in response to message #2 by Tom (UK)

Why not try www.classiccalculators.co.uk for HP calculators in the UK?

HP48GX newcomer

*Message #1 Posted by **Eric Lundgren** on 5 Oct 2003, 5:10 p.m.*

Hey all,

Well, I buckled down and got the 48gx, it appears to be the black screen, but have any of you noticed a 'pulsing' of the screen. Its barely noticeable until you turn the contrast really dark. Just curious, this thing's gotta get me through my BSME! ...saving the 32sii in a dry cool box for the eventual PE fiasco.

Any new-user tips from you all?

el

Re: HP48GX newcomer

*Message #2 Posted by **r. d. bärtschiger.** on 5 Oct 2003, 5:43 p.m.,*
in response to message #1 by Eric Lundgren

I think the pulsing depends on the type of ambiant lighting. Yes, mine has it also when the contrast is turned up.

rdb.

Re: HP48GX newcomer

*Message #3 Posted by **Ed Look** on 5 Oct 2003, 6:08 p.m.,*
in response to message #2 by r. d. bärtschiger.

Someone correctly pointed out on this forum that the refresh rate on 48G screens are a bit over 64 Hz so that if a light has frequency of 60 or so Hz, then the interference "pulsing" is seen.

Strobing

*Message #4 Posted by **Tom (UK)** on 6 Oct 2003, 1:19 p.m.,*
in response to message #3 by Ed Look

Normal bulbs pulse at 2x the ac frequency i.e. 100Hz or 120Hz, I'm not sure about strip lights.

The human eye can only 'see' pulsing up to about 25Hz as the eye has a low pass filter effect above that frequency. Strobe effects can easily bee seen if they are less than 25Hz.

Re: Strobing

*Message #5 Posted by **Ed Look** on 6 Oct 2003, 1:29 p.m.,*
in response to message #4 by Tom (UK)

Tom, in the US, power comes at 60 Hz. Some of our streetlamps seem to have that same frequency.

I was using my HP48G under one once and I could see the flicker! I'm told that its screen refreshes at around 64 Hz or so. I think that information might even be found in this museum site somewhere...

Re: Strobing

*Message #6 Posted by **Tom (UK)** on 7 Oct 2003, 12:44 p.m.,*
in response to message #5 by Ed Look

I don't know what rate the HP48G series updates the screen. Does a 'normal' house bulb give the same result as a street light (i.e. pulsing display)? If it doesn't visibly pulse then there is possibly some other effect.

From my recollection of electronics; if a light bulb runs from 60Hz the light will pulse at 120Hz. In the UK the mains electricity is 50Hz so lights pulse at 100Hz.

Light intensity = Power = ((Voltage)^2) / Resistance

If Voltage = V x COS(freq)

Power cx= (V x COS(freq))^2

Power cx= V^2 x 1/2(1 + COS(2 x freq))

(where cx= is 'proportional to')

Re: Strobing

*Message #7 Posted by **Wayne Brown** on 7 Oct 2003, 1:20 p.m.,*
in response to message #6 by Tom (UK)

My office is lit by a combination of fluorescent lighting on the ceiling and daylight coming through large windows. I normally don't notice any flickering on my 48GX. Sometimes, usually late in the day when there is little daylight left and the fluorescent lights are providing most of the illumination, I notice a slight flicker. However, I have a small fluorescent light on my desk and when I examine the 48 under *that* light the flickering clearly is visible, especially if I view the screen at a shallow angle.

At home, where I have only incandescent lighting, I *never* see any flickering.

Batteries and such

*Message #1 Posted by **Patrick** on 5 Oct 2003, 1:59 p.m.*

I have a bunch of small questions, mostly about batteries...

1) I've recently purchased an HP-19C and put in a new battery pack with NiMH 1850 mAh AA cells. Is it safe to recharge the batteries in the calculator? I've scoured the HP archives for information on this and it appears the consensus some time ago was that, yes, it was safe. I'm just looking for any updates to those opinions.

2) Same question for the HP-34C.

3) Any reason why a Woodstock would have problems with a rebuild pack using NiMH? I've tried a couple of packs/battery combinations and have gotten nothing. I know the batteries are ok because I can transfer them to another pack for a different type of machine and they work. I also know that the Woodstock calculators work.

3) Can you throw the HP "leatherette" cases into the washing machine? I have Voyager cases spraying the dreaded black powder and a Spice (fuzzy inside) case which stinks. Any experience here?

Re: Batteries and such

*Message #2 Posted by **David Smith** on 5 Oct 2003, 3:10 p.m.,*
in response to message #1 by Patrick

Yes, Nimh cells work fine in the 19C, spices, woodstocks, and classics. You need to keep them on the charger for up to three times as long, since they can hold up to three times the juice.

I have washed numerous HP41 and spice cases in the wshing machine with great success. Sometimes it takes two wash cycles to get the gunk out of a stubborn case. Air dry them with the mouth propped open.

Woodstock and HP19C machines are famous for bad battery pack connections to the machine terminals. The cells in the woodstock pack need to be able to move freely. If they are glued together or strapped tightly at the spring connection, one terminal may not be making contact. Try small wads of aluminum foil between the battery contacts and the machine terminals.

The ends of the woodstock cells should be connected by a welded strap with a little slack in it. Dont trust the springs alone to make good contacts between the cells.

Re: Batteries and such

*Message #3 Posted by **Ed Look** on 5 Oct 2003, 5:12 p.m.,*
in response to message #2 by David Smith

Mr. Smith, please be careful that your old Spice cases are not still deteriorating chemically, in which case you would still be contact with the (most likely) harmful residue.

Re: Batteries and such

*Message #4 Posted by **Ed Look** on 5 Oct 2003, 5:10 p.m.,*
in response to message #1 by Patrick

I only know about the Spice series black vinyl cases. The foam lining inside deteriorates over the years and leaves not only the objectionable powder, but a bit of an oily residue as well. Dollars to doughnuts this stuff is somewhat toxic or carcinogenic. Therefore, I don't advise washing them, as these things are organic molecules and water won't do much to them and they'll just continue to decompose, as the plasticizers evaporate over the years. I advise you do what I did- simply throw away the vinyl Spice case.

Nowadays, office supply places and stationery stores, especially during back-to-school season (just over) have these generic calculator cases for about $5 to about $10. They are made by the people who make notebooks, binders, etc. (Five-Star, I think, is one of the brands I can remember) But I myself have never bought one.

Re: Batteries and such

*Message #5 Posted by **David Smith** on 6 Oct 2003, 1:32 p.m.,*
in response to message #4 by Ed Look

The lining that decomposes is apparently foam rubber... they make pillows and beds out of it... probably fairly safe. The residue washes out quite well. The spice series cases usually come out of the wash looking like new.

The HP-33S and those evil MBAs
*Message #1 Posted by **Dave Hicks** on 5 Oct 2003, 1:55 p.m.*

Hi Everyone,

I haven't had time to read the 33s thread below until today. I didn't get a lot of sleep last night so please excuse me if I ramble.

A few thoughts on HP Calculators

> Quote:
>
> I wonder why its OK to "stand still" with the calculator for business, but engineering calculators shall be discontinued?

It's funny because I used to ask questions that were nearly the opposite of this - ie Is the inability to replace the 12C an indication that HP isn't willing to put a great deal of R&D into a new business model? That doesn't seem likely though because there were some nice later models, which didn't last as long. Really it seems the most likely answer to me is that the 12C is the defacto standard and people just keep buying it no matter what. This is much more a statement of HP's customers than HP I think. While some may like to make fun of MBAs, they are probably the ones keeping the 12C alive simply by putting their money where their mouth is and paying for a (relatively) expensive calculator in large numbers.

A few years ago I got a call from United Airlines. They wanted to get rid of a bunch of never claimed calculators in their lost and found. When I pressed for details, they told me they had 400 HP 12Cs - and nothing else. Now some might turn this into an MBA joke but I think it says more about sheer numbers and the fact that so many 12C owners are pulling their calculators out on planes and using them. (Which probably sold a few more to the people in adjacent seats. By contrast HP techy calculators have seen much more stealthy in the last decade.)

A lot of people are upset and/or sad at the recent state of HP calculators. However, blaming Carly Fiorina and/or MBAs seems a little misguided to me. At most, I think they are a symptom of the general US (and world) business trends of outsourcing, globalization, and maximization of profits with no other thoughts. I'm not entirely comfortable with this myself, but.....

I happened to be at a party recently with HP employees who used to work on various calculators. Even among such insiders, what happened to HP's calculator group is a matter of debate and mystery. One theory that I found rather plausible and compelling went like this:

HP had at one point moved its PDAs to Singapore. The head of the Singapore division made a great deal of effort to pull calculators into his sphere as well and eventually he succeeded. In the past, this has been seen as a mistake because calculators quickly lost focus while PDAs got all the attention. However, there's another "insider" theory that Singapore saw HP's calculators as a threat to their PDA line all along. They lobbied to get calculator design and production transferred to them so they could kill it. Of course, this is a classic model of business - if a little competitor is causing you some grief - buy them and phase out the "troublesome" products. (You might blame MBAs for such thinking but I've seen engineer-turned-managers do the same thing.)

Since then, calculators have bounced around HP. Each manager has had big plans to try to revive them but found it easier said than done. For one thing, most of the people who developed the original software base moved on. On the business side, surely HP wanted to see serious profits is short order. I had the same problem at my previous employer. They wanted my division to spew forth new businesses. They wanted each new business to become at least a billion dollar a year business within 6-18 months. Gee, what do you know, 99.9% of everything proposed got cancelled. Some in the Powerpoint phase, and some after years of development. It's just not so easy to turn out those billion dollar businesses. **The interesting thing is that while some people want to blame MBAs for everything, my company was run by engineers. It was simple engineering logic that declared those non-billion dollar businesses to not be worthwhile.**

I think some of us old(ish) engineers also have to allow for the fact that the educational market rather than engineering now probably drives calculator development. Sadly, the basic black device that functions forever may now loose to the fashion statement. As Luca suggested, there are cell phones with far more bizarre keypads that people seem to enjoy buying, (For some reason :-))

About the forum

I typically keep very "hands-off" on this forum. Recently I've gotten a couple of emails about the "flame level" of the forum. Spirited debate about a new calculator is great and there are a lot of great comments about potential usability issues with this model (some of which may or may not disappear after you use one for a few minutes.) I too think it looks weird but then so does my cell phone and by current standards my cell phone is one of the **least** weird. Did someone mention rotary dials? Check this one out:
http://www.nokia.com/pics/phones/phone_models/3650_mainpage_s1.jpg

Does this one even have a keypad?
http://www.nokia.com/BaseProject/Sites/NOKIA_MAIN_18022/CDA/Categories/Phones/PhoneModels/Nokia7600/_Content/_Static_Files/noflash.jpg

What I would like to avoid however is calling people mentally retarded, or blaming entire classes of people for everything we don't like about a new model. And while a lot of people like to blame HP's current CEO for a lot of things (many of which may be true) I'm not sure that she can really take the blame on this one. They took the LEDs out a **long** time before she got there, and the "organizational issues" alluded to earlier also greatly predated her. People were complaining about the "bizarre" green and purple color scheme of the 48G (which tested so well in its target educational market) years before Carly got there. (Check out the comments on design choices from a long-time HP designer.) Maybe you can blame her for not recovering HP's calculator business but I think it's much harder to recover than to maintain so why aren't we giving her predecessors at least some of the blame?

I guess you are right, Dave.

*Message #2 Posted by **Norm** on 5 Oct 2003, 3:32 p.m.,*
in response to message #1 by Dave Hicks

I guess you are right, Dave. It is not helpful to elevate posts to "flame" status, not even over the "Chevron" HP-33S.

I apologize for encouraging a chat board war now that HP has hit new lows. As to HP-33S, it will be enough to simply not buy one.

This still leaves us w/o a useful HP engineering calculator in production, however.

Surely we could solve this once and for all, by getting the HP calculator products moved over to Agilent? Agilent still has the proper scientific-community outlook. They would treat calculators properly, not like some sort of cheap PDA or gimmicky cell-phone, as has now been done with the calculators.

Doesn't even one of us know any of these boardroom people, and point out what must be done?

Agilent thoughts

*Message #3 Posted by **Dave Hicks** on 5 Oct 2003, 4:30 p.m.,*
in response to message #2 by Norm

I think you'd start at Agilent. Unless there's some kind of non-compete clause that I don't know about, they don't need HP's blessing to enter the calculator market. So I think you'd start by making a case to them. I just looked at Agilent's financials at yahoo and they're loosing money so I think they're going to want to see how this can make them some. On the plus side, they're a much smaller company than HP (less than 1/10th the revenue) so the calculator business could get more attention there.

Some things to think about are whether this is really a move, or simply Agilent going on it's own. Or perhaps Aglient operating as HP's OEM? I think the latter has the most potential because unless you're going for a very high end / low quantity market, I don't think there's a lot of retail shelf space for another brand. I could be wrong about that though. Back in "my day" we used to buy calculators at the nearest university bookstore or mail order from EduCALC. These days I think they're mostly sold at places like Office Depot and Frys but I could be wrong.

A while back I proposed (very casually) the idea of a "Swiss Watch HP42S". Basically take the 42S design, add a few updates (maybe a serial port or a flash card slot or even HP-IL), and then package it in something like a titanium case with a synthetic sapphire (scratch resistant) screen. Sell it as a super tank/serious calculator (but with the subtle hinting of a little status too.)

When I proposed that someone said something like "Yeah! I'd pay $150 for that!" Trouble is I was thinking more like $400-$600. But that was just my imagination. I have no idea how much it would have to cost or how many you could sell.

Re: Agilent thoughts

*Message #4 Posted by **Eric Lundgren** on 6 Oct 2003, 4:22 p.m.,*
in response to message #3 by Dave Hicks

I really like the idea of a 'skunk works' calculator. I can imagine the familiar case of a 42sii but in gun metal or titanium...it'd be a no-frills deal, programmable, no graphing screen, maybe a sd card like Dave said, and it would cost a (0.5)(paycheck). 400 dollars isn't that outrageous if this is the curtious union of say a 42s, 41cx, 32sii...a discrete looking powerhouse that would never be found on ebay 10 years from now as no one would part with it.

Only frills go out of style with time.

Glad to have a place to read about HPs by HP fans. el

Re: I guess you are right, Dave.

*Message #5 Posted by **Gordon Dyer** on 5 Oct 2003, 7:02 p.m.,*
in response to message #2 by Norm

I am going to buy one, insert some Nokia electronics into it and hold it to my ear on the train whilst talking very loudly!

Re: The HP-33S and those evil MBAs

*Message #6 Posted by **Massimo Gnerucci (Italy)** on 5 Oct 2003, 7:07 p.m.,*
in response to message #1 by Dave Hicks

Very well said Dave! I particularly like this sentence:

> Quote:
>
> *What I would like to avoid however is calling people mentally retarded, or blaming entire classes of people for everything we don't like about a new model.*

This is the best forum I ever happened to follow; here I met many wonderful, helpful *friends*.

I hate when common interests are buried by opinions carried over and over with an ever increasing rate of unkindness the way you could expect when dealing with politics, your favourite team, The Best Operating System etc.

Thanks for calming down the riot,
Massimo

Thanks Mr. Hicks

*Message #7 Posted by **Chris(FLA)** on 5 Oct 2003, 7:56 p.m.,*
in response to message #6 by Massimo Gnerucci (Italy)

> Quote:
>
> *This is the best forum I ever happened to follow; here I met many wonderful, helpful friends.*

I **totaly** agree with you on this Massimo. I come to this forum to relax and learn from everyone something I don't already know, and I have learned quite a bit.

The tone and respect everyone shows here is amazing and most welcome. Unlike what you see on that "thing" that works with NNTP. Thank you everyone, and....

Thank you Mr. Dave Hicks for allowing me to participate in such an enjoyable **and** relaxing venue.

Chris

Taylor polynomials on HP49G

*Message #1 Posted by **Jostein Trondal** on 5 Oct 2003, 11:32 a.m.*

Im having trouble with the TAYLR command.

I try

3: ln(x^2+1) 2: 0 1: 4

TAYLR

and want to get the 4th degree Taylor polynomial of ln(x^2+1) at x=0, but i get an error.

-- Jostein Trondal

Re: Taylor polynomials on HP49G

*Message #2 Posted by **Jostein Trondal** on 5 Oct 2003, 12:33 p.m.,*
in response to message #1 by Jostein Trondal

I found the solution:

3: ln(x^2+1)

2: x

1: 4

TAYLR

gives what I want. The advanced user guide isn't exactly abundant with examples...

-- Jostein Trondal

Paypal scam

*Message #1 Posted by **Thibaut.be** on 5 Oct 2003, 10:33 a.m.*

Most of you certainly know this issue, but just for the few of us who don't :

I've received an email with this content

Please verify your information today!

Dear Paypal Member. Your account has been randomly flagged in our system as a part of our routine security measures. This is a must to ensure that only you have access and use of your paypal account and to ensure a safe Paypal experience. We require all flagged accounts to verify their information on file with us. To verify your information, click here and enter the details requested. After you verify your information, your account shall be returned to good standing and you will continue to have full use of your account.

Thank you for using PayPal!

Please do not reply to this e-mail. Mail sent to this address cannot be answered.

The link is redirecting to a paypal-looking site where my card is requested to be confirmed as well as my pin code !

This is of course scam and I reported this to spoof@paypal.com.

If you receive this message, don't fill in the form and eventually report to spoof@paypal.com

Re: Paypal scam

*Message #2 Posted by **Patrick** on 5 Oct 2003, 1:41 p.m.,*
in response to message #1 by Thibaut.be

Better yet, respond to the request and fill in bogus (but credible looking) inputs.

Fill these scumbags inboxes with thousands of totally useless information sets that they'll have to wade through.

Be careful!

*Message #3 Posted by **Mike** on 5 Oct 2003, 9:38 p.m.,*
in response to message #2 by Patrick

I would BE CAREFUL, when clicking an kind of OK button on a form. The ones that I see that come via eamil, don't ask for a reply. They have a form, with a submit button.

How many times have you clicked an OK button form to install some program from a web site? Often we see these things on plugins and other upgrade type forms.

This particular one just sends info to a bogus site that collects names and passwords but what if that was a

ruse to get you to click an ok to install a program on your computer?

Be careful, when trying to play games with SCAM artists. The best course is to ignore them.

Besides, I believe this particular one does not send an email. It executes a CGI file on the server which reads the form. No emails are sent. At least that's the way the ones work that I get.

PS: I always look at the source for these to see what they are doing.
[img=http://www.msdsite.com/images/smile.gif]

Edited: 5 Oct 2003, 9:39 p.m.

Re: Be careful!

*Message #4 Posted by **thibaut.be** on 6 Oct 2003, 1:51 a.m.,*
in response to message #3 by Mike

This form is generated by a http link, and does not ask anything to be installed on your computer.

It is way much simplier than that... bit like "mike, please give me your card#, your csv and your pin code"

Besides I often scan my pc's with adaware... quite impressive tool !

Re: Be careful!

*Message #5 Posted by **Ed Look** on 6 Oct 2003, 1:21 p.m.,*
in response to message #4 by thibaut.be

Thibault, I'll second that. I think everyone should have AdAware or some other equivalent spyware scanner.

Re: Paypal scam

*Message #6 Posted by **Chris Randle (UK)** on 6 Oct 2003, 8:34 p.m.,*
in response to message #1 by Thibaut.be

I hope you have better results than I did. I notified AOL about this outrageous site:

http://www.syisecurity.com

One week later and it's still up.

Re: Paypal scam

*Message #7 Posted by **Steven Kutoroff** on 7 Oct 2003, 8:21 p.m.,*
in response to message #1 by Thibaut.be

I got the same message and also reported it to PayPal and eBay about two weeks ago. All they did was acknowledge my submission with a thank you and a warning to watch out. I too advise letting eBay and PayPal handle the perps.

Mach number: RPN vs. AOS comparison

*Message #1 Posted by **Karl Schneider** on 5 Oct 2003, 5:08 a.m.*

I evaluated the Mach-number equation given by r.d. baertschiger below:

M= sqrt[5 [({ [(1 + 0.2 [350/661.5]^2)^3.5 -1] [1- (6.875^1E-6) 25500]^-5.2656 } +1)^0.286 -1]]

using a number of diiferent machines.

RESULTS

-- RPN (12C, 15C, 17Bii, 28S, 48G, 49G):

I got the correct answer (0.835724536) every time within one minute of work, once I saw how the expressions nested (match the braces "{}" by multiplying two long results.)

-- Non-symbolic AOS with precedence (20S, Casio fx-3600p):

I got the correct answer on the first try with somewhat more time, when entering the expression exactly as written, which utilizes precedence. Doing the ()'s slows one down a little.

-- Symbolic AOS with precedence (28S, 48G, 49G):

I got the correct answer on the first try, but required more time, due to all the "()". This method gives no intermediate results, however, so the final answer must almost be accepted on faith, unless one scrutinizes the symbolic expressions after-the-fact.

-- Symbolic AOS without precedence (17Bii):

Serious difficulties getting the correct answer, with repeated failures. Extra ()'s must be inserted at the right time to handle lack of precedence, and if it wasn't done, it's difficult to fix.

-- Non-symbolic AOS without precedence (10B):

Repeated failures required completely starting over, and ()'s were shifted. Horrible!

-- Equation writers/editors (48G, 49G, 17Bii):

Very cumbersome; expressions were hard to read. Many failures. 48G equation writer could not keep up with user input.

FINAL VERDICTS

-- RPN:

Probably best for correctly solving this type of problem, because you see all intermediate results, and you know what they represent. Error recovery is easy. Of course, a strategy for evaluation must be devised beforehand, but RPN users are good at it.

-- Non-symbolic AOS with precedence:

Also useable, but the intermediate results produced by ")" are less obvious. (How many operations were performed, and what were they?) The user can enter the problem exactly as written, but it must be written according to the rules of precedence. "Fixing" the calculation midstream is nearly impossible.

Instead of entering the experssion left-to-right, a quasi-RPN approach can be emulated with liberal use of "=" and storage registers.

-- Symbolic AOS and equation writers/editors:

Allows the user to see the complete expression, but not the intermediate results upon evaluation. I wouldn't trust 'em.

- AOS without precedence:

Leave 'em for the business people!

Re: Mach number: RPN vs. AOS comparison

*Message #2 Posted by **Gordon Dyer** on 5 Oct 2003, 6:59 p.m.,*
in response to message #1 by Karl Schneider

I couldn't resist and had a go using a few calculators.
I found RPN on my 11C and 42S easy and quick once I had written the equation by hand with vertical structure and superscripts.
I then turned to my 71B and typed it in very quickly, but got an error message because it gives ^ precidence over unary- This was fixed with brackets around the (-5.2656)

M=SQRT(5*((((1+.2*(350/661.5)^2)^3.5-1)*(1-6.875E-6*25500)^(-5.2656)+1)^.286-1))

This gives M=0.835724535179

Other results were:
17BII 0.835724535179
42S 0.83572453518
11C 0.835724536

Overall I found each method equally slow to set up and debug and about the same speed after debug. I like both RPN and good algebraic calcs!

Re: Mach number: RPN vs. AOS comparison

*Message #3 Posted by **hugh** on 5 Oct 2003, 7:35 p.m.,*
in response to message #2 by Gordon Dyer

is that a bug? something like 2^-2, do you have to write 2^(-2)?

Re: Mach number: RPN vs. AOS comparison

*Message #4 Posted by **Gordon Dyer** on 6 Oct 2003, 4:59 a.m.,*
in response to message #3 by hugh

No, it is not a bug, but the 71B implements operator precedence with ^ first and then unary- next, this

means that it tries to evaluate 2^- before pulling in the number and gets an undefined result, so brackets are essential! Note thay 2^+5 also gives an error, but 2^5 is fine.
This is a strange order and I would like to hear from anyone who has an idea as to why the 71B operator precedence is like this.

Precedence of Operators (from 71B Quick Ref Guide).
The table below lists HP-71 operators in their order of precedence. Where an expression contains two or more operators having the same level of precedence, those operators will be evaluated in the left-to-right order in which they occur within the expression.

Performed first:

(...) (Nested parentheses are evaluated from the inside out.) Functions (such as SIN, RND, etc.)
^
unary +, unary -, NOT
*, /, \, DIV, %
+, -, &
<, =, >, #, ?, <=, >=, <>
AND
OR, EXOR

Performed last.

Re: Mach: RPN vs. AOS vs 48GX

*Message #5 Posted by **bill platt** on 6 Oct 2003, 2:13 p.m.,*
in response to message #1 by Karl Schneider

Hi Karl,

I got pretty similar results, except that I was not as fast!. However, I found the 20s to be just as efficient and easy as RPN--actually I got the right answer on the 20S first (And I am a died in the wool RPN guy!).

But on the symbolic type systems, namely 48GX equation writer: that beast is as useless as teets on a bore-hog! SLOOOOOW and cumbersome and a paint to edit in--it was actually much easier to create an algebraic object on the stack. I do not see any good in that equation writer thing for an equation like this! I wonder if that-there ALG48 or ERABLE or METAkernel whathaveyou is worth it.

I also tried writing the equation into my 32sii equation space--boy did that use a lot of memory! And I still got the wrong answer---don't know why!

Regards,

Bill

Try the MetaKernel

Quick (VERY quick) editors -numeric & symbolic matrices, equations, text, graphics, etc- with cut, copy and paste.. I actually think that the 48 is MUCH better with MK. I wouldn't use it without MK today...

Forgive me, what is the MetaKernel? An emulator of another calculator for a calculator?

Re: Try the MetaKernel

*Message #8 Posted by **bill platt** on 6 Oct 2003, 4:44 p.m.,*
in response to message #7 by Ed Look

MetaKernel is some sort of cool alternative graphic environment.

But I do have an emulator for another calculator running on a caclulator--it emulates the 41c series and runs on the 48G series---its very cool!

Regarding M-K, I downloaded it, but cannot figire out how to turn it on. I also cannot figire out how to get a lot of other stuff "on" such as XCELL (a spreadsheet) ERABLE (a computer algebra thing) and ERABLE (another computer algebra thing.).

Regards,

Bill

in response to message #7 by Ed Look

Noooooo: it's (in some way) a better OS for the 48GX

Re: Try the MetaKernel

*Message #12 Posted by **Ed Look** on 6 Oct 2003, 7:38 p.m.,*
in response to message #11 by R Lion (España)

Better?!

If it's not too much trouble, can you briefly summarize how so?

I will admit that using a 48G reminds me a bit of the old days of VMS on mainframes and their clunky little text editors... almost. Nothing really is as bad as that (VMS and all that)!

Re: Try the MetaKernel

*Message #14 Posted by **Wayne Brown** on 7 Oct 2003, 8:16 a.m.,*
in response to message #13 by R Lion (España)

I just wanted to point out that the review whose link Raul provided speaks of Meta Kernel being a 128K ROM card and says that it costs about US$90. That was true at the time it was written, but the authors have since released it as a free download. It's available at the same place as the review, hpcalc.org, at this link: http://www.hpcalc.org/hp48/apps/mk/mk230.zip You need a 128K RAM card to use it, which restricts its use to a 48GX. (This is an excellent use for one of the inexpensive Klotz 128K cards.) It fills the entire card, so port 1 has to be dedicated to Meta Kernel, but it's well worth it. With MK in slot 1 and another RAM card (in my case a 2MB card) in slot 2 the 48GX is a whole new machine.

Mach number - RPN vs. Algebraic

*Message #1 Posted by **Valentin Albillo** on 5 Oct 2003, 2:14 a.m.*

r. d. bärtschiger posted:

"Whenever I buy another type of calculator I always use the following equation, from page 106 of the HP-67 Owner's Handbook, to test the useability of the new calculator. Using an HP calculator usually takes about 45 seconds to get the correct answer. Using an algebraic calculator usually takes much longer, twenty minutes or more, if it in fact can solve the problem at all."

With all due respect, and not to doubt your words but your quoted figure and comment "twenty minutes or more if it in fact can solve the problem at all" seems a bit misleading and a lot unfair. 20 *minutes* ? Are you serious ?

If you are, it seems to me to be a typical case of a "language" chauvinist, using ineptly a "language" he dislikes, then pointing out how bad and inefficient are the results he inefficiently produced. You'd have a similar case if someone profoundly disliking RPN were to solve this particular Mach number example using RPN: he would take ages to solve it, would do a lot of false restarts and unnecessary stack manipulations, then would complain how much RPN sucks. Simply preposterous.

"Even trying to enter this equation into an HP-48GX or 49G+ equation writer is a difficult task."

Maybe that's the case for those calculators, but this "difficult" evaluation is a piece of cake for my SHARP PC-1350. The formula is entered like this:

```
Sqrt(5*(((((1+.2*(350/661.5)^2)^3.5-1)*(1-6.875E-6*25500)^-5.2656)+1)^.286-1))
```

where Sqrt is the "square root" symbol (a single keystroke). I timed myself entering this equation, exactly as written, and it took me 60 seconds flat (not "20 minutes"), the displayed result being 0.835724535, correct to all digits shown. If it actually took you 20 minutes, this only shows just how inefficient you are entering and evaluating algebraic expressions, or else just how bad your algebraic calculators are.

"If you really want to see how much easier RPN is, try to calculate the answer to this problem using an algebraic calculator. [...] I think you will agree the HP is easier."

No, I don't agree at all, by the simple reason that it isn't true, and your example is actually flawed. Why do I state this ? Let's see:

- Why it isn't any easier with "HP" (i.e.: classical RPN) ?: it isn't easier with classical HP RPN because, being limited to 4 stack levels, you CAN'T begin to evaluate the expression from the left, but as the actual RPN solution shows clearly, you MUST decide on a strategy for where to begin the evaluation, having to scan the expression to locate the innermost set of parentheses, then begin there, least you would need to store some intermediate result in a register. On the other hand, you CAN enter the expression in the PC-1350 exactly as written, from left to right, no strategy needed, no intermediate results stored.

  Also, there's the fact that RPN isn't particularly "efficient" for this particular example. RPN takes 66 keystrokes to evaluate this, starting from the innermost depths, then going outwards. In the PC-1350, it takes 75 keystrokes to enter the expression, left to right, no reordering necessary, and the ending parentheses could be ommitted as well. I don't think the difference in keystrokes to be groundbreaking at all, and certainly does not compensate for having to decide on the order of evaluation beforehand. The mere fact that you need to give a "proper keystroke sequence" as part of the solution is a real telltale that RPN isn't at its best in this example. The PC-1350 "proper keystroke sequence" is "as written".

- Why your example is flawed ? Because it's hopelessly *aged*. This example was fine, very fine at the time it was published. I remember trying it with my newly acquired HP-67 more than 20 years ago, and being awed at the power of RPN, because this example was well-nigh intractable with the primitive algebraic calculators of the time.

  But using it nowadays, as an example against *modern* algebraic calculators ? Come on !! You must be joking, or you have a serious case of wishful thinking ! Not only modern algebraic calculators, but vintage ones, as the Sharp PC-1350, can take examples like this and bigger for breakfast, without even blinking. You can key in the full expression left to right, as written, you can see it in full in the 4-line display, you can check it and recall it at will after evaluating it, to edit it and change some parameter to play what-if, you can do anything ! Try that with your classical RPN calculator. Will LASTx do you any good if the final result seems absurd ? Or will you have to reenter all of it, perhaps chosing some other order of evaluation ?

  HP used this example, very complex at the time, because algebraic calculators back then had very little memory for their intermediate operands and operators and most couldn't compute this example from left to right, as written, while in RPN you easily could by applying some ingenuity to the order of evaluation, ingenuity that most HP users at the time had in spades. Also, algebraic calculators back them could not display the whole expression at once, but only the number last keyed in, or an intermediate result, not even the operands would appear in the display. There was also no way to recall the whole expression in case of error.

  But what was ok and amazing then, and a very proper example and demonstration of RPN power, cannot be used right now, 2003, to demonstrate RPN "superiority" against "algebraic systems", because RPN hasn't changed an iota (RPL is *far* too different to be considered

> "RPN", more like FORTH) while algebraic systems have improved exponentially, and modern algebraic machines do not have the pathetic memory and display limitations that vintage models had.
>
> That being so, your example is just too ridiculous an "exhibit" to rest your case, and can only succeed with the most fanatic, blinded RPN addicts. Any serious RPN or algebraic user will simply be ashamed of your pathetic argument.

The point is: don't get me wrong. I've been using RPN for the past 20 years, like it very much, and, honestly, there's very few people in this forum or out that can do any calculation or program more efficiently in RPN than I can, even if it isn't proper I would say so myself. But just the same, and for that same reason, I can't suffer seeing RPN being "defended" with such pathetic arguments and such flawed, obsolete, no-longer-valid examples, much less seeing a lot of people being mislead by them into a false feeling of superiority which isn't exactly justified by examples like yours.

Just you try to use this Mach number example to demonstrate the "superiority" of RPN in your HP to someone having a decent algebraic calculator (even if it is as old as the Sharp PC-1350) and you'll only succeed in making a fool of yourself, and proving the other person just how pathetic those "RPN nerds" are. It goes without saying that this is no good to the RPN cause, at all.

Long live RPN !

Best regards from V.

Re: Mach number - RPN vs. Algebraic

*Message #2 Posted by **Ed Look** on 5 Oct 2003, 2:43 a.m.,*
in response to message #1 by Valentin Albillo

Well, given your arguments, I will (tomorrow sometime; I'm so tired, have to teach Sunday School tomorrow morning, and don't what the heck I'm doing up on this forum [it's 2:30 AM in NYC]) give it a try on my Casio fx-4200p just to see if it is hard or easy.

But that wasn't really why I am posting: I was able after seeing a correct display of the equation, to do the calculation on a one-line, four-stack machine, the HP-34C, without having to commit the first innermost term to a memory register. It wasn't necessary. Even with so many nested parentheses, it appears four stack levels is most often enough.

Incidentally, you do make some very good points and I generally agree with you. But I still think that I'll take the five or six steps I saved with RPN entry any day... for that reason, as the smallest economy in finger presses is worth it to me.

On my Casio fx-4000p

*Message #3 Posted by **R Lion (España)** on 5 Oct 2003, 4:55 a.m.,*
in response to message #2 by Ed Look

> Quote:

> give it a try on my Casio fx-4200p just to see if it is hard or easy

I needed three trials on this calc because, using RPN calcs for years, I've forgot a gold rule of algebraics: "open parens after sq root"
I'm sure that if I was using this Casio dayly, or if I was using the ALG entry in my 48GX everyday, I had got the answer at first attempt, as I did with RPN and with the MetaKernel Equation editor. Matter of taste, matter of use.

But... I prefer RPN.

Raul

*Message #4 Posted by **Ed Look** on 5 Oct 2003, 8:35 p.m.,*
in response to message #3 by R Lion (España)

Raul, I haven't used that Casio fx-4200p in MANY years. I'm just guessing that it's formula entry is like that of a Hp-32SII or HP-48G series calculator. If not, I'll have to wait even longer, as the only manual I have for it is on my computer's hard drive and I usually hate reading massive texts on the CRT.

Looking over Namir Shammas's post more carefully, I see that I overlooked the minus sign in front of the 5.2656

Re: Mach number - RPN vs. Algebraic

*Message #10 Posted by **Namir Shammas** on 5 Oct 2003, 8:35 p.m.,*
in response to message #9 by Rodger Rosenbaum

Roger,

I removed the exponentiation to the negative number and replaced multiplication with division. This change remove the presence of the operatod ^- in this sequence, which can trip many interpreters (BASIC, and other runtime interpreter such as the one I used to evaluation the expression). Namir

Re: Mach number - RPN vs. Algebraic

*Message #11 Posted by **Rodger Rosenbaum** on 6 Oct 2003, 3:11 a.m.,*
in response to message #10 by Namir Shammas

Yes, I realized that when I noticed that the minus sign had been removed. One could also use more parentheses to solve this problem. Those people who typed this expression into their HP71's had this problem, I noticed, but the HP48 in algebraic mode apparently has different precedence in this case.

Re: Mach number - RPN vs. Algebraic

*Message #12 Posted by **Wayne Brown** on 6 Oct 2003, 7:51 a.m.,*
in response to message #6 by r. d. bärtschiger.

rdb,

I just wanted to say that *I* liked your example very much, and thank you for posting it. Although, I confess that I had difficulty using it until Mark Hardman posted the scanned image from the book -- all those brackets and parentheses were hard to keep straight. But the book version was very easy to do with RPN. I just wanted you to know that *some* people appreciated the effort you (and Mark) made and agree with your reasons for doing it.

Re: Mach number - RPN vs. Algebraic

*Message #14 Posted by **Les Bell [Sydney]** on 5 Oct 2003, 4:06 a.m.,*
in response to message #1 by Valentin Albillo

Singularly unimpressive, Valentin. I just grabbed my trusty Jeppesen-Sandersen CR-5 "whizz wheel", place the Calibrated Air Speed opposite the Pressure Altitude, move the cursor to the correct Indicated Temperature, and read the Mach Number off the Mach Number scale.

No keystrokes, no messy programming and the whole process takes about three or four seconds.

Sometimes, the old ways are the best ways. . . <g>

(See http://www.jeppesen.com/wlcs/application/commercewf?origin=itemsummary.jsp&event=link(details)&wlcs_catalog_item_sku=JS514238&wlcs_catalog_category_id=PS2&wlcs_document_type=details)

Best,

Re: Mach number - RPN vs. Algebraic

*Message #15 Posted by **Rodger Rosenbaum** on 5 Oct 2003, 4:18 a.m.,*
in response to message #1 by Valentin Albillo

What's the problem with doing this on the HP48? Just put a 'tick' mark at the beginning and then type it in just as Valentin has it, with the "Sqrt" replaced with the square root symbol found on the keyboard. The 48 deletes one set of unnecessary parentheses, and evaluates the result as .835724535179
This is "algebraic" mode on the HP48, and it works quite nicely.

Re: Mach number - RPN vs. Algebraic

*Message #16 Posted by **James M. Prange** on 5 Oct 2003, 6:48 a.m.,*
in response to message #1 by Valentin Albillo

Well, I normally use an RPN (actually, RPL) sequence, but when I'm working with an algebraic formula that's already written out on paper for me, I find it easier to just enter it into the 48 as an algebraic object. I've never cared for the equation writer for entering algebraics, although I do like it for viewing them. But my first try didn't work, so I copied it onto paper and inserted the '*' operator for the implied multiplications and added parentheses to make the order of operations explicit.

In the following, "\v/" stands for the square root symbol, "\<<" and "\>>" for the program delimiters, "NEG" is the +/- key, and "^" is keyed in by pressing the y^x key.

Here's the object with flag -53 set (Show all parens):

```
%%HP: T(3)A(D)F(.);
@ Checksum: 68BAh
@ Bytes: 162
'\v/(5*(((((((1+(.2*((350/661.5)^2)))^3.5)-1)*((1-((6.875*(10^(-6)))*25500))^(-5.2656)))+1)^.286)-1))'
```

The same object with flag -53 clear (No extra parens):

```
%%HP: T(3)A(D)F(.);
@ Checksum: 68BAh
@ Bytes: 162
'\v/(5*((((1+.2*(350/661.5)^2)^3.5-1)*(1-6.875*10^-6*25500)^-5.2656+1)^.286-1))'
```

The above look right in the equation writer and when evaluated, result in the answer which others have said is correct: .835724535179

Having what I know is the correct algebraic object, with implied multiplications changed to explicit, the RPL key sequence is pretty straightforward. The sequence also gives the same answer. I've enclosed it within program delimiters below:

```
%%HP: T(3)A(D)F(.);
@ Checksum: CD8Ah
@ Bytes: 172
\<< 5 1 .2 350 661.5 / 2 ^ * + 3.5 ^ 1 - 1 6.875 10 6 NEG ^ * 25500 * - 5.2656 NEG ^ * 1 + .286 ^ 1 - * \v/ \>>
```

Actual evaluation time of either the algebraic object or the program is about a tenth of a second.

Regards,
James

Edited: 5 Oct 2003, 7:37 a.m.

Re: Mach number - RPN vs. Algebraic

*Message #17 Posted by **James M. Prange** on 5 Oct 2003, 8:52 a.m.,*
in response to message #16 by James M. Prange

PS:

Actually, leaving out the redundant spaces in the RPL sequence:

```
5 1 .2 350 661.5/2^*+3.5^1-1 6.875 10 6NEG^*25500*-5.2656NEG^*1+.286^1-*\v/
```

Press either the SPC or ENTER key where a space occurs in the above.

Again, the "^" is entered by the y^x key, "NEG" by the +/- key, and "\v/" represents the square root key. If I count correctly, that's 69 keypresses.

Regards,
James

random tangent

*Message #18 Posted by **hugh** on 5 Oct 2003, 8:22 p.m.,*
in response to message #1 by Valentin Albillo

as a random spin off, i'd like to air some related gripes.

so far, no distinction has been made between aos and formula style entry. i am happy using either rpn or aos. formula calculators are the ones you have to press sqrt then 5, rather than the other way round. some even want brackets round the 5 or else they shout "syntax error" at you. for a long time, i hated them.

more recently, ive been exposed to more and more formula calculators because, pretty much, thats all you get nowdays. scarily, i've begun to get more used to them and, in fact, for certain kinds of problem; like evaluating a big formula, they are easier to work with. for a formula written in front of you, its almost natural to press sin before x as written, possibly because its a no brainer. indeed you have to do this on hp solver models like the 19bii.

my gripes relate to the expression handling abilities and so far, ive seen considerable variation in ability. some are very pedantic. eg "sin 1", "2(3+1)" are syntax errors. personally, i would consider calculators that rejected these as broken and give the whole formula style a bad name. also ones that insist on the final close bracket. it means makers have missed the point about it being a useful tool.

another of my pet hates, is the silly unary minus button on these machines (ie "(-)"). how lame is that. so i have to press 1e-5 using the little minus and not the binary one (or its a syntax error again). same for "2^-3". theres no reason why the expression parser can't use the same "-" sign and get it right. a few things are ambiguous, like "-2^3", but i can handle that.

im still waiting for a model that gets all these right.

Re: Mach number - RPN vs. Algebraic

*Message #19 Posted by **WXYZ** on 5 Oct 2003, 8:45 p.m.,*
in response to message #1 by Valentin Albillo

I pretty much agree with everything. (Except some minor things, but what the hell)

You say that thats a flawed example.... could you give a good one?

Re: Mach number - RPN vs. Algebraic

*Message #20 Posted by **David Brunell** on 5 Oct 2003, 11:49 p.m.,*
in response to message #1 by Valentin Albillo

I keyed Valentin's key sequence into my wife's lowly TI-30, and it spit out the correct answer after about 2 seconds. I also got the correct answer the first time on my TI-59, although I had to save the SQRT operation for last.

I think if this calculation were important to someone, then he would write down the intermediate answers anyway, since keystroke errors are very possible even on an RPN machine.

HP48gx

*Message #1 Posted by **Eric Lundgren** on 5 Oct 2003, 1:55 a.m.*

I've found a store that has 4 hp48GX machines, going for 139 dollars. My question is, as an RPN faithful and 'hp-click' lover, and engineering student, do any of you have recommendation of getting this 48gx instead of the new 49G+?

There's one with a torn box, that they are willing to let go for a 10percent discount. With tax that comes to about 135. My concern is that if I will try to finish school with this, is the difficulty/cost of expansion cards worth it or should I just wait for the G+?

I'm searching for a suitable calc to let my 32sii take a break. btw, I do plan on taking the FE and PE exams in 1.5 years or so.

el

Re: HP48gx

*Message #2 Posted by **James M. Prange** on 5 Oct 2003, 7:19 a.m.,*
in response to message #1 by Eric Lundgren

I don't have a 49g+, but I'll think that it will be like the 49G in many ways. The 49G might be better for mathematics students, and is fun to play with, but for "real work", that is, where I want to get a numeric result quickly with a minimum of fussing around, I prefer the 48SX or 48GX.

Yes, the expansion cards are expensive, but keep in mind that the 48GX comes with 128KBytes built-in, so maybe you don't really need an expansion card. If you do feel a need for an expansion card, see http://uuhome.de/oklotz/index_e.html for what's probably the best prices. The Klotz cards look primitive, but many have reported that they work just fine.

I don't know that the price on that 48GX is especially good, you might want to search online or check eBay and compare prices.

As the 48s and 49s may well be banned on the tests, hang on to your 32SII and don't forget how to use it. Or consider the 33S.

Regards,
James

So far I have three of the Klotz cards, with which I am quite satisfied, and plan to buy at least a couple more. Considering that a "genuine HP" *one* MB card sold for about $189 on eBay recently, the approximately $80 I paid for a Klotz *two* MB card seems quite a bargain.

By the way, the Klotz cards may look "primitive" because they do not have covers and so the circuit board is exposed, but if you examine one you will see that the construction of the board and the soldering of the components looks quite neat and professional. They look every bit as well-made as any of the expansion cards that I've ever bought for my desktop PCs.

Wayne: .....the Klotz cards may look "primitive" because they do not have covers and so the circuit board is exposed, but if you examine one you will see that the construction of the board and the soldering of the components looks quite neat and professional.....

Hi!

I have also one card from Klotz and a 2 MB card from Cynox. I agree to Wayne´s statement, the quality is fine and the soldering is professional done....and the card works quite fine! I wouldn´t say, that they looks primitive but professional done in a simple way.

I do not handle the card outside the 48GX. So for me it doesn´t matter if they don´t have a housing. And as Klotz reports on his web page, he never had problems with electric static.

The price is real unbeatable.

Wayne: .....They look every bit as well-made as any of the expansion cards that I've ever bought for my desktop PCs.....

I would wish all my expension cards would look as good as the Klotz cards :-)

*Message #5 Posted by **James M. Prange** on 7 Oct 2003, 1:46 a.m.,*
in response to message #4 by Thomas Otterbein

Ok, guys. "Primitive" looking in the sense that they lack any case. To those familiar with other cards, this may make them look "unfinished". But on the other hand, I suppose that this makes them appear more "high-tech".

I don't see any great need for the card to have a case while it's inserted in the calculator, but I suppose that while it's out of the calculator, it would be more vulnerable to shorts, contamination, mechanical damage, and conceivably even static discharge.

So I'd consider the lack of a case to be, at worst, a rather minor disadvantage. I certainly didn't

mean to imply that there's anything wrong with the Klotz cards; quite the contrary. By all reports they work fine and I doubt that you could find even a used card at those prices.

Regards,
James

YAEA (Yet Another eBay Auction

*Message #1 Posted by **Daniel Sancho** on 4 Oct 2003, 6:03 p.m.*

Here is another auction in eBay that uses this wonderfull web:

http://cgi.es.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3050932640&category=50577 %0ÙÎxÅ Regards

Daniel

Re: YAEA (Yet Another eBay Auction

*Message #2 Posted by **Raymond Del Tondo** on 4 Oct 2003, 7:53 p.m.,*
in response to message #1 by Daniel Sancho

Yes, the auction description is near to spam. I had to press the PgDn key 13 times to get to the bottom (1152x864 resolution)... A link to some site with docs, like hpcalc.org , or since some weeks to here (MoHPC) would be better.

The seller has many non-working links in his auction description, most of them to other eBay seller sites. What a mess...

Raymond

Thanks Daniel

*Message #3 Posted by **Dave Hicks** on 5 Oct 2003, 3:21 p.m.,*
in response to message #2 by Raymond Del Tondo

I asked him to credit the material and he did. I too wonder whether that much text in an auction is a selling point. Whenever I see that much text clearly pulled from some website, I look it all over for a "(Not selling product described)" type message hidden inside.

New HP Calc

*Message #1 Posted by **Lance Apollonaire** on 3 Oct 2003, 6:41 p.m.*

Are there any new HP Calcs coming out- high end to replace the 48GX or 49.

Ultra High End

Lance

Re: New HP Calc

*Message #2 Posted by **Raymond Del Tondo** on 3 Oct 2003, 8:46 p.m.,*
in response to message #1 by Lance Apollonaire

Theoretically the 49G+ is the replacement for the 49G and 48. Since nearly all of the new calcs (after 1995, that is) have a somewhat unergonomic keyboard layout (aside from their unreliable key response), I'd suggest to get an 48G(X) with the new b/w display.

HP-38G printing

*Message #1 Posted by **Michel Beaulieu** on 3 Oct 2003, 12:22 p.m.*

Hi! I have a HP-38G and i receive a 82240A printer : can i print to this IR printer via the IR link of my HP-38G or the calculator is just for calc to calc transfer?

Thanks Michel

HP-82240A printer

*Message #2 Posted by **Michel Beaulieu** on 3 Oct 2003, 12:33 p.m.,*
in response to message #1 by Michel Beaulieu

There is a possibility of a power supply for this printer; which is the voltage and the polaryty in use?

On wich calculator this printer can be use?

Thanks again

Re: HP-82240A printer

*Message #3 Posted by **Chan Tran** on 3 Oct 2003, 3:53 p.m.,*
in response to message #2 by Michel Beaulieu

I have the 82240B and I bought a walwart power supply from HP and it's designed for the printer. I think it should work with the 82240A. I don't know the model number right now as I am at work and don't have the thing in front of me.

Re: HP-82240A printer

*Message #4 Posted by **James M. Prange** on 4 Oct 2003, 2:11 a.m.,*
in response to message #2 by Michel Beaulieu

For both the 82240A and 82240B, the manuals specify 9-12 V AC or DC; 500-1500 mA. Experimentally, either polarity works fine; I surmise that the external power goes through a bridge rectifier. The manual also says that you should have batteries installed even when using the AC adapter, as the printer may require supplemental battery power during heavy printing; my experience is that it works just fine without batteries, but it's no doubt best not to push your luck on this. The power connector is specified as 5-5.5 mm outside diameter, 2.1 mm inside diameter.

HP made two AC adapters for these printers. The earlier HP 82241A adapter is rated at 9V AC 13.5VA MAX; the later HP F1011A at 12V DC 0.75A. The 82241A uses a fixed input voltage and frequency (120 V 60 Hz for the U.S. option); the F1011A takes an input from 100-240V at 50-60 Hz and is much lighter, but runs warmer. I believe that both are available in various options to fit various styles of outlets.

The 82240A has only the "Roman 8" character set, and works with the 28 series calculators, and I expect a good many others. The 82240B has both the "Roman 8" character set and the "ECMA 94" character set.

The ECMA 94 character set is used in the 48 series calculators, so if you want to print from a 48 series, the 82240B is better. That said, the 48 series provides for character remapping when printing via IR, so the more commonly used characters will still print ok on a 82240A. Of course, the 82240B is also fine for any calculator that prints to the 82240A. I don't know which character set is used in the 38G and so on.

The 48 series calculators, when printing via IR, start out each transmission to the printer (well, except from the CR command) with an escape sequence to switch the 82240B to the ECMA 94 character set. If an 82240A printer is being used, this escape sequence is simply ignored.

Regards,
James

(HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #1 Posted by **NH** on 3 Oct 2003, 4:50 a.m.*

Holy Cow! Am I late to the party? Do you guys already know about this ?????? HP-33S is the planned replacement for the HP-32Sii ????????

http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=363&Sku=HP33S

Ha Ha Ha! Cool! My new-sealed HP-32Sii is going to be going up like Microsoft stock! This latest piece of trash from Carly lights my rocketship to the moon!

Can you believe what an incredibly ugly-fied design they came up with? The insanity of saying that an HP-32Sii user would want to use some ugly piece of trash like that????

Well, after watching, and comparing notes, about these insane, mentally disturbed monsters called "MBA's" it should not surprise me anymore.

I guess a fella can just laugh about it, and them.

What, do they think they are building a cowcatcher for a railroad engine?

I have never seen anything so stupid in my entire life.

Hey, they forgot something..... the digits in the display should be all made to look like it is melting, you know, wavy and tilted, big digits towards the right side, littler digits towards the left side..... everything crooked. Whoops! I just gave away the secret to the "next" model they will release in another 6 months. Damn those MBA's are brilliant.

:o|

*Message #5 Posted by **Ed Look** on 3 Oct 2003, 4:39 p.m.,*
in response to message #4 by Charles L

Gentlemen, I won't disagree with your aesthetic assessments. I'm more worried that if I actually have to do some serious crunching on this keypad, am I going to be able to find stuff on it? And, weren't we all taught to visualize for the most part on a Cartesian-style orthogonal grid? How are going to remember where the buttons are for speedy usage, like we all used to on the HP RPNs we grew up with?? (When I use a 32SII or 48G is still silently form the 34C keystroke sequences with my mouth; for example, say, even though on the 48G, SQRT x is purple shift key-SQRT x, I'm still thinking, "g-SQRT" [blue "g" shift key- 3], or on my 32SII, the linear regression button is blue shift key-LN, I'm still thinking, "h-L.R." [black "h" shift key-6]!)

BIll

orthogonal grids are out!!!

*Message #7 Posted by **Carly** on 3 Oct 2003, 8:01 p.m.,*
in response to message #5 by Ed Look

How dare you talk about orthogonal grids for the keyboard !!

There are no more orthogonal grids !!! From now on, whatever I say, GOES! Period! You will bow down and worship me, and you will buy my worthless trash and give me all your money!!

We are also going into printing and we have a new line of paper products featuring lines of random pitch, so that no two lines are the same. Also, graph paper where all the lines are crooked and wavy and unevenly spaced. How dare you disagree whether we should do that??

We are the MBA's and the marketeers. Whatever we say, goes. If we kill a few shuttle astronauts along the way, that's good then we get pay raises. For we run the almighty bureacracy, and we have all the money, and you have none, so you will not question my decision making again !

- Carly !

*Message #9 Posted by **Charles L** on 3 Oct 2003, 2:42 p.m.,*
in response to message #1 by NH

uh-oh, someone has a HP32sii that is new-sealed...that means it isn't being used, and thus being forced to fail in its primary mode of function, just kidding :)

I've been using my 32sii day in and out for over 1 year now, and I'm glad I found it in the discard bin at a Fry's. If it had been unopened, I might have been tempted to preserve it too. Its great to see classmates smirk at my 'old' calculator as they pull out their shiny ti89s before a test, then half way thru they look up in surprise as I'm handing my test and heading for an early friday afternoon of beach strolling.

Yes, you are right though, aesthetically, the 33s is a bit offensive. I wish only that the keys could have been in line. I'll get one though, and I will be patient and see how it performs....*dreaming* maybe they just used a really poor camera to take the pictures, jk ;)

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #18 Posted by **James M. Prange** on 4 Oct 2003, 2:29 a.m.,*
in response to message #1 by NH

My theory is that the drawing for the keyboard got stretched out somehow, and whoever made the molds figured "Well, if that's what they want..."

It looks to me as if the keys are about to leak out of the bottom of the calculator.

But who knows; maybe the kiddies will think that it "looks cool".

But maybe it's supposed to be "ergonomic"? Like those wierd-looking keyboards for PCs, "Wave" or something like that.

I think I'll hold off on buying this one. It looks to me as if it would be very un-ergonomic.

Regards,
James

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #19 Posted by **Naim** on 4 Oct 2003, 5:56 a.m.,*
in response to message #18 by James M. Prange

A lot of people are bashing the 33S, but how much of us will be buying one when it is released? I am dis-satisfied with it's design, primarly because of it's looks. But I will definitely be buying one. And I am sure that most of you all who are bashing it would eventually if not as soon as it is released purchase one.

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #20 Posted by **Wayne Brown** on 4 Oct 2003, 9:20 a.m.,*
in response to message #19 by Naim

I will not ***ever*** buy a 33S. If all my other calculators break and the 33S is the only thing available, I will use my slide rules and give up calculators altogether. But I will ***not*** support such a mostrosity as the 33S in any way.

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #21 Posted by **James M. Prange** on 4 Oct 2003, 9:54 a.m.,*
in response to message #19 by Naim

Well, I suppose that it might turn out to be an ok calculator in spite of the wierd cosmetics.

But I don't feel any great need for such a calculator even if it did have a more conventional appearance. What advantage does it offer me over the 48s and 49s? To be sure, it is smaller, but still seems a bit much for a shirt pocket. No thanks.

Regards,
James

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #22 Posted by **CME750** on 4 Oct 2003, 12:34 p.m.,*
in response to message #21 by James M. Prange

I (and probably many others) will be buying a 33S for one reason alone: it appears to be the best calculator (from any manufacturer) that is explicitly approved by NCEES for use on the professional engineering and land surveying examinations.

I would much rather use my 48GX, but it has been banned.

HP33S (Was a ridiculously long subject line)

*Message #23 Posted by **John Cadick** on 4 Oct 2003, 10:57 a.m.,*
in response to message #19 by Naim

Let me see if I have a grasp of the cogent facts in this thread:

(In no particular order)

1. Some (many?) consider the HP33S to be ugly. 2. Some (many?) blame the design of the 33S and the decline of the HP Calculators on Carly and/or on anyone who works for HP that has an MBA. 3. Some believe that the downhill slide in all calculators started when the LEDs were removed from the display. 4. The HP33S is apparently intended to be a replacement for the HP32SII with 32kB of memory instead of 256B.

My thoughts on these four issues:

1. HP had a non-working model of the 33S at HPCC2003. They expressed concern over the negative comments that they had been receiving and asked us all to look at the 33S and comment. Several objected to its appearance. Several were OK with the appearance. No consensus was reached and no "vote" was taken; however, many seemed to feel that actually having the model in hand resolved some

of the issues. Personally, I have liked the design from the beginning. I also like the design of the older calculators, but I know that any company that stands still - dies. One final comment - if you don't like it, say so. However, this persistent loud bashing accomplishes nothing.

2. At the end of the day, HP must make a profit. Whether we agree with the way they choose to do it or not is irrelevant. In any event, arbitrarily trashing a human being on the basis of having an MBA is silly. All that said, the technical personnel design the products, not the MBAs or Carly.

3. Classic Thunderbird (classic success) and Edsel (classic failure) collectors I am sure believe that all would right in the world if only all cars were modeled after these classics. There is a huge collector's market for them and they sell for many times their original price. This does not mean that reintroducing them would result in an enormously successful resurgence of their commercial sales. Avid interest from a group of (at most) a few hundred die-hard collectors does not make a market.

4. Instead of whining about the design, praise the fact that HP realizes the need for a good, scientific, RPN calculator. If it doesn't sell well, they'll change it to something else.

I don't mean any of this personally; however, I have been dismayed by the amount of negativism displayed on this and other issues.

John

(12345 to delete)

Hey John,

*Message #24 Posted by **Norm** on 4 Oct 2003, 1:42 p.m.,*
in response to message #23 by John Cadick

Hey John, I wonder why the MBA marketeers don't make a dumb stupid "cowcatcher" keyboard for their business-model calculator ? (HP-12C)

I wonder why its OK to "stand still" with the calculator for business, but engineering calculators shall be discontinued?

I wonder why for the business people, they get to keep using the classic from 15 years ago, with a standard keyboard that does NOT look like a hood ornament on a Buick, but for the engineers, we get to use the cowcatcher?

I think our negativisim is more than justified, not only that, it's fun!!!!!! Jump on in, the water is fine!

And the sky is blue for those with HP-32S or 32Sii..... c'mon baby.... $500 a calculator..... USED in good condition!

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #25 Posted by **Ed Look** on 4 Oct 2003, 11:35 a.m.,*
in response to message #19 by Naim

Naim and John, to tell you the truth, I did not hear about any poll from HP over their calculator cosmetics. Also, when I first saw an image, about a month or so ago, I was given pause! It did not really look like a calculator at first glance. However, I do realize that gadgets for the younger set do seem to be designed to have a similar appearance. I suppose there could be worse faceplate designs.

My major real complaint (ugliness really isn't one) with the keyboard layout is that it might be harder to memorize, as that really makes for most efficient usage of the calculator.

I would actually buy a 33S as soon as it came out if I had more "disposable income". One reason for this despite its looks is the "HP" logo: I'm crossing my fingers and hoping that it works and lasts like all other HP calculators I've had.

If my 32SII bit the dust, then I would seriously consider going out and getting one... this is on top of the fact that I already set to buy a HP-49G+.

After having said this, I just might wind up buying a HP-33S in a few months to year or so, as in the words of other posters, "to take the load off my HP-32SII".

I definitely will not be buying a 33S. The ENTER key is in completely the wrong place and the calculator with its sTRaNgE keyboard looks wierd. I'd be embarrassed to be seen by my colleagues using one. Besides I'm very happy with my 32Sii -- by contrast it looks serious, professional and has ENTER where I expect it to be.

Re: (HP-32Sii) and HP-33S, the latest calculator from Carly (for the mentally retarded)

*Message #27 Posted by **Ed Look** on 4 Oct 2003, 1:35 p.m.,*
in response to message #26 by Graham Wilson

Yeah, it looks like it's designed for the JHS/HS/college crowd. In some ways I still wish I was one of them, but then I'd have missed out on the 34C and 32SII!

HP-33S is $59.99 ??????

*Message #28 Posted by **NH** on 4 Oct 2003, 3:47 p.m.,*
in response to message #27 by Ed Look

MBA's are so brilliant.

First they mandate an HP-33S calculator that looks like trash.

Then they know its so stupid and ugly looking that nobody
will want to buy it.

So how much do they charge for it?? $59.99 suggested price?

In a desperate fit to encourage a few suckers buy it...
sell it for next to nothing.....
to the ones who toss it in a drawer without trying to use it...

Meanwhile they could be getting $130 per unit if they would
merely sell an HP-32S or a HP-32Sii, and they don't
even have to pay anybody to design & tool anything.

Brilliant! Simply brilliant. Those brilliant MBA's
and their marketeering and management brethren.
Time to buy a Dilbert cartoon book..... "
Please dont step in the management".

Again, with the attacks on those of us with MBAs?

*Message #29 Posted by **Gene** on 4 Oct 2003, 5:06 p.m.,*
in response to message #28 by NH

Give it a rest and take it elsewhere. You are exposing your ignorance in public, which is an unwise thing to do.

I guess it's ok to attack MBAs out here. I can always haul out the engineering jokes, but then I have more respect for others than some do here.

Perhaps if you understood profit and loss, you might be able to better communicate.

Gene

P.S. To those who are not as obnoxious...I too wonder why the wild/weird keyboard...but I have it on good authority that once people hold this 33S in their hands, they like it. If you don't, great...go buy a $500 HP-32SII somewhere.

How do you loose an argument with an idiot?

*Message #30 Posted by **Randy** on 4 Oct 2003, 5:18 p.m.,*
in response to message #29 by Gene

You argue with him.

Thank you Gene. Well said.

Re: Again, with the attacks on those of us with MBAs?

in response to message #29 by Gene

Hi Gene,

You know, I know some MBA's--some are cousins, some are friends, others are acquaintences, and the fact is that I do not find a discernable stereotype (except maybe more drive for getting ahead:-) One MBA in my in crowd is very much of a scientist--he runs a small value investment company, which he founded after leaving a big Institutional which he found was going the wrong way. He loves digging into the nuts and bolts of a comnpany--researching it in detail--and then developing a value. He likes this so much, that he has not been doing enough marketing. So, he hired someone else (who is not an MBA but a sharp guy) to do the marketing. In other words, an MBA (in this case Wharton) is merely a tool in the box--he learned some tricks for analysis there, got his foot in the door etc.

Another friend is a Princeton Mech Engineer, who after 4 years in the paper and pulp business, then 4 years in the industrial controls business, went back to school (Kellogg) and earned an MBA. He now works for a major pharmaceutical---teaching hospitals and doctor's groups how the vaccines they are offering work. And he is climbing the ladder.

The point is, MBA does not automatically equate with SLEEZE. There is SLEEZE everywhere and it has NOTHING to do directly with business school. It may have much more to do with, well, the evolution (devolution) of American culture.....

regards,

Bill

That sounds OK Bill Platt,

*Message #32 Posted by **Norm** on 7 Oct 2003, 1:34 a.m.,*
in response to message #31 by bill platt

That sounds OK Bill Platt,
I will reflect upon your words.

Of course you must realize life is so much simpler
if all problems can be blamed onto one category of person :o|

BTW "Sleaze" is spelled "sleaze" not "sleeze".

http://www.dictionary.com

Also "sleazy", "sleaze-ball", "sleaze-bag".

I stand corrected

Sleaze sleeze sleezy cheezy cheazy wheezy pass the greasy greezy freedon fries pleeze freezing popsicles eating bleating sheep

Where am I going? I don't know; go ask your Seuss!

Re: HP-33S is $59.99 ??????

*Message #34 Posted by **CME750** on 4 Oct 2003, 5:29 p.m.,*
in response to message #28 by NH

There are some odd things about the 33S, but its retail price is not one of them.

The 33S replaces the 32SII, which also retailed for about $60. Do a search on Google, and you can still find old advertisements listing the 32SII at that price (don't expect to find any in stock, though).

The cost of the 32SII soared after it was discontinued. It may come down somewhat after the 33S becomes available.

MBA's, hear this: I AM STUNNED

*Message #35 Posted by **Norm** on 5 Oct 2003, 1:41 a.m.,*
in response to message #34 by CME750

MBA's hear this: I AM STUNNED that there are actually a number of MBA types on this chat board who actually defend the stupidity of the HP-33S.

MBA's whom actually think it is reasonable that HP has destroyed their classics such as 41C, and expect technical people to instead use a calculator with keys shaped like a cowcatcher. Who say "its not so bad if you try it".

MBA's, dear friends, if you just read what I said, I rest my case. You are the only ones dumb enough to buy what you advocate. The people intelligent enough to be engineers prefer rectangular coordinates. Perhaps an MBA does not know what those are.

what's next, a keyboard based on polar coordinates? Make the keyboard look like a big round circle ???

Why not make the calculator completely spherical, so that the keys are on all sides of of a big round ball ????

I bet when you actually get it into your hands, it will "not be so bad".

Sheeeshhhhhhh! the lunacy of you business people. Why don't you go buy a Dilbert book, to see what engineers think of you ! No, people actually working with technical realities won't be buying your stupid HP-33S , and its proof that business people have sunk far lower into the gutter than even the most cynical engineers might have imagined !!!!!

Re: MBA's, hear this: I AM STUNNED

*Message #36 Posted by **Eric Lundgren** on 5 Oct 2003, 2:07 a.m.,*
in response to message #35 by Norm

Hey, yeah...I know. If worse comes to worse, we could buy a batch and retro fit them into our own "weird" rectangular layout keybd cases. Just wondering, does the "s" in 33s stand for 'slanted'?

Or maybe we could create an 'overlay' like the ooooold hp's had, and it would be rectangular. That would be the 33R. :)

el

Re: MBA's, hear this: I AM STUNNED

*Message #37 Posted by **Ed Look** on 5 Oct 2003, 2:32 a.m.,*
in response to message #36 by Eric Lundgren

Yeah, but to create such an overlay, you'll have to use the calculator first to solve some transform equations, I imagine, to map the chevron shaped grid onto an orthogonal one. So, I guess, one might as well get used to it's weird layout. ;)

As one who started off with a TI SR-40, my second calculator, which was the HP-34C, needed some getting used to (algebraic to RPN, addressing storage registers, shift keys, etc.). Then, when the formerly trusty ol' 34C started to get a little dotty, I tried to replace it with the HP-48G. The general keyboard layout was very similar, but still wasn't exactly the same and required some getting used to. This was displaced by a HP-32SII (as at the time, I needed more of the 32SII's features than the 48G's). Yet again, I had to adapt to another calculator keyboard, as all the functions and labels, etc., were again in different places from that of the other two.

Admittedly, these were all HP RPN models, but so is the HP-33C. Hopefully, this will give it an underlying similarity to its predecessors so that sloped positions of the keys will be merely the slightest of annoyances. Again, as I said in another post, just being ugly is not really a problem. Compared to the Spices, I think all other calcs just don't look so cool. Functionality over form. In fact, in this very museum site, I think we can all find a calculator or two that may be "beautiful", but may not be much of a joy to use.

Re: MBA's, hear this: I AM STUNNED

*Message #38 Posted by **Eric Lundgren** on 5 Oct 2003, 2:54 a.m.,*
in response to message #37 by Ed Look

Hey Ed,

Ive seen alot of this SPICE on here, what exactly is SPICE? Is there any relation to the spice expansion boards for the 48gx?

eric

Re: MBA's, hear this: I AM STUNNED

*Message #39 Posted by **Graham Wilson** on 5 Oct 2003, 3:09 a.m.,*
in response to message #38 by Eric Lundgren

Eric - "Spice" was the code name given to the HP-33E, 33C, 34C, 38E and 38C calculators of the late 70s and early 80s.

See http://www.hpmuseum.org/3qs/34c3q.jpg for a good example of the aesthetics of the Spice machines that Norm and others have written about.

Re: MBA's, hear this: I AM STUNNED

*Message #40 Posted by **Wayne Brown** on 5 Oct 2003, 11:37 a.m.,*
in response to message #35 by Norm

Norm,

I think it's a bit unfair to use MBA as a derogatory label. While there are, I'll agree, many idiots who become MBAs, there also are many MBAs who are not idiots. The degree someone earns is not a reliable indicator either of intelligence or character. (Personally, I can't imagine anyone being interested enough in business to want to major in it -- I successfully avoided taking any business or accounting classes in high school, college or grad school; I didn't even take high school typing class!). But I know a number of business types who are intelligent, pleasant and reasonable people.

Having said that, I agree with you about how horrible HP's recent calculators (especially the 33s) have turned out to be. I prefer the 41C over the 34C, and unlike you I actually *like* the 48GX (which IMO is the last acceptable HP machine to be made), but otherwise we are in agreement about HP products. I also agree with your low opinion of current HP management, and because of their treatment of Walter Hewlett, I would like to see Carly and the whole board not only unemployed but reduced to poverty and jailed, if possible; but I don't think we can blame it on them being MBAs (if indeed they are). I really don't think engineering degrees would have

saved those people from being scum.

I also share your frustration with those who are willing to settle with HP's current offerings. It's a bit like the case of a former co-worker of mine who was chronically late. His boss finally told him he had one more chance. If he was late again for *any reason* -- it didn't matter if his car broke down, or the roads were closed, or he had to go to the hospital, or whatever -- he would be fired immediately, no questions asked and no appeal. He had already used up all his excuses and second chances, and *no* further excuse would be acceptable. That's the way I feel about HP. They've had *years* to get it right -- and have proven on many occasions that they *can* get it right -- and they have screwed up now so often and for so long that I no longer give them the benefit of the doubt about anything. Either they get *every* detail *exactly* right, or it's completely unacceptable to me. If that seems unfair, well, they shouldn't have squandered their good name on the extremely bad decisions they've made in recent years (and I'm *not* talking just about their calculators).

Second Guessing

*Message #41 Posted by **Patrick** on 5 Oct 2003, 1:37 p.m.,*
in response to message #40 by Wayne Brown

I sure would like to return to the days of old, when HP calculators were solid, understandable, and well documented. I'm sitting on the fence in regards to the 33S. I'd like to hold one in my hand before I make statements I might regret. It sure does look ugly in pictures, though.

I am also a Palm enthusiast and I remember not long ago the discussions that went on in those forums when Palm introduced its low-end Zire model at $99. This thing had only 2MB of memory, no colour, no backlight, and only a couple of the standard application launcher buttons on the front. In a place where people were looking for MP3 and video playback, built-in cameras and WiFi, it did not impress. Of course, by all accounts, Palm went on to sell a bazillion of them, with the Zire becoming the most popular handheld of all time.

Those "dumb" MBA's sure got lucky, eh?

Wayne.... Calc's need to be Agilent

*Message #42 Posted by **Norm** on 5 Oct 2003, 3:16 p.m.,*
in response to message #40 by Wayne Brown

Hi Wayne, I agree. I like your style.

One other pointer..... calculators need to be over at "Agilent". Agilent took all the scientific instruments and HP went on to build personal computers (wow).

AGILENT is why we still have microwave spectrum analyzers, impedance analyzers, and other sophisticated tools in production. The "Carly" types would've simply said 'derr wuts all this' and discontinued it.

AGILENT should have the calculator products also. THIS is the essential heart of our problem. I have often suggested we need a PETITION to move calculators over to Agilent..... but nobody has bit on that idea yet. Considering the "Chevron" HP-33S, moving calculators to Agilent is, obviously, our only hope!

Re: Wayne.... Calc's need to be Agilent

*Message #43 Posted by **Wayne Brown** on 5 Oct 2003, 6:16 p.m.,*
in response to message #42 by Norm

I absolutely agree; Agilent is now the "real HP" as far as I'm concerned.

A few months ago I read something the head of Agilent said. He was explaining an unpleasant decision he had to make -- I believe it involved layoffs -- and he said something like, "I always ask myself, what would Bill and Dave do in this situation?". *That's* the kind of person that ought to be running HP.

Wayne..... about that head of Agilent

*Message #44 Posted by **Norm** on 5 Oct 2003, 6:56 p.m.,*
in response to message #43 by Wayne Brown

Hi Wayne,

you mentioned the head of Agilent asked "what would Mr. Hewlett and Mr. Packard do" about a problem.....

Got the name of that executive? I am ready to write him about this festering problem of 'no calculators for the engineers'...

Re: Wayne..... about that head of Agilent

*Message #45 Posted by **Wayne Brown** on 6 Oct 2003, 12:14 p.m.,*
in response to message #44 by Norm

Norm,

You can find the article (from April 2002) to which I referred here:

http://groups.google.com/groups?selm=a9ntpn0reu%40enews3.newsguy.com

Here is a relevant excerpt from it (there's much more at the link I gave above):

"Agilent is run by three people, one of whom is alive. At the earthly level, there's CEO Ned Barnholt. Barnholt, a 35-year veteran of HP, sports big gold-framed glasses that droop slightly at the sides. He wears his gray hair in a comb-over. He is completely without pretense. When Barnholt, 58, chats with employees--something he does frequently enough that in the past six months he's given speeches to and taken questions from some 20,000 workers--they call him Ned; calling him "Mr. Barnholt" elicits giggles from employees. But while Barnholt manages the company, he seems to consider himself only a caretaker for HP founders Dave Packard and Bill Hewlett. All big decisions are vetted with the question, What would Dave and Bill do?

"Indeed, the entire company functions on the premise that it is the real heir of Packard and Hewlett. When HP's house archivist had to choose between staying at HP or going with Barnholt, she went with

Agilent. The company's Palo Alto headquarters is home to Hewlett and Packard's original 200A Audio Oscillator, which launched HP, and its labs still churn out testing and measurement devices. But even more, Agilent considers itself the true keeper of the HP Way--the management objectives devised by Hewlett and Packard that spelled out how to treat customers, shareholders, and most of all employees. The Way's key precept is that workers will give their best if they're treated honestly and listened to. In his 1995 book The HP Way, Packard asserted that making people feel that they are working toward a common purpose or solving a common problem creates "participatory management." To get there, all managers had to keep to a strict open-door policy and practice MBWA--management by walking around."

Re: HP-33S is $59.99 ??????

*Message #46 Posted by **Eric Lundgren** on 5 Oct 2003, 2:01 a.m.,*
in response to message #34 by CME750

Yes, the 32sii is hard to find without an ebay fight. The looks of the 33s kbd layout seem to be the biggest fear of mine.

I still don`t know what the memory will be, but Ive gotten pretty used to the 364 of the 32sii. There are two aspects to the success of the 33s in my op.: assuming the calculator functions well, (click?) those taking PE exams might need a non graphing/infrared/usb..yadda... machine. For them the 33s may be a savior. But the old school of big enter keys and thoughtfully laid out kbds may twitch at the sight. I am one of the old school, but I will be giving it a chance, if it has potential, I'll add it to my seedling collection. Best of luck! el

HP-12C and HP-12CP RETROFIT service for MBA

*Message #47 Posted by **Norm** on 5 Oct 2003, 3:26 p.m.,*
in response to message #46 by Eric Lundgren

This has been a fun thread. I may have been too harsh on "marketeer mafia MBA enron business" types of people, but it was just due to shock of seeing the HP-33S in a photo:

http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=363&Sku=HP33S

To offer apologies and "bury the hatchet", as an electrical engineer, I now offer "retrofit services" for any marketeer, MBA, or businessman with an HP-12C or an HP-12CP. That's the prized 'classic' business calculator that has the obsolete orthogonal keyboard (yet was kept in production so that you can do your business calculations).

What you do is mail me your HP-12C or HP-12CP. I will carefuly retrofit your calculator to be just like the HP-33S.

I will carefully clamp your business HP-12C into my bench vise, and then I will bend the keyboard using a couple of pliers, until it has the SAME angle as the HP-33S (about 30 degrees) so that you business people can enjoy the same angle'd keyboard that you present to the engineers.

I will do this retrofit at no charge, and even pay return postage, just to show I am on your side about the new keyboard angle.

:o) I am serious. Start sending HP-12C and I will return them as promised, postage pre-paid, retrofitted to HP-33S style. Since you business types were just now very serious that you "like" the HP-33S, I expect some takers on my retrofit offer.

Re: HP-12C and HP-12CP RETROFIT service for MBA

*Message #48 Posted by **Luca** on 6 Oct 2003, 3:42 a.m.,*
in response to message #47 by Norm

Hi Norm,

I have again to disagree with you, but in a constructive way.

I am (unfortunately) a business type, but without MBA (I preferred to use my time for serious things like women, beer and work..) and I use my HP-12C and HP-41C daily.

I don't want my old calculators to be customized, but I suggest some features to be added to the 33S (besides cell phone and MP3 player, as you know):

1) Vibracall - it has several uses, including some for Carly ! 2) GPS 3) Pac-Man and Asteroids 4) Built-in Hitchhikers' Galactic Guide 5) Coffee machine 6) Another (spare) equal key instead of the old-fashioned ENTER key 7) DON'T PANIC ! key 8) Self-destruction key 9) Calculator-shaped condom

This will certainly increase the sales and I will (perhaps) buy one !

Best regards,

Luca (Switzerland)

Luis Viera where are you?

*Message #1 Posted by **Charles L** on 2 Oct 2003, 6:44 p.m.*

Hi Luis,

I think a few months back you countered me with a shorter 32sii program for computing the cross product of two vectors. My original was VERY long and actually stored the results as variables (!!) hahaa. Well, I was fooling around and I realized a shorter, albeit harder for the user to input code would be:

LBL V INP A INP E X INP D INP B X - INP C RCL XD INP F RCL XA - RCL B RCL XF RCL E RCL XC - RTN

When executing, it prompts you for the components out of order, so you'd have to adhere to <A,B,C>x<D,E,F>. It's 17.4% on memory though (28.5 vs. 34.5) :)

Please, before tearing me apart, know that I am extremely amateur at programming, but it is very fun :) cl

I "heard" my name...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 3 Oct 2003, 1:02 a.m.,*
in response to message #1 by Charles L

Hello, Charles;

Thank you for asking; I'm "about" here...

I'm absolutely running out of time, I'm teaching more classes than I thought I'd be required to, and time is "slicking through my fingers..." I'm finding a way to handle it so far.

About your program:

```
V01 LBL V
V02 INP A
V03 INP E
V04 ×
V05 INP D
V06 INP B
V07 ×
V08 -
V09 INP C
V10 RCL ×D
V11 INP F
V12 RCL ×A
V13 -
V14 RCL B
V15 RCL ×F
V16 RCL E
V17 RCL ×C
V18 -
V19 RTN
```

I remember reading, but I am almost sure someone else wrote a shorter version for the HP32SII. I remember that many complex routines were suggested for a complex [ENTER], but I do not recall showing a shorter

cross-product solution. In any way, yours is a clever way to reduce memory requirements. I'd try a program where A, B and C are entered in sequence (A [ENTER] B [ENTER] C) prior to execute it; right after storing them, the program would stop again so you'd enter C, D and E the same way you entered A, B and C. Maybe this program would not use registers C, D and E, but it would be bigger in order to handle all data in a different way. Something like:

```
V01 LBL V
V02 STO C
V03 Rv (roll-down)
V04 STO B
V05 x<>y
V06 STO A
V07 STOP
V08 ...
```

It's easy to see it's gonna need more memory than yours. Also, as it would be necessary to press [ENTER] between entries, you'll just use [R/S] as well. As I mentioned, yours is a clever solution, I think. And if this program is, as you call it, an amateur's version, I wonder what will you be doing soon with your 32SII! "Keep on doing the good job", I'd say!

Thank you for your remind, but I am almost sure the shorter program from your first version was another contributor's contribution.

Best regards. (it's 2:00 A.M in Brazil right now... See yah later |^0 zzz...)

Luiz (Brazil)

Hey luiz I was wondering where you were. Glad everything is OK.

Re: I "heard" my name...

*Message #4 Posted by **Charles L** on 3 Oct 2003, 2:50 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Great to see you on here again :)

Yes, your idea of calling the stack for the first 3 components had struck me shortly after I submitted my pgrm to the museum. That has my attention now, and I'm also thinking of merging two or three 'vector' type computation programs into one to reduce the need for repetitive memory wasted on 'input A...B..C'. It really is fun to try to squeeze a few extra bytes here and there :)

Good luck with the classes!

No RPN calcs. anymore??

*Message #1 Posted by **Arun** on 2 Oct 2003, 5:26 p.m.*

Hard to believe but does HP not make RPN scientific calculators anymore? I have a 15C, bought in 1984, and a 48G, bought in 2000. I'd love to get my hands on a 42S or 32SII, or equivalent, but they're priced so exorbitantly on sites like Ebay, etc.

I wonder if HP realized what they're missing by ending production of RPN scientific calculators.

Comments??

Re: Several are on the way . . .

*Message #2 Posted by **Paul Brogger** on 2 Oct 2003, 5:54 p.m.,*
in response to message #1 by Arun

It may be that the HP-12C/CP is the only pure RPN line left.

But H-P is going to make several new models which are optionally (user-selectable) RPN or AOS.

See The Samson Cables Catalog for more info . . .

I like RPN but...

*Message #3 Posted by **Mike** on 2 Oct 2003, 10:13 p.m.,*
in response to message #1 by Arun

I like RPN just as well as others but I don't understand the big deal with RPN vs Algebraic. Neither is really any better (really) than the other. It's simply personal preference.

Being that, the world is comprised of mostly algebraic people. From a business sense, it makes sense to drop the RPN. It is a much smaller market and really offers nothing that can't be done by the algebraic calculators.

It's like FORTH. Many like it but it's a tiny part of the computer segment.

Re: I like RPN but...

*Message #4 Posted by **tmstock** on 3 Oct 2003, 2:38 a.m.,*
in response to message #3 by Mike

I think algebraic mode makes great sense for music majors and Fortran programmers - they are well used to the extra punctuation necessary.

My dad also mentioned that there were bunches of guys at Cornell in the 50's that got along well with those cheapie printed metal slide rules instead of decent Versalogs and Decilons, etc.

I guess it's a matter of taste after all.

Fewer keystrokes for a given problem. Wasn't that _one_ of the reasons HP decided to use RPN?

delete: 12345

Re: I like RPN but...

*Message #6 Posted by **Ron Ross** on 3 Oct 2003, 11:30 a.m.,*
in response to message #5 by Chris(FLA)

While that is Hp's advertised reason, the real reason was functions and features vs. adding AOS and giving up functions. The earlier machines (ie Hp35) had very limited memory to add features. RPN made the user keep track of operations, which made for fewer keystrokes as a bonus. This bonus of fewer keystrokes sounds better than, "We don't make algebraics because we can't offer Algebraic input and trig in the same pocket calculator (this applied to the Hp35)." That the Hp35 was so popular and RPN was so good kept RPN as the preferred OS for Hp calcs for the next two decades.

Re: I like RPN but...

*Message #7 Posted by **r. d. bärtschiger.** on 3 Oct 2003, 7:06 p.m.,*
in response to message #3 by Mike

In addition to numerous HP calculators, I also have a few other brands. Whenever I buy another type of calculator I always use the following equation, from page 106 of the HP-67 Owner's Handbook, to test the useability of the new calculator. Using an HP calculator usually takes about 45 seconds to get the correct answer. Using an algebraic calculator usually takes much longer, twenty minutes or more, if it in fact can solve the problem at all. This equation calculates the Mach number given pressure altitude and calibrated air speed. All the variables have been substituted into the equation, you need only calculate the answer.

M= sq. root of [5 [({[(1 + 0.2 [350/661.5]^2)^3.5 -1]

[1- (6.875^10-6) 25500]^-5.2656 } +1)^0.286 -1]]

Even trying to enter this equation into an HP-48GX or 49G+ equation writer is a difficult task.

If you really want to see how much easier RPN is, try to calculate the answer to this problem using an algebraic calculator. Post your answer and an honest estimation of how long it took you and I will then post the correct answer as given in the 67 handbook. I think you will agree the HP is easier.

rdb.

Re: I like RPN but...

*Message #8 Posted by **Ed Look... unless I messed it up** on 3 Oct 2003, 7:53 p.m.,*
in response to message #7 by r. d. bärtschiger.

I used the HP-48G strictly with RPN entry and I got 8.35049933621x10^-13 as the answer, though in about 2 and a half minutes, glancing at the 48G's clock display in the upper right hand corner.

As a note, I first tried my HP-32SII and it didn't work, as I got an "Invalid y^x error". Then I went to my favorite, though somewhat intermittent HP-34C, and got an "Error 0". I broke down and reached for the 48G.

After looking at R. D. Baertschiger's convoluted Mach equation, I WASN'T going to even try with the algebraic HP-20S (and definitely not with the Radio Shack algebraic scientific (cat. no. 65-1081) (double for the Sentry scientific).

Re: I like RPN but...

*Message #9 Posted by **r. d. bärtschiger.** on 3 Oct 2003, 8:05 p.m.,*
in response to message #8 by Ed Look... unless I messed it up

Sorry you thought the equation was convoluted. I tried to copy it as shown in the 67 handbook. The two lines should of course be all on one line. The square root is taken of the entire rest of the equation. As I said, just entering it into the message was a chore. As to your answer... Sorry, wrong answer. Please try again.

rdb.

Re: I like RPN but...

*Message #10 Posted by **Ed Look** on 4 Oct 2003, 11:49 a.m.,*
in response to message #9 by r. d. bärtschiger.

Mr. Baertschiger, this time I got 0.835724535179 (to include all the digits) again using the HP-48G, but it took one minute and a half, using Mr. Hardman's display of the equation.

Please allow me to point out that on your posting, you specified 6.875^10-6, which I did not understand properly (and I apologize!) when I expected 6.875x10^(-6).

Re: I like RPN but...

*Message #11 Posted by **r. d. bärtschiger.** on 4 Oct 2003, 12:24 p.m.,*
in response to message #10 by Ed Look

Yes! You are correct. I just realized this mistake myself a few minutes ago. I was about to post a correction. I guess it is a little late now for that. I think you will agree however, that rpn is much easier than any other method.

rdb.

Re: I like RPN but...

*Message #12 Posted by **Ed Look** on 4 Oct 2003, 2:31 p.m.,*
in response to message #11 by r. d. bärtschiger.

Hee hee hee... you are preaching to the converted! After my first taste of RPN, I was hooked. It was the 34C, by the way.

And since now I have the correct Mach equation, I'll try it again on the 34C (if I can get all the LEDs to light up) and on the 32SII. If you are interested, I'll let you know how I

did.

in response to message #13 by el

No. Check one of Mark Hardman's posts in the thread; he has a corrected version of the way the equation is laid out. I strongly suspect you may have calculated using an incorrect version of it.

Re: I like RPN but...

*Message #15 Posted by **r. d. bärtschiger.** on 3 Oct 2003, 8:37 p.m.,*
in response to message #8 by Ed Look... unless I messed it up

I just re-read your answer, remember we are looking for a mach number for an airplane in flight. Therefore the answer will be between ca. .25 & 1.

I have entered this equation into a word document where it looks as it should. However I have not been able to figure out how to paste the equation by itself into a message here on the museum.

*Message #18 Posted by **Mark Hardman** on 3 Oct 2003, 9:34 p.m.,*
in response to message #17 by r. d. bärtschiger.

Nothing magical. I cut the image straight out of the HP-67 manual on the MoHPC DVD, saved it as a .gif and uploaded it to my web site.

By the way, I was able to crank through this in 10'13" using the low end HP-20S. I ran out of paren () levels well before the inner-most 350/661.5 term. I had to start over and use a storage register.

The answer is 0.8357.

It took me 2'43" to get the same result on a HP-41CX.

Re: I like RPN but... not rpn (71b version)

*Message #23 Posted by **Terry Ingram** on 4 Oct 2003, 1:10 a.m.,*
in response to message #22 by r. d. bärtschiger.

The same equation keyed into a 71b...

SQR(5*((((1+.2*(350/661.5)^2)^3.5-1)*(1-(6.875E-6)*25500)^(-5.2656)+1)^.286-1))

I'm a fan of RPN also.

Terry

Re: I like RPN but... any 48gx equation writer examples

*Message #24 Posted by **Terry Ingram** on 4 Oct 2003, 12:54 p.m.,*
in response to message #23 by Terry Ingram

Can a 48gx user please post a step-by-step procedure for solving the Mach problem posted by Mark Hardman, usign the equation writer of the 48gx?

I have a 48gx, but have only learned how to use the basic rpn operations. This would be a big help to see side-by-side examples/procedures.

If the equation writer is not the best way to solve this, are there another way, besides using the rpn keystrokes as listed in a previous post?

Thanks, Terry

Re: I like RPN but... any 48gx equation writer examples

*Message #25 Posted by **r. d. bärtschiger.** on 4 Oct 2003, 1:32 p.m.,*
in response to message #24 by Terry Ingram

The easiest way is is to use the rpn keystrokes as I listed them earlier. I have also tried to enter this equation into the equation writer of both a 48gx and a 49g+. It can be done, but is much more difficult because you can not see all of the equation at one time as it takes up more and more of the screen. Also making corrections is not very straight forward.

I will try to to make a list of the necessary keystrokes to enter it into the equation writer and post the list later.

rdb.

Re: I like RPN but... any 48gx equation writer examples

*Message #26 Posted by **r. d. bärtschiger.** on 4 Oct 2003, 3:19 p.m.,*
in response to message #25 by r. d. bärtschiger.

Here are the keystroke sequences for entering the equation into an HP-48GX or HP-49G+ calculator:

Procedure for HP-48gx:

left shift equation

square root

5

left shift parenthesis

left shift parenthesis

left shift parenthesis

left shift parenthesis

left shift parenthesis

1 + 0.2

left shift parenthesis

350 / 661.5

right arrow

right arrow

y^x

2

right arrow

right arrow

y^x

3.5

right arrow

- 1

right arrow

left shift parenthesis

1 -

left shift parenthesis

6.875 * 10 y^x chs 6

right arrow

right arrow

25500

right arrow

y^x

chs 5.2656

right arrow

right arrow

+ 1

right arrow

y^x 0.286

right arrow

- 1

right arrow

enter

You should now store the equation:

'machno' STO

If the equation was entered correctly, then pressing

'machno'

then 'eval' should return 0.84.

If not then check the equation as entered and edit it as necessary.

Procedure for HP-49G+, must be set to 'rpn' mode:

right shift eqw

square root

5

left shift parenthesis

left shift parenthesis

left shift parenthesis

left shift parenthesis

left shift parenthesis

1 + 0.2

left shift parenthesis

350 / 661.5

right arrow

right arrow

y^x

2

right arrow

right arrow

right arrow

right arrow

y^x

3.5

right arrow

- 1

right arrow

right arrow

right arrow

*

left shift parenthesis

1 -

left shift parenthesis

6.875 * 10 y^x chs 6

right arrow

right arrow

right arrow

right arrow

*

25500

right arrow

right arrow

right arrow

right arrow

y^x

chs 5.2656

right arrow

right arrow

right arrow

right arrow

+ 1

right arrow

right arrow

y^x 0.286

right arrow

- 1

enter

You should now store the equation:

'machno' STO

If the equation was entered correctly, then pressing

'machno'

then 'eval' should return 0.84.

If not then check the equation as entered and edit it as necessary.

rdb.

Re: I like RPN but... any 48gx equation writer examples

*Message #27 Posted by **Terry Ingram** on 4 Oct 2003, 3:42 p.m.,*
in response to message #26 by r. d. bärtschiger.

Thanks for this example. I'll give it a try...

Looks quite a bit more complicated than RPN. In fact, almost everything that I try to accomplish with the 48gx takes longer and is more difficult than the more simple RPN keystroke models.

I'm not trying to bash the 48gx, but only admitting that I don't fully understand how to operate the machine, but still want to continue trying to learn.

Your equation editor procedure will certainly help.

Can the 48gx also use parenthesis to solve the Mach formula without using the equation editor, similar to the 71b listing previously posted?

I use RPN (41cv, 32Sii)for a lot of calculations, but still find the 71b style of entry

easy for some formulas also.

Thanks again for your time, Terry

in response to message #27 by Terry Ingram

Can the 48gx also use parenthesis to solve the Mach formula without using the equation editor, similar to the 71b listing previously posted?

Yes. However you need to add a few more pairs of parenthesis at certain places, there are already enough of these, and then if you need to edit the equation, it will be loaded into the equation writer anyway. Why not just stick with 'rpn'? Much easier.

rdb.

Re: I like RPN but... any 48gx equation writer examples

*Message #29 Posted by **GE (France)** on 4 Oct 2003, 5:49 p.m.,*
in response to message #28 by r. d. bärtschiger.

Interesting test. When I tried it, two strange things happened : 1) I typed the equation in under 30 seconds on the algebraic machine that was available at the time (shame prevents me from saying what it was, but it's under the $50 tag) 2) The result displayed is 0.8279147828

Can this test be THAT simple and the result be THAT inaccurate ??

> given in the 67 handbook as 0.84

I think, this is the correct answer. I don't know what's that formula (but I'll an mechanical engineer - specialised for fluid's mechanics).

That's seems to me like a empirical formula. And all of terms have got 4-5 significant digits. If we use this calculations, the result's significant digits no more than 2 or 3.

And what's this M really ;) ? (M=0.84 is enough, I think...)

Re: No RPN calcs. anymore??

*Message #36 Posted by **Valentin Albillo** on 3 Oct 2003, 8:47 a.m.,*
in response to message #1 by Arun

Arun posted: *"I wonder if HP realized what they're missing by ending production of RPN scientific calculators."*

First, there's no "ending" at all, HP's releasing new scientific calculators with RPN and/or RPL modes right now.

Second, HP would miss *nothing* if they stopped dead production of RPN/RPL calculators altogether. Only a bunch of die-hards like us care at all about RPN, the 99.999% of people using a calculator couldn't care less about it, and it's not clear at all that they're "missing" anything and need to be "saved" from their error in not realizing just how superior RPN is, because to begin with, it actually isn't. The mere fact that you or me like it does not make it "superior" in the least.

That being so, HP is not a charity but a profit-driven organization, and if RPN calcs aren't economically profitable, which frankly they aren't, they're doing the right thing dropping them out of production. If it were your enterprise and your money, you'd do the same.

Anyway, you'll be able to sharpen your teeth with the new Kinpo ... erm, I mean HP, models. They'll calm your addiction for a while but think twice before introducing any children of yours to the joys of RPN: it's a crippling, blinding addiction for sure. Or would you prefer to be in the losing side of the Beta vs. VHS rage ? :-)

Best regards from V.

Re: No RPN calcs. anymore??

*Message #40 Posted by **Eric Lundgren** on 5 Oct 2003, 3:04 a.m.,*
in response to message #39 by Euclid (Jack)

Well, I'd rather be an RPN user forced to convert back to algebraic, that poses no difficulty. The only problem is being a little slower for a while. Now, learning rpn, and I mean REALLY learning rpn, is something that takes some effort.

I used to be a power house algebraic ti86-er, yeah I could evaluate expressions quickly, but after returning to the rpn platform, I appreciate the thought process that is involved with rpn. Consider this, using rpn takes some thought, algebraic does not really. I get some satisfaction from knowing that thought goes into my calculations, and that I'm not just a data-enterer. I understand that there are people out there committed to algebraics, and that is ok with me. I think that you will become fluent in any form of entry you practice. Let's all just enjoy what we have and appreciate that we have choices, :)

The ENTER key, kbd density 49g+

*Message #1 Posted by **Charles L** on 2 Oct 2003, 1:14 p.m.*

I was reasoning about HP's insistance of the small enter key, and was staring at the 49g+ pics...its just my opinion, but look at the up/dwn/lft/rght toggle buttons, and the vast acreage surrounding them, could not a little compromise in size here have accomodated a big enter key?

I'm assuming that those u/d/l/r keys have some significant stuff going on under the key plate to warrant such isolation, what do you think?

Any thoughts?

cl

Re: The ENTER key, kbd density 49g+

*Message #2 Posted by **Dave** on 2 Oct 2003, 2:09 p.m.,*
in response to message #1 by Charles L

There is no reason to not have a large ENTER key except for marketing insistance that it would confuse customers that it is not in the same place as other calculator manufacturers or an indication that the calculator is too difficult to use.

Re: The ENTER key, kbd density 49g+

*Message #3 Posted by **Brandon Del Bel** on 2 Oct 2003, 4:29 p.m.,*
in response to message #1 by Charles L

I believe HP actually does know what people want, and when I say "people," I don't mean a few old guys who stubbornly hold on to HP tradition. Compare the layout of the 49 series to most of the TI graphers, and you will see a resemblance. A rediculously large enter key would very much discourage everyone who has been brought up on TI calculators since middle school. Secondly, the arrow keys of the 49Gs are separated for a reason (also owing to TI): you can find them a whole lot easier than those on the 48. Now please don't tell me that the new enter key is hard to find... I would be amazed if all the 8th grade algebra students can find it and you can't.

No hard feelings, it's all in good fun :)

Re: The ENTER key, kbd density 49g+

*Message #4 Posted by **Charles L** on 2 Oct 2003, 6:18 p.m.,*
in response to message #3 by Brandon Del Bel

Brandon,

I see the TI connection clearly, and am disheartened that HP has to cater to these demands, but my issue with the enter key is simply based on ergonomics of input. Without stepping on toes, my mind is wired

around the left side/ mid-kbd enter button. What strikes me even more is the position of the 33s enter position, not only did it move from center, it doesn't correlate to the new bottom right trend either, well...its RPN, thank you for that HP! :)

Re: The ENTER key, kbd density 49g+

*Message #5 Posted by **Charles L** on 2 Oct 2003, 6:35 p.m.,*
in response to message #3 by Brandon Del Bel

Ok, you all have good points.

I'm withdrawing my complaints. The principle that I am defending is purely that of efficient entry, and, looking at the 49g and 49g+, I should factor in that they are dressed to be 'ti-slayers'. Ok, ok you all win! :)

Like the 'modal shift' mentioned in P.Brogger's response (he credited it to someone) and other counter arguments too, its clear that we can all offer personal ideals, or justifications to the product. Perhaps the screen itself could be the enter key, a whole display dedicated to that function like atm machines use, then no one could ever fuss over size again :)

I'll never lose the nostalgia for the great HPs' though. ;)

Re: The ENTER key, kbd density 49g+

*Message #6 Posted by **Paul Brogger** on 2 Oct 2003, 5:47 p.m.,*
in response to message #1 by Charles L

To buy the argument that a wide Enter key was prevented by keyboard density is to accept that *every single keyboard function* as implemented is *absolutely* essential -- that there was no way to combine a couple of menus under a single name, or move a couple of functions to the appropriate menus (where they're probably already available anyway).

Many of the choices for keyboard accessibility no doubt were made due to measured or perceived frequency of use, and higher priority on a large Enter key would have merely forced a few more moderately difficult choices.

So, keyboard density alone wasn't the reason for a small Enter. As mentioned by others, a desire to better fit market expectations was more likely the determining factor.

Hey, if it keeps H-P manufacturing decent calculators, it's a small price to pay.

By the way, during the Powell's lunch recently, Wlodek Mier-Jedrzejowicz suggested a "modal shift key" (I don't remember whether he used that exact terminology) might have been used, with one push offering, say left-shift, a second push offering right-shift, and a third push clearing the shift. Such an approach would have freed up one complete keyspace (its primary legend, alpha character and both shifted functions), for the expense of making every right-shifted function require an extra keypress.

Another approach would have been to squeeze the cursor control buttons to the left, and put a two-place vertical Enter above the backspace key.

But that's all moot, as far as the current models is concerned. Perhaps a future version (49G+IIxUltraClassic) could have a double-height Enter stuck somewhere . . .

Re: The ENTER key, kbd density 49g+

*Message #7 Posted by **Dave** on 3 Oct 2003, 10:06 a.m.,*
in response to message #6 by Paul Brogger

Back to silly ergonomics....

The issue is primarily one of where people have become accustomed to the location of the ENTER key. The convenience of any particular location depends on the last digits of the number entered. If the number has your hand moving towards the upper left then the upper left is closest for the ENTER, if the number has you hand moving towards the lower right then that is easiest. New users who do not have the bias built in from earlier designs should not be affected by the location....

Monroe 1330/HP 46,81

*Message #1 Posted by **David Brunell** on 2 Oct 2003, 10:30 a.m.*

There is a Monroe 1330 on eBay for $6. It is my understanding that this calculator has the same Shinshu Seiki printer as the HP 46 and 81. Might be a good opportunity for someone to pick up some spare parts.

My apologies to any snipers out there who already knew this. :)

David

regression - logarithmic curve fit

*Message #1 Posted by **pieropiero** on 2 Oct 2003, 9:37 a.m.*

From the HP-67 standard pack I have converted into qbasic language the linear, power, and exponention formulas as mentioned in pages 03-02 thru 03-04. They work alright but I am unable to make use of the logarithmic regression curve fit. This will not give the correct results. I do not need the qbasic program lines but I would like to get the correct logarithmic regression formula. Any help will be welcomed.

I have some spare HP items, such as HP-41 complete with card reader and printer. Anyone interested?

Re: regression - logarithmic curve fit

*Message #2 Posted by **Tizedes Csaba** on 3 Oct 2003, 7:25 a.m.,*
in response to message #1 by pieropiero

The form of the curve is:

```
y=a+b*ln(x)
```

, where

```
x>0
```

.

49G+ Equation Library

*Message #1 Posted by **Ed Look** on 1 Oct 2003, 10:23 p.m.*

Someone posted a little while ago asking whether HP threw in an equation library like they did in the 48G series.

I just saw something on the Singapore Educalc site that seems to say that there IS one in the 49G+, as well:

http://www.educalc.net/default.asp?tid=155481

Re: 49G+ Equation Library

*Message #2 Posted by **Joesph** on 1 Oct 2003, 11:41 p.m.,*
in response to message #1 by Ed Look

I have a 49G+. If there is an equation library, I cannot see it.

Re: 49G+ Equation Library

*Message #3 Posted by **r. d. bärtschiger.** on 1 Oct 2003, 11:45 p.m.,*
in response to message #2 by Joesph

If you enter 113.01 MENU a menu similar to that on the 48gx appears. However if you press the left most key, i.e. EQLIB, a blank menu is displayed. Perhaps they planned to include the equation library and forgot. Or perhaps it will be included in a later ROM update. Time may tell.

rdb.

Re: 49G+ Equation Library

*Message #4 Posted by **Ed Look** on 2 Oct 2003, 12:43 a.m.,*
in response to message #3 by r. d. bärtschiger.

Uh, this is sort of terrible... a website statement says there is one, then there is a blank table in the calculator itself under the heading of such a library!

Hopefully, it is not a flash update that one has to buy!

But I have two personal views on this and I hope not to offend anyone:

1. The 48G series equation library I understand is compatible and can be downloaded into a 49G/G+.

2. Do any of us really use (often enough, anyway) such a library? If it concerns your interests, you'd probably know it well enough not even to require a book for reference, and if it's something you'd use once in a while, it may not be too much trouble to key in the equation into the table yourself!

Comments?

Re: 49G+ Equation Library

*Message #5 Posted by **Ed Look** on 2 Oct 2003, 1:04 a.m.,*
in response to message #3 by r. d. bärtschiger.

As of early AM 10/2, Samson Cables' site says that there may be the POSSIBLE INCLUSION of an equation library!

Re: 49G+ Equation Library

*Message #6 Posted by **Mitch** on 7 Oct 2003, 10:52 p.m.,*
in response to message #5 by Ed Look

There is no Equation library included on the 49G+. However, as pointed out, you can download one. There are some very good offerings on hpcalc.org (better than the standard 48 offering).

Module storage boxes

*Message #1 Posted by **Matthias Wehrli** on 1 Oct 2003, 4:37 p.m.*

Some month ago I found a very usefull sorage box for all my HP-41/71/75 modules. Is is white transparent and can be put into a file. It can hold 32 modules a "page" and is available in Germany by Conrad Electronic:

Holder for 32 modules: 419150 (Klarsicht-Sordiment mit 32-Fächern) Holder for 10 larger items: 419184 (Klarsicht-Sordiment mit 10-Fächern)

I hope I can help many collectors by this posting.. I had many asks for these numbers...

41 MCODE Question

*Message #1 Posted by **Ángel martin** on 1 Oct 2003, 5:42 a.m.*

Hello fellow MCoders, (you know who you are...)

This is really a very simple question. I just need to know the entry point for a subroutine in the 41 CX. It is part of the X-functions, but I don't have the VASM listings for it.

The routine is called "RSTKCA", and as such it should be listed in the VASMS.

I know where it's located in the X-Functions Rev. C module: at address "PA06" (P is the page number). Of course that's different from the CX, as HP moved the entry points when building the bank-switched CX-Xfunct.

Can you help?

Best, ÁM.

Re: 41 MCODE Question

*Message #2 Posted by **Mike (Stgt)** on 2 Oct 2003, 9:04 a.m.,*
in response to message #1 by Ángel martin

In XFunc 1C is at pA06 a call to "main frame" 0952.

```
FA06 149 *
FA07 024 NCXQ   0952 =ENCP00
```

ENCP00 is 'Enable chipset 0' if I remember correctly. Yes, look here:

```
0952 046 C=0    X
0953 3F0 PERSLCT
0954 270 RAMSLCT
0955 3E0 RTN
```

That disables peripherals as there is no peripheral 00, selects the 'first page' of RAM (stack, alpha, status) and returns.

What are you doing BTW???

Ciao.....Mike

Re: 41 MCODE Question

*Message #3 Posted by **Ángel Martin** on 2 Oct 2003, 4:28 p.m.,*
in response to message #2 by Mike (Stgt)

Yes, but later on there's code to reset the key assignement bits on the keyboard keys.

This is part of a "Reactivate Local assignments" routine, companion to a "Suspend Local assignments" one.

I got it working with CV and X-functions, but it flunks on the CX.

Now, do you know where (at which address) is that entry on the CX??

Is it possible that HP never made the CX VASM listings available??

Best, AM.

Re: 41 MCODE Question

*Message #4 Posted by **Chris Catotti (Florida)** on 3 Oct 2003, 5:23 p.m.,*
in response to message #3 by Ángel Martin

I could dissasemble any chunk of code you want.

I have not played with mcode much yet. If you can tell me what exactly tto look for, or if you want me to run a "ticker tape" printout I could.

I was contemplating connecting up the disassembler (HEPAX is my favorite, an HP-IL Module, an HP-IL Video Display, and the family VCR and see if I could make a useable video-tape dump of a module.

Let me know ...

Chris.

Re: 41 MCODE Question

*Message #5 Posted by **Ángel Martin** on 4 Oct 2003, 3:07 a.m.,*
in response to message #4 by Chris Catotti (Florida)

Chris, thanks for your offer.

I ended up copying the code stream from the x-functions module directly into my function. Now it works for both the CX and CV w/ X-fct. It took a bit more of space, but I had plenty left, so I'm happy.

Yeah, the HEPAX disassembler is also my favorite. In fact, I've always contended that the HEPAX module (device more properly) is the holy grail for the 41 system...

Hey, let me know if you want sponsors for your video! It sure sounds like a tremendous idea :-?).

Best, AM

32sii - Should one be careful?

*Message #1 Posted by **John** on 30 Sept 2003, 10:03 p.m.*

This auction lists a new in open box 32sii but in the description it says,

"Please not that this is a multiple item auction; **you may receive a different, yet equivalent item** than pictured"

Then, way down at the bottom he has a disclaimer that says, "**Disclaimer:** This is either a MANUFACTURER or THIRD PARTY'S DESCRIPTION that may differ from the actual item. This in no way provides any guarantee from us for any and all of the item contents."

and if you check the feedback, you will see lots of negatives for substituted, switched and or broken items.

I think this might be one to be careful on.

Edited: 30 Sept 2003, 10:09 p.m.

Re: 32sii - Should one be careful?

*Message #2 Posted by **Ed Look** on 30 Sept 2003, 10:35 p.m.,*
in response to message #1 by John

If you click on the image of the calculator, it's a HP-20S, not a HP-32SII; they do have the same form factor, though.

And, the image of the back has a serial number of what appears to be "ID92001946".

Yeah, this might be one of those less than up front deals.

Re: 32sii - Should one be careful?

*Message #3 Posted by **Ernie Malaga** on 30 Sept 2003, 11:18 p.m.,*
in response to message #1 by John

Yes, stay away from that one. The seller has given himself so many "outs" that he could deliver a 6S (that has been run over by a truck) with almost impunity.

-Ernie

FYI - Email replies

*Message #4 Posted by **Mike** on 2 Oct 2003, 11:47 a.m.,*
in response to message #1 by John

I have sent several emails to this seller with some questions about his 32sii. He is very quick to reply and seems to have several 32sii, in the same condition.

The fact that he replies to all my emails with reasonable answers, seems to be to his credit.

HP75 EPROM Buring

*Message #1 Posted by **andy** on 30 Sept 2003, 9:25 p.m.*

The hp75 utilizes a standard TI smj27c256 32K eprom. Burning to this eprom should be fairly straight-forward.

Does anyone have any information past this? How does one place hp75 files on the eprom? Do you need the hp75 plug-in rom simulator (PMS)?

Thanks,

Andy

Re: HP75 EPROM Buring

*Message #2 Posted by **Mark Ordal** on 2 Oct 2003, 2:30 p.m.,*
in response to message #1 by andy

I don't think you need the ROM Emulator---it was for testing that what you were going to burn would actually run from ROM. As a secondary intent, I think it was assumed that some users would send the ROM Emulator to a service bureau to have actual ROMs made for them.

I had the ROM Emulator but used it just to increase the data space available for my programs. By putting my programs in the ROM Emulator, I could have almost the whole 24k of RAM available for data. (I don't remember exactly how much of the 24k was available.) The ROM Emulator had two 8k "banks" if I remember correctly.

--Mark

Re: HP75 EPROM Buring

*Message #3 Posted by **andy** on 2 Oct 2003, 3:49 p.m.,*
in response to message #2 by Mark Ordal

From the manual, it seems like HP would have also allowed customer send them the rom image on either mag cards, tape, or diskette. The reason I think this is because the PMS manual directs the user to request a ROM i.d. from HP before sending them anything. Then you actually have to re-build your rom using the ROM i.d. HP assigns.

The rom image can be obtained with the command "copy 'all:romX' to 'filename'". This results in a file with a "rom" extention.

Incidentally, the contents of ANY rom can be copied in this manner as long as you have the PMS LEX file on your system. I've copied the contents of my i/o rom in this manner. It consists of 3, 8K lex files which can't be copied any other way (at least not in a straight-forward way).

The trouble is that this command results in a ROM file, not a LEX file. So in order to burn this to an eprom, one would have to somehow convert the ROM file back into its constiuent files.

I'll bet HP had a nice setup on a larger computer that would read in the ROM file, process it, and burn it to an eprom.

Maybe for kicks I could call hp and ask them for a ROM i.d. # for my PMS and where I should send the image to for processing!

BTW, do you still have your PMS? Would you like to sell it? If I had two, then I would have a total of 32K in rom space which would allow me to copy complete roms (like i/o or visicalc) and run them on 2 PMS's (my wife gets a kick out of that acronym).

Andy

hp 33s and memory

*Message #1 Posted by **Marcel Pelletier** on 30 Sept 2003, 6:49 p.m.*

The datasheet about the hp 33s on HPCALC.ORG tell us that this caculator will have 32 KB and 27-independent memory (A-Z,i). What's that? On hp 41 we use STO 00 - STO ???, so, this is more than 27 memory... only 27 memory for the hp 33s?

Re: hp 33s and memory

*Message #2 Posted by **CME750** on 30 Sept 2003, 7:58 p.m.,*
in response to message #1 by Marcel Pelletier

The new 17bII+ financial calculator has only 10 independent memories. But...you can also define any number of variables, using 10-character names, for use by the Equation Solver. Maybe the 33S will be similar ?

Re: hp 33s and memory

*Message #3 Posted by **Axel Bodemann** on 1 Oct 2003, 3:27 a.m.,*
in response to message #1 by Marcel Pelletier

The 33s is intended as a 32sii update, not a successor of the 41, 42s or whatever. So it has all the features and properties of the 32sii, plus bigger memory, 2-line display and can be switched to algebraic mode. Apart from the keyboard (doesn't look very user friendly...) these are all the features I always wanted for my 32sii.

Regards Axel

Re: hp 33s and memory

*Message #4 Posted by **Joshua Belsky** on 2 Oct 2003, 1:39 p.m.,*
in response to message #3 by Axel Bodemann

I imagine that another feature you would want would be better complex number handling. This is the major thing missing from the HP32SII, I feel. I imagine that the HP33S will work the same way, but at least with the two line display both parts will be visible at once.

User keys of the 49G

*Message #1 Posted by **Charles L** on 30 Sept 2003, 6:48 p.m.*

I read about someone planning to swap the functions of two keys on their 49gplus, ...does this mean that the 'enter' key could be configured to take over a key located where the 48gx enter key was? Does this work on the 49G too?

Counting the days to go play at Fry's with the new toys..

Btw, is anyone still looking for 48gx? If so let me know, a store near here has a few new ones still.

cl

Re: User keys of the 49G

*Message #2 Posted by **Veli-Pekka Nousiainen** on 30 Sept 2003, 7:39 p.m.,*
in response to message #1 by Charles L

The User keys don't work in all the Environments (or paraterized-outer-loops) you will have little luck in ASsigNing the ENTER to - say - EEX, so that it works everywhere. Just get used to the new location...and new speed!

VPN

Re: User keys of the 49G

*Message #3 Posted by **dave** on 30 Sept 2003, 11:27 p.m.,*
in response to message #1 by Charles L

It is easy to assign an enter functionality to the X key that is in the center of the 49G. This keeps teh enter where you like it. Of course any key can be used but the X makes some sense to me with location and if you use the EEX key, you need to reassign that keys functionality (& remember its location).....

Which Glue?

*Message #1 Posted by **Arnaud Amiel** on 30 Sept 2003, 3:13 p.m.*

I am currently restauring a hp45 and I have a problem with the ON/OFF switch, its base is broken in two. I would like to glue it back together but I fear gluing it to the metal part on which it is sliding as well. I don't want to open the calc for that. Any idea which kind of glue would glue the plastic together but not the metal?

I would also like to know how to unweld the tabs in the battery pack. If possible. I have been trying to search the archives for hp45 but it does not seem to work.

Thank you,

Arnaud

Re: Which Glue?

*Message #2 Posted by **Paul Brogger** on 30 Sept 2003, 3:55 p.m.,*
in response to message #1 by Arnaud Amiel

See my caution below, and proceed at your own risk!

I think that methylene chloride might do the trick, though I've never tried it in a situation such as you describe. I found it (in the NW U.S.) as "Ambroid ProWeld" in a hobby shop. (I understand that what I have is not 100% methylene chloride, and that a stronger solution, if found, would be better.) I've used it for several things HP-related.

You need to hold the pieces to be glued together closely, and let the glue be drawn into the joint by capillary action. The pieces must be held in close approximation for some time. (At least an hour?) The methylene chloride (a highly volatile aromatic hydrocarbon, if I've got my chemistry straight) melts the plastic and fuses the pieces together. A few of the things on which I have used it (including an HP-97 battery compartment door, broken right in half) seem as strong as new. (But it hasn't worked on everything.)

I worry, however about applying it to anything attached to a calculator, and to anything that needs to move again someday. If at all possible, take the switch out of the calculator before using *any* glue.

Re: Which Glue?

*Message #3 Posted by **Ed Look** on 30 Sept 2003, 10:55 p.m.,*
in response to message #2 by Paul Brogger

Actually methylene chloride is a chlorinated hydrocarbon, aliphatic, not aromatic, even if it does have a powerful aroma, AND IS A SUSPECTED CARCINOGEN (okay, so what isn't?)!

As for other solvents as glues, if this works, then you need one of low polarity (not the battery or circuit kind) like gasoline or one of its components, though these are all less than friendly compounds, as far as our health is concerned. But I suppose you'd only need a little bit.

Oh! A flash(back)- old fashioned model glue! This stuff is toluene based, which is also a nonpolar substance, and should dissolve the same stuff methylene chloride does, but is not carcenogenic. But kids used to get high on this stuff. One other problem- this stuff is usually sold in rather viscous form as compared to the pure solvent and may leave some surface marring if you're not like an expert craftsman or model builder. Maybe a slightly beaten looking HP is better than a nonfunctioning one.

Re: Which Glue?

*Message #4 Posted by **David Brunell** on 30 Sept 2003, 10:48 p.m.,*
in response to message #1 by Arnaud Amiel

Regarding the battery terminals, what I do is slide a strong but thin knife under the material and pry up. Worst case, it will leave a little of the material behind exactly where the weld was. However, there is usually plenty of material left to solder to, particularly if the replacement nicads you're using have solder tabs.

Not-so-elegant-approach

*Message #5 Posted by **Michael L. Meyer** on 1 Oct 2003, 12:07 a.m.,*
in response to message #4 by David Brunell

I've rebuilt a lot of HP and TI packs. I guess I take a less precise approach.... I tear off the metal tabs by twisting into a circle using needle-nose pliars (hemostat), then straighten them, flatten, and grind. When tinned, they make a nice, strong, flat joint with the tinned end of the battery. (It also is a quick way to detach from leaking batteries without much handling.) Despite the warnings, with a really hot iron there seems to be no damage to the batteries from the brief heat. (Besides, modern NiCd's can get normally quite hot in use in a high-drain device. Many manuals have said to let them cool before charging.) But mostly: I don't have a spot-welder.

I take a more delicate approach to a lot of other things.... honest.

(sound of crashing and breaking), Michael

Appart from the fact that it is just slightly older than me (1301), there is some sentimental value. This one was just given to me by my dad as a birthday present so like said in a post, I prefer an estheticaly challenged calc to a functionally challenged calc so I won't open this one. I have a couple of others as spares (one with the same switch problem) so I might explore one of these. As to cleaning the keyboard, I found that window cleaning liquid (windowlene here in the UK: mostly some kind of alcool or an other I believe) works wonders when used with coton buds.

Thanks all for your help.

Arnaud

Re: Which Glue?

*Message #8 Posted by **Arnaud Amiel** on 4 Oct 2003, 3:17 p.m.,*
in response to message #1 by Arnaud Amiel

After looking around I didn't find methylene chloride glue so I went to the model shop. I had to go anyway for chrome paint for the same calc, that works wonders if you have a steady hand. I asked for the most liquid glue and it worked. I just had to move the switch when the glue was getting dry to avoid getting the switch glued to the calc body. Thanks for all your help.

Arnaud

To take apart a HP-01

*Message #1 Posted by **Erik Wahlin** on 30 Sept 2003, 1:20 p.m.*

Has anybody had any experience taking apart a HP-01 watch? From the drawing in the Hewlett Packard journal, it appears the two halves of the watch are held together by a ring with thread on the OD. I guesss you somehow unthread this ring?

Re: To take apart a HP-01

*Message #2 Posted by **David Smith** on 1 Oct 2003, 10:11 a.m.,*
in response to message #1 by Erik Wahlin

Hello Erik,

You guess right. I took one apart many years ago. I seem to remember that there are two of the retaining rings. One I seem to remember is a split ring. I also think one of them is reverse threaded. You need a fine pin spanner to manipulate them... but I used a screwdriver blade.

While on the subject of watches, Harbor Freight Tools sells a watch case opener tool (made in India). It has three removeable bits that can be adjusted in a triagular pattern to match various watch cases. It comes with several types of bits. Sells for $8, $4 on sale. I think you could use just two bits and use it as a pin spanner.

Favorite Calculator

*Message #1 Posted by **Mike** on 30 Sept 2003, 8:07 a.m.*

Just an update on the favorite calculator poll. This did not include every HP calculator but did most of the high power scientific.

http://www.msdsite.com/hpcalcs/fav-calc-poll.jpg

Re: Favorite Calculator

*Message #2 Posted by **Thibaut.be** on 30 Sept 2003, 10:00 a.m.,*
in response to message #1 by Mike

I did 2 years ago a similar poll. Results can be accessed http://membres.lycos.fr/hpcalc/hp_calc_poll.htm

Re: Favorite Calculator

*Message #3 Posted by **Erik Ehrling (Sweden)** on 30 Sept 2003, 1:03 p.m.,*
in response to message #2 by Thibaut.be

Looking at both polls definitely supports the theory that a new HP41/42S compatible calc could find its fans...

Hey! I did not vote but the message with your chart says that I have already voted! Where can I go to vote anyway?

Re: Favorite Calculator

*Message #6 Posted by **quemazon** on 1 Oct 2003, 9:25 a.m.,*
in response to message #5 by Ed Look

I think this poll talks more about the demographics of the board more than the likeability of any particular calculator. I bet most people that chose the 41/42 series bought and used them in college when they were at the height of their popularity. Or maybe many "classic" users upgraded to them because they were like the classics, but provided many advantages.

I went to school with a 48 series and can't imagine how someone could want anything else. The equation library, powerful unit conversion, graphing capability, constants library, multi-level stack, and much more would be sorely missed if I had to switch to a 41. I doubt that many people who when through school with a 48 series calculator (and learned how to use it) would want anything else.

I think everyone simply likes what they feel comfortable with, which is usually a result of what they used in school or profession.

Re: Favorite Calculator

*Message #7 Posted by **R Lion (España)** on 1 Oct 2003, 9:59 a.m.,*
in response to message #6 by quemazon

The 48GX is the TOP!!

(and the 15c when a shirt pocket calc is needed)

That is why...

*Message #8 Posted by **Mike** on 1 Oct 2003, 11:22 a.m.,*
in response to message #6 by quemazon

I have another poll on the site that allows you to specify your age group. Then, it might be possible to see if age is a factor. If popularity is based on when you used them (as in college), it might show up in the age voting.

Re: That is why...

*Message #9 Posted by **Patrick** on 1 Oct 2003, 3:26 p.m.,*
in response to message #8 by Mike

However, it is difficult to correlate the two since the data is only indirectly linked. We don't even know how many of the same people voted in the two polls, for example.

While I pretty much agree with quemazon, I should point out that I voted for the 15C, having never owned one (or indeed any Voyager model) until earlier this year. I went to school with an SR-10 and then an HP-25 (there was no "C" at the time). In grad school I purchased an HP-41C. I owned no other HP models until my mid-life crisis kicked in this year and I was *forced* to start a collection of familiar and fascinating little gadgets from my youth.

It will come as no surprise, therefore, that I would never consider voting for the 48 series as my favourite calculator, not in a million years. That wonderful little HP-25 has forever biased my notion of what a calculator *ought* to be:

- It should be small.
- It should be keystroke programmable, and
- It should be quickly understandable (for example, by having at least the lion's share of its functions visible on the keyboard).

The 48's have all but three of these characteristics.

I do like the 41 and the 42S, but the size, amazing power, and intelligent keyboard of the 15C is very, very appealing. I wish I had discovered it decades ago when I had my head too deep into 41C synthetics.

Re: That is why...

*Message #10 Posted by **Juan J** on 1 Oct 2003, 6:40 p.m.,*
in response to message #9 by Patrick

I went to school with the 41 and shortly before graduating upgraded to the 48GX. Yes, it can do almost everything, yes, it is powerful, and if you went to school with it surely you wil want nothing else.

But the 41 is perhaps the finest calculator ever made by HP, and you can do many things with it (from how to nuke your neighbor to how to land the space shuttle to balancing your home buidget.) It can also be expanded and programmed in amazing ways and is deservedly regarded as a personal computing system long before PCs were available round the corner to anyone.

The above being said, going from one model to another is like a fighter pilot upgrading to a new fighter model. The new one can do anything and handle superbly, but the old one will always handle nicely and will retain features not exactly preserved or matched or improved in the newer model. (I wrote something like this in a post a few years ago here in the museum.)

I do like the 48s but will always regard with fondness the trusty 41. Probably other forum members feel the way I do about the 41 and other models.

HP-41C the best?

*Message #11 Posted by **Karl Schneider** on 2 Oct 2003, 12:45 a.m.,*
in response to message #10 by Juan J

(Note: Just a few editing improvments for clarity)

> Quote:
>
> But the 41 is perhaps the finest calculator ever made by HP...

Back in the very early '80s, I coveted the HP-41 and would occasionally visit retailers to experiment with it. On two separate occasions, I was "perusing the wares" in the calculator/electronics department at my univerity bookstore while another shopper was disparaging the 41 to the sales manager.

One was a wheelchair-bound man who basically said, "Oh, I don't like it; it's terrible." The second man, in his unfortunate, very nasal voice, said, "It's the *all-time bad calculator*".

After they had departed, the manager and I just shrugged our shoulders at each other. ("Oh well -- to each his own!")

I bought a 15C in late '83, which would be my only HP until I started revisiting my own youth last year, and started a collection with a 41CV and a 34C, which I had shunned in favor of the newer 15C.

Working with the 41CV, I began to really see what the two critics were talking about. On the 15C, powerful, practical functions were available right on the keyboard with no spelling or menus; however, on the 41CV, many basic functions had to be spelled out letter-by-letter, and some functions were not available without extra-cost Pacs. For those accustomed to the traditional non-alphanumeric HP's, the HP-41 must have seemed as convoluted as the RPL HP-28 and HP-48 models would seem, to an RPN-purist.

> Quote:
>
> ...and is deservedly regarded as a personal computing system long before PCs were available round the corner to anyone.

Bingo! That is the true hallmark of the 41C -- a complete, expandable system with its own family of peripheral devices. There was nothing else like it, and with PC's and other small computing devices, there never will be.

Re: HP-41C the best?

*Message #12 Posted by **Ed Look** on 2 Oct 2003, 12:56 a.m.,*
in response to message #11 by Karl Schneider

Aside from the prohibitive cost to a student, one reason why I chose the 34C over the 41C series calculators was that it was explained to me similarly that one had to either spell out functions or program them in. Considering that I had other things to do for which I needed a rugged HP calculator, I figured that constant reliance on a 41C might have been too time costly. If I had already graduated and needed it on the job, that would have been a different story unless time again is an issue.

Anyhow, just nosy: what do you think of the 34C?

(Me? It's my favorite!... though my first HP; that may have something to do with it...)

34C impressions (Re: HP-41C the best?)

*Message #13 Posted by **Karl Schneider** on 2 Oct 2003, 1:34 a.m.,*
in response to message #12 by Ed Look

> Quote:
>
> Anyhow, just nosy: what do you think of the 34C?

Ed --

My impressions of the HP-34C:

1. Very good-looking; impressive pioneering capabilities.

2. Early models in particular had unacceptable poor quality, due to ill-advised cost-cutting. I own an old-style and a new-style, and they both need repairs.

3. Somewhat awkward to use because of programming-based functions taking many of the unshifted key positions. For example, all of the basic transcedentals (sin/cos/tan, exp/ln, 10^x/log, 1/x, y^x, sqrt, x^2) are shifted, while "GSB" and "GTO" are not.

4. LED display lacks informative annunciators, such as angular mode.

4. No longer having to deal with 1.2V rechargeable cells? Priceless!

Final verdict: As the nice young salesman finally convinced me in late 1983 when I compared them both side-by-side, the 15C was a big improvement over the 34C.

Edited: 2 Oct 2003, 1:41 a.m.

What about the 34C

*Message #14 Posted by **Patrick** on 2 Oct 2003, 3:11 a.m.,*
in response to message #12 by Ed Look

It was only a couple of weeks ago, actually, that I bought my first HP-34C. I had never even touched one before then.

Nevertheless, I have always had a certain attraction for this machine from a historical perspective. It is the first calculator, after all, that offered SOLVE and INTEGRATE type functions, AFAIK. I remember clearly reading those amazing articles by William H. Kahan in the HP Journal about these functions and wishing my (now considered lowly) HP-25 had them. Even the HP-41C I bought in 1980 didn't come equipped with them.

You have to admire the thought and pure engineering that went into these capabilities. It is terribly easy to write a pure secant or Newton's method routine to find roots. It is every bit as easy to lead a user totally astray with such an oversimplification of a very complex subject. HP went out of their way in two ways to mitigate against this. First, they paid a lot of attention to the tiny details of the algorithm itself, buttressing it with a slew of intelligent refinements designed by a numerical expert and implemented by expert coders. Second, they documented the functions extremely well, in particular warning the user quite properly not to expect nirvana, and explaining in detail why. It seems ludicrous that any company today would undertake such a seemingly low yield venture.

Unfortunately, I was put off by the hardware quality of the Spice series. I see a few of our regulars here have been using them for some decades, but statistically it seems they did much worse than many of their predecessors (Woodstocks) or their descendants (Voyagers).

On a purely practical note, my likes and dislikes of the 34C at this early stage are so far like this:

Like: Dedicated A and B buttons that don't try to double as other keys in some sort of User/Custom mode.

Like: The GSB key right next to the keys you hit next, like A and B (the 15C could have learned a lesson from the 34C here ... its GSB is too far away from A..E)

Like: Solve and Integrate.

Like: All functions are on the keyboard.

Like: LEDs are cool.

Like: Great manual.

Dislike: Power hungry. Boy, is it ever easy to get used to batteries that last 18 years. Power that lasts just a couple of hours completely colours the way you use a

machine. I think nothing of turning on one of my 15C's to just play around with a program. With the 34C it is like I'm watching the clock trying not to use too much juice. Purely psychological, but there you have it.

Dislike: Too much shifting for routine functions (e.g., RUP/RDN, SST, Sigma+).

Re: HP-41C the best?

*Message #15 Posted by **Ángel Martin** on 2 Oct 2003, 2:14 a.m.,*
in response to message #11 by Karl Schneider

If you think spelling the function names on the 41 is a hassle is because you've never used the 42S with its soft-alpha. That alone made the 42S an undesirable model to me when it came out, never mind its lack of I/O!

Well, I guess that I'm as well on the 41 unconditionals' side, used it in engineering school and post-grad years, tinkered with its seemingly endless expansion and device-control capabilities, and even now use daily.

And yes, I also started a collection last year right at the peak of the mid-life crisis! (I see a theme in here...)

Best, ÁM.

42S "soft alpha"

*Message #16 Posted by **Karl Schneider** on 3 Oct 2003, 2:03 a.m.,*
in response to message #15 by Ángel Martin

Angel stated:

> Quote:

Nope, I have a 41CV and and a 42S! True, the two-keystroke alpha entry on the 42S is cumbersome, but it can often be avoided. Any function can be simply chosen from the catalog or oftentimes, group menus.

When writing programs using an alphanumeric external label or variable, one trick is to pre-enter the label within a program, or variable outside the program. It will then available in the menus (STO, RCL, XEQ, GTO), eliminating the need to re-type its name when programming.

While the 41 requires function names to be spelled out (unless on the keyboard or assigned), the menus of the 42S eliminate much of this.

Regards,

Karl S.

*Message #17 Posted by **Jeff Barstow** on 4 Oct 2003, 1:19 a.m.,*
in response to message #10 by Juan J

When I entered Michigan Tech in the summer of 71' the first course that you took was the care and feeding of a slide rule. By the time I graduated in 77' most slip sticks were religated to the shelf in the closet. My first calc was a HP35. Before that calcs available just did not do trig so you still had to carry the rule. I have run the gammot of HP's... once you really learn RPN it becomes very difficult to revert to other calcs with "conventional?" notation. I still can't do more than add on one. I have owned in order: HP35, HP45, HP25, HP11C, HP41CV*, HP28C*, and an HP48G*. Calcs with a "*" I still own and they still work. My favorite of all is the HP28C. Being able to do vector algebra and the solver in a really rugged little case gives this calc my vote. I was initially inclined to agree with someone who said that the calculator you used in school was the one with the fondest memories but I wouldn't give up the ol 28 for a thousand times the price I paid...(traded a very ancient radio for it and later got the radio back also). HP calcs rule!

I am the same way and so is the wife. I tought here RPN on my '80 41C. Soon I noticed my 41 was moving by itself or I couldn't find it. She had borrowed my 41 and didn't put it back were I left it.

I went out and got here an 11C and she used it alot for her work. I have asked here if she would give me here 11C and she says no way. :(I even offered to pay here for it. The answer is still NO! Her 11C is an '85 'A' model in MINT condition.

I get very frustrated with AOS calcs.

Chris

15C vs. 41C

in response to message #9 by Patrick

> Quote:
>
> In grad school I purchased an HP-41C. I owned no other HP models until my mid-life crisis kicked in this year and I was forced to start a collection of familiar and fascinating little gadgets from my youth.

Sounds like me. I coveted the 41C in 1980-81, bought the 15C in late 1983, and never felt the need to upgrade/replace it. Last year, I started collecting the ones I "missed out" on -- a 41CV among many others.

Quote:

I do like the 41 and the 42S, but the size, amazing power, and intelligent keyboard of the 15C is very, very appealing. I wish I had discovered it decades ago when I had my head too deep into 41C synthetics.

Well said. I believe that the HP-15C deserves a place in a personal-electronics "hall of fame" for engineering excellence. For what it is designed to be, the only reasonable improvement would be computational speed.

HP-15C Reasonable Improvements

*Message #20 Posted by **Valentin Albillo** on 2 Oct 2003, 4:35 a.m.,*
in response to message #19 by Karl Schneider

Karl posted: *"I believe that the HP-15C deserves a place in a personal-electronics "hall of fame" for engineering excellence. For what it is designed to be, the only reasonable improvement would be computational speed."*

Nope. There is more than one "reasonable improvement", (and I mean *reasonable*) namely:

- faster speed, as you mentioned

- larger RAM, say up to 999 steps (i.e: matrices up to 12x12). More would be desirable but 999 is reasonable.

- program steps displayed as alphanumerics, not keykodes, even if no further alpha capabilites (no alpha input, no commands to do alpha manipulations). I for once, would *not* desire alpha capabilities built-in, at all, save for the alpha display of keycodes.

- if the complex stack does exist (i.e.: we are in 'complex mode') then STO and RCL should deal with both components of a complex number at once, instead of forcing you to store and recall separately the real and imaginary parts. This would require an implicit redefinition of the registers' boundaries, but the HP-16C does it all the time when the word size changes, so it can be done. This feature alone would save tons of keystrokes and/or program steps, and it would make complex number handling that much more consistent.

and last but not least, one probably *unreasonable* improvement, which nonetheless it happens to be the one I would desire the most:

- a built-in card reader, *a la* HP-67, i.e. a small slit in the side, where you would enter a mag card to read/write your program/data. You would push the card slightly into the slit, a small motor would grab it and enter it into the machine proper, and a couple of seconds later it would be pushed back.

An HP-15 with the above mentioned feature would be indeed a dream come true, don't you agree ? :-)

Best regards from V.

in response to message #20 by Valentin Albillo

Hi Valentin :)

I totally agree with you - and do you know that this calculator actually exists ? If you look at Pocket15C on www.lyria.com... this is a 15C *Simulator*, not emulator, which is fast, with a lot of memory (999 steps + 64 registers per matrix), and will alpha display of key codes. But you need a PocketPC... An Ipaq 1910 will do the job (very small size), but it is expensive; and yes, we would need a way to download programs. Since I have a Palm, I stick to P41CX emulator with Advantage module - overall more complete.

Cheers, Vincent

Alpha keystrokes

Of course, this would be better. But once you're used with with the keystrokes code, this becomes a smaller issuer. I used to program my equations with a 11C and then with a 15C, and frankly speaking I could recognize an instruction with its keystroke code without looking at the keyboard. 32 was RDN, 42.21.11 -> f LBL A, 43 32 -> g RTN, 14 -> y^x, 43 11 -> g x², ... which are the functions you most often use when you key in equations.

But I won't deny that I found it easier when I switched to a 41C 2 years later...

Thibaut wrote: *"Of course, this would be better. But once you're used with with the keystrokes code, this becomes a smaller issuer"*

Yes, but if and only if you completely switch from one machine to another altogether. In my case, I am writing programs (and articles) for a number of machines on a regular basis, and having a collection of 5, 6, 7 or more different keycodes for something as simple as, say, GSB A, is a chore ! :-)

Also, many programs will run unchanged in an HP-34C, 11C and 15C, and if you're including them in an article, you would need either 3 separate versions of the article or else you would include 3 different sets of keycodes for the exact same instructions ! Same thing applies to the HP-67/97, HP-19C/29C pairs, among others. My usual approach is to *not* include keycodes at all, just the intructions themselves.

Nevertheless, I agree that if you're focused mainly on a single machine, say the HP-15C, it quickly becomes second nature and stops bothering. But else ...

Best regards from V.

Re: Alpha keystrokes

*Message #26 Posted by **Paul Brogger** on 2 Oct 2003, 2:32 p.m.,*
in response to message #22 by Thibaut.be

Keep in mind that true alpha display requires something beyond the Voyagers' 7-segment character cells.

The 41c's alpha LCD was an early attempt at a general-purpose display and, while characteristic of that much-loved model, it doen't to my eye render characters or numbers very nicely at all.

The next generation (dot-matrix Pioneers) does a better job of rendering characters, but at the cost of dense, solid segments and crisp contrast.

Adding (many) alpha characters to the 15c display would (have) likely force(d) degredation of one of its chief attributes: that lovely, clear, high-contrast Voyager display.

Re: Alpha keystrokes

*Message #27 Posted by **Nelson M. Sicuro (Brazil)** on 2 Oct 2003, 2:47 p.m.,*
in response to message #26 by Paul Brogger

There is a way to show alpha characters on a 7-segment display (more or less readable, but understandable), I'm working on it (on LEDs yet) on a emulator. My goal is to replace the circuit board of my old HP-11C or 12C and put there a new CPU, mantaining the rest (including the display). And there is plenty of room to put a SD/MMC card inside it... Even a MP3 player!! (but no battery enough ;)

I just love my HP-15C for its functions and style. But I need a calculator that uses Base-N numbers and boolean logic, and some more RAM to use as program storage/matrix space (simplex method).

As I also like to build things using microcontrollers and I pretty near to get the ROM out of my Voyagers, I think that build a "HP-15S" is not impossible (but a good challenge!).

Regards,

Nelson

Re: 7-Segment Alpha

*Message #28 Posted by **Paul Brogger** on 2 Oct 2003, 3:01 p.m.,*
in response to message #27 by Nelson M. Sicuro (Brazil)

Ahh, yes -- the old 7-segment alpha-bet. I remember scrolling (Wall Street style) snide remarks about classmates across the lab's KIM-1 microcomputer training units . . .

In fact, I assume the HP-16C (and other early Base-N-capable calculators) displayed at least AbCdEF with seven segments. Careful choice of operations' names and mnemonics would avoid problem letters (like "K" and "X") and allow a more mnemonic display of program codes in a 7-segment format.

Sounds like a fun project!

*Message #29 Posted by **bill platt** on 2 Oct 2003, 9:38 a.m.,*
in response to message #20 by Valentin Albillo

Hi Valentin,

Your input is, as usual, excellent reading. Having been using the 15c a fair amount lately, and I totally agree about the alphanumerics for the prgram lines. I find the 32sii so much nicer in this respect, that I have been doing "throwaway" programming on the 15c, and "archival quality" on the 32sii, because I can see what is what better in the latter.

I also thing the 15-c manual is a must have--even if you have a 32sii--as it has a lot of info that is directly applicable, and more detailed, than the 32sii manual. I wonder if there is even more in the 34c manual?

But, I am this month trying to force myself to stop doing too much calculator stuff, and instead I am refreshing my mathematics knowledge. I recently needed to curve-fit some data, and realized I was not only rusty, but never really figured out how that FFT (fast Fourier transform) business worked. We'll see how far I get! Hopefully, in the end, I'll figure out how do do something useful with the calculator in this regard.

Regards,

Bill

Bill posted: *"Your input is, as usual, excellent reading".*

Thank you very much, you're too kind ! I must say I also enjoy your postings :-)

"I also thing the 15-c manual is a must have [...] I wonder if there is even more in the 34c manual?"

No. There's nothing in the HP-34C Owner's Handbook on the advanced functionality (i.e.: solve and integrate) that isn't already covered in the HP-15C Owner's Handbook. But even that absolutely pales in comparison to the ultra-excellent material provided in the HP-15C Advanced Functions manual, which is totally unique in its class, a real advanced course on numerical algorithms and accuracy. It should be mandatory text for any numerical algorithms class. If you don't have one, I urge you to get it ASAP. Trust me, you'll be delighted.

"I recently needed to curve-fit some data, and realized I was not only rusty, but never really figured out how that FFT (fast fourier transform) business worked."

The kinds of functions and algorithms to use in data-fitting are mostly dependent on the type of data (i.e: mathematically-obtained data, empirical data of limited precision, periodic data, aperiodic data, etc). The easiest algorithms to program are least-squares polynomial regression and the likes using functions and/or conversions other than polynomials, but IMHO, the best results are always obtained using mini-max approximations, which are guaranteed to minimize the absolute error, which is what one usually wants (not the *square* of the error !).

The price you pay for this is that computing a mini-max approximation is much, much harder to program than a simple least-squares one, but it's certainly worthwhile as you'll only compute the coefficients once. I did write an HP-71B program to compute the Nth-degree minimax polynomial fit to any set of data points (obtained from the keyboard, from a file, or even continuous data generated by some mathematical function or program), but it's unpublished as of yet (I was planning to submit it to Datafile for publication, but there's been some problems with my subscription).

As an example of fitting continuous data you might want to try your hand at, find a 3rd degree polynomial which will fit y=sin(x) over [0, Pi/2] minimizing the absolute error over that interval. My program produces the cubic polynomial:

```
y = -0.00136 + 1.02519 x - 0.07061 x^2 - 0.11253 x^3,
```

which has a maximum error of 0.00136 (approx.) over the whole interval, far better than what you can achieve by any other kind of 3rd-degree polynomial fitting.

Best regards from V.

Thanks, Valentin! (NT)

A polite "rebuttal" to Valentin's HP-15C Reasonable Improvements

*Message #32 Posted by **Karl Schneider** on 3 Oct 2003, 1:59 p.m.,*
in response to message #20 by Valentin Albillo

First, some emphsasis: By, "*For what it is designed to be*", I intended a fairly restrictive definition of the product within the technology of the era: its form factor, display type, features, and design objectives/constraints.

I agree that Valentin's suggestions are not unreasonable, and would certainly make the HP-15C more capable, but several are a bit "out of bounds", in my opinion.

Valentin stated:

> Quote:
>
> *- faster speed, as you mentioned*

No disagreement here...

Certainly HP had the capability at the time to make LCD machines faster than the Voyagers; the antedated 41C* is about twice as fast. However, I'm not sure if the Voyagers' early '80s CMOS technology permitted faster operation. The hardware experts could explain how Voyager technolgy differed from 41 technology. It would be a shame if the Voyagers could have been faster, but were "held back" by a desire for non-competition with the 41C*.

> Quote:
>
> *- larger RAM, say up to 999 steps (i.e: matrices up to 12x12). More would be desirable but 999 is reasonable.*

Well, 1 kB (1024 bytes) allocatable RAM would give the 999 lines or 12x12 matrix. Maybe that would be the "reasonable" upper limit. The 67x7 = 469 bytes was more than the base 41C, and more than twice as much as the 11C/16C and 34C had.

Certainly, more RAM always offers more flexibility, but, given the limitations (no I/O, alphanumerics or external labels for programming, slow processing), I think that most users would find it difficult to put very much more RAM to practical use. And, how expensive was this constant memory at the time?

It seems that the 64x7 = 448 bytes of allocatable RAM was a conscious decision by HP.

It was just enough for an 8x8 matrix and solution of a 4-variable complex-valued system with some special techniques, as described in the manual. Would you really want to generate or enter larger ones? The calc is slow, and storing or recalling each element takes two keystrokes (unless a looping program is written). Forget about electronic data exchange...

999 lines of programming, shown in keycodes with no modularization with external labels, cataloguing, or alpha messages? Perish the thought. The 15C is not well-suited for permanent libraries of programs.

I would be nice, however, to have more memory to allow storage of large amounts of data while still being able to access INTEG and other features.

> Quote:
>
> *- program steps displayed as alphanumerics, not keykodes, even if no further alpha capabilites (no alpha input, no commands to do alpha manipulations).*

How would this be done well with the 7-segment LCD characters? This was discussed extensively in the thread.

However, here's an idea: Represent the rows of the keycodes spreadsheet-cell style, using A, b, C, and d, rather than 1-4. That way, multi-digit numbers could be merged onto one line, as on the alphanumeric 41C*, 42S, and 32S/Sii.

> Quote:
>
> *- if the complex stack does exist (i.e.: we are in 'complex mode') then STO and RCL should deal with both components of a complex number at once, instead of forcing you to store and recall separately the real and imaginary parts. This would require an implicit redefinition of the registers' boundaries, but the HP-16C does it all the time when the word size changes, so it can be done.*

This certainly would make some things easier, but I don't think it's a very sound idea. The 42S allows explicit redefinition of the numbered storage registers to allow them to accommodate complex-valued inputs, but you're talking about automatic changes. This is fraught with problems:

If the space allocated to numbered registers were to be automatically doubled each time complex mode was set, the expansion might constrain the pool (even at 1 kB). If there was inadequate pool space for the expansion, complex mode could not even be set. Also, the imaginary parts of complex numbers in numbered registers would be lost each time complex mode was un-set if redefinition were automatic.

If matrix-data allocation remained real-valued in complex mode, then storing the contents of any complex-valued data in numerical registers into matrices would not work the same way as in real mode -- the imaginary portion would fall into the "bit bucket".

BTW, the 16C will cut either the precision of data or number of registers each time the word size is changed, which may cause a loss of user data.

No, until there is Fortran-style data typing, these things should be avoided.

Re: A polite "rebuttal" to Valentin's HP-15C Reasonable Improvements

*Message #33 Posted by **Ed Look** on 3 Oct 2003, 4:58 p.m.,*
in response to message #32 by Karl Schneider

Oooooiiiiyyyyy! (Sorry, I know, this is not so polite!)

FORTRAN?! I loved my HP-34C because it often kept me from having to write FORTRAN code! I used to have to make MANY repetitive calculations; instead of having to write cumbersome program lines, I just keystroke programmed by 34C and ran it. Okay, so both methods required "debugging", but I could be home in my pajamas to solve the equations! Perish the thought, putting FORTRAN style programming formats into calculators! (Although, this might allow one, along with PCs to do FORTRAN in the kitchen in your jammies!)

Data typing

*Message #34 Posted by **Karl Schneider** on 3 Oct 2003, 9:16 p.m.,*
in response to message #33 by Ed Look

Ed --

I didn't really intend to convey that programming requirements of Fortran (or any other language) be introduced within handheld calculators; that would defeat the very purpose and principle of simplicity.

My real point there was that explicit data typing was a better approach to implement what was suggested, rather than automatically changing the size of numbered storage registers in order to accommodate different types of data.

All high-level languages include explicit data typing, and Fortran is one of the few that intrinsically support complex-valued data.

*Message #35 Posted by **Richard Garner** on 3 Oct 2003, 7:13 p.m.,*
in response to message #20 by Valentin Albillo

Here is a thought, why not install a 1 and a 1/2 inch CD-RW that could hold about 100MB and could be removed and placed into a normal CD-RW and read or written to? There are 2 inch drive being used in cameras now, why not calculators?

Re: HP-15C Reasonable Improvements

*Message #36 Posted by **Ed Look** on 3 Oct 2003, 7:57 p.m.,*
in response to message #35 by Richard Garner

Yeah, but now we're getting into being "sorta like PCs". The use of an inbuilt slot for SD cards (and they come nowadays up to, what, about 1GB?) is a much more elegant solution, I think.

Re: 15C vs. 32Sii

*Message #37 Posted by **Britt** on 2 Oct 2003, 12:37 p.m.,*
in response to message #19 by Karl Schneider

I'm curious what other 15C fans think of the 32Sii. I have a 15C, 16C, 32Sii, 41CV, 42S, 48G, etc and find the 32Sii to be the most all around useful. I like the 15C layout and keyboard but the 32Sii seems better for keystroke programming plus it is much faster and does number base conversions which I frequently need. I prefer the 32Sii to the 42S mainly because the display is much more readable and it doesn't have those annoying menus.

-- Britt

Re: 15C vs. 32Sii

*Message #38 Posted by **bill platt** on 2 Oct 2003, 1:16 p.m.,*
in response to message #37 by Britt

Hi Britt

I have similar: 45, 11C, 15C, 32Sii, 41CV, 48GX

And I agree: for day to day general anything goes computing, and fast, easy keystroke programming, the 32sii is the best. BUT there is so little memory so more of my stuff has been migrating. And, I have written a few very useful tiny little programs in the 48 that take advantage of lists, so that machine is sure enough becoming indispensible.

But I am sure that if I needed to do more matrix or complex number work, then I would be a 48 user or 15 maybe?

But I really like the 15C; it is nifty!

-Bill

15C vs. 32Sii vs. 42S Ramblings

*Message #39 Posted by **Patrick** on 2 Oct 2003, 2:32 p.m.,*
in response to message #37 by Britt

I prefer the 15C to the 32SII for totally personal reasons. The 32SII is clearly a much more capable calculator in many respects. If I had to choose, though, between the 32SII and the 42S, there is no contest. I would pick the 42S every time. I point out that the 32SII does have menus of its own, although I readily admit they are not nearly as pervasive.

In my mind, the two main complaints about the 42S are dealt with this way:

1 - Awful alpha entry

So, don't use it. Yes, you must use it for some things, like program names, but if you limit yourself to doing the absolute minimum, you are no worse off than in using a 32SII or a 15C. Besides, I don't think alpha entry is all that bad. I'm getting pretty good at my two thumb technique.

2 - No I/O.

Same answer as above. If you don't use gobs of memory for programs, it is not an issue to have to re-key programs. Again, you are no worse off than in using one of the other models. It is still useful to have all that room even if you only use it as space for program generated data.

My philosophy is that the 42S provides many advantages over the 15C (such as alpha program codes) even if you choose not to use it to its fullest. Of course it would be wonderful if there was true I/O capability and if the alpha entry capabilities were better ergonomically, but I still like the little guy.

Returning to Valentin's 15C enhancement remarks, I must say that I like many of his suggestions. I disagree with the card reader suggestion, though. The trauma that it would bring to the device's architecture aside (i.e., increased bulk), there are much better solutions in modern technologies for transfer and storage of calculator programs and data. I have said before that a Bluetooth connection would be, for me, absolutely ideal. Imagine being able to hotsync your 15C just by bringing it within a few feet of your PC and pushing the hotsync key? Coupled with an emulator on the PC upon which you could do software development, that would be oh so very, very nice. And no fiddly and destruction/loss prone little cards to deal with. Backup is via your PC disks, floppy, flash disk, or whatever other storage medium is invented for a PC.

Too bad that lygea emulator for the 15C doesn't run on Palm OS. Since you can get a Palm emulator for a PC, you could imagine running your 15C emulator inside your Palm emulator inside your PC! It would probably still run a couple of orders of magnitudes faster than the 15C!! Anyone know if there is a PPC emulator for PC? I really don't want to buy a PPC device. I mean, I *really* don't want to buy one.

Edited: 2 Oct 2003, 2:33 p.m.

Re: 15C vs. 32Sii vs. 42S Ramblings

*Message #40 Posted by **Britt** on 2 Oct 2003, 5:00 p.m.,*
in response to message #39 by Patrick

I appreciate your comments. The only thing that really disappoints me about the 42S is the poor display contrast.

On my Palm M500 I run the MathU Pro RPN calculator (http://www.creativecreek.com/) which has a semi-Voyager style virtual keyboard with either a one or two line display. It has a good selection of functions including TVM and logic. I like it a lot. It will also run on the Palm emulator on a PC or Mac.

Built-in card readere vs. PC link

*Message #41 Posted by **Valentin Albillo** on 3 Oct 2003, 5:14 a.m.,*
in response to message #39 by Patrick

Patrick wrote: *"I disagree with the card reader suggestion, though. The trauma that it would bring to the device's architecture aside (i.e., increased bulk), there are much better solutions in modern technologies for transfer and storage of calculator programs and data."*

Your remarks about "trauma" and "increased bulk" are debatable and I don't agree at

all with them. I've seen extremely thin, light, magnetic-stripe readers which could probably be fitted inside the body of a 15C. Micro-mechanical technology has advanced a lot in these last 20+ years and modern card readers have nothing to do with the somewhat bulky designs we are accustomed to, like the HP-41C card reader. May I remind you that even back then, the HP-67 *internal* card reader was indeed *much* smaller than the bulky HP-41C *external* one, right ?

" I have said before that a Bluetooth connection would be, for me, absolutely ideal. Imagine being able to hotsync your 15C just by bringing it within a few feet of your PC and pushing the hotsync key? Coupled with an emulator on the PC upon which you could do software development, that would be oh so very, very nice. And no fiddly and destruction/loss prone little cards to deal with. Backup is via your PC disks, floppy, flash disk, or whatever other storage medium is invented for a PC."

For me, that's exactly the point !! I *do not* want to rely on, depend on, or even be forced to own or carry a PC, portable or not, for such a simple thing as loading and saving programs and data to and from my *pocket calculator*. I relish those wonderful days when you just carried your HP-67 in your pocket, together with a 40-card holder, and you would have all your important programs instantly available, anywhere, be it in the classroom or in a mountain's peek or a crowded subway. Why on earth would anyone want to depend on owning and having a PC available somewhere just to download a particular needed program ? Is that portability ? Is that convenient ?

That may be fine for such bloated "calculators" as the HP-48/49 series and things like that, with their large memories. But for a pure, real, keystroke-programmable pocket calculator (NOT do-it-all, 8000-functions "handheld computer", etc) like the HP-15C, having to depend on a connection to a PC to download programs borders on the utterly ridiculous. Give me my built-in card reader and a 40-card holder and you can take all your PCs, Blueteeth, or whatever your heart desires, thank you. :-)

Best regards from V.

Re: Built-in card readere vs. PC link

*Message #42 Posted by **Nelson M. Sicuro (Brazil)** on 3 Oct 2003, 7:57 a.m.,*
in response to message #41 by Valentin Albillo

I think that the best option to store information in a calculator of the size of the HP-15C is SD/MMC cards. They are small and simple to handle, and fit perfectly inside the body of the 15C (and runs on low voltage, 2.7~3.3V).

Regards,

Nelson

Re: Built-in card readere vs. PC link

*Message #43 Posted by **Ed Look** on 3 Oct 2003, 5:09 p.m.,*
in response to message #42 by Nelson M. Sicuro (Brazil)

This may not exactly fit you guys' discussion exactly, but the new member of those "bloated calculators", the HP-49G+ DOES use SD cards for expansion memory. I'll agree these beasties are not exactly pocket calculators; rather, they hearken back to the days of what, the 45s? 67s? Even so, I just wanted

to mention that the use of such small and (marginally) affordable technology is a step in the right direction, even if form factor is not.

SD cards vs. Wireless Connection

*Message #44 Posted by **Patrick** on 4 Oct 2003, 7:54 p.m.,*
in response to message #42 by Nelson M. Sicuro (Brazil)

I like SD card technology. I own a Tungsten|T which uses them and find them very convenient and stable. If you could get an SD drive into the body of a 15C that would be great, but for me this is not essential if there is the wireless PC connection that I wished for.

I rarely find myself far from a PC anymore, either in business or personal life, so I don't share Valentin's desire to be independent of the PC. Having SD cards (or whatever) would be fine, provided it did not unduly increase the machine's bulk. I like devices which are small and light. A wireless Bluetooth connection capability would require very little extra space, from what I understand of the technology. I see that HP has gone to SD for some of its new models, but none of the new models are small, and certainly not the ones with SD technology.

Re: SD cards vs. Wireless Connection

*Message #45 Posted by **Nelson M. Sicuro (Brazil)** on 4 Oct 2003, 8:04 p.m.,*
in response to message #44 by Patrick

I think that the advantage of the SD/MMC card is that they are very simple to implement (serial I/O) and most of the new microcontrollers have this serial I/O already implemented. The wireless communication is more complicated (hardware & software) and to a small project like mine is a very difficult task. Maybe in the near future a new single-chip with wireless capability come up and make it simple to develop.

Regards,

Nelson

Re: SD cards vs. Wireless Connection

*Message #46 Posted by **Ed Look** on 5 Oct 2003, 1:00 a.m.,*
in response to message #45 by Nelson M. Sicuro (Brazil)

Wireless is good, too! I have a homemade 48G to PC cable; the PC end is a serial connector and very nice. The 48G end is the connector I bought separately when Samson Cables still carried them and while it fits perfectly, it falls off if I just frown at it. (Yes, yes, I could have BOUGHT a very nice fitting cable, but I wanted to recapture my youth when the people I worked for wouldn't buy the cables we needed and we had to make them; some of them had about 20 pins on each end! I think I did a better job back then!!)

But I have one serious poor man's concern- the power drain increase if wireless technologies were built onto the "motherboard" of the

calculator. Right now, even the mighty HP-48G's use only three AAA batteries, even the cheapest C-Zn types! I'd hate to see these marvels require a few of the more expensive dry cells, though if rechargeable, Ni-metal-H cells these days are a far cry from the easily depleted and worn out Ni-Cds.

Re: 15C vs. 32Sii

*Message #47 Posted by **Tizedes Csaba** on 2 Oct 2003, 5:22 p.m.,*
in response to message #37 by Britt

I've got this calcs too, and I use usally the 32SII. But I think the 32's got a big deficiency: On this calc haven't got 'GTO i' command.

Many weeks ago I wrote to this forum (the title was 'Nested loops'). I wrote an algorithm, about how I maked nested loops on 15C. I wanted other solutions to this problem, but nobody was answered.

This nesting-method can't adaptable to 32SII, because on this calc haven't got 'GTO i'.

Csaba

PS.: Hmm... Sometimes I think that is no difference between 'GTO i' and 'GTO (i)', but it's not really true...!

Re: 15C vs. 32Sii

*Message #48 Posted by **Karl Schneider** on 3 Oct 2003, 2:44 a.m.,*
in response to message #37 by Britt

Britt stated:

Sounds familiar! I have all those RPN scientific models, plus the 49G and 34C, as well as business and AOS models.

> Quote:
>
> *I like the 15C layout and keyboard but the 32Sii seems better for keystroke programming plus it is much faster and does number base conversions which I frequently need.*

I agree completely -- the 15C layout is a marvel of thorough planning, while the 32Sii's is a bit helter-skelter in places.

The 32Sii is better for programming because of alphanumeric display, cataloguing and deleteion of program blocks, prompted input, equations, etc. The 4x speed is also a boon for execution of programs.

I use the 32Sii at work, where I have a PC with Matlab on my desk for any matrix or

complex-valued calculations. Also, I can sit away from the desk and use the 32Sii as a handheld.

However, if I were told that I could keep and use only one or the other, it would be the 15C, because of the important functionality for matrices and complete complex-domain functionality that the 32S/Sii lacks.

I've read that the 32S was marketed as a replacement/upgrade for the 11C, and the 42S was the replacement/upgrade for the 15C. I can accept this, although I belive that the 11C/15C are much closer to each other than the 32S/42S are. I don't believe that the 11C has anything that the 32S/Sii doesn't; the 32S/Sii has plenty that the 11C doesn't.

in response to message #1 by chris

The EL-5001 is fairly rare and sought after due to its unique barrel function selector switch. It's the only calculator that I've seen with this feature that let's you select which functions the top 4 keys will perform by using a rotating 6-position switch.

My guess is that you'll get $50-$100 for it on ebay. I've only seen a couple of them go by and they both went for around $75.

Interesting quote about old (calculator) times at HP

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Sept 2003, 6:56 p.m.*

The following is a quote from an article titled "Semantic Services" by Robert E. Filman (IEEE Internet Computing magazine Editor in Chief).

... "The other [story] was from a friend who had worked at Hewlett Packard on the first handheld {scientific} calculator. When he asked the information system accounting folks how much profit HP had made on that invention, they responded with a list of 43 questions to clarify what he meant by "profit." (For example, "How should earnings and losses on foreign currency futures transactions be treated?")" ...

The article has (otherwise) nothing to do with calculators, and appeared in the IEEE Internet Computing magazine, July-August 2003, pages 4 to 6. It can be found in the IEEE Computer Society Digital Library (there is no charge for this particular article), the URL is:

http://csdl.computer.org/comp/mags/ic/2003/04/w4004.pdf

It seems that, while those were glorious times at HP, the seeds of certain situations that we regret today were already planted...

hp49g+ manual - I can't believe it!

*Message #1 Posted by **Frank B. (Germany)** on 29 Sept 2003, 3:16 p.m.*

Hi,

got my new HP49g+ calculator last week. There have been lot's of discussions about keyboard, speed etc. at comp.sys.hp48, so I don't want to comment on these. But I do want to comment on the manuals.

In addition to a quickstart manual one gets english, spanish and german versions of the user's guide as pdf-files. The translation of the user's guide to german is horrible!!! I couldn't believe it when I first saw it.

Example: On page 12.43 (english) resp. 12.50 (german) parametric surface plots are discussed. At one point, "parametric surface plot" is translated into "photoreceptor surface plot". Ok. Funny. Same line: "x(X,Y) = X sin Y", "y(X,Y) = x cos Y" is translated into "x(X,Y) = X Sünde Y", "y(X,Y) = x Lattich Y". "Sünde" is the religious meaning of "sin", and "Lattich" means "lettuce".

This is ridiculous!!! They are selling a calculator, but don't even know what "sin" and "cos" mean??? To me this entire manual sounds like a babelfish translation. Thanks HP!

Frank.

in response to message #1 by Frank B. (Germany)

Well, kids have been telling me a long time, at least here in America, that math is evil.

Re: hp49g+ manual - I can't believe it!

*Message #3 Posted by **Ed Look** on 29 Sept 2003, 3:39 p.m.,*
in response to message #1 by Frank B. (Germany)

Frank, sorry about the flip post.

I understand how you feel; whenever I buy something that comes with a useless or poorly translated (usually from Japanese) manual, it's enough to make me scream (sometimes I actually do!).

In fact, I was about to complain about the poor print quality of my 32SII and 48G manuals, even if the content was excellent. My 34C manual was both very useful and a joy to look at.

***

Most American kids think English and history are evil, too; only recess is good.

*Message #4 Posted by **Ernie Malaga** on 29 Sept 2003, 4:27 p.m.,*
in response to message #1 by Frank B. (Germany)

The Italians have it right: "Traduttore, traditore."

That aside, it looks like a botched computer-processed translation without supervision or editing. The kind of translation that would result in "The spirit is willing, but the flesh is weak" into "The booze is good, but the meat is rotten."

There are no excuses for this sort of fiasco.

-Ernie

*Message #5 Posted by **Karl Schneider** on 30 Sept 2003, 2:16 a.m.,*
in response to message #1 by Frank B. (Germany)

Contrast that "effort" with the documentation work performed for the HP-15C -- a top-notch 293-page small-font(!) manual in English, meticulously translated into German and other languages. Also, a 219-page Advanced Functions Handbook.

This took place in the early '80s, before NAFTA and the opening of mainland China, when engineers called the shots, got the budgets and support, and the products cost enough to justify it all.

"Ya don't get what ya don't pay for" is the real meaning of the expression.

-- Karl

Re: hp49g+ manual - I can't believe it!

*Message #6 Posted by **Daniel Diggelmann** on 30 Sept 2003, 2:39 a.m.,*
in response to message #5 by Karl Schneider

Hi, as always I avoid reading too much in the manuals ;) But I had to look up how the function %T exactly works. The examples are wrong and don't mach the results of the HP-49G+. Actually the calc does it right :) These kind of things are wrong in both the english and german manual. Normally I still use the HP-48 Advanced User's Reference as well as the two Urroz books for the HP-49G. Another very weak point about the new calcs. This certainly doesn't help to gain more new users on the market. As with the HP-49G this calc is only useful for longtime HP freaks.

Cheers Daniel

Re: hp49g+ manual - I can't believe it!

*Message #7 Posted by **Tom (UK)** on 30 Sept 2003, 12:56 p.m.,*
in response to message #1 by Frank B. (Germany)

This is quite clearly unaceptable. If HP claim in their adverts to have a German manual for the HP49G+ then they should provide one. In the UK this area is known as false advertising and the company can be fined and/or stopped from making false claims.

Have you complained to HP? If Germany has the same kind of rules as the UK then you could say you will refer them to the advertising body.

You sound fortunate in this case as you seem able to read / write good english, think of all those people who can't.

I'm only saying the above because HP will only change their ways if it hurts them, at the moment HP will only notice if they are fined or taken to court because then the share holders get upset.

PS What hope have we got for the HP33S?

Re: hp49g+ manual - I can't believe it!

*Message #8 Posted by **gewinner@fbalzer.de** on 30 Sept 2003, 5:07 p.m.,*
in response to message #7 by Tom (UK)

Hi there,

> Have you complained to HP? If Germany has the same kind > of rules as the UK then you could say you will refer them > to the advertising body.

yes, I have sent an email to HP Germany, although they dont't even have a website dealing with calculators. So I don't expect an answer. But somebody from HP has responded to my posting at comp.sys.hp48, so maybe there's hope!

>You sound fortunate in this case as you seem able to > read / write good english,

no, not to write ...

> think of all those people who > can't.

Yeah, I think this is the point! If I would not be able to read english, this entire calculator would be completely useless. And I'm only talking about the translation. I'm a complete novice in using a HP49. If the manual has a lot of textual errors too (as mentioned above), I'll be lost. How can I try to persuade my students of using the superiority of RPN if the top calculator from HP has such a crappy manual???

> I'm only saying the above because HP will only change > their ways if it hurts them, at the moment HP will only > notice if they are fined or taken to court because then > the share holders get upset.

> PS What hope have we got for the HP33S?

Reading a lot of posts at comp.sys.hp48, I think HP is on the right track back to their famous calculators from pre 1995. I've already preordered a HP33s, and I'm really looking forward using it. But: HP, please don't use the users as beta testers for both hard- and software!

Frank.

*Message #12 Posted by **Ariadna Castillo González** on 1 Oct 2003, 1:45 p.m.,*
in response to message #1 by Frank B. (Germany)

Dear Frank,

I don’t know if you are familiar with the translation business but as a professional translator and owner of a small translation agency, which participated in the translation into Dutch of another calculator manual for HP, I can explain you the reason of such bad quality translations. Not long ago, some of the translations for the HP manuals (if not all) were handled by a top-quality translation agency in Australia (of which I guess I cannot say the name even though they really deserve to be mentioned on grounds of their professional attitude). They carefully selected the appropriate translators based on their backgrounds and linguistic knowledge. They fully supported their translation team and offered them honorable rates. All this, of course, has a price. Unfortunately, HP decided to go the wrong way (a general trend lately). Money seems to be more important than quality and they often forget that a manual is a very important part of any product to be sold. The translations of the manuals are now handled by an agency in Asia (I saw myself their advertisement and the rates they offered, in two words “insulting rates”). They pay their translators less than 2/3 of what translators were getting before. That, of course, translates into poor-quality results (with all my respects to those professionals who have no other option than to accept these rates). My motto is “pay peanuts and you’ll get

monkeys". I honestly feel sorry for the people who need to use such manuals but, on the other hand, I'm having a good laugh here because their stupid decision is paying back. I really hope many more complaints like yours are made public for everybody to realize that translation is not a game but a profession, which not everybody is qualified to perform.

Kind regards, Ariadna Castillo

Corrosion in HP67 battery compartment

*Message #1 Posted by **Neil Strickland** on 29 Sept 2003, 6:09 a.m.*

My HP67 has bluish corrosion around the battery terminals from a leaking battery. What is the best way to remove this? I suspect the gold coating on the terminals is ruined too. Can the terminals be replaced? Are they still procurable? - Thanks.

Sure, they can be cleaned

*Message #2 Posted by **Mike** on 29 Sept 2003, 1:00 p.m.,*
in response to message #1 by Neil Strickland

They can be easily cleaned and they can be replaced. But to replace them requires peeling the label on the back. Since the terminal corrosion when cleaned, is simply a cosmetic condition and can't be seen from the outside, I wouldn't replace them unless there is a connection problem.

Be careful in cleaining them that you don't break them. Corrosion gets on the underside of the contacts as well.

The best source of new contacts is from non-working and trashed 45 or such.

Re: Sure, they can be cleaned

*Message #3 Posted by **Michael L. Meyer** on 30 Sept 2003, 12:15 a.m.,*
in response to message #2 by Mike

I agree. Does the calc work?

I've never seen one with even some corrosion that didn't have internal corrosion as well.

Others can help me out here, but I think that even minor corrosion should be removed, if possible, so as not to let moisture and time produce more corrosion.

Michael

Re: Sure, they can be cleaned

*Message #4 Posted by **Neil Strickland** on 30 Sept 2003, 6:40 a.m.,*
in response to message #3 by Michael L. Meyer

No, the calculator is dead. The LEDs don't even flicker anymore. I am only keeping it for sentimental value at this stage.

With what should I clean it, dear Henry, dear Henry?

*Message #5 Posted by **Neil Strickland** on 1 Oct 2003, 11:53 p.m.,*
in response to message #4 by Neil Strickland

Can anyone recommend what I should use to remove the corrosion? Preferably something that won't damage the rest of the calculator. Thanks.

Re: With what should I clean it, dear Henry, dear Henry?

*Message #6 Posted by **Ed Look** on 2 Oct 2003, 12:50 a.m.,*
in response to message #5 by Neil Strickland

Personally, I'd not recommend any chemical agents; I believe that'd cause more problems later.

The best bet might be to gently scrape or gently scour it off with something small, if it is a small area. But I would use a bit of plain water, perhaps on a cotton swab or tiny wad of paper towel to wash off any leaked corrosives. Most of the inorganic salts that form or leaked acids or bases should be fairly easily removed by water. After being sure to rinse thoroughly to forestall any further corrosion, be sure also to DRY THROUGHLY, for the same reason.

I recently had a close call with my old HP-34C: a replacement pack of NiCd cells began to leak and slightly damaged the contacts, but a bit of wiping removed the small amount of leaked and corroded material. Of course, toss the leaked cells. The contents of batteries are toxic and corrosive.

Re: Sure, they can be cleaned

*Message #7 Posted by **Katie Wasserman** on 2 Oct 2003, 2:10 a.m.,*
in response to message #3 by Michael L. Meyer

I agree that scrapping away corrosion is the way to go. I found a great tool to do this with, a fiberglass brush. The brush can work though any amount of corrosion and sort of disintegrates as it's removing the corrosion so you need to buy refills for it.

Here's the brush:

http://mcm.newark.com/NewarkWebCommerce/mcm/en_US/support/catalog/productDetail.jsp?id=SABU10191

and the refills:

http://mcm.newark.com/NewarkWebCommerce/mcm/en_US/support/catalog/productDetail.jsp?id=SABU1019210

What I'll suggest for my father?

*Message #1 Posted by **Joe Panico** on 28 Sept 2003, 10:53 p.m.*

To all, This isn't a debate over the merits of old HP's, new HP's or future HP's (right), the subject has plenty coverage already. My father used the calculators for thirty years, mostly while teaching statistics at college. He FINALLY did a big project using an HP-28C I bought for him when it was first introduced. He loves it, possibly more than his long retired 67. But now he wants more and ask me what he could get. I own a 48GX down to a 10B, plus the usual collection of in-beweens.

I'll divide HP's into two catagories - big ENTER keys and the current, almost missing, ENTER keys.

So, all things considered, when you see my posting in the Classified ad's, it's for my father. I figure another 28, an S version, because he likes it and a 48GX because I use it and have all sorts of stuff to go with it - manuals, hacker junk, experience. And ---- big ENTER key!

Joe

PS: This first one we ever owned (and still do) is a 45, purchased a few months after it's introduction. It was hot. Some guy got it from a friend and had more use for $50 than all the advanced engineering, scientific, slide-rule features. That's one rationalization I've yet to see for past, present & future HP's debated at this site: greater demand in the black market!

Re: What I'll suggest for my father?

*Message #2 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 5:07 a.m.,*
in response to message #1 by Joe Panico

The HP 49G+ is fast in plotting graphs and every operation is snappy. Because it is new the support should go long long time to the future (it uses ARM9 emulating Saturn). The modern connections like standard Irda and USB at 115,200 speed gives 12*speed compared to a 48G in connecting to a PC. You will never go back when you try that! Plus there is that SD card for another means of data exhange or for further storage expansion if the internal 768KB Flash is not enough. The main RAM is 256KB, which gives plenty of room to operate on big things. The screen is 131*80 pixels. The status line is on all the time, while it gives you the maximum stack at the same time.

The ENTER key is small because that gives the change to make the cursor keys to work in the alpha mode, too! The new 49G+ has a tactile keyboard (the HP click) and a possibility to use "beep" on every key press to help a new use to adjust to the key press. The green and red shift keys give a good contrast on that beautiful light golden face plate.

It has both RPN and Algebraic operations and if you set it to the Approx. mode, it will be compatible with all the old HP 48 user programs. Except that it runs them much faster, like, say 4 times as fast. "Slow" operations: Inverting a large numerical matrix is "only" down to 50% time or 2*speed. Native operations (ARM9 at 75MHz) like Garbage Collection or binaries like #1 #1000 FOR k NEXT loop, are 7*speed. Plotting a truth plot is 3*speed. The new Parisse's MSLV for solving multiple variables problems is 3.5*speed. BUT again I feel that the connection to a PC at 12*speed is the most remarkable speed increase. VPN

Re: What I'll suggest for my father?

*Message #3 Posted by **Joesph** on 29 Sept 2003, 7:21 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

I second that!

The screen is much better for old eyes.

Re: What I'll suggest for my father?

*Message #4 Posted by **Raymond Del Tondo** on 29 Sept 2003, 8:55 a.m.,*
in response to message #3 by Joesph

The screen quality difference gets much smaller if you compare the 49G+ with the latest 'black/white' high contrast screens in the HP-48GX's

I played with some 49G+'s at the Aschwil meeting, and I must say it's a really nice machine. Daniel Diggelmann showed me the keyboard issues, they are reproducable, maybe the next batch of machines will be better.

However, the 49G+ could be the real succesor of the HP-48. At this point there are 'only' three known flaws: Keyboard reliability, ENTER key position & size, and HP-48 software compatiblity. Keyboard reliability could be fixed (as written above), but a major drawback (for me) is the keyboard layout. Seems I have to build my own REAL HP-48GX+ at some time...

Raymond

Re: What I'll suggest for my father?

*Message #5 Posted by **Ron Ross** on 29 Sept 2003, 9:40 a.m.,*
in response to message #1 by Joe Panico

I think you are correct to consider the Hp28s or Hp48G series and pass on the newer calculators. At his age (and even mine) he will not appreciate the finer elements of these machines if he has to look for that DAMN tiny enter key that MOVED! The newer 49G+ doesn't have the HUGE library available to it yet that the 48G series has available to it NOW! And I suspect he probably has no use for the CAS or other extras (and if he does, the 48G series isn't that bad with the right downloads).

He may not even like the 48G series, if he is used to a 28c. Then the 28s would be an even more attractive solution. And best of all, these Hp's are actually affordable (especially after the exam bans have been announced).

The folly of dual data-entry modes

*Message #1 Posted by **DanO** on 28 Sept 2003, 10:44 p.m.*

Most people prefer a single data-entry mode (RPN or ALG). Why would any individual customer want a calculator that has both modes available?

This dual entry mode approach is nothing but a bad compromise on HP's part to try and appeal to all users and keep manufacturing and distribution costs low. Unfortunately, this approach is going to annoy HP's customers and create additional costs.

Imagine this: You are working on a complicated problem and you reach for your new HP dual data-entry calculator. You turn it on. Can you get to work immediately on your problem? No, because there is something you must do first. You must mentally set aside your work, however briefly, and check to make sure the calculator is in your preferred data-entry mode. This may not sound like much but it has to be done each and every time you turn on your calculator; day after day, month after month, year after year.

I predict failure for HP's dual data-entry mode approach. I would compare using one of these calculators regularly to going on a long walk with a permanent pebble in your shoe.

The additional costs will come when an ALG mode user inadvertently sets RPN mode and then contacts HP customer service because his calculator has gone haywire and doesn't work anymore. Does HP really want to deal with this?

The CORRECT approach for HP is to offer each calculator in its line-up in two versions: Permanent RPN mode and permanent ALG mode. For example, offer an HP-12CP RPN and a separate HP-12CP ALG and let the customer choose.

Re: The folly of dual data-entry modes

*Message #2 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 5:19 a.m.,*
in response to message #1 by DanO

You obviously have NEVER used a HP with both RPN/Alberaic entry. You set the mode once when you get the calculator out of the box and it stays that way.

If you need to soft-reset the calc, [ON]&[F3 C], the mode reverts to Algebraic (and some other flags will be reset to default, too), BUT, you can have a STARTUP program at Home: << myflags STOF >>, which will set them back (as long as you have done RCLF 'myflags' STO). Naturally you can put more stuff on that STARTUP.

In case you loose *all* your RAM, you can RESTORE you latest ARCHIVE from the User Flash "RAM". After that you boot and the STARTUP will kick in restoring your flags. So there you go!

NOW: Do you have other issues that worry you? Regards, VPN

I just tested an 'ON-C' warm boot on my HP-49G+ and it does not revert to algebraic mode. However I did notice one other undesired effect, it seems to detach any libraries attached to the HOME directory. This is something which the previous models, i.e. HP-48GX & HP-49G, did not do. Can someone confirm this behavior?

rdb.

After further testing, an 'ON-C' does detach libraries attached to the HOME directory but not any attached to a sub-directory, which is the same as on the earlier HP-49G. Neither calculator reverts to algebraic mode.

rdb.

Re: The folly of dual data-entry modes

*Message #4 Posted by **Todd Stock** on 29 Sept 2003, 9:36 a.m.,*
in response to message #1 by DanO

I agree in general; however, as covered in another note, the NCEES seems to be moving toward providing one type of calc for their exams, with this calc capable of either logic (pretty much narrows the field to those itty-bitty-Enter machines).

Given an announcement down the road that NCEES will only use a dual logic Calc X from Bad Calc Corp for exams, how many engineering students would opt for something else?

As I noted earlier, maybe HP's new approach is designed to allow their calcs to be used both in current programs with algebraic-only text book chapters, as well as in the NCEES-type environments.

Re: The folly of dual data-entry modes

*Message #5 Posted by **Mike (Stgt)** on 29 Sept 2003, 10:43 a.m.,*
in response to message #1 by DanO

I am not convinced.

Imagine, there exists an HP-nnGX2plus(RPN) _and_ an HP-nnGX2plus(ALG), you drive downtown to get one, drive back home to see you got inadvertently the HP-nnGX2plus(ALG) but wanted the HP-nnGX2plus(RPN). You can't change that by phone call.

To realy lower costs (on both sides) how about this vision: There is only **one** basic calculator (pocket sized, one-thumb operatable even by a one-armed salesman, like the HP-21 and homologous) and the functionality of your choice you choose from internet, test it in a emulator on your PC and transfer it by USB to the real device. You could even "build" a RPN scientific with TVM capability <G>.

Ciao.....Mike

Re: The folly of dual data-entry modes

*Message #6 Posted by **Steve** on 29 Sept 2003, 3:15 p.m.,*
in response to message #1 by DanO

I agree with your assessment of the dual mode of the HP-49. I used to be a great fan of the HP-48 and often recommended it to my students and offered help sessions on the calculator. But with the advent of the dual mode and the temporary disappearance of HP from the calculator scene, I gave up on them. It was just too much to ask when a student shows up for help to try to take into account their mode preference. Seems to me a solution would be to make two OS available via a flash memory installation, one for us RPN fans, and another for the rest.

Re: The folly of dual data-entry modes

*Message #7 Posted by **Victor Koechli** on 30 Sept 2003, 2:42 a.m.,*
in response to message #6 by Steve

I do not agree. Not at all. In fact, I can't see the problem here. Why should it be bad to allow the user to make his / her choice on the device of his / her preference?

Not to mention that, once you'd want to sell your calc, you could only find buyers for the logic your device has. Silly.

As for myself, I'll never use algebraic mode, of course, but then again, I couldn't care less about the calc being able to to it. My HP 49, BTW, does not revert to Alg on a machine reset (ON + C), only if you coldstart it.

Cheers, Victor

*Message #8 Posted by **Karl Schneider** on 30 Sept 2003, 3:11 a.m.,*
in response to message #1 by DanO

I have an HP-17Bii and 49G, and neither is difficult to toggle between modes, which stay set until they are changed.

Of course, dual mode will cause some unshifted key positions to be unused (e.g., "(", ")", "RDN").

screen reolution

*Message #1 Posted by **joe** on 28 Sept 2003, 8:48 p.m.*

Hi! I have a HP Pavillion 503w with 128 mb of ram, 40 gig hard drive, an intel celeron 1.7, and windows xp. I reinstalled windows on my computer now it won't let me change the screen resolution or the color. It is stuck in medium 16bit color and a 640 by 480 screen resolution. Also, when I go to device manager it has a section that says "other devices". In there it says video controller (VGA Compatible) and that has a little yellow thing on it. And I don't know what kind of video card installed. Can anyone help me???

Re: screen reolution

*Message #2 Posted by **David Ramsey** on 28 Sept 2003, 9:07 p.m.,*
in response to message #1 by joe

First, you should be aware that this is a forum for HP _calculators_. Your Pavilion is not a calculator.

Second, the reason you can't set higher resolutions is that you need to install an additional driver for your video card. Without this driver, Windows is limited to the 16 color, 640 by 480 pixel screen you have.

You can get the drivers from the web site of your video card's manufacturer. If you don't know what kind of video card you have, there are several options:

1. Look in the documentation and on the CDs that came with your computer.

2. Open the computer up, remove the video card, and look.

3. The video card's guts are probably made by either nVidia or ATI. Download drivers from both companies and try to install them-- they won't install unless you have the right card, so it's pretty safe.

32sii Memory upgrade

*Message #1 Posted by **charles** on 28 Sept 2003, 8:23 p.m.*

Hi all,

Have any of you attempted to upgrade the memory of the 32sii? Maybe 128k? I am new to circuitry so don't laugh if this is an obvious impossibility, but any thoughts would be nice.

Re: 32sii Memory upgrade

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Sept 2003, 8:39 p.m.,*
in response to message #1 by charles

I understand it is not possible to do so, but even if you manage to connect such memory to the calculator electronics, the software which runs the HP 32 Sii would not look for such memory, nor "see" it; and hence the memory will not be of any use.

Any expandable machine needs to be designed and programmed with expansion in mind to become so.

HP 41, 42 and 48 models are able to recognize memory beyond their original capacity, but (AFAIK) other models are not.

Re: 32sii Memory upgrade

*Message #3 Posted by **Tizedes Csaba** on 29 Sept 2003, 2:19 a.m.,*
in response to message #1 by charles

I'm not a 'nibble-man', but I think the hardware can't to attach more program area: This calculator have got 384 bytes of memory and one operation take 1.5 bytes. So, (384 bytes)/(1.5 bytes/step)=256 steps. The program-counter maybe sized only 1 byte...

Csaba

32Sii 3-nibble instructions

*Message #4 Posted by **Victor Koechli** on 29 Sept 2003, 8:14 a.m.,*
in response to message #3 by Tizedes Csaba

This is interesting! Are you sure there are only 3-nibble instructions in the 32Sii's program space? You would think that the limited number of programmable commands would allow for most instructions to be only 2 nibbles (1 Byte)...

Cheers, Victor

Re: 32Sii 3-nibble instructions

*Message #5 Posted by **Christoph Giesselink** on 29 Sept 2003, 12:20 p.m.,*

in response to message #4 by Victor Koechli

>Are you sure there are only 3-nibble instructions in the 32Sii's program space?

No there aren't. There's one exception, most (not all) real numbers have a three nibble prolog (#000) followed by a 16 nibble BCD floating point number.

Christoph

Re: 32Sii 3-nibble instructions

*Message #6 Posted by **Tizedes Csaba** on 29 Sept 2003, 3:57 p.m.,*
in response to message #4 by Victor Koechli

The 32SII haven't got 1 byte long instruction, only 1.5 bytes long. The integers from 0 to 254 use 1.5 bytes, all other numbers uses 9.5 bytes (from the B-2 page of manual).

Csaba

Re: "Meta-calc"

*Message #7 Posted by **Paul Brogger** on 29 Sept 2003, 9:17 a.m.,*
in response to message #1 by charles

I suspect that it would be possible to insert a new layer of logic an memory *between* the original 32SII chip and its I/O (keyboard and LCD).

Some currently unrecognized keystroke combination would bring the new environment to the fore, disconnecting the original chip temporarily. The new layer would replicate the 32sII program editor, but enhance it with named program storage and (perhaps) named register arrays.

New commands would cause the loading of a named program into the actual 32sII's program memory by keystroke simulations. Likewise, resulting data (the 27 registers) could be copied out to the new memory as an array of values, perhaps to be reloaded later.

The new electronics could include fast stream I/O capabilites and could be supported by PC links and software. The physical ciruit board might be installed in place of the original, with the 32sII board then attached as a daughter board to the new one.

Taking it a step further, one might replace 32sII electronics and logic entirely, with a new, more capable implementation.

Buutttt . . .

H-P appears ready to solve at least *some* of the 32sII's problems with the 33s (albeit, while introducing others!), so it would seem to make sense to wait and see just how that unit behaves before embarking on an elaborate upgrade for a discontinued model. Another approach might be to get one of the other new models (48GII or 49G+) and obtain or develop a four-level stack emulation for that environment.

*Message #2 Posted by **Tom Scott** on 28 Sept 2003, 8:02 p.m.,*
in response to message #1 by Andy

I bought an HP 82240B (new) a couple of months ago at:

http://www.holmans.com/eStore/Model_2_new.asp?ModelID=39&prodline=154

Tom Scott Lander, WY

A reason to keep the IR printer in production:

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Sept 2003, 8:16 p.m.,*
in response to message #2 by Tom Scott

... it is not RPN (sigh)

Re: Is the IR printer Still in production

*Message #4 Posted by **James M. Prange** on 29 Sept 2003, 5:31 a.m.,*
in response to message #1 by Andy

As far as I can tell, the 82240B is out of production, but you may well be able to find some still available. Note that they frequently show up on eBay. Note that for the 48 and 49 series calculators, you'll want an 82240B instead of an 82240A, to get the ECMA 94 character set.

I don't have a 49G+ (yet), but I've read that the 49G+ can still print to the HP 82240 printers.

Does anyone know whether the 49G+ can print by IrDA as well as the "Red Eye" protocol used for the HP 82240 printers?

Martel Instruments has some nice printers that look to me as if they should work HP calculators. See http://www.martelinstruments.com/8800.html. Perhaps HP will re-badge one of these, or have Martel Instruments make a customized version for HP. If the 49G+ can print by IrDA, I wonder whether the "IrDA physical layer" would suffice, or would the "IrDA stack" be needed.

Some of the Martel printers also have RS-232 available, so should work with the "old" 49G, although I expect

that a special application on the calculator would be needed for printing graphics.

Re: Is the IR printer Still in production

*Message #5 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 5:48 a.m.,*
in response to message #4 by James M. Prange

hp 49g+ has a "real" IrDa at 115,200. I have not tested it yet. Not on an old printer, not with an IrDA compatible printer, not even connected to a laptop. I use solely the USB at 115,200 to connect to a PC. The amazing 12*speed has prevented me to reverting back to any old HP with only 9600 baud serial connection. I don't use my HP 48GX anymore...)-`:

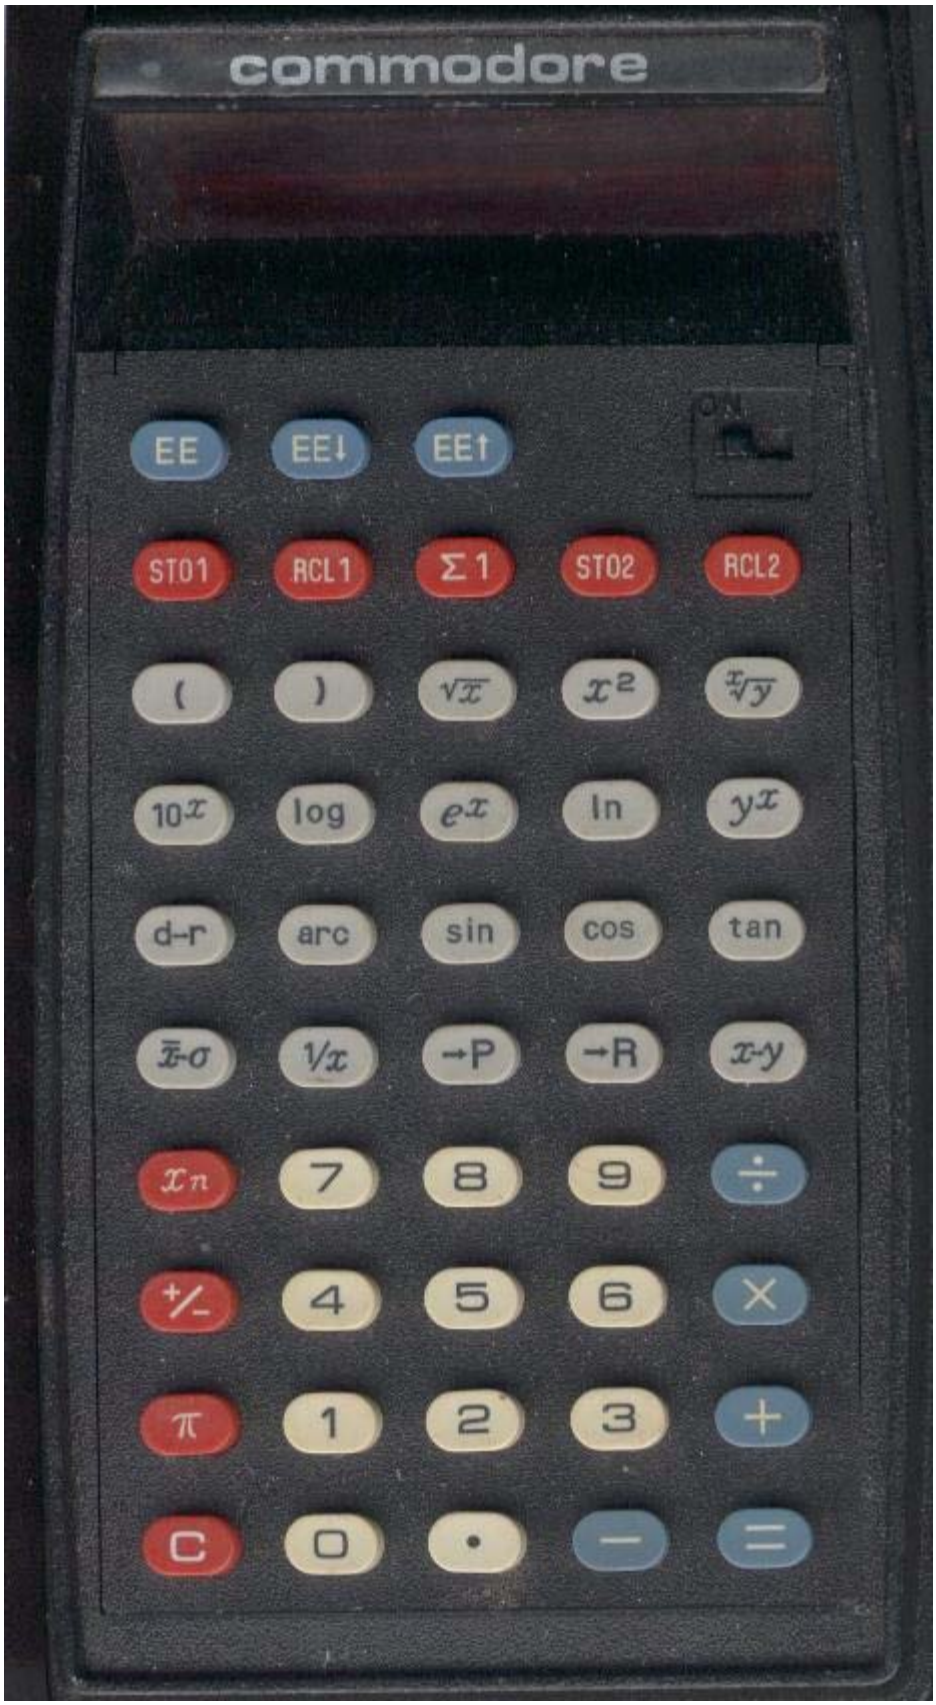
Commodore & Sharp calculators

*Message #1 Posted by **Thibaut.be** on 28 Sept 2003, 9:40 a.m.*

I came around to these calculators :

Commodore SR4148



Could anybody give me some details about it ? Does anyone know to what voltage I should plug in an adapter ?

This one is more for Valentin.

I remember a schoolmate had one of these, actually this calc is a programmable calc where you could store formulae pretty much in Hp style.

All comments welcome !

Re: Commodore & Sharp calculators

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 28 Sept 2003, 12:49 p.m.,*
in response to message #1 by Thibaut.be

I have the SR4190 (Dismac HF-37PR, brazilian clone) and SR9190. The SR4148 isn't much different, I guess.

Mine SR4190 uses a DC 6V non-regulated input (positive center), and their NiCD batteries are internal (non-removable). I think that they won't work without the batteries.

Regards,

Nelson

Re: Commodore & Sharp calculators

in response to message #3 by Douglas Rohm

The pictures are just a scan of the calcs themselves... This is the easy way to do so. Main disadvantage is that it makes look the item far worse than it is actually...

Re: Commodore & Sharp calculators

*Message #5 Posted by **hugh** on 28 Sept 2003, 6:44 p.m.,*
in response to message #1 by Thibaut.be

my take,

```
http://www.voidware.com/calcs/el512.htm
http://www.voidware.com/calcs/sr4148r.htm
```

be careful with commodore units that have internal cells. they normally have 3AA nicads. these leak and burn the circuit board. you should remove the old ones asap.

you have two choices (1) rebuld the internal batteries. to do this you will need to obtain tagged cells and even then they might not fit. the cavity inside the case is tight. i have tried to build a *very* slim holder for batteries so i can put in regular cells or regular chargable cells without them being soldered in. this plan has failed. my thinnest holder is too fat.

(2) remove the cells and run the unit from external power. do *not* power it from the correct mains adapter!! the correct adapter will put out something like 9v and damage the unit (the internal cells act as a load). i have found the unit powers happily if given the equivalent 4.5v from external power.

good luck,

Re: Commodore & Sharp calculators

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 28 Sept 2003, 8:55 p.m.,*
in response to message #5 by hugh

I rebuilted my SR4190 battery pack with one from wireless telephones batteries such as Panasonic KX-

A36A (NiCD, 3 cells, 300mA/H) or another with more mA/H (NiMH ones). They fit perfectly inside and are sealed.

Regards,

Nelson

Congratulations !

Rightly so !

*Message #9 Posted by **Valentin Albillo** on 28 Sept 2003, 8:15 p.m.,*
in response to message #8 by Mike

Congratulations for your fine-looking Sharp PC-1211 !

This was (and still is) an extremely fine, revolutionary machine, contemporary of the original 41C no less. It was less than half the price, yet it included such revolutionary characteristics as a 24-character alphanumeric dot-matrix display (the 41C was doing its best with a meager 12-char, segmented display), I/O to inexpensive magnetic tape and printer, 1680+ bytes of memory (equivalent to a 41C plus 3 RAM modules), redefinable keys, and high-level BASIC programming (instead of low-level, assembler-like RPN).

You could key-in expressions just as written, with such byte-saving niceties as implied multiplication (i.e: 5AB instead of 5*A*B), parenthesis supression (i.e: SIN X instead of SIN(X)), automatic parenthesis-balancing at the end of an expression (i.e: 5+SIN(2+3*(5-X with no need to include the two closing parenthesis), abbreviated entry (i.e: I. instead of INPUT), keyword tokenization (i.e: INPUT took a single

byte to store, not five), multiple expressions per line (i.e: X=2+3, Y=3-7, Z=2*SIN(X+Y)), and further you could recall the *whole* expression to the display after evaluation, for further editing and reevaluation (instead of LASTx in the 41C). Also, in case of errors, the expression would be recalled automatically with the flashing cursor pinpointing the exact location of the error.

All in all, a wonderful, revolutionary machine. You could do wonders with it, I wrote 100+ programs for it at the time, and most would do in just a few simple lines what you'd need hundreds of steps to accomplish on a 41C, say.

This was the machine that made me reevaluate my fixation for HP products and start my collection of Sharp machines. A true revelation. BTW, I've got 3 of them, plus two TRS-80 PC-1 models which are exactly the same machine, only this time manufactured for Tandy Radio Shack.

Best regards from V.

Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Sept 2003, 8:33 p.m.,*
in response to message #9 by Valentin Albillo

Valentín:

You have accurately described some of the nice features of the PC 1211, also marketed by Radio Shack (IIRC as TRS80 Pocket Computer).

I followed those models at the time, but political and economical circumstances in my conutry made us "disconnect" from such advances after 1982. I needed about 10 years after buying my HP 41C to be able to buy my next calc (HP 42S). The 75C and 71B were skipped, as the Voyagers did.

(OK, I also get married and become a happy father during these years, so HP calculators had to wait for a while...)

To the point: How would you compare the PC 1211 against the HP 75C/D and the HP 71B?

I assume these HP models were more expensive than the Sharp unit, but perhaps are more comparable to it than the HP 41.

Edited: 28 Sept 2003, 8:43 p.m.

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #11 Posted by **Valentin Albillo** on 28 Sept 2003, 9:31 p.m.,*

Andres wrote: *"To the point: How would you compare the PC 1211 against the HP 75C/D and the HP 71B?. I assume these HP models were more expensive than the Sharp unit, but perhaps are more comparable to it than the HP 41."*

Well, yes and no. "Yes" because all are BASIC "pocket computers", and "No" because it would be an outrageously unfair comparison.

Why ? Because the Sharp PC-1211 model is a pioneer-like machine, the very first handheld to feature BASIC as its programming language, released circa 1980, and designed to compete against 41C-class machines, thus its characteristics and, most importantly, price, are targeted to that segment.

On the other hand, the 75C and 71B (released circa 1982-1984) are *much* more expensive machines, 25 times and 10 times costlier, respectively, and are targeted to the business and engineering markets, not the casual home user. They are more like instruments or advanced tools than mere calculators/pocket computers. The 75C was squarely aimed to business users at first, what with its large alpha keyboard, appointment applications and Visicalc. The 71B was similarly aimed at engineering professionals, intended to be the controller of a number of advanced, specialized digital-capable instruments, via HP-IL and a number of interfaces.

This being so, comparing any of them to the Sharp PC-1211 is an utterly preposterous mismatch, and should not be done, IMHO. It would be like comparing the 41C-class machines to, say, the HP-25.

Anyway, they share a number of important characteristics in common, namely:

- large, dot-matrix alphanumeric display

- I/O capabilities, including printing and mass storage

- BASIC language

- ability to evaluate algebraic expressions directly, while being able to recover the whole expression after evaluation

- instant-mode calculations without programming

- redefinable keyboard

but the differences in speed and features are overwhelming. Nevertheless, the Sharp PC-1211 is a pleasure to use, and has a larger display than the 71B, and for casual programming and use as a powerful, programmable pocket calculator/computer, it does more than deliver.

Further, though its BASIC interpreter is way simpler than 71B's, it *does* include some capabilities that the latter doesn't such as computed GOTO/GOSUB (i.e: GOSUB 200*X+100*((Y>5)+(Y<8))+200*Z or GOTO B$), and you can save hundreds of programs on inexpensive cassette tape instead of quite expensive mag cards or digital tape drive.

Best regards from V.

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #12 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 5:43 a.m.,*
in response to message #11 by Valentin Albillo

The HP-75 is a direct CMOS copy of the HP-85 PC (8-bit CPU), which was "current" at that time. The cost was very justifiable for the users of the bigger brother. The Visicalc module was the key sales factor and other expansions, including then popular HP-IL, gave versatility. Using a Video adapter you would not even need that heavy HP-85, at least not if you were traveling around.

The HP-71 was the only BASIC computer to follow the IEEE standards in math. There is no comparison for it's math features! Expansion for HP-IL (cassette or disc drive, etc), RAM, MATH, Curve Fit, Finance, FORTH/Assenbler (including a HP 41C emulator) gave it versatility.

What can I say? They were expansive, but worth it. I had them *AND* I re-bought them lately!!!

I also still have two Sharp calculators: PC-1500 (with expansion cradle and a plotter) and PC-1261. The Casio FX-702P that I also own, is much harder to use than any Sharp or HP due to limitations in editing and BASIC language.

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

in response to message #12 by Veli-Pekka Nousiainen

VPN wrote: *"What can I say? They were expansive, but worth it."*

Only if you could afford them, which was extremely unlikely if you were a student at the time, as I was. The HP-75 was some US$ 2,500 (1982's dollars), and the HP-71B was US$ 750 (1984's dollars) and there was no way I could get that much money then, let alone forking it our for a 'calculator'. The Sharp PC-1211, on the other hand, was just a mere US$ 120 (1981's dollars), which was a reasonable price I could actually afford and I did get one.

"I also still have two Sharp calculators: PC-1500 (with expansion cradle and a plotter) and PC-1261."

You'd do well to try and get a Sharp PC-1350 (or 1360). You'll find it's much more lighter, smaller and stylish than the 'brick-like' PC-1500, and after getting used to its wonderful 4-line, 96-character graphics display I'll bet that you'll find the HP-71B's 1-line, 22-character display next to unusable for program editing and results output, as it actually happened to me, after many years using and programming the HP-71B.

Now the Sharp PC-1350 (together with the HP-15C) is my usual, everyday pocket computer for quick programming and manual computations while the HP-71B (all 3 of them) are comfortably stored in their drawer. After being spoiled by the four lines available to key in the longest of expressions in full view, without reordering anything, without ever getting lost, I just can't stand the ultra-cramped, always-scrolling HP-71B's display anymore.

Best regards from V.

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #14 Posted by **hugh** on 29 Sept 2003, 11:39 a.m.,*
in response to message #13 by Valentin Albillo

im with valentin on this one. the pc-1350/1360 is top kit. i used one for years and found it highly versatile. you can set up key abbreviations to your liking, the 4 line display is lux and programing is a doddle.

very well made units too.

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #15 Posted by **GE (France)** on 29 Sept 2003, 4:34 p.m.,*
in response to message #14 by hugh

Just note that the PC1211 has 1424 steps (bytes) available to the user. If you want one of those excellent 4-line Sharp machines, you'd rather turn to the PC1600 for

absolute top of the line. Alas, it's hard to find, and has the 'brick' style of the 1500. Another possibility is the PCE-500 which has all what the 1350/1360 has, and more. Expandable to 512K, and still available brand new in Germany, as the updated 'S' version.

HP should have made multiple-lines Basic machines, but maybe it would have been too 'fun' ? Also, prices were maybe justified, but out of reach. This probably leaded them to -erroneously I believe- give these the axe. Too bad.

Palmtops with BASIC

*Message #16 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Sept 2003, 6:25 p.m.,*
in response to message #15 by GE (France)

Well, trying to be positive with HP, a 95/100/200 LX with MS-DOS 5.0 and QuickBasic is a nice "HP palmtop with BASIC and multiline display"...

And it also has a very nice calculator application with 4-level stack RPN and Algebraic modes, a good scientific and financial functions repertoire, graphing, etc... running in a 8086-class machine. (Emulator fans, please note!!!)

Re: Sharp PC 1211 vs. HP 75C? (or 71B?)

*Message #17 Posted by **Valentin Albillo** on 30 Sept 2003, 4:50 a.m.,*
in response to message #15 by GE (France)

GE posted:

"Just note that the PC1211 has 1424 steps (bytes) available to the user."

Nope. It has 1424 bytes available for programs *plus* 26 fixed variables A-Z, plus 48 bytes for key definitions, which makes a total of 1424 + 26*8 + 48 = 1680 bytes available to the user. I'm not counting internally reserved memory, such as 80 bytes for the command-line input buffer, the stack for operators and operands, etc.

" If you want one of those excellent 4-line Sharp machines, you'd rather turn to the PC1600 for absolute top of the line. Alas, it's hard to find, and has the 'brick' style of the 1500."

Exactly, it's "brick-like", i.e: large, heavy, and bulky, and eats batteries pretty fast. I still stand for my recommendation to get instead a Sharp PC-1350/1360, which is far lighter and smaller, its batteries last many months, and has a lot of memory, 4x24 char graphic display, and tons of advanced functionality. The PC-1600 is *not* a good choice at all for an everyday-use machine, and it's also quite rare and thus very expensive, while a 1350 can be had for as few as US$ 25-50.

" Another possibility is the PCE-500 which has all what the 1350/1360 has, and more. Expandable to 512K, and still available brand new in Germany, as the updated 'S' version."

The PCE-500 is far larger than the HP-1350/1360, much less 'attractive-looking' (i.e: uglier), and has a plastic body instead of metallic. Its screen is also much

darker and much less easier on the eyes than the luminous, clear screen of the 1350. But the biggest problem is it's very bulky, it certainly fits no pocket whatsoever, and takes a fairly amount of space in your briefcase. Not in the same league as the slim 1350. It also eats batteries very fast.

As someone else posted recently, remember this proverb: "The best is the enemy of the good". Don't strive to get 'maximum functionality' at the expense of convenience, else you may find yourself with an HP-49 in your hands.

Best regards from V.

Where did you get these numbers

*Message #18 Posted by **Mike** on 29 Sept 2003, 10:08 p.m.,*
in response to message #13 by Valentin Albillo

You say: "The HP-75 was some US$ 2,500 "

Where did you get that number. I bought one when they first came out and didn't pay half that.

Re: Where did you get these numbers

*Message #19 Posted by **Mark Hardman** on 29 Sept 2003, 11:17 p.m.,*
in response to message #18 by Mike

I agree that $2,500 is way too much. I bought my HP-75C in 1982 at the BYU bookstore for $995 less 10% discount (end-of-semester sale) and another 10% off for my parents' staff discount.

It came to less than $850 with tax. It was the first thing I did with that year's student loan.

Mike wrote: *"You say: "The HP-75 was some US$ 2,500. Where did you get that number."*

From my HP sales representative in Madrid (Spain, Europe) circa 1982. They were sold at those outrageous prices abroad. If I recall correctly, Wlodek says in his "Guide ..." that the HP-71B was sold at something like 700-800 sterling pounds in UK, which is also a truly awful lot of money for something that at the time essentially seemed like a calculator.

As far as I know, HP Spain sold extremely few HP-75 units in Spain ... if any ...

Best regards from V.

in response to message #10 by Andrés C. Rodríguez (Argentina)

Hello Andrès,

As pointed by Valentin, the PC 1211 is the first of his kind and could not be compared with HP 75.

I suppose that the more advanced PC 1500 or PC 1600 are better candidate. But as I don't have an HP 75 or 71 I can't do the review myself. The PC 1211 could not even be compared to the HP 41, as they are very different machines with different philosophy. To make things short the HP 41 has more built-in function and more interface possibilities, but the Sharp is far easier and faster to program when dealing with large formulas. The connecting possibilities of the Sharps pocket computers to nearly every kind of tape recorder is a great advantage also. Then specially to Valentin : I sometime post in two new forum dedicated mainly to Sharp machines : http://www.aldweb.com/forum.php?lng=fr&cat=70 http://pocket.free.fr/forum/list.php?f=1 There is still few contributions and we lack good pens. So we wait for you Valentin !

All the best

Re: Commodore & Sharp calculators

*Message #28 Posted by **Chris Randle (UK)** on 29 Sept 2003, 5:58 p.m.,*
in response to message #1 by Thibaut.be

Wow, that picture of the SR4148R brought some memories flooding back.

It must have been about 1975 when I got mine. I was ten years old. At school we were free to choose whatever calculator we liked as long it had certain functions that we needed for the maths lessons. There was surprisingly little duplication.

The machine you chose said a lot about you. I was very proud of my Commodore and thought it easily the best calculator in the class! Today, I still remember some boys just because of the calculator they had. There were one or two with HPs. One with a TI. Mostly Casios though. There was one other boy out of about 25 with another 4148.

Something that makes me smile every time I think about it was the lessons we had where we did our calculations from log books even though we all had calculators. This was because, as our teacher explained, we'd always be able to find a log book but we couldn't always guarantee that there'd be one of these new-fangled calculators to hand.

Re: Commodore & Sharp calculators

*Message #29 Posted by **Ed Look** on 29 Sept 2003, 8:39 p.m.,*
in response to message #28 by Chris Randle (UK)

Your story made me laugh. A young lady once came into a lab class without a calculator (this is less than ten years ago). She wanted to be excused without penalties on this basis. A technician silently and promptly disappeared into his lab and reappeared with log tables. The young woman stared in a confused way at them and exclaimed, "I need a calculator and you bring me sheets of paper?!"

The tech and I, well, we bemoaned the reality (nowadays) that you can almost always get a calculator but almost no one even knows what those charts of antiquity even mean.

HP 41cx mem and math module

*Message #1 Posted by **Phil Jonker** on 28 Sept 2003, 4:30 a.m.*

Hello, Can someone explain what difference a quad memory and math module will make to an HP 41CX please. Kind Regards Phil

Re: HP 41cx mem and math module

*Message #2 Posted by **Juergen (CH)** on 28 Sept 2003, 6:08 a.m.,*
in response to message #1 by Phil Jonker

Quad memory module is useless for an 41CX/CV. It's for an 41C and adds 4 x 63 storage registers; same as four "normal" memory modules 82106A, but uses only one slot. Math module adds some enhanced mathematical routines to your 41C/CV/CX. I have one and can give you a list of the routines if you are interested.

Regards, Juergen

Re: HP 41cx mem and math module

*Message #3 Posted by **Ion Abraham (New Mexico USA)** on 28 Sept 2003, 11:27 a.m.,*
in response to message #2 by Juergen (CH)

Also, the math module was eventually combined with the statistics module. Then, later, the math/stat module was reworked into a version called the advantage module. I personally prefer the math/stat version.

As far as memory, the only memory enhancement that can be made to the CX is the extended memory module.

Regards,

Ion Abraham Albuquerque, New Mexico

Re: HP 41cx mem and math module

*Message #4 Posted by **Valentin Albillo** on 28 Sept 2003, 7:54 p.m.,*
in response to message #1 by Phil Jonker

The quad memory module does *not* work with an HP-41CX so there's no use at all in plugging it in, at worst you could lock the machine.

As for the math rom, you can use it with your 41CX if you've got one, but you'd be better advised to try and get the Advantage ROM instead, as it is far more powerful and convenient (for instance: extensive matrix functions, numerical solve, numerical integrate all implemented as machine-language keywords, instead of user-code RPN programs, thus 10+ times faster and no user resources required; plus basic financial functions, complex-number handling, vector computations, differential equations, etc).

Best regards from V.

HP-30S Discontinued?

*Message #1 Posted by **Tom** on 27 Sept 2003, 7:17 p.m.*

Does anyone know if the HP-30S has been discontinued? There was a notice in the local STAPLES store that HP-30S was on sale for about $5.00 as a Discontinued Item. Does anyone know what the replacement will be if it is discontinued?

Re: HP-30S Discontinued?

*Message #2 Posted by **Raymond Del Tondo** on 27 Sept 2003, 7:56 p.m.,*
in response to message #1 by Tom

The suitable replacement could be the NULL device...

Look at the 9G, 9S, and maybe 33S ;-)

Raymond

Re: HP-30S Discontinued?

*Message #3 Posted by **ned** on 28 Sept 2003, 3:39 p.m.,*
in response to message #1 by Tom

just picked up one for $6 at staples, just for kicks. it's worth that much due to the quadratic root solver and linear intersect solver, but the lcd is impossible to see because of the curved glossy plastic finish. the calc won't stay put on a table without being slid into the cover. keys are plastic but don't have good feel. yadda yadda yadda. i'd rather have a 20s. -ned

Re: HP-30S Discontinued?

*Message #4 Posted by **hugh** on 28 Sept 2003, 6:36 p.m.,*
in response to message #3 by ned

a real shame is the quadratic solver could be a lot more accurate than it actually is. the 30s (and others like 9g) work internally to 24 digits.

the 30s suppresses add & subtract relative result to 10^-9. eg 2+1e-9-2 = 0 on a 30s (this is wrong). this has been fixed on the 9g which gets 10^-9 correctly. it however supresses at 10^-13 to emulate 13 digits.

the suppression means it wont be any more accurate than a ten digit calculator for any calculation involving add & subtract :-)

Re: HP-30S Discontinued?

*Message #5 Posted by **Bob** on 30 Sept 2003, 9:15 a.m.,*
in response to message #4 by hugh

I guess I just like all calculators. I picked up one yesterday for $5.50 just to look at it. I wouldn't spend the $16 dollars it cost before, but for $5.50 I think I will buy a couple and just play with them. It seems to be just as good as the TI that I bought for a briefcase beater-calc, and this one says "hp" on it. My daughter will like the teal faceplate. I'm using the black one.

The shape will also come in handy if I decide to level my table with one by placing it under the leg.

Sparcom´s Drive95

*Message #1 Posted by **Thomas Otterbein** on 27 Sept 2003, 5:59 p.m.*

Hi!

Anybody use Sparcoms´s Drive95 with the HP49GX?

If yes, which drivers and connection cables are needed?

Thanks for help! Bye... Thomas

Re: Sparcom´s Drive95

*Message #2 Posted by **Raymond Del Tondo** on 27 Sept 2003, 7:54 p.m.,*
in response to message #1 by Thomas Otterbein

Hi,

I don't use a 49GX, I think you mean the 49G+ ;-)

However, the Drive95 acts as a KERMIT server, so if your 49Ganything has KERMIT, it'll work. Just use the appriorate KERMIT commands.

Please note that the Filer library from the Drive95 diskette won't work in any 49G machine. That filer from James Donnelly is exclusively for the real HP-48 series. For DOS based machines, like the LX series, a driver is supplied on the disk, too.

The HP-48 series and the 49G have a 'normal' serial port, the 49G+ has a mini USB, maybe a usb-to-serial adapter could do, but that should be in the manual;-)

BTW: Watch the NiCd cells!

Raymond

HP-33S

*Message #1 Posted by **George Rose** on 27 Sept 2003, 4:36 p.m.*

I have been seaching for information on the new 33S. From what I have read it will have 32K of memory. While this is only a small memory by todays standards, it is a lot to enter by hand more than once. It doesn't look like the 33S will have a main power supply and a battery back-up for program memory. So you could end up re-entering the programs after changing batteries. Has anyone read something I have missed? I am interested in putting my surveying programs into the 33S and reselling them if it had input/output capabilities.

Re: HP-33S

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Sept 2003, 4:49 p.m.,*
in response to message #1 by George Rose

I understand it will have no I/O. Memory should withstand a prompt battery change, even without a backup battery, but I agree that the risk of losing contents is more than acceptable for such models and memory amount.

Please note I have no special information on this model, this is just from what I have read about it.

Re: HP-33S

*Message #3 Posted by **CME750** on 27 Sept 2003, 5:34 p.m.,*
in response to message #1 by George Rose

You can safely assume that the 33S *won't* have IR capability. All calcs with IR, including every HP48 model and the 49G+, were recently banned by NCEES for use on the professional engineering and surveying exams. But NCEES has also announced that the 33S has their "seal of approval". That can only mean that it lacks IR.

It probably won't have a serial or USB port either. The 33S looks like a modified 32SII, and the 32SII didn't have them. The most detailed prerelease info about the 33S, at http://www.hpcalc.org/images/datasheet33s.pdf, makes no mention of any I/O ports.

I wouldn't expect memory loss during battery changes, as long as this is done reasonably quickly. I've never had a problem with other HP calcs in this respect.

Re: HP-33S

*Message #4 Posted by **Ed Look** on 27 Sept 2003, 6:31 p.m.,*
in response to message #3 by CME750

Well, with my FIRST HP, the 34C, I believe we were told in the manual (if anyone likes, I'll go look it up) that we had about a minute or two before programs and values stored in memory began to be lost or corrupted. I do recall that times I was able to swap battery packs efficiently, my programs were not lost, but when I was slow, there was the dreaded "Pr Error" message staring at me in glowing red.

I have not yet had to change (the disposable) batteries in my Pioneer series or Charlemagne series models

yet, so for those, I have no idea.

Re: HP-33S

*Message #5 Posted by **Richard Garner** on 28 Sept 2003, 2:51 a.m.,*
in response to message #4 by Ed Look

I just checked my manual for the 42S. It states that the batteries must be replace within 1 minute of there removal to prevent memory loss.

Re: HP-33S

*Message #6 Posted by **CME750** on 29 Sept 2003, 12:17 p.m.,*
in response to message #4 by Ed Look

For the record, the 32SII and 48G Series manuals give you 2 minutes to swap batteries without memory loss.

The 11C manual states that the memory is preserved without batteries for a "short time". This interval, though unspecified, supposedly allows "ample time" for battery replacement. Memory may be lost if the batteries are out for an "extended period".

Edited: 29 Sept 2003, 3:50 p.m.

Changing batteries

*Message #7 Posted by **Valentin Albillo** on 27 Sept 2003, 6:43 p.m.,*
in response to message #3 by CME750

"I wouldn't expect memory loss during battery changes, as long as this is done reasonably quickly. I've never had a problem with other HP calcs in this respect. "

Just you try an HP-28C/HP-28S. You'll discover a new definition of hair-pulling ! Worst design ever for a battery door/battery compartment ...

Best regards from V.

Re: HP-33S

*Message #8 Posted by **George Rose** on 27 Sept 2003, 9:00 p.m.,*
in response to message #3 by CME750

I don't use the IR communications of my 48GX very often. But I use the wire communications port very regular. It would be great if the 33S would get a USB port to enable upload and download capability. This should allow the 33S to obtain the "seal of approval" from NCEES.

Re: HP-33S -- may have only 4k BYTES of memory . . .

*Message #9 Posted by **Paul Brogger** on 29 Sept 2003, 3:36 p.m.,*
in response to message #1 by George Rose

Some observant lurker noticed that the product sheet for the 33s' microprocessor (as announced, the "SPLB31A") notes 32K *BITS* of RAM, which translates to 4K *bytes*. Given the rough-cut nature of those early PDF product summaries, it wouldn't be surprising at all that the 33s has only 4k bytes of memory. For my part, I've been assuming the 33s has 4K, and will be pleasantly surprised if it has more than that.

Now, maybe that's enough for surveying applications, maybe not. It's still a whole lot of one-finger typing!

Re: HP-33S -- may have only 4k BYTES of memory . . .

*Message #10 Posted by **Ed Look** on 29 Sept 2003, 3:42 p.m.,*
in response to message #9 by Paul Brogger

Yipes. And here I was thinking that the 32Kbytes of the 48G was confining.

Re: HP-33S memory -- the links

*Message #11 Posted by **Paul Brogger** on 29 Sept 2003, 4:10 p.m.,*
in response to message #9 by Paul Brogger

The original message with the 4k warning has URLs for the SPLB31A datasheet.

(Now I'll go see if the work . . .)

Re: HP-33S -- may have only 4k BYTES of memory . . .

*Message #12 Posted by **CME750** on 29 Sept 2003, 4:31 p.m.,*
in response to message #9 by Paul Brogger

There is a pre-release PDF product summary for the 17bii+, dated May 30, 2003, at:
http://www.davik.plus.com/17bii+.pdf

According to this sheet, the 17bii+ has the "SPLB31A" CPU, and "32K bytes" of memory. Seems suspiciously similar to the 33S.

The 17bii+ is now available, and it has 28KB of memory. So the 33S may be similar.

By the way, the 17bii+ sheet also indicates that this model offers "Currency conversations". Apparently money talks.

Re: HP-17BII+ memory capacity

*Message #13 Posted by **Paul Brogger** on 29 Sept 2003, 6:28 p.m.,*
in response to message #12 by CME750

Well, that's interesting. This from a datasheet that says (and I quote): "Memory Capacity -- Unlimited within available memory". I suspect they're using the same translation program for these datasheets that they used for the 49G+ manual.

Anyway, following the SPLB31A "confirmation sheet" link (see also earlier post), it doesn't exactly say "32K Bits", but does specifically say 4096 Bytes of data RAM (and 192 bytes of "zero page RAM", plus 256 Kb ROM). Well, maybe they added a memory chip, or somehow got parts with upgraded specs?

If it's got tens of thousands of bytes available, I'll be the last to complain! The 384 bytes (or whatever) in the 32s/sII was those models' major drawback, as far as I'm concerned. (Especially inasmuch as that limited space was needed for both programs *and* registers.)

However, even if it's got something like 32K of program space, it will be crippled if it's still only got the 32s/sII's 27 registers for data memory . . .

Hey! I'm ever-hopeful. I've pre-ordered a 33s from Samson Cables, and am blindly optimistic that the

thing will act more rationally than it looks!

Re: HP-17BII+ memory capacity

*Message #14 Posted by **CME750** on 29 Sept 2003, 7:38 p.m.,*
in response to message #13 by Paul Brogger

The available prerelease info indicates that the 33S will only have 27 storage registers, like the 32SII.

But look again at the 17bII+. I don't have one, but the manual is online; follow the "product manual" link from: http://www.hp.com/calculators/financial/17bIIplus/

At first glance, the 17bII+ seems even worse: it only has 10 storage registers. But if I understand the manual correctly,up to 28KB of equations and variables can be defined for use by the Equation Solver. The variables can have names up to 10 characters long. The values within the variables can be stored and reused by different equations.

If the 33S has a similar Solver, and if programs can invoke the Solver (as they do in the 32SII), then it may be possible to use Equation variables for data storage.

So, what would you pay to have programs entered into your 33s or 42s?

*Message #15 Posted by **Paul Brogger** on 29 Sept 2003, 3:46 p.m.,*
in response to message #1 by George Rose

Survey:

If someone were to offer a service whereby *your programming*, obtained as, say, a .txt file, was accurately entered into *your calculator* (mailed, I presume, to a post office box somewhere -- and returned promptly afterward), how much might you be willing to pay each time you needed it?

Re: So, what would you pay to have programs entered into your 33s or 42s?

*Message #16 Posted by **Ron Ross** on 29 Sept 2003, 4:35 p.m.,*
in response to message #15 by Paul Brogger

Nothing, because who could trust another finger pusher. Unless you develop a quick downloading method, you probably won't get any customers (even though they realize your effort is worth $$$$). Just no one can trust to pay you up front and you could not trust to be paid after the fact. Therefore It won't be worth your while.

And you could get an ocassional reset or memory loss from the customer (or he could inadvertainly delete) and want you to rekey.

Only way it works is if you develop a download technique that is fast and sure. Then maybe market that.

Re: So, what would you pay to have programs entered into your 33s or 42s?

*Message #17 Posted by **GE (France)** on 29 Sept 2003, 4:39 p.m.,*
in response to message #16 by Ron Ross

No, typing is much time-consuming than *checking*, so a suspiscious customer could fast-scan the program for correctness. So this service has value. However, from experience I think not a lot of people would put say $10 for service around a $70 calculator. Just a problem of perceived value.

Re: So, what would you pay to have programs entered into your 33s or 42s?

*Message #18 Posted by **Ron Ross** on 29 Sept 2003, 4:55 p.m.,*
in response to message #17 by GE (France)

And while checking, screw up your work, and expect you to again correct. May happen in 1 out of 20 cases (many people are much dumber than can be imagined, even an occasional RPN user). 8o) (BUT NOT ME!!!! well sometimes)

But when it does, and the person doesn't realize he is the one at fault, he will cause you 20 times the grief of your fee. Therefore you will break even and be stress out. Doesn't sound attractive to me. But if you can develop a fast download method, you could overcome this shortcoming.

Re: . . . Assume the accuracy question is solved . . .

*Message #19 Posted by **Paul Brogger** on 30 Sept 2003, 12:57 a.m.,*
in response to message #16 by Ron Ross

(I'm not planning to have my high schooler type in calculator programs to earn his milk money!)

For the sake of this question, assume there's no accuracy issue. (The 42s' contents could be fully and automatically verified against the input by comparing an IR-output listing to the original .TXT file -- the 33s would have to have the MEM sizes of the programs checked manually against predicted values.)

Assume no physical changes to the calculator, except perhaps an optional 32K upgrade to the 42s, and/or a capacitor replacement to insure retention of memory during battery changes. Would it be worth sending it away to get its memory "refreshed"?

What if there were a library of useful programs available as well? (What if making *your* programming available to others helped defray any costs to you?)

The tone of the other responses is negative, though most of those objections relate to the accuracy question. I wonder if the value of these compact and otherwise powerful units would be enhanced enough to make a viable service of overcoming their external storage and bulk-input problems . . .

Program Entry Service --> Automation

*Message #20 Posted by **Katie** on 30 Sept 2003, 1:16 a.m.,*
in response to message #15 by Paul Brogger

Recently, I was thinking about designing a machine to enter programs into calculators that don't have external input interfaces. What would be needed is an movable X-Y table and a spring loaded solenoid. The X-Y positioning system could be low-precision since it would only need .1" (or worse) accuracy and would only need to travel a few inches. There might well be some surplus robotics stuff out there that is perfect for such an application and that already has a PC interface. Much of the work would be in writing the program to position the right calculator key under the solenoid, working out the solenoid stroke to avoid key bounce and translating the PC-stored calculator program into the right keystrokes.

This would allow for long programs to be loaded with much less chance of error than a person entering them. But you'd still need some sort of verification to make sure that it loaded correctly. The 20S, 21S and 32S/II provides a checksum for this purpose, but I don't know of any other HP calculators that do. Alternatively, calculators with IR printer output could be matched against the PC-stored program for error checking.

Has anyone tried to make such a machine? (Should I head down to the patent office right away or will they just cart me away when I get there? :)

Re: Program Entry Service --> Automation

*Message #21 Posted by **Dave Shaffer** on 30 Sept 2003, 1:44 a.m.,*
in response to message #20 by Katie

re: "Has anyone tried to make such a machine?"

I'm not sure about _making_ one, but a while ago (perhaps two-ish years) there was a fair discussion of such a robot button pusher - specifically to overcome the lack of I/O capability for certain of our favorite toys.

Somebody more familiar than me with searching the archives out to be able to find it.

Re: Program Entry Service --> Automation

*Message #22 Posted by **glynn** on 30 Sept 2003, 4:44 a.m.,*
in response to message #21 by Dave Shaffer

I much prefer an actual add-on, which permanently "enhances" the function of the calculator.

In a 33c, for instance, one could imagine a postage-stamp sized circuit board designed to hide in the internal cavity of the calc. Tagged to the matrix lines of the keyboard, so that it takes on the keyboard entry function electronically. Paralleled, in effect, with the real keyboard. If it is to synchronize with cpu signals on those pins, it might well be able to derive timing for its function from there.

It would communicate with the outside (probably a pc serial port) via the power-port. Your wall-charger would be a modified version of the regular one, but have a serial input port, and the incoming keypress data would modulate the power in a way that could be interpreted by the keypress circuit.

So your 33c would look the same in every way, yet a user could send a file of keypress data into it when needed. In every other circumstance, the extra circuit card would be dormant, benignly silent *(maybe the presence/absence of a modulating signal on the power line would wake/sleep the circuit)*.

I have no idea of the internal workings of a 33c, yet I think this sort of thing SHOULD be in the realm of the possible. Anyone know whether this could or could not be done, and why?

Would darn sure be convenient to have a "library" of programs that might be downloaded rather than "prodded" into the machine.

:-)

Re: Program Entry - Answers to Katie and Glynn

*Message #23 Posted by **Andrés C. Rodríguez (Argentina)** on 30 Sept 2003, 8:45 a.m.,*
in response to message #20 by Katie

Katie:

If you can find an HP Digest issue (perhaps from 1979, I'm just trying to recall back from 25 year old

memories), you'll see a black and white photo of an HP Button Pusher "robot", used to simultaneously exercise two or three Woodstock-class machines. I think it was sort of a quality control device, to test serviced units (HP considered calculators as not discardable items at the time).

Glynn:

The discussion about a "paralell keyboard" could be found in the MoHPC archives. Paul Brogger, Tony Duell, others, and I discussed how to arrange a couple of CMOS multiplexers (chip type is CD4052) and some optocouplers to create an electronically driven switch matrix which serves as a program input device for a HP42S. While I was not willing to risk my mint HP42 in the project, Tony Duell actually built and successfully test the circuit. What was left undone (as far as I know) was the PC interface. My idea was to use the printer/paralell port, but I also noticed there were drivers issues to be solved for a Windows environment. Since Tony is a Linux user, he could avoid such limitations...

For everyone else:

If the shipping issues could be solved (I don't think so), I can say (with pity and shame) that in my country you can find many, many unemployed, or almost unemployed, very qualified people (even medical doctors, engineers, PhD, etc.) who would program your calculators for a few dollars and with their degrees as a quality warranty.

Re: Program Entry - Answers to Katie and Glynn

*Message #24 Posted by **katie** on 30 Sept 2003, 11:05 a.m.,*
in response to message #23 by Andrés C. Rodríguez (Argentina)

Andrés-

I don't know about sending our calcs to Argentina to be programmed, supposedly the US is outsourcing too much high-tech labor already! :)

It's horrible that you have so many well-qualified people that are un/under employed. We complain about the situation here but I think that it's nowhere near as bad as it is in many other countries.

That's it!! Thank you.

Re: Program Entry Service --> Automation

*Message #28 Posted by **David Smith** on 30 Sept 2003, 12:44 p.m.,*
in response to message #20 by Katie

I built one once out of a cheap X-Y plotter. By taking off the plotter surface, the calculator could be put down into the machine case. Pen DOWN/UP commands pushed the buttons. Took about an hour to get everything working.

Backwards from the checksum

*Message #29 Posted by **Tizedes Csaba** on 30 Sept 2003, 12:58 p.m.,*
in response to message #20 by Katie

If the checksum is the 'exclusively' identifier, why not remakeable the program from it?

The programming: CK=? [type it...] HOW LONG? [type it, if it's necessary...]

Csaba

Re: Backwards from the checksum

*Message #30 Posted by **Paul Brogger** on 30 Sept 2003, 3:05 p.m.,*
in response to message #29 by Tizedes Csaba

Depending upon the checksum algorithm employed, the checksum will typically have enough information to indicate *whether* one or two mistakes have been made, but won't tell you *where* the mistake(s) is (are), and it (almost) certainly won't have enough information to completely rebuild the program.

Two *very* different programs may have the same checksum value. The idea is that two programs which differ, say, by only one line, will have different checksums. A wrong checksum indicates that the programmer must look more closely to find what is missing, or has been inserted, or may have been misspelled.

HP 42S'es on EBay?

*Message #1 Posted by **CaptainMorgan** on 27 Sept 2003, 10:20 a.m.*

Is it just me or does it seem like 42S'es have really gone up in value on EBay?

Re: HP 42S'es on EBay?

*Message #2 Posted by **Richard Garner** on 27 Sept 2003, 11:41 a.m.,*
in response to message #1 by CaptainMorgan

It's not just you, I have seen the prices jump about $150 in the last 2 to 3 weeks. One of the replacement 42S that HP sold as surplus a couple of years ago, a number of people bought to scalp, sold for about $500 last week.

Re: HP 42S'es on EBay?

*Message #3 Posted by **Patrick** on 27 Sept 2003, 12:20 p.m.,*
in response to message #2 by Richard Garner

I don't think it is limited to 42S's, either. Here is an HP-11C which sold for $265. Another one, described as used only a couple of times, sold for $405. This model usually sells in the mid to high $100's, with nice models breaking the $200 plateau.

Not sure what is happening.

Re: HP 42S'es on EBay?

*Message #4 Posted by **CME750** on 27 Sept 2003, 12:23 p.m.,*
in response to message #2 by Richard Garner

Any recent increase in 42S prices could be related to the new NCEES policy for calculators on professional engineering and surveying exams, which was announced without warning in late August. NCEES has banned all models in the HP48 and 49 series. There are *no* RPN scientific calculators in current production that are acceptable under the new NCEES criteria.

This situation has created a scramble for older, NCEES-compliant RPN calculators, like the HP11C, 15C, 32SII, and 42S. The 42S is particularly desirable, as it has a relatively large memory and handles complex numbers nicely.

When I learned about the new policy, I put down my 48GX and ran (not walked) to the local community college bookstore, where I found one last 32SII in their inventory.

Perhaps 42S prices may ease when the 33S becomes available.

Re: HP 42S'es on EBay?

*Message #5 Posted by **Valentin Albillo** on 27 Sept 2003, 6:48 p.m.,*

in response to message #4 by CME750

"The 42S is particularly desirable, as it has a relatively large memory and handles complex numbers nicely."

I don't think so. The 42S has both a relatively large memory AND text-input/storing capabilities. So it's probably not allowed as well.

The one-and-only most desirable model under the current restrictions is the HP-15C hands down. I've got four, Patrick's got six (IIRC), ..., it would be wise getting at least one before prices go skyrocketing even more.

Best regards from V.

*Message #6 Posted by **Ed Look** on 27 Sept 2003, 8:19 p.m.,*
in response to message #5 by Valentin Albillo

;)

Were you the guys who first drove the prices up?

Re: HP 42S'es on EBay?

*Message #7 Posted by **Bert K** on 28 Sept 2003, 4:58 a.m.,*
in response to message #6 by Ed Look

LOL, you've got a point there Ed. I must confess I'm guilty too, perhaps we are all responsable for sky rocketing prices on 42S'es and 32SII's. People start snooping up backup calcs, when demand is high and availability is low prices go up.

Re: HP 42S'es on EBay?

*Message #8 Posted by **CME750** on 28 Sept 2003, 1:28 a.m.,*
in response to message #5 by Valentin Albillo

The NCEES rules do not explicitly address the HP42S: it has neither been banned nor approved. As I understand it, the 42S has some text handling capabilities, but they are primitive compared to those of banned graphing calculators. Thus, there should not be same level of concern regarding exam security. Furthermore, the 42S has no alpha characters on the keyboard, and is unlikely to be perceived as a potential problem by exam proctors. In the absence of an explicit ban, you can assume that some people will be using the 42S on NCEES exams.

The 15C is a fine calculator, and it may be the best choice for electrical engineers. But only about 10% of professional engineering candidates take the electrical exam. The vast majority (around 75-80%) take the civil exam (in California anyway). For civil candidates, the greater programmability of the 42S is more valuable than the higher math functions offered by the 15C.

Land surveyors are also affected by the NCEES rules, and they are another solid market for the 42S. The 42S was widely used by surveyors before the introduction of the 48GX, and a lot of surveying programs were written for it. Since the 48 has been banned on the surveying exams, the old 42S may be the best available alternative.

in response to message #1 by Jon

```
Take care!
Some such HP-25,... could be damaged.
However for instance my HP-71B worked with HP-82066B & without any battery inside.
Yours.
```

Re: Classics calculators working with charger

*Message #3 Posted by **Randy Sloyer** on 27 Sept 2003, 9:15 a.m.,*
in response to message #1 by Jon

Classics were designed to run from the charger without the need for batteries in place. Perfectly safe.

Classic models (65,67) with card readers will need batteries in place for the reader to work as the wall wart alone cannot supply enough current.

The 20 series continuous memory machines will most certainly be toasted to death by operation with the wall charger with a bad battery or no battery present. The non-C models don't handle it as well, they just take a little longer for the smoke to come out.

Re: Classics calculators working with charger

*Message #4 Posted by **Jon** on 27 Sept 2003, 11:48 a.m.,*
in response to message #3 by Randy Sloyer

When I say classics I mean HP-35, HP-45, HP-55, HP-65 and HP-67.

Re: Classics calculators working with charger

*Message #5 Posted by **David Smith** on 27 Sept 2003, 2:05 p.m.,*
in response to message #4 by Jon

The classic charger has two supplies built in, one regulated for running the electronics, the other is low current, unregulated for charging the battery.

That gold strap in the charge plug port is actally a switch that connects to battery to the electronics when the charger is unplugged. When the charger is plugged in, the electronics run only off of the regulated charger and the battery is connected only to the unregulated charge voltage.

The 35/45/55/70/80 are fine for use on AC alone. The 65 and 67 have a connection of the card reader chip directly to the battery. Without the pack installed, the charge voltage can be fairly high and theoretically could damage the reader chip. Since dead reader chips are rather rare, I suspect that this is not too big a problem... certainly not like dead ACT chips in the woodstock machines.

External charging cradle for 41/97

*Message #1 Posted by **dbrunell** on 26 Sept 2003, 11:39 p.m.*

I recently acquired an external charging cradle for the sub-C pack used in the 97 and 41 printer. It is the same color as the 97 and has a translucent lid. When I place a battery pack into it and close the lid, the lid does not latch. Thus, the battery does not always make contact properly, and I have to put a rubber band around the unit to hold the lid closed.

Is this normal? Is the lid supposed to latch?

Thanks,

Dave

Re: External charging cradle for 41/97

*Message #2 Posted by **Vassilis Prevelakis** on 27 Sept 2003, 12:44 a.m.,*
in response to message #1 by dbrunell

No the lid does not latch, the weight of the battery pack is supposed to keep it in place so that the lid can close.

32SII Programming (General?) Question

*Message #1 Posted by **Ed Look** on 26 Sept 2003, 2:10 p.m.*

Actually, because of the length of time I have owned and used it, I am much more familiar with programming a 34C than the 32SII. I find the 32SII very similar except I don't see an "i" or "I" register (used for indirect addressing in the 34C). What is the equivalent or the work around in the 32SII?

Thanks in advance to anyone who has any ideas. (I know, I ought to look in the manual, but as of right now, even though it is by my elbow, I'm in the middle of something else [so what am I doing here, right?].)

Re: 32SII Programming (General?) Question

*Message #2 Posted by **Paul Brogger** on 26 Sept 2003, 2:36 p.m.,*
in response to message #1 by Ed Look

It should be the same as my 32s: There's a lowercase "i" on the "." key, and one in parentheses "(i)" on the "R/S" key. Use the former to STO & RCL to/from the register itself, use the latter to STO & RCL indirectly.

Re: 32SII Programming (General?) Question

*Message #3 Posted by **Ed Look** on 26 Sept 2003, 2:55 p.m.,*
in response to message #2 by Paul Brogger

Holy smoke!!

It must be more than simple blindness! I can't believe I didn't see it (all these years)! I have been avoiding writing routines that would have required the indirection.

Maybe I just still love my very worn out 34C way too much. I am hoping that the 49G+ will blow me away so I can begin to look at my bab... uh, 34C as you guys do, a virtual museum piece, or as Norm Hill put it, "an heirloom" (like my GameBoy oriented kids would want a RPN machine; I fear when they get old enough, and that's soon, their teachers will indoctrinate them with TIism, though admittedly as a parent, they are more affordable [so to speak; my 34C is now with me for close to thirty years, essentially very usable all that time!] and if the little tykes break one, I [emphasis on me] won't feel so bad.) Sorry for the rant.

49g+

*Message #4 Posted by **bill platt** on 26 Sept 2003, 3:03 p.m.,*
in response to message #3 by Ed Look

Hi Ed,

If the 48GX did not blow you away, and the 49G did not either, then I daresay the 49G+ won't. Maybe the 33s will?;-0

Regards,

Bill

Re: 49g+

*Message #5 Posted by **Ed Look** on 26 Sept 2003, 5:25 p.m.,*
in response to message #4 by bill platt

Well, I actually have the 48G (no +, no X), and the major irritation there was that, here I have this incredibly powerful calculator and no memory to run it on! It's like having some hulking, nasty battleship that has to stay in port because it guzzles too much diesel (or, tanks too low).

So, I'm guessing that I would have had a much more positive experience if I had a GX. I never got the 49G. I only have an emulator that I downloaded right before the real unit was released, the emulator that came in connection with some contest HP had back then to publicize the 49G. And an emulator is not a hard piece of plastic studded with cool buttons.

Re: 49g+

*Message #6 Posted by **Paul Brogger** on 26 Sept 2003, 5:50 p.m.,*
in response to message #5 by Ed Look

If you're handy with a drill and a soldering iron, it's EASY to upgrade to 128K (basically, a 48g+), and only somewhat more difficult to go to 256K. Theoretically, I guess, it's possible to go to something like 1-and-a-half Mb, but that's with an extra board and several decoding chips.

There are a number of links on the Web describing this process.

I did a couple 48g's to 256K, but backed 'em down to 128k when some of the solder joints didn't hold. (You have to piggy-back two 128K memory chips, and I didn't do something right, as the pins didn't stay soldered together very well.) But the 128K versions seem to be fine.

FYI . . .

Re: 49g+

*Message #7 Posted by **Ed Look** on 26 Sept 2003, 6:13 p.m.,*
in response to message #6 by Paul Brogger

I'm not too bad with the ol' soldering iron; it's the drilling part that spooks me. I don't own a Dremel or any such thing. Even so, if I were to do it manually with some small tool bit or screwdriver or some such implement, I'd fear damaging the surrounding plastic around the rivets; neither do I believe I can find a chunk of time to concentrate so delicate a surgery- kids, etc. I think I'll entrust the upgrade to Randy Sloyer.

But as to soldering on two RAM chips piggybacked, would there be the slightest risk of excessive heat during operation if it did work? And as to the actual connecting- were the pins long enough for this sort of thing or could you connect them using some fine wire and do sort of an early Spice-type clamp down of the unsoldered chip to the soldered one? Anyhow, just daydreaming out loud.

Re: 48g(+)

*Message #8 Posted by **Paul Brogger** on 26 Sept 2003, 6:38 p.m.,*
in response to message #7 by Ed Look

I must say, both of my units had some slight scratches on the face from separating the case halves. (The drilling went fine, and doesn't show -- it was the act of pushing some internal spring tabs aside to separate the front from the back that I didn't handle as well as I might have . . .) I believe that, with the right tool and a unit to practice on, all cosmetic damage can be avoided. But my two 48G's *were* my "practice units".

On the piggybacking of memory chips, the plan was to bend the upper chip's surface-mount tabs straight down, and then solder almost all of them to the leads of the chip below. In fact, there was something like a ~.5 mm gap between the ends of the upper pins and the tops of the lower, and I bridged that with solder. Apparently, some of those bridges broke loose over time. (The units worked fine for several weeks, then started exhibiting intermittent failure.)

I suppose some sort of tie-up with thin copper wire would work. I envision a loop or figure-eight around each pair of pins to be connected, and temporary connections across the top to the next pair of pins to be joined. After soldering, all the superfluous connections would be cut away.

But before I got to that point, I realized that I don't really fill up my 48's with programs -- I just wanted to upgrade 'em *because it could be done* ... I resisted the urge to make it work, and satisfied myself with 128K.

Re: 48g(+)

*Message #9 Posted by **Ed Look** on 26 Sept 2003, 8:58 p.m.,*
in response to message #8 by Paul Brogger

I understand the feeling. It's nice to be able to reach up and pull up another level higher... but usually this costs, in terms of sweat (and sometimes tears).

But I really need the extra memory, though I suppose 128K is sufficient... <fingers crossed>.

Re: 32SII Programming (General?) Question

*Message #10 Posted by **Paul Brogger** on 26 Sept 2003, 3:21 p.m.,*
in response to message #3 by Ed Look

There's something to be said about using a trusted model with a red LED display! I'm not surprised you subconscously found a way to justify it.

I wouldn't count the 48Gii/49G+ out just yet. It looks as if many of the 49G's problems have been addressed, and if "early production quirks" does indeed explain the few keyboard problems we've heard about, it should be even better than the 48's.

Re: 32SII Programming (General?) Question

*Message #11 Posted by **Iqbal** on 26 Sept 2003, 5:27 p.m.,*
in response to message #10 by Paul Brogger

I especially like the display resolution and the lightning speed of downloading to the 49G+. Programs that took upwards 5 mins to download on the GX takes only less than 5 seconds on my G+. The only thing I can really say I dislike on the G+ apart from the loud keyboard [try typing when the wife is trying to sleep], is the fact that you must watch everything you type, cause you

might miss a character.

Re: 32SII Programming (General?) Question

*Message #12 Posted by **Ed Look** on 26 Sept 2003, 5:38 p.m.,*
in response to message #11 by Iqbal

You don't say! 5 seconds?! I don't think my PC moves files to a Zip drive or jump drive that fast! Well, that too is something to look forward to. Hmmm... maybe HP is angling to regain some sort of dominance in calculators.

Re: 32SII Programming (General?) Question

*Message #13 Posted by **Ed Look** on 26 Sept 2003, 5:33 p.m.,*
in response to message #10 by Paul Brogger

Well, my 48G FEELS as solid as a brick, as solid as my Old Spice ;) ... and actually, the 32SII feels rather solid, too, but you know, and here's where I show my real geeky side, the 34C is like TOS Star Trek, you know, Captain Kirk's ship with all the buttons sticking out from all the consoles, etc., and did the job well. The 32SII is like the Next Generation Trek: slicker, streamlined, rounder corners, and LCDs instead of LEDs, but still does the job well (even better, really, if I'd admit to it), but somehow feels a little less substantial nevertheless.

I preordered a 49G+ and am sort expecting it to blow me away! (You know, allows use of SD chips, and like that... that one feature impresses me the most, that HP would allow the user to do that rather than buying some prohibitively expensive memory plug ins proprietary to HP!)

Programming Equations

*Message #1 Posted by **TMC** on 26 Sept 2003, 10:06 a.m.*

Is there a way to program or save several frequently used (and complex) formulas to be used later in the Solver application of a HP48GX, instead of having to reenter the entire equation every time?

I'm feeling rather stupid that I haven't been able to figure this out.

Any help is appreciated.

Re: Programming Equations

*Message #2 Posted by **dbrunell** on 26 Sept 2003, 10:21 a.m.,*
in response to message #1 by TMC

Sure, just enter the equation on the stack, enter a variable name, then hit STO. Set up different directories as necessary to keep things organized. When you're in the solver, hit CAT to bring up a list of equations.

HP-95LX Palmtop Maintenance Kit

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 26 Sept 2003, 6:40 a.m.*

Hey out there...

Can anyone tell me where I buy a "Palmtop Maintenance Kit", HP Part Number F1216-60998.

I'm living in Europe.

Thank you Johnny

Re: HP-95LX Palmtop Maintenance Kit

*Message #2 Posted by **katie** on 26 Sept 2003, 8:52 a.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

I don't think that you can buy these any longer. HP stopped selling them a couple of years ago. Your best bet for replacement parts (battery door, rubber feet, etc.) is to buy a used 95LX on ebay. The 95 is not in demand and you can usually get these for $30- $40 or even less.

You can also join the HP-LX LISTSERV group and post a request for spare parts there:
http://www.lsoft.com/scripts/wl.exe?SL1=HPLX-L&H=UCONNVM.UCONN.EDU

in response to message #2 by Larry M.

Hi Larry thanks for this perfect link ! harry

Re: HP67 magnetic-cardreader

*Message #4 Posted by **David Smith** on 27 Sept 2003, 2:09 p.m.,*
in response to message #3 by Harry

There is another common reader problem that you may have. The worm gear is press fit onto the motor shaft via a nylon bushing. This friction fit may wear loose or the bushing may be crumbled. If this happens the motor will spin, but the gears will not.

HP82973A INT54 driver and HP3421A

*Message #1 Posted by **Ellis Easley** on 25 Sept 2003, 11:49 a.m.*

The INT54 document in the Museum FTP site (ftp://hpmuseum.org/lif/hplink/int54h.doc) has an example program which controls the 3421A. I haven't tried it yet but I studied it and I think it has a couple of errors that could cause problems. First, after the "enter" subroutine has read the voltage reading from the 3421A into the location "buffer", it appends terminator characters to the text using 8086 string move instructions, first "CR/LF" using a word length store string (stosw), and then the "$" terminator required by the DOS call using a byte length instruction (stosb). Because the program does two string move instructions, it is depending on the state of the "direction" flag to be set to "increment" to make sure DI is bumped up two by the stosw so the destination of the stosb will be correct, but the program has not done a "cld" (I remember it as "clear decrement") to make sure this is the case. (If anybody can show me where DOS requires the direction flag to always be set to increment, I would appreciate knowing about it. I had a run-in with this situation a few years ago.) Second, the program allows 32 bytes to be transferred in the "enter" subroutine (I don't think the 3421A would ever send this many bytes) but the space reserved for the location "buffer" is only 32 bytes, so if the program was adapted to an application where more than 29 bytes were transferred, there wouldn't be room for the three terminator characters. Since "buffer" is at the end of the program, you would probably get away with it in an old machine running MSDOS, which would be likely since the board needs a slow ISA bus, but if you were running in virtual mode, this might cause a fault.

Also, there was a discussion about the protocol used by the 3421A to communicate with its option boards. There is a pretty good description in the 3421A Operating, Programming, and Configuration Manual, section II (Option Assembly Installation and Configuration), chapter 9 (44464A Breadboard Option). It says the prototyping Breadboard is logically the same as the 8 bit I/O option board (44465A) but without the isolated receivers and drivers. Data is sent and received from the mainframe serially and the 44464A and 44465A have an 8 bit parallel/serial shift register plus a separate 8 bit latch to implement a an 8 bit I/O port. I haven't seen a description of the logic of the 44462A 10 channel mux option board, but I imagine it is similar with a 10 bit shift register. One interesting item is that the 3421A borrows "red" and "wrt" from the HPL language to use as commands for controlling the 44464A and 44465A.

Re: HP82973A INT54 driver and HP3421A

*Message #2 Posted by **Philip** on 25 Sept 2003, 2:55 p.m.,*
in response to message #1 by Ellis Easley

A quick review of the DOS technical manual doesn't seem to indicate a default status of the Direction Flag which implies to me you should not assume the state of the flag and you must explicitly set or clear the Direction Flag based on your need.

Also, thanks for the pointer the INT54 Doc. I'm working on writing a program to control either the 3421 or 3468 using the 82973A (just for fun) using the example in the doc you mentioned.

Re: HP82973A INT54 driver and HP3421A

*Message #3 Posted by **Ellis Easley** on 25 Sept 2003, 5:13 p.m.,*
in response to message #2 by Philip

I'm glad I could help! I downloaded that file and printed it out some time ago but I never read the whole thing till now.

Years ago, I worked for Tandy when they built their first AT compatible. I had written a disk drive diagnostic that ran fine on a real AT but hung up every time I ran it on our prototype (which worked fine otherwise, including running DOS). We traced the problem to the fact that the BIOS that Tandy licensed from Phoenix (also at an early revision level) used a series of string moves without clearing the direction flag, and my diagnostic happened to set the flag in a display routine. Somebody tried to argue that maybe DOS expected the flag to be cleared at all times. But they couldn't produce any documentation, and besides we could see where the IBM BIOS used a similar series of string moves and did establish the state of the direction flag first, so Phoenix added it. Presumably, Phoenix used a "cleanroom" system: one group of software engineers studied the IBM BIOS source code (which IBM published) and wrote a specification which was then designed and coded by another group of programmers.

Pictures taken during Wlodek's visit to Powell's

*Message #1 Posted by **Paul Brogger** on 24 Sept 2003, 7:53 p.m.*

In case anyone is interested, here are a couple of images snapped at Powell's Books during Wlodek's visit to Portland on 9/23/2003;

The group around the table (L-to-R: Wlodek M-J, Paul Brogger, Matt Kernal, Dan Roloff, Dave Hicks and Karl Schneider -- taken by Sharyn Brogger) and

sort of the same group (this time including Sharyn, and taken by Karl Schneider).

[Please forgive and correct me if I've gotten any of the names wrong ...]

Thanks to Dave and Wlodek for making themselves available. I believe I speak for all when I say we had a *great* time!

Edited: 25 Sept 2003, 1:52 p.m. after one or more responses were posted

Re: Katie & Bill (& others): We missed you!

*Message #4 Posted by **Paul Brogger** on 26 Sept 2003, 10:13 a.m.,*
in response to message #3 by Bill Smith

Folks:

It is indeed too bad you and others couldn't make it, but I suppose any location and/or time would prove inconvenient for most of us.

Bill: I felt a similar chagrin over hearing too late about the HHC conference in Newport Beach, CA last weekend, but apparently I'd missed or disregarded the earlier announcements. (Perhaps this meeting was mentioned too late for you to make changes in your reservations?)

FWIW, there was some swapping of calculator stories (making, buying, selling & using) and sharing of hardware: Dave brought an HP-94 and a 41 with an Air Force keyboard overlay and a 4x (?) speedup circuit; Matt had his 49G, 11c and a dusty 41 with four modules installed, found at the thrift store for a dollar(!); Karl brought his 34C, 15C and 42S; and I had my Frankenstein's monster 32K-upgraded 42s-in-17B-clothing. Wlodek was also selling and autographing a couple of his latest books: an updated-edition survey of HP programmables and "RCL 20", an informal history of the UK's PPC chapter, the HPCC.

I hope you who are interested may be offered similar opportunities some day (and hope to be involved myself in one or two of those).

Re: Pictures taken during Wlodek's visit to Powell's

in response to message #1 by Paul Brogger

Paul, et al. --

It was very good to meet you all! Thanks, Paul, for bringing the digital camera (and Mrs. Brogger as the photog!) I was glad to reciprocate.

-- Karl

Where were ya, Norm?

*Message #6 Posted by **Karl Schneider** on 25 Sept 2003, 11:08 p.m.,*
in response to message #1 by Paul Brogger

Norm Hill --

I was a wee bit disappointed that you didn't attend the gathering at Powell's. Your having mentioned visiting the Fry's in Wilsonville, Oregon led me to believe that you were in the area.

I brought my recently-purchased *1982 soldered-chip* HP-34C (visible in the pictures) along with the HP-15C I bought in November 1983 after comparing both models side-by-side.

I'd planned to show you how the 15C was a vast improvement over the 34C I'd planned to purchase back then. It took some convincing by the young salesman at the university bookstore, but he ultimately succeeded at "showing me the light".

-- Karl

Preferred models and future meeting location

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Sept 2003, 3:42 p.m.,*
in response to message #6 by Karl Schneider

I am afraid that, if some of us plan to convince any others about "best" models (34 vs 15, 41 vs 42, 41 vs 48, etc.), we should choose a Far West saloon for the next meeting, instead of Powell's, Fry's or Borders!

Of course, I'm just joking; or perhaps a little bit envyous for not being at the meeting.

Improvement on HP-45.

*Message #1 Posted by **r. d. bärtschiger.** on 24 Sept 2003, 7:06 p.m.*

Something just occured to me and in case no one else has thought of this, I thought I would post this and see if there are any responses. On page 7 of the HP-45 owner's Handbook there is an example of what a child prodigy can do. In this case calculate 365365365365365 squared. It was stated that he was able to do this calculation in just under one minute. Well, I just tried this on my HP-49G+ in exact mode and in about one second it returned the answer, and it is the same as the one given in the book.

rdb.

Re: Improvement on HP-45.

*Message #2 Posted by **Valentin Albillo** on 25 Sept 2003, 5:39 a.m.,*
in response to message #1 by r. d. bärtschiger.

Perhaps this particular problem is not that difficult for a math-type prodigy, because of its 'regularity'. I would proceed like this:

```
365365365365365^2

  =  (365 * 1001001001001001)^2
  =  365^2 * 1002003004005006005004003002001
```

Now, 365^2 can be computed 'in the head' very fast using the well´known trick for squaring numbers ending in 5, namely:

```
 [N]5 ^ 2 = [N^2+N]25  (e.g.: 45^2 = [4^2+4]25 = [16+4]25 = 2025)
```

so 365^2 is computed like this:

```
    [36^2+36]25 = [1296+36]25 = 133225
```

at once, requiring only the trivial addition of 36 to the memorized value of 36 squared (any math prodigy worth his/her salt has all squares up to 100^2 perfectly memorized, at the very least).

This being accomplished in a second or so, the prodigy must now compute:

```
    133225 *  1002003004005006005004003002001
```

but this is much easier to do than it seems, because 133225 is such a small, 6-digit value, and the other factor has only 6 different non-zero digits, arranged in such a regular fashion. The prodigy just needs to form the following 6 partial products:

```
  133225 * 1, 133225 * 2, ... , 133225 * 6
```

but they are trivially formed by simply starting with 133225, then keep on adding 133225 to the previous result five times:

```
       133225, 266450, ... , 799350.
```

Thus, all six of them can be computed mentally in a few seconds at most. Now, it's just simply a matter of arranging them properly for the sum, like this:

```
                                  133225
                              266450
                          .....
        .....
     266450
  133225
 -----------------------------------
  133491850208566925016658299941583225
```

and that's it. It's actually much easier (for even a mild prodigy) than it seems at first, and most readers of this forum would be able to accomplish it rather easily with a little training. As you have seen, it has little to do with actual complicated computation but with arranging things properly and doing a few sums of small, 6-digit numbers. Only the final result is really multi-digit.

Best regards from V.

in response to message #2 by Valentin Albillo

So, Valentin, why is it that you collect calculators again?

;-)

Re: Improvement on HP-45.

*Message #4 Posted by **Valentin Albillo** on 26 Sept 2003, 4:36 a.m.,*
in response to message #3 by Patrick

Patrick wrote: *"So, Valentin, why is it that you collect calculators again?"*

Well, you know, they are essentially "toys" for me. I don't have real-life uses for them, save occasional trivial arithmetic, but I find it challenging to explore their programming capabilities and overcome their limitations. I specially like writing unusual programs and composing 'challenges', then write an article or two about it all to share with other likeminded people, such as yourself.

But one thing I don't do is "HP chauvinism". If some calculator is good, then it's good, be it HP, Sharp, Casio, TI, whatever. The 'fundamentalistic' approach of "If it's an HP then it's good (regardless of whether it obviously stinks) and if it isn't an HP then it's junk (regardless of it being a far superior machine)" just doesn't cut it here.

Best regards from V.

Programming fun

*Message #5 Posted by **Patrick** on 26 Sept 2003, 4:17 p.m.,*
in response to message #4 by Valentin Albillo

Yes, Valentin, I applaud your attitude, even if I sometimes have trouble in exercising it myself. My first HP, that wonderful little HP-25 I bought way back in 1977, permanently polluted my view on life. That machine was so amazing for its day, so well engineered, so comfortable to use, and so challenging to use to its limits, that HP made something of a devoted little kitten out of me. Oh, the shame of it.

I share your love of exploring the programmatics of these machines. In fact, it is the real reason I became a collector. I have very few non-programmable machines in my collection (of course, HP made relatively few of them if you look back in history).

Right now, for instance, I'm working on a version of the SOLVE function for the HP-11C (only, what... 20 years too late?!). I am trying to be as faithful as I can to the original algorithm described by William H. Kahan in his December 1979 article in the HP Journal. Obviously, it is a challenge to fit such a sophisticated algorithm into the rather limited resources of an 11C, but for me that is the fun of it. I have a working version that implements most, but not all, of the secant method refinements described in the article. However, I am not yet happy with. It currently leaves only 39 program steps for the definition of the function to SOLVE, and is somewhat arcane in its implementation (a result of trying to squeeze the code, I think). Perhaps once I'm more happy with it, I'll follow your lead and submit an article to HPCC.

Best regards, Patrick

in response to message #6 by Andrés C. Rodríguez (Argentina)

You're welcome, Andres, thanks for your kind words and best regards from V.

Re: "Exact Mode"

*Message #8 Posted by **Paul Brogger** on 25 Sept 2003, 5:31 p.m.,*
in response to message #1 by r. d. bärtschiger.

I've heard much about this "exact mode" recently -- mostly in connection with HP-49G/G+ and the TI-89/V-200.

Would someone offer a quick explanation of it, its limits on those calculators (if indeed those all do make it available), and whether any other calculators offer it?

Thanks.

Re: "Exact Mode"

*Message #9 Posted by **R Lion** on 25 Sept 2003, 5:57 p.m.,*
in response to message #8 by Paul Brogger

2 ENTER 4 / gives 0.5 in aprox. mode but 1/2 in exact mode.
48 with Erable, 49G and 49G+ offer these two ways. (I don't know about the 39&40)

Raul

Re: "Exact Mode"

*Message #10 Posted by **Paul Brogger** on 25 Sept 2003, 6:27 p.m.,*
in response to message #9 by R Lion

I'm interested in playing with prime factorizations of lllllllllaaaaaaaaarrrrgggggeeeee numbers, and it would appear that "exact mode" supports manipulation of quite long integers. Does any one know *how* long?

I'll look into the Erable documentation -- thanks for that!

Re: "Exact Mode"

*Message #11 Posted by **Giiiii** on 25 Sept 2003, 6:35 p.m.,*
in response to message #10 by Paul Brogger

Exact mode works like said before, 1/2 instead of 0.5, 1/3 instead of 0.333333333... But it can work with incredibly long integers (its sort of different with floats. For example, 100!*100! can be calculated VERY quickly. I guess that the size of the integer nmbers you can work with are limited only by memory and time. (Just a guess)

Re: "Exact Mode"

*Message #12 Posted by **Werner Huysegoms** on 26 Sept 2003, 2:13 a.m.,*
in response to message #10 by Paul Brogger

'Long integers' are limited by available memory only. Whether you're in exact mode or approx makes no difference: arithmetic with long integers returns exact answers. When you're in approx mode, you can't enter an integer directly, it will always be entered as a real (with a decimal point following).

Werner

Re: "Exact Mode"

*Message #13 Posted by **Julián Miranda (Spain)** on 29 Sept 2003, 4:06 a.m.,*
in response to message #9 by R Lion

The HP40G will work in "Exact Mode" if you're using the CAS. You can calculate 1000!, for example, it takes around a minute but you have all its digits.

Re: "Exact Mode"

*Message #14 Posted by **dbrunell** on 25 Sept 2003, 6:45 p.m.,*
in response to message #8 by Paul Brogger

On the TI-89/92/200, the limit for exact mode is a little over 600 digits. However, if you have an expression like 1000!, it will carry it around as an unevaluated (but exact) factorial.

HP-67 Display: Big Trouble -> HELP!

*Message #1 Posted by **Albert** on 24 Sept 2003, 5:29 p.m.*

Hi

I've a big trouble with my HP-67 display: two days ago it began to light on several segments as a "shadow". I mean, for instance: 0.00 is shown as 8.88, but not on all segments with the same brightness. It happens on the 'almost' every 15 digits (sign digits shows "-" dull).

The machine works fine (programming, calculating and storing run OK).

Would anyone bring me the two ICs display drivers pin out? May be the three current drivers were out at the same time? Is a bastard drain resistor guilty, or a dead capacitor? Perhaps the problem is there ... I don't know, really. What can I do?

Thanks in advance,

Albert

Re: HP-67 Display: Big Trouble -> HELP!

*Message #2 Posted by **David Smith** on 25 Sept 2003, 3:09 p.m.,*
in response to message #1 by Albert

The middle segment of the HP67 display is a very weird thing. It is driven differently than the other segments because of the way the sign and exponent sign are decoded. Most of those discrete transistors on the keyboard circuit board are for doing that segment.

HP-49G+ update Problems, HELP!

*Message #1 Posted by **r. d. bärtschiger.** on 24 Sept 2003, 5:03 p.m.*

Has anyone tried to update the ROM on a new HP-49G+? Were you successful? I just received my new 49g+ and have been trying for the last hour or so to update the ROM. Each time it appears as though the image is downloaded correctly, but then after pressing the reset button the display says 'FLASH NEED UPDATE.' I have tried using both the USB connection to a computer and placing the files on an SD card and using that. Same results both ways. Is there some sort of trick? Thanks for any hints or other information you may be able to suggest.

Dunno about the USB update, but are you sure you gave the update file the correct name as instructed, and placed it in the root of the card?

Raymond

*Message #3 Posted by **r. d. bärtschiger.** on 24 Sept 2003, 6:36 p.m.,*
in response to message #2 by Raymond Del Tondo

Hello Raymond:

Yes. All the file names were correct and placed in the root of the sd card, which I re-formatted just to be sure. Thank you for your response.

I think I found the reason. See my next message.

rdb.

Re: HP-49G+ update Problems, HELP!

*Message #4 Posted by **r. d. bärtschiger.** on 24 Sept 2003, 6:40 p.m.,*
in response to message #1 by r. d. bärtschiger.

I think I solved this problem, however I need to do some more detective work before I can be sure. At any rate the new ROM is now installed. In case anyone may be interested, I will relate what I did. When I bought my HP-49G in 1999 one of the first things I noticed was that the date was now given with the month spelled out

instead of a number, i.e. SEP instead of 09. Although this was an improvement, in my opinion the fact that the month was in all capitals was a mistake and not very professional. So I used a disk editor to change the names of all the months to capitalized lower case, i.e. JAN to Jan etc. After making this change I downloaded the ROM image to the calculator. Although a crc error was returned, this didn't seem to have any real affect. After downloading the new ROM for the 49G+, I did the same thing, and this may be the reason why the installation failed, for as soon as I used the original image the updating of the ROM procedded correctly.

rdb.

Re: HP-49G+ update Problems, HELP!

*Message #5 Posted by **Andy** on 24 Sept 2003, 6:46 p.m.,*
in response to message #1 by r. d. bärtschiger.

Have you tryed to Upgrade over the same Rom?. Example: _ You upgrade to the first rom, and got the message, right. After that you tryed to upgrade for the same version that you install a while ago, right.

I don't see how can you the rom itself can send a message for auto-upgrade. That cannot be possible, because the rom don't recognice itself as a lower OS, but as the highest OS.

Try to flash the first rom. After that go for the last version of the rom. If that doesn't work send me an e-mail at: suffer002a@yahoo.com

I hope this can help you.

Andy

NCEES Calc Policy and Foxy Ole' HP

*Message #1 Posted by **Todd Stock** on 24 Sept 2003, 9:35 a.m.*

After writing a lengthy note to the good folks at NCEES re: their recently announced policy, I was invited to spend an hour or so discussing the matter with one of the NCEES staff. I'll summarize the discussion, along with why I'm beginning to reevaluate HP's marketing choices. This discussion is applicable to an HP list - cut to the chase if you want the executive summary.

1. The NCEES policy is evolutionary (more on this later), and based on three factors:

a. The observed ease of removing question numbers and possibly correct answers from Eastern time zone test sites to benefit HI and AK examinees (opinion: not very valid in my opinion - care to guess the number of examinees in either state? Just shifting the exam start time can address the issue)

b. The ease of modifying almost any calc for either longer range IR or RF communications (opinion: this is substantive - there are way too many talented engineers with time on their hands these days...)

c. The perception on the part of some at the NCEES that current engineering grads are more skilled at data entry than in understanding and applying basic engineering principles, and cannot reliably do the calculations necessary without Matrix Editors, Solvers, Equation Libraries, or other automation (opinion: NCEES has to convince a few hundred thousand educators that going back to pen, paper, and basic calc/slide rule is the way to go here - like it or not, no one does FEA or 40 x 40 matrices by hand these days, and few engineers open a table of integrals when MathCad or similar is available...).

2. Long range IR link mods were said to be available for the HP-48, and in at least one other exam setting (not NCEES-administered), RF-capable TI calcs were observed, allowing communications between rooms.

3. NCEES proctors have observed one or more examinees using a set of calcs to record answers for removal from the test setting (e.g., '1D2A3B4A').

4. Computer based testing is not an option under serious consideration, given the security concerns and limitations on just how many variants of the FE and PE exam can be produced that are identical for grading purposes (see PPI's FE/PE FAQ for why this is so). The NCEES rep confirmed what I have suggested in previous notes - video technology and RF links have resulted in at least one licensing activity moving to administer all exams simultaneously (e.g. 2 PM start in NY, 11 AM start in LA, and 6 AM start in Honolulu).

5. Re: video/digital still cameras, NCEES stated that other testing agencies have banned watches, jewelry, head wear/scarves, etc. from test sites (I assume it's in the works for NCEES as well).

Now for my take on things:

The direction that the NCEES is going is toward a nothing-in/nothing-out exam site - nothing else will prevent removal of question numbers and assumed correct responses. In other words, the NCEES would publish a list of calcs available at the exam site, and it would be the responsibility of the examinee to become familiar with the operation of those models.

Summary:

My assessment is that the NCEES will settle on one non-graphing, scientific calc which can operate in either algebraic or RPN logic modes, thus, ensuring that examinees do the lion's share of number crunching - this will become the provided calc (brush up on doing matrix operations and SLEQ by hand, or practice speed programming).

Given that only HP currently offers a calculator with both RPN and algebraic modes, as well as full support for the math functions that NCEES judges necessary for the FE and PE exams, I think chances are good that TI will have to respond with a serious algebraic/RPN scientific calc similar to the HP-33S or risk seeing the engineering market firmly back in HP's court. Although it will take TI a little time to respond, I can easily see a 2006 exam year where no calcs are taken into or from the site.

Sort of makes you think that HP had a game plan all along for the new dual mode calcs, despite the knuckleheads responsible for the 33S case and keyboard design. FYI - NCEES was told that HP would have the 33S out by Dec, hence it's inclusion in the list of authorized calcs. Does anyone else see the writing on the wall?

My question to the group is that should NCEES announce that they would change policy to a single algebraic/rpn platform for all exams, how long would it take for engineering schools, GRE-Engineering, etc. to follow suit?

DISCLAIMER: This note summarizes an informal conversation with one NCEES rep, and certainly does not represent the stated position of that organization. The opinions expressed here are my own, and do not represent my employer's, my wife's, or my dog's view of the world.

Re: NCEES Calc Policy and Foxy Ole' HP

*Message #2 Posted by **Paul Brogger** on 24 Sept 2003, 10:20 a.m.,*
in response to message #1 by Todd Stock

At the risk of adding to someone's paranoia surrounding this, wouldn't a calculator with multiple registers (or array capabilities) enable the kind of answer encoding alluded to under **3** (above)?

In fact, my little SPECTRA SSC-200 has 27 memories, and if it is/were allowed, I could store as many as 10x27 answers using a positional encoding with decimal digits. Using Octal, I should be able to encode even more (if, that is, I could get its Base-n functions to actually *work?!?!?*).

Of course, this assumes I know the *correct* answers.

So, even without an alpha capability, any calculator with multiple registers may be used to carry at least some answers out of the test site.

(How many questions are there typically on these tests?)

Re: NCEES Calc Policy and Foxy Ole' HP

*Message #3 Posted by **Dave Shaffer** on 24 Sept 2003, 11:18 a.m.,*
in response to message #1 by Todd Stock

A few comments (aimed at NCEES, I guess):

re: "3. NCEES proctors have observed one or more examinees using a set of calcs to record answers for removal from the test setting (e.g., '1D2A3B4A')"

This looks like a case of an overly technical approach to a VERY simple problem: if somebody is going to export answers (let alone the questions), why not WRITE THEM DOWN SOMEWHERE??!!?? I am not an engineer, and am unfamiliar with the entire testing protocol, but from the discussions herein, it seems that you can bring in whatever printed matter (books) you want. All you have to do is write down the answers

somewhere in one of your books. Presumably all material is subject to inspection at exit, but with enough books and a simple encoding scheme, you could write down anything and there is little likelihood they'd find it anyway amongst the 1000's of pages.

If the system switches to providing its own calculators, then there is no reason (other than the expense of providing the calcs) not to have ANY kind available. They could offer a variety of your favorite HP and TI (and anything else), on-site. You might have to request your favorite in advance. To prevent various on-site cheating installation, they could a) glue shut all access ports; b) cover all IR ports; c) even wrap the whole thing in aluminum foil (to prevent RF transmission (although (a) should pretty well negate attempts at this)).

Re: NCEES Calc Policy and Foxy Ole' HP

*Message #4 Posted by **Todd Stock** on 24 Sept 2003, 11:44 a.m.,*
in response to message #3 by Dave Shaffer

Your arguments are mine - it's pretty much impossible to prevent some types of cheating without providing the calc, closely proctoring the exams, and timing start/finish to avoid the issues with East Coast versus AK/HI.

Personally, I think the states should make it a felony rap to cheat, make examples out of those few individuals that do cheat (and are caught), and put the main effort int addressing the other 99.99% of the folks being tested who just want to punch the ticket.

The interesting part of the discussion for me was the potential impact on calcs in engineering programs - the rest of this is pretty academic for those not sitting for an exam anytime soon. I'm not certain how much NCEES policy drives engineering program decisions, but if I were a first year civil/mechanical and knew that only certain calcs were allowed on my licensing exam, I'm not certain that I'd have a good reason to acquire "banned" machines.

Re: NCEES Calc Policy and Foxy Ole' HP

*Message #5 Posted by **CME750** on 24 Sept 2003, 1:37 p.m.,*
in response to message #4 by Todd Stock

I don't see the new NCEES policy as a win for HP. It's true that the new policy may drive up sales of the forthcoming 33S. Even people with no previous interest in HP calculators are looking hard at the 33S, because it is currently the only algebraic programmable with an explicit "seal of approval" from NCEES.

Unfortunately, the NCEES policy is going to *cripple* sales of the much more expensive 48GXII and the 49G+. Like it or not, the calculator has long since been supplanted in the engineering workplace by the PC. But the proficient "calculator power user" still had a significant advantage in one situation: the NCEES licensing exams. Now even that advantage has evaporated.

Many people (including me) bought the 48GX or the 49G specifically for use on the EIT or PE exams. That market has just disappeared. My 48GX is great, and it certainly helped me through the EIT exam -- but I no longer use it for PE exam preparation, since the 48GX will be banned when I take the exam next year.

I may very well buy a 33S to supplement my 32SII. But much as I like my 48GX, I would not buy any 48 or 49 series calculator if I was starting the NCEES exam process today.

Re: NCEES Calc Policy and Foxy Ole' HP

*Message #6 Posted by **CME750** on 24 Sept 2003, 2:19 p.m.,*

in response to message #3 by Dave Shaffer

NCEES has policies which are supposed to prevent people from copying down the exam questions or answers:

(1) The EIT/LSIT exams are *not* open-book. Once you are in the exam room, you are issued a reference manual and an exam booklet, but you have to return them (with all the pages intact) when you leave. You are not allowed to write on anything else. If there is an extra sheet of paper on your desk, you can be disqualified.

(2) For the PE/PLS exams, you are allowed to bring books in and out. But any notes that you write in your books prior to the exam *must* be in ink. You are not allowed to bring any writing implements into the exam room. Once you are in, you are issued a mechanical pencil, which can only be used on the exam booklet. You can be disqualified if (a) you are caught writing with the pencil in your books, or (b) anything written in pencil is found in your books.

33C <clear button> repair

*Message #1 Posted by **DG** on 24 Sept 2003, 6:50 a.m.*

I have a trusty old 33C circa 1981 that I still use at work. It has deveoped a problem with the <clear> CLx button, the CLx button feels the same as the other functioning buttons, but appears to have lost contact sensitivity. Is there a way to remove the back panel and effect some type of repair to the button contact? I understand that the buttons are over some form of "bubble" pad, and not actually a mechanical type switch. True? If so does anyone know how the this contact can be improved, or is it toast?

First things first though, I tried to remove the back cover (two scews in battery compartment -top), but the attachement at the bottom of the two panels is solid/tight and I am afraid it will just bust apart if I try to pry it open like a clam shell. Is there a special method of doing this? I really want to keep the old 33C working. Any help or suggestions for repair to improve the button contact would be appreciated.

Darryl B.C. Canada Enter >=

Re: 33C <clear button> repair

*Message #2 Posted by **Jeff** on 24 Sept 2003, 7:49 a.m.,*
in response to message #1 by DG

This has been much discussed in the past here, a thorough search of the Forum Archives should yield some information. There are several methods for opening Spice series calculators. The most basic and brute force method (as noted in your post in the Articles Forum) is to just pry the case halves apart. To answer your question, it opens like a clamshell. It takes a lot of force, and when the case finally separates, it does so with a loud "crack" that is quite disconcerting. Therefore, others have developed alternate techniques. One is to "squeeze" the cases apart. I could not find the post where this was described in detail, but it involves putting your thumb on the lower edge of the front of the case, your fingers in the battery compartment, and squeezing. Another technique involves the use of dental floss, described here:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=22660
Regarding your button contact question, there are two versions of Spice internals. One type implements the keyboard contacts via plastic domes, the other has metal domes. See David's post below for cleaning instructions for the metal domes. I believe that the sheet with the plastic domes of the other version is also accessible, so it should be possible to clean the contact surfaces.
Good luck with your repair.

Edited: 30 Sept 2003, 12:30 p.m. after one or more responses were posted

Re: 33C <clear button> repair

*Message #3 Posted by **DG** on 24 Sept 2003, 5:21 p.m.,*
in response to message #2 by Jeff

Hey Jeff, Thanks alot for your response. The methods for opening the 33C are especially helpful. I've had that unit for over 23 years, hate to kill the old dog needlessly. I have to admit the tightness of the attachment is a little daunting.

I guess the button contact design will reveal itself once opened. I'll have to do a search on the archives for button/contact repair. If it is the plastic bubble type, I assumed that the lost contact was due to a 'stretched" out bubble dome, and then not likely repairable. However, this is a great site, a lot of expertise here, so I am sure someone has devised a solution or have some useful ideas.

I was surprised to learn from this site three things; 1) that all these old HP calculators have such a strong following and retain an "antique" value; 2) that people still use their old HP's everyday and I am not the only one; and 3) that HP has fallen so far behind or forgotten about the hand held computer market.

I was going to buy a new scientific HP calculator at my local "Staples" store, but the unit did not even have RPN! I checked the HP website and found they only have around 2 scientific models to choose from. I guess I have not stayed tuned to the calculator market for quite a few years, since I've alway been using my 33C, but I just assumed that with the advancment of digital electronics over the last 23 YEARS, that HP would have had made a quantum leap by now in this market. Must not be a market with a huge return on investment, but you would have thought that just for the purpose of SELF RESPECT as a company, HP would have thrown a few $ at maintaining their lead in the hand held market, if only as a marketing tool for the rest of their computer electronics line, ..or even if it was just for nostalgia purposes.

Darryl

Re: 33C <clear button> repair

*Message #4 Posted by **Dave Shaffer** on 25 Sept 2003, 12:24 a.m.,*
in response to message #3 by DG

Darryl,

Your last paragraph will resonate at the 99.9% level with most of the inhabitants of this site.

We all, too, use our beloved HP calculators daily and can't understand why HP has pretty much abandoned us. There is some hope for a couple of new calcs, but we're all stuck in the heyday of the 20-year old models!

Re: 33C <clear button> repair

*Message #5 Posted by **Ed Look** on 25 Sept 2003, 3:00 a.m.,*
in response to message #4 by Dave Shaffer

Yes, and I count myself as one of that majority, but the economy and manufacturing realities have changed, though I suppose that could just be an excuse for the obvious shift in "philosophy" which came in with the change in the leadership of the company.

Re: 33C <clear button> repair

*Message #6 Posted by **David Smith** on 25 Sept 2003, 3:15 p.m.,*
in response to message #2 by Jeff

The spice series never used the strip switches. They were either the plastic bubble keyboard type (compression machines) or the dome switch type (soldered machines) like used on the woodstock or HP41 machines.

The dome keys are easily cleaned. There is a feedthough hold under each key. You clean the key by making a tiny wire brush out of three wire brush bristles in a pin vise holder. Place a drop of alcohol on the hole, dip the wire brush in more alcohol, and then gently scritch around in the key hole with the wire brush. The problem with the spice keyboard may be that several of the key holes are blocked by the

soldered down 40 pin chip.

Re: 33C <clear button> repair

*Message #7 Posted by **DG** on 25 Sept 2003, 8:38 p.m.,*
in response to message #6 by David Smith

Tried to pry the back cover off my 33C. NO WAY is it coming off. The bottom attachment of the two halves is secured like it is SCREWED down. It will snap off for sure if I try to open it up like a clam. Tried pushing it together to unsnap a hook, tried twisting the two halves gainst each other, nada. Not willing to risk ruining the calculator. I guess I will just have to turn my calc on and off every time I want to clear the stack..

Thanks for all your help anyways guys.

Darryl

Re: 33C <clear button> repair

*Message #8 Posted by **dbrunell** on 25 Sept 2003, 9:41 p.m.,*
in response to message #7 by DG

Darryl,

It is actually possible to finesse the back off of a Spice calculator. After you've done it once, it gets easier. However, with just the back screws loose, you should be able to peek in there and see which type of unit it is and whether or not it is worth proceeding. The solderless ones have a beefy plastic backbone. There should be pictures somewhere on this site showing the differences.

in response to message #4 by Andy

He asked for a 49g+ emulator, currently n/a, even in hpcalc.org

Re: 49G+ PC EMULATOR

*Message #6 Posted by **Mike (Stgt)** on 25 Sept 2003, 1:06 p.m.,*
in response to message #5 by Wiiiiiiiii

As the 49G+ uses an ARM CPU (same as in PDAs?) you have to emulate that. May be you need the WinCE-SDK from M$ (300MB) as for the Xpander <VBG>. No - I don't know realy.

For shure you are better off with the EMU48 to emulate the HP49G. Then take a photo of the 49G+ as 'faceplate' and adjust the KML.

Ciao.....Mike

Hp 38S II vs. 48GX

*Message #1 Posted by **Cora Stewart** on 23 Sept 2003, 6:38 p.m.*

We have used the 38SII for years at work. We use it because of the programming features: Label, input, etc. How can I convert these types of programs to the 48GX. I am no calculator guru and I don't have days to sit and try to figure this one out! Any help would be appreciated.

Re: Hp 38S II vs. 48GX

*Message #2 Posted by **David Ramsey** on 23 Sept 2003, 7:56 p.m.,*
in response to message #1 by Cora Stewart

I assume you mean "32SII" since there's no such thing as a "38SII".

The quick answer to your question is "You don't convert the programs." The 32SII is a classic HP "keystroke programmable" calculator that records sequences of keystrokes. The 48GX takes an entirely different approach; you write programs using a small built-in text editor and the syntax and operation of the system is totally different.

Basically, you'd have to figure out exactly what the programs on the 32SII do and rewrite them from scratch for the 48GX.

Re: Hp 38S II vs. 48GX

*Message #3 Posted by **Ed Look** on 23 Sept 2003, 10:01 p.m.,*
in response to message #2 by David Ramsey

Well, I suppose this is a bit time consuming, but you could sort of "translate" the function of the particular keystroke of a 32SII program to some command in the (what, RPL?) language of the 48GX, or set of commands that would accomplish the same task or action. Unfortunately, this would require that programming the 48GX is mastered to some degree in addition to knowing how to program a 32SII.

Incidentally, I am currently (and very slowly, mind you) trying to do that for programs I had already erased on my 32SII onto a 48G. Unfortunately, this last beastie has very little RAM (32K).

Re: Hp 38S II vs. 48GX

*Message #4 Posted by **CME750** on 23 Sept 2003, 11:48 p.m.,*
in response to message #1 by Cora Stewart

You probably mean the 32SII, which has has been discontinued by HP. There is no simple way to port 32SII programs to the 48GX. The programs would have to be rewritten.

HP is supposed to introduce a new model, the 33S, in October or November 2003. It appears that this new model will resemble the old 32SII, but with much more memory; it is possible that it may be able to run 32SII programs. But the 33S is not yet available, so no guarantees.

Re: Hp 38S II vs. 48GX

*Message #5 Posted by **Ron Ross** on 24 Sept 2003, 8:45 a.m.,*
in response to message #1 by Cora Stewart

Or you could mean the 38G. Either way, the 48G series is totally different. I suspect you do mean the 32sII. The Hp48G series has a lot of programs that are FREE and available at hpcalc.org . You could just download your program if it is available there (which it probably is). This site makes the 48/49 series worth twice their price. It is a tremendous contribution to Hp calculators (as is this site also).

Re: Hp 32S II vs. 48GX

*Message #6 Posted by **Andy Agui** on 24 Sept 2003, 6:59 p.m.,*
in response to message #5 by Ron Ross

There is no way to port programs to a 48Gx if the program was originally written for the 32SII or the 38G. Both of those calc have " lower class" porgraming languages, compared to the User RPL, the programmability is quite simple. You should write the propurse of the program,it specific features and resolts. And after that program your 48GX. Probably the program that you wrote,is a built in command in the 48GX. So scan the 48Gx and then go for the programs.

Regards

Andy

*Message #7 Posted by **Ed Look** on 24 Sept 2003, 11:57 p.m.,*
in response to message #1 by Cora Stewart

I should have been working, but I was surf... ahem, reading, and I came across this. I didn't follow up on it, but the site has links and you just might find what I think you may be after regarding "translating" 32SII programs to the 48GX:

http://pub8.ezboard.com/fhpcccalculatorclubgeneral.showMessage?topicID=6.topic

I hope this is useful.

Re: Hp 38S II vs. 48GX

*Message #8 Posted by **bill platt** on 25 Sept 2003, 10:43 a.m.,*
in response to message #1 by Cora Stewart

Hi Cora,

Well, here is another approach: you can run an emulator of the hp41c (or cv or cx) on your 48gx. I have been doing this for about 2 weeks, and it is really pretty neat. The 41 series is closer to the 32sii--it uses GTO and is RPN not RPL. For the "Input" command, you insted use the PROMPT command followed by STO xx where xx is a storage register. The registers are numbered instead of lettered, though the first 10 registers are implicitly lettered. I like the "Input" command of the 32sii though, as it is such a fast streamlined way to go, but if you put PROMPT on a user key on the 41c, you can code an input pretty fast (less typing).

If however you happen to use equations within your programs on the 32sii, that does not translate well to the 41c--you have to put the equation into a subroutine in RPN (using horner's method or other if need be).

The long of the short of it is that there is no easy way!

But some RPN programs translate very easily to RPL--skipping hte 41c emulator approach. I'll post some of the ones I have done, in a later post.

Regards,

Bill

*Message #10 Posted by **bill platt** on 25 Sept 2003, 3:40 p.m.,*
in response to message #9 by R Lion

Hi Raul!

Yes, from HPcalc.org:

http://www.hpcalc.org/hp48/apps/misc/hp41e48.zip

If you cannot get it to download for some reason, I'll send it to you.

Let me know how iy goes!

BTW, I tried it out first on the emu48---all you have to do is drag the file over on top of emu48 and there it is on the stack!

I uploaded it to the real HP48gx with no problems, either, and saved it to both port and system memory without any trouble. I also made up a keyboardd template (do you know where to get more of them for the HP48?!)

Best regards,

Bill

Re: Bill, please

*Message #11 Posted by **R Lion** on 25 Sept 2003, 3:48 p.m.,*
in response to message #10 by bill platt

When I read your first post I quickly looked for it in hpcalc... without success. So thanks for the link, Bill. About Emu48, yes it's a blessing. I always have a backup of my real calc in Emu and the new programs, are tested on it. Sorry about the templates... I saw some of them once in ebay...but I don't have more info.

Thanks again and best regards

Raul L

Re: Bill, please

in response to message #10 by bill platt

There is much advanced version of emu 41 for HP-48GX and HP-49G on http://hrastprogrammer.tripod.com/HP41X. It is called HP-41X but I think it comes from the same author. Alse, an HP-42S emulator exists on http://hrastprogrammer.tripod.com/HP41X which is more close to the HP-32SII than HP-41 emulator. Sadly, these emulators are not free :-(

Has the HP12C improved in chip speed over the years?

*Message #1 Posted by **dave brown** on 23 Sept 2003, 2:16 p.m.*

My finance prof said this in class but I wonder if it's really true? Is an HP12C bought today faster than 1 made, say, 15 years ago?

(This would be reason to buy newer ones)

Thx if u know

Re: Has the HP12C improved in chip speed over the years?

*Message #2 Posted by **David Ramsey** on 23 Sept 2003, 5:43 p.m.,*
in response to message #1 by dave brown

No. A 12C bought today is no faster than the very first one off the production line.

Now, the 12C Platinum, a new version, uses a different processor and is faster for most things. However, a number of bugs have been discovered in the Platinum version and most HP fanatics prefer the original.

Re: Has the HP12C improved in chip speed over the years?

*Message #3 Posted by **hugh** on 23 Sept 2003, 6:26 p.m.,*
in response to message #2 by David Ramsey

over the years, the 12c internals have undergone several cost reduction changes. down to 1 chip now, i think.

shrinking the chip: does that mean it could be run faster at the same power consumption as before? and if so, why didnt they because "running" looks awfully antique these days.

Re: Has the HP12C improved in chip speed over the years?

*Message #4 Posted by **Joshua Belsky** on 23 Sept 2003, 7:36 p.m.,*
in response to message #3 by hugh

It is my understanding that they increased the speed, but the businesspeople to whom they showed it did not trust the quicker answers. So they slowed it back down.

This could be legend, though.

Re: Has the HP12C improved in chip speed over the years?

*Message #5 Posted by **dbrunell** on 24 Sept 2003, 12:16 a.m.,*
in response to message #1 by dave brown

Can anyone tell me when they switched the 12C from double-shot molded keys to painted-on legends? I have in front of me a 1995 Singapore model with painted keys.

Re: Has the HP12C improved in chip speed over the years?

*Message #6 Posted by **Mike Sebastian (Texas)** on 24 Sept 2003, 6:18 p.m.,*
in response to message #5 by dbrunell

Cost (i.e. to increase profits).

Also, for some strange reason, HP would paint over double-injection molded keys. See http://www.hpmuseum.org/collect.htm#variations and scroll down to "10C Series Versions."

Questions about 32SII and 18C variations

*Message #1 Posted by **Thomas Radtke** on 23 Sept 2003, 7:08 a.m.*

Hi *,

I have two questions about variations of the 32SII and 18C:

(i) my old 32SII (serial 3136S05168, bought in '92 in Germany w/ a dutch manual) has this 'fixed denominator bug'. I'm interested to hear whether this has been corrected in later versions. Btw., what is this thing about prices of $300 and more for a calculator that has been about 70DM (35EUR) before. As soon as I saw this strange prices I was forced to pick up one of these ultracheap 48G's just to not have to touch this device anymore:(.

(ii) my 18C (serial 2744A01171) has 'shifted key' labels on its alphanumeric keyboard. I haven't seen this on any picture I found and the manual states that they shouldn't be there. I got this calculator from an ebay auction (18EUR, seems to be not too beloved:) and thus I don't know if its original or a replacement part from a 19BII. Any infos about a keyboard design change with the 18C?

Thanks,

Thomas

Re: Questions about 32SII and 18C variations

*Message #2 Posted by **Bert K** on 23 Sept 2003, 11:30 a.m.,*
in response to message #1 by Thomas Radtke

About 32SII prices, since its discontinuation 32SII prices have gone through the roof. I saw a site (samsoncables.com) asking $399 for a new silver or a brown bezel. A refurbished brown bezel was $299.

The good news however is that good deals can still be found. I bought a like new 32SII silver bezel for 35 EURO last month...

I don't now about the 'fixed denominator bug', I'd have to check both my 32SII's. I have an old brown bezel and the newer silver bezel.

Re: Questions about 32SII and 18C variations

*Message #3 Posted by **Thomas Radtke** on 23 Sept 2003, 2:10 p.m.,*
in response to message #2 by Bert K

Hi Bert,

I don't know any details of this bug as I never tried this feature (setting flag 9, that is). There was simply an 'update' notice added to the manual that warns about that bug.

I too think that you can still make a bargain on ebay if you're patient enough:). When it comes to hp calcs in particular, one could make a life buying in Germany and selling in the US. There's always a reasonable

arbitrage:). Anyway, I still wonder who is paying this prices. The 32SII is a nice machine, no doubt, but it's still more or less low end. Electronic devices are no good speculative objects either as they tend to die quickly compared to oil paintings or similar objects.

Thomas

Re: Questions about 32SII and 18C variations

*Message #4 Posted by **Juan J** on 23 Sept 2003, 2:35 p.m.,*
in response to message #3 by Thomas Radtke

While I cannot say much about the 32SII, the 18C has shifted characters on its alphanumeric keyboard. They are not exactly listed on the manual and somebody made overlays for them. They include relational operators, question marks and other things (I might be wrong on this,) some of them useful for printing messages with the 82240 printe. For you it might take a little trial and error to figure them all, but it's woth it.

I got my 18C from the estate of an insurance broker (who had recently passed away) with the overlay, which turned to be quite handy.

fixed denominator bug, was Questions about 32SII

*Message #5 Posted by **Bert K** on 25 Sept 2003, 2:55 p.m.,*
in response to message #1 by Thomas Radtke

I checked both my 32SII's. They both do not suffer from the fixed denominator bug (see here: http://www.finseth.com/~fin/hpdata/hp32sii.html). The brown bezel is an Indonesian ID8290xxxx and the silver bezel is an Indonedian ID1110xxxx.

Re: fixed denominator bug, was Questions about 32SII

*Message #6 Posted by **Thomas Radtke** on 25 Sept 2003, 3:21 p.m.,*
in response to message #5 by Bert K

Checked mine too, it has the bug(s). It is an early Singapore model. I can live with that since I never seriously used the fraction mode--but anyway, all these bugs in hp calcs are really annoying.

Thomas

Re: fixed denominator bug, was Questions about 32SII

*Message #7 Posted by **Ed Look** on 26 Sept 2003, 2:04 a.m.,*
in response to message #6 by Thomas Radtke

Gentlemen, I have been following your thread with a bit of interest, as I own a 32SII also. But I bought mine back in March of 2001 and according to the serial number decoding scheme found elsewhere on this site, it was manufactured in Indonesia in 1999, presumably in late April.

I tested my unit according to the fractional display tests found on Craig Finseth's site, but mine tests correctly! I suppose HP must have built into later units updated ROMS with the correct programming.

Incidentally, does anyone know about when they started to sell the silver bezel version (the one with the blue and white shift keys)?

Re: fixed denominator bug, was Questions about 32SII

*Message #8 Posted by **Bert K** on 26 Sept 2003, 6:34 a.m.,*
in response to message #7 by Ed Look

According to Viktor Toth the silver bezel was made from 1999 until the discontinuation of the 32SII in 2002.

http://www.rskey.org/detail.asp?manufacturer=Hewlett-Packard&model=HP-32SII+Silver

Re: 32SII prices

*Message #9 Posted by **Paul Brogger** on 26 Sept 2003, 9:40 a.m.,*
in response to message #1 by Thomas Radtke

I suspect that 32SII prices should fall somewhat as the 33S becomes available, though it's unlikely that we'll again routinely find examples as low as ~$70.00 .

48G display flicker

*Message #1 Posted by **Ed Look** on 23 Sept 2003, 1:44 a.m.*

For the first time ever, I was using my 48G in my car parked near a sodium vapor streetlamp. At many angles of view, the 48g's display flickers (not unlike an older or cheap CRT monitor on some older or cheap PC) under the illumination of the streetlamp. What's the primary line of Na? 5880 angstroms or something like that? Although, it must the the frequency of the lamp that's doing it, not the frequency of the light (what COULD that have to do with anything here?). It was annoying enough I had to move my head or the calculator so as not to see the flicker!

What's the refresh rate, if such a concept applies, of the 48G's screen??

Re: 48G display flicker

*Message #2 Posted by **Randy Sloyer** on 23 Sept 2003, 7:17 a.m.,*
in response to message #1 by Ed Look

I don't know the exact scan rate but would suggest it is time to change your batteries. I have found most G's will flicker in 60hz light when batteries are low, this is well before the battery low light comes on. The effect is much more prononuced when the temperature approches freezing.

Re: 48G display flicker

*Message #3 Posted by **David Smith** on 23 Sept 2003, 10:31 p.m.,*
in response to message #1 by Ed Look

The LCD display on the calculator is a scanned display. The sodium vapor lighting flickers at 60Hz. This acts like a strobe light that produces a beat frequency with the scanned LCD display. Flourescent lights may show a similar display, but the phosphor in their tubes has a longer decay time than the sodium vapor lights, so the effect is not as noticeable.

Re: 48G display flicker

*Message #4 Posted by **Ed Look** on 23 Sept 2003, 10:50 p.m.,*
in response to message #3 by David Smith

No wonder this is not normally observable. The decay tail! I didn't realize that fluorescent lights' phosphors had such a long decay time. Well, here's a good use for slow switching!

Re: 48G display flicker

*Message #5 Posted by **David Smith** on 25 Sept 2003, 3:17 p.m.,*
in response to message #4 by Ed Look

FLourescent lights have gotten better over the years. You only need 1/60 of a second hold time. Some gas discharge bulbs (usually metal halides) have a phosphor coating also.

HP-41CX Pricing

*Message #1 Posted by **Garrett Moore** on 22 Sept 2003, 9:50 p.m.*

The Museum of HP Calculators indicates that the HP-41CX was introduced in 1983 at a retail price of $325, and ended production in 1990. Does anyone know the HP-41CX retail price at the end of production in 1990?

Re: HP-41CX Pricing

*Message #2 Posted by **Richard Garner** on 22 Sept 2003, 11:04 p.m.,*
in response to message #1 by Garrett Moore

I bought my first 41CX in 1984 and it was about $225.00. I bought my second 41CX in 1988 and it was about $185.00. Both were bought from a mail order electronics store known as Elek-Tek out of Lincoln IL. In the early 1990's it changed its name to PC Electronics and as for as I can tell went out of business shortly there after.

10BII

*Message #1 Posted by **Thibaut.be** on 22 Sept 2003, 3:42 p.m.*

I just acquired a 10BII from a sell-off of a shop.

Actually I like this calculator. It would just be great if it were also RPN. I like the display, the voyager-like keys, the smooth edges, anf the sliver bezel. The keys are easy to read.

I've read a lot of flaming about recent HP's, and even if I definitely regret the 42S and the voyager series, I have to say that the recent ones are not that bad.

The 33S seems to be great, the 49G is a hell of a machine though the keyboard is just crap (let's wait for the 49G+ or whatever it is).

Let's be positive and encourage HP going further in the right direction, who knows, maybe there is a HP guy of the calculators department who will realize our dreams...

Re: 10BII

*Message #2 Posted by **GE (France)** on 22 Sept 2003, 4:10 p.m.,*
in response to message #1 by Thibaut.be

You're right, this machine looks very nice. Now, just type on it...

Re: 10BII

*Message #3 Posted by **Paul Brogger** on 22 Sept 2003, 5:53 p.m.,*
in response to message #2 by GE (France)

I have one, bought "as is" at Office Despot (Ahhh say, that there's a *joke*, son!) Its keyboard is firm and responsive. It doesn't convey the feeling of "mass" that older HP keys offer, but it's waaaaaay better than those of the 6s & 30s examples I've tried.

If the newer H-P's offer keyboards as good as this (and if they last a while), I'd say it'll be a step in the right direction.

hp42s defect beeeeep

*Message #1 Posted by **Michael** on 22 Sept 2003, 4:12 a.m.*

who can help? my hp42s doesen't work with new batteries it only beeps permanently after power on.

Re: hp42s defect beeeeep

*Message #2 Posted by **christof** on 22 Sept 2003, 10:38 a.m.,*
in response to message #1 by Michael

Sounds like you need to remove the batteries, short the terminals with a piece of wire (steel paperclip is good enough) and put the batteries back in.

That's how I've done it in the past for pioneers.

Some people recomment shorting with a reversed battery, but I've never seen that mentioned outside of the voyager series.

Re: hp42s defect beeeeep

*Message #3 Posted by **David Smith** on 22 Sept 2003, 3:48 p.m.,*
in response to message #2 by christof

The HP42 manual says to short across the battery terminals for one second WITH THE BATTERIES INSTALLED. This will not damage the batteries and will protect the machine from static problems.

The 42 beeeeps when the batts are almost dead

*Message #4 Posted by **Menno** on 23 Sept 2003, 1:40 a.m.,*
in response to message #3 by David Smith

The 42 has the strange feature that when the batteries are allmost empty it will start to beeeep continously. This has happened to me twice, both times in the middle of the night. That little bastard has a mind of it's own.....

So I think that you try to install batts that are almost empty. Measure the voltage of your batt; it will be less than 1 volt.

have fun

Menno

Re: hp42s defect beeeeep

*Message #5 Posted by **christof (NoVA USA)** on 23 Sept 2003, 3:07 p.m.,*
in response to message #3 by David Smith

"The HP42 manual says to short across the battery terminals for one second WITH THE BATTERIES INSTALLED. This will not damage the batteries and will protect the machine from static problems. "

NO IT DOES NOT.

I have the museum pdf, my old spiral bound paper copy, and a photocopy all three in front of me and they ALL say:

"Now turn the calculator back on. If it does not function, you might have taken too long to change the batteries or inadvertently turned the calculator on while the batteries were out. Remove the batteries again and lightly press a coin against both battery contacts in the calculator for a few seconds...."

I've been through this a few times now, and each time I go back and check, and each time, my manuals say to REMOVE the batteries.

Not saying that you will certainly cause damage to the 42S by leaving the batteries in, but the manual is really very clear.

-Christof

Re: hp42s defect beeeeep

*Message #6 Posted by **David Smith** on 26 Sept 2003, 7:30 p.m.,*
in response to message #5 by christof (NoVA USA)

I checked my manuals and the HP11/12/15 manuals all say to short the batteries.

My only 42S manual is a late version that says to remove the cells. I think the earliest 42S manual wanted the batteries in (I was fixing a balky 42S when I first read about shorting the batteries), but I no longer have that manual. I have used the technique on a couple of 42S machines and it worked just fine.

41cx US Govt sticker on back

*Message #1 Posted by **Paul** on 21 Sept 2003, 9:31 p.m.*

Greetings. I picked up a 41CX on eBay that has a small bar code sticker on the back that says "SVAD U.S. GOVT Authorized Removal Only." Anyone have an idea where this 41 came from? Maybe Bill Clinton used it to pick up chicks and then sold it on eBay before Hillary found it? Regards, Paul.

Re: 41cx US Govt sticker on back

*Message #2 Posted by **Mark Hardman** on 21 Sept 2003, 10:26 p.m.,*
in response to message #1 by Paul

No, that would be the HP-41SEX.

It looks like this would be an inventory tag for the SaVanna Army Depot. It **also** looks like this is an EPA site.

http://www.epa.gov/fedrgstr/EPA-IMPACT/1997/February/Day-05/i2803.htm

The calculator is very likely contaminated. You really ought to dispose of it by sending it to the:

LED HP-41CX Superfund Disposal Corp
13819 River Keg Dr
Houston, TX 77083

Mark Hardman

Edited: 21 Sept 2003, 10:57 p.m.

HP seems to have lost its Way

*Message #1 Posted by **DanO** on 21 Sept 2003, 8:40 p.m.*

Why would a company deliberately throw away its competitive advantage?

Customers used to choose an HP calculator over the competition for two main reasons:

1) RPN

2) Ease of use coupled with good key feel and high-quality durable construction.

Any calculator from HP that does not rely on these strengths is doomed. The very successful HP-12C is perfectly aligned with HP's competitive edge. Compare this to the recently discontinued HP-6S (algebraic entry, poor construction, lousy key feel).

HP must either exit the calculator business entirely or else HP must rely on these two competitive strengths and try to return to greatness. There is no middle ground here. It is either one or the other for HP.

Re: HP seems to have lost its Way

*Message #2 Posted by **Pierre Brial** on 22 Sept 2003, 5:32 a.m.,*
in response to message #1 by DanO

Dan, The fact is that there is no longer a large market for good quality programmable calculator. During the 70-80's desktop computer were too much expensive so people bought calculator instead. Nowadays most calculator users don't bother to program themselves. Nevertheless, there is still a small demand for portable and powerfull calculating devices, mainly amongst engineers. And the adequate tools no longer exists. There never have been a large market for oscilloscopes, surveying equipment and so on, but they still exists. These devices are expensive but people who need them buy them. I wonder why HP didn't maintain a high quality line of calculators, even at higher prices in order not to lose money. When you see the prices of used HP-67, 41, 15C, 42S, you can guess that HP could sold high quality & high priced calculators.

All the best, and sorry for my poor english

Pierre

Re: HP seems to have lost its Way

*Message #3 Posted by **Namir** on 22 Sept 2003, 11:52 a.m.,*
in response to message #2 by Pierre Brial

I agree with you Pierre. I started working for a French water treatment company here in Virginia in 1980. I used my HP41C to do a lot calculations and statiustical anaylysis for data. PC were very expensive and NOT portable at that time. I was able to travel all over the USA with my 41C as I did technical demonstrations of water treatment equipments to existing and potential clients. The advent of faster and cheaper PC overshadowed calculators that had previously enjoyed the status of being "personal computing devices" between mid 70s and the early 80s. PC also had very efficient mass storage and RAM

specifications. Even today, while my HP49G and TI-200 can do cool numerical analysis calculations, I find my C++, VB, and C# programs able to run circles around the calculators (provided that I program these applications on the PC). I look at the high end HP and TI calculators as specialized handheld micros.

I guess it was Moliere (correct me if I am wrong) who said "The better is the enemy of the good".

Namir

Re: HP seems to have lost its Way

*Message #4 Posted by **Juan J** on 23 Sept 2003, 2:23 p.m.,*
in response to message #3 by Namir

Calculators had their finest hour when PCs were big, clumsy and expensive, that is true. But there are always problems you can handle with a calculator more efficiently than you would on a PC, even a portable one.

From my experience, for field work a well-programmed calculator (for instance, a 28, 41, 42 or 48) can beat a laptop PC or a PDA and endure much more abuse under harsh work conditions. And there will always be a need for such applications (and devices.) On the other hand, PC-based job design can quickly be confirmed with a calculator; a parameter that those nice software applications of today does not include on its results but is needed can be calculated on the way with a calculator.

Unfortunately HP has apparently shifted its interests from those little machines we use and love so much, but that is another story.

And correct me if I am (quite possibly) wrong, but Admiral Sergey Gorshkov liked to say that "better is the enemy of good enough."

*Message #6 Posted by **F. Casanellas** on 25 Sept 2003, 5:34 a.m.,*
in response to message #3 by Namir

Absolutely agree. Just compare the HP48G series with the HP49G, this one has: - a rubbishy keyword - a cover that first slides to hard, later too smoothly - a "garbage collector" that stops the calculator very often for several seconds.

I had to say in favor of HP (in Spain) that I was very annoyed for the pausing problem. They explain to me that there was no solution and accepted my calculator back returning me the money I had payed to the distributor.

When I returned back to the HP48G with the soft keyword and no appreciable pausing, it was a sort of relax.

*Message #7 Posted by **Valentin Albillo** on 25 Sept 2003, 5:52 a.m.,*
in response to message #6 by F. Casanellas

F.Casanellas wrote:

"this one has: - a rubbishy keyword - a cover that first slides to hard, later too smoothly - a "garbage collector" that stops the calculator very often for several seconds."

It seems the "garbage collector" isn't recursive. Else it would have garbage-collected itself. Anyway you did very properly indeed, returning your "garbage" item and "collecting" your money back.

And, BTW, it's "keyBOARD", not "keyWORD" :-)

Best regards from V.

-41CV fading display

*Message #1 Posted by **Jim** on 21 Sept 2003, 5:28 p.m.*

The display on my -41CV is fading. I've never had this happen to a -41. What's usually the problem and what's the probable fix? Thanks.

Re: -41CV fading display

*Message #2 Posted by **Thibaut.be** on 22 Sept 2003, 6:04 a.m.,*
in response to message #1 by Jim

I konw its sounds silly, but have you tryed fresh batteries ? Are your battery contacts clean ?

Re: -41CV fading display

*Message #3 Posted by **Jim** on 22 Sept 2003, 10:44 a.m.,*
in response to message #2 by Thibaut.be

Oh, yes, I tried fresh bateries, but I've never known a fading display in 41 associated with weak batteries. Plus, I had the unit serviced earlier this year and the battery contacts were fine then. I bought the unit from a friend of mine who didn't take care of it so that's probably part of the problem now.

HP-34C, spice calc's, what about "2 disease"

*Message #1 Posted by **Norm** on 21 Sept 2003, 5:17 p.m.*

Greetings: Haven't posted here in awhile. For those who don't know, I am the #1 proponent of 34C and its cousins ... when working properly I think the 34C in particular is superb, both cosmetically and operationally.

Was just noting, with another 34C owner, a unit that has contracted "2 disease". This is a condition that still allows the unit to function, but the display does not blank properly, causing annoyance by flashing more than necessary.

A unit with full "2 disease" will show flashing while it computes sin(x) for example. And it blinks with each press of "2" (i.e. enter 2.2222222).

What are we gonna do about this? I remain convinced that it is an irreversible damage to the silicon chips (probably ESD or overvoltage) and is triggered either by servicing the units (like servicing without fullest ESD precautions) or it is caused by running the units when they have intermittent internal connections.

The problem is, with solderless circuit boards, the unit gets an intermittent, then the user runs it anyway, then it gets "2 disease" ??

What are we gonna do about this ?

Re: HP-34C, spice calc's, what about "2 disease"

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 21 Sept 2003, 8:05 p.m.,*
in response to message #1 by Norm

Hi! I cleaned the contacts of my HP-32E (not soldered also) with pencil eraser (soft white rubber) until the entire board gets a bright and clean aspect (not too much, and not much harder to not damage it). Mine was missing digits and segments of the display, now is good as new.

Regards,

Nelson

Re: HP-34C, spice calc's, what about "2 disease"

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Sept 2003, 8:30 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Be careful with both eraser debris and with static caused by friction between the eraser and the board (just in case there are electronic components still connected to the board, apart from the solderless chips)

Re: HP-34C, spice calc's, what about "2 disease"

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 21 Sept 2003, 10:50 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

At least in the case of the HP-32E, you can disassemble it entirely, leaving only the flex board and the metal/foam base (no electronic components at all). Yes, you must clean all the debris with a brush or anything like that. You must take care to not touch the IC's pins, they are ESD sensible.

As I said, mine is now fully functional.

Regards,

Nelson

Re: HP-34C, spice calc's, what about "2 disease"

*Message #5 Posted by **Jon** on 22 Sept 2003, 4:44 p.m.,*
in response to message #1 by Norm

I think nothing can be done. Just take care when repairing these units. I also recomend charging the cells outside with a battery pack charger (just in case).

Re: HP-34C, spice calc's, what about "2 disease"

*Message #6 Posted by **Paul Brogger** on 22 Sept 2003, 5:41 p.m.,*
in response to message #1 by Norm

Has anyone compared the "bus behaviors" of two units side-by-side -- one with the "2 disease", one without? Has it been decided what electrical characteristic results in the flickering? (E.g., are common cathodes or anodes not held low or high during use of other shared lines for internal ROM accesses, etc.?)

If the actual breakdown could be elicited, I wonder whether then it *might* be possible to beef up a pin or two through the use of an external resistor or something like that?

One has to wonder whether anything *can* be done . . .

9114 drives

*Message #1 Posted by **christof** on 21 Sept 2003, 3:15 a.m.*

So, having failed to find another drive unit for my 9114, and haivng failed to find anyone to fix it, I'm looking at another option-

I have a few HP-9121 units, and I'm willing to cannibalize some of the parts. From what I can tell, the drives *may* be usable in a 9114B if a cable adaptor can be made. Maybe.

So, I'm looking for pinouts for both drives so that I can try this out.... (and if it works, i have spare drives at last)

Re: 9114 drives

*Message #2 Posted by **Vassilis Prevelakis** on 22 Sept 2003, 1:51 p.m.,*
in response to message #1 by christof

```
christof wrote:

>I have a few HP-9121 units, [...]
```

If you are thinking of replacing a drive from the 9121 with that in the 9114, it won't work. The pinouts may or may not be the same (9114A drives have the same pinouts, 9114B have the newer single connector that carries both data and power), however, the **drives are different**.

The 9121 have single sided drives, while the 9114 are double sided.

You may be able to use drives from 9122 devices.

Alternatively you may try to use parts from the drives inside the 9121 but that depends on what is wrong with the drive in the 9114B.

Nelson

PDF docs for 82240

*Message #5 Posted by **Randy Sloyer** on 21 Sept 2003, 8:57 a.m.,*
in response to message #1 by andrew

No cracking necessary.

HP placed this information in the public domain so that other OEMs could use the 82240. The technical specs exist as a PDF document:

http://www.hpcalc.org/details.php?id=4742

IIRC, the 42S does an initial preamble that is not documented in the spec. It seems to be 3/4 of a word, ~90us on/~550us off, 16 reps. I think it must be used to clear the input buffer of the 82240.

Edited: 21 Sept 2003, 9:06 a.m.

HP82973A HPIL PC Card

*Message #1 Posted by **Philip** on 20 Sept 2003, 4:15 p.m.*

Can the 82973A HPIL card that can be installed into a PC be used to control or communicate with other IL devices besides printer, disk, plotter and display devices? For instance, I'd like to control the 3421A Data Acquisition device or 3468A Voltmeter. I know the HPIL.SYS driver turns the PC into a controller but I'm not sure if it can control all devices and if so, how?

Thanks

Re: HP82973A HPIL PC Card

*Message #2 Posted by **Holger Veit** on 22 Sept 2003, 4:11 a.m.,*
in response to message #1 by Philip

>Can the 82973A HPIL card that can be installed into a PC be >used to control or communicate with other IL devices besides >printer, disk, plotter and display devices? For instance, >I'd like to control the 3421A Data Acquisition device or >3468A Voltmeter. I know the HPIL.SYS driver turns the PC >into a controller but I'm not sure if it can control all >devices and if so, how?

Effectively, this controller "speaks" HP-IL, and this means it can send and receive any HPIL command that is possible. The HP-IL module in the HP-41 and in the HP-IL converter uses exactly the same chip.

So the answer is "yes, that's all possible".

The "how to" is the problem, because you have to understand the HP-IL command language, and have to know what instructions the target devices actually accept. This should be documented in the particular documentation for the device (for the 82161 mag tape and the 82162 printer, this is IIRC unfortunately not described in detail, but can be obtained from VASM listings of IL module and other second sources.

A must IMHO is to read the Kane&Ushijima bible on HPIL to comprehend what is really going on at all on the bus.

Holger

Re: Use EMU41

*Message #3 Posted by **Christoph Klug** on 22 Sept 2003, 5:54 a.m.,*
in response to message #2 by Holger Veit

Dear Philip,

your application, control the HP3421 or HP3468 or other IL-devices by PC is easy possible by using the new full version of EMU41 from Jean-Francois Garnier. Addidional you get much more advanced features. Please refer to the HP-Museum article forum item 311 "HP41-PC gateway and emulator".

Best wishes from Germany - Christoph Klug

Re: HP82973A HPIL PC Card

*Message #4 Posted by **Philip** on 22 Sept 2003, 5:24 p.m.,*
in response to message #1 by Philip

Thanks for the input. I determined that the HPIL.SYS driver installs a software Interrupt (INT 54) that handles the communication to the IL through the PC Board. I may be able to determine what functions are available. For example, I know that Function Int 54, Function 0 is Config Loop and Function 1 is Find Device. If I find out more I'll try to document this in the Articles forum.

Re: HP82973A HPIL PC Card

*Message #5 Posted by **Ellis Easley** on 23 Sept 2003, 11:43 a.m.,*
in response to message #4 by Philip

There is a document in the museum FTP site that describes the INT54 driver:

ftp://hpmuseum.org/lif/hplink/int54h.doc

There are two directories related to the 82973A in the FTP site, lif/hplink and lif/hpillink. I think they represent two different releases of the software that came with the board.

Dead HP31E

*Message #1 Posted by **Peter Martin** on 20 Sept 2003, 3:36 p.m.*

I have an HP31E calculator which appears to have died (... or possibly to have been murdered by me!). When powered up the calculator displays all 8s with the '-' sign showing very brightly. After a while the calculator gradually displays all 9s. Can any one diagnose the problem?

Yours, Peter Martin.

Re: Dead HP31E

*Message #2 Posted by **Renato** on 20 Sept 2003, 3:46 p.m.,*
in response to message #1 by Peter Martin

Are you using a good battery pack ? If the pack is dead or missing, and you are using the AC adapter, you may damage the calculator, and you will get erratic operation.

Re: Dead HP31E

*Message #3 Posted by **Peter Martin** on 20 Sept 2003, 4:59 p.m.,*
in response to message #2 by Renato

The reason I said that I may have murdered the calculator is because I made the battery pack out of 2 NiCad AA batteries and think that I may have inserted it backwards once. The calculator did work perfectly well with this pack and the fix I did to the contacts. I suspect I may have fried a chip with either dodgy contacts to the battery pack and hence a direct connection to the power supply or the incorrect insertion of the power pack. I've charged the batteries several times and swapped the AA cells but to no avail. The calculator abruply stopped working after a house move. Whether this is significant I don't know; but vibration may have played a part.

Vibration

*Message #4 Posted by **Renato** on 20 Sept 2003, 11:42 p.m.,*
in response to message #3 by Peter Martin

Might be the cause, if this is a non-soldered version. Have you tried to squeze the calculator on the sides, and see if behavior changes ?

If you take a look at the pages about the 31E technology, you´ll see the reason for the suggestion.

Renato

Re: Vibration

*Message #5 Posted by **Peter Martin** on 21 Sept 2003, 3:12 a.m.,*
in response to message #4 by Renato

I've dismantled the calculator and even though its serial number is 1830A17943, indicating a 1978 build date, it is a soldered version.

Re: Dead HP31E

*Message #6 Posted by **db(martinez,california)** on 20 Sept 2003, 6:35 p.m.,*
in response to message #1 by Peter Martin

re: the -8,888,888,888 changing to -9,999,999,999 problem. every time this happens; add 1,111,111,111.

Seriously; running on any kind of battery other than the hp battery pack IS a very good idea, as long as you don't reverse the polarity. In addition to what Renato said about the charger; if the batteries are not making good contact when you are using the charger then you can fry the calc. That means to never let them go completely dead, so you know that you have a good battery connection before you plug in the charger.

It's sad that hp made such a bad recharging system. As a collector i want to have a charger for each calc but as a calculator user i don't want to plug the charger in.

Re: Dead HP31E

*Message #7 Posted by **Peter Martin** on 21 Sept 2003, 3:32 a.m.,*
in response to message #6 by db(martinez,california)

This would make sense. After the move, by the time I got to the calculator the NiCad batteries would have self discharged. I would probably have charged them in the calculator.

Re: Dead HP31E

41CX with dead extended memory

*Message #1 Posted by **dbrunell** on 20 Sept 2003, 2:18 a.m.*

I have a 41CX with what appears to be inoperable extended memory. I can try to create a text file with CRFLAS, and no error is reported. Yet nothing shows up under CAT 4. If I try to call the file up by name, I get a "FL NOT FOUND" error. Same result when I try to save/get a program.

Is this a common problem? Is it fixable? I've tried clearing out memory. Everything else on the calculator works fine. Halfnuts aren't very repairable, are they?

Thanks,

Dave

Re: 41CX with dead extended memory

*Message #2 Posted by **christof** on 20 Sept 2003, 11:25 a.m.,*
in response to message #1 by dbrunell

when you do cat 4 you get 'DIR EMTPY' ?

and what is reported in the X register after that?

assuming >0, what happens when you enter a simple program with label and end (say, something with 30 lines, like LBL FOO 2 enter enter enter enter + + + + + ...)

when you SAVEP after putting FOO in the alpha register, do you get a catalog 4 entry for the program? what number is left in the X register then?

have your tried a reset (memory lost, something synthetic might have messed you up, you may even have to do the old batteries out reset)

Re: 41CX with dead extended memory

*Message #3 Posted by **dbrunell** on 20 Sept 2003, 8:25 p.m.,*
in response to message #2 by christof

Thanks for your reply. Yes, CAT 4 gives DIR EMPTY and 124 in the X register. So it's like the machine thinks it's got a full memory there. When I try to save a program with SAVEP, no errors are generated. It must do a write without verify because if I immediately do a CAT 4 I get DIR EMPTY and 124.

When I got the unit, the batteries had been out of it for over a week, so it had time to do a hard, cold reset. I've had the batteries out several times since and did numerous <-/ON clearing operations.

I'm guessing that the extended memory (and clock) are on that little board soldered piggyback to the main board. I haven't pulled it off yet, but it doesn't look like there is much that can be serviced on it, save for maybe a shorted capacitor. I'd further guess that the actual rom functions are on the main board, since it has

no trouble finding and executing them. Surprisingly, the clock works just fine.

Dave

Re: 41CX with dead extended memory

*Message #4 Posted by **Tony Duell (UK)** on 20 Sept 2003, 8:49 p.m.,*
in response to message #3 by dbrunell

That little daughter board (the 'enhancement assembly') was about the only part of a halfnut you were supposed to replace. It contains 3 chips directly bonded to the PCB -- the timer chip, the ROM with the extran 41 CX functions (12K words, but note the main ROM on the display driver is different between the CV and CX, so you can't turn the former into the latter just by adding this board), and the extended RAM. It's quite possible for the RAM to fail, but the rest of the board to keep on working.

Re: 41CX with dead extended memory

*Message #5 Posted by **dbrunell** on 21 Sept 2003, 1:10 a.m.,*
in response to message #4 by Tony Duell (UK)

Tony, thanks for the explanation of the enhancement assembly. There must indeed be some sort of internal problem with the RAM chip. The only other components on that board are a crystal and a resistor. It probably wouldn't help to plug in an extended RAM module since the calculator would still try to fill the internal memory first.

I'm beginning to get a very negative view of HP these days. I have a number of old TI and HP calcs, and the TIs have proven to be the least troublesome. I've got an 18C with a broken battery door, a 32E where the power switch quit working, a 45 with a broken keyboard, a 12C with a bad LCD, an 82240A printer that doesn't advance the paper properly when a full roll is present, and now a 41CX with bad extended memory. Plus, my HP laptop (not a Compaq design) locks up all the time.

Where is this "HP quality" that people speak of? I think I've spent my last dollar on HP products.

Re: 41CX with dead extended memory

*Message #6 Posted by **David Smith** on 21 Sept 2003, 3:22 p.m.,*
in response to message #5 by dbrunell

Actually, depending upon the failure mode, an external RAM module may even work. If the onboard RAM chip has a bad interface that does not respond and lock up the bus, an external RAM could be OK. I seem to remember a case of a 41CV that had a bad RAM. The guy that had it removed the extra RAM chips and used a quad memory module.

Gorilla Glue

*Message #1 Posted by **gifron** on 19 Sept 2003, 2:47 p.m.*

Has anyone ever tried a little Gorilla Glue on a toothpick under the edge of a peeled up face plate? The label says it works on metals and most plastics. I've tried it on other stuff, and it works great in general. But after it dries, it is hard to remove, so I don't want to use it if it's only going to stick to one surface. Please post if you have any experience with this. I'm hoping to repair my 32SII that's in excellent condition, other than the fact that the face plate is coming loose at the corner.

Re: Gorilla Glue

*Message #2 Posted by **bill platt** on 19 Sept 2003, 3:19 p.m.,*
in response to message #1 by gifron

Hi Gifron,

Well, I just fixed my 15c, which had a peeling back plate.

See http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=42223

But before I fixed it for real, I tried gluing it down, and it did not work. It is impossible to properly prepaire the surface for adhesive when you are just shooting glue underneath, and also, the plate acts as a spring--and if you calculate the force required to hold that spring down, you will discover that the stress at the edge of the glue joint is very high.

Also, the adhesive that is still under the plate is going to interfere with the gorilla glue.

Regards,

Bill

Re: Gorilla Glue

*Message #3 Posted by **David Smith** on 19 Sept 2003, 7:59 p.m.,*
in response to message #1 by gifron

I fixed a rather beat to a pulp 32Sii faceplate that had a bent/lifted display bezel with IC2000 tire cement. It is a black rubberized superglue sold a hobby shops to glue tires to the rims of radio controlled race cars. The faceplate has been firmly in place for a year now.

Glues for aluminum bezels

*Message #4 Posted by **Randy Sloyer** on 19 Sept 2003, 9:36 p.m.,*
in response to message #3 by David Smith

I have tried super glues and found them to be dangerous with the white blush they release upon curing. It's very hard to get off the plastic case. I would not use Gorilla Glue as it too would be impossible to remove should something go wrong.

I have been using Goop Household contact adhesive from my local Ace hardware. It also shows up in craft shops. It's clear, dries fast and can be rubbed off metal and plastic when cured. It's similar to a very strong rubber cement. You don't have to be super careful, just get enough under the corner to do the job, press down to spread, let it up to dry for a second then back down. I use a small plastic jawed spring clamp to hold it down for about an hour. Pop off the clamp and rub off the exposed glue. You can clean out the grove between the bezel and case with a toothpick.

for reference:
http://www.drugstore.com/qxp81910_333181_sespider/goop/household_goop_contact_adhesive_and_sealant.htm

If you're gluing near keys, be careful to use small amounts. If you use too much and squeeze it into the keys, you'll have weird key action if they work at all. You can recover from this by waiting for it to cure, peel the bezel back up and picking it out of the key hinge bit by bit with tweezers :-(

Edited: 19 Sept 2003, 9:37 p.m.

Thanks Randy

*Message #5 Posted by **Patrick** on 19 Sept 2003, 10:30 p.m.,*
in response to message #4 by Randy Sloyer

I have a couple of 42S's with loose bezels that I've just decided to try your Goop on.

Thanks for sharing your experience here, Randy. I'm sure you've saved a vintage machine or two from a horrible fate.

Re: Glues for aluminum bezels

*Message #6 Posted by **dbrunell** on 20 Sept 2003, 2:23 a.m.,*
in response to message #4 by Randy Sloyer

I've had good luck using Armor All to remove the white blush left by super glue.

Re: Glues for aluminum bezels

*Message #7 Posted by **David Smith** on 20 Sept 2003, 12:32 p.m.,*
in response to message #4 by Randy Sloyer

Yes, I tried a similar product to tack down my bezel corner, but it did not hold. The IC2000 did. I inserted it under the bezel with a piece of piano wire and pressed it in place until it set.

I really like contact adhesives for sticking down the corners of classic calculator rear labels that have been lifted for servicing. I never install the screws under the labels so that any future servicing will not risk more damage to the label.

Re: Gorilla Glue

*Message #8 Posted by **Todd Stock** on 20 Sept 2003, 12:14 p.m.,*
in response to message #3 by David Smith

Gorilla Glue and other polyurethanes foam as they cure - not what you'll want to be cleaning out of a calculator.

...and the winner is.... (about 48's screen colours)

*Message #1 Posted by **R Lion (España)** on 19 Sept 2003, 1:42 p.m.*

A month ago I bought a spare 48GX. As it is new, it has black screen. Then I posted something like "the new screen is slightly better, not much better...".
Well, after four weeks of testing, I have decided to use the new black screen unit, and keep my old blue unit in home as a backup...
Now, when I look to the old blue one, I can see it clearly: the new screen is definitly better.

Regards Raul

Re: ...and the winner is.... (about 48's screen colours)

*Message #2 Posted by **Bill (Smithville, NJ)** on 19 Sept 2003, 2:31 p.m.,*
in response to message #1 by R Lion (España)

I agree. I have both units and only use the newer black screen one. It definetly has better contrast. Very important since as I get older, I find I really need the extra contrast.

Re: ...and the winner is.... (about 48's screen colours)

*Message #3 Posted by **Chan Tran** on 19 Sept 2003, 3:31 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

I found that my 48SX version C is very difficult to read the screen.

Re: ...and the winner is.... (about 48's screen colours)

*Message #4 Posted by **Michel Beaulieu** on 19 Sept 2003, 4:23 p.m.,*
in response to message #1 by R Lion (España)

I jsut get my first HP-48S and if i take my 48GX side by side, i can see they are blue . But when i tried to adjust the contrast of my 48S, the background also get darker and the result is not so clear. On my 48G, the contrast adjustement is good, even if it's blue : the background stay clear (until high contract at least). Is it normal for a 48S blue LCD vs a 48G blue LCD too?

Thanks! Michel

Edited: 19 Sept 2003, 5:30 p.m.

HP48GX, missing alarm beep

*Message #1 Posted by **Thomas Otterbein** on 19 Sept 2003, 9:46 a.m.*

Hi..

I own a new HP48GX. All is working fine, except the alarm beep. During a alarm there is now beep. The alarm flags are set, but nevertheless, no beep is to hear.

When I do wrong inputs, the HP48 beeps. Also the beep comand with time and frequencies is working, except the alarm beep :-(

What I´m doing wrong?

B.t.w. the calculator has the newes ROM-Version ´R´.

Thanks for helping..

Thomas, Germany

Re: HP48GX, missing alarm beep

*Message #2 Posted by **Wayne Brown** on 19 Sept 2003, 5:52 p.m.,*
in response to message #1 by Thomas Otterbein

If flag -57 is set then the alarm beep is disabled. Clear it with **-57 CF** and I'll bet your alarm beep starts working.

Re: HP48GX, missing alarm beep

*Message #3 Posted by **Thomas Otterbein** on 20 Sept 2003, 4:46 a.m.,*
in response to message #2 by Wayne Brown

Hi... you loose :-(

I set the flag, that the alarm beep is on. But it didn´t help. The beep is still missing during the alarm. I will continue playing. With other commands and with wrong inputs, the beep works. Only with the alarm it didn´t. Strange..isn´t it?

Bye.. Thomas, Germany

Re: HP48GX, missing alarm beep

*Message #4 Posted by **James M. Prange** on 20 Sept 2003, 5:53 a.m.,*
in response to message #3 by Thomas Otterbein

Well, maybe if you clear flag -57...

Regards,
James

Re: HP48GX, missing alarm beep

*Message #5 Posted by **Michel Beaulieu** on 20 Sept 2003, 8:08 p.m.,*
in response to message #4 by James M. Prange

Use the reset hole under a rubber feet if you don'T worry about loosing memory...

Re: HP48GX, missing alarm beep

*Message #6 Posted by **Thomas Otterbein** on 21 Sept 2003, 8:12 a.m.,*
in response to message #4 by James M. Prange

Hi all, thank´s for all the hints.

Either I´m to stupid for this calculator or somthing is wrong.

I tried in the meantime: - Reset (by switch under the rubber foot - Set and canceled the flag 57 - set the alarm direct after the calculator reset - and so on.....

The result, the alarm didn´t beep. I think I have to live with it :-)

Bye.. Thomas, Germany

Re: HP48GX, missing alarm beep

*Message #7 Posted by **Wayne Brown** on 21 Sept 2003, 10:40 a.m.,*
in response to message #6 by Thomas Otterbein

Make sure it's flag **-57** and not **57** that you're clearing -- the **minus sign** is required. Negative flags are system flags, whereas positive flags are user flags. The alarm beep is controlled by a system flag.

Re: HP48GX, missing alarm beep

*Message #8 Posted by **Thomas Otterbein** on 21 Sept 2003, 11:46 a.m.,*
in response to message #7 by Wayne Brown

Hi.. it works...

I know now why it didn´t work before. When I set a alarm and insert a alarm message, the beep is missing. Without a message...the beep comes during a alarm.

I think it´s mentioned in the manual.

How I can handle the 48 when I even understand the beep funktions, I should stay at may good old HP41CX with card reader :-))

It´s realy nice, that you stay in contact with such guys as me :-)).....

Have a nice day!!!

Bye.. Thomas, Germany

Re: HP48GX, missing alarm beep

*Message #9 Posted by **James M. Prange** on 22 Sept 2003, 3:55 a.m.,*
in response to message #8 by Thomas Otterbein

Appointment alarms cause the alarm beep. For the alarm to be an appointment alarm, the "alarm message" has to be a character string; that is, text enclosed by double-quotation marks, as in: "HELLO". If you leave the message field in the input form empty, then an empty character string, "", is entered for you, so that causes it to be an appointment alarm.

Any other type of alarm object causes the alarm to be treated as an execution alarm, which doesn't cause an alarm beep. For example, if you enter: HELLO (without quotation marks) into the message field, it will be treated as an execution alarm. Execution alarm objects are usually programs or global variable names for programs.

You could use a program object which explicitly executes the BEEP command as the alarm object. Of course, for the BEEP command to be effective, the standard beep has to be turned on; that is, flag -56 must be clear.

Regards,
James

HP49G+ vs. HP49G, pausing

*Message #1 Posted by **F. Casanellas** on 19 Sept 2003, 8:54 a.m.*

The HP49G had two annoying defaults (I returned it and keep using the HP48G): the keyboard was very hard and very often it stoped working for a few seconds.

The first problem seems somewhat solved. I would like to know if the HP49G+ does not stop any more.

Edited: 19 Sept 2003, 8:54 a.m.

Re: HP49G+ vs. HP49G, pausing

*Message #2 Posted by **John Cadick** on 19 Sept 2003, 9:48 a.m.,*
in response to message #1 by F. Casanellas

The pausing of the 49G was caused by its periodic "garbage collection." This problem was fixed in the 49G some time ago with one of the ROM upgrades. Since it was fixed in the 49G, I suspect it is not a problem in the 49G+.

I am at the HHC2003 this weekend and will get to see (I hope) a 49G+. If no one else answers your question more specifically, I'll get back to you.

Re: HP49G+ vs. HP49G, pausing

*Message #3 Posted by **Veli-Pekka Nousiainen** on 19 Sept 2003, 9:38 a.m.,*
in response to message #1 by F. Casanellas

About the pausing = Garbage Collection:

"Jean-Yves Avenard" <me@privacy.net> wrote in message news:BB76747A.12B42%me@privacy.net...<VPN snipped>

*<< 1 500 FOR I I NEXT 500 ->LIST LIST-> MEM >>: 7.98s (HP49G: 45.81s) (This test the GARBAGE collector and SysRPL kernel)

==========

TO measure just the CG, I changed this to << MEM DROP # 0d # 999d FOR k k NEXT 1000 ->LIST LIST-> >> EVAL {MEM} HEAD TEVAL and it takes only around 15% of the "old" time to do CG now.

"Jean-Yves Avenard" <me@privacy.net> wrote in message news:20030915085021446+1000@news.cis.dfn.de...<VPN snipped>

> Must be a fair bit of native code in there otherwise you wouldn't see > such a speed gain.

The CG routine could be ARM native to gain ~ 6*speed increase or time decrease.

Just buy the HP 49G+ !!! - VPN

Re: HP49G+ vs. HP49G, pausing

*Message #4 Posted by **Francesc Casanellas** on 29 Sept 2003, 3:01 p.m.,*
in response to message #3 by Veli-Pekka Nousiainen

I have loaded the ROM beta version 19.6 and it seems to have solved the garbage collector problem.

Regarding the J.Y. Avenard test, reported by Veli-Pekka Nousiainen: "TO measure just the CG, I changed this to << MEM DROP # 0d # 999d FOR k k NEXT 1000 ->LIST LIST-> >> EVAL {MEM} HEAD TEVAL and it takes only around 15% of the "old" time to do CG now."

I would like to know how long does it take it in the HP49G+. In the updated HP49G it takes 0.44 s.

Unfortunately I did not make the test with the 18.1 version.

Edited: 29 Sept 2003, 3:19 p.m.

Re: HP49G+ vs. HP49G, pausing

*Message #5 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 4:42 p.m.,*
in response to message #4 by Francesc Casanellas

49G (1.19-6): 324.6 seconds

49G+ (1.22): 53.4 seconds

Note: I did not check the flag settings & only one run

VPN

*Message #6 Posted by **Iqbal** on 20 Sept 2003, 4:54 p.m.,*
in response to message #1 by F. Casanellas

Yes this appears to have been stopped. I just got my 49G+ and it's really a very nice calculator. Looks very 'rich' with it's colour and leather case. The only complaint so far is the fact that two buttons the Q and R needs to de depressed a little harder to register. I have seen this complaint before on other forums also. But I would really receoment buying the 49G+ because it is a trememdous improvement over the 49G.

Re: HP49G+ vs. HP49G, pausing

*Message #7 Posted by **Ed Look** on 20 Sept 2003, 11:35 p.m.,*
in response to message #6 by Iqbal

Iqbal, may I ask what you paid for it? I preordered one (I am in the US) for about $160 USD before shipping.

So, your opinion has made me feel better about the expenditure!

I once had a Monroe desktop calculator with nixie tubes. I traded it with Bruce Lamm for a copy of his book on calculator.

Re: Any suggestions for an affordable Nixie tube device?

*Message #5 Posted by **Dave Shaffer** on 19 Sept 2003, 12:31 p.m.,*
in response to message #2 by Paul Brogger

Does your "device" have to be a calculator?

HP (and others) made all kinds of test equipment with nixie tube displays back in the 60's. I suspect these can be had for just about free if you can find them. Look for a frequency counter or a DVM.

Re: Thanks to All!

*Message #6 Posted by **Paul Brogger** on 19 Sept 2003, 1:26 p.m.,*
in response to message #5 by Dave Shaffer

All very good suggestions. In particular, the non-calculator idea appears to be a fruitful avenue of inquiry -- an eBay search for "nixie" (in titles and descriptions) yielded several apparently usable multimeters, for example.

Thanks again!

Re: Any suggestions for an affordable Nixie tube device?

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Sept 2003, 9:56 a.m.,*
in response to message #2 by Paul Brogger

Paul: a Google search for 'nixie tube' will offer many good places to look at. I specially liked www.nixieclocks.de, www.cathodecorner.com, and www.sphere.bc.ca

Yes, I have been bitten by the nixie bug, and plan to design and build "something" nixie-based...

Re: Wow. Old BIG commodore desktop programmable on ebay

*Message #13 Posted by **Andreas** on 19 Sept 2003, 1:44 p.m.,*
in response to message #1 by Gene

It's actually a Casio, see this very informative page on it: http://www.oldcalculatormuseum.com/commal-1000.html Hmm... a $1200 buy it now price... Someone is optimistic!

I'm also a big fan of Nixie - finally got my hands on my first Nixie calc (a beautiful 16 digit Sharp) a few weeks ago.

Granted, the calculator I desire most has a CRT :-)

Oh, I don't know

*Message #14 Posted by **Mike** on 19 Sept 2003, 6:39 p.m.,*
in response to message #13 by Andreas

It's already at $900.

HP49G PC link

*Message #1 Posted by **Neil Strickland** on 19 Sept 2003, 7:48 a.m.*

I received a cable with what looks like a serial adapter with my 49G calculator. Does anyone know if this can be used to connect my 49G to my PC or will I fry my calculator? Thanks.

Re: HP49G PC link

*Message #2 Posted by **Randy Sloyer** on 19 Sept 2003, 8:32 a.m.,*
in response to message #1 by Neil Strickland

It should be the std PC connection cable. If you can find a number molded on a connector somewhere, consult the cable list of lists:

http://holyjoe.org/hp/cable.htm

You'll also want the latest PC Comm program from HP:

ftp://hp.com/pub/calculators/software/hpcomm.zip

HP 49g+

*Message #1 Posted by **Ben Salinas** on 18 Sept 2003, 6:54 p.m.*

Well, I got my 49g+ this morning, and opened it up. I haven't had much time to learn how to do everything, and won't have time until saturday, but one of the things I was wondering about is the speed in comparison to the TI-89. I am planning on having a full test completed this weekend (HP 49g+, TI-89, HP-48gx (belongs to a friend), HP 32sII (just for kicks)) This morning, I quickly tried doing some factorials on this calculator to test the speed. I decided to use 252! since that is just about the highes number the 32sii can give you. The 49g+ takes about 1.5 seconds to calculate this (giving you all the digits) The TI-89, to do the same thing takes 10 seconds. No joke! Furthermore, on teh 49g+, multiplying or doing common operations with this 498 (or so) digit number occur instantaneous (just like if u were adding 1 and 1). On the TI-89, about 13 seconds to multiply 252! by 270. The 49g+ takes less than 1 second!

I am personally amazed by the speed of the 49g+

As far as the keyboard, it is great. I havent had any problems with it yes.

I have a "Phase three- marketing sample, not for resale (dated) 03/07/30)" Serial Number: CN33103042 It came with a USB cable, the leather case, a small manual (only a few hundred pages), and a CD with the conectivity software and the PDF manual. It is easy to tell that this is a pre-release version of the calculator because the CD is a burnt CD with the title written in sharpie:).

As far as news on the other calculators. I talked to Tony Jones (whom some of you all will be seeing at the HP calculator conference this weekend) and he said that the reason they did not give me a 33s is because they do not have a marketable version yet. I dont know what that means.

He really didnt talk as much about the new calculators as I hoped.

Well, that's it for now... I will keep you posted -ben

33S Delayed? (Was: HP 49g+)

*Message #8 Posted by **Erik Ehrling (Sweden)** on 19 Sept 2003, 1:13 a.m.,*
in response to message #1 by Ben Salinas

> As far as news on the other calculators. I talked to Tony Jones (whom some of you all will be seeing at the HP calculator conference this weekend) and he said that the reason they did not give me a 33s is because they do not have a marketable version yet. I dont know what that means.

It might sound a little bit strange but, personally, I find the news of a delayed HP-33S good news indeeed! Maybe, after all, HP are listening to our user reactions and are taking it back to the drawing board making it into what it really should be:

-Backwards compatible with the HP-42S
-RPN only (large ENTER key in the classical position)
-Equipped with serial I/O

Anything else would, in my opinion, be a mistake.

Regards,
Erik Ehrling (Sweden)

Re: 33S Delayed? (Was: HP 49g+)

*Message #9 Posted by **DougT** on 19 Sept 2003, 6:48 a.m.,*
in response to message #8 by Erik Ehrling (Sweden)

I have to agree with Erik - the 33S as it appears now it is UGLY, with a capital UG. And what's the deal with that weird chevron keyboard? Overall, the calculator looks like something Ultraman would have used back in the '60s! I When I first heard about the 33S, I had high hopes of nabbing one to take the wear and tear off my trusty 32SII. I reckon I'll keep waiting...

Re: 33S Delayed? (Was: HP 49g+)

*Message #10 Posted by **Bert K** on 19 Sept 2003, 2:49 p.m.,*
in response to message #9 by DougT

Why don't you try to get hold of another 32SII? I managed to grab one for 35 euros (less than US $35) a month ago. It is a silver bezel with some "sticky keys" but now I can put my brown bezel into storage.

Spare 32SII

*Message #11 Posted by **DougT** on 20 Sept 2003, 11:25 a.m.,*
in response to message #10 by Bert K

Good idea, Bert, and it's one I'm pursuing. A "lightly used" silver-bezel unit would be perfect for my desk drawer at work.

Re: 33S Delayed? (Was: HP 49g+)

*Message #12 Posted by **Tom Scott** on 19 Sept 2003, 1:57 p.m.,*
in response to message #8 by Erik Ehrling (Sweden)

They're probably taking more time just to find ways to make it cheaper and increase the profit margin. They seem to think that by making it look like a cell-phone that it will be more marketable.

Tom Scott

Re: 33S Delayed? (Was: HP 49g+)

*Message #13 Posted by **CME750** on 19 Sept 2003, 5:36 p.m.,*
in response to message #8 by Erik Ehrling (Sweden)

There's growing interest in the HP33S, even among people who have never owned an HP calculator before, because of the recently-announced calculator restrictions imposed by the National Council of Examiners for Engineering and Surveyoring (NCEES). NCCES prepares professional licensing examinations which are used throughout the U.S. for engineers and surveyors.

Starting in 2004, NCEES has banned all calculators with text-editing capability, including (but not limited to) the HP48, HP49, TI83, and TI89. It looks like all currently available graphing calculators may be unacceptable under their definitions.

Programmable calculators are OK, as long as they are not graphing calculators. Unfortunately, it seems that nobody makes programmable non-graphing calculators anymore. The HP32SII may have been the last one.

NCEES says that the 32SII is acceptable, but it has several drawbacks. Since it's been discontinued, it's expensive and hard to find. It has a relatively small memory. And it's RPN only (obviously this is not a problem for everyone). The same drawbacks apply to older HP calcs.

If the 33S appears as scheduled in October, then it should resolve these issues. The 33S should be relatively inexpensive, will offer 32K of memory, and the choice of algebraic or RPN mode. Too bad it's so ugly. But there's still a lot of people who are prepared to buy one, because they need something that is both (a) programmable and (b) legal for use on professional engineering or surveying exams. The 33S may have this market to itself; I don't think TI, Casio, or Sharp offer any models that qualify.

This is still not a big win for HP, though. The new NCEES calculator policy may increase sales of the 33S, but it will also cripple the sales of the more expensive 48GXII and 49G+.

Re: 33S Delayed? (Was: HP 49g+)

*Message #14 Posted by **christof (NoVA, USA)** on 20 Sept 2003, 1:01 a.m.,*
in response to message #13 by CME750

(and yes, we have power.... well, at work, anyway. At home it's all laptop)

I think that the last non graphing programmable HP was producing was actually the 20S.

There are some other programmables out there, I just haen't been able to get any of them in the US. I think 2 or maybe 3 of the citizen models have programming capability of some sort.

I think that trying to force the 33S to be a replacement for the 41CX is a losing battle- serial IO, 42S/41C code compatibility, and all.

The calculator seems obviously to be a follow on to the- here's where the detective work comes in- 32Sii. As such, it seems great. Well, aside from the freaked out keyboard.

Not every calculator *must* be another rebadged 41/48. There really is a place for a smaller, simpler, solid programmable.

I'm as much addicted to serial IO as anyone- and I desperately want it for my 42. But *not* for my 32. Even with practically endless RAM. It's just not the same machine.

Re: 33S Delayed? (Was: HP 49g+)

*Message #15 Posted by **Ed Look** on 20 Sept 2003, 11:28 p.m.,*
in response to message #14 by christof (NoVA, USA)

Christof,

You don't think a 32SII or 34C type machine could use a little non-keyboard I/O? Back when my 34C was my only calculator, I dreamt of having the ability to do stuff on it and then upload it to a PC or minicomp, and vice versa. These "low end" (not in my opinion, though, I think they're totally great) calculators are great for most things, small programs, a bit of statistics, and repetitious calculations not requiring humongous equations, which is, in my opinion, what the bulk of calculator work for many of us is.

If I could retrofit my 34C or 32SII with serial I/O... what is it that the kids say nowadays, "Woot?"

Re: 33S Delayed? (Was: HP 49g+)

*Message #16 Posted by **Christof** on 21 Sept 2003, 1:56 a.m.,*
in response to message #15 by Ed Look

Nahhhh,

I desperately want a pioneer with serial IO. I admit it. but it has to be the 42S. (even better in my mind would be a 42 ROM with IO in a clamshell, but.....)

I just don't think the 32S is one of those- nor any upgrades. There are reasons- there will always be a testing environment where the serial IO disqualifies the calc. There will always be a price difference.

there's a place for more than one hp rpn scientific programmable, that's all :)

Re: 33S Delayed? (Was: HP 49g+)

*Message #17 Posted by **Ed Look** on 21 Sept 2003, 10:23 p.m.,*
in response to message #16 by Christof

I'll agree with that! There DOES need to be more than one HP rpn programmable.

I read somewhere in this forum that it would so sweet if they reissued the 15C or 16C or 32S or 32SII or 42S. I hope HP monitors the stuff on this forum... nahhhh.

Re: 33S Delayed? (Was: HP 49g+)

*Message #18 Posted by **Erik Ehrling (Sweden)** on 22 Sept 2003, 11:44 a.m.,*
in response to message #17 by Ed Look

Yes, I would happily see A HP-15C Platinum alongside a HP-42S Platinum (with serial I/O). But if I had to choose I would pick the latter...

Best regards, Erik Ehrling

in response to message #13 by CME750

The 33s on the Samson Cables website. ETA is 10/10. It will be interesting to see what it is like.

That would be a major revamp

*Message #20 Posted by **Patrick** on 19 Sept 2003, 6:39 p.m.,*
in response to message #8 by Erik Ehrling (Sweden)

While I cannot deny the brilliance of your suggested changes, Erik, it is exceedingly unlikely that HP would do this based just on the reaction of the people who have seen the leaked 33S information.

What you suggest would be a major revamp, requiring significant new engineering and test. I'm not in the manufacturing business, but I would reckon the changes you asked for would take a minimum of 6 months to engineer, not to mention test.

More likely is that they've found bugs through beta testing and need to produce a new ROM image.

Re: Given their 12cPlat experiences . . .

*Message #21 Posted by **Paul Brogger** on 19 Sept 2003, 7:15 p.m.,*
in response to message #20 by Patrick

... it's not surprising (indeed, it's to be hoped!) that they'll be a bit more careful in testing before committing to production.

Sure it's ugly, but if it's got the features advertised, significant *usable* program memory and decent keyboard action, I'll no doubt find a way to overlook the keyboard's layout . . .

(My youngest thought it looked like a remote control -- I countered with a cell phone comparison, and he said he'd rather have a cell phone than a calculator . . .)

Re: That would be a major revamp

*Message #22 Posted by **Erik Ehrling (Sweden)** on 20 Sept 2003, 4:59 p.m.,*
in response to message #20 by Patrick

Yes! Surely it would be a major revamp, however much of the work has already been pursued in the making of the new HP49G+: The Saturn emulation on the ARM architecture is already there and the ROM of the HP-42S has been with us for a very long time. OK, it would be naive of me to say that these changes are either small or of a kind that could be implemented in a very short time. But many of the improvements of the HP49G+ over the HP49G seem to indicate that HP are actually listening to what the consumers care about - and a very large proportion of the user community are spelling out the same "mantra": Keystroke programmable, HP-42S compatible, I/O... (over and over again).

Best regards, Erik Ehrling (Sweden)

Waiting till the next "next"

*Message #23 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Sept 2003, 9:01 p.m.,*
in response to message #22 by Erik Ehrling (Sweden)

If the 33S becomes an acceptable replacement for the 32S and 32Sii (despite keyboard layout),

If the "Saturn emulation on ARM..."is so real, and ROM images are surely available to HP...

Then, shouldn't many of us wait and hope and prey and ask for a 43S?

(But we should not expect the 33S to replace the 42S; it may be fine if it just covers the 32S model spot)

Re: That would be a major revamp

*Message #24 Posted by **Patrick** on 20 Sept 2003, 9:41 p.m.,*
in response to message #22 by Erik Ehrling (Sweden)

I think you make an unfortunate error in assuming the existence and availability of the 42S ROM helps very much in the building of a new calculator.

Based on the nature of the bugs found in the 12C Platinum, I would venture that it's ROM is a brand new implementation, not a modification/extension of the one in the 12C Classic.

HP has apparently lost the corporate knowledge that would make the 12C's ROM reusable -- perhaps because of all the corporate shuffle with ACO and the Compaq merger -- who knows?

I suspect the same is true of the other older calculator technologies, like the 42S. The ROM listing itself would be a good start, but you'd need to have the pre-compiled listing (commented!), at least, to make it feasible to re-use it.

Re: That would be a major revamp

*Message #25 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Sept 2003, 8:51 p.m.,*
in response to message #24 by Patrick

I was just quoting the previous post, which states:

"The Saturn emulation on the ARM architecture is already there and the ROM of the HP-42S has been with us for a very long time."

I was just trying to suggest that,

IF these conditions were true (which I cannot prove or deny)

, THEN a newer 42S style machine COULD be POSSIBLE

BUT I think the 33S is not such machine.

Now, IF a Saturn emulation is available on ARM (the 12Plat failures are not proof on the contrary, because the 12Plat is not ARM based, as the 49G+ is supposed to be), the ROM images may be enough, even without all the knowledge.

I think this has nothing to do with the Compaq merger. Time and life of both products and people are enough to cause knowledge loss.

Examples as eV41, HP41X, HP42X, which some people successfully developed to emulate HP calculators on other platforms show that ROM images are quite useful to this end.

Just my $ 0.01, these are just some ideas as I have no access to HP internal information, or to 33S or 49G+ units. The use of IF and THEN should indicate the conditioned and conditional nature of these thoughts.

And sorry for my "unfortunate error", but I consider that elaborating upon someone else ideas is not the same than assuming them as proven; which I certainly tried to avoid most of the time.

Re: That would be a major revamp

*Message #26 Posted by **Erik Ehrling (Sweden)** on 22 Sept 2003, 11:56 a.m.,*
in response to message #25 by Andrés C. Rodríguez (Argentina)

I totally agree with you Andrés, and my personal hope is that the reason why HP has not yet released the HP-42S ROMs in the Public Domain is that they have not yet ruled out such an option...

In effect, building a HP-42S Platinum around the ARM-based emulation from the HP-49G+ should theoretically even be cheaper than designing the HP-33S from scratch.

Best regards, Erik Ehrling

Re: That would be a major revamp

*Message #27 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Sept 2003, 7:43 p.m.,*
in response to message #26 by Erik Ehrling (Sweden)

Thank you, Erik, for your comments. Let's keep a little hope on the "43S" idea...

Re: That would be a major revamp

*Message #28 Posted by **Patrick** on 23 Sept 2003, 10:42 p.m.,*
in response to message #25 by Andrés C. Rodríguez (Argentina)

I seemed to have given offence. My apologies, Andres. That was certainly not my intent.

By using the word "unfortunate" what I meant was that it is unfortunate that HP has lost this corporate knowledge. It would generally be a reasonable assumption that technical knowledge gained in producing one product could be used advantageously in the development of a new, similar one. My point is that, in my opinion, HP no longer has sufficient corporate knowledge to leverage past successes. I use the nature of the HP-12CP as my rationale.

Again, sorry if I offended you.

Re: That would be a major revamp

*Message #29 Posted by **Andrés C. Rodríguez (Argentina)** on 24 Sept 2003, 2:56 p.m.,*
in response to message #28 by Patrick

Patrick:

Of course, there was no offense. Sometimes I feel I was unable (perhaps due to language issues) to state clearly my ideas. That was the case with my first posting. Let me apologize if my intent of clarification suggested that I was offended, and let us not enter in an endless apologies loop.

Thank you again, and best regards.

Re: 33S Delayed? (Was: HP 49g+)

*Message #30 Posted by **Alex Paramonoff** on 21 Sept 2003, 5:20 p.m.,*
in response to message #8 by Erik Ehrling (Sweden)

Hi Erik,

I am an engineer in the consumer electronics industry, and unfortunately it is very unlikely that they can make radical changes to this design this late in the game (unfortunately).

Probably they are frantically pressuring their supplier to "dial-in" the production of new 49 and 48, particularly the keyboard. It takes time to get a new supplier to understand your needs and hold them to your standards. Also, it's good marketing to introduce the expensive models first.

Luckily this means that the problens we are seeing on the 49G+ are likely to be tweaked by the time the 33S rolls out.

Here's my hope: if they are still in production with the 12C, why not use the tooling to do a run of 15C's? Every engineer on the planet who graduated before 1990 would buy one.

Best regards,

Alex P

Speed of factorial calculations

*Message #31 Posted by **Karl Schneider** on 19 Sept 2003, 2:57 a.m.,*
in response to message #1 by Ben Salinas

The 42S calculates 252! in about 1.5 sec, also. For even more impressive speed, try gamma(253.000000001) on the 42S or x! of 252.000000001 on the 32Sii and compare the answers.

Something must be wrong with the TI-89 to take 13 sec for that operation. I'll check with a co-worker on that one...

Re: Speed of factorial calculations

*Message #32 Posted by **Werner Huysegoms** on 19 Sept 2003, 3:22 a.m.,*
in response to message #31 by Karl Schneider

He was talking about the full 498-digit answer (vs the 12-digit floating-point approximation of the 42S).

Werner

Re: Speed of factorial calculations on TI-89

*Message #33 Posted by **Jonas Lööf** on 19 Sept 2003, 3:37 a.m.,*
in response to message #31 by Karl Schneider

Something indeed is wrong with the TI-89... It has about the slowest display of large integers found anywere! Sombody (i dont remember the reference) did a disassembly, and it was not impressive reading...

Re: Speed of factorial calculations

*Message #34 Posted by **dbrunell** on 19 Sept 2003, 11:53 a.m.,*
in response to message #31 by Karl Schneider

My TI-92 Plus takes about 1 sec to calculate 253! in approximate mode and 6 seconds in exact mode. It takes about a minute to scroll through all of the digits in the exact mode answer. :)

Re: Speed of factorial calculations

*Message #35 Posted by **Mark Ordal** on 19 Sept 2003, 1:21 p.m.,*
in response to message #34 by dbrunell

My timings for 253! on my TI Voyage200 are similar to the reported timings for the TI-92+, namely:

about 1 second in approximate mode.

about 7 seconds in exact mode.

about 50 seconds to scroll horizontally through all the digits of the exact answer.

--Mark

Re: Speed of factorial calculations

*Message #36 Posted by **Ben Salinas** on 19 Sept 2003, 3:54 p.m.,*
in response to message #35 by Mark Ordal

Yes, the time I provided for the 49g+ (1.5 seconds) was for exact mode. Some more times HP-49g+ 252! in exact mode: 1.5 seconds 252! in scientific notation:the closest I could get with a stopwatch was .37 seconds, but it is considerabley less than that... pretty much instantaneous To scroll through all the digits: 40 seconds

HP-32sII 252! in scientific notation: 1.5 seconds

Now the question is, can you really test the speed of a calculator using the x! function, or does that simply test the speed of the algorithm? -Ben

Re: Speed of factorial calculations

*Message #37 Posted by **Veli-Pekka Nousiainen** on 19 Sept 2003, 6:08 p.m.,*
in response to message #35 by Mark Ordal

It used to take a minute to calculate 1000! on the old 49G, the new plus does it (Exact, no LASTARG/Stack) in 26 seconds (2568 digits). So the speed is almost exactly four fold in this case. The smaller 252! takes only 1 second (498 digits). How about V200 with 1000! or whatever is the largest it can do? My code was 1000{!}HEAD MEM;TEVAL - VPN

Re: Speed of factorial calculations

*Message #38 Posted by **Ben Salinas** on 19 Sept 2003, 6:13 p.m.,*
in response to message #37 by Veli-Pekka Nousiainen

Wow.... 26 seconds... that's a long time. The TI-89 does the same calculation instantaneous... of course its answer is 1000!:) -ben

Re: HP 49g+

*Message #40 Posted by **Michel Beaulieu** on 19 Sept 2003, 5:30 p.m.,*
in response to message #1 by Ben Salinas

Hey wait a minute! with the HP-48S it also took half a second to do 252! but you only have 13 significants numbers and the EE. With the TI-89, you have all the 497 numbers calculated insted of 13!!!

I don't know if the HP-49G+ calculate ALL the digit of 252! or only the usual 13 numbers and the exponent. If yes, that's an explanation of the apparent big difference of speed between the calculators...

O.K., Ben -- Please report on your new HP 49g+!

*Message #41 Posted by **Paul Brogger** on 22 Sept 2003, 8:55 p.m.,*
in response to message #1 by Ben Salinas

Did you get a chance to play with it? Whaddya think?

Congrats, by the way!

Re: O.K., Ben -- Please report on your new HP 49g+!(long)

*Message #42 Posted by **Ben Salinas** on 28 Sept 2003, 9:51 p.m.,*
in response to message #41 by Paul Brogger

Sorry it took so long for me to reply, but here we go. I have been using my free time to figure out all of the basic features. FYI, this is the first graphing calculator that I really have learned to use, so some of my observations might be flawed. Most of what I am comparing it to is my 32sii (well, my school's) and my ti-89 (also my school's)

The first thing that i noticed is the speed in graphing functions. This is in comparison to the TI-89 (which is the one function I used on the 89). It graphs them 3-4 times faster, and many times faster than my friend's 48gx.

The feel of the keyboard is also great. It has that "click back" so to speak.

One worry is of the LCD screen. It seems to not have enough padding around it, so that when you press in the back, or front you will turn the pixels on (i dont know how else to say it) Also, today I was using the calculator, and suddenly 1/4 of the screen on the right side went permanently on. I quickly reset the calculator (using on and f3) but that had no effect. I pressed a few buttons at random and the screen was back to normal. I think this might be a design flaw. Afterwards, i ran a test on the LCD screen and there werent any broken pixels

As for battery life, I have had it for almost 2 weeks, and the batteries that it came with are still running fine. Of course this is with less than an hour of use each day. I will alert you when the batteries do die.

As for cosmetic appearance, it looks extremely classy (who knows waht people will think about it in a few years) The gold gives it an extremely elegant look (and I know that is why I buy a calculator, for what it looks like :))

I dont have a SD card to test it out with, and havent copied any files to the calculator yet, although it connected to the computer with no problems. As soon as i figure out how to copy files, i will give a speed test on that.

The quick start manual is excellent, although it is a bit redundant and complicated in places due to having to explain stuff in RPN and Algebraic mode. My one regret is it doesnt have an index. I have hardly used the manual on the computer, as it is cumbersome to have to go to my computer, open the pdf, and then do a search for what I want to know. Most of the pdf is pictures, so you can't search, and the pdf has no bookmarks, so if you want to go to page 13-2 you have to scroll down till you see it. I would much perfer a printed manual.

I personally perfer the interface of scientific calculators over that of graphing calculators, because it is so much easier to input data in scientific. That being said, the 49g+ is by far the best graphing calculator that I have ever touched for doing basic math (my experience includes using friends ti-83's, a casio color graphing one, the ti-89, and a few other) It might be because it is RPN, but the keyboard is laid out very well. As for the keyboard layout, my one gripe is that the space key is at the bottom next to the enter key, considering i have used the space key all of twice, i think it should be an alpha function. And actually, having the enter key down at the bottom is not nearly as nice as the wide, mid keyboard enter key, but it is not as bad as people make it out to be.

Overall, this calculator is a great graphing calculator (especially because of teh speed), and a decent scientific calculator replacement. Personally, for most of my school work, I will stick to my 32sii (even for calculus), because I am fast with it, and it fits so much better in my hands, but if i ever am lazy and need

to grpah something, or solve a complex equation, or my 32sii is far away, i will reach for the 49g+ over the ti-89.

(oh and the leather case is great. I have dropped it a few times, and it just bounces to a soft fall)

So, in conclusion, if you like powerful graphing calculators, then this is most definitely the calculator for you. It is most definitely worth the extra 50-60 bucks in comparison to the ti-89 (and really and truly, it competes, and wins with the ti-92, plus the 49g+ is much smaller than the ti-92)

If you want a scientific calculator, find a nice old HP, or get this one, and get used to the weird enter key.

-ben

Re: O.K., Ben -- Please report on your new HP 49g+!(long)

*Message #43 Posted by **Ed Look** on 29 Sept 2003, 1:03 a.m.,*
in response to message #42 by Ben Salinas

Nice to see you having a great impression of the HP-49G+ and gave us such a detailed report!

But even though you don't have a SD card, could you tell us from the quick start manual or CD manual what is the maximum (or minimum) card memory capacity (e.g., 64 MB or 128MB, etc.) is acceptable to the calculator?

Incidentally, I don't mean to step on toes and as an old guy, I once lusted after (and still don't have) one of those shining 41C series machines. But having the ability to use (RELATIVELY) cheap SD chips is a major plus over the 41CX or even 48GX, all other considerations aside.

Re: O.K., Ben -- Please report on your new HP 49g+!(long)

*Message #44 Posted by **Veli-Pekka Nousiainen** on 29 Sept 2003, 4:40 a.m.,*
in response to message #43 by Ed Look

Tested MMC 8MB from Nokia Communicator 9110i and a fresh 64MB SD card (Sandisk). Using *standard* DOS FAT16 gives a 2GB max card size/32KB clusters. Formatting the clusters bigger, might give a bigger card size, like 4GB/64K. That I tested on a PC HD drive, because the maximum SD on shops is currently 512MB. One may order 1GB.

How much do you need for a calculator? The 8MB MMC, limited by some Nokia programs, has enough room for all the programs that I have used intensively during past 4 years in my old 49G. So you may buy the least expensive one. If you use the card for something else, too, like in a camera, consider buying the largest possible. If you need Nokia compatibility then the best choice would be a 64MB MMC card. That's what I'm going to buy next! * VPN #

Re: O.K., Ben -- Please report on your new HP 49g+!(long)

*Message #45 Posted by **Ed Look** on 29 Sept 2003, 3:56 p.m.,*
in response to message #44 by Veli-Pekka Nousiainen

Wait a minute... the 49G+ can FORMAT a SD chip?? Or, do you do that first on a PC? Now, my ignorance will show- I thought that if you formatted using larger cluster sizes, you get effectively a smaller drive.

Anyway, I agree that a calculator should require gigabytes of memory, but I was more worried that there might be some minimum size requirement. Heck, the cheapest one it is! I'll be looking

for a SanDisk/Lexar/etc. sale in local stores. 64MB should be more than enough until someone invents really bloated programs or starts to stuff high definition images and such on a calculator!

Re: O.K., Ben -- Thanks for the report! (short)

Rechargable batts for a HP25C, but how?

*Message #1 Posted by **Matti Övermark** on 18 Sept 2003, 9:26 a.m.*

Hello fellow enthusiasts.

I am aquiring an usable (he said) HP25C with a broken rechargable battery. How is that fixed? BR Matti Sweden

Re: Rechargable batts for a HP25C, but how?

*Message #2 Posted by **Dave** on 18 Sept 2003, 11:23 a.m.,*
in response to message #1 by Matti Övermark

Replacing the cells is quite easy. Just make a cut in the end of the plastic strip that runs between the cells and remove the old cells. You can replace the cells with any NiCad, Alkaline, Li-ion, NiMH cell you want (AA size). There are occasional size variations that can make some cells work better than others, but all can be made to work. Make sure you get the polarity right- easy to check by noting polarity of cells removed, or info is available on this site. Of course alkaline batteries can not be recharged. It is not a good idea to recharge your batteries in these calculators due to potential damage to circuitry. Of course the original charger circuit was not designed for Li-ion or NiMH, but this is not an issue if you do not recharge them in the calc, and I am not sure if it is an issue in any case. Again - please do not recharge in the unit as poor contact with the battery can destroy the calc circuits....

Re: Rechargable batts for a HP25C, but how?

*Message #3 Posted by **Thibaut.be** on 18 Sept 2003, 11:23 a.m.,*
in response to message #1 by Matti Övermark

Very easily. - with the blade of a cutter, desolidarize the battery holder - remove the old batteries and clean up the compartment - buy 2 AA rechargeable batteries, the most common type you can find - put them into the holder, respecting the polarity + and - are written on the compartment - glue the part you deloidarized.

Put it into your calc and charge it.

Enjoy your calculator for the next 20 years, then repeat the operation

Re: Rechargable batts for a HP25C, but how?

*Message #4 Posted by **DougT** on 18 Sept 2003, 12:07 p.m.,*
in response to message #1 by Matti Övermark

If you'd like to retain the stock look, instead of cutting the thin plastic strip in the battery pack, it is possible to *carefully* pry the two halves apart with a strong, sharp knife. I've done this with several, and installed NiCad AA cells (see the "Replacement Nicads for HP Battery Packs" article elsewhere on the site). Make sure you have the polarity correct and the spring in place, and stick the halves back together with a few small drops of glue.

My HP-12c seems to be dead....

*Message #1 Posted by **Luca Passaggio (Switzerland)** on 18 Sept 2003, 5:33 a.m.*

Good morning everybody,

This morning my belowed HP-12c (Singapore 3347S04420) is not responding to the ON button. I took out the 3 batteries and put them in again, but it is still not working. Yesterday it was OK and the batteries are almost new. I know that it hasn't a great value and that it is still sold, but I love THIS ONE !

I kindly ask you suggestions....

Thanking you in advance,

Best regards,

Luca

Re: My HP-12c seems to be dead....

*Message #2 Posted by **GS Leong** on 18 Sept 2003, 6:01 a.m.,*
in response to message #1 by Luca Passaggio (Switzerland)

Take the batteries out and shunt the two connectors together with a paper clip. Then try reinstalling the batteries and hit the ON switch.

Sucess!

Re: My HP-12c seems to be dead....

*Message #3 Posted by **Luca** on 18 Sept 2003, 8:46 a.m.,*
in response to message #2 by GS Leong

Thank you for the reply !

I tried, but it didn't work.

Other suggestions ?

BTW, I immediately ordered a new HP-12C, and while waiting I will use my dear old HP-41C writing some financial programs in order to transform it in a financial calculator. At least I will do some exercise !

Best regards,

Luca

Re: My HP-12c seems to be dead....

*Message #4 Posted by **Renato** on 18 Sept 2003, 10:37 a.m.,*
in response to message #3 by Luca

Luca, HP manual suggests shorting battery terminals *while the batteries are in the calculator*.

Also, you may try exchanging batteries, even if the current ones are new. I would try that before buying a new 12c - China units are not as good as your Singapore unit.

There are some financial programs for 41 here:

http://www.hpmuseum.org/software/41td/fincalc.htm

Ciao

Renato

Re: My HP-12c seems to be dead....

*Message #5 Posted by **Luca** on 18 Sept 2003, 11:32 a.m.,*
in response to message #4 by Renato

Grazie mille, Massimo ! (Many thanks)

I have done what was written in the manual, now I will try new batteries as per your suggestion but anyway I want a spare unit (even a Chinese one).

I was in the middle of a financial meeting when the calculator died and I borroved a stupid algebric one from a collegue: now I know that I cannot work without RPN !

I am not an engineer but trust me that RPN works better also for marketing and financial people !

Thank you so much also for the link, it is very nice to see how kind and helpful is the people you find in this site !

Best regards,

Ciao

Luca

Sorry, I have written Massimo instead of Renato

*Message #6 Posted by **Luca** on 18 Sept 2003, 3:42 p.m.,*
in response to message #5 by Luca

I apologize....there are few with an Italian name and nevertheless I made a mistake..... I am suffering for my HP-12C.....

Luca

Not a problem...

*Message #7 Posted by **Renato** on 18 Sept 2003, 10:45 p.m.,*
in response to message #6 by Luca

Besides, may I suggest you buy a used 12C instead of a new chinese unit. There are

Singapore and Malaysia units around, and I bet they will last longer than most new chinese ones. You can even get lucky, and find a Brazilian or American one.

I´ve been in Italy in mid-90s, at Falconara Maritima, working on a telecom manufacturer. Nice country - Brazil has a large number of Italian origin people, and has inherited some features.

Ciao

Renato

Re: Not a problem...

*Message #8 Posted by **Luca** on 19 Sept 2003, 3:09 a.m.,*
in response to message #7 by Renato

Obrigado muito muito !

Ciao

Luca

Re: My HP-12c seems to be dead....

*Message #9 Posted by **Luca** on 30 Sept 2003, 12:20 p.m.,*
in response to message #4 by Renato

Many thanks, Renato !

I did as you suggested, also with new batteries, and it didn't work, but after cleaning the contacts and doing it again few days later, it is working again now !!!

I agree with you about the China made units, I bought one as a back-up but the feeling is not the same as my old one !

Thank you again,

Ciao

Luca

Re: My HP-12c seems to be dead....

*Message #10 Posted by **Renato** on 30 Sept 2003, 10:10 p.m.,*
in response to message #9 by Luca

Ciao Luca ! I´m happy you got your 12c working again. I was not surprised you succeded. There have been many horror stories - cars passing over, hypopotamus digestion, etc., and the 12c survived.

I also have seen some cases where a battery change turns up to a non-working calculator. I´ve seen this on 11c, 42S, 32SII and 41CV. Patience, some knowledge and persistance makes a necessary and effective solution.

My HP-12c seems to be dead....

HP 48GII

*Message #1 Posted by **Doug** on 17 Sept 2003, 10:41 p.m.*

There has been no discussion of the HP 48GII. I wonder why. Did everyone migrate to the 49G and now they have no need to bother themselves with the 48GII? (I know the answer to that is no).

From the spec sheets on hpcalc.org, it appears that the only differences are screen size, memory size (and expandability), and cable type. Could there be other differences. Does the HP 48GII take the same rom, and is it also upgradeable?

I still use my HP48G, and don't need all that memory (believe it or not), so I wonder if I should look at the 48 GII.

Re: HP 48GII

*Message #2 Posted by **Jonathan Purvis (New Zealand)** on 17 Sept 2003, 11:37 p.m.,*
in response to message #1 by Doug

The 48GII is not at all a continuation of the 48G series, it's just a 49G with a new CPU. I guess there's not been any discussion of it as it doesn't seem to add anything over the existing 49G except being faster. HP should have named them the 49G+ and 49GX.

Personally i'll stick with my 48GX (and 38G, 39G and 48G).

HP-97 Blues... any advice?

*Message #1 Posted by **Michael Meyer** on 17 Sept 2003, 8:21 p.m.*

Hi, all.

I've got an HP-97 that won't power up. When I turn it on, it shows only the low-battery LED. The transistor and resistor near the power input get hot. I presume I've got a component or chip shorting. Any advice on where to start? Sound like a familiar problem to anyone? The voltages barely register, of course.

Thanks! Michael

Re: HP-97 Blues... any advice?

*Message #2 Posted by **Katie** on 17 Sept 2003, 8:51 p.m.,*
in response to message #1 by Michael Meyer

Hi Michael,

Have you tried to power it up with the printer motor and/or card reader motor disconnected. I found that the printer motor caused that problem on one of my 97's. I just pulled the wires to the motor and that did the trick. (Then, I had to fix the printer, of course.)

Failing that, have you tried some board swapping with one of your good machines to isolate the problem? It could be on the printer driver board, keyboard or main circuit board.

-Katie

Re: HP-97 Blues... any advice?

*Message #3 Posted by **Ellis Easley** on 18 Sept 2003, 2:30 a.m.,*
in response to message #1 by Michael Meyer

Just from my memory of things I've read here - the 97 has a transistor for over-voltage protection that is turned on to load down the power supply if the voltage gets too high, to pull the voltage back down. I don't know if the transistor has a load resistor to absorb the energy or if the transistor drops all the voltage itself. I remember reading that the transistor sometimes goes bad, stays on, gets hot, and keeps the power supply voltage from rising to its normal level.

Re: HP-97 Blues... any advice?

*Message #4 Posted by **David Smith** on 18 Sept 2003, 3:44 p.m.,*
in response to message #1 by Michael Meyer

First get out your handy dandy HPMUSEUM CDROMS. The HP97 service manual is on them. Full schematics and everything. Most of the power supply is on the display driver board. I have seen several machines where either the power resistor failed or the transistor across it. This led to a cascade of other failues taking out a total of four transistors... yummy.

Another problem that I have seen was due to a stuck print head. The machine will either not light up or displays ERROR if the head cannot go home.

Follow Katies advice and swap out the top end first to see where to start. Also remember that the machine will not work if the printer circuit board is not connected.

Re: HP-97 Blues... any advice?

*Message #5 Posted by **Tony Duell (UK)** on 18 Sept 2003, 5:41 p.m.,*
in response to message #1 by Michael Meyer

I had a Topcat in for repair that did this (it wasn't a 97, it was a 95C, but the circuitry is much the same). There's a circuit in the Topcats to load the power supply down if the input voltage tries to exceed the correct +ve output voltage -- this protects the machine if it's connected to the AC adapter with no battery pack in place, so you don't get IC failures like in the Woodstocks. Anyway, if the power converter (on the CPU board) isn't running, this circuit will try to pull the inpjut voltage right down to 0V, and gets hot in the process. I would start there. The service manual, with scehamtics, is on the MoHPC CD-ROMs. THe power converter is a simple discrete component circuit based round 2 transistors (oscillator and regulator) and a transformer. Most of the times I've had problems with this circuit (not just in Topcats), the oscillator transsitor is open. A 2N3904 is a suitable replacement.

Re: HP-97 Blues... any advice?

*Message #6 Posted by **Michael Meyer** on 19 Sept 2003, 1:12 a.m.,*
in response to message #5 by Tony Duell (UK)

Hi All.

I have the service manual. I started out by swapping boards... it's definitely in the largest main circuit board, even with the printer and card reader disconnected.

The service manual is a bit difficult to read, and the components are in a very different layout than the nice diagram in the manual.

I appreciated the suggestions for where to start to look for the problem, and I'll keep you posted.

Michael

Re: HP-97 Blues... any advice?

*Message #7 Posted by **David Smith** on 19 Sept 2003, 8:08 p.m.,*
in response to message #6 by Michael Meyer

Oooh, bad news doc... I have never seen a bad main board had the decency to have a off-the-shelf component fail. Or an ACT chip either. I have seen a couple of bad PIK chips and a bad ROM chip though.

Re: HP-97 Blues... any advice?

*Message #8 Posted by **Tony Duell (UK)** on 20 Sept 2003, 3:45 p.m.,*
in response to message #7 by David Smith

Odd, my 97 (which I was given in a rather poor state) had a bad ACT chip (I replaced it with one from a 21 with a bad ROM...). The other chips on the CPU board were all fine. I have also replaced many PSU oscillator transistors in Topcats (and classics)....

Re: HP-97 Blues... any advice?

*Message #9 Posted by **Tony Duell (UK)** on 20 Sept 2003, 3:47 p.m.,*
in response to message #6 by Michael Meyer

Electrically the boards are much the same (I would guess you have the later version board with the 16 pin DIL space for the cabel for the 97S I/O module). Start by finding the power converter autotransformer -- a little 'wound component' with 4 pins. Trace the circuitry round that to find 2 transistors. Then test these transistors out of circuit.

How to repair the aluminum plate on voyageur?

*Message #1 Posted by **jimc** on 17 Sept 2003, 4:39 p.m.*

I am wondering if anyone has repaired or replaced the aluminum plate on a 10/11/15? Mine took a hit on the aluminum on the upper left corner on one of the "bends". I would like to repair or replace this aluminum piece if at all possible.

TIA.

Re: How to repair the aluminum plate on voyager?

*Message #2 Posted by **Randy Sloyer** on 17 Sept 2003, 6:47 p.m.,*
in response to message #1 by jimc

Replacement isn't practical as the part can only come from another calculator. Unless the calculator fairy pops a 11/15/16 under your pillow, you'd be lucky to find a dead one on eBay for less than $50.00.

Repair is tough as it is a real pain to pull one off without doing yet more damage. They are stuck on with a tenacious double sided tape. The only positive experience I've had is with units that are really beat and they need to be straightened or completely crazed display windows that have to be replaced. I use UN-DO adhesive remover and flat Glide dental floss. It's made of polypropylene and very strong. You soften the goo with the UN-DO and then use the floss like a cheese cutter, sliding it between the faceplate and the case. Takes a while. Any over-eagerness to get it done fast will result in disaster.

For my 2¢ worth, unless it's so bashed it's peeling off, leave it alone! It adds to the character. It's now a confirmed work machine.

Edited: 17 Sept 2003, 7:28 p.m.

in response to message #3 by jimc

Calculator fairies... smaller and flightier than the calculator elves... but also kinder and gentler.

The history as I see it

*Message #5 Posted by **Randy Sloyer** on 18 Sept 2003, 8:34 p.m.,*
in response to message #3 by jimc

David, you're right. You know your HP calculator history.

Some additional facts that some may not be aware of:

The Fairies where much later than the Elves.

The Elves are still to this day an angry lot after having been made redundant with the discontinuance of the 9800 lineup. No need for any heavy lifting once plastic was being used. Hi-Ho-Hi-Ho.

The Pixies quickly displaced the Elves with the introduction of the Woodstock machines. The Elves felt abandoned. They tried to enjoy their forced retirement but the Pixies made it difficult with their rapid expansion into places the Elves never imaged they could venture. The Pixies very much enjoyed their tenure as most wonderful working group in all of calculator-land. The sun shone on all the land.

The Pixies fell in an ugly uprising by the Gremlins of the 30 series. It was an ugly time for all. There was unrest in all the land. A few 34C's did manage to make it out alive to tell about it. They are still on permanent disability but continue to tell all those who listen of their greatness.

The Fairies came to the rescue with low power 7 segment LCD's and batteries that never died. There was rejoicing in all the land once again. Tranquil times existed for those that saw the future.

The Leprechauns managed to push them all out of the way when they brought the Pioneers to town. We soon forgot about all the troubles in the world and went back to work with LCD's and batteries that lasted longer than a wall wart with a broken connector. The world was once again a wonderful place for all who had followed.

It all ended with the passing of two most magnificent engineers. One who understood marketing and how it required products that are not driven by the market, the other an engineers engineer.

It seems the Trolls were left to pick up the pieces...

Edited: 18 Sept 2003, 9:26 p.m.

HP82161 tape drive problem

*Message #1 Posted by **Pavel Korensky** on 17 Sept 2003, 4:29 p.m.*

Hello,

I just bought my second 82161A tape drive on EBay.

I received it, cleaned the head and I tried to test it. But the behavior of the unit is strange.

I have one tape which was written by someone else and I can read from that tape without any problem. But when I am trying to format a new tape (NEWM 064 for example) I am getting "MEDM ERR" message. When I am trying to write something on the tape, where already are some programs, the WRTP is without any error message and the written file name can be seen in the DIRecory listing. But when I am trying to VERIFY it or read it with READP, I am getting "MEDM ERR". But I can delete the file with PURGE without any problem.

Also, sometimes when I am trying DIR, I get the "MEDM ERR" message, but when I try the DIR once more, I get the listing without a problem.

Anyone have some idea what can be wrong ? I tried several tapes. Also, when I bought my first unit almost two years ago, I had (and still have) the similar problem with the first unit. Tapes can be read, but not written.

Is it possible that something is wrong with my HP-IL module ? Or maybe the head of the new unit is magnetised ? Or some mechanical problem ?

Re: HP82161 tape drive problem

*Message #2 Posted by **Ellis Easley** on 18 Sept 2003, 3:49 a.m.,*
in response to message #1 by Pavel Korensky

Do you retension your tapes? Advancing the tape to the end and then rewinding to the beginning? If you don't, this might be the problem, considering that it is intermittent and occurs with both units. The 82161A manual doesn't address this (maybe these tapes are less prone to the problem) but manuals for machines like the 9825 do. I know the 82161 tapes work completely differently (the 9825 type tapes are driven by an internal belt) but just from my experience with audio cassette tapes, I think there is a tendency for wound tape that has been unused for a while to stick at the edges, layer to layer - especially since these tapes are getting old! Formatting (NEWM) moves the tape through the whole range (but of course overwrites the data). Also, if the tape is sticking, the format put down by NEWM might be marginal due to momentary variations in the tape speed while the format was being written. This could cause marginal operation until the tape is re-formatted. If this was the case, executing NEWM twice might help, allowing the first pass to retension the tape. I wrote a program to move the tape to the end and then rewind it when I was learning how to use the HPIL Devel. ROM. The tape needs to be formatted for the Seek operation to succeed:

```
01 LBL 'RETEN
02 1
03 LAD  ;I had only the tape drive connected
04 4
05 DDL  ;DDL4 = Seek
06 0  ;track (doesn't matter which you use)
07 OUTBIN
```

```
08 255  ;last record
09 OUTBIN
10 LBL 01
11 INSTAT
12 X=0?  ;not busy, no error (seek finished)
13 GTO 02
14 GTO 01
15 LBL 02
16 STOP  ;pause between seek and rewind, just press R/S
17 1
18 LAD  ;again, I had only tape drive connected
19 7
20 DDL  ;DDL7 = Rewind
21 LBL 03
22 INSTAT
23 X=0?  ;wait till rewind finished
24 GTO 04
25 GTO 03
26 LBL 04
27 '*** DONE ***
28 AVIEW
29 END
```

I guess I didn't know about "X(not equal)0"! The Extended I/O ROM has LAD and DDL and I think you can use OUTXB in place of OUTBIN. INSTAT is in the HPIL Module ROM.

in response to message #2 by Ellis Easley

How are you powering the unit? I used to power mine with a bench power supply that didn't have enough amperage and it caused strange behavior.

Andy

Re: HP82161 tape drive problem

*Message #4 Posted by **Pavel Korensky** on 20 Sept 2003, 10:54 a.m.,*
in response to message #3 by andy

Hello Andy,

I am using the adapter which have the same parameters as the original one. Except that my adapter is for 230V.

The original is 110V -> 8V/3W mine is 230V -> 9V/300 mA

But thank you for the idea. I will test the unit with my benchtop power supply. It is regulated from 0-30V and from 0-5 A and I also will try to measure the current.

Re: HP82161 tape drive problem

*Message #5 Posted by **Pavel Korensky** on 20 Sept 2003, 10:55 a.m.,*
in response to message #2 by Ellis Easley

Hello Ellis,

thank you very much, but the retension of tapes did not help. The behavior of the tape unit is the same.

*Message #7 Posted by **Hans Brueggemann [GER]** on 20 Sept 2003, 4:50 p.m.,*
in response to message #1 by Pavel Korensky

pavel, 1) after long storage, it could be a "magnetizing problem" of the tape-head. may be, demagnetizing of the head will do the trick (there are special demagnetizers for tape decks and alike available. maybe, you can borrow one from your local radio store?)

2) tapes wear out after time. i.e., the glue that holds the magnetizable powder on the tape will start to decay (i think, normal lifetime is just about 5 years or so) --> loss of magnetic particels -->loss of information on the tape surface. (hmmm, but where to get a "fresh" tape from?? --> i dont know)

cheers, hans

Does HP-42X work on the new HP-49G+?

*Message #1 Posted by **Erik Ehrling (Sweden)** on 17 Sept 2003, 1:58 p.m.*

Hi!

Has anyone tried using HP-42X on the new HP-49G+? Does it work well? (The idea of a HP-42S that is 3-5 times faster than the original is appealing to me...)

Best regards, Erik Ehrling (Sweden)

Re: Does HP-42X work on the new HP-49G+?

*Message #3 Posted by **Douglas Rohm** on 18 Sept 2003, 8:38 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Hi Erik, Here is my reply to your post in comp.sys.hp48.

(First reply)

Hi Erik, I just downloaded it and it seems to be running okay. I haven't done any thorough testing yet, but I haven't seen any major issues. The header on the 49G+ remains at the top at all times, as usual. The HP42X screen fits nicely underneath this header so there aren't any display issues.

I did, however, notice that when you exit the emulator with !BYE or ON-F6, the screen clouds up for a second and then clears up and returns to the stack. Nothing is lost or corrupted in the emulator or the 49G+, but it isn't pretty to watch.

I'll let you know if I find anything else.

Doug

(Second reply)

The version I tested in my previous post was the HP42X49E version. I just tried it with the extended version and it doesn't work. I downloaded the HP42X file to the 49G+, stored it in port 1, where it showed up fine, then did ON-C, then recieved the XQ42 file. Tried to run the emulator and the emulator screen shows for a fraction of a second, then the calculator turns off. I turned the calculator back on and I got "Error: Object Not in Port". I checked port 1 and it was deleted either by the emulator or the calculator (I'm guessing the calculator).

It might be wishful thinking, but it seems like the 49G+ handles critical errors more elegantly, instead of "Memory Clear" messages. I'll prove this point more when I start doing more programming :)

Doug

HP-12cPlatinum "Closeout"?

*Message #1 Posted by **Paul Brogger** on 17 Sept 2003, 10:22 a.m.*

I received an "HPShopping" email recently, announcing "red tag savings" on "closeout" products.

Under the "Calculators" link are listed the 9s, 10bii (neither surprising) and *the HP-12c Platinum*. (??)

Are they clearing out units from the first production run (those with the high program memory "jump bug"???)

Re: HP-12cPlatinum "Closeout"?

*Message #2 Posted by **christof (NoVA US)** on 17 Sept 2003, 5:01 p.m.,*
in response to message #1 by Paul Brogger

The link you posted seems to have expired- I see a special price on hp.com, but no mention yet of closeout pricing...

Re: HP-12cPlatinum "Closeout"?

NCESS Exam - Would you have time to enter the Q's??

*Message #1 Posted by **Bill (Smithville, NJ)** on 17 Sept 2003, 6:18 a.m.*

I've been following the discussion on the banning of certain calculators by the NCEES . I've never taken the exams in question, but...

Would a person really have time during the test to sit there and enter the actual questions into a calculator? I'm guessing that if he was serious about passing the test, he'd be too busy working out the answers to be entering them into a calculator - to do what with them? Study them later so he could take the test again? Pass them on to other peple? How many of the q's could be entered into a calculator during an exam? You'd have to be a very familar with the text entering capability of the calculator to make it pay off.

Don't they change the exam between tests? And most people would be able to recall a large quantity of Q's from memory anyway. If the only purpose of taking the test is to come away with the exam questions, then 5 or 6 serious cheaters could agree to take the test, each one agreeing to memorize certain groups of questions and then pooling them afterward.

Likewise with the IR port - is there time to actually pass answers by IR from one person to another? This would assume that two people (or more) taking the test were conspiring to cheat and are sitting close enough to one another for the ir port to reliably transmit between them. And they would be depending on no one observing them lining their calculators up at odd angles to make the ir work.

It would seem that random seating selection after arrival or even randoming shuffling of the seating after everone has been seated would be enogh to negate the possiblity of someone depending on the use of the IR port.

I'm assuming that the NCEES has seen people actually doing text entry or IR beaming - otherwise why ban it. But I really wonder how big of a problem is it.

I would have thought the bigger concern would be people storing the answers to test questions in the calculator before arriving at the test site instead of worring about them taking the q's home with them.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #2 Posted by **Chan Tran** on 17 Sept 2003, 7:49 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I wonder why they ban calculator as an engineer would very likely use a calculator in his/her work.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #3 Posted by **hugh** on 17 Sept 2003, 8:31 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

i've always assumed it was an irrational paranoid fear in the examining world about exam calculator use, or just a ballyhoo deterrent to create the impression of effective anti-cheat methods.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #4 Posted by **christof (NoVA US)** on 17 Sept 2003, 10:37 p.m.,*
in response to message #3 by hugh

Me, too- I've never heard of anyone being actually accused of using IR during a test, nor of using the text entry to pull exam questions.

Seriously- if they can't be bothered to come up with new and workable questions, what good are these people?

Re: NCEES Exam - Would you have time to enter the Q's??

*Message #5 Posted by **John Cadick** on 17 Sept 2003, 9:22 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I have been in touch with several of the state boards and the NCEES. None of them seem to have any documented cases of the type of cheating that they are worried about. The actual meeting discussions (according to one of the state board excecutive directors) was over handheld communications devices like PDAs and cell phones. The NCEES took it upon themselves to extend the ban to the list of advanced calculators.

All of the points that you make are valid. The main reason this is being done is to "simplify" the job of the examination proctors. Many of whom are not knowledgeable enough to know if someone is cheating with a calculator. Also, because of the number of exams given each year, the question pool is difficult to update regularly. That is the reason they are so concerned about people stealing questions.

I am working with a number of people to get this stupid decision reversed. If you agree that it is a stupid decision (or even if you don't) the best thing you can do is to send a protest to the NCEES and your local state board. The protest should be calm and logical and have your points listed logically. A copy of your original post would be good.

By the way, I took my examinations in the 1960s and 1970s. My protest is philosophical not personal. <G>

John

They're Feeling The Heat

*Message #6 Posted by **J.C. Randerson** on 17 Sept 2003, 11:09 a.m.,*
in response to message #5 by John Cadick

After NCEES reposted the policy again I sent them a tongue in cheek message. This got someone there upset enough to write the dean of engineering at my college, who then wrote me. I fired back that as long as I stated my opinion without profanity or threat of violence, it's free speech. At any rate though, I think the Luddites at NCEES are feeling the heat.

J.C. Randerson

Re: They're Feeling The Heat

*Message #7 Posted by **Todd Stock** on 17 Sept 2003, 3:54 p.m.,*
in response to message #6 by J.C. Randerson

This is more about making questions meaningful (e.g., for the 3 x 3 matrix A, find A^-1, or find (A dot (BxC)). Modern calcs have made these exercises pretty much pointless. Same thing with roots of a cubic and a dozen other operations performed in an instant by the HPs or advanced TIs.

I find it curious that none of the permitted machines are capable of matrix or vector algebra, nor will they quickly handle roots and other time consuming but ultimately trivial chores.

The NCEES's problem is also declining numbers of engineers willing to be put through the ringer, an set of exemptions (e.g., industrial, government, or federally controlled) unlikely to disappear, and a flood of non-citizen engineers further diluting the meaning of a PE.

Texas and Florida recently overturned laws banning the use of the term 'engineer' by a broad range of people, and California has proposed to cease recognizing a wide range of engineering specialties as requiring state license.

All this has got the NCEES trying to figure out how to stay relevant and the FE/PE wannabees scrabbling to find calculators designed 15-18 years ago, and long out of production.

Re: They're Feeling The Heat

*Message #8 Posted by **Valentin Albillo** on 18 Sept 2003, 5:17 a.m.,*
in response to message #7 by Todd Stock

Todd posted:

"I find it curious that none of the permitted machines are capable of matrix or vector algebra, nor will they quickly handle roots and other time consuming but ultimately trivial chores."

If I'm not wrong the HP-15C is permitted, as it does have neither I/O nor alpha capabilities at all, yet it boasts fairly comprehensive matrix and vector operations, root finding and numerical integration, as well as being fully programmable and very small, true shirt-pocket size.

Best regards from V.

Re: They're Feeling The Heat

*Message #9 Posted by **Todd Stock** on 18 Sept 2003, 6:22 p.m.,*
in response to message #8 by Valentin Albillo

Val:

Agree - I expect the HP-11C and 15C to be allowed, though the only explicitly permitted machines per the NCEES are as follows:

'" Texas Instruments: TI-30 series (this includes the TI-30Xa, TI-30X IIB, TI-30X IIS, TI-34 II, TI-36X Solar, and TI-36X II Solar)

Hewlett Packard: HP-9 series (this includes the HP-9g and HP-9s), HP-32s, HP-33s (if available)'"

I used a 15C for a few years prior to moving to an HP-41CX, etc. - I found the matrix operations to be a bit cumbersome, but workable if you have the time.

I assume my K&E Decilog would also be legal, though the technology might be deemed too advanced (no required power supply, simplified interface, etc.)

in response to message #10 by bill platt

The Texas law is actually one sunsetting the current 66 year old restriction against anyone using the term engineer in a public setting - anyone. There were competing house and senate bills last time I checked, though I believe the current status is that the legislature will 'sunset' the old law if neither revised statute goes forward.

The Texas law is pretty silly, and can levy a $3000/day fine should I drop a business card in a restaurant fishbowl drawing - simply for either using the title engineer or indicating that I provide engineering services. Pretty funny, considering no state currently offers a PE exam in Aerospace (my degree field) - it would be useless - the FAA Administrator performs as the approving airworthiness authority, making PEs a non-starter.

The Florida issue was a court decision on the use of the term - the law still restricts the use of licensed engineer, PE, etc., but allows 'engineer' to be tacked on to other titles, e.g. software engineer, domestic engineer, sanitation engineer etc.

A silly issue anyway - legislating title instead of actions...while no one resonably expects a radio talkshow host going by "Doctor of Love" to offer medical services, apparently the licensing organizations are convinced that the trash men might be considered approving authority for that next $200M waste water management project.

The CA proposal is just that - Google and make your own interpretation.

in response to message #12 by RANDY EAST

I believe the ban takes place starting in 2004.

I also noticed you are having problems with your ON key. While you can press down lightly just below the screen and then turn on the calculator (this works because that is where the circuitry runs from the on button to the CPU). Still, I suggest you buy another Hp48 so as to not be caught without a good calculator either a few days or even during the exam.

A plain 48G would be cheap and easy to get, if you have any memory or Cards, buy another SX or probably better, a GX. The G series is slightly faster and has the EQ Lib built in sans the periodic table which is a free download if you really want or need it.

From reading your posts (test in a couple of weeks, etc), I strongly encourage you to just buy another 48 first and then fix your present one.

Re: NCEES Exam - Would you have time to enter the Q's??

*Message #14 Posted by **todd stock** on 18 Sept 2003, 7:02 p.m.,*
in response to message #12 by RANDY EAST

Randy:

Check the FAQ at NCEES website - the ban (if it takes effect) is on the Apr 04 exam, but NCEES claims that they have always had a policy which implicitly 'outlaws' most of the calcs used by engineers and engineering students

In other words, check with your state board to see if they will restrict your use of the HP-48 series.

PPI - the publishers for the Lundeburg books - keeps a fairly current list of individual state policy on their site. Only two states appear to have banned current technology TI, HP, or Casio products - looks like one does not permit graphing calcs.

Given you've probably used the HP-48SX for your entire degree program, I'd raise holy hell if your state elected to go with the Luddite stance for the Oct exam.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #15 Posted by **CME750** on 17 Sept 2003, 4:19 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

NCEES claims that a skilled typist can, with practice, learn to enter text rapidly, even on a non-QWERTY calculator keyboard. It is unlikely that you would be able to do this and still work out the answers to the questions. However, a dedicated professional cheater could, in theory, take the exam solely for the purposes of copying it; it wouldn't matter if he failed.

NCEES doesn't release copies of their old exams. They apparently like to reuse questions, or rework them slightly, between exams. So they don't want their questions to become general knowledge. They apparently believe that cheaters would be able to sell genuine NCEES test questions for major $$.

NCEES acknowledges that the stock HP48 IR port has a very limited range. However, a few years ago, someone on comp.sys.hp48 claimed that you could increase the IR reception range to many feet by simply changing a capacitor or something. This may be a legend; as far as I can tell, no one has ever successfully communicated between HP48s at any significant distance with IR. But NCEES is totally spooked by the claim.

NCEES only cares about what you take *out* of the exam room in your calculator, not what you bring *in*.

The PE exam is open book. In fact, companies like Chotkeh.com have historically marketed PE exam software for the HP48.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #16 Posted by **PhreePhly** on 17 Sept 2003, 6:24 p.m.,*
in response to message #15 by CME750

Have you seen the latest? Digital watches are now banned from the exam room. This is for the October Exam.

NCEES is definately scared. They, of course, brought this on themselves when they went to an all multiple choice exam. This made it easier to grade, but took away the element of "showing your work". I am taking the exam in October (Civil) and appreciate the multiple choice format (I think it is easier), but would be lost if I had to use a non-RPN/RPL calculator.

I started with an 11c in high school and moved to a 15c, 41CX and now a 49G. (Man do I wish I still had my 15c). The 41 went out on me 2 years ago (the only reason I have the 49), but I got desperate and opened it up and fixed the problem. I assume that the 41 is still okay, even for the April exam.

The point is that I have a very difficult time with algebraic entry. I might be able to get the hang of it in 6 months time, but it would be an additional learning curve on top of the pressures of the exam.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #17 Posted by **christof (NoVA US)** on 17 Sept 2003, 10:46 p.m.,*
in response to message #16 by PhreePhly

wait a minute- the exam is all multiple choice?

I'm a computer guy- whether or not I'm an engineer is more up to HR than anyone else. (the fact that I can debug an ATM connection that's flaky because of poor ground maybe makes me a bit more engineer like than the average CCNE, but it's still up to HR)

But.... *multiple choice*? come on. I've helped trian people in how to get passing grades on multiple choice tests without knowiing the material. If they want the PE to mena something, then the test has to mean something.

(sort of like the relative merit of some CS certs:

an MCSE - low, it's a multiple choice dream.

and a CCIE- requires multiple days in a lab- poeple tend to put a lot of stock in it.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #18 Posted by **CME750** on 18 Sept 2003, 1:28 a.m.,*
in response to message #17 by christof (NoVA US)

The Engineer-in-Training Exam is 8 hours of multiple-choice questions. The Professional Engineer Exam is typically another 8 hours of multiple-choice questions. Some states have additional requirements; for example, civil engineers in California get another 5 hours of multiple-choice on surveying and seismic issues.

So yes, it is all multiple-choice. However, the problems --unlike those on most multiple-choice tests

-- are typically quantitative in nature. In other words, you usually have to perform a calculation and then pick one of four *numerical* choices. For most questions, your answer options will be something like this:

(a) 25 ft-lbs (b) 37 ft-lbs (c) 44 ft-lbs (d) 51 ft-lbs

Classical multiple-choice test strategies are of limited value in this situation, because the answer options have no wording clues that might tip you off. You have to be able to perform the calculation.

Multiple-choice exams are probably a practical necessity given the number of exam takers. In California, you can expect about 3,000 people to take the EIT exam and another 3,000 to take the PE exam. The exams are offered every six months, so that makes some 12,000 engineering exams per year in California alone. Nationwide it may well exceed 100,000 exams per year.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #19 Posted by **CME750** on 18 Sept 2003, 12:46 a.m.,*
in response to message #16 by PhreePhly

Digital watches were recently banned by the California Board for Professional Engineers and Land Surveyors. This is not the same as the NCEES ban on graphing calculators.

NCEES prepares standardized engineering and surveying licensing exams, which are used throughout the U.S. However, the exams are actually administered by the State engineering boards. Both NCEES and State Boards can establish exam rules as they see fit.

The NCEES graphing calculator ban applies to all jurisdictions that use NCEES exams (which means nationwide). But the digital watch ban only affects California, at least for now. This could change if other state boards or NCEES choose to adopt the California policy.

I don't think you would have that much trouble getting used to the algebraic if you put your RPN calc in the closet for a few months. I grew up with algebraics. I didn't really work with RPN much until a couple of years ago. I bought a 48G+ to perform complex numbers calculations at work, but primarily to use when I took the PE exam. Well here I am now, preparing to take the exam in April, and I am going back to an algebraic. I got used to the RPN pretty quick, but I'm not having much trouble going back. However, I did have to give my 48G+ to a friend who is taking the October exam to use as a backup and also to keep me from switching back and forth. I recently picked up the HP 9S. I know this sounds stupid, but I am throroughly impressed with this little guy. It does complex number calculations (but only when entered in rectangular form). Every key has a second function. Everything is easy to find. I am currently taking a PE exam review course, and so far I haven't needed a more powerful calculator for anything. Some things are actually a little easier to do on it than on my 48G+. I have pretty much decided to go forward with the 9S, and will be purchasing a second one as a backup, for a grand total of less than $30.

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #21 Posted by **hugh** on 17 Sept 2003, 8:18 p.m.,*
in response to message #15 by CME750

i know this sound silly but, whats to stop people writing the questions on bits of paper and hiding them about their person?

Re: NCESS Exam - Would you have time to enter the Q's??

*Message #22 Posted by **todd stock** on 17 Sept 2003, 10:18 p.m.,*
in response to message #21 by hugh

A pool of a few thousand questions, randomly generated tests, and some reordering of choices might do the trick. Let Sylvan or Plato administer the test, and use screen emulations of the test-taker's choice of calcs. Nothing in and nothing out - game over.

I'm curious about the def of communications - does an HP-28C communicate if it only transmits short range (18") to a printer? Does an HP-42S communicate (same deal and even less memory/string capability). I noticed the NCEES has "approved" the 32S for use...but who knows with the 32SII, eh?

I guess these guys have never seen a really small video rig. One of our programmers has a significant number of beads, etc. in her hair - could pretty much put a dozen minicams on the exam.

Is it time to pull out my dad's K&E?

Confusion

*Message #1 Posted by **Andreas Stockburger** on 17 Sept 2003, 2:21 a.m.*

Hi calculator-world,

I am confused about the new models. Can someone please help me?

What new models are out (or will be out in a short timeframe) in europe ?

Thanks for your help

Andreas

Re: Confusion

*Message #2 Posted by **Arnold Steekelenburg** on 17 Sept 2003, 3:59 a.m.,*
in response to message #1 by Andreas Stockburger

Hi Andreas:

Take a look at www.cynox.de or www.dynatech.de. There you can find an overview of the new calculators.

Arnold

HP49G+ sd-card size

*Message #1 Posted by **Juergen Rodenkirchen (GER)** on 16 Sept 2003, 1:50 p.m.*

The other day, I learned at comp.sys.hp48 that the HP49G+ would be able to address 2GB sd-cards. OK, but is there any reasonable recommendation on the size for sd-cards used with an HP49G+? I do know that a reseller in Switzerland sells bundles that include 64MB cards ...

Juergen

Re: HP49G+ sd-card size

*Message #2 Posted by **Veli-Pekka Nousiainen** on 16 Sept 2003, 4:09 p.m.,*
in response to message #1 by Juergen Rodenkirchen (GER)

"reasonable recommendation on the size for sd-cards used with an HP49G+?"

For absolute compatibility & low budget, if you are planning or already use a Nokia Phone with MMC, I recommend a 64MB MMC. On the other hand, if you want to use the card with digi-camera, get the largest SD (512MB), but you're better off with a camera using CF. CF can go 4GB with FAT32. You may consider cheapest SD available. The calc doesn't need that much memory. I currently use an old 8MB MMC and it's ok.

Re: HP49G+ sd-card size

*Message #3 Posted by **Brandon Del Bel** on 17 Sept 2003, 12:06 a.m.,*
in response to message #1 by Juergen Rodenkirchen (GER)

"...HP49G+ would be able to address 2GB sd-cards."
The only reason anyone would ever need that much memory is if the calculator supports audio playback that blows mig out of the water (perhaps mp3 or the like). I'm sure the highschoolers would love to have usb headphones plugged into their calculator.

Re: HP49G+ sd-card size

*Message #4 Posted by **Bill Wiese** on 17 Sept 2003, 6:21 a.m.,*

calculator."

While the 75MHz ARM on the HP49G+ could very well support the compute requirements of MP3 playback, it'd prob be hard to get the audio out - don't know of any onboard DAC, and it is very likely that the USB functionality on the ARM chip on this calc is that of a 'USB device', not 'USB host' - which means it could not "drive" a USB audio adapter or USB headphones etc. as it is a slave device not a

master.

HP48SX Sticky ON/ATTN button.

*Message #1 Posted by **Randy East** on 16 Sept 2003, 12:58 p.m.*

HOW CAN YOU FIX THIS PROBLEM?

HOW CAN YOU FIX THIS PROBLEM?

*Message #2 Posted by **Randy Sloyer** on 16 Sept 2003, 7:19 p.m.,*
in response to message #1 by Randy East

It all depends.

Physically sticky? Maybe a coffee/cola spill? It would need a bath in distilled water (without the batteries).

Electrically sticky? It would need a new one :^(

Or, in the case of the most bizzare sticky switch I ever saw, it needed to have the aluminum bezel shaved down. Seems the SX was in a car accident and the calculator bottom edge took the impact compressing the bezel and binding the ON button. A real long shot but worth a mention.

Re: HOW CAN YOU FIX THIS PROBLEM?

*Message #3 Posted by **Tracy Vermeyen** on 17 Sept 2003, 12:02 a.m.,*
in response to message #2 by Randy Sloyer

Randy,

I may need to put my 41CV through a bath to clean up the ON/USER and PRGM/ALPHA keys can you please explain how to do this?

I had some corrosion problems and I have cleaned the contacts with a small wire through the access hole, but the contacts gradually get less responsive with time.

HP41 non-responsive keys

*Message #4 Posted by **Randy Sloyer** on 17 Sept 2003, 7:01 p.m.,*
in response to message #3 by Tracy Vermeyen

Try a few drops of Caig Deoxit D5 in the hole first, let soak then scratch around. This is a lower concentration of their Deoxit product and will evaporate after doing the job. That usually does it.

I've found trying to wash the keyboards only makes matters worse as you run the risk of getting dirt into rather than out of the key domes.

Edited: 17 Sept 2003, 7:02 p.m.

Re: HOW CAN YOU FIX THIS PROBLEM?

*Message #5 Posted by **Randy East** on 18 Sept 2003, 12:15 p.m.,*
in response to message #2 by Randy Sloyer

NO COFFE OR ANY FOOD LIQUID HAS BEEN SPILLED ON THE hp. THE KEY DOES APPEAR TO BE LOWER IN THE SETTING THAN THE OTHER KEYS. i TURN IT ON BY TOUCHING THE ON BUTTON THAN THURNING THE ENTIRE CALCULATOR OVER AND TASPING IT ON MY KNEE. iT APEARS THAN i CANNOT TURN THE CALCULATOR OFF BY THE SAME PROCESS. iF i DO NEED A NEW KEY, HOW DOES ONE GO ABOUT THAT PROCESS?

HP48 keyboard woes

*Message #6 Posted by **Randy Sloyer** on 18 Sept 2003, 8:56 p.m.,*
in response to message #5 by Randy East

The ON button is normally lower than the rest. U can try this:

Place the unit on the desk in front of you. With a left finger, press down on the raised portion of the bezel above the B and C keys. Now with your right, try turning the unit on. You may find some pressure applied to the area described will get the unit working normally again. It may continue to work okay for a while or work only with pressure applied. If this test restores operation, the problem is an intermittent keyboard connection and can be repaired.

Post again if this works and we can go to the next step.

Help!!!

*Message #1 Posted by **BSCobb** on 16 Sept 2003, 11:21 a.m.*

Help!!! I will be taking the Professional Engineer Exam in April 2004. We have recently been informed that calculators with either infrared communication or text capability will not be allowed. I am an electrical engineer, specializing in power systems, so I need to perform many calculations in polar, and flip them back to rectangular easily. In fact, I bought my 48G+ specifically because of the way in handles complex number calculations. Any ideas on a suitable replacement??? I just spoke to HP Technical Support and a 32SII replacement is due out this fall, but if it has IR it won't do me any good.

Re: Help!!!

*Message #2 Posted by **Valentin Albillo** on 16 Sept 2003, 12:24 p.m.,*
in response to message #1 by BSCobb

The HP-15C is the obvious and best choice. It's got no text capabilities nor any other feature which would ban it from exams, yet it has the most comprehensive, integrated, and allegedly better handling of complex numbers in any HP calculator bar none, via its unique complex, parallel, full RPN-stack. It's also got matrices (including linear systems of up to 7 equations, or complex systems up to 4 equations), hyperbolics, factorial and gamma, combinations, permutations, linear regression and statistics, numerical solve and integrate, etc, etc.

If I were you, I wouldn't hesitate to get one ASAP. A decent working unit, somewhat cosmetically challenged, would be reasonably priced even in eBay.

Best regards from V.

Hey Valentin...email me

Re: Help!!!

*Message #6 Posted by **CME750** on 16 Sept 2003, 12:44 p.m.,*
in response to message #1 by BSCobb

The 32SII replacement is the 33S. Unofficial prerelease specs are available at http://www.hpcalc.org/hp49gplus.php and http://www.hpcalc.org/images/datasheet33s.pdf. Warning: you may want to put on eye protection before viewing this calculator; it's ugly.

The 32SII didn't have IR, and it doesn't appear that the 33S will have it either. It is likely that the 33S will be deemed acceptable for the EIT/PE exams (but this depends on NCEES, so no guarantees). Suggested retail price = $66.

The 32SII supports complex number operations, but not as elegantly as the HP48. Complex numbers are entered using two levels of the stack. Thus, the 4-level stack becomes a 2-level stack for use with complex numbers. Complex math is performed by hitting the "CMPLX" key before the operator. The 33S will likely be similar.

The 32SII had good programming capabilities, but had very little memory (384 bytes). The 33S is supposed to have 32K of memory. It should be possible to streamline complex operations through programming.

The 33S may turn out to be the most powerful calculator model that is acceptable for the EIT/PE exams under the new rules. Virtually all high-end "graphing" calculators from HP, TI, Casio or Sharp have text capability, and are presumably banned. There don't seem to be many keystroke-programmable scientific calculators on the market today; the 33S may have the market to itself.

An alternative would be older discontinued HP models, such as the 42S or 15C, which had better support for complex numbers. These can be bought used, but they tend to be quite expensive. The 42S may not meet the NCEES criteria for text capability.

Re: Help!!!

*Message #8 Posted by **Chan Tran** on 16 Sept 2003, 1:27 p.m.,*
in response to message #7 by deleted

Can you ask them if you can use the 48 with the IR port tapped up?

Re: Help!!!

*Message #9 Posted by **CME750** on 16 Sept 2003, 2:16 p.m.,*
in response to message #8 by Chan Tran

No good. Even graphing calcs with *no* IR port (like the TI83, TI89, or the original HP49) have been

banned. NCEES doesn't want any calcs with "text editing" capability, which includes virtually all modern graphing calculators, including the HP48 and HP49. They claim that a skilled typist can rapidly copy the exam questions, even on non-QWERTY calculator keyboards.

Some non-graphing calcs, like the HP32SII, HP41, HP42S, and forthcoming HP33S, have some primitive text handling features. But so far, NCEES doesn't seem to be concerned about such models.

My PE plans (Civil) were also upset by the ban on the 48. As an alternative, I plan to use the 32SII. I may also get a 33S for backup and for programming certain functions. It's so ugly that I can't imagine using it as my primary calculator, but perhaps it's something you can get used to. An old 42S would be great, but they're too expensive.

In the unlikely event that the 32SII and 33S are banned, then I will turn to my old 11C.

Re: Help!!!

*Message #10 Posted by **Chan Tran** on 16 Sept 2003, 2:32 p.m.,*
in response to message #9 by CME750

May be some of us would offer a Rent-a-Calc service?

Re: Help!!!

*Message #11 Posted by **christof (NoVA US)** on 16 Sept 2003, 9:34 p.m.,*
in response to message #9 by CME750

the 32Sii has test editing? - I mean, it has alpha variable names, but... I haven't seen any real text entry of any form.

If NCEES gets their panties wadded about single character varnames, i'll laugh.

Re: Help!!!

*Message #12 Posted by **CME750** on 17 Sept 2003, 1:00 a.m.,*
in response to message #11 by christof (NoVA US)

Actually, the 32SII does have some ability to store text messages, if they are entered as an "equation". See p. 12-15 of the manual. But it obviously is not in the same league as a modern graphing calculator as far as text capability goes. NCEES apparently does not perceive the 32SII as a threat to exam security, because it is on their recently-posted list of "approved" calculators.

Re: Help!!!

*Message #13 Posted by **Pierre Brial** on 17 Sept 2003, 11:52 p.m.,*
in response to message #12 by CME750

Is the NCEES list available online ?

Cheers

Pierre

Re: Help!!!

*Message #16 Posted by **hugh** on 16 Sept 2003, 7:33 p.m.,*
in response to message #7 by deleted

i agree with these recommendations. for me, i would use the 15c even if there werent any restrictions.

however, a point of consideration is that both the 15c and the 42 (and indeed the 32sii) are not cheap to obtain. if you get any of these three, use it. a low-cost alternative is another make (eg casio fx-5500l). ok, its no hp, but then its not as bad as a 9g either. its complex support is weak, but you can evaulate expressions like "2i+sqrt(2+3i)/6" in a freeform way and see both parts onscreen at once. theres no text support.

Re: Help!!!

*Message #17 Posted by **ned** on 16 Sept 2003, 4:25 p.m.,*
in response to message #1 by BSCobb

the TI-73! no alpha, but does matrix math, with a downloadable software pack:
http://education.ti.com/us/product/apps/73/matrices.html

Download the guide book. It has a real equasion solver (not just a 'root solver' like the 83). Maybe the old gray model had matrix built in, dunno. As for polar-rec, this can probably be programmed in too. What a shame that only a calc meant for 10 year old kids is allowable. The higher models, 83 and up, might make it only because there is no easy way to type in 'notes' without some notepad software. Otherwise try a casio power graphic series. Again the alpha keys might be allowed, due to lack of notepad function. HP, yeah, the 15C... 49g would be perfect, if only. Let's see if HP makes it back into the education/testing market with the 33s! ha! they make a decent race vehicle tho.

-ned

Re: Help!!!

*Message #18 Posted by **Thibaut.be** on 16 Sept 2003, 4:46 p.m.,*
in response to message #17 by ned

As Valentin quoted, I don't see any better calc than a 15C, that would comply with these rules.

With a little more understanding from the examinators, I agree that the 42S would also be totally adequate (and ever more comfortable to use than a 15C) if they accept a IR-output only calc and that even if capable

of alpha it has in no way any text editor.

Re: Help!!!

*Message #19 Posted by **CME750** on 16 Sept 2003, 4:58 p.m.,*
in response to message #17 by ned

The high-end TIs won't make it. So far, NCEES has explicitly *banned* the TI83, TI89, TI92, and Voyage 2000.

NCEES has not explicitly addressed other TI graphing calcs, or any Casio or Sharp graphing calcs. But all of these models have some degree of text-handling capability. Even if there is no built-in "notepad" function, it's probably possible to find a workaround, or even to just download appropriate notepad software from the Internet.

It's been unofficially suggested, as a rule of thumb, that any calculator with an "Alpha Lock" mode for the keyboard is probably banned. The only purpose for Alpha Lock is to make it convenient to enter long strings of text. And that's precisely what NCEES doesn't want you to do.

So what is the alternative? So far, NCEES has explicitly *approved* the TI30 series, the HP9 series, the HP32SII, and the HP33S. If you want programming capability, the HP33S looks like the way to go.

Re: Help!!!

Meeting in Portland, OR

*Message #1 Posted by **Wlodek Mier-Jedrzejowicz** on 15 Sept 2003, 8:31 p.m.*

I'll be visiting Dave Hicks, the Museum Curator, on Tuesday September 23, just after the HP Handhelds Conference. We'll be in Powell's downtown bookstore that afternoon, and it would be a great chance to meet some folks whom we usually meet only on the Museum web site and talk about the conference and other interesting things.

Dave and I plan to be in the bookstore's coffee shop between 3pm and 4pm, no doubt with some HP books and calculators on the table so people can recognize us ;-)

Hope to meet some of the folks from Portland then!

I'll be going on to Corvallis after that, and then to Seattle, meeting HP calculator fans in both towns too. Anyone interested in joining us?

Wlodek Mier-Jedrzejowicz

HP-49G+ ROM....

*Message #1 Posted by **Speck** on 15 Sept 2003, 8:25 p.m.*

Does anybody know, or have you heard any speculation, as to whether or not ROM 1.20 will be made available to the public for download, and if both it and future ROMs will be backwards compatible with the current 49G? I'm wondering if this is the end for my HP, or if I can take adavantage of some of these new bug fixes. The new calc and ROM numbering system would imply a natural continuation, but with a completely different hardware system, I don't want to just take it for granted. If you wonder why I'm concerned, just consider that my TI-92 is HW1 (HardWare version 1), the 89's are HW2, and the Voyage200 is HW3. I can certainly continue to download and install ROM updates for my 92, but can actually take little, if any, advantage of the new code.

Also, if memory serves, you could, at least for a while, update the base code from one TI to another. Could 49G's ever do this? This is just curiosity on my part.

Re: HP-49G+ ROM....

*Message #2 Posted by **James M. Prange** on 16 Sept 2003, 1:52 a.m.,*
in response to message #1 by Speck

I don't know about the 1.20 ROM, but the 1.22 ROM is available for download at http://h20000.www2.hp.com/bizsupport/TechSupport/SoftwareDescription.jsp?locale=en_US&lang=English+%28US%29&pnameOID=351776&prodSeriesId=33568&prodTypeId=215348&basePartNum=COL4392&locBasepartNum=ca-14639-2&os=Microsoft+Windows+95&tech=Firmware.

Given the differences between the 49G and the 49G+, I'd be surprised if the ROM for one could be used on the other. But I don't have a 49G+ yet, haven't tried the 49G+ ROM, and so I really don't know.

Maybe someone could try a 49G+ ROM on a 49G (either actual hardware or emulator) or vice versa?

Judging from the documentation available at http://h20000.www2.hp.com/bizsupport/TechSupport/DocumentIndex.jsp?contentType=SupportManual&docIndexId=179166&locale=en_US&prodTypeId=215348&prodSeriesId=33568, UserRPL (and, I guess, SysRPL) source code for the 49G+ and 49G should be very similar.

From posts on the newsgroup comp.sys.hp48, I understand that some (but not all) libraries written for the 49G work on the 49G+.

Yes, the ROM of a 49G, at least in later revisions, could be used to upgrade the ROM of another 49G via a serial connection between the two calculators..

As for the 49G+, it seems to me that it wouldn't be possible to establish communications between two 49G+s via USB, but perhaps via IrDA? Or maybe the "Serial IR" used in the 48 series is still available on the 49G+? I would hope that it would be possible to transfer the ROM image to an SD card, and then move the card to another 49G+ to update its ROM.

I've read that the 82240B printer works with the 49G+, so apparently the 49G+ can use the "RedEye" protocol as well as IrDA.

Speaking of printers, I wonder whether HP will be marketing an improved printer. Martel Instruments has some nice-looking printers listed at http://www.martelinstruments.com/cased.html. I wonder whether an MCP8830 would work with the 49G+'s IrDA.

So many questions, so few (certain) answers.... I suppose we'll just have to be patient.

Regards,
James

HP 11C Calculator

*Message #1 Posted by **Phyllis** on 15 Sept 2003, 4:38 p.m.*

Just got an old HP 11c. I don't remember how to change the number of decimal places.

Thanks

Re: HP 11C Calculator

*Message #2 Posted by **Victor Koechli** on 15 Sept 2003, 4:58 p.m.,*
in response to message #1 by Phyllis

Congratulations on your aquisition!

To change the display format, press [f], then either [Fix] for fixed decimals, [Sci] for scientific, or [Eng] for Engineering, then the desired number of decimals (e.g. [f] [Fix] 2 to change to 2 decimals fixed mode).

If you need a manual, get the Museum CD Rom available from this site, then start buying the calcs to fit the manuals you find there ;-)

Cheers, Victor

28C Memory upgrade ?

*Message #1 Posted by **Roberto FLores** on 15 Sept 2003, 3:10 p.m.*

Hi !...

I know it's out there somewhere but I cant't find the information to upgrade my 28C to 32K...

Anyone ?

Thanks;

Roberto

Re: 28C Memory upgrade ?

*Message #2 Posted by **Andreas Stockburger** on 17 Sept 2003, 2:22 a.m.,*
in response to message #1 by Roberto FLores

Hi,

I would sell my 28c on ebay and buy a 28s ... This is the easiest possibility. Perhaps you make money with this deal ...

HP49G+ where to buy?

*Message #1 Posted by **Chan Tran** on 15 Sept 2003, 12:32 p.m.*

Where can I buy or look for specs and pictures of the new HP49G+ as well as other new HP graphing calcs?

Re: HP49G+ where to buy?

*Message #2 Posted by **David Ramsey** on 15 Sept 2003, 4:55 p.m.,*
in response to message #1 by Chan Tran

Specs and pics here:

http://www.hpcalc.org/hp49gplus.php

Not available in the U.S. just yet, but should be in a couple of weeks.

Re: HP49G+ where to buy?

*Message #3 Posted by **HP49G+soon** on 15 Sept 2003, 9:00 p.m.,*
in response to message #1 by Chan Tran

It's not available yet, but you can pre-order it for 159.99

Re: HP49G+ where to buy?

*Message #4 Posted by **Chan Tran** on 16 Sept 2003, 8:35 a.m.,*
in response to message #3 by HP49G+soon

I read the specs available at hpcalc.org but can't determine if either the 49G+ or the 48GII has a clock.

HP-38C aand HP-97

*Message #1 Posted by **Jerry Pfile** on 14 Sept 2003, 10:36 p.m.*

Hi,

Apologies for breaking in but I need some information.

I have the above to HPs but each needs a little work. Bought both new years ago but as I'm retired I have no professional need as I did then. However, I'd like to get them up and running for sentimental reasons if nothing else.

The 38C charger has disappeared somewhere over the years as has the box, manual etc. What was the charger model number? All I recall is that it had the two flat contacts housed in the male end of the AC adaptor.

The 97 has perhaps a fatal condition. The battery was removed years ago and lost. What model was the battery and are they still available? More ominous is that the "+" key has no "spring action" at all. Can that be repaired, or are replacement circuit boards still available in the aftermarket?

Would greatly appreciate any info someone can give me regarding the above.

Thanks in advance,

Jerry

Re: HP-38C aand HP-97

*Message #2 Posted by **Thibaut.be** on 15 Sept 2003, 9:23 a.m.,*
in response to message #1 by Jerry Pfile

Spices chargers are quite easy to find on ebay. Check http://www.hpmuseum.org/collect.htm#batts for more details.

The good news is that you can easily replace your battery pack with 2 standard AA batteries (positive above and left side) joined together with a paper clip or a bit of aluminium fold. If you haven't charged your batteries for a long time, my guess is that they are dead and you might want to replace them with 2 rechargeable AA batteries. They work perfectly.

Regarding the 97 there are some far more specialized people on this forum to provide you witha correct answer.

Thibaut

Re: HP-38C aand HP-97

*Message #3 Posted by **Gordon Dyer** on 15 Sept 2003, 1:51 p.m.,*
in response to message #1 by Jerry Pfile

Hi, my 38C ac adapter is HP8207A, 1.8VA, 10V AC output.

The transformer is moulded into the 2 pin plug.

The HP-97 can easily be dismantled and the keyboard taken apart. The spring mechanism for the key cap is seperate from the contacts and you sgould be able to take it apart ot fix or replace the spring. Have a look through this museum's Articles Forum for info on repairing the HP-97.
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=180
I will email to you some pictures I took of my own 97 keyboard dismantled.
Spare battery packs are available on eBay, I have recently bought a new 97 battery pack for $27. I wouldn't have found one here in the UK.
You can also find HP 30 series ac adapters in eBay if you keep looking patiently each week.
Good luck with the repairs!

Random number generated on a 32sii

*Message #1 Posted by **Charles** on 14 Sept 2003, 8:47 p.m.*

Have any of you written a random number generating program for a 32sii? Specifically generating an integer between say 1 to 5? I don't have the manual and wonder if it could be already in existance?

Best regards, Charles

Re: Random number generated on a 32sii

*Message #2 Posted by **Robert** on 14 Sept 2003, 10:22 p.m.,*
in response to message #1 by Charles

It has a random number generator from 0 to 1(Prob -> R). Couldn't you just use a linear transform of that, i.e.,

Your Random Number = 1 + (4*R)

Re: Random number generated on a 32sii

*Message #3 Posted by **Patrick** on 14 Sept 2003, 11:06 p.m.,*
in response to message #2 by Robert

I think you would need to compute 1+int(5*R) to get a random integer in the range 1..5. Most random number generators produce fractions from zero to one, including zero but not including one.

1+IP(RANDOM*5 [CK=A6CC 10.5byte] (NO TEXT, just a 'dot')

*Message #4 Posted by **Tizedes Csaba** on 15 Sept 2003, 3:46 a.m.,*
in response to message #1 by Charles

.

With a little program

*Message #5 Posted by **Tizedes Csaba** on 15 Sept 2003, 4:44 a.m.,*
in response to message #1 by Charles

Hi!

Try it:

```
LBL R         #random
INPUT N       #how many Nums?
INPUT I       #mInimum?
INPUT A       #mAximum?
LBL J         #jump here
RCL A
RCL sub I
1
add
```

```
RANDOM
mul
IP
RCL add I
PSE          #put another PSE, if it too fast
DSE N
GTO J
RTN

'add', 'sub', 'mul', 'div' mean
'add', 'substract', 'multiple' and 'divide' in this order.
```

Csaba

New HPs keyboard quality

*Message #1 Posted by **Victor Koechli** on 14 Sept 2003, 5:13 p.m.*

Yesterday I played a bit with a 17BII+ in a store here in Zurich. In my opinion the keyboard is awkward, it feels *very* cheap, and the '1' key didn't even work. Of course this particular machine was there for everyone to play with, but still: Are 49G+ keyboards the same as of the 17BII+? If yes, I'll have to think very well about buying one...

Cheers, Victor

Re: New HPs keyboard quality

*Message #2 Posted by **Gene** on 14 Sept 2003, 5:28 p.m.,*
in response to message #1 by Victor Koechli

No, the 49G+ and 48GII keyboards do not look like they are the same as the 17BII+ (which has the same keyboard as the 10BII).

They appear to be much better and, although reports on comp.sys.hp48 have indicated some problems with early unit keyboards clicking but not registering the push, another individual there has indicated no such problem.

As always with early adopters, there may be some tweaks that need to occur.

Looks like the 49G+ are going to be very good.

Re: New HPs keyboard quality

*Message #3 Posted by **Joan Cárdenas** on 15 Sept 2003, 8:16 a.m.,*
in response to message #2 by Gene

Hi all,

My 49g+ can be an early unit since its serial number is cn33100781, made at the end of july.

But the overall quality of the keyboard is quite bad and is not reliable at all. I think the reason is quite simple, they just change the system from metalic bubble to a plastic bubble. There's nothing to do with the old Hp's keyboards. And also there's a funny thing, if one press and hold a key and keep increasing the preasure more times, the calc keep registering the input, instead of the old keys behavior, where a press means only one register until the complete release.

So, a bit disapointing...

Regards.

Re: New HPs keyboard quality

*Message #4 Posted by **J.Manrique** on 15 Sept 2003, 10:39 a.m.,*
in response to message #3 by Joan Cárdenas

Funny, your Serial Number seems to be lower than a marketing sample I've seen some time ago. Maybe some one is offering too early units.

Mine is CN33101969, and its keys work fine, perhaps not as good as hp48g, but fine anyway.

Re: New HPs keyboard quality

*Message #5 Posted by **hugh** on 14 Sept 2003, 7:00 p.m.,*
in response to message #1 by Victor Koechli

i've been meaning to ask about the new 17bii for a while now. functionally, are there any improvements over the original 17bii, or is it an excersise in cost reduction.

i've always thought the original 17bii was a very fine machine (one of my favorites).

they've messed it up, havent they?

Re: New HPs keyboard quality

*Message #6 Posted by **Victor Koechli** on 15 Sept 2003, 4:31 a.m.,*
in response to message #5 by hugh

I don't know the 17BII, so I can't tell what differences there are between it and the 17BII+. Of course, if you'd like to know anything special, I can always go back to that store and check it out, it's quite close to where I work. As far as the keyboard quality is concerned, it certainly seems to be a step in the wrong direction. I mean, the machine hasn't been out for long, has it? And still, one key on that specimen I was playing with already is broken.

If there is something I can find out for you, let me know. Just be warned: I don't know much about financial stuff. But others in this forum do...

Cheers, Victor

Sounds like time to ask randy if he thinks the old 17bii will take a 32k chip, since that seems to be the main upgrade.....

Re: New HPs keyboard quality

*Message #8 Posted by **Alan Miles** on 15 Sept 2003, 12:08 p.m.,*
in response to message #6 by Victor Koechli

HI

I have an HP 17Bii+ AND an HP 17Bii in front of me. The HP 17Bii+ has all the functions of the 17Bii and uses the same menu tree etc. As far as I can tell everything seems to calculate in the same way although I have heard there may be one or two changes in some formula (although I havent found any of these yet!). The HP 17Bii+ is claimed to have 32 KB memory, a lot more than the old 17Bii. The 17Bii+ also has currency convesion that was NOT in the 17Bii.

The keyboard seems OK to me although it is possible to get a "click" without the number actually registering (for some reason this seems to happen mostly on the number 4 on my calculator) Once you get used to the keyboard it works OK. The keyboard layout is identical to the HP 17Bii+ but the keys are bigger. The printing on the keys seems very solid and I wouldnt expect this to rub off even under heavy use.

I have a 10Bii as well, the keyboards are NOT the same. 10Bii keyboard is actually a little larger. The 10Bii has 8 rows of 5 keys and the 17Bii+ has 2 rows of 6 keys at the top then 5 rows of 5 keys below. The 10Bii keyboard does however have the same problem of getting a click on the "4" key not always registering (weird??) The 10B and 17Bii+ are identical in size and shape overall except the 17Bii+ seems a little thicker, it looks nicer too.

I actually quite like this 17Bii+ unit. I prefer the look to the old HP 17Bii. The supplied case (leather?) is VERY nice and MUCH better than the old 17Bii case. Manual is still very comprehensive with 300+ pages. Also it still has the ir port for printing.

Does anyone know of another calculator I should look at that is as good for finance/banking/business use?

Another financial calculator ...

*Message #9 Posted by **Valentin Albillo** on 15 Sept 2003, 12:48 p.m.,*
in response to message #8 by Alan Miles

Alan Miles asked:

"Does anyone know of another calculator I should look at that is as good for finance/banking/business use ?"

If you can find one (eBay, for instance), then the vintage SHARP PC-1421 Business/Financial Computer (known as EL-5510 in the US) can give a run for its money to anything HP has to offer, past & present, both in sheer power, ease of use and programming, and full I/O. Very good manual, too: thick, detailed, and full of examples and useful programs.

Go get one, I've got both in my collection, and very proud of them.

Best regards from V.

The ghost of HP past

in response to message #8 by Alan Miles

Does this mean the potential HP42S lives on inside the HP17bii+?

If you say the menu and keys are the same and it has IR then it sounds very similar.

Has anyone taken one to bits to see if there is a ROM chip, or is this inside a 'one chip' circuit?

Sorry if I'm going over old ground.

Re: New keyboard problems

*Message #11 Posted by **Randy Sloyer** on 15 Sept 2003, 8:18 p.m.,*
in response to message #8 by Alan Miles

Okay, now you have my attention. I've ignored the 17Bii+ up to now as a 10Bii knock-off. I never looked close enough at the keyboards to see that they were indeed different.

I have dissected several non-functional keyboard 10Bii's and found the common problem to be flux contamination from the bottom to top plate-through holes in which the battery clip is installed. The flux migrates onto the top of the circuit board that forms the base cross-points of the key switches and prevents good contact. If you pop the battery door and remove the batteries, you'll see the lower right side of the battery clip is opposite the 4 key.

They actually improved the design over the Pioneers as the bottom of the switch is gold plated copper, much better than what preceded them. The keyboard dome is still a formed plastic sheet with a conductive ink deposit that closes the switch. I think it is more a process problem than a design issue. They did improve some other nagging Pioneer problems, notably the common breakage of the LCD. It floats in the 10Bii rather than being glued to a rigid metal frame. I would imagine it is the same in the 17Bii+. The 10Bii was actually an HP design, I'm speculating, but it may have been the last thing ACO did as the circuit boards have a year 2000 copyright. I think the 17Bii+ is an extension of that design. One only needs to look at the 33S to know that is NOT an HP design.

The fact it has an I/R port baffles me. Why 'o why would they go to the trouble of adding that when they no longer make a printer to receive it? Is it a Saturn chip or is it an emulator? I think it is time for me to buy one and bust it open just for fun to see if the 42SX might really be a possibility.

Edited: 15 Sept 2003, 8:23 p.m.

*Message #14 Posted by **Gordon Dyer** on 17 Sept 2003, 5:50 p.m.,*
in response to message #11 by Randy Sloyer

Any new calculator with an IR port should be IRDA v2 compliant, bi-directional and be able to communicate with a PC. Can the 17BII+ or 49G+ do this?

Re: New HPs keyboard quality

*Message #15 Posted by **Christof (Hurricane Path USA)** on 15 Sept 2003, 9:10 p.m.,*
in response to message #8 by Alan Miles

There are a few of the more esoteric functions missing from the 17Bii+ it seems, but overall what I hear about the operational aspects is encouraging.

The currency conversion is interesting- that along with the multi language capabilities makes me wonder if the 19Bii ROM wasn't used as the source for this emulation.

The 17Bii and the 19Bii were not very much different. I've often wished that the few things they didn't share were shared.

I'm curious to see how the new 19bii+xtra-supersized-gold-platiunim-collector's-limited edition will come out. Personally I always loved the clamshell. I've never had one break- and I've got several 28S machines that are ex high school classroom calcs that have seen some pretty heavy use. Yes- the battery door always sucked a bit, but the dual mode usage (that clamshell folds all the way over) and ergonomics always have attracted me.

And in direct respone to yur question--

It's a toss up. If you need RAM (I keep an entire set of books summarized in a 17Bii) then the 17Bii+ is probably the best one for you. Otherwise, the 12C is fantastic and well respected in a world where appearances matter.

The TI BA series isn't half bad, either.... but..... well.

HP17Bii languages

*Message #16 Posted by **Tom (UK)** on 16 Sept 2003, 7:13 a.m.,*
in response to message #15 by Christof (Hurricane Path USA)

I think some 17Bii's had an extra ROM for the multi language version so this 2nd ROM may have been the source for the 17Bii+.

Re: HP17Bii languages

*Message #17 Posted by **Victor Koechli** on 16 Sept 2003, 11:19 a.m.,*
in response to message #16 by Tom (UK)

Actually, the machine I played with 'spoke' german, so either all 17Bii+ are multilingual, or HP again makes models with an additional ROM..

Cheers, Victor

Dead HP35?

*Message #1 Posted by **PeterL** on 14 Sept 2003, 1:06 p.m.*

Hi there, today I found a HP35 with Charger on a fleamarket. Got it for 2.5 Euros (appr. 2.5$). And I did'n look into the battery compartment before I paid for the calculator. The calc has the Ser.No 1302S 75403 and the batterie are numbered 1420-0272. I think this means that both, the calculator and the batteries are about 30 years old.

They looked this way, a huge amount of crystals from the electrolytic and green and blue debris from the junction of electrolytic and copper... The liquid managed to reach the supply-unit's plug in the calculator. Testing with a regulated power supply, the calculator doesn't work :-(I didn't peel off the back label yet, are there any experiences that the calculator can be get back to life?

73 Peter

Re: Dead HP35?

*Message #2 Posted by **Tony Duell (UK)** on 14 Sept 2003, 1:16 p.m.,*
in response to message #1 by PeterL

If the fault is bad connections, corroded wiring, or a problem with the discrete components in the power converter circuit, it can be fixed. If the problem is a dead IC, well, then you need to find another machine to raid parts from as all the ICs in an HP35 are custom. So it might well be able to be repaired. It's certainly worth peeling off the label, taking the case apart and having a look. And if everything looks alright, then power it up from the bench supply and test at least the power voltages on the testpoints.

Re: Dead HP35?

*Message #3 Posted by **PeterL** on 16 Sept 2003, 3:52 a.m.,*
in response to message #2 by Tony Duell (UK)

Hi Tony, Thank you for your answer. I hope it will be not too bad.....

73 Peter

Re: Dead HP35?

*Message #4 Posted by **David Smith** on 14 Sept 2003, 3:02 p.m.,*
in response to message #1 by PeterL

Don't peel off the full label. You just need to carefully peel back the top corners of the label (around 1/2 inch).

Re: Dead HP35?

*Message #5 Posted by **PeterL** on 16 Sept 2003, 3:48 a.m.,*
in response to message #4 by David Smith

Hi David, can you tell me the coordinates of the two hidden screws? Then I will drill holes to get them out.

It seems to be a better way to me than peeling off the thin aluminium plate.

73 Peter

Re: Dead HP35?

*Message #6 Posted by **David Smith** on 16 Sept 2003, 1:42 p.m.,*
in response to message #5 by PeterL

You rub around the upper corner of the labels with your finger and find where the screws are. If I remember right, the screw holes are mayby around 5/8 inch in from the edges of the label and around 3/8 inches down.

Re: Dead HP35?

*Message #7 Posted by **PeterL** on 17 Sept 2003, 4:44 a.m.,*
in response to message #6 by David Smith

Hi David, thank you, Iwill try it.

Plagerized HP-85 ad? - (Not exactly!)

*Message #1 Posted by **Mike** on 14 Sept 2003, 8:58 a.m.*

I have been contacted by some members of the forum, about an HP-85 auction that is running, that appears to be plagerized copy of one of my auctions.

I just wanted to let everyone to know that the seller purchased that item from me just about 10 days ago and had an emergency and had to resell it. He was too honerable to back out of the deal and didn't even want to let me know of the situation, when it occured. But he did explain what he was doing.

That auction is here:

Copied ad

My auction

I hope he gets what he is asking, as that is one of the nicest HP-85 that I have sold. It is virtually unmarked and has been 100% restored (belts and capstan). The inside was remarkably clean as if not used much.

I would also like to thank those that contacted me about the ad. http://www.msdsite.com/images/smile.gif

Edited: 14 Sept 2003, 9:02 a.m.

Your a class act mike.....

Horse Racing 11C

*Message #1 Posted by **tbcab@aol.com** on 14 Sept 2003, 1:30 a.m.*

Further down this page, there is some discussion concerning a "horse racing" 11C on eBay. I ended up buying this 11C, and wanted to post what I have (and have not) found.

There is, in fact a template on top of the regular face plate. The template looks to have been professionally die cut, with an adhesive backing, not glued on at the kitchen table. Also, the printing on the template looks like a "factory" job. The calc passes both tests, and seems to function simply as an 11C.

I found another reference on some other discussion site to another one of these having come up on eBay some time back. The discussion was similar to what we saw here. But the point is that there has been at least one other auction of this type of item - Yes, maybe this very one.

Something else I found interesting, and possibly related to this calculator, is that HP apparently sponsors the "Galway Plate" horse race. I don't follow horse racing, and have never heard of the Galway Plate, but see http://sport.guardian.co.uk/horseracing/story/0,10149,1009359,00.html to see what I am talking about. Perhaps HP put these out in association with this horse race. Just speculating.

Does anyone else know anything about HP's association with horse racing?

Re: Horse Racing 11C

*Message #2 Posted by **Patrick** on 14 Sept 2003, 4:00 a.m.,*
in response to message #1 by tbcab@aol.com

Congratulations on your purchase, tbcab. I think the 11C is a very fine little machine. In fact, for the last few weeks I've been labouring to bring the power of the SOLVE function from the 34C and 15C to the 11C by means of a program which follows Dr. Kahan's algorithm description reasonably closely. I'll publish it here at some point.

But about your "special" version...

Does the template suggest that certain keys have functions that cannot be explained with the normal operation of the calculator? For example, I could make certain keys operate differently by using USER mode or by prefixing the keystroke with GSB. Are there template key functions which don't follow these patterns?

The reason I'm asking is that, if so, it would suggest that a different ROM was installed, in some machines at least. Based on your description of it operating like a "normal" 11C, the odds are small of this being so, but I thought I'd ask!

TI Converts an HP fanatic

*Message #1 Posted by **Steven Kutoroff** on 13 Sept 2003, 8:05 p.m.*

I have been using HP Calculators since the HP-35 and even used a 9830 when they were new. I have a pretty good collection of different models and always scoffed at those made by TI. But, we just bought my son a new TI-83 Silver for school and I was playing with it. These are really very nice units, maybe not the same ergonomics, but the ease of use and the logical way they work for routine operations is very very impressive. It comes with software for both PC and Macintosh computers. Overall, I was impressed. If HP re-enters this market, they cannot use a warmed up 48 series. The TI has become a remarkable unit. Any agree?

in response to message #1 by Steven Kutoroff

I agree.

I just bought my son an 83 Silver as well. These are fantastic calculators with SUPERB support from TI.

I've owned and used a 45, 55, and 41CX. I even bought six of the British hoard of new 41CXs when they were still cheap. I guess I'll keep them for all the fanatics in a few years.

HP dropped out of the race and will NEVER catch up. NEVER!

Best, Karl (((like posting Corvette news on the Porsche board!!!))

"HP dropped out of the race and will NEVER catch up. NEVER!"

You really think?

Thr 39G+ sounds like it will be good for kids to me. Has some nice features like a 75MHz processor. It also has a very intuitive interface.

We'll just have to wait and see.

in response to message #2 by karl gruber

As an "HP fanatic", does the acronym RPN mean anything at all to you? Another thing, the last time I checked, the TI-83 series can't even take a derivative of a function or do symbolic integration. I went from

an 83+ to a 49G, and I will never go back; I don't even like my 89 as much as the 49G. TI dominates the market because they are weasels; they make mediocre products with loads and loads of support and promotion (sort of reminds me of Microsoft). Sorry to be so blunt, but I hate TI calculators with a passion. You can have your "SUPERB support"; I'll stick with quality and RPN.

*Message #5 Posted by **Frederic** on 14 Sept 2003, 8:38 a.m.,*
in response to message #4 by Brandon Del Bel

I have about every HP and TI graphing calculators made and if you are talking about quality, i think TI win the race! I have in my hand a TI-86 for a lot of year without any problem with it even if heavily use. You don't like them because you have a passion hating TI for long but thinks change a lot since the TI-55 cracky calculator!

The TI-89 with RPN application is very difficult to beat in terms of usability, physical quality, support, ease of use.

But yes, you were true: between 1970 and 1990, TI introduced a lot of mediocre, cheap, cracky, uninspired calculators, but their graphing line are simply the best, and not only for students.

But yes, i confess it, for every day calculations and fun of using them, i will never echange my HP-41 system or 25C for anything graphing TI or HP sharp or casio did!!!

*Message #7 Posted by **Michel Beaulieu** on 14 Sept 2003, 11:38 a.m.,*
in response to message #6 by Veli-Pekka Nousiainen

I have a HP-48GX and a T-89 and they are very diferent but they are, IMO, quality products over casio than can please a scientist like me. Screen and processor is better in TI but keyboard and "extra feature" (sound, time etc) is for HP. But i never had any HP screen problem nor TI keyboard one

20 years ago, TI were more affordable but HP were better calc. Today the difference is only a question of choice between RPN or ALGEBRAIC phylosophy. And as a matter of choice, no one can tell another that he made the good choice and the other is in the dark side.

So the competition that begun 20 years ago between TI and HP users is now over without looser just winners that presents good products to their respective customers...

I wholeheartedly concur. Every implementaion of RPN on the TIs has been nothing more than awkward.
When I say bad quality, need I mention the fact that the TI-89 has no x-root button? I personally do not enjoy having to type inverse powers. Why is there no button for the base 10 log, and why are the trigonometric functions all secondary!? Do you actually think I want buttons for x y z and t removed from the rest of the alphabet (do I even want a button for y z and t)? I could go on, but I'll just sum it all up by saying that TIs suck.

did your kids learn any math ?

*Message #9 Posted by **Norm** on 14 Sept 2003, 8:49 p.m.,*
in response to message #8 by Brandon Del Bel

Greetings to the crowd,

let me jump in to the debate. I see that the uproar is whether a TI graphing calculator or an HP graphing calculator is better for your kids to learn math.

I just cringe when you guys say "....has got excellent support and a 75MHz processor". My view: Your kids aren't learning any math, they are just buying more outlandish modern software trash (Windows XP) and then having to call "tech support" when it doesn't work worth beans.

My viewpoint: Get your kid a restored HP-34C (or HP-31E) or an HP-32S (OK HP-32S is the most reasonable selection) and get the kid to LEARN SOME MATH not how to CALL TECH SUPPORT.

ANY PROPERLY DESIGNED CALCULATOR REQUIRES ZERO (0.00000) in the way of "TECH SUPPORT" because every button and every feature and every subtlety will already be NICELY explained and intuitively obvious to use.

Not only that, it will function flawlessly for the next 40 years (such as with an HP-34C) and be a flawless calculating companion even though you NEVER phoned any "tech support" or quoted how many hundred MegaSnertz or GigaHurtz the CPU had. Such as with an HP-34C.

Does your kid know the answer to Sin(45) in his head? Does he have an understanding of what is E to the -1 power ? Or is he just playing videogames, surfing the internet, drinking starbucks coffee and trading e-mail with his friends all thanks to his marvelous TI or HP piece of squash rot. ??

Either company's offerings at the present time are trash and an insult to intelligent people. Stick with the classic HP's that were discontinued by the likes of "Carly".

sigh Where to begin?

"I just cringe when you guys say "....has got excellent support and a 75MHz processor". My view: Your kids aren't learning any math, they are just buying more outlandish modern software trash (Windows XP) and then having to call "tech support" when it doesn't work worth beans."

WTF does Windows XP have to do with this? The 49G+ doesn't run XP. I'd hardly call it "outlandish modern software trash". It seems to be very high quality.

<snip luddite rant about being too complicated>

"Either company's offerings at the present time are trash and an insult to intelligent people. Stick with the classic HP's that were discontinued by the likes of "Carly" "

Are you nuts? How are excellant tools an insult to intelligent people?

I think you're trolling (I *hope* you're trolling).

Starbucks

*Message #11 Posted by **Ellis Easley** on 15 Sept 2003, 6:19 a.m.,*
in response to message #9 by Norm

If you dislike Starbucks, you might enjoy a recent novel by Kinky Friedman (country singer turned detective novel writer) called "Kill Two Birds And Get Stoned". If you are a Kinky Friedman fan, you might not know about this book because it's not necessarily stocked in the Mystery section, with all his detective stories in which he (Kinky) is the main charcter. This book introduces a new main character (a writer) and I found it at Borders in the Literature section, not the Mystery section.

Coffee Tax ? You laugh, but....

*Message #15 Posted by **Speck** on 16 Sept 2003, 9:40 p.m.,*
in response to message #13 by Euclid

It was more-or-less a smart-allecky post by me, but the city of Seattle, Washington, has been getting a lot of media attention lately for the proposed 10 cent per cup "Espresso Tax" (I'm not kidding about this) that the city is estimating will bring in as much as 6 million dollars. I believe some of that money is to be siphoned off for preschool programs. It's that whole "anything for the kids" mentality, along with the previous post about education, calculators, and coffee, that made me muse whimsical.

If you think this is no big deal, imagine the posts we'd get here from Norm if they still made red LED calculators, and gov't started taxing those LED's "for the kids!" :)

Speck.

*Message #16 Posted by **Charles** on 14 Sept 2003, 6:54 p.m.,*
in response to message #6 by Veli-Pekka Nousiainen

I've used the TI86 and liked it, UNTIL I tried a 48G, then was hooked on rpn...then I finally found a 32sii, and the enter key center and large along with layout make them winners. For any students choosing an 89, I have to ask have you noticed the trig (both primary and arc) are all SECONDARY keys?? Count your keystrokes, I've done it on many calculations, enough to know that rpn is better for me, and rpn goes hand in hand with a dedicated key layout. That's just my opinion. HP will have to wow us with the new calcs, if they don't then I'll just pick up a 48gx as a backup for my 32sii and pray for longevity! Charles

Oh, no!!

*Message #17 Posted by **R Lion (España)** on 15 Sept 2003, 5:30 a.m.,*
in response to message #16 by Charles

> Quote:
>
> ...then I'll just pick up a 48gx as a backup for my 32sii...

Better buy and use the 48GX and keep the 32SII in a drawer as RPN backup... ;-)

Re: Oh, no!!

*Message #18 Posted by **Ed Look** on 19 Sept 2003, 2:56 p.m.,*
in response to message #17 by R Lion (España)

Actually I have both the 32sii and a 48G (no +, no X, no bloody A, B, C, D... sorry, wrong forum) and like him, I am using the 32sii as my workhorse and the 48G as backup. The 32sii LOOKS like it's used: a little smudging, dirt, fine scratches, etc.; the 48G is still new looking.

I still have my first HP, a 34C. I'd rather use that but due to age and wear, it's kind of dotty these days. In fact, that's what I like about the 32sii- it's remarkably like a 34C! For general calculating and light programming, not all night theoretical crunching, it's very "user friendly".

Microsoft offers lots of support? Am I missing something?

Re: TI Converts a [so called] HP fanatic

*Message #21 Posted by **Norm** on 15 Sept 2003, 9:08 p.m.,*
in response to message #20 by unspellable

point taken, Mr. Unspellable.

Microsoft does not have what we would call "customer support".

I heard they do have a 1-800 number that you can phone if you are having difficulty. There is a tape recorded voice, which laughs hysterically at you and repeats on an endless loop. Because they can play that into hundreds of telephone lines all at the same time, it keeps costs down and profits up.

Re: TI Converts a [so called] HP fanatic

*Message #22 Posted by **Andy** on 21 Sept 2003, 6:37 p.m.,*
in response to message #4 by Brandon Del Bel

Well,You are indeed right.but really you don't have to be so harsh. I have a friend whom works in 2A systems, they are doing an app. And well that app modifies everything in the TI 83, and is as capable as a 49G os. I wouldn't change HP for TI,(i never Will),but when the app reach the market I'll be the first one to buy it. 2A Systems. keep that name is mind.

regards Andy

*Message #23 Posted by **jimc** on 14 Sept 2003, 2:08 p.m.,*
in response to message #1 by Steven Kutoroff

At the risk of jumping in to an argument much like religon, politics or best new female rap vocalist (OK, maybe not), I will say that the new TI does run circles around my recent experiences with HP calcs. I purchased a new HP calc (30S) for my son for school. Within a year the calculator lay at the bottom of the dreaded junk drawer, because the 8 key no longer did. It also suffered from display issues. It was not a well constructed calc.

I bought him a used 83 TI, and I do very much like it, as does he. I don't appreciate the AOS, but the keys are large (for old eyes), seem well placed and the quality does seem to be there. I will not opine on the quality of the new HP's as I haven't yet seen them.

Thus far however, I think the old HP (the one I remember) and the new HP are completely different companies. One is market driven, the other was product driven. Different philosophies for different times. In today's WalMart world, large companies only know market driven- blame it on MBA's, blame it on globalization, but to find a profitable niche market for a quality product is tough for a publicly held company. Face it, the calculator market is being sandwiched between PDA's, cell phones, and laptops. I applaude HP for not abandoning the market YET.

My experience with HP's include my 48GX (good calc, but awkward interface), 41CX (the best!), 10C (great design - a classic) and 25 (RED LLLLEEEEEDDDDD's).

TI hardware's quality is very good. You won't have a problem with the screen (scratches...) and the keyboard is excellent (hard plastic keytops...). Recent HPs have put the company to shame. I ran to buy the HP-10B-II and found that the product was impressive, until I physically typed on it - an horrible experience ! My fear for the new models is that they may use this kind of keyboard. I am the first to say that HP48s were nice machines, a little confusing for the old-time user, but still very powerful. Note also that Steven is talking about the TI83+SE, not the TI89. The latter has usability issues due to the cramped keyboard, one should go to the Voyage200 instead, very usable. Also, the TI83+ is very VERY fast ! Alas, its function set is limited, an example : its 1-character variables (reminds me of the lousy HP38G...). So, hardware wise TI rules today (2003). I hope no crappy keyboard (or short battery life) will prevent HP from jumping again in the race.

Re: TI Converts an HP fanatic

*Message #26 Posted by **Steven Kutoroff** on 14 Sept 2003, 7:17 p.m.,*
in response to message #1 by Steven Kutoroff

Pleased to see I stirred up the pot on this.

I offered my son an HP48SX, but it put him off and the school uses the TI and suggests it for home use. So we bought him one. I was hoping he wouldn't use it and we could return it for a refund. But it became clear we had to open it, so I did and I played with it.

I like the way it you set up graphing and I think it works naturally for a kid learning algebra and trig. The 48 entry of formulas is sophisiticated and slick, but maybe too much for kids in middle and high school.

I will stick to my HP calculators (35,41,16,75,71,48). But, if HP intends to compete in this market today, they are going to have to keep costs down yet make a machine that appeals to GameBoy toting kids that expect a lot from their electronics.

I think us older guys grew up with unreliable electronics and products like the HP handhelds changed our view of things because they worked day to day and worked well. $395 in 1973 must be as much as a good laptop costs today. So, $100 and change buys a lot these days for kids.

I've never seen any of those prototype HPs that worked like a PDA or were PDA based. Pen and stylus devices are not permitted at the standardized tests and TI has done a good job of making a machine for classroom use.

Would I buy a TI for work? NO. I'll take one my HPs or use Excel.

Re: TI Converts an HP fanatic

*Message #27 Posted by **Les Bell [Sydney]** on 14 Sept 2003, 8:33 p.m.,*
in response to message #26 by Steven Kutoroff

>> I think us older guys grew up with unreliable electronics and products like the HP handhelds changed our view of things because they worked day to day and worked well. <<

If you think electronic devices are no longer unreliable, then the new HP will prove a sad disappointment.

When I bought a 82240B printer for my 48GX a couple of years ago, I added an HP6S to the order for my son, who would soon need a scientific calc for secondary school.

I was disappointed with the poor design, inconsistent key sequences and lousy documentation. In the end, he barely used the calc, but it hardly matters as it has now died, with two display segments failed.

I continue to have high hopes for the 48GII and 49G+, but I have to say, it's against the evidence of my own experience and others. Sad . . .

Best,

--- Les [http://www.lesbell.com.au]

I think I should point out that I am only 18, and, thus, my first HP was a 49G. I do not love HP for nostalgia's sake; I love them because they are designed for people who actually know something.

TI designs calculators for the average highschool student: conformist and uninterested. I'm fresh out of highschool; I can tell you guys first hand that teenagers couldn't give a damn about how good their calculator is. All they care about is if it's the one everyone has and (more importantly) what games can they get on it. You would be surprised at how many of these students just play games durring class (I know I used to do it). A previous author mentioned the voyage200 calculator; I'd like to see you use that on any test.

In my experience, TI calculators do the math for you; HPs help you along the way.

aftermarket programs for hp / obscure Pournell refrence

*Message #29 Posted by **db(martinez,california)** on 14 Sept 2003, 11:05 p.m.,*
in response to message #28 by Brandon Del Bel

I have heard of RPN applications for TI but not aftermarket AOS applications for HP. Does this mean that TI users are now the better programmers, or just stuck with a lemmon and desperate?

TI has constructed some well built calculators but imho; if it is not RPN then it is not worth using. (Here comes that Jerry Pournell refrence) On the gripping hand; i just love my new old Corvus 500.

in response to message #29 by db(martinez,california)

"I have heard of RPN applications for TI but not aftermarket AOS applications for HP."

Well ... HP 38G, 39G, 40G, and the new fast 39G+ ALL have Algebraic only operations. The 49G and the new fast 48GII and 49G+ have both RPN and Algebraic and you can even call one environment from the other using RPL> or `back-ticks`.

There are also several HP financial calculators with Algebraic only or both RPN & Algebraic (HP-19BII being the top-model)

*Message #31 Posted by **Paul Brogger** on 15 Sept 2003, 12:09 p.m.,*
in response to message #1 by Steven Kutoroff

I've several times posted my favorable impressions of my TI-83+SE -- most notably the extent of support and the cost of tools (read: FREE) for assembly-level (Z80) development.

That said, my next-to-last son is very happy with his HP-48G+, wouldn't have anything to do with a non-RPN calculator, and readily figured out how to translate the high school TI-oriented math exercises to his HP, and *without* the manual(!) ("It's not *that* hard to figure out, dad!") He has just carted the calculator off to college.

The youngest, however, is perfectly content with a TI, and he's is rather more involved with the ladies than in the AOS/RPN debate! Now, if I had it to do over again, (and if forced to choose), which one would I rather be more like?

Well, let's just examine the evidence . . .

I have (at least) two sons. (Actually five kids.)

But as a counter example, Alex (the HP-48 user) is off to a school associated with Nintendo -- one that specializes in the art, science, math and programming behind video game production. (It's actually accredited, believe it or not!) Of his freshman class of 199, only 9 are women. (But then, he's been told not to plan on "having a life" for the next four years anyway . . .)

So, I'd say it's possible, but not always easy.

wow- that is not an easy ride

*Message #35 Posted by **christof (Heavy Weather, USA)** on 15 Sept 2003, 11:20 p.m.,*
in response to message #34 by Paul Brogger

Computer programming. Even worse- *game* programming. all that realism, physics, the math behind movement. how silly! :)

That is one tough school. Of course it is accredited. Wish him luck for us- and tell him we expect a new FPS for the 49G+ ! (I'd prefer a civ I type game, but....)

Re: no, it's not!

*Message #36 Posted by **Paul Brogger** on 16 Sept 2003, 9:39 a.m.,*
in response to message #35 by christof (Heavy Weather, USA)

Alex is big on RPG's. He and my youngest cut their video game teeth during that magical time when the technology wasn't quite up to full audio -- by reading all the plot & dialog text as it scrolled across the screen, they actually "learned something": both test off the charts in vocabulary and spelling. (Now the characters are speaking audio; I fear for the next generation!)

But it does look like a daunting program. (Regardless, I can't help feeling jealous of him!)

Please feel free to delete, mod down, up or postero-antero laterally. I must admit that one girlfriend and I roamed the corridors of our large teaching hospital armed with dual HPs, 67s and our HP Rappaport-Sprague stethoscopes sneering at all the lesser lights with their cheapie Littmans (and probably TIs ;-)). Gawd knows what it would cost to replace the HPs these days, hopefully I'll never find out as the stethoscope is indestructible but my 67 & 41CX are in need of the gentle ministration of Randy ;-). This forum reminds me ever so slightly of a certain populous computer platform versus a more ummm, innovative platform forum, or indeed a certain trauma list forum when the LIttmanites demand that theirs is "the one true way" as we HP users sniff at their cheapie construction. And don't let anyone get started on the 14" versus 18" tubing debate, that one can run and run, nearly as bad as the indefensible gun debate or the SUV debate on the trauma list ;-). Ahh well, just my Pacific peso's worth.

Littmanns

*Message #41 Posted by **Victor Koechli** on 17 Sept 2003, 5:50 a.m.,*
in response to message #40 by Peter Anderson-Stewart (AU)

Well, at the time of my internship, I thought Littmanns weren't sooo bad. I could hear things some reidents with their HPs couldn't, but then again this maybe was not the stethoscope's merit. In the meantime, however, my Littmann has almost completely disintegrated, and if I'd still work in Internal Medicine, I'd certainly have a HP by now...

Anyway, as for calculators, I always stuck with HP. My 15C was my permanent companion, it had all the formulas I needed on the go and is the smallest HP I know of - gorgeous! A long time since, though...

An yes, I am an Apple user, and will always be.

Cheers, Victor

Re: Stethoscopes -- Parallels with HP Calculator unit?

*Message #42 Posted by **Paul Brogger** on 17 Sept 2003, 10:14 a.m.,*
in response to message #40 by Peter Anderson-Stewart (AU)

I didn't even know HP made stethoscopes. So, out of curiosity, I search for info, and find out that HP has sold its patents to Philips, and is no longer manufacturing a much-loved product. (If there is a spirited debate over which brand is better, there is a cadre of devoted users on each side of that debate.)

Let me guess: I suppose the stethoscope unit didn't return the kind of profit that was respectable during the .com bubble [note especially the use of *past tense*], or that they don't fit the new corporate self-image. Now, where else have I seen the effects of that kind of thinking, I wonder?

Re: Stethoscopes -- Parallels with HP Calculator unit?

*Message #43 Posted by **Laurence** on 17 Sept 2003, 2:29 p.m.,*
in response to message #42 by Paul Brogger

Actually HP spun off its whole medical group a few years ago with the rest of the buisinesses that went to Agilent Technologies. Agilent then sold the Medical group to Philips where it is now thriving, especially in patient monitoring. The HP stethoscope went along with the rest of the product line and Im glad to see its still for sale! I was responsible for the sales and marketing of this item (amongst other things!)in the UK for a couple of years, it never sold in large quantities as it cost 20 times the price of a standard stethescope but it was of superb quality and did sell to the very top cardiologists which bought HP a lot of good will and probably contributed to the sale of lots of other equipment these people bought.

There were lots of "stories" circulating about this stethescope including a story about a solid gold one made for a doctor in Saudi Arabia in the 70's!

More OT reminiscing ;-)

*Message #45 Posted by **Peter Anderson-Stewart (AU)** on 17 Sept 2003, 5:24 p.m.,*
in response to message #44 by bill platt

Regarding gold HPs steths, one of the more, shall we say, flamboyant cardiologists with what one could only describe as a borderline personality disorder here in Sydney had his HP gold plated some years ago and I still see him wandering the streets with it in the position du jour (believe me dear members, it varies more often than fashion ;-)).
I can't imagine that a solid gold one would be particularly useful as I would have thought that with gold being such a malleable metal that its ability as a conductor of sound would be less than stainless steel, but hey, what would I know ;-)
As for a spirited debate, well, that is certainly gilding (no pun intended) the lily, as it normally degenerates to a "is" "isn't" gainsaying 3 or 4 way slanging match between the "True Believers tm", the "Lovers of Littman", the meths drinkers and the corn circle society.
I guess it all comes down to what you are comfortable with, for me, I was lucky (or prescient) enough to have always had HP steths and calculators and used Apple, others obviously feel they can get by with more, ummm, popular or disposable items.
As "they" say, you pays your money .....
Cheers, and all the very best, Peter

PocketPC 2003 and the HP48 emulator

*Message #1 Posted by **Marcel** on 13 Sept 2003, 10:46 a.m.*

It seems that there is a common problem with PocketPC 2003 and the HP48 emulator. I've heard others mention the problem but haven't seen any solutons. The GNU licence screen shows for a fraction fo a second and then the program (apparently) exits.

HP-41 Unit Management System

*Message #1 Posted by **Angel Martin** on 13 Sept 2003, 3:29 a.m.*

Here's an entry in the nostalgia department - though fun!

I'm currently working on an extended Unit Managemenr System ROM (UMS) for the 41, based on the implementation made on standard modules like the THERMAL, MACHINE, or PETROLEUM packs.

My goal is to also add electrical units, obviously missing on these above.

I started reverse-engineering the MCODE listings for the "SI-" function, but was wondering if someone has information on how this UMS was designed and implemented, so I can get a boost start with the project.

Any suggestions will be appreciated. Also, if the interest is there, we could have it available on line once finished.

Re: HP-41 Unit Management System

*Message #2 Posted by **Mike (Stgt)** on 13 Sept 2003, 5:48 a.m.,*
in response to message #1 by Angel Martin

If I may help, let me know. What I could do is an MCode-trace for one or two calls (loops reduced).

Ciao.....Mike

Re: HP-41 Unit Management System

*Message #3 Posted by **Angel Martin** on 13 Sept 2003, 8:03 a.m.,*
in response to message #2 by Mike (Stgt)

I take you up on that. Can you e-mail me the results? SI- is my favorite, have you got the THERMAL rom?

What I'm after specifically is how they implemented the look-up table for the allowed units, as well as how they wrote the dimension-checking algorithm.

It might be a tall order, but no pain no growth..

Thanks, AM

Re: HP-41 Unit Management System

*Message #4 Posted by **Mike (Stgt)** on 14 Sept 2003, 9:25 a.m.,*
in response to message #3 by Angel Martin

I'm currently sick at home, ASAP I have access to the IBM host I do send all about what I may extract from the THERMAL.

Ciao.....Mike

Re: HP-41 Unit Management System

*Message #7 Posted by **Ed** on 14 Sept 2003, 8:24 p.m.,*
in response to message #2 by Mike (Stgt)

Wow....this is great! The longer I get to use my hp41 the better!!

Re: HP-41 Unit Management System

*Message #8 Posted by **Chris Catotti (Florida)** on 17 Sept 2003, 3:27 p.m.,*
in response to message #7 by Ed

Also, please look at the functions that were available with the AECROM by Redshift Software. It had features like display the X register in Feet or inches. For example, 6.5 in the X register displays as 78 when in the Inches Mode, but only with the AECROM installed. The display defaults to regular mode if the AECROM is removed.

I sold the ROM, but I have a scan of the manual, if a copy would help, drop me an e-mail. (Caution: PDF File sizes are approximately 1 MB + 1 MB + 3 MB = 5 MB Total)

Re: HP-41 Unit Management System

*Message #9 Posted by **Mike (Stgt)** on 18 Sept 2003, 5:25 p.m.,*
in response to message #8 by Chris Catotti (Florida)

Yes I am interested in that manual. But I do all my eMails with a HP200LX and a 33.8k modem, so 5MB are a heavy load. Well, let's try. My address you find here
http://ourworld.compuserve.com/homepages/NutEm/nutem.htm#re

Ciao.....Mike

Re: HP-41 Unit Management System

How to replace battery of GRiD card?

*Message #1 Posted by **John Smith** on 13 Sept 2003, 2:52 a.m.*

Those who are using 1 MB GRiD ram card, can you help how to replace the battery?

I do not see any battery chamber, or battery cover. All I see is a battery marker cicumscribed by a circle on face paper paste on to the card. I'm afraid to do anything without proper instructions, in case I damage the card.

I do not have the instruction booklet. If anybody would be kind to provide me step by step instructions, would be highly appreciated. Or if you can refer me to related web site address would be equally helpful. Thanks,

John

in response to message #1 by Michel Beaulieu

```
Several programs for instance could be useful too:
PBC    (needs CCD Module) for ThinkJet HP2225B (IL version)
PBCDJ  Christoph Klug's version of PBC for DeskJet 500
CBNN   (needs Plotter Rom) for Plotter HP7470A (IL version)
       in order to print BC of Non Normalized Number
CBPG   (needs Plotter Rom) for Plotter HP7470A (IL version)
CBP    (needs Plotter Rom) for HP82162A Thermal Printer
CBD    (needs Plotter Rom) for Plotter HP7470A (IL version)
       in order to print BC of Data (Numbers, Instructions)
MCBCP  (needs MCP MCode instruction) for HP82162A
       Thermal Printer or Plotter HP7470A (IL version)
       in order to print BC of MCode instructions

Also a special ROM exists:
SKWID Bar Code ROM for ThinkJet HP2225B (IL version)

Good luck! To be continued...
```

HP49G repairs---what's the situation?

*Message #1 Posted by **Mark Ordal** on 12 Sept 2003, 3:35 p.m.*

I now have a 49G with a largely nonfunctional keyboard. I haven't taken the time to identify all of the nonfunctioning keys but I know that Enter, +, -, /, *, Delete, and Clear are all completely dead. I can still turn the calculator on and off. Not very useful as it is.

Any help would be appreciated.

--Mark

Re: HP49G repairs---what's the situation?

*Message #2 Posted by **Randy Sloyer** on 12 Sept 2003, 7:34 p.m.,*
in response to message #1 by Mark Ordal

In warranty, HP will replace it. Out of warranty, they will replace it for a fee. I think it is about $90, don't know for sure.

If you're into DYI, try pressing down hard above the F5 key while trying the dead column. If it works with pressure applied, you'll need to open the unit to fix a lost contact between the logic board and keyboard.

Post again if that works and we can take it to the next level.

Re: HP49G repairs---what's the situation?

*Message #3 Posted by **Mark Ordal** on 13 Sept 2003, 3:00 p.m.,*
in response to message #2 by Randy Sloyer

Randy is on target! Applying pressure above the F5 key does indeed restore function to the dead keys!

The next question is how to open the case without damaging it? It seems to be just a friction fit at the bottom, but there must be some kind of hidden clips further up---how does one deal with those?

--Mark

Re: HP49G repairs - how to open

*Message #4 Posted by **Randy Sloyer** on 13 Sept 2003, 8:23 p.m.,*
in response to message #3 by Mark Ordal

Using a 5/32"/#22/4mm drill bit, drill the tops off the six heat stakes in the battery compartment. Do not use a power drill, but simply twist the bit in your fingers. You'll find the blue plastic drills quite easily by hand. You only have to go deep enough so that the rivet releases, you'll end up with a blue ring when you've drilled far enough.

Now find yourself a clean, dry wooden popsicle stick. Seems silly as everything handy is made of

metal but the wood will not mar the plastic case. From the bottom, slide the stick up the channel that the cover fits in about a half-inch. Use the stick as a crowbar and separate the case halves. Repeat on the other side. They will pop open with enough force.

Once both halves are free at the bottom, pulling away from the case, free the positive battery clip from it's retainer.

Hold the case bottom in one hand, the top in the other and pull the halves apart. Don't seperate by more than a quarter of an inch or so or you'll break the case.

Now, push the bottom half up toward the top of the front half. The halves should separate and the top should slide up and free itself. You should not have to pry or do anything other than push up and pull apart at the same time. Once it pops apart, you may trash the battery clip, but it does not matter, it is easily bent back into its original position.

The next step is to separate the logic board from the keyboard. Above and below the three large chips at the top you'll see six twist tabs, three above, three below. Study them carefully. Normally, you will have to twist the bottom tabs clockwise, the top counter or anti-clockwise to release. In some machines the direction stated is not correct and you will need to establish the proper direction to free the logic board. You do not want to twist them in the wrong direction as doing so will surely fracture them and you will be cursing the dyslectic person that assembled the unit. Once the tabs are centered, you can lift the logic board up from the bottom and free it from the six cinch points.

It's now time to inspect the keyboard connector, especially on the far left side as the last connection to the left is the right most row that you are having trouble with. Bend the white plastic of the keyboard connector upward and see if the foam pad underneath is centered in the case. Many times it is not and it causes the loss in connection. The solvent UN-DO (aka heptane) available in hardware stores and Wal-Mart will cause the sticky pad to release so that you can remove and re-position the pad in the proper place. Many times you'll only need to bend the keyboard connector upward to reestablish proper connection. Clean the keyboard and logic board connections with a cotton swab and isopropyl alcohol. Reassemble, twisting the tabs in the reverse of the direction as required to remove. You'll get about four to six cycles on these before they fracture so be very carefull as to not to waste close/open cycle for no good reason. It is best to start with the left and rightmost bottom tabs followed by the center bottom then the left/ right upper and finally the center upper. This is the best order to center the logic board to insure the proper connectiion to the very fine pitch LCD connections.

Once back together, simply snap the black bottom back into place. Install batteries and test. If all goes well, your 49G will be back to normal.

Edited: 13 Sept 2003, 8:25 p.m.

HP-49G Dead COM port

*Message #8 Posted by **Jeff** on 15 Sept 2003, 7:14 p.m.,*
in response to message #1 by Mark Ordal

Since we are discussing the opening of the HP-49G, is there a way to determine, once open, what exactly is wrong with the COM port? Or possibly even fix it?

Re: HP-49G Dead COM port

*Message #9 Posted by **Randy Sloyer** on 15 Sept 2003, 11:05 p.m.,*
in response to message #8 by Jeff

The first thing wrong with it is that is it not true RS-232. Nothing like the 48 I/F at all, it looks like the RX and TX lines pass through a 150 ohm resistor with a transorb to ground. The other end of the resistors go directly to the CPU, same pins as the 48. There are no level shifting circuits like the 48. It looks like there are three other active pins that go to the CPU in the same manner.

I haven't put a scope to one, but I suspect the TX swing to be 0 to 5V rather than the standard +/-12. I know a lot of 232 receivers will handle that, but will it work in all cases?

Re: HP-49G Dead COM port

*Message #10 Posted by **James M. Prange** on 16 Sept 2003, 2:10 a.m.,*
in response to message #9 by Randy Sloyer

Note that early (ID93... and lower) 49Gs had a "serial port hardware bug" that caused a weakened and distorted signal. This would usually, but not always, still work with most RS232 ports.

See http://www.hpcalc.org/search.php?query=serial+port+bug for more information.

Regards,
James

Re: HP-49G Dead COM port

*Message #11 Posted by **Ellis Easley** on 17 Sept 2003, 4:45 a.m.,*
in response to message #9 by Randy Sloyer

The old bipolar 1488/1489 chip (whichever is the receiver) switched at about +1V, like a TTL chip. I've wondered whether today's CMOS receivers could be depended on to have a similar threshold. The RS-

232 EIA spec says from -3V to +3V is undefined. There is a later spec (RS-485? 422?) specifying 0-5V voltage swings (the original Mac serial ports were based on this) but it also specified differential signals, although the chips could be used single-ended.

1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #1 Posted by **Albert** on 12 Sept 2003, 2:59 p.m.*

Hi all,

I know, this issue was already asked long time ago and far away; unfortunately, I don't remember when and where... Let's go: Are 1600 mAh 1.2 V NiMH Batteries dangerous for an HP-25C? I mean, only use; recharging will be performed outside calculator. Original pack is Ni-Cd 1.2 V 750 or 600 mAh.

Thanks,

Albert

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #2 Posted by **Randy Sloyer** on 12 Sept 2003, 7:38 p.m.,*
in response to message #1 by Albert

To quote the Nike ads, Just Do It.

You already know the #1 rule - never charge in the calculator. With that law of calculator preservation firmly established, any 1.2-1.5 Volt AA sized source will do fine. The calculator doesn't know and doesn't care, but you will when they last two times longer...

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #3 Posted by **PeterL** on 14 Sept 2003, 12:46 p.m.,*
in response to message #2 by Randy Sloyer

Hi there, ...never charge in the calculator....

Since I didn' knew that rule, it killed my HP25 after three Years charging them in the calculator. :-(

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #4 Posted by **David Smith** on 13 Sept 2003, 12:45 p.m.,*
in response to message #1 by Albert

Yes, they will work just fine. Even better are the 1800maH cells. There are some supposedly 2100-2300maH AA cells out there, but testing and users seem to indicate that they are no better than the 1800 maH... must be marketing milliamp hours (2300 mmaH).

Although they will charge just fine in the machine, we all know that it is best to avoid connecting your Woodstock machines to the evil power plug. If you MUST do it, try to make sure that the battery pack is making contact (LEDs light up) and leave the machine on while charging. The increased load will help keep

the voltage down. Remember that these batteries require 3 times as long to fully charge as the originals.

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #5 Posted by **Tom Scott** on 13 Sept 2003, 2:02 p.m.,*
in response to message #4 by David Smith

Sorry if this has been discussed many times before, but what is the problem connecting a Woodstock to the power line?

Thanks, Tom Scott

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #6 Posted by **Albert** on 13 Sept 2003, 5:41 p.m.,*
in response to message #5 by Tom Scott

Let's see,

Internal Integrated Circuits (IC) of calculator are connected directly to the power supply. If you forget batteries out while power supply is connected, the ICs will be fried. The reason is the following: in woodstock calculators , the AC power supply adapter doesn't have the rectifier itself, instead of that, it is the machine with a single diode and a resistor who converts AC voltage in order to charge the battery pack. Unfortunately, the same circuit is connected to the whole ICs set of calculator without any kind of protection. In fact, battery pack must play the capacitor role. Without batteries, internal circuits are exposed to high voltage/current combination, very dangerous and lethal gift.

Regards, Albert

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #7 Posted by **George** on 14 Sept 2003, 10:09 a.m.,*
in response to message #6 by Albert

Does this "rule" also apply t the classics?

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #8 Posted by **Albert** on 14 Sept 2003, 11:45 a.m.,*
in response to message #7 by George

More or less ...

Not 100 * 100, but I suggest you to follow that rule always if possible. Classic AC power adapter has a diode bridge rectifier inside. In addition, classics are protected because they are 3 input contacts (2 positives (+) and Ground - GND). First (+)ve with 15 Vdc or V= to charge batteries and the second one with 3.6 Vdc to operate with the machine safely. Therefore, charging battery pack circuit is isolated from internal machine ICs. For more information, please see explanations on the following HP Museum link:

http://www.hpmuseum.org/batts/battery.htm -> Classics.

Anyway: Avoid charge battery pack without batteries in!

Albert

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #9 Posted by **George** on 14 Sept 2003, 1:44 p.m.,*
in response to message #8 by Albert

Thanks for the info. I have been selling off some of my collection of HP calcs. and would like to get a HP45 or HP55 to "play" with. Hence my interest in this thread.

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #10 Posted by **Albert** on 14 Sept 2003, 2:58 p.m.,*
in response to message #8 by Albert

Misprint:

Wrong: "Anyway: Avoid charge battery pack without batteries in!"

Right: "Anyway: Avoid use the machine without batteries in AND AC Power Adapter connected!"

Sorry, Albert.

Re: 1600 mAh 1.2 V NiMH Batteries for an HP-25C

*Message #11 Posted by **David Smith** on 14 Sept 2003, 3:07 p.m.,*
in response to message #7 by George

The classic chargers have a dual supply/volatge regulator built in. You can run them just fine without the battery pack installed... except for the card reader machines. These machines have a direct connection to the unregulated battery supply to the card reader chip. Also they need the extra current from the battery to run the reader motor.

HP-48S v. HP-48G

*Message #1 Posted by **whoru** on 12 Sept 2003, 1:53 p.m.*

Can somebody tell me the differences (in great detail if you wish) between the 48S & the 48G? I think the 48G is supposed to be more powerful but how? Are they equally matched in terms of graphics capabilities? If not, what are the differences?

Thank you.

Re: HP-48S v. HP-48G

*Message #2 Posted by **Raymond Del Tondo** on 12 Sept 2003, 8:38 p.m.,*
in response to message #1 by whoru

Hello,

there are some obvious differences. The G is faster than the S, has a much better display, and adds some functionality like forms and 3D graphing over the S. The color and menu trees have changed, as some of the standard key assignments.

Some prefer the S over the G because of its standard key assignments. However, the G has many advantages over the S, so I vote for the 48G.

Note that the display resolution on the S and G are the same, but the contrast is much better on the G model, and even better on the latest production units, which have a nearly black and white high contrast display.

Much more information on these machines and their differences can be found on www.hpcalc.org

Raymond

Re: HP-48S v. HP-48G

*Message #3 Posted by **christof (NoVA USA)** on 13 Sept 2003, 1:16 p.m.,*
in response to message #2 by Raymond Del Tondo

I don't think the display is all that much better. In fact- with the exception of late model 48GX machines, I can't seem any real functional diffrence at all. the contrast on some of the earlier 48SX machines is actually better than the standard production 48G (except the very late chinese models).

I prefer the S/SX in many cases because of the lack oof gui menus- which is the exact reason many people prefer the G series.

For anything short of sysrpl programming, the differences are really very minor seeming to me except for the 1: menuing system 2: equation library (which the 48G has and the 48s lacks.) (the cpu speed doesn't really affect life unless you are doing some pretty heafty computing)

My 48GX makes a much better PDA, though :)

Re: HP-48S v. HP-48G

*Message #4 Posted by **Juergen Rodenkirchen (GER)** on 13 Sept 2003, 1:25 p.m.,*
in response to message #2 by Raymond Del Tondo

Just to add a probably important difference to the list Raymond gave already: There is no built-in solver for initial value problems with differential equations on the S (as far as I know). Unlike the G which has the RKF (Runge-Kutta-Fehlberg) scheme implemented which works very well and enables you to visualize solutions of an IVP directly from the plot menu.

Best Wishes, Juergen

Re: HP-48S v. HP-48G

*Message #5 Posted by **Chan Tran** on 16 Sept 2003, 11:33 a.m.,*
in response to message #4 by Juergen Rodenkirchen (GER)

In general the G is more powerfull than the S. I have both the SX and GX and I used the GX more if only for the screen. It would be difficult to describe the difference in details. However, if you are thinking of buying one of them I suggest that you buy both because they are very cheap now.

Copying the standard Pac cards

*Message #1 Posted by **quemazon** on 12 Sept 2003, 12:20 p.m.*

I have a 67/97 standard card pac and would like to copy it to blank cards. I have a 97 and a 41CV with card reader. Is there a way that I can use either of these machines to copy the standard cards to blanks? Thanks,

Nathan

Re: Copying the standard Pac cards

*Message #2 Posted by **Chan Tran** on 12 Sept 2003, 12:28 p.m.,*
in response to message #1 by quemazon

I think you can just load them into the calculator then write a new card. I would use the 97 though.

Re: Copying the standard Pac cards

*Message #3 Posted by **Victor** on 12 Sept 2003, 2:11 p.m.,*
in response to message #1 by quemazon

I don't think you can use the 41CV to copy cards. When the reader reads the cards, it converts the program to 41 format. It would still be in that format if you were to write them back out. Then the program on the card would not be usable in a 67 or 97.

Meeting info, Allschwil

*Message #1 Posted by **Matthias** on 12 Sept 2003, 7:40 a.m.*

Last news of the meeting in Allschwil can be seen here:

http://www.hp-collection.org/meeting.htm

Re: Meeting info, Allschwil

*Message #2 Posted by **Thibaut.be** on 12 Sept 2003, 9:29 a.m.,*
in response to message #1 by Matthias

Thanks Matthias.

I suggest that everybody brings some specialities from his place to be shared at the meeting.

By the way I am planning my journey by car. Route is Brussels - Luxembourg - Strasbourg - Basel. I'd be glad to give a lift to anyone going to the meeting. I have up to 3 free seats in my car.

Re: Meeting info, Allschwil

*Message #3 Posted by **Mike (Stuttgart)** on 12 Sept 2003, 4:13 p.m.,*
in response to message #2 by Thibaut.be

I'll have to come by my own car as I have to transprort more than only some ROMs. <G>

BTW, instead of names, Matthias could have shown some URLs, just to give an idea who is who. Here is mine (not too much uptdated since long, new: about the HP200LX, alas unfinished)
http://ourworld.compuserve.com/homepages/nutem/

Ha - if I see the meeting list I suppose the conference language will be French. C,a va être dure.

Ciao.....Mike

Re: Meeting info, Allschwil

*Message #4 Posted by **Museum** on 12 Sept 2003, 4:36 p.m.,*
in response to message #3 by Mike (Stuttgart)

I prefer swiss german for the conference language :)

(Ok, german and english is alo ok, but french? this will hard for you to listen to me that day!!)

Re: Meeting info, Allschwil

*Message #5 Posted by **Emmanuel, France** on 12 Sept 2003, 6:18 p.m.,*
in response to message #3 by Mike (Stuttgart)

I think we will speak only one language: beer. ;o)

Re: Meeting info, Allschwil

*Message #6 Posted by **Matthias** on 13 Sept 2003, 2:25 a.m.,*
in response to message #5 by Emmanuel, France

There is no alcohol inmy appartment :)

Re: Meeting info, Allschwil

*Message #7 Posted by **Emmanuel, France** on 13 Sept 2003, 3:25 a.m.,*
in response to message #6 by Matthias

Beer w/o alcohol exists... I saw one, one time!

Re: Meeting info, Allschwil

*Message #8 Posted by **Mike (Stgt)** on 13 Sept 2003, 5:54 a.m.,*
in response to message #6 by Matthias

NO ALK? Sorry, but how about shifting the meeting location to the next resaurant? There will be a free side room for us all, otherwise wee look in the near France for one. They'll take the 25 EUR too. (One beer I speek French as good as English <G>)

Ciao.....Mike

Thanks, Matthias! Meeting info, Allschwil

*Message #9 Posted by **Emmanuel, France** on 12 Sept 2003, 2:42 p.m.,*
in response to message #1 by Matthias

```
Hello everybody!

Will bring some items if interest:
HP41C, HP41CV, HP48G, HP48GX, HP49G,
Paname modules for HP-41,
HP82162A HPIL Printer, HP82168A HPIL Acoustic Coupler, HP82169A HPIL/HPIB interface with PC
ISA card,
HP110 and HP-85.

Before I go to Aschwill, you can order your pre-programmed
Eprom sets for HP-41 and HP-71 Eprom Box, or items below.

Thanks for interest!
```

Stuff for trade?

*Message #10 Posted by **Angel Martin** on 13 Sept 2003, 3:43 a.m.,*
in response to message #9 by Emmanuel, France

I too will bring some stuff for trade, it isn't much but somebody may be interested. Here's a partial list:-

- 10 meter HP-IL cable (or was it 5 meter?) - HP 110 laptop computer - HP-IL acoustic coupler - plain 41 Memory Modules - 41 Card Reader 1A

Best, AM

Reparing half-nut 41CV

*Message #1 Posted by **Tracy Vermeyen** on 11 Sept 2003, 11:28 p.m.*

I am trying to repair a half-nut 41CV for a friend. I found two cracked posts near the strip connection and fixed them using tips from this forum... this fixed the problem, Yes? No, it still will not turn on. Tried fresh batteries, still no luck. Can someone give me some more troubleshooting tips to keeping me progressing toward success?

Tracy

Re: Reparing half-nut 41CV

*Message #2 Posted by **Tony Duell (UK)** on 12 Sept 2003, 5:40 p.m.,*
in response to message #1 by Tracy Vermeyen

If you have a 6V supply (either a bench PSU, or even a 6V battery), connect it directly to the logic PCB with the machine apart. The -ve side goes to the -ve terminal of the largest capacitor on the board, the +ve side to the commoned end of the 2 piggybacked diodes in the top left corner of the PCB (as you look at it). If the machine will power up then, the fault must be in the flexible PCB in the I/O assembly, or cracked posts (etc) which are preventing it from making good contact with the logic PCB. If the machine doesn't power up when the logic PCB is connected to the PSU, then there's a fault on that board. Could be just about anything -- 'on' switch contacts, CPU, diplsya hybrid, passive components.

Re: Reparing half-nut 41CV

*Message #3 Posted by **Randy Sloyer** on 12 Sept 2003, 7:48 p.m.,*
in response to message #1 by Tracy Vermeyen

The first thing to try is a "master reset". Short the leads together for a second or so of the 470uf (the largest) cap on the left side of the board and retry. Many times the processor will be in la-la land and will not respond otherwise.

If that doesn't do it, Tony's suggestion is spot on. The current consumption will help with a fault finding direction. If it powers up with a direct connection to the diode and capacitor, it is most likely a broken trace on the battery connector. This usually happens only with a battery leak.

Normal operation will be between 30 and 50 ua, standby will consume about 1 ua.

My money's on a master reset. Half-nuts are pretty darn hard to kill.

Edited: 12 Sept 2003, 7:49 p.m.

Re: Reparing half-nut 41CV

*Message #4 Posted by **Tracy Vermeyen** on 13 Sept 2003, 12:22 a.m.,*
in response to message #3 by Randy Sloyer

Thanks to Tony and Randy for the technical assistance!

Another 41CV is back into service! The calculator was revived by shorting across the capacitor as recommended by Randy. Good thing too, because I would have had to ask Tony for better directions, like a photo, on where to apply the 12V (I'm a CE, not a EE).

I feel great being able to return a working HP to my buddy at work, thanks guys.

Re: Reparing half-nut 41CV

*Message #5 Posted by **Randy Sloyer** on 13 Sept 2003, 9:50 a.m.,*
in response to message #4 by Tracy Vermeyen

Congrats on a job well done. Good thing you didn't apply 12 volts, you would have smoked it. 4 x 1.5 volt batteries = 6 volts. They'll actually work down to about 4 volts.

One other thing to mention is the classic green fuzz problem. Always look on the battery connector and springs in the battery holder for green stuff. If you see any, clean it up with cotton swabs and alcohol. The current levels at which a 41 operates does not tolerate cooties on the connections.

Re: Reparing half-nut 41CV

*Message #6 Posted by **Tracy Vermeyen** on 14 Sept 2003, 9:45 p.m.,*
in response to message #5 by Randy Sloyer

Randy,

I recognized my 12-volt error right after I sent the post, thankfully my electronic skills are somewhat better than my typing. Thanks again for you help you are a wonderful source of knowledge and I appreciate you sharing it.

Re: Reparing half-nut 41CV

*Message #7 Posted by **David Smith** on 13 Sept 2003, 12:47 p.m.,*
in response to message #4 by Tracy Vermeyen

You can connect the test supply directly across the big capacitor. The low battery indicator will light up though.

Re: Reparing half-nut 41CV

*Message #8 Posted by **Thibaut.be** on 14 Sept 2003, 4:25 p.m.,*
in response to message #1 by Tracy Vermeyen

Tracy, you have a Belgian name. Are you from Belgium ?

Re: Reparing half-nut 41CV

*Message #9 Posted by **Tracy Vermeyen** on 14 Sept 2003, 9:50 p.m.,*
in response to message #8 by Thibaut.be

My father immigrated to the US from Belgium after WWII- he was 13 yo at the time. I have never been there, but I hope to visit relatives over there some day.

I am curious, is Vermeyen a common name in Belgium? I know of one famous painter from the 15(?)th century with the same name, but very few others.

Take Care

Old HP calculators in stock

*Message #1 Posted by **Jon** on 11 Sept 2003, 4:21 p.m.*

I have found some HP calculators in a bookshop (an old stock) I have asked for the price and this is the result:

HP 41CV halfnut: 250 eur. HP 28S: 200 eur. HP 27S: 100 eur.

Prices are based on the price they had when they were in production (paid by the bookshop) and must be confirmed because the responsible didn´t know what to do with them . Anyway I don´t think it is possible to get a great discount.

All of them are New in Box, but I think they are too expensive. What do you think?.

Cheers

Jon

Re: Old HP calculators in stock

*Message #2 Posted by **Christof (VA USA)** on 11 Sept 2003, 6:20 p.m.,*
in response to message #1 by Jon

I think the price is very fair for the 27S - I'd love to finally get one of those, myself! It's one of the few Pioneers I just *cannot* find.

The CV is also probably more than fair, the NOS 41CX machines are regulalry getting > $300 prices.

I can't say much about the 28S- While NIB is rather rare, it seems about 50EUR high for my enteric response. (psych joke.)

Re: Old HP calculators in stock

*Message #3 Posted by **chan tran** on 11 Sept 2003, 8:03 p.m.,*
in response to message #2 by Christof (VA USA)

i think i would love a nib 28s for 50 euro. about 80 dollars right.

Re: Old HP calculators in stock

*Message #4 Posted by **Andy** on 11 Sept 2003, 8:35 p.m.,*
in response to message #1 by Jon

Tell me how to buy them .. Please, Here is my e-amil: suffer002a@yahoo.com

Re: Old HP calculators in stock

*Message #5 Posted by **thibaut** on 12 Sept 2003, 5:50 a.m.,*

in response to message #4 by Andy

Take the 41CV and the 27S, forget the 28S.

Don't forget that these are mint items, so at this price it's quite a bargain.

Re: Old HP calculators in stock

*Message #6 Posted by **Joe Edwards** on 12 Sept 2003, 8:58 a.m.,*
in response to message #1 by Jon

Tell me how to buy them .. Please, Here is my e-amil: lamewing@(nospamplease)sbcglobal.net

Joe

Re: Old HP calculators in stock

*Message #7 Posted by **Jon** on 13 Sept 2003, 10:14 a.m.,*
in response to message #6 by Joe Edwards

Hi everybody:

I have got several proposals related to trade these calculators, buying them from other countries... Ok! I am not interested on them at those prices and I will not organize any contact with the bookshop´s owner. Please understand it is an small shop in Spain and they don´t speak english. Anyway if somebody is interested and pays their price plus paypal fees and delivery cost I can do it for you. In fact the bookshop is very close to my home.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=41672

Re: Dust on HP-42S Window

*Message #3 Posted by **Tom Scott** on 11 Sept 2003, 8:03 p.m.,*
in response to message #2 by DUSTBUSTER

Thanks. I don't know how I missed that.

Tom Scott

I forgot to mention...

*Message #4 Posted by **Randy Sloyer** on 12 Sept 2003, 8:23 p.m.,*
in response to message #3 by Tom Scott

One thing I failed to mention was not to jam the tube in so far as to split the bottom half from the top. The older windowed version machine bezels will distort a bit, possibly leaving a wrinkle. Uggh. You just need to direct the air blast between the halves and the tapered tip helps alot.

Edited: 12 Sept 2003, 8:24 p.m.

Re: I forgot to mention...

*Message #5 Posted by **Tom Scott** on 13 Sept 2003, 2:07 p.m.,*
in response to message #4 by Randy Sloyer

The techique worked pretty well although I did leave small marks on the side of the plastic case where I wedged the two halves apart. Also, it looks like I left a small mark on the window (perhaps when I slipped trying to wedge the tube in).

Tom Scott

HP 48gx

*Message #1 Posted by **Kevin Liebzeit** on 11 Sept 2003, 10:11 a.m.*

Could someone provide me with a starting location for information on programming the HP 48gx - for a beginner? Help is needed! :)

Is it worth getting a HP 48gx or should I look at the new HP 48GII or HP 49G+ ?

Kevin

Re: HP 48gx

*Message #2 Posted by **Raymond Del Tondo** on 11 Sept 2003, 10:56 a.m.,*
in response to message #1 by Kevin Liebzeit

The source is: www.hpcalc.org . There you'll find all you need, from the starter to the expert.

Regarding the model to choose:

It's always worth getting an HP-48GX, aspecially if it has the new b/w display;-)

However, just take a look at the new machines (48GII, 49G+), try them, test them, and then decide which suits you best.

Raymond

HP 15c HP-42s or HP 41cx

*Message #1 Posted by **Krystal** on 11 Sept 2003, 10:03 a.m.*

Hello, I am looking to purchase a HP calc for my husband. He is a returning college student who always complains about his classes requiring a TI calc. He uses it fine when he needs to, but he's always talking about HP calcs. I know he owns a HP-20s or two, but complains that they are not RPN or something. Which should I get him: 15c, 42s, or 41cx. He is a mathematics major/computer sci minor and will be using this pretty much every day when he isn't forced to use the TI. I think he owned a HP 32 a while ago, but from what I have read it doesn't do matrices, so that is out. Which is the best choice for my hubby? If you give an answer, can you please explain in non engineering/mathematical terms as to why it is a better choice? Thank you.

Re: HP 15c HP-42s or HP 41cx

*Message #2 Posted by **Raymond Del Tondo** on 11 Sept 2003, 10:49 a.m.,*
in response to message #1 by Krystal

I'd vote for the HP-42S, because your husband seems to be used to the form factor, because he uses a 20S, The 42S can easily do matrices with it's editor, has a two line display, is easily programmable, has enough memory for most tasks, and the batteries can last years.

There are more reasons for the 42S, but these should suffice for the first turn;-)

There are of course reasons for the HP-15C, or the 41CX.

Regards,

Raymond

Re: HP 15c HP-42s or HP 41cx

*Message #3 Posted by **Randy Smith** on 11 Sept 2003, 10:51 a.m.,*
in response to message #1 by Krystal

All of these calcs are pretty hard to find for a decent price. All of them have different things that make them better for different purposes. The 15c has built in matrix functions. However, it has no output capability except to the display. But it is quite pocketable as is the 42S. The 42S also has built in matrix functions and further has infra red output capability to a printer so that you can have a permanent record of what his working on. The only input capability is through the keyboard. The 41CX has no built in matrix capability but it can be added through a module called the Advantage Module. The 41CX has several storage choices such as a magnetic card reader, a disk drive, and a tape drive. All of the information and programs saved on these devices can be saved indefinitely until needed. Altogether, the 41CX is probably the most flexible choice; but, you need to have more items to have matrix capability. The 15C is limited by having no output capability. In my opinion the 42S bridges the gap between the 15C and the 41CX pretty well, but has the disadvantage of having no long-term storage capability except in the memory of the machine. Any programs or information lost in the memory of the machine due to lock up or accidental clearing would have to be loaded again through the keyboard.

A definite cost analysis!

in response to message #3 by Randy Smith

All of the machines will *work*

The 15C is probably the least useful (sacrilege, I know) for a CS major. But it cna be had for under $150 pretty handily.

the 42S (WITH THE RAM UPGRADE) is much more useful, and is probably the most useful dollar for dollar. An IR printer (the a model) can be had for under $60 generally, and the 32K RAM version should be available off and on for a reasonable price from fixthatcalc.com (I'd estimate under $300, perhaps as little as $250) - With 32K RAM you have enough room to model algorthms, code up some nifty time savers (network calculators, binary calculations, etc), and run some large matrices.

The 41(CX) has the most goodies- but you pay for the goodies. Estimate about $150 for a good working CX with maybe one useful module- $30-$80 each for extended memory (two), $100 minimum for a working disk drive, $30 to $100 depending on condition and type of printer, then there's the HPIL module, etc. (I'm a heathen. I love my 41CXs, but the calc that I CARRY as a computer professional is a 42S(upgraded)

the 48GX is also a great option if it is allowable. GREAT option. You can even code original computer languages in assembler on it. (but I still carry the 42S every day)

Re: HP 15c HP-42s or HP 41cx

*Message #5 Posted by **Ron Ross** on 11 Sept 2003, 11:01 a.m.,*
in response to message #1 by Krystal

If $$$$ is not an issue, the Hp42s is probably a good solid choice (actually, you just named 3 of the best ever calculators). And you won't have to deal with hubby spending any more money on 41c periphials and ROM cartridges.

However all three are discontinued and actually quite sought after.

For a more powerful present day graphics, I suggest an Hp48G+ or a 48GX if you wanted to (or needed to) buy today.

Next month Hp will release a new line of graphics calculators that look to be really nice. However, they are not proven machines and with Hp's recent track record, could be loaded with Cockroaches or other nasty parasites (some seem to live on or eat batteries).

I use an Hp48GX and am very happy with it. I also have the newer and then discontinued Hp49G. The 49G is faster and has better software features than my 48GX, but doesn't compare in keyboard quality FEEL (I have heard from reliable sources that while the keyboard of the 49G doesn't feel as good, it is designed to outlast the older Hp's: I can't argue against this point because MINE WILL, but only because I don't use it!).

Two places to look for the three calculators you mentioned(and none are really reasonable for the average calculator user). As I stated earlier, the three you ask for are three of the best.

http://www.hpcalcman.com/pages/1/index.htm

and ebay.

Else look at the Hp48G series. It is your best buy for the features and value (and handles Martices really well).

Re: HP 15c HP-42s or HP 41cx

*Message #6 Posted by **Krystal** on 11 Sept 2003, 11:05 a.m.,*
in response to message #5 by Ron Ross

I looked at the HP 48gx and I don't think he wants anything like that due to the size issue. It looks as big as his TI calc. I read through some of the info on the 48gx and it uses RPL. I though I was looking for an RPN calc.

Re: RPL is advanced RPN

*Message #7 Posted by **Ron Ross** on 11 Sept 2003, 11:09 a.m.,*
in response to message #6 by Krystal

Though there are many who would argue this. It is keystroke similiar and to general use RPN.

Re: RPL is advanced RPN

*Message #8 Posted by **bill platt** on 11 Sept 2003, 11:23 a.m.,*
in response to message #7 by Ron Ross

Yes, RPL is different from RPN, but only slightly or greatly, depending on what you want to do! For hand calculations on the keys (no programming) they are almost identical, except that "number ENTER x^2" gives the square of a number in RPN, but "number ENTER ENTER x^2" is required in RPL (this is a very minor difference and in essentially all other things, they are the same). RPL also has an "infinite" stack and no "lastx" feature, but a 4 level limited stack, and lastx, are easily implememented on RPL machines (I got the "lastx" from someone here on this forum!).

The real difference between RPN and RPL is in the programming. It is a really significant change in thinking to go from a 32s type of programming to the 48 series or RPL language. Yes, RPL is more powerful, structured etc but for someone like me, a practicing engineer, it has been a significant learning curve to get proficient on RPL--in some ways it is like PASCAL or BASIC and so seems easy, but then in other ways is is not so clear.....

The "form factor" difference is also important. The 48 is really big. The 15c is beautifully small. The 42s is a very nice size. The 15c is significantly slower than the 42s--noticable with small programs especially if they use transendentals or trig.

The 41cv is generally less expensive than the 42s on e-bay, but you have to be VERY careful about damage to the battery compartment and broken screw posts (just ask lots of questions before bidding). If you want to do matrices, you must get a module (Advantage) which I don't think is all that expensive.

Also, look at the following:

http://www.hpcalc.org/hp49gplus.php

it looks like HP is bringing out a new RPN programmable in the next month. yes, it looks different, but it is a possibility.

Re: HP 15c HP-42s or HP 41cx

*Message #9 Posted by **Ron Ross** on 11 Sept 2003, 11:14 a.m.,*
in response to message #6 by Krystal

One other reasonable consideration. The Hp28S. He may like this machine (I don't). It will be fairly cheap, is smaller than a 48G (actually its direct predicessor), and still easy to get via ebay.

Buy one in as good of condition as you can get. Make SURE you get one with a GOOD battery door.

Feature wise, a really nice pocket calculator (if you have a slightly oversized pocket). Looks good.

But again if $$$$ is not an issue, I vote for a 42s.

Re: HP 15c HP-42s or HP 41cx

*Message #10 Posted by **Thibaut.be** on 11 Sept 2003, 11:23 a.m.,*
in response to message #9 by Ron Ross

As already stated, these 3 calcs are excellent, and they all have their + and - but at the end they all score in the same range.

I'd also vote for the 42S as it is the most powerful and the fastest of these 3.

Nevertheless I would also seriously consider 48GX and 49G+ for academic use. The CAS is a very luch advanced tool that really help when discovering new topics in maths. For a lower price than a nice 15C, 41CX or 42S you could find on ebay.

*Message #11 Posted by **Krystal** on 11 Sept 2003, 11:22 a.m.,*
in response to message #1 by Krystal

I think I have decided to go with the HP 42 since it has a few more features than the HP 15c and it has the same body style as the HP 20s.

Now, is the programming on the HP 42 the same as on the HP 41x?

Also, why did HP stop making this calculator if it was such a nice piece of equipment?

Krystal

*Message #12 Posted by **bill platt** on 11 Sept 2003, 11:37 a.m.,*
in response to message #11 by Krystal

Hi Krystal,

THe 42s is designed to be compatible pretty directly with 41c/v/x programs. I am not personally familiar with this aspect, but have heard a bit about it:

http://www.hpmuseum.org/hp42s.htm

scroll down to the "programming" part.

Sadly, it was off the market before I knew it existed--so I bought a 32sii instead (in 1996).

Maybe the 42s was discontinued due to the release of the 48 series. It is sort of like being a boat manufacturer---do you produce a 20' 22' 25' 28' 29', or do you drop the 28 footer?

Regards,

Bill at plattdesign dot net

Re: HP 15c HP-42s or HP 41cx

*Message #13 Posted by **Thibaut.be** on 11 Sept 2003, 11:52 a.m.,*
in response to message #12 by bill platt

The 42S is supposesd to be compatible with programs written for the 41.

At a certain programming level, you might regret the full alpha keyboard on the 41CX, onlmy accessible with menus on the 42S, but other people swear that with a bit of habit it's not an issue anymore.

Anyway it is an excellent choice.

Re: HP 15c HP-42s or HP 41cx

*Message #14 Posted by **Erik Ehrling (Sweden)** on 11 Sept 2003, 11:30 a.m.,*
in response to message #1 by Krystal

It is all a question of taste, but I would vote for the HP-42S. It is the only of the three that has a two line LCD, it has more memory, is faster and contains all the functionality that you would have to spend a fortune on special modules to get for the HP-41C(V/X).

Regards,
Erik Ehrling (Sweden)

*Message #15 Posted by **Valentin Albillo** on 11 Sept 2003, 11:41 a.m.,*
in response to message #1 by Krystal

Krystal wrote:

"Hello, I am looking to purchase a HP calc for my husband. [...] I know he owns a HP-20s or two, but complains that they are not RPN or something. Which should I get him: 15c, 42s, or 41cx. [...] If you give an answer, can you please explain in non engineering/mathematical terms as to why it is a better choice?"

The ideal choice would be an HP42S. Reasons:

- Same form factor as the HP20S. If he's used to that and only regrets it not being RPN, the 42S is same physical quality, like shape, but much more powerful, and RPN to boot. It easily fits a shirt pocket, try that with a bulky 41C.

- The HP42S is much faster (more than 15 times), has much more memory (more than 15 times) and is much more capable than the HP-15C, and the same applies re the HP-41 He will be able to do all kind of matrix manipulations with utmost ease, as well as many other advanced functions, while using

glorious, classic RPN.

- The HP42S has a fully alphanumeric, graphic, two-line display, whereas the other models feature a non-graphic, one line display. This will allow him to clearly see all messages and results with full prompts and texts, and even some small but useful graphics.

Matter of fact a small routine can be prepared that, the moment your husband is presented with and turns on the machine, it will display an "I LOVE YOU" message on the display, complete with music *and even a big, graphic heart and all!!*. It would make for the nicest surprise, don't you think ? :-)

Best regards from V.

I forgot to mention the graphics.

They really do matter. For minehunter and yahtzee (still working on that, using the dice roller code on the site)

But also for plots (I admit to using this as a technically allowed cheating aid - the prof never believed the the calculator was programmable and allowed it on exams- to help me sanity check some solutions.

-oh, and the statistics on the 42S are great, and very expandable.

Yahtzee programming

AH- that should make the whole project a lot faster :)

thanks, Gene!

Re: HP 15c HP-42s or HP 41cx

*Message #20 Posted by **Bob** on 11 Sept 2003, 11:41 a.m.,*
in response to message #1 by Krystal

For every day use and cost effectiveness, my choice is a 4th calc, the HP48GX. If you are getting one because he always wanted one of those 3 calcs that is different. I have had and used the 41C, 41Cv, and the 42S. I don't use any of them anymore. I have borrowed and used a 15C, but didn't like it. After using the 48GX, I am sold on it's performance. I now own 3 of them as well and use them in my work as an R&D Engineer.

I think the 3 machines mentioned will all be more expensive than a new 48GX, but will be less capable. The size makes a difference to some, but not to me. I don't walk around with a calc in my pocket. Ever. If I go to a meeting, it is not really all that big to carry with me. For longer hikes to another building, I always take my briefcase/bag with me anyway. The 48GX is powerful, has tons of software and programs for it, and is easy to use.

It's your choice of course, but collectors have driven the price of the 3 calculators that you mentioned to collector level prices, not daily use affordability. While still expensive, the 48GX is available new, has later technology, and is durable. It was billed as the supreme engineering calculator and it's longevity and popularity support that claim.

As for RPN vs. RPL, I really can't tell much difference in use for the most part other than the stack difference.

As a bonus, you can pick up a 48GX, 48G, or 48G+ pretty cheap on EBay compared to the other calcs you mentioned.

Good luck.

*Message #22 Posted by **Vincent Weber** on 15 Sept 2003, 4:34 a.m.,*
in response to message #1 by Krystal

Hi Krystal,

The 3 calcs you mentioned are among very best HP manufactured and I understand your dilemna: none of the 3 can totally outperform the other 2 in every aspects:

I) 15C --- - Strenghts:

1) Very nice form factor, the best ratio features / volume ever and probably the "most classy" award 2) one of the very few calculators to feature a complex stack (the first one actually) 3) limited but nice matrix integration (you can even recall a matrix pointer of the stack, long before the HP28/48 series) 4) complete set of advanced features accessible directly from the keyboard (hyperbolics, random number, combination & permuation, gamma, solve, integrate). 5) Recall arithmetics (RCL+,...) and all 12 conditionals.

- Weaknesses:

1) -Very- slow... 2) No alphanumeric display. Not even an alpha display of program steps, which makes

programming (otherwise quite powerful) and degugging a -real- pain. 3) No I/O whatsoever. Don't even think about exporting or importing a program... 4) Matrix handling looks nice on the surface, but actually requires a lot of key stroke to enter a matrix, even in "User" mode - which is not even as convenient as the '41 Advantage module, supposely less integrated. Complex matrix is a nightmare (you need to enter the matrix in real form, call a matrix function to transform it into a complex form, and convert back after finishing the operation).

II) 41CX ----

Strenghts:

1) The most flexible calc ever, due to the expansion ports. No other calc can claim to be as versatile: advanced math, finance, aviation, chemistry - everthing is there. But you need to pay for extra modules. 2) I/O: Provided you buy the necessary hardware (again...), you can load/save programs with various kind of hardware. 2) Very good handling of alphanumerics, with letters directly accessible on the keyboard. 3) Extended memory: this offers a lot of flexibility, especially the ability to manage files (ascii or binary). 4) Timer functions: if you want to use your calc as a clock/"PDA" (less useful nowadays - but this is a myth as the NASA made HP build the time module to take the '41 on board the space shuttle in 1981). 5) Synthetic programming: The calc is a hackable machine that allows to enter extra instructions (some kind of machine code) - while neither 15C or 42S can. But you need to have a 'hacker' mind... 6) Prestige: Along with the '48, the '41 is the most mythical device ever produced ! You have to remember that the first version (41C) was out in 1979 (i.e. prehistory) and nevertheless is still a very useful tool today !

Weaknesses

1) Quite slow (but still twice faster as the 15C). 2) Quite big (not pocket-friendly, due to the expansion ports). 3) Will cost you a lot in add-on modules, cf. next point. 4) Lack of build-in functionality (this is a deliberate choice - the machine is meant to be expanded, hence there are few built-in features). Compared to the 15C and the 42S, the '41 is especially lacking a complex stack (even the Advantage Module only offer a 2-number "stack" implementation, not very ideal). But you may not need to compute complex operations. On the other hand, matrixes are quite well handleded by the routines of the Advantage Module: although they are not as integrated as those of the 15C and the 42S, they do the job very well and offer additional functionality of its 2 competitors (especially for matrix manipulation). 5) Lack of recall arithmetics and only 10 conditionals (minor point to me anyway). 6) Lack of Gamma function, combination and permuation, random number - all of which are easily programmable and some of which being present in the PPC ROM, so, not that much of an issue (if you can find the ROM). 7) No named variables as on the 42S - you have to deal with registers only, which makes it hard to remember what you really wanted to do in a program when you review it after a long time.

III) HP-42S ------

Strenghts:

1) The almost perfect calc: The programmation power of the 41, the features of the 15C, and much more. 2) Elegant and pocket-friendly. 3) Very fast 4) Smooth and nice complex & matrix integration. Just as the 28 or the 48, can handle various object types on the stack (matrix, complex, strings - but no lists, programs, or algebraic expressions/equations).

Weaknesses:

1) No other I/O than I/R one-way printing, which is -a shame- for a calc of this quality. No other way to input a program than your fingers. That's why the '41 survived still for 2 years after the 42 release. The 42 was actually more a 15C upgrade than a 41C upgrade, and only the 48SX would definitely berry the good old 41. A 42SX project was sadely cancelled (probably not to undermine the '48 sales). 2) Ackward alphanumeric entry. No matter how people can claim that you can get used to it, the fact remains that you will never type a text a fast on the 42 than on the 41, simply because each letter requires 2 key strokes instead of 1. If you are very

keen on using your calc as a memo pad, I strongly recommend you choose the 41 instead. 3) Limited memory (8K, which is little more than a '41CX with 2 extended memory module). A 32K upgrade is possible, but is a very manual operation and you will have a hard time to do it. 4) No time function - but these are not so useful on a calc nowadays. 5) No extended memory, meaning no "files" as on the 41CX. You can type additional text editing programs, though. But again, see my point on the '42S alphanumerics entry... 6) No way to enter complex numbers in a different mode than the dislay mode (rectangular or polar). An "angle" key like on the 48 would be welcome. 6) No algebraic equations for the solver. The more recent 32SII added this handy feature (while I love RPN, I think that it is easier to type 'P*V=N*R*T' than ' LBL "GAZ" MVAR "P" MVAR "V" MVAR "N" MVAR "R" MVAR "T" RCL "P" RCL "V" * RCL "N" RCL "R" * RCL "T" * - RTN' :) A matter of choice.. 7) A 42SII could also have introduced the very nice fraction support of the 32SII.

That's it for now :) Other points you could consider:

1) If you do not need matrixes and are not too demanding on complex numbers, you can go for the 32SII - simple and solid. 2) If you want power of RPL in a nice format, the HP28S is a good alternative. 3) If you have a Palm device and do not mind using a sytlus instead of a keyboard, I recomment the "P41CX" '41CX emulator for PalmOS from Charles (www.palmgear.com). You can have *all* 41 modules for a mere $10. The emulator is very good. If you own a PocketPC, you might want to look at ev41, or the very good Pocket15C 15C simulator (www.lygea.com).

My 2 cents. Cheers, Vincent Weber

HP-49G+ Power consumption

*Message #1 Posted by **Daniel Diggelmann** on 10 Sept 2003, 7:10 p.m.*

[pre]As my home page is gone I'll go on posting my news here. When I received my new calc the batteries where already dead as they were of most other buyers. So I suspected the machine would draw excessive current even when off. So I measured the current of the the new HP-49G+ vs HP-49G:

HP-49G+ ------- OFF: 0.02 mA ON: 10 mA (doing nothing) Running: 80 mA

HP-49G ------ OFF: 0.02 mA ON: 7 mA (doing nothing) Running: 20 mA

The Test shows that the new calc draws four times more power when it's running a program. Actually the current is approx proportional to the speed gain. As the calc is usually not doing much most of the time I don't expect it to eat too much batteries. So I take the installed batteries were of poor quality. The off current is just the same.

Re: HP-49G+ Power consumption

*Message #2 Posted by **Tom (UK)** on 11 Sept 2003, 3:50 a.m.,*
in response to message #1 by Daniel Diggelmann

The power sometimes is not in proportion to the speed gain as smaller technology versions of the same design have lower current (as internal capacitance is lower). Also newer technology usually HAS to run on a lower voltage - the HP49G+ could run on 3V rather than 4.5V? (I assume the HP49G+ runs from 3 x 1.5V batteries). I wonder what voltage is connected to the ARM processor.

Saturn design may have been more efficient as it wasn't trying to 'emulate' anything. The new design may have lower power 'per instruction' but the emulation may require 2 or 3 instructions each, so no net gain.

The stand by current of 10mA doesn't look too good, a large improvement can be gained by turning off or reducing the clock speed to the processor (not the display) when it's not doing anything. The down side is a tiny start up delay when you start pressing keys, but this should not be noticable.

Do you know the Off / Standby / Running current of other HP calcs using the Saturn processor (e.g. '28, '42, '32, '48)

If the speed is 4x and the running current is 4x then for a given set of tasks the batteries should last the same time. With most electronics the battery life is dominated by the standby current (10mA vs 7mA) so I would guess the batteries will only last about 70% of the time as the older calculator. From memory the AAA batteries used to last about 6 months of light use in the HP49G, so the HP49G+ should need new batteries every 4 months?

I presume there is no connector for an external power supply. HP could have done a 'docking station' including the data connection and power / charger for the internal batteries - oh well may be in the next series of calcs :-)

Re: HP-49G+ Power consumption

*Message #3 Posted by **Veli-Pekka Nousiainen** on 11 Sept 2003, 4:04 a.m.,*

in response to message #2 by Tom (UK)

I Assume (I make "Ass" out of "u" and "me") the CPU is Samsung S34210 - the same used HP iPAQ h1940. I/O 3V, core 1.8V, slow mode = 12MHz, running 48/75MHz (calculator) and about 203MHz on a PDA. Maybe the slow mode could be halved to 6MHz, to cut off even more from the stand-by current, but otherwise it is a very good design. OFF has every possible circuitry OFF - even annuciators, which don't have a dedicated line anymore (like they did in Yorke/Clarke).

Standard usage is maybe one month of battery life. The fast IrDA, fast USB (serial on 48gII), SD card, 25% more LCD, etc. will eat more batteries. So a "typical" heavy user may need to buy a new set before every weekend. (-;

A suggestion to those who did not receive their parcel

*Message #1 Posted by **Emmanuel, France** on 10 Sept 2003, 4:29 p.m.*

```
I just know that there's too many robberies or other crimes
because La Poste is using temporary workers.
Sometimes they change them after a week ...
Mister G. of La Poste gave me this information.
Alas ...
First I was thinking that CDRs or serial cables (for HP-48)
were good reasons for a theft or for a parcel to be opened.
It's not the fact of customs. My green labels are an example but they read them and found some
interest.
Complaints made are too often unregistered and needed to be re-made.
Any suggestion from someone who used UPS from France?
```

Re: A suggestion to those who did not receive their parcel

*Message #2 Posted by **Jeff** on 11 Sept 2003, 7:14 p.m.,*
in response to message #1 by Emmanuel, France

Emmanuel, If this would get me package here any sooner I would agree. I do not have any experience with UPS overseas.

Re: A suggestion to those who did not receive their parcel

*Message #3 Posted by **Emmanuel, France** on 12 Sept 2003, 7:17 a.m.,*
in response to message #2 by Jeff

```
Not recovered previous parcel. No news from La Poste.
Boring.
Prepared another one in case of ...
```

Let's go to the moon, its '69 again :o)

*Message #1 Posted by **Norm** on 10 Sept 2003, 4:09 p.m.*

Howdy friends, didn't have anything worth telling U the last couple of weeks.

But check out this news article: http://www.time.com/time/nation/article/0,8599,480984,00.html

It says that NASA has recently compared the tradeoffs between the Space Shuttle and the Apollo rockets (with space capsule for crew) and finds considerable advantage to the Capsule !!!!!!!

They are even thinking of going back to the earlier design. No this is not a joke, and this is no drill. Read it for yourself.

Apparently a 100 ton winged space shuttle has more economic and engineering difficulty overall, than a 5 ton space capsule (!)

NASA is also looking at a mini-space shuttle (no doubt pushed along by a rocket). One thing they are way too quiet about ..... using a rail-gun to pre-launch the whole thing with energy from the ground. I think there are STILL too many MBA's to be visionary enough to really jump ahead..... a rail gun launch from the mountain at Hawaii, of a mini-space-plane, somewhere between a shuttle and a space capsule.

Classified information about updated space capsule....

*Message #2 Posted by **Norm** on 10 Sept 2003, 4:11 p.m.,*
in response to message #1 by Norm

I have just received classified information from NASA headquarters..... when the Apollo rockets are put back into service, there will be an HP-34C
with RED LEEDDDDDDDD's (oooweee babeee)
next to each astronaut, bolted to the armrest.

also

*Message #3 Posted by **Norm** on 10 Sept 2003, 4:14 p.m.,*
in response to message #2 by Norm

also breaking news,

Carly Fiorinia will get a ride into space on the new updated Apollo rocket. There will be a special framework to hold a Wal-Mart beach chair for her, just directly below the rocket nozzles.

Re: Let's go to the moon, its '69 again :o)

*Message #4 Posted by **Grant Goodes** on 10 Sept 2003, 4:28 p.m.,*
in response to message #1 by Norm

It's not so much that the shuttle is advanced and a capsule old-fashioned; rather, NASA has basically insisted

on a winged-design for any proposed manned vehicle since the Apollo system was retired, despite the clear engineering disadvantages. Similarly, NASA has continued to persue LOX/LH2 (liquid oxygen + liquid hydrogen) rockets, despite the engineering reality that the less exotic, seemingly primative LOX/Keronsene rocket (as used by the Saturn V first stage, and Soyuz) results in a cheaper cost/Kg to orbit. Something other than engineering expertise is driving these designs (and I don't think I have to point out the obvious parallels with HP calculator designs post-1985).

As long as people (both in NASA, and in their funding bodies such as Congress) continue to be swayed by Buck Rogers -style flash, the US space program will continue to flounder. A return to a less flashy, but far more realistic (and proven) capsule design for ferrying astronauts to/from LEO would be a definite turning point, and although I wouldn't hold my breath, might indicate the first "small step" on the way back to the moon.

To bring it back to HP: Are we seeing the first small steps to the return of the traditional HP values with the latest releases? I'm not so sure, and will definitely NOT be selling my HP-41 system or my HP-16C anytime soon.

grant..

Great fuel. Great burn. Great *manned* test platform.

(and I had a lot of fun doing some static tests on a visit I made a few months ago)

Re: Let's go to the moon, its '69 again :o)

*Message #6 Posted by **Paul Brogger** on 10 Sept 2003, 5:37 p.m.,*
in response to message #1 by Norm

I don't think a winged "space ferry" is necessarily a bad idea. The fault, as I (inexpertly) see it, is in insisting that the shuttle be the primary lift vehicle, and that it be capable of returning cargo from orbit.

Those requirements dictated the overall size of the vehicle, and of the boosters, resulting in a great deal of the costs incurred. Were they to have simply developed something along the original "Dyna Soar" concept (that is, a winged, maneuverable space taxi), the stress on a smaller, lighter vehicle would have been a fraction of what actually resulted, both going up and coming down.

Meanwhile, use of the Shuttle as the primary lift vehicle limited the sizes of satellites, and delayed a whole string of launches when the Challenger exploded.

I'm sure there's more to it than that, but putting all their eggs in the Shuttle basket sure seems to have been a boneheaded move.

Re: Let's go to the moon, its '69 again :o)

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Sept 2003, 11:20 a.m.,*
in response to message #6 by Paul Brogger

The Gemini capsule initial concept was to land as a sort of an ultralight glider (a unfoldable Rogallo wing),

which was disregarded later in time. Perhaps it could be reconsidered now, some 40 years later, to provide a new capsule with the ablity to make controlled landings, instead of relying in "fishing" astronauts in the middle of the sea, as noted in the Time article referenced by Norm. (Certainly, some classics are coming back!)

Re: Let's go to the moon, its '69 again :o)

*Message #8 Posted by **David Smith** on 11 Sept 2003, 12:18 p.m.,*
in response to message #1 by Norm

When the shuttle was first funded, all the tooling for the Apollo rockets and engines were destroyed so that we would be guaranteed of not having anything to fall back to if the shuttle program ran into problems.

Let's go to Mars... let's not invite NASA or the gooberment.

Useful Space Links

Thanks for the space chat, folks,

*Message #10 Posted by **Norm** on 12 Sept 2003, 5:47 a.m.,*
in response to message #9 by bill platt (les Estats Unis d'Amerique)

Thanks for the space chat, folks, I enjoyed all of your reply posts. "XCOR" was interesting, as was the consensus that NASA has too much bureaucracy to proceed with things beyond the Space Shuttle.

The Shuttle was, obviously, quite an achievement when it first flew. But NASA has not done any impressive "buck rogers" stunts in the last decade or two. They just run the school bus back & forth, back & forth (until it blows up) they need to try some new stuff.

For those of us with engineering mindset (all of us?) the focus needs to be upon cost per kilogram of material shipped into space. That specification will vary with the different vehicles that get proposed and built. It needs to be made as low as possible. My vote is for an electric rail-gun launch from Hawaii. The vehicle should already be going 400 miles an hour and be at 15,000 feet by the time the rocket motors are ignited.

I don't yet see any unifying consensus between all the different factions. It appears President Kennedy did the nation a favor by demanding a very specific goal of our country, at the earlier time. Painful to say if you are a republican, but its true that it was the democrat Kennedy that got everybody to focus upon the specific goal, that gave us the legendary "Apollo" years, an absolutely unbeatable time that no number of Humvee's, big-screens and stock-fraud millionaires in McMansions shall ever replace.

Meeting at Allschwil

*Message #1 Posted by **Emmanuel, France** on 10 Sept 2003, 2:06 p.m.*

```
Will come with JFG from Grenoble. Then might need a plan.

Will bring a 486 mother card with power supply, keyboard, mouse, FDD, HDD and my Eprom Burner.
Christoph, could you loan a HP-IL/PC card?

My contribution:
Briefing on making bar code for HP-41
Briefing and demo on data transfer
Briefing and demo on making Eproms
Briefing on building an Eprom Box

Enough? Boring? Any idea?
```

HP-97 Printer

*Message #1 Posted by **Howard** on 10 Sept 2003, 1:15 p.m.*

Hello All. I'm hoping somebody can help me with my HP-97 printer.

The problem is that the top row of pixels does not print. It appears to be an alignment problem but I cannot see any adjustment.

Can the problem be fixed?

Thank you in advance.

Re: HP-97 Printer

*Message #2 Posted by **David Smith** on 10 Sept 2003, 5:39 p.m.,*
in response to message #1 by Howard

There are three likely causes (in order of probability): 1) A burned out dot in the printhead. Bad news. Only replacement is from another HP91/92/97. If you check the resistance of the print head signals, you should see around 10 ohms to ground for each one. An open circuit is not good.

2) A bad driver transistor. Good news is the transistor array chip is a standard off-the-shelf part.

3) A bad cable trace or connector connection. Cable trace may or may not be fixable depending upon where it is bad.

Is there any info about the Voyager series hardware?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 9 Sept 2003, 11:42 p.m.*

Hi to all, I'm gathering any info I can get about the Voyagers hardware: ROM, RAM, CPU, display pinout, description and versions, PCB versions, electrical signals (coconut-like CPU) and with some luck the ROM dump... Any links or personal information to share? I'm about to poke my some of my Voyagers (HP-11C, 12C, 15C) with a scope to get some electrical information, and display driver info (multiplex rates, segments, columns). I've seen many HP-41 sites, but none of our beloved HP-1xC series! I'm planning to build a PIC-based microcontroller logical analyser (very basic, only the bus signals) to see what I can get of it.

Best regards,

Nelson

Info about the Voyager series: Luiz is da man

*Message #2 Posted by **Renato** on 10 Sept 2003, 1:27 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Nelson, Luiz has gathered much information about voyagers. He has enough information, he could write a book about them ...

Renato

Luiz is da man- but I lost his email!

in response to message #2 by Renato

Luiz- email me please :)

thanks- christof

I'll be back soon...

*Message #4 Posted by **Vieira, Luiz C.** on 10 Sept 2003, 11:21 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hi all you guys;

I read my name and thought I should answer... (Thanks, Renato).

About Voyagers, all I get was taken from some stuff I collected myself and many information posted here by guys like Tony Duell, Ellis, Pavel, Meindert and Vassilis among others (if I misspelled the names or forgot someone, forgive me). What I have so far is information related to ID codes for some IC's, LCD different types and a few HP15C compatible "IC" mixing. What I saw, based on Tony's observations, is that the main NUT-based chips (derived from the NUT-family used in the HP41) have internal ROM data, being the main chip the

R2D2. No, not the golden android from Star Wars, instead RAM_ROM&Display_Driver. This main NUT is also the controller, and I cannot imagine a way to dump internal ROM contents unless there are some "hidden" codes that allow it to be done. The main subject is the extra third chip available in the HP15C: is it only a 64 extra registers CHIP or it also contains ROM-code? As the HP15C's owners know well, the HP15C has 67 registers (plus Random seed register), and 64 of them are shared with program lines. And that's the main part!

I'm in the middle of some time consuming activities and I'm visiting the MoHPC pages about twice a day in a "read-only" basis. That's why many of you have not heard my "voice" so often, but don't be so "happy"... I'll be back soon.

Best regards.

Luiz (Brazil)

Re: I'll be back soon...

*Message #5 Posted by **Bill Wiese** on 10 Sept 2003, 12:06 p.m.,*
in response to message #4 by Vieira, Luiz C.

Luiz wrote (with some trimming): [quote] What I have so far is information related to ID codes for some IC's, LCD different types and a few HP15C compatible "IC" mixing..... the main NUT-based chips (derived from the NUT-family used in the HP41) have internal ROM data, being the main chip the R2D2.... Yes I suspected that HP15Cs have some ROM on their CPU chip. (Perhaps not all versions though ??)

If the Nut instruction set has an instruction something akin to "MOV reg, codespace[addr]" or "MOV mem, codespace[addr]" and there are no security bit issues - many modern microcontrollers have provisions to disallow program code ROM areas from being fetched as data - then an external ROM could be created with a PLD & EPROM - to fetch 10bit words from the internal codespace ROM on CPU.

Bill Wiese

San Jose CA

Re: I'll be back soon...

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 10 Sept 2003, 2:34 p.m.,*
in response to message #5 by Bill Wiese

I was thinking of what chip is CPU or ROM or RAM on the HP-15C. I have a HP-15C and HP-11C both brazilian and both from the approx. same date, and they share exactly one chip in common: the 1LM2-0001 (on the right corner). The 15C have another in the middle (1LH1-0302), and the display controller is different (1LH1-0305 on the 11C and 1LH1-0306 on the 15C). By simple deduction I think that the 1LM2-0001 is the CPU and the display controller have ROM/RAM inside, and the middle chip on the 15C is more RAM. This is a wild guess, I can't prove this yet (I'll try as soon I get borrowed some scope). I still have hope that I can get the ROM out of them with some microcontroller probe. About the display, it has some distinct characteristics: it has a excellent viewing angle because it uses 2x multiplex instead of 3x or 4x from the more modern calculators. This explains the HUGE ammount of pins that the display have: 56! At least in my old Voyagers.

11C s/n 2644B33846 - fiber PCB w/ 2 chips, keys, display

12C s/n 2317A01958 - fiber PCB w/ keys, flex PCB w/ chips and display, all sealed with a black envelope

15C s/n 2723B12245 - fiber PCB w/ 3 chips, keys, display

The 11C and 15C above uses the same display and steel mounting, the 12C uses the same display with different mounting (adhesive tape?)

I'm curious about the newer 12C ones, is the display or PCB or chips much different? Anyone have some pics of inside one to share? I have many scanned pics from my 11C and 15C all disassembled.

Best regards,

Nelson

Re: I'll be back soon...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 10 Sept 2003, 5:20 p.m.,*
in response to message #6 by Nelson M. Sicuro (Brazil)

Olá, Nelson;

the "big chip" is the R2D2 (controller with RAM/ROM and display driver; you can see many of its terminals are connected to the LCD) and the small, common one is the keyboard scanner, common to many Voyagers (I saw almost all except the HP10C with this chip). You can see it's the only one with connections ending in the keyboard; maybe it has other functions... No other chip is connected to the keyboard.

Exception made to the new HP12C units and the HP10C (I have not seen one in the inside), all Voyagers have two chips, and the HP15C has three.

I have some scanned images my own and I'll post them later. I'm in a rush because I have to apply a test to my students in a few minuts...

Best regards

Luiz

HP-15C chips?

*Message #8 Posted by **Nelson M. Sicuro (Brazil)** on 10 Sept 2003, 5:45 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Olá, Luiz

If I remember right, the coconut CPU has the keyboard scan lines in it, and it also controls the wake-up of the CPU with the "ON" key with an interrupt. I think that there is no "keyboard scan chip", this is really the CPU. If you look at the pics of one Voyager opened here in the museum, the chip on the right side is the 1LF5-0301, and in the HP paper that describes the coconut CPU from Tom Revere (HP, dated 7/14/81) it describes the 1LF5-0301 as the HP-11C version of the coconut CPU. I'll try to identify the pinout of the CPU of my HP-11C with a scope next week.

Best regards,

Nelson

Makes sense to me

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 11 Sept 2003, 12:43 p.m.,*
in response to message #8 by Nelson M. Sicuro (Brazil)

Hi, Nelson;

your post makes perfect sense to me. Thank you.

I looked at one of the pictures I have and it shows a newer HP11C, single PCB, no flex circuit board. I see a 1LH1-0305 connected to the LCD lines and a 1LM2-0001 connected to the keyboard lines. Wich one is the processor?

http://www.logeng.com.br/images/HP11C_internals.jpg

Best regards.

Luiz

Re: Makes sense to me

*Message #10 Posted by **Nelson M. Sicuro (Brazil)** on 11 Sept 2003, 12:54 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Olá, Luiz

I think that the 1LM2-0001 is the CPU and the 1LH1-0305 is some sort of LCD controller/ROM/RAM.

As I said, I concluded that the CPU is the very same on the HP-11C and the HP-15C that I have (made here in Brazil, year 1986/1987).

With this in mind, I'll try to discover the bus signals (clocks 1 and 2, ISA, DATA, SYNC, PWO) and try to build a "dummy cpu replacement" to copy the ROM. Of course I can be wrong, but I'll try to prove my theory.

Best regards,

Nelson

(P.S. I'm talking with Renato about other calculator projects. I'll be great if we can trade some ideas!)

Some new facts... Halfnuts on the rescue

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 11 Sept 2003, 5:32 p.m.,*
in response to message #10 by Nelson M. Sicuro (Brazil)

Hi Nelson, folks;

despite of my "smashed" available time, I also include this new fact: halfnut architecture. Look at the picture. (please, guys, feel free looking at the other pictureshere. Maybe you can find something useful. Be my guest.)

http://www.logeng.com.br/images/halfnut_CPU.jpg

As you can see, the HP41 halfnuts have a sigle nut-CPU connected to the keyboard and a sort of R2D2-hybrid display driver, with RAM and ROM as well.

What can I say? ROM dump is now closer to be done in Voyagers, as all of these facts become clearer. I think your considerations are perfectly correct, Nelson.

And Yes! Let's play some e-cards around here and let all folks be informed for new achievements as we get them, right?

Best regards.

Luiz

in response to message #3 by Pavel Korensky

So for instance you could make a replica of a ppc module etc? Is that easy to do? I am also interested in picking up a few rare modules.

Re: BTW, when we are talking about ROM modules,

*Message #5 Posted by **Holger Veit (DE)** on 10 Sept 2003, 9:45 a.m.,*
in response to message #4 by David

>So for instance you could make a replica of a ppc module etc? >Is that easy to do? I am also interested in picking up a few >rare modules.

As long as the module is *passive*, i.e. a pure ROM, this should not be too difficult. Some modules have additional hardware in it, though; obviously the Card Reader ROM (which might still work for its "7XXX" emulation commands, though), the HPIL module, the Time module, the Wand module, the IR printer module, and the HEPAX module, to name the most prominent ones.

For the PPC module, I am wondering though, whether it is so attractive to have a replica in ROM - the code in there is not MCODE, but user code; so you could load the most attractive things into user memory (I did this with MK and LB, for instance, until I had more powerful commands from the CCD module). From this point of view, it is meanwhile outdated, and more a collector's item, and as such, one would of course not accept a copy.

Regards Holger

"(I did this with MK and LB, for instance, until I had more powerful commands from the CCD module). From this point of view, it is meanwhile outdated, and more a collector's item, and as such, one would of course not accept a copy. "

Yes this is true, but I still use my HP41 everyday, and ROMS such as the unit conversion in the thermal or petroleum roms would be a great thing to have (without using up a port because I don't need any of the other functions.) It's like buying a music CD....You only want 1 song, but have to buy the album to get it (and meanwhile get 10 other songs you have no use for). It would be great to have a few functions etc from different roms.

Re: BTW, when we are talking about ROM modules,

*Message #7 Posted by **Diego Diaz** on 10 Sept 2003, 2:48 p.m.,*
in response to message #6 by David

Sure, you can get'em. I did, just browse a little and they'll come up in several flavours...

I've even done my own one (flavour, I mean...)

That is, as the 41's ROM data is organized in 10bits words, and usual unit for binary info is the 8bit (byte) the original MLDL desing from Lynn A Wilkins, (published in the PPC Journal Vol. 9 Nr. 3 April 1982) used two chips, namely one 2732 for the Lower 8bits and one 2716 for the remaining upper 2bits, with a splitting-bits "organization".

Please take a look at: www.kuipers.to/hp41.htm, he's doing an amazing work about this issue.

and also: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=39344, another little contribution by my side.

Cheers.

Sorry Meindert :-(

Re: BTW, when we are talking about ROM modules,

*Message #10 Posted by **Meindert Kuipers** on 11 Sept 2003, 6:04 a.m.,*
in response to message #9 by Diego Diaz

I like Diego's approach as well, although bits are thrown away. That is not a big problem these days, but I remember the times when we were fighting to save every single byte. My usage of the 2 upper bits is more complicated, and requires an extra multiplexer, plus complicated logic when writing to MLDL RAM. I am now at 2/3 filling of the CPLD, and still have to add bankswitching. I am considering to use Diego's approach when I am running out of CPLD macrocells, we will see.

Meindert

Re: BTW, when we are talking about ROM modules,

*Message #11 Posted by **Christof** on 12 Sept 2003, 12:02 p.m.,*
in response to message #5 by Holger Veit (DE)

I would love a copy of the ppc rom- I'm not particularly concerned with serial numbers and boxes, more concerned with operation.

The PPC ROM in particular is very useful regardless of the programming language used to generate the rom as I don't always have 8K of storage (or whatever) to set aside for copies of the ROM :)

Add in the hpil/dev or ext/io and a few other hard to find roms and I would dearly love to have some actual *fit in the rom slot* roms to use when I need them.

HP 20 Build quality???

*Message #1 Posted by **Joe Edwards** on 9 Sept 2003, 10:01 a.m.*

Hey guys, I have searched high and low for an HP calc to replace my lost 32s. Still looking too. My wife needs a calculator, but doesn't like RPN. It will be used for simple 4 banging. My school bookstore had about 3 HP 20s models (in the box, vs. the blister pack). They are on sale for 15 bucks each. Should I pick them up? I am more interested in the quality workmanship of the older HP's vs. today's scientific calcs (please no graphing calcs - I have a TI for that - school). I guess my question is this, "Are the HP 20s built as well sturdily as the 32 and 42s models? " Thanks for the help.

Joe

Re: HP 20 Build quality???

*Message #2 Posted by **bill platt** on 9 Sept 2003, 10:14 a.m.,*
in response to message #1 by Joe Edwards

Joe:

Yes, the 20s is equal to the 30s in build quality. I have a couple and so do my co-workers. Some will quibble about indonesia versus singapore etc but i have not found any severe differences. The 20s is nice--it even has 99 lines of programming space which is great for putting a repetitive calc into--like a conversion you have to do over and over--like say square feet converted to square meters--you just go (in program mode) LBL A * .3048 x^2 = RTN. Then, when you want to take square feet to square meters, you type in the square feet, hit xeq a, and out pop the square meters. It's great for that sort of thing.

The 20s also has a "last" key which makes it possible to easily do chain calcs, and a "swap" key for when you change your mind about what divides what etc.

So, yes, buy some. 15 bucks is very good, too--I'd like more of them at that price!

Regards,

Bill

Recommendation: BUY!

*Message #3 Posted by **Paul Brogger** on 9 Sept 2003, 10:17 a.m.,*
in response to message #1 by Joe Edwards

Toward the end of the 32s' availability, production was shifted (I think to China), and a switch was made from double-shot molded keys to painted keytops. I have examples of both versions, and I can attest that the look and feel of the later 32s example is noticeably inferior to those of the earlier unit. (Of course, the very last examples of the 32s sported a notoriously bad color scheme -- and, I suspect, painted keytops.)

I will say, however, that operationally, any difference is much less noticeable -- maybe a slightly less definitive keypress in the newer unit, but still **much** better than that of ANY contemporary competitor.

I have in hand an early HP-20s, and it too has double-shot keys, bright, beautiful, lasting legends, and both solid feel & operation. I don't know if later production of the 20s was changed to painted keytops or not, but I suspect it was. Regardless, you'll either be buying truly wonderful, absolutely rock-solid algebraic (sigh!) calculators, or dependable units that are "merely" superior to anything else you're likely to find.

At 15 bucks each, I'd buy all three. (I'll buy one of them from you for $20 + postage . . .) I don't know what they're going for on eBay, but I suspect you could recoup the entire investment by selling one MIB.

Re: HP 20 Build quality???

*Message #4 Posted by **hugh** on 9 Sept 2003, 1:23 p.m.,*
in response to message #1 by Joe Edwards

i've always felt the 20s was underrated. its a rather nice scientific calculator for day to day use. the programming model is sensible.

also, i think it has the clearest display of all pioneers, being segments rather than dot matrix.

buy them all, definitely

*Message #5 Posted by **Christof (NoVA US)** on 9 Sept 2003, 2:20 p.m.,*
in response to message #1 by Joe Edwards

these are true pioneers, with the old quality.

and they are worth a bit more than $15 on ebay right now, so you will be getting yourself a decent deal on lifetimes machines.

and hey, who ca argue with 99 program steps on top of the best $15 scientific you can find?

Bought them all

*Message #6 Posted by **Joe Edwards** on 10 Sept 2003, 8:55 a.m.,*
in response to message #1 by Joe Edwards

Well, even before checking the responses I decided to purchase all three of them. There are several more in the blister packs, but I have seen one of those before and the construction didn't seem to be up to par. Made in China? These three are as solid as my old lost buddy (HP 32s) and I am happy to own them. Too bad they are not RPN, but hey at least the are real Pioneer models. It is a good thing they are cheap considering my student loans are going to be a month late!!!!

Joe

Re: Bought them all

*Message #7 Posted by **Bert K** on 10 Sept 2003, 12:41 p.m.,*
in response to message #6 by Joe Edwards

The 20s is very nice. I have one as a backup for my two 32sII calculators (a brown and a silver bezel). The 20s has the most pleasing color scheme (yellow/blue) IMO. Indeed too bad it isn't RPN, it doesn't get much use because of that. The 32sII is my work horse.

Re: Bought them all

*Message #8 Posted by **bill platt** on 10 Sept 2003, 3:24 p.m.,*

in response to message #7 by Bert K

Hi Bert,

I have exactly your combination, too (2 32sii, 1 br 1 silver, 1 20s). Except that then I went crazy and became a calculator addict and bought (2) 48gx, a 48g, a 41cv, a 45 (inherited) more 20s', an 11c and a 15c, and the list is growing....

regards,

Bill

Latest on the HP Create a Calculator Contest

*Message #1 Posted by **Ben Salinas** on 8 Sept 2003, 10:47 p.m.*

Yes, there is still stuff going on with this. Basically, HP has been making plans with my school district, and my school district has been telling me nothing. I have been kept informed on what has been going on via e-mails from Gene Vicano from San Diego. Here is the latest news: On September 18th, Tony Jones (HP's Worldwide Director of Product Management) will be coming from Australia to Mercedes, Texas to present me with a check (a check made out to me... not a scholarship) and a calculator which is (and i quote) "a yet-to-be released HP graphing calculator. It will be our most-powerful one to date. Unfortunately, our press policy forbids us from disclosing details prior to launch." (my guess is that it is the 49g+). I recieved that answer when I asked which calculator I would be receiving. I was told that I was supposed to be recieving a 9g, but since "...[my] entry was very sophisticated [they] are making an exception." The presentation made by Tony Jones will include the presentation of the check and calculator as well as a question and answer session. In the near future (tomorrow or Wednesday) I should be recieving a call to answer a few questions HP has. Thanks for all your support. -Ben Salinas

Re: Latest on the HP Create a Calculator Contest

in response to message #1 by Ben Salinas

Thanks for the update.

Please make sure all the keys work on your new calc (if early reports are accurate), if they don't it will be a powerful and high profile message to HP if you have to hand back the prize to Mr Jones.

I'm sure you will be inundated with heartfelt requests of what to include in the question and answer session with HP! I'm sure you can read all the other threads on what people here want so I won't pester you with my pet 'hates' of recent HP calcs ;-)

in response to message #1 by Ben Salinas

SCIENCE ACADEMY STUDENT WINS NATIONWIDE HEWLETT PACKARD/SCHOLASTIC CREATE-A-CALCULATOR CONTEST Hewlett Packard executives to hold local award ceremony on September 18

MERCEDES – Sixteen-year-old Ben Salinas of McAllen won the first annual "Create-A-Calculator" contest sponsored by Hewlett Packard (HP) calculators and Scholastic magazine. The nationwide contest, which closed in May 2003, was an effort to get students and teachers involved in creating the next version of an HP calculator.

Salinas, a junior at The Science Academy of South Texas in Mercedes, won the 9-12 grade category with his design of the HP-51S scientific calculator. As the first place winner, he will receive a $3,000 scholarship for him to use as he sees fit and a pre-launch edition of the hp 49g+ graphing calculator scheduled for release in stores on October 6 at a suggested retail price of $175.99.

Hewlett Packard's Director of Worldwide Product Development Tony Jones and Director of Worldwide Marketing Lee-Khuan Goh will present him with the scholarship check and calculator on Thursday, September 18 at 9 a.m. at Biblioteca Las Americas library, located in Mercedes off Expressway 83 and Mile 2 West Road.

The good news was not too surprising to Salinas, who was the top winner out of 6,000 entries.

"I felt that I had made a good product, and I thought I would have a chance to win once the engineers took a look at my entry," Salinas said. "All of my features were realistic and possible to make. It's a real calculator."

The HP-51S was Salinas' ideal calculator, which combines the best features of different calculators into one instrument. Many of the device's features are the same as his HP-32II scientific calculator, but with a number of innovative features, upgrades and functions.

"I put things that have never been on calculators before, like the blue backlit LCD screen on mobile phones that you find," he said.

Other practical features that Salinas included in his calculator were a glow-in-the-dark keyboard, USB and IR ports as well as more memory and programmability.

The probable engineering major also added several impressive functions to the HP-51S, such as: • Psuedo-graphing, which allows the scientific calculator to graph in a way more accurate than a graphing calculator; • Total base conversion and operation, something that has never been on a calculator before even though users such as computer scientists and electrical engineers frequently need it; • SigFigs, which helps users preserve accuracy on sophisticated measuring calculations; • Unit conversion, something that is on graphing calculators but not on scientific calculators; and • RPN, which allows users to get intermediate answers during long equations.

For the Create-A-Calculator contest, Salinas submitted a professionally compiled binder to Hewlett Packard that contained thorough and detailed information on the HP-51S calculator.

Hewlett Packard Calculators General Manager Fred Valdez said the company was very impressed with both Salinas' intelligence and practicality of design.

"Ben worked off a solid basis of information and familiarity with our high-end scientific calculator, which is a major achievement for someone of his age and experience," Valdez said. "He enhanced this with what he recognized to be the needs of like-minded students and professionals to create a perfectly viable design."

Valdez continued: "Ben had tough competition, as we received more than 6,000 entries by May 15 (the closing date for entries), and the entries were still flooding in. He was a clear entry in his age category."

The self-starter actually learned about the contest on his own through the Internet. According to Mark Schroll, Engineering, Designing and Development teacher at The Science Academy, Salinas approached him a week before the contest deadline and asked him to be his sponsor for the contest.

“Ben had already put his binder together. He just wanted my input and my approval,” Schroll said. “Ben put together an exceptional project.”

Salinas credits The Science Academy, a public school for students who wish to explore the career fields of math, science, architecture and engineering, for teaching him the skills he needed to develop his calculator. Some of his documents are written in Java, a computer programming language, and his calculator is drawn in AutoDesk Inventor, an engineering design software.

“Everything that’s contained in this binder has been what I have learned from this school,”Salinas said.

This particular student also keeps his mind intellectually charged by participating in University Interscholastic League (UIL) competitions in Math, Science, Calculator, Number Sense and Computer Science divisions.

There were two other winners in the Create-A-Calculator Contest. In the K-5 grade category, Michelle Klutcharch of Glen Oaks Elementary School in Glen Oaks, Illinois won a $1,000 scholarship award and hp 9g graphing calculator. In the 6-8 grade category, Zlatko Minev of Kent Middle School in Kentfield, California won a $2,000 scholarship award and hp 9g graphing calculator.

The New HP calcs

*Message #1 Posted by **Andy** on 8 Sept 2003, 8:37 p.m.*

I guess you all have seen the new HP PDF calcs series.Well the calcs only have one light source, (I laugh whenever I look at it....) But the HP 49G+ is real... judging from the 49G that it wasn't a bad untraditional model, I supposed that the new Branch of calcs will be of the quality of the 39/49G series. Yes piooners died, long time ago.... (so my 17B is alone in this town...) the quality of the past still in the machines (and in some manuals,like the one in the 39G, but dissapointly gone in the 49G manual,....), If you have faith in the 49G it will do awesome demostrations of power in your very hands... Just like we,saw the 48G showing it incredible power.... :).

If there is any power in the (emulation of the saturn = OS of the ROMS, Yes the ARM probably is runnig an emulator of the chipset saturn.)we will see it. I'm just dissapointed with the PDF . The 17BII+ isn't not as bad as it looks. It is indeed as powerful as the 17B that I have had for 13 years. It is just the way that we look at the math. The new users (KIDS) do the math considerably different than we do.

User programmable ROM module ?

*Message #1 Posted by **Pavel Korensky** on 8 Sept 2003, 6:53 p.m.*

Hello,

after more than one year, I returned to my hobby project of the redesigned user downloadable ROM module for HP-41.

The whole idea is to use the modern parts and fit 16KB (10 bits wide) of EEPROM into original HP-41 module.

Currently, I have two possible solutions how to fit the necessary memory and interface electronic into small place inside the original module.

1. PIC18F252 in SO28 package or 18F452 in TQFP44 package. Both processors have enough internal memory for both the necessary code and 16KB of HP-ROM code. 2. PIC16F72 or similar in the SSOP28 package and external SPI compatible serial EEPROM (256 Kb, 32768 x 8).

Both modules can be loaded with HP ROMs binary images from PC, via RS-232 port and special adapter.

Anyone is working on similar project ? I would like to share ideas and/or problems.

Re: User programmable ROM module ?

*Message #2 Posted by **Bill Wiese** on 8 Sept 2003, 8:04 p.m.,*
in response to message #1 by Pavel Korensky

Hi Pavel..

I'm not 'working' on this but have a few ideas...

Maybe try a small PIC 12Cxx CPU. In an 8pin DIP these have 5 or 6 I/O pins. And then use some serial EEPROMs - 93Cxx, 24CXX, etc. All CPU has to do is manage the HP41 bus protocol and the I2C or Microwire serial memory protocol. You might even be able to use a MMC or SD card!!

Bill Wiese

San Jose CA

Re: User programmable ROM module ?

*Message #3 Posted by **Pavel Korensky** on 8 Sept 2003, 8:23 p.m.,*
in response to message #2 by Bill Wiese

It is not so simple. Those small PICs are not fast enough to do the job. When you look at the timing diagram of HP-41 bus cycles, you can see that the ROM address is sent between 16-32 cycle and the opcode must be sent by PIC between 46-00 cycle. So, there is only 14 cycles for the whole processing. It is 14 x 2.8us = 39.2 us. It is roughly 39 PIC instructions (let's suppose that the PIC is running on 4 MHz).

During this time, you must check the address (if it is in the module or not), recalculate the address to the EEPROM address space, send the command and address to the EEPROM and read back 16 bits of EEPROM data (at least 40 clocks on CLK line of serial EEPROM). I2C is of course out of discussion, because maximum clock rate for I2C is 400 KHz.

On the other side, with PIC16F72 or similar (with hardware SPI/Microwire) it is possible to do it. Modern SPI/Microwire EEPROMS can have clock rate up to 5 MHz and PIC itself can run at 20 MHz. Personally, I think that the 18F252 is the best solution, because there is only one chip inside the module and also, the fast serial EEPROMs in SMD package are hard to buy in small quantities, at least in my country.

Re: User programmable ROM module ?

*Message #4 Posted by **Pavel Korensky** on 8 Sept 2003, 8:36 p.m.,*
in response to message #3 by Pavel Korensky

There are more problems than the timing. One of them is power consumption. Of course, it is possible to send the PIC to "sleep" state, but when there is wake-up from sleep, the PIC needs to wait 1024 clock cycles before it is able to continue. It is 51.2 us for the 20 MHz clock or 18.28 HP-41 bus cycles. It means that the module will draw approx. 5 mA all the time when the HP-41 is switched on.

Re: User programmable ROM module ?

*Message #5 Posted by **Holger Veit (DE)** on 9 Sept 2003, 3:45 a.m.,*

This is simply a K.O. criteria for the PICs despite of what other merits they might have (typicially the only merit is that people are just accustomed to them for long - this is still keeping the lousy 8051 pest alive). You might consider TI's MSP430 series as a suitable alternative.

Holger

I just looked at MSP430 and it looks good. Thx for the idea, maybe I should learn a new micro family.

Zeprom

*Message #9 Posted by **Christoph Klug** on 9 Sept 2003, 10:20 a.m.,*
in response to message #8 by Pavel Korensky

Dear Pavel,

inside a Zeprom you find a small pcb. On top side of pcb is placed the Eprom and less smd components. On the bottom side of pcb is placed a surface mounted ASIC chip for interfacing the Eprom to HP41 bus. The ASIC chip is bonded directly to the pcb and sealed by a black glue mass. Zeproms make available 16KByte ROM and opional bank switching.

Best wishes from Germany - Christoph Klug

Re: User programmable ROM module ?

*Message #10 Posted by **Bill Wiese** on 9 Sept 2003, 2:40 p.m.,*
in response to message #3 by Pavel Korensky

Pavel I didn't realize the PIC12Cxx series was that slow (or HP41 bus timing that fast).

Yes, take a look at the TI MSP430... small fast low power...

Bill

With this microprocessor (TI-MSP430F449 with 60KB flash ROM) you can put THE ENTIRE HP-41 INSIDE!! I just ordered some (free!) samples from TI, I'll start to develop a emulator with this chip. Its assembler language is really powerful, it is best suited to a project like this than the PIC series. It is also capable to drive a LCD display directly! (not the one from HP-41 :'(it has much more segments... but the (numerical) one from the Voyagers is great!)

Best regards,

Nelson

Re: User programmable ROM module ?

*Message #12 Posted by **Pavel Korensky** on 9 Sept 2003, 4:31 p.m.,*
in response to message #11 by Nelson M. Sicuro (Brazil)

of course, you can emulate the whole HP with this chip. I suppose that the same you can do with ATMega128 or similar.

But in my project, I am facing a different problem. I must fit one or two packages in a really small space. I measured it and the whole design must fit on the PCB which is 10x24 mm. It is

really not easy, especially if the whole design should be made from available SMD parts (this mean no fancy micro packages, sold only in 1000 quantities).

Re: User programmable ROM module ?

*Message #13 Posted by **Meindert Kuipers** on 9 Sept 2003, 11:52 a.m.,*
in response to message #1 by Pavel Korensky

All info on my project is on www.kuipers.to/hp41, but this will not fit in a module housing. My intention is to put it in a cardreader. Power consumption looks acceptable and connects to a PC with USB.

*Message #14 Posted by **Pavel Korensky** on 9 Sept 2003, 1:43 p.m.,*
in response to message #13 by Meindert Kuipers

Of course, I know about your design. Actually, I have the printed PDF just here at the table. :-)))

But my goal is not to make MLDL, but to make a replacement for normal ROM modules which will be downloadable by user.

BTW, how do you catch the start of the 56 bits cycle in your design ? I hooked the HP-41CV to my logic analyzer and it seems that all timing diagrams which was described in PPC or your PDF are a bit wrong. Namely, the SYNC does not go low with the raising edge of CLK02, but with falling edge. Also, after pressing the ON button, there are really wild things on SYNC and POW lines.

Re: User programmable ROM module ?

*Message #15 Posted by **Meindert Kuipers** on 9 Sept 2003, 2:22 p.m.,*
in response to message #14 by Pavel Korensky

I almost feel flattered ;))

I have looked at the exact relationship of SYNC and the clocks with a scope, and they are a bit off indeed. Just make certain that it does not matter. The best reference is the original MLDL design, which catches the end of SYNC with 2 flipflops, mine is based on this. If you want to have the VHDL code, send me an email and I will mail it to you. I will publish the final code anyway. The important times are the rising edges of the clocks, do not use any other edges of HP41 signals!

Note that my MLDL is a ROM replacement as well, but just in a larger housing, but a smaller module would be great anyway. If I would do a project like yours I would go for the 8051 variations of Cygnal see (www.cygnal.com). The big problem will be power consumption as you need to verify the address in every single cycle. Startup times after a powerdown will be critical as well, but the HP41 will be doing several internal cycles anyway before accessing external ROM.

The relationship between PWO and SYNC is described in the HP41 Service Manual. Use google to find the relevant website, as the URL cannot be used in this forum unfortunately.

Meindert

Re: User programmable ROM module ?

*Message #16 Posted by **Pavel Korensky** on 9 Sept 2003, 4:05 p.m.,*

in response to message #15 by Meindert Kuipers

The problem is, that I never had a chance to look at the original MLDL design. I only have a PDF with the first part of the article, where are no schematics. Maybe, I should buy a PPC Journal CDs.

Because I am trying to use only microcontroller, the VHDL is not necessary. BTW, I like the idea of using old card reader as a housing for MLDL and/or modules. I was thinking about similar design, but I do not have card reader, so I am trying to put everything in normal small module.

I have the service manual (from HP-Museum CD-ROMs), but the informations in the manual are not complete. Between pressing ON button and the phase when HP-41 is going to Standby mode and waiting for key press, there are especially wild things on SYNC and PWO lines. In my current prototype, I am testing both PWO and SYNC lines and I am waiting for the state, when PWO is low and SYNC is high for at least 200 us. This seems a solid indication that calculator is in standby mode. As soon as SYNC goes low and PWO up, we are at the 54 cycle and the program start counting CLK pulses.

Re: User programmable ROM module ?

*Message #17 Posted by **Diego Diaz** on 9 Sept 2003, 6:58 p.m.,*
in response to message #1 by Pavel Korensky

Hi everybody,

Pavel, I'm deeply interested in this issue.

Please take a look at: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=40493.

The full thread is interesting indeed, please read.

I'm still working on the PIC18LF252 approach. Last weekend I finished my (home-made) PIC programmer, and I'm still reading the oversized PIC Data-sheet.

I followed the advice from Vassilis Prevelakis (on the referred thread) and sent a mail to Mr. Ioannidis asking for the code, but I haven't received his reply... yet? So the code for the 18C252 is still a secret for me. May you can try to ask him and perhaps the luck be with you... :-)

On time, the MPS430F14x(1) (wich seem to fit the suitable size for the task) are "huge" 64 pin QPF's... Remember you only have 12mm x 23mm PCB space inside a standard 41 module. They use 1.8v... 3.6v supply. As far as I've tested, all my 41's (I've got 1 "C" 1 "CV" and 3 "CX") started to show a weird behavior when logic "1" falls below 3.5v, this looks like a very narrow gap (0.1v) for the reliability to fit in. And MPS430's (please correct me if I'm wrong as I've not yet read the full specs) don't run above 8Mhz.

At 40Mhz a PIC18LF252 powered at 4.2v. draws 10mA typical, wich seems quite reasonable. Should the code handle the task efficiently, lower frequencies (and currents) can be reached. Furthermore, the required 1024 cycles for start-up are not needed if you use EC mode, and keep the oscillator running while PIC is in SLEEP.

So, next step, try to get the existing code (I'm not very confident about that) or develop a brand new one from scratch.

If your're interested mail me.

Cheers.

Re: User programmable ROM module ?

*Message #18 Posted by **Pavel Korensky** on 9 Sept 2003, 7:42 p.m.,*
in response to message #17 by Diego Diaz

It is interesting, that same ideas and arguments are recycled over and over again. :-)

The low power microcontrollers (with 3.x V power supply)really does not work reliable with HP-41. I already tried it. So, MPS430 or Cygnal are not usable. Others have timing problems when it comes to wake-up from sleep (for example Atmel ATMega, PIC) etc.

BTW, did you tried to look at the power consumption of external oscillators ? I tried and it seems that the average external oscillator consume 3x more power that the PIC or ATMega at full speed. I think that the only solution is to use normal crystal attached to the PIC and use a smart software. The PIC must be in the SLEEP state when the calculator is switched off. There is enough time for 1024 Tosc cycles, because the ROM-module access is not needed at least for several HP-41 instruction cycles. It seems that it should be OK, if PIC start to work when the calculator is in Standby mode, just after the pressing the ON button. When the calculator is switched off (ON button pressed once again), the PIC can do to sleep.

The only problem is, that the PIC will consume power when the HP-41 is in Standby mode. Personally, I can live with it.

This URL (http://members.fortunecity.de/aerobat/index.html) is dead for me since today? Has anybody still access?

Christoph

Re: URL

*Message #4 Posted by **Daniel Diggelmann** on 10 Sept 2003, 6:25 p.m.,*
in response to message #3 by Christoph Giesselink

Hi Christoph,

Many thanks for letting me know. It seems I have been suspended from FORTUNE CITY. They can just delete any home page which doesn't comply with the rules. If that happened I don't see what I did wrong. The only thing I remarked when calling my classified ads from the office is that our firewall blocked a popup or something which is on their "black list". Does anybode have more experience with this kind of problems. It was my first attempt whith a free webhsting service. I'll possibly change to another provider. Sorry for any inconvenience caused. I still got the classified ads. I'll se what I can do with them.

Best Regards Daniel

Re: URL

*Message #5 Posted by **Wayne Brown** on 11 Sept 2003, 1:15 p.m.,*
in response to message #4 by Daniel Diggelmann

Free web-hosting services often prohibit any sort of commercial or profit-making activities. They might have misinterpreted your classified ads as some kind of business activity. Perhaps it would help if you email them and explain the real purpose of your ads.

Re: URL

*Message #6 Posted by **Raymond Del Tondo** on 11 Sept 2003, 7:04 p.m.,*
in response to message #3 by Christoph Giesselink

Not for Daniel's home page, but I can still edit my ad.

BTW: I also have an edit button in your ad. The other ads from Christoph K., Matthias, and Daniel only have their email link, of course. How come?

Raymond

I repaired my 15C back plate

*Message #1 Posted by **bill platt** on 8 Sept 2003, 5:14 p.m.*

Some time back, I posted with a question regarding repairing the back of my 15c, where the metal plate was peeling up. A number of helpful comments were posted, and so I got to work! Following Randy Sloyer's suggestion, I first removed the rubber feet, disconnected the screws, and took care in lifting the back of the calculator off, so as not to lose the Electrostatic Discharge spring connectors (thanks for the head's up Randy!).

Then, I soaked the back in heptane. now, I remember being able to buy heptane in 1 gallon quantities back in the city (Philadelpha) but now I am in the country--so I used "white gasoline" instead (camp stove gasoline, aka naptha (but not *real* naptha)). I used a narrow, very sharp "k-bar" knife to gently pry the back off--which of course caused it to roll up a bit. Once I had it off, it was generally easy to flatten it using a rolling pin. (In retrospect, one of my cooking knives is even thinner and would have been better).

Finally, with all the glue residue cleaned off, I applied double sided carpet tape to the calculator back, and then applied the metal plate, working from middle to edges. I may go back with a "vacuum bag" to suck it down really tight. (Vacuum bagging is a common practice in the production of high quality fiberlgass or "composite" parts. You merely put a plastic bag around the part that needs to be squeezed, and suck out the air. the result is 14.7 psi pressure on the part).

Mistakes made:

I was impatient. This is always a problem to be dealt with. In a moment of indescretion, I slopped a bit of acetone into the glue joint---having forgotten that the calculator is made of polystyrene! Acetone dissolves PS, and so some of the "tooth" is gone from the outside, and I have discoloration and a permanent fingerprint. Oh well, I knew better, so serves me right!

In peeling the back off, before I rummaged around for a really narrow knife, I started out the cleaving process using a too-dull knife, and this left some permanent ridges in the back --maybe 3 mil (0.076 mm) deep--which were not removable with the rolling pin. Perhaps a small printing press would do the trick--but then I might damaged the silkscreened back labels.

It is interesting to note that in the original construction, a double-sided tape was used--both for the feet, and for the plate, though they are of different kinds--perhaps in order to deal with the higher compliance of the rubber feet, a more compliant tape was used there.

I have flatbed scans of the pieces, if anyone would like to see them, please e-mail me at bill at plattdesign dot net.

Best regards, and thanks again to all who posted help,

Bill Platt

Zapping NiCd cells

*Message #1 Posted by **Renato** on 8 Sept 2003, 4:24 p.m.*

I tried an alternative for zapping battery cells. I used a current/voltage controlled DC supply, instead of a large capacitor. Without any connection to the DC output, I set a 20V voltage limit, with a low current (300mA) limit. After the output voltage is stabilized, I connect positive output to cell +ve, and negative to cell -ve : ZAPPP.

So far so good, and much less clutter than using a capacitor.

HP45 self-tests?

*Message #1 Posted by **barry** on 8 Sept 2003, 4:06 p.m.*

any self-tests for the HP45? tnx! barry carson city, nv

Re: HP45 self-tests?

*Message #2 Posted by **Bill Wiese** on 8 Sept 2003, 4:19 p.m.,*
in response to message #1 by barry

Hi Barry

IIRC, I don't think any of the Classic or Woodstock calcs had self-test code - ROM space was just too precious.

Bill San Jose CA

Re: HP45 self-tests?

*Message #3 Posted by **barry** on 8 Sept 2003, 4:49 p.m.,*
in response to message #2 by Bill Wiese

would you or others please recommend a good procedure for checking the unit out before putting it up for auction/sale? in beginner parlance, of course! it just had the cadmium pack rebuilt by Batteries Plus, unit powers up nicely, etc, but i would like to be able to state in the ad that i feel reasonably safe that the item performs as stock. no manual on hand! tnx in advance, barry PS: i know, i'm going to have to breakdown and purchase the CD!

Re: HP45 self-tests?

*Message #4 Posted by **Bill Wiese** on 8 Sept 2003, 8:14 p.m.,*
in response to message #3 by barry

Hi Barry...

I commend you on your trying to be a good-faith seller and caring about what your purchaser buys.

See that entering 8.888888888 [CHS][EEX] 88 [CHS] results in a display of "-8.888888 -88" (oops, might have gotten one too many '8' digits in the mantissa).

See that every key "does something". See that you can store and recall numbers into the memories. See that changing one memory doesn't wipe out another's contents.

On a calc like an HP45 if a few calcs work and the keys work and the display lights OK then you're pretty well off. If anything failed in the ROM or ACT chip the whole calc would've gone haywire. (Not necessarily true of higher-end later programmable calcs.)

Get another sci calc (even cheapie non-HP is OK). Run them back to back for several calculations on log & trig functions. They won't be exactly the same (HP's prob better!) A good test:

[9][sin][cos][tan][f][arctan][f][arccos][f][arcsin]

should end up with a number close to 9:

9.004076644

is what the Calculator Forensics project at http://www.calcinfo.com says the HP45 produces.

Bill Wiese

San Jose CA

Re: HP45 self-tests?

*Message #5 Posted by **Ernie Malaga** on 8 Sept 2003, 10:20 p.m.,*
in response to message #4 by Bill Wiese

When performing these tests on the HP-45 and HP-65, remember that the contents of R9 is corrupted by the execution of certain operations. Don't be concerned if RCL 9 gives you garbage you didn't put there; that's "normal" on these two machines.

The operations that corrupt R9 are all trigonometrics (including polar/rectangular conversion) and, in the case of the HP-65, the logical tests (such as x=y?, etc.).

-Ernie

Re: HP45 self-tests?

*Message #6 Posted by **David Smith** on 9 Sept 2003, 4:06 p.m.,*
in response to message #1 by barry

A really quick and dirty test of HP machine internals is to press E+ (the summation key) twice. You should see "2" in the display. This exercises a lot of the CPU and the memory chip. Recommended for all HP25 machines in particular... way to many of them will say "1" because the RAM chip is toast.

And test the display by entering -8.888888888E-88.

is the display test good for all?

*Message #7 Posted by **barry** on 9 Sept 2003, 10:48 p.m.,*
in response to message #6 by David Smith

i'm guessing this is true for all displays as it lites up all segments?

Re: is the display test good for all?

*Message #8 Posted by **David Smith** on 10 Sept 2003, 5:42 p.m.,*
in response to message #7 by barry

Yes, the idea is to light up all possible segments. It is also a good idea to punch in all all 10 possible digit displays and a 1-9 display. You could have a shorted display segment that would not show up with all 888888888. I had a machine that showed the "1" digit weird.

HP-49G+ keyboard issue

*Message #1 Posted by **Daniel Diggelmann** on 8 Sept 2003, 3:25 p.m.*

I tried to find out what the reason could be for the keyboard problems with the new HP-49G+. First of all the keyforce is too high. Secondly sometimes keypresses are not recognised. Look at the HP-41 ENTER key at the bottom of my homepage: http://members.fortunecity.de/aerobat/index.html The red dot shows the point where force is applied to the new keyboard whereas the nicely molded 41-key had it in the middle. So clearly the force must roughly double. I could imagine that changing to the original design would bring back the nice keyclick we all wanted. But this would require changing the key molds as well as the PCB layout which is a mayor cost factor. What do you think?

Re: HP-49G+ keyboard issue

*Message #2 Posted by **dbrunell** on 8 Sept 2003, 4:56 p.m.,*
in response to message #1 by Daniel Diggelmann

Daniel, thanks for putting up the great pictures so that the rest of us can see the HP49G+ up close. Making the change you suggest would indeed reduce the force necessary, but it would also increase key travel. How does the 49G+ key travel compare to the 41C? I'm inclined to believe that changing the leverage would not affect the reliability of contact closure. That would be more a factor of the dome design and materials used. The classics had gold plating on the PCB.

Re: HP-49G+ keyboard issue

*Message #3 Posted by **andy** on 8 Sept 2003, 8:40 p.m.,*
in response to message #1 by Daniel Diggelmann

Does the 49G+ has the same 3D rotation that the original 49G ?

Re: HP-49G+ keyboard issue

*Message #4 Posted by **Daniel Diggelmann** on 9 Sept 2003, 7:11 p.m.,*
in response to message #3 by andy

The HP-49G+ has got the same functionlity as the HP-49G. Just everything works a lot faster :)

HP 71b Metal-back vs Plastic Back: Robustness

*Message #1 Posted by **Neil** on 8 Sept 2003, 3:06 p.m.*

I recently managed to acquire an HP 71b, metal back version, dated 1984 (sw version 1BBBB). I have read almost everything on the 71b found in the forum archives since I got this model and the consensus seems to be that the plastic back version is much more robust, and even if it does go faulty, it is straightforward to open up and repair. Contrast this with the metal back version which appears to have a flexible connector which is prone to corrosion, and if it goes faulty then is awkward to open up and repair. So, I am wondering, is the metal back version really that bad compared to the plastic back one? Is this corrosion due to extensive use outdoors, in wet or humid climates?

Any other plus and minuses to the metal back version?

Re: HP 71b Metal-back vs Plastic Back: Robustness

*Message #2 Posted by **Gordon Dyer** on 8 Sept 2003, 3:25 p.m.,*
in response to message #1 by Neil

I have 3 71B's, all with metal backs and no corrosion problems. I suspect that the plastic back was for cost saving.

Re: HP 71b Metal-back vs Plastic Back: Robustness

*Message #3 Posted by **Neil** on 9 Sept 2003, 3:27 p.m.,*
in response to message #2 by Gordon Dyer

Hi Gordon,

How long have you had your 71b's and have you used them extensively?

Re: HP 71b Metal-back vs Plastic Back: Robustness

*Message #4 Posted by **Gordon Dyer** on 9 Sept 2003, 6:18 p.m.,*
in response to message #3 by Neil

I liked the look and spec of the 71B during the late 1980's but never used one. Then 2 years ago I saw one advertised and bought it, then 2 more! I havent used them extensively but just occasionally I find some time to have a go.

HP Conference in Orange County CA - 9/20-21

*Message #1 Posted by **Guy Ball** on 8 Sept 2003, 3:00 a.m.*

I have no connection to the organizers, but I just wanted to pass the word that this year's HP Handheld Conference will be held in Newport Beach, CA this year on Sat./Sun., Sept 20/21. This is the premiere HP calculator and handheld device users event held every year by a diehard collection of HP enthusiasts/volunteers. This year, HP itself will be there, talking about and showing off their newest calculators. For more information, visit their site at http://holyjoe.net/hhc2003/index.htm The event cost is probably going to be about $50 for the two days. Word has it that HP may even be footing the bill for the conference dinner on Sat.

Re: HP Conference in Orange County CA - 9/20-21

*Message #2 Posted by **Paul Brogger** on 8 Sept 2003, 1:18 p.m.,*
in response to message #1 by Guy Ball

It would have been nice to have known about this a couple of weeks ago, to save on air fare, etc. (I've relatives in So. Cal. & could have made a very economical trip of it . . .)

What should I watch for early info regarding next year's event?

Re: HP Conference in Orange County CA - 9/20-21

*Message #3 Posted by **Arnold Steekelenburg** on 8 Sept 2003, 1:57 p.m.,*
in response to message #2 by Paul Brogger

Hi Paul,

The website of Joe Horn (holyjoe.net) is the one to watch. Every year around june Joe updates the site with information on that years event. Or watch newsgroup coms.sys.hp48. When the dates are set the newsgroup receives a post.

Arnold

Earlier Warning Was Here

*Message #4 Posted by **Dan M** on 8 Sept 2003, 2:31 p.m.,*
in response to message #2 by Paul Brogger

Jake Schwartz gave the info in this Forum this past June.

Early Warning Here

Watch Holyjoe.org, as mentioned, or join a discussion list for more info or warnings.

Dan M. </P>

in response to message #4 by Dan M

Well, I guess I missed it . . .

Thanks to those who've posted the announcements, and I'll keep my antennae up for similar posts in the future. (I suppose if I frequented a few more sites, I might be a bit better informed!)

HHC: financial aid?

*Message #6 Posted by **Brandon Del Bel** on 8 Sept 2003, 3:41 p.m.,*
in response to message #1 by Guy Ball

Man, I would really love to go to this, but the cost of the conference and a hotel room is rather prohibitive for a college student. *sigh*, I'll probably just suck it up and pay, but I at least want to check into all of my options. Let me know if there is any assistance available; thanks.

Brandon Del Bel

Re: HHC: financial aid?

*Message #7 Posted by **Guy Ball** on 9 Sept 2003, 11:47 p.m.,*
in response to message #6 by Brandon Del Bel

Unfortunately the conference is paid for by a bunch of HP calculator users like you and me who just hope to break even. This is definitely not a high-powered, business type affair. No COMDEX here. Just a bunch of HP fanatics (and you know who you are) -- many who were there when the HP thing got started 30 years ago. I'm a newbie when it comes to this. So I look in awe at their continued efforts! Take a look at the type of presentations to get a good feel for the type of conference it will be: http://holyjoe.net/hhc2003/index.htm -- towards the bottom of the page.

Re: HHC: financial aid?

*Message #8 Posted by **Brandon Del Bel** on 10 Sept 2003, 12:30 a.m.,*
in response to message #7 by Guy Ball

yeah.. I just had to ask anyway; hopefully I'll be able to split a room with someone to cut costs.

in response to message #1 by Quemazon

I have a 15C in the exact same condition.

My opinion has always been that this is simply as a result of taking the machine in and out of its case. Even if you otherwise treat the calculator with the utmost respect, that friction from the case eventually exacts its toll.

I have a number of other Voyagers which show logo paint wear -- the paint is partially rubbed off for some distance from the edge of the logo. That's the forensic evidence which leads me to my opinion.

Re: 11C non-painted logo

*Message #3 Posted by **Gordon Dyer** on 7 Sept 2003, 10:11 p.m.,*
in response to message #1 by Quemazon

I think that when the paint is badly worn some owners then rub it all off deliberately (my mother did this to her gas cooker markings!).

Re: 11C non-painted logo

*Message #4 Posted by **Randy Sloyer** on 8 Sept 2003, 7:08 a.m.,*
in response to message #3 by Gordon Dyer

Most of these are made of metalized plastic. The chrome is very thin and wears off. The very early ones where make of die cast zinc and hold up better.

You can repaint with chrome model paint or a paint marker pen. Sharpie markers now have a silver metallic ink pen which works quite well.

12c rubber feet

*Message #1 Posted by **Mike** on 7 Sept 2003, 2:26 p.m.*

What type of glue should I use to reattach the rubber feet? One of them just now fell off. Its age is # MY73400494

Re: 12c rubber feet

*Message #2 Posted by **David Smith** on 7 Sept 2003, 3:13 p.m.,*
in response to message #1 by Mike

The feet are held on by double sided sticky tape. The 3M stuff in the little dispensers sold at any office supply store will work, but carpet tape available at hardware stores is stickier and works better.

hp86b hpib dip switch setting

*Message #1 Posted by **Andy** on 7 Sept 2003, 12:46 p.m.*

My hp86's hpib dip switch(s) is internal. There are 10 switchs on the small red panel.

I would like information on their settings so I can utilize the hpib port.

Thanks,

Andy

What is this on eBay??

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 6 Sept 2003, 11:35 a.m.*

Hi all, take a look at this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3045612562&category=11712

I also see one with the picture of the 49G...

Comments??

Nelson

I won't be paying to find out

*Message #2 Posted by **Patrick** on 6 Sept 2003, 11:48 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

This guy is very aggressive and puts a very similar ad into eBay next to a picture of every kind of electronic doo-dad you can possibly think of. No matter what you are searching for, he wants you to find his one product.

To his credit, he makes it very clear in the ad itself you are not actually buying anything physical, just information.

I certainly wont be prospecting for gold with this guy. He may very well have some useful info, but there are just too many people out there trying to fleece you to make it worth finding out.

My approach with all of these too-good-to-be-true offers is that (real-estate no-money-down is the prime example), if the scheme does work as well as they say, why aren't they out there doing it and making those huge profits instead of spending their time like this selling a handfull of items for a few bucks each?

Re: I won't be paying to find out

These ads are against eBay rules

*Message #4 Posted by **Mike** on 7 Sept 2003, 12:00 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

and when reported are removed.

Report any such add that is just selling info links to other "FREE" stuff. It's all bogus and against ebay terms. It is essentially selling info to buy outside ebay but is really just a SCAM anyway.

Do search for FREE HP and you can find many.

Bet this one is gone within an hour.

Edited: 7 Sept 2003, 12:02 a.m.

Custom HP-11C?

*Message #1 Posted by **Patrick** on 6 Sept 2003, 3:34 a.m.*

Did HP or anyone else ever offer a customization service for HP-11C's or other Voyagers. Take a look at this auction which shows an 11C like machine with strange keyboard markings. They appear to be very well done, not haphazard. It also appears that certain keys now have new functions. Very strange.

Re: Custom HP-11C?

*Message #2 Posted by **R Lion (España)** on 6 Sept 2003, 4:37 a.m.,*
in response to message #1 by Patrick

I saw this (or other like this calculator) on ebay some time ago. The seller canceled the auction when he realized he had a special unit...

It's only an overlay

*Message #3 Posted by **Randy Sloyer** on 6 Sept 2003, 8:56 a.m.,*
in response to message #2 by R Lion (España)

Since the Voyagers have a USER mode, there where custom programs developed that simply mapped the unique functions to different keys. Based on the sellers description, I think this is a horse handicapping program ported from the 41.

The different legends are on a sticky sheet pasted onto the calculator. The real bezel should be underneath. If not, they just peeled it off and stuck on their own.

No different than 41 or 48 overlays.

NBD (No Big Deal)

Edited: 6 Sept 2003, 9:01 a.m.

Re: It's only an overlay

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 6 Sept 2003, 11:22 a.m.,*
in response to message #3 by Randy Sloyer

The HP-11 have the "User" mode, but it only swaps the function of the first 5 keys of the first row. You can call the labelled functions "A" through "E" without using the "G" shitf, but the original functions are called using the "G" shift. I really thing that it is a customized HP-11C with different keyboard faceplate and ROM. My 2¢...

Regards,

Nelson

Re: It's only an overlay

*Message #5 Posted by **Patrick** on 6 Sept 2003, 11:38 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Yes, not sure about the overlay theory. I think there are custom key labels here that cannot be explained by user mode or through "GSB X" key combinations.

It still could be an overlay

*Message #6 Posted by **Victor Koechli** on 8 Sept 2003, 4:55 a.m.,*
in response to message #5 by Patrick

The custom labels are only on the A through E, R/S and RCL keys. The keys themselves are all original. I really think it's just an overlay designed for a specific program.

Just my 2 cents. Victor

Aurora FN1000 available at Fry's

*Message #1 Posted by **Mike Sebastian** on 5 Sept 2003, 10:37 p.m.*

The Aurora FN1000 financial calculator is available at Fry's for $24.99. The Arlington, Texas, store had several. Yes, it is RPN and has a four register stack. And, while it appears to be inspired by the 12C, there are differences.

Another HP calc. on eBay using hpmuseum pictures!

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 5 Sept 2003, 9:15 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3045535039&category=11713

Is so hard to get a real picture? Or the item is in so bad shape?? This don't smell right...

Re: Another HP calc. on eBay using hpmuseum pictures!

*Message #2 Posted by **Patrick** on 5 Sept 2003, 9:44 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

With a zero rated seller, no less. Caveat emptor.

Re: Another HP calc. on eBay using hpmuseum pictures!

*Message #3 Posted by **Mitch** on 5 Sept 2003, 11:31 p.m.,*
in response to message #2 by Patrick

Everyone has to start with zero. He just needs to be asked questions before bidding. Looks like he can post pics of calc he is selling because he has other items for sale that looks like he took pics of. Also he doesn't say how much shipping will be, have to ask ahead otherwise he could be surprisingly high.

It will be available around sep. 24th check samson cable at
http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=360

Re: HP 49G+ calcs for sale in the US?

*Message #9 Posted by **Ben Salinas** on 9 Sept 2003, 7:35 p.m.,*
in response to message #8 by Eddie

I have reason to believe that it will be released in stores on October 6th (although webstores might recieve them earlier). Today a press release about my winning the HP contest was released by my school district (i will link you as soon as it is online) and it said "a pre-launch edition of the HP 49g+ graphing calculator scheduled for release in stores on October 6 at a suggested retail price of $175.99" I am expecting that my district got the information from HP. Furthermore, at this mini-press release at my school they will be talking about the release of 3 new calculators which will be released in October (i am guessing the 48gII, the 33s and the 49g+). -ben

HP97 keyboard

*Message #1 Posted by **Chan Tran** on 5 Sept 2003, 8:52 a.m.*

I have a 97 and it's very nice. The main keyboard kind of losing the click and I have to press them pretty hard to make sure they registed. I hope someone would suggest a cleaning and or repairing technique.

Re: HP97 keyboard

*Message #2 Posted by **Katie** on 5 Sept 2003, 11:15 a.m.,*
in response to message #1 by Chan Tran

The 97 keyboard doesn't "click" so I assume that you mean that the key press isn't making good contact. Anyway, it's pretty easy to disassemble the 97 keyboard and clean it.

Once you open the 97 case (6 screws) there are another few screws to remove the keyboard from the top of the case and then a bunch more screws to remove the contact PCB from the keyboard itself. But you don't have to worry about any pieces falling out, all the keys and springs are kept in place by caps on the end of the key stalks. Just clean the gold plated contacts and the gold plated contact matrix with isopropyl alcohol and that should fix your problems.

Re: HP97 keyboard

*Message #3 Posted by **David Smith** on 5 Sept 2003, 5:37 p.m.,*
in response to message #1 by Chan Tran

The HP97 service manual is on the HPMUSEUM CDROM set. When taking apart the HP97 keyboard, note the relative positions of the gold keyboard contact sheet and the two white plastic spacer sheets. Different machines have them in different orders.

Re: HP97 keyboard

*Message #4 Posted by **Chan Tran** on 8 Sept 2003, 8:48 a.m.,*
in response to message #3 by David Smith

Thanks all for the posts. I will try to clean the keyboard. I also have an offer for a keyboard. I think it would be just fine. Thanks.

Re: HP97 keyboard

*Message #5 Posted by **Gordon Dyer** on 8 Sept 2003, 3:23 p.m.,*
in response to message #3 by David Smith

My HP-97 had the white spacer sheets together on the smaller keys and either side of the gold contact sheet on the larger keys. The manual shows a white sheet either side of the contacts. I reassembled it with white spacer sheets either side of the contacts for both sets and it now feels better and seems very reliable. I wonder if the assembly line used the spacer sheets to better position the contacts, or was it just poor quality assembly???

Re: HP97 keyboard

*Message #6 Posted by **David Smith** on 8 Sept 2003, 3:32 p.m.,*
in response to message #5 by Gordon Dyer

Almost all the HP97 machines that I have seen have had the two sheets together. I had a machine with lots of flakey keys and a spacer sheet on each side of the contacts. I reassembled the keyboard with the spacer sheets together and all the problems went away.

HP 49G+ now available

*Message #1 Posted by **Juergen (CH)** on 5 Sept 2003, 5:26 a.m.*

Just saw that a reseller in Switzerland now sells the HP 49G+. Anyone out there who already bought one and can tell us about keys, speed, color scheme, ... ?

I'm looking forward to see the first review here on this forum.

Regards, Juergen

Re: HP 49G+ now available

*Message #2 Posted by **Daniel Diggelmann** on 5 Sept 2003, 8:23 a.m.,*
in response to message #1 by Juergen (CH)

Hi all,

The first batch of HP-49G+ arrived in Switzerland yesterday. I preordered one a few days ago and received it today. I'm actually quite impressed how HP came back to the calc market. The calc looks very good with appealing colours. The finish is of good quality. It came in a cardboeard box, USB cable, german manual, CD. What I really like is the genuine leather case with magnetic catch as seen on some ladies handbags. The calc's case feels sturdy and the LCD is of very good contrast. The keys are of hard plastic and do have the good old hinge on the bottom side. They have a very strong click. For me it's very important to be able to do fast entries. This has improved over the HP-49G. But sometimes (seldom) it clicks and the calc doesn't read the key. My calc has got one key y^x which needs s specific pressure (it actually seldom works). I'll return the calc for a replacement after having played whith it. The speed of the calc is very comfortable and plots are very fast compared with the HP-49G. As mentioned on comp.sys.hp48 the speed is 3-5 times the HP-49G. There is a IR port but it doesn't work with my HP-82240B printer. What surprised me a bit is that the installed batteries were already dead. Counting in that this is a brand new product I just hope that it doesn't consume huge amounts of power. Bear in mingd it's a 75MHz CPU! But on most PDAs it's actually the background lighting of the LCD which eats a lot of power. The port is now IrDA compatible which makes sense. With the SD card it should be possible to have all programs from HPCALC.ORG on-board :) All in all I'm happy with HP's new creation. More comments to come soon.

nitpicking on this silly post.

*Message #8 Posted by **christof (NoVA US)** on 5 Sept 2003, 11:47 a.m.,*
in response to message #6 by Veli-Pekka Nousiainen

Look- I *did* look at the site. I have been there several times over the past few weeks. I said- not the pictures i'm looking for.

Agian, to be clear: the site lacks additional photographic information I am interested in. I have been to the site. Many times.

Okay, let's get into it, then.

1: the main photo on the page is an obvious marketing picture and has no real 'how it feels in the hand' referents.

2: the close up photos of the usb and sd ports don't give us a lot about the case construction, just 2 limited views of the slots.

3: there's no photo of the manual (a sample page isn't a manual) nor the case at all.

4: How's the screen look in light? what's the contrast like? Marketing photos are NEVER right in that regard.

Now, can you stop implying I'm incapable of web browsing? :)

in response to message #11 by Raymond Del Tondo

My HP-20S, 30S 48G, 6S, 38G don't have any Keyboard problem. Even my HP-49G, no contact problem ,it's just a bad feeling but no problem with newer keyboard for me. The only calcs i have with keyboard problem is my C, CV and CX HP-41's halfnut (none of my fullnut have problem) And a lot of my older TI calculators ;-) have problem of bouncing ;-)

Manuals on CD are the worst marketing invention of the past ten years. Did HP give a free computer in order to read the CD ? What about peoples who don't have a computer (yes, that still exist) ? And if you want to bring your calculator on travel ? Do at least Hp offer a paper manual on request ?

All the Best

Pierre

0-for-1 on Working Keyboards?

*Message #21 Posted by **Paul Brogger** on 5 Sept 2003, 5:10 p.m.,*
in response to message #2 by Daniel Diggelmann

I appreciate the several positive points mentioned, but I find this early report of keyboard trouble worrisome, especially in light of what folks have said about 10Bii keyboards. Problems already in a sample of size=one. Ouch!

Re: 0-for-1 on Working Keyboards?

*Message #22 Posted by **dbrunell** on 6 Sept 2003, 1:03 a.m.,*
in response to message #21 by Paul Brogger

One solution to this problem is to keep returning your calculators to the store until you get a good one with no bad keys (assuming one exists). If everyone does this, the rejects will pile up at HP pretty quickly and they will learn the benefits of designing things correctly the first time. Sadly, they once understood this. True, the old HP used to turn out occasional bad products, but usually it was because of the engineers trying to be "clever." The solderless Spice series and the battery door on the 28S come to mind. Now it's just junk.

I have an assortment of HP classics, a TI-92 plus with a fantastic RPN shell (and a large ENTER key :), and an iPAQ. Of what value would a 49G+ be to me if the keyboard stinks?

Re: 0-for-1 on Working Keyboards- BUT

*Message #23 Posted by **christof (NoVA US)** on 6 Sept 2003, 2:34 a.m.,*
in response to message #22 by dbrunell

Wow-

(great pictures.)

given the photos, I have to say that this looks like an amazing beast. the display really is a step up, probably better even than the 32Sii contrast.

I'm willing to see how the keyboard works out, but I'll say that (and I have a ti89, as well as 48sx/gx and 49g) this looks like a winner. In terms of speed, adaptability (someone will shortly put onboard assemblers in), and usability (aside fromt he possibly bad keyboard) this beats the 89 hands down. I'll bet it's a matter of months before usb keyboard drivers appear for those of us who like to develop onboard, too :)

Overall I think that the design team has made massive improvements in looks. The calculator is actually pretty again- and the case is a drastic improvement over the recent trends of calculator slide on covers.

I'm personally pretty excited (not quite enough to struggle with a german manual, though).

(and great pictures!)

-Christof

in response to message #21 by Paul Brogger

I don't know how much I'd make of the keyboard reports so far. I think I would wait until it is actually introduced in the US, whenever that is.

Early models are often in a state of flux. Imagine the mess the 41c would have been in had the internet existed in the first few weeks when bugs were found.

HP knows the keyboard is important. I am sure they read the letters about the 49G's terrible keyboard.

They appear to be back in the market to stay and if these first ones aren't as good as we like, give them the benefit of the doubt and a few weeks / months to respond...or just wait until the intro is official, at least. :-)

Gene

Re: Hi Gene... Now 0-for-2 with regard to Working Keyboards???

*Message #27 Posted by **Paul Brogger** on 8 Sept 2003, 9:20 a.m.,*
in response to message #26 by Gene

Note I didn't say it's the end of the world, just that I'm worried . . .

[BTW, it appears (unless I've misread things) that two out of two reports mention keyboard quirks. Double-ouch!]

And, to compound the worry: if anyone thinks the HP calculator division, anxious to show

profitability on these new products, is going to trash their initial production run *and* the internal keyboard designs and spruce things up (to release an HP-49G+iiBetaSuperSportUltraModified?) -- well let's just say that I'm guarding against over-optimistic thinking.

Now, if H-P can exert some serious pressure upon its supplier... well that's another matter entirely. I hope they wrote some sort of "acceptance clauses" into their contract with Kinpo (or whomever)!

Re: Hi Paul... Early in the game :-)

*Message #28 Posted by **Gene** on 8 Sept 2003, 9:48 p.m.,*
in response to message #27 by Paul Brogger

Again, I am just trying to get people to wait until it's been available in the US before jumping to conclusions. I don't think these very early 49G+ are going to be indicative of the way things will be soon. There are always kinks early. Just look at the 41c..."Not saving x to lastx when pressing Sigma+? How dare they!"

:-)

HP knows the importance of the keyboard...just look at the return of the "click".

I am confident in the HP future.

Re: HP 49G+ now available

*Message #29 Posted by **Juergen Rodenkirchen (GER)** on 6 Sept 2003, 2:34 p.m.,*
in response to message #2 by Daniel Diggelmann

Daniel, thanks a lot indeed for this first review of the new HP49G+. As I can see from the pictures that you put on your web-site (thanks again), the manual included in the package probably is just the "Quick Start Guide". As Eric reported at hpcalc.org regarding the new HP48GII,

> Quote:
>
> I also have a copy of the first 175 pages of the 48GII documentation (this is the "Quick Start" guide). The first production calculators will only come with the Quick Start Guide, but there should be a coupon included to receive the full manual (800 pages or so) free of charge.

I was wondering if this is also true for the 49G+. So, my question if the package actually does include such a coupon for the complete manual?

Regards, Juergen

Re: HP 49G+ now available

*Message #30 Posted by **Daniel Diggelmann** on 6 Sept 2003, 7:07 p.m.,*
in response to message #29 by Juergen Rodenkirchen (GER)

Hi Juergen,

My package didn't come with a coupon. The printed manual is a quickstart manual but it's quite good. The CD includes a PDF file with almost 1000 pages! This manual is very good and seems to be from G. Urroz which wrote the two manuals for HP-49G. All in all the HP-49G+ is an interesting machine. On the other hand the keyboard can be a knockout criterium for a calc. In my opinion todays the main reason to use a calculator instead of a PC is the ease of keying-in numbers. Ol' HP did use to have not

only excellent software, good manuals but also very very good keyboards. And they should definitely find a way to improve the keys of the new calcs. I mean compared to a HP 30S the HP-49G+ is much more HP look and feel (except for the keys). But they seem to have tried to redo the hinged keys. They just did not get them right first time. The thing is that a quality check on the prototypes would have shown this in the very first minutes of operation. But I'm positive that HP will work on it or they will loose the calc market completely. Students and professionals need a calc to do their number entries without always checking the display. To sum it up: Except for the keys the HP-49G+ is certainly the most powerful calc availabe. The next thing I will check is the power drain compared to the HP-49G. I'll measure this with a HP-3468A Digital Multimeter connected to the HP-41CX :) Stay tuned...

Why did HP stop building the HP 15 and 16c?

*Message #1 Posted by **Joe Edwards** on 4 Sept 2003, 6:07 p.m.*

I was just looking thru HP's website and I see the sell the 12c. Can anyone explain to me what they stopped making the 15c and the 16c? It seems that the 15c would still have a great deal of value...its size and capabilities outweigh the size of my TI-83+ I have to use in class. I would much rather pull out a small calculator like the 15c for quick number crunching, but I don't want all the financial calculations as I still need the scientific calculations.

Thanks.

Joe

in response to message #1 by Joe Edwards

It's like anything else that is a perfect product. It's good, it's in demand, it's useful, therefore it must be discontinued?

Re: Why did HP stop building the HP 15 and 16c?

*Message #3 Posted by **Frederic** on 4 Sept 2003, 7:29 p.m.,*
in response to message #2 by Richard Garner

I remember someone saying that about the Volksvagen "beetle" original edition! And they stop produce it too. Today the vast majority of drivers won't buy a volks "bug" even if they were still produce; they prefer Honda Civic or a Hyundai Santa Feeee!

Not enought scientists and eng. to buy these tools but enought businessman, bankers and students for the 12C!

Lack of business sense :-)

*Message #4 Posted by **Mike** on 5 Sept 2003, 11:56 a.m.,*
in response to message #1 by Joe Edwards

There is no doubt in my mind, that if HP started selling the original HP-15C, that it would be one of the most popular calculators of all time. It would sell far better than any of HP's current calculators. The 10 series is **the only shirt pocket calculator**, that HP has ever made. That makes it a strong seller.

If you walk through most engineering departments, you will see the 15C or 41 used more than just about any other calculator.

The 15C is still heavily used, hence it's high costs. I had a friend that had his 15C stolen on a business trip. I gave him a brand new 48GX, for free, and he asked if I could get him a 15C. He much preferred the 15C.

hp85 trouble

*Message #1 Posted by **andy** on 4 Sept 2003, 10:32 a.m.*

My hp85 has a problem. It turns on, and it passes its self test. However, after ~1-2min it turns off and then back on again and hangs. If I tap on the corner (near the power switch) it will come back on. It of course sounds like some kind of intermitancy. I think I've traced the problem to a bad power switch. When I test the continuity across the switch in its "on" position, my meter reads closed for a while and then reads open.

Any thoughts? It seems like a high quality switch but I suppose it could certainly be to blame.

Andy

Re: hp85 trouble

*Message #2 Posted by **hugh** on 4 Sept 2003, 2:37 p.m.,*
in response to message #1 by andy

you could take the switch out of circuit and see if all is well.

Re: hp85 trouble

*Message #3 Posted by **Tony Duell (UK)** on 4 Sept 2003, 5:25 p.m.,*
in response to message #1 by andy

According to the HP85 service manual, the power switch is a double-pole unit that breaks both the live and neutral mains wires. I assume you realised this, and are checking each section separately. For testing you could try shorting out each section of the switch with a jumper wire (take care -- this is mains you're working with). If the machine then works (of course the power switch won't do anything if it's shorted out), then you know the switch is faulty. Again, from what I can see in the service manual, each half of the switch has 2 wires of the same colour, so to short it out you just link those 2 wires of the same colour together, and keep the 2 groups separate.

Re: hp85 trouble

*Message #4 Posted by **David Smith** on 4 Sept 2003, 5:41 p.m.,*
in response to message #1 by andy

If the switch is flakey, you can probably make it work again just by spraying it with contact cleaner. Most switches like this have sealed housings. I have successfully fixed many of them by drilling a small access hole in the side of the switch with a hand (pin vise) drill. I try to locate the hole away from probable internal workings like pivots or bearings. I drill in an upwards direction so that drill shavings do not fall into the switch.

Re: hp85 trouble

*Message #5 Posted by **andy** on 4 Sept 2003, 10:37 p.m.,*
in response to message #4 by David Smith

Well, its not the power switch. I de-soldered both wires from the switch and soldered them directly together. After plugging it in, it came up just fine for about 2 minutes and 10 seconds. Then the power light goes off, the screen goes blank, and the cassette light comes on.

Then I can give the unit a nice solid tap on the corner just above the power switch and it resets itself and comes back on (picking up on that corner does the trick too). Then it returns to its locked-up state with the cassette light ~10-15 seconds later.

Should I check the big transformer next? It seems like a power supply problem to me.

Any thoughts?

Thanks...

Andy

Edited: 4 Sept 2003, 10:42 p.m.

Re: hp85 trouble

*Message #6 Posted by **David Smith** on 5 Sept 2003, 5:40 p.m.,*
in response to message #5 by andy

I would try to start wiggling around wires and tapping around with a screwdriver handle to isolate where the intermittent connection or component is. These sort of things can be rather frustrating to find.

Re: hp85 trouble

*Message #7 Posted by **Tony Duell (UK)** on 5 Sept 2003, 5:51 p.m.,*
in response to message #5 by andy

The fact that the cassette light turns on means it's not the transformer. In these machines, the transformer porvides only one voltage, which is then regulated on the PSU board (the one on the side of the paper roll holder) to give all the voltages the machine needs. The fact that the power LED goes out implies that you're losing the +6V line (IIRC) from the CPU board. This does sound like an intermittant connection. I'd start by re-seating all the cables and connectors in the unit (especially those darn tape-like ribbon cables). Then I'd get the service manual (it's on the MoHPC CD-ROM set), and check the PSU voltages when the machine fails. Find out which one(s) you're missing, and from which PCBs.

TVM program for HP20S

*Message #1 Posted by **Chan Tran** on 4 Sept 2003, 8:16 a.m.*

I wonder if someone out there has a TVM program for the 20S. My wife needs those functions but she refuses to use any thing RPN or RPL. Thank you.

Re: TVM program for HP20S

*Message #2 Posted by **RR** on 4 Sept 2003, 9:44 a.m.,*
in response to message #1 by Chan Tran

You can probably program in a simple payment program, but with only 99 steps and NO SOLVER, you might not get a nice TVM program like the 12c or other Hp's.

The Hp21s has TVM via a loadable program (and I do have that out of storage). If it works well, and I can look at, I will post code so you can use on 20s (should work key for key).

But a far better and more reliable way to handle might be to buy an Hp10B (not the Bii, in this case).

Another approach is to buy an Hp38G and use its solver (Hp38G has nice HP quality keyboard). Or buy an Hp17B (cheaper than an Hp17Bii since it is NOT RPN selectable). Also Hp18C's sell fairly cheap (looks just like a 19B, but with a lot less RAM and no Trig)

If you can find it or get very lucky, an Hp27s is the calculator of choice (but you could get an Hp17Bii or Hp19Bii for less). An Hp22s also has TVM in a built in library, I believe.

If she doesn't mind colorful and rubber keys, an Hp49G has TVM and can be set to algebraic. Hp39G's are dirt cheap and behave just like the Hp38G's (aside from rubber keys) and give you access to lots more features ie RAM, programs, and other goodies.

Lastly, if you can bear it, a Ti-83 (graphics) or a BAII plus would work nicely. Both are actually pretty good, I just am Highly biased myself to Hp calculators.

Cheap and Fast solution: Buy an Hp10B. Simple easy to use calculator.

Best solution: Hp27s but $$$$ and hard to find.

I also like the Hp19BII+, but I can't say anything about the keys (I haven't touched one).

Re: TVM program for HP20S

*Message #3 Posted by **christof (NoVA US)** on 4 Sept 2003, 10:06 p.m.,*
in response to message #2 by RR

my votes-

the 20s is going to be rought to solve for, but you cna maybe do it.

the 10b (not ii) is great, and makes a matching pair with the 20s if she needs to do 'other math stuff' ever.

the 17Bii and 19Bii are probably the best, hands down- anytime you are dealing with finance you will have to deal with lists, equations (solver), and statistics. (and the 17Bii+ has a lot more RAM)

the 38G is really cheap, though :)

let me see how short any kind of usable tvm progrma can be....

Re: TVM program for HP20S

*Message #4 Posted by **bill platt** on 4 Sept 2003, 9:48 a.m.,*
in response to message #1 by Chan Tran

Hi Chan,

I programmed it in once, but in a very simple way:

I just translated the equation into the program space, but you have to know what you want to solve for, first--and arrange the equation to isolate the chosen variable. I am not sure if the 99 lines is enough so that you could have 4 different routines: for P, int, N and B (assuming no FV or initial value variation).

Regards,

Bill

Re: TVM program for HP20S

*Message #5 Posted by **Chan Tran** on 4 Sept 2003, 1:44 p.m.,*
in response to message #4 by bill platt

Thanks RR and Bill for the responses. I think I can get something working here but more suggestion would be greatly appreciated. Let me explain a bit about my situation here. My wife as in my original post won't use any RPN or RPL machine. She also won't let me make any purchase as she knows that I love to buy calculator stuff. For the calculators in my collection they are: HP20S HP32SII HP41CV and 41CX HP48SX and 48GX HP97 TI58C TI55 TI85

Now I am pretty sure that the TI85 can run some nice TVM program but I am not familiar with the thing and downloading software is not possible because I don't have the link cable. (buying the link cable is not an option). I am familiar with the TI58C so may be it's an option but since this is an HP forum I didn't want to post such a question. The HP20S is about the only other alternative.

Again thanks for any suggestion.

Re: TVM program for HP20S

*Message #6 Posted by **Adem Ordna** on 4 Sept 2003, 1:54 p.m.,*
in response to message #5 by Chan Tran

Kind ok clumsy but it works.

http://www.hpmuseum.org/software/20stvm.htm

Re: TVM program for HP20S

*Message #7 Posted by **bill platt** on 4 Sept 2003, 2:26 p.m.,*
in response to message #5 by Chan Tran

Hi Chan,

Your other option is to let her use the 32sii----you put the TVM equation into the equation list, and you can solve for any variable.

Or, if you are doing the 20s route, just translate:

Most likely, you want to find out hte payments, given a set initial balance and a fixed interest rate and number of payments. So:

Given that

-B = P*[1-(1+I/100)^-N/(I/100)] + F*[1+(I/100)]^-N

It is a simple matter to program your 20S to solve for -B: Just STO the appropriate values for payment ,interest, and number of payments, and then run a program that does this equation:

LBL A RCL P * (1 - (1 + RCL I / 100) y^x RCL N +/-) / (RCL I / 100) = + RCL F * (1 + (RCL I / 100)) y^x RCL N +/- = RTN

for the variables, use 0 for P, 1 for I, 2 for N, and 3 for F

If you enter exactly what is here, it will run fine.

Example, a 5 year used car loan at 4.8% APR, with 100 per month, and no value at end of the loan:

-B = $5324.89

so, first you store 100 in register 0, 0.4 in register 1 (that is, 4.8 / 12) and 60 in register 2, and 0 in register 3.

If you want to solve for P, you have to rearrange the equation and reenter it in the calculator. If you are lucky, it will fit along with this program, just as "label B".

There are 47 lines, and the checksum (assuming no other programs in memory) is 8A8b (leftshift show ["."] in program mode)

BTW, I entered this equation after writing it straight down, and ran it, and it worked fine. The 20S is a fine little simple algebraic machine!

Best regards,

Bill Platt

Edited: 4 Sept 2003, 2:29 p.m.

Re: TVM program for HP20S

*Message #8 Posted by **bill platt** on 4 Sept 2003, 3:34 p.m.,*
in response to message #7 by bill platt

OK, so here is the equation rearranged equation, solving for "P" (payment)

We assume that the operator can handle the -B business in the front end, so there is no +/- call. You can also save lines in both these routines if you make sure to enter the "N" as a negative number (then you can remove those +/- lines as wll).

Given: P = -B-F*(1+I/100) / { [1-(1+I/100)^-N] / (I/100) }

B = register 4, F = register 3, N is Register 2, I is register 1

LBL B RCL B (assumes -B is stored in B) - RCL F * (1 + RCL I / 100) y^x RCL N +/- (don't need this if N is saved as negative) = / ((1 - (1 + I / 100) y^x RCL N +/- (dont need this if N is saved as negative)) / (RCL I / 100 = RTN

I have not attempted to totally optimise this--saving a few lines where possible. But both porgrams fit!

Best regards,

Bill

Re: TVM program for HP20S

*Message #9 Posted by **Ron Ross** on 4 Sept 2003, 2:31 p.m.,*
in response to message #5 by Chan Tran

Sounds like the rest of us. I buy anyway, but have to wear earplugs on many occasions. Your Ti-58C is a poor substitute even if you have the finance module (but then agaaaain, you might make another Hp convert). But then I shouldn't need to tell you, since you do have one.

The Ti-85 does have some software available via download (I know, not an option) and it also has a simple solver that can easily handle the TVM eq. It is your best bet without shelling out any bucks under your constraints. It is superior to an Hp20s for versatility (quality and feel are a different matter). This was Ti's answer to the Hp48G (didn't quite measure up, but got them in the game). If you no longer have manual, Ti website either has or you could probably use an 86 manual for reference which is definitely available via download from Ti.

If the wife gets tired of carrying around a graphics, then suggest a $20-30 pocket calculator such as the Hp10b or the BAII+. I suggest the BAII+ for versatility, but the Hp10B is still a quality calculator (unlike the more recent 10Bii trash, I haven't played with the latest and very newest of course).

Good luck!

Re: TVM program for HP20S

*Message #10 Posted by **DougT** on 4 Sept 2003, 4:12 p.m.,*
in response to message #9 by Ron Ross

I have to agree with what Ron and some of the other folks have mentioned: sneak off and buy a dirt-cheap 10B! I bought one years ago for my wife, who also is RPN-challenged. She recently decided to get a "fresh" Casio or some other non-HP unit, so I sold the 10B for peanuts on eBay. They are nice, solid business calculators with decent keys.

I say, TAKE AWAY ALL OF THEM! (Except for a museum collection, of course).

(sigh)

Re: TVM program for HP20S

*Message #13 Posted by **Roberto Flores** on 4 Sept 2003, 5:50 p.m.,*
in response to message #5 by Chan Tran

Hi...

I hate to say this - in this HP forum but the TI-58C has all the financial formulas built-in in the Master Library ROM, which was included with each and every 58/59 calc. I still have mine and also the manuals, if you need info on how to use it I will be glad to help.

This is, if you must use the TI, the LED and rechargeable batteries may not be the way you want to go.

Regards;

Roberto

in response to message #13 by Roberto Flores

Roberto! Yes I need info to use the library. I have the module installed in the calculator but I lost the instructions for the module. It would be great if you can help. I would like to use other programs in the library too. Thanks

the ti85

*Message #15 Posted by **christof (NoVA US)** on 4 Sept 2003, 10:09 p.m.,*
in response to message #5 by Chan Tran

There's a kind of cable that you can make for it, that requires no electrical parts (just cable and ends). Check google

and programming it may not be that hard- I am fairly certain the manuals can be downloaded...

Re: the ti85

*Message #16 Posted by **Chan Tran** on 5 Sept 2003, 8:46 a.m.,*
in response to message #15 by christof (NoVA US)

Thanks Gordon, I looked at a few drawings for the cable and they don't look that difficult. They do requires some resitors and diodes but that's not a problem. The connectors used are readily available unlike the one on the 48 and 49.

Re: the ti85

*Message #18 Posted by **Gordon Dyer** on 4 Sept 2003, 7:36 p.m.,*
in response to message #1 by Chan Tran

You can buy a HP-10B cheaply!

Re: TVM program for HP20S

*Message #19 Posted by **Chan Tran** on 8 Sept 2003, 8:47 a.m.,*
in response to message #18 by Gordon Dyer

Thanks for all the good suggestions and assitance. This is what I did. I wrote a simple program that would only calculate the payment based on interest rate, number of payments and present value. It basically what my wife needs. I got the instructions to use the master library for the TI58C. I can get the TI58 to work but not the 58C but it's not a problem. Thanks. I will be making the link cable for the TI85 and look for some program to download. Thanks again for the info.

So look like I am OK.

Thanks.

Re: Glad to hear it!

*Message #20 Posted by **Ron Ross** on 8 Sept 2003, 9:50 a.m.,*
in response to message #19 by Chan Tran

I did get my 21s out and load the TVM program. It takes ALL 99 steps, is in keyboard code and would have taken me a while to re-code to standard label keystrokes for the 20s. I could easily SCREW this up and my 20s's are still in storage, so I had no way to check if my translation was successful.

I still suggest an HP10b, if your wife complains about the large graphics calculator.

Using disposable batteries in a 82143A printer?

*Message #1 Posted by **Emmanuel Verbeeck** on 4 Sept 2003, 4:44 a.m.*

Hi everyone,

Do anyone of you know wether it is possible to use disposable batteries (cells) in the 82143a thermal printer?

The standard rechargeable battery pack I got is dead, and I would like the possibility to use the printer without any external power source (like my matching HP-41CV where I just put disposable N cells).

The holder for the 4 batteries is intact, I am wondering wether I can open it and put some disposable batteries (something like a AA cells, but thicker) in it?

Thanks in advance, Emmanuel

Why not use rechargeables?

*Message #2 Posted by **Mike** on 4 Sept 2003, 12:09 p.m.,*
in response to message #1 by Emmanuel Verbeeck

If you are going to the bother to open the battery holder, why not just stick in some Sub-C rechargeables? It's easy and these batteries are readily available.

Why do you prefer disposable over rechargeable?

Good suggestion

*Message #3 Posted by **Emmanuel Verbeeck** on 4 Sept 2003, 3:04 p.m.,*
in response to message #2 by Mike

Thanks Mike, I'll follow your advice.

I'll also need to find a 110V-to-220V convertor (US-Europe) but that's very easy and cheap to obtain.

A graphic display for a HP-42 *hardware* emulator?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 3 Sept 2003, 8:09 p.m.*

Hi all, I'm searching for a graphic display (with controller) to build an emulator with microcontrollers of the Saturn CPU, to emulate the HP-42S (resolution of at least 131x16). Any of the "hardware" fellows knows any cheap one? Or anyone interested in the project?

Best regards,

Nelson

Fast HP41CX *hardware* emulator?

*Message #2 Posted by **Werner** on 4 Sept 2003, 4:09 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hi Nelson,

that's an absolutely great idea to emulate a HP42s as a real hardware emulator with modern microcontrollers! It is an extremely valuable approach for the HP fan community.

I am more an enthusiast of the HP-41CX because it has the synthetic programming capabilities and the multiple I/O- and IL-capabilities. These allow ROM image exchanges between PC and RAMbox and M-Code programming including I/O. Would it also be possible for you to build a hardware emulator for the HP-41 with a nut processor emulation ?

I believe that many people would buy an HP-41CX-hardware emulator from you which they could place into an old original housing with the good keys. There is really a big fan community for the HP41!

The reason for this inquiry is the discrepancy of the slow performance speed with the enormous quality and brilliance of the HP-41 design (also the HP42 is of course of enormous desing quality).

There are different great emulators for PC or PDA, especially I would like to mention Jean-Francois Garnier's "EMU41", an indeed great emulator for PC/MS-DOS. His new version not only perfectly emulates the HP41 with all ROMs and also with RAMBOX for machine code programming, no, it also emulates the whole HP-IL-loop system in a bidirectional manner, i.e. the real HP-41 that is connected to a PC via HP-IL and IL/PC-interface card can “see” and control virtual mass storage devices, printers, video interfaces and more of the “inside-PC-world”. On the other hand the PC-emulator can “see” and control the “outside world”, i.e. all the real equipment of the real IL-loop. So you can transfer ROM images, m-code programs and everything.

Already on a 600MHz-Windows notebook EMU41 is 400 times as fast as the real HP41 !

There are some great guys who support the broad HP41 community with very good new hardware, for example Christoph Klug with his great IL2000 system and interfacing solutions and Meindert Kuipers, developing a real Machine Language Design Lab Module (MLDL) for the HP41.

The only thing that is still really missing, that's a fast hardware emulator based on microcontrollers for HP41

which one could build into an original old housing. It should be able to address a RAMbox / MLDL (internally implemented or in conjunction with Meindert's MLDL) and it should be able to address HP-IL. High speed would mean high power consumption, but with modern Li-Ion batteries there should be a solution, what do you think ?

Nelson, would it be possible to develop such a wonderful device ? For us HP41 fans that would be "Heaven on Earth"...

Best regards, Werner

Edited: 4 Sept 2003, 5:51 a.m.

Re: Fast HP41CX *hardware* emulator?

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 9:08 a.m.,*
in response to message #2 by Werner

Yes, it can be done. I was thinking on the 42S because I have one and I really like it... The "Coconut" CPU is even simpler than the "Saturn" CPU, and the original ROM of the 41CX is only 24Kword. I only need to know how to emulate the HP-IL periferal (I was thinking on a MMC/SD card as a mass storage, they are simple and cheap). I still gathering information, any help from this community is welcome!

Best regards,

Nelson

Re: Fast HP41CX *hardware* emulator?

*Message #4 Posted by **Werner** on 4 Sept 2003, 10:22 a.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

Nelson,

thank you for your response, that's indeed great news that it would be principally possible! I think Jean-Francois Garnier is THE software expert on modeling of virtual IL. And Christoph Klug is a top IL hardware expert. Perhaps you could co-operate with those smart and kind people or other great experts like Meindert Kuipers, HrastProgrammer or Warren Furlow on such an ambitious mega project? I believe the huge HP41 enthusiasts community would really be thrilled and grateful, I don't think that I am exaggerating ...

If the emulator had RAM that emulated Quasi-ROM (like every RAMbox, MLDL or Hepax module does), one could load all ROM images and there would not be any need for further fast hardware emulation of the very many application ROMs. So this would generalize and simplify the overall approach.

The HP41 platform is very flexible and comprehensive, one can later write M-code programs that enhance its capabilities by far. For example one could later easily write M-code software that allows sophisitcated complex vector and matrix manipulation being similar to Matlab solutions and being better than the existing HP calculator solutions (this is one example only). The only critical issue really is the slow speed of the original HP41 hardware! So in my opinion a microcontroller based emulator would be THE breakthrough.

Best regards, Werner (Germany)

Re: Fast HP41CX *hardware* emulator?

*Message #5 Posted by **Monte Dalrymple** on 4 Sept 2003, 10:31 a.m.,*
in response to message #2 by Werner

I hesitate posting this because the project is one of those "as time permits" endeavors, but...

I have started a project to replace the main board of a fullnut CX with an FPGA version of the CPU that I am in the process of reverse-engineering, a large FLASH memory to hold the ROM images (main, timer, ex fncs, plus a number of modules) and a large RAM to hold memory, ex memory and memory for the port images. I expect the FPGA version of CPU to run up to 100X the speed of the original design, under program control.

As the memories will be 16-bit I plan to use one of the extra bits to enable/disable the high speed operation. Thus the I/O bus would not "see" the faster operations, only the normal-speed transfers aimed specifically at something connected to a port...

There are copyright issues involved, so the board would only be available as an exchange for an original 41CX board and the FLASH would be shipped without any module images installed. I might stick a serial port in the FPGA though.

Re: Fast HP41CX *hardware* emulator?

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 12:48 p.m.,*
in response to message #5 by Monte Dalrymple

My project is also "as time permits", but it will be based initially on Microchip's PIC microcontroller, and I think that the speed will not be that fast (max. 2~4x original). I'm building my project with a very (very!) modest budget, as I cannot afford using those FPGAs, and I'll use parts from "deceased" 486/PentiumI boards (SRAM, Flash). I built my own PIC burner... I'm a hobbyst in electronics and a programmer as a real job (I have my own little software house), and one of the challenges that I'm going for is to "recycle" old non-working calculators (not only HP ones, but all will be using RPN logic!). I'm also learning the algorithms to use in other CPU platform I'm developing (simulated on PIC) with more resources, or a "upgrade" from a Saturn/Coconut CPU (more instructions, larger registers?). I could get faster microcontrollers (Scenix?) but I cannot get those here...

Your CPU simulation is on firmware or pure gate logic? I'm searching another CPUs as well, and I found some very interesting ones from Holtec that have on-board LCD controller and about 4KB ram, but these are OTP, not well suited for this kind of (trial-and-error?) project.

Regards,

Nelson

Re: Fast HP41CX *hardware* emulator?

*Message #7 Posted by **Monte Dalrymple** on 4 Sept 2003, 1:43 p.m.,*
in response to message #6 by Nelson M. Sicuro (Brazil)

The CPU will be as exact a copy of the nut CPU as I can make from the available documentation, with the addition of parallel address and data busses for the FLASH and RAM. I design using a hardware description language, which is then synthesized into the gates (or CLBs for an FPGA).

Re: Fast HP41CX *hardware* emulator?

*Message #8 Posted by **Meindert Kuipers** on 4 Sept 2003, 1:27 p.m.,*

in response to message #5 by Monte Dalrymple

This thread is developing into something REALLY interesting. I am working on implementing the logic of an MLDL (RAM/ROM box) in a CPLD. A larger FPGA will certainly fit the HP41 processor, but it will be very hungry for power. Thay is the main reason why I will stick with my 'slow' 41CX with my MLDL in a Card Reader housing. Communication with a PC will be based on USB.

If I can be of any assistance let me know, and please share as much infomation as possible!

Meindert

Re: Fast HP41CX *hardware* emulator?

*Message #9 Posted by **Monte Dalrymple** on 4 Sept 2003, 1:54 p.m.,*
in response to message #8 by Meindert Kuipers

I am very aware of the power issue. That's why I am still thinking about what family I'll use for the implementation. I would prefer an antifuse of flash-based device but the quiescent power may shoot down that idea unless I power it down. But then there's the issue of recognizing the "on" button...

Re: Fast HP41CX *hardware* emulator?

*Message #10 Posted by **J.D.Clemens** on 4 Sept 2003, 2:09 p.m.,*
in response to message #9 by Monte Dalrymple

What are the fast today's PDA's, Palms and so on made of? Is their hunger for power such a problem? 400 MHz ? And HP-49G+: 75 MHz ? I think the HP-49G+ is not originally engineered but based on an emulator layer of the Saturn and nevertheless 5-10 times as fast as HP-49G ? John

Edited: 5 Sept 2003, 4:54 a.m.

Re: Fast HP41CX *hardware* emulator?

*Message #11 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 2:13 p.m.,*
in response to message #9 by Monte Dalrymple

About the power consuption issue, how about using a low-power, high-speed microcontroller emulating the CPU on firmware? There is some chips that consumes less than 1mA on full speed (about 20~40MHz), but I'm not shure as I don't have their datasheets here. My project uses PIC microcontrollers (2mA at 4MHz max) but is meant to be inexpensive, not fast. The RAM/ROM flash that I can get is a bit power hungry, but the total power is less than 100mA. If I can use some 1800mA/H NiMH cells it can last about 18 hours of full speed processing (not in sleep/standby mode).

Regards,

Nelson

Re: Fast HP41CX *hardware* emulator?

*Message #12 Posted by **Monte Dalrymple** on 4 Sept 2003, 3:21 p.m.,*
in response to message #11 by Nelson M. Sicuro (Brazil)

The issue isn't so much the operating power as it is the quiescent power. The FPGAs I'm looking at would require less than 10mA if running 2x and less than 20mA running 5x.

However, they require 5mA (typical) when not running. This is what I would like to get rid of. The flash and RAM power can probably be ignored when running at these slow speeds because I'll only have the chip selects on when absolutely necessary. Power goes directly as frequency, so running very fast (more than 10x) needs to be limited to things like inner loops where it really pays.

Re: Fast HP41CX *hardware* emulator?

*Message #13 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 4:52 p.m.,*
in response to message #12 by Monte Dalrymple

Is there any way to disable the clock for some "regions" in the FPGA creating some "deep sleep" mode? I'm not familiar with such devices. The microcontrollers that I use have very low quiescent current in sleep mode (5V, 2~9uA; 3V, 0.7uA) but their clock is about 4MHz (at 5V, 2mA).

Regards,

Nelson

Re: Fast HP41CX *hardware* emulator?

*Message #14 Posted by **Bill Wiese** on 4 Sept 2003, 4:50 p.m.,*
in response to message #11 by Nelson M. Sicuro (Brazil)

Hi Guys...

One CPU you might wish to examine is the TI MSP430 series. Onboard RAM & flash, various I/O ports, etc. Numerous variants. Ultra-low power, 16-bit ALU, and there's a free C compiler available.

I think microcontroller emulation of Nut CPU will be quite good performance-wise even on a standard 8-bitter - 6805, PIC, etc. - running at even a moderate clock speed.

For a bit of extra speed, perhaps the native code that emulates each Nut instruction should use unlooped code. This will not change size of the emulation kernel appreciably.

I'd bet that with a tight interpreter loop, the bit of emulation overhead would be more than compensated for by higher clock speed, parallel fetches, and faster register moves.

Bill Wiese

San Jose CA

Re: Fast HP41CX *hardware* emulator?

*Message #15 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 5:02 p.m.,*
in response to message #14 by Bill Wiese

I'm thinking on the Atmel's ATmega128, it has 128KB Flash ROM, 4KB SRAM, 4KB EEPROM, clock up to 16MHz and very low power CMOS. But I can't affor yet the programmer and some chips to begin the tests. I'm thinking in various optimizations in the emulator code, but first I'll try to fit it in 2Kword of code in the PIC16F628 that I have here! I'm planning on pre-fecth of the external EEPROM (where the HP-ROM is) in 5 bytes chunk (4x10 bit word) to speed up, but it is serial... Well, this is just a

prototype to prove the concept. The basic hardware (display, keyboard) is working very well on 7-segments display or 5x7 matrix LED display (beautiful!). The project is going a little slow, as I have much work to do with my Delphi projects (those that pay the bills!!).

Regards,

Nelson

Microcontrollers and Calculator Re-engineering

*Message #16 Posted by **Paul Brogger** on 8 Sept 2003, 1:49 p.m.,*
in response to message #5 by Monte Dalrymple

I have myself spouted off several times about hardware and/or software ideas which I've taken absolutely nowhere, but here goes again . . .

The last notion I had was building an LED RPN model. I bought a few used TI-55's (10-digit LED stick, double-shot keys, acceptable key click, but a too-large plastic case), thinking I might insert a microcontroller between the original chip and the keyboard and display. The idea is: the RPN-aware microcontroller would monitor the keyboard, generate the display, and maintain, stack, register, and program memory. It would control program vs. execute modes, implement program editing, and sequence program execution.

Whenever calculation needed doing, it would electronically "press the keys" for the original TI-55 chip, and decode the answer from the chip's LED drivers (output lines). This would minimize program development -- all the math stuff would be available from the original electronics. But that would be had at a possibly unacceptable price: the original TI's keyboard de-bounce delay would be encountered with most steps during program execution . . . (The microcontroller might optimize its own programs by "keying in" small subroutines into the 55's 49-step memory and then executing them?)

One might even gang two LED sticks together and get a two-line LED display!

It all sounds fun, but I haven't done anything yet, so it's just a thought experiment at this point. I don't have any experience with microcontrollers, but that looks tractable. The 9V supply for the TI-55 might be a problem, if the microcontroller requires 5V (if only from a complexity standpoint). I did play with decoding 7-segment LED drivers way back in collge. (If I remember right, you only need 5 of the segments' states to determine the intended numeral.)

Anyway, if anyone has knowlege of the difficulties involved, you might want to set me straight!

Re: Microcontrollers and Calculator Re-engineering

*Message #17 Posted by **Nelson M. Sicuro (Brazil)** on 8 Sept 2003, 2:49 p.m.,*
in response to message #16 by Paul Brogger

I already tested with 7-segment displays and the TI-55 keyboard, is really easy do manage it. I have also a HP-32E with non-soldered chips and display and I'll built a "replacement" to their mainboard with the low-cost chips that I use (Microchip PIC16F628). I also have some TI calculators (TI-30, 55, MBA, Programmer) that uses LED stick displays (the one of the TI-55 is the best, 11 digits plus sign) and some Commodore models (these are the best, display is 14 digits and the keyboard is far better than the TI's). Writting the calculator software from scratch is a big challenge, but not impossible. To write an emulator for some HP-ROMs available is much simple (I'll try an HP-41 emulator with LED 5x7 matrix displays). I'll try both ways, as time permits... Please write me an email if you have any questions about hardware and microcontrollers, I'll try to

answer.

Best regards,

Nelson

Re: A graphic display for a HP-42 *hardware* emulator?

*Message #18 Posted by **dbrunell** on 4 Sept 2003, 4:20 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Www.mpja.com has a 240 X 64 LCD with backlight and controller for USD 24.95. There are a number of surplus electronics outfits on the web that might have something closer. If I were building it, I would use an active display technology like vacuum fluorescent or LED dot matrix.

Re: A graphic display for a HP-42 *hardware* emulator?

*Message #19 Posted by **Nelson M. Sicuro (Brazil)** on 4 Sept 2003, 9:04 a.m.,*
in response to message #18 by dbrunell

I already have LED dot-matrix display (5x7 char.), but it the characters are well-spaced and can't be used for "graphics" application. In the other hand, ther are well suited for a HP-41cx emulator... but the power consumption is really high! A 16 char. display consumes about 500mA at 5V, 2.5W!! But it is beautiful, indeed...

Regards,

Nelson

in response to message #19 by Nelson M. Sicuro (Brazil)

Use the LCD and work on a 4 line display enhancement which shows all of the stack...
Good luck with the project.

high speed fourty-one

*Message #21 Posted by **Christoph Klug** on 5 Sept 2003, 5:56 a.m.,*
in response to message #20 by Gordon Dyer

Dear Hp41 hardware enthusiasts,

creating a high speed HP41 by using modern technologies is really a great idea.

Please desing the new hardware compatible to the existing HP41 case. Also include a bus system which is compatible to the existing HP41 plug in ports. Than we are able to use the new "fast speed" solution with existing components like IL-Module or the new MLDL unit from Meindert Kuipers.

Remember : The HP41 is much more than a handheld calculator, this machine is also a system controller for HP-IL (Which includes printing, plotting, mass storage and advanced hardware interface applications :-). Last not least nice gateway solutions exist to PC world (EMU41 from Jean-Francois Garnier)

Best wishes from Germany - Christoph Klug

HP-15C or 11C i found

*Message #1 Posted by **Frederic** on 3 Sept 2003, 7:24 p.m.*

Hi! i finally found a scientific calculator that have the same series as the HP-12C i already have. But the calculator is in very bad cosemtic condition : completely scratches back label, no more logo on the right, the silver besel have a lot of tin scratches ant there is a scratches on the black faceplate ;-(

The good news is that it works perfectly! The problem is that i don't know which model is it : a 15C or a 11C. I remember the 2 models and they have differences with keyboard key assignements?!?

I have no BLUE keys and if i remember, the 15C and 11C have one : is there variant keyboard assignements for the 15C or the 11C. One thinks i'm sure is that's not a 12C : no business key!

thank you for answering

Fred

*Message #4 Posted by **Frederic** on 4 Sept 2003, 7:19 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

You were right. it's a 10C i made the self test and i saw the museum picture; me, i was hoping to get a 15C

or at least a 11C. Well it's better than nothing.

Thanks Fred

Better than nothing?

*Message #5 Posted by **Patrick** on 4 Sept 2003, 7:57 p.m.,*
in response to message #4 by Frederic

Well, if you are a pure user then, yes, the 11C and 15C would be of more value to you. However, the 10C is the rarest of all the Voyagers and those of us who fancy themselves as collectors hunt for them avidly. In fact, if you look on the "Prices & Rarity" section of the Museum, you'll see that the 10C is rated as "Very Difficult" to find, whereas the 11C is "Easy" and the 15C is "Moderate".

A few months ago, a 10C with a manual went for about $175 (I know because I bought it). Just recently, a 10C alone went for over $200 (no, I didn't get that one). You can generally get an 11C for much less than $200 and a 15C in average condition in that range as well.

If you don't fancy the 10C, I suggest you put it up for auction on eBay and use the proceeds to buy a 15C. It will be pretty close to a wash financially, I suspect, or a small gain for you.

Re: Better than nothing?

*Message #6 Posted by **Frederic** on 4 Sept 2003, 8:51 p.m.,*
in response to message #5 by Patrick

Well, i wasn't aware of that! I'm not a collector but i lie the 15C; i had on but it has been stolen some years ago. You are probably ok with selling it but the problem is that it is cosmetically very BAD but electronically fully functionnal so for a collector, it's not a good specimen! Perhaps i can find someone with an ugly 15C to exchange it for my very ugly 10C ;-)

P.S. : i'm more happy now since i know i have a rare calculator, ha if the ex owner's knows what you know about the 10C and it's value...

hp 48s calc with 48sx manual (vol 1)

*Message #1 Posted by **Neil** on 3 Sept 2003, 3:58 p.m.*

I won an auction some time ago on ebay for a hp 48s calculator which came in the box + case + 48sx quick reference guide + 48sx owners manual volume 1. Everything was made in Singapore.

Since this is my first RPL calc, I was looking for the programming section in the manual, which I noticed is to be found in volume 2 of the owners manual, which did not come with the calculator. I then checked a few other 48s auctions on ebay and I see that there exists a specific 48s owners manual.

So what I am wondering is did HP ever supply the vol 1 48sx manual + 48sx quick ref guide with 48s calculators? There is only enough room in the box for one manual, so the seller couldn't have forgotten to enclose volume 2. Anyway, I asked the seller but I didn't get an answer. Possibly the factory just stuffed the 48sx documentation by mistake in a 48s box, but I am just curious if anyone has experienced this.

Re: hp 48s calc with 48sx manual (vol 1)

*Message #2 Posted by **christof (NoVA US)** on 3 Sept 2003, 4:12 p.m.,*
in response to message #1 by Neil

The 48S and 48SX are the same aside from the external port expansion slots. So the manuals work for both- My 48S (also bught used) came with the later one big volume edition of the 48SX manual, which works fine. AFAIK, HP never put out a seperate manual set for the 48S as they did with the G series, HP put out one manual set for the 48g, 48g+, and 48GX)

I do prefer the printing where they had the manual split into 2 volumes, since they are wire bound and lay flat more easily.

But- you either have the one BIG single volume, in which case you ust need to dig deeper and find that everything really is in there, or you have the 1st volume of the 2 volume printing (again, they had the SAME information, just different printings), In which case yoou need to buy the MoHPC DVD/CD set with the 48s/sx manuals on it :)

and , incidentally, hpcalc.org has a great tutorial on user rpl. area48 has tons of information of all sorts that you will find very useful.

*Message #3 Posted by **Roberto Flores** on 3 Sept 2003, 8:08 p.m.,*
in response to message #1 by Neil

Hi !.

Perhaps you need to take a look at the HP 48 Programmer's Reference Manual (00048-90054) which was not included with the SX.

It is basically the same as the Advanced User's Reference manual for the 48G, it describes the functions but is

no programming tutorial.

Regards;

Roberto

*Message #4 Posted by **Chan Tran** on 3 Sept 2003, 10:50 p.m.,*
in response to message #3 by Roberto Flores

My 48SX came with 2 volume user's manual. I did have to buy the Advanced User's Reference Manuals.

Re: hp 48s calc with 48sx manual (vol 1)

*Message #5 Posted by **Neil** on 7 Sept 2003, 3:14 p.m.,*
in response to message #4 by Chan Tran

Thanks for all the feedback. I'm pretty sure the HP factory packed the SX vol 1 manual because they probably ran out of 48s manuals at the time, and since these manuals are so thick, they couldn't put both vol 1 & 2 in the same box. As I said, I got the 48sx quick reference guide as well. So altogether, that makes a 48s calculator + 48s box + 48sx vol 1 manual & ref guide. No big deal. I'll use the websites for RPL programming info.

"A user's comments on two HP-42S emulators"

*Message #1 Posted by **Erik Ehrling (Sweden)** on 3 Sept 2003, 3:21 p.m.*

Hi!

This is a short note to tell that I just have uploaded a short presentation that I held at the HPCC London July meeting regarding the two HP-42S emulators Emu42 by Christoph Giesselink and HP-42X by "Hrastprogrammer" at:

http://w1.322.telia.com/~u32220482/index.html

Best regards, Erik Ehrling (Sweden)

Re: "A user's comments on two HP-42S emulators"

*Message #2 Posted by **Richard Garner** on 3 Sept 2003, 5:56 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

In your presentation you said that Emu42 supports 32KB RAM. How do you set Emu42 to register 32KB instead of 8KB? That was a nicely put together presentation by the way, good job.

Re: "A user's comments on two HP-42S emulators"

*Message #3 Posted by **Christoph Giesselink** on 3 Sept 2003, 7:13 p.m.,*
in response to message #2 by Richard Garner

The emulator itself can only make HP42S state files with 8KB RAM. An external program is necessary to make one with 32KB RAM. The program is available at http://privat.swol.de/ChristophGiesselink/Lewis/Mke42.zip.

HP 42s ROM Dump

*Message #1 Posted by **Richard Garner** on 3 Sept 2003, 3:12 p.m.*

Hey Folks,

I finally found someone that had a 48GX. We spent this past holiday weekend getting the 42s ROM dumped. I would like to thank all of you that have written procedures, programs, taken time to answer questions and make suggestion in this forum. Thank you. I have a copy of the Emu42 Demo that was listed here a few months ago. Has there been any updates to it sense it was listed here last?

I want to sell a spare HP-15C but I don't know how...

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 3 Sept 2003, 2:53 p.m.*

I want to sell a spare HP-15C that I have (in box, manual in brazilian portuguese, protective plastic cover of both calc. and manual, vinyl case, very well preserved) but I don't know how to do it! I cannot pass the eBay credit card verification for some reason (misspelled adrress? but the card is ok!). And I don't know how to recieve payments here in Brazil from international buyers also. I have a personal PayPal account, but it doesn't accept credit cards. I'm seeking for any advices, help, or even offers (pls ask for pics)... I'll put the offer on the Ads section also, but I need first know if I can recieve payments from other countries besides my own (Brazil).

Best regards,

Nelson

P.S. I have also a HP-11C but it is in poor condition, no box, no manual, several scratchs, rubber foot missing...

*Message #2 Posted by **GS Leong** on 3 Sept 2003, 3:00 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

sell it here in the classifieds take bids by email set a date and sell to the highest bidder. Then take only certified check and do not ship until you receive the money I think that if you let every one know up front there will be no problems.

my $.02

*Message #4 Posted by **Dave** on 3 Sept 2003, 3:26 p.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

Usually international money orders work. Check with your bank what works best. Western Union offers pretty good service - used it with some tranactions to Eastern European countries just fine.

Re: I want to sell a spare HP-15C but I don't know how...

*Message #5 Posted by **David Smith** on 3 Sept 2003, 3:30 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

I would reccomend using Western Union for payment. They have a wire transfer sort of service or have paper money orders. They have offices just about everywhere on the planet.

*Message #6 Posted by **unsepllable** on 3 Sept 2003, 3:55 p.m.,*
in response to message #5 by David Smith

Before using Western Union check out MoneyGram. They are generally cheaper than Western Union.

Re: I want to sell a spare HP-15C but I don't know how...

*Message #7 Posted by **David Smith** on 4 Sept 2003, 5:47 p.m.,*
in response to message #6 by unsepllable

Last time I checked the Moneygram people were not as widespread as Western Union, but if the buyer an seller both have access, go with whatever is cheapest.

International money orders from the US post office can be a joke. It can take a couple of months to get one for most countries. You have to find the right clerk at the right post office, pay for a voucher, send it to New York, who sends it overseas, who sends back a money order, who eventually sends it to you, who sends it to your customer.

Re: I want to sell a spare HP-15C but I don't know how...

*Message #8 Posted by **christof (NoVA US)** on 3 Sept 2003, 4:27 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

One thing you can do is have people who have paypal accounts use the echeck or balance transfer features.

the classified ads here are good, you may also want to talk to Luis when he gets on, he's bought and sold with some of us in the past.

good luck, and the 11c sound great, too :)

HP 9114B Battery Problems ???

*Message #1 Posted by **Chris Catotti (Florida)** on 3 Sept 2003, 3:20 a.m.*

I need to use my HP-IL type HP 9114B Disk Drive. The Battery is dead and will not take a charge. Can I remove the battery back and connect up an external power (Such as 1.5 Volt alkaline D-Cells via jumper wires with alligator clips) source.

I really need to use it, sooner than I can have the battery pack rebuilt.

Re: HP 9114B Battery Problems ???

*Message #2 Posted by **Victor Koechli** on 3 Sept 2003, 7:05 a.m.,*
in response to message #1 by Chris Catotti (Florida)

The battery is a 6V lead acid battery, and unfortunately the drive will not operate once it's dead.

I have disassembled my battery pack in order to rebuild it. I'll check the wiring when I get home, and then I'll get back to you...

Cheers, Victor

Re: HP 9114B Battery Problems ???

*Message #3 Posted by **Victor** on 3 Sept 2003, 12:57 p.m.,*
in response to message #1 by Chris Catotti (Florida)

I was able to get a lead-acid 6V lantern battery from Radio Shack and was able to use it. I removed the existing battery from the battery pack, attached wires to the connections to the original battery pack via alligator clips, ran the wires out of the battery pack, and attached the wires to the 6V lantern battery. I was able to plug in the charger to recharge the battery, then use the drive normally.

I would imaging attaching wires to a normal 6V lantern battery would work OK as long as you didn't try to recharge it.

Re: HP 9114B Battery Problems ???

*Message #4 Posted by **David Smith** on 3 Sept 2003, 3:32 p.m.,*
in response to message #1 by Chris Catotti (Florida)

The lead acid cell is 2.0 Amp-hours. Four "D" cells should work just fine... just don't hook up the charger.

Re: HP 9114B Battery Problems ???

*Message #5 Posted by **Chris Catotti (Florida)** on 3 Sept 2003, 5:21 p.m.,*
in response to message #4 by David Smith

Does anyone know exactly of a battery part number (Radio Shack, Intestate Batteries, etc.) that I can buy

to wire internally to replace the sealed lead acid cells. I may gett by tonight on flashlight cellls, but I should make it more permanant.

Any hints? THANKS!

Re: HP 9114B Battery Problems ???

*Message #6 Posted by **Tony Duell (UK)** on 3 Sept 2003, 5:30 p.m.,*
in response to message #1 by Chris Catotti (Florida)

The connector inside the battery pack compartment on a 9114 is a 6V DC input. I forget the polarity, but if you pull the cover off the drive unit itself (4 TX9 screws on the bottom), you can see the wires to the back of the connector -- red is positive. You can use an external 6V supply, but the 9114 draws a considerable current (well over 1A at times), so I doubt if normal D cells would work. A 6V bench supply will, though.

Re: HP 9114B Battery Problems ???

*Message #7 Posted by **Diego Diaz** on 3 Sept 2003, 7:24 p.m.,*
in response to message #6 by Tony Duell (UK)

http://www.marvac.com/products/powersonic/ps628.htm

AFAIK, this is the substitution battery for the original Panasonic LCR-226P (no longer available).

You can find the PowerSonic PS-628 in several places, the above is only an example from a Google search.

Regards.

The absolute easiest solution

TVM accuracy revisited

*Message #1 Posted by **Tommi** on 3 Sept 2003, 3:13 a.m.*

Heylo! Was looking for a good TVM program for my HP41CX and found the improved FI (FIN) program in PPC Journal 1983 Jan/Feb, p.22f. Great program btw :)

In another thread, the first accuracy problem presented in the PPC article was discussed. What is really the most "correct" answer here???

According to the PPC article, the HP12C in those days returned FV=-1,244,458.491 (in the previous thread, the incorrect FV=-1,237,786.903 is mentioned for 12C/P, but the payment period is BEGIN, not END).

The PPC article goes on to calculate the trouble-some interest rate using the super accurate function (((1+i)^n)-1)/i, where n can be fractional (available on e.g. HP-37E in those days, but not 12C or HP41). This will give FV=-1,244,458.519.

(The above function do exist in 12C, but only works with INT(n). What about 12CP?)

The improved FI (FIN) program for HP41 presented in the article, will give FV=-1,244,458.520, using the accurate E^X-1 and LN1+X functions available on the HP41.

Interestingly, my HP49G emulator (ROM version 1.18) returns FV=-1,244,458.523.

Do we have 10 significant digits here somewhere for FV?

- HP12C : -1,244,458.491
- HP41C : -1,244,458.520
- HP37E : -1,244,458.519 (returns same as 12C in normal use)
- HP49G : -1,244,458.523

Re: TVM accuracy revisited

*Message #2 Posted by **Victor Koechli** on 3 Sept 2003, 7:29 a.m.,*
in response to message #1 by Tommi

And which would be the correct answer?

Re: TVM accuracy revisited

*Message #3 Posted by **Rodger Rosenbaum** on 3 Sept 2003, 8:09 p.m.,*
in response to message #1 by Tommi

Tommi says:
"Do we have 10 significant digits here somewhere for FV?

HP12C : -1,244,458.491

HP41C : -1,244,458.520
HP37E : -1,244,458.519 (returns same as 12C in normal use)
HP49G : -1,244,458.523"

The interest rate in this problem is (lots of digits):

i=.538 993 302 623 106 141 922

The FV is (lots of digits):

FV=-1,244,458.519 105 488 899 859 678

Interestingly, if one computes the interest rate with the following sequence on the HP17B II
(or some similarly Saturn based financial calc)

(begin mode) 1 N 15 I%YR 100 PV FV 26 N I%YR
one gets i=.538 993 302 622

But if one uses the LNP1 and EXPM1 functions on the HP48
and evaluates EXPM1(LN(1.15)/26) one gets:
.538 993 302 623

I'm sure one of the things the later financial calcs, especially the Saturn based ones, did to improve accuracy is to use an internal LNP1 and EXPM1 where appropriate. So why the discrepancy in the LSD?

If this problem is solved with the HP48's TVM solver, and the interest rate is calculated with the keystroke sequence:
(begin mode) 1 N 15 I%YR 100 PV FV 26 N I%YR
the result is -1,244,458.51909
But if the interest rate is calculated as EXPM1(LN(1.15)/26), and this is stored in I%YR, and the FV is solved for,
the result is: -1,244,458.5191, which is more nearly correct . I hadn't before seen a result where the internal result of a Saturn based financial calc is less accurate than what I can calculate myself with the LNP1 and EXPM1 functions.

Re: TVM accuracy revisited

*Message #4 Posted by **Rodger Rosenbaum** on 3 Sept 2003, 8:19 p.m.,*
in response to message #3 by Rodger Rosenbaum

In the interest of clarity, in my previous posting, where I said:

If this problem is solved with the HP48's TVM solver, and the interest rate is calculated with the keystroke sequence:
(begin mode) 1 N 15 I%YR 100 PV FV 26 N I%YR
the result is -1,244,458.51909

Replace with:

If this problem is solved with the HP48's TVM solver, and the interest rate is calculated with the keystroke sequence:
(begin mode) 1 P/YR 1 N 15 I%YR 100 PV FV 26 N I%YR
Then type 1040 N 0 PV 25 PMT FV
the result is -1,244,458.51909

HP DEKJET 610CL Printer -- does not print

*Message #1 Posted by **Harsha** on 3 Sept 2003, 2:07 a.m.*

have a HP DEKJET 610CL Printer. When i give the print command it takes the paper in but does not print anything. The paper actually stays there and I have power off and on to get the paper out of the printer. Meanwhile I get a message 'THERE WAS AN ERROR PRINTING THE DOCUMENT. THE DEVICE IS NOT CONNECTED'. I installed the drivers again but nothing changed. If the device is not connected why will it even take the paper in when I give the print command?? Any clues?/ Thanks

Re: HP DEKJET 610CL Printer -- does not print

*Message #2 Posted by **Victor Koechli** on 3 Sept 2003, 2:54 a.m.,*
in response to message #1 by Harsha

Are you printing from a new HP 49G+ ? I never get this error message on my 49G... ;-)

Sounds like the printer or cable could be the problem. For differential diagnosis, you can try the following:

- Download the most recent driver version for your OS from HP's website. Chances are that they are more recent than what you've got on any CD that came with the device.
- Uninstall the driver first, reboot, then reinstall it, then reboot again.
- You might also want to check the cable, i.e. try a different one.
- If it's USB, check if other USB devices work with your computer. If not, the USB drivers could be the problem. However, I have no idea how to reinstall these...
- Finally, test the printer with a different computer. If you get the same result, then probably your printer is defective.

What OS are you using?

Cheers, Victor

HP-45

*Message #1 Posted by **Jon** on 2 Sept 2003, 6:58 p.m.*

I have got a HP-45 and I see the model is not written in the front label (just hewlett packard). Is this usual?. I can´t use the timer facility (RCL CHS 7 8). Are there calculators without it?.

Thanks

Jon

Re: HP-45

in response to message #1 by Jon

Are you sure it isn't an HP35 or HP80?

Re: HP-45

*Message #3 Posted by **Jon** on 3 Sept 2003, 4:50 p.m.,*
in response to message #2 by David Smith

Yes, I am sure. I can send you a photograph if you say to me your e-mail

Best Regards

Jon

Re: HP-45 Timer Missing?

*Message #4 Posted by **Katie** on 4 Sept 2003, 12:48 a.m.,*
in response to message #1 by Jon

Supposedly the later models of the 45 don't have the timer in ROM. What's the serial number on yours? The most recent one that I have is 1350Axxxxx and it has the timer in there.

Sorry,the timer is present

*Message #5 Posted by **Jon** on 4 Sept 2003, 2:50 p.m.,*
in response to message #4 by Katie

The timer works. I was doing it wrong, sorry. I was pushing all the keys at the same time. When I push RCL and after CHS-7-8 it works. In the other hand I insist, it is a HP-45 and the model doesn´t appear in the front label :-)

Re: HP-45 Timer Missing?

*Message #6 Posted by **David Smith** on 4 Sept 2003, 5:59 p.m.,*
in response to message #4 by Katie

I have never seen an HP-45 without the timer function, and I have played with some very late model ones.

I would suspect that your machine either has had the front label replaced from a '35 or an old style label was left hanging around in the HP parts bin and was used when the machine was built. I have seen quite a few flukes like this (particularly very early in the production cycle) like HP25C machines with HP25 front labels, or keyboards that did not have "Continuous Memory". I also have an HP25 with an HP22 front label (known to have come that way from the factory).

SERIAL NUMBER

*Message #7 Posted by **Jon** on 5 Sept 2003, 12:56 p.m.,*
in response to message #6 by David Smith

May be somebody is interested on the serial number. It is 1507S06263

My good luck: a 10C

*Message #1 Posted by **John** on 2 Sept 2003, 9:47 a.m.*

Today, an old civil engineer friend of mine called me in for a consultation on a project. He was very satisfied with my advice and when I was about to leave, he said "now be sure to send me a bill for your services." It was then that I noticed two 10C's on his desk. Oh,I said, you have two of those? -Yes, you like them? Here, have one! I thanked him and told him there wouldn't be any bill coming. (I'm comfortably retired anyway, and usually I don't charge my friends for 'over the board' advice, especially when I even get a good lunch...) This 10C (1982) is very well kept, with only minor signs of use.

Congrats (n/T)

*Message #2 Posted by **Raymond Del Tondo** on 2 Sept 2003, 10:37 a.m.,*

in response to message #6 by christof (NoVA US)

Hi christof,

what kinds did you have before? I think I remember you having a 48, and a 41 also?

Re: My good luck: a 10C

*Message #8 Posted by **christof (NoVA US)** on 3 Sept 2003, 4:22 p.m.,*
in response to message #7 by bill platt

I've got a bit of a collection now-

For pretty much daily use, i tend to use the 48, 42, and 41 most. (though the 41 is more often used to explore the 41 than for calculating maximum rack densities and network aggregation) The 28 is nice, but it's losing ground. I like the keyboard better than the 48, but the display and memory of my black LCD gx is winning out.

I also use a 17Bii and 19Bii (I keep them both updated, not sure yet which one will get the final nod) for some home business data and calculations. (If the 17Bii had 32K, I think it would hold all the data I need for a year.)

The Voyager is new, but I'm working on some programs already :)

I do have a few others- I'm a nut for handheld computing devices, but they have to be onboard programmable to be 'real' :)

Re: I'm a nut for handheld computing devices

*Message #9 Posted by **Valentin Albillo** on 4 Sept 2003, 4:52 a.m.,*
in response to message #8 by christof (NoVA US)

Christof wrote:

" I'm a nut for handheld computing devices, but they have to be onboard programmable to be 'real' :) "

Then do yourself a favour and get some Sharp vintage handheld programmable pocket computers. There are plenty of them in eBay, at quite low prices, and I'm sure you'll agree they're incredibly enjoyable machines, with physical quality and features second to none.

Some suggestions: if you like financial models, try and get a Sharp EL-5510 and enjoy comparing its features and capabilities to the HP-12C/12CP. You'll be amazed ! As for scientific models, try

the Sharp PC-1475 with its matrix capabilities and 20-decimal precision versus the HP-15C, or if you happen to like graphics, try the Sharp PC-1360 with its 4x24 characters, 150x32 pixels. And for maximum pocketability, get a Sharp PC-1260, 1261, or 1262, which are even smaller than an HP-15C, fully metallic, boast up to 10 Kb of RAM, and feature a full alphanumeric keyboard and 2-line display, running programs 10+ times faster than an HP-15C, by the way !

All four models are programmable both in extended BASIC *and in machine language* right from the keyboard, as per your request, and have full I/O capabilities to a number of peripherals, including printer, mass storage, serial devices, even to a PC.

If you happen to like them, you can build quite a sizable collection now that their prices are still low (that's gonna change fast). Not only will you enjoy and use them, but it will also broaden your perspective re handheld computing devices. Most HP calc fans and collectors tend to think there has never existed anything approaching the quality and capabilities of their beloved calcs, which blinds them to the possibility of appreciating some other equally good or even better machines. Owning and getting to know well said Sharp machines will open many an eye and mind.

Best regards from V.

I sell or trade a vintage SHARP

A fine machine, indeed [LONG]

*Message #11 Posted by **Valentin Albillo** on 4 Sept 2003, 9:26 a.m.,*
in response to message #10 by R Lion

The Sharp PC-1350 is extremely similar to the 1360 model, and even somewhat faster, actually. It does have a very comfortable, fully alphanumeric QWERTY keyboard and a wonderful 4x24 character alphanumeric and graphic (150x32) display (including lowercase characters).

This is the machine I use the most, together with an HP-15C. Its large display makes it a pleasure to enter and edit program lines and expressions to be evaluated. You can recover any line/expression once entered/computed, edit it via cursor keys, and reevaluate it again with utmost easy. In case there's some error, a message appears and the cursor will be positioned at the exact place where the error was detected, which is extremely fast and convenient.

I took this machine with me during 2002's summer holidays and wrote a fully graphic version of my HP-41C Othello for it, showing the full 8x8 board on the display and allowing the user to enter moves by navigating said board with the cursor keys. This machine is so comfortable to use that I did write the whole program directly on it, from scratch, without ever needing pencil or paper, the 4-line display was more that enough to avoid losing sight of the whole 'picture'.

In short, I would heartily recommend this machine to anyone and everyone. If you've got

one, you can find a lot of information and some software for this machine here, including some graphic games written in machine language.

In case you're wondering how programming looks like in this machine, here's an excerpt from my Othello program, namely parts of the subroutine that sets up the graphic board and the one that checks if it's legal for you to pass. You can see in the listing instances of nested FOR..NEXT loops, subroutine calling, multiple statements per line, logical decisions, printing user-defined graphics in binary form at a given position, string arrays, string handling, etc.:

```
240 GOSUB 140: PRINT "Setting up board...";
245 FOR X=3 TO 31 STEP 4: FOR Y=2 TO 30 STEP 4: PSET (X,Y)
246 NEXT Y: NEXT X
250 M=45, N=55, B(44)=-1, B(54)=1, A=-1, H=44
252 GOSUB 435: IF U LET M=55, N=45
255 B(M)=-1, B(N)=1, H=M: GOSUB 435
257 A=1, H=54: GOSUB 435: H=N: GOSUB 435
260 GCURSOR (36,15)
262 GPRINT "1C701C007050700070407000282828007878787800 28"
265 GCURSOR (38,22)
268 GPRINT "7C1830187C007C545C00282828007848487800 28"
269 RETURN

270 L=LEN C$(0)-K, C$(1)=LEFT$(C$(0),K-1)
275 C$(0)=RIGHT$(C$(0),L), C$(0)=C$(1)+C$(0): RETURN
280 GOSUB 140: PRINT "Checking your pass": K=1
285 S=ASC MID$(C$(0),K,1): IF ABS B(S) GOSUB 270: GOTO 300
290 A=1, R=1: GOSUB 95: IF N RETURN
```

BTW, in case any of you are interested, I'll make this program freely available online in the very near future, as soon as I get some free time to set up a web page for it. My original Othello program for the HP-41C was featured in PPC Technical Notes, circa 1981, and a 'version 2' appears in the PPC Journal as well, though you can find it online at Gene's excellent site.

Best regards from V.

*Message #13 Posted by **christof (NoVA US)** on 4 Sept 2003, 10:31 a.m.,*
in response to message #9 by Valentin Albillo

I've got a few- a PC-1500, two 'reabdged' radio shack models (pc-1 and pc-2), In the 'not really programmable" department, I've also got a memosriter el-7001.

I have to say that Sharp has done some wonderful things- first in offering a continuous array of onboard BASIC programmables from the late 70s on right through the latest of the BASIC programmable wizards. Sadly, I haven't seen any of those on store shelves lately. (though the keyboard version of the linux-based zaurus is really impressive)

I do only have a few of the sharps- and several of the ones I really want I haven't found yet.

Sharp made a few decisions, also, that I think HP messed up. Onboard rs-232 serial, and mass storage in 'standard' tape formats, for example.

love em!

HP's allegedly wrong decisions [LONG]

*Message #14 Posted by **Valentin Albillo** on 4 Sept 2003, 11:40 a.m.,*
in response to message #13 by christof (NoVA US)

christof (NoVA US) posted:

"Sharp made a few decisions, also, that I think HP messed up. Onboard rs-232 serial, and mass storage in 'standard' tape formats, for example."

Here's a short list of the 'few' decisions Sharp got rigth and HP got wrong [of course, IMHO]:

- All Sharp handheld BASIC programmables, be they big (PC-1500A) or very small (PC-1262) did include onboard RS-232 serial I/O, plus interfaces to printer and/or 4-color plotter and mass storage (cassette or floppy drive).

  In contrast, a handful of HP machines did include serious I/O (and then, proprietary (read expensive) like HP-IL), mass storage or printing. Such powerful models as the HP42S (which really is begging for some I/O) have none. The tiniest, smallest SHARP can be connected to a much larger printer/cassette 'dockstation' right from the box. You can have hundreds of programs stored in inexpensive audio cassettes or micro-tapes, under remote control.

- All Sharp BASIC programmables feature a BASIC dialect 99.9% upward-compatible among them, such that your programs written for a model can be loaded (from tape !) and run on others. Automatic conversion of line numbers and incompatible statements is done, and the tape recorded by an earlier model can be read in the newer.

  On the other hand, just try to load (by hand) an HP-25C program in an HP-15C, say (with GTO label but no GTO 'line number' unless you do some fancy tricks with the I register), or an HP-15C program in a HP-41C, or an HP-41C program in an HP-28S or ... you get the point.

- Most Sharp BASIC handhelds are metallic (not metallic-painted plastic), very sturdy, quality built, consistently from the older models (PC-1211) to much newer ones (PC-1475). They will stand use and abuse, they have the same good keyboards and great displays, large or small as the machine may be. The theme here is consistent-quality throughout all of them.

  HP has such different builts and qualities as Classic models like the HP-67, Woodstock's like the HP-25, then the Voyagers, then the Spice series (were construction quality took a deep dive), then the completely different HP-41C, then the HP-28C/S and its abysmal battery door and compartment, then the HP49 and its rubber keys, etc, etc.

- Sharp BASIC handhelds tend to have large amounts of RAM (for their time), with 4 Kb being a minimum, 16 Kb being typical, and 64 Kb/128 Kb being possible. Apart from the very earliest models, all the rest are quite fast [FOR I=1 TO 100: NEXT I taking between 0.8 sec and less than 0.05 sec], and most are expandable, accepting

non-volatile extra RAM cards and even ROM application modules.

On the contrary, most HP handhelds have always been extremely lacking in RAM: 70 bytes for programs/data in the HP-10C, 203 bytes in the HP-16C, 448 bytes in the HP-15C, and about 2.3 Kb in the HP-41CX, even the commercially available HP42S had only 7 Kb at a time were any Sharp machine would come with at least 16 Kb built-in. Only a few HP's have accepted ROM modules or cards, and even HP-41C/71B RAM modules were completely volatile if removed from the machine.

- All Sharp BASIC handhelds but the very earliest have featured an extended version of 'standard' BASIC, including such niceties as two-dimensional arrays, string or numerical, string functions, long variable names, multiple statements per line, powerful I/O functions, and even comprehensive graphics functions in some models. All models featured the same BASIC plus their particular extensions, be they financial functions, statistic functions, computer science functions, all perfectly integrated: you can compute a sine on a financial model or a logarithm on a computer science model. All of them could be programmed in machine code right from the keyboard, via PEEK, POKE, CALL.

  In contrast, HP models featured RPN, which is obviously less high-level than BASIC, in various flavors. Many specialized models lacked general functions (like trigonometrics in financial models or trascendentals in computer science models), all had their particular version of RPN, with GTO-number versus GTO-label, GSB existing or not, indirect operations being allowed or not, whatever. None of them were programmable in machine code except by using some ridiculously expensive and/or mostly inconvenient external hardware, if at all.

- And last but not least, Sharp handhelds were always much more affordable than HP's, with a much greater quality/price ratio. For instance, the Sharp PC-1211, an HP-41C's contemporary, offered equivalent power, a full QWERTY keyboard, a 24-character dot-matrix display, metallic body, I/O, BASIC, and superior built-quality at 1/3 of the price. Same for the rest.

This list could go on an on, but I think anyone can get the point. This is not meant to be HP-bashing, I love my HPs as much as you do yours, thank you very much, it's only that the next time you boast that HP handhelds are the best in the world, lightyears ahead of the rest, you'd do well to think twice. At least it would save some heavy embarrassment if you happen to find a knowledgeable Sharp user.

Best regards from V.

After Saturn CPU was launched, the things changed quickly. Yoday you can write (using the latest Debug4x) software for both the 48 and 48 series. There is enough RAM and a standard serial/USB connection to a PC. You described HP machines from the past. How is Sharp today?

How is Sharp today?

I'm writing this on my Zaurus 750. It's a different world now- this is more powerful a handheld than most of my old laptops. Really- I watch streaming video on this for demo purposes at work.

BASIC and machine code onboard? sure! And C, lisp, perl, shell programming- all installed right now.

Wireless networking, 64meg RAM onboard, 64meg flash onboard, 512Meg sd card installed (the CF slot is being used for wireless)

My first handheld

*Message #17 Posted by **Tizedes Csaba** on 4 Sept 2003, 1:33 p.m.,*
in response to message #14 by Valentin Albillo

Hello!

My first handheld was a CASIO FX-850P with plus 8K RAM-PACK. Everything was right on this pocket computer too, as Valentin write about SHARP's.

When I began the university, I used a HP32SII. And not my CASIO... I don't know why I forgot my favourite PC. It's got wery powerful BASIC, 116 built in application program, 10 progs in the memory parrallel, PEEKs and POKEs (yeahhh! I liked it!!!), and 13264 bytes of RAM.

But, when I want to solve or integrate an equation, calculate in polar coords or with complex numbers, the CASIO is not was really flexible.

Today, if I want to solve a problem, the order is the next:

1. thinking about it
2. paper and pencil
3. HP32SII (just tapping->equations->programming)
4. HP48SX (equations->graphs->progs, and the result's graphs)
5. table-PC with Maple (to give simbolic/general result, if it is possible)
6. table-PC with programming language (numerical method)

But I think, I will take back my old CASIO again...

Csaba

hp35 is magic

*Message #1 Posted by **hugh steers** on 1 Sept 2003, 5:34 p.m.*

the recent mention of csim (thanks jonathan) has got me reading the hp35 assembler again...

ive been trying to experiment with cordic calculation methods (as used in the 35). although theres several papers out there, there's not a lot of code (i couldnt find any). so i decided to try to write some.

im shifting and adding in binary, so i need 53 bits (for a double) and 53 constants (one for each mantissa bit). now, i assume the 35 worked in decimal right through, so it would need 10 ten digit constants but use each more than once (binary uses each constant for add or subtract just once).

worse, it would need to implement the hyperbolic iteration (for logs and square root), which means it needs the atanh constants as well as the atan ones. thats 20 constants.

i dont see those constants in the assember. where are they??

i read the original paper by j.s.walther of hp, "unified algorithms for elementary functions". here he describes some trickery for only storing half the constants. but i still dont see even 10 in the assember (and i know it works!). there are about 5 or so patches of "load constant X".

theres more. in my version ive separated the logic for linear, circular and hyperbolic iteration. i know you can combine them using more inner-loop tests, but, it gets quite cumbersome, and you have to do the hyperbolic 3k+1 malarkey otherwise your answers are wrong.

which brings me to the final question. why didnt early models have hyperbolic functions on keyboard, since internally hyp was used for log, exp and square root. i can understand the space restriction at first, but what about hp80 and hp55. perhaps they didnt think anyone wanted them. or was it because it didnt really do the 3k+1 correction internally but somehow log and sqrt could be extracted accurately.

or perhaps its voodoo magic ;_)

my code: http://www.voidware.com/cordic.htm

Re: hp35 is magic

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 1 Sept 2003, 6:41 p.m.,*
in response to message #1 by hugh steers

Can you describe this method (or point to some link) in "algorithmic" form (not C or other language)?

I'm planning to build a calculator with microcontrollers, initially as a emulator for HP ROMS and in the future a calculator of my own as a "compilation" of various algorithms and functions of my interest (as merging the functions of the HP-15C and HP-16C). I'll try to get the 15C ROM, but it isn't a easy task. In another way, I can use the HP-42S's ROM and modify the assembler to fit in my emulator (Saturn CPU) and 7-segment display (to fit in a HP-32E case with its display/keyboard).

Best regards,

Nelson

P.S. your scicalc for Palm OS is a beauty! I can't imagine such a precision on a real pocket calculator... Or can I? Building one from scratch is a lot of work, but as a hobby (read "open source" and "free") project, who knows...

Re: hp35 is magic

*Message #3 Posted by **hugh** on 1 Sept 2003, 7:01 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

google search for "crdcsrvy". i found that the most useful. j.s.walthers paper is here, http://www.voidware.com/uafef.pdf

btw, im currently working on scicalc v3. originally, i thought v3 would extent v2. but v3 is completely new. it will be able to handle symbolic expressions for solve, integrate, factorize and so on....

i reached this conclusion by reading the 15c advanced functions handbook. there are problems that no numerical method can touch (eg integrate sin(1/x) from 1 to inf). it has a value. what is it? the trick (as in the book) is to first transform it into another expression that can be handled numerically.

Re: hp35 is magic

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 1 Sept 2003, 7:22 p.m.,*
in response to message #3 by hugh

Thanks, I'll read that paper. I'm not a mathematician but I'm really interested in numerical algorithms (as I use many of them in my work as a Delphi programmer, now working on forest growing/planning software).

How is the compiler that you use for Palm platform? I'm really interested in porting the EMU42 to the PalmOS, but I'm not a C programmer, barely read it... If it was in assembler, no problem at all! (I think I'll put this task on my "hobby projects" list ;-)

Best regards!

Nelson

Hi...

```
why didnt early models have hyperbolic functions on keyboard, since internally hyp was
used for log, exp and square root. i can understand the space restriction at first ... but
somehow log and sqrt could be extracted accurately
```

Well I'm guessing that they simply ran out of ROM space so hyperbolics were first to go. The HP35 did all its stuff in, what, 768 instructions? And that ROM was chock-full. As programmability was added (HP25, etc.) the extra ROM space would've gone to support these features. Also features were determined also by marketing folks so hyperbolics may have been down the list.

I don't think square root was done via CORDIC methods - more likely an algorithm very similar to division or

a Newton's method which works very well for sqrt(x).

Bill

Re: hp35 is magic

*Message #6 Posted by **hugh** on 2 Sept 2003, 8:22 a.m.,*
in response to message #5 by Bill Wiese

im thinking they didnt have the rom space *not* to do hyperbolic functions!

and then using exp(x) = sinh(x) + cosh(x) and log(x) = 2atanh((x-1)/(x+1)).

something im speculating on is that hyperbolic functions have always been, at least internally, present on calculators but they've chosen not to put them on keyboard.

does anyone know how early japanese makers like sharp & casio did their scientific functions. did they copy hp or a different technique altogether.

Re: hp35 is magic

*Message #7 Posted by **Bill Wiese** on 2 Sept 2003, 11:35 a.m.,*
in response to message #6 by hugh

Hi Hugh...

There are *direct* CORDIC shift & add methods (don't have the reference but I've seen 'em) for the hyperbolics, log funcs, etc. That is, the hyp funcs are not "derived".

This generally seems to allow better accuracy in the last place (digit or bit depending on radix). This 'ulp' issue is a big thing for floating-point engine designers.

There is even concern about rounding/last-place error dealing with scaling & range reduction preprocessing (i.e, bringing input into a range where actual calculations work properly, converge, etc.)

You might want to take a look at the books by: J. M. Muller, "Elementary Functions" (Birkhauser/Boston); Israel Koren, (paperbound, don't have title at hand); Cody & Waite,"Software Manual for the Elementary Functions";

You'll see a lot about last-digit concerns, rounding matters, etc.

Many many Japanese sci calcs of Woodstock vintage do NOT have the same accuracy on logs & trigs. Sometimes seem accurate to only 5+ dec places!

in response to message #1 by hugh steers

In the old reference "Collected Algorithms of the ACM" there was a cute continued fraction routine. You ran a rather simple iteration a few times and got a couple of numbers. By combining these numbers in various simple ways you could got trigs, exponetials, etc. I always thought it was kinda neat.

HP-25 internal Power Circuit Charger

*Message #1 Posted by **Albert** on 1 Sept 2003, 1:17 p.m.*

Hi all,

Could anybody bring me the HP-25 internal power circuit to charge NiCd batteries? I know is a little bit dangerous to charge batteries inside the machine (I put already the Zenner between contacts), this is the reason why I would like to make an external battery charger using the original HP AC adapter.

Thanks in advance,

Albert

Re: HP-25 internal Power Circuit Charger

*Message #2 Posted by **Tony Duell (UK)** on 1 Sept 2003, 4:21 p.m.,*
in response to message #1 by Albert

Sure. The chearger circuit is very simple, it consists of 4 components in series. They are : The AC adapter secondary winding; A diode (try a 1N4007 or similar), a 8.2 Ohm resistor (looks to be at least 1W, maybe 2W), and the NiCd pack. The diode's cathode (banded end) goes towards the +ve terminal of the battery. That's it. The actual 'reserve power pack' is a bit more complicated as it has an LED to indicate the batteries are on-charge, I can dig out a schematic of that if you like.

Re: HP-25 internal Power Circuit Charger

*Message #3 Posted by **Albert** on 2 Sept 2003, 12:22 p.m.,*
in response to message #2 by Tony Duell (UK)

Thanks a lot, I'll try to find out the components and a single-layer circuit.

Albert

Re: HP-25 internal Power Circuit Charger

*Message #4 Posted by **David Smith** on 2 Sept 2003, 2:57 p.m.,*
in response to message #2 by Tony Duell (UK)

I think they just put the LED/current limiter resistor across the 8.2 ohm resistor. Thats what I do when I modify Woodstock corpses to be external chargers.

HP 41 worth more as collection?

*Message #1 Posted by **Quemazon** on 1 Sept 2003, 10:09 a.m.*

I have a 41CV with printer, card reader, manuals, and modules, all in excellent working condition. Is there any added value to the collection as a whole or should I split it up and sell it as parts? I plan to sell on ebay. Thanks.

Nathan

Re: HP 41 worth more as collection?

*Message #2 Posted by **Valentin Albillo** on 1 Sept 2003, 10:12 a.m.,*
in response to message #1 by Quemazon

In this particular case, and for the items you do mention, I think you'll make more money by auctioning each item separately, IMHO, though certainly it will mean much more hassle.

Best regards from V.

Re: HP 41 worth more as collection?

*Message #3 Posted by **Tom (UK)** on 1 Sept 2003, 12:55 p.m.,*
in response to message #1 by Quemazon

'Boxed sets' seem to fetch the highest prices.

If you sell the items grouped together as they would have been bought from HP you will probably make more money than lumping them in one package, even if some bits are missing (boxes seem to make the biggest price difference - it's the same with collectable toys). Some buyers only want the calculator + manuals, others may already have a printer or module and don't want to pay for another.

Re: HP 41 worth more as collection?

*Message #4 Posted by **Raymond Del Tondo** on 1 Sept 2003, 1:14 p.m.,*
in response to message #1 by Quemazon

Opinions vary, but I have another note.

Regardless if you sell the items 'en bloc' or separately, you'll have a value add of about 20 to 40 percent if the item is really complete, which means with its box, and all paperwork. For some items, the box alone may be worth the deal.

Regards,

Raymond

Graphics with HP48SX in programs - HELP!

*Message #1 Posted by **Tizedes Csaba** on 1 Sept 2003, 7:49 a.m.*

Hello!

I use a HP48SX and I want to use it's graphic possibilties in programs. I want to make a program, what draws graphs to the LCD in real time, and not in the behind.

What is the simplest way to draw under a running program?

Thanks for answering! Csaba

Re: Graphics with HP48SX in programs - HELP!

*Message #2 Posted by **Raymond Del Tondo** on 1 Sept 2003, 1:06 p.m.,*
in response to message #1 by Tizedes Csaba

Hi,

just take a look at www.hpcalc.org . There you'll find many graphing tools for the HP-48, some of which are really fast.

Raymond

BTW: For a real time speed test, search for D3D on hpcalc;-)

Re: Graphics with HP48SX in programs - HELP!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 Sept 2003, 6:25 a.m.,*
in response to message #1 by Tizedes Csaba

Hi, Tizedes;

About what you want, the "worst" part of plotting from a running program is scaling. I remember I've done this when I bought my HP48SX (in the 80's) but I have not found my notes about his yet.

I remember I read chapter 17, 18 and 19 extensively and I tested all possibilities. At the end of the process, I thought it was fun to see and handle the curve as you zoom it in and out, and find its poles and zeroes as you work with it.

As I find the listings and check for their functionality I'm posting again.

Best regards.

Luiz (Brazil)

Re: Graphics with HP48SX in programs - HELP!

*Message #4 Posted by **Tizedes Csaba** on 4 Sept 2003, 3:08 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz!

But I buyed my 48SX many years ago, I never used it's graphing possibilities IN programs. But sometimes I want to draw Function/Scatter plots in progs. (I used this method: I put the plot-coords in the matrix, and used the Stat-Scatter plot; it's not a very clever method, and eats the memory.)

Think I must to read the Manual... :)

> Quote:
>
> As I find the listings and check for their functionality I'm posting again

I hope it's not will stealing your time! Thanks for your helping!

CSIM (HP-35 emulator) ported to Palm OS (again)

*Message #1 Posted by **Jonathan Purvis (New Zealand)** on 1 Sept 2003, 5:14 a.m.*

Hi,

I have once again ported CSIM to Palm OS. Currently it's only emulating the HP-35. I hope to add emulation of the HP-45 soon and the HP-55 when i've drawn the buttons for it. You can download it from http://one-two-three-four-five.com/palm/csim/csim-0.3-alpha-1.prc. If someone could download it and tell me if runs on their Palm that would be much appreciated. I have only tested it on my Treo 270 (Palm OS 3.5).

To avoid problems like last time (my hard disk died and i lost the source), i have included the C source code (compressed with gzip) as resource 'c.gz' number 1. Use something like par to extract it.

Regards,

Jon

Re: CSIM (HP-35 emulator) ported to Palm OS (again)

*Message #2 Posted by **Julián Miranda (Spain)** on 1 Sept 2003, 8:32 a.m.,*
in response to message #1 by Jonathan Purvis (New Zealand)

It works in my Palm M515, OS 4.1 and also in my Palm Tungsten C (OS 5.2.1) running from a SD card. I have only tried "Calculator forensic" arcsin (arccos (arctan (tan (cos (sin (9)))))), the answer match the one listed for the HP-35 v3 at Mike Sebastian's data base.

Runs fine on my oldie Vx, OS4

*Message #3 Posted by **Renato** on 1 Sept 2003, 2:54 p.m.,*
in response to message #1 by Jonathan Purvis (New Zealand)

Good job !

Inexpensive batteries on eBay

*Message #1 Posted by **Patrick** on 31 Aug 2003, 10:02 p.m.*

Has anyone here bought those packages of inexpensive batteries on eBay for Pioneer and Voyager models? What is your experience with them. I suppose they don't last as long but, even if they lasted half as long as name brand batteries, they'd still last, what, 9 years in my 15C??

Re: Inexpensive batteries on eBay

*Message #2 Posted by **Mike Sebastian (Texas)** on 31 Aug 2003, 11:02 p.m.,*
in response to message #1 by Patrick

Those batteries are alkaline batteries. They are great for devices that consume those types of batteries rather quickly like laser pointers or toys. But, alkaline batteries tend to leak after a few years, possibly causing irreparable damage to the device they are in.

Those alkaline batteries are fine for short term use in a calculator, but I wouldn't leave them in a valuable calculator like a Pioneer or Voyager. Spend the extra money on silver oxide batteries.

Re: Inexpensive batteries on eBay

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 31 Aug 2003, 11:49 p.m.,*
in response to message #2 by Mike Sebastian (Texas)

I think that thise batteries aren't so inexpensive... $3.33 plus $2.42 shipping is $5.75 for 10 units ($0.57 or $0.58 each). Here in Brazil I just bought 6 units of Maxell LR44 (original) silver-oxide for my HP11C and HP42S for about $0.84 (R$2,50) each in a common photo-store. I think that if you search for those Maxell LR44 there in the US you can find it for even lower prices.

Regards,

Nelson

I can't imagine why anyone would purchase

*Message #4 Posted by **Mike** on 1 Sept 2003, 11:04 a.m.,*
in response to message #1 by Patrick

those batteries on eBay.

First, there is such a thing as shelf life. These are likely ones that can't be sold retail any longer.

Second, why risk a valuable piece of equipment with old, possibly defective batteries.

Third, they are not that cheap in the first place.

Re: I can't imagine why anyone would purchase

*Message #5 Posted by **David Smith** on 2 Sept 2003, 3:06 p.m.,*
in response to message #4 by Mike

I suspect that they are fresh cards Vinnic batteries from China. I have not used the Ebay ones becuase I can get them locally for less. They work great and are a bargain... 25 cents a cell. Some places charge up to $2.00 each for an LR44! I had a set in a digital scale for 5 years and another in a 12C for the same amount of time. No leakage. I usually replace ALL my batteries (smoke alarms, thermostats, cameras, calculators, etc) yearly on "battery day", but these two items were lost in the back of a drawer.

HP printer paper supplies (HP 82240B)

*Message #1 Posted by **Patrick** on 31 Aug 2003, 6:23 p.m.*

I just purchased an infrared printer (Model HP82240B) which comes with a few rolls of paper. My question is, where do I get additional supplies of paper for this machine? Is the only source eBay or is this a reasonable standard item that can be found in office supply stores?

I've looked under the Museum pages (learned my lesson) and couldn't find any mention of paper supply sources.

Re: HP printer paper supplies (HP 82240B)

*Message #2 Posted by **Richard Garner** on 31 Aug 2003, 7:29 p.m.,*
in response to message #1 by Patrick

Any office supply store, like Office Depot, will have paper for thermal printers. The last pack I got was a generic pack of 8 rolls for about $5.00. I have had no problems using the generic types of thermal paper.

Good Luck

Re: HP printer paper supplies (HP 82240B)

*Message #3 Posted by **David Smith** on 2 Sept 2003, 3:08 p.m.,*
in response to message #1 by Patrick

The NCR brand of paper at any office supply store works great. Even better than the original HP paper (which by now is all well past its prime). The modern stuff is much smoother and more sensitive than the old stuff. I know of HP97's and HP82143A's that have gone through over 50 rolls without any problem.

Printer paper for HP-85?

*Message #4 Posted by **Juergen (CH)** on 2 Sept 2003, 8:58 p.m.,*
in response to message #3 by David Smith

Anyone found paper for the HP-85? Seems to be a less common size...

Thanks, Juergen

Re: Printer paper for HP-85?

*Message #5 Posted by **David Smith** on 3 Sept 2003, 3:38 p.m.,*
in response to message #4 by Juergen (CH)

What is the width? NCR also makes the 3 (or is it 3.125) inch width rolls. Same stores that sell the narrower paper carry it. Some stores don't have it on the shelf and must order it from their warehouse... same as the 1.5 inch wide stuff for the 19C.

Re: Printer paper for HP-85?

*Message #6 Posted by **Juergen (CH)** on 4 Sept 2003, 5:30 a.m.,*
in response to message #5 by David Smith

The width is 4.25 inch.

Re: Printer paper for HP-85?

*Message #7 Posted by **David Smith** on 4 Sept 2003, 5:54 p.m.,*
in response to message #6 by Juergen (CH)

Buy 8.5 inch wide thermal fax machine paper and cut the roll in half using a good razor saw. I get a good square cut by wrapping a piece of adding machine tape around the roll, aligning the edges, taping it in place, and the using the edge as a guide.

There are places on the web that sell various widths of thermal paper. Also check the office supply store catalogs. The have a lot of oddball products that are not carried in the stores. That is how I get my HP19C paper.

HP-11C Solutions Handbook Errata?

*Message #1 Posted by **Patrick** on 31 Aug 2003, 6:20 p.m.*

In my April 1981 version of the HP-11C Solutions Handbook (00011-90009) there is a formula for a Runge-Kutta solution for a second order differential equation that I think is in error. On the bottom of page 22, the formulas for k_2 and k_3 both include a factor of h/8 in the second argument. I have worked out these formulas myself and I always get h/4.

Does anyone have a later edition of this book? If so, could you tell me whether yours has an 8 or a 4 in those formulas?

As an aside, I have written programs based on the value 4 which provide correct results to 10 digits of accuracy with a step size of 0.01 while taking over one hundred steps, so I'm pretty sure the 4 is correct and the book is "buggy"!

Re: HP-11C Solutions Handbook Errata?

*Message #2 Posted by **Valentin Albillo** on 1 Sept 2003, 7:12 a.m.,*
in response to message #1 by Patrick

Hi, Patrick:

I don't have the Solutions Book at hand now, but if you've tried both values (the one in the book and the one you think is correct) in several test equations and yours provides the accurate answers while the one in the book does not, the conclusion is obvious, don't you agree ? Anyway, I'll check it within 10 hours, back home.

Now, here's a 'challenge' specifically for you (others may apply as well and are welcome to try, of course), your preferred algorithm (Runge-Kutta or whatever), and your preferred HP calculator (physical or emulated):

Given the 1st-order differential equation:

```
y' = x^2 + y^2
```

subject to the initial condition **y(0) = 0**, try and find **y(2)**, *accurate to 10 or 12 decimal places*, give or take a few ulps.

All correct answers will be rewarded with a pre-release copy of my "Long Live the HP-16C!" incoming article, in PDF format. All those people who do not have my previous articles will receive them as well, if desired. :-)

Of course the answer must be obtained using an HP calculator, so the program and/or procedure used to obtain it must be produced on demand.

Beeest regards from V.

Re: HP-11C Solutions Handbook Errata?

*Message #3 Posted by **dbrunell** on 1 Sept 2003, 5:37 p.m.,*
in response to message #2 by Valentin Albillo

I find a pole at x=2.

Sorry but no cigar :-)... Patrick ?

*Message #4 Posted by **Valentin Albillo** on 2 Sept 2003, 4:05 a.m.,*
in response to message #3 by dbrunell

There's *no* pole at x = 2, sorry. If your software says there is, chances are it was written by MS, but in any case you should definitely get a better one. :-) (joking, of course)

Patrick, are you listening ? Does the expert mathematician cum HP-15C programmer accept this simple 'challenge' :-) ?

What's the 10-digit-accurate value of y(2) ? Further, if this function has some pole, could any of you provide a 10-digit-accurate value for the corresponding x ? It's *not* 2.000000000, mind you.

Best regards from V.

Edited: 2 Sept 2003, 7:55 a.m.

Yes, I'm listening

*Message #5 Posted by **Patrick** on 2 Sept 2003, 4:29 p.m.,*
in response to message #4 by Valentin Albillo

But because it came from you, Valentin, I just knew there had to be a catch! I'm sure, knowing nothing but your reputation, that a 10 digit value for y(2) derived through numerical means will somehow turn out to be meaningless! I'm just trying to think of why...

Besides, differential equations was.... uh.... not my field. Yea, that's the ticket...

Re: Sorry but no cigar :-)... Patrick ?

*Message #6 Posted by **dbrunell** on 2 Sept 2003, 6:20 p.m.,*
in response to message #4 by Valentin Albillo

I tried to find a solution on my 97 using the R-K program in the Math Pac. For successively smaller values of h, I got successively larger results for y(2). Therefore, I concluded there was a pole at x=2. Then I ran it under Mathematica, and here is what I got:

http://www.cdinc.com/misc/mathematica.jpg

So what am I doing wrong?

Re: Sorry but no cigar :-)... Patrick ?

*Message #7 Posted by **tony** on 3 Sept 2003, 1:44 a.m.,*
in response to message #6 by dbrunell

Looks like the pole is just above 2

Re: Sorry but no cigar :-)... Patrick ?

*Message #8 Posted by **tony** on 3 Sept 2003, 2:37 a.m.,*
in response to message #6 by dbrunell

google on

euler maple x^2 y^2

gives a first hit on a pdf at oregonstate.edu which shows maple actually *solving* this in closed form using Bessel functions!!!

Their graph only goes to x=1 where it looks like y is about .35

This is a real challenge!! I wish I knew how to evaluate Bessel functions - the Y(2) that Maple gives is:

2*(BY(-.75,2)-BJ(-.75,2))/(BY(.25,2)-BJ(.25,2))

Re: Sorry but no cigar :-)... Patrick ?

*Message #9 Posted by **dbrunell** on 3 Sept 2003, 3:37 a.m.,*
in response to message #8 by tony

Here is the function you gave, calculated to 50 decimal places:

http://www.cdinc.com/misc/mathematica2.jpg

Are you sure you got the signs right? I have Jn on my HP-48 but no Yn, and I'm too lazy to key it in. ;)

Edited: 3 Sept 2003, 3:37 a.m.

A little BIG rant

*Message #10 Posted by **Valentin Albillo** on 3 Sept 2003, 4:58 a.m.,*
in response to message #6 by dbrunell

This is going to be a little BIG rant, and I most sincerely hope I don't offend anyone, that's certainly not my intention, at all. Also, though I'm particularizing somewhat on this challenge, most of my remarks actually apply to other such similar challenges I've issued in the past.

The question is, while I really thank those of you such as Patrick and drbrunell and other people who were interested in my 'challenge' and kindly took the trouble to investigate it, I actually feel *very* disillusioned at the approach taken, and I'm now fully convinced that I cannot attain my intended didactic goals no matter how hard I try. I'll explain:

My original message stated this:

*"Now, here's a 'challenge' specifically for you (others may apply as well and are welcome to try, of course), your preferred algorithm (Runge-Kutta or whatever),***and your preferred HP calculator (physical or emulated)**"

the intention obviously being to get some HP-programming wizardry in action, a novel approach on how to tackle very difficult problems with our marvelous HP calcs, and thus learning something on the way and appreciating our beloved machines that much more.

What did I get instead ? People absolutely ignoring the challenging side of the problem, and

instanly reaching for their top-gun, pc-based Mathematicas and Matlabs, and whatever, after they tried the most cursory approach on their HP calcs, if at all.

Now, I also own a copy of Mathematica, and my copy can detect that this is an instance of the Ricatti differential equation and provide an explicit symbolic expression for the solution in terms of BesselJ and BesselY functions, which can be evaluated to thousands of decimal places at x = 2, or at y -> infinite.

So what ? I'm *not* interested in the least in the actual, numeric solution, what I wanted to see was some clever thinking applied to the problem, in order to solve it in an HP-97, an HP-15C, or and HP-25C, say !! Yes, it *can* be solved on an little, puny, 49-step HP-25C !!

So, I'm terribly sorry for this rant, but it's simply that I'm somewhat fed up. Everytime I issue some challenge to be solved using some HP calc, no matter how clearly I state that people should solve it using their HP calcs, it does me no good. People *always* use their PCs do to the job and achieve some results I couldn't be less interested in. As they say, "It's the journey that matters, *not* the destination".

So much for my rant. I really hope noone feels offended, indeed no offence was intended and I heartily apologize if any was taken. Anyway, as this isn't gonna change, as it seems that noone can refrain from putting their HP calcs apart, as the useless toys they surely are, and reaching for their oh-so-wonderful Mathematica software running on a oh-so-marvelous 2.4 Ghz Pentium IV PC, I'll refrain myself from issuing any such numerical 'challenges' in the future, lest I receive yet another 300+-digit Mathematica-computed result I couldn't care less for.

Best regards from V.

Can I use a HP 200 LX (with DERIVE student version)??

Re: A little BIG rant

*Message #12 Posted by **christof (NoVA US)** on 3 Sept 2003, 4:06 p.m.,*
in response to message #10 by Valentin Albillo

I've also been very interested in HP specific math elegance- partly because I do use them daily, nad partly because I keep a little notebook where I write keystroke programming 'bits' to use later. And they always do seem to get used.

I don't have an answer for this one, though :)

Re: A little BIG rant

*Message #13 Posted by **Wayne Brown** on 3 Sept 2003, 4:29 p.m.,*
in response to message #10 by Valentin Albillo

Is there any reason it can't be done *both* ways -- with an HP calculator and with a computer (or even by hand)? I don't see that some people giving a Mathematica or Matlab solution *prevents* anyone else from offering a calculator solution. Personally, I'd like to see both.

Re: A little BIG rant

*Message #14 Posted by **dbrunell** on 4 Sept 2003, 3:39 a.m.,*
in response to message #10 by Valentin Albillo

OK Valentin, you win.

The solution to the equation can be represented by:

http://www.cdinc.com/misc/riccati1.jpg

Where c is subject to initial conditions:

http://www.cdinc.com/misc/riccati2.jpg

Thanks to your initial condition of y(0)=0, we are simply left with y(2)=2*J(.75,2)/J(-.25,2).

Here is my 48S program for Bessel function of the first kind:

```
%%HP: T(3)A(D)F(.);
\<< \-> N X
  \<< 0 0 1.E99
    FOR K DUP '(-1)
^K*(X/2)^(N+2*K)/(K
!*(N+K)!)' EVAL +
      IF DUP ROT \=/
      THEN 1
      ELSE 2.E99
      END
    STEP
  \>>
\>>
```

I get an answer of 317.722460354.

I will leave it to you to write a Bessel function for the HP-25. :)

Re: A little BIG rant

*Message #15 Posted by **tony** on 5 Sept 2003, 1:18 a.m.,*
in response to message #14 by dbrunell

Thanks for the great HP48 program!!

FWIW this produces 317.722 460 675 750 307

I run it using powerbasic.

It requires rather great storage<G> but only really uses the four basic arithmetic operators. It just expands y(x) as a polynomial (I put dy/dx = x^2 + y^2 and match up coefficients. The same as a Taylor expansion about (0,0)).

```
defext a-z
dim a(6500)
t=6500
x=2
k=3
a(1)=(X^K)/K
S=a(1)
for i=2 to t
k=k+4
a(i)=0
```

```
for j=1 to i-1
a(i)=a(i)+a(j)*a(i-j)
next j
a(i)=a(i)*x/k
s=s+a(i)
print i,a(i);
print using "###.################";s
next i
end
```

If only I could spot a pattern in the coefficients it could be done with minimal storage and would be a candidate for a calculator.

It runs fine in quickbasic with defdbl in the first line.

Small HP calc versus MATHEMATICA ! [LONG]

*Message #16 Posted by **Valentin Albillo** on 5 Sept 2003, 6:48 a.m.,*
in response to message #14 by dbrunell

For those of you (if any) expecting a solution using just some tiny HP calculator, read on, I include a comprehensive one at the end of this post, but first some pertinent comments:

dbrunell posted:

"The solution to the equation can be represented by: [an explicit symbolic solution found using Mathematica]"

First of all, let me clearly state that I thank you very much for your interest in this informal 'challenge' I issued, and rest assured that none of my remarks are meant to be derogatory of your efforts to solve it. It's just that I am the kind of person that likes to abide by the rules of the game and expect others to do likewise, so I'm somewhat upset when someone disregards them, specially when it's totally unnecessary.

As you may guess, using Mathematica, MathLab, Derive, or whatever to solve one of my challenges is *utterly useless* as far as showing and learning new tricks with out beloved HP calculators is concerned, and as far as I'm concerned as well. As I said before, I also own a copy of Mathematica, and can easily achieve these results with no effort and to no purpose whatsoever.

Should you had found the explicit symbolic solution using some CAS or symbolic package in your HP48/49, that would be a thing. But finding it using Mathematica is breaking the rules big time. Now, once Mathematica has given you that weird-looking expression in terms of Bessel functions , you then go on:

"Here is my 48S program for Bessel function of the first kind: "

THIS is more like it !! That's what I want, some real code running in a real (or emulated) HP calculator, solving some difficult problem. What a pity that you chose to resort to that Mathematica of yours, instead of fully solving it with your powerful 48S from the scratch ! But you then end it all saying:

"I will leave it to you to write a Bessel function for the HP-25. :) "

What for ? WHO needs Bessel functions to solve this problem ? Mathematica needs them ? And WHO needs Mathematica for this problem ? Not anyone owning most any HP RPN or RPL calculators, for certain ...

In order to prove my point, here's a complete, reasoned solution to this challenge, using nothing more and nothing else than a vintage HP calculator. The solution is given for the HP-15C, for the one and only reason that it's the HP model I use routinely. A similar solution can be given for most other models, up to *and including* the HP-25 itself, but I don't have an HP-25 at hand right now. And yes, you *can* solve this challenge quite easily with a humble yet powerful HP-25, in a few minutes. Let's begin:

Given the equation y' = x^2 + y^2, with y(0) = 0, find an accurate value for y(2).

Step 1:

We need to use some algorithm and corresponding program to find numeric solutions for 1st order differential equations. Any will do, the HP-25C Application Programs does include one (Euler's method), the HP-41C Advantage ROM includes a better one (4th order Runge-Kutta method), and there are may others available.

As I'm going to use my everyday-use HP-15C, this is the program I wrote from scratch, ad-hoc for this task. It's unoptimized, hastily written, but it does the job. It implements Runge-Kutta 4th order method, in 45 steps. The 4th-order RK algorithm goes like this:

```
   Given  y' = f(x,y), with y0 = y(x0), we use a suitably
   small 'step' size, h, to compute additional values, (x1, y1), (x2,
y2), ...,
   like this:

      x1 = x0 + h
      y1 = y0 + (k1 + 2k2 + 2k3 + k4)/6

   where k1 = h.f(x0, y0)
         k2 = h.f(x0 + h/2, y0 + k1/2)
         k3 = h.f(x0 + h/2, y0 + k2/2)
         k4 = h.f(x0 + h, y0 + k3)

   once (x1, y1) have been computed, you then go on
   likewise to compute (x2, y2), etc.
```

and the resulting HP-15C implementation is this:

```
01  LBL A     13  STO 3     25  RCL 1     37  GSB 2
02  STO 0     14  GSB 0     26  PSE       38  STO+ 3
03  Rdn       15  GSB 0     27  RCL 2     39  RTN
04  RTN       16  RCL+ 2    28  PSE       40  LBL 2
05  LBL B     17  RCL 0     29  GTO 1     41  RCL+ 1
06  STO 1     18  GSB 2     30  LBL 0     42  GSB C
07  X<>Y      19  RCL 3     31   2        43  RCLx 0
08  STO 2     20   6        32   /        44  STO+ 3
09  LBL 1     21   /        33  RCL+ 2    45  RTN
10  X<>Y      22  STO+ 2    34  RCL 0     46  LBL C
11  GSB C     23  RCL 0     35   2        47  RTN
12  RCLx 0    24  STO+ 1    36   /
```

where you define your function f(x,y) under LBL C, assuming y is in the Y register and x is in the X register. Set User mode and specify the step value h, like this:

```
h, A
```

Then enter the initial condition (x0,y0) and proceed to compute (x1,y1), (x2, y2), etc, like this:

```
y0, ENTER, x0, B -> (x1) -> (y1) -> (x2) -> y(2)
```

press R/S to stop the program when done. By the way, this program *doesn't use any unique HP-15C features*, apart from recall arithmetic (RCLx 0) which you can easily

simulate (RCL 0, x), so *it will run* essentially unchanged on an HP-11C, HP-34C, and most any models having subroutine capability and labels. A version for the HP-25 and similar GSB-less machines is available as well.

Step 2:

Now, we need to define our equation, y' = x^2 + y^2. To this purpose, insert these steps after 46 LBL C

```
47  X^2
48  X<>Y
49  X^2
50  +
```

Step 3:

Let's try to find y(2). In User mode, FIX 7, using h = 0.1 (.1, A), and x0 = 0, y0 = 0 (0, ENTER, 0, B), we let the program run until it arrives at x = 2, duly noting the final result and several intermediate ones for x = 1, 1.7, 1.8, and 1.9. To check the accuracy of the result, we repeat the procedure a couple of times, halving the step size to h = 0.05, then to h = 0.025. This is what we get:

x	y (h=0.1)	y (h=0.05)	y (h=0.025)
0	0	0	0
1	0.3502337	0.3502320	0.3502319
1.7	2.9727649	2.9727984	2.9727975
1.8	4.6866510	4.6880373	4.6881254
1.9	9.5161319	9.5622688	9.5666582
2	71.5789968	124.2866329	194.9352142

Step 4:

Now, instead of blindly accepting the last value for y(2), we must evaluate the results. From the table above, it's obvious that while y(1) = 0.3502319 is accurate to 7 decimals, y(1.8) is accurate to no more than 4 decimals, y(1.9) only to 2 decimals at best, and y(2) isn't accurate to any given digits. Further, the y-values seem to be more than doubling for a small linear increase (h) of the x-values, and this exponential growth should make us suspect a pole (singularity) at or near x = 2.

Step 5:

If a singularity is present nearby, reducing the step size h further to h = 0.001, 0.00001, or smaller, will be no use. The running times will be astronomic and the accumulation of rounding errors to reach x = 2 after 200,000 steps or more will make the final result inaccurate anyway. Do we reach for Mathematica ? No way, it's just that a different approach is called for.

As it's well known, HP vintage calcs were *"designed by engineers for engineers"*. Though many people now tend to take the easy ride and use pure brute force (i.e., Mathematica's N[..., 100]) instead of neuron-power, engineers of old were expected to have some familiarity with Calculus, at least elementary Calculus, plus a fine intuition for difficulties. On suspecting a pole, a singularity, any engineer worth his/her salt would think along these lines:

"Aw, gee, we've got some nasty singularity nearby, which is spoiling our algorithm's accuracy. Let's remove it out of existence ! How ? Easy ... let's make some change of variable, such as to turn a singularity-ridden function, like this unknown y(x), into some smooth, singularity-free one ... how about the arctan(x) function ? It will return a finite

value, Pi/2 at most, for any argument x, even if it goes to infinity. Let's try !"

Step 6:

Lo and behold, let's make a change of variable:

```
[1]   y = tan(z)
```

so then we have:

```
[2]   z = arctan(y)
```

its derivative will be:

```
[3]   z' = y'/(1 + y^2)
```

isolating y' gives:

```
[4]   y' = z'.(1 + y^2) = z'.(1 + tan^2(z))
```

but the original equation says:

```
[5]   y' = x^2 + y^2 = x^2 + tan^2(z)
```

so equating both expressions [4] and [5], we get:

```
[6]  z'.(1 + tan^2(z)) = x^2 + tan^2(z)
```

which, after isolating z' gives:

```
[7]  z' = (x^2 + tan^2(z)) / (1 + tan^2(z))
```

which is the new differential equation (in [x, z, z'], instead of the original [x, y, y']) we must now solve, subject to the initial condition:

```
z(0) = arctan(y(0)) = arctan(0) = 0
```

and once we find z(2) using our HP-15C program, we'll simply have:

```
y(2) = tan(z(2))
```

Step 7:

The new differential equation is programmed under LBL C (after removing the original equation) like this:

```
47  X^2     52   1
48  X<>Y    53  LASTX
49  TAN     54   +
50  X^2     55   /
51   +      56  RTN
```

and now, in RAD mode, using h = 0.1, then h = 0.05, we get

```
  x       y (h=0.1)     y (h=0.05)
-----------------------------------
  0       0             0
  1       0.3368811     0.3368813
  1.7     1.2463033     1.2463031
  1.8     1.3606417     1.3606412
  1.9     1.4666491     1.4666485
  2.0     1.5676491     1.5676489
```

which clearly shows that the singularity has been effectively removed, so we've got:

```
z(2) = 1.5676489
```

and thus:

```
y(2) = tan(z(2)) = 317.7225457
```

which has *nearly 7 digits correct*, greater accuracy being possible by simply using a smaller step size, h. Further, the exact x value corresponding to the pole near x=2 can be found accurately with our little HP calculator using a single iteration of Newton's method, like this:

```
Xpole = 2 - (z(2)-Pi/2)/z'(2)
```

where we already have z(2) and can compute z'(2) by simply using the differential equation [7]. So, calling z(2) = 1.5676489 = k, we then compute:

```
Xpole = 2 - ( k - Pi/2) / z'(2)
      = 2 - ( k - Pi/2) / ((4+tan^2(k)) / (1 + tan^2(k)) )
      = 2.0031473
```

which *is accurate to all 8 digits shown*.

Thusly, we've succedded in finding both the value of y(2) and the singularity, to 7-8 digits accuracy, using just our small HP calculator and a little bit of the elementary knowledge and basic intuition any engineer should have in spades.

If any of you did find some of this useful or even learnt something, I think I will have proved my point and achieved my goal.

Best regards from V.

Re: Small HP calc versus MATHEMATICA ! [LONG]

*Message #17 Posted by **Werner Huysegoms** on 5 Sept 2003, 7:20 a.m.,*
in response to message #16 by Valentin Albillo

Thank you, Valentin. I liked it a lot, even if I had to look up the formula for Runge-Kutta again (it's been too long). (yes I was trying to solve it) Your comments are spot-on: having an all-powerful Mathematica on your PC is no substitute to a bit of careful analysis - for some problems will remain beyond even Mathematica's power - and then what?

Werner Huysegoms

Re: Small HP calc versus MATHEMATICA ! [LONG]

*Message #18 Posted by **Valentin Albillo** on 5 Sept 2003, 8:08 a.m.,*
in response to message #17 by Werner Huysegoms

Hi, Werner:

Werner posted: *"Thank you, Valentin. I liked it a lot, even if I had to look up the formula for Runge-Kutta again (it's been too long). (yes I was trying to solve it)"*

Thanks for your kind comments, much appreciated. I'm glad to know that you were giving it a try and liked my approach to solving it. I usually hesitate a lot to post such challenges and corresponding long answers, for it's been my (sad) experience that they get by and large ignored, or even worse, are interpreted in a bad light, and frankly, it's a lot of work ! :-)

"Your comments are spot-on: having an all-powerful Mathematica on your PC is no substitute to a bit of careful analysis - for some problems will remain beyond even Mathematica's power - and then what?"

Certainly, but sadly few people seem to realize that. For instance, re my 'challenge', Mr. dbrunell used Mathematica to find an explicit solution to **y' = x^2 + y^2** and Mathematica succeeded, producing one in terms of Bessel functions. So far so good.

But what if the problem were *slightly* changed to **y' = x^2 + y^2.00281** or **y' = x^2 + y^e**, say ? Though quite similar, they aren't Ricatti-equation instances anymore, and Mathematica thus **fails** to produce an explicit, closed symbolic representation. No Bessel functions you can evaluate on your 48S (what for, if you've got Mathematica ...), no nice closed-form representation for the constant integration factor. The slightest change in the equation completely changes the nature of the solution.

On the other hand, the approach I detailed, using a humble, small HP calculator, is absolutely *oblivious* to the fact that **y^2** has been changed to **y^2.00281** or **y^e**, and will work exactly the same, unaffected by the change, because it does not depend on such specifics but in a sound numerical algorithm and some sound judgment and professional proficiency on the part of the user. Brute force only goes so far, and will spend gigabytes and gigaflops to get results that a 49-byte handheld calculator and its knowledgeable user can get much more economically, while learning something in the process.

Thanks again and best regards from V.

in response to message #16 by Valentin Albillo

Valentin, thanks for taking the time to prepare and publish your elegant solution!

If TAN is not avaliable then y=z/(1-z) is the best substituion I can find. The equation becomes z'=(x^2)*(1-z)^2 + z^2, and we start from x=0,z=0. With h=.1 I end up with y(2)=318 and with h=.05 I get y(2)=317.73. So, it's not as powerful as y=TAN(z), but not a bad substitute.

Cheers, Tony

Dear Valentin:

Thank you for taking the time to create that lengthy and educational post. Having taken differential equations over 20 years ago and never using the knowledge in my professional endeavors, I admit to being quite rusty. I would never have considered a change of variable.

Incidentally, the form of the solution I gave in my post (using Bessel functions) came not from Mathematica but from the book "Differential Equations and Linear Algebra" by Edwards and Penney.

I have printed out your post, and it will become a permanent part of my reference material.

Best regards,

David Brunell

Thanks to all of you. Best regards. [no text]

Re: HP-11C Solutions Handbook Errata?

*Message #23 Posted by **tony** on 4 Sept 2003, 12:14 a.m.,*
in response to message #2 by Valentin Albillo

Valentin, I am trying a polynomial form for y(x)=(x^3)/3+(x^7)/63+(x^11)*2/(11*9*7*3)+terms in X^15,X^19 etc. If only I could get a manageable pattern in the coefficients, I reckon I could implement it on a calculator with minimal storage. As it is I think I need to remember each coefficient to get the next one. Am I getting close? My algeraic manipulation skills are not what they once were<G>. This is the only way I can see of doing it - following the slope from (0,0) in small steps does not help it is a long journey and one is not sure one is still correctly connected to (0,0).

- later - maybe you use TAN in the solution? I'm after a hint<G>. TAN could be handy because of the y^2 as d(TAN(x))/dx=1+TAN(x)^2

Yep, maybe better to start with TAN rather than the (x^3)/3 - looks like that polynomial will need a lot of terms for Y(2) and we maybe need the power of TAN?

Edited: 4 Sept 2003, 1:26 a.m.

Program Encapsulation on a HP-42S (Was: Re: QPI for the HP-42S)

*Message #6 Posted by **Erik Ehrling (Sweden)** on 2 Sept 2003, 1:37 p.m.,*
in response to message #5 by Werner Huysegoms

Hi Werner!

Certainly the lines should be there! The lines 2-12 at the start of the program stores the contents of the stack (and all registers). The corresponding lines 376-391 at the end of the program restores the stack (and all registers). This way program encapsulation is achieved on the HP-42S! Further, this allows you to run QPI in the middle of a calculation and then continue the calculation after QPI has run!

Best regards, Erik Ehrling (Sweden)

Re: Program Encapsulation on a HP-42S (Was: Re: QPI for the HP-42S)

*Message #7 Posted by **Victor Koechli** on 2 Sept 2003, 8:04 p.m.,*
in response to message #6 by Erik Ehrling (Sweden)

No, Werner is right, I've noticed this too. The lines 381 and 383 are too much. Consider: If you do

```
RCL "T_QPI"
STO ST_T
```

you will restore the saved T register contents directly to T. But if you now execute

```
RCL "Z_QPI"
```

the stack is lifted and the contents of T are lost. Instead you should just do

```
RCL "T_QPI"
RCL "Z_QPI"
RCL "Y_QPI"
RCL "X_QPI"
```

as Werner suggests, and the entire stack will be restored.

Cheers, Victor

Oh yes, they are redundant! (Was: Program Encapsulation on a HP-42S (Was: Re: QPI for the HP-42S))

*Message #8 Posted by **Erik Ehrling (Sweden)** on 3 Sept 2003, 2:10 p.m.,*
in response to message #7 by Victor Koechli

Oh yes! The lines are redundant (even though the program works perfectly with the lines in place as well...). Thanks!

Regards, Erik

Recap of HP calculators emulators for PDAs

*Message #1 Posted by **Vincent Weber** on 31 Aug 2003, 6:56 a.m.*

Hi all,

In these days where old HP calculators are missed, I would like to share my experience of HP calculators for PDAs, since I never found the posts on this subjects exhaustive. I hope the follwoing info will be useful. I think it is pretty complete, but please feel free to add to the list !

1) HP-41: -----

The queen of the 80's, still very useful today, especially with the Advantage ROM, making it one of the very few calculators on PDA supporting matrixes.

- For PalmOS: P41CX is a faithful, accurate and fast emulator for the 41CX (with time & extended memory functions). I use this program daily. It can be found on www.palmgear.com. What is remarkable of this emulator is that it allows hot-swap of nearly of the modules made for the 41. You have also printing to memo, 2-lines display, object loader - all this for a mere $10. A fantastic program. There was another emulator for PalmOs called Coconut... but the author has decided to discontinue it. It was good, but not as accurate and fast as P41CX. It integrated a full printer display, though.

- For PocketPC: eV41 is also a very good emulator. It does not support 2 lines nor printing, though. But the look and feel is very good.

2) HP-48/49--------

The queens of the nineties...

- For PalmOS: A fantastic emulator called Power48, totally free. It can be found at: power48.mobilevoodoo.com. Absolutely fast and accurate, with very realistic faceplates. Lucky owners of Sony Clie NX and NZ series with Hires+ mode (320x480) can enjoy a full size calculator without having to zoom the screen. Sadely, there is not (yet) emulation of port2 nor custumizable faceplates ("KML"s in Emu48 terminology).

- For PocketPC: There is Emu48CE V1.23 (web.jet.es/leobueno/emu48.htm). Sadely, this is not a vey good piece of software... not so stable, and can lag. A (not so good) adaptation of Emu48 for PocketPC, which has not been updated for a long time. Far less usable than its PalmOS counterpart, Power48. (Yet another) good reason to go for a Palm ?

- For EPOC32 (PsionOS): For die-hard Psion lovers (I used to be one), there is a recent very good emulator: Emu48E 1.4. It can be found on www.hpcalc.org.

3) HP-15C ------

A fantastic calc ahead of its time, the first one to integrate matrixes and complex numbers on the stack.

There is no actual emulator... The HP-15C is a closed system from which the ROM cannot be uploaded. However, there is fantastic SIMULATOR for PocketPC: Pocket15C (http://www.lygea.com/pocket15cdetail.htm). A simulator

of HP-41 and HP-48 calculators would be a little interest since the machine code programs would not work; but for a HP-15C which is not very "hackable", never mind. A simulator gives the opportunity to enhance the calculator. Pocket15C, unlike an atucal HP-15C, is able to display programs in alphanumeric form (this was the major complain against the very good 15C - programs were very hard to edit), is very fast (The 15C is very slow), has plenty of memory (999 registers + 64 registers per matrix). A must have for PocketPC owners. I really wished there was such a product for PalmOS... Of course the squarish screens of Palm devices make it a bit cumbersome to display the rectangular-shaped Voyager series, but the NX or NZ series should do this just fine. Wait and see...

4) HP-12C ------

The best selling HP calculator is also widely emulated. I will just quote two "emulators" (simulators actually).

- PalmOS: KK-12C (www.palmgear.com). A very nice product, very accurate able (unlike the actual 12C) to load external programs. It deals with the squarish screen of the Palm (vs. the rectangular shape of Voyager calcs) by cutting the screen into two possible views. Not perfect, but usuable.

- Pocket12C: The business counterpart of Pocket15C from Lygea, described above, with the same qualities. Note that Lygea also make a "10B+" simulator (extended 10BII) but I find this of little interest...

5) HP-16C ------

- PalmOS: Palm16C 1.0.0 (wwww.palmgear.com). A bit rough, does not look very sexy, but does the job.

- PocketPC: Nothing yet - but I heard from Lygea that they are preparing a Pocket16C ! Wait and see...

Now, what is missing:

1) HP-42S: ------

Probably the most complete (with no I/O, but this could be patched in an emulator) pre-RPL HP calc... and sadely, no emulator for PDAs. There is none emulator for Windows by Christoph Giesselink:

http://privat.swol.de/ChristophGiesselink/Lewis/Hp42demo.zip

It is quite fine, but the ROM is -not- included for obscure copyright reasons within HP (I fail to understand why 41/48/49 ROMs are available while the 42 is not !). Christoph has no intention to port it to PalmOS or PocketPC. I am trying to make a 42S -simulator- (with extensions such fractions & equations support from the 32SII, better (direct) alpha entry, user-redifinable keyboard, to address the (very few) weaknesses of the '42). It is still an early project, but I think it would be welcome... any interest ? :)

2) HP-32Sii: --------

Would be nice to have. Not as powerful as the 42, does not handle matrixes, handle complex numbers in a rather primitive way, limited to only 27 variables. But very easy to use and nice touches, such as equation and fractions support. Looking at the 'Power Rangers' look of the new 33S calculator supposed to replace the 32SII... There may be some room for developping a 32SII simulator / emulator :) But the 32SII is another 'closed' system, with no way to get the ROM other than asking HP...

3) HP-17Bii --------

Same remark as above: Looking at the new 17B+ '10Bii-syle- case... there may be some room for a 17Bii emulator !

4) Others ------

- 28C/S: I don't think an emulator would be relevant: No PDA has big enough a screen to emulator the double

keyboard, while a 48 emulator does most of the things better than the 28 (expect for the catalogs...) - 19Bii: Same remark (same case). - Pre-41 models: Would be nice for nostalgy, altough the 41 or even 15C can do most of the things they did. Nevertheless, a 65/67/25C/29C/34C emulator would certainly be sucessful :)

My 2 cents... Vincent

Re: Recap of HP calculators emulators for PDAs

*Message #2 Posted by **Patrick** on 31 Aug 2003, 5:14 p.m.,*
in response to message #1 by Vincent Weber

Excellent post, Vincent.

I am a pretty staunch supporter of the Palm platform, but I tell you that Lygea 15C emulator may someday force me to buy an (old?) PocketPC just for that one program, despite it being a Microsoft platform. I am a 15C fanatic and am always on the lookout for 15C related materials.

Thanks again.

Re: Recap of HP calculators emulators for PDAs

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 1 Sept 2003, 8:56 a.m.,*
in response to message #1 by Vincent Weber

While not exact emulators or simulators of HP models, MathU and MathUPro for the Palm platform (from creativecreek.com) are Voyager-like RPN calculators.

Also BizCalc for PocketPC (from odysseyinc.com) operation is based on the 12C.

There are many other RPN calculators for Palm or PocketPC, but not quite similar to the HP units.

Re: Recap of HP calculators emulators for PDAs

*Message #4 Posted by **christof (NoVA US)** on 1 Sept 2003, 11:01 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

Don't forget RPN by nthlab. It's not a direct emulator, but it's very good and really cusomisable/programmable.

I'd like to see more developments not tied quite as heavily to the exact operation of a specific calc. Given the capabilities and OS features of palmos and embedded linux*, A good calculator making the most of the capabilities and programmability of RPN machines should be possible.

nonetheless, don't forget nthlab :)

-Christof

* (I'm over the pocketPC stuff. MS has tries hard to make wure you can't get full effective use out of one of these devices with out a pc plugged in and I think they've done the job too well)

Re: Recap of HP calculators emulators for PDAs

*Message #5 Posted by **Mark Ordal** on 9 Sept 2003, 9:19 a.m.,*
in response to message #4 by christof (NoVA US)

I wanted to remind everyone that these emulators can be very slow compared with stack-based

calculator programs that are simply somewhat HP-like, rather than being exact emulations.

Obviously, if you only want to run programs already written for a particular HP model, then something like the P41CX emulator running on a PalmOS PDA is a very convenient thing to have.

On the other hand, if you plan to write your own programs, the difference in run time between a "modern" calculator program and an emulator can make the emulator seem like a waste of time.

A case in point: one of my programs takes 250 seconds to run on my rebuilt HP41CX; the same program runs in 120 seconds under the P41CX emulator on my Palm m505 (33 MHz Dragonball cpu); a program to do the same calculation under version 3.10 of nth Lab's RPN calculator program on my m505 takes 8.9 seconds; and finally, a program for Creative Creek's "MathU Pro" on my m505 takes just 3.1 seconds.

So 120 seconds versus 3.1 seconds: your choice.

Gamma function differences?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 30 Aug 2003, 11:40 p.m.*

Hi to all! I was just playing with my hp-42S and my newly arrived (and fixed!) HP-11C, and I found this difference: In the Gamma function (in HP-11C shared with factorial [n!]) I found these results:

HP-11C: n = 68.5, result = 2.056343638e97

HP-42S: n = 68.5, result = 3.0019615151e95

HP-11C: n = 67.5, result = 3.00196151e95

HP-42S: n = 67.5, result = 4.44735039275e93

HP-11C: n = 66.5, result = 4.447350392e93

Commodore SR4190: n = 68.5, result = 3.00196151995e95

Commodore SR4190: n = 67.5, result = 4.44735039501e93

I'm just curious (as I don't have the HP-11C user's manual): the argument for Gamma function in the HP-11C is added by 1 internally?

Regards,

Nelson

Re: Gamma function differences?

*Message #2 Posted by **Brandon Del Bel** on 31 Aug 2003, 1:21 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Dude, gamma(x)=(x-1)! To calculate gamma(68.5) on your 11c, you need calculate the factiorial of 67.5 to get 3.001961515*10^95 (which is what you got for for your "n=67.5" except for the last decimal; I multiplied the result of 67.5! by 1e-95 to display all the digits.) On a side note, the results of your 42s match my 48gx and 49g. I hope this clarifies the discrepancy.

Sincerely,

Brandon

Re: Gamma function differences?

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 31 Aug 2003, 2:08 a.m.,*
in response to message #2 by Brandon Del Bel

This is because the gamma function in HP-11C is "hidden" in the factorial function? The use of the same

key is clever, but as I said I don't have the manual, and I really forgot about the gamma(n) = (n-1)! equivalence...

Thanks!

Best regards,

Nelson

Re: Gamma function differences?

*Message #4 Posted by **Ellis Easley** on 31 Aug 2003, 4:24 a.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

Viktor Toth has a good discussion of the gamma function at rskey.org:

http://www.rskey.org/gamma.htm

ebay partial refund question / poll. RSVP

*Message #1 Posted by **db(martinez,california)** on 30 Aug 2003, 8:34 p.m.*

I bought a 19C a while back, just the calc, case, and battery. The seller described everything correctly except that he said the printer had worked when he last used it but it did not print at all when i got it. btw: the motor does run and the paper works well in another HP thermal. I have written to the seller and he asked me what i want to do. Thats a fair question but i don't know a fair answer yet. I know that i would like to keep it.

My question is; what percent of the total value do you all think the printer is? If i get 5 or 6 answers i could use my 19 to get a mean value and even a standard deviation to send back to him. Thanks in advance to whoever responds.

Re: ebay partial refund question / poll. RSVP

*Message #2 Posted by **Katie** on 31 Aug 2003, 12:57 a.m.,*
in response to message #1 by db(martinez,california)

db-

I'll get the ball rolling but reiterating my feeling that somewhere around 30-40% is the right amount of refund. Although this might be repairable (this seems to be a common fault on the 19C's, due to corrosion problems on the printer power supply board under the battery compartment) I still think that a refund is in order, it's a very difficult repair.

-kt

Re: ebay partial refund question / poll. RSVP

*Message #3 Posted by **Valentin Albillo** on 1 Sept 2003, 5:07 a.m.,*
in response to message #1 by db(martinez,california)

Both the HP-19C and its non-printing version, the HP-29C, were introduced in 1977-7-1, at $345 and $195 respectively, so the lack of a printer resulted in the non-printing model costing 44% less.

However, the 19C did include other benefits, printer-related but quite independent of it working, such as larger size, better keyboard, and more capable batteries, and all of them keep on improving the machine whether the printer itself works or not, so I guess that a 33%-40% refund would be Ok. If the seller doesn't agree and you like this particular machine very much, I would even go for a mere 25% refund, but not a cent less.

Best regards from V.

The printer "makes" the 19C

*Message #4 Posted by **Mike** on 1 Sept 2003, 8:36 p.m.,*
in response to message #1 by db(martinez,california)

Refunds are a funny thing. If the seller offers "as is" or "no refunds" then none should be expected. However, on the otherhand, if the seller deceives the buyer, he should offer a refund.

Phrases like "**work last time I tested it**" should be read as "**but it probably doesn't work now**." Anyone that knows how to test one, would actually test it. He may not tell you the results and might resort to wordsmanship. They are worth much more, when known to work.

As for how much, remember that the printer is what makes the 19C special. It is much more than just some incremental delta of the whole value. I'd say the printer is the "whole" calculator. I would expect that you should expect 40%-50% refund, IF he gives a refund.

PS: I know of one HP seller/collector that offers DOA guarantee but this would not qualify because it is not 100% dead. That is really deceptive advertizing.

windows driver for hp82240 printer

*Message #1 Posted by **luciano fernandes** on 30 Aug 2003, 11:50 a.m.*

does anyone knows one driver for printing thru pc/windows/ir to an 82240 printer? of from a pocketpc pda?

Re: windows driver for hp82240 printer

*Message #2 Posted by **Christoph Giesselink** on 1 Sept 2003, 1:19 p.m.,*
in response to message #1 by luciano fernandes

> does anyone knows one driver for printing thru pc/windows/ir to an 82240 printer? of from a pocketpc pda?

that will not work because of hardware reasons. On most PC hardware the Ir transmitter is somehow directly connected to an UART. This UART cannot be programmed to use the HP82240 Redeye protocol or have the ability to control the Ir-LED directly. So IMHO some sort of special hardware is necessary. But in this case you can also make an intelligent interface with a standard interface (COM, LPT, USB) transmitting data in the HP Redeye protocol. I don't know if someone made something so far.

Christoph

New HP Calculator

*Message #1 Posted by **Garry** on 30 Aug 2003, 11:21 a.m.*

Looking to purchase new HP engineering, scientific, surveying,etc. calculator. With the current 48gx model being discontinued, do you recommend waiting for the new models or purchase the 48gx now?

Re: New HP Calculator

*Message #2 Posted by **Raymond Del Tondo** on 30 Aug 2003, 12:15 p.m.,*
in response to message #1 by Garry

Depends on your needs.

If you're used to something like the Pioneer Series, including the HP-48, then you should get a GX while you can.

If you don't mind rubber keys, less ergonomic keyboard layout, and eye-blinding color schemes, then you may want either the new 49G+, or the '48GII'. These both have some interesting features, namely the higher speed CPU, the bigger diplay (49G+ only) and the SD card slot (49G+ only...)

In fact the '48GII' is more a relabelled 49G.

I have to admit that the color schema of the '48GII' is MUCH better than that of the 49G/49G+.

Raymond

Re: New HP Calculator

*Message #3 Posted by **phreephly** on 30 Aug 2003, 2:33 p.m.,*
in response to message #2 by Raymond Del Tondo

Actually, according to the messages on comp.sys.hp48, the keys on the 49G+ (and I assume the 48GII) are plastic and the seem more like the 48GX. Apparently a few folks have gotten their hands on these new calcs and are not under a NDA.

Speed tests seem to indicate 3 times better performance than the 49G on average.

Check out the newsgroup and thread "HP49G+ is on my hands!!"

Now the question is how soon will it be available!

Sam

JUST my thoughts, Raymond !! (no text)

Re: New HP Calculator

*Message #5 Posted by **Joseph** on 30 Aug 2003, 10:13 p.m.,*
in response to message #1 by Garry

I think you'd have to be nuts not to wait for the new calculators... they seem to have overcome almost every complaint with the HP49G.

You have (on the 49G+)

Bigger Screen, 48G style plastic keys, SD card slot (128mb of memory or more), 3 times the speed (with the potential for even more) and IrDA and USB

What's not to like?

Re: New HP Calculator

*Message #6 Posted by **fwbrown** on 31 Aug 2003, 10:18 a.m.,*
in response to message #5 by Joseph

> Quote:
>
> What's not to like?

The colors, the ugly face plate, the cursor keys, the tiny [ENTER] key in the wrong place...

Not being fair to the 49G+

*Message #7 Posted by **Gene** on 31 Aug 2003, 4:10 p.m.,*
in response to message #6 by fwbrown

The colors are NOT that bad. I think it will look fine along side a 12c with its gold and black color scheme. I think you have just decided not to like the new machine.

I think that's sad, because OTHER THAN the smaller out-of-place ENTER key, it looks like HP has addressed many/most of the user community's concerns.

I call that progress.

And, it's 3-5 times faster too.

Stay with the older calculator if you must, but it looks like it will be great! Gene

Re: Not being fair to the 49G+

*Message #8 Posted by **Wayne Brown** on 1 Sept 2003, 8:17 a.m.,*
in response to message #7 by Gene

Well, I never liked the 12C's color scheme either... and the **[ENTER]** key issue is enough by itself to keep me from buying a 49G+. I wouldn't buy *any* HP calculator without the double-size **[ENTER]** key.

As far as making progress goes: HP has screwed up so often for so long that I no longer cut them

any slack at all on new products. Either they get *everything* right, or I'm not interested.

Re: Not being fair to the 49G+

*Message #9 Posted by **Gene** on 1 Sept 2003, 10:32 a.m.,*
in response to message #8 by Wayne Brown

I know that is how you feel, Wayne. You should probably just resign yourself to living in the past. Don't get me wrong, I too like the double-wide ENTER key, but I don't believe it will come back. If that means you never buy another HP calculator, oh well.

The color scheme is a matter of preference or opinions, and I know you have strong ones. However, the majority of observers who see a picture of the 49G vs. the 49G+ like the 49G+ pictures better.

And, the 49G+ will look great on MY desk next to my 12c, particularly since 12c calculators are EVERYWHERE within the financial community (normally a very conservative community at that) and no one minds the black and gold color.

As I said, to each their own, but I believe HP has a winner on their hands with the new 49G+...particularly since they have solved so many of the user group complaints about the 49G with this new model.

Re: Not being fair to the 49G+

*Message #10 Posted by **Mark Hardman** on 1 Sept 2003, 11:22 a.m.,*
in response to message #9 by Gene

I hate to disagree, but the new HP-19II+ will have the double wide "Input" key and, I assume, a supported RPN mode like the HP-19II.

Mark Hardman

Re: Not being fair to the 49G+

*Message #11 Posted by **Gene** on 1 Sept 2003, 2:08 p.m.,*
in response to message #10 by Mark Hardman

Quite right. Had forgotten about the pre-pics of the 19BII+ or whatever it will be called.

I still don't believe a new scientific calc will be made with a double-wide key. The inconsistency seen with the new 19BII+ is something HP should be asked about of course.

Thanks for pointing that out, Mark! :-)

HP and double width keys

*Message #12 Posted by **Tom (UK)** on 2 Sept 2003, 3:51 a.m.,*
in response to message #11 by Gene

There HAS been a recent HP scientific calc with a double width key! The calculator is the HP6(S).

Before you shout 'foul' because it's not RPN (or actually an HP design) it DOES show that it IS possible to design a modern calculator with double width key that is economical and aceptable to the buying public. I accept it's not quite in the 'correct' place and is an '=' key rather than 'enter'.

So it looks like HP just doesn't want to do this rather than there being a technical or marketing problem. Are they trying to create clear blue water between the new stuff and the RPN only past?

Re: Not being fair to the 49G+

*Message #13 Posted by **bill platt** on 1 Sept 2003, 2:53 p.m.,*
in response to message #10 by Mark Hardman

I wonder if that "INPUT" key will be just as it says: input. THe equals key has "enter" labelled on it, so I am afraid that RPL enter will be down in the lower right corner, just as with the 49G+ etc.

Regards,

Bill

Re: Not being fair to the 49G+

*Message #14 Posted by **Mark Hardman** on 1 Sept 2003, 3:23 p.m.,*
in response to message #13 by bill platt

In most situations on the HP-19BII, the INPUT and = (ENTER) keys are interchangable in RPN mode.

Any idea what kind of battery door that 19bII+ will have?

being fair to the49G+, BUT

*Message #16 Posted by **christof (NoVA US)** on 1 Sept 2003, 9:56 p.m.,*
in response to message #9 by Gene

Will HP be able to catch up?

I was recently scouting a store while the college folk do their shopping- Casio has some really CHEAP and *Good* stuff out there- and TI has gone so far as to offer a real keyboard for the 83/89/etc.

Think the 49G+ will make good use of that USB port?

Graphing tablet? Keyboard? Sensors?

I can't wait, but I'm a bit scared that Carly will shoot down anything that doesn't involve layoffs and personal salary increases at this point.

> And, the 49G+ will look great on MY desk next to my 12c, particularly since 12c calculators are EVERYWHERE within the financial community (normally a very conservative community at that) and no one minds the black and gold color.

I'm not really concerned one way or the other about the 12C, since I have no use for a financial calculator. At least it has the classic Voyager styling going for it, so it's a good-looking machine, although I still think the other Voyagers look better.

I might be able to stand the 49G+'s color if it weren't for that stupid curved faceplate and the little round cursor buttons -- and, of course, the **[ENTER]** key, which as I said before is a deal-breaker for me. It's as much a matter of philosophical differences as of practicality. I still see no sign of remorse or hint of apology from HP for betraying their RPN tradition and those of us who rely on it. If I see signs of a return to the old attitude of "We're different because we're *better* and we don't *want* to look like our competition; if you like TI and Casio better, then we don't *need* you!" then perhaps I'll be willing to give them another chance.

Exclusiveness

Exclusiveness.
That was the way.
Some days ago somebody posted something about Harley-Davidson (perhaps it was in comp.sys.hp48)
Other example? Why to make very expensive mechanical watches, when cheap Quartz Casio's are much more precise?
Yes, Wayne, *that* was the way...

That's right. What if Ferrari started making cars that look just like Toyotas or Chevrolets? I don't think many Ferrari fans would want one.

Hey- casio is great!

*Message #20 Posted by **christof (NoVA US)** on 3 Sept 2003, 4:56 p.m.,*
in response to message #18 by R Lion

Casio makes a lot of watches, but they also have often been at the front of the market for introducing specialty electronics in wrist form.

The best wrist PDAs, the only IR remote temperature recording, Intelligent Remotes, data Sync, sat. time sync, GPS-

You may think of it as all toys, but I think Casio makes some of the best electronic watches there are.

grin

Re: Hey- casio is great!

*Message #21 Posted by **R Lion** on 3 Sept 2003, 5:39 p.m.,*
in response to message #20 by christof (NoVA US)

I don't think Casio's are "toys". What I mean is that some brands like Rolex, Breitling, Omega, IWC, Zenith, etc, etc, etc, etc... are making increidible expensive MECHANICAL watches (less precise than the cheap quartz watches) only because some people prefer an "exclusive" watch in his wrist...Luxury. Those brands are not trying to get more customers neither in schools nor in supermarkets ;-)

OT: Special case

*Message #22 Posted by **Raymond Del Tondo** on 3 Sept 2003, 9:58 p.m.,*
in response to message #21 by R Lion

Hi,

Rolex is a special case in your list. Other than the other brands, Rolex is a foundation, and thus more independent than the other companies. Moreover, Rolex is nearly the only brand in your list which develops *and* manufactures their own clockworks/calibers, whereas most of the others use ETA (NOT in the Spanish sense!) clock engines or alike. Don't get me wrong, ETA engines are very well, but the 31xx caliber(s) from Rolex are real hardcore, extremely durable, and nearly undestructable. One point which nearly no other clock engine can compare to is the 'Unruh-'bridge. Most automatic watches only have an 'Unruh-' arm.

Sorry I don't have the word for 'Unruh' handy here. It's the heart of the watch, and swings back and forth with a spiral feather contracting and de-contracting...

Regards,

Raymond

Re: OT: Special case

I knew, Raymond. But the idea is that those watches brands are selling "luxury&exclusiveness" and they have their own "brand image". They are not triyng to get thousand of customers...
BTW, I have not one of these master pieces. Mine is (a very good "Swiss Made") quartz Kronos. (With an ETA Cal 251.265)

in response to message #27 by R Lion

If Breitling says that I don't know what to think about my 25 years old mechanical Orient 1 minute in a month.

Re: Quality (was Re: Exclusiveness)

*Message #30 Posted by **Thibaut.be** on 5 Sept 2003, 12:54 p.m.,*
in response to message #26 by Frank Wales

I have worked for nearly 4 years in a famous watches group, and I've never heard that mechanical watches were more reliable than quartz watches. An expensive coaxial Omega is about 100 times less accurate than the cheapest Swatch.

In addition mechanical watches are far more sensitive to their environment such as position, temperature, ... Only a few of them have a sufficiently accurate mechanism that enable them to be "CHRONOMETER" certified.

Not to be confused with the Chronograph, that you use for cooking your morning eggs...

That is!!

*Message #31 Posted by **R Lion** on 5 Sept 2003, 3:32 p.m.,*
in response to message #30 by Thibaut.be

Perhaps the Breitling numbers are exaggerated, perhaps not but as Thibaut.be has said, it all depends on MANY things. Some people choose very carefully the position of the watch in the table for the night: so, the inaccuracy of the day can be compensated in the night. But mechanical watches ARE LESS accurate than quartz watches. Among many other things, a watch with an inaccurate of +6 seconds per day (3 minutes per month) can be oficialy certificated as Swiss Chronometer.(My quartz Kronos: 25 seconds in a year)...

And talking about this, we are loosing the point... This was ONLY an example, so please, let's talk about calcs again. Neither about Harley-Davidson nor Breitling...

Edited: 5 Sept 2003, 3:55 p.m.

Re: Quality (was Re: Exclusiveness)

*Message #32 Posted by **Frank Wales** on 7 Sept 2003, 6:56 a.m.,*
in response to message #30 by Thibaut.be

Note that I made no claims about mechanical watches versus quartz watches in general; I stated that my mechanical watch keeps better time than my quartz watches, and it does. I set the watch about once a month, at which point I find that it's drifted by about 15-30 seconds from the actual time (usually slow). Both the quartz watches I wear with any regularity drift by more than that in the same time.

Of course, as I only have one data point, to me it's the average even if, to those reading the spec, it's highly untypical.

Re: Not being fair to the 49G+

*Message #33 Posted by **Veli-Pekka Nousiainen** on 2 Sept 2003, 7:44 p.m.,*
in response to message #17 by Wayne Brown

I take the ENTER key in wrong position any day! Why?

Because that's how it is possible to make the cursor keys to work in ALPHA mode, too!

Very good when you are programming.

Re: Not being fair to the 49G+

*Message #34 Posted by **Wayne Brown** on 3 Sept 2003, 7:44 a.m.,*

in response to message #33 by Veli-Pekka Nousiainen

If all that space hadn't been wasted around the cursor keys on the 49G+, there would be plenty of room for a larger **[ENTER]** key and still let the cursor keys work in ALPHA mode. Besides, I don't mind the way the cursor keys work on my 48GX because I rarely program on it, since I don't like RPL very much. When I want to program I reach for my 41CX.

Re: Not being fair to the 49G+

*Message #35 Posted by **Veli-Pekka Nousiainen** on 3 Sept 2003, 12:32 p.m.,*
in response to message #34 by Wayne Brown

You're right, B. Wayne: Two more keys could be easily squeezed in leaving just enough room for a bigger ENTER and the [/] key would slide back where it belongs when the small ENTER is removed from the lower right corner, but noooo...not HP way anymore.

So you're the only "old-school" (41-era) person not buying an ARM based super-49?

I DON'T want to be unfair to the 49G+...

*Message #36 Posted by **R Lion (España)** on 1 Sept 2003, 9:34 a.m.,*
in response to message #7 by Gene

...and I think that this will be a great calculator. But I've preferred to buy a spare 48GX.

Best regards
Raul

Re: I DON'T want to be unfair to the 49G+...

*Message #37 Posted by **Gene** on 1 Sept 2003, 10:34 a.m.,*
in response to message #36 by R Lion (España)

No problem. :-)

Just be sure to give the new 49G+ a try, because I know I will. I like what I see and I am encouraged for the first time in years with HP's responsiveness after the 49G problems.

SLIDE RULES!

*Message #38 Posted by **christof (NoVA US)** on 3 Sept 2003, 5:04 p.m.,*
in response to message #7 by Gene

What is with all this newfangled handheld calculator stuff anyway? The only proper keypad for calculating is the kind on a desktop calculator - with real keys in the right place!

And LCDs! and *alphanumerics*?? Calculators are supposed to have LED 7 segment displays and that's it.

What is this calculator stuff, in fact? The machining on a fine slide rule can't be duplicated- and they never run out of power, and they don't even have keys! HP won't be on top of things until they drop all this electronics stuff and get back to real mathematical tools.

(humor. yes, humor. I prefer a big enter key, too- but I won't say that that one thing alone will make me buy a TI)

Missing the point?

*Message #39 Posted by **Tom (UK)** on 1 Sept 2003, 8:28 a.m.,*
in response to message #1 by Garry

If you have used a HP48 or HP28 before then wait as the new hardware looks good (speed, display, memory) and OK (keyboard, battery use?).

HOWEVER if you have not used a HP28 or HP48 then it all depends on the manual available for the new machines. The manual for the HP49G is very very poor and a newbie to the HP49G (even if they know how to use a keystroke RPN like the 32 or 42) won't be able to use more than 10% of it. I know because I tried and had to buy a HP48 in the end - the HP48's manual is very good and there is an advanced user manual too.

HP's recent support in the way of manuals has been poor so don't be suprised if the new ones are bad.

P.S. Has anyone seen the manuals that go with the HP48GII or HP49G+?

49G+ manuals

*Message #40 Posted by **Gene** on 1 Sept 2003, 10:37 a.m.,*
in response to message #39 by Tom (UK)

I think hpcalc.org has some sample pages. Rumors indicate a 180 or so page paper manual and a second advanced manual with around 750 pages. There is confusion as to whether this will be available from HP in printed form or just as an electronic copy.

We'll have to wait and see.

However, I'm encouraged by the attempt to put together a manual that size. That's an improvement!

Some have so soured on HP that nothing will please them except the re-release of the HP-41c. From what I see, I believe that we are on the road back in the right direction.

in response to message #1 by Kin Kaide Deveraux, New Orleans

I have one but don't use it.

Re: Port X-Tender

*Message #4 Posted by **Chris(FLA)** on 2 Sept 2003, 9:55 a.m.,*
in response to message #1 by Kin Kaide Deveraux, New Orleans

I have 2 of these. I used to have 3 but sold one.

They are great if you have a 41C. I can load up my 41C with Quad, Time, Cardreader then plug the X-tender into port 3 then I can add IL, Ext-Func. and 2 X-Mem, Ext I/O, wand and either PPC or games ROM(They conflict). I can switch between the modules quickly with the dip switches.

They also have a battery so when you unplug it from the calc it will hold your memory information.

I opened mine to change the battaries and noticed that they aren't that complicated. I'm sure somebody could make one easily. The only problem would be the case that holds it.

Anyway great item to have if you have a 41C and more modules than available slots.

Chris

Luxury

*Message #1 Posted by **Kin Kaide Devereaux, New Orleans** on 30 Aug 2003, 9:01 a.m.*

Anyone have any luxury accoutrements for HP Calcs?

KD in NO

Re: Luxury

*Message #2 Posted by **Randy Smith** on 30 Aug 2003, 4:23 p.m.,*
in response to message #1 by Kin Kaide Devereaux, New Orleans

I have a keyboard overlay on my 41C. Is that the type of item you mean?

Re: Luxury

*Message #3 Posted by **db(martinez,california)** on 30 Aug 2003, 8:10 p.m.,*
in response to message #2 by Randy Smith

imho; Using any rpn is a luxury. I do have a leather educalc case for my cx. When it was still cutting edge i cut out foam to pad a small suitcase/large briefcase to hold the 41, cassette drive, thinkjet, and a small amount of paperwork. Does that count as luxury?

On Thursday the geologist on my job comented about the taped up baggie that i keep my 41 in and asked about humidity. I told him that it has never been a problem for me but that dust is. I added that i used to keep it in a condom but the calc kept slipping out of my hands and little thinger on the end would flap in the wind and annoy me. The last was a lie, of course, but i figured if he was the sort who wants straight answers then he wouldn't be using a TI.

TVM calculations (again)

*Message #1 Posted by **Thomas Radtke** on 30 Aug 2003, 6:17 a.m.*

Hi,

a few weeks ago I complained about some miscalculations concerning TVM and a HP-18c et al. The method usually used to calculate the FV for payments that occur at a different period than the interest compoundings is to convert the interest prior to the TVM calculation. Thats not ok if payments are made more often than interest compoundings. I found by iterating over payments and a subsequent iteration over compoundings that

FV=PV*q^j+a*(q^j-1)/(q-1)

where

a=PMT*(n+p%*(n+1)/2)

if payments are made at the beginning of the payment period and

a=PMT*(n+p%*(n-1)/2)

if payments are made at the end of the payment period.

(q=(1+p%),j=interest compounding periods,n=payment periods per comp.period)

Note that the payment convention is strictly german i.e., the PV and PMT are signed (the germans are thinking in 'savings accounts' instead of loans;).

Well, I thought I had something to publish here as noone I asked could tell me anything else than to use the faulty method described first. Too bad, I recently found an older source which mentions equations similar to mine:(. Anyway, I did the same for the case where payments occur less often than interest compoundings and found for begin and end of period payments

FV=PV*q^(n*j)+PMT*q^j*(q^(j*n)-1)/(q^j-1)

and

FV=PV*q^(n*j)+PMT*q^j*(q^(j*(n-1))-1)/(q^j-1)

(n=payment periods,j=comp.periods per payment period)

respectivly. This is--probably by accident>:)--exactly what ICONV+TVM gives (You have to check this by hand as Maple refuses to validate it correctly:). It's just in a more compact shape and easier to use.

bye,

Thomas (Who is still seeking for (i) a job anywhere in the western world and (ii) a cheap 28C to accompany his 18C:)

Re: TVM calculations (again)

*Message #2 Posted by **Gordon Dyer** on 30 Aug 2003, 3:28 p.m.,*
in response to message #1 by Thomas Radtke

Thanks for your posting.
Do you have any comparison of the results and accuracy of your method against HP calculators?
I have a 12C, 10B, 10BII, 14B, 17BII, 38C, and a finance pac for the 71B. Also the HP finance program for the 11C.
If you would like any results from these let me know.

Re: TVM calculations (again)

*Message #3 Posted by **Thomas Radtke** on 30 Aug 2003, 5:57 p.m.,*
in response to message #2 by Gordon Dyer

Gordon,

I have to admit that the 18C is my only financial calculator. I've heard that the 11C and 17BII uses the same TVM equation as the 18C. Anyone else could most probably answer that better than me.

About the FV problem where payments are made more often than interest is compounded, the commonly propagated solution to convert the interest to an effective or nominal interest from an 'equivalent interest' and then to use the TVM equation is actually not just inaccurate but completly false. Therefore it makes no sense to compare results.

Some of your calculators offer a convenient solver (like the 18C) and I would recommend to just enter the equations I gave in case you need them.

Thomas

Re: TVM calculations (again)

*Message #4 Posted by **tony** on 31 Aug 2003, 6:57 p.m.,*
in response to message #1 by Thomas Radtke

Hi Thomas - good luck finding the job and the 28C :)

I finally found a savings example from HP where payment frequency > compounding frequency. It is Example 2 on page 48 of the HP-12C solutions handbook. They get $11.49 for the weekly payment in advance to fund $6000 over 8 years at 5.5% compounded quarterly. This assumes the compound interest operates as a continuous geometric process. If simple interest (an arithmetic process) applies over each quarter then I obtain the same PMT - rounded to the penny - 11.4942 as against 11.4944 for the compound assumption. Pretty close in this case.

On page 46 they state "Payments deposited for a partial compounding period will [usually?]accrue simple interest for the remainder of the compounding period. This is often the case, but may not be true for all institutions."

Cheers, Tony

Re: TVM calculations (again)

*Message #5 Posted by **Thomas Radtke** on 1 Sept 2003, 7:52 a.m.,*
in response to message #4 by tony

Hi Tony,

the example was probably choosen to give a result thats close to be correct:).

I personally think HP should do a better job to make their financial calculators of more general use. But ok, I'm not an expert and hundreds of thousands of users are apparently satisfied with what is offered.

Thomas

Re: TVM calculations (again)

*Message #6 Posted by **tony** on 1 Sept 2003, 9:46 p.m.,*
in response to message #5 by Thomas Radtke

Thomas, yes undoubtedly why they chose that example :)

I agree with you 100% - in none of the HP manuals I have and even Grapevine books is there an example of the simple interest FV of a series of payments, and how to use that.

I have seen it in one old book though - "Modern Financial Computation" published in 1983, by Tony Hutchins<G>. There is a chapter called "Simple Interest During Compounding Periods", from pages 115-135, together with 5 loan examples and 6 savings examples. This 270pp book (wirebound) is still available from the author but he has to charge about 50USD for it to cover cost and airmail postage from New Zealand. So, he doesn't sell many copies - keeps life simple<G>.

Re: TVM calculations (again)

*Message #7 Posted by **Thomas Radtke** on 2 Sept 2003, 6:43 a.m.,*
in response to message #6 by tony

Hi Tony,

Seems to be an excellent book;), I would buy it if I could effort it:).

Thomas

Re: TVM calculations (again)

*Message #8 Posted by **tony** on 2 Sept 2003, 7:04 a.m.,*
in response to message #7 by Thomas Radtke

Thomas, I did have a copy with me in Munich in May last year - would have been happy to trade it for a beer :)

Today I was surprised (and delighted) to receive three inquiries about it so I scanned the introduction and contents and put them at:

http://homepages.paradise.net.nz/th/mfc.htm

Cheers, Tony

82033 Battery Pack replacements discontinued

*Message #1 Posted by **Philip** on 29 Aug 2003, 5:49 p.m.*

Hi, I received the following email from DigiKey regarding the discontinuation of the battery back that has been used to rebuild the 82033 packs that are used in the 82162 and the 82161 (among other things). I'm interested if anyone knows other sources.

You have purchased the following part number(s) from Digi-Key within the last two years. The manufacturer has announced this part(s) will become obsolete.

PANASONIC - BSG (VA) Description: BATTERY PACK NICAD 4.8V 1400MAH Manufacturer Part No: P-140SCRL2X2 Digi-Key Part No: P233-L022-ND Your Most Recent P.O. No:

Re: 82033 Battery Pack replacements discontinued

*Message #2 Posted by **dbrunell** on 30 Aug 2003, 12:19 a.m.,*
in response to message #1 by Philip

Choose one of these instead: P162-L022, 1300 mAh, $9.66; P175-L022, 1500 mAh, $10.06; P180-L022, 1700 mAh, $11.86.

Re: 82033 Battery Pack replacements discontinued

*Message #3 Posted by **David Smith** on 30 Aug 2003, 12:59 p.m.,*
in response to message #1 by Philip

Take your old pack down to your local Batteries Plus, Batteries, Etc or similar store. They will do all the work and rebuild it properly (welded contacts, etc) for a round $20-$25 depending upon the batteries. I use the highest capacity cells that they have.

Re: 82033 Battery Pack replacements discontinued

*Message #4 Posted by **Ellis Easley** on 31 Aug 2003, 4:45 a.m.,*
in response to message #3 by David Smith

I wonder if the message from DigiKey means that Panasonic is going to stop making NiCad's? The Eveready Energizer website indicates that they have stopped supporting NiCads - the only rechargeables they have data for are NiMH [, and AA, C and D are all rated 1850 mA-H - must be the same cell in all of them.] - this was the case a few weeks ago, now they are rated 2100, 2200 and 2200 mA-H.

Strange blue outline in eBay picture

*Message #1 Posted by **Patrick** on 29 Aug 2003, 5:21 p.m.*

Can anyone explain the strange blue outline around the HP-15C in this auction?

Is it possible the picture is a composite?

Re: Strange blue outline in eBay picture

*Message #2 Posted by **Philip** on 29 Aug 2003, 5:45 p.m.,*
in response to message #1 by Patrick

It looks like a superimposed image to me.

Re: Strange blue outline in eBay picture

*Message #3 Posted by **Jim L** on 29 Aug 2003, 5:57 p.m.,*
in response to message #1 by Patrick

Sure. He took the HP museum picture and disguised it by moving a couple segments and scaling it down.

But the source is still obvious. Just look at the identical lighting on the background. Makes you wonder just how bad the one he's selling is if he thought the defects would be too obvious at that size.

Re: Strange blue outline in eBay picture

*Message #4 Posted by **M. Currie** on 29 Aug 2003, 6:59 p.m.,*
in response to message #3 by Jim L

You mean 15.15 isn't what comes up every time you turn it on?

Re: Strange blue outline in eBay picture

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 29 Aug 2003, 7:14 p.m.,*
in response to message #4 by M. Currie

No, the only "15" that it shows is a centered one when you finish the keyboard test. This "15.15" is some fancy thing the user typed... It doesn't show anything different on power-on than the number already on the X register.

I really think that is a (bad quality!) make up, I cannot imagine the real condition of the item... If it has an item, anyway!

Regards,

Nelson

Re: Strange blue outline in eBay picture

in response to message #1 by Patrick

It could just be sitting on a blue poly bag.

Looks at border spacings....

*Message #9 Posted by **Mike** on 30 Aug 2003, 4:41 p.m.,*
in response to message #8 by David Smith

The exactly match the HP Museum borders. Widest on Left, 2nd on top, 3rd on bottom and narrowest on right. Also, the right border is about 1/3 of the left border on both.

What are the odds of these border spacings coincidently matching the HP Museum site. I bet if you look around, you'll find another recent auction that has the same manual and cover.

Finally, look at the darker shadow at the top. Same in both photos. Same highlight on front two corners.

I think it's an HP Photo cut and pasted into another image.

Look at these two. Use the same photos. Be careful from whom you buy.

15C with case and manual

another 15C with same photo

batteries, need more batteries!

*Message #1 Posted by **christof (NoVA US)** on 29 Aug 2003, 4:27 p.m.*

Anyone know the best sources for:

silver oxide sr44 type batteries?

Hi cap rechargeable N, AA, AAA, and subC

alkaline N

cells?

Preferably online or phone order.

-Christof

Re: batteries, need more batteries!

*Message #2 Posted by **dbrunell** on 29 Aug 2003, 4:36 p.m.,*
in response to message #1 by christof (NoVA US)

Try www.digikey.com. Great service. Just bought a 1700 mAh sub-C pack for my 97 for less than $12! Let me know if you need help figuring out the correct part number for battery packs.

Re: batteries, need more batteries!

*Message #3 Posted by **Tom Cox** on 29 Aug 2003, 7:51 p.m.,*
in response to message #1 by christof (NoVA US)

Try the site: WWW.SR44.COM

They have Silver Oxide Batteries at a very reasonable price. Have purchased batteries from them and was satisfied with price and quick delivery.

Re: batteries, need more batteries!

*Message #4 Posted by **db(martinez,california)** on 30 Aug 2003, 2:48 a.m.,*
in response to message #1 by christof (NoVA US)

A buck a piece including tax for Duracell n cells in Sacramento. Oops; you don't live there anymore. Traitor. :-)

You can ask this guy about sr-44's. i think that is what he is selling at $8.65/20 batts including shipping on ebay. Auctions@vFish.net

Re: batteries, need more batteries!

*Message #5 Posted by **David Smith** on 30 Aug 2003, 1:12 p.m.,*
in response to message #1 by christof (NoVA US)

I use Vinnic LR44 batteries, 10 for around $2.50. I think they also make a cheap SR44. For alkaline "N" cells, try Home Depot! For rechargeables try your local battery store (Batteries Plus, Batteries Etc). Frys sometimes has NiMH AA cells for super cheap. Also Harbor Freight Tools puts NiCads on sale for ridiculous prices.

I always have my battery store rebuild packs. They do all the work, properly weld the cells together, and recycle the old cells.

Posting from wireless PDA

*Message #1 Posted by **Mike** on 29 Aug 2003, 1:11 p.m.*

One of the benefits of a forum like this is that it is very readable with a wireless PDA.

Had surgery yesterday and I'm limited to a PDA. At least I can still stay connected.

Anyone else using a wireless PDA?

Re: Posting from wireless PDA

*Message #2 Posted by **christof (NoVA US)** on 29 Aug 2003, 3:16 p.m.,*
in response to message #1 by Mike

Hi-

I regularly connect from two PDAs

I am phasing out my jornada 720- the problems with windows CE, lack of upgradability on core ROM, and the screen size are getting to me.

I'm phasing into my zaurus 750 (import from Japan). Very very very very nice machine. The english support is still a bit spotty, but it's a full unix and once you get a toolchain on it, you can port almost anything.

Anyone know where I can get a unixified 15C emulator? (I'm working on the 48 emulator port, and some of the java ports)

And it's the same size and my field notebook and 42S :)

-Christof

HP 32S display screen dust

*Message #1 Posted by **jsrlnd** on 28 Aug 2003, 10:16 p.m.*

Does someone know how to remove the dust particles from the INSIDE of the display screen window on a HP 32S RPN? I own two of these with this problem.

Re: HP 32S display screen dust

*Message #2 Posted by **David Smith** on 29 Aug 2003, 4:36 p.m.,*
in response to message #1 by jsrlnd

Try blowing it with canned "air" from inside the battery compartment (about the only place to get the tube into the machine). Don't use shop compressor air. It always contains oil. Keep the can vertical and level so you dont blow the compressed liquid into the machine. It can leave marks on the display window.

Re: HP 32S display screen dust

*Message #3 Posted by **Randy Sloyer** on 30 Aug 2003, 9:01 a.m.,*
in response to message #2 by David Smith

Opening the calculator helps, but not enough to make it the first act. I would save that as the last resort.

You can try cutting the end of the air tube to make it fit into the seam on the sides of the calculator. Just make two diagonal cuts so it forms a v. Jam it in the side and give it a blast, just making sure the can is level as David Smith mentioned. It will take several shots from either side to get it all. Stubborn bits might need help from a small strip of stiff paper slid in through the side seam. Don’t use anything sharp as the window material and LCD polarizer are soft material and scratch easily. Plastic coated paper (backing paper from double sided foam tape) works quite well for this as it slides in easily.

Re: HP 32S display screen dust

*Message #4 Posted by **jsrlnd** on 2 Sept 2003, 7:24 a.m.,*
in response to message #3 by Randy Sloyer

This worked very well. Simple and effective. Thanks.

HP48 SX and 48 GX

*Message #1 Posted by **Charles Miller** on 28 Aug 2003, 7:26 p.m.*

Could someone please tell me if the 48 SX was replaced by the 48 GX and well the serial cable to calculator cable the same for both? Next question I have well the equation library card for the 48 SX work in the 48 GX? Im looking to purchase a 48 GX for my daughter for school/ college and need to know as soon as possble. I currently own a 48 SX. Please help, Thank you.

Re: HP48 SX and 48 GX

*Message #2 Posted by **Harry (Germany)** on 28 Aug 2003, 7:39 p.m.,*
in response to message #1 by Charles Miller

I know the cables are the same. I don't know about the cards, but think they will work in either calculator, too.

Regards, Harry

Re: HP48 SX and 48 GX

*Message #3 Posted by **Jonathan Purvis (New Zealand)** on 28 Aug 2003, 7:42 p.m.,*
in response to message #1 by Charles Miller

The serial cables for the 48SX is the same as the one for the 48GX. I believe the equation library card for the 48SX will work in slot one of the 48GX, but not slot 2 (i don't have the equation library card, so i can't check it in my 48GX). However all the functionality of the equation library card is the ROM of the 48GX, except for Tetris and the Periodic Table, both of which can be downloaded from http://www.hpcalc.org

Some facts to consider

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2003, 8:17 p.m.,*
in response to message #1 by Charles Miller

Hi, folks;

I want to point out some facts and risk my own conclusions sbout this.

There is a warning in the HP48G manual about sysRPL programs written for the HP48S-series. Some internal calls were changed from S- to G-series, and some programs may generate wrong answers or disrupt the system operation, mostly the ones using these internal features. And I believe the Equation Library card will use them.

I'd also consider the fact that if the Equation Library is already part of the HP48G internals and both Tetris and Periodic Table are available as download files for the HP48G, than I'd keep the card with the HP48SX and load the 48G with the available files so both calculators will show about the same resources. If you use the card with the 48G, the Equation Library will probably conflict with the existing Equation Lirary in the HP48G and you'll not be able to use it. And you cannot load Tetris and the Periodic Table in the HP48S because there are some resources available in the HP48G that are not available in the HP48SX, and they are probably used

by these programs.

My 2¢.

Re: Some facts to consider

*Message #5 Posted by **Chan Tran** on 28 Aug 2003, 8:57 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

If you want a 48GX you should try to buy it now because they don't make them any more.

Re: HP48 SX and 48 GX

*Message #6 Posted by **christof (NoVA US)** on 28 Aug 2003, 10:52 p.m.,*
in response to message #1 by Charles Miller

First: the cables work fine. (though with the current prices, i'd recommend getting two machines and backing them up to each other anyway)

Second: the EQ lib card will work in the 48GX, but it's pointless. Buying a 128K and 1MB card set from germany will let you have everything you will ever need in a 48GX. Start with Metakernel, then download whaver games and chemistry software you don't have (the equations from the EQ lib card are in ROM on the 48GX) and so on.

Third: There *are* some 48SX programs that won't run on a 48GX, but as HP put out public informational guides on how to avoid doing that, one would hope they avoided it themselves :)

Re: HP48 SX and 48 GX

*Message #7 Posted by **R Lion (España)** on 29 Aug 2003, 2:04 a.m.,*
in response to message #1 by Charles Miller

If you look at www.hpcalc.org, as Jonathan said, you will never be worried about software resources... Thanks to Eric Rechlin and all the guys who shared.

```

My advice is to throw them away.

**vp

Re: batteries

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 28 Aug 2003, 11:39 a.m.,*
in response to message #2 by Vassilis Prevelakis

I'll agree, throw them away. And to clean the terminals I use 1/2 lemmon juice with one tea spoon of salt (NaCl), this cleans the copper oxide.

Regards,

Nelson

Re: batteries

*Message #4 Posted by **Victor** on 28 Aug 2003, 1:14 p.m.,*
in response to message #2 by Vassilis Prevelakis

Don't throw them away; recycle them. Since NiCad's contain Cadmium, they are considered toxic waste and can damage the environment. Besides, it is illegal to throw them away.

To find a place where you can recycle them, see http://www.rbrc.org.

Re: batteries

*Message #5 Posted by **unspellable** on 28 Aug 2003, 11:15 a.m.,*
in response to message #1 by Robert

The compounds from a Ni-Cad are generally water soluble. In areas where it's safe to use water, just use warm

water. On plastics I wouldn't use water any warmer than I could put my finger in.

If you are getting into the elecgtronics it's dicier. It's possible to wash with water but requires careful rinsing and drying techniques and runs the risk of the water carrying salts to areas further away where you don't want them if you haven't controlled the washing and rinsing well enough.

PS. If you must use a leaking Ni-Cad, get a 99 cent flaslight to use it in.

Edited: 28 Aug 2003, 11:16 a.m.

Re: batteries

*Message #6 Posted by **Tony Duell (UK)** on 28 Aug 2003, 4:20 p.m.,*
in response to message #1 by Robert

The electrolyte in NiCd cells is alkaline (it used to be potassium hydroxide IIRC, no idea what it is now). So you want a (chemically) weak acid to clean it up. I normally use a dilute solution of citric acid, which seems to clean battery contacts, cases, etc with no further damage.

Re: batteries

*Message #7 Posted by **David Smith** on 28 Aug 2003, 4:39 p.m.,*
in response to message #6 by Tony Duell (UK)

One usually winds up with mostly potassium carbonate as the offending white powder. Cleans up well with vinegar, water, or isopropyl alcohol.

HP41 key press delay (for NULL)

*Message #1 Posted by **Vassilis Prevelakis** on 28 Aug 2003, 7:24 a.m.*

On the HP41 if you hold down a key you will see the function that is assigned to it. If you keep holding it, the key press is cancelled and you see NULL on the display. This is very useful if you want to see which function is assigned to a key (in USER mode) or which program instruction will be executed by SST, etc.

Unfortunately the timeout value is a constant hardwired into the HP41 firmware. It is just a number, independent of the CPU speed.

So under certain HP41 emulators this timeout is extremely painful, as you have to press and release the keys very fast to avoid cancelling their action.

While looking around the HP41 sources I have found the relevant bit of code.

The VASM listing is on the MoHPC CDROM, file 41VASM.pdf, page 113 (in the PDF), 112 in the document.

The line is

```
1306   460   LDI
1307  1100   CON 576  INITIALIZE NULL TIMER
```

The timeout is 576 (decimal), or 1100 (octal), or 240 (hex).

So how does this help?

I have looked at the binary ROM dumps and I have found out that the timeout value is in ROM 0, offset 1D8E.

This offset is the same on the F, G, and N ROMs.

**vp

Can it be deactivated/changed in V41 ?

*Message #2 Posted by **Valentin Albillo** on 28 Aug 2003, 7:36 a.m.,*
in response to message #1 by Vassilis Prevelakis

I've suffered this very problem you mention and it is **incredibly** annoying !

Is there any short routine or 'patch' that would deactivate and/or increase this value in the V41 emulator, so that the problem would dissappear altogether ?

BTW, the HP-15C also has this NULL feature for some of its matrix functionality: when you press STO B/RCL B, say, the (i,j) indexes of the stored/recalled element are displayed briefly while you hold the 'B' key pressed. If you then release it within a certain lapse, the STO/RCL is performed. Else, NULL appears on the display and no action takes place, exactly like in the HP-41C. This is extremely useful when accessing a number of matrix elements if you forget what element is the current one. I thought I would mention this, as a further example of the vast amount of attention-to-detail used in the design of the HP-15C. Those were the

days ...

Best regards from V.

Spice troubles

*Message #1 Posted by **dbrunell** on 27 Aug 2003, 10:48 p.m.*

I have a 33E which I acquired recently. It looks brand new, but that is about the only thing positive you can say about it. I got past the trauma of opening the case. Alas, it is a solderless beast.

Here is the trouble I am having. On DC power (2.4 V to the battery terminals), I get no display whatsoever. On AC, I get a flickering display of either all zeros or just a lone decimal point on the left side. Keys seem to have no influence. I tried pressing the flex sandwich this way and that with no noted effect. There is no corrosion on the ICs or flex circuit. It really does look brand new inside and out.

Any ideas? Does anyone have a schematic? I'm thinking it is perhaps a simple problem with the power supply.

One other thing...is the silver 8-pin IC only supposed to have 7 leads?

Thanks and best regards,

David

Re: Spice troubles

*Message #2 Posted by **Jon** on 28 Aug 2003, 10:14 a.m.,*
in response to message #1 by dbrunell

It is probably a problem of bad connection. Check the flex connector. If that is ok, you probably need spare parts for the circuit or ICs

Cheers

Jon

Re: Spice troubles

*Message #3 Posted by **David Smith** on 28 Aug 2003, 2:14 p.m.,*
in response to message #1 by dbrunell

Most liekly cause is a crack (often invisible) in on of the conductors in the flex cable from the battery board. Check them with an ohmmeter. Repair involves soldering a wire to replace the offending flex circuit. Often time just jiggling around the flex circuit to fix it will break another conductor. You may have to replace all three conductors.

Re: Spice troubles

*Message #4 Posted by **dbrunell** on 29 Aug 2003, 1:20 a.m.,*
in response to message #3 by David Smith

>Most liekly cause is a crack (often invisible) in on of >the conductors in the flex cable from the battery

board.

Bingo! You da man! Now I have a fully-working, mint 33E to add to the collection.

It must have failed on the original owner shortly after purchase, because the calculator looks like it sat unmolested in its box in a closet for 25 years.

Thank you and best regards,

David

Algorithmically refined...

*Message #1 Posted by **eclectic_echidna** on 27 Aug 2003, 7:39 p.m.*

A recent post had this in it:

> the HP15C is a very algorithmically refined calculator

Later they lead me to believe that they would love it if those "special" algorithms would be perfect for use on a PDA. The HP15C algorithms are refined for its particular processor, memory size, and battery.

In this day and age of 200-400MHZ pocket PCs, wouldn't a more appropriate algorithm be one that utilizes modern day strengths, speed and memory size?

Wouldn’t an arbitrary precision floating point package linked with appropriate transcendental algorithms provide superior computation?

Am I missing something?

Edited: 27 Aug 2003, 7:40 p.m.

Re: Algorithmically refined...

*Message #2 Posted by **Randy Sloyer** on 27 Aug 2003, 8:04 p.m.,*
in response to message #1 by eclectic_echidna

> Quote:
>
> Am I missing something?

IMO, yes you are.

The algorithms already exist in Saturn machine code. Why re-write them for the processor du jour? Don't monkey with hand-tuned assembler. Any idea of how many man-years that code represents?

> Quote:
>
> Wouldn’t an arbitrary precision floating point package linked with appropriate transcendental algorithms provide superior computation?

Nope. Far better in BCD despite the speed loss. Just write an emulator for the processor, a far easier thing to do than starting to muck with proven algorithms.

Re: Algorithmically refined...

*Message #3 Posted by **Jonas Lööf** on 28 Aug 2003, 11:58 a.m.,*
in response to message #2 by Randy Sloyer

I would take IEEE binary floating point over BCD any time. Except when doing financial calculations, wich I never use a calcualtor for, the inability to exactly represent decimal fractions is not inportant. Proper rounding behaviour is specified in the (IEEE) standard; my guess is that common IEEE implementations are every bit as well tested as the HP BCD, despite beeing newer. When doing scientific computations there is absolutely no reason whatsoever to use BCD.

Re: Algorithmically refined...

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 8:05 p.m.,*
in response to message #1 by eclectic_echidna

This is the same thinking of the M$ people, "why do we need to refine our algorithms if the CPU is fast enough? If it wasn't fast enough, let the user buy a faster CPU!" As a programmer, I think that refined algorithm is that "plus" (= quality) of some product.

Regards,

Nelson

Re: Algorithmically refined...

*Message #5 Posted by **Bill Wiese** on 27 Aug 2003, 9:16 p.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

A lot of thought went into Solve & Integrate. (Apparently Wm. Kahan of floating-point math fame was deeply involved.)

There's more than just coding involved here: the parameters of these algorithms, search ranges, etc were prob more carefully chosen than for other calcs. This was at the peak of HP's calc dominance (in terms of quality/market positioning/etc.) and where HP would spend $$$ to differentiate from low-end competitors.

Of course these functions could be written better w/more memory, etc. But we DO know the limits of the 15C, bugs, etc. - we've had 15+ years now. Hell, doesn't the 15C even have its own Advanced Functions book?

If we want a 15C on a Palm-type unit, why not just emulate more than the keyboard layout? Start w/an exact match and improve - no more 12C Platinum debacles!

Bill

Well said...

*Message #6 Posted by **Pierre Brial** on 28 Aug 2003, 6:08 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Well said Nelson. I am happy there are still some guys who think like this. The lack of research of refined algorithms in modern programming is the reason why, despite having more and more power, modern computer are slower and slower to boot. Happy programming Pierre

Re: Algorithmically refined...

*Message #7 Posted by **Valentin Albillo** on 28 Aug 2003, 4:18 a.m.,*
in response to message #1 by eclectic_echidna

You posted:

"Am I missing something ?"

Indeed you are. But it's not easy to explain it in a few lines, nor is this exactly the proper place to do it.

If you really want to know and understand what you're missing, just get a copy of the HP-15C Advanced Functions manual, either spiral-bound for easy reading or in CD, and read it carefully. You don't need to have an HP-15C at hand to make the most of this wonderful book, which is more a treatise on accuracy and the techniques to achieve it than a 15C-only manual.

I'm pretty sure you'll be amazed at the many traps and pitfalls lurking out there when implementing sophisticated algorithms, and the ultra-clever ways in which HP engineers and consultants of the time (most notably Mr. Kahan who is a world-class authority on the subject) managed to succeed, thus making the HP-15C the very best pure calculator in the world, bar none.

Best regards from V.

P.S.: And don't let "multiprecision" computations fool you. I do own a vintage Sharp PC-1475, which can do computations in double precision (20 decimal digits) and believe me, it doesn't hold a candle next to the "13-digit internal precision of the HP-15C + the best possible algorithms" bundle. If you trust it blindly you'll end up with 20 digits, yes, but they might be 7-digits correct + 13-digits garbage, for all you know.

Edited: 28 Aug 2003, 4:20 a.m.

Re: Algorithmically refined...

*Message #8 Posted by **Pierre Brial** on 28 Aug 2003, 6:08 a.m.,*
in response to message #7 by Valentin Albillo

Hello Valentin,

I also own some Sharp pocket computers (including PC-1475) and I like them as much as my HPs, for their quality and usefullness. But I never tested them to compare with Hp about accuracy. Do you have some examples of calculations where the double precision PC-1475 could give less accurate results than the HP-15C ?

All the best

Pierre

Re: Algorithmically refined...

*Message #9 Posted by **Valentin Albillo** on 28 Aug 2003, 6:23 a.m.,*
in response to message #8 by Pierre Brial

Hi Pierre,

Pierre posted: *"I also own some Sharp pocket computers (including PC-1475) and I like them as much as my HPs, for their quality and usefullness."*

Exactly same here, I do own a large collection of Sharp PC pocket computers and they are every bit as good, if not better, than HP vintage handhelds, not to mention newer models.

"But I never tested them to compare with Hp about accuracy. Do you have some examples of calculations where the double precision PC-1475 could give less accurate results than the HP-15C ?

Yes, try the determinant or matrix inversion built-in functions of the Sharp PC-1475 versus the equivalent HP-15C ones when applied to Hilbert matrices of orders 5,6,7, etc. Just in case you've never seen Hilbert matrices before, have a look at this PDF document:

Hilbert matrices

Best regards from V.

*Message #10 Posted by **Pierre Brial** on 30 Aug 2003, 2:06 a.m.,*
in response to message #9 by Valentin Albillo

Hello Valentin It seems that with Sharp PC the double precision is only available in RUN mode, and not in CALC or MATRIX. So matrix calculation are made with only 10 digits accuracy. I see recently in the local library a book about calculator use at school where they give some examples of simple calculations which give wrong results. I will look at this and try some tests on my machines. Cheers Pierre

Quote:

In this day and age of 200-400MHZ pocket PCs, wouldn't a more appropriate algorithm be one that utilizes modern day strengths, speed and memory size?

This is what I personally call the "Micro$oft Falacy": The delusion that problems are always better solved by a bigger box with (apparently) fancier software. In fact, as soon as you enter the realm of mathematics, rigour is more important than marketing, and "modern day strengths" as you call them, are but sirens singing you onto the rocks. The fact that this falacy sells more mother-boards/hard-drives/memory etc., is the explanation of why it is so pevasive, but that's another thread.

I would claim that having a heavily constrained platform to develop your algorithms on (say an 8-bit processor and 4k of memory) almost always results in better code than the bottomless memory/GHz pit of a modern PC. You end up having to think, and the tough constraints necessitate that the algorithm must be thoroughly understaood.

I hate to belabour the point (a lie: Actually I love to belabour this particular point), but the vast computing resources available to the average "modern" programmer means that few ever really bother to write anything more than a first hack at an algorithm, go through a cycle of bug-fixing, and release it to the unwitting customers. With a limited platform, coding inevitably goes through a cycle of think/write/refine/repeat. I don't think too many people would apply the word "refined" to the SW out of Redmond, but the HP-15C? Now there's refined!

I usually draw the analogy of the piano versus the syntesizer: Much music written for the piano (in some respects, the first "universal" musical instrument, much like a microprocessor is a universal calculating device) is far superior to that written for the far more flexible synthesizer (flexible in the sense that it can make basically any sound). The very versatility of the synthesizer ensnares many musicians in a net of infinite possibilities, most of which just sound bad. The extremely limiting constraints of the piano seem to result in a purity of form that often inspires the composer to greater art.

Just rambling now, I guess, so I'll shut up.

grant..

Before we really get into whose calcs are better at ln(x) or arctan(x), etc. I want to say I was NOT just referring to the basic accuracy of transcendentals & other funcs.

I was more referring to the elegant Solve & Integrate functions - which, BTW, were nicely done on the HP34C also.

Just because your formula to evaluate is calculated accurately to the Nth digit DOESN'T mean that a given iterative algorithm is suitable, stable, or will even find a root in a troublesome region!

I do think HP thought a lot about the transcendentals as they went on developing calcs - remember, they even included LN(1+x) and e^(1+x) functions for x values close to zero on the 41C, 42S (and maybe others).

I thought it was way cool when the 11C/15C were introduced (I was a Sr in high school) and they had the Gamma function! I'd spent a merry prev summer dealing with log(gamma(x)) on my TI58 and exploring "big factorials".

although i agree with the other replies, there is a point here. a question i often ask myself is, whats now possible with 50-500MHz pocket devices, PDA or otherwise.

i was impressed by hps attempts to tackle symbolic calculation and would have liked to have seen this technology improve in their future calculators. it would have make proper use of more speed & memory.

the kinpo offerings meant two things to me. firstly that hp (amazingly) were chucking away those algorithms that had been refined, and secondly, that use of elementary algorithms translated to cheap chips.

the new range will be interesting. do they run their old algorithms or are they new like on the 12CP where we've seen real novice tvm results. i suppose they'll be flash upgradeable. i can see it now: hp49II sp1a.

on the subject of bcd. i am now convinced that we're seeing a phase change in the calculator industry where all units will go over internally to binary due to the availability of cheap, working fp cores. numerically, this will be interesting.

in response to message #13 by hugh steers

Umm many PDAs now have enough horsepower to run at least a small version of Matlab.

While a calc is great for playing w/numbers, Matlab is great for playing with "sets of numbers". That along w/an integrated Maple symbolic engine would be very nice - though a handheld-appropriate UI might be necessary.

Yes, IEEE FP is prob better overall for math stuff than BCD FP. However remember HP calcs were 'do all' consumer products and they didn't want people to be puzzled why 3*(1/3) = 9.99999999999 instead of 10.

in response to message #14 by Bill Wiese

Bill Wiese says: "Yes, IEEE FP is prob better overall for math stuff than BCD FP."

There is an IEEE floating point standard for radix-independent math. "Radix-independent" includes BCD math, and the HP71B was designed to adhere to the IEEE BCD floating point standard as it existed at the time. Thus, in the HP71B, IEEE FP is not different from BCD FP. The later calcs using the Saturn have the same basic algorithms, minus some of the niceties like NaN's, infinities, signed zero, etc. So, IEEE (binary) FP may be better than the BCD math in "other" brands of calculators, but the Saturn based calcs are doing IEEE BCD math. That's why they're so good.

How Do I switch back to N. American Notation??

*Message #1 Posted by **Raf** on 27 Aug 2003, 6:10 p.m.*

How do I switch my HP 15C back to N. American notation?

It has suddenly started displaying numbers in the European format, like this:

1.000,0000 INSTEAD OF 1,000.0000

- Raf

FAQ Needed?

*Message #2 Posted by **Patrick** on 27 Aug 2003, 6:36 p.m.,*
in response to message #1 by Raf

Hold down the decimal point key as you turn the unit on.

Not your fault, Raf, but this question is asked here (usually in the context of the HP-12C) every week or two, it seems.

To our esteemed Curator: Perhaps you should consider adding a FAQ section to the site in which answers to questions like this might be put. It could be nothing more than a clone of the articles page with a different header?

in response to message #4 by Patrick

Well besides the articles forum, a couple of people volunteered to somehow try to organize/FAQ-ize the forum and the archives.

I'll let them add something here if they haven't drowned due the volume of their task.

FAQs

*Message #6 Posted by **Ellis Easley** on 27 Aug 2003, 8:43 p.m.,*
in response to message #5 by Dave Hicks

For my part, at first I thought I would just accumulate links to the posts I found while searching the archives. I was primarily interested in hardware repair tips. A file of such links relating to a specific model or family would constitute an FAQ. Doing this on a casual basis is one thing but going through the archives rigorously is another! Also, Dave believes that at the rate posts are accumulating, he might not be able to keep all the archives online forever, so the relevant information in archive posts needs to be copied to a new FAQ file. To me, this suggests the need for editorial judgment and that's where I get bogged down. But as Patrick pointed out, how to switch the Voyagers' radix mark is a truly frequently asked question, along with what batteries the Voyagers use and how to change the number of digits displayed by Voyagers, and I have to admit that I was not conscious of the fact that these questions are all answered in the Museum FAQ! From time to time I have had the pleasure of answering questions in the Forum by pointing to answers that are stored in the "other rooms" of the museum, and at those times it strikes me how much the Museum is like the Doctor's TARDIS - we were always learning about additional rooms (in the earlier shows, before the Doctor had to jettison a lot of them to save the TARDIS).

Hello,

What surprise me is that this kind of question has its answer in the manual and in HP FAQ webpages. Furthermore most (if not all) questions in HP FAQ has their answer in the manual. People don't read manuals ?

All the best

Pierre

FAQs

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2003, 6:15 a.m.,*
in response to message #5 by Dave Hicks

My turn;

hello, folks;

now from my part. I "talked" to both Ellis and Dave at the time this activity began, and I was

one of the guys that much suggested this sort of reference source.

As a pilot-text, a reference for my own, I collected a lot of posts related to daily use of many calculators and began to order them for each family and then for each model in family, so I could "measure" and decide for the final type of text I should have. I was also tracking daily posts so I could add the newest information. Suddenly, in one fatidic day, after lots of hours under current activity, I got home and found a very interesting post about calculator use. I collect it, cleaned it up, and saved it. About 8Kbytes of data overwrote almost 8Mbytes of text and I did not see it. I was tired enough. And I did not realize that till I tried to open it again about a couple of days later, when the "trash bag" was cleaned at least three time. No traces of more than five months of dedicated work...

I'm just finishing some other activities for now and I'm getting back soon to these files, I promise. I remember that one of my concerns was about credits, and I would like to listen from others. What I actually did was to concentrate everything in one text about the same subject at first, then I refined this text and try to make it as simple and easy to read as I thought it could be (another concern: do I know English enough to do it the best way?). But later I thought about some sort of documentary with "interviews", I mean, keep contributor's original text. Then I cut and paste the text from each post with their author's credits. Later I saw that many people said the same thing with a different approach, so I so I joined these "speakers" in one single mentioning with their names. After that, I returned to the original format and finished the one-text-only with many credits at the end of it, but I still don't know the best way of organizing this sort of data. Unfortunately this final text is the one I trashed at once...

I take this kind of task as fun and enlightening, believe me. But I think it must be well done, as all posts in here have their quantity of judgement sense, heavy tech knowledge and wisdom, and in many cases the author's style, and these are characteristics that should never be purged from original posts. As an example that I keep in mind, see db(martinez, ca) posts. Like a few others, he writes everything in lower case, no matter what. This must be kept if cutting and pasting parts of his posts, but I cannot see a way to keep this "format" in an integral text. See what I mean?

Best regards.

Luiz (Brazil)

What about Google "Advanced Search"?

*Message #9 Posted by **Paul Brogger** on 29 Aug 2003, 11:30 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Google's "advanced search" seems to have links to the FAQ as well as to the Forum, and results may be limited by domain. So, one may search for "commas points" and only view results from www.hpmuseum.com . I do note that neither "commas dots" nor "commas periods" return a link to the FAQ, that some of the links are obsolete, and that some of the linked-to pages seem to be stripped of the MoHPC header (???) Is there a way to "force" (encourage) Google to re-index a particular domain? This might be a way to search across the Forum archives, which can be problematic.

. . . or use the "Search" link?

*Message #10 Posted by **Paul Brogger** on 29 Aug 2003, 11:20 a.m.,*
in response to message #2 by Patrick

Maybe the Museum's "search" link could be more prominently displayed (for newcomers) on the Museum's opening page. Searches for "commas dots", "commas periods" and "commas points" each returned a link to the FAQ (among other things).

I do, however, wonder whether many 12c owners would recognize theirs as a "10C series calculator"? (One could also wonder whether the Museum's navigation should be geared more toward newbies or to enthusiasts?)

Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #1 Posted by **Bill Wiese** on 27 Aug 2003, 2:53 p.m.*

Hi all...

[reference: http://www.pmonta.com/calculators/hp-35/index.html]

Anyone out there with a dead 15C and that has access to "chip peeling"/decap equipment? Maybe we can get a ROM dump. (15C ROMs are apparently not a separate standalone chip apparently. Dunno how to 'grab' the data electrically... but that may not matter this way.)

Decapping usu means use of a fuming nitric acid jet to debride the epoxy body/cap of a chip 'til the chip die & bond wires are exposed. (Then rinsed quickly so the acid doesn't hang around! :) BTW chips can work after this process!!

The chip MIGHT be directly (micro)photographable like Peter Monta did, unless the line widths are a great deal smaller. If that is the case, the glass passivation layer (outermost) may need to be removed too. [Late technology chips can be harder to photomicrograph given feature size vs. wavelength of light used are in similar ranges.]

Years ago I did this w/some automotive microcontrollers. A coupla chips still worked afterward for awhile - though the ones w/passivation layer ground down died shortly after.

If we can get nice photos of 15C ROM array areas we might be able to differentiate btwn '1' and '0' bits in ROM, letting us "dump" it.

Of course we'd have to figure out the array sense (that is, what is actually a '1' and '0' - or is it vice versa?) and array arrangement & interleaving (addr[n] is not necessarily next to or even near addr[n+1] or addr[n-1]).

But with a bit of help from other 'Nut calcs we prob can figure this out statistically (opcode/operand frequency analysis, positional information, etc.)

If someone can supply me with a GOOD noncompressed image(s) scan of photographs of these ROM dies I'm glad to try attempting this latter half of the work. I don't have access to the former services (decap/photograph...) anymore

Bill Wiese San Jose, CA

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 3:23 p.m.,*
in response to message #1 by Bill Wiese

I think that is much easy to read the ROM through eletrical means. I'm planning build one "ROM Ripper" to use it in the Voyagers. Their CPU is the SAME as the HP-41 (Coconut) and the technical description of their signals is well documented. If you can read the ROM by other means, that's great! But I think that is much harder...

Best regards,

Nelson

Re: Why Bother Really???

*Message #3 Posted by **Ron Ross** on 27 Aug 2003, 3:52 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Since there is no way to up or download software from this calculator, there is no software base to recover. Why bother??? Just use the symulators already out there. I think there is an 11c floating around, and an enhancement would be better than bothering to get an exact machine with warts and all.

Re: Why Bother Really???

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 4:17 p.m.,*
in response to message #3 by Ron Ross

The thing is create an EMULATOR not a SIMULATOR. And it helps to preserve the knowledge. There is many hours of work in those algorithms and this is no trivial to do in a simulator. Can you trust any simulator your sensitive data? Besides, it is a good challenge.

Regards,

Nelson

Re: Why Bother Really???

*Message #5 Posted by **Bill Wiese** on 27 Aug 2003, 4:36 p.m.,*
in response to message #3 by Ron Ross

Um, partially true... BUT:

the HP15C is a very algorthmically refined calculator, esp in root finding & integral work. Pretty nice setup.

It'd be great to run a true emulator of 15C ROM code. The emulator UI could, in PRGM mode, be setup to translate user keycode opcodes into text-like user instructions.

It'd be REALLY great to have this run on a palmtop :)

Bill Wiese San Jose CA

Re: Anyone w/dead 15C that can decap/peel chips w/ ROMs?? ROMs may be internal

*Message #6 Posted by **Bill Wiese** on 27 Aug 2003, 4:28 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Hi Nelson,

The 15C apparently has 3 chips. However I am not sure about partitioning of ROM on these chips. IIRC, the the main CPU chip may indeed have all the ROM and the others are just RAM chips (??) for user program area & data memories perhaps w/some extra I/O capabilities. Correct me if I'm wrong. It'd be nice to know...

Indeed, if *all* ROM could be readily dumped by electrical means that would be handiest. (Perhaps even a PC running good ol' DOS and toggling bits on its LPT: parallel port and then reading back data stream could do this.)

But as the paragraph below from The Museum's HP15C entry indicates, the CPU may have 61Kwords of mask ROM on it. This ROM may well NOT be 'dumpable' if all pins on this CPU are devoted to KB/LCD I/O - or the dumping action is a proprietary factory mode. And just because the external user prgm/data memory requires CPU to expose addr/data bus does NOT mean the internal ROM can be read out similarly - esp as we'd be using an external device as 'master'...

"The CPU for these new machines included 61Kbits of ROM, 2.2Kbits of RAM, an LCD driver and a low-battery detector on-chip. To improve on previous designs, HP developed a new CMOSC process...."

Bill Wiese San Jose, CA

Re: Anyone w/dead 15C that can decap/peel chips w/ ROMs?? ROMs may be internal

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 5:24 p.m.,*
in response to message #6 by Bill Wiese

I think that the three chips are (left to right if you watch the picture of inside a 15c): 1) Display Controller (and RAM??) (the bigger chip) 2) Coconut CPU (pratically the same of the one on 41CX) 3) ROM (and RAM??) and keyboard scanning

I read in one HP internal documentation of the Coconut processor that it is really the same on the 41C, 11C and 12C (and consequently 15C), the only difference is the battery voltage monitor and the power down system (mask 7, CMOSV): 1LF5-301 on 11C and 1LF5-0002 on 41xx. Mine 15C have one marked "1LH1-302" (the other two: display ctrl. 1LH1-306, the ?ROM 1LM2-0001). This documment also describes the serial bus states (clock 1 and 2, sync, pwo, isa, data).

With some kind of logic analyser (or PC paralell port or a microcontroller) we may get the right pins of the serial bus and cutting it from the CPU we can drive the ROM simulating the serial bus and reading the data sequentially.

I'm thinking of try this approach on a less expensive HP-12C (vintage, not the new ones) and if I have any success I'll try on the 15C.

Any other information will be great.

Best regards,

Nelson

*Message #8 Posted by **Bill Wiese** on 27 Aug 2003, 6:09 p.m.,*
in response to message #7 by Nelson M. Sicuro (Brazil)

Hi Nelson..

Unless they're referring to specific chips, that 'Coconut' term prob largely refers to a combination of instruction set & CMOS techology. I doubt the same chip was used in 41xx and 11C-15C.

Also later 15Cs as Randy Sloyer pointed out have 2 chip and 1 chip versions.

Regards, Bill

Its not the same IC, the 41 series uses a different IC because it requires a higher voltage and runs faster.

Apart from such minnor differences the CPUs are the same, but the ICs used are different.

The 1xC series used the 1LF5-0301 while the 41 the 1LF5-0002

Having said that, the techniques for extracting the contents of the ROMs by manipulating the address and data buses would be very similar.

Like many other microcontrollers, it sounds like the Coconuts are part of a 'line' - same

instruction set but different speeds, I/O, etc.

Generally speaking, for a given process technology, RAM takes up more space (chip area) per bit than ROM. So having 61Kwords of machine ROM in the CPU would not surprise me. Just because the Coconut can connect to external chips for KB/IO and user data storage does NOT mean the ROM can be dumped via these I/O lines!!!

Bill Wiese San Jose, CA

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #12 Posted by **Randy Sloyer** on 27 Aug 2003, 5:57 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

FWIW, the 15C was built in three, two and one chip versions.

I have an original 3 chip, 2 board version here that works but eats batteries in a week available for disection if someone can do the work.

I would love to see any technical documentation on the chips and their signals. Can you point me to a source?

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #13 Posted by **Diego Diaz** on 28 Aug 2003, 2:16 p.m.,*
in response to message #12 by Randy Sloyer

Hi all,

Nowadays I'm involved in HP-41 ROM Packs cloning, so I'm dealing on a daily basis with Clk1, Clk2, ISA, SYNC... lines.

Yes, the HP available info about 1LF5-0301 (11C, 12C) and 1LF5-0002 (41C Fullnut) clearly says that they both share the same funcionallity and pin-out, only differences are regarding Power supply voltage management.

So the task can be achieved, provided:

a) 15C's (at early versions) still "wear" the same chip or,

b) at least another functional compatible one AND Rom's were not masked inside the processor waffer if the former is true.

Further more, if a separate ROM chip of said processor is available, reading the internal code is as simple as provide it with the required lines: Clocks 1 & 2, SYNC, ISA, PWO, V+ and GND. That can be done with a PC parallel port and a +5v DC power supply. Of course it'd be better if done at ASSEMBLY language level. Remember MOV DX,AX?? :-)

Another way to work it out migth be placing the said ROM chip into a 41C module, and loading it with DAVID assembler. This will also allow the M-code mnemonics dumping to printer. Wouldn't be nice?? ;-)

Contact me if you're interested in the info regarding this CPU.

Cheers from the Canary Islands.

Hi Diego... Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #14 Posted by **Bill Wiese** on 28 Aug 2003, 3:58 p.m.,*
in response to message #13 by Diego Diaz

Hi Diego...

Interesting. I have a 41C but it has a 40pin(?) DIP CPU. So later 41Cs/Vx/Xs have a small flat-pack CPU?

The disadvantage of dumping a 15C w/external ROM instead of a later 15C unit w/fewer chips is that you prob won't get the latest ROM & any bugfixes (offhand, I dunno what bugs are in or were fixed in 15C).

Yes, I'd like to see docs on this particular Coconut chip!! You can reach me at bill[at]bwiese[dot]org - despam my address appropriately :)

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #15 Posted by **Nelson M. Sicuro (Brazil)** on 28 Aug 2003, 5:02 p.m.,*
in response to message #13 by Diego Diaz

I'm very interested in any information I can get about the Coconut CPU as long with its ROMs and RAMs. I'm building a emulator in hardware (fisically, a microcontroller simulating the coconut in a body of a deceased HP calc.) in my spare time as a hobby project.

My email is in the header above.

Best regards,

Nelson

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #16 Posted by **Diego Diaz** on 28 Aug 2003, 8:28 p.m.,*
in response to message #15 by Nelson M. Sicuro (Brazil)

Hello everybody,

First my apologise, I've just realized I did an unforgettable mistake on my second approach to this issue, namely:

It's not possible to place an isolated 15C rom chip and try to fool the 41's CPU because:

- The main ROM of the 15C will try to respond at the same address space (i.e. starting at address 0x0000) than the 41 main ROM, and due to that conflict the CPU won't start at all.

- That main ROM can't be remaped (as normal 41's modules can via B3 & B4 lines) because it's address space is "firm-wired" inside the chip.

Nevertheless the first approach is still valid and, provided you can dump the ROM contents into a binary file this can be later burnt into an EPROM and placed in a ROM-BOX, then treated a separated re-addressable module, thus DISASSEMBLED and listed. Little bit more complicated but still fairly easy... er... well, at least I think so.. :-)

Regards.

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #17 Posted by **Nelson M. Sicuro (Brazil)** on 29 Aug 2003, 10:05 a.m.,*
in response to message #16 by Diego Diaz

I'm comparing two Voyagers, the 11C and the 15C that I have with me. The 11C have only 2 chips, from left: 1LH1-0305 and 1LM2-0001. The 15C have 3 chips, from left: 1LH1-0306, 1LH1-0302 and the same 1LM2-0001. I also read in one document (http://www.vcalc.net/hp-11.htm) that it has 2 chips, the bigger (1LH1-305 in my 11C) that is the multi-function and display chip and the CPU. The extra 15C chip I can only guess that is a RAM chip, as it have double the amount of RAM. I also guess that the multi-function chip (1LH1-030x) is also the ROM chip. My objective here is to dump the ROM, so I'll try to cut the traces between the chips and insert my own signals to read it (as soon I get the guts to do it in a working HP-11C!!). What do you think?

Best regards,

Nelson

Re: Anyone w/a dead 15C that can decap/peel chips w/ ROMs??

*Message #18 Posted by **Diego Diaz** on 29 Aug 2003, 4:49 p.m.,*
in response to message #17 by Nelson M. Sicuro (Brazil)

Hi Nelson,

I have no previous (neither current :-) knowledge about the Voyager series. I focus my interest in the 41 & related peripherals.

There is a picture in this site where you can see a 15C's (early model) guts with three chips. One of them is the 1LF5-0301 wich is, as stated in previous post, the same functional waffer as the 1LF5-0002 used on 41 Fullnuts series but inside a flatpack package.

On this basis it's possible to read 15C ROM using (or emulating) the same lines.

On later 15C models the chipset were substituded so the referred aproach is useless.

Nevertheless you can alwais try to take a look at the internal lines, though an oscilloscope probe shold be, in my opinion, a preferred tool instead an exact-o-knife ;-).

Anyway I wish you the best of lucks whatever the method you choose.

Regards.

Anyone w/a dead that can decap/peel chips w/ ROMs??

*Message #1 Posted by **Bill Wiese** on 27 Aug 2003, 2:53 p.m.*

Hi all...

[reference: http://www.pmonta.com/calculators/hp-35/index.html]

Anyone out there with a dead 15C and that has access to "chip peeling"/decap equipment? Maybe we can get a ROM dump. (15C ROMs are apparently not a separate standalone chip apparently. Dunno how to 'grab' the data electrically... but that may not matter this way.)

Decapping usu means use of a fuming nitric acid jet to debride the epoxy body/cap of a chip 'til the chip die & bond wires are exposed. (Then rinsed quickly so the acid doesn't hang around! :) BTW chips can work after this process!!

The chip MIGHT be directly (micro)photographable like Peter Monta did, unless the line widths are a great deal smaller. If that is the case, the glass passivation layer (outermost) may need to be removed too. [Late technology chips can be harder to photomicrograph given feature size vs. wavelength of light used are in similar ranges.]

Years ago I did this w/some automotive microcontrollers. A coupla chips still worked afterward for awhile - though the ones w/passivation layer ground down died shortly after.

If we can get nice photos of 15C ROM array areas we might be able to differentiate btwn '1' and '0' bits in ROM, letting us "dump" it.

Of course we'd have to figure out the array sense (that is, what is actually a '1' and '0' - or is it vice versa?) and array arrangement & interleaving (addr[n] is not necessarily next to or even near addr[n+1] or addr[n-1]).

But with a bit of help from other 'Nut calcs we prob can figure this out statistically (opcode/operand frequency analysis, positional information, etc.)

If someone can supply me with a GOOD noncompressed image(s) scan of photographs of these ROM dies I'm glad to try attempting this latter half of the work. I don't have access to the former services (decap/photograph...) anymore

A spare black screen 48GX

*Message #1 Posted by **R Lion (España)** on 27 Aug 2003, 10:09 a.m.*

I have just received a 48GX from Samson Cables, as a spare unit. The black screen is slightly better than the old blue. Not a wonderful, but it is a better screen.

What I want to know is about the serial number. It is ID311xxxxx. Does this mean that this unit has been made this year?

Thanks in advance

Raul

Edited: 27 Aug 2003, 3:55 p.m. after one or more responses were posted

*Message #4 Posted by **R Lion (España)** on 28 Aug 2003, 7:20 a.m.,*
in response to message #3 by Randy Sloyer

I'm surprised: I thought they have discontinued it in 2001 or 2002...

Re: A spare black screen 48GX

*Message #5 Posted by **48 Lover** on 28 Aug 2003, 1:52 p.m.,*
in response to message #1 by R Lion (España)

So, R. Lion, you say that the screen is a bit better, but only marginally. I was wondering if you could elaborate?

I was thinking about buying a backup 48 and I was going to get one that has a black screen, but I can find

blue-screen used ones cheaper, and need some help to decide.

I'm very interested in your (and other people's) insights.

Thank you ver much!

Re: A spare black screen 48GX

*Message #6 Posted by **R Lion (España)** on 29 Aug 2003, 2:37 a.m.,*
in response to message #5 by 48 Lover

What I see when I put both calcs side by side, is a better contrast in the black screen. Although I wouldn't say a "much better" contrast, the black screen is certainly more readable specially with poor light.
Other thing I see is that the new screen reflects less, but I can be sure if the old one has lost some kind of covering along years...
That's for what I said "slightly better "... but I've seen other people's posts saying what a wonderful the black screen is... You can look for more opinions in comp.sys.hp48

Strange recurring HP41CX at $440 on eBay

*Message #1 Posted by **Sergio** on 27 Aug 2003, 4:59 a.m.*

Did anyone notice this "december" guy on ebay selling "new" hp41cx's one after another, at buy-it-now of $440, for several months? As soon as one is sold, another appears. Same photos and price and description. Is this a scam? Are the hp41cx's still manufactured?

Re: Strange recurring HP41CX at $440 on eBay

*Message #2 Posted by **Veli-Pekka Nousiainen** on 27 Aug 2003, 6:05 a.m.,*
in response to message #1 by Sergio

No - the 41 series has been discontinue a long time ago.

The "new" calculator could be in an unopened box.

VPN

Re: Strange recurring HP41CX at $440 on eBay

*Message #3 Posted by **hugh** on 27 Aug 2003, 6:51 a.m.,*
in response to message #1 by Sergio

i think he has a stash of them and selling one at a time. i bought one from him right at the start (when they were cheaper). they are indeed new in box with unopened manuals.

Yes, but SO many ?

*Message #4 Posted by **Sergio** on 27 Aug 2003, 8:00 a.m.,*
in response to message #3 by hugh

They are selling like hot cakes (of course); his selling history shows tens and tens of them. This guy discovered a pure stock of gold - governement sale? Ex repaired units? Hidden son of Mr Hewlett or Mr Packard? :-P

Yes, seems like...

*Message #5 Posted by **Raymond Del Tondo** on 27 Aug 2003, 8:12 a.m.,*
in response to message #4 by Sergio

Hi,

I also have one of these new units, and the person I got it from had at least *ten* of these new units from UK. It seems there's more than one seller, and if the eBay deals over the last months were real, the stock propably was many hundreds of units.

Raymond

Re: Yes, they are new in the box

*Message #6 Posted by **Randy Sloyer** on 27 Aug 2003, 8:59 a.m.,*
in response to message #5 by Raymond Del Tondo

The story I heard was a palette load was found somewhere in a storage facility in the UK. It went to auction and the entire load was sold to one buyer. They sold off some of the units in groups of 10 or 20 before they realized the value.

They've been selling one a week or so for the last year. I heard some where sold for as little as $50. The lowest I've seen was about $220 to a high of $660.

It's for real, get one while you still can...

Re: Yes, they are new in the box

*Message #7 Posted by **Michael Meyer** on 28 Aug 2003, 3:38 a.m.,*
in response to message #6 by Randy Sloyer

I bought two for $50 each. I was afraid to buy more then fearing a scam.

Oh well. I just bought a 42S for $225, used. Like everything else....

Michael

Re: Yes, but SO many ?

*Message #8 Posted by **christof (NoVA US)** on 27 Aug 2003, 8:59 a.m.,*
in response to message #4 by Sergio

There was a stash of them discovered in the UK a while back- like a warehouse lot or something. I also got one- and also at an earlier and lower price.

I'm curious to know when he will run out, but until he does, we are all assured of a way to get a new one if we can pay. (though I think he's scalping a bit, I can't blame him, really)

-Christof

Re: Yes, but SO many ?

*Message #9 Posted by **Iqbal** on 27 Aug 2003, 9:24 a.m.,*
in response to message #8 by christof (NoVA US)

I got two, though I wished I had paid $50 [the price he started out selling at]. One thing is sure though, if he wasn't a millionaire before he is one now. If he was making a profit selling at $50 and now he sells for $450+ well, I don't need any HP calc. to tell me he's making a huge profit. I am glad, though that somebody found these new units. I am saving these for my two daughters. Unless next 10 years HP comes out with something better [which I seriously doubt].

Re: Yes, but SO many ?

*Message #10 Posted by **John L Shelton** on 27 Aug 2003, 12:49 p.m.,*
in response to message #8 by christof (NoVA US)

"Scalping" is such an unpleasant term for a voluntary transaction between two parties who both get

something they value. Unless force is involved, there is no reason to criticize the price anyone else pays for something they want.

If you claim that you, yourself were "scalped", you are merely admitting that you regret your voluntary purchase. Auctions are designed to let emotions dictate price, yet you always have the option to consider your bids rationally.

Applause to the profit motive of such trades is due - without that motive, you'd have much more trouble finding the things you want.

Re: Yes, but SO many ?

*Message #11 Posted by **christof (NoVA US)** on 27 Aug 2003, 4:43 p.m.,*
in response to message #10 by John L Shelton

Scalping is something that happens. I've used scalpers more than once to get tickets to sporting events. There's nothing derogatory about it.

Profiteering- now that's a different story. Selling water at $5.00 per liter because you are the only one with a clean supply, now that i'd say was 'wrong'.

Scalping is something that happens- and it's a normal part of life. there was no bad intent with using the word.

-C

Whats wrong with profit?

*Message #12 Posted by **Randy Sloyer** on 27 Aug 2003, 7:17 p.m.,*
in response to message #11 by christof (NoVA US)

> Quote:
>
> Profiteering- now that's a different story. Selling water at $5.00 per liter because you are the only one with a clean supply, now that I'd say was 'wrong'.

I think there is a big difference between selling at a profit that which people need and that which people want.

I would agree selling water that cost you $0.25/L at $5/L would be morally wrong if you set up your stand in the desert.

Nobody "needs" calculators. The market sets the price because more than one person is willing to pay more than the next guy. I'm always baffled at why people think it is "wrong" to sell at a profit, no matter what the margin. For the seller, it's a once in a lifetime event. Doesn't everybody deserve a little good luck now and then?

Re: Whats wrong with profit?

*Message #13 Posted by **christof (NoVA US)** on 27 Aug 2003, 10:47 p.m.,*
in response to message #12 by Randy Sloyer

Well- that's why I made the distinction.

scalping calcualtors isn't the same thing as profiteering.

If I found a pallet of HP42s calcs NIB, I wouldn't insist on selling them at suggested rtail price. I'd scalp, sure.

Re: Strange recurring HP41CX at $440 on eBay

*Message #14 Posted by **Axel Poqué** on 27 Aug 2003, 10:06 a.m.,*
in response to message #1 by Sergio

I bought one from him, too. Actually "december64" is quite nice, because he promptly offered to send me a replacement when my CX developed contact problems (I posted about this about a month ago). He even let me the keep the non-working calc for parts (for a minor fee). The calcs are really brand new / mint and the manuals are still sealed. So even if the price seems a bit steep, you can be sure they have never been used, have no corrosion, and do actually work (unlike some other auctions, where used calculators of uncertain condition described as 'mint' are sold for not much less).

9810 Power Problem?

*Message #1 Posted by **Katie** on 27 Aug 2003, 3:30 a.m.*

My 9810 has gotten flaky. The problem seems to be somewhere in the power supply circuit. There seems to be some sort of power-is-good-boot-the-CPU function in the calc because after you turn it on, it normally takes a few seconds before it comes to life. Recently my machine isn't getting this "boot" signal as it should, I think. Sometimes it does work, but then goes dead after a minute or two. Other times it just sits there with all LED's off or some of them on but with no keyboard response. But the fan always works and all 5 marked power supplies (+12, -12, +16, +20, +24) measure good and are clean (no noise).

Does anyone have any experience with this or any idea about where this supposed boot-up circuit might be located in the 9810?

Thanks,

Katie

Re: 9810 Power Problem?

*Message #2 Posted by **Tony Duell (UK)** on 27 Aug 2003, 3:10 p.m.,*
in response to message #1 by Katie

There is a power-on reset circuit, which pre-loads all the microcode PC flip-flops with 1's to start the CPU at the right point. The reset circuit is on the 5V PSU card (09810-66581), andis built round a '121 monostable chip. The A inputs are grounded, the B input comes from an RC network (3k3 to +5V, 1uF to ground). The monostable has timing components of 27k and 1uF. Finally, the Q output of this monostable is buffered by a simple transistor stage and is fed out of the rearmost pin of the front card edge connector.

Re: 9810 Power Problem?

*Message #3 Posted by **Achim Buerger** on 27 Aug 2003, 9:12 p.m.,*
in response to message #1 by Katie

Katie, I don't think that the Problem comes from the power supply since when e.g. an overvoltage is detected the 5V line is completely shut down. The same occurs when you switch the power off and on again too quickly. The symptom appears to come from a weak TTL IC. Some months ago I had a similar problem in my 9830: it hang up every time after a few minutes and did'nt start up when switched off and on again. I had to wait about 5 minutes before the machine worked again. I localized the thermic fault by means of cold spray. It was IC6 (74H74) on board 9810-66512.

Good look, Achim

Re: 9810 Power Problem?

*Message #4 Posted by **Katie** on 27 Aug 2003, 9:56 p.m.,*
in response to message #3 by Achim Buerger

Thank you both for that great information. I'll check out the monostable circuit that you described, Tony, to see if it's working correctly. If that's not the problem I'll try the cold spray technique, Achim.

Just one question for either (both of you)? How did you get access to the boards while the machine is running? Do you use card extenders? If so, how to you get to the boards in the stack positioned in front of the fan? Right angle extenders? HP must have made a special test jig for servicing these machines. Of course all that the field techs would do would be board swapping, but what did the real service techs use?

-Katie

Re: 9810 Power Problem?

*Message #5 Posted by **Achim Buerger** on 28 Aug 2003, 5:49 a.m.,*
in response to message #4 by Katie

Hi Katie, I did build two simple bus extenders for the 2*18 nad 2*15 connectors of the CPU boards. I made them from small PCBs with gold contacts, the matching PCB connectors, and ribbon cable. If you are interested, I can mail you some photos.

To access the boards in the memory cage is principically the same, but for some boards you need one more bus extender with 2*10 contacts. By using ribbon cable which is long enough you can bend it out of the card cage and lay the card under test on top of the calculator.

Achim

Re: 9810 Power Problem?

*Message #6 Posted by **Tony Duell (UK)** on 28 Aug 2003, 4:39 p.m.,*
in response to message #4 by Katie

Firstly a couple of points from your first message. The fan doesn't tell you a lot -- it's an AC fan running off the mains side of the transformer (in you case (120V), straight off the mains, in my case (240V), the mains transformer primary acts as an autotransformer). Secondly, you say you tested the 5 labelled PSU rails, but presumably you didn't test the 5V line (which is, of course, the supply for all the logic). There's a convenient capacitor to use for this on the display PCB (I think the ends are even marked!), or you can check it on any TTL IC in the unit. Of course noise on this line causes problems! I don't have a set of extenders -- I wish I did. One problem is that the CPU boards all have 15 and 18 pin DS connectors, but at different positions on the 4 boards. This is great for failed circus, who;d find it difficult to get the PCBs in the wrong slots (I won't say impossible, I've met failed servoids..). It does mean you either need a different extender for each PCB, or you need to use 2 little boards, one for each connector, which is not mechanically too rigid. I guess if you want to work on boards in the memory cage with extenders, you'd put the entire cage on an extender (you only _need_ the rear connecotr, the front one is for the expansion ROM cartridge signals only), and then use another set of extenders to put the boards outside the left side of the cage. If I was going to do this, I'd make up some metal rods that would screw into the memory cage mounting holes, aand which would then support the cage on the extender. Anyway, what I actually do is to either use the wonderfully slim probes of the LogicDart, which will get to wquite a few IC pins without extenders (!), or to pul lthe card in question, solder wires onto useful testpoints, put the card back in, and test the free ends of the wires. It's a bit slower than using extenders, but it does work. Tracing a 'no display' fault on a 98x0 is non-trivial. The display is scanned in software (well, firmware), so for the display to come up, the entire CPU, memory controller, ROM, RAM, I/O controller and display circuitry have to be working. I am trying to work out ways to really trace faults -- HP kindly provided a test connector on the CPU control card (09810-66513) which carries the microcode address signals, and connectors o nthe memory box/memory control cards (depending on the model) that carry the address/data bus. To use the latter, you'd want to trigger a logic analyser on a particular micrcode address -- say just after the instruction fetch. All this is

possible (and I have a lot of notes I've made on how it works), but it'll have to wait until after the HPCC mini-conference.

Re: 9810 Power Problem?

*Message #7 Posted by **Katie** on 29 Aug 2003, 3:34 a.m.,*
in response to message #6 by Tony Duell (UK)

Wow Tony, where do you find the time to do all this hacking? I don't know if I'd have the patience to do the the kind of debugging that you do with your Logic Dart and wires soldered to the boards. I really need to use the board extender approach so that I can move from circuit to circuit quickly. I also have a really hard time working on these large machines without schematics. It's one thing to fix the handheld HP's with 2 to 12 chips blindly, but the 9810 is impossible. I tried repairing a dead Wang 520 without a diagram and got nowhere. Luckily I found someone with a full set of schematics and it was a relative breeze with them. [The Wang 500 design seems a lot more straightforward to me than the 9810, but the Wang is a simpler machine.]

BTW, I forgot to mention that the 5V supply looks pretty clean in my 9810 so I figured that wasn't the problem.

Re: 9810 Power Problem?

*Message #8 Posted by **Achim Buerger** on 29 Aug 2003, 7:37 a.m.,*
in response to message #7 by Katie

Katie, there _is_ a full set of 9810 schematics. You find it in the original patent 3859635 available at USPTO. I downloaded the about 400 TIF pages and made a 35MB PDF of them for convenient usage. At the beginning it's a bit difficult to identify which schematics belongs to which board. If you like, I can tell you which figure corresponds to which board. Achim

Don't you already have a set of 9810 schematics... your friend in Texas...

Re: 9810 Power Problem?

*Message #11 Posted by **Katie** on 30 Aug 2003, 12:51 a.m.,*
in response to message #10 by David Smith

Oh my, I completely forgot about those! Thank you, thank you. They are much more

readable than the fragments in the patent. However, the patent makes a nice complement to the schematic in that it explains the detail that's not noted on the drawings.

Re: 9810 Power Problem?

*Message #12 Posted by **Tony Duell (UK)** on 29 Aug 2003, 5:59 p.m.,*
in response to message #8 by Achim Buerger

The HP Patents for the 98x0 series are a wonderful resource, but do be careful. I've found differences between the schematics in the patent and production machines (the memory system in my 9830 is _totally_ different to that in patent GB144141). IMHO, use the patents for clues, but don't follow them blindly.

*Message #13 Posted by **Tony Duell (UK)** on 29 Aug 2003, 6:04 p.m.,*
in response to message #7 by Katie

Actually, I generally have a pretty good idea as to the problem area from testing on pins I can reach with the machine fully assembled. I then pull the probably bad card and solder up to 10 wires on it (I can't find more than 10 different colours of wire easily :-)). I then probe those. It rarely takes more than 2 attempts at soldering on 10 ways to find the bad chip. As regards time, alas I don't have much else to do (like a job), so I figure I might as well work out how to repair HP calculators. And then share any tips here. FInally, you didn't mention you'd checked the 5V line, so that's why I asked about it. OK, it's not the problem...

Emmanuel at Xeq41@aol.com

*Message #1 Posted by **Jeff** on 26 Aug 2003, 9:26 p.m.*

Has anyone completed a successful purchase from Emmaunel? I am not trying to give him a bad name but, I purchased something two months ago and yet to receive it. Also, he is not responding to e-mails regarding the transaction. Has anyone else had the same problems. Is shipping from his country really this difficult? Jeff

Re: Emmanuel at Xeq41@aol.com

*Message #2 Posted by **andy** on 26 Aug 2003, 9:46 p.m.,*
in response to message #1 by Jeff

I made a trade with him once and everything went well.

I have been trying to email him a scan and he hasn't been responding to my emails either. I think that he may travel a lot.

Andy

*Message #3 Posted by **Dave** on 26 Aug 2003, 10:50 p.m.,*
in response to message #1 by Jeff

Just be aware his equipment is usually very high priced for the quality received....

Re: Emmanuel at Xeq41@aol.com

*Message #4 Posted by **Don Davis** on 26 Aug 2003, 11:28 p.m.,*
in response to message #3 by Dave

I made a trade deal with him for a 16C which I am very happy with. He shipped promptly and the item was in great condition as described. He also sent me additional documentation which was not part of the original deal. I am assuming that he may be traveling or something, as another respondent suggested. My dealings with him were very good.

Don

in response to message #1 by Jeff

I know Emmanuel very well and I promise you he will never cheat you. I also have a open deal with him. He sent out a parcel some month ago that never arrived to me. I will see him in a month and I'm absolutely shure he will manage this. His problem is, that several parcels didn't arrive at the same time, so it's logic that he wants to get informations an dmoney from "la poste", and this will take some time. Please do trust him, and I

promise you, you will be satisfied with your deal. I had several deals with him that were all positive.

Matthias

*Message #6 Posted by **james (UK)** on 27 Aug 2003, 8:47 a.m.,*
in response to message #1 by Jeff

I bought a Panam module from him a couple of months ago and had no problems with the deal or with getting email responses from him. 'La Poste' can slow things up as the first time he tried to mail the module to me 'La Poste' returned it to him but the second attempt got through. However, I believe August is a big holiday month in France and therefore things may be quiet at the moment.

I would have no worries about dealing with him again.

in response to message #1 by Jeff

Reply from above message of negative criticism of Emmanuel Xeq41@aol.com: I recently purchased a Hewlett Packard graphic calculator HP 49g, their advanced model, in July. He was so concerned that I get it that when he found out that the first shipment did not arrive to my residence in California, USA, he shipped me a second one knowing that he was going to complete his transaction. We still don't know what may have happened to the lost shipment, but the second one arrive in perfect order. The calculator was well packaged, even more than I expected, in new condition as he stated. I am completely satisfied with his business and would rate him a 10 from a scale 1-10, 10 being the best. He is an honest man, who can be trusted in saling exactly what he says he will. I would do business with him again. Sincerely, Joseph Barrera Southern Calif., USA

Re: Emmanuel at Xeq41@aol.com

*Message #15 Posted by **Jeff** on 1 Sept 2003, 9:42 a.m.,*
in response to message #1 by Jeff

This thread was not intended to give anyone a bad name! I was just concerned about the package and wondering if the La Poste really stinks. I feel very comfortable that the package will arrive now that I have talked to everyone. Sorry Emmanuel, I did not realize that August was the vacation month, my apologies. Jeff

buying HP calculators

*Message #1 Posted by **Phil Jonker** on 26 Aug 2003, 8:06 p.m.*

due to the place where I live (Australia) how can I successfully and safely purchase a used HP calculator?

Re: buying HP calculators

*Message #2 Posted by **Patrick** on 26 Aug 2003, 9:37 p.m.,*
in response to message #1 by Phil Jonker

I regularly see calculators for sale from Australia on eBay. Some here would argue that eBay does not qualify for your "safe" condition, and they would be right. It is not safe, not like buying from a reputable electronics chain. However, electonics chain stores don't carry the kinds of HP calculators I think you mean (i.e., not 9s, 9g, etc). Moreover, I have made some 60+ transactions so far on eBay, the most expensive being $340, and I have had mostly good experiences and no outright bad ones (like non-receipt of the merchandise).

Of course, the items on eBay don't have to be from Australia for you to buy them, either. :-)

that HP42sx thing again

*Message #1 Posted by **christof (NoVA US)** on 26 Aug 2003, 6:40 p.m.*

Reading old literature and journals, i've found out that there was some form of HP42sx prototype actaully present and publicly used by a Corvallis engineer. The I/O functionality had been burned to a larger ROM and a hole cut in the case to take the hand wired socket. But it worked, and was there!

A fully disassambled ROM image from a 42S would make building an IO/extended functions ROM this much easier. I'd also vote for strictly Infrared IO due to power and space.

A disassembled 17Bii ROM would also add the ability to get the code for some of the financial and statistics functionality into a second ROM.

I'm sure that it would be easy to get submissions sifficient to fill any ROM package that was made. (to preserve the 'pioneer-ness' of the calc, it would have ot be a small surface mount item.

Periodically, steps are taken by various people to try and get closer to this Holy Grail of Pioneer calcs.

So here I am, starting the next cycle :)

Maybe I can get a disassembler running on a 48 to handle this.

and- for anyone building an emulator, go for it! a good 42 emulator would make final builds of a ROM much easier

Re: that HP42sx thing again

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 26 Aug 2003, 8:47 p.m.,*
in response to message #1 by christof (NoVA US)

I'm actually building a emulator in hardware (with microcontrollers) in my spare time, and I'm planning to emulate the coconut processor (HP41CX, 11C, 12C, 15C). I can add later the ability to emulate the Saturn processor, it isn't so different. The part I'm thinking about is the graphical LCD of the 42S, it is 131x16... I may use a larger graphic LCD and use some part to display the status of the emulator and the annunciators.

Regards,

Nelson

*Message #3 Posted by **Erik Ehrling (Sweden)** on 27 Aug 2003, 1:24 a.m.,*
in response to message #1 by christof (NoVA US)

We *do* have an extremely good HP-42S emulator for this purpose (Emu42 by Christoph Giesselink). And we also have a very suitable mechanism for it in the additional ROM (as used for the mulilanguage 17BII)...

Re: that HP42sx thing again

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 9:22 a.m.,*
in response to message #3 by Erik Ehrling (Sweden)

Yes, I have this emulator, and it is great! My hobby project is to build a mainboard replacement for some Spices, and using a matrix LED display (5x7, 12 char.) it is possible to run a HP-41cx emulation. I'm working to get the ROM of my HP-15C, as it uses the same CPU as the 41. I'm thinking of make a "blended" calculator using the most interesting functions from several others... (not a pure emulator; a CPU emulator running a new ROM image compiled from several sources). As I said, it is a hobby project. I have some microcontrollers and some non-working calculators, and why not?

Regards,

Nelson

Re: Getting HP to market an HP42sx

*Message #5 Posted by **Frank Travis** on 27 Aug 2003, 10:45 a.m.,*
in response to message #1 by christof (NoVA US)

I purchased an HP 42S in 1991 from the now defunct Educalc (not related to the current Educalc.net). I like it very much. A few years back I read in a Chip Chapter newsletter that HP was working on a prototype for an expandable HP 42S (what is here referred to as an HP 42sx). The newsletter stated that the HP 48SX put the HP 42sx idea on hold. If enough persons expressed an interest, could HP market an HP 42sx? I know some persons are skeptical, but with HP introducing several new models of calculators this year (the HP 49G+ of which I am eagerly waiting) it might happen. I am open to comments/feedback.

Re: Getting HP to market an HP42sx

*Message #6 Posted by **Jonas Lööf** on 27 Aug 2003, 11:03 a.m.,*
in response to message #5 by Frank Travis

As long as we are discussing 'dream' calculators, this is my take on it...

Introducing the hp 48c. Basicly a hp 48 in a pocket (pioneer) sized case with a smaller screen (131x32 ?) and perhaps ditching the serial IO, but keeping IR IO. Using IRDA would allow direct comunication with PC:s anyway...

Re: Getting HP to market an HP42sx

*Message #7 Posted by **christof (NoVA US)** on 27 Aug 2003, 11:26 a.m.,*
in response to message #5 by Frank Travis

Unfortunately, I don't think HP will do it. At least, not to a degree that would make anyone here happy.

it is *possible* that something in a 10bii case (ugh) with some of the capabilities of a 42, and maybe even IO, could happen.

i'm a bit skeptical about their actual *ability*, let alone willingness, to provide something of the hardware and software capability of the 42S. Look at the obvious and silly bug with program entry limits in the 12CP, the case durability of the 10bii.

Hence my desire to add on to my 42S further :)

Re: HP42sx emulation for the upcoming HP 49G+

*Message #8 Posted by **Frank Travis** on 27 Aug 2003, 1:13 p.m.,*
in response to message #7 by christof (NoVA US)

Maybe the HP 42sx will never become a calculator available to the general public. The next best thing might be HP 42sx (i.e., compatibility with HP 42S, HP 41C/CV/CX) emulation for the soon to be released HP 49G+. I remember that there was an HP 41CV emulation package for the HP 48SX about 10 or more years ago. After a while I no longer saw this package. The huge amount of programs written for the HP 41C/CV/CX and HP 42S could run on a much faster platform with the ability to add additional memory with the Secure Digital (SD) card that can be inserted. I do not know if applications can actually to burned to the SD cards as applications could for the HP 48SX/GX plug-in cards, as well as the HP 41C/CV/CX plug-in modules.

Re: Getting HP to market an HP42sx - comment to Christof's comment...

*Message #9 Posted by **Bill Wiese** on 27 Aug 2003, 1:24 p.m.,*
in response to message #7 by christof (NoVA US)

Hi..

[Christof wrote:] i'm a bit skeptical about their actual ability*, let alone willingness, to provide something of the hardware and software capability of the 42S. look at the obvious and silly bug with program entry limits in the 12CP, the case durability of the 10bii. I agree about the 42S :) Dream calc.

HP/Kinpo failed on the 12CP because they had a small time & cost budget and decided to do a rewrite from scratch. In situations like this it would've been faster & more reliable to write a 'Nut CPU emulation layer - poss w/a few 'hotspot' areas optimized - that runs on the 6502. Even if written in assembly code, this wouldn't take too long; not that hard to emulate a 'Nut in C or assembly macros.

Instead of a "code interpreter" the emulation could also be done as a machine translation (i.e, at "compile time") via macros/pseudoops & subroutine calls, taking into account ROM space use.

Since I/O setups would be different, you'd jump in & out of emulation for KB, display I/O.

Then the 12C code could could run in 100% conformity to a regular 12C. Once this is done, minor changes (# of program steps, etc) could be done incrementally.

Building a new-old calculator is not difficult these days software-wise if you can change/replace/reflash a ROM with your choice of firmware. The new ARM-based 49 would be WAY cool for this. (Linux on a 49 anyone? :) The hard part for small runs on consumerish widgets like calculators is finding/manufacturing keytops w/appropriate legends and keyboard overlays w/legends. This takes at least (guesstimating) $25K-$40K for even small runs because setup costs are the big thing.

Bill Wiese San Jose, CA

"The new ARM-based 49 would be WAY cool for this. (Linux on a 49 anyone? :)"

I think it just might have a miniature Linux underlying there... VPN

Re: Getting HP to market an HP42sx

*Message #11 Posted by **Erik Ehrling (Sweden)** on 28 Aug 2003, 12:51 p.m.,*
in response to message #5 by Frank Travis

This is exactly what I hoped to see among the new calculators released this autumn: A HP42S compatible calculator with 32K (or more) memory, a faster CPU and *most* important - I/O. In a way the HP33S is a step in the right direction, at least HP are producing a keystroke programmable RPN calculator again! (Only future will tell if we are waiting in vain for the dream calculator I describe above...) However, in the meantime - I/O for the HP-42S!? - well, I would be delighted! :-)

Best regards, Erik Ehrling (Sweden)

-+*/ -> /*-+
*Message #1 Posted by **tony** on 26 Aug 2003, 6:01 p.m.*

The HP41C and all HP calculators before it all seem to have had the vertical top-down ordering of -+*/ for those 4 keys.

Then came the Voyagers with /*-+, setting the tone for the future. Anybody know why this ordering was changed?

It looks like HP did a X<>Y RDN RDN, in 1981, on those 4 fundamental keys. Maybe it was around then that the numeric keypad appeared on PC keyboards?

Re: -+*/ -> /*-+
*Message #2 Posted by **bill platt (les Estats Unis d'Amerique)** on 26 Aug 2003, 6:07 p.m.,*
in response to message #1 by tony

tony,

I have always wondered this, too. I will merely note that just about all other brands of calculator seem to have the order and position on the right, and like the voyagers and pioneers. Perhaps HP was merely aligning with an industry "standard"?

regards

Bill

Re: -+*/ -> /*-+
*Message #3 Posted by **Gordon Dyer** on 26 Aug 2003, 6:41 p.m.,*
in response to message #1 by tony

I have always found the Voyager order much more logical and intuitive to use.
The first HP I used was a 9825 which has the same key order as Voyager, and an HP-11C was my own first HP calc.
Before that I had a Commodore 7919 with x / - + in order from top to bottom and I prefered the HP-11C (in all aspects!).
I also have HP-41 and find the arithmetic key order very awakward.

Re: -+*/ -> /*-+
*Message #4 Posted by **Raymond Del Tondo** on 26 Aug 2003, 7:05 p.m.,*
in response to message #1 by tony

Hi,

I think the 41 series had the arithmetic keys this way because of ergonomical and practical reasons.

Hold your HP-41 in your right hand, with only your right thumb beeing able to access the keyboard.

Imagine you don't have your left hand free for typing. Now you're in a situation like an engineer in the field, with one hand holding a paper or adjusting a total station, and the calc in your other hand.

Your thumb can describe a specific angle over the keyboard, and the keys near the middle of the keyboard are simply easier to reach for your thumb. It's harder to reach the outmost keys, like '*' and '/', and thus the most used keys moved towards the center of the keyboard.

And that's one of the reasons why the ENTER key is where it used to be before the 1999 machines, by the way.

Regards,

Raymond

Left hand to operate the calc, right hand to write with a pen(cil) VPN

One-handed use; WAS: Re: -+*/ -> /*-+

*Message #8 Posted by **W. Bruce Maguire II** on 26 Aug 2003, 10:37 p.m.,*
in response to message #7 by Veli-Pekka Nousiainen

> Quote:
>
> Left hand to operate the calc, right hand to write with a pen(cil) VPN

Correct. I believe that the *vast* majority of right-handed people hold the calc. with their left hand, and punch keys with their right. It was for this exact reason that I found the earlier post about one-handed operation to be very strange! A right-handed person will almost *always* hold the calc. in the **left hand**---keeping the **right hand free** for writing! Therefore, any design for one-handed use

should really be designed for **left**-handed use.

I'm not convinced that one-handed use dictated the position of the "Enter" key on early HPs. I think it just makes the most ergonomic sense. For a "portrait" orientation, it seems that you would want a somewhat-standard "ten-key" orientation of the numbers, and the arithmetic operators in a vertical column close to the numbers. Remember, adding machines and basic office-machine-four-bangers somewhat standardized that vertical column of arithmetic operators (near the numbers) *many* years before HP produced their first calc. Anyway, back to the point, for a portrait orientation, it seems that you would want nothing in the lowest rows but the numbers and four arithmetic operations. It just makes sense to put a big "Enter" key right above the numbers.

I don't know... Maybe it just seems common-sense *now*, because we've all become so accustom to the great ergonomics of the old HP calc.s!

Bruce.

Re: One-handed use; WAS: Re: -+*/ -> /*-+

*Message #9 Posted by **christof (NoVA US)** on 27 Aug 2003, 3:38 p.m.,*
in response to message #8 by W. Bruce Maguire II

Interesting. I hadn't thought of it much before, becausethe Pioneer and Coconut calcs just work so well for me as they are.

I'm left handed and almost always use a calc with my right hand, saving my left hand for important things like the coffee cup.

It doesn't seem as comfortable to use with my left hand, though that is very possibly due to my normal habits. The enter key definitely belongs shere my index finger can get at it

Re: One-handed use; WAS: Re: -+*/ -> /*-+

*Message #10 Posted by **Nelson M. Sicuro (Brazil)** on 27 Aug 2003, 4:25 p.m.,*
in response to message #9 by christof (NoVA US)

I also use my left-hand on computer mouse and the right on the HP42, on my desk. <off topic> It is curious that many left-handed people (like myself) likes mathematics. As an exemple, in one project I worked three of four people was left-handed (one mathematician, one engineer and one programmer [me]). </off topic>

Regards,

Nelson

Re: -+*/ -> /*-+

*Message #11 Posted by **bill platt (les Estats Unis d'Amerique)** on 27 Aug 2003, 11:37 a.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,

I am a leftie---and I use my calculator many different ways:

Sometimes it is on the desk--and I use it with either left or right hand, depending on whether I am sketching or something with my left hand,

Other times, the calc is in hand, and I use it three ways here:

Left hand, with thumb, Right hand, with thumb, and both hands, with two thumbs.

All of these methods are quite even in usage, too.

What I have noticed recently, is that going back to a voyager, after 8 years with pioneers, is that the voyager really is much more awkward for 1 handed use--though I remember being quite comfortable that way in the past. I think I used to be adapted to seeing the lcd at a cattywompus angle, and now I have lost that adaptation.

Regards,

Bill

Pioneer Cases

*Message #1 Posted by **Patrick** on 26 Aug 2003, 4:37 p.m.*

I have some Pioneer class machines which I purchased without cases. Does anyone know of a source for cases other than eBay (where they seldom appear)?

Is there a common commercial case, perhaps not originally intended for these calculators, but which would otherwise make an acceptable substitute?

I would be happy to purchase the real leather HP cases if they are still available for sale somewhere.

Re: Pioneer Cases

*Message #2 Posted by **Richard Garner** on 26 Aug 2003, 5:15 p.m.,*
in response to message #1 by Patrick

Patrick,

CalcPro.com has cases or they did for the 32s and 17b.

yes

Looking for magnetic-backed cardstock

*Message #1 Posted by **Andy** on 26 Aug 2003, 3:21 p.m.*

The 9100, 9810, 9820, 67, 97, 41, 71, and 75 all use magnetic cards made of seemingly identical material...a kind of flexible plastic with a magnetic coating on one side.

It seems like there must be a source for this type of media (maybe in sheets or rolls). If so, one could simply cut their own cards to fit their machine.

Any suggestions?

Thanks,

Andy

Re: Looking for magnetic-backed cardstock

*Message #2 Posted by **Victor Koechli** on 26 Aug 2003, 4:41 p.m.,*
in response to message #1 by Andy

The 71 and 75, with their hand-pulled card readers, use cards that are pre-recorded with a timing track so the card reader knowns at what speed the card is being pulled. Without this information, a card will not be usable on these machines.

The cards of the 65, 67, and 41, on the other hand, are simply blank. Don't know about other machines.

Just my 2 cents, Victor

Re: Looking for magnetic-backed cardstock

*Message #3 Posted by **Tony Duell (UK)** on 26 Aug 2003, 5:25 p.m.,*
in response to message #2 by Victor Koechli

THe 9100 and 9810 (and presumably the 9820, since the reader and interface are the same as for the 9810) use cards which are not 'pre-formatted'. There is no factory-written clock (timing) track for these machines.

Re: Looking for magnetic-backed cardstock

*Message #4 Posted by **andy** on 26 Aug 2003, 5:40 p.m.,*
in response to message #1 by Andy

I happened to have an old 8" floppy lying on my desk at work (don't ask why).

I think its big enough to cut 2 6x2" cards out of. I'll give it a try and report back.

Re: Looking for magnetic-backed cardstock

*Message #5 Posted by **David Smith** on 27 Aug 2003, 5:01 p.m.,*
in response to message #4 by andy

The floppy material is too thin for reliable feeding... been there, tried that. Back to gluing things onto thicker stock... by the way, the floppy envelope material may make a good cardstock.

Re: Looking for magnetic-backed cardstock

*Message #6 Posted by **andy** on 28 Aug 2003, 10:05 a.m.,*
in response to message #5 by David Smith

Do you mean the paper/fiber envelope or the plastic cover that you have to cut open to remove the disc?

Andy

Re: Looking for magnetic-backed cardstock

*Message #7 Posted by **David Smith** on 28 Aug 2003, 2:20 p.m.,*
in response to message #6 by andy

I mean the plastic housing of the magnetic floppy disk. This material seems to be close to the right thickness and flexibility of a magnetic card.

HP 41 rubber feets

*Message #1 Posted by **Frederic** on 26 Aug 2003, 12:35 p.m.*

Hi, i just repair my HP-41C and fully clean it. To finish the job, i need all the four black rubber feet tht had been lost with time.

What material can i use to replace these rubber feets and what to use to glue them in place?

I think about using a old tire inside trip but nothing for the glue.

Re: HP 41 rubber feets

*Message #2 Posted by **Naim** on 26 Aug 2003, 12:50 p.m.,*
in response to message #1 by Frederic

"feets"? Anyway, I used a good quality tyre tube with much success.

Re: HP 41 rubber feets

*Message #3 Posted by **David Ramsey** on 26 Aug 2003, 1:03 p.m.,*
in response to message #1 by Frederic

To glue the feet in place, use automotive interior trim adhesive. It comes in a spray can and one can will be a lifetime supply-- easily enough for thousands of rubber feet. This stuff is available at any auto supply store and is normally used for things like repairing sagging roof liners.

Place the foot or foot substitue face down on wax paper. Lightly spray the foot with the adhesive. Carefully pick it up and stick it on the calculator.

Re: HP 41 rubber feets

*Message #4 Posted by **Renato** on 26 Aug 2003, 1:25 p.m.,*
in response to message #3 by David Ramsey

Double sided scotch tape is ok for me. It is also very easy to apply.

Re: HP 41 rubber feets

*Message #5 Posted by **bill platt** on 26 Aug 2003, 2:05 p.m.,*
in response to message #1 by Frederic

Bonjour Frederic,

try searching the current forum, as well as the most recent archive. There was quite a bit of activity on wht sort of rubber sheet material to buy.

Regards,

Bill

Re: HP 41 rubber feets

*Message #6 Posted by **Randy Sloyer** on 26 Aug 2003, 5:47 p.m.,*
in response to message #5 by bill platt

Double sided carpet tape works well as it has a high shear strength adhesive just like the original 3M stick-ums. I just wish I could find it in the original black color.

Re: HP 41 rubber feet

*Message #7 Posted by **Katie** on 27 Aug 2003, 9:49 a.m.,*
in response to message #6 by Randy Sloyer

Randy,

I use carpet tape as well and it's white. But since it's not visible under the rubber feet (if you cut it right) why do (would) you want to use black tape. Isn't that carrying authenticity a bit too far! ;-)

-Katie

Re: HP 41 rubber feet

*Message #8 Posted by **Randy Sloyer** on 27 Aug 2003, 12:13 p.m.,*
in response to message #7 by Katie

I'm into preserving perfection :^)

I have found a good way to hide the white. First, clean the rubber sheet, and apply the tape so you can cut both the foot and tape in the same operation. I then cut with a rotary wheel cutter on a resilient cutting pad using a small metal T-square. It makes for very smooth, straight sided cuts. Almost as good as...

Re: HP 41 rubber feet

*Message #9 Posted by **David Smith** on 28 Aug 2003, 2:24 p.m.,*
in response to message #8 by Randy Sloyer

3M makes all sorts of double sided sticky industrial adhesives. I had some samples of some that was an exact physical match for the stuff HP used. I think it was rated at around 2000 lbs per square inch of material... them footsies ain't gonna fall off.

Re: HP 41 rubber feet

*Message #10 Posted by **Randy Sloyer** on 28 Aug 2003, 5:02 p.m.,*
in response to message #9 by David Smith

Do you know what the 3M product number was? I went through their website for double-sided tapes but I never found any black carrier products.

Re: HP 41 rubber feet

*Message #11 Posted by **David Smith** on 30 Aug 2003, 1:07 p.m.,*
in response to message #10 by Randy Sloyer

I check the pieces that I have. They have no number on them. Only "3M Hi Performance"... The pieces were cut out of a larger sheet and any number was probably there. The earlier material I have was a dark grey color. The later was clear.

Re: HP 41 rubber feets

*Message #12 Posted by **Stefan Hauschild** on 27 Aug 2003, 7:01 a.m.,*
in response to message #1 by Frederic

Spare rubber feet for some case sizes are available at our local parts store (Conrad Electronic). If I needed some I would try to cut them down.

Best regards

Stefan

Re: HP 41 rubber feets

*Message #13 Posted by **Michael Meyer** on 28 Aug 2003, 3:49 a.m.,*
in response to message #12 by Stefan Hauschild

I just tonight stuck 4 new feet on a 62A printer. I used the "roll-on" adhesive tape method (the new press and roll dispensers). Works great on many things and allows simple, fast, complete coverage of surfaces.

HP 59309A HP-IB Digital Clock

*Message #1 Posted by **Vassilis Prevelakis** on 26 Aug 2003, 1:05 a.m.*

The HP 59309A HP-IB Digital Clock allows access to a time of day clock via the HP-IB bus.

I have connected this thing to an HP-85 but have been unable to convince it to return a value.

I can send commends to the 59309A, (e.g. I can stop it and then restart it), but trying to read from it jams the bus, till I reset the bus (using the RESET 7 Basic command). The 59309A has a "ADDRESSED" LED that lights up when it sees its address on the bus. So when I send commands to it, the ADDRESSED LED briefly lights up, when I try to read from it, the ADDRESSED LED stays on till I reset the bus.

Assuming that the clock has address 17, the command I am trying is a simple:

```
ENTER 717; A
```

Behind an access cover under the display, are a few switches. The ones on the right serve to set the time and date, but the ones on the left are puzzling. There is a switch labeled INT/EXT, the clock works if it is set to INT, if the switch is set to EXT, the clock display goes out and the machine does not respond to commands sent over the HP-IB.

Another button labeled READ makes the display blink, but does not appear to do anything else.

BTW on the back of the machine there are 7 little switches, 5 are used to set the HP-IB address, and the other two are used to set the "MODE". On one setting the machine is configured only to talk (i.e. cannot accept commands over the bus). On the other setting the machine acts both as a listener and a talker. I have tried the ENTER command shown above in both modes (I even tried pressing the READ button), but so far the machine is mute.

Another thing that is strange with this clock is that the decimal dots of all the digits are always on. Does that mean something and how can I turn them off?

Any help really appreciated.

**vp

Re: HP 59309A HP-IB Digital Clock

*Message #2 Posted by **Vassilis Prevelakis** on 26 Aug 2003, 2:06 a.m.,*
in response to message #1 by Vassilis Prevelakis

Oops, typo

I guess I cannot even write a one line program without making a mistake. The correct command is:

```
ENTER 717; A$
```

Since the 59309A should send a string terminated by a linefeed character.

**vp

Re: HP 59309A HP-IB Digital Clock

*Message #3 Posted by **andy** on 26 Aug 2003, 11:17 a.m.,*
in response to message #2 by Vassilis Prevelakis

You're in luck. I recently scanned the entire 59309a operating and service manual. I'll look up the commands tonight and post them.

I use a 59309a with my hp85. In the startup program, I call the time from the 59309a and use it to set the 85's clock. It works great.

I think the command is:

output 7??; "C" input 7??;a

but like I said...I'll look it up tonight. There are also some dip switches inside the 59309a which set the format of data output.

Also, if you just got your 59309a, you should look inside and make sure noone installed an internal 9V backup battery since it could leak. I made a BNC-9V cable so I can utilize the 59309a's external 9V backup.

Its the perfect lab clock (except you need a magnifying glass to read it) 8^)

HP-17BII+

*Message #1 Posted by **Tom Cox** on 25 Aug 2003, 8:26 p.m.*

I have seen the HP-17BII+ advertised. I believe that CalcPro has them in stock. Does anyone have any hands-on experience with that machine yet? Since it uses the same case as the 10-BII, which is known not to be very reliable, I don't want to be on the bleeding edge.

Any information would be appreciated.

Re: HP-17BII+

*Message #2 Posted by **d4days** on 27 Aug 2003, 1:16 a.m.,*
in response to message #1 by Tom Cox

I just bought one on Ebay.

Will let you know when I get it.

:-)

Re: HP-17BII+

*Message #3 Posted by **chi** on 27 Aug 2003, 6:21 a.m.,*
in response to message #2 by d4days

I owned a HP 17BII and just bought a new HP 17BII+. When I re-inputted the solver equations to my new HP 17BII+, specifically the Black Scholes equation, the calculator returned "INVALID EQUATION" and the cursor stopped at the first L of the equation. I wonder if the L caused the error. Both L and G were not documented in the HP 17BII and 17BII+ manuals but they worked well on my 17BII.

Anyone has any idea on this issue or any work around or else my HP 17BII+ will be useless!

BTW, anyone who wish buy the new calculator should beware of the keyboard feel of the new calculator. They are completely different (between the old 17BII and new 17BII+). If not the new calculator is equipped with more memory, I would prefer my old 17BII!!

Re: Interesting!

*Message #4 Posted by **Ron Ross** on 27 Aug 2003, 7:47 a.m.,*
in response to message #3 by chi

The Let and Get functions were not documented in any of the Hp17's literature (it was documented in an Hp19b/Hp27s advanced manual). Could it be, that it was overlooked and left out?

Recheck with a much simpler equation than the Black Scholes eq. (you could have easily FAT FINGERed an error since I would NEVER blame a QUAULITY HP keyboard for a missed key stroke).

Fat Fingers (off topic)

*Message #5 Posted by **bill platt** on 27 Aug 2003, 11:45 a.m.,*
in response to message #4 by Ron Ross

Hi Ron,

Have you ever seen Itzhak Perlman play violin? His fingers look too big--but he *never* misses a note. How can that be? ;^)

Regards,

Bill

Re: Fat Fingers (off topic)

*Message #6 Posted by **Ron Ross** on 27 Aug 2003, 11:57 a.m.,*
in response to message #5 by bill platt

Perhaps the quality of the violin is somewhat better than the keyboard of the Hp17BII+? (I only wish and hope this is a mild understatement) But the ORIGINAL Hp pioneers??? That is a different question!

8o)

Re: New HP 17BII+

*Message #7 Posted by **chi** on 27 Aug 2003, 11:11 p.m.,*
in response to message #4 by Ron Ross

I just wrote to HP asking for a fix. They reponded quickly to ask me to check my typo. But after half an hour they send me another email saying that they were taking up the issue and would advise me later.

Actually, I don't think it is a matter of typo as I have compared line by line with my two calculators for the equation input.

My concern is that HP is rolling out new or improved models of their once and still favoured models to the market but manufacturing process was outscouced. It really remains a question to the extent of involvement of HP in the development stage and how hard both HP and the Kinpo had done to preserve the goods and introduce new improvement in response to users' suggestions.

For those who wants to try new models especially the coming 49G+ etc should take note of the concern raised here.

Edited: 28 Aug 2003, 5:23 a.m.

recodign the new machines

*Message #8 Posted by **christof (NoVA US)** on 29 Aug 2003, 3:22 p.m.,*
in response to message #7 by chi

The BEST thing, IMO, that HP could do with the 49G+ and other new machines is to recode them from scratch- but that requires a real and fully functional ACO.

The ARM CPU is a wonderful beastie, but it's not a Saturn- and it shouldn't be treated like one.

By all means, keep RPN/RPL, continue to provide really good real world functionality- but improve and recode while you do.

With the 12CP and the 17Bii+ we have already seen this-- emulating the 17bii in a new machine with dissimilar hardware is hardly an improvement (except in RAM capacity)- and entropy creeps in when you do that.

Re: HP-17BII+

*Message #9 Posted by **Britt** on 28 Aug 2003, 9:51 a.m.,*
in response to message #3 by chi

I received my HP-17Bii+ yesterday. My initial impressions are:

PROS:

1. RPN mode.

2. Nice looking calculator.

3. The display is much more readable than the two-line Pioneers.

4. Surprisingly lightweight but the case has a good rigid feel to it.

5. Big, hard plastic keys that click.

6. The manual looks OK but I haven't read it yet.

CONS:

1. The key springs are a little too stiff. The key in the top-right corner requires extra pressure to activate.

2. There is no real "ENTER" key.

3. At $119 U.S. list price, it is way overpriced.

Although I like the calculator so far, I paid $75 on E-Bay and I'm thinking that may have been too much. I'll probably end up using it less than my Brazilian HP-12C but more than my HP-18C.

Britt

Hm. That sounds familiar.

Re: HP-17BII+

*Message #11 Posted by **tony** on 29 Aug 2003, 2:25 a.m.,*
in response to message #3 by chi

Try an equation like

L(A:1)-B

If it stops on the "L" we sure have a big problem with the 17BII+ - I wonder if they couldn't re-use the 17BII code?

Re: HP-17BII+

*Message #12 Posted by **chi** on 29 Aug 2003, 10:17 a.m.,*
in response to message #11 by tony

It stops at A.

Re: HP-17BII+

*Message #13 Posted by **tony** on 29 Aug 2003, 4:13 p.m.,*
in response to message #12 by chi

oh that is like my 18C - it stops with the cursor on the (before the A and says "INVALID FORMULA". The only work around is to solve for each otherwise local variable with a string of IF(S(D1):... or to make the equation much longer with lots of repeated stuff. if you use the BS from the hp website then you can get away with solving for D5. For the shortest formula you need to solve for D5,D6,D1,D2 - then CALLV, then PUTV. Still quite workable. But if L(.) and G(.) don't work it's like the old 17B and 18C.

Re: HP-17BII+

*Message #14 Posted by **tony** on 29 Aug 2003, 5:44 p.m.,*
in response to message #3 by chi

```
Chi the BS equation below doesn't use L(.) or G(.)
- so, it may be a work-around for you.
It uses the same notation as the HP 17BII Black-Scholes equation
available from their web site at:
```

http://www.hp.com/cposupport/mobile_computing/support_doc/bpia5179.html

```
It is twice as accurate as the HP 17BII Black-Scholes equation
and 15% shorter to code.

First page:   PS PE RF% T S    MORE
Second page:  D1 F1 D2 F2 CALL MORE
Last page:    PUTV             MORE

Input first page variables.
Solve for D1,F1,D2,F2 and CALLV in order.
Then MORE PUTV to solve for PUTV.

So, the cost of not having L(.) and G(.) is that we now have 4
extra variables to solve for manually, before solving for
CALLV.

I have separated the lines below just to make it easier to
follow.
```

```
BS:0*(PS+PE+RF%+T+S)+
IF(S(D1):D1-(LN(PS/PE)+(RF%/100+S^2/2)*T)/S/SQRT(T):
IF(S(F1):F1-1/(1+ABS(D1)/3.006):
IF(S(D2):D2-D1+S*SQRT(T):
IF(S(F2):F2-1/(1+ABS(D2)/3.006):
IF(S(CALLV):CALLV-PS*ABS(IF(D1<0;0;-1)+
EXP(-D1^2/2)*F1*((187*F1-24)*F1+87)/500)
+PE*EXP(-RF%*T/100)*ABS(IF(D2<0:0:-1)+
EXP(-D2^2/2)*F2*((187*F2-24)*F2+87)/500):
PUTV-CALLV+PS-PE*EXP(-RF%*T/100))))))

This is also based on the UTPN approximation in my article in
HPCC (www.hpcc.org) DataFile V22N3 pages 13-21.

Cheers,
Tony
```

Re: HP-17BII+

*Message #15 Posted by **tony** on 31 Aug 2003, 6:38 p.m.,*
in response to message #14 by tony

warning: on the 17BII+ it seems my B-S equation work-around needs extra brackets - the exp(-D1^2/2) needs (D1^2) and also a (D2^2) is required. This is the first HP solver I have seen that doesn't follow the usual precedence for an exponent.

41CV turns off after 30 seconds

*Message #1 Posted by **Matt Kernal (US)** on 25 Aug 2003, 6:09 p.m.*

I picked up a good condition 41CV at a thrift store the other day (paid less than $1)! It has very slight indications of minor battery leakage, but no corrosion damage.

I took the N-cell batteries out of another 41 (which works perfectly BTW), and inserted them into the "new" 41CV. Everything seemed to worked great on the new one, but it shut off after 30 seconds of no activity.

Any thoughts/ideas about having it to stay on longer? I didn't think the shut-off time was programmable (I could be wrong, I don't have my manuals handy).

Thanks, Matt

Re: 41CV turns off after 30 seconds

*Message #2 Posted by **David Smith** on 25 Aug 2003, 6:44 p.m.,*
in response to message #1 by Matt Kernal (US)

Open it up and clean the circuit board, back of the display, connections, and keyboard with 91%+ isopropyl alcohol. Keep the alcohol off of the display window. It will leave a white stain.

If this does not work, there is a capacitor on the CPU card that controls the timeout system (actually the LCD module does the work). The HP41 service manual is on the HPMUSEUM CDROMS.

Re:42 repair -->alcohol damage to display lens

*Message #3 Posted by **Katie** on 25 Aug 2003, 7:31 p.m.,*
in response to message #2 by David Smith

If you do accidentally get isopropyl alcohol on the display window and it clouds it up, it can easily be removed using Novus Plastic Polish. Use their #2 to clean off light scratches and the #1 to polish with. #3 is too harsh for most circumstances. The best prices on this stuff seem to be from tanning supply companies (of all places!) like: http://www.tanforless.com/tansup.html

Re:42 repair -->alcohol damage to display lens

*Message #4 Posted by **Grant Goodes** on 26 Aug 2003, 10:46 a.m.,*
in response to message #3 by Katie

I concur that Novus is easily one of the best plastic polishes out there, and that #2 is the most useful. It has a very gentle abrasive, as well as cleaning compounds, and will remove ground-in dirt, restoring plastics to their original luster and colour. I use it for pinball restoration, and have sucessfully used it on the plastic cases of HP instruments that had yellowing due to age/dirt and possibly tobacco.

You can apparently find it in most Harley dealerships, and some box-stores. Us pinball types buy it in large jugs from pinball parts dealers.

grant..

Re: 41CV turns off after 30 seconds

*Message #5 Posted by **Daniel Diggelmann** on 25 Aug 2003, 6:45 p.m.,*
in response to message #1 by Matt Kernal (US)

Hi Matt,

I have experience the same problem on a fullnut HP-41CV. I actually was a bad contact between the CPU board and mainboard. After cleaning the contact with ISOPROPYL Alcohol the calculator switched off after the usual ~10 minutes. The reason for this is that the shut off timer is part of the display assembly and not of the CPU assembly.

Good luck Daniel

Thanks for the advice... I'll try it. (NT)

Buying a Used HP

*Message #1 Posted by **Dave** on 25 Aug 2003, 5:21 p.m.*

I have an HP 15C that I've owned for twenty years and I really like it. I would like to buy a used HP to use exclusively at work, but I'm not sure which model to buy. (I work as an EE). I like the 15C, but they are ridiculously expensive, so I've been looking at the 28C or 48G because they can be purchased at reasonable prices. Of these two choices, which would you recommend for general-purpose usage?

Dave

Re: Buying a Used HP

*Message #2 Posted by **Raymond Del Tondo** on 25 Aug 2003, 5:44 p.m.,*
in response to message #1 by Dave

I'd take an 48G, if you don't plan to carry it around too often. Nearly all attributes of the 48G are larger/bigger/better than in the 28C: Display, RAM, speed, connectivity, and form factor.

The operating system is far more advanced, there is MUCH more software available for the HP-48 series, and one of the most important points is the ability to exchange data between the 48G and other machines, like a PC or other HP-48.

The only advantages of an HP-28 are their smaller form factor when folded, and the separate ALPHA keyboard.

From my current point of view, I'd never buy a clamshell (HP-28, etc) machine again, at least not for real usage.

From usability views, I'd suggest an 32S, 32SII, or even 42S.

Regards,

Raymond

Re: Buying a Used HP

*Message #3 Posted by **Jeroen** on 25 Aug 2003, 6:07 p.m.,*
in response to message #1 by Dave

I'd buy a 48G instead of a 28C (I own both a 48G and a 28S), at least if you're sure you don't need more than 32K (otherwise, buy a 48G+ or a 48GX).

The 48G: - has a better display - has more memory and functions - is easier to use in one hand than the clamshell model of the 28C - has a cable link

The 28C is slightly better for alpha entry and has a less cluttered keyboard.

Jeroen

Re: Buying a Used HP

*Message #4 Posted by **David Smith** on 25 Aug 2003, 6:45 p.m.,*
in response to message #1 by Dave

You get what you pay for... the old machines are expensive for a good reason.

Re: Buying a Used HP

*Message #5 Posted by **christof (NoVA US)** on 25 Aug 2003, 7:22 p.m.,*
in response to message #1 by Dave

except for collecting, I see no reason at all to gt a 28C. Of course, I tend to muck around and fill my machines up with more than 2k of programs, data, and working needs.

the 28S is a fine fine fine machine, on the other hand :)

The 48g is probably your best bet, though- unless you want the pleasure of the alpha keyboard (I personally love it). A new in box 48g can be had for under $60 quite handily.

while the 42S appeals to me slightly, more, you can pretty handily get a pair of 48Gs for half the price, and use them to back each other up.

You may also want to look at a 48S. they don't come up as often, but tend to be drit cheap when they do. My work desktop calc is a 48S I got for a $8 bid on ebay a while back :)

Re: Buying a Used HP

*Message #6 Posted by **Paul Brogger** on 25 Aug 2003, 8:21 p.m.,*
in response to message #1 by Dave

I think the 28C/S keyboards have a bit more of the Woodstock, Spice, etc "classic feel" to them than do the 48G keyboards.

The 28C/S is much less sturdy -- if you plan to squeeze or drop it, you'll rather want a 48 (given the choice offered).

The 28C/S battery compartment door is legendary for being very badly designed, and very toublesome in use. If you get one, try to make sure the battery compartment is in near-mint condition, and be VERY careful when changing batteries yourself.

The 28S, with 32K, is preferable to the 28C if you're going to store anything at all. (The 28C, with 30K fewer bytes, is, however, lighter. ;^))

As noted elsewhere, the 28C/S keyboard is less cluttered.

All in all, I'd take a 28C/S over a 48G -- it has more personality and a better feel. But if ruggedness or PC connectivity are significant, go for the 48G.

You really shouldn't be disappointed either way. (You might try to find both!) They won't compare to your trusty 15C, but they are good, usable RPN (or should I say, RPL) machines.

in response to message #6 by Paul Brogger

IMO, while the 28 series may have a great alpha keyboard, it stinks as a general purpose scientific. Just try to find logs or 10^X without going through a menu pick. Doooaahh as Homer would say. At least the 48 series did that right.

Much too painful for me. I guess I shut down when the concept of X<>Y turned into a shifted function, aka swap, it was time for me to go...

Re: Buying a Used HP

in response to message #1 by Dave

Having used the HP-15C, be prepared for a culture shock when moving to a 28C/S or a 48. The reason is that the new machines have RPL. This means that the stack is no longer 4 deep (can be as big as there is memory), and that some things behave differently.

Personally I hate it. I hated my 28C and I hate my 48SX and 48GX.

On machines like the 15C everything is up there on the keyboard. On the RPL machines you have to go down various menus till you hit the function you want.

Having said that, I think that a more recent machine (like the 48) is a better choice because of the larger screen and generally decent quality.

in response to message #8 by Vassilis Prevelakis

The HP 48 series has the USER Mode: a redefinable keyboard. They also have the serial link for PC and even a bi-directional Sir to exhange data between two 48 without cables. The HP 28C model had memory only on it's display drivers and that is around 2K free, which is not enough for anything. Also DEFining new user functions was restricted to algebraic syntax only. Minus (not plus) there was no decent file structure system with subfolders. It's more like the stupid TI 89 in that respect. (it get's not much respect from me [pun intended]). The lack of Input other than keyboard in the 28 series makes it more of a calculator than a real computer. I'd rather buy the new hp 49g+. It has SD card, real IrDA, USB, CAS software and a lot of other goodies, plus the speed! VPN

*Message #10 Posted by **Victor Koechli** on 27 Aug 2003, 3:02 a.m.,*
in response to message #8 by Vassilis Prevelakis

That could be good news for me: If you hate your 48's, you could just as well give them to me :-))). I actually love them!

Seriuosly: The large display is fantastic. Seeing multiple stack levels is very convenient, even if you just use it to crunch numbers. And with a stack replacement program like HPSauce (on the 48G/G+/GX, anyway), you'll always know how many stack levels you are using at the moment.

I agree, however, that the lack of simple LastX is nasty...

Cheers, Victor

in response to message #10 by Victor Koechli

With Vectored ENTER and/or some other tricks, you can program the old LASTX behaviour to your 48/49 calculator. You may also do something like unlimited undo, etc. OR You could limit your stack size and duplicate the T-reg behavior. VPN

Re: LastX for HP-48

*Message #12 Posted by **Victor Koechli** on 27 Aug 2003, 7:39 a.m.,*
in response to message #11 by Veli-Pekka Nousiainen

Actually, it's not so difficult to do:

```
<< DEPTH -> d
  << LASTARG DEPTH d - ROLLD
  LASTARG 1. - DROPN >>  >>
```

Although it has one major flaw: It works only once, the next time it will return the number of dropped stack entries from DROPN, and subsequent executions will always return zero. I have yet to find a way to store the original LASTARG contents back into LASTARG before the program ends. If anyone knew of a possibility...

And if anyone could tell me how to increase the CMD-Stack. Type a few numbers, and gone is the last command you entered. 4 Levels is simply not enough.

Cheers, Victor

in response to message #13 by Werner Huysegoms

Victor and Werner,

Thanks soooo much for your simple post! This is completely cool! Here I thought I was going to *need* the hp41 emulator running on the 48 in order to get this to happen.

(See my recent post:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=41322

Why didn't I think of writing a program myself?! It is so simple, elegant, and so far, seems absolutely robust to me.

Awsome!

Best regards,

Bill Platt

? what's wrong with ... LASTARG, then ?

Werner

Re: LastX for HP-48

*Message #18 Posted by **James M. Prange** on 1 Sept 2003, 6:45 a.m.,*
in response to message #12 by Victor Koechli

My program for this on the 48 series and 49G is:

```
\<<
  DEPTH \-> d
  \<<
    LASTARG DEPTH d -
    IF
      DUP
    THEN
      DUP2 2. + ROLLD DROPN
    END
    DUP DROP
  \>>
\>>
```

If you change the command LASTARG in the above to LAST, then it will also work in the 28 series.

If last arguments is disabled (flag -55 set in a 48 or 49G, or flag 31 clear in a 28), then the program errors out.

In the event that the last arguments buffer is empty, then the program returns the real number 0 to the stack and puts it in the last arguments buffer.

Regards,
James

Re: Buying a Used HP

*Message #19 Posted by **Ron Ross** on 26 Aug 2003, 7:43 a.m.,*
in response to message #1 by Dave

Buy the 48. It is much tougher and has a better keyboard layout for number crunching compared to a 28. If you still fancy a 28, skip the 28c and buy a 28s, 2K ram is veeery little on the 28c. The 48G with 32K RAM isn't much, but with a cable, you could download 2-3 really good programs (lite versions) and have room for serveral of your own. Check out www.hpcalc.org to see what I am talking about.

This resource alone actually makes it worth considering an Hp48G+ or Hp48GX (both have 128K RAM, the GX can be expanded to 3.5 Meg).

My first Hp was a 15c (which is still my favorite), but I wouldn't leave it at work. A 48? Who cares? (I am not quite that flipiant). But the 28/48's do have many feature you will really appreciate. Just look at the programs from www.hpcalc.org .

Re: Buying a Used HP

*Message #20 Posted by **dave** on 26 Aug 2003, 3:41 p.m.,*
in response to message #19 by Ron Ross

Thanks to all for the great suggestions. I am leaning towards the 48 and probably the cheapo G model. I don't typically use the calculator for anything complicated (i.e. running a program), but I would like some of the advanced functionality (i.e. complex math, matrix math, etc.) and RPN computations. I'm so accustomed to RPN entry that it's hard to explain. It's so logical. I bought a TI-36 solar calculator a few years ago to provide a backup and travel calculator (I travel a lot for work), but I hate using it. It's not a bad little calculator for the money, but I really would like to have another HP. I'd love to run across a

$1.50 HP-15C at a garage sale somewhere. :) Thanks again...

Cheapo RPN Scientific: No Such Animal

*Message #21 Posted by **Patrick** on 26 Aug 2003, 5:19 p.m.,*
in response to message #20 by dave

You know, even if you do come across a 15C for $1.50 at a garage sale, its not like you think of it as a cheap calculator once you have it. No matter what you paid for it, you know you could get a bunch of money for it if you sold it, and that's what drives your behaviour in how you use it.

I know, I have an HP-10C that I got for $20, but do you think I leave that baby hanging around unguarded on my desk or toss it non-chalantly into my briefcase at the end of the day? Not a chance. It is pampered every bit as much as if I had paid $150 for it.

The only solution to this is for there to be a cheap RPN that is simultaneously cheap and easy to replace.

Re: Cheapo RPN Scientific: No Such Animal

*Message #22 Posted by **Bill (Smithville, NJ)** on 26 Aug 2003, 8:18 p.m.,*
in response to message #21 by Patrick

Come on, people. It's just a calculator. I have my HP-11C, 15C, and 41CV laying around at work. They are MEANT TO BE USED!!!! I enjoy taking a different HP calculator to work every few days. But the HP-11C, 15C and 41CV stay at work, as well as another HP-11C that stays in my briefcase. I plan to pick up another 42S to keep at work also.

If we don't use them on a daily basis, how can we expect HP to make a quality replacement that we'd all love to use????

HP will NEVER make a calculator that we think they should make as long as we are only willing to collect them, admire them and put them on a pedastal. We have to be willing to USE them!!

HP is not in the business of making collectable calculators, but are in the business of making calculators that will be bought and used - no matter what we, as colletors, think.

I don't care how much I can get for my calculators - I carry them with me, I use them, and ... YES ... I will be sorry if they get stolen, but I will have used them for what they were intended for - TO CALCULATE!!

Sorry for the RANT, but I really love to calculate with them, and think we too often forget what they were designed for.

*Message #23 Posted by **Patrick** on 27 Aug 2003, 3:53 a.m.,*
in response to message #22 by Bill (Smithville, NJ)

I don't remember saying anything about not using them? At work I have an HP-11C, an HP-12C, an HP-15C, an HP-42S, and an HP-48G. In my briefcase is another HP-11C and sometimes other ones.

While I *use* these wonderful machines, my point was that I don't *abuse* them, even when the purchase price was relatively small. I value them in spite of their original cost.

Re: Cheapo RPN Scientific: No Such Animal

*Message #24 Posted by **Bill (Smithville, NJ)** on 27 Aug 2003, 11:29 a.m.,*
in response to message #23 by Patrick

Patrick, Sorry - didn't mean to go off the way I did. I'm sure the majority of us do use their calculators. I just wanted to point out that the true value is in the using, not what it would sale for on e-bay.

After re-reading my previous post, I guess I must of had a bee up my bonnet when I wrote it... :)

NP!

*Message #25 Posted by **Patrick** on 27 Aug 2003, 2:20 p.m.,*
in response to message #24 by Bill (Smithville, NJ)

Hey, no problem, Bill. One of the attractions of this place for me is the passion people have about this topic.

At the end of the day, we seem to be in violent agreement: my main enjoyment is in using (specifically, programming) these wonderful devices. That is not to say that I don't also have a few rather minty devices that I keep tucked away for the occasional fondling session. Nevertheless, if I only had one sample of a particular type of machine, I would use it (carefully), even if it was mint! What's the point of a mint machine if it doesn't get used? Might as well have a picture of it instead.

PE exams, calculators, NCEES - PLEASE READ!!

*Message #1 Posted by **John Cadick** on 25 Aug 2003, 3:49 p.m.*

Hey all:

I have been in contact with the executive director of the Texas State Board of Registration - Victoria Hsu. (I live in Texas and am a registered PE here.) She tells me that the calculator issue was very contentious in the last general meeting. Originally the NCEES proposed to allow only certain calculators to be used. Eventually that was voted down and, according to the Exec Dir. they voted to disallow only communications devices like cell phones and pagers. She is of the opinion that NCEES acted beyond what the vote allowed.

The Texas Board is putting together a letter of protest to NCEES. Ms.Hsu does not believe that the calc communications issue is a real one; however, she would like to have some technical expertise to back her up. Key issues might include:

1. Short range of IR capabilities 2. Incredibly slow input of text. (No stealing questions) 3. Inability to comm with anything other than their own brand.

And so on. If some of you would be willing to lend your expertise to these issues, I would be glad to act as a clearing house to get the information out to her. I will also be calling the other state boards where I am registered which include Michigan, Indiana, and Louisiana.

John

Re: PE exams, calculators, NCEES - PLEASE READ!!

*Message #2 Posted by **christof (NoVA US)** on 25 Aug 2003, 5:05 p.m.,*
in response to message #1 by John Cadick

I'm not sure, but wasn't the IR removed on the 49G anyway?

Note that some RPL machines notably lack IR input (28 series).

Re: PE exams, calculators, NCEES - PLEASE READ!!

*Message #3 Posted by **John Cadick** on 25 Aug 2003, 8:08 p.m.,*
in response to message #2 by christof (NoVA US)

The IR was removed; however, the 49 is banned on the basis that the 49 has text editing. I believe they are concerned that someone might copy down questions and take them out. ???

Re: PE exams, calculators, NCEES - PLEASE READ!!

*Message #4 Posted by **Tom (UK)** on 26 Aug 2003, 7:33 a.m.,*
in response to message #3 by John Cadick

I thought they did not like text storage because it would allow students to take notes into exams and

'cheat' (perhaps you are talking about exams where notes CAN be taken in?)

Also in the exams I have taken in the UK the exam papers are usually available after the exam for revision for next year. Do you have access to past papers in the US?

At most schools and university exams calculators that can store text are not allowed. At Sheffield Uni the HP32 is banned, see their page at: http://www.shef.ac.uk/ssid/admin/calculator/

Avid readers may like to note that the HP42S IS approved - I think because letters are not printed on the keyboard (unlike the '32) they thought it couldn't store text!

Re: PE exams, calculators, NCEES - PLEASE READ!!

*Message #5 Posted by **John Cadick** on 26 Aug 2003, 8:58 a.m.,*
in response to message #4 by Tom (UK)

Thanks for your reply Tom. Our PE exam is a 16 hour examination. The first 8 hours is a fundamentals of engineering (FE) exam and is usually taken by recent graduates or, in some cases, by undergraduates in their last year. Currently, the FE exam is a "references provided" exam and participants are not allowed reference materials. I suppose that something like the equation library in the 48GX or the 49G could be a problem.

The second 8 hours is the professional portion (PE). This is usually taken by engineers who have been in practice for some time. The actual requirements vary with the level of education obtained; however, most with undergraduate degrees have to wait four years. In this test the participant is allowed to take as many reference books in as he/she can lug.

The NCEES ban applies to both portions of the exam.

John

Eigenvalues on 42S?

*Message #1 Posted by **Steven Soto** on 25 Aug 2003, 2:11 p.m.*

Does anyone know how to find all of the eigenvalues for a 3x3 matrix on a 42s? I know you can find ONE using the solver, but I'd like to be able to find all three, like on a 48g. Can this be done with "standard" matrix operations like inverse, determinant, etc.?

Re: Eigenvalues on 42S?

*Message #2 Posted by **Patrick** on 25 Aug 2003, 2:49 p.m.,*
in response to message #1 by Steven Soto

I can't think of a direct method.

Since you are only interested in a 3x3 (not nxn) you could go back to first principles. Take an arbitrary 3x3 matrix, A =[a_{ij}], and expand the expression det(A-xI) as a cubic polynomial in x. The roots of this cubic are, of course, the eigenvalues. The coefficients of the cubic should be readily expressible in terms of determinants of various sub-matrices of A (you could probably even find this written out explicitly in a beginner's book on eigenvectors).

Write a program which computes the cubic's coefficients using the sub-matrix and determinant capabilities of the 42s, then feed the resulting cubic into the solver.

Re: Eigenvalues on 42S?

*Message #3 Posted by **Steven Soto** on 25 Aug 2003, 3:12 p.m.,*
in response to message #2 by Patrick

Exactly my problem. I already knew I could get one from the solver: I want to know how to get all three. I guess I'll have to manually factor out the one result from the solver and then put the remaining result into the quadratic equation. Any ideas on how to write a program to do this that will simply output three values?

Too late in Hungary

*Message #4 Posted by **Tizedes Csaba** on 25 Aug 2003, 5:03 p.m.,*
in response to message #3 by Steven Soto

Hi Steven!

If you can wait to next day, I will help you. Too late here, and the PC's keyboard is clicking, and my girlfriend not like that in the night.

I haven't got 42S, I'll write a little program for 32SII, what can solve ANY REAL roots of an equation. (I'm hoping... :))

A part of it is ready to run, the solver part I'll make tomorrow morning...!

Good night! Csaba

Algorithm

*Message #5 Posted by **Patrick** on 25 Aug 2003, 7:52 p.m.,*
in response to message #3 by Steven Soto

The cubic equation

$p(x) = \det(A-xI) = c_3x^3 + c_2x^2 + c_1x + c_0$

has the following coefficients:

$c_0 = \det(A)$

c_1 = -(sum of all 2x2 determinants obtained by deleting the same row and column from A)
$= -((a_{11}a_{22} - a_{12}a_{21}) + (a_{11}a_{33} - a_{13}a_{31}) + (a_{22}a_{33} - a_{23}a_{32}))$

c_2 = sum of all 1x1 determinants obtained by deleting the same two rows and columns from A
$= a_{11} + a_{22} + a_{33}$

$c_3 = -1$

Now, if a cubic, p(x), has 3 real roots, then they occur between successive extrema of the cubic. If the extrema are located at $x=x_1$ and $x=x_2$, with $x_1 < x_2$, then the roots of the cubic are in the three ranges:

(-inf, x_1)
(x_1, x_2)
(x_2, +inf)

You can compute x_1 and x_2 as the roots of a quadratic:

$p'(x) = 3c_3x^2 + 2c_2x + c_1$

Once you have these roots, you can feed the ranges above into the solver as guesses. Of course, you'd have to do something intelligent in place of the infinities.

Nth order solver

*Message #6 Posted by **Tizedes Csaba** on 26 Aug 2003, 5:26 a.m.,*
in response to message #3 by Steven Soto

Hi Steven,

this is a solution for your problem. This program can solve polinom-equations ANY of order (limited by mem). It's not too long, only 92 byte ;). It work fast with built-in solver, and use Horner-method:

Only one problem with it, it's solve JUST REAL ROOTS... But in the real problems, like mechanical stress calculations, the roots are reals.

This is the HP32SII version:

```
E01 LBL E        #prepare of 'i'
    FIX 3
    RCL N
```

```
    1
    add
    1E3
    div
    1
    add
    RND
    STO i
    0
E13 RTN

P01 LBL P        #the 'dinamical polynom'
    XEQ E
H01 LBL H          #Horner's method
    RCL mul X
    RCL add (i)
    ISG i
    GTO H
H06 RTN

X01 LBL X        #polynom solver
    SOLVE X
    GTO R          #if found root goto 'R'
    SF 0           #no real root, set flag 0
X05 RTN

D01 LBL D        #decrement polynom order,
    XEQ E
J01 LBL J          #use a little modified Horner method
    RCL mul X
    RCL add (i)
    STO (i)        #overwrite coefficients
    ISG i          #with decremented polyn.'s coefficients
    GTO J
J07 GTO X

S01 LBL S        #start-routine
    CF 0
    CF 1
    INPUT N
S05 XEQ E
I01 LBL I         #coefficient input-routine
    INPUT (i)
    ISG i
    GTO I
    FN= P
I06 GTO X

R01 LBL R       #we found a root
    VIEW X
    1
    STO sub N
    VIEW N       #number of roots, what we dont found yet
    RCL N
    x<>0?        #more root?
    GTO D        #go decrement order, and solve again
    SF 1         #no more root, and all was REAL: set flag 1
R10 RTN

'add', 'sub', 'mul' and 'div' mean 'add', 'substract', 'multiply' and 'divide' in
this order.

The checksums:

E:CK=0BE8 27.5 byte
P:CK=E452  3.0 byte
H:CK=3E78  9.0 byte
X:CK=3894  7.5 byte
D:CK=11DF  3.0 byte
J:CK=C765 10.5 byte
```

```
S:CK=BB8E  7.5 byte
I:CK=32B5  9.0 byte
R:CK=E775 15.0 byte

An example:

solve this polynom with this program:

-2*x^6 -6*x^5 +82*x^4 +174*x^3 -800*x^2 -888*x +1440 =0

 A*X^6  +B*X^5 +C*X^4   +D*X^3   +E*X^2   +F*X    +G=0

In the program the coefficients are A, B, C, ... The limit of order N=12, because
the 14th variable is N, and we use this variable for the order of solved polynom. If
you replace it with Z, you can solve the 24th order of polynomials. And it's not a
joke...

Now, start the program: [XEQ S] the calc prompting for order of polynom:

N? type 6 [R/S].

Then the program prompts for all of coefficients, type it in decrease order:

A? -2 [R/S]
B? -6 [R/S]
C? 82 [R/S]
D? 174 [R/S]
E? -800 [R/S]
F? -888 [R/S]
G? 1440 [R/S]

Then you will see the 'RUNNING/SOLVING' message, and the program stops with one of
six roots: for example X=1. Press [R/S], and you'll see N=5 this mean, the polynom's
got 5 root yet. Press [R/S] and repeat this method until all of roots founded.

When N=0 press [R/S], the 'flag1' anunciator set and program end. 'flag1' set mean,
all of roots was real.

This polynom got 6 real roots: 1, -2, 3, -4, 5, -6, and the simplyfied form is: -
2*(x-1)*(x+2)*(x-3)*(x+4)*(x-5)*(x+6)
```

I hope it help to you and anybody, who want to solve polynomials. The roots are 'more exacts' if the round off error is not a very big.

Csaba

Re: Nth order solver

Tizedes,

Thanks. Very helpful and useful. I'm still amazed by the power of the pioneer series. I have used these calculators since 1988 starting with a 32s my freshman year in high school. I got a 42s as a

senior in high school, and I still use that calculator today. I have a spare that I have tested, and never used which sits in a hard case without batteries. I have used this calculator all through undergraduate school and graduate school while everyone else seemed to migrate to TI's, I have yet to find something that I cannot get my 42s to do that I need it to.

And yes, this eigenvalue problem was to solve three dimensional stress states.

Re: Eigenvalues on 42S?

*Message #9 Posted by **Valentin Albillo** on 26 Aug 2003, 10:57 a.m.,*
in response to message #1 by Steven Soto

If your matrix is symmetric (which is usually the case in many real-life engineering problems), the eigenvalues will all be real, and Jacobi's method will produce them all at once, to full precision. Jacobi's method uses 2x2 rotation matrices applied iteratively to any arbitrary symmetric NxN matrix, till it reduces it to a diagonal matrix. The eigenvalues are then precisely the diagonal elements, and the corresponding eigenvectors are produced as well as a side effect.

This algorithm is very straightforward, always converges without requiring any input from the user other than the NxN matrix itself, and converges very quickly, producing accurate results (great stability as well). Further, the transformation is made *in-place*, thus requiring a minimum amount of memory.

I wrote such a program for the barebones HP-41C, which should run unchanged, as is, in any HP42S. It was published in the PPC Journal, circa 1980 or so, a little search will find it. It is only 100+ program steps, so you can key it in effortlessly.

Else (or also), have a look at this excellent paper (PDF format):

Eigenvalues of a symmetric matrix: Jacobi's method

which includes a full, detailed description of the method, as well as a program listing.

Best regards from V.

the method is also coded for the 15c in the advanced functions handbook page 148.

however, i do like csaba's program as a good programmatic use of the solve feature.

something ive been doing recently is the same problem the other way around. ive been finding it much better to use an eigenvalue approach to polynomial roots rather than the reverse. you also get the complex roots a lot easier this way too.

Thanks for your interest re my "Eigenvalues for an NxN symmetrical matrix: The Jacobi Method" article and program for the barebones HP-41C .

I initially thought it was published in "PPC Journal", V7 or V8, but a cursory search in the PDF pages available online failed to locate it, which means it was published in "PPC Technical Notes" instead, which alas, has no online presence as far as I can tell.

If you've got the first 10 issues or so of "PPC Technical Notes" (circa 1980 or 1981), you'll find it there for sure.

I remember it was heavily optimized, took just 100+ steps or so (thus fitting in a single card, maybe even in just one side of a card), and could handle very large matrices as it made use of the fact that the matrix was symmetrical, so it only needed to store N*(N+1)/2 elements (i.e: only 120 elements for a 15x15 matrix) instead of N*N (i.e: 225 elements for said 15x15 matrix). The N eigenvalues were found all at once, simultaneously (not one by one), and very quickly.

Best regards from V.

49 blues

*Message #1 Posted by **Harry** on 25 Aug 2003, 6:32 a.m.*

Whenever I turn on the 49 it requires that I press the on button a few times in rapid succession. A splash screen pops up for a brief period that advertises something about being "Powered by the ---kernel" (I cant make out the whole name) and also I have to adjust the contrast each time.

Is there a way to turn the thing on by just pressing the on button only once and is it possible to store the contrast setting? Also what is the purpose of the splash screen?

Any help would be greatly appreciated.

Re: 49 blues...

*Message #2 Posted by **Raymond Del Tondo** on 25 Aug 2003, 9:30 a.m.,*
in response to message #1 by Harry

The splash screen has no real purpose. It's only a banner for the 'MDG MetaKernel', MDG meaning 'Maubert Development Group', AFAIK.

Since you see the splash screen, this means your machine does a warmstart. After a normal off-on cycle you don't see the splash.

Make sure you don't have a strange STARTUP program, which could set your contrast.

If you don't have valuable data in your machine, you could do a reset, pressing ON+A+F, then the NO softkey. For more details on this procedure, please consult your manual...

You should also check your installed ROM version. The current version is 1.97 (beta) or alike, but nearly all machines were shipped with older, unstable versions. If you have such an older version, you should urgently upgrade to the latest one. Again, please consult your manual...

If that isn't the cause, you could check if your calc is still under warranty. If yes, just return the thing to your dealer.

After all, it's just a 49G (sorry;-)

Raymond

ROM upgrade

48GX /SX Observation

*Message #1 Posted by **Ted** on 25 Aug 2003, 4:04 a.m.*

As a regular reader of this forum, I thought it might be interesting to 'report' on some actual users of HP calculators in practice: During a trip in Switzerland last week, I came across several people using HP 48 series machines in the world of engineering/fine mechanics. They were surprised at my interest in their HP's (all sitting next to their computers with CADCAM software), and I asked each one why they had a 48 next to their computers. Virtually all answered identically:

'I NEVER use the graphing capability'; 'The 48 is quicker and easier to use than the computer when dealing with formulas and requiring quick results'; 'Seeing the stack levels during computations is really handy and useful';

Not earth shattering news of course- but a slice of real 'HP' life in actual practice.

Low-resolution graphics

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 Aug 2003, 12:37 p.m.,*
in response to message #1 by Ted

Hi, Ted;

I agree with the fact that having a high-resolution graphics device in front of you, like a 1024×768 dots monitor with 16-bit per pixel, color images, with a graphics O.S. is far better than having a tinny 131×64 dots, 1 bit per pixel LCD screen.

BUT... if you want your high resolution device to produce high-resolution graphics, you'll need specific SW. And if you have only the HP48, you can do graphics without extra packages, almost everything you need is already there. Of course, if you need to see a curve or parts of a surface so you can have a general idea about it, then the HP48 will probably fit your needs. Otherwise...

For me,the best of all is that you can order a complete Memory Clear, dettach all libraries and you still have all graphics resources in an HP48/49. A computer, even most portables and palms, will ask for extra SW to be downloaded so you can achieve graphics. And you see, even when compared to a computer, some HP48 math resources, mostly symbolic, are hard to beat...

My 2¢.

Luiz (Brazil)

Calculators vs Adding Machines

*Message #1 Posted by **Katie** on 25 Aug 2003, 12:42 a.m.*

When talking about my calculator collection, I often get asked "what's the difference between a calculator and an adding machine?". It seems like a naive question and usually comes from people that don't much about calculators, but I've come to think that it's a good question that's not so easy to answer.

According to at least one dictionary an adding machine is:

> Quote:
>
> a machine capable of adding numbers and sometimes capable of performing the other arithmetic functions of subtraction, multiplication, and division: such machines are now obsolescent, having been replaced in most applications by electronic calculators.

Which is not particularly satisfying to my mind as it doesn't distinguish it from a calculator and implies that we would not encounter them often, yet modern business are filled with what people still call "adding machines".

I don't really have a good answer to this question, but I think it should be more along the lines of who the intended user of the machine is. To me, an adding machine is a calculating device intended to be used primarily by accountants. Along with this definition comes the usual adding machine entry logic, sort of half prefix/half postfix operators -- but not always. Early mechanical machines only added, some subtracted and still later ones did multiply and divide and even square root but they all used difference operator orders and they were/are all called adding machines.

So, what's the right definition?

Re: Calculators vs Adding Machines

*Message #2 Posted by **Vassilis Prevelakis** on 25 Aug 2003, 1:34 a.m.,*
in response to message #1 by Katie

I would have thought that an *adding machine* is a mechanical calculator.

So at one stage we had mechanical and electronic calculators, but as the former became obsolete, the term calculator evolved to imply electronic.

Of course people will come up with examples that blur the distinction, but like in the case of calculators vs computers there is no clear cut distinction.

E.g is an HP-34C a calculator or a computer? If you say a calculator, then what if I now replace its ROM so that I can enter machine code via the keypad. Now its a computer for sure.

If you insist on input/output devices, then consider an HP-97. This one has both. Is it a computer?

**vp

Re: Calculators vs Adding Machines

*Message #3 Posted by **Pieter Botha** on 25 Aug 2003, 2:17 a.m.,*
in response to message #2 by Vassilis Prevelakis

Interesting Issue. I've always wondered when a calculator crosses the "great divide" to become a computer.

Let's try to define what a computer should look like, then measure the HP-97 against those requirements:

(*) Input: Yes - Keyboard, Magnetic Cards

(*) Output: Yes - Display and hardcopy

(*) Processing: Yes - Maths primarily, I'd say too weak on strings :^)

(*) Programmability: Yes

(*) Decision making: Yes - Several conditional branchings

(*) Long-term storage: Yes - Magnetic Cards

Looks like, apart from scale (more is better), the Pentium 4 on my desk offers nothing that the HP-97 doesn't. Oh, sure, it can do fancy-schmancy graphics (windows etc), but that doesn't make it more of a computer. Or does it ?

Something like the TI-58, though, I would hesitate to call a "computer", simple because of the lack of off-line storage facilities, though it can produce hard copy with the optional printer. Guess that one straddles the line...

What do other people think ?

Cheers Pieter

Re: Calculators vs Adding Machines

*Message #4 Posted by **Katie** on 25 Aug 2003, 2:19 a.m.,*
in response to message #2 by Vassilis Prevelakis

To keep this discussion relevant to the HP world (and this forum), Dave has called the HP-10 an adding machine on this site:

> Quote:
>
> HP-10 Handheld Printing Adding Machine

So, it's not a moot point by any means nor does "adding machine" just refer to mechanical devices. There is a blur between computers and calculators, I agree and there is no doubt a blur between calculators and adding machines. But why do (we) experienced (very experienced in Dave's case) collectors call some devices calculators and others adding machines when they are similar in many ways (e.g., HP-10 and HP-19C).

Dave, how come you called the HP-10 an "adding machine". Did HP use that term in their advertising literature? In the manual they call it a "handheld printing calculator".

Re: Calculators vs Adding Machines

*Message #5 Posted by **Vassilis Prevelakis** on 25 Aug 2003, 6:38 a.m.,*
in response to message #4 by Katie

So should we call the HP-10 an adding machine?

Well if I was trying to sell a printing 4-function calculator to people used to buying adding machines, I'd sure call it an adding machine. It is *functionally equivalent* to a mechanical adding machine, so you might as well call it an adding machine.

Doesn't this discussion remind you of the horseless carriage?

I'd be tempted to say that 4-function non-RPN machines are adding machines, but Dave calls the HP-01 "The Hewlett-Packard Calculator Watch" so that one is not considered an adding machine.

So, since the 19C is a calculator, your (electronic) adding machine should be both brain-dead and print.

**vp

Re: Calculators vs Adding Machines

*Message #6 Posted by **Masao Kinoshita** on 25 Aug 2003, 10:44 a.m.,*
in response to message #5 by Vassilis Prevelakis

I believe the term calculator originally referred to somebody who performed calculations. Then there were adding machines and then electronic calculators.

Horseless carriage, automobile, car and ride all can mean the same thing.

Therefore, the first "personal computer" was an aid who performed computations for somebody, e.g., king or astronomer, a long long time ago. :-)

Re: Calculators vs Adding Machines

*Message #7 Posted by **Dave Hicks** on 25 Aug 2003, 1:05 p.m.,*
in response to message #4 by Katie

That's my attempt to capture the "essence" of the 10 and distinguish it from others on the front page in a short caption. It's not precise but I don't know what is. In the article I use "adding machine logic" but that's a term I invented. It seems that people who sold/sell these machines don't feel a need to label the logic system. They just evolved and everyone expects them to be as they are.

The HP10 is called an adding machine. (?)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 25 Aug 2003, 2:17 a.m.,*
in response to message #1 by Katie

Hi, folks;

this was extracted form the MoHPC page dedicated to the HP10:

> Quote:
>
> The HP-10 was modeled after a standard desktop "10 Key" adding machine. Adding machines use their own style of logic. To add numbers on an adding machine, the user clears the machine (either by an explicit clear command or a previous total command,) enters the first number, presses the + key which adds it to zero, enters the second number and presses + again to add it to the previous result. For adding and subtracting, an adding machine is much like RPN, except that the first number is added to zero rather than Entered.

And about being a calculator or a computer, it has a printing device. Is it a unique adding/calculator/computer machine in one single package?

I agree with Katie that there is a lack of definition for adding machines, and I also have my belief, like Vassilis posted, that it is supposed to be a mechanical device as well, but if we take the word "adding" as it is, then addition is what every computer does when performing any arithmetic operation, exception made to inverting (NOT) a number or comparing it (XOR). Before any complains, I know NOT and XOR are logical operations and should not be considered in this case, but logical operations are the heart of a classical computer and I thought I should mention them.

Babbage developed and created the difference machine; was it an adding machine as well? Based on operands and reasoning over the answer, it may perform additon, too.

Another point: should an adding machine be considered as an analog-based device, while calculators should be considered as digital machines? This way, ENIAC was an electronic version of an adding machine. Or not?

No answers from me, I know. Anyway, "add" my name to the list: I'm curious and I'll wait for a reasonable answer.

Thanks.

Luiz (Brazil)

Addign Machine -- Calculator

*Message #9 Posted by **Randy Smith** on 25 Aug 2003, 4:49 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

To me the difference between the two is in the output. I call it an adding machine if it has only a printed output and no display of the answer on the machine. It is a calculator if there is an output of the answer on the machine itself exclusive of having the answer on a paper tape.

Re: Calculators vs Adding Machines

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Aug 2003, 9:04 a.m.,*
in response to message #1 by Katie

Just my $ 0.02:

Adding machine:

Main function is add-subtract, perhaps with some kind of memory for totals. It may have multiplication and division functions, but they look as later "additions" (pun intended), usually not well integrated with the main function. Paper tape output is convenient to check both results and sequence (completeness of input).

Computer:

User-programmable device, must have some kind of "open" Input/Output capability (i.e.: peripherals, RS232) AND the ability to process (at least) two types of data: numeric and character-based.

The HP41 qualifies (to increase its qualification, just add HP-IL), as the HP48, HP75, HP71 do.

The HP42S is not a computer, due to the lack of enough I/O capabilities and openness.

The HP 97 and TI 59 are "almost computers", the HP 97S just fall a little short of my yardstick to be considered a computer.

Calculator:

Specialized device, oriented to mathemathical, financial, statistics, computer science... calculations. May be programmable or not, the preprogrammed functions go from the basic four operations to much many and very complex ones. The HP42S and the HP15C are examples of calculators.

By the way, the HP01 watch can use the real time as a variable for calculations, which sets it far from an adding machine. MoHPC definition "In a class by itself" is the best I can think about.

Re: Calculators vs Adding Machines

*Message #11 Posted by **Paul Brogger** on 25 Aug 2003, 10:56 a.m.,*

in response to message #1 by Katie

Generally speaking . . .

Most of the things that I encounter in the thrift stores and that I call "adding machines" have a combined "plus-equals" key, and seem to be optimized for serial summation ("adding").

The things I call "calculators" have separate "plus" and "equals" keys.

. . . except, of course, for RPN calculators, which have separate "plus" and "enter" keys. (But then, I don't encounter *those* very often -- neither in thrift stores nor anywhere else!)

I don't suppose this is a *definition* so much as an *observation*, but it may point in some useful direction.

Re: Calculators vs Adding Machines

*Message #12 Posted by **Mark Glusker** on 25 Aug 2003, 11:08 a.m.,*
in response to message #1 by Katie

I think you have to go back fifty years to answer that question, when calculators were all mechanical.

There were rotary calculators, like the Friden STW in the MoHPC collection, that performed all four functions (+ - x ÷) and adding machines that performed addition and subtraction only. Rotary calculators had mechanical displays and adding machines usually had a paper tape.

After WWII, several manufacturers enhanced their adding machines to enable them to multply and divide, giving them the name "printing calculators" to distinguish them from adding machines. Articles from that era are clear about this distinction, because it was a big deal back then.

My definition is that a calculator can add, subtract, multiply and divide. An adding machine can only add and subtract. However, I have heard the term "adding machine" applied to anything that has a paper tape.

Here are the distinctions that I make

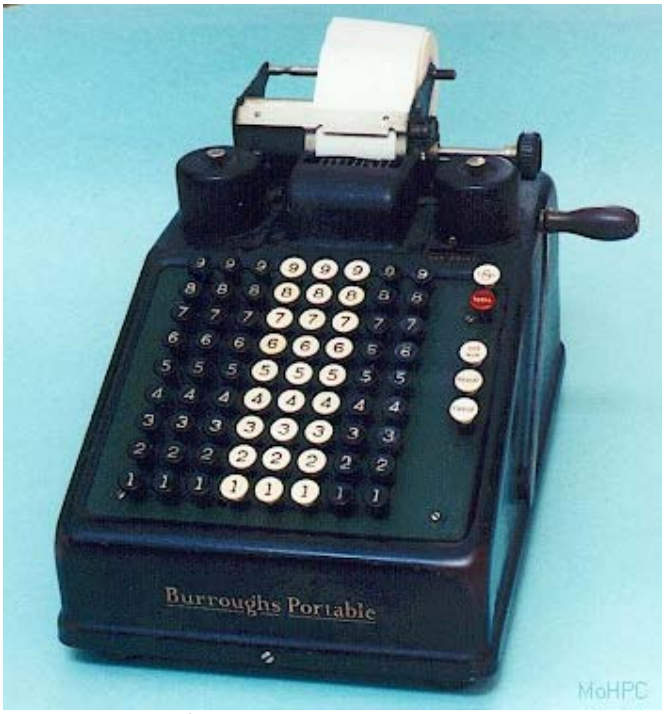
*Message #13 Posted by **Dave Hicks** on 25 Aug 2003, 12:30 p.m.,*
in response to message #1 by Katie

Machine vs. Electronic
This is pretty simple. Although many people will refer to computers as machines, I think you know the distinction I'm making here. Some machines are electrically driven though the logic is mechanical.

Adder vs. Calculator
This is a little more fuzzy but there are devices that make division and multiplication "easy" and those that don't. Mechanical calculators usually have a carriage that can be shifted. For example to multiply a number by the number 1024, you would enter the first number, then turn the crank 4 times, shift the carriage, turn twice, shift the carriage twice (skipping the zero) and then turn the crank once more. Electrically driven machines can do all this at the push of a button. Even the basic adding machine sometimes provides at least a *little* support for multiplication however. For example, you enter your number and press the repeat button down and pull the lever 3 times. Push the repeat button back and pull the lever again (number * 4 is now entered). Now enter the number times 10 and you can figure out the rest...

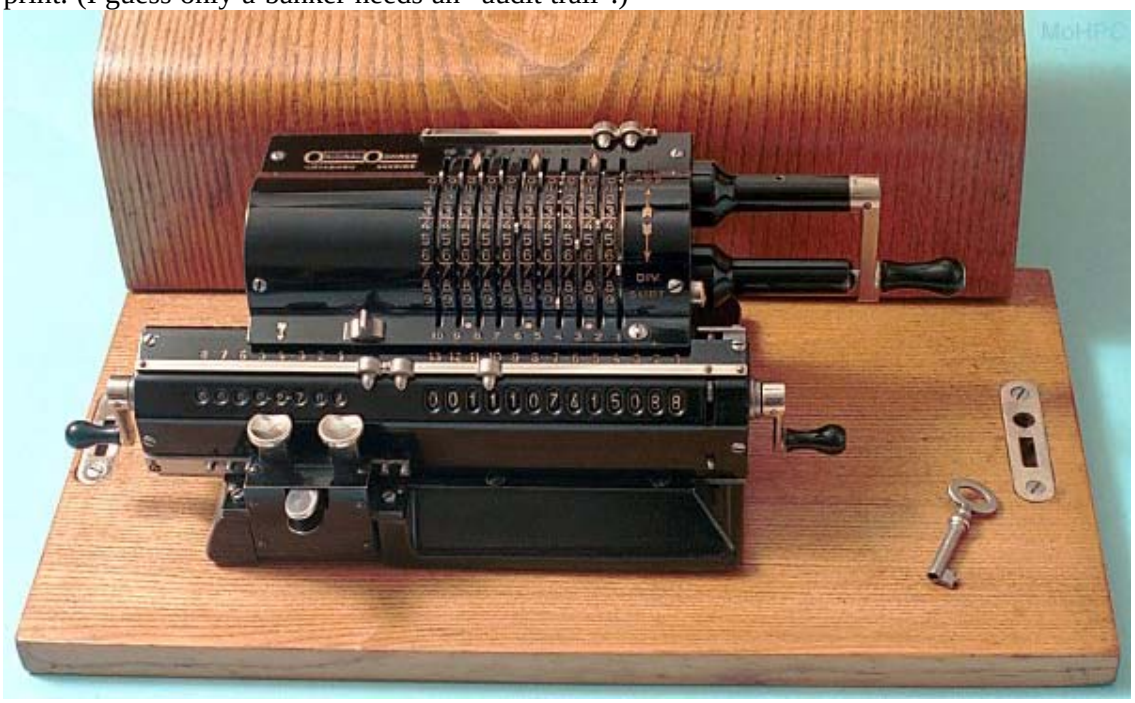
These distinctions form a 2x2 grid with the boxes being

Mechanical Adder (or Adding machine.)
There are many examples of these for example...



These devices frequently (but don't always) print.

Mechanical Calculator
There are many examples of these too but the general public is almost completely unaware. These devices usually don't print. (I guess only a banker needs an "audit trail".)



Electronic Adders.
While theoretically possible, I can't think of a good example. Because electronics are so cheap and calculator functions are now generally a matter of software, there seems to be little reason to leave multiply and divide out. Having said that, someone's probably got one for sale on ebay. Perhaps built into a ruler, keychain or a mouse ;-)

Electronic Calculators.
I'm sure you know what these are.

The above distinctions are different than the question of what logic system is used (though there's a lot of overlap in practice.) Most machines are essentially postfix with around two to three registers (not really a stack). One of the registers is frequently the keyboard or the key levers.

Electronic calculators come in Algebraic (a term covering many logic systems), RPN/L, and what I call "adding machine logic". The latter refers to electronic calculators for accountant-type functions. These calculators (usually with printers) do + and - in a postfix way (clear x + y +), * and / in an infx way (x * y =) and are usually now electronic though with a mechanical impact print head that produces more or less the same printout that adding machines have produced for centuries.

As for computers vs. calculators, I assert that almost all modern calculators are computers which are programmed to behave like calculators. This trend began when Busicom contracted Intel to build the chips for an early electronic calculator. Intel thought the design was too complex (27 different chips) and counter-proposed a 4 chip design (ROM chip, RAM chip, I/O chip and... the first microprocessor that would later be called the Intel 4004.)

Re: Does anyone remember the link to the "minimum calculator"?

*Message #14 Posted by **Paul Brogger** on 25 Aug 2003, 9:48 p.m.,*
in response to message #13 by Dave Hicks

I'm trying to chase down an example of **"Electronic Adder"** to complete the table implied by Dave's analysis (above).

It seems to me that, not too long ago, there was a discussion thread that devolved to a topic something like: "What is the minimum number of keys ever implemented in an electronic calculator?"

Someone posted a link to a checkbook-balance tracker that had VERY few keys -- maybe as few as fourteen. I remember something like plus, minus, clear and ten digits . . . Anyway, I've been searching the Forums for an hour and haven't found the post -- maybe someone remembers?

Re: Does anyone remember the link to the "minimum calculator"?

*Message #15 Posted by **Katie** on 25 Aug 2003, 10:28 p.m.,*
in response to message #14 by Paul Brogger

Here's the device that you're referring to, I think:

http://datamath.org/Related/Corvus/CheckMaster.htm

Not quite a calculator, not quite an adding machine either.

Edited: 25 Aug 2003, 10:30 p.m.

Thank you, Katie.

*Message #16 Posted by **Paul Brogger** on 26 Aug 2003, 1:06 a.m.,*
in response to message #15 by Katie

Yezzz, that's it.

I picked up a TI-2500 "Datamath" a few months ago -- four operations and no memory, but at least it could multiply & divide. Just recently got a Litronix "Checkmate 1700" -- same story.

But that Checkmaster thingy is about as simple as they can come.

Thanks for remembering!

Re: Does anyone remember the link to the "minimum calculator"?

*Message #17 Posted by **Victor Koechli** on 26 Aug 2003, 2:57 p.m.,*
in response to message #14 by Paul Brogger

Out of the buttons of my Nokia cell phone, only 13 are used to accomplish the four basic functions. Quite minimal, don't you think? Let's see if someone can come up with even fewer...

Cheers, Victor

Re: Calculators vs Adding Machines

*Message #18 Posted by **christof (NoVA US)** on 25 Aug 2003, 1:44 p.m.,*
in response to message #1 by Katie

I've been thinking about this off and on all day.

I think, growing up, that there are a few related differences-

Adding Machine was something my father use for accounting. paper tape, LED display, desktop, generally no carrying system. It stayed on a desk.

From the time my unlce started buying me cheap radio shack pocket calculators in the late 70s, 'calculator' meant a pocketable machine, sometimes with programming capability, almost always with 'special' functions (statistics, 'scientifics', and business were the distinctions I made then. many models had combinations of those)

When I first saw a desktop scientific, I knew it wasn't an adding machine- it was a calculator. I had not codified the differences at the time, but I knew.

Printing alone doesn't make an adding machine, nor does financial functions. Even the desktop form factor doesn't do it. All three together do, though.

regarding computers- I disagree that a computer must have rs-232 and/or a card reader to be a computer.

The HP42S is most defintiely a computer. It has all the requisite parts, and they all work quite well. Lest anyone forget- keyboard entry, videographic display, and printed paper output via IR *are* all forms of input or output.

It may be slower to recover your backups from printed paper than from a magnetic card, sure. That doesn't mean it doesn't exist as output.

I'm not arguing that the 42S wouldn't be better with serial IR bidirectional. If I could get my hands on a properly disassembled 42 ROM image, I'd be tracing code to help find a way to get a good serial IR addition. But that's not this thread :)

-Christof

Re: Calculators vs Adding Machines

*Message #19 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Aug 2003, 7:15 p.m.,*
in response to message #18 by christof (NoVA US)

The HP42S is perhaps the nicest machine I have (I like my 41C and my 25 too). Certainly it has some interface capabilities, but (in my humble opinion) it lacks some kind of OPEN I/O to be considered a computer.

RS232, USB, HP-IL, IrDA, SCSI, IEEE 488, an Ethernet port, a Compact Flash slot, etc., etc., are just some examples of OPEN I/O: a place where SOMEBODY else could connect an external device. The proprietary infrared stream HP uses for its printer (in my humble opinion) does not qualify as open enough.

Sure, there are forms we have discussed here to use these IR pulses, decode TONEs, and simulate keyboard operation to get some I/O, but I think that is not enough.

Again, it is just my opinion.

Re: Calculators vs Adding Machines

*Message #20 Posted by **christof (NoVA US)** on 25 Aug 2003, 7:26 p.m.,*
in response to message #19 by Andrés C. Rodríguez (Argentina)

I understand the need and importance of open standards. But I must say I disagree that an OPEN input/output system or lack thereof determines whether or not a device is a computer as opposed to a not-computer.

And i've worked on several other computers that lacked everything you mentioned :)

(how much more open you can get than english text on thermal paper, I don't know- HOw the data gets to the text isn't the important part. the printed output is.... output)

Trivial, perhaps. But I'm occasionally frightened by the One True Way approach to defining *all* computing using only *one* set of standards (OPEN)

Cheers- Christof

Re: Calculators vs Adding Machines

*Message #21 Posted by **Andrés C. Rodríguez (Argentina)** on 26 Aug 2003, 9:26 a.m.,*
in response to message #20 by christof (NoVA US)

Perhaps I hadn't found the proper way to express it in English, but I was not supporting any *one* set of standards. In fact I mentioned various interfacing methods, some more standarized (RS232, USB, IEEE

488), some more proprietary (HP-IL)...

I think (and that is just my opinion) that a computer is a general purpose, programmable digital device; and as such the ability to connect to external devices, even from other manufacturers, is an important feature. A proprietary I/O bus, well documented, may be enough. The user hands and eyes are not sufficient (in my humble opinion). Of course, there will always be "border" cases.

Again, I was just trying to suggest one criterium; and my intention was far from suggesting there is only *one* way to look at *all* things.

While I am surprised because of such unintended side effect of my posting, I apologize if my comment produced a "frightening" effect.

Re: Calculators vs Adding Machines

*Message #22 Posted by **christof (NoVA US)** on 26 Aug 2003, 6:22 p.m.,*
in response to message #21 by Andrés C. Rodríguez (Argentina)

You have to tak einto account that I work in a field populated with large numbers of religious folk who overcapitalize words like OPEN, SOURCE, STANDARDS, GPL, and etc. Many of these people would like to make illegal any form of computer or software they disapprove of based on their spec ific value of sufficient 'openness'

So that probably explains it part of it :)

The other part is- well, the CS definition of a general purpose computer *sodes* include a requirement for input and output, but all the old CS classes also stress that printouts and text entry are valid forms of input and output.

True- making a computer networkable generally requires more, but networkable isn't a defining characteristic of a general purpose progammable computer. (special purpose and non programmable computer exist) Actually- let me state that it wasn't in 1988. Nowadays, maybe it is.

I'm just being a computer nazi. It's my job, actually. :)

no worries-

Christof

41C ROM versions

*Message #1 Posted by **Randy Sloyer** on 24 Aug 2003, 11:35 a.m.*

An easy one for you 41 experts out there: How does one tell which version rom is in a 41C?

I have an early unit (D/C 1943A) but I can't find a way to list the rom version. The keyboard bezel is a flat finish with a very flat 2 key. The 0,1 and 3 feel different, but the 2 is really bad.

Re: 41C ROM versions

The unit has an HP service sticker inside - maybe they update the ROM or just changed out the processor board?

Is there any way to verify which ROM you have through keyboard entry?

Re: Classic KBs over current 49g

*Message #4 Posted by **Raymond Del Tondo** on 24 Aug 2003, 12:52 p.m.,*
in response to message #3 by Randy Sloyer

Not directly. You need to read the last word of each system ROM block, which together gives the three chars ROM revision.

If you have an RSU loaded with appriorate ROM images, or CCD or ZENROM, then this is an easy task.

Raymond

Sorry, wrong title;-) NT

The easiest way is with the service ROM, but I guess few people have that (the image is available, so if you have an EPROM box or MLDL that can be addressed as page 4, then it's possible to run this code). There is a keyboard procedure in 'Extend your HP41', but it's somewhat complicated. However, I can look it up if you need it. Actually, if you're using an HP41, buy this book (or get it from the MoHPC CD-ROMs, or whatever). It's full of useful information. It's not a particularly technical book, but it's the place I look first for user-level information, synthetic programming stuff, etc.

in response to message #1 by Randy Sloyer

There is a way to do it if you have the PPC ROM. It uses synthetic programming tricks, is very cumbersome, and is based upon a technique listed in the back of some very thick (800 page) book (I can't remember which right now).

Re: 41C ROM versions

*Message #9 Posted by **christof (NoVA US)** on 24 Aug 2003, 9:22 p.m.,*
in response to message #8 by David Smith

I've noted a couple of times references to making a ROM.

I realize that with the current market prices for something like the Advantage or PPC ROM that making them- in addition to any copyright issues, would decrease the value of holdings for some merchants.

so I expect that there will be some resistance, but- how do I do this? (I lack a way to burn bits, but I am sure I have access to someone who can)

More to the point- specific to the PPC ROM- si there any way to get permission to do so? I dont' want to sell them, but I'd love to have 3 (I'm a bit paranoid about spares).

I'm kind of sick of reading the manual and not getting to use it :)

41C & 15C

*Message #1 Posted by **Vincent Weber** on 24 Aug 2003, 6:37 a.m.*

Hi all,

I am just curious to know how 41C users welcomed the 15C in 1982. The 15C was,overall, not as an ambitious machine as the 41C: No alphanumerics (even in program listing), no expansion ports, less memory, no global labels, no user-defined keyboard, and poor performance (about half the speed of the 41C). Nevertheless, the 15C introduced new features that the 41C did not have: a clever complex stack (making full use of the 4-level stack), smooth matrix integration (matrix could even be recalled on the stack), native SOLVE and INTEG support, recall arithmetic, and all 12 conditionals. All this in a much smaller package, with every function accessible directly thanks to a well-organized keyboard with two shifted keys. At the time of the 15C introduction (1982), only the MATH module was available for the 41C. This module could do basic matrix operation, but no proper matrix arithmetics which were natively supported by the 15C. Only in 1985 was introduced the Advantage module. IMHO, this module (finally) outperformed the 15C in terms of matrix support, especially with complex matrixes. The 41C' alphanumeric capabilities made it easier to enter an review a matrix than the 15C, even if the matrixes could not be recalled on the stack. But the complex integration was not as good as the one of the 15C (the complex stack was limited to 2 levels). However, it was possible to use the CA application on the PPC ROM to work with an 'infinite' complex stack. Only the 42S would bring the best of both '41C and '15C worlds (without the expansion and I/O, though - nothing is perfect !) in 1988. Overall I think the 41C is a better machine than the 15C, but that 41C users must have been frustrated that a mid-range, cheaper model could outperform it in quite a few areas, at least before the Advantage module was released. That's why I think it today we have a 41 emulator for Palm (P41CX) while we still do not have a 15C emulator (only a simulator for PocketPC, Pocket15C by Lygea).

Thanks for sharing your thougts on the above :)

Best regards,

Vincent Weber

Re: 41C & 15C

*Message #2 Posted by **Patrick** on 24 Aug 2003, 12:16 p.m.,*
in response to message #1 by Vincent Weber

I bought a 41C/card reader in 1980, within a week of them first becoming available at my local college book store. I still have both. That machine replaced the HP-25 that I had been using since 1976.

The Spice models came out after the Woodstocks and I was somewhat unimpressed with them. It appeared that HP had taken a step backwards in build quality and I was disappointed with them for backing off of the quality heritage of the Classics and Woodstocks. Of course, SOLVE and INTEGRATE were quite fascinating on the 34C (there, Norm), but the looks and apparent quality still threw me off. Besides, my 25 showed no signs of deterioration so I had no appetite for another battery-hungry LED model (nor did I have enough money in those lean college days to splurge on a *third* calculator).

When the Voyagers came out, the disappointment of the Spices was still with me. I therefore gave the 11C just a quick perusal. I did like the looks of them, although you have to remember that they looked very, very odd in

those days. People like me came to think of the Classics as what a calculator *should* look like (the 41C certainly didn't disappoint in that respect). So, I went into the bookstore to try out a Voyager, to measure the mettle of which they were made. The 11C sure felt good in the hand. The build quality had certainly returned, and the display was great. Then I pressed the ENTER key. Yikes! It doesn't click! Well, it does, but nowhere like it should! That lone low-tactile key really turned me off. It was bad enough that they had oriented it up and down (horrors!), but damn that weak key click!! I decided right then and there not to buy one and never even followed the Voyager series after that. Despite being an HP fanatic even then, it hardly made a difference to me when the 15C and 16C were announced.

Thinking back on this, it strikes me that I was looking to find fault in these devices. I was certainly very happy with the 41C and used it on a daily basis, either for useful stuff or for exploring the then new area of synthetic programming. Probably I realized I didn't have enough money to justify another purchase and found a reason not to indulge my passion.

People who remember my previous postings here know that I am now a **huge** fan of the Voyagers, and particularly of the 15C. I agree with you, Vincent, about the extremely well engineered keyboard and features. It is a wonderful little machine. I lament not giving them more of their due back when they were available. Every Voyager I own -- all 22 of them -- were purchased on eBay. However, to this day, I remain very unhappy with the click on the ENTER key, and probably always will.

Re: 41C & 15C

*Message #3 Posted by **Bill Smith** on 24 Aug 2003, 1:08 p.m.,*
in response to message #1 by Vincent Weber

actually, it was the other way around for me.

my first calc was the 25 in my freshman year of 1977. when the 34C arrived, i upgraded primarily for the increased program space and continuous memory. i couldn't really justify the 41C, but when the 15C arrived, i just couldn't resist. it is still the best calc ever made, IMHO. i finally got a 41CV during my first job in 1985; alas i still have the coupon for the free Advantage module, and can't quite stomach the ebay prices to obtain one now. the 41CV was my desktop PC through the remainder of the eighties, and i still occasionally use a couple of analysis programs too long, complex and infrequently used to port to another platform. They work on Calc41 on my 200LX without modification.

Have a look at these articles

*Message #4 Posted by **Valentin Albillo** on 25 Aug 2003, 4:57 a.m.,*
in response to message #1 by Vincent Weber

Hi, Vincent:

Have a look at these articles, recently published in Datafile, which discuss at length *exactly* the topics you raise in your message. Both articles form a matched pair, discussing and comparing the HP-41C vs. the HP-15C matrix capabilities, and including a thoroughly commented program implemented in *both* machines, with appropriate remarks about the relevant differences:

DatafileVA007.pdf

DatafileVA008.pdf

Hope you'll find them interesting, any comments welcome :-)

Best regards from V.

BTW, should you want to have a look at some of my former Datafile articles:

DatafileVA001.pdf

DatafileVA002.pdf

DatafileVA003.pdf

DatafileVA005.pdf

DatafileVA006.pdf

Re: Have a look at these articles

*Message #5 Posted by **Vincent Weber** on 25 Aug 2003, 6:59 a.m.,*
in response to message #4 by Valentin Albillo

Hi Valentin,

Thanks a lot ! I really appreciated your article. Very accurate and informative. I have just two comments:

1/While the matrix operations on the Advantage are clearly better than the ones on the 15C, for complex numbers handling the 15C has an edge (full complex stack); although one may argue that what is useful with complex numbers is matrix operations (much better done on the 41C as you pointed out) and basic operations on complex numbers are not that useful, especially when it is quite cumbersome to deal with polar form on both machines; I think the makers of the Advantage ROM should have included the CA implementation from the PPC ROM (infinite complex stack). 2/In the end, when you say that a 41C will never look at a 15C or 42S with envy again... this is true of the 15C, but I am not sure that it is true of the 42S, which has a really fantastic matrix integration ! 3/Advantage ROM, to be complete, should have included hyperbolics and hex/bin arithmetitics.

What do you think ? Cheers, Vincent

Re: Have a look at these articles

*Message #6 Posted by **Valentin Albillo** on 25 Aug 2003, 8:05 a.m.,*

Vincent posted:

"While the matrix operations on the Advantage are clearly better than the ones on the 15C, for complex numbers handling the 15C has an edge (full complex stack)"

Agreed, no machine handles complex numbers better than the HP-15C (not even the HP42S), save the HP-71B/Math ROM bundle, but that's not RPN and lacks some functions that the HP-15C has defined for complex arguments (such as inverse trigonometrics). Anyway, as stated in my article, the intention was to "commemorate" the Advantage ROM so as it wasn't a full review, I focused on just one important topic: matrix handling and compatibility.

"I think the makers of the Advantage ROM should have included the CA implementation from the PPC ROM (infinite complex stack)."

Disagree. I'm not very fond of "infinite" stacks, *a la RPL* because I think the disadvantages (variable size which can result in less than 4 stack registers or even none, no automatic replication of the upper

level, 'garbage collection' frequently necessary, lots of memory used by the stack, slower, cumbersome LAST functionality, etc) do not pay off for the advantages. To me, it's just a book case of 'diminishing returns', i.e.: 2 or 3 levels are too few, 4 levels are much better, even ideal, 5 levels would perhaps be marginally better, but 6, 7, or 'infinite' levels do not really improve things appreciably and can even detract from usability.

In the end, when you say that a 41C will never look at a 15C or 42S with envy again... this is true of the 15C, but I am not sure that it is true of the 42S, which has a really fantastic matrix integration !

Yes it does, but it completely lacks I/O ... and that's extremely important and that's the way it is. If you can point out some particular strength of the HP42S, such as its 'fantastic matrix integration', it's only fair that I should be allowed to point out and remind you of the greatest strenght of the HP-41C system, namely its I/O and expandability, right ?

You can bet that if I have my HP-41CX with a double X-MEM module attached (i.e: nearly same RAM as a 42S), with an Advantage ROM and a PPC ROM plugged in, and a beautiful card reader ready to download any program from a small card holder full of them, in seconds, and you're next to me with an HP42S, you're probably the one that's going to feel envious as soon as we began to do something serious with them, or simply show off each other our latest tricks.

In short, the HP42S may be a fine machine, etc, etc, but next to the HP-41C described above, the fact that you can't plug any ROM modules into it to expand its capabilities, and the fact that you have to key in every program you intend to use, and can never backup anything on external media, make it a non-contender, actually. No way any 41CX user is going to feel 'envious'. What wouldn't any HP42S user give for being able to use a card reader, uh ? :-)

Advantage ROM, to be complete, should have included hyperbolics and hex/bin arithmetics.

Agreed. However, I would have preferred that all its many functions were machine-coded, complex functions in particular. Also, a better TVM section, *a la HP-12C*, would have been nice as well.

Thanks for your interest and kind comments, and best regards from V.

Re: Have a look at these articles

*Message #7 Posted by **Vincent Weber** on 26 Aug 2003, 7:54 a.m.,*
in response to message #6 by Valentin Albillo

Hi Valentino,

I agree with you on the I/O on the 42S. I just think that the 42S has a lot of valuable features: the complex and matrix integration is neat, the variables is a nice touch, the menus are nice, the solver makes it easy to solve for different variables (without the equation feature of the 32S, too), and the speed is great. Sadly the lack of I/O limits its interest, but a lot of features are alreayd on-board, and when I praised it I was more talking from an emulation point of view: a emulator/simulator for Palm of the 42S would be great, and would allow to enter programs. I am actually working on such a simulator, rather than emulator: I gives me more freedom to correct some flaws of the 42S (the worse alpha entry method ever, the lack of equations and fractions from the 32SII, the lack of direct polar/rect entry without changing the complex display mode); furthermore, the 42S ROM is not available from HP (unbelievable, when you know that the 41, 48 and 49 ROMs are available !); emulating the Saturn processor is complex, and does not bring benefits as the 42S had no ML/Synthetics available.

Would anybody would be interested in such a simulator, btw ? I am trying to see whether there is a "market" :)

I am actually quite happy with P41CX, the 41 emulator for Palm by Charles Lee. It is loaded with full extended memory (600 register) and leaves the 4 ports free, so I can have the Advantage ROM (with great matrix support), the PPC ROM (bringing part of the 32SII functionality, such as fractions and random numbers), the CCD (improving the catalogs: I never understood why you cannot XEQ or ASN a function directly from the catalog !!), and the Finance module. Actually I prefer the TVM program from the Advantage to the one of the Finance module (better presented, IMHO). Why don't you like it ?

Cheers, Vincent

"Actually I prefer the TVM program from the Advantage to the one of the Finance module (better presented, IMHO). Why don't you like it ?"

I didn't say that I don't like it, only that it is very basic. It should have included more of the advanced financial functions present in the HP-12C. As it is, financially-aware HP-41C users can still be envious of the HP-12C's capabilities, as the Advantage ROM financial functionality is no match for it (unlike the matrix functionality or even the complex-numbers functionality, up to a point).

Best regards from V.

Re: 41C & 15C

*Message #9 Posted by **Ron Ross** on 25 Aug 2003, 9:07 a.m.,*
in response to message #1 by Vincent Weber

I had just that choice in 1985. The Hp15c was $50 ($100) cheaper than an Hp41cv (cx). And then I would need to fork over another $50-100 for a software package ROM to get the features that came standard with the 15c. I wanted to replace my trash Ti-55 (I liked the calculator and its functions and feature, just the keyboard was worthless after 6 months of use and I was on my second one). Well an Hp15c was definitely going to be less expensive and do everything I needed.

The Hp15c could easily have been my last HP (and I mean this in the very best way!) 8o)

Later I bought an Hp42s (which I feel is better than a 15c, but I still like my stylish 15c better). I also have a 41c and a math module. I use my 42s (now expanded to 32K), but without real input, I acknowledge, the 41c series is a better calculating machine. But that is also why I often use a 48 or 49 as they are superior to a 41c in this regard. But a 41c, 42s or 15c are all able to fit is a pocket or take up minimal space in a breifcase. That isn't true of a 48/49. Also, I don't like the idea of pulling out a cannon in a meeting to do a simple calculation (simple is a relative term) and would rather use a much less obtrusive calculator such as a 41, 42 or 15.

The 41c series certainly had their time and place and were never really replaced by any equilivent calculator. The 42s was meant as an upgrade to the 15c user (which it did very well). As such, no real I/O wasn't considered all that much of a hinderance. The 28/48/49 is the upgrade path of the 41 series, but the 41 user had

to give up small one hand portability and the established I/O of the 41 series (which wasn't always acceptable). If the 42s had been released with 32K and real I/O, I do not think any 41c user could ridicule a 42s (I believe Hp had such an animal in the planning as an Hp42sx). But that never happened, probably since Hp wanted the 48 to do so well and feared robbing sales from the more estemed model.

In comparison MBA's and business types never had to give up their cherished toys, since Hp still makes the 12c (15c equavalent) and the Hp17b (Hp42s equavalent) in the lower end line of calculators. That doesn't seem fair. 8o(

I'll end my rant here.

Re: 41C & 15C

in response to message #9 by Ron Ross

"The 42s was meant as an upgrade to the 15c user (which it did very well). As such, no real I/O wasn't considered all that much of a hinderance."

BULL. The 42S is code compatible with the 41 and even the HP model numbering refers to that. YOU may think it's an upgrade of your 15C, but that's not what HP made it for. VPN

Re: Your Wrong!!

*Message #11 Posted by **Ron Ross** on 26 Aug 2003, 7:52 a.m.,*
in response to message #10 by Veli-Pekka Nousiainen

Refer to the literature of the time when the calculator was released. The Hp32s was the upgrade for the HP11c. The Hp42s was the upgrade for the 15c, and the 28c/s was the upgrade for the 41c (poor upgrade path for 41c users).

This is documented by HP's own sales literature (for what that is REALLY worth).

That the code was 41c compatiable was a nice bit of bait, no 41c user would go for a calculator with no I/O. And that is why the 28 was probably replaced with a 48 series after only a couple of years. A 42sx was on the drawing boards (from what I have heard), but was scrapped (and I am guessing here, because it would rob sales from the 48 line). 42sx specs will make quite a few somewhat irritated: 32K RAM and serial I/O like the 48G.

Re: Your Wrong!!

*Message #12 Posted by **Vincent Weber** on 26 Aug 2003, 8:05 a.m.,*
in response to message #11 by Ron Ross

All what you say is perfectly correct. It is amazing to see that the 41C has been constantly under attack since its birth: - In 1980, by the first basic pocketcomputer (Sharp PC1211). - In 1982, by the Casio fx-602p (less impressive but faster), and from HP by the 15C (less powerful but with nice extra features as discussed in this thread). - In 1984 by the HP-71B that could simulate the 41C in a much faster way. - In 1985 by the first graphic calculator (Casio fx-7000G). - In 1987 by the first HP RPL calculator (HP-28C). I understand why 41C users did not take the 28C seriously: Its punky 2K memory did not allow to take advantage of its amazing features, and you could actually have much more elaborated programs on the '41 - let alone the major flaw of the 28, i.e the lack of I/O. - In 1988 by the 28S (which started to undermine it seriously because of its huge memory for the time and its revolutionnary features), and then the 42S (much improved in many ways, but the lack of I/O did not allow to take it a a serious rival). Interesting enough, the sales brochures of the time

showed the 41 and 28 on equal grounds: the 41 for exandability, the 28S for build-in capabilities. Amazingly, HP was still pricing the 41CX more expensive than the 28S ! - Finally, in 1990 by the 48SX. It is interesting to note that *only then* after 11 years (1979-1990), HP decided to discontinue the '41 series, which is a acknowledgement that no calc until the 48 could actually replace it. And the '41 fans (among which your humble servant) will still say that they prefer the '41 to the (super-powerful, but bulky, and with less flexible I/O) '48 :)

It is impressive that the '41 survived all these treats without a problem. That shows how flexible and well design this calculator was - to be able to compete with supposely much more powerful machines.

My 2 cents. Cheers, Vincent

HP 19C calculators used to be quite rare, and this has been driving prices up. However, the past 2 months quite a few 19Cs were auctioned off so I would guess that will drive prices down.

in response to message #1 by Gene

I know of a truly mint condition unit in a really nice box that sold for over $1200... I sold it. Both buyer and seller are quite happy. It would probably bring more these days...

12C Platinum: Better/Worse than Original?

*Message #1 Posted by **tomk** on 23 Aug 2003, 8:20 p.m.*

I searched the forum and found surprisingly little direct testimony on the 12C platinum versus 12C. I read elsewhere that the buttons don't feel the same...anything else? what about 360 day based bond calculations?

Re: 12C Platinum: Better/Worse than Original?

*Message #2 Posted by **tony** on 23 Aug 2003, 11:39 p.m.,*
in response to message #1 by tomk

There is a thorough review of the 12CP by Jordi Hidalgo in HPCC Datafile V22N3 pages 8-11. Kinpo intended the 12C platinum to have the same functionality as the 12C - the 30/360 Day basis Bonds are covered by a program in Section 16 of the manual,which is basically the same as the old 12C manual.

Re buttons I suggest to try before you buy, if possible. I have found it very usable. It has a great battery life, and this is needed as it takes longer than the 12C to solve for i and IRR. Also the unit I have is limited to 253 usable programming steps.

Re: 12C Platinum: Better/Worse than Original?

*Message #3 Posted by **Don Shepherd** on 24 Aug 2003, 8:48 a.m.,*
in response to message #2 by tony

Tony is right about the programming step problem. I just bought one from Amazon.com a week ago and the problem is still there. If you try to use most of the programming space, then the GTOs won't work. I wrote HP about this and they verified the problem, but I don't know what they will do about it.

Performance for programs is faster. It has a nice leather case. I think the keys are OK. The programming model is the same as the 12c, unfortunately (GTO line numbers and you cannot insert/delete lines).

Re: 12C Platinum: Better/Worse than Original?

*Message #4 Posted by **Patrick** on 24 Aug 2003, 12:29 p.m.,*
in response to message #3 by Don Shepherd

When you say "nice leather case" do you *really* mean leather? The case that comes with the legacy 12C is vinyl but there is an upgraded Voyager case that is real leather. You don't mean you get one of those with the 12CP, do you?

It's leather looking not real

*Message #5 Posted by **Gene** on 24 Aug 2003, 1:14 p.m.,*
in response to message #4 by Patrick

But better than the plastic cases the 10B used to ship with.

Re: 12C Platinum: Better/Worse than Original?

*Message #6 Posted by **Don Shepherd** on 24 Aug 2003, 3:08 p.m.,*
in response to message #4 by Patrick

Heck, Patrick, I don't know if it's real leather or not, but it is a step up from the standard vinyl slipcases that the original Voyager's shipped with back in the 80's, and the 12c's shipped with a year or so ago.

copying 9815 tapes

*Message #1 Posted by **db(martinez,california)** on 23 Aug 2003, 8:18 p.m.*

Can someone give me and my partner in crime some beta on how to copy one of the "general utilities and test routines" tapes that hp supplied with the 9815 ? She says : "There are a mix of regular and binary programs on the tape which (I think) are impossible to copy -- at least I don't know how. Most (all?) of the regular programs cause binary programs to be loaded in order to do their thing. So just copying the regular programs doesn't work (I've tired it).

Also: does anyone have all three of these tapes?

thanks - d

NCEES Banning of 48GX, 49G, TI83, TI89, Etc

*Message #1 Posted by **John Cadick** on 23 Aug 2003, 6:20 p.m.*

Gents:

As a simple matter of fact, a calculator is a tool for a technologist - whether an engineer or otherwise. I wrote to the NCEES and asked why they had done this. The reply was that they have had a rule banning devices with comm capability for some time. Since they have heard about mods to the (now) banned calculators that would allow cheating, they decided to enforce the rules. This is my response to them:

> Quote:
>
> Thank you for your reply. I had actually thought that it might be something of that nature. As a PE for thirty years, I certainly am among those that want to maintain integrity in the examinations. Having said that, I wish to make a few points if you would take the time:
>
> 1. With today's technology, a cheater can communicate with a wristwatch. 2. The existing infrared comm capabilities of the various calculators that you are banning are short range and probably useless unless they are modified. 3. If someone is going to the trouble to modify an Hp49g or TI89, they could just as easily modify a TI35 or HP9 or Casio whatever. In fact, an hp42s (obsolete but still available) has infrared capability and could be modified quite easily. 4. Entering text into any of the calculators that your are banning, even the QWERTY keyboard models like the Ti92+, is a long laborious process. Anyone entering anything of value would surely be noticed by the proctor. 5. Including college and professional practice I have been working with technical tools for forty years. I am trying to imagine how I would prepare for the PE exam now when I was told that I was not allowed to use the tools of my trade.
>
> I do not believe that banning these calculators is the correct approach. For what it is worth, based on the communications that I have had with a number of registered engineers, I am far from alone in this belief. I would suggest the following alternative approach.
>
> 1. All calculators that are to be used in the exams must be submitted for examination by the proctor(s). 2. All applicants using calcs with comm capability should be seated in the same general area to make the job easier for the proctors. 3. When students leave the test site, they must submit their calculators to the proctor for a hardware reset.
>
> Closer proctoring and monitoring is the correct answer not taking the engineer's tools away from him/her just when they are most needed.
>
> John Cadick, PE

I suggest that everyone (pro or con) contact NCEES and let them know of your position. The gentleman that I correspnded with is j carter @ ncees . org. Remove the spaces for email.

John

Re: NCEES Banning of 48GX, 49G, TI83, TI89, Etc

*Message #2 Posted by **christof (NoVA US)** on 23 Aug 2003, 7:04 p.m.,*
in response to message #1 by John Cadick

John-

You might also suggest the simple procedure of taping infrared ports.

I'd also note that anyone who did successfully modify the 42S would have some cash coming from me if he'd be willing to do mine, and would definitely have to have some reasonable knowledge base to do so.

:)

Re: NCEES Banning of 48GX, 49G, TI83, TI89, Etc

*Message #3 Posted by **John Cadick** on 23 Aug 2003, 7:49 p.m.,*
in response to message #2 by christof (NoVA US)

;-} Yeah, modification of the 42s might be more than a chore. I hope that NCEES realizes my meaning is that he who wants to cheat, will figure a way.

John

Math(s) class is a calculator tutorial

*Message #1 Posted by **bill platt** on 23 Aug 2003, 12:46 p.m.*

Hello all,

I am going to bring up something which I hope will stir controversy and discussion regarding education, learning, and the "correct" HP-Compaq market positioning for the educational market.

Having graduated from HS in 85 and College in 91, I never experienced the use of a calculator in math(s) class. Sure, we were allowed to use them in physics class, but math was MATH!

Reading some posts here, I am amazed to learn that teachers "build lesson plans around the TI-xxx" and "HP does not provide support for the educational market" and "Daddy will buy the child the Ti, because that is what the teacher uses".

Am I alone in thinking that this is a horrendous travesty?! Shouldn't the valuable time spent in maths be spent learning math? Shouldn't the calculator be a tool that is chosen and learned outside of the curriculum? (like for instance typing!) As technology marches on, doesn't the student who learned on a particular machine become dependent on it? (Aren't we even "dependent" on RPN!)

On the other hand, what are the positives? Does the calculator somehow make it possible for the teacher to provide better quality in the same time frame? Or do the children understand the concepts sooner? (Somehow I totally doubt that the latter is true.)

I for one am skeptical. Sure, the children may be able to learn to be proficient at producing *answers* using the calculator, but are they *understanding* any faster-better-deeper?

Ideally, we should hear some anecdotes from the younger set here---those who have actually experienced classes that were taught with a calculator. Like, I can't even imagine how this would go. Is it like, "OK everybody, find the f-shift key. Got it? Ok, now, you are going to press 'f-shift', 'solve'. Your screen should show a curve. OK, now push 'roots'. See the highlights....."

Regards and looking forward to commentary.

Bill Platt

Re: Math(s) class is a calculator tutorial

*Message #2 Posted by **GS Leong** on 23 Aug 2003, 2:03 p.m.,*
in response to message #1 by bill platt

Your right Bill, this is a horrendous tragedy! They are teaching these kids a process and not teaching them to think independently. The current teaching philosophy is geared at getting higer scores on federal test to obatain money. It will kill us in the long run. I agree that the calculator is mererly a tool and the better the tool the more efficient the user. I feel we need to get back to teaching fundamentals! I have had an hp since my high scool days I graduated HS in '79 and college in '86 and have alwas been a loyal hp fan. My $.02 worth.

in response to message #2 by GS Leong

Maybe I'm just getting old (graduated from high school in 64) but when I heard that my grand-daughter had to get a calculator for her kindergarten class starting this year, I was highly concerned for the reasons mentioned earlier (i.e., learning process over substance). On the other hand, maybe the instructors (kindergarten through college) spend most of the time on the actaul subject and use the calculator to maximize that time.

Re: Math(s) class is a calculator tutorial

*Message #4 Posted by **bill platt** on 23 Aug 2003, 3:11 p.m.,*
in response to message #3 by Tom Scott

My son is starting 1st grade this fall. Last year, he had a great time in kindergarten. The teacher did use 1 computer a little bit, but really she seemed to be in agreement that technology should not be stressed.

Now, when we go on road trips, I sometimes give my son a calculator to play with. I feel strange about this--like am I encouraging the very thing I don't want to! Yet it seems to be OK. I'll give him a 20s, and he'll type in numbers. Then, I'll give him a 48, and he'll put numbers in it. And then he'll ask me question, like "why is this one have more numbersOr, "they are shaped differently" or "they are smaller." Once, he mamaged to get an exponent into the system, and that was fun--he wanted to know what htat did, so I showed him a huge pile of numbers and said that the exponent merely counts how many numbers. Then I show him how to make letters, and letters on the 20s by turning it upside down etc. Note that all ofthe good stuff was easier and more direct to do on paper--like showing the exponent thing. So the calculator is a "failure" in many teaching respects.

The result of this play has confirmed in me that at kindergarten, the calculator is not a serious teaching tool, but a fun diversion once in a while. At least he isn't playing with a gameboy?:~/

Regards,

Bill

Re: Math(s) class is a calculator tutorial

*Message #5 Posted by **christof (NoVA US)** on 23 Aug 2003, 4:21 p.m.,*
in response to message #4 by bill platt

Last year I gave a pair of HP38G and a pair of 48G machines to a friend and her daughter. Said daughter was 8 at the time.

Is this a travesty? Is it so horrible? Did I suddenly reduce her brain mass by 30% and her effective IQ by 60 points?

Yeah yeah- anyone who graduated after 1970 or is horribly uneducated and *every* student in the old days could solve a quadratic in his head while simultaneously reciting the cubes of the Fibonacci series. While walking uphill both ways to and from school in the rain during an ice storm in May. Or something. Fine.

The problem isn't the *calculators*. My friend's daughter is doing quite well with her calculators - outside of school. She's figured out how to structure most of the measurements involved in making

a grape arbor, she knows what fourier series means, she's fine. the calculator is not sucking her brains out through her nose. Oh- maybe it makes things a bit more fun since the machine will do the boring bits of adding and subtracting. Granted- she's a special case, but her in school math bores her to tears. The only thing keeping her interested at this point seems to be her favorite calculator (alas, it's the 38G, not the 48G)

And I've yet to see a teacher allow a calculator for anything that hadn't already been taught (the way the high schools in one part of CA I'm familiar with do it- first, you learn trig. THEN, you learn trig on a TI).

Learning is a lifelong process. If using a calculator rots your brain in school, it rots your brain now. Fess up- how many of you are going to sell me all your HPs cheap because of this?

Another issue- and a fairly important one- is the need for students to adapt to technology early. Oh- it may not matter if we get bombed back to the stone age, but given the structure of our society right now, technophilia is a trait that is likely to improve your prosperity.

I find the influences that try to prevent children from gaining skills in the use of computers harmful. (And when you get past 4 * 7, a calculator is a computer and can teach you a lot about how to think about them.)

If you believe that having a calculator automatically means a child will never learn to add, that's your prerogative, of course. As for me- I'm hoping the son will go for the 32Sii instead of the 20s, but who knows :)

Christof (accept that there is humor in this, along with the grit)

Re: Math(s) class is a calculator tutorial

*Message #6 Posted by **Ernie Malaga** on 23 Aug 2003, 5:25 p.m.,*
in response to message #5 by christof (NoVA US)

Bravo! I was going to post something like this, but you beat me to it -- and did it better than I could have. I only wish to add a bit more:

What matters (or what _should_ matter) in education is building the ability to analyze a problem: take it apart, see its components, and then come up with a solution. If you don't have that ability, the spiffiest calculator in the world won't make up for the lack. If you already have it, it makes no difference whether you employ paper and pencil, a slide rule, or a graphing calculator to get the answer.

One way or the other, then, calculators should NOT be banned. Banning them is equivalent to forcing students to walk in a thunderstorm when they could be riding their cars.

Another 2Â¢.

-Ernie

Basic arithmetic skills

*Message #8 Posted by **Frank Wales** on 23 Aug 2003, 10:44 p.m.,*
in response to message #5 by christof (NoVA US)

> Quote:
>
> If you believe that having a calculator automatically means a child will never learn to add, that's your prerogative, of course.

Well, I don't think it's automatic; I can add, and I had a load of calculators at school, but only in later years (15+), so my experience isn't directly germane. (Plus, in Scotland in the 1970s, arithmetic was a separately-taught subject from mathematics, and attempted to provide a reasonable education in day-to-day number work for those who weren't studying maths proper.)

However, here is a story from the other day which might be a small data point that tells us something about something.

I was buying a calculator on eBay (no surprise there), and had to get a money order to pay for it. I went to the closest Western Union agent to my home, which happened to be a bureau-de-change in a travel agent. The total cost of the money order was £27.49 plus a £12.00 fee.

The manager had to get a calculator to add these two numbers together.

Once he'd figured out that I owed him £39.49, I gave him £40 in cash. He then asked me if I had a penny, to make the change he had to give me easier.

A puzzled look must have come over my face, because he clarified that he didn't have any pennies. So I thought: "ah, he's going to give me fifty-*two* pence, so he wants a penny back."

So I gave him a penny. He then gave me a fifty pence piece in return, and indicated he was done.

I pointed out that he had owed me 51 pence in change.

After a few moments looking at me, he then looked at the penny in his hand, and the fifty pence piece in mine, smiled the smile of a problem well solved, and handed the penny back to me.

At this point, I thought I was in one of those splitting-the-bill puzzles where a dollar "goes missing" between the waiter and the diners, and really didn't fancy having to draw diagrams to explain what was going on.

So I repeated that I'd been owed 51 pence, and that so far, I'd only been given 50. After an even longer period of looking at me funny, the guy said it had been a long day, took a penny from his cash drawer (which previously he'd claimed he didn't have), and handed it to me.

Now, I would just like to point out, for those who didn't spot it the first time, that this guy RUNS A BUREAU-DE-CHANGE! Yet, apparently he can't add small currency values, nor

correctly reckon change, in his head.

Thank goodness that he can work a calculator, eh?

Re: Math(s) class is a calculator tutorial

*Message #9 Posted by **Tony Duell (UK)** on 23 Aug 2003, 4:28 p.m.,*
in response to message #1 by bill platt

Sure it bothers me. It bothere me a lot. School (and university) classes should be about learning concepts, not how to use particular tools!. When I was at school, we were allowed to use calculators, but we were never taught how to use them. We were expected to read the instruction book and figure it out. In UK schools, it appears, 'computing' classes consist of learning how to use the current versions of Word and Excel. Ouch!. No matter what your views on Microsoft products (and mine are not repeatable in a public forum!), schools should not teach what keys to press. They should teach the _concepts_ behindword processing (how to correctly format various types of document, when to use particular types of font, etc) and spreatsheets. Learning what keys to press is something you find out for yourself in an afternoon with the program's documentation. Incidentally, I once read something that I strongly agree with. It basically said that OK, calculators are here to stay, and therefore most students probably don't need to do endless long division examples any more. But if you are going to let school students use calculators, then they have to learn how to use said calculators correctly. THey have to learn about truncation and rounding errors. They have to learn that because a statement is mathematically true it does not mean it's a useful method for calculation. They should learn about iterative processes, and so on. In other words, let students use the 'new' tools, but make sure they understand the concepts relating to said tools.

Re: Math(s) class is a calculator tutorial

*Message #10 Posted by **Richard Garner** on 23 Aug 2003, 5:30 p.m.,*
in response to message #9 by Tony Duell (UK)

I agree with you. My nephew had to get a TI-83 for junior high this year. The manual was on a CD. No printed manual other than here is where the batteries go. I had to spend 2 days over a weekend printing out over 800 pages so he could start learning how to use it. So if a number of students don't have a way to print out the manual that is on the CD or if they buy their calculator in a pawn shop to save money, there is no manual for them. The teacher will have to spend most of the class time telling all of them press this key, them that key. The fundamentals need to come first then the calculators can be used as aids not crutches.

Re: Math(s) class is a calculator tutorial

*Message #11 Posted by **J.C. Randerson** on 23 Aug 2003, 5:09 p.m.,*
in response to message #1 by bill platt

At the grade/middle school level, calculator usage should be minimal. At the high school level, calculator and computer usage should be encouraged with the proper (hard to do) balance between old time skills and machine use.

A good example of what happens when the old fashioned diehard Luddite types take over is being argued several threads down, with the banning of calculators for national PE tests.

Trying to reason with the Luddites is like trying to talk with religious fundamentalists, it can't be done. In a nutshell: if you don't like calculators and computers, don't use them - but when you infringe on my wish to use them, @#$%!

*Message #13 Posted by **gifron** on 24 Aug 2003, 5:27 p.m.,*
in response to message #1 by bill platt

My HS son just took a trig class at the community college, in which he was required to use a TI-83+. This fall, he is taking calc at the same college, and is required to use an 86. He was told that an 89 would do, but that the 86 was better suited to the course. I suppose that for his calc 2 course, he will need to buy an 89, and then a 92 (or whatever) as he continues on. I graduated HS in 82, and used a sharp 506H until my senior year in engineering school, which is when I received a 41CV as an anniversary gift from my sweet wife.

I don't have a problem with the use of calculators in class, once the concepts and processes involved have been learned. I do have a problem with the use of the calculator in performing the work, when the student has not learned to do the work w/o the calculator. I also don't appreciate fact that the classes are structured around specific calculators, as I can't afford to buy every TI calculator. More importantly, we should be able to do the work if the calculator we learned on dies, and we have to use a different model, or (no, don't even think it) a pencil.

in response to message #13 by gifron

This is exactly the sort of baloney I was afraid of--just making mathematics class into a seminar for appliance operators. Ughhhhh. I think the teach needs a pep talk--actually, the faculty board or whathaveyou.

regards,

Bill

Re: Math(s) class is a calculator tutorial

*Message #15 Posted by **christof (NoVA US)** on 24 Aug 2003, 11:55 p.m.,*
in response to message #13 by gifron

That is odd, and disturbing.

I'm very much in favor of technology in the classroom, but requiring different machines for different math courses - especially at a community college- seems very bad.

I'd suggest having some discussion with the college, or local newspaper. I can accept suggesting one calculator, but not requiring multiples!

and there is still the statement "first you teach trig, then you teeach trig on a calc"

-C

in response to message #1 by bill platt

Personally, I do agree with the opinion of e.g. Tony (see his post above). But still, I'm thinking that calculators -- espec. graphing calculators -- can be reasonably and sensible used for supporting and complementing teaching (at least) undergraduate math classes. I sincerely believe that graphing calculators can enter math classrooms for the benefit of both, the learning folks to delight them for math in a "playing" manner and for the mathematics itself to make she -- right, I'm mathematician and I do love her :-) a lot -- more attractive in modern, technology driven world. By the way, I'm currently reading a textbook titled "HP48G/GX: Investigations in Mathematics" which IMHO clearly shows that and how calculators can be used to actually teach mathematics. The "instructors" at the college mentioned there use calculators for teaching math since the advent of the HP-28 and so do have a profound experience in that matter. If someone would be interested in the book, I can post information on the authors, the publisher and where one probably can get a copy.

HP15C

*Message #1 Posted by **Hans** on 23 Aug 2003, 9:34 a.m.*

I changed the batteries on my HP15 calculator. Now I have only illegible characters on the display. Is my calculator defect or what's the problem? Is there anyone who knows abaout this problem? Thanks: Hans

Re: HP15C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Aug 2003, 9:59 a.m.,*
in response to message #1 by Hans

Hi, Hans;

sometimes it happens that old batteries have a voltage difference to the new ones that's enough to "hang" the calculator. You may start with the [ON]&[y^x] pressed together: this is the first attempt to get the calculator back to normal operation after a [ON]&[-] memory clear.

If you get your Owner's Handbook and search for the Battery replacement text (appendixes) you'll also find some information about resetting calcualtor's memory. One of the most simple procedure is the hardware reset: a single, brief shorten in batterie's terminals. Yes, you get a piece of wire or any conductive material (a paper clip, as mentioned in the manual, may give you some trouble if bending it to fit in) and briefly, very briefly, connect both (+) and (-) poles of the batteries. As for safety precaution, do not remove the batteries: they will ensure no more than 4.5V will be present in their terminals, even if you have electrostatic charges in yor body, what could dammage your calculator. To be even safer, touch some GROUNDED metal parts before doing this.

Hope this helps.

Luiz (Brazil)

Re: HP15C

HP Calculators in movies ??

*Message #1 Posted by **Norm** on 23 Aug 2003, 3:58 a.m.*

Are there many HP calculators seen in Hollywood movies ??

Probably not, its kind of like spotting an HP microwave network analyzer in a movie .....

HOWEVER I know of at least one such, its "Andromeda Strain".

This is a classic "engineers movie" from when engineers ruled the earth (not MBA's) U know that early 1970's timeframe, when even the average 12-year old knew his algebra (now they just watch beevis & butthead) .

Now, help me out here folks, but along with all the spectrum analyzers, oscilloscopes, electron microscopes, and chemical equipment featured in "Andromeda Strain" did U not clearly spot the outlines of a "classic" HP scientific calculator in the white Ford econoline van (the one with the radar dish on top, near the beginning).

U know, one of those calculators the size of a suitcase. No, I dont know the model number, maybe somebody else does?

Heyyyyy which movie has got an HP-34C in it ????? With Reeeeeeed LEEEEEEED's ..... oooo aaaaahh hubba hubba

in response to message #1 by Norm

It's not a calculator but the movie "Real Genus" showed the HP-71B. It was used by the backstabbing suck-up Kent. I you ever watched any of the first episodes of "This Old House", Bob Villa used an HP-35.

Re: HP Calculators in movies ??

in response to message #1 by Norm

Norm, you are a genius. Just when we have all gotten off track, worrying about a bunch of new trash coming

out of carly-copaq-land, you put us back to our roots. I remember when I saw a HAM radio station in a movie--that was totally cool---(being a HAM you soemtimes wonder if the WHOLE world thinks you are a commitable nerd). Now for calculators.

Next time we go to Blockbuster to rent a movie, I am going to override my wife's choices. We are on the hunt!

-Bill

Blockbuster

*Message #5 Posted by **Norm** on 23 Aug 2003, 1:57 p.m.,*
in response to message #4 by bill platt

you would not likely find "Andromeda Strain" at a Blockbuster, they only have got modern dumb stuff like Vin Diesel starring in "XXX" etc etc

However U can get anything U want on eBay .....

DONT watch "Solaris" dumbest piece of modern trash I ever seen in my life, dumber even than Tom Cruise in "Vanilla Sky".

LETS WRITE A SCRIPT for our own movie.....

"KICK 'EM OUT" starring Norm, gang of angry teeth-gnashing HP calculator users storms Carly Fiorina's board of directors. We pelt the board of directors with rocks and bottles and old HP calculator parts, they run from the building, we kick back in the chairs and drink from beer bottles to celebrate our victory.....

script needs to feature a hp calculator

*Message #6 Posted by **hugh** on 23 Aug 2003, 3:08 p.m.,*
in response to message #5 by Norm

scientists discover an asteroid on COLLISION course with the earth and no one can stop it. world leaders cant agree on a solution so scientists get together all over the world to think of something themselves.

after some subplots and a love triangle (goes here) the scientists come up with a missile that could deflect it, if programmed correcltly.

however, microelectronics today is too small and would be hit by cosmic rays in space and malfunction. norm, our hero, in a long shot but it might just work fashion, programs his own hp 34c whose large retro electronic could withstand the rays to guide the missile and fits it inside the unit just in time to save the world.

hmm...

I ran across this in the April issue of Microcornucopeia:

Confusing at Catastrophy Manor

Alas, it has been yet another sleepless month here at Catastrophy Manor. My faithful Z80, Beulah, began spitting out 'not ready' errors two weeks ago and my in-house technician didn't discover until yesterday that I had not put a disk in the drive.

During that time I was forced to use Zimblefield J. Rothschild, the Cray 1 that normally monitors the odor level from the kitty box. What a frustrating machine! I certainly wish someone would enlighten the Cray people on how to design a proper keyboard. The left shift key is positioned at least a sixteenth of an inch from the standard position on the Selectric! I call their customer service department to complain but it doesn't do any good. This is the fit}ih Cray they've given me, and they still haven't gotten the left shift right.

WORTHLESS SOFTWARE

Now that my latest novel, 'Stumblefeet' is completed, I have refocused my attention on eating, and insulting anyone who markets a product I have not already recommended in my column, along with those who program in anything other than Pascal or Modula-2.

This month I received a program for the IBM-PC that guarentees to find enough tax loopholes to reduce your income tax to nothing. Every year. How ludricous. I have never seen that in my column. I even went back and looked (plus, I paid taxes last year, so I must not have reviewed it). To make things even more ridiculous, it is written in C. And they expect me to open the box? Come now fellows, how much effort do you expect me to make?

HIGH TECHNOLOGY

I have been saying for years that the only way for a computer company to be successful is to design a Timex-Sinclair compatible S-100 board. I must have said that to at least 50 people. Nobody listened. But finally, Say Co. Computers came out with exactly what I have been waiting for, and it is truly a tribute to high technology. It can add 200 numbers (some of them large) in under a second, it has a real time display, and it is water resistant.

I am considering using one here at Catastrophy Manor to replace the Crays if something isn't done about that appalling keyboard.

FREE POURSMELLE SOFTWARE

A while back I was thunbing through the truckloads of mail, free copies of Burpo Pascal and free Honkubro hardware that all of us famous overweight computer columnists get, when I found a request for another incredible Modula-2 Star Trek game. Since I don't want to write another Star Trek game, and I don't reallu pay any attention to my mail anyway, I decided to write a Pascal to Lisp translator.

I have been laboring over it for several months and it is finally done. I was planning on selling it for $99.95 through The Software Foolworks, but due to a momentary affliction of divine benevolence, I have decided to publish it here in the hallowed pages of OVERBYTE.

This translator avoids all the usual problems of converting infix to prefix notation

and of moving from the domain of a sequential language to that of a procedural language. In fact, my translator is very unusual because its output precisely mimics the original Pascal (The process is known as LISP Sync).

My son Smartalex doesn't think that anyone WANTS to convert Pascal to Lisp (but then he thinks that the 68000 is more powerful than the 6502).

By VERRY POURSMELLE

(As compiled by Laine Stump)

Re: Confusing at Catastrophy manor (Parody of Pournelle's Chaos Manor)

*Message #13 Posted by **Wayne Brown** on 27 Aug 2003, 9:23 a.m.,*
in response to message #12 by Vassilis Prevelakis

Vassilis,

Very good! I used to read Pournelle's column way back in the "Olden Days" :-) and this captures the flavor nicely. The only thing missing is a smug reference to some "inside info" he read on ARPANET or, in later columns, complaints about losing his (unauthorized) ARPANET account.

Intentional use of HP gadget on screen, number one

*Message #14 Posted by **Frank Wales** on 25 Aug 2003, 2:50 p.m.,*
in response to message #6 by hugh

There is an episode of 'The Six Million Dollar Man' where, following an unexpected problem with an experimental aircraft he is test-flying, Steve Austin is fooled into thinking that he has accidentally travelled into the future.

How did the bad guys persuade Our Hero? While he was unconscious after the aircraft problem, they altered his HP-01 to show that the year was 1984 instead of 1978. Steve seems happy to believe that, somehow, his HP-01 would detect time travel, and keep its clock accurate, and so he goes along with the deception for most of the episode.

Now, is this a good or a bad use of an HP gadget? On the one hand, it's a testament to the watch's durability and engineering that a test pilot trusts it over common sense. On the other hand, it shows that an HP product can be abused for nefarious purposes, making Our Hero look like a dork.

Re: Intentional use of HP gadget on screen, number one

What about Mars ?

*Message #19 Posted by **Norm** on 24 Aug 2003, 12:14 a.m.,*
in response to message #18 by G. Lucas

Mars is supposed to be about as bright as it gets, on August 27th. Like, the brightest in recorded history ???? Your next chance is in about 225 years and by then U might be getting old and have to squint.

Maybe the movie should be like this: the asteroid came from Mars and we were going to send a missile, but all the MBA's had smashed and destroyed all the engineering and technician's equipment, so we could not launch any missiles and the earth was destroyed and everybody dies. The end.

HEY SERIOUS now, why is it that the whole space program (brainchild of Werner Von Braun) is in ruins and got by replaced by a national agenda of illegal Mexicans with nail guns pounding together 6000 sq. ft. homes (on small lots) for the MBA's ???

As a result, nobody goin' to Mars ?? Hell we can't even make a decent MOVIE about goin' to Mars, much less actually go there..... what's wrong with this picture.....

*Message #21 Posted by **Silvio** on 24 Aug 2003, 12:41 a.m.,*
in response to message #1 by Norm

I know of at least two movies where an HP-41 has some brief part. Unfortunately I can't remember the names of the movies or any actor, but the plots go something like....

Movie 1: A British movie, very early 80's. A guy works in Life Insurance and has tons of statistical data on accidental deaths. He finds out that the most common way to 40 years old women to die is to slip on the tub, after trying to pull themselves up using the small bar so common on many tubs. He kills his wife with the help of a computer (I can't remember how the computer could control things in the real world, but…) At the end, the guy is committed to a hospital for mentally unstable people. A reporter finds out the whole plan and confronts him, telling that the story will go public the next day. The last scene is her car exploding at the hospital's gates, after a count down on a calculator the mad guy has on its hands gets to ZERO. Well, the calculator is a 41C, with a program to count down to zero. I'm just about 80% sure about this movie, because I did not own a 41 at the time.

Movie 2: An American movie, mid 80's. A group of Engineering Students develop a computerized system to break a Casino. They use what I believe is the first Wearable Computer, the main player has a 41 (C/CV/CX??) on his pocket, connected to an electric device on his shoes, and he receives the numbers by electric impulses on the shoe, as it would be illegal to look at the calculator's results while playing the Roulette. I don't remember if the calculator was used to predict the results, or if it just received the values from another computer by microwaves or something like it. I'm 100% sure about this HP 41 appearance.

Silvio

*Message #26 Posted by **Michael F. Coyle** on 24 Aug 2003, 11:54 a.m.,*
in response to message #1 by Norm

The Andromeda Strain came out in 1970, predating the HP-35. But the props guys should have gotten a 9100 + plotter -- that would have been nice.

It's probably the only movie where an ASR-33 Teletype played a small but crucial role.

Interesting thread though...Bob Vila used an HP-35???? Cool!

- Michael

It must've been an HP-9100

*Message #27 Posted by **NH** on 24 Aug 2003, 12:47 p.m.,*
in response to message #26 by Michael F. Coyle

It' must've been an HP-9100 in the white ford Van in "Andromeda Strain".

It says that calculator was 1968; you say the movie came out in 1970 .

If you check this, better do it with a DVD (not VHS) because you will need the extra resolution to decide.

Re: It must've been an HP-9100

*Message #28 Posted by **Ellis Easley** on 26 Aug 2003, 4:31 a.m.,*
in response to message #27 by NH

I don't remember the scene, but I think there was a 9100 in Andromeda Strain because of the display that is shown - three rows of digits painted on a green CRT. It seems like the display belonged to a system that determined the location of something.

Boom...!

*Message #29 Posted by **Tizedes Csaba** on 24 Aug 2003, 4:18 p.m.,*

I'm wash one's hands of about it... :) I just saw it about 7-8 years ago...

The calc was great not Stallone ;) !

Csaba

Ps.: The Ewings never used a financial calc?

Re: Calculators in movies ??

*Message #32 Posted by **Paul Brogger** on 25 Aug 2003, 11:09 a.m.,*
in response to message #1 by Norm

I remember one wasted moment (among many) watching a probably-made-for-TV movie about some hotshot rocket scientist. During character development, in order to demonstrate just how far this guy was beyond his peers, some situation arose with a presumably nuclear-tipped missile on a collision course with New York (or whatever), the anti-missile is launched, and it is off course, and the ground-based course correction computer won't work. (Cue the tense, dramatic background music . . .)

The protagonist goes to work on a (Litronix, I think) four-banger, keying in values and operators in fast-forward at a rate the calculator's key de-bouncing algorithm would render all but meaningless. After the requisite delay until the final possible second, he announces the course correction value, the anti-missle hits the warhead, and the world is saved!

What a tragic waste of youthful minutes of consciousness (and potential for *real* drama), and of aging, ever-diminished memory!

Re: Calculators in movies ?? - Jonesy

*Message #33 Posted by **Juan J** on 25 Aug 2003, 5:31 p.m.,*
in response to message #32 by Paul Brogger

In The Hunt for Red October, the book, Jones, aka Jonesy, the sonar officer, after doing some unusual signal processing of the Red October's caterpillar drive acoustic signature, plotted the curse in a map (which contained the Soviet submarines known patrol courses that he kept on the Dallas for security reasons) and calculated the Red October's probable course through subsea canyons and then to North America. When he presented his results to Captain Mancuso he pulled out an HP calculator. Alas, Tom Clancy did not mention the model, and the calculator was omitted in the movie. But since Jones is a very smart character, it was probably a 41.

There are also some references to series 9000 computers for submarine officers' traiuning in The Sum of All Fears.

Re: Calculators in movies ?? HP-71B

*Message #34 Posted by **Michael Meyer** on 26 Aug 2003, 1:12 a.m.,*

*Message #35 Posted by **Happy Holden** on 26 Aug 2003, 1:09 p.m.,*
in response to message #33 by Juan J

Tom Clancy was just relaying an old secret known by all nuclear sub and Orion P3 Sonar men...That their final backup on identifiying Soviet Nuclear subs' fourier-series accoustic signatures was a group of magnetic program cards for their HP67 calculators. I have a set of the cards that I picked up off the floor of the HP Print Lab in Palo Alto in 1978. These were defective and unprogrammed, but the good ones soon would be headed for the only "spy-froof room (is it Tempest?)" HP had at the time to be programmed by a Navy DOD officer. I doubt many people knew about the number of HP67 calculators in critical Government roles including the Apollo Program. Astronauts had a "HP Pocket" for their 67 on the moon program-they could run the capsule from the HP67 and the magnetic cards if the $50 million triple-backup computer aboard failed.

HP and Apollo

*Message #36 Posted by **Grant Goodes** on 26 Aug 2003, 1:27 p.m.,*
in response to message #35 by Happy Holden

As the HP-67 came out in 76, it is not likely that it was used on Apollo missions! AFAIK, the HP-65 _was_ part of the Apollo/Soyuz (ASTP) mission, and HP-35's were present on Skylab, but the moon missions did NOT use any of these calculators.

The first significant "integration" if you will of an HP calculator and a manned NASA program was the well-known (to us!) use of the HP-41C for backup landing software on the early Shuttle (and for all I know, to this day).

Cool information about the HP-67 in sub detection!

grant..

Re: HP the Military

HP33S

*Message #1 Posted by **Iqbal** on 22 Aug 2003, 5:04 p.m.*

http://www.hpcalc.org/images/datasheet33s.pdf

If you look at the dimensions of the 33S the metric dimensions doesn't correspond to the Imperial. 16.1 mm is definitely not equal to .06 inch [width] at least not on my GX. I wonder if they used the 33S to do this conversion. If in fact they did, then I think I just discovered the HP33S's first bug :)

You're mean...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Aug 2003, 5:14 p.m.,*
in response to message #1 by Iqbal

Hello, Iqbal;

long time no see... are you well?

I sent you an e-mail for these days; did you receive it?

About the HP33S: you're mean... It's not yet born and you're slapping it already!

Best regards!

Re: HP33S

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 22 Aug 2003, 6:16 p.m.,*
in response to message #1 by Iqbal

I think that 16.1mm IS 0.06 inch. 0.161cm / 2.54 = 0.0063385826 inch

I'm just curious how do you have converted it.

Best regards.

Nelson

Re: HP33S

*Message #4 Posted by **bill platt** on 22 Aug 2003, 6:37 p.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

1 inch = 25.4 mm

1 inch = 2.54 cm

the calculator is 16.1 mm = .634 inches

I am trying to see if the mistake was made by confusing centimeters with millimeters. Seems that's what happened! (my 32sii is 1/2" thick).

regards,

Bill

Re: HP33S

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 22 Aug 2003, 10:16 p.m.,*
in response to message #4 by bill platt

Ops!!! My mistake. Just messed up in the conversion mm <> cm... What a shame! And I'm surrounded with calculadors.....

Best regards

Nelson

Re: HP33S

*Message #6 Posted by **Torsten Hartwig (Germany)** on 23 Aug 2003, 1:15 a.m.,*
in response to message #5 by Nelson M. Sicuro (Brazil)

1 inch = 25.4 mm

But when you take the dimensions of the HP-33S you get

158.0 mm / 6.2 inch = 25.48387097

83.0 mm / 3.2 inch = 25.9375

16.1 mm / 0.06 inch = 268.3333333

Best regards,

Torsten

Edited: 23 Aug 2003, 1:38 a.m.

Round-off error

*Message #7 Posted by **bill platt** on 23 Aug 2003, 1:23 p.m.,*
in response to message #6 by Torsten Hartwig (Germany)

Hello Torsten,

Let's 1st assume that the device was "designed" in metric. So,

158/25.4=6.2204.....round to 6.2 ok

but:

83.0/25.4=3.267717.....so should round to 3.3. So, this one is goofy.

The 16.1 case is obvious in the decimal slip (hmmmm-maybe the text writer used a slide

rule!!!!!)

But this all brings up an interesting point: If you want to design something that has an exact conversion to exact (non-repeating decimal) in another unit system, you have to bear in mind the conversion.

So, if you design in inches, and you make all your dimensions rational and non-repeating, then all the dimensions will scale to perfectly clean millimeter (centimeter, meter) dimensions. But it does not work in reverse--and that is part of the wonder, beauty and mystery of numbers:

All finite place decimals, when multiplied by a finite decimal place factor, produce finite decimal place products.

BUT

A finite decimal place number, when divided by a finite decimal place number may or may not produce a repeating or infinitely long decimal dividend.

So, the real result is that ALL good designs should be carried out in INCHES, or FEET (1 meter = 0.3048 feet exactly) ;^}

Example, a standard "NATO" round is known now as a "7.62" but what it really is is 30 caliber (3/10 inch). But 9mm does not convert cleanly.....

So much for metric.....!

Edited: 23 Aug 2003, 1:27 p.m.

Re: Round-off error

*Message #8 Posted by **Torsten Hartwig (Germany)** on 23 Aug 2003, 6:28 p.m.,*
in response to message #7 by bill platt

Hello Bill,

When I posted my last message I felt an uneasiness with the numbers (in cm and inch) describing the dimensions of the calculator. But I did not really know what it was.

While reading your posting I had this idea: The number of decimal places do not correspond.

Example: When you enlarge the length of the calculator (6.2 inch) for the smallest amount representable (0.1 inch) you get 25 (rounded) units of the last decimal place of the metric number:

6.2 inch * 25.4 = 157.5 mm (rounded)

6.3 inch * 25.4 = 160.0 mm (rounded)

But when you do it the other way round, the last decimal place is unchanged:

158.0 mm / 25.4 = 6.2 inch (rounded)

158.1 mm / 25.4 = 6.2 inch (rounded)

So, my suggestion for HP is to have two instead of only one decimal places to represent the

number of inches.

BTW a minor correction to your posting (1 meter = 0.3048 feet): It should be 1 feet = 0.3048 meter as 12 * 2.54 cm = 30.48 cm.

Best regards,

Torsten

But don't forget, there is both land diameter & groove diameter when refering to calibers and bullets. 7.62 NATO is the land dia. = 0.30000". The groove dia is 0.3080" same as .30-06 Govt. or .308 Win. for example. The actual bullet dia. is 0.3080" or 7.8232m.m. As to the 9mm, I'm not sure what your point is. Also the word 'caliber' has two different meanings depending on use. That is 30 caliber is not the same as caliber 30. For instance the 'M1 Garand' is a 'United States Rifle Caliber 30 Model M1' and uses a .30-06 cartridge. 30 caliber on the other hand means the barrel length is 30 times the diameter of the projectile. This is used mainly for large sized Naval guns.

See the following:

http://www.chinfo.navy.mil/navpalib/ships/battleships/missouri/mo-may86.jpg

This shows photo of a gun turret of the Missouri, with a caption which alludes to this meaning.

and this:

http://www.britannica.com/eb/article?eu=18955&tocid=0&query=caliber&ct=

Which gives the various definitions of caliber.

in response to message #7 by bill platt

Why do the world isn't yet using just one unit system? I think that new designs should use the international metric system. Here we allways used metric (decimal) unit systems and we hadn't no problem of this kind as I remember. The problem is when we have some product that is in inches or feet or miles or (name it), and need to do several conversions.

Just my 2 cents (or R$0,05?)...

Regards,

Nelson

Re: Round-off error (Long)

*Message #13 Posted by **bill platt** on 24 Aug 2003, 7:01 p.m.,*
in response to message #7 by bill platt

Hi Torsten, r.d., Nelson et al:

Well, I did wink when I said, "All good designs should be done in INCHES." Though it still is an interesting irony that it is "easier" to work in inches if you know you will need two unit systems in the end.

Also on this topic, I worked for a EU shipbuilder for some time, and as it was a new start-up yard in the US, the Euros set us up to take a number of classes as training: AutoCAD, various ship design programs, German language (this was actually a great benefit--it made the business trip to Deutchland much more interesting, fun and meaningful), and: "metric"! The teachers were all americans (yes, one was Canadian) and really quite good; but what we learned in "metric" class (we all rolled our eyes when we heard we had to take this one!), what we learned was that contrary to popular belief, Americans ARE bilingual---that is to say, inches, and Metric! (We all used SI units in school, grew up in the 70's when the Carter administration had put wheels in motion to switch over, and then the first things I remember in the Reagan epoch were: 1: can metric, 2: bring back the (already obsolete) B-1 bomber program, 3: eliminate federal funding for Solar Energy (and probably wind etc), 4: remove sound decibel rating/warning stickers from lawnmowers). Never mind all the other good things that did come along.....(too off topic!)

So, yes, metric is, well, too EASY! like, you never have to play games with the factor 12 or .083333333333333333333333333333333.....

Another couple good tidbits: the first is that in conversion, there are two concepts: "hard" conversion, and "soft" conversion. I am sure I will mix the terminology up as I remember it being counter-intuitive, but the idea is this: an "exact" conversion is "soft", e.g. a 4" flat bar converts to a 101.6 mm flat, whereas a "hard" conversion rounds (to some predetermined pseudoprecision) to 100 mm. This sort of stuff is important for concept and preliminary design, and for picking "equivalent" parts etc.

A lucky coincidence:

In ship design ("naval architecture"), we design in "long tons" not in little mass units like slugs or lb-m or kg. A "long ton" is 2240 lb, (a "short" ton--the landlubber's ton--is 2000 lbs). By wonderful happenstance, a metric ton (or tonne to make it sound all frenchie--the frenchiness of international standards is a whole 'nother topic, like in radio Morse code, N3LPX DE F1FRE FBOM, 73 F1FRE SK) is 2204.623.... lbs. And so it is both confusing (metathasizing the "4" from the 1's column to the 10's column) yet also simplifying---because 2240/2204 = only 1.6% difference, and so for general design concept comparisons stuff, they (metric and long ton) are the same.

The last tidbit is that all U.S. Federal highways are engineered in meters----and have been ever since the Carter administration. Evidently, they (the DOT) made the switch early on, and when Reagan said, "we quit" the DOT said "not us--we're sticking with it!"

Regards,

Bill

Re: Round-off error (Long)

*Message #14 Posted by **Nelson M. Sicuro (Brazil)** on 24 Aug 2003, 9:00 p.m.,*
in response to message #13 by bill platt

Well, I'm not an engineer, I'm a computer analyst/programmer and I doesn't have any fancy experience in such proportions. I just think that new designs have to take in account the other countries as well (unless it is only a local product). Yes, the metric system is easy, and it is used in all distance measuring using only decimal multiples, from sub-atomic proportions to interplanetary distances. I know that the north-americans doesn't like much the french and the metric was create by them, but it was accepted as an universal system. It is a question of accepting the ideas from others, not only your own (as an example: Santos Dumont [brazilian] having the first airplane to fly with its own propulsion, in Paris [France]).

Excuse my ranting, I'm just tired of see north-americans (not all, of course) thinking that they are the Center of the Universe and just ignoring the rest of the world, or paying attention to the other countries having in mind only selfish interests.

Please don't take it personally. I don't have anything against the american people (as a people) as I don't have anything against any other people. I'm an american too, but from the south half of the America. Here in Brazil we are a much more "blended" people, with persons that came from different cultures from all five continents. I just think that the world is bigger than only one nation.

Ok, i'm way off topic... Let's talk again about HP calculators! Yes, they are a great north-american design and I use a HP-42S in a daily basis (before was a HP-15C), and I really feel sorry when HP took it both off production line. I just hope that the HP-33S fill the gap despite its ugly keyboard.

Best regards

Nelson

Don't say "north American" when you mean the US - Canada and Mexico are metric, and they don't like being lumped in with US!

Re: Round-off error

*Message #16 Posted by **unspellable** on 25 Aug 2003, 4:28 p.m.,*
in response to message #7 by bill platt

Example, a standard "NATO" round is known now as a "7.62" but what it really is is 30 caliber (3/10 inch). But 9mm does not convert cleanly.....

You don't get off that easy. The Nato 7.62 mm bullet is 0.308" in diamter and in its civilian guise is known as the 308 Winchester...

Re: Rounds

*Message #17 Posted by **bill platt** on 26 Aug 2003, 4:19 p.m.,*
in response to message #16 by unspellable

Unspellable et al,

Well, you are right-----my general ingorance (a little learning is a dangerous thing) on this topic has been exposed.

Now, how about a real off-topic issue: I have heard it said that the Soviets had their own caliber, which was slightly larger than the 7.62, and that the purpose of this difference was so that the soviet rifles could use 7.62 rounds, but the other side would be unable to use the soviet rounds. Is this true?

Re: Rounds

*Message #18 Posted by **r. d. bärtschiger.** on 26 Aug 2003, 4:39 p.m.,*
in response to message #17 by bill platt

Basically, yes. I will try to find a reference if you would like to see more information about this.

rdb.

Re: Rounds

*Message #19 Posted by **r. d. bärtschiger.** on 26 Aug 2003, 5:11 p.m.,*
in response to message #17 by bill platt

This may be what you are looking for.

http://www.bertsoer.nl/sniper/sniperrifls/SV-98i.htm

7.62x54mm r russian.

7.62x51mm nato.

The length of the 7.62 nato is 51mm from head to shoulder, whereas the russian is 54mm. Thus the russian round is 3mm longer and thus it would not fit the chamber of a 7.62 nato firearm.

Also the 'r' may mean that it is rimmed, whereas the nato is rimless.

Old other HP products

*Message #1 Posted by **Pierre Brial** on 22 Aug 2003, 8:36 a.m.*

Hello all

I read that at the time of the HP-35, Hewlett-Packard was a manufacturer of scientific instruments. But what kind of instruments ? Is there somewhere a list of their productions ?

All the Best

Pierre Brial

Re: Old other HP products

*Message #2 Posted by **Laurence Carr** on 22 Aug 2003, 10:40 a.m.,*
in response to message #1 by Pierre Brial

I used to be a salesperson for the HP instrument group back in the late 70's. There was a huge range of instruments available. In fact the instrument business was HP's main activity, although sales of HP computers (1000 series, 3000 series etc)was rapidly catching up.

The instruments sold were signal generators, spectrum analysers, scopes, rf, microwave, DVMs, logic analysers, power supplies, and some strange items like atomic clocks, borehole loggers, surveying equipment, laser systems, process contol systems etc etc. The instrument catalogue was a huge book about 1 1/2" thick!

Hewlett and Packard started their business as manufacturers of instruments in 1939 and only expanded into other things like medical systems (now owned by Philips) in the 1960s. They also had an analytical insturments group and a components group, and of course the calculator group!

All HP instruments were taken by Agilent Technologies when this company was spun off by HP a few years ago.

Re: Old other HP products

*Message #3 Posted by **Dave Shaffer** on 22 Aug 2003, 10:50 a.m.,*
in response to message #1 by Pierre Brial

Pierre,

In the 60's and 70's, HP was THE manufacturer of all sort of electronic test equipment: signal generators, frequency counters, oscilloscopes (but Tektronix was the acknowledged leader in this field), spectrum analyzers, frequency standards, power meters, volt/amp/ohm meters (originally analog, but digital, too) etc. Most with HPIB interface (for computer control and data access) A properly-equipped test and measurement lab had many shelf's worth of this stuff!

Every electronic engineer (real or imagined - I come closer to the latter) had the annually-issued HP catalog prominent on his bookshelf. This legendary hard cover book contained hundreds of pages of product

description, as well as many technical notes and discussions of all sorts of matters relevant to the hardware that HP was selling. You NEVER threw one of these catalogs away - they contained so much useful information. I still have a dozen of them. Nowadays, I think they still issue the hardbound version, but you can also get the CD (for Agilent, of course - another monsterously stupid move by HP - they gave up decades of number one name brand recognition to pursue their computer addiction).

Re: Old other HP products

*Message #4 Posted by **jimc** on 22 Aug 2003, 4:49 p.m.,*
in response to message #1 by Pierre Brial

I remember that, as a student of Chemistry in University in the early 80's HP's gas chromatographs were state of the art. While my memory is foggy now, I recall that they incorporated some advanced features such as programmable oven set temperature for multiple temperatures, heat ramp up or down, integration of component concentrations, and a choice of which component column you wanted to utilize all via a keyboard interface. If I recall correctly, you could also select the type of carrier gas you wanted as well. The other thing it had built in was a printer that printed the concentration graphs, and broke out the components automatically.

While it may seem simplistic today, back then EVERYONE wanted to use the HP as it was the best and easiest lab instrument. Every other manufacturers required way too much work to get a useful result from. I also recall feeling proud about setting my HP on top of the HP-GC. (I know, I know - a little brand showoff). Other students knew that the HP calculator was made by the same company who produced some real world instrumentation.

Re: Old other HP products

*Message #5 Posted by **Renato** on 22 Aug 2003, 6:17 p.m.,*
in response to message #1 by Pierre Brial

Pierre,

A good source for information on old HP scientific instruments is the Scientific American Magazine. HP ads in that magazine were a pleasure to read. Here in Brazil many university libraries keep all the issues since the 60s.

If you don´t find it there, please tell me what you want, and I´ll look for them at Unicamp when i can (it may take sometime...), scan and email you.

Renato

*Message #8 Posted by **db(martinez,california)** on 23 Aug 2003, 7:28 p.m.,*
in response to message #7 by Gordon Dyer

Gordon; I just looked around that link and i noticed two omisions:

They didn't mention the very popular 48 series but did feature the 49. I wonder if this means that the 48 is now "calculadora non grata".

They also blew off HP's impressive line of surveying instruments. The 3800 distance meter was a groundbreaking unit and was still being used in the 90's when someone wanted a long distance measured. The 3820 was the worlds best surveying instrument for about eight years running, till Wild of Switzerland came out with the T2000 - long after HP had gone on to other things.

I can see why they covered the 41 but did not mention that tens of thousands of us are still using it, 24 years after it's introduction, while we wait for the "something better" that they will no longer "invent". HP sure is proud of evry little throw away computer and printer though.

This Will Boost R & D, Sales of Scientific Calcs

*Message #1 Posted by **J.C. Randerson** on 22 Aug 2003, 8:20 a.m.*

The Luddites have struck again: all calculators with memory/text editing have been banned from national EIT exams:

http://www.ncees.org/exams/registration/8-20-2003_press_release.pdf

banning all calculators with extended memory/text capabilities. I sold 3 HP32s last fall thinking I'd never need them again. About a month ago, when moving, I found another HP32 in its unopened package in a drawer I'd completely forgotten about! What a relief...

J.C. Randerson

Re: This Will Boost R & D, Sales of Scientific Calcs

*Message #2 Posted by **Jeffrey_G** on 22 Aug 2003, 12:31 p.m.,*
in response to message #1 by J.C. Randerson

I took my Electrical PE exam armed with two HP48S's. I was able to work all the problems with time to spare. This is because the HP48 is an excellent tool. It was test preparation, not my calculator which determined my exam outcome (BTW I passed).

Banning these HP calulators is an outrage. The NCEES has done a disservice to future EIT & PE test takers.

Jeff

Re: This Will Boost R & D, Sales of Scientific Calcs

*Message #3 Posted by **Tony Duell (UK)** on 22 Aug 2003, 6:28 p.m.,*
in response to message #1 by J.C. Randerson

ARGH!!! IMHO, when an exam bans a tool (like a programmable calculator), it simply means the examiners are too lazy to set proper questions. If I was setting an exam, I would allow _anything_ apart from a person or a communcation system to another person to be used. You could take in any calculator, computer, notes, books, whatever. And you'd still have problems with it :-) What really annoys me is that a person's perfomance in an exam is used to judge their ability to solve real-world problems, but at least around here nobody cares what tools I use to solve a problem. I don't, for example, get handed a 9810 for repair and get told 'BTW, you can't use your LogicDart, and you must do the soldering with a screwdriver heated in a blowlamp flame rather than using your fancy temperature-controller iron'. People are just glad that I fix their machines, no matter how I do it. Selecting the right tool, and being able to use it correctly, is part of the process.

Re: This Will Boost R & D, Sales of Scientific Calcs

*Message #4 Posted by **bill platt** on 22 Aug 2003, 6:50 p.m.,*
in response to message #3 by Tony Duell (UK)

I generally agree with Tony on this, merely on the basis that many of the best (or worst!) exams I sat for in college were "open book." The profs understood the material, understood how to ask questions which required one to think, regardless of the tool, etc.

But there are exceptions, of course. For instance, my verbal matriculation examination in materials engineering was sort of like a stand-up thesis defense, but without the thesis. No materials at all, except the chalkboard. The panel of distinguished professors asks, "could you discuss the concept of the stress-strain curve?" And then once that is charted out, "why is it drooping over there?" to which you answer, "ah, good question! This is an engineering stress-strain curve referenced against the original cross sectional area...etc." And so you are feeling smart, but then they just dig deeper. So then, why does the curve curve over? (Yielding). And then with some more prodding, they expect you to get to the atomic stress-strain curve, and to dislocations, and defects, and Griffith energy....

But note that in the latter case, if you have no knowledge of the topic, or very little, you are sunk! Whereas in the open-book exam, if you are organized, and a quick study, you might just find what you want... (I did this in freshman Physics on my first exam and got an A, but then the prof got smart and by the end I was getting D's!). But still, if the professor structures the exam with some skill, you will have no way to "cook-book" the answer.

I think perhaps it is the multiple choice aspect that kills the open book concept. When the student is required to show work and to describe her understanding in words, then there is a good exam.

Just my 5 guineas worth.

Exam cheats must die

*Message #5 Posted by **Richard** on 23 Aug 2003, 9:42 a.m.,*
in response to message #4 by bill platt

During WWII, the Enigma machine and it's code was solved by brilliant mathematicians who used only their brains and a piece of paper - no computers and no calculators - they probably passed their exams by using only their brains too. What a bunch of wet-weaks we've all turned into. The decision to ban cheat potential calulators is an excellant move.

Re: Exam cheats must die

*Message #6 Posted by **J.C. Randerson** on 23 Aug 2003, 3:48 p.m.,*
in response to message #5 by Richard

This is bull$@#$! Who says anyone was cheating? What this really about is the age old contest of arguments between those who hate technology and those who love it: Luddites vs. Geeks.

On one side you have the diehard mathematician types, remember your instructors from the calculus series, no calculator whatsoever allowed? On the other side you have the Steven Wolfram,(creator of Mathematica) types who say you get nowhere without technology.

I tend to agree with Wolfram: after a certain level, without technology you can't do much. And to ban a certain calculator on an engineering test, where you are supposed to bring all your skills to bear (including use of technology) to solve real world problems is unbelievably stupid.

We've all taken tests where you could have brought in all your notes, the text, even a pc, but without understanding the material, you couldn't even start a problem. Having technology does not mean you understand anything. It's just a tool to speed the computation process. And no machine can replace the human brain to set up the process. That's what makes an engineer.

This current NCEES decision wins a round for the Luddites. I'd take them more seriously if they gave up their computers, cars, insulated homes, electric lights, eyeglasses, modern health care, etc... But of course they're not, and that's what makes them and those defend them phony. In short, all they're trying to do is make it as hard as possible. To that I say with emphasis: bull$@#%!

J.C. Randerson

Re: Exam cheats must die

*Message #7 Posted by **Tony Duell (UK)** on 23 Aug 2003, 4:21 p.m.,*
in response to message #5 by Richard

Err, wait a second. Yes, enigma was cracked using brainpower, but I will bet that had computers been available then, they would have been used. The codebreakers would _not_ have artificially limited the tools they could use. No sane person would do that. I once read a book which said 'It is good for students to overcome difficulties, but those difficulties should be real, not artificial'. This is a view I strongly agree with. Sure calculators make _calculations_ easier, but they are not a replacement for understanding the subject -- and that's what exams should be testing. To comment on an earlier message in this thread, when I did my Ph.D. viva, I did ask if I could look up something in a databook (I think it was whether a signal was inverted or not). The examiners said 'sure'. I don't think it counted against me either (I passed :-)). Had I been an examiner, then I would have been happy for a candidate to look something like that up -- it was clear he understood the subject, clear he knew there was a possibilty the signal was 'upside down' and clear he knew how to check. Which is what a real-world designer would do. Better that that get it wrong in a complex design and have to sort it out later! To go back to the example of a stress-strain curve -- if I'd asked the candidate to discuss the stress-strain curve of a particular steel, then I would be happy for him to look it up in a databook. Nobody can, or should, remember details like that. But then he should be able to make intellegent comments about it from memory, without just reading sections out of the book. That's a test of _understanding_.

Re: Exam cheats must die

*Message #8 Posted by **Richard** on 24 Aug 2003, 5:09 a.m.,*
in response to message #7 by Tony Duell (UK)

The point here is that the Enigma Code wasn't solved by a computer or a calculator, it was solved by the brilliance of someone's brain - a testimony to the ability of the individual who has proved his skills a million times over. Even now most people are in awe of this and how they achieved it - without computers or calculators (that's the point).

If he can use his own skills and resources to solve the complex enigma code, it goes without saying that if there had been computers available it would have been solved infinitely more quickly by the same brilliant individual, or by a million other non-brilliant individuals whose only great shill is being able to press a button on a keyboard to demonstrate the use of technological aids, to activate a computer program to solve the porblem. In this case the only brilliant one would not be the millions of non-impressive individuals who demonstrate their skill by using tools such a computer (my 5 year old does that now), but would be the single brilliant person who spent hours using his BRAIN to devise and construct the computer program that is utilised by millions of others who supposedly show questionable initiative and skill to solve the problem by choosing HIS program. Of course "the others" will try to impress the pants off everyone by boasting how they solved major complex problems using the available technological aids such as a computer and a program (yawn!) - but this doesn't prove or establish their abilities or "manhood".

By the way, it makes sense to me that if computers did exist back in WW2 , the Germans would

have devised an Emigma code simulation by computer that was more complex by a factor of 1,000,000,000 (probably), it would have had 10,000 rotors, 100,000 symbols on each rotor and it would have been ENCRYPTED to boot, plus it probably would have had 1,000 other safety measures the brilliant german mathematicians would have added (don't forget Einstein was a German!!!). Give the old original Enigma code to some of the current "brilliant!?" college graduates (assuming a level playing field), and see how they go trying to solve the problem. You will soon hear, "Mommy I want my computer- it can't be done without the use of technological aids - after all I passed all my exams using my ability to use and demonstrate my ability to use computers and my excellent ability to select the right program off the shelf to solve the problem instantly".

The bottom line is..... if you've proved yourself without the need to pass exams using advanced aids then it goes without saying that you're capable of pressing a button on a calculator or a computer to do same brain functions infinitely faster - the point is you've proved you're able to use your brain in the first place without artificial prosthetic devices like PC's and calculators.

Of course we can go to the other extreme and embrace the use of all technological aids to help pass examinations. In 100 years from now when the human brain is hardwired to plug-in module in the back of the brain, all you will have to do when you sit for your "ADVANSED STRESS ANALYSIS" exam is plug the data module into you brain socket and hey presto you've demonstrated your immense initiative and abiltiy to use the available design tools available around you to solve the problem and pass the exam - the whole class would pass with A+++ results - even the local street drunk would get an A++++ in "ADVANCED STRESS ANALYSIS" - good on him for using all available technological aids and devices. Mind you, if these aids and devices were banned in examinations - then we'd really see who the real brains are!!!!!

THE BOARD's DECISION TO BAN HIGH TECH CALCULATORS IN EXAMS IS AND EXCELLENT DECISION - SHOULD HAVE BEEN DONE AGES AGO - WELL DONE AND ABOUT TIME.

Re: Exam cheats must die

*Message #9 Posted by **Patrick** on 24 Aug 2003, 12:50 p.m.,*
in response to message #8 by Richard

Due to the extreme importance of the task, the people who worked on the Enigma problem were hand picked throughout the entire allied population as being the most brilliant and appropriate to the task. Making a public education policy decision based on the fact that this *elite* group of people were brilliant and successful is nothing short of obtuse.

I have been on the exam-giving end of this equation. I think the onus should be on the instructors to set an exam for which technology cannot play a key role. For example, if I was teaching numerical integration techniques, it would be stupid of me to ask in an exam to numerically approximate some integral. A calculator of the HP-34C vintage could do that with the press of a few buttons. What I should ask is for the student to explain which numerical integration technique(s) should be used given the circumstances (smoothness of the function, existence of poles, required accuracy, time available). I might even ask for the student to show one step of the process (x -> x+h) in its entirety, just to see if the student understands what all the formulas mean. I, as an instructor, wouldn't care less what the numerical value of the integral over the entire region of integration actually was, which is all the 34C could really tell me.

in response to message #9 by Patrick

Hi Patrick,

One of my preofessors said, "yes, you can bring your calculator if you like, but it won't do you any good." He was right. His questions required one to answer for the understanding, not the numerical answer. But he let us bring our calculators--because I suppose he was both confident in his questions, as well as perhaps mildly entertained when watching furious buttonpressing.

advanced stress analysis

*Message #11 Posted by **christof (NoVA US)** on 25 Aug 2003, 12:39 a.m.,*
in response to message #8 by Richard

Leaving aside the enigma machine (enigma was only decrypted in the first place due to samples of the hardware- the machine itself)-

Advanced Stress Analysis. - I really don't think that anything beyond a multiple choice exam cna be successfully passed simply by loading software into your hp48/49 or TI89/92. Even to do *that*, you have ot know enough to structure the problem. Even if the program you use is cribbed from the web, you have to be able to apply it. That requires at a bare minimum, the ability to think about the problem to some degree.

Beyond that, i'd like to point to the brain rotting experience of my last chemistry refresher course, where I was allowed to use any calculator I cared to bring. i was encouraged to use it, in fact- as the professor said that if you coldn't get accurate results in the real world, knowing the formulae wouldn't mena much.

She also required that you provide intermediate steps on the exam. Kind of hard to fake it with a downloaded 'brain plug' or whatever.

All of your supposed plug in modules for the brain model 41CX (I want the time module built in, after all) miss something very important. The ability to solve problems.

'who the real brains are' - while quite an ego booster, is not actually determined by who can memorize the most stuff. it's how you use it that counts, not what lists you've memorized.

Now, I realize that you disagree, and I accept that. But I'm a bit put off by the idea that one extremist view should hold sway.

The use of 'high tech calculators' allows a test giver to increase the quality of testing dramatically by structuring tests for understanding, for reasoning ability, for problem solving application- instead of worrying about who memorized a log table best, or who dropped a decimal point in an otherwise perfect pencil calculation. If the tests are not increased in quality, and you aren't able to show 'who the best brains are' without list memorization, that isn't the fault of the calculator- nor of the person who owns and uses the calculator.

another nickel, another post :) -Christof

Re: Exam cheats must die

*Message #12 Posted by **Geoff H.** on 25 Aug 2003, 7:27 a.m.,*
in response to message #11 by christof (NoVA US)

Surely people can manage without their "security blankets" - their professional aids and devices for 2 hours in an exam. After all, it's the process that matters and the abiltiy to understand the process and demonstrate that they understand the process(as has already been mentioned by others). Once you've proved your ability for 2 hours in an exam room in a TOTALLY AND COMPLETELY LEVEL PLAYING FIELD without the aid of these tehnological devices, you can then proceed to use anything and everything you want to use to solve all subsequent problems for the rest of your life - no restrictions whatsoever.

The pressing of a button on a machine is irrelevant and is the easiest part of the process. After all, computers, calculators and other technological aids are only GIGO (garbage-in-garbage-out) devices - they have no intelligence, no initiative - that ability comes from you and your demonstrated abilities - and that's what the exam is trying to establish. These devices are only prosthetics to enhance your abilities - they're not needed in the exam room to prove your ability to solve the problem or demonstrate your ability about how to solve the problem - therefore what's the point of having calculators in the exam room in the first place - if you know the process, that's what you're there to prove and you have nothing to worry about, calculators are not needed and are not necessary in the exam room.

The complexity and scope of the type of the exam questions has nothing to do with whether calculators should be allowed into the exam room. After all, as has been mentioned previously by others, the ability to solve the question depends solely on your skills and ability - you still have to derive the solution about how to resolve the problem no matter how complex or challenging it is - the calculator won't do that and having a HP48, HP49 or a PC won't resolve that delema for you - remember, they have no initiative, no intelligence they're just prosthetics - GIBO devices.

However when the HP4200Sii calculator (ii = double artificial intelligence) comes out in a hundred years from now with RBT - Reverse Robot Notation, then that will be a different story. The guy next to you in the exam room will be using one of these calculators and he will look like something out of TERMINATOR: JUDGEMENT DAY - so if he wants to use a calculator in the exam room the Board of Studies is going to have real problems telling him.

in response to message #13 by Dave Hicks

Kidding aside, I don't think the objection is to alternative views, but to outright misrepresentation in the expression of any view. In a cool medium such as this discussion board, much is inferred from relatively few clues. It is patently deceptive to surreptitiously create "artificial pluralities" around issues by posing as several different people who happen to be in agreement.

That said, I appreciate the humor when someone emphasizes irony by signing a note with the name of a well-known individual. But in such cases, while the perpetrator's identity isn't necessarily clear, the fact that something is being perpetrated *is*.

*Message #23 Posted by **Veli-Pekka Nousiainen** on 26 Aug 2003, 6:15 a.m.,*
in response to message #12 by Geoff H.

My dis/agreements:

1) tests should be made so that calculator doesn't "solve" your problems, you do!

2) I would ban calculator capable of solving the problems in question (at that level of education) because not all teachers can comply with 1) eg. TI 89/HP 49 banned on graduation test, but not in the university level. Graphing banned when functions are teached so that you're required to hand draw some graphs. etc.

3) Related to 2) there should be different levels of calculators allowed for different levels (grades) of education. Also math/physics/chemistry/etc. might have different restrictions. Global Guidelines should be given and national guidelines enforced.

I'm in total agreement Veli-Pekka - but watch yourself the thought police are patrolling this site to exclude anyone expressing free speech and anyone who expresses a point of view different from his!! WOW this guy is FRIGHTENINGLY serious - I think he got upset that someone found out that he needs his securtiy blanket HP4200Sii to sing him a lullaby at night before he go to sleep. Probably also uses a HP49 to tally up his grocery shopping - WOW impressive guy (LOL).

Thank God I'm a TI fanatic - some HP fanatics are a real worry!!!

The Turing Bombe

*Message #25 Posted by **christof (NoVA US)** on 23 Aug 2003, 4:29 p.m.,*
in response to message #5 by Richard

If you mean the Poles, they broke Enigma in the 1930s. Probably without the aid of machines.

After the Germans improved the Enigma, when the Allies were breaking it, a guy named Alan Turing built a machine to do the job. A computer of sorts.

Alan Turing is dead, yes. Whether or not his use of a machine makes him a cheate risn't really relevant- there was a war to win :)

Re: The Turing Bombe

*Message #26 Posted by **Alexander** on 24 Aug 2003, 5:39 a.m.,*

in response to message #5 by Richard

Didn't the personel at Bletchley use something called a 'Bombe' to help crack the Enigma codes? And was it not revealed not too long ago that the first computer was developed at Bletchley? A title which heretofore had been claimed by Univac. Research the site

http://www.bletchleypark.org.uk/

for further information. The recent film Enigma, (2001) has a few scenes of a 'Bombe' at work. It may not look like a computer, however it sure seems to be computing something.

in response to message #5 by Richard

Excuse me for saying so, but your attitude reminds me of the classical Greeks (Pythagoreans) who insisted that all numbers were rational and that all geometrical constructs be made with compass and straightedge alone.

This (equally narrow-minded) attitude resulted in 2000+ years of fruitless toil for circle squarers, angle trisecters, and cube doublers.

Technophobia is plain irrational. If you start rejecting technology just because it is technology, where do you stop? Are we to give up cars, air conditioning, vaccines, the internet, and so on?

Re: Exam cheats must die

*Message #30 Posted by **David Smith** on 24 Aug 2003, 6:15 p.m.,*
in response to message #5 by Richard

I think that anybody taking a professional exam should be allowed to bring anything and everything they would have access to in the real world to the exam. You want to see if they can solve problems using the tools that they would have available to them in real life. Testing their ability to remember some equation, etc is just plain ridiculous.

Calculators became "available" my senior year in high school. Our physics teacher debated whether to let us use them on exams. After playing with one a while he realized that he could give real world problems instead of ones contrived to be answerable with a slide rule, etc. His only concern was what if some poor (financially) student did not have one. That was not a problem since everybody in the class had access to one. All the people taking that high school class also placed out of college level physics courses.

*Message #31 Posted by **db(martinez,california)** on 23 Aug 2003, 8:05 p.m.,*
in response to message #1 by J.C. Randerson

One thing for those of you who have not sat for one of these exams: you can take in as many books, tables, drafting supplies, and notes as you want, including the correct answers to years of earlier tests.

As i remember; NCEES did something like this once before, by banning programmable calcs (although i know they were allowed when i passed the LSIT in '86). Does anyone else remember the test from that era and the most common sound in the hall: the "BEEP beep BEEP beep - aw SHIT!" from us 41 owners who forgot to put it back in user? They now try to write many of the questions so you cannot just plug and crank using the common programs or at least to force you to lie to the program to get the right answer.

The second half of the questions on the L.S. exam (and i guess the P.E. too) come from practicing professionals. They require judgment and the ability to describe your thought process - not just a numeric answer. It might be possible to get the wrong answer on the majority of the questions and still pass the test by showing a mastery of the theory, law, history, and logic involved - but i wouldn't bet on it.

Re: This Will Boost R & D, Sales of Scientific Calcs

*Message #32 Posted by **Todd G** on 23 Aug 2003, 10:53 p.m.,*
in response to message #1 by J.C. Randerson

I think one area of concern here is that a lot of new calculators can communicate with each other via infrared. I believe it is these features, and not the programmable aspects of the calculators, that have the engineering exam folks in an uproar.

My wife is a university professor (biochemistry), and she does not allow calculators with communication functions, text pagers, beepers, or the like. People have used these devices to share answers with their friends. It's sad, but most of the good, high performance calculators that engineers use have these functions.

in response to message #32 by Todd G

If you were to decide which potential employee to hire for your high tech company, which person would you be likely to employ - the person who solved a highly complex exam paper using no technological aids such as calculators, computers or other devices ... or the one who solved exactly the same complex exam paper using all technological aids available with no restrictions whatsoever.

I would be hiring the first - if he can solve the complex problem without technological aids, there's a fair chance he also has the abilty to solve the same problem USING technological aids and devices. The reciprical situation in most cases is unlikely to be the case i.e. the person dependent on using available technological aids is usually incapable of coping without the aid of these devices to solve the problem.... there available "YA JUST GOTTA USE THEM" mentality.

Who's the more capable - the young 8 year old school kid who can do maths in his head to solve the problem, or the younger 7 year old school kid who uses a calculator to add up!!! The 8 year old must be an idiot and should know better because he doesn't take advantage of the available technological devices at his disposal like the "smart" and absolutely "brilliant" 7 year old. The "smart" 7 year old has proved his perceptive skills and demonstrated how "ingenious" and "brilliant" he is by using an available advanced technological device or tool to do the work for him to solve the problem ...yeah right... The 8 year old has proved how stupid he is by not using a calculator to do the problem....what a Dumb-***se!

Believe me, I work with idiots who believe everything has to be done using all available technological devices ... most can't wipe their own ***ses unless a technological device is available to assist them to do it (in most cases their wives come to the rescue ... the "use all resources available" philosophy... why do it by your own means).

Re: Exam cheats must die

*Message #34 Posted by **Stephen Sester** on 25 Aug 2003, 1:11 a.m.,*
in response to message #33 by Orlando W.

Orlando,

I beg to differ with you.

A student must understand a problem and it's correct solution methodology if he/she is to program a calculator to solve the problem. I have done this many times and usually I learn several different ways to solve the problem that would not have been evident if I had just worked the problem once on paper. This type of programming is also a very valuable skill for an engineer.

Another HP calculator feature that I really value is unit conversions...I understand units and their inter-relationships but under time pressure, one is susceptible to making careless errors and the calculator unit conversions enable a quick double check. Judging from the past mistakes of some very prominent scientists and engineers, even the best of us make simple mistakes sometimes. Calculators help us to catch these errors in the office or at the exam table not in a catastrophic failure or an unexpectedly bad grade. NCEES should understand and appreciate this!

For yourself, perhaps this isn't an issue...but I doubt it. At any rate, I wish you the best of continued perfection, :/

Re: Calculators and exams-- students hate me.

*Message #36 Posted by **Michael Meyer** on 26 Aug 2003, 1:02 a.m.,*
in response to message #35 by christof (NoVA US)

I don't know, but there may be some students in one of my classes who still hate me 20 years later.

During a college statistics class (1981), calculators were allowed and really required for exams. I shared with the professor that I'd programmed all of the statistics on my TI-59. I proudly showed him the programs with each new concept learned. I understood the concepts better having programmed each of them.

On the day of the final, he passed out the exam and then announced: "I wrote this final exam with Mr. Meyer in mind."

There wasn't a single problem to work! It was all questions about theory!

I scored 100%, but there just may be some fellow former classmates who hate me for that day.

Michael

Any Interesting HP 3421A applications out there?

*Message #1 Posted by **Tracy Vermeyen** on 22 Aug 2003, 12:54 a.m.*

I was wondering if anyone wanted to share some interesting HP 3421A applications using the HP 41C calculator as the controller?

I've heard of someone using this system to run a sprinkler system and I want to know more.

Tracy

Re: Any Interesting HP 3421A applications out there?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Aug 2003, 2:44 a.m.,*
in response to message #1 by Tracy Vermeyen

Hi, Tracy;

some contributors in here have 3421A units, and I'm about to get one myself. Do you know what I'm actually interested on after taking it? Build custom boards. Anything, since collecting specific data to external actuators.

The unit I'm about to take has only an input 10-ch board (or would it be 8-ch?). Anyway, do you know if there is any documentation about how to design custom boards for it? is there any information about internal bus and the like?

Just curios about.

Another thing: it seems that the HP41 becomes a fine controller for the 3421A when the specific 3421A ROM is installed. Do you have it? I plan to use mine (to come soon, I hope) with the HP71B or, if and when is delivered, an HP75. I think these are better controllers, not because I take as better than the HP41, but because they have a bigger display and bigger internal RAM, allowing more data to be recorded without the need for external mass storage access so often. Are you interested only in applications with the HP41?

Best regards.

Luiz (Brazil)

Edited: 22 Aug 2003, 4:04 a.m.

Re: Any Interesting HP 3421A applications out there?

*Message #3 Posted by **Tracy Vermeyen** on 23 Aug 2003, 1:07 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luis,

Yes, I do have the 3421A ROM module and it makes using the 3421A quite simple. For now I am only

interested in 41C applications because that is the only system I have (for now anyway).

I have access to a full line of documentation for the HP 3421A in paper form only and it would be alot of work to convert it to PDF. Sorry, I do not have any specific information on creating custom boards. I can look for information on the internal bus, do you have any specific questions?

Regards, Tracy

Re: Any Interesting HP 3421A applications out there?

*Message #4 Posted by **Christoph Klug** on 22 Aug 2003, 5:15 a.m.,*
in response to message #1 by Tracy Vermeyen

Dear Tracy,

some weeks ago I sold a HP-IL/PC interface card to Technologie Center in Karlsruhe/Germany. They use some HP3421 - controlled by PC (not HP41) for water quality measurement. But I have no detailed informations about the sensor systems they use.

I have also an HP3421 - but for measurement,data logging and interfacing applications I prefer my modular I/O-Board and my new IL2000 system. This include some more features and less space than the HP3421. As system controller I use the HP41CX including EXT-I/O Module and CCD-Module. Applications are audio measurement, temperature measurement....

Best wishes - Christoph

Re: Any Interesting HP 3421A applications out there?

*Message #5 Posted by **Christoph Klug** on 22 Aug 2003, 5:25 a.m.,*
in response to message #4 by Christoph Klug

Dear Tracy and Luiz,

some details about the HP4321 including service manual you find on the webpage of Warren Furlow. Including a describtion of the 8 bit input-output option board.

Have anyone practical knowledge about calibrating a HP3421. Please give details about this procedure to the forum .

Best wishes from Germany - Christoph Klug

Calibating 3421

*Message #6 Posted by **Renato** on 22 Aug 2003, 6:29 p.m.,*
in response to message #5 by Christoph Klug

Christoph, I have no practical knowledge, but I know that the DC and AC reference voltages are not so easy to get. Also, a 6 digit voltmeter is quite a rare animal.

Renato (with one 3421 to calibrate, to send to a great friend).

Re: Calibating 3421

*Message #7 Posted by **Lawrence** on 23 Aug 2003, 8:10 a.m.,*
in response to message #6 by Renato

Agilent Technologies (former HP Instruments Div.) will calibrate a HP3421A. I had them calibrate mine. It was determined one of my three multiplexer boards was faulty. Given the age of the unit they could not offer a replacements. The cost of calibration is $US 275 which included domestic shipping to and from my location.

Their phone number is 800-403-0801 if you're interested.

The best source of info on the unit is Warren Furlow's 3421A CD-ROM. It includes numerous example programs with barcode.

I control my unit with a Data Acq / Control ROM image within my HEPAX ROM.

Good Luck.

Re: Any Interesting HP 3421A applications out there?

*Message #8 Posted by **Tony Duell (UK)** on 22 Aug 2003, 6:44 p.m.,*
in response to message #1 by Tracy Vermeyen

I have an HP3421 (great instrument!), but I normally use it with the HP71. That machine has more memory than the 41, which is useful for storing and processing whatever data I measure with the 3421. One application I use it for is testing the HP chargers. It is well-known that the chargers for the Woodstock, Spice, and Topcat series are just transformers, but they're transformers with deliberately high internal resistance. So i decided to do the stand school experiment with said chargers -- connect various resistors to the output and measure the voltage, then plot the V-I curve. Of course I've got better things to do than measure voltages all day long. So I connected 8 relays to the digital outputs of the 3421 (I actually used a ULN2803 chip to drive them, this is probably not necessary, the 3421 could do it directly), and used said relays to switch in the resistors in a 7 stage chain (1, 2.2, 3.9, 8.2, 15, 33, 68 ohms IIRC, with a 10 ohm in series with the lot). The last relay disconnected all the resistors from the charger so i could measure the open-circuit voltage. I wrote a little HP71 program to cycle through the 129 possible resistances (128 settings of the chain, and open-circuit), and record the AC voltage at the output of the charger. These readings were stored in a text file that was then uploaded to my 95LX palmtop (one of the few machines I have with a spreadsheet) to plot the graph. On other thing I did was to use the resistance ranges of the 3421 to measure the resistance of the chain in each of the settings, and saved that on the 71. That way I could get away with cheap 10% power resistors.

Re: Any Interesting HP 3421A applications out there?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 22 Aug 2003, 11:58 p.m.,*
in response to message #8 by Tony Duell (UK)

Hi, Tony;

you know what? That's what I think is one of the best examples of what can be done (amongst lots and lots of things) with an instrument like the 3421A. I thought about charging/discharging battery curves as well; also, Simultaneous/multipoint measuring would be a lot easy.

In my previous post in this very thread, I asked about internal 3421A specs. Do you have (or know where I could find) this sort of information? I would like to know if it is possible to build custom boards with ordinary, commercially available components, to be used with the 3421A.

Best regards and thank you.

Luiz (Brazil)

*Message #11 Posted by **Tony Duell (UK)** on 23 Aug 2003, 4:12 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

I believe the 3421 service manual is on the web somewhere -- that includes full schematics. I do know that the digital I/O card is all standard components -- it's a bit unconventional since all the inputs and outputs are isolated, but you should be able to make a card that looks the same to the 3421 without all the transformers (!). The mux is a bit harder -- there's a temperature sensor IC for cold junction compensation on that board, so if you homebrew that one you'd have to calibrate it. Not impossible, but not trivial. Again, AFAIK there are no custom chips on that board either.

Re: Any Interesting HP 3421A applications out there?

*Message #12 Posted by **Gordon Dyer** on 24 Aug 2003, 11:30 a.m.,*
in response to message #11 by Tony Duell (UK)

Sorry but the link I thought I had included to the website was missing, it includes the manuals and brochures for the HP3421A.

```

Its bad manners to ignore the wishes of your host.

Since David does not want this site to be mentioned here, I think we should all respect his decision.

You can always send this info via email. A person who asks for advice but does not include an email address only has himself or herself to blame.

*Message #15 Posted by **Ellis Easley** on 26 Aug 2003, 4:06 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

My 1986 HP catalog lists an option for the 3421A, "Option 040 Breadboard Assembly [HP44464A] - The breadboard assembly is convenient for constructing custom circuitry. It comes complete with a manual describing the circuit that enables the HP3421A to communicate directly with an 8-bit microprcessor." That manual would probably be quite useful! I wonder if it is on that other website?

HP 3421A actuators

*Message #1 Posted by **Tracy Vermeyen** on 22 Aug 2003, 12:43 a.m.*

I have a HP 3421A that I have repaired and I have a question about the 10-CH multiplexer assembly (Option 20)boards. What applications are there for the actuator's channels (channels 0 and 1)?

Tracy

Re: HP 3421A actuators

*Message #2 Posted by **Andy** on 22 Aug 2003, 5:51 p.m.,*
in response to message #1 by Tracy Vermeyen

I have used the actuators to activate relays so I can turn higher voltage devices on and off.

For example, I once hooked a humidifier up to a relay controlled by channel 0 on the 3421a. Then I had two thermocouples to measure both wet bulb and dry bulb temperatures. I used my hp75 to calculate relative humidity from the two temperatures (and a known air pressure) and then had it turn the humidifier on or off to control humidity.

Also, I have a freind who uses his 3421 and his 41cx to control his home sprinkler system (I think he has the digital card option though which gives you more on/off channels). He uses a repeating alarm on his 41cx to call a program which opens and closes valves.

The possiblities are endless!

Enjoy,

Andy

Re: HP 3421A actuators

*Message #3 Posted by **Tony Duell (UK)** on 22 Aug 2003, 6:23 p.m.,*
in response to message #1 by Tracy Vermeyen

OK, the 10 channel input board has 10 (electromechanical) relays on it. 8 of them (channels 2-9 IIRC) are connected to the input of the ADC section, and can only be used as 'multiplexers' -- to switch different signals to the ADC so that you can, for example, measure input and output voltages of a circuit. The other 2 can be set by links on the input board to either be multiplexer channels, or 'actuators'. The latter means the contacts are not connected to anything inside the 3421 (apart from protection networks IIRC), so you can use them to switch external circuits. Be warned the contacts can't handle much current or voltage -- use them to switch a larger relay if necessary.

Raul

Re: HP 48GX Expansion cards

*Message #4 Posted by **bill platt** on 22 Aug 2003, 8:54 a.m.,*
in response to message #3 by R Lion (España)

Hi Raul,

Good to see your post. I just bought some RAM cards from Klotz ysterday! I decided that I needed to "take the plunge" as it were. My curiosity regarding some of the programs on hpcalc.org, and my interest in trying out the hp41 emulator on the 48, finally convinced me that I needed to get extra memory.

Some time back, you gave me some pointers on RPL programming and it was a great help. I re-coded my simple little RPN keystroke 3-D centroid solver to RPL using lists, and it is very cool! Even my co-workers like it.

Best regards,

Bill

question re: 12C HP

*Message #1 Posted by **Debi** on 21 Aug 2003, 8:09 p.m.*

I was wondering if someone could help me. I have a HP 12C and cannot locate my manuel, so I can fix this problem. The calculator has a comma instead of a period, and it's driving me crazy. I know this is a simple problem to correct, but can't seem to find the right keys to press so I can get the period to replace the comma. I have searched on the internet and I am still having no luck, with this simple problem. I would soo appreciate it..if someone could help. Thank you.

Re: question re: 12C HP

*Message #2 Posted by **Randy Sloyer** on 21 Aug 2003, 8:41 p.m.,*
in response to message #1 by Debi

1. Turn the unit off.
2. Press and hold the "." key.
3. While holding down the "." key, turn the unit on.

Doing this again will toggle it back to a comma.

Re: question re: 12C HP

*Message #3 Posted by **Debi** on 21 Aug 2003, 9:27 p.m.,*
in response to message #2 by Randy Sloyer

OMG Thank you so much.. this has been driving me crazy and I couldn't find our how to fix it. I know it was a stupid question, but thank you for your help.

Re: question re: 12C HP

*Message #4 Posted by **Randy Sloyer** on 21 Aug 2003, 10:18 p.m.,*
in response to message #3 by Debi

It is just as obvious as changing the number of displayed decimal places...

1. Turn on.
2. Press the gold "f" key.
3. Press the number of desired places on the numeric pad.

It's another one of those things that you'll never remember when you need it most. The manual is available online here: http://h20015.www2.hp.com/content/common/manuals/bpia5184/bpia5184.pdf

is 12C platinum better than old 12C?

*Message #5 Posted by **tomk** on 23 Aug 2003, 2:34 p.m.,*
in response to message #1 by Debi

anybody use the 12c platinum yet? is the old 12c better?

Re: is 12C platinum better than old 12C?

*Message #6 Posted by **bill platt** on 23 Aug 2003, 3:14 p.m.,*
in response to message #5 by tomk

Search on "platinum" and 12cp and 12c etc in both the forum, and the latest archive, and you will find LOTS of info.

Regards,

Bill

HP 32E Display Question

*Message #1 Posted by **Harry (Germany)** on 21 Aug 2003, 7:59 p.m.*

I have a HP32E, wich has a display problem. When I switch it on, all the upper left segments are missing. This problem disappears after a few seconds. But pressing a key sometimes produces the same thing, but only in the first 2 minutes of operation.
Does anybody know what that is?

There is also another problem, one of the dots is missing, I changed it to comma as radixmark, so its not a big deal now. I think it has to be the led itself that is bad, could it be anything else?

Regards, Harry

Re: HP 32E Display Question

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 21 Aug 2003, 11:28 p.m.,*
in response to message #1 by Harry (Germany)

I have a HP32E too, and when it arrives (I bought it through eBay) its display was horrible, digits missing, half-digits. I begin the restoration, and I found that my 32E is that version that the chips isn't soldered (as its display). I disassembled it and begin restoration, cleaning the contacts with a soft pencil eraser. When I assembled it again it was working as new!

Look at http://www.hpmuseum.org/tech30.htm

As your 32E is showing the same simptoms as mine I guess that it is the solderless version too.

In less words: bad contacts, a good cleaning will fix it. But take care, the case is tricky to open, and the chips just jump away when you take the holders off!

Good luck.

Nelson

Re: HP 32E Display Question

*Message #3 Posted by **David Smith** on 22 Aug 2003, 2:22 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Before working on any HP calculator record the positions of any wires (HP65/67 card readers) or chips (unsoldered spice series machines). A few closeups with a digital camera can come in really handy.

Mine is the soldered version

*Message #4 Posted by **Harry (Germany)** on 22 Aug 2003, 2:41 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

I also resoldered all the contacts.
I don't think it is a bad contact, as the problem only appears in the first minutes of operation.

Regards, Harry

Re: Mine is the soldered version

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 Aug 2003, 5:10 p.m.,*
in response to message #4 by Harry (Germany)

Hi, Harry;

have you also soldered all terminals in the mani chip? As the display connections end there, maybe you have a bad contact in the main chip itself instead of the LED assembly.

Anyway, if you look carefully, you'll see that the soldering tabs in the LED assembly are pressed to it, not soldered. I once applied solder material to each connecting point in the LED assy and the display worked fine again. I consider this a "last alternative", because when a complete set of segments is missing, I consider a bad connection. Have you also gently "twisted" the case when it happens? If it is indeed a bad connection it will probably restore their normal operation at the moment you do it.

If you still need help, let us know.

Luiz (Brazil)

48 series memory cards

*Message #1 Posted by **unspellable** on 21 Aug 2003, 1:09 p.m.*

In the 48SX and 48GX, if a RAM card is merged with user memory, it presumably will stay in place and not be taken out and put back in like a card used for backup, storage, or moving programs from one calculator to another.

In this case, is there really any purpose in having the backup battery in the card? Other than it keeps the low battery warning shut off?

Re: 48 series memory cards

*Message #2 Posted by **Ron Ross** on 21 Aug 2003, 1:19 p.m.,*
in response to message #1 by unspellable

You would probalby lose all memory on a battery change also (the capacitor barely keeps the original memory intact, much less extra).

Just my thoughts, not proven one way or the other.

Re: 48 series memory cards

*Message #3 Posted by **unspellable** on 21 Aug 2003, 6:09 p.m.,*
in response to message #2 by Ron Ross

I don't know about the 48 series, but I have an HP 28S here that was intermittent. It had been dropped once too often. Thinking there might be a crack somewhere I took it to our failure lab and had it X-rayed. All during this examination it had no batteries in it. Went twenty minutes or so. Upon replacing the batteries there was the entire memory intact!

Just as an experiment I might try to see how long a 48 will hold up without batteries.

I suppose one should have a cell in the RAM card just to avoid the nuisance of a low battery warning if nothing else.

Re: 48 series memory cards

*Message #4 Posted by **R Lion** on 21 Aug 2003, 4:18 p.m.,*
in response to message #1 by unspellable

If I'm not wrong, the card NEEDS its battery for keeping the stuff stored when the calc is off. The three main AAA batteries only "feed" the card when the calc is on.

Raul

Voyager Back Metal Plate Repair

*Message #1 Posted by **bill platt** on 21 Aug 2003, 12:28 p.m.*

Hi all Voyager fans,

So, I have a 15-c which has the back plate peeling up on one end. Because the (aluminium) plate is plastically deformed, I have been unsuccessful with superglue--there is too much stress on the glue, (the plate springs back against the glue) and of course I cannot clean the faying surface.

So, the other option would be to carefully remove the entire back plate, then make it perfectly flat, (taking care not to damage the silkscreened areas) then reinstall.

Has anyone tried this? Does anyone have photos showing the faying surface between the plate and the plastic calculator chassis?

Best regards,

Bill

Re: Voyager Back Metal Plate Repair

*Message #2 Posted by **Randy Sloyer** on 21 Aug 2003, 9:04 p.m.,*
in response to message #1 by bill platt

Yeah, I've done it. Not fun, but the results justify the effort.

Go to your local Wal-Mart. Head for the craft section. Look for a bottle with a yellow label marked "The Scrapper's Solution". This is the jumbo-economy-sized container of the product called UN-DO, aka heptane. $5 will get you a full four ounces. The same thing sells in most hardware stores without the scrappers moniker at $5 for one ounce.

Find a well ventilated area to work and a six inch thin metal scale. Working with the back off of the calculator, apply the UN-DO to one edge of the metal label. Keep it wet with UN_DO for about thirty seconds for the solvent to work. Slide the scale under the plate and work it free. Where the UN-DO soaks in, the adhesive lets go. You work your way under the entire plate, slide the scale under the plate and applying more UN-DO. It will take at least ten minutes to free the plate from the calculator back as the acrylic adhesive has a death grip on both sides. Don't deform the plate any worse than it already is, this is the artsy part of the equation.

Great gooey, sticky fun with noxious vapors to add to the enjoyment of the moment.

Once off, remove the adhesive from the back of the calculator using denatured alcohol. The black carrier film will probably be left on the metal plate. Peel it off and then remove the residual adhesive.

Now comes the fun part. Find yourself a really good rolling pin and flat, hard surface. I have a marble rolling pin and board used for making pasta. It works well. Just roll the plate flat. Press too hard and it curls. Flip it over, roll it again, bend to suite, warp to fit, etc, etc. Just knock yourself out until your happy with the flatness.

Get some double sided carpet tape, peel one side and cover the back. Trim it 1/16" from the edges. Cut out the two spots where the ESD springs from the front make contact with the back. Peel off the other protective film, line it up, press it down and enjoy.

Re: Voyager Back Metal Plate Repair

*Message #3 Posted by **bill platt** on 21 Aug 2003, 9:24 p.m.,*
in response to message #2 by Randy Sloyer

Hi Randy,

Thanks for your reply!

I have a few questions:

1. You say to "work with the back off of the calculator". Does this mean I first need to remove the rubber feet and unscrew the screws?

2. What are the "ESD Springs"?

Thanks again!

Best regards,

Bill

Re: Voyager Back Metal Plate Repair

*Message #4 Posted by **Randy Sloyer** on 21 Aug 2003, 10:24 p.m.,*
in response to message #3 by bill platt

Yes, take the feet off, then the four screws, then the back comes off. This is so the UN-DO doesn't work its way into the calculator through the two holes under the plate.

Once the back is off, you'll see two small springs that connect the front metal plate to the rear metal plate which all goes to the negative battery terminal. This is part of the electrostatic discharge protection for the unit. The longer one goes near the battery area.

Alternative backplate "fix"

*Message #5 Posted by **Larry Corrado, USA (WI)** on 21 Aug 2003, 9:57 p.m.,*
in response to message #2 by Randy Sloyer

Randy:

I, too, have a 15C with the same kind of peeling back plate. Since I was afraid of damaging it worse if I tried to take the plate off and reglue, I used a different kind of "fix." I made a frame for my machine out of 12 mm thick wooden molding glued to an 11 x 16 cm piece of thin fiber board. The 15C just fits inside, and is held hard against the back by two plastic tabs pressing down from the top. The result is of course bulkier than the calulator by itself, but it works for me since I only use the machine at my desk at home.

If I get ambitious, I may try your technique, Randy, but for now, this is working well.

Regards. Larry

Meeting in Basel - Youthhostel

*Message #1 Posted by **Christoph Klug** on 21 Aug 2003, 3:11 a.m.*

Dear friends,

as Matthias told me the Youthhostel Basel is a very nice and low price place to stay at night before and after the meeting on 20. September. Please refer to the webside www.youthhostel.ch/basel or contact them by email basel@youthhostel.ch

There exist two bed rooms (42,-CHF per night) four bed rooms (32,30CHF per night) and six bed rooms (31,50CHF per night). Non-members of the youthhostel organisation have to pay additional 6,-CHF per night. The youthhostel is placed 10 walking minutes beside the center of Basel. I can send you a entry-form document for the youthhostel by email...

Best wishes - Christoph

Classic KBs over current 49g

*Message #1 Posted by **Charles L** on 20 Aug 2003, 9:43 p.m.*

Hi all,

Just a comment on a remark about one poster's *fast* number crunching abilities on a classic hp keyboard, YES! I agree with you, I am furiously fast at computing long equations with my 32sii, because the kb buttons are responsive and the *BIG* (are you reading HP?) ENTER KEY!!

Conversely, have you noticed that when you key in numbers quickly on a 49g, it MISSES SOME?? For example, keying in 333 quickly gives you 33, and 4444 gets 444 at best if not just 44. It's pretty pathetic...I'm venting in concerned anticipation of the new 33s and 48/49 series...It is really a joy to flick in a bunch of numbers on my 32sii knowing that I don't need to repeat and divide to make sure it's the same (it would give '1' of course if both results are equal, it's something I used to resort to when learning the real depth that rpn lets you go to)

Best regards, Charles

Re: Classic KBs over current 49g

*Message #2 Posted by **Raymond Del Tondo** on 20 Aug 2003, 10:28 p.m.,*
in response to message #1 by Charles L

Hi,

at least the 49G has some kind of keyboard bounce adjustment (KEYTIME or alike). I don't know how good it works, but it was a bad sign that the machine even needs this feature, due to the bad keyboard...

The '48GII', which is in fact more like a relabelled 49G, seems to have the same or similar keyboard as the old 49G.

I admit that's one of the reasons I'll stick to the REAL HP-48 (GX), which deserves the classification '48 series', whereas the 48GII doesn't seem to have much to do with an HP-48 (OMHO).

Raymond

in response to message #1 by Charles L

Yep...

>[Charles wrote:] >Just a comment on a remark about one poster's >*fast* number crunching abilities on a classic >hp keyboard, YES! I agree with you, I am >furiously fast at computing long equations with >my 32sii, because the kb buttons are responsive >and the *BIG* (are you reading HP?) ENTER KEY!!

I was the guy that posted that. Key spacing is relevant too. HP41s have a nice key spacing - so do Woodstocks, as well as 11C/15C/16C. I can live w/32S as well. There's something about the 'click' on the older calcs that's satisfying, that you know you've entered it by feel even without looking at the display.

I couldn't tell you about 48/49. I had a 48 for a few days and got rid of it - I wanted a 4-level stack!

Some times I rest the calc in my fingers and use both thumbs on both hands to work the keys. Sounds inelegant, but works nicely for me. (I'm slightly dextrous, piano lessons when younger helped.)

Bill Wiese San Jose CA

49G KEYTIME adjustment

*Message #5 Posted by **Victor Koechli** on 21 Aug 2003, 5:01 p.m.,*
in response to message #1 by Charles L

Hi,

you can (and you actually have to, as your experience shows) adjust the debouncing time on the 49G by entering a number in level 1 of the stack and executing ->KEYTIME. -> is the arrow character. I think the unit is ticks, i.e. 1/8192th of a second, and the value determines how long the calc will wait before another keystroke is accepted

The default ist something around 1300, which is far too long because it causes the calc to miss keystrokes on rapid entry, just as you describe. Try values around 500 - 600 for a start, and experiment a bit with it.

Cheers, Victor

Re: 49G KEYTIME adjustment

*Message #6 Posted by **Charles L** on 22 Aug 2003, 4:01 p.m.,*
in response to message #5 by Victor Koechli

Remarkable, I am so very glad to read your post about the keytime adjustment feature! You have made my day with that one. I'm off to dig up my 49g and put it to work!

PS. How can I access the AJDUSTENTERBUTTONPOSITION feature lol...

Best regards, Charles

Re: 49G KEYTIME adjustment

*Message #7 Posted by **Victor Koechli** on 23 Aug 2003, 3:59 a.m.,*
in response to message #6 by Charles L

Hmm... You would also have to use ->ENTERBUTTONWIDTH to make it double-wide. The units

will probably be 1/131-Angstroms. And if you don't pay attention, increasing the width will simply push the rightmost button off the keyboard. Because this would be a permanent damage (resetting the width to original will simply fill the missing space with a correctly labeled black hole), HP has not made these functions publicly available.

Better just live with a tiny ENTER in the wrong place, then ;-)

Cheers, Victor

Enter Key Position

*Message #8 Posted by **bill platt** on 23 Aug 2003, 1:05 p.m.,*
in response to message #7 by Victor Koechli

Hi Victor,

You know, I am not so sure I dislike the position of the "enter" key in the proposed 33s, and the 49 position isn't so bad, either, and here is why:

When using my 48, I frequently "enter" numbers using the "space" key instead of the "enter" key. As the machine treats the results the same way, it really does not matter. So, I have inadvertently acclimated myself to the new system!

Regards,

Bill

Re: 49G KEYTIME adjustment

*Message #9 Posted by **Charles L** on 23 Aug 2003, 12:54 p.m.,*
in response to message #5 by Victor Koechli

Hi,

I tried to perform the keytime adjustment ->KEYTIME after entering a 500 into the stack, but so far it doesn't seem to take...I'll keep hacking, but if I'm missing something would someone point it out please?

This is really going to cause me to log serious time on this machine for a change!

Best regards, Charles L

Re: 49G KEYTIME adjustment

*Message #10 Posted by **Victor Koechli** on 26 Aug 2003, 10:00 a.m.,*
in response to message #9 by Charles L

Try executing KEYTIME-> after setting it with ->KEYTIME. You should get back the value you just set it to. Also, make sure you are using the Arrow-Character for ->, it's on right-shift zero.

Of course, if you're a *very* fast hacker, you'll probably need a value less than 500. However, at some point, keyboard debouncing will suffer...

Tell us if it works. Cheers, Victor

PS Sorry that it took me so long to reply, but I have he calc at work. Yes, that's right: I am one of the very few people actually *using* a 49G!!! ;-)

El-Cheapo Wally-World Four-Banger

*Message #1 Posted by **W. Bruce Maguire II** on 20 Aug 2003, 7:01 p.m.*

Hello all:

I just dropped by for a respite from work, and got to reading the Forum posts (as usual!). Much too much fun, and much too much temptation to join-in!

Anyway, I accompanied my wife and two kids to Wal-Mart the other day to buy some school supplies for our second-grader and fourth-grader. The school-supply list for my fourth-grade daughter included a calculator. I---being the good HP-of-old guy---said *"nothing but old HP RPNs for my kids!"* That is, until my wife talked some sense into me; these calculators would be *left* at school, and some things have been known to "disappear" (from a Catholic school, no less!). Well, I decided to give-in, and figured that I could always wait until later in their school "careers" to introduce them to RPN and the quality of the older HPs---what the heck, ***I*** didn't start using HPs until my HP-11C in 10th grade.

OK, to make a short story long, ;-) Wal-Mart had a *huge* selection of these "LeWORLD" calculators: four-bangers and basic scientifics. The basic four-bangers were **$1.00** (and there were probably a half-dozen or more colors to choose from)! My daughter opted to shoot-the-moon, and wanted the translucent pink "Dual Power" *solar* four-banger. It was **$2.00**. The basic scientifics were **$3.00**!

Now, granted, these "El-Cheapos"---oops, I mean "LeWORLDs"---are blister-pack fare, but are they really any worse than the "Kinpos" over which HP is brimming with pride?

One dollar basic. Three dollars scientific. At least a dozen colors and styles. ***This*** is the market in which HP sees itself making money? I'm glad it's not *me* running that division!

Bruce.

Re: El-Cheapo Wally-World Four-Banger

*Message #2 Posted by **Mike Sebastian (Texas)** on 20 Aug 2003, 8:05 p.m.,*
in response to message #1 by W. Bruce Maguire II

...but are they really any worse than the "Kinpos" over which HP is brimming with pride?

You need buy one of those "El-Cheapo" LeWorld $3.00 scientific calculators to fully appreciate the Kinpos. I did. In comparison to the LeWorld, the Kinpo feels like a solid HP classic.

I like to buy calculators and take them apart to see how well they are built. Again, in comparison, the Kinpo is a masterpiece of engineering and workmanship. (IMHO, in the sub-twenty dollar category, Casio makes the best quality calculators. TI is a close second on quality. Sharp is about equal with the Kinpos.)

Now, don't get me wrong, I didn't feel cheated by the $3.00 LeWorld scientific. For three dollars, it is a tremendous bargain. I just wouldn't sent my kids to school with one.

Re: El-Cheapo Four-Bangers and RPN for Kids!

*Message #3 Posted by **Dwight L. Myers** on 20 Aug 2003, 10:48 p.m.,*
in response to message #1 by W. Bruce Maguire II

I also wanted to start out my kids on RPN, so when the HP32SII looked like being discontinued, I bought one for each of my daughters (6th grade and 12th grade this year), one for my wife, and one for me. We have liked them rather well. If they aren't quite the quality (physically) of the old HP34C/HP32E calculators, they are miles ahead of the older TIs of keyboard bounce fame. I have gotten used to their touch and like them pretty well.

I decided the investment was worth it, since they aren't too likely to be lost at school... one advantage of home schooling. (On second thought, we lose a lot of things around here!)

On the subject of the Le World calculators I was tempted to buy one for a spare for students who forget theirs on exam day. (I teach college chemistry.) I am interested to read Mike Sebastian's take on them. I suppose at $3.00 it's hard to go wrong for a spare for students, though.

Dwight

Give them a slide rule

*Message #4 Posted by **bill platt** on 20 Aug 2003, 11:58 p.m.,*
in response to message #3 by Dwight L. Myers

Then if they make it through the test, you know they are worthy ;-0)

Re: el cheapos

*Message #5 Posted by **unspellable** on 21 Aug 2003, 8:21 a.m.,*
in response to message #4 by bill platt

On the subject of el cheapos, I think I paid the princely sume of $4.95 for a Tevion at Aldi's. This is fairly standard, fairly full featured scientific algebraic entry, but it has a neat feature in that above the entry line there is a smaller line that displays a complete running account of your entry formula, making it much easier to keep track of what you are doing. (After all, if it's algebraic entry instead of RPN, we need some help.)

Edited: 21 Aug 2003, 8:22 a.m.

Re: el cheapos

*Message #6 Posted by **christof (NoVA US)** on 21 Aug 2003, 7:02 p.m.,*
in response to message #5 by unspellable

But you can get the modern 6s for the same rough price range.

Not that I am a serious fan of modern HP calcs, but if there's a chance they will deliver with the 33S and 17Bii+ (which, aside fromt he case, looks REALLY good), then i'd rather support them.

if you want a serious deal, look at the 9G

if you want RPN of couse, life is a bit rougher.

Re: el cheapos

*Message #7 Posted by **unspellable** on 22 Aug 2003, 7:57 a.m.,*
in response to message #6 by christof (NoVA US)

But where do you buy the HP 6S? Sure I can mail order it, but that hardly counts for a low end calculator. I don't see them in Target, Kmart, Wally World, et al, and that's what counts for a low end calculator.

Re: Another el-cheapo

*Message #8 Posted by **Paul Brogger** on 22 Aug 2003, 12:11 p.m.,*
in response to message #4 by bill platt

I mentioned once before the Spectra SSC-200 that I got for $5-$8.00 at Target. It's a nice, small, two-line unit with rubber keys that feel halfway-decent, and 27 memories -- a feature I appreciate. (One memory is just not enough.)

Here again, my reaction to its features/price combo was, "How can HP make money in this market?"

you guys are wrong ... same as HP MBA bozo's

*Message #9 Posted by **Norm** on 22 Aug 2003, 1:47 p.m.,*
in response to message #8 by Paul Brogger

Greetings:

You guys are wrong because you keep saying that HP has to compete against the $2.00 calculators at Wal-Mart.

That simply is not true!! And by the way, when do we start calling them "Agilent calculators" as a matter of protest against HP MBA babboons still holding the HP calculator heritage, like holding a cluster of bananas hostage while they swing from the branch of a tree.

The calculator lineage and heritage belongs at AGILENT. The HP bozos are mentally retarded millionaires. They have long since deserved to be fired. They can be fired in effigy if we start calling them "Agilent Calculators".

ANYWAY, during the glory days of HP calculators, they did NOT compete against the cheap-junk that existed at that time also (TI-30 for example). The HP would have been a hundred dollars or more higher in price !! :o)

Is that to compete? Not hardly!!!

A superior product does not compete with cheap junk.

HP is idiots from top to bottom because they think they are competing against $3 calculators. And then they try to build $3 calculators.

THEY ARE SUPPOSED TO BE BUILDING $100 - $300 calculators !!!!!!!!!!

They pay MBA's 7 figures in order to come up with the idiotic idea that they need to satisfy the $3 calculator niche market.....

that's about as smart as HUMVEE paying an MBA 7 figures so that the MBA can spout off that the "REAL MARKET" that they must target is to supply the world with a cut-down Yugo with a pickup bed welded onto the back. And some fuzzy dice hanging from the mirror.

Yah right.

Re: 6s and 30s indicat that HP is trying . . .

*Message #10 Posted by **Paul Brogger** on 22 Aug 2003, 3:21 p.m.,*
in response to message #9 by Norm

We're not so far apart.

I don't think we're saying H-P *should* be competing on the low end. Quite the contrary, the evidence seems to indicate that there's LOTs of competition down there, with product prices at or below $5.00 .

Yet, H-P produces the 6s, 9s, and 30s, indicating that they do, in fact, want to compete for the entry-level market. Very confusing.

Perhaps if those models were RPN (or at least, RPN-selectable), they'd be differentiated somewhat, and would have a secondary market in the RPN-initiated. The latest announcements (12CP, 33S, 48GII and 49G+) seem more in line with H-P's traditional place in the calculator market (as so evocatively described above). Hopefully, their quality will place them somewhat above the competition as well.

OK.

*Message #11 Posted by **Norm** on 23 Aug 2003, 12:33 a.m.,*
in response to message #10 by Paul Brogger

OK.

Re: you guys are wrong ... same as HP MBA bozo's

*Message #12 Posted by **Mike Sebastian** on 23 Aug 2003, 10:44 a.m.,*
in response to message #9 by Norm

You guys are wrong because you keep saying that HP has to compete against the $2.00 calculators at Wal-Mart.

No, we are not saying that at all. Producing an absurdly cheap calculator, IMHO, only cheapens the reputation of that manufacturer. HP really cheapened their reputation when they put the 6S on sale. TI's functional equivalent at that time, the TI-34, cost twice as much.

After I first posted this response, it dawned on me that TI doesn't compete on price. TI competes on features. Although, they do target specific price points, and the price point to some degree does dictate the features that will be offered. In any category, I doubt you will find that TI has the cheapest calculators. HP and Casio each offer cheaper graphing calculators. Sharp seems to have the lowest price "name brand" scientifc calculators, but this price advantage comes with a cost - cheaper materials (e.g. phenolic PCBs) and shorter lifespan (e.g. higher failure rate of the heat seal - the ribbon-cable-like connector between the PCB and LCD).

I can see HP wanting to compete with TI in the lucrative educational market. The 38G was clearly designed for the educational market. The HP-30S was clearly an attempt to compete with the TI-30 series of low-end scientific calculators. The 39/40G and now the 9G are more recent educational offerings. But, HP still really isn't a viable competitor in the educational market. HP is now only offering "me too" scientific and graphing calculators. TI provides a lot of supporting materials for educators, which HP isn't doing. And now, teachers have built lesson

plans around specific TI calculators (I've been told that is why the TI-82 is still in production), so it is going to take a product that is significantly better (e.g. something radical like the Xpander with lots of supporting educator materials) to get teachers to switch.

Meanwhile, HP still seems to be producing calulators for the MBAs, which is why the 12C is still in production and why HP still has a wide selection of high-priced financial calculators. (This suggests to me that HP could still produce high-priced calculators for technical professionals.)

Edited: 23 Aug 2003, 11:42 a.m.

Re: you guys are wrong ... same as HP MBA bozo's

*Message #13 Posted by **Les Bell [Sydney]** on 24 Aug 2003, 3:26 a.m.,*
in response to message #12 by Mike Sebastian

If HP was to do an RPN equivalent to the 6S, at twice the price, they'd be selling like hot-cakes.

I bought a 6S for my son, who was in elementary school at the time, thinking it couldn't be so bad. The build quality isn't so bad, to be honest, but it's the usual horribly inconsistent mess of prefix and postfix notation, coupled with weird memory syntax and strange use of prefix keys; in short, sickening.

That's why we worry that math classes with calculators could be wasting time teaching calculator usage rather than mathematics - those calculators are absolutely counter-intuitive and get in the way of learning the underlying concepts.

Besides, a low-level entry RPN calc could win HP a lot of loyal customers who would upgrade later.

Best,

--- Les [http://www.lesbell.com.au]

*Message #14 Posted by **Brian** on 24 Aug 2003, 11:32 a.m.,*
in response to message #13 by Les Bell [Sydney]

A 6S with RPN and algebraic would be a killer product - everyone's happy - and HP are the only one's that do this in higher model calculators. TI don't have this option on any of their models (except for an rpn emulator done by someone external).

Les 31E

*Message #15 Posted by **Norm** on 24 Aug 2003, 12:51 p.m.,*
in response to message #14 by Brian

Hi Les, I appreciate what you were saying.

I too have noticed that the typical $9.99 "Casio Scientific" is pretty much useless BECAUSE there is so much bullcrap on the front panel (weird notations, graphic symbols, 12 different kinds of parentheses, etc etc).

I am willing to declare it impossible to utilize with, or without, the owner's manual.

Sharp contrast to an HP-31E, a REAL scientific calculator for beginners. I suggest restoring an HP-31E for purposes of giving to a younger person (i.e. 10 - 15) so that they can actually learn the math that pertains to that calculator.

Re: Les 31E

*Message #16 Posted by **Les Bell [Sydney]** on 25 Aug 2003, 6:21 a.m.,*
in response to message #15 by Norm

The "owner's manual"?

These things come with ONE SHEET most of the time!

Ironically, HP fell foul of the same disease with the 48 series. Have you ever tried to read the User's Guide for that sucker?

Give me a decent manual or give me . . .

. . . Mathematica? . . . a cheap substitute? . . . nothing - I'll make do by nursing my 41's along?

Best,

--- Les [http://www.lesbell.com.au]

Re: Les 31E

*Message #17 Posted by **Norm** on 25 Aug 2003, 6:49 p.m.,*
in response to message #16 by Les Bell [Sydney]

Hi Les, I thought my own personal disgust with the 48G+ etc was legendary on this chat board. Had quite a streak of chat noise going about 3 months ago..... I had bought a 48G+ and was thrashing it to pieces with the posts.

I said anybody who wanted one of these was crazy and in the asylum and I was going to get rid of it so it would not be adding to the PSI weight loading of my house foundation.

Immediately came a half-dozen inquiries (from crazy guys?) who wanted to buy it..... made a good deal and haven't seen it since.

So Les, we think the same..... 48G is not useable. That's why I mentioned 31E as an excellent example of a "real" beginner's scientific calculator. Yes it has an owner's manual, although its remarkably short and deficient IMHO but at least you dont really need one (for 31E).

Re: Les 31E

*Message #18 Posted by **Les Bell [Melbourne]** on 26 Aug 2003, 3:56 a.m.,*
in response to message #17 by Norm

Actually, I have mixed feelings on the 48G. It's *possible* that I've been approaching it from the wrong direction.

Since I'm holed up in a hotel all this week, and there's nothing else to do

at night in Melbourne <vbg> I've brought the 48GX and the User's Guide with me, with a view to investigating some things.

But even if I'm right about this, it still doesn't remove the fact that the 48G is just too much device, with too little manual, and requires too many keystrokes and too much thinking to complete simple tasks.

I'll write up my thoughts and results when I get a chance.

Best,

--- Les [http://www.lesbell.com.au]

Re: Les 31E

*Message #19 Posted by **bill platt** on 26 Aug 2003, 12:45 p.m.,*
in response to message #18 by Les Bell [Melbourne]

Hi Les and Norm,

I am, in the very near future, going to have the HP41 emulator running on my 48GX. I am curious to see if, with keyboard overlays on my 48, I can make a decent RPN tool out of the "monster".

But I have also found the 48 does do some very cool things in its native format--like the whole list processing thing, and also the matrix business.

But for straigtforward calculations, the loss of the simple "lastx" is a pain. So we'll see how it goes and I will report back as I develop an understanding.

Note that at least 4 persons who post here reasonably regularly, are experts on the 48 (certainly compared to me!). A few come to mind: R. Lion, Luiz, VPN, Raymond Del Tondo. In one case, I was very frustrated with an impasse I was having in translating a program from RPN to RPL, and these guys straightened me out quickly and gave me new insight---making the "monster" much more tame.

regards,

Bill

33s Search on Google Gives 1-page Results List

*Message #1 Posted by **Paul Brogger** on 20 Aug 2003, 5:05 p.m.*

I recently heard of an interesting game or exercise: choose any two words such that a Google search with them as the search argument gives a single page of results. (That is, not zero -- 1-10 hits.) (Example: "positronic fortnightly".)

It just so happens that, at this precise, magical moment, a search on " H P - 3 3 S C A L C U L A T O R " (remove the extra spaces -- I don't want to affect the situation!) gives a single page of hits. (Not especially productive hits, mind you, but a single page.)

(Just thought I'd share . . .)

Re: 33s Search on Google Gives 1-page Results List

Switzerland is the source for new HP calcs

*Message #1 Posted by **Juergen (CH)** on 20 Aug 2003, 11:06 a.m.*

When you hear Switzerland, do you think of mountains, cheese, chocolate, Heidi? You have to change your mind now. If you want to buy one of the new HP calcs like HP 17BII+, HP 33S, HP 48G II, HP 49G+ (also available with 64 MB SD Card!), you have to check

http://www.calculators.ch

a Swiss calculator dealer.

Choose the "Online-Shop" link, then select "Hewlett Packard" and press "Suchen".

You can buy: HP 17BII+
You can book: HP 33S, HP 48G II, HP 49G+

I will post more infos as soon as possible.

Regards, Juergen

Some facts

*Message #2 Posted by **Juergen (CH)** on 20 Aug 2003, 11:37 a.m.,*
in response to message #1 by Juergen (CH)

HP 33S
available by mid of October

HP 48G II
available by end of September
48 Mhz CPU, IRDA

HP 49G+
available by end of September
75Mhz CPU, 1.5 MB memory, IRDA, USB connection to PC, RAM expansion by SD cards (e.g. 64 MB)

Why so many "Will ship to USA only" sellers on eBay ?

*Message #1 Posted by **Emmanuel Verbeeck** on 20 Aug 2003, 5:07 a.m.*

I still don't understand why so many HP calculators are put as auctions on eBay with "Will ship to the United States only", considering that

1) a PayPal or BidPay payement is the same electronic transfert from anywhere in the globe (isn't that what the internet is all about : removing the distances?);

2) I will happily pay the shipping cost, in advance (which is normal) as defined by the seller;

3) I don't live in a weird, third-world country (it's in Brussels, capital of Belgium, Europe) and my little website www.emmanuel-verbeeck.net confirms my name, address, etc...;

4)I have a positive eBay feedback history.

Just puzzled. Your opinion is welcome!

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #2 Posted by **Valentin Albillo** on 20 Aug 2003, 5:51 a.m.,*
in response to message #1 by Emmanuel Verbeeck

Hi Emmanuel,

Being a Spanish resident, I've experienced the same kind of problems and frustration over "US only" as yourself, so I can understand you perfectly. These are some of the rational reasons for it, IMHO:

1) The US is such a large and powerful country and thus such a large market, that any seller can confidently expect to get many more local bids than foreign ones. The foreign 'share' is so small next to the local one that just plainly ignoring it isn't likely to affect business noticeably.

2) That being so, most sellers, specially those that do not run a business, don't feel comfortable dealing with foreign bidders, which probably aren't native English speakers and so there's the possibility of misunderstanding ("mint", "NIB", "no COD", etc), and which perhaps could result in excessive delays or charges to get the payment and/or send the items. There's always the possibility of a scam lurking out there.

3) Finally, sending a package to an US address is very easy and there's a choice of ways to do it, many of them requiring very, very little effort on the seller. On the other hand, sending a package abroad requires a cumbersome, delicate packaging, with plenty of protective material if the calculator inside is going to stand the rough treatment of a 6,000-mile trip, and that costs money and, specially, a lot of seller's time. Also, the seller is forced to fill and sign a number of forms for the Customs, declaring the value of the item, and a number of other formalities, which many sellers consider a real, big nuisance and yet more time spent.

There's also the fact that many foreign postal services are not as optimal as they should be, and tremendous delays and even lost packages are extremely common, resulting in a lot of inconvenience for the seller. Not to mention when the item arrives broken and it was in perfect working order when it left the seller's hands.

Taking all of these into account, it's easier to understand why many sellers will opt instead to restrict their sales to the big, familiar, comfy local US market. They might occasionally get a slightly smaller final bid for their items, but they'll save a lot of troubles, headaches, effort and time on the long run. Just put yourself in their place.

Best regards from V.

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #3 Posted by **Raymond Del Tondo** on 20 Aug 2003, 6:12 a.m.,*
in response to message #1 by Emmanuel Verbeeck

There are various possible reasons for this behaviour.

One of them could be that sending a packet to a foreign location means somewhat more writing into address forms, and the need to declare the contents.

Another one: It can be far more complicated and unsafe to cancel or correct a deal if the 'partner' is located outside your own country.

And another one: I once sold a huge load of HP Series 80 stuff (to Belgium, BTW;-) , and I restricted the shipping range to Europe back then. The reason was: Shipping overseas would have been that expensive so selling chances would have fallen dramatically.

If you buy an item for e.g. 100 EUR, and have shipping cost of about 30 EUR, you may think twice if you'd better try to get the item somewhere else cheaper...

Maybe I simply was lucky enough, but I made very good experiences with sellers and buyers all over the world, on eBay and through other contacts.

I also made the experience that sending stuff from the U.S. to another country seems to be much cheaper than sending thing *to* the U.S.

So far on fair competition :-/

Raymond

Just ask them

*Message #4 Posted by **Juergen (CH)** on 20 Aug 2003, 7:20 a.m.,*
in response to message #1 by Emmanuel Verbeeck

My experience is that many sellers are willing to ship overseas if you ask them. Especially for international transactions, I recommend to get in touch with the seller before bidding. This may provide a certain confidence for both, seller and buyer.

But be aware that shipping may be expensive because many do not use the US postal service (USPS, fair shipping rates). Futhermore, custom taxes may apply.

Regards, Juergen

I thought I was the only Brussels HP amateur, but it seems one of my neighbours is also one of these !

My experience is that some people find it extremely difficult to fill in customs forms, and that they just don't want it. Yes, you're all right, there are a lot of safe ways - for the buyer - to get paid.

I just don't agree on Raymond's comment about buying items in Eruope rather than in the US : the problem is that there are almost no HP calcs for sale down here, maybe excepted on ebay.de.

As a seller, I often sold items such as 32SII, 42S and 11C that reached very average prices, even if shipping was included, just becauseUS people are somehow scared of customs... though it is true that Europe-US package shippings have dramatically been dela&yed these last months...

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #6 Posted by **Gary** on 20 Aug 2003, 11:32 a.m.,*
in response to message #1 by Emmanuel Verbeeck

I've tried selling outside the US and the biggest problems are shipping related. Initially, I tried figuring the shipping cost myself via a scale and on-line rate schedules but I always underestimated and would have to pay extra out of my pocket to cover the difference. I never got complaints but I was out some of my own money. I then tried packing the item(s) up and going to the post office to get shipping cost. Then report the cost to the buyer, then go back to the post office again to mail it. If I did ebay for a living, I suppost this wouldn't be so bad but I've only sold a hand full of items and only once every few months. Taking time off from work to go to the post office twice was a serious inconvenience (I normally work till 5pm and the post office closes at 5pm). I could go on two seperate Saturdays to the PO but that would incurr a minimum of a one week delay in shipping to the buyer at wich point they become understandably impatient. I tried padding the shipping cost but got complaints from the buyers that I charged them too much (e.g. I figured $20 but asked for $25 and it came out to be $23.45). Even if things went smoothly, the time it takes to actually ship the item(s) could take weeks before the buyer receives the merchandise. And unless you use something like UPS, there's practically no way to track the shipment. That delay causes frustration in the buyers and results in more complaints. I also tried to stipulate that foriegn bidders contact me before bidding but they rarely read that and bid anyway, then complain about one thing or another. I'm sure the language barrier doesn't help. Again, if I did this for a living then it may be worth the headaches and I would be able to develope systems and processes to deal with foriegn shipments better but for the occasional hobbyist, it's just not worh the hassle; it takes the enjoyment of collecting and trading out of it.

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #7 Posted by **Juergen (CH)** on 20 Aug 2003, 11:54 a.m.,*
in response to message #6 by Gary

Good reasons not to do it. Just wanted to add, that I always had very smooth transactions, and shipping time from US to Switzerland was between 7 to 10 days. Yes, shipping rates can be high, but you know this. I cannot understand that your customers complained they paid $2 too much (stingy persons).

Regards, Juergen

*Message #8 Posted by **W. Bruce Maguire II** on 20 Aug 2003, 5:30 p.m.,*
in response to message #1 by Emmanuel Verbeeck

Emmanuel:

After reading all the responses, it's clear that there are several credible reasons to limit sales to the U.S.

Unfortunately, let me be the first American to admit that not all Americans are rational! IMO, we've got a lot of employees in the ignorance department! ;-)

As was suggested by a foreign colleague, I think your best bet is an e-mail. A reasonably well-written e-mail asking for an exception to the rule---and mentioning that you will pay all extra shipping costs---might erode some seller's ignorance and misconceptions.

Remember: you never get anything without asking.

Good luck!

Bruce.

p.s. A small consolation: maybe the inflexible (unfriendly?) sellers who still won't ship overseas after you ask, are just the sellers that you are best-off not dealing-with!

2 squared things

*Message #9 Posted by **db(martinez,california)** on 20 Aug 2003, 11:03 p.m.,*
in response to message #1 by Emmanuel Verbeeck

1) The little form is a drag to fill out. Ditto for the insurance one. People who will lie about thousands of dollars on their taxes will agonise over pennies in the "value" column on a customs form. I do.

2) Nobody wants to be the bad guy in an inocent misunderstanding. We only speak english here (and wish youall would too) so it's hard for some of us to deal with your imperfect English. If you don't believe that we speak perfect English then just ask us! Don't ask the Brits. They lie.

I have bought, sold and traded with people in France, Germany, Poland, Japan, and Russia, along with Canada, Ausland, and "Jolly Old". So far everything has worked out ok. Knock on wood. Toque madera. NOTE TO SELLERS: I have sold things to people in four of those countries because they BID HIGHER on those items. Isn't that a good reason to do business with them?

Two things i have found are:

1) Nobody in HongKong can understand a thing i say, no matter how slow i type it.

2) Anything and everything, including greasy 1960's Volvo parts, used books, bootlegged tapes, and candy bars that are mailed to Ecuador from a first world country (insured or not - just try to collect from them) will be stolen. Let me rephrase that: WILL BE STOLEN!!! Lest someone say that i am anti South American; insurance is a waste of money if you are shipping to Chile or north Bolivia. What you send will get there if it gets out of your own country.

I think that fear of the language barrier is the big deal. If you want to bid, and your shipping info isn't Bin Ladin/in a cave/somewhere, then just ask - in good english. I bet most American sellers will say "for you, o.k."

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #10 Posted by **Jennifer Seelye** on 21 Aug 2003, 1:38 a.m.,*
in response to message #1 by Emmanuel Verbeeck

I have been selling on ebay for 5 years, I have always shipped overseas. Most of these transactions have worked out well but they also take more time.

I figure by keeping my auctions open to everyone I allow the bid price to go up. Most of the time the overseas

person is outbid so all they do is drive up the price.

On the flip-side, my only negative feedback was from a Frenchman. He paid for 2 knives, asked for them to be packed together & shipped uninsured. I shipped 24 hours after he paid. He went on vacation & more than a month later he emailed saying that one did not arrive. I personally packaged them & delivered them to the post office beyond that I don't know what happened. 7 months later he filed fraud charges. Luckily I save every receipt, I sent copies & the charges were dropped. I still have the negative feedback but at least no fraud charges.

Payments are also hard. Money Orders often times have a $5 or more fee from your bank for cashing them plus it takes a while to clear (like a personal check). Paypal says overseas transactions are "unconfirmed" so there is no seller protection. I now only accept overseas payments via bidpay.com.

One other pain in the neck situation was someone from Austrailia won a Gibson Guitar auction. I spent a lot of time packaging the Gibson & checking into shipping costs. The only shipping company that would ship it said shipping would be $280. We did not complete that transaction.

English is not a major problem for most overseas bidders, I do get a few laughs though.

To sum it all up, there is a give & take. I find these rules work for me:

1- only accept bidpay.com payments, no exceptions.

2- package the item, measure & weigh it, get rates from usps.com add a little extra to what the online calculator says, when you get there it will always be slightly higher.

And a final note, never do "off ebay" transactions from overseas bidders, especially when they want "arrange shipping" & to send you a bank draft (or something like that) for $11,000, then you wire them the difference. You will get that certified check in a day or two but by the time you discover that the check bounced they made off with $10,000 of your money.

*Message #11 Posted by **Stephan (CH)** on 21 Aug 2003, 2:42 a.m.,*
in response to message #10 by Jennifer Seelye

Good morning Jennifer. To get around the shipping cost problem I usually offer the seller to send his items via DHL or UPS with my customer account number. This way all charges will be pay by the receiver. I know, not every body has an account - but if one asks around mostly a friend or a relative does have one. I am glad that overseas foreigners give you sometimes a laugh in trying to write proper English. Unfortunately we can't laugh over here because nobody in the USA even tries to communicate in a other language but English ;-)

Re: Why so many "Will ship to USA only" sellers on eBay ?

*Message #12 Posted by **christof (NoVA US)** on 21 Aug 2003, 7:16 p.m.,*
in response to message #1 by Emmanuel Verbeeck

It really seems to be based on arrogance and ignorance.

The administrative ignorance- people don't realize:

*Global Priority for something the size of a calculator- even a NIB 41CX, isn't outrageously expensive (most auctions where I send stuff overseas it is old computer parts under 1 kilo. I average 13.23 per mailing over the

past 3 weeks)

*Customs forms are trivial. No harder than addressing the package and stating the item and value.

*Insurance is no harder than any other insurance.

*The people at the post office will even fill out the forms for you, or at the very least help you.

The ignorance of money:

*Many Americans seem to feel that no one outside of the US has money to bid usefully (this has been explained to me by a few ebay sellers on in chats)

Arrogance:

We are Americans. Everything outside of America is shoddy, untrustworthy, subject to bribes, and generally so unrealiable as to be not worth pursuing. Besides, aren't Belgian almost Germans? And thus peacenick weenies who don't support our President? <humor, humor. humor>

Or something.

(personally, I've purchased several items from France, Canada, and the UK. While french mail has occasionally had a few oddities [!], generally it's all quite as simple as doing business in the US. So obviously, the last reason isn't my personal view.)

HP-41 Durability

*Message #1 Posted by **bill platt** on 19 Aug 2003, 7:56 p.m.*

Well, here is the qustion: Having taken the plunge some months back and bought a damaged 41CV, I now have to ask the question to the "experts":

How is the durability of the 41 series? How d oyou stack it up against the Voyagers, or the previous HP's? Or, against the Charlemagnes and Pioneers? How about differences between "Halfnut" and "FullNut?

I seem to remember soemone saying that he halfnot might be harder to break in the 1st place, but that the fullnut has better chance of repair.

Is the "cracked post" problem endemic or occasional? Does the Halfnut sufferfrom this too?

And how come I don't hear a lot of complaints about the seemingly fragile golden plastic battery contacts/expansion port connectors? Are these actually more durable than they look?

Regards,

Bill

*Message #4 Posted by **Valentin Albillo** on 20 Aug 2003, 5:26 a.m.,*
in response to message #1 by bill platt

Not being a hardware guy, I can only offer my nearly 26+ year experience with HP calculators. Among the ones I have in my collection:

Voyager series (HP-10C/11C/12C(USA)/15C/16C)

Most resistant to anything and everything, nearly impervious to use. Never had one broke, all have withstood heavy use with no visible effect. A particular HP-11C I used extensively for a year in the Sahara desert, while I was in the Foreign Legion, and 22 years later it still looks and works like new (now running in its 3rd set of batteries in 22 years, expect them to last till its 30th anniversary at the very least).

HP-71B

Another brick of a machine, I own three and all of them are immaculate and absolutely as new, one of them despite heavy use in less that safe environments. Never failed despite their age, seem unaffected by use or time.

HP-25C

Apart from the battery pack, which I had to rebuild, same as the previous ones: impervious to everything, looks and works as new (acquired in 1976)

Pioneer series (HP-32S/32SII/42S)

These models have also never failed at all, and they all are as new, but they are less old, and I haven't used them at any length, so I can't really compare them to the above models. They do seem quite solid and reliably built, indeed, if somewhat less than the Voyagers, the 71B, and the Woodstock series, not to mention the Classic series (HP-67, etc).

HP-41CV (fullnut)

Another model absolutely brand new. However, I've used (very extensively) a large number of HP-41C/CV/CX models, and while it's a great machine, I always had the feeling that it wasn't as solidly built and durable as, say, an HP-67, which I owned previously. Perhaps an example will help: if you take an HP-67 in your open hand, and strongly close your fist around it, as it to crush it, you'll feel that it does not crack or make cracking noises, no bending, it doesn't noticeably yield, you'll probably hurt yourself if you increase the pressure.

But if you try to do that with an HP-41C instead, you'll hear noises, you'll feel it bending appreciably, and chances are you'll actually damage the machine while applying only a moderate amount of pressure.

Spice series (HP-34C, etc)

The flimsiest of them all. However much I like these machines, their looks, their display, their innovative and advanced functionality, I can't help but feel that their physical casing is the worst, leading to many hardware failures, most specially non-working keys, etc. I think that HP tried to cut costs, but they simply overdid it and these machines aren't very durable or reliable at all, which probably explains their low popularity (except for the HP-34C, fortunately).

Finally, a special mention for the battery door and battery compartment of such models as the HP28S, which are the least durable and worst design ever (the battery doors and compartment, I mean) in any HP machine whatsoever, and the Chinese batch of HP-12Cs, which have the most unreliable keyboard ever.

Best regards from V.

in response to message #4 by Valentin Albillo

Valentin,

Thanks for your feedback!

BTW, I broke the LCD of my first 11-C when it fell off the desk in class, back in 1983. So, I switched to a slide rule for the rest of the year while I waited for my HP to come back (it was under warranty.) It survived many a fall after that--until I lost it in 1996 on an Airplane from New Orleans to Philly.

*Message #6 Posted by **Pierre Brial** on 20 Aug 2003, 10:22 a.m.,*
in response to message #1 by bill platt

Hello Bill Some times ago a friend give me a suposedly broken HP-41CX without battery pack. In fact only the posts were cracken, and there was not enough pressure on the soft connector. I replace it with soldered wires, and now the calculator work as new. From what I see inside, the weak posts are the only major flaw in this calculator. The electronic is very hardy and standed some overvoltage I put by error during my numerous attempt to power it with external power. The keyboard is good also, and for mine, only the LN key need to be pressed stronger to work (I don't know why) There is reports of corrosion or wear of the plastic battery and ports connector, but despite mine has been intensively used by its previous owner in damp equatorial environment, I didn't notice this kind of problem. All the best Pierre

Re: HP-41 Durability

*Message #7 Posted by **David Smith** on 20 Aug 2003, 3:07 p.m.,*
in response to message #1 by bill platt

From my experience (with over 100 '41 series machines) I would say that half have some sort of post/screw boss problems. Probably half of those (25) are just minor cracks or splits that don't affect anything. I do try and fix them with plastic welding solvent.

The other half have more severe problems. Mayby 20 have broken screw bosses that keep the battery contact assembly from making good contact. The other 5 have sheared off bottom screw posts. These can be fixed but it is a pain.

An interesting thing about the tall key 41C machines... pretty much ALL of them have a "1" key that is not very clicky and a somewhat less weak feeling "0" and/or "2" key.

Re: HP-41 Durability

*Message #8 Posted by **bill platt** on 20 Aug 2003, 4:55 p.m.,*
in response to message #7 by David Smith

Hi David,

So, then it sounds like 1 out of 4 have problems that are significant and severe enough to cause a loss of function without repairs being carried out. This is interesting and significant--Perhaps even more interesting is that this calculator was the longest selling until the 12-C, yes?

I wonder how many of the 25% that are damaged, end up non-repairable?

Regards,

Bill

Re: HP-41 Durability

*Message #9 Posted by **David Smith** on 21 Aug 2003, 3:03 p.m.,*
in response to message #8 by bill platt

Well, I have managed to fix pretty much all of the really bad cases... It takes a lot of time and practice. Also just about any '41 will need to be opened and have its internal contacts cleaned and probably a few key contacts also.

Most of these statistics are based upon a couple of rather large lots of machines that I bought for cheap. They are probably indicative of what you would find when buying dead, flakey, or "unknown" condition machines... or "good" ones from strangers.

Also I neglected to include the corroded battery contact failures in my numbers. Probably 1/3 of the machines have some sort of corrosion. Mayby 5 percent are basically so far corroded that they are not repairable. Another 10 percent just need cleaning and dousing with anti-corrosion goo. The rest need some surgery to mend the contacts (usually only the left most contact in the battery compartment).

Re: HP-41 Durability

*Message #10 Posted by **Randy Sloyer** on 20 Aug 2003, 10:09 p.m.,*
in response to message #1 by bill platt

What we don't see in these 41 numbers is what percentage of the total population the dead ones represent. I think you will find it is an incredibly small number, probably less than 1% of the total population. Lets remember we are talking about a twenty-year-old product here. How many twenty-year-old TI's do you still see in daily use?

For my two cents worth, the original Voyagers are the highest reliability of all HP calculators. The newer Malaysian and Chinese 12C's should not be included; they are a different animal altogether.

Second place goes to half-nut 41’s. While broken posts and corroded battery holders account for most half-nut problems, they still hold up better in rough use than any other model due to the keyboard. Full nuts have all problems David mentioned but you can’t beat them for display size and viewing angle. 41’S are by far the most repairable of the LCD models.

The Pioneers and 48’s take third place for one reason: the keyboard. While the tactile feedback is great, use in dirty environments will lead to keyboard failures due to dirt ingress. Keyboards account for 98% of all non-repairable Pioneer/48 models. Also, there are a fair number of LCD failures; this is related to physical size on the 48 and rigid mounting used in all models in this family.

If you want a 41 and don’t care about the differences in the LCD, buy a half-nut. Here’s my top ten list for maximum life:

10. Don’t forget to change the batteries every year no matter what.

9. Don’t install A23 12 volt batteries even though they fit.

8. Don’t put it in your shirt pocket, even though it fits.

7. Don’t sweep the eraser dirt into the keyboard (You draw on a computer???).

6. Don’t loan it to a co-worker that thinks the keyboard is a manual typewriter.

5. Don’t leave it in the glove box of a hot car.

4. Don’t use it as a fly swatter.

3. Don’t use it as the float to check specific gravity of your home brew ale.

And should it ever have a problem:

2. Don’t tin the battery contacts with solder when the unit doesn’t power up.

1. Don’t spray the keyboard with WD40 because a key is sticky.

There is only one item above I made up. All the others I have seen in 41’s returned for repair. Honest.

Tnx, Randy! Excellent List!

*Message #11 Posted by **bill platt** on 21 Aug 2003, 12:05 a.m.,*
in response to message #10 by Randy Sloyer

And actually it is very helpful and insightful. I think the point you make about repairability is especially importatnt, too--judging from Luiz and ither's posts here a few months back, it can be done successfully! And so I must say I am finding this more fascinating all the time.

Regards,

Bill

*Message #12 Posted by **Pieter Botha** on 21 Aug 2003, 12:42 a.m.,*
in response to message #10 by Randy Sloyer

Thanks Randy, good advice. Especially the SG metering of the ale ;^)

What do you experts recommend for repairing battery contacts, then ? I seem to remember somebody else having repaired them by soldering thin cpooer sheet across the contact tips.

What do you guys (girls ?) think ?

Re: HP-41 Durability

*Message #13 Posted by **Randy Sloyer** on 21 Aug 2003, 7:03 a.m.,*
in response to message #12 by Pieter Botha

Beer stories

Technically, I have seen calculators killed by beer, just not a 41. It was a 17B that was being used during an all night cram fueled by brew. The calc got soaked with suds and was left to dry, batteries still inside. A day later the keyboard was toast due to electrolysis, a common Pioneer failure.

Indestructible Voyager stories

I repaired a 15C that spent three days on a street in Vail Colorado during ski season. There were tire tread marks on the back of the case and cinders embedded in the keytops. The only fault with the unit was that the LCD locating pins had been sheared off and it was out of position. Still works today.

Battery holder repairs

I use two methods. One is quick and dirty: conductive adhesive copper foil tape. Works fine, but I would rate life at no more than five years or so. Only works in the case of minor gold tip wear damage, the kind of damage that most solder over. Ugly.

Method two yields the most robust repaired connector. This is David Smiths' fix of using 1/8" brass U channel. Cut pieces about 5mm long (less than the width of the negative terminal of a battery) that forms a cap over the damaged area. The flat bottom part of the U becomes the new battery contact. Scrape the insulation off the connector and solder to the copper foil. I use a low-temperature hard solder called Tix and an adjustable temperature soldering iron to avoid melting things. You might have to cut away some of the old copper and sometimes glue the brass piece in place first. Every damaged holder is different, it is a touchy feely kind of fix.

HP-25 football

*Message #14 Posted by **Michael Meyer** on 21 Aug 2003, 1:06 a.m.,*
in response to message #10 by Randy Sloyer

Voyagers may be reliable, but I don't think any HP was built with the durability of the Woodstocks.

When I first started collection years ago, I bought several HP-25's for about $25 each on eBay. Who knew they'd become more valuable? I used to carry one of the 25's as my "every day" calculator. Not the prettiest, of course. Now I use a 67.

Anyway, I repeatedly and confidently threw the calculator across the room (carpeted floor). I don't think I've ever seen a broken woodstock case. Actually, the 25 seemed to be MORE reliable, as far as battery contacts. I've never succeeded in breaking an HP-25. I've posted in the past what I put my high school calculator through....

I don't think any other HP... and certainly any newer, LCD calculator could survive being bounced end over end on the floor. The 25, however, is almost indestructable. I presume it's destructable: again, I've never broken one from even purposeful, brutal abuse.

I remember reading the letters to HP about calculator survival. One survived being blown through a snowblower. Another survived a whole winter buried in snow.

An amazing machine, and it doubles as a football in a pinch!

Pioneer calcs: Gaps between keys and faceplate cutouts

*Message #1 Posted by **Neil** on 19 Aug 2003, 6:36 p.m.*

Hi,

I've been collecting hp calcs (mainly pioneers) for a while now and I've noticed on some of my calcs that the keys do not sit squarely in the cutouts of the metal faceplate ie. there are gaps above each key, large enough for hairs, breadcrumbs etc. to fall through and get stuck under the key itself. It almost looks as if these particular calcs were stuck together in a hurry because nobody took the time to line up the faceplate cutouts with the keyboard itself. Is this quite common with hp calcs?

Re: Pioneer calcs: Gaps between keys and faceplate cutouts

*Message #2 Posted by **Paul Brogger** on 20 Aug 2003, 5:30 p.m.,*
in response to message #1 by Neil

[fact-like assertions]

Looking at my trusty -33s, I note (for the first time) that the keys are all offset slightly to the left -- the gaps on the right sides are consistently wider than those on the left.

In fact, the keys are molded as a single unit with the plastic front -- they're attached at the top side of each key to the plastic beneath the aluminum faceplate by two thin bridges (which act as hinges as well as points of attachment).

[outright speculation]

The alignment you're complaining about is the alignment of the holes cut in the aluminum faceplate with the keys, or the alignment of the faceplate itself with the calculator front.

Either way, I'd be surprised if there was any "one" around who bears direct responsibility for not taking extra time to align the face and keys. I assume that they were put together by machines which were periodically adjusted to keep the flow of calculator fronts within some specified acceptable range of alignment.

If the keys move without rubbing any sides of the holes in which they're placed, I suspect your unit met production tolerances at the time it was built.

[hope]

But maybe there's someone out there who REALLY knows something about this topic . . .

HP's new calc page

*Message #1 Posted by **charles** on 19 Aug 2003, 6:21 p.m.*

I'm sure you've all visited http://www.hp.com/calculators/news/index.html

Did you all find it a bit funny how the guy says "we've just released an old financial favorite" (HP12plat.) and then briefly mentions science/graph calcs, then yet another financial calc is on the way. Then at the end of his note, he says later in the year there will be yet another exciting addition to the financial line of calcs? What's the deal here? His writing does not sound very planned at all...

Also, I've heard rumors and seen pics of a 48gII and a 49g+...why bother with so many different models? Is it really necessary? Glad to have my old 32sii...

Re: HP's new calc page

*Message #2 Posted by **Fred** on 19 Aug 2003, 7:58 p.m.,*
in response to message #1 by charles

With all the ranting going on on this board it is obvious everybody wants just one calc released and it must be just the one they would specify for themselves. An easier way would be to invent a time machine and simply pick up what you want, then everybody could be happy....

One model of calculator

*Message #3 Posted by **christof (NoVA US)** on 20 Aug 2003, 12:45 a.m.,*
in response to message #2 by Fred

HP has tried to issue a 'do everything' calculator a few times. The main problem is they never did a real do everything calculator. A true 'do everything' Pioneer, for example, would have been a combination of the 27S and the 42S - or the 17B and the 42S. That means *programming capability*.

The 41 series and 48 series really are single calcs that can do everything and make everyone happy except for (basically) two things:

1: the 41 series ain't made no more. 2: many people dislike the size and appearance of the 48.

I could add RPL as a third, but that's bogus. Several implementations of good algebraic and RPN/keystroke interfaces are available. Or were available.

I don't think offering one calc is the best plan. i *do* think that a real series of machines with shared technology- like the voyagers or the pioneers, would be a good idea.

(as for the 'boxyness' of the Pioneers, i've had more than one co worker under the age of 25 comment on how pretty the photographs of the 27S are. - I'd show them iin pperson if I could find one!)

Hmm... Is this "Fred" as in Fred Valdez of HP??

Most of us want a few things. We're flexible on everything else. Most of us here want an HP calc with:

(1) Ye olde quality. When 30+yr old calcs are mechanically outlasting those produced recently, something's wrong. We're a little more paranoid too, since there's not a great supply of RPN calcs out there. And keys that don't bounce, keys that stop working, or LCD ribbon connectors that separate from PCB are kinda all-important items.

(2) True 4-level XYZT+L RPN with large ENTER key above numeric area. Non-RPN or half-assed RPN without the large [ENTER] key doesn't cut it.

(3) Accuracy. When the new calcs (12C-Plat) don't offer the same accuracy for some functiosn as the orig 20yr old 12C design does, that's a poor sign. Regression in one area indicates likely problems with others.

I'd be grateful to just get something like a TI25X with RPN!

Gee, this never happens with those Hp41, classics, etc. (not, I have quite a few that exhibit all these issues) The connections in a 41 series and some of the Spice are pressure fits, etc.) Some of the good old days were good, but others certainly were not!

"(2) True 4-level XYZT+L RPN with large ENTER key above numeric area. Non-RPN or half-assed RPN without the large [ENTER] key doesn't cut it. "

I do agree with the ergonomics of the classic ENTER key placement, but the effort to maintain RPN is commendable.

"(3) Accuracy. When the new calcs (12C-Plat) don't offer the same accuracy for some functiosn as the orig 20yr old 12C design does, that's a poor sign. Regression in one area indicates likely problems with others"

Certainly it indicates room for improvement if it is in a practical analysis situation, but rarely are products without bugs even with the best intentions. Lets only deal with actual problems and not inferred problems!

HP has certain production facilities and capabilities they can draw on with their development partners. We may not like the reality, but going back to the days when calculators were originally developed is impossible. Patience will bring some rewards (not all) but what I see now occuring will only lead to having nothing at all....

Fred...

"(1) Ye olde quality. When 30+yr old calcs are mechanically outlasting those produced recently..."

>Gee, this never happens with those Hp41, classics, >etc. (not, I have quite a few that exhibit all these >issues) The connections in a 41 series and some of >the Spice are pressure fits, etc.) Some of the good >old days were good, but others certainly were not!

Yes, some truth there. But quality is also "Feel" (in automotive world it relates to "NVH" - noise, vibration, harshness, even though the engine may be fine and the doorknobs don't fall off). Having good click KBs that have double injection molded keytops that don't wear is a good start.

"True 4-level XYZT+L RPN with large ENTER key above numeric area. Non-RPN or half-assed RPN without the large [ENTER] key doesn't cut it. "

>>I do agree with the ergonomics of the classic >>ENTER key placement, but the effort to maintain >>RPN is commendable.

Yes. But KB layout and RPN entry are very tied together. I am *FAST* number-cruncner on an RPN calc w/large ENTER key - whether it's a 41, 25, or 32S... doubt a small ENTER will help :)

"(3) Accuracy. When the new calcs (12C-Plat) don't offer the same accuracy for some functiosn as the orig 20yr old 12C design does, that's a poor sign. Regression in one area indicates likely problems with others"

>Certainly indicates room for improvement if >it is in a practical analysis situation, but >rarely are products without bugs even with the >best intentions. Lets only deal with actual >problems and not inferred problems!

The 12CPlat bugs I speak of are clearly *systemic* and *architectural* in design. They could EASILY have written a small 12C emulator that runs in the 6502-style CPU of the 12C-Plat without taking up much more (if any) ROM space. (In fact, such emulation may in fact allow some code compression given that the 'Nut instruction set is well adapted to BCD FP math ops - as opposed to a native rewrite in 6502 assy or C.) This would allow a perfect emulation of a 12C. And additional funcs could be added inside or outside of the emulation layer.

>HP has certain production facilities and capabilities >they can draw on with their development partners. We >may not like the reality, but going back to the days >when calculators were originally developed is impossible. >Patience will bring some rewards (not all) but what I >see now occuring will only lead to having nothing at >all....

Development partners?? That implies both do some work. Here it merely looks to me like HP issues a quick spec and has slave-labor Kinpo slightly rejigger an existing calc (33S). No 'value-added' with the HP name.

The ARM-based 49 does seem to be innovative. We'll see how good it is. Now if we could just get that large ENTER key on it we'd be set.

HP has largely turned into a 'rewrap' "badge engineering" house. The brains went away to Agilent (some stayed in the printer division, there still seems to be some innovation there) and they seem to wanna concentrate on building PC clones to sell at Costco - against Dell, who will eat their lunch (and I don't like Dell PCs).

```
Fred wote:
> An easier way would be to invent a time machine and simply pick up what you want ...
```

Actually I did try that, but it's not very practical:

a) It requires a shit load of electricity. For example, I used it last Thurday afternoon and I had to wait almost 24 hours for the power to return.

b) I wanted an HP-97, so I went back to 1978 to get one, but it turned out to be too expensive. SEVEN HUNDERED AND FIFTY DOLLARS for a calculator, can you believe it? I told them they were nuts and came back.

*Message #9 Posted by **bill platt** on 21 Aug 2003, 11:34 p.m.,*
in response to message #8 by john

HI John,

I feel just as much chagrin at the loss of the good scientifics. But I wonder if (and until we see internal sales figures I do not know how to substantiate this) the real problem is that in fact the vast majority of engineers, scientists and technical people have left the (programmable) calculator behind--i.e. the sales really fell off. Perhaps this even happened to the 32sii. Sure, there are die-hards like you and me, but perhaps most of the rest of the world of engineering is way "past" the calculator approach.

One of my cousins is a prominent scientist involved in groundwater modeling. I spoke to him the other day about my calculator interest, and to him, all is all terribly anachronistic. The amount of data he processes, the very core of his ideas, have left the handheld far behind.

Strangely enough, is it the more "pure math" oriented that have remained enamored with the calculator? Until I discovered this collecting subculture 6 months ago, I had never heard of a "CAS" (computer algebra system). Now I hear the tern "Erable" and "Alg48" frequently. I am a practicing practical mechanical sort of engineer, and when I have an algebra problem I just get out my pencil---usually if it is a strange dynamic problem, or a multi-variable problem, I am rusty enough that I need to refresh my memory anyway! But if one is very math oriented all the time, then I suppose the "CAS" etc would be useful?

Regards and sorry for the ramble....time to hit the sack!

Re: HP's new calc page

*Message #10 Posted by **Bill Wiese** on 22 Aug 2003, 1:31 p.m.,*
in response to message #9 by bill platt

When I have some 'big' math to do I too do not use a calculator but instead use Excel or Matlab or a custom C program, etc.

So requirements of fancy programmability are actually been reduced for me. Matrix math, plotting, etc - I'll use a 'puter. Though it is nice to be able to have a calc customized via programming for various specialty work - and a root-finder is helpful for TVM problems, etc.

[I want to do a nice exterior ballistics program for my 41C. Unfortunately it's too useful of a calc to take to a rifle range or the desert and drop it, get it dirty, etc.]

But I still use a calc to 'think' thru/play with numbers - figuring out bounds of a problem, degree or extent of something, roughing out an approximation, etc.

So a nice RPN sci calc is welcome. Basic funcs of my dream calc, again (w/o even considering programmability):

- RPN w/4-level XYZT stack + LastX reg

- traditional HP KB layout: positioning [ENTER][CHS][EEX][CLx] row above 0-9 keys

- reliable debounced 'click' KB w/double injection molded keycaps

- full logs/trigs/hyperbolics

- x^2 should NOT be shifted function (wastes keystrokes)

- complex # use is nice (a la 42S)

- memory math ops: "[STO][+]03" or "[STO][/]Z"

- quick base conversions (Hex/Dec/Bin/Oct) and non-base10 math (32S too slow, have to use menus)

- basic TVM functions (i, PV, FV, PMT, n,...)

I'd live w/something like a 32SII again but I'd like it slightly narrower.

And an RPN version of a true pocket calc (roughly credit-card sized, 3/16" thick) like TI's TI-25X would be wondrous!

HP 15C Manuals over $100

*Message #1 Posted by **Mitch** on 19 Aug 2003, 5:20 p.m.*

Ebay item #3041127894. Manual & Adv. Func. Handbook. I don't believe there is a calculator involved in this sale.

Re: HP 15C Manuals over $100

*Message #2 Posted by **Patrick** on 19 Aug 2003, 6:40 p.m.,*
in response to message #1 by Mitch

No, there is no calculator here, just the two manuals.

I have purchased each of these manuals individually for about $30 each. This seller is pretty lucky, although to be fair the Advanced Functions Handbook is a wonderful piece and doesn't come around all that often.

Re: HP 15C Manuals over $100

*Message #3 Posted by **Valentin Albillo** on 20 Aug 2003, 4:47 a.m.,*
in response to message #1 by Mitch

It all depends on the quality of the manuals and the financial resources of the buyer.

In my case, I paid US $90 for a brand-new, shrink-wrapped, spiral-bound "HP-15C Advanced Functions" manual, for my collection. I already had three or four of them at the time, but either they weren't brand-new, never-used, or else they were the hardbound type, which is pretty useless for comfortable reading as it won't lay open flat on the table while you're keying some routines from it in your HP-15C.

As the manual I got was indeed in the absolute best possible condition despite it being 20+ years old (no yellowing, utterly immaculate), I found the price reasonable, specially since I deem it impossible and unnecessary to ever try and get a better one.

Best regards from V.

HP41 Card Reader

*Message #1 Posted by **Colin Lambert** on 19 Aug 2003, 11:58 a.m.*

I bought a UK 'ex-army' HP41 card reader and calculator about 10 years ago. The HP41CV still works well but the card reader has never been tried - until today with my 'new' HP41CX.

It appears to write programmes OK but does not read them back - no error message shown (brand new cards being used). When I verify the cards I get the message "malfunction".

The card reader appears to take the cards through OK - sounds OK as well (what do I know I have never heard a working one!).

When I do'Catalog 2' the message "CARD RDR 1G" lists.

Any suggestions would be greatly appreciated - should I get the screwdrivers out yet?.

Thanks

Colin (in sunny Derbyshire UK)

*Message #4 Posted by **Vassilis Prevelakis** on 21 Aug 2003, 1:20 a.m.,*
in response to message #3 by andy

Pass a new card once through the reader and then look on its underside (the black surface) if it has skid marks then the roller that pulls the card through may be going soft.

look in the forum archives for repair instructions

9810 Magnetic card options

*Message #1 Posted by **andy** on 19 Aug 2003, 10:17 a.m.*

Would it be possible to use 9100 magnetic cards on a 9810?

Also, would it be reasonably easy to make a magnetic card that would work in a 9810 or would formatting it be too difficult?

Re: 9810 Magnetic card options

*Message #2 Posted by **David Smith** on 19 Aug 2003, 2:38 p.m.,*
in response to message #1 by andy

9810 cards are much larger than 9100 cards... no joy there. You might try making some cards by gluing strips of video tape to a backing material (think plastic, card stock, etc) so that the tape is under the heads. I have used a spray adhesive and made workable 9100 cards this way. Spray the back of the tape, keep excess glue off the cards and tape edges.

Re: 9810 Magnetic card options

*Message #3 Posted by **andy** on 19 Aug 2003, 3:57 p.m.,*
in response to message #2 by David Smith

Good idea! I'll give it a try and report back with my results.

I just finished up succesfully repairing the printer. The rubber on the paper roller had turned into a kind of gummy tar. I had to dissassembly the entire mechanism to free the paper roller. Then I had to think for quite some time on a way to re-create the rubber. I finally came up with a solution that involved making a nylon roller and covering it with some high-end 3M heat shrink. It works beautifully now.

Thanks!

Andy

in response to message #3 by andy

How did you make the nylon roller? I have the same problem with a 9810 printer and haven't found suitable materials yet.

Achim

Re: 9810 Magnetic card options

*Message #5 Posted by **andy** on 20 Aug 2003, 10:24 a.m.,*

in response to message #4 by Achim

I had a machine shop make the roller from nylon round stock. I had them machine the OD to 20mm and drill a hole to allow press fit of a 1/4" shaft. Then we pressed the original stainless steel shaft into the new nylon roller (after removing the deteriorating original rubber).

Then I used a 3M heatshrink which has a layer of adhesive coating its ID (I think its called EPS-300). I carefully heated the heatshrink over the nylon roller. It came out very nice and even (the 3M heatshrink is very high quality). The heatshrink provides the roller with the grip it needs to move the paper and is just soft enough for the thermal head to make good contact with the paper.

I can give you more specific information if you email me.

Re: 9810 Magnetic card options

*Message #6 Posted by **David Smith** on 20 Aug 2003, 3:14 p.m.,*
in response to message #3 by andy

If you can find some old 9 track computer tape, it may be more suitible than video tape. Probably reel-reel audio tape would work, but you would need to align the tape much more carefully when you glued it down. You need two strips on each card since the cards had an "A" and a "B" track.

The 9810 used two sizes of cards. Short ones did not hold as much data as the longer ones.

Re: 9810 Magnetic card options

*Message #7 Posted by **Andy** on 20 Aug 2003, 4:16 p.m.,*
in response to message #6 by David Smith

Do you have the exact dimensions for the 9810 card? Better yet, do you know where and how wide the magnetic strips should be on the card?

From http://www.oldcalculatormuseum.com/hp9820a.html it looks like the dimensions are:

6x2 inches and 10.5x2 inches for short and long cards respectively.

I figured that I could just glue two strips of VCR tape and was planning on looking at the card reader to determine where to position the strips.

If it turns out good, I might make a request for a scanner image of a 9810 card so I can have a more faithful reproduction ;) (I could print the image on card stock and then glue the magnetic strips on the back). The main thing is for it to work though.

I may have time to try it tonight.

Re: 9810 Magnetic card options

*Message #8 Posted by **David Smith** on 21 Aug 2003, 3:09 p.m.,*
in response to message #7 by Andy

I will try and measure some tonight. I would position the tape by looking at where the head is.

Re: 9810 Magnetic card options

*Message #9 Posted by **Tony Duell (UK)** on 21 Aug 2003, 5:16 p.m.,*
in response to message #7 by Andy

When you say 'exact' dimensions, how 'exact'? Do you want me to dig out the travelling microscope (yes, I do have one), or are the following dimensions, measured with a ruler, good enough? The short card, part number 9162-0012 measured 6" long by 2" wide. The long card, part number 9162-0045 is 10.5" long by 2" wide. There is, AFAIK, no pre-fomatting on these cards (or on the 9100 cards for that matter). The 9810 records 4 tracks in each direction (it's a 4-coil head). 3 data tracks and a clock track. Porgram keycodes on the 9810 are 6 bits long, and are recroded as 2 sets of 3 bits on the card. I am not sure how 16 bit data words are stored, probably as 6 3 bit words. I must get round to reparing my 9810 card reader (it's got the 'stock fault' of the decayed roller, and is otherwise OK I think). I had also better figure out how the 9810 works before the HPCC conference in a couple of week's time (If there are any UK people here who would like to come to that (13th Sept in London), then e-mail me and I'll provide details).

Re: 9810 Magnetic card options

*Message #10 Posted by **Andy** on 24 Aug 2003, 1:54 p.m.,*
in response to message #1 by andy

I tried making a 9810 card from a file folder and VCR tape. The card has to make a sharp 180 after passing through the head and this was causing the tape to come unglued.

I eventually got frustrated and decided to try an 9100 card just for kicks and IT WORKED!. 9100 cards are the same width but only 3 5/8 inches long.

The 9810's card reader is full of light sensors (which use visible light) and so its smart enough to know that the card is shorter and so it waits for the next side. It looks like ~279 steps can be recorded on each side. I sucessfully recorded a 500 step program on one 9100 card (both sides). I also successfully recorded all of the memory registers on 2.5 cards (5 sides).

Andy

Re: 9810 Magnetic card options

*Message #11 Posted by **David Smith** on 24 Aug 2003, 6:18 p.m.,*
in response to message #10 by Andy

What kind of glue were you using?

Re: 9810 Magnetic card options

*Message #12 Posted by **andy** on 25 Aug 2003, 11:06 a.m.,*
in response to message #11 by David Smith

I was using 3M spray adhesive...the basic kind. I noticed there was some 3m High Strenght for an extra $10....probably should have bought that.

It seems like there must be a source of magnetic card sheet like what the actual cards are made of. I'll have to look around.

Re: 9810 Magnetic card options

*Message #13 Posted by **David Smith** on 25 Aug 2003, 6:58 p.m.,*
in response to message #12 by andy

I used the 3M Super 77 spray on a test. Seemed to work fine, but I only ran a few cycles. This is their medium strength spray. They also make a really nasty one (#99 ?).

Re: 9810 Magnetic card options

*Message #14 Posted by **Tony Duell (UK)** on 24 Aug 2003, 6:22 p.m.,*
in response to message #10 by Andy

Interesting about the 9100 cards. I'll have to try some when I get my 9810 card reader back together (I also have a _few_ real 9810 cards which I'll try first). My 9810 reader is currently in bits, I am replacing the decayed roller (of course). I've made a puller tool and got the old rollers off the shaft. Now all I need to do is make a new roller with grooves for a couple of O-rings. I didn't like the idea of putting O-rings round the hub of the old roller -- I can see them slipping off after a little use. The light sources for the sensors are filament lamps. I can't remember the voltage (it's either 5V or 12V, probably the former), but I do know they're a standard bulb (T1 size), available from RS components and/or Farnell in the UK. I guess they're available elsewhere too. Mind you, they're considerably under-run, so they should last a very long time.

Re: 9810 Magnetic card options

*Message #15 Posted by **andy** on 25 Aug 2003, 11:14 a.m.,*
in response to message #14 by Tony Duell (UK)

I put the o-rings on my rollers without making grooves in the rollers first. I only used 2 o-rings...1 for each roller. It seems unstable to me too but I figured I'd try it for a while and see if they stay on. So far they're holding up fine (after ~50 card reads).

If they fall off, I was thinking of working them back onto the roller and placing several dots of super-glue gel between the roller and 0-ring (my rollers appear to be aluminum).

The 5/8"x7x8" o-rings are a perfect fit and grip the card nicely. Instead of machining groves into the roller, you might want to consider glueing some flanges on either side of each roller (like a train wheel only on both sides). I'm sure there are some standard washers out there that would work well.

Andy

Re: 9810 Magnetic card options

*Message #16 Posted by **Tony Duell (UK)** on 25 Aug 2003, 1:14 p.m.,*
in response to message #15 by andy

Actaully, making a new roller from a piece of 7/8" brass rod took under an hour... It is a very simple piece of machining. Fitting it on was a little harder, it's all-to-easy to bend the shaft or crack the drive pulley. Anyway, it's done now. And it works fine. Finally, my machine works with 9100 blank cards too, so I guess they all do.

Re: 9810 Magnetic card options

*Message #17 Posted by **Katie** on 25 Aug 2003, 10:37 p.m.,*
in response to message #15 by andy

I posted an article here http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=154 a couple of years ago when I came up with this repair using O-rings too. I used three of them to keep them stable and they've been working ever since.

Re: 9810 Magnetic card options

*Message #18 Posted by **andy** on 26 Aug 2003, 11:10 a.m.,*
in response to message #17 by Katie

Hi Katie,

I read your article before I my repair. It was very helpful (especially the o-ring size information).

I couldn't quite figure out how you used 3 though. My two rollers are far enough apart that a third o-ring would have just flopped around in that space. So I just put on o-ring on each roller. I was careful to get rid of any twists and the ring seems reasonably stable. If I have trouble with it falling off, I think I'll epoxy a washer on either side of the roller to act as a flange.

Thanks!

Andy

Back on line & new articles !

*Message #1 Posted by **Valentin Albillo** on 19 Aug 2003, 6:44 a.m.*

Hiya all, just came back from my 26-day summer vacation out there in some beautiful & sunny Spanish beach.

Upon checking my regular mailbox, I was delighted to find there the latest issue of HPCC's "Datafile" publication (V22N4 July/August), which coincidentally happens to include [shameless plug] two of my articles, namely

HP-15C Nth degree Polynomial Fitting

A 6-page article which includes a program to fit a polynomial of up to 6th degree to a set of arbitrary data points. The program prompts for the data points, then computes and outputs the coefficients of the explicit polynomial which fits them all, in just 42 steps.

Long Live the Advantage ROM!

An 8-page article belonging to my commemorative "Long Live!" series, which includes a 41C/Advantage user-friendly, fully-prompting implementation of the above HP-15C program, in just 60 individually-commented steps, and including a thorough discussion of the differences between both approaches.

Four application examples are given in all, including fitting, interpolation, inverse interpolation, finding a polynomial given its roots, and exposing polynomials disguised as trigonometrics :-)

Of course, this Datafile issue is also choke-full of other interesting articles and programs, including:

```
"A Note in Internet Access with the HP-200LX"
"RPN, ALG, and the HP12C Platinum"
"HP-38G Clear Advantage Over HP48G/49G"
"Old Timers" [very interesting article on the HP-45/55 timer, by Jordi Hidalgo, includes
extremely comprehensive references]
"QPI for HP42S"
"What is HP-42X?"
"EMU41 for HP48/49: Some hidden key-combinations"
"A substitue i-solver for the HP12C Platinum"
"HP Calculator History: the HP95LX"
```

etc, etc.

For the very next issues, expect to find (Mr. Bruce Horrocks permitting) several more of my articles, including "Long Live the HP-16C!", featuring a program which *really* makes the HP-16C capabilities shine, and an awesome, chess-related program for the HP-71B ! (ditto).

If you feel like having a look at some or all of these, I would heartily suggest you visit the HPCC's web site at:

HPCC - HANDHELD AND PORTABLE COMPUTER CLUB (formerly PPC UK)

Since the good old PPC, CHHU and HPX bit the dust, this is one of the best and most successful struggles to keep our beloved machines alive. You still get the old thrill of waiting for your issue to materialize in the mailbox, and read it with utmost delight and interest. So, anything we can do to help it going, be it submitting articles and programs, or subscribing, or both, will be in everybody's best interest.

Best regards from Valentin Albillo (formerly PPC member #4747, currently HPCC member #1075), who, needless to say, gets no profit at all from this, other than the pleasure of contributing to the HP calcs users' community.

Read and enjoyed your articles a lot (even though alas I do not own a 15C). Keep on contributing those excellent articles to Datafile! Good to having you joining HPCC!

Best Wishes and Happy Hacking,

Juergen HPCC #1065

Thanks to both of you, and ...

*Message #4 Posted by **Valentin Albillo** on 20 Aug 2003, 6:16 a.m.,*
in response to message #1 by Valentin Albillo

... and, as usual, rest assured that I intend to make available these articles on line, in PDF format, in a near future, so that anyone interested can get them. I'll post a message here to let you know.

Meanwhile, as it can probably take some time, the fastest way of getting to read them is to subscribe to Datafile, which has the obvious extra-large benefit of being able to read all the other great articles featured, written by many very knowledgeable, kind contributors and which, naturally, I can't ever provide in any format for obvious legal reasons.

Best regards from V.

Welcome back!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 20 Aug 2003, 7:48 a.m.,*
in response to message #1 by Valentin Albillo

Hey, Valentin;

nice reading your words here again. I hope you had a good time in your vacations.

Unfortunately I'm running through some time-consuming activities for these days, but I am sure I'll have good moments when reading your papers.

Best regards from Brazil.

Luiz

HP29C documentation and data

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2003, 5:21 p.m.*

Hello, folks;

I'm taking the chance to try to repair two HP29C (unfortunately it seems their ACT are bad) and I decided to collect as much data as possible about them. I'll contact the owner and ask for a few more time with them so I can go further. Have a look at the image below (low resolution):

http://www.logeng.com.br/images/HP29Cps_view.jpg

I scanned the mainboard and the power supply unit. I tried to "draw" the power supply in an electronic design SW but I did not achieve good results. So I decided to refine the original scanned image and generate the drawing over it. It seems I have a better look, now. I know it's not the final art I want but I'd like to ask you , please, check it and add your feedback so I can improve it. Original scanned images and track-only are saved.

I also removed the transformer and I measured its "coils" so it's now easier to "see" what's going on. I am transferring the "free-hand" drawings to an appropriate layout so I will add its final art later.

I measured the output DC voltages and I'll add them in a final drawing. I also tried to see (and record) the waveforms, but I have an old audio-lab, vacuum tube oscilloscope that is far from being able to read more than 100 kHz (if more than this, image is fuzzy and out of focus), so I cannot add this information.

I scanned the mainboard without any IC and the power supply, just a few components, both sides. This way I'll be able to generate final schematics.

I'll let you know as soon as it's ready and I'll post the information here. Please, Dave, is it O.K. to do it? I mean, will it be an issue if HP does not allow? Please, let me know.

Best regards.

Luiz (Brazil)

HP29C: transformer schematics

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2003, 6:30 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, folks;

this is to add the image of the transformer coils.

http://www.logeng.com.br/images/trafo_hp29c_schem.gif

As many of you may have already noticed, I'm using an old OrCad version (DOS based) to draw the schematics. No big deal, ahn?

Color names refer to the colors used in "painted" wire (isolating foil). The "COPPER" means transparent foil.

Spice's transformer has a different coil arrangement, as I have checked. I intend doing this sort or "cataloged information" for the HP25/25C. What do you think?

Best regards.

Luiz (Brazil)

Edited: 18 Aug 2003, 6:42 p.m.

HP29C: few questions

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 19 Aug 2003, 1:19 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi folks;

after collecting a few more data, there are three questions I want to ask. If anyone can help with answers...

1 - I saw at least three different codes for ACT chips:
1820-1741 (I saw some HP25, a few HP25C and one HP22 with this one)
1820-1523 (one HP25, two HP22 and at least two HP25C with this one)
1820-1596 (three HP29C)

Are they all interchangeable?

2 - The HP29C's power supply has two transistors and I did not remove any of them till now. Does anybody have the specs/ID for them? This information would allow me to let them in place instead of removing to identify them.

3 - Is there any relation between the 8-pin pinout used in RAM/ROM chips in the HP29C, the HP97/67, Spices and the HP41? I see that pin names for Ø1, Ø2, DATA, SYNC and Is/Ia are the same used in the HP41 and the HP97 ROM/RAM. Are they kept in the HP29C chips? If so, that would allow a better identified schematics.

Thank you for any information.

Luiz (Brazil)

Re: HP29C: few questions

*Message #4 Posted by **David Smith** on 19 Aug 2003, 2:42 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

As far as I know, all the woodstock ACT chips are compatible (except the HP27).

I have never had to take apart the HP29 power supply. I did have one with the on-main-board supply with a bad tantalum filter cap. One DC votage looked fine on a meter, but on a scope it was a square wave.

Re: HP29C: few questions

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 20 Aug 2003, 7:55 a.m.,*
in response to message #4 by David Smith

Hello, David;

as always, thank you for the technical info.

The fact is that I just want to catalog info, and I'd like to know who are those fellows. If I have the chance, I'd test the transformer with external frequency generator and get its characteristics. But I have no generator and no applicable scope, so I thought about disassembling it and collect physical characteristics and # of turns for each coil. Again, the calculators are not mine and I'll not risk damaging their P.S. units.

As I have new data I'm posting. I intend building an article about this particular "adventure" and I'd like others to read and add whatever needed.

I'll post a message about this later.

Best regards and thanks again.

Luiz (Brazil)

Re: HP29C documentation and data

*Message #6 Posted by **Ellis Easley** on 19 Aug 2003, 10:10 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I don't see any unoccupied pads or vias for connections to the rest of the calculator. I assume wires were tack-soldered to pads - which pads are used for power input and output?

Connecting Pads

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 19 Aug 2003, 4:17 p.m.,*
in response to message #6 by Ellis Easley

Hi, Ellis;

I used an input VCC of 2.4V (two rechargeable NiCad's) connected in C1 terminals (the electrolytic capacitor). All connecting points are shown below:

http://www.logeng.com.br/images/hp29c_ps_conn.jpg

I removed all IC's and measured all voltages with no load connected to the output terminals. There are four connecting points that I found interesting. The ones I marked in blue are single connections to a paralell LC arrangement; a ressonant circuit, maybe. I did not follow the other two ones, shown in green, but the images will help figuring it out: all tracks are shown as all IC's are removed. If needed, I can mark where and which IC's are there.

Hope this helps for now.

Luiz (Brazil)

Edited: 19 Aug 2003, 4:18 p.m.

Re: Connecting Pads

*Message #8 Posted by **Ellis Easley** on 20 Aug 2003, 5:48 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

I don't have a 29C, I just want to try to analyze the power supply circuit. Your posts make it easy to do

without any hardware! Is that power supply PCB "surface mounted" on the main PCB? No wires, just solder? If so, we could call it a "ball grid array" (BGA). Pretty advanced for mid-1970's!

The parallel LC circuit leads go to two pins (13 and 14) on the ACT chip, I imagine they are the resonant tank for the oscillator that generates the clocks for everything.

Re: Connecting Pads

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 21 Aug 2003, 12:36 a.m.,*
in response to message #8 by Ellis Easley

Hello, Ellis;

your analysis is correct. It's a BGA (I didn't know the term) and the connecting points shown are the only ones between the power circuit and the mainboard, no extra wiring. And there is also an isolating foil between them both.

After having a brief look at an HP21 schematic circuit, the only things conneted to pins 13 and 14 (ACT) are two capacitors.

Thank you, Ellis.

Luiz (Brazil)

HP-21 Clock Components

*Message #10 Posted by **Michael F. Coyle** on 21 Aug 2003, 9:04 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luiz,

That schematic is wrong. Pins 13 and 14 are connected to an *inductor* and capacitor in parallel, not two capacitors.

The values are 150 microhenries and 330 pF, giving an oscillator frequency of about 715 kHz. (Which is then divided by 4 to give a clock of about 180 kHz (5.5 microsecond clock period).

- Michael

Thank you!

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 22 Aug 2003, 12:06 a.m.,*
in response to message #10 by Michael F. Coyle

Hello, Michael;

thank you very much. I thought it was a suspicious arrangement, but I do not have an HP21 to check. I have seen many Woodstocks with inductors that are capsulated as an ordinary, tubular shaped resistor with colored rings to identify them (mH value?). Maybe the author of the schematic concluded it was another sort of capacitor, to justify the use of two of them in parallel, who knows.

Thank you for the additional info. I'll update my schematics with the values you post.

Best regards.

Luiz (Brazil)

Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #1 Posted by **Victor** on 18 Aug 2003, 2:38 p.m.*

I received a message from service@paypal.com. It said that my PayPal account may be deleted if it is inactive for 3 months. It gave me boxes to type in my email address and PayPal password to log into my PayPal account. I didn't do this, suspecting this was a hoax.

I went to www.paypal.com and logged into my account from there. The first thing I received was a message saying that PayPal will never ask for your PayPal password via email or phone.

I think this was an attempt to illegally obtain my PayPal password.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #2 Posted by **bill platt** on 18 Aug 2003, 3:35 p.m.,*
in response to message #1 by Victor

Any official information from paypal will come only from HTTPS://paypal.com The "s" means secure. Paypal has a warning posted on their site about fraudulent attempts.

regards,

Bill

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #3 Posted by **unspellable** on 18 Aug 2003, 3:50 p.m.,*
in response to message #2 by bill platt

It's not a hoax, it's a scam. A hoax is a not for profit prtactical joke. This sounds like it's for profit and therefor qualifies as a scam.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #4 Posted by **Les Bell [Sydney]** on 19 Aug 2003, 4:42 a.m.,*
in response to message #1 by Victor

It's a scam. If you look closely at the URL where the account details are submitted, you'll find it doesn't go to Paypal at all, but goes to a different site. From memory, the URL is cunningly disguided - something along the lines of

http://www.paypal.com@www.scamstersite.com

In other words, it uses www.paypal.com as the user ID - the real hostname is www.scamstersite.com. Devious.

There's a number of these things floating around, impersonating pages on the Paypal site, as well as regional bank web sites. I've received two of the Paypal scam emails, and I don't even have a Paypal account.

Best,

--- Les [http://www.lesbell.com.au]

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #5 Posted by **Wayne Brown** on 19 Aug 2003, 6:38 a.m.,*
in response to message #1 by Victor

This definitely was a scam. If you still have the email, forward it to **spoof@paypal.com** and they'll investigate it. eBay has a similar address, **spoof@ebay.com**, to use for forwarding emails that try to obtain your eBay information.

Some of these scam emails don't ask directly for your id and password. They ask you to "update your account" by clicking a link that *appears* to take you to eBay or PayPal, but really goes to a fake web site. (It may even include text and images copied from the real site.) It *looks* just like you're entering information into the real site, but you're really giving the scammer any info that you enter. **Never** follow a link from one of these emails to eBay or PayPal, but rather go directly to them from your web browser.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #6 Posted by **Patrick** on 19 Aug 2003, 2:27 p.m.,*
in response to message #5 by Wayne Brown

The other option is for **everyone** to follow the link and to enter bogus data. Effectively, they will be spammed by a plethora of false leads. If a large fraction of would-be victims did this, the slimeballs would be inundated with gobs and gobs of useless data that would take them days or weeks to go through, in a (hopefully) vain attempt to find one that works.

Of course, you would also report them.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #7 Posted by **Victor** on 19 Aug 2003, 6:26 p.m.,*
in response to message #6 by Patrick

This may not be a good idea. Here is a copy of an e-mail someone sent me:

"Never and I mean never respond to any such email. Even responding with fake information can be dangerous. Some have code that will copy your personal information from you machine once you allow their program to execute by sending a response."

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #8 Posted by **Patrick** on 19 Aug 2003, 6:43 p.m.,*
in response to message #7 by Victor

If this were true then it would have already happened. How many people have randomly surfed the internet and come across a less than reputable site, shall we say. If it were possible for a web site to get your personal information just by visiting the site, there would be no need for scams like the ones being talked about here. The information would be available for the taking.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #9 Posted by **bill platt** on 20 Aug 2003, 9:05 a.m.,*

in response to message #8 by Patrick

I think your e-mail address is accessible to a website--because I have spam that comes now that never did before, until I visited a particular website. And, it is addressed to my e-mail!

What I do not like about the current online system is that you basically have to trust the microsoft/norton "wizards" that they have protected you. There is no way to understand what their code is doing, i.e. no one really understands Windows.

[OT] How spammers harvest e-mail addresses

*Message #10 Posted by **Valentin Albillo** on 20 Aug 2003, 9:26 a.m.,*
in response to message #9 by bill platt

Hi, Bill, have a look at this:

How spammers harvest e-mail addresses

Paragraph 6.1 seems to me to be most likely applicable in your case. You'll be able to tell if other paragraphs do apply an take appropriate measures to prevent the harvesting.

Best regards from V.

How Spam Works: Thank you, Valentin!

*Message #11 Posted by **bill platt** on 20 Aug 2003, 11:02 a.m.,*
in response to message #10 by Valentin Albillo

Valentin,

TNX 4 the excellent link! Wow, that is the mother lode of Spam delineation. It is just what I was looking for!

BTW I hope U had a gr8 vacation ("holiday") --you lucky Euro Duck! (We only take 10 days here :-(but had a gr8 time in Canada anyway----saw seals, dolphins, Minke Whales, Basking Sharks (10 meters long!) all sorts of cool birds like Gannets and petrels and coots, eider ducks, Guillemots, ravens, osprey.....and went musseling and clamming and caught wild mackerel, ate lobster, picked wild blueberries, swam in the (not so cold this year) cold water, went sailing, rowing, canoeing, double-paddling, reef-gunkhgoling by motorboat, bog trotting (finding carnivorous plants--bladderworts, sundews, pitcher plants, and also wild orchids, Labrador tea, stunted 100 year old larch only as thick as a broomstick--all to leave 4 future generations) and taught my 6 year old to steer a sailboat, made up family plays in the evenings, load 15 people in the old Dodge woody and off we go to the alley for candlepin bowling and soft ice cream....and on.... We work hard and play even harder! So, I hope you feel refreshed from your beach time.....

Best regards,

Bill

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #12 Posted by **David Smith** on 19 Aug 2003, 2:46 p.m.,*
in response to message #5 by Wayne Brown

I got several of these from "ebay". When I tried (several times) to contact the real Ebay about reporting

them, I never got back any response. They did not seem to be interested in stopping the scam in any way.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #13 Posted by **Victor** on 19 Aug 2003, 6:28 p.m.,*
in response to message #12 by David Smith

I did report this to spoof@paypal.com. I got a response back saying that PayPal did not send the email and that the email linked back to a site not run by PayPal. They also said that they will investigate this fully.

Since eBay and PayPal are part of the same organization, hopefully eBay will be investigating this as well, even though they didn't send a response.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #14 Posted by **Wayne Brown** on 20 Aug 2003, 6:53 a.m.,*
in response to message #12 by David Smith

All the emails I've forwarded to spoof@ebay.com have gotten a response from eBay. Usually there's an immediate response, then a follow-up message in a day or so.

Re: Paypal Accounts May Be Deleted If Inactive (Hoax?)

*Message #15 Posted by **Chuck from Phoenix** on 20 Aug 2003, 10:11 a.m.,*
in response to message #1 by Victor

Interestingly, a similar scheme was perpetrated on Earthlink. Emails containing false email links 'back' to Earthlink requested passwords and personal info. The linked pages looked quite legitimate. I believe even Bank of America has been through this scam.

But, just like virus protection, the general public is clueless about this scam technique, and despite repeated warnings, the spammers still score plenty of good info from well-meaning saps.

The cat-and-mouse game continues.

Another hoax/spoof

*Message #16 Posted by **Patrick** on 20 Aug 2003, 7:48 p.m.,*
in response to message #1 by Victor

Just had what looks to be another spoof attempt show up in my inbox. Here's the URL of the (very-authentic looking) "Sign In" link that supposedly enters you into a contest to win a nice vehicle:

http://www.ebay.com&refer=ebay@acfis.net/aw-cgi/eBayIsapi.html

This URL actually goes to acfis.net, not ebay.com, if I understand URL-speak. When you go there, you get a eBay-like login box. I'm sure they'll catch a bunch of folks with this.

Re: Another hoax/spoof

*Message #17 Posted by **Victor Koechli** on 20 Aug 2003, 8:10 p.m.,*
in response to message #16 by Patrick

Definitely a spoof. Looks fucking real, though! All elements of the login form are actually ebay's, and all the links go to ebay, except of course the sign in button. It even says 'Thank you' and tells you it had you

entered in the draw if you enter anything...

You're right, there'll be tons of people falling for this.

(deleted post)

*Message #18 Posted by **deleted** on 21 Aug 2003, 12:21 a.m.,*
in response to message #16 by Patrick

This Message was deleted. This empty message preserves the threading when a post with followup(s) is deleted.

Re: DO NOT EVEN CLICK ON THE HOAX!!!

*Message #19 Posted by **Patrick** on 21 Aug 2003, 1:10 a.m.,*
in response to message #18 by deleted

I think you can relax, Bill... eBay is down at the moment.

Phew--that was close

*Message #20 Posted by **Bill Platt** on 21 Aug 2003, 4:33 a.m.,*
in response to message #19 by Patrick

Tnx Patrick---I was a bit hysterical there for a moment!

All OK now.

Re: Another hoax/spoof

*Message #21 Posted by **unspellable** on 21 Aug 2003, 8:28 a.m.,*
in response to message #16 by Patrick

What's this thing look like?

I have a message in the bulk mail section (My Yahoo generally puts eBay stuff in the regular mail box.) about an "ebaY Draw". I have not opened it yet. I tried opening it but it stalled out. If eBay is down at the moment then maybe it was really from eBay.

Re: Another hoax/spoof

*Message #22 Posted by **Patrick** on 21 Aug 2003, 3:39 p.m.,*
in response to message #21 by unspellable

eBay, and most other reputable web organizations, make it a point to emphasize that they will **never** ask you for your password as part of an email. This is exactly what this spoof is doing.

Ask yourself this: why would eBay need you to login to "confirm" your entry in this so-called "bonus draw"? Even if there was such a draw, why wouldn't they just tell you to log into your account **in the usual way** and then click on some special bonus link?

These slime moulds are preying on the vast hordes of people who are not intimately aware of all the idiosyncracies and vagaries of web technology. In fact, by default browsers should pop up a warning explaining what is happening whenever this special URL mechanism is used. The true domain that is being asked for should be part of the pop-up message. These days it is rare for anybody to want to send user name and passwords in the clear as part of a URL. Anonymous ftp might be the most common

exception.

Re: Another hoax/spoof

*Message #23 Posted by **puckmasterc** on 23 Aug 2003, 11:54 p.m.,*
in response to message #22 by Patrick

Hey guys, I got this email too. It is deffinately not from ebay. I sent it to their fraud department. They assured me that they are not connected to this hoax in any way.

HP-55

*Message #1 Posted by **Howard** on 18 Aug 2003, 8:28 a.m.*

A couple of months ago I wrote to this forum about the problems I am having with my HP-55.

It works OK in Timer and Run modes but will not programme. It gives " -15" for every key that is pressed except for when "GTO 0, 1, 2, 3, or 4".

The general consensus of opinion was that the main memory chip is shot.

Anyway I've got hold of another HP-55 for parts and I am looking to see if it is feasible to take out the main memory chip from it. I thought of changing over the whole board but it does not appear be working.

My first problem is that there are eight chips.

Can anybody point me to the right chip?

Or better still, Does anybody fix these calculators?

Thank you in advance.

hp 80 keys don't respond well

*Message #1 Posted by **Irfan** on 17 Aug 2003, 8:31 p.m.*

I have hp-80 and some of the keys on top row (FV, PMT) don't respond. Every now and then these key function but mostly don't. What would be best way to fix this problem? Thanks in advance for any tips. - Irfan

Re: hp 80 keys don't respond well

*Message #2 Posted by **Victor Koechli** on 18 Aug 2003, 7:12 a.m.,*
in response to message #1 by Irfan

Most of what you need to know shold be in http://www.hpmuseum.org/howtohp/howtohp.htm. That should get you started.

In addition, I have found that using a plain strip of paper (instead of sandpaper) to clean very bad key contacts can be a valid alternative. It's potential for damage might be less than the sandpapaer's.

Cheers, Victor

Re: hp 80 keys don't respond well

*Message #3 Posted by **Jon** on 19 Aug 2003, 5:45 p.m.,*
in response to message #2 by Victor Koechli

If you use a piece of cloth impregnated with isopropilic alcohol it will work for sure. And you can´t damage the metal part (take care with the sandpaper).

Recovering a HP97 printer

*Message #1 Posted by **Jose Goncalves (Brazil)** on 17 Aug 2003, 6:37 p.m.*

Hi

I've been busy trying to revive the printer of my HP97. The main problem so far is a nylon gear some 10 mm in diameter, 30 teeth, that is turning into powder.

I'm sure it doesn't have to be nylon, may be nylon was chosen to porvide a smooth movement. Have you been trying other type of material for this gear ?

Where can I find a replacement for it ? I'm sure the printer in my HP92 will display the same problem when I start to work on it.

Re: Recovering a HP97 printer

*Message #2 Posted by **Katie** on 17 Aug 2003, 7:13 p.m.,*
in response to message #1 by Jose Goncalves (Brazil)

You can use an aluminum gear. Take a look here:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=84

HP 71B - plate below hp logo

*Message #1 Posted by **Neil** on 17 Aug 2003, 4:18 p.m.*

Having seen various pictures of the 71b, I noticed that on some 71b's there appears to be a metal plate just below the hp logo, while on the museum's 71b pictures, this plate is not there, or I should say, it looks instead like some kind of black slot with a smaller plate to the right side of it. Upon reading the museum's 71b description, it looks like the card reader/writer is installed.

Does this mean that the larger plate just a cover which can be removed to install the card reader/writer?

Re: HP 71B - plate below hp logo

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Aug 2003, 4:24 p.m.,*
in response to message #1 by Neil

Hi;

yes, there is a "protective" plate that must be removed prior to install the card reader. Also, there is a 32KRAM module that fits in the same place.

Luiz (Brazil)

Yes, that is the card reader

*Message #3 Posted by **Mike** on 18 Aug 2003, 1:04 a.m.,*
in response to message #1 by Neil

You can install a card reader blank or one of many other memories.

There are 32K RAM, 32K RAM/EPROM, 64K RAM/32K EPROM, 96K RAM, 128K RAM and who knows what else.

Re: Yes, that is the card reader

*Message #4 Posted by **Neil** on 20 Aug 2003, 5:14 p.m.,*
in response to message #3 by Mike

Thanks for all the feedback on this. I actually wanted to know because there was an ebay auction where the seller stated that the only marking on the calculator was engraved numbers on this plate. It was then I checked the photos in the museum and I noticed that that 71b was different to the one in the auction.

Question for HP-48GX Experts

*Message #1 Posted by **John Smith** on 17 Aug 2003, 3:21 p.m.*

Do any of you know GRiD 1 MB RAM CARD is for? Perhaps would be kind enough to explain the functionality of that card. Thanks,

John

Re: Question for HP-48GX Experts

*Message #2 Posted by **Raymond Del Tondo** on 17 Aug 2003, 5:26 p.m.,*
in response to message #1 by John Smith

Hi,

as you wrote, it's a RAM card. It can be used in slot 2 of the GX, and offers eight additional ports of 128K RAM each.

Regards,

Raymond

Re: Question for HP-48GX Experts

*Message #3 Posted by **John Smith** on 17 Aug 2003, 5:41 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond,

Thank you for your reply. What I meant to ask is that is this GRiD brand 1 MB ram card similar to HP 1 MB ram card? In other words, will it increase HP-48GX's ram additional 1 Meg as HP, TDS, and RAMSS 1MB ram cards do? Thanks.

Re: Question for HP-48GX Experts

*Message #4 Posted by **Erik Ehrling (Sweden)** on 18 Aug 2003, 4:28 p.m.,*
in response to message #3 by John Smith

I have a 1MB GRID RAM card and it works in every respect as any other 1MB HP48GX RAM card.

Regards, Erik Ehrling (Sweden)

in response to message #4 by Erik Ehrling (Sweden)

Erik,

Thanks for the info. I was looking for someone just like you who has the working knowledge with this GRiD brand card. Can you share some knowledge with me? Does it require battery or batteries? How often do you need to change them? What kind of battery (brand and number) do you use? Can you also perhaps provide me some instructions on how to reset the calculator after inserting the card etc. Perhaps you can refer me to card manual in the Web site so that I can download? Any further help would be highly appreciated. I'm asking a lot of questions because all I have is the card. No batteries and no manual. Thanks.

John

Re: Question for HP-48GX Experts (Erik)

*Message #7 Posted by **Ben Moss** on 19 Aug 2003, 6:36 p.m.,*
in response to message #6 by John Smith

Hi John,

It takes a CR2016 3 volt watch battery. The instructions say to change it every year and I've always done that without problems. You change the battery while the card is in the calc (With the calc turned on) so that you don't lose the data.

After you insert the card into slot 2, turn the calculator on. It will say "Invalid Card Data". Type 'PINIT' and all is good.

I've read that you should not let the calculator's AAA batteries drop too low while using a GRiD card. I'm not sure why, but you might want to search comp.sys.hp48 usenet archives about it.

Hope that helps, Ben

Did anyone notice this {HP33S}

*Message #1 Posted by **Naim** on 17 Aug 2003, 8:25 a.m.*

It has a display button and it also has a ENG button. Does that make sense? Or am I missing something?

"Shortcut"?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Aug 2003, 11:19 a.m.,*
in response to message #1 by Naim

Hi, Naim;

I see what you mean. Have you thought that it may be sort of fast "choice selection", or even a shortcut? If you see also, there is a MODES key and RPN/ALG selection key, and I would not be surprised if the "MODES" menu contain ALG and RPN keys as well.

My 2¢.

Luiz (Brazil)

Re: Did anyone notice this {HP33S}

*Message #3 Posted by **Paul Brogger** on 18 Aug 2003, 2:18 p.m.,*
in response to message #1 by Naim

In the summary of features, the "ENG" key must be what is referred to by "engineering notation conversions: ->ENG, <-ENG". (And that, in turn, may explain the otherwise puzzling green left-arrow above ENG.)

FIX, ENG, and SCI are joined by "ALL" in the features list.

My $.02 on the 33S

*Message #4 Posted by **Katie** on 18 Aug 2003, 9:02 p.m.,*
in response to message #1 by Naim

Did anyone noticed that the "Rmdr" function is the only one in mixed (upper/lower) case? I like that HP finally added a remainder to a low/middle-end calc (along with integer divide) but its inconsistent labeling really stands out -- so much so that I'll bet that this is not the final version and (like someone else pointed out on comp.sys.hp48) perhaps this photo/mock-up/whatever is just a test balloon floated to see what people's reaction to the design is.

Re: My $.02 on the 33S

*Message #5 Posted by **Patrick** on 19 Aug 2003, 1:26 a.m.,*
in response to message #4 by Katie

If the 33S is really due for release in the Sept/Oct time frame, I seriously doubt there is time to re-design

the keyboard, even if it is as simple as a re-labelling of some functions.

This is just a gut feel based on the lead time in my industry (custom software development). Perhaps someone with industrial production experience can comment more authoritatively.

Pioneer keyboard (esp. HP-42S)

*Message #1 Posted by **Erik Ehrling (Sweden)** on 17 Aug 2003, 7:48 a.m.*

Hi all!

I have two keyboard problems with two of my HP-42S calcs.

1) On a USA built Rev A the LN key has become unresponsive. It works if I press it firmly but not with a light press (all other keys do).

2) On a Singapore built Rev B the STO key has a very annoying clicking sound. Sometimes the sound goes away if you press it two or three times, but it comes back if you have not pressed it for some time.

Is there anything I can try to fix these calcs? (Blowing them with compressed air? Cleaning them in a ultrasonic cleaner? Anything else?)

Best regards, Erik Ehrling (Sweden)

Re: Pioneer keyboard (esp. HP-42S)

*Message #2 Posted by **Randy Sloyer** on 17 Aug 2003, 8:43 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Take the batteries out of both and give them several passes in distilled water in an ultrasonic cleaner. Ten minutes is usually enough on each pass. Stop midway through each cycle, take the unit out of the water and press each key several times. This changes the water inside each key dome area. Change the tank water after each 10 minute cleaning cycle. You might be temped to clean both at the same time, don't unless the cleaner is large enough to hold them without touching. The cases and bezels will develop wear marks should they touch.

When you've done two or three cycles, shake out all the water and let dry for two days in a warm place.

Unit 1 may clean up and be okay as the LN key gets low usage compared to the 0-9 and basic 4 (+-*/). If it was one of those keys, I wouldn't have a lot of hope. I've found the older USA and early Singapore units to develop this type of failure, it's due to the conductive material flaking off in the domed part of the switch.

Unit 2 will probably clean up fine, sounds like a spill of something got into the keyboard.

in response to message #1 by Vassilis Prevelakis

Excellent photos of the blackout!

BTW, a guy from my office had to drive from Newark Airport to our office in Connecticut that evening. He was picking up two european business partners at the airport---they landed at exactly the time of the blackout! I guess the europeans will have some stories to tell!

Anyway, he said that driving by NYC with absolutely no lights on in any of the buildings was him just about the eeriest feeling imaginable. The only feeling that trumped it was the feeling he got after September 11, 2001, driving by and not only seeing, but feeling a hole in the skyline.

Regards,

Bill

HP Journal for the Integral PC

*Message #1 Posted by **Vassilis Prevelakis** on 16 Aug 2003, 7:19 p.m.*

The October 1985 issue of the HP Journal contains a lot of very interesting info on the Integral PC, a luggable Unix workstation.

http://www.series80.org/HP-Journal-IPC/Images/OS-I0001.JPG

The issue is about 36 pages and covers the construction of the unit itself and the version of Unix it runs.

You can either get a monster PDF file (19 Mbyte) http://www.series80.org/HP-Journal-IPC/HP-Journal-IPC.pdf or see the individual pages as jpg.

http://www.series80.org/HP-Journal-IPC

Note that clicking on an image will give you the full resolution bitmap.

BTW You can get tons of info on the HP-IPC at http://www.coho.org/~pete/IPC/integral.html

Re: HP Journal for the Integral PC

*Message #2 Posted by **Les Bell [Sydney]** on 16 Aug 2003, 10:14 p.m.,*
in response to message #1 by Vassilis Prevelakis

Thanks for that, Vassilis. HP loaned me an Integral for a few weeks when they were first released (I was editor of a computer mag, and they knew I was a long-time HP calc enthusiast, so . . .).

It was my introduction to HP-UX, running out of ROM on a 68000. With X on the plasma display, it was uncannily similar to Windows 386 running on the Compaq Portable 386 I bought a few years later. But the Integral even had the printer built-in - quite an amazing unit.

I must have written a review of it at the time, but it's long lost now. If I ever come across it, I'll make sure to post it.

Best,

--- Les [http://www.lesbell.com.au]

Re: HP Journal for the Integral PC

*Message #3 Posted by **Les Bell [Sydney]** on 17 Aug 2003, 12:26 a.m.,*
in response to message #2 by Les Bell [Sydney]

Actually, now that I'm reading through the articles, I'm reminded that the Integral didn't run X - it ran a HP-proprietary windowing system (HP Windows).

Best,

--- Les [http://www.lesbell.com.au]

Re: HP Journal for the Integral PC

*Message #4 Posted by **Vassilis Prevelakis** on 17 Aug 2003, 4:06 p.m.,*
in response to message #2 by Les Bell [Sydney]

Shame about the losing your article on the IPC.

Having such articles presents a historical perspective

For example, I found an article on the HP-85 from the early 80s. Since the magazine (BYTE) is still around (for some small value :-) I got permission to put it up on my site
http://www.series80.org/ByteArticle

To provide real context, ads from that era are also very important: E.g. on the same issue of BYTE there was an ad for a 26 **Mega** byte hard disk for $5000 (Yes, five **THOUSAND** 1980 US dollars).

in response to message #6 by Raymond Del Tondo

```
> Yes, and I think I saw this or a similar photo in one of HP's product
folders.
```

Not the same photo since that was taken by the BYTE photographer and the quality is not really up to the standards of promotional material.

Please remember that in 1980 BYTE was a small-scale operation, closer to (say) Steve Ciarcia's INK, than to PC Magazine.

Technical people in the 70s and 80s were absolutely in love with HP (and I include myself in that group), so its not surprising that the BYTE reviewer had an HP-01. Moreover, people thought digital watches were cool, back then :-)

**vp

Thank you for posting this link!

*Message #8 Posted by **Matt Kernal (US)** on 18 Aug 2003, 1:35 p.m.,*
in response to message #1 by Vassilis Prevelakis

I've been looking for this issue of the HP Journal for quite some time (a couple years :-). I appreciate finally getting a chance to read the articles.

Has this online edition been available for a while, or is it new? I don't see a direct link to it from the series80.org site (as you've posted it in your message), nor have I seen it turn up in various searches I've attempted through Google.

In any case, I'm glad I can now read it. Thanks again!

Matt

Re: Thank you for posting this link!

*Message #9 Posted by **Vassilis Prevelakis** on 18 Aug 2003, 10:57 p.m.,*
in response to message #8 by Matt Kernal (US)

I am glad that you liked it. I think the IPC is a very cute machine and I really view it as an HP-85 on steroids (too bad it doesn't look anywhere near as good as the HP-85).

I put the HP Journal images on the series80.org site last week, but I had the scans for some time.

When I completed the original scan, I did email Peter Johnson to let him know that I had scanned the material, since he has been asking for it on his web site (http://www.coho.org/~pete/IPC/integral.html), but he never replied.

Scans always require some post processing and this is extremely labour intensive with the software I have (Corel Photopaint), so I forgot about these scans till early last week. Then I did the processing, uploaded the PDF file and the images and posted the note.

The reason why there is no direct link from the top page is that the IPC is not really a part of the Series 80.

I don't want to put up unrelated stuff on this site, so if I have stuff that do not fit, I try to send it to the admins of the appropriate websites (e.g. I have scanned a couple of HP-41 and HP-71 manuals, but I gave them to Dave since on the MoHPC site they will be of use to more people).

Buying FN1000

*Message #1 Posted by **Paulo Costa** on 16 Aug 2003, 4:59 p.m.*

I've read a discussion about Aurora FN1000, and I'm still in doubt about buy an HP12C or or this cheaper clone. Didn't have it in US? Here in Brazil isn't ease to find, but is a half of price. It is the only RPN financial calculator besides HP?

Re: Buying FN1000

*Message #2 Posted by **db(martinez,california)** on 16 Aug 2003, 8:23 p.m.,*
in response to message #1 by Paulo Costa

Paulo:

As far as i know, only HP and Aurora market RPN calculators. I have not been able to find an Aurora 1000 here in the U.S. I wrote to Aurora twice asking if the 1000 is sold here. They did not return my emails. I could ask a Japanese friend to write by regular mail in conji (it reads basicly the same in Chinese) but there are no conji characters for some modern concepts, like calculator for instance.

BTW: Isn't that interesting that there are two distinct languages, not even related like Spanish and Portugese, that can use the same written form?

Please keep an eye out for another Aurora RPN model and tell us if you see it. We would all be interested.

- d

Help Please - HP32SII Fractional Display

*Message #1 Posted by **Chris Thomson** on 16 Aug 2003, 12:06 a.m.*

Like so many others, my HP32SII has been a trusty friend for years. My (about 1994) model is helping me do some carpentry framing in Thailand. When I came over here last year, I didn't realize that I would be staying, so I left the instruction manual in storage in the USA.

There are two settings for the Fractional Display mode (FDISP orange shift "." key). The denominator for the fractional display is controlled by the value of /c, blue shift "." key. Mine is on the setting I don't like. I want to be able to change /c value to 8, 16, 32, etc., and have that /c value remain constant. Now it is in some type of float mode that I've never found useful.

I can't remember how to switch the setting. I recall having done it a few times over the years, and that switching the setting is not a straightforward exercise unless one refers to the manual. The manual tells how to do it.

Can someone please post the instructions for switching that setting?

Thank you in advance, Chris Thomson

Re: Help Please - HP32SII Fractional Display

*Message #2 Posted by **Patrick** on 16 Aug 2003, 12:44 a.m.,*
in response to message #1 by Chris Thomson

Sorry, don't know the answer to your question off the top of my head, but here is a link to the HP-32Sii User Manual.

Re: Help Please - HP32SII Fractional Display

*Message #3 Posted by **Chris Thomson** on 16 Aug 2003, 1:03 a.m.,*
in response to message #2 by Patrick

Patrick & Everyone Here:

Thank you so much. I posted here first, then immediately jumped over to HP's website "just for grins" to check & see if they had the answer. Since I knew the HP32SII was discontinued, I never dreamed they would still have support online.

However, to my great satisfaction, the manual was available *free* in .pdf format, and I had it quickly downloaded. Reason I always buy HP - just bought the Compaq laptop I'm writing this on in May.

So, scratch my request.

FYI - Three fractional display modes. Mode I wanted is what they call "Factors of denominator." Procedure is to set flag 8, clear flag 9.

Thanks to everybody, Chris

Re: Help Please - HP32SII Fractional Display

*Message #4 Posted by **Renato** on 16 Aug 2003, 1:08 a.m.,*
in response to message #1 by Chris Thomson

I am not sure if this is what you want, but to enter a fractional number, you enter two decimal dots in the same number.

OK, we know what's wrong..now, what's right

*Message #1 Posted by **bill platt** on 15 Aug 2003, 11:45 a.m.*

OK. We have a near conensus regarding what is wrong with the supposed new 33S. (We still don't know if it is even real.)

Now, assuming someone from HP *might* be listening, then what is right?

Re: OK, we know what's wrong..now, what's right

*Message #2 Posted by **Paul Brogger** on 15 Aug 2003, 12:54 p.m.,*
in response to message #1 by bill platt

Here's my list:

```
1. New offering with some favorite H-P fundamentals:
     * native RPN (not RPL) with Enter, Roll Down and Swap keys,
     * multiple continuous-memory registers, and
     * storage register arithmetic
2. keystroke-programmable (again, not RPL)
3. plastic keys
   (presumably better than rubber -- someone was listening!)
4. 32K memory
5. two-line display
6. "4-arrow key" should give direct (unshifted) access to SST, BST and scrolling
7. built upon well-integrated and easy-to-use 32s/sii
```

Re: OK, we know what's wrong..now, what's right

*Message #3 Posted by **christof (NoVA US)** on 15 Aug 2003, 2:20 p.m.,*
in response to message #2 by Paul Brogger

Absolutely!

Paul's list is very good- there is one and only one thing I don't like about the 33s enoough to really care. And that's the keyboard. in *every* other respect, it seems to be the upgrade to the 32sii that I want*. Pop that puppy in the 10bii case (kind of ugh, but it's workable) and I'll buy them.

-Christof

*(which doesn't make it an upgrade to the 42S! but that is a totally different issue.)

Re: OK, we know what's wrong..now, what's right

*Message #4 Posted by **Les Bell [Sydney]** on 16 Aug 2003, 1:00 a.m.,*
in response to message #3 by christof (NoVA US)

You know, I can compromise on the keyboard, if two conditions are true:

1. at least it's a decent RPN calc in the other ways described, and

2. the keyboard appeals to new (young?) users, and thereby actually *grows* the RPN community.

If 2. holds true, then it's no bad thing. I'd prefer a more plain-vanilla keyboard, but I don't expect to get everything my own way. I'd just like to be able to buy some kind of RPN machine with a consistent interface for my kids to use in school, as opposed to the god-awful half-prefix/half-postfix Casio things they're stuck with now.

Best,

--- Les [http://www.lesbell.com.au]

Last night my daughter had her boyfriend and three other members of the "nerd patrol" over to watch DVDs.

Out of curiosity I showed them a side-by-side image of the HP-33s and the TI 34II with identifying marks backed out. I asked, "If both of these were on the shelf at BestBuy, which one would you choose?"

All five teen-geeks emphatically picked the HP-33s.

Comments were:

"Very cool keyboard."
"The silver one looks more modern."
"Very, very krunck(??)"
"Where can I get one?"
"Is there more dip?"

On the other hand, none were impressed with the HP-49g+. And a brief discussion of RPN vs. algebraic entry had them all glazed over and chanting "boring."

Mark Hardman

"Burgess was wrong..." Maybe so, but lubbywubbing and synthemesc are still popular. The ultraviolent is taken care of by the government though.

BTW: I plan to buy a 33 to throw in the glove compartment. I may even use it some. I will not program it extensively. No matter how good it may turn out to be; without mass storage capacity it is just a rat hole. After loosing 6k of programs on a 42 i am not impressed at all by 32k that is not backed up on something permanent.

32k (Long)

*Message #8 Posted by **bill platt** on 17 Aug 2003, 6:28 p.m.,*
in response to message #7 by db (martinez, california)

Hi db,

There is a positive side to the 32k--but you have to see it from the other perspective. Currently, when using the 32sii, it is quite common to have written a whole bunch of tiny little programs, and equations, each of which is relatively trivial and simple on the fly stuff. Now, the crunch comes when you want to "solve" or "integrate" or do some other thing with the machine---and it runs out of memory. 384 bytes is easy to fill up by hand with off the cuff programs---but it is always a shame when you have to chip away half of them just to get "solve" to work.

(This just happened to me today--wrote a simple program for figuring 2nd moments of areas---and had to clean out some stuff--and then discovered that I needed my 2nd 32sii to have enough memory for my handy beam formulas. All these formulas are trivial and easy to program in--and the "overhead" isn't really an issue because the good engineer is always re-familiarizing and confirming anyway---and further without writing paper documentation for 32sii programs, the operational I/O is so cryptic that you can never remember easily what something is, anyway. Now, why wasn't I using a spreadsheet? Ah, the great question--I DO use them--even on this job, but when you are designing a complicated structure, there is really no other good way in my opinion than having decent size scaled sketches, and a calculator and grid tablet, and you go through the structure and design it--very fluid, very hands on and tactile--very direct, but I am getting of topic.....)

So, the 32k will take care of this problem.

What remains to be seen is whether or not they have worked through any addressing issues to make it possible to use all of that space---as we have seen, the 12CP is really stuck at 253? lines of programming--so I wonder if we will see a significant line number limitation (either documented or not) in the 33S.

---all assuming of course that it is not a HOAX!

Regards,

Bill Platt

yes bill,

*Message #9 Posted by **db(martinez,california)** on 17 Aug 2003, 10:02 p.m.,*
in response to message #8 by bill platt

I had thought of something like that; that one use for the otherwise uslessly huge memory would be if someone needed a lot of space for solving a big matrix. That is assuming, like you said, that there is a calculator and it is decently programmable.

Re: Did someone say "matrix"?

*Message #10 Posted by **Paul Brogger** on 18 Aug 2003, 2:02 p.m.,*
in response to message #9 by db(martinez,california)

Maybe I'm missing something obvious, but does anyone see any indication that the 33s has any matrix capability whatsoever?

This ain't a 15c or 42s. I think we're talking 27 registers and 32K program space to mess with 'em.

there i go assuming again

*Message #11 Posted by **db(martinez,california)** on 18 Aug 2003, 10:57 p.m.,*
in response to message #10 by Paul Brogger

I was thinking you could both program it like an HP and move the curtain to change the default storage/program memory alocation. I was thinking this about a modern bottom of the line HP whose parameters were probably laid out by mba's.

DOH!

While i think the solve function is a cool idea, quick-dirty-simple and very impressive, it is not how i learned to program. The 42's version was great though.

Re: there i go assuming again

*Message #12 Posted by **christof (NoVA US)** on 19 Aug 2003, 2:34 p.m.,*
in response to message #11 by db(martinez,california)

Well...

Having used multiple stats lists (sum lists) and a few dozen little solver programs on the 17bii, I can say that the 32k could handily be used if the 33 has the ability to do useful things. Maybe matrices are out (and maybe they aren't- how long will it take one of our regulars to write a program for that?), but if the machine has enough useful program cappabilities, then 32k is more than I had ever asked for in a 32s upgrade. The biggest downfall I see with that much space is only having 27 variables. It's still a functionally *very* good upgrade to the 32sii (assuming the keyboard is usable in the end)

to replace the 42, you simply do need I/O. or a backup module. something. I'm going on 10k of data in mine now. gettin kind of scary. At

least I do printouts periodically. I keep hoping for a 42 replacement.

Nerd Patrol :-))

Me and my 32sii, and insufficiency of it...

*Message #15 Posted by **Tizedes Csaba** on 17 Aug 2003, 7:22 a.m.,*
in response to message #2 by Paul Brogger

Hello!

My first (usable) HP calc is an HP32SII (brown with blue-orange shifts). I buy it for my entrance examination. (And I'm a student now in a Hungarian university... ;))

I use it to solve for many-many problems. I very like it, and if I want to use an fast calculator, I choose this machine.

But some things, what I dont like in it:

1.) Equations not editable, only with [BackSpace] key 2.) SOLVE and INTEGRATE not works parralel (try to calculate an half axis of ellipse if the ellipse's half circumfence and another half axis is available... It's a really problem if you want to design plastic tunnels for vegetables. Or try to calculate inverse normal distribution...) 3.) SOLVE don't works with SOLVE, and INTEGRATE don't works with INTEGRATE 4.) Memory is too small 5.) Haven't got AND, OR, NOT and XOR commands 6.) No two character long (or one character+ a number) variable names (like on C=64 :)), no BEEP, no IR (It's not a really problems...) 7.) And a REALLY problem: No METAL case, and no WATERPROOF case and keyboard. (And no shock resisitant, and not dust catchered,...) Its only a table-calculator, and not usable in industry...

Csaba

Waterproof

*Message #16 Posted by **Patrick** on 17 Aug 2003, 1:42 p.m.,*
in response to message #15 by Tizedes Csaba

I have found some ziplock bags at Staples (office supply store) that are almost exactly the same size as a Pioneer. If you slip your calculator into one of those, it is still usable and pretty much protected from the elements. Of course, it still won't withstand the knocks and tumbles of an industrial environment, though. For that we need to have an inexpensive RPN machine so that replacing it isn't too much of a financial burden.

Re: Waterproof

*Message #17 Posted by **bill platt** on 17 Aug 2003, 2:35 p.m.,*
in response to message #16 by Patrick

You can also get really sturdy ziplock bags that are designed for protecting marine VHF walkie talkies. And, you can apply sticky-backed foamp padding to the case and sides of the calculator for protection.....

regards,

Bill

Re: OK, we know what's wrong..now, what's right

*Message #18 Posted by **Erik Ehrling (Sweden)** on 17 Aug 2003, 7:53 a.m.,*
in response to message #1 by bill platt

The best thing with the 33S is that HP is again producing a keystroke programmable RPN calc. This makes it much more likely that they will ever come up with a 43S (i.e. a HP-42S follow-up).

Regards, Erik Ehrling (Sweden)

One thing is missing?

*Message #19 Posted by **bill platt** on 17 Aug 2003, 2:24 p.m.,*
in response to message #1 by bill platt

Well, we have some good posts here! Interesting post from Mark Hardman--I guess we really are a different species after we have been out of school for ten years!

Something is missing on the 33S keyboard: Standard Deviation, and "R". Note that the "Probability" menu has been removed, the Cn,r and Pn, r are now where "MODES" and "DISP" used to be (+/- and "E" keys) but where did the SD and R go? They surely are not in the "modes" menu or the "solve" button, or the "display" buttons?

Another thing: although the keyboard maintains most of what was already there on the 32sii, it does nothing but worsen the "consternation factor" regarding having menues sort of scattered about the keyboard willy-nilly. Valentin would surely second these comments--he is right about this menu scastering--I still get a bit befuddled using my 32sii menus--especially if I have not had to dive into one in a while.....

But maybe this really is a hoax? I mean, how could they throw out hte Standard Deviation?!

Regards,

Bill

Re: One thing is missing?

*Message #20 Posted by **Tom Scott** on 17 Aug 2003, 6:30 p.m.,*
in response to message #19 by bill platt

I think the standard deviation function is on the same key as on the 32SII (i.e., above the 1/x key). I would imagine that the "r" function is in the "LR" menu on the LN key.

Illegal Use of Unregisterd Electronic Devices

*Message #6 Posted by **Director of Homeland Security** on 15 Aug 2003, 5:18 p.m.,*
in response to message #1 by Norm

From: Department of Homeland Security Reference: post to MoHPC 15 Aug 2003

Sir (aka "Norm"):

We are informing you that your use of said electronic device is a violation of USCj 1334 Subpart g(ii)c, "Non-Compliant Electronic Devices" and you will pe prosecuted to the fullest extent of the law.

Quote from USC 1334 Subart g(ii):

"(a)...any and all electronic devices shall be constructed with a 'v-chip' which enables the Department to examine the device communication history. (b) The Department shall be empowered to collect 'v-chip' data upon reciept of a valid Federal subpoena. (c) All devices which were manufactured prior to Nov 17, 2002 shall be registered with the Department. Form GAO-DHS-011-3 may be obtained.....

"iii. Mandatory Minimum Sentencing. The minimum sentence for violation of this subpart shall be:

"a) for violators with non-compliant Texas Instrument Devices: confiscation of said device and mandatary replacement with SunnyPlains solar 4-function calculator for a 2 year period.

"b) for violators with non compliant Hewlett-Packard Devices: confiscation of said device and subsequent cleansing treatment, consisting of placement of device on active CSX railroad tracks for a minimum exposure period of 48 hours...."

Your trial date will be sent to you via Registered Mail.

So it was YOU! (OT Blackout Report)

*Message #7 Posted by **Michael F. Coyle** on 15 Aug 2003, 5:56 p.m.,*
in response to message #1 by Norm

Hi Norm,

Yeah, those old LED machines will really suck up the power...why do you think they come up in FIX 2?

They'll find you by tracing the red-hot wires all the way back to your house.

That'll teach you never to use a penny in the fuse box.

By the way, I live on Long Island, New York. The blackout hit at 4:12 PM local time, giving us over three hours of daylight for the commuters to find their way home. I live and work in the suburbs, so no problem for me. Power was restored to my house at about 3:15 AM. I had no damage or problems, just had to clean out the fridge and reset a couple of clocks.

I was proud to see that my fellow New Yorkers took it all in stride...civilians directing traffic, just about everyone polite, no looting, crime or fires. There was a little bit of oppurtunistic price gouging ($5 bottles of water, $2 hot dogs) but one store was giving stuff away for free -- flashlights, sneakers, etc.

There were no deaths reported and perhaps just minor injuries caused by the blackout. It's inconveinent but maybe we should have one of these things every 20 years or so, just to show everyone (and ourselves) just how decent New Yorkers can be. It won't offset the bad publicity of the other 19 years, but what the heck.

- Michael

I thought it was MY fault.

*Message #8 Posted by **Michael Meyer** on 15 Aug 2003, 6:44 p.m.,*
in response to message #7 by Michael F. Coyle

I spent my lunch hour yesterday installing a new UPS at my office... hard work to move everything, get behind a cabinet, etc. The blackout hit hours later. (Not here in lovely Nebraska)

You know, when you wash your car it rains. I installed a UPS... so power went out elsewhere.

Isn't that a coincidence... that I was essentially preparing for a blackout and hours later there's a big one!?

Naaah.

*Message #9 Posted by **Ernie Malaga** on 15 Aug 2003, 7:13 p.m.,*
in response to message #1 by Norm

I have a much better theory to explain the blackout. Some sentimental fool in Philadelphia must have switched on good ol' ENIAC to celebrate its 57th anniversary... running a long extension cord from nearby NYC "just in case".

18,000 vacuum tubes will do that to you!

-Ernie

Blackouts and ERO's

HP-67 for $760

*Message #1 Posted by **Nick** on 14 Aug 2003, 10:30 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3039688962&category=11713

This HP 67 is going for $760, and it has 22 hours to go still. And the battery won't hold a charge. Yikes, I definetely need to sell mine now.

Re: HP-67 for $760

*Message #2 Posted by **Victor Koechli** on 15 Aug 2003, 3:05 a.m.,*
in response to message #1 by Nick

Keep yours. The 67 is so fun to use, and you'll have trouble finding a comparable quality calculator anywhere. I only recently bought a 67 (finally!) that needed some serious keyboard repair, but it could be done quite easily.

Honestly, I can't believe that this price is really gonna be paid. You would be crazy...

Cheers, Victor

Re: HP-67 for $760

*Message #3 Posted by **Gary** on 19 Aug 2003, 6:52 p.m.,*
in response to message #1 by Nick

This auction finally ended with $810.00 as the final bid. Note how the winning bidder has zero (0) feedback. Looks like bid rigging to me.

Re: HP-67 for $760

*Message #4 Posted by **David Smith** on 20 Aug 2003, 3:32 p.m.,*
in response to message #3 by Gary

If it was bid rigging, then the guy with the (0) feedback probably would not have wound up with the final bid.

But then, I have noticed that when a person with a reputation for bidding way above prevailing market values is around (JOE_OIL, THERWIL, JONCONALI, etc) that (0) bidders seem to pop up and drive the bids even higher. It is very rare that they actually get stuck with the high bid. I don't know how often they actually pay for it.

New HP32Sii Platinum Model

*Message #1 Posted by **Renard** on 14 Aug 2003, 9:07 p.m.*

If you're a financial person, you're currently in heaven when it comes to the range of "Classic" look calculators you can currently choose from - HP10Bii, HP12C and also the HP12C Platinum (overkill?). It's either a drought or a flood at HP it seems, come on!! ....a HP12C and a HP12C Platinum at the same time? (but currently absolutely no basic scientific model). It's obvious that the financial business minded bean-counters at HP (not scientists) decide the models. Imagine a HP42S, a HP32Sii and a HP32Sii Platinum available at the same time (with no basic financial model available for 2 years)!!!

Now if the same look as now exists in the current financial range was now available in the scientific range then I would be in heaven too. The HP33S should look like the HP10Bii, the HP11C should be added to the current HP12C production line (the moulds are exactly the same) and just for good measure add a HP11C Platinum to the existing HP12C Platinum production line now running and pumping out machines. The HP11C Platinum (or HP11Cii) could be included just to prove the point that HP can produce an over-kill of scienticfic "classic" look calculators just like now exists with the current financial "classic" look range.

HP-42S With 32K

*Message #1 Posted by **Tom Cox** on 14 Aug 2003, 8:34 p.m.*

Have had a modified unit for a couple of months now and it works just great. Fortunately, the 42S is rock-stable and there is not much danger in losing memory. It took me many hours to key in the nearly 8k of programs I had in machine before the unit was modified.

I would be really upset if I had machine nearly full of 32k and crashed it as it would take a looooooooong time to key in that much stuff.

Will reserve judgment on 33S until more details and reports are available -- but, the features appear to make it a suitable substitute for 32SII. For someone that uses matrices, it would not seem to be a reasonable substitute for 42S.

Unless the reviews are outstandingly bad, will probably purchase one just to see what it can do. As for the keyboard, I can probably get used to it. Perhaps HP was copying the TI-34 when they made Integer Divide a top level key.

Does anyone know when the 33S will actually be available for sale?

All things considered, for $50-$60 the HP-33S appears to be a reasonably priced machine.

Re: HP-33S With 32K

*Message #2 Posted by **Paul Brogger** on 15 Aug 2003, 10:55 a.m.,*
in response to message #1 by Tom Cox

I think the reasoning behind 32K in the 33s is "no practical limit" -- a vast improvement over the mere several hundred bytes offered by the 32s/32sii. From that perspective, the lack of I/O, while unfortunate, is not illogical.

Also (and without really knowing anything about the subject) I suspect that, given the reliability of current fabrication processes and chip yields, 32K is not significantly more expensive than would have been a 2K or 8K addition to the CPU circuit. (That assumes they're on the same chip. If no one gets there before me, mine will be dismantled soon after I get my hands on it.)

Note that the 32s/sii programming model for line numbers (three digits unlabeled, plus 26 labels with two-digit suffixes for each) has a potential range of at most ~3,600 lines. The 33s' 14-character display lines (up from 12) must be dictated by the availability of 32K bytes of storage, if that is to be made available to programmers.

I note the addition of a "space" function, implying a "space" character -- that wasn't available in the 32s/sii, was it? That could imply variable and program naming, or maybe it's just a syntactic requirement elsewhere?

Space in 32sii

*Message #3 Posted by **bill platt** on 15 Aug 2003, 11:13 a.m.,*
in response to message #2 by Paul Brogger

Hi Paul,

There is a space in the 32sii---it is on the R/S key and it is only active when in the equation writer. Remember that in the 32sii, the equation writer can be used a number of ways:

1. You can write equations in the "equation list" and solve them for any varible. The "equation can be either an assignment, an expression, or an equality. Then, you can solve it, using "solve"

2. You can write equations in PROGRAM mode. This way, you can sneak algebraics into your programs. The equation takes up one "line" in hte program, and it can be solved in the program etc.

3. By setting a flag, you can use the equation writer in PROGRAM mode, but instead of treating the equation as a mathematical expression, it will instead just dump the contents to the display via a "pause" so that you can have text messages!

And also, you can integrate, too. So, for lots of stuff, this is just soo much more than the 11c ever was (and 19 times faster, too). But I still like the 11c. It is a beautiful thing.

So that's the long of the short of it.

regards,

Bill

Re: HP-33S With 32K

*Message #4 Posted by **John Moore** on 20 Aug 2003, 6:16 a.m.,*
in response to message #2 by Paul Brogger

I do not think that the 33s has 32K-bytes. It is more likely to be 32K-bits. The CPU is a SPLB31A. The specification can be found here:

http://www.innotech.co.jp/sunplus/products/p_splb.html

and here:

http://w3.sunplus.com.tw/products/lcdcontroller/confirmsheet/lb31a_cm.pdf

The CPU has 4 K Bytes. This is the same as 32K-bits. I think someone has made a mistake.

It could use an extenal RAM but this would add a lot to the cost. The 12C Platinum uses a CPU from this range.

Re: HP-33S With 32K (bits?)

*Message #5 Posted by **Paul Brogger** on 20 Aug 2003, 9:39 a.m.,*
in response to message #4 by John Moore

In the 33s' description (as provided) there are enough grammatical mistakes and clumsy turns of phrase to make your observation very plausible.

4K would be more in line with the lack of electronic I/O and the apparent limitation of 27 registers, while still being a vast improvement over the severely hamstrung 32s/sii memory. Another benefit

would be reduced need to alter the 32s/sii user programming address scheme (limited to something like 3573 lines, if I've got it right).

Quite apart from the obviously ugly keyboard, all this speculation about actual *capabilities* has me checking hpshopping.com regularly . . .

Re: HP-33S With 32K (bits?)

*Message #6 Posted by **bill platt** on 20 Aug 2003, 11:05 a.m.,*
in response to message #5 by Paul Brogger

Hi Paul,

But isn't most of the memory in these calculators used up in the built-in functions and routines? In other words, this 4k may not be any more than the existing memory in the 32Sii?

regards,

Bill

Re: Not 4K (but I'm no expert)

*Message #7 Posted by **Paul Brogger** on 20 Aug 2003, 11:52 a.m.,*
in response to message #6 by bill platt

I understand that "secret" registers are used for STAT & complex number operations, and probably for SOLVE, but I would think only a handful.

Remember (for example) in the Woodstocks, the statistics features took up 6 registers that were otherwise made available for general use. I think as memory got cheaper, these registers were simply allocated in the background, and dedicated to statistics uses to simplify the user interface.

I assume similar things are done with SOLVE, etc. But again, that shouldn't take too much memory.

But then, what do I know? Maybe they've implemented a huge jump table in RAM to allow dynamic patches to the OS Kernal and support viruses & worms . . .

Re: Not 4K (but I'm no expert)

*Message #8 Posted by **bill platt** on 21 Aug 2003, 12:23 p.m.,*
in response to message #7 by Paul Brogger

Hi Paul,

Somewhere here recently someone posted about how much ROM is used up in implementing the machine's functions (like sine cosine etc) I think it was Gene who posted.

Anyway, what I am guessing is that much of that 4 kB would be used up in ROM as opposed to user RAM. Am I confused?

BTW, just read your contribution regarding taking apart Pioneers----so, how is your black stealth 14-BS doing?!

Regards,

Bill

Re: Stealth 42s

*Message #9 Posted by **Paul Brogger** on 22 Aug 2003, 4:24 p.m.,*
in response to message #8 by bill platt

I was assuming the 4K referred to RAM, and that the ROM was a different number. If they're combined as 4K either/or, I think we're not going to see much user memory in a 33s! Someone probably has some idea how much ROM it takes to implement something like a 32s/33s -- I 'll bet it's a LOT more than 4K!

I have two Dr. Frahnkenshteen HP-42s'. One is all black, upgraded to 32K, with some sort of keyboard or power-short problem. IIRC, it randomly resets itself, quickly uses batteries and dies. The other is a 32K model too, in a 17BII with most keys and the faceplate black, but the numerals, operations, and a few other shared keytops exposed. It's doing great.

In addition, I bought 42s with a sticky keyboard a while ago. A few attempts at un-sticking it don't seem to have worked. Way down on my projects list is performing "keyboard surgery" to replace its internals, and documenting the whole process with pictures. But that's just not going to be done anytime soon.

Re: Stealth 42s

*Message #10 Posted by **John Moore** on 22 Aug 2003, 7:16 p.m.,*
in response to message #9 by Paul Brogger

THe SPLB31A CPU has 256K ROM and 4288 bytes of RAM. It can address up to 4 megabytes externally. It has all the hardware needed for a display and keyboard. Using just the CPU would make the calculator cheap to build, adding external chips puts up the cost.

The calculator must have a least 4K-bytes or 32K-bits of RAM. It could have RAM external to the CPU , though I doubt this. It has 256K of ROM, more than enough for all the functionality

http://w3.sunplus.com.tw/products/lcdcontroller/datasheet/lb31av03.pdf

Re: Stealth 42s - A guess...

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 23 Aug 2003, 3:43 a.m.,*
in response to message #9 by Paul Brogger

Hi, Paul;

I read your post and it made me remember I want to catalog the available 32KRAM chips for the HP42S/HP42S+ upgrade. BTW, have you tried to remove/replace the 32KRAM chip in the all-black, self resetting Frahnkeshteen? The high-current drain made me think of RAM chip as the cause. Just a guess...

In time: do you know where did I find related 32KRAM with ID code close to the ones I used in some HP42? Ancient hard-disk controler board (two so far, one with two 32K IC's and another with only one), an old sound board (with three IC's, two

already used) and a controler ISA-type board for a hand-pulled, colored Genius scanner. The only board I could remove the IC's is the sound board; the others are still in use. As I mentioned, I'll collect data and post later.

Best regards.

Luiz (Brazil)

Pampered Texas Instrument Calculator users

*Message #1 Posted by **Max** on 14 Aug 2003, 7:24 p.m.*

Do you think HP would go to the trouble of giving HP calculator users one of these? (see below site) - Hey Man they're really breast fed at TI!!

http://education.ti.com/us/product/accessory/keyboard/features/features.html

Re: Pampered Texas Instrument Calculator users

*Message #2 Posted by **Garry H.** on 14 Aug 2003, 7:30 p.m.,*
in response to message #1 by Max

Going to need one of these when I'm 70 years old.

Re: Pampered Texas Instrument Calculator users

*Message #3 Posted by **Les Bell [Sydney]** on 14 Aug 2003, 8:03 p.m.,*
in response to message #1 by Max

I've got to hand it to them; TI is running rings around HP these days, in terms of product design (they're actually *designing* things, not just picking from a Kinpo OEM product list), support (manuals, applications, etc.), marketing (obviously) and probably build quality (I haven't used a TI since my TI-59A crapped out after only a few months of use).

Sad to see.

Best,

--- Les [http://www.lesbell.com.au]

Re: Pampered Texas Instrument Calculator users

*Message #4 Posted by **VPN** on 15 Aug 2003, 4:48 a.m.,*
in response to message #3 by Les Bell [Sydney]

Well TI cut back the manual size for the new TI 89 (I used to own the old model with good manual) and the new HP is promised to have a much bigger manual.

There is no SD card model in the TI calculator line.

The keyboard of all the TI sucks big time. There is no key-click whatsoever. THAT you call "design"? Eat my socks! The new Kinpo models ARE designed specially for HP.

You can find enough applications for the 49G models to fill up a SD card here: www.hpcalc.org

Re: TI Keyboards

*Message #5 Posted by **Paul Brogger** on 15 Aug 2003, 11:36 a.m.,*
in response to message #4 by VPN

I disagree re: "ALL" TI keyboards. I think the TI-83+ Silver Edition (plastic, not rubber keys) has as good a feel as can be found in a modern device. Not as good as older H-P's, but still fine.

If the 33s feels even that well, I'll consider it a step in the right direction.

Re: Pampered Texas Instrument Calculator users

*Message #6 Posted by **Speck** on 15 Aug 2003, 9:26 p.m.,*
in response to message #1 by Max

I would understand the keyboard for people who did serious programming on the machines, but most who do already have PC's and are using all the SDK's, GraphLink editors and the VTI emulators they can get their hands on. Besides, most people using TI's don't even know how to program them (but then, I STILL haven't figured out how to program my 49G yet, so who am I to talk?). You do have to hand it to TI, though, for their ambition to get their machines into the classrooms. Looks like it's really paid off for them. Are you listening, New HP?

HP11C LCD Display "Corrosion"

*Message #1 Posted by **Daniel** on 14 Aug 2003, 6:32 p.m.*

Does anyone know what causes the black "sandwich bite" corrosion effect which gradually "eats" along the perimeter edges of the HP11C LCD display and generally increases with time - oxidation? The display still functions OK (seemingly) but will eventually encroach into the digits and render them unreadable.

How do you stop this? - store the calculator in a zip plastic bag away from the air? or in a vacuum seal bag? --to stop the corrosion increasing.

Can the LCD be replaced by a HP11C LCD spare part and what is the HP spare part number for the HP11C display?

Alternatively, what is the HP Spare Part number for the HP12C or 12C Platinum display to order from HP? (if compatible)

Failing all of the above options, would it be feasible to purchase a currently available HP12C or HP12C Platinum and cannibalize the LCD display from these models to put into the HP11C?

Thanks

End of Evolution (long)

*Message #1 Posted by **Ernie Malaga** on 14 Aug 2003, 1:16 p.m.*

I wish I could remember who said first what Iâ€™m going to say now. The idea isnâ€™t mine; if you disagree with it, donâ€™t blame me.

The point I want to make is that devices are first created using a less-than-ideal design, which keep improving through the years as user feedback arrives pointing out possible improvements.

But this evolution reaches an end sometime. A time comes when itâ€™s impossible to further improve on utensils such as spoons and forks, chairs, toothbrushes, and so forth. You can make an aesthetic improvement, but not one of functionality. You can also add gee-whiz gimmicks and doodads, but you canâ€™t really make the product better.

I believe the telephone keyboard belongs in this category. It reached its plateau many years ago. Making oddly shaped keys or holographic captions wonâ€™t make the keyboard better; in fact, it usually does the opposite. Often Iâ€™ve seen phones (which are designed to look antique) in which the buttons are arranged in a circle. Others have the buttons arranged in a triangle. All these make the phone _difficult_ to use; in an emergency I donâ€™t want to have to figure out where the 9 and the 1 keys are so I can dial 911. Iâ€™d rather have a boring, square-shaped keyboard in which the keys havenâ€™t moved since the 1970s.

Likewise with calculators. Give me a boring rectangular keyboard and Iâ€™ll be happier than if the keyboard were along the lines of HPâ€™s latest abomination, the HP-33S.

-Ernie

i have always wanted a telephone with a keyboard the same way up as a calculator.

Keyboards on telephones

*Message #3 Posted by **bill platt** on 14 Aug 2003, 2:18 p.m.,*
in response to message #2 by hugh

Now that isw an interesting idea.

The other day, I was struggling with the HP-45 a bit, since it has the old original locations for the math operators. This got me to thinking: How come I never feel awkward or discombobulated when going from calculator to telephone?! Like, the numbers run opposite, yet I don't fumble!

I guess the brain is a remarkable thing.

So also this is why design is so difficult--since adaptation can sometimes prove to be just fine. Or in other

words, finding the difference between mere stylistic annoyance and truly bad design is not always straightforward.

Nokia Mobile Phones

*Message #5 Posted by **bill platt** on 14 Aug 2003, 4:30 p.m.,*
in response to message #4 by Marx Pio

BTW, I read an interesting article about Nokia and Cell Phones in a business magazine about a year ago. It turns out that the guy behind all of their great designs is not Finnish--and neither is their manufacturing chief. The designer is a Southern Califronia dude who dreams about almost nothing but cell phones, and the manufacturing chief is a Princeton grad from the U.S. So much for Finnish ingenuity :-(

Also, my old 1989 Saab 900 had a Nokia spare tire. And our first big CAD monitor in 1994 was a NOKIA. It burned out in 99.

(somebody from Finland, flame me, PLEASE!)

Regards,

Bill

*Message #8 Posted by **Michael Meyer** on 14 Aug 2003, 6:59 p.m.,*
in response to message #7 by R Lion (España)

Anyone remember the weird chairs that came from the '70's? Egg-shaped, uncomfortable, and even comfortable but strange "ergonomic" shapes? Pretty much back to the same chair they had thousands of years ago now.

I like my old chair. And I like my old calculator.

Now, maybe I'm just an "old (slang for flatulence)", but this IS testable. Let's pit someone using an old HP-67 (or equivalent) against someone using one of the new TI's, etc. and give them some problems to solve.

But, alas, I'm very biased. But maybe not.... I remember the great awe I felt as I looked at and held an old HP. Still have the same feeling. I don't get too excited holding a TI-83. Maybe because nothing's so new anymore, but I'll bet there's more to it than that.

Re: Nokia Mobile Phones

*Message #9 Posted by **VPN** on 15 Aug 2003, 4:56 a.m.,*
in response to message #5 by bill platt

So you have found some "foreign" workers on the biggest multi-national cell phone manufacturing company? The design of the circuitry and the outer cell is not entirely Finnish, but the programming is mostly done in Finland. The series 60 platform is the defacto standard in cell phone software engineering and it is certainly Finnish from the root to the leaves. The head of the company, Jorma Ollila, is a genuine original Finn. VPN PS: The flame you wanted:

May the flees from thousand hobo dogs bite you!

Re: Nokia Mobile Phones

*Message #10 Posted by **bill platt** on 15 Aug 2003, 9:00 a.m.,*
in response to message #9 by VPN

Terve VPN,

Thank you for your reply!

Now that I have your attention, let's add some more outstanding Finnish technical and business achievements:

Shipbuilding: Turku and Helsinki (the old Wärtsilä now Aker-Kvaerner) arguably the most capable builders of complex ships in the world.

Software: NAPA (Naval Architectural Package) A remarkable ship design system--including a programming language. Used by many of the world's best yards--not just the Finnish ones.

Engines: Regardless of the business woes of a few years past, one must regard Wärtsilä with admiration.

Yachts: Nautor's Swan. Outstanding. Has been and continues to be the most sought-after production yacht in the world.

The list goes on.

And yes, hobo dog fleas are NASTY! (ouch;^)

Best regards,

Bill Platt

new hp 17bII+ on eBay

*Message #1 Posted by **Juergen (CH)** on 14 Aug 2003, 12:11 p.m.*

Item number: 3041142335

Re: new hp 17bII+ on eBay

*Message #2 Posted by **Raymond Del Tondo** on 14 Aug 2003, 1:12 p.m.,*
in response to message #1 by Juergen (CH)

Thanks for the hint.

I made a bid of 15 dollars, because that's the real value.

It's the same housing as the 10BII, and thus it's likely to be just trash (OMHO).

Raymond

Re: new hp 17bII+ quality

*Message #3 Posted by **christof (NoVA US)** on 14 Aug 2003, 7:45 p.m.,*
in response to message #2 by Raymond Del Tondo

Well, as somene stated previously- i'd take a 42S in that case if it was available.

I'm curious to see how the software handles, really. the upgrade in RAM sound useless until you try to track a small business and home finances in a 17bii using summed lists and solver programs. (hey Randy, ever do a RAM upgrade on a 17bii?)

The description of the machine mentions text handling- maybe they've upgraded the 17bii to a 19bii, heheheheh.

I'm sure the quality of the case is far far far from the quality of the pioneer hardware. And I think it's a bad idea for HP to move away from the Pioneer. It's now old enough and well known enough to be as recognizable by people who know as the 12c is.

That said- I'll use the 17Bii+ ... maybe. I'll certainly buy on and use it as my car calculator. or something. maybe. (but if it's a case of spending *$70* on THAT or finding a 17Bii pioneer for $150 [one can hope], I'll buy another 17Bii)

HP82494 HP71B Survey Module

*Message #1 Posted by **Stefan Hauschild** on 14 Aug 2003, 9:12 a.m.*

Hello,

I asked this question a few months ago but got no answer. Maybe I am luckier these days. I am looking for a short summary of the functions this module offers. Some things I discovered myself but I am not a surveying engineer so I miss some information. A scan of the manual will although be nice because it is not in the museums files.

Best regards

Stefan

Re: HP82494 HP71B Survey Module

*Message #2 Posted by **Ellis Easley** on 14 Aug 2003, 12:46 p.m.,*
in response to message #1 by Stefan Hauschild

82494 is the model number of a Custom ROM Module. A while back, I posted some information about custom modules from a 1986 HP catalog:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=37334

For information beyond this, the catalog said HP would refer you to third-party software developers who would help you get your application into a custom module.

Try SHOW PORT, it should give the size of the device in the port and the number 2 indicating it is a ROM. 82494 should be a 64K (size 65536) ROM.

I think these were mask ROMs, not programmable ROMs - I think HP would assign a unique model number when a customer's module went into production. Maybe the A or B suffixes indicate EPROM vs. mask ROM. Maybe what you have is a pre-production copy of the module. Try to get a listing of the files in the module with CAT :PORT(n) and post that here. Someone might recognize the module from the file names.

Re: HP82494 HP71B Survey Module

*Message #3 Posted by **Stefan Hauschild** on 14 Aug 2003, 1:08 p.m.,*
in response to message #2 by Ellis Easley

Hi Ellis,

thank you for the information. I think that it is a masked ROM (64k), too, but I didn´t know that these were made avialable by a 3rd party developer.

The exact text on the back of the module shows: "82494 REV 0 SURVEY 1 of 1 SINGAPORE". This seems to be the standard HP label.

The ROM contains some BASIC-files which are protected. If I could find a way to read them my problem is solved.

The files are named: "INPT, CKSUM0, VAL1, INSECT, SURVEY, CONVRG, TRAV, RESECT, POLTAB, SUBTNS, ALTMTH, GEOUTM, AZDIST, HASUN, HASTAR, TRIANG"

When I start "SURVEY" I get a table to choose the desired algorithm or program. But I am not enough of a surveillance engineer. I only unterstand the AZDIST and GEOUTM programs (by the help of a nice book about field surveillance techniques) but the parameters of the other programs are unknown.

Best regards

Stefan

Re: HP82494 HP71B Survey Module

*Message #4 Posted by **Ellis Easley** on 16 Aug 2003, 9:05 a.m.,*
in response to message #3 by Stefan Hauschild

> Quote:
>
> I didn´t know that these were made avialable by a 3rd party developer

I'm sure HP made the ROMs, but the catalog says this:

```
"Custom Products and Programming Development Aids
   Through customization, the powerful HP-41, HP-71, and
HP-75 can be tailored with your own software to perform
the functions that will increase performance productivity.
   Using customer- or third-party written programs, the
HP-41, HP-71, or HP-75 can be customized using Custom ROMs,
EPROMs, Magnetic Cards, and Keyboard Overlays. The HP-41
can also be customized with Custom Keyboard Touchpads and
Bar Code.
   The services of Independent Custom Consultants (ICCs)
make the customization process easy. (A list of ICCs is
available from your HP Sales Representative.) ICCs are
application-oriented software houses with in-depth training
on HP products and system integration. They convert
software to finished Custom Products and can write and
field test software, package the system, write user's
manuals, and more. Choose and contact an ICC to help you
decide if customized HP products can be used to help meet
your needs."
```

So a company specializing in surveying, for instance, could have a ROM made without having their own in-house HP computer software development people.

The reason I think it might be a third-party module is because I would guess that HP would have assigned a unique model number, even in pre-production. BTW, I looked in the same 1986 catalog and found that HP did have a surveying module for the HP-71B, model number 82483A. The catalog has no details other than the model number and its manual isn't on the Museum CD-ROMs. Maybe what you have is a pre-production (judging by "REV 0") release of the HP 82483A.

Re: HP82494/82483 HP71B Survey Module

*Message #5 Posted by **Stefan Hauschild** on 17 Aug 2003, 9:50 a.m.,*
in response to message #4 by Ellis Easley

Hello Ellis,

thank you for your help. I took some interesting facts from your posting. So I decided to modify the header - perhaps someone has some hints on the other module. I think there is a chance that the contents of these two are not too much different. I have looked at the manual of the HP41´s survey module and the HP97´s handbook but these two only gave me some hints on the used algorithms. The HP71 has a more comfortable user interface. I made a picture of the module. The printed letters and the case look exactly like that on my HP-4k-module. As I remember the real 3rd-party-modules have a different character set for the label. When I pulled it out I found an additional description on the back (my fault, should have looked before...) :

104 001 120 2 HTI SURVEY (c) MAY 85

http://www-tkn.ee.tu-berlin.de/curricula/ss03/vl-kts/hp1.jpg

http://www-tkn.ee.tu-berlin.de/curricula/ss03/vl-kts/hp2.jpg

Best regards

Stefan

Re: HP82494/82483 HP71B Survey Module

*Message #6 Posted by **peter (Germany)** on 18 Aug 2003, 4:26 p.m.,*
in response to message #5 by Stefan Hauschild

Hello Stefan,

here is a link to an US army site which contains documentation to the system this ROM belongs to:

http://www.adtdl.army.mil/cgi-bin/atdl.dll/fm/6-2/toc.htm

The complete system was called BUCS (BackUp Computer System). I got mine together with a ROM called DDCT installed in a HP-71, and the web site mentions the SURVEY ROM also. If You should find the manual for the surveying ROM there, please post the link. The HTI SURVEY ROM is completely different from the HP survey ROM. There are other army related HP-71 ROMs, seems that the US army bougt a lot of hp-71 stuff.

-peter

Re: HP82494/82483 HP71B Survey Module

*Message #7 Posted by **Stefan Hauschild** on 19 Aug 2003, 8:24 a.m.,*
in response to message #6 by peter (Germany)

Hello Peter,

thank you - that was indeed the information I was looking for. Now some things become clear because some parts of the program didn´t look like made for terrestical navigation for yachting or general surveying.

The documents you mentioned contain a good description of the theoretical background. Chapter 12 contains a description of the programs. It is not like a manual but some hints to the experienced user. They often refer to some military standard paper forms to copy the values.

After reading it all I will write a short paper with the descriptions for the forums data base.

But that will take some time, it´s a lot to read.

Bst regards

Stefan

New HP33S & Pontiac Aztec Design Philosophy

*Message #1 Posted by **Danny** on 14 Aug 2003, 7:42 a.m.*

Funny, I don't recall the Pontiac Aztec becoming the world's number one top selling design because it was radically and appealingly different, and youthfully eye-catching .....I must have missed something!!!!!! By adopting the same design philosophy with the HP33S this machine will enjoy the same notoriety and become a world Number 1 sales success (NOT).

Why should HP adopt the same old design strategy as Harley Davidson has adopted with their motorcycles and Volkswagen has with their famous VW BUG .....it obviously doesn't work at all to stick to the same theme to achieve longevity and fame.....do you get my drift!!!

Image what would happen to Harley Davidson if they dropped their classic design and went with the mega-trendy modern youthful design of the Japanese HONDA CB750.....bye bye Harley Davidson. The Japs are actually copying the Harley Davidson design in droves because it is so popular (despite Harley's antique design formula hardly changing for more than 50 years). Young and old people love the Harley's because it's a sign of quality, prestige, affluence, uniqueness, distinctiveness - and people aspire to own them. Same analogy applies here with HP's design experiment in the HP33s – they've changed to far from what they traditionally produce ....and people don't like it.

If economics is the rationalism of HP, why can't we have the best of both worlds - put the plastic face of a HP41 (example only) on the cheap electronic internals of a HP33S style calculator ....this has got to be remotely possible, surely. The homogeneous rectangular keys of the HP41 have to be more economical to manufacture than the exotic "vee" shaped keys of the HP33S.

The HP33S design has already been pseudo-tested on the market in real life .....in the equivalent CITIZEN calculator model. Has this been a run-away sales success with the mega-trendy youth market and received rave reviews.....NO!!!...the point has already been proven about the design already ...In this case the HP33S design is one step worse than the equivalent CITIZEN....a Citizen that's been hit by an earthquake…..hence the mal-aligned and mis-shapen keys and keyboard arrangement of the HP33S…The earthquake must have been a 6 on the Richter scale.

48GX /SX

*Message #1 Posted by **Andrey** on 14 Aug 2003, 3:28 a.m.*

The 48 doesn't get too much posting on this site, but I'm sure there are big 48 experts out there. Can anyone clue this clueless guy in on the various SX/gx versions (Singapore, US, etc made) and the screen question? Is the higher contrast new screen really so much better? Or does it come at the cost of corner cutting somewhere else in the production specs? What are the known problems with 48 ? Thanks for any tips and advice.

Re: 48GX /SX

*Message #2 Posted by **Randy Sloyer** on 14 Aug 2003, 8:58 a.m.,*
in response to message #1 by Andrey

S and SX's were made in both USA and Singapore (molded keys).

G and GX's were made originally made in Singapore (molded keys).

G,GX and G+ were then made in Indonesia (painted keys).

The GX finished up in China (painted keys).

Yes, the black on gray screen is that much better, but at the cost of Chinese unit. The printing of the keys and bezel is not as sharp as on earlier units, but worth the trade off IMO.

There are no other changes in manufacturing for the black on gray units.

Edited: 14 Aug 2003, 8:59 a.m.

in response to message #2 by Randy Sloyer

Yeah-

I've heard rumors of the early 48sx with a black LCD. Neither of mine have it. Shame, as I prefer the SX over the GX in most particulars.

I do have one GX with the black screen and the screen is really amazingly better. It's visible in all sorts of work situations where the older screen isn't.

I occasionally consider carrying a 48GX with black screen instead of my trusty 32k 42s. then I turn the 42s on and say.. "naaaaah" (though the calendaring on the 48 would allow me to never have to carry anything else)

Re: 48GX /SX

Hi folks;

Just to add a few comments of my own about the HP48G/S. I'm not an HP48 expert user (no SYS RPL neither Assembly knowledge), but for me, the best additional features that the HP48G has are related to data input/output and the equation library itself. The 3D addition is somehow important, but I believe a faster processor and a bigger, higher resolution display would be of help in this case.

The new features (new commands) are listed in Section E of the HP48G AURM.

Best regards.

Luiz (Brazil)

8051 as HP-41 module?

*Message #1 Posted by **Ben Moss** on 14 Aug 2003, 3:08 a.m.*

I have been considering the possibility of using an 8051 microcontroller to act as one of the HP41 ROM modules. I would like feedback on some of my early ideas.

From reading the articles at Meindert's MLDL site (Meindert, you have one impressive gizmo!) the clock on the serial line is at 359kHz. A typical 8051 can run 10-20MHz, so it can process at least 30 instructions in the time one bit goes by on the serial line. If the ROM image from the module is kept in internal memory of the 8051, I think that is plenty of time to do the necessary thinking to send out the data on the serial line.

Atmel sells a variety of 8051-derivative microcontrollers with 32K of flash (and in-system programmable) memory, internal oscillators, and plenty of I/O pins to do the job. These chips come in PLCC packages which are small enough to fit in a module case. The 8051 would probably draw somewhere between 15-25mA while in operation, which is a bit steep... if the clock speed is kept down the power consumption would be less. These chips can run off of 6V - a single chip could do everything. A level convertor (like a MAX232) would be needed to reprogram the chips (like if you wanted to change from a Game to a PPC rom) but that could easily be outside of the module.

Now, the tricky part. The HP-41 is a 10 bit machine, and the 8051 is an 8-bit machine. To make the 8051's job easier, I think the ROM image should be broken up into 10-bit chunks, with each 10-bit chunk occupying 2 bytes in the 8051's memory. There will be 6 bits wasted per every 10-bit word, but since there is memory to spare, it won't be a problem. It will also be tricky to keep track of the necessary timing so that the 8051 receives and talks to the HP41 correctly.

I think this could work. Anybody have ideas, or lots of experience with 8051 chips? Anything horribly wrong with what I have thought up so far?

Thanks, -Ben M.

Re: 8051 as HP-41 module?

*Message #2 Posted by **Vassilis Prevelakis** on 14 Aug 2003, 6:00 a.m.,*
in response to message #1 by Ben Moss

There is already a PIC based version designed by ji. The system is described at
http://www.tla.org/hp41/mldl.html

http://www.prevelakis.net/MLDL/108-0854_small_IMG.jpg

The problem with the PIC is that the high clock rate causes it to eat up too much juice. Also the fact that the PIC core has to be running to see whats on the bus, does not allow the MLDL to go into sleep mode, so it drains even more power.

To avoid draining the HP-41 batteries, I placed the PIC board into a printer enclosure so that it can be powered by the much larger printer battery pack. Pictures are at http://www.prevelakis.net/MLDL

The FPGA version should solve the power consumption problem. However, it introduces a new one: size. The

FPGA is too big to fit into a module so you need to use a card reader enclosure.

*Message #3 Posted by **Diego Diaz** on 14 Aug 2003, 7:57 a.m.,*
in response to message #2 by Vassilis Prevelakis

Hello Ben, Vassilis.

I've done some job on the hardware side of the PIC-ROM modules approach.

As a result, the layout of a module-sized (23 x 14mm) PCB is on my drawing board rigth now, it contains the PIC18LF252 (SMD), 40Mhz Xtal, 2x15pF caps, and 2x1n4148 in series with V+ line just to pull it ~1v down. I think that nothing bigger than a 28pin SO SMD device can fit into a HP-41 module, and even this has some difficulties to manage with such an small area (less than 1/2 sq inch!!.)

I'm now dealing with the PIC programmer, and hope to have it working in a few days.

Vassilis, it seems that you have already developed the required software to deal with the HP-41 I/O lines, wich is BTW the most difficult part of the job. Your info will be of great help to me, if you feel the will to share it. I'd also like to know if the B3-B4 lines handling and the BankSwitching are implemented in your design.

Thank you.

(remove the NO-SPAM if you want to mail me)

*Message #4 Posted by **Ben Moss** on 14 Aug 2003, 10:43 a.m.,*
in response to message #3 by Diego Diaz

Hello Diego, Vassilis.

What would be an acceptable level of current consumption to run the module off of the calculator's batteries? I have found several chips that draw slightly less than 10mA in operating mode at 10MHz.

Thanks, Ben

Re: 8051 as HP-41 module?

*Message #5 Posted by **Diego Diaz** on 14 Aug 2003, 2:06 p.m.,*
in response to message #4 by Ben Moss

Hi Ben,

Typical Idd vs Vdd @ given Osc Freq. chart for PIC18LF252 in HC mode (Xtal operated), shows 7.5mA for 5v. Vdd @ 20MHz. This is much more than a *real* HP-41 module, but I think it's still low enough for the 41 to handle.

Anyhow I'm confident about beeing able to manage with SLEEP mode, wich will ask for a few µA only.

You can chek the full specs for that PIC at www.microchip.com, make a search for 18F252.

Regards.

Slowing CLK down?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 15 Aug 2003, 2:46 a.m.,*
in response to message #5 by Diego Diaz

Hi, folks;

As Ben mentioned in starting post, the 8051 has plenty of "waitting time" between two bits if working at 10-20MHz. Also, Diego mentions using a 20MHz CLK PIC and Vassilis is using an ATMEL chip (probably fast, too).

As Ben's first idea is emulating ROM moduless, I'd like to know if a lower clock-while-active (and consequent low power consumption in most cases) wouldn't be a better choice *if applicable*. In this case, how many cycles would any of these processors need to "push" the next bit out of its internal flash memory? If I am not wrong, bit manipulation facilities in the 8051 are restricted to internal RAM, although it has a serial OUT pin and I'm not sure if TX-rate is clock dependant. Also I'm not aware of the ATMEL and/or PIC instructions and if they would allow a better data handling than the 8051. As they are newer designs, it's possible that they will.

Have you, guys, also thought about I/O implementation other than IL-compatible? I know this is something that would never work if standard protocol is not set firstly, but I do not like to think that I depend on HPIL devices to transfer data from/to the HP41.

I'd like to be in contact with you all about these subjects, may I? For these days I've been working with some heavy activities and my spare time is none; I can barely read new posts. But I'll find a way to follow this subject as I can.

Thanks.

Luiz ((Brazil)

in response to message #2 by Vassilis Prevelakis

I'm back form my vacation and ready to join the discussion. Have a look at the products fron Cygnal at www.cygnal.com. These are very small and include oscillator, power regulator and a full 8051 with pretty

low power consumption. These should fit inside a module housing as the require virtually no other extrenal components.

As most of you are aware of, I am building an MLDL with an FPGA but I have been seriously looking at the small microcontroller products, but the main problem is that they lack serious amounts of memory, otherwise I would certainly have chosen one. Especially the USB version are great!

Meindert

Re: 8051 as HP-41 module? a note or two about 8051s

*Message #9 Posted by **Bill Wiese** on 14 Aug 2003, 4:19 p.m.,*
in response to message #1 by Ben Moss

Hi... Just remember that many 8051 CPUs - at least of original design - run at 12 clock states min. per instruction. (Some take longer). That is, many 12MHz 8051s effectively give a 1MHz instruction rate (or less, if lots of 3-byte instructions used...)

Some 51s have a newer internal design with 6-state or less but these aren't as prevalent as yet..

Bill San Jose

Re: 8051 as HP-41 module? a note or two about 8051s

*Message #10 Posted by **Diego Diaz** on 15 Aug 2003, 3:18 p.m.,*
in response to message #9 by Bill Wiese

HI all,

Well Luiz, you can of course contact me for whatever I can be of any help, so can the rest of you.

First a pair of mods to my previous posts:

a) The Xtal must be slower than 26 ~ 24 Mhz, wich is the max. speed a PIC18F252 can run at from its internal resonant circuitry, and there is no space inside a module enclosure to fit an external oscilator. (Pls correct me if I'm wrong about that.)

b) You can pull the V+ line down to 3.5v with a series zener diode, this is enough for the 41 to handle the ISA line, while the 18LF252 is able to keep the 24Mhz Xtal running when powered at 3.5v thus lowering the Idd to a typical 5.5mA, 6.5mA max. wich seems quite reasonable, as the original MLDL design drawn about 12 ~ 14 mA. (not counting the EPROMS!!, they were only powered during ONE single cycle for -obvious- reading purposes.)

Now some facts:

It's about 2.77µS between clock pulses in a standard 41 (not 2x clocked) at 360kHz. The PIC needs four clock cicles per instruction so it gives us 6MIPS at 24MHz so we can process 16 instructions to handle the corresponding I/O line... It's not too much but I think it's worth trying.

Regarding the program Vassilis, I'll contact I.J. and will ask him about. I asked you because I didn't know if you were the one that developed the code, and there is no downloadable file in your page nor Mr. Ioannidis'. Is this code copyrighted? or is it only a "Coca-Cola formulae alike" well keep secret...? :-)

I'm starting the PIC18F252's thick PDF Data Sheet reading, I've also already done the flowcharts for the corresponding port B interrupt handling, and hope to begin testing (and a huge amount of debugging) as soon as my PIC programmer is ready.

Trying to keep 41's alive.

Diego.

Re: 8051 as HP-41 module? a note or two about 8051s

*Message #11 Posted by **David Smith** on 15 Aug 2003, 4:27 p.m.,*
in response to message #10 by Diego Diaz

The Scenix chips are PIC compatible and can do 1 instruction per clock (at up to 100MHz). Draws 1 mA/MHz.

Re: 8051 as HP-41 module? a note or two about 8051s

*Message #12 Posted by **Diego Díaz** on 15 Aug 2003, 8:25 p.m.,*
in response to message #11 by David Smith

Hi David,

Yes, they are really fast processors but lack of memory space, only 2048 x 12bits, wich is not room enough to place a 4096 x 10bits standard HP-41 module, and there are double, triple and four times this size modules out there...

Please let us know if you have any further info about those chips other than I have stated above as it should be of great interest for some of us.

Thanks.

Diego.

Are 1970’s sales brochures worth anything?

*Message #1 Posted by **ben** on 14 Aug 2003, 1:48 a.m.*

Hello everyone,

My eyes were opened to this world of HP collecting earlier this year. I sold my dad’s little-used 11c after he passed away.

While cleaning out his office, I also found some HP sales brochures.

They are all from the mid 1970’s.

Among others, they include:

*HP 9831 Desktop Computer (including insert on Technical Data and pricing insert)

*HP 3000 Series II Systems: An Introduction for Managers

*Data Entry and Communications: Applications of Hewlett-Packard computer systems

And more along those lines....

Any chance anybody would be interested in them? Would it be worth it to compile a full list of the brochures and post it in classifieds/ebay?

9830 / 9831 / 9815A / 9896 / 3000 Series II / 21MX / HP - 1B / HP 1000 / 3070A / 9825 brochures

*Message #2 Posted by **ben** on 23 Aug 2003, 12:01 p.m.,*
in response to message #1 by ben

Hmmm...interesting. Apparently these old artifacts interest nobody?

I don’t know that much about HPs, but just from a historical perspective, these brochures looked interesting to me. They seemed pretty cool.

Or is information like this plentiful and commonplace?

I suppose I could just throw them away. I simply thought they might interest someone actually into HPs.

Re: 9830 / 9831 / 9815A / 9896 / 3000 Series II / 21MX / HP - 1B / HP 1000 / 3070A / 9825 brochures

*Message #3 Posted by **bill platt** on 23 Aug 2003, 12:32 p.m.,*
in response to message #2 by ben

Ben,

Yes, yes, they are interesting! I think 2 things happened:

1. Your 1st post got lost in the "daily view" rollover,

2. It wasn't clear what any response was to be.

3. If you would like to sell or trade them, there is a separate section in this online museum for that.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi

or without an associated auction:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi?noauctions

Regards,

Bill

just don't buy one

*Message #1 Posted by **bill platt** on 13 Aug 2003, 10:04 a.m.*

So, here is a proposal regarding the 33s: just hold your breath and let them sit. The overwhelming response here to the keyboard is: OOOOOOGLy! and dIsTRacTInG.

So, IF it comes out with that Whacky keyboard, then LET IT GO! Then, they'll re-tool, and we can give Compaq the money once they give us the product we deserve.

OR: HEY COMPAQ-HP! ARE YOU LISTENING! We want a REAL KEYBOARD!

So, hopefully someone at HP (Mr. Valdez, you are a real person----can you sway this in our favor?) will read these posts and see what the problem is.

-Bill Platt

Edited: 13 Aug 2003, 10:07 a.m.

Re: just don't buy one

*Message #5 Posted by **Jonas Lööf** on 14 Aug 2003, 8:03 a.m.,*
in response to message #2 by David Ramsey

Do you actually think it looks cool? I must be getting old, and I only just turned 27...

Seriously, I think the design is unbalanced, with the calculator being too elongated and the 'midsection bulb' (between the 'mode keys') too dominant. That combined with the crowded keyboard and the vee-shaped keys making the allready busy keyboard even more busy, makes the calculator look cheap, I think.

Re: just don't buy one

*Message #6 Posted by **christof (NoVA US)** on 14 Aug 2003, 7:38 p.m.,*
in response to message #5 by Jonas Lööf

Nah, I think the point is being missed all over again.

The new cell phones with the crazy keyboard layouts aren't selling because they have crazy keyboard layouts (I know people with them who hate the keyboards, but none who like them).

They are: cheap They are: color

yeah- the overall look is much better than the older phones. Sorta look like cheap knockoffs of the $400 multipupose phones. Oh, wait- that's what they are.

The 33s isn't going to sell well because it's got a keyboard tht looks like stacked female chalice symbols. It's going to sell well (if it does) because the display, capabilities, and interface (software).

I could be wrong, but I think the only people *really* turned on by this layoout are marketers. Show me one of those elementary or middle school math students in the contests that would pick this as an *upgrade* to his 32Sii.....

Texas Instruments RPN calculator

*Message #1 Posted by **Graeme W.** on 13 Aug 2003, 8:33 a.m.*

Surely the HP32SII production line is not that cold that it couldn't be restarted in Indonesia so that HP could get back to producing at least one single classic calculator - surely that's not too much to ask is it!!!! - just one single solitary measly lonesome classic calculator - why the hell is that so difficult to do. HP just had a calculator competition to determine what the kids would like to see in a calculator.....ummmmmmmm.....why don't they ask the veteran/expert users instead (sorry kids). Some of these veteran users have been using HP and RPN since 1972 and might possibly know a couple of things (more likely a thousand good ideas some of which have already been mentioned on this site).

It's now totally apparent that the HP calculator design contract was won by a Canon or Casio design bureau. Take all the tell-tale labels off the HP33S and ask the public what brand of calculator it is - guaranteed 99 percent would say its a Canon or maybe a Casio ... no.... it must be the new Sharp model.

Maybe someone should be tapping Texas Instruments on the shoulder to try to get them into RPN machines - after all HP cross-dressed into algebraic machines. Maybe TI would do a better design job and produce a classic looking machine ... desperate times require desperate measures.

Re: Texas Instruments RPN calculator

*Message #2 Posted by **Ron Ross** on 13 Aug 2003, 9:07 a.m.,*
in response to message #1 by Graeme W.

I think it would be a wasted effort. As long as Hp is even remotely capable of making or outsourcing a calculator, Ti will never make an RPN model (the Ti-89 has a pretty good download to change it over to an RPN, I am told, but that was developed outside of Ti). Why? Because that just might breathe new life into a competitor on the ropes (HP). There is a whole decade of Ti users and a new Hp calculator user is in the EXTREME minority (and I would bet 2/3's of the new users are using Algebraics, since that is what many new Hp's are). Textbooks are written around Ti calculators. Why would Ti even think to make an RPN to admit or recognize its merit?

But that is only my belief, and you could certainly campaign Ti to do otherwise.

And concerning many of the new Hp algebraic models, while they may be superior to their competetion, they are not significantly superior to warrent any tears if they disappear. I'll use an Hp39G as an example. It has lots more functions and capability and 10 times the RAM as Ti's 83 series. Very similiar and you could almost use their manuals interchangably. But they are not identical, and when the text book is using a Ti-83 for examples, what calculator do you think the student or parent will buy? And Hp could have added more to the Hp39G, but chose not to, to compete directly with the Ti-83. Why not give the student who buys Hp the UNFAIR advantage. Thats my slogan! You buy Hp to get the best, not a castrated eunuch. While Hp may get banned from a few exams, the truth is, it often is anyway, since they are so seldom seen, that the proctors ban them out of ignorance. Give them a REASON, I say. If the Hp39G had an RPN mode and a units library, it would have been a great low priced graphics calculator. Both features would have cost Hp NOTHING. But marketing wanted to put their 39G head to head with the Ti-83. Those extra features would have hurt sales (and this is true, but I suspect you would have gained 5 sales for every one lost). The knowledgable customer

would have purchase for the units feature and maybe learned RPN later. Others, such as myself would use the 39G as a knockaround calculator for day to day use, since it would be an RPN (well, I would probably still stay with my 48G).

TI 89 RPN program is great!

*Message #3 Posted by **Matt Kernal (US)** on 13 Aug 2003, 1:11 p.m.,*
in response to message #2 by Ron Ross

Ron > (the Ti-89 has a pretty good download to change it over to an RPN, I am told, but that was developed outside of Ti)

I picked up a TI 89 for $40 a couple years ago just to try out Lars Frederiksen's RPN program. What a nice (and fast) interface!

One really cool aspect is that as you perform a calculation (in rpn entry format.. working from the inside out.. ie. no parenthesis), it builds/maintains a "history", in algebraic format, as the calculation is entered.

In other words, the history shows the same calculation, as if you entered it algebraically (ie. it shows the calculation in the order it was calculated *with* parentheses inserted).

It is by far, the BEST way I have seen to teach an "RPN impaired" person how/why RPN is so efficient, while also reinforcing rules of precedence (order-of-operations).

I must admit, I only use it (TI 89) as a four-banger calculator (can't stand SO MANY things about the TI 89).

Matt

ps. I should take a stab at writing a similar app for the 48/49G series.

The point is:

*Message #4 Posted by **Harry (Germany)** on 13 Aug 2003, 9:24 a.m.,*
in response to message #1 by Graeme W.

All those "veteran/expert" users already HAVE RPN calculators that they use.
Why would you buy a 32SII if you allready got 2 of them? Your old ones are not very likely to stop operating, and if they did, you could always buy a new one - after your old one has failed.
Thats why they focus on the kids. Every year thousands of schoolkids need a new calculator, and they don't care about quality or RPN, they just want it to be stylish. And their parents want it cheap, as they have to pay.
Ok, WE would by an RPN calculator for our kids (and I am very happy my Dad did the same), but thats just a few parents who would do that. Most parents have no idea about calculators. I was the only kid in school that had an HP calculator, all the others had Casio or TI.

Regars, Harry, who is very disapointed that nowadays it is not quality, but design that is important.

btw, its the same with cars:
They put more and more (in my oppinion) useless electronic stuff in cars, that makes them more expensive, heavier, less reliable, and no fun to drive.
For example they don't put time and effort (and of course money) in designing a good suspension, but they just put a stability control in, that keeps the car from flying off the road.
Ok, I guess I am loosing focus...

Re: The point is: (LONG)

*Message #5 Posted by **bill platt** on 13 Aug 2003, 9:54 a.m.,*
in response to message #4 by Harry (Germany)

Harry,

No, you are not losing focus--you are right on!

This problem of doingthe details without the fundamentals is endemic in design and engineering today. Just read the "technical" papers from any technical socierty and you will notice that the majority of papers focus on minutuae and not fundamentals. It is becoming increasingly difficult to find good, reliable fundamental engineering information that is not 30 or more years old. I suspect that most younger engineers don't even know where the (old but good) information can be found--never mind that they may not even know it exists.

On the other hand, if you read any industry magazines from the world of photonics, electronics, microelectronics, or robotics, you will see great enthusiasm for the ability to do anything formerly requiring mechanical action by using electronics. I have read just such a piece regarding automobile stability and control!

What does this have to do with calculators? The same dynamics are at work---the products are produced using 3-D wiz-bang total product models, TQM ("total quality management") and "advanced analysis" (read: the software thinks instead of the engineer) and so in the nd, you have no real quality--only what a robot "thought" would work. I suspect this is why the 12C has the problems it does.

We'll see about the 33s. And yes, that keyboard layout looks like the Pontiac Aztek! (Uuuuuuuuuuugly).

BTW: Interesting that you, a German, were the only one with an HP in your class. What years? For me, in the States, I was the only HP kid in 1983, out of 2,000 students. Clearly, the old HP was not successful with the "kids".

regards,

Bill Platt

I got my first Calculator - a HP 32S - in 1989. Although I wasn't allowed to use it in class at that time. I don't know about now, but back then we started using calculators in class from 8th grade on. That was in 1992 for me.

Looking for pictures of that ugly Pontiac now ;)

Regards,
Harry

Bill,

Quote:

This problem of doing the details without the fundamentals is endemic in design and engineering today.

I totaly agree with you. I am studying electronics engineering, and this happens to me all the time. When I try to understand the theory behind a way of solving a problem, I am often (too often) told, that I do not need to know. The Professors are like: "Belive me, it works that way, just do it!"
For example the Laplace-transformation. In class all we do is, looking up the transformations in tables. I tried to calculate those tables myself, by simply solving the actual Integral, wich defines the Laplace-transformation. It worked pretty good. But what I can't find out is (don't know all the words in english here, sorry for this) why the table can be read backwards. I mean, before doing this, you have to proof, that two diffrent functions that are transformed, ALWAYS give a diffrent answer, wich is essential. Or in diffrent words: may f(x) be the original function and F(s) the transformed. Then there must not be more than ONE f(x) for every F(s). There is a simple word for this, I just don't know it in english.

Regards,
Harry

Re: The point is: (LONG)

in response to message #7 by Harry (Germany)

The word in English is "one-to-one". Your question can be rephrased as: "why is the Laplace transform one-to-one?" (sometimes the term "injective" is used instead).

Eduardo

Thank you Eduardo!!

Right on, Bill! I've noticed a general de-emphasis of fundamentals, too. There could be several reasons:

1. Students are expected to cover more topics and advanced material in their "4-year" degree programs, so they don't spend as much time learning the fundamentals.

2. Computing devices (more PC's than calculators) make it so easy to get answers without analyzing the problem from a fundamental standpoint.

3. Higher emphasis on short-term payback can result in "solutions" intended to make distinct impressions rather than to withstand the test of time.

4. Rapidly-advancing and more-complex technologies make it more difficult for most people to comprehend the fundamentals, except for the exclusive "cognosenti" (sp?)

I assume that this was in high school. I bought my first HP (15C) as a college junior in 1983, after being enthralled by the 41C in 1980-81. I think it was more a matter of "kids" not being able to comfortably afford HP's until the mid-80's. The $115 I paid exceeded my monthly scholarship stipend.

hp's marketing strategery (rant)

*Message #11 Posted by **ned** on 13 Aug 2003, 11:02 a.m.,*
in response to message #1 by Graeme W.

HP contracted Kinpo to build their calcs. This company makes perfectly good ones branded as Citizen. The 30s is an example of straight rebranding of an OEM, in this case the Citizen SR260. The 9s is the SRP325g, which is a redone Casio fx-6300. The 33s, 48ii, and 49+ all appear to be designed exclusively for HP, as evidenced by the keys EVAL, R/S etc. HP surely wants to re-enter the education and mass consumer market. They already have a strong distribution chain, in fact this is all they are anymore: a distributor. OEM printers, ink, digital cameras, etc in asia, resell them in the americas and europe. Every company does it. They split off Agilent to seperate their 'tech' division, which is higher risk, narrow customer base, from their 'consumer' division, which is lower risk, broad customer base. They want to sell gagets to the masses through brand recognition and reputation. Just keep paying Juan Pablo Montoya the big bucks HP! ~ned

We should be happy

*Message #1 Posted by **L Martin** on 13 Aug 2003, 8:19 a.m.*

Hello,

From my point of view, we should be happy with the new HP 49G+ (if everything is true).

Consider this:

* Five to ten times quicker than the old HP 49G. Come on, be honest: how many of you would have killed to get this much? 100 %

* An USB port. This is a high speed standard connection, isn't it?

* A sd Card expansion. We can buy a (hopefully) standard SD Card and have 32 Mb to keep data and programs. The HP 48GX could only hold up to a 4Mb card (if you could find one) That is 8 (or 16 or more) times more memory. So what?

The biggest complaint is the keyboard (no big ENTER key), plastic and other minor things. I guess most of us are in love with the machine we studied with, and cannot accept easily something with a new design without comparing. This only means we are getting OLD!

Let us accept these new machines as they come and see if they really work (calculate!) fine.

I second you... somehow

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Aug 2003, 12:27 p.m.,*
in response to message #1 by L Martin

Hi, L. Martin;

to be honest, I do not like the hP33S look, but I thought that if this look will make it be acceptable among youngers, let's bring them to RPN "world" with a different bait, if this is the case. I read Bill's post and I think the HP33S should look more serious, not as a current videogame personal tool, almost a sci-fi object. As many in here point out (and I am not aware of these facts), HP must survive somehow if we want RPN calculators, OR someone else should start producing RPN calculators. As mentioned in Graeme's post, I don't know if Texas would offer an RPN model so far.

If these "market targeted" calculators allow HP staff to consider producing others with a different approach, I think we could wait to see. If I have the chance, I want to try the new HP49G+. But I still believe an O.S. upgradable HPg48G*whatever* would be better.

My 2¢.

Round off (beautiful...)

*Message #1 Posted by **Tizedes Csaba** on 13 Aug 2003, 1:40 a.m.*

In the first math exam we got this example:

What is the limit of this serie: (the calculator use not was allowable!)

an=(1+1/(2^n+1))^(2^(n+1)) where n->infinity (n is integer)

the limit is e^2 (~7.39), but look, what happen if we try to calculate it! Grab your 48, and plot it: 0 40 XRNG 0 10 YRNG 'n' INDEP ERASE DRAW You'll see, the value of function about 37.5-37.8 will be 1. (not 7.39)

That happen, when 1+1/(2^n+1)=1 for 12 digit, the limit will be 1.

Where? Its simple calculable:

1/(2^n+1)<5e-12 -> n>37.54

Csaba

Re: Round off (beautiful...)

*Message #2 Posted by **hugh** on 13 Aug 2003, 3:28 p.m.,*
in response to message #1 by Tizedes Csaba

like you say, let k=2^n+1, then your problem is written (((1+1/k)^k)/(1+1/k))^2 ~ e^2 as k->inf.

the difficulty for the calculator is (1+x/k)^k -> exp(x) as k->inf because you have here a classic 1+epsilon problem.

the 1+eps problem is a defect of floating point numbers as real approximations. floats (inc calculator BCD) are only dense around zero.

with a single floating point, 1+x-1 = x, only where abs(x) > 10^(-d) where d is the number of internal working digits.

when IEEE floating point was invented (1983??), it was a big step forward in standardisation. i believe its time for calculator makers to move forward again onto a fundamentally new way of approximating reals.

Restoring the 'ole click to a "classic"

*Message #1 Posted by **Michael Meyer** on 13 Aug 2003, 12:52 a.m.*

Well, I've not seen this reported before, and it's a pretty aggressive approach, but...

I'm repairing a *very* used HP-67. (Yes, I know... not really a classic, more of a Woodstock.) The key contacts were extremely worn. After a light sanding of the contacts as described elsewhere, the keys remained mushy with little "click". One had even broken from fatigue: I patched it with a little tinned piece from an old badly corroded HP-25 keyboard. Repaired it perfectly.

The scary part: I used a small nylon cable tie and threaded it through each contact. The cable tie acted as a wedge, allowing me to carefully stretch each metal arch away from the board. I put a little more force into it than I was comfortable with, but none broke.

Guess what? It worked pretty well! The keys have a much more positive click to them, and there are no bounces. It's really not too bad now.

I suggest this as a radical approach to help only nearly expired keyboards. I couldn't bear to see a good machine die.

Michael

Re: Restoring the 'ole click to a "classic"

*Message #2 Posted by **Tom Scott** on 13 Aug 2003, 2:38 p.m.,*
in response to message #1 by Michael Meyer

I appreciate your work on this calculator. I don't feel quite so stupid for paying way too much on eBay. What a contrast: all the unselfish work you're putting into this compared to the seller who lied and walked away with the money. It will be great to have a working unit (even with some remaining problems) since the 67s were such great instruments.

Re: Restoring the 'ole click to a "classic"

*Message #3 Posted by **Michael Meyer, M.D.** on 13 Aug 2003, 9:30 p.m.,*
in response to message #2 by Tom Scott

My pleasure.

You know: I was playing with it today, and it's really not bad at all! Again, a testimony to it's quality... even the keyboard can be fixed!! What a beauty.

I think you'll be surprised.

RTN2RPN Michael

Re: Restoring the 'ole click to a "classic"

*Message #4 Posted by **Tom Scott** on 14 Aug 2003, 3:18 p.m.,*
in response to message #3 by Michael Meyer, M.D.

Great news. Considering the poor condition of the HP-67 when I received it from the eBay seller, you must have worked some miracles! There's just something about the solid feel of these units and the key click action that is hard to describe. They (and the other HP oldies) were in a class by themselves. Of course, maybe I'm just getting old.

My self centered "but objective" opinion

*Message #1 Posted by **Ron Ross** on 12 Aug 2003, 6:07 p.m.*

I believe Eriks site as I know him to be a reputable source of information. Am I estatic over what I see? No, but at least we will get a fresh supply of RPN calculators into the market place to placate RPN fanatics that do not need the Hp quality of old (ok, mostly for the newbies who don't know what an Hp calc SHOULD FEEL LIKE). I really had hoped for an enter key in the original location for both the Hp33s and Hp48G. I didn't really expect it for the Hp33s, but I was dissappointed with the 48G.

I am glad to see the new Hp33s. Not so much as it is the great savior to pocket calcs, but because it IS RPN. Perhaps this will lower the competetion for the older Hp32s and Hp42s and therefore allow their prices to fall (where I can buy another spare).

I noticed it is an RPN/Algebraic selectable. This is probably smart. However, I feel Hp is pricing this unit to high to make it the seller that it could or should be. It is really only a $30 calculator about on par with the 9G. Even though it has 32K (who really knows yet??) what good is that much memory without matrix math, only 27 variables and NO I/O? Marketing has probably struck Again!!! 32K sounds WONDERFUL!!!

An algebraic user will probably buy a Casio 7400 or maybe an Hp9G. Both cost less.

Design style makes me cringe, but I will buy. Function wise, it is well equiped. It is more powerful than an Hp32s, but I still like the old RPN keyboard and time will tell (but if I were to predict and I suspect this IS AN EASY PREDICTION, I won't like the new keyboards at all).

If the Hp33s really does have 32K, WHY DIDN'T they give us long variable names, matrix functions and I/O? Why not?

I feel the 48G won't last long on the market due to marketing genius'es. Why? Why buy a 48G? The beloved enter KEY is gone. Only a paltry 128K RAM (no mention of any expansion slots). True, it should be lots faster than an older 48, but it will only be half the speed of a new 49G. With the same keyboard layout, there is no reason to buy the 48G. Hp could have abandoned it. Why bother?

While I use a 48 much more than my 49, I do so only because of the keyboard and eq library. Now that the new 49 is going to have an eq library AND the very same keyboard, why would anyone buy a new 48G unless there is a drastic difference in price? Marketing!!!????

Well, I used up bandwith again.

I hope I haven't offended any legitimate Hp (or Kingpo?) engineers. However you marketing or management #@$%^'s at Hp, on the other hand, should be horsewhipped! I don't feel my comments are to far out of line considering what we will get to buy in the near future.

Re: My self centered "but objective" opinion

*Message #2 Posted by **Patrick R** on 12 Aug 2003, 6:33 p.m.,*
in response to message #1 by Ron Ross

What I don't understand: 1. Why is the 48GII called 48GII? It has absolutely nothig to do with a 48G series calculator. 2. 39G+, fast processor, small screen; 48GII slow processor, small screen; 49G+ fast processor, big screen.

Being a young physics teacher, I need high quality calculating equipment for my everyday use. So last year in spring I started buying new spare HP calculators, some good old brown 32SIIs and some 48GXs + ram cards for that fantastic metakernel (thanks to those exceptional programmers), for absolutely reasonable prices, just in case that my current machines could fail some day. I am happy, whether those new calculators are real or not. I will not need them and I will not buy them.

HP41C halfnut serial numbers

*Message #1 Posted by **David Smith** on 12 Aug 2003, 4:58 p.m.*

I recently got an HP41C HALFNUT. It had a serial number of 1932A00XXX. This number was 13 off from my old full-bugs, gold ball, tall key unit. This seems to support the theory that the halfnut 41C's were very late date service replacement units. For a service replacement they swapped the old case back onto the new halfnut front end to keep the old serial number. If you had a damaged case back, you got back a new case back with a hand-engraved serial number.

Re: HP41C halfnut serial numbers

*Message #2 Posted by **Randy Sloyer** on 13 Aug 2003, 9:40 a.m.,*
in response to message #1 by David Smith

That would make a lot of sense. Why not just replace the front with current production and give the customer his old serial number back. I guess the older case bottoms without the extended cylinders on the bottom screws didn't matter on a half-nut?

This gives rise to the question: Was the C just a CV with a trace cut for the reduced memory? I doubt they masked a separate chip for just the C's. Maybe they just dropped a wire bond or two at packaging. I read the memory was in the display module, I believe Luiz did or at least tried to confirm this a few months ago. Maybe the module part numbers will tell the story?

Re: HP41C halfnut serial numbers

*Message #3 Posted by **David Smith** on 13 Aug 2003, 4:03 p.m.,*
in response to message #2 by Randy Sloyer

HP was rather agressive about keeping a unit's serial number when the case was replaced during service. I know a lot of calculators back then were kept under inventory control systems. Changing a serial number could cause a lot of user headaches.

I have not opened up the halfnut 41C yet to see what differences it has with the CV. It is definitely a 41C halfnut (with quad memory module plugged in).

New HP calculators

*Message #1 Posted by **Dave** on 12 Aug 2003, 4:38 p.m.*

Not to be picky, but... Could we try to remain positive about HP reentering the calc market & having an offering that supports RPN, RPL, etc. These calcs will not be the same as the classics - today's market will not support the cost of making those old designs. Nor are there enough people on this board to supprot such an effort! Please wait until you have your hands on a physical calc and make constructive comments...

Thanks

Amen, Dave. All the negativism of the last few months has really been a downer.

Re: New HP calculators

*Message #6 Posted by **christof (NoVA US)** on 13 Aug 2003, 12:40 a.m.,*
in response to message #1 by Dave

I'm honestly fairly happy with the physical layout of the new 48.

And I hope that we will be able to write real code on it and hack any software defects or forgotten tools.

but the 33S is...

it would be everything I ever wanted in a 32Sii upgrade is the keyboard was just remotely sane. With THAT keyboard, I'll be somewhat negative.

(granted, It is barely possible that once I get my hands on it and try, i will decide it's not much worse than a pioneer. But.... well, we shall see)

-C

Re: New HP calculators

*Message #7 Posted by **Wayne Brown** on 13 Aug 2003, 2:29 a.m.,*
in response to message #1 by Dave

I'm sorry, but if these things are real, then there simply is nothing positive I can say about them. The closest I can come is "the 48GII isn't *quite* as ugly as the 49G+." The 33S, however, is one of the ugliest devices of *any* type that I have ever seen.

I honestly would rather HP simply abandoned the calculator business altogether than continue to besmirch the memory of their decent calculators with trash like this.

New HP 33s and so forth

*Message #1 Posted by **Charles** on 12 Aug 2003, 3:54 p.m.*

Hi all,

regarding that 33s and 48gii spec sheet, did you notice the orientation of the 33s in the scientists white coat pocket? and the 48 laying on the students table? They sure looked to have been pasted in...

On a lighter note, maybe one of us should send a pic of our calcs to HP since they seem to have forgotten what they should look like. That 33s key layout hurts to look at. It seems that HP is confusing calculators with automobiles, the beauty of the old HPs was the simplicity and no nonsense design. We don't (at least I don't) need fancy v-shaped key orientation and scratch-off lettering.

I guess I'll get to continue to have moments of pride as I whiz thru calculations RPN-style during exams while the TI folks step thru their deep parenthesis set-ups...One of my profs refused all programmable calcs for tests, and when I confronted him with my old HP he said "that one's ok". Well, back to work, best regards, Charles

Re: New HP 33s and so forth

*Message #2 Posted by **Patrick** on 12 Aug 2003, 4:27 p.m.,*
in response to message #1 by Charles

I loved the part where it said that the 33S is pocket sized -- right next to the photo of the scientist with 1/3 of the calculator jutting up out of his lab-coat sized pocket.

Now, the 15C is truly pocket sized. It fits in a typical *shirt* without sticking up at all.

Re: New HP 33s and so forth

*Message #3 Posted by **Trent Moseley** on 12 Aug 2003, 11:19 p.m.,*
in response to message #2 by Patrick

No shirt pocket for your 15C today. Can you imagine leaning over and have that baby hit the deck?

tm

Re: New HP 33s and so forth

*Message #4 Posted by **Jonas Lööf** on 13 Aug 2003, 7:00 a.m.,*
in response to message #2 by Patrick

The size is actually the most annoying thing about the 33s... Whats the point, when it is nearly as big as a graphing calculator? It should have been the same size and design as the 17bii+, IMO. I guess it's time to get that 42s...

Re: Examine those images . . .

*Message #5 Posted by **Paul Brogger** on 13 Aug 2003, 5:37 p.m.,*
in response to message #1 by Charles

I've pasted the calculator images into a picture editor & blown 'em up to 400%.

What I found interesting (among other things) is that on **BOTH** the 49G+ image (from the marketing materials link of a while back) and 48GII image, there appear to have been some labels "blanked out" above the "Tool" keys.

Am I misreading these pixels, or was (were) some function(s) axed at the last minute?

Re: Examine those images . . .

*Message #6 Posted by **Ned** on 13 Aug 2003, 5:55 p.m.,*
in response to message #5 by Paul Brogger

uuh, that's a lower case i and an upper case I, right above the same key used for alpha I. Look on a 15c above cos and tan. ~ned

ps I just found out google will do math. Calculate 50 N / 2 kg (= 25 m/s^2) pretty cool.

About that Google thing

*Message #7 Posted by **Harry (Germany)** on 13 Aug 2003, 7:24 p.m.,*
in response to message #6 by Ned

That is cool, I didn't know it has a build in calculator.

I played a bit with it and found this:

ln(e^(2 * pi * i)) = 0

At this point I was a bit surprised I get no roundoff errors.

I tried this next:

ln(e^(4 * pi * i)) = - 1.15771108 × 10^-15 i

And now got roundoff errors. Any idea why?

Regards, Harry

33s and 48gII Info

*Message #1 Posted by **Jeff** on 12 Aug 2003, 12:27 p.m.*

Just found this info at hpcalc.org in case you haven't seen it yet:

http://www.hpcalc.org/images/datasheet48gii

http://www.hpcalc.org/images/datasheet33s.pdf

Sorry folks, the double-wide enter key at the left of the fifth row from bottom appears to be history. Time will tell if that is the worst omission from these new models.

Re: 33s and 48gII Info

*Message #2 Posted by **hugh** on 12 Aug 2003, 12:55 p.m.,*
in response to message #1 by Jeff

looks interesting. not sure what they mean by "internal napier precision". but they have a sensible amount of memory. the 33s claims keystroke programming, but the 48 doesnt say. is it the same or some C like basic?

i just hope they're not full of bugs.

on the subject of bugs, i am supposing that the old range worked by recycling and improving the same algorithms as they were developed, maintaining a strong base. if you've ever tried to write a scientific calculator in software from scratch its way too easy for quite embarassing bugs to get in there. limiting cases of trig functions and so on. even though you think youve really tested it.

Re: 33s and 48gII Info

*Message #3 Posted by **JaSon** on 12 Aug 2003, 1:04 p.m.,*
in response to message #2 by hugh

I worry. All the pictures look like the calculor was just pasted on. Look at the shadows on everything else then that of the calculator the real ones have several shadows coming from different light sources the calc has only one. Plus the wording of the specs is strange. It doesn't fit with the wording for the 9g and 30s. It looks like a very elaborate fake.

Re: 33s and 48gII Info

*Message #4 Posted by **Dave Shaffer** on 12 Aug 2003, 4:36 p.m.,*
in response to message #3 by JaSon

JaSon,

I agree - looks very much like a set of fakes.

The description of functions is incredibly inconsistent. There are some details that anybody who can

figure out how to turn it on won't need, and some other remarkably obtuse comments (like the "Napier" precision) and the appearance of linear regression twice (for the '33S) as well as other confusing, non-standard terminology in the "statistical function" section.

Re: 33s and 48gII Info

*Message #5 Posted by **Raymond Del Tondo** on 12 Aug 2003, 4:45 p.m.,*

I wish I thought that the pictures and information shown on the 33S and 48GII were fake. Unfortunately, they are probably real. The keyboard on the 33S may be perfectly functional, but my first impression is: "Its a toy." Looks like a calculator Mattel would make.

On the other hand, my 32SII, 42S, and 41-CX look professional, have a good keyboard feel, and are sturdily constructed.

After I find out more about the new line of calculators I may be more impressed. But, as the saying goes, "If it looks like a duck and quacks like a duck, it is probably a duck."

Still, they do use RPN, so maybe there is some hope.

in response to message #6 by Thomas Cox

The 48GII looks better than the 49G+, as far as being able to see the myriad of key function s clearly, but the 33S? That has got to be the worst possible design for a calculator keyboard ever imagined! Talk about throwing the ergonomics book into the paper shredder!!!

If they have already built and are selling the 12C Platinum, why not build a remake of the 15C? They have already solved the manufacturing and die casting issues, simply build on the 15C capability and correct the already identified ergonomic issues with the 12CP. I think that would be better accepted than this alleged 33S monstrosity. It does RPN a disservice by making it appear hard to use simply because you can't find the keys you need. Talk about a wacko casting job that must be too.

*Message #8 Posted by **Tom (UK)** on 12 Aug 2003, 1:09 p.m.,*
in response to message #1 by Jeff

For both of these the make or break for me will be the manual - from recent efforts (last 10 years) HP will have to try MUCH harder.

HP33S:

1) Sack the keyboard designer (is it the worst looking calc ever?)

2) Is this like the HP42 or HP32? Keyboard - 32, display - 42 (or is the display for alg replay - yuk)

3) What is the manual like?

4) 0.06 inches thick - WOW!

5) No input output (not even Ir out?) - so having 32K RAM is not very useful (lose power - start typing).

HP48GII:

1) Looks like the HP49G+ to me but: less memory, slower processor, fixed operating system?

2) Is the Ir only compatible with the HP48GII and HP49G+?

3) Serial port - RS232 or USB?

4) MOST IMPORTANTLY is the manual any better than the heap-o-junk that the HP49G came with?

5) It still looks way too high end for my use :(

*Message #11 Posted by **Patrick** on 12 Aug 2003, 2:56 p.m.,*
in response to message #1 by Jeff

Well, the 33S sure makes the 32Sii look gorgeous, doesn't it? Form has ultimately trounced function, it seems.

I'm sorry, I know it is somewhat unfair to criticize without ever having held a machine in your hands, but these documents sure don't fill me with warm fuzzies.

Look at how in both documents the thickness has been incorrectly translated from mm to inches -- was it one of these calculators which did the conversion?

Look at the paragraph at the end of the 48Gii document, the one with the asterisk. Can anybody make sense of

this paragraph, in English? Say what? You need an internet connection in order to use the serial cable? But please purchase the cable separately because it is included!?

If this is the attention to detail the microcode got then we're in for some serious disappointment.

I also echo another poster's comment about no I/O with the 33S. This was one of the biggest criticisms of the 42S and so what does HP do but go out and repeat it. Probably some brainy marketer vetoed it to keep "product separation" with the 48Gii.

Re: "Please purchase separately"

*Message #12 Posted by **Paul Brogger** on 12 Aug 2003, 6:22 p.m.,*
in response to message #11 by Patrick

I think that phrase should be in parentheses (as in, "please purchase the PC separately").

Hey, at least they're being consistent. They've patched up some old designs and put 'em in flashy packaging. For marketing materials, they're not doing all new photography -- just patching in images of the new units into existing pictures. (I think I've seen the architect guy somewhere before . . .)

As for the 33s, it occurs to me that the designer either worked on or drives a Pontiac Aztek.

in response to message #17 by Patrick

I was hoping a Canadian would get into this thread--I rather expected it with my ambiguous "american" moniker!

It's fun how Canadian english is sort of in between--the spelling of "colour" yet the use of "math" "funny" (meaning queer or eerie) "diaper" (not nappy). I can't remember about "soda" or "pop" but certainly not "tonic". I'd say Canadian feels more "States" than "U.K" to me--but I mostly interact with those in Nova Scotia where there are lots of familial ties and also an old french speaking population (L'Acadie was the province's original name after all). I don't know so much about the West (i.e. west of N.B!).

I had a great conversation just a week ago, in N.S., with a 16 year old, on this topic. She had a bunch of other great comparisons which I cannot think of now. My 15 year old cousin was also in the chat, and she just moved back State-side after five years in the Midlands--so she had a bunch of great comparisons and of course "bad words" to compare (like b*gger, bl**dy, and the British expression for a person who wears the jerseys of her favorite sports team all the time---). I wish I could remember them all!

regards,

Bill

Canadian vs. American english (long)

*Message #19 Posted by **Scuba Diver** on 14 Aug 2003, 12:11 a.m.,*
in response to message #18 by bill platt

Well, Bill, to answer your question,

We refer to it as pop, not soda. And the only time I order tonic is if it's mixed with gin!!

My school had quite a few british teachers, so I have a few british phrases in my lexicon. For instance, I refer to it as maths, and thanks to my chemistry professor (from Nottingham), I also pronounce some chemical names differently, for instance, aluminum is "alew-minium", methane is "meethane" and ethane is "eethane". You'd think that it would be an easy thing to change, but it isn't!!

The fact that I was exposed to british accents for most of my schooling makes it easier for me to follow Coronation Street...I've watched that since I was "knee-high to a grasshopper" (thought I'd throw some American English in for good measure!) I had some American friends up a few weeks ago, and they couldn't understand a word of it. Then again, most Canadians can't understand what they're saying either!

Of course, with the last name of Platt, I'm sure you would have no problem Bill...any relation to Gail and her gaggle of obnoxious children?? She married a murderer, don't you know!

(A coronation street reference, for those of you who don't follow the longest running soap opera in television history...now in its 41st season!!)

Anyhow, I digress...back to American and Canadian English

The difference between the two dialects becomes apparent to me when I go south of the border. For instance, when I order tea, they usually bring me iced tea, so now I'm in the habit of ordering hot tea. When I need a napkin (which we call a serviette), Flo usually stares at me like I'm from Mars. Finally, when I give up on the tea and order a pop, she asks me if I want "a Sprite Coke, an Orange Coke or a Coke Coke". The power of branding! Hehehe

Imagine if HP had the same brand power as Xerox, Kleenex, or Coke...

So do you want a Casio HP, a Citizen HP or an HP HP?

B.

Oh, and one more thing...

Canadian Bacon

*Message #21 Posted by **bill platt** on 15 Aug 2003, 11:59 p.m.,*
in response to message #20 by Scuba Diver

Scuba,

(canadian bacon). How did this one ever come to be? And what do *you* call it?

Then there is french fries (pomme frites en francais?)

and how about "raisin" and "grape" vs french "raisin et "raisin sec". I have a theory about this one. If we english speaking people use the french word meaning grape to decribe the dried grape, perhaps it is because any grapes that came from France would have been dry by the time they got there, and so the "raisin" printed on the box would have "stuck". Or hte box said "raisin sec" but the second word was merely dropped for expedience. (I don't know what the real reason is, but it is fun to imagine it, anyway.

Isn't the bird the "turkey" so named because somewhere in europe it was though or assumed that the bizarre creature was from Turkey? What did the pilgrims call it, anyway--big-*ss bird?

And then there is cos(x) rather than cosine(x).....

ciao,

bill

classic calculator; classic pizza

*Message #26 Posted by **Norm** on 18 Aug 2003, 4:21 a.m.,*
in response to message #25 by bill platt

An HP-34C is what I call a classic calculator.

Canadian Bacon and pineapple is what I call a classic pizza.

There is a problem that there is too much variation between pizza stores; often substituting cheap types of meat for the genuine back-bacon that was mentioned.

Another classic pizza is pineapple with olives.

HEY GET THIS ONE: The ultimate classic pizza? I invented it myself . FOUR ingredients

* Canadian Bacon

* Pineapple

* Pepperoni

* Olives

See? You take two classic pizzas and merge them together. You can't beat the taste, plus it keeps most everybody happy.

Kind of like combining the red LED's of an HP-34C with the more sophisticated programming of an HP-41C.

Re: classic calculator; classic pizza, classic beer

Re: classic calculator; classic pizza, classic beer

*Message #28 Posted by **Scuba Diver** on 18 Aug 2003, 10:22 p.m.,*
in response to message #27 by Randy Sloyer

Well, just so long as it isn't American beer...one of these days

you'll realize that beer is supposed to have alcohol in it! Hehehe

The pizza sounds yummy, and I'd go with a nice wheat beer, especially this time of year. Nice and refreshing.

On the topic of beer, a British friend (who was a bartender) told me something and I don't believe him (I'm usually quite a trusting fellow!) I'm a big fan of snakebites, which are 1/2 lager, 1/2 cider. He said that British pubs can't serve it, and the reason is that it can cause brain aneurisms. If pubs are not allowed to sell this drink, I think it's because the cider makes the lager go cloudy, which might throw off other patrons.

My question to those on the other side of the pond is:

Can I order a snakebite in a local, and if not, why?

B.

For me, the 33s looks much like a 32sII with more memory. The design, especially of the 33s, remembers me to stylish cellular phones. A matter of personal taste, but I wonder if that key arrangement is really comfortable. The worst is the missing PC link: did you ever typed in 32KB of program/data?

As Patrick noted before, I'm curious what the Internet connection is good for (perhaps to access MoHPC?).

My fear (see 12C Platinum): stylish, but not really an invention...

Juergen

*Message #32 Posted by **christof (NoVA US)** on 13 Aug 2003, 12:32 a.m.,*
in response to message #31 by Juergen (CH)

I have typed in large amounts of programs- my 42s has about 22k in.

Far, far worse for me than the lack of IO is the keyboard look.

Oh- I'll end up buying one and trying it out, but it looks horrid.

(And i still think the 32Sii is a pretty machine)

but- what about the 48? Do we get to hack? Can you get in there and do assembly language programming? Is it *real* addition to the 48 series?

Re: 33s and 48gII Info

*Message #33 Posted by **Richard Garner** on 12 Aug 2003, 3:57 p.m.,*
in response to message #1 by Jeff

Well Folks,

I had high hopes that these new units would return HP back into what it once was, in terms of calculators. Reading the descriptions and looking at the images, I now have to finally come to terms, that the old HP is truly dead and this new one is not far behind. Currently the only option that I can see is to take out a mortage on my house and buy 10 units of each of the older HP calculators I use off of eBay.

Re: 33s and 48gII Info

*Message #34 Posted by **Tizedes Csaba** on 12 Aug 2003, 4:35 p.m.,*
in response to message #1 by Jeff

I am a little conservative... I am a mechanical engineer student, and the classical design mean me a value of this profession (engineering).

I belive, the calculator represents this profession, like slide-rule many years ago.

I will be an engineer, and I use day-to-day a classical HP calculator.

I think the next young engineer generation LOST something from the honour of this profession when begin to use this new calculators.

That was a 'great era', when the engineers desingns for engineers not the market.

Sorry for my poor english...!

*Message #36 Posted by **Raymond Del Tondo** on 12 Aug 2003, 4:42 p.m.,*
in response to message #1 by Jeff

Thanks for the update.

>Sorry folks, the double-wide enter key at the left

>of the fifth row from bottom appears to be history >

Yes, I really hoped that at least the 48GIIxyz;-) would have a more ergonomic keyboard. The new electronics inside the machines made hope for some advanced program development options, like programming in C or alike, and interfacing to RPL.

Like Richard, I'm very disappointed.

Maybe I'm too used to the much more ergonomic keyboard of the Pioneer Series, including the 'Streched Pioneers' (HP-48, not 49), and of course the HP-41 series.

The 49G and alike aren't Pioneer series machines, at least from the overall hardware.

So maybe someday I'll buy one of these 'redesigned 49G's' for my collection only, but after seeing the pictures, my buying priorities suddenly shifted to one of the latest HP-48GX's with the high-contrast display. The mechanical quality isn't as good as in the 'A' or 'S' made units, and the key legends are painted, but these are minor points, because the keyboard layout and tactile feedback is how I want it.

So if someone wants to sell or trade a GX with the new display, or knows where I could buy such a unit for a good price, please let me know.

Raymond

Hi Raymond,

I think samson cables (www.samsoncables.com) may have the black and white ones.

There was a post in last month's archives, which I instigated, which also found a source.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=35477

just follow down through the responses, and you'll see who found one--he leaves his e-mail address.

Another source, from an old post:

http://cgi.es.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3029192245&category=20335

Best regards,

Bill

Re: 33s and 48gII Info

*Message #38 Posted by **Daniel Diggelmann** on 12 Aug 2003, 5:50 p.m.,*
in response to message #37 by bill platt

I agree with all your posts that the classic HP cals were of high quality and I always apreciated this

very much. But I don't see the new calcs as negative. At least it's a sign that HP have changed their mind upon leaving the calc business. And it seems as if they were reading the comp.sys.hp48 and also MoHPC in order to find out what the customers want. I only do hope that the new calcs will be of better make than the 6S and 30S which I had in hands. I can imagine that Kinpo are able to write an emulator. But where are the innovations? What we want is a more powerful CAS, other calc software or engineering packages which need a lot of know how and ingenuity. And we want it bugfree because we like to use the calc for work and not to play. I'm curious and will sure buy the HP49G+ to play but maybe only to play with...

oh no, it's kinpo

*Message #40 Posted by **ned** on 12 Aug 2003, 5:49 p.m.,*
in response to message #1 by Jeff

just what I feared after seeing the 49G+ pdf. The 33s is a Kinpo. Has the entire world gone form over function? I wish it *were* a hoax, but seeing is usually believing. Conspiracy theorists: please don't waste everyone's time.

Here is page 5 of Kinpo's line of Citizen branded calcs:
http://www.jcbm.co.jp/eng/consumer/calc/scientific/scientific5.html look familiar? I wish the 33s were as plain as the citizen SPR-350, but hp had to go and do a flashy custom design. I'm definitely getting a 48gx while still I can, they're on hpshopping.com for US$150. Try using those slanted keys during a test. I'll treat my 28s very well from now on. I was hoping they would at least reuse the 10bii mold for the 33s, but it wouldn't be 'economically viable' to start that production line up again. Somewhere in a dump in Singapore or Malaysia there lies the fab line for the pioneer series. :(To Kinpo's credit, they do have good bang for the buck. Someone please convince Kinpo to buy the Pioneer patents and sell HP calcs back to HP. ~ned

in response to message #1 by Jeff

I don't like the looks of the 48gII, but the 33s is really awful! The weird key shapes are very distracting.

They must be getting their design ideas from the same people who are doing the new Nokia phones. (The phones are even worse -- they've replace the standard rectangular keypad with various strange layouts apparently designed for their novelty effect, rather than what's easiest for the customer to use. Hopefully they won't sell many and this terrible trend will come to a swift end.)

Give me a boring rectangular keyboard any time.

I'm not crazy about the small Enter key either.

Having said all that, I may end up getting a 33 just so that I'll have a cheap throwaway RPN machine I can take everywhere. Otherwise, I'll stick with my *real* HP calculators.

- Michael

Posts are too negative

*Message #45 Posted by **Louis Alley** on 13 Aug 2003, 9:58 a.m.,*
in response to message #1 by Jeff

Who cares if the keyboard slants like a cell phone. After a while of using the calc, you'll get used to it.

Face it - it's not the 1980's anymore. HP won't doom itself by bringing the ugly brown design back. Some people buy based on looks. HP needs that.

I feel like a lot of people who post are just bigoted for the 1980's calcs. They haven't even used the new ones, and they are already bashing them.

If the 33S turns out to be a smashing success for my generation, I'm sure we'll be nostalgic when HP changes the color to black in 2020.

. . . and both SST & BST are shifted (as in HP-32Sii). And for Algebraic users, left & right parentheses are shifted . . .

Troubling! (Geez! How I wish *someone* who frequents this board had had a shot at the keyboard layout early on!)

But more memory is what the 32sii needed most. And a second line of display (assuming it's appropriately functional in RPN and programming modes -- it had better be!) will be nice. And the 32s/sii programming interface (assuming *that's* what's being carried forward) is, I think, H-P's **most** user-friendly for the occasional programmer.

I'll still probably buy one, and I still hope it *feels* good!

Re: 33s and 48gII Info

*Message #49 Posted by **Eduardo** on 13 Aug 2003, 7:29 p.m.,*
in response to message #1 by Jeff

I was hoping the 33S would be more like the 42S than the 32S ---vain hope, it turns out now. Also, the specs say the display is 2x14 characters of 5x7-pixel characters, so it's a 2-line version of the 32S display rather than a true pixel grid like the 42S, aka, not even suitable for (rudimentary) graphics :-(

Price?

*Message #50 Posted by **Erik Wahlin (USA)** on 13 Aug 2003, 10:38 p.m.,*
in response to message #1 by Jeff

Anybody have any idea what the price on these calcs. might end up being?

Here's another one borrowing CX material from an official site. This time the idiot stole a .jpg from a well known site that I am not permitted to name here (as an automatic filter on this site warned me!) If they don't have digital cameras, why not just have no picture and leave it at a description. What do these people possible think they are gaining by posting such stuff? People never cease to amaze me- I must be getting old.....

Re: ... growing old ...

*Message #2 Posted by **Paul Brogger** on 12 Aug 2003, 10:33 a.m.,*
in response to message #1 by Andrey

You may have just suggested another defintion for "grown old":

*when one stops being **amazing**, and is merely **amazed**.*

He also has BAD Contact Info

*Message #3 Posted by **Mike** on 12 Aug 2003, 10:44 p.m.,*
in response to message #1 by Andrey

and 5 negatives for not matching description.

If you report his BOGUS email address, he WILL be suspended. Guaranteed!

A rule of eBay is that contact info must be valid at all times. His is bad.

Can we bring ebay prices down ?

*Message #1 Posted by **Renato** on 12 Aug 2003, 2:16 a.m.*

Just by NOT BIDDING AGAINST SOMEONE ELSE ?

Even if the first bid is very low, just keep your faith and do not bid.

I have been trying to do this for some months.

Can we all do it for a couple of months ?

Re: Can we bring ebay prices down ?

*Message #2 Posted by **Juergen (CH)** on 12 Aug 2003, 5:33 a.m.,*
in response to message #1 by Renato

Don't think it will work. They are too many people interested in HP handhelds on eBay. If you look for cheap calcs ask your friends, your coworkers, etc. The more people know of your hobby the greater will be the chance to get HP calcs for reasonable prices (or even for free).

Regards, Juergen

the only way is auction sniping

*Message #3 Posted by **Norm** on 12 Aug 2003, 6:03 a.m.,*
in response to message #2 by Juergen (CH)

Renato --

Auctions are problematic because some people do not concentrate on fair/value/market pricing. Instead they think they are playing a game of ping-pong, and whatever the existing bid is, they go higher. They don't concentrate up front and decide on a fair price, they just keep entering numbers as they go, always trying to outbid. It is like they think they are hiking up the side of a mountain, instead of evaluating the fair price of something.

The only way around this is auction sniping. You either bid low, or not bid at all. Let the other guy think he won the auction. Then enter your final bid price a few seconds before the auction closes.

If everybody auction sniped, instead of being a game of ping-pong, it just becomes a voting system.... everybody enters a value they think it is worth, and high-entry takes the item.

Auction sniping is problematic because you have to enter that true final bid in the last 5-10 seconds, and sometimes you miss, so then you lose entirely.

I have been very happy with an automatic auction sniping service, of which there are several. People on this board pointed me towards: http://www.auctionsniper.com

I can't see any other way to "bring eBay prices down". It is not a cure, but it DEFINITELY helps, and quite a lot . :o)

Acution sniping software

*Message #4 Posted by **Mike** on 12 Aug 2003, 10:55 p.m.,*
in response to message #3 by Norm

Is completely unnecessary, unless you can't be there in person. The software does not help you beat another in-person sniper.

Simple rule of auctions: Highest bid wins. Just pick your bid and bid at the last second. If you lose, oh well, you didn't want to pay higher. If you win, you most likely will get it at a lower price than you expected.

free auction sniping

*Message #5 Posted by **Clive Marner** on 12 Aug 2003, 7:31 a.m.,*
in response to message #2 by Juergen (CH)

I agree with Norm. I try never to get into a bidding war on an item because the moment you do the final price will be more than you want to pay. I've used sniping services a lot - auctionsniper is very good but you can only use it so much before you have to start paying. There is another site I've used which you never have to pay for - I think it's www.lotsnipe.com but I can't check at work because everything to do with auctions is blocked! They do have a premium service which you pay for, but if your happy with 10 second sniping then it's completely free.

Conversely, I would encourage everyone to get into bidding wars on all my items ...

Re: free auction sniping

*Message #6 Posted by **Thibaut.be** on 12 Aug 2003, 8:41 a.m.,*
in response to message #5 by Clive Marner

www.vrane.com provide a sniper publix boxn, that let you snipe one auction at a time. Though 6 seconds is not always good : i've been sniped in the meantime on a complete 65 for $ 185... quite cheap !

Waste of money

*Message #7 Posted by **Mike** on 12 Aug 2003, 10:58 p.m.,*
in response to message #5 by Clive Marner

Paying for sniping service is a waste of money. There are always in-person snipers and software does not help you beat those.

For instance, I always bid my maximum bid in the last seconds. If someone outbids me, they pay too much (based on what I believe it's worth). No auction software can beat that. They might win, but they pay more than I would have paid and they can have it at that price.

Re: Can we bring ebay prices down ?

*Message #8 Posted by **Patrick** on 12 Aug 2003, 3:11 p.m.,*
in response to message #1 by Renato

I think this question is motivated by a belief that the prices on eBay are somehow "inflated". I totally disagree with this notion. To me, the prices on eBay are almost by definition the true market value of these items. Other than needing access to the internet, there are few restrictions on who can buy and who can sell there. If this does not result in "true market value" then what does?

However, to answer the question asked, it is only the market as a whole that can influence prices. The people who visit this forum are significant part of that market but by no means the majority, I suspect. Even if you manage to get a bunch of people here to bid lower or bid less often or refusing to snipe, what I think will happen is that the people who don't participate in this effort will start to win items (marginally) cheaper. The people who do participate in the experiment won't win many auctions at all and will be in pretty much the same boat they're in now.

Re: Can we bring ebay prices down ?

*Message #9 Posted by **David Smith** on 12 Aug 2003, 4:47 p.m.,*
in response to message #8 by Patrick

The people who visit this forum tend to bid very reasonable amounts for machines... typically the low side of average. It is the newbie, uninformed, or desparate people who tend to bid those really high prices. And it takes two of them at the same time and place to make that Ebay magic happen... all too often though.

Re: Can we bring ebay prices down ?

*Message #10 Posted by **Patrick** on 12 Aug 2003, 7:25 p.m.,*
in response to message #9 by David Smith

I'm not sure how you know how the people on this forum bid. I would imagine that there are people here of a vast variety of means and values who bid altogether differently from one another -- just like the rest of the world.

But even if you are right, even if it is the newbie, uninformed or desperate who bid "high" prices, it makes no difference. Those people are part of the free market, just like everybody else, and their contributions help to set the "market price", and always will. It's not like there is another eBay-like place out there where newbies don't go and where the items are therefore more affordable. This is it, folks. This *is* the free market system.

Let's also remember that the people who bid those so-called high numbers generally *pay* for their items. What is perceived as a lamentable unaffordability of these items by buyers like you and me, are a corresponding financial boon to the good folks selling these items. Many of them also have kids to feed, I suspect.

Re: Can we bring ebay prices down ?

*Message #11 Posted by **David Smith** on 13 Aug 2003, 4:14 p.m.,*
in response to message #10 by Patrick

The regular people here are a fairly small and chummy community. We know each other fairly well, often trade and correspond with each other, know Ebay user names, and very often bid against each other.

No, it's not a true market.

*Message #12 Posted by **Thibaut.be** on 13 Aug 2003, 6:43 a.m.,*
in response to message #8 by Patrick

... at least for HP calcs.

Ebay is the bets place to sell and the worst place to buy.

Since there at the same time is a very limited supply of calculators and that the auction system make lots of buyers bid on the same item, you often switch from a true market to an oligopolistic and often monopolistic market where prices are inflated.

Then where?

*Message #13 Posted by **Patrick** on 15 Aug 2003, 2:36 a.m.,*
in response to message #12 by Thibaut.be

Ok, so point me at the place where I can go -- mark you -- where *I* can go -- that is more representative of a true market.

I emphasize that it must be possible for me to go there and to do so at a very reasonable cost. There's no point to me or to anyone else if there's a market in some place that costs me a great deal of money and/or effort to use. I'm not going to spend thousands of dollars in travel costs or in my time to save a small percentage on items costing a few hundred.

I'm sorry, I just don't get it. You can't argue that eBay is somehow biased towards sellers unless you have something else to compare it to that has similar mass market appeal and availability and does not have that bias.

I'd be very happy if you were to prove me wrong. Then I wouldn't have to spend so much money pursuing my geekish hobby!

Of course, if you were able to do this, everybody on eBay would flock there and the same situation would soon develop there as is now the case on eBay.

What if we just try to see what happens ?

*Message #14 Posted by **Renato** on 12 Aug 2003, 4:54 p.m.,*
in response to message #1 by Renato

Lets just not bid against anyone for a few months. This HP activity is for fun. If the prices do not go skyhigh, we will have more fun.

What will happen if this does not work ? We will not get some calculators for a few months.

What if it works ? We will get cheaper calculators for some time.

Let me play devil's advocate

*Message #15 Posted by **Mike** on 12 Aug 2003, 11:01 p.m.,*
in response to message #14 by Renato

Let's assume we played your game. Let's assume prices came down. (it won't; but let's assume)

When do we all start to bid again?

Who gets the items at bargain prices in the meantime?

When we all start to bid again, against each other, the prices will rise again? And those that didn't play your game, got some bargains, while we forced the price back up for ourselves, when we start again.

No thanks!

Ouch!

*Message #16 Posted by **Renato** on 13 Aug 2003, 1:10 a.m.,*
in response to message #1 by Renato

Enough spanking ... I quit.

Ok - wait for me . I´ve just reloaded my auctionsniper account. Bidders beware !

Renato

Re: Ouch!

*Message #17 Posted by **Patrick** on 13 Aug 2003, 2:15 a.m.,*
in response to message #16 by Renato

Way to go, Renato! Snipe away!

You see how the free market works? Any "plan" to thwart true market value is overcome by other market forces (i.e., the rest of us :-), thereby forcing true-market behaviour on the would-be planner.

Re: Can we bring ebay prices down ?

*Message #18 Posted by **Victor Koechli** on 13 Aug 2003, 8:54 a.m.,*
in response to message #1 by Renato

IMHO, no, we can't, at least not significantly, because there will always be people who don't play your game and continue bidding, also against each other.

I have tried to bring Picasso (insert you favorite artist here) prices down this way, with no success :-((If everybody wants to have something, the ones who will spend the most money for something will get it.

That said, and referring to an earlier post where I thought out loud about starting collecting something else (not being serious, of course), statistical fluctuations are there and will sometimes allow you to get a calculator at a reasonable price even if they are usually waaay to expensive.

Cheers, Victor

Re: Not a good idea!

*Message #19 Posted by **gifron** on 13 Aug 2003, 1:54 p.m.,*
in response to message #1 by Renato

Whether it would work, or not, is one issue. The real issue though is that this is ILLEGAL bid rigging. I'm not talking about "eBay illegal." This is real, "Sheriff at your door at supper time" illegal... In the US anyway.

Re: Difference between boycott and Bid rigging

*Message #20 Posted by **Ron Ross** on 13 Aug 2003, 2:28 p.m.,*
in response to message #19 by gifron

I believe that boycotting is legal, Bid Rigging is not. And there is a difference. How one accomplishes the feat determines whether it is legal or illegal.

What is really proposed here, regardless of what they call it, is boycotting. Bid rigging really only takes place in closed sealed bids. Everyone is in on the scam and one person is predetermined to be the high bidder. Bid Rigging.

This group is really advocating a boycott (which is totally within the whole groups rights). But as has been mentioned earlier, is that this will be an ineffective and probably counter productive endever. It may depress a few auctions, by allowing those not participating or even ignorant of this groups efforts to purchase some calculators below the present market value.

I foresee the new Hp's will depress the market somewhat. How? Because some less knowledgable consumers (maybe smarter! 8o)) will wait until the newer and improved RPN's come out so they won't have to buy the outdated and discontinued JUNK! There are engineers who just have to have an RPN calculator and when their ONE and only breaks, they jump in and buy the first one available when they can't find Hp at the local store and also find HP no longer even makes. These guys need a tool now and cannot afford to bargain shop. That is why I believe Hp32s and Hp42s (and older Hp10c series calculators as well) are usually so high. Collectors have to fight over these as well, but these models might actually be much more common than a 21s, 22s or 27s which typically bring less.

Pioneer Prices

*Message #21 Posted by **Randy Sloyer** on 13 Aug 2003, 6:22 p.m.,*
in response to message #20 by Ron Ross

The 21s, 22s and 27s are of course algebraic. IMO, only the collectors and a few dedicated users buy them. It's not that their prices are low, they are probably just about right. Saw a nice 22S go last week for <$70.

Its that huge pool of everyday RPN users driving up the prices on the 32S and 42S machines. When someone plunks down $250 for a dented 42S, that ain't no collector.

$600 for a NIB 15C is another story...

Re: Not a good idea!

*Message #22 Posted by **David Smith** on 13 Aug 2003, 4:09 p.m.,*
in response to message #19 by gifron

If you read the Ebay fine print you will find that they are technically NOT an auction! They are a name-your-price service. That way they don't need auction licenses in every state/country that they deal in. Auction bid rigging laws don't seem to apply.

simple math

*Message #1 Posted by **Don Alexander** on 12 Aug 2003, 1:19 a.m.*

how do you do simple math ie adding,multi.div.sub on a hp19c. where is the = key?

Re: simple math

*Message #2 Posted by **Vassilis Prevelakis** on 12 Aug 2003, 1:30 a.m.,*
in response to message #1 by Don Alexander

RTFM

The manual for the 19C is on the MoHPC CDROM

For a quick how-to read the RPN article on the HP web site: http://www.hp.com/calculators/articles/rpn.html

**vp

Re: simple math

*Message #3 Posted by **Don Alexander** on 12 Aug 2003, 2:53 a.m.,*
in response to message #2 by Vassilis Prevelakis

thanks VP I will either get the cd or get rid of this thing if i can't figure out how to use it if it was a slide rule I would know how to use it.

Re: simple math

*Message #4 Posted by **Chan Tran** on 12 Aug 2003, 8:26 a.m.,*
in response to message #3 by Don Alexander

Dear Don, If you want to get rid of it please donate it to one of us. Please

Re: simple math

*Message #5 Posted by **Jim L** on 12 Aug 2003, 12:47 p.m.,*
in response to message #3 by Don Alexander

> Quote:
>
> it if it was a slide rule I would know how to use it.

But I'm sure you were given some instruction on slide rules. Get a manual for it and it will all make sense. You won't want to go back to calculators with = keys.

Re: simple math

*Message #6 Posted by **Chan Tran** on 12 Aug 2003, 2:25 p.m.,*
in response to message #5 by Jim L

Thanks Jim. I was about to ask Don to trade his 19c for a calculator with the "=" key. (I would buy him a brand new one too)

Re: simple math

*Message #7 Posted by **Chan Tran** on 12 Aug 2003, 2:36 p.m.,*
in response to message #6 by Chan Tran

I can't help but post again. A fully functioning HP19C is worth more than any handheld calculator that you can buy new in store today. So Don do ya wanna trade?

Re: simple math

*Message #8 Posted by **ned** on 13 Aug 2003, 2:01 p.m.,*
in response to message #1 by Don Alexander

Don, please read about RPN on HP's site, and be sure to check out the explanation of RPN here on hpmuseum.org also. link to HP: http://www.hp.com/calculators/articles/rpn.html

If you really wanna get rid of it, put it up for sale in the classified's on this site. Otherwise just tough it out and learn RPN for 'fun'. Get a Casio fx260 solar at walmart for $9 to do your everyday math.

~ned

HP-71B/HP-41CX on same HP-IL Loop

*Message #1 Posted by **Jeff** on 11 Aug 2003, 8:26 p.m.*

HP-71B/HP-41CX on same HP-IL Loop, can this work? I presume so but I have been having problems getting the HP-71B or the HP-41CX to print or access the tape drive. I have checked the cables for continuity and also that each one works, prints and accesses the tape drive, while the other is not plugged in. I have been reading the HP-IL books for both machines and have yet to get anything that works. "Broken IL Loop" is one of the messages I get. Any thoughts or ideas would be appreciated. I would like to leave them both connected and just transfer control from one to the other when required. Best Regards, Jeff

Weird, isn't it?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 Aug 2003, 12:17 a.m.,*
in response to message #1 by Jeff

Hi, Jeff;

Because of the fact I had only one IL cable, one 9114B (IL disk drive) and the 82160A (HP41 HPIL ROM module), I tried this about a couple of months ago to see what happened.

The fact is that the HP71B (and anyone else) cannot be a controler in a loop where an HP41 is part of. If you put two HP41 in a loop (as Jose Ernesto once tried) they will conflict with each other because both will try to be controlers, and one of the rules in an HPIL loop is that only one controler can exist; all other devices are "talker" or "listener". I tried to go further and set the HP71 as a listener, but I believe it is set as a listener by the HP41. If you have the Extended I/O module (or any other taht is able to do it, like PANAME ROM) you can connect both the HP41 and the HP71 together (and only) and execute AID in the HP41. In the first attempt you'll read [TRANSMIT ERR] in the HP41, but in the second attempt you'll find no errors and the ALPHA register will contain [HP71] text after executing AID.

Try it and tell us. I cannot go any further because I did not try to.

Not too much of a help, but I think it's a starting point.

Success.

Luiz (Brazil)

Re: HP-71B/HP-41CX on same HP-IL Loop

*Message #3 Posted by **Philip** on 12 Aug 2003, 8:02 p.m.,*
in response to message #1 by Jeff

Try this with just the 71 and 41 connected.

on 71: CONTROL OFF @ RESTORE IO ENTER :LOOP;A$ @ DISP A$ (there must be a space before :)

on 41: 1[ALPHA]TESTING[ALPHA] XEQ [ALPHA]OUTA[ALPHA]

That should send the string from the 41 to the 71.

I believe CONTROL OFF is the key to removing the 71 from Controller Status. You'll need to do a RESET HPIL or CONTROL ON on the 71 to regain loop control.

Hope that helps.

Symbolic math

*Message #1 Posted by **Tizedes Csaba** on 11 Aug 2003, 5:17 p.m.*

Hello!

Try to solve for 'x' the following equation:

```
3*x+1/(x-5)=15+1/(x-5)
```

The MAPLE, MATHEMATICA and HP48SX (solve with QUAD) give me the bad answer (x=5). (The "good" answer is 'no solution'.)

Who understand it...!?

Csaba

Re: Symbolic math

*Message #2 Posted by **Wayne Brown** on 11 Aug 2003, 5:52 p.m.,*
in response to message #1 by Tizedes Csaba

I would imagine it is rearranging it as:

3*x=15+(1/(x-5)-1/(x-5))

and simplifying that to:

3*x=15

which it then solves to get x=5. (I'm just guessing here.) Obviously it doesn't try to go back and substitute x=5 into the original equation and solve it, else it would get a divide-by-zero error. Hence the admonition of my algebra teachers over 30 years ago: Always go back and check your answer!

BTW, Erable 3.201 on my 48GX gives the same answer: x=5.

Well...

*Message #3 Posted by **Jim L** on 11 Aug 2003, 6:48 p.m.,*
in response to message #2 by Wayne Brown

Undefined-approaches infinity = Undefined-approaches infinity?

Seems like a pretty good "machine answer". Needs a person to put it in context though.

Re: Symbolic math

*Message #4 Posted by **Larry Corrado, USA (WI)** on 11 Aug 2003, 5:56 p.m.,*
in response to message #1 by Tizedes Csaba

If you try to find a solution by inserting values and testing, the 1/(x-5) terms on each side "blow up" when x approaches 5. However, if you first algebraically cancel out those denominators (by multiplying by (x-5)), you can solve it normally (and get x = 5). To be honest, I don't know which solution ("no soultion" or x = 5) a mathematician would call correct.

Don't know if this is helpful or not... Larry

Re: Symbolic math

*Message #5 Posted by **Speck** on 11 Aug 2003, 9:55 p.m.,*
in response to message #1 by Tizedes Csaba

On the TI-92:

Solve(3*x+1/(x-5)=15+1/(x-5),x)

Returns x=5

The TI-85 numeric solver returns X=5.00000000001, but does so with a sign change error before final resolve.

As a direct algebraic problem, x=5 doesn't really work. However, if the machine is internally doing some sort of a limit process, then the returned answer x=5 is quite correct, as it would never actually reach the discontinuity at x=5. If something like Newton's method (or bisection, or one of the better methods) is being used, then there is some sort of stop condition where, based on a preset tolerance level, the algorithm figures it's "close enough," and returns the found answer to the user, even though that answer may appear to be exact. The machine doesn't just magically pick x=5, plug it in and see what happens. You could just as easily do that on your own. The machine has to use a method more suited to it's type of "thinking." The advice posted above about always checking your answer is definately good advice. The computer can never be better than the person using it.

Unfortunately, this doesn't look like one of the problems where the conjugate trick works, either.

Speck.

Re: Symbolic math

*Message #6 Posted by **J. Osugi (E. U.)** on 12 Aug 2003, 1:32 a.m.,*
in response to message #1 by Tizedes Csaba

```
 > Try to solve for 'x' the following equation:
 > 3*x+1/(x-5)=15+1/(x-5)
 >
 > The MAPLE, MATHEMATICA and HP48SX (solve with QUAD) give me the bad answer (x=5). (The
"good" answer is 'no solution'.)
 >
 > Who understand it...!?

I wasn't able to get a symbolic result with the HP48GX (expan, colct and isol
fail to isolate the 'x' variable).
The numeric solver (root) instead works and returns 5.

The functions solve(), nsolve(), and zeros() of the TI89 <EG>
return 5 as well.

Mupad Light and Math Cad return 5, too.

I suppose it's a matter of how the function behaves when the value of x
```

```
tends to 5: both the terms 1/(x-5) tend to the same order of infinite
and elide each other, so that x=5 is the actual "good" solution.
In other words: evaluate both the terms of your equation, 3*x+1/(x-5) and
15+1/(x-5) for x=4.9, 4.99, 4.999, and so forth, or for x=5.1, 5.01, 5.001,
and so forth. It should be self explaining.
Just my two Eurocents. :-)
```

Re: Symbolic math

*Message #7 Posted by **Thibaut.be** on 12 Aug 2003, 10:25 a.m.,*
in response to message #6 by J. Osugi (E. U.)

I agree with previous comments. When it goes about solving an undefined equation, then you need to calculate the limit for f(x) when x tends to the value of the indertimenation, which is here x-5 = 0, or x=5. The limit clearly tends to 5.

My really problem...

*Message #8 Posted by **Tizedes Csaba** on 12 Aug 2003, 4:10 p.m.,*
in response to message #1 by Tizedes Csaba

Thanks for your answers, opinions!

I think, the really problem is that, if a program works symbolically, why dont examine the denominators?

And if the solver works numerically why give back x=5? (And not 'division by zero' error...) In this case the 'good' solution is a number near 5 (where 1/(x-5) is properly big number (=:N) considering 3*x or 15 AND 3*x+N equal with 15+N for 10, 12 or many digits.)

Csaba

TVM inaccuracy

*Message #1 Posted by **Thomas Radtke** on 11 Aug 2003, 1:51 p.m.*

Hi,

am I the only user who finds the TVM calculations on HP-18C et al. to be horribly inaccurate? Take just a simple example: PV=100, PMT=10, I%YR=3, annual interest compounding, monthly payments. Interest conversion leads to I%=2.96... and the subsequent TVM calculation (Begin mode, N=12, P%Y=12) gives a value of -224,941194... where it should be exactly -224.95. Higher cash flows lead to a worser inaccuracy. Are these problems accepted?

Any statements are very welcome.

Thanks,

Thomas

Re: TVM inaccuracy

*Message #2 Posted by **Gene** on 11 Aug 2003, 2:28 p.m.,*
in response to message #1 by Thomas Radtke

Original 12c gives $224.9411945

Excel 2000 gives $224.941194069285

Where did you find that the "exact" answer should be $224.95?

Probably due to some rounding in the interest rate conversion. i is equal to 0.00246626977230369 and 0.00246627 on the 12c.

Re: TVM inaccuracy

*Message #3 Posted by **Thomas Radtke** on 11 Aug 2003, 2:49 p.m.,*
in response to message #2 by Gene

Hi Gene,

1) I can do this by hand:) 2) I wrote an iteration for my 32SII 3) I solved the iteration to get an analyical equation. Thats probably more exact since there is not such a high exponentiation necessary as in the usual formula which explicitly needs the conversion (you end up w/ e.g. q^N^CP, CP=compound period, something like that). Dunno exactly, I haven't done the error calculation yet but am fairly sure that this method is problematic.

Well all three methods get the same result. That, of course, does not mean that I'm right;). Might be bad logic on my side. Anyway I will look into this further and if only to prove that I'm too stupid to use my pencil and calculators;(.

Thanks for your answer!

Thomas

Re: TVM inaccuracy

*Message #4 Posted by **Gene** on 11 Aug 2003, 4:15 p.m.,*
in response to message #3 by Thomas Radtke

Well, perhaps what you're using is not really a simple example? You have a rate that is annual and monthly payments.

Usually, simple problems have a rate and payment frequency that are the same.

On the 12c, here's what I do to find the given answer:

1.03 ENTER 12 1/x Y^x 1 - 100 x i (This gives the equivalent interest rate per month, or 0.246627, which means that 2.959524% compounded monthly is equivalent to 3% compounded annually) 100 PV 10 PMT 12 N FV

which returns the value I have posted earlier.

Re: TVM inaccuracy

*Message #5 Posted by **Victor Koechli** on 13 Aug 2003, 4:34 p.m.,*
in response to message #1 by Thomas Radtke

This is really interesting. If you supply the FV value you state as exact and calculate i, you get 2.96473629127 (on the 48GX) which is significantly different from the 2.959523724 you get from the conversion.

If you add interests up manually you do indeed get -224.95. I get this result by doing

$$10*.03 + 10*\frac{11}{12}*.03 + 10*\frac{10}{12}*.03 + \ldots$$

and adding 3 for the interest from the initial 100. What's going on here? The error seems too large to be simple roundoff...

Cheers, Victor

Re: TVM inaccuracy

*Message #6 Posted by **tony** on 14 Aug 2003, 1:23 a.m.,*
in response to message #5 by Victor Koechli

Very interesting Victor!! So, that is where the exact 224.95 comes from. It uses simple interest over the year!! As you say :

224.95 = 100*1.03 + 12*10 + .03*10*6.5

TVM uses compound interest, like so:

100*1.03 + [10*.03*(1.03)^(1/12)]/[(1.03)^(1/12) - 1]

Re: TVM inaccuracy

*Message #7 Posted by **Victor Koechli** on 14 Aug 2003, 4:31 a.m.,*
in response to message #6 by tony

Hmmm... Forgive my ignorance, but I'm trying to find out why this makes a difference. Is it because, in this example, interest is only compounded once a year, while payments are received monthly?

And if so, could you still calculate this example using the TVM solver?

Cheeers, Victor

Re: TVM inaccuracy

*Message #8 Posted by **tony** on 14 Aug 2003, 6:21 a.m.,*
in response to message #7 by Victor Koechli

>Hmmm... Forgive my ignorance, but I'm trying to find out why this makes a difference.

Oh, I just gave the mathematical side. My reading was you wanted to know why there was a small difference.

The TVM expression I gave assumes monthly compounding. TVM always compounds at each payment incident.

> Is it because, in this example, interest is only compounded once a year, while payments are received monthly?

The exact 224.95 answer assumes the payments get simple interest. If the plan lasts for one year only then there is really no compounding at all.

>And if so, could you still calculate this example using the TVM solver?

No, TVM will not do this. But what it will do is ... if the savings plan lasts for a number of years, and the compounding occurs one a year, then you can compute an FV by using the equivalent end-of-year payment, as PMT. This would be 121.95 in this case. So you can correctly compute the FV after 10 years with n=10 i=3 PV=100 PMT=121.95 at END.

This also works with n=1, of course, but we have had to calculate the PMT manually... this is as close as we can get to representing this problem in TVM.

Hope this ramble helps :)

Cheers, tony

Does this 82162A work?

*Message #1 Posted by **David Ramsey** on 11 Aug 2003, 12:05 p.m.*

I bought an untested 82162A HP-IL printer and am trying to determine if it works.

I suspect it doesn't: it powers up and can advance the paper, but the "Print" button does nothing, and nothing prints when it's set to "Trace" mode and I perform operations on the HP-41 I'm using to test it.

I know the HP-IL interface works-- it controls a tape drive just fine.

Still, there's one thing that makes me think I'm overlooking something: according to my HP-IL module manual, I should be able to test flag 55 to see if a printer is present. But with either HP-IL module I have, pressing "TF" and "55" returns "Nonexistent", rather than a status.

Ideas?

Re: Does this 82162A work?

*Message #2 Posted by **David Smith** on 11 Aug 2003, 2:08 p.m.,*
in response to message #1 by David Ramsey

That teeny little switch on the HPIL module enables or disables the printer functions (so you can use HPIL and the 82143A in the same machine). Make sure it is ENABLEd.

Re: Does this 82162A work?

*Message #3 Posted by **David Ramsey** on 11 Aug 2003, 3:53 p.m.,*
in response to message #2 by David Smith

"Hello, my name is David and I'll be your moron today..."

Yep, that was it. The printer works fine (well, there's a print element out in the middle of the head, but I can live with that). Thanks!

Have you checked the printer enable switch at the IL interface ?

*Message #4 Posted by **Renato** on 11 Aug 2003, 2:03 p.m.,*
in response to message #1 by David Ramsey

Have you checked the printer enable switch at the IL interface ?

Renato

Check the print head ribbon cable...

*Message #5 Posted by **Michael Meyer** on 12 Aug 2003, 12:27 a.m.,*
in response to message #4 by Renato

I've had great luck by opening these printers and using VERY light oil (flute valve oil) on the moving parts and shafts. Don't get any on the rubber drive belt!

While you're in there, you might check the ribbon cable for damage and firm seating. I have a "junk" printer sent to me for the print head to repair a 19C, but the power board on the 19C was corroded beyond repair. So, I have an unknown print head.

RTN2RPN Michael

Re: Check the print head ribbon cable...

*Message #6 Posted by **David Smith** on 12 Aug 2003, 3:15 p.m.,*
in response to message #5 by Michael Meyer

The 82143A print head will work fine in the HP-IL printer. You can get them cheap on Ebay. The 82143A printhead is NOT compatible with the HP91/92/97/19C. Those earlier machines have a low resistance (10 ohm) head. The 82143A and HP-IL printers have a high resistance (80 ohm) head that is driven by a boosted power supply voltage. HP did this becuase the 82143A can print twice as fast as the HP97.

Ebay - HP-12C #ABA

*Message #1 Posted by **Howard** on 11 Aug 2003, 6:37 a.m.*

Have I missed something? What is the "#ABA" mean in this item? http://cgi.netscape.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3040554321&category=11712

U.S. model

*Message #2 Posted by **Raymond Del Tondo** on 11 Aug 2003, 9:17 a.m.,*
in response to message #1 by Howard

Hi,

at least the last letter is for the target market. ABA: U.S. America ABD: Deutschland (Germany) ...

Raymond

But I don't think

*Message #3 Posted by **Mike** on 11 Aug 2003, 10:56 a.m.,*
in response to message #2 by Raymond Del Tondo

I don't think ABA means it is "Made in the USA".

Re: But I don't think - ABA on HP12C

*Message #4 Posted by **Bill Wiese** on 11 Aug 2003, 12:48 p.m.,*
in response to message #3 by Mike

I didn't get a chance to peruse the EBay ad post - but this "ABA" doesn't sound like an HP model #, etc.

Is this a logo on the calc in addtion to HP & 12C?

If that's the case, "ABA" = American Banker's Association or American Bar Association (perhaps a calc for tax lawyers?)

Bill Wiese San Jose CA

Re: But I don't think

*Message #5 Posted by **Raymond Del Tondo** on 11 Aug 2003, 7:30 p.m.,*
in response to message #3 by Mike

No, it doesn't mean 'made in', but 'made for';-)

Raymond

Re: Ebay - HP-12C #ABA

*Message #6 Posted by **gifron** on 11 Aug 2003, 1:03 p.m.,*
in response to message #1 by Howard

Probably doesn't mean anything. My guess is that the seller just put it in the title to attract attention from ABA type people. May have to ask the seller.

Re: Ebay - HP-12C #ABA

*Message #7 Posted by **r. d. bärtschiger.** on 11 Aug 2003, 1:43 p.m.,*
in response to message #6 by gifron

#ABA is the 'option' 'number'. The most recent HP-48GX which I purchased came with a card listing some of the features of the calculator. At the bottom of the card are the following:

(3OP) Option ABA

Proof of Purchase 48GX ABA

If you check the hp sales site you will see that most hp items carry such an option designator. #ABA probably refers to a u.s. version made for sale in the u.s.

HP-41C LCD

*Message #1 Posted by **Terry** on 10 Aug 2003, 8:12 p.m.*

okay, I corrected it to LCD - thanks. I have an HP-41C that I kept in a closet for several years when I did not need it. When I finally needed it again, I found the LCD has a brown haze to it. But it looks more like something under the display cover (if there is such a thing). I would like to know if that is true, that there is a separate cover protecting the LCD, and if I can get to it easily for replacement or cleaning. The repair info posted here does not go into removing the LCD, so I do not know if I can and whether or not the risk of having a non-functioning calculator would be worth it. The only thing bothersome about it is that it looks dirty.

Edited: 11 Aug 2003, 7:41 p.m. after one or more responses were posted

Re: HP-41C LED

*Message #2 Posted by **Randy Sloyer** on 10 Aug 2003, 8:44 p.m.,*
in response to message #1 by Terry

Refer to Dave's photo to see which model you have:

If it's a half-nut, you're out of luck, the LCD cannot be removed. If you're lucky enough to have a full-nut, you can desolder the LCD and remove for cleaning.

? There are no LEDs on a 41C

*Message #3 Posted by **Mike** on 10 Aug 2003, 9:01 p.m.,*
in response to message #1 by Terry

The 41C has an LCD display. http://www.msdsite.com/images/smile.gif

Huh?

*Message #4 Posted by **Randy Sloyer** on 10 Aug 2003, 9:18 p.m.,*
in response to message #3 by Mike

I thought it was a "Luminosity Echo Device"

Re: ? There are no LEDs on a 41C

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 10 Aug 2003, 9:29 p.m.,*
in response to message #3 by Mike

I replaced all LED occurrencies for LCD and it fit fine. (in the text, of course)

Luiz (Brazil)

Edited: 10 Aug 2003, 10:49 p.m.

yeah but there should be

*Message #6 Posted by **Norm** on 11 Aug 2003, 4:09 p.m.,*
in response to message #3 by Mike

yeah but there should be LED's, for a 41C display.

Wanted: Hp Xpander connectivity cable schematic

*Message #1 Posted by **Sean McNamee** on 10 Aug 2003, 8:02 p.m.*

Hi all - Bought an Xpander without connnectivity parts (cable or CD). I'd like to u/l some WinCE software to it - can someone post the cable schematic? Or perhaps point me to somehwere this info might be on the web already? Also, what software would I need on the PC side? I assume that something can be substituted for whatever came with the XPander originally.... Many thanks.

Special Cable

*Message #2 Posted by **Mike** on 10 Aug 2003, 8:52 p.m.,*
in response to message #1 by Sean McNamee

I believe the cable is special and may contain electronics in the 9 pin plug end.

There is a warning in the manual that it's a special designed 9 pin plug for HP. One end is a 9 pin female. The other end is a phone plug.

I buzzed the cable and only one pin makes continuity to the 9 pin connector (see photo). I checked both polarities, for diodes, and still no continuity. That leads me to believe there is electronics in the 9 pin end.

http://www.msdsite.com/hpcalcs/xpander/iox.jpg

Edited: 10 Aug 2003, 8:53 p.m.

Re: Special Cable

*Message #3 Posted by **Colin** on 10 Aug 2003, 11:10 p.m.,*
in response to message #2 by Mike

There is an RS232 level converter in the housing of the DB9 connector. 3V logic at the Xpander connection. Only RX, TX and GND are present. Don't ask me which one because I just cannot remember.

Re: Special Cable - RS232 level converters

*Message #4 Posted by **Bill Wiese** on 11 Aug 2003, 12:56 p.m.,*
in response to message #3 by Colin

Yep, the cable has some level RS232<==>5V logic level converters in it.

You can do this with a couple of transistors & resistors & caps or do it right w/a chip.

A typical & common chip used for this task is the Maxim MAX232. I believe there is a successor called the MAX2232. Other variations (...233, etc.) also exist. These are 'low power' chips.

The cable's electronics is likely powered from the RS232 connector. Sounds like it's just using TxD, RxD and Gnd (pins 1,2,3,7, IIRC, on a DB25 - dunno about DB9) and picking up power from another

signal line like CTS, DTR, etc.... The PC application software may have to switch one of these control lines from default state to power up the electronics in the cable head.

15C: Original Packaging or Repackaged

*Message #1 Posted by **Mike** on 10 Aug 2003, 3:37 p.m.*

There is an auction running that is advertized as never opened. But the packaging does not look like original HP packaging, that I've seen.

Did HP ever shrinkwrap the calculator to the manual? I have seen original 15C Manuals that were shrinkwrapped seperate from the 15C.

I wonder is this is repackaging?

Repackaged or Original

If it is repackaging, who knows what is really inside the case.

Re: 15C: Original Packaging or Repackaged

*Message #2 Posted by **Raymond Del Tondo** on 10 Aug 2003, 7:47 p.m.,*
in response to message #1 by Mike

Hi,

when I bought my first new 11C in the early eighties, it was in a pink air 'bubble' sleeve. The manual was wrapped separately. The retail box had the old graphic design with the symbolized technical construction platform, in other words the four squares;-)

In those years I saw many new 11C's and 15C's, and all were packed like mine.

Maybe the newer 15C's were packaged in a different way, and HP omitted the sleeve, because it better fitted into the box that way (the 15C manual has more pages than the 11C manual), and it could save cost.

It's hard to tell if this is original packaging. The page cut of the manual and the edge of the calc seems to be clean. Too bad the seller didn't include some more pictures which could show the manual front side, and parts of the side case of the calc.

However, let's see what the buyer will make with this expensive item. If he/she doesn't open the plastic, he/she will never know if the item is just a dummy.

Otherwise if opened, the 'never opened' price bonus will go away. Very difficult decision;-)

Raymond

a fake, quick & dirty repackaging...

*Message #3 Posted by **Emmanuel Verbeeck** on 11 Aug 2003, 2:01 a.m.,*
in response to message #1 by Mike

... as you often find on eBay.

It's very easy to go to a bookshop (or any other shop with this equipment) and ask to have a manual + a calculator shrink-wrapped. There are cheap devices can can shrink-wrap second-hand videotapes, cd or dvd cases, books, magazines with a bonus cd, etc...

IMHO HP never packaged items like this (it looks like a very very cheap method, and during the glorious HP days it was absolutely not their corporate culture).

And it works : $686 for a calculator that was bought without even seeing a picture of it !!! Gullible people ar e amazing.

Maybe well, maybe not...

*Message #4 Posted by **Thibaut.be** on 11 Aug 2003, 3:44 a.m.,*
in response to message #3 by Emmanuel Verbeeck

When I bought my 1st 15C in 84, the manual was indedd shrinkwrapped.

I also bought a 12C solutions handbook for Father's day and it was also shrinkwrapped.

Nevertheless this one does not seem original...

Sure manuals are shrinkwrapped

*Message #5 Posted by **Mike** on 11 Aug 2003, 11:02 a.m.,*
in response to message #4 by Thibaut.be

But was the calculator shrinkwrapped to the manual?

I have seen many manuals shrinkwrapped but never a calculator shrinkwrapped to the manual. Bookstores might shrinkwrap a return like this.

However, the seller does say this was given to his father, by HP, so it might be special packaging. If he has first hand knowledge that it has never been open, then it's probably mint.

Edited: 11 Aug 2003, 11:05 a.m.

Re: 15C: Original Packaging or Repackaged

*Message #6 Posted by **Fred** on 11 Aug 2003, 4:14 a.m.,*
in response to message #1 by Mike

I think it's TRUE.

The seller said : "the plastic wrapping around the calculator and manual HAS NEVER BEEN OPENED"

The seller does not say : "this is the orignial packaging"

!!!!!!!!!

Yes indeed, they did

*Message #7 Posted by **Casey** on 11 Aug 2003, 7:43 a.m.,*
in response to message #1 by Mike

I've owned 4 NIB voyagers that had the calc shrinkwrapped with the manual. All new, all original. But whether this auction claim is legit, is anyone's guess

I sold the 15C. It is indeed originally packaged.

*Message #8 Posted by **Chris Gardner** on 11 Aug 2003, 11:06 a.m.,*
in response to message #1 by Mike

Thank you to Renato for bringing this discussion to my attention. As I said briefly in my Ebay listing, when HP stopped making the 15C, they pulled them out of stores and gave them free to their employees. My father was one of those employees. At the time, they gave him 3 or 4 15Cs and he gave most of them away to friends and family as gifts. He also had 1 or 2 15Cs that he used himself. He nor I never had any reason to "repackage" it. In fact, I just found this one 2 weeks ago while cleaning up the house and I was going to give it away as well...that was until I saw what they were going for on Ebay, so I decided to sell it. I am as amazed as you are that someone was willing to pay so much for an old calculator, but it is definately authentic. Nobody in my family (including me) had any idea of its value...we probably would have eventaully given it away, thrown it away, or sold it at a garage sale for $5. It is just an old calculator taking up space to us.

I do have some more pictures if any of you would like me to email them to you. I just didn't provide them on Ebay because I'm not a very good photographer and they didn't come out.

As for peoples' comments about how their 15C was wrapped, I think it is entirely likely that HP changed the box and wrapping during the years they were selling it. In fact, just looking around on the Internet for 5 minutes has shown that there are a few different boxes. Just go to www.hp-collection.org/Rechner/hp-15c.htm Mine looks like the box on the right. However, it is not exactly the same - the description on mine is slightly different. Also, notice that the manual in that picture is bound rather than punched and bound with wire like mine - an obvious move towards cheaper packaging and materials in my calculator. There is no way it would ever fit in the box if it was anything other than shrink-wrapped to the manual...the box is not very big. I know my father would not have cared enough to rewrap it because he had so many of these things...and he could probably get more from work whenever he wanted.

Finally, you're right Raymond, it was a difficult to choose whether or not to open the item. Not because I'm worried it is a "dummy," but just to see if it works. I decided to leave it wrapped because these are very high quality calculators...I'm sure it is fine.

Thank you all for a very interesting and unexpected conversation. I would have never thought that they way an old calculator is wrapped would spark such a lively debate.

P.S. The manual is shrinkwrapped separately from the calculator, and then the whole thing was wrapped again with the calculator

Edited: 11 Aug 2003, 11:55 a.m.

Re: I sold the 15C. It is indeed originally packaged.

*Message #9 Posted by **Renato** on 11 Aug 2003, 2:11 p.m.,*
in response to message #8 by Chris Gardner

Chris, I´m happy that I emailed you, and with your reply. In my opinion you were very lucky with the price you got for the calculator, and you deserved it. I am also happy that your father, a HP employee of the old times, left such a nice surprise to his family. Here in Brazil, yesterday we had Father´s day.

Now you know what to do with any old HP itens you may find laying around the house -including books, manuals, magazines - ANYTHING.

Best regards, Renato

Re: I sold the 15C. It is indeed originally packaged.

*Message #10 Posted by **David Smith** on 11 Aug 2003, 2:19 p.m.,*
in response to message #8 by Chris Gardner

I suspect that it was an machine returned or recalled to HP. The original packaging for the machines was a pink anitistatic foam or bubble pack bag. A lot of HP return items were repacked by shrink wrapping them together (usually with a piece of cardboard backing). I have several HP65 and HP67 software pacs that were done this way. They were part of a special promotion that HP did for cleaning out a bunch of returned items.

:o)

Try to "find" [(SIGMA)-] in an HP48S/SX...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 10 Aug 2003, 3:50 p.m.,*
in response to message #1 by hugh

Hi, Hugh;

Maybe I'm actually playing silliness, but I'd like to "hear" from others, if applicable.

When I had the chance to use an HP48SX, I tried its statistic resources and I got myself stuck: where was the [(SIGMA)-]] key/function? As it deals with lists instead of final summations (all RPL's do this way), I thought I should remove the last entry in another way, so [(SIGMA)-] did not exist.

Later, after a careful reading, I "found" it: HP48 Owner's Manual, 3rd. Edition, single volume (big brochure), p. 21-4. There you read:

```
1 - Press [left-shift][(SIGMA)+] (the (SIGMA)- command) in the STAT menu to delete
the last data point.
```

You can't see it, it's not in the keyboard, but it exists. Far worst than finding [y^x] in the HP41's kbd...

My 2¢.

Luiz (Brazil)

12c/12c Platinum programming differences

*Message #1 Posted by **Don Shepherd** on 9 Aug 2003, 8:31 p.m.*

I was wondering if anyone who has bought the new Platinum 12c has noticed if programming is any different. Specifically, since the original 12c used up all 256 possible combinations for an 8-bit command, and the Platinum has some new keys (x^2, =, ALG, RPN), how are these accomodated? Come to think of it, with GTO 000 to GTO 399 taking up 400 combinations, and an 8 bit command allowing only 256, did they maybe take a new approach and have the GTO command take 2 bytes now?

Has anyone checked this out?

thanks, Don Shepherd Louisville, KY

Re: 12c/12c Platinum programming differences

*Message #2 Posted by **tony** on 10 Aug 2003, 2:13 a.m.,*
in response to message #1 by Don Shepherd

Don, programming is the same, using RPN. In my unit i cannot go over 253 lines though as then any earlier GTO cease to work.

Re: 12c/12c Platinum programming differences

*Message #3 Posted by **Don Shepherd** on 10 Aug 2003, 3:44 a.m.,*
in response to message #2 by tony

Thanks Tony. Based on your experience, it sounds like they goofed up the GTO command implementation. What good are 400 steps if you can't use them?

Don Shephed

It does show a lack of testing

*Message #4 Posted by **Gene** on 10 Aug 2003, 8:26 a.m.,*
in response to message #3 by Don Shepherd

A good period of beta testing using people who really know what they're doing would have caught the GOTO problem.

FYI...I was a beta tester of sorts, but only got the unit about 6 weeks before it was sold on retail. That won't work, HP. Beta testing has to be early enough where you can fix things they find!

Re: 12c/12c Platinum programming differences

*Message #5 Posted by **Karl Schneider** on 11 Aug 2003, 1:53 a.m.,*
in response to message #3 by Don Shepherd

Don wrote:

> Quote:

I have a "classic" 12C (Singapore 1993), and find its programming capabilities suitable for little more than short, disposable routines. Its "GTO" goes to line numbers only, in the style of old BASIC -- no "GSB"/"XEQ" for execution of subroutines identified by a "LBL" (statement label/routine name). There is no capability to edit programs by inserting or deleting individual instructions.

If the 12C Platinum works the same way, perhaps a better question is, "What good is 400 steps of programming under this paradigm?"

Re: 12c/12c Platinum programming differences

*Message #6 Posted by **bill platt** on 11 Aug 2003, 9:54 a.m.,*
in response to message #5 by Karl Schneider

Or further,

why did HP use such a crippled version of RPN in the 12c in the first place? Does somebody have any clues to this? Did the built-in financial routines just take up too much space?

Perhaps another way to answer this would be to see how much space it would take on a 15c to implement all of the 12c financial routines. Perhaps it would not even fit on an 11c, or even a 15-c?

regards,

Bill

Re: 12c/12c Platinum programming differences

*Message #7 Posted by **Gene** on 11 Aug 2003, 10:11 a.m.,*
in response to message #6 by bill platt

It's not a crippled version of RPN per se but of RPN programming.

I thought all op codes were used in the 12c. If so, then there was no room for LBL, RTN, GSB, etc.

No excuse in the 12c plat however.

It is normally much too painful to write anything really useful on the 12c for me to do so.

I know that Valentin has done wonders, but I dont' have the patience any more to write things on feature-starved calculators when they should have more instructions.

My 2 cents. Gene

Pioneer Display

*Message #1 Posted by **gifron** on 9 Aug 2003, 4:24 p.m.*

Are Pioneer displays interchangeable? I suspect they are, but don't know. If so, can they be gotten at from the front by removing the bezel, as opposed to opening the case by breaking the stakes? As you can tell, I've never worked on one of these.

Pioneer LCD Matrix

*Message #2 Posted by **Randy Sloyer** on 9 Aug 2003, 5:25 p.m.,*
in response to message #1 by gifron

Removing the bezel is sure fire looser deal. Don't do it under any circumstances. You'll only have a bent bezel to show for your efforts as LCD's can only be removed from the back after the logic board is off. Flat bezel models with the clear window presents another problem as you cannot push on the front of the LCD to get the stick-um to release. Be sure to use some UN-DO on windowed units or you'll crack the LCD.

It's always best to leave the zebras attached as it helps center the LCD in the frame. The 17/27/42 LCD's are VERY sensitive to alignment in both directions. You'll have approximately 1 MM (0.040") clearance on all sides when aligned properly.

The interchangeables:

- 10B = 20S = 21S
- 14B = 22S = 32S
- 17B = 17Bii = 27S = 42S

The only single:

- 32Sii

Let me know if you have a specific model request as there is some weirdness with the 14B/22S/32S interchangeability as the stepped bezel version can be different than the original with the window.

HP32SII - Keypad Labels

*Message #1 Posted by **Tony** on 8 Aug 2003, 9:59 p.m.*

Can anyone tell me for sure why HP changed the colors of the HP32SII key labels from yellow/blue to green/mauve in the last model they manufactured. Was this an economic decision or what? - everyone I know seems to hate the new model because they changed colors from blue/yellow.

The contrast on the green/mauve design is pretty poor compared to the tradional blue/yellow setup they've had on their various other machines since the HP25 era (eg HP33E etc). My theory is that were trying to save money and they used green and mauve because it was cheaper - hence the reason why they also dropped the brown painted LCD surround and left it as silver - saves on brown paint and hence saves on money.

I guess only HP themselves can supply the true reason but it was a pretty poor management decision to change the colors after all those years of blue/yellow production models.

I also reckon the top painted shift keys look pretty ordinary compared to the all color keys they had on the HP25, HP33E etc - HP should go back to all color keys again including all white/cream keys for the number keys & the plus/subtract/multiply/divide keys. You compare the keypad on the HP33E with that of the HP32SII and you'll see instantly what I mean.

At least TI still makes the effort for all color keys on their TI-83 and in various colors too - the keypad on the TI83 is very pleasing - keys moulded in black, grey, blue, yellow, green - not painted on the top like HP. Unfortunately the TI doean't have CLICK-STOP.

Re: HP32SII - Keypad Labels

*Message #2 Posted by **Trent Moseley** on 8 Aug 2003, 11:10 p.m.,*
in response to message #1 by Tony

Tony,

My HP25 has two function keys, "f" yellow and "g" blue. On the other hand the HP32SII the function keys are ORANGE (not yellow) and blue with the bent arrows.

tm

Re: HP32SII - Keypad Labels

*Message #3 Posted by **Randy Sloyer** on 8 Aug 2003, 11:57 p.m.,*
in response to message #2 by Trent Moseley

IMO, it had absolutely nothing to do with cost. This silver color is ink, not bare metal, so the cost between the two should be the same. Each scheme had four different inks used in the printing process.

It had everything to do with change for change sake by the marketing department. The HP fashion police wanted to compete with TI, the old brown looked dated. It was OLD HP. This is the NEW HP. The teal and purple colors where the same as used on the 48G series, they just applied it to a black background.

You know, black, the new designer color awhile back. The fad that lasted for about a year with a appliances until people realized it showed every last finger print.

It wasn't just the 32Sii, the black scheme also appeared on the 10B, 17Bii and 20S before they shut down the Pioneer line in Indonesia. It was not about cost and certainly not about usability, but about appearances.

Then came the red and blue keys of the 49G on a light blue background. Beginning to see the pattern here?

Edited: 8 Aug 2003, 11:59 p.m.

Re: HP32SII - Keypad Labels

*Message #4 Posted by **Pierre Brial** on 9 Aug 2003, 1:23 a.m.,*
in response to message #3 by Randy Sloyer

I agree with Randy. I think this change of color is only for aesthetical and fashion reason. At first sight, I find the 32SII "Silver bezel" nicest than the old one. But one don't speak about usability here... Pierre

Don't forget the 19BII!

*Message #5 Posted by **Scuba Diver** on 10 Aug 2003, 12:34 a.m.,*
in response to message #3 by Randy Sloyer

As an aside, the 19BII case colour also changed from brown to black when they launched the redesigned battery cover.

The colour of the keys also changed from grey to black. AFAIK, however, the LCD remained the same.

B.

Re: HP32SII - Keypad Labels

*Message #6 Posted by **Graham Wilson** on 9 Aug 2003, 2:05 a.m.,*
in response to message #1 by Tony

I think the change had something to do with the change from light brownish LCDs to later more grey LCDs. 17BIIs for example made up until about 1997 or so have the lighter brown LCDs with yellow markings on a dark brown case. Later 17BIIs have a LCD with darker activated segments and have corresponding black cases with yellow markings.

I think the earlier 48SXs had less-contrasted brownish LCDs whereas the 48GXs (not the latest with the black/grey screen) have darker, more greeny-blue LCDs. Hence the 48SX has a brown case and blue and orange markings to blend with their LCDs, and the 48GX has a grey case and turquoise and lilac markings to blend with their greeny-blue (and post 2000 black-grey) LCDs.

The contrast between 32SIIs is not as obvious as the other two, but you can see that earlier models have more brown LCDs.

I've not seen this explanation as a reason for the colour change -- it's just my opinion based on my observations.

Re: HP32SII - Keypad Labels

*Message #7 Posted by **Raymond Del Tondo** on 9 Aug 2003, 4:15 a.m.,*
in response to message #6 by Graham Wilson

Hi,

the HP-48SX doesn't have a brownish LCD. Instead, it is blue with extremely bad contrast. And when the machine is off, I think the LCD more tends to green.

Raymond

Pioneer and 48 LCD differences

*Message #8 Posted by **Randy Sloyer** on 9 Aug 2003, 1:53 p.m.,*
in response to message #6 by Graham Wilson

The color of the Pioneer LCD polarizers never changed. They are all a neutral gray. It's an illusion due to the change in surrounding colors. I've got a pile of broken ones here that says so. There are major differences in the display timing and resultant contrast of the LCD's on the 32Sii and 17Bii. You can't compare apples and oranges.

The 48 series did change for not so obvious reasons. The original 48S/SX and early G LCD's were simply larger versions of the Pioneer displays. They did go to a light blue polarizer for unknown reasons with the resultant lousy contrast. The LCD's have silver reflector on the back of the LCD, but it is not totally opaque. After the 48 machines started getting replaced under warranty, they found one of the high rates of failure was LCD breakage. In order to strengthen the LCD, the HP engineers designed a molded black plastic plate that attached to the back of the LCD with thin double sided tape. This gave the glass some support and distributed the load for a non-sharp impact. This also changed the light transmission due to the reflector now being backed up with an opaque material. Since the contrast was also a problem and the reflective characteristics had changed, it was time for a polarizer change. They did add some green to the blue as we all know. While the reinforced LCD's are better and less prone to breakage, it still happens.

With the advent of the 39 and 49, they went back to a gray polarizer and put the LCD behind an acrylic lens to totally prevent breakage. That just created a new set of problems. Maybe the 39/49 team maybe didn't know about how hard it was to read an LCD through a secondary clear, reflective lens. Just ask anybody with an older Pioneer (17B/32S/42S) with the clear lens in front of the LCD. And then there is the issue of the softness of the material. Maybe it was just to make them look more like a TI. I certainly don't know for sure.

PS: Just a thought on 48 LCD swaps. Should you ever find yourself swapping a newer, reinforced LCD for an older non-reinforced, make sure you use the zebra strips from the new one - they are 0.015" thicker to accommodate the thicker LCD.

Re: Pioneer and 48 LCD differences (spell checked)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 9 Aug 2003, 3:17 p.m.,*
in response to message #8 by Randy Sloyer

Hi Randy, folks;

About protective lenses: I think the best ones are those used in Voyagers and in the HP71B (does the HP75 also have it?). Voyager's and HP71B's lenses are perfect! They have such a high degree of transparency that they do not interfere. And you are also correct: I have an older HP42S (deceased) that has the protective lens: it is not as good as the one found in Voyagers and HP71B's. I noticed that Voyager's lenses have a thin coat that seems to be the "trick": once it is removed by any reason, the protective lens seems to be as reflexive as regular protection. Is it some sort of silicon-based film? Looks like a thin silicon plaque.

Luiz (Brazil)

Re: Pioneer and 48 LCD differences

*Message #10 Posted by **Randy Sloyer** on 9 Aug 2003, 5:30 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

On Voyagers, it's a thin film metallization anti-reflective coating that will wear off over time. It will also come off when trying to polish scratches out of the lens. You can certainly tell the difference side by side when the coating is missing.

HP-97 Card Reader - Reads but won't Write (Photos)

*Message #1 Posted by **Mike** on 8 Aug 2003, 3:33 p.m.*

Problem: You have an HP-97 that will read cards just fine. But you get an **Error** whenever you try to write to a card.

Well, I have had two, just today, that had this problem. Both had the same fix.

I've decided to document the solution to the ones I just repaired. There may be problems with similar symptoms, for which this fix will not work.

Solution: the card switch needed adjustment. But which contact? The photo below shows the specific contact that I found, in both cases, to not be making contact.

http://www.msdsite.com/hpcalcs/hp97/cr-swx.jpg

Adjustment: If you look at the reader on edge, as shown in the photo, and slide a card in from the right, you can see the switches rise to make contact with the PCB (which is now out of the way). The closest switch was not rising high enough to make contact. It should rise above the surfaces shown in the photo below.

http://www.msdsite.com/hpcalcs/hp97/cr-edgex.jpg

You can adjust the switch adjustment screw and watch the switch rise high enough to contact the PCB. Make sure that the switch drops down far enough when you remove the card.

This has been the fix to problems I have seen with HP-97 card readers that will read ok but won't write.

Hope this helps some of you out there that have seen this problem.

Meeting V

*Message #1 Posted by **Matthias Wehrli** on 8 Aug 2003, 2:15 p.m.*

Hi Volks!

Here the latest news for our meeting in Basel (CH) on september 20:

1. Members: Until now, I know, that the following persons will join us:

Thibaut Cousin (BE) Emmanuel Compes (F) Jean-Francios Garnier (F) Matthias Wehrli (CH) Daniel Diggelmann (CH) Klaus Bussinger (CH) Christoph Giesselink (I don't have your email!) Raymond Del Tondo (DE) Christoph Klug (DE) Massimo Gnerucci (I) (I don't have your email!) Ángel Martin (?)

2. Programm: My personal whis is to meet some other collectors, programmers, ... and to talk to them. I will have 1-2 side activities if desired, but I will not “plan” this day. Just let us join and enjoy.

Let us fix a time... 10 am. We meet on my personal appartment:

Matthias Wehrli Bettenstrasse 53a CH-4123 Allschwil (1km away from Basel)

Emmanuel will offer one of the following workshops, if desired:

- burning Eproms for HP-41 Eprom Box and HP-71 HHP Eprom module - building a 4K Eprom box for HP-41 - transfering data from/to HP-41 to/from PC

If you also want to offer a workshop, please contact me (room, reservation, material) and the forum.

3. overnight stay: There are different possibilities:

- hotel in the area of Basel: double room with shower and toilett arround €100 - youth hostel in Basel: arround €20 (not checked the price)

Please have a look at the internet (Google “hotel Basel”). I can not arrange overnight stays for everybody... (I also have a normal job to do aside of my collection..)

So, I hope I don’t have forget too much....

Matthias

*Message #4 Posted by **Thibaut.be** on 10 Aug 2003, 9:54 a.m.,*
in response to message #3 by Emmanuel, France

If needed, I do have here a old 486 with plenty of Isa slots. Matthias should provide Swiss A/C cords, I know by experience than French/German.Belgian ones don't fit over there (too thick)

Re: Meeting V

*Message #5 Posted by **Ángel Martin** on 10 Aug 2003, 7:07 a.m.,*
in response to message #1 by Matthias Wehrli

Matthias,

Great plans. I´d also like to have a discussion or workshop on HEPAX vs. RAMBOX. Anybody else interested?

I have compiled a collection of mcode routines into a 4k page (project SANDBOX), and would be nice to share it with all of you if you cared.

Best wishes, Ángel Martin

Re: Meeting V

*Message #6 Posted by **Meindert Kuipers** on 15 Aug 2003, 4:06 a.m.,*
in response to message #1 by Matthias Wehrli

All,

I would really like to come to Basel, but this is not possible for me at that date. Maybe next time?

Meindert

Re: Meeting V

*Message #7 Posted by **Museum** on 16 Aug 2003, 1:27 a.m.,*

in response to message #6 by Meindert Kuipers

We both will arrange a meeting for ourself, so that we meet us one day...

Greetings Matthias

Re: Meeting V

*Message #8 Posted by **Christoph Klug** on 18 Aug 2003, 5:50 a.m.,*
in response to message #1 by Matthias Wehrli

I hope to come with Reimund Del Torno :-) because we have nearly the same way (from Hannover and Hildesheim) to Basel.

I want to present some interface hardware (I/O-Board, IL2000, second generation HP-IL/PC Card), and a nice interrupt circuit (external power on) for HP41.

Furthermore I take the exotic AEC-Rom to the meeting. Hope Emmanuel disassemble this 12KByte bankswitched rom during the meeting for use with EMU41...

Best wishes - Christoph

computation challenge

*Message #1 Posted by **hugh steers** on 8 Aug 2003, 1:39 p.m.*

here's one that i thought would be easy.

a lot of people know that 1+1/2+1/3+1/4+1/5 diverges and that 1+1/2^2+1/3^2+1/4^2+... converges to pi^2/6 in fact, and there are simpleish formulas for the limit sums of 1/n^(2k), ie even powers. but no one knows if there are easy formulae for odd powers.

lets look at the most simple case, cubes. write a program to find the limit sum of 1+1/2^3+1/3^3+1/4^3+... if you're really smart, try other odd powers.

thinking this was a five minute job, i wrote a simple loop to do the obvious adding, but after some 600 iterations (some time on a hp41c) it had only managed 5 decimal places. can you do 10?

Re: computation challenge

*Message #2 Posted by **Dave Shaffer** on 9 Aug 2003, 4:52 p.m.,*
in response to message #1 by hugh steers

Hugh,

It's gonna take a lot of terms until you get the value to the tenth decimal place (for the cube). A quickie Fortran program on my PC indicates that you'll need somewhere between 50,000 and 100,000 terms until there is no more change in the tenth place, and you'll need almost 250k terms if you are worried about round-off (i.e. at 250k terms, the eleventh and beyond digits indicate you need to round up by one in the tenth place). However, I'm not sure the calculator has enough precision - you need 11 digits: the answer is 1.202 056 903 15 (to 11 decimal places).

I don't know for sure how the '41 calculates powers, but I suspect you can increase your speed by multiplying 1/n three times rather than taking the third power. On the PC (in Lahey fortran), multiplying was about three times faster than taking the third power of 1/n .

I hate to make your calculator seem like a slowpoke, but on a modest PC (a 200 MHz pentium pro, accelerated to 333 MHz), summing 10 million terms (using multiplication and not exponentiation) takes about 2.5 seconds with an old (10+ years) Lahey Fortran compiler, using double precision.

Re: computation challenge

<just kidding mode> Yes, Pentium is fast. If only it were accurate... </just kidding mode>

Just reasoning...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Aug 2003, 7:00 p.m.,*

in response to message #2 by Dave Shaffer

I am always trying to improve my own knowledge (and skills, if possible) when we're dealing with subjects like this one.

I don't know what sort of method you use in your program to compute how many terms are needed till the tenth digit does not change. I'm curious because the HP41 uses 12-digit internal precision and 10-digit mantissa results. I know it's not necessary to relate one thing to another, but you mentioned you used a double-precision compiler to compute a 10-million terms summation in 2.5 seconds, right?

I'm afraid you'll think my question is irrelevant, but I'm curious: does your 50,000 to 100,000 estimation take 12-digit to 10-digit rounding after each loop or it is based on FORTRAN's double precision? Maybe it's based in another approach, I don't know.

I'm curious because after reading the *HP15C Advanced Functions Handbook* and understanding that internal limits may also not change external results, I always try to understand the rounding consequences of series computations, like the one we're talking about here.

Please, I'm not asking you to explain your conclusions, I just want to know how did you get to them. I think they are clever and understanding, and if they can be expanded to systems with different digit numbers (like Pioneers and the RPL models), maybe we can significantly reduce computation time based on the difference achieved between terms instead of wait till they are steady.

Thank you.

Luiz (Brazil)

Re: Just reasoning...

*Message #5 Posted by **hugh** on 10 Aug 2003, 10:25 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

hi guys,

dave is right. you need too many terms to sum the series directly. this is what i had discovered in my "5 minutes" answer.

so a viable solution involves some kind of series acceleration. one discovery is that a series of the alternating terms (ie 1-1/2^3+1/3^3-1/4^3+...) converges faster.

let z(s) = 1+1/2^s+1/3^s+1/4^s+... we'd like, at first, z(3). now z(s) = (1-1/2^3+1/3^3-1/4^3+...)/(1-2^(1-s))

this is better. i get a good answer in around 2000 terms. but still way too many for the 41c.

there are further accelations possible. here is my new program to compute z(s).

Re: Just reasoning...

*Message #6 Posted by **Dave Shaffer** on 10 Aug 2003, 7:18 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz,

Here is my fortran program (with proper line breaks, I hope!):

```
      PROGRAM POWERSUM
C
C  CALCULATES SUM OF POWERS OF RECIPROCAL INTEGERS
C
      IMPLICIT REAL*8 (A-H,O-Z)
C
C  DO A LOT OF NUMBERS TO GET TIMING
C   TRY IT TWO WAYS - MULTIPLY & EPONENTIATION
C
      SUM = 0D0
      DO 100 N = 1,10000000
      X = 1D0/DFLOAT(N)
C
C  RUN IT ONE WAY OR THE OTHER, BY MOVING THE COMMENT
C
      SUM = SUM + X*X*X
C     SUM = SUM + X^3
C     IF(MOD(N,50000) .EQ. 0) WRITE (*,2000) N,SUM
  100 CONTINUE
      write (*,2000) n,sum
 2000 FORMAT(I9,F25.16)
      END
```

Nothing fancy. The line (commented out here, because I was doing the timing tests) just before the CONTINUE statement gives me the value after every 50,000 terms. I was NOT rounding off; just summing the results to the precision of the compiler/computer.

I just looked at those values to make my statement that it was between 50k and 100k terms that the sum settled down in the tenth decimal place. (I was too lazy to try to find exactly how many terms were needed!) It was looking at the printout that also indicated that somewhere around 200k-250k terms, the tenth decimal place should be rounded up (IF you were interested in only the "correct" properly rounded-off value to ten decimal places).

Double precision fortran should be good to 15 or 16 significant figures - plenty enough for this test. If amybody cares, there is quadruple precision, too, I think.

This doesn't offer much insight into HP calculator precision or round-off. Conversely, if you can define the algorithm that the calculator uses, it would be easy to check it this way.

In any case, Hugh's solution with alternating terms is far more elegant!

Re: Just reasoning...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 10 Aug 2003, 8:01 p.m.,*
in response to message #6 by Dave Shaffer

Hello, Dave;

thank you very much twice: allowing me to remember FORTRAN and showing me (us) the listing. About fanciness: I like to see programs that run, like yours; it's fancy enough for me.

I did not dedicate enough time to understand FORTRAN in deep, because I learnt it enough to accomplish all tasks related to the language at the university (1979 & 1980). But I want to know if it is possible to add a small modification at this line:

```
      X = 1D0/DFLOAT(N)
```

such that **1D0/DFLOAT(N)** is rounded to ten significant digits. Is it easy to do, if possible? I think that, given that specific rounding propagation errors do not occur so often, rounding a 16-digit mantissa or a 12-digit mantissa to ten places will give closer but equal approximated results. I thought about writing a program in PASCAL, but I see that yours is ready and we can, at least, see

if rounding to ten decimal places will reduce the number of cycles.

If you think it's worth doing and you have the time to (on Sunday...), I'd just like to know what happens.

Thanks again, Dave. It's been enlightening, though.

Luiz (Brazil)

Edited: 10 Aug 2003, 8:04 p.m.

Re: Just reasoning...

*Message #8 Posted by **Dave Shaffer** on 11 Aug 2003, 12:47 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz,

I don't recall a truncation or rounding function in fortran, but it is fairly easy to accomplish.

After the statment X = 1D0/DFLOAT(N) , you would multiply X by 1e10 (where 10 is the number of decimal places you want), then set the floating point value equal to an integer, and then refloat the integer and divide by 1e10.

Because IX = X truncates the value in X, for proper rounding you should add 0.5 to X before integerizing it. (You have to be a bit careful about the sign of X, because setting the floating point value equal to an integer TRUNCATES the floating point number, causing a rounding in the wrong direction for a negative value. You can use the SIGN and ABS functions to take care of the general case.)

Thus a few steps after X = 1D0/DFLOAT(N) that go like this:

(I omit FLOAT and INT operations, which are often inserted automatically by the compiler, although it is good practice to do it yourself, so you KNOW what is happening.)

```
X = X * 1E10
  IX = X + 0.5
  X = IX/1E10
```

will round X off to 10 decimal places. You need to worry about the overall precision of fortran. You'd probably want to use double precision integers! A regular integer (4 byte) has about 9 or 10 digits of precision (2^31 or thereabouts, you need a bit for the sign - although "twos-complement" style numbers may give this bit back). I never worried to much about that. Astronomers seldom do anything that needs so much precision! The joke is that we worry about significant figures IN THE EXPONENT!

Doing this could falsely indicate how fast a sum converges - you'd be throwing away higher order digits that otherwise add up. However, it should show what a calculator would do.

Re: computation challenge

*Message #9 Posted by **Rodger Rosenbaum** on 16 Aug 2003, 6:34 a.m.,*
in response to message #2 by Dave Shaffer

The value of the limit to 36 digits after the decimal is:

1.202 056 903 159 594 285 399 738 161 511 449 990 ^ The 11th digit | after the decimal point should be

rounded up to 6, if what we want is a result correct to 11 digits after the decimal point.

Summing 329894 terms gives:

1.202 056 903 154 999 980 070

Summing 329895 terms gives:

1.202 056 903 155 000 007 923

So, we would have to sum 329895 terms to get a correctly rounded result to 11 digits after the decimal point.

Isn't this fun?!! Thanks to Mathematica for all these results.

Re: computation challenge

*Message #10 Posted by **Tizedes Csaba** on 10 Aug 2003, 5:30 p.m.,*
in response to message #1 by hugh steers

Hello!

You can approximate the minimal numbers of terms: Nmin=ceil((1e10)^(1/3))=2155. But this serie is not alternate, the numbers of terms you must to add is N=70711. (with MAPLE7)

If you want more precision, begin the summation with 1/70711^3, then decrease the number in the denominator.

Csaba

Hmm... It is suspicious...

*Message #11 Posted by **Tizedes Csaba** on 10 Aug 2003, 5:58 p.m.,*
in response to message #10 by Tizedes Csaba

70711... Its suspicious... I try it with some numbers...

Yes! The numbers of terms you must to add is N=1/SQRT(2*eps), where eps is the desirable precision.

Cs.

Re: Hmm... It is suspicious...

*Message #12 Posted by **hugh** on 11 Aug 2003, 6:50 a.m.,*
in response to message #11 by Tizedes Csaba

thats remarkable. you do indeed get 70711 with that calculation.

the program i wrote was based on further series acceleration. various techniques here, http://numbers.computation.free.fr/Constants/Miscellaneous/seriesacceleration.html

so that the number of terms for eps is given by -log((1-2^(1-s))*eps)/log(8). which for eps=1e-10, rounds up to 12. in fact i use 10 in the program which happens to be enough.

I was played with this in MAPLE

*Message #13 Posted by **Tizedes Csaba** on 11 Aug 2003, 12:40 p.m.,*
in response to message #12 by hugh

Try it in MAPLE, and play with 'n':

```
restart;with(plots):
Digits:=20;
a:=sum(1/x^3,x=1..infinity);
b:=sum(1/x^3,x=1..n);
d:=a-b;
n:=424;evalf(d);
```

And if you plot 'd' in loglog plot, you'll see an linear function:

```
loglogplot(evalf(d),n=1..100000);
```

The equation of linear function is:

```
log(N)=-1/2*log(2)-1/2*log(eps), where base of 'log'-s are anything.
```

('d' are equal 'eps')

(I know, its not a very elegant solution, I just use it for a fast 'research'...)

Csaba

in response to message #1 by David L. Taylor

Initial investment $10000 Cash Flows: Year 1 $5000 Year 2 $4000 Year 3 $3000

Clear the financial registers.

10000 CHS g CFo 5000 g CFj 4000 g CFj 3000 g CFj

f IRR

10.65%

Re: HP12C - Internal Rate of Return

*Message #3 Posted by **Patrick** on 8 Aug 2003, 2:32 p.m.,*
in response to message #2 by Gene

In addition to what Gene has said, if any consecutive set of cash flows are equal, you can use the Nj function to specify how many times the flow repeats. Extending on Gene's example, suppose that there were flows in years 4, 5, and 6 that were all equal to the $3000 flow in year 3, then instead of keying these in individually, you can just type "4 g Nj" just before the "f IRR" keystrokes. The 4 signifies 4 payments of $3000 corresponding to the four years (3, 4, 5, 6).

Apart from saving some keystrokes, this method also saves on memory registers. Basically, you only use one memory slot for a repeated flow. Somehow, the HP engineers have stored the value of Nj (which can be as large as 99) in some spare bits inside the calculator, probably in the bits in the memory register which holds the payment itself.

Re: HP12C - Internal Rate of Return

*Message #4 Posted by **Gene** on 8 Aug 2003, 2:50 p.m.,*
in response to message #3 by Patrick

Quite correct!

One can also see an example from my business math textbook that uses the HP-12c...

Hi,

You can download and read the manual of HP 12C Platinum at:

http://h20015.www2.hp.com/content/common/manuals/bpia5309/bpia5309.pdf

The way to use of HP 12C is mostly similar with HP 12C Platinum (in PRN mode).

Good luck!!!

Luc - Vietnam

HP32SII Emulator

*Message #1 Posted by **D.W.** on 7 Aug 2003, 11:28 p.m.*

Does anyone know if a life-like emulator exists for the now-extinct HP32SII which is as realistic as the fantastic HP41 emulator. And if a good HP32SII emulator exists where can it be found?

Re: HP32SII Emulator

*Message #2 Posted by **Randy Sloyer** on 8 Aug 2003, 9:24 a.m.,*
in response to message #1 by D.W.

While my knowledge of HP emulators is not the broadest, I do know that if one existed, it could only be a rough facsimile. The creator would have to write the entire program from scratch as there is no way that I am aware of to access the microcode contained in the 32Sii. Even if you could find a hidden entry point, you would have to hand transcribe the image as the unit has no printing ability.

Most all of the very faithful to the original emulators out there are processor simulation engines that run on top of an image of the original HP microcode. This is how the 28,41,42 and 48 series machine emulators work.

Anyway you go with a project of this complexity, it's a pretty tough nut to crack.

Re: HP32SII Emulator

*Message #3 Posted by **Patrick** on 8 Aug 2003, 2:37 p.m.,*
in response to message #2 by Randy Sloyer

I know I'm asking a lot, but wouldn't it be possible to take the ROM chip from a defunct unit and put it into a piece of hardware that could read out its guts?

This would be a great breadboard project for a first year EE student! Do we know enough about the ROM package (electrically) for someone to accomplish this?

Re: HP32SII Emulator

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 8 Aug 2003, 3:32 p.m.,*
in response to message #3 by Patrick

I think that the ROM is inside the Saturn CPU, so it will be impossible to get it - but I don't know it for shure.

Good luck!

Nelson

Re: HP32SII Emulator

*Message #5 Posted by **Christoph Giesselink** on 17 Aug 2003, 8:16 p.m.,*

in response to message #1 by D.W.

As somebody know, there is a HP32SII emulator, but because of the ROM image problem Randy wrote about, it isn't available. The ROM image can't be uploaded from an original calculator, so we must wait that HP makes a copy of the ROM image available.

BTW, the HP32SII use the Sacajawea 1LR3 chip, another chip of the Saturn family chips, quite similar to the Lewis 1LR2 chip. The HP32SII is fully programmed in assembler, no RPL code inside.

Regards

Christoph

All but two of HP's current calculators already smell, albeit not like a rose.

in response to message #5 by Les Bell [Sydney]

I second Les' comments. And I keep my fingers' crossed. Maybe they're just late.....really enjoyed Ben's posts!

regards,

Bill Platt

Easy to figure out the winners...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 11 Aug 2003, 1:01 a.m.,*
in response to message #1 by Matt Kernal (US)

Hi, folks;

the winners are:

the HP Staff and
Kimpo Manufacture Co.

Now, let's hope that they have found a good amount of "what_should_a_calculator_do" so they will learn how to do that and find a way to produce them. And let us win, too... I mean, in a sense, good and acceptable calculators. Not as gifts from them to us, instead as buying options.

Luiz (Brazil)

Re: And the winners are.... ? OOPS, I lied

*Message #10 Posted by **Ben Salinas** on 12 Aug 2003, 9:40 a.m.,*
in response to message #1 by Matt Kernal (US)

Well, I walked into my electronics teacher's room this morning, and he told that he needed tot alk to me. He told me that he had recieved a call from HP, and they left a message on his answering machine saying that I won the contest, and he wanted to talk to him about working with my school on future science/calculator related stuff. He told me that he (the HP guy, last name was vignette or something), was extremely amazed by my entry. I guess since HP said August 1st, I should have known I needed to wait another 2 weeks.:) -Ben

Congratulations, Ben!!

*Message #11 Posted by **bill platt** on 12 Aug 2003, 10:56 a.m.,*
in response to message #10 by Ben Salinas

I kept my fingers crossed! That is really excellent!

Re: Congratulations, Ben!! and a challenge to HP

*Message #12 Posted by **jimc** on 13 Aug 2003, 7:59 p.m.,*
in response to message #11 by bill platt

Ben, you are to be congratulated for not only your project, but the energy and enthusiasm you showed for the work and the professional presentation. Wow.

I don't know your age, but I will say that I can only hope that HP hires you. Old engineers like me are hoping that you can bring some technology and quality back to HP.

A challenge to HP: You hire Ben, give him free rein, unencumbered by marketing. Let him build you a calculator. I'll guarantee that you'll sell every calculator you make. I'll buy two!

OOPS... and "Congrats!", too

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 12 Aug 2003, 12:21 p.m.,*
in response to message #10 by Ben Salinas

Hi, Ben;

congratulations!

Hey, as HP is turning your design an actual project, you're surely be "A" beta tester. Please, as this happens, use a nickname and let us know whatever we can about it, will yah?

For what I saw, you deserved this.

Best regards.

Luiz (Brazil)

Congrats Ben! Hold out for a 49G+

*Message #14 Posted by **Matt Kernal (US)** on 12 Aug 2003, 1:06 p.m.,*
in response to message #10 by Ben Salinas

Hey, that's GREAT news! Ditto on the Congratulations! Sounds like you'll get some scholarship money, and at least a new calculator. Hold out for a 49G+, 48GII, or at least a couple 33S's! Don't settle for a 12C Platinum or 9G.

Concerning HP and prizes, in previous HHC's (HandHeld Conferences), and I'm thinking of the two held in Vancover Washington a few years ago, HP was very generous and donated some nice prizes for an on-site HP48G programming challenge. I believe the winner received an HP notebook PC AND a Jornada PDA. Everyone attending got a free 49G.

HP will be present for this year's HHC as well. See http://www.holyjoe.net/hhc2003/index.htm

Once again, good job Ben! Oh, one more thing... how about reposting your entry for us to see again?

Matt

Re: And the winners are.... ? OOPS, I lied

*Message #18 Posted by **Ben Salinas** on 12 Aug 2003, 6:31 p.m.,*
in response to message #10 by Ben Salinas

To answer some of the questions that have been asked: As far as I understand, the prize is a HP 9g, and $3000. I will be sure to ask to see if they will give me a nicer calculator, though I am not sure if they will. (Trust me, I would much rather have a HP 49g+ than a 9g:)) There is no guarantee (and probably very little chance) that they will make this calculator I designed. First off, a few of the features might be physically impossible(a few, mind you) but more importantly, remember they were expecting , and I quote, "What if a calculator could measure the ocean's depth, transmit the temperature on Mars, and solve any complex math problem you could dream up? What if a calculator came in the shape of a rocket ship, butterfly, or snake, or was painted in patriotic stars and stripes?" It said in the rules, that the calculator designs might be used for ideas in future calculators. I truly doubt they will make my calculators, but there is a strong possibility that they will use some of my ideas in future models (if they make future models)

My teacher called the HP person back (as he was instructed to do so). They want to interview me, via phone, on thursday, and would like to come down to south Texas to see the school. (http://scitech.stisd.net)Supposedly they were very amazed by my entry. They also said that they might want to donate some equipment/money to the school, if they like it (which I believe they will like it) (the school itself is a magnet school with emphasis on math, science, and engineering, and all the skills I used

in creating my design I learned in the required technology classes) I will hope for the best. -ben

Well done!

*Message #19 Posted by **Patrick** on 13 Aug 2003, 2:26 a.m.,*
in response to message #18 by Ben Salinas

Absolutely fabulous story, Ben. Hearty congratulations!

If I were you, I'd take the 9s, smile and say thank you. They're giving you $3000, after all, so you can now afford to buy a mint version of anything you want on eBay!

What you *should* ask for, IMO, is a co-op/summer job at their calculator division (if it still exists)! There's something worth leveraging into this opportunity!

Good luck!

Re: And the winners are.... ? OOPS, I lied

*Message #20 Posted by **Les Bell [Sydney]** on 14 Aug 2003, 12:25 a.m.,*
in response to message #18 by Ben Salinas

That's great news, Ben - congratulations!

Best,

--- Les [http://www.lesbell.com.au]

Hey, Congratulations!

*Message #21 Posted by **Michael F. Coyle** on 12 Aug 2003, 9:49 p.m.,*
in response to message #10 by Ben Salinas

Glad to hear you won!!!

It seems like they were looking for fun, casual, "blue sky" stuff and you gave a complete serious design proposal, just like they'd get from their own engineers. No wonder they were blown away!

(I must admit that I was impressed by your entry -- what I read of it. It was so large I was rather intimidated by it!)

Hopefully, given the amount of work you did, HP will upgrade your prize to the new 49. And hopefully they will do right by your school. When they visit, send us a report -- we'd like to know what they're up to.

Again, congratulations!

- Michael

Re: CONGRATULATIONS!!!

*Message #22 Posted by **Ron Ross** on 13 Aug 2003, 11:17 a.m.,*
in response to message #10 by Ben Salinas

To me, your design may have had more thought and sense than what Hp delivered! Perhaps the prize committee conversation went like this.

"Would you LOOK AT THIS!!!"

"Did one of our previous engineers enter??"

"Well!! IT DOESN'T look like the butterfly we were looking for! (contemputous tone)"

"Yeah, but if we ever need to get back into the calculator business, we can't have this kid submitting this design to Ti."

"Ok, so its the best (again contemputous resignation). I wanted the designs to look like colorful crayon markups that I could scan over to my powerpoint presentations to show to Carly. She won't want to look at this (snear and snival)."

"Well, I guess we'll award to this kid, but we wanted more imagination and less research and work. I just can't understand these techie types."

Sadly, the above conversation probably didn't take place, becuase the above would be to intellectual for the present Hp management. Kingpo probably does most of Hp's real design and a look at the new 33s (which is larger than some graphics) pocket?? calculator gives me an idea of their skill.

However, Again my congratulations to a well deserved award. Use the scholarship money well and Who knows, Maybe you can design the next Hp calculator.

Re: Congratulations!

*Message #23 Posted by **Paul Brogger** on 13 Aug 2003, 12:51 p.m.,*
in response to message #10 by Ben Salinas

Ben, regardless of the happy outcome, in the process of creating your fine entry you exhibited traits and talent that will take you places. You should take some confidence that, whatever direction you choose in life, you are certainly capable of most any achievement you may desire. What a way to start out in life!

Congratulations!

*Message #25 Posted by **eclectic_echidna** on 13 Aug 2003, 4:07 p.m.,*
in response to message #24 by eclectic_echidna

Nevermind, I have found it.

Quoted from Ben's design document:

The first, and most impressive, is the Pseudo-Graphing function. This function allows the scientific calculator to graph in a way more accurate than a graphing calculator. This function was put in this

calculator to increase the market to high school students, most of whom depend on their graphing calculator. This function creates a table of value of only important points. This will greatly decrease graphing time and allow students to be weaned from their graphing calculator. Important points are those which are directly adjacent to curves in a graph, or at a vertex, as well as a point ½ to 1/3 of the way through a curve (which will make sure the line drawn on paper is accurate). Important points also include the x and y-intercept, and any other number which happen to be “nice” whole numbers. The table will display 2 lines at a time, and be scrolled through using the Up and Down “Program Navigation” keys (keys 18 and 23).

CP/M on an HP-86/87XM

*Message #1 Posted by **Mike** on 7 Aug 2003, 5:30 p.m.*

I have a nice HP-87XM system that I was going to sell. I wanted to include the CP/M Module as well but I don't seem to be able to get the CP/M to boot.

The system has 384K of RAM, the CP/M module and I have an original CP/M disk. But, when it tries to boot, I get an error saying, "operating system not on drive A, please correct and hit any key" or something to that effect.

Drive A?

Should I have a 2nd disk? Is this a sign that my CP/M disk is bad? I have a 2nd CP/M module and it behaves the same.

Does the CP/M module have to be in a specific slot?

Is there any setup required besides just booting from the floppy?

Re: CP/M on an HP-86/87XM

*Message #2 Posted by **Vassilis Prevalakis** on 9 Aug 2003, 2:52 a.m.,*
in response to message #1 by Mike

Sorry for the delay, I had to find the CP/M module first :-)

You only need one floppy, here is the directory:

```
[ Volume ]: HPCP/M
Name         Type    Bytes      Recs
CP/MSYS      DATA      256      1021
Autost       PROG      256         5
CP/M         BPGM      256        25
```

Autost is a Basic program:

```
10 PAGESIZE 24
20 PRINTER IS 705
30 FLIP
40 LOADBIN "CP/M"
50 END
```

File *CP/MSYS* is the CP/M filesystem (your DRIVE A). If you try to use the native *COPY* utility, you are likely to corrupt this file. You have to use the CP/M *PIP* command.

The floppy behaves like typical *Autost* floppies: if the floppy is in the drive, the system loads *Autost*, runs it and boots into CP/M, if the floppy is inserted after the 87 boots into Basic, you can still *LOAD* and *RUN* the *Autost* program and boot into CP/M. If you press *[SHIFT] RESET* you get back into Basic.

Once CP/M is up, you can do a DIR and see the files that exist inside the CP/MSYS (filesystem) image.

BTW, if you happen to have the software for the HP 82900A terminal emulation co-processor, then this

should be usable with the CP/M module, since the actual hardware card is the same for both systems. Unfortunately, I do not have this S/W.

**vp

Thanks for info but...

*Message #3 Posted by **Mike** on 9 Aug 2003, 11:58 a.m.,*
in response to message #2 by Vassilis Prevalakis

Sadly, I have an original disk and it still does not boot. That doesn't mean that it wasn't overwritten at some point.

My program file list matches what you have here. The autost program is slightly different but that is a file that is configured to match ones system so it makes sense that it might be different. For instance the printer is at a different location.

I suspect that my master disk may be corrupted.

Thanks,

Mike

Just a guess..

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Aug 2003, 3:02 p.m.,*
in response to message #3 by Mike

Hi, Mike;

I'm not aware of using CP/M, but I found some troubles on floppy system disks in other systems that were solved by starting with another disk drive unit. I'm not sure if you can do one of these:

- prepare another CP/M startup disk (or system disk)
- use another disk drive unit
- clean the head(s) of the existing drive unit

As I mentioned, I never used any CP/M-based system, I just thought about this and maybe it's nonsense. Anyway, maybe current drive (the one you are usiing) is able to read disk information and disk contents, but somehow it cannot read startup (system) data. I once found a multi I/O (daughter)board that was able to do enything EXCEPT prepare a hard disk as a system disk. I tried whatever you can imagine: use another I/O board, prepare another hard disk, use the same hard disk prepared in another computer, use the "bad" daughter board in other computers... That multi I/O board was not able to write startup information. It was able to read but write. And the problem was only when using that board.

There are things one must go too deep inside the system's inner secrets to explain...

Qapla' (as Ernie thought me as being Klingon's world for Success!) Please, let us know if/when you succeed.

Luiz (Brazil)

Copying CP/M floppies

*Message #5 Posted by **Vassilis Prevelakis** on 9 Aug 2003, 3:10 p.m.,*
in response to message #3 by Mike

OK, then I'll send you a boot floppy.

For the rest, here is a list of what I had to do to create the new diskette:

Conventions: I assume you have two floppy drives and you are booting from the lower numbered one. This will be drive A (like in MS/DOS). The second drive will be drive B.

To copy the boot floppy you have to boot with it and when you are within the CP/M environment you have to perform the following steps

1) Format diskette and install the CP/M system files

Run the *FORMAT* command, select option 2 (Create CP/M system diskette), and follow the instructions.

2) Copy user files from the master diskette

Assuming the master disk is on drive A, and the new disk on drive B, use *PIP B:=A:*.**

Warning: Unlike most systems, the *PIP* syntax is *Destination := Source*

3) Use *DIR A:* and *DIR B:* to confirm that the files have been copied.

Notes: The *FORMAT* command is not a standard CP/M command, it was developed by HP for the Series 80 CP/M emulator. I do not have the HP CP/M documentation, but you can download the CP/M 2.2 OEM docs from http://www.cpm.z80.de/manuals/cpm22-m.pdf

Holy CP/M Batman... (Photos)

*Message #6 Posted by **Mike** on 9 Aug 2003, 7:46 p.m.,*
in response to message #5 by Vassilis Prevelakis

It worked!

I guess I hadn't tested the original masters as I thought I did. I tried again and it booted. Guess I won't need that floppy.

The images below show the boot screen.

Photo 1: This is what the CP/M boot screen looks like

Photo 2: This is a screen that shows results after creating a new Master CP/M disk.

Photo 3: This shows the same disk when viewed using CAT from the BASIC environment.

http://www.msdsite.com/hpcalcs/hp87/cpm/bootx.jpg
http://www.msdsite.com/hpcalcs/hp87/cpm/copyx.jpg
http://www.msdsite.com/hpcalcs/hp87/cpm/after-copyx.jpg

Now, how to get a bootable 3.5" disk http://www.msdsite.com/images/smile.gif

Thanks VP

Edited: 9 Aug 2003, 8:25 p.m.

Re: Holy CP/M Batman... (Photos)

*Message #7 Posted by **Vassilis Prevelakis** on 9 Aug 2003, 11:18 p.m.,*
in response to message #6 by Mike

I have used a 9121 3.5" disk all along, so there is nothing fundamentally wrong with CP/M and 9121 disks.

The setup I have here does not have 5.25" disks. I have a 9121 (HP-IB device 0), a 9122 (HP-IB #4, used with the EMS ROM) and a ThinkJet printer (HP-IB #5).

CP/M has the following drive allocation:

```
   DRIVE           CP/M
9121 left drive      A
9121 right drive     B
9122 left drive      E
9122 right drive     F
```

So there is a gap in the drive numbering (C and D are missing).

My guess is that maybe CP/M does recognize all your floppies but you don't know what drive letters to use.

Try booting CP/M with both types of floppy connected and then try using drive letters till the floppy access led lights.

I have done this scan by placing a normal HP-85 floppy on the 9122 right drive (not a CP/M floppy) and executing *DIR B:*, *DIR C:*, *DIR D:*, *DIR E:*, etc till the drive mechanism engaged.

**vp

That did the trick

*Message #8 Posted by **Mike** on 10 Aug 2003, 12:22 a.m.,*
in response to message #7 by Vassilis Prevelakis

I had to swap my drive letters to make my 5.25 the boot drive. Then, it was a simple matter to format a 3.5" disk on drive E: and copy the system files to the 3.5" disk.

Now, I have CP/M bootable from 5.25" or 3.5" depending on the drive letter setup.

You have been a great help. There is a lot of good documentation here.

Thanks,

PS: I owe you one, or two, or three http://www.msdsite.com/images/smile.gif

HP-80 Questions

*Message #1 Posted by **Michael Barry** on 7 Aug 2003, 11:21 a.m.*

I'm very interested in trying to purchase an HP-80. I'm a finance guy and live with my 12c. I would love to have the first handheld business calculator HP made. I have been to the "Collectors Corner." Can you give me your thoughts, warnings, and suggestions regarding trying to buy HP-80 that I didn't find in the Corner? Are their problems inherit with the HP-80 both then and now? What is the most common deficiancy I should expect to see when trying to buy one? What would be a reasonable goal to strive for in buying one? As you can tell, I have never done this before. I've been reading this forum for some weeks now and have seen a lot of good information regarding older calculators, but nothing on the HP-80. Any additional help would be appreciated.

Sincerely, Mike

Technical Mac HP48gx connectivity problem with USB to serial converter

*Message #1 Posted by **Cameron Downunder** on 7 Aug 2003, 5:54 a.m.*

Like the 5 points (commandments) for this group.

I am posting here on the suggestion of Wayne Brown, who I met on the comp.sys.hp48.

I have in the past connected my HP48sx calculator to an old mac via a serial port, no problems using Link 48 software.

I have been trying to do the same unsuccessfully using a New Motion USB to serial port adaptor to a G4 powerbook running OS 9.2.2, with Carbon Lib 1.6. I have also tried on a G3 powerbook with same OS setup.

There is some initial indication of communication on the HP calculater.. with the following..

HP: <connecting> <processing command> <connecting> <processing command> later ..<retry 1> <retry 2>,... then <timeout>.

With the attempted exchange process between the HP 48 sx and HP Link 48 software program, the Link software reports the error (result code 55) Couldn't complete the last command because the connection timed out. Please check your connections.... etc (all fine, HP calculator in server mode etc..)

Within the Link 48 software, program continues to report no connection. Have tried many combinations of set up within Link 48 software and the control panel for iDock USB to serial dual port adapter from NewMotion. No success.

I thought someone familiar with the Kermit exhange process may have some suggestions as to a solution.

I have also tried connecting through Appleworks (software on Macs) with no success.

The USB serial converter software has an option of 5V on pin 9. Not sure what this is about, and if I want to use it? This is a second technical question I think?

In response to my comp.sys.hp48 posting, Bill Graves made the following comments about this problem....

This is my guess ....

1. The round trip time for serial communication between the PC and the Calc is pretty short IF the calc does not have to do much.

2. Although USB has a much higher peak transfer rate, it seems like the total round trip time can be a little longer for the one character server commands.

3. In the case we are discussing, it is a little worse because the characters go through USB then serial then to the calc then back as serial and then back to USB.

4. Again I think the total throughput rate might be fine, the round trip time for a single message might be too long.

5. This might cause the link program to time out because it has been coded for the shorter serial, round trip times.

(...full posting on comp.sys.hp48 4 August 2003)

For those technically minded I have added below a USB Events List, accessed from Apple System Profiler. (Powerbook started up and Link 48 program begun, with USB to serial converter and HP48sx already connected ready. - keeping this list as short as possible!)

I am consious this makes for a long posting, however on the other hand putting all information into the one posting can be time efficient interms of another scanning to see if they have something to offer.

I am having trouble posting it formatted by individual line. Sorry.

Cameron downunder.

Xpander battery compartment

*Message #1 Posted by **Sean McNamee** on 7 Aug 2003, 12:43 a.m.*

So all, Just bought a Xpander. I understand that the battery issue can be dealt with by charging the batteries outside the unit, but... In trying to open the compartment, it seems that the bottom of the lid is attached to two posts, which go down into the unit. Are these attached to screws? How do I remove the lid without damaging anything? Thanks all you collector.

PS> Any questions anyone wants to ask about the Hp Xpander - feel free!

Re: Xpander battery compartment

*Message #2 Posted by **Colin** on 7 Aug 2003, 2:08 a.m.,*
in response to message #1 by Sean McNamee

The tabs were broken off and the lid held down by a strong double sided tape because the prototype hardware could not tell the difference between Standard Alkaline batteries or NiMH batteries which are installed. It was decided for the field trial prototypes that the battery compartment would not be user accessable.

Using a small screw driver insert where the tabs were and disengage them. Then slowly but firmly lift the cover off. The tape will give way and you can lift the lid off. Clear any left over gum and tape off the lid or unit.

Colin

So, regular alkalines can be used?

*Message #3 Posted by **Sean McNamee** on 7 Aug 2003, 3:02 a.m.,*
in response to message #2 by Colin

The rechargables (got them out - thanks!) have tape covering most of them, but look like they're labeled 1.2V. Normal alkalines are 1.5V, if I'm not mistaken. That would make them incompatible...

Not quite...

*Message #4 Posted by **Mike** on 7 Aug 2003, 8:26 a.m.,*
in response to message #3 by Sean McNamee

That makes them different, not incompatible.

I don't think I have ever seen a piece of equipment that would work with NiCads but not Alkaline.

I have an XPander too and they are very interesting. I replaced my dead batteries with new AA rechargeables, with solder tabs (tabs removed). I think a normal AA alkaline will be a tight fit because the + terminals stick out further on normal alkaline.

Alkalines or any other battery other than NIMH AA in Xpander

*Message #5 Posted by **Colin** on 7 Aug 2003, 7:04 p.m.,*
in response to message #4 by Mike

If you do put any other battery other than NiMH into the Xpander, please be aware that the charger chip will not be determine that the wrong type of battery has been inserted. Do not connect the AC adapter if this is the case as it will attempt to charge the wrong battery.

Colin

Except

*Message #6 Posted by **Mike** on 7 Aug 2003, 7:19 p.m.,*
in response to message #5 by Colin

that NiMH and NiCads have the same voltage levels and the chip will see them as the same and charge them just fine.

I don't know why anyone would put anything but a rechargeable in one of these.

Re: Except

*Message #7 Posted by **Sean McNamee** on 8 Aug 2003, 1:24 a.m.,*
in response to message #6 by Mike

As I have since found out that these types of rechargables are commonly available - I wouldn't want to use non-rechargables either. I thought they were some specialty battery no longer available, As it is, you can get them out Radio Shack - neat!

Not quite, either.

*Message #8 Posted by **Speck** on 8 Aug 2003, 9:09 p.m.,*
in response to message #6 by Mike

I use Panasonic NiMH cells, and they charge to 1.4V, closer to the 1.5V of alkaline cells than the 1.2V of any NiCd cells I've ever used. Guess we've got to start checking that on a cell-by-cell (or mfgr-by-mfgr) basis, too.

I don't get your point

*Message #9 Posted by **Mike** on 8 Aug 2003, 10:40 p.m.,*
in response to message #8 by Speck

They will charge just fine in the Xpander.

Are you sure about the 1.4? Is is spec'd at 1.4 or do you just measure that? What is the part Panasonic number?

I just checked the Panasonic NiMH battery list and don't see any 1.4V cells.

But in any case, your comment doesn't conflict with what I said above.

Re: rechargables vs. alkaline

*Message #10 Posted by **Sean McNamee** on 9 Aug 2003, 1:18 a.m.,*
in response to message #9 by Mike

My boss (who knows everthing) says that the NiMH batteries hold much closer to full voltage under a load than alkaline or NiCAD. Low internal resistance. Now I don't know about what kind of load an Hp expander would put on these, but might it be that the other batteries drop closer to 1.2V under load anyway? ...Just pondering...

Batteries are spec'd

*Message #11 Posted by **Mike** on 9 Aug 2003, 2:28 a.m.,*
in response to message #10 by Sean McNamee

Batteries are spec'd at a specific voltage. That is what we should be talking about.

Re: I don't get your point

*Message #12 Posted by **Speck** on 9 Aug 2003, 9:39 p.m.,*
in response to message #9 by Mike

It wasn't much of a "point" at all. It was just an observation, that when one is looking for compatibility in cells, one might want to look past the label. I use Panasonic HHR-3UP AA NiMH cells with 1600mAh capacity. They are labeled 1.2V on the sides, but many of them tend to measure out to just under 1.4V. I got them cheap (that may be why), but I've had no complaints with them sofar, except that I can't seem to find a couple of them. They're kind of goofy things, but then I've just made (or am making) the switch from alkalines and MiCd's to NiMH cells, so I'm still learning about them. I've already saved quite a bit of money on them, so that's one thing I'm glad I'm learning.

STAT PAK for HP-48GX

*Message #1 Posted by **Thomas Cox** on 6 Aug 2003, 8:42 p.m.*

Recently obtained a HP-48GX and Stat PAK by Davinci, originally by Sparcom. The manual scrambles the keycodes so that I don't know what keys should be pressed to activate the various operations. For example, on page 8 there is a paragraph that starts as

Setting the Current Director(sic)

To set the current directory, go to the Matrix Manager and use "E, B, 3i, i, 3c, and 6" to switch to the current directory. I think "6" is "ENTER" and the combination "3i" and "3c" are probably shifted entries.

Any assistance in either explaining the codes or providing a "Rosetta Stone" for interpretation of the codes would be appreciated.

Many of the examples are unintelligible. It would seem that printer used for printing manual was incompatible with code for printing special characters, resulting in garbage.

Does anyone have a copy of the manual either in hard copy or scanned that I could borrow or purchase?

Thanks.

Re: STAT PAK for HP-48GX

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2003, 8:48 p.m.,*
in response to message #1 by Thomas Cox

Hi, Thomas;

Aren't these references related to menu keys? I mean, when you enter in Matrix Manager (not Matrix Editor) aren't you in a particular environment?

Just to know.

Luiz (Brazil)

Re: STAT PAK for HP-48GX

*Message #3 Posted by **Thomas Cox** on 7 Aug 2003, 7:25 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

The messages in the menu keys are clearly written in manual, it is the other keys that are not printed in a way that I have been able to determine what key(s) to press.

Also, what is more confusing is the examples in manual show scrambled printing so I can't see what results I should be getting.

Thanks

Thomas Cox

F and G

*Message #1 Posted by **John** on 6 Aug 2003, 6:17 p.m.*

Can anyone explain the useage by HP of "F" and "G" keys for function keys? Why were these letters chosen? Also, it looks like the new 49G+ has "left" and "right" arrow keys for other key functions. Why not F and G?

Re: F and G

*Message #2 Posted by **Gordon Dyer** on 6 Aug 2003, 6:23 p.m.,*
in response to message #1 by John

I have always assumed that this was "f" for function key, and originally this was the only one. Later HP added a second one and used "g" as it was the next letter. "h" appeared in the HP-34C.
I have no evidence for this, just my own speculation.

Re: F and G ... and H (shifted function keys)

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Aug 2003, 8:05 a.m.,*
in response to message #2 by Gordon Dyer

Just a comment: "h" first appeared in the HP 67, long before the HP 34.

While "f(x)" and "g(x)" are usual mathematical function notation (as is "f-1(x)"); the letter selection also fit nicely with the A,B,C,D,E definable keys on the HP 65 and 67. This may have been infuenced by the physical layout of the handhelds (5 top row keys).

The need for a sixth top row key, as in the Pioneers, with A...F meaning, is very convenient for hexadecimal functions; but this doesn't seems to have been an important concern before 1980. If "F" means binary 1111 or decimal 15, then the function key should be labeled differently. The angled "left shift" and "right shift" keys are compatible with this. Personally, I don´t like them, but one must concede that such arrows are a blessing for persons with color blindness.

Re: F and G

*Message #4 Posted by **Ernie Malaga** on 6 Aug 2003, 6:46 p.m.,*
in response to message #1 by John

> Quote:
>
> Can anyone explain the useage by HP of "F" and "G" keys for function keys? Why were these letters chosen?

It's mathematical notation. In math one uses the notation f(x) and g(x) to denote functions. The notation f^{-1} is also mathematical, meaning the inverse function of f. I believe the HP-65 was the only one ever to have f^{-1}.

> Quote:

> Also, it looks like the new 49G+ has "left" and "right" arrow keys for other key functions. Why not F and G?

Beats me. I've never liked those angular arrows myself; it would have been enough to have unlabeled, colored shift keys.

By the way, the colors gold and blue initially chosen by HP of the Golden Era were wise choices; color-blind people are likely to be unable to distinguish between green and red, but yellow and blue are okay. But then the Golden Era ended and all sorts of "in style" colors appeared, all the way to the (ugh) teal and lavender of the HP-48G/GX.

-Ernie

Re: F and G

*Message #5 Posted by **Ernie Malaga** on 8 Aug 2003, 2:31 p.m.,*
in response to message #1 by John

Texas Instruments calculators have had [2nd] from the very start. In recent years, calculators such as the TI-36X have added [3rd].

I find it amusing that TI has always used gold for [2nd] and now blue for [3rd] -- a copycat color scheme from HP calculators.

One advantage of TI's shift key naming scheme over HP's is that HP's uses up letters that _may_ collide with other key labels, while TI's choice is unlimited ("Press [17th] and [x^{25}] to raise a number to the 25th power"). For example, if the HP-67 had to have another shift key, it couldn't be named [i] because that's already used in financials and, in more modern machines, for the imaginary unit.

-Ernie

Re: F and G

*Message #6 Posted by **Vassilis Prevelakis** on 10 Aug 2003, 1:31 p.m.,*
in response to message #5 by Ernie Malaga

```
Ernie Malaga wrote:
> For example, if the HP-67 had to have another shift key,
> it couldn't be named [i] ...
```

Of course, because the HP-67 and 97 already use the letter i for the index register. In fact the HP97 *has* an I key (in the HP-67 the function of the I key is replaced by composite instrustions, i.e. STI rather than STO I).

HP41CV basic statistics question

*Message #1 Posted by **Andrew** on 6 Aug 2003, 5:37 p.m.*

Hi All,

I'm new to this forum and just started to use my calc after over 10 years. I can't find my manual as well. How do you use the basic stats built in this unit. That is, how to input values and view results for single (x) or double (x,y) to calc sdev, x*y, x^2, mean, and their respective sums.

thanks,

Andrew

Re: HP41CV basic statistics question

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2003, 6:46 p.m.,*
in response to message #1 by Andrew

Hi, Andrew; and welcome!

In the text below, please consider (SIGMA) as a reference to the greek symbol used to represent summation, O.K.? To use the Statistics resources available in the HP41, let's first see what does it offer:

Labeled key [(SIGMA)+] and [SHIFT][(SIGMA)-] are the "starting point" to enter data, but you should first take some initial precautions:

enough registers - if you have the means, check for existing registers. You need at least six registers to compute statistics. If you have an HP41CX or an X-functions module, execute SIZE? and verify if it is bigger than 6. If not, simply execute SIZE 006 or anything bigger and that will be fine.

Default value is SIZE 017 because the statistics resources use a "block" of six consecutive registers starting at R11, i.e., R11 to R16. This block may be changed to any existing position by using [(SIGMA)REG], provided a block of six registers is reserved. In the worst case, use [(SIGMA)REG] 000 to use the first six registers (R0 to R5) and the maximum value is [(SIGMA)REG] 314, when all memory is dedicated to registers and you'll use the block from R314 to R319. In any case, these registers will contain:

```
R(x)   - summation of X
R(x+1) - summation of X^2
R(x+2) - summation of Y
R(x+3) - summation of Y^2
R(x+4) - summation of X*Y
R(x+5) - n (# of sampled data)
```

where x is the number of the first statistic register, the same one used with [(SIGMA)REG] to define them. Prior to enter data and after defining/knowing the statistics block, execute CL(SIGMA) to clear only the six registers defined for statistics.

To enter data for a double statistic sample:

enter the first value for Y;
press [ENTER];
enter the related value for X;
press [(SIGMA)+]
repeat these four steps for each remaining pair of sampled data

If it is a sample with one value only, first enter a single 0 [ENTER] and then:

enter the first X value;
press [(SIGMA)+];
repeat these two steps for each remaining X-value

If you enter a wrong data, repeat the input procedure with the wrong data and press [SHIFT][(SIGMA)-] to remove; then you enter the correct data and press [(SIGMA)+] to enter it.

After the data is completely entered, there are two statistical functions that will help you:

[MEAN] - Mean of each value; you'll see the mean value for X and you may press [X<>Y] to see the mean value for Y, if applicable;

[SDEV] - Standard Deviation; works the same as MEAN

Also, you can recall any of the six statistic accumulated data with [RCL] x to [RCL] (x+5) and use it as you need. You can create programs to compute other values.

Hope this helps as a starting point. If you need more advice, let us know.

Best regards..

Luiz (Brazil)

JYA just mentioned ROM 1.20 for the 49G on c.s.hp48

*Message #1 Posted by **Gene** on 6 Aug 2003, 5:28 p.m.*

He was talking about ROM 1.19-7 and then he put in parentheses "(officially ROM 1.20)".

I've asked a follow-up out there, but the obvious leap to make is that ROM 1.20 is what the 49G+ will use and I would have every reason to think it would work on existing 49G calculators.

FYI.

Re: JYA just mentioned ROM 1.20 for the 49G on c.s.hp48

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2003, 9:26 p.m.,*
in response to message #1 by Gene

Hi, Gene;

is JYA "back to business"? Just to know.

Another thing I'd like to figure out: for what I could see, the HP49G+ has about the same memory amount already available in former HP49G: 512K+800K against 256K + 1024K (if not rounding, it's even closer)

Am I getting things wrongly? I read the PDF announcement and understood that. Any lacks of reasoning?

If so, the new O.S. fits in former HP49G UNLESS the new processor is used in a different way, meaning internal resources not existing in previous models that are explored by the new O.S.

My 2¢.

Luiz (Brazil)

Edited: 6 Aug 2003, 9:27 p.m.

My guess on the 800K thing

*Message #3 Posted by **Gene** on 6 Aug 2003, 10:46 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I suspect they had the original 1MB of flash but have taken away roughly 200K for system enhancements...kinda like the most recent ROM takes 64K away.

For what? I don't know, but that's my guess.

Maybe HP reached a buy agreement with JYA and BP to buy the rom update?

Re: My guess on the 800K thing

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 Aug 2003, 12:01 a.m.,*

in response to message #3 by Gene

Hi, Gene;

if I am not wrong, this is enough to add the Equation Library and additional resources to access its data. I read that Equation Library is sharing space with CAS in the HP49G+. If so, welcome!

Forgive me folks if I repeat the fact I'm a teacher all the time. So, let me add that I tell my students that information already existing somewhere must only be found. There was a time that knowing some sort of information by heart was a privilege; I thing that knowing how to find some sort of information is the key for today's professionals. We have virtual libraries in CD's or DVD's, no paper, no forest destruction. For itself, this achievement is a good justification. Based on this, I think that having basic equations already stored in a pocket calculator the way they are, together with CAS in one single unit, is something I cannot disregard. Although many contributors in here express their "worries" for the HP49G, I look at it and see the first HP pocket calculator with "upgradable" O.S., something that neither the HP48G has. And this is something that counts a lot for me. If the HP49G+ is actually an enhancement, I'll find a way to have one.

I'll wait to see.

Roll-on adhesive use

*Message #1 Posted by **Michael Meyer** on 6 Aug 2003, 2:50 p.m.*

Just thought I'd post this in case it's ever helpful to others:

I overhauled an HP-41 card reader last night. When it came to replacing the square sticker, I wanted it to stick firmly without too strong a glue, etc.

I placed the sticker/id plate upside down on some scratch paper and rolled over it with the new roll-on office adhesive (applies an adhesive double stick film). Lifting it off the paper, I had a completely re-adhesive piece. Thin, even. The tiny bit of adhesive on the edges rubbed right off after the sticker was replaced.

I wonder if temporary adhesive would work as well and still allow easy removal if needed? Anyway, this might be of use elsewhere in restoration. Liquid adhesives are messy and usually uneven and difficult to remove again.

Michael

This can also be useful for...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2003, 2:59 p.m.,*
in response to message #1 by Michael Meyer

Hi, Doc;

sometime ago I posted some messages about a "custom" faceplate protection based on a rugged, transparent self-adherent acetate. I mentioned this sort of product and anoter contributor (not sure if it was Ellis Easley or Randy Sloyer) posted another message about this roll-over adhesive.

Is it the same one? He posted the specs as well, I don't remember.

Best regards and thanks for the tip, Doc.

just got HP12C-Plat. spam from HP

*Message #1 Posted by **Bill Wiese** on 6 Aug 2003, 1:34 p.m.*

Since I've sent a couple of emails to Lee-Kuan Goh and Fred Valdez of HP (two of their calculator marketing dudes) I guess I ended up on their spam list.

Got an email last nite - HTML! - extolling the virtues of the 12CPlatinum. No new info, no new info on other HP calcs. May just be a replay of a prev brochure, etc. so I didn't bother cutting/pasting it to the Forum here.

HP, if you're gonna spam me, please do it in ASCII.

HTML emails are just plain *rude*.

Bill Wiese San Jose, CA

Re: Spam

*Message #2 Posted by **The Marketing Department** on 6 Aug 2003, 2:33 p.m.,*
in response to message #1 by Bill Wiese

We know, but you can't do spiffy marketing stuff in plain text.

Re: Spam -

*Message #3 Posted by **Bill Wiese** on 6 Aug 2003, 4:23 p.m.,*
in response to message #2 by The Marketing Department

If you ARE indeed in the HP calc mktg department, you should know it's RUDE to email in HTML. In fact, I'm trying to set up my email now so that all HTML stuff goes into the spam bucket.

If this is a prank msg from Norm, that's cool too :)

HP, save your HTML marketing efforts; it'd be far wiser to put the manpower into fixing bugs in the HP12CP firmware!

And bring back a good RPN calc, dammit!

Bill Wiese San Jose, CA

HTML and Calculator Design

*Message #4 Posted by **Paul Brogger** on 7 Aug 2003, 11:07 a.m.,*
in response to message #1 by Bill Wiese

Surely it's no coincidence that HP (and other brands') calculators got pointlessly glitzier at the expense of usability about the time college kids started graduating after their visual incubation in an HTML world.

It's more important that products look like **pieces of Flash animation** than that they be well-thought-out tools . . .

. . . and don't call me Shirley.

Re: HTML and Calculator Design

*Message #5 Posted by **hugh** on 7 Aug 2003, 12:17 p.m.,*
in response to message #4 by Paul Brogger

a very good idea you have there. i wouldnt be surprised if those fiendishly clever people at kinpo handnt already put a html browser inside the new hp models.

that way the whole operation would be html driven including bits of javascript to do the actual math.

moaney old beards pining over rpn could then upload their favourite java 41c/34c/whatever emulator and weep. that'll stop 'em :-)

HP95LX HELP !!

*Message #1 Posted by **Rick VanHuss** on 5 Aug 2003, 7:56 p.m.*

I just bought a HP95LX for 40.00, no manual or cables of course, and need help with a PC cable to program it. Anybody know the pin-outs? I know the Hp pins, but dont know how to hook them to the PC (serial 9 pin?). A manual (or zip file) would be nice if anybody has it.($$). Also once the cable is connected what do I use to xfer the data? The computer was cheap, but I dont have a sram-pcmcia card for it (125.00)for 1 meg. Also do I need to upgrade any of the software. Any help would be VERY appreaciated.

Re: HP95LX HELP !!

*Message #2 Posted by **Katie** on 5 Aug 2003, 10:20 p.m.,*
in response to message #1 by Rick VanHuss

Software http://www.palmtop.net/super95.html

Hardware http://www.daniel-hertrich.de/95lx/

and lots more http://www.technoir.org/hplx/hplx-l/

Re: HP95LX HELP !!

*Message #3 Posted by **Bill** on 6 Aug 2003, 5:39 a.m.,*
in response to message #2 by Katie

The old palmtop paper is online at

www.palmtoppaper.com/

Look at the earlier archives which included lots of good stuff on HP95LX.

Re: HP95LX HELP !!

*Message #4 Posted by **Bill Smith** on 6 Aug 2003, 1:45 p.m.,*
in response to message #1 by Rick VanHuss

don't give up hope on the PCMCIA card. there are files at palmtop.net that supposedly allow use of sandisk cards, and these are very cheap. even SRAM cards come up on ebay occasionally.

i have the manual at home, and will check on serial connection info, since you have to get the driver into the 95lx to use a sandisk. also, there is the IR port. you can use a terminal program with the serial cable if you don't have the connectivity kit software. there is a wealth of info at the links posted by Katie.

guess i was lucky to get the 95lx, manuals, cable w/ connectivity kit, and sram for $45 :)

Re: HP95LX HELP !!

*Message #5 Posted by **Bill Smith** on 6 Aug 2003, 11:29 p.m.,*
in response to message #4 by Bill Smith

here are the pin connections for the 9-pin DB end:

```
1, 4, 6-9 not used.

2 transmit data (from 95lx)
3 receive data (to 95lx)
5 signal ground
```

best of luck,

bs

HP-41C or V?

*Message #1 Posted by **Michael Meyer** on 5 Aug 2003, 2:06 p.m.*

Sorry to ask such a basic question, but I'm new at this model. I bought a lot on eBay that included an HP-41CV.

When I turn it on, it only shows 63 memories, like a C. Could it be a C in a CV case, or is this a loose internal module or what?

Thanks for a little help.

Michael

Re: HP-41C or V?

*Message #2 Posted by **Holger S.** on 5 Aug 2003, 2:13 p.m.,*
in response to message #1 by Michael Meyer

You may expand program memory by reducing the number of registers using the 'size' function. I.e. type XEQ [ALPHA] SIZE [ALPHA] 017. That should give you 302 registers programming space which is equivalent to about 2000 bytes. You may reduce registers further but then you have to relocate the statistics registers (IIRC) if you intend to use them.

Re: HP-41C or V?

*Message #3 Posted by **Michael Meyer** on 5 Aug 2003, 3:24 p.m.,*
in response to message #2 by Holger S.

Thanks. That works.

Whatever happened to the "Logic Dart" HP product?

*Message #1 Posted by **Gene** on 4 Aug 2003, 10:34 p.m.*

I remember seeing a video demo of this from the Philly PPC chapter from about 4-5 years ago where Eric (?) showed the new product.

Have never seen one live or on ebay since. Anyone ever actually seen this? Did it really get released?

Anyone know what I'm talking about? :-)

Re: Whatever happened to the "Logic Dart" HP product?

*Message #2 Posted by **Ellis Easley** on 4 Aug 2003, 11:05 p.m.,*
in response to message #1 by Gene

I've never touched one but I know it shipped because at least one person here has talked about owning one - I think it was Tony Duell. And he or someone else once sent me a link to a webpage with details - I can't remember if it was at HP/Agilent or a dealer. So I'm quite sure it was once available.

Re: Whatever happened to the "Logic Dart" HP product?

*Message #3 Posted by **Tony Duell (UK)** on 5 Aug 2003, 4:26 p.m.,*
in response to message #2 by Ellis Easley

Indeed I do have a LogicDart, and several of my friends (who played with mine) bought one too. So it certainly shipped. It is one of those typically HP products -- an excellent tool that was somewhat badly marketted. The most useful mode is 'Investigate' In that mode, you put probe 1 on a point in your circuit. The unit displays the average DC voltage at that point (great for checking power lines) and the freqeuncy (done by counting the number of crossings ofa threshold in one second or something). So far it doesn't sound like it does more than a good DMM, but if you now press the appropriate button, it records the logic waveform (high, low, undefined, with user-selectable thresholds) at that point. So it's great for distiguishing between clock waveforms (close to 1:1 Mark:Space ration, and regular) from sync pulses (more extreme Mark:Space ratio, but still regular) from data lines (not regular). Much of my HP classic-series calculator investigations were done using this mode. There's also a 3 channel logic analyser mode. 3 channels doesn't sound like much, and indeed I am sometimes gald of my larger benchtop logic analyser. But 3 channels will let you look at most handshake sequences, or clock and data lines, or... One great feature is the fact that it records each signals as high, low, or undefinded. This is very useful for picking up illegal levels either due to shorts between signals or faulty chips. This saved me a lot of time when sorting out my 98x0 machines, which had a number of 74Hxx chips that didn't pull high properly. The threshold settings will even (just about) let you look at the flip-flops in an HP9100... I guess I can sum up by saying that it's the first instrument I go for when investigating an unknown digital circuit, or when testing one of my own designs. Sure I sometimes need the 'scope or the bigger logic analyser, but the LogicDart often gives enough clues on its own, or at least it tells me where to use the larger instruments.

Re: Whatever happened to the "Logic Dart" HP product?

*Message #4 Posted by **Michael F. Coyle** on 5 Aug 2003, 6:45 p.m.,*
in response to message #3 by Tony Duell (UK)

The Logic Dart did look interesting, but at, what, $800? it was way too expensive for mere mortals to buy. To me, it fell into the category of "cool toys that maybe I could persuade the company to buy for me". (I couldn't.)

As for me personally, I struggle along with a logic probe and a borrowed 'scope. Maybe I'll go onto eBay one of these days and pick up a cheap logic analyser.

- Michael

Re: Whatever happened to the "Logic Dart" HP product?

*Message #5 Posted by **Tony Duell (UK)** on 6 Aug 2003, 5:04 p.m.,*
in response to message #4 by Michael F. Coyle

Are you suggesting I'm not a 'mere mortal'? I am just a hobbyist, who happens to take things a little more seriously than most :-). Anyway, I bought the LogicDart myself. As did the friedns of mine who bought them -- I don't know of any that were bought by companies (I guess I jsut don't know the right people). Sure it was expensive, but IMHO it's worth it. It does the job. It's saved me a lot of time over the years. But then you could say the same thing about may great HP products, right :-)

Re: Whatever happened to the "Logic Dart" HP product?

*Message #6 Posted by **Michael F. Coyle** on 7 Aug 2003, 12:16 a.m.,*
in response to message #5 by Tony Duell (UK)

Hi Tony!

I'm glad you like your Logic Dart and feel that you got your money's worth.

For me, I already had a logic probe, DMM, and storage 'scope. So I already had most of the Logic Dart's capabilities, and to spend $800 didn't seem worth it to me. (And BTW, I never even tried to get my employer to buy me one either; I knew I couldn't make a convincing case for it.)

The fact that Agilent no longer sells the Logic Dart tells me that it probably wasn't a good match for the marketplace. I notice that the Fluke ScopeMeters are still going great guns, though. (Now, how can I tell my boss that I just can't live without one...?)

I guess we'll just have to agree to disagree on this one.

- Michael

Re: Whatever happened to the "Logic Dart" HP product?

*Message #7 Posted by **Vassilis Prevelakis** on 6 Aug 2003, 6:00 a.m.,*
in response to message #3 by Tony Duell (UK)

Actually you can still get the Logic Dart from Agilent.

However you get the bare unit, no manuals or probes.

i.e. the product number is for the replacement units under waranty.

**vp

Re: Whatever happened to the "Logic Dart" HP product?

*Message #8 Posted by **Ellis Easley** on 4 Aug 2003, 11:27 p.m.,*
in response to message #1 by Gene

I went to agilent.com and entered "logic dart" into the search available on the home page. The first document in the search results, dated 5-5-2003, apparently announces the discontinuation of the Logic Dart. This link goes to the page that the first search results go to:

http://we.home.agilent.com/cgi-bin/bvpub/agilent/Product/cp_Product.jsp?OID=536880960&NAV_ID=-11264.536880960.00&LANGUAGE_CODE=eng&COUNTRY_CODE=ZZ

It says the product will be supported until 12-1-2004.

eMail from eBay

*Message #1 Posted by **Ellis Easley** on 4 Aug 2003, 9:52 p.m.*

Has anybody else ever received the following message from eBay?

Dear eBay User, During our regular update and verification of the accounts, we could not verify your current information. Either your information has changed or it is incomplete. As a result, your access to bid or buy on eBay has been restricted. According to our site policy you will have to confirm that you are the real owner of the eBay account by log in and complete the form that will pop up or else your account will be suspended without the right to register again with eBay. After you will login please verify your information in order to complete this verification. Thank you eBay Customer Support

The email contains a form that asks me to login. The form is part of the email, it's not downloaded - I can see the parts of the form with View, Message Source. I don't understand Java well enough to see what they are doing with the ID and password. It sure looks like it could be a scam to get my password so I didn't respond to it. But since there is no way to contact eBay, how can I find out if it is real? My ISP promises to never ask for any passwords or other confidential information except via a secure link. I realize when I login to eBay, I'm not using a secure link, but at least I know I WENT TO eBay in that situation.

Re: eMail from eBay

*Message #2 Posted by **Mark Hardman** on 4 Aug 2003, 10:01 p.m.,*
in response to message #1 by Ellis Easley

It most surely is a scam.

From the eBay help pages:

Safety Tips:

Be cautious of emails that ask you to submit personal information such as your credit card number or your eBay password. Some members have reported attempts to gain access to their personal information through email solicitations that are made to appear as having come from eBay. These solicitations will often contain links to web pages that will request that you sign-in and submit information. At eBay, we identify these as 'spoofed' emails or websites. Remember, eBay employees will never ask you for your password.

If you receive or suspect you have received such an email, do not respond to it or click the links. Immediately send a copy of it to spam@ebay.com.

To be sure that you are signing into a genuine eBay website, look at the Address/Location field of your browser. At an eBay Sign-In or log-in page, the URL (link) that appears in the Address/Location field of your browser will begin with "http://cgi.ebay.com/" or "http://cgi3.ebay.com/"

Re: eMail from eBay

*Message #3 Posted by **Ellis Easley** on 4 Aug 2003, 10:16 p.m.,*
in response to message #2 by Mark Hardman

Thanks, Mark! I've send it to spam@ebay.com.

SCAM, SCAM, SCAM

*Message #4 Posted by **Mike** on 4 Aug 2003, 10:14 p.m.,*
in response to message #1 by Ellis Easley

All the images and links appear to be ebay links and images. In fact, some actually take you to ebay. **all but one...**.

Go to the browser View->Source and search for the "submit" tag for the SUBMIT button. You will find that when you click the SUBMIT button on the form (don't actually click it), it sends the username and password to a CGI script, on a non-ebay domain.

There is also an email address visible in the source, as a parameter to the CGI script.

The one I had was on the Elvis.com domain.

I actaully sent an email to this guy and he responded, "You are only slightly smarter than the others." Indicating that he was acknowledging it was a scam.

PS: The one I got, didn't do anything but email the username and password. It didn't capture anything except what was in the form. So, one could have written...

Username: BugOff Password: BiteMeDoughBoy

And he would have received that email...

Don't try this unless you verify that the email is otherwise harmless :-) (I'd advise against it altogether)

Edited: 4 Aug 2003, 10:18 p.m.

Re: SCAM, SCAM, SCAM

*Message #5 Posted by **Ellis Easley** on 4 Aug 2003, 10:28 p.m.,*
in response to message #4 by Mike

What damage could a person do with my account (other than cause me grief!) since I am not a seller? I guess he could bid on items as me, and get me kicked off Ebay - and if he had a lot of accounts, he could bid on and win auctions of people he has a grudge against, just to give them extra negative feedback. But how could he make money with extra accounts? Maybe if he is a seller, or is working with a seller, he could use my account to shill. I might be a good target for that because I haven't used my account for some time (I assume it is possible to track my activity) and if I had just responded to keep my account alive (I almost did!) someone could have bid in my name without my ever knowing, as long as "I" never won an auction. I'm beginning to believe that shilling is real! (Hey, man - shi***** happens!)

Well, for one...

*Message #6 Posted by **Mike** on 4 Aug 2003, 10:39 p.m.,*
in response to message #5 by Ellis Easley

They could start buying everything in sight. Your negatives would start piling up, as you likely wouldn't want to pay for the Lexus and Jaguars that they might buy, **in your name.**

If there is any doubt, you should **change your password, ASAP**.

Before I analyzed that email, I immediately changed my password, just in case.

Edited: 4 Aug 2003, 10:39 p.m.

Re: Well, for one...

*Message #7 Posted by **Ellis Easley** on 4 Aug 2003, 11:01 p.m.,*
in response to message #6 by Mike

I know Ebay always points out that a bid is a legally binding agreement. But other than losing my Ebay priveleges, what other penalties would I be subject to because of bids that were made in my name without my knowledge - or even bids I made and chose to not honor? Are there any horror stories about this? What recourse would a person have if he got in such a position because he innocently (if stupidly) gave away his password in response to an email like this? Is it better or worse than identity theft (bank, credit card account, etc.) in general? I understand that is pretty bad - if it happens to you, getting out of it becomes your new career!

Well, how about this

*Message #8 Posted by **Mike** on 4 Aug 2003, 11:22 p.m.,*
in response to message #7 by Ellis Easley

Suppose someone starts selling stuff on eBay, using your name. Of course you could cancel anything you didn't recognize. But say he offers great, "Buy-it-Now" deals, with paypal link, to his account. PayPal need not be related to eBay, whatsoever.

Then, people snap these up and he is paid.

You could be hassled beyond belief.

Example: A guy was selling Iraq 52 Cards for $9.99 per pack. He sold over 5,000 in one hour. That is $50K and he was paid via PayPal ONLY. He was legit, but what if he was using your account.

Hard to beat, "buy-it-now" are snapped up immediately. What if the SCAM guy decided to sell Nikon Digital Cameras for $100.00 (New in Box). He could probably SCAM hundreds before you knew what was happening. Once an auction ends, you can't cancel or change anything, including any bogus PayPal links in the auction.

Or, what if a guy sold a $100,000 Jaguar for $15,000. Someone might want to sue over that. Also, you'd be legally on the hook for eBay fees. You'd have to prove your case.

This is just one of many examples. Still, you might not be liable but if it's a lot, you could be sued or hassled.

Edited: 4 Aug 2003, 11:25 p.m.

is there any history of this -

*Message #9 Posted by **Ellis Easley** on 4 Aug 2003, 11:36 p.m.,*
in response to message #8 by Mike

- or has Ebay hushed it up as well as the banking industry has suppressed news reports about people being robbed at ATM's?!!!

Re: is there any history of this -

*Message #10 Posted by **David Smith** on 5 Aug 2003, 2:21 p.m.,*
in response to message #9 by Ellis Easley

If you have your credit card account registered with ebay the scum scammer would have it, etc.

HP-91 How rare?

*Message #1 Posted by **Michael Meyer** on 4 Aug 2003, 7:20 p.m.*

Quick question:

I don't remember reading or hearing that HP-91's are that rare, yet I don't remember ever seeing one for sale on eBay. A search doesn't show any either currently or in completed auctions. The Museum shows it as "somewhat difficult" to find, but I've seen far more of the others in that category....

Has it become more rare, or have I just not noticed the auctions?

Michael

Re: HP-91 How rare?

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 4 Aug 2003, 7:35 p.m.,*
in response to message #1 by Michael Meyer

No, they don't show up frequently, however, sometimes, they may be hidden in a lot:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3035907091

I asked for permission to bid on them but the seller replied - quite rudely - that they were for sale in the USA only.

Given this, and since I don't like when links to eBay items are reported here, I thought that this seller did not deserve to see his items sold for an amount much higher than his dull auction title was worth.

Massimo

Re: HP-91 How rare?

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 4 Aug 2003, 7:39 p.m.,*
in response to message #1 by Michael Meyer

BTW: do you know who *mlmeyermd* is?

;-)

Re: HP-91 How rare?

*Message #4 Posted by **Raymond Del Tondo** on 4 Aug 2003, 8:42 p.m.,*
in response to message #1 by Michael Meyer

It depends.

- on overall look;

- on what comes with it;

- on how/if it works;

- on something I forgot here;-)

The units in the eBay auction #3035907091 look very used from the picture, and the description says '..in unknown working condition..' which tells nearly all about the machines.

From the user's view, they're just trash, because it's 99.9 percent sure they are *not* working properly.

From the collector's view they're like a two blade knife: If you don't have an 91, maybe you want to get one regardless of it's condition.

If you want them for display, these units seem to be hard work to look nice (and complete) again...

Raymond

Re: HP-91 How rare?

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 4 Aug 2003, 8:58 p.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,
four Topcats for less than $90 is a fair price to me even though you'll have to work on them a little (?) to end up with 1 or 2 working units... and the 91 in the middle row doesn't look so ugly.

Nevertheless I agree with your points.

Massimo

Re: HP-91 How rare?

*Message #6 Posted by **Michael Meyer** on 4 Aug 2003, 11:34 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

Yes, it's me, of course, that bought the lot.

The guy was really pretty nice to me, on the phone anyway. And I really enjoy the restoration part.

And I thought no one else spotted the auction. Silly me.

Michael

Re: HP-91 How rare?

*Message #7 Posted by **David Smith** on 5 Aug 2003, 2:29 p.m.,*
in response to message #1 by Michael Meyer

My estimates are that HP91 and 97S machines show up 8-12 times a year on Ebay. HP-92 machines are mayby twice as scarce.

Re: HP-91 How rare?

*Message #8 Posted by **Michael Meyer** on 5 Aug 2003, 7:36 p.m.,*
in response to message #7 by David Smith

That's really pretty rare... given how many calculators sell on eBay. Thanks! Hopefully at least one will be restorable for my collection and maybe the other will sell and pay for the lot. I've never sold on eBay, but it's getting time, so my hobby might be a little more self-supporting. Besides, it's fair; it takes some time to restore these things!

RTN2RPN, Michael

Re: HP-91 How rare?

*Message #9 Posted by **David Smith** on 6 Aug 2003, 3:13 p.m.,*
in response to message #8 by Michael Meyer

Some people like the bare simplicity of the HP-91, but the HP-97 is a LOT more capable of a machine... for usually a lot less money.

True, but this is more for collecting...

*Message #10 Posted by **Michael Meyer** on 6 Aug 2003, 9:19 p.m.,*
in response to message #9 by David Smith

No doubt!! I LOVE the 97!! Pictures just don't do it justice (like the 71B). I "pictured" a much bigger machine. The 97 is really a reasonable size, given the desktop concept. Like other HP's, a beauty to behold and use. And I really like working on them... the quality of the engineering shines through. As our friend Luiz has said, it's great to think about the human factor behind the design.

Anyway, my interest in the 91 is just to add to the collection, frankly.

Otherwise, I'd have only one spice, maybe one or two voyagers, etc.

Michael

What do you think of my HP buying prices?

*Message #1 Posted by **Emmanuel Verbeeck** on 4 Aug 2003, 5:00 a.m.*

Hi everyone,

I just finished the three purchases (over the last 3 months) of my prefered vintage HP RPN calculators -- I purposely limited myself to the 3 models hereunder, trying not to break the bank, at least for the time being...

So, I paid: -- $119 for a perfect HP41CV + carrying case (no books); -- $250 for a mint HP71B + carrying case + books + box; -- $275 for a mint HP15C + carrying case (no books).

Although non-HP lovers would say this is way too much, after 3 months of daily prices inspection, and considering the perfect or mint status I was looking for, I think it's still OK ... or am I wrong?

Thanks for your opinions!

Re: What do you think of my HP buying prices?

*Message #2 Posted by **Thibaut.be** on 4 Aug 2003, 8:27 a.m.,*
in response to message #1 by Emmanuel Verbeeck

You paid "normal" ebay prices....

If they fit your needs...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Aug 2003, 10:12 a.m.,*
in response to message #1 by Emmanuel Verbeeck

Hi, Emmanuel;

first of all, if they they fit your needs, are in good condition and will be of any use, then congratulations. For what I can tell you, you made very good choices. As I can see, you are not exactly in the business field, right?

If your bank account is still healthy, better. As Thibaut mentioned, normal prices.

Make good use.

Luiz (Brazil)

Re: What do you think of my HP buying prices?

*Message #4 Posted by **Dave** on 4 Aug 2003, 10:30 a.m.,*
in response to message #1 by Emmanuel Verbeeck

A bit high for the 71B but otherwise the going prices on EBay.

Re: What do you think of my HP buying prices?

*Message #5 Posted by **Patrick** on 4 Aug 2003, 2:14 p.m.,*
in response to message #1 by Emmanuel Verbeeck

I think most people who use eBay should expect some bargains and some rip-offs. I've been pretty lucky in the bargain department (2 10C's for a total of $57) and have over-bid on some items ($149 for a very marginal 55).

You have to go into eBay expecting this sort of roller coaster ride. You have to be very alert and very up-to-date not to be taken every once in a while.

Re: What do you think of my HP buying prices?

*Message #6 Posted by **Howard** on 4 Aug 2003, 4:58 p.m.,*
in response to message #5 by Patrick

Beauty is in the eye of the beholder. If you are happy with your purchases then you paid the correct price.

You have the added support in the fact that somebody else (the loosing bidder) valued your purchases at almost the same value as you did.

Enjoy your purchases.

Re: What do you think of my HP buying prices?

*Message #7 Posted by **Michael Meyer** on 4 Aug 2003, 7:25 p.m.,*
in response to message #6 by Howard

I even think the 71B price was good, given the fact it was in the box. Wasn't that long ago that the boxed ones were selling for up to $600. I know, 'cause I have the box from my original purchase and I've followed the prices....this stuff goes up and down like the stock market.... if it hits REAL high, I'll have to "sell".

Not sure I can bring myself to part with the ones in my collection with no duplicate, though....

Michael

Well, since I sold you one...

*Message #8 Posted by **Mike** on 4 Aug 2003, 10:36 p.m.,*
in response to message #1 by Emmanuel Verbeeck

I think you got a fair deal. http://www.msdsite.com/images/smile.gif

I actually don't know if you are referring to the 71B that you got from me but if you are, thanks for calling it Mint. I didn't because it wasn't mint to me. That's how picky I am. But many would call it mint.

I'm finding more and more that there are many sellers (far too many) that aren't collectors that are selling junk and overstating the condition. They don't mention obvious flaws that aren't shown and even sell broken items as working.

I have been on ebay for several years and it is getting to epidemic porportions, when it comes to misinformation.

I am thinking about modifying my **Calculator Buying Tips** to make it generic in nature (rather than specific to

me), and have a list of collector-sellers at the end. Of course, it will be subjective.

Still puzzling over whether or not I should do this. Good idea; bad idea?

Edited: 4 Aug 2003, 10:42 p.m.

Yes, it's yours :-)

*Message #9 Posted by **Emmanuel Verbeeck** on 5 Aug 2003, 1:25 a.m.,*
in response to message #8 by Mike

Admittedly, I haven't received it yet, but I must said I bought in total confidence considering the very detailed pictures you made, as well as your very good references.

I hope it's arriving soon in the mailbox :)

Your idea about the generic tips is very good, but you'll have a lot of work since imho buying tips are typical to each "zone of interest" (i.e. buying tips for vintage calculators being slightly different from other areas).

Anyway, thanks for all the answers, and have a nice day!

Buying Tips

*Message #10 Posted by **Tom Scott** on 5 Aug 2003, 9:36 p.m.,*
in response to message #8 by Mike

I wish I had read your "Buying Tips" before I recently bought an HP-67 which was advertized as having "all keys working properly" and the "card reader working perfectly". Unfortunately, neither were and I paid way too much. I guess the only thing I can do at this point is give a negative rating to the seller but he has a "0" history so probably doesn't care.

Tom Scott

It can be fixed....

*Message #11 Posted by **Michael Meyer** on 5 Aug 2003, 10:59 p.m.,*
in response to message #10 by Tom Scott

Hi Tom!!

I apologize for not knowing, but do you restore calcs? If not, the HP-67 is wonderfully fixable.

The keyboard is fairly easy to repair by polishing the contacts... there are many threads on how to do this. The card reader is also a fairly easy fix, especially if you've done a couple.

Let me know... I've been pretty busy, working 18 hour days lately (everyone is in crisis at once), but I'd be happy to take it on as a project. There are those more knowledgeable than I, but I'm a good technician. (I was a bicycle mechanic for many years, and can fix most anything, sometimes with some help from the kind folks here).

Let me know if you'd like help, and if not, K'pla!

RTN2RPN, Michael

*Message #12 Posted by **David Smith** on 6 Aug 2003, 3:19 p.m.,*
in response to message #11 by Michael Meyer

I have been fixing up my old bike lately... you go into a bike shop these days and their "mechanics" have never seen downtube shifters and just blink when you ask for a five gear freewheel. It took seven shops before I found one who could rebuild a set of Campy hubs.

I miss fixing bikes, David!

*Message #13 Posted by **Michael Meyer** on 6 Aug 2003, 9:57 p.m.,*
in response to message #12 by David Smith

That's sad. Gone the way of HP quality....

I spent three years at a shop in high school, then 4 years as a pro mechanic at a place called Turin Cyclery in Evanston, IL. Our shop was ranked the number 2 in the country, and I was one of the three "head mechanics." I once stripped a bike down to the bearings (no sealed ones then except a few popping up), repack, recable, and re-rubber,etc. in 60 minutes. I was the best. I lived with bicycle racers. Bikes got the good spots-- we sat on the floor.

There are few things I could ever say I was "the best" at. I'm proud of this. I could listen to the sounds of a bike bouncing on the floor and tell how it was adjusted...I was lucky to work at a store that even rebuilt the bikes that were sold as new.

Of course, it was now almost 25 years ago. As my wife would say, "yeah, yeah; nobody gives a sh*t..."

I actually tried to work at a shop during medical school in Kansas City, but few stores cared about quality. "We'll fix it if it comes back" was pretty much the rule.

I suspect finding a shop with quality as a priority is hard to do. And it does take some natural talent; we hired college students for the summer who knew what to do, good kids-- but never had the feel for how to tighten something to the point of, but not past metal fatique, etc. They did it by rote, not by the art. I might break a bolt now and then, not several a day...

I quess there's a strong connection to the restoration of calculators. Making something look and work the way it is "supposed to"... is a spiritual thing. "Zen and the art of calculator maintenance?"

That's why I like this group and this forum... there IS an appreciation of these values and quality calculators.

Michael

Zen and the art of calculator maintenance

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 7 Aug 2003, 12:06 a.m.,*
in response to message #13 by Michael Meyer

Wow!

Hey, Michel! To be honest, I'm taking these repairs as "therapy" for longer than I can recall.

No prescriptions, just good and conscious practice.

Best regards.

Luiz (Brazil)

Once a head mechanic.....

*Message #15 Posted by **db(martinez,california)** on 7 Aug 2003, 12:33 a.m.,*
in response to message #13 by Michael Meyer

....always a head mechanic. Was that on purpose or was it punintentional?

Re: I miss fixing bikes, David!

*Message #16 Posted by **David Smith** on 7 Aug 2003, 1:29 p.m.,*
in response to message #13 by Michael Meyer

Custom frame built by Trek before they did production bikes... Reynolds 531 tubing. Campy cranks, hubs and shifters. Weinmann concave rims. Suntour Superbe brakes. Phil Wood bottom bracket. Regina freewheel and chain. TA titainium/saphire pedals. Brooks Pro sadle.

Over 60,000 miles on it and it still looks and works like new. Now if I could just find a new freewheel and some proper gum hoods for those Suntour brake levers...

I didn't even make the connection....

*Message #17 Posted by **Michael Meyer** on 7 Aug 2003, 7:59 p.m.,*
in response to message #16 by David Smith

I guess I am a "head mechanic" now!

The bike sounds great. I doubt I have any hoods in my parts box, but just might. I have a spare free-wheel or 2, but don't know what configuration.

They must still sell them, no?

Re: I didn't even make the connection....

*Message #18 Posted by **Freewheels** on 8 Aug 2003, 10:31 a.m.,*
in response to message #17 by Michael Meyer

I really enjoyed the posts in this thread reagarding bicycle racing,bicycle mechanincs, and classic bikes!

But here is my take on the freewheel issue:

I finally got tired of breaking rear axles on campagnolo 6 speed hubs, and have switched to the far superior cassette style rear hubs. You can still get shimano 8 speed cassettes, and with these, you can make new spacers so that you can emulate the 6 speed spacing (or even 5 speed spacing!) of older freewheels. Then, you change out the locknuts and spacers on the axle, taking the nut to nut dimensions down from 130 mm to 126 mm (6 speed). I have not tried it for 5 speed spacing but think it will work--and you can squeeze a 126 into a 120 mm rear end anyway (sometimes!).

What does this have to do with HP? Well, you have to use your trusty HP-41 (or HP-67) to compute the new spacer thicknesses, offsets etc. To use a cheap modern

calculator is blasphemous.

Regards,

Bill Platt

Creative License Redux

in response to message #13 by Michael Meyer

Hi Mike,

I was looking in the Archives and saw your request for vanity plate ideas. What did you eventually go for? Some of the suggestions were pretty good, even the ones that weren't mine. :)

Maybe you could put up a photo, too.

- Michael

Re: Creative License Redux

*Message #20 Posted by **Michael Meyer** on 7 Aug 2003, 8:04 p.m.,*
in response to message #19 by Michael F. Coyle

Embarrassingly, I've never followed through. It's a "someday" thing, though.

Sooo..... anything is still possible.

I still like RTN2RPN the best. Nostalgic, like my collecting. Understandable by almost anyone with at least some computer knowledge. And it includes elements of both programming and RPN.

I also like the dual-meaning one: MEM LOST

Fun, but not clearly related to my hobby. Still, universally understandable on some level.....

It may be fixable but...

*Message #21 Posted by **Mike** on 6 Aug 2003, 3:20 p.m.,*
in response to message #11 by Michael Meyer

According to Tom, it was advertized as working. I'm seeing this more and more on ebay. Many shody sellers that are selling junk and leveraging off of collectors prices.

Things to watch out for.

1) Single photos - A single photo is very easy to conceal flaws.

2) Poorly lit photos - Very bright photos are what some people use to hide scratches. Very dark photos can hide other flaws. If you see poor photos, be suspicious.

3) Slight of hand advertizing - Look for what they are not telling you as much as what they are telling you. Some sellers will tell you about a minor flaw but ignore larger flaws. Don't assume that

if they tell you something that nothing is left out. Often they leave things out.

4) DOA guarantee - Ask seller if his DOA guarantee convers partially working or to put it another way, partially dead. One ebay seller offers a DOA guarantee but sells broken items. When you try to collect, he says, it's not completely dead so it's not covered by the DOA. Ask seller if his DOA includes partially broken calculators.

5) Look at other auctions he runs. I saw one seller that said, "can't test card reader because I have no cards." Sounds reasonable, right. But he was selling in another auction, cards that he said he didn't have.

Re: It may be fixable but...

*Message #22 Posted by **Tom Scott** on 6 Aug 2003, 8:26 p.m.,*
in response to message #21 by Mike

Most of your warnings certainly applied in my case. The picture was small and not brightly lighted. The wording was somewhat vague in parts. I did send two e-mails prior to the bidding which he answered somewhat vague terms as well but it is clear now that he was intentionally exaggerating or lying actually.

Tom Scott

Re: It can be fixed....

*Message #23 Posted by **Tom Scott** on 6 Aug 2003, 8:30 p.m.,*
in response to message #11 by Michael Meyer

Thanks, Michael. I've read some of the repair instructions but I think they're beyond my capabilities. However, I appreciate you offer. I have two HP-67s which both work to some degree. All LEDs work and most of the keys work, but not all (at least they way they should). So, I don't know if it's worth your time or not. It certainly would be worth it to me to spend more money to get a good working unit.

Tom Scott

Re: It can be fixed....

*Message #24 Posted by **Michael Meyer** on 6 Aug 2003, 10:03 p.m.,*
in response to message #23 by Tom Scott

Well, it shouldn't cost anything but the postage. I'm glad you have others, though: If you only had one, it would be a guarantee that something would go wrong and kill the one I was working on. It's never happened, but there's Murphy's Law...

Having said that, if you want, I'm happy to fix it up.

Michael

HP67 (1975) problems

*Message #25 Posted by **alan.hurren** on 13 Aug 2003, 5:40 p.m.,*
in response to message #11 by Michael Meyer

My revered HP67 is now show a series of zero's thus:

-00000000000 00 . . . . . does this mean the end of a long enjoyed partnership or can it be restored to full RPN working order ? Sadly the magnetic tape drive ceased to work a couple of years ago but I understand that even this can be resolved.

I literally have scores of manuals but have been unable to use them, although the calculator has operated OK until now.

Who do I contact for assistance - or is the HP67 era now closed ? ? ?

Re: HP67 (1975) problems. Doesn't sound good.

*Message #26 Posted by **Michael Meyer** on 13 Aug 2003, 9:49 p.m.,*
in response to message #25 by alan.hurren

All zeros in the display is usually a sign of a fried ACT (processor) chip. A common end to HP classics, it usually means the circuit was exposed to voltage unbuffered by a battery. I think this is rarer with the 67, as I think the calculator is designed to operate without the battery. Sometimes they just die.

It isn't completely hopeless, though. Amazingly, a processor from a lesser model, such as the common HP-21 or HP-25 can be used to repair the 67. Of course, you have to find a broken Woodstock or be willing to sacrifice a working unit.

I think I have several bad chips in a box, now. My own "group project" 67 went through 2 before becoming stable and happy. (It's been suggested that static damage was the cause, though I've never had problems with any other calculators. I think it was simply bad luck....)

I can't tell you how to go from here... it's up to you. You could wait until you find a "donor" machine, or you can sell it or trade it. I'd be happy to look at it, but it could be awhile until a "donor" chip comes my way, and the more often you try to transplant, the more the chances of permanent circuit board death....

New ones on eBay go from $150 to as high (lately) as $800. Broken, it's roughly worth $50, or at least IMHO (what I'd pay).

Michael

Re: HP67 (1975) problems. Doesn't sound good.

*Message #27 Posted by **David Smith** on 14 Aug 2003, 3:51 p.m.,*
in response to message #26 by Michael Meyer

I have found it all too common for a replaced ACT chip to fail a few minutes after being installed. It could be static electricity or heat stress from desoldering/soldering. I use a high dollar vacuum desoldering system with isolated/heat controlled/static controlled tip, etc and still have problems with replaced chips going legs up in the recovery room. I think the main problem is that I salvage chips from the worst looking, most corroded HP21 or HP25 machines that I can find... garbage out, garbage in...

Re: Well, since I sold you one...

*Message #28 Posted by **Dave** on 8 Aug 2003, 9:24 p.m.,*
in response to message #8 by Mike

Hi Mike,

It would be wonderful if you made your tips generic. There are several people whom I know could benefit from your page, but would probably be too distracted by the calculator specificity. Also, I could refer people to the page without revealing myself to be too nerdy :-)

Be sure to include the story about the "untestable" card reader and the separate auction for cards :-)

David

norm, take note

*Message #1 Posted by **db(martinez,california)** on 4 Aug 2003, 12:50 a.m.*

I just read an interesting article. It says that printer makers are getting rich off of their proprietary ink cartriges and that if gas cost what ink does; it would take $175,000 to fill your tank. Now that is onehellofa business model.

It would probably only cost $99,000 to fill my small tank, lucky me. No wonder hp doesn't care much about us calculator users (ti, sharp and casio are even worse of course).

http://www.suntimes.com/output/news/cst-nws-zay03.html

Re: norm, take note

*Message #2 Posted by **Ellis Easley** on 4 Aug 2003, 9:37 p.m.,*

As Rush likes to point out, at $1 for a 16 ounce bottle, fancy water costs several times as much as gasoline.

Re: norm, take note

*Message #3 Posted by **Paul Brogger** on 4 Aug 2003, 9:45 p.m.,*
in response to message #1 by db(martinez,california)

Geez! You guys, thinking out of the box . . . You should watch where you put this stuff!

If someone from GM drops in, pretty soon we'll be buying gasoline, oil and transmission fluid in big, plastic cartridges, no two of which will be the same. ("Sorry, we're fresh out of Cruiser cartridges. But I have a Hummer-to-Cruiser converter with which you can buy three times your original capacity, but it'll have to sit in the passenger seat . . .")

Don't get these guys started!

Re: norm, take note

*Message #4 Posted by **Speck** on 4 Aug 2003, 11:31 p.m.,*
in response to message #3 by Paul Brogger

Perhaps they should start selling "Computer Health Insurance." After all, some drug makers sell eye drops after glaucoma surgery for about $50 for a tiny bottle (worked out to roughly $20,000 per GALLON!). You could get a "prescription" for new toner, and the cost would be subsidized by everyone else. People would still bitch about the cost of ink, but they would only be paying a fraction of the actual "cost." Call your Congressional representatives.

Anybody know if they sell printer ink in Canada?

Re: norm, take note

*Message #5 Posted by **Ellis Easley** on 4 Aug 2003, 11:42 p.m.,*
in response to message #4 by Speck

How about the fluoride rinse the dentist charges $20 a shot for? What really gets me is that a few years ago, he told me fluoride rinse after a cleaning was nothing compared to using fluoride toothpaste every day, then I guess some vendor or trade magazine article shook him up by showing him how he could mark up a cleaning by 20%!

Yup, I hear yuh

*Message #6 Posted by **Norm** on 5 Aug 2003, 12:57 a.m.,*
in response to message #5 by Ellis Easley

Yup, I hear yuh, always thought the printer cartridges were a ripoff. Likd that specification of $175,000 to fill your gas tank.

Well, what can you do, its not about building an honest product to an honest price anymore ..... its about seeing who you can $crew and how badly.

Maybe I'll have to start thinking like that. Anybody want to buy a large bridge from me, it connects traffic to a major city .

:o)

business practice, old navigation calculators

*Message #8 Posted by **Norm** on 6 Aug 2003, 4:52 p.m.,*
in response to message #7 by db(martinez,california)

Business practice is supposed to be a mutual exchange in which both sides are better off for it (I pour cement for your driveway, you pay me, I wanted the money, you wanted the driveway both sides are happy with the trade).

You mentioned both sides get $crewed but both sides enjoy it..... that would still classify as a win-win situation.

What I am seeing lately in business leaders is an obsession with finding "win-lose" transactions. They dont care what they are winning, just so the other side is losing. They are happy selling buggy whips instead of jet engines, just so long as the customers pay too

much and the vendors are going broke. these types of business leaders would rather shut the business down, than see a scenario where everybody is making it.

True business leaders (gag, dare I mention Bill Gates?) want a great many factions to come out winners, i.e. the vendors and the employees are well-compensated. But business leaders to be wary of are the ones that dont care what the opportunity, the market, or the customers are saying, just so long as they make money and you go broke. Run for your life on those types.

****

old navigation calculators may well be an example where you really can't use it for much.

I'm thinking it has to be an item approved for FAA exams, otherwise why bother learning its idiosyncracies and getting familiar with it.

Therefore if it is no longer approved for an FAA exam, whats the use.

That would point towards using the more recent Jeppesen navigation calculator products.

wanna be pilot

*Message #10 Posted by **Norm** on 6 Aug 2003, 11:23 p.m.,*
in response to message #9 by db(martinez,california)

I'm just an armchair wanna be pilot, thats all.

I took quite a lot of flying lessons, then stopped rather abruptly.

They say that the theoretical principle of flight is that
the air over the top of the wing flows more rapidly over
the top surface than the bottom surface, thereby generating lift.

But that is wrong. The actual principle of flight is that
the flow of money out of your wallet generates the lift caused by the wing.

However, the lift is only generated if the flow of money is very large. Otherwise the airplane does not fly.

Realizing all of this, I decided that I did not wish to have a flow of money that large so I have left the airplanes and the navigator computers temporarily out of reach for now.

Just wondering??

*Message #1 Posted by **Naim** on 3 Aug 2003, 8:04 p.m.*

I read the great by Mr Brogger about increasing the memory of a HP42S to 32K. My question is, has anyone found a use for the area where maybe a second RAM chip could be installed? Or is this for some other hardware that was abandoned at some stage. Just wondering [out loud]

Re: Just wondering??

*Message #2 Posted by **Randy Sloyer** on 3 Aug 2003, 10:07 p.m.,*
in response to message #1 by Naim

The 42S shares the same logic board with the 17B/17Bii and 27S. The vacant rom location was used only in the 17Bii for the different text strings to internationalize the calculator.

The detailed answer can be found here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=266 and look toward the bottom for "XFCN".

Just wondering, too... Did you???

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 Aug 2003, 11:32 p.m.,*
in response to message #1 by Naim

Hi, Naim;

I just want to know if you proceed with the upgrade and, in this case, if you succeed.

I am asking about this because I am trying to collect data about which 32K chip have people found to be usefull. I have found three different codes, each one with a different brand label, and in two cases, the donator was a non-working HP48G. Anyway, in two cases, I removed the chip from a deffective sound board. There were two chips in that board and I have already used them.

I have these RAM ID codes/numbers written somewhere, I just have to find the file. Have you taken note of yours, if any?

Another issue: as I see, the HP17BII has the same board and layout, but the HP42 uses a main chip with another package. The question is: would the HP17BII accept a 32KRAM chip as well? Not that I intend doing this, I just would like to know if its O.S. will address the extra 24KRAM. If the answer is Yes, then the HP17BII+ will need no further HW enhancement, only SW additions (if any) and a Kinpo-like design.

Best regards.

Luiz (Brazil)

Re: Hp17BII

*Message #4 Posted by **RR** on 4 Aug 2003, 8:11 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Speaking with experience. No the Hp17Bii cannot make use of the extra RAM space of a 32K chip. It will work (you then HAVE to configure just like the 42s), but it will not see the extra RAM. I never did the experiment on the 27s as I used the 17B for practice before I tackled a valuable 42s.

Re: PPC ROM on eBay

*Message #2 Posted by **Dave** on 3 Aug 2003, 8:42 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

The bidding is curious, don't you think? The bidder with the most bids is someone who knows well the value of HP Calc stuff, so why so much???

Re: PPC ROM on eBay

*Message #3 Posted by **Steve (Australia)** on 4 Aug 2003, 1:27 a.m.,*
in response to message #2 by Dave

Perhaps it's the one that went "missing" during packaging of the PPC ROMS :-)

Re: PPC ROM on eBay

*Message #4 Posted by **Randy Smith** on 4 Aug 2003, 10:44 a.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Gee, I only paid $80 about 2 years ago for mine without a manual. Someone else gave me a manual in trade for some slide rules later. But heck, if someone offered me $600 for my getup I might be tempted to sell.

Re: PPC ROM on eBay

*Message #5 Posted by **Raymond Del Tondo** on 4 Aug 2003, 11:30 a.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Hmm. I paid 100 EUR for mine a few years ago, which came *complete* with module, manual, pocket guide, synthetic card, and some additional PPC paperwork, and it was (and is) like new.

Ok, I bought my first PPC module back in the early eighties, and that one was much more expensive. My HP dealer charged me nearly 500 DM, which is about 250 EUR. But that was twenty years ago, and the module just hit the market...

Re: PPC ROM on eBay

*Message #6 Posted by **Gene** on 4 Aug 2003, 11:50 a.m.,*
in response to message #5 by Raymond Del Tondo

Mine was an original, ordered during the actual project itself. I still remember waiting nearly a year after sending in the $95 (1980 $$) to PPC. You can tell the early ROMS because they were engraved with your order number.

What a wonderful Christmas I had when it arrived in mid-December. :-)

> What a wonderful Christmas I had when it arrived in mid-December. :-)

Perhaps it was I who packaged your PPC ROM in those old days of 1981. I was one of the "local PPCers" who volunteered during the (nightmarish) shipping day.

Now it's been almost 22 years, and I still remember it...

-Ernie (PPC#6594)

Re: PPC ROM on eBay

*Message #8 Posted by **Dave** on 4 Aug 2003, 5:57 p.m.,*
in response to message #6 by Gene

Yes, Gene, I also remember that looooooonnnng wait. But also, remember that I got TWO for the price of one. My order number with an "A" on one and with a "B" on the other. Turned out to be a deal!

Re: PPC ROM on eBay

*Message #9 Posted by **Andrey** on 4 Aug 2003, 12:14 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Well, only a few weeks ago, a complete set on eBay went for something like $ 255. and was totally complete. I guess everyone was on vacation and missed it (including me) :(((

Re: PPC ROM on eBay

*Message #10 Posted by **Chris Catotti (Florida)** on 4 Aug 2003, 2:14 p.m.,*
in response to message #9 by Andrey

I sold a "module only" in May 2003 that was one of the original "PPC Members Only" distribution for $103.50 on ebay.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2731022589

I could easily have been talked into adding the manual, QRG, etc. for that kind of price.

HP41CX - hard reset

*Message #1 Posted by **Richard McDonald** on 3 Aug 2003, 4:05 p.m.*

Hi there; The net of my question is "what's the keyboard sequence required to induce a 'memory lost' reset in an HP-41CX. My old, failing memory thought Enter/clx/on would do it, but it doesn't seem to work. I also left the batteries out for 24 hours and that still didn't cause a "memory lost" reset. That was odd.

I'm trying to resurrect my HP41CX that I've owned about 15 years. It's been stored in a dry location, in it's case and I've replaced the batteries periodically.

The last time I replaced the batteries it wouldn't power on correctly. A series of Enter/clx/on sequences will sometimes bring it up after removing the batteries for a few moments. Once I get 0.0000 in the display, I have control of the keyboard and can execute most functions. The display seems fine. Pressing keys and the sides doesn't cause a flutter so I think the contacts are ok. So I think the program memory is messed up and needs to be reset. A PCLPS doesn't seem to clear the offending problem and doesn't seem to complete (I don't see "packing").

Comments and recommendations are most welcome.

Richard McDonald

Re: HP41CX - hard reset

*Message #2 Posted by **Ernie Malaga** on 3 Aug 2003, 4:15 p.m.,*
in response to message #1 by Richard McDonald

Richard:

The hard reset is called "master clear" and is performed by holding down the correction (back-arrow) key while turning the machine on. This feature clears continuous memory and resets flags to their default states.

-Ernie

HP41CX - small remarks

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 Aug 2003, 5:31 p.m.,*
in response to message #1 by Richard McDonald

Hi, Richard;

just to add that PCLPS will be effective if executed while at least one program is the current one OR if an specific global label is in ALPHA register. If ALPHA is empty and the calculator is "positioned" to the last program in memory (the one with the permanent .END.), nothing will be cleared. It's also important to keep in mind that all programs after the one you clear with PCLPS will be cleared as well.

As Ernie mentioned, the "Master Clear" procedure is the standard "clear all" resource for the hP41 series, and you should see

```
[MEMORY LOST]
```

if you succeed performming it. As you mentioned, if you pressed [ENTER][CLx][ON] and nothing happend is because this is not the correct sequence; please, do as Ernie explainned and you'll probably achieve a memory clear.

Success. Should you need more advice, please, let us know.

Luiz (Brazil)

HP 41 cv "Memory lost"

*Message #1 Posted by **Juergen Schneider** on 3 Aug 2003, 6:27 a.m.*

I changed my batteries and the calculators show "memory lost" and switch in the "PRGM" modus and display only on the left site "-)--". Have anyone some idea?

Thanks

Re: HP 41 cv "Memory lost"

*Message #2 Posted by **Thibaut.be** on 3 Aug 2003, 12:28 p.m.,*
in response to message #1 by Juergen Schneider

If you have such a strange display, I'd expect 2 causes

1) low batteries 2) fixing post cracked; try when pressing your calculator just below the display if the problem disappears. A previous thread explained longly how to repair this.

Dead HP41CX

*Message #1 Posted by **Ben Moss** on 3 Aug 2003, 12:27 a.m.*

Ok, I just got my new HP41CX to work today (look down a couple of threads). I was using a power supply at my university's radio club shack to test it. Right after I got the battery pack to work, a friend of mine walked in and I showed it to him. He looked at the modules, and before I could stop him he said "Wow, look at these!" and pulled one out while the calculator was turned on. According to the manuals, this is a Big Fat No-No.

The calculator seemed to work immediately afterward; I tried some basic math like 3+3 and it gave the right answers. I put it away, and now when I try to turn it on, nothing happens. I know it isn't the battery because I have tried it with the power supply as well.

So, either the calculator died from having the module removed while it was on or it died from me playing with batteries and whatnot. I was very careful with the batteries to never reverse the polarity or give it too much voltage but it's still a possibility. What's the prognosis?

Again, many thanks.

-Ben Moss

Re: Dead HP41CX

*Message #2 Posted by **Hans Brueggemann [GER]** on 3 Aug 2003, 4:25 a.m.,*
in response to message #1 by Ben Moss

ben, i never ever saw an hp41cx being killed by just *removing* modules during operation. most likely, your calc has the typical 'foul keyboard contact syndrome' or 'battery removal amnesia'. the doctors in this forum already wrote a lot about that topic. just dig through the archives.

cheers, hans

Re: Dead HP41CX

*Message #3 Posted by **Randy Sloyer** on 3 Aug 2003, 10:25 a.m.,*
in response to message #1 by Ben Moss

In you have it open, try a hardware reset to clear memory:

Just short out the biggest capacitor on the logic board for a couple of seconds. It should be 470 uf at top left on fullnuts and to the left of the cpu on halfnuts.

If it's not open, hold down the backspace key, press the on button and release the backspace. You should see MEMORY LOST.

41's are pretty hard to kill.

It works

*Message #4 Posted by **Ben Moss** on 3 Aug 2003, 5:10 p.m.,*
in response to message #1 by Ben Moss

It works again! Thank you so much for your help.

I had tried twisting the calculator a little, pressing under the display, and applying pressure in various places. None of that helped. Pressing various combinations of backspace/on (and all other combinations listed in the repair guide) didn't do the trick either - it was the 1" drop that fixed it. I guess one of the internal connections got messed up while I was playing with the battery pack.

HP35 New Model

*Message #1 Posted by **Scott Elesandro** on 2 Aug 2003, 8:47 p.m.*

What with the much hailed re-entry of HP back into the calculator scene - eg all the hype about new models such as 12CP, 33S, 49G+ etc - I would forego all these new models for a resurrection/remanufacture of the original HP35 exactly as it was made in 1972. HP could have made trillions of dollars by re-manufacturing this world famous model - I would have bought 35 to celebrate!!!! The quality and the feel have never been surpassed - and besides retro is all the rage right now. Come on HP - celebrate 30 years plus in the RPN calculator scene by re-introducing this model and see how us HP drug-addicts respond - you would never regret it!!!!

> I would forego all these new models for a resurrection/remanufacture of the original HP35 exactly as it was made in 1972.

I'd rather see the HP-45 resurrected. It has always seemed (to me) like the first _useful_ scientific calculator. I always think of the HP-45 as "version 1.0"; the HP-35 seems like a beta release.

But of course the HP-35 could be resurrected as well. Not _exactly_ the way it was in '72, though. The [CHS] function needed work, [x^y] is guaranteed to trip modern calculator users, and the rechargeable batteries... phooey.

Hmmm. HP-35C?

-Ernie

Re: HP35 New Model

Re: HP35 New Model

*Message #5 Posted by **Troy H** on 3 Aug 2003, 7:26 a.m.,*
in response to message #4 by Les Bell [Sydney]

I think the real point here is that HP have to keep the new generations interested in their calculators and more importantly interested and hooked on RPN. If I were a young school student with limited money and not familiar with RPN, then I wouldn't even consider HP/RPN because their entry scientific calculator with RPN is now the HP48 and too expensive to consider. Even the HP32SII was on the steepish side of expenive and kids will buy cheap algebraic models because they are cheaper eg Canon, Casio etc. A new simple RPN calculator is needed - like the original HP35 (without any of the bugs and limitations, of course) - modernise it a bit for current technology - but keep the essence of the HP35 calculator there. Could be sold for a relatively affordable price and the young ones would buy it - and once that occurs - they're permanently hooked on the RPN breed and become a lifetime repeat customer. This is what happened to me - my first HP was a HP21 - sweet and simple and still a classic - once hooked many other more complex models followed in my inventory - I would never go back to algebraic format. We've nearly witnessed the death nell of RPN and HP calculators - only us HP enthusiasts have redeemed the RPN breed with our pestering of HP. The fact that they brought out too many expensive highly advanced models and neglected the main stream bottom end models like a simple HP35 was probably what caused the recent near-death crisis of HP calculators in the first place. A huge hole has existed for about 2 years because the dropping of the HP32sII - only now is this appalling situation about to be rectified with the HP33S. But still a much cheaper more basic entry level RPN model like the original HP35(modernised)is still needed to encourage the take-up rate by the young ones.

Re: HP35 New Model

*Message #6 Posted by **William** on 3 Aug 2003, 7:59 a.m.,*
in response to message #5 by Troy H

HP are basically in the calculator business as a profit making venture. Although this may come as a shock to HP enthusiasts, HP don't build calculators because they like to keep you guys happy with an endless supply of loss making RPN calculators - shock, horror. The big killer to bringing out new models is the development and design costs these days, so it might be attractive to HP to save costs in bringing out new models by returning to extremely successful and popular past models, and dig out the design blue prints of the HP35 and HP45 - certainly has got to be a hundred fold improvement on the abysmal design exercise we see in the HP49 rubber toadfish, and which they now appear to be carrying over into the HP49G+ which is about to be released (because they're stuck with the HP49 case design and can't afford to change too much because of retooling costs).

Re: HP35 New Model

*Message #7 Posted by **Les Bell [Sydney]** on 3 Aug 2003, 11:40 p.m.,*
in response to message #5 by Troy H

I think that's a reasonable point, but . . .

While schoolkids needs could *mostly* be served by a simple RPN scientific, those who are doing maths are influenced by teachers who want to use a more advanced - especially graphing - calculator as a pedagogical tool. The ones who would most appreciated the orthogonality of an RPN calc are the ones who will be directed by their maths teachers to buy a TI or Casio graphing calc.

These are the ideas that HP flirted with in the 38G ('aplets') and in the Xpander, but which never really got the momentum to knock TI and Casio out of poll position.

An HP45-level machine would be ideal for most schoolwork outside the maths classroom: reducing experimental results in the physics and chemistry classes, figuring out material requirements in the woodwork shop, and so on.

It's those damn mathematicians that have done the damage!

I've tinkered with the Casio calc my son was told to buy for maths classes at his new secondary school, and it's a counter-intuitive mess of arbitrary key combinations when compared with, say, my 41CX. I'm *sure* that a lot of teaching overhead must go into explaining the peculiar keystroke sequences required to get results out of this illogical little nightmare.

Something like the 11C or 32SII would be just about right for the schools market, IMHO.

Best,

--- Les [http://www.lesbell.com.au]

Re: HP35 New Model

*Message #8 Posted by **J.J.** on 4 Aug 2003, 11:21 a.m.,*
in response to message #7 by Les Bell [Sydney]

Don't agree here because most kids buy a calculator based on what they're allowed to take into exams!!! Anything above a simple HP11C class calculator is banned in exams because of the cheat potential of the more powerful machines - there's still some attempt to still try to get kids/students to use their brains a bit.

In some cases, schools take no chances and even ban any programmable calculators from exam rooms. I know that was the case in exams I've done. Pointless for students to buy a complex HP48 or HP49 when all you need (and are permitted) is a reliable HP35 or HP45 class calculator for exams - hence the forced potential huge market for this type of simple machine. People keep hyping the requirement for more powerful, more complex HP's. Well, once you get to the level of the HP49, you might as well not beat around the bush and just buy a pocket PC and put a HP41 or graphing emulator on it (like I've done). But notwithstanding this, I still have a requirement for a run-of-the-mill basic cheap calculator like the HP45 for everyday use as well.

Re: HP35 New Model

Or a simple slide rule. When I was in college in 1973 (Lima, Peru), that's the only thing

allowed in exams. I still have mine somewhere. They considered calculators "unfair advantage" because so few students could afford them back then -- an HP-45, for example, was $400 or thereabouts.

Re: HP35 New Model

*Message #10 Posted by **Les Bell [Sydney]** on 4 Aug 2003, 5:34 p.m.,*
in response to message #8 by J.J.

Don't agree? But that's what I said!

There seems to be a double standard among teachers with respect to calcs in exams v what they want in the classroom. Companies like HP and TI are producing increasingly sophisticated calcs aimed at the school/college market, but you're saying kids won't buy those calcs because they won't be allowed in exams?

Best,

--- Les [http://www.lesbell.com.au]

Yea , but I'd rather see the cuddly Woodstocks ..

George

Re: HP35 New Model

*Message #12 Posted by **Patrick** on 4 Aug 2003, 2:09 p.m.,*
in response to message #11 by G Evans

Imagine a much flatter but still contoured Woodstock-like calculator. With an LCD display (sorry, Norm), it wouldn't need to be so thick to accommodate the huge batteries of that era. If it was about a quarter to a half inch thick but about the same size as the old Woodstocks, with a contoured edge to fit the hand nicely, and the power of an 11C, that would be quite a little device.

Of course, I would prefer 15C like capability, but I think that might violate school rules. I think it is important in a small machine to not clutter the keyboard too much. The 10C would be a nice machine had it had a few extras, such as way more memory and some extra programming capabilities.

Just my 2 cents (Canadian -- about 1.4 cents in real money).

Re: HP35 New Model

*Message #13 Posted by **Dave Shaffer** on 4 Aug 2003, 2:23 p.m.,*
in response to message #12 by Patrick

I, too, would buy several HP-35 knock-offs - put one everywhere I was likely to need to reach for a calculator - if the price was right.

The price and feature target could well be deemed to be the TI-30xxxx line. TI makes half a dozen

versions of this, with just about the capability of the original HP-35 (plus some simple statistics - broadens the appeal), for around $10. Thus, TI sucks in the youngens for their TI-8x line when they need/want to upgrade.

If I could buy HP-35 RPN functionality for $10, I'd go wild. HP would then have an entry-level (RPN!) calc, too. I agree that they've ignored the entry-level market.

Re: HP35 New Model

*Message #14 Posted by **Michael F. Coyle** on 5 Aug 2003, 6:56 p.m.,*

Maybe. But I really like the shape of the Woodstocks and the way they fit into the hand. I'd hate to give that up for a thinner machine.

And nowadays we could do a very powerful machine in that style case. After all, the 34C had 30 keys, just like the Woodstocks.

> Quote:
>
> The 10C would be a nice machine had it had a few extras, such as way more memory and some extra programming capabilities.

It's called the HP-11C. Sorry, no modern equivalent.

Re: Exam Calculator

*Message #15 Posted by **Paul Brogger** on 4 Aug 2003, 7:35 p.m.,*
in response to message #1 by Scott Elesandro

O.K., then how 'bout this: Make a basic, ~10-memory RPN model with a two-line LCD display in a solid package with the legendary feel . . .

Incorporate a slot at the top for some kind of standard photo memory stick -- so that the memory "sticks" out about a quarter inch when inserted. (Maybe the memory compartment door hangs open and has a yellow-and-black-striped indusrial warning sticker affixed inside.)

With memory: programmable. Without memory: basic scientific/statistical/financial/numerological/biorhythms/whatever.

Pay the Teacher's Unions (or whatever standards bodies may exist) to certify the thing ***"Exam Safe"***.

Or, adopt a philosophy whereby gettting the right answer, by whatever means, is considered adequate

performance. And take some time to devise questions that can't be answered without some understanding of the nature of the problem, despite the ready availablity of a Cray supercomputer . . .

(Too bad they don't bother to ask us!)

97S Test connector outlay

*Message #1 Posted by **Erik Wahlin** on 2 Aug 2003, 4:49 p.m.*

I had a few requests to map out my HP-97S test connector. It is a fairly simple thing to build if you can find the IC. Please see http://g.msn.com/9SE/1?http://www.emar-online.com/15xyzx.htm&&DI=293&IG=1d9138f3-ba80-4ad8-a0f6-4de9754a962b&POS=1&CM=WU&CE=1). This company may have some. Please see http://www.colutron.com/97S/97S.htm for the connector details, and http://www.colutron.com/97S/97S2.htm for the diagnostic program used with the connector. I have attempted as best as I can to double and triple check the connections. Please use at your own risk. I assume no liability if you damage your HP-97S.

Edited: 2 Aug 2003, 5:22 p.m.

Re: 97S Test connector outlay

HP-19C Help needed

*Message #1 Posted by **Renato** on 2 Aug 2003, 3:06 p.m.*

Just got this 19C. Non-functional, in rough shape. No battery pack, no battery door.

Would someone tell me:

1- How to open the case - I removed the 5 screws (2 under feet, 2 in battery compartment, 1 in PS socket), but there seems to be a latch somewhere

2- I know it uses 82059 AC adapter, but I only have 82059D - is it ok for the 19C to use a 82059D ?

3- Does it suffer from the common woodstock fragility on the power supply ? In other words, can it be operated with AC power *without* a battery pack ?

thanks,

Renato

Re: HP-19C Help needed

*Message #2 Posted by **David Smith** on 2 Aug 2003, 3:53 p.m.,*
in response to message #1 by Renato

You have the screws out. The bottom of the case is a lot like a woodstock. Also the case halves are somewhat held together by fork pins between the keyboard and the printer board.

Any 82059 charger should work. You do need a battery pack in the machine for it to work (but I don't think it is as delicate as the woodstocks damage wise).

Re: HP-19C Help needed

*Message #3 Posted by **Renato** on 2 Aug 2003, 5:05 p.m.,*
in response to message #2 by David Smith

David,

Thank you. I have the case open - a severe case of battery leakage. Looks like it will require some debugging - lucky me - I´ll enjoy the fun.

What about pinout of the interboard connectors ? - I´ll look for normal DC voltages, before trying to go further. There is some corrosion on the terminal of the diodes on the lower right side of the power supply circuit - four diodes - should be the rectfying bridge. The 1826-0287 IC also has corrosion near it.

Caig Progold cleaned a portion of corrosion. I will work on it .

Thanks again,

Renato

Re: HP-19C Help needed

*Message #4 Posted by **David Smith** on 4 Aug 2003, 4:12 p.m.,*
in response to message #3 by Renato

Corrosion seems to be a rather common problem in these machines. I have seen three or four that were rather badly infested with the green fuzzies. I usually use 91% isopropyl alcohol to start with then go with the more exotic contact cleaners.

A lot of the printer circuitry is very similar to the HP97 and the HP97 service manual on the HPMUSEUM CDROMs can be a help.

Re: HP-19C Help needed

*Message #5 Posted by **Renato** on 4 Aug 2003, 5:55 p.m.,*
in response to message #4 by David Smith

David,

Thank you, again.

I managed to get it to turn on. As the logic-board-to-keyboard connector is corroded, i traced the on-off traces to the logic board side connector and shorted 1-2 to 4-5 . Display turned on with "0.00 80", printer purred and display showed "error".

I´m much pleased that it worked - must have been dead for decades. Now I´ll try to fix the bad connector.

Renato

Re: HP-19C Help needed

*Message #6 Posted by **Michael Meyer** on 4 Aug 2003, 7:36 p.m.,*
in response to message #5 by Renato

Let us know if you get it 100%. For "grins", let me know if the little decimal points in the display are little "hp" symbols. About half I've come across are!

The 19C is still my favorite machine to look at, marvel and admire. I think it's a really special calc.

Others have more power, smaller size, etc. And it's a 71B that I still use to play games and as an alarm clock, and a 67 to do my day-to-day calculating.

Can't explain it....

I guess that other machines had card readers (TI), and there were several amazing models. None that I can recall that were classic programmables with a printer. Too bad there wasn't a card reader stuffed in there somehow.... A pocketable 67/97....

It's just a really cool classic calc. (OK, technically a Woodstock, not a classic.)

I can't explain it, but I suspect you'll understand when you have it all working....

Michael

Re: HP-19C Help needed

*Message #7 Posted by **Renato** on 4 Aug 2003, 8:49 p.m.,*
in response to message #6 by Michael Meyer

Michael,

Yes, the decimal dots are HP logos. This was the first thing I checked when I got it to turn on. C O O L - I could see the logo without any magnification.

Another yes - for the fascination . For me the "purr" sound of a 97 card reader, printer or the 19c printer is fascinating.

Right now I´m just spending time away from the calculator, just wondering if I will try to fix the keyboard connector, or if I will build a cable to operate the machine with the case open. Former is most likely - if there are other things to fix, it might be useful.

Renato

Re: HP-19C Help needed

*Message #8 Posted by **David Smith** on 5 Aug 2003, 2:35 p.m.,*
in response to message #5 by Renato

I'm sure an old Woodstock or HP97 would be able to supply some pins... or are those the really long ones that went bad?

Re: HP-19C Help needed

*Message #9 Posted by **Renato** on 5 Aug 2003, 5:09 p.m.,*
in response to message #8 by David Smith

David,

The gold pins are ok. Corroded connector is the one at the keyboard. I believe it is called a "berg stick" - a row of square holes, in a black plastic housing. Too bad my digital camera went bad (canon S-20 - worst purchase decision i´ve made in the last two years).

Thanks,

Renato

Re: HP-19C Help needed

*Message #10 Posted by **David Smith** on 6 Aug 2003, 3:23 p.m.,*
in response to message #9 by Renato

The HP97 LED module connects to the display driver board with that type of cable and connector. Later machines were soldered on both ends.

Re: HP-19C Help needed

*Message #11 Posted by **Renato** on 6 Aug 2003, 11:50 p.m.,*
in response to message #10 by David Smith

As far as I recall, one 97 and three 91 i´ve opened (all made in Brazil) had display soldered to the logic board.

Renato

Re: HP-19C Help needed

*Message #12 Posted by **David Smith** on 7 Aug 2003, 1:19 p.m.,*
in response to message #11 by Renato

Many of them have one end of the display cable soldered down and the other end in a socket.

HP49G+

*Message #1 Posted by **Monte Dalrymple** on 2 Aug 2003, 1:53 p.m.*

SInce nobody else has posted a link...

http://www.hpcalc.org/hp49gplus.php

Re: HP49G+

*Message #2 Posted by **George** on 2 Aug 2003, 3:26 p.m.,*
in response to message #1 by Monte Dalrymple

Thank You for the posting!!! I am a surveyor who still uses a HP-48GX as a data collector on the job. After purchasing SMI's latest Robotics Version 7 card, I received a letter stating that the HP48 was discontinued and I should look to the Allegro for any future needs. But this 49G+ has everything that I wrote to HP and requested, such as the SD card slot and USB port. I can't wait to get my hands on one.

Re: HP49G+

*Message #3 Posted by **Raymond Del Tondo** on 2 Aug 2003, 6:11 p.m.,*

in response to message #3 by Raymond Del Tondo

Did you noticed the -4999 to +4999 exponent range? If the HP49+ is based of an emulator, it should be -499 to +499. So I guess it's a mistake. The other figures (12 displayed digits, 15 internal digits) are consistent with the Saturn BCD architecture.

Re: HP49G+

*Message #6 Posted by **Raymond Del Tondo** on 3 Aug 2003, 3:41 p.m.,*
in response to message #5 by J-F Garnier

The higher display is nice, but I wonder how programs will behave, which use the display directly, e.g. games, graphics progs...

The OS had to be rewritten in some places to handle the new display boundaries (at least the constants had to be changed). And for the numeric resolution: Maybe the host CPU can handle the extended resolution, but in the 4x OS the would have been many places to be adjusted...

And for the USB connectivity: Maybe there's a hardware layer which acts as adapter for the serial I/O software of the 49G.

However, it's much too late (or too early) to be an easter egg.

I can hardly wait to see (and maybe get) the 48GII+, you know, the one with the real keyboard;-)

Raymond

*Message #7 Posted by **Speck** on 4 Aug 2003, 11:38 p.m.,*
in response to message #2 by George

Assuming this thing is actually real, I wouldn't be surprised if a few Linux junkies won't want to get their hands on a few as well, just to see what they can do with them. Imagine sitting in EE classes and having access to a version of Octave in your hand (Matlab clone, in case no one is familiar).

And damn, but that thing looks a bit nicer than my 49G. They've still got work to do, though, from the looks of it.

Speck.

Testing an HP41CX

*Message #1 Posted by **Ben Moss** on 2 Aug 2003, 1:58 a.m.*

I've been using the V41 emulator for a long time and I really like it (kudos to the programmers), so I decided to get a real HP41CX off of ebay as a programming toy. Of course, it has a dead rechargeable battery pack, and I have no charger... (you know the story). I've been reading through the archives about battery options, but I still need a bit of clarification.

1. Apparently the battery pack uses an AC adaptor, and the voltage isn't constant. Is there some way I can try to charge the battery pack I have? I have access to fairly well-regulated adjustable AC and DC power supplies. I will be on the lookout for a real power supply in the meantime.

2. Apparently there is circuitry inside the rechargeable pack. This has made me paranoid. Can I test my calculator by giving it 6 volts DC from a power supply? If so, do I apply +6 to the leftmost gold contact and ground to the rightmost contact, leaving the middle two alone? (looking at the calculator from the back). I would like to know if it works.

I have an HP41CX, s/n 2851S21829. It has a rounded display, I think this makes it a halfnut or something, one of the later models? The rechargeable pack (82120A) has 2 pins for the charger.

Thank you very much. I know this topic has been beaten to death, and I apologize in advance for bringing it up again. If there's a website or FAQ that I've missed please post the link. -Ben Moss

Re: Testing an HP41CX

*Message #2 Posted by **Ernie Malaga** on 2 Aug 2003, 3:15 a.m.,*
in response to message #1 by Ben Moss

Ben:

After suffering rechargeable batteries for years on older HP calculators and cell phones, I rebelled and decided to never use them again if I had a choice. You have to leave the batteries charging for hours, only so they can die on you when you least expect it.

The HP-41 was initially intended to use 4 N-cell _non_-rechargeable batteries. I know they're a bit expensive, but they will give you several months of use without having to worry about recharging them.

On the other hand, I still remember my HP-67. I had to recharge its batteries for 14 hours -- and then the charge lasted only 3 hours (without using the card reader).

Do yourself a favor and use non-rechargeable batteries on your 41CX.

Just my 2Â¢.

-Ernie

Re: Testing an HP41CX - additional info

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 Aug 2003, 8:25 a.m.,*
in response to message #2 by Ernie Malaga

Hi Ben, Ernie;

just to add a few additonal info to Ernie's good advices.

About polarity: looking at the back, LCD in the upper side, the leftomst golden contact is the negative one (closer to the square hole used by the charger connector) and the rightmost is the positive: use ONLY 4.8 to 6.2 Vcc external power source. You should not care for the mid ones: they just close the circuit and are not used internaly.

I built a 6Vcc power source with a set of D-side alkaline batteries that I use when reading cards, barcoded data or IR output. Otherwise, I keep standard N-cells inside.

I agree with Ernie that alkalines are actually a good choice, but I still think that when you use extra power-consuming devices, a set of rechargeable would be fine. My thoughts. Anyway, I think that charging batteries for 14 hours and using the equipment for three, four hours tops, is something weird.

I've been using an HP71B with a set of four NiCad and I have other four always charged. I've been using the first set for more than one month and they are running fine, no Low Batt indication so far.

Add 2¢ to Ernie's contribution from my pockets.

Best regards.

Luzi (Brazil)

Re: Testing an HP41CX - yet more info

*Message #4 Posted by **Randy Sloyer** on 2 Aug 2003, 10:01 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Yes, there is circuitry inside the pack, a basic rectifier with current and voltage limiting devices.

The charger input to the pack is 8 VAC, 3VA max. I would recommend charging the pack outside the calculator so you can monitor battery voltage to see if the pack is any good. Connect the AC source to the two side pins and watch what happens on the battery terminals. Voltage that never rises is a shorted pack, voltage that immediately rises to 4 volts and above is an open pack.

While Ernie's suggestion of using alkaline N cells is good, you'll find it an almost impossible task to locate a battery holder. The best method is to buy the cheapest dead 41C you can find on eBay with a holder. You'll still pay at least $40 though. Average price these days is $50 to $60 for a decent shape unit. You can resell the remaining bits and recover maybe $20-$30.

All my rechargeable 82120A packs have been rebuilt with Gold Peak 160 mah 1/3 AAA nickel-metal-hydride cells. They run forever since they have almost three times the capacity of the original ni-cads. http://www.tnrtechnical.com/ in Florida will rebuild your pack for $15 plus shipping. I buy replacement cells from them welded up in the proper orientation and rebuild my own. Takes some patience to split the case open, but it can be done very cleanly with a single-edge razor blade.

Beware of using alligator clips on the gold battery terminals (actually, don't do it), it is a flexible film and will tear. Clip onto a ball of crumpled tin foil and tape in place for testing. There is no current draw to speak of (< 100 ua) so the contact force need not be very high. Only when using accessories does the

power go up.

Re: Testing an HP41CX - additional info

*Message #5 Posted by **Gordon Dyer** on 2 Aug 2003, 10:03 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

You should all try NiMH batteries instead of NiCd. I find they are well worth the extra money for longer life and they are rechargeable.

Thank you! It works!

*Message #6 Posted by **Ben Moss** on 2 Aug 2003, 5:12 p.m.,*
in response to message #1 by Ben Moss

The calculator gives a "Memory Lost" message when I turn it on, so all is good.

The NiCd pack charged to 3.1 volts, so I cracked open the case and found the two dead cells. After "zapping" the cells with a couple of amps the battery pack was at close to 6 volts. It doesn't hold a charge for long, so it will have to be rebuilt, but at least I know the calculator works.

Again, thank you for the help. Regards, -Ben Moss

Re: Thank you! It works!

*Message #7 Posted by **David Smith** on 4 Aug 2003, 4:16 p.m.,*
in response to message #6 by Ben Moss

The 1/2N cells in the pack were only made by Sanyo. They stopped building them a few years back and are just about impossible to find anymore. Possible replacements are 1/3AAA cells. Nicads have less capacity than the originals. NiMH cells can be hard to find in 1/3AAA. Also the 1/3AAA cells will require some shimming because they are a bit smaller than the 1/2N.

Gold Peak does make a 1/2N NiMH cell, but you have to buy 1500 of them. I have never found a distributor of smaller quantities.

HP 37E repair.

*Message #1 Posted by **Harry (Germany)** on 1 Aug 2003, 6:44 p.m.*

Help, I need help!!
Ok, I don't really deserve help, as what I have done is just too stupid, but anyway...
I am still trying to fix this HP37E. And now I got that 32E for parts (Thanks Stephan!!). So I started working on it again. And.....I droped the chips out of the frame. I had numbered them before, but it came of when I used alcohol to clean the contacts. :(
Now I am not really sure wich chip goes where and wich way round.
Does anyone have a picture handy? What I *think* is correct is this:
The big chip is inserted so I can see the "AMI" at the bottom-end (opposit of the LEDs) of the calculator. Then one silver chip to the top (towards LEDs). This one is missing one pin, the pin that is on the top left (towards LEDs and towards calculator middle). The other silver Chip is the one at the bottom-end, looks the same, has also one missing Pin pointing in the same direction.
I am pretty sure about the silver ones, as I can see where there is no mark on the flexible circuit-board from the missing pin. Are those chips both the same?
In the middle of the two silver ones, there is a little black one. I placed it, so that the hp logo points to the top (LED side) of the calculator. Just like the logos on the silver chips do.

Sorry for beeing that stupid... And thanks for your help.

Regards,
Harry

Stop worrying (whats the correct spelling?)

*Message #2 Posted by **Harry (Germany)** on 1 Aug 2003, 9:30 p.m.,*
in response to message #1 by Harry (Germany)

I figured I can make a working 32E out of the parts too. And that is what I did. It is working now. All I have left to do is make a nice faceplate for it now. Any suggestions on how to do that? The one I have is worn out. I would like to paint i black (its kinda grey now), but how do I get the legends on then?

Regars,
Harry

PS: Stephan, you get more then one beer now, most of the parts in the calculator were good.

IC numbers???

*Message #3 Posted by **Jon** on 2 Aug 2003, 9:05 a.m.,*
in response to message #2 by Harry (Germany)

Please make me know the id number of each chip and I will try to say its position.

Cheers

Jon

Re: IC numbers???

*Message #4 Posted by **Harry (Germany)** on 2 Aug 2003, 5:40 p.m.,*
in response to message #3 by Jon

All I can read is the little black one. It says: IMA?0008 SGP791028. The others are not readable anymore. (This was the same before I used alcohol to clean the contacts)

Regards, Harry

Re: IC numbers???

*Message #5 Posted by **Jon** on 2 Aug 2003, 6:21 p.m.,*
in response to message #4 by Harry (Germany)

Ok: According to one HP-37E I repaired long time ago. The position of the chips was. The closest to the display was 00031, the second hadn´t any readable id, and the third was 1MA10008. So that chip should be the last one. With the other two, just test.

I think this can help you.

Best Regards

Jon

Re: IC numbers???

Thanks Jon

All 8-pin chips are in paralell

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 3 Aug 2003, 10:46 a.m.,*
in response to message #2 by Harry (Germany)

Hi, Harry;

if you look at Spice's mainboard layout you'll see that all 8-pin chips are in paralell with each other, say, pins with the same "number" (position) in all of them are connected together with each other. The only exception goes for the C-type models (33C, 34C and 38C), where the upper IC has a separate connection for pin # 8. This is the position where the RAM chip must go. As you have an HP37E, pin # 8 of the first IC is connected with the others as well.

All you need to do is align the IC's in a way that pin # 1 of each chip points to the upper part of the calculator, the LED assembly part, and everything should goes fine. You may check for yourself and you'll

see all of the pins are connected to the same cooper trails.

Success.

MY HP-67 CARD READER AGAIN

*Message #1 Posted by **Jon** on 1 Aug 2003, 3:19 p.m.*

Long time ago I posted the problem I had with the HP-67. It writes but doesn´t read. The problem should be a capacitor. But this unit hasn´t the capacitors described normally. It has three silver cylindrical capacitors in the card reader circuit. So I decided to replace all of them for tantalum capacitors. I have seen they are 22uF, 22uF and 15uF. But once re-assembled nothing changes. It writes but doesn´t read. Any idea???

Thanks in advance

Jon

Re: MY HP-67 CARD READER AGAIN

*Message #2 Posted by **Vieira, Luiz C.** on 1 Aug 2003, 4:56 p.m.,*
in response to message #1 by Jon

Hi, Jon;

once we had a problem in one 82104A, the HP41 card reader (belongs to Gordon Dyer), that was detected as being the magnetic head with an open circuit, one of the coils had a broken wire. I am not sure of what procedure was taken by Gordon to identify the problem, but if one of the wires measures too high resistence to any of the other four, then you found it.

I'd guess an operational amplifier could be the "bad guy", but I do not know the card reader's circuit. I have an HP97 and if I am not wrong, the card reader in both of them is slightly different. What I can tell is that depending on the analog parts of the circuit, you may have an operational amplifier that works fine in a pre-defined gain and current conssumption (e.g. recording) and cannot keep the expected performance in another situation (e.g. reading).

Anyway, based on previous posts, I am taking a lot of care not inducting owner's to search for problems that are hard to be the cause, so I'd also suggest searching for bad contacts, head cleaning, contact strips alignment...

Oh, yes, in time: when I received the HP97 I have it was not able to read or write. At the moment it was switched to ON the card reader's pulling motor started to work and after about three to four seconds it stopped. I checked to see that all metal strips were in contact with their equivalent tabs, as if there was a card already inserted when it was switched to ON. I saw three screws above the metal strips and I adjusted them in a way the strips were close enough to their tabs without touching them. Since then it works perfectly fine, all functional. I don't think this is the same that happens with yours, but you see: the problem was much more simple than short circuited motor drivers, bad connections, controllers, etc. Only adjustment.

Hope you succeed repairing it.

Luiz (Brazil)

Edited: 1 Aug 2003, 4:59 p.m.

Re: MY HP-67 CARD READER AGAIN

*Message #3 Posted by **Gordon Dyer** on 1 Aug 2003, 8:05 p.m.,*
in response to message #2 by Vieira, Luiz C.

You are right Luiz. My card reader had an open circuit coil.
The coil connections are:
Red - Yellow is coil 1
Blue - Orange is coil 2
Black is a screen

You should measure (with a DVM) about 35-40 ohms for each coil and about 1Kohms between coils and the screen with them plugged into the circuit. If they are unplugged then you should measure open circuit between the coils and the screen on a 2Mohm range.
I am relying on memory for the values so don't think they should be accurate!

Re: MY HP-67 CARD READER AGAIN

*Message #4 Posted by **David Smith** on 2 Aug 2003, 3:56 p.m.,*
in response to message #1 by Jon

I had an 82104A reader for the HP41 that had a motor wire too close to the head. It did the same thing. Another possibility is a bad reader chip.

"n" function in HP 12C

*Message #1 Posted by **Luc** on 31 July 2003, 11:51 p.m.*

Hi all, Any one know why the HP 12C calculator rounds the calculated value of "n" up to the next higher integer?

Example: for a financial problem, when we solve to get the Number of Payments or Compounding Periods "n", the correct answer is n=3.1 years (just for example), but the HP 12c will answer n=4 years.

Oh, It's surprised.

And, this situation also occur on the Financial Consultant Casio FC-200.

Luc

Re: "n" function in HP 12C

*Message #2 Posted by **Gene** on 1 Aug 2003, 8:39 a.m.,*
in response to message #1 by Luc

Well, in truth, you can't make 3.1 payments in real life. The designers decided that they would report a value for n that would make sure the PV or FV had actually been reached.

In your example, after 3 payments, you haven't quite had enough put in. At 4 payments, you are beyond it. They chose to use 4 rather than 3, and didn't like the "exact" solution for n as noted above.

That said, I wish they had decided to just report the real n and let users round up. Users are not stupid, but that's something calculator designers sometimes forget.

Cheers!

Re: "n" function in HP 12C

*Message #3 Posted by **Luc** on 1 Aug 2003, 8:38 p.m.,*
in response to message #2 by Gene

Hi Gene, Are you "Gene Wright" author of some books in which is "Quantitative Analysis For Business - The Time Value of Money and Basic Business Statistics - Using a Business Calculator"book ? I saw on Amazon, but the book is expensive (as for me - Vietnamese) > 40USD.

OK, thank you for you answer !!!

But in HP 10B, it is not happen that case of "n", HP 10B give a correct answer, it same to answer og TI BAII+.

And HP 12C and Casio FC-200 gave an answer of "n" same together with round up to next interger.

cheers Luc

Edited: 1 Aug 2003, 9:06 p.m.

Re: "n" function in HP 12C

*Message #4 Posted by **Gene** on 1 Aug 2003, 10:20 p.m.,*
in response to message #3 by Luc

Yep, that's me. Sorry for the high price. I can't do a very big print run and that drives unit cost up. :-(

They implemented the solution for n differently in the HP-10B, etc. I dont' know why the HP-12c was made the way it was.

The BAII Plus is a great cheap calculator for business students. If they made a good keyboard it would be fantastic. Our university changed the recommended calculator to the TI BAII Plus last year because of the terrible HP-10BII keyboard.

Sadly, leaked pics of the new business calculators rumored to be coming appear to show the same keyboard. I hope they worked that part out.

Re: "n" function in HP 12C

*Message #5 Posted by **hugh** on 4 Aug 2003, 7:30 p.m.,*
in response to message #1 by Luc

also, the 12c has a special meaning for n input as a non-integer. the fractional part is intended for the odd payment. ie that fractional part of loans to cover the intermediate time before it starts proper.

only as input tho'.

New HP 49 Plus

*Message #1 Posted by **Richard Garner** on 31 July 2003, 10:59 p.m.*

Hi folks.

Here is more information from the roomer mill at comp.sys.hp48 on the HP 49+.

This was said to be from a reliable source. ???

The hp49G+ 's features:

Electrical CPU: 75Mhz ARM9 Display Size:131 x 80 pixels Display type: Pixel Memory:RAM 512KB 800KB flash ROM IR Port : IrDA Serial port: USB Expansion port: SD card Power Supply: AAA x 3 + CR2032 Auto power OFF: approximately 5 minutes

Material Case: plastic Keys: plastic Size: 184.0 x 87.0 x 23.5 mm 7.2 x 3.4 x .09 in Unit weight: 220 grams 7.7 ounces

HP 49 Plus - O.S.?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 11:46 p.m.,*
in response to message #1 by Richard Garner

Hi, Richard;

thank you for the latest news!

BTW, is there any information about the O.S.? Are former ACO folks involved? I mean, did HP keep previous O.S. or the HP49G+ will extend the HP12CP's "saga"? I'm not sure if I'll "pay to know".

I prefer an Xpander than an HP49G+...

Best regards.

Luiz (Brazil)

Re: HP 49 Plus - O.S.?

*Message #3 Posted by **Richard Garner** on 1 Aug 2003, 12:38 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

The information was just posted today, July 31. There was no mention of what the OS would be. There was a mention of a photo, floating around. Requests for a link or copy of the photo by several people have been made, but nothing has been offered by the original poster other than there was a photo.

Thanks, Richard! 8^) (n.t.)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 1 Aug 2003, 9:15 a.m.,*
in response to message #3 by Richard Garner

Surprised no picture is out there yet

*Message #5 Posted by **Gene** on 1 Aug 2003, 10:44 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Since pictures of the new 17BII+ and 19BII+ have been spotted on retailer's yet to be shown pages, I'm surprised no 49G+ picture has slipped out yet.

I'm glad to see that no beta testers are leaking information (assuming as I hope that there IS beta testing), but many times something will be inadvertently posted anyway.

Re: IT'S ALL BS Marketing!

*Message #6 Posted by **Ron Ross** on 1 Aug 2003, 11:02 a.m.,*
in response to message #5 by Gene

While I know Hp will release an Hp49G+, I don't believe it will be anything close to the specs mentioned on the listed post.

Why? Because no marketing genius would let the opportunity go by to release an HP5# super something with the specs mentioned vs staying with a loser dog 49G wimpy + designation for an already labled, market LOSER image that the 49G has generated (frozen Hamster butt blue).

That is why I think the specs are BS. I think HP will release the same Hp49G with maaaybe better buttons, maaaybe a 6 MHZ Saturn (might be more, but probably not much), and a new cable (it would be nice if there were a standard USB port instead) to tie into USB vs RS-232. That is YOUR BIG +. If Hp did anything more, you could bet HP marketing would have stepped in to toute the 2nd coming. And I didn't catch that. Therefore, I conclude the previous.

P.O.J. anyway ...

in response to message #6 by Ron Ross

Why get excited, it will be a piece of junk anyway.

This HP-49 stuff is an attempt to build something halfway between a desktop PC running MATLAB and a handheld calculator, not useful.

HP-49 "P.O.J. anyway ..."

I'd agree completely with that assessment, although it's worth pointing out that an individual copy/license for Matlab costs $1900 -- more than 10x the price of a 49.

It seems that ergonomical improvements have been made and some missing HP-48 features have been added (IR, equation library), but the 49 is still quite cumbersome to use.

Let's hope at least that the obvious bugs have been fixed and the spped has been improved with the new processor.

Good point,

*Message #9 Posted by **Norm** on 2 Aug 2003, 4:56 p.m.,*
in response to message #8 by Karl Schneider

Good point, of course for many collegiate math students, copied software is free.

Re: Good point,

*Message #10 Posted by **Max** on 3 Aug 2003, 8:16 a.m.,*
in response to message #9 by Norm

If your looking at something like the HP49+ you might as well not beat around the bush - get something decent like a pocket PC and put the HP49 emulator on it and get the best of both worlds - PC and Calculator (less frustration).

Re: I don't agree

*Message #11 Posted by **Ron Ross** on 4 Aug 2003, 10:00 a.m.,*
in response to message #10 by Max

While the idea sounds good and performance for high end exotic calculations it is probably even FASTER. But what about plain old button pushing? Sorry, for general calculations (short of FFT's), simple graphs, durability and cost, I want a calculator, not a pocket PC (though, this new 49G+ is really a pocket PC loaded up with an emulator as you just suggested, BUT it comes in a Calculator package).

I may even like it (though, I will have to see it to believe it! and if the buttons SUCK, well, I won't have to say more).

Re: Good point,

*Message #12 Posted by **Håkan Thörngren** on 5 Aug 2003, 10:49 a.m.,*
in response to message #10 by Max

There is nothing more frustrating than trying to use a PC. They should be banned forever.

I hope the hp49g+ gets quality keys, though I see it still lacks a real ENTER key where I want it... sigh... I might get used to it, if that is the only downside with it.

Re: New HP 49 Plus (Photo)

*Message #13 Posted by **Richard Garner** on 2 Aug 2003, 11:40 a.m.,*
in response to message #1 by Richard Garner

I guess the rumors are true of what is to be the new HP 49G+.

Here is the link: http://www.hpcalc.org/hp49gplus.php

excellent link Richard,

*Message #14 Posted by **NH** on 2 Aug 2003, 1:23 p.m.,*
in response to message #13 by Richard Garner

excellent link Richard,

thank you for posting it.

Most interesting feature in the review..... plastic casing with metal paint finish..... surely that could not be that same finish that rubs off in everyday usage ? exposing the molded plastic underneath ???

Well, the only purpose of a business is to make money, and to create maximum equity for shareholders.

Therefore, I approve of the decision to use a disposable finish that will pi$$ off every customer who buys one. It will add wealth to the corporation.

Re: excellent link Richard,

*Message #15 Posted by **Scott** on 2 Aug 2003, 8:20 p.m.,*
in response to message #14 by NH

Thanks Richard for posting this info - you're the greatest. But if the machine doesn't have the all important mandatory trademark CLICK-STOP keys that blazed their way to notoriety with the universe famous HP35, then I'm afraid this will be a major disappointment to all true HP fanatics like myself. No matter how great this machine is, I wouldn't consider buying any HP unless the CLICK-STOP keys are present.

Re: New HP 49 Plus (Photo)

*Message #16 Posted by **Les Bell [Sydney]** on 2 Aug 2003, 8:24 p.m.,*
in response to message #13 by Richard Garner

Dammit! The Enter key is still too small and in the wrong place.

I'll be interested to see what the 48GII looks like - if it's a bit more RPN-friendly it might be worth considering, although I doubt it would offer enough to make me upgrade from my current 48GX - only to perhaps replace it if the GX died.

Best,

--- Les [http://www.lesbell.com.au]

Re: New HP 49 Plus (Photo)

*Message #17 Posted by **Wayne Brown** on 3 Aug 2003, 10:04 a.m.,*
in response to message #13 by Richard Garner

It appears to be at least *marginally* less ugly than the 49G, though it's still pretty bad, and it still doesn't

have a decent **ENTER** key. At least it looks less video-game-ish than the 49G, so it wouldn't be *quite* as embarassing if my colleagues saw me with it...

HP Listening to Customers Again?

*Message #18 Posted by **Paul Brogger** on 4 Aug 2003, 7:23 p.m.,*
in response to message #13 by Richard Garner

The many reported improvements (most notably, I think, the plastic keys) over the 49g suggest that HP is actually listening to customers and users. What a business model!

I may just find some excuse to buy one, despite the lack of a "proper" ENTER key.

Re: HP Listening to Customers Again?

*Message #19 Posted by **Raymond Del Tondo** on 4 Aug 2003, 8:46 p.m.,*
in response to message #18 by Paul Brogger

Let's wait for the 48GII. At least in theory it should have the correct ENTER bar...

Raymond

HP41CV gone crazy...

*Message #1 Posted by **Marx Pio** on 31 July 2003, 10:14 p.m.*

Hi all

I turned on my beloved fullnut 41 and it started to show ones and fours by itself...Turned off an on again...and it started to scream its name again(41!). Now its ok. but does anybody here believes in digital ghosts that screams 4's and 1's using an old body of an 41??

Luiz ma brother(Tá tudo bem mano??)

Marx Pio

Re: HP41CV gone crazy... (edited 2 times)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 10:47 p.m.,*
in response to message #1 by Marx Pio

Tamo aqui!

Long time, no... read!

Man, that's completely awesome! I never heard about this before... But Amazonas has a lot of ghosts, doesn't it? The famous Boto and other jungle creatures... Have you been to the jungle for these days? Just kidding... I'd suggest checking the keyboard for humidity (and you know it's not hard to happen where you are) OR static discharges, if you are in "dried" regions. Keep in mind taht both keys share the same collumn electric contact. In time: your HP41CV, is it a half- or fullnut?

Nice reading your posts again. Keep close! (some não, meo)

I wish I could help a bit more...

Best regards.

Luiz Cláudio

HP-97 Power Supply

*Message #1 Posted by **Gordon Dyer** on 31 July 2003, 7:07 p.m.*

I have just got an HP-97 but without power supply.
It has a battery pack fitted.
My HP-71 PSU plug fits and I know it needs ac like the 71 but is it the same voltage?

Re: HP-9x Power Supply

*Message #2 Posted by **Raymond Del Tondo** on 31 July 2003, 7:19 p.m.,*
in response to message #1 by Gordon Dyer

Hi,

HP used the nearly the same standard wall adapter for many machines.

My HP-91 desktop calc came with an 82031A adapter, some of my other machines came with the 82066B adapter.

They both have 8 volts output at 3VA alternating current, so no difference from the electrical side. However, the 82031A plug for the calc has a somewhat different housing, but both adapters fit and work with the HP-91. The 82031A won't fit into an HP 82161A, for example, because the plug housing fits exactly to the HP-9x machines.

Regards,

Raymond

Re: HP-9x Power Supply

*Message #3 Posted by **Gordon Dyer** on 31 July 2003, 7:28 p.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for the help, it is as I suspected, but I wanted confirmation before switching it on!
However the HP-97 seems dead, so I opened it and tested the voltages the main power rails on the output of the regulator went down to zero when I switched the on switch.
Seems as if something is shorting the power rails. I will investigate further....

Re: HP-9x Power Supply

*Message #4 Posted by **Tony Duell (UK)** on 1 Aug 2003, 1:49 p.m.,*
in response to message #3 by Gordon Dyer

The HP97 (certainly, maybe other Topcats too -- I know for a fact the 95C has this) has a circuit to load the AC adapter should the 'battery' voltage attempt to exceed the main +ve supply rail voltage. This is designed to protect the machine if the battery pack goes open-circuit, preventing the sort of damage that's all too common in Woodstocks. If the DC-DC converter circuit fails (this is often due to

a failure of the oscillator transisotor on the CPU board), then this circuit will attempt to pull the battery voltage down to zero. I've seen one draw over 1A from my bench PSU when this happened. As others have mentioned, the HP97 service manual is on the MoHPC CD-ROMs. And my experience suggests a 2N3904 is a suitable transistor to use in the DC-DC converter.

Re: HP-9x Power Supply

*Message #5 Posted by **Gordon Dyer** on 1 Aug 2003, 2:52 p.m.,*
in response to message #4 by Tony Duell (UK)

Thanks for the suggestions, I am investigating....

Re: HP-97 Power Supply

*Message #6 Posted by **David Smith** on 1 Aug 2003, 1:02 p.m.,*
in response to message #1 by Gordon Dyer

The universal 82059 plug goes with the HP97, etc.

The HPMUSEUM CDROM set has the HP97 service manual. There are a few common HP97 power supply problems. The power supply is on the display circuit board. Most problems start with a fried power resistor and can cascade into failure of three or four transistors.

Re: HP-97 Power Supply

*Message #7 Posted by **Gordon Dyer** on 1 Aug 2003, 3:31 p.m.,*
in response to message #6 by David Smith

I have an older set from last year without the HP-97 service manual, maybe I will have to invest in a new set...
Can you tell me the PSU spec from the service manual? Photos I have seen show a much larger PSU than the HP-71 so maybe I need more power...

HP-41 programming question

*Message #1 Posted by **Axel Poqué** on 31 July 2003, 9:31 a.m.*

I'm writing a little program to time the performance of other programs. I figured that the easiest way would be to place the name of the program to time in the alpha register and then start the timing program which would do the following:

```
...           ; start stopwatch
asto T        ; uses T since I want to preserve X
xeq  ind T
...           ; stop watch and display time
```

Is this the right way to do it or is there another possibility (one that doesn't use a stack register)? My documentation is at home so I can't look it up now.

Axel

Re: HP-41 programming question

*Message #2 Posted by **Werner Huysegoms** on 31 July 2003, 10:12 a.m.,*
in response to message #1 by Axel Poqué

```
I use L for it
  ASTO L
  XEQ IND L

Werner
```

Re: HP-41 programming question

*Message #3 Posted by **Axel Poqué** on 31 July 2003, 10:16 a.m.,*
in response to message #2 by Werner Huysegoms

So it's OK to do it this way? And you're right, using L doesn't disturb the stack at all (should have thought of that).

Thanks,
Axel

Edited: 31 July 2003, 10:17 a.m.

Re: HP-41 programming question

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 10:21 a.m.,*
in response to message #1 by Axel Poqué

Hi, Axel;

you know, when I bought my HP41CX I began doing time measures for whatever I thought relevant as internal

resources. I once programmend the following:

```
...
RUNSW
XEQ "PR1"
STOPSW
...
END
LBL "PR1"
END
```

This was just to start: time to jump to a program and return. Tehn I added these modifications:

```
...
RUNSW
XEQ "PR1"
...
END
LBL "PR1"
STOPSW
END
```

and

```
...
XEQ "PR1"
STOPSW
...
END
LBL "PR1"
RUNSW
END
```

so I could measure the jumping and return time separately. I also did this:

```
...
RUNSW
LBL "PR1"
STOPSW
...
```

to measure the LBL instruction time. And:

```
...
RUNSW
STOPSW
...
```

for the system time spent since the stopwatch was started and stopped. All of these measures were repeated 10 and 20 times for average and I have them annotated somewhere. As you seem to be in a hurry, I decided to pass you the hint.

If the program to be measured cannot be changed, then te way you describe seems the best one. Anyway, a first measure with a blank LBL"name"END just to capture the jumping ang return would give you some more info. But if you have the chance to change the program to be measure, try this:

```
LBL"MEAS"
CLX
STOPSW
SETSW
RUNSW
LBL"PRG1"
....
(last program step - cannot be STOP or END or RTN)
STOPSW
...
END
```

where PRG1 is the program to be measured and MEAS is the name I gave to the measuring program additional part. This would also give you the chance to measure PRG1 execution time. The only fact is that you cannot add a STOP, or RTN or END in your original program because you still need the clock running. The

other way would be:

```
LBL"MEAS"
CLX
STOPSW
SETSW
RUNSW
XEQ"PRG1"
STOPSW
...
STOP
LBL"PRG1"
....
END
```

As you are aware of the initial jumping time and pre-measuring, after you compute the basic program execution time you just compensate the values.

I hope this is something close to what you have in mind. If not, I'm sorry not helping you the way you want.

Best regards.

Luiz (Brazil)

Edited: 31 July 2003, 10:25 a.m.

Oops! Far from you question...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 10:28 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi, Axel;

I'm sorry if I added so much information to your question. After reading Werner's posts and your reply I understood I was far from your request. Maybe you are aware of what I wrote.

If you believe what I wrote is irrelevant, please, let me know, so I'll remove my post. If you believe it is of any help, that's better.

Best regards.

Luiz (Brazil)

Re: HP-41 programming question

*Message #6 Posted by **Axel Poqué** on 31 July 2003, 10:36 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thanks for your ideas, Luiz.

Since I want to compare different versions of a program to find the optimal way to do it, the overhead of calling the program doesn't matter.

BTW, is there a table somewhere giving the timing of different instructions? Has someone already done this? Or I might just do one myself (I'm on holiday the next 3 weeks, so I've got plenty of time).

Axel

Re: HP-41 programming question

*Message #7 Posted by **hugh** on 31 July 2003, 12:12 p.m.,*
in response to message #6 by Axel Poqué

in terms of instruction timings, i would expect branches to have a sensitive effect. according to the 41c docs, it scans forward to find a local jump destination (lbl 00-lbl14) until END, then wraps to the program start. this would make forward jumps quicker than backward ones.

also, it claims to cache the destinations for 00-14 unless they are over 112 bytes away. im not sure whether it caches labels 15+ (which are 1 extra byte).

Re: HP-41 programming question (edited)

*Message #8 Posted by **Vieira, Luiz C.** on 31 July 2003, 12:26 p.m.,*
in response to message #7 by hugh

Hi, Hugh;

as you mention, all jump destinations are recorded except when calls ment to "short" are used for longer than expected. In this case, computed distance is not recorded and everytime a GTO or XEQ is found, it is computed again.

LBL 15 to 99, LBL "A" to "J" and "a" to "e" may be used for longer calls (I don't remember how far they can be from the related XEQ or GTO), and global labels may be anywhere in main memory that their distance to XEQ and GTO is always saved.

About timming each instruction: I have some relevant measures and as I find my notes I'm postiing them.

My 2¢.

Luiz (Brazil)

Edited: 31 July 2003, 11:49 p.m.

Re: HP-41 programming question (edited)

*Message #9 Posted by **Johnny Billquist** on 5 Aug 2003, 7:51 a.m.,*
in response to message #8 by Vieira, Luiz C.

All local labels can be at any distance. A linear search is made from the jump to the end of the program, and then from the start up to the jump, until the label is found.

GTO and XEQ for labels 00 to 14 save the relative address in the jump instruction so that the jump can be executed faster in the future. But this has a limit on the distance. They always work, but the relative address is only saved if the distance isn't too long. Longer distances will be just the same as jumps to any other label. GTO IND and XEQ IND will (obiovusly) not save the relative address of the label at any time. Also, as soon as you modify a program, all the saved relative addresses are deleted, so that a new computation will occur the next time you run.

Speaking of distances, my memory seems to have some vague notion of a bug in the early C version, where a program could get into problems if it was too large (over 1000 steps perhaps?).

Enron Hewlett Packard Finan Calculator HP-12C

*Message #1 Posted by **Howard** on 31 July 2003, 7:02 a.m.*

I wonder if this the financial calculator that was used to do all the damage. Its historical value will most probably be greater than its item value. http://cgi.netscape.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3038614791&category=11712

seems like a gimmick

*Message #2 Posted by **Norm** on 31 July 2003, 1:18 p.m.,*
in response to message #1 by Howard

seems like a gimmick because he probably just stuck the logo onto there.

Even so, that trick might fetch a few extra bucks, maybe from some financial person who has admiration for Enron and its officials.

If it is a REAL Enron calculator, there should be some alligator teeth marks in the plastic.

Re: seems like a gimmick

*Message #3 Posted by **David Smith** on 31 July 2003, 4:17 p.m.,*
in response to message #2 by Norm

These are legit machines. Enron issued them to a lot of their people. I have seen them with and without the "Crooked E" on the machine and/or case. I suspect you need the logo on both to be truly legit. They seldom seem to sell for more than normal machines these days.

Re: Enron Hewlett Packard Finan Calculator HP-12C

*Message #4 Posted by **Valhalla** on 31 July 2003, 4:49 p.m.,*
in response to message #1 by Howard

Enron??? Damage??? What are you talking about?? What does enron mean?? Does it make the calc better or something?? One last thing, used to cause what damage??

Just curious.

"|V\a.l/h\a.l/l\a.|"

Re: Enron Hewlett Packard Finan Calculator HP-12C

*Message #5 Posted by **Raymond Del Tondo** on 31 July 2003, 7:26 p.m.,*
in response to message #4 by Valhalla

Hi,

do a google search for enron, then you'll see.

Enron was one of those companies which didn't know how to correctly calculate. Seems they didn't use their E12C's very much;-)

Raymond

On the contrary, Enron calculated flawlessly

*Message #6 Posted by **Norm** on 1 Aug 2003, 3:08 a.m.,*
in response to message #5 by Raymond Del Tondo

On the contrary, Enron DID know how to calculate correctly.

It was a perfect model of business management, something that other business leaders (and the lowly engineering community) should study and learn from.

Enron created maximum equity for the shareholders, exactly according to mandatory guiding gospel of the MBA community.

All you had to do was sell your shares near the market high, when the equity value had reached maximum. And if you didn't then that's your problem.

hp41c negative battery

*Message #1 Posted by **hugh steers** on 31 July 2003, 6:10 a.m.*

i have acquired a 41c in which the batteries were old and tired, but not leaky. the unit would power up with BAT for a short time only. i put in new batteries and it works fine (new N-cells appear to be 1.4v which is odd).

out of interest i tested the voltage of the old cells. three read out 1.2v and one -0.3v (yes negative). is this just a figment of my test meter's imagination. ie no current, or is it likely for one cell to be hammered more than the others.

just curious?

Re: hp41c negative battery

*Message #2 Posted by **Wayne Brown** on 31 July 2003, 9:02 a.m.,*
in response to message #1 by hugh steers

Yes, that's quite possible. When batteries get low on charge, minor differences in manufacturing cause some batteries to run completely out faster than others. If one goes completely dead then the others that still have a little charge will begin to "reverse-charge" the dead one. That's why you always should replace all the batteries at the same time with fresh ones. Mixing old and new batteries can produce a situation where a significant portion of the new batteries' power is going to reverse-charge the old ones, causing the overall voltage to drop (perhaps lower than the device's requirements) as well as shortening the life of the new batteries.

This is a major cause of death for NiCd battery packs. Letting the pack run all the way down can produce this reverse-charging situation in one or more cells, causing damage to those cells. Often a dead NiCd pack will have several perfectly good cells and one bad one.

Re: hp41c negative battery

*Message #3 Posted by **hugh** on 31 July 2003, 12:04 p.m.,*
in response to message #2 by Wayne Brown

thanks wayne, that makes good sense.

Re: hp41c negative battery

*Message #4 Posted by **Matthias** on 2 Aug 2003, 4:17 a.m.,*
in response to message #1 by hugh steers

In addition to the good explanation Wayne gave, let me tell you, that in most of the cases you can revive this cell by using a charged polarized capacitor which you connect (pos to pos and neg to neg, of course) to the (isolated!) battery. The strong but very short current should remind the cell of its original polarity.

Matthias

Display for the HP-15C

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 30 July 2003, 11:58 p.m.*

A friend of mine have a HP-15C with its display "broken" (a large dark "blob" on the right corner). Its serial is #2628B92723. It passes on self test, but the display is a mess.

What I need to know if I can replace the display with one from any HP-12C or if HP still repairs it (I think not...)

I have scanned the interior, and it is very different of those I already know. Is just one big golden PCB with keyboard and display on one side and three ICs on the other side, no rubber cover, and just one spring on the battery compartment.

If any of you are interested I can send the pictures.

Regards,

Nelson

Re: Display for the HP-15C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 1:05 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hello, Nelson;

I repaired many Voyagers, and the new HP12C's have a different alignment for the LCD contact pads. The eariler units, when all of them were still under production, had a different number of pads in both upper and lower LCD frames. The newer HP12C, even the Indonesian units with three 1.5V batteries, have a new LCD with equaly spaced contact tabs that's incompatible with the earlier units.

I once mentioned here that we may probably have hundreds of thousands of earlier HP12C's carcass spread around the world that still have usable battery cover, LCD, case and internals (the keyboard scanner chip is the same for all Voyagers) because new units were available for sale and have probably replaced almost all broken units. This is not true for the other models, mostly the HP11C and HP15C.

If I have a spare LCD I'd gladly send you. Should we find old HP12C's, their LCDs' will surely be of use.

Best regards. Inté.

Luiz Cláudio

HP42S: scary moments

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 30 July 2003, 7:57 p.m.*

Hi, all;

again, one new episode of the not-so-unknown Scary Moments.

This time with an HP42S.

Yesterday I was reviving some healthy memories form the time I was a newcomer in the world of the HP42S and I took the previously mentioned Load Flow program in order to verify some storage techniques when dealing with indexed matrices. I remember that when I bought my NIB HP42S (still deceased) and I began to deal with it, I already had an HP28S, an HP15C and an HP41CX, amongst a few others. I also remembered that I took the HP42S as the easiest and most powerful "numeric" calculator. In time: I do not compare a numeric to a symbolic calculator as a whole because there is no way to balance their resources in a fair way.

Well, this is not the subject and, after being corrected once (thanks, Valentin), I'm actually "loosing focus".

I got the HP42S I recently took with the others after cordial and friendly arrangements (hey, R.L.A.) and switch it ON. I created a [100 × 1 Matrix] , pressed [ENTER], [SHIFT][COMPLEX] and while the busy indicator flashes, the low battery indicator turn itself ON, also. "New batteries, please!" I thought. At last, there it was: [100 × 1 Cpx Matrix] and the low battery indicator still ON. I decided to remove the MATRIX menu by pressing [EXIT] ([ON]) and then I store the complex matrix in DT ([STO][ALPHA] DT [ENTER]). Then the nightmare begins: Freddy Kruger and Jason in my back looking at the HP42S vanishing the display and... resting in peace?

New batteries, no batteries for a night, new batteries, shorting batteries connector... Cutter, hands, fingers... Back case removed and let's inspect. As I had an extra 32KRAM chip waiting for the chance to become something more than a number, I removed the original RAM in this HP42S and transplanted it. I did not think that it would put it back to work, but if it returned from the dead, then it would be back as an HP42S+.

I decided to inspect components and I saw a suspicious SMD that seemed to be a capacitor: no polarity marks and a somehow revealing inscription: 102K. I took 102 as 10E2 pF, or 1000 pF or 1KpF or 1nF. What called my attention was the fact that the soldering terminals were too "recessed", meaning it was easy to see a considerable space between the component body and its terminals. I re-soldered it and nothing. I re-soldered the terminals of all remaining components and nothing. I removed the mainboard and added a strip of tape between the foam and the keyboard "sheet" to increase pressure and enhance contacts, but nothing. I was about to give up when I remember that I'm the first one to insist with others not to give up. Then I thought with myself: "Are you a man or a rat?" It took me a couple of minutes till I realize there would be no answer, so I decide to move on. I removed the suspicious capacitor and measure it: nothing! Great! Let me take another capacitor and solder it in place. I searched for another SMD capacitor and the one I found that was closed to 1nF (1n2) was too small and tinny. Well, the HP42S is a 4.5V designed calculator, why using capacitor with a lot bigger isolation voltage? Something was not right. Then I decided to take extreme measures: I used the soldering iron and pressed both terminals till they could touch the body's surface, as I thought they should be. Then I decided to measure it again: I did not understand the reading, one thousand times the one I thought it should be: 1µF. So, I should read 102K as 10E2 × K = 1000Kpf = 1µf. Interesting!

Best regards.

Luiz (Brazil)

Oh, yes, the HP42S? Now it is a working HP42S+, thanks! And please, don't ask me to explain what happened... I'm still collecting my brain, spread around the room.

Edited: 30 July 2003, 8:03 p.m.

Re: HP42S: scary moments

*Message #2 Posted by **Randy Sloyer** on 1 Aug 2003, 12:02 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

The typically blue part marked 102J, above and to the right of the crystal is an inductor. It is part of the step up voltage converter for the LCD display. I believe it is 1000 uh, it measures about 27 ohms.

I've never seen a bad one but it is likely to have fractured solder connections as it is high enough to come in contact with the back esd shield. This means any mechanical shock of the case in that area will land on the solder connections. Check the esd shield for signs of transfer imprinting due to impact. I've seen many a 100uf tantalum memory backup capacitor broken off and rattling around inside the case from the same cause.

An inductor!!!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 Aug 2003, 9:23 a.m.,*
in response to message #2 by Randy Sloyer

Hi, Randy;

thank you very much.

After what you post, I'm somehow worried. This means that, in fact, the component was still opened when I measured it, what explains the "remaining" capacitance. When I soldered it in place maybe the extra heating finaly closed the internal broken solder, otherwise the calculator would not be working as it is (passed 24 hours).

I'll check if there is any mark in the ESD protection. But I'll first try to find an inductor with this value. 1KµH or 1KnH?

Thank you very much.

Luiz (Brazil)

Re: An inductor!!!

*Message #4 Posted by **Randy Sloyer** on 1 Aug 2003, 11:01 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I don't know the value from the marking. I could just mail you one, send me an email, I lost yours.

damaged hp?

*Message #1 Posted by **seth hendren** on 30 July 2003, 2:32 p.m.*

Hello to all!!

This morning i spilled coffee on my hp. i immediately turned it upside down to drain. i then went and got a wet paper towel and wiped the outside off. I thought that i should try to take the top cover off to clean under the keys but i was unable to do so. when i turned the calculator back on i got the great message asking if i wanted to try to recover the memory. when i hit the button it didn't do anything. the only button that seemed to work was the on button. i tried resetting the calculator using a paper clip under the rubber stopper on the back. when i turned it back on the buttons still didn't work. HELP!!!!!!

Re: damaged hp?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 July 2003, 3:06 p.m.,*
in response to message #1 by seth hendren

Hi, Seth;

you have which HP48? Or it's an HP49?

In any case, I read here that clear and neutral water is the only way. If you spilled coffe closer the the area between the display and the keyboard, it's exactly where the keyboard connects to the mainboard. Any substance that is "inserted" between both the keyboard "sheets" and the mainboard contact pads will cause problems.

As it is coffe, opening the calculator and removing the mainboard for a cleaning procedure is the most efficient way, but it is actualy the hardest. There are many procedures to open an HP48 and some of them are already described at www.hpcalc.org. I do not knwo exactly where in this site are these procedures available to download, but other contributors will help you better.

I have done it a couple of times and I succeed. In one of them the keyboard "sheet" had its trails "destroyed" by battery leakage and it was not responding to key presses anylonger. As the mainboard was fine, using a "donated" "sheet" recovered the calculator.

If you want to use water to solve the residual coffe, it's also possible and others may guide you as well. I did not try it so far, but I know it's possible and viable.

Wait for other suggestions, please.

Success! Oh, yes; and if you understand Klingon: Qapla'! (thanks, Ernie!)

Re: damaged hp?

*Message #3 Posted by **unspellable** on 30 July 2003, 4:28 p.m.,*

in response to message #2 by Vieira, Luiz C. (Brazil)

First remove the batteries.

Second, as a professional photographer, if we got a serious case of salt water, muddy water, etc. in a camera we would remove the batteries, then submerge it in distilled water, rinse and change the water a couple of times and keep it under distilled water until it reached the repair shop. The big mistake was to take it out of the water and let air get to it. The air would cause steel to rust and mud or salt to dry in the works.

In the case of the calculator there is not much in the way of steel to rust, so with a drastic case of coffeeitis I would consider soaking it in distilled water, changing the water a few times, then drying it as quickly as practical. Drain it and use gentle heat from a hair dryer or the like.

Obviously it would be better if you can open it, but opening has its own dangers.

Re: damaged hp?

*Message #4 Posted by **David Smith** on 30 July 2003, 6:23 p.m.,*
in response to message #3 by unspellable

In emergency cases I have used an ultrasonic cleaner loaded with distilled water (remove all the port covers, etc). Repeat three times (change the water each time). Shake out as much water as you can. Place the machine in a very low oven for around 48 hours.

This I'd like to do!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 30 July 2003, 8:00 p.m.,*
in response to message #4 by David Smith

Hi, David;

as always, your tips, suggestions and techniques are thoughtful. This is something I'd like to do, because I believe it's the best solution.

Thank you for sharing these gems.

Luiz (Brazil)

Re: damaged hp?

*Message #6 Posted by **unspellable** on 31 July 2003, 8:04 a.m.,*
in response to message #4 by David Smith

The oven scares me. I had a plastic slide rule that was warped. I got the idea of heating it just enough in the oven to straighten it. All the tick marks and lettering literally fell off!

Re: damaged hp?

*Message #7 Posted by **David Smith** on 31 July 2003, 4:23 p.m.,*
in response to message #6 by unspellable

I have cooked a lot of calculators without problem. My oven can be set to a fairly low temp (I'm not sure how low it is). Most electronics has max allowable storage temps of 50-70 degrees C. Remember that these machines were meant to be able to withstand being left in a closed car... which would probably make a good substitute for an oven... keep out of direct sun.

Re: damaged hp?

*Message #8 Posted by **Ron Ross** on 31 July 2003, 8:21 a.m.,*
in response to message #4 by David Smith

How about this idea. After you rinse two or three times in distilled water, toss a bunch of dry towels in a clothes drier. Heat the dry towels up (very hot). Then pull the towels out and toss your calc into the towel pile. Repeat every two hours or so (this avoids using an oven with a poor lower temperature control that might over heat and melt your calculator). The Towels will heat your calc and absorb the moisture. If you do have an oven that you can trust to keep the temp regulated between 110 and 130 degrees F it would be faster and better. But normal ovens may not be that reliable, Temperatures over 150 F will probably damage your calculator.

Re: damaged hp?

*Message #9 Posted by **seth hendren** on 31 July 2003, 9:29 a.m.,*
in response to message #8 by Ron Ross

Thanks to all but my calculator started working again yesterday afternoon. You can tell it's a little sticky under the buttons but all in all it works. Thanks guys.

Re: damaged hp?

*Message #10 Posted by **Howard** on 31 July 2003, 10:58 a.m.,*
in response to message #8 by Ron Ross

I left my HP42S on a warm windowsill for several hours after shaking it fairly violently edge on to get all the water out. But it seems to me that you could also tie it up in a plastic bag with a couple of those silica gel satchels that come with every electrical appliance you purchase nowdays. After all that is the purpose of them to remove any traces of moisture from the appliance.

Re: damaged hp?

*Message #11 Posted by **Michael Meyer** on 31 July 2003, 7:48 p.m.,*
in response to message #10 by Howard

I'm not sure that silica gel would do the trick quickly enough... the idea of heating is to raise the vapor pressure of the water... then the silica gel could absorb it. I suppose you could put the calc in a vacuum... that'd result in the water vaporizing.

Yes, that's a good option. Take your trusty shuttle to orbit, and throw the calc.... never mind.

I wonder if placing the calculator in the blower side of a vaccum cleaner would work? If the calculator were immersed in the flow, the entire unit would be at a lower pressure, driving out the water vapor, which would be then blown away...

When I clean calc parts, I use this method to dry the cases, boards, etc.... but I'm not sure it would work on a whole calculator.

Just some ideas.

Invalid card data

*Message #1 Posted by **mapet** on 30 July 2003, 4:08 a.m.*

Hi, I have "invalid card data" message on... HP 40G !!! The calc has no extension ports... What is going on?

Re: Invalid card data

*Message #2 Posted by **Ellis Easley** on 30 July 2003, 6:41 a.m.,*
in response to message #1 by mapet

It's like in "2001" when HAL starts singing the first song he learned. Maybe HP calculators contain all the code from previous models. See if it will do "x^y" like the HP35!

Did you buy it used?

*Message #3 Posted by **Harry (Germany)** on 30 July 2003, 10:13 a.m.,*
in response to message #1 by mapet

Maybe it has an internal RAM extention that causes that.
I have a HP48S that has 256kb RAM added internally and it displays the same message you have (and beeps) every time it is switched on.

Regards,
Harry

Re: Did you buy it used?

*Message #4 Posted by **Chan Tran** on 30 July 2003, 11:50 a.m.,*
in response to message #3 by Harry (Germany)

The 48s has the same rom as the 48sx which has card slot. The 40g doesn't have a card slot. May be some of the code for the 48 is in the 40 rom

Re: Invalid card data

*Message #5 Posted by **Ron Ross** on 30 July 2003, 11:59 a.m.,*
in response to message #1 by mapet

Well the 40G has the same CAS as the 49G. Check the memory(it is shown in the upper left corner whenever you are in an App). It should be over 200K unless you have loaded up some programs. If it is below 128K, I suspect a memory chip failure, since on a 48Gx this would signify memory corruption of a card and that happens above 128K. The 39/40G's are limited to 256K and that is what is they come with.

Try the command PINIT also (shouldn't work, but it might).

Re: Invalid card data

*Message #6 Posted by **mapet** on 31 July 2003, 3:28 a.m.,*
in response to message #5 by Ron Ross

The calc is brand new. After reset everything is ok now. But I lost all memory... :-(

HP42S Programming question

*Message #1 Posted by **Harry (Germany)** on 29 July 2003, 7:16 p.m.*

Hi guys,
if I want 110 complex storage registers, how do I get to those bigger than 99? I mean, I would need to acces them indirectly. But that does not work, as I have only complex registers to stor the adress in. And a complex number is not a valid adress.

Regards,
Harry

Some possible solutions...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 11:30 p.m.,*
in response to message #1 by Harry (Germany)

Hi, Harry;

I thought about some possibilities:

1 - Use a "named" register; I know it will lead to the use of instructions with more than 1- or 2-byte and you probably don't want this;

2 - If it is a temporary indirect addressing, stack registers may also be used;

3 - Store the complex numbers in a complex matrix other than REGS and index it and live REGS as a real-number matrix. REGS will always be used the way you need, and the indexed matrix data will be accessed by RCLEL, STOEL, ->, <-, ^ and v (four arrows). These are all 2-byte instructions as RCL IND nn and STO IND nn are, and as you'd somehow need to set up initial values and control over the index register, you will also need to set up and control indexed matrix pointers.

I used the third option in a program I wrote when I was finishing my Engineering course. I was the first student in the history of the university I was studying at the time to *stuff* a Load Flow program *in* a pocket calculator (HP42S). My first and only 10 (A+) in the whole Engineerign course.

I was writing the program firstly to run in an HP41CX, but the HP42S "saved the day". A detail: I had to completely rewrite the program in one week after spending a whole weekend "learning" the new features in the HP42S.

If you ned further information, let us know.

Best regards.

Luiz (Brazil)

Re: Some possible solutions...

*Message #3 Posted by **Harry (Germany)** on 30 July 2003, 10:09 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the suggestions, Luiz. I will probably use option 3.
What is Load Flow? Is it kind of network analyzing?

Regards,
Harry

Re: Some possible solutions...(edited: wrong info)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 July 2003, 2:44 p.m.,*
in response to message #3 by Harry (Germany)

Hi, Harry;

I wrote some wrong data in first post that I corrected here.

Load FLow is the term we used (at the time I was a student at the University) to refer to network analysis programs, you're right. It used to be a common term, I'm not sure about today.

It's a somewhat big program with about 500 lines (I wrote *more than 400 lines*) and uses 1.1 KBytes (I wrote *occupies more than 1.5K bytes*), listing only. The teacher agreeded with the program since I was able to show her that I was using complex arithmetic and no other internal matrix resource except element handling . And I did it! That's why it's too big: accelerated Newton-Raphson's convergency method in a discrete "fashion" and all data editing, handling and post calculus.

Best regards and success in your programs.

Luiz (Brazil)

Edited: 30 July 2003, 4:53 p.m.

Re: Load Flow

*Message #5 Posted by **Jeff** on 31 July 2003, 7:37 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

```
Luiz,
     Yes the term "Load Flow" is still the commonly used
term for the programs that calculate voltage and current
in electric power system networks.  I prefer the term
"Power Flow" myself, because the loads are fixed, and
therefore do not "flow".  Power flows to the loads.  Just
another of my many pet peeves...
     I would like to see that program.  Perhaps you could
send it to Dave to post in the software section for the
42S.
```

Re: Load Flow (edited)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 10:21 p.m.,*
in response to message #5 by Jeff

Hi, Jeff;

I found the first version only, still typewritten and with some correction notes. And it's not Newton-Raphson's, it's accelerated Gauss method. I need to find another updated listing, with

minor corrections. I'll scan the pages, load the program in the HP42S (498 lines... What did I have in mind!), send it to the HP48G+ and upload it to the computer so I can list it and use it in a final document. Then I'll add the necessary comments in English (original is completely written in Portuguese) so you and anyone else can follow it.

It's an academic program, developed in 1989, full of remarks, and it has a complete editor that allows you to build all matrices by answering questions about all power loads, sources and buses. This editor consumes part of the program but I had to include it so the teacher would be able to use it by simply reading the instructions and typing input data. No extra "keywork" needed.

After convergence is accomplished, you can perform load calculus with updated data. It's interesting and somehow fun reading all of this stuff again.

As soon as it's ready I'm posting it, you bet!

Best regards.

Luiz (Brazil)

Re: Load Flow (edited)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 1 Aug 2003, 9:27 a.m.,*
in response to message #7 by deleted

Hi, Jeff;

I did not restrict the size of the YBus matrix. There is a restriction for the Swing Bus as it must be bus # 1, but this restriction exists because the original HP41CX program was like this. Unfortunately I never finished the CX original version, it stops after the YBus is completed. The original HP41CX version uses X-memory to hold all YBus and in this case it holds a 10-element restricted database.

When I wrote and tested the HP42S version, it was able to build a 16 element YBus. I did not try with an HP42S+ (the way I call the 32K upgraded model) as it was not even mentioned at that time, but as I have one this "big" now, I'll load the program and test it.

Thank you for your interest.

Best regards.

repair hp 27S calculator

*Message #1 Posted by **Bob Plachta** on 29 July 2003, 6:40 p.m.*

I have an HP27S calculator that I've been using for 15 years. Recently the calculator started beeping when I pressed the multiply or divide keys, but still worked okay. Now those keys have started "sticking" sometimes, and I'll have to press them several times before they will display. However, they don't usually beep anymore. Now the plus and minus keys are also starting to stick sometimes, but they don't beep when pressed. Has anyone experienced either of these problems (beeping or sticking keys), and do you know how to fix them? I thought maybe circuit cleaner would help, but I can't get the calculator opened. Does anyone know how to open a 27S. Thanks for any suggestions!

Re: repair hp 27S calculator

*Message #2 Posted by **Randy Sloyer** on 30 July 2003, 12:48 a.m.,*
in response to message #1 by Bob Plachta

Circuit cleaners are not the answer. Don't go there, as they can cause more damage, depending on the formulation.

It sounds like possibly two problems.

One, a loss of connection between the keyboard and logic board. This would explain the multiply and divide key behavior. After opening, you'll have to shim the foam pad that holds the keyboard connector against the logic board to solve this one.

Two, if it beeps and displays "Memory Clear" or "Machine Reset", you might have fractured solder connections on the 8k ram chip or a bad connection somewhere. It will take at least 5X magnification to see the cracks. Very subtle.

See the Rosetta stone of Pioneer opening here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5

Post again should you have any questions.

HP-71B Strange Behavior

*Message #1 Posted by **Jeff** on 29 July 2003, 1:26 p.m.*

I have tried to turn on my HP-71B and the display shows only > . When the batteries are inserted or the power cord is installed, this is the only thing that happens, nothing works! Is there a master Reset that is different from the ON / sequence? Any ideas? Jeff

Re: HP-71B Strange Behavior

*Message #2 Posted by **Holger** on 29 July 2003, 3:00 p.m.,*
in response to message #1 by Jeff

The manual says if the 71B locks up, do the following:

- Remove power supply, batteries and modules - Hold 'ON' for approximately 30 seconds - Insert batteries and press 'ON'

You should be greeted with MEMORY LOST

Re: HP-71B Strange Behavior

*Message #3 Posted by **Jeff** on 29 July 2003, 7:39 p.m.,*
in response to message #2 by Holger

Unfortunately this did not work. I even tried holding the ON button down for 4 min. Still when the batteries were put in, the same result >. Is there any other ideas to try? Please let me know. Jeff

Re: HP-71B Strange Behavior

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 11:41 p.m.,*
in response to message #3 by Jeff

Hi;

is there a chance taht one (or even some) of the keys is stuck? I mean, do all keys "sound" and act the same when pressed? This is just a guess.

I also have observed that some calculators "freeze" for a while and in particualr the HP41 fullnut. In most situations, opening the calculator and shortening the terminals of both big electrolytic capacitors is enough to completely reset the calculator.

I have already opened my HP71, but I did not inspect it for components, I was just "having a look". It is, as all HP calculators, very interesting inside...

Should you try this procedure, please be carefull and make sure you'll shorten only the capacitors in the power supply. Please, take all ESD precautions and use a low-value resistor (about 10 ohms) instead of a straight wire. It's safer.

Best regards, success and let us know what happens.

Luiz (Brazil)

Re: HP-71B Strange Behavior

*Message #5 Posted by **Jeff** on 31 July 2003, 8:54 p.m.,*
in response to message #3 by Jeff

Someone by the name of Doug sent me an e-mail describing a way to correct this problem. Here is the e-mail he sent: "Two things to try. I had the same thing happen with a unit that I purchased brand new and used for a couple years then one day it did about the same. Plug in the adapter, then turn the unit on. Hold the on key for about 30 seconds. Then turn it off and on, then try it. If no result then remove a/c power plug and all batteries, and let it set for 24 hours, not any less. Do not push any buttons once power is removed. After 24+ hours, press the on button and hold down for 2 minutes. Do not press and release even once. It cleared the unit I had and never had it happen again." Voila! This worked. Thanks to all who helped. Jeff

Re: HP-71B Strange Behavior

*Message #6 Posted by **Victor Koechli** on 30 July 2003, 4:25 a.m.,*
in response to message #1 by Jeff

Does the calculator respond to pressing ON and / simultaneously? If so, you could try an INIT: 1 (by simply pressing <ENDLINE>) which is the approximate equivalent of a machine reset (ON + C) on the Pioneers, i.e. it just gets you out of any infinite loops and into a defined state (with USER mode off so all standard functions are available again. It will not destroy any data except maybe, if I remember correctly, the command stack.

Next thing you could try is INIT:2 (ON /, then 2, then <ENDLINE>) which does a ROM check. By the speed of it, I'd think it is merely a checksum test, but it'll still tell if any of the ROMs are faulty.

If the test passes and your machine still won't run, you could have a problem with the RAM or the main PCB. I have no knowledge about the 71s internals but from the amount of RAM initially installed (17.5K) I'd guess that 16K are in one chip and the lower 1.5K are in another. The OS uses the lower addresses first, especialy for its internal purposes, so that's where I'd look for a problem. You could have a hairy crack in a trace on the PCB, for example, which, if you find it, would be repairable.

Keep us posted about any results.

Cheers, Victor

*Message #7 Posted by **Stefan Hauschild** on 31 July 2003, 6:12 a.m.,*
in response to message #6 by Victor Koechli

I have had this problem a few weeks ago. The calculator was "frozen" and with the known methods nothing was to help. So I removed the batteries and forgot the thing for about two weeks. After that period I gave it a new chance and put some batteries in. The unit responded in a normal way and all was fine. I think there was some capacitor or a high resistance CMOS circuit that held some voltage for a few days. But maybe it was a mechanical problem or wrong temperature... Noone knows :)

Best regards

Stefan

LED failure

*Message #1 Posted by **Matthias** on 29 July 2003, 1:26 p.m.*

I`ve got a HP67, which is in pretty nice shape, even the card reader still works, just the minus sign for the exponent doesn't show up.

Did anyone have a similar problem, is it somehow likely to be a bad soldering joint, or am I really "lucky" enough to have a damaged LED?

What's your best guess, I'm still hesitant to open it.

Re: LED failure

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 4:27 p.m.,*
in response to message #1 by Matthias

Hi, Matthias;

If I am not wrong, all classics have a complete position in the display dedicated to the minus sign for the exponent of ten. From the Woodstocks on, you'll see less digits and a "shared" portion (two or three digits) that act sometimes as least significant digits for the mantissa and others as the exponent of ten.

I'm mentioning these facts because if it is possible to activate all segments in this position then we could verify if it is a matter of bad contact or not. Anyway, based on what you described, all of it may be out of operation. This is not bad, because each digit has a dedicated connection common to all cathodes (in some cases may be anodes) and each anode in all segments taht share the same position (a, b, c, d, etc.) are connected together. This is a common arrangement and is driven by multiplexed signals. You probably know about that, but maybe others don't.

Well, it is possible that a single bad connection is the cause. IN all Classics (HP55, HP65, etc.) and in the HP67, the display is arranged in four blocks with four digits each. I would do the following: I'd open the calculator and identify the block that contains the exponent signal (the rightmost) and I'd carafully and re-solder all of its terminals. If you decide you should test before or inspect to find with pin is not connecting, no problem. To be honest, I'd do the same if I have the time to search for the problem.

Hope this helps.

Success! (I did not spell check the text, so forgive my mistakes, please...)

> Please, in which language is Qapla' written?

Klingon! According to the Star Trek universe, that's the word for "Success" in that language, and is used as a "farewell" word.

> Quote:
>
> In Portuguese it's almost the same as in English, with one single "c" and an extra "o" in the end: Sucesso.

But it's "Ã©xito" in Spanish and "sukceso" in Esperanto. In Spanish, "suceso" is a big event.

Once I read that "escova" is a brush in Portuguese (but it sounds like "escoba" in Spanish, which is a broom. And "vassoura" was the broom, but that sounds like "basura" in Spanish, which is the trash. If any of this is true (and I have no way of knowing, since my knowledge of PortuguÃªs is extremely limitado), it's got to be quite a source of confusion. Incredible, since Portuguese and Spanish _should_ be more closely related!

Re: LED failure

*Message #8 Posted by **David Smith** on 29 July 2003, 4:34 p.m.,*
in response to message #1 by Matthias

It could be a bad LED, but the HP67 has some really weird circuitry involved in generating the minus signs. There are several transistors on the keyboard used to make them. If I remember right, both minus signs are generated from the same digit driver. Tony Duell could tell you a lot more on the subject.

In the Victor Toth´s page you have some information about similar problems. I will try to copy that information and post it. And in the service manual of the HP-97 you have also some descriptions of the led´s working (HP-67 and 97 are very similar)

Cheers

Jon

Re: LED failure

*Message #15 Posted by **Jon** on 30 July 2003, 4:55 p.m.,*
in response to message #14 by Jon

Here you have the promised information. I hope it can help:

Usually, if the same segment is dead across all digits in a calculator, the segment driver is suspect. In the case of the HP-67, the segment driver chip is the smaller of two chips located underneath the LED display modules. It is easy to map this chip's inputs and corresponding outputs. This chip contains seven independent driver circuits. When a single segment is dark across the entire display, chances are that one of the driver circuits is dead. Replacing the entire chip is often not an option, since substitute chips are hard to find. However, a single driver element can be replaced using a 2N4401 transistor. The base of the transistor should be connected to the corresponding input, the emitter to the corresponding output, and the collector to pin 15 of the segment driver chip. Using fine wire-wrap wire, you can place the transistor in such a way so that the keyboard/display PCB still fits snugly against the calculator's plastic backbone, and the case can be closed securely. If the driver circuit in the segment driver chip is shorted, it may be necessary to disconnect (cut) one or both corresponding pins in order for the substitute transistor to work correctly.

Re: LED failure

*Message #16 Posted by **David Smith** on 30 July 2003, 6:27 p.m.,*
in response to message #15 by Jon

The anode driver is a standard off the shelf chip that is still made. NTE even has a replacement in their product line. I cant remember the non-HP part number, but it is something like CA3080 or CA3083. Again the HP67 has weird circuitry driving the sign segments that is independent of the anode driover chip.

Re: LED failure - Conclusion?

*Message #17 Posted by **Matthias** on 2 Aug 2003, 4:01 a.m.,*
in response to message #1 by Matthias

Thanks to all, a good deal of helpful infos you guys can provide indeed. I'm impressed.

That much for the positive side. After a rough evaluation of what I learned from you and the manuals and considering the fact that ALL elements of the display (even the minus sign for the mantissa) but the one for the exponent show up, I have to assume that the LED is likely to be the problem.

So, now some further questions (always assume I'm not an expert like you, I know basics about electronics but I never opened one of those so far): What's the cure? Does every digit have a single 7seg LED, are there groups or is it a complete bank? Can it (to whichever extent I need) still be purchased or can anyone provide it as a spare part?

I waited almost 20a to get one of them, it's supposed to be perfect, even if the only calculations I do nowadays

are how much month will be left after the end of the money, hi.

Thanks again.

Matthias (Germany)

Re: LED failure - Conclusion?

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 2 Aug 2003, 8:12 a.m.,*
in response to message #17 by Matthias

Hi, Matthias;

What I can tell you is that HP offered LED digits pack as standard product, so I guess you'll be able to find the same (or equivalent) LED assembly in other HP products or even HP LED assemblies in other brand equipment as well. remember finding a four-digit HP assembly in a portable, battery operated RPM metter, a small, rugged handy tool used in our electric lab when I was in the university. One digit was missing and I and two other guys were assigned to repair it. I was surprised for finding an HP logo stamped in the LED assy.

I think that the only way out is finding a replacement, from a donator unit. Old, trashed equipment may be a source as well. Why not to try? They will be "rated" 1975 to 1982, probably. I hav a Test and Measurement catalog where these LED's are announced. I'll scan the image and post it here later.

Best regards and success.

Luiz (Brazil)

Re: LED failure - Conclusion?

*Message #19 Posted by **David Smith** on 2 Aug 2003, 4:03 p.m.,*
in response to message #17 by Matthias

The problem could still be a bad transistor, etc on the HP67 keyboard. The HP67 middle segments are really weird circuitwise. They are all totally independet of the rest of the segments.

The LED's are packaged like a DIP circuit. Five digits to a package. Your only source is another calculator. All the classic series machines use the same displays. They come with either gold or silver leads. They are not quite the same! The digits are slighty different sizes. There is also a letter on the back of each package. It indicates the relative brightness level. The letter is usually in the range of K to M. One or two letters different is usually a pretty good match.

Re: LED failure - uneducated suggestion

*Message #20 Posted by **Renato** on 3 Aug 2003, 6:04 p.m.,*
in response to message #17 by Matthias

Matthias,

I´ve never examined a classic display module, but I´ve seen 97, woodstock and spice displays. I have a woodstock display module with two bad segments in the third digit, and I don´t think there is anything I can do, except find a parts donator machine.

In your case, I would try to use another segment to indicate exponent sign, by rerouting connections on the display assembly. If this did not work, then i would look for a single , third party led, to indicate exponent

sign. I have no idea if these are feasible, but I think it would be fun to try to make it work.

Good luck,

Renato

HP-41CV - Card Reader

*Message #1 Posted by **Frank V** on 28 July 2003, 6:51 p.m.*

The card reader on my HP-41CV is not responding. I have tested the same card reader on the HP-41C and it works as expected. I don't know what the problem could be? Can someone out there please guide me in the right direction. Thanks.

Re: HP-41CV - Card Reader

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2003, 7:12 p.m.,*
in response to message #1 by Frank V

Hi, Frank;

what you wrote leads to I/O problems (most likely to be bad contact) in your CV. The best remedy would be to open the calculator and clean the contacts between the BATT/IO assembly and the calculator contact pads. You could also test another extension (printer, wand, ROM module) in port 4, the one used by the reader, and see if they also fail.

If the reader works fine in the HP41C, the HP41CV I/O is the first to be checked.

Success. And let us know if you need more advice.

Luiz (Brazil)

Hi Hugh,

you got a bug in your program. It finds 35 as a primnumber. I think it does not really check for 5 beeing a divider of the number thats beeing tested.
I will look deeper into it now to find where it is.

Regards,
Harry

Re: HP-41 Programming Challenge

*Message #5 Posted by **hugh** on 31 July 2003, 6:06 a.m.,*
in response to message #4 by Harry (Germany)

aaawwl. and i thought i had it nailed.... :-)

after more testing, i am not happy with this submission of mine. it appears to start quite fast and after a minute or so, is way ahead of the division programs listed here. however, its long term performance

suffers because the algorithm can have worst cases later on.

i submitted another program below, which (although a bit long) is complementary to the division programs. its a lot slower at first, but gets better (against division for bigger numbers). say you start at 100,000. its happy.

the ideal agorithm would be some mix of trial division and the "tortoise".

regards,

What About an HP-25 Programming Challenge?

Sometimes I challenge myself... (edited)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 1:15 a.m.,*
in response to message #6 by Trent Moseley

Hi, Trent;

I always like to challenge myself first and then I go for the fight!

I tried once to write a program for the HP25 and I did not succeed. It was supposed to compute nPr and nCr (permutations and combinations given n and r). I succeeded writing it for the HP33, that is essentially an HP25 with subroutine and a few extra functionality. I also wrote it for the HP55 and HP38.

The key its the fact that both HP55 and HP38 have [n!], primarily needed to compute both nPr and nCr. Both HP25 and HP33 do not have [n!] and it is necessary to implement it OR add some math simplification based on numbers entered. I simply coded the original nCr and nPr expresions so they fitted in the HP33 memory. The only restriction is that neither n nor r might be greater than 69. Would it be possible to write a program for the HP25 to compute both nPr and nCr? In my program for the HP33C/E, you simply do this:

```
key in:  press:   display
         [f]CLEAR[PRGM]
  n      [ENTER]      n
  r       [R/S]      nCr
          [x<>y]     nPr
```

Pressing [f]CLEAR[PRGM] before [R/S] or before inputting data ensures that the calculator is "pointing" to the first line of the program. I will add the listing below, but should you prefer trying from scratch, you should simply not to look at it |^). I accept challenges if I think I have a chance to succeed, but I do not feel comfortable challenging... I cannot explain why! I'd rather showing what I achieved and ask for new, different, clever solutions.

Thanks.

Luiz (Brazil)

Re: Sometimes I challenge myself... (edited)

*Message #8 Posted by **Victor Koechli** on 29 July 2003, 2:06 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Actually, by using the n! function, you restrict yourself to n <= 69 on the older calcs, or n<= 253 on then newer ones. By programming a loop instead that keeps multiplying and dividing as needed, you will need more time (and space, of course), but you will get an extended range of input values that the program can compute for.

I have no access to my calcs at the moment (they're at home, of course, and I'm at work right now), but I'll try to find my old HP41 program I wrote for these functions. Our math teacher got a thrill out of presenting problems that could not be solved with the calculator, and that's why I wrote a program to circumvent these limits.

I could, however, write a HP49 program if I find the time to - I have that one at work with me. But it would be fun to see if it fits into the HP25...

Cheers, Victor

Allow me some questions?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 2:34 a.m.,*
in response to message #8 by Victor Koechli

Hi, Viktor;

thank you for the additional information.

In fact, I was aware of the fact that the [n!] limits for a single factorial are not the same when computing nCr or nPr. I tried to mention this fact when I wrote "add some math simplification based on numbers entered", but I simply missed it. Thank you.

I'm not sure if both HP11C and HP15C were the first HP pocket calculators to offer Py,x and Cy,x as standard resources, but I know the algorithm used in both works things out in a way these limits

are surpassed. What I want to know is if it's worth detecting overflow before it happens and mostly if it is possible to do it. I did not take spare time to think of it, but it seems to me it's not possible to detect such overflow occurrence in other way than using calculator's overflow detection after each successive multiplication to accomplish simplified terms for permutation and combination. (did I write a concise, understandable text? I hope so...:)

If I understand it correctly, your program for the HP41 extends [FACT] limits so it computes nCr and nPr with n or c >69 if final result is <= 9.99999999E99. Is it correct?

I'm curious to see it.

About developing a program for the HP49G: I think using RPL would be very interesting, mostly to handle internal factorial limits. What makes me lazy about this is that all RPL models, since the HP28C, already have COMB an PERM as standard resources...

Best regards, Victor.

Luiz (Brazil)

Re: Allow me some questions?

*Message #10 Posted by **Victor Koechli** on 29 July 2003, 5:43 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have not found a way to detect overflow in advance, so the program has to go for it and see if it overflows or not.

My HP41 program circumvents the limit of FACT by explicitly multiplying and dividing things out. The implementation is not difficult. Consider

$$nPr = \frac{n!}{(n-r)!}$$

For n=7 and r=3, this yields

$$7P3 = \frac{7x6x5x4x3x2x1}{4x3x2x1}$$

leaving only 7*6*5=210 after cancelling out the corresponding factors in enumerator and denominator. Similarly,

$$nCr = \frac{n!}{r!(n-r)!}$$

so

$$7C3 = \frac{7x6x5x4x3x2x1}{3x2x1x4x3x2x1} = \frac{7x6x5}{3x2x1} = 35$$

In the second case, it can be debated whether doing the multiplications (more accurate, but higher risk of overflow) or the divisions (less accurate, lower risk of overflow) first is better. I think I have used an intermediate way doing both alternatingly, so 7C3 is evaluated as 7:3x4:2*5 (=35, at least on the HP49G I have available right now).

I will try to find my program, but be warned: Chances are not that high, it's a long time since. If

I don't find it, let's simply write new programs. It's fun, after all! Let's try to fit it into the HP25!

And let's not forget to thank Harry for starting this challenge, and Axel for restarting the thread.

Cheers, Victor

in response to message #10 by Victor Koechli

```
Well, here's mine.
Some pitfalls:
. If you calculate COMB(8,3) as 8/3*7/2*6, the answer is not correct (it's
56.00000001)
. If you calculate COMB(335,167) you get an overflow, yet
  the answer is < 1e100
. Calculate C(n,p) as C(n,min(p,n-p)) to avoid lengthy calculations (eg
C(1000,999) = C(1000,1))
. C(n,0) = 1

This does it all, and the contents of reg Z are preserved
(and end up in Y afterwards). Answers larger than 1e10 may
be slightly inaccurate due to roundoff errors. Not much I can do about
that.

Luiz, Victor,

Here is a program for the HP-25 that calculates either C(n,r) or P(n,r) for all cases where C(n,r) and P(n,r) are less than 1e100. The program fits comfortably in the 49 steps of program memory available on the HP-25. I haven't tested these routines on an actual HP-25, but I have tested them on the simulator found on this museums HP-25 page.

The C(n,r) routine is based on the algorithm described by Victor. It makes use of the identity C(n,r) = C(n,n-r), selecting the minimum value of r and n-r for the calculations. In the loop body, the division is done first, to avoid overflows in cases where the intermediate calculations exceed the dynamic range of the HP-25. Since doing division first can result in non-integer results, the final result is rounded to the nearest integer. This routine does work for the case C(355,167), returning a value of 3.0443588e99. Incidentially, the HP-11C also works for this case, returning a value of 3.044358e99. There is a possibility that the final rounding does not produce the correct result, but all the cases I've tested it with seem to work fine so far.

The P(n,r) routine uses the identity P(n,r) = n x (n-1) x (n-2) x ... x (n-r+1). No divisions required here, so the result is always an integer. There is no limitation on the values of n and r, as long as P(n,r) is less than 1e100. For example, P(5000,27) is calculated to be 6.9446225e99.

To use the C(n,r) routine, position the program counter at step 0 if it's not there already, key in n, hit enter, key in r and hit R/S.

To use the P(n,r) routine, position the program counter at step 30 (GTO 30), key in n, hit enter, key in r and hit R/S.

Enjoy,

Eamonn.

*Message #16 Posted by **Werner Huysegoms** on 30 July 2003, 3:00 a.m.,*
in response to message #15 by Eamonn

try C(90,7). It should be 7471375560, but your program returns (probably) 7471375562, if you would have done the calculations as 90/7*89/6*88/5*87/4*86/3*85/2*84, it would have returned 7471375566. That's why I calculate it as 90/1*89/2*88/3 etc guaranteeing integers all along. BTW, there's no need to do the divisions first in your case. Either the result will overflow, or none of the intermediate calculations will. Werner

Updated HP-25 C(n,r) program

*Message #17 Posted by **Eamonn** on 30 July 2003, 8:50 p.m.,*
in response to message #16 by Werner Huysegoms

Werner,

I don't have a HP-25 at hand, but I calculated C(90,7) on a HP-11C, using the algorithm implemented in my original program. It gives a result of 7471375562, as you expected, which is incorrect.

When I checked my program on the HP-25 simulator I didn't come across any failure cases. This seems to be because of the 17 digits of percision that the simulator uses. On the simulator, the program I wrote does return the correct value of C(90,7) = 7471375560.

I had a look at the programs that you wrote for the HP-41 and now I see how you very elegantly avoided the overflow that can occur with the intermediate calculations.

Here is a version of your HP-41 program for the HP-25. It will not overflow for C(n,r) < 1e100 and should return the correct value for C(n,r) < 1e10. It does not preserve the Z register, as your program does, but then again the HP-25 instruction set isn't nearly as powerful as the HP-41 instruction set. It requires the use of several registers, but uses your method to calculate the minimum of r and n-r to save a couple of steps. There's still room to have both this program and the other program that calculates P(n,r) in the 49 steps of HP-25 program memory.

Regards,

Eamonn.

I'm not a statistical power user but my 32SII returns 1,6712 e 105 for C(355,167) and my 11C flashes with 9,999999 99 as a result.

Re: Allow me some questions?

*Message #19 Posted by **Eamonn** on 29 July 2003, 6:16 p.m.,*
in response to message #18 by Julián Miranda (Spain)

Oops I mis-typed in my original message.

That should be C(335, 167) = 3.0443588e99, not C(355, 167). C(355,167) is indeed 1.671163e105.

Rgds.,

Eamonn.

Gentlemen, that's amazing!

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 31 July 2003, 1:48 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi all;

I read the posts in this thread again and I can tell you, if you allow me so: if I am the teacher and these are your answers for the task, I'd never feel more proud for them! I'm impressed.

I think that dealing with "restrictions" is teasing, and dealing with resourceful equipment may be confusing. Using different resources and combining their power so you can achieve results is sometimes a matter of "taste" and specific knowledge.

On the other hand, using all available resources that are not enough to accomplish the task without an specific "treatment" and find a clever "way out" with them is way beyond "taste" and specific knowledge.

I'm amazed.

Best regards.

Luiz (Brazil)

What to do with new HP-25

*Message #1 Posted by **G Evans** on 28 July 2003, 9:17 a.m.*

I picked up what appears to be an 'as good as brand new' HP-25 , perfect box, manuals, charger, bag, and machine. I fitted new NiCds. Bag even has that new perfume smell.

Should I :

1- Use it instead of my Casio 2- Moth-ball it hoping it appreciates 3- Keep it but do not use it just look at it now and then

I'm concered it might go the way my other 25 went: fried memory chips.

What would you do?

George (UK)

*Message #2 Posted by **Axel Poqué** on 28 July 2003, 9:28 a.m.,*
in response to message #1 by G Evans

You missed an option:

4- Give it to me for safekeeping :-)

But seriously, I would use it, but I wouldn't take it to work. If you want to use it as your everyday calc I'd suggest getting another cheaper one in not-as-good condition. (I wouldn't want to risk my NIB 41CX at work.)

Axel

*Message #3 Posted by **Harry (Germany)** on 28 July 2003, 9:39 a.m.,*
in response to message #1 by G Evans

I would chose option 3. And get another one to play with.
I got a very good 29C that my brother gave to me 5 years ago cause he bought a 32Sii :)). I take it out of its like new box every now and then and I am always happy to see it is still in a very good condition. I would regret it so much if I used it and then scratched it.

Regards, Harry

*Message #4 Posted by **David Smith** on 28 July 2003, 12:23 p.m.,*
in response to message #1 by G Evans

If you store it, seal the battery pack in a couple of zip lock bags... you don't want to wind up with a corroded machine 20 years later.

If it is in like-new condition I would put it away and get a not so nice one for everyday use.

Re: What to do with new HP-25

*Message #5 Posted by **Chan Tran** on 28 July 2003, 12:33 p.m.,*
in response to message #4 by David Smith

I would definitely use it. I would take good care of it though. It's no fun to have it and not using it. It may worth more later if you save it but then really how much it will be worth? $1000? $2000? Even if I would lose that much money in the future I don't want to miss out the fun of using one.

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2003, 11:53 p.m.,*
in response to message #1 by G Evans

Hi, G. Evans;

I'm no collector, instead I'm a user.

That said, if I'm a collector, I'd keep it and never leave home WITH it.

If I intend only having a daily-use calculator, I'd sell it (or trade it) so I can buy (or have) OTHERS and use at least one, cheaper and more powerfull, and keep the remaining one(s) as spare.

My thoughts. I'm no collector.

Best regards.

Luiz (Brazil)

Re: What to do with new HP-25

*Message #10 Posted by **Victor Koechli** on 29 July 2003, 2:13 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Give it to me as a present. You can be absolutely sure that I will take good care of it ;-)

Of course it'll be used every day, as that's what calculators are for in the first place, right? But then again, I'm not a collector, but rather a fan of these machines, and I just *love* to use them.

BTW: Do you think that by just using it from time to time you could fry its RAM chips? I certainly don't hope so...

Cheers, Victor

Re: What to do with new HP-25

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2003, 2:48 a.m.,*
in response to message #10 by Victor Koechli

Hi;

I do not think RAM chips would "fry out" just because you are using the equipment, and if so, then you have an equipment with a lazy electronic design.

What I do not know is: would any X-MOS (X == C, P, V, N, whatever...) component be timeless? Of course they are not, and under different circumstances, either bipolar components can be destroyed or altered in such a way they will not work properly.

What in fact bothers me is that there are no replacements and, at least so far, no hardware emulators for these calculators. Once fried, the owner should pray for a donated organ. I found one 32KRAM chip in a sound board that was used in an HP42S and it worked perfectly fine (at least I was not yet called back...). Waht to do if a RAM, or an ACT chip dies? And there is no way to be sure that it's not gonna happen when you switch your calculator ON next time... Current surges are also dangerous in some circumstances, as well as ESD.

I prefer the LCD ones. Although they deal with µA and excessive current would fry them easiear, protection is enhanced in their case. At least I hope so... If not, some of them are still available and are easier to be replaced.

Best regards.

Luiz (Brazil)

Yeah, now what will you do?

*Message #14 Posted by **Norm** on 30 July 2003, 11:45 p.m.,*
in response to message #13 by Harry (Germany)

I too will volunteer to help you keep it safely stored away (at my house).

this is what I will do ..

*Message #15 Posted by **G Evans** on 1 Aug 2003, 6:05 a.m.,*
in response to message #13 by Harry (Germany)

I will keep the little Woodstock in its case along side my 35 and 45 in my studio. Every now and then I will allow myself the luxury of some calculations using the 25. When my hands are too dirty I will use my Casio fx-61F for the donkey work.

To be honest for complex math Matlab or Mathcad can save a lot of programming time with good graphics thrown in- but maybe not as much fun !

thanks to you all !

George

Looking for Susan Wechsler

*Message #1 Posted by **Heather Mackenzie-Campbell** on 27 July 2003, 12:58 p.m.*

I think Susan Wechsler, who authored articles on the HP71B, is the same Susan Wechsler who attended Woodrow Wilson Highschool Class of 1973. I googled her name and found a possible link to the Susan Wechsler who designed the HP71B. Not surprised.

If you can contact Susan and she did in fact graduated from Wison, Long Beach, California in 1973, please let her know the 30 year reunion is August 8-10th. www.wilson73.com

Heather

Re: High School Reunions

A wise man (wiseguy?) once told me, in anticipation of my own high school reunion, "The most interesting stories will be those of the people who *don't* show up."

I attended, but nearly everyone I'd hoped for wasn't there . . .

I am confused... Hey, Norm, this may be of interest

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2003, 1:43 a.m.*

Hi;

I've been walking around e-Bay announcements and found these two:(I think Norm would like to check the first one)

http://ebay3.ipixmedia.com/abc/M28/_EBAY_3df2cbc5742c01c8fe46bee5c3ee2955/i-1.JPG

http://www.globalarray.net/user/ykwong/HP34Ca.jpg

Well, I am somewhat lost about both prices: the first one is almost 15% of the second one...

What is an HP34C worth?

Images are associated to links; please, just click them to see e-Bay's item.

Luiz (Brazil)

HP-34C Hi Luiz,

*Message #2 Posted by **Norm** on 27 July 2003, 4:02 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

If a 34C is busted to bits, and good to try and put the bits back into the injection molder and make a new calculator, then its probably good for about $50 on eBay.

If it has a charger, a furry case, and it works, its probably worth about $100 .

Those auctions seem to have the cardboard box and all the manuals. If the calculator works good, either of them might fetch $200 - $260.

Appreciate the update, but I was not going to buy any HP-34C right now. After all, I can't own all of them !!

Not 'til I find my way out of this recession.

Anybody seen any good engineering jobs lately ?

Or maybe its time for me to join the boardroom, and get my key to the executive washroom. I could go with a 7 figure salary, and it should be easy enough..... all I would have to do is discontinue products that are sole-sourced and selling well, oh yeah, and cook the books at quarterly earnings time.

I see... 8^) (n.t.)

The key to the difference in price is the spelling of "calculater" in the first item's title. It didn't answer a title search for "calculator", and hence had fewer bidders.

Characteristics:HP 9871A printer

*Message #1 Posted by **Jack T.Lee** on 26 July 2003, 5:02 p.m.*

Dear Friends, I'm looking for the pin assignment of the DC-37 port of the above daisywheel printer.And for the data of the two TO-3 case power transistors from the underside of chassis of the printer (serial voltage regulators) (probably blown out). Any kind help from your party is much appreciated. Many thanks in advance! Best Regards,

Jack

The 98032A Option X71 parallel interface is used to connect the 9871A printer to a 9825, 9835, or 9845 calculator/computer. it might be possible to connect the 9871A to other calculators but the 9825 is the only model I am familiar with.

From the 98032A manual, pages 60-61, "9871A printer Interface":

(This manual is on/in CD6 in the latest Museum CD/DVD-ROMs. I can't look at mine now, my DVD drive is broken! but I have a printed manual)

printer 37 pin connector pin:printer signal name (98032A Interface Connector pin:98032A signal name) [wire color code]
