two screws, which I assume replaces the removed "heat stakes"

Best regards, Erik Ehrling (Sweden)

PS. By the way, does anyone know where you can get a HP48*SX* upgraded to double speed? (There are descriptions of it on the net, so it can be done...)

HP21 batteries

*Message #1 Posted by **Bill** on 6 Nov 2003, 3:48 p.m.*

Hi there, new to the forum. I have an HP21 which I bought for fun at a garage sale but am currently relying upon as I lost my beloved 41CV. I don't see how to remove the rechargable AA batteries from the pack/holder. The calc. will only work now when plugged in, I would like to replace the batteries, any suggestions? thanks in advance....

Re: HP21 batteries

*Message #2 Posted by **David Ramsey** on 6 Nov 2003, 4:09 p.m.,*
in response to message #1 by Bill

Actually, replacing the batteries is pretty simple.

Use wire cutters or a knife to trim out the central plastic spline that runs between the two batteries.

Now you can easily remove the old batteries, clean out any corrosion, and simply insert a fresh pair of "AA" alkaline or NiCads. Make sure you get the polarity right!

Re: HP21 batteries - link

*Message #6 Posted by **Bill Plaxton** on 6 Nov 2003, 6:00 p.m.,*
in response to message #5 by R

ok now here's a dumb question, can I run nickel-metal-hydride batteries in place of the NiCDs which I haven't been able to find? thanks again...

Re: HP21 batteries - link

*Message #7 Posted by **David Smith** on 7 Nov 2003, 3:19 p.m.,*
in response to message #6 by Bill Plaxton

Yes, NiMH cells work wonderfully in these machines. 1800maH cells will run it for three times as long as the originals (if you charge them for three times as long).

HP-IL mass storage

*Message #1 Posted by **Pavel Korensky** on 6 Nov 2003, 3:39 p.m.*

Hello,

today I got (free of charge) another HP82161A tape unit.

The unit is not working. Maybe, something is wrong with the motor, because the tape is not moving and the rewind does not work. I did not have time to test it yet.

But I got one idea. If the HP-IL part is working, it should be possible to build some kind of mass storage and put it inside the 82161A plastic case.

I was thinking about some microcontroller (ATMega or maybe SC-12) and MMC card or CF card. The card connector assembly can be glued to the cassette door (for simple media exchange).

Anybody tried to do something similar ?

The second possibility, how to use the HP-IL components is to build something like HP-IL/USB or HP-IL/Ethernet convertor and use PC with USB or Ethernet for connection to the HP-IL system. The PC can simulate the mass storage, printer, etc.

Re: HP-IL mass storage

*Message #2 Posted by **Raymond Del Tondo** on 6 Nov 2003, 4:43 p.m.,*
in response to message #1 by Pavel Korensky

Hello Pavel,

AFAIK similar solutions exist. Are you sure the battery of the drive isn't just too flat or even dead? The battery must have a specific minimal charge level to allow the motor to work correctly.

As for the HP-IL <-> PC mass storage. Just use something like TRANS41, maybe it even runs with your IL-RS232 interface somehow ?

Regards,

Raymond

Re: HP-IL mass storage

*Message #3 Posted by **Pavel Korensky** on 6 Nov 2003, 5:06 p.m.,*
in response to message #2 by Raymond Del Tondo

This is not a problem with batteries. The unit was stored for a lot of years in a very wet environment (cellar) and the corrosion worked on it. I suppose that all mechanical parts are useless. There was some mould (is it a right term for for a nasty grey/green organism ?) inside the box.

I will disassemble the unit to parts and I will try to clean and dry them. I was thinking about the possibility to use the case and HP-IL components and made some kind of battery operated mass storage from those components.

In the meantime, I got a third idea. Maybe I can build the HP-IL analyser. Just connect the HP-IL chip to some PIC or Atmel microcontroller and hook the whole design to USB and write some PC software. Or hook the HP-IL to the SC-12 and connect it to the PC via Ethernet. The rest is only software on PC side.

Re: HP-IL mass storagen and PC interface

*Message #4 Posted by **Christoph Klug** on 7 Nov 2003, 3:35 a.m.,*
in response to message #3 by Pavel Korensky

Dear Pavel,

for both HP-IL applications you describe exist solutions :

1: Mass storage = the CMT RAM-Disk-Unit with up to 512 Kbyte RAM and RS232 option (I am looking this nice device...)

2: PC interfacing = full version of EMU41 which includes HP-IL support (and works with HP-IL PC interface card)

Your idea about creating a IL-mass storage device is absolutely nice - this solution would expand the actual development projects of HP41 ROM/RAM storage systems (plug in module or card reader case). Furthermore your solution would be interestig for any handheld which supports HP-IL (for example HP71)

Best wishes from Germany - Christoph Klug

Re: HP-IL mass storagen and PC interface

*Message #5 Posted by **Pavel Korensky** on 7 Nov 2003, 4:19 p.m.,*
in response to message #4 by Christoph Klug

I was reading some materials today and I was thinking about the mass storage. Probably, I will use ATMega microcontroller and MMC card. The 64MB card will be formated as a set of 512 files, each file 128KB long. The LIF medium filesystem will be implemented inside each file. With this arrangement, the whole system can behave like HP-IL cassette drive with 512 cassettes. For "tape exchange", there will be some push buttons and some display.

But firstly, I will use the HP-IL chip for the implementation of HP-IL analyzer. I need to find what commands are used by HP-41 for communication with the tape unit.

Or better, do you know where to find the listing of device dependent commands for HP-IL mass storage peripherals ? I am too lazy to read the whole HP cassette control ASM listing.

Re: HP-IL mass storagen and PC interface

*Message #6 Posted by **Raymond Del Tondo** on 7 Nov 2003, 5:59 p.m.,*
in response to message #5 by Pavel Korensky

Hi Pavel,

for the DDL/DDT commands: IIRC, there are tables of the related commands in the tape drive

manual.

Regards,

Raymond

question about 41c peripherals

*Message #1 Posted by **jimc** on 6 Nov 2003, 10:00 a.m.*

OK, I have finally obtained my (once missing) petroleum pac for my day job. Now, I would like to expand my system. The question is; what should they be? What would you consider the minimum components for a fairly serious 41 user? Card reader? Video interface? Printer? PC gateway? Advantage pac? What components would you get the most use of of?

Waiting on your input....

12345

Re: question about 41c peripherals

*Message #2 Posted by **Valentin Albillo** on 6 Nov 2003, 11:52 a.m.,*
in response to message #1 by jimc

Minimum:

```
Card reader
Advantage ROM
Printer
```

Recommended:

above, plus:

```
a Quad RAM Module [if 41C]
Extended Functions/Memory ROM [if 41C/41CV)]
2 Extended Memory Modules [if 41CX, else only one]
Mass storage (tape or floppy, may require HP-IL ROM)
```

Best regards from V.

Re: question about 41c peripherals

*Message #3 Posted by **David Smith** on 6 Nov 2003, 1:55 p.m.,*
in response to message #1 by jimc

Card reader, printer, Advantage ROM, PPC ROM

Re: question about 41c peripherals

*Message #4 Posted by **Håkan Thörngren** on 6 Nov 2003, 4:17 p.m.,*
in response to message #1 by jimc

More RAM.

I find the timer module very useful.

Some means of storage outside the 41:

HP-IL is useful to interface to a computer or a mass storage, such as the 9114 floppy disk.

The wand can also be of use if you do not want the expense of HPIL and have a means of producing bar code for your programs.

The card reader can also be an alternative.

Håkan Thörngren: Thanks!

*Message #5 Posted by **Angel Martin** on 7 Nov 2003, 12:38 a.m.,*
in response to message #4 by Håkan Thörngren

Hello Håkan ,

Just wanted to give you my belated thanks for your MCODE articles in those old PPC Journal's! I have added a few of your superb routines to the SandBox ROM (a compilation ROM), you may have read the thread?

I've got a couple of questions on some aspects I couldn't sort out very succesfully, too tecky for this thread, can you reply to my email address?

Best wishes, Angel Martin

Re: question about 41c peripherals

*Message #6 Posted by **Bill Smith** on 6 Nov 2003, 4:34 p.m.,*
in response to message #1 by jimc

for me the answer has evolved to:

external storage

either a 9114 or 82973A (and the IL module to run either). my card reader (specifically the cards) is deteriorating, and it is a real pain to have a large program fail on cards. also, the bar code wand is relatively simple and inexpensive, but is a one way device. if i could only have one of the above devices, it would be the 82973A. also, with the appropriate software the PC can provide the printer.

Re: question about 41c peripherals

*Message #7 Posted by **Raymond Del Tondo** on 6 Nov 2003, 4:38 p.m.,*
in response to message #1 by jimc

Ok, I'll throw my suggestions here, too.

Most important: 1. Quad Memory module 2. X-Functions module

3. HP-IL module

Then either 4a. Advantage Pac or 4b. CCD module

The Advantage Pac offers numsolve and integ, the CCD module the best user interface, both offer matrix ops, which were from the CCD module to the Advantage Pac.

HP-IL mass storage device, either 5a. tape or 5b. disk

6. HP-IL printer

Raymond

Re: question about 41c peripherals

*Message #8 Posted by **Christoph Klug** on 7 Nov 2003, 3:51 a.m.,*
in response to message #7 by Raymond Del Tondo

Dear jimc,

best would be to have the HP41CX with internal X-Functions and Time module. Expand the internal X-Memory by one or two plug in X-Memory module or better by an Double-X-Memory module. Next install the CCD module. Than install HP-IL module plus EXT-I/O for interfacing to external world :

Use the full version of EMU41 on your PC : This replaces some real IL devices (mass storage, printer, barcode print, video screen). Furthermore you get an advanced emulator and a gateway to PC-world and exchange by internet...

Therefore the best today HP41 system solution is :

HP41CX Double-X-Memory CCD EXT-I/O EMU41 (advanced emulator, mass storage, printer, barcode, video screen, gateway to PC and web...)

For HP41 interface applications to real world and for measurement data logger applications take the HP82166A IL-Converter and I/O-Board or IL2000 System ...

Best wishes from Germany - Christoph Klug

*Message #2 Posted by **John Limpert** on 6 Nov 2003, 4:08 a.m.,*
in response to message #1 by pascal

There used to be an organization, Science for the Blind, that adapted scientific equipment for use by the blind. I suspect that is what is up for auction, a calculator that was modified to be usable by a blind person.

That is what I could find on Google. There were references to Thomas Benham, a blind professor at Haverford College.

Re: strange hp 34c on ebay, anyone knows what it is ?

*Message #3 Posted by **Pascal** on 6 Nov 2003, 9:57 a.m.,*
in response to message #2 by John Limpert

Did you find something specific for this hp-34 ? what features for the blinds were added ?

Re: strange hp 34c on ebay, anyone knows what it is ?

*Message #4 Posted by **John Limpert** on 7 Nov 2003, 12:37 p.m.,*
in response to message #3 by Pascal

I don't have any more information on the calculator. My guess, based on its age, is that they decoded the LED display signals and used them to drive some sort of braille device.

HP-41C Video interface PAL/NTSC?

*Message #1 Posted by **Giuseppe Marullo** on 5 Nov 2003, 9:10 p.m.*

Hi, I would like to buy a HP-IL video interface module, but it is not clear to me if it will support PAL standard. Any clue?

Thanks,

Giuseppe Marullo

Re: HP-41C Video interface PAL/NTSC?

*Message #2 Posted by **Vassilis Prevelakis** on 5 Nov 2003, 9:44 p.m.,*
in response to message #1 by Giuseppe Marullo

The HP one (82163A) comes in either PAL or NTSC.

The Mountain Computer inc (80 column) (MC00701A, alias HP92198) allows the user to select the video format.

**vp

Re: HP-41C Video interface PAL/NTSC?

*Message #3 Posted by **Giuseppe Marullo** on 5 Nov 2003, 9:52 p.m.,*
in response to message #2 by Vassilis Prevelakis

Hi Vassilis, thank you for your answer. I don't have the module, I should ask the seller to check. Since he is in the States, I guess it will be NTSC, any hint on how to check it other than testing it? He does not have a 41C at the moment.

It could be used thru the monitor port anyway? What kind of monitor signal is?

Thanks again,

Giuseppe Marullo

Re: HP-41C Video interface PAL/NTSC?

*Message #4 Posted by **Diego Diaz** on 6 Nov 2003, 4:49 a.m.,*
in response to message #3 by Giuseppe Marullo

Hi Giuseppe,

I don't think you must care about this. As for early 80's TV sets were designed to handle one specific system PAL, SECAM, NTSC... but remember those are colour modulation system, so the colour information in the composite video signal becomes useless from one system to the others. But colour is

not an issue with HP-41 system, as they only offer B&W.

Next thing to care is luminance (the real B&W image), and again, nothing to care about, signals are compatible at this level.

Synchronism is the last point, PAL uses 625 interlaced horizontal lines and 50Hz vertical refresh rate, while NTSC handles 525 interlaced lines and 60Hz vertical refresh... This sound quite different, but they aren't. In fact almost every TV set manufactured since early 90's handles both systems efficiently.

So you can symply plug it into your TV set video input (usually an RCA type coaxial connector) or to the V-IN line if you are going to use an Euroconnector (Scart).

The signal itself is a composite 1Volt peak to peak assymetric video. Video info goes from 0 to +0.7v while sync pulses go from 0 to -0.3v.

Anyhow, you must be carefull if you are intended to use an old B&W monitor, as those are usually suitable for one specific video system.

Hope this help

Re: HP-41C Video interface and LCD-Monitor

*Message #5 Posted by **Christoph Klug** on 6 Nov 2003, 5:04 a.m.,*
in response to message #4 by Diego Diaz

Dear Giuseppe,

as Diego explaines in his answer, the IL-video interface box generates an FBAS signal. This is compatible to valve-monitors.

If you interface the FBAS singnal to an modern LCD screen you get an incomplete screen display, because the line format of LCD monitors is different from the line format of valve-monitors. That is terrible because a small LCD screen (used for automotive applications) would be a nice extension for your IL-system...

Alternatively to the IL-Video interface box you are able to use your PC-monitor as screen display. For example the software soultions TRANS41 and EMU41 includes a screen display feature. Furthermore this solution (I prefer EMU41) gives you much more advanced features, much more than a poor screen dispay output. Refer to the articles forum item 311 : "HP41-PC gateway & emulator"...

Best wishes from Germany - Christoph Klug

Re: HP-41C Video interface and LCD-Monitor

*Message #6 Posted by **Holger Veit (DE)** on 6 Nov 2003, 10:37 a.m.,*
in response to message #5 by Christoph Klug

Just for the record:

"FBAS" is a German acronym (Farbsignal,Bildinhalt,Austastung, Synchronisation"), the internationally better known term is CVBS (color,video,burst,sync).

Holger

FBAS

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Nov 2003, 3:15 p.m.,*
in response to message #6 by Holger Veit (DE)

An appreciated and much needed clarification, thank you!

Re: HP-41C Video interface PAL/NTSC?

*Message #8 Posted by **Giuseppe Marullo** on 6 Nov 2003, 6:29 p.m.,*
in response to message #4 by Diego Diaz

Thanks for your answers. I will purchase them, if I have understood well the signal is 1Vpp composite, so any frontal RCA / SCART connector will let me see the images.

Christoph, are you saying that a HP-IL LCD module would sell well? :)

Giuseppe Marullo

Re: HP-41C Video interface & LCD monitor

*Message #9 Posted by **Christoph Klug** on 7 Nov 2003, 4:09 a.m.,*
in response to message #8 by Giuseppe Marullo

Dear Giuseppe,

LCD monitors I tested are not able to display any line of the IL Video Interface correctly - form this result incomplete characters. That is bad, because the LCD´s have a small size, which is pratical for a portable system :-(

Personally I prefer EMU41, this includes also an Video Interface screen output running inside a DOS window...

Best wishes from Germany - Christoph Klug

Re: HP-41C Video interface & LCD monitor

*Message #10 Posted by **Giuseppe Marullo** on 8 Nov 2003, 9:34 p.m.,*
in response to message #9 by Christoph Klug

So I only have to interface a LCD display (like a 128x64) to a HP-IL bus, right? Wow, another project.

Re: HP-41C Video interface & LCD monitor

*Message #11 Posted by **Raymond Del Tondo** on 8 Nov 2003, 9:59 p.m.,*
in response to message #10 by Giuseppe Marullo

BTW: There exist at least two versions of LC displays from CMT for HP-IL...

Since these are relatively rare, it would be nice if someone will be able to develop a new solution.

Regards,

Raymond

ugrade from 1.18 ->1.22?

*Message #1 Posted by **Gitte** on 5 Nov 2003, 4:52 p.m.*

I have my old hp49g(rom 1.18), and I want to upgrade to 1.22. Is that necessary? What will change? What is the difference between 49g and 49g+? Thanx! :)

Re: ugrade from 1.18 ->1.22?

*Message #2 Posted by **Raymond Del Tondo** on 5 Nov 2003, 5:44 p.m.,*
in response to message #1 by Gitte

I don't know if such an upgrade is even possible. Did you take a look at the feature list of the + ? The hardware is different, the configuration may be incompatible. Unless someone can state the opposite, I'd suggest to upgrade your 49G to ROM 1.96 or 1.97 (if available)

Raymond

Re: ugrade from 1.18 ->1.22?

*Message #3 Posted by **John** on 5 Nov 2003, 9:21 p.m.,*
in response to message #2 by Raymond Del Tondo

You cannot upgrade the 49G with 49G+ roms. The highest available for the 49G is the "unofficial" (but very stable) 1.19.6.

I have heard that there is a 1.19.7, but I have not seen it.

John

Re: ugrade from 1.18 ->1.22?

*Message #4 Posted by **Jordi Hidalgo** on 6 Nov 2003, 12:02 p.m.,*
in response to message #2 by Raymond Del Tondo

There were rumours the version 1.22 for the 49G could be (easily?) extracted from the 49g+ file. But would it be of any good? I don't think so.

Jordi

Re: ugrade from 1.18 ->1.22?

*Message #5 Posted by **Raymond Del Tondo** on 6 Nov 2003, 4:28 p.m.,*
in response to message #4 by Jordi Hidalgo

IMHO you would have to patch the image in various places, since it uses some new opcodes (81Bx) which are not available in the 49G, and the compiled display offset constants are different, of course.

I don't think that it's worth the effort. People who can't live without a 49G-like calc should consider selling their 49G, and buy a 49G+. The 49G+ is better than the normal 49G in all and every aspect.

However, I'll stay with my 48GX, which is even better IMHO;-)

Raymond

17BII - place and date of manufacture

*Message #1 Posted by **bmclaurin** on 5 Nov 2003, 3:48 p.m.*

I'm trying to find out the years (and places) of manufacture of 17BII's. I'm aware of how to decipher the serial codes to determine this information for individual units. What I'm interested in is where and when, generally, production occurred for this model. Were any 17BII's made in the USA, or were they all foreign made? I understand that production was roughly between 1990 and 2002, but I don't know what countries were involved. Any help would be appreciated.

Re: 17BII - place and date of manufacture

*Message #2 Posted by **Raymond Del Tondo** on 5 Nov 2003, 5:39 p.m.,*
in response to message #1 by bmclaurin

I've seen 2 country codes on 17BII units so far, S for Singapore and ID for Indonesia. I'm sure the latest units have CN for China as code. Others could include Brazil.

Raymond

Re: 17BII - place and date of manufacture

*Message #3 Posted by **Randy Sloyer** on 5 Nov 2003, 7:09 p.m.,*
in response to message #1 by bmclaurin

To the best of my knowledge, only the 17B was manufactured in the USA. The 17Bii did not appear in the lineup until Pioneer production had moved to Singapore. So, no USA built 17Bii's exist. They possibly had a brief run in Malaysia before moving to Indonesia. I'm basing this on 32Sii production as I have never seen a Malaysian built 17Bii. They were probably built in Brazil as well, but most of those where for in-country consumption due to their importation laws way back them.

They also followed the same slide in quality as the 32Sii, that is to say once they were made in Indonesia, the key legends where printed on. All the Singapore units where double molded keys so the legends would never wear off, one of the hallmarks of HP quality.

Re: 17BII - place and date of manufacture

*Message #4 Posted by **bmclaurin** on 6 Nov 2003, 11:05 a.m.,*
in response to message #1 by bmclaurin

Thanks for the replies. That's just the info I needed. So I gather that the first 17BII's were made in Singapore. I have a 2001 Indonesian-made model, and the keypad quality is less than stellar. I'm thinking of selling that one and trying to find a good/excellent condition "early" model (early 90's), presumably made in Singapore.

Re: 17BII - place and date of manufacture

*Message #5 Posted by **Scuba Diver** on 6 Nov 2003, 11:31 a.m.,*
in response to message #4 by bmclaurin

Hello!

I found a bunch of 17BIIs at an electronics store a while back, and I bought up the lot. Sold most of them on eBay.

Here's what I found;

The last Singapore unit in the lot was made in late 1995. All of the units manufactured in 1996 (in this lot) were made in Indonesia. The interesting thing is that some of the Indonesian units are in boxes that say "Calculator Manufactured in Singapore". I guess that they shipped the leftover boxes to Indonesia so that they weren't wasted (how prudent of HP!)

The keypad quality was noticeably different between the Singapore and Indonesian units. If you're looking for a Singapore unit, you don't need to look for one from the early '90s. I have two Singapores from 1995 and they meet my expectations of keypad quality and feel.

Hope that helps! B.

Re: 17BII - place and date of manufacture

*Message #6 Posted by **bmclaurin** on 6 Nov 2003, 2:09 p.m.,*
in response to message #5 by Scuba Diver

Thanks a ton. That's exactly what I needed to hear. Nice to know that I don't have to limit my search to early 90's...sounds like any good/excellent condition Singapore unit will do.

How long should I charge the batteries

*Message #1 Posted by **Arnaud Amiel** on 5 Nov 2003, 1:33 p.m.*

I have rebuilt my 45 battery pack and used 650mAh NiCad. I believe the original was 450mAh and had to be charged for 14h. Am I right in thinking I should charge mine for 20h.

Thanks for your input

Arnaud

Re: How long should I charge the batteries

*Message #2 Posted by **Bill (Smithville, NJ)** on 5 Nov 2003, 1:49 p.m.,*
in response to message #1 by Arnaud Amiel

I've always used the following for NiCds:

(1.5) times (battery capacity) divided by (charger capacity) = hours

Assuming the HP-45 charger is 50 ma, then

1.5 x 450 / 50 = 13.5 hours

1.5 x 650 / 50 = 19.5 hours

So, 20 hours should be about right.

Re: How long should I charge the batteries

*Message #3 Posted by **David Smith** on 5 Nov 2003, 3:42 p.m.,*
in response to message #1 by Arnaud Amiel

Most of the original HP packs were 600 maH. Some very early ones were 500.

Re: How long should I charge the batteries

*Message #4 Posted by **JasonG** on 8 Nov 2003, 2:55 p.m.,*
in response to message #1 by Arnaud Amiel

Aha!

Charge them all the way to the end, right from one end to the other. Anything else leads to a big bulge at one end and then it won't fit into the battery compartment.

Wooooooooha!

JasonG...

PS: Sorry for the frivolity...it's just a wild reaction against a very crap week...

82120A assembly questions

*Message #1 Posted by **Bill Smith** on 5 Nov 2003, 12:39 p.m.*

several months ago, i disassembled an 82120A pack with the intent to replace the cells. naturally, i didn't get back to this project until after the snow flew, and now can't recall exactly what came from where. seems there are some extra parts.

i've soldered the new cells in series, and know which end to attach to the circuit board. this assembly seems to only fit one way into the case, so no problems there. the extra parts consist of a curved plastic board about the length and height of the case, and two metal V-shaped springs. my questions are: where do the board and springs fit in relation to the batteries? are all the batteries supposed to make contact with the 41 coppery contacts? (i only have the N-cell holder to compare, and note that each cell is individually sprung). the soldered battery assembly seems like it may be too stiff to make good even contact against the 41. comments, suggestions, and especially pictures would be much appreciated.

thanks, bill

You have mail:-)

in response to message #1 by Bill Smith

The plastic strip fits between the case and the back of the battery string. If you used smaller batteries than the originals you may need to use a fatter strip to take up the space.

The spring clips connect to the outside two cells and are where the calculator battery contacts touch. The inner two cells do not use them. Look carefully in the holder and you will notice little "pockets" in front of each cell position on one half of the case. The curved part of the spring goes in the pocket.

*Message #4 Posted by **Bill Smith** on 6 Nov 2003, 12:46 p.m.,*
in response to message #3 by David Smith

thank you both for the quick responses. with your help i have ressembled the pack, and it is recharging just fine. i did use the smaller NiMH cells, and they are a bit loose. i assume this means possible premature failure of the soldered tabs, but i'm too jazzed at the moment to take it apart again to rectify that.

next project is to rebuild the 88014 pack for my disk drive.

thanks again.

bill

> next project is to rebuild the 88014 pack for my disk drive. >

This is easy. The suitable cell pack (not the drawer itself;-) can be ordered from Panasonic and other vendors.

Simulations

*Message #1 Posted by **Walter** on 5 Nov 2003, 1:18 a.m.*

Tried the fabulous HP25 simulation - very nice! It was my first HP, too. Unfortunately, the simulation will close when I leave the net. Is there any good HP calculator simulation available for PC to be used without the net or did I miss anything? I use MathU for my palm 515 already.

If you really want a very good Virtal HP41C on your PC, you just have to use Warren Furlow's one ....

It is simply the best in my own opinion !!!!!!!

It seems that it is impossible to write here a link to his web site ..... I really don't know why ..... it's sad !!!!

Frederic

Re: Simulations

*Message #5 Posted by **Mike (Stgt)** on 6 Nov 2003, 11:19 a.m.,*
in response to message #4 by Frederic

Warren's has the best MMI (Man-Machine-Interface) but JF Garnier supports HP-IL.

If you realy want to know why it's not possible to publish a link to V41 (currently R8beta2 available) try to contact me offlist, see http://ourworld.compuserve.com/homepages/nutem/nutem.htm#re

*Message #6 Posted by **Bill (Smithville, NJ)** on 5 Nov 2003, 10:51 a.m.,*
in response to message #1 by Walter

Since you have a Palm, you may want to look at the HP emulators for the Palm. I use P41CX, which is a true emulator of the HP-41CX. The registered version comes with a Rom mangement program which allows you to emulate changing the four mudules. Comes with the rom images for most of the major roms, including the Advantage. Also includes images for the CCD, PPC, and ZenRom.

There's also a emulator for the HP-48/49 called Power48. It's a free program that emulates the 48SX, 48GX and the 49G on the palm. Not sure how fast it would be on a Palm 515. I'm using it on a Sony Clie NX60 with OS5 and other than the slow loading, runs great.

Power 48 URL: http://power48.mobilevoodoo.com

I believe I read that there's also a simulator for the HP-35 that runs on a Palm. Not sure where to find it or how good it is.

Hope above helps.

Re: Simulations

*Message #7 Posted by **hugh** on 6 Nov 2003, 9:01 a.m.,*
in response to message #6 by Bill (Smithville, NJ)

do you know if its possible to run power48 without a sd card?

also, the csim hp35 for the palm works well. there might be a new version now for the other classics.

Yes, seems to me you missed the fact that there's a link to the source code for the Java applet. If you've got some proficiency in creating Java applets and applications, that's all you need to create a stand-alone Java simulation that will run locally, off-line. It can be easily translated to VB.net as well, if desired.

Anyway, apart from the "oh-so-cute" factor, I would recommend using instead V41 available for free from a well-known-but-censored-out-here-for-undisclosed-reasons web site. This is an amazing piece of software that will give you an exact lookalike of a real 41, with all RAM, X-Functions/X-MEM ROM, Advantage ROM, etc, nearly indistinguishable from the real thing, except it's several times faster (and some I/O capabilities, of course).

Best regards from V.

32Sii 99 digit PI program

*Message #1 Posted by **rbaird1@ihug.com.au** on 5 Nov 2003, 12:39 a.m.*

I have been trying the "99 Digits of PI on an HP 32SII" program, from the Articles forum on my 32Sii and I cant seem to get it to work. It just runs and runs and runs.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=281

Has anyone else seen this problem, and can anyone else help fix it?

I have noticed a couple of bugs in the program: - N13 should be DSE i not DSE - E13 should be ISG i not ISG I

Is there another bug I have missed - because my LBL R checksum is 1FF0 not AF06 ?

Re: 32Sii 99 digit PI program

*Message #2 Posted by **Katie** on 5 Nov 2003, 2:10 a.m.,*
in response to message #1 by rbaird1@ihug.com.au

Hi,

You're right about those two errors in the listing, I've just corrected them, thanks!

I reentered the program from the listing and verified that the checksums and byte counts are correct. The program does run for a while, about 11 minutes on my 32SII. I'm not sure why you're getting a checksum error in LBL R, what byte count are you getting?

-Katie

OK, I am missing something?

*Message #1 Posted by **Scuba Diver** on 4 Nov 2003, 11:57 p.m.*

A few weeks ago, there was a post that quoted the HP website. The quote said something about there being 11 HP calculators; the 9G, 9S, 30S, 10BII, 12C, 12CP, 17BII+, 48GII and 49G+ have already been launched, and the 33S is forthcoming. The person posting wondered what the last calculator would be, and I assumed it was the 19BII+.

Today I decided to look on the HP site myself, and I came across this comment in the press release for the 48GII;

"Within the next several weeks, HP plans to launch two additional new calculators: one graphing and one scientific. The forthcoming graphing calculator, together with the HP 48gII, HP 49g+ and the entry-level HP 9g, are designed to fulfill the needs and budgets of a broad spectrum of users."

I don't know about you, but I wouldn't consider the 19BII+ a "graphing" calculator, would you? Wouldn't it have made more sense to describe it as a financial? Is it possible that they were trying to disspell the optics of having almost 50% of their product line "financial" calcs? 5 of the 11 will be financials...that's enough to make the MBAs grin and the engineers shiver :)

Although I'm not paranoid, I wonder whether the 19BII+ is really a go; the graphing line has some good offerings in the $100 and over category, but maybe they're planning something like a 38G+ for the $60-$70 range...

So, I was wondering, has anyone heard anything more concrete about the remaining calcs? I know we've all seen loads of info on the 33S, however I haven't seen anything that official for the 19BII+...

Thoughts? B.

in response to message #1 by Scuba Diver

According to hpcalc.org, HP plans on releasing a "39G+". You can find a fact sheet for it at http://www.hpcalc.org/hp49gplus.php

Regards, Steve

Re: OK, I am missing something?

*Message #3 Posted by **Scuba Diver** on 5 Nov 2003, 12:23 a.m.,*
in response to message #2 by Steve Ramsey

Well, once the 33S is launched, that brings us to the 11 calculators that HP will have in its line.

I guess the 19BII+ is dead!

Does anyone have any evidence to the contrary?

B.

Re: OK, I am missing something?

*Message #4 Posted by **Jean** on 5 Nov 2003, 2:53 a.m.,*
in response to message #2 by Steve Ramsey

39G+ would be a very nice calc – in fact much simpler to use than 48 and 49 models and good enough for most of day-to-day tasks. In practical life I found 3 weaknesses in the 38G implementation:

1. Variable name in the solver: one character only. Nothing compared to 19B or 27S

2. Displaying numbers without 1000 separator. I believe that the last HP, which had the same weakness, was the HP 35 series

3. Poor scaling of graphics (there is a solution with a separate program however)

I did not found any hints, that the new 39G + resolved those problems

Jean (Switzerland)

Re: OK, I am missing something?

*Message #5 Posted by **Graham Wilson** on 5 Nov 2003, 1:20 p.m.,*
in response to message #4 by Jean

Hi Jean

>>Displaying numbers without 1000 separator... the last HP... was the HP 35 series<<

The 28 series (ca. 1986) is I belive the last HP calculator that can't display the separator (an inconvenient drawback in an otherwise very fine machine).

OK, am I missing something (else)?

*Message #6 Posted by **Paul Brogger** on 5 Nov 2003, 2:04 p.m.,*
in response to message #5 by Graham Wilson

28? What about the 48G/GX/G+, 49G, 48GII, 49G+? Or am ***I*** missing something?

Re: OK, am I missing something (else)?

*Message #7 Posted by **Bill (Smithville, NJ)** on 5 Nov 2003, 2:10 p.m.,*
in response to message #6 by Paul Brogger

The HP-48GX displays with the comma separator AFTER you hit the enter key. This is probally due to the fact that the calculator does not know what type of object is being entered until the enter key is pressed.

The HP-11C displays the separater WHILE you are entering the number. I prefer this method. But then the 11C doesn't have an asssortment of object types.

OK, I WAS missing something!

*Message #8 Posted by **Paul Brogger** on 5 Nov 2003, 2:22 p.m.,*
in response to message #7 by Bill (Smithville, NJ)

(. . . including my HP-48G(+) -- I lent it out recently and it's not yet back.)

My 49g+ wasn't displaying with commas, *even after* <ENTER> .

Of course, after experimenting I see that commas are entered for "FIX" number formats (and presumably for others), but not for "STD" format.

Re: OK, I WAS missing something!

*Message #9 Posted by **Bill (Smithville, NJ)** on 5 Nov 2003, 2:33 p.m.,*
in response to message #8 by Paul Brogger

I had forgotten that the 48/49 had a "Standard" format. Just checked on my 48GX and no commas. I wonder what the thinking was for the Standard mode??

Re: OK, I am missing something?

*Message #10 Posted by **Gene** on 5 Nov 2003, 7:34 a.m.,*
in response to message #1 by Scuba Diver

Perhaps the part of the HP quote you need to note is:

"Within the next several weeks..."

That sounds like HP has a wave coming but there may be waves after "the next several weeks" as well.

?

Gene

HP 49G+ My Disappointment

*Message #1 Posted by **Joe Edwards** on 4 Nov 2003, 6:40 p.m.*

Well, I just got my HP 49G+ this afternoon, and it is already on its way back to the HP calculator graveyard. Why? Like I need to tell you folks! I had such high hopes for a new HP calc to replace my late HP 48GX calc. I was sorely mistaken to trust that HP could change its ways. Within five mins (max) of using it, both of the Shift keys began to stick and the ON button completely stuck in the down position. Grrrrrrrr. It is sad to say that I finally broke down and bought a TI-89. :(Seriously though, could someone PLEASE explain why it is so dang hard for HP to design a calculator that at least matches the quality construction of the old Pioneers. I don't mind the color scheme of the new machine, and heck, I can even handle the new keyboard layout. But WHY can they not make a simple keyboard to match the Pioneer series? Is it that cost prohibitive to make a quality product? I would really like to hear your ideas on this. Thanks.

Joe Edwards A former HP customer.

Re: HP 49G+ My Disappointment

*Message #2 Posted by **Raymond Del Tondo** on 4 Nov 2003, 6:55 p.m.,*
in response to message #1 by Joe Edwards

Hi,

I'd take one of those 48GX's with b/w high contrast display. Why? You won't miss much of the 49x , but you'll have the good display, and the better keys & keyboard;-)

Raymond

Re: HP 49G+ My Disappointment

*Message #3 Posted by **Joe** on 4 Nov 2003, 7:10 p.m.,*
in response to message #2 by Raymond Del Tondo

I already knew that. The knowledge was just further justified after the 49g+ episode.

Re: HP 49G+ My Disappointment

*Message #4 Posted by **Bob** on 4 Nov 2003, 7:14 p.m.,*
in response to message #1 by Joe Edwards

I am sad to say that I too have made the switch to the TI though the screen and keys suck. I purchased mine about 8 months ago and at the time I knew that the 49G was not a good choice.

I had high hopes when I heard about the g+ I have considered buying one for the past few days. It looks like that wouldn't be worth while. I have gone through some of the Manual for the 49G+ and it seems much better written then the TI manuals. It really is disappointing that the once ruler of the calculator world can't even produce a calculator of similar quality to the ones they produced a few years ago.

I own 4 hp's and one ti and unfortunately at this point it look like I'll be owning the TI a little longer. I really miss the hp's but they just don't do the math anymore.

While we are talking about quality

*Message #5 Posted by **Naim** on 4 Nov 2003, 8:42 p.m.,*
in response to message #4 by Bob

Could someone tell me if the 17BII+ is a good investment, or should I get a 17BII while I can?

Re: While we are talking about quality

*Message #6 Posted by **Raymond Del Tondo** on 4 Nov 2003, 8:55 p.m.,*
in response to message #5 by Naim

If the 17BII+@xyz... housing nad keys are similar to the ones of the 10BII, then I strongly recommend the 'classic' 17BII (without the plus)

Raymond

Re: While we are talking about quality

*Message #7 Posted by **CalcKidd** on 4 Nov 2003, 10:14 p.m.,*
in response to message #5 by Naim

I have a 17BII+, though I haven't taken it out of the blister pack yet.

I does appear to be a 10BII on weak steroids.

I, too, agree that HP needs to stop the bullsh*t and make a 49GX with a better keyboard (at least they stopped the rubber keys; like the 49G has).

The only sane thing to do is have someone fabricate a new keyboard for the 49G+... hmm....

49G keys

*Message #8 Posted by **Karl Schneider** on 5 Nov 2003, 1:54 a.m.,*
in response to message #7 by CalcKidd

CalcKidd wrote:

> Quote:

> I, too, agree that HP needs to stop the bullsh*t and make a 49GX with a better keyboard (at least they stopped the rubber keys; like the 49G has).

I have a 49G and, like others, have found it difficult to enter anything quickly. The real problem, though, isn't the rubber keys; it's the fact that they aren't hinged. On any non-49G HP, you can strike a key off-center and it will register. On the 49G, if you hit a key on its corner, it just "lists" to that side. The keypad I have to use to open my garage door has the same problem, and I end up having to punch the code three times.

How can such fundamental things be forgotten or overlooked in product design?

Re: 49G+ keys -- hinges may have helped, but ....

*Message #9 Posted by **Paul Brogger** on 5 Nov 2003, 9:11 a.m.,*
in response to message #8 by Karl Schneider

My 49G+ apparently has hinged keys, but several still consistently register inconsistently [;^)]. On those keys, I can press on one side and get a better recognition rate than when pressed on the other.

Not having a 49G, I don't know how they compare. It does seem, however, that the 49G+'s tactile feedback is somehow divorced from its electrical contact, and that it's possible to have one without the other. Somehow, H-P *used* to be able to cause the tactile feedback be a MUCH more reliable indication of electrical contact.

A lost art?

Key debouncing

*Message #10 Posted by **David Ramsey** on 5 Nov 2003, 12:10 p.m.,*
in response to message #9 by Paul Brogger

As I recall, one of the justifications for the crappy-feeling keypads on the 49G and similar models was that the new key switches did not require software debouncing. The older HPs debounced keys in software using the main processor, which took a significant performance toll. My memory is that the 49G is about twice as fast as a 48 series machine with the same processor and clock speed, simply because it's not spending so many CPU cycles debouncing keys.

Anyone else remember this?

Re: Key debouncing

*Message #11 Posted by **Raymond Del Tondo** on 5 Nov 2003, 12:42 p.m.,*
in response to message #10 by David Ramsey

But in the HP-48 it simply works. Please remember that many 49G users had to adjust a constant (->KEYWAIT ?) manually, to reduce keypress registation errors, or even bounces.

Many users of both machines can tell keyboard entry on the HP-48 is much faster than on the 49G, simply because of the much better kbd mechanics, and thus more reliable user interface.

And for the speed: the 49G has many optimizations inside the OS compared to the HP-48, where the keyboard debouncing is only a very little part, which doesn't even count, because they had to introduce that (->KEYWAIT ?) mechanism, which burns valuable CPU time again when reading the user defined constant. Much more important regarding speed is the new memory management, the FLASHPointers, and the latest garbage collector. It was a very long way for them to get it going well;-)

Nevertheless I don't think the 49G is twice as fast as the HP-48G series. Many things are faster, some are slower.

Raymond

BTW: I'm not sure if the function is called ->KEYWAIT or only similar...

Re: Key debouncing

*Message #12 Posted by **Francesc Casanellas** on 7 Nov 2003, 2:24 a.m.,*
in response to message #11 by Raymond Del Tondo

The key debouncing function is ->KEYTIME (you can use the CATalog). I recommend you try a value of about 500 (500 ->KEYTIME in RPN).

The function is always used, so de processor is always looking at it as in any machine. The factory set value is too high, making the keyboard too slow. Changing the value does not decreasse processor speed.

Edited: 7 Nov 2003, 2:26 a.m.

Re: 49G+ keys -- hinges may have helped, but ....

*Message #13 Posted by **Raymond Del Tondo** on 5 Nov 2003, 12:14 p.m.,*
in response to message #9 by Paul Brogger

> A lost art?

Yes, seems to be this way...

It started with the horrible keyboard of the 49G and it's relatives (39G, 40G), not counting the doorstop crap (6S, ...) , and not talking about the spoiled keyboard layout.

AFAIK they had to reduce cost as much as possible to be profitable, but the long-term consequence is 'hp' looses customers because of those incredible cost & quality savings...

Raymond

Re: 49G+ keys -- hinges may have helped, but ....

*Message #14 Posted by **CalcKidd** on 5 Nov 2003, 1:48 p.m.,*
in response to message #13 by Raymond Del Tondo

Apparently, HP thinks that making cals in China with sub-par keyboards reduces costs. Yes and no.

It reduces inital costs (I assume), but increases returns and causes loyal HP customers to look elsewhere for quality.

It seems that Americans are getting used to sub-par products and services. Just go to almost any checkout line and see what kind of service you get from the teenager at the register. Call you local utility company or cell phone company and see how many buttons you have to push to get into "hold hell".

Customer service is nearly dead. Customer satisfaction is not far behind. The bottom line is now the top line. We are being "fed" crap on a spoon and just supposed to accept it.

Anyway, until some of us can get onto the "board" at HP, we're gonna get what we get. All we can do is hope there is an after-market company startup that takes these calcs and turns them into what they should've been to begin with.

(rant over)

Re: 49G+ keys -- hinges may have helped, but ....

*Message #15 Posted by **Joe** on 5 Nov 2003, 3:18 p.m.,*
in response to message #13 by Raymond Del Tondo

But, how much of a savings is there per machine to construct a 48GX style keypad compared to the 49G+ keypad?

As I stated, the new layout is fine with me. I miss the BIG enter key, but I can live without it.

What I cannot handle is a keypad that doesn't register my keystrokes or has keys stick in place within five minutes of use.

Does anyone actually know the approximate differences in cost to manufacture those two style keypads?

Joe

Re: Don't know calcs but can quote for phones

*Message #16 Posted by **Ron Ross** on 5 Nov 2003, 3:58 p.m.,*
in response to message #15 by Joe

Manufacturing different types of phone keypads is as little as 0.50$ to $2-3 difference depending upon the complexity (a phone does have fewer contacts). But multiply this by millions of units sold and the CEO's at Hp immediately see the bottom line savings of using the cheaper keypad.

They cannot imagine anyone would return such a fine instrument, since it looks so good, back for a replacement or a refund. Cowcatchers are in! Functionality are OUT! Get with the program!

My last Hp I bought new was an Hp10BII. What a POS!!! When I heard about soft keys and no consistancy, I had NO idea what these people were talking about. They must be on DRUGS! Then I opened the 10BII and used it for about two minutes. The upper right corner keys were flat. If it were a $5-10 calculator, so what? But Hp list's this POS for $30. If a $30 Hp20s had a good keypad, why can't a $100 Hp have a good keypad? Hp only recently quit making the 20s (about a year or two ago). Get THAT keyboard technology back!!!

Re: Don't know calcs but can quote for phones

*Message #17 Posted by **Joe Edwards** on 5 Nov 2003, 4:14 p.m.,*
in response to message #16 by Ron Ross

I understand that completely. I would have paid and extra $10.00 for a quality keyboard!!!

I just picked up the last 3 HP20s models from my bookstore. They may not be RPN, but they are my choice to work with on a day to day basis for number crunching.

I realize that the early 21st century may not gives us personal jet packs, but how about giving us a keyboard of the same quality that was built no more than 5 - 10 years ago!!!

Boo HP.

Don't get me wrong. I was okay with the color (preferred the silver on the 48GII) and the capabilities of the machine, just not the CONSTRUCTION.

That's really unfortunate!

*Message #18 Posted by **Gene** on 4 Nov 2003, 11:33 p.m.,*
in response to message #1 by Joe Edwards

I have a VERY early 49G+ and although I get some key presses that don't register, I have had no problems at all like you mention.

I have used it more than 99% of those who have it and have not found it hard to use at all.

Newer units than mine have been said to have much much better response with the keyboard.

I think perhaps you just got a lemon off the production line.

Why can't HP make a $150 calculator that won't do that?

Why do Macintosh computers sometimes arrive at customer's houses and don't turn on?

Why do Dell's have hardware problems at times that I read about?

Why can't Microsoft make an OS that has its security holes plugged?

Buying a TI is not the answer, IMO. The 49G+ has many features the 48GX and TI models do not have.

Hard to know too if any reports might be forged by TI users...think that's beyond the realm of possibility? Perhaps, perhaps not.

(Note: I'm not suggesting this post if forged...but some might be)

Gene (and slightly paranoid!)

> Why can't Microsoft make an OS that has its security holes plugged?

I'm going to stick my neck out. The question I'd really like to have answered is, "Why can't Microsoft make software without bugs?" _Every_ piece of software made by MS has bugs of one kind or another; sometimes serious, others trivial.

Just this afternoon, for example, I was editing a document with Word. I highlighted a word, clicked to change its case (upper-, lower-, etc.) and nothing happened. I reduced the selection by one character (i.e., leaving one character out) and the "Change Case" command worked.

And we're talking about a product that has been around for at least 13 years!

in response to message #18 by Gene

Gene, This has nothing to do with TI brand loyalty. Heck, I have used HP's since I was out of high school. I have owned a HP 41CX, a HP 32s, a HP 48G+, a HP 48GX, and the returned HP 49G+. I am not advocating TI over HP. I REALLY wanted that calc to work!!! Many of my friend could attest to that. :) In fact, I have been bitching constantly for over a month as to why an American company chose not to release them first in the U.S. (Not racist here, just impatient). I guess I could have gotten a lemon, sure. But that doesn't answer my question as to why HP chose to return to the calc scene with a calc that has a substandard keyboard. Even ignoring the stuck keys, why couldn't they just manufacture a keyboard like the 48GX in quality? How difficult would it be? I am not trying to be sarcastic, I really am curious as to the differece in the manufacturing process of the old and new keyboards.

Re: HP 49G+ My Disappointment

*Message #21 Posted by **Joe** on 5 Nov 2003, 6:58 a.m.,*
in response to message #1 by Joe Edwards

So, can anyone tell me as to why it isn't done? Profits? That can be the only reason. I really cannot believe that it isn't possible to build a keyboard like on the 48G series. How much extra would such a keyboard actually cost?

Re: HP 49G+ My Disappointment

*Message #22 Posted by **John Limpert** on 5 Nov 2003, 8:38 a.m.,*
in response to message #21 by Joe

It may be that the contractor (Kenpo?) does not have the knowledge or equipment to make old-style HP keyboards.

HP may not have any engineers left from the days of quality calculator construction, when the hardware design and manufacturing were done in-house.

I've seen something similar happen with PC keyboards. There has been a "race to the bottom", in quality and price.

Re: HP 49G+ My Disappointment

*Message #23 Posted by **Tom Scott** on 5 Nov 2003, 2:01 p.m.,*
in response to message #22 by John Limpert

You'd think that if HP would have used their old (HP48) keyboard engineering design scheme on the 49G+, they would have not only produced significanlty better keyboards but also would have saved money. Surely HP would provide that information to Kinpo.

Tom Scott

Does it worth to buy an HP49G+ ?

*Message #24 Posted by **Artur** on 5 Nov 2003, 8:35 p.m.,*
in response to message #1 by Joe Edwards

Hi,

I'm reading the comments and I becoming afraid of buying the new HP's calculator - not only the calculator, but today I was looking for a scanner and the HP49Gx keyboard ghost was in my mind all the time... worst to HP, which had a good name since I was a school student ... So, could someone give me a support, because I would like so much the new calculator ... Buy it or forget this idea forever???

Re: Does it worth to buy an HP49G+ ?

*Message #25 Posted by **Joesph** on 5 Nov 2003, 8:58 p.m.,*
in response to message #24 by Artur

Why not just buy it, and if the keyboard has problems take it back?

The other problem is with the blinking screen. This is irritating, but it seems like a software problem. I am hoping for a flash update.

If you want to see something amusing, read this: http://www-s.ti.com/cgi-bin/discuss/sdbmessageview.cgi?databasetoopen=calculators&topicarea=Graphing+Calculator+Comparisons&viewmethod=Thread&messageid=142953

It's a nice review, coming from the TI website!

*Message #26 Posted by **John Limpert** on 7 Nov 2003, 2:05 p.m.,*
in response to message #24 by Artur

Another choice is just to wait for a while and see if HP corrects the initial design and production problems with the calculator. There is something to be said for waiting for version 1.1 of any hardware product.

15c or 32s, which is better?

*Message #1 Posted by **Jim B** on 4 Nov 2003, 5:39 p.m.*

I have a choice between picking up either a 32s (Singapore 1991) or a 15c (US 1987). Both are in like new condition. The problem is that I can only pick up one of them and I'm having a hard time choosing. I thought I'd get the opinion of those of you who are knowledgeable about both calculators. So, which one should I choose????

Edited: 5 Nov 2003, 10:46 a.m. after one or more responses were posted

Re: 15c or 32s?

*Message #2 Posted by **Victor Koechli** on 4 Nov 2003, 6:37 p.m.,*
in response to message #1 by Jim B

Pick up both. I know you can't, but do it anyway. Borrow money from a friend, or go to the bank. Just get them. However, if you *really* have to choose, there are good arguments for either of these two. I'd take the 15C for the following reasons:

- It's the smallest of all HPs ever (except the HP-01, of course)
- It does matrix math
- It has a true complex stack
- It has more memory
- It's of superb quality
- It runs for decades on a single set of tiny batteries
- Nothing, really nothing beats a Voyager. I mean, the looks!

Cheers, Victor

The 15C hands down

*Message #3 Posted by **Valentin Albillo** on 5 Nov 2003, 6:08 a.m.,*
in response to message #1 by Jim B

It's really a no-brainer. The 15C is the one to choose for far too many reasons to mention.

Best regards from V.

Confirming Valentin and Victor's opinion

*Message #4 Posted by **Thibaut.be** on 5 Nov 2003, 6:58 a.m.,*
in response to message #1 by Jim B

If it's a OR choice, then the 15C is the choice. But if you can manage to pick up both of them then do it !

Consider the 32s for programming ...

*Message #5 Posted by **Paul Brogger** on 5 Nov 2003, 11:08 a.m.,*

in response to message #1 by Jim B

The main argument in favor of the 32s is:

If you're going to do ad-hoc programming -- especially if you're going to do it infrequently, then

The 32s and sII programming environment is surpassed only by that of the 42s (and, presumably, the 41C's), from the standpoint of simple, mnemonic, ease-of-use.

With all programmables employing 7-segment displays (and that includes the 15c), program lines are encoded and presented as row/column values describing the keyboard matrix. The user is constantly deciphering sequences of two-digit numerics, scanning the keyboard and translating into keystroke sequences, and thus the intended commands.

With the 32s, command codes are presented alphanumerically, and are MUCH more straightforward in interpretation.

Certainly, with experience, a given non-alpha calculator's keycodes can become second nature, but the casual or infrequent user will find alphanumeric command presentation to be much easier to pick up again & again. (Yes, an assumption of infrequent use is a counter-argument: it ain't that important 'cause you don't use it that often!)

ALSO (IIRC), the 32s will handle hexadecimal display and conversions much more nicely than the 15c. If you're to use it for programming & debugging rather than for matrix calculations, the 32s may be much better suited to the task.

ALL THAT SAID, the 15c is simply a less-readily-available beast than is the 32s/32sII. From the "calculator-ownership strategy" standpoint, you'll choose the rare one when it's available . . .

(I used "programming" in two ways)

*Message #6 Posted by **Paul Brogger** on 5 Nov 2003, 2:16 p.m.,*
in response to message #5 by Paul Brogger

To clarify a bit (not that anyone has expressed confusion yet),

The alphanumeric display of the 32s simplifies **programming** *the calculator itself*, while

The hexadecimal coversion feature (and BASE conversions in general, for any octal or binary unfortunates out there) help in any role involving **programming** and debugging *other systems*.

Re: 15c or 32s, which is better?

*Message #7 Posted by **Ron Ross** on 5 Nov 2003, 11:55 a.m.,*
in response to message #1 by Jim B

Most of us would chose the 15c, but that being said, both machines are top shelf.

If you want matrix functions, you need the 15c, if not you still have a choice and as Paul mentioned, the 32s is somewhat better to program (more clearly).

Layout of the keyboard will probably determine your choice. The 15c horizontal layout is very addictive once you use it, hence you should avoid it! I am serious with this statement. A 32s user could make do with a 48G ten years from now without to many complaints except that it is a big clunker on your desk or takes up room in a travel bag. A 15c user would also complain about the vertical layout and maybe would switch to a 12c rather than use a 48G (which is a mistake in my opinion).

10-15 years from now, you may have to replace it and then you will cry about not finding a suitable replacement. A 32s user can easily find 48G's. A 15c user will be crying about having to program a 12C.

I have both, and if I were buying, I would buy the 15c again. I started with a 15c, then got a 42s. The 42s gave me so much more that I could not stay with with my 15c any longer. But I never would have went from a 15c to a 48G without the 42s. And I wouldn't have started using the 48G except, I could not bear to part with it being stolen (such irony, my favorite tool, stays home).

I still like my 15c layout best. I miss it (I know, tears rolling down cheeks, etc...). But a 32s user can switch right over to a 48G, a 15c user may hesitate to touch such a beast, and instead opt for the lowly 12c. That is how well liked the horizontal format is, once it is used (some people never like this layout though either). That is your delimia.

in response to message #7 by Ron Ross

How are the keys on the 32s compared to the keys on a 15c or 11c? I've used a 32sii (Indonesian made in 2001) and I wasn't impressed with the keys. I also own a 28s and like those keys very much. Just wondering how the keys on the 32s and 15c compare.

Re: 15c or 32s, which is better?

*Message #9 Posted by **RR** on 7 Nov 2003, 10:22 a.m.,*
in response to message #8 by Joel B

My suggestion is that you would be better served with an Hp32 (and anything made after 1999 does not reflect the true quality of these machines). For general use the 32sII actually has some useful conversions and a very good solver. My 32sII happens to be made in the Good Old USA (and my plain 32s is made overseas) I don't have an answer to that one.

My reasoning is the keyboard layout, plain and simple. Most people prefer the vertical arrangement. If by chance you use and begin to appreciate the horizontal layout, you will forever miss it, should you need to replace. Why go there? Both are RPN and very well made. Both will have to be purchased used. One will live 25 years, the other 20, but since the other is 5 years newer, well, you get the point (Most think they will last forever, and a few just might). But general use and ABUSE will kill each and everyone off, eventually.

Re: 15c or 32s, which is better?

*Message #10 Posted by **bill platt** on 5 Nov 2003, 2:03 p.m.,*
in response to message #1 by Jim B

Well, I use the 32sii most. But now that I own 8 calculators (and rising), what I am about to say is not so directly applicabhle to me, but is worth mentioning.

The 15c has Considerably more memory than either the 32s or 32sii. It has both mopre registers (over 60, vs about 27) and more potential lines of programming (over 400, insteaed of about 256).

So,

IF `you like either:

LONG programs,

LOTS of DATA,

MATRIX STUFF,

LOTS of DIFFERENT LITTLE PROGRAMS,

THEN 15c,

ELSE 32s

<END>

Regards,

BILL

My 32SII [long]

*Message #11 Posted by **Tizedes Csaba** on 6 Nov 2003, 4:01 a.m.,*
in response to message #1 by Jim B

I've got an 32SII and an 15C. My first programmable HP was the 32SII, that is that calc, what I use in every day.

(The following lists are not fulls...)

Things, what I like in my 32SII:

- it had vertical shape
- LN and e^x functions are not shifted (!important in engineering practice!)
- program listings are uses mnemonics
- simple program editing
- simple program deleting (with thats labels)
- equation editor
- 12 digit precision
- solver result structure: x:root1, y:root2, z:f(root1) t:f(root2)
- fast machine
- keyboard 'feeling'

Things what I don't like in my 32SII:

- too small memory (max. 256 steps)
- GTO label.line is non programmable (but it's not really problem)
- no GTO I (!missing, when I try to programming nested loops!)
- equations not editable (!just BS, then re-write!)
- INTEGRATE and SOLVE not useable at some time
- no AND, OR, NOT and XOR instructions
- no complex stack
- not all the mathematical functions and their inverses works with complex numbers
- not really slim
- plastic case, not metallic (???why the CASIO CAN to make very good metallic cases, like on my CASIO FX-850P: thats a beautiful slim machine with strong metal body, with REALLY screws! I dont understand this 'Barbie-plastic-world'???)

And my 15C? I think it came from an another world. It had mistakes, but the 15C is one of the best calculators of HP.

Csaba

My HP-15C vs. your 32S/SII

*Message #12 Posted by **Valentin Albillo** on 6 Nov 2003, 5:49 a.m.,*
in response to message #11 by Tizedes Csaba

Here are a few reasons why the HP-15C is better than the HP32S/SII:

- smaller, the most pocketable of all bar none.
- much more rugged and solidly built, will stand a lot of abuse without flinching, wears very little with age even in the worst environments. So far, 20 years up and counting ...
- clearer, very contrasty, segmented display, ideal for optimum visibility and legibility of numbers and numeric computations, like it should for a pure *calculator*.
- batteries last for *decades*, even under daily use.
- the 32S/SII usually gathers a lot of dust under the display, which is very annoying and extremely difficult to remove, if at all. The 15C doesn't, even if using it in extremely dusty places (e.g.: a year at the Sahara desert)
- *much* better keyboard, with classic molded keys, Helvetica font lettering, [f] and [g] keys, large ENTER key, ..., never failing to register a key or provide tactile feedback.
- *much* larger RAM, besides most instructions take 1 byte. The 32S is absolutely *starved* for RAM, and instructions take 1.5 or more bytes, so it uses it fast. For instance, the number 123 in a program takes just 3 bytes on the 15C, 9.5 bytes on the 32S !! This means that any given amount of RAM (say 200 bytes) will store much more instructions in the HP-15C than it does on the 32S/SII, so further compunding the problem.
- complete matrix functionality, including multiple matrices in memory, perfectly integrated with RPN: you can have matrices on the stack, on registers, do all kind of arithmetic functions with them, solve systems of linear equations with a single instruction, special functions to deal with complex matrices, etc, etc.
- complete complex number functionality, perfectly integrated with RPN: *all* standard functions work with complex numbers, including hyperbolics and inverse hyperbolics, 5-level parallel RPN stack, including LAST X, etc.
- the 15C can have up to 67 registers available for data. The 32S can have only 26 at most.
- the 15C has all 12 comparison test, the 32S doesn't. Many other instructions have test capabilities in programs as well, such as SOLVE, INTEGRATE, and a number of matrix operations.
- the 15C does have GTO (i) and GSB (i), for indirect branching, plus if the I register contains a negative number, it will perform rapid branching to *any* program *step*, no label needed. The 32S/SII has no such capabilities at all, which further cripples programming.
- The Hp-15C oozes quality. Every feature, from the extremely well-thought keyboard layout, to the microcode implementation of all its many functions, has been designed with utmost care, no

compromises. For instance, the HP-15C overloads operators to maximize every key's functionality. Take the [+] key, for example; would you believe it has *seven* different functionalities ? Namely:

1. to add up two real values
2. to add up two complex values
3. to add up two matrices
4. to add up some scalar to all elements of a matrix
5. to directly add up a value in the display to a register (STO+)
6. to directly add the value of a register to a number in the display (RCL+)
7. to specify a certain diagnostic test ([ON]-[+])

That's just the tip of the quality iceberg. The numerical algorithms are the best, most accurate in the world. The USER modes for entering/displaying matrix elements, with autoincrement, do-if-true capability, will even preview the name of the matrix and indexes of the affected element as long as the relevant key is kept pressed, performing the operation upon release or nulling it out upon timeout, etc, etc.

On the other hand, the HP32S/32SII is a machine full of compromises, with some good features intermixed with other half-baked ones or even frankly crippled. It's not an all-round product, at all. Just look at the overloaded [+] key example above: to add two complex numbers on the 32S, you must use an ad-hoc function for the task, CMPLEX +, as the obvious choice, the [+] key on its own, won't do it.

- The bottom line: the HP-15C is probably the best pure calculator ever built, period, and owning one is both classy and expensive. The 32S, though desirable, can't come up even close to that privileged status. It's just a fine but ultimately seriously flawed calculator. Comparing it to the 15C is kind of preposterous, the 42S is more like it.

In short, I'm not saying that the 32S/32SS aren't worthwhile machines, I've got several of both, they do a lot of work very well, and they are great, even excellent. But comparing them to the HP-15C ... !!! Come on !!! :-)

Best regards from V.

Re: My HP-15C vs. your 32S/SII

*Message #13 Posted by **Tizedes Csaba** on 6 Nov 2003, 6:29 a.m.,*
in response to message #12 by Valentin Albillo

Dear Valentin,

I don't want to compare two calculators, I just wrote what I like and dont't like in my 32SII.

I own some of HP calc's, but I'm not a really collector. My 15C was my 2nd calc from HP. The 1st is my 32SII.

When I preparing to my controlling-exam, I use 15C for wrote programs to calculate cutting-frequency, to examine Nyquist- and Bode-plots, to examine stability of controlling systems with feedback and disturbance.

I never think to use 32SII. I use 15C. It was very powerful.

So, my heart is throbbed, when I begin to use it. ;)

The really problem about the valuation of calculators is that, who when started to use this machines, and which machines used.

I wasn't meeted with this calcs in the '80s, I'm not really feel what mean this era. But my feeling is 'nearest to the truth'.

Csaba

Re: My HP-15C vs. your 32S/SII

*Message #14 Posted by **bill platt** on 7 Nov 2003, 9:30 a.m.,*
in response to message #12 by Valentin Albillo

Hi Valentin,

I have to put a couple cents in....

1) My 15c has dust under the display---my 32sii does not have that--and cannot--as the LCD is not covered with a protection, like the 32s was.

2) The 32sii DOES have GTO (i) and XEQ (i) ....so yes, you can inderectly address a subroutine or a spagetti noodle in the 32sii. (Is this also true for the orig 32s?) BUT you are correct that you cannot program a line number Goto---but then again that is bad spagetti noodle practice anyway, yes?

3) You actually have 33 available storage registers in the 32sii---the statistics registers are accessible via indirection (i). This is no less cumbersome than the 15c--where *most* of the registers must be accessed via indirection. Doesn't the 32s allow this?

4) The 32sii has all twelve conditional tests. Is it true that the 32s does not?!

I have never owned or used the original 32s---so I am not familiar with its intricacies.

You know, if the 32sii had a lot more memory, then it would be far more powerful than the 15c--because you could write programs to handle the Matrix and Complex stuff. The only real cramp in the 32sii is the small memory. However, I am assuming the good old days of HP, where HP would provide the matrix and complex math programs in the manual.....

It will be interesting to see what the 33s brings...

Oh, one more question for you: A while back, you suggested that I really *must* get the 15c advanced functions book---(regarding numberical methods)----do you know is that the same as what I saw included on the Museum's CDROM?

Best regards,

Bill

Re: My HP-15C vs. your 32S/SII

*Message #15 Posted by **Valentin Albillo** on 7 Nov 2003, 10:11 a.m.,*
in response to message #14 by bill platt

Bill Platt posted:

"If the 32sii had a lot more memory, then it would be far more powerful than the 15c"

In Spain we have kinda proverb which roughly translates like this:

```
"Were my father to be round and red, he'd be a tomato ...
 But since he's not, he ain't."
```

Get the point ? If your statement above would be worth anything, then by the same token "if the 15c had a faster CPU and/or alphanumerics and/or a card reader it would be far more powerful than [insert any given calc here]" ... Alternate futures are interesting sci-fi devices, but I suggest we limit our arguments to actual *facts*, ok ? The 32sii does *not* have a lot more memory, and so it's *not* far more powerful than the 15c, period.

"... because you could write programs to handle the Matrix and Complex stuff."

Since when writing programs to do something is comparable to having the complete set of functionality implemented in microcode right in the internal ROMs ? As long as it is a programmable calculator, you can in theory write programs to do anything, but facts are that you frequently neither have the space to write all necessary programming (the HP-15C has a very comprehesive matrix functions set) nor do the resulting programs run as fast or as conveniently as the microcoded built-in set. So the fact that you could (in theory) write a program to do something is a given for a programmable calculator and adds nothing to the discussion.

"The only real cramp in the 32sii is the small memory.

Yes, if you so chose to ignore the lack of matrices and matrix operations, true handling of complex numbers, etc, etc, etc. I don't quite get it why you feel it correct to make such an statement, as if these and all other points were nonexistent or nonrelevant.

Anyway, Bill, do as you please. You want to think and believe that the 32S/Sii is better ? Do it, man, I don't get paid to promote the 15C, be my guest, that's entirely your issue, I couldn't care less ... :-)

*"one more question for you: A while back, you suggested that I really *must* get the 15c advanced functions book---(regarding numberical methods)----do you know is that the same as what I saw included on the Museum's CDROM?*

I don't have the Museum's CD-ROMs so I don't know.

Best regards from V.

Re: My HP-15C vs. your 32S/SII

*Message #16 Posted by **bill platt** on 7 Nov 2003, 11:02 a.m.,*
in response to message #15 by Valentin Albillo

Hi Valentin,

Thanks for your reply-----

Actually I do not think the 32sii is "better" than the 15c---clearly without the matrix stuff and the complx stuff, AND less memory, it is inferior...

The point of the bit about more memory and making the Matrix and complex stuff programmed rather than built-in is that not everyone uses matrix and complex numbers---I for instance rarely need either, yet I often run out of programming space.....

So, if you free the ROM (by making matrix anc complex optional) you also make the calculator

more versatile for some users.....

And, I am not a crack programmer, but would it not be reasonable and possible to duplicate the 15c Matrix and complex functionality in an RPN program set? Am I missing some fundamentals? (I ask these questions because your explanations are generally very well written and enjoyable to read!). Obviously the 32sii does not have enough memory available for that....but how about the 33s IF it has 32 kB?

Or in other words, just how much more programming lines could the 15c have had, had that ROM space been made available for the user (rather than used for matrix stuff). We also must not forget that a significant portion of the RAM in the 15c gets used in *manipulating* matrices and complex numbers----

And of course I am sure that the Matrix and complex stuff is *packed* in the ROM more efficiently than an RPN program of equal power would be----perhaps that is one of the careful trade-offs made way back in 1983.

The fact is, the 15c is realy cool----no doubt! I just thought it is interesting that the 32sii has all the programming features, except line number gotos.....so it is quite good for many tasks--just too small!

And regarding differences between the 32s and the sii that I raised---anyone have answers there?

Regarding numerical analysis, HP15c "Advanced Functions"----is that the one?

And I like the spanish proverb----that's a good one! How do you write it in Spanish (my son likes Spanish).

One more thing--your name appears in the Chess world a lot--is it you, or your doppelganger?

Best regards,

Bill

Now we are making progress ... :-)

"not everyone uses matrix and complex numbers"

Fine. At the time of the 41C release, not everyone had a use for many of its advanced capabilities. But that didn't invalidate the fact that it was the superior machine. If you only need the basic four arithmetic functions, that won't mean that an HP-32S isn't superior to a $1 four-function banger, right ? In our present case, the fact that not everyone uses matrices and/or complex numbers does nothing to detract from the fact that the 15C is nonetheless the superior model.

"So, if you free the ROM (by making matrix anc complex optional) you also make the calculator more versatile for some users....."

I don't follow your argument here. ROM and RAM are very different beasties. "Freeing" ROM won't do a thing to increase your RAM availability, both were very differently priced at the time, and it was usually much more sound from an economical point of view to implement as much functionality in ROM as possible, just to save a few precious RAM bytes. That's why HP did include so many functions and features in the ROM, such as hyperbolics or recall arithmetic, because that would save the user a lot of bytes here and there. But if you chose not to use the ROM for said purposes, it would simply remain unused. The HP-45, for instance, had some pages of ROM available after implementing all projected functions. Havig nothing better to do with it ('trading' it for extra RAM being out of the question), they did include there the microcode for the HP-55 timer.

"would it not be reasonable and possible to duplicate the 15c Matrix and complex functionality in an RPN program set?"

That's a *VERY* tall order, for any programmer. The microcoded matrix algorithms were state-of-the-art, developed ad-hoc for the HP-15C, and going through every loop to achieve maximum speed and accuracy, even above and beyond the 13-digit internal precision. And as the HP-15C's matrix set is quite comprehensive, accurately emulating it in user-code software would be prohibitive for most any individual.

I ask these questions because your explanations are generally very well written and enjoyable to read!

Thank you very much, but trying to lure me with sweet words won't do you any good, I'll trash you all the same ... :-) :-)

"Obviously the 32sii does not have enough memory available for that....but how about the 33s IF it has 32 kB?"

That amount of RAM would be enough to implement a number of programs and routines simultaneously, even at the preposterous rate the 32S gobbles up RAM (remember the 1.5 bytes minimum per instruction, 9.5 bytes for all numbers not 0-99, etc). But in the case of the matrix operations, the difficulty lies not only in the RAM required, but in the complexity of the algorithms themselves. Of course you can implement a matrix inversion or solve a system with fairly compact programs, but not with the quality and accuracy of the built-in 15C matrix functions (also present in the HP-71B, 42S, etc).

"just how much more programming lines could the 15c have had, had that ROM space been made available for the user (rather than used for matrix stuff)."

None. See my explanation above. You just didn't trade RAM for ROM at the time. Either you used all the ROM available for useful or miscellaneous functionality, or else it was left unused. If I recall correctly, the HP-75's I/O ROM was another such case, with a certain amount of poetry being burned into spare ROM space, just for fun as it would be left utterly unused otherwise.

"I like the spanish proverb----that's a good one! How do you write it in Spanish (my son likes Spanish)."

My pleasure. The proverb goes like this:

```
"Si mi padre fuese redondo y colorado, seria un tomate."
"Pero como no es, no es."
```

My compliments to your son. This is for him:

```
Hola, me alegro mucho de que te guste mi idioma
nativo. A mi tambien me gusta mucho el idioma Ingles,
es precioso, potente, y permite comunicarse a gente
de todos los paises. Espero que sigas progresando
con el idioma Español y que algun dia te animes a
venir de vacaciones a España. Saludos de Valentin.
```

"One more thing--your name appears in the Chess world a lot--is it you, or your doppelganger?"

It's me. As far as I know, I am the only Valentin Albillo in the world ! :-)

Thanks for your kind words and interest, and best regards from V.

Does 15c feel as cheap as a 12c?

*Message #18 Posted by **John** on 10 Nov 2003, 5:52 a.m.,*
in response to message #1 by Jim B

I was in an Office Supply Store yesterday looking over their calculators, which were all TI's except for a 12c. Having never used a 15c (I have only used a 32sii) I was wondering if the 15c keyboard feels as cheap as the 12c does??

Re: Does 15c feel as cheap as a 12c?

*Message #19 Posted by **Wayne Brown** on 10 Nov 2003, 7:42 a.m.,*
in response to message #18 by John

When the 15C was being manufactured, neither it nor the 12C felt cheap. The current-production 12C, like everything HP makes these days,is inferior to what it once was. Try to find a 12C that was made about 10 years ago and you'll see a real difference in quality.

Re: Does 15c feel as cheap as a 12c?

*Message #20 Posted by **Valentin Albillo** on 10 Nov 2003, 7:52 a.m.,*
in response to message #18 by John

OK, I'll bite ...

The HP-15C (the US-made models, at least), along with all other models from the Voyager series (10C, 11C, vintage 12C, 16C) has one of the very best keyboards ever made for any handheld calculator, if not the best. Only the HP-71B's keyboard can compare.

None of the HP-15C's physical aspects feels 'cheap' in the least, quite on the contrary. It's solid as a brick, has a wonderfully clear, contrasty display, and as I've said before, it oozes quality.

By the way, should you try to test this humble opinion of mine, try and get an HP-15C, from eBay for example. You'll discover a new meaning for the word 'cheap' ... ;-)

Best regards from V.

*Message #21 Posted by **Ron Ross** on 10 Nov 2003, 8:42 a.m.,*
in response to message #18 by John

That is really a bold and misguided statement to compare quality of a 15c to any of todays calculators.

Talk about guts!!!

Re: Does 15c feel as cheap as a 12c?

*Message #22 Posted by **Paul** on 10 Nov 2003, 8:53 a.m.,*
in response to message #18 by John

I had a 15C and a 28C, but felt the 15C needed more. So I traded it accross the ocean to the USA where an Engineer traded his 48G for the 15C that I had. I thought I had a good deal, until I found that the 48G was not made in the USA like the 15C. Quality, is not the word for the 15C. Supreme Excellence bar none. I done regret the swap because the 28C feels almost as rugged as the 15C. I'd never part with it. But the 48G.....a little disappointing. Cheap in its construction and sound speaker. Boy what a screach of a noise when beep is enabled. Now it runs silent, like a mute. Never again a non USA unit will I but, but what other option is there. They are all crap now. The old units leave them all for dead.

Paul

A 32s is much better than 2001 made 32sii

*Message #23 Posted by **John** on 11 Nov 2003, 6:43 a.m.,*
in response to message #18 by John

In comparing the 15c to the current 12c, I think I now believe what everyone's saying.

I had ordered a 32s from ebay and it arrived yesterday. I compared it to my 2001 Indonesian 32sii and was shocked at the difference in feel of the calculator. Every aspect of the 32s was better. The display, the keys, keyclick, everything. I will never doubt any of you again! I now know you can't compare the construction of a new 12c with a 15c. Thanks.

Edited: 11 Nov 2003, 7:23 a.m.

Re: A 32s is much better than 2001 made 32sii

*Message #24 Posted by **Raymond Del Tondo** on 11 Nov 2003, 8:04 a.m.,*
in response to message #23 by John

You're right, the older Singapore & U.S. made machines are ways better. The 32SII (all versions) has at least one advantage over the 32S: the display pixels are bigger;-)

...and one big drawback: The cluttered keyboard...

Raymond

Re: A 32s is much better than 2001 made 32sii

*Message #25 Posted by **Frank** on 11 Nov 2003, 9:51 a.m.,*
in response to message #24 by Raymond Del Tondo

I find the big, clear display of my 32sii cause enough to generally prefer using it over my 42s, which has the same clean keyboard layout as the 32s. I also find the shifted functions of the 32sii easier and faster to use than the nested menus of the 42s. In my hands, for simple tasks, the 32sii

wins, irrespective of keyboard esthetics.

Re: A 32s is much better than 2001 made 32sii

*Message #26 Posted by **Ed Look** on 11 Nov 2003, 10:38 p.m.,*
in response to message #25 by Frank

I'll agree with this last post. I've found the 32SII a joy to use, the only exception being its limited program memory (I hate erasing programs... I always have this biting feeling I might need it again, and soon!) MAINLY BECAUSE of its "cluttered" keyboard. I much prefer key, even if shift is required, access over menu access; the latter feels too much like trying to follow someone else's branched subroutines.

I only wish the 32SII keys felt as snappy and solid as the 34C (Spice series) calculators. I even like the old color scheme on my 32SII: all dark blackish brown with gold and blue shift keys and shifted key labels.

(OT for thread but on-T for NG- If the 48G series kept that same orange and blue system of labels, even with its green/gray case and faceplating, it would look pleasant, in my opinion, again.)

32S variations

*Message #27 Posted by **Randy Sloyer** on 12 Nov 2003, 2:09 a.m.,*
in response to message #25 by Frank

If you like the bigger characters of the 32Sii and like the keyboard of a 32S there is a solution:

Near the end the of 32S production, that is to say right before the 32Sii came out, the 32S went to the same stepped bezel as the other Pioneers. This eliminated the glare common with the lens over lcd design. When this was done, the lcd changed to the larger character size later used on the 32Sii.

So, you can have your cake and eat it too!

If you look at Dave's 22S photo, you'll see the bigger characters and the step bezel design. His 32S picture is of the older design. I think the bigger lcd's with stepped bezels tend to be much rarer than the originals but it doesn't seem to make much difference in the selling price :o)

Re: 32S variations

*Message #28 Posted by **Nelson M. Sicuro (Brazil)** on 12 Nov 2003, 8:27 a.m.,*
in response to message #27 by Randy Sloyer

My HP-32S have the big digits display and the stepped bezel. Is made here in Brazil in 1990 (S/N 3046B33967). Its display is way better (in contrast and glare terms) than my HP-42S with its old non-stepped bezel display. Even my 17BII (stepped bezel also) that has the almost same display have better contrast than the 42S.

(12345 to delete)

Best regards,

Nelson

USA, Singapre, Brazil, et al

*Message #29 Posted by **Scuba Diver** on 12 Nov 2003, 11:30 a.m.,*
in response to message #28 by Nelson M. Sicuro (Brazil)

Hi all!

With all the talk earlier about US and Singapore units vs. Indonesian and Chinese, I thought I'd throw my 2 cents (Canadian) in.

I recently acquired a Brazilian-made 19BII, and I find its quality to be identical to that of units made in the US and Singapore.

This is the only Brazilian unit I own, so I didn't want to make the blanket statement that Brazilian units were all on par with US/Singapore. Can anyone else confirm/deny this? I know that the 12C and 17BII were also made in Brazil...were those units of similar quality to US and Singapore ones?

B.

Re: USA, Singapre, Brazil, et al

*Message #30 Posted by **Julián Miranda (Spain)** on 12 Nov 2003, 3:28 p.m.,*
in response to message #29 by Scuba Diver

I have a brazilian made 12C and as far as I have used it (not too much, as Tony Duell says I don't have enough money to need a financial calculator) I can put it at the same level as my U.S.A. made 15C.

A comment off topic. I decided to buy a 12C to celebrate its 20 anniversary, I serched eBay and found someone from Corvallis, OR, who was selling a nice looking 12C and thought it will be a genuine U.S.A. made HP, I got it and was really nice but it was made in Brazil.

Re: USA, Singapre, Brazil, et al

*Message #31 Posted by **Stephan (Germany)** on 12 Nov 2003, 6:09 p.m.,*
in response to message #29 by Scuba Diver

My Brazilian 12C is definetely of the same quality as my 15C made in USA. The only difference is that it has repainted keys (keys are from a 15C).

Re: USA, Singapre, Brazil, et al

*Message #32 Posted by **Nelson M. Sicuro (Brazil)** on 12 Nov 2003, 7:20 p.m.,*
in response to message #29 by Scuba Diver

I have the 41CV, 15C, 11C, 32S, 17BII, 42S all brazilian and a USA 12C. All are excellent and the 15C and 11C are the same quality of the USA 12C. I also have a Singapore made 17BII and the quality is equal of the brazilian one. All abore have double-molded keyboard, and their construction is really good. In time, all brazilian-made HP calculators are only assembled here in Brazil, as far as I know, with USA boards and japanese displays (Epson, mostly). I don't know if the cases are molded here or just "stamped" with "Brazil" on it.

My R$0,02 (brazilian currency...)

Best regards,

Nelson

Re: USA, Singapre, Brazil, et al

*Message #33 Posted by **Scuba Diver** on 12 Nov 2003, 7:59 p.m.,*
in response to message #32 by Nelson M. Sicuro (Brazil)

Well, the interesting thing about my 19BII is that it has a Brazilian serial number (3627BXXXXX) but the body is stamped "Made in Indonesia"...my guess is that the body was made in Indonesia, then shipped to Brazil for manufacturing.

B.

Convert from .bin to .rom

*Message #1 Posted by **Poul Kaarup** on 4 Nov 2003, 1:28 p.m.*

How can I convert an hp41 ROM image from .bin format into .rom format? (I can do .rom to .bin)

Thanks in advance /Poul

Re: Convert from .bin to .rom

*Message #2 Posted by **hugh** on 5 Nov 2003, 6:18 a.m.,*
in response to message #1 by Poul Kaarup

not sure what the .rom format is. the v41 emulator comes with a conversion utiility thats handles formats; lif, p41, raw, dat, bin and txt.

Re: Convert from .bin to .rom

*Message #3 Posted by **Poul** on 5 Nov 2003, 2:50 p.m.,*
in response to message #2 by hugh

The ROM images that come with the V41 are in an uncompressed format like CCD1B.ROM (the CCD module). The ROM images used with Emu41 are in a compressed format like GAMES.BIN (the Games Pac). I know how to convert from .ROM to .BIN but not the other way around. The utility you mention is for converting USER code programs, and can't (as far as I know) convert a whole image.

/Poul Kaarup

Re: Convert from .bin to .rom

*Message #4 Posted by **J-F Garnier** on 5 Nov 2003, 3:49 p.m.,*
in response to message #3 by Poul

Bin format packs 4 words into 5 bytes (makes 40 bits):

```
byte
0       word0[7-0]
1       word0[9-8] + word1[5-0]<<2
2       word1[9-6] + word2[3-0]<<4
3       word3[9-4] + word4[1-0]<<6
4       word4[9-2]
```

and so on...

In the future releases of Emu41, I will support .rom format as well.

J-F

Cheap chinese junk

*Message #1 Posted by **Dom Dinis** on 4 Nov 2003, 12:12 p.m.*

Are all hp calcs made in CHina now? I'd be curious to know how much cheaper are Chinese production costs compared to the US. They must be substantially lower if hp hopes to recover the additional expenses related to returned items, additional repairs under warranty, customer dissatisfaction and the irreparable damage to the firm's reputation.

DD

Re: Cheap chinese junk

*Message #2 Posted by **Bill Wiese** on 4 Nov 2003, 9:09 p.m.,*
in response to message #1 by Dom Dinis

Well, labor costs are very cheap in China - far cheaper than even Mexico. Lots of assembly labor there is essentially 'slave labor' - folks go unpaid, jobs are misrepresented as to hours/duties/wages, folks are held prisoner in factories (locked doors, managers hold employees' internal passports so they can't leave facility or town). Many of these firms are one step removed from the Chinese gov't or military and/or are run by favored cronies of the Politburo elite, not subject to prosecution for all but the grossest of crimes.

Even w/diminished quality, it seems to be the norm in the consumer electronics biz that the true mfgr "eats" warranty returns & some associated costs. It's the dirty little secret in the consumer elec. industry that 25+% items (other than TVs and stereos, which ordinary folks seem to be able to use without skills) are returned to seller. Oftentimes this is not due to any real defect/product problem but due to incompatibility w/platform or user skill in installing devices (for example, PC peripherals) or confusing usage due to poor user interfaces & firmware (VCRs, camcorders, etc.) Often, when you buy a 'refurbed' item there may be NOTHING wrong with it other than the customer couldn't figure out the logic of the product; the product is just reboxed/resealed and new paperwork is thrown in. Can't be sold as new (except at Fry's ;)

Many Chinese electronic firms operate on time value of money "float" for their profits: they get money upfront to build a widget, chip, etc. The work is done at cost, but the profit is gained on the float. Risky, and they are willing to live w/the small margins. (Many do go broke.)

In general, I don't know why we do business with Red China. I'd pay triple to avoid them. It is an avowed enemy state. I don't doubt we'll have a war with them in the next 50 years - maybe sooner if they try to take Taiwan. I try to avoid buying ANYTHING originating from there (sometimes difficult, but actually possible). Given such low labor costs, every dollar spent in Red China adds a significant kick to their internal oppression & military budget.

Voyager 1

*Message #4 Posted by **bill platt** on 6 Nov 2003, 11:41 a.m.,*
in response to message #3 by Vassilis Prevelakis

Voyager 1 is still going strong--and sending signals back from the edge of the solar system---over 25 years in space and still functioning.....built when the spice series--or topcats maybe? were new.....

Just try THAT with chinese junk.

Oh well, so much for MADE IN USA. Now that the "Long March" launch vehicle is working and China has put a human into (sub?) orbit, I guess even space will be explored with tools that were MADE IN RED CHINA.

But god, I hope Bill is wrong---I sure hope my children do NOT fight a war with China in 50 years.

Re: Voyager 1

*Message #5 Posted by **Bill wiese** on 6 Nov 2003, 6:11 p.m.,*
in response to message #4 by bill platt

Hi Bill

Just so you & other readers don't mistake my words, my Red Chinese postings are not a racial comment. It is just that it will be exceedingly difficult for even the most innovative flexible societies (USA, Japan, Europe - and even Russia) to compete against an overpopulated, high-birth-rate society with cheap labor, lack of respect for intellectual property, etc. - R&D is funded thru a bit of 'fat' on product pricing, and the chinese mfg houses are essentially "stamp out a million cloned items for lowest price". We will end up fighting for the bottom not the mid-to-top of marketplaces.

Some sort of war will be inevitable. A Red Chinese takeover of Taiwan would cause gross world financial distress. {We need to get to the Taiwanese 'cross strait' businessmen, thru their gov't, and lay down the law that if we're gonna protect them, they've gotta not 'invest' (read: seek ultracheap slave labor) in China. It will not be a territory seeking war - we don't need to put 'boots on the ground' in China - but one to restrain its slave-driving tendencies and keep its military in check, and perhaps allow true democracy to take over (raising living standards).

Bill Wiese

San Jose CA

Re: Cheap chinese junk

*Message #6 Posted by **Bill Wiese** on 6 Nov 2003, 5:59 p.m.,*
in response to message #3 by Vassilis Prevelakis

Hi Vassilis..

If you're mail ordering ask for country of origin of item. If they don't know, ask if you can return it (unused, w/all packaging) if you find out it's made in Red China. If they say no, don't order it ;) If they bitch & moan upon returning it, it was a 'sales condition' (get a tape recording!) and let your credit card co help out on refund.

I've not seen anything so necessary to my life that I really have to buy a Red Chinese product. Getting harder though for some consumer electronics items. Even lots of low- to mid-range "Japanese" electronics (Sony etc) is red Chinese made.

For freedom & nonenslaved markets, Bill

Re: Cheap chinese junk

*Message #7 Posted by **Steven Kutoroff** on 6 Nov 2003, 8:46 p.m.,*
in response to message #1 by Dom Dinis

I won't dispute that many products made in China are of low quality. I also won't dispute that there are factories in China that are as described in one of the replies. However, I have been to China (less than 2 years ago) and I visited several manufacturing facilites. Some for US companies and some companies owned by other nationalities. I did this while with a University group. The companies I visited had first rate facilities. Not the same as they would have in the US with OSHA requirements, but still very good and much better than I expected. I saw facilities owned by Emerson Electric, Nokia, and others. Most were making items not for export, but domestic Chinese consumption. If HP wanted to make really quality devices in China they would. But, if a company really wants to have the highest sales margins, they will find a way to cheapen any product and going to China is the first step. HP took it and have the product made just as they want it made. All of us that collect, own, and use "vintage" HP products because of what they were probably regret the cheapening of these items, I do. But I also can look the items I have bought in the past 5-10 years and assess that some decent products have come from China. The Chinese people I saw working were not working as hard as Americans, but they are paid a fraction of our wages and they are working to do the best for their families the same way you or I do for ours. I look forward to another visit there some day. The people I met were terrific and truly concerned for the events of 9/11. But, that was almost 2 years ago.

hp 15c

*Message #1 Posted by **glenn sasser** on 4 Nov 2003, 11:10 a.m.*

I am looking to reset this calculator to the floating dismal?

Re: hp 15c

*Message #2 Posted by **Thibaut.be** on 4 Nov 2003, 12:33 p.m.,*
in response to message #1 by glenn sasser

The "floating decimal" does not exist on the 15C, neither on all pre-1990 calculators.

The only choice you can make is on the number of decimals, wich is selected by f FIX n, f SCI n, or f ENG n, where n is the number of decimals.

The default value of n is 4

Floating decimal

*Message #3 Posted by **Karl W. Schneider** on 5 Nov 2003, 1:40 a.m.,*

> The "floating decimal" does not exist on the 15C, neither on all pre-1990 calculators.

If "floating decimal" (Glenn Sasser, the original poster, erroneously wrote "dismal") refers to the calculator's showing only the minimum number of decimal digits (rather than a fixed number) to represent a value to best-possible accuracy, then at least several of the Pioneer scientific models can do so. The 42S and 32Sii and 20S, released prior to 1990, have an "ALL" display mode. Don't know about the 21S and 27S...

However, I remember in the early '70s when "floating decimal" had a different meaning. One low-end 4-banger Commodore calc from that era had a slide switch for power and display mode -- off/no decimal/2 decimal places for monetary arithmetic. Otherwise, the user had to keep track of decimal places, slide-rule fashion. The true floating decimal was a later innovation...

Another odd beast is one of the Sinclair Cambridge line (I think the 'Scientific'), which doesn't have a 'dot' key, it is always assuming you type a mantissa with one digit before the decimal point. For example, to type 0.15 you'd type [1] [5] [E] [-] [1], weird !!

Re: "Floating dismal"

*Message #6 Posted by **Paul Brogger** on 5 Nov 2003, 5:37 p.m.,*
in response to message #3 by Karl W. Schneider

I dunno . . . "floating dismal" sounds perfectly appropriate in other contexts.

For example, the "4" key on my 49G+ . . .

Re: hp 15c

*Message #7 Posted by **Richard Garner** on 4 Nov 2003, 12:38 p.m.,*
in response to message #1 by glenn sasser

The original setting for the 15C is FIX 4. I think it went f key, 7 key, then 4 key . Or it could be 4 Enter, f key, then 7 key. It has been awhile and I no longer have a 15C or manual to look at.

Re: hp 15c

*Message #8 Posted by **Thibaut.be** on 4 Nov 2003, 1:42 p.m.,*
in response to message #7 by Richard Garner

The correct setting is f FIX (up the 7 key) 4

Re: hp 15c

*Message #9 Posted by **Richard Garner** on 4 Nov 2003, 5:15 p.m.,*
in response to message #8 by Thibaut.be

It has been over 10 years sense I used a 15C. It's good to know that I still can remember some of the operations off of the top of my head.

Clonix 41 module proyect, 2x upgrade.

*Message #1 Posted by **Diego Díaz** on 4 Nov 2003, 9:05 a.m.*

Hi all,

It's been pointed out in a previous thread about Ángel Martin's elegant SandBox ROM (my apologies for the intromission Ángel), that the Clonix modules will be little more than useless if they cannot run on 2x machines.

I assumed (while developing the hardware power control) that low power figures were more likely to be the main thing to care of. Anyhow I was probably wrong.

Running at 2x with current software implementation will drastically increase the power requirements while in STAND-BY mode (from 1mA to 20mA!), it's possible though.

Now I will accept the challenge to re-write the Clonix code and cope with both low power and 2x speed, this is only a personal proyect after all, and the more I play with it the more fun I get ;-)

I'm using an old over-clocked 41C with 1LE3-0001 processor (yes, it produces those nasty negative pulses into the SYNC timing), it runs OK at 610KHz (1.7x) and becomes really unstable around 620-630KHz.

I'd like to know about your experiences with, so called, 2x machines: real clock speed, processor type, machine type (C, CV, CX, Half, Full...), unstability issues, etc.

Your comments will be greatly appreciated and will, in turn, help to the Clonix 41 2x upgrade proyect.

It's a real pleasure to see such a number of ROM/RAM Box proyects blooming those days, may we get those oversized eBay prices to low down a bit with all this effort.

Thanks in advance.

Re: Clonix 41 module proyect, 2x upgrade.

*Message #2 Posted by **Meindert Kuipers** on 4 Nov 2003, 11:01 a.m.,*
in response to message #1 by Diego Díaz

My HP41C runs at about 526 kHz (original was 357 kHz), with no stability issues at all, including any of the peripherals I have.

I have not tried to overclock my 41CV and 41CX, and I don't think I will attempt to point a soldering iron to these beauties.

I do think however that ebay prices will increase for module housings and cardreader housings ;-)

Meindert

Re: Clonix 41 module proyect, 2x upgrade.

*Message #3 Posted by **Diego Diaz** on 4 Nov 2003, 12:29 p.m.,*
in response to message #2 by Meindert Kuipers

That's a good point, Meindert. I'll be ready to accept your "overpriced" module housings :-)

Now, seriously, I'm trying to get a non working card readed to fit you MLDL kit in. In the meantime, playing with my Clonix is keeping me busy, and your info regarding clock speed served me as a reference. I've been browsing PPCJ's to see over-clocking related issues, and it seems that no-one pulled the 41 clock above 625KHz, wich means an increment of 173.6%, but those PPCJ articles were based on early machines, by the other hand the 1LF5-0002 built-in oscilator is nominally a 800KHz resonant circuit according to the chip specs, so later 41's could, theoretically, be pushed up to this clock frequency: a 222.2% increment!

Hope to see more messages in this thread, to make myself a more accurate picture of that.

Thanks for your comments.

Cheers.

Diego.

*Message #4 Posted by **Raymond Del Tondo** on 4 Nov 2003, 2:00 p.m.,*
in response to message #3 by Diego Diaz

AFAIR, the CX, and especially the halfnut version, runs at a somewhat higher clock than the older C's and CV's .

Raymond

Re: Clonix 41 module proyect, 2x upgrade.

*Message #5 Posted by **Meindert Kuipers** on 5 Nov 2003, 3:53 a.m.,*
in response to message #3 by Diego Diaz

Diego,

There are several memory modules available at pretty low prices, for example:
http://cgi.ebay.nl/ws/eBayISAPI.dll?ViewItem&item=3056135106&category=11713

Buy a bunch of them and make a fortune, I still have some left for myself so I will not be the one driving up prices :-)

Re: Clonix 41 module proyect, 2x upgrade.

*Message #6 Posted by **Angel Martin** on 4 Nov 2003, 3:21 p.m.,*
in response to message #2 by Meindert Kuipers

I for one, wouldn't bother so much about 2x issues. IMHO it is *much* more important to have the lowest possible consumption, and won't trade that for "high" (?) speed.

If not, consider:

no Time Module support (Alarms included)

no Card Reader support...

Besides, how much faster does it get? Compared to modern calcs even 2x is very slow. Speed isn't the point of the 41 system, it never was but now less than ever.

Best wishes,

AM.

Re: Clonix 41 module proyect, 2x upgrade.

*Message #7 Posted by **Helmut Kueppers** on 5 Nov 2003, 5:35 a.m.,*
in response to message #6 by Angel Martin

i have 200%(2x) 41cv + time. time module can be used with 200% speed!!! it has own clock/crystal. I using card reader. have switch - micro switch. card reader @ switch=0, speed @ switch=1. conclude: card reader and time module = no problem. helmut kueppers

in response to message #1 by Diego Díaz

No intromission at all Diego...

besides, now you give me another thread to bring up my SandBox ! (just kidding, or am I?)

Best wishes, ÁM.

Re: Clonix 41 module proyect, 2x upgrade.

*Message #9 Posted by **Diego Diaz** on 4 Nov 2003, 3:51 p.m.,*
in response to message #8 by Ángel Martin

Ha, ha, you're welcomed Ángel, my home is your home (sincerely)

Ok, I must admit (confess?) that the aim of this thread is double folded: I *really* want to know about the technical details of 2x 41's, as those reported by Meindert... and, poll the forum to see if the 2x machines are so common and they deserve the effort of re-coding the PIC.

Up to now, there seems to be no much interest in the issue, or no interest at all in the Clonix... time will tell.

Regarding Raymond post, I've got two HalfNut CX machines (s/n 2646S.... and 2819S....) and they run at 361 and 358Khz respectively. So, no speed up were provided by HP on late models.

I'll keep on tracking.

Kind regards from the Canaries.

Diego.

Re: Clonix 41 module proyect, 2x upgrade.

*Message #10 Posted by **Werner** on 5 Nov 2003, 3:42 a.m.,*
in response to message #9 by Diego Diaz

Hi Diego,

you just said: "Up to now, there seems to be no much interest in the issue, or no interest at all in the Clonix... time will tell." Oh, I think there is a lot of interest, maybe yet not many messages here at this place. I am VERY interested in such a great option, please keep on working on it! It is a wonderful project!

From my point-of-view I cannot really decide what would be better (for me), double speed or low power consumption. (I have a "slow" and one speeded-up (x2) HP41CX, so fortunately I could use your module anyway)

Concerning power consumption: You mentioned 1mA vs. 20mA at standby.

Do you have numbers of former devices to compare with ? a) how much current is needed for the HP41CX without extension modules ? b) how much extra current would be needed for a X-Memory module, a HEPAX 8k/16k module or a ZEPROM module ?

Concerning the speed issue: There was a question in the sandbox thread with regard to the possible speed of ZEPROM modules. I tested my ZEPROM-16k module in my 2x speeded-up HP-41 and it still works fine. But I have not yet measured the power consumption !

Concerning your question on maximum speed for fullnuts and halfnuts: I found a note in the forum on a 3 to 4 times speed upgrade for halfnuts: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv006.cgi?read=11913

"The half nut circuits works great even without the mounted 150pF capacitor at 3-4x (BEEP sounds very different at that speed)."

I also had found another note a year ago in the web speaking about a times-4-upgrade of halfnuts. Unfortunately I did not save the document and cannot relocate it by Google. I still remember that there was written that the new halfnut circuitry was based on hardware technology of the later calculator models (e.g. HP-42s) und could thus be speeded up twice as much as the fullnut which could only be speeded up to 2 times maximum (sometimes less, dependend on the device). Nothing was written on the speed upgradability for X-Memory modules or, e.g., the HEPAX RAM. Can they also follow a 4x speed up? I do not know.

Does anyone have information or practical experience on the described x3-x4 upgrade ?

So far for the moment. Please keep on going with your nice project - independent if fast or "slow" - I can only congratulate you to that activity!

Best regards, Werner (Germany)

Re: Clonix 41 module proyect, 2x upgrade.

*Message #11 Posted by **Christoph Klug** on 5 Nov 2003, 4:31 a.m.,*
in response to message #10 by Werner

Dear Diego,

your Clonix project sounds nice, and some of your modules are wellcome to the plug in ports of my

handhelds. I only use/need standard speed for my HP41 projects - not the 2x speed up feature. Speed is not a key feature of the HP41 system...

A good source for getting module cases would be creating Double X-Memory modules. And from them follows an optimal HP41 port configuration.

When you have finished your prototype design with positive results you have to complete the next step : Mass production of 20 up to 100 samples of your Clonix Module - including a nice Documentation, describing your system and the needed programmer tools.

I think it will also be possible to transfer function tested Clonix pcb´s to the user. Than they solder the terminal and complete the module shell...

Best wishes from Germany for your Clonix project -

Christoph Klug

Re: Clonix 41 module proyect, 2x upgrade.

*Message #12 Posted by **Diego Diaz** on 5 Nov 2003, 9:34 a.m.,*
in response to message #11 by Christoph Klug

Hi Christoph,

Glad to hear form you again, and of your interest in my personal proyect.

Yes, the module housings search issue is becoming the "Achiles' heel" of the whole proyect.

I'm trying to get them, (currently an ad with this aim is posted in this very site), but still no answers...

Probably my best chance is to offer an appropriate rebate to those potential customer that send me one or more spare modules.

I'm not very happy with the idea of offering the PCB's, this may turn into a source of question/troubles related to the manufacturing process. Anyhow, this may be a last resort if modules become unavailable at the end.

The best choice to program the Clonix is IC-Prog (www.ic-prog.com) it's freeware and runs really fine. A small PCB adapter (wich will go as the Clonix companion) routes the appropriate lines from the module connector to the PIC programmer DIL socket. I'm also preparing a full detailed documentation for the Clonix user, as well as a small program to make the PIC programming process as automatic as possible. This documents and the program will be freely available on the net (hopefully in the next 2 or 3 weeks). I bet you'll find them as soon as they show up...;-)

My first production run is planned to be of only 25 units (I must also pay my bill's and those PIC's are not the cheapest one can find :-), some of them, as I posted in a previous thread, will go to the main contributors on this proyect and of course I'll keep 2 or 3 for my own use. The rest will be ready for sale/auction at the pace shells become available.

Best wishes.

Diego.

I think this is a much better use of Diego's time/effort compared to supporting 2x. Like most others, my 41C with speed-up modification has a switch for normal speed.

That's just my opinion, Diego should decide what he wants to do.

James

I will be pleased to contribute in advance of the first-run, I suspect others will as well.

> Quote:
>
> I'm not very happy with the idea of offering the PCB's, this may turn into a source of question/troubles

I hope that unpopulated boards or kits will be available so that the price can be as low as possible (I expect to want a few). For this community, I would not fear accusations when trouble arises, but it should be made clear that unassembled boards/kits have no warranty. (I am assuming, and strongly recommend, that the boards will be 100% electrically tested.)

Good luck!

James

Re: Clonix 41 module proyect, 2x upgrade.

*Message #16 Posted by **Diego Diaz** on 5 Nov 2003, 5:28 a.m.,*
in response to message #10 by Werner

Thanks a lot for your enthusiasm and interest Werner. It looks like I've been a little bit unclear in my previous posts, and I'd like to poit out some facts:

I'm not going to give up. The Clonix module IS already a real thing, and it will work on 2x 41's, it's a simple question of time for re-coding the PIC and make some minor hardware modifications.

The 3x and 4x 41's are, for now, completely out of range, as there exist a technological limit for the PIC to run, determined by the number of PIC instruction cycles that can be executed between two consecutive 41's clock pulses. This limit is around 750Khz (2.1x), so this machine's users will have to slow down if they are interested in playing with the Clonix module. Sorry for that, but there's nothing I can do to modify PIC's specs... I can push it beyond the reasonable limit though, and make it run with a 20 or 25Mhz Xtal, (current implementation uses 12MHz Xtal.) but I don't think this worth the risk of internal malfunction/instability due to a severe 200% or 225% overclocking wich PIC are not supposed to cope with. But, of course, I'll also try this anyhow... ;-) One can never tell where the limit is without breaking it...

More to come.

Cheers Diego.

New HP-71B emulator with HP-IL

*Message #1 Posted by **J-F Garnier** on 4 Nov 2003, 1:56 a.m.*

Hello all,

I'm happy to announce a new version of my HP-71B emulator. It features now a full HP-IL emulation with display, mass storage, printer and DOS interface devices. Emu71 now gives direct access to LIF archives like the ones found on this site.

Please have a look at http://membres.lycos.fr/jeffcalc/emu71.html

It's still a text mode application (consistent with the HP-71B system look and feel) and runs well in DOS or command box in Windows 95/98/NT,2000, etc...

Some of you may notice that this new Emu71 has some resemblance with the basic system on HP9000 computers. It's not a true coincidence because: 1) I like very much HP9000 machines (I used a HP9845 during my first job), 2) Emu71 evolved like the 98xx serie by integrating the one-line display with a full screen display in a common device. With the additional great JPCROM enhancement (available on my site) which provides structured programming (REPEAT..UNTIL, SELECT...CASE, ...), the resemblance with RMB is even closer!

Like Emu41, basic Emu71 version is still freeware, and I propose an extended version with real I/O capability (with HPIL/PC board) for a small free.

Best regards from France!

J-F

Re: New HP-71B emulator with HP-IL

*Message #2 Posted by **Christoph Klug** on 4 Nov 2003, 3:44 a.m.,*
in response to message #1 by J-F Garnier

Dear Jean-Francois Garnier,

big gratulation for your actual work about EMU71 for the HP71 world. Now HP71 user get the same amazing power, as EMU41 brings to the HP41 system.

Emulators which includes real HP-IL support are the best today application for any HP41 and HP71 enthusiast - you get some virtual IL devices and a gateway to the PC world which includes internet applications : Connect your HP41 and now your HP71 to the world :-)

Best wishes from Germany - Christoph Klug

in response to message #4 by Gordon Dyer

This looks like a very impressive piece of work. Do you think it could run on an HP200LX ?

Re: New HP-71B emulator with HP-IL

*Message #6 Posted by **J-F Garnier** on 7 Nov 2003, 6:56 a.m.,*
in response to message #5 by GE (France)

Hi,

Emu71 (as Emu41) will run on HP95/100/200LX, although Emu71 will run quite slowly. I presented pre-versions dedicated to such small machines during the Allschwill meeting (look at http://membres.lycos.fr/jeffcalc/allschwil.html for more details), I'm working to optimize these emulators to these machines.

J-F

Re: New HP-71B emulator with HP-IL

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 7 Nov 2003, 11:41 a.m.,*
in response to message #6 by J-F Garnier

If you need a hand in optimizing your (very good) emulators to HP-95LX and/or HP-200LX (I have both) in assembler, please let me know! I like very much to programm in assembler and Pascal (I have Turbo Pascal 6/Turbo Assembler/Turbo Debugger on them) and I'm thinking in port the EMU42 to them also. They are beautiful machines!

Best regards,

Nelson

Replacing the CPU board on fullnut HP41

*Message #1 Posted by **Vassilis Prevelakis** on 3 Nov 2003, 6:16 p.m.*

Current technology allows us (with a small effort) to create a CPU board that will fit inside the case of an HP41 and be able to run original HP41 microcode. Assuming we do not try to be clever (i.e. increase memory, add more lines to the display, etc), this simulated 41 can be made to behave like an original HP41.

Why would anybody want to do this? Well speed may be one reason, and the ability to have lots of modules loaded in the base unit (and perhaps some extra e-disk memory).

The question is whether HP will accept this "product", or consider that this emulated 41C infringes their Intelectual Property.

Any ideas?

**vp

Re: Replacing the CPU board on fullnut HP41

*Message #2 Posted by **Dave** on 4 Nov 2003, 12:01 a.m.,*
in response to message #1 by Vassilis Prevelakis

All of the HP-41 coding has been released by HP I believe so their should be no issues. Run a Palm or Pocket PC engine and use HP-41 emulators....

Cardreader behavior

*Message #1 Posted by **Stephan (CH)** on 3 Nov 2003, 4:42 a.m.*

Good morning to all. Yesterday my cardreader showed a strange behavior. It accepts card wrighten long ago and I am able to work with those programs. Yet, when I wright a card it does it all right, this shows me the "xeq ver" operation. The display shows the correct letter "P" for program and the correct track which is only 1 in this case. But then it refuses to read the card wrighten before to its memory. The wording "working" flashes but in the end the calculator left me with the same amount of memory and the program was not in the CAT 1. The programm its self is functional as I have the program in Barcode and tryed to transfer it via the calculator to a magnetic card. Has anybody a solusion/conclusion to this? Thank you very much in advance for your help. Stephan

Re: Cardreader behavior

*Message #2 Posted by **Victor Koechli** on 3 Nov 2003, 12:39 p.m.,*
in response to message #1 by Stephan (CH)

You have probably written an empty card. To write a program to magnetic cards, position the calculator at the program you want to write (by pressing GTO.prgm_name or by using CAT 1, then stopping at the program in question), switch to PRGM mode and insert the card. Make sure the write protect tab has not been cut away, else you will have to set flag 14 (SF 14) to overwrite the card.

Does this help? Cheers, Victor

Re: Cardreader behavior

*Message #3 Posted by **Vassilis Prevelakis** on 3 Nov 2003, 6:08 p.m.,*
in response to message #2 by Victor Koechli

Do you have enough free memory in you HP41 to accommodate loading the program stored on the card?

**vp

Re: Cardreader behavior

*Message #4 Posted by **Stephan (CH)** on 4 Nov 2003, 3:02 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi Vassilis. Thank you very much for your thoughts to my problem. It looks to me the calculator has enough memory indeed. There are only two other programs (Distance conversion and Great Circle Navigation) in memory of my CX at this point in time. The temperature program of concern is not very big, or let's say long. As a matter of fact the program is stored already. Brought into the calc via the barcode reader. Yet I' ve tried to write it to the card and deleted the program after I've writhen it. Trying to get it back into memory via the cardreader, this procedure failed. The card its self is recognized by the calc all right as it prompts for the correct card kind and tracks. But the program won't be loaded to memory. I am a little bit clueless here. It seems to write on one hand (XEQ VER) but seems to fail on the other (no program). Greetings Stephan

Re: Cardreader behavior

*Message #5 Posted by **Stephan (CH)** on 4 Nov 2003, 2:40 a.m.,*
in response to message #2 by Victor Koechli

Hi Victor, thank you very much for your advises. Just to make sure I didn't miss a step I've tryed again to wright a card. Same result. The calculator shows me - by verifing the card - there must be "something" on it. Showing "P" for program and the correct amount of tracks. But you are right, it looks like a blank card when I try to reload the program. Is there a possibility that I own old, say unmagnetable cards? Greetings Stephan

Re: Cardreader behavior

*Message #6 Posted by **Victor Koechli** on 4 Nov 2003, 9:04 a.m.,*
in response to message #5 by Stephan (CH)

No, if your card would not keep magnetization, you'd be receiving checksum errors.

Some things to try:

- Make sure the calculator is positioned in a program that actually contains something. For example, make a short program containing only a few lines, save it to an empty card, delete it and try to reload it from the card. Does this work?

- Check the available memory, as Vassilis suggested. Press GTO.., then switch to program mode. You will see '00 REG xxx', xxx being the number of free registers. One card track can hold up to 16 registers, so if your program has 4 tracks, you will need at least 49 and up to 64 registers for it. To increase the number of free registers, either delete a different program or decrease the SIZE (using the SIZE instruction). BTW, do you see 'TRY AGAIN' after reading in a program card?

- Test the card reader with a card that has never been written to (will show 'CARD ERR' or probably 'CHKSUM ERR' when checked with VER). Write a program to it and see if VER displays the correct type afterwards. Alternatively, you can take a card of known type (let's say, 'P') and write something else onto it, like data (using .015 WDTAX) or Status information (using WSTS), and then check if the new type gets displayed by VER. If not, your card reader is most likely not writing anything. If you see the correct type and still can't read back your programs, then we'll have to think of something else...

Hope this helps. Keep us posted. Cheers Victor

Re: Cardreader behavior

in response to message #6 by Victor Koechli

Hi Victor. Wow, quite a lot of things to do. Give me 2 days and I'll be back with the results. Thank you so much for your help. I let you know by Friday about the outcome. read you later:-) Stephan

Re: Cardreader behavior

*Message #8 Posted by **Stephan (CH)** on 7 Nov 2003, 3:14 a.m.,*
in response to message #6 by Victor Koechli

Good morning Victor. I have done the procedures you suggested. Here the results: The card reader seems to write. It showed "card err" with a blank card. Taken the blank card, it showed "type S track 1" and "type S track 2" for the WSTS procedure. Overwriting the card now with my program,

it showed "type P track 1", but didn't reload it to the calculator. I do not know, if there must be a special procedure or some flags has to be set for a program to write? But as I gathered from the manual (yes, I do read them not only for calculators) the only thing I have to do is to set the calc to the program in question and switch to program mode. Now sliding the card through should do the trick. It looks to my that my program causes the problem. But then why does the correct type and tracks show up on the display? If you have a clue or maybe another "thinking approach" to this let me know. Thanks again very much in advance. Stephan

Re: Cardreader behavior

*Message #9 Posted by **Victor Koechli** on 8 Nov 2003, 5:36 a.m.,*
in response to message #8 by Stephan (CH)

Hmmm... this is getting stranger and stranger. Is it the same with any program you want to write to card, or just a particular one?

And, of course, to read the program back in, you switch to RUN mode (*NOT* PRGM)....

If this all fails, write a short program to card and send the card to me, I'll check it with my own card reader. Then we'll know if there's something on it or not. I live in Switzeland too, so that would be easy... I'll send you my address via email.

Maybe someone else in this forum has an idea what the problem could be?

Cheers, Victor

HP42 Malfunction

*Message #1 Posted by **Paul W** on 3 Nov 2003, 2:50 a.m.*

would anyone have any ideas concerning a work mates HP42 which is playing up.

a brief history of his troubles follows;

HP42 batteries went flat causing it to crash. new batteries were inserted, without causing the loss of program memory. The calculator now inserts a series of zeros (about 6 or 7) before any other number which has been typed usually leaving only enough space for a single digit. He hasn't tried any of the self testing procedures (he will when he finds his manual) nor has he tried the resetting procedures yet (but he will)

any thoughts or ideas would be welcomed.

regards Paul W

Re: HP42 Malfunction

*Message #2 Posted by **Raymond Del Tondo** on 3 Nov 2003, 5:40 a.m.,*
in response to message #1 by Paul W

Hello,

the first thing to do is a reset (ON+C). No fear, it works non-destructive.

Regards,

Raymond

Re: HP42 Malfunction

*Message #3 Posted by **Paul W** on 5 Nov 2003, 1:27 a.m.,*
in response to message #2 by Raymond Del Tondo

yes that worked Raymond thankyou for your help.

i no longer have a hp42 but i used to and i found them one of the best machines (almost better then the hp41 series)

regards Paul

Re: HP42 Malfunction

*Message #4 Posted by **TD** on 9 Nov 2003, 1:39 p.m.,*
in response to message #3 by Paul W

Why is a hp42 better than a hp41 ?

Re: HP42 Malfunction

*Message #5 Posted by **Veli-Pekka Nousiainen** on 14 Nov 2003, 6:13 a.m.,*
in response to message #4 by TD

42S + mostly compatible with 41C + both registers and named variables A..Z + buil-in applications + more memory + more speed + less weight & size + IR print - no I/O - no expansion ports - cumbersome ALPHA

HP 15c

*Message #1 Posted by **sb** on 3 Nov 2003, 12:38 a.m.*

I need the owner's manual of HP 15C (French or English): in pdf format if possible.

Thank you / Merci

Buy the Museum's CDs or DVD

*Message #2 Posted by **Patrick** on 3 Nov 2003, 1:21 a.m.,*
in response to message #1 by sb

This Museum sells manuals on CD or DVD. They are scanned copies of the originals in PDF format. This is not exactly like a true PDF document in that you can't search for specific text, but they are inexpensive and help to support our esteemed Curator!

Your only other alternative, AFAIK, is to buy a manual off of eBay. They are often available and go for around $30.

Business as usual at HP ?

*Message #1 Posted by **DanO** on 2 Nov 2003, 10:21 p.m.*

'Stevens v. HP' is an unfair business practices consumer class action filed in state court in Riverside County, California on or about July 31, 2000. Consumer class action lawsuits have been filed, in coordination with the original plaintiffs, in 32 additional states. The various plaintiffs throughout the country claim to have purchased different models of HP inkjet printers over the past four years. The basic factual allegation of these actions is that when the affected consumer purchased HP printers they received half-full or "economy" ink cartridges instead of full cartridges. Plaintiffs claim that HP's advertising, packaging and marketing representations for the printers led the consumers to believe they would receive full cartridges. These actions seek injunctive relief, disgorgement of profits, compensatory damages, punitive damages and attorneys' fees under various state unfair business practices statutes and common law claims of fruad and negligent misrepresentation.

[Text is from page 119 of the HP 2002 annual report to shareholders]

<<HP does not appear to deny the claim that it engages in this practice. Instead, HP seems to be arguing that it is not liable because it never promised to provide full ink-cartridges with each new inkjet printer.>>

Re: Business as usual at HP ?

*Message #2 Posted by **Clive Marner** on 3 Nov 2003, 7:08 a.m.,*
in response to message #1 by DanO

In the setting up instructions for my new Epson C64 printer it states that ink is used during the pass-off procedure for each printer & that the first time the consumer uses the printer extra ink is used to prime the printer heads, thus the consumer should not expect to get a full cartridge life from those supplied with the printer.

Now that's a good angle!

Re: Business as usual at HP ?

*Message #3 Posted by **Juan J** on 3 Nov 2003, 10:43 a.m.,*
in response to message #2 by Clive Marner

Shouldn't we call it a very ellegant form of "cover your ass by finding a nonsensical scapegoat?"

Re: Business as usual at HP ?

*Message #4 Posted by **unspellable** on 3 Nov 2003, 1:22 p.m.,*
in response to message #1 by DanO

I find this all too believable. For some time it has been my claim the manufacturer sells a printer at a loss in order to have a more or less captive market for the cartridges. If the cartridge that came with the printer is half full, then the profits start that much sooner. In some case a full set of cartridges will cost more than half the prinetr price.

This applies to the printer market generally, not just HP.

Re: Business as usual at HP ?

*Message #5 Posted by **Barltleby** on 3 Nov 2003, 4:36 p.m.,*
in response to message #4 by unspellable

I find that as the clark for a small law office, it is actually more efficient in total cost to use the computer only for doing number tasks, especially accounting. But rather than printing, I use a broad-nibbed pen and India ink to prepare documents--even copying the numbers off of the screen. (The computer is very helpful even without printing--its ability to compute large sums, leaving the inputs available for checking, is simply a marvel.)

This has saved us thousands of pounds each year in ink costs. Before we went to this method, we were spending £700 on ink-jet cartridges per ream of paper. And, at least three-quarters of that money was wasted on "check-prints." The cost of the india ink is, by comparison, cheap--only about £15 per ream of paper. And as you know, solicitors like to write reams!

Cheers,

Bartleby

Re: Business as usual at HP ?

*Message #6 Posted by **Jim L** on 3 Nov 2003, 4:55 p.m.,*
in response to message #4 by unspellable

I thought this was "the common wisdom". If you intend to use a printer a lot, you get a laser printer - preferably a workgroup model if you REALLY want to get the cost per page down.

Ink jet printers are just disposable razors. It's the blades that they're selling.

My first printer cost $3000 (back in the 70s when you could get a nice new car for the same price) and ribbons cost $15. But then even that $15 ribbon was around the price of a modern low end ink jet printer once you allow for inflation!

I recently bought a halogen lamp that included a no-name 100w bulb that emitted about half the light of other 50w halogen bulbs that I already had. I thought something was wrong with the lamp itself but a replacement bulb fixed it. But then they just said it included a bulb. They didn't say it was a good one :-)

Re: Business as usual at HP ?

*Message #7 Posted by **Joshua Belsky** on 4 Nov 2003, 3:40 p.m.,*
in response to message #4 by unspellable

This is why I tell people to buy Canon ink-jet printers. The ink costs $7 if you buy the authentic canon product, or you can buy the no-name brand for $5. HP, Epson, Lexmark and the others all play the buy-the-razor-buy-the-blade game, but Canon doesn't. Hence, they get my business!

What will 33s have that 32sii doesn't??

*Message #1 Posted by **Justin T.** on 2 Nov 2003, 6:55 p.m.*

Besides a 2 line display and a modified keyboard, what will the new 33s offer that the existing 32sii doesn't have?

Re: What will 33s have that 32sii doesn't??

*Message #2 Posted by **Ben Salinas** on 2 Nov 2003, 7:37 p.m.,*
in response to message #1 by Justin T.

The 33s will have more memory (much more... some say as much as 32 kilobytes, although this is probably 32 kilobits, either way, it is much much much more than the 384 bytes of the 32sii)

It also offers the use of Algebraic mode (which is an advantage to some... I guess)

The 33s has more keys, and thus, less menus. According to the Datasheet (from hpcalc.org), it will have more advanced statistical functions (such as logarithmic and exponential)

It will not have Gradians mode (who uses that anyway)

It will have Integer division, a different random number generator (generates a random number between x and y) Finally, it will have 40 physics constants (but i believe that number includes the unit conversions and stuff)

I am also guessing (this is only a guess) that it will have a faster processor. I am speculating that this is the case only because of the trend in the other new releases (all of which use a non-Saturn processor)

Other than that, the only difference is that you can buy it for less than 180 bucks. -Ben

Re: What will 33s have that 32sii doesn't??

*Message #3 Posted by **Dave** on 2 Nov 2003, 11:28 p.m.,*
in response to message #2 by Ben Salinas

it will have a lousy keyboard....

Re: What will 33s have that 32sii doesn't??

*Message #4 Posted by **Norm** on 3 Nov 2003, 12:47 a.m.,*
in response to message #3 by Dave

33S has a keyboard shaped like a cowcatcher.

32Sii did not have that feature.

Spend your money accordingly.

Can't we see the positives for once ?

*Message #5 Posted by **Thibaut** on 3 Nov 2003, 3:52 a.m.,*
in response to message #3 by Dave

... 2 years ago we were here all flaming HP for abanondonning RPN.

The 33S, at least on datasheet and OK, apart from its keyboard, widely answers our wishes, and at a bargain price comapred to the current market.

Can't we say "HP, OK, you're on the right track with this one, go ahead..." instead of shouting at them ?

Re: Can't we see the positives for once ?

*Message #6 Posted by **Patrick R** on 3 Nov 2003, 6:31 a.m.,*
in response to message #5 by Thibaut

" Can't we say "HP, OK, you're on the right track with this one, go ahead..." instead of shouting at them ? "

Better: " COMPAQ, OK, you're on the right track with this one, go ahead... "

HP died some time ago.

Re: Can't we see the positives for once ?

*Message #7 Posted by **Ernie Malaga** on 3 Nov 2003, 10:15 a.m.,*
in response to message #5 by Thibaut

Thibaut:

Griping the way we do, we raise red flags on design flaws, bugs, and low quality -- problems that might otherwise go unnoticed. Of course then it's up to HP to listen and do something about it. Messrs. Hewlett and Packard would've listened (maybe even recalled the flawed products). Ms. Fiorina... well, do I have to spell it out?

So, yes, let's gripe all we can. Some of it may come to HP's attention.

It's no secret that quality has gone down to unheard-of depths. There are many HP-35s out there that still work after 31 years of use. How long will a 49G+ endure?

My 2 cents.

-Ernie

No grousing, Thibaut

*Message #8 Posted by **NH** on 3 Nov 2003, 5:37 p.m.,*
in response to message #7 by Ernie Malaga

There is no grousing ("shouting" etc) from us, Thibaut.

Note that a question was asked (difference between 33S and 32Sii).....

Myself and others are replying to the question.

If the information is factual, its not grousing.
I, for example, have noted that the keyboard is
shaped like a cowcatcher. This is neither shouting
nor grousing. It is just a factual truth.

While I am not familiar with the 33S, (I like 32Sii however)
tentatively, it also does not offer "RPN"
with a stack and "Enter" button. This is also just
more factual information, take it how you will and spend your money accordingly.

Re: Can't we see the positives for once ?

*Message #9 Posted by **Arnaud Amiel** on 4 Nov 2003, 3:32 a.m.,*
in response to message #5 by Thibaut

At work I have to use a 20s so I can lend it to my colleagues. I would rather use a 32s to have RPN. With the 33, it seems that I got the perfect solution.

Arnaud

Re: Can't we see the positives for once ?

*Message #10 Posted by **bill platt** on 4 Nov 2003, 10:08 a.m.,*
in response to message #9 by Arnaud Amiel

Why do you HAVE to lend your calculator? Just curious. (I keep a couple 20s's around to lend out, too...but use my 32 most of the time).

Re: no gradians!

*Message #12 Posted by **Valentin Albillo** on 3 Nov 2003, 11:31 a.m.,*
in response to message #11 by hugh

It's an old European geodetic-surveying thing, more specifically French:

```
  French Geodetic System

  The French equivalent of the Ordnance Survey, the Institut
  Géographique National (IGN), produces 1:50,000 and
  1:25,000 sheets using a Lambert Conformal Conic Projection
  based on the Clarke Ellipsoid 1880. The sheet boundaries
  are cast on lines of latitude and longitude using the
  French Geodetic System, which traditionally employs the
  Meridian of Paris (approx. 2°20'E) rather than Greenwich,
  and expresses angular measurements in gradians rather
                                          ^^^^^^^^
  than degrees (400grad = 360°).
```

```
A typical older 1:25,000 sheet (e.g. Institut Géographique
National, 1969) covers a quadrant 0.20 by 0.10 gradians
                                                ^^^^^^^^
and is labelled only in gradians.
                      ^^^^^^^^^
```

Best regards from V.

Re: no gradians!

*Message #13 Posted by **CME750** on 3 Nov 2003, 12:43 p.m.,*
in response to message #11 by hugh

The normal US term is "grads", not "gradians". I don't think that anyone in the US actually works with them.

Nonetheless, scientific calculators have traditionally included a grad option. It would be surprising if grads were lacking on the 33S, and I would be curious to know the source of this rumor.

The most detailed 33S specifications that I have seen, at http://www.hpcalc.org/images/datasheet33s.pdf, indicate that DEG, RAD, GRAD modes will be included. Furthermore, available images of the 33S, such as that at http://www.hpcalc.org/hp49gplus.php, show a GRAD annunciator at the top of the display.

The US military uses "mils", where 360 degrees = 6400 mils. Thus, one mil is approximately (but not exactly) equal to 1 milliradian.

Re: no gradians!

*Message #14 Posted by **James M. Prange** on 3 Nov 2003, 1:56 p.m.,*
in response to message #13 by CME750

> Quote:
>
> The US military uses "mils", where 360 degrees = 6400 mils. Thus, one mil is approximately (but not exactly) equal to 1 milliradian.

Various definitions of the angular mil have been used, including that one of course.

Unless I'm badly mistaken, when I was in the U.S. Navy, we defined 1 mil as being exactly 1 milliradian. The last that I heard, the UK military also defined it this way.

The mil isn't used for measuring large angles, so it's irrelevant whether you can define a full circle or right angle as an exact rational number of mils.

The purpose of the mil is for making (presumably small, in angular terms) corrections to gunfire. If your observer tells you that the projectile struck a certain number of units to the left or right of the target (from your own viewpoint of course), then you divide that number by the number of thousands of units of range to get the angular correction (in mils) to the bearing for the next shot(s).

This is for plain unguided gunfire, where no corrections to the path of the projectile after it's left the muzzle are possible; it's not for any type of guided or "smart" projectile. Given the uncertainties and lack of perfect repeatability in this situation, and that "missing" by a small distance may very well still destroy the target, it makes very little practical difference which definition of the mil is used.

Regards,
James

Re: no gradians! (My Mistake)

*Message #15 Posted by **Ben Salinas** on 3 Nov 2003, 8:01 p.m.,*
in response to message #13 by CME750

Sorry about that, I must have looked over that in the PDF datasheet when I posted last night. Indeed, it does say that there will be gradians also (or grads if you so prefer)

Sorry about that -Ben

Re: no gradians!

*Message #16 Posted by **unspellable** on 3 Nov 2003, 1:25 p.m.,*
in response to message #11 by hugh

How is it that so many calculators have grads but not mils? I'd have more use for angles in Mils. I have slide rules with the trig scales laid out in mils.

Re: no gradians!

*Message #17 Posted by **CME750** on 3 Nov 2003, 2:34 p.m.,*
in response to message #16 by unspellable

You can still get slide-rule type products for calculations in mils. They are marketed for snipers. For example:

http://www.ustacticalsupply.com/mildot-slope.shtml

http://www.snipercountry.com/InReviews/IOR_PocketMilRangefinder.htm

Never seen a comparable calculator product from any manufacturer. Perhaps there could be a market for an olive-drab HP-10C Tactical Edition.

Re: no gradians!

*Message #18 Posted by **Vassilis Prevelakis** on 3 Nov 2003, 6:25 p.m.,*
in response to message #17 by CME750

```
> Never seen a comparable calculator product from any

```

I've seen TI58C calculators used for these kind of ranging, although I would hardly associate the word "hardened" with these calculators.

(The TI58C was physically identical to the TI59, but it had a smaller memory. Unlike the TI59 the 58C's memory was non-volatile, hence the C designation).

Re: no gradians!

*Message #19 Posted by **James M. Prange** on 3 Nov 2003, 2:57 p.m.,*

in response to message #16 by unspellable

Which definition(s) of the angular mil should be used?

What need is there for it? The angular mil is intended for use by gunnery crews so that they can work out a reasonable approximation (say to the nearest whole mil, for example) of the spotting correction very quickly in their heads, not fool around with punching numbers into a calculator while they're involved in a live fire situation.

If anyone feels a need for such a unit in his calculator, it's easy enough to make a user-defined unit.

Of course it would have to be distinguished from the distance mil unit, defined as 1_mil=.001_in, and commonly used for thin coatings, films, and sheets. If you buy a package of plastic bags (in the U.S.A. at least) you'll probably see their thickness labeled in mils.

Regards,
James

Dead HP97

*Message #1 Posted by **Michael Schuetz** on 2 Nov 2003, 5:19 p.m.*

Got a defective HP97, thought it was the battery, but it works fine. When switching on, some '0' (not always the same) light up for some milliseconds, but then the display remains dark. (When shifting the printer head by hand, it returns to its initial position and when disconnecting the printer pcb, some '0' stay lit) Checked all contacts, and wanted to figure out whether the power supply circuit works and all ICs get their correct voltage, but without any documentation...

Is this a typical failure with simple solutions or has anyone some info e.g. required voltages or signals (clock generator) on special pins or info on the used ICs? (pcb is the same as on http://www.hpmuseum.org/97intern.jpg)

Michael

in response to message #3 by Michael Schuetz

Quote:

---

could someone please confirm, that this manual contains something more than simply "how to replace the battery", "cleaning the keys" or "removing paper from the printer feeder"...

Of course there's more than that. It also shows you how to turn it on and off. 8^)

Seriously, though, it contains diagrams galore, information to a level of detail that I don't really understand (my expertise in electronics is very limited). I believe it will help you get the 97 repaired or, at the very least, help you diagnose the problem.

The CD set (or DVD) is an incredible resource. You should get it ASAP.

-Ernie

No need for the ":-)".

*Message #5 Posted by **Mr. Fix It** on 3 Nov 2003, 11:04 a.m.,*
in response to message #3 by Michael Schuetz

> Quote:
>
> But could someone please confirm, that this manual contains something more than simply "how to replace the battery", "cleaning the keys" or "removing paper from the printer feeder"...

That would be in the users manual...

Honestly, you get pointed to the most valuable resource you'll even find to fix a 97 and all you can respond with is a flame about me putting a happy face on end of my message?

You asked for information, I gave you the source.

You're welcome, in spite of your comments.

BTW - make sure the battery is indeed good under load. A print head that doesn't return to the home position is either a dead battery or a locked up printer. It's common for the battery voltage under no load to measure good but it can't deliver much in the way of current, and 97's love their batteries...

Edited: 3 Nov 2003, 11:08 a.m.

Please excuse me, that is in no way what I wanted to express. I am not a native speaker of English, and what I wanted to say is that I got the hint that there is a way to support hpmuseum.org, what I really would like to, as it is a nice place to get information, contact, and quick help like your's.

> You're welcome, in spite of your comments.

In future I will be more sensitive.

Re: Dead HP97

*Message #8 Posted by **Katie** on 3 Nov 2003, 5:14 p.m.,*
in response to message #3 by Michael Schuetz

The 97 service manual on the CD set contains block diagrams, disassembly instructions, parts lists, test procedures and partial schematic diagrams, but not a complete schematic. It's quite useful however and should at least help you in determining what's not the problem.

Edited: 3 Nov 2003, 5:15 p.m.

Re: Dead HP97

*Message #9 Posted by **David Smith** on 5 Nov 2003, 3:51 p.m.,*
in response to message #8 by Katie

The HP97 service manual schematic is quite complete... it is just spread out over several sections.

Re: Dead HP97

*Message #10 Posted by **Katie** on 6 Nov 2003, 1:47 a.m.,*
in response to message #9 by David Smith

David,

I stand corrected. It is all there along with parts placement diagrams as well. Thanks for pointing that out!

Thanks for your information. I already ordered the DVD on tuesday, and as it is shipped on thursdays, I expect it to arrive next week.

Michael

Re: Dead HP97

*Message #12 Posted by **David Smith** on 3 Nov 2003, 12:44 p.m.,*
in response to message #1 by Michael Schuetz

The HP97 requires the printer circuit board to be installed... it contains the CPU clock generator. Also you need a GOOD battery installed. Also the printer needs to be operational (or at least have the head at the HOME position).

Re: Dead HP97

*Message #13 Posted by **Michael Schuetz** on 7 Nov 2003, 5:46 a.m.,*
in response to message #12 by David Smith

The print head returns to its home position on its own, when shifted by hand, so I suppose the battery delivers enough current.

>it contains the CPU clock generator

So if the LEDs stay lit without and become dark with the printer pcb, that could mean that the CPU starts its reset-routine but gets stuck somewhere (or that the printer pcb contains the power on reset circuit, which also clears the display buffers...)

As soon as the DVD arrives and if I get my oscilloscope fixed (another case...), I'll do some measurement on the voltage drop and the clock signals.

Michael

RPN - why 4 registers?

*Message #1 Posted by **adam** on 2 Nov 2003, 12:11 p.m.*

RPN newbie here.

Since the Z register is already available for a constant, why do I also need the T register? How do I use the 4th level in the stack?

Re: RPN - why 4 registers?

*Message #2 Posted by **bill platt** on 2 Nov 2003, 1:12 p.m.,*
in response to message #1 by adam

With only 3 levels (the earliest machines--pre-handheld) you really do not have enough levels to deal with pending operations without being very careful. 4 levels seems just about right for almost all the time--any more levels hand you cannot relly remember how many pending ops you have going!

Regarding the constant--the Z register does not make a constant---the T does---T duplicates itself any time the stack drops a level (after an arithmatic operation between x and y for instance). So, fo a constant, you "load the stacK" thus C <enter> <enther> <enter> puts the C in all 4 levels. now, any new value typed into X may be operated against the Constant. To operate a new item against the constant, simply type backspace or clx, to clear the last result, and type the new number to be operated on, and then operate on it. (Don't hit "swap" after clearing though, as that will enable the stack and you will have a "0" in y!)

Alternatively, you can use the LST x register to hold a constant--but then you have to do a "swap" (also called x><y) before operating--to preserve the constant ---or you can enter your first object to be operated on by the const, then type the constant, then operate, then type a new number, then lastx, then operate, and so on. In the latter case, your recent results will "scroll down" and fill the stack. You can then see the last results (rolling the stack does not alter the lastx contents).

So, depending on what you are doing, you have a variety of choices. They all make sense for different situations.

And of course you also have lots of registers, too!

Regards,

Bill

Sandbox ROM

*Message #1 Posted by **Poul** on 2 Nov 2003, 4:30 a.m.*

I found a ROM image called Sandbox ROM on the internet. Two questions: 1) is it possible to convert it from .bin format to .rom? 2) who/where/why/when was this ROM made?

chears /Poul

Re: Sandbox ROM

*Message #2 Posted by **Raymond Del Tondo** on 2 Nov 2003, 7:47 a.m.,*
in response to message #1 by Poul

Hi,

the only site where you could download he Sandbox has infos about the author, Angel Martin.

Raymond

Re: Sandbox ROM

*Message #3 Posted by **Poul** on 2 Nov 2003, 2:19 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks Raymond. I checked back after your response, and now the .rom file has been added in stead of the .bin format. But I would still like to know a little more about this SANDBOX project. Is it available as a module? I've never seen one on sale.

Chears /Poul

Re: Sandbox ROM

*Message #4 Posted by **Angel Martin** on 2 Nov 2003, 2:37 p.m.,*
in response to message #1 by Poul

Hi,

The SANDBOX is indeed now available on the web as a .rom and .bin files, and thus works on V41 and Emu41.

As per what it is, it started as a personal project to learn MCODE programming, using Ken Emery's book as main tool. It then grew until becoming a collection of (hopefully) handy utilities.

It contains many functions published many moons ago in magazines like PPC Journal, Data File, PRISMA and HPX. All were contributions from members, and thus freely shared. My contribution has been putting them together in a more-or-less logical format, besides modifying them enough to correct minor bugs and make them fit in the 4k space.

Its main sections are:

- Sandbox 3d (General utilities) - Alpha/Display functions - Math Functions - MLDL Tool kit.

There's also a couple of multi-function functions (a la HEPAX), a handy way to go around the 64-max function limit in the ROM FAT. For these, index=000 produces a catalog of the subfunctions.

It is of course an "open" ROM, and as such its source code is also published together with the ROM file and a short quick reference guide in pdf format.

Any comments and feedback for improvement is always appreciated.

Happy playing in the SandBox! Angel Martin

Re: Sandbox ROM

*Message #5 Posted by **Diego Diaz** on 2 Nov 2003, 11:12 p.m.,*
in response to message #1 by Poul

For now you can play with Angel's amazing SANDBOX in the V41 emulator... but this will change soon...

The Clonix 41 (a personal proyect) is fully operative now and will be ready to reach your 41's by Xmas.

It's a standard module size ROM, with room enough to hold five 41's pages, it's fully reprogrammable (PIC programmer needed) with the .ROM images files you like, every page in its flash ROM can be addressed to any free 4k block and supports banksitching too. Runs in Half and FullNuts, not in 2x units though.

You can merge your favourite modules to save physical ports for other peripherals/modules, and/or load your own programs and make them run into a *real* world HP-41.

To be continued...

Diego.

in response to message #5 by Diego Diaz

Diego, does this will be a hardware? Can you send me some pictures? Should this be a new Rambox? What are the advantages?

Matthias

Re: Sandbox ROM

*Message #7 Posted by **Diego Diaz** on 3 Nov 2003, 3:47 a.m.,*
in response to message #6 by Matthias

Hi all, Mathias,

I'll try to answer your question as well as provide some general info about the Clonix 41 module.

Now, when I've read my previous post I realizaed that it sounds like a commercial ad. Nothing to do with it.

So, I'm going to start telling some things my Clonix module cannot do: it has no RAM so it cannot emulate an HEPAX module or other such MLDL-like devices, you can programm the ROM code of this modules though, but the behavior is not as expected. The ROM contents of peripheral devices is also suitable to load but again you cannot espect it to work properly.

Yes it's a new piece of harware, namely a PIC microcontroller with Flash memory, it's the same idea that John Ioannidis proposed, my goal has been making it fit inside a standadr module housing, make it handle the three power status of the 41 (SLEEP, STAND BY and ON) thus drastically reducing the power requirements (by far the more dificult task of the proyect), modify the code to manage early machines (those that insert two negative pulses inside the SYNC), manage the four BANK-SWITCHING instructions, and built the hole thing in a way it can be reprogrammed trough the same connector.

Obviously the 41 cannot program flash eproms by its own means it must be made by a PIC programmer, but they a very common nowadays and fairly cheap ($10 - 15), also the required programming software is free at IC-Prog.com.

It uses the same .ROM image files than the well known V41 emulator, and can hold up to five pages.

Regarding the benefits, the most obvious benefit is reducing the port usage, if you want to plug for example Advantage + CCD + Ext I/O you'll end with a single port left; but with a cClonix module you can load this configuration and still have three free ports.

You'll also can keep those expensive ROM modules in a safe place while using ROM images of them without risk. Can also load your own programs: Angel's SandBox is the best example of that. And with a little bit of imagination can even built some "impossible" configurations, Advantage + HP-IL Dev.?? You only need to change one byte (the XROM) for one module to avoid the conflict in the programmer's editor and... voi-lá, (of course you'll need to re-code the previous written programs to match the new XROM number.)...

Ok, it's starting to sound commercial-like again, sorry.

I can send you pictures of this new child, anyhow there's not too much to see, it's a module with a label that identifies it as a Clonix 41.

I'm now trying to prepare an adequate manual to properly document the programming process.

And hope to have some units available about Xmas, they'll be very few due to the lack of the module shells needed for housing. And three of them are going to be sent to my contributors (they will become -by this way- into involuntaries Beta-testers... :-), the rest will of course run at eBay.

Cheers by now.

Re: Sandbox ROM

*Message #8 Posted by **Ángel Martin** on 3 Nov 2003, 7:43 a.m.,*
in response to message #7 by Diego Diaz

Diego's project is a super cool addition to the 41's world. It also removes the "tyranny of the Zeproms" (lastly seen on eBay for $250 apiece), as we will be able to fit even more stuff on Clonix's !

Watch out however for uncontrolled changes to XROM id's, sometimes it isn't all that simple: the xrom id# can indirectly be part of the code within the module. I know this because it happens in a couple of functions on the SANDBOX... call it risky programming, but it saved dozens of words,

and space is at a premium!

Best, ÁM.

does not work with 2x speed up

*Message #9 Posted by **Felix** on 3 Nov 2003, 8:04 a.m.,*
in response to message #8 by Ángel Martin

But there is a problem, it does not work with speed-tuned HP41! I do not know about Zeproms that you mentioned. Can they be used with 2xspeed up HP41's? I think all of you use speed-tuned HP41, it can be done so easily?

Re: does not work with 2x speed up

*Message #10 Posted by **Poul Kaarup** on 3 Nov 2003, 10:58 a.m.,*
in response to message #9 by Felix

Yes, the Zeproms runs on speed-up 41's. I made 3 PK-ROM images a long time ago (also inspired by Ken Emery's book). They were mostly in m-code, but a few programs were user-code. If I get the time to write some kind of manual, I might publish them. As everybody else I'm thrilled about the news of better/cheaper ways of making modules. I'd like to contribute, but I'm afraid I'm not much help there.

Poul Kaarup, Denmark

Re: Sandbox ROM

*Message #11 Posted by **Meindert Kuipers** on 3 Nov 2003, 5:43 a.m.,*
in response to message #5 by Diego Diaz

Let me add to the confusion:

I have done something similar to the Sandbox, it is called the ML ROM, but not available anywhere, I used it in an EPROM box only. May post it some day. It runs fine on V41.

I am working on the MLDL2000, which will hold SRAM as well. It will hold up to 63 ROM images in FLASH and 16 ROM images in SRAM and will talk to a PC using USB. The bad news is that it will NOT fit in a module housing, but requires the shell of a card reader. It will probably support the HEPAX module.

Meindert

Re: Sandbox ROM

*Message #12 Posted by **Felix** on 3 Nov 2003, 6:27 a.m.,*
in response to message #11 by Meindert Kuipers

Meindert, cool project - when will your MLDL be available for us freaks? Can we afford it, i.e. how much will it cost? Thanks!

Re: Sandbox ROM / Clonix

*Message #13 Posted by **Christoph Klug** on 3 Nov 2003, 8:24 a.m.,*
in response to message #12 by Felix

Dear Diego,

your Clonix plug in solution sounds absolutely interesting, a small alternative to the powerfull MLDL unit from Meindert. What we need today are replacement solutions for Zeprom, RAM-Box (W&W or Eramco)and HEPAX, because this exotic parts are hard to find and includes absolutely high prices. Therefore any new development (plug in module or card reader case) are absolutely wellcome to the HP41 world :-)

Please Diego, open a own tread for your Clonix project - do not mix this news with Sandbox.

What HP41 enthusiasts need beside hardware storage units like the systems above, are new HP41 plug in modules and ROM-image-files, programmed in USER code - or much better in MCode.

Therefore the actual work of Angel about his SANDBOX project is absolutely nice. Please Meindert present also your solution to the HP41 world. Furthermore we hope to get the modified CCD-Module solution from Reymond Del Torno in next time :-)

Angel, please contact me about "page 2 = W&W RAM-BOX operqting system" ???

Best wisesh from Germany - Christoph Klug

Re: Sandbox ROM

*Message #14 Posted by **Pavel Korensky** on 3 Nov 2003, 6:16 p.m.,*
in response to message #11 by Meindert Kuipers

It seems that there will be more than enough ROM emulators :-)

Today, I succesfully finished the simulation of my private ROMPACK emulator and I am starting to build the prototype.

My design will fit in cardreader, supports 62 4K ROMs (plus one special ROM), can coexist with original ROM modules, supports banking and draws very low current.

Maybe, there will be also an USB interface. :-)

There will be no SRAM, so the module works as a pure ROM emulator, not as MLDL.

Re: Sandbox ROM

*Message #15 Posted by **Angel Martin** on 4 Nov 2003, 1:53 a.m.,*
in response to message #14 by Pavel Korensky

Pavel, not more than enough! The more, the merrier... choice is a word long ago extinct in the 41 world, it won't be bad to get it back to our vocabulary!

Best, Angel Martin

hp 49g adapter

*Message #1 Posted by **steve** on 1 Nov 2003, 3:41 p.m.*

I bought a hp49g off ebay the adapter i got uses 4 pins but my hp 49g uses 10 could i get an adapter somewhere?

Re: hp 49g adapter

*Message #2 Posted by **James M. Prange** on 1 Nov 2003, 5:01 p.m.,*
in response to message #1 by steve

What you need is a 49G cable. The adapter is for connecting to a 48 series calculator. See http://holyjoe.net/hp/cable.htm for more information on cables and adapters. See http://www.calcpro.com/ or http://www.hpcalculators.com/ for the cable.

Re: hp 49g adapter

*Message #3 Posted by **James M. Prange** on 1 Nov 2003, 8:23 p.m.,*
in response to message #1 by steve

PS:

If you visit http://www.hpcalc.org/ and search for "cable", I expect that you'll find information on how to make your own.

Regards,
James

Re: hp 49g adapter

*Message #4 Posted by **Francesc Casanellas** on 2 Nov 2003, 3:38 a.m.,*
in response to message #1 by steve

The HP49G serial cable has plug-in adapters for compatibility with the HP48 series. It is delivered with the 4 pin HP48 adapter on.

If you pull the end of the 4 pin connector you will get the 2x5 pin adapter for the 49 series.

If you pull the RS232 connector, another 2x5 pin connector appears: this allows to conect an HP48 to an HP49.

Edited: 3 Nov 2003, 2:21 a.m. after one or more responses were posted

Re: hp 49g adapter

*Message #5 Posted by **James M. Prange** on 2 Nov 2003, 4:29 p.m.,*
in response to message #4 by Francesc Casanellas

I hadn't considered the possibility that perhaps Steve hadn't removed an adapter from the cable.

The 48 series (the "old" ones) uses a 4-pin connector for RS-232, and you can also connect an overhead projector display unit by plugging it into one of the expansion slots.

But the 49G doesn't have expansion slots; it uses a 10-pin connector for both the RS-232 I/O and the display unit.

Note that you can physically connect a cable made for HP palmtops to the 49G, but don't try it; the display goes dark immediately and it may well fry components in the 49G. Perhaps even more dangerous on 49Gs with serial numbers starting with ID93 or lower; they had mistakes in the I/O circuitry.

The earlier 49Gs came with a cable having a 10-pin connector on both ends for connecting two 49Gs to each other, plus a 10-pin to 4-pin adapter so you can connect a 49G to a 48 series calculator using the same cable. If you asked for the "ROM update kit" or purchased a "connectivity kit", you also got a 10-pin to DB-9 cable in the kit.

Later 49Gs added a 10-pin to DB-9 adapter in the package, so with that, you can use the same cable to connect two 49Gs to each other, or with one adapter connect to a 48 series, or with the other to any RS-232 device that uses a DB-9 connector.

If you happen to have two of the 10-pin to 4-pin adapters, the calc-to-calc cable also works fine for connecting two 48 series calculators to each other.

Regards,
James

What's the most reliable, best built HP Calc in the last 25 years?

*Message #1 Posted by **Brian S** on 1 Nov 2003, 7:22 a.m.*

I was wondering what the best built, most reliable HP calculator has been over the last 25 years? Looking to add a backup and wanted to get the best. Any HP calculator will suit my needs, as long as it has RPN. Expandibility and memory are not a concern. Number one priority is getting something that will last a long long time.

And the winner is...

*Message #2 Posted by **Randy Sloyer** on 1 Nov 2003, 8:35 a.m.,*
in response to message #1 by Brian S

A voyager. 10/11/12/15/16C

Although the newer 12C's must be excluded from the list.

Re: And the winner is...

*Message #3 Posted by **Larry M.** on 1 Nov 2003, 9:28 a.m.,*
in response to message #2 by Randy Sloyer

Agreed. Almost all of the old LED models were quite reliable. However, they all used rechargeable batteries, and some have suffered outgassing and subsequent corrosion damage after all these years. Additionally, these calculators contain a relatively high number of discrete components. Some of the components, such as capacitors, start going bad after a while.

The Pioneer series (HP-32SII, HP-42S, and others) do not have such problems, although their keyboard construction is not as robust as on earlier models.

Definitely the Voyagers.

Larry M.

Re: What's the most reliable, best built HP Calc in the last 25 years?

*Message #4 Posted by **Namir Shammas** on 1 Nov 2003, 12:35 p.m.,*
in response to message #1 by Brian S

Interesting to notice almost a role reversal between HP and TI. HP made expensive and reliable calculators, while TI made inexpensive calculators that don't seem to be working today.

Today TI makes calculators that are more robust and powerful .... AND owns the market. HP has taken second place.

Oh well .... life IS strange!

Namir

in response to message #7 by Mike

Hello Mike,

If nobody responds to your TI "Junk" comment - I have to...

I received yesterday from TI the 2004 model of the TI-89 for my www.datamath.org museum. Please believe - it is a real cutie ! The colour of the housing is now dark blue instead the black plastics and the display bezel changed to silvertrim. The whole calculator is a reminiscence of the wonderful SR-50. You remember the SR-50 ? It was TI's answer to the HP-35 and IMHO the best engineered TI calculator ever (but still a half class behind the HP-35).

Don't miss the new TI-89...

Regards, Joerg

Re: What's the most reliable, best built HP Calc in the last 25 years?

*Message #9 Posted by **David Smith** on 1 Nov 2003, 6:43 p.m.,*
in response to message #1 by Brian S

Mayby you should not be as concerned with basic reliability, but with long term maintainability. Although the Voyager series are very reliable, they tend not to be very repairable if they ever do break.

I would probably choose the HP67. It is a very reliable machine to start with (once you replace the card reader

drive roller). It shares many components with other woodstock series machines. Pick up an extra charger or two along the way. The connection in the plug tends to break.

Any USA-made Voyager: 10C-11C-12C-15C-16C

Re: What's the most reliable, best built HP Calc in the last 25 years?

*Message #13 Posted by **John W** on 1 Nov 2003, 9:39 p.m.,*
in response to message #1 by Brian S

So, it sounds like a majority of the people who responded think that the 10c-16c series of calculators is the safest bet for having a reliable calculator well into the future? More reliable than the 32s, 32sii or 42s calculators? How about the 41 series? The 41's seem to have had trouble with the battery's. Too bad.

Re: What's the most reliable, best built HP Calc in the last 25 years?

*Message #14 Posted by **Valentin Albillo** on 1 Nov 2003, 11:42 p.m.,*
in response to message #13 by John W

John posted:

"So, it sounds like a majority of the people who responded think that the 10c-16c series of calculators is the safest bet for having a reliable calculator well into the future?

Definitely. But they *must* be USA-made models, for maximum reliability and better durability. Ones made in other countries (such as Brazil) aren't as sturdy or well-built, many of them having the key letterings painted over molded keys of other models, and thus prone to erasure given enough time and use, let alone China-made HP-12C's which are abysmal quality, specially the keyboard.

"More reliable than the 32s, 32sii or 42s calculators?"

Certainly. Specially the 42S's display, which being a dot-matrix type has a lot more elements (pixels) than the simpler, segmented LCD display of Voyager series, so it's more prone to eventual failures in the future.

"How about the 41 series?

Wonderful as they are from a functional point of view, they don't come even close in sturdiness and long-term reliability when compared to Voyagers.

Just to further emphasize my point, I've got some 12 or 14 Voyagers when I last counted, and you'd be well advised to get some as well, high prices notwithstanding. Else, you'll have to kiss RPN goodbye far earlier than me. You've been warned ... :-)

Best regards from V.

I'm no engineer but I had the impression that the Singapore made calculators, especially the 41 and pioneer series, were as solid as the US made... Am I wrong ?

Singapore vrs USA

No, not at all. In general, that is my opinion as well but it should be qualified. You where correct when mentioning the 41 and Pioneers as having been made in Singapore. I have never seen an 11C or 15C made in Singapore as those models were being discontinued as early Pioneer production shifted from the USA to Singapore. So, AFAIK, the 12C was the only Voyager made there. I see no difference in construction or quality with USA or Singapore 12C's. The same is true of the 41's and Pioneers. When the Pioneers moved to Malaysia - this marked the beginning of the decline in quality with the first appearance of painted keys. The Malaysian 12C's were only marginally better than today's Chinese paperweights, which is not a compliment.

I have repaired several Brazilian 11C's and see no difference in quality vrs USA models with the exception of the rubber feet being made of a thicker, different material.

*Message #17 Posted by **Nelson M. Sicuro (Brazil)** on 2 Nov 2003, 9:06 a.m.,*
in response to message #16 by Randy Sloyer

I agree that the brazilian Voyagers are very good indeed, regardless that I'm brazilian. I had a HP-15C build in 1983 here in Brazil that is identical of the USA version. My atcual 15C is brazilian also, as my 11C. The most recent ones doesn't have the extra rubber protective layer around the circuit board, but they are very good. The Pioneers are identical also, I have a 42S and a 32S made in Brazil that are the very same as others I saw made in Singapore or USA. Their components are all USA and Japan made and the keyboard legends are molded, not painted.

Regards,

Nelson

*Message #18 Posted by **Thibaut.be** on 2 Nov 2003, 11:13 a.m.,*
in response to message #16 by Randy Sloyer

Yes, forget about the 12C, that was built at several places.

I also never saw any voyager made outside the US.

But' I've got in my collection several "S" and "A" 41 C, CV and CX and I can't see a difference between them.

The same applies to 42S, 17BII, 32S and early 32SII, as weel as spice series : I've got in my hand 2 38C, 1 "S" and 1 "A" and I reaaly couldn't tell which one is betterly made...

BTW I have 2 "ID" 19BII and the qality seems pretty much alike my "S" 19BII.

I think that the quality difference was noticeable in the mid 90s production, where it was shifted to Malaysia and China...

Just a feeling, no certitude of course !

I have an American made 42S and I put it on a while back, nothing came on. I checked the voltage and it was a little over 2 volts. I changed the batteries, knowing I got to type back all these programs. When it powered up, to my amazement all programs were intact. This never happened to any of my other 42S, including 3 Singapore and 2 Indonesia made ones. Additionally you never hear any clicks when the buttons are pressed. Something all to common with the ID made ones.

A vote for the HP-25 -- battery leakage not withstanding

*Message #20 Posted by **Michael Meyer** on 2 Nov 2003, 10:14 p.m.,*
in response to message #1 by Brian S

I do think the HP-25 was one amazingly solid calculator. The main damage being from battery leakage and using without good battery connection. 25C's were electronically more fragile as well.

Otherwise, this baby can be blown through a snowblower, run over by cars, buried in snow, and many other horror stories I've read about... I always liked how it could be used as a football (something I HAVE done with a well-abused spare). I think the secret is the uni-body case and modular design which leaves no room for disconnection once assembled. I'll bet it can be physically abused more than any other model series.

And my spare 71b has survived many a fall unharmed (as I've fallen asleep playing games in the ... library...)

I can't disagree, however, that the Voyagers are the most surviving calculator overall. I just wouldn't want to try the above "tests" with one <grin>.

RTN2RPN Michael

in response to message #20 by Michael Meyer

Although the HP25 is one of my favorite machines (it got me an EE degreeee) it is probably the least reliable HP machine becuase of it's infamous power supply problems. It is electrically much more fragile than the HP21... the ACT chip and/or the RAM chip just love to die. My estimate that if you were given a box of a random selection 100 HP25 machines, over 50 would be bad. The same selection of HP21 machines would have 15-20 bad machines.

48 or 49 constants edit

*Message #1 Posted by **Ed Look** on 1 Nov 2003, 12:59 a.m.*

I see there are some nifty programs to edit units in both the HP-48G series and 49G series calculators. Are there any analogous programs around that would allow similar manipulation (edit, add, remove) of constants? Now, I'm not sure there is a library of constants in the 49G+, but I know there is in the 48G's. Sometimes, use of them saves a few seconds; but often this is negated by far as I have to convert them into units I need, making the list of constants less useful (yeah, I know the constants I normally need, but most often only to three, maybe five significant digits. If I need more, I have to recalculate it from scratch or convert the one preloaded in the 48. I'd like to permanently store my conversion in the same library or a nearby subdirectory. I don't suppose the rather marvelous Unitman can do this too, can it?

Removing rubber feet on 15c

*Message #1 Posted by **hpnoid** on 31 Oct 2003, 7:54 p.m.*

Hello, All:

I have a 15c which has a divide key that "pops". The unit also flexes and "creaks" slightly when applying light pressure at opposite corners, indicating that perhaps the two halves of the unit are not fastened tightly enough. I searched the archives and found a posting of someone who said that he fixed a problem similar to this by merely removing the rubber feet and tightening the four screws which hold the unit together.

My question is: How do I go about removing the rubber feet without damaging them and then reapply them after tightening the screws? Is it possible that the glue will still be sticky enough to reapply them?

Note: I did find an article that outlined the steps of opening Voyagers but did not go into specifics of dealing with the rubber feet.

Thanks!

Re: Removing rubber feet on 15c

*Message #2 Posted by **Katie** on 31 Oct 2003, 9:54 p.m.,*
in response to message #1 by hpnoid

The feet are attached using double sided tape (black in color). So just pull them off and then remove the tape that's either going to be left on the rubber foot or the calculator. Before reassembling them, clean the feet and the area on the calc where they go with isopropyl alcohol. The best tape to use when replacing them is carpet tape (available at hardware stores), it's very sticky and very thin (usually white in color).

Re: Removing rubber feet on 15c

*Message #3 Posted by **David Smith** on 1 Nov 2003, 12:47 p.m.,*
in response to message #2 by Katie

3M makes an outdoor carpet tape that is black in color, slightly textured, and VERY sticky. Best thing I have found for sticking down them footsies.

*Message #7 Posted by **Ed Look** on 8 Nov 2003, 10:35 p.m.,*
in response to message #6 by Norm

I am near a high school and I heard the cops dropped by and gave the kids a "talking to". Some of them went home and told their moms they weren't even going to step out the door (for fear of arrest! I love it!) So only some little kids trick-or-treated... all the others were probably home plotting parabolae on their TIs... or IM-ing on their HP PCs.

Re: What happened on Halloween?

*Message #8 Posted by **Norm** on 10 Nov 2003, 3:31 a.m.,*
in response to message #7 by Ed Look

Hmmmmmmm.....

you say the cops showed up, and threatened to bust all the teenagers, then they didn't trick or treat.

This means that you got very few of a certain type of trick or treater: the 6 foot tall teenagers with half-hearted costumes, carrying black garbage bags 3/4 filled with their candy.

Instead you got meticulously dressed 3' tall kindergartners, with a little tiny plastic pumpkin that holds about 10 pieces of candy at most .

This was a good situation, you got more leftover candy that you get to eat for yourself.

HP12C

*Message #1 Posted by **Vince** on 31 Oct 2003, 4:24 p.m.*

I've owned my HP12c for 15-20 years and no longer have a manual. I turned it on today and had the numbers appearing with a comma. If I put in more than 3 digits in, it begins to put periods in where I would expect to see a comma. Does anyone know how to get it back to a straight digitable format??

Re: HP12C

*Message #2 Posted by **Raymond Del Tondo** on 31 Oct 2003, 4:56 p.m.,*
in response to message #1 by Vince

This is easy:

To toggle between comma and period as decimal separator, just turn the 12C of, press_and_hold the period key (right to the zero key), press and release ON, then release the period key.

Raymond

Don't lose that calculator

*Message #3 Posted by **bill platt** on 2 Nov 2003, 11:38 a.m.,*
in response to message #1 by Vince

If you've had your 12c all that time--then it is a gem--probably US made. The new ones are made overseas and are very poor quality.

Aaaah...wistful thinking . . .

*Message #1 Posted by **Faithful HP User** on 30 Oct 2003, 10:45 p.m.*

Since wishful thinking won't get us anywhere...

I bought my 15C in 1984. It served me well through college, medical school, residency, etc. The original batteries died in 2001! It still works great.

I love my 15C. The bevel-edged keys with the blue, "g-shifted" labels, the solid feel, the obvious detail in the quality of the construction.

From all the comments I've seen about the new calculators, I think we've witnessed a bygone era...

I wonder why HP did away with the "f" and "g" shifted keys and introduced these "left" and "right" pointing arrows. I think it makes the face look needlessly cluttered.

I have a 48G at work. It's very nice but doesn't have that great "HP look" anymore. These new 33s/49g+, etc. look like TI/Casio/Sharp, etc.

Re: Aaaah...wistful thinking . . .

*Message #2 Posted by **rsenzer** on 2 Nov 2003, 9:17 p.m.,*
in response to message #1 by Faithful HP User

It is interesting that the battleship grey tones in the various olive and lavender color schemes that HP adopted recently for the HP-20S, HP-32SII, and the HP-48G's are similar to the color tones used in some of the old HP computer terminals of the late 70's and early 80's.

I believe that the marketing [or non-marketing] message reflected durability. That is, HP didn't waste money on aesthetics. These were solely meant to be technical devices of the highest caliber, like their scientific and instrumentation products.

This color scheme still reflects a lack of aesthetics, but it now seems synonymous with lack of quality.

Of course, this has nothing to do with "f" and "g". I'm sure this has been discussed before, but if you have difficulty distinguishing colors, the arrows might make more sense than the "f" and "g" [and "h"].

New Battery Technology Available

*Message #1 Posted by **Michael Meyer** on 30 Oct 2003, 9:18 p.m.*

Hi all! I am hoping this is of general interest to Forum members:

I just purchased Rayovac's new IC3 batteries-- 2000mah AA cells that charge in only 15 minutes! Each cell has its own charging control circuitry ("In Cell Charge Control... IC3).

Since they have to charge in the specific charger, I don't think it's going to change the way calculators charge, but I know we've talked batteries before, and the in-cell charging circuit has been mentioned here.

BTW, of all places, Walgreens has them on sale at $29 instead of $39, including the charger and 2 cells. Plus, you get a free 4 pack of batteries. The wall-wort is 14.5V at 4.5A!

Good for powering the cameras we use to photograph the calculators. (THERE. I knew there was a reason to mention them here....) Anyway, I think they're a real innovation, and a long way from NiMH technology of a decade ago!

RTN2RPN, Michael

Death of a Calculator

*Message #2 Posted by **Jim Chumbley** on 30 Oct 2003, 10:00 p.m.,*
in response to message #1 by Michael Meyer

I was using these I-C3 cells in my new HP-49g+ when it displayed its "low battery" warning. I was in the middle of formatting my 256MB SD card, so I continued, thinking I would change the cells as soon as I was finished. The display slowly began to dim, went dark, and the machine would never turn back on again. After trying every possible change of battery, including the keep-alive button cell, and every combination of key depression to turn it back on again, including the paper-clip reset hole/switch, and leaving it with no batteries for 36 hours, I gave up. So did Hewlett-Packard. The machine was exchanged for a new one, which lives only on the batteries recommended for it: disposable, Alkaline AA cells. These present 4.5 volts to the calculator, just as HP recommends. The I-C3 cells by Rayovac present only 3.6 volts. My recommendation: NEVER use rechargeable cells by any manufacturer, even the wonderful new I-C3 cells, in a voltage-sensitive application such as an HP-49g+. They are great for things like remote controls, children's toys, cameras (possibly--untested by me), and flash lights. Just please don't EVER put one into your new HP calculator. Thanks, Jim Chumbley

Re: Death of a Calculator

*Message #3 Posted by **Michael Meyer** on 30 Oct 2003, 11:25 p.m.,*
in response to message #2 by Jim Chumbley

Scary. Not good. I see that Rayovac also has the promise to "repair or replace any device damaged" by their batteries. What a hassle, though.

I know most older HP's used rechargeable cells that were lower voltage... in fact, many here on the Forum

have warned the opposite: don't use disposable batteries due to their HIGHER voltage. NiCd's also have 1.2v per cell. I haven't had any trouble doing this, but it makes sense that a higher voltage could put a failing chip over the edge.

You just can't win.

I suspect your failure was a fluke, but it makes sense to use disposable cells in the newer calcs. They should last a nice long time with the lower power requirements of modern circuits and LCD displays.

The rechargeables, especially NiMH, are notorious for a sudden dropoff of voltage, which doesn't allow much warning before they go dead.

The jury is far from out on these new cells. So far, in devices like toys, they've been awesome-- taking as little as a few minutes to "top off". I'm also hoping that the internal circuits allow for longer cell life without internal pressure build-up, leading to leakage. I also wonder if they cut off before becoming completely drained. Great for cell life, but bad for a device like your calculator.

Thanks for the warning, Jim. Again, I don't see much role for these in calculators, as once built into a standard HP pack, they'd charge at the slower rate anyway.

Michael

Re: Death of a Calculator--looks like others have died also

*Message #4 Posted by **Michael Meyer** on 30 Oct 2003, 11:28 p.m.,*
in response to message #3 by Michael Meyer

Reading down further, I see other posts about dead 49G's. Nothing about your advice changes, but it may not have been just from the batteries.

Just an observation.

Michael

Re: Death of a Calculator

*Message #5 Posted by **James M. Prange** on 31 Oct 2003, 6:01 a.m.,*
in response to message #2 by Jim Chumbley

I wouldn't blame the batteries, especially as the voltage was lower than would be typical of the alkaline AAA cells.

I think you had a genuinely defective 49g+. It seems that being defective wouldn't make it a "collectors' item though. :-(

Consider the 48SX, 48GX, and 49G. With fresh cells, they get about 4.8 volts, a bit over the nominal. As the batteries are used, the voltage drops, until somewhere around 3 volts (under load), you get the low battery warning, and if you're doing I/O, or writing to flash on the 49G, that will error out. Otherwise you can keep using the calculator for quite a long time. If you keep using it for too long, it will turn itself off and refuse to stay on until the batteries are replaced. Even then, as long as you replace the batteries reasonably soon, you'll find that it kept everything in memory just fine. I think that the only cases I've ever seen of these calculators being actually damaged from low batteries were because of battery leakage.

By the way, how long did it take to get the replacement? And did they send it right away, or did they wait until they received the defective item before sending it?

Regards,
James

Re: Death of a Calculator

*Message #6 Posted by **Jim Chumbley** on 31 Oct 2003, 9:05 p.m.,*
in response to message #5 by James M. Prange

I have been building semiconductors for 27 years. I didn't think the failure was caused by a high-voltage junction blow-out, just an internal logic lock where voltages were not high enough to signal a difference between logic 1 and logic 0. HP must have thought so too, since taking all the batteries out and letting it sit unmolested for at least 24 hours was the first thing they recommended to do.

Contacting HP was the funniest experience I've had in months. If you want to try using their telephone's expert system, call the area (800) number printed in the back of the -49g+'s manual. I was eventually able to speak with a real person who told me that, no, they couldn't swap machines with me and that I should go back to the retailer who sold it to me, as it was they who are responsible for swapping failures that occur in the first 30 days. I did, and the retailer sent out a new replacement the same day, which I received the next day.

Re: Death of a Calculator

*Message #7 Posted by **James M. Prange** on 31 Oct 2003, 9:20 p.m.,*
in response to message #6 by Jim Chumbley

Yes, I can see that a problem where something is "not 1" but "not 0" either due to low supply voltages could cause permanent damage. If that's what happened, it suggests to me that the low-battery shut-down doesn't work as well as in the previous calculators, and I suppose that the same problem may occur even with alkaline batteries.

Good to know about the replacement policy, thanks.

Regards,
James

HP-34C back cover swap ;-(

*Message #1 Posted by **Michel Beaulieu** on 30 Oct 2003, 7:37 p.m.*

I opened my 34C and my 37E and when reinstalling on the 2 calculators, i realize that i don't know which cover goes on wich calculator...

One cover has "Made in USA" and the other one has a serial number 2027s35507 "made in Singapore"... ... Same color, same size, same scratches ;-(...

Thanks Michel

Edited: 30 Oct 2003, 7:38 p.m.

Re: HP-34C back cover swap ;-(

*Message #2 Posted by **Karl Schneider** on 30 Oct 2003, 11:53 p.m.,*
in response to message #1 by Michel Beaulieu

All three of my 34C's, with serial numbers corresponding to 1980, 1981, and 1982 were made in Singapore. Yours is a 1980 model.

Re: HP-34C back cover swap ;-(

*Message #3 Posted by **Ed Look** on 31 Oct 2003, 1:24 a.m.,*
in response to message #1 by Michel Beaulieu

Michel, I have a 34C the back of which says it's made in USA and that the serial number starts with 19, which puts its manufacture year at 1979. What are the first two digits of the serial number on the made in USA half case? According to this museum's pages, the earliest sighted 37E serial number starts with 1850 whereas the earliest 34C starts with 1928. Hopefully, this can help you.

If not, ask again on this forum if anyone knows when the 34C and 37E respectively had shifted production from the US to Singapore.

HP-34C charger terminal

*Message #1 Posted by **Michel Beaulieu** on 30 Oct 2003, 7:27 p.m.*

I have a great HP-34C but i lost the charger. Brand new batteries in the calculator. Can someone give me some tips for "building" a homemade connector than can goes in the original femeale connector on the calculator.

What are the specs for the adaptor?

Thanks Michel

By the way, thanks for the peron who give the dental wire tip for removing the back shell on the 34C! It works easily and effortless!

Re: HP-34C charger terminal

*Message #2 Posted by **Katie** on 30 Oct 2003, 8:27 p.m.,*
in response to message #1 by Michel Beaulieu

It's 10VAC 1.8VA, but you can use any AC output charger with 8-10 volts output. The 82059 (the one used for the 91,92,97, 10, 19C, etc.) will work fine on the Spice calculators. However, coming up with a homemade plug for this is going to be very difficult. You're best bet (and certainly the safest thing to do) is to remove the batteries and charge them outside the calc.

Edited: 31 Oct 2003, 2:21 p.m.

in response to message #1 by Michel Beaulieu

Michel,

You will find plenty of such adapters on ebay. They won't sell for more than 20 bucks. I guess it's really worth purchasing one of these than trying out to build one...

My 2c worth

HP charger part number

*Message #4 Posted by **Michel Beaulieu** on 31 Oct 2003, 8:07 a.m.,*
in response to message #3 by Thibaut.be

Can you tell me the HP part number so i can fin on th eBay site you told me. I found some but it all for the HP-75/41 calculators...

You know what ? The Museum of HP Calculators is a GREAT site !

The HP-34C wizard speaks

*Message #6 Posted by **Norm** on 31 Oct 2003, 10:19 p.m.,*
in response to message #1 by Michel Beaulieu

Yeah definitely just find a working charger with plug.....

You should be able to bid less than $20 and win, you'll spend more than that trying to use bathtub caulking and paper clips to make your own.

Consider where you are really headed with all that..... is it really worth charging the thing up, with the short runtime of NiCad batteries?

OK, maybe you are using NiMH that would help.

The point is I just feed mine with "AA" Alkaline batteries, and put in more when it runs down. Then you don't need a charger, even though I have got one.

Internet programs for HP48/49/49+ calculators

*Message #1 Posted by **Yoann Désir** on 30 Oct 2003, 5:43 p.m.*

Hello, everyone !

I'm a long-used HP calculators developper, however I've just discovered this interesting forum.

I'd like to know what you think of surfing the internet using a HP48G/G+/GX or HP49G or even HP49G+ calculator. It is indeed possible thanks to hp->modem connection, or with ip-masquerading under linux, in that case the linux box acts as a relay between the HP calculator (49G+ for instance) and internet.

Then, we install a TCP/IP library, that handles the internet connection, called Usinagaz.

You can visit http://www.hp-sources.com/internetprime/english.html for more information (there are a web browser called Navigator, a mail client "Mail Prime", an IRC client, and some other tools).

Best regards,

Yoann Désir.

HP-12C stunt-scientific?

*Message #1 Posted by **Eric Lundgren** on 30 Oct 2003, 3:45 p.m.*

Hi all,

Since I can still find new 'gold' 12c's but need a scientific...and considering that sin/cos/tan plus inverses are a must for me, would anyone consider trying to make do with a 12c with trig approximators? Would it leave any room for a short program in addition?

I assume no one would recommend the platinum despite its greater memory, right? I am looking for the good old 15 years of service potential, and the 12c seems the only candidate aside from buying someone's off of ebay. (while being aware that I'd never know what environment it had been exposed to)

Thoughts? Eric

Its been done and in the articles section

*Message #2 Posted by **Ron Ross** on 30 Oct 2003, 4:12 p.m.,*
in response to message #1 by Eric Lundgren

The 12c is no better than the newer 12c platinum, since they both come from the same plant, unless you buy older merchandise. But then, why not buy the Hp 17BII. Much more ram and faster. If you can wait, the new Hp33s will be available in another month or so.

If I were pressed to buy an RPN scientific and $$$$ were an issue, I would buy a 48G. They are cheap ($40 or so, ebay), well made, and have all the functions (maybe to many). My only gripe is that it WONT fit in a pocket, like it should. The Hp28s series sells for a bit more and size wise, a bit less. But the battery door is a soft spot and the clamshell case isn't as tough as any other Hp calculator. It really needs a desk to be used properly.

Your best solution would be an Hp11c, as these are usually available and will give you a great all around calculator that will hold up better than any of the new Hp12c's you will find retail. Cost is usually less than $150 (and occasionally sell for about $100, far better buy than a 12c).

Re: HP-12C stunt-scientific?

*Message #3 Posted by **Katie** on 30 Oct 2003, 8:33 p.m.,*
in response to message #1 by Eric Lundgren

Victor wrote this program http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=225 that gives you all the trig functions and their inverses on a 12C. Very compact, with good accuracy but it does take up most of memory. On the 12C Platinum you'd have plenty of room for other programs.

Re: HP-12C stunt-scientific?

*Message #4 Posted by **Valentin Albillo** on 31 Oct 2003, 4:29 a.m.,*
in response to message #1 by Eric Lundgren

Eric posted:

"Since I can still find new 'gold' 12c's but need a scientific...and considering that sin/cos/tan plus inverses are a must for me, would anyone consider trying to make do with a 12c with trig approximators?"

Yes, certainly. Please have a look at this article published in Datafile, HP-12C Tried & Tricky Trigonometrics, where I discuss at length exactly the topic you're considering. The article enters into fine details about how to implement quality trigonometrics on the 12C (i.e: *fast, accurate, full range, and complete*, not run-of-the-mill, mediocrely programmed Taylor expansions) and includes a program which meets and exceeds said requirements, with plenty of interesting examples and performance tables.

"Would it leave any room for a short program in addition?"

It depends. For the classic HP-12C, the program uses all 99 steps to implement all 6 trigonometric functions (sin, cos, tan and their inverses), but if you don't need some of them, you can save some steps. On the other hand, the program will run in the 12C Platinum with a lot of room to spare, at least 124 extra steps before the GOTO bug creeps in. :-)

Best regards from V.

How do I check what version rom my 49g+ has?

*Message #1 Posted by **Samantha** on 30 Oct 2003, 2:56 p.m.*

I just received my new 49g+ and have been reading through all the manuals and no where can I find out how to check which version ROM the calculator came with. Can anyone please tell me how to check this? I am VERY FRUSTRATED and have given up after a good hour of looking this up. I'm assuming it's version 1.20 but I'd like to cehck. Thanks.

Re: How do I check what version rom my 49g+ has?

*Message #2 Posted by **r. d. bärtschiger.** on 30 Oct 2003, 3:13 p.m.,*
in response to message #1 by Samantha

In RPN mode type 'VERSION' then press 'ENTER'.

rdb.

Re: How do I check what version rom my 49g+ has?

*Message #3 Posted by **Ed Look** on 30 Oct 2003, 9:48 p.m.,*
in response to message #2 by r. d. bärtschiger.

It's a bit cumbersome, but there's a shifted function called "CAT" (I forget if it's left or right shift; it's not with me right now) and it has every command in it. If you scroll (backwards is faster) down toward the end, there's VERSION. Choose that and that'll do it. Or as rdb says, just type it in and ENTER.

Re: How do I check what version rom my 49g+ has?

*Message #4 Posted by **r. d. bärtschiger.** on 30 Oct 2003, 9:57 p.m.,*
in response to message #3 by Ed Look

An easier way to find a command in the catalog is to press alpha and then the first letter of the command you are looking for. In this case 'v'. Then down, or up, arrow.

rdb.

Re: How do I check what version rom my 49g+ has?

*Message #5 Posted by **Juergen Rodenkirchen (GER)** on 31 Oct 2003, 5:00 a.m.,*
in response to message #4 by r. d. bärtschiger.

... you may even alpha-lock and type more than just the very first letter in order to be led "nearer" to the command you're searching for! But don't forget to go out of alpha-mode before pressing the OK-key :-)

Juergen

Re: How do I check what version rom my 49g+ has?

*Message #6 Posted by **Ed Look** on 31 Oct 2003, 8:39 a.m.,*
in response to message #5 by Juergen Rodenkirchen (GER)

I ALWAYS forget! I am so used to operating the simpler programmable scientifics, in which I normally use the alphabetical letters as program labels or storage register designators (which does not require hitting an "ALPHA" key) that on the HP-48 or 49 series calculators, I usually waste a couple of seconds or keystrokes deleting the unexpected letter when I meant simply "ENTER" and forgot to turn "ALPHA" off.

How the FETCH S&X instruction really works ?

*Message #1 Posted by **Pavel Korensky** on 30 Oct 2003, 11:54 a.m.*

Hello,

anyone knows, how the instruction FETCH S&X (hex 330) in HP-41 ?

I know that this instruction fetch the word in system memory, at address specified in C[6:3] to C[2:0].

But what is the actual timing of this instruction ? Let's say that in cycle 0, the HP-41 fetch this instruction from ROM (address is on ISA and ROM send the 0x330 instruction at the end of cycle also on ISA).

During the next cycle 1, the HP outputs C (with address in C[6:3]). I suppose that the mechanism is similar to WRITE S&X (hex 040) instruction, which write to MLDL.

But where and when is the peripheral unit supposed to put the word from system memory ? On ISA at the end of this cycle 1 ?

I tried to study all manuals and materials which I have, but I was not able to find any informations about this.

Re: How the FETCH S&X instruction really works ?

*Message #2 Posted by **Monte Dalrymple** on 30 Oct 2003, 1:00 p.m.,*
in response to message #1 by Pavel Korensky

I haven't put an oscilloscope on this but I am pretty sure that this is how it works:

It is a two word time instruction (obviously) that uses the second word time to access the ROM. The SYNC signal is suppressed during this second word time to prevent other devices on the bus from trying to decode the data (a 10-bit instruction) that is being fetched from ROM. The contents of C[6:3] are driven onto the ISA bus during the normal address time and the ROM returns the data at that location (again on the ISA bus) during the normal data time. At the end of this second cycle the fetched instruction is shifted into C[2:0]. I assume that the 10 bits are right-justified in C[2:0], but this assumption may or may not be correct. The timing should be such that the fetched instruction appears on the data line during the C[2:0] time.

HTH, Monte

Re: How the FETCH S&X instruction really works ?

*Message #3 Posted by **Pavel Korensky** on 30 Oct 2003, 1:31 p.m.,*
in response to message #2 by Monte Dalrymple

Are you sure about it ? The Write S&X instruction sends the address and data on DATA bus dirung second instruction cycle.

Re: How the FETCH S&X instruction really works ?

*Message #4 Posted by **Monte Dalrymple** on 30 Oct 2003, 1:47 p.m.,*
in response to message #3 by Pavel Korensky

Since the ROMs don't connect to the DATA line they can only transfer information over ISA... Remember that the Write S&X "instruction" is really just a NOP to the NUT CPU and it is only by convention that we say how external devices should interpret it.

Monte

Re: How the FETCH S&X instruction really works ?

*Message #5 Posted by **Meindert Kuipers** on 30 Oct 2003, 2:07 p.m.,*
in response to message #1 by Pavel Korensky

FETCH S&X is not seen from the point of view of the ROM being addressed. All it sees is the 16-bit address on ISA, and all it has to do is return the 10-bit data on ISA, if that particular ROM is being addressed. This means that the ROM does not have to use the DATA line.

Even the state of SYNC is more or less irrelevant for the ROM. The CPU will drive SYNC during reading of the 10-bit instruction if it is really an instruction to be executed. In all other cases, like FETCH S&X, but also the second word of an instruction in the GO and XQ, SYNC is not driven.

This is important when implementing the WRITE S&X, since you have to be certain that your device sees the instruction only of it is being executed, not when it is for example part of a block of data or the second word of a GO or XQ.

Meindert

Re: How the FETCH S&X instruction really works ?

*Message #6 Posted by **Pavel Korensky** on 30 Oct 2003, 2:22 p.m.,*
in response to message #5 by Meindert Kuipers

OK, I understand. It means, that if I want to read back the content of the descriptor table in my CPLD (I am talking about the design of my ROMPack), I need to issue FETCH S&X from some unused address in HP-41 address space (somewhere between 0x0000-0x7FFF), interpret the 0x330 instruction and in next cycle, I need to output descriptor content on ISA. Right ?

Re: How the FETCH S&X instruction really works ?

*Message #7 Posted by **Monte Dalrymple** on 30 Oct 2003, 2:30 p.m.,*
in response to message #6 by Pavel Korensky

Not just "some unused address"! It needs to be in a page that is not already physically present. Otherwise you will have bus contention on ISA and perhaps blow either or both devices. Page 4 is used for the Service ROM or disabled IL printer, Page 6 is the Printer ROM and Page 7 is the IL Control Functions. I would use one of these pages...

Monte

Re: How the FETCH S&X instruction really works ?

*Message #8 Posted by **Pavel Korensky** on 30 Oct 2003, 3:23 p.m.,*
in response to message #7 by Monte Dalrymple

Yes, I meant some address from this area. The take-over space between 0x4000-0x4FFF seems like

a good space. I have 8 descriptors in the table, so 0x4F00-0x4F07 looks good for decoding.

Re: How the FETCH S&X instruction really works ?

*Message #9 Posted by **Meindert Kuipers** on 31 Oct 2003, 3:00 a.m.,*
in response to message #6 by Pavel Korensky

Pavel,

You are almost right. Remember that you do not have to decode the $330 FETCH S&X instruction! The NUT processor does that for you. What your descriptor table needs to do is simply sit there and watch the address cycle on ISA, and return the data on ISA if there is a match in the address window. You suggestion to use page $4 is OK, just be careful not to use the lowest or highest addresses, otherwise the system might think that there is a service ROM connected.

Meindert

Re: How the FETCH S&X instruction really works ?

*Message #10 Posted by **Pavel Korensky** on 31 Oct 2003, 6:44 a.m.,*
in response to message #9 by Meindert Kuipers

Hello Meindert,

I need to decode the 0x330 instruction by my hardware, because the descriptor table is not a part of the normal HP address space.

Actually, it is not necessary to support descriptor read at all, but I want to have this feature for debugging purposes.

I will write you more by mail as soon as I will have my e-mail back. Currently, our mail server is packed in the box, because our company is moving.

Re: How the FETCH S&X instruction really works ?

*Message #11 Posted by **Meindert Kuipers** on 31 Oct 2003, 9:12 a.m.,*
in response to message #10 by Pavel Korensky

Looking forward to your email. There is really no need to decode FETCH S&X. I have looked at this in detail, and I am implementing this in my MLDL2000. Just remap the addressing to your descriptor table and that should work.

I was confused about this myself, but looked very closely at what exactly is happening. I use the Settings Registers to map a page in I/O space, and use that to remap to real-world I/O or access to FLASH and/or SRAM.

Meindert

Re: How the FETCH S&X instruction really works ?

*Message #12 Posted by **Pavel Korensky** on 31 Oct 2003, 6:32 p.m.,*
in response to message #11 by Meindert Kuipers

Hmmm, I tried to figure out how to do it without decoding FETCH S&X, but without success. Problem is, that I need to multiplex three different sets of descriptor addresses as an

address to descriptor table.

1. bits 12,13,14 of normal ISA address during normal ROM emulation or during cycle after ENBANKx instruction. 2. three bits from DATA latch 3. bits 0,1,2 of ISA address during second cycle of FETCH instruction. I am implementing the descriptor table read back as a fetch from addresses 0x4F00 - 0x4F07.

So, I implemented the FETCH S&X decoder and according to simulation (not yet complete), it seems that it works OK.

in response to message #2 by David Smith

David, please tell us more. Tell us everything you know. Thanks, Jim Chumbley

Re: Record for 'dead' 49G+

*Message #4 Posted by **Jim Chumbley** on 30 Oct 2003, 10:13 p.m.,*
in response to message #1 by Iqbal

My -49g+ died after being used from 10/8/2003 to 10/26/2003. This is 18 days. In the interest of scientific accuracy, we would have to know exactly the hours to failure. Mine went into service at 9:30 a.m., 10/8, and died at 7:00 p.m., 10/26. This totals 442.5 hours of life for my first -49g+. The clock is still running on my second one. I wonder how many hours your machine, Iqbal, ran to failure? Seriously, for only two sample points, these are amazingly tightly clustered for MTTF (mean time to failure) estimates for infant mortality failures of the -49g+. There is one other -49g+ that failed. We can ask Jerry how many hours his lived. However all these numbers work out, I claim the FIRST -49g+ failure. Regards, Jim Chumbley

HP 12C vs TI BA II plus

*Message #1 Posted by **Luc (Vietnam)** on 29 Oct 2003, 8:21 p.m.*

Hi every body

Yesterday, I bought a new financial calculator TI BA II

plus for taking CFA exam. Before, I also owned an HP 12C.

After doing some TVM (time value of money) exercises, I

realized that TI BA II plus was faster than HP 12C very

very much when solve for i (interest) and IRR. so, I

wonder why most of professional financial analyst like HP

12C than TI BA II plus ?

any comments?

thanks

Re: HP 12C vs TI BA II plus

*Message #2 Posted by **Jim L** on 29 Oct 2003, 8:46 p.m.,*
in response to message #1 by Luc (Vietnam)

Later HP business calculators such as the 17BII and 19BII are also many times faster than the old 12C. (15 times faster.)

But the 12C lives on and they're gone. I guess speed isn't everything.

Re: HP 12C vs TI BA II plus

*Message #3 Posted by **Gene** on 29 Oct 2003, 9:57 p.m.,*
in response to message #2 by Jim L

I'm a lecturer for a CFA exam review course. For a while, the video presentations I did on the time value of money using the BAII Plus and 12c were available for free viewing on the web.

The 12c was all there was for quite some time and so it developed quite a following.

Today, the BAII Plus has a great deal of additional functionality and speed that the 12c does not possess, you are correct.

The 12c (perhaps not the VERY recently made ones) feels much more solid...not cheap like the BAII Plus does.

The BAII Plus sells for $29.99, the 12c for $60-80.

I just wish HP made a $30 business calculator that:

1) USED operator precedence...1+2x3 = 7, not 9!!!!! 2) Had built-in trig functions 3) Had more statistics etc.

Gene

Re: HP 12C vs TI BA II plus

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 29 Oct 2003, 10:20 p.m.,*
in response to message #3 by Gene

The HP-12C has not operator precedence... is RPN!

1 (enter) 2 (enter) 3 * + results 7.

Are you talking about the other financial HP calculators (10B, 17B, 19B) that uses algebric entry??

Regards,

Nelson

Re: HP 12C vs TI BA II plus

*Message #5 Posted by **Gene** on 30 Oct 2003, 7:28 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Yes, quite correct. The 10B/10BII (which is HP's entry to compete with the BAII Plus) does not have it.

The 12C platinum, which is also algebraic, does not have parentheses OR precedence.

Really a mystery that one.

Re: HP 12C vs TI BA II plus

*Message #6 Posted by **Luc (vietnam)** on 29 Oct 2003, 10:22 p.m.,*
in response to message #3 by Gene

Hi Gene

What do you think about HP 10BII?

Re: HP 12C vs TI BA II plus

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 29 Oct 2003, 10:31 p.m.,*
in response to message #6 by Luc (vietnam)

I have both HP12C and HP10BII, I think that the 10BII is much faster and uses 12 digits against the 10 digits of the 12C but lacks the programability and the date functions. The 10BII hasn't operator precedente in its algebrical entry. I think that the 12C is better, but slower. And the durability is another story... My 12C is 22 years old, and works like a charm! I don't think that the 10BII will last half longer.

Re: HP 12C vs TI BA II plus

*Message #8 Posted by **Mike** on 30 Oct 2003, 12:04 a.m.,*
in response to message #3 by Gene

Gene

I know it's not made anymore but it sounds like the HP27S would fit your profile.

"1) USED operator precedence...1+2x3 = 7, not 9!!!!! 2) Had built-in trig functions 3) Had more statistics etc."

Regards Mike

Re: HP 12C vs TI BA II plus

*Message #9 Posted by **Gene** on 30 Oct 2003, 7:31 a.m.,*
in response to message #8 by Mike

What I'm saying is that to compare to the $30 BAII Plus, HP's only offering is the 10BII, which lacks a large number of functions the BAII Plus has.

I'd take my 19BII if I really wanted to do these things, but that's not in the $30 class.

If TI can make a business model for $30 with precedence, trig, etc., surely HP can do it.

The 10BII is not a competitor for the BAII Plus.

Re: HP 12C vs TI BA II plus

*Message #10 Posted by **Ron Ross** on 30 Oct 2003, 8:37 a.m.,*
in response to message #3 by Gene

Your number one issue about precidence HAS always bothered me with business calculators. But I suspect all business types to be a slow and dimwitted bunch and not even noticing this problem (Especially those DAMN MBA's!). Well, okay, you noticed it. 8o) And the Ti BA II also does this UNTIL you re-configure it also.

At least Hp always included parenthisis keys up until the Hp12c platinum (If you don't count the Hp10 printing calc).

I know you need recommendations for your books and classes so calculators like the 27s cannot be considered as someone here suggested. But it really was the 2nd best pocket calculator ever made, even without RPN (I have to exclude the 41c series with accessories to make this statement).

*Message #3 Posted by **Michel Beaulieu** on 29 Oct 2003, 10:02 p.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

Yes but i need to enter my code in my PC before. How to directly print bar code from my HP-41?

Re: HP-41 wand module code printing

*Message #4 Posted by **Massimo Gnerucci (Italy)** on 29 Oct 2003, 10:17 p.m.,*
in response to message #3 by Michel Beaulieu

For this to work I think you need the Plotter module.

Re: HP-41 wand module code printing

*Message #5 Posted by **Raymond Del Tondo** on 29 Oct 2003, 11:00 p.m.,*
in response to message #4 by Massimo Gnerucci (Italy)

You don't need the plotter module for barcode printing on the 82162A or 2225B IL printers. Only the XF module is needed if you want to print program barcodes, and of course the HP-IL module.

You can even print barcodes on an 82143A, but for this you'll have to modify it's hardware for half-line feed. There were articles about this topic in the PPC and CCD publications.

However, the plotter module has some very powerful functions to ease barcode creation, and if you're using an IL plotter, like the 7470A, you'll need it.

Raymond

Re: HP-41 wand module code printing

*Message #7 Posted by **Mark Hardman** on 29 Oct 2003, 10:22 p.m.,*
in response to message #3 by Michel Beaulieu

Our friend Gene has posted a variety of HP-41 programs for printing barcode on his web site. One requires the plotter module, another requires extended functions/memory, still another requires the IL DEV and CCD modules. All require synthetic.

http://www.rskey.org/gene/calcmuseum/41bc.htm

Re: HP-41 barcode plot with EMU41

*Message #8 Posted by **Christoph Klug** on 30 Oct 2003, 3:23 a.m.,*
in response to message #7 by Mark Hardman

Hi HP41 barcode enthusiasts :

Take EMU41 with virtual SKWIDINK module running on your PC. A Laser printer gives your best barcode plott quality. Programm upload from HP41 to EMU41 is possible with HP-IL/PC interface card.

From this system solution resulting much more advanced applications : Refer to HP-Museum articles forum item 311 "HP41-PC gateway & emulator"...

Best wishes from Germany - Christoph Klug

HP 12C w/o serial #?

*Message #1 Posted by **Sandinista** on 29 Oct 2003, 3:27 p.m.*

G'day fellas,

I was given a used 12C in mint conditions, with manual but no box. The calculator is made in China and, strangely enough, doesn't have a serial number. Is this normal on the Chinese batch or do I have a counterfeit?

Cheers, August

HP 22 - Batteries

*Message #1 Posted by **Peter S. Dworkis** on 29 Oct 2003, 2:36 p.m.*

Any help will be appreciated. I am looking for the mah rating for the HP 22. They appear to be the size of AA batteries and I would like to open the battery case and replace the batteries.

Thank you

Re: HP 22 - Batteries

*Message #2 Posted by **hugh** on 29 Oct 2003, 3:19 p.m.,*
in response to message #1 by Peter S. Dworkis

i found a better way to replace the pack batteries than cutting the side of the plastic. here:

http://www.voidware.com/calcs/woodstock_repairs.htm

this page is not finished. i'm still repairing the keyboard :-)

good luck.

Re: HP 22 - Batteries

*Message #3 Posted by **Randy** on 29 Oct 2003, 7:13 p.m.,*
in response to message #1 by Peter S. Dworkis

The original HP AA nicads were 700 mah. These are still made by Sanyo, see the pages here on batteries. You can sub 1100 mah nicads as well, just allow for 50% longer charging times.

You can of course use alkaline and lithium AA's - but under no circumstances should the charger be anywhere near the unit when you do this.

You can also use the super-extended capacity ni-mh rechargeables at 1850 mah - but you must recharge externally. This is really the best way to preserve your 21 or any woodstock as plugging in a unit with a dead or missing battery is the most common way to kill it.

Re: HP 22 - Batteries

*Message #4 Posted by **David Smith** on 30 Oct 2003, 1:30 p.m.,*
in response to message #3 by Randy

Although it is recommended that you always recharge a woodstock battery pack externally (to prevent possible overvoltage damage to the calculator electronics), NiMH cells recharge just fine in the machine... well as well as any NiCads. Since their capacity is three times as large as the originals, you need to charge them three times as long to get a full charge.

32E - three or four chips?

*Message #1 Posted by **Michael Meyer** on 29 Oct 2003, 2:19 p.m.*

Hi all!

I just got a 32E, as of now non-functional. It has 3 chips, with a blank between the smaller chips. Is that right for this model, or is it missing one?

Thanks! RTN2RPN, Michael

Re: 32E - three or four chips?

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 29 Oct 2003, 3:54 p.m.,*
in response to message #1 by Michael Meyer

I have a HP-32E also (solderless version), and it has 2 chips and a spare space. I think that are 2 roms and the cpu.

Good luck!

Nelson

Re: 32E - three or four chips?

*Message #3 Posted by **Michael Meyer** on 29 Oct 2003, 6:47 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Thanks Nelson!

This one has some corrosion on the battery ribbon cable. Seems to be an achille's heel of this series: corrosion breaks continuity at the junction of the exposed copper and the protective plastic top layer at the distal end. Most have been restored by simply splicing the cable (running new wires from the battery contacts to the proximal ribbon cable). (I don't know if engineers talk in those terms, but they work for anatomy)...

Take care, Michael

It works great!

*Message #4 Posted by **Michael Meyer** on 30 Oct 2003, 1:21 a.m.,*
in response to message #3 by Michael Meyer

Well, As usual, bypassing the ribbon cable worked fine, and the calculator looks and works like new. Not bad for $13. Thanks for you help!

34C weights

*Message #1 Posted by **james (UK)** on 29 Oct 2003, 8:39 a.m.*

Since my last queries on the 34C Calling Captain Zener I have been thinking about how to tell whether mine is a solderless one without finding a crowbar to lever the case halves apart - is weight a reliable indicator? The 34C specs in the Museum give the weight as between 6oz and 8oz with earlier models weighing about 1.5 oz more than later. Mine tops out at 6.5oz - is it safe to infer that mine is a later model and has soldered chips or do I need to have a couple of stiff drinks and go inside the machine?

Captain Zener to the Rescue...

*Message #2 Posted by **CAPTAIN ZENER** on 29 Oct 2003, 3:52 p.m.,*
in response to message #1 by james (UK)

Sorry to have missed your urgent cries for help, but even if you were on a speeding locomotive that just shot off a cliff, on October 17th, Captain Zener was preoccupied on the planet Krypton with this georgeous Hollywood gal wearing a tinfoil brazierre.

NOW THEN.....

Dear Captain Zener

1) The dreaded 2 disease - fortunately it seems to be OK with full blanking when calculating functions (eg the Gamma function) - is there any preventative maintenance that can/should be undertaken to try and keep it sound?

YES DONT TAKE IT APART!!!!!!! Here is the best plan to avoid "2 disease", based on our limited knowledge thus far ..... if it works properly, do not disassemble to the level where the chips fall out. YOu can, however, take it apart enough to lubricate the slide switches :o)

If it's a soldered unit, you really stand a good chance that it will keep on tickin' for the long haul.

If its a solderless unit, use it and enjoy it until the very first bit of obvious unreliability (display flickers, you get an "Error 9" etc etc). Then its like you have a kidney stone and you have to go to the hospital. And who knows if it will be fixed right or not.... you have to take a chance then. At that point you DO take it apart and you DO have the chips fall out onto your desktop. You have to clean all the contacts underneath all the chips, use a bit of lube-oil to help keep things bright & shiny, and then reassemble.

(that's the Luiz Viera plan, haven't heard from him in awhile).

THE PROBLEM is if you take it apart to the chip level, and try to clean each leg of each chip, your ESD (your polyester socks, the flourescent lamp whining overhead, etc) are going to induce "2 disease" into the prehistoric non-ESD protected chips (probably NMOS, etc, or heck maybe they are bipolar, except bipolar was fairly rugged, so must be NMOS w/o static protection).

At that point you would be on a metal desktop, with aluminum foil stuffed into your socks and alligator clips grounding you to the desktop surface. At that point MAYBE you would not destroy the chips (50-50 chance) I

have yet to try these methods but have great fear, just because one can, in theory enter the cave and slay the dragon, does not mean you will succeed when YOU try it.

"2 disease" is a miserable outcome, like you are still alive but you are stuck in a wheelchair, its just not the same as being 100% functional.

**** So in summary, and I hope I did answer clearly, take it apart and lube the slide switche (I preferred a Q-tip well-moistened with "TRI FLOW" which is a WD-40 with Teflon particles added) and don't take it down to the chip level. Even for taking apart just to the circuit board level, it would be prudent to ground your own body to one of the battery terminals of the calculator, or to the main circuit board frame, even while lubricating the slide switches. (aluminum foil stuffed into your smelly moist socks would be a very expedient ground path).

2) I haven't psyched myself up yet to try and open it - without opening it is there anyway to tell whether it has the solderless construction - serial no. 2033S?

Weight really and truly is a good indicator. If its "heavy" its probably solderless. If its "light" its soldered. Just use your best imagination and judgement.

3) Should I open it anyway in order to lubricate the on-off and run-prog switches?

Yes. If you plan to use it more than once a month.

4) What's the best stuff to clean the display (a few minor scratches) and the keyboard (suffering from bits of sticky black plastic from the pouch - I have just put the pouch through the washing machine [yes - I remembered to take the 34C out first] following a post I saw a while ago on the forum which did the trick on a 41CV pouch which suffered from the same problem)?

I've never had to cover up any scratches, most people wind up recommending Armor All, or other equivalent automotive products (dashboard polish, etc).

WELL THAT'S IT FROM CAPTAIN ZENER.... and about that gal on Planet Krypton, her name is Kryptonia and that tinfoil brazierre is just too hard to forget.... so I'm up and awayyyyyyyyyy..... until next time!

- CZ

aluminum capacitors

*Message #3 Posted by **CAPTAIN ZENER** on 29 Oct 2003, 3:58 p.m.,*
in response to message #2 by CAPTAIN ZENER

If you do take the electronics module apart on a SPICE calculator, there are two aluminum electrolytic capacitors on the power supply board. It would be prudent to replace them with dipped-tantalum so that they never need to be serviced again.

Their values are unpopular (22uF, 10V dipped tantalum replacements) therefore have to locate them in advance of taking the unit apart.

These are all reasons why SPICE calculators are just tough enough to service that there ought to be a little service shop somewhere to deal with it (my garage?).

Rubber keypad membranes are not always present. Its a part that we ought to be able to have tooled up and more of them stamped. I tried to specify the material and simply could not thus far. There is a "dry lubricant" on the rubber sheet. I will however try again in the future.

BTW if any of us gets the least-bit serious about the SPICE calculator series, it ought to be fairly easy to have new manuals printed up, new boxes printed up, and a textile sewing shop make us a few thousand new HP furry cases.

C'mon guys.... think big! We can slay the Carly beast !

Thanks for the info Captain.....

*Message #4 Posted by **james (UK)** on 30 Oct 2003, 5:50 p.m.,*
in response to message #2 by CAPTAIN ZENER

At least it looks as if mine is soldered from the weight so one less thing to lie awake at night worrying about. My 34C is in daily use at the moment as I'm still exploring it (code for being so over the moon with it that I can't keep my hands off it - another advantage of red leds - you can still play with it at night!!) so I guess I will need to have a go at lubing the switches.

Enjoy Kryptonia, the tinfoil bra should sort any static! And keep a wary eye out for any lumps of Carlyite lying around.

Thanks again.

Carlyite kills everything, HP-34C rules

*Message #5 Posted by **CAPTAIN ZENER** on 31 Oct 2003, 4:50 a.m.,*
in response to message #4 by james (UK)

Glad to hear you are enamored with your HP-34C . Isn't it a sweetheart? Captain Zener says confidence it could be manufactured profitably even now, because it's just that cool. There is however an MBA Mafia Marketeer's society that says 'nay nay nay' and some are even on this chat board. They are kind of like sheep. Sheep say 'baah baaah baah'.

Yes, Carlyite kills everything. It's a real bitch if you get any on you.

Back to that tinfoil brazierre..... yeah, the tinfoil must offer ESD protection.

But I can "run the system" with the ESD protection removed.

Recent HP Sitings

*Message #1 Posted by **Ben Salinas** on 28 Oct 2003, 11:20 p.m.*

Just to fill you in on a few recent HP sitings. Today, (about 2 minutes ago) I was checking my mail (from yahoo) and there was an ad for "Bank Of America". On the ad is a large message on the left. On teh right, there is a calculator with numbers running accross in front of it. I noticed that the calculator looked like a HP (had the completely black look), and so I zoomed in on the picture, and sure enough, it said "10B" in the corner. It looks like they "whited out" the HP logo (unless the 10B has no logo), but any trained eye knows what it is.

Also, a few days ago I was watching a Bill Nye the Science Guy video in physics (No, we do not regularly watch videos, but my teacher got sick that morning, and had nothing that a substitute could teach), and they were doing one of thier "interview a scientist and show that science is cool interviews". There was a quick pan across this man's desk, and I caught a glimpse of a gold calculator. I immediately said "12C," and my friend next to me said "What?". I replied, "The calculator on his desk is an HP 12C". Sure enough, a few moments later, it zoomed in, and you had a closer view of the calculator. I was pretty sure that it was a 12C, but now I am starting to wonder, "Would an engineer really use a calculator that you have to emulate functions such as sin and cos?" Perhaps it was one of the others in the series which is similarly colored (I am not familiar with all of them)

-Ben

Programs name : i don't understand?

*Message #1 Posted by **Frederic** on 28 Oct 2003, 9:30 p.m.*

Hi,

I'm porbably missing something but i read this forum everyday and i can read the reviews of many HP programmable calculators like the 15C, 41C, 34C, 25C, 65, 67 and other classic one. These, i thinks, are the most love one here.

I tried learning programming all of these and i found that the only one that can have more than one program in memory at the same time is the the 41 series. I especially love the 15C but i need a calculator that can take more than one program at a time, like 10 programs or more! On the 15C, after using a program, i erase it and enter another one i need. I also tried to put a new program at the end of the last i entered as i enter it as new label in my original program... But this way, the "master" program is becomming very big and less ergonomic to use and modify all the labels that acts as new programs...

Is there a way to enter 10 INDIVIDUALS programs on all these calculators like it is possible on the 41C? I'm sure it is possible because all comments about the the 15C are as positive as the 41C so...

Re: Programs name : i don't understand?

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 28 Oct 2003, 9:36 p.m.,*
in response to message #1 by Frederic

The HP-42S have the capability to store several programs by name, and have all 15C's functions and many more, and is software-compatible with the 41C. I just love it! (BTW I have all three, 15C, 41CV, 42S).

Best regards,

Nelson

Re: Programs name : i don't understand?

*Message #3 Posted by **Richard Garner** on 28 Oct 2003, 10:14 p.m.,*
in response to message #1 by Frederic

I no longer have a 15C, but if I remember the manual correctly, you can have multiple programs in it if you use the A - F keys as the program labels. You will probably need to start at the end of the previous program and continue with the line numbers, but I remember doing that. You may have to setup a display that would alert you for your number entries at a prompt or load the stack before running the program.

Hope this helps. Richard

Re: Programs name : i don't understand?

*Message #4 Posted by **Ed Look** on 28 Oct 2003, 11:18 p.m.,*
in response to message #3 by Richard Garner

Shoot! Even the 34C could in this way theoretically have multiple programs (h LBL A, h LBL B, or h LBL <some single digit; I liked 0>), but I think the complaint is, unless I misread him, is that these machines, 34C, 15C, are quite limited in RAM. The 34C had to "steal" register memory to make more program lines (7 lines for one register), so if you had some data in such a register, it was gone, though.

I must be getting old; I rolled those keystrokes right off and it's been YEARS since I actually did it; I couldn't do that with the 32SII or 48G+ (and definitely not the 49G+).

Oh, even so, I think the 15C and 34C (and 32S series) might also run out of labels for subroutines after a while and some are invalidated for other reasons, but right now I can't remember what (so I might be wrong here, I hope). But these new 48G series and 49G series tricorders don't use labeled addressing of subroutine branches. I'm still trying to teach myself these, so I won't comment much more on this except to say that I think they look so far to me like you may not really ever run out of "labels" (incorrect term for these newer machines) for programs.

Re: Programs name : i don't understand?

*Message #5 Posted by **Ernie Malaga** on 28 Oct 2003, 11:51 p.m.,*
in response to message #4 by Ed Look

Ed:

I think the problem that Frederic is alluding to is that, in every programmable calculator except the 41 and 42, the programs you write aren't truly independent. Putting it into 41 terms, the labels are all global instead of local. If the "program" at LBL A has a GTO 7 and LBL 7 (by oversight) is in the "program" at LBL B, running program A executes part of the code of program B, giving rise to all sorts of problems.

I loved the 65 and the 67, but they share this problem as well. The 41, on the other hand, has that all-important END instruction that creates hard boundaries between programs and guarantees that LBL 07 is truly local.

Did I get your question right, Fred?

-Ernie

Re: Programs name : i don't understand?

*Message #6 Posted by **Richard Garner** on 29 Oct 2003, 12:59 a.m.,*
in response to message #5 by Ernie Malaga

Ernie,

Thanks for reminding me about the local and global labels, I had forgotten about that. The program code would have to be slim-lined with little to no spaghetti and no duplication of subroutine labels between programs, or that would cause problems.

Re: Programs name : i don't understand?

*Message #7 Posted by **Ed Look** on 29 Oct 2003, 1:17 a.m.,*
in response to message #6 by Richard Garner

Ah, I see. Yes, I did have problems in those days with exactly that. Local variables would have kept you from worrying about something as trivial as labels for a subroutine, something that I know the 48G series has, so I assume the 49G series must have, also.

Would it have been too (much more) cumbersome for a design EE to have built that into the hardwiring (or at least firmware) in circuits like in a 34C or 15C?

If not, that'd be a great feature to put into a "replacement" or "reissue" type scientific programmable. This would truly be a time saver, as there'd be one less small thing (easily overlooked) to worry about. Good thinking, gentlemen!

Individual programs vs. Neumann Janos

*Message #8 Posted by **Tizedes Csaba** on 29 Oct 2003, 2:34 a.m.,*
in response to message #1 by Frederic

I never seem individual progs. When Neumann Janos invented how the computers stores the progs and datas, the individuality of progs are stopped.

We have got only one memory - we have got only one program.

Labels, subroutines, program names are just humbug... :)

Csaba

ps.: Neumann Janos == John von Neumann, but I'm a hungarian, and Neumann Janos was a hungarian, so...

Multiple programs in the 11C, 15C and 34C

*Message #9 Posted by **Karl Schneider** on 29 Oct 2003, 3:16 a.m.,*
in response to message #1 by Frederic

Ernie --

I think that Ernie Malaga identified the crux of the issue -- END statements allowing separation of program units in the 41C* and 42S, with alphanumeric "global" and numeric or single-character "local" labels.

My contrast, the other calcs you mention lack the END statement, and all labels are effectively "global". This makes it more dificult to manage libraries of separate programs.

Here's how to get around this problem on the 11C, 15C, and 34C. (NOTE: These instructions will NOT work on the 10C or 12C -- they have no labels or line-delete key; programs cannot be edited and subroutine-calls can be emulated only with GTO to line numbers.)

The 15C offers 25 labels: A-E, 0-9, and .0-.9 The 34C offers 12 labels: A, B, 0-9. (I'd have to look up the 11C on this website.)

1. Before assigning a label in a program (e.g., LBL A), exit program mode and try to go to that label in run mode(e.g., GTO A). If the display returns without error, the label is in use; try others one-by-one, until you get an error message, then use that one.

2. Put a "return" statement (RTN) at the end of every routine. That way, any routine will stop when completed, and individual routines can be executed.

3. You may delete an individual routine line-by-line on these three calcs by pressing the back arrow (11C, 15C) or the DEL instruction (34C), starting with the last instruction in the routine. However, CLEAR PROGRAM in PRGM mode will wipe out all user programming in one fell swoop.

Best prog calculator!!!

*Message #10 Posted by **Frederic** on 29 Oct 2003, 8:33 a.m.,*
in response to message #9 by Karl Schneider

Ok, understand what you mean for the 15C or the 34C. I just try it on my 15C and it works; thanks!

I think it's a way to do multiple programs on a 15C but... it's not very "cool" in my opinion... HP-15C were created after the 41C no? why don't they include this important ergonomic feature in the 15C (the end function)?

And what about the "XEQ" button : i don't see it on any other programmable one!?!? And i think it's the master key on a 41C no? And the user key - I really like the fact that the calculator don't make the difference between my program and ROM program - especially when i can "program" a key to execute my own program like any other key on the 41.

I read about the 31SII here as a great calculator; is there a ROM capability of naming program independently?

I all stop programming HP, TI, casio and sharp calculators because of this lack except the 41C; which HP should i bought to find this feature (no graphing; i don't like these for my hobby, just for the job...)

If there is no other one, is it possible that the old 41C is the best programmable calculator ever produce so i can stop buying HP calculators because i already have the best one???

Edited: 29 Oct 2003, 8:50 a.m.

XEQ

*Message #11 Posted by **bill platt** on 29 Oct 2003, 9:31 a.m.,*
in response to message #10 by Frederic

Hi Frederic,

On the 41 series, and the 32s, 32sii (and maybe the 42--I don't know that one) the "XEQ" key calls any labelled routine and runs it. On the 15c and 11c, the GSB does the same thing. (In other words, in RUN mode, pushing GSB <label> will do the same thing as XEQ <label> does on the 41.

On the 15c and 11c, the normal way to start running a program is to push f <label>. This does exactly the same thing as pushing GSB <lbl>.

But the really cool thing on the 15c and 11c is the "user mode" which switches the "f" key and the unshifted position for keys A-E, so that to run a program labelled "E", in user mode, you merely push "E" (which is the 1/x key).

Note that there are some subtle differences between labelling with letters versus labelling with numbers---only the letters can be called in one keypress using user mode. But GSB <label> will run any routine from run mode.

Of course you understand the difference between GSB and GTO in program mode-right? GSB will return to the routine that called it, whereas GTO will return to line 000-or go wherever the second routine goes!

Another thing about the 15c and 11c--the machine will allow you to accidentally put two different routines in with the same label--in which case, if that label is called, the program will go to the next one----this is why Karl suggested that you go out to RUN mode and search for the intended label

before using it--so that you don't find yourself with that mess!

In the 32sii, the machine will return an error message right in program mode, if you try to use a duplicate label.

Regards,

Bill

Re: Using limited label space

*Message #12 Posted by **Paul Brogger** on 29 Oct 2003, 10:32 a.m.,*
in response to message #11 by bill platt

The "feature" allowing multiple use of labels goes back to the 29C, if not beyond, and was designed in, not an accident. The idea is to allow "overloading" of labels because so few are available.

Thus, the main routine might be called "A", and it might repeatedly call subroutine "A" located further on in memory. This effectively provides a second label. The only hitch is that you have to make sure you start at line 000 to insure you invoke the main routine (the first "A" encountered) and not the subroutine from the keyboard.

With the 32s' 26 labels, it probably made sense to restrict each to a single use, despite that model also having relatively limited program memory.

Re: Using limited label space

*Message #13 Posted by **Ernie Malaga** on 29 Oct 2003, 12:08 p.m.,*
in response to message #12 by Paul Brogger

in response to message #11 by bill platt

I'm sure this must have been discussed time after time, but in case someone hasn't...

The names of the letters in "XEQ" is "ex-e-cue", which is pretty damn close to "execute." I've always thought it was a very clever mnemonic, and wondered who thought it up.

-Ernie

Command files in the (then) large HP3000 mainframe computer (circa 1972) had the .xeq extension (e.g.: cp.xeq, days.xeq, etc).

in response to message #10 by Frederic

I have personally got stuck with the HP-42S as the "best calculator" for me and that I therefore can stop there. I am aware of that I might be influencing you to actually buy one at a quite high price from eBay (or similar source), but I would be surprised if you were disappointed. Especially if you are coming from the HP-41C(V/X) and the HP-15C. In a way the HP-42S combines some of the finest features of these two calculators (in fact I like to think of the HP-42S as a HP-41CV with the Advantage module, with much more memory, faster CPU, two-line LCD and a smaller form factor).

The only thing that could change my recommendation would be if HP decided to produce a successor to the HP-42S in its new calculator line. As I have pointed out in my (plentiful) previous postings in this forum, this is actually technically "within reach" for HP. They have the emulation of the Saturn CPU (the HP-49G+ uses it), the HP-42S supports 32K RAM (there are postings on this site telling how a standard HP-42S can be upgraded to 32K by just changing the 8K RAM chip to a 32K RAM chip) - and so on. Well, to put it shortly, I have personally not stopped hoping for such a calculator...

Best regards, Erik Ehrling (Sweden)

Yes, but you forgot " ... less I/O and any expandability at all". Don't get me wrong, I like the HP42S very much and think it's one of the finest HP calculators ever, but for me the lack of I/O for saving/loading programs and data is a tremendously big no-no, specially considering the much larger RAM.

That being so, I'd rather have an HP-41CX with Advantage ROM, PPC/HEPAX/ZEN ROM, a card reader and a number of card holders with plenty of programs recorded in magnetic cards, ready to load, plus a sizable number of blank cards for any programs or data I might develop anew. The enjoyment factor and actual possibilities would be far greater.

That said, an HP42S with card reader (or any other I/O allowing for easily recording/loading programs, say SD cards, or even a barcode reader of all things !) would be a real *killer* calc, if

there ever was one. I would order five at once ! :-)

Best regards from V.

The problem with this is that you have just made the 42SII the same size as the 48GX. I think having the 32KB (or more) of RAM, read/write IR and a USB port would be enough in terms of hardware improvements. This would allow the calc to stay the same size that it is now. The only other improvement I would like to see is the 128 or so unit conversions that come with the 48G Series added to the 42SII. I work in the Planning Department for a city government and I am constantly having to convert Rods, Chains, Furlongs, Meters, Hectares, Acres, Square Feet, Miles, Kilometers, etc. from deeds, surveys, and subdivision plat. It would be nice to have the 48G unit conversions in something that would fit in my shirt pocket instead of hanging from my belt.

Yes, the lack of serial I/O is definitely a serious limitation and I would say that deliberately crippling the HP-42S by not giving it I/O can actually be called one of the worst mistakes HP has ever made! By not giving I/O to the HP-42S they killed a long line of very fine keystroke programmable four level RPN calcs: The HP-67 -> The HP-41C -> The HP-42S. (Hopefully they realise this and are willing to rectify it almost 15 years later...)

Theoretically I/O would be possible to add to the HP-42S. The CPU is able to create the signals needed and there is room for an additional 32K ROM that even allows for MCODE to be called from UserRPN! The "only" thing that is needed is a huge amount of Saturn Assembly expertise and good insights into electronics (unfortunately I have neither of the two).

> Quote:
>

Well, I would actually prefer a double speed HP-48GX running HP-42X (if you haven't tried it you should!) to a fully equipped HP-41C(V/X). This setup gives you the I/O, roughly four times the speed of the HP-41C and 96K of RAM...

To wrap things up...

Three things to dream about:
- HP-42SII (or HP-42S Platinum?) with 32K RAM + I/O
- Hrastprogrammer developing HP-42X for the new HP-49G+
- Serial I/O for the original HP-42S

Yes, all true, perhaps, but you'd still miss the two most sensuous things about the HP-41CX: its "heft" and its keyboard. Count me among those who just love to hold it, touch it, look at it, and press its keys. I couldn't afford one when they were new, but now, with things a little better, I've managed to put together a brand new HP-41CX, brand-new printer, brand-new wand, and two rebuilt good-as-new card readers. My wife thinks I'm crazy. She might be right.

Not to mention that you can both HP-41X and HP-42X installed on the same machine so you can have HP-41X with 28K RAM and CCD/HEPAX/Printer/PPC/ZENROM/ADVANTAGE/CARDREADER/etc together with 96K RAM version of HP-42X at the same time ... if you have enough RAM ports, of course. If this isn't enough, you can install HP-71X with 160K RAM and Math/Forth/Assembler/HPIL/etc modules.

Regarding the HP-41X/42X/71X on HP-49G+: I am affraid that there won't be any FULL/EXTENDED versions of my emulators for this calculator because HP had very STUPIDLY dropped the size of Port1 from 256K to 128K (only one bank).

Best regards to Erik and all of you ...

Hm. I always wonder how many (large) programs people develop for their calc. The 42S has what, 6kb or so. Even a somewhat complex routine needs only a few hundred bytes. What the heck do you key in there that you need 32kb??

Re: Best prog calculator!!!

*Message #23 Posted by **Marx Pio** on 29 Oct 2003, 4:56 p.m.,*
in response to message #22 by Holger S.

I think that we think about other users ;)

We need quite a few bytes to develop a simple routine for our own pourpouses, but our tendency is to keep the code more friendly, so we spend more and more bytes just to make a kindly of human and machine dialog.

My dream machine is a 49G+ in a size and keyboard layout of a 15C.

Just get a 48/49 G series calculator. THey rock! I have over 50 large programs in my 49g and still have LOTS of memory left.

Conclusion?

*Message #26 Posted by **Frederic** on 29 Oct 2003, 8:15 p.m.,*
in response to message #25 by gigoli

I have a 48G but don'T learn it so much; i like keystroke programming? it it? RPL??? humm..

So the 41CX is the best for programmability and I/O capability and not so bad for direct calculation! Where can i find a "advantage module"? what it adds to my calc? I already have the stat/math module and it's great!

If the 42 cna't be plug on my 41CX printer it's not cool..

Just for fun, i have a CX with double memory module install : How can i convert "register" in KBytes? In another word a fully load 41CX have how much memory in KB?

Mine is full, no more momory so i use card reader. It should be great to add about 5000 registers of memory to the calc so i can have all my programs in the calculator.

41 & 42 (was: Conclusion?)

*Message #27 Posted by **Karl Schneider** on 29 Oct 2003, 10:49 p.m.,*
in response to message #26 by Frederic

Frederic --

If you want a well-equipped 41C*, you should get an Advantage Pac (at least the module and manual).

Try eBay or the MoHPC Classifieds; expect to pay at least US$50. A scan of the manual can be obtained on the CD-ROM or DVD-ROM set from MoHPC.

The 42S has an IR output for the 82240B or older 82240A printers. Try eBay.

The 41CX has 124 extended registers built-in; each X-Memory module provides 238 registers, for a total of 600 extended registers. At 7 bytes apiece, that's 4200 bytes of extended memory. You can store programs, data, and text in the X-memory, but you cannot run programs from it.

You'll need to keep buying...

*Message #28 Posted by **james (UK)** on 30 Oct 2003, 6:24 p.m.,*
in response to message #10 by Frederic

If you're like me you'll still need to keep buying HP calculators as you can never have too many - afterall you need a backup 41 in case your 41 gets sick, and a backup for the backup and so on - plus if you get more than a couple of modules you need storage for them and the best module holder I've found is a 41! ;-)

And then, of course, you succumb to the seductive red glow of leds but I won't go there for the moment.

James

Anyone with a 49g+ serial >cn334...??

*Message #1 Posted by **JohnW** on 28 Oct 2003, 7:35 p.m.*

Just wondering if anyone has a new 49g+ with a Serial Number newer than CN334xxxxx? Just wondering if some of the early bugs have been fixed yet?

Also, does anyone whose followed HP Calcs through the years know if other newly introduced HP calculators had similar type early problems too??? Please only respond for calcs that were made earlier than the 48 series....

Thanks.

Most definitely. The best-documented example is the HP-41C. It had a dozen or so bugs, and they were given numbers. Bug #2, for example, allowed you to set or clear flags greater than 29, if done indirectly. Bug #3 (I think) allowed you to store program lines into memory registers -- again, by doing it indirectly. This gave rise to the Synthetic Programming fever, of which I took a very tiny part.

Happy programming.

-Ernie

*Message #3 Posted by **Arnaud Amiel** on 29 Oct 2003, 6:01 a.m.,*
in response to message #1 by JohnW

As far as the new hardware glitches are concerned: I have a 45 that is older than me but whose original owner confirmed that the [1/x] key never worked reliably, he always used logs then. So missed keys is not something new. What is more on this model the bottom "hp45" sticker is not even straight. Some people criticise the Chinese quality control. I should say that the US one was not much better then. However, apart from the battery pack that I have been in the process of trying to begin to restore for the last three months or so, the calc is still running strong.

*Message #4 Posted by **Jim Chumbley** on 29 Oct 2003, 10:27 p.m.,*
in response to message #1 by JohnW

Hi, John. I might qualify to help answer the concern. My first 49g+ was bought on 10/7/2003, was delivered on 10/8/2003, and failed on 10/26/2003. This machine's serial number is: CN33103995, and it was delivered with a ROM image of 1.19. Very interesting to me was the reaction of HP's Customer Support team when I called them asking them to please call 911. They swear that this serial number is earlier than ANY delivered -49g+, and from this they conclude that my machine MUST be some other model, some other calculator. The new machine, which just arrived today, 10/29/2003, is serial number CN33404556 and contains a ROM image of 1.20. My retailer told me that it was from the second production run of the -49g+s. My conclusion: The machines are identical in touch, feel, and appearance, but not--let us hope--in reliability.

49g+Beta?

Re: Anyone with a 49g+ serial >cn334...??

*Message #8 Posted by **Anonymous** on 3 Nov 2003, 9:50 a.m.,*
in response to message #7 by James M. Prange

The 49g+ was released in other parts of the world, more then a month before they released the calculator in the United States. It is possible to get old serial and ROM versions. The US models should have a ROM of 1.20 or higher, but should come with the ROM version 1.22.

Re: Anyone with a 49g+ serial >cn334...??

*Message #9 Posted by **James M. Prange** on 3 Nov 2003, 2:33 p.m.,*
in response to message #8 by Anonymous

You may have something there. Maybe these low serial number 49g+es were intended to go

out to those durn foreigners as beta test units, but imported to the U.S.A. as grey market items.

Just kidding (mostly).

Mine came from Samon Cables with an external serial CN331..., internal serial CN337..., and ROM revision #1.20.

Regards,
James

My serial # is CN333040946

*Message #10 Posted by **CalcKidd** on 7 Nov 2003, 9:20 a.m.,*
in response to message #9 by James M. Prange

Came with 1.19 (which I immediately upgraded to 1.22).

Flickers and sometimes seems to forget what key I pressed.

Bought it from Samon Cables.

49G+/SD card: Epilogue

*Message #1 Posted by **Ernie Malaga** on 28 Oct 2003, 6:42 p.m.*

I got the SD card to work. Finally! It turned out that the card had to be formatted using FAT16. I have no idea what format it used before. In any case, the upgrade to ROM 1.22 went successfully.

I want to thank you each and every correspondent in this forum who coached me and offered ideas for the solution of the problem. I am particularly indebted to Tom Scott, who emailed the de-EXE'd files the 49G+ required.

I couldn't have done it on my own. That's one reason why this forum is such a great resource. Thank you all.

-Ernie

Re: 49G+/SD card: Epilogue

*Message #2 Posted by **Tom Scott** on 28 Oct 2003, 9:08 p.m.,*
in response to message #1 by Ernie Malaga

That's what's so nice about this forum. There are a lot of really helpful people here. For example, I bought an HP-67 on eBay which was in horrible shape (despite the lies of the seller). I felt awful about paying so much for such a poor quality device but the seller was non-responsive. A forum member (Michael Meyer) volunteered to restore it, which he did at no cost to me. He spent a great deal of time and effort getting it to function properly again and yet he refused any payment. There must be something about calculators that attracts good people!

Tom Scott

49G+ & 48GII

*Message #1 Posted by **CalcKidd** on 28 Oct 2003, 5:58 p.m.*

My 49G+ accepts a 256MB SD card just fine (FYI).

Just got 48GII today, though have not opened it. Don' t think I ever will either... just got it to have, not to use. 49G+ will be #1 calc for now, since 48GII is a step down. Yeah, I know... crazy.

However, I still like to use my 41CX - for nostalgic sake.

HP49G+ is TRASH, HP41 is best !!!

*Message #2 Posted by **Linda** on 30 Oct 2003, 9:39 a.m.,*
in response to message #1 by CalcKidd

HP-41 is best, f... the rest .... HP49G+ is TRASH, garbage !!! and HP48GII is even worse!

Why using such calculators ? Use subnotebook with Mathematica, Maple, Origin, Matlab, Excel. It is 1000 times faster on my 1.2GHz laptop than HP49G+, there is much more functionality, human interface is more comfortable and easy. 3D graphics are great at 768x1024, not that "funny" dot LCD of a HP49G+ ...

For calculator tasks and playing, hacking etc., take HP-41. It is the best calc ever built!

So, take notebook with good sofware plus HP-41 and throw away the new garbage ...

Re: HP49G+ is TRASH, HP41 is best !!!

> Use subnotebook with Mathematica, Maple, Origin, Matlab, Excel.

That sounds nice. The only problem is the cost. An expensive subnotebook computer and one or more very expensive software packages.

I'm not thrilled about the HP-41. Mine died a few months ago. They seem to have some long-term reliability problems, judging from what I've read.

Re: HP49G+ is TRASH, HP41 is best !!!

*Message #4 Posted by **Raymond Del Tondo** on 30 Oct 2003, 5:24 p.m.,*
in response to message #3 by John Limpert

If your HP-41 died only some months ago, I don't think it had a 'long-term reliability problem'. Remember that your HP-41 must be at least 14 years old, and depending on how intensively you used

it, the machine may have done a good job for you.

Raymond

Re: HP49G+ is TRASH, HP41 is best !!!

*Message #5 Posted by **John Limpert** on 30 Oct 2003, 11:20 p.m.,*
in response to message #4 by Raymond Del Tondo

It (HP-41C) must have been 20+ years old when it died. I was disappointed because it was the first time a HP calculator has failed on me, and I've been buying them since the HP-35. I sold all of my HP LED calculators many years ago, so maybe I've just been lucky.

Re: HP49G+ is TRASH, HP41 is best !!!

*Message #6 Posted by **Bill Wiese** on 31 Oct 2003, 1:42 p.m.,*
in response to message #2 by Linda

Perhaps I wouldn't put it quite so severely, but I do have a fondness for the HP41s and HP42S that goes beyond reason.

Most all of us here prob. have PCs or laptop PCs as well. If I need to do math requiring a 48, I'm better off using something like Matlab.

The 48 is not really, to me, a good "playing with numbers" calculator - esp w/o a standard 4-level XYZT+L stack and large ENTER key. 32S is useful however, and I still like the Woodstock keyboard layout & formfactor too.

Glad I have some calcs stored away for the future ;)

Bill Wiese San Jose, CA

Re: HP49G+ is TRASH, HP41 is best !!!

*Message #7 Posted by **Raymond Del Tondo** on 31 Oct 2003, 4:50 p.m.,*
in response to message #6 by Bill Wiese

BTW: The real HP-48 does indeed have a large ENTER key, and with an HP-41CV emulator, it even has LASTx ;-) The keyboard ergonomics on the HP-48 are the same as on the 42S and 32S. And even better, you can see more than only one number simultanously.

However, for just adding a few numbers I mostly take an HP-41, of course.

Raymond

mathematica on a pda - even better

*Message #8 Posted by **harryb** on 7 Nov 2003, 5:44 a.m.,*
in response to message #7 by Raymond Del Tondo

here here! the 41 was the best of the best.

mathematica on a laptop (student version costs about the same as a 49g+) is the way to go... you just need to spend a few hours learning the ropes..

BUT ... you know what I would love to see...

Mathematica for a PDA OS! Now that would kick the ass out of any calculator. You basically choose the hardware platform of your choice and just load mathematica on it.. Rock on!

imagine writing the equations on the screen with a stylus... colour 3d graphics... total symbolic math... rearranging equations on the fly without the need to type and then visualizing the effects...

Stephen (W.) are you listening!!!!!

Here's a whole new income stream/market for you man...

Give "A new kind of science" a break and get your codecutters to port a scaled down version of mathematica so that us students can have a break!

RPN on an RPL machine

*Message #9 Posted by **bill platt** on 7 Nov 2003, 9:52 a.m.,*
in response to message #7 by Raymond Del Tondo

Hi Raymond,

A while back I got a great little tiny user RPL routine here on the forum, which makes lastx available for use on the RPL stack! It works almost exactly like the RPN lastx--- (there are some subtle differences but for most computational work ii is functionally identical):

<< DEPTH -> d << LASTARG DEPTH d - ROLLD LASTARG 1 - DROPN DUP DROP >> >>

I put it onto USER KEY "alpha enter" and so it is almost the same keystrokes as a 10c series! (You just ahve to remember to turn alpha off before hitting enter, if you had been writing text, or you will both enter your TEXT, [into level 2] and LASTx [into level 1])/ Other than that one minor annoyance, I find it very useful, and it lives in my home directory.

I suppose a savvy programmer could make a 4 level stack emulation, too.

In fact, I am surprised that I have not yet run across a sysRPL or UserRPL program to simulate a voyager or pioneer system--but right in the RPL shell....that would be very useful.

BTW I also have the Hrastprogrammer 41series emulator on my 48gx's and I use it frequently---it is nice to be able to do RPN keystroke programming on the 48---or to take a program that I have written on the RPN and just plunk it in there--to have all on one calculator is nice for travel.

Best regards,

Bill

Re: RPN on an RPL machine

*Message #10 Posted by **Raymond Del Tondo** on 8 Nov 2003, 1:17 a.m.,*
in response to message #9 by bill platt

Hi Bill,

yes, I remember the thread. Actually, if I want HP-41 feeling on my 48GX, I also start an HP-41 emulator (EMU41CV) from Zengrange.

There exists an HP-16C emulator for the HP-48 . Ok, it doesn't mimic voyager hardware, but

16C number manipulation features.

Best Regards,

Raymond

in response to message #9 by bill platt

> Quote:
>
> << DEPTH -> d << LASTARG DEPTH d - ROLLD LASTARG 1 - DROPN DUP DROP >> >>

But note that on the RPL calculators, the last arguments save can be disabled, and when it's enabled again, the buffer is empty. For dealing with IFERROR, I often find it easier to disable last arguments save. Sometime the last thing that my programs do is restore the original flags, and thus (presumably) re-enable last arguments save. If you run the above under that condition, it errors, and if you run it again, it returns -1. But it is better than some that I've seen; at least repeated runs return the same value due to the DUP DROP at the end. Try the following:

```
\<<
  DEPTH \-> d
  \<<
    LASTARG DEPTH d -
    IF
      DUP
    THEN
      DUP2 2 + ROLLD DROPN
    END
    DUP DROP
  \>>
\>>
```

This one returns 0 in the event that the last arguments buffer is empty. Of course, if last arguments save is disabled, then it errors out.

> Quote:
>
> I suppose a savvy programmer could make a 4 level stack emulation, too.

It never occurred to me that anyone would want such a thing. What would it do, limit the stack to 4 levels and have level 4 replicate downward when anything is removed from the stack? Using vectored ENTER, I suppose that it would be pretty easy to do that for ENTER or any keypress that does an implicit ENTER, but how to have it do after every command within a program I don't see; I think that it would require more than UserRPL.

Regards,
James

Bad HP-48SX ON/ATTN key

*Message #1 Posted by **Al Kimball** on 28 Oct 2003, 3:01 p.m.*

Hello;

The ON, or ATTN key on my 1991 vintage HP-48SX is not working well when it comes to turning on the calculator; however once the unit comes to life, I can press ATTN at will and the button works every time.

Some days (but rarely) I push the button and the calculator springs to life right away; most days I have to press and hold the button for several minutes before it starts working. Sometimes I find that grabbing the unit with both hands and giving it a gentle twist (yikes!) will do the trick, but I really hate doing this.

When it does start to work, I see the little hour-glass very briefly and if I let go of the ON key while the hour glass is present, the calculator comes to life.

I thought it might be the batteries or battery contacts, but I've beat that horse to death... It's not batteries.

It's almost as though there was some weird capacitive based startup feature for the calculator that isn't working, because once the unit comes to life, all keys work (including the ON/ATTN key) and the unit is fine otherwise.

From another post (posted in Oct/2003, last month), I tried pressing just above the B and C keys on the raised portion below the display to see if it was the internal keyboard connector... to no avail.

Any other suggestions?

Thanks,

Al

akimball@mac.com akimball@sarcos.com

I currently have three HP calculators, an HP-41CX with many modules/BC reader (use it all the time), this HP-48SX (used less and less cause it won't start), and a newer HP-12C Platinum (horrible reading the yellow graphics on the shiny silver face plate) which I bought just because I wanted it. Sure wish I had spent the money on that HP-16C in college; it's one of only 3 things I really regret not buying in life. :(Thanks again for any help on the 48SX. :)

How to Arrest Corrosion of 41CV battery

*Message #1 Posted by **bill platt** on 28 Oct 2003, 11:49 a.m.*

Well, I pulled my 41CV fullnut back out the other day to take a look at maybe trying again to get the broken post thing fixed. When (6 months ago) I got the unit, the battery contacts were pretty badly corroded, and there was even a little bit of turquoise bloom down at the CPU zebra connector. I cleaned it all up at the time with rubbing alcohol, and got everything nice and shiny. Then, she worked for a bout 2 weeks, and quit again. (Turned out to be a broken post).

So, now the turquoise is back :-{ And I wonder what is an appropriate neutralization--should I perhaps make a dilute baking soda solution and carefully dab that on all the corrosion? If it keeps re-blooming, then no amount of fixing is ever going to be satisfactory.

Regards,

Bill

Re: How to Arrest Corrosion of 41CV battery

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 28 Oct 2003, 12:07 p.m.,*
in response to message #1 by bill platt

I use citric acid (lemmon juice) with a bit of salt. It takes the blue oxide off very easy, but you need to wash it after - as it is an acid, it will corrode things also! I cleaned a TI 2550 *badly* corroded battery terminals, and now is very clean and the blue oxide doesn't appeared anymore.

*Message #3 Posted by **David Smith** on 28 Oct 2003, 3:50 p.m.,*
in response to message #1 by bill platt

I have a friend who does conservation of antiquities, etc. She has talked about "corroison centers" forming on items. They are like little cancers from which all things blue and green grow. They can be almost impossible to kill. Clean things up and the green fuzzies invariably return.

I have been treating my green fuzzies with Caig DeOxit and Pro Gold pens. Seems to help.

Re: How to Arrest Corrosion of 41CV battery

*Message #4 Posted by **Ed Look** on 28 Oct 2003, 5:15 p.m.,*
in response to message #3 by David Smith

Gentlemen, corrosion is a complex redox phenomenon. And battery discharge is also redox based, as well. That is to say that Mr. Smith is absolutely correct that it is technically impossible to arrest corrosion. Besides, we live in an atmosphere of 20% oxygen. Metals tend to corrode. One possible trick in addition to keeping your contacts scrupulously clean with frequent inspections is possibly do what you might do to a jack o'lantern to keep it fresh a few more days- put a barrier film of some oil or grease (thin! Did I say

thin?) on the metallic surfaces that are exposed to air or are in contact with batteries, like the way you might oil a hand tool to keep it from rusting. Be careful that the protectant used is not flammable (toxic is okay; who eats calculators? ;)). But if you find you have to remove oxide, a little fine sanding or scraping is okay. Using more acid to remove it may compound the problem in the long run, as the oxides are generally unreactive to acids and they come off because you are removing the metal layer below it. But after sanding or scraping, if you can somehow protect that clean surface, all the better.

Hello Cyrille,

Very nice to have the chance to say hello!

Yes, There is a link here at the museum under the repairs or something section:

http://www.fixthatcalc.com/

Also, you will see Randy Sloyer's posts---he is the "company".

Best regards,

Bill

Batteries_SR44

*Message #1 Posted by **bill platt (les Estats Unis d'Amerique)** on 28 Oct 2003, 11:38 a.m.*

Hi all,

Has anyone bought SR44 batteries from http://www.sr44.com/feedback.html

This source was posted here a bout a month ago--I have never used it.

But, they are not taking orders--I wonder if there is another good (and trusted) discount source?

Thanks and regards,

Bill Platt

Re: Batteries_SR44

*Message #2 Posted by **Mike Brady** on 28 Oct 2003, 2:39 p.m.,*
in response to message #1 by bill platt (les Estats Unis d'Amerique)

I posted that original Battery question on October 16, 2003. So until www.sr44.com ordering is back on-line, check out my investation of the following:

Jim L. recommends www.batterymart.com for Eveready 357 Silver Oxide. Purchase 6 batteries (includes shipping) at $1.50/ea. Go to http://www.batterymart.com/battery.mv?p=BAT-357

Fry's Electronic's www.outpost.com for Eveready 357 Dilver Oxide. Purchase 6 batteries (includes shipping) at $1.79/ea. Search for product #1935338.

Fry's also has Duracell PX76A/675B Alkaline. Purchase 6 batteries (includes shipping) AT $1.49/ea. Search for product #2015037.

Radio Shack store has Silver Oxide, cost $3.00/ea, and they have Alkalines too.

Re: Batteries_SR44

*Message #3 Posted by **quemazon** on 28 Oct 2003, 4:23 p.m.,*
in response to message #1 by bill platt (les Estats Unis d'Amerique)

You might try bgmicro. I order from them whenever I can. Look for item# BAT1015. Aparently they are an alkaline variant, but at 10 for $2 you can't go wrong!

HP48GII available on HP's website now

*Message #1 Posted by **Gene** on 28 Oct 2003, 7:30 a.m.*

http://www.hp.com/calculators/graphing/48gII/

It looks like the same situation as the 49G+...says "Locate a reseller" right now, but the 49G+ did that and after a couple of days was taking orders on the site.

Price $109.99

Not upgradeable, no Flash, no SD card support ...

*Message #2 Posted by **Raymond Del Tondo** on 28 Oct 2003, 12:12 p.m.,*
in response to message #1 by Gene

...too expensive for the missing features.

Re: Hp39G+ 2X faster and 2X RAM and Cheaper

*Message #3 Posted by **Ron Ross** on 28 Oct 2003, 1:14 p.m.,*
in response to message #2 by Raymond Del Tondo

What are Hp marketers thinking? Or perhaps not, as usual.

Re: HP48GII available on HP's website now

*Message #4 Posted by **Ronelle** on 28 Oct 2003, 8:28 p.m.,*
in response to message #1 by Gene

Hi, I had to get this calc because it was a class requiredment. I was wondering if anyone knew whether or not downloadable programs for the other hp 48g (series) are compatible with this one? There's not much online yet specifically for this calc. My whole class seems to be having a problem as far as making it connect to our pc's too. Cant get any info at the HP site. Thanks Ronelle

Re: HP48GII available on HP's website now

*Message #5 Posted by **Joesph** on 28 Oct 2003, 8:33 p.m.,*
in response to message #4 by Ronelle

What class requries you to buy a certain calc at all, esp. a new, unproven one? I think whoever made this a requirement is a bit foolish.

For the record, most HP49 programs should work. Go to http://www.hpcalc.org/ . Everything except games should be OK. There are various tutorials on the net - most are for the HP49g. I saw one a while back for the HP49G+, but they are mostly identical anyway.

Re: HP48GII available on HP's website now

*Message #6 Posted by **James M. Prange** on 28 Oct 2003, 9:42 p.m.,*
in response to message #5 by Joesph

Re: HP48GII available on HP's website now

*Message #7 Posted by **Ronelle** on 29 Oct 2003, 4:29 p.m.,*
in response to message #6 by James M. Prange

It's actually our book store and HP that came to the idea that this is the calc required, since the calc originally required has been discontinued. The Civil Engineering Program at my college requires the calc, however the lady who usually runs the program is actually out in the field all year, so we have a replacement. So I really don't know why. I asked the same question when I saw how expensive it was...Thanks for the links Joseph and James. Ronelle

128MB SD card $20 after a $10 rebate

*Message #1 Posted by **Gene** on 28 Oct 2003, 7:21 a.m.*

http://www.microcenter.com/single_product_results.phtml?product_id=21718

Rebate good through 11/09/03:

http://www.microcenter.com/rebate_show.phtml?id=6411

FYI. Gene

Re: 128MB SD card $20 after a $10 rebate-rebate URL

*Message #2 Posted by **James m. Prange** on 28 Oct 2003, 1:54 p.m.,*
in response to message #1 by Gene

Thanks Gene. but the rebate seems to be at:

http://www.microcenter.com/single_product_results.phtml?product_id=21718#rebate

and to make it easier to get to the product URL:

http://www.microcenter.com/single_product_results.phtml?product_id=21718

Kind of makes me wish that I hadn't already purchased an SD card. Maybe I really, really, **need** a second SD card?

Regards,
James

Re: 128MB SD card $20 after a $10 rebate-rebate URL

*Message #3 Posted by **Ed Look** on 28 Oct 2003, 2:14 p.m.,*
in response to message #2 by James m. Prange

Ouch, James!

Did you see the price I paid for 256 Mb? Yes, it's a bigger card, but boy, I think 128 would have been sufficient. But for the price... what was the name of that (vintage) group? Temptations?

Come to think of it, you know what might be a nice touch/possibly effective technique for HP calcs? Suppose they offered a rebate of some sort to those who can prove they're students (current registration, or some such paperwork) and who buy one of their calcs. Where would that leave us old folks, though?

(I'm getting "Product no longer available" ...)

*Message #4 Posted by **Paul Brogger** on 28 Oct 2003, 4:15 p.m.,*

in response to message #1 by Gene

Bummer!

Try again in a couple of days, I guess . . .

Re: (I'm getting "Product no longer available" ...)

*Message #5 Posted by **Ed Look** on 28 Oct 2003, 10:30 p.m.,*
in response to message #4 by Paul Brogger

Paul,

Actually, there's a MicroCenter near me. On my way home tonight, I snuck over and looked for one. Their flash memory section looked bare and almost ransacked. I had a salesman check and they ONLY sell it through their Customer Service desk, of all things! So, if the stores still have stock and their kind of keeping it sort of hidden, I'll bet they can get stock back to the online store rather soon.

It's a great price and I couldn't resist this. I might just take the 256 Mb I got in my 49G+ out and replace it with this 128 Mb card. Then maybe I can use the 256 Mb in my Jumpdrive for more or backup portable storage. I'll bet the 128 Mb might be accessed more quickly by the 49G+, anyway.

HP-71B/RS232 Handshaking with Computer

*Message #1 Posted by **Jeff** on 27 Oct 2003, 7:10 p.m.*

Recently while trying to get the RS232 and the HP-71B to handshake with my computer, Windows XP, I found the HP82440A Development Utility Owners Manual. Following the procedure in this manual,in order to initialize the "IBM Personal Computer", enter the following command: C:/MODE COM1:600,N,8,1,RS,CS0,DS0,CD0 The A> replaced with the C:/ This command only gives an invalid command error. When I type the following command: C:/MODE COM1:600,N,8,1 The following result occurs: Status for Device COM1: Baud: 600 Parity: None Data Bits: 8 Stop Bits: 1 Timeout: OFF XON/XOFF: OFF CTS Handshaking: OFF DSR Handshaking: OFF DSR Sensitivity: OFF DTR circuit: ON RTS circuit: ON Obviously, there are other parameters that are needed to complete this handshake. Can anyone help me with this? Thanks

Re: HP-71B/RS232 Handshaking with Computer

*Message #2 Posted by **andy** on 28 Oct 2003, 10:39 a.m.,*
in response to message #1 by Jeff

Tony Duell gives the pinouts for connecting the hp82164a to a serial port. He mentioned it requires a special pinout due to the interesting way the 82164 handles handshaking.

If you're interested in a good program to connect your 71b to a modern PC using the hp82164a, let me know. I have a program that allows you to tranfer files back and forth, turns the PC into an 80 column display, and lets you use the PC keyboard to type on your 71. It works great on my XP machine.

Andy

HP-71B And FORTH/ASM ROM

*Message #1 Posted by **Jeff** on 27 Oct 2003, 6:52 p.m.*

Is it possible via the RS232 interface to transfer the FORTH/ASM ROM from the PC to the HP-71B and effectively use this file? Possibly save it onto a 32K Memory Module?

Re: HP-71B And FORTH/ASM ROM

*Message #2 Posted by **Victor Koechli** on 27 Oct 2003, 7:14 p.m.,*
in response to message #1 by Jeff

IIRC, the FORTH/ASSEMBLER ROM is hardwired to some address range, so you will not be able to use it from a (soft configured) memory module. Furthermore, I think the ROM is 64KBytes (not Nibbles) so 32K won't be enough anyway. What you see in the catalog is just the LEX files necessary for FORTH activation and for integration into the BASIC environment, the ROM itself is invisible. Sorry!

Regards, Victor

Re: HP-71B And FORTH/ASM ROM

*Message #3 Posted by **Raymond Del Tondo** on 27 Oct 2003, 8:30 p.m.,*
in response to message #2 by Victor Koechli

The ROM is divided into two parts: The floating LEX files you mentioned, and the hardwired ROM. As far as I recall, the overall size is 48 KBytes.

There exists a floating version of the FORTH environment for third party developers, which needs to stay in one continguous 64KB block (at least), so two merged/claimed ports with 32K each won't do.

Word clarification: 'Floating' (or mobile) is an HP term (or part of) for libraries (ROMPARTS) or LEX files which don't have to reside at a specific address. Most libraries/LEX files are of this type, except the BASIC ROM (of course;-), and some others, like part of FORTH.

Regards,

Raymond

SD card on 49G+

*Message #1 Posted by **Ernie Malaga** on 27 Oct 2003, 4:38 p.m.*

Here's another chapter in the ongoing saga of The Confused User.

I tried running a test on my recently purchased SD card (32 MB) to see how things worked:

I typed [RightShift] "" AAAAA [ENTER] and [LeftShift] :: 3 [Right arrow] XXX.TXT, making the stack look like this:

```
"AAAAA"
3:XXX.TXT
```

Then I pressed STO. According to the manual, the string "AAAAA" should have been stored in file XXX.TXT on the SD card. It didn't. After a long interval (30 seconds long approx.), I got an error dialog box:

```
STO Error:
DOS unknown error.
```

Once again, and until you guys get fed up with my dumb questions, what went wrong?

-Ernie

Re: SD card on 49G+

*Message #2 Posted by **James M. Prange** on 27 Oct 2003, 6:30 p.m.,*
in response to message #1 by Ernie Malaga

I don't know; your example worked fine for me. Maybe your SD card needs formatting. Which ROM revision is calculator using?

Re: SD card on 49G+

*Message #3 Posted by **Ernie Malaga** on 27 Oct 2003, 6:46 p.m.,*
in response to message #2 by James M. Prange

I'm using 1.2. I'm trying to upgrade to 1.2.2, but everything I've tried so far has failed.

The funny thing is that the card _is_ formatted. It came already formatted for DOS (8.3 file names), and I have checked that on my Mac (OS 9.2.1). Furthermore, when I drag a simple text file to the SD card (which appears as a drive on the Mac desktop), it is accepted. Then I plug the card on the 49G+ and it shows empty. Then I mount it again on the Mac, and my text file is still there.

NOTHING has given me as much frustration (and exasperation) as this jump-through-hoops act. It's all Carly's fault. Maybe I'll trade my 49G+ for an HP-45 and forget I ever saw it. 8^(

-Ernie

Re: SD card on 49G+

*Message #4 Posted by **William** on 27 Oct 2003, 7:38 p.m.,*
in response to message #3 by Ernie Malaga

Make sure it is formatted for FAT 16. You can also try having the calculator format it: hold on & hit F4, then select Format.

Re: SD card on 49G+

*Message #5 Posted by **James M. Prange** on 27 Oct 2003, 8:49 p.m.,*
in response to message #4 by William

Well, but with ROM 1.20, he'll have to use the reader to format it. Formatting on the calculator was added at 1.22.

Re: SD card on 49G+

*Message #8 Posted by **Nelson M. Sicuro (Brazil)** on 28 Oct 2003, 8:12 a.m.,*
in response to message #7 by James M. Prange

I think that the Macs doesn't format FAT16 at all, regardless this is the industrial standard for SD cards. It *supports* FAT16 on SD cards very well (my brother has a Mac and SD card reader) but it puts a lot of "hidden" files on it. I think if you really need to re-format the SD card, do it on other computer (or digital camera, mp3 player...), write the ROM image in it with the SD reader on the Mac and try on your calculator.

Good luck!

Nelson

Why is that? How did you learn that was a requirement? And what is FAT 16?

-Ernie

(Getting more and more frustrated by the second.)

Re: SD card on 49G+

*Message #12 Posted by **James M. Prange** on 28 Oct 2003, 12:46 a.m.,*
in response to message #11 by Ernie Malaga

FAT16 is a file system, the one that the 49g+ requires for the SD card. I don't know about your computer, but when I format it from Windows 98SE, I have a choice between "FAT" and "FAT32". "FAT" formats the card with a FAT16 file system, and is the one I want.

Regards,

James

Re: SD card on 49G+

*Message #13 Posted by **James M. Prange** on 28 Oct 2003, 3:40 a.m.,*
in response to message #12 by James M. Prange

Whoops, on second thought, Windows 98SE doesn't give me the option of formatting a 128MB card as FAT32, and if I try to "convert" it to FAT32, it tells me that the drive is too small.

Not that I'd relly want to use FAT32 on something this small anyway, but I wanted to experiment with whether the 49g+ would support a FAT32 card, and I thought that it was possible to use FAT32 on a 128MB drive. Well, maybe I have some other tool that I can get to format it as FAT32.

Regards,
James

Edited: 28 Oct 2003, 3:41 a.m.

Great. So now, after I've spent $160 for a calculator and another $50 for the SD card + reader, it turns out I can do nothing the scant manuals would have me do. Thanks for the information, though.

I may have to return the 49G+ to HP, and sue them if they won't let me. They misrepresented their product; that's plain and clear. There is no sane reason for blocking Mac users except that they're too damn lazy to provide support, or that Redmond is putting pressure so that only Windows clients can be successful.

Sorry for venting my anger like this, but you have no idea how it is. I've come across this kind of attitude literally dozens of times, and am getting fed up with it.

Thank you for trying to lend a hand.

-Ernie

Re: SD card on 49G+

*Message #16 Posted by **Ed Look** on 27 Oct 2003, 8:42 p.m.,*
in response to message #3 by Ernie Malaga

It IS possible to upgrade your ROM via cable. I did it. When you open the Conn4x window, there's a drop box for "Connect Using", which may be set to either "Auto" or "HPx9G", and a drop box for "Speed" which should be set to 115200. Then you should be able to select "ROM" from on top of the Conn4x window. Now it gets a little complicated, but follow to the letter the instructions in the little gray pop up box that pops up, not the instructions in the ReadMe (they led me astray!). If I recally correctly, you then have to hold down the + and - keys simultaneously and while doing that, hit the reset contact (with a bent open paper clip or some such thin, rigid thing) on the back of the HP-49G+. Then let go of both + and - keys (and now I forget the order) you either have to first choose 1 and then 1 again as the menu choices, now on the 49G+'s screen, or first unplug and replug the USB connector and then do the menu. Then it should start to very quickly update your ROM. It was fast!

EDIT Uh, did you say you have a Mac? Then the above may not apply at all!

No, it doesn't apply at all. Is there any reason why HP doesn't support Macintosh, besides wanting to kiss Bill Gate's butt?

Can we please stop the childish comments (like "besides wanting to kiss Bill Gate's butt?") ?

The main reason is probably marketshare. How many windows PC's are there vs Apples?

Although my wording may have been flowery, it does describe the attitude of Microsoft, doesn't it? What do you think the Department of Justice's anti-trust suit is all about?

As for market share, it's true that Mac users are a minority. But not as little as you probably believe. And even HP doesn't mind taking money from Mac users. Last time I checked, they still make laser printers that support _both_ Windows and Macs.

Re: SD card on 49G+

*Message #20 Posted by **James M. Prange** on 28 Oct 2003, 5:42 a.m.,*
in response to message #19 by Ernie Malaga

Well, Ernie, I agree that HP calculators should work with non-Microsoft operating systems. And they should make it clear just what operating systems are needed to support the device.

But I expect that it's a matter of getting the product on the market in a rush, rather than pressure from Microsoft or any desire to kiss up to Bill Gates.

Re: SD card on 49G+

*Message #21 Posted by **Tom Scott** on 27 Oct 2003, 9:23 p.m.,*
in response to message #1 by Ernie Malaga

I had a similar problem attempting to update my 49G+ ROM using an SD card which came formatted. After no success, I took my card (and card reader) to a neighbor's house and he reformatted the card using his PC A(running Windows 2000 Pro). After that I was able to do the ROM upgrade successfully. I still get some garbage on the SD when viewing it with the 49G+ filer. I assume this is put there by the Mac even though it doesn't show on the Mac Finder.

At any rate, if you can, I would suggest that you get your card reformatted. It worked for me.

Re: SD card on 49G+

*Message #22 Posted by **Ted** on 28 Oct 2003, 2:05 a.m.,*
in response to message #21 by Tom Scott

Well, the other way around: at least MAC does support Windows- there is a program called 'Virtual PC'. Gives the MAC user a full fledged Windows desktop and environment that works just like the real thing. I use it for all the PC stuff that I still want to download, etc

Maybe this would be a solution for Ernie's problem?

Only if I could find somewhere I copy of Virtual PC that is _not_ for OS X. I use 9.2, and apparently that's that. And I'm reluctant to sink another $200 on this project.

It was a nice thought, though. I checked my old CDs and found a very old copy of SoftPC. I tried installing it on the Mac, but it doesn't work anymore. Maybe SoftPC was created for a much older version of the Mac OS -- like OS 8 or even 7.

Thanks.

Re: SD card on 49G+

*Message #24 Posted by **Tom Scott** on 28 Oct 2003, 2:58 p.m.,*
in response to message #23 by Ernie Malaga

I still think that the SD card formatting is the key to your dilemma. No matter what format it has now, I would recommend getting it reformatted with a PC runnning Windows (more recent that Windows 98). This has solved the problem for me and (apparently) several others who have posted on comp.sys.hp48 forum.

woodstock keyboard repair

*Message #1 Posted by **hugh** on 27 Oct 2003, 12:41 p.m.*

how weird and wonderful it is inside the woodstock. with those little connector fingers. unfortunately it doesnt appear possible to dismantle the keyboard. however there are small holes through which to see the back of the keycap making contact. presumably this is where dirt gets in.

i am trying to restore the keyboard to full function. most of the keys work, but those near the bottom, in particular the number 3 are not behaving. if i press really hard the key works, so i figure its a bad contact with the key itself.

does anyone have any suggestions. i thought about giving the keyboard a bath, since all the (other) electronics can be easily disconnected.

thanks for any help.

49G+/Mac: Next Question

*Message #1 Posted by **Ernie Malaga** on 27 Oct 2003, 11:20 a.m.*

I really wish HP wouldn't make things so complicated. I just checked their site (www.hp.com), looking for a place where I could download the update for my new 49G+.

Guess what? HP must be in bed with Bill Gates. Apparently you are expected too. I couldn't find a link for Macintosh users.

Thanks to the forum members, I now have an SD card and a reader -- but HP has placed a new roadblock on Mac users. Could some kind and understanding soul **please** point me in the right direction? My 49G+ is at version 1.2, the display flickers, and the batteries probably won't last much longer.

Help!

-Ernie

*Message #2 Posted by **Tom Scott** on 27 Oct 2003, 3:05 p.m.,*
in response to message #1 by Ernie Malaga

You have to download the *.exe and extract the necessary files from that. I used a PC I had on hand and then sent the appropriate files to my Mac. If you would like, I could e-mail the files (approx. 1.2 MB) to you.

That would be great. Two things, though:

1. If you can distribute the files in a non-.EXE format, why can't HP do the same?

2. I hope the files make it through the e-mail. Some ISPs limit the size of e-mailed files, and I'm not sure that's the case for my ISP (Earthlink).

My email address is kajzero AT earthlink DOT net. Thank you!

> Quote:
>
> check out my comment above. The problem of PC stuff for MAC guys like us will always be there. Go buy Virtual PC.

I'm aware that the problem won't go away. But at more than $200, Virtual PC is too much for me right now. Besides, Micro$oft only makes it for OS X, apparently... and I'm using 9.2. I just downgraded my Mac from 10.2.6 to 9.2 after having too many problems with crashes, freezes, and general slowness of OS X.

Maybe I'll find somewhere an old copy of SoftWindows or Virtual PC.

Thanks for your reply.

Re: 49G+/Mac: Next Question

*Message #6 Posted by **JT** on 28 Oct 2003, 2:19 a.m.,*
in response to message #3 by Ernie Malaga

Ernie,

The tool "cabextract" will allow you to extract the contents of the ROM update file on a non-Windows machine. I've not tried it on a Mac (only Linux), but I've found some webpages that imply that it compiles and works OK on OSX.

The source is available here: http://www.kyz.uklinux.net/cabextract.php

This is not an elegant solution, but it should be able to get the job done.

If this tool doesn't work out, or the ROM doesn't survive the email, post a reply and I'll put the file on the web and email you a link.

Good luck

49G+ -- FACTORS Has Bug?

*Message #1 Posted by **Paul Brogger** on 27 Oct 2003, 10:24 a.m.*

If I pass a prime number to FACTORS on my 49G+ while the Angle Measure mode is set to degrees, it asks permission to set radians mode, and halts if I don't allow it. (Example: With trig mode set to degrees, enter "997 FACTORS" <enter> .)

This seems weird, unless there's some mathematical algorithm for determining prime-ness that involves trig. (And even *then*, should it require a particular mode setting???)

Has this been a problem on the 49G?

Just curious . . .

Re: 49G+ -- FACTORS Has Bug?

*Message #2 Posted by **Arnold Steekelenburg** on 27 Oct 2003, 11:18 a.m.,*
in response to message #1 by Paul Brogger

The 49G acts the same.

Re: 49G+ -- FACTORS Has Bug?

*Message #3 Posted by **Arnaud Amiel** on 27 Oct 2003, 11:19 a.m.,*
in response to message #1 by Paul Brogger

This is a known problem, as well as going into complex mode when it is not really needed. People have been complaining a lot about this but hp didn't do anything. I am wondering if anyone is actually doing much work on the CAS since the first bugs of the 49 have been fixed about three year ago.

Arnaud

PS: All questions regarding the 49g+ are better addressed to the newsgroup comp.sys.hp48. This forum would rather deal with problem with older calcs, it is a useum after all.

Re: comp.sys.HP48 -- How do I subscribe?

*Message #4 Posted by **Paul Brogger** on 27 Oct 2003, 11:29 a.m.,*
in response to message #3 by Arnaud Amiel

Please forgive my newbie-ness -- I haven't spent much time with or about newsgroups. I've taken a look, but don't see anything about how to subscribe or join. I must be missing something . . . (and, not doubt, it should be obvious!)

Re: comp.sys.HP48 -- How do I subscribe?

*Message #5 Posted by **Arnaud Amiel** on 27 Oct 2003, 1:48 p.m.,*

in response to message #4 by Paul Brogger

Welcome to the hpcalc world

Either your ISP has some news server and he will explain you how to use USENET, which is the newsgroups.

Or you can use Google's, just go to http://groups.google.com and in the search type comp.sys.hp48

That is the discussion group dealing with all matters related to new and recent hp calculators. You will certainly learn a lot by following comp.sys.hp48

Arnaud

PS: in case you don't know, you might also like http://www.hpcalc.org

Re: Thanks for the "Welcome"!

*Message #6 Posted by **Paul Brogger** on 27 Oct 2003, 2:02 p.m.,*
in response to message #5 by Arnaud Amiel

Thank you. I've always known that comp.sys.HP48 exists -- I've just never got 'round to digging into it.

And I encountered hpcalc.org 'way back -- a great resource.

Thanks again!

Re: Thanks for the "Welcome"!

*Message #7 Posted by **James M. Prange** on 27 Oct 2003, 7:19 p.m.,*
in response to message #6 by Paul Brogger

Google is great for its archives. By doing a search of the newsgroup on Google, you can avoid asking the same question yet again, and also find answers from experts who no longer participate. Note that a good deal of the design of the current RPL calculators goes way back at least to the 28C. You'll probably look a lot smarter if you search for an answer before you ask a question.

But the last time that I checked, there's a several hour delay between updates of Google's server, so for active participation it's not so great.

Your ISP should, of course, allow you to read and post to the newsgroup, but I find that my ISP's server is sometimes rather slow in getting updates, and on rare occasions isn't updated for a few days. Lately, I've been having a lot of trouble trying to post anything through my ISP's server. My ISP agrees that there's a problem, but I guess that it's not a high priority item; weeks later, it still hasn't been fixed.

The best "web-based" *free* newsreader that I've found is at http://mailgate.org/. To use it, you do have to register and agree to its "Terms of Service". Trolls and spammers may find the terms of service to be onerous, but I expect that most would find them reasonable. Read the legalese for yourself. And you do have to login every time; hopefully, your browser will make that easy enough. Note that Mailgate does do at least some filtering; I don't see the obvious spam on Mailgate.

But reading the news on a web-based newsreader has some disadvantages. For example, you

won't be able to use your own filters, and you'll probably see things with a proportional font.

After you've registered with Mailgate, you can use your own newsreader with the server "newsreader.mailgate.org", rather a better experience in my opinion.

Regards,
James

Re: comp.sys.HP48 -- How do I subscribe?

*Message #9 Posted by **Paul Fox** on 27 Oct 2003, 4:56 p.m.,*
in response to message #4 by Paul Brogger

I wouldnt worry too much. Despite having used usenet since the mid 80's I actually mostly use groups.google.com to browse/post. My news provider is bad at providing anything approaching reliability and is actually a good test of news clients to handle the often baroque errors one gets. (Program fault - core dumped being a common reply when asking for a news item).

This site is privately run and I guess the curator might be upset to see the 'Museum' nature of the site being used for high volume current rants. But all material posted here is invaluable for the future. When we all look back in 5 or 10 years, these insights into a new calculator arrival will be very educational.

HP48/49 graphics

*Message #1 Posted by **Francesc Casanellas** on 27 Oct 2003, 8:19 a.m.*

Does anybody know how to load graphics (i.e. a 131 x 64 bitmap) from a PC to an HP48 or 49?

... and how to add labels (text) to a graphic on these calculators when you are in PICTURE mode?

Edited: 27 Oct 2003, 12:12 p.m.

RTFM ;-)

*Message #2 Posted by **Raymond Del Tondo** on 27 Oct 2003, 1:22 p.m.,*
in response to message #1 by Francesc Casanellas

sorry, couldn't resist.

Seriously, all this is explained in the manual. If that isn't sufficient, take a look at www.hpcalc.org , THE software and documentation site for the HP-48 and others.

Raymond

Re: RTFM ;-)

*Message #3 Posted by **Francesc Casanellas** on 28 Oct 2003, 2:03 a.m.,*
in response to message #2 by Raymond Del Tondo

Perhaps it is explained in the HP49G+ manuals but could you tell me in which page of the HP49G or HP48G manuals have you found:

- convert bitmaps (as the ones made with Windows Paint) to an HP48/49 GROB (pass them later to the calculator, of course, it is explained). - add text to a GROB (I mean any text, not coordinate labels).

which were my two questions?

I have downloaded the two HP49+ manuals and at first glance have no seen answer to my 1st question. A "bitmap" search gives no answer.

Edited: 28 Oct 2003, 2:31 a.m.

Re: RTFM ;-)

*Message #4 Posted by **Joesph** on 28 Oct 2003, 2:39 a.m.,*
in response to message #3 by Francesc Casanellas

XnView should do the trick - google for it.

Re: RTFM ;-)

*Message #5 Posted by **James M. Prange** on 28 Oct 2003, 2:43 a.m.,*
in response to message #3 by Francesc Casanellas

Well, coverting from a file made on a PC to a grob may be just a tad more complicated than simply transferring a grob. Try a search at http://www.hpcalc.org/.

Sorting on a 12C

*Message #1 Posted by **Katie** on 26 Oct 2003, 11:11 p.m.*

In playing around with the good old 12C I realized that it has indirect register access. You can use the CFj and RCL CFj functions to store and recall indirectly through the n register. Furthermore it does a pre-increment (for CFj) and post-decrement (for RCL CFj) before the store and recall, respectively.

So just to see if this was at all useful I wrote a simple (bubble) sort program in only 21 bytes! It's easy to use, just fill up registers 0 - n with your data and call the program with n in the x register.

Here it is:

```
01      STO i                   i = maximum register
02      1
03      STO n           A:      n = 1
04      RCL CFj         B:      y = A(n)
05      RCL CFj                 x = A(n-1)
06      x<=y                    if (x <= y)
07      x<->y                     swap x,y
08      CFj                     A(n-1) = x
09      Rv
10      CFj                     A(n) = y
11      RCL i
12      RCL n
13      1
14      +                       n = n+1
15      x<=y                    if (n <= i)
16      GTO 03                    goto B
17      2
18      -                       i = i-1
19      x=0                     if (i = 0)
20      GTO 00                    return
21      GTO 01                  else
                                  goto A
```

in response to message #4 by Patrick

Patrick wrote:

"Very nice, Katie. It only took... what? ... 21 years for someone to realize this?"

Not to belittle Katie's amazing sort in 21 steps, but seems to me you're implying that the possibility of using CFj in the HP-12C to achive indirect addressing of registers is a new discovery, unrealized for 21 years.

If that's what you mean, that's not the case. My "Serendipitous Solver" article, published in Datafile V21N2, (March/April 2002), 18 months ago, did include a program to evaluate and find roots of arbitrary polynomials in the HP-12C which already uses precisely this technique to indirectly access the storage registers where the coefficientes will be stored (see lines 05 and 12, as well as the description of the uses of CFj and CF0 in the article). I've seen no previous examples of this technique being used elsewhere, but it's quite possible that I wasn't the first to use it for practical purposes. In any case, it doesn't qualify as a new discovery.

All the same, kudos to Katie for its magnificent sort program. It would have made a superbly good challenge for all of us HP-12C lovers ("Given a set of n values stored in registers R0 to Rn, try and write a sorting routine in 21 bytes or less") :-) !!

Best regards from V.

Re: Sorting on a 12C

*Message #6 Posted by **Katie** on 29 Oct 2003, 6:22 p.m.,*
in response to message #5 by Valentin Albillo

Valentin,

I hadn't seen your polynomial solver before, it's a wonderful use of indirect storage on the 12C! I did some looking around on the web when I first realized the usefulness of the CFj functions but couldn't find any reference to using them for indirect access. I was pretty surprised since there are so many clever people out there playing around with these things. I'll bet that someone, somewhere has been using this "feature" for 20 years and has even written exactly the same sort program that I did. I've come to realize that nothing in computer science is really unique. (My philosophy after doing this stuff for far too long.)

Hi Katie,

Now go and implement my favorite sort... heapsort.

Re: Sorting on a 12C

*Message #8 Posted by **Katie** on 29 Oct 2003, 12:21 a.m.,*
in response to message #7 by David Smith

David,

You might be able to write a heap sort on the 12C (or more likely the 12C platinum) if it had just a bit more register memory. Amazingly, you can structure register memory as a linked list on the 12C using the byte of memory where the cash flow counts are stored (Nj) and, of course, you can access this indirectly. There's a complication with this, however. When you use CFj it automatically sets Nj to 1 overwriting what you ave stored there, bummer.

-Katie

HP-41CV vs. HP-41CX: 12KB vs. 24KB

*Message #1 Posted by **Chris Catotti (Florida)** on 26 Oct 2003, 10:20 p.m.*

I was looking through my HP stuff and came across an advertising booklet (HP 5954-1474 12/87) ***Selling Hewlett-Packard Calculators*** .

While describing **The HP-41/CV/CX Advanced Programmable Calculators** it states:

> Quote:
>
> - 24K-byte operating system (HP-41CV has 12K)

I guess they must be counting the TIME MODULE and EXTENDED FUNCTIONS modules as 8K more. Is the TEXT EDITOR the additional 4K, or did I miss something? What is the mainframe address structure (please review in case I missed something) following the 4K page concept and numbering 4K blocks as Hex 0 through F.

Thanks!

Re: HP-41CV vs. HP-41CX: 12KB vs. 24KB

*Message #2 Posted by **Monte Dalrymple** on 27 Oct 2003, 12:14 a.m.,*
in response to message #1 by Chris Catotti (Florida)

Pages 0, 1 and 2 are the "mainframe ROMs" Page 3 is the CX X functions Page 5 (bank 1) is the timer module Page 5 (bank 2) is the new CX timer and X functions

executing the enbank 2 instruction in either page 3 or page 5 enables bank 2 in page 5. powoff puts everything back to bank 1.

HTH, Monte

HP 32S vs H 32SII

*Message #1 Posted by **John Beckwith** on 26 Oct 2003, 1:00 a.m.*

I have not followed the progression of HP calculators much over the last 25 years since I got out of college but have tried to make up for lost time since I found this HP museum's website. My HP 45 that I bought in 1974 is still serving me well and is used every day at work.

I have been saddened recently to find out that HP really seems to no longer make what I would consider to be a good scientific calculator that STILL USES RPN!

As a result I have decided to buy an HP 32S and maybe an HP 21 or 42S as well (E-bay perhaps). I have a 9 year old son and want to get something that he might be able to use later. I know the HP 21 somewhat as I have used the one my sister has that she bought when she was in college but really know nothing about the 32S (or 42S for that matter). I sure hope that HP will bring out something before he gets to high school and college.

Anyway, to the real reason for my post. I have a basic question about the 32S. It seems that there are 2 versions; a 32S and a 32S series II. What are the differences? I have looked over this website but can not seem to find anything on the difference in the 2 versions.

Besides that, does anyone have any comments regarding my quest involving these calculators or have any suggestions on these or any other models?

Sincerely,

John Beckwith

RPN Calculators

*Message #2 Posted by **John Limpert** on 26 Oct 2003, 1:40 a.m.,*
in response to message #1 by John Beckwith

How much money do you want to spend? If price were no object, I would get an HP-15C or HP-32SII. Those are both compact scientific RPN calculators with plenty of bells and whistles. The problem is that the prices on those models reflect their desirability and scarcity. If you don't mind a larger calculator, you can find some good deals on the HP-28C/S, HP-48S/SX and HP-48G. I think the HP-48S/SX is an excellent value if you don't mind its incompatibility with some of the programs that are written for the HP-48G/GX. The problem with the LED models is the rechargeable battery packs. They eventually fail and they have to be rebuilt, since new battery packs are no longer made by HP.

in response to message #1 by John Beckwith

Hi John,

I have one of each: 32S and 32S II, and I'll provide you a brief--but by no means expert--answer. The 32S II

has two shift keys, vs. the one shift key on the 32S, so a lot of the keys on the 32S II have double shift functions. The 32S has a lot of menu driven features, which eliminated the need for double shifted keys, and made for a really clean keyboard to boot. The 32S was not in production for a long time, and when it was replaced by the 32S II HP "unburied" a lot of functions that had required digging into a menu for access. For example, on the 32S II the factorial is left shift > 1/x, whereas on the 32S you access it through a menu that is brought up as shift > prob. The stat functions are improved on the 32S II with the introduction of sample standard deviation in addition to the population SD available on the 32S, the 32S II has fraction capabilty and a few conversions (cm/in, kg/lb, Celsius/Fahrenheit). A really obvious difference is the perenthisis on the 32S II, which are used in programming equations with an + sign.

Both are great calculators. Do have a look at the HP 33S (see Samson Cables), for example. This is the replacement for the 32 series, and you'll find many postings in this forum, mainly concerning it's rather odd appearance. Chevron-shaped keyboard or not, I'm looking forward to getting one in my hands.

Best regards, Jim

Re: HP 32S vs H 32SII

*Message #4 Posted by **Tom Sherman** on 26 Oct 2003, 9:57 a.m.,*
in response to message #1 by John Beckwith

John,

A striking difference between the 32S and the 32SII is the fact that the 32S uses an RPN-entry solver, whereas the 32SII uses algebraic entry for its solver. In my opinion, the algebraic solver is much easier to use, even for RPN enthusiasts. For example, if you want to put Newton's second law into the algebraic solver, you just write in f=m*a. To do the same in the RPN solver, you have to write f[enter]m[enter]a*-. The RPN solver does not allow equations to be written (it has no = sign), so equations have to be converted to expressions by subtracting one side of the equation from the other. An excellent explanation of the RPN solver on the 32S is given on the HP Museum site under the description of the 32S.

The best algebraic solvers, in my opinion, are found on the 27S and 19BII calculators, but these models are not otherwise programmable. If you have not used an algebraic solver before, it is almost indecently easy and convenient. It takes the place of having to write, for example, a BASIC program to do the same thing. The solver will numerically determine an implicit variable, even when there is no means algebraically for making the variable explicit. For example, in the equation R^x = S^x + T^x, given values for R, S, and T, it will find x, even though there is no algebraic means for solving for x, that is, for putting x explicitly on the left-hand side of the equation.

Another difference between the 32S and the 32SII is that the the 32S has only one shift key, and makes greater use of menus on the screen. The 32SII has two shift keys, uses fewer screen menus, but has a more cluttered keyboard. I find the 32SII keyboard a little hard to read, but I think the algebraic solver makes up for it.

Tom

*Message #5 Posted by **Erik Ehrling (Sweden)** on 26 Oct 2003, 2:15 p.m.,*
in response to message #1 by John Beckwith

A radical suggestion: How about considering buying a HP-42S instead of a HP-32SII? It might be slightly more expensive on eBay, but it has much more memory (7.2K vs 384 bytes) and a two line graphical LCD. Also, as it is program compatible with the HP-41CV there is a much larger program base for it. Of course, it is ultimately a question of taste, but personally, if I had to choose between the HP-32SII and the HP-42S I would definitely prefer the latter...

Regards, Erik Ehrling (Sweden)

Re: HP 32S vs H 32SII (worse with every new model)

*Message #6 Posted by **Norm** on 26 Oct 2003, 3:17 p.m.,*
in response to message #1 by John Beckwith

Although many will disagree, I recommend the basic HP-32S, even though it was not produced in large numbers and may cost more to locate a used one.

* * * The reasoning:

A calculator is not supposed to do an infinite amount of tasks. It is used for simpler things. If you want to do something really complicated, you'd use a PC instead.

THEREFORE, the HP-32S is a nice little package of 'just the right stuff'. The keyboard is not too complicated. The single shift key (orange button) lends itself to clarity and understanding. Whereas the HP-32Sii is annoyingly complicated just by looking at the two shift keys and the humongous amount of stuff on the keyboard. I have a "fleet" of HP-32S units that I keep kicking around the house. About 3 or 4 of them last time I counted. I just grab the closest one to do some calculations, and save the HP-34C for special occasions, like bringing out finest red wine.

Another negative about HP-32Sii is that they kept moving production around to cheaper & cheaper facilities, and plenty of the later versions have got painted key legends that aren't as bold and can rub off with usage.

= = = = = = = > > > >

As a rule of thumb (setting aside the 41C for a moment as in a world of its own) HP calculators got worse with every single model release. HP-34C was the best of all, a stunning marvel of cosmetic cool-ness and a concise vision of what it was supposed to do, all in the prehistoric "relays & diodes" era of about 1979.

In other words, a graph of the "desirability" of the scientific calculators from HP looks like a ski slope.

So then came HP-32S, which gave us the long battery life and slim profile, via LCD and CMOS, but with a feeling of cheapness and a tendency of the display to fill up with dust & dirt because HP was too indifferent to seal it up properly. And an entirely "disposable" design philosophy, which means you aren't going to have much luck cleaning up a dirty one.

NEXT came HP-32Sii, which over-cluttered the keyboard with a bunch of 'stuff' (metric conversions, or whatever) and which pioneered rub-off key legends in the later models. Therefore, HP-32Sii is worse than its predecessor.

THEN THEY DISCONTINUED ALL THE SCIENTIFIC CALCULATORS (that's about when yours truly showed up at HP Museum) of course, what's worse than not having an HP-32Sii ?? Why, having no calculator at all. So that is what HP did in order to maintain the downward slope on our calculator graph.

NOT TO BE OUTDONE, HP has continued the trend. What could be worse than having no calculator at all? Why, an HP-33S of course. :o| Featuring a keyboard bent into the shape of a Chevron gas station emblem, you would be better off owning no calculator at all, than owning an HP-33S.

If HP continues the trend, what types of features will be offered AFTER HP-33S ?????? keys with no legends? no keys? Vulcan mind-meld interface ?

Re: HP 32S vs H 32SII (worse with every new model)

*Message #7 Posted by **Frank B. (Germany)** on 26 Oct 2003, 6:22 p.m.,*
in response to message #6 by Norm

I think it's just a matter of personal taste. I believe HP's calculator design peaked with the 15c and the 42s. I own a few HP calculators, and most of them are under display in my living room. But all my Spices are well hidden in a drawer because I think they are among the ugliest calculators HP ever produced.

Regarding the 33s: Has anybody tried this calculator yet? No? So nobody knows about keyboard quality or how one can work with this new keyboard design. Maybe it is much more ergonomic than the older HP designs. Maybe not. To tell one has to try one.

Frank.

Norm posted:

"HP calculators got worse with every single model release. HP-34C was the best of all, a stunning marvel of cosmetic cool-ness and a concise vision of what it was supposed to do ..."

Surely you're not being fair to the HP-15C, are you ? I'm a big fan of the HP-34C, wrote a whole "Solutions Book" for it (published by HP, "Advanced Mathematics") and know the machine inside out, including its "synthetics", so to speak.

But certainly, the HP-15C is a much better machine in all counts: better physical construction and reliability, no weak parts or "Achilles' heel" points at all, far smaller, lighter and thus 'pocketable', its batteries last decades instead of hours (no charger), much larger memory, much more advanced functionality (matrices, complex numbers), better display, etc, etc, etc.

I concede that everyone's entitled to his own opinion and tastes, but your statement "HP calculators got worse with every single model released" seems to me absolutely wrong and unfair when applied to the former HP-34C and the later HP-15C. The HP-15C certainly was a better model than the 34C, and denying it or ignoring it is just futile and unreasonable.

Best regards from V.

Hello V. Albillo, yes you are right that 15C is good. I have no problem with it.

Of course if not for oversimplification, I would not have a situation to turn into a posting. To presume they always get worse, one must conveniently forget about 15C and also 41C.

Wasn't 15C a bridge between 34C and 32S ??? But they kept making 15C for awhile.

Hi, Norm:

Norm posted: *"Hello V. Albillo"*

You can call me "Valentin", if you want to ... :-)

"Wasn't 15C a bridge between 34C and 32S ??? But they kept making 15C for awhile."

Yes, the 32S and the 15C overlapped for a few months before the 15C was finally discontinued, but no, the 15C was never intended as a bridge between the 34C and the 32S.

The whole Voyager series (11C, 15C, ...) was a 'stopgap' series while the "Titan" project continued. This "Titan" was intended to be the 41C successor but in the end it became the HP-71B instead. The 15C was then meant to be the most advanced, small pocketable pure calculator ever, so the very best algorithms known to man (or even invented rigth then, for the purpose) were implemented on its hardware, to ensure the utmost feasible precision for every operation and function, from hyperbolics to complex-valued operations to matrices. They fully succeeded an the rest is history. You can read a lot about it in this very interesting paper, of you haven't seen it already:

Mathematics written in sand

As for the 32S, it's not quite the 15C's sucessor (that would be the 42S), and though it's much faster and has some other desirable improvements, it regrettably lacks many important 15C's features such as comprehensive, integrated complex-number functionality, matrix operations, and larger RAM, among others.

Matter of fact, you can fit much larger, more complex programs in the 15C than you can in the 32S, and using the SOLVE and INTEGRATE features won't leave you absolutely starved for memory for the expression you're trying to solve or integrate, let alone if you want to include those advanced features in a program !

The conclusion is: far from being a bridge, the 15C is actually a far more powerful programmable calculator than the 32S is, and so you can attack much more complex applications with it, albeit more slowly. The 42S is the real sucessor to both the 15C and the 41C, even though it still lacks some important features that the 15C has (try to enter 4 complex numbers on the RPN stack at a time)

Best regards from V.

Message #11 Posted by ***Paul Johnson*** *on 27 Oct 2003, 12:30 a.m.,*
in response to message #1 by John Beckwith

I would NOT recomend you buy a 'vintage' HP RPN calculator for your 9 year old. The current prices reflect the fact that they are collectors items, not to be carelessly tossed into a kid's backpack. I've got 3 kids in college, and one in high school. When my kids 'needed' a calculator for class, it generally involved a graphics model, specific to the class. The same calculator used by the rest of the class (and the teacher) was highly recomended. Before that time comes, a $9.95 algebraic will probably take care of most of your son's immediate needs.

You really hit the point: "..HP really seems to no longer make what I would consider to be a good scientific calculator that STILL USES RPN!" Everyone visiting this site has been singing this song for several years! Don't hold your breath for the 33s. If it is just another dying ember of the RPN funeral pyre, you won't miss anything. If it takes off and finally turns HP calculators around, it will be available for a while, at least until it's

replaced by a better model. Before you place too much hope in that happening, repeat that point you already made, and repeat it again until you understand it. Don't expect a miracle. HP's calculator future has been all too clear for the past few years.

By the time your son gets into college, don't plan on him looking to 15 or 20 year old calculator technology to meet his needs. The calculators available then will no doubt be more advanced then those we have today. I expect that he'll have more of a pocket computer than a pocket calculator.

If you want a "good scientific calculator that STILL USES RPN", by all means look for a vintage bargain. Use it, but also take care of it. It may have to last a long time. As for your son, unless he expresses an interest in collectable calculator, I'd look towards a newer model.

Wait.... go ahead and give one to your kid (long)

*Message #12 Posted by **Norm** on 27 Oct 2003, 5:30 a.m.,*
in response to message #11 by Paul Johnson

Suggest that one could indeed teach a kid to appreciate math with use of an HP-32S, HP-32Sii etc. And if the kid knows RPN and can crunch numbers effectively with such a calculator, he will be ahead for life.

Though not my favorite, the abundant quantity of HP-32Sii would make it an ideal choice, with an ongoing used supply. (HP-32S my favorite, though smaller pool of surviving units). Face it..... functional working HP-32Sii will be available for the next 50-60 years, that's long enough for your kid if he wants to own a couple of them in his life.

Usage of the "RPN" calculator has value all its own..... it is a tool that can be used. It is like a good milling machine or a good skilsaw. It does not go obsolete. Its value does not diminish with time. It cannot be made obsolete anymore than the laws of physics (F=mA, KE=1/2mv^2 etc) can be made obsolete. Supposed plan to come up with something "better" will not work when the original was already all you need... how do you come up with "better than" F=ma for example. Same with an HP-32S .

Casual number crunching with a calculator is an absolute requirement that will not change. It must be done effectively and efficiently. RPN is a must. Keyboard that does not look like a cowcatcher is a must. Since space aliens from the planet Zargon took over HP, and they don't make the right item anymore, give your kid something real..... give him the 32Sii for example, and tell him "this is it" it can meet his needs for a lifetime.

SURE your kid will have plenty of teachers who demand he use the latest flim-flam piece of junk that is free at the bottom of the Cheerios box.... yeah, a TI-83 or whatever, and yes, he will have to use it for that class. For long-lasting personal use, a 32Sii could last for life however. I already got a chuckle how the only kid I am in contact with who has a TI graphing calculator???? here was what he said..... played video games on it.... until it busted, and no it didn't heal itself... its still busted. Hmmmmmmmmm thats not how it went when I dug deep and bought my HP-34C brand new from a discount NY camera shop back in 1980. I learned and learned, and no it didn't bust.

Prices for HP-32Sii remain sky-high on eBay, probably because it is the most abundant and available choice if somebody wants to keep working with the 32Sii long-term with no factories producing it.

****

HEY about various posters here who defend marketeers as these brilliant people? How come the marketeers dont recognize the sky-high eBay prices as proof of a huge marketplace for things like HP-32Sii ??? Wait I already know the skeptics answer. "Ahh all those 32Sii moving thru eBay?? Thats just a few crackpot collectors, a few loose lug nuts from eBay, just a handful of units going to wacked out OLD-HP enthusiasts". But I tell you waht..... you got a dozen or more units a week going thru eBay at

astronomical prices..... not to mention all the other models also... and that's proof of a deep, deep, long lasting interest in the product, and 100% proof of a market for a REAL scientific calculator same as they made before, the "old HP" style, the need is not diminished.

So get your kid that HP-32S, or HP-32Sii .

Would be a sad mistake [LONG]

*Message #13 Posted by **Valentin Albillo** on 27 Oct 2003, 7:58 a.m.,*
in response to message #12 by Norm

Norm posted:

"Suggest that one could indeed teach a kid to appreciate math with use of an HP-32S, HP-32Sii etc. And if the kid knows RPN and can crunch numbers effectively with such a calculator, he will be ahead for life."

He won't. He will be handicapped for life instead, not knowing well how to use nor being comfortable with anything except those ultra-rare, nobody-knows-them RPN things. Kids are already way reluctant of maths to tell them that instead of keying in:

```
COST = PRICE * QUANTITY
```

they must do it thusly:

```
PRICE, [ENTER], QUANTITY, *, COST, STO
```

Comparing RPN to 1980's primitive algebraic calculators is blinding oneself. Modern algebraic calculators are way more adequate to really understand and enjoy doing math.

"Face it..... functional working HP-32Sii will be available for the next 50-60 years"

Wrong. That's wishful thinking. All HP32SII (and all HP-15C for that matter) will be absolutely dead before 35-40 years have elapsed since they were built, due to unavoidable and irreversible aging of their electronics components, even if left unused and properly stored. That's still plenty of time, but saving a number of machines to ensure using one in a few decades from now on, is pathetically futile: all of them will be nonfunctional by then.

Usage of the "RPN" calculator has value all its own..... it is a tool that can be used. It is like a good milling machine or a good skilsaw. It does not go obsolete.

Wrong again. They ARE obsolete right now. Of course they can still be used profitably, and for some very special purpose applications they may be the only choice, but that's *despite* they being RPN, not *because* they are RPN. With today larger RAMs, displays and speeds, RPN has lost all its former superiority, and can even become part of the problem instead of the solution.

"Supposed plan to come up with something "better" will not work when the original was already all you need... how do you come up with "better than" F=ma for example."

See ? You wrote "F=ma" instead of "m, ENTER, a, *, F, STO" ;-) You see, you're right, then. Bettering "F=ma" is not possible, and "m, ENTER, a, *, F, STO" is not going to do it for most people :-)

"It must be done effectively and efficiently. RPN is a must.

Was a must. It isn't anymore. Can be used, of course, for all of us old timers is the preferred way, of course, but it isn't a "must" anymore for most anyone. If anything, most people consider it a "must

avoid" ...

"give your kid something real..... give him the 32Sii for example, and tell him "this is it" it can meet his needs for a lifetime.

For all the above reasons, neither "this is it" nor "a lifetime" are statements that can be reasonably justified.

"So get your kid that HP-32S, or HP-32Sii."

Anyone can do with their own kids whatever he feels best in educational matters, but for me, it would be a terrible mistake to try and make your children RPN fanatics. You'll be doing them a real disservice, and will only succeed in handicapping them for life in calculating matters.

For my own children, this is the approach I've taken:

- First, make sure they know how to use and program efficiently a modern, large screen BASIC-programmable calculator (like most any vintage SHARP), to the point that they actually like and enjoy solving their home assignments with it and even trying things on their own. The inherent easiness in doing calculations and writing simple programs, taking out all drudgery, will make wonders in reinforcing their feeling of success.

- Then, once the children actually like math and find themselves comfortable with the machine, I tell them there is an alternate system, called RPN, which works such and such, and they learn to use it as if it were kind of a game, a mere curiosity.

- Finally, they use the algebraic BASIC machine for most everything, though they can occasionally grab and use an RPN machine if need be. From time to time, I can show them how some simple program would be written in RPN, to propose them simple RPN programming tasks, as *intelectual challenges*, just for *fun*.

Want an example ? My 11-year old daughter was taught divisibility at school yesterday. One of her home duties was to find the divisors of a given, small number. She took her SHARP PC-1350 and produced this program within a minute:

```
10 INPUT "NUMBER ? "; N
20 FOR D = 1 TO N
30 IF N/D = INT(N/D) PRINT "DIVISOR = ";D
40 NEXT D
50 PRINT "NO MORE DIVISORS"
```

She pressed RUN, keyed in a number, and lo and behold, all divisors were duly displayed. Her simple, intuitive program was readily written and was extremely simple to understand, she even would go on to show and explain it to her classmates.

Do you think the RPN version would be so easily written, in such a short time, so intuitively, and so simply understood ? Do you think it would make the math look simpler ? Or would it instead be a problem in itself, obfuscating the simple underlying procedure with its cryptic, machine-like RPN code ?

RPN is Ok either as an intellectual amusement or real use for us old timers and fanatics of classic HP RPN and RPL machines, but to burden your 21st century kids with obsolete, long ago surpassed, machine-like notations ??? Trust me, forget it.

Best regards from V.

Edited: 27 Oct 2003, 10:06 a.m.

Hi again, Valentin (long)

*Message #14 Posted by **Norm** on 27 Oct 2003, 10:12 p.m.,*
in response to message #13 by Valentin Albillo

Hi again, Valentin.

I noted your comments about 15C being superior to 32S or 32Sii, and what you say seems believable enough.

Even if it has better complex number support, etc etc tell you a couple things I never liked about 15C..... the display width seemed a bit narrow, and, I never liked the thing being wider-than-taller. Sure I know some people like that.

For me it has to do with that my desktop space is limited, esp., say, if I was at a college wooden student desk, in some class. The 32S is taller than wider, and this is better suited to putting on the desk in front of me. To hell with the complex numbers..... I have seldom needed to crunch them using a calculator.

***** Now about kids and use of RPN, all I can say is for you to reply sentence-by-sentence, so eager to prove me wrong, well, I must surely be right just by how frantically you are typing. Guess I hit a nerve there?

I really don't agree with what you are saying. I advocate what I typed before. You say all 32Sii will be dead in 35 years not 60. That's just not true. As an electrical engineer, I know what are the components and which ones are going to age (and which ones are not). No I do not have a bill-of-materials for these units, but they should be doing just fine then. Frankly I am confident my HP-34C will be doing fine 60 years from now, and it is already 20 years old. (IT IS JUST THIS TYPE OF SITUATION THAT INFURIATES A CARLY FIORINA TYPE..... imagine a product still running 80 years after it was built..... I mean, you don't get to screw your customers and make them by the same thing over and over!!!!!!)

So from there, you are telling me that RPN is obsolete, NO i do not agree. And then you are making that classic error, equating a personal computer running BASIC, to a pocket calculator.

A computer is a computer. A calculator is a calculator. No they are not the same. They are meant to be different, Valentin. You can use them at different times for different tasks.

A handheld "jigsaw" from Home Depot is a "saw". A 3 foot diameter circular saw at a sawmill is also a "saw". Either of them is used to cut wood. Neither of them is inherently "good" and neither is inherently "bad". Neither of them is obsolete!!! Either of them is a "saw" even though they are used for completely different types of jobs.

RPN is NOT obsolete, an RPN calculator is NOT obsolete, and it is the finest available tool for specific types of jobs. BASIC on a computer is a fine tool for other types of jobs (quick little bits of software like you gave to your daughter).

I entirely and adamently disagree with your conclusions, and I absolutely would continue to advocate that teaching a kid an HP-32Sii would be a very very fine gift (not an 11 year old, no. We're talking about the last few years of high school).

Valentin, haven't you heard the stories lately from kids who ARE using 32Sii in their high school & college math classes? They get everything done FAST and walk out of their tests early. I think you should read a specific POST OF MINE that is on the "HP Museum memories forum"..... let's see..... its #178

Nothing's changed, dude, and nothing ever will. If you have a quick need to evaluate a formula, the RPN is the best way to do it. That's why the engineers invented it, and that's why the MBA/marketeers and others lacking technical expertise discontinued it. They discontinue things that work.

I absolutely do not see what you are talking about with your F=ma discussion. I use RPN and I compute things like that all the time quickly and efficiently. No I do not say " m enter a * STO" or whatever you were trying to come up with. Why would I use "STO" that is for storing into a register.

What you were saying really does not make sense. Thanks anyway though for replying and expressing your view . Check out #178 if you want to see where I am coming from. That type of story is unchanged to this day, it's still happening, its just that HP quit making RPN units at the factory, so we get to fight over used ones on eBay.

in response to message #14 by Norm

Hi Norm,

Thanks for your thoughts. As a fellow EE, it seems, at least at first blush, that you and I agree a bit about the uses of RPN and the difference between a CALCULATOR and a COMPUTER within a calculator.

I wrote and posted my ideas (interupted several times in the creation) about the different uses. No sooner do I post then I see your post.

It will be interesting to see what the next comments are.

Sincerely,

John Beckwith

Hi again, Norm [LONG]

*Message #16 Posted by **Valentin Albillo** on 28 Oct 2003, 6:13 a.m.,*
in response to message #14 by Norm

Hi again, Norm:

First of all, thanks for your mesurate and kind reply, I know that my position on RPN is not exactly popular in this forum, so I'm all the more grateful for you not flaming me outright. Now some comments:

Norm posted: *" I never liked about 15C [...] the thing being wider-than-taller. Sure I know some people like that."*

Sure. I do, and all the millions of financial users that did buy the HP-12C did also like it, a lot. It's 'classy' and neatly differentiated their expensive, horizontal financial HP calculator from the cheap-looking vertical concoctions used by the competence. That's one of the reasons why it sold in the millions, it marked differences.

"To hell with the complex numbers..... I have seldom needed to crunch them using a

calculator."

Perhaps it's just that as your beloved and much preferred HP-34C can't handle them, you simply resorted to other means when dealing with them. Because I can't believe that an Electrical Engineer like yourself wouldn't need to use complex numbers almost constantly for circuits computations. I know many, many EE, colleagues of mine, and all of them did own and used an HP-15C in their time, constantly. Till the HP-71B+Math ROM came (and then the 42S), it was the easiest and most efficient way by far to deal with complex numbers.

"All I can say is for you to reply sentence-by-sentence, so eager to prove me wrong, well, I must surely be right just by how frantically you are typing. Guess I hit a nerve there?"

Not at all ! :-) Replying sentence-by-sentence is just my style, I do it in all my e-mails, either in this forum or private, as you can easily see in the Archives. Also, I'm not in the least eager to prove you wrong, because these matters are nearly 'religious-kind', and trying to convince anyone or proving anyone wrong is just futile, doomed to failure, and serves no purpose. And finally, I don't type frantically at all, I've been typing all my life at tremendous speeds, and can write a message this long or longer almost as fast as I speak. If that makes you think you're right, well, what can I say ? :-)

"I really don't agree with what you are saying. I advocate what I typed before."

That's perfect with me. You're fully entitled to your own opinions, and I was just trying to offer you a set of arguments why I thought otherwise. You don't agree ? That suits me fine. Mine was a well-meant advice, if you don't want to take it, that's alright with me. Maybe you'll see things differently eventually, maybe not. It won't affect me in the least.

"Frankly I am confident my HP-34C will be doing fine 60 years from now, and it is already 20 years old."

What can I say ? I applaud your unfounded faith in such a possibility, but the chances are nil. Consider yourself fortunate if it will last another 20 years, at most. On the other hand, there will always be emulators/simulators available, so don't worry.

"Then you are making that classic error, equating a personal computer running BASIC, to a pocket calculator."

It's not an error on my part. Seems to me you've had little to no experience using handhelds other than HP, probably due to your extreme prejudice against anything not RPN. Should you have owned and get to know some of those machines, you'd see that they are handheld *calculators*, only using an underlying algebraic system instead of RPN, and BASIC as program language, instead of RPN-style programming. Saying they are not calculators doesn't quite cut it, even in the back of the machines themselves you can read "Electronic Calculator Model such-and-such". They do have an immediate mode, and specific functions on specific keys (LN, SIN, etc), so there's nothing to differentiate them from any other RPN *calculator* whatsoever. Saying they are not calculators but computers is a lame attempt to define them out of existence.

"I entirely and adamently disagree with your conclusions, and I absolutely would continue to advocate that teaching a kid an HP-32Sii would be a very very fine gift"

Fine with me. I fully respect your stand. Go ahead.

"haven't you heard the stories lately from kids who ARE using 32Sii in their high school & college math classes? They get everything done FAST and walk out of their tests early.

And how can you be so sure that their fast performance is due *just* to their using the 32SII ? Seems to me that a father giving his son a 32SII is *not* a typical father, much more likely to be a knowledgeable, technically-oriented father, that probably understands his math quite well, and can and will eagerly teach it to his son in clear terms, helping him understand the concepts. Evidently, such a child will perform better and faster at any test, but it's not so much due to their using an RPN calculator, but for the fact that his father has positively influenced his math learning and abilities, don't you think ? That being so, would you doubt that if same child with like kind of father be given a comparable non-RPN machine, wouldn't he perform equally well ?

"If you have a quick need to evaluate a formula, the RPN is the best way to do it."

Put it to test. Take some suitable formula (like Mach's number) and pit two boys, one armed with an RPN calculator and the other with some modern algebraic model he knows inside out, and test the times. For added panache, ask for immediate recomputation of same formula changing some parameter.

"That's why the engineers invented it, and that's why the MBA/marketeers and others lacking technical expertise discontinued it. They discontinue things that work."

That's an oversimplification and somewhat 'paranoid' :-) Products that don't sell are discontinued, if they sell they aren't. Take the HP-12C as an example. It's never been discontinued because it sold in the millions, while other wonderful similar machines such as the HP-15C and HP-16C just didn't so out they went. And the fact, whether you and me like it or not, is that RPN doesn't sell in quantities which justify sizable investments in research and marketing, and HP is a profit-driven company, not a charity. If it doesn't sell, fewer and fewer resources (i.e.: money) will be allocated to the product, and eventually it will be cancelled, period.

As for engineers inventing it that why, don't oversimplify: HP engineers of the time were confronted with the fact that RAM was incredibly expensive then (a mere 49 extra bytes meant US $100 or more), and ROM wasn't cheap either. So, instead of implementing a multi-level internal stack to hold the operands and operators in some algebraic expression to be evaluated, and having to microprogram in ROM the necessary parsing of the expression and hierarchy of operators, they simplified in a most elegant and practical way by using RPN instead: the user would do the parsing (thus saving space in ROM and microprogramming) and no hierarchy of operations would be needed.

All very neat, tidy, elegant, and above all, economically feasible, money-saving, space-saving. BUT (and a big BUT that HP has failed to sell to the masses) the user would be forced to DO the parsing from algebraic to stack notation *himself*, and would need to adopt a new paradigm.

As you well know, users were more than happy to do that at the time, given thay they would get better performance at a high but still affordable price. But nowadays RAM and ROM aren't a problem anymore, and users do not need nor want to do the 'parsing' themselves, you see. They just want results, and want them fast and effortlessly. Time for the machine to use its huge RAM and ROM and do the work instead.

That's why masses are shying away from RPN and that's why RPN is obsolete. I'm as sorry as you are, I've been programming in RPN for the last 27 years and still write RPN programs (have you seen any of my 34C programs ?). But I'm neither fanatic nor blind, and can perfectly see that there are much better ways of calculating and computing in a handheld, even a vintage one, let alone more modern units.

"I absolutely do not see what you are talking about with your F=ma discussion."

It was a well-meant joke.

"That you were saying really does not make sense. Thanks anyway though for replying and expressing your view."

Same here. Thanks again for your kind, articulate reply. I've always enjoyed your very funny postings, even if they are often somewhat 'on the far side', and, at any rate, how can I not like a person who's a fervent and passionate admirer and promoter of my beloved HP-34C ? :-)

Take care. Best regards from V.

Me & John vs. Valentin (LONG)

*Message #17 Posted by **Norm** on 28 Oct 2003, 3:45 p.m.,*
in response to message #16 by Valentin Albillo

Hi Valentin, it's good to trade a bunch of views on the chat board. Both of us are touch typists I tell you that for nothing. Maybe from here this will fizzle out a little don't have that much more to tell you. Your view that "RPN is obsolete" however is
(a) incorrect
(b) unpopular with the types on this chat board

although there are an increasing number of posters here who are thinking like you..... who aren't loyal to RPN but like the latest "cereal box" trinkets from "KINPO" (HP calculator made in China) . To that end, note a nearby post from "GE" he says "THIS IS A MUSEUM" and he doesn't want people talking about those newest cereal box toys. (GE's censorship will not work of course. A wild idea might be that Dave Hicks could have two chat boards..... RPN and non-RPN, though not enough posters to fill them both..... maybe many) chat boards divided by model number ??

I like what John says about "CALCULATOR" vs. "COMPUTER" and did he also infer "computer within a calculator" ?? (That last one a 49G with the little LCD screen etc etc) I stand by the view.... any is a saw.... cuts wood.... but you need different saws for different jobs.

HP (and some like Valentin) are enamored with the view that a calculator is now a "COMPUTER IN A CALCULATOR" (the graphing calculator craze). I don't agree. A calculator has a niche of evaluating little formulas. I have y=f(x) and maybe its some funny trigonometry formula and I want to evaluate it so that I can continue my design work with the numbers. That's what a calculator is for. Giving me a cheezy, terribly low-res graph on some 100 x 150 pixel (?) screen on a calculator is
(a) useless
(b) interferes with me getting my work done
because now the calculator is complicated, difficult to use, has a bunch of worthless chrome hood ornaments on it that are just getting in the way.

I start good debates on this chat board sometimes.... I bought a 48G+ (?) about 4 months ago..... used it for a couple of days... found it so atrocious I declared it rotten goods and got rid of it to the first taker (some guy in England, of all things). Its difficult and annoying to use, lacks bedrock foundational principles such as RPN and a clean, well-defined keypad.

Valentin you mentioned "thank you for not flaming" on this chat board. I've visited here

awhile.... this chat board has some of the most thoughtful and intelligent people I've bumped into..... would say that flaming is usually for more derogatory (and low-IQ) environments such as the stock market chat boards. So no need to say 'thanks' its been the way of it around here. So atrocious is the newest model (HP-33S) that I nearly started a flame-war a couple weeks ago... regretted it of course.

Valentin you object to my comment: "To hell with the complex numbers"..... I have seldom needed to crunch them using a calculator."

Let me elaborate..... my chosen engineering skill is analog electronic design (LaPlace transform analysis of LRC circuits, etc). LaPlace transforms specifically allow us to do much less evaluation overall of the complex numbers. We learn the underlying theory of what circuits do (a pole, a zero, a rolloff, a 3db point, a 20db/decade slope, a 40 db/decade slope) and the LaPlace transforms, although miserably complicated math, reduce it all to THE SIMPLEST OF ALGEBRA. Frankly I can do my 'complex numbers' on the 4-banger algebraic calculator on my wrist (CASIO CA-602) even though it has not even a "pi" button (the biggest detractor is lack of a square-root button) and the reason I can use it for complex numbers???

BECAUSE I KNOW THE THEORY IN MY HEAD, I was taught by very good professors, in the aerospace era, and I learned it the way they wanted me to. As a result, evaluation of formulas or learning is typically a modest and simple thing that is easily evaluated. In the simplest of cases, I could have one resistor and one capacitor and I want to know their 3dB breakpoint. Although this is entirely a result of two complex vector impedances varying with frequency, I know that the breakpoint is 1/2*pi*RC and I can do that on a 4-banger. THIS is my comment about I dont care about complex numbers on the 15C... its nice that it has them of course.... but if anything, means somebody didn't appreciate the great empowerment of the LaPlace transform theory AND PRACTICE as taught in the EE department.

Valentin wrote: >> I can't believe that an Electrical Engineer like yourself wouldn't need to use complex numbers almost constantly for circuits computations. I know many, many EE, colleagues of mine, and all of them did own and used an HP-15C in their time, constantly.

I stand firm by the "HP-34C" mindset and its extension into its obvious successors, 32S and 32Sii . If I did have two complex numbers and want to multiply them, etc., I can easily type the simplest of little programs into a 34C, use the registers and do that in seconds. I seldom need to.

Valentin wrote: >> I'm not in the least eager to prove you wrong, and can write a message this long or longer almost as fast as I speak. If that makes you think you're right, well, what can I say ? :-)

You are right of course, that was just an attempt to grab your necktie and use it to my advantage in this small scuffle :o)

To wrap up, I also stand by that there is no reason that a 32Sii wont function 60 years from now. Sure the keyboard could be "typed to death" like if the domes break apart. I dont use mine that much. The 34C can fail at its electrolytic capacitors (replace them with tantalum, those do not fail). The biggest problem with 34C is the silicon chips are too fragile in regards to static damage, and those are suffering atrition as we speak because people take them apart and blow the chips with their fingers. Equally bad, the "solderless" design (incredibly stupid manufacturing decision) gets corrosion at the solderless joints, the circuit opens, and the chips can be damaged or degraded just by running it in that condition. HOWEVER the 32S and 32Sii are very reliable, and probably don't even have electrolytic

caps in them. They will run 60 years from now. I am the EE, I win you lose. :o| And the 34C will run, but ONLY IN THE CARE of skilled people who understand its frail 1970's interior very well (I'm getting to be in that category now).

You mention that RPN was created ONLY DUE TO RAM BEING EXPENSIVE, etc etc. WELL, even if that was the original root cause of RPN, it's NOT THE REASON FOR IT. EASE OF USE IS THE REASON !!!!!!! It allows a person to quickly bang out results by holding the intermediate results in a "STACK". You advocate an "algebraic calculator" but this is so wrong it aint funny!! Why? Because you have to start an entire new step..... type in the formula as an abstract!!!!!!! You don't do that with an RPN calculator. If you have a formula, that's either in your head, on a chalkboard, or on a piece of paper in front of you. The formula stays there..... only the numbers go into the calculator, by typing keystrokes. IF I WANT THE FORMULA IN THE CALCULATOR then I switch it to "PRGM" mode and I type the formula in a "language" of typing the keys themselves (which are stored as the program). This is so georgeously simple (in comparison to the tedium that you are burdened with , typing formulas into that 100 x 150 pixel display) that the RPN wins hands down. I dont care if it cost $20 to buy a byte of RAM in 1965 and that's the reason, or whatever. RPN evolved to being the most convenient and simplest of calculating methods, because it was friendly to intermediate results and you DONT HAVE TO do all that baloney that 48G+ users do.

HEY one thing I can tell U.... EVEN IN THE DAYS like 1980 and at MOMENTS like in my "memories post" (#178??) THERE WERE UNBELIEVERS. This is like church, my friend. It's about whether you are going to "BELIEVE" in RPN or not. Some will just say "no way I dont believe, I worship some other God at some other church". Others keep the faith and show up every Sunday. Even at crowning defining moments that prove me right (memories post #178) NINE OUT OF TEN refused to believe in RPN. Well that's fine. The HP behavior to get rid of a wonderful thing, in a fit of corporate maliciousness, greed, selfishness, and non-attention to academic matters, leaves Mr. Hewlett and Mr. Packard rolling in their graves (hey are both of them dead, I dont keep track of all that) and is very unfair to those who DO BELIEVE.

You have also missed an important point that I often post here, Valentin. HP-15C, a calculator you like, was discontinued but HP-12C was not. This is a powerful statement AGAINST present HP management and the present rampage against RPN.

You said how fine that is (keeping 12c) because "HP-12C sells enough units, etc" . OK, then all that matters is profits and maximum greed and biggest pile of cash, right? Well for all who advocate THAT, you beter hope you don't get some weird brain tumor at some location in your head that only afflicts 150 patients a year and the only company that makes the unique probe or tool for it chose to provide the item NOT BECAUSE OF GREED but because they wished to solve an academically interesting problem and help some people on their way.

See, JOhnson & Johnson could be just like HP. They could say "well the largest cancer problem we've got is lung cancer, so lets sell tools only to fix LUNG CANCER and to hell with those funny little tools to fix all those other weird cancers, they were low-volume products and we can't stand those designers who work on that stuff anyway, so lets discontinue all that stuff and only sell the profitable LUNG CANCER tools because we sell millions a year of those"...

That would be foolish wouldn't it. For a corporation to do as HP has, which is to sell a product ONLY IF it sells millions of units and makes a giant pile of cash, is disgustingly irresponsible, juvenile, idiotic, and could originate only in the business school where they

draw funny little graphs of how to make the biggest pile of money (which is all they care about) and I regularly try to make that point on this chat board and typically nobody gets it.

OVER AT AGILENT they have all kinds of absolutely world-class EE instruments... say a microwave impedance analyzer. And it has some funny little machined jig that holds, say, a weird surface mount part. So that you can make the measurement. And maybe they sell.....what..... about TEN A YEAR of that little machined jig. So they make it available because its academically necessary. (Dont stop me I'm on a roll) Carly Fiorina's behavior is disgustingly selfish and juvenile by comparison because they wont sell it unless they are going to make this huge pile of cash on millions of units. Under Carly (were she dictator of consumer-land) there would be no Universities, and be no academia, be no albert einstein and be no e=mc^2 because its not profitable enough for her.

MY POINT IS NOT YET MADE.... HP-15C can obviously co-exist on the same production line as HP-12C. THEY CONTINUE TO MAKE HP-12C and the only difference is the programming in the chip, and the front keyboard. So that's about multiple products off the same production line, and its about incremental sales. ITS ALSO ABOUT enjoying the continuing return on investment, on a thing that was already designed. The decision therefore to CANCEL 15C while KEEPING 12C is an example of simple corporate maliciousness, selfishness, and petty vandalism against the EE, scientific, and academic communities. HOWEVER THIS SITUATION (discontinue 15C, discontinue 32Sii, etc) is NOT explained by your saying "RPN is obsolete". They were already designed, and people were buying them. Help me along here..... but surely hp-12C is RPN ??? Why not discontinue it then, since you clearly take the stance that RPN must be banished from the corporate factory production as well as by new learning of gifted young people??

OK, well, there's no flames here, no war here, just talk, and fast typists. And smiley faces :o) . Its been fun (though burndensome on our schedules) and there have ALWAYS been the unbelievers in regards to RPN, even in 1980, and they were always numerous. Its interesting how they took their warfare to the boardroom however and choked off the source (except for business people who can have their 12C).

ONE INCREDIBLE POINTER that you are wrong..... the continuing traffic on EBAY of HP "RPN" product is an absolute TORRENT of activity at high prices, and a very CLEAR indicator to any marketeer who has an IQ above 60 that HP is doing the WRONG thing by assaulting RPN and its followers..... the dollar volume and market demand for those discontinued items is NOT representative of 'a few crackpot collectors' etc etc. and with that final thought to logically win out over your stance, I wish you well and hope the time to trade this stuff was not too burdensome.

Best, - Norm

Re: Me & John vs. Valentin [very LONG!]

*Message #18 Posted by **Joesph** on 28 Oct 2003, 4:59 p.m.,*
in response to message #17 by Norm

This has started an interesting arguement. Here are my views:

The old system of RPN, with a 4 level stack, is terribly outdated. Yes, there is a small amount of people who love it, and they push ebay prices right up. But will these people be enough for HP to bother with?

Back when algebraic calculators were primitive, this system of RPN won hands down. The algebraic calcs did not understand precedence, and had a small limited amount of

nested brackets.

However the new algebraics are much nicer. A typical scientific sharp has a 2 line display - one where you type the formula (and can modify it as wll), another where you get the result. You can clearly see the formula - not just have faith in an invisible and tiny stack (yes, I know 4 levels is adequate in theory, but i find it incredibly cramped).

Also, as someone else mentioned, challenge people to a contest - one using a HP classic HP RPN, anither using said sharp. Both have equal skill with their calcs. Race them - make them both enter a complicated formula, and evaluate it 3 times with different numbers. What do you think the result would be?

Now, include 2 more people in this race - one with a TI graphics calculator, the other with the new 49g Plus. The TI offers a few advantes of the sharp, but not many. It is worse in that the keyboard is poor (Sin, Cos, Square Root are all shifted) but better in that the formulate can be modified easier.

Now, the person using the 49G Plus has the advantages of 'real' postfix notation, not HP's limited version. They have an unlimites stack (not that it is applicable, but nicer then 4 levels), with the first 6 or so levels visible. Whats more RPL is *symbolic*. They can enter the equation just as fast as the classic RPN user, if not faster because they can see what they are doing,

BUT they have a great advantage when it comes to evaluating the formula multiple times. Once the formula is on the stack, they press 'Enter' 3 times to DUP, Type a quick list o variables to modify eg {x 1 y 2 z 3} and press WHERE then ENTER. Write down the answer, then repeat 2 more times. By this time the TI user is still entering the formula, and the classic RPN user has been slowed down re-evaluating the formula. The Sharp user is somewhere in the middle, the 49g Plus user is almost certainly first.

Note that the TI can also do the 'WHERE' trick.

Now, just to make things interesting (grin), if you disagree with me, I'll let you pick a formula and we'll time each other. We are each permitted one practice run, if you want.

Joesph

RPN handed down to Moses directly from God (incredibly LONG)

*Message #19 Posted by **Norm** on 29 Oct 2003, 4:50 a.m.,*
in response to message #18 by Joesph

ha ha just kidding. havent you all had enough book-length posts from me for awhile now ??

Hey..... the 34C can easily win that CONTEST between 48G+, 32Sii, etc etc and you make a guy type in a formula. You guys want the algebraic graphing calc to win because the contestants have to type in the formula..... right???

OK but here's the deal. The contestants have never used any of these models before. They all are good students but they only used 1989 Casio scientifics before the great contest.

FOUR HOURS before the contest, each person gets a crash tutorial on THEIR model of calculator, by an avowed wizard and proponent of that calculator model. So, say

you revere 48G+, you get FOUR HOURS to teach the guy how to use it.

UNDER THESE CONDITIONS, the 34C would clobber any of these other models, and clobber them real bad.

That's because the 34C guy will be done in mere minutes even though he only had 4 hours to get acquainted with it. And by the time that poor bastard with the 48G+ figures out how to turn it "on"and type in a formula with that miserable syntax/display/keyboard language, everybody will have gone home and the janitor will be sweeping up !

MORAL: HP management can't expect me to waste half my life learning the idiosyncracies and irrationalities of their latest model..... I just wont buy it. I'll keep using the thing that had a bedrock foundational vision underneath it and CAN be substantially familiarized in about 4 hours ..... solo, with a thing called a 'getting acquainted booklet' (gasp, can't have something like that!).

Re: RPN handed down to Moses directly from God (incredibly LONG)

*Message #20 Posted by **Joesph** on 29 Oct 2003, 5:42 a.m.,*
in response to message #19 by Norm

sorry, but I learnt how to do simple stuff like that in under an hour :-) It is nowhere near as hard to get started as you claim.

The 49G+ can do way, way more then the other HP calc - of course it will take longer to learn. I personally believe RPN is easier to explain when you can see the stack, and not just remember it.

By the way, my argument still stands. I still think I'd beat you in a race :-)

Joesph

All good things ...

*Message #21 Posted by **Valentin Albillo** on 29 Oct 2003, 10:21 a.m.,*
in response to message #17 by Norm

... must come to and end.

This must be so as well for this very interesting and polite thread (a real example of people having nearly opposite points of view, but nevertheless managing to discuss them without going for each other's throats, a real rarity in forums but not so in this one).

Hi Norm & everyone following this thread.

I've read your long and interesting reply with all due attention and though the thread must finish now, I want to comment a few points I feel you may have misunderstood, probably because of me not explaining myself with total clarity (a typical problem we non-native English speakers frequently must deal with). Let's see:

"Your view that "RPN is obsolete" however is [...] unpopular with the types on this chat board"

I know, I know, but just the same ...

"there are an increasing number of posters here who are thinking like you..... who aren't loyal to RPN but like the latest "cereal box" trinkets from "KINPO"

Not me. My HP collection does not include anything but classic, worthwhile models. No China-made junk (save for an HP-12C that I promptly got rid of), and no RPL machines at all (save an HP-28S, for historical reasons). HP48s and 49s have no place at all next to my 15C's, 41CX's, 71B's, 32S's and 42S's, among others, not forgetting my beloved 24+ year old HP-34C. I wouldn't touch a KINPO model with a ten feet pole.

"HP (and some like Valentin) are enamored with the view that a calculator is now a "COMPUTER IN A CALCULATOR" (the graphing calculator craze). I don't agree."

Neither do I. I have not a single graphing calculator, from any brand name. The fact that many of my SHARPS do have large screens which are pixel-addressable (and thus can show graphics on them) doesn't mean they are 'graphing calculators', at all. If you want some function graphed on the display, you'd better write a program to do it, pixel by pixel. The large screen is nonetheless very useful to enter and edit programs, and for hand calculations and sometimes graphics come handy, such as for my Othello program, with the board always displayed on screen.

"Giving me a cheezy, terribly low-res graph on some 100 x 150 pixel (?) screen on a calculator is (a) useless (b) interferes with me getting my work done"

For the typical, student-oriented graphing calculator, you're probably right. But for the scientific calculator which happens to have a large screen, as mentioned above, it's just the opposite. It greatly facilitates your work, as you can see previous calculations and results still in the display (till they scroll out), and you get to see more program lines at a time, and longer program lines, without scrolling. One of the worst flaws of the otherwise excellent HP-71B was that its very small, 1x22 character display made a chore of entering and editing any programs. A 4x24 display, on the other hand, is extremely convenient. Even the small, 2-line display of the HP42S is a great help over one line displays.

"Let me elaborate..... my chosen engineering skill is analog electronic design [...] I also stand by that there is no reason that a 32Sii wont function 60 years from now [...] I am the EE, I win you lose."

Nope. Though I work as a Senior Systems Engineer right now, I'm also an EE ... and anyway, time will pass by, and we will eventually see who was right. My best advice would be: use your 34C and enjoy it as much as you can, even if that means it will wear out. Keeping it in a safe, avoiding using it to make it last is futile, and in the end it will die by itself and you'll be left with a nonworking machine that you never fully used like it deserved to.

"WELL, even if that was the original root cause of RPN, it's NOT THE REASON FOR IT. EASE OF USE IS THE REASON"

That's the problem, Norm. Just stating your point in capital letters (as if shouting) won't make it right. As I see it, the problem is you seem to never have given any other machines a chance, at all. You just decided at some past date that RPN was it, and there you are. Never questioning it. Never really comparing it against more modern approaches. Never really taking some good non-RPN machine and invest the time to get to know it and see its good points.

That being so, seems to me you're just rooting in what you know, never trying out new things and gaining experience. Me, I am not a TI-junkie or otherwise, sadly ignorant of The-RPN-Revelation. On the contrary, I've been into RPN all my life, bought every classic RPN machine as they were being released, and have written thousands and thousands and more thousands of lines of highly-optimized RPN code, and still do. I have many articles (+programs) published in PPC, Technical Notes, Datafile, a couple books by HP (one for the 34C), etc. etc, so I know RPN pros and cons inside out. But I'll never let myself get blinded or limited by a single point of view, however right it may seem, and I got to know and experience other machines, and of course, tested them against RPN ones.

You know the results. I still like very much RPN, still write RPN programs and articles, and will do so in the near future, but I know (because I've tested it) that RPN can't beat the best algebraic systems neither in ease of use, nor in speed, nor in convenience. It may do for you, but not for me. I can evaluate and reevaluate any cumbersome expression (not "formula", as you seem to understand this term as a symbolic formula) in my SHARP PC-1350, say, long before you've had a chance to even decide on where to begin with.

But don't trust me, do the test yoursef, pitting two persons, one versed in RPN, the other versed in some powerful algebraic model, and give them some complex expression they've never seen before. Provided they're both proficient with their respective models, the non-RPN guy will win hands down. A reevaluation changing some value would be a killer for the RPN guy, as the other fellow would just bring the whole expression to the display with a single keystroke, then place the cursor over the value to change and press ENTER, and there you are, while the RPN fellow would have to reenter all numbers (even the ones not changed) and operators from scratch, as if he were evaluating it for the first time. Even using registers to store parameters wouldn't save the day for him, unless he would resort to try and write a program on the spot, which the non-RPN guy wouldn't need to. Try it !

"You advocate an "algebraic calculator" but this is so wrong it aint funny!! Why? Because you have to start an entire new step..... type in the formula as an abstract!!!!!!!"

You misunderstood something here. Seems to me you're thinking I'm advocating graphing calculators, where you must enter symbolic expressions with some kind of equation editor and such. That's not correct. I completely dislike graphing calculators and symbolic equations editors, never use them and never would. The calculators I advocate are the ones where you can enter:

X=3.0013431 , (X/EXP 1)^X*SQRT(2*PI*X)*(1+1/(12*X)+1/(288*X^2)-139/(51840*X^3))

and press [ENTER] and you'll get the result instantly evaluated on screen (while the expression itself still remains on-screen, above, ready for re-evaluation). No tedium and no burden, absolutely straightforward.

"It's about whether you are going to "BELIEVE" in RPN or not."

For a lot of people, yourself probably included, this is indeed kind of an 'emotional' issue, but not for me. There are issues that do require some faith into the proceedings, but this isn't one of them. This is a matter that can be tested, and rational reasons can be given and discussed. The problem is lots of people *won't discuss it* (lest they might risk losing their 'faith' in RPN, which they dare not), *won't give other machines any

chance whatsoever* (after all, not being RPN they can't be any good), and above all, *they won't perform any fair tests, at all* (why testing, when RPN's superiority is so obvious ?). This might be an acceptable attitude for most people, in this issue and in other more important real-life issues, but it's not an acceptable position for me.

"OK, well, there's no flames here, no war here, just talk, and fast typists. And smiley faces :o) [...] and with that final thought to logically win out over your stance, I wish you well and hope the time to trade this stuff was not too burdensome."

I wish the same for you, Norm. I've found this exchange of opinions most interesting, still think I must thank you for your consideration and patience with my 'heretic' :-) points of view. If you post any reply, I'll read it with interest, but I won't add further to this thread. In any case, rest assured that I like RPN a lot, and you'll be hard pressed to find any other person who has devoted so much time (and money) to it and its HP hardware implementations. That's a whole lot more of a chance than most RPN people would give to any non-RPN systems.

Best regards from V.

Valentin, one more thing.....

*Message #22 Posted by **Norm** on 29 Oct 2003, 3:25 p.m.,*
in response to message #21 by Valentin Albillo

You mentioned you prefer HP-42S because of a 2-line display.....

(Valentin wrote: the small, 2-line display of the HP42S is a great help over one line displays.)

I dont even want 2 lines in my display. I've run those, and they are distracting and reduce my productivity. Part of the incredible magic and beauty of making an HP-34C your friend (or, you know 32S, 32Sii) is that only the RESULT is on display and you keep the other stuff in your head. I SEE STUFF in "X" and I know there is stuff in "Y" and "Z" and "T" even though I dont see it, I know its there and that's enough. What if you could have a really big screen to show the entire operating system contents of your HP-49G etc would that make it better? Would it help solve a practical problem? I hold 3 patents and I have work to do and problems to solve. They wont get solved any better, nor faster, if the entire contents of the Communist Manifesto are displayed on a really big screen on my calculator.

BTW I've got plenty of company on this. A fine personality, Mr. Bob Carver (Phase Linear Corp., Carver Corp., Sunfire Corp.) is down the road and he ALWAYS totes an RPN HP calculator with him (not sure model, probably 41C) and that guy is a very busy problem solver. ....

Valentin, you have carefully described that my calculator WILL NOT function in 60 years from now, and also, that a 32Sii will not function 60 years from now. You have inferred that there is a little timer inside each resistor, and each capacitor, and at 35 years (the number you mentioned) kawhoom a little detonator goes off and each little molecule is vaporized in that resistor, or capacitor, and I'll be $hit out of luck !!

Well, I guess inside each ASIC on the circuit board, what, the glass oxide disappears and the polysilicon gates suddenly touch the drain-source?? At 35 years.

It's a marvelous testimony that plenty of HP calculators from 1980-1990 WILL BE FUNCTIONING 60 or 80 years from now, and NO, I don't have to keep it in a refrigerator in an antique art museum. Just a little respect and technical knowledge is all it needs. THE VERY THOUGHT must make Carly Fiorina absolutely freak out. She wants you to buy a new one every 2-3 years and a potential 60-80 year lifetime of a product just don't meet her personal profit agenda.

(((Do you buy your garden hose at HOME DEPOT or LOWE's ?? I used to. Till I figured out I was being gypped and the dang things rot away to dust within 5 years..... if not blowing a leak outright in the first 2 years. So One day I talk to the hydraulic wizards and ask what kind of hose gets used on production floors, etc., and they say "200 psi Parker push-on, accept no inferior". So I get these 200 psi garden hoses made up from a hydraulics shop and screw them on the side of my house. That was 10 years ago and its obvious they will last 40-60 years FULLY PRESSURIZED (except I drain them in the wintertime). This is the best way to be, dodge corporate America's (Carly Fiorina's) attempts to mine your wallet while plugging the landfill. Only buy good stuff that lasts a long time, IMHO.)))

If you are an EE, then you know that ALUMINUM ELECTROLYTICS are the lousy so & so's that ruin electronic equipment by self destructing. Their little self-destruct timer is set to about 25 years, not the 35 you mentioned.

But you replace those !!

I also stand by that there is no reason that a 32Sii wont function 60 years from now [...] I am the EE, I win you lose."

Valentin wrote: ("in the end it will die by itself and you'll be left with a nonworking machine that you never fully used like it deserved to.") No, no, but you know, I dont use the calculator every single day. That just varies but I'm not just using it in order to have entertainment it gets used when it needs to get used. Sure I admit I will use the 32S for the most casual jobs and "save" the HP-34C for more "special occasions" (like bringing out that vintage finest red wine). I would estimate that if its used for an hour, or two, every week, it is not going to get a wornout keypad, or whatever you feel it is going to succumb to. (Sure if you use it 4 hours a day you will wear out the dome switches)

"WELL, even if that was the original root cause of RPN, it's NOT THE REASON FOR IT. EASE OF USE IS THE REASON"

(Valentin wrote: "That's the problem, Norm. Just stating your point in capital letters (as if shouting) won't make it right.) WELL, once inawhile CAPITAL LETTERS are useful for punctuating the more important parts of email, and..... so are long strings of dots to make pauses

not to mention the occasional line break to knock apart a thought into a few more pieces.

Valentin wrote: As I see it, the problem is you seem to never have given any other machines a chance, at all.

NOT TRUE. I purchased a 48G+ and was horrified with the lack of clear thought on its design, and the lack of a fair introduction to new users. I could point to 20 things in teh supposed "getting started" manual that were highly offensive. So I finally decided that somebody was trying to waste my time, and I thwarted their efforts to

mine my wallet by passing it along to another buyer.

(Valentin wrote: You decided at some past date that RPN was it, and there you are. Never questioning it.) Nope, see the above paragraph.

The calculators I advocate are the ones where you can enter:

X=3.0013431 , (X/EXP 1)^X*SQRT(2*PI*X)*(1+1/(12*X)+1/(288*X^2)-139/(51840*X^3))

HEY VALENTIN ONE MORE THING (see I used the all-caps because I'm not sure if you are still reading by now) on your way to the exit door, can you shout one last thing at me.....
tell me the make and model number of the calculator that does what you just said above. Tell me one make and model that most embodies what you are advocating.

I will go so far as to look it up, if its not something I am familiar with, maybe I will buy one. I am receptive to knowing what's the superior unit, if there is such. It has to be superior all-around, like with a good 'getting started' manual, because maybe I'm not some fanatic who hangs out in a computer room so that his buddies teach him how to use it w/o a manual (that's Bill Gates corporate policy) .

I do like what you mention, just typing in with the keyboard, ALTHOUGH, as always, its really the domain of the computer not the calculator. For example, the HP-34C has no meaningful letters like A-Z on it... why? Because its a NUMBER CRUNCHER (not a letter cruncher).

Anyway if somebody did a reasonable job of putting that kind of stuff you like (enter formulas using letters, quickly and easily) into a calculator and it works good, give me the model number and I'll at least look around a little.

After all, if all my HP calculator fails precisely at 35 years of age, and don't make it to 60, I will need some sort of alternative, no matter how miserable it is to use.

Best,

- Norm

Battery technology highly advanced

*Message #23 Posted by **james (UK)** on 30 Oct 2003, 6:08 p.m.,*
in response to message #22 by Norm

Hi Norm - re your comment: "You have inferred that there is a little timer inside each resistor, and each capacitor, and at 35 years (the number you mentioned) kawhoom a little detonator goes off and each little molecule is vaporized in that resistor, or capacitor, and I'll be $hit out of luck !!" - this seems to be the case with auto battery technology which seems to have advanced to the stage where the life can be designed extremely accurately - at least every car battery I get invariably dies one month out of guarantee ;-)

HEY VALENTIN

*Message #24 Posted by **Norm** on 31 Oct 2003, 4:59 a.m.,*
in response to message #22 by Norm

there was a question for you near the end of the prior post.

And the answer is ?

Re: HEY VALENTIN

*Message #25 Posted by **Valentin Albillo** on 31 Oct 2003, 7:46 a.m.,*
in response to message #24 by Norm

Hi, Norm:

Don't think for a moment I forgot your question, quite on the contrary. I've read your interesting reply a few hours ago (very different time zones, you know), and thought it was very nice on your part offering to try some non-RPN machine, so I'm thinking most carefully which machine would most likely suit your tastes best. To that effect, I'm preparing a full response, images and all, giving you some choice and several useful comments to help you decide.

I can either post it here or else send it directly to your e-mail address (analogee ...) assuming it's valid. In any case, expect a reply from me within 24 hours (now at the office, too busy, all of my materials and pics are at home).

Best regards from V.

Hi Valentin If Norm has no objections can you post your thoughts here please, as I for one would be interested in reading them.

James

Re: HEY VALENTIN

*Message #27 Posted by **Ron Ross** on 31 Oct 2003, 9:10 a.m.,*
in response to message #26 by james(UK)

Remember, you should also make sure your recommendation is easily available.

An Hp27s is very nice, non-RPN, but also, not available either.

Same for your older Sharps.

I'm also curious as to your suggestion (as I might just have to buy and determine for myself as well).

To James and Ron (and Norm)

*Message #28 Posted by **Valentin Albillo** on 31 Oct 2003, 9:24 a.m.,*
in response to message #26 by james(UK)

Hi, James & Ron (and Norm):

James posted:

"Hi Valentin If Norm has no objections can you post your thoughts here please, as I for one would be interested in reading them."

Certainly. Glad to see you're interested in my comments, let's hope they're up to your expectations ! :-)

Ron posted:

"Remember, you should also make sure your recommendation is easily available [...] I'm also curious as to your suggestion (as I might just have to buy and determine for myself as well)."

Some models are more easily available than others, of course, but rest assured that the ones I have in mind are both quite easily available *and* quite affordable, nothing like the outrageous prices most desirable HP models are selling for these days

As I said to James above, I'm very glad to see that there are some good HP users and collectors that aren't afraid to try and judge for themselves whether other machines are any good or not.

Frankly, I don't think they ought to be *mutually exclusive*, i.e.: either you love HP machines *or* you love other brands. I think you can love both at the same time, no problem, provided them all are extremely worthwhile achievements in the vintage handheld computing world.

Best regards from V.

Valentin..... No need for an HP,

*Message #29 Posted by **Norm** on 31 Oct 2003, 6:59 p.m.,*
in response to message #28 by Valentin Albillo

Valentin, no need for an HP.

The request is, recommend the make/model that most eloquently does things BETTER than an RPN HP Classic. That may well NOT be an HP .....

And then maybe I will try it (maybe... gotta shop around).

Say that Carly Fiorina declares war on HP-34C and HP-32S and HP-32Sii . Say that Carly is like the king when they had to kill all the babies because one was said to be the chosen one. (One of 'em got floated away on the river however and got away...)

So Carly bids all the 34C's off of eBay, and smashes each one. No more RPN!! No more 41C !! Not even used ones!! If so, what would I buy? What is being churned out of the factory RIGHT NOW so that I would go buy something?

That is why the question.... to see what is the runner-up to what I prefer. If its better, like you say, that would be Ok too.

- Norm

Re: "Ans" function goes a long way toward (one of) RPN's core conveniences

*Message #30 Posted by **Paul Brogger** on 31 Oct 2003, 9:16 a.m.,*
in response to message #25 by Valentin Albillo

Interesting subject. I noticed when I got the TI-83+ that it's "Ans" key/function seems to bring it closer to RPN.

With "Ans" available, I seem less anxious about (and less "shackled" to) the result of the previous calculation. The previous result isn't necessarily waiting to pounce on the next part of a formula that I enter. I can pretty much start up a new sub-calculation and stick the "Ans" in wherever I want, without explicitly saving it to and recalling it from memory.

In this respect (and in reference to an earlier post about using RPN in working through complex formulae), while RPN may *impose* some rigor in methodically decomposing and working through a complex expression, an Algebraic with an "Ans" key (kind of like a two-level stack or implicit memory register) seems to better support that kind of approach than does an Algebraic without such a function.

(Does anyone happen to have noticed when "Ans" first appeared?)

Re: "Ans" function goes a long way toward (one of) RPN's core conveniences

*Message #31 Posted by **Valentin Albillo** on 31 Oct 2003, 9:37 a.m.,*
in response to message #30 by Paul Brogger

Hi Paul,

Re "Ans", I'm not familiar with that particular calculator you mention having the "Ans" key, so I'm not sure if I get rigth what "Ans" actually does.

Assuming "Ans" just recalls the last result computed in any desired place of a new expression you're calculating, this is not a new feature at all. HP already did it in the HP-71B, where RES recalls the last computed value anywhere, i.e:

```
X = 2*3
Y = 5*RES + RES^2
```

would assign 6 to X and 5*6+6^2 = 66 to Y. There's a similar approach when in CALC mode. This way you don't need to explicitly assign the last result to any variable at all, plus RES is faster than using a named variable, as it is a fixed location in memory and there's no need to search for it. There's also the fact that if you've got the Math ROM, RES can store the last complex result, both real and

imaginary parts.

SHARP machines do likewise. To re-use the last computed value in a subsequent new expression, you simply press [CURSOR DOWN] at any place you want the value inserted, like this:

```
2 / 3  [ENTER]  ->  0.666666666667

5 *   [press cursor down, see 5 * 0.66666666667
       in the display]

+ 4 / [press cursor down, see 5 * 0.66666666667 +
       4/0.66666666667 in the display]

[ENTER]
```

If this is more or less what "Ans" does, both HP and SHARP (and probably other brands) already did it 15 years ago.

Best regards from V.

Re: "Ans" function

*Message #32 Posted by **Paul Brogger** on 31 Oct 2003, 9:50 a.m., in response to message #31 by Valentin Albillo*

Right -- that's exactly what it does.

I wasn't claiming it was "new" or unique to my (only) new TI calculator. It merely came as something of a minor revelation to me just how useful could be that feature in an Algebraic interface.

There's also an "Ans" function on the HP-49G+ -- I believe in Algebraic mode, it simply returns the most recent entry on the stack. (And the stack is, in Algebraic mode, simply hidden from view -- if I've got it right.)

"RES" on HP-71B (thanks, Valentin!)

*Message #33 Posted by **Karl Schneider** on 1 Nov 2003, 1:20 a.m., in response to message #31 by Valentin Albillo*

Valentin --

Good tip! (I was, in fact, wondering about that; it seems that "RES" is like "ans" on Matlab.) I just got myself an HP-71B on eBay for about $100. Complete with manuals, fully functional and in near-perfect condition, but unfortunately no extras (e.g., Math ROM, RAM).

I've only scanned through the manual, but have some of your posts about the 71B.

Re: "RES" on HP-71B (thanks, Valentin!)

*Message #34 Posted by **Valentin Albillo** on 2 Nov 2003, 12:08*

a.m.,
in response to message #33 by Karl Schneider

Karl posted:

"Good tip! (I was, in fact, wondering about that; it seems that "RES" is like "ans" on Matlab.)"

A curious fact about RES: if you've got the Math ROM and perform some computation which results in a complex number, RES will store the value of this complex result, both real and imaginary parts. What would happen if you would then turn off the machine, unplug the Math ROM, then turn it on again and execute RES ? I know the answer ... :-)

"I just got myself an HP-71B on eBay for about $100. Complete with manuals, fully functional and in near-perfect condition, but unfortunately no extras (e.g., Math ROM, RAM)."

Congratulations on your new acquisition, but if you haven't got the Math ROM, then you *don't* have a full HP-71B, only *half* an HP-71B. And I'm not kidding. You can't claim you've got an HP-71B till you get the Math ROM, as it was an integral part of the machine which was intended to have *three* internal ROMs: ROM 0,1, and 2. Because of budget constraints and marketing pressures, ROM 2 was taken out forcibly, leaving the machine seriously handicapped in its projected math abilities. Needless to say, the Math ROM *is* the wayward ROM 2. They wouldn't remove all code, so some is still left in the bare bones HP-71B. For instance, try to enter this line as part of a program:

```
10 X = (2,3) * (4,5) @ Y = SIN((1,1))
```

and notice that you actually *can*, i.e.: it won't complain at all, no syntax error, because the bare bones machine's operating system still recognizes complex numbers. But sadly, if you then try to execute that program line, you'll get an "XFN NOT FOUND" error, as the code in ROM 2 which was in charge of all complex functions and arithmetic was unmercifully removed. So, you know what you've got to do, this will give new meaning to your life from now on: go an get a Math ROM, no excuses. I've got three HP-71Bs, and all of them have their very own Math ROM plugged in, as it should.

"I've only scanned through the manual, but have some of your posts about the 71B."

More seriously, I'm glad if some past posts of mine are any use to you, and if I can help further, don't hesitate to ask.

Best regards from V.

Re: "RES" on HP-71B (thanks, Valentin!)

*Message #35 Posted by **Karl Schneider** on 3 Nov 2003, 10:21 p.m.,*
in response to message #34 by Valentin Albillo

Valentin --

Aha! Thanks for the history of the Math ROM. I was aware that the Math ROM added considerable functionality, but was unaware that it was intended as "standard equipment". It's a shame that something that cost $525 in 1984 (I'd believed that the price was $750) was deliberately crippled by such "de-contenting".

I'l see what I can do about procuring a Math ROM, but eBay might not be the best source. I remember a few months ago that one seller offered two non-functional 71B's, but can't remember if either had a Math ROM. Getting one bundled with a broken 71B might be an "economical" option, if no one is selling them "a la carte".

Re: "RES" on HP-71B (thanks, Valentin!)

*Message #36 Posted by **Valentin Albillo** on 4 Nov 2003, 6:24 a.m.,*
in response to message #35 by Karl Schneider

Karl postedd:

"I was aware that the Math ROM added considerable functionality, but was unaware that it was intended as "standard equipment".

Apart from the "10 A=(2,3)+(4,5)" example I gave you in my former post, there's even better confirmation by simply reading through the "HP-71B Internal Design Specifications (IDS) Volume II", which contains the full listing of the assembler source code for the whole 64 Kbytes Operating System (i.e: internal ROMs 0 and 1). There you'll find a large number of calls and polls to Math ROM routines, for it to handle all kinds of functionality, from complex numbers to arrays to IMAGE statements formatting, etc, etc. Of course, if the ROM is not present, they simply fail gracefully and ROM 0 or 1 takes over and continues, either absorbing the 'error' without the user ever noticing it, or else reporting an XFN NOT FOUND error, as required. At the time where the Math ROM was still an internal ROM (ROM 2), those calls and polls would have always succeeded, of course.

" It's a shame that something that cost $525 in 1984 (I'd believed that the price was $750) was deliberately crippled by such "de-contenting".

If only it were the Math ROM 'crippling' ... Have a look at this very interesting post to read, in the very words of one of the most prominent members of the HP-71B Project Team, what other 'deliberate misfortunes' fell upon the poor 71B:

HP & AES in the past

"I'l see what I can do about procuring a Math ROM, but eBay might not be the best source."

Short of finding one at a flea market, your best chances are eBay and the Classified Ads section of this very MoHP. If you decide to try eBay, your best chance is finding some HP-71B, functioning or not, cosmetically challenged or not, which does *include* a Math ROM plugged-in as part of the auction. This usually results in a lower higher bid.

Whatever the case, do get one, the sooner the better.

Good luck and best regards from V.

Complex Numbers on HP-71B (Valentin, please help!)

*Message #37 Posted by **Jeff** on 5 Nov 2003, 12:18 p.m.,*
in response to message #34 by Valentin Albillo

Valentin,
Although it was not directed to me, I would like to take you up on your offer of help in using the 71B. Please excuse what is probably a ridiculously simple question, akin to the recurring cries for help in switching the dots and commas on the voyagers. I have a 71B with the Math ROM. I have access to the 71B manual on my set of the museum CDs, but could not find any help there. Unfortunately, I have not upgraded my 5 CD set to the 7 CD version yet, so I can't look at the Math ROM manual which is on CD 6. This probably has all the answers and I will upgrade my museum CDs soon. However, any tips or pointers you could offer before I do this would be appreciated. So, on to my inquiry.
Upon reading your little challenge regarding what would happen to a complex RES value if you removed the math module, I figured I would try it and see for myself. However, I have so far been unable to get it to provide a complex answer. It seemed to me that SQRT(-5), or perhaps ASIN(1.5) or similar should do it. Whenever I try these or similar, the 71B beeps at me and the display reads "ERR:SQR(neg)" or "ERR:Invalig Arg", depending on what I tried to do. Is there a trick to getting it to give complex answers when needed, like setting a flag or choosing complex mode as on the 15C or 42S? I also tried

entering the program line you presented. The 71B does indeed accept the program line. Without the Math ROM installed, when I press RUN, I get “ERR L10:XFN Not Found”. With the Math ROM, I get “ERR L10: Data Type”.

Re: Complex Numbers on HP-71B (Valentin, please help!)

*Message #38 Posted by **Valentin Albillo** on 6 Nov 2003, 5:06 a.m.,*
in response to message #37 by Jeff

Jeff wrote:

"Although it was not directed to me, I would like to take you up on your offer of help in using the 71B."

Of course, you're welcome .

"However, I have so far been unable to get it to provide a complex answer. It seemed to me that SQRT(-5), or perhaps ASIN(1.5) or similar should do it [...] Is there a trick to getting it to give complex answers when needed, like setting a flag or choosing complex mode as on the 15C or 42S?"

No, there's no 'complex' mode or flag setting to select either complex answers or an error. If you do nothing special, you'll get an error when trying SQRT(-5), etc. If you'd rather have complex answers, then you'll need to use complex variables to store/manipulate them, and when applied to a complex variable, SQRT [etc,] does return complex answers. For instance:

```
  10 REM *** this will give an error ***
  20 REAL X,Y
  30 X=-5
  40 Y=SQRT(X)

vs.

  10 REM *** this will give a complex answer
***
  20 COMPLEX X,Y
  30 X=-5
  40 Y=SQRT(X)
```

This will also work right from the keyboard (or in CALC mode) if you have executed COMPLEX X,Y or COMPLEX SHORT X,Y before attempting the SQRT. Besides, if you want to get the square root of -5 as a complex answer without using any variables at all, you can do it from the command line or CALC mode like this:

```
  SQRT((-5,0))
```

This will specify -5 as the "complex" value (-5,0) and thus SQRT will happily deliver a complex result. Just to test how easy it all is, try and get the result of evaluating i^i :-)

" I also tried entering the program line you presented. The 71B does indeed accept the program line. Without the Math ROM installed, when I press RUN, I get "ERR L10:XFN Not Found". With the Math ROM, I get "ERR L10: Data Type".

The message "ERR L10:XFN Not Found" is as it should, as the mainframe will poll the Math ROM to handle the complex calculation and it's not there. The "ERR L10: Data Type" results from X not having been 'declared', which the 71B interprets as X being REAL, by default. Of course, a REAL variable can't store a complex result, and that's why the error shows up.

To get it to correctly run (or execute from the command line or CALC mode) you need to include a line such as "5 COMPLEX X" or "5 COMPLEX SHORT X", or else execute "COMPLEX X" right from the keyboard. Having declared X to be a complex variable, the assignment should work.

Any further doubts or questions, just ask ! :-)

Best regards from V.

Edited: 6 Nov 2003, 9:36 a.m.

in response to message #30 by Paul Brogger

As to when "Ans" was introduced on Texas Instruments calculators: I don't recall that feature being present on my SR-50, circa January 1975. However, it is present on my TI-85 and I believe they were introduced in 1993.

--Mark

Repeated evaluation of an algebraic expression

*Message #41 Posted by **Tom Sherman** on 31 Oct 2003, 8:33 p.m.,*
in response to message #22 by Norm

Functions, whether single or multi-variable, can be entered algebraically and evaluated repeatedly in any of the calculators that have an algebraic solver. This includes the 27S, 19B or 19BII, 28C or 28S, 32SII, and most of the graphing calculators from HP and TI. The algebraic solver is particularly nice on the 27S and 19B or 19BII. That on the 32SII is not quite so attractively presented. The algebraic solver is also part of the HPCalc software packaged with the older Windows Omnibooks (300 to 800 series) and in DOS version with the HP-200LX pocket computer.

The graphing calculators are well set up for the repeated evaluation of functions of a single variable, for that is what they do in making graphs. In addition to presenting the results in graphical form, they will present them as tables, rather like spreadsheets, incremented in whatever way the user chooses. Amazing to see!

The HP 38G and 39G calculators are available on eBay for absurdly low prices, $15-25. They are much better calculators in many ways than the 32SII, which goes for prices nearly ten times as high. But they are algebraic, and they are graphical, and folks are entitled not to like those characteristics if they wish.

I became an HP enthusiast (and HP snob!) in 1975, when I bought an HP-25, my first personal computer. For twenty years I pitied my poor students who carried TI calculators around. But after I retired from college teaching, I woke up to the fact that the TI-83, TI-86, and TI-89 are supremely good calculators. The fact that American high schools are filled with students playing games on the TI-83 does not detract from its power or ease of use for those who really want to do something with it. The TI-83 also has a very fine manual(unfortunately now on CD, instead of in book form)which is fun to learn from, and which was probably part of the reason that it won out over the HP 38G and 39G, which have manuals almost as terrible as that for the 49G. The main limitation of the TI-83, so far as I am concerned, is that its BASIC language does not accept indexed variables or variables containing more than a single letter. The TI-89 is not so limited, but its manual is very inadequate in explaining the syntax of its BASIC, which is somewhat different from that of the 83.

My two cents, too many times over.

Tom

Re: Repeated evaluation of an algebraic expression

in response to message #41 by Tom Sherman

Tom,

I agree with you. The TI-89, TI-92 PLus, and TI-200 offer new power. Let me explain with an example. One area of math fun for me is to solve the root of equations (which I also use to test new machines and programming languages). With the new TI (and I guess the new HPs too) you CAN ask the calculator to obtain the derivative(s) of the function based on the equation you are solving and then use algorithms like Newton in a more literal way

since now you CAN do this:

x_new = x - f(x) / f'(x)

With NOOOOOOOO approximations needed to calculate f'(x)!!

Now that's what I call new power ... sorry HP-65, 67, and 41CX ... you are not cut out to this kind of math magic!

in response to message #42 by Namir Shammas

Namir,

Good to hear from you. I have enjoyed reading your posts, and meeting in this way the person who wrote all those beautiful programs listed in the Users' Library catalog for the HP-41. I only ever wrote one program for the 41 Users' Library -- one to calculate automatically the local altitude and azimuth of the navigational stars, sun, moon, and planets, using the Navigation Pac and Time Module. I still use it to find out whether that bright object in the night sky is Jupiter, Saturn, or Mars. It was interesting to learn that you wrote some of your programs in hotel rooms while you were traveling!

Best regards,

Tom

> All very neat, tidy, elegant, and above all, economically feasible, money-saving, space-saving. BUT (and a big BUT that HP has failed to sell to the masses) the user would be forced to DO the parsing from algebraic to stack notation *himself*, and would need to adopt a new paradigm.

This is the only point I take issue with, Valentin, and it hinges on the distinction between the algebraic notation for writing expressions and the use of RPN in evaluating them. The parsing from algebraic is *exactly* what anyone has to do when performing a calculation. Otherwise, why do kids have to be taught the rules of algebraic precendence?

It strikes me that algebraic notation is great for writing and storing equations/assignments, including for use in programming languages like BASIC et al. But it's not a good mechanism for performing 'back-of-an-envelope' calculations, which is where RPN excels. This is why algebraic notation is a good fit for mathematical teaching tools like the HP-48, etc. but not so good for working engineers who need to grab a convenient device to see whether some numbers 'make sense'.

Best,

--- Les [http://www.lesbell.com.au]

RPN, Slide Rules & Good Medicine

*Message #45 Posted by **Paul Brogger** on 28 Oct 2003, 5:34 p.m.,*
in response to message #16 by Valentin Albillo

When last the subject of RPN's obsolescense came up (and that was not so long ago), it was in the context of the Mach number formula.

I've gotta say, I tried it both with my TI-83+ and with my HP-32s. It was difficult with either. On the TI, I got some of the same "syntax errors" that others did. That doesn't make me stupid or incapable of pushing the right paren key enough times (as was alleged in the heat of the battle) -- it just indicates how complex the formula is. I also had trouble getting it right with RPN -- and it was especially difficult with either method when the formula wasn't available in "textbook format".

Now, before I make my point, I'd like to recall the days when I put aside my wonderful Post "Versalog" slide rule in favor of an HP-21. Scientific calculators were just gaining wide acceptance, and not all were pleased with the prospect. The very next year, the professors of the natural sciences program that I'd just completed issued an edit that no calculators were allowed -- that slide rules were mandatory.

Then, impetuous youth that I was, I dismissed those Luddite instructors as backward know-nothings. Now, I can appreciate what they were trying to do: to force students to actually understand what they were doing; to appreciate orders of magnitude and logarithms; and to build the habit of estimating a plausible result in advance of actually doing any computation.

Recently, it seemed to me as I tried both ways of working through the Mach number formula, that the AOS (or whatever) approach was rather more in line with a new-fangled "just punch in the values and trust the result" way of doing things, and the RPN approach seemed to force a certain rigor in deconstructing the formula, taking it a step at a time, and monitoring the reasonableness of the interim results obtained.

I'm not an educator, but I would support an argument that RPN is preferable to Algebraic/formulaic operation in early higher-maths learning situations (i.e., high school) -- analogous to (though not exactly the same as) the earlier contention that slide rules were preferable to scientific calculators.

And no, I don't think anyone is going to be "crippled" by learning either way, just as I'd not have been disabled if I'd been forced to put down my HP-21 for a year or so . . .

Re: RPN, Slide Rules & Good Medicine

*Message #46 Posted by **Ed Look** on 28 Oct 2003, 11:08 p.m.,*
in response to message #45 by Paul Brogger

Paul, I'd like to add that RPN is good more than just for high school teaching/learning; whenever you need, as someone just said in this thread, to do a quick calculation of something involving more than just arithmetic, a RPN calculator will do the job the best, in my opinion.

With what I do, whenever I use my 48G+ strictly as an RPN, albeit infinite level stack, machine, I also take advantage of its large memory and program capabilities whenever I do a lazy thing by quickly calling up Arnold Moy's Chem/Periodic Table program, very quickly get some atomic weights and then do some second grade addition and I've saved myself many minutes (or more) by not having to run all over (though at home, it's just by my lazy elbow) to dig constants out of some text I haven't looked at for twenty years so I'm not sure where it is.

If I have to actually do a calculation according to some equation or formula, I reach for the 32SII all time, and this is because it is marvelously simple RPN... and fast (enough for me)! I'd use the 34C, except that it's display is now buggy and Norm warned me not to use it too much, if at all in this condition (I'd like my grandchildren to see what red LEDs looked like!).

don't run that 34C.

*Message #47 Posted by **Norm** on 29 Oct 2003, 4:41 a.m.,*
in response to message #46 by Ed Look

Yes, yes it is true. If the display has been behaving buggy, pull the batteries, set it aside, rubber band a note to the front of it, and dont run it until somebody can go in and clean up all the "solderless" connections in a 100% ESD-free environment (tinfoil and grounding straps all around). intermittent connections blow the chips, I am sure of it.... they cause a deterioration we call "2 disease" and you would much rather your unit didn't go that route.

I would like to open up a little HP-34C service shop (i'd take in a few 33C and 31E etc etc) ... so I would very carefully service these antique spice calculators, with methods that don't let the chips get damaged.

Yeah, that would be a nice little service to society..... but I can't afford to do it on engineer's pay... maybe later.

Re: HP 32S vs HP 32SII (LONG)

*Message #48 Posted by **John Beckwith** on 27 Oct 2003, 10:31 p.m.,*
in response to message #1 by John Beckwith

WOW! Did I set ablaze a firestorm!

First of all, I would like to thank EVERYONE who has responded to my rather simple (or so I thought) post about the lack of currently available calculators from HP that support RPN and searching for something for my son. Little did I know... As I said in my original post I have not had the opportunity to even see much less use ANY of the more recent offerings from HP.

I am not looking for an "Cheat Machine" for my son. I was a little suprised about the comment "...thrown in a back pack..." or something. I want him to learn and FULLY understand math before he will be allowed to really use a calculator. My brother in law gave my son a 4 banger calculator on his 3rd or 4th birthday. It disapeared into my desk drawer and remained there until he was 7 but it came out only as a teaching tool along with my HP-45.

I came up through grade school and high school using nothing but pencil and paper, then learning log interpolation, slide rules and pouring over sine and cosine tables as anyone of my vintage did. When I got to college I programmed PLI and Fortran on BIG IRON IBM using key punch machines to enter lines of code on Hollerith cards. Do I know that things have changed? YES, DRASTICALLY!

I remember first reading about the HP-35 in a Popular Electronics magazine as a senior in high school. It was in a monthly section, I forget the name, something like the Gus Wilson's Model garage was to Popular Science. I fell in love with it thinking of how much something like this would ease calculations....

Prior to that I ocasionally had the chance to use, or rather play with, one of my fathers "adding machines", a huge contraption with 10 rows and 10 columns of keys that weighed a TON. No real multiplication, no real division but yes it could add and subtract. In retrospect, by my evaluation, it was like using RPN in a way.

I lived, and stil do, near St. Louis, MO and finally convinced my parents to allow me to visit an HP office, in Westport I believe. It was spring of 1974. As a freshman in JR. college I am sure that they thought that I was nuts,an 18 year old walking in there with my Mom asking to SEE AN HP-35!. Not only did he show me one and allow me to actually us it he also brought out what would have been at that time the Holy Grail, the HP-45. I was hooked. I arranged with my father to LOAN! me the $395 needed to purchase the 45 and soon there after went to UMSL and bought one.

But enough! I think that the real thing that must be looked at here in the discussion of RPN/RPL and arithmetic is what is going on and how you intend to use it. I still am a holdout to the belief that RPN is closer to how you actually, finally, solve many problems the LONGHAND way where as keying in a neat equation and entering values for variables into a calculator (or computer) is quite another thing. It all boils down to how you look at it and how you are going to use it. I think that a properly designed calculator with BOTH RPN/RPL and arithmetic has its place assuming that one can quickly and easily move back and forth between the two. RPN/RPL for using your MIND and and the "longhand" way to solve problems and arithmetic for plug and play entering of equations and data. One method is better used for a CALCULATOR and perhaps the other is better used for the COMPUTER use in a calculator. Some of this could simply be symantics.

I could go on from here but I know that I have used up my dime, (or am I showing my age, is it more like 50 cents now?) and have surely re-kindled the embers of discussion.

Sincerely,

John Beckwith

Re: HP 32S vs HP 32SII (LONG)

*Message #49 Posted by **Ed Look** on 27 Oct 2003, 11:45 p.m.,*
in response to message #48 by John Beckwith

John, I agree with you, though I am not an EE. People have brought over to my house those freebie four bangers for shopping or checkbooks or whatever intended for my kids. They disappear, too. I suppose I am just a tad bit after your time, as I essentially learned math the same way, though by the time I got to high school, relatively affordable TIs and Bowmars were uh, "the cat's meow". I never got to use a slide rule (for real work or study).

Anyhow, one of my boys has gotten to the point at which his math teacher is either going to ask him to get a calculator at the end of this year or beginning of next. Since Samson Cables had it at such a great price, I got him a HP-39G, which is totally algebraic and does not have CAS for equation entry. Right now, there is no math he's being taught that truly requires a HP or any kind of calculator. But it is programmable. I've gotten him barely started in what it means to write any kind of simple program (c'mon, kid, make that blue plastic thing draw a circle!), hoping that the mental and physical discipline and creativity of coming up with a program to accomplish even the simplest objective will educate him additionally in a way that I know public schools do not (anymore).

RPN? The advice I've gotten (some from this forum) is that while RPN is pretty natural, that is so only AFTER you've had a chance to wrestle with math in class (or at 3AM in your basement). Prior to that, an algebraic entry type approach is more natural to someone being introduced to mathematics higher than arithmetic. Come to think of it, even in "those days" none of my teachers ever taught an equation or even algorithm in RPN style. I first learned it from a HP-34C outside of classes, at home, trying to get some calculations done by the morning.

I think Norm is right in that RPN should only be introduced to kids in the latter part of high school or beginning college. My son is nosy about my RPN HP calcs; but I won't go there, not yet, not till, he's had some solid algebra and trig under his belt... or even some programming in school. I fear I may be his initial programming instructor (not good) and if I follow my gut, I'll whip out my 32SII (I'll whack him if he even gets a smudge on my 34C) and show him how to initally do some keystroke RPN programming, then some time later, maybe a little RPL the 48G+, for I'm no kind of computer programmer in real life... and hope that in this area, he can take off from there.

But to get back to the point after all this shaggy dogginess, I recommend you get your son a graphing algebraic entry calculator. Since my background made me partial to HPs, that's what I looked for, but I hear the new TIs, Casios, and Sharps these days are also quite impressive. From my heart, I'd recommend even more stringently that only a one or two line scientific calculator be used, as this is more ideal for teaching the math of it, rather than figuring out how to get kewl grafyx, but most teachers in America may not have even seen those machines before.

RPN not for little kids....

*Message #50 Posted by **Norm** on 28 Oct 2003, 4:51 p.m.,*
in response to message #49 by Ed Look

Ed naturally inferred that one should get a kid an RPN calculator at the later years of high school. Yeah, that's what I was meaning to say.

Incase there has been a non-clarity, I would not mean to say that RPN calculators should be introduced to a kid who is too young, as a primary calculator tool.

When around young kids (9 yrs, 10 yrs) I note that they naturally prefer that "eeekwulz" button (two plus 6 eeekwulz 8) etc. and naturally their "first calculators" are algebraic entry 4 bangers and so on. How else could it be. It correlates with the fact that they just learned how to add.

A scientific calculator could be a next step for kids. Still algebraic entry, mind you. A TI-30 equivalent makes sense. (I know of no true equivalent on the market now, to the nostalgic item, they all have over-complicated the plumbing way beyond necessary). This is about incrementalism. The kid starts with a simple thing, then a little more complicated.. and more.. and more.. until one day the kid is an adult, doing difficult things with advanced tools.

TI-30 is a nice layout for an algebraic scientific. (has RED LED's too. pant pant... drool drool... ooweee babeee) The closest thing in HP is an HP-31E. That could be a nice thing for a kid to see but its rare and expensive now.

So get the kid a 4-banger algebraic. Then get him a scientific algebraic (a $4 china special from WalMart if you must).

Lastly get him a 32Sii from eBay, for about $300. Do that when he is in about grade 11.

Sincerely,

- Norm

HP49G Bashing

*Message #53 Posted by **Joesph** on 29 Oct 2003, 5:53 a.m.,*
in response to message #52 by deleted

"AND LASTLY if you really care about your child, get him or her a 49G graphing calculator by HP. He won't learn any math on it, but hey, I care about children, and even if you think I don't, the public schools will MAKE YOU buy it from me, because I took care of that because I CARE ABOUT CHILDREN."

You seem to be suggesting that a vintage HP will be more educational then a modern calculator? Can you please explain your reasoning?

I love the classics, but they don't have a fraction of the functionality of a modern device.

This is my last say on the subject, I can't be bothered getting involved in this holy war :-)

Re: HP49G Bashing

*Message #54 Posted by **Ed Look** on 29 Oct 2003, 11:00 p.m.,*
in response to message #53 by Joesph

Joseph, it's by belief that for a child beginning to learn math beyond arithmetic, the material is better understood by having to things by hand first, until proficiency is gained to the point that you won't forget by next week. If a kid just goes to (any calc's) log button (let's forget about ln) all the time, I don't think he will have the same insight into how it works as the kid (like us ol'folks) who had to wrestle with squinting between the interpolation charts; they might even think mantissa is the new girl in class.

Same holds for the trig functions. I much prefer that a child first looks at a chalk-drawn triangle, then the unit circle (, and someday, exponentials... oops there's another button I don't want them to press yet!)

And what about an appreciation for simple decimal math? Manual work with powers of ten make for better mental agility and an increased ability when it does come time to use the calculator or spreadsheet or mainframe.

Now, as for old vs. modern calculators, it seems to me that all the attention-getting

calculators (as far as teachers are concerned) are the warp-driven, magic-photon torpedo protected graphing models.

Norm had an excellent idea, suggesting that the equivalent of an old HP-31E would be optimal for such a student, shortening the (drudgery??) time needed to do the arithmetic, but still forcing the kid to actually play with the equations and functions. Of course, a simple $1.00 four-banger should do that except that it may not have the memory space to do some of the harder homework problems.

And, it should also have some simple programming capability as the child goes on in math classes, assuming the calculator survives the kid.

Re: HP49G Bashing

*Message #55 Posted by **Joesph** on 30 Oct 2003, 1:10 a.m.,*
in response to message #54 by Ed Look

There is no question that children should do things by hand first. While I agree that using a slide rule does help with logs, and using tables helps with logs, it just isn't gonig to happen. My view is that once a skill has been mastered, use a device to take the grunt work out of it.

Kids these days haven't even seen log tables, let alone a slide rule :-)

kids these days

*Message #56 Posted by **Norm** on 30 Oct 2003, 1:42 a.m.,*
in response to message #55 by Joesph

kids these days are all listening to rap music and inhaling from their hash pipes, so who cares what calculator, they wont be learning math anyway.

No, it's worse. They are sniffing glue again! What Morons! I thought that ran itself out in th 70's. And they use the NOx in whipped cream (maybe that is the least of our worries) and getting oxycontin and grinding it up---then they die a few weeks later...Wasn't Heroin invented 100 years ago as a less addicting form of morphine? Didn't work. So, now they try the same old same old, just with the codeine side of the poppy goop---oops--didn't work--again! If you think Carly is bad, what about Big Drug?!

Please DO NOT TIE TO THIS EMAIL--KILL IT!

1234 to delete.

Thanks.

NOx in whipped cream??

*Message #59 Posted by **Norm** on 31 Oct 2003, 4:58 a.m.,*
in response to message #58 by bill platt

Tell me how you do that. Do you have to eat the whipped cream or do you just inhale it?

Re: NOx in whipped cream??

*Message #60 Posted by **Michael Meyer** on 31 Oct 2003, 11:31 p.m.,*
in response to message #59 by Norm

I usually try to inhale the whipped cream, but the apple pie keeps getting up my nose.

Seriously, it is a huge problem. Solvents are being abused..."huffed"... again.

But, you forgot the worst of all. Methamphetamine is epidemic in this country, especially in smaller towns. It affects children, adults, housewives, and business men and women. Rich and poor alike.

It's such a huge problem that is being completely ignored on a social level (though it keeps law enforcement busy, they can't begin to curb the spread). There's nothing being invested in treatment, and next to nothing on education.

Now, I do note that I've never treated anyone for meth abuse who also uses RPN calculators. Draw your own conclusions....

HP-28S Battery Door

*Message #1 Posted by **John Limpert** on 25 Oct 2003, 6:16 p.m.*

I recently purchased an HP-28S for my collection. I had a terrible time installing the batteries. It was much more difficult than on my HP-28C. Is there a trick to replacing the battery door? I'm afraid that I will break it next time.

Re: HP-28S Battery Door

*Message #2 Posted by **CalcKidd** on 25 Oct 2003, 10:01 p.m.,*
in response to message #1 by John Limpert

I often wondered why the 28S's door (and 19BII) was so hard to close. It appears the spring inside is either larger ot stiffer than in the 28c or 18C.

Though not advisable, I was going to maybe remove some of the spring (just not sure how yet).

:-(

Re: HP-28S Battery Door

*Message #3 Posted by **Marx Pio** on 26 Oct 2003, 3:51 p.m.,*
in response to message #2 by CalcKidd

This thing was made for headaches. Be carefully. I insert and release the batteries until the spring became more "soft" and then I insert the plastic slide cap.

Cheers.

Marx Pio

Well done boys. I knew you would understand the basic, primal feel for RED-LEDs. Thank you for no name caling, and the joy of meeting people deeply conscious of the greatness of lower, shameful low-end, disgusting low-power things like the onboard Apollo 11 computer, HP35, HP9825, and many others, who are such a pile of crap for not having a 3 Ghz CPU and just being able to send people to the moon as compared to making big bucks at your local Wal-Mart. Sorry for giving a shit to REAL engineers and not just $$$-lionaires ! I Should respect $$$$ instead of proper design. Won't make this mistake twice. Also, I'll set flag 456 in order to speed up some remote calculation case as discussed for 3 weeks in this very forum *devoted* to *OLD* (read : 2-week old) calculators.

Apart from that, thanks to all serious (old calculators) on this forum.

GE you forgot to mention

*Message #10 Posted by **Norm** on 29 Oct 2003, 4:23 a.m.,*
in response to message #9 by GE (France)

Hi GE, you forgot to mention that your favorite 1960's Apollo launch computer.... or HP calculator, etc., has a CPU that RUNS RELIABLY however that 3GHz baby from Bill Gates hangs about every 3rd day (probably when the 64 bit bus changes from all 1's to all 0's enough times to make the backplane resonate) and nobody knows why, and who cares, if it only crashes every 3rd day, its reliable.... right ?????

(you can always reboot it..... wanna know a scary fact about the 777 first test flight ever??? ? So the computer has some bug in it and the software guys never fixed it. The airplane is sitting on the numbers and they want to fly it, the engines are idling..... and it just sits there.

After a couple minute delay, the pilots take off in the 777 first ever prototype maiden test flight. The reason for the delay????? The software bug makes the avionics computer malfunction, so the pilots had to go running down into the avionics bay underneath the cockpit..... and pull the main breaker to "off"..... and then "ON" again !!!!!!

Wish I were joking, but I'm not.... who can understand the minds of the software-heads.....the manager-heads..... the anti-RPN crowd..... or inside the brain of Carly Fiorina. They better hope that nobody needs to reboot their 777 computer while they are on-final on a dark foggy night, but of course, if it works 2 days out of 3, that's OK in the Starbucks/Bill Gates society, right ?

Scary 777

Read it in some book, of course, about the 777 project.

No, didn't make it up out of thin air.

I think it was "21st Century Jet". If you want me to verify any further let me know, I got a copy around here somewhere.

Of course by now they have fixed the software bug.

What's interesting is they flew on that day by turning the computer off and on..... right out on the runway. That's a Bill Gates mentality, of accomodating unreliable equipment.

ABOUT THE FOLLOWING POST (airbus not immune, etc.) That article talks about whether pilots are allowed to make extreme maneuvers. With the Airbusted, they are not allowed, with the Boeing, they are allowed.

Perhaps the philosophy should be called into question now that Mohammed Atta types could be your co-pilot. It might help a little if the plane restricted its own movements, say when Co-pilot Batooti crashed the Egyptian Air 767 into the ocean (what a guy).

Airbus is not immune . . .

My Chev truck wouldn't start one afternoon out in the field. Just wouldn't. Nothing. No radio, no windows, nuthin'. As I, trying to be the good engineer sat there futilely trying to trace "OK, gas, spark, air", (Ever look under the hood of one of these things?) one of the operators in the field comes by and pulls the positive terminal off the battery, waits 30 seconds and bolts it down again. Truck starts! "What the heck was that?" I ask, and the operator responds "Dunno. It's like you gotta reboot the computer".

not sure about the exact cause, all I know is it worked.

Holy cow, that's one to keep in mind. Gotta reboot the car's engine computer to make it start.

My Chevy truck has got too much computer flim-flam on it (Bill Gates mentality). Like, I dont have control over my dome light. It turns it out automatically about 60 seconds after I leave the car. I dont like that. It's my business, not theirs. I don't have control over the headlights. They come on when I put it in "Drive". I dont like that none of their business.

So I'm out in Wyoming going like a bat out of hell, and when I hit right about 99 - 101 miles an hour, the engine ceases firing, until the speed comes down to about 95. Apparently the engine computer has a hard-limit at 100 miles an hour, and if you hit the limit, it shuts off the fuel injectors.

I say that's none of their damn business how fast I am going, and they ought not to limit my max speed. Ever seen the videotape of some guys trying to outrun a tornado on the freeway? It's like, right behind 'em!! If you were in the Chevy you'd be dead.

I'm with Boeing not Airbus. "If its not Boeing I'm not going"

(well OK, I went, but only with a guilt complex).

I had to have the engine computer in my car replaced about a couple of weeks ago. This is what happened: I drove it to work one morning -- everything was fine. I went to lunch that day -- still fine. I tried to drive home that night -- it wouldn't start. Well, actually, it *did* start, but immediately stopped again aftr runing two or three seconds. This happened every time I tried to start it. I played around with it off and on for a few days, and verified that it was getting plenty of gas, the wiring and fuses seemed fine, the built-in engine diagnostic codes said there was nothing wrong, etc. I also had a shade-tree mechanic friend take a look at it. Finally my wife got tired of driving me to work so I just had it towed to a garage. They discovered that the engine computer had decided that the anti-theft system was reporting the car was being stolen, so it shut down the engine every time it was started. The cute thing was that my car doesn't *have* an anti-theft system! The computer apparently was programmed to handle one *if* it was installed, and it went bonkers and decided the non-existent system had been activated. There was no way to reset it, so a new computer had to be installed. Parts, labor and towing came to a little over $500. Grrrrrrr...

Saab 900 long

*Message #18 Posted by **bill platt** on 30 Oct 2003, 3:47 p.m.,*
in response to message #16 by Norm

I had an '87 saab, great car, ran nicely, reliable, etc. Mechanical fuel injection. Replaced it with an '85 saab 4 door--another nice car. Year later, that gets totalled by an undocumented driver. When I asked to see his papers, he drove away!

So, Got a 1990 saab, thinking, these are cool cars, they are very safe, pretty good on gas, very comfortable, low cost (for a eurocar anyway).

Well, the 90 was a whole nother ballgame. ECU or ECM or something. That godddaaammm thing was nothing but trouble. Finally got tired of repacing it--3 times--and now that car sits in the yard, serving as a Property Value Reduction Prop. Next week, I plan on taking the wheels off, sitting the car on blocks----since the house across the street just sold for 375k ;^}

Apparently, they went "electronic" in 89 or 90 or something.

Also, Detroit diesel is involved in a massive lawsuit from a major shipowner,

regarding their electronically controlled high speed 4 cycle diesels. Apparently, they are not making the 15k hours between rebuild--more like 500 to 1000!

And, I know of some smaller ferry operators who shy away from the electronic ones--had troubles etc.

You know, electricity is great and all, but why does it seem like it is less reliable now than in the past? (I can answer that but I wont--too much of a rant).

So, why is this relevant? Because In 20 years of using an 11c and 32sii, I have NEVER had to "reboot". But how about the 49g+----see c.s.hp48 and yo uhear reports.....

Here's another curio: Big Shipyard, Big Mainframe, Unix. 150 CAD workstations--running different programs. Programs linked to eachother. Not a single crash in 7 weeks.

Another shipyard. a "Microsoft" approach. Microsoft NT server, 50 Cad workstations, local machines windows NT4 SP3. Crash server almost daily. Crash local machines more than once a day. Blue Screen of Death, and others, too.

Why do we accept this?! Why are we throwing away stable UNIX systems for this CRAP! So we can have eXcel or Word?! For C...sakes..those programs arent't THAT good....(I liked Word Perfect 5.2 more--and Quattro Pro had more functionality...)

So, along that line, I am NOT going to buy a 49G+ for a while---I don't want to encourage them! Send the useless junk marketeers the only message they understand---nothing!

Re too much thought control in today's autos, an extract from an article by Paul Cockburn on the E-Type Jaguar (XKE) in the Australian car mag 'Wheels'

"I read somewhere recently where the current Cadillac has 103 separate electric motors aboard to make your life that little bit easier.

That's nice.

The Series 1 E-Type has three that usually do something. Starter motor, fuel pump and radiator fan.

It has another two that work, but do nothing worth a damn (the heater fan and windscreen wipers) and one that does something very peculiar (the screen washer switch, when activated, soaks the passenger's right foot).

The only other one that I know of drives (for a few moments after delivery and any subsequent attempts at repair) the rightly famed Sir William Lyons Memorial Clock, which sits in the rev-counter of every early E-Type and almost immediately seizes at 25 to 12 .... presumably predicting the moment of his departure from the mortal coil.

It has pwoer-operated nothing.

You want the windows up? Sort them out yourself.

Think of erecting the roof as a mental and physical accomplishment.

Steer it like a man, damn you!

God will determine the condition of the air. And so on."

Re: Airbus is not immune . . .

*Message #24 Posted by **Vassilis Prevelakis** on 31 Oct 2003, 7:29 p.m.,*
in response to message #13 by Paul Brogger

a) Unreliable software is not a "new" thing. There were bugs even in early HP calculators, despite the fact that the code was much smaller and the product develpoment cycles were longer.

b) The first flight of Columbia had to be postponed for 2 days because of a software bug. The four PASS computers (primary avionics) could not sync with the backup flight computer. Somebody suggested rebooting everything. NASA did not want to try this especially with Columbia fully fueled and ready to go. So they cancelled the launch and tried again the following Monday. The second time everything went OK. Over the weekend they found and bypassed the bug, which had 1 chance in 64 of occuring (so if they had rebooted, chances were that the computers would sync).

c) Having computers ensure that the plane stays within a safe envelope will not make the plane safe. The recent crash of the AA Airbus 320 over NY (where the pilot commanded a series of end-to-end deflections of the rudder, causing the vertical stabilizer to break off) proves that the "user" can always cause unpredicted behavior.

d) In the case of the 747 that went out of control, it may be worth investigating whether envelope protection would have prevented the incident from occuring in the first place. Also in another incident (in the Philipines) the pilots could not regain control of the plane (another 747) and it crashed.

e) The traditional way of controling flight surfaces is dead, because it costs too much (weight, manufacturing, maintenance, etc.). Even in traditional flight control systems a degree of automation exists. E.g. in large planes such as the 747, MD11, etc, you need hydraulic pressure to control the flight surfaces anyway. So the pilot's controls are not linked directly to the flight surfaces. In these cases feedback to the pilot (e.g. the stick shacking when the plane approaches stall) are "simulated" (e.g. by having a motor shake the stick when the plane approaches stall). In the O Hare DC 10 crash (where one of the engines detached from the wing taking with it all three hydraulic lines) the pilots stick shaker did not work because it was powered from an electrical power bus that was powered from the missing engine. (so what about the co-pilots stick shaker? it was an optional extra and was not installed). The plane stalled and crashed.

f) (to finish on a possitive note) Having a fully manual backup can save your ass. Remember the Air Canada 767 that run out of fuel. The pilots managed to land it on an unused strip by gliding. Most of the avionics were dead (they had a little bit of power from a windmill generator), even the APU was dead since it uses fuel from the main tanks. Of course the hydraulics had pressure, but without power the pilots

could only achieve reduced deflections of the fligh surfaces (like braking your car with the engine switched off). (In fact the nose landing gear did not deploy properly because it drops against the wind stream, and the plane suffered some damage).

VP wrote:

>> AA Airbus 320 over NY (where the pilot commanded a series of end-to-end deflections of the rudder, causing the vertical stabilizer to break off)

Hi VP, although I personally don't believe in vertical stabilizers they break off (an Airbus innovation) do you know anything further about why the pilot pressed end-to-end? Are you sure the command was so extreme?

VP wrote:

>> In the case of the 747 that went out of control, it may be worth investigating whether envelope protection would have prevented the incident

Hi VP, it would have, in this situation. The reason the 747 begins with that they were flying very high (maybe 37,000 feet or whatever is higher than usual) . Then the initiating problem was that one of the 4 engines quit. It was a flameout, or some such minor thing. However, when in the very rarified atmosphere, you must maintain airspeed. If an engine quits, you must lower the nose (descend) and probably lower the nose quite strongly. The pilot did not significantly lower the nose. As a result, the airplane on 3 engines quickly went into a stall, probably on one wing first. This made it tumble crazily and caused a lot of upside-down gravity etc. from which they were lucky to recover. Therefore to answer your question the AIRBUSTED philosophy of intervening over the pilot WOULD HAVE prevented the incident (the airplane would've shoved the nose down harder than the pilot did).

I dont know if the Airbus philosophy is better however. The computer guys write buggy code and they may cause more accidents than they prevent.

VP wrote:

Keep in mind that there were other disasters at work. The DC-10 like most big jets has got leading-edge flap surfaces and trailing edge flap surfaces. They have to extend together; if one extends and the other doesn't you have a junk airfoil that won't fly. The leading edge flaps were held in position by hydraulic fluid only, even though it was tradition to use mechanical locks also, the managers decided on a payraise t(o executives only) instead and used hydraulic fluid only

for locking the leading edge flaps. When the engine came loose (due to uncertified maintenance procedures damaging the engine mount) it ripped loose all the hydraulic lines like a bunch of spaghetti. The hydraulic pressure failed on one side only and the leading edge flaps retracted on the one side while the big trailing edge flaps were still extended. The pilot now had a junk airfoil. Sadly it was still flying as he was climbing out, however the book called for him to REDUCE his airspeed as part of a failed engine. He didn't know that he had even lost an engine; when the airspeed was reduced the improperly configured wing stalled unexpectedly (left side) and the plane rolled to the left, flipped over and hit the ground.

Therefore a variety of problems there; bad hydraulic designs, management cheapout, and regulations on the pilot that didn't prove advantageous (if I was flying and I lose an engine I'd want to go like hell, keep my airspeed up).

Re: Airbus is not immune . . .

*Message #26 Posted by **james (UK)** on 1 Nov 2003, 6:21 a.m.,*
in response to message #25 by Norm

From what I remember, the Airbus was turning and following a plane in front (also turning) and twice ran into that planes wake turbulence, the first time the pilot managed to regain control through reversing the rudder a couple of times, unfortunately the second time structural failure intervened.

According to Airbus, it was a mixture of pilot error (shouldn't have reversed the rudder as this imposes way too much stress) and the airline (their manuals didn't tell the pilot what he should do). Apparently simulations have shown very high stresses in these situations but funny how pilots have been reversing the rudder on Boeings and other planes since the days of Orville & Wilbur without any problem.

Kind of like don't push the throttle lever too far forward

*Message #27 Posted by **Norm** on 2 Nov 2003, 3:47 a.m.,*
in response to message #26 by james (UK)

Kind of like if it said "don't push the throttle lever too far forward....."

"if you do, the knob falls off in your hands."

The owner's manual says thats what will happen, so its OK that it is what happens.

"dont push rudder pedal too hard, rudder might fall off".

Interesting how all the blue-suits and the lawyers and the managers are willing to keep a straight face while they say such lunacies. I suppose they can't just admit the truth (rudder was too flimsy, shouldn't fall off) because then the lawsuits will win bigger.

rather harsh statement, read below:

From Aviation Week and Space Technology, Nov 25, 2002
> The Airbus A300-600R's rudder moved from stop to stop five
> times, causing the vertical stabilizer to be torn from the
> transport. The total force exerted was 1.93 times limit
> load, the maximum load expected in service.

From Aviation Week and Space Technology, Feb 8, 2002:
> NTSB officials stressed that problems from successive
> rudder inputs is a threat on all transport aircraft, not
> just Airbus A300-600s.
```

In fact the KC-135 (military version of the the Boing 707) manual specifically cautions against rudder reversals.

My point was not to say my plane is better than your plane (unlike John Travolta, I don't actually own an airliner :-). My point was that this was one case where envelope protection may have prevented the accident.

```
> I dont know if the Airbus philosophy is better however.
Neither do I. This is why I gave examples both for and
against. The court is still out.

> The computer guys write buggy code and they may cause
> more accidents than they prevent.
```

This statement is so general as to be useless. Computers **are** used in both Boing and Airbus airliners and soon they will be used in practically all aircraft.

In reality, technology and economics force the replacement of manually driven actuators with computer driven ones.

You have to realize that old technology is not inherently better because its does not involve computers. Its just different. It has its own problems, like things falling off without the pilot having a clue (O Hare crash), like elevators being incorrectly adjusted (TWO recent USAir Express crashes), etc.

```
(regarding the DC-10 O Hare crash)
> Keep in mind that there were other disasters at work.
```

Of course. Most accidents are due to an unfortunate conbination of events. The DC-10 crash was one of these cases. However, my point was not that the stick shaker was the root cause of that crash, but that even in older aircraft that do not use "fly-by-wire" technology, there is still a lot of automation that can ruin your day.

Hmmmmmmmm Work for Airbus ?

*Message #29 Posted by **Norm** on 2 Nov 2003, 3:51 a.m.,*
in response to message #28 by Vassilis Prevelakis

Hmmmmmmmmm. Sounds like you work for Airbus.... in the legal department.

Well, if I understand your position correctly, Vassilis, you are saying that its mechanically OK to put a rudder on the airplane that will fall off with stop-to-stop actuation. (I guess they do that by using plastic bolts and chewing gum, etc.)

So you are telling me its OK to make a rudder like that, so long as the software is coded to prevent the pilot from stomping on the rudder pedals. Ok..... whatever you say.

You done much flying ? Take any lessons ?

Re: Airbus is not immune . . .

> the airplane that will fall off with stop-to-stop
> actuation.
```

Which part of "The Airbus A300-600R's rudder moved from stop to stop **five** times" you don't understand? In an earlier flight (AA 903) the rudder was moved end-to-end eight times and did not fall off, because it is contructed of composite materials and has been overengineered on purpose.

Regarding my previous posting:

a) I quoted the NTSB statement from AW&ST. If you think you know more than these guys then apply for a job at NTSB and save thousands of lives.

b) Planes, unlike Abrams M1 tanks are by design fragile. They are not made of steel or titanium, but aluminum and composites. This is because the higher the dry mass of an airplane the less payload (i.e. paying pax or cargo) you can carry for a given MTOW (max take-off weight). So, guess what, if you apply the thrust reversers in flight, the plane falls to bits. If you do this in an M1 you make a big hole in the ground and you simply have to back out. The flight instruction manual tells you what you can and what you cannot do. Pilots have to obey these rules. The more professional the pilot the closer he or she follows the book. Sometimes the book is wrong (like in the case of the O Hare crash) and people get killed. In most cases the book is right and everybody gets to tell scary stories to their grandchildren.

c) Screwing around with a two story rudder will get you in trouble. The big question during the inquiry was whether this needed to be stressed in the aircraft manual and the AAMP (Advanced Aircraft Maneuvering Program), or that this should be self evident. The KC-135 manual includes this warning. NTSB board member J.A. Hammerschmidt and some American Airlines pilots were receiving the impression that the AAMP indicated that rudder, rather than ailerons was the primary method for roll control in some upset circumstances including wake encounters (AW&ST Nov 4, p.47). One of the recommendation of the board was that this had to clarified.

d) Ultimate load for the vertical stabilizer is 1.5 limit load (maximum load expected in service). In the case of flight 587, the tail broke off when the actual load reached 1.93 of limit load. The A300-600 tail is actually 30% stronger than required, which allowed other flights (e.g. AA 903 where during 8 rudder reversals the **ultimate** load was exceeded 3 times) to survive.

e) There are lots of things you shouldn't do when flying an airplane (e.g. applying the thrust reversers, lowering the landing gear at cruising speed, etc.). For some of these things there are safeguards that prevent the pilot from performing the action, for others, the pilot can perform the action and pray that he/she can get away with it. In the two cases mentioned above (thrust reversers, and landing gear) there are mechanical interlocks that prevent accidental deployment. As computers are gradually installed between the pilot and the plane, some/most/all of these interlocks will be implemented in software. While I am not sure whether its a wise decision, I predict that most new planes that will be built in the next ten years (Boeing 7E7, Airbus 380-800, etc) will have software that will be flying the plane and the pilot will be less in control.

```
> Sounds like you work for Airbus....
```

The question should be whether I work for the aircraft industry. :-) Airbus, Boeing, Bombardier, everyone has to make products that are sellable, i.e. economical to purchase, operate, maintain, and so on. They all have to make design decisions on how to reduce weight, automate tasks (e.g. this is how they got rid of the flight engineer), simplify maintenance and (of course) operate within the parameters specified by national and international law. So everybody is trying to get as close to the sweet spot by coming up with new solutions. In some cases they are rewarded because these solutions allow them to improve their price/performance, in other cases they have to backtrack and pay millions of dollars to remove the "optimization".

Feel free to question what I say, but before you respond, check the NTSB report, and the AW&ST website (www.aviationnow.com).

Now can we get back to HP calculators?

No, we can't. Your viewpoint is terrifying, I wish to make sure I really understand it.

As an analog electronics engineer, I have watched the software types slowly come to power and tighten their stranglehold on society with their viewpoint that 'things ought not to work properly'.

I am familiar with the design of linear amplifiers. It can be difficult to make the linear amplifier stable under some conditions, so it oscillates. Thus comes the heart & soul of analog electronics, to make things work properly. BUT NOW comes the software guys.... and my impression of them (as far back as 20 yrs ago) was that they would just assume have an UNSTABLE badly performing amplifier (like for their stereo speakers) just so long as they get to add a microprocessor and some lines of code, imagining in their childlike fantasies that they get to sort of 'clean up' what they dont understand by tap-tap-tapping at their little keyboards and running their tidbits of assembler instructions.

Well, I dont buy it. I think you software guys would just assume put in a substandard foundation underneath a 50 story building..... like not use very much cement so maybe it wants to tip over. After all, we can just add a microprocessor and just write a few lines of code!!!!!

You seem to have some expertise about the crash of the Airbus jet. So, did anybody change ANYTHING in the design? Or did they just count the number of stop-to-stops of the pilots feet and say '5 is too many'.

In advance, it sounds like they did not do ANYTHING!!! This conveys a total disrespect for people's lives, comparable to Ford/Firestone.

I think software people are unwilling to look at the big picture. You say 'the rudder is 2 stories, of course it falls off'. You keep pointing out that it was at 1.93 of the supposed 'load limit'. Did it ever occur to you that maybe the load limit number is WRONG? Maybe it failed at 0.5 of the fair load limit, if you only pick a reasonable design limit in thei first place.

WELL how about designing the rudder extra strong at the bottom, with a deliberate breakpoint up higher so that if the worst-case nightmare occurs, the pilot can still fly home on half a rudder? Why? Because of the middle managers! This would require them to actually think, and maybe have a bunch of fresh work to do, and maybe they don't want to do that. So they shall just do

nothing!!! Did you know that the Concorde crash was preceded by NUMEROUS examples of the exact same problem, but the managers did nothing? Did you know in the 70's that TWO DC-10's were damaged or lost due to cargo-door failure, before the middle managers finally got kicked off their butts and onto their feets to actually do something about it?

Back to software, you keep assuming that the jet flies in a straight line, so that the rudder doesn't have to do very much. Well, how about if the plane tumbles in flight. How about if there is a screwup and it flies into a cumulus cloud. How about if your co-pilot is an arab like Bhatouti. You could wind up damn near crossways to the wind stream under any of these conditions. The China airlines (?) 747 certainly did when it tumbled from 37,000 feet after a turbine trip.

I have to presume you are just toying with my mind and that is why you write this stuff, so if you dont want to reply fine.

As to me, I absolutely do not believe in rudders that snap off due to a pilot stomping on rudder pedals, and perhaps you should reiterate your viewpoints to the victim's families.

in response to message #32 by Vassilis Prevelakis

Well, Vassilis, cooperative teamwork is about if you know something, you are welcome to fill me in. I dont have time to go and read this report, and if you have already done so, you are welcome to provide me with details.

Meanwhile I promise next time I am in a Cessna 172 I will

caefully count my applications of rudder pedal and be very careful not to exceed 5 counts lest I break off the rudder and crash. I believe that makes good sense to me.

As you do not wish to provide useful facts or details (did Airbus do anything after the crash???) and you continue to cling to the notion that "5 is too many" (or whatever the airbus lawyer said) I think I too am ready to bid farewell to this exchange.

As before, I reiterate my suggestion..... go share your viewpoints with victim's families.... starting with the wife of the captain of the Airbus. BTW the captain is obviously being blamed after his death as a scapegoat, a common tactic by businessmen and MBA's who care less about technical realities. Too bad you are on their side.

I see, you have the time to draw conclusions based on total speculation. E.g.

```
> In advance, it sounds like they did not do
ANYTHING!!!
> This conveys a total disrespect for
people's lives [...]
```

... but you do not have the time to go and read a couple of pages so that you can get a first hand idea of what the experts believe *really* happened.

So, OK Norm, you are absolutely right. Airbus is total trash and we must urge all people never to set foot on one of their flying coffins. Now that this has been settled, take a few deep breaths and go back to your important work that leaves you no free time.

And now that you have shown me the light, can we go back to calculators?

**vp

Vassilis,

*Message #36 Posted by **Norm** on 3 Nov 2003, 7:16 p.m.,*
in response to message #35 by Vassilis Prevelakis

Vassilis,

I really have no further need to absorb your "wisdom" that killed hundreds on that Airbus flight. I also find your helpful and cooperative spirit most intriguing, in which you refuse to describe whether any subsequent mods (presumably strengthening the flimsy rudder) were, or were not, implemented.

Actually I can clearly see why you would refuse to answer the question... you lose either way

(a) if they strengthened the tail, then the captain you are damning (for having pushed the rudder pedal 5 times) would be vindicated, since they made structural changes (b) if they did not strengthen the tail, then its just as flimsy as ever and another will crash very soon

Therefore, Vassilis, you try to "win" by becoming obsessed with the fact that I have not sat down to read some lengthy report (its true, why should I, tail-fin fell off because pilot used rudder, what more do I need to know!)

Please note that I posted with my genuine name, a genuine e-mail address. Now, shouldn't you quit pestering all the people on this chat board (including me) with your desire to make pilots count the number of times they count rudder

actuations (1, 2, 3, 4, oops!) BECAUSE if you have any specific need to contact me further, you may do it direct to my e-mail,and I will continue to try to assist you to learn prudent and logical engineering practice.

BTW along with logical engineering thought processes being on my side, the victims and their families would also be on my side of this debate, something you repeatedly refuse to acknowledge (instead you are dwelling on whether I have read precisely the same scraps of paper as you, which obviously is unlikely for two chat board participants to have read the same materials in advance, yet you seem to find great satisfaction in dwelling on that detail).

Again, please send it direct, or not at all. I post here only because along with your continuing conviction that its OK for airframes to fall apart, you also do not divulge your e-mail address.

Re: GE you forgot to mention

*Message #37 Posted by **Les Bell [Sydney]** on 29 Oct 2003, 5:55 p.m.,*
in response to message #10 by Norm

The F-22 has been suffering similar problems in its avionics suite software, to the extent of requiring a reboot several times in a typical early test flight. That's rebooting *in flight*, folks.

Things have improved somewhat, though - apparently they only lose a few minutes while rebooting as opposed to half an hour or so during early flights.

The original "Atlanta Journal & Constitution" article is gone now, but a Slashdot story still refers to it, at http://slashdot.org/articles/02/07/22/0615221.shtml?tid=126.

I always thought that for test pilots, the object of the game was not to cheat death, but not to let him play the game in the first place. Perhaps times have changed. . .

Best,

--- Les [http://www.lesbell.com.au]

HP49g+ for $129.99?

*Message #1 Posted by **Brian** on 25 Oct 2003, 2:42 p.m.*

Just saw a website that is selling the new 49g+ for only $129. The site is http://www.graphingcalculators.net/gcteststore1/hepabgrca.html

This sounds way too good to be true. Does anyone have experience with this store?

Re: HP49g+ for $129.99?

*Message #2 Posted by **U of I EE** on 25 Oct 2003, 7:21 p.m.,*
in response to message #1 by Brian

I just bought my new HP 49g+ at the University of Illinois' Illini Union Bookstore in Urbana, Illinois for $132.99.

*Message #3 Posted by **Alain (Canada)** on 25 Oct 2003, 4:16 p.m.,*
in response to message #1 by David Motto

Hello,

the ROM option will become available if you select the dedicated USB com port (something like "HP-4xG+"). Then, you can upgrade your calc. Make sure to select 115kbps (kind of slow otherwise).

Alain

New bug?

*Message #1 Posted by **Paul Fox** on 25 Oct 2003, 9:39 a.m.*

Decided to take 5 mins off and read the manual and follow some of the examples to refresh my brain.

Tried typing "1234567890123456" to see what it did, i.e. whether it was an integer or a float.

I got to about '6' and the calc powered off as if it had lost battery power or I had OFFed it. (Batteries are fresh as of last night).

Turned on again and repeated test numerous times...but didnt reproduce the 'glitch'. Havent seen anyone else report this, but just in case.

I havent had any issue with the keys being too hard or different...strange. I put it down to Solar Flares for now.

Re: New bug? #2

*Message #2 Posted by **Paul Fox** on 25 Oct 2003, 10:49 a.m.,*
in response to message #1 by Paul Fox

Was playing around with APPS and looking at the ALG menu and went to CANCL the popup and the calc hung hard. ON-C didnt do anything. Had to hard reset it.

Either this calc suffers from static (got a static spark when touching the hifi a minute or two after this activity) or them bugs are really opening up on this baby.

Not specific enough

*Message #3 Posted by **Gene** on 25 Oct 2003, 10:56 a.m.,*
in response to message #2 by Paul Fox

To help others see how to find this bug, you didn't provide enough info to replicate it.

"playing around with APPS"

Were you in the APPS choose box? If so, how did you access the ALG menu? Press the RS ALG key? Go through the APPS choosebox to the calculus menu then the algebra menu?

?

I'm using ROM 1.22 and just did:

APPS

11

ENTER (Enters the CAS menu)

2

ENTER (Enters the ALG menu)

and I can press CANCEL very easily without a crash.

If you did something else, help us replicate the "bug" report.

Re: Not specific enough

*Message #4 Posted by **Paul Fox** on 25 Oct 2003, 11:03 a.m.,*
in response to message #3 by Gene

Sorry - I am not being specific enough. It very much surprised me and it was difficult to know exactly what I did. I was defintely playing with CHOOSE boxes which I have done plenty of times before.

I am not necessarily looking for help here..I am trying to be deliberately thick (not hard for me!) and just bash about and learn whats on all the menus.

I raise these here in case others see similar issues and dont want to feel alone.

It upsets me that the HP48SX was brilliant, the HP49 I found unusable because the screen was so difficult to see, and the HP49G+ is looking 'buggy' (hardware and/or software). But I am still happy with it. Its a learning tool and I am not sure I trust it.

Re: Not specific enough

*Message #5 Posted by **Gene** on 25 Oct 2003, 11:07 a.m.,*
in response to message #4 by Paul Fox

And I'm just trying to duplicate the bug.

If it can't be duplicated then no one can be sure if there IS a problem.

Gene

Re: New bug? #3

*Message #6 Posted by **Paul Fox** on 25 Oct 2003, 10:59 a.m.,*
in response to message #2 by Paul Fox

Them bugs coming thick and fast...this one is definitely sw.

Set the stack display to small.

Did a RCLF -- this is me typing them in from the calc:

{#800028205410ff0h #0h #12000000098h #0}

Now keep DUPing them on the stack. Eventually you see levels 1..5 showing the same flags.

But frame 5 redraws wrong. It needs two lines for display and each of levels 1..4 are correct. But level 5 shows just the top 2 pixels of the second line. Maybe this is correct behaviour but it looks flipping ugly. It should use the "..." notation if it cannot fit.

Re: New bug? #3

*Message #7 Posted by **Gene** on 25 Oct 2003, 11:05 a.m.,*
in response to message #6 by Paul Fox

Set my 49G+ to small stack display.

I did a RCLF but my list is: {#CF1h #1100h #80h #0h}

When I DUP this, I can fill all 9 levels of the stack with it and it displays fine.

Why did you indicate "5" levels of the stack? If the stack display is set to small, it should show 9 levels not 5.

My flags are set to show "many lines" (flag 52 is clear), but when I have it set to "show one line", I still dont' get this behavior.

?

Gene

Re: New bug? #3

*Message #8 Posted by **Paul Fox** on 25 Oct 2003, 11:46 a.m.,*
in response to message #7 by Gene

I assume that if you use my flags ie what RCLF returns you get all my settings, namely font size. I have 5 levels showing because those flags spill over to two lines for the font setting.

If you use your flags (which are shorter than mine) you likely wont see it.

Its debatably a bug -- if you have a big array on the stack, it likely wont be able to display all of it. In which case it depends on the code for showing either the top bit or the bottom bit. But it would be nice if partial lines didnt show. At a small font, the pixels run into each other making it look very bizarre.

Not a biggie. I'm still happy that the HP49G+ is cleverer than me... :-(

Re: New bug? #3

*Message #9 Posted by **Pete M. Wilson** on 28 Oct 2003, 5:34 p.m.,*
in response to message #6 by Paul Fox

Duplicated on 49g+.

Note on 49G, only 4 levels display, level 4 shows .. at end rather than trying to display between level 4 and 5.

Re: New bug? #4

*Message #10 Posted by **Paul Fox** on 25 Oct 2003, 1:35 p.m.,*
in response to message #1 by Paul Fox

Power off doesnt seem to work. I havent come across where its possible to enable/disable this or change the timeout (not sure its possible without programming the STARTUP/STARTOFF functions. I may have the OFF function wrong).

Walked away from my calc and it was on about half hour later. It could be that it is powering itself on - I'm pretty sure I power it off when I finish with it.

Will keep an eye on it....

Re: New bug? #5

*Message #11 Posted by **Paul Fox** on 25 Oct 2003, 1:47 p.m.,*
in response to message #1 by Paul Fox

Oh there coming thick and fast....

I tried one of the silly examples:

<integral> 0 to X exp(X) dX

(sorry not sure of the ascii convention to get this right). Anyway, note I am evaluating exp(X) and not exp(-X).

I would expect this to be infinite?

Anyway after 30 secs, maybe 1 minute it was still calculating away. Maybe it is fine to do this in one or other of the numeric modes .. not sure.

So I aborted the operation with ON/CANCEL.

It popped up a note saying the operation was interrupted.

The bug is it left this on the stack:

2: External 1: 0.728780437708

I think any command leaving an External on the stack can be considered a bug? Not sure what the 0.728780437708 corresponds to (the right answer?)

more later when the next baby appears.

Re: New bug? #5

*Message #12 Posted by **Eric Lundgren** on 25 Oct 2003, 3:22 p.m.,*
in response to message #11 by Paul Fox

Hi Paul,

I have no book to reference here, but if I remember, Dx(exp(x)) = exp(x), in which case, Int(exp(x))dx, would be exp(x) + constant.

then if you eval at 0, and x, (I'd think to use t or something for clarity) you'd get [exp(t) - 1] ...but that's if you are doing symbolic mode I guess...you might be way beyond my background. Then if you meant for x->infinity, then I'd be sure to agree that the integral will diverge. Maybe that object it leaves is an intermediate calculation while its trying to do the impossible. ?

best regards, Eric

Re: New bug? #5

*Message #13 Posted by **Arnold Steekelenburg** on 25 Oct 2003, 5:38 p.m.,*
in response to message #11 by Paul Fox

On my HP49+ this integral returns exp(x)-1, within a fraction of a second.

HP49g+ questions

*Message #1 Posted by **Brian** on 25 Oct 2003, 2:00 a.m.*

I grabbed my HP49g+ from the University of Washington bookstore last Friday, and I've been quite happy with it. I've always preferred RPN, though I've never before had an HP calculator. (I have, however, used an RPN program on my PalmPilot for quite some time, and my chem teacher has an extra 11c that he lets me use in class.) I'm gradually learning about my new calculator and what I can do with it... I think I've got the basics down, the next step is figuring out RPL.

There have, however, been a couple of issues with this calculator that I was unsure about. I've noticed that the bottom few lines of the screen (where the soft menus are) flickers every few seconds. Also, occasionally, the rightmost portion of the screen will display a bit of garbage for a few seconds, and then go back to normal. This only seems to happen when the calculator is running its normal OS... on all of the self-diagnostic screens, LCD test, ROM update screen, etc, the display seems fine. This leads me to believe that there are some bugs in the ROM.

Is anyone else having these issues? If it's a common problem, then I won't worry about it. I just want to know if I have a fried graphics controller/CPU or if this is just a common bug that will eventually be corrected through a ROM update.

I've also done a little bit of experimentation with downloading 49g programs and trying them out. I've basically found that some work, some don't. I've had the most problems with programs in library format - mostly they either don't work well at all or they work, but the calculator turns off semi-randomly. Other programs I've had more success with, although some games run *really* fast.

One more thing that I've noticed is that this calc seems to have a lot of trouble with grayscale, or at least the way grayscale was done on the 49g. Trying to run a grayscale program on the 49g+ results in a really flickery image, and the contrast way too light.

Really, I'm surprised that assembly programs for the 49g work on this thing at all, considering that they have completely different processors.

I'm assuming that the incompatibilities with most 49g software is normal and to be expected, right? It's just being new to HP I'm not familiar with how the older calculators worked or what the differences really are between the 49g and the 49g+ and it's hard for me to tell if I've got a defective unit or just am experiencing a few bugs.

All in all I've found it to be an excellent calc. The issues I've experienced, while just a little bit annoying, really aren't bad at all. If these are common, they won't bother me, I just want to make sure I got a good unit :)

Also, any advice about good resources on HP calculators would be appreciated. I've already found hpcalc.org, and obviously here as well. I've also read most of the hp48 FAQ...

Edited: 25 Oct 2003, 2:01 a.m.

Re: HP49g+ questions

*Message #2 Posted by **SV** on 25 Oct 2003, 5:47 a.m.,*
in response to message #1 by Brian

HP's website http://www.hp.com/calculators has many, many trainingn modules under the Solutions Groups.... there are tonnes of examples you can use. I have found it really helpful...just click on the product icon and it leads you straight into the modules under "solutions groups" by occupations.... education, technical, profesionals, etc. Hope this helps

Re: HP49g+ questions

*Message #3 Posted by **James M. Prange** on 25 Oct 2003, 5:55 a.m.,*
in response to message #1 by Brian

Yeah, lots of us have noticed "minor" problems with the 49g+. See http://groups.google.com/groups?q=comp.sys.hp48.

Regards,
James

Re: HP49g+ questions

*Message #4 Posted by **Karl-Ludwig Butte** on 30 Oct 2003, 4:07 a.m.,*
in response to message #3 by James M. Prange

I, too, observed the flickering of the bottom line of the display with my unit, which arrived yesterday. Does anybody know, if this problem is corrected with ROM Version 1.22 ? My unit came with ROM Version 1.20 installed and because I read that the problem has something to do with the garbage collection I still have hope, that it can be corrected.

Re: HP49g+ questions

*Message #5 Posted by **James M. Prange** on 30 Oct 2003, 4:42 a.m.,*
in response to message #4 by Karl-Ludwig Butte

I found it obvious with ROM 1.20, but with ROM 1.22, I haven't been able to detect it, even with the clock displayed. But I think that I've seen some posts that claim that it's still there, although not as noticeable.

Regards,
James

Re: HP49g+ questions

*Message #6 Posted by **Karl-Ludwig Butte** on 30 Oct 2003, 6:39 a.m.,*
in response to message #5 by James M. Prange

so there's still hope. I'll tell you my experience as soon as I tried it out with 1.22.

Re: HP49g+ questions

*Message #7 Posted by **Karl-Ludwig Butte** on 3 Nov 2003, 9:30 a.m.,*
in response to message #6 by Karl-Ludwig Butte

as promised here's my experience wit ROM version 1.22: There's not so much change in the flickering behaviour but turning off the clock display helps a bit.

Re: ROM v. 1.22: Flicker is there, but reduced

*Message #8 Posted by **Paul Brogger** on 30 Oct 2003, 11:08 a.m.,*
in response to message #4 by Karl-Ludwig Butte

FYI -- It's occasionally noticeable on mine after 1.22 upgrade, but is much less obvious. (That's without the clock displayed.)

Re: ROM v. 1.22: Flicker is there, but reduced

*Message #9 Posted by **Ed Look** on 30 Oct 2003, 2:05 p.m.,*
in response to message #8 by Paul Brogger

Gentlemen, after 1.22, mine still flickers only if the clock is used, so I unchecked it. Also, after using some menus (I forget which) there a flicker, but only once after the menu is closed. THAT I can live with; but with such an advanced calculator, it'd be nice to see the clock with it annoying me, like on the 48G's. Maybet they'll kill that and add seconds back to the digital clock display with next ROM update?

A solution to the flickering is [Press ON plus up-arrow].

Re: HP49g+ questions

*Message #11 Posted by **Frank B. (Germany)** on 25 Oct 2003, 9:43 a.m.,*
in response to message #1 by Brian

Both display problems (are they really problems?) seem to be common. Look for example at

http://groups.google.com/groups?q=comp.sys.hp48

and search for "49g+ earthquake photo"

Frank.

in response to message #1 by Brian

The flickering and garbage on the screen have been reported by other people also. Over in comp.sys.hp48 they're calling the screen garbage the "display earthquake." You can find details (and a link to pictures of the effect) here:

49g+ earthquake photo

in response to message #1 by Brian

Yeah, I get the slight flickering as well, but I don't think I could live with that earthquake/grabage stuff. Is it actually a problem with the rom or the hardware itself?

Re: HP49g+ questions

*Message #14 Posted by **Veli-Pekka Nousiainen** on 26 Oct 2003, 7:11 a.m.,*
in response to message #13 by Brandon Del Bel

I think that the "Earthquake" is probably a GC issue in the new HW/SW combo, but to my opinion it is the least problem. The most important are: keyboard & battery issues! THEN I'd like to see a complex numer in polar format with units attached and solved in the Equation Writer using a new CSOLVE. AND the user setting should *NOT* change to radians (etc.) but stay at (5.2_V,45.0_o) as the _user_ wants it to be!!!

URL for HP CALCULATOR WEBSITE; DIRECT LINK/BUYING

*Message #1 Posted by **SV** on 25 Oct 2003, 1:42 a.m.*

It took time but I figured this out. The hp website URL is as follows:

http://www.hp.com/calculators

If you go into the main website and key in "calculators" under search, it doesn't bring you to this site.

Try it.... it has all new products and modules

a change that will come because of the 49G+?

*Message #1 Posted by **Gene** on 25 Oct 2003, 12:29 a.m.*

Now that the 49G+ has an SD expansion slot capable of holding many, many MB of programs and applications, I think a change will be coming.

To my knowledge (and that's imperfect), I don't think Library objects can be stored and/or accessed/run from Port 3 (the SD port).

Programs, however I think I read, can be run while stored on the SD card.

Many/most of the really good programs on the HPcalc.org site are in the form of libraries.

I think these will either get converted to normal programs (again) or new programs won't be constructed as libraries.

Imagine...most of the games you've ever thought of downloading from hpcalc.org in the 49G+ on an SD card.

most of the math programs you've ever thought of downloading from hpcalc.org in the 49G+ on an SD card.

most of the other applications you've ever thought of downloading from hpcalc.org in the 49G+ on an SD card.

All able to be with you and can be run at the touch of a couple of buttons.

Big change coming, IMO.

Re: a change that will come because of the 49G+?

*Message #2 Posted by **Joesph** on 25 Oct 2003, 2:12 a.m.,*
in response to message #1 by Gene

I was wondering how long it would take for someone to point this out. It seems a shame to have so many programs that will not run straight off SD.

Carly Fiorina meets Bill Hewlett

*Message #1 Posted by **DanO** on 24 Oct 2003, 10:48 p.m.*

Fiorina did her best. "It's a great honor to meet you," she told Hewlett. She walked around the table, close to his wheelchair, and crouched down so he could hear her better. "I've been seeing all these pictures of you," she said. "And I want you to know, you were a hell of good-looking guy!" Hewlett just stared. Fiorina thought she saw a flicker of amusement in his eyes, but that was all. She promised to keep HP strong as a technical leader in its fields and to maintain the highest regard for what she called the company's "shining soul." She mentioned that she had been to the garage where the company started. She hoped that at least a little of her message was getting through. And then Hewlett muttered something. The visitors strained to comprehend. They picked up only one word: "Here." Hewlett spoke again. This time his male nurse translated. "Bill said, 'Get me out of here!' " the nurse explained.

[Passage is from page 72 of the book 'Perfect Enough: Carly Fiorina and the Reinvention of Hewlett-Packard' by George Anders.]

I hopped over to a major online seller's website and looked at the reviews of this book. These excerpts from comments by an HP employee (who came from Compaq in the merger) reveal the "bad" side of the "New HP" culture ...

"Well, Bill and Dave brought an absolutely staggering amount of over-design into the company, and while that may have worked in the 40s, 50s, 60s, 70s, it gets in the way in today's marketplace more often than not."

"They did many wonderful things - but Bill and Dave's time has passed."

I guess this guy would call the 35, 67, 41, or 15 examples of staggering over-design.

Sigh .....

Re: Carly Fiorina meets Bill Hewlett

*Message #5 Posted by **Ed Look** on 25 Oct 2003, 12:42 p.m.,*
in response to message #4 by Ed Martin

Yeah, I'll agree... sigh.

To me, it's a(nother) case of attitudinal poisoning... from passive absorption of some professors' or mentors' or managers' or writers' skewed philosophies on how a "modern" era is supposed to function.

There are old moral and ethical basics which are being ignored by our current culture on all levels and this is disguised as progress, or worse, profits. The change in HP calculators (as compared to the classic ones) is simply a small though irritating symptom of the entire world oriented in the direction of some famous place while sitting in a handbasket.

Re: Carly Fiorina meets Bill Hewlett

*Message #6 Posted by **db** on 25 Oct 2003, 7:04 p.m.,*
in response to message #4 by Ed Martin

That comment from the new HP employee is indicative of the modern techie culture, where hardware is expected to crash and everyone knows that software is sold buggy and will need to be updated to even function. The old (HP) way, that "gets in the way in today's marketplace more often than not" was based on the now outmoded idea that somebody might just expect the dam thing to work.

The reason we saw our favorite pieces of consumer electronics used to navigate for blue water sailors, commercial airliners, military transports, and spacecraft is that they function, often in spite of how we treat them. That they still work twenty and more years after they were built is a testament to the culture that fostered them. HP was not the only company that made good quality RPN scientifics but until the mid eighties they made nothing but that. Several times they even redefined the idea of "the best possible".

I have used one particular example of "staggering over-design" every day of college and in my miserable excuse for a career since 1983. That's in the heat, in the cold, in rain and dust, in the Nevada desert and the upper Amazon. Lets see if Mr. Compaq/HP makes anything that even comes half way close to that. But lets not hold our breath while we wait.

"HP products fill real needs. And provide lasting service." So ended a little paragraph on the back of the cover of HP manuals, after proudly stating that HP products were ussed by "the most discrning customers in the world [...] including astronauts, alpinist, Nobel laurates and scientists..."

One day the paragraph disappeared from manuals and HP became the company we know today. What ever happened to that´philosophy is anybody´s guess.

Re: Carly Fiorina meets Bill Hewlett

*Message #8 Posted by **Ed Look** on 25 Oct 2003, 9:47 p.m.,*
in response to message #6 by db

Ah, db, as you alluded to, the problem is not whether they can or will produce items of the same quality; it's that they don't want to, because that's the way the "new math" teaches them to operate.

Re: Carly Fiorina meets Bill Hewlett

*Message #9 Posted by **Pavel Korensky** on 26 Oct 2003, 1:03 a.m.,*
in response to message #8 by Ed Look

Partly, it our own fault. We, as a customers, want to buy everything as cheap as possible. And maybe, we forgot, that some things can be made either cheap or reliable.

If I remember correctly, HP-41C was introduced almost 25 years ago and its cost was approx. 300 USD. I do not know exactly, how much USD in 2003 equivalent of 300 USD in 1979, but I suppose that it can be something like 600 USD. Can you imagine, that some normal customer will spend today 600 USD for a calculator ?

And also, there is also a second problem. In the 80's, almost everyone who had a programmable calculator or small computer (Spectrum, Commodore, TRS-80 etc.) was supposed to how to program it. So, it was possible to have simpler, well designed hardware and small, bug free firmware, because the users/customers was able to make their own programs. Today, waste majority of computer/calculator users does not have the knowledge how to formulate a problem which should be solved and how to write a program for solving it.

And not only regular users lacks this ability. The young guys, who call themselves "programmers" lacks those basic abilities too. When they need to multiply the integer number by 2, they write something like "foo=2 x foo" and the compiler (also written by a bunch of young guys, who called themselves "programmers") will compile it as a call to int->fp conversion, fp multiplication, fp->int conversion. And those young guys, writing the "programs" probably never heard about shift left operation. But they must finish the program till Sunday, because Monday morning, there is a meeting of the top management and the project manager must have a nice presentation on color slides and the marketing manager convinced the top management, that the product must be on the market till the end of the month.

Re: Carly Fiorina meets Bill Hewlett

*Message #10 Posted by **Ed Look** on 26 Oct 2003, 1:32 a.m.,*
in response to message #9 by Pavel Korensky

Yes, it is partly our fault. Admittedly the old classic HP calcs were darned expensive. Don't think as a proud owner of an original HP-34C I didn't rather have a 41CV or CX (especially the latter). It was all I could do to scrape up the $124 (what a deal! List price was tens of dollars higher) for the 34C.

But even the old HP marked up their products a bit (more than other companies). As an old lab rat, I can tell you that sometimes, we went with a competitor's model just because it could fit into our budget (but the people who got the HP equipment were usually very happy with it). Instead of $300 for the 41C, maybe $250 (this IS a big difference, especially if you're only a student). I know that to produce even a Spice-quality calculator would be expensive. But electronic components don't cost so much these days, either.

As for the quality of the end user, or the attitudes of contemporary management, no argument. Maybe the situation we have now is because they deserve each other... or THEY ARE each other. Where, though does this leave the rest of us?

I can see your point here, when they don't even bother to put together a truly good manual (and I don't mean content so much as correct grammar and usage or correct examples, etc.), and when they do, it is an "accessory" for "advanced users". You know, I knew how to program my

34C. I can program my 32SII. I am learning my 48G+ and 49G+ (and my son's 39G... he's still little; I have to teach him the basics of basic programming), but I have never and do not now consider myself a "programmer". When being one of the old "less expert" users makes one now "highly proficient" without actual change in ability is frightening.

Re: Carly Fiorina meets Bill Hewlett

*Message #11 Posted by **Joesph** on 26 Oct 2003, 1:52 a.m.,*
in response to message #9 by Pavel Korensky

As a 'young programmer', I assure you that 95% of programmers know binary math. And compilers are much smarter then you give them credit for. I have looked at the output from Intel's compiler - it is simply amazing.

Re: Carly Fiorina meets Bill Hewlett

*Message #12 Posted by **John Limpert** on 26 Oct 2003, 2:31 a.m.,*
in response to message #9 by Pavel Korensky

I bought a new HP-35 for $295 in 1973. According to my handy CPI calculator, that is about $1220 in 2002 dollars. Ouch. That was after HP cut the price by $100. I think we have become spoiled by the glut of cheap electronic gadgets. I saw a display rack full of solar powered four-bangers in a local store, only $1 each.

The Big Rant Price Vs. Quality (long)

*Message #13 Posted by **How much is 300 dollars worth** on 27 Oct 2003, 10:18 a.m.,*
in response to message #9 by Pavel Korensky

Well, it is interesting to note that some people seem to be spending approximately $500 for little windows CE or Palm devices--like the Tungsten W. So maybe there is room for a $300 high quality device.

So yes, you might ask, "who would spend 300 bucks on a calculator" and the answer is "quite a few people" if you expand the category to "multipurpose digital electronic (computing) device".

On the other hand:

One of the other reasons that quality is now suffering, is the massive deflationary environment of the digital device. Obsolecence of devices is almost immediate--and this has been a problem for some years (decades!). The products are victims of their own success--inasmuch as manufacturing has continually evolved to produce a given product at a lower price, parallel with the ability to improve speed or other for a given price.

Or in other words, inventory is far more expensive--if it is digital devices--than it is for commodities such as cotton, wool, iron ore, ASTM A-53 GR B pipe, etc. So make it now, make it FAST, and keep moving.

But there is a market, and always will be, for devices where reliability comes first---but these are not produced by "big names" in mass-production. Yes, sometimes the proverbial $3,000 toilet seat is worth the money.

Perhaps there could be / is already a company producing devices--or even RPN calculators---at a price--which would be built for durability and reliability--at a price. And they would be made in USA---NOT China---- (or they would be made in Europe--not China). But not cheap. Most

of us are not willing to make that jump. Yet. But one more broken $10 chinese POS_____(fill in the blank: lamp, table, toaster, etc) that lasts 2 weeks and must be replaced, and I might just be happy with paying 10 times more for a high quality domestic product. Oh, but I forgot, we don't have any domestic manufacturing anymore (DEAD and GONE!)....now what!

Interesting to note that I could roll the clock back 40 years and say "Hong Kong KRAP" or 30 years ago and say "Japanese JUNK". So the trend continues, even as we now acknowledge that Japanese products are SUPERIOR (I drive a Toyota and dont Ever want another euro car (they cost too much and always break down) or GM (they cost too little and nickel/dime you to death).

-Bill Platt

Have a new 49G+ in my hand...

*Message #1 Posted by **CalcKidd** on 24 Oct 2003, 9:45 p.m.*

I have a 49G too (and 48GX, 48SX, 41C, 41CV, 41CX, 32Sii, 42S, 16C, 15C, 12C, 11C, 10C, etc... alot of them).

You can only compare the 49G+ to the 48 and 49 series because it would be apples to oranges otherwise.

The 41's display, keys, and processor are totally different than the 48 and 49 series. So what if each can add 1 and 1... I can do that on a TI and Casio too.

Anywho, the 49G+ is DEFINITELY better than the 49G in all ways. The 48 series has a better keyboard (layout and tactile feel), though. The keyboard layout is exactly the same as the 49G, just without the rubbery, squishy keys (thank God). The cursor keys are round with a metallic look (covered plastic to be sure) and seem to work quite well. The keys have a lightly audible click (the 49G has a muffled clunk).

The 49G+ screen is way better than anything before it, though it could've been better considering the technology used in PDAs (it doesn' need to be color, just sharper). The screen is pleasantly larger than the 49G and easier to read, though not by too much.

The 49G+ definitely runs faster than the 49G, which is also nice. I found myself waiting on the 49G, where the 49G+ zoomed through. :-D

The G+ is lighter in weight than the G, though the G+ is just a tad bit wider (not enough to worry about).

The G+ takes 3 AAA batteries, and a CR2032 backup battery - G does not have this. Inside the back it says: "Memory Backup Battery!! Please don't remove the main batteries while you replace it." That kinda blows - having to keep track (and buy) a backup battery.

Since I just got it today, I haven't tried everything yet. I will more than likely retire the two 49G's I have and use the 49G+ instead - unless it crashes and burns.

So, there it is... (BTW - these are my opinions and maybe not yours. Respond all you want, but the 49G+ is not life and death - it's a calculator. Period. The 41 series is NOT coming back either. Unless we can force HP to do our bidding or come up with enough money to create our own calculator company, we will just have to play the hand we're dealt.)

Re: Have a new 49G+ in my hand...

*Message #2 Posted by **William** on 24 Oct 2003, 10:05 p.m.,*
in response to message #1 by CalcKidd

The 49G+ is definatley an improvement over the G.

Though the keyboard is better than the G in feel, the keys don't always register though which is irritating. The arrow buttons could stand to be bigger too.

The format option in the system tests menu now actually formats something, the SD card(if present) without

asking for comformation....so dont hit it. Also, format the SD card to FAT16 with a computer, the calc chopped about 25% of the available space off when it formatted it.

The CR2032 will probably last for years, so there isnt much to worry over with that.

How about we all put in five dollars and start our own RPN calculator company?

Re: Have a new 49G+ in my hand...

*Message #3 Posted by **CalcKidd** on 24 Oct 2003, 10:57 p.m.,*
in response to message #2 by William

:-D

I forgot about the really great leather case that came with it! MUCH better than the plastic cover of the G.

I just updated my ROM with the 1.22 version with is supposed to help prolong battery life and some other things.(?) I like to keep current if I can.

It would be great to have the ear of HP when they create a new calculator. However, it appears that HP has become IBM... IBM created the PC, but sat on their asses while other companies at the time pushed forward gaining market share leaving IBM scrambling to catch up. Once you lose that edge, it might never be attainable again.

At least HP is creating new calcs. Even if we don't agree on the specifics, it's something. I thought that after the 48, HP was done altogether (be TI came on so strong).

Hmmm...

Re: Have a new 49G+ in my hand...

*Message #4 Posted by **Sean** on 25 Oct 2003, 1:47 a.m.,*
in response to message #3 by CalcKidd

Druthers: If we started a calculator company (or could get Hp to design our spec'd calc), it would be based on the 48. It would have the 48's keyboard and OS, but LOTS more mem, bigger screen, better I/O, and an old-school leather case (like the 45 had). It would rock. Flash mem for updating the OS would be cool, plus it would have "advanced" features built in. Like a Sys-Rpl compiler, and even ML tools. Yeah... that's the ticket.

Or else just stay out of the game. That's what I've chosen to do, at least with regard to new calculators. I'll continue using the older models until they wear out, and then either switch to another company or else (more likely) stop using calculators altogether. Unless HP drastically changes the way they're doing things (and I don't expect that to happen), I'll never again buy *anything* new from them.

Better to sit on the sidelines than play for a team I don't want to win...

The **[ENTER]** key makes a good "litmus test" because it show's HP's real attitude. They clearly aren't fully committed to promoting RPN above all else, and it's that attitude that makes me wish for them to fail.

Re: Have a new 49G+ in my hand...

*Message #9 Posted by **CalcKidd** on 25 Oct 2003, 11:32 a.m.,*
in response to message #6 by Wayne Brown

Oh my God!

I'm as "old school" as anyone, but when you ignore new technology (good or bad) you continue to live in the past.

Obviously, not everything new is good (to your point), but it ain't all bad.

I like to know what's going on, who's doing it, and how it works. I think HP can kick start their calc division if they would listen to us (the ones who use and know their products). However, until the right person (someone with the vision and the "nads") steps up to the plate at HP, we will probably get 49G+'s... which is at least better than TI-clones like the 9G, 9S and 30S. Yuck!

Something is better than nothing, even if it's not exactly what we want.

:-D

My view is...

*Message #10 Posted by **Gene** on 25 Oct 2003, 11:42 a.m.,*
in response to message #9 by CalcKidd

is the most recent calculator a move TOWARD what I want or AWAY from it?

When the 49G came out, I was one who vocally publicized a nickname for the color of the case as "FHB" on c.sys.hp48 (search googlenews if you want to find it). I disliked the 49G from the start. I thought it was a hoax.

Now we have the 49G+.

Is it a step in the right direction? yes, no question.

Can I hope that the next machine is another step in the right direction? Sure, no reason not to do so.

Don't criticize HP for making baby steps toward what we all want.

Gene

> Don't criticize HP for making baby steps toward what we all want.

Well, Gene, I'm sure you feel that way because you view HP as a bunch of good guys trying to do the right thing, and you're giving them the benefit of the doubt. I, however, see them as traitors who have betrayed HP's traditions, its customers, its founders, and the founders' descendants. You think they're trying to head in the right direction and want to be patient with them; I think they should be on their knees confessing their treason and begging forgiveness, and I've seen no indication of that.

Re: My view is...

*Message #12 Posted by **Ed Look** on 26 Oct 2003, 1:37 a.m.,*
in response to message #11 by Wayne Brown

Wayne, this is not done in our culture today. No one has humility or even sees the need for any. Do not expect a major corporation to publicly atone for their alleged transgressions. Do hope, however, for a quiet turnaround in goals and philosophy. If they begin again to produce superior products, that is way good enough for me.

I for one see the 49G+ as definitely a step in the right direction, for one who sees (power-hogging) red LEDs in a romantic light.

Re: My view is...

*Message #13 Posted by **Wayne Brown** on 26 Oct 2003, 8:02 a.m.,*
in response to message #12 by Ed Look

> Quote:

> Do not expect a major corporation to publicly atone for their alleged transgressions. Do hope, however, for a quiet turnaround in goals and philosophy.

That's why the **[ENTER]** key issue is so important to me. What clearer indication is there of a "turnaround in goals and philosophy" than that? Here's how I see it:

Old HP: "RPN is superior to any other entry system; let's use it proudly."
"We pioneered the use of RPN in handheld calculators; we built our reputation with them; and we'll ***always*** give precedence to our own inventions over those of our competitors. Being developed by HP means it's *automatically* better than everyone else's inventions and we'll never back down from that!"
"We built our business selling audio oscillators, gas chromatographs, etc. Our products should be designed to appeal to people who are comfortable with that level of technology, not the dimwits who are afraid of programming a VCR!"

New HP: "Who cares if anyone uses RPN or not? RPN, algebraic, what's the difference -- all that matters is whatever will make us the most money!"
"All the other calculator companies make algebraic calculators. We don't want to be different; and that big **[ENTER]** key makes it *obvious* that we're different! Let's shrink that thing and de-emphasize RPN as much as possible so we can attract more business. Loyalty to our company traditions is insignificant compared to making money!"
"A lot of people are used to calculators with a little bitty [enter] key down in the bottom right-hand corner. Let's make ours look like that, too, because we don't want to lose customers who might be intimidated by something unfamiliar. Remember, we're targeting morons who wouldn't know a skateboard from a spectrum analyzer."

I haven't seen the "new" HP give any evidence of a turnaround, quiet or otherwise, back toward the "old" HP attitude about RPN. It's still not the default mode on new calculators, the keyboard layout still favors algebraic entry and there's still no clear, deliberate effort to steer customers away from algebraic entry and toward RPN.

Re: My view is...

*Message #14 Posted by **Samantha** on 26 Oct 2003, 1:00 p.m.,*
in response to message #13 by Wayne Brown

I think you're being a bit too rough on HP. I think that the small enter key on a calculator that uses both rpn and algebraic entry will increase the number of people who will use RPN in the long run. Many people (myself included at one time) are scared away from rpn and don't want to take a risk by spending the money on a RPN only calculator. The new calculators give us the option without buying two separate calcs. More people will try out rpn now, many of whom will probably decide it's far better than algebraic and stick with it. I think it's a great idea.

I too will really miss the large Enter key, but it's a small price to pay to keep new rpn calculators coming.

Re: My view is...

Yes, you're right Samantha. HP, like any other company, has to appeal to as many

customers as possible since expensive calculators are no longer competitive due to the existence of cheap computers.

People use the phrase "live in the past" as if there's something wrong with that. There are some parts of the past (including some from before I was born) that are much better than the presnt equivalents. If I could find a place that combines the manners, morals and customs of Victorian England with 1980's American technology, I'd happily spend the next 30 or 40 years there.

Re: I think the real question: What does HP's calculator unit do NEXT?

*Message #19 Posted by **Paul Brogger** on 27 Oct 2003, 11:24 a.m.,*
in response to message #9 by CalcKidd

There seems to have been two product lines of late -- some new stopgap models (6s, 9g, 30s) and the latest releases. I'm talking only about the latter.

Not having owned an HP-49, I may be oversimplifying when I say that the 48GII and 49G+ are really 49G's with some new features: SD card memories, faster processors, larger screen (49G+) & USB connection (49G+). Maybe the most important aspect of their implementations is behind the scenes: the shift to an off-the-shelf processor [ARM] and away from Saturn.

The other new models all seem to be incremental upgrades of previous products: The 12C Platinum, the 10BII, 17bII+, and the 33s (a gussied-up 32sII). Again, the 33s has moved away from Saturn (as, I presume, have the others.)

That's great, as far as it goes. The new (that is, "latest") calculator unit has hit the ground with incremental upgrades to previous models while essentially outsourcing their processor design and manufacture. The new product line's feature set and user interfaces have been largely built by translating existing software investments (made primarily by precursors in the "old" H-P) to new platforms.

Where to next? I don't expect anything soon, but I wonder what they'll come up with (if, indeed, anything) as the next really new product or line from the calculator division.

Re: I think the real question: What does HP's calculator unit do NEXT?

*Message #20 Posted by **Raymond Del Tondo** on 27 Oct 2003, 1:19 p.m.,*
in response to message #19 by Paul Brogger

BTW, the 12Cp doesn't have a nut core anymore. Even the 'normal' 12C has been redesigned a few years ago. The 48GII & 49G+xyz seem to use kinda Saturn emulation layer between the ARM core and the 49G OS.

And I'm not sure about this point, but IMHO the 48GII doesn't have an SD card slot.

Raymond

What do you want to see in the "next" wave?

*Message #22 Posted by **James M. Prange** on 27 Oct 2003, 8:45 p.m.,*
in response to message #21 by Gene

Fix the problems new to the 49g+. Bad keyboard, lack of full support for subdirectories on the SD card, communications support for other OSes, Kermit ASCII transfer and/or source code transfers with Xmodem. IR to the printer with the range of the 48 series, communication via Serial IR. Bring back RS-232 and add a host USB port as well as the device USB port.

Fix problems inherited from the 49G. Unwanted mode changes and any remaining bugs/problems.

Market a high-speed hand-held sized printer customized to go with the calculator, as well as with previous calculators. Maybe have Martel customize the MCP8830 so that we can be sure that it works well with all HP calculators capable of sending to a printer.

Market a good shirt-pocket-sized scientific calculator.

Market a very basic RPN calculator suitable for use as a "first calculator". Just +, -, *, /, and +/-

. Maybe square root and a memory register with M+, M-, MR, and MC. Get them "hooked on RPN" before they're indoctrinated into using those arcane algebraic interface calculators.

Regards,
James

in response to message #22 by James M. Prange

Fix the problems new to the 49g+. Bad keyboard,

Gene: According to people with units purchased today, this has already been fixed.

lack of full support for subdirectories on the SD card,

Gene: Fixable with a ROM upgrade. I consider this trivial. :-)

communications support for other OSes,

Gene: Perhaps, but even though I am a mac person, this may not happen. After all, why hasn't Microsoft made Access for the Mac? Sometimes, those of us with Macs just deal with life.

Kermit ASCII transfer and/or source code transfers with Xmodem. IR to the printer with the range of the 48 series, communication via Serial IR. Bring back RS-232

Gene: This is rumored to be on the 48GII. Macs killed serial and third parties created USB to serial converters. Don't see why that can't happen here.

and add a host USB port as well as the device USB port. Fix problems inherited from the 49G. Unwanted mode changes and any remaining bugs/problems.

Gene: Fewer bugs remain than you might believe. The mode changes are a pain, I agree.

Market a high-speed hand-held sized printer customized to go with the calculator, as well as with previous calculators. Maybe have Martel customize the MCP8830 so that we can be sure that it works well with all HP calculators capable of sending to a printer.

Gene: Might be on the shelf. good idea!

Market a good shirt-pocket-sized scientific calculator.

Gene: The 33s is coming and, despite how it looks, those who have held the unit believe it to be very nice. Guess we'll have to wait and see.

Market a very basic RPN calculator suitable for use as a "first calculator". Just +, -, *, /, and +/-. Maybe square root and a memory register with M+, M-, MR, and MC. Get them "hooked on RPN" before they're indoctrinated into using those arcane algebraic interface calculators.

Gene: good idea too. Just a tradeoff problem I think...how many of these would sell? Unless they do it, they'll never know...but how many of these do you have to sell at $12.99 before

you make enough $$ to make it worthwhile? Yes, you'd probably get some incremental sales later, I agree...but hard to tell in advance!

Good ideas! Keep them coming!

I've seen the posts, but I've also seen a lot of posts that say that there's no problem, just press harder. To me, this is much like saying that a car starts just fine, you just have to spray starting fluid into the carburetor every time. It occurs to me that the posts that say that the problem has been fixed might be from folks who always press hard, and so don't even recognize the problem, so I'll wait a bit before I send mine in for a replacement.

> Quote:

Same here, I look forward to it. But I wonder why HP didn't include it in the first place.

But this isn't an Apple or Microsoft product, it's an HP product. Wouldn't it be useful to a wider market it it included support for more OSes? And not just Apple products, there are a lot of linux users out there. And what about those handheld devices, Palm or whatever?

Ok, maybe it isn't feasible for HP to write communications software for every possible OS, but perhaps they could make information available and support "open source" projects.

But, as near as I can see, except for higher-speed RS-232 and the "improvements" made in the 49G, the 48gII will actually be inferior to the 48SX and 48GX that I already own.

Despite anything Macs may have done, I believe that RS-232 is very much "alive and well". RS-232 has significant advantages over USB. For example, it's more "peer-to-peer", while USB is more "client-server". RS-232 is simple and easy to design for, but USB seems to require a driver specific to each and every device and host.

All too true that many new PCs seem to lack any RS-232 port, so USB is indeed welcome. But I'd be a lot happier if they managed to keep an RS-232 port and make the USB device port an addition.

A USB to serial converter may have been useful if the 49g+ had a host USB port and a driver for the 49g+ were available, but I don't see how a converter could help with the 49g+ as it actually is.

Of course, since ROM 1.20 for the 49G has never been released, we haven't had much time to find out what has and hasn't been fixed.

The MCP8830 looks pretty darn close to me, but there are a few things that I'm not sure of, and it's not exactly cheap from what I've read.

But at a rumored size of 6.2 x 3.2 x 0.6 inches and weight of 4 ounces, it seems uncomfortably large and maybe a bit heavy for my shirt pockets.

> Quote:

Yes, you'd probably get some incremental sales later, I agree...but hard to tell in advance!

Well, besides use as a "first calculator", I'm sure that there are a lot of people out there that never use the "scientific" operations on a calculator. If they could be weaned away from the "algebraic input" model, such a calculator might suit them just fine. Maybe it could be made cheaply enough for HP to give it away as a "promotional item", and encourage people to at least try RPN.

> Quote:
>

PS:

This one may well be a bit of a stretch, but just in case there's anyone out there with a really large-capacity SD card who actually wants to store more files on the card than FAT16 allows (somewhere in the neighborhood of 65,000), if the 49g+ doesn't already have it, add support for FAT32.

How is the 48GII "inferior" to the 48SX? (48GX perhaps?)

*Message #26 Posted by **Gene** on 28 Oct 2003, 7:32 a.m.,*
in response to message #24 by James M. Prange

I know the 48GX can have plug in cards and ram expansion, and the 48GII does not. Both have serial.

In what other ways would the 48GII not be up to snuff with the 48GX?

Its faster, has a good CAS built-in, etc.

Compared to the 48SX, I would think it is vastly superior.

?

Gene

> In what other ways would the 48GII not be up to snuff with the 48GX?

Isn't that enough?

"With its 128KB memory (80.7KB available to the user)..."

My 48GX has 128KB memory (over 124KB available to the user), *before* adding any card.

With only one 128KB card merged, my 48SX has 160KB memory (over 157KB available to the user), and I can still add and merge another card.

But I grant that the much higher speed of the 48gII's RS-232 may be a big advantage in many cases.

> Quote:
>
> Its faster,

But for "real work", either my 48SX or 48GX is fast enough for me.

> Quote:
>
> has a good CAS built-in, etc.

Maybe great for students, but I haven't noticed that the CAS helps me at all. If anything, it adds complications to things that work well on the 48 series. And I don't have any need for grey-scale grobs, fancy fonts and styles, GameBoy type applications, etc.

> Quote:
>
> Compared to the 48SX, I would think it is vastly superior.

I'll grant that the faster RS-232 could be an advantage, but other than that, I suppose that it depends on the target market. It may be fun to play with, but I already have the 49G and 49g+ to play with. And when I want to get something done with a minimum of hassle, I have the 48SX and 48GX.

No, I'm not inclined to purchase this one.

James

Re: How is the 48GII "inferior" to the 48SX? (48GX perhaps?)

*Message #28 Posted by **Gene** on 28 Oct 2003, 8:42 a.m.,*
in response to message #27 by James M. Prange

Well, it depends on what that RAM is used for! If things that take up ram on the 48GX are built-into the 48GII, then the ram isn't as much of an issue.

But it depends on what each individual uses the machines for...you appear to need/want lots of ram.

Others may not.

That doesn't make the 48GII inferior to the 48GX for everyone.

Make sense? :-)

And...I like my old 48GX too. But I'll be using the 49G+ most of the time...when I'm not picking up my 12c.

Gene

Re: How is the 48GII "inferior" to the 48SX? (48GX perhaps?)

*Message #29 Posted by **James M. Prange** on 28 Oct 2003, 10:31 a.m.,*
in response to message #28 by Gene

Ok, not inferior for everyone, but by no means vastly superior for everyone either.

I forgot to mention that it looks to me as if the 48gII's ROM really is ROM, not "flash ROM". What if, by some remote chance, it just happens to have a bug? It seems to me that the only way to fix it, if it could be

fixed at all, would be to add a library, using up a bit more of the RAM available to the user. Surely having the user download and install a new "ROM" must be a lot cheaper than replacing the calculator. Is flash ROM that much more expensive than ROM? Oh well, I know that every ROM in the 48 series has bugs, and I haven't found them to be any real problem for what I use them for. Let's hope that they did as well with the 48gII as they did with the earlier 48 series calculators.

Although I've had the 49G for over 3 years, I'd still rather use the 48 series when I really want to get some results with a minimum of hassle. The 49G gives me too many missed keystrokes, unexpected mode changes, unexpectedly complicated results full of exponents and logarithms, and so forth. And of course it won't print to the 82240B. But for all of that, it is an interesting gadget and fun to play with, and if I didn't already have the 48SX and 48GX, I'd be thrilled to own such a useful tool.

It looks as if the 49g+ will fix some of the shortcomings I find in the 49G. In particular, it is expandable and can print to the 82240B. But why is the range for printing only about 3 inches? Did I get a unit with a defective IR transmitter?

Regards,
James

No. No! NO!

Those damned M+, M- things are exactly the kind of inconsistent and arcane 'special case' functionality that make algebraic calcs so problematic! Instead, have ten memory registers, STO and RCL keys, and implement register arithmetic with the consistent [STO] [+] [n] notation.

If there is to be an entry-level RPN calculator, at least let it demonstrate the elegance, simplicity and consistency of RPN.

Best,

in response to message #32 by Les Bell [Sydney]

While I'm not sure storage register arithmetic is a strictly "RPN" feature, I agree overall.

Since my HP-21 days (alluded to elsewhere) I can't help feeling a vague sense of distaste every time I see the typical "M+", "M-", "STO M", "RCL M" gang eating up space on a calculator keyboard, all devoted to one pathetic little register.

(Yes, the HP-21 only has one, but it's a heck of a lot more useful when it's supported the

way that it is!)

Re: STO+, STO-, etc: Hear, Hear!

*Message #34 Posted by **James M. Prange** on 28 Oct 2003, 7:49 p.m.,*
in response to message #33 by Paul Brogger

Good points, Les and Paul. STO and RCL would be better. I'm not sure how many registers would be appropriate. My only excuse is that I think that it's nice to have at least one place to stash a value away from current operations, and as I was thinking **cheap** only one register seemed enough, and I was looking at my little credit card sized calculator and just copied the keys from that algebraic input little pain in the neck. Considering how much trouble I have trying to use that thing, I should've known better.

The 48 series has the STO+, STO-, etc. commands, but I rarely use them; they've never seemed quite "natural" to me.

Regards,
James

STO+, STO-, etc. go way back

*Message #35 Posted by **Paul Brogger** on 29 Oct 2003, 9:30 a.m.,*
in response to message #34 by James M. Prange

They're of less significance on a machine with RPL, ~infinite stack depth, and ~megabytes of program memory. But I just visited my trusty old HP-21 on its MoHPC page (sadly, I didn't keep my original), to rediscover that storage register arithmetic was implemented with separate shifted M+, M-, M* & M/ functions. Which kinda undercuts my original point . . . (But that made sense with only one "unnamed" memory.)

Actually, it's the HP-29C's implementation that I remember: merged keystrokes for "STO + n", "STO - n", etc. (Sadly, I didn't keep that one, either . . .) In a machine with only 98 program steps, this was a great space-economizer.

By the time of the 32s (& perhaps before?) one could also do "recall register arithmetic" -- "RCL * A", etc. Another nice twist. So, on an HP with storage register arithmetic, "STO" & "RCL" only hint at the beginning of what's possible.

Did TI ever copy that feature? I just tried "STO * n" on my TI-55 (old red LED, minimally programmable) and my TI-83+SE and it didn't work on either.

(On the RPL machines, STO & RCL have joined all the other stack-based postfix operators, so separate STO+ & STO- operators had to be defined in lieu of overloading STO & somehow pushing "+", "-" & etc. onto the stack.)

RCL+, RCL-, etc.

Quote:

> By the time of the 32s (& perhaps before?) one could also do "recall register arithmetic" -- "RCL * A", etc. Another nice twist.

Recall arithmetic goes back to the HP-45, almost 15 years before the 32S. Too bad HP didn't keep it in later models.

Ernie posted:

"Recall arithmetic goes back to the HP-45, almost 15 years before the 32S. Too bad HP didn't keep it in later models.

The HP-15C doest boast recall arithmetic, too, being the only Voyager to have this feature. Just for completeness, both the HP-10C and HP-11C do have store arithmetic (but not recall arithmetic), the HP-12C does have store arithmetic only for registers 0 to 4 (but not for the rest) and the HP-16C lacks store and recall arithmetic altogether.

In the case of the HP-15C, recall arithmetic saves losing the T stack register and LastX contents and allows for shorter programs in terms on program steps, but not in terms of bytes as all recall arithmetic instructions take two bytes of memory instead of one.

Best regards from V.

> They're of less significance on a machine with RPL, ~infinite stack depth, and ~megabytes of program memory.

Not quite megabytes, but kilobytes. I think that the 48SX with two 128KB cards merged would be the record holder; MEM returns 292423 immediately after a memory clear. And of course, since the HOME directory, last stack (UNDO), last arguments, and last command lines all share that pool of memory, the user will have somewhat less to play with.

But I certainly agree that minimizing memory use is much less of a concern with the RPL models, except maybe the 28C. For everyday use, I often write ad hoc "throwaway" program that are far from optimal in terms of size, speed, or memory usage, but have the advantage of being written quickly and (usually) working without any debugging.

The RPL calculators' full set of "storage arithmetic" commands seems to be

STO+, STO-, STO*, STO/, INCR, DECR, SINV, SNEG, and SCON (INCR and DECR not on the 28 series; added with the 48SX). Of course, where appropriate, they work on other object types, not just "real" numbers, and they work on both global and local variables.

No doubt if I were to utilize them more, I could save myself some program code and memory usage.

Well, nice printed lay-flat manuals would be nice.

But I'm a lot more concerned with the content of the manuals. I want a reference manual that includes full information on all operations, system flags, reserved variables, object types, menu maps, keyboard "shortcuts", character set table, and I/O translation table. And information on how the I/O works. And information on fonts and "styles". And anything else of interest that I forgot to list right now. And of course a manual that shows how best to use the calculator and how to write and optimize UserRPL programs. And written clearly with proper grammar, spelling, and punctuation in whichever language it's intended for.

Even if it's a PDF that I have to print out myself, I'd be a lot happier with good documentation. I understand that printing and shipping manuals adds expense, and the "typical" purchaser may be frightened of buying something that comes with thick volumes of documentation, but I think that HP should make printed manuals available for those who want them; maybe they could make arrangements with an "on demand" publisher.

I like printed documentation, but "electronic" documentation does have some advantages. It's easily searchable (as long as it's not the typical assortment of "help" files that we find on PCs), links could be added, and it would be easier to update and make corrections.

Regards,

James

Re: What do you want to see..REAL DOCUMENTATION!

*Message #41 Posted by **Raymond Del Tondo** on 1 Nov 2003, 12:49 a.m.,*
in response to message #40 by James M. Prange

You're talking about the real HP-48SX documentation. AFAIK this was the last of the high quality manuals which was available spiral-bound. The GX manual wasn't bad either, but different, and only light print paperback. One could see that they were going into the current direction somehow ('quick start'). And then came the 49G 'manual'...not much to say;-)

I think some sort of merger of the PDA and calculator would be nice. (They threw out the baby with the bathwater when they totally eliminated keys on the PDA.)

How about:

A roughly pioneer-style keyboard layout, with the absolute minimum to get alpha input as well as numeric, but not too much busy-ness on the keyboard. Make 'em the tactile and visual equivalents of what I'm looking at on my HP-41CV -- absolutely clear, bold, decisive, "over-engineered", no-nonsense human-interface, data-entry, reliable, dependable KEYS. (C'mon guys, it's been done before in a mass-produced product -- it can be done again!)

The calculator display is the top ~1" of a typical PDA-style touch-screen, which slides vertically up for "full-screen" browsing, etc, and slides almost all the way back down behind the keys for two-line "calculator mode".

And, just in case I should want or need 'em, I'd like the option of installing all the PDA bells and whistles in addition to the wonderful mathematical environment that a good calculator provides. A clock with tons of time functions, alarms, etc. A GPS with the math needed to calculate from here to there, etc. Wireless communications -- heck, maybe even a laser pointer and a camera & a cell phone. (Just let me pick & choose what exactly I want installed.)

How about wireless laser mouse capability, with mouse software that lets me slide the calculator around on my desk, thus moving the computer cursor in a spreadsheet, and squirt or suck data to & from whatever I'm pointing at? (And could the laser mouse tracker also let me run the calculator over a map or blueprints or two-by-fours, to measure distances and/or lengths and use the information in my work out in the physical world?)

And I challenge the designers of today: don't give it to me in a fancy, too-large plastic case that's mostly full of air! I want it (with screen semi-retracted) in a package about the size of a Pioneer model -- shirt-pocket sized.

(But we've been on this subject before . . .)

Good ideas, but that might involve "turf" wars between the PDA and calculator groups! :-)

That kinda thing happens alot in a big company. But, imagine the possibilities.

Re: What do you want to see in the "next" wave?

*Message #44 Posted by **James M. Prange** on 28 Oct 2003, 5:20 a.m.,*
in response to message #43 by Gene

The "turf wars" are indeed an unfortunate possibility, all too common. Too bad that different divisions within a corporation can't remember that they are all part of the same corporation, and cooperate and share their expertise for the common good.

But regarding PDA/calculators, I want a "calculator" with a real tactile-feedback keyboard. But I know some people who wouldn't be without their PDA and cell phone, except perhaps in the shower, and would no doubt object to having to carry yet another device for doing on the spot calculations. Perhaps the calculator division could develop and market "software calculators", much like the emulators already available, for use on PCs, laptops, PDAs, and so on.

But given that the emulators are available, and that HP has already released ROMs for the 48 series and 49G, and although the 49g+ ROM installation program requires that the user agrees to the license, there's no way to enforce payment there, I'm not at all sure that this would be profitable.

Man, Paul! Even Captain Kirk and Mr. Spock didn't have anything so powerful and so small! (They had to wait 'til Picard's time to have those great mini things they walked around the hallways with.

Seriously, the 33S really sounds like it's on the right track, cosmetics notwithstanding. If they give it lots of room for storing data and program lines along with SOME SORT of basic I/O and a case capable of protecting it from routine roughness, then I think they have a winner. Even though I've got this great 49G+, in a little while, I may probably get a 33S if it is at all in some way like the 34C/15C/32S type calculator because those are the "we mean business" machines, no-nonsense with (depending on your field and tastes) adequate crunch and storage power... and were fairly affordable. I knew grad students who bought 15C's, and beggars know how much they make.

Re: What do you want to see in the "next" wave?

*Message #46 Posted by **Mark Ordal** on 28 Oct 2003, 9:43 a.m.,*
in response to message #42 by Paul Brogger

For the "next wave," how about making the algebraic mode of the successor to the 49G+ truly useful? What I envision is, choose "RPN" (really RPL) mode for a working & programming environment similar to the HP48 series (just as is true now for the 49G and 49G+). Choose "algebraic" and get algebraic entry with Basic programming in the manner of an HP75C/71B.

The competition (mainly Texas Instruments) is programmable in a dialect of Basic, so if you want to compete with them in the academic market, you can't offer an "algebraic mode" that lacks programmability, as HP now does with the 49G and 49G+.

I for one really enjoyed the Basic programming capabilities of the HP75C, but then I have really enjoyed RPN programming (mainly the HP41CV/CX) and RPL programming (HP28C/S, HP48SX/G and HP49G) too.

Re: I think the real question: What does HP's calculator unit do NEXT?

*Message #47 Posted by **James M. Prange** on 27 Oct 2003, 8:19 p.m.,*
in response to message #19 by Paul Brogger

I have the 28C, 28S, 48SX, 48GX, 49G, and now the 49g+.

What does the 49g+ add? To me it seems much like the 49G, but with:

Newer electronics. It seems that most of the calculator's operations are run on an emulator of the Saturn processor instead of the native processor. Some speedup, but don't expect it to be proportional to the increase in processor speed.

A rather unsuccessful (at least on the first units) attempt to improve on the 49G's keyboard. Maybe they'll fix this; otherwise I'd consider it to be junk, even worse than the 49G's keyboard. When I feel the tactile feedback, the keypress should register, no "ifs, ands, or buts" about it.

The return of expandability with the SD card. Much cheaper and greater capacity than the cards for the 48 series.

But note that storage on the SD card isn't the same as on the 48 series card; it's more like storage on a DOS disk. Support for a subdirectory structure isn't there according to the manual, but *may* be added in a future ROM release. Actually, if you make subdirectories on the card in the reader, you can store and recall files to/from the subdirectories.

Replacing RS-232 with device-only USB, a bad trade in my opinion, but for those who connect only to a PC, and noting that many new PCs lack an RS-232 port, it would be an advantage.

The return of IR capability. The addition of IrDA? I don't have anything to test IrDA with, so I can't say for sure that it works. It can print to the 82240A/B printers, so the old "Red Eye" format is there, but the range seems to be about 3" instead of 18" now. Maybe this is supposed to still have a range of 18", and my unit is defective? I haven't been able to get it to communicate with the 48 series in "Serial IR" mode; I don't know whether it's designed that way, or perhaps my IR transmitter is defective.

Notably lacking in support for communicating with non-Microsoft OSes. If you don't have Windows 95 or newer, you may have a problem.

And the communications software provided by HP is Xmodem only; Kermit ASCII transfers via USB aren't available, so if you want to transfer source files, you'll have to jump through some hoops.

I happen to have an apparently fairly unusual combination of Windows 98SE with a particular USB chipset on the motherboard, so I can use Conn4x only to update the ROM.

I hope that they first fix the already noted problems new to the 49g+ and those "inherited" from the 49G.

Then continue with new models. But honestly, I'm not sure what new math operations would be worthwhile adding.

Regards,
James

Nothing. This is the end of the line.

in response to message #19 by Paul Brogger

Don't be too shocked if there are no more HP calculators after the current product line.

There was a time when it made sense for HP to market high-end calculators to professional scientists and engineers. Those people needed great calculators -- because they didn't have computers. They were willing to spend hundreds of dollars on a powerful calculator, plus software, plus extra memory, maybe even a printer.

But today, scientists and engineers have PCs on their desks at work, plus another one at home. Any serious number crunching is done on the computer. A calculator may come in handy for quick and simple calculations, when it seems like too much trouble to prepare a spreadsheet. But that's about it.

The reality is that there is no longer a significant market for high-powered calculators among professional scientists and engineers. Yes, traditional HPs command a high price on Ebay. But so do K&E slide rules.

So HP is taking a shot at the education market, since there's still a strong demand for calculators there. That's why the new calcs have shiny colors, funky keyboards, and algebraic entry; HP is trying to appeal to teenagers. It's actually a logical strategy. But it probably won't work, because TI and Casio are too well entrenched.

HP will try to penetrate the education market for a year or two. If they fail, they will probably scrap the calculator division altogether (except, of course, for the 12C).

Like it or not, the PC has replaced the calculator, just as the calculator replaced the slide rule. Eventually, even TIs and Casios will disappear, after all high school and college students are issued laptops. Maybe HP laptops.

This is NOT the end of the line.

That's my guess too. But HP advanced calculator development has been apparently abandoned before, and may well be abandoned again. The competition is well-entrenched now, and HP will have a difficult time of it. Hope for the best.

James

Re: Then why not re-release the 15c, 42s combination?

*Message #51 Posted by **Ron Ross** on 28 Oct 2003, 8:56 a.m.,*
in response to message #50 by James M. Prange

Why not make a $50 Hp15c and a 42sx with I/O. Give the 15c a dot matrix display, crude serial I/O and 8 or 32K RAM. Make sure it HAS nor real text capability so it can work for exams.

Make the 42sx with 128K ram and serial I/O (drop the IR). Basically toss in everything the 48G had, but without graphics. Keep everything in menues and release an SDK so development of serious programs can take place on a PC to avoid keyboard clutter. Bury everything in menu's so the calc looks and functions basically as it does now, but everything is available to the user without a PC. It might be awkward to use (it is already), but once a program is written, it works great, and would be customizable and fit in a SHIRT POCKET! Reduce the size to the 15c diminsions as the 42s has always seemed about a 1/2 in (1 cm) TO DAMN TALL (and the GREAT AND WONDERFUL NEW ANSWER to our prayers, the 33s is just a BIT bigger yet! MORON'S!)

Oh, well, need to take my medication.

Sorry about the rant. I just get somewhat peaved when R&D budgets and costs of start ups are talked about, but Hp has the 42s and 15c already designed (and with the 17BII+ and 12c platinum redesigned) Hp's start up costs would be minimal.

Re: Then why not re-release the 15c, 42s combination?

*Message #52 Posted by **James M. Prange** on 28 Oct 2003, 9:43 a.m.,*
in response to message #51 by Ron Ross

Why not indeed? It seems to me that there's room for more calculators in the HP lineup, particularly truly shirt-pocket-sized models. What do they have now? Well, *maybe* the financial models, but the scientific models all seem too big to be comfortable in my shirt pockets. I suppose that a shirt-pocket graphing model is probably too much to hope for, short of drastically reducing the keyboard. Why not bring back some of the best models from the past, redesigned to run on the currently available electronics and, where feasible, correcting any obvious shortcomings. What

the heck, if it will help the marketing, even add a little glitz to appeal to the high school students.

Re: Then why not re-release the 15c, 42s combination?

*Message #53 Posted by **Erik Ehrling (Sweden)** on 28 Oct 2003, 3:07 p.m.,*
in response to message #51 by Ron Ross

Theoretically HP could produce a true HP-42S compatible calc using the ARM-based Saturn emulation from the HP-49G. And as the HP-42S already supports 32K RAM, at least that amount is possible to achieve with true emulation. (HP-42X achieves 96K RAM with some "tweaking").

As some might be very well aware of by now, I am still "dreaming" of the HP-33S coming out as a calc
- Being 100% HP-42S compatible
- Having the same keyboard layout as the HP-42S
- 32K RAM
- Serial I/O (or SD card support)

Regards,
Erik Ehrling (Sweden)

Sorry, but you'll have to KEEP DREAMING!

*Message #54 Posted by **Ron Ross** on 29 Oct 2003, 1:45 p.m.,*
in response to message #53 by Erik Ehrling (Sweden)

Sadly, Hp won't make such a machine because it would rob sales of the much higher hyped 49G+ or 49G- (I know Hp48GII).

Hp had such an animal on the boards back in 89 and canned it so as not to rob sales from the 48s line. The ability to address 32K of RAM made it into the calc, and partial I/O code also made it into the ROM, but not completed, due to not needed for the plain 42s.

The specs and info on the 33s lead me to believe it is only a 32s with lots of extra RAM, but probably not even as good as a 27s for real use (aside from its being RPN). If I have 32K of RAM, I want LONG VARIABLE NAMES! Not single variable names. Also matrix functions, where the HELL are they???! Sorry, I need to reach for my medication again.

I see someone was sticking up for Carly again. May I make a request? Don't!

Carly deserves the bashing she has and is getting! Plain and simple. While I do not know her personally, I have followed her humble rise to the top from the very beginning at Hp. She is indeed very capable of writing the sacastic letters that have been written her (We all really know who wrote these). She is a very bright and intellegent woman, but she is also a corporate CEO B$%^&*ch whose values and ideals are for her own interests first, her board second, stock holders, 3rd, and Hp is the mule to carry the aforementioned overhead. To her, Hp is a tool to increase wealth to herself, the board, the stockholders. Period.

An a measure of my arguement: If asked, "If you could liquidate Hp and double the value of every single Hp share via buyout, but the company would be

absorbed and disappear, would you do this?" (keep in mind, Carly would probably get a 1-2% commision of total brokage fees perhaps $50 million) What do you think she would do? (We might all do the same, so not exactly a fair question, but H & P certainly would not!) They would feel for their shareholder and dig down for some revolutionary new idea to accomplish THIS, not some cheap shuffle board scheme.

Bill Hewlett's idea of a pocket scientific went against all marketing polls (internal ones anyway). But he made his baby and is now revered for his great decision. That Hp should abandon this market is tragic and a mistake. That Hp is again back in the market is good to see. Whether, Hp does it right?? I don't know.

My med's have started working, I rest.

don't ?

in response to message #54 by Ron Ross

I've never held a 35, but from the description, I'd say that it required a good-sized shirt pocket. Certainly easily handheld sized and a remarkable achievement though.

Although HP is back in the market, they still seem to lack anything that fits truly comfortably in the shirt pocket. That may be hard to do with a graphing mode, but should be easy enough with a scientific, and certainly could be done with something that I just carry when shopping to calculate cost per unit prices.

Regards,
James

Re: Sorry, but you'll have to KEEP DREAMING!

*Message #57 Posted by **Ed Look** on 29 Oct 2003, 10:48 p.m.,*
in response to message #56 by James M. Prange

James, would you REALLY carry a HP RPN shopping???

* * * :O * * *

To me, it's too valuable to put in a casual pocket (in some places, that's invitation to theft) or bag, for fear of it getting banged up too much. I can't see a really cheap HP RPN, however, unless they revive some kind of 31E type calculator with a Pioneer form factor. Even the 20S algebraic is too valuable for that! Way lots of power in a "low end" algebraic! (I haven't yet held a 6S or 9S nor 30S, so I wonder if those are the shopping type calcs.)

I've been bringing my 48G (the G+ I leave home) with me lately and I tell you, I've got the willies. Boy whatever happened to that college bravery, when I would carry the 34C everywhere?

Re: Sorry, but you'll have to KEEP DREAMING!

*Message #58 Posted by **James M. Prange** on 29 Oct 2003, 11:42 p.m.,*
in response to message #57 by Ed Look

> Quote:
>
> James, would you REALLY carry a HP RPN shopping??
> ?

Of course! I'd love to! It would be much easy to work with than the "algebraic input" 4-banger that I normally carry now.

But my current HP calculators are too big to fit comfortably in my shirt pocket, and of course out of production models are a bit too valuable for that.

I don't see why it would be particularly expensive to make a very basic non-scientific RPN model. If anything, I'd expect that an RPN input model would be simpler than an algebraic input model.

HP49G+ Improvements?

*Message #1 Posted by **Brian S** on 24 Oct 2003, 7:55 p.m.*

I've been reading about all the problems with the keys, garbage on the screen, necessary ROM upgrade, etc. Hopefully HP is paying attention to all these problems and will improve the way that the 49g+ is manufactured to fix these things.

I was just wondering, for all those of you out there who are familar with the manufacturing process...How long, assuming HP is looking into improving the keys (which I consider the number one priority) and other problems, before the upgraded models find their way back into stores/distributors?? THe 49g+ looks and sounds like a great calculator that I will definitely buy, but I'd like to wait for things to improve before buying one. Hopefully it won't be a long wait.... Any thoughts?

Re: HP49G+ Improvements?

*Message #2 Posted by **Ben Salinas** on 24 Oct 2003, 9:59 p.m.,*
in response to message #1 by Brian S

Lately there have been lots of complaints about the 49g+, especially from people who have never used one or seen one. Realize that it is MUCH easier to complain about what is wrong than what compliment HP for what is right. Even if all of the given problems were fixed, we would find more things to complain about. For example, if the keyboard was perfect for everyone's tastes, then we would start complaining about the LCD screen. If that was fixed, the power consumption would be next. Then the size. And so on and so forth.

Realize that for every bad point you hear about (rom updating, LCD screen, keyboard, power consumption etc) there are literally 20 good points. The most obvious being the speed. A close second is the weight (especially when compared to the 39g. The 49g+ weighs less with batteries as the TI-89 does without) Furthermore, the software is great, along with the documentation (compared especially to other current calculator manuals) There are wonderful asthetics, and the memory size is amazing. The USB is fast, and it has IR. The SD slot is a great addition for future uses. The leather cases is to die for. It is RPN!!!! It has almost every function under the sun.

In my personal opinion, it will become the HP-41 of my generation. Everyone talks about how the HP-41 and the 16c are great, but let's face it they are not available to the general public. This, on the other hand, is available. I plan on keeping it for many years, and hope one day to be writing on this same forum about when I got my 49g+, and how I have used it for 15 or 20 years and can use it faster than the current calculators, even though it is so slow.

my 2 cents -Ben

Re: HP49G+ Improvements? [long response]

*Message #3 Posted by **Ed Look** on 25 Oct 2003, 12:28 a.m.,*
in response to message #2 by Ben Salinas

Great post, Ben.

I think I mentioned in another post here yesterday that it takes time also to build a fan following. One interpretation of this is that people need time to actually get to press the keys and write a few quickie, but useful, programs for their most routine uses and then get to see how good it really is.

I just got my 49G+ today, despite my putzing around (which delayed it) I also finally got to figure out how to update the ROM to v. 1.22 via Conn4x (I don't know how to get the update .bin file from my PC's HD to the SD I installed on the 49G+; I only know how to d/l a file from the PC to the calc's HOME directory) and saw how stinkin' fast that was! Who here remembers or had to stupidity to try transfering files via a serial or parallel cable between two PC running DOS 3.x? You went to lunch, came back, did some work, went and got a couple of beers, came back, went to the rest room, did some more work, went to grab a cup of Joe, chatted with the fellas, came back, did some work... and it STILL wasn't done!

Okay, so that wasn't fair. The update .bin file was what, about 1.2 Mb? It took about as long as a 48G series would to download a multi kb file. Over the next years, lets see what kind of math this 49G+ dude can do. I'm not going to worry about (even though I'm thinking about it) some version of 48Trek or chess or pretty pictures on it. The reason all the calcs in this museum became worthy of their places is because of all the real work we could on them... enjoyably! So far, from a couple of intermittent hours of exposure to this beautiful, golden, shining tricor... uh, calculator, it looks like it can do math, unlike many college students today (no offense to any one here... only those not here ;)).

Oh, my hours were intermittent because I had to drag the kids out to search for a reasonably priced SD card for the 49G+ that came to my door just today and this is what I saw in case anyone is interested:

Best Buy in NYC area- Fuji 128 Mb SD card for $40 USD.

Costco, again in NYC area- San Disk 256 SD card for $65 USD.

Great prices, but don't forget the 8.5% to 9% tax in our area. I hope these chains have the same cool prices in other areas as well. I also hope you folks overseas from here can get decent prices on these as well. I think I saw someone from Germany(?) say that his 49G+ came free with a 8 Mb card! That's great!

I understand what you're saying, Ben. However, keep in mind that for *some* of us, most of the things that are positive for you are neutral or negative for us:

Speed? I don't care much about speed; the 48 (and the 41 in many cases) is fast enough for me.

Weight? I like a heavy, solid-feeling calculator. One of the things I like about using memory cards in the 48 is that they make it heavier; a 48 without cards feels almost too light to me.

Software? The software is nice, though MetaKernel + Erable + Alg48 gives me most of that on a 48.

Documentation? From what I've heard about the documentation, at least some of the people who have it feel it's inadequate and recommend supplementing it with the 48 manuals. (It *is* supposed to be better than the original 49's documentation, though.)

Aesthetics? Though it's an improvement over the 49G, I still don't like the looks of the 49G+. I still think it looks too much like a consumer appliance and not enough like a complex piece of industrial/technical apparatus. In other words, it looks like it belongs in a living room, not in a laboratory. Of course, as I've said before, the puny **[ENTER]** key is a showstopper for me. No matter *what* other features a calculator has, I won't buy it unless it has a prominent double-sized **[ENTER]** key. That's an absolutely non-negotiable point with me.

Memory size? After a year of using a 2mb card in my 48GX, I still have 634kb free. I could free another 896kb by deleting 7 ports filled with backup objects (some dating back to July). They're already backed up on my laptop; I only keep them in the calculator because at present I don't need that memory for anything else. If I needed more I could get a 4mb card, but I don't anticipate ever needing more than 2mb. (It would be nice to have a larger port 0, but I've learned to manage just fine with what I have.)

USB? I like RS232C better than USB. Since the 49G+ is a USB client device, you can't hook it directly to another USB client (like a printer or another 49G+). A plain old RS232C serial port is more flexible.

IR? Already have that in my 48.

SD slot? Useless for me. (See comments above about memory size.)

Leather case? Sounds nice, but I've heard that the large magnetic clasp makes it difficult to fit in a pocket. If that's true, it would be a problem for me because I frequently carry my 48 (case and all) in my pocket.

RPN? That's great, but my 48 has that already. (Well, RPL, which is *almost* as good as having genuine RPN.)

Functions? My 48 (with MetKernel + Erable + Alg48) has many functions I've never (yet) explored, and probably always will. I don't need any more.

So while the 49G+ may be perfect for *you*, it falls far short of being right for *me*.

"Rookie" question

*Message #1 Posted by **Jerry Pfile** on 24 Oct 2003, 6:08 p.m.*

Is 82045A the correct thermal paper for the HP-97?

Also, does thermal paper degrade over the years in storage? I'd hate to buy some that I was only able to "look at", rather than use.

Thanks in advance,

Jerry

Re: "Rookie" question

*Message #2 Posted by **Raymond Del Tondo** on 24 Oct 2003, 6:57 p.m.,*
in response to message #1 by Jerry Pfile

I don't know the 82045A, I use black 81275A for the HP-IL printer. The printing on the 81275A box says it doesn't fit for the 97, but the characteristics should be the same as for the 82045A (even the format is identical). If stored in a dry, cool and dark place it can last for years, before and after use. But generally speaking, thermal printing paper is nice for quick & dirty protocol works, but never for long-time documentation purposes. Back then when I heavily used the printer for ML printouts from the HP-41, I immediately put the stripes onto a sheet of paper, and xeroxed it onto normal copy paper. This way the printouts were easier to handle than the thin rolls, and the copies I kept are still in excellent condition after (more than) 20 years now.

Raymond

HP-85A to HP-85B Conversion (82972A)

*Message #1 Posted by **Mike** on 24 Oct 2003, 3:30 p.m.*

HP-82972A Conversion (HP-85A to HP-85B Conversion)

I have an HP-85B that is marked HP-85 and has a sticker inside the printer compartment that says "82972A Installed."

I have always just assumed that was some sort of upgrade. I haven't been able to find anything on this part number. Maybe I haven't looked hard enough. However, while going through some misc HP-85 documents today, I came across the "Conversion Instruction Sheet."

If I read this correctly, the conversion is very extensive. Install HP-85B PCA, Printer/Power Supply PCA, Logic PCA, as well as Mass Storage, Electronic Disc, and I/O ROMs.

Need recommendation on a RPN calc

*Message #1 Posted by **Gene J (Chicago)** on 24 Oct 2003, 1:28 p.m.*

Hi,

I already have a 48GX and the new 49g+ but I'm wondering if someone could recommend the best HP model that has...

* RPN (don't want to go algebraic);

* scientific functions (mostly trig, log, and inverse functions, units and matrices would be nice too); and is

* non-programmable.

A multi-line display (at least two lines) would be nice too.

I need such a calculator as a requirement for certain exams and as a backup at times when a proctor might be sceptical. I'm planning ahead for January '04, so whether it is an old model that I might be able to find on eBay or something new on the horizon, any recommendation would be great.

Another general question is whether all HP scientific calculators have RPN? I thought RPN was pretty much standard for HP but when I've viewed calculator descriptions recently on the HP web I see algebraic mentioned but not RPN.

Sorry if these sound like dumb questions but having a 48GX workhorse, I haven't been in the market for a new calculator for over 10 years.

Thanks in advance!

HP-21 or HP-31E

*Message #2 Posted by **Paul Brogger** on 24 Oct 2003, 1:40 p.m.,*
in response to message #1 by Gene J (Chicago)

You haven't missed many non-programmable RPN models in the last 10 years!

I think the last two non-programmable RPN pocket calculators were HP-31E, and the HP-21 before that. The HP-91 desktop printing calculator was also non-programmable RPN.

All have one-line LED displays, and are considered collectible as well as actually useful for their designed purpose.

H-P hasn't made a non-programmable RPN model for some time, and the 12C is the only pure RPN model left in production (it doesn't have trig functions and is programmable).

A lot of us would like to have a quality, low-cost, RPN-capable, not-necessarily-programmable scientific available -- some of those attributes may be found in H-P's latest offerings, but I'm afraid not all.

Re: Need recommendation on a RPN calc

*Message #3 Posted by **Patrick** on 24 Oct 2003, 1:54 p.m.,*
in response to message #1 by Gene J (Chicago)

Wow. What you ask for is tough.

If you look over the list of legacy HP calcs elsewhere on this site, you'll see that not many of them are non-programmable. All of the scientific LCD models are programmable, so that leaves you with LED models. I see the following candidates:

```
HP-35
HP-45
HP-21
HP-27
HP-31E
HP-32E
```

Many of these are viable choices in the sense that you can still pick up perfectly functioning examples. Batteries will be another story, not to mention having to lug the wall wart around with you. I doubt exam rooms still run power lines along the desks anymore so that students can plug in their (now solar powered) calculators!

You could pick up any one of these for under $100 on eBay, with the exception of the HP-27, which commands a premium.

If you relax the non-programmable criteria, then that opens up a whole slew of other models for your consideration. I would suggest the HP-42S as it has the multi-line display and support for matrices that you asked for. For me personally, other great alternatives would be the HP-15C and HP-11C.

As far as your other question regarding the presence of algebraic models on the HP web site... therein lies a long and twisted tale, much discussed on this site. The short answer is nobody knows why. Happily, this hasn't prevented the folks here from giving their opinions! If you take a look back through the forum archives, you're bound to see what I'm talking about.

Good luck Gene.

*Message #4 Posted by **Mark Hardman** on 24 Oct 2003, 2:27 p.m.,*
in response to message #1 by Gene J (Chicago)

Strange as it may seem, the HP-19BII Business Consultant II might be a good fit for what you are looking for:

* Selectable RPN mode

* scientific functions (trig, log, and inverse functions, unit conversions -- but no matrix functions.

* non-programmable in the classic sense -- though we could argue the merits of HP Solve.

* A multi-line display -- three line stack and one line soft menu.

Mark Hardman

17BII will do a perfect job...

*Message #5 Posted by **Thibaut.be** on 25 Oct 2003, 1:05 a.m.,*

in response to message #4 by Mark Hardman

.... has all you need...

....AND includes a solver that is quite difficult to detect... might help you in your exam !

Re: Need recommendation on a RPN calc

*Message #6 Posted by **SV** on 25 Oct 2003, 1:40 a.m.,*
in response to message #1 by Gene J (Chicago)

You need to go directly into the hp calculators website:

http://www.hp.com/calculators

This site shows the full range of HP calculators which are being sold.

HP33s will be allowed by NCEES

*Message #7 Posted by **Brian S** on 25 Oct 2003, 8:24 a.m.,*
in response to message #1 by Gene J (Chicago)

NCEES (they administer the professional engineering exams) has banned the TI-83, HP 48 series and 49 and other calculators from upcoming exams. However, they do allow the 32s and the yet to be releases HP 33s. If you're looking for a 2 line display with rpn, the 33s is your best bet. Should be released by the end of the year.

For additional info on the NCEES calculator ban, go to: http://www.ncees.org/exams/calculators/

Hope this helps.

Re: HP33s will be allowed by NCEES

*Message #8 Posted by **Gene J (Chicago)** on 25 Oct 2003, 2:12 p.m.,*
in response to message #7 by Brian S

Thanks a bunch to everyone for all the useful info and the link to the NCEES calculator ban.

I'm planning to take the ABHP exam next summer and while they state the calculator requirements, they're much more general than what NCEES says. Given the communication-capability ban, not even my old 28c would have cut it.

At approximately $60 when it becomes available, it looks like the 33s is the safe and cost-effective way to go in my exam case and as a general backup, although some of those old LED models would be pretty cool to have.

Thanks again!

Calcpro are a bunch of toe-nails

*Message #1 Posted by **Paul Fox** on 24 Oct 2003, 8:33 a.m.*

I mentioned the other day placing an order on their web site and never having got an acknowledgement that my order was received....I emailed them subsequently to see if the order had been placed and to ensure they email me at work & home.

Not a sausage from them....

So I waited til I could order from someone in the UK and placed the order a few days back.....

You know the rest of this story. Wife called today to say theres a parcel for me at home...HP49G+. From Calcpro.

So looks like I might be the proud possessor of two buggy-beauties and may need to sell one at a good price.

A pot of used and smelly toe-nail cuttings to calcpro for being such wallies.

Re: Calcpro are a bunch of toe-nails

*Message #2 Posted by **Paul Fox** on 24 Oct 2003, 3:40 p.m.,*
in response to message #1 by Paul Fox

Well its arrived and Ive updated the ROM to 1.22.

Nice and fast! The keyboard appears to be fine - no dodgy keys as far as my limited testing has shown.

The key feel reminds me of the difference between Lego and Megablocks .. for those which have children. Lego is heavy duty plastic, perfectly formed and fits together properly. Megablocks looks like Lego but is cheap and nasty and doesnt stick together properly. The HP keys are like megablocks - look the part, til you press them and then you feel that they are adequate for a $5 calculator.

After minutes of use, I am happy and at home with the keyboard - acceptable but not a feeling of quality. So dont let the keys put you off.

The calc does feel very light but thats no bad thing.

Having followed c.s.hp48 for the last few weeks, the ROM upgrade went smoothly (small issues related to not reading the docs first of all).

Supplied manual is a let down but not a big deal - I have the HP48+49 manuals plus the downloadable online stuff. (I have Wicke's original books as well, which I cherish).

Now...wheres the games ? :-)

As mentioned in prior post looks like I will have 2 calcs soon so if anyone wants to make a reasonable offer, I'll let it go at a good price (when it arrives).

If theres any poor students or poor out of work IT workers, let me know and maybe we can cut a deal (especially if you are in the UK - especially London area).

Or I could take one to work and leave it there...

Re: Calcpro are a bunch of toe-nails

*Message #3 Posted by **Arnaud Amiel** on 24 Oct 2003, 3:56 p.m.,*
in response to message #2 by Paul Fox

I think there is a poor imperial college student lurking in comp.sys.hp48. Look for the thread looking for 49g+ in London

Arnaud

Re: Calcpro are a bunch of toe-nails

*Message #4 Posted by **Paul Fox** on 24 Oct 2003, 4:49 p.m.,*
in response to message #3 by Arnaud Amiel

yup - i saw him wandering around feeling lonely. Not sure if he reads this board .. see if I get any responses by the time it arrives. I think the UK arrivals are imminent (its nearly November now... crumbs its nearly Xmas).

Maybe the wife would appreciate a HP49G+ ... not!

Re: Calcpro are a bunch of toe-nails

*Message #5 Posted by **Joshua Belsky** on 24 Oct 2003, 6:03 p.m.,*
in response to message #2 by Paul Fox

I seem to remember seeing a c.s.hp48 post by apoor engineer in a country where engineers make very little money. Maybe him?

Re: Calcpro are a bunch of toe-nails

*Message #6 Posted by **Wayne Brown** on 24 Oct 2003, 4:10 p.m.,*
in response to message #1 by Paul Fox

It *can* be difficult communicating with CalcPro; I've found that calling them on the phone and actually talking to a real person is the most reliable method. However, on the plus side, they're good at finding hard-to-obtain items and getting them to customers, even though it sometimes means waiting long periods with no updates from them on what's happening. For instance, a year or two ago I ordered some out-of-production stuff -- HP-41 magnetic cards, magnetic tapes, card holders, module wallets, etc. from them. It took quite a while for the shipment to arrive, which didn't surprise me because I knew it would be difficult to locate some of these items. By the time it arrived I'd almost forgotten what I ordered. Several weeks later another package arrived, containing, if I remember correctly, a couple of mag tapes. At first I though it was a mistake, but after checking my original order I found that I had indeed ordered them. At some point CalcPro had decided to ship what they had managed to find so far, and when they later located the tapes they shipped those also. The point is that there was no communication from them to say that the shipments would be delayed, or that there would be partial shipments made as items became available. I think the assumption they make is that if you order something you want it, no matter how long it takes, and that since you'll get it as soon as they can find it, there's no need to talk to you about it any further after the order has been placed. That can be frustrating when you're wondering if they even received your order or not, but after dealing with them several times I have to admit they *always* have (eventually!) filled my orders correctly. So I guess that means I'm a satisfied, if

occasionally irritated, customer.

(I also have to admit some sympathy with their way of doing things. Sometimes, after attending the umpteenth status meeting at work, I answer questions about when some project will be finished like this: "Not as quickly as it would be done if I weren't wasting time in meetings talking about work instead of actually working!")

Re: Calcpro are a bunch of toe-nails

*Message #7 Posted by **Les Bell [Sydney]** on 24 Oct 2003, 5:55 p.m.,*
in response to message #1 by Paul Fox

Heh. I remembered your earlier email about Calcpro, as I had placed an order with them around the same time, for an HP-48 manual set (to replace a lost Quick Start Guide).

The order turned up last week. . . I probably should have mentioned it. . . <g>

Best,

--- Les [http://www.lesbell.com.au]

Re: Calcpro are a bunch of toe-nails

*Message #8 Posted by **Ed Look** on 24 Oct 2003, 7:36 p.m.,*
in response to message #7 by Les Bell [Sydney]

I ordered the HP 48 AUR some days ago, about a week, maybe. I just e-mailed them just for some information on the order. I find that the manuals that came with the 48G's are not extensive enough when it comes to programming the thing to "automate" some calculational tasks. I think it's all the more imperative now that I just received my 49G+ this afternoon!

Did I mention I just received my 49G+ this afternoon? :D

Let me see if I can hook it up to my dinosaur PC and see if I screw up the ROM upgrade!

From 'Perfect Enough' by George Anders:

*Message #1 Posted by **DanO** on 23 Oct 2003, 11:37 p.m.*

"Hewlett's best ideas were masterful. In the early 1970s, when cheap little calculators were catching on, he ordered HP engineers to build mightier machines that still could fit in a shirt pocket. These calculators wouldn't just add and divide; they would churn out everything from factorials to hyperbolic cosines. It took months to figure out how to cram all the essential circuitry into what seemed like an impossibly tiny shell. Outside consultants couldn't see any meaningful market for such an elaborate device that might cost more than $300. But beginning with the HP 35 calculator, scientists and engineers bought the company's calculators by the millions. For a few years, handheld calculators were HP's most successful and profitable product."

[Quote is from page 8 of the book 'Perfect Enough: Carly Fiorina and the Reinvention of Hewlett-Packard' by George Anders.]

Connecting 49G+ to Mac

*Message #1 Posted by **Ernie Malaga** on 23 Oct 2003, 9:38 p.m.*

Help!

I use a Macintosh and have been unable to read the manuals contained in the CD that came with the calculator. Everything I have tried so far has failed.

This is what I'd like to do:

1. Download the manuals from somewhere, in PDF format, without having to "install" them by running a PC-only application.

2. Be able to make use of the USB cable that came with the calculator. Sooner or later I'll have to upgrade the OS to a new version!

Help!

-Ernie

Re: Connecting 49G+ to Mac

*Message #2 Posted by **Gene** on 23 Oct 2003, 11:01 p.m.,*
in response to message #1 by Ernie Malaga

http://www.textodigital.jazztel.es/hp49gplus/BPIA5324_CSB.zip

This is a zipped version of the PDF manual.

You need on the mac:

Stuffit Expander

and

Acrobat Reader.

That's it.

Both are installed as default applications on OSX. OS 9.1 or later should have them too.

Hope that helps.

Re: Connecting 49G+ to Mac

*Message #3 Posted by **Ernie Malaga** on 24 Oct 2003, 2:30 p.m.,*
in response to message #2 by Gene

Thanks for the quick answer, Gene.

What about issue #1? Any thoughts on how to transfer data between the 49G+ and a Mac?

-Ernie

Re: Connecting 49G+ to Mac

*Message #4 Posted by **Tom Scott** on 24 Oct 2003, 3:29 p.m.,*
in response to message #3 by Ernie Malaga

I use an SD (64 MB SanDisk) with reader that I just purchased from Circuit City. I just finished using it to upgrade my ROM to 1.22. Initially I had some problems using the card in the 49G+ but after having a neighbor reformat the card using Windows 2000 Pro, everything works fine for transferring files between my Mac and the 49G+.

Yep, like Tom says...use an SD reader

*Message #5 Posted by **Gene** on 24 Oct 2003, 6:59 p.m.,*
in response to message #4 by Tom Scott

Tom has it right!

Re: Yep, like Tom says...use an SD reader

*Message #6 Posted by **Tom Scott** on 24 Oct 2003, 7:17 p.m.,*
in response to message #5 by Gene

I should metion that when I use the "Files" feature on the HP-49G+ I see some garbage files (apparently put there by the Mac). I ignore these and just use the files that I'm interested in.

Re: Yep, like Tom says...use an SD reader

*Message #7 Posted by **Gene** on 24 Oct 2003, 10:26 p.m.,*
in response to message #6 by Tom Scott

I usually see a .DStore or such and a .Trashes file.

Just keep on moving. Nothing to see here. :-)

Re: Connecting 49G+ to Mac

*Message #8 Posted by **Ernie Malaga** on 24 Oct 2003, 8:40 p.m.,*
in response to message #4 by Tom Scott

> Quote:

Thanks for the reply. I've got a question, though -- what is a SD? And how much did you spend on it?

-Ernie

Re: Connecting 49G+ to Mac

*Message #9 Posted by **Gene** on 24 Oct 2003, 10:27 p.m.,*
in response to message #8 by Ernie Malaga

SD stands for Secure digital. The card slot in the 49G+ can take SD memory cards or MMC

(MultiMedia Cards)...they are the same thing.

64MB cards are about $30. 128MB cards are about $50.

Re: Connecting 49G+ to Mac

*Message #10 Posted by **Ed Look** on 25 Oct 2003, 12:31 a.m.,*
in response to message #9 by Gene

Gene,

around me, (NYC area), 128 Mb generally goes for upwards of $70! The 64 Mb's go for about $50, and the 256 Mb cards for around $90. (Methinks me is getting me pockets picked...)

Start spreading the news...

*Message #11 Posted by **Ernie Malaga** on 25 Oct 2003, 1:43 a.m.,*
in response to message #10 by Ed Look

> Quote:
>
> around me, (NYC area), 128 Mb generally goes for upwards of $70! The 64 Mb's go for about $50, and the 256 Mb cards for around $90. (Methinks me is getting me pockets picked...)

That's just NYC for you. A friend of mine was paying $1800 a month for a tiny one-bedroom apartment on floor 29 of a building close to the Lincoln Center. I'm talking about 1998 or 1999; I have no idea how much it is now.

Are you guys still paying 25% sales tax? 8^)

-Ernie

$36 for 128MB MMC card (free shipping too)

*Message #12 Posted by **Gene** on 25 Oct 2003, 11:09 a.m.,*
in response to message #10 by Ed Look

http://dealram.com/prices/26/128MB.html

You can select other sizes too.

Re: Connecting 49G+ to Mac

*Message #13 Posted by **Ed Look** on 25 Oct 2003, 12:37 p.m.,*
in response to message #10 by Ed Look

Thanks, Gene. Bookmarked for the coming days when I have to get RAM for a computer I want to put together to replace the clunker I'm typing on now.

Incidentally, I got 256 Mb at $65, but after tax, it's like shipping w/o tax, so the second law of thermodynamics has its revenge... again. (Or, first law, depending on how sanguine a person you are!)

Re: Connecting 49G+ to Mac

*Message #14 Posted by **sv** on 25 Oct 2003, 11:47 p.m.,*

in response to message #1 by Ernie Malaga

Try this URL on the HP website:

http://h20015.www2.hp.com/en/manualCategory.jhtml?reg=&cc=us&pagetype=manual&prodId=hp49ggraph351775&lc=en&sw_lang=en&docparent=manual&cat=manual

It goes straight into the section where you can download the manual on PDF.

BTW, try the website: http://www.hp.com/calculators

HP 29C keyboard repair?

*Message #1 Posted by **Victor Koechli** on 23 Oct 2003, 5:22 p.m.*

Hi all,

once more I'm trying to repair a woodstock keyboard, this time in a HP 29C. One of the keys is not working, and I have no idea how to fix this. It looks like there are two different types of keyboards in the woodstocks, one 'old style' that has a small hole under every key contact, and a newer one that doesn't. This is one of the newer style. It appears that its key contacts are no longer spot welded metal, but plastic domes.

Does anyone have an idea how this could be repaired? Do I have to take it apart and re-apply some sort of conductive material to the contact? And where would I get this in Europe?

Thanks for any help, Victor

Re: Once upon a time... (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Oct 2003, 7:04 p.m.,*
in response to message #1 by Victor Koechli

Hi;

I remember the days I was at the University (80's) when an HP29C was shown to me as having this sort of problem. I opened the keyboard and I saw the plastic domes for each key, as you mention. And the faulty key had a broken cooper trail, because in these keys, the cooper trails are slightly stretched when the key is pressed. The newer plastic dome-type keyboards have no trails, only a centered conductive island in the inner middle part of the dome.

If, at that time, I had the option to use cooper foil with conductive glue (available today) or the conductive inks, I'd try repairing the faulty key the way you mention: disassembling and applying the conductive material. And I think there are also other options.

Success!

Luiz (Brazil)

(P.S. - I'll be back... soon)

Edited: 23 Oct 2003, 10:51 p.m.

Re: HP 29C keyboard repair?

*Message #3 Posted by **Renato** on 23 Oct 2003, 8:15 p.m.,*
in response to message #1 by Victor Koechli

Victor, I have succesfully repaired woodstock keyboards , plastic dome types.

Two methods:

1. Using conductive ink. It is a graphite based ink, and after dry it becomes a very dark grey. This method is good if the plastic dome is not damaged.

2. Using a 12C metal dome. I cut away one metal dome from a deceased 12c, and successfuly used it in place of a damaged plastic dome. The damaged key was "enter", and the holes is the 12c metal dome matched the plastic pins in the woodstock keyboard.

Good luck,

Renato

Re: HP 29C keyboard repair?

*Message #4 Posted by **Victor Koechli** on 24 Oct 2003, 8:20 a.m.,*
in response to message #3 by Renato

The dome looks intact. Where would I get this conductive ink? I live in Switzerland...

Thanks, Victor

Re: HP 29C keyboard repair?

*Message #5 Posted by **Thomas Radtke** on 24 Oct 2003, 9:40 a.m.,*
in response to message #4 by Victor Koechli

Hi Victor,

any electronics shop should carry it. It's sometimes called 'Leitsilber' in german. Apply it with the finest brush you can find (or cut away some bristles of a not-so-fine brush). Don't forget to shake the bottle very well.

Thomas

Re: HP 29C keyboard repair?

*Message #6 Posted by **Victor Koechli** on 24 Oct 2003, 12:57 p.m.,*
in response to message #5 by Thomas Radtke

Thanks, Thomas. Read it, went there, bought it - I'll do the repair work tomorrow, and I'll keep you posted.

Thanks everybody for the great help in this forum. I love it!

Cheers, Victor

Re: HP 29C keyboard repair?

*Message #7 Posted by **David Smith** on 24 Oct 2003, 2:56 p.m.,*
in response to message #1 by Victor Koechli

Most likely the problem is a bad contact under the key dome. You fix these just like the ones with the access hole under the keys, except that you must drill your own hole with a small hand drill. Be careful not to drill through the etches on the other side. This can be a problem if the circuit board material is that opaque black stuff. Also don't get drill cuttings in the hole.

Once you have your hole, make a small wire brush out of three bristles cut from another brush. Chuck the bristles in a pin vise, twist them together, and trim the end flush. Now put a drop of 91%+ isopropyl alcohol in the hole, dip the wire brush in more alcohol, and then gently scratch around in the hole. Do this with the key up and down.

Re: HP 29C keyboard repair?

*Message #8 Posted by **Victor Koechli** on 24 Oct 2003, 5:56 p.m.,*
in response to message #1 by Victor Koechli

Well, I've done it: Dissassemled the keyboard and applied fresh silver ink to the bad contact where the original silver contact had broken off.

Now I have to get the whole thing back together. It seems that this assembly needs a firm pressure in order to work properly, especially for the conact spots between the keyboard PCB and the row lines in the plastic. How can I accomplish this? So far, I have been unsuccessful. The plastic rivets are not long enough to allow for an easy re-fixing. Should I use glue? screws? magic, perhaps ;-)

Thanks again, Victor

'Gummy wheel'

*Message #1 Posted by **Phil Jonker** on 23 Oct 2003, 4:57 p.m.*

I am looking for a 'Gummy' Wheel repair for an HP 41 card reader.Can anyone help me?

Kind Regards

Re: 'Gummy wheel'

*Message #2 Posted by **Victor Koechli** on 23 Oct 2003, 5:07 p.m.,*
in response to message #1 by Phil Jonker

Look in the 'Articles' section on this website to find instructions on how to do it. It's actually not difficult if you follow the instructions carefully. Most important is not to lose any of the small parts and not to bend the switch contacts, most difficult (for me) was finding a suitable replacement.

Cheers, Victor

Re: 'Gummy wheel'

*Message #3 Posted by **Juergen** on 24 Oct 2003, 9:48 a.m.,*
in response to message #1 by Phil Jonker

Gummy wheels including repairing instructions are also offered on eBay. See item nr 3054833188. BTW, waterhosko is a very nice guy, a pleasure to deal with.

HP49G+ ,Embedded formulas

*Message #1 Posted by **Andreas Archenti, Sweden** on 23 Oct 2003, 4:32 p.m.*

Hi HP lovers,

I just bought my Hp49G+, but to my surprice I cant find any embedded formuls like tous in 48GX.. Mohrs cirkel etc.

Is that right or am I lost in space ?! :o)

Re: HP49G+ Embedded formulas

*Message #2 Posted by **Paul Brogger** on 23 Oct 2003, 5:05 p.m.,*
in response to message #1 by Andreas Archenti, Sweden

IIRC, the Equation Library was considered a lower-priority feature that wasn't available in time for the calculator's release. I seem to remember mention of hope that it will be included in a future ROM upgrade . . .

Keyboard layout history

*Message #1 Posted by **Arnaud Amiel** on 23 Oct 2003, 9:42 a.m.*

Seeing all the fuss there has been since the introduction of the small ENTER key at the bottom of the calc, I was wondering if there had been such an outcry when the operator keys were moved to the right side of the calc and reordered. I wasn't into calcs at the time but I feel this must have bothered the users much more than the movement of the ENTER key: I still have some problem myself on the 49 multiplying instead of dividing or substracting instead of multiplying, but never had problems with ENTER. The new ENTER key troubled me much less than the rearranged +-x/ on the 49.

Arnaud

Re: Keyboard layout history

*Message #2 Posted by **Juan J** on 23 Oct 2003, 11:29 a.m.,*
in response to message #1 by Arnaud Amiel

Perhaps the rest has noticed it but in RPN mode the 17BII's equal key performs the same function as INPUT, i. e., lifts the stack and allows RPN operation. I have not seen much fuss about that (I haven't checked the Forum archives in detail about this subject.) It takes a little to get used to this second ENTER key, maybe because there is that "long key" above the number key pad. It is much the same thing with the little ENTER key on the 49 series.

Thankfully, on the 49G+ you can assign it to EEX and used the "normal way" but in time it is possible to get used to it. Lately I've been trying a 49 and I am in the process. A good advice is to think of it as if it were the 17BII's equal key.

Re: Keyboard layout history

*Message #3 Posted by **Wouter Peters** on 24 Oct 2003, 1:51 p.m.,*
in response to message #1 by Arnaud Amiel

As far as I am concerned I can live with a small Enter-key to the right of the digits instead of a double one above to the left. I (and not only I) had to learn two different digit layouts when telephony moved from a dial to a keyboard with 123 above and 789 underneath 456. Just the other way around as they are grouped on a calc. Nevertheless I hardly make mistakes punching in numbers either on a phone or on a calc...

It just needs getting accustomed to the thing.

Wouter

HP-95LX question

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 23 Oct 2003, 8:45 a.m.*

Hi all,

Is those PCMCIA SD/MMC adapters compatible with the HP-95LX? I have MMC cards and I wish to use them on my 95LX (just acquired!) I have a SD/MMC card reader on my PC, I think that this can be a great (and easy!) way of transfer fiels between them. If not compatible, I can do this by serial, but I don't have the discs/manual of the HP-95LX (bought used).

I am searching also documentation about its hardware, to program in assembler or TurboPascal. I know the PC (XT) hardware pretty well (I used to program them in asm/TurboPascal 'eons' ago...), but I need to know the differences/particularities of the 95LX hardware (screen, keyboard, serial/IR, etc).

Thanks in advance!

Nelson

Re: HP-95LX question

*Message #2 Posted by **Terry Ingram** on 23 Oct 2003, 10:02 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hello Nelson,

I use a PCMCIA adapter with a Compact Flash card with a hp200lx, but not sure about the SD/MMC adapters. The 95lx supports the PCMCIA 1.0 & JEDI 4.0 standards with ram cards up to 2 megabytes.

I use a 512k ram card (HP F1003A) with the 95lx. These are available from Thaddeus Computing. I think I paid around $15.00 used. Larger sizes are also available.

For information regarding programming, try http://www.palmtoppaper.com. They have a 100/200 developer's guide that may also provide information for the hp95lx. They also have a CD Infobase with early issues of a magazine supporting the hp95lx. Some of the information on their CD Infobase is also online at http://www.palmtoppaper.com/PTPHTML/index.htm

Another website for the palmtops is http://www.palmtop.net. There is a file available that discusses assembly language with the hp95lx. I don't remember the name of the file right now, but a search on the site could find it.

Good luck, Terry

in response to message #2 by Terry Ingram

Thanks for the links, I'll browse them.

I already know that the PCMCIA that the 95LX uses is 1.0, but I can't find what stantard this cards support:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=18872&item=2959311471

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=43450&item=2959502172

Best regards,

Nelson

Re: HP-95LX question
*Message #6 Posted by **Bill Smith** on 23 Oct 2003, 12:18 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

i have successfully used a PCMCIA-CF adaptor on my 200lx, but it doesn't work on my 100lx or 95lx. additionally, most of the 5 or 6 PCMCIA memory cards that also work on the 200lx don't work either. The exceptions being SRAM cards.

i haven't tried using the available drivers, though. all the cards work well in my desktop with the SCM adaptor.

Re: HP 49G vs. HP 49G+ Prices

*Message #5 Posted by **Paul Brogger** on 23 Oct 2003, 11:40 a.m.,*
in response to message #1 by Ed Look

I'm guessing the costs of development (and probably production) of the 49G+ are lower than those for the 49G, especially inasmuch as the latter seems to have been largely built on the former's code base.

49G prices probably haven't started to reflect the reality of introduction of the 49G+. H-P may be trying to re-establish a market presence with relatively aggressive pricing on the new high-end models. Once the new models start shipping in quantity, prices of the 49G (and competing graphical models from TI & others?) should be forced downward.

Maybe the 49G fans should correct me -- I don't sense the same level of loyalty to that model that seems

evident for the 48G series (and all the more so for the earlier & classic models).

Re: HP 49G vs. HP 49G+ Prices

*Message #6 Posted by **Ed Look** on 24 Oct 2003, 12:43 a.m.,*
in response to message #5 by Paul Brogger

Paul, give it time. I don't think the 41C's and Spice series got this rabid following in just five or so years. It takes people time to realize how good something is after things change for a while.

I began to love my 34C much more only after I saw the LCD models introduced. I began to love my 32SII more only after I saw the RPL models introduced. And I'm still working on the 48G's... all the while peeking on the UPS website to see if my 49G+ is coming yet!

Anyone have problems viewing the Symbolic Trig Integration training aid?

*Message #1 Posted by **Gene** on 22 Oct 2003, 7:05 p.m.*

http://www.hp.com/calculators/docs/guides/49gPlusSymtrig.pdf

A user has indicated this PDF shows black boxes for some of the screen prints (i.e., totally black) and that some of the functions show up as black boxes rather than as a readable function.

I can view them fine in WinXP and on my PB G4 Macintosh.

?

Gene

Re: Anyone have problems viewing the Symbolic Trig Integration training aid?

*Message #2 Posted by **Ed Look** on 22 Oct 2003, 10:54 p.m.,*
in response to message #1 by Gene

Gene,

I have only viewed that particular page online. I downloaded it for more leisurely reading, but haven't gotten around to it. So, I can only speak for reading it online with Adobe Acrobat Reader 4.0 via my browser (Netscape 6). It looks fine.

HOWEVER

As I scroll, many of the pictures or objects, such as the equations, etc., would become black rectangles for barest of a fraction of a second as I scroll through the file.

I wonder if it is a compatibility issue between versions of Acrobat. .pdf's sometimes are not so "portable".

Re: Anyone have problems viewing the Symbolic Trig Integration training aid?

*Message #3 Posted by **Veli-Pekka Nousiainen** on 23 Oct 2003, 4:52 a.m.,*
in response to message #2 by Ed Look

Have you tried it directly with Acrobat Redaer 4.0? I think it could be a Netscape plug-in progran (in v.6)

HP-41CX to PC connection

*Message #1 Posted by **Jon** on 22 Oct 2003, 5:46 p.m.*

I would like to connect my HP-41CX to the PC (Windows me). I don´t know which is the best option. I have read it is possible to use the HP-IL/RS232+ ext I/O with linux (Is it possible to do it with Windows? Which software is needed?). I could also buy the card made by K. Klug. Both are quite expensive solutions so I would like to know some opinions before.

Thanks in advance

Jon

Re: HP-41CX to PC connection

*Message #2 Posted by **Pavel Korensky** on 22 Oct 2003, 7:08 p.m.,*
in response to message #1 by Jon

Currently, I am trying to use the HP-IL/RS-232 module. Finally, I have the module. Now, I only need to finish the ROMpack, because I do not have the original Ext.I/O module.

I am planning to write my own WinXP software for file transfer.

Maybe, there will a third possibility in the near future. As far as I know, Meindert implemented the USB interface is his MLDL2000. But I do not know, if it will possible to use this interface for program/data transfer between PC and HP-41.

Re: HP-41CX to PC connection

*Message #3 Posted by **Bill Smith** on 22 Oct 2003, 7:16 p.m.,*
in response to message #1 by Jon

there are several ways to get files from a 41 to a PC. see Articles (on this site) 54, 118, 260, 311 and any related for technical info.

i think the 82973A or the Klug IL2000 may be the most versatile to directly transfer PC files because of the several software packages available, and there are calculator emulators and IL system stuff as well. they may also be a bit cheaper than the 82164A and 82183A combo, as these items seem to fetch $80 and higher apiece on ebay. there was some discussion on trying to develop the necessary XIO commands in mcode to obviate the need for the 82183A, but i haven't heard of any success to date.

perhaps the least expensive is the 9114 disk drive, though not as common as they used to be. actually, i paid less for my 82973A (3 years ago) than the 9114 (1 year ago), and i still need a battery pack for the latter. if file transfer is your only objective and you can find a 9114 ready to go, i'd grab it; then the disks can be read in most PCs with the lifutils software.

best of luck finding what you need, bs

Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #4 Posted by **Dr.J.Kahler** on 23 Oct 2003, 12:52 p.m.,*
in response to message #1 by Jon

Hi Jon

Why a HP-41CX ? I cannot understand. That is an absolutely archaic machine from 1980. Better buy a HP-49G+, this can be connected to PC easily. And the price is quite OK. I saw price discussions on HP-41CX here at the forum. The people spoke about several hundreds of dollars for one HP-41CX from Ebay. That is crazy if compared to prices for HP-49G or G+. Of course, I really can understand the prices. It is for collectors. For collectors any old HP calculator is a very valuable item, I can understand well. But it is not practical for real use and you seem to be someone who really wants to use it, with a PC.

From technical point-of-view a HP-49G+ is of course much better than HP-41CX because it is newest technology with many add ons that have been engineered in 20 years. For example: A HP-41CX cannot do graphics, it has a ridiculous 12-digit display only. A HP-41CX cannot do symbolic algebra. The memory size is negligible. What can you do with 2 or 3 kByte? To be honest, nothing really advanced. It can only be used for relatively simple programs or routines. And one of the worst things may be that the calculator is very slow. I found ridiculous benchmark values at the museums site. The new HP-49G+ has a 75(?) MHz CPU, that's so great! What does a HP-41CX have? Maybe 50 kHz CPU or something like that, I do not know.

OK, there is one real disadvantage: The HP-49G+ has much worse keyboard than all the old HP calcs. But a keyboard cannot drive a decision - that's my opinion. I found a lot ofdiscussion on HP new and old keyboards here at the forum. I believe that this is the reason why so many peolpe still ask for something like a HP-41CX. Why doesn't HP improve that??? That is the only bad point! Even if price would be higher by 30%, who cares?

Finally: My proposal: Forget about HP-41CX-PC-connection but buy one of those brilliant new HP-49G+. Even if keyboard is not one of the best they are absolutely great for relatively little money and can be connected easily. As HP-49G+ has just been launched this is the hour to buy it!

Best regards, Johann

Re: Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #5 Posted by **Holger S.** on 23 Oct 2003, 2:13 p.m.,*
in response to message #4 by Dr.J.Kahler

The point ist not the keyboard and not the superior performance of the 49G+ (or any other modern programmable). The point is that the 41CX is magic, beautiful, unique and the 49G+ is not. It's a piece of engineering that has the power to make us happy just by looking at it. It's like a 1970 Mercedes SL500. Even a modern lowly Ford has superior performance. It's not really comparable.

Regds, Holger S.

*Message #8 Posted by **Wayne Brown** on 23 Oct 2003, 7:08 p.m.,*
in response to message #5 by Holger S.

Exactly! Holger, that is a perfect description of the 41CX. Though I use my 48GX more frequently these days for real work, sometimes I take the 41CX out of its case and just hold it. Feeling the weight and shape, turning it at various angles so that it catches the light, switching it on and watching that crisp display appear, tapping those wonderful keys and feeling the solid "click..." I admire it the way some people admire sculpture or fine jewelry: Not just for what it can *do*, but for what it *is*. It's hard for me to imagine feeling that way about a 49G or 49G+.

Re: Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #9 Posted by **bill platt (les Estats Unis d'Amerique)** on 23 Oct 2003, 2:23 p.m.,*

Hi Dr J.

Well, yes, 'tis true what you say.

But,

Maybe Jon has been using that CX for 20 years and knows it really well. Maybe he realizes that to change to a new machine will take a significant learning curve. Maybe he really knows his field, his stuff, and he is a Well-Oiled Machine. So, the 49 is just a bunch of overhead for him.

Or, maybe he enjoys the old machine--some people actualy like to play with these old machines for no other reason than that they enjoy doing it (I know you know that--I'm just ribbing you).

I fell into the first category for 20 years, but now I find myself falling into the second category.....boyoboy there is no way out now...I'm in way too deep.....

regards,

Bill

Hi,

Maybe there are several subjetives (and appreciations) points of view. I understand your "scientific approach". However, I love my HP-25C (27 years old), and even my HP-67 (in the garage, under repair waiting spare parts). The HP-41C (and cousins), are, let's say, wonderful.

Chiao

Re: Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #12 Posted by **Raymond Del Tondo** on 23 Oct 2003, 2:51 p.m.,*
in response to message #4 by Dr.J.Kahler

Hi,

I still vote for the HP-48GX (with b/w display). Ok, it's slower than a 49G(+) but in most cases, that's not the main point. For many people an important point is reliability, at least if they spend that much money for just a calculator. From this point of view the HP-48GX outbeats all of it's 'succesors'.

I don't know if you know that the 49G OS took more than 3 (three) years *after* lauch to get to something that you can call stable.

The 48GX has a reliable keyboard, and an OS which is stable enough that you don't need to fear a memory loss every week.

And yes, IMHO the 128K memory is suitable for most serious cases, and if not, it can be easily expanded.

The SD card feature of the 49G+ is very nice, but seriously, do you have or know an application which needs that much? You could load all programs from hpcalc.org into the machine, and maybe some people try it, but I'm not sure if this makes sense.

Even the RAM and flash of the normal 49G was more than enough, except for people who load all games available, or many GROB animations;-)

For the HP-41: The CPU clock is some hundred KHz, and the small amount of RAM lead to another effect: Highly efficient quality programs.

And no, you could do very advanced programming on the HP-41. Of course not much with graphics, but the HP-41 is still great for numerical calculations. One reason is the *much* better keyboard than that of the machines after the HP-48...

And yes, there were some *very* advanced modules for the HP-41, e.g. the CCD ROM, AECROM, HEPAX, to name only a few.

I must admit that a high quality keyboard is essential for me, and this was never a problem with HP calcs up to and including the HP-48 .

You press a key, and the tactile feedback 'informs' you that the key has registered. In other words: You simply can type without checking every key stroke.

When I read things like: ...after I got used to the stiff keys, and knew I had to press very hard to have the key register... (49G+)

or people filling threads debating about the best value range for >KEYTIME to somehow get rid of

immanent key bounces (49G)

or similar then it seems people get what they deserve;-)

Regards,

Raymond

MY REASON

*Message #13 Posted by **Jon** on 23 Oct 2003, 5:28 p.m.,*
in response to message #12 by Raymond Del Tondo

Hi everybody:

I have used a Hp-42S since 1989. It is wonderful. But some time ago I bought a HP-41Cx. And, what can I say, I love it. And I am sure I will not buy a 49G+. Because I don´t like it. I don´t really need the calculator to everyday work (who needs if you have excel in the computer?). But I like playing with it. Can you imagine a calculator from 1983 connected to a modern PC?. Please, don´t compare it to the 49G+ or I will feel offended (It is a joke, of course)

Kind Regards from Spain

Jon

Re: MY REASON

*Message #14 Posted by **Ron Ross** on 23 Oct 2003, 5:39 p.m.,*
in response to message #13 by Jon

Well said.

"Please, don´t compare it to the 49G+ or I will feel offended (It is a joke, of course)"

The joke, I will infer, is the 49G+. 8o) Did I put words in your mouth??

As far as Dr. J. Kahler's post, "Why not buy a PDA, if you don't mind lousy keyboards?" That is the superiority of the calculator, and if you supply a lousy keyboard, no need to stay with the calculator, but simply buy the PDA. Once your input degrades (keyboard), you really have a fancy overgimmicked gameboy. While I like my 42s best, it suffers from lack of I/O and RAM (well, not really, but with no I/O, no use for my 32K). A 48G overcomes this barrier and I now use a 48GX almost exclusively. But it doesn't fit in a shirt pocket. Still, it has a decent keyboard, but if it didn't have that, I wouldn't use it (I never did get used to my 49, I hope the new 49G+ is better).

Re: MY REASON

*Message #15 Posted by **hugh** on 23 Oct 2003, 6:22 p.m.,*

theres a rather nice free version of 48SX/GX or 49G for the palm pilot (and possibly others?).

A reason to reconsider...

*Message #16 Posted by **Gene** on 23 Oct 2003, 7:31 p.m.,*
in response to message #12 by Raymond Del Tondo

"The 48GX has a reliable keyboard, and an OS which is stable enough that you don't need to fear a memory loss every week."

Gene: Hi Raymond!

I've had reason to use the 49G+ for the last 2 months VERY intensely, for obvious reasons.

I have not had a single crash, and I've been trying to MAKE it do that.

I think the days of a memory lost are long gone.

The keyboard is fairly reliable and a friend who has a 49G+ that is 2 months "newer" than mine cannot make the keys miss when he is trying.

You can always give it a try and see. I think it is very nice.

And, as fast as it is, even choose boxes are a joy.

Gene

Re: Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #17 Posted by **Pavel Korensky** on 23 Oct 2003, 7:24 p.m.,*
in response to message #4 by Dr.J.Kahler

For me, there are several reasons why to use the old calculators like HP-41 or HP-16C.

1. Those old machines always do, what I suppose they should do. They do not bother me with system crashes, short battery life etc.

2. Whatever they are doing, they are doing it fast and simple way. For example, I have one old HP-41 in my workshop. It is loaded with simple programs, which are usefull for everyday life (resistor divider calculations, metric-imperial conversions, some math, resistor color codes, some machinist equations, ultimate answer to the ultimate question "Should I continue to work and piss my wife, or should I go to the bed ?" and similar). With the user defined keyboard, it is so simple to use it.

3. HP-16C is a separate story. This is the best calculator for the programmer (assembler, microcontrollers etc.) and nobody did not invented nothing better. I am using it approx. 3 hours each day.

4. A bit of nostalgia and the glamour of the old, better times, when men were real men, women was real women and small furry creatures from Alpha Centauri were real small furry creatures from Alpha Centauri. Glamour of the old times, when the things was designed and manufactured to last and work forever.

Of course, I have PDA, I have several PCs. And if I need some graphs or FEM modelling, I am using PC. But when I need to do some simple calculations, I take my old HP in my hand.

in response to message #4 by Dr.J.Kahler

Your arguments are purely rational, and in that sense you are totally right (excepted that keyboard quality IS an essential quality as it is the first human interface with the calculator).

Our beloving of the 41C series is not only rational, though many actual calculators can do a better job, but also emotional. And in htat sense even being archaic it still remains a very much useful calculator.

Nope

*Message #20 Posted by **Valentin Albillo** on 24 Oct 2003, 6:42 a.m.,*
in response to message #19 by Thibaut.be

Thibaut posted:

*"Our beloving of the 41C series is not only rational, **though many actual calculators can do a better job** "*

I don't agree, at all. There aren't MANY actual calculators that can do a better job than the 41C series. Depending on the job, I doubt if there's even *one*. For many jobs, there's simply none.

"And in htat sense even being archaic it still remains a very much useful calculator. "

A fork is also archaic and I'm sure most of us find it incredibly useful and would not consider replacing it with any other gadget, however "modern" or "new".

The question is *not* if the 41C is "archaic", but whether its functionality and ergonomics are suitable for the tasks its user intends. And for many, many, many tasks and users, it certainly does.

Anyway we do agree on the main idea that the 41C series are still great calculators and that there are a lot of good reasons for continuing using them !

Not even a Sharp

*Message #22 Posted by **Valentin Albillo** on 24 Oct 2003, 12:15 p.m.,*
in response to message #21 by Thibaut

Not even a Sharp. One of the features I've always liked the most about the HP-41C series was its card reader.

The sheer fact that you could have a very powerful calculator-cum-computer plus a card holder or two with most if not *all* of your programs, all in a small, easily pocketable zip case, was amazing and invaluable to me. Main RAM could be erased accidentally or on purpose and no big deal, just take a small mag card from the holder, stuck it in the card reader slot, and there

you are, your program and/or data loaded in seconds ! Your whole program library always with you, at all times, anywhere !

That you can't do so conveniently with most any modern calculators. Yes, the 42S is faster, larger RAM, but that's no big deal if you have to enter all your programs using the keyboard. You are so aware of just how boring and painful entering programs is that you'll usually enter the ones most useful to you, then find yourself reluctant to enter any other, lest you would have to purge some to make room. Yes, the 48/49 can hold tons of programs in their largish RAM but then it may get corrupted, or erased, or whatever, then what ? Linking to a PC ? Is then a PC a 'required', vital "accessory" for the calculator ?

On the other hand, with the 41C/Card Reader you wouldn't give a second thought to purging some program to make room for another, nor would care if MEMORY LOST would appear while sleuthing synthetics. Loading an status card with the precious synthetic assignments was easy as pie. Deleting that 3-module Checkers program to load a 3-module Othello program for a quick game was done almost without thinking. Just imagine a 42S user considering doing the same !

Which is more, with the 41C/Card reader, you could even afford to lose not just the RAM, but the entire machine (say it dropped from your hand to that ravine below) and you could borrow another from your pal out there in the field, feed the card with your program and continue working, within seconds. And don't even get me started on plug-in ROM modules !!

Most Sharp models can be connected to a normal audio tape recorder via a small 'docking station' or else there are small docking stations including printer and mini-tape where the unit can be docked, but locating/loading/saving programs is far, far slower than using magnetic cards, and the docking stations themselves, though small, are many times bigger than a 41C/Card reader, and not pocketable at all.

That being so, I rest my case. There's nothing as convenient as a 41C for many taks, nor a best combination of features, excellent engineering, and usability will be achieved any time soon.

Best regards from V.

mag cards and nostaliga

*Message #23 Posted by **bill platt** on 24 Oct 2003, 12:52 p.m.,*
in response to message #22 by Valentin Albillo

Hi Valentin,

My father's friend was an aerospace engineer, and we used to stop by on out way through Connecticut when I was a kid. I distinctly remember playing moon-lander on an HP when I was, oh maybe 9. Boy was that a cool machine! I remember it had a card reader--and that was how he loaded the game. It was probably a 65 or a 67--may be even older?

That magnetic card thing really did work well, huh? I never owned one :(

On the topic of audio tape storage: In 1985, when I was in design school, we had the very beginnings of CAD for ship design---a TRS80 model II (III?) which read 5" FD's, a Timex Sinclair (1000?) and a commodore vic 16 and some other little tiny Timex. All of these (little) machines were quite clever, and could be programmed in BASIC and were good for doing things like propeller and propulsion calculations (way more than my HP 11C could handle on account of the regression tables).

BUT the audio tape thing S**KED!!! It was so unreliable. The tapes really did not safely store digital data. Stuff would just get corrupted with no warning--or worse the confuser would crash while saving down--and you'd have 3 hours of work lost!

Amazingly, the 5" floppies on the trash80 seemed so stable by comparison (but once the 3-1/2" came along, that perception changed--and now even the latter are terrible! compared to flash or CD...)

SO, How did the mag cards really compare? Were they better made (than analog audio tape)? Do they really still stack up against a storage technique such as USB Flash (Sony Microvault et al)?

Best regards,

Bill

PS, (Off Topic) you must see this video--it gives you a sense of the sheer joy of sailing--and imagine the sense of accomplishment from the designer----THAT is what I do--design things that go on the water (but not the one in the link!)--and THAT is what my HP's are really for :^)

Re: mag cards and nostalgia and lunar lander

*Message #24 Posted by **Renato** on 24 Oct 2003, 1:05 p.m.,*
in response to message #23 by bill platt

I just got my recently acquired 67 to read magnetic cards. You ask about reliability ? Well, I just read all the cards in a HP original standard pac - perfectly, not a single error.

I felt like a 9 year old kid playing lunar lander in the 67 - it is much better than others because it does not require you to press R/S after each entry.

Re: mag cards and nostaliga

*Message #25 Posted by **Valentin Albillo** on 24 Oct 2003, 1:55 p.m.,*
in response to message #23 by bill platt

Bill asked:

"How did the mag cards really compare? Were they better made (than analog audio tape)?"

Yes, certainly. To prove the point, my card reader can still read perfectly all my 24+ year-old mag cards, no errors whatsoever. For comparison purposes, most of my audio tapes that old have degraded noticeably (despite them being top-class TDK Super Avilyn tapes), not to mention my 15 year-old VHS tapes.

Which is more, though I've used mag cards thousands and thousands of times, I've never seen more than two or three bad cards in all. Same for the long, HP-71B magnetic cards. A set of then still keeps my EXTENLEX lex file after 15+ years.

"Do they really still stack up against a storage technique such as USB Flash (Sony

Microvault et al)?"

Not at all. Magnetic cards were among the costlier media, being expensive and having very little capacity. An HP-41C card would hold just 224 bytes, 112 per side. The longer HP-71B ones stored something like 600+ bytes per card, IIRC. It goes without saying that this can't compare with the typical 128 or 256 *mega*byte USB flash "hard disk" for US $25. Storing and retrieving information would be many orders of magnitude slower, too.

But the comparison isn't fair, of course. Back then, 24 years ago, there were no such devices to compete. Just very expensive floppy disk drives, bar code, digital tapes, and audio tapes, to name a few. None of them could provide the convenience and portability of mag cards, by far.

Best regards from V.

Re: mag cards and nostaliga

*Message #26 Posted by **Mike - Leavenworth KS** on 26 Oct 2003, 12:10 a.m.,*
in response to message #23 by bill platt

A little bit of apples and oranges comparison.

I have magnetic tapes that were made in the early 60's (and have had some even earlier), and can attest that they are a very stable medium, even under less than optimum storage conditions. They play music and/or voice fine each and every time I take them out, and amaze (and confuse) the children and others who see this in my office and in two rooms in my house.

HOWEVER - in the quest for the best fidelity and high frequency response in studio environments, the extremely high end tapes are another story. As the crescendo of audiophile and production interest peaked in the 1970's and 1980's, new formulas were adopted that served the SHORT TERM advertising/production/ needs, but were (still under discussion as to if known or unknown) not stable for long term storage. Good to excellant storage would protect the tapes for a few years, but over time they absorb moisture, and the "binder" (that holds the magnetic particles to the mylar tape base) turns to GOO. This is known in the industry as "Sticky Shed" or similar, and can make a MESS of recording heads and your evening of listening to old master tapes for enjoyment.

IMPORTANT - Tape is formulated differently for digital applications than for analog ones. Digital seeks a tape that will securely hold a +/- state and can consistently be changed when needed. Analog applications (like music and voice) require a tape that retains more subtle variations, and is therfor more easily "modified" by external forces from + to - or similar . Early attempts to use analog tape in a digital environment compensated for this by slowing down the data transfer rate (more tape per bit, etc.) to reduce errors rather than making their customers seek (more costly) digital quality tape.

Digital data tapes can be used for analog applications, and vice-versa. The results may be satisfactory for your needs, but most likley you will be somewhat disapointed.

SO - the HP magnetic strips were formulated differently than high end magnetic tapes for different reasons. The strips that have been reasonably protected from heat and colld, and from excess humidity can be used, almost without worry, and so can most CONSUMER tapes.

The high end tapes are another story. They are a problem, and it gets worse over time. Their musical history can be salvaged by heating the tapes in ovens (fairly low tech approach) and recorded to another medium (possibly new and "improved" tapes, most likley digital of some sort) and then saved some more or tossed out or even (WATCH OUT) sold on Ebay.

My $0.02 worth in an effort to avoid unncecessary defamation of recording tapes. As in any hobby - knowledge is power, and I hope this helps

Re: mag cards and nostaliga--Knowledge IS power

*Message #27 Posted by **bill platt** on 27 Oct 2003, 9:52 a.m.,*
in response to message #26 by Mike - Leavenworth KS

Mike,

Thank you very much for your post. Wow, I am ashamed to say that it never occurred to me that the expensive audio tapes may in fact be lower quality for archiving---

And as you say, knowledge is power---and I will add, that understanding the principles is more valuable than merely memorizing the results. (E.G. understanding that the binders have properties which may or may not be conducive to archiving).

On the topic of old audio tapes---I helped my father move to a new place recently, and we found a box of audio tapes he made of us when we were little (4 ears old)---WOW! was that a mind-bender! And they were pretty regular tapes, and they played just perfectly, even being 30+ years old! But I have Super Wiz-Bang HIFI MAXELL or TDK fancy sshmancy tapes that I made back in the 80's, of my favorite albums (Specials, English Beat, Peter Gabriel, Herbie Hancock, Grand Master Flash etc) and they are GARBAGE. And I KNOW they were not that bad the last time I heard them (15 years ago). This anecdotally supports the information you provided.

Best regards,

Bill Platt

REEL TO REEL IS COOL.... dolby sucks

*Message #29 Posted by **Norm** on 29 Oct 2003, 5:18 a.m.,*
in response to message #28 by Mike McDonald

THAT'S COOL that you keep a reel-to-reel running.

I still use the occasional cassette. (Cassette tape is poor man's reel-to-reel.... has small tape and small reels).

REEL TO REEL incredibly cool even during its golden era of the 1970's and 1980's.

BE IT DOLBY OR CASSETTE..... one thing I can assure you, straight from the Analog Electrical Engineering department.....DOLBY SUCKS!!!!!!!!!!

It's a masterful marketing coup, a tax on every cassette deck ever sold, and its LOUSY! Want to make your tape deck sound TEN TIMES better than it ever sounded before ??? TURN OFF THE DOLBY SWITCH!!!!!!

It's just a scam from marketeer wacko's like who get rid of our RPN calculator. I looked at Dolby circuits and they sound as rotten as their schematics. Use a lousy stinkin' JFET to set a variable rolloff point for turning the treble up and down according to the musical content (cute on paper, lousy in practice). True to form, its a terrible amplifier of "tape dropouts". When a bit of dirt glides over the heads, it makes it sound 10 times worse than it actually sounded in truth. Also, cannot respond quickly during transients, Dolby ruins cymbal crashes, piano notes, and other quick-attack sounds.

If you don't believe me, then you can believe Professor Emeritus Ward Helms at University of Washington, and from the master himself I do quote:

"when recording with cassette tapes, the correct position for the Dolby switch is OFF".

Re: REEL TO REEL IS COOL.... dolby sucks

*Message #30 Posted by **Ed Look** on 29 Oct 2003, 11:16 p.m.,*
in response to message #29 by Norm

Norm, what about tape hiss. It BUGS me. I know that the digital of a CD can't compare to the warm analog of a vinyl disc, but the CD does not

have hiss! (I can live with the occasional snap, crackle, and pop of a vinyl record, though... just prejudiced, I guess.) Oh, it may not count, but my 90's tape deck has blue-green LEDs (I can swear that there was no blue in those days, however!).

tape hiss is better than dolby

*Message #31 Posted by **Norm** on 30 Oct 2003, 1:40 a.m.,*
in response to message #30 by Ed Look

You say 'dont like tape hiss'.

Well, tape hiss is better than the artifacts of Dolby.

Listen, if you set the gain properly and as high as is fair, so that the signal comes close to saturation during the loud spots, the music is plenty louder than the tape hiss. And the tape hiss is smooth & even but the dolby artifacts are nasty and make the tape pretty much unlistenable.

Just make sure you set the record level high enough up. It's always bad if you dont use the full dynamic range of an audio recording system because then the S/N ratio is worse than it could otherwise be.

- Norm

Re: tape hiss is better than dolby

*Message #32 Posted by **jimc** on 30 Oct 2003, 9:58 a.m.,*
in response to message #31 by Norm

I'd like to interject a comment that some music sounds better with hiss, pops, or lp crackles. I can't imagine Barbeque Bob's voice without the crackles of the original 78's. How about Memphis Minnie? Or even Enrico Caruso or Edith Piaf. Cleaning these up might make 'em sound better to my kids, but it would lose some of the originality.

Just figgered out that there is a connection between my HP41 and my musical tastes. (to the Vapours tune: "I'm turning Luddite, I really think so...")

The worst of both worlds

*Message #33 Posted by **james (UK)** on 30 Oct 2003, 6:01 p.m.,*
in response to message #30 by Ed Look

Unfortunately, if you have my taste in music - early jazz - a lot of stuff is only available on CD but has been copied from LP so not only do you get the inherent coldness of CD but it comes with hiss, crackle and pop as well.

Unfortunately, very few cassette deck manufacturers, other than

Nakamichi, could be bothered taking compact cassette to its limit so Joe Sixpack never realised how good it could get and was easily persuaded that the new fangled silver disc was the answer to everything .....hmmm.. now what does that remind me of?

Re: The worst of both worlds

*Message #34 Posted by **unspellable** on 31 Oct 2003, 1:50 p.m.,*
in response to message #33 by james (UK)

Used to buy an LP then copy it onto a tape cassette. The results were much better than buying the pre-recorded cassette, particularly with regard to tape noise since I used decent tape. Now if I could do this at home, it dosn't say much for the quality of the commercial pre-recorded cassette.

Re: The worst of both worlds - Check This

*Message #35 Posted by **Juan J** on 2 Nov 2003, 10:27 a.m.,*
in response to message #34 by unspellable

A few years ago Thomas (was it? I am possibly wrong with the name) Dolby was interviewed in Scientific American's "Profile" section. Back then he praised how signal analysis, for some a very cryptic subject, had improved sound quality since its invention.

Back then, emphasis was also made on how scratches had been eliminated "forever" from recording and how digital processing could make sounds and music cleaner and better. Sounds convincing, doesn't it? Take a look at

http://www.vttoth.com/addnoise.htm

It turns out that some noise can improve a "pure and pristine" digital sound quality. Adding complexity or improving the format does not necessarily makes for better result or improved efficiency. What ever happened to "Practical"?

Re: The worst of both worlds - NOISE in the audio signal

*Message #36 Posted by **Norm** on 4 Nov 2003, 12:13 a.m.,*
in response to message #35 by Juan J

Many have wondered why the high-noise, high-THD environment of vinyl records, tapes, etc., sounds so much better and more natural.

Here is a pet theory. The addition of hiss is like "dither". It means there is noise in the signal that makes it wander in amplitude beyond the true signal itself.

I suspect that the total audio experience may be enhanced by the deliberate inclusion of noise. It may help the

eardrum to 'rattle back & forth' as well as the speakers, not to mention all the neurons inside of your brain.

Though never tried this experiment, I would suggest that a summing circuit which deliberately injects white noise (or what the heck... pink noise) into an otherwise pristine digital signal, would find on A/B comparisons that the inclusion of the noise makes for a radically more delightful listening experience.

Re: The worst of both worlds - NOISE in the audio signal

*Message #37 Posted by **Ed Look** on 4 Nov 2003, 1:20 a.m.,*
in response to message #36 by Norm

Are you saying that a summer's day with the window open sounds better than with the (soundproof) windows closed and and nobody home, no neighbors around, and all machines unplugged?

A silence can be deafening, especially right after somewhat loud sound. A silence can be deafening, even when your blood vessels and nerves are quiet.

Sugar is good, but when some lemon, dash of orange, ice, etc., is thrown in, it's better?

I think you have something there! The THD and background (not environmental; I think you know what I mean) noise may make a sound more "expected" and not so "die-cut" or "laser-printed", so as not to sound artificial or sterile. Hmmmm... I have thought about this a long time ago...

you pegged the meter

*Message #38 Posted by **Norm** on 4 Nov 2003, 1:58 a.m.,*
in response to message #37 by Ed Look

you pegged the sarcasm-detector. Now, now, there is no need to play devil's advocate on this stuff.

No, we didn't say to add the sound of a fire engine passing by, nor the sound of a hubcap being tossed onto a scrap metal heap. We said "dither"..... "white noise" ..... "pink noise" ..... does not equate to the sound of throwing a cherry bomb into a toilet, etc. or whatever other noises you were thinking of adding.

See the thing is, with a vinyl record, its already in there. You get it included for free. But with digital

sources, you are going to have to pay extra if you want noise added.

Frankly I'm surprised there haven't been pre-amps marketed which include a "analog enhancer" button that simply adds a noise source.

There are mechanical equivalents to this problem. Suppose you have a mechanical actuator (rudder controller on an airplane) but there is a little bit of slop in the linkage. And the whole thing is run by an autopilot, or some other feedback loop.

If the system is run under pristine laboratory conditions, you will get a "limit cycle" where it slowly oscillates and keeps bumping into its own slop-limits. HOWEVER put it into the real world, with it being rapidly buffeted by wind, control stimuli, turbulence, etc., and guess what, it doesn't make a bit of difference.

So, in all seriousness, Ed, my own belief is that a noise source added (which would sound like the hiss of a leaky tire) helps overcome nonlinearities of

(a) the speaker drivers, which are hanging on cloth, resin & plastic

(b) your eardrum, which is just a bunch of ground beef hanging on some bones & tendons.

(c) the funny little hairs in your cochlea, which bend in the breeze but perhaps nonlinearly (esp. if half of 'em are busted off from that AC/DC concert)

(d) the neurons in your head, which absolutely nobody on earth has any idea how they are wired, much less work, but they might benefit from some ongoing stimuli that exists in parallel to the signal to be decoded (i.e. the music).

KNOW HOW MAGIC it sounds when you visit a big waterfall? Kind of like you got a sensation of awe and grandeur ? Same topic. Just one more demonstration of the appeal of white noise energy to the auditory system.

Re: you pegged the meter

*Message #39 Posted by **Wayne Brown** on 4 Nov 2003, 7:40 a.m.,*
in response to message #38 by Norm

Perhaps my sarcasm meter is broken, but I

didn't detect any sarcasm in Ed's message. I thought he was completely serious.

Re: you pegged the meter

*Message #40 Posted by **Ed Look** on 4 Nov 2003, 1:21 p.m.,*
in response to message #39 by Wayne Brown

Wayne, you are precisely right.

Norm, there was no sarcasm; your (very good) post brought back a flood of feelings and memories from the days way back when I still cared much about the crossover dB of my speakers and the timbres from the cone materials, etc. Heck, I even used tons of Discwasher and worried about the (-70 dB!) rumble of a turntable.

Then CDs came around and when you're calm and even just sort of listening, you can hear a kind of nebulous quality difference between the old vinyls (and I include their homemade cassette recordings) and the CDs. Initially I really scratched my head, for heck, it's digital, right? Digital allows for much control in editing and recording and NOISE CONTROL, right? Well, son of a gun, it turns out that normal background noise is a PLEASANT thing after all! And here all us college kids were doing our best to scrub all noise out of tapes of our records. But what's Thelonius Monk (or Keith Jarrett for that matter) without the occasional mumble of satisfaction or impassioned grunt?

No, my friend, the SU meter needle (sarcasm unit... just in case; litigous society today...) stays at 0 dB. But it's funny that you said I "pegged the meter" rather than "maxed the red LEDs"! ;)

Compression on CDs?

*Message #41 Posted by **Jim Chumbley** on 4 Nov 2003, 9:22 p.m.,*
in response to message #40 by Ed Look

Just one thought. I have been a singer in symphony choruses for quite some time. Recorded music, vinyl and open-reel tape, never sounded real to me because they never were able to sound like

putting me right inside the tenor section of a great chorus. Cassette tape was much better, and CDs were astounding, except for one flaw. The dynamic range on a CD always sounds to me as if it has been "enhanced" by the mixer. What I mean is that, on CDs, from most quiet to most loud is a range that is much greater than reality.

I bought a Lexus back in 1993, and its stereo had an option on it that I have never before seen on any other playback unit. It had a "CD Compression" button on it, which amazingly lowered the dynamic range so that from max. quiet to max. loud sounded exactly like it does while singing in the middle of the tenor section. Unfortunately I wrecked the Lexus and have never been able to find another CD playback deck with a "CD Compression" button on it. Is there one? Can you tell me where to buy it?

I'm sorry not to be talking about HP Calculators, the love of my life, but I would really appreciate your help and thoughts about this audio topic.

Re: Compression on CDs?

*Message #42 Posted by **Ed Look** on 4 Nov 2003, 10:30 p.m.,*
in response to message #41 by Jim Chumbley

Sorry, I can't help on the CD player (nor the car, either!), but I was just wondering if the differences in sonic spatial imaging among these various media isn't like the difference between an image from a conventional projector and a holographic image. Given the physical limitations of most recording media materials, there must be some loss of information and in my opinion, the first aspect to be affected is the information that would help recreate a sense of three dimensionality. It's probably impossible with the old monaural techniques to do this, but stereo was a step in the right direction. But I fear that the acoustics of the playback room must also be tailored to make faithful reproduction of the

original sound.

Now calculators- even 2D (graphing) is on the edge; I can sometimes see its utility... if you're a student. But after one masters basic function plotting, most often, a more "one dimensional" approach, like just dealing with digits or even symbolic manipulations and programming may be enough (and lessens the cost of the calculator, hopefully).

even the 12AX7's Re: you pegged the meter

*Message #43 Posted by **Norm** on 5 Nov 2003, 1:11 a.m.,*
in response to message #40 by Ed Look

yah, pegged that meter movement,

and even the 12AX7's seemed to glow just a little brighter!

easy on the Discwasher fluid.. ever try brushing, with a
drycarbon fibre brush. In hindsight what should
be the best..... HEPA FILTER, and a nozzle with dry-filtered compressed air back to an oil-less compressor! No dust ! PSSSHHHT!

Re: even the 12AX7's Re: you pegged the meter

*Message #44 Posted by **Ed Look** on 5 Nov 2003, 10:27 p.m.,*
in response to message #43 by Norm

Now you're gettin' facetious: who has dry compressed air in the living room? Maybe a HEPA filter for the real bad allergy sufferers or in your Hoover, but I don't think I've ever heard, "PSSSHHHT!" in anyone's living room.

Microdust is hard to remove, though. If there is static attraction, even air may have a hard time. This is the only advantage of the 3X distilled H20. Yeah, easy on it; I don't think I can buy it anymore and I don't want to set up a

still in my living room! Anyhow, I play vinyls these days just to get a howl out of the little ones... and then I try to explain my they've got a rainbow on the bottom of the (music AND PC games) CD they rather play.

Now this reminds me of a back on topic question- what would happen to a keyboard, and not necessarily on a HP RPN beauty, in a high grit environment, like by a chalkboard or a very dusty place? I wonder if any of the surveyor guys here have any experience with grit under the keys and etc.

Norm is Analog

*Message #45 Posted by **bill platt** on 5 Nov 2003, 10:46 a.m.,*
in response to message #40 by Ed Look

Yes, but Norm likes RED LED's because they feel closer to his analog roots than the LCD's---if he had his druthers, he would have a calculator with dial read-out ;^0

Re: Norm is Analog

*Message #46 Posted by **Ed Look** on 5 Nov 2003, 10:19 p.m.,*
in response to message #45 by bill platt

Ha ha ha!

But Norm, take heart- one of the best golden oldies of the past, one of the best sci fi digests, was named, "Analog". Notice they didn't call it "Digital". We know what happened to THEM! I wonder... is there any Digital (as in DEC) left in HP since they ate Compaq, who ate DEC?

Re: Why that archaic 41..

*Message #47 Posted by **jimc** on 24 Oct 2003, 1:34 p.m.,*
in response to message #4 by Dr.J.Kahler

Again, at the risk of entering a discussion with no conclusion (and perhaps a flamebait response); I think that a couple of questions need to be asked before one suggests a product to someone.

If you need graphs, plots, built in rudimentary equation libraries, then a 49+ will probably work quite nicely. I expect a steep learning curve, though.

For pure unadulaterated (guilty?) pleasure, the 41 is a dream to work with. Does a Bugatti Royale lack because it is several years old? Hardly. When I look at the Chrysler Building, I don't think about how old it is. The Chrysler Building probably will not hold as many people as other, newer buildings, but the newer buildings lack for identity or personality. The product represents an era - and does it quite nicely, thank you - even with it's shortcomings.

Philosophically, My HP-41 is an extension of my problem solving technique and thought patterns. It has been a formative tool in my educational process. Hence, my lifelong love. Also, this explains in part, why it is so difficult for me to get along with a newer HP calculator.

Will the 49G+ have a life long partnership the way the forums' 41C have? Only time will tell, but the 49 won't with me.

Re: Why that archaic (and bad) HP-41CX ? Take the great HP-49G+ !

*Message #48 Posted by **Wouter Peters** on 24 Oct 2003, 2:14 p.m.,*
in response to message #4 by Dr.J.Kahler

With an HP41C alone you can't do graphics. But if you have a printer connected you can and your display would be much wider.

A limited amount of memory forces you to economise and optimise your programming. And even then with a 41CX you've lot's of memory compared with a 25C and even that one was capable of highly complex calculations.

Bill Gates started his DOS with a limit of 640k "Most likely one never would use software that needed more". And he was the one that lets us stuff Gigs of harddisk- and Megs of RAM into our PCs. But most of those Gigs and Megs of programs go to OS and hardly ever used features of applications and of data to big graphic or audio files. The core of calculations still use only peanuts compared to the shell around it.

Still using my 41CX but on the other hand I must say that I am very interested in the new 49g+

Wouter

*Message #2 Posted by **Raymond Del Tondo** on 22 Oct 2003, 12:52 p.m.,*
in response to message #1 by Tom Sleeves (UK)

Hi,

it's an HP-IL to serial interface, which is switchable between pure serial printer output, and serial I/O. For this some of the signal lines have to be swapped, which is done via a switch here.

Back then these interfaces were, amongst other things, used to connect HP's to surveying equipment, like total stations / theodolits.

Raymond

Eurpoean sellers...

*Message #1 Posted by **Matthias Wehrli** on 22 Oct 2003, 9:11 a.m.*

As you know I very often buy HP items all arround the world. After 3 years I have to concluse, that the easyies seller conditions are in the U.S. There I can pay through paypal what is, as I think the best way of transaction in the net. European sellers often accept bill or cash, but no payment by credit card. I wonder why... I only know some people that accept paypal or bidpay. I know, that there are fees to pay, but on a transaction bank to bank you also have to do. So this is a appeal to all european sellers to accept paypal payment. It´s free (and if you want, you can tell the seller to pay the fees)...

Matthias

Re: Eurpoean sellers...

*Message #2 Posted by **Thibaut.be** on 22 Oct 2003, 9:55 a.m.,*
in response to message #1 by Matthias Wehrli

The reason why I refuse paypal is very easy to understand : I can without any problem send money to anyone (though the fee I have to pay is totally illegal in Belgium), but cannot receive any cent.

In the past, this was possible, but you never got reimbursed when the balance of your credit card was in your favour.

Bidpay is quite similar : I can't receive any money from them.

But Western Union works fine and this is one of my preferred payment method : I don't have to wait for clearance as it is immediate.

But there are still some interesting ways to pay : the new IBAN bank account structure authorizes to send web-based banking drafts to anyone in the EU, and the fees are very low for both parties. In addition you can always track payment and know the real identity of the person who has received the money.

Hope this helped,

Gruessli,

Thibaut

Why is this here in this forum?

*Message #3 Posted by **GS Leong** on 22 Oct 2003, 12:19 p.m.,*
in response to message #2 by Thibaut.be

shouldn't this be addressed elsewhere?

Re: Why is this here in this forum?

*Message #4 Posted by **Veli-Pekka Nousiainen** on 22 Oct 2003, 2:50 p.m.,*
in response to message #3 by GS Leong

Because people want to know how to buy/sell calculators in/out/inside EU, etc. I think it's relevant information.

Re: Eurpoean sellers...

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 22 Oct 2003, 12:24 p.m.,*
in response to message #1 by Matthias Wehrli

Once you'll convince PayPal to accept italian based bank accounts I will be really happy to use it. It's three years now that, now and then, I mail them to know if/when they'll do.
The answer is always the same: we don't know; we are not planning this in the near future.

Massimo

P.S. I think I should take a swiss account...

Re: Eurpoean sellers...

*Message #6 Posted by **Matthias** on 22 Oct 2003, 3:40 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

Switzerland becomes more and more a interesting place to collect HP calculators:

- We can use paypal without problems (as seller and buyer) - We get the new calculatros for a reasonable price and we get then very fast (remember the 49G+) - We have some relevant collectors here who like to join meetings (I do not only think about me)

Matthias

Re: Eurpoean sellers...

*Message #7 Posted by **GE (France)** on 22 Oct 2003, 5:42 p.m.,*
in response to message #6 by Matthias

In Europe plastic money is not regarded as a natural extension of your arm, people are still cautious - a cultural thing. Another topic would be to explain WHY OH WHY so many sellers only send to the continental US. I wonder.

Re: Eurpoean sellers...

*Message #8 Posted by **Pavel Korensky** on 22 Oct 2003, 6:58 p.m.,*
in response to message #7 by GE (France)

This answer is easy. They either do not want to make a necessary paperwork or they do not know how to do it.

This is the answer I received from several US sellers. Also, they have problems with buyers from Europe, who won the auction, but when it comes to the shipping charges, the total price is suddenly twice more and they refuse to pay.

Eurpoean sellers...

HP 38C

*Message #1 Posted by **Paul** on 22 Oct 2003, 8:17 a.m.*

I have had an HP 38C for about seven years now and had received it as a hand me down. It came with nothing but the functioning chasis, battery door and battery carousel.

I keep hearing about a "charger" for this model in the classified section. Does anyone know what the charger is for? Is it simply a "power cord"?

If in fact it is a power cord, I may make a bid for someone selling the cord or the cord with a non functioning 38C in classifieds.

Thanks for any help you can offer.

Paul - NY, NY

Re: HP 38C

*Message #2 Posted by **Thbaut** on 22 Oct 2003, 9:05 a.m.,*
in response to message #1 by Paul

All 3X series (Spices, not recent 38 or 39) do use the same adapter. Thje connecter is similar for all models, a long square notch with 2 contacts.

This calculator can even work with the adapter and no battery pack connected.

You will easily find such an adapter by placing an ad on this site or on ebay. I you don't I think I do have a few US models for spare but because of shipping costs consider ebay as a 1st option.

Good luck !

Thibaut

Re: HP 38C

*Message #3 Posted by **DougT** on 22 Oct 2003, 12:20 p.m.,*
in response to message #1 by Paul

Hey Paul,

Go look under "Battery Packs & Chargers" on the main page for the P/N of chargers for your 38C. The "B" model chargers are preferred; per the manual (I've got a 38C, too) the "A" models won't harm the calculator but may clear the continuous memory. The manual also warns to not operate the calculator via charger without a battery pack in place. There's been plenty of discussion on the Forum on this topic before.

You should be able to score an applicable charger on eBay for $20-30 - that's what I did last year.

Regards,

Doug

Re: HP 38C

*Message #4 Posted by **David Smith** on 22 Oct 2003, 3:44 p.m.,*
in response to message #3 by DougT

Actually Spice series chargers can still be had on Ebay for $5-$10 if you are willing to do some hunting. The "B" series chargers are best for the continuous memory models (otherwise you can lose memory when plugging the charger in).

HP-34C "PR error"

*Message #1 Posted by **Frederic** on 21 Oct 2003, 10:32 p.m.*

Thank you in advance for helping me.

I have a hp-34C fully working but everytime i switch it on/off i get "PR error" and my program is erase. I clean the switch contacts and the calculator didn't switch off alone by itself anymore but i still get pr error when powering it on. What can cause this situation?

By the way, can someone gime me a tip for opening the case of this series : every time i open the case i pray that the case will resist the high pulling i give to separate the two shells (the bottom of the case is very hard to dissambled without a great great force).

Fred

Re: HP-34C "PR error"

*Message #2 Posted by **Victor** on 22 Oct 2003, 12:45 a.m.,*
in response to message #1 by Frederic

I had an HP-33C that had the same problem. It was caused when I replaced the power supply board (the board with the ribbon cable attached to the battery connectors) with one from an HP-38E. Apparently the power supply boards from the "E" series are not the same as the ones from the "C" series. No power was being supplied to the memory when the calculator is swithed off.

If your calculator does not have a power supply board borrowed from an "E" series calculator, I would suspect a bad component on the power supply board.

Re: HP-34C "PR error"

*Message #3 Posted by **Frederic** on 22 Oct 2003, 7:55 a.m.,*
in response to message #2 by Victor

Well, i replaced the battery connector and the ribbon with a 33E in good condition but not the board itself... Are the ribbon the same in a 34C and a 33E?

Re: HP-34C "PR error"

*Message #4 Posted by **Victor** on 22 Oct 2003, 1:49 p.m.,*
in response to message #3 by Frederic

As far as I know, the ribbon cables and battery connectors are the same.

Re: HP-34C "PR error"

*Message #5 Posted by **Jon** on 22 Oct 2003, 4:44 p.m.,*
in response to message #4 by Victor

I had the same problem with a HP-34C. Two of the chips were in wrong position. If you tell me the position/ reference that they have probably I can help you.

Best Regards from Spain

Jon

Tips for opening Spices (incl. 34C)

Good luck!

yes for 22 seconds!

*Message #8 Posted by **Frederic** on 22 Oct 2003, 7:22 p.m.,*
in response to message #1 by Frederic

I realize that the calculator is able to keep a program for about 22 seconds on "off". More than that i get the "PR error"; less the program is intact. What can cause this issue?

Fred

Re: yes for 22 seconds!

*Message #9 Posted by **Victor Koechli** on 23 Oct 2003, 5:14 p.m.,*
in response to message #8 by Frederic

In the C models, power has to be delivered to the RAM even if the calc is OFF. In your calc, that seems not to be the case. Turning off has the same effect on your machine as removing the battery: A built-in capacitor preserves memory for 22 seconds, then the capacitor is empty and your memory is erased.

Im not familiar with the ciruitry in the spices, but you should look for a trace (on the PCB or the flex ribbon) that supplies power to one of the chips without being interrupted by the power switch. That trace could be broken or have a bad contact somewhere. In fact, it would have to be broken somewhere between

the battery and the capacitor.

Just thinking out loud, of course...

Good luck, and keep us posted. Regards, Victor

Re: yes for 22 seconds!

*Message #10 Posted by **Jon** on 23 Oct 2003, 5:30 p.m.,*
in response to message #9 by Victor Koechli

Fred:

Let me insist. I had the same problem. I am quite sure the chips are in wrong position.

Jon

Re: yes for 22 seconds!

*Message #11 Posted by **Nelson M. Sicuro (Brazil)** on 23 Oct 2003, 5:40 p.m.,*
in response to message #10 by Jon

I think that if the chips are in the wrong position the calc cannot work (don't turn ON or display garbage) or simply fry the chips.

The power converter connections of the HP-25 and HP-25C are different, there is a path to power up the RAM even if the calc is OFF. In any case that one swaps the power converter or flex ribbon of the 25 and 25C, I think that 25C will not have the continuous memory (at last ~20 seconds powered by the backup capacitor).

Just my $0.02...

Best regards,

Nelson

Re: yes for 22 seconds!

*Message #12 Posted by **David Smith** on 24 Oct 2003, 3:04 p.m.,*
in response to message #11 by Nelson M. Sicuro (Brazil)

All the wiring on the 8 pin chips are conencted in parallel, except the one for the RAM chip has a separate line to the battery power supply. The machine will work just fine if the chips are in the wrong places. If the RAM chip is wrong, it will not get battery backup power. Only the filter cap will power it (for a few seconds). This can also happen if the RAM chip in the correct place but not seated properly.

Re: yes for 22 seconds!

*Message #13 Posted by **Nelson M. Sicuro (Brazil)** on 24 Oct 2003, 3:42 p.m.,*
in response to message #12 by David Smith

I was thinking of "wrong" as "upside-down"... not one in the another's place... You're right, the upmost chip has the vcc connection to the battery and the other two doesn't (if I recall right from my HP-32E).

Thanks for the correction!

Best regards,

Nelson

41CX schematics

*Message #1 Posted by **Michel Beaulieu** on 21 Oct 2003, 8:19 p.m.*

I already have the 41C schematics that can be found on the Museum CD set but i need the 41CX one in order to know the value of some small capacitors on the main board; where to find this information?

Thanks Michel

Re: 41CX schematics

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 8:59 p.m.,*
in response to message #1 by Michel Beaulieu

Now that you mentioned it, I was looking at the schematics also. It isn't accurate, the chip named "RAY 8024" isn't the LCD driver, is the power supply chip.

The schematics that I have is from a HP-41C. The 41CX may have another power supply design, but try to measure all discrete components and compare with the marked value on them (color-coded resistors and "cryptic" marked capacitors, you need to be familiar with that).

Old capacitors usually are the guilt.

Good luck!

Re: 41CX schematics

*Message #3 Posted by **Michel Beaulieu** on 21 Oct 2003, 9:16 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

I just change the 2 electrolitic ones without resule. Now i want to change the tiny colorful capacitor near the coil but i don't know their capacity. It written on them :

a orange one : 471

2 orange : 352

one tiny blue : 1517

There is also a small but "long" metalic component glue on a spongious tape that i don't know what it is; if i do i will be able to try another one.

Re: 41CX schematics

*Message #4 Posted by **Holger Veit (DE)** on 22 Oct 2003, 5:16 a.m.,*
in response to message #3 by Michel Beaulieu

>Now I want to change the tiny colorful capacitor near the coil but i don't know their capacity. It

written on them : a orange one : 471 2 orange : 352 one tiny blue : 1517

471 is 470pF

352 is (theoretically) 3500pF, but this is not a standard value. I think it is rather 392, which is then 3900pF.

The rule would suggest the tiny blue one is 15*10^17pF but this is nonsense, so probably better read it as 151 and a (not-well readable) letter, which stands for the tolerance. Plausible might be J=5% or Z=-80%/+20% (!). The value is then 150pF.

Holger

HP-41CV without serial number!

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 5:37 p.m.*

I acquired a non-working HP-41CV last month for parts to fix my other 41CV (leaked display). The most interesting thing is that it hasn't the serial number engraved on the back! The reserved space is there, untouched, clean and... blank! It appears to be older than mine (2214B03932, Brazil) and is made in USA. Is fullnut and the CPU board has a different layout and the front lower plate where is printed the name the letters are printed in bright reflective golden ink. The brazilian one is printed on a more "brownish" ink and not reflective.

This calc was toasted! I had to replace the CPU and display boards with my old 41CV. The display chips has the epoxy melted! What can cause this? Wrong batteries? (those of 12V x 4?)

Any information will be welcome.

Nelson

Re: HP-41CV without serial number!

*Message #2 Posted by **Raymond Del Tondo** on 21 Oct 2003, 9:53 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hi,

I can't say anything about the electrical problems of your calc, but about the nonexistent serial number.

Those 'virginal' cases were used for replacement units by HP, and could be ordered from HP by companies which made custom accessories.

For example, I once worked for a company in Germany where HP-41 cardreader housings w/o serial numbers were used as containers for RAMBoxes (Guess the name;-)

Raymond

BTW: I also have a new and empty HP-41 housing w/o serial number

Re: HP-41CV without serial number!

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 10:05 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for the help!

So what's the lowest prices for an HP49G+?

*Message #1 Posted by **Namir Shammas** on 21 Oct 2003, 4:59 p.m.*

So what's the lowest prices for a new HP49G+?????

Namir

Re: Best I've heard of is $132.00 .

*Message #2 Posted by **Paul Brogger** on 21 Oct 2003, 6:08 p.m.,*
in response to message #1 by Namir Shammas

Eric Lundgren wrote below that they're available for $130.00 at his school (wherever that is).

I paid $149.99 at H-P, but shipping and state sales tax boosted the total cost to $170.00 .

Amazon's Also Good Source

*Message #3 Posted by **Namir Shammas** on 21 Oct 2003, 11:00 p.m.,*
in response to message #2 by Paul Brogger

Amazon is selling the 49G+ for $140. You can ask for free shipping (and wait for a few extra days), and that's your TOTAL cost!!!!!

Re: Amazon's Also Good Source

*Message #4 Posted by **JohnW** on 22 Oct 2003, 8:16 a.m.,*
in response to message #3 by Namir Shammas

maybe I'm missing something, but I can't find the 49g+ on Amazon.com?

Amazon has HP49G+ AND HP48GII

*Message #5 Posted by **Namir Shammas** on 22 Oct 2003, 3:19 p.m.,*
in response to message #4 by JohnW

John,

Please check this URL:

http://www.amazon.com/exec/obidos/tg/detail/-/B0000DK662/qid=1066850257/sr=8-1/ref=sr_8_1/102-2200770-5075361?v=glance&s=electronics&n=507846

I ordered one!!

I also ordered the new HP48GII!!!!

BOTH machines are in stock over at Amazon.

Namir

Re: So what's the lowest prices for an HP49G+?

*Message #6 Posted by **David Smith** on 22 Oct 2003, 3:57 p.m.,*
in response to message #1 by Namir Shammas

Who cares? Home Depot has bags of manure for $1.00... not much difference...

C'mon! Tell us what you REALLY think! ;-) (NT)

*Message #7 Posted by **Paul Brogger** on 22 Oct 2003, 4:34 p.m.,*
in response to message #6 by David Smith

;-)

Re: So what's the lowest prices for an HP49G+?

*Message #8 Posted by **Tom Cox** on 22 Oct 2003, 7:29 p.m.,*
in response to message #1 by Namir Shammas

A Google search shows one place with a price listed of $130, but they also indicate that they don't have them currently available. 12345 to delete.

HP-41CX fullnut noise!!!

*Message #1 Posted by **Michel Beaulieu** on 21 Oct 2003, 4:35 p.m.*

I still continue searching my main board problem. I cleaned every contact, i check every diodes, condensators and resistor the best i can. I reassembled the calculator and it works great for about 1 minutes : great improvement over the 1 second i was use too...

I realize another things : in the minute of good working, nothing anormal is heard but the calculator is slowly beginning to give a distortion noise comming from what i think is the main board. When the noise is steady, the calculator stard do freegames again (about 1 minutes).

I thought it was the piezospeaker giving that noise so i removed it. reassembled the calculator and the noise is still there!!! WHAT ELECTRONIC component can do noise in the mainboard of a HP-41CX mother board?!?

Thanks for help!

Edited: 21 Oct 2003, 5:27 p.m. after one or more responses were posted

Re: HP-41CX noise!!!

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 5:24 p.m.,*
in response to message #1 by Michel Beaulieu

The only other component I think that can make a noise is a coil. But I don't know it the halfnut have one, the fullnut have one in the switching power supply.

Good luck!

Nelson

My immagination

*Message #3 Posted by **Michel Beaulieu** on 21 Oct 2003, 5:56 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

It was my immagination : when i remove the piezo, no noize can be hear... So the noise is from the piezo.

When i turn on the calc no noise (calculator 100% fonctionnal) and slowly a quiet creaking high frequency noise noise is heard mor and more continuously. a minute after, the noise get steady and calc get buggy LCD and key.

Edited: 21 Oct 2003, 5:57 p.m.

Re: My immagination

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 6:55 p.m.,*
in response to message #3 by Michel Beaulieu

It must be the power supply regulator! There is a coil in the board that is switched in high frequencies but if you can hear it the regulator can be defective (lower frequency) and the voltage may be altered (erratic behaviour).

This can be caused by a discrete component (probably a capacitor) that is too old. Can you check the components or the voltage? It can start good and drop to a altered voltage (the point that you hear the noise).

Good luck

Nelson

Re: My immagination

*Message #5 Posted by **Ed Look** on 21 Oct 2003, 10:07 p.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

I have never had or even held a 41C of any kind, but some calculators' rechargeable batteries emit oftentimes a high frequency whine. But in my cases, I had to hold the calculator somewhat close to my head to hear it.

Re: My immagination

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 21 Oct 2003, 10:12 p.m.,*
in response to message #5 by Ed Look

The battery or a battery pack? I have some TIs that uses a battery pack with two NiCD cells and a power converter with a coil. That coil can emit a high frequency noise, I think...

Regards,

Nelson

My fullnut 41CX has same problem

*Message #7 Posted by **Karl Schneider** on 22 Oct 2003, 2:41 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Nelson --

I hope that you're right about the symptoms Michel hears, being cause by a failed discrete component. My 1984 fullneut 41CX has nearly identical symptoms -- intermittently works properly, then a high-pitched ringing broken by clock pulses, key-presses causing shutoffs, and erratic display.

Perhaps www.fixthatcalc.com will be able to make this one functional for little more than the standard $60 fee. I don't mind paying them -- I'm not an electronics technician or a 41C* expert.

Re: My fullnut 41CX has same problem

*Message #8 Posted by **Victor Koechli** on 22 Oct 2003, 4:50 a.m.,*
in response to message #7 by Karl Schneider

I have acquired a pretty rotten fullnut 41C some time ago that had the same problem, but only itermittent. I eventually found out that the contact between the battery/module flex connector

and the keyboard PCB was the problem. Repeated thorough cleaning of this contact with contact spray has finally resolved the issue, the machine now works pefectly.

I found this out because a) the same problem occurred with this calc after I had exchanged the main PCB with a known good one, and b) because I could cause or prevent this behaviour by pressing the case halfes together at various spots near or between the ON/USER and PRGM/APLHA switches.

I guess the other contact (between keyboard PCB and main PCB) could cause similar problems, plus a few others. I'd try to get these as clean possible.

Hope this helps, and keep us posted!

Cheers, Victor

What's the black conductive stuff in Pioneer keyboards?

*Message #1 Posted by **Paul Brogger** on 21 Oct 2003, 2:57 p.m.*

I'm attempting repair of a couple of Pioneer keyboards. (Taking 'em apart isn't so hard -- getting them stuck back together may be interesting!)

I've diagnosed at least one problem: the matte black conductive "dots" inside the mylar (or whatever) dimples on the bottom row have worn through under oft-used keys. It's deposited itself among the black interlaced "fingers" imprinted on the facing contact sheet.

Cleaning the contact sheet fingers with alcohol went nicely, and seems to have rejuvinated a formerly "dead" 32SII and a 42S. But the dimple dots have visible wear, with some areas lacking the black stuff entirely. Keypress detection for these keys is intermittent, at best.

An obvious solution is to replace the dimple sheet with a better one. But as you might imagine, these things are in rather short supply. Because the plastic itself seems in relatively good shape, I'm wondering whether I can re-coat the inside of the dimples with something adhesive, flexible, durable and conductive. (I assume all those properties are required, as well as perhaps some others I haven't come up with.)

Does anyone have any idea what the flat-black carbon-looking stuff is that is used to effect contact inside these Pioneer keyboard assemblies?

Any info or ideas re: substitutes will be appreciated!

Thanks.

Re: substitutes

*Message #2 Posted by **Renato** on 21 Oct 2003, 8:30 p.m.,*
in response to message #1 by Paul Brogger

Paul,

I have not tried, but I think Caig´s Gold Pen would be a good candidate for fixing the "dots" - Newark had it. I have also found a dark grey conductive ink here in Brazil - it is graphite based, and after dry it looks very similar to the dots in the 48G keyboard mylar.

Good luck,

Renato

Re: substitutes

*Message #3 Posted by **David Smith** on 22 Oct 2003, 3:50 p.m.,*
in response to message #2 by Renato

The Caig Gold Pen is just a contact cleaner/corroison inhibitor. It will not restore a missing conductive

thingy.

HP 25C keyboard repair

*Message #1 Posted by **Victor Koechli** on 21 Oct 2003, 12:10 p.m.*

Hi all,

I have a HP 25C whose keyboard PCB has come off, and now I'm confronted with the necessity to put it back on. What's the best way to do this, i.e. can I somehow 'redo' the heatstaking that keeps the PCB in place?

Thanks for any helpful suggestions, Victor

Re: HP 25C keyboard repair

*Message #2 Posted by **Thibaut** on 21 Oct 2003, 1:25 p.m.,*
in response to message #1 by Victor Koechli

Hi Victor,

If you need some spares, I have a dead 25.

Best regards,

Thibaut

Re: HP 25C keyboard repair

*Message #3 Posted by **Victor Koechli** on 22 Oct 2003, 4:20 a.m.,*
in response to message #2 by Thibaut

Would that be a 25C? Because the machine I'm trying to reanimate is a 25C...

Thanks, Victor

Re: HP 25C keyboard repair

*Message #4 Posted by **David Smith** on 22 Oct 2003, 3:51 p.m.,*
in response to message #3 by Victor Koechli

The HP25 and 25C use the same keyboard. Only difference is in the "HP25C" and "Continuous Memory" labeling.

Re: HP 25C keyboard repair

*Message #5 Posted by **Victor Koechli** on 23 Oct 2003, 5:04 p.m.,*
in response to message #4 by David Smith

Yes, I know that, but the 'Continuous Memory' writing is just so cool...

Anyway, Thibaut, what about that dead HP 25 of yours? Is its keyboard intact?

Thanks, Victor

Where can I get a 49G sliding cover?

*Message #1 Posted by **gifron** on 21 Oct 2003, 10:44 a.m.*

Anyone know where I can get a replacement?

Re: Where can I get a 49G sliding cover?

*Message #2 Posted by **Raymond Del Tondo** on 21 Oct 2003, 12:56 p.m.,*
in response to message #1 by gifron

maybe try to get a dead 39G/49G from eBay?

Alternative: Buy a 49G+, which comes which comes with a serious leather case ;-)

Raymond

Re: Where can I get a 49G sliding cover?

*Message #3 Posted by **Tom** on 21 Oct 2003, 1:02 p.m.,*
in response to message #1 by gifron

The 49G and 39G use the same sliding cover. So one answer would be to buy a 39G on eBay (available new for $20-25 plus shipping). A little expensive for a cover, but then you have a great back-up calculator (without cover!), equivalent to the TI-83. Maybe somebody else has a much better solution.

HP41CV / CX interfacing with MCUs [LONG]

*Message #1 Posted by **Giuseppe Marullo** on 21 Oct 2003, 9:42 a.m.*

Hi to all, I would like advice on purchasing a 41CV or CX model. I would like to build some HP-IL interfacing circuits to communicate with MCUs like pic and DSP.

I would like to know useful tips in choosing a good one, common pitfalls and mistakes.

What does it mean halfnut, fullnut, which one is best and how can I check which is which.

Is there a firmware revision better than others, and the like.

I would like advice on how to succesfully interface using the HP-IL module, I am not sure about what to look for.

Minimum - HP41CV or CX. Is that worh getting a CX instead of a CV?

- eurocharger (Italy 220V/50Hz) or at least a power cord

- HP-IL interface module (82160A or 82401 ?).

- HP-IL cable to get the IL connectors.

- HP-IL expansion ROM or HP-IL DEVELOPMENT ROM . Not sure about this, which one, if any is necessary to control a HP-IL bus?

Nice to have: - A magnetic card reader (even broken) to host some circuitry

- 82164A HP-IL/RS-232 May be useful to transfer programs between computer and the hp41? I would like to know alternatives that works, this seems a little expensive unit to get.

Is it correct, or am I wrong? Am I missing something important and/or useful?

Giuseppe Marullo

Thanks in advance

giuseppe.marullo@iname.com

P.S. please I need a quick answer time goes by...

Re: HP41CV / CX interfacing with MCUs [LONG] come on!

*Message #2 Posted by **Giuseppe Marullo** on 22 Oct 2003, 10:35 p.m.,*
in response to message #1 by Giuseppe Marullo

Nobody willing to help? I won a auction so now I have a HP-41CX halfnut (in a few days).

I am sorry if I did't do all of my homework before posting, but now I know a little more, even major part of

infos is still missing. TIA,

Giuseppe Marullo

Re: HP41CV / CX interfacing with MCUs [LONG] come on!

*Message #3 Posted by **Christoph Klug** on 27 Oct 2003, 7:38 a.m.,*
in response to message #2 by Giuseppe Marullo

Dear Giuseppe,

for hardware interfacing solutions with HP41 take a CX model plus IL-Module plus EXT-I/O Module and the HP82166A IL-Converter. The last unit gives you a parallel 8 or 16 bit port and some handshake lines for interfacing your external hardware - for example a PIC. Some more details, hardware circuits and software routines you find in the I/O-board manual (over 300 pages)and the IL2000 manual (150 pages).

Best wishes from Germany - Christoph Klug

49g+ stunt calc in photo (long)

*Message #1 Posted by **Eric Lundgren** on 21 Oct 2003, 12:56 a.m.*

Hey, yep...still sitting here in the lab trying to do my homework, with occasional staring/gazing bouts at the sealed 49g+ on my desk...why don't I open it?? Oh, well you know, the '7' key looks like someone jabbed it crooked with a pencil. I can't believe I missed that in the store!! Arghh..so anyway, in my staring, I noticed that the calculator in the hand of the guy featured on the package isn't really in his hand, but looks superimposed, hahaa, folly. Oh, he's holding a real set of blueprints in the other hand, but no real calc. Hey, if you have seen it, it makes me think of star trek, "capt, I'm getting strange readings..wait there's nothing in my hand!" Or is it a garage door opener..heh heh.

Ok, enough of that, I am eager to use my new calc, just gotta wait to go back for an exchange in the morning. They won't take opened packages, and claimed that they've had nearly 200 returned 10bii+ (is that what its called?) already...though, if its rpn I think it just might be uninitiated college students who didn't see that brickwall on their radar...

I'm in deep envy of those of you who can already use your machines!! Ok, back to fracture mechanics for now.
Eric

Re: 49g+ stunt calc in photo (long)

*Message #2 Posted by **Joesph** on 21 Oct 2003, 1:34 a.m.,*
in response to message #1 by Eric Lundgren

agreed, it is a fake picture for sure.

Re: 49g+ stunt calc in photo (long)

*Message #3 Posted by **David Brunell** on 21 Oct 2003, 1:55 a.m.,*
in response to message #1 by Eric Lundgren

I always laugh at the dweeby-looking people that marketing types come up with for product promotion photos. Can the photo look any more contrived than it already does? Is the guy on the left "dancing the Egyptian" or relating his latest surfing story? And when is the last time you saw a couple of civil engineers in suits? Don't go anywhere without your safety glasses and hard hats, either! We wouldn't want anyone to get hurt when that guy's keyboard stops working and he hurls his 49g+. ;)

41CX LCD viewing angle

*Message #1 Posted by **David Brunell** on 20 Oct 2003, 11:16 p.m.*

I have a 41CX halfnut from 1985 which has mediocre display contrast when viewing at 90 degrees but good contrast when viewing from below (such as when it is on a desk in front of you). I don't see this behavior on my 41C or CV fullnut. Is this normal for some 41's, or my LCD dying?

Thanks,

David

Re: 41CX LCD viewing angle

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 20 Oct 2003, 11:51 p.m.,*
in response to message #1 by David Brunell

I have a HP-41CV fullnut, the contrast at 90° is very good (it has a great viewing angle).

The display uses different voltages generated by a regulator chip in the fullnut, in the halfnut I really don't know. If you open it try to check all contacts.

Best regards,

Nelson

Re: 41CX LCD viewing angle

*Message #3 Posted by **Karl Schneider** on 21 Oct 2003, 1:59 a.m.,*
in response to message #1 by David Brunell

David --

On loan, I have a 1987 halfnut 41CX with the very same display problem. The unit is also somewhat sluggish in its response, and shows signs of having been dropped or banged against something.

My own 1986 halfnut 41CV exhibits neither problem, and is cosmetically and functionally perfect.

Low internal voltage due to damage or broken circuitry?

Re: 41CX LCD viewing angle

*Message #4 Posted by **Ángel Martin** on 21 Oct 2003, 2:53 a.m.,*
in response to message #1 by David Brunell

Halfnut models are capable of changing the contrast settings, but unfortunately HP never got to update the function set to include control on this, so you'll need a (EP)ROM with the function actually implemented.

Or if you can key in MCODE, this is the rutine that will do the work. Input the contrast value (from 0 to 15) in the X register, then execute the function.-

094 "T" 013 "S" 012 "R" 014 "T" 003 "C" 0F8 READ 3(X) 38D ?NC XQ 008 ->02E3 0A6 A<>C S&X 130 LDI S&X 010 CON: 16 306 ?A<C S&X 01F JC B8BC +03 085 ?NC GO 0A2 ->2821 270 RAM SLCT 3F0 PRPH SLCT 0A6 A<>C S&X 168 WRIT 5(M) 3E0 RTN

Best, ÁM.

Re: 41CX LCD viewing angle

*Message #5 Posted by **David Smith** on 21 Oct 2003, 4:23 p.m.,*
in response to message #1 by David Brunell

This is how all HP41 machines behave. Fullnuts were designed to look best straight on, halfnuts at an angle.

Re: 41CX LCD viewing angle

*Message #6 Posted by **David Brunell** on 21 Oct 2003, 10:29 p.m.,*
in response to message #5 by David Smith

Thanks everyone! It's nice to know there's nothing wrong with this calc. It would still be nice to have a way to adjust contrast. What's the path of least resistance to being able to write and execute MCODE?

HP 49g+ Warning

*Message #1 Posted by **Michael** on 20 Oct 2003, 10:13 p.m.*

I received my HP 49g+ today and opened the manual to see how to put the memory battery inside. I followed the illustration in the book pushing down on the plastic piece with a pen while sliding the door off. The pen broke off the plastic retainer, Be very carefull when installing battery, plastic brakes VERY easily !!!

I think I hold a world record for breaking a 49g+ :(

Michael

Re: HP 49g+ Warning

*Message #2 Posted by **Ed Look** on 21 Oct 2003, 12:09 a.m.,*
in response to message #1 by Michael

Thanks for the warning.

I'm many of us, even we hardened, experienced HP calc nuts have broken a battery door or chipped a case.

It always feels bad, though worse when it's new. I am very sorry this happened to you. But because the calc is so new (not all resellers have it yet!), maybe if you contact HP, you can get a new battery cover.

Re: HP 49g+ Warning

*Message #3 Posted by **Bob** on 21 Oct 2003, 10:10 a.m.,*
in response to message #2 by Ed Look

I would probably contact HP and first ask for a free replacement door, rather than buying one. Since it was a new calculator and you were almost certainly handling it gently, it might have been a void or flaw in the molded plastic piece. (Examination of the fracture under a magnifying glass can sometimes be helpful in this effort)

Small areas in molded parts are sometimes diificult to fill with the polymer during the molding operation. They might appreciate knowing this is a part that is prone to failure. It could be an under-designed part or a start-up problem.

Now, if you were fumbling, tearing at the packaging, and being ham-handed due to the excitement of actually seeing a new RPN HP (and who among us could blame you ?)it might actually be your fault. You will have to judge.

Good luck

Re: HP 49g+ Warning

*Message #4 Posted by **Michael** on 21 Oct 2003, 1:28 p.m.,*
in response to message #3 by Bob

Thanks guys, I didn't break the door, what I did break is in the battery compartment itself it's a small black plastic protrusion that helps hold the door in. It does seem to be secured but I will use some tape to secure it.

Re: Do you think it's repairable?

*Message #5 Posted by **Paul Brogger** on 21 Oct 2003, 1:36 p.m.,*
in response to message #4 by Michael

I haven't got a 'G+ yet, so I don't know what kind of plastic is used in its case, but someone here recommended methylene chloride for fixing broken plastic, and I've found some that works *really* well.

What I found at a hobby shop (flying airplanes, R/C cars, plastic & balsa models, etc.) is called Ambroid "ProWeld". While it's apparently not "pure" methylene chloride, it does contain a substantial amount, and it is wonderful for fixing broken plastic -- even pieces that must tolerate some stress.

It certainly won't work for ALL plastics, nor in all situations, but you may wish to try it . . .

Is this the "great" 49g+ we've been waiting for?

*Message #1 Posted by **Eric Lundgren** on 20 Oct 2003, 10:02 p.m.*

I was surprised and happy to find the 49g+ in my bookstore tonight...and it was only 132.00! So, I bought one, and sit here in the library in awe...the '7' key sits like a lifted pickup with one flat tire! The policy is open=permanent sale, so...guess I can't afford that risk, gotta go play with one at fry's...

Too bad, the machine looked great in the dim light of bookstore...

eric

Yes, it is . . .

*Message #2 Posted by **Paul Brogger** on 22 Oct 2003, 11:32 a.m.,*
in response to message #1 by Eric Lundgren

Well, I don't know about *great*. It's too soon to say. But it sure looks nice. (Same image, but over twice as big: nearly 1 Mb.)

(Sorry about your "7" key, by the way. I hope you get a suitable exchange.)

The ROM upgrade went well -- read *everything* in the upgrade instructions before starting. Note that the messages & prompts won't read *exactly* as documented, but they're close enough. And you may want to practice the paper clip "reset" first, just to get the feel of it.

The USB cable and connectivity software seem to work, and the program offers clear, helpful prompts. Note that, for some reason, downloading (for example) a .txt file is a different process than backup & restore, and while doing the latter the download/upload options are not active in the Conn4x menu. Just disconnect the backup/restore connection to make the down/upload options available.

I note that the calculator face and screen seem to be plastic, and hence *will* show wear over time! (I've a Casio wristwatch that I *thought* was entirely stainless steel when I bought it -- now I can see the gray plastic case beneath its once deceptive silvery finish.) So, you collectors, buy a second unit and don't use it! Also, I think putting the calculator in the case facing the front may be a good idea, to minimize scratching by the metal magnet clasp on the hinged case cover.

And, by the way, isn't this the *best* standard case ever provided with a calculator? I don't know of a better quality one, though I grant it is a bit bulky.

But the keyboard isn't perfect -- it does miss keystrokes -- some keys worse than others. It is amazing -- my cheapo little HP-10Bii has (so far, at least) a more reliable keyboard!?!? I like to believe it will be more consistent when it gets "broken in", but I'm not holding my breath.

All in all it is, I think, an elegant unit and a credible attempt to reestablish a presence.

Re: Yes, it is . . .

*Message #3 Posted by **Ed Look** on 22 Oct 2003, 7:13 p.m.,*
in response to message #2 by Paul Brogger

Gee, it looks THIN! Is it the width of a Pioneer or a Charlemagne (48's, 38G, 39G)? Or does it look so thin only because it's long?

It's Thinner front-to-back -- and what's it's "code name"?

*Message #4 Posted by **Paul Brogger** on 22 Oct 2003, 7:39 p.m.,*
in response to message #3 by Ed Look

If by "thin" you mean front-to-back depth, yes, I think it does indeed have a slightly lower profile than the 48G, etc.

It appears slightly wider (side-to-side), however, and that probably emphasizes its thinness.

I don't have a Charlemagne at hand for comparison just now, but I was able to zip up the 49G+ my 48G's nylon case -- the increased width compensated for the decreased depth, and so it was a snug fit. (Length-wise, top-to-bottom, I'd guess they're the same.)

By the way, the fancy case is rich, supple, textured vinyl, with a fuzzy lining and a magnetic closure. Classy, but not actually leather, so use the Armor-All, not the lanolin.

Also, I entered "3" and started pushing X^2 . . . about 15 times or so. (I had to wait for each operation to finish before I could enter another one.) Anyway, I ended up with an integer with almost 63,000 digits(!) before giving up. I suppose I might have continued at least once more, but the last multiplication took something like two hours!

Not having had a 49G, some of these features are new to me!

Aaaaannnnddddd . . . Speaking of "Charlemagne", does anyone know what the code names are (if any) for H-P's new calculator lines?

Re: It's Thinner front-to-back -- and what's it's "code name"?

*Message #5 Posted by **Ed Look** on 22 Oct 2003, 9:58 p.m.,*
in response to message #4 by Paul Brogger

Hmmmm... verrry interesting!

No one has even mentioned that it has one!

I wonder if this is not because the codenames were more a cultural artifact of the original American or Australian-based designers. By "cultural", I mean that of a small group, as in "corporate culture", but much more local than that.

I suppose the Kinpo people do look at things differntly...

3421 Control Module for HP-41C

*Message #1 Posted by **Jeff** on 20 Oct 2003, 5:50 p.m.*

Can anyone tell me what a 3421 Control Module does on the HP-41C? I have never seen this one before. Currently on e-bay.

Re: 3421 Control Module for HP-41C

*Message #2 Posted by **Raymond Del Tondo** on 20 Oct 2003, 7:56 p.m.,*
in response to message #1 by Jeff

I don't have one of these, but AFAIK the module is intended for use with the HP-3421 Data Acquisition/Control Unit .

HTH,

Raymond

Re: 3421 Control Module for HP-41C

in response to message #2 by Raymond Del Tondo

It contains programs fro controlling the HP-3421 data Acquisition unit. This unit is an old HP instrument that can be interfaced either HP-IL, HP-IB, or RS-232 and has cards that cna connect to the outside world (volts, frequency, etc.)

Re: 3421 Control Module for HP-41C

*Message #4 Posted by **Philip** on 20 Oct 2003, 10:24 p.m.,*
in response to message #1 by Jeff

What is the item number on eBay for the item, I haven't found it? I'm asking because I know there is another ROM that was created by HP that shows up as either "CONTROL" or "MONITOR" with a CAT2 that was used for internal testing in particular with HP-IL devices. I believe it mimics most of the HP-IL Development ROM functions. More than likely the eBay listing is for the HP3421A Data Acquisition and Contorl ROM is it labeled.

Re: 3421 Control Module for HP-41C

*Message #5 Posted by **Karl Schneider** on 21 Oct 2003, 2:42 a.m.,*
in response to message #4 by Philip

The eBay auction number is 3053369397 - a fullnut 41CV with Time Module and the 3421 Control module. I would suspect that the Time Module was acquired for providing inputs to the 3421.

I didn't know what the 3421 was either -- I thought it might be a rocket-launch game: "4-3-2-1 Mission

Control"

Re: 3421 Control Module for HP-41C

*Message #6 Posted by **Tracy Vermeyen** on 20 Oct 2003, 11:25 p.m.,*
in response to message #1 by Jeff

I have used one of these ROMs and it says "3421 Control" on the ROM case. The HP 41C CAT 2 commands shows "--INST 1B--" The ROM contains many programs which control the 3421A via HP-IL. Some of the more useful programs is the Data Logger (DL) which allows the user to setup complex data logging applications that acquires data from multiple channels and output data on digital tape and/or thermal printer. The ROM also came with two HP-41C keyboard overlays - one for the DL program and another for a Front Panel (FP) program which allows you to measure (V, Ohms, Freq, Temperature.

I hope this information is useful. I think it is a useful ROM especially if you are a novice at interfacing with HP data acquisition systems. If you have any additional questions, feel free!

PPC-ROM Ebay prices down again

*Message #1 Posted by **Malden** on 20 Oct 2003, 3:02 p.m.*

The PPC-ROM prices are at reasonable level again. Fortunately! They ranged between $350 and $450 two months ago. Now I saw twice around $160 and now $113, all in perfect condition with perfect manual and pocket guide.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3051383863&category=11713

... happy those who did not ran into Ebay trap ...

Right now I´m looking for Bruno Maignan from Texas. I payed him my Paypal money for an HP17B calc plus mail expenses and I´m ableto conclude our exchange. No replies to my emails, other than "this account will not accept messages from you" and no other direction that I can try to reach. Is there any other means to reach Mr Bruno ? Does anyone know him ?

in response to message #2 by jose goncalves

I bought a lot of 20 calculators through Ebay from Bruno Maignan in March. Transaction went fine. In fact, He accidently sent me a box with only the hard calculator case in it for one of the machines; when I notified him, he sent me TWO machines of somewhat greater value.

More recently, on October 10, I won his auction for a Si IC wafer. I haven't received it yet, and haven't heard anything from him about shipping it. He did answer the "Ask seller a question" query I sent him on about October 4.

FWIW... Larry

Re: PPC-ROM Ebay prices down again

*Message #12 Posted by **F.R.Muller** on 21 Oct 2003, 7:28 a.m.,*
in response to message #11 by Matthias

Also ZENROM is cheap again! I remember prices around $600 maybe a year or half a year ago. Now you get it for $108.50, only, with following stuff (ended auction!):

1. 1 Zenrom 1 plug in module. 2. 2 keyboard overlays. 3. 2 quick reference cards for synthetic programming. 4. 1 instruction book for synthetic programming and machine language programming that came with the module. 5. 1 book HP-41 Synthetic Programming Made Easy by Keith Jarett. 6. 1 book Synthetic Programming on the HP-41c by W.C. Wickes.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3051384485&category=11713&rd=1

I think that this price is MAXIMUM reasonable for a 4k only ROM (no 8k, no RAM, nothing!).

I believe that all prices for HP calculators are going down again now. Like stock market dynamics.

It is very dangerous to invest in HP calcs because maybe there will be less people buying these calcs in the future. It's like very dangerous stock options. I do not understand people that buy Zenroms or PPC ROMs for $300 or more, crazy!

Frank

Re: I agree

*Message #13 Posted by **RR** on 21 Oct 2003, 9:28 a.m.,*
in response to message #12 by F.R.Muller

I agree. This is purely a market for collectors and hobbiests, all others need not apply. Many of Hp's products skyrocketed simply because there was nothing compariable left on the market. The Hp32s is an excellent example. Now that the 33s is in sight and will be available shortly, people (users and uniformed) are willing to wait rather than pay over $200

for a pocker RPN scientific (whether this is really smart or not, ie, if the 33s is of the same quality as the Hp10BII, the 32s will still be the calc to own). If the 33s were a $30 calculator, I would overlook a slight drop in quality, if it is $60, I expect Hp32s type quality, nothing less (and I suspect I will be disappointed)!

But users actually influence this market as much as collectors, because, these Calculators are STILL the right tool for the job. True a PDA can have all the functions of our beloved Hp's but none come with the keyboards that we demand.

48GX is up a lot

*Message #14 Posted by **bill platt** on 21 Oct 2003, 10:39 a.m.,*
in response to message #13 by RR

3 months ago, it was easy to buy a 48GX for $75 to $100 USD. Now, I just did a survey and found the price is more from $115 to more than $200.

So, market forces are very product specific. Perhaps this is just a "lull" in the 41 market.

Re: PPC-ROM Ebay prices down again

*Message #15 Posted by **Ángel Martin** on 21 Oct 2003, 7:45 a.m.,*
in response to message #11 by Matthias

"RPN LIVES ON"? I don't think so...

*Message #1 Posted by **W. Bruce Maguire II** on 20 Oct 2003, 2:17 p.m.*

In my semi-monthly ;-) visit today, I saw Gene's post about the new articles posted on HP's calculator site. I had some trouble downloading some, and while I was staring at the page, I saw the "News from the GM: RPN LIVES ON" snippet right under the smiling guy's picture (he must be pretty proud of himself---with his picture on the main page, and again at the top of his "message"). *I'll bite*, I thought. So I went to the page, and I saw this in the first paragraph:

> Quote:
>
> HP is dedicated to its unique Reverse Polish Notation (RPN) entry mode...The HP 49g+, our most powerful scientific and engineering graphing calculator, has the familiar "Enter" key - revealing its RPN heritage.

I got kind of excited (HP nerds are like that)! Wow, *"...has the familiar "Enter" key..."!* I thought I had seen a picture of the 49G+, but I didn't remember it having a *real* Enter key! I'll buy one, if it really has the Enter key where it belongs---not just throwing RNP a really-small bone like we saw on the 49G...

Well, you know the rest! I quickly zipped over to the 49G+ page, and enlarged the picture...and to my real disappointment, I saw that the "familiar Enter" key, was *not*, in fact, familiar; it was the same pathetic b*stard son that it was on the 49G. HP's not "dedicated to...RPN"! They're dedicated to their marketing department and nothing else. They'd drop that "RPN" in a heartbeat if they thought the result would be more appealing to students!

I'm really beginning to dislike Mr. GM! He's awfully full of himself, and he's awfully wrapped-up in the glorious HP past---as evidenced by the "familiar" Enter key on the 49G+! As we all know, the trouble is that the current Kinpo/HP calculators have *absolutely* no connection to their wonderful ancestors. Oh well. I'm not really *too* mad or upset; I really did give-up on HP a while ago---when they killed all the good calculators to replace them with the new crap.

A final question: Does Mr. GM *know* that he's shovelling B.S.? Or does he really believe it? I guess that boils down to: Is he an unscrupulous swindler, or is he just stupid?

Bruce.

Re: "RPN LIVES ON"? I don't think so...

*Message #2 Posted by **Ed Look** on 20 Oct 2003, 2:33 p.m.,*
in response to message #1 by W. Bruce Maguire II

I agree in essence, but have to differ on a few points. I don't think they can sell enough to make profit of the original style RPN scientifics we grew up with. Valentin Albillo believes that teaching RPN to today's students is not profitable, neither for them or manufacturers of calculators. He has a point. RPN's efficiency, born of the old expense of RAM, is initially counterintuitive (like riding a two wheeled machine or getting into a large body of water, though once you learn it...) and kids today... well, they're fed color graphics, flashy cases, beeping noises (my 48G's still scare me when they go "beep" when I screw up), and mostly, they suck at math

(and science, and language, and history, but two of the latter may not matter with regard to HP calcs).

I'm not sure it really matters substantially if HP no longer has in house calculator manufacturing. I'm not sure the American labor and management is capable of or willing to achieve what it used to, in terms of quality. Of if so, any of us could really afford to buy the product.

I forgot who, but another poster here said that even if these new calculators are nothing compared to the old RPN babies we nursed (rather, nursed us through school), if it helps to get HP back on track, then it's a welcome step in the right direction.

Mine is still in the mail, but from what I've seen of its specs, the 49G+'s design was well thought out, unlike the affordable, but apparently rush-designed algebraic models they released in recent years, after the original 49G.

Re: "RPN LIVES ON" (and is doing quite well, thank you)

*Message #3 Posted by **Paul Brogger** on 20 Oct 2003, 2:43 p.m.,*
in response to message #1 by W. Bruce Maguire II

I don't think it's as negative as all that . . .

I'm sure it takes a significant investment in design, implementation, testing, and documentation to offer a second mode of operation. It would have been much easier for HP had they gone ahead & dropped RPN altogether.

Given the state of things for the last several years, I'd say things are looking about as good as might be expected, small "Enter" key notwithstanding.

We could all come up with things *we* might have done differently, and I suppose changes to the keyboard layouts on the newest models would be high on the lists of many folks who frequent this Museum.

But pay attention to the basics: new RPN-capable models are being made available, with features like SD card memory and USB connections. Pooh-poohing that is like throwing the baby out with the bathwater.

I don't really mind the new ENTER key

*Message #4 Posted by **bill platt** on 20 Oct 2003, 3:08 p.m.,*
in response to message #1 by W. Bruce Maguire II

Hi Bruce,

...And a new user does not care at all! Come on, remember the voyagers--they have a different position. HOw about the move of the aritmetic operators? (from woodstock to voyager) Like, this ENTER key fixation is going a little too far. Heck, on my 48, I use SPACE more than ENTER anyway--it's right next ot the numbers!

But then again, last week I said I would WAIT before buying on account of potential bugs.....

Best regards,

Bill

Re: "RPN LIVES ON"? Don't get me started.

*Message #5 Posted by **Ron Ross** on 20 Oct 2003, 3:13 p.m.,*
in response to message #1 by W. Bruce Maguire II

I would love to refute your RANT of HP. But I can't.

As others have said, just be glad we get crumbs from Carly's table. Hp published its board members and their portfolio's. Less than half were of technical backgrounds (and that is probably generous), to me that says volumes for a sceintific company. Carly herself is a History Major, now running what used to be a Creme de la Creme Tech Company. Now we have a marketing company existing and trading off the great heritage that once was.

Hp supposedly bought out Compaq, but check out who is there and who is GONE! Aside from Carly (she sold out the Hp Brass, who probably deserved the shaft anyway), a greater percentage are Compaq. Sounds like a deal was made to me.

If I were buying out a company, I would can their execs over mine (if I had competent ones, Within Hp that might be debatable).

I will end my RANT before I have a heart attack or start frothing at the mouth.

With this background, I think we have to be happy to still get RPN calculators. ACO was shut down right after Hp bought Compaq (can't have calculators compete with ipaq's can we?). With this philoshpy rampant, we are very lucky to get a new calculator. I would still like to see a 42s capable calculator with 32K or MORE RAM and I/O. To hell with the exams, make something for the professional. A real pocket calculator on par with the business professional's Hp 17B, not the wimpy 33s.

Sorry, I Rant again.

(. . . but it says "INPUT" . . .)

Re: 10BII's ENTER Key

*Message #14 Posted by **Raymond Del Tondo** on 20 Oct 2003, 7:37 p.m.,*
in response to message #13 by Paul Brogger

...but it does what it should: ENTER ;-)

Re: 11 Calculators By Year End?

*Message #15 Posted by **Raymond Del Tondo** on 20 Oct 2003, 7:46 p.m.,*
in response to message #12 by Mark Hardman

Interesting thing is if you click on the 'click to enlarge' area for the 19BII+xyz@...

To my surprise it shows a 'classic' 19BII then, which isn't a disappointment, however...

Raymond

BTW: the 'names' of the current 'hp calcs' tend to get somewhat lengthy. It was much nicer when one could abbreviate the calc's name by a simple C, CV, CX, or SX, GX ;-)

Re: 11 Calculators By Year End?

*Message #16 Posted by **Jim Chumbley** on 20 Oct 2003, 7:12 p.m.,*
in response to message #10 by Patrick

Well, the -49g+ operates in Algebraic mode by default, so that would make as the 11th calculator the roughly 2.7% of -49g+s whose owners will go to the trouble to change modes to RPN. By the way, it takes a minimum of FIVE carefully pressed keystrokes to place the machine into the operating mode about which we are promised that "HP is dedicated to its unique Reverse Polish Notation (RPN) entry mode...The HP 49g+, our most powerful scientific and engineering graphing calculator, has the familiar "Enter" key - revealing its RPN heritage." Yep, the promise is there all right. It's just too bad that it takes FIVE very unintuitive key depressions to begin to realize on what very shaky ground that promise is based. "Ya wanna use RPN? Sure! It's easy, see. Just press the MODE key, and then the CHOOS key--no, look in the bottom of the window--that's right, and then the DOWN key--no, it isn't labeled; it's the round button that has the down-looking arrow on it, then the OK key once, and then the OK key again for the second time. What? Why do you have to press the OK key twice? I guess so you can convince the calculator that you really, really do want to change to the operating mode to which Hewlett-Packard is so highly dedicated. Maybe the calculator wouldn't believe you were serious if you only pressed it once."

Actually, only 3 keys pressed to change to RPN

*Message #17 Posted by **Gene** on 20 Oct 2003, 9:57 p.m.,*
in response to message #16 by Jim Chumbley

MODE +/- OK

That will do it.

Gene

Some won't be caught DEAD pressing "OK" on a new HP calculator

*Message #18 Posted by **Paul Brogger** on 20 Oct 2003, 10:03 p.m.,*
in response to message #17 by Gene

. . . it don't actually matter *how many* keystrokes, but whether they seem to imply *agreement* or *submission* . . .

;^)

Re: Actually, only 3 keys pressed to change to RPN

*Message #19 Posted by **Joshua Belsky** on 21 Oct 2003, 8:01 p.m.,*
in response to message #17 by Gene

Is that documented, or is that one of those magic things that you just have to "know"?

-Joshua

It is in one of our training aids for sure

*Message #20 Posted by **Gene** on 21 Oct 2003, 10:43 p.m.,*
in response to message #19 by Joshua Belsky

That's why it may help to download those documents and read through them.

Anyone have an easy way to put them all in one PDF? I have the individual PDFs and word files, but don't relish doing 54 copy and paste actions.

Gene

Combining multiple PDFs

*Message #21 Posted by **Dave Shaffer** on 22 Oct 2003, 1:50 a.m.,*
in response to message #20 by Gene

I have full-blown Acrobat 5.0 (i.e. not just the reader, but the writer/creator as well), and it took me about two seconds to concatenate two PDFs into a single file which had all the pages from both files. It shouldn't take much longer to combine an arbitrary number of files (once I can get my hands on them!).

I'll offer to combine any number of files (I have only a slow connection at home, but much faster at school) on a time-available basis if I can get them easily from the web.

Re: It is in one of our training aids for sure

*Message #22 Posted by **Katie** on 22 Oct 2003, 7:25 p.m.,*
in response to message #20 by Gene

I use PDF-Tools http://www.docu-track.com/index.php?page=36. It lets you do almost anything with PDF's, is fast and cheap.

Documentation Possibilities?

*Message #23 Posted by **Paul Brogger** on 22 Oct 2003, 7:55 p.m.,*
in response to message #20 by Gene

I upgraded the SD card in my digital camera, and put its 16Mb card into my 49G+. For some reason, that shows as ~13Mb in the FILES menu.

But regardless, you can get 256Mb SD cards for a reasonable price. That means the whole freakin' manual could be put (somehow, in some format) *in the calculator itself!*

I well remember boggling at the 28S' "CATALOG" (I think) command, which not only listed all commands, but their various requirements re: arguments on the stack. Imagine having a link from the "CAT" menu to brief text explaining what each command or operator does, what it requires, and perhaps even with examples of its use!

I know the 49G+ screen isn't exactly e-book-capable, but now that memory is really no object, a likely candidate for a popular download will no doubt be a calculator-formatted and -indexed version of the manual(s).

Re: Documentation Possibilities?

*Message #24 Posted by **James M. Prange** on 23 Oct 2003, 6:31 a.m.,*
in response to message #23 by Paul Brogger

Don't forget that sectors are used up for the boot sector, FATs, and root directory. I expect the filer to show you how much is actually available for storage.

Yes, no doubt the entire manual could easily be stored on a card. And you'd still have plenty of room to store objects from your calculator.

The 49gII desparately *needs* a PDF reader! ;-}

Regards,{nl]James

BIG Memory Enables Other Options

*Message #25 Posted by **Paul Brogger** on 23 Oct 2003, 11:28 a.m.,*
in response to message #23 by Paul Brogger

Another thing that occurred to me -- I wonder which of the programmable calculators are capable of running a (single?) program which exercises *every* command and feature available -- a sort of "calculator calisthenics routine"? (And, BTW, what is the minimum size of such a routine?)

Probably the 67/97 models could. (Has it been tried?) And the 41C & 42S presumably. I'd guess that the 15C, 34C and 32S/SII cannot. 12C? (Would the 12C Platinum's extra memory push it over the line?) What about other models with which I'm not familiar?

The 48G? 49G? 49G+? Probably all can, but with (IIRC) 2,700+ commands/features to be exercised, a 49G+ calisthenics program would be extensive.

If I may amend the (alleged) Chinese proverb: "*May you live in interesting times* ***-- with plenty of inexpensive memory***".

Re: "RPN LIVES ON"? I don't think so...

*Message #26 Posted by **James M. Prange** on 20 Oct 2003, 6:54 p.m.,*
in response to message #1 by W. Bruce Maguire II

Oh, c'mon now, Bruce. Even if the ENTER key happens to be in a position that you're not familiar with, it's still an ENTER key. The very first HP calculator (a desktop model) I ever used had a QWERTY keyboard with one ENTER key (or maybe it was RETURN or something) at the bottom right of the numeric keypad, and another one somewhere at the right side of the standard alpha group of keys.

I'd prefer a large centrally located ENTER key, but having it at the lower right isn't that hard to get used to. Like Bill, on the 48 series, I more often simply use the SPC key to separate the arguments on the command line and put them all on the stack with one press of the ENTER key (or a keypress that does an implicit ENTER). On the 28S, I use the "," key to separate the arguments. Now that I think about it, the ENTER key is probably one of my "occasionally used" keys; I more often press a key that does an implicit ENTER.

And at least it is an RPN calculator, though I expect that it will come set in ALG mode by default.

If the location and size of the ENTER key turns out to be the worst thing about the 49g+, I'll be extremely happy with it.

Regards,
James

It's not so much the postion as the size to which *I* object. I won't accept anything but a double-sized **[ENTER]** key.

in response to message #27 by Wayne Brown

Great news! I will fit a wide ENTER key to your new 49g+ or old 49G for a mere 1000 €uros. Works perfectly (if the old key worked perfectly). The old tiny key is destroyed for good! (-;

HP-41CX fullnut strange issue

*Message #1 Posted by **Michel Beaulieu** on 20 Oct 2003, 1:19 p.m.*

My belove HP-41CX begin to do freegames! 2 months ago i remove the batteries and put the calc in a closet. 2 days ago i put new batteries in it and i get that :

2 beeps MEMORY LOST message and the calculator is blocked in PRGM mode all keys i push rapidely close the diaplay and i get a "memory lost" message

I cannot "off" the calculator; i need to remove the batteries.

The battery contact are shinny new and the plastic post looks to do a good job (i don't open the calculator yet)

Any suggestion - I REALLY LOVE THAT BEAST HELP!!!

Thanks, crying Michel

Edited: 20 Oct 2003, 1:20 p.m.

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Oct 2003, 1:29 p.m.,*
in response to message #1 by Michel Beaulieu

Hey, Michel;

just for the records: is it a full- or a half-nut?

If it is a fullnut, chances are you have some sort of problems with posts and/or bad contact between the mother-board and the keyboard. I have also seen some related symptoms when a RAM/ROM chip is faulty or with bad connection as well.

If it is a halfnut, I'd check for broken connections and/or cold soldering, too.

Let us know what happens next.

Bonne chance!

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

HEY HI LUIZ; i lost your email months ago; i hope you remember me my friend!

I have a lot of questions for you about my newer programs; can you still answer them via email?

For my CX; you know i love it since it's a full nut; but i used my normal 41-c for months and when i need my CX it wasn't working good... Do you think i need to open it? You know, chances are that i will broke a plastic post for ever no?

I know it's better that not working in good cosmetic condition ut is there some kind of soft/hardware things i can do before that operation on a 25 years old calculator.

By the way, how can i know the magnufaturing date on my CX and c with the serial?

Thanks and email me!

New clues

*Message #5 Posted by **Michel Beaulieu** on 20 Oct 2003, 6:47 p.m.,*
in response to message #1 by Michel Beaulieu

I took my HP-41C and the 41-CX apart and exchange the CPU board : The 41C board is working ok in the 41CX case but the 41CX board not working at all in the 41C case.

The 41CX board in is original case : i can sometime get some 0.000 screen and make a fast calculation but in a second i get "MEMORY LOST" and a second after i get the "goose" and the anonciator "PRGM". After that all key i push i get an instant "MEMORY LOST" and a accompaging Beep...

I'm sure that it's on the CPU board and i'm sure it's repairable BECAUSE i get ok 1 or two seconds every hour... ;-(

Thanks for any tips!

Michel

in response to message #5 by Michel Beaulieu

Michel, I am so sorry about your broken HP-41CX calculator. Those of us who love them, really do love them. There is a firm: fixthatcalc.com that advertises to repair the HP-41CX for a flat rate fee of US$59.00 plus cost of parts (logic board in your case, I think) and actual cost of shipping. It might be worth your while to check them out. I don't have any experience with them at all, so I cannot rate them for you. But it would at least be a place to start. The very best of luck to you, Michel. Regards from: Jim Chumbley

Fixthatcalc.com

*Message #7 Posted by **Karl Schneider** on 21 Oct 2003, 3:13 a.m.,*
in response to message #6 by Jim Chumbley

Jim --

Many thanks for listing the website! I have an intermittently-functioning 1984 fullnut 41CX that is cosmetically real good, and which I believe is repairable for a reasonable price -- hopefully just a bad connection, and not a bad chip.

I think I'll give them a try.

Re: HP-41CX fullnut strange issue

*Message #8 Posted by **David Smith** on 21 Oct 2003, 4:32 p.m.,*
in response to message #1 by Michel Beaulieu

One thing that brings back a lot of flakey HP41 CPU boards is to clean the card with 91%+ isopropyl alcohol. Scrub it well with a toothbrush, rinse with more alcohol, and repeat. Shake it well, and let dry several hours. Many of these CPU cards have some hand soldered components on them with old solder flux residue. Others have some kind of invisible contamination. Both things seem to interfere with the low current CMOS chips.

Keep the alcohol off of the calculator display window. It will leave a stain...

in response to message #1 by Gene

Copying "http://www.hp.com/calculators/graphing/49gplus/scientists.html" (without quotes, of course :-)) into the address field of my browser would immediately change the address to "http://www.hp.com/country/us/eng/js/hpwpc_utilities.js" and then return an hp-site telling me "we're very sorry, the page you requested cannot be found". What am I doing wrong?

Juergen

Another way to get to the training aids...link

*Message #7 Posted by **Gene Wright** on 20 Oct 2003, 2:08 p.m.,*
in response to message #6 by Juergen Rodenkirchen (GER)

Try going here:

http://www.hp.com/calculators/graphing/49gplus/

and then click on the categories on the right side of the page...under the "solutions" header.

educators & students scientists & engineers

etc.

Don't know why the links aren't working for some of the modules.

And, FYI, I have nothing to do with the creation of the webpage...only the mistakes in the modules are my fault! :-)

Supposedly, all the links to training aids are fixed now

*Message #8 Posted by **Gene** on 20 Oct 2003, 6:54 p.m.,*
in response to message #7 by Gene Wright

Remember, I didn't name the files on the web page. :-)

I asked them to correct the spelling and it should all be ok now.

Hope these are helpful/useful to new users or existing users who haven't tried certain features.

I view the creation of this many training aids as a good thing. HP didn't have to do this, but chose to do so.

That is a positive!

Gene

Re: Supposedly, all the links to training aids are fixed now

in response to message #2 by Pierre Brial

Here in Brazil it is sold for about US$53 (R$150), there is a link to an auction (in portuguese):

http://www.mercadolivre.com.br/jm/item?site=MLB&id=13231402

Re: Aurora FN 1000 quality

*Message #4 Posted by **Wlodek Mier-Jedrzejowicz** on 19 Oct 2003, 11:16 p.m.,*
in response to message #2 by Pierre Brial

Pierre Brial on 19 Oct 2003, asked:

What is the overall quality of this calculator (keyboard, display,...) ?

None of it is traditional HP quality, but it is not bad. Rather soft keys, excellent big and contrasty display. The worst design feature IMHO is that when the lid is closed, it is easy to press it above the general area of the ON button, and turn the calculator on. Since the display is hidden, you will not see that you have turned it on, and so you can do this repeatedly and run down the battery. My other complaint is that the keyboard is evidently taken from a different Aurora model, so the right-shift (orange) key is labelled "Alpha", though it does not provide any alpha features :-)

But, yes, a non-HP RPN model at last, and let's indeed hope for an HP-15C clone next :-) But it's only a hope.

Many thanks to Dave Hicks for helping me get one to Europe!

Wlodek

Thank you Wlodek, for these informations.

I just received your book, it's great !

A bit difficult to order it from France, but I finally succeed. Very good job, congratulations ! I read it like a novel, but faster.

All the best

Pierre

Re: Aurora Patent Infringements?

*Message #6 Posted by **Jim Chumbley** on 20 Oct 2003, 8:45 p.m.,*
in response to message #1 by db(martinez,california)

In the early 1970s, HP bought up ALL the RPN-type patents from the old office-machine companies. This is why my baby, the National Semiconductor 7100 calculator, was algebraic and not RPN when it was under development in 1976/1977. This is also the major reason why nobody else in the entire world has ever dared to infringe HP's RPN patents now that they have bought them all. I just wonder if Aurora is named for the (rumored) Aurora space-plane, which has supposedly replaced the U-2, and the SR-71, and which is believed by many to fly faster than Mach 8. Mach 8 may well be the speed required to outrun Hewlett-Packard's herd of lawyers.

Re: Aurora Patent Infringements?

*Message #7 Posted by **William** on 20 Oct 2003, 9:03 p.m.,*
in response to message #6 by Jim Chumbley

Patents expire after 20 years (I think).

Re: Aurora Patent Infringements?

*Message #8 Posted by **David Smith** on 21 Oct 2003, 4:34 p.m.,*
in response to message #7 by William

Old patents died 17 years after issue. New ones die 20 years after initial fileing.

Re: (One-time) Patent Renewals?

*Message #9 Posted by **Paul Brogger** on 21 Oct 2003, 6:00 p.m.,*
in response to message #8 by David Smith

Isn't/Wasn't it possible to renew patents once for an additional 17-/20-year period? If so, does anyone know how to find out whether a particular patent has been renewed?

Re: (One-time) Patent Renewals?

*Message #10 Posted by **William** on 21 Oct 2003, 11:27 p.m.,*
in response to message #9 by Paul Brogger

One can always do a patent search, costs money though.

Re: (One-time) Patent Renewals?

*Message #11 Posted by **bill platt** on 22 Oct 2003, 9:13 a.m.,*
in response to message #10 by William

You can search for free (I've done this extensively):

www.uspto.gov/patft/index.html

Regards,

Bill

Re: (One-time) Patent Renewals?

*Message #12 Posted by **David Smith** on 22 Oct 2003, 3:56 p.m.,*
in response to message #9 by Paul Brogger

You cannot renew your patent. At one time people used to be able to play the "reissue" game where you added something to the patent to keep in in paperwork limbo. Since old patents did not start their 17 year clock until they were issued, this effectively extended their lives. Really sleazy people kept patents alive for over 40 years. When the revolution comes... I have a wall...

Re: Aurora Patent Infringements?

*Message #13 Posted by **GE (France)** on 21 Oct 2003, 4:12 p.m.,*
in response to message #6 by Jim Chumbley

Hello Mr Chumbley. "...my baby, the National Semiconductor 7100 calculator..." !? Dare I ask you were in some way involved in the design of this one ? I'd be *VERY* (major understatement) interested in any information regarding this machine. Was there any prototype built ? Blueprints ? Thanks.

in response to message #1 by Gary

Learn to calculate quickly?

Re: HP-41CX turning off quickly -- was discussed here recently

*Message #3 Posted by **Paul Brogger** on 20 Oct 2003, 10:42 a.m.,*
in response to message #1 by Gary

I'm no 41 expert, but I believe this has been discussed here recently. If I remember right, it's either bad contact between the keyboard and the cpu board, or it's a bad capacitor on the cpu board.

But don't take my word for it. Search the Forum or the Archives -- I'm sure you'll find some recent discussion of this very problem.

Good Luck!

Re: HP-41CX turning off quickly -- was discussed here recently

*Message #4 Posted by **David Brunell** on 20 Oct 2003, 10:58 p.m.,*
in response to message #3 by Paul Brogger

I've made a habit, anytime I open a 41 for the first time, of replacing the two electrolytic capacitors with tantalum units. One is a 470 uF @ 6.3 V and the other is a 100 uF at 10 V. I believe the former holds the memory while changing batteries and the latter controls the shutoff time.

I had one 41CX that was eating batteries even while shut off, and it turned out to be a leaky 470 uF cap.

Re: HP-41CX turning off quickly -- was discussed here recently

*Message #5 Posted by **Gary** on 26 Oct 2003, 7:39 p.m.,*
in response to message #4 by David Brunell

Thanks David, I will change the capacitors and let you know the results.

Question about the Create-a-Calc contest, and 33S Info

*Message #1 Posted by **Tony David Potter** on 19 Oct 2003, 5:52 p.m.*

When the Create-a-Calc contest was announced, there was a part where the school that submitted the most calculator entries would receive a prize of (I believe) 100 calculators for the school. Does anyone know which school won this? The HP contest results seems to have forgotten this part of the contest, and the Scholastic site doesn't have anything either.

Also, for those Swiss out there, I found the HP-33S on the Swiss HP website: http://h40043.www4.hp.com/products/calculator/wiss33s.htm and http://h40043.www4.hp.com/products/calculator/wiss33s_f.htm . Although there's a purchase button, it doesn't seem to work yet.

Since there are others better at navigating the HP site here, I'll let them do further exploring.

Thanks in advance. Tony David Potter.

Re: Question about the Create-a-Calc contest, and 33S Info

*Message #2 Posted by **Ben Salinas** on 19 Oct 2003, 10:50 p.m.,*
in response to message #1 by Tony David Potter

As far as the HP contest, the school that won the 100 calculators is mentioned in the Scholastic Instructor Magazine from last month. I looked at a copy of it. If you want a great laugh, find a copy of it. It is hilarious.

The article is surrounded by pictures of student's calculators. I was looking at some. One looks like a pen and has 6 buttons (numbers 1, 2, 3, 4, 5, and 6) I thought it was a base 7 calculator, until i noticed there was no 0. They spotlighted several calculators, and the elementary and middle school grand prize winners. Then, in size 10 font, under the title "Runners Up" was my name. I wasn't too pleased.

So, in conclusion, if you want to know the other winners, or you just want a good laugh, go and find a copy of Scholastic's Instructor Magazine.

oh, BTW Tony, one of the runners up for the high school level was also from Texas (George West to be exact). I wonder if he does UIL.

-Ben

How to refill inkjet cartridge?

*Message #1 Posted by **Larry** on 19 Oct 2003, 11:51 a.m.*

Hi, Plese, advise how to refill a cartridge to my HP Officcejet K80 printer?

Thanks for any advices or links.

Re: How to refill inkjet cartridge?

*Message #2 Posted by **Fred** on 19 Oct 2003, 12:44 p.m.,*
in response to message #1 by Larry

First take your HP-49G+ calculator and write a program to calculate the desired volume needed. Then go out to your local chemistry store and put together a recipe of fast drying pigmented ink. There are a number of patents and references you can find on putting together a formula. Build the processing equipment and make a lot to last a lifetime (don;t worry, shelf stability limit a lifetime to months - 1 year). Or, go buy a refill kit and follow directions there, poking a hole in the appropriate place, refilling with a syringe and praying for no leaks or mess to destroy your printer...

Or maybe a calculator forum isn't quite the right place to get answers along this line....

CRT has a strange disease

*Message #1 Posted by **Marc** on 19 Oct 2003, 7:12 a.m.*

Hi,

I'm facing an unusual problem on my 9845's CRT : since a few months, dozens of little white spots developed along the sides of the screen. Clearly they're on the outside of the tube, but they also seem to be under the surface since I can't wipe them off by any chemical or mechanical means. Above it all I'm afraid the problem may get worse as time passes... In advance thank you for your help !

Regards Marc

Re: CRT has a strange disease

*Message #2 Posted by **James M. Prange** on 19 Oct 2003, 11:14 a.m.,*
in response to message #1 by Marc

I don't have one, so this is obviously just a guess, but I wonder whether the CRT's glass has some sort of protective coating that's starting to separate.

Re: CRT has a strange disease

*Message #3 Posted by **Marc** on 19 Oct 2003, 1:35 p.m.,*
in response to message #2 by James M. Prange

Hi James,

Thanks for your answer ! If such a protective coating is used, it is actually glass. That makes me wonder whether the whole tube is not built with some kind of glass sandwich (two layers or more ?). Another fact : I found other spots, apparently on the inner side ! They're dark, hard to locate (need intense lighting). Your guess is probably the right one. Sigh ! I don't think that such a phenomenon is reversible... What surprises me the most is that the computer has always been stored in a safe place (no temperature / moisture hazards). Maybe just a few batches of these CRTs are concerned ? Anyway it still works ! Informations are welcome ! Thank you...

Regards

Re: CRT has a strange disease

*Message #4 Posted by **David Smith** on 20 Oct 2003, 4:08 p.m.,*
in response to message #3 by Marc

Many CRTs are built with a protective layer of glass bonded to the tube like a car windshield. This is to protect the user from an imploding tube if it shatters. You might have a problem with the bonding layer. It is usually a clear rubber/plastic compound.

Marc- This sounds just like the problem I had a year or so back- Basically mould-like stuff in the layer of clear 'adhesive' between the antiglare screen on the tube front and the bonded faceplate on the tube itself. Mainly around the egdes of the screen area. I had to separate them completely and clean all the adhesive off both surfaces- a task that needs to be done with considerable care but is not all that difficult.

Hardest part was extracting the CRT from the case in the first instance-I had to get a very long philips screwdriver to reach all the way in from the back of the case to the mounting screws on the two bottom CRT mounting brackets. Then mount the CRT on a stable and solid wooden frame before doing any work on it. The tube front needs to project well forward of the corner frame mounts so you have clear access to the edges of the 'gap' all the way round.

When reasssembling I just used a very small amount of replacement adhesive-clear silicon rubber- in the corners ONLY of the antiglare screen- the resulting gap between the tube faceplate and the antiglare glass has not caused any lack of visibility etc. While dust etc can now get in that gap it should also be fairly easy to clean it out again.

I am considering maybe filling in the gap down both sides of the antiglare glass with silicon rubber as well. That will give a bit more strength to the assembly-and will leave a top to bottom air path that can still be used for cleaning etc as required.

*Message #6 Posted by **James M. Prange** on 20 Oct 2003, 6:20 p.m.,*
in response to message #5 by Dave Brown

Keep in mind that there is some hazard involved when working on a CRT. It can be very messy if a CRT implodes. Handle carefully of course, and don't neglect personal protection, at least safety glasses or goggles. If you have any spectators while working on this, be sure that they're protected as well.

Don't forget that you can get a nasty shock from the CRT's anode. Even in cases where the shock may not be truly life-threatening, the surprise could be enough to cause you to drop the CRT. I've personally found that even CRTs that have been stored "on the shelf" for months still can have a charge. I've found that even discharging the tube doesn't entirely solve the problem; after a while, there may be enough of a charge available to give me a shock.

Regards,
James

Thank you so much !

in response to message #6 by James M. Prange

Hi !

James, Dave, David, I'd like to thank you all for these valuable informations. It's good to know that a solution exists. Doesn't seem to be very easy, but sure, I'll try it some day ! First, I need two important things : spare time, and enough room to work it out safely (these dear old machines take some place...)

Best regards, Marc

HP48GX Banned from Exams

*Message #1 Posted by **Don Queen** on 18 Oct 2003, 8:48 p.m.*

Since the ban of the HP48GX by NCEES, does anyone have the number and availability of the new calculator that is being released by HP that will be allowed in the Engineering and Surveying Licensing Examinations?

Re: HP48GX Banned from Exams

*Message #2 Posted by **Veli-Pekka Nousiainen** on 18 Oct 2003, 8:52 p.m.,*
in response to message #1 by Don Queen

"Since the ban of the HP48GX by NCEES, does anyone have the number and availability of the new calculator that is being released by HP that will be allowed in the Engineering and Surveying Licensing Examinations?"

hp 33s

Avail? Nov/Dec?

Re: HP48GX Banned from Exams

*Message #3 Posted by **CME750** on 18 Oct 2003, 11:10 p.m.,*
in response to message #1 by Don Queen

According to NCEES, the forthcoming HP 33S will be acceptable for use on the engineering and surveying licensing exams. NCEES also states that "Hewlett Packard expects the HP-33s to be available by 12/1/2003":

http://www.ncees.org/exams/calculators

Expected retail price is $60 to $66. Some unofficial pre-release info about the 33S is available at:

http://www.hpcalc.org/images/datasheet33s.pdf

It's hard to believe, but there are *no* RPN scientific calculators in current production that can be used on professional engineering or surveying exams. If you can't wait for the 33S, the only alternative is to find an older discontinued model, like the 32SII, 42S, 15C, or 11C. However, the market value of such models has risen markedly since NCEES banned the HP48 and 49 series.

Fry's Availability of New HP Calculators

*Message #1 Posted by **SV** on 18 Oct 2003, 6:59 p.m.*

I was at Fry's today and found the newest calculators: 12C Platinum, 17bII+ as well as the older ones eg. 39g, 12C, 30s, 10bII and even the 48gX!

They told me that the 49g+ will soon be stocked and was on its way....

Which Fry's was it? [NT]

*Message #4 Posted by **rsenzer** on 19 Oct 2003, 11:49 p.m.,*
in response to message #1 by SV

The Fry's in West Phoenix had 12C, 12C platinums, and hp17bII+s as well as 2 or 3 hp48gx models [made in Indonesia] in the hp cardboard boxes rather than the new plastic packaging.

I was surprised to see the extent to which the platinums had the same form factor as the old 12c. This was not apparent [to me] from the pictures I had seen on the net.

On the other hand, the hp17bII+ has a form factor similar to the hp10bII, as has been stated previously on the board.

Teaching with a 32SII and a new RPN user (hopefully)

*Message #1 Posted by **Juan J** on 18 Oct 2003, 6:10 p.m.*

After a busy week, finally I got some time to write about this. It was encouraging for me.

I got a part-time job teaching Physical Chemistry to engineering students at a local college. Last Wednesday, after a laboratory session, we were discussing error analysis and how to fit curves using experiment data. While discussing how to calculate averages and standard deviation using a calculator (it might be the exception rather than the rule, but most college freshmen don't really read their calculators' user manuals) when one of the students pulled out an HP 32SII with the stat menu on screen. "How can I do with my calculator?" he asked. I have seen a few 48s and 49s on campus but not in my class and had given up on trying to find one. "Can I use it to show you and everyone?" I asked.

With the 32SII I managed to explain how to calculate averages and other statistics, and how to fit data. Surprisingly, the 32's menu system proved to be quite good for the job of explaining how to find a function and use it with your data, and when I noticed I was working some examples using it while the class listened and gave their calculators a try. Function names as shown on screen turned out to be useful to explain some concepts. Then I noticed that other manufacturers have mimicked HP's menu system on their products, and that the 32SII had became a teaching aid. They all had understood what to do with their data and how to do it on their calculators. Finally we discussed about the examinations that rule out most calculators but not the 32. It felt good but it wasn't the end of it.

The 32SII's owner was amazed at the power of his machine. After finishing the class, when I gave him his calculator back, he told me that he got it from his father, a retired engineer who received it as a gift (how many of us would like such a gift) with no manual. His father himself had a 41C with some peripherals and had found the 32 of little interest. The kid had managed to learn about RPN and the stack but did not know how to work through complex expressions without using parentheses, among other things. I had to recall the Mach number equation from memory (by that time we were sitting on the grass below a tree) and explained about the four-level stack and how to start from the inside out. The benefit of knowing intermediate answers showed by itself. "This expression would need a lot of parentheses if entered in another calculator," was all he managed to say, adding later "but on the HP it is much easier to solve."

Then came the next question, "how can I integrate a function?" After making it clear that the 32SII does numerical integration only, we discussed the integral of cos(x) between 1 and 2. The kid understood easily how to enter a function in program memory and then integrate it; later he checked it doing the integral by hand. He didn't believe his eyes. As most of us did when numerical integration was not standard on calculators.

The next day he approached to me to ask some more things and comment on the 32's functions. And he had confirmed that his dad's machine was 41C. "The best scientific calculator family ever made, the 41 series," I said, mentioning how the 41 had been used on the Space Shuttle when there were no laptops as a backup for the main computer. He found it interesting and said he will get his dad's 41 to see what it can do. Hopefully he will start to use it. But for the moment he's been "converted" to RPN. I was happy.

It felt good to see that RPN does not scare users as most marketing experts and similar fauna are inclined to say. And it was encouraging to see the same emotions when discovering it in a college freshman of today that I (and most other users and Forum contributors) felt back when I was his age. I was also amazed that the 32SII could be

so fine a teaching aid.

Re: Teaching with a 32SII and a new RPN user (hopefully)

*Message #2 Posted by **GS Leong** on 19 Oct 2003, 11:07 a.m.,*
in response to message #1 by Juan J

That is a beatiful thing and I feel that the only way RPN will survive is by passing it to future gererations by repected peers (i. e. father,professor et al) the problem I see is that hp refuses to make a quality machine of even the caliber of the 32 SII. So there are very limited resources to pass. And as we can all see on ebay the prices reflect this shortage. So hp is really not helping the cause but I guess that all that read this forum know that already

my $.02 worth

Not at all

*Message #3 Posted by **Valentin Albillo** on 20 Oct 2003, 6:02 a.m.,*
in response to message #2 by GS Leong

GS Leong wrote:

"I feel that the only way RPN will survive is by passing it to future gererations by repected peers (i. e. father,professor et al)"

RPN will only survive for future generations as a gimmicky, purely intellectual, miscellaneous notation to compute mathematical expressions in a weird way, never as a mainstream method.

People aren't fools in general, despite what we RPN addicts may think (i.e: "we are right and they are wrong"), and will always select the easiest, most natural, prominent and accepted way to do calculations, and that's algebraic, mind you. RPN was Ok only when RAM was scarce and expensive and every register or memory resource would greatly add to the price. Now that's not the case and RPN is utterly obsolete, and economically unappealing so it's no great surprise that neither HP nor anyone else cares about it anymore.

By teaching childs to learn and use RPN you will only succeed in alienating their minds, and create constant frustration when they see that noone does or explains things like this neither in class nor in real life, no RPN calculators are easily available, and the ones which are can't compete in quality, features and price with the ones their pals do own.

I suggest you teach RPN to your childs as some sort of intellectual "game", if at all, a mere curio, but making a strong point that they are comfortable and can use proficiently algebraic systems, mainly. Otherwise you'll be doing a serious disservice to your children's education and future math capabilities.

Best regards from V.

Oh, it might just surprise you.

*Message #4 Posted by **Jim Chumbley** on 20 Oct 2003, 9:31 p.m.,*
in response to message #3 by Valentin Albillo

Mr. Albillo said, "no RPN calculators are easily available, and the ones which are can't compete in quality, features and price with the ones their pals do own." Sir, I am looking at my brand new HP-49g+ while I'm composing this response. Let me just say that I'll bet you have not yet been able to see and hold a 49g+ or try any of its built-in 2,700 operations.

Re: Oh, it might just surprise you.

*Message #7 Posted by **Jim Chumbley** on 22 Oct 2003, 12:23 a.m.,*
in response to message #6 by Veli-Pekka Nousiainen

As I was about to say, I never bet against a sure thing or a man who is holding all five aces! What I was hoping was that Valentin had not had an opportunity to compare the 49g+'s hardware/software with the big dogs in the neighborhood. It makes me sad to realize that he thinks the 49g+ "can't compete in quality, features and price" with TI's 89 and Voyage 200. I am reminded of a song from the 1960's: "Teach your children well. No one can tell what they might grow like. Feed them on your dreams . . ." At least Mrs. Susan Marie (Chumbley) Rook, now age 34 and with two handsome sons, still uses her HP-15C from college. Even to add up a grocery bill.

Re: Oh, it might just surprise me.

HP Algorithms

*Message #1 Posted by **eclectic_echidna** on 18 Oct 2003, 3:35 p.m.*

I downloaded emu48, and have attempted to trace through what the calculator executed to do a square root (5 enter SQRT).

After stepping through hundreds of lines, I am almost convinced that I never made it to the actual algorithm. It seemed to be stuck in the housekeeping portion of the ROM.

Can anyone offer me any advice on how to trace through SQRT or other numerical functions? Or better yet, are there any ROM maps around? I can only guess that someone has looked into this already.

HP9100B parts and information

*Message #1 Posted by **Jools Smyth** on 18 Oct 2003, 2:34 p.m.*

I am the owner of a hp9000b + Printer & other bits. The rubber on the magnetic card reader roller, cables and printer have deteriorated. Does anyone have some experience of replacing these parts? Apart from this the machine is in full working order.

Will the value be increased by replacing the rubber?

Additionally the unit has a large folder with program listings, a few journals, and a few hundred magnetic cards. Do these extras have any kind of value attached ? I have read that the cards are hard to come by ?

eBay bargains

*Message #1 Posted by **Randy** on 18 Oct 2003, 12:29 p.m.*

I've been ignoring eBay silliness of late, but I had to post this one.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3053527421

Yeah, right, $500 for a used 41C with no case or manual. This is about the best a job of distorting facts as I've seen lately. But then we are approaching election day so perhaps this ad copy was written by a political speech writer.

Such a deal we've got for you...

Notice the the bottom photo is a gold border halfnut and the top photos are a silver C fullnut. I wonder which unit is for sale. Then there is the number of feedbacks of both buyer and seller... humm.

My latest eBay calculator lie: "Looks like it just came out of the box". Translation: It just came out of the 50 lb box of 10 penny nails that has been bouncing around in the back of Buba's truck for six months.

Re: eBay bargains

*Message #2 Posted by **Pascal** on 18 Oct 2003, 2:06 p.m.,*
in response to message #1 by Randy

Aren't you not supposed to post such messages in the Classified ad section ?

in response to message #2 by Pascal

Pascal wrote: "Aren't you not supposed to post such messages in the Classified ad section ?"

I don't think Randy is the seller - his post is not an ad for a calculator, it is a comment on dubious ebay practices.

Have a great day, Don

Re: eBay bargains

*Message #4 Posted by **Ed Look** on 19 Oct 2003, 12:27 a.m.,*
in response to message #1 by Randy

I'm from the NYC area and real estate prices here are out of control. If you assessed my house you'd think I was some kind of rich guy. No one thinks it's going to fall back down for a long time (if ever). Still, the value, in my opinion, despite my owning it, is way overinflated.

I love HP calculators, especially all their scientific/graphing RPN models, old or new. But what some people

have the nerve to ask for something that even when it was new that cost less than $200 USD at most is... well, disappointing. Even if you're a rabid collector, is it truly worth so much?? Oy, eBay!... a mirror image of game shows!

It reminds me of businesses that gouge their (often longtime) customers when things go bad, as when local discount stores here were charging ten, twenty, or more US dollars for flashlights and batteries during the recent and infamous blackout.

Gouging?

*Message #5 Posted by **Patrick** on 19 Oct 2003, 3:45 a.m.,*
in response to message #4 by Ed Look

I have to disagree with you, Ed. I think the word *gouging* can only apply when an individual or company is in a monopoly situation. When there is competition, the free market system works to punish those who overprice their goods -- customers go elsewhere and the would-be gougers generally don't make any money.

The people who bid on eBay do so of their own free will, I suspect. For the auction in question, a modest amount of research would show a would-be bidder that this item is not worth what the seller suggests. Someone who bids based solely on what the seller tells them, when better information is readily at hand, deserves whatever deal they wind up with.

Re: Gouging?

*Message #6 Posted by **Ed Look** on 19 Oct 2003, 6:01 p.m.,*
in response to message #5 by Patrick

Valid points, all, Patrick.

It's just that I was beginning to get the impression, however, that most if not all eBay auctions for HP RPN calcs were going out of control. The few I happened to look at were getting up there in price. But, you're right; bidders go their on their own, hopefully with their eyes open (wide).

Personally, research notwithstanding, and no matter how much I'd love to have a particular model, there's a line in my gray matter past which the wallet does not go. F'rinstance, I'd love to own a HP-25 or 25C, just because they were the first HP's I laid eyes on before I got my own (by which time these guys were discontinued). But I'm not sure I'd be willing to pay for one of those what I'd pay for a spanking new 49G+! Again, this is only my opinion. This is why some of those prices seem to me to be "gouging level" numbers.

Thanks for your constructive reply.

HP-25 Fans

*Message #7 Posted by **Patrick** on 19 Oct 2003, 8:05 p.m.,*
in response to message #6 by Ed Look

I wonder if the HP-25 is one of the most beloved of HP's amongst my generation (I was a new undergraduate at the time of its release). When the HP-25 came on the scene, the alternatives available which had programming cost considerably more, so it was something of an affordable programmable for its day, and extremely capable in its own right.

Through the vagaries of life and broken relationships, I lost my original HP-25. Through the wonder that is eBay, I have managed to get a replacement. The bizarre thing was that the seller was

local and it turned out that the machine previously belonged to a friend of mine! He had given it to a charity.

Every time I hold that HP-25 in my hand, I see again how its contours were designed to be held just that way. I am flooded with the memories of my undergraduate days. To say that the price of the machine has been paid back to me would be a terrible understatement.

Re: HP-25 Fans

*Message #8 Posted by **Ed Look** on 19 Oct 2003, 8:16 p.m.,*
in response to message #7 by Patrick

Ah, see, I only *PLAYED* with some professor's old 25C and never really got to work with one. By the time I got to college, the 34C was introduced (though the 41C's were the cat's meow, I couldn't afford one then... I'm not sure I can now!) so I'd side with Norm Hill in that to me, the 34C is the epitome of affordable handheld programmability! But, one reason why I made the comments I did was because there were times I could have sworn I was going to max out the 34C's memory capability (storage registers get converted to program memory as needed); I think the 25's memory was smaller!

See, we have different ideas as to what constitutes a pinup, even if they have very similar pinouts!

Re: HP-25 Fans

*Message #9 Posted by **Valentin Albillo** on 20 Oct 2003, 4:58 a.m.,*
in response to message #7 by Patrick

I couldn't agree more, Patrick. I'm also a very great fan of the HP-25, which was my first HP. It had that incredible physical quality lost ever since (the 34C couldn't compare at all), was eminently affordable (unlike the 65 and 55), and it was amazing what you could do in just 49 steps, I guess even its very creators couldn't anticipate just how much some people would put in it.

Newer generations of HP fans are somewhat 'spoilt' with models having far greater RAM, but at the time (1976), the mere fact that you could compute elliptic integrals on a handheld calculator was nothing sort of miraculous on engineering clasees. Not to mention doing things that could barely be attacked on our faculty computer, using FORTRAN and a batch of perforated cards (the least intereactive kind of programming you could imagine), such as root finding and even solving differential equations using 3rd and 4th-order Runge-Kutta. That could be done with an HP-25, single-handedly, on the spot. People were astonished to the most.

There were programs you could fit on a 49-step HP-25 that wouldn't on a 100-step HP-65, not to mention the HP-55. I wrote dozens of programs for it at the time, and even though they were of increasing complexity, I don't think I really reached the limits of ingenuity for 25's programming. There are still cleverer programs that could be written for it.

Anyway, I fully doubt that any person not having experienced this first hand would be able to ever grasp the feeling, but for those of us who did, nothing compares, be it 34C or 41CX or 42S or 49G+. The HP-25 was an amazing feat of engineering, the like of which the calculator world would never experience again.

Best regards from V.

Re: HP-25 Fans

*Message #10 Posted by **Namir Shammas** on 20 Oct 2003, 10:34 a.m.,*
in response to message #9 by Valentin Albillo

Valentin,

I agree with you. The early programmable HP calculators were revolutionary in that they gave you a "programmble" AND personal device.

My first calculator was the HP-55 (which I chose over an HP-65 because it had more memory, a timer, unit conversions, and built-in linear regression). I pushe dprogramming the HP-55 to the limit. I did interpolation, polynomial evaluations, and mostly linearized regression. By the time the HP-67 showed up I was more than ready for it power. My favorite HP calculator is the HP41C which I used in graduate studies and my first job. It was my little companion that I took on job assignments. After work (especially whne I was out of town) I'd sit in my hotel room and write programs that I'd document and send to the HP User's Library in Oregon.

Programming in BASIC, Pascal, C++, VB, C#, and so on has definitely overshadowed keystroke programming, but the latter still remains a nostalgic activity.

Namir

*Message #11 Posted by **Ed Look** on 20 Oct 2003, 2:14 p.m.,*
in response to message #9 by Valentin Albillo

Ow!

Smack me for being a little kid with the "newfangled" 34C!

LOL!!! :D

At least SOME people have had "more ancient" HP calculator experiences than I!

I truly wish I could have used a 25C (no continuous memory... I used to store stuff like Plank's constant, permittivity of space, etc., just so I didn't have to flip open the bookcover. You know, when you're slumped on the couch or at the desk poking away at the calculator and scribbling on paper, YOU JUST DON'T WANT TO GET UP just to look up some silly constant.) But by the time I was really needing a good calculator AND had some money, the 34C the was latest thing.

No offense, but here's where I must say I like the 48's and 49's better even than any 25, 34C, 32S- these 48's and 49's have prerecorded scientific constants built in (unfortunately, I have accidentally memorized quite a few of them now, so this is no longer so useful)! And, I was able even to load in a periodic table, along with much even non-numeric chemical data, without using up the RAM! Well, that may not thrill too many people, but for me, it's a bit of a timesaver.

HP28 question

*Message #1 Posted by **Colin Lambert** on 18 Oct 2003, 8:12 a.m.*

I recently bought a HP28s and wonder if anyone can advise on the folliwing.

Using the manual I have been able to change display format to have a full stop for the decimal point rather than a comma. However can I change the display to show 'thousand seperators' eg I will get 3,000,000 rather than 3000000. As you will hopefully appreciate the former is much easier to read and take in, especially for my aging eyes and brain. The manual makes no reference to this issue but I can't believe that the older calcs HP 11, 41, 42 etc make this display available but the 28 doesn't appear to.

Thanks

HP-49G+ finally shipping

*Message #1 Posted by **Ernie Malaga** on 18 Oct 2003, 7:52 a.m.*

Just checked Samson Cables' site. Now they say the 49G+ is **in stock**.

Funny thing, though -- HP's site *still* doesn't mention the machine. Is there no end to their idiocy?

-Ernie

Re: HP-49G+ finally shipping

*Message #2 Posted by **J. Lopez** on 18 Oct 2003, 11:42 a.m.,*
in response to message #1 by Ernie Malaga

Well, I ordered one yesterday (Friday) from the hp website mentioned here in another thread (www.smb.compaq.com). Later, I received an e-mail confirmation of shipment, with a UPS tracking number. Checking the UPS' site says the package is in transit from Ontario (not Taiwan, mind you) and will be delivered in New York on Tuesday the 22nd.

Now what to do to spare my nails from this biting while waiting...

Re: HP-49G+ finally shipping -- it seems to be true.

*Message #3 Posted by **Paul Brogger** on 19 Oct 2003, 7:08 a.m.,*
in response to message #1 by Ernie Malaga

If you care, details re: ordering by phone are to be found below.

One twist not fully explained there: H-P's **Small-Medium Business** (SMB) unit has a physical presence in all 50 states (as well as internationally) and so must charge any applicable state sales taxes.

Their **Home Office** unit, however, works from only one(?) location (I don't know where), so if the new calculators become available from the Home Office web site at the same list price, your overall cost will likely be lower.

However, at this point, it seems only available via the SMB site, and that via a not-exactly-obvious path.

Sparcom´s Drive95

*Message #1 Posted by **Massimo Gnerucci (Italy)** on 18 Oct 2003, 3:34 a.m.*

Three weeks ago there was a thread about this accessory. I managed to find one in really good shape, the only thing it is missing is the floppy with drivers/software.
Does anyone have it? Would you be so kind to share it with me?

TIA!
Massimo

There is such calculator?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 17 Oct 2003, 11:44 p.m.*

Hi all!

Is there some scientific calculator shaped like the HP-10BII? I think that I saw something like that but I can't remember where.

Regards,

Nelson

in response to message #1 by Nelson M. Sicuro (Brazil)

You sure saw the 17BII+ , which has a similar housing like the 10BII...else you may have seen some other machine from Kinpo.

Raymond

Calling Captain Zener!

*Message #1 Posted by **james (UK)** on 17 Oct 2003, 6:24 p.m.*

Dear Captain Zener

I've given in to temptation and acquired a HP-34C and have a few queries:

1) The dreaded 2 disease - fortunately it seems to be OK with full blanking when calculating functions (eg the Gamma function) - is there any preventative maintenance that can/should be undertaken to try and keep it sound?

2) I haven't psyched myself up yet to try and open it - without opening it is there anyway to tell whether it has the solderless construction - serial no. 2033S?

3) Should I open it anyway in order to lubricate the on-off and run-prog switches?

4) What's the best stuff to clean the display (a few minor scratches) and the keyboard (suffering from bits of sticky black plastic from the pouch - I have just put the pouch through the washing machine [yes - I remembered to take the 34C out first] following a post I saw a while ago on the forum which did the trick on a 41CV pouch which suffered from the same problem)?

I'll leave it at that for the moment.

James

HP-41cx Question?

*Message #1 Posted by **MB** on 17 Oct 2003, 3:14 p.m.*

Can the display's digit separators and decimal point be changed from periods to commas and back? How?

Re: HP-41cx Question?

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 17 Oct 2003, 3:21 p.m.,*
in response to message #1 by MB

Hi To use a comma as a decimal separator press CF 28 (clear flag 28), and to use a dot press SF 28 (set flag 28)

Regards

Nelson

Re: HP-41cx Question?

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 17 Oct 2003, 5:39 p.m.,*
in response to message #1 by MB

Oh, I forgot to mention that if you clear the flag 29 (CF 29) you can disable the digits separator (and SF 29 to enable again...)

Regards,

Nelson

HP-49g+, First Impressions

*Message #1 Posted by **Jim Chumbley** on 17 Oct 2003, 12:51 p.m.*

I have been asked to post my first impressions of the new HP-49g+ machine, so here they are: I received the machine on 10/8, so I have had it in constant use for 9 days. I had no experience with UserRPL programming, but I have used HP calculators since 1970, beginning with the 9100A desktop machine. The new gold 49g+ is the most beautiful of all the HPs, even more beautiful than my 41CX. The display is so much easier to read than that on my 48GX, and you have a choice, depending on font size chosen to see either 7, 8, or 9 stack levels simultaneously! This is a stupendous achievement, and HP has not gotten any credit for it in the commentaries I've been reading. The display now has jet black characters against a greenish-cream background. Others have complained about the paint. Mine is perfect, and the two-color silk-screening (green and red) over gold is perfectly registered and easily read. The main complaint others have listed in their commentaries is that they have keyboard problems in that their machines do not always recognize a key depression. I had that problem also at the beginning, when I was pressing too softly. Now that I know that the keys require a firm, sharp depression, I don't have any keyboard problems any more. It's rather like the difference between a soft USA typewriter keyboard compared with a firm German DIN-standard typewriter keyboard. To make it work, you just have to press harder. I printed the 856 page User's Guide, and spent most of my time learning the stack and UserRPL programming. The learning curve is steep, but not impossibly difficult. I think a new section, call it a "Quick Start Guide for Experienced RPN Users" is needed. Oh, yes, the version of the User's Guide that comes on the CD with the calculator has all of its chapters in order. Be ready for a number of typographical, grammatical, and even key-stroke errors throughout the manuals. They read as if they were not written by a native speaker of English. So that's all, folks. It's beautiful, I love it, and I am even getting pretty good at writing UserRPL programs.

College Course using HP-42S

*Message #1 Posted by **Bill (Smithville, NJ)** on 17 Oct 2003, 10:55 a.m.*

I just ran across the following course offered at CEET, Northern Illinois University. Looks like a very interesting course in use of HP-42S. I wonder if they still offer it or if their web pages are just out of date.

http://www.ceet.niu.edu/courses/ee/list/ele202.html

If it's still being offered, maybe that's where all the HP-42S on ebay are going to - CEET students.

Re: College Course using HP-42S

*Message #2 Posted by **CME750** on 17 Oct 2003, 10:50 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

It appears that the course is no longer available. Check the NIU class schedule database at:

http://www.reg2.niu.edu/CFDOCS/findclass/search.htm

According to this database, there are no scheduled classes for ELE 202 in Summer 2003, Fall 2003, or Spring 2004. Other 200-level ELE courses are scheduled, but not that one.

HP 49G+ pre-order available from HP

*Message #1 Posted by **Alexander Castro** on 17 Oct 2003, 9:49 a.m.*

Go check out: www.smb.compaq.com and look up HP 49G+. The price is $149.00.

Re: HP 49G+ pre-order available from HP

*Message #2 Posted by **Paul Fox** on 17 Oct 2003, 11:55 a.m.,*
in response to message #1 by Alexander Castro

Wow! Brilliant..I would never have guessed that HP would advertise their brand new baby on one of the most obscure URLs ever (using compaqs brand name)...and then hide it. Its like a game of Adventure...now which door should I try now to find it.... :-)

The HP49G+ is beginning to be the best calculator I have never owned.....

Re: HP 49G+ pre-order available from HP

*Message #3 Posted by **James M. Prange** on 17 Oct 2003, 12:29 p.m.,*
in response to message #1 by Alexander Castro

Well, US$149.99 actually. I wonder what the "Authorized Resellers" think of HP selling it direct at $26 under the MSRP.

Regards,
James

Re: HP 49G+ pre-order available from HP

*Message #4 Posted by **Hp Calc Lover** on 17 Oct 2003, 2:45 p.m.,*
in response to message #3 by James M. Prange

This is not an hidden web site, it is HP's SMB (Small Medium Business- inherited from Compaq hence the URL) site and ALL the HP Calcs can be observed under Handhelds and then Calcultors- it isn't hidden.

Re: maybe not "hidden", but how to get there again???

*Message #5 Posted by **Paul Brogger** on 17 Oct 2003, 3:19 p.m.,*
in response to message #4 by Hp Calc Lover

I'll delete this if my third try is successful, but (at this moment, at least) "handhelds" from the SMB home doesn't have a "calculators" option.

And "Handheld Devices / Calculators" from www.hp.com doesn't show any of the new models.

I'm sorry, but it's not obvious to me how to get there from here.

But, I assume I'm being impatient -- perhaps things are in a state of flux, what with U.S. availability only now becoming a reality . . .

Re: maybe not "hidden", but how to get there again???

*Message #6 Posted by **martin cohen** on 17 Oct 2003, 8:21 p.m.,*
in response to message #5 by Paul Brogger

The key is to indicate "software and peripherals", not "smb store"!!!

Re: HP 49G+ pre-order available from HP

*Message #7 Posted by **James M. Prange** on 17 Oct 2003, 3:22 p.m.,*
in response to message #4 by Hp Calc Lover

Well, it wasn't me who wrote that it's hidden, but I do think they could've made it a lot easier to find.

Let's see: http://www.hp.com/, now click on "Handheld Devices" to get to http://welcome.hp.com/country/us/en/prodserv/handheld.html, now click on "Calculators" to get to http://www.hp.com/calculators/, and now click on "graphing" to get to http://www.hp.com/calculators/graphing/9g/index.html. There, that wasn't so hard, but this looks as if they haven't released the 49g+ yet; only the 9g is listed. But wait! What if I click on

"buy online from SMB store"? That gets me to http://www.smb.compaq.com/sp_main.asp?hp_url=searchresults.asp?store_id=8&search_id=164&dept_id=1001&dsc=calculators, just scroll down, and glory be! They really do offer the 49g+! How could anyone miss it !?

And with that price so much below the "Manufacturer's Suggested Retail Price", if word does get around, why would anyone buy them elsewhere? So why would anyone else stock them? Great marketing HP! It's not hard to see how HP got to where it is now.

Regards,
James

Re: Thanks for that. (Bot don't overlook the small print ...)
*Message #8 Posted by **Paul Brogger** on 17 Oct 2003, 3:30 p.m.,*
in response to message #7 by James M. Prange

Ahh, yes. I assume the Webmaster is working on updating links as we type . . .

But take a look at that footnote on the $149.99 price;

HP is not liable for pricing errors. If you place an order for a product that was incorrectly priced, we will cancel your order and credit you for any charges. In the event that we inadvertently ship an order based on a pricing error, we will issue a revised invoice to you for the correct price and contact you to obtain your authorization for the additional charge, or assist you with return of the product.

Not exactly a guaranteed price!

Re: Thanks for that. (Bot don't overlook the small print ...)
*Message #9 Posted by **James M. Prange** on 17 Oct 2003, 3:38 p.m.,*
in response to message #8 by Paul Brogger

Yes, I noticed that. If I recall correctly, they had something drastically underpriced not too long ago, so I hope that that's just a "CYA" disclaimer. I doubt that they'd get away with saying "Oops, we really meant $175.99, so either send another $26 or return the product."

Regards,
James

Edited: 17 Oct 2003, 3:39 p.m.

Re: I assume it's a provisional DB entry, perhaps with wrong price.
*Message #10 Posted by **Paul Brogger** on 17 Oct 2003, 3:53 p.m.,*
in response to message #9 by James M. Prange

I'm guessing the web site updating started with a provisional database entry, and perhaps a wild stab at a price. It looks as if none of the to-be-expected HP-48G+ hype is yet to be found on the publicly-available web pages, but a database search returned the 49G+ product entry. (As other parts of the probably-not-even-yet-completely-integrated HP & Compaq web sites get updated, things will get brought more into line.)

It will be interesting to see whether $149.99 is indeed going to be HP Shopping's true price. As you said, undercutting one's distributors doesn't seem to be a wise way to do business.

Re: I assume it's a provisional DB entry, perhaps with wrong price.
*Message #11 Posted by **Veli-Pekka Nousiainen** on 17 Oct 2003, 7:55 p.m.,*
in response to message #10 by Paul Brogger

You mean HP-48G+ => hp 48gII

Re: ... actually, I meant HP-49G+
*Message #12 Posted by **Paul Brogger** on 19 Oct 2003, 7:00 a.m.,*
in response to message #11 by Veli-Pekka Nousiainen

... a slip of the fingers.

This all looked pretty clear, until I was actually able to order by phone -- now it looks as if the price may be correct. Hmmmmmmmmmm . . .

Re: HP 49G+ pre-order available from HP
*Message #13 Posted by **Paul Fox** on 17 Oct 2003, 3:48 p.m.,*
in response to message #4 by Hp Calc Lover

Hm...well my eyes must be duff. Ive looked at that page twice (Handhelds) and still cannot see any reference to calculators.

I visit the main HP calc web site and at present not a mention of the HP49G+.

It is sincerely shameful how much the web masters dont care about the product. I can understand its not as popular as ink refills etc but its a shame....

Maybe I am seeing a different page to other people....

Re: HP 49G+ pre-order available from HP
*Message #14 Posted by **Paul Fox** on 17 Oct 2003, 3:51 p.m.,*
in response to message #13 by Paul Fox

Praise the lord! I didnt realise you needed a Ph.D in web site infiltrating to buy an HP calc. Least not last time I bought one..

must be getting too old....

Look closely at the HP-49G+ keyboard ...
*Message #15 Posted by **Paul Brogger** on 17 Oct 2003, 3:56 p.m.,*
in response to message #14 by Paul Fox

... maybe there's a new "FERRET" command that is used in conjunction with the USB cable and HP's web sites?

Re: HP 49G+ pre-order available from HP
*Message #16 Posted by **Alexander Castro** on 17 Oct 2003, 3:57 p.m.,*
in response to message #14 by Paul Fox

I agree with everyone...I don't know how I found the site...serendipity I suppose. I doubt the webmaster knows how serious this could be.

Re: HP 49G+ pre-order available from HP
*Message #17 Posted by **Hp Calc Lover** on 17 Oct 2003, 4:32 p.m.,*
in response to message #16 by Alexander Castro

Ok everyone who is exited about these. This is what I found. The HP SMB sales site which is easily found at WWW.HP.COM, there is an area for Home and Home office and Small Business (SMB) on the top right side. Click there (SMB)and a series of categories come up in the middle, including HANDHELD devices (isn't a calculator a handheld-yes)? Click there and scroll down, CALCULATORS SHOW UP and an area where it says SHOP for Hp calcs at SMB- Click there and you are in the area where these are sold. Let's face it Calculators will NOT be the first screen anyone see's at HP.COM. Be reasonable they have 10 million different products and this is ONE of a million. Just use common sense about it. Here is the exact link: it gets you right to them! Don't worry about the price, it probably is correct, if not you'll be contacted however compare what the other units sell for- none are list price, I think they call this street price don't they. In any case Enjoy and be happy stop being upset, you can buy one if you want it!!!!

http://www.smb.compaq.com/sp_main.asp?hp_url=searchresults.asp?store_id=8&search_id=164&dept_id=1001&dsc=calculators&c=HPSMBCtr_calculators&n=D_I_DR_X_T_x_GenericNVP&t=ad&r=HP_SMBCtr_O&jumpid=re_R295_store/busproducts/computing/calculators

Re: HP 49G+ pre-order available from HP
*Message #18 Posted by **sv** on 21 Oct 2003, 12:40 a.m.,*
in response to message #16 by Alexander Castro

The HP calculator website URL is:

http://www.hp.com/calculators

You can click on the 49g+ pic under "Graphing Calculators" and it brings you to a "buy online button" right next to the product. This says it is "coming soon" but if you click on "Buy from SMB Online", you will be able to buy from the business store.

Happy shopping.

One additional step to find 49G+ page
*Message #19 Posted by **Matt Kernal** on 17 Oct 2003, 4:22 p.m.,*
in response to message #1 by Alexander Castro

Go check out: www.smb.compaq.com, **select software & peripherals**, and look up HP 49G+. The price is $149.00.

Re: HP 49G+ -- I just ordered from HP . . .
*Message #20 Posted by **Paul Brogger** on 17 Oct 2003, 5:53 p.m.,*
in response to message #1 by Alexander Castro

FYI --

I called the SMB order line (800.888.9909) and entered the required button-pushes. The salesperson couldn't find (!) the HP-49G+ using the typical path, so I offered the manufacturer's number (#F2228#ABA) and voila!

Interestingly, the SMB unit has a physical presence in all 50 states, so I had to pay Washington State sales tax, which sorta' cut into the savings a bit -- as in, completely wiped 'em out and then some!

But his system showed the 49G+ in stock & shipping, so I went ahead.

(Now for the waiting . . .)

Re: HP 49G+ -- I just ordered from HP . . .
*Message #21 Posted by **CalcKidd** on 17 Oct 2003, 8:56 p.m.,*
in response to message #20 by Paul Brogger

I too, just ordered a 49G+... see what happens (?).

I also have a 49G+ and 48GII on order from Samson Cables.

Hopefully, someone will come thru! :-D

Kettleware

*Message #1 Posted by **Ernie Malaga** on 17 Oct 2003, 6:38 a.m.*

I've been following the 49G+ saga with great interest. As the release date keeps being pushed further and further, I wonder if there's a hardware equivalent to the software "vaporware."

Hmm. "Kettleware." Sure describes the 49G+ perfectly. Opinions, anyone?

-Ernie

Re: Kettleware

*Message #2 Posted by **Valentin Albillo** on 17 Oct 2003, 6:48 a.m.,*
in response to message #1 by Ernie Malaga

The 49G+ it's been released in Spain for several weeks now, at some 250 euros or so. Don't know why does it take so long to be released elsewhere ...

Best regards from V.

Faster than the speed of light???!!!

*Message #3 Posted by **Namir Shammas** on 17 Oct 2003, 9:05 a.m.,*
in response to message #2 by Valentin Albillo

Valentin,

I get the impression that HP is subcontracting the new calculator from another (presumably small or smaller) manufacturer. If my assumption is true, then it explains why the new calculators are hitting the market at a speed that exceeds the speed of light (said with tongue and cheek).

Or maybe there is a black hole that appeared near the factory that makes the new HP calculators.

Or .... a more possible explanation ...

A band of fanatic TI calculator gremlins are messing up the production of the new HP calculators.

soooooooooooo ... pick the explaination you like ... or be my guest and throw one of your own making!

Frustrated Buyer for new HP calculator!!

:-(

Namir

PS: Until the new HP calculator arrive I have much time to write silly comments that this one!

PS2 (no this is NOT the PlayStation 2): I am actually busy writing an HP-67 emulator in Windows.

Re: Faster than the speed of light???!!!

*Message #4 Posted by **Paul Fox** on 17 Oct 2003, 12:26 p.m.,*
in response to message #3 by Namir Shammas

Faster than the speed of light...hmm doesnt that mean things start to go backwards...maybe the MBAs at HP are working hard to discover a steam engine...

Me too ... too much time on my hands trying to decide if its worth spending the money....

Maybe I'll start collecting stamps...

Re: Faster than the speed of light???!!!

*Message #5 Posted by **Namir Shammas** on 17 Oct 2003, 2:11 p.m.,*
in response to message #4 by Paul Fox

Paul,

If you find stamps for the HP65, HP67, HP55, and HP41CX drop me a line please!

:-)

Namir

Re: Faster than the speed of light???!!!

*Message #6 Posted by **Veli-Pekka Nousiainen** on 17 Oct 2003, 3:10 p.m.,*
in response to message #4 by Paul Fox

Kjeh, kjeh (G) I have been using the best calculator there currently exists from last month, I also have a hp 48gII in my hands plus a hp 17bII+. The memory in the 17 is good, the currency calc from the 19 has been added, so it's ok. The 48gII has a fast serial port and is best used as a controller, but the 49g+ is the king! the overall speed is very good (like in the 48gII, too) so it just feel snappy. The manuals are a must even for a former 49G user: finally there is a usable manual (even with details in ODE & Matrix calculations. Yammy!) Sorry that you Yankees can't have it yet...aaah! It feels so good to finally have some warp speed....

An HP48/49 CAS question

*Message #1 Posted by **Valentin Albillo** on 17 Oct 2003, 5:01 a.m.*

Hi everybody. Not owning any HP48/49 model, there's no immediate way for me to test this, so I'd appreciate if any of you HP48/49 owners would try this for me and post here the results.

The question is: what result does the HP48/49 symbolic algebra system produce for the following indefinite integral:

```
Integral[ sin(x^n) . dx ]
```

where n is a constant ? Specifically, I'm interested to know if it does produce some kind of exact closed result, in terms of known functions (elementary or not). I'm not interested in Taylor-series-expansion based results or any other non-closed approximations (not to mention purely numerical results).

In case it can't produce a closed result for general, arbitrary n, I would then be interested to know if it can produce a closed result for some particular values of n, and if so, the specific values of n it can solve. I would expect it to be able to produce a closed result for n = 0 and n = 1 at the very least, but what about other values of n, both integer and non-integer (n = 2, 3, ..., 1/2, 1/3, ...) ? What about negative values of n (n = -1, -2, ..., -1/2, ...) ?

Thanks in advance for any results or comments and best regards from V.

Re: An HP48/49 CAS question

*Message #2 Posted by **Werner Huysegoms** on 17 Oct 2003, 7:23 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin. Firstly, the 48 does not dispose of a CAS worth mentioning; And the 49 cannot solve any but the most trivial of these integrals (ie with N=0 or 1). All the rest are simply returned in integral form. Not a great surprise, as for N=2 the result is a Fresnel integral, and for larger n it is expressible as complex incomplete gamma functions, both of which are not builtin to the 49G.

Cheers, Werner

Re: An HP48/49 CAS question

*Message #3 Posted by **Valentin Albillo** on 17 Oct 2003, 9:26 a.m.,*
in response to message #2 by Werner Huysegoms

Werner posted:

"The 49 cannot solve any but the most trivial of these integrals (ie with N=0 or 1). All the rest are simply returned in integral form."

Thanks for replying, Werner, but have you actually tried it on an HP-49, or is your comment just what you think based on your experience ? I would need an actual attempt on the calculator.

"Not a great surprise, as for N=2 the result is a Fresnel integral, and for larger n it is expressible as

complex incomplete gamma functions, both of which are not builtin to the 49G."

But what about non-integer and/or negative values of N ? Have you actually tried some ? Which ? If it cannot deal with values other than N=0 and N=1, it *would* be somewhat of a surprise, at least for me ... Please try it on an actual machine, if you haven't done already so, and tell me what values did you try and what results did it produce.

Best regards from V.

Re: An HP48/49 CAS question

*Message #4 Posted by **rolando** on 17 Oct 2003, 10:11 a.m.,*
in response to message #2 by Werner Huysegoms

Valentín: I have used an HP-49G emulator downloaded from hpcalc.org and I got the following answers:

INTVX(SIN(X^N)) = INT(SIN(EXP(N*LN(X))) RISCH(SIN(X^N),X) = INT(SIN(EXP(N*LN(X)))

I did no try the IBP (integration by parts) command because the function to be integrated must be expressed as a product of functions.

The ROM in the emulator was 1.18

It seems that this is too much for the HP49G CAS.

Rolando

Re: An HP48/49 CAS question

*Message #5 Posted by **hugh** on 17 Oct 2003, 12:39 p.m.,*
in response to message #1 by Valentin Albillo

you're expecting a bit much arent you. these integratals are mostly only in terms of special functions (like complex gamma, sinc, and fresnel) which arent even there. except for the cases n = 0, 1 and 1/2.

interstingly the case n = -1, is close to one of my numerical tests: integrate(cos(1/x), 0, 1) numerically or otherwise. so far no calculator has even got close (-0.0844109505)

Re: An HP48/49 CAS question

*Message #6 Posted by **hugh** on 17 Oct 2003, 2:41 p.m.,*
in response to message #5 by hugh

there's some more. 1/m (m = 1,2...) are also representable since int(sin(x^n), dx) can be solved when int(x^n sin(x), dx) is soluble.

i'd be interested to know if these come out of the 48/49, using alg48, for example.

Re: An HP48/49 CAS question

*Message #7 Posted by **Werner Huysegoms** on 20 Oct 2003, 3:30 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin. I did use a real 49G in the process: n>1 or negative: integral returned n=0,1 OK n=1/2 '2*SIN(SQRT(X))-2*SQRT(X)*COS(SQRT(X))' n=-1/2,n=1/3 integral returned That was in 'real mode'. In complex mode, nothing much changes. For negative n, the integral is split in two parts that are both left

unintegrated, eg for n=-1 I get: 'INT(-(i*EXP(i/Xt)/2),Xt,X)+INT(i/(2*EXP(i/Xt)),Xt,X)'

The Xt stuff is a change of variable and the 4x's way of saying it can't solve the integral.

Cheers, Werner BTW you can play with a 49 yourself using the excellent Emu48 emulator and a 49G ROM, both of which can be found at www.hpcalc.org

Re: An HP48/49 CAS question

*Message #8 Posted by **Valentin Albillo** on 20 Oct 2003, 4:33 a.m.,*
in response to message #7 by Werner Huysegoms

Thanks Werner, it's more or less what I expected and what would be reasonable, by the way. The fact that it manages to solve the n=1/2 case is encouraging.

I've always been somewhat amazed by the fact that sin(sqrt(x)) is elementarily integrable while sin(x^2) is not. One would tend to expect exactly the opposite, as the square root function seems more 'irrational', so to speak, than the simple, polynomial, 'square' function :-)

Best regards from V.

Thermal paper

*Message #1 Posted by **John Dundas** on 16 Oct 2003, 4:15 p.m.*

Probably no surprise to others, but I was pleased to pick up a package of 9 rolls of thermal paper ("for gas pump receipt and credit/debit card printers") at Staples today for $9.95. Works just fine in the 82240A and I'm sure the other similar printers as well.

Specs are 2-1/4" x 85' or 57mm x 26m.

That's a lot better than ebay!

John

Re: Thermal paper

*Message #2 Posted by **Bill (Smithville, NJ)** on 17 Oct 2003, 1:04 p.m.,*
in response to message #1 by John Dundas

John, I've used this paper also and agree it works great and is cheaper than trying to buy original paper.

But - I've been real lucky this year on finding boxes of original HP paper at local ham fests (Amateur Radio Flea Markets). I've picked up about ten full boxes (both older and newer styles) for $1 each. The last ham fest is this weekend, so I'll see if my luck still holds.

Re: Thermal paper

*Message #3 Posted by **Paul Brogger** on 17 Oct 2003, 3:34 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

Another place to watch is the clearance bins/tables at Staples/OfficeMax/OfficeDepot/etc. They all seem to have one or more pre-opened packages, presumably wrong-sized rolls returned for exchange. They're usually Saran-wrapped and ~half-priced.

rom fix for 49G

*Message #1 Posted by **Eric Lundgren** on 16 Oct 2003, 2:04 p.m.*

Recently a post showed up regarding the adjustablity of the time in which the 49g records a key press, I believe the function is "KEYTIME". I have checked my rom version and it was the latest official release from HP, since my 49g isn't in front of me, I will guess and say 1.18. Here's the procedure I tried:

1. Clear stack. 2. Introduce the desired value to the stack, I tried 500. 3. Key in 'KEYTIME', including the ' marks.

When this didn't seem to work, I tried : 500-> 'keytime', and other variants. Will someone please point out the correct variant that I must have missed? Or is this feature only on the unofficial 1.19 rom?

Eric

Re: rom fix for 49G

*Message #2 Posted by **Veli-Pekka Nousiainen** on 16 Oct 2003, 2:58 p.m.,*
in response to message #1 by Eric Lundgren

How about using it from the CATalog? The command to set the value is ->KEYTIME. You will find it more easily (while in the CATalog) by pressing [Right-Shift] [0], which says -> in red.

Batteries?

*Message #1 Posted by **Mike Brady** on 16 Oct 2003, 12:26 p.m.*

I've had difficulty finding alkiline and silver oxide batteries at local retailers, and some battery web sites are outrageously expensive. Anyone know if the site, www.sr44.com , is a good source for batteries? Any suggestions?

Re: Batteries?

*Message #2 Posted by **Tom Cox** on 16 Oct 2003, 12:31 p.m.,*
in response to message #1 by Mike Brady

Have had good success with the batteries I got from that source. Used them in HP-20S, HP-32SII, and HP-42S with no problem. 12345 to delete.

Re: Batteries?

*Message #3 Posted by **John Limpert** on 16 Oct 2003, 2:34 p.m.,*
in response to message #1 by Mike Brady

I recently ordered some calculator batteries from BatteryMart.com. Their prices seem very reasonable if you order 5 or more of a given type. I paid $1.38 each for some Eveready 357s.

Re: Batteries?

*Message #4 Posted by **David Brunell** on 16 Oct 2003, 4:08 p.m.,*
in response to message #1 by Mike Brady

Any good camera shop will have SR/LR 44's. What does it matter what they cost, given the infrequent replacement? ...unless you do a lot of printing of course.

Re: Batteries?

*Message #5 Posted by **Michael** on 17 Oct 2003, 1:24 a.m.,*
in response to message #4 by David Brunell

I bought replacements for my 32S at Radio Shack, bit pricey but I seldom change them.

I'm the one who acquired that completely overpaid Calculator! (Which I actually use for work)

Re: Price on ebay

*Message #8 Posted by **Thibaut.be** on 16 Oct 2003, 3:33 p.m.,*
in response to message #7 by truemondu

There is no reason for being aggressive.

We all one day overpaid an ebay item we really desired... Who did not ?

Re: Price on ebay

*Message #9 Posted by **Frederic** on 16 Oct 2003, 4:11 p.m.,*
in response to message #8 by Thibaut.be

You are right, i overpaid ofen on eBay for calculators ... But not over 100$ for a paper brochure indee... But i can understaand it's easy to get crasy with eBay : HP offers is less than the demand so....

Re: Price on ebay

*Message #10 Posted by **truemondu** on 16 Oct 2003, 4:15 p.m.,*
in response to message #8 by Thibaut.be

...if there is anything agressively in my statements then I apologize for all exclamation points that I typed...

...by the way, could you or my "new friend" Matthias sell a really virginal HP-41CV with memory-, time-, and Schenk modul, mint original manuals in its original boxes for less than 500US$?

Re: Price on ebay

*Message #11 Posted by **Raymond Del Tondo** on 16 Oct 2003, 8:01 p.m.,*
in response to message #10 by truemondu

It depends.

The NIB CX's from last year first went for about 75 EUR, and two years ago a complete Schenk module went for about 50 EUR. Of course this was before the price inflation;-) I think it's a mixed calculation. Sometimes you get an item for that much, sometimes nearly for free. So the medium price over time may be moderate.

However, there are some really rare HP-41 related items which I wouldn't let go for less

than you paid for the mentioned set. Interested?

Raymond

Re: Price on ebay

*Message #12 Posted by **Matthias Wehrli** on 17 Oct 2003, 12:47 a.m.,*
in response to message #10 by truemondu

Shure I could sell a virgin CX with Bobby Schenk module, I can do this several time cause I have thm all on stock, but I do not sell them to a aggressive person like you!

Schenkmodul

*Message #13 Posted by **Stephan** on 17 Oct 2003, 2:56 a.m.,*
in response to message #12 by Matthias Wehrli

Hi Matthias - I would be really interested in one of your Schenkmodules. But first let me know about the price(-range). I stepped in to a "Fettnäpfli" before remember the diagnostic module? By the way, did you get it at last? Looking forward hearing from you soon. Gruss Stephan

I encourage folks to check out Warren Furlow's HP41CX emulation. This babe has NO key problems, NO battery corrosion, NO display problems, AND NOOOOOO COST!

Also, you can read and write programs to you PC. Now that is a class act!

Namir

PS: DID I MENTION THE EMULATOR IS FREE????

:-)

Warren Furlow's HP41CX emulation

*Message #18 Posted by **David Brunell** on 16 Oct 2003, 11:14 p.m.,*
in response to message #17 by Namir Shammas

I was thinking that a nice feature for the emulator would be the ability to use the keyboard for input. The TI-59 emulator allows this. :p In fact, if all 41CX keys were mapped, then you could get one of those customizable PC keyboards and recreate the 41CX's keyboard.

Next on the wish list would be the ability to resize it (a 2X switch would be fine). On high-resolution screens, the calculator gets pretty small.

David

Re: Warren Furlow's HP41CX emulation

*Message #19 Posted by **Veli-Pekka Nousiainen** on 17 Oct 2003, 3:44 a.m.,*
in response to message #18 by David Brunell

Where is that emulator? URL? I would like to try it at 2048*1536 resolution (21" Sony F520)

Re: Warren Furlow's HP41CX emulation

*Message #20 Posted by **Massimo Gnerucci (Italy)** on 17 Oct 2003, 5:58 a.m.,*
in response to message #19 by Veli-Pekka Nousiainen

Cannot post URL here...

Anyway it's still quite usable @ 1800x1440.

Massimo

Re: Warren Furlow's HP41CX emulation

*Message #21 Posted by **Veli-Pekka Nousiainen** on 17 Oct 2003, 3:02 p.m.,*
in response to message #20 by Massimo Gnerucci (Italy)

I have the URL, and I downloaded the V41. Can someone please send me the LCD4.TTF font file, it was broken...BIG is good at 2048, but HUGE would be even better...

Re: Warren Furlow's HP41CX emulation

*Message #22 Posted by **Richard Garner** on 18 Oct 2003, 1:00 a.m.,*
in response to message #21 by Veli-Pekka Nousiainen

If you go to Warren's website and go to the all emulators download section, you will find a download for the fixed LCD4.TTF for Windows 2000 SP4 and up.

Re: Warren Furlow's HP41CX emulation

*Message #23 Posted by **David Brunell** on 20 Oct 2003, 12:50 a.m.,*
in response to message #18 by David Brunell

My mistake! I was using ev41 and not V41. Everything is much better now. :)

Re: Price on ebay

*Message #24 Posted by **Pavel Korensky** on 17 Oct 2003, 7:36 p.m.,*
in response to message #17 by Namir Shammas

The emulators are perfect. But...

Firstly, there is no value for collector to own the emulator. Secondly, you cannot take the emulator in your pocket and have a good calculator anywhere you go. For me, the main problem with emulators is, that I am not able to use them when I am working on PC. Of course, I have both HP-41 and HP-16C emulators in Start/Accessories/ menu of WinXP, but when I need to calculate something, it is more confortable for me to grab a real calculator.

And one more argument against emulator. It is almost impossible to take bunch of papers, pencil, HP-16C emulator and go to the toilet, where I finally have enough time and peace to think if my newest ASM routine will work. :-)

Re: Price on ebay

*Message #25 Posted by **Ed Look** on 17 Oct 2003, 7:45 p.m.,*
in response to message #24 by Pavel Korensky

Nice to know I have company in the washroom. But make sure I don't leave my HP manuals behind when I leave!

Re: Price on ebay

*Message #26 Posted by **Veli-Pekka Nousiainen** on 17 Oct 2003, 7:58 p.m.,*
in response to message #24 by Pavel Korensky

"Secondly, you cannot take the emulator in your pocket and have a good calculator anywhere you go"

You can - if your emulator runs on a HP48/49 [or - without a proper keyboard - a Palm/PPC, etc. device]

Re: Price on ebay

*Message #27 Posted by **james (UK)** on 18 Oct 2003, 4:31 a.m.,*

Help, 48G+ serial pins got pushed in.

*Message #1 Posted by **Matt Kernal (US)** on 15 Oct 2003, 12:36 p.m.*

I did a bad, bad thing. I misaligned the 4-pin serial cable connector with the mating connector on my 48G+ and pushed the calculator's 4 pins in too far! I pulled them back out with a needle-nose pliers, but the calculator won't communicate serially anymore.

I guess I have no other choice but to open it :-(so I can re-solder the pins on the inside. With all the different instructions of how to disassemble a 48, can anybody recommend the best, first choice method? Or should I send it to someone that has experience? Upgrade memory at the same time to 256KB+ (currently has 128KB)?

Calling all advisors.. Thx.

Matt

Re: Help, 48G+ serial pins got pushed in.

*Message #2 Posted by **bill platt** on 15 Oct 2003, 1:46 p.m.,*
in response to message #1 by Matt Kernal (US)

Hi Matt,

Well, I have copies at least three different methods that I have found. One of the methods reportedly will work without having to drill any holes. I took apart a 48G with a method requiring sokme cutting and drillig, and it worked out OK but it sure would be nice to do it without leaving a loose body and all the holes!

I will look for these files, and fwd them to you.

BTW, I had a pin push in, too, but pulled it right out with pliers and all is fine. I have a very nice new cable made by Konstantin Lysenko, and it has a little "arrow" to show the way, and it fits snugly, so I hope I don't make the misalignment again!

regards,

Bill

Re: Help, 48G+ serial pins got pushed in.

*Message #3 Posted by **Matt Kernal (US)** on 15 Oct 2003, 4:58 p.m.,*
in response to message #2 by bill platt

>it sure would be nice to do it without leaving a loose body and all the holes!

Exactly.

>I will look for these files, and fwd them to you.

Thanks. I believe there are a couple procedures at hpcalc.org too. I need to take a look at them.

>BTW, I had a pin push in, too, but pulled it right out with pliers and all is fine.

Sounds like you were lucky and pushed the shield pin in.

Re: Help, 48G+ serial pins got pushed in.

*Message #4 Posted by **Victor Koechli** on 16 Oct 2003, 6:18 a.m.,*
in response to message #2 by bill platt

Can you publish these files for all of us? I'd be interested specifically in the method of opening a HP 48 without any drilling...

Thanks, Victor

Re: Help, 48G+ serial pins got pushed in.

*Message #5 Posted by **Ed Look** on 15 Oct 2003, 3:03 p.m.,*
in response to message #1 by Matt Kernal (US)

You might want to try Randy Sloyer at FixThatCalc.com. I believe his specialties are the 48's, both the S and G series, and the Pioneer series machines (32SII, 42S, 20S, etc.) He sometimes posts here and his site and e-mail addresses are listed somewhere on one of the pages of this Museum site.

Re: Help, 48G+ serial pins got pushed in.

*Message #6 Posted by **Matt Kernal (US)** on 15 Oct 2003, 5:08 p.m.,*
in response to message #5 by Ed Look

Thanks for mentioning Randy. I see his repair pricing is pretty reasonable- $39.

I'll have to ask him if he can upgrade memory as well. My feelings are that it could get too expensive to justify (especially cause I'm savin' for a 49G+).

Matt

                   2*a+b+3*c=6
                   5*a-b+4*c=8
                  -3*a+2*b-c=-2

DESTROY ALL @ OPTION BASE 1 @ DIM A(3,3),B(3),X(3)
MAT INPUT A,B
                  2,1,3,5,-1,4,-3,2,-1,6,8,-2 [ENTER]

MAT X=SYS(A,B) @ FIX 4 @ DELAY 0.5,0.5 @ MAT DISP X

-------------------------------------------------------------------------------
|               RAICES E INTEGRALES DE POLINOMIOS Y OTRAS FUNCIONES           |
-------------------------------------------------------------------------------

X=FNROOT(A,B,FNF(FVAR))

   Calcula la raiz real comprendida entre A y B de la ecuacion FNF(X)=0
   dada por el usuario. Si no existe, calcula el minimo de la funcion en
   ese intervalo. Se pueden anidar hasta 5 llamadas a FNROOT, pudiendo
   asi resolver sistemas de ecuaciones no lineales con hasta 5 incognitas
   o bien determinar maximos y minimos de una funcion de hasta 5 variables.

   FVAR   representa la variable de la funcion,y contiene su valor. Debe
          emplearse en la definicion de la ecuacion en lugar de la incognita.
   FVALUE es el valor de la funcion en la raiz. Debe ser 0 o casi 0, si es
          una raiz. Sino, la X hallada es un minimo de la funcion.
   FGUESS es la aproximacion anterior a la raiz

   Nota: la ecuacion a resolver puede estar definida:

         - en la propia llamada    : X=FNROOT(1,2,FVAR^3-FVAR-1)

         - en una funcion definida : X=FNROOT(1,2,FNF(FVAR))

               donde se supone  que existe una funcion definida de una
               sola linea o multilinea que define la ecuacion:

                    10 DEF FNF(X)=X^3-X-1
```

X=INTEGRAL(A,B,P,FNF(IVAR))

Calcula la integral entre A y B de la funcion FNF(X) dada por el usuario con la precision P. Al terminar, aparte del valor de la integral, se puede utilizar IBOUND, que da el valor maximo del error cometido. Se pueden anidar hasta 5 llamadas a INTEGRAL, lo cual permite calcular integrales multiples de hasta 5 variables.

IBOUND da el valor maximo del error, si es negativo no hubo convergencia
IVAR representa la variable de integracion, y almacena su valor. Debe emplearse en la definicion de la integral en lugar de la variable de integracion.
IVALUE es el valor de la ultima integral calculada

Nota: la funcion a integrar puede definirse:

- en la propia llamada : I=INTEGRAL(0,1,1E-5,SIN(IVAR)*COS(IVAR))

- en una funcion definida: I=INTEGRAL(0,1,1E-5,FNF(IVAR))

donde se supone que existe una FNF asi:

```
10 DEF FNF(X)=SIN(X)*COS(X)
```

Nota: INTEGRAL puede emplear FNROOT en la definicion de la funcion, y viceversa, de forma que es posible

- resolver ecuaciones en las que aparecen funciones definidas por integrales

  ej: hallar la x que corresponde a un valor dado de la probabilidad definida por una campana de Gauss

- integrar funciones implicitas

  ej: integrar la funcion definida por X^3+Y^3-3*X*Y=0 (folio de Descartes) entre 0 y 1

MAT R=PROOT(P)

Dado el vector P, que contiene los coeficientes de la ecuacion polinomica de cualquier grado cuyas raices queremos hallar, calcula todas las raices reales y/o complejas, y las coloca en el vector complejo R.

Ejemplo: Hallar todas las raices de la ecuacion

x^5-3*x^4+8.1*x^2-1.37=0 (5 raices, 6 coeficientes)

```
DESTROY ALL @ OPTION BASE 1 @ DIM P(6) @ COMPLEX R(5)
MAT INPUT P
              P(1)=?   1,-3,0,8.1,0,-1.37 [ENTER]
```

```
   MAT R=PROOT(P) @ FIX 4 @ DELAY 0.5,0.5 @ MAT DISP R

-------------------------------------------------------------------------------
|                       SERIES Y TRANSFORMADAS DE FOURIER                     |
-------------------------------------------------------------------------------

MAT Z=FOUR(B)

   Calcula la transformada directa o inversa, o la serie de Fourier de una
   serie de datos almacenados en la matriz B, y coloca el resultado en la
   matriz Z.
```

Re: HP-71 Math Pac Manual [LONG][SPANISH]

Valentin,

mil gracias por tu pronta y efectiva respuesta. Efectivamente esto me encauza por el buen camino a descubrir este modulo.

Saludos desde la selva negra, AM

Un par de ejemplos [SPANISH]

*Message #4 Posted by **Valentin Albillo** on 16 Oct 2003, 6:40 a.m.,*
in response to message #3 by Angel Martin

Celebro que te sea util, Angel. Aqui te adjunto un par de ejemplos de elaboracion propia, para que veas mejor como se usan de forma anidada las potentes funciones "solve" (FNROOT) e "integrate" (INTEGRAL) que este maravilloso ROM proporciona.

Saludos de V.

```
Ejemplo de integral doble (82 bytes):
-------------------------------------

  Calcular la integral doble entre [1,2] y [3,4] de la
  funcion z = 1/(X+Y)^2

  10 DEF FNF(X,Y)=1/(X+Y)/(X+Y)
  20 DEF FNG(X)=INTEGRAL(1,2,.001,FNF(X,IVAR))
  30 DISP INTEGRAL(3,4,.001,FNG(IVAR))

     RUN -> 4.08219617611E-2

  El valor exacto es Ln(25/24) = 4.08219945235E-2. Con
  la tolerancia 0.001 hemos obtenido 6-7 cifras correctas.
  Este ejemplo tambien podria hacerse directamente desde
  el teclado, sin necesidad de lineas de programa.

Ejemplo de resolucion de un sistema de dos ecuaciones
no lineales con dos incognitas (135 bytes)
-------------------------------------------------------

  Resolver el sistema:
```

```
             sin(x+y) = x
             cos(x-y) = y

  1 RADIANS
 10 DEF FNF(X,Y)=X-SIN(X+Y)
 20 DEF FNG(X,Y)=Y-COS(X-Y)
 30 DEF FNY(X)=FNROOT(1,5,FNF(X,FVAR))
 40 X=FNROOT(1,5,FNG(FVAR,FNY(FVAR)))
 45 Y=FNY(X)
 50 FIX 5 @ DISP X;Y

    RUN -> 0.93508   0.99802

           X-SIN(X+Y) -> 2.00000E-12
           Y-COS(X-Y) -> 3.00000E-12

    Hemos especificado que las raices se busquen en el
intervalo [1..5], y los valores obtenidos son exactos
hasta 12 cifras (aunque solo mostramos 5). Para otras
ecuaciones o sistemas mas grandes (hasta 5 ecuaciones
simultaneas), se generaliza sin problema.
```

Reverse Engineering HP Solve [long]

*Message #1 Posted by **Patrick** on 15 Oct 2003, 3:28 a.m.*

For the past couple of months I've been engaged in the rather fun intellectual exercise of trying to reverse engineer the HP Solve algorithm, as found on the HP-34C and HP-15C (experiments suggest it is the same). My source material for this effort is primarily the HP Journal article by William H. Kahan on the implementation of Solve for the HP-34C. Very similar discussions appear in other HP literature, such as the HP-15C Advanced Functions Handbook.

After writing a program for the HP-11C which incorporates *most* of the details described in those articles, I wised up and realized that I first ought to build a spreadsheet which implements the algorithm correctly. The spreadsheet is a bit cumbersome as a programming language, but at least I was not restriced to fitting the "program" in to the relatively meager amount of resources offered by the 11C.

In Kahan's article, he uses several examples to illustrate how Solve behaves based on the following family of function:

```
f(x) = exp(x) + A*x + B
```

for various values of A, B and starting guesses.

I was successful in building a spreadsheet which generates the exact (well, almost exact) sequence of root approximations for those problems as does the HP-34C or HP-15C. To say the least, I was very happy there for a while. The spreadsheet correctly computes the secant approximation and takes into account most of the algorithm features described by Kahan.

There is a feature, though, which Kahan describes as *bending the secant*. This happens when a root has been *bracketed* between two guesses but the secant method, used blindly, would land you outside of those brackets. Alas, none of the problems he gives in the article need to bend the secant in order to find a root. Once I found a problem which did have to bend the secant, my spreadsheet results diverged from those produced by my calculators.

Sigh.

So, here I am with a plea to the HP calculator community. If anyone is aware of *any* details regarding the HP Solve algorithm, especially in regards to bending secants, I would be quite grateful for a hint! Dr. Kahan, are you out there? ;-)

in response to message #1 by Patrick

Patrick: could you publish the spreadsheet as it is, please? VPN

Re: Reverse Engineering HP Solve [long]

*Message #3 Posted by **Patrick** on 15 Oct 2003, 4:29 p.m.,*

in response to message #2 by Veli-Pekka Nousiainen

Yes, I will publish the spreadsheet but I would *really* like to get it to be much more faithful to the HP Solve algorithm first. I would also have to write a mess of documentation for it. I wrote this thing for my own use. To get it to the point where it would useful to others is a job.

My question to you all is, what is the appropriate medium for publication? There is also the HP-11C program which implements the algorithm (to some degree!). Maybe our esteemed Curator would like to weigh in on this?

Re: Reverse Engineering HP Solve [long]

*Message #4 Posted by **Bruce Horrocks** on 16 Oct 2003, 10:16 a.m.,*
in response to message #3 by Patrick

> My question to you all is, what is the appropriate medium for publication?

I would be very happy to publish your discoveries in Datafile (www.hpcc.org) if you are willing to write them up in article form.

Bruce <mailto:editor@hpcc.org_sans_spam>

Re: Reverse Engineering HP Solve [long]

*Message #7 Posted by **Herman** on 15 Oct 2003, 8:35 a.m.,*
in response to message #1 by Patrick

Can the spreadsheet solve f(x) = cos(nx), where n is an integer, given initial guesses a = 0 and b = 2PI/n ?

Re: Reverse Engineering HP Solve [long]

*Message #8 Posted by **Patrick** on 15 Oct 2003, 4:56 p.m.,*

in response to message #7 by Herman

Well, no and ... yes.

Of course, as Kahan points out in his Solve article, any algorithm which depends upon function sampling can be led astray by a careful selection of the function.

Your example, though, is problematic to the HP Solve algorithm due to the mulitples of pi/n that the algorithm tends to generate. The culprit here is the number 100 in the part of the algorithm which makes the restriction:

```
|x3-x2| <= 100 |x2-x1|
```

See Kahan's article for a reference to this. The number 100 is problematic for your example mostly because it is an integer. If I change my spreadsheet to use the number 99.67 instead, it brackets a root and, therefore, eventually converges to it.

I just want to point out that my intent is to reverse engineer the existing HP Solve algorithm, as it is found on the HP-15C. My intent is not to build a better Solver (that would be considered "Phase 2" ;-).

Re: Reverse Engineering HP Solve [long]

*Message #9 Posted by **Patrick** on 15 Oct 2003, 4:59 p.m.,*
in response to message #8 by Patrick

BTW... it occurs to me that precisely the sort of circumstance exhibited by your example is what might have led HP to introduce the randomization I referred to in my initial post.

Solve in HP48

*Message #10 Posted by **Mike (Stgt)** on 15 Oct 2003, 9:20 a.m.,*
in response to message #1 by Patrick

Pls allow me a subject drift to the solver of HP-48GX. A colleague just asked me if the algorithm is available. He has written one in C that up to now never failed where the one from the HP48 did. (Well, I'll give him some patholotic functions that are known to fool every solver like

```
y = 3*SQ(x) + LN(SQ(PI - x))/SQ(SQ(PI)) + 1
```

) Now he wants to see how HP did implement SOLVE on the HP48.

TIA.....Mike

Re: Reverse Engineering HP Solve [long]

*Message #11 Posted by **David Brunell** on 15 Oct 2003, 10:44 a.m.,*
in response to message #1 by Patrick

Why not look at a 41C Advantage or Math Pac listing? I think the algorithm is pretty close to the 15C.

Re: Reverse Engineering HP Solve [long]

*Message #12 Posted by **Mike (Stgt)** on 15 Oct 2003, 11:12 a.m.,*
in response to message #11 by David Brunell

IFAIK, in the Advantage it's written in MCode. PPCROM would be a good idea as it comes with a very complete manual, no - documentation!

But I assume the algorithms in other HP calculators vary in some respects.

Re: Reverse Engineering HP Solve [long]

*Message #13 Posted by **Patrick** on 15 Oct 2003, 4:31 p.m.,*
in response to message #11 by David Brunell

I have the Advantage Pac, but the Solve algorithm is written in assembler. It is not listable as a normal HP-41C program. Of course, if I had such a listing, my reverse engineering job would be somewhat moot! I don't know if that would be a good thing or a bad one...!

Re: Reverse Engineering HP Solve [long]

*Message #14 Posted by **J-F Garnier** on 16 Oct 2003, 8:00 a.m.,*
in response to message #13 by Patrick

You can have a look at the Advantage Solve code with any emulator that supports ROM modules and have a disassembly function (for instance, my Emu41 :-)

Please post *details*, i.e: exact "problem which did have to bend the secant", your exact and complete spreadsheet's results for said example, same for the actual calculator's results.

If you've got more than one "secant-bending" example available, the more the merrier.

Best regards from V.

Re: Reverse Engineering HP Solve [long]

*Message #16 Posted by **Patrick** on 15 Oct 2003, 3:13 p.m.,*
in response to message #15 by Valentin Albillo

To see the effect of the bent secant characteristic of HP Solve, try the following experiment. Using an HP-34C or an HP-15C (other calculators may use the same algorithm, I have not verified any others yet), key in a program which consists of a single instruction, R/S, sandwiched between a label and a RTN:

```
LBL A
R/S
RTN
```

This program forms my lab bench upon which I perform experiments on Solve. If you run "Solve A" the program will stop each time it calls your "function". The program simply waits for you to look at the x

value in the display and type in the y value you want to correspond to it. You then press R/S to continue the Solve algorithm.

Using this technique, you can present the algorithm with any sort of situation you like, without having to craft some sort of mathematical function that does it for you.

With this setup, start Solve running with initial guesses x1=1 and x2=-1 (1, ENTER, CHS, SOLVE A). When your program stops to get y values, suppy the values y1=1 and y2=-1 (i.e., just press R/S each time). Of course the secant line between these two points lands you smack dab at the origin, so the next x point you'll be asked about is x3=0. Well, not quite. There is a certain amount of what can only be described as *randomization* inserted by HP Solve, so what you get is an x3 value *near* zero. For this x value, whatever it is, supply the y value y3=-0.8.

So far, you've given the algorithm three points to consider: (1,1), (-1,-1), and (0, -0.8). Note that the first two x values already *bracket* the root, since the corresponding y values are of opposite signs. The brackets become *tighter* once you know that the value of the function at zero is negative. Now the root should lie between 0 and 1. However, if you try to draw the secant line between the second and third points, the resulting x value is x4=4, outside of the brackets. This is where the bending of secant should take place, so as to guarantee x4 stays between the brackets: $0 < x4 < 1$.

My spreadsheet uses the following algorithm: If the secant method lands you outside the brackets, pick the midpoint of the brackets for the next trial. In this case, my spreadsheet would choose x4=0.5. The HP Solve algorithm on my HP-15C doesn't do this. It selects x4=0.6997201114.

My question is, how is that strange number selected?

In fact, after an initial period of experimentation, I believe that the HP Solve algorithm has computed:

```
x4 = base + randomizer
```

where base=0.7 and the randomizer is on the order of (5e-4 * base). I have an inkling as to why the randomization is included, but it is still pretty foggy to me.

Anyhow, why 0.7? That is my question.

Using this technique, one can generate any number of examples of when the bent secant algorithm is needed. Using a series of experiments, I have determined that:

- The x4 value scales linearly in x1 and x2 (i.e., replace x1 by c*x1 and x2 by c*x2 and the x4 value changes to c*x4)
- The x4 value scales linearly in y1 and y2.
- The x4 value does not depend on a value of x and y previous to (x1,y1).

I have computed the value of x4 for a host of values of y3 and have plotted the results, but don't have a functional relationship there yet. Still trying...

in response to message #16 by Patrick

Aha! Now I've got the point. Alas I can not tell you the solution right away.

Ciao.....Mike

Re: Reverse Engineering HP Solve [long]

*Message #18 Posted by **hugh** on 15 Oct 2003, 5:46 p.m.,*
in response to message #16 by Patrick

im wondering if its fitting some parabola to the points. according to the manual, it sometimes fits a parabola then takes the x value where this curve is min or max.

for (-1,-1),(0,-0.8),(1,1) i get y = 0.8x^2+x-0.8 using this directly for y = 0, gives x = 0.5542 and it mimimises at x = -0.625, neither of which give 0.7

inverse quadratic interpolation (brents method) gives x4 = 2.222 (out of range) and ridders method gives x4 = 0.6247

ridders method is pretty good btw, i'd recommend it as a possible improved algorithm.

Mystery Solved

*Message #19 Posted by **Patrick** on 23 Oct 2003, 1:45 p.m.,*
in response to message #16 by Patrick

Just wanted to let people know that I've solved this little mystery. I am now quite certain the "true" value in the example I illustrated was, in fact, 0.7. Referring to figure 6 in Kahan's article on the HP-34C Solve algorithm, I believe the following alogorithm is used to bend the secant (I write a, b,c,... instead of the Greek letters alpha, beta, gamma, ...):

Let

```
r = (a-c)/(s-c)
```

Where s is the place line 1 in that figure intersects the x axis. Thus, s is the place where the secant method would bring us to if we *didn't* bend the secant. Set r=0 if the line never intersects the x axis. We see that r is the ratio between the size of the best known brackets for the root and the distance the secant method wants to travel from the previous best estimate for the root (which is c). The HP-34C and HP-15C use the following formula for where the secant should be bent:

```
d = c + (a-c)*t
```

where

```
t = (2-r)/(3-2*r)
```

Applying this to the example I gave, c=0, a=1, s=4, so r=0.25 and t=0.7, as advertized.

As I mentioned in my previous post, this is not exact. There is some randomization added in. I doubt that I'll ever be able to figure out the formula for that since the effects are quite small.

Wanting Info on Monroe "Educator" Mechanical Adding Machine

*Message #1 Posted by **Paul Brogger** on 14 Oct 2003, 5:21 p.m.*

Is anyone here, or does anyone know of, a source of information on the Monroe "Educator" mechanical adding machine?

There is no model # on the outside, but I'll look for one in the next few days when I open it up.

I just now picked it up and haven't found anything with a few quick Google searches. If anyone knows something or where to look, I will appreciate hearing from you.

Thanks . . .

Re: Wanting Info on Monroe "Educator" Mechanical Adding Machine

*Message #2 Posted by **Charlie O.** on 14 Oct 2003, 6:07 p.m.,*
in response to message #1 by Paul Brogger

Go here and find Calclist-T and subscribe.

http://www.webcom.com/calc/

There are many links to other sites as well. To use it simply enter the numbers by pressing the keys and turn the large crank. The small crank at the end of the carriage clears the registers and the T crank on front is the carriage shift. Reprints of instructions are available from Office Machines Americana in Idaho.

Re: Thanks for the leads . . .

*Message #3 Posted by **Paul Brogger** on 15 Oct 2003, 10:12 a.m.,*
in response to message #2 by Charlie O.

It seems that in early searching I was too focussed on the "Educator" model name -- searches for "monroe adding machine" & the like gave relevant results -- not surprisingly, some of them right here at the MoHPC.

I also found record of an eBay sale of a similar item, though *that* one appears to have been much more complete and probably in better condition that is the one I found. (Mine appears older, with red & gold block letters for the company logo, but is missing its large right-hand crank.)

I'll check the references you've given. Thanks again.

hp71 32k CMT Ram Module troubleshooting

*Message #1 Posted by **Andy** on 14 Oct 2003, 5:07 p.m.*

I took a chance and bought an "untested" 32K CMT ram module recently. Well, its tested now and its not working :(Guess that makes the price/Kb infinite.

I have disassembled the module. All of the contact fingers look good. There are two potted ic's and a single memory chip (NEC 8616K910 D43256G-15L).

What are the chances its the memory chip? Is that easily replaceable?

Thanks,

Andy

HP41CV cardreader

*Message #1 Posted by **Karel Marchena** on 14 Oct 2003, 9:01 a.m.*

I repaired the cardreader with fuel line and it runs o.k. but gives a card error massage each time after reading the magnetic card. I resized the register to 026 so this is o.k. too, but still gives the error massage. I realised that I switched the black electrical wire with the orange wire. Maybe I damaged the cardreader doing so?. After having this problem I switched it back. The cardreader still gives the error masage. Maybe I need to buy a new cardreader? Is there anyone who has a cardreader?Please advise. Thanks Karel

Re: HP41CV cardreader

*Message #2 Posted by **David Smith** on 14 Oct 2003, 12:40 p.m.,*
in response to message #1 by Karel Marchena

Switching the head wires should not damage the reader. Make sure that the black and red motor wires are routed as far from the head as possible.

HP49G Connectivity

*Message #1 Posted by **Neil Strickland** on 14 Oct 2003, 6:55 a.m.*

Dear All, My HP 49G displays the message "Awaiting Server Cmd" but the PC connectivity kit(ver 3.0r4 running on Windows XP Pro) fails to "Connect to the Calculator" and "Get calculator information". The lower pane on the PC connectivity kit screen just displays "double click to try to connect" and I get the same errors above when I try to do so. I am able to print screen dumps from the calculator to the PC so I know the connection is okay. Has anyone got any suggestions?

Regards, Neil

Re: HP49G Connectivity

*Message #2 Posted by **Victor Koechli** on 14 Oct 2003, 7:27 a.m.,*
in response to message #1 by Neil Strickland

Make sure the port settings (speed, baud rate, parity etc) are the same as on your HP and that you select the correct port.

Cheers, Victor

OOPs sorry.

Re: HP49G Connectivity

*Message #14 Posted by **James M. Prange** on 14 Oct 2003, 8:27 p.m.,*
in response to message #1 by Neil Strickland

I've occasionally had this happen. Doing a "Restart" on MS Windows 98SE always seems to get it working again for me. I'm not positive, but I think that connecting to the calculator with HyperTerminal (and then disconnecting HyperTerminal) has fixed it too. I'm guessing that for some reason MS Windows "thinks" that that COM port is already in use.

Re: HP49G Connectivity

*Message #15 Posted by **Neil Strickland** on 15 Oct 2003, 8:05 a.m.,*
in response to message #14 by James M. Prange

Thanks guys, I still can't work out why I can do a calculator screen dump to the PC yet it tells me it has failed to connect. I'm obviously doing something wrong. I will persevere (or perish trying!!)

Re: HP49G Connectivity

*Message #16 Posted by **Victor Koechli** on 16 Oct 2003, 7:24 a.m.,*
in response to message #1 by Neil Strickland

I've tried the new version (3.04) in the meantime, it works without any problems with both my HP 48G+ and 49G.

Some thoughts to consider:

- Make sure that the COM port your calculator is connected to is actually enabled, as suggested by Tizedes Csaba.

- Make sure the COM port you're thinking of is the one you're actually using. I know it sounds silly, but maybe you think you're on port 1 when it's actually port 2.

- Check if any other application (e.g. fax software or the program to make screen shots from your HP) is using that port, preventing HPComm from using it. If so, disable them and try again.

- Make sure you actually use Kermit. Start the server on you HP by pressing and holding right-shift, then pressing right arrow. On my 1.19-5 ROM, not holding right-shift when pressing right arrow starts the Xmodem server instead. It should say 'Awaiting server command' in the display.

- Check if translation (Newline) and checksum (3) settings are the same as in HPComm.

- Delete any IOPAR variables sticking around to revert to the calculators defaults, and move to the home

diretory before starting the server.

Hmmm.. can't think of any more right now. Tell us if you succeed. Good luck!

Cheers, Victor

One more thing..

*Message #17 Posted by **Victor Koechli** on 16 Oct 2003, 7:30 a.m.,*
in response to message #16 by Victor Koechli

.. just crossed my eyes: On HP's website there is no mentioning of Win XP, just older versions up to 2000. Maybe someone else can comment on this? I'm using 2000 myself, which obviously works OK.

Cheers, Victor

HP-41 MCODE re-entry question

*Message #1 Posted by **Ángel Martin** on 14 Oct 2003, 3:32 a.m.*

Dear fellow M-Coders,

Does anyone know whether re-entry is possible at all?

I've coded a multi-function routine, which isn't more than normal prompting function that redirects the execution to a series of sub-functions, depending on the input suffix.

Some may recognize this being done on the HEPAX ROM, as a mean to break over the 64-function limit imposed by the FAT constrains.

My contribution to the scheme has been a "catalog" of the subfunctions, triggered with the suffix zero. It currently ends after displaying all the sub-function names, but I'd like it to re-issue the multi-function routine, now with the names fresh in the user's mind.

So, any chance to get it done?

Best, ÁM

Funny story

*Message #1 Posted by **Pavel Korensky** on 13 Oct 2003, 9:57 p.m.*

This night, I had a really funny time with my HP-41CV. I was reading some materials about HP-41 synthetic programming on my PC and I played with my HP. Suddenly, the calculator died. Totally. No ON, no "Memory lost", nothing.

Hmmm, it seems that the batteries died. So I put a fresh set of batteries into the calculator and.... Nothing. So, I removed the batteries, short contacts for couple of seconds, put the batteries back in, switched ON and... Nothing.

At this time, I started to be a little nervous. Maybe I finally discovered how to fry the HP-41 via synthetic programming. :-)

I took the calculator to my workshop, disassembled it and I tried to short a capacitor. I assembled the HP together, put the batteries in, switched ON and... Nothing.

I disassembled the calculator once more and I applied 6V from my power supply directly to the PCB. Switched on and bingo, the HP works again. So I tried to look at the flexible PCB battery contacts. Yes, there was a big crack in the flex PCB, just at the + battery contact. It seems that it was just a coincidence that the calculator finally died during my experiments with synthetic programming.

So, it was necessary to repair the battery contact. I used the following method (I do not know is this method was posted here in the past. If not, maybe I should call my patent lawyer :-)))

Those flexible PCBs are made on Kapton foil. It means that you can solder them without any problem, because the Kapton will not melt. You only need to solder quickly, otherwise the plastic parts around will start to melt. I have a couple of thin copper foils in my workshop. I bought them couple of years ago from McMaster-Carr. They are 0.05 mm thick. I cut a small piece (approx. 7 x 3 mm) of the copper foil, applied a lot of SMD flux (from the flux pen) to it on both sides and with the soldering iron, I put a small amount of solder on both sides. After that, I put a good amount of flux to the battery contact and applied a small amount of solder on them. Finally, I put the foil to the contact and applied a small amount of heat to it. The foil was nicely soldered to the flexible PCB and the contact is like new. :-)

Re: Funny story

*Message #2 Posted by **Victor Koechli** on 14 Oct 2003, 2:47 a.m.,*
in response to message #1 by Pavel Korensky

Maybe synthetic programming uses *a lot* more power, so that may have killed your battery contact ;-)

Thanks for the repair tips. Do you think that spice calculators could be fixed the same way? If so, it really may be time to call your patent lawyer - or have Dave Hicks list your article permanently on this site.

Cheers, Victor

Re: Funny story

*Message #3 Posted by **Charlie O.** on 14 Oct 2003, 10:38 a.m.,*
in response to message #1 by Pavel Korensky

I bought a 286 computer in late 80's to run AutoCAD R10. I was given a software math coprocessor emulator to save the expense of buying the real thing. I fried 2 motherboards in a short time and went for the coprocessor with the third board. No more problems and the computer was much faster. It still works today.

It is possible to overwork components with software.

Re: Funny story

*Message #4 Posted by **Richard Garner** on 14 Oct 2003, 11:23 a.m.,*
in response to message #3 by Charlie O.

"It is possible to overwork components with software."

I remember when the first 386 computers came out, Norton Utilities would not run properly in turbo 386 mode with out doing damage to the hard drive. So, it is also possible to overwork software with faster components.

Re: Software vs. Hardware (Rocks-Paper-Scissors?)

*Message #5 Posted by **Paul Brogger** on 14 Oct 2003, 11:46 a.m.,*
in response to message #1 by Pavel Korensky

It goes back further and weirder.

Our early library information application was designed by Boeing, run on an IBM operating system, using a German database management system, and (initially) on Japanese plug-compatible drives (IBM 3350 look-alikes).

Early in the application's production life, as the database grew, repeated disk failures on index volumes became evident. A lengthy and painful investigation revealed that the database's indexing structure and search algorithm, when coupled with our application's key length, database size and usage patterns, all introduced harmonics in the drives' read/write heads and positioning circuitry, causing site-specific failures. The cure: switch to a different brand of disk drive (IBM) which embodied physical characteristics *different enough* that our application didn't induce problems!

(At least, that's how it was related to me, a budding DBA. A simpler interpretation might be that, at the time, IBM made better 3350's than did Hitachi . . .)

Re: Funny story

*Message #6 Posted by **WOW** on 16 Oct 2003, 2:39 p.m.,*

Just received my 49G+ ...already having 2nd thoughts

*Message #1 Posted by **Layne Carruth** on 13 Oct 2003, 6:08 p.m.*

I'm a very long time HP calculator fan -- bought my first one in 1973, and have had a couple dozen since then. I just received my new HP49G+ ordered through CalcPro in Oregon (they did a great job of shipping next day, BTW) and I'm already having second thoughts.

While the keys are better than the 49G and we do have the choice of RPN, the overall feel of the unit is CHEAP. The display is larger, but the dot pitch is so coarse that it doesn't really help much. I think I will order a couple of gross of the little covers for the backup battery, as they should be quite valuable in a few years for replacements.

Perhaps I should reconsider that PDA with a 15C emulator program...

Cheap...

*Message #2 Posted by **Gene** on 13 Oct 2003, 9:41 p.m.,*
in response to message #1 by Layne Carruth

While the keys are better than the 49G and we do have the choice of RPN, the overall feel of the unit is CHEAP.

GENE: Hi. Cheap is hard to describe. Part of the reason may be because the unit is lighter and not as heavy as the 49G or 48GX style machines. Plus, another 10 years has gone by since the 48GX and that means inflation has eaten away at what $175 will buy...$175 then is not $175 now. And, given the attempts to reduce cost, that would also influence it.

The display is larger, but the dot pitch is so coarse that it doesn't really help much.

GENE: Here I would disagree. I remember the 48SX display. Talk about COARSE! :-) The contrast of the new 49G+ looks great in comparison to any of the older 48GX series machines. Maybe a personal preference, but looks good to me.

I think I will order a couple of gross of the little covers for the backup battery, as they should be quite valuable in a few years for replacements.

GENE: This could be a valid concern...but then, backup batteries don't go bad that frequently...if you're replacing one every 2-3 years, just be careful for that 5 minutes!

Perhaps I should reconsider that PDA with a 15C emulator program...

GENE: Perhaps. I've played with that on my AXIM, but I like a real calculator better.

Dot pitch vs. Contrast?

*Message #3 Posted by **Matt Kernal (US)** on 14 Oct 2003, 12:05 p.m.,*
in response to message #2 by Gene

Layne>The display is larger, but the dot pitch is so coarse that it doesn't really help much.

GENE: Here I would disagree. I remember the 48SX display. Talk about COARSE! :-) The contrast of the new 49G+ looks great in comparison to any of the older 48GX series machines. Maybe a personal preference, but looks good to me.

Gene, I enjoy and value your posts, but what does improved contrast have to do with course dot pitch?

IIRC, the pixel count of the 48 Series machines (and 49G) have always been 131 wide by 64 high. The 49G+ has increased the height count to 80 (ie. 131x80).

It's been great(!) that backward compatibility has been maintained over the last thirteen years concerning display dimensions, but I believe he is referring to his desire for higher resolution (higher pixel count) within the new larger display area (ie. like cell phones, PDA's, and even, God forbid, TI89's have (160x100)).

Matt

Re: Dot pitch vs. Contrast?

*Message #4 Posted by **Gene** on 14 Oct 2003, 10:49 p.m.,*
in response to message #3 by Matt Kernal (US)

Hi. I had meant to start a different thought.

My comparison to "dot pitch" was with the 48SX. The 49G+ doesn't seem that "dotty" to me.

The contrast was just a second idea.

Each will have to make their own decision, of course!

Next time, I won't run my thoughts together quite so much. :-)

Thoughts..

*Message #5 Posted by **Matt Kernal (US)** on 15 Oct 2003, 11:58 a.m.,*

Re: Just received my 49G+ ...already having 2nd thoughts

*Message #6 Posted by **Ed Look** on 13 Oct 2003, 10:40 p.m.,*
in response to message #1 by Layne Carruth

You know, I bought for my son a HP-39G. Now, people have complained about the quality of its keyboard (akin to those for the HP-49G). But it's "feel" is that old heavy, solid, "red LED HP-34C" feel, in contrast to my HP-48's. By comparison, the much adored (and rightly so) HP-48's are light and "cheap" feeling, but

which calculator would you rather have (if you're already out of grade school)?

I'll admit that psychologically, a heavy-and-hard-as-a brick calculator gives many users (most definitely including myself) a major league warm fuzzy, it's not a necessity and the lower weight makes it a better calculator to carry around. No, if HP can make a high quality calculator that is light that's really better than it being heavy, though that loose-halves-of-the-case feeling does turn me off; now, THAT feels "cheap".

Oh, interesting thing I noticed: the 39G has 256 kb while the 48G has only 32 kb RAM. Even the 48G+ and GX max out at 128 kb! ... Kids and games, oh well.

39G/49G heft. vs. 49G+ lightweight.

*Message #7 Posted by **Matt Kernal** on 15 Oct 2003, 6:23 p.m.,*
in response to message #6 by Ed Look

Yeah, I also like the extra "heft" of the 39G and 49G. They do feel solid. Ya know, the front and back half cases on the 39 and 49 **don't** creak at all, whereas most of my 48-series do creak, some more than others.

The 49G+ is much lighter than the 39/49. It's what you'll notice first. At least for me it was. That in itself may lend to the Layne's feeling of cheapness.

Matt

Re: 39G/49G heft. vs. 49G+ lightweight.

*Message #8 Posted by **Ed Look** on 15 Oct 2003, 10:11 p.m.,*
in response to message #7 by Matt Kernal

Yeah, it's fine if you generally leave it in one position, and seldom carry it around. The extra weight, when you throw it into a briefcase, or worse, a coat pocket, over time, becomes a pain. I think that's one of things about the Pioneer series that appeal- they're small, light, and powerful. That's why also I like the 48's: they're light and powerful, if not small.

N eed good HP-67 picture

*Message #1 Posted by **Namir Shammas** on 13 Oct 2003, 2:08 p.m.*

I am looking for a good picture of an HP-67. I am writing a Windows emulator in Visual Basic 6. The emulator uses a picture of an HP-67 and tracks where on the image a person clicks the mouse. It's not an easy task to emulate the calculator in run and program modes, but I am willing to give it a try. I appreciate if you can "donate" a picture for the project. Email me your hp-67 picture to hpticalcfan@aol.com. Thanks!

Namir

Re: N eed good HP-67 picture

*Message #2 Posted by **Raymond Del Tondo** on 13 Oct 2003, 6:01 p.m.,*
in response to message #1 by Namir Shammas

Hi,

you could ask Dave Hicks, the curator of this site. Chances are good that he has a very good picture of an HP-67 (in both meanings;-)

Raymond

Re: N eed good HP-67 picture

*Message #3 Posted by **Namir Shammas** on 13 Oct 2003, 8:23 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks Raymond. The picture of the HP-67 in this web site is nice, but it includes the picture of a magnetic card!! I looked on the web for a similar picture WITHOUT the card, but did not find as one that was as good.

Thanks

Namir

Re: N eed good HP-67 picture

*Message #4 Posted by **Chan Tran** on 14 Oct 2003, 10:52 a.m.,*
in response to message #3 by Namir Shammas

Do you have a 67? If so you may try to scan it with a flat bed scanner. I found scanning give a good picture for your application.

Re: N eed good HP-67 picture

*Message #5 Posted by **Namir Shammas** on 14 Oct 2003, 1:11 p.m.,*
in response to message #4 by Chan Tran

Chan,

I don't have an HP-67 right now. I'd like to buy one, so I am watching eBay auctions.

Thanks!

Namir

PS: I am gradually implimenting the emulator ... boy!! So many things to keep track of. Th eHP-67 is one heck of a state engine!!!!

in response to message #12 by Veli-Pekka Nousiainen

Sorry no 49G+, 48GII, nor 33S pictures yet. But here are the 75C and 71B scans:

http://wass.net/pictures/hp75c

http://wass.net/pictures/hp71b

Re: 34c and 33c pics

*Message #14 Posted by **Veli-Pekka Nousiainen** on 18 Oct 2003, 8:50 p.m.,*
in response to message #13 by Katie

Gee - Thanx! What else can you scan, Katie? Bring them all in one bunch of links - take you time until your total collections is scanned. Borrow from friends and/or calc stores to add more. I can't have enough od these!

I have a HP-6S Solar, HP-10B, HP-16C, HP-17B, HP-17BII, hp 17bII+, HP-19BII, HP-25, HP-28S*2, HP-32S, HP-32SII*2, HP 39/40G dualmode, HP-41CX*2, HP-42S, HP 48SX*2, HP 48GX*2, hp 48gII, HP 49G*2, hp 49g+, HP-71B*2, HP-75C, HP-700LX Omnigo+Nokia2110i, HP 720 Jornada AND I'm darely missing the HP-34C & HP-15C (never mind the HP-11C, HP-41CV adjustable speed [self-made], HP-41C) and the HP-200LX

Re: 34c and 33c pics

*Message #15 Posted by **Katie** on 19 Oct 2003, 1:52 a.m.,*
in response to message #14 by Veli-Pekka Nousiainen

I'm not quite sure what the fascination is with the scans of these calculators. Although they're pretty high resolution I don't think that they're as nice looking as the pictures that Dave has on this site. A scan is a nice way of photographing a calculator for use in an emulator/simulator, but otherwise it doesn't really give you as good a feel for what it looks like as do Dave's 3/4 pictures, for example.

Re: 34c and 33c pics

*Message #16 Posted by **Namir Shammas** on 19 Oct 2003, 9:47 a.m.,*
in response to message #15 by Katie

The sideview pictures are excellent to look but are virtually useless for an emulator since I am imposing text box controls over the picture of the LCD to emulate teh display.

Re: 34c and 33c pics

*Message #17 Posted by **Namir Shammas** on 18 Oct 2003, 10:05 p.m.,*
in response to message #13 by Katie

Katie,

I chekced out your web site. I bow in humility in homage to you state of excellent collectorhood. I have a china hutch that is crawling with calculators too, but they are not as well laid as your machines!!

I am very impressed. What do you do for a living?

Namir

Re: 34c and 33c pics

*Message #18 Posted by **Namir Shammas** on 18 Oct 2003, 5:12 p.m.,*
in response to message #11 by Katie

Katie,

You are spoiling me with all these pictures that cry out to be animated with an emulator!!!!!!!

For your most kind efforts I will email you the HP-67 emulator for beta testing. I am still alpha testing and finding crazy bugs here and there. Overall it works and seems to be taking programs!! I am trying to stick to specs as much as possible. It's very tempting (and basically effortless) to add more stack/memory registers and program memory ... maybe that will be for a special souped up emulator ... the HP-67X emulator!

Funny thing, now that I have an emulator my desire to actually buy a

physical HP-67 has died out a bit (ok ok I have 2 HP-97 sitting here :-))

Re: Need good HP-67 picture

*Message #19 Posted by **Namir Shammas** on 15 Oct 2003, 1:39 p.m.,*
in response to message #6 by Katie Wasserman

Katie,

A million thanks! This one hits the jackpot. Borrowing from a popular saying by a dictator currently in hiding, I can say your picture is "the mother of all HP=67 pictures!".

Namir

HP-67 Emulator

*Message #20 Posted by **bill platt** on 17 Oct 2003, 3:29 p.m.,*
in response to message #1 by Namir Shammas

Hi Namir,

Great Project! Will you make a real emulator (requiring a ROM image of a 67?)--or will you have to simulate (i.e. write your own native code which mimics the functionalitry).

It will be really cool--a real classic on the desktop--will make a great trio---v41, emu48, and Namir67!

Good luck with the project.

And Katie's scan looks excellent, too.

Regards,

Bill

Display on HP-25C shows 000000´s

*Message #1 Posted by **Matti Övermark** on 13 Oct 2003, 4:34 a.m.*

Hi gurus,

I have recently obtained an HP 25 C. However I cannot get it to work. I inserted new batteries, rechargable, in the battery compartment, but all it shows is a full display of 0´s (zeros). In one instant the last zero became a 3. Very wicked, I´d say. The original batteries were dead. Any clues?

TIA Matti, Sweden

Re: Display on HP-25C shows 000000´s

*Message #2 Posted by **Victor Koechli** on 13 Oct 2003, 5:22 a.m.,*
in response to message #1 by Matti Övermark

I'd suggest taking the calculator apart and carefully cleaning the interior contacts that connect the keyboard and the display to the main PCB. While doing so, you can also check for broken traces or loose solderings on the main PCB.

Another oddity of these calcs is that some of them only work after a warm-up period of up to an hour, so if cleaning does not help, try leaving it turned on for some time. I have a HP-25 with that behaviour. It's supposed to be a problem of the ACT chip, and there are a number of fixes you can try (search this forum's archives for more information).

One thing, though: Never, under any circumstance, connect your HP-25C to the AC adaptor when you have no battery installed or if there is even the slightest chance that the battery contacts could be bad! You could kill the calculator's RAM chip just by plugging in the adaptor! In the C-version, the RAM is connected to the power supply even with the calculator off.

Cheers, Victor

Re: Display on HP-25C shows 000000´s

*Message #3 Posted by **Albert** on 13 Oct 2003, 1:13 p.m.,*
in response to message #2 by Victor Koechli

Hello,

Don't touch PCBs with your fingers! Static voltage could destroy ICs.

Check up space / gaps between integrated circuit (ICs) and display pins. Using a sharp / fine plastic, you can remove any dust or suspicious tiny objects. In addition, with a magnifying glass check both printed circuit board faces, ground metal paths mainly. Clean the keyboard printed circuit also. If battery pack was placed for a long time inside calculator, corrosive damage could "blur" device metal contacts.

Good luck,

Albert

Re: Display on HP-25C shows 000000´s

*Message #4 Posted by **David Smith** on 13 Oct 2003, 3:10 p.m.,*
in response to message #1 by Matti Övermark

This problem is almost always caused by a dead ACT chip (the wide 22 pin chip near the bottom of the circuit card). The only source is another Woodstock series machine (except the HP27). The chips have different part numbers, but they are all compaitible.

Re: Display on HP-25C shows 000000´s

*Message #5 Posted by **Matti Övermark (Sweden)** on 14 Oct 2003, 5:39 a.m.,*
in response to message #4 by David Smith

Hi,

Thanks for all hints. I let it (the HP 25C) stay on for a while, a quarter of an hour or so, then I occasionally by turning it on/off reapeatidly got it to show 0.00 in the left corner. But then (sigh!) it failed to show anything.

I think the HP-25C is opened by removing the rubber feet and then there ought to be some screws to work with.

Anyone suggesting what I should do? There seems to be no surplus stock of these calcs around here...

Best regds Matti

Re: Display on HP-25C shows 000000´s

*Message #6 Posted by **David Smith** on 14 Oct 2003, 5:54 p.m.,*
in response to message #5 by Matti Övermark (Sweden)

By bet is still a failing ACT chip, but you might try opening up the machine and cleaning the circuit board with 91%+ isopropyl alcohol. Sometimes corrosion (often invisible) or solder flux residue will stop the machine from working.

If there is a lot of green or white corrosion on the board you may need to use vinegar. Basically stand the board up in a glass of vinegar up to the top of the battery contacts for 30 minutes or so. Scrub it down with a stiff toothbrush. Rinse VERY well. Shake all the water off... better yet blow it off with canned "air"... do not use an air compressor (they blow oil and air). Let dry for at least 24 hours.

So...who here will be buying a 49G+?q

*Message #1 Posted by **Gene** on 12 Oct 2003, 9:44 p.m.*

Yep...I know Wayne and Norm won't. :-)

But...who else here is waiting until they are available here in the US?

Re: So...who here will be buying a 49G+?q

*Message #2 Posted by **David Brunell** on 12 Oct 2003, 9:52 p.m.,*
in response to message #1 by Gene

I will buy one as soon as they are available at large US retailers. No use burdening a small mail-order outfit with multiple returns or myself with the hassle and expense of mailing defective units back. ;)

Re: So...who here will be buying a 49G+?q

*Message #3 Posted by **Ernie Malaga** on 12 Oct 2003, 10:16 p.m.,*
in response to message #1 by Gene

Gene:

I'd like to get my hands on one for a "test drive" before I commit to buying one. I didn't like the HP-49G (actually, that's a gross understatement), but I'm willing to give the G+ a fair chance.

-Ernie

Re: So...who here will be buying a 49G+?q

*Message #4 Posted by **Aaron** on 13 Oct 2003, 12:39 a.m.,*
in response to message #3 by Ernie Malaga

yes, definitly waiting for the 49g+. If they've got the grapher spead up and the keys are plastic, it will surely make life easier. also looking forward to a better case, and a non-reflective (or at least not as much as the 49G's) screen.

Re: So...who here will be buying a 49G+?q

*Message #5 Posted by **Chan Tran** on 13 Oct 2003, 7:36 a.m.,*
in response to message #4 by Aaron

I don't know what the price of the 49G+ is. If it's around $150 I think I would buy one if I have permission from my wife. May be it works better than Norm's 34c huh?

Re: So...who here will be buying a 49G+?q

*Message #6 Posted by **Jeffrey_G** on 14 Oct 2003, 7:36 a.m.,*

in response to message #5 by Chan Tran

My wife (and me sometimes) can't understand a yet another new calc purchase. I'm going to wait until my 49G to die before I get a 49G+. Of couse if the 49G+ turns out to be a must have winner, my 49G might find itself accidently placed beneath my Honda rear tire!!

Re: So...who here will be buying a 49G+?q

*Message #7 Posted by **Namir Shammas** on 14 Oct 2003, 1:09 p.m.,*
in response to message #6 by Jeffrey_G

Paul,

You also have the option of selling your HP49G on Ebay, Amazon, or even here, and using what you get for the 49 to buy the HP49G+. Thanks to easy online trading we rarely feel "stuck" with aproduct we no longer want to keep.

Namir

Re: So...who here will be buying a 49G+?q

*Message #8 Posted by **Ed Look** on 14 Oct 2003, 11:06 p.m.,*
in response to message #6 by Jeffrey_G

DUDE!!

You brought a tear to my eye. (Similar themes at my house.) Put it under MY tires! (I won't back up... I'll sneak off the car and PICK IT UP!) I'd treat it real good, promise!

Re: So...who here will be buying a 49G+?q

*Message #9 Posted by **Paul Brogger** on 13 Oct 2003, 9:24 a.m.,*
in response to message #1 by Gene

I think so -- it sounds and appears to be a nice unit.

I definitely will buy a 33s because, appearance notwithstanding, that's more like what I really want. But while sitting out its delay in shipment, a 49G+ would probably keep me distracted.

Re: So...who here will be buying a 49G+?q

*Message #10 Posted by **Ernie Malaga** on 13 Oct 2003, 2:14 p.m.,*
in response to message #1 by Gene

As I mentioned in my post of October 12, I'm willing to give the 49G+ a try, and eventually buy it, if I ever see one. So far, however, all I've seen is vaporware -- no hardware.

-Ernie

Re: So...who here will be buying a 49G+?q

*Message #11 Posted by **Ron Rpss** on 13 Oct 2003, 2:23 p.m.,*
in response to message #1 by Gene

I plan to buy one (or hint heavily to wife) around Christmas.

Re: So...who here will be buying a 49G+?q

*Message #12 Posted by **Erik Ehrling (Sweden)** on 13 Oct 2003, 3:09 p.m.,*
in response to message #1 by Gene

Personally, I still keep my fingers crossed for the HP-33S magically being turned into a HP-42S compatible successor with more memory and I/O... if not I would probably buy a HP-49G+ when (if?) Hrastprogrammer has upgraded HP-42X for it...

Best regards, Erik Ehrling

Re: So...who here will be buying a 49G+?q

*Message #13 Posted by **Paul Fox** on 13 Oct 2003, 5:34 p.m.,*
in response to message #12 by Erik Ehrling (Sweden)

I will...might even buy 2...duh!

Tried www.calcpro.com and their web site and must say I am totally disgusted by them. Their ordering web site doesnt make clear how to pay for internal delivery. (Do Americans truly believe that the world is US and CAN only? .. no dont answer that!)

Anyway I placed an order on the web site, quoted credit card.

And waited .. no confirm email. So I mailed them again and told them to mail me at work or at home, and .... nothing. Not a sausage!

I dont know if they have my order or not...I presume not so will have to try somewhere else. Definitely would touch those amateurs with a bargepole again.

(I didnt phone because of the TZ differences).

Oh well...its taking so long that I am beginning to lose interest in the calc altogether....

Re: So...who here will be buying a 49G+?q

*Message #14 Posted by **Paul Fox** on 13 Oct 2003, 5:37 p.m.,*
in response to message #13 by Paul Fox

Darn it...that should have been "would NOT touch them with a bargepole..."

Thinks my PC keyboard is emulating the HP49G+....oh well...

Re: So...who here will be buying a 49G+?q

*Message #15 Posted by **unspellable** on 14 Oct 2003, 5:33 p.m.,*
in response to message #1 by Gene

So where would I see one? Nobody around here carries HP calculators anymore. I don't think the bookstores serving the university in the next town carry them any more.

I'd have to go by the pictures and mail order one. One does like to actually see one before commiting.

Re: So...who here will be buying a 49G+?q

*Message #16 Posted by **James M. Prange** on 14 Oct 2003, 8:30 p.m.,*

in response to message #1 by Gene

Well, I've "pre-ordered" one, hoping that it will be an improvement over the 49G, but I've begun to wondered whether I'll ever receive it.

Let c.s.hp48 beta it

*Message #17 Posted by **bill platt** on 15 Oct 2003, 4:52 p.m.,*
in response to message #1 by Gene

I will wait---until the fall-out.

We'll see about the 33s.

My better judgement is to wait---I like the vintage models--why upgrade!

-Bill

Re: Let c.s.hp48 beta it

*Message #18 Posted by **Ed Look** on 15 Oct 2003, 10:17 p.m.,*
in response to message #17 by bill platt

Bill, vintage calculators are almost by definition on the verge of wearing out. Of course, it probably happens gradually, unless you drop it a lot. (I have on occasion dropped my 34C, but that never impaired its functioning; time took care of that!)

I have heard right here on this forum that some folks are buying the new ones so as to prolong the service life of their old ones, by "taking the load off them". Not a bad idea, really, if one can spare the cash. The 33S is quite reasonably priced and scientific models like it are probably better for students than any graphing model by any company.

HP-25 Prog Cose Puzzle

*Message #1 Posted by **Gordon Dyer** on 12 Oct 2003, 10:46 a.m.*

I have noticed that the HP-25 accepts the key combination of 15 25 in program mode (g SUM+).
There is no blue key legend for this, so is it an undocumented instruction which does something? or is it a NOP?

Any help would be appreciated.
Thanks.

Re: HP-25 Prog Cose Puzzle

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 12 Oct 2003, 10:57 a.m.,*
in response to message #1 by Gordon Dyer

As fas as I recall, it is a NOP by other OpCode...

HP48/49, converting units

*Message #1 Posted by **Francesc Casanellas** on 12 Oct 2003, 9:46 a.m.*

In the HP49 manuals, the way to convert units is explained as follows. For example to convert 12 m to ft (RPN):

12_m 1_ft CONVERT

However as explained briefly in the HP48 guide, if you are not programming, it is much faster to go to the UNITS/LENGTH menu and type

12_m (type “12” and then “m” soft key) LS ft (Left Shift and “ft” soft key)

Using RS (Right Shift key) units are divided.

I do not understand why this is not explained in the HP49 manual. I think you need to get the User’s Guide and the Advanced User’s Reference Manual of the HP48 to use all the resources of the HP49.

Missing the Point

*Message #1 Posted by **db(martinez,california)** on 12 Oct 2003, 12:20 a.m.*

I was looking at ebay tonight and i found these two calculator auctions.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3052222576&category=3294

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3052043599&category=3294

They were interesting to look at but i can't help wondering who was more unclear on the concept, the manufacturers or the original buyers.

Re: Missing the Point

*Message #2 Posted by **Thibaut.be** on 12 Oct 2003, 4:07 a.m.,*
in response to message #1 by db(martinez,california)

I couldn't load the images of the 2nd calculator, but I actually got acquainted with Japanese people some time ago and they told me about that special arithmetics method with an abacus, that is the same as presented on the Sharop calculator auction.

It is tought in every school in Japan and is quite impressive how fast it is assimilated and how fast one can do simple arithmetics with.

Unfortunately I have no clue how it works but maybe some people in this forum can explain us better...

Re: Missing the Point

*Message #3 Posted by **lcorrado@uwc.edu, USA (WI)** on 12 Oct 2003, 8:08 a.m.,*
in response to message #2 by Thibaut.be

Well, of course the abacus is an ancient calculating device still used in much of the orient. Each column of sliding beads represents a decade in the decimal number system. Each bead below the bar has a value of 1; each above the bar, 5. Machines I've seen have either one or two 5-counters.

Manipulating the beads lets one add and subtract, with the user performing all carrying and borrowing that has to be done. Multiplication can be performed by shift and add; division by shift and subtract. I understand that square roots and cube roots can be done also, but I don't know anything about their method. Calculation on an abacus by a skilled user can be very fast.

My guess is that this dual-use device is made for doing calculations beyond the abilities of the four-function machine or situations (eg, a store) where there would be multiple users.

Larry

Re: Missing the Point

*Message #4 Posted by **db(martinez,california)** on 13 Oct 2003, 9:30 p.m.,*
in response to message #3 by lcorrado@uwc.edu, USA (WI)

Reading the replies, i got curious about the "soroban" and asked about it in general and that one in particular. My Japanese friend says that the one in the auction is probably not for students and that the older type used two "5 counters" and the newer type uses one "5 counter". I couldn't get a quantification on old/newer. In a culture with roots that old, the one bead type may have been introduced 500 years ago and is still the new wave.

I still think that ebay item is a silly juxtaposition, and i think the Casio fortune telling calculator is ridiculous. Are there Gypsies in Japan?

Re: Missing the Point

*Message #5 Posted by **Katie** on 12 Oct 2003, 11:32 a.m.,*
in response to message #1 by db(martinez,california)

db-

Although I haven't seen one of these fortune telling calculators before, they used to sell an awful lot of astrological and biorhythm calculators; are they any different? I think that the manufacturers got it "right"; no comment on the original buyers.

The abacus calculator sort of makes sense as a bridge between two technologies for those that have trouble switching. Faber Castell made the western version of this. Their TR1, TR2 and TR3 where electronic calculators on one side and slide rules on the back. (I'd love to get one of those, BTW.)

It could be made for the school market in Japan. I believe that they still teach the use of abacus over there.

*Message #7 Posted by **Paul Brogger** on 13 Oct 2003, 9:29 a.m.,*
in response to message #1 by db(martinez,california)

. . . or it could be a way to market calculators to conservative buyers -- a way for the old-schooler to justify buying a new-fangled calculating device?

Re: Missing (the?) (a?) (which?) Point?

*Message #8 Posted by **Juan J** on 14 Oct 2003, 12:24 a.m.,*
in response to message #7 by Paul Brogger

Until very recently, clerks in Russian stores used abacus instead of machines, and they were pretty fast with them, much like the Japanese. Soviet-era stores were well known for this accounting method, and probably many stores still use it.

No wonder neighbouring Japan uses the abacus system too. Russians even developed a machine called arithmometer, a small-size mechanical calculator, the first model being named after Feliks Dzherzhinkiy, the founder of the KGB.

*Message #9 Posted by **Ed Look** on 14 Oct 2003, 12:41 a.m.,*
in response to message #8 by Juan J

When I was a kid, I actually saw real shopkeepers in Chinatown, New York use abacuses. In those days, there were no HPs, handheld nor desktop, definitely NO TIs, Bowmars, though I wonder if they would have used a Wang Labs desktop adding machine if they were invented at the time ;)

I guess only IBM mainframes were around in those days, and mechanical NCR cash registers... you know, the kind with the ornate, baroque metalwork plating!

Great machines

*Message #10 Posted by **Bob** on 14 Oct 2003, 8:03 a.m.,*
in response to message #1 by db(martinez,california)

When I lived in China ('95-'98), the abacus was used everywhere. All of the little shops and stores had them at the ready. (and they were FAST!) We used to challenge them to race in math calculations until we grew tired of being humiliated. It is a skill still taught to accountants in the universities.

I saw one being used in a small village restaurant that looked to be 1000 years old. It had lots of character and was well worn. I bought a new one and took to the little old woman to use to entice her to sell it to me. When I offered an outrageous sum of money and the new abacus, for the old one, she turned me down. My translator told me that she simply didn't trust the new one like the one she was used to. .....? When you think about it, it is just like preferring a 41CV to a 49G because of the keys.

I took the new one home and now it hangs on the wall in my office, at the ready, should my 48GX fail.

Just like HP's, each abacus model has it's loyal fans.

Re: Great machines

*Message #11 Posted by **Patrick** on 14 Oct 2003, 11:36 a.m.,*
in response to message #10 by Bob

Great story, Bob! Thanks.

However, I'm told these things have a very small ENTER key, so it's a real no-go for me. ;-)

If Norm had been born in China.....

*Message #13 Posted by **Ed Look** on 15 Oct 2003, 11:30 p.m.,*
in response to message #12 by db(martinez,california)

If he'd been born in China, maybe he'd have been recently in orbit around Earth with his HP-34C. ;)

Re: Sort-of-similar Abacus/Calculator Hybrid

*Message #14 Posted by **Paul Brogger** on 14 Oct 2003, 11:50 a.m.,*
in response to message #1 by db(martinez,california)

I recently found at the thrift shop and then offered on eBay a similar hybrid - this one a marketing combination of a four-banger and an abacus.

(Didn't make a whole lot of money on the deal, though!)

Re: Missing the Point

*Message #15 Posted by **James M. Prange** on 14 Oct 2003, 8:46 p.m.,*
in response to message #1 by db(martinez,california)

Back when I was visiting that part of the world (before calculators were in common use), I noticed that those using the abacus or soroban often did calculations on them faster than I could've done with either pencil and paper or an adding machine. It looked like magic, and as far as I could tell, always got the correct answer.

The combination would be good for when the batteries go dead.

Regards,
James

HP-01Calculator watch.

*Message #1 Posted by **HENRY SOLAN** on 11 Oct 2003, 6:22 p.m.*

Ladies&Gentlemen, I own a HP-01 Calculatorwatch,all functions are working. Some of the keys are worn because of the use of the metal stylus. I would like to replace either the entire key board or just the few that are worn. I want to offer the watch for sale on e-Bay. I also would like to buy a stylus pen with retractable plastic point, to be added to the package when offered for sale.Would like to hear from you. Henry Solan

Re: HP-01Calculator watch.

*Message #2 Posted by **David Brunell** on 13 Oct 2003, 12:54 a.m.,*
in response to message #1 by HENRY SOLAN

Good luck finding parts for the '01. You really need to buy a parts unit, and even then there's likely to be wear to the keys. I'm sure your watch will fetch a handsome price as-is.

You can find lots of styli at styluscentral.com.

Re: HP-01Calculator watch.

*Message #3 Posted by **David Smith** on 14 Oct 2003, 12:48 p.m.,*
in response to message #1 by HENRY SOLAN

The pen/stylus for the Pulsar calculator watch is identical to the HP. Some are lightly marked with the company name, others are blank.

Added Feature on the 48gii???

*Message #1 Posted by **Ben Salinas** on 11 Oct 2003, 11:19 a.m.*

According to Samson Cables, the HP48gII does indeed have a SD port. I was under the impression, from the original data sheet, that it did not have the SD port. I would have thought that HP would have stressed something as revolutionary as a SD port on its data sheet.

So, is Samson Cables mistaken, or did HP go back and add some more stuff to the 48gii? This might give hope to the 33s. -ben

Re: Added Feature on the 48gii???

*Message #2 Posted by **Veli-Pekka Nousiainen** on 11 Oct 2003, 3:19 p.m.,*
in response to message #1 by Ben Salinas

"According to Samson Cables, the HP48gII does indeed have a SD port. "

Well, I have a hp 48gII in my left hand when I'm writing this (slowly) and there is a silver-colored cover where the SD slot is in the 49g+. Realize the truth: there is no spoon! VPN

HP32->HP48

*Message #1 Posted by **Pierre Brial** on 11 Oct 2003, 6:44 a.m.*

Hello,

I have some trouble to translate HP-32sII programs to an HP-48GX just borrowed to me. Well, the RPN calculation part is OK. But what is the simplest way to ask to the user a value for a variable ?

With the HP-32 it is very easy. If you want to ask a value for variables A and B, just type in your program :

INPUT A

INPUT B

Just 6 keystrokes, very easy and straightforward.

But then if you want to do the same with HP48, according to the manual, you need many many keystrokes, with INPUT, OBJ->, and a lot of -> "" {} :: and so on...

But may be I didn't understand the trick ?

Any help ?

Pierre Brial

Re: HP32->HP48

*Message #2 Posted by **James M. Prange** on 11 Oct 2003, 7:31 a.m.,*
in response to message #1 by Pierre Brial

Yes, no doubt it is a lot more complicated on the 48 series, but I suppose that that's because you can do a lot more things with the INPUT command on the 48.

For what you want to do, start with:

```
"Enter a value"    @ Tell the user what to do.

""                 @ An empty string for the command line.

INPUT              @ After the user types in a value and presses ENTER, the string will
end up on level 1.

OBJ\->             @ Assuming that a number was entered, the string will be changed to a
number.

                   @ If you want to store it in a variable:

'VarName'          @ Whatever name you want.
```

```
STO                @ Store it.
```

Note that because the 48 isn't limited to 4 stack levels, you might not need to store the value; just use the stack.

Of course, there are more options that you can use with INPUT, but you don't *have* to use them.

Also consider the PROMPT command for what you're doing.

Regards,
James

Re: HP32->HP48

*Message #3 Posted by **Pierre Brial** on 11 Oct 2003, 1:02 p.m.,*
in response to message #2 by James M. Prange

Thank you James for your clear answer.

As to the HP-48, I balance between love and hatred.

Love for its astounding capability to handle mathematical objects, like matrix, sums, equations. I usually don't like to do matrix calculation, but with this calc it is a true pleasure.

Hatred for programing. Before then I've done a lot of programs in RPN for HP-41, HP-32sII, algebric for TI-59, Basic and machine language with Sharps, so I wrongly believed I could handle easily any other calcs. But Hp-48 is hard nut. Very powerfull indeed, but there is few simple solutions for simple problems, and it is far from intuitive.

I understand better why long-time users of HP-41, 42, 15 prefer to keep their good old calcs.

But on the other hand, there is many many user of the HP-48 and you can find a lot of programs on the net. So some people do really succeed to program it.

I suppose I'm too much rusted with old programming way....

All the best

Pierre

Emulated HP-41 ROM pacs... at last!

*Message #1 Posted by **Diego Diaz** on 10 Oct 2003, 7:56 p.m.*

Yes, it works. A 28 pin PIC18F252 with the Stuctural Analysis module ROM image is connected to my HP-41 right now... and, of course, it's correctly recognised and fully operative.

I've used the PIC code from John Ioannidis' 18C252 PAC with almost no modifications. Great job John!!

The next step is to place the SOP version of the chip inside a standard module enclosure. It needs nothing but the PIC, one diode and a Xtal to run.

Several issues are still pending though:

1) The device needs 6.5 - 7.5mA wich is a pretty low figure, but... (this are the bad news) it keeps on running even when the calc is off... Still working on that, and have found a simple method to switch the PIC off but... (there's always a "but"... :-(paradoxically this method is only useful when the batteries are weak, as it needs a sensible voltage difference between BAT and V+ lines, and that doesn't occur with fresh batteries. Your comments or ideas are welcomed.

2) As the PIC holds 5 pages (4k words x 10 bits), the B3 and B4 lines can not be used to map the module according with the port number it is connected to. Of course you can sacrifice 3 pages and map the device into the correct port, but I think this small win shouldn't justify the loss.

3) Early 41's introduce two inverted pulses in the SYNC line at phases 49 and 53. This behavior fools the PIC code, thus it can not be used with those early machines.

4) The code is supposed to handle bankswitching between banks 1 and 2 (I haven't try this yet), so modules with pages in banks 3 and/or 4 can not be burned. IIRC only the HEPAX module uses this feature, but may be others. Nevertheless I think this could be implemented with very little code modification.

5) Last, but, again, not least, I have no other modules to cannibalize and experiment with!!

Your comments, corrections, suggestions, and support will be of great help. If you want to mail me please remove the NOSPAM garbage from my address above.

Constructive critics are also welcomed, please send the destructive critics to my ex-wife (she's an expert in that matter ;-).

Kind regards from the Canary Islands.

Diego.

Re: Emulated HP-41 ROM pacs... at last!

*Message #2 Posted by **Hans Brueggemann [GER]** on 11 Oct 2003, 2:34 a.m.,*

in response to message #1 by Diego Diaz

congrats diego! if you can drop me a complete schematic of the electronics (especially interconnect between Hp-41 port and i/o of the PIC),i will be looking into possibilities of powering on/off the whole thing.

cheers, hans (send email to porkpiehat at gmx dot net)

Re: Emulated HP-41 ROM pacs... at last!

*Message #3 Posted by **Diego Diaz** on 11 Oct 2003, 2:36 p.m.,*
in response to message #2 by Hans Brueggemann [GER]

The PIC's on/off switching issue is now fixed... using my first approach: PNP transistor polarised by BAT voltage.

A simple resistor does the job!!!!

Put the blame on me: I forgot Ohms Law!!!!

Still at work, now refining PCB layout.

CU

Re: Emulated HP-41 ROM pacs... at last!

*Message #4 Posted by **Pavel Korensky** on 11 Oct 2003, 5:33 p.m.,*
in response to message #3 by Diego Diaz

Just a question. How did you solved the power on delay ? Depending on the configuration of oscillator, there is either 72 ms (plus more if PLL is enabled) or at least 1024 Tosc clocks delay.

BTW, the pulses on SYNC line are also on my HP-41CV, so it seems that this situation is not limited to early HP-41C.

Re: Emulated HP-41 ROM pacs... at last!

*Message #5 Posted by **Diego Diaz** on 11 Oct 2003, 6:30 p.m.,*
in response to message #4 by Pavel Korensky

You're right, the pulses at SYNC line are not related with the model itself but with the date/version of miroprocessor manufacturing.

It seems like HP modified the microprocessor specs related to that issue some point in the production time line, but for now, I can not find out the exact moment.

I've got five 41's, the oldest (FullNut 41C s/n 2134S...) is the only one that produces those pulses, the next one (FullNut 41CV s/n 2427S...) does not, neither the rest three 41CX: 2502S..., 2646S... and 2819S... (last two are HalfNuts)

It may be interesting to investigate when the change happens, so anyone that can contribute with info about his/her 41's SYNC behavior will be of great help.

Regarding the power-up delay, it's fast enough to cope with the 41 needs (provided it's not a 2x modified unit). I have even try at 28.5Mhz and it still works, 24Mhz crashes the whole thing though, so the limit must be some point in between.

Cheers from Spain.

Diego.

Re: Emulated HP-41 ROM pacs... at last!

*Message #6 Posted by **Meindert Kuipers** on 13 Oct 2003, 5:33 a.m.,*
in response to message #5 by Diego Diaz

Diego,

Congratulations to get everything running! I would like to have the design files if possible. Your observations on the pulsing SYNC are correct. My 'old' fullnut (it has the gold ball contacts) has the pulses, my newer CX shows a stable SYNC.

About the pulses in SYNC, it should not be difficult to handle that. In my hardware MLDL (and in the classic design by Lynn Wilkins) the phase counter is reset by the first CLK02 that occurs after a SYNC occured first and after that a CLK01 occurs without SYNC (or on phase counter=55 in case no SYNC was present). This is probably easier to implement in hardware than in your software, but it does work!

This is the bit of VHDL code which does the job (this code creates two flipflops)

```
sync_detect: process(SYNC, CLK01, CLK02, t1_reset, t2_reset, U7, T6)

-- Generates the actual counter reset after detecting SYNC sequence

-- and on phase 67 (octal) if no SYNC is present

begin

if (CLK01'event and CLK01 = '1') then

t1_reset <= SYNC;

t2_reset <= t1_reset or (T6 and U7);

end if;

ph_reset <= (t2_reset and CLK02 and not t1_reset);

end process;
```

Re: Emulated HP-41 ROM pacs... at last!

*Message #7 Posted by **Diego Diaz** on 13 Oct 2003, 5:30 p.m.,*
in response to message #6 by Meindert Kuipers

Hi Meindert,

I'll send you the files related to this design as soon as I have I have a final release (by the next weekend, hopefully) as I have a *real* job during the week... (I think you also know what I'm talking about... ;-)

For now still some difficulties with the on/off switching, and the needed lines to reprogram the device thru the module connector.

The PCB design is still pending, quite defined though. And I have no clue where can I have some PCB prototypes done.

Still the most annoying issue is the lack of modules (shells + connector) to build the first "real sized" cloned module. Some Ebay auctions are on my "Watch List"...

Regarding the "SYNC line pulses" issue, yes it's really quite more simple in HW than in SW, but for now I'll put my effort in finishing the Module's PCB and specs. As the code can be upgraded to a new version at a later time.

I live in a wonderful place, quite far away from almost everywhere though... Thus, "10Mhz SMD Xtal" might sound like "Klingong dialect" to my local components dealer's clerk (judging by the way he stared at me when I asked...), now I must wait until they make a new order to their supplier... and cross fingers in the meanwhile.

Excuse me for the "list of troubles" but it's usefull to talk about... sometimes you find solutions this way.

Cheers.

Re: Emulated HP-41 ROM pacs... at last!

*Message #8 Posted by **David Brunell** on 14 Oct 2003, 10:54 p.m.,*
in response to message #7 by Diego Diaz

Diego, how soon do you need the PCBs? If you can wait until the second week of November, I can get them done for you. I am too busy right now getting ready for a trade show in the UK.

Can you provide Gerber files, or do you need me to generate them?

I can round up and ship to you any small parts you may need too if you like. That I can do right away as I order parts just about every day it seems.

Best regards,

David

Re: Emulated HP-41 ROM pacs... at last!

*Message #9 Posted by **Diego Diaz** on 15 Oct 2003, 6:16 a.m.,*
in response to message #8 by David Brunell

Hello David,

There is no rush in this proyect, it's a hobby with no defined time line, so your offer widely fulfils my needs.

Regarding the PCB I'll try to built a prototype file this weekend, and mail it to you during the next week.

So far the only component that I cannot find locally is the SMD Xtal. I'll mail the specs this afternoon.

Apart from the Xtal, I'm still willing to buy, beg, steal, trade, borrow... are old/non-

working modules to place my prototypes in... but that's another "mission impossible" story :-)

Thanks a lot for your interest in this proyect, and my best wishes from the Canaries.

Diego.

Samson Cables update

*Message #1 Posted by **Eric Lundgren** on 10 Oct 2003, 7:55 p.m.*

Hi all,

This sounds kinda promising (off of Samsoncables.com)

>>Product Alerts This new calculator is not available yet but we expect it to arrive with the next week. One of our suppliers told us on October 10th that HP had confirmed the product had shipped to them and that they expected them within the next week. <<

Lets hope for the best, Eric

HP49G+ in Orlando!

*Message #2 Posted by **Art Litka** on 10 Oct 2003, 11:07 p.m.,*
in response to message #1 by Eric Lundgren

I happened to stop by my local calculator dealer for a quick Friday afternoon chat and not really expecting anything new. You can imagine my surprise when he pulled out a 49G+! He had three in stock and had already sold two. His shipment arrived last Friday (Oct 3). To my delight he said he would let me try one out and opened the package. After installing the batteries, I breathlessly awaited his pressing of the ON button. When the moment arrived, nothing happened-no display or beep. He was as surprised as I was-in all his years in the business, a new HP unit has never failed the turn-on test. We checked the batteries and connections and tried several times to fire it up but nothing. He opened unit 2 with the same result! However, the last unit was the charm-it worked beautifully! The keyboard has a good tactile feel and the display contast is very good. There was no hesitation with registering the keystrokes as on the 49. The time to graph a simple function was not lightning fast but still impressive. Believe it or not, I did not purchase it today-I wanted to think about it over the weekend. I am impressed by what I have seen and tried out so far-even the starter manual appears to be an improvement over the old 49's. I guess I was a bit shaken by the quality control and wanted some time to think about it. He said that the 33S is expected in mid November. Any other experieces out there?

Re: HP49G+ in Orlando!

*Message #3 Posted by **Joesph** on 11 Oct 2003, 12:21 a.m.,*
in response to message #2 by Art Litka

Your dealer probably has the early ROM problem. The early ROM will suck power even while the calculator is off. I suggest you upgrade and all will be well.

Re: HP49G+ DOA: Perplexing...

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Oct 2003, 10:52 a.m.,*
in response to message #3 by Joesph

Two questions about a previous message:

1) How could you upgrade the Flash ROM of a machine which doesn't turn on?

2) How could a power management software issue deplete uninstalled batteries?

Re: HP49G+ DOA: Perplexing...

*Message #5 Posted by **Veli-Pekka Nousiainen** on 11 Oct 2003, 3:16 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

Two questions about a previous message:

1) How could you upgrade the Flash ROM of a machine which doesn't turn on? VPN_Answer: Use a new set of batteries?

2) How could a power management software issue deplete uninstalled batteries? VPN_Answer: Part_1) Bad batteries?

VPN_Answer: Part_2) European Boxed calcs come with batteries installed AND there was a power-management issue (possibly due to unannounced change in one pin of the used CPU) which should be fixed any_day_now by a new ROM

Re: HP49G+ DOA: Perplexing...

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 12 Oct 2003, 10:56 a.m.,*
in response to message #5 by Veli-Pekka Nousiainen

The person reporting the Orlando experience states: "After installing the batteries..." and also says "We checked the batteries and connections, and tried several times to fire it up, but nothing", so the batteries are not factory installed on those units, and it seems they were not discharged either.

I'm afraid that those units have a more fundamental problem than the already-mentioned power management issue.

Re: HP49G+ DOA: Perplexing...

*Message #7 Posted by **Art Litka** on 12 Oct 2003, 11:11 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

Being the person reporting the Orlando (Fla-USA) experience, I would agree that these early 49G+'s have quality control problems. I think that the model is potentially a very good calculator, far superior to the 49 in all ways. It will probably take some problems from "early buyers" to help the rest of us obtain the quality and reliability from HP that we expect. I am eager to own one after my "test drive", but I may wait until the larger retailers have them as you suggest.

Re: Samson Cables update

*Message #8 Posted by **James M. Prange** on 11 Oct 2003, 7:47 a.m.,*
in response to message #1 by Eric Lundgren

Oh yeah, that's really promising. With any luck, the supplier might receive them from HP next week, and Samson Cables might receive them from the supplier the week after that, and then Samson Cables can get them packed up, labeled and on the way to the customers....

Oh, and then the customers get to try them and see if they work....

Regards,
James

performance of 48g vs 49g

*Message #1 Posted by **Eric Lundgren** on 10 Oct 2003, 6:07 p.m.*

Hi, In waiting for the 49g+, I ran some tests between my 49g and my new 48g.

I ran them side by side calculating the volume of y=1/x revolved about the x-axis from 1 to 10,000. I'd have like to do it to infinity and get an answer of PI, but so far I don't see why the 48g won't like that. I keyed it in as an algebraic object:

'PI*Int(1,10000,(INV(SQ(x)),x)' and was amazed that the 48g finished 63 seconds faster than the 49g..?? I must have something 'flagged' on my 49g that causes the slow down....

Also, I have Chotkeh mechanical engineering software loaded, leftover from my pops PE exam...could its presence be contributing? I don't think it should, but..

Eric

Re: performance of 48g vs 49g

*Message #2 Posted by **James M. Prange** on 10 Oct 2003, 7:04 p.m.,*
in response to message #1 by Eric Lundgren

On the 49G, maybe try it in appoximate mode, or use a trailing decimal on the numbers.

Regards,
James

Re: performance of 48g vs 49g

*Message #3 Posted by **Eric Lundgren** on 10 Oct 2003, 8:08 p.m.,*
in response to message #2 by James M. Prange

Thanks, I just tried it again with Approximate on the 49g, but it still took 191 seconds (I may have miscounted a few on first run). I'd try the trailing decimal if I knew what you meant by that, you don't refer to 'float' as the same thing, do you?

I think I remember trying something like this on the ti89 for fun, and that went quicker. Hahaa, looking at my 49g kbd, the enter key says 'ente ', as the 'r' is gone as well as the alpha c, d, e, and f :)

Eric

Re: performance of 48g vs 49g (long)

*Message #4 Posted by **James M. Prange** on 11 Oct 2003, 6:55 a.m.,*
in response to message #3 by Eric Lundgren

Aha, apparently you meant:

```
%%HP: T(3)A(R)F(.);
'\pi*\.S(1,1000,INV(SQ(x)),x)'
```

(I'm using the "backslash" character translations here, so "\pi" represents the lower-case Greek letter pi, "\.S" represents the integral symbol, "\->" represents the right-arrow, and "\.d" represents the derivative symbol.)

instead of:

```
'PI*Int(1,10000,(INV(SQ(x)),x)'
```

For a while there, I was thinking that by "Int" you meant "INT".

Flag settings (besides exact/approximate) that I think *may* be relevant are:
-2 clear (Constant \-> symb)
-3 clear (Function \-> symb)
and in the 49G:
-99 clear (CAS:quiet)
-100 clear (Step by step off)
-120 set (Silent mode on)
-123 clear (Allow Switch Mode)

All of the times are for a single trial each, and should be considered to be approximate.

I thought that it would be best to get the algebraic evaluated all the way to a numeric value in one step, so I used \->NUM instead of EVAL. It turned out that that wasn't such a good idea.

A 48SX returned 3.13845106094 in 433_s.

A 48GX returned 3.13845106094 in 293_s.

A 49G in approximate mode returned 3.13845106094 in 369_s.

A 49G in exact mode returned 3.13845106094 in 369_s.

By "trailing decimal", I meant:

```
%%HP: T(3)A(R)F(.);
'\pi*\.S(1.,1000.,INV(SQ(x)),x)'
```

Which causes the 49G to treat the numbers as type 0 floating point numbers ("real" numbers, in RPL jargon) instead of type 28 exact integers.

A 49G in approximate mode with reals returned 3.13845106094 in 369_s.

A 49G in exact mode with reals returned 3.13845106094 in 369_s.

BUT...

Using EVAL, the 48SX returned:

```
'\pi*(-INV(x)/\.dx(x)|(x=1000)-(-INV(x)'/\.dx(x)|(x=1)))'
```

in 1.49_s.
EVAL on that returned:

```
'\pi*.999'
```

in 1.12_s.

\->NUM on that returned 3.13845106094 in .0132_s.

Using EVAL, the 48GX returned:

```
'\pi*(-INV(x)/\.dx(x)|(x=1000)-(-INV(x)'/\.dx(x)|(x=1)))'
```

in 1.05_s.
EVAL on that returned:

```
'\pi*.999'
```

in .793_s.
\->NUM on that returned 3.13845106094 in .0092_s.

Using EVAL, the 49G in approximate mode with exact integers returned 3.13845106094 in 365_s.

Using EVAL, the 49G in exact mode with exact integers returned:

```
'(999*\pi)/1000'
```

in 3.54_s.
\->NUM on that returned 3.13845106094 in .157_s.

Using EVAL, the 49G in approximate mode with reals returned 3.13845106094 in 365_s.

Using EVAL, the 49G in exact mode with reals returned:

```
'.999*\pi'
```

in 3.04_s and left the 49G in approximate mode.
EVAL on that returned 3.13845106094 in .0779_s

Go figure....

It looks to me as if the best strategy is to use EVAL (and in the 49G, exact mode) to solve symbolically as far as possible, and only then force a numeric result. And for "real work", I think I'll keep using the 48 series.

Regards,
James

SD cards for the HP49G+

*Message #1 Posted by **Eric** on 10 Oct 2003, 5:17 p.m.*

Hi, Do these SD cards come in 512KB ? Where in the US could I get them?

Re: Do you mean 512Mb (as in MEGAbytes)?

*Message #2 Posted by **Paul Brogger** on 10 Oct 2003, 6:38 p.m.,*
in response to message #1 by Eric

FWIW, at www.CircuitCity.com I see 64Mb, 128Mb, and 256 Mb card (the last apparently for under $100.00).

My camera came with a 16Mb card installed.

Maybe someone else can address whether 512**K**b are available, but I doubt it, given the sizes of these others ...

Re: SD cards for the HP49G+

*Message #3 Posted by **Ed Look** on 10 Oct 2003, 7:35 p.m.,*
in response to message #1 by Eric

I could have sworn I saw larger capacities at CompUSA. Also, do check the online stores. I think I did see them up to 1GB; the reason why it seems to be in my mind is that I kind of recall seeing some awful price, upwards of $200 USD for one of these.

Re: SD cards for the HP49G+

*Message #4 Posted by **Dave** on 10 Oct 2003, 8:40 p.m.,*
in response to message #1 by Eric

Yes there are 512 MB SD cards, I believe one is on sale today only ay Buy.com for ~$150. Pretty good deal. I don't think the 49G+ can handle that much though I could be wrong...

Re: SD cards for the HP49G+

*Message #5 Posted by **Ed Look** on 10 Oct 2003, 11:53 p.m.,*
in response to message #4 by Dave

Actually, if I recall, VPN (I can't spell his name without looking at it!) mentioned that the 1GB SD card does exist, only it has to be ordered (online, I guess). I'm pretty sure though that I physically saw a 512 MB one in a store. (I'm using a 256 MB one stuck in a portable Jumpdrive unit right now to carry files from one place to another conveniently- no more floppies or even Zip disks; I keep these for backup purposes.)

Re: SD cards for the HP49G+

*Message #6 Posted by **Patrick** on 11 Oct 2003, 12:27 a.m.,*

in response to message #5 by Ed Look

My Palm Tungsten|T uses SD cards and, yes, I've physically seen 512MB cards ($400 Canadian... ouch). The 1GB cards have been announced but are still in pre-production, AFAIK. Of course, you can expect to pay an early adopter premium on that baby. Besides, I'm not sure it is the right choice for a calculator...

Re: SD cards for the HP49G+

*Message #7 Posted by **Ed Look** on 11 Oct 2003, 12:47 a.m.,*
in response to message #6 by Patrick

Patrick, thanks for the confirmation.

Yeah, aside from technical factors, a 512 Mb or 1Gb SD card is just plain too expensive.

But I had asked a question and had not yet gotten an answer. Let me rephrase it:

Is there some minimum SD card size that the 49G+ requires? (I hope not!) This is because, as VPN did ask, how much memory would even a 49G+ need?? Therefore, an affordable 64 Mb or even 128 Mb would make an optimal choice, if they're acceptable to the 49G+.

Re: SD cards for the HP49G+

*Message #8 Posted by **Veli-Pekka Nousiainen** on 11 Oct 2003, 3:28 a.m.,*
in response to message #7 by Ed Look

I have successfully tested 64MB SD, 8MB MMC, 64MB MMC. The Nokia 8MB MMC has plenty of room left for both the calc and the old 9110i Commmunicator. For cameras get the largest. For calc get the cheapest. For Nokia/calc get MMC. I have now that 64MB MMC for my 49g+. The 8MB is back in my B/W 9110i. The 64MB SD is with the original owner.

The DOS FAT16 partition size limits is "standard" 2GB/32K clusters. You maybe may be able to format an SD card as 4GB/64K clusters for FAT16. The 49g+ can handle at least any "legal" size MMC/SD as FAT16. I believe that future ROM upgrades will give better access to long names (non-DOS), but no support for FAT32 (to access some Terabytes).

VPN

Re: SD cards for the HP49G+

*Message #9 Posted by **Ed Look** on 11 Oct 2003, 1:01 p.m.,*
in response to message #8 by Veli-Pekka Nousiainen

Thank you Mr. Nousiainen, for making that all clear. And I will remember you name... at least better than I did last night!

I think then, that I'll just look for an affordable SD card, when my 49G+ arrives. I heard rumors of that...

QUOTE: "FAT" ? "DOS" ? "non-DOS long names" ? Is there some relationship between the 49G+ and the worst OS in the world ? Please be it not so !! ######

No, it's Sinclair compatible - you remember that 68010 CPU machine with tape drives? Just kidding! What file system you think your digicamera is using? You need to have some kind of compatibility in the file system. There is no DOS, just FAT16 like in cameras. So don't worry, be happy!

deleting variables, 19BII

*Message #1 Posted by **Jim** on 10 Oct 2003, 11:33 a.m.*

When I'm doing correlation analysis using my 19BII, as shown on p. 166 of Owner's Manual, I'm having trouble deleting variables created by NAME in the SUM menu. For example, after I've run a problem I want to reload the list and use the same names for X and Y. I'm having trouble doing that. Or, if I want to give the lists new names but delete the old names (variables), I can't seem to find a scheme that works. I've deleted the data and the labels but the variables still remain. Thanks for you help.

Re: deleting variables, 19BII

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 Oct 2003, 2:07 a.m.,*
in response to message #1 by Jim

Hi, Jim;

I am not sure that I'll answer your question completely, but I took a look at the HP17BII manual (mine is in Spanish, so I think page numbers may not match) and I read an observation at the bottom of Page # 24 (seems to be "Start Using your HP17BII") where some variables are mentioned to be permanent, meaning they exist anytime in calculator's memory. Also, I remember reading somewhere else (HP19BII User's Guide, and mine is in Portuguese...) that clearing (system?) variables is storing a "zero" on them.

I'm not sure about it, but maybe some statistical variables are created with default names, and the calculator will store "zeroes" on them instead of "purging" them out when they are cleared. As for CLEAR and PURGE (HP28/48/49), I think that the remaining variables are consistent.

Please, if my analysis is wrong, I'd invite others to add applicable corrections.

Let us know if you succeed.

Luiz (Brazil)

Paul's HP memories contribution

*Message #1 Posted by **Eric Lundgren** on 9 Oct 2003, 7:18 p.m.*

I was stepping through the 'memories' section of the MoHPC and I found Paul Brogger's 'Impact-tested' (21c?) HP. I find this funny, since when I was in 3rd grade, I used to show-off my Casio "G-shock" watch's resilience by pounding my wrist against the cement lunch tables! It never gave up, but then again I wasn't that strong back then. If any one has never seen this watch, it was from a child's eyes, an LCD wearing a rubber coated bank vault and two wrist straps.

Interestingly, Paul, you mention your attachment the 42s, a machine my father is also "locked" on to. I was curious to find a SECOND 42s user manual in the house during my last visit, confirming I did indeed have my own copy once...and I remember it too...but where is it?! Hahaa, my search through the boxes is soon to begin :)

If I strike gold, my (meager) collection will include a 42s, 32sii, 48g, 48gx, 49g, 12c, and, any day now, maybe a 49g+ & 33s! Its not huge, but I should never have to use 'algebraic' again :) Oh hey! The post just knocked on the door with my 48g from ebay! Eric

Instruction manual for HP 20s

*Message #1 Posted by **Richard Clarke** on 9 Oct 2003, 9:56 a.m.*

Hi- I am looking for an instruction manual in English for the HP 20s. Does anyone have an ecopy or a link to where I can find a copy

thanks

Re: Instruction manual for HP 20s

*Message #2 Posted by **David Brunell** on 9 Oct 2003, 5:38 p.m.,*
in response to message #1 by Richard Clarke

I don't know of a source for an electronic English manual, but if you go to the main hp page and search on "20s" you will find a wealth of step-by-step instructions for its use. If you have any specific questions, then ask here and I will try to answer them.

David

Re: Instruction manual for HP 20s

*Message #3 Posted by **Ed Look** on 9 Oct 2003, 11:10 p.m.,*
in response to message #1 by Richard Clarke

Hey! The manual is still offered for sale at Samson Cables! Look at this link:

http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=353&Sku=0002090001

How to download the spanish manual?

*Message #4 Posted by **R Lion (España)** on 10 Oct 2003, 4:03 p.m.,*
in response to message #1 by Richard Clarke

I am in this page but I don't get the download... help, please and sorry if I'm stupid...

Edited: 10 Oct 2003, 4:07 p.m.

Re: How to download the spanish manual?

*Message #5 Posted by **Ed Look** on 10 Oct 2003, 7:27 p.m.,*
in response to message #4 by R Lion (España)

I went to that page and I didn't see a link, either. I think HP took it offline. This may be why some of these companies are selling this out of print manual for so much money (I think that's what it cost when it was still new!)

Re: How to download the spanish manual?

*Message #6 Posted by **Julián Miranda (Spain)** on 11 Oct 2003, 3:27 a.m.,*
in response to message #4 by R Lion (España)

You select the language (only spanish and portuguese available) and click on the arrow at the right of the language window. The page reloads and a new frame appear below with the title of the selected manual and the file size (10 MB for the spanish one, I think is scanned and put in a PDF, so it's not searcheable(?)), you click on the title and the download begins.

The download is complete now and I can confirm is a scanned version.

If you are interested I think I have a spare one some where, contact me and I'll look for it.

hp49 g algebraic programming

*Message #1 Posted by **Ortiz R.** on 8 Oct 2003, 10:17 p.m.*

I would like to learn how to program my hp49g in algebraic mode. I also want to know where I can get some documents including some examples.

Re: hp49 g algebraic programming

*Message #2 Posted by **Tom (UK)** on 9 Oct 2003, 12:44 p.m.,*
in response to message #1 by Ortiz R.

HP didn't realy support programming for the HP49G, the only guide and examples I know of are in the HP49G user guide. RPL programming support was only there because it was so similar to the HP48G that people could use the many books and programming examples on the HP49G. (HP even suggested to me that if I wanted to learn how to program the HP49G in RPL then I should buy the HP48G manuals!).

There has not been much interest from the calculating community in programming in algebraic mode so support (official and unofficial) is very scarce - this is a pity because although the algebraic mode is not as powerful as using RPL it may be an aption some buyers would like to use.

Those who have received the documentation for the HP49G+ may be able to say if there is any support for programming in algebraic mode.

Re: hp49 g algebraic programming

*Message #3 Posted by **tom lianza** on 9 Oct 2003, 1:20 p.m.,*
in response to message #2 by Tom (UK)

I recently recieved my 49g+ and keeping with the current HP form, the documentation is dismal. The product ships with a "User's Manual" that references the "User's Guide". The User's Guide has all the documentation and it is shipped as a PDF file, which is OK, but they didn't use any of the pdf functionallity for table of contents. Hence, you have to page through 800 or so pages of text whose page numbers in the manual index (listed in chapter-page number) don't correlate to the pdf page numbers.... The answer to the above question is that HP still does not support programming in Algebraic mode....

Re: hp49 g algebraic programming

*Message #4 Posted by **bill platt** on 9 Oct 2003, 2:30 p.m.,*
in response to message #1 by Ortiz R.

Hi,

Well, as some previous posts in this thread suggest, HP is not taking any responsibility for the programming capabilities of the new machine. Now, maybe I am a bit alarmist, but as far as I am concerned, any calculator that does not come with a manual, is merely a toy, and not a real tool. Yes, some people are willing, able, and actively going after the programming of the 49G and the G+, and JYA and others who were intimately involved in the development of the 49 are still actively posting to comp.sys.hp48, and so perhaps that is

"documentation" enough for some, but not for me., Especially in light of the "outsourced" nature of the beast (49G+) and the whole new harware platform--and hte recent track record with the 12C platinum.

I don't trust the product if the manufacturer doesn't even trust it. I will stck with my older machines including the 48, until better documentation comes along. Why rush, if the product is not up to snuff?

There are plenty of new old stock 48's around!

regards,

Bill

Re: hp49 g algebraic programming

*Message #5 Posted by **Eddy** on 9 Oct 2003, 5:56 p.m.,*
in response to message #1 by Ortiz R.

"I would like to learn how to program my hp49g in algebraic mode. "

Good Luck! Algebraic programing just stinks. Its ineficient and confusing. RPN is just to awesome my advice: stick to it.

"I also want to know where I can get some documents including some examples."

Nowhere. All tutorials and documents {and programs) ive ever seen are for RPN.

but, if you really want to srick to algebraic... Get an RPN tutorial and convert instructions to algebraic.

Remember: In RPN, Arguments come first (x+2=Y SOLVEVX) but in algebraic, the command comes first, followed by the arguments inside a parenthesis and arguments separeted by a comma. --> SOLVEVX(x+2=y) Thats about it, if you need any help or more detail reply here, ill give u my email then.

HP-15C

*Message #1 Posted by **Eric Lundgren** on 8 Oct 2003, 7:51 p.m.*

In my search for matrix capability I found a 15c for 249...will it hurt my reputation to be caught paying this much? According to the museum it has numerical integration too, and has the solid build that I admire. This of course would be a team mate to my most often used hp, the 32sii. Any opinions?

eric

Re: HP-15C

*Message #2 Posted by **Marx Pio** on 8 Oct 2003, 8:18 p.m.,*
in response to message #1 by Eric Lundgren

Hi Eric,

249 USD for a HP15C?. Too expensive. A brand new HP49G+ do matrix algebra and much more for less bucks.

Marx

Re: HP-15C

*Message #3 Posted by **Larry Corrado, USA (WI)** on 8 Oct 2003, 8:36 p.m.,*
in response to message #1 by Eric Lundgren

Eric:

FWIW, I've been tracking HP-15C's on Ebay for the past month. I found the average price (9/2-10/7) to be $219, with a std dev of $55 and n = 27. This was with a rather generic "completed items" search, which did not include the poorly listed units, which presumably sold for somewhat less. (Who knows how many of those there were.)

I agree: the 15C is a great machine. Should one pay $249? How important are looks to you? Is owner's manual included? Advanced functions manual? My own feeling is that you could do a lot better by waiting a bit.

FWIW...

Good Luck, Larry

in response to message #3 by Larry Corrado, USA (WI)

I think that one is a little overpriced, considering that it has some obvious defects, and an engraving. Who

want's someone elses initials on there? It would be like if your wife has a tatoo with an old boyfriend's name - you know about it, but you don't want the constant reminder. However, I see nothing wrong with paying even a lot more for one that is in mint condition. There's nothing better than that new calculator smell, when you open a perfect HP 15C that has been sitting in its box somewhere for 20 years. I think the one you're referring to should probably sell for closer to 200, or maybe 175 considering that it looks like it has some screen defects.

*Message #5 Posted by **Karl Schneider** on 8 Oct 2003, 11:51 p.m.,*
in response to message #1 by Eric Lundgren

Eric --

$249 seems a bit high to me for a HP-15C, unless it is functionally perfect and comsetically immaculate.

However, the 15C is definitely worth having (I bought mine in Nov 1983). At work, I also use a 32Sii, but would take the 15C if forced to choose between one or the other, because of the matrix and complex-number functionality.

As Marx Pio points out below, other units also have matrix functions. However, ease of use and clarity of display are also important; the 15C and 42S are better in those respects for matrices than the RPL-based units (28, 48, 49).

Overall, the 42S matrix functions are slicker and faster than the 15C functions. However, the 15C does a few things better: Matrix annunciators include the label (e.g., "C 4 2" in the displayed X-register, while the 42S will show only "[4x2 Matrix]". If you have matrix descriptors in both the X and Y registers of the 42S for an operation, you'd better remember which matrix is which, because only matrix addition is, in general, commutative.

*Message #6 Posted by **Thibaut.be** on 9 Oct 2003, 5:27 a.m.,*
in response to message #5 by Karl Schneider

Paying $249 for a calculator capable of matrix, num integration, solve and complex is far too expensive.

Paying $400 or even more for an unused 15C mint and complete in its box is cheap.

There are 2 "distribution channels", if I may say so. Using the calculator and collecting them. The difference between these 2 concepts are as important as between day and night.

*Message #7 Posted by **bill platt** on 9 Oct 2003, 8:56 a.m.,*
in response to message #1 by Eric Lundgren

I bought a heavily used 15c for $110. Yes, it is missing the nameplate, and had damage to the back plate, and the owner's name engraved. But it did come with the original manual, box, sleeve, and even the pink plastic bubble pack. The 15-c is a neat device, but quite slow. I am glad to have it, though. It is way compact, has gobs of memory for RPN programming, every function on the buttons, a handy back plate guide, and a very clear display. On of the very best pocket calculators, (so wonderfully compact) though for my use the 32sii is as good or better for most operations--and has that nice alphanumeric feature.

BUt 250 bucks is a lot.

regards,

Bill

simultaneous eqns. on 32sii...anyone?

*Message #1 Posted by **Eric Lundgren** on 8 Oct 2003, 4:02 p.m.*

I've written a 2 equation in 2 vars program in 36 bytes, in the form of Ax+By=C & Dx+Ey=F. Has anyone pulled off a shorter one? I would hope to get it up to 4eqn/4var without having a massive memory brunch.

I'm also searching for any known space saving tricks like performing one operation on several (3 or more) values at once, or more than one operation on one value, for example:

input, sqre, + A,B,C to individually recall, square, and then add the results. (I know this won't work if I enter as is) It currently takes me ten lines to input, perform, and store this in a variable.

In light of the massive storage capacity offered by models like the 48gx/49G/G+ I am really enjoying the experience of managing stuff in limited space. I analog it to learning the value of a dollar, like dad always said. back to the kbd. eric

*Message #2 Posted by **Karl Schneider** on 9 Oct 2003, 12:08 a.m.,*
in response to message #1 by Eric Lundgren

Eric --

Nah, I haven't tried to write an optimal linear-systems solver for the 32Sii. Why do so, if one has other models with the capability built in, as well as Matlab on the workplace PC? Even the 20S has a 3x3 solver, but you'll probably need to consult the manual to run it, and you'll lose any programming and memory contents.

I'd invest the effort in mastering your new-used 15C. On an EE midterm exam in 1991, I was able to solve a three-loop AC ladder network as a set of three simultaneous equations using a 3x3 complex system matrix, and then manipulate the complex-valued solutions in complex mode. The students using calc's without these two built-in features would have had to "collapse the ladder" with laborious manual calculations.

Re: simultaneous eqns. on 32sii...anyone?

*Message #3 Posted by **Valentin Albillo** on 9 Oct 2003, 10:02 a.m.,*
in response to message #1 by Eric Lundgren

Have a look at these HP32SII links:

Simultaneous Linear Equations in 2 unknowns

Simultaneous Linear Equations in 3 unknowns

Simultaneous Linear Equations, 1 Linear, 1 Quadratic

Anyway, perhaps you should try an HP-15C instead. It can solve linear systems up to 7x7, with no programming necessary, in just a few seconds.

Best regards from V.

How does one access files on the HP-75 Visicalc & Text Formatter modules?

*Message #1 Posted by **Tom Sherman (Maine)** on 8 Oct 2003, 9:43 a.m.*

I have an HP-75 that contains the VisiCalc and Text Formatter modules. While I have a manual for the HP-75 itself, I have none for the modules, and these manuals do not seem to be in the HP Museum's CD archives.

Can anyone tell me how to access the programs on these modules? Does anyone have a list of file names, or know where documentation can be found?

Thanks very much. -- Tom

Re: How does one access files on the HP-75 Visicalc & Text Formatter modules?

*Message #2 Posted by **andy** on 8 Oct 2003, 10:34 a.m.,*
in response to message #1 by Tom Sherman (Maine)

To start visicalc type "VC". To exit press shift-attn (like you're turning the 75 off).

To obtain a menu in visicalc press "/" (remember lotus 123?). You should be able to decipher oost of the operations by experiment.

Also, "time" "appt" and "edit" are all toggles...you can experiment to find out what they do because I forget.

Andy

Where in the World is the 49G+ or the 48GII?

*Message #1 Posted by **Jack N** on 8 Oct 2003, 9:37 a.m.*

I don't know about the rest of you people, but I want to know where and when the 49G+ and 48GII are going to hit the street (in the USA). My mouth has been watering ever since I heard about these calcs. I can't wait any longer!

In the meantime, I happily computing away on my 48GX. I doubt that the new calcs will replace my trusty 48GX, or 48SX, or 42S, or 32S, or 41 (CV or CX), or 32SII, or 28S, or 15C or 11C. But I just still can't wait to take the new calcs for a test drive.

in response to message #7 by Eddie

Crikey! Christmas? Maybe they were retaliating out of frustration due to the load of questions they must be getting..

I visited a local Fry's Electronics here in San Diego on Saturday, and the calculator guy said he was waiting "any day"..he said to check back on wednesday which is today. But still no word...

eric

HP49G+

*Message #9 Posted by **Iqbal** on 8 Oct 2003, 9:21 p.m.,*
in response to message #8 by eric lundgren

Might be a disappointment for a few. Normally, when running my surveying programs with my 48GX or 42S I never watch the display because when i press a key it registers. Well believe me when I say that you must watch the 49G+'s display for input. I have regularly pressed buttons and they never registered on my 49G+. Big problem when you are typing about 20 lines of data. But on the plus side, it really is much faster than the 48GX.

Re: I've been watching . . .

*Message #10 Posted by **Ed Look** on 8 Oct 2003, 11:03 p.m.,*
in response to message #8 by eric lundgren

LOL!

These stores always say, "Check back this coming ___day! The truck arrives then!" They tell me this in Best Buy, Circuit City, Radio Shack, Staples, etc. At least Samson Cables, and others online aren't committing to a specfic day in the week to come. I truly wonder what's going on over on HP's end. Could it really be a production issue? Or, as someone else said, it's a financial year issue?

Whatever. We've got to wait in any case.

After reading many of the posters here, I think I'm going to give poor Samson Cable's site a rest from my checking! And here I thought my connection slowed down.

*Message #12 Posted by **Rob Harris** on 9 Oct 2003, 10:48 a.m.,*
in response to message #11 by Jim Chumbley

Jim,

Since you already have one.....

I'm considering grabbing a 49G+, since my 48SX is recently deceased.

Just looking at the keyboard of the 49G+, I don't see any buttons for Swap, Drop or Roll....Are these functions easily accessible? How?

I'm sure that they are there somewhere, but I'd be a little more comfortable if I knew how a user accessed them.

Thanks,

Rob

*Message #15 Posted by **Bob** on 9 Oct 2003, 8:51 a.m.,*
in response to message #1 by Jack N

I am not sure how many of you are in the business of developing and manufacturing products, but I can tell you that missing ship and to-market dates are devastatingly easy to do. I'm not making excuses for HP or their contract manufacturer, but that is a fact.

There are a thousand and one things that can go wrong if the product engineering and design are perfect. Some of these include: contract issues, employee training, machine setup/failure, inadequate spare parts, revision of subcomponents, poor project manager, loss of key technical leaders, intervention from marketing and sales, inadequate quantity or quality of raw materials, logistics issues, a typhoon, accidents, etc.

If they are revising the design, or discover flaws in the transition from prototype to production units, it could be even more time before they see the light of day.

If they are not, then this is where the program/project manager and team earns their pay. Provide leadership, do detailed planning to avoid errors, mitigate the negative impacts, resist design change, make contingency plans, delegate tasks, and make the critical path schedule.

With the roll-out of 3 different models, so close together, through a contract manufacturing arrangement in Asia, the challenge must have been tremendous. No one should be surprised that the delivery dates have slipped.

32Sii BROWN vs. 32Sii BLACK

*Message #1 Posted by **NH** on 8 Oct 2003, 2:43 a.m.*

Greetings:

Anybody got an opinion of which is better..... 32Sii BROWN vs 32Sii BLACK ????

Did they make mostly the brown or mostly the black ??

Is the brown version perhaps more cosmetically pleasant, more viewable, etc etc?

I was thinking of swapping my 32Sii from black to brown, based on a hunch that brown is the earlier version and might be better overall. I am also suspicious that the white ink on the keys of the black version is more likely to come off ?

Re: 32Sii BROWN vs. 32Sii BLACK

*Message #2 Posted by **Tizedes Csaba** on 8 Oct 2003, 3:01 a.m.,*
in response to message #1 by NH

In the room, in the neon-light, my 32 is black. Outside in the sunshine the color of it is brown. And the soft case is too.

Csaba

Re: 32Sii BROWN vs. 32Sii BLACK

*Message #3 Posted by **Thomas Radtke** on 8 Oct 2003, 8:59 a.m.,*
in response to message #1 by NH

Why should the old version be the better one? If you're unlucky you might get a buggy one. If this is what you want we could probably swap our calcs since I'm not a collector and would be pleased to get a full working device (In case you don't know what I'm talking about--some brown bezel devices have the fraction calculations messed up:).

Re: Take a close look at the keys . . .

*Message #4 Posted by **Paul Brogger** on 8 Oct 2003, 10:13 a.m.,*
in response to message #3 by Thomas Radtke

I've one of each, and can attest that the older keyboard puts the newer one to shame.

The older has double-shot keys (indelible legends molded in two colors of plastic) with big, elegant, readable characters and great contrast. The newer has painted-on keytops, with *noticeably* smaller, dimmer, less-well-positioned characters and a distinctly cheaper look & feel.

If one of yours has painted keytops, take special care of the *other* one!

Re: Take a close look at the keys . . .

*Message #5 Posted by **bill platt** on 8 Oct 2003, 10:51 a.m.,*
in response to message #4 by Paul Brogger

Hi Paul and Norm,

I have one of each, too, and even my brown one has painted keys, just as my black and green one has. I wonder if there is any coincidence between resolution of the fraction bug, and phase out of the double shot keys? BTW, my painted keys show no signs of failure--and I have a 48GX with painted keys, and it is fine, too.

Regards,

Bill

32Sii keyboards

*Message #6 Posted by **Randy Sloyer** on 8 Oct 2003, 11:03 a.m.,*
in response to message #1 by NH

A couple of points about 32Sii's.

The 32Sii started life with units made in the USA. These were the only ones with the fraction bug and HP was swapping them out FOC. I doubt there are many buggy ones still out there.

If I had to guess, I would bet there are at least 10 times more brown units out there than black, so there is no way the browns are "rare" as so many eBay sellers like to point out.

Production shifted to Singapore, a very brief period when they where made in Malaysia and then finally to Indonesia.

The black units represent the end of production units made in the last two years of their life as a product. The keyboards tend to have some keys that click louder than others, primarily on release. Some find it to be very annoying, especially those of us who know that not all units do this. This is a trait of all later Indonesian Pioneers, not just 32Sii's. It is my personal belief that the specification for the bi-axially oriented mylar sheet used for the key dome material was relaxed, creating the problem. Never have I seen a Singapore or USA unit with this very annoying habit.

Malaysian and Indonesian 32Sii units, both brown and black, ALL have printed keys and yes, they do wear off. More correctly, they chip off. Only the USA and Singapore models have the better double molded key legends. As Paul so correctly states, the legends are smaller and of a lower contrast. The painted keys do have a clear coating over them to prevent wear-off, which helps but does not prevent a loss of the key lengend.

I personally find the brown scheme to be much easier to see. The teal and purple against a black background is pretty tough for me. The 48 series was better with the blueish-gray background.

IMO, if you're in the market for a brown unit, I would look for one made in Singapore.

Edited: 8 Oct 2003, 11:12 a.m.

Re: 32Sii keyboards

*Message #7 Posted by **Thomas Radtke** on 9 Oct 2003, 5:24 a.m.,*
in response to message #6 by Randy Sloyer

Hi Randy,

my 32SII is a Singapore model and I can confirm all the bugs with the fraction mode on this particular calc. I was not able to swap it since I wasn't aware of the exchange program by HP. About the keys, yes, the symbols are 'molded' into the plastic and the feeling is much softer and more silent than on my '98 48g or even my '90 20S. But again, thats just a detail for collectors and does not affect the usability. At least I-being just a user-don't mind the difference.

Thomas

Re: 32Sii BROWN vs. 32Sii BLACK

*Message #8 Posted by **Bert K** on 8 Oct 2003, 12:06 p.m.,*
in response to message #1 by NH

I have both a black and a brown 32SII and I prefer the brown version. The black 32SII suffers from sticky sounding keys, the brown one does not. The brown one has a better color scheme IMO. Both are Indonesian made and do not suffer from the fixed denominator bug.

Re: 32Sii BROWN vs. 32Sii BLACK

*Message #9 Posted by **NH** on 10 Oct 2003, 4:44 a.m.,*
in response to message #8 by Bert K

Wow ! That was some heavy duty information. Randy especially did quite the meticulous summary of HP-32Sii history.

I too perceived that the last part of the production run had cheap keys..... and I haven't even pulled it out of the plastic. I like the way that was stated by you guys.... the legends are thinner and fainter and harder to see.

As I try to be a connosseur, I would tend to try for earlier in the production run. Of course, I maintain a bias towards 32S as preferrable to 32Sii ..... and 34C best of all :o)

BTW, how do you prove whether or not 32Sii has the bug in the fractions ?? And even if it does, is it enough of a problem to likely interfere with everyday calculations ?

*Message #4 Posted by **Richard Garner** on 7 Oct 2003, 10:05 p.m.,*
in response to message #1 by Michel Beaulieu

Sense HP still makes the 12C and now the 12CP, they are the same size as the 10C. You could try and get a replacement pouch for the 12C from HP.

Re: HP-10C pouch

*Message #5 Posted by **CME750** on 7 Oct 2003, 11:21 p.m.,*
in response to message #1 by Michel Beaulieu

Official HP-12C pouches are currently on sale at Samson Cables for $14.99 plus shipping (which is another $6-7).

According to Samson Cables, the current price is marked down from the normal price of $19.99 and the MSRP of $24.99.

The same pouch was used for the 10C, 11C, 12C, and 15C. It has the HP logo, but no specific model number. So I got one for my 11C.

Details at: http://www.samsoncables.com/catalog/prodByCat.cfm

in response to message #8 by Martin (UK)

I'd like to hear from people who've purchased one of these newly designed leather cases.

The flap on these new ones is in the long, horizontal direction whereas the flap on the legacy (HP) leather cases was along the short, vertical direction. I imagine this means more case material is needed, and therefore more bulk -- something of a turn-off for me.

Does anyone have both? Which do you prefer?

*Message #10 Posted by **David Smith** on 8 Oct 2003, 7:18 p.m.,*
in response to message #1 by Michel Beaulieu

There have been a couple of people selling new old stock HP vinyl and leather cases for those machines on Ebay rather regularly. They usually go for $10-$20.

HP 48S and G learning

*Message #1 Posted by **Michel Beaulieu** on 7 Oct 2003, 7:07 p.m.*

Hi, i have, at school, the mission to try calculators in order to give my opinion to my principal (who buy calculators for students) and also to tell students which calculator to buy.

1 months ago i receive a HP-48s, a TI-92+ a HP-38G and a HP-48GX to "try" and give my opinion.

I don't have any problem with RPN or Algebraic mode so my opinion is not base on this "feature".

I begun with the HP-38G and fin that learning this calculator is easy but the capabilities are a little bit limited. Next i try the 48S and 48GX. I read the quick start guide and begun to use the calculator.

after one or two weeks of use i was amase about what it can do but learning it is very difficult for me so i think my student will find that nearly impossible! I always hear the "beep" after entering a key that seems to be the good one!!! That reapiting beep over time get me nervous and i stop using the calculator (i know i can disable the beep).

exemple : just entering a closing parenthesis in an equation is painful and not ergonomic, changing the window range, exchanging files with computer is painful and time consuming to learn.

After that i open the TI-92 and find it easy and ergonimic to learn; i was able to draw at my taste a polar or a parametric situation withou the manual in a clic of an eye.

The problem is that i don't like basic programming and prefer keystroke : no graphing calclator i know is capable of that. Keystroke programming is ergonomic and you don'T have to learn a lot to program it basicly.

So i told my student to buy a TI-89 or a ti-92 or a voyage 200 and for lower grade i also include a hp-38G.

I like RPN, it's logic and fun to teach it to student and see and their eye they catch it in a minute BUT graphing calculator from HP are too hard to learn and time consuming. Why not do a TI-89 like calculator with RPN entry?

I think RPN can have a chance with students if someone can make a calculator that can be fun and easy to learn and ERGONOMIC like the TI-92!!!

My HP-41 is the best but don't have the graphing capabilities i need. For learning the 41, it's not so easy but very FUN and logic!

I'm lucky and open mind because when i compare what other teacher that have the same "job" in others schools, they even don't want to hear about RPN or HP! Thye miss things : RPN is ergonomic but HP-48G is not!

I'm talking about learning a tool, but not the keys, the LCD, the functions, or nothing physical here; i think HP graphinc calculator 48 series have a good quality; the problem is the OS?

Or do you have some tips for me for the 48? learning tutorial?

Is the 49G the same, i never try it yet...

Michel

Re: HP 48S and G learning

*Message #2 Posted by **Jeremy** on 9 Oct 2003, 10:44 p.m.,*
in response to message #1 by Michel Beaulieu

Michel,

You never mentioned what level your students are at. I have had a TI-85 (a predecessor of the TI-89 and 92) for many years, since 1990. I love it. It is so easy and intuitive to use.

It doesn't have the character of an HP though. I think that a student who is very serious about getting the most out of his calculator might enjoy the HP more, but for the other 98%, they just want to get the job done.

I got my 48G on ebay for about $35. I think a TI-85 would go for about the same. A TI-89 would cost considerably more, probably around $100-120. A TI-92 is a huge beast, and obsolete now that the 89 is out. Also, many big standardized tests specifically ban anything with a QWERTY keyboard, so I would steer your students clear of that one.

The TI-89 does symbolic differentiation and integration easily. The 48G doesn't. I'm not sure about the HP49 series.

So if your students are college level engineering students, the HP would be worth a thought. Otherwise, save them a lot of hassle. I know that is sacreligious to say here, but it is true that it takes more 'dedication' to learn an HP. To many of us, it is ultimately more gratifying in the end. To everyone else? Give them simplicity.

-Jeremy

What is that annunciator? (33S)

*Message #1 Posted by **Tizedes Csaba** on 7 Oct 2003, 5:42 p.m.*

Hi,

who knows, what's that ann. on the 33S's LCD, under the Left-Shift ann., near '0.5...' on www.hpcalc.org?

Csaba

Uh, whatever it is, it looks like it has a cable sticking out of it. Perhaps it is a connection (to PC or another calculator) icon?

Re: What is that annunciator? (33S)

*Message #3 Posted by **Ben Salinas** on 7 Oct 2003, 7:01 p.m.,*
in response to message #1 by Tizedes Csaba

While looking at the tiny simple on the LCD screen, I compared it to that of the 32sii, and realized that the only thing that the 32sii's screen has that the 33s doesnt have is all the little arrows pointing down (for selecting stuff in menus). My question is this: Although there are many of the functions directly on the keybaoard of the 33s (such as Cnr, and Pnr), there still will need to be menus (such as for linear regression), so how will these menues be navigated? The 32sii has "softkeys", however it does not look like the 33s has those (judging by the lack of little arrows). I truly hope that you will not have a menu to scroll through (such as on many of the TI scientific calculators), because I can get used to a weirdly arranged keyboard, but if you have to scroll through 4 options to get to some of the features... Just think of the number of keystrokes. On the 32sii, to get 'r' (provided the Stat data is inputted) you need 3 keystrokes (right shift, L.R., y^x). It is possible that on the 33s, it would be 8 keystrokes. IMHO, that takes the advantage out of the scientific calculator (namely, speed) -Ben Salinas

I don't think, that is arrows...

*Message #4 Posted by **Tizedes Csaba** on 8 Oct 2003, 2:20 a.m.,*
in response to message #3 by Ben Salinas

On the right side of LCD it had two arrows (up/down), and had two arrows for left and right. I try zooming and sharping the pic (with ACDSee) it looks like letter 'B', but not really 'B'.

I don't know, what's that. (And I don't want guessing...)

Csaba

Navigation with...

*Message #5 Posted by **Tizedes Csaba** on 8 Oct 2003, 2:29 a.m.,*
in response to message #3 by Ben Salinas

Hmm... Under the LCD, that big empty place look like an four-direction 'joystick' and the four direction is marked with lines.

I'm guessing very hard now... :)

Csaba

Re: Ben, I think you called it . . .

*Message #6 Posted by **Paul Brogger** on 8 Oct 2003, 10:02 a.m.,*
in response to message #3 by Ben Salinas

In the early-release .PDF product summary, 2nd page, top of middle column under "edit" it says "4-arrow key in menu:" and goes on to (sort of) explain (clumsily) how the "up arrow" and "down arrow" actions work.

I've assumed that the large center space between "ALG/SOLVE" and "MODES/DISP" is in fact the "4-arrow key". Note that there aren't up and down arrows, as such, anywhere on the keyboard, and the "up diode" and "down diode" (left-shifted 7 & 8) functions are probably "top of list" and "bottom of list" jumps. (Those are alluded to in the .PDF text as well.)

So, Ben, I'm sure you're on to something. They increased the number of keys by 6-10 (depending on how you count 'em), sprayed every function they could think of onto the keyboard, and short of adding a third shift key, needed to make menus work somehow (given the design all but precludes the use of soft keys). So you get cursor-navigated lists.

I feel some hope for new kbds..?

*Message #1 Posted by **eric lundgren** on 7 Oct 2003, 2:39 p.m.*

I think the 33s kbd might be saved. Does anyone know the cycle for releasing new machines? How late could they pull the brake and do a retool of such a component?

I've just got this feeling..factor in also that if I'm correct (if not correct me) the design for the 33s was presented before the new PE exam restrictions. Would this potential market be sufficient motivation for them to slap some 48/32s buttons on that thing?

eric

Re: I feel some hope for new kbds -- but not 33s ...

*Message #2 Posted by **Paul Brogger** on 7 Oct 2003, 5:07 p.m.,*
in response to message #1 by eric lundgren

I was joking elsewhere with regard to the 33s' delayed release. They've slipped delivery of the 48GII and 49G+ a few times already, so it's not at all surprising that the 33s is being delayed too.

I don't think for a moment that, because of complaints on this board, they're going to do a 180 on their racy new design and start from scratch.

It does appear that, inasmuch as the new keys aren't rubber and mushy, they'll be better than we might have expected, and *that's GREAT news* indeed.

Re: I feel some hope for new kbds -- but not 33s ...

*Message #3 Posted by **eric lundgren** on 7 Oct 2003, 5:10 p.m.,*
in response to message #2 by Paul Brogger

Well, how about that! Are they really 'hard' keys?? Great!

Yeah, I was feeling a little optimistic this morning :)

Re: I feel some hope for new kbds -- but not 33s ...

*Message #4 Posted by **John Limpert** on 7 Oct 2003, 7:32 p.m.,*
in response to message #2 by Paul Brogger

I just don't understand this new school of industrial design that insists on doing weird things to keyboards. The HP-33S looks tame compared to some of the new cellular phone handsets. Whatever happened to "Form follows function"?

The old Bell System used to conduct usability studies on new designs for telephone equipment. I wonder if HP did any usability testing on the new calculator designs?

Re: I feel some hope for new kbds -- but not 33s ...

*Message #5 Posted by **Robin** on 18 Oct 2003, 6:11 p.m.,*
in response to message #4 by John Limpert

I'm quite shure they where doing some tests, but in many product lines, the sales/marketing has the last word - they first want to sell, and to many manager's mean that's already done with a "special" design, usability does not seem primary for them :-(.

But there is still hope - I haven't seen the final release yet, the say it will be available in the middle of November in Switzerland. We'll see.

MLDL2000 for HP41: Update

*Message #1 Posted by **Meindert Kuipers** on 7 Oct 2003, 10:28 a.m.*

You have not heard from me for some time, but I have been working on the MLDL2000. I could not spend as many hours as I would have liked but some progress has been made.

Right now I am debugging the I/O interface, which allows me to program FLASH and SRAM from my PC with ROM images. Due to some issues I had to change (and simplify) the design of the I/O interface, and I hope to release a new version within a week or so. This will be a pretty final specification before I start making the layout for the PCB. After that there is no way back.

The changes in the I/O interface are that the bit-serial interface has gone away, and only a (faster) parallel interface remains. Signal configuration is based on a USB digital I/O module that I am using and that is very likely to be an integral part of the MLDL2000. Both will fit together in a cardreader housing, which is my design goal.

Meindert

Re: MLDL2000 for HP41: Update

*Message #2 Posted by **Jeffrey Davis** on 7 Oct 2003, 1:26 p.m.,*
in response to message #1 by Meindert Kuipers

Meindert, Great work! I have been following your progress and I am looking forward to using one of the completed units soon. From your posting, I had one question. How big is the flash rom and how many rom images could be flashed? For example, could I have both the David Assembler and the Zenrom flashed to the unit and use each separately? Keep up the good work. Jeff

Re: MLDL2000 for HP41: Update

*Message #3 Posted by **Meindert Kuipers** on 8 Oct 2003, 3:10 a.m.,*
in response to message #2 by Jeffrey Davis

Do youreally want to know how much memeory there is? Check out the specifications ;)

There is room for 47 ROM images in FLASH and 11 RAM blocks, is that enough for you?

Meindert

Re: MLDL2000 for HP41: Update

*Message #4 Posted by **Jeff** on 8 Oct 2003, 9:32 p.m.,*
in response to message #3 by Meindert Kuipers

Thanks Meindert. Will you be completing the mfg. of the units for sale, will you provide the kits for assembly or just supply all the specs for the unit that fits into the card reader? Do all of us who want one of these units need to purchase a card reader? Thanks

Re: MLDL2000 for HP41: Update

*Message #5 Posted by **Meindert Kuipers** on 9 Oct 2003, 2:32 a.m.,*
in response to message #4 by Jeff

I will only be offering kits with the complete PCB's. It is up to you to put in in a box, be it a cardreader or something else. I will repeat again that this project is for hobby and fun, and not intended to be very professional and certainly not for profit. Besides, I only have three cardreaders housings that I want to keep for my own unit ;) If you want to put it in a cardreader housing you will need to get hold of one. I suggest you wait purchasing one until I finalize the mechanical details.

Meindert

Jornada X25 Linux prototype : has anyone seen on sale ?

*Message #1 Posted by **Pascal** on 7 Oct 2003, 8:16 a.m.*

I've searched both forum and classified ad section for the Jordana X25 prototype but I didn't find anything.

Has anyone ever seen those on sale on ebay or anywhere else ? Have some prototype units been distributed to testers like the xpander ? how many units were built ?

Thanks for any info on this subject.

Pascal.

Re: Jornada X25 Linux prototype : has anyone seen on sale ?

*Message #2 Posted by **Laurence** on 7 Oct 2003, 12:17 p.m.,*
in response to message #1 by Pascal

Hi

There have been a few (3 or 4) X25 prototypes sold on Ebay over the last 12 months or so but they seem very rare. A few were sold at the HPCC meeting last year in the UK when a small number of units were available. I have one myself purchased at this meeting. there are more details at http://www.geocities.com/wongyapkong/x25 and you should find a lot more sites via Google

Re: Jornada X25 Linux prototype : has anyone seen on sale ?

*Message #3 Posted by **Colin** on 7 Oct 2003, 7:39 p.m.,*
in response to message #2 by Laurence

About 200 pilot production units were built of the Jornada X25. The X25's were handed out to ACO staff and contractors when we were closed.

Re: Jornada X25 Linux prototype : has anyone seen on sale ?

*Message #4 Posted by **Les Bell [Sydney]** on 7 Oct 2003, 10:17 p.m.,*
in response to message #2 by Laurence

Thanks for posting the link to Wong Yap Kong's X25 site - I think <g>. Looking at his pics, it's obvious that the product was very close to launch, with packaging, manuals, various accessories all ready to go. It's heartbreaking to see all that work wasted, and it would have been a neat product, too.

Best,

--- Les [http://www.lesbell.com.au]

Reading HP9800 tapes

*Message #1 Posted by **Jean-Louis Dornstetter** on 7 Oct 2003, 6:58 a.m.*

Hello everyone

I used to work in the eraly 80's on an HP desktop calculator that was equipped with a thermal printer and two cartridge tape readers, plus a decent green/black display. It looks similar to HP9825 but I couldn't recognize the exact model I was working with, which I didn't find on the WEB. My problem is as follows : the mice did actually eat (!) the listing I kept of some of my junior engineer work deep in the garage. I still have the program tapes, HP200 'certified data cartridge' that are still in good physical shape and weren't exposed to dangerous conditions, and I wonder whether somebody could provide me a hint on how to read such tapes, given that I do no longer have access to one of those machines, I even don't have the precise model, and I have no clue on the (compressed ?) format used to store the lengthy HP Basic routines I would like to read the source code again.

Any help would be more than welcome...

Cheers

Re: Reading HP9800 tapes

*Message #2 Posted by **Vassilis Prevelakis** on 7 Oct 2003, 9:05 p.m.,*
in response to message #1 by Jean-Louis Dornstetter

OK, first the tapes, do they look like these?

http://www.classiccmp.org/hp/hp200.jpg

According to your description, the computer cannot be a 9825 since this one has only a one line LED display. So you are either thinking of a 9835, like this one:

http://www.classiccmp.org/hp/9835a.jpg

Or (most likely as this one can have two tape drives) an 9845. This is not the best picture, but its the only one I could find:

http://www.classiccmp.org/hp/hpjournals/4-78.jpg

Now the bad news, your tapes are probably long gone -- destroyed by age. Assuming that you can find a working 9845 you may have a single chance at reading the data off the tape, but before you do that, you have to make sure that

a) the rubber belt that moves the tape still works. You will have to open the tape housing and look inside. If the belt is broken or about to break you will have to replace it with one from a working tape (preferably manufactured the past 10 years). This is a not so good picture of the internals:

http://www.classiccmp.org/hp/hp-tape.jpg

b) Make sure that the tape is not stuck on itself. Carefully wind (manually) the tape from end to end (DO NOT USE A RE-TENSION COMMAND) checking to see whether the oxide stays on the correct part of the tape. If the oxide is falling off or sticking to the back of the tape, then your tape is gone.

Assuming that the tape passes the above two tests you should assume that you have ONE chance of copying the data.

Have another tape or (preferably) a disk (diskette or hard) ready to accept the contents of the old tape and PRACTICE the copy operation a couple of times with ANOTHER TAPE.

If everything looks OK, insert the original tape, say something comforting to the machine in a friendly and stress-free voice and good luck.

**vp

The pictures above are from the Classic Computers web site www.classiccmp.org.

Re: Reading HP9800 tapes

*Message #5 Posted by **Jean-Louis Dornstetter** on 11 Oct 2003, 2:32 a.m.,*
in response to message #2 by Vassilis Prevelakis

Vassilis

Thanks for your thorough/detailed response. The tapes are exactly that in the upper right corner of the pictures you provide (HP 200 'certfied cartridge") and I already had done the physical integrity check, and this seems OK, so far so good. Of course, they may well desintegrte wfter the first pre-tension operation, life is sometimes a bitch.

My most 'fundamental' problem remains to either access one such machine, I found the model (also thanks for the pictures) by searching deep into my almost fossile memory, and it definitely was an HP9845B, a really rare monster I have no clue how to get one. The last sale opportunity I could track on the Web was from an Autralia-based machine in 1999 :-(

I will try to find a compatible QUIC tape reader and access the binary content, a couple of dirty hacks might prove necessary but I am not afraid with programming, and also seek for such a fossile machine in the garage of research labs, they don't easily junk their past stuff in France...

Best regards

Re: Reading HP9800 tapes

*Message #6 Posted by **Vassilis Prevelakis** on 11 Oct 2003, 2:56 a.m.,*
in response to message #5 by Jean-Louis Dornstetter

```
Jean-Louis Dornstetter wrote:
> I will try to find a compatible QUIC tape reader [...]
```

There are lots of 9825 and (of course) 85 computers out there. I think their drives are compatible with the 9845, but I not sure about data portability.

I know that the 85 will NOT read 9825 tapes, but I do not know whether an 9825 will be able to read 9845 tapes (these two families were quite close, e.g. they had the same expansion cards).

I have looked at the possibility of writing an assembler program on the 85 to read 9825 tapes, but at this stage this task looks hopeless.

Of course TESTING your software will also be a problem, as you do not want to try it on the 20 year old tapes, and (at this stage) you do not have anything more recent.

Of course, you can try recording the pulses as they are coming off the drive and then reverse engineer the format.

**vp

Re: Reading HP9800 tapes

*Message #7 Posted by **Petr Horsky** on 12 Oct 2003, 3:24 p.m.,*
in response to message #1 by Jean-Louis Dornstetter

Jean-Luis:

I am afraid that even if you succeed to read the raw data from your tapes, everything will depend on whether your programs have been SAVEd or STOREd. The former means just ASCII files (which could be also read programmatically as a sequence of ASCII strings), while the latter are binary data corresponding with particular partially-compiled BASIC program lines. I don't see any reasonable method how to reverse-compile the latter outside the HP 9845B or its exact emulator.

BTW, as far as I know, the HP 9845 and HP 9835 data formats are fully interchangeable (again, with possible exception of STOREd programs). So an HP 9835 might do, too. They used to be cheaper, but, I think, also much rarer.

Incidentally, an HP 9845B keeps standing on my kitchen table; it isn't fully operable, though. (Or, from the user point of view, it's rather quite inoperable, as it hangs up with the "MEMORY TEST IN PROGRESS" message on screen.) Unfortunately, one of its two 16-bit processors seems to be defective. I have precisely the same problem as you have (and, moreover, I would probably like to operate the machine just out of nostalgia). I would appreciate any opportunity to borrow the boards (maybe chiefly from the left card cage) somewhere, even from a wreck of this machine, at least in order to be able to locate the defect on the board level.

Best Regards, Petr Horsky

invalid card data at my hp48g

*Message #1 Posted by **kalimero** on 7 Oct 2003, 4:44 a.m.*

Every time i switch on my hp 48 g , i get the warning "invalid card data ". I tried all kind of memory and hardware tests and everything was all right. what could i do ? Is that a hardware problem and how could i solve this problem!

Re: invalid card data at my hp48g

*Message #2 Posted by **Wayne Brown** on 7 Oct 2003, 7:25 a.m.,*
in response to message #1 by kalimero

Try typing **PINIT** and see if the problem goes away.

Re: invalid card data at my hp48g

*Message #3 Posted by **kalimero** on 7 Oct 2003, 8:08 a.m.,*
in response to message #2 by Wayne Brown

Thanx for your help ! i solve the problem !

Re: invalid card data at my hp48g

*Message #4 Posted by **Wayne Brown** on 7 Oct 2003, 8:32 a.m.,*
in response to message #3 by kalimero

You're welcome. The problem occurs because the 48 series calcs' memory is organized into 128K ports. The expandable models (the SX and GX) can have RAM cards inserted that add additional ports. A little information (such as the amount of memory available in each port) is stored at the beginning of each port. When a new RAM card is installed, this little bit of information may be missing or corrupted. The **PINIT** command scans all the ports and (re)writes this info in them. (It doesn't erase or otherwise affect any files already stored in the ports.) The "invalid card data" message just means that at least one port's header information has become corrupted and needs to be rebuilt with **PINIT**. Since the 48 treats all memory the same, including the built-in memory, it's possible even for a model without expansion cards to get this error.

Re: invalid card data at my hp48g

*Message #5 Posted by **Jonathan Busby** on 8 Oct 2003, 7:05 a.m.,*
in response to message #4 by Wayne Brown

This is somewhat inaccurate. There is no "header" stored at the beginning of each port. All a port consists of is a sequence of library and/or backup objects --each one being immediately followed by its 4-nibble CRC-- which is then terminated by a 5 nibble zero value. The "available memory" of a port is not stored anywhere, but is indirectly determined by a 5-nibble pointer in the PORTnEOS "end of sequence" table. This pointer indicates where the previously described library/backup object sequence ends when the port has been uncovered and is located at address C0000 . Note that this can also be determined by the aforementioned zero value, but the table allows faster access.

When the calculator "boots up" it scans all the ports, while recording the locations of any library objects and also checking the CRC of each backup/library object encountered. If a corrupt object is found, then an "Invalid Card Data" error is generated and the associated PORTnEOS pointer is set to point immediately after the last valid object. When you store something to a port, the corresponding PORTnEOS pointer is used to determine where to place the object. If the port in question is corrupted, then the start of the corrupted portion will be overwritten with a valid object and the PORTnEOS pointer will be updated to point past the new object. So, you can see the second advantage of the PORTnEOS table. PINIT makes use of this fact by storing and then purging a small valid backup object in each port. As just explained, if there is any corruption, it will be overwritten with valid data.

Note that the above doesn't apply to port 0, at least without some modification. While port 0 does have an entry in the PORTnEOS table (the first entry), it is treated differently. Like the other ports, it is scanned at startup, and if a corrupt object is detected, then its PORT0EOS entry is modified, but in this case it has a different meaning to the code that is responsible for storing objects. Unlike the other ports, when an object is stored it is *prepended* to the start of the object sequence and the PORT0EOS pointer is *not* updated. PORT0EOS usually points to address BFFFB or FFFF6, depending on whether port 1 is unmerged or merged respectively. If a corrupt object is detected upon booting up, then PORT0EOS is set to point to the start of the corruption as in the other ports, but unlike in those cases a new 5 zero nibble sentinel is written at the PORT0EOS address -- effectively an automatic port 0 "PINIT". This has the effect of silencing the "Invalid Card Data" errors, but at the price of the space between the "logical" end (PORT0EOS) and the actual end of port 0 being left in limbo. So, you effectively have a "memory leak". This is the cause for all the questions about lost or missing memory that you see every so often on various forums. Since the 48 series has no built in mechanism to reset the PORT0EOS pointer, then a normal user would be SOL. This seems to be a design flaw in the 48 operating system. Fortunately, there is a user written program that can do this, and possibly even recover lost data. See http://www.hpcalc.org/details.php?id=2454 .

Hope this helps...

invalid card data at my hp48g

*Message #6 Posted by **bill platt** on 8 Oct 2003, 9:23 a.m.,*
in response to message #5 by Jonathan Busby

Hi,

Thanks for your timely post. Just minutes earlier, I saw "invalid card data" and having the 128 card merged to sysram, I lost access to the object I had stored to port zere, and as you mentioned, the memory is "missing". Thanks again for your timely post.

Regards,

Bill Platt

*Message #7 Posted by **Wayne Brown** on 8 Oct 2003, 12:14 p.m.,*
in response to message #5 by Jonathan Busby

If I understand you correctly, the PORTnEOS table is stored in the calculator and not in the card. Why is it, then, that removing the card's battery to erase it causes the "invalid card data" error? Does it involve the CRC you mentioned? It seems to me that *something* (in addition to the user's files) must be stored in the ports and is lost when the battery is removed. I've also seen cases where a card is only partially inserted and gives the "invalid card data" error, then the error goes away when the card is fully seated (without using PINIT). Are the port CRCs actually stored in the card itself?

Re: invalid card data at my hp48g

*Message #8 Posted by **Jonathan Busby** on 8 Oct 2003, 2:07 p.m.,*
in response to message #7 by Wayne Brown

You wrote:

"If I understand you correctly, the PORTnEOS table is stored in the calculator and not in the card"

Yes. Internal ram (IRAM) to be exact, and it consists of a contiguous series of 33 5-nibble pointers starting at address 80536 hex on the G series.

"Why is it, then, that removing the card's battery to erase it causes the "invalid card data" error? Does it involve the CRC you mentioned? It seems to me that something (in addition to the user's files) must be stored in the ports and is lost when the battery is removed."

Yes, it could be the CRC, but that is unlikely (see below). As stated in my previous post, a port consists of a contiguous sequence of lib/bak-object , 16-bit CRC pairs. Obviously loss of power will invalidate the CRCs. There are also other criteria under which a port is judged to be "corrupted" though. Specifically, if an object other than a library or backup is found in the sequence, if an object's structure is invalid, if the end-of-sequence marker (the 5 zero nibbles mentioned in the last post) is absent, or if an unknown object type is encountered (ie. corrupted or invalid object prologue), which is probably the most common case after a power loss.

"I've also seen cases where a card is only partially inserted and gives the "invalid card data" error, then the error goes away when the card is fully seated (without using PINIT)."

Obviously in this case the data read from the card would be garbled, which would cause it to be deemed corrupted by the OS under the conditions listed above.

"Are the port CRCs actually stored in the card itself?"

Yes, as stated above.

Regards,

Jonathan

Many of the Ram card "died" after you take the 2025 out of them. The problem sometimes is that the card has a complete RAM chipset... Even the format is on the RAM, by taking the battery out some times the format goes out with it. It you have a HP 95lx and plug a "dead" card with a new battery, it shows << I/O ERROR. press ESC to exit>>, in that case you have to grab the HP 100lx or the 200lx and formatt the card. PINIT is the formatting command for the HP 48GX, by executing that command you can plug the formatt and bring the card back to "live". You can also reformatt the card with any computer with PCMCIA ports. That should work. you are using the HP cards right?

regards

Andy

I have one HP card and three Klotz cards. None of them are PCMCIA cards. (They're the same size as PCMCIA, but have very different connectors.) But PINIT works fine, so that's all I need.

what does the + give a 48g?

*Message #1 Posted by **Eric Lundgren** on 6 Oct 2003, 10:30 p.m.*

What distinguished the G, G+, and GX in the 48 series? Is the SX still a contender if you don't require too much memory?

My guess is that the G has no (8, 16k ?)memory...and G+/32k GX/128k?

eric

Re: + = 128K

*Message #2 Posted by **Paul Brogger** on 6 Oct 2003, 11:39 p.m.,*
in response to message #1 by Eric Lundgren

I think it goes (er, *went*) like this:

48G: 32K

48G+: 128K

48GX: 512K + expansion port(s)

The Museum covers the 48S/SX -- they apparently each had 32K, and there too the "X" was expandable.

I just looked at that for the first time -- the S/SX colors are much nicer than those of the G models. I suspect the G's are faster, and probably have other advantages too. But it may be that, for your use (as it probably *would be* for mine), that the more readable keyboard is more important than whatever advantages the G's offer.

(I think with the final 32SII color scheme, and the announcement of the 33S, we're seeing just how important some of those "mere appearance" decisions can be!)

Re: + = 128K

*Message #3 Posted by **Jonathan Purvis (New Zealand)** on 7 Oct 2003, 12:01 a.m.,*
in response to message #2 by Paul Brogger

The 48GX had only 128KB of RAM builtin, not the 512KB Paul claimed. Initially only the 48G and 48GX were produced, the 48G+ came later when calculator production was shifted to control of the ACO.

Re: + = 128K

*Message #4 Posted by **eric lundgren** on 7 Oct 2003, 2:22 p.m.,*
in response to message #3 by Jonathan Purvis (New Zealand)

So just to confirm, and I'm assuming if you are right that Paul meant 512k including the cards? Well, I really just need a cheapie-who-cares-if-its-stolen back up rpn calc. And it turned out being the G. I'm

hoping that its not muuuuch slower than a G+.

Also, Paul, yes the colors are much more pleasant on the SX!

eric

Re: + = 128K

*Message #5 Posted by **Paul Brogger** on 7 Oct 2003, 4:17 p.m.,*
in response to message #4 by eric lundgren

I believe that all 48G models are created equal with respect to Speed. (Someone will certainly correct me if that's not the case!)

No, the 512K was something I thought I remembered -- if it's 128K, then that's all you get without adding cards. I understand the 48s are cabable of addressing something like 1 or 2 Mb (or more?) of memory, if it is hooked up correctly.

Re: + = 128K (long)

*Message #6 Posted by **James M. Prange** on 8 Oct 2003, 6:00 a.m.,*
in response to message #5 by Paul Brogger

I'm not an expert, so I hope that someone will correct any errors and clarify things that I don't make clear. This has gotten to be a lot longer than I had expected, but now that I've tried to explain it, I've noticed that it doesn't seem quite as simple as I thought it was.

First off, as to how much memory the 48 series calculators can address: The Saturn processor uses 20 bit addresses, thus can recognize 1048576 (1 Meg of) distinct addresses. But addressing is by the nibble (4 bits or a half byte), so that's 1 "Meganibble" (is that a word?), so 512 KiloBytes. 256KB is used for ROM, leaving 256KB for RAM. Well, 256KB of RAM that can be addressed "easily", that is.

Perhaps it's too bad they didn't develop a Saturn+ with larger addresses when they developed the 48SX or the 48GX, but that would have been a major project, and developing a new RPL with larger addresses would be another major project, so I suppose that it wouldn't have been feasible. When they developed the Saturn, who would've guessed at any desire for more addresses in a hand-held calculator!?

I'll refer to built-in RAM together with any merged RAM from expansion cards as "system RAM", which is used for storing global variables, the stack, and "working memory". Note that the operating system reserves some RAM for its own use, so the amount reported as available by the MEM command will be somewhat lower, even immediately after clearing the memory.

"Ports" are used for libraries and "back-up objects", that is, objects that can't be modified (at least not while they're stored in ports); although they can, of course, be stored or purged. "Port 0" comes out of the same pool of memory as the system RAM, sort of a "virtual port". All other ports are on expansion cards. When a card is "free", it's a port (or ports, in the case of the 48GX); when it's "merged", its memory is pooled with system RAM/port 0. Ports (other than port 0) are restricted to 128KB each.

The 48SX has 32KB of RAM built-in. Up to two RAM cards of either 32KB or 128KB each can be added, and each can be either free or merged. That means that 288KB can be used as system RAM! The 48SX manages this by "covering" a portion of ROM with RAM as needed; I think of it as bank switching. The card in slot 1 is port 1 if free, or system RAM/port 0 if

merged. The card in slot 2 is port 2 if free, or system RAM/port 0 if merged.

ROM cards can be added instead of RAM cards. ROM cards can never be merged; they're forever free. RAM cards can (if "free") be mechanically switched to write-protected, in which case they effectively become ROM cards. Write-protecting a merged card is a bad thing to do.

The "low-cost" follow-up to the 48SX is the 48S. Basically, it's the same except without the slots for the expansion cards, and of course, the price.

One company, TDS, marketed 256KB and 512KB cards for the 48SX; these are multi-bank cards. The general idea is that instead of using 2 or 4 128KB cards and physically switching them, you use 2 or 4 128KB banks on a single card, and use software to switch them. But the requirements for switching cards (except turning the calculator off and on) still apply when switching banks. A special library that came with the card allows the user to switch which bank is in use. The card can be merged, but to do a bank-switch, it has to be free. A bank-switch forces a warmstart so that the operating system can find out what's in the bank. Also note that the bank in use (if free) has the port number of whichever slot it's in. So while these cards do offer additional storage space, using it isn't all that easy.

When HP released the 48GX, it looked to me as if they borrowed an idea from TDS, but instead of the user having to make sure that the card is "free" and telling a library to switch to a different bank, the 48GX doesn't allow a card in slot 2 to be merged in the first place, treats each bank of a multi-bank card in slot 2 as a separate port, and doesn't need a warmstart every time that it looks at a different bank.

The 48GX has 128KB of RAM built in. Slot 1 can accept either a 32KB or 128KB card which can be either free or merged, and behaves the same as slot 1 in the 48SX. Slot 2 can take these and larger cards, but can't be merged, so the 48GX can have, at most, 256KB of system RAM, a bit less than is possible on the 48SX. The 48GX can have up to 32 ports: port 0 (from the 128KB built-in), port 1 (up to 128KB in slot 1), and ports 2 through 31 (128KB each in slot 2). So it *can* have up to 4MB of RAM, just not all on one card. The maximum of 30 ports of 128KB each comes out to 3840KB available in slot 2.

That slot 2 can have at most 30 ports would seem to be the reason why the Klotz 4MB cards have a mechanical switch to select between 2 pairs of 128KB banks to be used as ports 30 and 31.

Whether this restriction to 30 ports on the card in slot 2 was an oversight or intentional on HP's part, I don't know. As far as I know, 1MB was the largest card that HP ever marketed for the 48GX, so being able to access only 3840KB of a 4096KB card was never a problem with "Genuine HP" cards.

HP marketed 32KB, 128KB, and 1MB cards. Various other companies have marketed 128KB, 256KB, 512KB, 1MB, 2MB, and 4MB cards.

The 48G is the "low-cost" version released together with the 48GX. Like the 48SX and 48S, it came with 32KB of RAM built-in, and like the 48S, doesn't have any slots for expansion cards.

The 48G+ was, I believe, ACO's very first "new product". It came with 128KB RAM built in, so the "+" means 4 times as much RAM as the 48G, as much as the 48GX. But like the 48G, it doesn't have any slots for expansion cards. I'd guess that the only development required for it was to use the RAM chip from the 48GX, and changing the model number.

As for speed, the 48G series processor runs about twice as fast as the 48S series processor.

Note that having more memory available for the stack generally means that garbage collections won't be needed as often, but when a garbage collection is needed, it will take longer, which many perceive as a slowdown and find objectionable. Similarly, when you turn the calculator on, it checks on "what's out there" so having more memory, and potentially more libraries, probably slows that down too. So "more is better" isn't necessarily true.

Regards,
James

Re: + = 128K (long)

*Message #7 Posted by **Jonathan Busby** on 10 Oct 2003, 7:16 p.m.,*

You said :

"The 48GX can have up to 32 ports: port 0 (from the 128KB built-in), port 1 (up to 128KB in slot 1), and ports 2 through 31 (128KB each in slot 2)."

Actually, the hardware supports up to 34 ports : port 0, port 1, and ports 2 - 33. But there is a bug in the OS that prevents port 33 from being used correctly.

"So it *can* have up to 4MB of RAM, just not all on one card."

Well, as I indicated above, the hardware has the *potential* to access 4MB on one card, but is prevented from doing so by a defect in the software.

"The maximum of 30 ports of 128KB each comes out to 3840KB available in slot 2.

That slot 2 can have at most 30 ports would seem to be the reason why the Klotz 4MB cards have a mechanical switch to select between 2 pairs of 128KB banks to be used as ports 30 and 31."

Actually, that should be 31 ports or 3968KB for the Klotz card. (see the Klotz 4MB card manual at http://www.uuhome.de/oklotz/hp4096ae.pdf) Oh ye cursed inclusive subtraction off-by-one error, how I loathe thee. ;)

"Whether this restriction to 30 ports on the card in slot 2 was an oversight or intentional on HP's part, I don't know."

The bug that makes port 33 unusable is so hilariously trivial it's sad. Specifically, there is a typo on *one* line in *one* file that is the culprit. Even worse, it's just a constant that is off by 5 nibbles in said line. The file is rammap.a and the line is :

=INTRAM EQU (PORT2EOS)+155 a,D1[4321]*,C[15,..,5]* (16)

The "155" constant should be "160" . That's it. Without this, the PORT33EOS entry (see my posts in the thread "invalid card data at my hp48g for a detailed explanation of the PORTnEOS table) overlaps with the space used by the interrupt to save the contents of the registers. The result is that at best you get an "Invalid Card Data" error every time you turn the calc on, try to access the port, or perform a warm/cold-start. At worst, you could corrupt the contents of the port by attempting to store something to it. (this is unlikely though) For the original source of this information, see Jean-Yves Avenard's post on this subject : http://groups.google.com/groups?selm=357e5e4f.0%40isoit370.bbn.hp.com

Hi Jonathon,

Thanks for the corrections.

> Quote:
>
> Actually, the hardware supports up to 34 ports : port 0, port 1, and ports 2 - 33. But there is a bug in the OS that prevents port 33 from being used correctly.

Ok, then the 48GX can use up to 33 ports, except that I don't know of any commercially available card that makes 31 ports on the card available at any one time. Whether it's hardware or firmware that prevents port 33 from being used properly makes little difference to the user.

I wonder whether a work-around to the firmware error would be possible with an external library.

> Quote:
>

Having made that particular error all too often, I loathe it too. But have another look at the Klotz documentation. Because the card switches two *pairs* of 128KB banks, it only has 30 ports (3840KB) available at any one time. Well, at least that's what the documentation says; I don't actually have the card to experiment with.

I can't help wondering why it switches between two pairs of 128KB banks instead of two 128KB banks, but I suppose that there's a hardware reason.

> Quote:
>

> The "155" constant should be "160" .

Well, I'd call that a "mistake", not a "typo". You'd think that HP could've made a 4MB card for testing purpose, but I guess they were confident that the code was written correctly....

James

Re: + = 128K (long)

*Message #9 Posted by **Jonathan Busby** on 11 Oct 2003, 11:41 a.m.,*
in response to message #8 by James M. Prange

You said :

"I wonder whether a work-around to the firmware error would be possible with an external library"

The possibility exists, but you would need at least a 32K card in port 1 in order to override the interrupt handler.

"Having made that particular error all too often, I loathe it too. But have another look at the Klotz documentation. Because the card switches two *pairs* of 128KB banks, it only has 30 ports (3840KB) available at any one time. Well, at least that's what the documentation says; I don't actually have the card to experiment with."

Yes, I read that too, but it seems my brain decided to filter it out. In fact, the supposed "error" I pointed out in your post makes no sense. I don't know where I got a 32 where you only mentioned a 30 and a 31. Hmmmm... I feel like an idiot. :) The Jonathan "Reality Filter" syndrome strikes again.

"I can't help wondering why it switches between two pairs of 128KB banks instead of two 128KB banks, but I suppose that there's a hardware reason."

I don't know of any hardware reason. Multiplexing port 32 between physical banks 30 and 31 takes the same exact logic as multiplexing ports 30-31 between the physical bank pairs 28-29 and 30-31. Specifically, you need a 4-bit equality comparator and a 2-1 multiplexer, except in the case of multiplexing a pair of ports the output of the multiplexer would select the value of bit 1 of the bank address instead of bit 0 and one of the comparator's inputs would be 14 (decimal) instead of 15. Very simple. Don't know why it was done that way.

Regards,

Jonathan

HP15C 'Stuck' in User Mode

*Message #1 Posted by **Melody** on 6 Oct 2003, 5:00 p.m.*

Hello All - I hope someone can help, My husband's HP15C seems to be 'stuck' in the User Mode. The manual states that pressing f+USER keys again will deactivate this mode. Nothing happens when the f+USER key is pressed and USER annunciator continues to display. Anyone have any ideas on how to fix this? Any help would be greatly appreciated. Thx.

Re: HP15C 'Stuck' in User Mode

*Message #2 Posted by **bill platt** on 6 Oct 2003, 6:09 p.m.,*
in response to message #1 by Melody

Hi Melody,

First, check to see if either of the keys have problems---so try "f" with any other key and make sure it works, e.g. f prefix should clear a prefix, and also show the full "mantissa". And check the RCL key: does it recall a register? If both keys work fine, I would then run a self-check and see what comes up--and then clear the machine if need be (following the manual's instructions).

Good luck and best regards,

Bill

Re: HP15C 'Stuck' in User Mode

*Message #3 Posted by **Patrick** on 6 Oct 2003, 8:28 p.m.,*
in response to message #1 by Melody

Bill's suggestion is a good one, but I just wanted to make sure you are not actually pressing the '+' key. You press the yellow f key and then the RCL key which has 'USER' written in yellow just above it.

Sorry if you already realized this... there is a wide range of experience out there.

33s color scheme is good

*Message #1 Posted by **Eric Lundgren** on 6 Oct 2003, 4:11 p.m.*

Amidst all the 33s-bashing, should we take a moment to summarize the positive points?

1.RPN (not exclusively, but rpn) 2.A pleasant color scheme. 3.Possibility of the 'tactile click' ?? 4.No interchangeable face plate form over function. 5.Presumably a flat screen unlike the 49g. 6.contributions here?

Consider this: If our complaints were more penetrating, like demanding 42s menus, soft keys, etc, we'd have little hope of a redesign, but its really only the shape of the keys and their orientation. I'd happily trade the dual line screen for a normal kbd and possibly return of the big enter key.

I'm certain someone has noticed this; however, if not, the new TI business calc looks amazingly like the older HPs. Maybe if the 33S had some business functions, we could argue a change to a more 'TI-like' color scheme and key arrangement...

What new TI business calc?

*Message #4 Posted by **Jeff** on 6 Oct 2003, 7:15 p.m.,*
in response to message #3 by Todd Stock

What is this new calc that you speak of?

6: More (program) memory!

About the two-line display: It'll be great IF it performs something like the 42s handles two lines: occasionally one line for menus, otherwise two lines for program browsing, X & Y stack lines, etc. If they haven't carried two-line *behavior* into the 32S/SII base code, then the second line probably won't mean much. (Formula entry

is o.k., but let's have a full-featured two-line interface!) I suspect you're thinking I worry too much, and you're right: I don't have anything to go on beyond the product sheet and the picture, but let's just say I'm concerned . . .

With regard to menus, I prefer the 32s over the sII, as it has more of the functions buried in menus and not committed to the keyboard, leaving the 32s' front clean and simple. The 33s apparently wears its features on its sleeve rather than discreetly tucked away inside, and consequently its already funny-shaped keyboard is further degraded with generally useless clutter.

OOooops! This was supposed to be about the *positives*! Sorry!

(Hey, I'm pre-ordered, and in that sense, committed to at least give it a try . . .)

Re: 33s delayed?

in response to message #1 by Eric Lundgren

I note that Samson Cables has just changed their ETA for ***MY*** HP-33s to "unknown". (Apparently they've been told by H-P that the thing is delayed indefinitely.)

Maybe H-P is knee-deep in a keyboard redesign? (I doubt it, but one may dream!)

Maybe I should upgrade my order to an HP-49G+ . . .

Re: 33s delayed?

in response to message #6 by Paul Brogger

> Maybe H-P is knee-deep in a keyboard redesign? (I doubt it, but one may dream!)

...hm... As I have said earlier in this forum, delays for the HP-33S might not neccessarily mean bad news.

> Maybe I should upgrade my order to an HP-49G+...

Once Hrastprogrammer has adapted HP-42X for the HP-49G+ I would definitely go for a HP-49G+ instead of a HP-33S. (Theoretically HP-42X on the HP-49G+ would be 100% HP-42S compatible, have 96K RAM, have I/O, and run 3-5 times faster than the real HP-42S!)

Best regards, Erik Ehrling

Re: 33s delayed?

in response to message #8 by Erik Ehrling (Sweden)

Why would you want a 42S emulator on a 48/49/49G+++ or anything else???? I don't get why you would not just use the calculator you have.. An emulator would not have key labels, the size is bigger,

the emulating calculator has more functionality than the emulated calc, etc... Certainly a calc emulator for a PC or Pocket PC/Palm make some sense, but I am missing something with this desire to emulate one RPN calculator with another RPN/RPL calculator. I must be missing something, could someone help me understand this market?

Thanks

in response to message #9 by Fred

> Why would you want a 42S emulator on a 48/49/49G+++ or anything else????

There are several reasons - 1) You might prefer the keystroke programming of the HP-42S. 2) You want to run programs written for the HP-41C(V/X)/42S. 3) You are running Emu42 on your PC but you need a device to key your programs into (keying in programs on the HP-48GX keyboard is much nicer than on the PC keyboard). 4) You know how to use the HP-42S even in your sleep and don't have the time to learn another calculator (remember, many of us in this forum has *both* demanding jobs and a family!) 5) The HP-42S lacks I/O but a calculator emulator gives you the oppurtunity to emulate a HP-42S with LOAD/SAVE functionality

Just to name a few...

Best regards, Erik Ehrling

Re: 42s-on-a-48g?

*Message #11 Posted by **Paul Brogger** on 7 Oct 2003, 4:24 p.m.,*
in response to message #9 by Fred

If Erik E. didn't already mention it explicitly, four-level RPN is preferred by many over RPL for ad hoc use, as well as for programming.

One drawback to 42x would be the 48G's form factor -- it's pretty clunky in that respect when compared to the actual 42s. But there are certainly several promising aspects as well.

RAMBox for the HP-42S

*Message #1 Posted by **Erik Ehrling (Sweden)** on 6 Oct 2003, 3:14 p.m.*

Hi!

When I visited the HPCC in London this summer Tony Duell showed me a RAMBox for the HP-41C(V/X). Now I wonder, have anyone tried building such a thing for the HP-42S? Or could anyone hardware oriented judge whether building a RAMBox for the HP-42S would be feasible?

The idea would be to add 32K RAM in the place of the additional ROM and make this RAM programmable from a PC. (Another option could be to use a 32K RAM card from the HP-48SX and use a HP-48 to "program" it). Using the XFCN hook this could be a way to add memory that is both programmable in assembler and possible to call from RPN programs...

Regards,
Erik Ehrling (Sweden)

Re: RAMBox for the HP-42S

*Message #2 Posted by **db(martinez,california)** on 6 Oct 2003, 6:37 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

I don't know if you've seen the posts or not so maybe this is old news to you but; a couple of people have replaced the 8k chip in the 42 with a 32k which is pinned the same. The problem is that it is not removeable or accessable by the 48, except that you could probably write a routine for the 48 to read signals from the 42. The reverse is sadly, not true as far as i know.

Wouldn't it be great if the much maligned (but not yet seen) 33s turns out to have a back door that HP forgot to plug which allows communication with mass storage?

Re: RAMBox for the HP-42S

*Message #3 Posted by **Erik Ehrling (Sweden)** on 7 Oct 2003, 11:19 a.m.,*
in response to message #2 by db(martinez,california)

> I don't know if you've seen the posts or not so maybe this is old news to you but; a couple of people have replaced the 8k chip in the 42 with a 32k which is pinned the same.

Yes, I have indeed seen the posts regarding the 32K upgrade of the HP-42S (and have performed this upgrade to two of my HP-42S's).

However, what I was speaking about was a slightly different idea, where RAM is attached, not to the ordinary RAM position, but rather to the position of the additional ROM. This memory area has the benefit of, at least theoretically, being much more suited to programming in saturn assembly than the ordinary 8/32K RAM.

However, you would probably not like to enter more than very short programs by hand - therefore the RAMBox would need to be programmable from a PC (or some other device).

Best regards, Erik Ehrling

Phantom: RAMBox for the HP-42S

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Oct 2003, 12:37 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

A RAM chip that could be mapped "to the outside", so it can be logically detached from the HP42 while it is off (sleeping), and "dumped" via a serial or USB connector (somehow in the manner of the flash memory keyrings) to a PC... and then loaded from the PC with a memory image... and then reverted to the inside just before the calculator is about to wake up...

a) May be a good idea!

b) Issues:

b1) Standby power controller, there should be Chip Enable signals controlled sometimes from the HP42 (Saturn), and sometimes from the outside...

b2) The memory images would be difficult to edit or "compartimentalize", in some manner this would be similar to the WALL (Write All magnetic card) function on the HP41... not very frequently used. This could be solved with an emulator running on the PC which can read, understand, modify and save an HP42 memory dump...

b3) As the RAM is CMOS Static and a "standard" part, other timing and control issues could be solved.

c) The technique of using a block of memory initialized from one device and then addressed by other as if it was its own memory was called Phantom Memory. It was used for microcode loading (or control store programming, for those who don't like the microcode-microprogram terminology), for boot ROM emulation in the Commodore Amiga 1000, and in some 386 PCs some 12 years ago, to "upload" the image of 8-bit wide ROM in a 16 or 32 wide bit memory page, and so obtain performance benefits from bus usage (and also from better access time on DRAM than in ROM)

Re: Phantom: RAMBox for the HP-42S

*Message #5 Posted by **Erik Ehrling (Sweden)** on 7 Oct 2003, 1:22 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

> 1) Standby power controller, there should be Chip Enable signals controlled sometimes from the HP42 (Saturn), and sometimes from the outside...

Hmmm... I might be somewhat naive, but isn't this issue already handled by the RAM Cards for the HP-48SX/GX?

> b2) The memory images would be difficult to edit or "compartimentalize", in some manner this would be similar to the WALL (Write All magnetic card) function on the HP41... not very frequently used. This could be solved with an emulator running on the PC which can read, understand, modify and save an HP42 memory dump...

We do have Emu42 which certainly would be very useful for this. However, remember that my idea was to use this for the ROM area, i.e. the RAM that I am speaking about here would therefore be read-only once installed in the HP-42S.

Best regards, Erik Ehrling

Calcs in production

*Message #1 Posted by **Pierre Brial** on 6 Oct 2003, 12:17 p.m.*

Hello, As my sources disagree, I prefer to ask to the specialists in the forum: What are the hp calculators currently in production ?

All the best

Pierre

Re: Calcs in production -- I'll take a stab at that . . .

*Message #2 Posted by **Paul Brogger** on 6 Oct 2003, 12:29 p.m.,*
in response to message #1 by Pierre Brial

I'm guessing . . .

Older Models: HP-12C

New Models: HP-12C Platinum HP-10BII+ (did I make that one up?), HP-17BII+

HP-48GII, HP-49G+

HP-33S (not quite released yet . . .)

Questionable: HP-9S, HP-9G

Have I missed anything obvious?

Re: Calcs in production -- I'll take a stab at that . . .

*Message #3 Posted by **Tom (UK)** on 6 Oct 2003, 1:10 p.m.,*
in response to message #2 by Paul Brogger

Ouch! Has there ever been this few models in production (after 1975)? In late 1985 / early 1986 there were only 5 (6 if you include options): HP11, 12, 15, 16, 41C(V/X).

Calcs in production -- HP 40g

in response to message #4 by Pierre Brial

I guess you forgot to mention the 6S. My pet favourite calc machine!

Pio

Re: Calcs in production -- HP 40g

*Message #6 Posted by **GE (France)** on 7 Oct 2003, 4:13 p.m.,*
in response to message #4 by Pierre Brial

The HP40G seems to pack a lot of power, but I found it very very hard to use. Probably from lack of desire to learn its complicated usage. Apart from that, it feels solid, and is well built (no scratching screen). However, it has a painful hard-to-press keyboard (probably like the 49G), and is very slow (YMMV). Maybe at a middel-class price it would be a good mid-range offer after the same hardware revamping as the 49G+ ?

RPN vs. AOS: *GOOD* examples [LONG]

*Message #1 Posted by **Valentin Albillo** on 6 Oct 2003, 6:31 a.m.*

In regard with my criticism of the Mach number formula as a totally inadequate example to prove RPN's "superiority" over capable algebraic systems, WXYZ posted:

"You say that thats a flawed example.... could you give a good one?"

Yes, I can. First of all, let's make it clear from the start that RPN is *not* superior to algebraic systems, in general: there will be cases where it will certainly be superior, there will be cases where it will come out as inferior.

In particular, the evaluation of lengthy, complicated, algebraically-written formulas is about the *worst* possible case, and the one where any owner of a decent algebraic machine *who knows how to use it proficiently* (i.e: not the algebraically-challenged, RPN fundamentalist, who won't be able to even enter the formula without getting a syntax error, and will make a mess of it all) will not only give RPN a run for its money, but will win the race outright. In the case of the Mach number formula, said efficient user of an algebraic calculator, who knows his machine inside out, will key in the formula and get the correct result before many an RPN user has even decided on "where to begin" (as this formula cannot be attacked left-to-right in a four-level RPN stack) and "the proper key sequence".

What would then be a good example ? Well, to answer this question you just need to consider what are the main RPN strengths and differential characteristics. These are, of course, the user-manageable 4-level stack (instead of the internal, non-user-accessible stack typical of algebraic machines), and the powerful set of operations acting on it, i.e: X<>Y, Roll down and up, ENTER, automatic top-level replication, LASTx, etc. Any good example will make use to the most of some or all of those characteristics, to achieve results much more efficiently, faster, and in significantly less keystrokes than any algebraic system could. The Mach number formula fails miserably in taking advantage of any of those advanced RPN capabilities to any significant extent, which brings us to the original question: what would then be a *good* example ?

Well, I can think of many. "Think" is not the correct term however, as I do not need to "think" of a proper example. I've used RPN extensively in the last 20+ years, and I've come across many computations where it was most efficient. Just to name a few: continued-fraction evaluations, rational least-squares approximations, series expansions [*very* good examples here], Fourier series, complex-number operations, coordinate transformations, ... but there's a very simple example, that doesn't require high math at all, and which HP did include in each and every manual and many brochures as well, and that is "polynomial evaluation" using Horner's rule. RPN fits like a glove for this particular computation.

An example will make it clear. How would you evaluate the polynomial

```
8*x^4 + 5*x^3 + 2*x^2 - 7*x - 6
```

for arbitrary values of x ? Well, the RPN answer is simply (assuming x is already in the display):

```
ENTER, ENTER, ENTER, 8, *, 5, +, *, 2, +, *, 7, -, *, 6, -
```

Simple as it is, you're using both the stack to hold intermediate results and new operands, and *automatic top-level replication*, to keep a *never-ending* supply of x values. The computation is as fast and efficient as it can be.

On the other hand, if the user of an algebraic system wants to maintain the valuable left-to-right, no-thinking-

needed characteristics of his system, he would have to enter the expression as written, i.e:

```
8*x^4 + 5*x^3 + 2*x^2 - 7*x - 6
```

but this is *vastly inefficient*, because he ends up doing four multiplications *and*, additionally, THREE *slow* x^y operations, not to mention the ancillary additions and subtractions. This is awfully inefficient, can result in greater rounding errors, and it's painfully slow. For higher-degree polynomials, it gets much worse.

Now, a knowledgeable algebraic user would realize this, and would probably sacrifice the "as written, left-to-right" entry, and try instead evaluating the polynomial by mimicking the RPN approach, like this:

```
(((8*x + 5)*x + 2)*x - 7)*x -6
```

but he then needs to first open a number of left parentheses in a row, then keep on closing parentheses at the proper times, not to mention the need to re-enter or recall the x value constantly. This results in many extra keystrokes needed, and for sufficiently high-degree polynomials this approach *is doomed to *fail**, as soon as the maximum number of open parentheses is reached, while the RPN approach works for polynomials of arbitrary degree. There's also the fact that having many pending operations does waste a lot of memory, while the RPN approach needs no extra memory at all but the stack registers themselves.

So you see, this is a clear-cut case where RPN excels over any algebraic approach. Even HP recognized this fact, and the Curve Fitting pac for the HP-71B does include a binary (machine language) subprogram specifically designed for evaluating polynomials, which HP-71B's BASIC, awesome as it is, simply can't do efficiently, for the aforementioned reasons. Even so, said binary subprogram only succeeds in being twice as fast as its BASIC counterpart, and if I recall correctly, can only evaluate polynomials up to 18th-degree. An RPN (or RPL, or FORTH) approach can easily run rings around this.

How's that for an example ? :-)

Best regards from V.

Re: RPN vs. AOS: *GOOD* examples [LONG]

*Message #2 Posted by **hugh** on 7 Oct 2003, 5:50 p.m.,*
in response to message #1 by Valentin Albillo

a cheeky reply,

on the hg9g, your example is indeed shorter. working the formula as written:

M+ 8 M ^2 ^2 + 5 M 2nd x^3 + 2 M ^2 - 7 M - 6 = (20 buttons) or using nested evals: M+ - 6 + M () - 7 + M () 2 + M () 5 + 8 M = (20 again)

BUT your example falls short if you happen to have a zero coefficient (or more). if the 5 were a zero. you would still take 16 steps in your method, assuming you would enter zero for that stage. on the 9g, you would get:

M+ 8 M ^2 ^2 + 2 M ^2 - 7 M - 6 = 15 steps :-)

Re: RPN vs. AOS: *GOOD* examples [LONG]

*Message #3 Posted by **Valentin Albillo** on 8 Oct 2003, 5:22 a.m.,*

HP, if you are watching.

*Message #1 Posted by **Eric Lundgren** on 6 Oct 2003, 3:35 a.m.*

My digital watch reads 10/21/03, the 33s still isn't out, but I walk into my local electronic store for the weekly check of the release status of the new HPs. As I round the corner and eventually pass the stacks, and stacks, and stacks of TIs, the (likely) dark blue or white box will catch my attention...I look away in hopes of storing this anticipated moment...and retrace the arc back to the box...the 33s is ....not v-shaped!!! YES!!! I pull out my cell phone, check my balances, and carry 5 or 6 packages to the counter. I carefully deposit them on the counter and pull out my mastercard and check cash for the anticipated burger/introduction to my new calc lunch, and wait for him to swipe my card. In eagerness, I offer my ID, and sign, wondering if any user groups are waiting to ambush me and fairly distribute my insane greed amongst the masses...but no! My rpn/rectangular future is secure, the shelves are full of them! I carry both bags to the door, exit to the sunny fall weather, stomach indicating hunger levels, and make my way to my car..BEEP BEEP BEEP! 6:00AM Darnit! It was a dream....or..was it? (hint HP...HINT!!) :)

33s - ALG is default?

*Message #1 Posted by **Eric Lundgren** on 6 Oct 2003, 3:14 a.m.*

I've been staring and holding up my 32sii to compare to the 33s on hpcalculators.com, have any of you noticed some small details...for example the big silver keys near top: ALG is on the key, but rpn is shifted...so we'll have to be the ones who suffer if we inadvertantly press the ALG key..

Well, I'll be prepared to super glue that key out of motion if I have to. Its interesting, to me the 33s has 7 more keys than the 33s, yet the only function that appears to be new is the x^(1/3), could there possibly (dream) be a matrix capability added in to make up for the .5sized enter key?

Well, I will buy one, and give it the honest chance, because I was raised by an rpn-faithful, and I'm not letting those memories go, even if I go cross eyed with that kbd :)

Can you believe that I passed up a stack of 12-20 32sii's trying to convince myself that as a student I have to save money...of course they had just been discontinued, and I had yet to know what I was missing out on (circa 2001-2). Oh the pain. At least I got a 48gx before they escaped into the memories of rpn past. On a more serious note though, let's try to be open minded about HP. I don't agree with all the details, but it is rpn, and it is programmable. Could you imagine the face of the employee who confirmed the new 49g+ was coming and I still bought the old 48gx?? hahaa...

I listened in while he talked another customer into buying a ti89, "If the instructor uses the ti89, you'll really be better off using it too, other wise you might get lost when he reads out the key strokes during lecture. Those HPs are really difficult to use, they are for real scientists not students who are just learning." I'm glad that I'm one of the guys who sits waiting for the rest to catch up and confirm my answers. Thanks Jan Lukaezewikz (sorry for spelling) and HP.

Re: 33s - ALG is default?

*Message #2 Posted by **Ed Look** on 6 Oct 2003, 2:37 p.m.,*
in response to message #1 by Eric Lundgren

You know, how "real scientists" got to be RPN guys is because we got our first tastes of it during the some physics pop quiz in high school or chem midterm in college or quantum mechanics later on. Besides, in those days, we also appreciated its ruggedness and longevity more than design aesthetics. (Heck, we thought those old cast iron interferometer cases looked cool.)

I say, blitz the high schools... since all the kids have to calculators even in calculus (which I still say is horrendous pedagogy), then let it be keystroke programmable RPN and NO GRAPHING! (You learn it better as a child if you have to fight with your pencil, eraser, and graph paper, especially if it's semilog or log-log... and what's all this about SIN, COS, and TAN keys? Where are my tables?) Learn all'em teachers t'teach RPN entry in math class!

Re: Log tables on calculators . . .

*Message #3 Posted by **Paul Brogger** on 6 Oct 2003, 2:48 p.m.,*
in response to message #2 by Ed Look

Continuing Ed's thought . . .

. . . just store the four-place log tables in ROM and let students use the cursor control keys to navigate through them (something like the HP-48's matrix editor)!

Re: Log tables on calculators . . .

in response to message #3 by Paul Brogger

Capital idea, Paul! But I say HP, etc., should throw the students a bone and give them five to eight places!

All joking aside, a "HP-42S--" (as in double minus), in which it becomes very programmable with lots of RAM and optional limited expandability (no games except short programs), but with ONLY FOUR FUNCTIONS HARDWIRED onto the keyboard, well, exponentiation would be okay. The students would have to fiddle with exponentials and such to program their own sines, cosines, etc. And for discipline, there should only be a XYZT four level stack, all of which should be simultaneously displayed by a cut-LCD (as there's no graphing) screen.

I got this idea when Norm Hill said once to me that the HP-31E would be an excellent machine for a kid to learn math on. Well, I disagree... sort of. This "HP-42S--" of mine would have respectable program and data storage space. In fact, to continue, there also ought to be NO HARDWIRED SCIENTIFIC CONSTANTS either, but allow RAM space for kids to go look 'em up and type 'em in. And with respect to this, it should not beep in error when operations with improper mixes of units are done, as with the HP-48 series, so that they have to take a real glance at the display to see if they got the calculation right.

Um... any professional math/science teachers here? What you YOU think? Remember, this is for the kid market.

Re: Kid Market????

*Message #5 Posted by **Paul Brogger** on 6 Oct 2003, 4:54 p.m.,*
in response to message #4 by Ed Look

Ed: You're on the right track, from an educator's/educational perspective.

But your marketing skills are all messed up! ;^)

Don't claim it's for the "Kids Market" -- I doubt many kids will (on their own) want one, nor will they want the work that using one implies. It's for the Parents' and Teachers' markets -- for the folks worried about what that damned younger generation is actually *learning* these days!

*Message #6 Posted by **Ben Salinas** on 6 Oct 2003, 6:36 p.m.,*
in response to message #2 by Ed Look

Okay, here is the view of a high school student.

When I was a freshman in high school, a senior asked me if i wanted to check out a calculator (the 32sii). I

originally said no, as I had my TI-30xa which I ALMOST knew how to use blind, and I thought i was pretty fast with it. Well, he insisted on giving me the HP (and I am glad he did). I did a few simple math problems with it and tossed it into my backpack. A few days later I tried doing some more complex problems, and fell in love with it. I was originally so amazed by the fact that I could press "*", "-", "+" with no numbers in between. A week later, I could not do anything with my TI-30xa. And a year and a half later, I could use the 32sii blind, and knew how to use every feature of it.

I used the 32sii for my Algebra II and my Pre-Calculus class soley. Every week my Algebra teacher would tell the class that we should go out and buy a TI-83+, becuase pretty soon the class would be getting really hard, and we would need it. I refused to buy one, and just kept using my little scientific calculator. The funny thing is that most of my classmates wanted my teacher to ban the 32sii because it was too powerful. In Pre-Cal, I kept using my 32sii, and over the two years I became excellent at graphing in my head. Where other students had their crutch of a graphing calculator, I simply drew the graph.

This year I am taking Calculus. At the begining of the year I checked out a TI-89 from my teacher (I was not about to buy a TI-89). I used it a bit, and mainly when I was lazy. I would use it to graph, and for the "factor" function. All other math (such as solving equations) would be done by hand or on my 32sii. Then, I got the 49g+. I messed around with it a bit, and it has replaced my TI-89, even though I still know how to do very few features on it. I use it to graph, and simplify equations. On occasion I will use it do simple arithmetic, but I try to restrain myself from using it for that (mainly because the I am used to the + being at the bototm right of the keyboard, and on the 49g+ the enter key is there)

All of my friends who use RPN (about 10-15 of them) love it also. Although none of them are as diehard as I, they use graphing calculators less than the average student. Consequently, they also do the best on the "no calculator" parts of our exams.

So what is all this saying? I am extremely addicted to scientific calculators, due to their speed of entry, but it will be hard to wean students (at least Americans) off of graphing calculators. However, the best way to do this is to force them to use a better scientific calculator (such as the 32sii, or the 33s hopefully).

I plan on buying a 33s for two reasons. One, I will have to give my school back their 32sii in a bit less than 2 years. But more importantly, I have a sister in 6th grade, and they now use calculators (for what, don't ask me), but I want to get her addicted to RPN, and I figure I will lend her the $50 33s, rather than the $250 32sii, or the $175 49g+.

-Ben

Hi Ben,

Thank you for your post--we NEED to hear this sort of thing--'cause it gets us all FIRED UP! (NORM, Where are you!)

Seriously, you have proven once again that you can't get somthin' fer nothin' and that in mathematics especially, one must gain understanding the hard way--using one's brain! I am heartened to hear that you are learning math, not merely doing homework--though looking at your 51s proposal, I wouldn't expect any less.

Your story also reminds me a bit of my own bragging rights story. Way back in the olden times, ca. 1983, I was the only HP kid in the entire school--an 11c. Well, it broke, (yes, even voyagers can break) and while I waited for the warranty calc (SLOOOOW mail) I asked my Physics teacher if I could

borrow a slide rule. See, I showde up to the test, no calculator, looking like the typical goof-off student (hair down to my shoulders etc). He looked at me sideways, thinking I was joshin' him, but then got a sterling out and handed it to me. I finished the test way ahead of everyone else, and not only got an A, but the highest grade. Boyoboy did I gain respect! (And I still have that slide rule).

But the point is, I loved physics--and I understood it--and I was NOT going to let a crutch stand in my way (as you so wisely have also decided).

I wonder why the adults (!!) who make the policies for teaching are so stuck on the crutches--it seems like you are inadvertently leading a counter-revolution from the grass (silicon) roots.

best regards,

Bill

P/S. if you already heard my story somewhere, pardon me--I am getting old 8^)

Silicon Roots Campaign [long]

*Message #8 Posted by **Patrick** on 6 Oct 2003, 9:51 p.m.,*
in response to message #7 by bill platt

I taught mathematics for a spell at the University level and in my experience there are two distinct camps of students. There are those students who try to understand principles and those who try to understand problems.

Now, I'll likely get lampooned for saying this, and I recognize that it is a generalization, but I say walk a mile in my shoes. It is amazingly clear in a classroom who is who. I'll also let you guess which camp is the bigger, by a lot.

I have a terrible memory so it was just not an option for me to understand large classes of problems. I *had* to understand principles. Fellow students would ask me for certain formulas and I'd stare blankly at them, then go on to get the highest mark on the exam. I could *reproduce* formulas from the handfull of principles I was able to understand and commit to memory.

When I encouraged this sort of behaviour in my students, what I'd mostly get is "Yea, I see what you mean, but could you help me with *this* problem?" It made no difference that *this* problem was a restatement of the *previous* problem that we had just solved together.

I think Ben is showing signs of being in the "principle" category. I applaud you for that, Ben. It is true that technological crutches tend to obliterate a certain kind of learning. There's no doubt that learning is largely about overcoming obstacles. The pride of accomplishment fills you with the energy to go on to greater challenges. Having a box with a few buttons do the work for you may be fun (I certainly think so), but it also takes something away from you.

On the other hand, we must pick our fights carefully. No one would argue, for example, that we should do square roots by the old manual method because it gives us insight into certain types of mathematical algorithms. Those algorithms really don't lead anywhere important.

However, graphing is a certain general kind of skill which I would hope students could do without the aid of a graphing calculator. The experience in plotting those points for all those different kinds of cases is well worth the sweat. It leads, in my opinion, to better *estimation* skills... something that is one of your most valuable assets in engineering, science or business.

in response to message #8 by Patrick

Cheers to that! I remember back when, during one of my calculus courses, we were grouped to work as a team. We were dealing with surfaces and applying triple integrals to yield volumes and areas, and I presented our solutions to which one girl said 'you know, you're one of those who just SEE things'. Maybe, but I also happened to be one of those who enjoyed taking walks and thinking and reasoning about what we were learning.

Incidentally, the calculators helped me with calculus in a sense that I would propose expressions and differentiate and evaluate them at points. So they provided a quick check while I couldn't always integrate the expressions with the elementary methods you first start out with.

I remember the first time I tried to "apply" some calculus soon after learning the wonderful arc length by integration method. I decided to design and fabricate a curved shield that would redirect the A/C blowing down on my head in my room. After thinking about a nice curve whose expression I knew, I soon realized that I knew no way to integrate such a function, hahaa. Well soon later such gems as i.b.p. and trig substitutions came along, but it was sobering to learn the existance of limitations to my 'powerful' new tools. Ben, if you're reading this, there's a lot of great surprises coming your way! I'd love to relive some of those moments again :)

Chemistry and physics students, at least on the freshman level, come in WITHOUT GRAPHING SKILLS! Many can't tell abcissa from ordinate and have never heard of them (only "x-axis and y-axis"). They can't scale an axis. They have no clue how to plot points. Let's not even get into actually calculating those points!

To a small degree, I think these very nice graphing calculators have contributed to that. But if you look at the general societal trends, I am tending to the conclusion that even if these calculators were never invented, these mathematical abilities, all mathematical skills would still be in decline among students of recent years. But, these machines don't help it, either.

This reminds me of George Polya's classic book, *How to Solve It.* One of the first principles Polya teaches is to relate a new problem to previously-solved problems. "Is this something I've

seen before? Is it something I've seen in a different form? If not, is it at least *similar* to something I've already solved? Can the solution to a previous problem give some insight into this one, or suggest an avenue of approach?" Seems obvious, but I've seen too many people (including adults in the workplace) approach every new problem as if it fell out of the sky without any connection to anything else they've seen before.

Polya and others LONG

*Message #12 Posted by **bill platt** on 7 Oct 2003, 9:42 a.m.,*
in response to message #11 by Wayne Brown

I guess this will qualify me for ultra geekdom, but when I was in 5th grade, my two favorite boks on math were "How to Solve It" by Polya, and another book called the "Rule of Nines". They were my favorites because they were both over my head (I could *feel* it when they went over!) and also totally fascinating. I remember the Eureka! feeling when I finally learned Algebra in 9th grade (yes that was normal timing!) and I realized that by merely moving stuff across the equals sign, all sorts of seemingly intractible concepts that had been over my head, were suddenly not over my head!

Which brings me to one other thought---I am a very self-taught type, and also in addition to science type stuff, I am a liberal arts type (majored in English Literature) and one outstanding difference between the two disciplines (literature vs math[s]) is that oftentimes, a single mathematics book will not be enough to undertand a topic completely--one needs a professor, or absent that for a self taught type, another book. There is a more discrete quantized nature to mathematical knowledge--some concepts you just *get* or *not*. But in literature, you are always free to be rather "soft" in what is hard fact or understanding, and so you can gain a useable understanding without resorting to extra books--though one's understanding and opinions may and usually do broaden from reading criticism in addition to the Work.

In other words, sometimes (as was the case with algebra for me) you may have to wait a while (even years!) before you actually can even have the possibility of understanding!

Now, if only I can find my old books.....where DID they go!

regards,

Bill

in response to message #7 by bill platt

I daresay I'm older than you.

And I agree with your feeling about how our general philosophy of teaching has been going (down the tubes).

I am a bit of a calculator nut myself, yet, I DO NOT RECOMMEND them at all for students until halfway through high school. By then, if he is a serious math or science student, then he would already be familiar enough with the theoretical underpinnings that a calculator, with its speed, can only be a boon, even more than a PC because as someone here said, you can run calculations or program it on the subway, in the lunchroom, and even in church. (I saw a kid there a couple of weeks ago with his transparent cased TI-83 or something, totally engrossed in it. I thought, wow, what a hardworking fellow! His mother must be proud! I get closer... heck, he's just playing some game he programmed in or copied in. Oh, and if there's any clergy here- I don't recommend it for services, either, unless you're using it to run some sound or media equipment.)

Of course, for earlier grade levels, any calculator, even the one Mommy uses on the checkout line, is a definite no-no.

Prelude to a 49g+ computation

*Message #1 Posted by **Eric Lundgren** on 6 Oct 2003, 2:13 a.m.*

Well, I'm unwinding after my first day owning a new 48gx. Its letting my 32sii get some r&r. I'm a little frustrated, but it must be from going to a slightly different kbd layout. I suddenly appreciated just how efficient I had become behind the keys of the 32sii. I'll have to train myself to accept having more than one calc.

Its funny how going from 'keystroke' programming to more involved stuff can seem like stepping into 3D from a flat world. I am overwhelmed and dont know where to start, it doesnt like my attempts to assign the 'sqrt' function to a user key. Boy, I 'owned' that 32sii...thought I was a power user...heh...um....

Ok, so this is the way to go right? I mean if you all had choices, and had to choose one, would it be the 48gx or the new ..49g+?

By the way, I've been 'imaginarily keying in' computations into the 49g+ on samsoncables.com image of the new calc. Its really frustrating to have to relearn function locations, hahaa. In a way, having a 49g+ and a 32sii almost could work for me, as the keybds are WAY different, enter, more clutter, etc, so in that way I'd instinctively know there is extreme differences between the two and not end up squareing a figure when I need e^x evaluated, lol.

Long post, but its a way to release after the shocks of stepping away from something comfortable.

Having both, I'd say get the HP49G Plus. GX has better keys, but the G Plus blows it away in every other area.

Re: ARE YOU SURE??

*Message #3 Posted by **Ron Ross** on 6 Oct 2003, 8:36 a.m.,*
in response to message #2 by Joesph

I admit the 49G+ looks great. But how good is it on batteries. If you need batteries every 4-6 weeks and when the battery indicator shows low, do you have days/hours or minutes before she crashes and locks up.

A 48G series will still last through the week.

Re: ARE YOU SURE??

*Message #4 Posted by **Massimo Gnerucci (Italy)** on 6 Oct 2003, 9:02 a.m.,*
in response to message #3 by Ron Ross

Quote:

> *when the battery indicator shows low, do you have days/hours or minutes before she crashes and locks up*

Doesn't the 49G+ have a CR2032 for power backup purposes?

I would trust a backup battery more than a capacitor...

Massimo

Re: ARE YOU SURE??

*Message #5 Posted by **RR** on 6 Oct 2003, 9:32 a.m.,*
in response to message #4 by Massimo Gnerucci (Italy)

Thats very comforting during an exam, to know my programs won't be lost. Now how do I pass the exam? Unless I can switch over to the backup battery for that last calculation.

The new 49G+ may very well be as good with batteries as the 48G series (which isn't great, but still would go 2-4 months on average with average use). That is the point I am trying to make.

Re: ARE YOU SURE??

*Message #6 Posted by **Massimo Gnerucci (Italy)** on 6 Oct 2003, 9:55 a.m.,*
in response to message #5 by RR

Apart from bringing with you 3 AAAs ;-) one should try the 1.22 ROM upgrade.

As stated on the HP site:

> Quote:

*Message #7 Posted by **Tom (UK)** on 6 Oct 2003, 12:50 p.m.,*
in response to message #1 by Eric Lundgren

I had an HP67 first and was happy. (RPN, manual, keys, case, rugged etc.)

I then bought an HP32Sii and was even happier. (Manual, battery life and a few more functions, although LEDs have more of a soul than LCDs)

I then bought an HP49G and was very unhappy. (Impossible learning curve, manual, battery life, quick start guide, keys, scratches, manual, slow (try 2 + 2!), manual, creaky case and before I forget: the documentation was C.R.A.P)

I then bought an HP48GX and was dissapointed. (Good manual and construction but very steep learning curve and completely different to the RPN calcs, have to do alot of work and 'thinking' to do the same tasks as the HP32S).

I then bought an HP42S and was happy again. (see reasons under HP32).

So will I buy the HP49Gxyz? Hmmmm - what do you think. Unless the manual is 1e+99 times better or HP offer a good trade in for my HP49G then no.

Will I buy the HP33S? Well depending on user feedback about construction, manual and battery life - yes.

I'll just have to face it, I'm an RPN man not RPL.

Basic statistical functions on HP-32SII

*Message #1 Posted by **Ed Look** on 5 Oct 2003, 10:51 p.m.*

The average HP RPN scientific can calculate summations, square them, do all sorts of stuff, like least squares fitting, give an average (mean), and standard deviations, and this includes, of course, the 32SII.

But I'd love to use the 32SII to also calculate a median and modes (frequency, the statistical kind). Personally, I found that keystroke programming with the use of registers seems not to allow data sorting of any kind. Am I wrong, or would that require as many registers as you have data points?

Is it at all possible to create a reasonable (lengthwise) program to calculate a statistical median or mode from a set of data with one of these calculators (any HP RPN handheld before the Charlemagnes)?

Re: Basic statistical functions on HP-32SII

*Message #2 Posted by **Patrick** on 6 Oct 2003, 2:09 a.m.,*
in response to message #1 by Ed Look

In order to compute the median or mode, you need to know the frequencies of each distinct data point. This is essentially equivalent to having all of the data points.

Statistical Challenge

*Message #3 Posted by **Patrick** on 6 Oct 2003, 2:20 a.m.,*
in response to message #2 by Patrick

On the other hand, here is a little challenge which can be solved on the 32SII or any other HP programmable. (Its a little easier on machines which have a pseudo-random number generator, but, if your favourite calculator doesn't have one, you can always code one as part of your solution.)

Imagine a user having a long list of numbers that they key into the calculator under the guidance of a program you have written. The goal is for your program to select one of the user's inputs "at random". By this I mean that when the user is finished keying data, the calculator displays one of the user's data inputs. It must be true that any of the inputs that the user supplied was *equally likely* to have been selected by your program.

And, no, you don't know in advance how many items are in the user's data list.

Re: Statistical Challenge

*Message #4 Posted by **Tizedes Csaba** on 6 Oct 2003, 3:38 a.m.,*
in response to message #3 by Patrick

Err... I think it's workable... HP32SII version:

```
LBL F
INPUT X
SUMMA+
```

```
1/X
RANDOM
X<Y?
GTO C
GTO F

LBL C       #'X->Y'
RCL X
STO Y
GTO F

LBL R       #the 'result'
VIEW Y
RTN
```

The variable X is the actual data, and Y is the 'favourite'. If the RANDOM<1/n (n: number of datas, what typed), then X->Y.

If you want to see the actual Y, type XEQ R, on the 'X?' screen.

Usage: CLSUMMA, (CLVARS), XEQ F, type datas [R/S], XEQ R

Re: Statistical Challenge

*Message #5 Posted by **Larry Corrado, USA (WI)** on 6 Oct 2003, 7:15 a.m.,*
in response to message #4 by Tizedes Csaba

A very interesting problem posted by Patrick. My immediate inclination was to say that all the data must be stored, and a point picked out from the complete stored list after each new entry. It just didn't seem "right" to have all but one point ruled out as the winner part way through the data entry.

However, when I constructed the decision tree for n = 3 or 4 inputs, it worked out that each input would have a 1/n probability, where n = number of inputs. And it appears that this scales up to larger n.

It's been along time since I've done any significant calculator programming, but it looks like Tizedes' solution will work.

Interesting...

LC

Re: Statistical Challenge

*Message #6 Posted by **Patrick** on 6 Oct 2003, 5:55 p.m.,*
in response to message #5 by Larry Corrado, USA (WI)

Well done, Mr. Csaba. Your answer is right on.

In words, the basic idea of the algorithm is that the program always keeps the "current" selection stored, together with the current number of items entered to date. When the n'th input is made, it replaces the previous current selection with probability 1/n. So, for example, the first item entered is selected as the current value with probability 1. The second one entered is selected with probability 1/2, and so on.

After all the data is entered (or at any other time) the current selection is the value the program

will return as the "random pick" of the user's data.

Here is the proof that the program selects each item with equal probability. Suppose that the entire list consists of N items. Consider the k'th item in the list, with 1<=k<=N. What is the probability that it ends up as the final selection? In order for our program to be correct, this probability must be 1/N. Well, in order for this to happen, it must be selected when it is keyed in and then all further keyed data inputs must **not** be selected. These events are independent and so we multiply the probabilities for them each to happen:

```
(1/k)*(k/(k+1))*((k+1)/(k+2))* ... *((N-1)/N) = 1/N
```

Techniques like this used to abound in the literature in the days when memory and CPU costs were large. Typically, a large data set was read off of a tape and certain reports were generated from the data. Core memory was not so plentiful that it could maintain all of that data in memory all at the same time. Nevertheless, it was critically important to programs of the day that they not require multiple passes through the data -- reading a tape was expensive, in CPU time and in wall-clock time. "Single pass" type algorithms were key.

The algorithm at the base of this challenge is a simple example of such a single-pass (stochastic) algorithm. Many such have been lost from general knowledge and practice because of how inexpensive memory (e.g., virtual memory) and CPU power has become.

Ed --

The RPN/AOS HP-17Bii will store the entire set of input data for staistical analysis, and has built-in functions for median, max, min, and sorting. "Mode" could likely be programmed using its powerful language for equation-solving, documented not in its own manual, but in the HP-19 manual.

I know where I can abtain a 1993(?) HP-17Bii for you.

Has Hewlett-Packard hit bottom yet?

*Message #1 Posted by **DanO** on 5 Oct 2003, 10:04 p.m.*

A man was recently in the calculator aisle of a well-known office supply store. He can't find what he wants. A stockboy wanders by.

Man: Excuse me. I'm looking for the Hewlett-Packard calculators.

Stockboy: The what?

Man: The Hewlett-Packard calculators.

Stockboy: All of our calculators are right here.

Man: Yes, but I'm looking for the Hewlett-Packard calculators.

Stockboy: (blank look) Hewlett-Packard? Ummm . . . I'll have to ask somebody about that.

Man: OK. Thank you.

Five minutes later the man leaves the store. There were no Hewlett-Packard calculators. As he walks through the parking lot the man has a very uneasy feeling. He recalls his conversation with the stockboy and the man wonders to himself, "WHAT THE HELL IS GOING ON HERE?!?"

HP calculators are alost invisible in the UK and have been from the year dot. Try looking for an online UK shop with them (there are 1 or 2 but compared to Casio and TI...)

After I asked in a normal high street shop if they could order an HP calculator they said that they did do HP printers and computers and did I mean a Packard Bell calculator / organiser!!

HP in the UK don't seem to push calculators AT ALL. If you want one you have to hunt high and low.

On a day trip to France I did find a reasonable range of HP calculators but no HP32Sii ;-(All the boxes were well worn and looked as if they had been on the shelf for a very long time - the prices looked full list price and my French was not good enough for me to haggle due to the box condition.
