12:CALC7 (A10:DO7*) [90], 13:CALC6 (A11:DO6*) [903], 14:CALC5 (A12:DO5*) [9], 32:CALC4 (A13:DO4*) [97], 31:CALC3 (A14:DO3*) [96], 30:CALC2 (A15:DO2*) [95], 29:CALC1 (A16:D01*) [94], 28:CALC0 (A17:DO0*) [93], 26:GND (A18:GND) [6], 9:CMD (A19:PCTL*) [1], 10:HLT (A21:Preset*) [3], 33:GND (A24:GND) [98], 27:GND (B18:GND) [Inner Shield], 11:FLG (B19:PFLG*) [2], 5:COVER ON (B20:PSTS*) [4], 8:BUFR RDY (B22:STI0*) [5], 7:READY (B23:STI1*) [7], 34:GND (B24:GND) [901]

Also, at the 98032A Interface Connector, pin A25 (Chassis) is connected to the Cable Shield. And the 98032A Configuration Board must have wire jumpers installed at positions 4 and 5. (This configuration board wiring and cable make a 98032A into "Option X71".)

The wire color codes are the same as resistor color codes: 0:black, 1:brown, 2:red, 3:orange, 4:yellow, 5:green, 6:blue, 7:violet, 8:gray, 9:white. When there is more than one color listed for a wire, the first color is the insulation color, the second is the wider stripe, the third is another, narrower stripe.

*Message #3 Posted by **Jack T.Lee** on 28 July 2003, 6:18 p.m.,*
in response to message #2 by Ellis Easley

Many thanks to you,Ellis,for your kind message! It is very helpful to me.I will investigate thoroughly once more the pluggable interface PCB to compare it with your kind info.What type of calcs are you interesting

of? If I can be useful to you,please,ask me.I am very grateful to you for your kind service and I feel obliged myself towards you. I'm still hunting the circuit diagram of the printer in question for making known to me the type of the voltage regulators'transistors to be changed into the good ones. If somebody of your friends would have it(the drawing) or have already repaired that printer,I am grateful in advance for any info message on this matter. The best regards and the best greetings from the Polish Coast to you ,Ellis and to you all,Friends!

Jack T.L.

Re: Characteristics:HP 9871A printer

*Message #4 Posted by **Ellis Easley** on 30 July 2003, 12:15 a.m.,*
in response to message #3 by Jack T.Lee

You're welcome, Jack. I'm interested in all calculators! and many other areas, especially test and measurement equipment.

I don't have a 9871A printer and there is no documentation for it in the Museum CD-ROM set. However, if you can find any HP part numbers on the devices you are wondering about, we might be able to find out what standard component types they are. If they are on the bottom of the unit the markings might have rubbed off, but hopefully there is some marking left.

HP used a fairly regular component part number system, with four digit prefixes for families of components and four digit suffixes. Sometimes they truncated the prefix if space was limited on the device package. Here are some examples of prefixes I found in my service manuals:

```
1818-xxxx memory IC's
1820-xxxx digital IC's other than memories
1826-xxxx analog IC's

1850-xxxx PNP germanium transistors
1851-xxxx NPN germanium transistors
1853-xxxx PNP silicon transistors
1854-xxxx NPN silicon transistors
1855-xxxx FET
1884-xxxx SCR (HP used them for power supply crowbars)
```

However, I found 1820-0477 for an LM301AN op amp, and 1820-0493 for a LM307N op amp (and 1820-0430 for an LM309K +5V regulator) - maybe these were early IC part number assignments made before they developed the system of IC family part number prefixes.

HP also used alpha-numeric prefixes for IC's that they made, such as 1LB3-0003 for the HPIL chip.

I know your printer has TO-3 parts, but I found the following part numbers for TO-220 three-terminal regulators in a digital voltmeter:

```
1826-0122 7805
1826-0396 7815
1826-0214 7915
1826-0527 LM337T
```

This just illustrates that parts of this type have the same part number prefix (1826) and that the part number suffix bears no relationship to the standard part number - HP probably just assigned part numbers sequentially as they were used in designs.

I looked for TO-3 devices in my service manuals. Here are the parts I found:

```
1820-0430 LM309K (+5V regulator - note 1820 prefix)
1850-0021 Delco 2N441 (I think this is a TO-3)
1850-0098 "PNP germanium 300 kHz 250 mA"
```

```
1853-0059 Motorola 2N3791
1853-0063 "PNP silicon selected"
1853-0305 Motorola 2N5875
1854-0063 2N3055 (under "Mfr. Part Number", says 1854-0064 - might be HP selected)
1854-0225 "power NPN silicon" (in Harrison power supplies)
1854-0589 Motorola MJ3772
```

That's all I can find so far! Lots of TO-220's, but not too many TO-3's. All of the transistors were used as series pass elements in voltage regulators. There is a partial HP part number cross reference available - we might have to look in the Archives for it. Let me know if you can read any of the numbers on your devices.

Re: Characteristics:HP 9871A printer

*Message #5 Posted by **Ellis Easley** on 1 Aug 2003, 8:45 a.m.,*
in response to message #3 by Jack T.Lee

I found a few more TO-3 devices in HP service manuals:

```
1826-0123 "-12V regulator"
1826-0631 "IC:regulator"
1853-0310 2N4398 (PNP silicon)
```

Based on pin assignments, I think 1826-0123 is an LM320K-12 or an LM7912CK. Judging by a photograph showing a manufacturer's part number, the pin assignments in the schematic, and the resistor values which were used to set the output voltages, I think 1826-0631 must be an LM350K, an adjustable (1.2-33V) three terminal positive regulator with up to 3A output current.

15C Keyboard Test Error

*Message #1 Posted by **gifron** on 26 July 2003, 3:04 p.m.*

If a 15C has an "error 9," it has failed the keyboard test. But what does that mean?? All they keys seem to work, it just fails the test. Could a low battery cause this problem? I am asking for a friend who says it has a low battery indicator, but he doesn't have new batteries to test it.

Edited: 26 July 2003, 3:13 p.m.

Re: 15C Keyboard Test Error

*Message #2 Posted by **Randy Sloyer** on 26 July 2003, 5:16 p.m.,*
in response to message #1 by gifron

All bets are off with a low battery indicator. Get new batteries and try again.

Error 9 means a key did not register or was pressed out of sequence during the test.

Re: 15C Keyboard Test Error

*Message #3 Posted by **Valentin Albillo** on 26 July 2003, 5:16 p.m.,*
in response to message #1 by gifron

If all the keys seem to work Ok, there are two reasons why you may get Error 9, one being if batteries are indeed *very* low, and the other being that you (or your friend) aren't pressing the keys in the correct order.

You must press them from left to right, one at a time, beginning with the topmost row, and must press the vertical ENTER key ***twice***, once for each row it spans, i.e: you must press them like this:

```
   - press "Square root"
   - press "e^x"
   - ...
   - press "divide"
-------------------------
   - press "SST"
   - press "GTO"
   - ...
   - press "X"
--------------------------
   - press "R/S"
   - ...
   - press "arrow left"
   - press "ENTER"
   - press "1"
   - ...
   - press "-"
--------------------------
   - press "ON"
   - ...
   - press "RCL"
   - press "ENTER"
   - press "0"
   - ...
   - press "+"
```

If all goes well, you should then get a "15" right in the middle of the display. Else, either you did press one key out of sequence, or then the last key before you get an "Error 9" is malfunctioning.

Please try above sequence and see if this time it passes the test Ok.

Best regards from V.

*Message #4 Posted by **professorkscc** on 26 July 2003, 10:38 p.m.,*
in response to message #1 by gifron

The owner's manual describes Error 9 as follows:

Error 9: Service Self-test discovered circuitry problems, or wrong key pressed during key test. Refer to appendix F.

Appendix F relates to "Battery, Warranty, and Service Information."

Problem could be batteries?

Hank

Re: 15C Keyboard Test Error

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2003, 11:10 p.m.,*
in response to message #4 by professorkscc

Hi, professor;

in digital circuits, voltage levels below a minimum recommendation may cause the most strange and weird behavior, believe me. We're talking about MOS-based digital circuits, and in this case we may have larger voltage ranges, but if you consider that pressing a key in these calculators increases current consumption in about 300%, then having a previous low battery condition may lead to malfunction when a key is pressed, even if it is not when keyboard test is performed.

I observed once that ealier HP15C's with batteries "nearly-to-low-bat-condition" will sign this low-bat condition (flashing *) when performing keyboard test even when no keys are pressed, but will behave oppositely when in normal operation. I think these tests ([ON]&[+], [ON]&[×] and [ON]&[÷]) are like running programs and consume more power than regular use. If this is true, low batteries may cause [Error 9] in a normal unit running keyboard test.

My 2¢.

in response to message #1 by gifron

Are you sure you pressed twice the <ENTER> key ?

Re: 15C Keyboard Test Error

*Message #7 Posted by **gifron** on 29 July 2003, 3:08 a.m.,*
in response to message #1 by gifron

Thank you all for your inputs. I pulled out an 11C, and found some near dead batteries. It went part way through the KBD test, and got the error 9. With good batteries, it was fine. So I contacted my friend and found out that he got the 15C to pass the KBD test one time out of several. As previously mentioned, it had a low battery indicator - Looks like that's the problem.

HP41 Battery question

*Message #1 Posted by **Harry (Germany)** on 26 July 2003, 2:19 p.m.*

Does the original HP41 rechargable battery pack have 5 cells? I just put 4 N-size rechargables into the battery-holder and the calculator didn't power up ?!?

Regards,
Harry

Re: HP41 Battery question

*Message #2 Posted by **David Smith** on 26 July 2003, 2:23 p.m.,*
in response to message #1 by Harry (Germany)

Nope, they have four cells...

Re: HP41 Battery question

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2003, 2:54 p.m.,*
in response to message #1 by Harry (Germany)

Hi;

maybe it's a silly question, but... Have you tested each cell? Do all of them show the same voltage when measuring with a voltmeter/multimeter? Also, have they all been found with correct voltage, it's good idea to "load" them and check for current intensity. For testing purposes, a 15 ohms resistor should demand about 90 mA, as fully charged NiCad's offer about 1.2Vcc to 1.3 Vcc. If voltage is too low on any battery or current does not reach at least 80 mA in all of them, recharging each sell separately or replacing bad one(s) may be a solution.

Success.

Luiz (Brazil)

Re: HP41 Battery question

*Message #4 Posted by **Harry** on 26 July 2003, 5:50 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Yes I have tested them. And they are all good, as i expected, as they are new. They all have 1.30 to 1.32 Volts and go down to 1.1 at 3 (!) Amps. So thats not where the problem is. The Alkalines all have about 1V and still work fine. I cleaned all the contacts again. Even soldered metal plates to the cells now, because I thought they might not touch the contacts for some funny reason.
Now its getting wired: If I put 4 Alkalines in, it works. If I replace them one by one with rechargables and put the pack in the calculator after each one and turn it on and off again, then I get it working on all 4 rechargables. But if I take the 4 Alkalines out and put 4 rechargables in, it does not.
I have no explanation for this VERY WIRED behaviour.

Regards,
Harry, who goes crazy now

Re: HP41 Battery question

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2003, 7:48 p.m.,*
in response to message #4 by Harry

Hi, Harry; (Harald, right?)

if it is like you say, find a place for my brain beside yours, too...

I once had a problem with one alkaline cell, but as you measured all of them, not a way! Actualy weird!

One last possibility: have you thought aobt physical measures? I mean, size? Try "stretchning" the battey compartment's springs a little bit to enhance the pressure.

Success. An let us know what happens.

Luiz (Brazil)

Re: HP41 Battery question

*Message #6 Posted by **Harry** on 27 July 2003, 7:59 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Yes, Harald is correct.
I tried it over and over again. Same behaviour as described. I guess i always need a set of "startup" alkalines to get it running on the rechargables.
Here is one idea i have: When I put the batterys in, the first thing it does is probably to charge the backup capacitor. Now what if it draws a too high current because of the very low resistance of these new rechargables. Do you think that could lock it up then? Maybe I avoid this high current by replacing the alkalines one by one with the rechargables. The alkalines have only 1 Volt per cell left, so the Voltage of the rechargables is higher now and the capcitor has to be charged.
I will get new Alkalines and try replacing those with the rechargables (all four at the same time) maybe that works.

Regards, Harry

Still strange behavior...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2003, 11:15 a.m.,*
in response to message #6 by Harry

Hi, Rarry;

I'm following this situation with a particular interest and curiosity. A behavior like this is usualy related to a simple problem that was not supposed to happen. I'm thinking of faulty (dried) capacitor in mainboard, bad contact somewhere which somehow happens when batteries with different dimensions are inserted, and stuffs like this. Based on what you mention, when voltage raises in steps of about .3 volts, the calculator accepts rechargeable batteries. I also understand that if voltage drops of about 1 volt (when you return alkaline batteries back) then it's O.K. But if you change the set completely you'll force an extra 1.2 volt step and the system seems to hang at this point, right?

If in your case you replace a set of nearly exhausted batteries (1 volt each) for a new, fresh set, voltage will be increased in about 2 volts, from 4 Vcc (4 × 1V) to 6 Vcc (4 × 1.5V). I wonder of what's gonna happen!

Mostly I wonder about the cause, the reason. I replaced exhausted batteries for new, fresh ones in almost all of my calculators. Let's not forget that the HP41 was the first LCD calculator from HP and some units get stuck with a high pitch frequency sometimes. I once tracked (with the unit touching my ear) to "see" where it was comming from and I found that it was from the small coil in the power supply and not from the buzzer.

I think that there are situations where the power supply circuits may hang and others taht it will not hang.

I cannot go further from here. I am now waiting to "see" what's gonna happen if you use four new, fresh batteries at once and then you change for the rechargeable pack, say, a reduction in voltage. To be completely honest, I cannot even dare pointing a faulty condition, neither an operational characteristic as a cause for this "behavior".

Let us know as you have new information. Sorry not helping further.

Luiz (Brazil)

Re: Still strange behavior...

*Message #8 Posted by **Harry (Germany)** on 27 July 2003, 2:31 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Thanks for your interest in this strange problem.
I have found annother set of new alkalines. They are exatcly the same as the old ones, but fresh. I put them in and .... nothing, it does not work, same behavior as it shows with the rechargables.
Now I diged my mint HP41CV out of the desk, that I did not really wanna use, but this was driving me crazy. So I did it anyway. Surprisingly - or maybe not surprisingly anymore at this point - it works just fine on all 3 sets, the exhausted Alkalines, the new ones and on the rechargables.
Now please help me, what do I do if my calculator runs on exhausted batterys only?!?

Regards, Harry

Re: Still strange behavior...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2003, 2:52 p.m.,*
in response to message #8 by Harry (Germany)

Hi, Harry;

I was driving myself crazy. But now we can be sure that at least all battery sets are working fine. (Hey, Valentin, a "supposingly" useful hint for working calculators kept by collectors: testing each other!).

Have you checked if it is a fullnut or a halfnut?

This is an original MoHPC image.

I remember that the fullnuts have an IC in their mainboard that's the heart of a power supply. I read about this and never called my own attention for it... 'till now.

I'm not sure about how does it work, but there is something that I did not ask you so far: do these four 1volt alkaline batteries cause a low battery condition, say, is the **BAT** annunciator on? If it is not on, chances are that something is wrong with your calculator's power supply. I mean, if there is a voltage sensing component, like a voltage divider, and this(these) component(s) is(are) faulty, then the low battery condition is not sensed in fact. Maybe the 4V from the exhausted battery set is taken as normal voltage, and raising it slowly does not bother the power supply. Let's also think that the same faulty reference informs that anything above 5V is excessive voltage and the circuit does not allow the power supply to turn itself on to protect calculator's circuits. So, connecting anything higher than or equal to 5V instantaneously will not allow the calculator to switch to ON, but changing batteries one by one will not trigger sensing/protective circuits.

I'd first check schematics for this calculator (there are some different types of mainboard for the HP41; I've seen four myself) or inspect the mainboard itself in order to try to "see" any electronic components connected to the power supply IC that would be working as voltage sensing and/or reference. I have no schematics in hands for now, but I'll try to find some further info. Maybe Tony Duell or David Smith or others (I remembered their names because I read some of their posts a few minutes ago) will add other important information.

Success! As I have anything new I'm posting again.

Luiz (Brazil)

Edited: 27 July 2003, 2:56 p.m.

Re: Still strange behavior...

*Message #10 Posted by **Harry (Germany)** on 27 July 2003, 5:47 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Well, first, it is a fullnut (s/n 2127S11343). The BAT indicator is not on after turning it on. But when I run a program it comes on after a few seconds. BTW, thats when I stoped calculating primnumbers. I wanted to put the rechargables in and go on. I didn't know it would get so complicated....
When I bought that calculator about 1.5 years ago it had a strange behaviour too. After putting batteries in for the first time, it had a very dim display that was hardly readable. It got better the longer it was turned on. After like a month with the batteries in it that problem was gone and never appeared again. I have taken the batteries out of it an put back in, sometimes after a month of not using it, and it started with "Memory Lost" but a bright display. I used the same set of batteries all that time. The one that is exhausted now.

Regards, Harry

PS: I did not open it yet, I will probably do that next weekend.

Re: Still strange behavior...

*Message #11 Posted by **Axel Poqué** on 27 July 2003, 3:00 p.m.,*
in response to message #8 by Harry (Germany)

From what you're describing it seems like the voltage regulator circuit of your HP is broken. Electronic circuits need certain voltage levels to operate properly (e.g. 5 V for TTL circuits). Typically the battery/charger voltage of an electronic device is higher than the actual required operating voltage to allow for voltage drops and optimal use of batteries. If the regulator doesn't work, the supplied voltages are too high and can cause strange behaviour or even damage the device.

Axel Poqué

Re: Still strange behavior...

*Message #12 Posted by **Harry (Germany)** on 27 July 2003, 5:51 p.m.,*
in response to message #11 by Axel Poqué

Isn't the HP41 cmos, wich would not have problems with the higher voltage?
The powersupply is definatly the first thing I will have a closer look at when I open the calculator

Regards, Harry

Re: Still strange behavior...

*Message #13 Posted by **Axel Poqué** on 27 July 2003, 6:30 p.m.,*
in response to message #12 by Harry (Germany)

Yes, that may be right, but some other part might have narrower voltage requirements (the display perhaps? or are there TTL support chips? TTL chips do have a much narrower margin - 4.75 to 5.25 V I think). Have you tested if the calc beeps? If this is so, only the display can't cope with the voltage levels.

It would be nice if we had some schematics/specifications, so we could test this theory...

Regards, Axel

P.S.: Viele Grüße aus Aachen :-)

I am quiet sure I know what it is now

*Message #14 Posted by **Harry (Germany)** on 27 July 2003, 8:16 p.m.,*
in response to message #13 by Axel Poqué

I powered it by an external powersupply now, and here is what happened:
If I don't restrict the maximum current, it draws a current of about 500mA when I connect it to the powersupply at a Voltage between 4 and 6.2V.
If the Voltage is below or above (I tested it up to 6.5V) there is no problem and it works just fine.
Once it is connected I can change the voltage and there is no problem

between 4 an 6.2V anymore.
The problem also does not appear when the current is restricted to 50mA, wich makes sence as the Voltage drops when i connect it and then rises again.

All this tells me it is the internal powersupply that is faulty. Its probably the oscillator that does not start oscillating for some reason.

Any ideas what that reason could be?

Regards,
Harry

Re: I am quiet sure I know what it is now

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2003, 9:16 p.m.,*
in response to message #14 by Harry (Germany)

Hi, Harry;

an off-topic, relaxing comment: I see that not only we are "night workers" but also completely "workaholics", if that's the way it's spelled... In Brazil it's 22:10 PM, I'm delving into my post-graduation text and as I need a brief pit-stop, I read the posts. Wow!

I read Axel's posts and I would add that this selectivity "sounds me" like semicondutor trick, not exactly passive-component behavior. A few months ago I had an HP41C in hands with hig-current drain only when it was "ON". The LCD driver was the cause, and David Smith mentioned the fact it is a bipolar technology device. As it has capacitive load (LCD segments), current drain for this particular IC is not so much relevant. Anyway, depending on its' internal configuration/arrangement, chances are that depending on voltages supplied to it, a diffeent set of transistors may be switched to ON or OFF. If one of them is bad, high current drain may happen as well for an specific voltage range. I'd not be surprised if you have normal operation after simply replacing the LCD driver (the one with an 'RAYC' in its ID code). The problem is that a donator must be found, no commercial replacements so far.

Best regards and success.

Luiz (Brazil)

Edited: 27 July 2003, 11:03 p.m.

I am quite sure I *don't* know, but...

*Message #16 Posted by **glynn** on 28 July 2003, 12:40 a.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

While not discounting the idea that it may well be an LCD driver, INCLUDING of course the saga Harry recounted about the dim display when he first got the calc, I am perhaps one of those conservative types who like to check spark plugs before going off to

buy a new engine. Unless Harry happens to have a couple of spare known good LCD drivers around, he will also want to look at the most common failure modes of circuits before moving on to the more esoteric.

An oscillator circuit can be designed different ways, of course, and I don't have any knowledge of the HP41. But let us ask if the circuit has any external components to "tune" the frequency of the oscillator. Are any of them not at rated value? Especially capacitors (a good case could be made for replacement of these in lieu of trying to measure them; alternately, temporarily paralleling one in with another sometimes helps figure out what is wrong). What frequency should be output? Is there no output when the calc is acting "hung"? Is the calc in fact inactive, or is the lack of a display leading us to think "hung" when in fact the cpu is active and the output is simply not visible to us?

Visual inspection of contacts, pads, traces can be of value, if only to assure that some corrosion or partially-made contact is not acting like an added resistor in some timing-dependent function. Of course, measurement with voltmeter or even better, having an oscilloscope handy, is useful IF you have ready access to someone who can tell you what voltages you SHOULD be seeing or what waveforms you SHOULD be catching.

I merely suggest that while cannibalizing one machine to test another is very Tempting, leave your good machine good for now and instead gather as much information on this badly-behaving one as you can. I'd be willing to bet it *IS* either failure of a passive component like a capacitor, or a contact/trace/conductive failure near the power-supply circuit. At least, that is my first "intuition".

Hi, Glynn!

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2003, 2:26 a.m.,*
in response to message #16 by glynn

Howdy?

You know, I read your post and I think any valid suggestion, analisys, question, reasoning like yours MUST be taken into account.

One of the most "interesting" fact here, if I can classify it so, was the 500mA (½A) current consumption, a considerable high current for the HP41, when the calculator was "hung". And it happens when the calculator is connected to a power supply delivering a very specific voltage range. Out of this range, up or down, there is no more high current.

I "connected" this fact to semiconductors, not to passive components or faulty cooper trails. But you're right, a pre-check for not so complicated causes must be made. A broken cooper trail may disconect two pins and may also cause strange

behaviors. I wrote about this in one of my first posts in this thread:

> Quote:
>
> A behavior like this is usualy related to a simple problem that was not supposed to happen.

It seems I forgot my own words...

Thank you for the enlightment, Glynn.

Best regards.

Luiz (Brazil)

Re: Hi, Glynn!

*Message #18 Posted by **Chan Tran** on 28 July 2003, 12:39 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

I read in an article somewhere when the 41 was introduced that it has a voltage regulator that can provide a steady 5V when the battery voltage is from 4 to 6V. So is it possible that the regulator went bad?

Re: Hi, Glynn!

*Message #19 Posted by **Harry (Germany)** on 28 July 2003, 2:44 p.m.,*
in response to message #18 by Chan Tran

Thats exactly what I am thinking. I was talking about the oscillator in that voltage-regulator (or powersupply).

Regards,
Harry

HP41C power supply

*Message #20 Posted by **Ellis Easley** on 30 July 2003, 12:31 a.m.,*
in response to message #19 by Harry (Germany)

You know, there is a 41C service manual on CD5 of the Museum CD-ROM/DVD.

HP41C power supply

*Message #21 Posted by **Ellis Easley** on 30 July 2003, 5:38 a.m.,*
in response to message #19 by Harry (Germany)

I've been looking at the 41C service manual on the

Museum CD5 (schematic on page 36 and power supply Theory of Operation on page 10) and comparing it to the re-drawn 41C schematic that has been available for a while and I think the re-drawn schematic introduces some errors. For one thing, the 14 pin bipolar chip labeled "LCD-DRIVER" on the re-drawn schematic is actually the power supply chip (U2). One of its functions is to provide three voltages (nominally 1.1, 2.2 and 3.3V on pins 4,3 and 2) to the actual LCD driver chip which is part of the Display Assembly. The power supply chip also temperature compensates the three voltages, which is required for consistent display contrast over temperature. Another function of the power supply chip is to monitor the input voltage (the power supply chip gets its operating power on pin 14 from C1 and through CR1 from the battery) and if it falls below 4.2V, it pulls its pin 5 low, which is connected to CPU pin 6 (LLD) - the text says this pin's function is low battery voltage detection.

The Theory of Operation section doesn't go into the details of how the power supply chip generates the 6V Vcc operating power supply but it describes how the CPU turns the power converter on by driving a current into pin 13 (Vci) (from CPU pin 8 through R1) and how once the converter output voltage reaches 6V, the power supply chip drives its pin 6 (Vco) low to signal the CPU (on pin 7) that power is good, with a capacitor (C5) storing the low level (between power converter switching cycles, I think).

My guess is that the resistor (R3) and capacitor (C6) on pin 7 control the time constant of the power supply chip's power converter and that pin 10 (IND) is the converter switching output, driven low to store energy in the inductor (T1), and then when the current is turned off, the counter-EMF of T1 is rectified by CR2 and filtered by C3 to generate Vcc, which is sensed by the power supply chip on pin 9 to control the timing of the switching output on pin 10 to maintain Vcc at 6V.

The service manual Theory of Operation doesn't say anything about the resistor (R2) connected between power supply chip pin 12 and ground (although there might be something about it in the troubleshooting section). The signal is labled "ISET" which would generally mean "current set". Some oscillator chips use a constant current source to charge a capacitor to establish a time constant, so this pin might control that aspect of the power converter. Or the current could control the internal voltage references that determine the output voltage and/or the low battery voltage and/or the three LCD voltages. Or, given that it is named like a current input and the pin next to it (Vci) is described

as a current input, the current flowing from pin 12 to ground might establish the current level into pin 13 that represents a logical "1".

There are a lot of differences in the component reference designators on the service manual schematic and the re-drawn schematic - this might be because the two schematics represent different revisions of the logic board. There are also differences in the pin numbers on the board-to-board connectors on the two schematics. It might be that the person who re-drew the schematic assigned his own pin numbers, if they aren't marked on the PCB's (which could also explain the different reference designators). Also, the re-drawn schematic doesn't have the two transistor circuit that controls the DATA signal from the Phase 2 clock. Since both signals are connected to the CPU, maybe the transistors are eliminated by a revision of the CPU.

HP-110 Plus and Machine Language

*Message #1 Posted by **Jeff** on 25 July 2003, 6:22 p.m.*

Can the HP-110 Plus be used to assemble Machine Language for the HP-41? Can this unit be used as a MLDL of sorts?

Re: HP-110 Plus and Machine Language

*Message #2 Posted by **Tony Duell (UK)** on 26 July 2003, 5:58 p.m.,*
in response to message #1 by Jeff

There was official HP41 ROM development software for generic MS-DOS machines and it would run on the Portable Plus. IIRC, it was called 'SDS-II', and included a user language translator, assembler, linker, ROM image creation programs, etc It wasn't what I understnad by an MLDL, though (which to me is a piece of hardware). The docs for SDS-II suggested yuo should use a commercially-available ERPOM or RAM box (I think Eramco was mentioned) to test your ROM images before getting HP to make a custom module for you.

Xtreme Newbie Question

*Message #1 Posted by **V** on 25 July 2003, 4:43 p.m.*

Newbie Warning> following question is a rookie one.

In system RPL, the programing language, how exactly does error handling work? I wnat to know bout CKN and CK&Dispatch, how do they work, what exactly does Dispatch mean and, just a little curious, does CK stand for anything special?? TY

"\V/"

Doesn't sound like a newbie

*Message #2 Posted by **bill platt** on 25 July 2003, 5:20 p.m.,*
in response to message #1 by V

Mentioning SysRPL in anything resembling a technical question sounds advanced to me. I have a hard enough time finding the time to learn User RPL 6^)

regards,

Bill

Re: Xtreme Newbie Question

*Message #3 Posted by **Raymond Del Tondo** on 26 July 2003, 6:49 a.m.,*
in response to message #1 by V

www.hpcalc.org is the place to find information on SysRPL. First thing should be to read the manual as usual;-) In this case it's called RPLMAN.DOC and can be downloaded from www.hpcalc.org , either as single file and as part of the HP RPL Tools package.

The exist various other documents on SysRPL in the archive.

BTW: CK... are words for argument checking (chapt. 14), error handling/trapping is another chapter (chapt. 16)...

Meeting IV

*Message #1 Posted by **Matthias** on 25 July 2003, 4:42 p.m.*

Hello my dear friends...

Our european HP-Meeting has found a date. It's September 20. I have 9 persons how will join till now (You will get a mail from me). If someone else will join, please write me a short mail...

Matthias

I might come...

*Message #2 Posted by **Harry (Germany)** on 25 July 2003, 7:19 p.m.,*
in response to message #1 by Matthias

but I would need someone who takes me there. Basel is about 550 km away and as I am a student and don't have that much money, I can't afford to drive there. I live near Dortmund and study at Siegen. So if someone near there (I would be willing to drive 150 km or so) is going that would be great!

Regards,
Harry

Re: I might come...

*Message #3 Posted by **thibaut.be** on 26 July 2003, 10:35 a.m.,*
in response to message #2 by Harry (Germany)

If you come to Brussels I can take you over there, or Luxemburg is on my way...

in response to message #5 by Wlodek Mier-Jedrzejowicz

Hi

I´m glad to hear from you too.. Certainly everybody is invited to join our meeting... You know, Basel as a airport 15km in the north.. So, no problem... Do you plan to go to the US party that day?

Matthias

Would it be possible...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2003, 10:52 p.m.,*
in response to message #1 by Matthias

Hi, European folks;

greetings from Brazil (as if you don't know...).

Is it possible that some of you (or at least one) keep computers on line and connected during the meeting? If Dave allows it to happen, we could be "e-talking" while you're there. I know that there are other ways to do it, but I only access this forum, no one else. I have no ICQ and I think that chat rooms would allow other "audience". Not that it is a bad idea, only that if people not related to HP decide to rule, we'll be "uncovered".

Well, this is just a suggestion of mine. As Harald mentioned he is 550Km away, let me tell you: you're lucky having no ocean in between, if you understand what I mean. Please, Harald, this is just a general comment, don't take it wrongly or specifically to your situation. I know what it is to be a student and have no resources other than the necessary ones. IN other hand, I'm glad you are close to each other and can organize such events.

I'm glad for you all.

Please, let us know about what happens there.

Best regards.

Luiz (Brazil)

HP iPAQ PocketPC going to the moon

*Message #1 Posted by **gene** on 25 July 2003, 2:03 p.m.*

http://www.transorbital.net/PressReleases/press030715.html

FOR IMMEDIATE RELEASE

July 15 2003

HP iPAQ Pocket PCs to be Onboard TransOrbital's First Commercial Moon Mission Newly Introduced HP iPAQ h5550 to Facilitate Wireless Communication in Space

Editorial Contacts Dayna Fried, HP +1 949 240 2119 dayna.fried@hp.com

Sheila Watson, HP +1 281 514 6552 sheila.watson@hp.com

Dennis Laurie, TransOrbital + 1 858 455 5900 dlaurie@transorbital.net

Hewlett-Packard Company 3000 Hanover Street Mail Stop 1048 Palo Alto, CA 94304 www.hp.com

PALO ALTO, CALIF., JULY 15, 2003 - HP (NYSE:HPQ) plans to launch its HP iPAQ Pocket PCs into outer space onboard TransOrbital's TrailBlazer spacecraft, the first commercial mission to gain approval from U.S. authorities to explore, photograph and land on the moon, later this year.

With an early 2004 launch date approaching, TransOrbital looked to the newly introduced HP iPAQ Pocket PC h5550's innovative engineering, mobility, simplicity and ease of use to facilitate wireless communication within the satellite. The handheld device will integrate with the TrailBlazer systems on board the spacecraft to enable TransOrbital to effortlessly synchronize and share data while in space, during transit to the moon and while orbiting the moon.

During subsequent launches, it is anticipated that the HP iPAQ Pocket PCs will be used for wireless communication with cameras that are tethered on the outside of the spacecraft to provide superior video streaming capabilities for display on Earth. Future applications for the devices also may include the ability to communicate via e-mail with the Trailblazer lunar orbiter while it is orbiting the moon and on the moon's surface.

As the first and only private company to be licensed by the U.S. Department of State and the National Oceanographic and Atmospheric Administration for moon travel, TransOrbital believes that important and affordable advances in science, medicine, communications and information technology can be achieved by forming strategic global corporate alliances for space exploration.

"Lunar development requires innovative partners, and HP is an ideal world-class systems provider," said Dennis Laurie, chief executive officer, TransOrbital. "Being the first to send and utilize innovative technology in space, such as HP's iPAQ Pocket PCs on this lunar mission, demonstrates that the moon is now truly within anyone's reach."

"HP is a leader in providing technologies that work to improve the mobile experience, whether on Earth or on a spacecraft traveling to the moon," said Alex Gruzen, senior vice president and general manager, mobile computing

group, HP Personal Systems Group. "We are very excited that TransOrbital is about to include affordable, innovative HP products, such as our iPAQ Pocket PCs, to enhance this first commercial flight to the moon."

TransOrbital's first moon mission will provide HDTV (high definition TV) views of equipment left behind from past Apollo and Russian landings. The mission also will deliver a time capsule containing personal cargo from Earth, including personal messages and artifacts. Media collected during the mission, including a "barnstorming" video filmed as the capsule reaches the lunar surface, will provide TransOrbital with an array of content vital to future scientific and exploratory endeavors, as well as educational and entertainment uses.

In December 2002, TransOrbital successfully launched a test lunar satellite into earth orbit using the International Space Company (ISC) Kosmotras Dnepr rocket. TransOrbital also will use the ISC Dnepr rocket for the moon launch.

ISC Kosmotras is a Russian supplier of launch vehicles for many companies and countries around the world. ISC Kosmotras activities under the Dnepr program are covered by special decrees by both the Russian and Ukrainian governments. The Dnepr LV is developed on the basis of the world's most powerful SS-18 ICBM. Unique for a light-class launch vehicle, the Dnepr is able to deliver 3,500-4,000 kg of payload into low earth orbit. More information about ISC Kosmotras and Dnepr rockets is available at www.kosmotras.ru.

About TransOrbital, Inc.

TransOrbital, Inc. is a privately owned supplier of lunar delivery services, aerospace design, analysis and launch services. Established in 1998, TransOrbital is the first company of its kind authorized by the U.S. government to photograph, explore and land on the lunar surface. The 2003 TrailBlazer spacecraft's primary mission is to return HDTV video and other multimedia content from lunar orbit to market as commercial products, as well as the delivery of both personal and commercial cargo to the moon. More information about TransOrbital is available at www.transorbital.net.

About HP

HP delivers vital technology for business and life. The company's solutions span IT infrastructure, personal computing and access devices, global services and imaging and printing for consumers, enterprises and small and medium business. For the last four quarters, HP revenue totaled $70.4 billion. More information about HP is available at www.hp.com.

Re: iPAQ going to the moon -- who's (what's) gonna work the touch screen?

*Message #2 Posted by **Paul Brogger** on 25 July 2003, 2:34 p.m.,*
in response to message #1 by gene

I want a copy of whatever is the robot finger that will enter data remotely via the iPAQ's touch screen -- I can use to computer-control programming of my HP-42s! ;^>

Re: HP iPAQ PocketPC going to the moon

*Message #3 Posted by **Wayne Brown** on 26 July 2003, 9:23 a.m.,*
in response to message #1 by gene

Of course, iPAQ isn't an HP product. It was created by Compaq, and HP just gets to market it because of the HP-Compaq merger. It's like all their other remarketed stuff, except that this time, instead of buying another company's products, they bought the whole company.

Remember when HP used to be able to design and build things of their own that were good enough to go into space?

"may include the ability to communicate via e-mail..."

Advice on HP 25 Charging

*Message #1 Posted by **G Evans** on 25 July 2003, 9:23 a.m.*

The HP25 manual warns against using the battery charger without batteries fitted to the calc.

Can any one say if damage for this reason is common ? The 35 and 45 can be used with chargr alone.

In another thread I requested advice on a 25 that may have its RAM chip damaged (no STO or RCL but ok otherwise).

Could damage to the RAM have resulted for not observing the above ?

George (UK)

Re: Advice on HP 25 Charging

*Message #2 Posted by **Victor Koechli** on 25 July 2003, 9:49 a.m.,*
in response to message #1 by G Evans

In contrast to the Classic models, operating Woodstocks on the charger alone (without a **good** battery installed) is officially discouraged by the manual an can result in permanent damage to the calculator. This seems to be true especially for the HP 25C and 29C with continuous memory as their memory is always connected to the power and even connecting a charger without turning the calc on can damage it!

And: Yes, it may well be that your machine was damaged this way.

Cheers, Victor

Re: Advice on HP 25 Charging

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 25 July 2003, 4:21 p.m.,*
in response to message #2 by Victor Koechli

Hi;

For sure! Voltage supplied by power components to main circuitry when charger is connected and batteries are not may dammage them. Many threads were developed here containing information about this particular subject. Norm Hill found a zener diode that is suitable for this case when correctly connected to batteries' terminals, mostly if this is done inside the calculator. This zener has an id code and Norm is the best person to talk about this. He is the one who researched and found it.

Of course, using this zener diode is enough to prevent such bad situations. Also, this is not a definitive, permanent solution to allow using AC adapter without batteries in Woodstocks, instead it prevents damage when this happens, for example, in case of bad contact.

Success.

Luiz (Brazil)

Re: Advice on HP 25 Charging

*Message #4 Posted by **Albert** on 26 July 2003, 1:45 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello,

I agree with all these stuff. I put a zener and my HP-25C didn't suffer any problem. I also cut off the plastic soldering under the keyboard (to clean key contacts), and calculator works fine again. Bye.

Luiz:

I just sent you a test email; we'll see if you received it. In case you don't, my theory is that the Internet still has quite a few wrinkles to be ironed out. For example, once in a while I come across an interesting link on a web page, click on it, only to be told that the server isn't found. The funny thing is that if I try again two hours later (or two days later) there is no problem. This sort of situation arises when attempting to access web sites in Europe or Asia (not all -- not even most of them, but enough to draw some form of generalization).

Good luck.

why can't you hack into the other computer, Dave,

and replace your MoHP photograph with a picture

of a calculator that had a firecracker stuffed

into it at 4th of July.

Creative advertizing

*Message #4 Posted by **Mike** on 27 July 2003, 4:31 p.m.,*
in response to message #1 by gene

It's funny how many people say stuff like "It may be just a simple problem to fix" as if this is not a problem.

I can just about guarantee that the paper feed rollers are flattened which means you'd have to find a good one from another device. This is not really an easy fix, unless you are experienced with this.

Also, he has cards but doesn't actually say the readers work. I have seen lots of people say these work but they really use "works" to mean it calculates and nothing else.

He really should state specifically if the reader has been tested.

HP 42S ROM-versions

*Message #1 Posted by **Harry (Germany)** on 24 July 2003, 9:17 a.m.*

Inspired by Nelson M. Sicuro's post I downloaded emu42 and wanna play with it now.
But now I am not sure wich calculator to use for downloading the ROM.
I have only one 42S, but my dad has another few, I don't have the serial-numbers here though.

Now my question is, what are the diffrent rom versions, where are the diffrences and, how to find out wich Calculator has wich ROM?

Regards,
Harry

Re: HP 42S ROM-versions

*Message #2 Posted by **Nelson M. Sicuro** on 24 July 2003, 9:33 a.m.,*
in response to message #1 by Harry (Germany)

I found somewhere the information to get ROM version: Enter in "test" mode pressing ON and LOG together; then press <- (back arrow) to start the debugger; it will point to a routine that shows the ROM version on screen pressing the decimal point (execute, from the debug). Mine shows in the left "A" and in the right "5". To exit press ON together with SQRT (square root).

Regards,

Nelson

Thanks, I will try that.

Re: HP 42S ROM-versions

*Message #5 Posted by **Christoph Giesselink** on 24 July 2003, 12:06 p.m.,*
in response to message #1 by Harry (Germany)

For the HP42S the ROM Rev. A, B and C are existing.

In the version screen the character on top left side is the version, the number on top right seem to be the reason of last calculator restart.

On the emulators all three ROM versions have the COMP bug, because this is hardware dependent. Early HP42S with ROM rev. A use an older revision of the 1LR2 Lewis chipset with a bug inside that the COMP bug don't occur. I personally have a late HP42S with ROM rev. A SerNo. 3017Sxxxxx _with_ the COMP bug.

IMHO use the latest Rev. C ROM, the version I use for the Emu42 development.

Christoph

Re: HP 42S ROM-versions

*Message #6 Posted by **Harry (Germany)** on 24 July 2003, 1:08 p.m.,*
in response to message #5 by Christoph Giesselink

Thank you Christoph. I hope it works. The HP42 is at home and I will try that at the weekend.
Your HP28 emulator seams to be interesting too, does it run with either a 28C or a 28S rom-image?

Regards,
Harry

Re: HP 42S ROM-versions

*Message #7 Posted by **Christoph Giesselink** on 24 July 2003, 1:19 p.m.,*
in response to message #6 by Harry (Germany)

Only with a HP28C image. The HP28S hardware is more similar to the HP42S, because they use the same chipset.

More about this in http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=313 and http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=275.

HP 9825A

*Message #1 Posted by **Scott** on 24 July 2003, 8:48 a.m.*

I work for the Department of defense and we have an HP 9825A calculator used in a very old application. We are trying to make a copy of the program tape that is used to prevent loosing the program until newer technology is intoduced over the next several years. We have not been able to have the tape duplicated. Can anyone offer any suggestions.

Re: HP 9825A

*Message #2 Posted by **David Ramsey** on 24 July 2003, 12:03 p.m.,*
in response to message #1 by Scott

Can't you simply load the program(s) into the 9825 and save them back out to a new tape?

Re: HP 9825A

*Message #3 Posted by **Vassilis Prevelakis** on 24 July 2003, 12:42 p.m.,*
in response to message #2 by David Ramsey

```
David Ramsey wrote:
> Can't you simply load the program(s) into the 9825 and save them back out to a new
tape?
```

Programs are OK, but what about data files? You have to read them in, and then save them without messing them up.

BTW have you looked at the 9825 manual? This thing is totally wierd.

**vp

Re: HP 9825A

*Message #4 Posted by **Scott** on 31 July 2003, 7:59 a.m.,*
in response to message #2 by David Ramsey

Apparently there are some files that are protected some way. It will not allow us to copy all the files. Some copy fine others do not. To the best of my understanding there is some type of duplicator tape that allows you to copy the other tapes and the one that we have is bad.

Re: HP 9825A

*Message #5 Posted by **Tracy Vermeyen** on 25 July 2003, 12:18 a.m.,*
in response to message #1 by Scott

Can it be true that the DOD is still using 1980's technology to run an important application? I admire the DOD's frugality in not updating hardware and the quality of HP's older calculators. However, if you think better technology from HP is right around the corner you might be waiting a long time.

Tracy

I'm confused

*Message #6 Posted by **Mike** on 27 July 2003, 4:35 p.m.,*
in response to message #5 by Tracy Vermeyen

You start of by questioning the use of old technology and then turn around and say...

"However, if you think better technology from HP is right around the corner you might be waiting a long time."

Which seems to imply that no new technology is better. So which is it? You seem to be giving an argument for using old HP while at the same time, questioning that.

Need HP-25 troubleshooting tips

*Message #1 Posted by **G Evans** on 24 July 2003, 5:01 a.m.*

Can any one offer insite into HP-25 repairs?

The STO/RCL function on a 25 does not work but all math functions are OK. Progam store is also no good. Has anyone experienced similar & identified the specific register/program store memory chip that could be replaced?

Also the No 1 key sometimes registers a 3. The KB looks clean enough - could this problem be atributed to a dodgy contact? Any tips on cleaning inside KB in that case?

Any suggestions very welcome.

thanks George (UK)

Re: Need HP-25 troubleshooting tips

*Message #2 Posted by **Victor Koechli** on 24 July 2003, 8:40 a.m.,*
in response to message #1 by G Evans

Looks like your RAM chip is faulty. The stack registers seem to reside inside the CPU and work, but accessing storage registers or program memory fails or reads garbage. Try the following:

- Let the calc warm up for up to an hour. Some Woodstocks have problems with their internal clock signals that correct themselves after a warm up period. See http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=267 for details and possible repair suggestions.
- Carefully search for broken traces on the PCB or loose solderings on the pins of the chips, and repair any problems you encounter. You might also want to check the traces on the PCB with an Ohm meter.
- Replace the RAM chip if you have a spare one available
- Count on one of the more knowledgeable experts in this forum to come up with additional suggestions.

The problem with your keyboard could be related, esp. if you have a clocking problem, but I have not heard of such a symptom yet an cannot comment on it.

Success, and keep us informed! Cheers, Victor

Re: Need HP-25 troubleshooting tips

*Message #3 Posted by **G Evans** on 24 July 2003, 10:15 a.m.,*
in response to message #2 by Victor Koechli

Victor

Thanks for your suggestions, as I replied to Luis, I cleaned all I can inside all looks ok. I was also wondering about clocking problems I will let unit warm up as you suggest. The link you suggested has some interesting insites. Will keep in touch.

many thanks, George

Re: Need HP-25 troubleshooting tips

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 24 July 2003, 8:40 a.m.,*
in response to message #1 by G Evans

Hi, G. Evans;

just to helps us understanding better: what actualy happens when you punch [STO]n or [RCL]n? No [Error] message? The stored value is lost? Please, try [STO]8 or [STO]9 to force an error message.

RAM is shared into program steps and registers. I remember I saw images o fHP25 guts with what seems to be two RAM chips. In this case, I wonder if one of them is used to store program lines ant the other is used to store register data. If the 7 lines by register is internaly, then we can figure that one of the RAM chips contains eight registers, R0 to R7, and the other one contains the LASTx plus 7 × 7 (49) program steps. Stack registers are hold inside ACT big-chip. In this case, if your HP25 cannot hold registers data, chances are it is the type of unit with two RAM chips.

Would you have the chance to open it and describe what exists inside?

Success.

Luiz (Brazil)

Re: Need HP-25 troubleshooting tips

*Message #5 Posted by **G Evans** on 24 July 2003, 10:04 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luis

Thanks for reply,

I have opened the unit and carefully cleaned PCB and all accesible contacts .

Doing an (X STO n) does not bring any errors but doing a (RCL n) always returns a 0 for any of the 8 registers. (Last X) also returns 0 always.

It will not store progams either. Looks like RAM chip but which one is it ? I can take a pic of insides if the forum allows this ?

George

Re: Need HP-25 troubleshooting tips

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 24 July 2003, 10:24 a.m.,*
in response to message #5 by G Evans

Hi, G. Evans;

about the RAM chip(s), have a look at the bottom of the PCB, close to the batteries contacts. There a big chip, the ACT, and in its left side you'll see one of the ROM chips. The other small chip cloe to it, most likely to be closer to the batteries contacts, is the RAM chip. I saw a unit's picture showing two chips, and if you look at the PCB's layout, you'll see that there's room for a third chip. The HP25C has almost the same layout, with a diferent power supply scheme to allow RAM chips to be fed while the

calculator is OFF.

Unfortunately there's no such know replacement for these RAM chips other than original "donated organs" from deceased units. I hope you're lucky finding the problem. I had some HP25 and HP22 (both use the same RAM chip) and they have no good RAM to donate.

Best regards.

Luiz (Brazil)

Re: Need HP-25 - Keys

*Message #8 Posted by **JimC** on 24 July 2003, 1:58 p.m.,*
in response to message #7 by G Evans

My 25 had the same keyboard but with different keys; my 4 key pressed sometimes resulted in a 6. I fixed it (not entirely) by dismantling the unit and stuffing a strip of isopropanol soaked paper under the metallic bubbles that form the backplane of the keys. (I can't remember though, what kind of paper I used) I also cleaned the six up as well. This got rid of 95% of my errors.

If I recall, there is a technical article somewhere on this forum on cleaning under keys. I'll see if I can track it down.

Good luck!

Re: Need HP-25 - Keys - article

*Message #9 Posted by **jimc** on 24 July 2003, 2:09 p.m.,*
in response to message #8 by JimC

Well, it took me about 3.5 seconds to find the article. It is called "How to restore classic calculators" - (DUH, what else could it be called?)

http://www.hpmuseum.org/howtohp/howtohp.htm

I didn't use sandpaper, but rather I used a toothpick with alcohol on the "mystery" paper (that I can't remember).

Re: Cleaning Keys

*Message #10 Posted by **Victor Koechli** on 24 July 2003, 6:07 p.m.,*
in response to message #9 by jimc

I have just reanimated some dead keys on a HP 67 with a strip of plain paper soaked in contact spray. I applied some more spray afterwards and operated each contact a dozen

times or two (with the calc off!). Got everything back to perfect working condition.

However, this is not going to help here because the 25's keys cannot be accessed from above, as pointed out by David. If the problem with your keyboard is indeed bad contact, you could try to apply contact spray from the back of the keyboard. There's a convenient little hole behind every single contact where you can apply the spray. I have cured the keys of my own HP 25 this way, although I had to repeat the procedure 3 or 4 times (spray - operate -let dry -assemble - test - disassemble ..., you get the idea).

Did warming up help?

Cheers, Victor

Re: Need HP-25 - Keys

*Message #11 Posted by **G Evans** on 25 July 2003, 9:38 a.m.,*
in response to message #8 by JimC

One of the first things I did when I opened the calc for the fist time was to clean with PCB cleaner(alcohol based) the exposed side of the key pad. This, I must admit, did help A LOT (several other keys did funny things) now only the 1 registers a 3 about once in very 6 to 10 presses.

I will repeat the cleaning as others have suggested .

thanks to all.

George.

Re: Need HP-25 - Keys

*Message #12 Posted by **G Evans** on 25 July 2003, 9:40 a.m.,*
in response to message #8 by JimC

thanks for the link -

I will try to clean it again it helped the first time.

Thanks for the great article by Steve Loboyko.

Just printed it.

George

Re: Need HP-25 troubleshooting tips

*Message #14 Posted by **David Smith** on 24 July 2003, 3:03 p.m.,*
in response to message #1 by G Evans

You RAM chip is toast. This is a VERY common problem. I have seen dozens of HP25 machines that failed in this way. A similar amount failed with a bad ACT chip (the big wide 22 pin chip near the bottom of the circuit board). Only source of parts is another machine. Some HP25 machines have two RAM chips, others only one. The RAM chips are located either to the right of the ACT chip or directly above it next to the battery contacts.

The keyboard problem is caused by (often invisible) contamination on the keyboard. Clean it well with 91% isopropyl alcohol. Keep the alcohol off the LED window and the front keyboard surface.

If the problem persists, the contamination may be on the top side of the keyboard... bad news becuase the keyboard is held in place by a zillion melted heat staked plastic posts. If you cut them loose you can free the keyboard, but getting in back in so that it feels and works properly is VERY difficult. I would recommend using an ultrasonic cleaner. Use three different baths of distilled water. Shake out all the water afterwards and dry it overnight in an oven set on its very lowest setting.

Re: Need HP-25 troubleshooting tips

*Message #15 Posted by **Howard** on 25 July 2003, 12:12 a.m.,*
in response to message #1 by G Evans

Hello, My HP 25 also behavs in very mysterious ways as well. It will not programme unless it has been on the battery charger for several hours. It appears to have to be 11o% charged to operate or else it has to be "hot" (the right hand side of the calculator gets quite hot after it has been on the charger for several hours). Maybe yours is the same. I suggest leaving it the charger for several hours and try it when it is fully charged and still on the charger.

I keep wondering...

*Message #16 Posted by **Victor Koechli** on 25 July 2003, 7:03 a.m.,*
in response to message #15 by Howard

David Smith reports he' seen dozens of fried RAMs and a similar number of bad ACT chips. Many users make the experience that their HP 25s will only run when warmed up for a certain amount of time. And Katie provides at least two possible explanations plus the respective cures for these disorders in her excellent article (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=267).

I wonder if maybe most of these defective RAM or ACT chip problems could have been resolved in a similar matter, i.e. these chpis were not really bad, but just degraded to some point where even warming up would not suffice to get the calcs running. In that case it would still be worth trying Katie's suggestions on these calcs.

That said, if warming up with the charger (which is usually *very* effective) does not help, get a 20k resistor and a soldering iron and give it a try.

Cheers, Victor

Re: I keep wondering...

*Message #17 Posted by **G Evans** on 25 July 2003, 9:31 a.m.,*
in response to message #16 by Victor Koechli

Victor

No not yet, I will try this weekend and will also try Katie's suggestions.

thanks for you interest will keek the thread posted.

George

Re: I keep wondering...

*Message #18 Posted by **David Smith** on 25 July 2003, 5:34 p.m.,*
in response to message #16 by Victor Koechli

Nope, the chips I have pulled are well and truly bad. The thermal problems of the 25C and 27 are a different problem. I do have a couple of thermally sensitive ACT chips, but they are not very common.

Re: I keep wondering...

*Message #19 Posted by **G Evans** on 28 July 2003, 8:55 a.m.,*
in response to message #18 by David Smith

Any idea, then, what is causing these chips to fry ? Maybe trying to use the calc with charger and no batteries ?

George

Re: I keep wondering...

*Message #20 Posted by **David Smith** on 28 July 2003, 12:26 p.m.,*
in response to message #19 by G Evans

It's definitely a power supply type of problem. The HP67 and HP97 use the same ACT chip. They have a different type of charger system and their chips (almost) never go bad.

41 Blanknut

*Message #1 Posted by **Andrey** on 24 July 2003, 3:14 a.m.*

Question- What I should I offer for an original and fully functional 41 Blanknut? Know lots about them from the web, but no idea what I should pay for one I stumbled across and is being offered to me. Thanks.

Re: 41 Blanknut

*Message #2 Posted by **Chan Tran** on 24 July 2003, 9:16 a.m.,*
in response to message #1 by Andrey

I sold a 41cx blanknut in excellent condition for $175. The buyer didn't think it was high. I think you can get more for it.

Re: 41 Blanknut

*Message #3 Posted by **David Smith** on 24 July 2003, 3:07 p.m.,*
in response to message #1 by Andrey

Most blanknuts seem to fetch around 50% above a normal machine. Mayby twice normal for an exceptional unit on a good day.

Check Ebay prices for recently completed auctions for an idea of what normal is. For standard nice condition functioning machines figure $100 for a 41C, $150 for a CV, $200 for a CX. Add more for accessories and mint condition. Subtract for corrosion and defects.

Any information about HP-15C hardware/firmware?

*Message #1 Posted by **Nelson M. Sicuro** on 23 July 2003, 10:22 p.m.*

There is any information about HP-15C hardware/firmware? I think that it is really hard to find outside HP's labs... I'm willing to create a HP-15C REAL emulator, but I really don't know how to start. I'm planning to gather all information about emulators (REAL emulators and ROMs) of HP calculators I can get to create a "virtual" collection... Already have data about: HP-35, HP-45, HP-55, HP-41CX, HP-42S, HP-39G

Best regards,

Nelson

HP-15C Emulator (long)

*Message #2 Posted by **Michael F. Coyle** on 24 July 2003, 1:42 a.m.,*
in response to message #1 by Nelson M. Sicuro

Hi Nelson,

I don't think there is an emulator for *any* Voyager calculator. I'd really like to see one though. Perhaps the time is right to start thinking about writing one.

At the risk of telling you what you already know, I will describe what needs to be done to write an HP-15 emulator. I will also point out any questions we would need the answers to. Perhaps some of the other (very knowledgeable) contributors to this Forum can supply some of the answers. This could be a really interesting project; what I'm really trying to do is entice others into thinking so, too.

First, we would need to know the instruction set of the 15C CPU. The MoHPC Web site describes the Voyager CPU as an enhanced version of the HP-41 CPU (the so-called "nut" CPU). If this is so, most of our work is done.

(QUESTION: Is there any published description of the Voyager CPU? Any comparisons with the 41 CPU?)

Second, we would need a ROM dump to obtain the entire 15C program. Unless someone shows up with an HP-generated assembly listing of the 15, we will have to do it ourselves. This would be done by building some special hardware and reading the bits right from the ROM(s). I have been looking into doing this for the Woodstock machines (specifically the HP-21 and HP-25) and most of what I'm thinking about should work for the Voyagers too.

There is one requirement which absolutely must be met for this to work: *The entire ROM of the machine must be accessible to external probing.* If all the ROM is outside of the CPU, fine. But if the CPU also contains some ROM, it may be impossible to get the bits out. Signs that the CPU has ROM: different part numbers for different model calculators; swapping CPUs between calculators doesn't work. Signs that the CPU is only a CPU: same part number across all models; CPUs will work in different calculators.

(QUESTION: See above. Anyone with Voyager repair experience: what part numbers are Voyager

CPUs? Have you tried swapping CPU among different models? Did it work?)

Third, we would need to know exactly I/O works on the Voyager machines. If there's an article out there, fine. If not, we could probably figure it out by assuming it's similar to the HP-41, then reverse-engineer the firmware and probe the hardware to figure it all out. Hard, but doable. Tools needed: ROM dump, oscilloscope, brain.

(QUESTION: Any published info?)

Finally, we would have to write the emulator itself. Once we've got all the other stuff mentioned above, this is the easy part! The HP-45 emulator written by Eric Smith and modified by Dave Hicks could be used as the starting point since the newer CPUs are similar to the CPU used in the Classic machines. The emulator code itself is well-written and clear and is worth reading if you are unfamiliar with emulators.

(QUESTION: Is there anything I've missed?)

(QUESTION: Is anyone else interested in getting a project started?)

- Michael

HP-12C Emulator: are they actual, true emulators?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 24 July 2003, 2:08 a.m.,*
in response to message #2 by Michael F. Coyle

Hi, Michael;

Just to add some information. I saw at least two different HP12C emulatos, and one of them I used more often. If I dig my hard drives I'll probably find it.

One of the MoHPC contributors (I do not remember who was he, but it seems to me he is no longer contributing) posted some messages about an HP16C emulator. I still have one of its last versions, and it works fine.

I have seen and tested, but I am not sure if I still have it, a three-models-in-one emulator: HP11C, HP12C and HP15C, user selectable. This last one and the other HP12C I saw have a drawing-graphic interface, while the HP16C and the HP12C emulator I used for a longer time are both picture-quality graphics image. All of them run under Windows.

The only Voyager I saw no related emulator is the HP10C.

Anyway, I'm not sure if these "emulators" are actual emulators, say, I am almost sure that there is no ROM image and no virtual machine (java?), instead a "simulation" is most likely to be, i.e., a program that does everything those Voyagers do but in its own way.

If I find them (the HP12C emulator I think I can find it quickly, if you are interested on using it) I'll let you know.

Best regards.

Luiz (Brazil)

Doesn't anyone sleep around here???

*Message #4 Posted by **Michael F. Coyle** on 24 July 2003, 1:04 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I'm looking at my message and the replies. They were all posted in the dead of night: 1:42 AM, 2:08 AM, 2:24 AM, 2:38 AM.

When do you guys sleep?!?

(By the way, I suffer from insomnia so I'm often up late.)

Hi Michael:

Michael posted:

"I'm looking at my message and the replies. They were all posted in the dead of night: 1:42 AM, 2:08 AM, 2:24 AM, 2:38 AM.

When do you guys sleep?!?"

That's not the correct question. It should be "Where do you guys **live** !?".

For instance, I live in Spain an I'm posting this at 10:10 AM local time, not the seemingly late-night hour that appears reflected in the Forum.

That's not to say that there aren't any people here who actually post late-night messages, but be aware that many are simply posted from very distant foreign countries, where the sun shines in all her splendour (how poetic!) while you're peacefully asleep. :-)

Best regards from V.

Not me! I live in Miami, Florida; my time zone is -5 UTC, and this message, for instance, is being posted at 4:35 AM. That's not unusual for me. So it looks like I go to bed while you're getting up. 8^)

I think the MoHPC clock is set to Eastern Time (US/Canada/Mexico/other parts of the Americas?).

Re: HP-15C Emulator: Same "Calculator Forensics" result as actual 15C.

*Message #9 Posted by **Paul Brogger** on 25 July 2003, 6:06 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Maybe they don't appear to be "emulators", but the Pocket 15C download I'm trial-running gives the same Calculator Forensics result as is posted on the RSKEY.ORG website for the HP-15C:

arcsin(arccos(arctan(tan(cos(sin(9))))))=9.000417403 [note: "degrees" mode used]

Which is at least indicative of actual emulation.

Some other comparisons should probably be attempted, but I don't have a 15c in hand. (If I did, I wouldn't be messing with PDA simu-/emu-lations!)

By the way, I am just a poor boy, running a monochrome iPAQ 3150, and the slavish simulation of calculator hardware on the touch screen, bad enough on a color display, is just plain unreadable in monochrome. (Too bad, 'cause 15c functionality would be nice to have in my PDA.)

Too bad that they have it only for PocketPC and not for PalmOS 8-(

If it is a real emulator, how they manage to get the ROM, and how they get to manage the copyrights???

It's *NOT* an "emulator"

*Message #11 Posted by **Valentin Albillo** on 26 July 2003, 7:28 p.m.,*
in response to message #10 by Nelson M. Sicuro (Brazil)

Nelson posted:

"If it is a real emulator, how they manage to get the ROM, and how they get to manage the copyrights??? "

It's not an "emulator" but a *simulator*. However, in their web page they include this statement:

*"Pocket 15C is an HP-15C **emulator** for Pocket PC"*

which probably HP would find interesting, because to actually emulate something you must have the actual ROM code for said device, and it goes without saying that HP is the copyright holder. If, on the other hand, they do NOT use the actual ROM code, then that statement can probably be construed as misleading advertisement, as they would then be selling a *simulator* but advertising it as an *emulator*, which is a rather different beastie.

Curiously enough, in their web page they also include this other statement:

*"We hand painted our calculators. We coded them to function **just like the real ones**"*

Take notice of the *"... **we coded them** to function just like the real ones"*. If they were using the ROM code, I guess they would say it *proudly*, as an *extremely important sales point*, a decisive warranty of quality and utmost exactness for any potentially interested HP-15C fan. But instead, the above statement seems to be pointing in the wrong direction, don't you think ?

Anyway, you can easily check it: just download the trial version of this product, and try out the matrix example I propose in another message of mine in this thread. Do you get the same results ?

Best regards from V.

Re: It's *NOT* an "emulator"

*Message #12 Posted by **Vincent Weber** on 28 July 2003, 10:29 p.m.,*
in response to message #11 by Valentin Albillo

A few points demonstrate clearly that the program is a simulator, and not an emulator:

1) Look into the help file, on the topic 'differences with a real HP-15C'. We learn that the program does not share register & program memory, unlike a real HP-15C. This is clearly a different behaviour that could not just achieved by increasing the RAM size on a emulator.

2) The program patches one of the major drawbacks of the HP-15C, i.e. does not display program steps as keycodes but as alpha mnemos (HP-41C styles).

3) The speed is so fast, compared to any HP-41C emulator I have seen, that I definitetly cannot be a microcode emulator.

I regret this program is not available for Palm. Anyway, even if I do acknowledge that the HP-15C has a few improvements over the HP-41 (recall arithmetic, 12 conditionnales, and above all the complex stack), it still find the HP-41C much more valuable. One thing that amuses me is that HP-15C' core fans argue that with the HP-15C every function is directly accessible on the keyboard. Well, for instance, I compared the number of keystrokes required for matrix operations between the HP-15C and the HP-41 with Advantage module (once you assigned the proper functions to keys). The HP-41 requires much less keystrokes, even though the matrix cannot be recalled on the stack. One simple example: to edit the matrix, even in 'User' mode the HP-15C requires 2 keystrokes to enter an element (1 STO A), while the MEDIT command of the Advantage module requires just ' 1 R/S'. Anyway, I think we would better spend some time on an HP42S emulator/simulator (the latter allowing extensions, such as improving the horrible alpha entry of the 42, and support for algebraic expressions and franctions as on the 32SII). The 42s has the best of '41 and '15C worlds.

My 2 cents. Vincent

Re: HP-15C Emulator: Same "Calculator Forensics" result as actual 15C.

*Message #13 Posted by **Michael F. Coyle** on 25 July 2003, 11:19 p.m.,*
in response to message #9 by Paul Brogger

Hi Paul,

This just means that each result is being properly rounded to 10 places after each result. Maybe it's an emulation, more likely a careful simulation.

I have a Calculator Forensics article 90% written. Maybe I'd better finish it up and post it.

(On your Pocket 15C, try the stuff from the "13 digit precision on HP-15c" thread and see if *that* works!)

HP-15C "Emulator": Try this

*Message #14 Posted by **Valentin Albillo** on 26 July 2003, 5:54 p.m.,*
in response to message #9 by Paul Brogger

Paul posted:

"Some other comparisons should probably be attempted, but I don't have a 15c in hand."

I do. Try this: define this 3x3 matrix:

```
          |  1   1/2  1/3  |
   A  =   | 1/2  1/3  1/4  |
          | 1/3  1/4  1/5  |
```

and find its determinant. A real HP-15C gives

```
  det(A) = 0.0004629629590
```

A keystroke sequence to compute that, assuming a master-cleared machine, would be this:

```
f MATRIX 0        clear all matrices
3
ENTER
f DIM A           dimension A as a 3x3 matrix
f USER            set USER mode
f MATRIX 1        reset indexes to 1st row, 1st col
1
STO A             A(1,1) = 1
2
f 1/x             (the "f" is necessary as we are in USER mode)
STO A             A(1,2) = 1/2
3
f 1/X
STO A             A(1,3) = 1/3
2
f 1/X
STO A             A(2,1) = 1/2
3
f 1/X
STO A             A(2,2) = 1/3
4
f 1/X
STO A             A(2,3) = 1/4
3
f 1/X
STO A             A(3,1) = 1/3
4
f 1/X
```

```
STO A            A(3,2) = 1/4
5
f 1/X
STO A            A(3,3) = 1/5
RCL MATRIX A     recall matrix descriptor to X
f MATRIX 9       compute determinant of A
```

For a similar 4x4 matrix:

$$A = \begin{vmatrix} 1 & 1/2 & 1/3 & 1/4 \\ 1/2 & 1/3 & 1/4 & 1/5 \\ 1/3 & 1/4 & 1/5 & 1/6 \\ 1/4 & 1/5 & 1/6 & 1/7 \end{vmatrix}$$

a real HP-15C gives:

```
det(A) = 0.0000001653438744
```

This is a *much* more serious and revealing test than just doing a few trigonometric functions in a row. If your HP-15C simulator (*never* an emulator, there is none) can produce the *same exact* results for these two examples, it will be a real achievement, though allow me to rather doubt it.

Best regards from V.

in response to message #14 by Valentin Albillo

My own HP-42S have results very near of those of the HP-15C. If someone get the HP-42S's ROM and "cut-and-paste" some parts of if to provide the functions of the HP-15C it can be as near as possible of the original, assuming that the 42's ROM is a "41CX+15C grown up" version. Well, I'm guessing...

Internal accuracy (again?)

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2003, 11:34 p.m.,*
in response to message #15 by Nelson M. Sicuro (Brazil)

Hi, Nelson;

I'm sure you're aware of this fact, but it's never enough mentioning it again, right?

I performed the same tests in an HP42S and the results go seven (most significant) digits match. I consider that the HP42S has enhanced algorithms when internal accuracy and number of digits is considered. As you deal with programming, you know a lot more about this than I know, so please, if I write anything wrong I'd ask you to correct me.

If you increase the number of significant digits in a floating point system, you'll need to reorganize memory so you can hold intermediate and final results to each math operation, right? Using currently available compilers, your system will be automatically tuned to hold new digits (memory handling). If we are talking about calculators, the analysis will not be so different, mostly when new calculators may have their O.S. previously emulated and virtually updated anytime it's needed.

So, I'd add that the HP42S is an "HP41CX + 15C grown up, 15-digit enhanced" system. I guess it has enhancements not even possible in both HP41CX or HP15C unless their

memory is "logically" reorganized.

My 2¢.

Inté (seeyah)

*Message #17 Posted by **Nelson M. Sicuro (Brazil)** on 27 July 2003, 1:47 a.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

I think that if one have the patience and determination, this can be done: reverse-egineering of ROM's algorithms an taking only that is interesting for the project. Of course it may be a waste of time. But it is a way to get it done and creating a "new" calculator, but using "borrowed" algorithms and yet getting the same "forensics" results! Of course the internal number of digits can affect the result, but using the same precision may (?) have the same result. I really think that the HP-42S's ROM is a great evolution, following the path of (in the case of 'Solver' and 'Integration') HP-34C --> HP-15C --> (HP-41???) --> HP-42S, expanding precision as it uses more a powerful CPU.

I'm in a personal "quest" of understand the internals of as many calculators I can get and to create my own calculator (virtual or not). I love my HP-42S but I really miss my old HP-15C and its "look and feel". If HP creates a "landscape" "shirt-pocket" version of the 42 it will be a best seller! Ok, dream on... 8-)

Best regards!

Nelson

P.S. you can mail-me privatelly if you want to exchange more ideas...

Re: Internal accuracy (again?)

*Message #18 Posted by **Werner Huysegoms** on 27 July 2003, 5:03 a.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

The 42S carries 12 digits in user calculations, but uses 15 internally, much as the 15C carries 10, but uses 13 internally. A register in the 42S is eight bytes, vs. 7 in the 15C (and 41).

If you would enter into the 42S the exact same matrix you used in the 15C (ie with 0.3333333333 to 10 digits, not 12), you get:

0.000462962959074

and this time the answer agrees to 10 digits.

The matrix you take the determinant from is a Hilbert matrix, notoriously ill-conditioned, meaning that small changes in the matrix will cause comparatively large changes in the result, whatever the algorithm you use. Here, a relative change of 1e-10 produced a relative change of 1e-8 in the result, but then it is only a 3x3 system.

Werner

Thank you, Werner; I did not take it into account!

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2003, 10:52 a.m.,*
in response to message #18 by Werner Huysegoms

Hi, Werner;

thank you; I missed that part were the 1/3 is placed with a 10-digit mantissa instead of 12. This is a very important point when we are dealing with accuracy and specific situations.

Best regards.

Luiz (Brazil)

Re: HP-15C Emulator (long)

*Message #20 Posted by **Victor Koechli** on 24 July 2003, 2:24 a.m.,*
in response to message #2 by Michael F. Coyle

I remember reading somewhere that the 11C has only one chip, whereas my 15C has 3. Could be a sign that there is ROM inside the CPU, at least in the 11C. Can somebody confirm this with his/her 11C?

Just my 2 cents. Victor

of chips in Voyagers

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 24 July 2003, 2:38 a.m.,*
in response to message #20 by Victor Koechli

Hi, Victor;

I have an HP11C with two chips, an HP16C with two chips, an HP15C with three chips and there are at least five HP12C internal layouts, varying from two chips (earlier) to one single chip and currently the 12Cp with a bubble chip, ar what I called the Kimponut.

I saw at least four (maybe five) HP11C and all of them have two chips, as my own fella. I do not knwo anything about the HP10C; shouldn't it be the HP10C taht you heard about having only one chip? Just a thought of mine; it is the low-end and (at the time it was introduduced) "cheapest" Voyager.

Best regards.

Luiz (Brazil)

Re: HP-15C Emulator (long)

*Message #22 Posted by **Nelson M. Sicuro** on 24 July 2003, 9:27 a.m.,*
in response to message #2 by Michael F. Coyle

I have a friend that have a HP-15C with its display with "black blob" problem. But I'm not shure I can convince him to take it apart to trace it's ROM (if possible)... I'm thinking in another idea, a more hard one: build a calculator (not emulator or simulator) based on the best algorithms from the ROMs available and grouping all the functions that we need in one piece. This can be a copyright violation, but I'll try for my own hobby project. I cannot found yet a PC (windows) calculator that is easy of use as a HP-15C or 42S.

Maybe for PalmOS are better ones (portable!), but touching in the screen doesn't have that "click feedback" that we like. If I can code this "all-in-one" calculator in microcontroller's assembler I can built one from scratch using parts from "dead" vintage calculators (case/keys/display). Too crazy? Yes, I think... Anyone else interested?

Regards,

Nelson

HP 11C Error 3

*Message #1 Posted by **Phill higgins** on 23 July 2003, 8:53 p.m.*

While working on a program for private pilot navigation: which has one vector of known magnitude and direction and two others (one with a known direction and the other with a known magnitude), I got "error 3" when I tried to STO in registers 8 and 9 only. I have safely put the manual away (where I cant find it) and wonder what "error 3" means and if there is a way of overcoming it. The problem is to find the missing direction and magnitude to make the vectors close the triangle. Phill

Re: HP 11C Error 3

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 9:15 p.m.,*
in response to message #1 by Phill higgins

Hi, Phill;

[Error 3] means the registers you want to access ([STO] or [RCL]) are allocated to program lines. Please, press [g][MEM] and you will see something like this:

```
[P-nn, r-7]
```

This means you have only registers R0 to R7 and permanent RI (index register); also, you have already used up to 147 lines with program instructions.

nn is in the range 0 to 6.

To get rid of [Error 3] you should remove program lines; but this is only "possible" when you have unused or unwanted program lines. If you cannot remove program lines, you actualy cannot use registers R8, R9 and R.0 to R.9, in this case.

Hope this hels.

Luiz (Brazil)

Update: 13 digit precision on HP-15c (from Palmer Hanson)

*Message #1 Posted by **Gene** on 23 July 2003, 1:28 p.m.*

AN EXTENDED QUADRATIC SOLUTION FOR THE HP-41 USING THIRTEEN DIGIT CALCULATION OF THE DISCRIMINANT

We start with an arithmetic exercise using the statistical functions of the HP-41:

Consider the numbers:

```
x   = 1.000007

y   = 1.000004

x^2 = 1.000014000049

y^2 = 1.000008000016

xy  = 1.000011000028
```

If the squares and the product are rounded to ten significant digits as is done on the HP-41 and many other HP calculators the small values beyond ten digits are discarded and the values 1.000014000, 1.000008000 and 1.000011000 remain. The rounding process discards the values of 4.9E-11, 1.6E-11 and 2.8E-11. Perform the following sequence from the keyboard of an HP-41:

```
CLSUM                clears the statistical registers
1.000014 ST- 12      negative of the rounded value of x^2 to R12
1.000008 ST- 14      negative of the rounded value of y^2 to R14
1.000011 ST- 15      negative of the rounded value of xy to R15
1.000004 ENTER
1.000007 SUM+        adds x^2 to R12, y^2 to R14, and xy to R15

press RCL 12 and see 4.9000000 -11 in the display
press RCL 14 and see 1.6000000 -11 in the display
press RCL 15 and see 2.8000000 -11 in the display
```

where the contents of registers 12, 14 and 15 contain the values which were discarded during rounding of the squares and product. If you reverse the sequence and do the statistical entry first and then subtract the rounded squares and product from registers 12, 14 and 15 you will find that there are zeroes in those registers.

Another arithmetic exercise using the statistical functions:

Consider the numbers

```
x   = 111,111

y   = 1,111,111,111
```

```
                        x^2 = 12,345,654,321

                        y^2 = 1,234,567,900,987,654,321

                        xy  = 123,456,666,654,321

where in the HP-41 the squares and the product round to

                        x^2 = 1.234565432E10  displayed as 1.2345654 10

                        y^2 = 1.234567901E18  displayed as 1.2345679 18

                        xy  = 1.234566667E14  displayed as 1.2345666 14
```

where to see the actual ten digit mantissas you multiply the displayed values by 1E-10, 1E-18 and 1E-14 respectively. Perform the following sequence from the keyboard:

```
     CLSUM             clears the statistical registers
     1,111,111,111
     ENTER
     111,111
     SUM+             adds x^2 to R12, y^2 to R14, and xy to R15
```

where we expect the rounded values to appear in those registers and do; for example for y^2, by performing the following sequence

```
     RCL 14     1.2345679 18 in the display
     1
     EEX
     18
     CHS        1       - 18 in the display
     X          1.234567901  in the display
```

Now, perform the following sequence which, according to the description of the statistical functions on pages 103-104 of the owner's handbook, should remove the entered values from the statistical registers such that the values in R12, R14 and R15 should be zeroes:

```
     1,111,111,111
     ENTER
     111,111
     SUM-             subtracts x^2 from R12, y^2 from R14, and xy from R15

but,    RCL 12 yields -1
        RCL 14 yields 13,000,000
        RCL 15 yields 45,700
```

The result in R12 can be obtained by subtracting the exact eleven digit square of 111,111 from the HP-41 square of 111,111 with a ten digit mantissa; that is,

1.234565432E10 is 12,345,654,320 - 12,345,654,321 = -1

The results in R14 and R15 can be obtained by subtracting values for y^2 and xy which use truncated (not rounded) thirteen digit mantissas from values which use rounded ten digit mantissas; that is,

```
for R14   1.234567901E18 is   1,234,567,901,000,000,000
                            - 1,234,567,900,987,000,000
                            =                13,000,000

for R15   1.234566667E14 is   123,456,666,700,000
```

```
                          - 123,456,666,654,300
                          =              45,700
```

I obtain the same results with my HP-11C. I believe these results are a part of what was described as "... a tricky property of the Sum+ and Sum- keys whereby certain calculations can be carried out to 13 significant digits before being rounded back to 10" in a footnote on page 208 of the HP-15C Advanced Functions Handbook. I do not get similar effects with older HP calculators such as the HP-33C, HP-67 and HP-80.

Pages 205-211 of the HP-15C Advanced Functions Handbook proposes eight cases for evaluating the ability of a quadratic program to solve difficult cases. It presents a single precision program for the HP-15C which can obtain correct results for only three of the eight cases. It also presents a program which uses the "tricky properties" in a double precision routine which carries twenty digits during the calculation of the discriminant. That program obtains correct results for all eight cases. It uses eleven data registers and is quite slow. An equivalent program on my HP-41C runs for as much as ten seconds to obtain a solution. In 1991 I wrote a single precision program for the TI-59 which uses truncated thirteen digit mantissas as opposed to the rounded ten digit mantissas used with the HP-11, HP-15 and HP-41. My TI-59 program obtained correct results for seven of the eight cases. It failed for the seventh case where the discriminant is the single digit difference between two twenty digit numbers. That program and similar programs for the TI-74, TI-81 and Casio fx-7000G are described on pages 8-13 of the Volume 14 Number 3 issue of TI PPC Notes.

The four cases which a single precision TI-59 program solves correctly but a single precision HP-41C program solves incorrectly all involve discriminants which are calculated as the difference between two numbers 11 or 12 significant digits. One could, of course, devise a case in which the difference between two numbers of 14 significant digits was required and my TI-59 program would fail, but the double precision HP program would succeed. Using the insight into the "tricky properties" of the Sum+ and Sum- functions derived from the numerical exercises above I decided to write an HP-41 program which carries 13 significant digits during the calculation of the discriminant. Such a program should yield correct solutions to seven of the eight cases, use fewer registers and use less run time.

The program follows the convention in the HP-15C Advanced Functions Handbook where the quadratic is defined as c - 2bx + ax^2 = 0 and the discriminant is calculated as d = b^2 - ac . That definition reduces the size of the two parts of the discriminant by a factor of four. The program calculates the terms of the discriminant in two stages. First, the 3 least significant digits of the ac term are accumulated in R15 using the "tricky properties". Then the 3 least significant digits of the b^2 term are accumulated in R14 using the "tricky properties". The 3 least significant digits of ac in R15 are preserved by setting y = 0 during the b^2 accumulation. Finally, the 10 most significant digits of b^2 and ac are calculated in the normal manner and combined before the smaller corrections for the least significant parts are applied. The program uses only the six data registers associated with the statistics functions. The user solves by entering the constants of the quadratic with the sequence c ENTER b ENTER a, and running the program. For real roots the program stops with one root in the display. The second real root is displayed by pressing x<>y. If the solution is complex Flag 0 is set. The program stops with the real part in the display. The imaginary root is displayed by pressing x<>y where + and - signs for the imaginary part are implied. Thr run time is of the order of one second. The program listing follows. Experienced RPN programmers will surely find ways to optimize the program; after all, this is the first RPN program I have written.

```

52 CHS
53 SQRT
54 RCL 11
55 /
56 LASTX
57 RCL 13
58 X<>Y
59 /
60 STOP
61 END
```

This program will yield the correct answers to seven of the eight cases proposed in the HP-15C Advanced Functions Handbook. The exception is the seventh case from the text on page 211 where c = 4,877,163,849, b = 4,877,262,613 and a = 4,877,361,379. Then

```
d = (4,877,262,613)^2 - 4,877,361,379 x 4,877,163,849

  = 23,787,690,596,167,587,769 - 23,787,690,596,167,587,771

  = -2
```

so that twenty significant digits must be carried to yield the correct answer for d. The following program is a conversion of the double precision program from pages 208-210 of the HP-15C Advanced Functions Handbook which will solve the seventh case. The program runs for about ten seconds to obtain the solution. The roots are complex with the Re = 0.999979750 and Im = 2.8995463E-10. The HP-15C program requires 84 steps. My translation for the HP-41C requires 88 steps where the increase in steps is the lack of the combined commands such as RCL + which are used in the HP-15C program but are not available on the HP-41C.

Re: Update: 13 digit precision on HP-15c (from Palmer Hanson)

*Message #2 Posted by **hugh steers** on 25 July 2003, 11:14 a.m.,*
in response to message #1 by Gene

i very much like the trick of using the 13 digit precision rather than the "grannies china" version because its a lot smaller and quicker.

root finding and proximal double roots are good examples of why calculators need more precision. theres no reason why new models couldnt work internally to excess of 20 digits. it would help.

unfortunately, hps new range does do this but theyve crippled it. one of the problems of working in binary is that you have to suppress garbage. the 9g supresses at 10^-14 so b^2-4ac still gets 0. if they suppressed at less (eg 2^-80) it would solve the quadratic problem superbly.

HP41 Programming challange

*Message #1 Posted by **Harry (Germany)** on 23 July 2003, 12:16 p.m.*

The challange is:

Write a program that lists primnumbers and there number (I don't know the correct english word for that, what I mean is, the primnumbers should be numbered or "counted").
The main challange is to write a program that is as fast as possible.

The program I wrote searches for a common divider of the number it is testing and the products of the primnumbers it has stored in registers.

Now what you should not do is store the products of primnumbers (that you would have to compute in another way or take out of a book) in registers before the program has found them.
At least not a whole lot of them, lets say you can use all primnumbers no greater than 20. My program takes 2, 3 and 5 as given primnumbers.

This is my program.
It is not perfect and there would still be something to optimize, anyway, it was good enough to beat the program my dad wrote, hehe.
It calculates the first 500 primnumbers in less than 2 hours. I will let you know the exact time as soon as I know (just started it).

Happy programming :)

Regards,
Harry (Germany)

Re: HP41 Programming challange

*Message #2 Posted by **Harry (Germany)** on 23 July 2003, 12:28 p.m.,*
in response to message #1 by Harry (Germany)

At the beginning the program is slowed down a lot by displaying the numbers by "PSE". This takes about 2.2 seconds per primnumber.

Sorry for my bad english, I hope you can read it anyway.

Regards,
Harry (Germany)

PS: 111 primnubers after 12 minutes. The 111th one is 607

Results so far...

*Message #3 Posted by **Harry (Germany)** on 23 July 2003, 1:52 p.m.,*
in response to message #2 by Harry (Germany)

0h 06min: 068th 0337
0h 12min: 111th 0607
0h 32min: 249th 1579
0h 58min: 392th 2693
1h 16min: 482th 3449
1h 27min: 537th 3877
1h 30min: 552th 4003

now the "BAT" indicator has come on, I will have to restart with new Batteries or on the emulator, but then the speed won't be as it should be.

Regards,
Harry

*Message #4 Posted by **Trent Moseley** on 23 July 2003, 6:16 p.m.,*
in response to message #3 by Harry (Germany)

Harry,

I've got the old 67 plugged in the wall using a 49 line program adapted from Peter Henrici's book "Computational Analysis with the HP-25 Pocket Calculator". Later when I have more time I'll run in on my 32Sii. For the record the 67 took 20m 01s to reach the 73rd prime (starting out from 0), the number 359.

Re: Results so far...

*Message #5 Posted by **Victor Koechli** on 23 July 2003, 6:45 p.m.,*
in response to message #4 by Trent Moseley

Could you post the program here so we can participate?

Cheers, Victor

Results so far... Program listing

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 9:22 p.m.,*
in response to message #5 by Victor Koechli

Hi, Victor;

the program is listed in teh image below:

http://members.roadfly.com/harry2211/HP41_prim.jpg

The image file can be also downloaded in the starting post. There is a link Harry posted.

Cheers.

Luiz (Brazil)

Luiz Help Me Out

*Message #7 Posted by **Trent Moseley** on 23 July 2003, 10:43 p.m.,*
in response to message #5 by Victor Koechli

I think Victor is referring to my post that I am using a 49 line program. I dont't know to how to type this out and then somehow post it into the Forum.

tm

Oops! I post a wrong reply...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 11:17 p.m.,*
in response to message #7 by Trent Moseley

Hey, Trent;

I'm sorry; I thought that Victor was asking for Harry's listing; to be honest, I read his post and did not realise it followed yours. Please, forgive me.

About your post, is there anything I can I do for you? I'd gladly help you. If you list your 49-steps program in an HP97 printer or in an HP41's, scan the image and send it to me, I'll type it in for you. Is this what you need? I think I am the one that's confusing stuffs for good... 8*(Sorry!

Whatever you want, let me know. I'd be glad helping.

Best regards.

Luiz (Brazil)

Trent

On your post, click on Edit Message.

Put [PRE] before your listing. Put [/PRE] after.

Type your password and press Save.

There's more info here

Reformatted: Re: Here's the Program

*Message #13 Posted by **W. Bruce Maguire II** on 24 July 2003, 6:04 p.m.,*
in response to message #9 by Trent Moseley

Trent:

Is this what you intended?

```
001 LBL A      025 x=<y?
    DSP 0          GTO 3
    LBL 0          2
    2              ST* 3
    STO 3          1
    1          030 ST- 3
    STO 4          GTO 2
    RCL 1          LBL 3
    LBL 1          3
010 SQRT           ST+ 3
    STO 2          RCL 4
    LBL 2          CHS
    RCL 2          STO 4
    RCL 3          ST+ 3
    x>y?           GTO 2
    GTO 5      040 LBL 4
    RCL 1          1
    RCL 3          ST+ 1
    /              GTO 0
020 FRAC           LBL 5
    x=0?           RCL 1
    GTO 4          PAUSE
    RCL 3          1
024 4              ST+ 7
               049 GTO 4
```

I have not verified the code or anything; I just reconstructed what appeared to be a multi-column original with line numbers.

Ocassionally skulking,
Bruce.

The Reply of W.B.M. II!

*Message #14 Posted by **Trent Moseley** on 25 July 2003, 12:01 a.m.,*
in response to message #13 by W. Bruce Maguire II

Bruce,

You made my day, I was so frustrated. The program looks the way it should have been. I'm so greatful for your help. Just a note about line 48. As you see, this records the count that Harry in his original post asks for. So now everyone can test it out on different caluclators to give us the fastest run, and more importantly, shave off a few steps. If I have missed something please reply.

tm

Here's my version of the program (long)

*Message #15 Posted by **Axel Poqué** on 28 July 2003, 1:05 p.m.,*
in response to message #13 by W. Bruce Maguire II

Ok, here's my version of the program. I've added a few lines to time the program (lines 06-08, 56 and 58-60), and also the possibility to provide a maximum number to test (say, you want all primes up to 1000).

If we remove the special case of '2' as a prime (by starting at 3 instead of 1), we can reduce the running time of the program by about 25% since we only need to test uneven numbers in this case.

To run it, you put the maximum number to test on the stack, and do an [XEQ] "PRIME1".

```
01 LBL "PRIME1"
02      STO 06          ; last number to test
03      FIX 00          ; set display to show integers
04      CF 29           ; no decimal point
05      0

06      STOPSW          ; start stopwatch (remove lines 06-08 if you
07      SETSW           ; don't want to use the stopwatch)
08      RUNSW

10      STO 07
11      3
12      STO 01
13 LBL 00
14      2
15      STO 03
16      1
17      STO 04
18      RCL 01
19      SQRT
20      STO 02
21 LBL 02
22      RCL 02
23      RCL 03
24      X>Y?
25      GTO 05
26      RCL 01
```

```
 27      RCL 03
 28      /
 29      FRC
 30      X=0?
 31      GTO 04
 32      RCL 03
 33      4
 34      X<=Y?
 35      GTO 03
 36      2
 37      ST* 03
 38      1
 39      ST- 03
 40      GTO 02
 41 LBL 03
 42      3
 43      ST+ 03
 44      RCL 04
 45      CHS
 46      STO 04
 47      ST+ 03
 48      GTO 02
 49 LBL 04
 50      2               ; only uneven numbers (3, 5, 7, ...)
 51      ST+ 01
 52      RCL 06          ; loop if not maximum number
 53      RCL 01
 54      X<=Y?
 55      GTO 00

 56      STOPSW          ; remove if no timing needed

 57      SF 29           ; reset decimal flag

 58      FIX 06          ; 6 decimal places to show time
 59      RCLSW           ; show expired time
 60      VIEW X          ; lines 58-60 can be removed if you
                         ; don't want to time the program
 61      STOP
 62 LBL 05               ; show prime number
 63      CLA
 64      ARCL 01
 65      AVIEW
 66      1               ; count primes
 67      ST+ 07
 68      GTO 04
 69 END
```

I haven't been able to test it on a real HP-41, since I sent mine back for replacement (it suffered from frequent memory losses, if you remember). I ran it in V41 though, where finding all primes up to 100 takes 41 s instead of 56 s.

Axel

Re: Here's my version of the program (long)

*Message #16 Posted by **Harry(Germany)** on 28 July 2003, 2:37 p.m.,*
in response to message #15 by Axel Poqué

Testing only odd numbers is a good idea. My Program also does not test numbers that can be divided by 3. This is done by increasing the number by 2 and 4 like this:
5 +2
7 +4
11 +2
13 +4
17 +2
19 +4
23 +2

25 +4.....

Regards, Harry

Re: Here's my version of the program (long)

*Message #17 Posted by **Axel Poqué** on 28 July 2003, 3:05 p.m.,*
in response to message #16 by Harry(Germany)

Yes, I know. For this version I only made a simple change which could not negatively affect runtime through the additional required logic - the inner loop stayed the same excpet for the step width. I'm going to try to avoid numbers divisible by 3 (and perhaps 5) now.

Axel

Re: Results so far...

*Message #18 Posted by **Harry (Germany)** on 23 July 2003, 7:23 p.m.,*
in response to message #4 by Trent Moseley

The 32SII is faster than the 67 and the 41 I think.
I would also transfer my program, but the 32 does not provide the 107 register it needs. At least if it is set up to compute all primnumbers up to 1E6.
I have adapted it to an HP48 wich is a lot faster.

Regards,
Harry

Re: Results so far...

in response to message #18 by Harry (Germany)

Harry,

I haven't heard from you. Have you used the program that I posted after it was reformatted by Bruce?

tm

Re: Results so far...

*Message #20 Posted by **Harry (Germany)** on 28 July 2003, 2:22 p.m.,*
in response to message #19 by Trent Moseley

Yes, I have tested it, although i did not fully understand it. As I expected the speeddiffrence gets more significant with bigger numbers. The 29C I programmed it into was at #1500 after 2 days.

Regards, Harry

Re: Results so far...

*Message #21 Posted by **Axel Poqué** on 28 July 2003, 3:24 p.m.,*
in response to message #20 by Harry (Germany)

Well, the program works much the same way you suggested. Although it tests ALL number for primality, it only tests each number against a sequence of numbers avoiding multiples of 3, up to the square root of the original number (since 4 * 6 = 6 * 4 = 24). The sequence is as follows:

```
 2  3  5                      ; lines 23-31
  +1 +2

  7  11  13  17  19  23 ...   ; lines 32-39
+2 +4  +2  +4  +2  +4  +2 ...
```

I hope this clarifies things a bit.

Axel

in response to message #21 by Axel Poqué

Yes, I see it now. To be honest, I did not spend too much time on analysing it. But now I did.

Regards, Harry

Re: Results so far...

*Message #23 Posted by **Harry** on 28 July 2003, 4:50 p.m.,*
in response to message #21 by Axel Poqué

My program also stops when it reaches the square root of the number that is beeing tested. Thats why I had to store the biggest prime number that is in the product in addition to the product itself.
The disadvantage of my program is 1st its length (It is twice as long as the other one) and second its need for memory. It needs 108 registers if I want to search for primnumbers up to 1E6.

Regards,
Harry

Display Full Mantissa 41CV

*Message #1 Posted by **bill platt** on 23 July 2003, 10:08 a.m.*

Hello,

Does anyone know whether you can show the full 10 digit mantissa in the 41 series? I do not find this ability descibed in the owner's handbook and programming guide. In other words, when you have a big exponent number, some way to toggle viewing the mantissa, as you can on the voyagers and pioneers.

regards,

Bill

Re: Display Full Mantissa 41CV

*Message #2 Posted by **Thibaut.be** on 23 July 2003, 10:14 a.m.,*
in response to message #1 by bill platt

A full mantissa option does not exist by itself, but you can choose the largest FIX which is [GOLD KEY] FIX 9

You'll get 9 figures after the comma.

Re: Display Full Mantissa 41CV

*Message #3 Posted by **bill platt** on 23 July 2003, 10:40 a.m.,*
in response to message #2 by Thibaut.be

Thibaut,

thanks! So, this means that any really large or small numbers will only display 8 digits in the MAntissa, because of the Exponent display tasking up space.

Regards,

Bill

You could type up the PPC ROM routine for "MT"

*Message #4 Posted by **Gene** on 23 July 2003, 10:44 a.m.,*
in response to message #3 by bill platt

You could type up the PPC ROM routine for "MT" (ManTissa), which you can run to show the entire mantissa regardless of display setting.

Anyone have the listing handy for Bill?

Re: You could type up the PPC ROM routine for "MT"

*Message #5 Posted by **Ernie Malaga** on 23 July 2003, 12:02 p.m.,*
in response to message #4 by Gene

Gene, Bill:

All 13 lines of the MT routine are listed on page 339 of the PPC ROM manual, which is included in the MoHPC CDs/DVD:

```
29 LBL "MT"
30 CLA
31 STO M
32 ASTO M
33 INT
34 X!=0?
35 (Append x'00')
36 X=0?
37 (Append x'A0')
38 CLX
39 ST+ M
40 X<> M
41 RTN
```

Note: The line numbers begin with 29 because of the way routines are stored in the PPC ROM. They don't matter. Also, you may want to replace the RTN with an END.

Typing this routine requires using either a Byte Grabber in order to make it possible to type up the synthetic lines. The MoHPC page for the HP-41 contains a link to a page that describes how to create the Byte Grabber key assignment.

Finally, if you don't want to mess with synthetics AND you can spare the contents of both the T and LASTx registers, you can simply perform a multiplication or division by a suitable power of 10, which will eliminate the pesky exponent from the display. Example:

Supposing the HP-41 shows "1.2345678E-12", you simply multiply the result by 1E12 (EEX 12 x).

-Ernie

Re: Display Full Mantissa 41CV

*Message #6 Posted by **Chan Tran** on 23 July 2003, 10:51 a.m.,*
in response to message #3 by bill platt

Fix 9 does not display all digits in the mantissa if the number is too small or too large to be displayed in fix format. However, recall the X register to the alpha register and view the alpha register you can see all 10 digit mantissa and the 2 digit exponent.

Full Mantissa 41CV TNX!

About that HP37E I am trying to fix

*Message #1 Posted by **Harry (Germany)** on 23 July 2003, 9:40 a.m.*

As I posted a while ago, I got a faulty 37E. The powersupply is not working. Now I got annother spice, a 32E, (the 37E was my first one) and I used the 32Es powersupply to test the 37E. It still did nothing. Then I realized that the LEDs were badly corroded inside too, and after swaping those too it works!! The powersupply should not be a big problem to repair, as I have that working one to look at and measure on (Thanks to Luiz for the excelent pictures and enlightening me on that jumper :)). But do you have any suggestions on how to restore the LEDs?

Regards, Harry (Germany)

Re: About that HP37E I am trying to fix

*Message #2 Posted by **Jon** on 23 July 2003, 3:09 p.m.,*
in response to message #1 by Harry (Germany)

Harry:

I am am afraid you need a spare part. Any solderless spice display will work.

If you can repair it post the solution. I have two of those "internally corroded" displays.

Best Regards

Jon

Re: About that HP37E I am trying to fix

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 8:54 p.m.,*
in response to message #2 by Jon

Hi Jon, Harry (I wrote your name wrongly in my e-mail; sorry)

Just to add to Jon's correct note that if you find a working LED module in one soldered Spice and you are carefull enough removing it without dammaging it, it will work fine as well. I have already done that...

About restoring the "corroded" microscopic 7-segments LED blocks: I completely agree with you, Jon; I cannot see a better way than using a spare LED module. Harry, be patient and you'll surely find a "donator". Spices are not so rare.

Good luck, Harry. And let us know what happens. (thanks for mentioning the drawings; my pleasure)

Luiz (Brazil)

Re: About that HP37E I am trying to fix

*Message #4 Posted by **David Smith** on 23 July 2003, 4:53 p.m.,*

in response to message #1 by Harry (Germany)

If the connecting pins are corroded you can clean them with alcohol and lightly sand them with extra-fine grit sandpaper. Treat the pins with a corrosion inhibitor if you can find it. This should get the display up and running.

VERY occasionally the corrosion can get up under the LED lens and affect the bonding wires to the LED chips. This usually only affects a small portion of the display. It is not repairable.

Re: About that HP37E I am trying to fix

*Message #5 Posted by **Harry (Germany)** on 23 July 2003, 5:09 p.m.,*
in response to message #4 by David Smith

That is exactly what happened to my LEDs. I can see crystals arround all the boding wires through the lenses.

I will keep the calculator for spareparts...

Regards, Harry

Re: About that HP37E I am trying to fix

*Message #6 Posted by **Stephan (Germany)** on 23 July 2003, 7:09 p.m.,*
in response to message #1 by Harry (Germany)

Dear Harry,

I have a spare 32E at hand, which is corroded, but LEDs seem fine. I don't have time and pations to give it a try. If you want it for free, please drop me a line. In case it works out, I would be pleased to receive a bottle of beer of your home town as reward.

Best regards,

Stephan

HP-48GX display indicators

*Message #1 Posted by **Axel Poqué** on 23 July 2003, 8:25 a.m.*

All 4 display indicators (ALPHA, BAT, BUSY & CONNECT) of my HP-48GX are always on, regardless of mode and/or battery status. Does anybody know what could cause this? Is this perhaps an indicator for a faulty display or contact problems, or just a flag setting?

Axel Poqué

Re: HP-48GX display indicators

*Message #2 Posted by **Raymond Del Tondo** on 23 July 2003, 9:47 a.m.,*
in response to message #1 by Axel Poqué

I suspect it to be a display contact problem.

Somewhere here on this site there are/were articles/postings related to this topic.

Have you tried applying (carefully) some torsion on the calculator case?

What about installed software, and/or new batteries?

Raymond

Re: HP-48GX display indicators

*Message #3 Posted by **Axel Poqué** on 23 July 2003, 10:59 a.m.,*
in response to message #2 by Raymond Del Tondo

The calculator has had this problem for quite some time now (several years - I just didn't know who to ask before), so it's not a battery issue. I have a 1 Mb RAM card installed, but the indicators stay on when I remove it. There's only one additional program installed at the moment, because I lost the contents of the RAM card recently when its battery died, and I didn't bother to reinstall until now.

Flexing the case doesn't change anything.

When I change the contrast setting, the indicators do not change - they have always maximum contrast (is this normal?).

Axel

Re: HP-48GX display indicators

*Message #4 Posted by **Ron Ross** on 23 July 2003, 11:11 a.m.,*
in response to message #3 by Axel Poqué

On the newer 49 and 39 series, this indicates a problem with the battery circuit (high drain due to diode

problem, maybe in past you inserted a set of batteries backwards?). That said, a set of batteries will only last for a couple of weeks to a couple of months vs normal useage on a set of batteries should be 3+ months under even heavy use.

I have a 39G that was replaced with the same problem, but it was still under warrenty. But it didn't seem to use up batteries any more than my daughters other 39G either.

Re: HP-48GX display indicators

*Message #5 Posted by **Axel Poqué** on 23 July 2003, 5:00 p.m.,*
in response to message #4 by Ron Ross

Well, I know that I once inserted at least one battery backwards; but I discovered it immediately and put them in the right way. I can't remember if my problem started then, though. (I hope I didn't damage it.)

Up until about 3 years ago I used my HP-48GX almost daily for about 6-8 hours, a set of batteries used to last about 6 weeks then. Now I use it much less and I really can't tell how long a set of batteries lasts.

I'll probably back everything up and try a complete reset (as someone suggested) and see what happens.

Thanks, Axel

Re: HP-48GX display indicators

*Message #6 Posted by **unspellable** on 23 July 2003, 5:51 p.m.,*
in response to message #5 by Axel Poqué

Putting one out of the three cells in backwards will result in the battery voltage being at about 1.4 volts with the correct polarity, same as a low battery condition, and should not cause any harm to the hardware. The calculator would probably just not run. It might cause loss or corruption of the memory though.

Re: HP-48GX display indicators

*Message #7 Posted by **Roberto Flores** on 24 July 2003, 12:55 a.m.,*
in response to message #1 by Axel Poqué

Hi... I have a 49G that had the same problem (bought used). Last week I decided to swap the lcd screen (with a "donor" 39G) and this took care of the problem, my 39G now displays the indicators and my 49G works flawlessly. Now you know what to do... find an old 38G or 39G and replace that screen. Hope this helps.

Regards;

Roberto

Re: HP-48GX display indicators

*Message #8 Posted by **bill platt** on 24 July 2003, 5:54 p.m.,*
in response to message #7 by Roberto Flores

Roberto,

I remember you posting about this----but was it here, or at comp.sys.hp48?

Some of you guys here in this forum are damn good at taking apart machines that were not designed to be serviced, and you manage to perform the electonic equivalent of brain or eye surgery.

I am impressed, amazed, and perhaps even a bit intimdated. I have not had so much luck myself so far with calculator surgery :-(

regards,

Bill

Don't give up...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 25 July 2003, 12:02 a.m.,*
in response to message #8 by bill platt

Hi, Bill;

I see and read your posts here and let me tell you something: I think no one likes to post about losses, both because it's not a good thing to read about and may also cause lack of confidence in others.

I was not completely successful in all of my surgeries. I still have a deceased HP42S with 32K RAM, I could not repair some calculators sent to me sometime ago, but I feel I can do better.

We have a big advantage against doctors: we can kill our patients and resuscitate them anytime we want, even after days, months passed after they're "put to deep sleep".

I am a lot careful, I do not feel as having the rights to go beyond what I know I can, mostly when I have someone else's equipment in hands. A couple of months ago I was given an HP41CV, halfnut, with an intriguing behavior: only 64 registers available. What did I do? I disassembled it all, scanned its "guts" and allowed people to "see" the inside of a halfnut in a way many have never seen before. After that, I put all stuff back, soldered all necessary junctions and it woke up the same way it was before: only 63 registers. Now I use it as my first "fake" HP41C halfnut. Yes, I rebuilt it in a fulnut HP41C's original case.

I only give up when I "see" no way out and there is no one else to show me another alternative. Before getting acquainted with the MoHPC "environment" I had three HP41 disassembled and out-of-order. I was able to bring two of them back to life. The third one I'm using as an "organ donator". As I have seen in some movies: "Someone must do this job", right?

Best regards. And don't give up... Use a faulty experience to compose a new, successful one.

Luiz (Brazil)

Re: Don't give up...

*Message #10 Posted by **bill platt** on 25 July 2003, 8:24 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Tnx 4 the encouragement. BTW, my 41cv fullnut--the one that I have not fixed yet----before it wierded oit on me, when I went to empty program space, it would say "Reg 63" or "end Reg 63" or something. Does this mean I only had 63 registers, too?

Regards,

Bill

Re: Don't give up...

*Message #11 Posted by **Vieira, Luiz C (Brazil)** on 25 July 2003, 8:59 a.m.,*
in response to message #10 by bill platt

Hi, Bill;

based on what you say, chances are you have only a faulty RAM IC, maybe more. When you force a [MEMORY LOST] condition and execute SIZE 000, you get [00 .REG. 63] in PRGM mode, right? After doing that try one of these:
[RCL] 64 128 [RCL][SHIFT][.] X (i.e. RCL IND X) 192 [RCL][SHIFT][.] X

If any of these does not generate [NONEXISTENT] then you have only one faulty RAM chip. In this case, and of course, being it a be a fulnut, chances are you can repair it with a donated RAM from another CV. Fulnuts have all RAM chips as separate, discrete package. Halfnuts have an hybrid chip with all ROM, RAM and display driver (R2D2) in one single resine package that cannot be serviced.

Would you please check it out and let us know?

Best regards.

Luiz (Brazil)

HP41 Bank Switching & HEPAX Question

*Message #1 Posted by **Meindert Kuipers** on 23 July 2003, 4:26 a.m.*

Now that the basic functionality of the MLDL works I am trying to figure out the best way to implement bankswitching in the MLDL2000 design. I would like to know if I understand the behavior correctly:

The ENBANKx (x=1,2,3,4) enable the relevant bank in the page the instruction is executed from. I assume that the behavior of the instruction is not defined for the system ROM's (page $0, $1 and $2)? Are there any other exceptions? In the source for V41 some exceptions are mentioned but these are pretty hard to implement.

I also assume that the two pages in a port (for example $8 and $9) are totally independent.

When in standby the state of the Bank Enable does not change? After Deep Sleep or Power Down the Bank Enable state of all ROMs returns to Bank 1?

Other question about HEPAX: it supports two extra instructions, one to write protect a RAM page and one to relocate HEPAX to an empty page. In the current architecture of the MLDL2000 these instructions cannot be implemented. Can anyone comment to the fact what would happen to the functionality of HEPAX if these special instructions (only used by HEPAX AFAIK) function as NOPs?

Thanks,

Meindert

About Bank Switching, RAM/ROM-Boxes, MLDL, HEPAX... and so on.

*Message #2 Posted by **Diego Diaz** on 23 July 2003, 6:03 p.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert, folks,

First of all I must say I've been following your MLDL2000 work since the beginning, I have no microcontroller experience at all so I can't be of any help for you in that sense.

Anyhow, I'm quite handy with wires & chips (IC's... well... and fried potatoes also ;-) BTW I've just finished my own (breadboard-prototype) ROM Box, starting from the original Lynn A Wilkins MLDL as published in PPCJ V9N3.

I've done some modifications:

- As I was not interested in the RAM area, I rub the related components off.

- 2732 & 2716 pairs might be a good solution with '82 eyes, but nowadays, EPROM's are more easily found in bigger capacities and those older models are scarcy and non price competitive.

- Further more, the 10bit 41's word implementation in the original MLDL was extremely complex with 2 last bits (MSB's) multiplexed into an 8bit 2716 word for every four 2732 word... !? Well I simply place the 10 bits

into two consecutive words of a 2764 or 128 or 256 or 512 (the last gives you the full 32k-words available for the 41's four extension ports) then read the Least Significant Byte from the odd address, send them to the ISA line, and at the proper time read the remaining two bits from the even address. So one only shift register is needed to drive the ISA line output and one only EPROM is needed to hold the "module" (or modules) data. Yes, you throu 6 bits away for each word but who cares?

- Several other minor "improvements" regarding the state counter and some gates saved here and there, and the whole thing is working.

Sorry, up to here I'm pretty sure I've told you nothing new, but I'm willing to share my experience so other can see that there is no mystery in bulding an (EP)ROM-Box for the 41.

Up to this point I've not implemented the bank switching capability for that, mainly because I have not a full knowledge about the way it works, but I've been doing my homework and here you are what I've found out:

- Bankswitching instructions ENBANK1, 2, 3 & 4 ($100, $180, $140 & $1C0 respectively) are NOP's for the 41 mainframe OS.

- Wichever module's willing to handle with them must reserve some specific memory addresses for the RETURNing, namely $XFC7, $XFC9, $XFCB & $XFCD (X beeing the hex value for the address four MSb's.

Address:..Instrucions

$XFC7:....$100, $3E0

$XFC9:....$180, $3E0

$XFCB:....$140, $3E0

$XFCD:....$1C0, $3E0

This MUST be present in every 4k bank of the module.

Obviously if a module is only going to handle Banks 1 & 2 it has no need to implement the corresponding returnings for Banks 3 & 4.

- Once the swithching has been performed, is in the internal module electronics in wich the responsibility of handling it relays, so the enabled bank is the one that can be seen at this specific 4k address area. This is why you can (e.g. in the HEPAX) relocate the address the module responds at, and override the "hardwired" B3 & B4 address lines to the I/O ports.

Remember this is an "at first glance" approximation of the bankswitching behavior, I've got a lot to learn about it yet and, of course, it may not be accurate in some points, so take it AFAIK and excuse me for the possible mistakes.

Some others out there sure can enligthen us with a deeper knowledge regarding this issue.

Cheers from the Canary Islands.

Diego.

Re: About Bank Switching, RAM/ROM-Boxes, MLDL, HEPAX... and so on.

*Message #3 Posted by **Jeff** on 24 July 2003, 6:16 p.m.,*
in response to message #2 by Diego Diaz

I have and can get any number of the 2716 and 2732 EPROM's. If you need some please let me know. Also, I am interested in redesigning the SRAM section of the MLDL as the TC5504AP-2 units are not available, as far as I know. I would like to find a one chip to do it all if possible. Any suggestions? One possible solution posted last week was to use an 8 bit SRAM chip in place of two 1 bit chips, and waste 6 bits (tie them to ground, perhaps through a resistor). Also, is there a way to increase the RAM on this unit to something more than 4K? Jeff

Re: About Bank Switching, RAM/ROM-Boxes, MLDL, HEPAX... and so on.

*Message #4 Posted by **Diego Diaz** on 24 July 2003, 7:39 p.m.,*
in response to message #3 by Jeff

Hi Jeff,

First, thanks for your offer about 2732/16 EPROMS, I also have a huge amount of them, but the main question is that using a single chip for the ROM data greatly simplifies de circuit. I think that earlier designs used that configuration due to excesive cost of 2764 or 27128 chips circa '82 (only a guess).

Regarding the RAM question, the same rule is applicable, TC5504AP-2 must be almost impossible to find and are by no means recomendable for a new design. In my opinion you'd better try the previous thread advice, take any 8bit low power static RAM in the market and multiplex the access for the lower 8 and upper 2 bits.

Of course you can place as many 4k words pages as you can, provided you have no other modules in the same address space, wich means that you can have as much as 32k words of RAM space with all four I/O ports address space available (even 40k words if no other peripheral is connected as you can also use Pages 6 & 7). So you can accomodate two 16K bytes RAM chips (e.g. HM65256 or the alike).

Nevertheless you must save some space for the RAM read/write routines wich must be present to alow the use of said RAM.

Hope this help.

Kind regards.

Diego.

Re: About Bank Switching, RAM/ROM-Boxes, MLDL, HEPAX... and so on.

*Message #5 Posted by **James** on 24 July 2003, 7:49 p.m.,*
in response to message #3 by Jeff

> Quote:
>
> ... redesigning the SRAM section of the MLDL as the TC5504AP-2 units are not available, as far as I know. I would like to find a one chip to do it all if possible.

A quick look through DigiKey shows there are 16 bit wide SRAM chips available from Cypress, but they are in awkward packages (TQFP etc.), and it looks like the low power 16 bit SRAM only comes in low voltage versions (<= 3.6V). (You don't want a fast SRAM, as you couldn't run it off batteries.)

eg. go to http://www.cypress.com/ and click MicroPower SRAMs.

Toshiba has some low power 5V 16 bit SRAMs, also in awkward packages:

http://www.toshiba.com/taec/cgi-bin/display.cgi?table=Category&CategoryID=232

eg. TC554161A,-L, 256K x 16, 5V 54 pin TSOP II:
http://www.toshiba.com/taec/components/Datasheet/554161a.pdf

However, even if you can find a single chip part, I would avoid going this route... the more exotic the part, the harder it is going to be to get (more) in small quantities, and the more it will cost. Generic 6264 (8K x 8) parts are going to be available at a good price for ages.

HTH,

James

Re: About Bank Switching, RAM/ROM-Boxes, MLDL, HEPAX... and so on.

*Message #6 Posted by **Meindert Kuipers** on 25 July 2003, 3:32 a.m.,*
in response to message #5 by James

Get the biggest SRAMs you can get. The usage is all defined in your address decoder and you can always tie unused address lines to zero. I would not take 16-bit SRAMs, these are somewhat exotic.

I have just posted pictures of my breadboard prototype MLDL2000, and that uses a 4 mbit SRAM. This was not available in DIL, so I soldered a little board together(just do not drink too much coffee ;) The picture location is at

www.kuipers.to/final%20for%20web/original/P5200175.jpg The empty socket is for the FLASH Eprom, which was not available in the SO32 package

Problem today is that most of these parts are all 3V.

Consider FLASH Eproms instead of the classic. Programmers are cheap (unless you already have one) and fast and you do not have to spend 20 minutes erasing them under UV light.

Meindert

Re: 2 articles about it

*Message #1 Posted by **Robert Blaschke** on 23 July 2003, 4:24 a.m.*

Hi all,

after browsing some of the wonderful PPC CDs within the last nights I found an appropriate article in Datafile Vol.5, No.2, March, April 1986.

It's from Mark Power and says:

"Screen Scroll Bug I have recently discovered a bug in the error handling of my HP41CV (serial number 2349S40141). The problem is demonstrated by running the program given below.

01: LBL TST

02: CLX

03: "** HP41-CV *"

04: AVIEW

05: LBL 01

06: SF 25 (Ignore error)

07: SIN (Short delay)

08: GTO 01 (No LBL error)

09: GTO 01 (Do it again)

10: END

It seems that the calculator forgets that there is a message on the screen and treats it like the running symbol and scrolls the screen when the machine performs the GTO which creates he error. If you stop the program and look at the ALPHA registers you will see that the original message is still intact. This bug is not of great importance but I hope someone will put it to good use.

Mark Power"

There follows a remark from the editor: "(Ed - This is one of the display bugs which all HP41's have. These bugs are described in Appendix C of "Extend Your HP41".)"

Now let's take a look into W.A.C. Mier-Jedrzejowicz' great book:

"Display bugs

(...) If you VIEW or AVIEW something and execute an instruction that clears flag 25 then the contents of the

display will move around just as if they were the "flying goose". Enter and run the following short program:

LBL "DSPL", PI, SF 25, "?", AVIEW, SF 60, LBL 01, ATAN, GTO 01, END

SF 60 generates an error and clears flag 25. Flag 50, the message flag is cleared at the same time, but the display is not cleared, so the HP-41 acts as if the display had been cleared and the "flying goose" was in it, but actually moves whatever is in the display. The ATAN is just a delaying tactic, without it the display would move too quickly in the LBL 01 loop. You can use this bug to display your favourite message while a program is running, but the message must not be more than 12 display positions long (it can contain extra punctuation though). You can experiment with interesting displays, for example try the string " . , . , . , . , . , ," instead of the "?" in the program above. Reference: PPCCJ V6N8P24"

That's for the moment. Now we have 3 different examples for creating this nice effect and there is no more need to wonder about flag 99 ;-) In case I find more interesting articles about this fyling goose replacement I'll let you know.

Best regards and happy programming

Robert

Difference in CX roms?

*Message #1 Posted by **Sean McNamee** on 23 July 2003, 1:20 a.m.*

My co-worker has a halfnut (rounded corner) CX, mine is the older type. On mine, typing shift-ON causes the clock to be displayed, but not on his. Is this just a flag setting? Or are they different in the ROM encoding?

Re: Difference in CX roms?

*Message #2 Posted by **Les Bell [Sydney]** on 23 July 2003, 1:24 a.m.,*
in response to message #1 by Sean McNamee

I have a half-nut 41CX here, and shift-On works exactly as expected. I don't know of any flag that affects this, nor any ROM differences. My initial response is that his unit may be faulty.

Best,

--- Les [http://www.lesbell.com.au]

Re: Difference in CX roms?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 1:29 a.m.,*
in response to message #1 by Sean McNamee

Hi;

this sounds bad... Bad contact, bad environment, bad feelings. Any CX, AFAIK, calls the clock when [SHIFT][ON] is pressed. I do not remember seeing any flag that would suppress or override this feature.

In any case, if there is no trouble, try a [MEMORY LOST] procedure and call the clock with [SHIFT][ON]: all flags should be reset to default values and it must work after that.

If your co-worker is sure it's not an ordinary CV with X-Functions and Time module built inside, I'd be suspicious about it.

Also, try [CAT][2] and see if it behaves like the HP41CX [CAT][2]: only headers must be shown instead of all available function for each attached ROM.

Going further, try [XEQ][ALPHA] ED [ALPHA]. If this results in [NONEXISTENT], this is not an HP41CX.

Success. And let us know what happens.

Luiz (Brazil)

Another Thought

*Message #4 Posted by **Les Bell [Sydney]** on 23 July 2003, 1:33 a.m.,*
in response to message #1 by Sean McNamee

The 41CX manual describes Shift-On as being like switching the calculator off, then on before displaying the clock (which is why it has an effect on flags 12 through 20). However, [XEQ] CLOCK does not do this.

So, you might gain an insight by investigating whether [XEQ] CLOCK behaves the same way.

Best,

--- Les [http://www.lesbell.com.au]

Faulty battery?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 1:47 a.m.,*
in response to message #4 by Les Bell [Sydney]

Hi, Les Bell;

after reading your post I thought about another possibility, too. A few days ago I found a weird problem: one HP41 did not switch to ON. The LCD flashed the 0.0000 and vanished fast. I tried another battery set with a different holder and it worked fine. But its battery set and holder showed the same problem in two other calculators. I decided to measure batteries voltage while switching the calculator ON, and I found an weird behavior. Battery voltage was O.K. with calculator OFF. When ON was pressed, voltage dropped to less than 2 Vcc and the calculator could not switch to ON. I measured each battery and voltage was O.K. in all of them. I decided to load each of them and measure current intensity. There it was: one of them was not able to reach 1 mA. I replaced it and tested current intensity when the calculator is switched to ON: has a peak that goes beyond the steady maximum current (program running or key pressed). I have no precision instruments (not yet) to measure this current peak, but I'll find a way to measure it soon.

Based on this and after reading your post, I think this possibility should also be taken into account. If BAT indicator is present, I'd also suggest trying with a new set of batteries. Who knows?

Best regards.

Luiz (Brazil)

Low battery, CLOCK and [SHIFT][ON]

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 2:08 a.m.,*
in response to message #4 by Les Bell [Sydney]

Hi Les Bell, Sean, folks;

I had a look at the HP41CX Owner's Manual, Vol. II, and found something in p. 383.

If the batteries are low, either CLOCK or [SHIFT][ON] will turn the "computer" to OFF. The fact is that the low battery condition may also be "sensed" when the calculator is switched to ON but this condition does not prevail, what would gives us a low battery condition without BAT annunciator. I'd still suggest testing the unit with a fresh battery set. Just in case...

Success.

Luiz (Brazil)

Re: Low battery, CLOCK and [SHIFT][ON]

*Message #9 Posted by **Victor Koechli** on 23 July 2003, 4:02 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Low Batteries are usually the cause for this beaviour. You can easily see why:

Most 41s (all I have ever held in my hands, anyway) produce an audible sound when the CPU is running. Just program an eternal loop and start it, then hold your ear at the back label - you will hear a low hissing noise. Press R/S to stop the program, and it's gone.

When you press [SHIFT] + [ON], you will hear the CPU run as it turns the calc off, then back on. After that, the CPU will run until it's time for the first display update. That is, in CLKTD mode, where seconds are not displayed, the CPU will run continuously for up to 1 minute, until it's time to turn the minutes. After that, the 41 sets an internal timer, and the CPU will turn off until it's time to update the diplay again. Do this in CLKT mode, and you will hear the CPU quickly turn on and off every second after the initial continuous period is over.

As this can use quite some battery power, it's easily possible that you see no BAT indicator, but the clock will still not turn on. Same with the Card Reader, BTW.

Besides that, I remember reading somewhere that the 41 knows at least two different low power levels, and obviously only one can be communicated via the BAT indicator. Don't know which one, however.

Cheers, Victor

HP-42S Emulator??

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 23 July 2003, 12:50 a.m.*

Hi All! Where do I find the HP-42S emulator (HP42X)?? The original page said that this program is discontinued... Very sad! I own a HP-42S (S/N:2945B20860, ROM A-5), and it's display is getting bad. I need some alternative to use it on my PC (through Emu48) or even better if there is a emulator for PalmOS! As I don't have any means to download it's ROM to my PC, how do I get it? I'm thinking in create a Emu42 based on the Emu48... (as soon I translate-it to Delphi!)

Regards,

Nelson

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 1:20 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Hello, country mate!

J. F. Garnier wrote an emulator for the HP42S, but I am not sure if the HP42X is the one he wrote. I'll try to find his e-mail address and I'll contact you later, O.K.?

First time around here? Good to "see" country folks. Where are you?

If you feel fine about it, e-mail me. There are other two contributors in here that live in São Paulo.

Re: HP-42S Emulator??

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 23 July 2003, 10:36 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hello! I'm living in Curitiba, and I'm also a HP's calculator lover. I used to own a HP-15C but in 1989 I changed it by my atual HP-42S (if I had the money in that time to keep both!) My actual effort is to make a PalmOS based HP-42S emulator, some sort of porting of Palm's version of Emu48 but with 42S hardware. But this is not an easy quest! I'm a Systems Analist and Programmer (Assembler and Delphi/Pascal) and another (hobby) project of mine is to create a HP-55 (and/or HP-41CX) emulator in hardware, Microchip's PIC based with LCD display or any vintage LED display I can get.

Best regards!

Nelson

Re: HP-42S Emulator??

*Message #4 Posted by **J-F Garnier** on 23 July 2003, 4:45 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Although I wrote a HP-42S emulator (very basic, DOS based, semi-graphic text mode) some years ago, I never made it public. It was only a tool to study HP-42S internals. You can use the work from Christoph Giesselink, his HP-42 emulator sources are available, and he designed a fast method for ROM transfer.

Jean-Francois

Re: HP-42S Emulator??

*Message #5 Posted by **Nelson M. Sicuro** on 23 July 2003, 10:13 p.m.,*
in response to message #4 by J-F Garnier

I downloaded his emulator already, but I cannot read my HP-42S's ROM because I don't have any other IR reciever besides my Palm M125, but I don't have any software that reads HP IR printing data. 8-(I really want to read my own ROM, it is a bug-less version (no COMB bug) "A" version! I'm working in translate all the information I gathered about the Saturn processor and HP-42S to Delphi and 68K assembler (Palm), mostly rewriting from scratch. I'm not a "nativelly C speaking" guy, but I'll try anyway.

I have another crazy idea, about converting the ROM itself to 68K platform (sort of cross-compiling) and I/O converting to PalmOS API to run nativelly on my Palm. This could be really fast!

Best regards,

Nelson

Re: HP-42S LCD

*Message #6 Posted by **Randy Sloyer** on 23 July 2003, 8:14 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

If your 42S LCD is failing (black spots), you can find a replacement in a 17B/17Bii or 27S. They all use the same LCD.

Re: HP-42S LCD

*Message #7 Posted by **Nelson M. Sicuro** on 23 July 2003, 10:38 a.m.,*
in response to message #6 by Randy Sloyer

Thanks for the tip. As soon it gets bad (it only show some black spots in the left non-character area) I'll try to get one of these to replace it or search for some service to repair it.

Regards,

Nelson

Re: HP-42S Emulator??

*Message #8 Posted by **Richard Garner** on 23 July 2003, 9:54 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

If you look at all of the requests for a 42S emulator here and on comp.sys.hp48, there is a need for one that does not require you to have a degree in computer science and a computer workshop to download ROMs. I am one of those that would like to have and need a 42S emulator, but I do not have the computer background nor equipment to download the ROM. My thoughts are if you are going to offer an emulator for people to use, then you should provide all the components so people like myself who need it can use it. If neccessary charge something for it. I would rather pay $20-$30 for something that is complete and I can use, than to download something for free and not be able to use it because the most important item to make it run is beyond my ablility to aquire.

Re: HP-42S Emulator??

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2003, 11:40 p.m.,*
in response to message #8 by Richard Garner

Hi Richard, guys;

Maybe you already know about what's written below, but it is always worth posting, right?

There is a time-consumming procedure that requires an HP42S as a source and any HP48 with INPRT program. Unfortunately this requires a lot of key pressing.

Based on the excelent Craig Finset's database, if you press [ON][LOG] and [<-] you get into standard Pioneers' memory browser/scanner (if I am not wrong, all printing capable Pioneers have it: HP17B/BII, HP27S and HP42S). Then you move the pointer to address 00000 and go pressing [COS] as many times as you can afford. Each time [COS] is pressed, data shown in the display (16 nybbles, or 8 bytes) is sent through the IR port. Any HP48 running INPRT will collect this IR sequence and "convert" it to a valid binary stream sequence. If you "upload" ROM contents in separate strings, the HP48 can be used to concatenate them or you can "join" them together after copying them all to a PC. The last ROM byte is the one at address # $1FFFF_h$.

As I said, it is a time consumming task. But it is not too hard to find resources to accomplish it. Now, about available time...

Success.

Luiz (Brazil)

Re: HP-42S Emulator??

*Message #10 Posted by **Richard Garner** on 24 July 2003, 1:23 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

The point I am trying to make is, if I DO NOT have access to a 48G and I DO NOT have access to a 48G to PC cable, how do I get a 42S ROM image to use in an emulator.

Example:

This has not happened to me, but could be a possibility.

You are out on a job site, a delivery truck, by accident, backs up over the table being used as a work bench. The 42S is crushed into a lump of shattered plastic on the ground with no hope of being fixed. This is the only calculator you own and the only HP around. eBay prices are too high to buy a

replacement. Downloading an emulator is the only option left, but the emulator says the ROM image must come from your own 42S. There is no 48G and no PC cable.

How do I get the ROM to use in the program?

I'm sorry if I'm beating a dead horse here, but I am trying to look out for the people that are truly needing a solution to their problem and are hitting a brick wall.

I see what you mean... Sorry! : ((n.t.)

Re: Preemptive Dump?

*Message #14 Posted by **Paul brogger** on 25 July 2003, 7:44 p.m.,*
in response to message #12 by deleted

Buuuuuttttttt . . .

If you dump and archive your -42s ROM *before* it gets kissed by the truck, wouldn't you be guaranteeing your right to use that ROM image henceforth? (Until, that is, you dispose of the calculator itself?)

Then, even with a smashed calculator, you'd be in a position to make legal use of its ROM . . .

(I'm no lawyer, so any damages incurred by following this advice are strictly limited to twice what you paid for the consultation.)

There is a warning...

*Message #15 Posted by **Vieira, Luiz C.** on 25 July 2003, 7:54 p.m.,*
in response to message #14 by Paul brogger

Hi, Paul;

Since the HP41, HP introduced a warnning in calculators' manuals about internal routines and programs. HP states they own their "copyright protected" and their use and/or copy in

other systems is an infringement to their copyright protection. You have the right to use the calculator, not it's internal programs; it's assumed HP is refering to the programs developed to control the calculator itself.

After the HP41, many portable devices from HP allowed I/O activity and therefore, in almost all of the cases, downloading their O.S. was a matter of time. You'll notice that in the first HP41 manuals there's no explicit mentioneing to internal programs, but after the halfnuts it's clearly written.

At least that's what's written. Just to add a few more data.

Luiz (Brazil)

Notice about internal programs: correcting previous post

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 25 July 2003, 11:58 p.m.,*
in response to message #15 by Vieira, Luiz C.

Hi;

I decided to search for the warnings, and I fond the Notice that mentions them. Their text is basicaly as follows:

> Quote:
>
> The programs that control your HP*model_ID* are copyrighted and all rights are reserved. Reproduction, adaptation, or translation of those programs **without prior written permission of Hewlett-Packard Co.** is also prohibited

Well, at least there's hope. My previous post was not accurate: HP *may* allow their use.

I found the text in manuals of the following models:

HP42S, HP28S, HP17BII, HP19BII, HP48, HP49.

I tried to find the same notice in existing HP41 manuals and I was not successful. My mistake.

Best regards.

Luiz (Brazil)

HP Power Calcs

*Message #1 Posted by **Valhalla** on 22 July 2003, 9:14 p.m.*

Hi all: First of all, id like to say that i am not a collector, i only get calcs that i like and "use". So far, i have a 17Bii, 48Gx and a 49g, which have been quite usefull to me. I was wondering, what other calculators are powerful?? i am not interested in colectability, but in power and capability.

TY

"V(a)lh(a)ll(a)"

Re: HP Power Calcs

*Message #2 Posted by **Richard Garner** on 22 July 2003, 10:11 p.m.,*
in response to message #1 by Valhalla

The 41CX, 42s and 15c are all good power user calcs.

Hard to "enumerate"... (edited)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2003, 10:14 p.m.,*
in response to message #1 by Valhalla

Hey, Valhalla;

It's somehow hard to enumerate which one is "more" powerfull than the others. To be honest, there will be many "tendencies" and fair, healthy disagreements.

I have my own choice: the latest ones re more "resourceful", but at their time, each HP calculator was intended to be the best. Oops; I see owners from other brands that are getting their flames ready to launch...

An HP35 was the most powerfull pocket calculator at the time it was introduced. Yes, it was the first one, but it was indeed powerfull. The Xpander was too advanced for its time. Neither HP staff could understand it... well, I'm probably overestimating them :^) At least they showed to the world they know what hammers are for, right?

You already have, so far, the "top-of-line" from HP: HP48 and HP49. The HP17BII is the second-in-chain, good choice indeed. There are others to come, being HP49G+ and HP48G*whatever* (I forgot, sorry). They will probably add more memory, a Kinponut processor, bad keyboard and up-to-date, whoopy design. And probably in colored versions, who knows! (I wrote about this at this very forum in 2001...).

I have the same ones, and I'd add others, too powerfull for their time: HP65, HP29C, HP67/97, HP34C, HP15C, HP41CX, HP42S, HP28S, HP48SX, HP48GX, HP49G. If you want to know about financial, I'd add: HP80, HP27, HP38C, HP12C, HP18C, HP19BII.

Any suggestions? Changes? This is my top-of-line list; others will probabbly comment it. (I did not add the HP71B because for me it's a calculator/computer. A hybrid. An X-Men device... (|^)

Best regards.

Luiz (Brazil)

Xpander auction ending in 1 hour

*Message #1 Posted by **Scott** on 22 July 2003, 4:22 p.m.*

Take a look at this Xpander auction ending in about 1 hour.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3035922485&category=20335

What about it?

*Message #2 Posted by **Jim L** on 22 July 2003, 4:59 p.m.,*
in response to message #1 by Scott

Is there something wrong with it?

Re: What about it?

*Message #3 Posted by **Scott** on 22 July 2003, 5:10 p.m.,*
in response to message #2 by Jim L

Nothing wrong with it that I know of. It looks like it is in perfect condition.

Then why post it here?

*Message #4 Posted by **Jim L** on 22 July 2003, 5:12 p.m.,*
in response to message #3 by Scott

?

Re: Then why post it here?

*Message #5 Posted by **Scott** on 22 July 2003, 5:29 p.m.,*
in response to message #4 by Jim L

Sorry, I just thought it would be fun to watch. Auctions will often determine the true value of a collector's item. You don't have to watch if you don't want to.

Re: Then why post it here?

*Message #6 Posted by **Paul** on 22 July 2003, 5:49 p.m.,*
in response to message #5 by Scott

You're Scott Seelye, the husband of Jennifer Seelye who is selling the item - right? There's a classifieds forum here for advertising your auctions. For determining value, we do that after the auction ends :-)

Re: Then why post it here?

*Message #7 Posted by **bill platt** on 22 July 2003, 6:13 p.m.,*
in response to message #6 by Paul

Scott Seelye had a different E-mail---at the domain mac dot com.

this scott is at westernpulp dot com. Not neccessarily the same person?

Anyway, western pulp looks like it makes neat stuff.....but that's outside the purpose of this forum!

1234 to delete.

regards,

Bill Platt

Re: Then why post it here?

*Message #8 Posted by **Paul** on 22 July 2003, 6:32 p.m.,*
in response to message #7 by bill platt

Yes I noticed but email addresses are a dime a dozen. Actually less than that!

Anyway, Scott can tell me he's not if he wants to or Dave could help us out by checking his IP if we really wanted to know :-)

The main issue for me is that the stated rational for this thread is equally good for every HP on ebay and we'd get swamped if they all got posted here.

Re: Then why post it here?

*Message #9 Posted by **Raymond Del Tondo** on 22 July 2003, 7:49 p.m.,*
in response to message #8 by Paul

That's right.

And did you notice the new Xpander ad? I wonder how many units were in that garage;-)

Raymond

Yes, I see what you mean (no text)

Re: Xpander auction ending in 1 hour

*Message #11 Posted by **Jennifer Seelye** on 23 July 2003, 12:37 a.m.,*
in response to message #1 by Scott

Hello, I don't think my husband noticed that there was another board for classifieds. We always get a kick out of watching auctions the last hour & he probably thought other collectors would enjoy it too.

In terms of my ad I listed in the classified section, I contacted the person at the garage sale & was able to get a couple others last night. So far I know of 2 other people who bought some at that same garage sale. I think I will sell one more now and save the other for a few years.

I am sorry if his message bothered anyone here.

Anyway, have a great week! Jennifer

Re: Xpander auction ending in 1 hour - funny that

*Message #12 Posted by **Tom (UK)** on 23 July 2003, 7:29 a.m.,*
in response to message #11 by Jennifer Seelye

"Hello, I don't think my husband noticed that there was another board for classifieds."

Did you husband also not notice that (out of the hundreds of HP calculators on ebay over the last week or so) that the one he highlighted was the one you were selling? Hmmmmm - I think he did.

"We always get a kick out of watching auctions the last hour & he probably thought other collectors would enjoy it too."

But in this case your enjoyment is enhanced by the fact you are getting a buck as well as a kick.

There is something that confuses me...

*Message #13 Posted by **Harry** on 23 July 2003, 8:33 a.m.,*
in response to message #1 by Scott

Why do people sell HP calculators at a garagesell for a few bucks? Don't they know about ebay?

Regards Harry, who has never seen an HP calculator for sell at a flea market in Germany

Re: There is something that confuses me...

*Message #14 Posted by **Raymond Del Tondo** on 23 July 2003, 10:01 a.m.,*
in response to message #13 by Harry

Actually I have seen (and bought) the one or other HP calc on flea markets in Germany, but that was long time ago, and not very efficient. Of course it's easier to get some goodies in and around Corvallis, since there are many HP employees, and it was the former 'calculator' division.

However, some of my best HP calculators are those I got for free from colleagues, friends, or relatives.

Raymond

Re: There is something that confuses me...

*Message #15 Posted by **Jennifer Seelye** on 23 July 2003, 2:05 p.m.,*
in response to message #13 by Harry

I see hp calculators all the time at garage sales but we live in Corvallis where HP is the largest company in town and most people use HP everything.

In the past I never looked twice at the calculators since usually they are $10-$75 at garage sales. I know they are worth the price they are asking but I don't currently have a use for these, I get by just fine with the

few calculators that I already have. After reading the wonderful information on this website, I now know that there is a market for many of the calculators that I see. I will be taking a closer look at those calculators from now on.

I am always amazed at what people sell at garage sales for little or no money and the other things that they want a lot of money for. The $1500 Le Corbusier chairs I buy for $20 each, yet I see items that are sold at Kmart for $50 & they want $40 for that one. But that is what keeps me going to those sales, it is a treasure hunt.

Have a great day, Jennifer

Math pac vs. Advantage pac

*Message #1 Posted by **Sean McNamee** on 22 July 2003, 3:36 p.m.*

If I already have the Advantage pac, is there any reason to get the Math pac? I'm talking about funtionality, and not collecting purposes. It looked like the Fourier and Hyperbolic fcns on the math pac were not included in the advantage pac. Can someone verify this? Also, would the Fourier functionality be present (I assume) on the circuits pac? (I plan on getting this)) Anything from the Math pac missing on the advantage? Thanks, Sean

Re: Math pac vs. Advantage pac

*Message #2 Posted by **Karl Schneider** on 23 July 2003, 3:06 a.m.,*
in response to message #1 by Sean McNamee

Sean --

I have both. Just from memory, the Advantage Pac does not contain the Math Pac's Fourier analysis, hyperbolics, and triangle solutions.

Both have routines for rootfinding ("SOLVE") and numerical integration, but the Advantage Pac's routines are better. RPN programs for these functions on the Math (Simpson's Rule integration) and machine-coded functions (sophisticated Romberg method integration) on the Advantage. Both modules have the same functions for complex-valued inputs.

The Math Pac is a 4 kB module; the Advantage Pac is a 12 kB module.

[Shameless solicitation:]

I have an extra Math Pac that I'll sell to you for $10 + shipping. This is probably about the going rate; they're very common.

Re: Math pac vs. Advantage pac

*Message #3 Posted by **Sean McNamee** on 23 July 2003, 4:14 a.m.,*
in response to message #2 by Karl Schneider

$10? Cool! I'll take it! Thanks!

Please send the details of how you'd like to process transaction...

Thanks again!

Still available?

*Message #4 Posted by **Sean McNamee** on 25 July 2003, 4:27 p.m.,*
in response to message #2 by Karl Schneider

Karl - if you still want to sell your extra Math Pac, I'd like to buy it. You can contact me at

seanmc42@hotmail.com

Thanks.

Well... I also sell a Math Pac...

*Message #5 Posted by **Etienne Victoria** on 27 July 2003, 8:10 a.m.,*
in response to message #4 by Sean McNamee

Hi all,

Sorry for solliciting shamelessly here...but...

I also sell a Math Pac + original box & english doc for 10 euros.

Shipping to Europe...because object value looks low compared to shipping costs.

If anybody's interested

Etienne

NORM's CORRECT!

*Message #1 Posted by **Trent Moseley** on 21 July 2003, 10:27 p.m.*

We need more posts for the HP-34C (I would love to own one), 25C, 67, 15C, 16C, and 42S. In particular the 67. It seems that it was buried by the advent of the 41Cxxx. I can't remember the time frame.

tm

Re: NORM's CORRECT! (long)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2003, 12:12 a.m.,*
in response to message #1 by Trent Moseley

Hi Trent, folks;

I've been wondering sometime ago about programming and usage. As you may have noticed, I think working calculators should be used. I mentioned this fact in an isolated post where Valentin agreed with me, but also showed me (and others as well) that reasons are for storing an working calculator. O.K., not only convincing but also correct points.

After that I thought about Valentin's teasing challenges and I remembered some people here, me included, tried their (our) own challenges. Most of them, if not all of them, were answered by others. I also copied and saved a post by someone that's not a regular contributor (to be honest, I remember this only post by him) explaining the way he used RPN to solve electrical problems. A very "literate" description, you bet.

I still develop and translate programs from one "calculator" (system) to another, mostly for fun. I do not give up doing this, I go as far as I can to accomplish the task. To be honest, there are about fifteen programs I want (and need) to translate from RPN (HP41) to RPL (HP48) and I cannot find the "large and spare" time to do it. The fact is that the first of these programs uses loops that constantly update registers contents in order to achieve an expected result. The truth is that these loops are custom root-finders, and I did not take the time to "depict" them so I can "see" the original expression and use local RPL resources to find roots. It's teasing and fun to do, also keeps some parts of our brains working and alive, if you understand me. If it is not fun doing, I see no reason to do so. Maybe plenty bux in my pocket...

Well, I use about all of the models I have for my own delightful moments, but as a teacher, I must be close to the students and their own resources. So far, only two of the many students I had brought HP calculators to my classes: one HP32S (I tried the harder I could to trade it, but the owner did not want to :(for "personal reasons") and one HP48G. The HP32S' owner gave up studying and the HP48G's owner gave up using it and bought a CASIO...

What to do? Teaching them how to use their own calculators. I get each available model in the classroom and I figure out the fastest, easiest way to convert from DEGress to RADians, compute trigs (direct and inverses) in DEGrees and RADians mode (I only explain what GRAD stands for, but I do not use it in class), convert from polar to rectangular and vice-versa in each of them. Then I show how to use it all to perform complex arithmetic and apply it to vectors and impedances. I think this helps them finding useful applications to their small, key-filled magic boxes. If they understand how to use them, they will not try to make them give answers everytime their keys are pressed. Instead, when the problem is solved, calculators are good to help

with numbers *since the correct operations are performed*. I do not say stuffs like: "Press this and that keys and you'll find the answer". Instead, I say "How do you compute this value? Use sine of the angle times the amplitude, right? How do you compute sine of this angle in your calculator? How much is it?" Then each one gives the answer, and when there are different answers, I tease them to find where they were wrong. In most cases, they are able to find their own errors and they exchange their calculators with the others till they find their own errors. It's amazing to see some of them going from one desk to another and showing their classmates how did they find their answer. Everyone learns a bit with each other. Too bad they do not find RPN calculators easily... In fact, most of them are worried in learning the subject, and as a teacher I must accept it as good thing because it IS actually what teachers want.

Here, at MoHPC forum (thanks Dave and all of you, guys) is the place I find people to talk about RPN, RPL, stack manipulation, programming and the like. I'd like very much to discuss programming techniques, daily use, etc. I prefer not restricting to this or that fact, instead I'd like to see what others are doing. If what I'm doing is not the best way, let me see another, better way. When I was teaching programming basics, I used to say: "If your program gives the correct results for a given set of parameters, it is already the best program. If you want to reduce its size and enhance it's performance, it's a matter of goals and needs." I also always emphasized the fact that programming and using a language are related subjects, but should never be taught at the same time. Programming is a matter of recognizing a problem, finding its solution and teaching someone else how to do this. A programming language is the tool to teach a programmable machine how to do this in its own way, and it's sometimes not too close to the way you understand it. As I have students that naturally speak Portuguese, their understanding of "printf", "scanf", "if...else", "for" and "while" is not as natural as for English speakers. And most of them do not relate their understanding of English with those "keywords".

Sorry; I'm getting out of focus.

I know some will disagree with me, but I take programming as the best part a computing device may offer. Mostly a portable, continuous memory, resourceful computing device as a calculator can be.

Wow! All of this to express my own wishes to participate in any thread where usage, programming calculators and the like is the main subject. I like to use and program them as much as I like to understand how they work and to repair them. If it's worth accepting me as handy, count on me. Actually, I support.

Best regards.

Luiz (Brazil)

Edited: 22 July 2003, 12:16 a.m.

Re: NORM's CORRECT! (long)

*Message #3 Posted by **Harry** on 22 July 2003, 7:33 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

When I was in school I was the onlyone to use an HP calculator. I was used to it as I had it since I was 12 and I had played with my dads 45 and 25 since i was 6 years old or so. In all those years I went to school, I found only one classmate who was willing to let me explain to him how RPN works. The next day he showed up with a brand new HP 32SII.

In 1998 I started studying electronics engeneering, and about 35% of the students had HP calculators. Most of them HP48s. I saw one 42S and 2 32s.

In 2002 I started going to a diffrent University and had to take some of the beginners classes again, because my credids could not be transfered. Only about 5% or less of the students had HP calculators in thoses classes, most others have TIs and some have Casios. So in only 4 years there has been a significant

change in the popularity of HP cakculators.

And this might be a result of many teachers NOT beeing like Luiz, but just telling the students what buttons to press. Also it might be a result of HP not selling decent Calculators anymore....

Regards, Harry

Luiz's CORRECT! (medium)

*Message #4 Posted by **Valentin Albillo** on 22 July 2003, 7:51 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Luiz:

Just a few good-humoured comments to your post, I know you like comments, so there you are ...

Luiz posted: *"I think working calculators should be used."*

Definitely. I only own calculators I use or intend to use, no way the're staying unmolested for ages in some glass cabinet or vitrine, gathering dust and drying their capacitors out for lack of use. If properly used, quality calculators such as vintage HP's or Sharp's won't degrade noticeably.

"There are about fifteen programs I want (and need) to translate from RPN (HP41) to RPL (HP48) and I cannot find the "large and spare" time to do it."

Taking into account that you recently got an HP-71B, why don't you translate them for that machine instead ? That would serve you for training purposes and to get your '71B legs' so to speak. Or are you 'chickening' already out at the 71B ? ;-)

"One HP32S (I tried the harder I could to trade it, but the owner did not want to :"

What kind of teacher are you ? If he were my student, no way he could've get out of the classroom with that 32S still under its ownership, I would have made him an offer he couldn't refuse. There are many, many resources available to a determined teacher, don't forget who's boss in the class ...

"the HP48G's owner gave up using it and bought a CASIO..."

Now, why would he do such thing, I wonder ? Imagine, giving up a 48 for a CASIO ... unthinkable ... when there are so many excellent SHARP handhelds out there ... or TI's ... or even Kinpo's, come to think of it ... ;-)

"Too bad they do not find RPN calculators easily..."

Yes. If they did, we could perhaps coerce them into revealing their source ...

"When I was teaching programming basics, I used to say: "If your program gives the correct results for a given set of parameters, it is already the best program. If you want to reduce its size and enhance it's performance, it's a matter of goals and needs."

Could it be that the developers of Windows were among your past pupils, perchance ? That would explain why most every Windows program (Windows itself included) seems to take mega-amounts of RAM and disk space and yet be pretty slow, where in the past all serious programmers would do their best to optimize their programs to the max, RPN programmers included. If Bill Gates thinks like you do, that would explain it all: Why waste any extra money or effort, when you've already got the "best program", as per your criterium ?

"Sorry; I'm getting out of focus."

No need to worry ! There are a number of photoretouching packages such as Adobe Photoshop that can restore focus to most anything, yourself probably included ! As it seems that losing the focus is second-nature to you, I'm sending you a fully registered copy one of these days ! :-)

"If it's worth accepting me as handy, count on me. Actually, I support."

Uh ? I didn't get this one. Could you repeat it slowly, please ? :-)

Best regards, Luiz. One can always count with you to enlighten any thread, no matter how obscure or boring (not that this was so) !.

Edited: 22 July 2003, 8:09 a.m.

Keep the vein, keep the vein! Still on the mood...(slightly edited)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2003, 12:09 p.m.,*
in response to message #4 by Valentin Albillo

Hi Valentin, guys;

You, Valentin, do not let things cheap, ahn? ;^) Thanks for your always welcome words.

> Quote:
>
> (...) Or are you 'chickening' already out at the 71B ? ;-)

Not at all! The fact is that most of the times, I intend to reduce program "size", and BASIC needs text to be typed in... I'm lazy! Yes, there are shortcuts in the HP71 keyboard and you can also customize it. And I'm aware of the fact that, in many circumstances, reading a BASIC program listing allows faster understand of its primary purposes. Neither RPN nor RPL allow this so easily, and in some cases, this is almost impossible. Also, there's a need to enhance original programs to some sort of multiline and graphics output. It helps analyzing results when you have three, four or even five related answers at the same time in the same "screen". As I do not have the TV/monitor IL adapter, only the original HP71B one-line LCD, I'll have to generate the RPL versions firstly. Yes, the HP71B's LCD accommodates many well-organized results in one single "prompt" if the programmer uses strings correctly. But wait for me: I'm collecting a bunch of questions about the HP71, some of them related to LEX and BIN programming... Be sure I'm getting used to it; I'm doing my homework... Amazing machine!

For the records: it was a *she* (pretty little one, you bet) and the HP32S was a gift her father received from a later deceased brother (her uncle). What to do? :(

> Quote:
>
> Imagine, giving up a 48 for a CASIO ... unthinkable ... when there are so many excellent SHARP handhelds out there ... or TI's ... or even Kinpo's, come to think of it ... ;-)

If it is an HP15C, you'd be asking for his address so you could send him a bomb... and I'd give it to you, of course :^) But there is another story. One of the students at the university was trying to sale an HP15C so he could buy an HP12C. As others were looking for an HP12C as well, I was contacted by him and we made a deal: I completed the money he needed to buy the HP12C (Chinese model). He was so happy (me too, of course!)... My first HP15C came with the original box and I thrown it away after getting worn out, about twelve years ago. This one came with the original, somehow worn, box. I'm keeping it "alive and well", believe me. 8^)

> Quote:
>
> Could it be that the developers of Windows were among your past pupils, perchance ?

Remember: programs *must work first*... No chance! ;^)

> Quote:

Very kind of you, thanks, I'm flattered. Mostly when comes from guys like you, so much dedicated to the best of everything. And we're lucky having this forum crowded of people like this (I actually mean it, no pun intended). The only "problem" is that I like communicating... alot!

Best regards V, folks.

Luiz (Brazil)

Edited: 22 July 2003, 3:29 p.m.

Valentin's CORRECT! (rare)

*Message #6 Posted by **Valentin Albillo** on 22 July 2003, 7:56 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

The subject says it all: it's rare that Valentin's correct.

Specially when he's in a good-humoured vein ... :-)

Sorry for the nonsense, and best regards from V.

HP-34C (67, 25, ...) programs

*Message #7 Posted by **Valentin Albillo** on 22 July 2003, 4:44 a.m.,*
in response to message #1 by Trent Moseley

Hi, Trent:

If 'posts' does include programs and articles, I've got some unpublished ones, namely:

```
HP-25/25C & equiv:  50+
    HP-67 & HP-97:  50+
           HP-34C:  40+
  HP-11C & HP-15C:  20+
           HP-16C:   2+
     HP-41C/CV/CX:  40+
            HP42S:   2+
           HP-71B:  20+
   SHARP machines: 100+
```

as well as a large number of hints, tips, 'challenges', 'quizs', and similar. I intend to publish them all, if at all possible, in Datafile and in a future web site of mine, the only problem being it takes an awful lot of time and work to write, format, and proofread an 8/10 pages article (several days), so it will be a slooooooow process. Also, Datafile has limited space so I can't submit more than one article or so for publication every other month, for a maximum of some six a year, if at all. So, it'll take a number of years till all my programs and articles get published that way :-)

Being fully aware of this bottleneck, I considered the possibility of publishing them here, in the Museum of HP. To that effect, I would be willing to submit them to the Articles Forum, but the catch is they are in PDF format. Some months ago, I exchanged a number of e-mails with this Forum's David Hicks, re the possibility of creating a new section specifically intended to upload PDF documents, but David argued that that would make it quite difficult if not impossible to access them from PDAs, and that was it.

Frankly, I don't quite see why access from PDAs would be so important that it's preferable that 0% users have access to said materials (i.e., not publishing the materials at all) instead of 90% (say) users being able to download them. It's clear that even PDA users can eventually connect from a PC and download them as well, it's something that would affect them only on the fly, while far from a PC, and nevertheless there are many other already present contents equally difficult to access. So it would seem logical to publish said PDF materials as such, so that people accessing the site using a non-PDA device (say a PC) would be able to download them, but anyway I'm sure David knows best.

Nevertheless, it's a real pity, as I feel that PDF is the right format for the articles, because it allows full reproducibility, including fonts, tables, graphics, everything like it originally appeared in print, the user would in fact get a real facsimile of the original. Much of this would be lost if uploaded as HTML or plain vanilla text, and I'm not for it.

Should David reconsider the possibility of actually creating this new section, I would certainly obligue by submitting a number of my articles, both past and future, in PDF format. Otherwise, I'll probably create a site of my own to make them available, eventually.

Best regards from V.

Re: HP-34C (67, 25, ...) programs

*Message #8 Posted by **Ellis Easley** on 27 July 2003, 12:42 p.m.,*
in response to message #7 by Valentin Albillo

Is there any chance you could store your articles in the Museum's FTP site and then write brief Articles Forum abstracts (with suitable disclaimers regarding the .pdf documents) to introduce and link to your .pdf articles?

Re: HP-34C (67, 25, ...) programs

*Message #9 Posted by **Valentin Albillo** on 27 July 2003, 8:12 p.m.,*
in response to message #8 by Ellis Easley

Ellis posted:

"Is there any chance you could store your articles in the Museum's FTP site and then write brief Articles Forum abstracts (with suitable disclaimers regarding the .pdf documents) to introduce and link to your .pdf articles?"

Thanks for your interest, but the point is, since I have so much material and so little time, not duplicating efforts is essential. All materials are in PDF format, which I find best for facsimile documents, and that's the way they stay. A brief article for the Articles Forum can never be brief,

because that's not my style, and would mean duplicating something that's already done and existing as a PDF, a very considerable effort if there are a large number of articles involved.

That said, don't worry. If Mr. Hicks is not amenable to the idea of creating a section specifically for PDF documents (and it seems he is not, as he hasn't commented at all on my suggestion, either personally or publicly in this forum), I'll simply put them in a web site of mine, as stated, to be set up in a near future. Space would be the only problem, but PDF articles tend to be rather small (40-50 Kb), so plenty of them can fit in a modest amount of Mb.

By the way, I'm beginning my summer holidays within 24 hours, so please forgive me if I don't reply to any further postings till next August 20th, or so.

Best regards from V.

*Message #3 Posted by **Vassilis Prevelakis** on 23 July 2003, 12:46 p.m.,*
in response to message #2 by Raymond Del Tondo

The 82162A is a normal HP-IL device. You can print to it from any HP-IL controller (incl the 71B).

I have even printed to a 82162A from an HP-IPC (which has HP-IB) via the 82169A HP-IB to HP-IL converter.

**vp

Re: HP 71B and the 82162A

*Message #4 Posted by **Raymond Del Tondo** on 23 July 2003, 1:10 p.m.,*
in response to message #3 by Vassilis Prevelakis

Hi,

I also have an IPC and an 82169A. Which steps are required to transfer data (save/restore files) between an IPC and, say, a PC equipped with an Interloop HP-IL ISA card? Could it work with Trans41? Trans41 simulates, amongst other things, an HP-IL mass storage device.

Thanks in advance.

Regards,

Raymond

Re: HP 71B and the 82162A

*Message #5 Posted by **J-F Garnier** on 23 July 2003, 4:48 p.m.,*

in response to message #4 by Raymond Del Tondo

Hello Raymond,

I guess that Trans41 emulates a HP9114 compatible mass storage, which doesn't use the same protocole than the IPC.

SPICES KEYBOARD

*Message #1 Posted by **Jon** on 21 July 2003, 1:24 p.m.*

Hello everybody:

Some time ago I asked in this forum the way to remove the keyboard label of these calculators. I have had success (thanks everybody). Now I must place the label in the new calculator. Which is the best glue?. I don´t like the "super glue".

Thanks again

Jon

Re: SPICES KEYBOARD

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2003, 3:03 p.m.,*
in response to message #1 by Jon

Hi;

I'm not sure how hard it was for you to remove the keyboard faceplate. I had no difficulty at all, because in my case, both faceplates were plastic sheet.

Based on what I saw, I think that it is not difficult to elect another sort of glue to settle them in place. I think "superglue" is NOT the best choice. I'd try some silicon-based glue, the one that would allow the thinnest foil betwen the faceplate and the case itself.

If there is another "laminar" glue available, I'd try, too. If I am not wrong, Ellis Easley (if it is wrongly spelled, forgive me) mentioned that there is this kind of "laminar glue" available. It comes in waxed paper so you apply it to one of the surfaces to be glued and remove the waxed paper. Then you have a "glue foil", ready to be applied to anywhere you wish.

If it did not confuse you, I think it will help finding the best glue.

Success. And please, let us know about what you achieve.

Luiz (Brazil)

Re: SPICES KEYBOARD

*Message #3 Posted by **David Smith** on 21 July 2003, 4:04 p.m.,*
in response to message #1 by Jon

#M Super-77 spray adhesive. Availavle at most hardware and hobby stores. Clean off all the old adhesive first. I use white gas (camping stove fuel) or ligher fluid.

Re: SPICES KEYBOARD

*Message #4 Posted by **Jon** on 21 July 2003, 5:24 p.m.,*
in response to message #3 by David Smith

Hi Luiz and David:

I have made a test with that "both sides" glue with waxed paper that Luiz reported, but the problem is how to remove the glue from the key holes (hard work). I will clean everything again and try with the spray (I don´t know if it is available in Spain with the same denomination).

Cheers

Jon

I should have mentioned that...

Re: SPICES KEYBOARD

*Message #6 Posted by **Ellis Easley** on 27 July 2003, 12:52 p.m.,*
in response to message #4 by Jon

Yes, the acrylic transfer adhesive is tricky to cut through when it is not embedded between two layers of non-adhesive material, because it wants to stick to the knife! In actual use, it is applied in a solid layer to a solid layer with the release liner on the other side, and then the sandwich is cut with a die. I wonder if the 3M 77 spray adhesive is more like acrylic adhesive or like rubber cement (or contact cement)?

New RPN calculator

*Message #1 Posted by **Roland.** on 21 July 2003, 9:51 a.m.*

Can anybody tell me when HP issues the successor of the HP 32S? I understood it would be the HP-33S?

calculator collecting like stock market

*Message #2 Posted by **Norm** on 21 July 2003, 1:11 p.m.,*
in response to message #1 by Roland.

Calculator collecting is now like the stock market..... You have to peer into the future and be right about.

Say you own 5 units of HP-15C . That's like 5 shares of stock. Now you have to figure out what the future holds, will they go up or down in future.

How about 32Sii , if HP makes a really nice successor model, and releases it (HP-33S ??) then your share value of 32Sii will abruptly fall.

So guess the future then..... I'd guess that as long as "HP" is holding the calculator division (and that's analogous to a bunch of deep-jungle monkeys swinging on vines having a piece of test equipment like a spectrum analyzer in tow with them) then I'd say they are not capable of releasing a decent calculator.

Therefore I'd predict that HP-33S will be a piece o' junk, same as it has always been thus far.

Therefore I'd rate other collectible calculators as a "hold" or maybe even a "buy". The only thing that will make the collectible calculators plummet in value, is if the calculator division went where it belonged.... which is to Agilent..... like as if those monkeys brought the spectrum analyzer back to the dirt road, so that the guys in the jeep could take it back to civilization, but U see, that is not very likely to happen.

- Norm

in response to message #2 by Norm

it certainly is. the other month, i was considering entering the 20S futures market. a retailer had 6 new in stock in those red&white boxes (rather than the blister pack version). i thought about buying all 6.

in the end, i wussed out. i have bills to pay and all :-)

sell some puts

*Message #4 Posted by **Norm** on 22 July 2003, 7:08 p.m.,*
in response to message #3 by hugh

maybe you should have sold some puts or bought some calls.

But if you think the pricing of 20s will go down then you better short-sell the market.

Just make sure that you dont go beyond the limits of your trading account.

:o|

Problems with HP41C

*Message #1 Posted by **hugo (belgium)** on 21 July 2003, 8:21 a.m.*

Hello everyone,
I recently got an HP41C from my brother who hasn't used it anymore sincefor more than 10 years. There were no batteries inside anymore, but there was a little greenish color on the battery contacts. I tried with batteries from my 41CV- but the C didn't wake up. So i decided to open it and polish the battery contacts and the contacts between the upper and bottom part of the calculator (which were also a little green). After cleaning, all contacts were bright yellow (OK i thought), but after reassembling and testing with good batteries, it did not wake up...
What could i do next? Is there some testing procedure possible to find the cause? (unfortunately i am not an electrical engineer and i do not have testing equipment besides a multimeter)

I would be very happy to bring this machine back to life because it is a beautiful oldie, with the "steep" buttons! (S/N 2026A01398)
Thanks for any hints, Hugo

in response to message #1 by hugo (belgium)

Hi Hugo,

Yes, contact oxydation are a pain. Most probably your zebra connectors are also oxydated - you will need to open your calc and clean this up.

Problems with HP41C

*Message #3 Posted by **hugo (belgium)** on 21 July 2003, 9:19 a.m.,*
in response to message #2 by Thibaut.be

Hello Thibaut,
i suppose you mean with the zebra connectors the ones between the under- and upper part of the calculator? These i have already cleaned- are there other sensitive connectors?
Hugo

in response to message #3 by hugo (belgium)

Did you try the battery holder from the good calculator. The spring in the holder could be corroded too.

Re: Problems with HP41C

*Message #5 Posted by **Victor Koechli** on 21 July 2003, 9:54 a.m.,*
in response to message #3 by hugo (belgium)

If your 41C is a fullnut (no rounded edges around the display - see the HP41 pictures in the museum), it has a second connector that could have failed. It's underneath the main electronics board. To get to it, you have to losen the two nuts that hold the board down. These also provide the pressure necessary to ensure contact between the electronics board and the keyboard.

Two things could cause problems there: Corrosion or cracked screw posts. You can always try to remove corrosion if that's the problem, and there are several sources of information on how to repair cracked screw posts. I don't know about halfnuts - I have never opened one so far. I think they, too, can corrode, but the screw posts are no longer critical to the conection. Would make it a bit easier, then...

The problem is that these posts are extremely fragile and are easily damaged just by unscrewing the nuts. Therefore, I would first try again to fix the contact you already cleaned, between the battery/port assembly and the keyboard. Clean it again very carefully using very fine (1000 grit) sandpaper, then apply a contact spray to both the board and the felx circuit. Repeat if necessary. Hold the two halves togehter without inserting the screws and see if you can get the machine to life. Sometimes pressing on one side or the other or slightly moving the top half against the bottom suddenly produces a sign of life.

You should only dissassemble the lower contact if all of the above doesn't lead anywhere. And of course, make sure the problem is not the batteries ;-)

Tell me if this helps. Cheers, Victor

Re: Problems with HP41C

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2003, 9:45 a.m.,*
in response to message #1 by hugo (belgium)

Hello, Hugo;

Please, look at the pictures below (they are composed with some layers, that's why there are borders around mixed parts, O.K.?)

http://www.logeng.com.br/images/fn_int_01.jpg

This is what you see whn you open the calculator and remove the battery contacts assy (black protective plastic sheet is not shown)

http://www.logeng.com.br/images/fn_int_02_a.jpg
http://www.logeng.com.br/images/fn_mainboard_front.jpg

If you (carefuly) remove the mainboard, you'll see that there is a connector made with a lot of golden-plated wires. There's a chance you'll need to CAREFULY clean both the connector itself and the pads under the mainboard.

http://www.logeng.com.br/images/fn_int_03.jpg

You should also remove the connector and clean the keyboard connecting pads.

Chances are you have cracked or broken screw posts. If the srews are not tighten (not too much), only enough to achieve the contact between the mainboard and the battery assy with the keyboard, the "power supply" from batteries will not reach the mainboard's contacts. Also, if the mainboard cannot communicate with the LCD, no "image" will come from it.

If you need more advice (say, about broken posts), let us know.

Success.

Luiz (Brazil)

It took me long to post...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2003, 9:56 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Hugo, Thibaut, Chan Tran, folks;

I was setting images up and I took too long to post. Now I see Hugo have already done what he was supposed to. The images are no longer needed, though.

Hugo, if the calculator still does not swithc to ON as there is nothing in the LCD, try [SHIFT][BEEP] to confirm it's not ON indeed; maybe you have it working and there are problems in the LCD.

Some newer minboards need thin plastic washers to increase pressure in the small mainboard so it firmly connects with the keyboard. If you have the means to enhance this pressure, it would worth trying.

Success.

Luiz (Brazil)

Problems with HP41C

*Message #8 Posted by **hugo (belgium)** on 21 July 2003, 10:36 a.m.,*
in response to message #1 by hugo (belgium)

Hi Thibaut, Chan,Victor and Luiz,
thanks all for the good advice, i will need some time to try it all out! i will post a message again when i am through the list...
Of the items mentiones: i do not have broken screw posts (all four screws work OK) but perhaps the connectors are not yet clean enough. The beep i already tested: no sound- so it is not only the display that does not work. The 41C i have is one without rounded corners so i will have to check that second connector also. To test the C, i used my batteries and the battery case of my 41CV (that works with the card reader- so the batteries will be OK). But i have noticed that when i take the batteries out of the CV and leave them out a while, this calculator also has difficulties to start up. I have to remove all modules and the card reader, reinsert the battery pack to get it working again. Perhaps also a sign of corrosion somewhere? And when it starts up, sometimes i have a MEMORY LOST.
Anyways thanks already for all advice! Hugo

Re: Problems with HP41C

*Message #9 Posted by **Thibaut.be** on 21 July 2003, 10:55 a.m.,*
in response to message #8 by hugo (belgium)

Hugo,

As we live in the same country I could have a look and try my luck on your calculator... drop me an e-mail (I live around Brussels) if you want to arrange a meeting.

Best regards,

Thibaut

Battery contacts ????

*Message #10 Posted by **Jon** on 21 July 2003, 1:21 p.m.,*
in response to message #8 by hugo (belgium)

Hugo:

You should also try to look for broken battery contacts. Sometimes they look nice but are broken in the middle (where the battery is in contact). It is very easy to check it. Just place a piece of aluminum paper in each contact. You must guarantee there is contact in the borders, not just in the middle. I have found that problem in 2 of 4 HP-41C, Cv,Cx that I have repaired. If that´s the problem make us know. It isn´t so hard to repair.

Jon

...It works again!!!

*Message #11 Posted by **hugo (Belgium)** on 22 July 2003, 3:39 a.m.,*
in response to message #1 by hugo (belgium)

Hi all,
I cleaned all contacts again, including the one between the PCB's inside. After reassembling, it works again! Although i do not exactly know which contact has posed the problem, i am vary happy to see this 41C alive again.
Thanks for all good advice! To my opinion, this is not just a forum, it is a quick and very efficient HP helpdesk!!
Best regards, Hugo

Re: ...It works again!!!

Can anyone comment on the Lygea HP15C emulator?

*Message #1 Posted by **Emmanuel Verbeeck** on 20 July 2003, 5:20 p.m.*

Being quite amazed at the typical eBay prices for HP15C (typically $300+ for scratched/incomplete ones), I was looking for some good Windows-based emulation.

I have found a Windows CE / pocket PC emulator done by Lygea (see http://www.lygea.com/pocket15cdetail.htm).

Do any of you use this? Thanks for your opinion.

Re: Can anyone comment on the Lygea HP15C emulator?

*Message #2 Posted by **Victor Koechli** on 21 July 2003, 2:42 a.m.,*
in response to message #1 by Emmanuel Verbeeck

As far as I can see, you can download and try it for 14 days for free.

You could do that and then post your experiences here ;-)

Cheers, Victor

Emulator ? What emulator ?

*Message #3 Posted by **Valentin Albillo** on 21 July 2003, 8:26 a.m.,*
in response to message #1 by Emmanuel Verbeeck

Here's some enthusiastic opinion (and endorsement), if a bit brief:

HP-15C emulator

Anyway, this product is *not* an "emulator" at all, but a *simulator*. A real *emulator* runs a bit-perfect copy of the original ROMs in an emulated original CPU. This exactly mimics the full behaviour of the machine being emulated, bugs and all, limitations and all.

On the other hand, this HP15C *simulator* just tries to imitate more or less what the original 15C did, but it goes on changing things (more items in the display, more program steps, more memory) and you can be sure that many original 15C programs *won't* run on it as they would run on a real or emulated HP-15C. I can certainly write a number of perfectly legal HP-15C programs that won't run as intended on it, if at all. And for nearly all HP-15C programs doing some kind of extensive calculations, you can bet that your simulated results *won't* match the real ones.

Mr. Kahan and the rest of people involved in the design of the HP-15C algorithms took really *extreme* efforts to guarantee accuracy, stability, convergence, and such, to an extent never before seen (and probably after, as well) on a handheld calculator. I very much doubt that this simulator does include such ultra-finely tuned algorithms, and most probably relies blindly on greater native precision (typically 16 digits) to cater for any lack of refinement.

In a worst-case scenario, you could find yourself with the simulated Solve failing to converge to the correct solution (a la HP12C Platinum), failing to find an existing solution, or finding a solution that isn't, you just have a look at the **HP-15C Owner's Handbook** and **HP-15C Advanced Functions** to see the *many pitfalls* awaiting for non-optimized algorithms to fall into. I guess the people who wrote the routines for the 12C Platinum did just that, blindly relying on greater native accuracy and faster CPU, and we all have seen the results: non-convergence, lack of reliability, and utter inefficiency.

In a nutshell, I think that calling this product an "emulator" is a *gross* misrepresentation, and I wouldn't trust its answers, specially when using the advanced functions: matrices, complex, solve, integrate. I trust my HP-15C, because I know the who's and the what's behind it. Just read this unbelievably good article by Mr. Kahan, who's one of the fathers of the real HP-15C, and once you've read it, see if you would trust an HP-15C simulator to deliver the goods:

Mathematics written in sand (105 Kb PDF document)

If you really need an RPN emulator for your PC, you could do much worse than to get one of the freely available 41C emulators. One of the very best does perfectly emulate an HP-41CX, synthetics and all, complete with Advantage ROM and other modules also perfectly emulated. Actually, it's pretty indistinguishable from having a real, loaded HP-41CX inserted on your very screen, photorealistic cosmetics included. There's almost nothing you could do with a real or emulated (not simulated) HP-15C that you won't be able to do with this emulated 41C. I use it to write all my 41C programs and articles, for instance. And it's free. I don't know if some version is available for PocketPC or other PDA devices, but certainly a real emulator is the way to go.

Best regards from V.

Edited: 21 July 2003, 8:35 a.m.

Emulators for Woodstocks and Spices?

*Message #4 Posted by **Michael F. Coyle** on 21 July 2003, 6:48 p.m.,*
in response to message #3 by Valentin Albillo

I know that emulators are available for some Classic models (35, 45, 55) the 41 and various Saturn machines.

But does there exist a real honest-to-God emulator for any of the Woodstocks, Spices, or Voyagers?

I haven't looked at everything that's been published out there, but all I've seen are simulations, which are OK, but not the Real Deal.

I'd like to do an emulator but don't have enough info yet.

Anyone?

- Michael

Re: HP 25 Java simulator ... here, in this same MoHPC site

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 26 July 2003, 8:44 a.m.,*
in response to message #4 by Michael F. Coyle

There is an excellent HP25 simulator here at the MoHPC (Simulators page), as the source code is available, you can adapt it to run off-line...

Re: HP 25 Java simulator ... here, in this same MoHPC site

*Message #6 Posted by **Michael F. Coyle** on 26 July 2003, 4:11 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

I do like this simulator. The only problem I have with it is that it is very slow to respond to button presses. Sometimes it takes a couple of seconds for the display to update. It's very disconcerting.

Would running it off-line make it any faster?

(I use the HP-45 emulator a lot. It has a less-polished user interface but at least it responds instantly.)

- Michael

Re: RamBOX

*Message #6 Posted by **Meindert Kuipers** on 21 July 2003, 2:38 a.m.,*
in response to message #1 by Matthias

Do you mean to rebuilt an original old design? I am working on a completely new design that is a RAMBox! See the specifications at www.kuipers.to/hp41.

Meindert

Re: RamBOX

*Message #7 Posted by **Christoph Klug** on 21 July 2003, 7:32 a.m.,*
in response to message #6 by Meindert Kuipers

Dear Meindert,

It makes much sense, that you complete your actual design (working with modern technologie and parts).

Rebuilding existing Eramco or W&W Ram-Box solutions is too much work and some storage IC parts not available today or exotic and hard to find.

The "traditional" Eramco and W&W Ram-Box solutions are absolutely nice parts for active HP41 user and for any collector. Unfortunately Ram-Box systems hard to find.

Up to now (and for future times) Zeproms are the leading solution for concentrating maximally power in only one HP41 plug in port...

Best wishes from Germany -Christoph

Re: RamBOX

*Message #8 Posted by **Meindert Kuipers** on 21 July 2003, 9:19 a.m.,*
in response to message #7 by Christoph Klug

Christoph,

Can you actually make the ZEPROMS or just program them?

Meindert

Re: RamBOX

*Message #9 Posted by **Grant Goodes** on 21 July 2003, 10:30 a.m.,*
in response to message #8 by Meindert Kuipers

Yeah, my question exactly. I have a dual-Zeprom programmer, but no Zeproms, and haven't been able to find any. The guy I bought the programmer from had a stock of unmounted Zeprom EPROMs, but threw them out! If anyone (Christoph?) has Zeprom that they'd be willing to sell me (don't need the voltage convertor, and can be totally blank, which would normally make it pretty useless to people), I'd be willing to pay well for it.

grant..

Re: RamBOX

*Message #10 Posted by **Matthias** on 21 July 2003, 11:03 a.m.,*

I suggest you use an 8 bit SRAM chip in place of two 1 bit chips, and waste 6 bits (tie them to ground, perhaps through a resistor).

HTH,

James

non-calculator collections

*Message #1 Posted by **Sean McNamee** on 20 July 2003, 4:00 p.m.*

Besides calculators, what other collections do users of this forum collect? ...just curious...

Re: non-calculator collections

*Message #2 Posted by **Fred Lusk** on 20 July 2003, 5:56 p.m.,*
in response to message #1 by Sean McNamee

Sean…

I collect dust :-)

Seriously, though--I used to collect coins, but sold most of my modest collection about 20 years ago to help finance my first house. Unfortunately, I was in college when Bunky Hunt tried to corner the silver market and wasn't paying attention. For a short time, my silver dollars, silver half dollars, and silver quarters were worth about four times what I ended up selling them for just a few years later.

Now, I collect maps of all types: topo, highway, aeronautical, geologic, atlases, National Geographic, star charts, etc. Very few are worth anything more than face value…I just like looking at them. I have at least 3,000 individual maps and perhaps 30 atlases, plus some computerized maps. My collection is only partly organized. Yet another project I need to get to. As a civil engineer and geography buff, collecting maps seems like the natural thing to do.

I also collect pins from places I visit, but I only have about 100 of those. Most of these are on a hat I used to use for hiking before it got too heavy.

I guess I collect books, too, but not in an organized fashion. I read about 40 books a year, mostly history, science, etc (and maybe one novel every other year). My wife reads maybe 30 books a year, mostly fiction. Some books we buy, some we get from the library. Several years ago, when we had about 1000 books, my parents decided to sell their house and buy a smaller one. They had at least 5000 books and didn't want to move them all. They took membership in the Book of the Month Club very seriously! They gave me first shot at their library and I took about 1200 books. Some are still in boxes because I don't have enough bookshelf space.

I have had a subscription to National Geographic since I turned 5 and have kept every issue (I'm 44 now). Several years ago, I went to a used book sale and added the previous years back to my birth.

I "collect" waterfalls. By that I mean, when we travel, I like to see and photograph as many waterfall as I can. I actually started a database of waterfalls in California, but my plate has been too full to work on it much. Besides, a woman by the name of Ann Marie Brown wrote a very nice book titled "California Waterfalls" which serves my purpose just fine.

That's enough of my life story.

Fred

Wow! Those are fun! Especially the books and maps, by my own tastes... I have all my college textbooks related to my degree (EE), and most of the others. But I hardly have a "collection" - especially compared to something like yours. However, I was in an old bookstore night before last and it had a collectibles section, where I picked up a nice hardbound "Dracula" by Bram Stoker, and a nice edition of "The Original Illustrated Sherlock Holmes" with lots of cool, old-style drawings. Neat!

Sean…

One of my prizes is "Peck's Bad Boy and His Pa". Hard to explain, but one of the funniest books I have ever read. The author (George W. Peck) was a newpaper publisher and later mayor of Milwaukee and governor of Wisconsin. The book is based on columns Mr. Peck wrote for his newspaper. The central figure is the "Bad Boy", a mischievious young to mid-teenager. He gets into all sorts of trouble, but of a kind MUCH less serious than we hear about today. He mostly pulls pranks on people. His father is the main victim, but so is the grocery man he tells most of his adventures to.

I actually have two copies of "Pecks". The first copy is the one my father read to me when I was a kid, and my grandfather read to him. It was printed in 1900, which is even 12 years before my grandfather was born. The second copy my wife bought me for Christmas several years ago. It was printed in the 1880's and is in better shape.

I also have some old Roman coins my wife got off e-bay from a dealer back east. Several of the coins show the figure of Constantine. They're actually not very valuable because they are not very rare and the condition is so-so (my wife spent about $30 for seven coins). Even so, it's really cool to have them. I help teach sixth grade sunday school at our church. The first half of the year deals with church history, and the coins are a big hit since Constantine is considered the first Christian emperor, though how Christian he really was is open to debate.

*Message #5 Posted by **db(martinez,california)** on 20 July 2003, 6:03 p.m.,*
in response to message #1 by Sean McNamee

I just counted. I have 180 old bottles that i either dug up while excavating buildings or traded my duplicates for. They are on 12 shelves in my enclosed porch windows and provide quite a bit of privacy. Most came out of 100 year old privies. My favorites are an 1880's "Kellogg's" Kentucky whiskey bottle with a screw cap made of only-god-knows-what, a blue triangular "Owl" brand poison bottle, and a +/- 1890 blob top "XLCR" (excelcior) mineral water bottle from right here in river city; it's deliciously primative.

I also have a rather extensive collection of Plomb (not plumb!) tools, half of which i inherited from my dad. Since they comprise most of my english wrenches; i guess they are not a collection. They are just beautiful old greasy or rusty tools. My favorites have "VB" ingraved on them.

My ex wife (aka the formerly lawfully wedded mistake) said that i collect women. I can think of at least three ways that that is a filthy thing to say but with what i had to pay to get rid of her; it certainly rates her low on (at least) my scale of desireable collectables.

I collect Pinball machines. I used to collect stamps, SF firts-editions, camera gear, etc., but found that most of these areas are dominated by profit-motive, and are ultimately a bit pointless (I mean that, for example, stamps are no longer just a utlilitarian object, but a good portion of their "purpose" is to sucker collectors into spending more money).

Pinball machines are actually quite afordable, and whatever time and effort I put into restoring one directly translates into increased resale value. They are VERY fun to play and it is very rewarding to bring a trashed/abused game back to life. And, I get to use all my grade-12 electronics skills, which have otherwise been obsoleted by the modern style of electronics design (which has come to resemble software rather than hardware in most senses).

grant..

*Message #18 Posted by **unspellable** on 21 July 2003, 11:42 a.m.,*
in response to message #17 by Grant Goodes

I don't know that I would say that I am a calculator collector. Debatable.

I am a slide rule collector and a gun collector.

One aspect of calculators vs slide rules, is that if you are generally familiar with slide rule operation you can pick up the operation of a new one in a matter of seconds in most cases. Even with a few specialized scales you can learn most inside of an hour. (There are exceptions.) After living with my HP 28S and HP 48SX for some years, I am finding it will take days to really learn the TI, Sharp, or Casio programmables I recently picked up.

I am already finding that I do not like the fact that I don't seem to be able to set up a simple program that has a user interface like a function button. For example, on my HP 48SX I write << INV SWAP INV + INV >> and then 'PARA' STO. Now I can put two numbers on the stack, push PARA and I have the parallel combination. Can't seem to do this on the algebraic types. You have to call up a program and then enter values. The odd thing is that I have slide rules with this function. Now with something like 2300 functions on the 48 series, you'd think they could have included this one. It's not even in the EE PRP Pac. Now if they saw fit to put this on a slide rule where the number of available functions is rather limited by the available real estate and the cost of engine divided scales, you'd think it was useful enough to be

included among 2300 functions.

Hi, unspellable:

unspellable posted:*"I am already finding that I do not like the fact that I don't seem to be able to set up a simple program that has a user interface like a function button. For example, on my HP 48SX I write << INV SWAP INV + INV >> and then 'PARA' STO. Now I can put two numbers on the stack, push PARA and I have the parallel combination. Can't seem to do this on the algebraic types"*

Assuming you consider an HP-71B as being of "algebraic type", you can do it as simply as this:

```
10 DEF FNP(X,Y)=1/(1/X+1/Y)
```

then you can instantly use it right from the command line or in calc mode, like this:

FNP(3,4)+5*COS(PI/3)-FNP(2,6)+7*FNP(FNP(3,5)-FNP(1,4))

say, i.e. just like any other built-in function. As you can see, you may use the result of an FNP as input for another FNP. If you want to reduce typing, you can assign "FNP(" to any user key, so you would only need to press said key, key in your arguments separated by a comma, then press ENTER to get your parallel equivalent computed and displayed, the 71B will automatically close the parenthesis for you (in Calc mode). I guess this is as simple and convenient as it gets.

As for the SHARP models, assuming they are programmable in BASIC you can do something like this, for most models:

```
10 "=" INPUT X,Y: PRINT 1/(1/X+1/Y)
```

where the "=" means this small `program' is assigned to the shift-equals key, so in DEF mode you would simply press shift-equals and there you are, a "?" would appear, just enter both values separated by a comma, press RETURN or ENTER, and the parallel equivalent is computed and displayed. It's reasonably straightforward, don't you think ? If the particular model's BASIC does allow user-defined functions, the technique for the 71B above applies, too.

For one-argument functions, there's an even simpler solution for the SHARPs: suppose you want to compute exp(-x*x) for any given argument x. The 'program' would be:

```
10 "=" AREAD X: PRINT EXP(-X*X)
```

Then, in DEF mode, you would simply key in your x and press shift-equals. The value already in the display will be read into variable x, without asking you anything, and the computed value will be displayed, like this

```
    2  [shift-equals] -> 0,01831563889
```

This is as 'button-pushing' as possible for those models ...

Best regards from V.

unspellable: PARA on HP 48SX

*Message #23 Posted by **Tizedes Csaba** on 1 Aug 2003, 6:33 p.m.,*
in response to message #22 by Valentin Albillo

Hi,

I write it on HP 48SX:

<< -> x y << x INV y INV + INV >> >> 'PARA' STO

and use it like:

Set 'SYM' flag ON.

'PARA(3,5)' [ENTER] [EVAL] or 3 [ENTER] 5 [PARA] or 3 'A' STO 5 'B' STO 'A' [ENTER] 'B' [ENTER] [PARA] [EVAL] etc...

Try it with 'SYM' flag OFF.

Csaba

Ps. To Valentin:

"...*FNP(FNP(3,5)-FNP(1,4))" it's unworkable, but I see, what are you want! (Change '-' to ',' and it's will be correct.)

Csaba

*Message #24 Posted by **John** on 21 July 2003, 4:21 p.m.,*
in response to message #1 by Sean McNamee

I'm not a HP collector, only a most devoted user. I have had my 48sx since the day it was introduced. (Before that a 41cx.) I have made a number of short convenient programs, like 'STSM' which sums everything on the stack, 'REAL' and 'IMAG' which separates the terms in a complex, 'TRIAN' which gives the area of a triangle from three known sides. This has been very convenient in my work with site maps, etc. Otherwise, I collect Aristo slide rules - I'm supposed to have the most important private collection of those. Then, I have collected Art-Nouveau items, from jewelry to furniture, now unfortunately become a most expensive field which I can no longer afford (I started in the early 60s). I also used to collect Leica items, now also too expensive. To this other interesting subject below: I'm also divorced. However, I'm wondering about how many other divorced men still have joint bank accounts with their former? Keys to each other's homes? Keys to each other's cars? Being welcome to the former wife's beautiful country side residence (incl. her excellent cooking) every weekend? Well, those are some of my privileges...lucky me? (We are both 68 and she's still my only love...well, besides my pristine 1965 SAAB MonteCarlo...)

Re: non-calculator collections

*Message #25 Posted by **Speck** on 21 July 2003, 10:14 p.m.,*
in response to message #24 by John

I'd have to agree with John--I'm not a collector of HP stuff. And I don't care what anybody says about them: I both like, and use, my 49G.

As far as collections go, I collect N scale model railroad cars. Mostly Micro-Trains Line, but I collect others, too. I've also got a few engines and a half a dozen or so structure kits. One of these days they'll all stop being a collection, and will actually be trains running around on an actual layout instead of hiding in their boxes and sitting on my display shelf.

Speck.

'65 Saab Monte Carlo?...

*Message #26 Posted by **Karl Schneider** on 21 July 2003, 11:28 p.m.,*
in response to message #24 by John

Never heard of it! From your e-mail address, I see that you are in Norway. Was that model ever imported to the US? Also, is the engine 2-stroke or 4-stroke? I think 1965 was the last year that Saab made the smoky 2-strokers...

Re: '65 Saab Monte Carlo?...

*Message #27 Posted by **John** on 22 July 2003, 5:35 a.m.,*
in response to message #26 by Karl Schneider

Most MonteCarlos were exported to the US. Mine spent some years in Denver before being shipped back to Scandinavia. It has a 2-stroke engine with three carbs. Rather than running on an oil mix, it has an oil tank under the hood with a pump that injects oil into the bearings. So it doesn't emit any blue smoke. Among the standard eqpt was a dash board with 'professional' instruments, a Nardi wood and aluminum steering wheel, a pull-out map table for the navigator, etc. These cars are now very rare, mine is the only one in Norway. Since this was at a time before electronic calculators, I still have my Stevens Rallye Calculator on the navigator's table, plus a nice Curta.

in response to message #1 by Matthias

```
Please Matthias,
1. Immediatly protect the Eprom windows against UV.
2. There's two 2764 Eproms and may be a 2716 or 2732.
3. Are the Eproms sold on the printed board?
4. Could you disassemble the ROM?
5. Eprom Burner but not necessary for HP-41
6. ...
I use a Mountain Computer IL Eprom Burner
```

Re: Who knows more about this?

*Message #3 Posted by **David Smith** on 20 July 2003, 3:08 p.m.,*
in response to message #1 by Matthias

It looks like the EPROMS are installed in low profile screw machine type IC sockets. From the pictures it does not appear that they were programmable while in circuit. You probably had to remove them and program them externally.

It is strange that there are three of them. Most ROM boxes used two chips to generate the 10 bit wide instructions. Perhaps there was a way of loading two different ROM images and switching between them.

Re: Who knows more about this?

*Message #4 Posted by **Meindert Kuipers** on 20 July 2003, 3:59 p.m.,*
in response to message #3 by David Smith

Two 2764's means a total of ROM images. The smaller EPROM must be a 2732, containing the U2 bits for the 4 ROMs. There is no way that these can be programmed in circuit, and from the excellent picture it shows that the EPROMS are in sockets. I would certainly follow the advice to put a label on the EPROMS to prevent UV light getting in. There is no harm in removing the EPROMS from the sockets as long as it is done very careful so the pins are not bent.

It would be interesting to get the full CAT 2 list.

Meindert

Removing EPROMS - my advice

*Message #5 Posted by **Tom (UK)** on 21 July 2003, 12:35 p.m.,*
in response to message #4 by Meindert Kuipers

EPROMS (like most chips) can be damaged by static. Even though they may still work small static discharges can affect device life and reliability.

Before removing them get some conductive foam (this is normally 1/4 inch thick, black and doesn't spring back into shape very well). Failing that get a polystyrene ceiling tile and cover it with baking foil.

Remove the devices with a small screwdriver, working them out about 1mm at a time at each end so they come out 'square'. Do this on a (dry and clean) metal kitchen sink as this will act as a good ground. Touch the metal of the sink often to discharge your body.

After removal, immediatly press into the conductive foam / baking foil. You could also simply wrap them in the baking foil but this would mean you can see what's inside.

I would certainly put something over the window to stop the data being erased (note that a flash may have alot of uv energy - so don't photograph them again unless you cover the windows up!)

There is a funny story about flash photography and telephone exchanges. Ask if you want to know.

AFN - Tom.

Re: funny story about flash photography and telephone exchanges

*Message #6 Posted by **Ellis Easley** on 27 July 2003, 10:58 a.m.,*
in response to message #5 by Tom (UK)

I'd like to hear that story! Here are couple of related stories:

One pretty well-known story is that the stepping relay, which was used in the first dial telephone systems, was invented by a man named Strowger who was one of two morticians in his town. The wife of the other mortician was the town's telephone operator, and whenever a caller asked for a mortician, she connected them to her husband!

The other story has to do with an effort to develop a recordable CD by Memorex when it was part of Tandy Corporation. One of the engineers who worked on the project later worked in my department, after Memorex gave up on the recordable CD. He told us that Memorex had the recordable media working but a photo flash would wipe out all the data.

Re: funny story about flash photography and telephone exchanges

*Message #7 Posted by **David Smith** on 28 July 2003, 12:29 p.m.,*
in response to message #6 by Ellis Easley

Didn't Tandy get sued for hyping that read-write CD, driving their stock price up, then never getting it to market?

funny story about flash photography and tape drives

*Message #8 Posted by **Dave Shaffer** on 29 July 2003, 12:14 p.m.,*
in response to message #7 by David Smith

We used to use computer tape drives (7-track and 9-track -- anybody remember those?!) to record directly our radio astronomy data (we just wrote bits as fast as the drives could go: 720 kbs was about the limit). This was the late '60s.

Once, during an attempt to document the beginning of an experiment, I took a flash picture of one of the guys next to a tape drive. At the flash, the drive took off. Apparently, one of the photocells which were used to sense the tape position in the vacuum loops and provide feedback information to the take-up and supply motors interpreted my burst of light as an out-of-tape situation, which the drive then tried to "fix."

Re: funny story about flash photography and telephone exchanges

*Message #9 Posted by **Ellis Easley** on 30 July 2003, 1:22 a.m.,*
in response to message #7 by David Smith

I'm not sure, I never heard of such a lawsuit. I've been trying to remember the time-frame of that project. I'm pretty sure that another project was underway about the same time - the "Digital Compact Cassette" which Philips had specified and for which Tandy designed a recording deck. That one actually shipped but I think it didn't sell. It wasn't 4mm DAT, it used a tape cassette that looked like a regular Compact Cassette but it contained a high quality tape and sound was recorded on it digitally - the way it was explained to me, just the coefficients of an FFT were recorded (I don't know if this is true). The idea was to provide something better than regular cassettes to record your CDs on ("for personal use") - but maybe not so good that it would make the record companies mad. I remember reading that as part of an agreement to allow consumerization of DAT, the record companies were going to notch out all energy at 3 kHz on commercial audio CD's, then the DAT recorder would have to refuse to record unless there was some energy there, presumably from a live source. I've wondered what that (notched CD) would sound like! The recordable CD was going to be audio only at first, assuming the data reliability wouldn't be too good, and regular CD Audio error recovery would make it good enough for audio. Then as they worked out the bugs, they would make a recordable CD-ROM computer storage peripheral. So the time frame was after CD-ROM was available. I seem to recall that it was intended to be re-writeable from the outset - maybe that was too ambitious! But whatever the technical reasons why it didn't fly, it would still have been necessary to overcome the objections of the record companies.

Been away for a few days, here's the story told to me by my electronics teacher (who used to work for the monopoly telephone company in the UK - GPO):

An new exchange was installed and running, someone wanted to take a photo of the instalation (I think for promotion or to prove the meter readings?) and had to use a flash gun as the exchange was dark. They took the photo and the exchange 'crashed' for no apparant reason. The exchange was rebooted and all was well. Sometime later another photo was taken and again the exchange crashed.

Can you guess why?

Well - the story goes that the circuit boards had EPROMs without lables. The light energy from the flash gun was NOT enough to erase them but was enough of a energy 'kick' to make the circuits malfunction (E = hf). This is one of the reasons for putting lables over the windows of the EPROM.

I can testify that when probing silicon die in open topped packages that circuit performance changes when you have light on them - I would imagine that the number of photons coming from a photo flash gun would be enough to stop a circuit working for a milisecond or so.

Tom.

I've heard of that too - apparently every silicon junction will behave as a photodiode.

Re: funny story about sheep and telephone exchanges

*Message #12 Posted by **Paul Brogger** on 29 July 2003, 10:30 a.m.,*
in response to message #6 by Ellis Easley

While we're on the subject of funny telephone circuits . . .

In the pre-Internet days, our library information services company had to lease and monitor its own network of multi-drop telephone lines connecting participant libraries with a shared database.

Our Montana (or maybe it was Idaho -- the memory is getting hazy) line suddenly started falling over randomly. As was typical in these situations, we had to get in touch with the regional telephone company and have them trace the circuit, leg-by-leg, to try to isolate the problem.

In the end, it was found this particular problem was caused by a rancher grounding his electrical fence to a local telephone junction box. Apparently, every time one of his sheep brushed the fence, libraries in the region lost their connections to our online system!

Re: Who knows more about this?

*Message #13 Posted by **Victor Koechli** on 20 July 2003, 5:11 p.m.,*
in response to message #1 by Matthias

WDT could have been 'Weinert Datentechnik', which is now Cynox (www.cynox.de). Perhaps there's still somebody there who knows something...

Cheers, Victor

hp calculator batteries

*Message #1 Posted by **Jennifer Seelye** on 20 July 2003, 2:12 a.m.*

Hello, We bought another hp calculator this weekend at a garage sale. It is in very good condition except the model tag is missing & the batteries are dead. After looking at pictures I determined that it is a 12c. Not quite as good a buy as the xpander from last weekend but not bad for $2.

Anyway, where is a good place to buy batteries for these calculators? I see calculators ALL the time that have dead batteries. I would like to keep a supply on hand to test these when I see them. I already printed the list from this site of rarity (it didn't help me today with no model # but we were guessing it was an 11c).

Also, which batteries will be needed to test most calculators? Are there 4 or 5 common types of batteries for hp's or are there more like 40 or 50 types?

Are there other good collectible brands to watch for?

Thanks for your help & suggestions, Jennifer

Re: hp calculator batteries

*Message #2 Posted by **Raymond Del Tondo** on 20 July 2003, 7:44 a.m.,*
in response to message #1 by Jennifer Seelye

Hi,

most common in HP LCD calculator are:

- LR44 (Pioneer series, Voyager series (10C,11C,12C,15C,16C)) These should last for at least 5 to 10 years in the Voyagers.

- N, Lady (HP-41,Clamshell series)

- AAA, Micro (Stretched Pioneers (HP-48..))

I don't count the 'new' models from the last two years, and the older LED models all use rechargeable pacs.

Raymond

Other collectibles

*Message #3 Posted by **Valentin Albillo** on 21 July 2003, 9:13 a.m.,*
in response to message #1 by Jennifer Seelye

Hi, Jennifer:

Jennifer posted: *"Are there other good collectible brands to watch for?"*

Indeed. You'd be well advised to be on the look for SHARP Pocket Computers. These are small handheld devices, some similar in size to the HP-12C you just acquired (other are a little larger but always pocketable), very good quality and extremely performant, which can be found at nearly throw-away prices, because people still haven't noticed its 'collectibility', to coin a word. They already command reasonably good prices on eBay, and are on the rising, look at these very recent auctions for example:

Sharp PC-1403

Sharp PC-1500A

Sharp PC-1250

Sharp PC-1211

I've seen some models (such as the SHARP EL-5100, 5100S, and 5101) reach $200 and more, and other equally desirable models (SHARP PC-1350, PC-1360, PC-1600) can reach $100-150 and more. If you want to know just how they look like so that you can recognize them on sight, visit this site:

Sharp Pocket Computers

Taking into account that they can be found for $1-5 at most garage ('garbage') sales, you can see the chance for profit. Specially since they are on the rising and there are more and more people who recognize quality when they see it and are more than willing to collect them.

Best regards from V.

I think I did not understand this auction's subject

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 11:06 p.m.*

Hi, folks;

I'm sorry posting about such an off-line subject, but I saw so many auctions over the same theme I decided to see what was that about. It looks like those "MAKE MONEY FOR FREE!" messages I saw posted at the MoHPC forum sometime ago.

Have you seen this auction? There are some others like this. I tried to figure it out: it seems someone found a way to "acquire" (if it is the right way to use the verb) goods for no cost or about no cost. And now he/she is trying to sale the "way to do it".

Is it the auction's actual "subject"? If so, there is nothing to do with an specific "free HP48GX". This way, is it legal at e-Bay?

I just want to understand.

Thanks.

Luiz (Brazil)

*Message #2 Posted by **Raymond Del Tondo** on 19 July 2003, 11:26 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi,

I don't know if it's legal, but IMHO this 'auction', like many similar ads, is just trash. I think it offers no real gain. It's like I would charge you money if I told you a way to make your house secure, namely by closing and locking the doors;-)

However, you remember the guy who offered different stuff on eBay for a relatively low BIN price, and then charged the 'winner' a massive amount for shipping...

Regards,

Raymond

If I am not wrong...(edited)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 11:40 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond, Mark, guys;

I remember reading one auction where the seller mentioned his/her Grandma was too slow packing and it would cost...(?)

There are lots of things too much more important in the world than using the Grandma as an excuse, right?

Thanks, Raymond! Anyway, I still think the seller should not announce it as a free HP48GX.

Best regards.

Luiz (Brazil)

Edited: 19 July 2003, 11:44 p.m.

Re: If I am not wrong...(edited)

*Message #4 Posted by **Raymond Del Tondo** on 20 July 2003, 9:39 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Like Mark, I followed some of the items to their origin. It seems there's something like an eBay feedback pushing gang at work. Most of them do virtually nothing than giving and receiving positive feedbacks.

Maybe this could be interesting for the eBay legal department...

But OTOH, the sellers may just change their eBay pseudos, and start over again. So I fear there will always be some junk kids like those.

Raymond

Shill, spills, thrills

*Message #5 Posted by **bill platt** on 20 July 2003, 2:26 p.m.,*
in response to message #4 by Raymond Del Tondo

I too have followed stuff---Like this:

I found a 71B at auction, so I looked in the seller's feedback, and found the auction in which he had bought the unit, then I went into the previos seller's feedback, and found the auction when He bought it....

Interestingly, by the time the trail dropped, tyhree back, The 71b had been purchased for 250 bucks. That buyer sold it for about 130 (so lost some money, seems to me) and then that guy's action went for around 80 bucks----and so two epople in the cahin lost money----

But this was an unusual case, where I think there were actually fully ligitamate people buying and selling (at unwise prices) as I could see both buy and sell transactions in their records.

Most of the "power sellers" show NO buying activity, and most buyers show NO selling.

Further, I think there is a lot of shilling going on--because it is so EASY to do it!

Look at the bidders--almost all the time, you find a bunch of 1, 2, or 3 transaction bidders---now some of these are ligit----just new and inexperienced (I only have 10 feedbacks myself!). But others are surely shills.

Follow the experienced and successful buyers, and you will discover that tehy manage to buy stuff for WAY below the median price----calckidd is an excellent example. I have gone inot a number of acutions where "he" shows up, and he never stays in the running ifit goes anywhere near median price. If you check his records, you dicover that he gets stuff for way cheap---a 7Bfor like $50, a 48GX for like $25 or $35, etc.

So the savvy auction buyer make s a careful study of not only the product, but also the legitimacey of the auction.

Best regards,

Bill

Re: I think I did not understand this auction's subject

*Message #6 Posted by **Mark Hardman (LED)** on 19 July 2003, 11:27 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Its interesting to note that the seller has been registered for less than 24 hours and already has 16 positive feedbacks posted. If you follow each feedback to the original item, they consist of auctions for $1.00 or less selling an ebook, joke, etc. Each of these auctions openly promise positive feedback will be posted within 24 hours. This seller essentially purchased what looks like a bona fide eBay account in less than a day!

Let's see. Can you spell S-C-A-M?

How do you spell 'scam' in French, German, Korean, etc.?

Mark Hardman

I guess eBay didn't like his way of doing business either...

Re: I think I did not understand this auction's subject

*Message #9 Posted by **gifron** on 21 July 2003, 1:35 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I checked into this deal (but did not buy it). Basically, they send you contact information for electronics manufacturers. You are to promote yourself as a retailer, and ask for a free sample of the product, which some mfr's will provide. You may in fact receive something free of charge, but every scam has its price.

Another 41cx Q:

*Message #1 Posted by **Sean McNamee** on 19 July 2003, 7:05 p.m.*

How do I resize a file? I'm looking at the 41 extended fundtions manual, and I found flsize, but that only returns the size. Do you have to create a new file, and copy the data between the two?

Again, thanks...

Re: Another 41cx Q:

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 8:01 p.m.,*
in response to message #1 by Sean McNamee

Hi,

there is a way to resize ASCII and data files only in the HP41CX; the Extended Functions does not have this resource.

The function is RESZFL. File to be resized must be the working file, and the integer part of the number in X-register defines the number of registers that the file will contain.

Hope this helps.

Luiz (Brazil)

Edited: 19 July 2003, 8:02 p.m.

Re: Another 41cx Q:

*Message #3 Posted by **Victor Koechli** on 19 July 2003, 8:09 p.m.,*
in response to message #1 by Sean McNamee

RESZFL does just that: Put the number of registers you want to allocate to the file in the X register and execute RESZFL - voilà. You can increase or decrease a file's size this way. To force a size reduction of a data file even if used registers (those with a value orher than zero in them) would be lost supply the desired file size as a negative number.

RESZFL works on the current file, you cannot specify a file name. To make your file the current one you can use SEEKPTA (with the file name in the Alpha register and zero in X) or EMDIRX (with number of the file in X; e.g. if your file is the fourth in Extended Memory as listed by EMDIR or CATALOG 4, then you would put 4 in X and execute EMDIRX).

Actually, only the 41CX can resize a file this way, as RESZFL is not in the Extended Functions module, but only in the CX Extended Functions.

Hope this helps. Kind regards, Victor

Re: Another 41cx Q:

*Message #4 Posted by **Sean McNamee** on 19 July 2003, 8:30 p.m.,*
in response to message #3 by Victor Koechli

Thanks guys - one thing: since it is NOT part of the extended finctions, and is particular to the CX version of the 41, where in the hpmuseum CD-set of docs would I have found this? The index for calc manuals indicates that the documentation of the 41CX is the 41C/CV manual plus the extended functions manual - neither of which mention this function, ... ??

Thanks again

Re: Another 41cx Q:

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 9:12 p.m.,*
in response to message #4 by Sean McNamee

Hi, Sean;

the fact is that the HP41CX has an specific set of manuals. The exclusive CX functions, Time and X-functions related, are ony mentioned in the HP41CX Manuals.

Appendix I of the HP41CX Owner's Manual treats these differences. It is only six pages long. If you want, I can scan these pages and send them to you. In this case, should I use the e-mail you post here or another one?

Let me know.

Luiz (Brazil)

Re: Another 41cx Q:

*Message #6 Posted by **Sean McNamee** on 20 July 2003, 2:41 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hey - thanks! I guess the determining factor would be size. If they end up > 1M, please use seanm@cisco.com. Otherwise, the seanmc42@hotmail.com should be fine.

Re: Another 41cx Q:

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 20 July 2003, 2:11 p.m.,*
in response to message #6 by Sean McNamee

Hi, Sean;

your PDF with the comparison is on the fly right now.

As I mentioned in the e-mail, there is still another chapter (7 pages) describing [ED], a CX-exclusive ASCII-file editor. Please, read the e-mail and let me know what else you want.

Best regards.

Luiz (Brazil)

Re: Another 41cx Q:

*Message #8 Posted by **Sean McNamee** on 20 July 2003, 3:16 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Thanks! Regarding ED, that is described in one of the manuals I have (the extended funtions, I think), so I have used it - ED makes editing ascii files TOO easy! One issue I am having is that my pdf viewer (xpdf) runs REAL slow on my system, so just going to the next page is frustrating. I will most likely be taking the 41C/V manual to Kinkos for printing, possibly the extended manual, and your scans as well.

Thanks again!

Re: Another 41cx Q:

*Message #9 Posted by **Guillermo Castares** on 20 July 2003, 10:13 a.m.,*
in response to message #1 by Sean McNamee

I have written this little program and for me it's very useful:

01 LBL 'CUTFL

02 FLSIZE

03 ASROOM

04 7

05 /

06 INT

07 -

08 RESZFL

09 END

Put the file name in the alpha register and run the program. The file will be reduced to the minimun size without loosing information.

I normally create the file bigger than necesary, then I fill it it with the data, and finally I run this prog.

I hope that someone find it useful.

Regards, Guillermo

Re: Another 41cx Q:

*Message #10 Posted by **Sean McNamee** on 20 July 2003, 3:22 p.m.,*
in response to message #9 by Guillermo Castares

Cool program! I had the same idea, but hadn't coded it yet! What kinds of info do you guys keep in your calcs? Right now I have the names of a few of the file commands I thiink I might forget (as a new user).

Anyway, thanks for the great responses!

HP71B: two questions

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 5:40 p.m.*

Hi, HP71B users;

my turn to ask questions.

I received one e-message mentioning the HP71B's ROM version. How can I know which version is mine? Serial # or some specific command?

I remember that BASIC variables are all set to "0" (empty?) and all definable variables for an specific BASIC environment exist anytime a program "call" their contents. This is not the same with C, where variables not "declared" in a program are taken as "error" if called. Anyway, based on what I saw so far, used variables in the HP71B consume memory space. Is there a way to list varable names already used somehow?

Thanks for any help.

Luiz (Brazil)

Edited: 19 July 2003, 5:41 p.m.

Re: HP71B: two questions

*Message #2 Posted by **Emmanuel, France** on 19 July 2003, 5:58 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

```
VER$ should give you the version of your HP-71B and plugged ROMs. If I remember well...
Yours.
```

Re: HP71B: two questions

*Message #3 Posted by **Sean McNamee** on 19 July 2003, 6:27 p.m.,*
in response to message #2 by Emmanuel, France

...and my turn to pay you back ;) Yes, VER$ gives version info, and DELETE ALL deletes the space used by variables. Also, you can DELETE specific vars by name.

Re: HP71B: two questions

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 6:44 p.m.,*
in response to message #3 by Sean McNamee

Hi, Sean;

thank you for the information. I read that DESTROY *names* and DESTROY ALL would "erase" variable contents. I was not know about DELETE being used the same way.

Now, is there a way to know which variables have their contents changed before "erasing" (deleting,

destroying) them? I thought about listing their names. Is it possible?

Thanks again.

Luiz (Brazil)

Re: HP71B: two questions - oops

*Message #5 Posted by **Sean** on 19 July 2003, 6:50 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Sorry - I meant DESTROY. Not DELETE. I tend to mix both of those as well as PURGE up.... I really have no idea about listing variables, let me find my manual and take a look.... (will post results)

Thanks Emmanuel and Sean

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 6:45 p.m.,*
in response to message #2 by Emmanuel, France

Hi, Emmanuel;

thank you. As Sean confirms your answer, you actualy remembered it well.

Best regards.

Luiz (Brazil)

Re: HP71B: two questions

*Message #7 Posted by **Victor Koechli** on 19 July 2003, 7:49 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

DESTROY <var> can be used to free the memory used by individual variables, and DESTROY ALL will delete all allocated variables in the current environment.

However, I have not found an obvious way to list the variables currently allocated. You would probably have to consult the Software IDS to find out where this information is stored, and peek it from the HP 71's allocation tables.

Cheers, Victor

That's what I was affraid of...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2003, 8:13 p.m.,*
in response to message #7 by Victor Koechli

Hello, Victor;

I was affraid I'd have to "peek" RAM positions in order to seek for variables. I'm not aware of how is data organized in the HP71's RAM, I believe I'll find this information in the Internal Specs documents, as you mentioned.

I'd be delving into this subject with more "energy" if I had an HP71B, say, eighteen years ago, when I was actualy programming and working with assembly code. But I'll find the time to go further somehow.

Thanks a lot.

Luiz (Brazil)

Two questions on 41cx programming

*Message #1 Posted by **Sean McNamee** on 19 July 2003, 2:53 p.m.*

It seems that you use GTO .nnn to get to a line #, but only a line # within the current program - how do I get to/edit/delete a program which I did not give a label to? (Meaning it doesn't have a LBL in it) This is unlike the 15C, where line #'s are global...

Also, where can I find detailed info on the math pac and other ROMS? I only found cursory info here...

THANKS!

Re: Two questions on 41cx programming

*Message #2 Posted by **Ernie Malaga** on 19 July 2003, 3:09 p.m.,*
in response to message #1 by Sean McNamee

Sean:

You should always use a global label in all your programs, if only to avoid the scenario you have described. To access a program that has no global label, you'll have to use the CATALOG function:

1. Execute CATALOG 1 and immediately press [R/S] to stop it.

2. Now go through the catalog by pressing [SST] time after time. You can also press [BST] to go back some entries.

When you reach a spot in the listing that has two ENDs in succession, you'll have it. That's the program without global label. Press [<-] to exit the catalog. You'll be placed (I think) at the END of that program. In any case, from now on you can use GTO . nnn at will.

-Ernie

Re: Two questions on 41cx programming

*Message #3 Posted by **Axel Poqué** on 19 July 2003, 3:22 p.m.,*
in response to message #1 by Sean McNamee

Finding a program is simple:

Enter CATALOG 1 (shift ENTER 1), and immediately press R/S. This puts you in the program catalog. Now you can step through the catalog using SST/BST. Programs without labels are identified via their end statement (eg. "END 18"). If you found the program you wanted, press <-. Now you can execute the program by pressing R/S, edit it in PRGM mode, or delete it with CLP (press XEQ ALPHA CLP ALPHA to exeute CLP, then ALPHA ALPHA, since CLP clears the current program if you don't supply a label).

For information on ROMs you could try ordering the MoHPC CD set, it has probably more manuals than you'd ever need

Axel

Re: Two questions on 41cx programming

*Message #4 Posted by **Thibaut.be** on 19 July 2003, 3:25 p.m.,*
in response to message #3 by Axel Poqué

You can also go to the other program with GTO.<ALPHA>PROGNAME<ALPHA>

The 13 digit capability of the 15c (From Palmer Hanson...former TI PPC editor)

*Message #1 Posted by **gene wright** on 18 July 2003, 11:37 p.m.*

Hi all. This is part of an email that palmer hanson sent me. He is famous for being the editor of the TI PPC Notes for many years and to us HP fans as part of the Fast Calendar Printer challenge from around 1980. He had the fastest TI calendar printer program, which Roger Hill amazed us all by beating it with a very fast big 41c program. Anyway, what are your thoughts about the material below?

Valentin, this would seem to be right up your alley. :-) Remember, guys...Palmer hasn't spent years programming HP's, so if his program overlooks something, be NICE. :-) --Gene

---------- I have mentioned earlier that I was trying to understand the 13 digit capability which appeared in a footnote in the HP-15C Advanced Functions Handbook. I think I understand some of it and I used it to write a quadratic program for the HP-41 which uses 13 digits in the calculation of the determinant. I have added the draft of my documentation to this e-mail. When I figure out how to make attachments I will send it by that format. What intrigues me is the existence of a truncated (not rounded) 13 digit capability in an HP product. Do you remember the old HP vs TI comparisons in which the HP folks insisted that ten rounded digits were superior to thirteen truncated digits? AN EXTENDED QUADRATIC SOLUTION FOR THE HP-41 USING THIRTEEN DIGIT CALCULATION OF THE DETERMINANT We start with an arithmetic exercise using the statistical functions of the HP-41:

```
Consider the numbers  x   = 1.000007
                          y   = 1.000004
                      x^2 = 1.000014000049
                      y^2 = 1.000008000016
                      xy  = 1.000011000028
```

where the squares and the product round to 1.000014, 1.000008 and 1.000011 respectively on the HP-41. Perform the following sequence from the keyboard:

```
     CLSUM                clears the statistical registers
     1.000014 ST- 12      negative of the rounded value of x^2 to R12
     1.000008 ST- 14      negative of the rounded value of y^2 to R14
     1.000011 ST- 15      negative of the rounded value of xy to R15
     1.000004 ENTER
     1.000007 SUM+        adds x^2 to R12, y^2 to R14, and xy to R15

     press RCL 12 and see 4.9E-11 in the display
     press RCL 14 and see 1.6E-11 in the display
     press RCL 15 and see 2.8E-11 in the display
```

where the contents of registers 12, 14 and 15 contain the values which were discarded during rounding of the squares and product. If you reverse the sequence and do the statistical entry first and then subtract the rounded squares and product from registers 12, 14 and 15 you will find that there are zeroes in those registers. Another arithmetic exercise using the statistical functions:

```
Consider the numbers  x   = 111,111
                      y   = 1,111,111,111
                      x^2 = 12,345,654,321
```

```
                      y^2 = 1,234,567,900,987,654,321

                      xy  = 123,456,666,654,321

where in the HP-41 the squares and the product round to

                      x^2 = 1.234565432E10  displayed as 1.2345654 10

                      y^2 = 1.234567901E18  displayed as 1.2345679 18

                      xy  = 1.234566667E14  displayed as 1.2345666 14
```

where to see the actual ten digit mantissas you multiply the displayed values by 1E-10, 1E-18 and 1E-14 respectively.

```
Perform the following sequence from the keyboard:

     CLSUM            clears the statistical registers
     1,111,111,111
     ENTER
     111,111
     SUM+            adds x^2 to R12, y^2 to R14, and xy to R15
```

where we expect the rounded values to appear in those registers, and for example for y^2, by performing the following sequence

```
     RCL 14     1.2345679 18 in the display
     1
     EEX
     18
     CHS        1       - 18 in the display
     X          1.234567901  in the display
```

Now, perform the following sequence which, according to the description of the statistical functions on pages 103-104 of the owner's handbook, should remove the entered values from the statistical registers. If so, the values recalled from R12, R14 and R15 should be zeroes. But,

```
    RCL 12 yields -1
    RCL 14 yields 13,000,000
    RCL 15 yields 45,700
 /[pre]
The result in R12 can be obtained by subtracting the exact eleven digit square of 111,111 from
the HP-41 square of 111,111 with a ten digit mantissa; that is,
 [pre]
          1.234565432E10 is   12,345,654,320
                            - 12,345,654,321
                            =              -1
```

The results in R14 and R15 can be obtained by subtracting values for y^2 and xy which use truncated (not rounded) thirteen digit mantissas from values which use rounded ten digit mantissas; that is,

```
for R14   1.234567901E18 is   1,234,567,901,000,000,000
                            - 1,234,567,900,987,000,000
                            =                13,000,000

for R15   1.234566667E14 is   123,456,666,700,000
                            - 123,456,666,654,300
                            =              45,700
```

I obtain the same results with my HP-11C. I believe these results are a part of what was described as "... a tricky property of the Sum+ and Sum- keys whereby certain calculations can be carried out to 13 significant digits before being rounded back to 10" in a footnote on page 208 of the HP-15C Advanced Functions Handbook. I do not get similar effects with older HP calculators such as the HP-33C, HP-67 and HP-80. Pages 205-211 of the HP-15C Advanced Functions Handbook proposes eight cases for evaluating the ability of a quadratic program to solve

difficult cases. It presents a single precision program for the HP-15C which can obtain correct results for only three of the cases. It also presents a program which carries twenty digits during the calculation of the discriminant. That program obtains correct results for all eight cases, but uses eleven data registers. It is also quite slow. An equivalent program on my HP-41C runs for as much as ten seconds to obtainn a solution. In 1991 I wrote a similar program for the TI-59 which computes using truncated thirteen digit mantissas as opposed to the rounded ten digit mantissas used with the HP-11, HP-15 and HP-41. My TI-59 program obtained correct results for seven of the eight cases. It failed for the seventh case where the discriminant is the single digit difference between two twenty digit numbers. That program and similar programs for the TI-74, TI-81 and Casio fx-7000G are described on pages 8-13 of the Volume 14 Number 3 issue of TI PPC Notes. The four cases which a TI-59 program solves correctly but a single precision HP-41C program solves incorrectly all involve discriminants which are calculated as the difference between two numbers of more than 10 significant digits but less than 14 significant digits. Using the insight into the "tricky properties" of the Sum+ and Sum- functions derived from the numerical exercises above I decided to write an HP-41 program which carries 13 significant dgits during the calculation of the discriminant. Such a program should yield correct solutions to seven of the eight cases, use fewer registers and use less run time.

The program follows the convention in the HP-15C Advanced Functions Handbook where the quadratic is defined as c - 2bx + ax^2 = 0 and the discriminant is calculated as d = b^2 - ac . That definition reduces the size of the two parts of the discriminant by a factor of four. The program calculates the terms of the discriminant in two parts. The 10 most significant digits of are calculated in the normal manner. The 3 least significant digits are calculated using the "tricky properties". The most significant parts are combined before the smaller corrections for the least significant parts are made. The program uses only the six data registers associated with the statistics functions. The 3 least significant digits of the term ac which are accumulated in R15 are preserved by setting y = 0 during the accumulation of the 3 least significant digits of b^2 in R14. The user solves by entering the constants of the quadratic with the sequence c ENTER b ENTER and running the program. For real roots the program stops with one root in the display. The second real root is displayed by pressing x<>y. If the solution is complex Flag 0 is set. The program stops with the real part in the display. The imaginary root is displayed by pressing x<>y where + and - signs for the imaginary part are implied. Thr run time is of the order of one second. The program listing follows.

```

```

This program will yield the correct answers to seven of the eight cases proposed in the HP-15C Advanced Functions Handbook. The exception is the seventh case from the text on page 211 where

```
c = 4,877,163,849, b = 4,877,262,613 and a = 4,877,361,379.  Then

   d = (4,877,262,613)^2 - 4,877,361,379 x 4,877,163,849

     = 23,787,690,596,167,587,769 - 23,787,690,596,167,587,771

     = -2
```

so that twenty significant digits must be carried to yield the correct answer for d. The following program is a conversion of the double precision program from pages 208-210 of the HP-15C Advanced Functions Handbook which will solve this case. The program runs for about ten seconds to obtain the solution. The roots are complex with the Re = 0.999979750 and Im = 2.8995463E-10. The HP-15C program requires 84 steps. My translation for the HP-41C requires 88 steps where the increase in steps is the lack of the combined commands such as RCL + which are used in the HP-15C program but are not available on the HP-41C.

Re: The 13 digit capability of the 15c (From Palmer Hanson...former TI PPC editor)

*Message #2 Posted by **hugh steers** on 19 July 2003, 3:44 p.m.,*
in response to message #1 by gene wright

interesting indeed.

this is a good example of something superficially trivial but actually complicated to do properly. of course anyone can bang out the textbook quadratic formula. but there are times like these examples when it just doesnt work.

i too have been through the material int the 15c advanced function handbook. i am wondering what is the most stable implementation of this problem (and more generally, polynomial roots). i dont really like the "trick" of using the stats to access extra precision as a general method, although theres no harm in making use of it on the

15c where its available.

here are some ideas ive tried...

(1) use the textbook formula and let d=b^2-4ac go a bit wrong, but then polish the roots using a single newton iteration with no loop. to fix d~0 multiple root problems, i add a small "hack" factor to the roots (eg multiply resp (1+1e-7) and (1-1e-7)) before the newton iteration and this works well to recover information lost in `d'. if you perform the newton iteration in complex mode and add a complex perturbation instead, you can also recover errors in the sign of d. ie whether you've got complex roots or real ones. what happens is the complex roots become real if d < 0 and shouldnt have been.

BUT, case7 fails in the above. this is because the newton iteration winds up repeating a b^2-4ac style calculation that leads to bits being lost. basically case7 has numbers too large to handle.

(2) compute the roots as eigenvalues of a hessenberg matrix. ive tried this too. ive also wondered if theres a suave way of using the matrix functions of the 15c to make this work with very little programming. anyway, you balance the matrix and this helps bad coefficients a lot. all the cases work except case7 again! where the algorithm doesnt notice the complex part and thinks you have two (slightly different) real roots.

this method is much more complex, but surprisingly stable. the other win is, memory permitting, you have a program for arbitrary roots of real-coefficient polynomials.

Very interesting post; thanks, Gene!

in response to message #1 by gene wright

Hello, Gene;

I printed it and read, did not try any of the examples neither the programs, but it's not exactly necessary to do it, because the text is quite clear and the subject is very well explained.

Thank you again for sharing with us all.

Best regards.

Luiz (Brazil)

No, thank Palmer!

in response to message #3 by Vieira, Luiz C. (Brazil)

It is a real shame TI quit making higher end programmables when they did. The TI group had a lot to offer and the friendly competition helped both sides learn how to program better.

If only TI had introduced the TI-59 follow-up machine (The TI-88) instead of shelving it.

we need more HP-34C posts

*Message #1 Posted by **Norm** on 18 July 2003, 10:01 p.m.*

we need more HP-34C posts ..... otherwise I run out of things to talk about

:o|

I'm sure there are other subjects as well (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 July 2003, 11:22 p.m.,*
in response to message #1 by Norm

Hey Norm, Mr. Analog guy...

What's that you're talking about?

You talk about LED's, analog stuff, Electronics in general... All of these subjects (and a lot more) fit here, too.

Wanna talk about HP34C programming and usage as well? RPN techniques? All of these subjects apply to other HP calcs, as well. The HP11C has many resources available in the HP34C; the HP15C offers solve and integrate as well. Programming the HP34C is not much different of programming the HP67/97 and both HP11C/15C.

And what about batteries? Woodstocks, Classics, Topcats and Spices use, as standards, rechargeable batteries. Not only the HP34C.

Power sources and power supplies also need analog knowledge. I thought I would read something from you when the subject was standard voltage references for calibrating the 3421A.

See? I'm a nosy guy, as you have already stated... Sometimes I talk too much, I know that. But if I do not ask, how will I know what's the answer?

I've been dealing with some routines for small electrical computations. Some of them fit in the HP34C. Have you tried something like this?

Sometimes I fell as looking for some thread to post messages, but I feel that I'd not add too much after all that's been posted. And sometimes I also wrote more than I should and it may bother some people. But I feel as if I'll always find place if I keep reading.

I think I wrote too much again...

What do you use your HP34C for? Now I'm curious: do you program as well or prefer using it as a daily support?

Best regards. In time: where in the h..k is Captain Zener?

Luiz (Brazil)

P.S. - you were mentioned here... See what I mean?

Edited: 18 July 2003, 11:28 p.m.

Like HP 45 (long)

*Message #3 Posted by **bill platt** on 18 July 2003, 11:42 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

You don't write too much--you are always a good read!

So, for old calculators, I reported here that I inherited an old HP 45 with a corroded battery pack. So just tonight, I cleaned out the compartment (I like these classic compartments MUCH better than that absurd gold-plated mylar disaster-waiting-to-happen foisted on the 41). And then I ran down some alkalines until they read 1.25 volts on my father's old US Army Signal Corps Volt-Ohmmeter (Simpson Model 324)-- It is much more fun testing vintage equipment with other even older vintage equipment--and I temporarily wired her up...

So, in short, she WORKS! WhooHoo!!

At first, she was sensitive to pressure on the on-off slider and would only function right if I put light pressure there. But then she apparently warmed up, and worked just fine.

One curiosity, though, is that after running continuously for 10 minutes, the alkaline cells became quite warm. I guess the 0.50 Amps rating stamped on the back is for real! I hope this is not a sign of trouble....

So, next is a more time consuming part---building a new battery pack---but I see some more resources here on that.

Oh, and this calculator got daily use for an engineer's entire career--she shows the wear and tear of a consciensious owner--but all the buttons still work just fine (much better than my recently acquired beat-up 15c) although some of them are a bit softer than others. I think it is really a wonderful thing that this product, made in the 70's--the time of Viet Nam, Israel-Arab Conflict, OPEC Oil Embargo, Stagflation, Disco, Double-knit Polyester, Toxic Waste, LSD and the Clean Water Act, has lasted so long after so much use! (Like, you expect old Victorian Iron to age gracefully, but 70's plastic--what a wonderful surprise!).

Here's the heretical statement--she reminds me of my father's old TI from the 70's---the shape of the keys, layout, the whole RED LED Brick thing---except just more SOLID and SERIOUS (so i guess not so heretical of me after all...)

OH, and serial number:

1349A 20320

regards,

Bill Platt

You left out "Brady Bunch".

It was the time of "Brady Bunch".

I just watched the "Brady Bunch movies" a movie plus sequel from the 1980's, very sarcastic and cynical. Even the movies made for a good look backwards in the rear view mirror..... according to the movie plot, the Brady's were still wearing their polka dots and flowers and bright polyesters even in the 1980's, except by then all the punk rockers in black leather are giving them the bird.....

It all fits together ... The olden days were better !!

And the Partridge Family;-) (no text)

*Message #6 Posted by **tony** on 19 July 2003, 12:50 a.m.,*
in response to message #1 by Norm

Norm, I don't have a 34C, but I have a 38C. I leave my cell phone sitting next to it. When a txt message comes in it drives the 38C crazy!! It seems to write and run a 38C program!! Honest. Great error sequences.

Old HP calculators are radio stations

*Message #7 Posted by **Norm** on 19 July 2003, 2:38 a.m.,*
in response to message #6 by tony

Everybody knows that old HP calculators are radio stations.

You set up teh calculator to run a program, and then you set it next to an AM band radio. It's very interesting.

We were doing that even back when those units were brand new.

If it goes wacko with a cellphone next to it, that's just showing the reverse susceptibility, something that we did not try to observe in the olden days.

I would suggest not doing that..... keep the calculator away from the cellphone so not causing the unit to malfunction..... while unlikely, it could cause some sort of permanent silicon damage ("2 disease").

I kind of like the old calculators behaving like radio stations..... "FCC Part 15 sucks!"

Re: Old HP calculators are radio stations

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 19 July 2003, 1:21 p.m.,*
in response to message #7 by Norm

Hi, Norm:

Switching the "large" currents of a LED multiplexed display is a good manner to make a lot of electric noise... As you are an analog guru, yu may even be able to calculate the power of such noise. While I consider myself a digital EE, from your same timeframe, I also did a little of analog work certainly of little value (using LM340, CA3140, SN723, etc...)

As the LED current varies with display settings, a PAUSE with a 1 in the x-register and with FIX 0 "sounds" different than a 0 on FIX 9. As students, we used this rather crude technique to signal program status while working on other things. I described this trick in my article "Calculator Memories from Argentina", posted in the Memories Forum. Indeed, the HP41 BEEP was a welcome improvement for such purposes!

While I respect your HP34 fondness (I used a friend's -34 for a while around 1980), my favories are HP25, 41 and 42.

Regards,

Andrés

PS: And also thanks a lot for CZ duty protecting all those Woodstocks and Spices out there!!

*Message #9 Posted by **Ernie Malaga** on 19 July 2003, 3:11 p.m.,*
in response to message #7 by Norm

Norm:

The static produced by the classic calculators is nothing compared to that produced by early TI calculators such as the SR-51A. I remember testing this on an AM radio, and the TI produced much more static.

-Ernie

Re: Old HP calculators are radio stations

*Message #10 Posted by **Axel Poqué** on 19 July 2003, 3:42 p.m.,*
in response to message #9 by Ernie Malaga

I just tried a few of my calculators:

My HP-41CX (built 1988) is clearly audible, you can hear keypresses and programs, and you can also hear it count down to sleep mode (a slowly rising high-pitched noise, which ends when the calc shuts off). Attaching a printer (and using it) changes the noise quality as well.

The HP-48GX (1994) is also clearly audible, although is not as loud as the 41. Individual key presses sound a bit like a cash register or a printing desktop calculator.

I also tried a 1976 TI-30 - the loudest part is the LED display, you can tell the number of digits displayed from the noise level, but calculations (trig functions) have their charcteristic noise, too.

A ~1990 Casio fx5000p has also a clearly audible display driver, the 8-segment part of the display

produces an almost clear tone, while the dot-matrix part is rather noisy.

...oh the fun of playing around with calculators :-)

Axel

I tried to send you an e-mail, Ernie.

Semi-blanknut 41CX

*Message #1 Posted by **David Smith** on 18 July 2003, 3:59 p.m.*

I recently came across a rather strange HP beastie. It is an HP41CX blanknut, but the upper rows of keycaps have the shot molded legends. These keycaps on a standard blanknut do not have shot molded legends.

The keyboard background is a standard blanknut unlabeled black. The front label is gold and just says "Hewlett Packard" without any "41CX".

This unit came with an HP-IL interface to a custom data acquisition box.

Re: Semi-blanknut 41CX

*Message #2 Posted by **Gordon Dyer** on 18 July 2003, 6:58 p.m.,*
in response to message #1 by David Smith

Sounds like a special made for a company.
Can you post photos?
Thanks.

Faked blanknuts

*Message #3 Posted by **Mike** on 18 July 2003, 7:03 p.m.,*
in response to message #1 by David Smith

I once saw a 41 that was purported to be a blanknut. However, under close inspection, it looked like the key legends had been buffed off.

The blank keyboard background had the tabs (that fit in slots) that you see on a normal blank overlay.

So, it looked like someone just faked a blanknut. Pulled the old legend off and applied a blank template (forgot to remove the tabs and buffed off the key legends.

Is there any way to tell a blanknut other than the blank background and missing labels on the keys?

Re: Faked blanknuts

*Message #4 Posted by **David Smith** on 19 July 2003, 2:42 p.m.,*
in response to message #3 by Mike

This one is definitely the real thing. Proper blanknut background and the front label is correct for a blanknut. No signs of buffing, etc. Also it came from a very reliable source (a university junk pile... for free). I won't have any way to do digital photos for a while.

I suspect that it was either a custom-custom ordered unit or HP accidentally picked up a normal keyboard and applied the blanknut labels to it when sombody ordered Option 001.

I have a couple of HP25C units that had similar manufacturing errors. One has a 25C front label without the "Continuous Memory" script on the keyboard. Another has the "Continuous Memory" script but a normal HP25 front label. Both came from sources (and at prices) that had no motive to mess with faking.

HP 25 -> HP25C

*Message #1 Posted by **Victor Koechli** on 18 July 2003, 7:54 a.m.*

Hi all, I'm wondering if it is possible to turn an 'ordinary' HP 25 into an HP 25C. Can it be done? Thanks, Vic

Re: HP 25 -> HP25C

*Message #2 Posted by **David Smith** on 18 July 2003, 3:46 p.m.,*
in response to message #1 by Victor Koechli

The easiest thing to do is drop a 25C circuit board into a 25 case/keyboard. Otherwise you would have to mount the 25C RAM chip onto the HP25 circuit board and modify the power supply, etc.

Re: HP 25 -> HP25C

*Message #3 Posted by **hugh** on 18 July 2003, 7:26 p.m.,*
in response to message #2 by David Smith

ha! on the ti-57 you could do this in software :-)

[OT] Babelfish automated translations :-)

*Message #1 Posted by **Valentin Albillo** on 18 July 2003, 6:02 a.m.*

Re the subject of automated translations recently seen on this site, when I have to use them in order to translate some text to a language I know next to nothing about, the best strategy I've found to diminish the danger of sending out utter nonsense is to translate *back* to English the resulting foreign translation. If the translation back to English is still sort of understandable, then there's a good chance that the foreign text is also more or less correct.

On the other hand, if the translated-back text has nothing to do with the original, you can bet that the foreign text is garbage too, and it will do you no good to actually send it that way. In that case, try to reformulate your original English text using simpler constructions and words, till the translated-back text comes out ok.

Want some funny examples ? Look at these results I've just got using Babelfish (Altavista's Babelfish Translations). Sending out the translated Spanish text without back-translating verification would make you sound like a Martian, and a pretty dumb one at that ... (as all Spanish-speking visitors will see, the translated spanish text is already utterly absurd, but translating it back to English is just kinda surrealist ! :-)

- Original English: **The spirit is willing but the flesh is weak**

  Correct Spanish translation: El espiritu es fuerte pero la carne es debil

  Babelfish's translation to Spanish: El alcohol está dispuesto pero la carne es débil

  Babelfish's translation back to English: ***The alcohol is arranged but the meat is weak***

- Original English: **A nod's as good as a wink to a blind horse**

  Correct Spanish translation: A un caballo ciego, le da lo mismo que le digas que si con la cabeza o que le guiñes un ojo

  Babelfish's translation to Spanish: Un cabeceo tan bueno como guiña a un caballo oculto

  Babelfish's translation back to English: ***A as good pitching as yaws to an hidden horse***

- Original English: **All work and no play makes Jack a dull boy**

  Correct Spanish translation: Todo trabajo y nada jugar hacen de Jack un chico aburrido

  Babelfish's translation to Spanish: Todo el trabajo y ningunas marcas Gato del juego un muchacho embotado

  Babelfish's translation back to English: ***All the work and no marks Cat of the game a dull boy***

- Original English: **Do unto others as you would have them do unto you**

  Correct Spanish translation: Haz con otros lo que quisieras que hicieran contigo

  Babelfish's translation to Spanish: Haga a otros pues usted hizo que hicieran a usted

Babelfish's translation back to English: ***Do to other because you caused that they did you***

- Original English: **I'm considering parting with a mint 41 for a nib 15c, display ok, no mushy keys, will throw in a couple of blank mag card pacs for good measure**

  Correct Spanish translation: Estoy considerando deshacerme de una 41C en perfecto estado por una 15C nueva en su caja, pantalla perfecta, sin teclas duras de accionar, de regalo incluire un par de paquetes de tarjetas magneticas virgenes

  Babelfish's translation to Spanish: Estoy considerando el dividirme con una menta 41 para una semilla 15c, autorización de la exhibición, ningunas llaves pesadas, lanzaré en un par de los pacs en blanco de la tarjeta del mag para la buena medida

  Babelfish's translation back to English: ***I am considering dividing to me with a mint 41 for a seed 15c, authorization of the exhibition, no heavy keys, will send in a pair of pacs in target of the card of mag for the good measurement***

  This last, typical example, is even *worse* in the Babelfish Spanish translation than it looks, because the Spanish translation for "mint", which is "menta" has nothing to do with *quality* or *pristine*, it's just an aromatic *plant*. This means "menta 41" is utter *nonsense*, seems like a brand name for some kind of aromatic liquor or something.

  Similarly, "llaves" (translation of "keys") are those things you use to *open doors* and such, and have nothing to do with the keys you use in a keyboard, that would be "teclas" in Spanish. So "llaves pesadas" (literally "heavy door keys") makes you think of those big room keys you're provided with in some hotels to prevent you from carrying them out in your pocket and losing them. Pretty *far* from the original meaning of "mushy keys", uh ? :-)

Best regards from V.

12c Platinum Perpetuity challenge

*Message #1 Posted by **tony** on 18 July 2003, 4:17 a.m.*

If you have an unemployed 12cP, see if it will solve for i for this transaction:

f CLEAR FIN

360 n

100 PV

10 CHS PMT

i

My 12cP has taken 3.25 hours on this so far. I was wondering if all 12CP behave the same way. The answer is 10. This is a really elementary transaction, but even the gold 12C makes rather a meal of it, taking 25 seconds (normally it finishes within 12 or so seconds). I have heard that the 12CP is "sold out" in Hong Kong, and wonder if this is happening elsewhere. maybe a new ROM is in the works? If so, then this n=360 example will be a good test of it.

Re: 12c Platinum Perpetuity challenge

*Message #2 Posted by **Pierre Brial** on 18 July 2003, 7:47 a.m.,*
in response to message #1 by tony

My 12C made in Malaysia in 1999 take 24.28" to perform the test. I'm surprised of the bad result of the 12cp. May be it isn't as smart as the nice pictures of it on hp website let believe ? Or may be the 1970-80 calculator advanced technology is definitely lost now ?

All the Best

Pierre

Re: 12c Platinum Perpetuity challenge

*Message #3 Posted by **tony** on 18 July 2003, 1:06 p.m.,*
in response to message #2 by Pierre Brial

Yes, the gold 12C is rock-solid. My 12CP is still "running" after 12 hours now. Very good battery life!<G>

The funny thing is I am sure this test did work before, but maybe I just finished it with ON ON <G>

I don't think I've seen any TVM implementation by HP or otherwise (Sharp, TI) where an elementary case like this never converges.

Yes, apparently the 12C source code was "lost" by HP, which is quite bizarre in itself! The old knowledge is not lost, it is just a little more tricky to implement than at first glance. Compound interest has an almost trivial appearance, as (1+x)^n, where x is typically a "small" number, *seems* so simple. I guess the 12CP i-solving is just an example of what can happen if a company simply "outsources" software development to the cheapest provider, assuming that "anybody can do this trivial stuff"? All we need is another development cycle, probably.

The 12CP just needs a new ROM.

n=360,PV=10,PMT=-1 will be a good check of it :)

Re: 12c Platinum Perpetuity challenge

*Message #4 Posted by **Pierre Brial** on 18 July 2003, 3:59 p.m.,*
in response to message #1 by tony

I just try the test with another old "grognard", a TI-59 bought in 1979. There is a TVM program in the standard module. It takes 1' 42" to solve the problem. Less good than the 12C, but far best than the 12cp ! Someone have an hp-80 (the first financial calc !) to try Tony's test ?

All the best

Pierre

Re: 12c Platinum Perpetuity challenge

*Message #5 Posted by **Doug Burkett** on 18 July 2003, 10:44 p.m.,*
in response to message #4 by Pierre Brial

<<I just try the test with another old "grognard", a TI-59 bought in 1979.>>

The TI Voyage 200 Finance flash app finds the result in less than one second.

I had planned to get a 12cp for my wife so I could permanently add her 28C to my collection. Guess I'll wait.

P.S. 'gorgnard' - I love that word ...

Hi Tony,

Where is Norm when we need him? OK, I'll fill in for him....."there is only one way to improve the platinum--put it on the railroad tracks and come back after the midnight freight train has rolled through."

Judging from the number of bugs I have heard about here and at comp.sys.hp48, it seems that this product should be cancelled--or re-designed.

Did you here about the programming bug? Apparently it cannot handle a GTO if it is placed past line 252 (or is it 253)?

And there are others.....

Regards,

Bill

Tony:

Your post reminded me of a similar case with IBM System/36. In this minicomputer, you could perform calculations

in its Operation Control Language (OCL) like this:

// EVALUATE P1=1000000000/1

...which would divide 1E9 by 1. Simple? You bet. The problem was in IBM's implementation -- repeated subtraction. So the poor machine had to repeat 1E9 subtractions. That IBM could implement such brain-dead algorithm I still find unbelievable.

I never ran this test, but similar ones (with less zeroes).

*Message #9 Posted by **Les Bell [Sydney]** on 18 July 2003, 8:42 p.m.,*
in response to message #1 by tony

My 41CX with Financial Pac took 28 seconds.

Seems to me that the 12CP is a fitting symbol for the New HP.

Best,

--- Les [http://www.lesbell.com.au]

Re: 12c Platinum Perpetuity challenge

*Message #10 Posted by **tony** on 18 July 2003, 9:10 p.m.,*
in response to message #9 by Les Bell [Sydney]

yep, the financial pac is pretty stable. I just tried my 41cx with the PPC ROM "FI" and it gives the 10 almost instantly (~1 second I guess) The "FI" article in PPC ROM User's manual pp148-164 is an absolute classic. Got me interested in TVM when i saw it back in 1982. Graeme Dennes and Don Dewey did a great job.

To be fair on the new HP I'm sure quite a lot of effort went into the 12CP. Maybe just one final iteration of the ROM is required. Maybe two :-)

Re: 12c Platinum Perpetuity challenge

*Message #11 Posted by **Thomas Cox** on 18 July 2003, 9:04 p.m.,*
in response to message #1 by tony

Try the same problem on HP 48GX with built-in TVM solver, get correct answer in about 2 seconds. Same approximate time on TI Advanced Business Analyst.

How can one rate a calculator as satisfactory unless it can correctly solve routine problems in a reasonable amount of time?

Re: 12c Platinum Perpetuity challenge

*Message #12 Posted by **tony** on 18 July 2003, 9:29 p.m.,*

in response to message #11 by Thomas Cox

yep, after the 12C all HP TVM run on the faster Saturn chip, which probably disguises algorithmic deficiencies. Seems like the 12CP managed to escape from beta-testing too soon!

Maybe it should be code-named "Houdini" :)

Or maybe HP have a cunning plan to issue another ROM anyway, after a public beta-testing phase.

In a way it lives up to it's name, "Platinum" if one remembers the broad nosed "platypus", or the "platykurtic" distribution, and interprets "broad" as meaning "long time". Yes, indeed, maybe it will produce an answer to this perpetuity, a new category of "answer" ... not a real number or an imaginary number but .. a platy-number<G>

Accuracy × Internal # of digits

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 18 July 2003, 11:44 p.m.,*
in response to message #1 by tony

Hi, folks;

I could not help myself not adding an spiced comment: could we consider the following situation as feasible?

If, only if, original HP12C code was kept and a virtual HP12C runs to emulate it (most likely it's not what happens here), what's the chance that the interactive [i] computing that used to deal with 12-digit mantissa numbers now runs with a 16-digit base? What sort of approach we would find as for "A=B?" when iteractive calculus goes from (+) to (-) around the "zero" a lot of times more frequently? If the iteractive procedure converges with 12-digit mantissa numbers in a couple of seconds, what would it happen if the same process now handles a 16-digit mantissa base number? I'm not sure if I read this informatin here, but the HP12cP processor handles 16-bit mantissa numbers. If original HP12C code runs in an emulator that handles 16-bit mantissa numbers, I understand that at least relational operators will be simulated in the 16-digit "machine", and they will return "true" or "false" based on that. I wonder about what sort of beast we are dealing with...

Well, this is just a guess.

Luiz (Brazil)

Re: Accuracy × Internal # of digits

*Message #14 Posted by **tony** on 19 July 2003, 12:44 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

I don't know the answer. Visually the 12cp has a 10 digit mantissa. Arithmetically the 12cp processor seems to be fine. My impression is that the i-solving exit criterion is somehow "too tight". Only slightly so - it is hard to find cases that seemingly never converge. Also the i-solving algorithm itself is apparently inefficient - my guess is there is a simple coding mistake as it is quite easy to slow it down this way. In a way it is a remarkable under-achievement - who would have thought HP could have invented the worst i-solver ever seen in any financial calculator ever manufactured? That is what seems to have happened. I have never seen anything like it, made by HP, Sharp or TI. Makes it VERY collectable! I am sure the traditional HP quality will show in the next version :)

Worst case of wishful thinking

*Message #15 Posted by **Valentin Albillo** on 19 July 2003, 1:12 a.m.,*
in response to message #14 by tony

Tony posted:

"In a way it is a remarkable under-achievement - who would have thought HP could have invented the worst i-solver ever seen in any financial calculator ever manufactured?"

Noone, because as you fully well know, though you pretend not to, HP "invented" nothing. This "worst i-solver" was "invented" by Kinpo, which is the real manufacturer of the piece of crap called HP-12C Platinum. HP had nothing to do with this, except commission Kinpo to manufacture said crap and pay the bill.

"Makes it VERY collectable!"

Only if you happen to collect crap and garbage. Would you also call the HP6S, etc, "very collectable" ? I'm glad I'm no such kind of collector.

"I am sure the traditional HP quality will show in the next version :)"

Worst case of wishful thinking I've ever seen, unless you're saying it tongue-in-cheek. How on Earth can "traditional HP quality" show on any calculator NOT manufactured by HP ? If your, say, excellent cook aunt Gussie were to commission her excellent cookies to some cheap-as-hell Taiwanese cook, would they still be aunt Gussie's "traditional quality cookies" ? Come on !

HP will *never* again put on the market anything but Kinpo crap, real garbage if I ever saw one, at luxury prices. I know of several business people very fond of the original HP-12C that wouldn't touch an HP-12CP with a ten-feet pole.

If HP collecting means having to acquire, pay for, and pretend that one likes, such filthy products, I'm extremely happy having turned to collecting vintage Sharp machines instead. That's quality, man.

Best regards from V.

Bill

Re: Sharp

*Message #19 Posted by **Valentin Albillo** on 21 July 2003, 4:24 a.m.,*
in response to message #18 by bill platt

Thanks for bringing it to my attention, but I only collect machines I intend to use and write programs for, and those are always high-end models, which in the case of the Sharp machines means programmable in BASIC, from the Sharp PC-1211 upwards.

The only exception is a wonderful Sharp EL-5101, which can accept an 80-step algebraic formula but it's not fully programmable. Not that it matters at all, as both this model and the rest of its family (EL-5100, 5100S, etc) are arguably the most beautiful calculators ever released.

Best regards from V.

Call off your dogs, guys!

*Message #20 Posted by **Karl Schneider** on 19 July 2003, 1:53 a.m.,*
in response to message #1 by tony

Y'all --

Despite the modest numbers involved, this problem is anything but numerically "routine"! Furthermore, the ratio of interest paid to principal is 36:1 (10x360 / 100)-- not very realistic.

Tony's challenge:

> Quote:
>
> If you have an unemployed 12cP, see if it will solve for i for this transaction:
>
> ```
> f CLEAR FIN
> 360 n
> 100 PV
> 10 CHS PMT
> i
> ```

Filling in some "blanks" in the problem:

```
FV = 0
1 pmt/yr (if not using 12C/P)
END mode for payments
```

I, like others, got quick answers of 10% interest, using the 17Bii, 48G, and 49G (my 12C is at my workplace). However, just by doing the cash flow, you will see that exactly 10% is NOT a valid solution. The actual solution is just under 10%, by some amount not representable by the number of working digits in the calculators.

-- At 0% interest, only 10 payments are required, so 360 payments causes an overpayment of, e.g. $3500.

-- At 9% interest, amortization still results in overpayment, after which the interest (now being paid to the borrower) explodes into a FV of $3.3 x 10^14!

-- At 10% interest, $10 accrues on the $100 principal, matching the $10 payment for the period. At this rate, the principal will NEVER get paid. (Regrettably, some people get into credit-card traps like this.)

On the 17Bii, 9.99999999999% is as close as one can enter to 10%, resulting in an FV of 79,500 -- not very close.

If N = 285 payments, however, the 17Bii gives i = 9.99999999998%, which gives an exact solution.

So, in short, the "classic" units quickly give a very close, but incorrect answer to Tony's problem, while the 12CP gets lost trying to arrive at the unreachable correct answer. The former approach is certainly more "graceful" and therefore preferable, but we shouldn't call the 12CP incompetent solely on the basis of this problem.

-- Karl

in response to message #20 by Karl Schneider

Almost any tvm problem represented on a finite digit mantissa/exponent machine has the characteristics you mention - more than one solution for one of the parameters, either just in units in last place, or in the large. That's the nature of compound interest and the software has to handle it. The example i gave is just the tip of the iceberg.

12CP TVM algorithm and Tony's example

*Message #22 Posted by **Karl Schneider** on 20 July 2003, 3:26 a.m.,*
in response to message #21 by tony

Tony stated,

> Quote:

> Almost any tvm problem represented on a finite digit mantissa/exponent machine has the characteristics you mention - more than one solution for one of the parameters, either just in units in last place, or in the large. That's the nature of compound interest and the software has to handle it. The example i gave is just the tip of the iceberg.

I agree with your sentiments, and believe that some sophistication was lost in the 12CP's TVM algorithm. The original HP models handled these "impossible-to-solve-accurately" cases gracefully by provided the closest possible answer, then stopping. The 12CP, by contrast, probably toggles *ad infinitum* between two or more nearby results that aren't good solutions.

However, the example you provided is not quite "elementary" (as you suggested), or "routine", as Thomas Cox suggested. In fact, the quick answers other calculators provide are *not correct* within reasonable accuracy. The *calculated* future value in your example is extremely sensitive to small changes in the interest rate, making the interest value literally impossible for the machines to find, using their built-in financial equations with the number of significant digits available.

The "closest possible answer" of interest rate provided by the 12C and other originals in this example and in similar ones, is the one at which accrued interest balances the payment:

```
i = -PMT * 100 / PV
```

Using this solution for "i", FV = -PV can correctly be calculated for the 17Bii (although FV = 0 was originally requested); the 12C will incorrectly calculate FV = 0.

Using the calculated value of "i" and FV = 0, neither the 12C nor the 17Bii will be able to calculate N, and

they will tell you with an error message. Does the 12CP? -- probably not.

Can you provide a specific example in which the 12CP cannot calculate a correct answer that it ought to be able to, or takes way too long to do so? I would suggest trying a more-conventional TVM problem, with total payments not greater than 5x the principal.

Regards from Karl S.

Re: 12CP TVM algorithm and Tony's example

*Message #23 Posted by **tony** on 20 July 2003, 4:02 a.m.,*
in response to message #22 by Karl Schneider

Ok here is one with PMT=0 where the 12CP gives the wrong answer for i.

n=E7 i=E-14 PV=1 PMT=0 solve for FV=-1.000000001

resolve for i. the 12CP instantly gives zero exactly. the 12C gold gives 9.999999995E-15

So, the 12CP thinks that n*PMT+PV+FV=0, which is incorrect. Here we see the opposite extreme to the 12CP providing no answer in a finite period of time - a wrong answer instantly.

Instead of the perpetuity, which was an example of a loan, let us make this one a savings case with PMT=1, and set "END". Solve for FV=-10,000,001.01 (requires i=E-14)

Resolving for i on the 12CP takes 0ver 10 minutes and gives E-13. resolve for FV again and you get "5" instead of "1' in the last place.

By contrast the gold 12C gives 1.999999799E-14 in 4 seconds. This is an excellent answer as *all* i =>E-14 and under 3E-14 give the FV, and 2E-14 is in the middle of this range.

The 12CP takes over 10 minutes to give a really silly answer.

Re: 12CP TVM algorithm and Tony's example

*Message #24 Posted by **Victor Koechli** on 20 July 2003, 5:39 p.m.,*
in response to message #23 by tony

Here are the results from my 48GX Rev. R (1995):

- 0 for i instantly for the first example
- -10'000'001.005 for FV, then 9.9999989975E-15 for i (again instantly) for the second example. So i, in this case, is just below the lower limit of acceptable values.

I guess this, again, is a limited precision issue.

I'm no expert, but is there a way to set up calculations like these differently, so we could get better answers?

Regards, Victor

Re: 12CP TVM algorithm and Tony's example

*Message #25 Posted by **tony** on 20 July 2003, 4:20 a.m.,*
in response to message #22 by Karl Schneider

sorry I am not too used to using this message board. what I wrote was not just "sentiments". No compound interest problem is really more elementary that any other, but that one is pretty simple, as they go. I really don't know what you mean by realistic - everybody's use is different. TVM is just a calculating engine. If

you can input a problem it is nice to be able to resolve for a variable. That's all. It's not a question of "sophistication" is it? It's just a bit strange to get no answer or a wrong answer, particularly where the 12C gold was/is just fine.

You asked for me to provide examples where the 12CP is slow at solving for i. Is that necessary? Just about anything where PMT#0.

BTW I just posed the original case to see if anyone else with a 12CP could try it - Im hoping for a new ROM to appear. It just seemed a good test example. It had FV=0. Well it could have been almost anything I guess, as it gets discounted heavily. Why do you call it unrealistic?

Re: 12CP TVM algorithm and Tony's example

*Message #26 Posted by **tony** on 20 July 2003, 6:02 a.m.,*
in response to message #22 by Karl Schneider

Hi Keith - me again. You really raised a whole lot of issues. Forget about the FV thing. The PV is not at all sensitive to i. You mention N - of course yes that OFTEN is completely inteterminate. None of this is anything special. It's all just standard compound interest, which TVM is designed to handle. It's a question of functionality only, over the full range of problems. if you can input an i and solve for anything else then you should be able to re-solve for i - if not there has to be a well-defined reason. In the perpetuity case there is no good reason for the 12CP failure to resolve for i.

If you think the 12CP is toggling between two values and just cannot decide which one to choose, which values might these be?

You said i suggested that the perpetuity thing was elementary, and someone else suggested the same, but you think it is complex. Ok here is a challenge for you. Give us an example that you think is elementary and I'll see if i can convince you it is really incredibly complex. All the problems are really much of a muchness in this respect.

The reason i said to forget about the FV thing above is that I know that when the 12c solves for i in that case it does NOT use the FV as a focus - it uses the PV. Looking at that one again i would call it not just elemntary, but elementary in the extreme. It is a classic case where the answer is blindingly obvious. It is really sad that the 12CP fails miserably. Oh, dear, I'm starting to agree with Valentin!!!!

Thanks for your post! keith i hope you don't work for HP or Kinpo!!<G>

I wish this discussion board had an e-mail list option.

A response to Tony's spewings [LONG]

*Message #27 Posted by **Karl Schneider** on 20 July 2003, 6:06 p.m.,*
in response to message #26 by tony

Tony,

In your last three posts, I can see that you have a certain amount of knowledge about using a TVM program, but I didn't see very much clear analytical thought or coherent writing. Some of your statements even suggest a lack of maturity.

For the record, the name is "Karl", not "Keith" or "keith". No, I don't work for HP or Kinpo, but I have extensive experience with software that is based on iterative solution processes (power flow on an electric network), and passed a course in economic analysis that included TVM and cash-flow analysis.

I would suggest that you deepen your own understanding of the mathematics of TVM, by studying the 12C manual, working through cash flows step-by-step, and perhaps even reading a textbook such as "Engineering Economic Analysis".

I don't have a 12CP, and doubt that I would buy one. It looks like an inept "upgrade", with unrefined algorithms, as well as design changes and functionality enhancements that are ill-conceived.

Here are my responses to just a few the statements in your last three posts:

> Quote:
>
> Ok here is one with PMT=0 where the 12CP gives the wrong answer for i. n=E7 i=E-14 PV=1 PMT=0 solve for FV=-1.000000001 resolve for i.

Good grief! I asked for a "realistic" application of TVM, and you provide an example with 1 million payments at an interest rate of 0.00000000000001%! That doesn't look anything like an auto loan or mortgage in the real world. Granted, it's interesting to "test the robustness" of the software, but we should be determining how well the 12CP works as an everyday tool.

> Quote:
>
> the 12CP instantly gives zero exactly. the 12C gold gives 9.999999995E-15 So, the 12CP thinks that n*PMT+PV+FV=0, which is incorrect. Here we see the opposite extreme to the 12CP providing no answer in a finite period of time - a wrong answer instantly.

The 17Bii also gives i = 0.00, but this may just represent a choice not to display decimal digits of "I%YR" beyond its limits of precision. BTW, n*PMT+PV+FV=0 is correct if i = 0.

> Quote:
>
> Instead of the perpetuity, which was an example of a loan, let us make this one a savings case with PMT=1, and set "END". Solve for FV=-10,000,001.01 (requires i=E-14)

No, no, no. "END" refers to payments at the end of the period, as is done for loans (e.g., purchase of auto and homes). "BEGIN" refers to payments made at the beginning of the period, as is done for leases (e.g., autos and apartments). It's in the manuals.

> Quote:
>
> sorry I am not too used to using this message board. what I wrote was not just "sentiments". No compound interest problem is really more elementary that any other, but that one is pretty simple, as they go. I really don't know what you mean by realistic - everybody's use is different. TVM is just a calculating engine. If you can input a problem it is nice to be able to resolve for a variable. That's all. It's not a question of "sophistication" is it? It's just a bit strange to get no answer or a wrong answer, particularly where the 12C gold was/is just fine.

I can't find a coherent point in that army of words, but I see what you're trying to say. Your original example was one in which *none* of the calculators is able to compute the exact answer that solves the equation to a close tolerance, because it requires more significant digits than they have. Your original example had N*PMT = 36*PV. That amounts to interest charges 35 times as high as the amount borrowed! Would you buy a house for $200,000, then pay $7 million in interest? Your example was computationally "stiff" (hard to solve) because of this, and it was realistic only to a loan shark.

"Sophistication" in the algorithms involves identification of situations like this, and handling them gracefully, even if the exact answer that meets desired accuracy cannot be obtained with the equations and available precision. The 12CP appears to not to have this sophistication -- it seems to execute the standard equation in an eternal quest for the unobtainable precise answer. The other models pragmatically give the best answer they can, and then stop. "Sophistication" is not equivalent to "complexity".

I would suspect that the 12CP handles routine, conventional problems about as well as the others. Here's one (my auto loan from 1986 -- 12% annual interest (!) with monthly payments):

n=48; i=1; PV=8400; FV=0. Solving, PMT=-221.204218. Can the 12CP re-solve for "i"?

How about this one (a 30-year mortgage at contemporary low interest rates):

n=360; PV=175,000; PMT=-1000; FV=0. Solving, i = 0.46316% (or, 5.558% per year, nominal)

> Quote:
>
> Hi Keith - me again. You really raised a whole lot of issues. Forget about the FV thing. The PV is not at all sensitive to i. You mention N - of course yes that OFTEN is completely inteterminate. None of this is anything special. It's all just standard compound interest, which TVM is designed to handle.

Huh?? It's true that PV is not sensitive to "i" in that problem, but I don't believe that N "OFTEN is completely inteterminate *(sic)*" -- only in these examples where the function f(n,i,PV,PMT,FV) = 0 is not solved to a close tolerance in the first place.

> Quote:
>
> If you think the 12CP is toggling between two values and just cannot decide which one to choose, which values might these be?

i = 10.00000000 and i = 9.999999999. Compute FV for those values, using a 17Bii or a 10B if you have one.

> Quote:
>
> You said i suggested that the perpetuity thing was elementary, and someone else suggested the same, but you think it is complex. Ok here is a challenge for you. Give us an example that you think is elementary and I'll see if i can convince you it is really incredibly complex.

That doesn't even deserve a response, wise guy.

> Quote:
>
> All the problems are really much of a muchness in this respect.

Say what???

> Quote:
>
> The reason i said to forget about the FV thing above is that I know that when the 12c solves for i in that case it does NOT use the FV as a focus - it uses the PV.

In order to solve for any one of the five variables, fixed input values of each of the other four is required. It must solve f(n,i,PV,PMT,FV) = 0 for "i". Only in the case of "i" must this be done iteratively; direct anlgebraic equations can be written for the other four variables. That's why they solve faster.

> Quote:

> Looking at that one again i would call it not just elemntary, but elementary in the extreme. It is a classic case where the answer is blindingly obvious.

Better look at it again, Tony. Run the cash flows -- A value of "i" such that payment = accrued interest means that FV = -PV, not FV = 0.

> Quote:
>
> Oh, dear, I'm starting to agree with Valentin!!!! Thanks for your post! keith i hope you don't work for HP or Kinpo!!<G>

Valentin is a lot more intellectually coherent that you are, Tony. Grow up, or at least get some sleep before you post again.

> Quote:
>

"keith", here, does not.

Re: A response to Tony's spewings [LONG]

*Message #28 Posted by **tony** on 20 July 2003, 9:39 p.m.,*
in response to message #27 by Karl Schneider

Karl, very sorry i annoyed you and called you the wrong name. A total mistake!!! I am used to writing e-mail offline. I hestitate to write any more, in case i give the wrong impression. No worries. I'm real happy to email you in private - just email me at th@csi.com. I think i was tired when i wrote my posts. Technically they are not totally unsound. About n being indeterminate:- it is when PV=-FV or FV=-PV or, for PMT @ END mode, when PMT/i is between -PV and FV. It is surprising how often this happens. Also n is indeterminate if i=0 and PMT=0. BTW this is different to the error 5 conditions given for n in the 12C (and 12CP) manual - there they say PMT<=-PV*i which is true for the "=", but not for the "<" unless FV is less than -PV. You keep mentioning FV in that perpetuity case - it is the volatility of the PV that you have to look at. I should say I have studied, used and written about compound interest a lot over the last 30 years, not that that in itself is any guarantee that there might be any actual truth in what i write. To be honest, it can be a very boring topic - which means hardly anyone takes the time to get it right, because nobody is really interested anyway.

I don't want to argue with you in detail so i thought i would make a few general points. Is that OK? If you want to write about me like you have done in your post I would appreciate it if you did it to me personally in a private e-mail and not too much more in public. is that OK?

I really didn't realise my writing was so bad as you mention. It's amazing what strong feelings a TVM program can bring out!!!!!! I couldn't believe it when i saw the subject wording you used.

I must have given the impression i was being too clever or something in giving those examples. I'm sorry you didn't like them. They are realistic for some problems. i still have a letter from the consultant behind the 12C written 20 years ago where n=E7 is used to make the 12C do a calculation using continuous payments.

Repartee' with Tony about TVM

*Message #29 Posted by **Karl Schneider** on 20 July 2003, 11:14 p.m.,*

Karl - no worries. Thanks for your post. I did put a <G> after asking if you worked for HP. BUT I know a <G> often goes mis-read. Cheers, Tony

Re: A response to Tony's spewings [LONG]

*Message #33 Posted by **tony** on 20 July 2003, 10:57 p.m.,*
in response to message #27 by Karl Schneider

Karl - I forgot to say that i for the loans you mention would probably take about 45 seconds to resolve on the 12CP. Also perhaps i have been not forthcoming enough on that perpetuity example - it's just that i have little time to write. Suppose i come into money - in the form of $10 a month for 30 years. However this is a very risky stream of income, perhaps related to gold production in the far east. How do i value it? I have to use a high interest rate - even as high as 10% a month. There we have it. The high interest rate reflects to low *probability* of actually receiving the income stream. Is that so unrealistic? In fact in some countries interest rates are generally quoted "per month". They can be a lot higher in countries other than the USA.

Funny, my beta 12cp solves the perpetuity problem in 3 minutes!

*Message #34 Posted by **Gene** on 21 July 2003, 10:16 a.m.,*
in response to message #22 by Karl Schneider

Have no idea why!

It solves 360 N; 100 PV; -10 PMT; 0 FV

in about 3-4 minutes. Returns 10 as i.

This is the unit that turns off whenever a program hits a R/S or GTO 0000 instruction!

Go figure!

New units have fixed this "OFF" problem...

*Message #35 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2003, 12:21 p.m.,*
in response to message #34 by Gene

... but it cost a "reasonable" price :)

Edited: 21 July 2003, 12:21 p.m.

Re: Funny, my beta 12cp solves the perpetuity problem in 3 minutes!

*Message #36 Posted by **tony** on 22 July 2003, 10:41 p.m.,*
in response to message #34 by Gene

Thanks for testing it on your unit Gene - lucky the test didn't take too long ;-) Another funny thing is the 12C makes rather hard work of this one - it takes 25 seconds. But the 38C and 37E do it in 4 seconds flat (they must have better initial guesses, whereas I think the 12C just uses 1/n as the guess for i).

Actually when I ran this one on the 12CPt I was expecting it to take about 4 minutes - couldn't believe it when it just kept going.

Again: Accuracy × Internal # of digits (edited)

*Message #37 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2003, 11:23 p.m.,*
in response to message #36 by tony

Hi Tony, Gene, guys;

after reading your post mentioning that both HP37 and HP38 (both probably share the same basic firmware) need 4 seconds instead of 25 in the HP12C, 3 minutes in Beta HP12cP and some hours in the commercial HP21cP, I felt curious about one thing: do Spices have the same internal accuracy that Voyagers have? I mean, if original HP12C needs 25 seconds and both Spices need only 4 seconds, would they have different internal accuracy? If there are fewer digits to compare, the same iteractive loop may converge in less counts. In the HP12C, amortization has its accuracy in accordance with display settings, i.e., number of digits. I did not test so far, but I think that the more digits you set, more time is spent to compute a more accurate result.

Maybe it's just a wild guess, maybe clock (frequency) is the answer. But after what happened to the HP12cP, I'm trying to collect information.

My thoughts, only.

Luiz (Brazil)

Edited: 22 July 2003, 11:33 p.m.

Re: Again: Accuracy × Internal # of digits (edited)

*Message #38 Posted by **tony** on 23 July 2003, 6:04 a.m.,*
in response to message #37 by Vieira, Luiz C. (Brazil)

Luiz, I am not sure about internal accuracy, but suspect Spice and Voyager are very similar. My guess is that for this TVM example, the 38C uses a better starting point than the 12C. Normally their i-solving performance is pretty similar - taking 15 seconds or so. I remember reading somewhere that HP put a lot of effort into the initial guess of pre-12C TVM. But I think the 12C uses an improved algorithm (more powerful at converging), which is not as dependent on the initial guess... but not independent thereof - in fact the 12c can take up to 40 seconds where it should really take about 4.. ,and on the 12C they don't really worry too much about the initial guess, probably using something like 1/n. Earlier TVM really needed an accurate starting point as they were slower to converge.

Actually you can pretty much "see" the 12C i-solving algorithm in the "*I" routine in the 41C "Advantage ROM" - which is more nicely coded than the "Finacial Decisions Pac". The "*I" code follows the methods outlined in Prof kaplan's "Maths in the Sand".

I have thought about your earlier post of a few days ago - about the extra accuracy of the 12CP chip, and also Valentin's post about Prof. Kaplan's "Maths in the Sand", and the hypothesis that somehow Kinpo were able to "drop" the 12C gold code into the new chip. I am not a hardware guy, or a low level software guy, but it is quite conceivable that the 12C code includes a routine for EXPM1 for example - and we can be sure Prof. Kaplan would not have wasted any code space on that - it would compute to the required accuracy and no more. If Kinpo left that unchanged and allowed it to run on more digits than intended something is bound to go wrong. The algorithm relies on an accurate EXPM1, or some co-relative, just to compute accurate values.

I always thought the 12C iterated on '1+i/100' (or its inverse) , and that explained the way it truncates its answers (in an entirely practical way) and also its speed. If the 12CP is doing the same it will delve into realms of accuracy the rest of the 12C code may not be "in harmony" with. It does *appear* to do just that from some examples I have tried - my guess is that the 12CP chip has about 4-5 digits of extra internal accuracy avaibale (compared to the 12C).

This hypothesis does almost seem to explain some of the 12CP behaviour - like where it actually produces a wrong answer - a very bad sign. Maybe when it takes forever it is wandering up and down a broad step function, where it should be on a nice smooth curve.

I don't think it explains all the peculiarities I've seen, but that could be because of my limited imagination. Also I could be quite wrong about how scalable the 'EXPM1' routine might be. For all I know it may be fine, or Kinpo consultants tried to enhance it, but the end result is, well, to be honest, almost unusable when solving for i.

Also, surely HP are aware of this problem and yet new units are still being pushed onto the market. I am maybe very naive to hope for a new ROM. I did actually hear that HP were going to make some sort of "announcement' about the 12CP, but it didn't happen, yet ...

Cheers, Tony

Are you joking ?

*Message #39 Posted by **Valentin Albillo** on 23 July 2003, 7:24 a.m.,*
in response to message #38 by tony

Tony posted:

" ...and on the 12C they don't really worry too much about the initial guess, probably using something like 1/n"

Nope and nope. They *do* worry VERY MUCH about the initial guess, and they *do not* use *"something like 1/n"*. Just look at this paragraph taken from the same Mathematics Written in Sand document you mention but that you don't seem to have paid proper attention to (the paragraph does refer to the HP-92 but applies equally well to the HP-12C, which includes even more refinements to make it work for *non-integer n*, basically consisting in iterating over the logarithm instead of the variable proper):

"To cope with huge n on the HP-92 , Roy and I approximated the root x of the financial equation *asymptotically* (as n goes to infinity), and used the leading term as a first guess for the iteration. Despite having to recognize several cases, the approximation is quick and, when n is large enough that it matters, accurate to over *five significant decimals*."

So, you see, they worry enough that they generate and use an *asymptotic expansion* for the relevant equation, then consider *several distinct cases*, and they are rewarded by an approximation accurate to FIVE (!!) significant decimals, to begin with. I'm sure many financial models would give their souls to be able to get so accurate an initial *approximation* that most would consider it the outright answer. Obviously, this is a far cry from *"don't really worry too much"* and an even farther cry from *"something like 1/n"*.

Mr. Kahan goes on to say:

"Further details are not needed to make my point: Every day, hundreds of thousands of people employ powerful financial calculators that are convenient, fast and reliable because of Physical, Chemical, *and now Mathematical technology* more intricate than they imagine."

Yes, it *was* that way, then. That is, till HP did throw everything to the trash bin, 12C source code included, as well as the ultra-expert attention to detail that made them their reputation, and subcontracted a Taiwanese *cheapo* to put something on the market at the minimum possible cost.

QA ?? Who cares !! As long as there are users like yourself, not minding shelling out their hard-earned bucks for a pathetic piece of crap, and then wasting their time trying to understand why said crap doesn't work like it should, HP will feel justified in acting like they do. Not that it matters, really,

The proper thing you should have done is to return that *thing*, perhaps you can still get your money back.

Best regards from V.

Re: Are you joking ?

*Message #40 Posted by **tony** on 23 July 2003, 5:23 p.m.,*
in response to message #39 by Valentin Albillo

Valentin, no I was not joking at all. I can *tell* by doing examples that the 12C does not have the same initial guess as pre-12C HP Financial calculators. Note carefully that the *12C* itself is *not* mentioned until after the word "Later" below - this is significant:

"Dennis and I used related transformations to solve related equations for Internal Rates of Return on the hp-38E and C , whose [IRR] key will cope with over 2000 cash-flows. Later, to cope with a revised version of the financial equation above that, unlike the original, makes sense when n is not an integer, Rich and I used yet another

transformation in the hp-12C ; we used ln(y) instead of y as the independent variable in the equation above with terms cjyj , and applied Newton's iteration to its logarithm. Although each iteration cost now more time than before, the theorem continued to guarantee convergence which was rapid from every starting point regardless of n . Further details are not needed to make my point:"

Note that now Prof. Kahan suddenly makes the additional remark that convergence is "rapid from every starting point regardless of n." I say suddenly because in the previous paragraph he is talking about the HP92 an the problem of huge n. Note he carefully lists the machine names and the 12C is excluded.

The 12C has quite a different i-solving "speed profile" to pre-12C calculators, consistent with it not using any asymptotic guesses.

Cheers, Tony

Re: Are you joking ?

*Message #41 Posted by **tony** on 23 July 2003, 7:20 p.m.,*
in response to message #39 by Valentin Albillo

Valentin, here is evidence to show that the 12C does not use the same asymptotic guess as the 38C. Consider a loan with PV=100 and PMT=-10 in arrears, and FV=0. The asymptotic guess for i is 10. Here are the solution times in seconds on the 12C and on the 38C, as n gets larger:

n...12C...38C

E2...20...10

E4...30....5

E8...40....5

The 38C gets faster as the problem gets more "asymptotic", indicating it starts closer to the asymptotic answer. The 12C gets slower, indicating that it starts further and further *away* from the answer.

Cheers, Tony

Re: Are you joking ?

*Message #42 Posted by **tony** on 23 July 2003, 10:16 p.m.,*
in response to message #39 by Valentin Albillo

Valentin,

> Tony wrote: " ...and on the 12C they don't really worry too much about the initial guess, probably using something like 1/n"

> Nope and nope.

I still think the answer is actually yes and yes, for the 12C.

> They *do* worry VERY MUCH about the initial guess, and they *do not* use "something like 1/n".

> Just look at this paragraph taken from the same Mathematics Written in Sand document you mention but that you don't seem to have paid proper attention to (the

paragraph does refer to the HP-92 but applies equally well to the HP-12C, which includes even more refinements to make it work for non-integer n, basically consisting in iterating over the logarithm instead of the variable proper):

I know that paragraph does *not* apply to the 12C. It might appear to from your reading, but the 12C is not mentioned. The hp-92, -37E, -38E and -38C are mentioned.

> "To cope with huge n on the HP-92 , Roy and I approximated the root x of the financial equation asymptotically (as n goes to infinity), and used the leading term as a first guess for the iteration. Despite having to recognize several cases, the approximation is quick and, when n is large enough that it matters, accurate to over five significant decimals."

here is the next sentence, which you omit:

"Therefore, nobody has to wait more than about a dozen seconds, long enough for fewer than 100 multiplications, after pressing [i] on the hp-92, -37E, -38E or -38C , no matter how big n may be."

> So, you see, they worry enough that they generate and use an asymptotic expansion for the relevant equation, then consider several distinct cases, and they are rewarded by an approximation accurate to FIVE (!!) significant decimals, to begin with. I'm sure many financial models would give their souls to be able to get so accurate an initial approximation that most would consider it the outright answer. Obviously, this is a far cry from "don't really worry too much" and an even farther cry from "something like 1/n".

Oh yes i agree that is a far cry from what i wrote. I wrote about the 12C. That applies explicitly to pre-12C.

It is almost trivial to determine asymtotic guesses for TVM problems, and the accuracy of course gets better "when n is large enough that it matters".

>Mr. Kahan goes on to say:

>"Further details are not needed to make my point: Every day, hundreds of thousands of people employ powerful financial calculators that are convenient, fast and reliable because of Physical, Chemical, and now Mathematical technology more intricate than they imagine."

> Yes, it was that way, then.

Agreed. But the 12C itself is not a great example. If you set up n=10,PV=10,PMT=-1 and FV=0 you have a transaction with interest rate zero. Try it on the 12C. It takes *15 seconds* and returns this in the display: -7.757450 -12 Try it on the 38C - solving for i gives an instant zero.

> That is, till HP did throw everything to the trash bin, 12C source code included, as well as the ultra-expert attention to detail that made them their reputation, and subcontracted a Taiwanese cheapo to put something on the market at the minimum possible cost.

That is the story we are told about the source code. But, one never quite knows. Maybe HP didn't manage the source code ownership properly. I'm sure it will be sitting on a CD ROM somewhere.

> QA ?? Who cares !! As long as there are users like yourself, not minding shelling out their hard-earned bucks for a pathetic piece of crap, and then wasting their time trying to understand why said crap doesn't work like it should, HP will feel justified in acting like

they do. Not that it matters, really,

Fair enough, you are welcome to your opinion. No worries. I do care, I think. And, apart from the built-in i-solving, I find the 12CP more useful than the 12C, because of the 253 program lines. Think of the fun you could have with all those lines Valentin ;-)

> The proper thing you should have done is to return that thing, perhaps you can still get your money back.

Thanks for you advice - really, you made me think twice<G>

Cheers, Tony

Overkill

*Message #43 Posted by **Valentin Albillo** on 24 July 2003, 5:09 a.m.,*
in response to message #42 by tony

Frankly, Tony, I think yours is a case of overkill.

If you're right (which is debatable), then you're right, point taken.

But posting THREE LONG messages in a row to my single one, before I get even a chance to reply to the very first one, is overkill, and makes me think you couldn't decide on your answer in the first place. I was thinking about replying to them, but frankly, seems to me that you tend to discuss everything too passionately and don't know when to stop (just look at this very thread), and I'm not for entering never-ending discussions with anyone, free time is too scarce and valuable to waste it that way.

I suggest that in the future you should begin by making up your mind about what you really want to say and how to say it, and post a single, to-the-point reply. If afterwards you feel that something needs adding or changing, edit it by all means, but don't post again re-hashing once more all your arguments.

Else, posting one long message, then another, then another, IMHO only helps to give a bad impression on your arguing skills and makes the potential reader less eager to read your posts, present and future.

Best regards from V.

Valentin, fair enough. Maybe I simply should have replied "No, I am not joking". ;-)

Cheers, Tony

Re: Again: Accuracy × Internal # of digits (edited)

*Message #45 Posted by **bill platt** on 23 July 2003, 9:49 a.m.,*
in response to message #37 by Vieira, Luiz C. (Brazil)

Luiz,

I am sure you probably all ready know this, but just the other day, I decided to compare some of

my calculators regarding precision. So I did a simple trick of taking the sine of a number, and then taking the sine of that reuslt, etc, for lots of iterations (say 20 or 30).

You end up with a really small number. So, my results "grouped" my calculators as folows, regarding the resulting manitssa:

Group A) HP-45

Group B) HP 15c, HP 11c

Group C) HP 32sii, HP 20s, HP48GX

Note that the displayed mantisssa of the 48GX is larger than those displayed on the Pioneers; however, the round-off was at the last digit, so they appear to be coming the same internal precision.

By the way, the difference between these groups, after 26 iterations, was at the fifth or seventh mantissa position (I can't remember now). That is pretty darn close.

Anyway, I am afraid that this is probably not really news after all.

1234 to delete.

Regards,

Bill Platt

Limit of Sin(Sin(Sin(...)))

*Message #46 Posted by **Valentin Albillo** on 24 July 2003, 4:48 a.m.,*
in response to message #45 by bill platt

Hi Bill:

Bill posted:

"I did a simple trick of taking the sine of a number, and then taking the sine of that reuslt, etc, for lots of iterations (say 20 or 30). You end up with a really small number"

In case you are interested, the limit of applying *infinitely many* sine functions to any real number is *zero*, i.e:

```
lim [ sin(sin(sin(...sin(x)...))) ] -> 0
```

though the convergence to zero is *extremely* slow. It begins relatively fast, but after several thousand sines it slows to a crawl. This is easily seen considering the Taylor series expansion for sin(x):

```
sin(x) = x - x^3/6 + ...
```

where you can see that for very small x, sin(x) is *nearly identical* to x, except for an extremely tiny error term (- x^3/6 + ...). If x is very small, (- x^3/6 + ...) is *much smaller*, and that is the *only* thing that gets you nearer to zero as you take yet another sine. So the rate of convergence gets slower and slower the nearer to zero you are.

Also, a very curious fact is the shape of the resulting function y=sin(sin(sin(...sin(x)...))) as you take more and more sines. With just one sine, you get, of course, a perfectly sinusoidal curve, with amplitude 1. But as you apply more and more sines, the shape gets *squarer and squarer*, with smaller amplitude. The limiting shape tends to a *perfect square wave* with an amplitude tending to *zero*.

If you've got a PC, or even some reasonably fast programmable handheld with a decent graphics screen (say a SHARP PC-1350, 1360, or 1600), give it a try ! It's amazing to see the wave turning more and more square, though you'll need to re-scale because its amplitude also gets smaller and smaller. This is a very rewarding empirical result, and it's not difficult to prove it theoretically as well.

Best regards from V.

in response to message #46 by Valentin Albillo

Valentin,

Thanks for your excellent and informative reply!

But, you are taking the sine in RADIANS, yes? I was doing this but in DEGREES, which of course gives a totally different sort of result and decays much more rapidly.

I have not yet plotted---actually I have too much work to do before going on holiday Saturday----but I maybe will try then?!

Best regards,

Bill Platt

somebody get me a mathematician ... limit sin(sin(...

*Message #48 Posted by **Norm** on 24 July 2003, 7:16 p.m.,*
in response to message #47 by bill platt

Although we presume it will very slowly get to zero, there are mathematical formulas for that. It's possible that it will NEVER get to zero, and instead the ultimate limit is something above zero.

I'm not saying either way, because i dont like that kind of math work. But a mathematician could prove whether or not it reaches zero.

YES, you'd want to do that in radians.

Re: somebody get me a mathematician ... limit sin(sin(...

*Message #49 Posted by **Werner Huysegoms** on 25 July 2003, 4:22 a.m.,*
in response to message #48 by Norm

No, it will reach zero... For if it doesn't, and the limit would be some number a>0, then sin(a)<a - contradiction.

that's not a proof.

*Message #50 Posted by **Norm** on 25 July 2003, 5:40 p.m.,*
in response to message #49 by Werner Huysegoms

Common sense would suggest that it does go to zero, as you are saying.

But what you just said does not constitute a mathematical proof.

It would be possible to prove it mathematically.

Considering that the Taylor series disappears to the 3rd power, it is possible that maybe it does not get to zero.

I would be interested in seeing a genuine and complete mathematical proof.

Re: that's not a proof.

*Message #51 Posted by **Paul Brogger** on 25 July 2003, 7:49 p.m.,*
in response to message #50 by Norm

I would be interested in seeing a genuine and complete mathematical proof.

I would be MORE interested in watching YOU come up with one!

(Do you mind if I look over your shoulder for a while?)

;^>

Re: that's not a proof.

*Message #52 Posted by **Werner Huysegoms** on 26 July 2003, 12:59 p.m.,*
in response to message #50 by Norm

Alright, second go.

If f(1,x) = sin(x) and f(n,x) = sin(f(n-1,x))

Let lim(n->oo) f(n,x) = a Taking the sine on both sides: lim(n->oo) f(n+1,x) = sin(a) or a = sin(a), or a=0

mathematically correct enough?

Best Regards, Werner Huysegoms

maybe that was a proof, college nightmares

*Message #53 Posted by **NH** on 26 July 2003, 1:59 p.m.,*
in response to message #52 by Werner Huysegoms

Thanks Werner, that is looking more like a proof.

If you were bullsh*ting me I probably wouldn't notice but at least it looks right.

I took some very advanced math in college (trusty HP-34C at my side..... 1981 - 1985) and that included differential equations, calculus in 3 dimensions, LaPlace transforms, Z transforms, and calculus in "n" dimensions.

So I used to know how to prove the limit of something as N went to infinity.

I take great personal pride in the fact that I forgot it all.

However I still get the standard post-college nightmares that I am late for the big test, and I dont know the answers, and I skipped the class for 6 weeks continuous, and I am sitting in the back row taking the test but I forgot to put on blue jeans so I am wearing only underwear,

but I hope that nobody notices (and its all happening at the same time, until I wake up).

YEAH thanks a lot math professors, all that study and it gives me nothing but)*)(*^^%@#% nightmares, and the majority of engineering or other technical degree'd people report similar nightmares after college.

At the present juncture, all that study (not to mention competency) doesn't even produce a stinking income, the Carly Fiorina, the Mafia, the Ford/Firestone, and the Enron goons have pretty well shut down engineering and any decent or otherwise innovative products, and fullest contempt for those who can innovate is now in-session.

Now I have got a brand new nightmare ..... "would you like fries with that?" I have to wonder why I bothered learning all that stuff, I should have simply learned to sell insurance and then I could discontinue perfectly good products in exchange for granting myself christmas bonuses and pay raises.

MBA's also have post-college nightmares

*Message #54 Posted by **Norm** on 27 July 2003, 1:02 a.m.,*
in response to message #53 by NH

Apparently post-college nightmares are based upon the worst-case scenario's that we spend the whole 4 years not letting it happen (I didn't study, I'm flunking out, I'm late to class)....

Those scenario's didn't happen, because we were diligent. Afterwards, we get the nightmares as though we did not have integrity and those things really happened.

M.B.A. POST COLLEGE NIGHTMARES:

* Show up at the wrong fraternity and miss the mandatory hazing of new members.

* Drank so much beer at the frat party that you throw up on the beautiful fraternity gal U wanted to take to bed and then never speak to again.

* The latest $75,000 check from Dad bounced, the day before you are required to take delivery of the new Mazerati at the dealership downtown.

* You forgot to buy off the professor at the dinner party last Saturday, so now you have to take the final exam for real... and of course you dont know the material.

* You need to get into executive management at GE, and you forgot to buy a case of wine for your buddy's dad and now maybe you don't have that in you needed.

OF COURSE, these things didn't actually happen to MBA's, but they get these nightmares because it did not really happen that way.

How about cutting MBAs some slack?

*Message #55 Posted by **Gene** on 28 July 2003, 10:18 a.m.,*
in response to message #54 by Norm

Is this really necessary? I know full well the irritation at the apparently stupid decisions made by some in marketing and those with MBAs with regard to calculators over the years.

But this is starting to get tiresome, at least for me. Should I start abusing engineers? What good will that do?

Legitimate beefs are fine, but let's consider calling off the constant harping. Ok? :-)

Gene

Re: How about cutting MBAs some slack?

*Message #56 Posted by **Axel Poqué** on 28 July 2003, 10:42 a.m.,*
in response to message #55 by Gene

I don't know if this relates to MBAs or marketing, but (at least for me) the main problem of HP (or any other of todays companies) is their focus on shareholder value instead of customer satisfaction (note that I didn't say 'consumer') as their prime indicator for success. And since it is easier to boost shareholder value by reducing costs (laying off people, escpeially those with experience, that is) and selling increasingly larger quantities of increasingly inferior 'products', such inconveniences like quality and good engineering are no longer needed.

Sorry for venting a bit.

Axel

Re: How about cutting MBAs some slack?

*Message #57 Posted by **Gene** on 28 July 2003, 2:18 p.m.,*
in response to message #56 by Axel Poqué

Actually, shareholder value IS the appropriate goal for a company. After all, the company belongs to the shareholders and management is their agent.

However, the problem results when management and/or shareholders focus on the short-term instead of the long-term.

Long-term thinking to increase shareholder value will not short-change customers. You must keep customers happy or you won't stay in business long-term. If you're not in business, shareholders have no value.

That said, a focus on customer satisfaction is of course very important, provided making customers happy fits

with adding shareholder value.

For example, customers would be very satisfied with a $500 car price from a manufacturer, but if they made those customers very happy, they'd not make the shareholders very happy.

Another example, shareholders would be very happy with a company selling $30,000 cars made of crap, but since customers would notice this and never return, the shareholders would only be happy short-term.

Has to all fit together. Really can't have one without the other.

Where HP went wrong (or present tense if you like), was by not really knowing their customer. If you don't know what your customer wants, then decisions you make won't make the customers OR shareholders happy.

I'm with Alex, nope, no slack (your speaking Swahili)

*Message #58 Posted by **Norm** on 28 July 2003, 8:14 p.m.,*

I think this sounds like Swahili. It does not make sense, except in the narrow viewpoints of the super-rich class of business owners who don't care about anybody or anything. It is a selfish focus purely upon who owns the company.

I know what will happen now, comes a thought of socialism vs. capitalism. Now, I am no commie, Gene, I am a graduate of Rush Limbaugh or Mike Savage or both, take your pick, I breathe red white and blue, I believe in freedom not taxation, etc etc. However how much money did we make when we flew Voyager past the planets?? How much did we make when we grabbed rocks off the surface of the mooon ????? How much money is made by visiting the bottom of the ocean or how much money does AGILENT make by offering a unique

machined & polished test-fixture at $500 a pop that they only sell 10 units per year ??????

Did you know that the Boeing company was damn near bankrupted by creation of the 747 back somewhere in the 1970's, and that the management style you described would have never taken such a risk, hence we would never have had the cool-looking world's biggest aircraft with the hump-back and the double-decks and the spiral staircase ??? So who's got the better style, the management that plays everything safe and just concentrates on laying everybody off and selling buggy whips, or the management that pursues the new ideas in harmony with engineers, as a quest to get to cool and exciting new things ?

SO is it always about making money on a selfish basis? Or is it also about advancing technology itself, pursuing the new ideas, and providing the customer with what the CUSTOMER WANTS (which is invariably the new and superior innovative technology, not just the same old damn-fool buggy whips at Home Depot).

So! I do NOT think the ultimate goal of a company is to put the maximum amount of money in the bank. Instead, the ULTIMATE goal of a company is to do superior new things. That is to advance knowledge, methods, techniques, and intellectual property, and THAT is what ultimately secures our place in this world, NOT just having the biggest pile of money by doing the most clever job of laying people off and knocking off your competitors, reducing quality and gettting rid of engineers (or their calculators) and discontinuing products and developments that cost the company money.

YOUR viewpoint would be perfect for the Acme Buggy-Whip company in 1895. Then along comes those stinkin' engineers with the horseless carriage ..... SO maybe your viewpoint needs an expansion towards considering the need to create the cool new things.

The engineering department creates those cool new things (IF it is staffed with competent engineers). You said it all goes wrong with short-term vs long-term focus.

I disagree. Know where it really all goes wrong ? It all goes wrong when there are too many phony engineers. They have macaroni and cheese for brains, but the same cut-throat heart that you are admiring in the MBA. They fake and they con, and their ideas and their stuff doesn't work, but they still waltz off with their pay, their contract, or

whatever. I've met more than a few. The miserable new welfare-system "government grants" actually encourages scam engineering and is multiplying it up at a massive rate, like doubling that kind of fake-business (gov grant subsidized) every few years. Management has all the money so they make all the decisions, but they have no idea who are the competent engineers and who are the fake engineeers. THAT is where it all goes wrong. So then management stares blankly amongst different engineers who want to do different things, and lays off all of them.

What MBA's need to do, if they want to avoid the conflict, is learn something about engineering, so if an engineer says "I wish to reduce the weight of this assembly" or "I wish to increase the maximum speed at which this can operate" or "I wish to allow this to work at a higher temperature" that they could have enough engineering knowledge to have some faint glimmer of understanding whether the ideas are valid or not, and then know which engineers to let proceed with the engineering work.

I don't see that happening. I see, presently, MBA types who take immeasurable pride in not being able to change a light bulb, and when you pry for whatever philosophies they seem to be operating under, they just want to create maximum equity for their shareholders. I think life is a little more complicated than just seeing how much money you can hoarde, and as long as the MBA's show pure selfishness about money only, and cannot differentiate between good engineering and bad engineering, then the festering rift between the two camps shall surely continue.

To avoid cluttering the chat board further, you are welcome to simply respond directly to my e-mail (click on blue link at the top). And if you got this far, BTW, I think the "mba nightmares" were very funny upon re-reading, so how could I cut you slack by not posting them. If I didn't post them just to please you, wouldn't that be denying freedom of speech and thought ?? I'm surprised nobody added to them .

:o)

Cheez, the real reason maybe it offends is that MBA's have NO post-college nightmares. I dont think an MBA even begins to understand the amount of study and dedication a REAL engineer has got to do (not a fake engineer). And a real engineer's work is much like trying to be Wolfgang Amadeus Mozart or Beethoven, etc., its a lifetime passion, and it was the same for, say designer of the 41C..... a lifetime passion..... to where the initial

studies can create lifetime bad dreams, etc., and the MBA may have no appreciation of that, because all they have to do is wink and nod and deliver the secret handshake to their buddies (killing a few astronauts also is a plus) and the bank vaults are opened to them, so what's to worry.

Best,

- Norm

Sorry, you're wrong

*Message #59 Posted by **Gene** on 28 July 2003, 9:40 p.m.,*
in response to message #58 by Norm

Companies exist to make money for those who own them. Period. Businesses are either sole proprietorships, partnerships, or corporations. In each case, they are owned by owners who given their money to earn more money. Just as a mom and pop shop wouldn't earn money for long by selling spoiled beef sandwiches, neither would a corporation earn money for its owners for long by selling inferior products. Doesn't mean some mom and pop shops don't do that nor does it mean that corporations don't. They won't stay in BUSINESS for long, however.

I have attempted to be civil in this discourse, yet you persist in being antagonistic.

Sometimes ignorance is apparently bliss.

Gene,

*Message #60 Posted by **Norm** on 29 July 2003, 2:31 a.m.,*
in response to message #59 by Gene

Gene,

I'm doing my best to communicate with you directly, by direct e-mail, but you don't provide any email address to contact you directly.

I dont really want to clutter up the chat board in a debate with you, which is what you are starting to cause.

As for the simplistic comment "sorry you're wrong" well Gene, you aren't exactly dealing with this point by point.

So just how much money did we make by going to the moon and picking up a few rocks ? Did that fail, collectively speaking, to put the nation

into 4000 sq ft houses with hot tubs out back? You bet it did. People lived very humbly in order to allow technical quests.

Your approach is just to make sure that management and the CEO and the shareholders all live in ostentatious houses with Barbeque's out back sized to feed 50 men (even though there's typically just 2 people living in that 4000 sq ft house of yours).

YOu haven't responded to my points, and you contort what I said entirely. You suggest that I promote the sale of inferior products.

For example, you suggest that I promote the sale of spoiled corned-beef sandwiches.

Gene, when you keep that up, you are just demonstrating how hopelessly out of touch you MBA types are. You can't even follow some fairly clear black & white viewpoint that I gave you, and you come up with the total inverse of what I said.

Although I had suggested you contact me directly, when I see the non-response to my careful input to you, then I now suggest we cease this debate, and you go back to counting your millions, discontinuing products, and laying people off, and I will return to the engineering of a technologically superior new item, which I work on privately, which should hopefully result in my 4th patent (after a total of several years of hard and sacrificial work).

Thank you for not keeping this up, it's clearly a total mismatch of thought processes, incompatible as oil and water, is the MBA and the engineer.

- Norm

Norm; 3 short things

*Message #61 Posted by **db(martinez,california)** on 29 July 2003, 11:01 p.m.,*
in response to message #60 by Norm

1) In your posts here, i agree with you about 95% of the time. If you keep ranting, i'll keep reading.

2) I don't think that Gene ever said he prefers the total outcome of the way things are, HP in particular. He just said that that is the way the economic/social system is.

3)Be careful with rush. Have you noticed he does the bait and switch a lot? He will tell the obvious truth 8 or 9 times out of ten and then when your defences are down he slips a big one through.

its the only thing I'm sure of

*Message #62 Posted by **Norm** on 30 July 2003, 1:08 a.m.,*
in response to message #61 by db(martinez,california)

Rush Limbaugh is like a cement foundation.....

when I am listening to Rush, its "dont bug me, this is the only thing I'm sure of".

How could Rush ever say anything incorrect ... hasn't happened yet

U gotta love the music though....they got some really comical musicians who make up songs.

:o)

And just for the record ...

*Message #63 Posted by **Valentin Albillo** on 25 July 2003, 4:45 a.m.,*
in response to message #47 by bill platt

And just for the record,

```
lim[ cos(cos(cos(...(cos(x)...))) ]
```

when the number of 'cos' tends to infinity, is also defined for all real x and converges to this value, which you can compute with your trusty HP-15C, a suitable multiprecision program, and just a little patience:

```
lim =
0.739085133215160641655312087673873404013411758900757464965680635773 2...
```

The convergence here is much quicker than in the case of the sine function. In both cases, if x is complex, neither limit does converge but you get an hiper-exponential explosion(i.e: exp(exp(exp(...)))), with clear signs of fractal behaviour in the slopes of the incredibly step peaks. It's quite a mathematical experience to plot those functions for complex x, as 3D graphs, using colour for the 4th dimension needed in addition to the normal three spatial dimensions. The resulting graphics are amazing indeed.

Best regards from V.

A few other data points: my 1988 14B solves this in about 2.5 seconds; my 2001 10BII solves it in about two seconds; and the 'MathU' RPN calculator for PalmOS solves it instantly.

And, as with everyone else, my 12CPt never returns from its journey through SlowlyThrobbingRunningLand.

(For the benefit of anyone who's tracking this, my 12CPt's serial number is: CN31600185.)

Re: 12c Platinum Perpetuity challenge

*Message #67 Posted by **tony** on 21 July 2003, 5:30 a.m.,*
in response to message #66 by Frank Wales

Thanks for the serial number Frank. I was beginning to think maybe I had the only 12CP that did this. It is hard to imagine how the 12CP fails to converge. In fact there are 6 values if i that make the 12CP give the same PV=100, namely: 10, 9.999999999, 9.999999998,..,& 9.999999995 This means the 12CP has plenty of options to stop on.

More amazing is to put FV=-100 (as well as n=360,PV=100,PMT=-10, PMTs@ END) Then the 12CP solves for i=10 in 4 seconds flat!! However even for this case the sensitvity of the PV is the same - there are still the same 6 possible answers for i, as above.

So, why it does one case and not the other is quite a mystery.

-Tony

Re: 12c Platinum Perpetuity challenge

*Message #68 Posted by **bill platt** on 21 July 2003, 11:50 a.m.,*
in response to message #1 by tony

My 32sii:

with the following in the equation editor:

P*100*(1-(1+I/100^-N)/I+F*(1+I/100)^-N+B

solve I: input : P = -10 N = 360 F = 0 B = 100

Solving for I takes place in 10 seconds, and produces I = 10 (which is of course 120% interest per annum).

However, the starting conditions make a huge difference. Let's say the last time I ran a TVM computation, I had solved for the payment on a 67000 mortgage at 5% for 30 years, with monthly payments, I= 5% per annum, then, without starting the first guess for I = 1, then the run will take about 20 seconds, and produce I = -199.1958970637

So the moral of the story----boundaries and initial guesses are important, too------and I do not know how the 12C or 12cp is set up, but could not some of this be going on?

I am gerally very distrtustful of the idea of using a calculator to "solve" an equation when the solution really counts. I like to see it "on paper" as it were, and let the machine do the arithmetic, but let me do the algebra thank-you-very-

much. But then again I am distrustful because I am not well versed nor highly experienced in either computer science or mathematics--I use mathematics to solve problems, but 12 years out of college you have to work hard to stay fresh with topics that are not used every year!

Meeting III

*Message #1 Posted by **Matthias** on 17 July 2003, 8:08 p.m.*

So, Now I'm back home.. So, lot of you have made a propositions for our meeting.. Let us fix two dates and see, on which date we would be more:

august 30 (for long distance riders.. you can perhaps sleep here in Basel)

september 20 (sleeping possible too)

PLEASE. Give us your prefered date as fast as possible, even if you can on both dates).... Side activities...: Is not organized jet, but I love the idea of Thibaut to visit the Vitra Designer Museum Topics: Everthing you desire (programmers, repairing, trading, discussing, watching items, ... but please inform us. Perhaps some of you want to organize a workshop?) I will organize food and I will keep clean my appartment for you..

Matthias

Re: Meeting III

*Message #3 Posted by **Thibaut.be** on 18 July 2003, 3:51 a.m.,*
in response to message #1 by Matthias

I would vote for Sept 20 please , I'm on holiday end August.

And yes, some side activities such as software workshops (hints in programming) and hardware (simple problem repair) would be great ! Of course any cultural activities are welcome !

Thibaut

Re: Meeting III

*Message #4 Posted by **Albert** on 18 July 2003, 5:33 p.m.,*
in response to message #1 by Matthias

Hi guys,

How much for a cheap room (double) in Basel or surroundings in September? Thanks.

Re: Meeting III

*Message #5 Posted by **Matthias** on 19 July 2003, 4:47 p.m.,*
in response to message #4 by Albert

I'm not shure what you mean:

a) What will cost a hotel to sleep in Basel? b) Question to the public, if we should reat a room for our meeting.

I think, you mean a) but please tell me...

Matthias

Re: Meeting III

*Message #6 Posted by **Albert** on 20 July 2003, 12:49 p.m.,*
in response to message #5 by Matthias

Hi Matthias,

I would like to know how much for a cheap room for my wife and I near Basel, that's right now? Thanks in advance.

Re: Meeting III

*Message #7 Posted by **Matthias** on 20 July 2003, 3:14 p.m.,*
in response to message #6 by Albert

I would say arround 90€ for a doube room with bath room... perhaps we will also find a cheaper hotel without breakfast , shower, ...

Re: Meeting III

*Message #8 Posted by **Achim** on 18 July 2003, 5:58 p.m.,*
in response to message #1 by Matthias

Hi, I would prefer August, 30. and offer a workshop "How to restore a 98xx".

Achim

98xx repair

*Message #9 Posted by **Thibaut.be** on 19 July 2003, 4:50 a.m.,*
in response to message #8 by Achim

If you want I lend you mine for this lab ;-)

I still have to send you my 9820's PCB's did not have time yet to fly to the post office.

Cheers,

Thibaut

Re: 98xx repair

*Message #10 Posted by **Massimo Gnerucci (Italy)** on 19 July 2003, 6:24 a.m.,*

Me too! :-)

I've a sick 9815A

Massimo

Re: 98xx repair

*Message #11 Posted by **Matthias** on 19 July 2003, 6:35 a.m.,*
in response to message #10 by Massimo Gnerucci (Italy)

And I have a 9845A that needs your help... :)

Re: 98xx repair

*Message #12 Posted by **Achim** on 20 July 2003, 1:44 p.m.,*
in response to message #11 by Matthias

I think I should open a hospital ;-)

Re: 98xx repair

*Message #13 Posted by **Achim** on 20 July 2003, 1:39 p.m.,*
in response to message #10 by Massimo Gnerucci (Italy)

Hmm, difficult... The 9815A is a hardware class of its own. What exactly do you mean with "sick"?

Re: 98xx repair

*Message #14 Posted by **Massimo Gnerucci (Italy)** on 21 July 2003, 10:16 a.m.,*
in response to message #13 by Achim

The display doesn't turn on anymore; it was working OK until a few hours before shipping it to me (at least the seller was kind enough to sensibly lower the price for it).

Thanks,
Massimo

Re: 98xx repair

*Message #15 Posted by **Achim** on 21 July 2003, 11:27 a.m.,*
in response to message #14 by Massimo Gnerucci (Italy)

Seems as if either the display is broken (very bad, spare parts only from another 9815) or there is a contact problem (very easy, just open the 9815 and check every board). Have you checked the fuse? Can you print the x-register (press PRINT)? If yes: the display is propably broken.

Re: 98xx repair

*Message #16 Posted by **Massimo Gnerucci (Italy)** on 22 July 2003, 2:25 a.m.,*
in response to message #15 by Achim

Thanks for the tips Achim, I'll try them out during next weekend.

Massimo

Re: 98xx repair

*Message #17 Posted by **David Smith** on 21 July 2003, 4:24 p.m.,*
in response to message #14 by Massimo Gnerucci (Italy)

I have a 9815 with a flakey display. Several segments are either blank or very weak with only partial gas discharge along their length that changes as other digits are entered. I think it is the display module but could be the high voltage supply. I think one may be able to use the display from a Compucorp/Monroe/Sumlock machine. I have been meaning to try this for a long time... I have a Compucorp with a corroded keyboard.

Re: 98xx repair

*Message #18 Posted by **Achim** on 20 July 2003, 1:37 p.m.,*
in response to message #9 by Thibaut.be

I just got a working 9820A. So I'm prepared...

MLDL2000 now working as MLDL!

*Message #1 Posted by **Meindert Kuipers** on 17 July 2003, 3:42 p.m.*

Good news today! I just got the MLDL really working with MLDL capabilities. The WROM instruction is now correctly recognized. There was a very nasty little bug outside my state machine, and it turned out that the WROM instruction has been working all the time. Just reading the data back from MLDL SRAM failed.

For those interested: The MLDL I now created has one 4K page of SRAM at $E000. I have used an Eramco ROMBOX with several Eproms to test writing and reading individual words in the SRAM with the DAVID ASSEMBLER. Second test was to copy the ERAMCO ESMLDL-OS Eprom contents into page $E000 with the COPYROM instruction that is in ESMLDL-OS. Unplugging the ROMBOX left my good old HP41C (2* speedup) with only the RAM connected, and CAT 2 showed the copied ESMLDL-OS! My other machine, a non-speeded HP41CX, showed the same behaviour.

I will put some pictures I have just taken of the prototype on my website, but that could take a few days. Will let you all know when they are online.

Next step is to test the prototype with FLASH and multiple RAM pages. This requires to load larger amounts of data into memory, and I need the external I/O interface for that. The hardware is pretty simple but I need to do some software programming on the PC to be able to bit-bang the control signals of the external interface of the MLDL.

in response to message #3 by Emmanuel, France

Meindert, congratulations for your success! I'm highly impressed by your achievement in your spare

time. Many other projects, especially difficult or timeconsuming ones are never finished. I'm very positive to be able to buy an MLDL in the near future. Best Regards Daniel

Re: MLDL2000 now working as MLDL!

*Message #5 Posted by **Werner** on 17 July 2003, 8:52 p.m.,*
in response to message #1 by Meindert Kuipers

Dear Meindert,

also from my part I want to send you my congratulations! It is incredible how your project is proceeding. HP41 seems to experience a sort of Come-Back these days due to great efforts of people who deliver a lot of HP-material, great programmers creating new emulators (e.g. Jean-Francois, Warren, HrastProgrammer, and many other very good emulator programmers), and hardware experts like, e.g., Christoph Klug with his IL interfacing solutions and last not least you with your MLDL ! And of course there are many other good guys I did not mention here (sorry!).

All in all - even without HP - within internet age the great HP41/HPIL system concept is again very much alive, I am happy for that as I grew up with this marvellous machine.

Today it still seems to be easy to get a HP41CX (e.g. at Ebay) but it is NOT easy to get RAM that allows MCODING and loading available ROM-images. And that is one of the main "add-on"s which we 41-enthusiasts all need very urgently!

Meindert, I would be happy if you please could take me onto your list, I would like to get one of your fine MLDL when it is finished! (but please take all the time you need as it is certainly a lot of hard work).

Best regards - and "happy programming",
Werner
(Werner Weiershausen from Darmstadt/Germany)

For those humble ignorant like me : What is MLDL ?

All the best

Pierre

Re: MLDL2000 now working as MLDL!

*Message #7 Posted by **Ellis Easley** on 20 July 2003, 3:52 p.m.,*
in response to message #6 by Pierre Brial

Machine Language Development (Laboratory?)

It is a device with RAM where HP41C ROM's are addressed, and with a means to write information into the RAM. With it, you can write your own HP41C machine language programs or load images of existing ROMs.

Re: MLDL2000 now working as MLDL!

hp 41 c

*Message #1 Posted by **François Riverin** on 17 July 2003, 10:15 a.m.*

Après 23 ans, ma HP-41c s'est éteinte. Comment fait-on pour trouver si le problème vient du chargeur ou de la batterie. OU peut-on trouver une batterire principale de la HP 41c à Montréal?

Merci.

Re: hp 41 c

*Message #2 Posted by **Randy Sloyer** on 17 July 2003, 11:10 a.m.,*
in response to message #1 by François Riverin

Le rendement de chargeur peut être contrôle avec un voltmètre.

Si la batterie est du même âge, c'est certainement le problème. Examinez les réparations et la section de batteries ici pour assurer les sources pour la reconstruction de batterie.

////////////

Charger output can be checked with a voltmeter.

If the battery is of the same age, this is certainly the problem. Check the repairs and batteries section here for sources for battery rebuilding.

Re: hp 41 c

*Message #3 Posted by **Vieira, Luiz C.** on 17 July 2003, 1:55 p.m.,*
in response to message #1 by François Riverin

Hi;

Did you try to use the calculator with common alkaline batteries? Just to check if the calculator is O.K.

There is a contributor of ours, Michel Beaulieu, that lives in Canada, that owns some HP calculators, too. It´s not going to be hard to contact it, I think.

Success!

////////////////

Avez vous essayé d'utiliser la calculatrice avec les accumulateurs alcalins communs? Vérifier juste si la calculatrice est O.K.

Il y a un contribuant à nous, Michel Beaulieu, qui habite au Canada et possè quelques calculatrices de HP, comme l´HP41. Ces n'est pas difficile pour vous d'entrer en contact avec lui, je pense. (Excusez; je utilisé un traducteur électronique pour corriger mon texte original)

Succès!

Luiz (Brèzil)

HP 28S Fast Mode

*Message #1 Posted by **Victor Koechli** on 17 July 2003, 9:37 a.m.*

Hi, I've been trying to speed up my HP 28S (version 2BB) using the fast mode program presented at http://www.rskey.org/gene/hpgene/28sfast.htm However, it doesn't work, but keeps giving me an error message at the first STO operation.

Does anyone know how to put the 28S into fast mode?

Thanks, Vic

Re: HP 28S Fast Mode

*Message #2 Posted by **Christoph Giesselink** on 17 July 2003, 12:53 p.m.,*
in response to message #1 by Victor Koechli

Yes, the program on this site doesn't work. I had a look into my collected solutions and I found three different realisations. I think the following one is the shortest. I have no idea who's the author and if this program really work, just try it:

```
First up, it appears that there was never a posting for the SPEED or
FAST program which does not have to be in the home directory, or that
requires a POKE program to work. Either of which seems ridiculous to
me because the code to poke the speed nibble is so short.

This program will conveniently create FAST which can be stored at any
location in the user memory. FAST works by changing the speed nibble
at #FFF00h from #7h to #Fh.

    CFAST[D000]

<<  #1FFF00F1F0302331h
    #C80846124113l0D5h
    #3B82h  SYSEVAL
    #7195h  SYSEVAL
    #44A4h  SYSEVAL   >>
```

Regards

Christoph

Some interesting documents (2)

*Message #1 Posted by **Valentin Albillo** on 17 July 2003, 7:57 a.m.*

Hi all,

Here is a 2nd batch of links to some (hopefully) quite interesting documents (in PDF format, for best reproducibility), most of them related to HP calculators and calculators in general, with one or two math-oriented ones thrown in for good (even humorous !) measure.

The idea is that you get some interesting materials to read and even try on your HP this weekend, if you feel like it. I would suggest printing them on paper instead of reading them off the screen, for maximum visual comfort, graphic quality, and usability. Best regards from V.

A True Calculator

From Henry Brigss to Modern Calculators

A Mathematical Seduction

CORDIC: Elementary Function Computation using Recursive Sequences

Chance and Data: New opportunities provided by the graphics calculator

Finding Optimal Solutions to Rubik's Cube Using Pattern Databases

An Imaginary Tale: The Story of Sqrt(-1)

Modeling and Rendering Escher-like Impossible Scenes

Re: Some interesting documents (2)

*Message #2 Posted by **Alberto** on 17 July 2003, 2:31 p.m.,*
in response to message #1 by Valentin Albillo

Great !

But, Where is the first release? Thanks

First batch

*Message #3 Posted by **Valentin Albillo** on 18 July 2003, 4:39 a.m.,*
in response to message #2 by Alberto

Hi Alberto,

The first release was posted July, 2. Unfortunately, it's too 'old' to still be among the last 500 messages in the Forum, but too 'new' to be available in the Archives, so it's essentially unavailable till it makes it to the

next Archive.

That being so, I re-post here those links, for your convenience. Bear in mind that they were related to topics discussed back then (HP-12C Platinum's CPU, uses (if any) for the hyperbolic functions, financial uses (if any) for trigonometric functions, etc) so that's why they are so heterogeneous. Nevertheless I'm confident you'll find at least some of them interesting. Best regards from V.

All the following are PDF documents, for optimum reproducibility:

HP-12C Platinum's CPU:

Data Sheet

Confirm Sheet

Product family (12C's CPU = SPLB20D)

Hyperbolic Functions Theory and Applications:

Superstructure Engineering (Suspension Bridges)

Curves in Traditional Japanese Architecture and Engineering

Lecture on the exponential function, the trigonometric functions and the hyperbolic functions

Hyperbolic functions in the art of M.C. Escher

Trigonometric Functions Applications in Financial/Business:

The Discrete Wavelet Transform with Financial Time Series Applications

Some HP-related Datafile articles by me [shameless plug]:

Long Live the HP-12C !

HP-12C Tried & Tricky Trigonometrics

HP-12C's Serendipitous Solver

Long Live the HP-11C !

Long Live the HP-15C !

*Message #5 Posted by **Alberto** on 18 July 2003, 5:04 p.m.,*
in response to message #3 by Valentin Albillo

Hi,

Thanks! I find these texts very interesting. Bye.

Re: Some interesting documents (2)

*Message #6 Posted by **Les Bell [Sydney]** on 17 July 2003, 11:19 p.m.,*
in response to message #1 by Valentin Albillo

All outstanding stuff, Valentin. Thank you for posting them.

Harold Thimbleby's comments about the "referential opacity" (I would term it "instruction set non-orthogonality") of a selection of algebraic calculators is spot on. I was pleased to note that my aging 41C passed that test with ease. On the other hand, I found my son's HP-6S a nightmare, and could not raise any protest when his school recommended a Casio for use in maths classes. The Casio is no worse than the HP, as far as I can see.

Best,

--- Les [http://www.lesbell.com.au]

Re: Some interesting documents (2)

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 18 July 2003, 8:53 a.m.,*
in response to message #1 by Valentin Albillo

Valentin:

Would you consider to put the articles in the Articles Forum, avoiding the "short life" condition of messages in the Messages Forum?

PS: I haven't had time to follow the links, but the fact that they come from you is a warranty of quality.

Re: Some interesting documents (2)

*Message #8 Posted by **Valentin Albillo** on 18 July 2003, 9:46 a.m.,*
in response to message #7 by Andrés C. Rodríguez (Argentina)

Hi, Andrés:

Andrés posted: *"Would you consider to put the articles in the Articles Forum, avoiding the "short life" condition of messages in the Messages Forum?"*

If you refer to the 2nd batch of links, all of them point to PDF documents not authored by me, so I am not entitled to submit them for the Articles Forum.

If you refer specifically to the links I posted to some of my Datafile articles (the "Long Live ..." series for instance), I would be willing to submit them to the Articles Forum, but they are in PDF format. Some months ago, I exchanged some e-mails with this Forum's gentle provider and maintainer, David Hicks, re

the possibility of creating a new section in MoHP specifically to upload PDF documents, but he then argued that that would make it quite difficult if not impossible to access them from PDAs, and that was it.

However, I feel that PDF is the right format for the articles, as it allows full reproducibility, including fonts, tables, graphics, everything like it originally appeared in print, the user would in fact get a real facsimile of the original. Much of this would be lost if uploaded as HTML or plain vanilla text, and I'm not for it.

Should David reconsider the possibility of actually creating this new section, I would certainly obligue by submitting a number of my articles, both past and future, in PDF format.

"PS: I haven't had time to follow the links, but the fact that they come from you is a warranty of quality."

Thank you very much, you're far too kind. Matter of fact, both Luiz and you are probably the 'kindest' of all Forum visitors in general (IMHO, of course, not to belittle anyone else). Myself, I'm regrettably much more on the 'rude' side, so noone should expect too 'flowery' a language from me ... :-)

Today I took the HP41 to class, and...

*Message #1 Posted by **Harry** on 17 July 2003, 6:27 a.m.*

first the teacher took it away from me to play with it, cause his 41 is broken and he hadn't seen one for a while :)

But thats not the reason for this post. We did microcontroller stuff today and I needed to convert from decimal to hexadecimal. Now why does the HP41 not support that? Is there a module that does that?

I don't really need it, as I have a HP16C emulator for the HP48, wich is a lot nicer than using the 48 without the emulator. Also have a 16C, but its too mint to take it to class :)

Regards, Harry

ADVANTAGE ROM

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 July 2003, 7:15 a.m.,*
in response to message #1 by Harry

Hi;

As far as I know, ADVANTAGE ROM is the one that has direct binary-related handling functions for the HP41.

I am not sure if there are other HP original ROM that has them. Some not-original HP ROM (thirdy-part manufacturing) offer some sort of internal data handling and will accept and show hex representations.

I wrote some routines at the time I was graduating as an Electrical Engineer that allow 32-bit binary manipulation. They were based in the HP16C repertoire and offer some practical applications. If you wanna try them out, send me an e-mail and I'll send you the listings and how to use them. I'm preparing the definitve document so I can post it at the Museum's library. Another contributor has already tested the programs (I just do not like to mention names before asking if I can) and he found them usefull and added some important remarks, suggestions and even an extra routine. If you are interested, you can also help me enhancing them the necessary way.

Let me know.

Luiz (Brazil)

Edited: 17 July 2003, 7:19 a.m.

Re: Today I took the HP41 to class, and...

*Message #3 Posted by **Valentin Albillo** on 17 July 2003, 7:32 a.m.,*
in response to message #1 by Harry

Hi, Harry:

Harry posted:*" I needed to convert from decimal to hexadecimal. Now why does the HP41 not support that? Is there a module that does that?"*

The Advantage ROM module does that, and much, much more. Matter of fact, it gives the HP-41C nearly all advanced functions present in all Voyager series calculators (HP-12C, HP-15C, and HP-16C) and then a lot more, including full matrix operations, solve, integrate, boolean operations, base conversions, Time Value of Money, complex number operations, vector operations, differential equations and many others. It is a 12K (!!) ROM, and it shows.

Also, most of its advanced functions are implemented in machine code (not user code or synthetic programming), and they run extremely fast and use the least user resources possible (for example, the matrix function MSYS can solve a system of N linear equations in N unknowns in a *single* step (say 37 MSYS), and using NO numbered storage registers (it can work directly with matrices dimensioned and stored in Extended Memory), so it can run at SIZE 000 !!!

In my not-so-humble opinion, it's the best module ever made for the 41C, in terms of practical, all-purpose usability, for both students and technical professionals. There are other very interesting modules, but either they are far too specialized and low-level, or else they are written in user-code/synthetics and so can't really compete in terms of speed or convenience.

I would very heartily advise you to get the Advantage ROM really ASAP. It will solve your present hexadecimal problem, and will enhance your HP-41C power and usability 1000% for any other tasks you may contemplate in the future.

Best regards from Valentin Albillo.

Re: Today I took the HP41 to class, and...

*Message #4 Posted by **Harry** on 17 July 2003, 8:02 a.m.,*
in response to message #3 by Valentin Albillo

Thanks, sounds like i HAVE to have that module. I currently have (thats what my second 41 from ebay came with) a "Financial 1", "X Functions", and "Stat 1" module. Does the Advantage module include all the functions of these modules?

Regards, Harry

Re: Today I took the HP41 to class, and...

*Message #5 Posted by **Valentin Albillo** on 17 July 2003, 8:24 a.m.,*
in response to message #4 by Harry

The Advantage ROM does include basic Time Value of Money functionality. It does use Extended Memory for all matrix capabilities, if available, even defining a special matrix file type in EM. This means you can define very large matrices and work with them without using any of the numbered registers (000 and upwards) in main RAM, so avoiding conflicts with any other programs you might have.

Whatever the case, trust me and get one fast. You'll be delighted with it, I really think that having an HP-41C without the Advantage ROM is actually wasting that wonderful machine's potential, your teacher won't believe his/her eyes when you demonstrate even a small part of its capabilities.

Best regards from V.

One more question about the Advantage module

*Message #6 Posted by **Harry** on 17 July 2003, 8:35 a.m.,*
in response to message #5 by Valentin Albillo

How does it handle complex numbers? Do I get a complex stack, or does it use the x/z register for the real and the y/t register for the imaginary part?

I would rather have a complex stack like the 42s has.

Regards, Harry

Re: One more question about the Advantage module

*Message #7 Posted by **Valentin Albillo** on 17 July 2003, 8:55 a.m.,*
in response to message #6 by Harry

Fifty-fifty. You do get a complex stack, with all typical stack operations available, but it's only 2 levels high. Nevertheless, it's quite useable and you can perform basic arithmetic plus many other functions, trascendentals included. Which is better, they can be used both in an interactive way and as non-interactive calls from your own programs.

By the way, the HP42S doesn't actually have a "complex stack", it's more like it can store a complex number in a single stack register. The only HP calculator featuring a true complex stack is the HP-15C. What's the difference, you say ? Well, in the HP-15C you can enter a complex number in the X stack register without losing your complex number already present in the T stack register. That you can't do in an HP42S, because it does need to use both X & Y stack registers to enter a single complex value. The HP-15C will do that using just the X register, in both its real and complex incarnations.

Best regards from V.

Re: One more question about the Advantage module

*Message #8 Posted by **Harry** on 17 July 2003, 9:29 a.m.,*
in response to message #7 by Valentin Albillo

Yah, I get what you are saying. But I never had a problem with that.

BTW, on the 15C, to change the sign of a complex number you have to press: "f", "Re<>Im", "CHS", "f", "Re<>Im", "CHS". thats 6 (!) keystrokes. Is there an easyer way to do that? Ok, "1", "chs", "*" would do, but that would mean loosing the t register again ;)

I don't really use the 15C for complex operations anyway, as I like to have both parts of the number displayed at the same time. And I had to write a program to be able to store complex numbers.

Regards, Harry

Advantage Pac / general complex-number support

*Message #9 Posted by **Karl Schneider** on 18 July 2003, 12:47 a.m.,*
in response to message #8 by Harry

Harry --

You sound like a knowledgeable collector, too! I also have the 15C, 16C, 41CV, and 42S, as does Valentin and many others here.

I'll echo Valentin's comment about the Advantage Pac being the best one made for the 41 -- certainly the best one made by HP. (I have one, too.) Expect to pay > $40 on eBay for one. There are some details regarding the Advantage module that should be pointed out:

1. The complex-number support is the RPN-code routines originally developed for the Math Pac. It is not nearly as complete and easy-to-use as the complex-number functionality in the 15C and 42S.

2. The binary/octal/hexadecimal conversions, while micro-coded, are somewhat cumbersome and designed for unsigned integers only. Again, no match for the 42S/32S/20S, etc...

3. The curve fitting routines, I believe, are the ones in the Stat module you have.

Regarding complex-number functions, the 42S would be closest to ideal if its "COMPLEX" command brought up the two-level menus of the HP-28C "CMPLX" and 48G "CMPL" functions.

The 28C/S is also quite good, but it doesn't allow computations in polar mode or display polar-mode values. Conversions must be perfomed, 15C-like.

Regarding complex-number support on RPL machines:

1. Does anyone know how to enter a complex-valued number in polar form on a 48G or 49G? I'm stumped! Rectangular-coordinate entry is assumed, even in "POLAR" mode (R < Z annunciator); there seems to be no P->R conversion on RPL machines (28C, 48G, 49G) that works on two real-valued arguments.

2. Try this on a 49G in "FIX 5" display mode :

```
(ALPHA)
CMPLX
(ENTER)
```

I get the following pop-up menu:

```
0. MAIN MENU
1. 00000RE
2. 00000IM
3. 00000CONJ
4. 00000ARG
5. 00000ABS
6. 00000i
```

In addition to the bug, it's not even the same menu as the one provided by option 9 under the "MTH" function. What a POS! I assume that there's a downloadable ROM upgrade, but this product is beyond patches...

How to enter a complex number

*Message #10 Posted by **Harry** on 18 July 2003, 7:55 a.m.,*
in response to message #9 by Karl Schneider

I am not quite sure if I understand your question, but this is what I think you asked: You want to enter a number not by real and imaginary part, but by "Betrag" (don't

know the english word) and Argument. This is done by opening brackets, typing the "Betrag" (still don't know the english word :)), then <right-shift> <SPC> (that angle thing next to pi on the SPC key), then the argument followed by <Enter>.

I hope this is what you asked.

regards, Harry

Re: Advantage Pac / general complex-number support

*Message #11 Posted by **jeff** on 18 July 2003, 8:46 a.m.,*
in response to message #9 by Karl Schneider

If I could design a 42SII+ (entirely mythical of course, it is not going to happen), I would put a key labelled "i" somewhere on it, with a shifted function of the angle symbol. To enter a complex number in rectangular form, key in the real part, press "i" and key in the imaginary. For polar form, key in the magnitude, press shift "i", and enter the angle. The calculator would convert the entered number to the current display format if necessary. The COMPLEX function could then bring up a menu of useful complex operations as CMPL does on the 48.
There are at least a couple of ways to enter a polar coordinate form complex number into a 48. One is as Harry suggests, use the parentheses and the angle key (R-shift SPC). Another is to first convert it to rectangular form, with the real part in stack level 2 and the imaginary in stack level 1 then use the R->C command. You are correct, there is no high-level command on the 48 to convert to rectangular, but you can write a simple program to do it and call it ->REC (like the 42S) or P->R or whatever you like. You could use sines and cosines and such to do the work, of course. There is however, a processor level command (probably not the right term, all you 48 experts please forgive me) that does the job. It kind of annoyed me that the command is in the machine but HP did not make it a high level command with a name, so I access the function using the following routine:
Polar to Rectangular:
Angle in stack level 2, magnitude in level 1

<< SWAP # 2B4BBh SYSEVAL SWAP >>

returns the imaginary in level 2 and real in level 1. I guess you could leave out the second SWAP, and the numbers would be ready to do a R->C on, but I follow the old convention for polar to rectangular (and rectangular to polar) operations on values on stack level 1 and 2 (equivalent to x and y on 4-level stack machines).

Rectangular to Polar:
imaginary in level 2 and real in level 1

<< SWAP # 2B48Eh SYSEVAL SWAP >>

returns the angle in stack level 2, magnitude in level 1

Using the parentheses and the angle key, it takes 5 keystrokes (not counting keying in the numbers) to get a polar form complex number into the 48. If you assign the above functions to a custom menu to which you also assign the built in R->C command, it takes four keystrokes. If you leave the second SWAP out of the programs, it only takes three.
For your info, I have read that using SYSEVAL is somewhat dangerous. Something

about crashing the system if you type in the hex number wrong. The above programs have not caused any problems for me, but use at your own risk.

Entering complex in Polar mode

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 18 July 2003, 9:48 a.m.,*
in response to message #9 by Karl Schneider

Hi, Karl;

the HP49G is actualy a hard-to-deal calculator. I like its resources, but operating it is another story.

You need the angle sign, easily found in the HP48G's keyboard; in the HP49G, it's the right-shifted ALPHA simbol in the [6] key. Let's suppose you wnat to enter 10|_45º, right? Try this:

```
[left-shift] [()] 10
[ALPHA] [right-shift] [6]
45 [ENTER]
```

If everything is right, you'll see:

```
(7.07106781187,7.07>
```

To visualize it in polar mode, you should go to [MODE] menu and change Coor. System set.

Hope this helps.

Best regards.

Luiz (Brazil)

"Thanks" to Harry, Jeff, and Luiz...

*Message #13 Posted by **Karl Schneider** on 18 July 2003, 11:58 p.m.,*
in response to message #9 by Karl Schneider

You all answered my questions.

Looks as though the 48 has everything you might want in complex-number support, except "intuitiveness" of use. The 49G is something else - [ALPHA][Rshift][UNITS] to insert an angle symbol? Good grief!

HP-41C Standard Applications book, which was later sold as a Pac (should be cheap on eBay).

The program is limited and uses 141 instructions, though...

Re: 41C Hex<->Dec Program also in...

*Message #16 Posted by **David Smith** on 19 July 2003, 2:47 p.m.,*
in response to message #15 by Karl Schneider

I don't think the 41C Standard Applications Pac was ever sold as a complete pac with module and manual. For a while the manual was included with the machine. You could send in a coupon to get the module. It arrived in an antistatic zip lock bag mailed in a foam padded bag. The module was also sold in a small box like the 82106A memory module, but it was way too small for the manual.

Standard Apps module

*Message #17 Posted by **Karl Schneider** on 20 July 2003, 2:20 a.m.,*
in response to message #16 by David Smith

David --

Aha -- so *that's* how it was done! I bought a cobbled-together 41CV package with a stapled Standard Apps book from November 1981. I also have on loan a 41C from 1980 that apprently came with a spiral-bound Standard Apps book from August 1980.

I have seen "Standard Apps" packages with modules available on eBay. Since most of the programs are trivial, or were improved and provided with other Pacs (e.g., Time, Stat, Financial, Math, Advantage) later, these "Standard Apps" packages don't command high prices.

Re: Standard Apps module

*Message #18 Posted by **David Smith** on 21 July 2003, 4:20 p.m.,*
in response to message #17 by Karl Schneider

For a long time I thought that all the Standard Pac modules were sent out in the padded envelope. Then a couple of months back I got one in the small box. You obviously had to get the manual separately (if you did not get it with the calculator).

Help! Can one store a table of values as a 15c array?

*Message #1 Posted by **glynn** on 17 July 2003, 1:34 a.m.*

A silly question, but instruction books are far away...

I am currently working at a place where we do one thing repetitively all day long: quote prices on an item we manufacture. We have a base price, plus a table of prices based on the quantity and complexity of the items; the consumer pays the base price PLUS the price I find in the table.

We have a billion $1 4-bangers lying around to do the job. I have the laminated table of prices on my desk. I am not supposed to supply my customers with these intermediate values. This means I talk to the customer, show him the options, then run back to my desk, calculate his price, and come back to him. This, quite frankly, embarrasses me.

And it occurs to me that, in this 15c of mine, is the ability to store an arbitrary matrix such as my "table". I've never used matrices, for any reason, since getting the 15c-- but if I could enter the table into it and recall individual values from it, this would be a neat solution and yet another excuse to have my favorite calc in my pocket.

Has anyone used a matrix this way, and how do you do it?

If this is too silly to use the 15c for, I will probably dig out my junky wires-hanging-out '75 and try to write a BASIC program. But the 15c is so nice and unobtrusive...

;-)

Re: Help! Can one store a table of values as a 15c array?

*Message #2 Posted by **Thibaut.be** on 17 July 2003, 3:56 a.m.,*
in response to message #1 by glynn

The answer is yes

BUT

The matrix can't be bigger than 8x8.

In addition recalling the data is not that user-friendly.

But if this is sufficient for you, it's worth trying !

Re: Help! Can one store a table of values as a 15c array?

*Message #3 Posted by **Valentin Albillo** on 17 July 2003, 4:19 a.m.,*
in response to message #1 by glynn

Hi glynn:

It may be feasible (and convenient) depending on the amount of data we're talking about. If the number of table values is 67 or less, you can indeed store them in an HP-15C array and recall them manually at will.

If the number of values is less than 67, there will be some space still left to write a small program that would do the recalling and even perform some calculations using the stored values, automatically.

Please provide specific, exact and comprehensive details on the number of data and what you want to do with them (exact specifications) and it's quite possible that we can offer you some precise help or even write the routine for you.

Best regards from V.

Re: Help! Can one store a table of values as a 15c array?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 17 July 2003, 7:03 a.m.,*
in response to message #1 by glynn

Hi, Glynn;

just to add a few more data.

Based on what both Thibaut and Valentin posted, you can summarize these facts:

- the maximum number of registers in an HP15C is 67;
- only 64 of them can be used in matrices, because RI, R0 and R1 will be always RI, R0 and R1;

As Valentin mentioned, you can store up to 67 numbers, but only if you have less than 64 you'll have space for a program or routine; RI, R0 and R1 cannot be converted into program steps.

You can create matrices with valid dimensions starting with [64 × 1] to [1 ×64] and with any other [*# of rows* × *# of columns*], provided that *# of rows* × *# of columns* <= 64.

If you find a suitable arrangement, defined by an specific # of "products" and related # of items/product, you define the matrix DIMension directly like this:

of "products" [ENTER] # of items/product [f][DIM] { [A] to [E] }

The { [A] to [E] } means you can choose which one is better for you. Maybe [f][DIM] [C] suggests Costs, who knows?

You can fill the matrix as a sequence of linear data, starting with C (1,1) to C (r,c), being (r,c) the indexes for the last element in the matrix. Considering *r* as # of rows, *c* as # of columns and [C] as the matrix you are going to use to store your data, follow these steps to create the matrix and store data on it:

```
(1) [f][MATRIX] 0 (or [ON]/[-] to clear all memory)
(2) r [ENTER] c  [f][DIM] [C]
(3) [f][MATRIX] 1
(4) [f][USER] (to activate USER mode)
(5) enter first data
(6) [STO] [C] (shows element indexes while [C] key is held down)
(7) enter next data
(8) back to step (6) till last data
```

Obs: [f][MATRIX] 0 clears all existing matrices, if any, and frees their space to new data; [f][MATRIX] 1 stores 1 in R0 and R1, "initializing" matrix index, as explained right below; USER mode is activated to allow automatic "index update" (increasingly) each time [STO] {[A] to [E]} (or [RCL] {[A] to [E]}) is pressed.

Alternatively, you can use a non-sequential way to enter data that is almost the same one used to recall them

non-sequentially. This method uses two stack registers contents - Y and X - as indexes for (r,c). When using sequential access, R0 and R1 are used as indexes, i.e., element C (r,c) is, in fact, C (R0, R1). If you want, you can access C (r,c) using stack registers and the element would be C (Y,X). This is accomplished with the sequences [RCL] [g]{ [A] to [E] } and [STO] [g] { [A] to [E] }. Assume you are still working with matrix C and it was defined with ten products and 5 items for each product. To create this matrix you should use:

```
10 [ENTER] 5 [f][DIM] [C]
```

After you fill it with all data, let's suppose you want to add the first and the fourth elements in the third row. To recall each of them and add their values, you should do this:

```
(1) 3 [ENTER] 1
(2) [RCL][g] [C] ([C 3,1    ] is briefly shown)
(3) 3 [ENTER] 4
(4) [RCL][g] [C] ([C 3,4    ] is briefly shown)
(5) [+]
```

Step (1) defines row # 3 and column # 1 as indexes;
step (2) recalls C (3,1) (or C (Y,X)) to the stack;
step (3) defines row # 3 and column # 4 as indexes; note that previously recalled value is now in Z-register;
step (4) recalls C (3,4) to the stack; now you have C (3,1) and C (3,4) in Y and X registers, respectively;
step (5) adds them both.

I hope this helps you a bit. If I forgot anything and you cannot do it, please, let us know. I wrote this all by heart, maybe there are errors.

Success.

Luiz (Brazil)

Edited: 17 July 2003, 7:22 a.m.

You guys are awesome!

*Message #5 Posted by **glynn** on 17 July 2003, 9:10 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Though the H15c description here at the museum explained the modes of entry-- and I wouldn't change that description at all-- I was missing a couple of steps (or more likely, misperceiving them), resulting in "error 4"s and such when trying it solo. But I have printed out your explanation, Luiz, and just toying with it here before I go to work, I see I *can* put values into the matrix AND see them later. That is of tremendous value!! Thank you so much, Luiz!

While 8x8 won't hold *ALL* permutations I have in my table, it will certainly get the lower half in, the one my mind refuses to commit to memory. This ability to put things in an array would probably be more used by business people if they knew... so many times I've seen "cheat sheets" of data in co-worker's pockets, usually "encoded", like writing the number backwards with decimal removed.

All you guys-- Dave (what a great site), Thibaut, Valentin A. and Luiz V.-- thanks for being here and being helpful and willing. I'm always amazed at the cool ideas and precise information stored in YOU.

You´re welcome! And one missing fact

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 17 July 2003, 1:24 p.m.,*
in response to message #5 by glynn

Hello, Glynn;

thank you for your kind words.

One fact I did not mention is related to "randomly" store data in an existing matrix using

```
 [STO][g] {[A] to[E]}.
```

You simply enter the value you want to store, row # and column # and press:

[STO][g] {[A] to [E]}.

For example, if you take the previous marix C [10,5] and want to store 12 in C (4,2) using only the stack registers, you may use the sequence:

```
12 [ENTER]
4  [ENTER]
2  [STO][g] [C] ( [C 4,2      ] shown briefly)
```

Just to complement previous data.

Best regards.

Luiz (Brazil)

To Kill the Flying Goose

*Message #1 Posted by **Pierre Brial** on 17 July 2003, 12:41 a.m.*

Good morning the List

I've made a tide prediction program for my HP41CX. With heavy use of cosinus, the program is rather slow : 4 minutes to compute the low and high tides of a given day. During the process, one can see the famous goose flying slowly across the display. Is there a way to replace it with an alpha message which remain displayed without stopping the program ? something like "please wait", or "computing..."

All the best

Pierre

Re: To Kill the Flying Goose

*Message #2 Posted by **Ernie Malaga** on 17 July 2003, 2:15 a.m.,*
in response to message #1 by Pierre Brial

Pierre:

The "goose" flies across the display automatically and, to the best of my knowledge, there's no way to remove it. The "goose" advances one position to the right each time the program finds a LBL instruction, but even if you were to (somehow) remove all LBLs, all you'd get is a stationary goose.

It took the genius of Bill Wickes to make the goose fly backwards!

-Ernie

Re: To Kill the Flying Goose

*Message #3 Posted by **Mike (Stgt)** on 17 July 2003, 3:53 a.m.,*
in response to message #1 by Pierre Brial

Yep, that's a simple one: in your program just put a MSG in Alpha and do an AVIEW. W/o printer make sure flag 21 is clear otherwise AVIEW halts execution. For heavy itterating routines it's a good idea to put something in the display as the program runs some fraction of miliseconds faster. Reason: at any label there is no need to update the display.

Ciao.....Mike

Re: To Kill the Flying Goose

*Message #4 Posted by **Werner Huysegoms** on 17 July 2003, 4:10 a.m.,*
in response to message #3 by Mike (Stgt)

You can even make the message scroll the way the goose does. Do SF 25 "MESSAGE" AVIEW SF 99 and

from there on, every LBL will scroll the message one place to the right in the display.

Re: To Kill the Flying Goose

*Message #5 Posted by **Pierre Brial** on 17 July 2003, 5:58 a.m.,*
in response to message #3 by Mike (Stgt)

Great tricks ! Thank you very much, Mike and Werner, for these informations. I used the time function to see if there is any speed differences. They are under 2 seconds :

- with flying goose : 4' 29.18"

- with a still message : 4' 29.36"

- with a moving message : 4' 27.86" Thank you again.

Pierre

Re: To Kill the Flying Goose

Re: Great photos of the Xpander

*Message #3 Posted by **jennifer seelye** on 17 July 2003, 5:47 p.m.,*
in response to message #2 by Mark Hardman (LED)

I am glad you two like my photos. I did have one person that wanted more photos, a front view, back view & 3/4 view. Silly me, I thought I already did a front & back shot.

I will tell you my cost after the auction is over. All I can say is that I paid less than the price right now.

I do have one question that people here may know here. What kind of batteries should be used with this calculator & where can I get them? When I tested this xpander it was plugged in to recharge, I didn't realize that the batteries are dead and do not work. I posted that info on the auction & emailed the high bidder (no reply yet). I don't think that will change the auction much but I'm glad I noticed this before the auction ended & the calculator shipped.

Thanks in advance! Jennifer

Re: Great photos of the Xpander

*Message #4 Posted by **Y K Wong** on 17 July 2003, 9:25 p.m.,*
in response to message #3 by jennifer seelye

Hi Jennifer,

This is the common problem with all the prototype Xpander, once the battery is totally drained for sometime, despite that you charge it with the original charger for 8 - 10 hours, the batteries will not hold any charge.

All you need to do is open up the battery door (note, HP has clip off the two clips, therefore, you would need to use two small screw drivers to insert into the cut-off clips concurrently to open it) and remove the two "AA" NiMH batteries and put them in any standard NiMH external charger for a couple of hours. After that, reload the batteries into the Xpander to complete the eight hours charging with the original charger. Once this is done, the Xpander can be charge normally with the original charger. However, if you would leave the battery "flat" in the Xpander for a another short period of time, you would need to go thru the same process again. On the other note, please take care while removing the batteries since there are spring on both positive and negative end of the battery terminals, you would need to use two small screw drivers to depress the springs in order to remove and reload the batteries.

What is an HP 82972A for the HP-85?

*Message #1 Posted by **John** on 16 July 2003, 6:46 p.m.*

Hi,

eBay has a listing for an HP-85 with an 82972A upgrade - Google has no hits for this, anyone know what this means please?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2545475283

Thanks, John

*Message #2 Posted by **Vassilis Prevelakis** on 17 July 2003, 4:25 a.m.,*
in response to message #1 by John

It is probably the A to B upgrade. This is why you get the 64K memory module which does not work with the 85A.

MLDL2000 Specification Update

*Message #1 Posted by **Meindert Kuipers** on 16 July 2003, 3:31 p.m.*

I have just uploaded the official version 1.0 of the MLDL2000 Specification. Those who are interested are free to download the PDF file from www.kuipers.to/hp41. In the past I have had questions for other formats, but I am trying to keep the spec under revision control, so PDF is what you get.

Progress: The new state machine works, I seem to have just a tiny little bug in the address decoder, which I hope to fix tonight. If this works the next steps are:

- Make USB I/O work, this is actually more software work than hardware, but not extremely complicated. - Get the PCB routed and make real proto's!

Overall expectations: put the MLDL2000 on your Xmas shopping list ;)

To avoid flames: this is NOT a commercial project, I will sell units at cost. Unless of course HP has the common sense to start producing the HP41 again (or anything else that has I/O ports. I will be first in line to hook up something to it).

Meindert

I know sometimes I'm dense but what in the world is a "MLDL2000"?

tm

Re: MLDL2000 Specification Update

*Message #4 Posted by **Meindert** on 17 July 2003, 2:49 a.m.,*
in response to message #3 by Trent Moseley

From the MLDL2000 Specifications:

What is an HP41 MLDL? MLDL stand for Machine Language Development Lab. Sounds cool and high-tech, doesn't it? But what does it? The HP41 architecture understands two programming languages: User Code and Machine Code (or M-Code). The latter is normally not available to end-users. Expansion of the HP41 system is usually done with plug-in modules, or ROM (for Read Only Memory). These contain either User Code or M-code (or a mix thereof). These ROMs could be produced by HP only, although larger groups (like the PPC who made the famous PPC ROM) could develop code and have it produced by HP. When details of the HP41 interface became known it was apparent that the ROM could actually be emulated by (battery backed) RAM. An unused HP41 instruction was defined by the user community to enable writing into the RAM and the Machine Language Development Lab was born. It was now possible for end-users to write and test their own M-Code and later burn it into an EPROM.

Re: MLDL2000 Specification Update

*Message #5 Posted by **Mark Hardman (LED)** on 16 July 2003, 10:42 p.m.,*
in response to message #1 by Meindert Kuipers

I think I might wet myself.

Do I understand correctly that this will give me a way to protect the precious investment I have in rare HP-41 modules by copying their ROM images to the MLDL2000? An giving me access to them all (well some) of them at the same time?

Put me on the list for one.

Oh, the dream of learning m-code is within my grasp.

Mark Hardman

12c: How do you change from "," to "."?

*Message #1 Posted by **bruce** on 16 July 2003, 10:40 a.m.*

Somehow, I changed from the normal US setting of the thousands separator being a "," to a "." Also, decimal points are now ",".

Does anyone know how to change it back?

Thanks

Looks a bit liek the 10bII

10bII

regards, Harry

Re: HP 17bii+ picture!
*Message #3 Posted by **Scuba Diver** on 16 July 2003, 10:20 a.m.,*
in response to message #2 by Harry

It looks a LOT like the 10BII! Hopefully ir doesn't suffer from the same quality control issues as the 10BII!

The interesting thing is the reference to CITIZEN...any ideas???

B.

Quality?
*Message #4 Posted by **Patrick** on 16 July 2003, 12:52 p.m.,*
in response to message #2 by Harry

So, it appears likely that the technology of the new 17BII+ will be on about par with the 10BII. As Ron says, the 33S will likely be the same.

So the question is, are there quality issues with the 10BII? I've never touched one, but they sure look cheaply made. Do they feel solid? How do the keys feel? Do they register reliably? Do they bounce? Is the display easily readable? Tell us more!!!

Re: Quality?
*Message #5 Posted by **Scuba Diver** on 16 July 2003, 1:16 p.m.,*
in response to message #4 by Patrick

Well, I've played with a 10BII at the store, and it definately is of lower quality than the 10B. The keys don't have the same feel; in short, you can tell the difference, and it's not a good difference!

I read a thread on here a few months ago that talked about the "N" key sticking on many 10BIIs because the key is too close to one of the plastic stakes...not a sign of good planning and design!

One thing to keep in mind is that the 17BII+ will retail for about $120 US and the 10BII is nowhere near that price point. Although the design is the same, it's possible that the internals are more robust...who knows, we may be pleasantly surprised...emphasizing the word MIGHT! :)

B.

Re: Quality?
*Message #6 Posted by **Gene** on 16 July 2003, 5:57 p.m.,*
in response to message #4 by Patrick

I quit using my 10BII after about a month because the FV key in the top right corner turned mushy and quit responding reliably to key pushes.

This was a contributing factor to the university where I teach the business math course deciding to change their recommended calculator from the HP-10B to the TI BAII Plus.

Oh well.

We'll see what this new puppy is really like soon, I suppose.

Re: HP 33s soon to follow
*Message #7 Posted by **Ron Ross** on 16 July 2003, 11:01 a.m.,*
in response to message #1 by Jonas Lööf

I suspect the new Hp33s will be along similiar lines also. Just imagine an Hp10bii keyboard on an Hp32s and Voila!!! Hp33s! Well double or triple the Ram on a 32s also, to maybe 1000 steps so as to justify a small number increment.

Re: HP 33s soon to follow
*Message #8 Posted by **jeff** on 16 July 2003, 1:03 p.m.,*
in response to message #7 by Ron Ross

I'd like more than just a few more program steps to justify that number increase. How about:
1. a two line display with softkeys like the 17Bii+.
2. 32k ram for programs
3. ability to enter, manipulate and display complex numbers as r + jx or magnitude and angle
4. shifted functions above the keys, alpha characters on that slanted key face
5. infra-red and/or serial cable input and output
6. clock and appointment functions
OK, I guess I am really hoping for a 42Sii+!

I order one of those too :)
*Message #9 Posted by **Harry** on 16 July 2003, 1:27 p.m.,*
in response to message #8 by jeff

I have little to no hope it will be like that though.

Regards, Harry

Re: HP 17bii+ picture!
*Message #11 Posted by **Scuba Diver** on 16 July 2003, 12:25 p.m.,*
in response to message #10 by Jonas Lööf

I wonder if the 17BII+ has any sort of I/O capability; IR port?

I don't think that many 17BII users took advantage of the IR port, so perhaps they've taken this opportunity to keep the price point low and removed it...

Now I'm interested to see what the 19BII+ looks like!!

B.

NEW: HP 19bii+ picture!
*Message #12 Posted by **Mark Hardman (LED)** on 16 July 2003, 10:00 p.m.,*
in response to message #11 by Scuba Diver

Ask and ye shall receive!!!

HP-19ii+ is located at:

http://www.seodots.co.kr/AsaBoard/asaboard_show.php?bn=hp-calculators&fmlid=14&pkid=15&startTextId=0&buffer=14&thisPage=1&jk=1&mode=search&srchValue=&searchTemp=&term=

OK, it looks more like a concept drawing. But it does look nice IMO.

Mark Hardman

Edited: 16 July 2003, 10:02 p.m.

Mark, you're a miracle worker!
*Message #13 Posted by **Scuba Diver** on 16 July 2003, 11:33 p.m.,*
in response to message #12 by Mark Hardman (LED)

It does appear to be a concept drawing, but it looks sweet! It has the fullsize enter key, which is missing on the 17BII+

I'll be lining up for that one when it goes on sale, let me tell ya!

B. P.S. Any idea how we can become beta testers? I'd give my right arm to be ambidextrous and my left to be a beta tester...

Re: Mark, you're a miracle worker!

*Message #18 Posted by **Raymond Del Tondo** on 17 July 2003, 12:31 p.m.,*
in response to message #12 by Mark Hardman (LED)

Yes, this one looks very stylish. As Scube Diver noted, it has the ENTER/INPUT key :-)

And it has the 'Printer' key.

Let's see it in real, please.

Raymond

Re: HP 17bii+ picture!
*Message #19 Posted by **Raymond Del Tondo** on 16 July 2003, 2:12 p.m.,*
in response to message #10 by Jonas Lööf

It's nice to see the original HP-17BII just right to the '17BII' :-) Just below the beamers, and above the cashier's machine.

However, I have a 10BII, and I must say, the keyboard is *not* reliable.

Maybe they solved the other problems, like the rubber feet, which were too small in the 10BII. Lets hope they improved the keyboard, else the machine is just trash.

BTW: I could imagine a 19BII+ to have an alpha keyboard like some of the older Casios, only some contact sheets behind a flexible plastic 'curtain' , at least after seeing the new 17BII;-)))

Raymond

Whatever happened ... ?

*Message #1 Posted by **unspellable** on 16 July 2003, 9:44 a.m.*

Whatever happened to Sparcom and da Vinci?

Re: Sparcom and DaVinci

*Message #2 Posted by **Frank Travis** on 18 July 2003, 1:11 p.m.,*
in response to message #1 by unspellable

I had purchased Sparcom and DaVinci plug-in application cards (and their accompanying manuals) for HP 48SX/GX in years past from the now defunct EduCalc. Sparcom later became DaVinci and had the website www.dvtg.com. They apparently went out of business and sold their products to resellers. Now the only place I know of that still sells these products is Calcpro website www.calcpro.com. Its manager is Paul Nelson. I have bought HP 48GX calculators and accessories from them. Occasionaly Ebay website www.ebay.com has some of the plug-in cards and manuals.

HP-41CX lock-ups

*Message #1 Posted by **Axel Poqué** on 16 July 2003, 8:36 a.m.*

I have recently acquired a HP-41CX in mint condition. It was produced in 1988 and it really appears to never have been used before (it was sold as Mint in Box).

I have been experiencing several (about 5 times) lock-ups during the short time (4 days) I've used it. The calculator cannot be turned off anymore, or it shows strange characters on the display, or it just displays "MEMORY LOST" when turned on.

Is this normal for a HP-41? Could this be related to just pressing a few keys to fast in succession? At least on one occasion it happened right after pressing 2 keys very rapidly when entering a program.

Axel Poqué

Re: HP-41CX lock-ups

*Message #2 Posted by **Thibaut.be** on 16 July 2003, 8:51 a.m.,*
in response to message #1 by Axel Poqué

Have you already tried fresh batteries ?

HP-41CX lock-ups

*Message #3 Posted by **Axel Poqué** on 16 July 2003, 9:00 a.m.,*
in response to message #2 by Thibaut.be

Yes, I had to, since they were the only thing not included.

I would have opened the calc already, to see if maybe the srew posts were damaged, but I do not want to risk damaging it, given its good condition. There are no loose parts inside, and it feels stable in my opinion.

Re: HP-41CX lock-ups

*Message #4 Posted by **bill platt** on 16 July 2003, 9:06 a.m.,*
in response to message #1 by Axel Poqué

Axel,

Is it half-nut or full-nut? Half-nuts have a rounded border in the display. My full-nut CV did that, abd it turned out to have cracked lower screw posts--which makes the compression contact between the brains and everything else.

I hope someone else with more experience has better news. But even with cracked posts, you can fix it.

Regards,

Bill

HP-41CX lock-ups

*Message #5 Posted by **Axel Poqué** on 16 July 2003, 9:14 a.m.,*
in response to message #4 by bill platt

It's a half-nut, produced 1988.

Is there a possibility to find out IF the screw posts are cracked (maybe transportation damage?) WITHOUT opening it? (I really don't want to damage it, since it is really mint!) How stable is the case if the calc is still ok - is it possible to bend it slightly, or does it creak when you try it? (I can't try at the moment since I'm at work and the calc is at home)

Re: HP-41CX lock-ups

*Message #6 Posted by **Harry** on 16 July 2003, 9:22 a.m.,*
in response to message #1 by Axel Poqué

Both my HP 41CVs behave strange when I haven't had batteries in them for a long time (more than 2 month).

One of them has a dimed display and shuts down after turning it on and off again a few times. It takes a week or so with batteries in it untill it operates propperly.

The otherone sometimes does not operate at all after puting batteries in. I then have to take them out again and give it another try after a week .

I got now idea what causes these strange behaviors.

Regards, Harry

HP-41CX lock-ups

*Message #7 Posted by **Axel Poqué** on 16 July 2003, 9:30 a.m.,*
in response to message #6 by Harry

Since the calc probably hasn't seen a battery for about 15 years, this could be the reason (although I guess that it has been tested by the seller). So you think the problem should go away over time?

Many thanks, Axel

Re: HP-41CX lock-ups

*Message #8 Posted by **Harry** on 16 July 2003, 9:45 a.m.,*
in response to message #7 by Axel Poqué

Well, I am not sure it will go away, as it sounds a bit more serious than the problems I have. But I would wait a while before opening it, especially when you are worried about damaging something. Just leave the batteries in it for a week. It's worth a try in my opinion. In case it locks up, you could also discharge the internal backup capacitor by connecting the batterie-contacts with alumin(i)umfoil for a day or so.

Regards, Harry

and good luck!

HP-41CX lock-ups

*Message #9 Posted by **Axel Poqué** on 16 July 2003, 10:23 a.m.,*
in response to message #8 by Harry

Ok, I will do so. Thanks a lot!

Axel

Re: HP-41CX lock-ups

*Message #10 Posted by **Thibaut.be** on 16 July 2003, 9:38 a.m.,*
in response to message #6 by Harry

Yes, next step after fresh batteries is bad contact. You can easily check this out in trying to turn it on while pushing with one hand the edges of the calculator close to the 1st row keys (LN, LOG, ...). If behaviour changes and improves while your're pressing then basd contact has been recognised.

If you hear something inside, it might be the fixing posts that are broken.

You will have to open it, but don't worry it's very easy. 1) take off the 4 rubber feet. Put them in a smaal plastic box so that no dust come on the glue. 2) unscrew the 4 screws. Make sure you recognize the short and long screws. 3) check if the posts are cracked. If yes try to recover all plastics parts 4) the calc should split into 2 parts with a center plastic part. The battery contacts and port contacts shold easily come out. 5) with a rubber, clean all contacts. 6) take a pin and put it under the flexible contacts. There is a kind of white foam that you could strecth by 1/2 - 1 mm. Make sure you dont scratch the flexible contacts. 7) glue up all the fixing posts with dedicated plastic glue (some people in the articles of this site gave exact name of components and brand). I use 2 component plastic glue that can be found il any DIY shop. Let it take the time to solodify correctly. 8) blow up all dust/dirtiness but make sure not to scratch anything. 9) mount your flexible back, make sure they are in good contact evrywhere with the PCB and the battery contacts 10) screw your calc, using the correct screws. you could put some very light grease on the screws as you will have to "dril" your fixing posts. PLEASE DO THIS GENTLY, AS CRACKING THE FIXING POSTS IS THE MAST THING YOU WANT : at the end, each 1/4 turn put the batteries on and turn your calc on : stop screwing when it turns on correctly

HP-41CX lock-ups

*Message #11 Posted by **Axel Poqué** on 16 July 2003, 9:46 a.m.,*
in response to message #10 by Thibaut.be

I think I will do this as a last resort, if the problem doesn't fix itself in time, as Harry suggested. I'll check for contact problems when I get home today.

Axel

Re: HP-41CX lock-ups

*Message #12 Posted by **David Smith** on 16 July 2003, 11:00 a.m.,*
in response to message #1 by Axel Poqué

My guess is the internal contacts need to be cleaned with 91% or stronger isopropyl alcohol. Halfnut machines only have the battery contact assembly. Fullnuts have a zebra strip connector under the CPU board. Both can get oxidized after a few years.

One way to check for cracked case problems is to look very carefully at the side seams of the case. Gently

squeeze the case halves together near the rubber feet. There should not be any movement (or mayby a few 1/1000 of an inch).

Also remove the port covers from the top of the machine and GENTLY pull on the case halves. Again there should be no movement. Dont pull too hard or you may cause the problem you are attempting to find. If the case halves come apart any then one or both of the top screw bosses has broken.

Re: HP-41CX lock-ups

*Message #13 Posted by **Pierre Brial** on 16 July 2003, 11:08 a.m.,*
in response to message #1 by Axel Poqué

Hello Axel Incorrect voltage supply sometime bring this behavior. What kind of battery do you use ? One day, by mistake, I supplied my HP41cx with 9 volts. The display began to show strange characters. I disconected the supply immediately, but after to have put correct voltage, the calculator didn't want to switch on again. I was very angry again myself and believed to have killed it. One month later, I try again without much hope with a soft 4.8 V. Miracle, the calculator work again ! So good luck with yours, and please tell to the forum if you succeed to fix the problem. All the best Pierre

Re: HP-41CX lock-ups

*Message #14 Posted by **Axel Poqué** on 16 July 2003, 12:40 p.m.,*
in response to message #13 by Pierre Brial

Just standard 1.5 V type N/LR-1 alkaline cells, so that should be not the problem.

I just discovered that I can provoke the behaviour by pressing the case near the top row, so it seems an internal contact problem (as suggested by Thibaut.be and Dave Smith). Now I only have to convinve myself to open the calculator...

Re: HP-41CX lock-ups

*Message #15 Posted by **Thibaut.be** on 17 July 2003, 4:47 a.m.,*
in response to message #14 by Axel Poqué

Gop ahead, open it. It's very easy, if you're a little careful you won't do any harm.

Re: HP-41CX lock-ups

*Message #16 Posted by **Thibaut.be** on 17 July 2003, 4:50 a.m.,*
in response to message #14 by Axel Poqué

BTW one can't sell a 41CX in mint condition with lose screw posts inside... You might want to try a replacement...

On the other hand once you've repaired it it will be quite invisible.

Re: HP-41CX lock-ups

*Message #17 Posted by **Raymond Del Tondo** on 16 July 2003, 2:18 p.m.,*
in response to message #1 by Axel Poqué

Hello,

did you buy one of these NIB CX's either at ClassicCalculators.com , or alternatively, from december64 off

eBay?

If yes, you could try to get a replacement from the seller.

Regards,

Raymond

HP-41CX lock-ups

*Message #18 Posted by **Axel Poqué** on 17 July 2003, 6:58 a.m.,*
in response to message #17 by Raymond Del Tondo

Yep, bought it NIB from december64 on eBay.

It is not that there is any visible or otherwise noticable damage to the calculator, nothing loose inside, etc - it just exhibits random lockups a bit to often. If you think I could get a replacement for this...

Axel

Re: HP-41CX lock-ups

*Message #19 Posted by **Thibaut.be** on 17 July 2003, 7:09 a.m.,*
in response to message #18 by Axel Poqué

Well, try it... they still have some as far as I know, and cracked screw posts is quite strange for a new calculator.

Re: HP-41CX lock-ups

*Message #20 Posted by **Axel Poqué** on 21 July 2003, 11:06 a.m.,*
in response to message #19 by Thibaut.be

Well, John Innes (december64) has kindly agreed to send a replacement. He even offered to send me a replacement if I tried repairing it first and couldn't get it working. I declined since I didn't want to (possibly) ruin an otherwise excellent calculator. (Thanks a lot, John, I hope you don't mind me posting this here, I just wanted to give an update and praise the way you do your business.)

Axel Poqué

Blank-Nut On eBay?

*Message #1 Posted by **Mark Hardman (LED)** on 15 July 2003, 9:52 p.m.*

At the risk of pulling a "Gene" here, I'm curious why the following auction for an HP-41C OPT-001 has not been bid through the roof over its initial six days.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3034801541&category=11713&rd=1

Am I missing something here? The seller obviously does not know what he has on his hands. Or is the auction for a clever counterfit? The seller insists that his description of the item is correct, "No overlay or letters on the keys."

Re: Blank-Nut On eBay?

*Message #2 Posted by **Randy Sloyer** on 15 July 2003, 10:47 p.m.,*
in response to message #1 by Mark Hardman (LED)

For my 2¢ worth, the "clear tape on the bottom and sides" is probably holding the unit together. Once the top posts crack off, it's the standard user method to keep the battery/port connector in contact with the logic board.

In short, unless you are willing to solvent weld it back together, caveat emptor. That is of course if you are fortunate enough to get all the pieces. I doubt it though, as it missing a rear cover, so the broken bits had an escape port :^)

Or, being positive, it could just be holding the battery charger port cover on...

Edited: 15 July 2003, 11:06 p.m.

Re: Blank-Nut On eBay?

*Message #3 Posted by **Mark Hardman (LED)** on 15 July 2003, 11:39 p.m.,*
in response to message #2 by Randy Sloyer

The tape is too low to be holding the battery port in place. I'll go with your pessimistic view and count myself lucky that I pulled up short on the bidding.

Even a highly collectible piece of crap is still a piece of crap.

Looks like it is a legit blank nut. However, I think it's in pretty bad condition.

Re: Blank-Nut On eBay?

*Message #5 Posted by **ted** on 16 July 2003, 1:24 p.m.,*
in response to message #4 by Chan Tran

Well, it is even more weird than that:

He talks about it being a CX, but there's no label on the front it as it's a blanknut; He talks about 'not having an adapter', but anyone knows how to put batteries in a holder; I suspect he knows it doesn't work, and is just talking about adapters to make it sound hopeful. In any case he knows more than he's disclosing.

Sorry to sound so distrustful and disillusioned; I've learned my lessons the hard way.

Re: Blank-Nut On eBay?

*Message #6 Posted by **Raymond Del Tondo** on 16 July 2003, 2:28 p.m.,*
in response to message #5 by ted

Hi,

I don't think that the calc is a CX. Look at the bottom label. Every CX I saw so far has the silver CX label with the CX 'ED' short key description.

There's a chance that a blanknut doesn't even have this by default, but there's also a chance that the top and bottom halves of the machine just don't belonged to each other originally. Or the tape strip is used to hold the label down, because it may not glue perfectly...

However, the missing front label isn't a sign against a blanknut. AFAIR the ones I saw so far didn't have that label, too.

Raymond

Re: Past Auctions

*Message #7 Posted by **gifron** on 16 July 2003, 2:36 p.m.,*
in response to message #5 by ted

This seller has sold electronics in the past that he could test, even though he was selling the unit only. See http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=38331&item=3032060039

Of course N cells are not something everyone has lying around the house.

Re: Past Auctions

*Message #8 Posted by **Chan Tran** on 16 July 2003, 2:39 p.m.,*
in response to message #7 by gifron

I had several CX blanknuts. I have only one now. When I got them they don't have the label affixed to the calculator but one came with the calculator so you could put it on.

Calculator Logic Systems (long)

*Message #1 Posted by **bill platt** on 15 July 2003, 6:05 p.m.*

Until I discovered this forum, I really was not a calculator Geek. Sure, I used one frequently, but I did not think about them constantly.

Now however, I am a total calculator Geek. I think about them all the time. When asked when this will all blow over, I usually say, "we'll see"!

The point of all this prelude: In my previous life, I was only proficient in RPN--meaning that I have always had an intuitive feel for its use (from frequent use) and when tackling complex manual calcs, I have always been able to use all of the stack, and avoid losing data off the back of the t register etc.

For any non RPN machine, I would work with it in a "crippled" mode--using pencil and paper, or the (usualy solitary) memory register even when not needed--always careful.

But now, whenever I see a machine, I have to see how it works--so I have made some interesting discoveries! I am sure many or most of the present audience has already made them, so please forgive my recent enthusiasm.

So far, I have found at least 5 major different logic systems: (and many sub-sets!)

RPN/RPL

Adding Machine Logic

"Regular Calculator" Logic

"Algebraic" Logic

"Formula entry"

So, for instance, most of the cheap regular 4 or 6 function machines have a curious stack system: Note that I am indicating chain calculations following on from the original:

1+2=3 4=5 6=7; or also 5/2=2.5 5=1 10=0.5

PLEASE SEE THE FOLLOW ON POST WHICH CORRECTS AND AMENDS THIS PART.

In other words, it is sort of a perfect infix: it remembers the first number and the operator, and if you type anoither number right after, followed by equals, you will get an answer. And therefore if you type equals twice, you will carry on with the answer and the first number. This is actually as good or better than RPN for doing certain chain sums. Of course there is also no precedence--but with a memory register, you can get around this, and in fact I did some big computations and compared them to an HP 20s and they had the same number of keystrokes.

The more curious part is this:

8/=0.125 =0.015625 etc for each equals. In other words, there is an implied leading "1" for some reason. This is sort

of a mirror of the other fact: 8x=64 =512 etc.

Interstingly, the built-in Windows calculator does the same thing except that you get the more expected series of:

8/=1 =0.125 =0.015625 etc.

Now, the "algebraics" generally do not seem to have this handy chain behavior, but I am sure some of them do (for instance, the Windows built-in one does). The 20s has no good chain system, other than writing a progam to add or mult a constant, so two keystrokes is still possible.

An interesting thing about the algebraics with precedence, like the 20s, is that you actually do not need to use all the parentheses--and in fact if you use one in every place you see on paper, you will use way more keystrokes. For an RPN guy, this business of whether and when to hit close parentheses, versus =, is quite confusing and a source of error.

Then of course there are the 27s with the stack, and most HP pioneers, with the "input" swap and also last x.....

Finally, a co-worker has a casio with "true" algebraic--so even sqrt, cos, sin etc are infix rather than postfix. I have not explored it in depth yet, but I am sure there are some interesting nuances.

I must say, I was surprised at the utility of the cheapo regular calculator logic, once I got to trying it out!

Regards to all.

Bill

*Message #2 Posted by **harry** on 15 July 2003, 7:39 p.m.,*
in response to message #1 by bill platt

Theres just one problem: Nothing of this is documented. So you have to do a lot of try and error testing before you know whats going on. And then when you use another of those casio or texas calculators that seams to be exactly the same, you find out it behaves diffrent.

Maybe I am just lazy, but when I calculate something I wanna think about the problem I am solving, not about what the right keystrokes are to avoid loosing data.

Regards, the RPN guy Harry

Re: Calculator Logic Systems (long)

*Message #3 Posted by **hugh** on 15 July 2003, 9:20 p.m.,*
in response to message #1 by bill platt

none of mine i can find do the first logic example. what makers work with a prefix constant like that, eg 1+2=3, 4=5? i have found that different manufactures always did have slight differences in operation. today a lot has been standardised.

all the casio i can find, for example, will either auto constant on the second term (eg 1+2=3,3=5) or require you press the operator twice (eg 1++2=3, 3=5). canon, models tend to auto constant this way too.

there is also desk calculator logic. 1+2=[2] (im using [] to indicate the display). this is not right, instead you do; 1+2+[3] or 2*3=[6], but 1+2+[3]2*3=[6]+[6] or on some models, more usefully, 1+2+[3]2*3=[6]+[9]. you

also always get an auto accumulator (that works differently) and a memory that works as normal (or two memories).

in response to message #1 by bill platt

Bill,

A very interesting report. The only non HP calc that I have to ckeck all this out is my teeny weeny Sharp ELSI MATE. And I can't find a battery for it. I will get one and report back.

tm

Correction: Calc Logic

*Message #5 Posted by **bill platt** on 15 July 2003, 11:12 p.m.,*
in response to message #1 by bill platt

Hugh's observation regarding infix type loading of a constant is correct: I goofed in writing the logic system of "regular" calculators, and Hugh's post is correct, viz:

1+2=3; 2=4; 3=5. However, on my 6yr old's $1 "LeWorld" and on my wife's trusty Sharp ElsiMate EL 230, the multiplication seems to be as my original post, viz:

1x2=2; 3=3; 5=5, and 2x3=6; 5=10 etc. And the Division is different yet again:

20/4=5; 5=1.25; 4=1; 4=1; 4=1 etc! And for Subtraction:

50-5=45; 3=-2; 2=-3; 5=0! Don't ask me to explain this--I have no Idea!

So maybe I should go back to being conservative when using non RPN. Harry s right--the calculations should be reliable!

But I think this behavior of these calculators probably points to the underlying architecture---so I am going to pretend to be an archeologist, and work backwards to deduce the system.....

Regards,

Bill Platt

News from Mr Packard

*Message #1 Posted by **jose goncalves (brasil)** on 15 July 2003, 5:30 p.m.*

I was reading a Business Week feature called "Hewlett-Packard: where slower growth is smarter management" (BW June 9, 1975), something that should be read by people interested in the future of that company. I quote the first part of it:

"David Packard ... then proceeded to set the ... company's strategy for survival in the fast-changing world of high-technology electronics. The leading producer of electronic instruments and a major force in minicomputers and calculators had grown too fast in the boom years of 1972-73, Packard declared.

He ticked off the disturbing results. Inventories and accounts receivable got out of hand, products went into production before they were fully developed, and prices were set too low. The problems were well in hand now, but Packard wanted to be sure that the lesson was understood.

"Somewhere we got into the idea that market share was an objective," Packard told his attentive audience, jingling a pocketful of coins for emphasis. "I hope that's straightened out. Anyone can build market share, and if you set your prices low enough, you can get the whole damn market. But I'll tell you it won't get you anywhere around here."

Packard's feisty speech was part of a year-long campaign he and President William R. Hewlett have been waging to reemphasize the principles they laid down when they launched their unique partnership 36 years ago. The fact that Hewlett and Packard had to initiate and lead the drive personally shows clearly why some company watchers are beginning to worry about what will happen to the high-flyer once its two founders depart."

How things have changed since ! Right now market share is everything, even if you have to resort to low end products ! Strange times !

Jose

hp 45

*Message #1 Posted by **bill platt** on 15 July 2003, 5:18 p.m.*

Hello all classic enthusiasts,

I just got lucky yesterday and inherited an hp 45 from a co-worker. It was her father's, and she just found it in her desk drawer. Of course, it has a corroded rechargable battery pack, and some corrosion salts inside the compartment.

I read the writeups on batteries and on classics disassembly here in the MoHPC--and what I am wondering is two things:

Has anyone found a non-rechargeble battery that can be used instead?

After getting a new battery (either rebuilding the battery pack, or getting a new battery), is it safe to merely clean the battery compartment, and give it a try? I guess I am concerned about opening up the case uneccessarily. I know from my experience with my first and only 41cv, that the screw posts can be quite fragile and damage to them can be terminal (I still have not gotten that machine back to life).

In the case of my 41, I found some small corrosion deposits inside---but that machine had worse battery corrosion than this 45.

Any thoughts?

Regards,

Bill

Re: hp 45

*Message #2 Posted by **David Smith** on 15 July 2003, 5:58 p.m.,*
in response to message #1 by bill platt

Yes, you can just clean up the battery compartment and give it a try. Howecer, there might be some corrosion growing inside the machine. Leaving it there could be bad news in the long run.

The classic machines do not have screw post problems like the HP41. Occasionally their screw "posts" will split, but it does not affect the workings of the machine.

Re: hp 45

*Message #3 Posted by **bill platt** on 15 July 2003, 6:06 p.m.,*
in response to message #2 by David Smith

Thanks, David!

So then, I guess your suggestion is to go ahead and carefully open her up!?

regards,

Bill

Re: hp 45

*Message #4 Posted by **David Smith** on 16 July 2003, 11:06 a.m.,*
in response to message #3 by bill platt

I'm sort of 50/50 on opening it up. If you can clean the battery area up well and the machine operates properly (all keys work well, switches are OK, etc) then you might not want to open it. If the machine has significant signs of use, I would probably open it. Usually battery corrosion gasses like to affect the top row of keys and the row with ENTER first.

Re: hp 45

*Message #5 Posted by **Harry** on 15 July 2003, 7:24 p.m.,*
in response to message #1 by bill platt

Bill,

you can use alkaline batteries in the HP45. The problem with opening the calculator is, that two of the screws are under the back lable. I did not find a way to peal it off without damaging it.

Regards, Harry

HP Keyboards

*Message #1 Posted by **Thomas Cox** on 15 July 2003, 12:29 p.m.*

Although it is hard believe that there could be a keyboard on an HP calculator that is more unreadable than HP 12CP, I nominate the HP-6S. This is the one with the Blue Case, not the HP-6S Solar which has a Silver Case. The key top is perfectly legible, but anything above the keys is almost completely unreadable in any light. I can see why the 6S is now discontinued. The main thing 6S Solar has going for it is the small size. Fits very nicely in a shirt pocket.

One other comment comparing the 6S and 6S Solar is that I would have thought they would use the same display -- but they don't, the display on 6S solar is bolder and more legible and the width of the zero character is significantly wider on 6S solar.

I know that these are the lowest of the low-end for HP, but I fear their construction gives me some idea of what to expect from the new and improved calculator line to be introduced this fall. I am hoping that the 33S will be a worthy successor to the 32Sii -- but I expect to be disappointed.

Re: HP Keyboards

*Message #2 Posted by **Raymond Del Tondo** on 15 July 2003, 1:35 p.m.,*
in response to message #1 by Thomas Cox

You forgot to nominate the 'high-end' 49G and its sisters. The 49G has a metallic-blue case with blue (!) and red (!) key legends, best viewed with light shining onto the case from one side:-)))

Re: HP Keyboards

*Message #4 Posted by **Thomas Cox** on 15 July 2003, 7:49 p.m.,*
in response to message #3 by Ernie Malaga

Amazing! The one thing that the high end and low end HP calculators have in common is their unreadable keyboards. Sometimes "bright and flashy" turns out to be "dumb and trashy." Although the individual colors are bright enough, the chosen combinations cancel. Perhaps the Marketing Department needs to take some courses in basic "Color Science."

For most people the color schemes used on such calculators as the HP-41 and HP-48SX are very legible. For some color-blind persons, the colors used on 48G are supposed to be more distinguishable. For normal color vision, white against a dark background is quite legible.

If HP had used the keyboard colors of the HP-6S solar on the HP-49 I think it would have been more successful.

Does HP listen to users about such seemingly mundane matters? If so, how do we get their attention -- other than not buying calculators which are so user unfriendly?

Re: HP Keyboards

*Message #5 Posted by **Ernie Malaga** on 15 July 2003, 10:05 p.m.,*
in response to message #4 by Thomas Cox

Thomas:

I don't think it takes a rocket scientist to figure out that high contrast is better than low contrast. And the designers (people who ought to know these things), should also know that the most common form of color blindness (about 10% of males) is that which prevents the sufferer from distinguishing red and green. I suspect this is the reason the early calculators used gold and blue for the shift keys. Too bad the new crop of designers missed the class in which they explained this item.

-Ernie

Re: HP Keyboards

*Message #6 Posted by **Trent Moseley** on 15 July 2003, 11:10 p.m.,*
in response to message #5 by Ernie Malaga

I think Ernie has it right. I have or have had four Voyagers, a 1981 11C; a 1982 15C; a 1988 16C; and a 1997 12C. On the 12C (made in MY) it takes a flashlight to see the blue notations on the lower side of the keys.

Best thing about the HP12cp

*Message #1 Posted by **Michael Barry** on 15 July 2003, 12:02 p.m.*

Do you know what the best thing about the 12CP is? It gives you a pocket case worthy of the original 12C. I have a 12CP, which I purchased before reading this forum. I have one with the incorrect dates on the back. I am really dissapointed in the calculator. The keys are flimsy, especially the "Enter" key, which bounces and gives me a double click every time I use it - incredibly irritating. As was mentioned before the look is awful and the speed is terrible considerign this is an upgrade with almost 20 years of new technology to draw from. Also, to add insult to injury, I accidentally dropped the 12CP and dented the metal right above the LCD panel and, since the numbers and functions are painted on, scratched the down arrow on the roll down key. I wonder if after 20 years of use the 12CP will have blank areas where the primary functions of the keys were due to wearing the paint away. I'm also dissapointed that HP couldn't come up with a way to incorporate a back arrow key on the new 12CP. I briefly used a 10B in college before switching to the 12C and found that I really missed the back arrow key that the 10B has.

I probably won't be a regular contributor to this forum, but I wanted to post a message from an average user who doesn't have quite the amazing background that the regular contributors to this forum seem to have. Anyways, the insight you provide here is invaluable and I will be reading this forum regularly, especially if I have any calculator questions. Thanks so much!

Sincerely, Michael Barry

Re: Best thing about the HP12cp

*Message #2 Posted by **hugh** on 15 July 2003, 12:29 p.m.,*
in response to message #1 by Michael Barry

i agree with you totally on the delete key issue. im assuming they wanted a close approximation to the original 12c which also has no delete.

recently ive been using a 12c instead of my trusty 15c for arms reach calculations and, although i really like the 12c, i miss the delete key, and also i keep pressing G CLX which is my fault :-)

User RPL IDE

*Message #1 Posted by **Randy Sloyer** on 15 July 2003, 8:26 a.m.*

After much delay, I've decided it's time to learn RPL in a serious way. I've poked around and downloaded a few utilities that are mostly sysRPL and are too advanced at the moment.

Since I do not want to edit programs directly on the 48, can anyone recommend a usable Windows based USER RPL programming environment?

Re: User RPL IDE

*Message #2 Posted by **Mark Hardman** on 15 July 2003, 8:56 a.m.,*
in response to message #1 by Randy Sloyer

How about the HP4X User-RPL Program Development System? From the description, it looks like it might be what you are looking for.

Mark Hardman

*Message #3 Posted by **Smartin** on 15 July 2003, 12:53 p.m.,*
in response to message #1 by Randy Sloyer

Hi Randy,

Most powerusers do not use a 'programming environment' for code development on the 48/49. Instead, most write programs using a text editor and then cut and paste into emu48 (a 48/49 emulator that runs under Windows, available at: http://www.hpcalc.org/hp49/pc/emulators).

Steve

Re: User RPL IDE

*Message #4 Posted by **Randy Sloyer** on 15 July 2003, 1:24 p.m.,*
in response to message #3 by Smartin

Even better. I like my programming editor that does block indenting and brace balancing, etc, etc.

Now I can learn RPL syntax by writing the tokenizer for the editor highlighting. Two birds, one stone. Good stuff, Thank you!

Re: User RPL IDE

*Message #5 Posted by **Chan Tran** on 16 July 2003, 2:51 p.m.,*
in response to message #4 by Randy Sloyer

I use HP Program Development Link (PDL) a DOS based software. It is quite good and run fine under Windows. It allowed me to enter spcial 48 characters which is difficult to do on a standard text editor.

Re: HP-38G

*Message #1 Posted by **Ron Ross** on 14 July 2003, 12:55 p.m.*

Actually you should be able to use an Hp39G manual verbatim. You will not have the memory or some of the functions of the 39G, but from a user perspective, they look very similiar (underneath the looks is a major revision according to the author of the 39/40G, and if you were to play with a 39/40 you would have to agree). But the manual is in PDF format from Hpcalc.org and will give you a great start and over 90% similiar.

Re: HP-39G Manual

HP-38G

*Message #1 Posted by **Fréderic** on 14 July 2003, 10:26 a.m.*

Hi. I received my first HP graphing calculator as a "used gift". I'm already familiar with the 25C i use every day and with the 41C. I'm sure the calculator is not keystroke programmable; i read on the net about "applet programming" and RPL?

What is these new languages? A kind of basic? I read an "applet" program i can find on the net and it looks like some kind of basic (BEEP (200,168,15)) i long know from my VIC-20!!!

Any modern calculator with keystroke programming derivation?

Anyway, where can i find a manual for my HP-38G so i can see all the enhencements over my 41C. I already bought the set of CD from the museum for my 41 and 25C but no manual for the 38G; is there an "upgrade" containing this manual?

If i'm happy with my 38G, perhaps i'll try the newer one 49G; where to buy one, i'm not able to find it on HP site. I read here and there it have a bad keyboard compare with the 38g or my 25C... What aboutthe rest?

Thanks

Fred

in response to message #1 by Fréderic

Dear Fred, Someone is selling a new 49g. Got to the following URL. http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi?read=10380 Sincerely. Manfred

Re: HP-38G

*Message #3 Posted by **bill platt** on 14 July 2003, 11:17 a.m.,*
in response to message #1 by Fréderic

I feel that you should not think of the 38G as an enhancement over the 41. The 38G is really a schoolboy's crutch, not an engineering programmable. That is not to say that one could not figure out a way to program it--it is just that it really is not worth the trouble! The 41 is the last large-memory I-O capable RPN Keystroke Programmable(to like a compter or card reader etc).

The 48G, 49G+ and 48GX are RPL, not RPN, as is the 49G. This is an "enhanced" high level language, and is reverse polish with a stack, but a whole new ball game really. You can also get HP41 emulators that run on the 48G series (generally 48gX) and even an HP-produced 41 emulator, with keyboard overlays, which runs on the 48SX (a discuntinued model easily obtained in good condition). Expanded memory for the 48 series can be obtained at reasonable cost from some german makers--HP no longer makes memory expansion. I do not know the technical details of the 41 emulators or the memory required--but I know there are a number of different

choices--in fact I have been contemplating that route myself.....but it is too much for me to figure out just now...

If you want to see just how enthusiastic some people are about the 48 and 49 series, just go to comp.sys.hp48 and to hpcalc.org. But if you are an engineer, not a computer geek, you will probably be overwhelmed....:-) Ther eis also 38G stuff at www.hpcalc.org.

regards,

Bill

Buggy 11C

*Message #1 Posted by **Mitch** on 13 July 2003, 8:13 p.m.*

I have an 11C with a bug. When you enter 0.0xxx then backspace over all the digits & press enter, 1.00 was entered rather than 0.00. Does this hamper the functionality of the calculator? Thanks in advance for any help.

Re: Buggy 11C

*Message #2 Posted by **Vieira, Luiz C.** on 13 July 2003, 11:28 p.m.,*
in response to message #1 by Mitch

Hi, Mitch;

I remember I saw something about it at Craig Finset's database sometime ago. I searched there and I found this:

Quote:

```
Bugs/ROM-Versions::

From Stephen J Thomas <sjthomas@bcfreenet.seflin.lib.fl.us>
     ...
HP did acknowlege a bug in the 11C, but never released a ROM version
which corrected this (I don't know why this popped into my brain last
nite after lying dormant for several years).

If you are entering a number with a decimal point, and then use the
back-arrow key to erase any (and all) digits to the right of the
decimal point AND erase the decimal point, the magnitude of the
integer portion of the number will be incremented by 1 when the ENTER
key is pressed.

For example,

        1  1  .  <-  ENTER

should put 11 in the X-register, but 12 is entered instead.

Another example,

        2  .  3  4  CHS  <-  <-  <-  ENTER

will put -3 in the X-register instead of -2.

I'm not sure if this also occurs when a function key -- such as [+] --
is pressed rather than [ENTER], or if this occurs on any other
Voyager-series models.

Later:
```

```
The mentioned bugs arent present by S/N 2750A15169.
```

Hope this helps.

Luiz (Brazil)

Re: Buggy 11C

*Message #7 Posted by **Gordon Dyer** on 14 July 2003, 7:07 p.m.,*
in response to message #1 by Mitch

My 11C is 2206A00034 and it has this bug.
I have also tried this in the 15C emulator for PocketPC and it does not have this bug, but it behaves differently to my 11C when deleting the decimal point.
The 11C deletes the decimal point as if it was a seperate character (as expected), but the 15C emulator deletes bothe the decimal point and the zero before it together.
Does a real 15C do this?
Try it by typing 2 or 3 zeroes before the decimal point 000.123 then delete backwards and see if the decimal

point takes the preceding zero with it.

Re: Buggy 11C

*Message #8 Posted by **Mark Hardman (LED)** on 14 July 2003, 7:57 p.m.,*
in response to message #7 by Gordon Dyer

A real HP-15C deletes the decimal point independent of the number that precedes it. Same behavior as the HP-11C. I'd expect that the program you are using on your Palm is an HP-15C simulator and not an emulator.

41 & 71 file suffixes for the site I'm building

*Message #1 Posted by **Emmanuel, France** on 13 July 2003, 11:04 a.m.*

```
I will use the following file suffixes for my site. Any idea?

Files only for PC:

*.BIN   Binary file for Jean-François Garnier Emu-41 (5120 bytes)
*.LST   Dissassembled listing of ROM with mnemonics
*.PGM   Program file for ELI-41 and Transfer-41
*.41R   SDS-II ROM file (8192 bytes)
*.41L   Motorolla S Hex file for 2732 Eprom (11276 bytes)
*.41R   Motorolla S Hex file for 2716 Eprom (2828 bytes)
*.U2    Binary file for 2716 Eprom (1024 bytes)
*.L8    Binary file for 2732 Eprom (4096 bytes)

HPILDISC.n      Virtual Disc Drive for Linkplus
HPSIDEn.PAK     Virtual Disc Drive for Transfer-41

Files only for HPILLINK:

*.P71   Basic HP-71B
*.B71   Binary HP-71B
*.D71   Data HP-71B

Files only for LIFUTIL:

*.PRG   HP-41 program
*.DTA   HP-41 data
*.REG   HP-41 registers
*.ALL   HP-41 all memory
*.XMS   HP-41 X-Memory with Paname
*.ERA   640 register Eramco or Zeprom Programmer or Rambox Rom copy format
*.HPX   640 register Hepax Rom copy format
*.MM    824 register Mountain Computer Rom format
*.MLE   825 register Mleprom Rom format

To be continued ...
```

in response to message #1 by Emmanuel, France

Emmanuel,

I use:

*.DIS for HP41 disassembled listings *.ROM for HP41 rom image files (8192 bytes)

Meindert

Re: 41 & 71 file suffixes for the site I'm building

*Message #3 Posted by **Gordon Dyer** on 13 July 2003, 1:05 p.m.,*
in response to message #1 by Emmanuel, France

Just a couple of minor points.
I would prefer the HP-71 file extensions to have the number before the character for easier sorting on filename, as follows:
*.71P Basic HP-71B
*.71B Binary HP-71B
*.71D Data HP-71B
this will be consistent with your HP-41 file extensions.
Note that Motorola has only 1 letter l !!

Cringely Comment on HP

*Message #1 Posted by **Les Bell [Sydney]** on 13 July 2003, 1:19 a.m.*

This from Infoworld's weekly "Cringely" column (yeah, it's not really Cringely, but what the heck, Norm is going to love this one anyway):

"Hewlett-Packard is giving a leave of absence -- so to speak -- to storage, despite higher hopes it may have once held. HP called a mole at 8 o'clock one evening last week and fired him on the phone. Pretty nice, eh? My good man was a storage specialist, and his Midwest regional manager told him that HP wasn't going to spend any more money trying to sell storage. "If customers want to buy it, they can have it," the manager commented. In character, HP's financial folks did some fancy math to calculate that two weeks of severance pay per year for six years of service amounted to nine weeks for the forlorn and forgotten. And I thought the HP Way meant treating people with dignity?"

Looks like the New HP calculates severance pay on a 12C Platinum. . . .

Best,

--- Les [http://www.lesbell.com.au]

what is HP storage?

*Message #2 Posted by **Norm** on 13 July 2003, 2:11 a.m.,*
in response to message #1 by Les Bell [Sydney]

I did not know HP was into the storage business.

I can rent an 8 x 8 for $75 a month out here, put old motorcycle parts and paint cans and stuff into it so I have more room in my garage.

Re: what is HP storage?

*Message #3 Posted by **Les Bell [Sydney]** on 13 July 2003, 3:49 a.m.,*
in response to message #2 by Norm

Norm, I swear you are proof positive that the new HP was right to get out of the storage business.

At any rate, *storage* means big disk drives on network servers where MBA's store their massive, undocumented, untested and undebugged Excel spreadsheets - the ones on which those multi-million dollar decisions depend.

I guess the reason they don't need to sell storage outside the company is that they are now their own best customer. . .

Best,

--- Les [http://www.lesbell.com.au]

Re: what is HP storage?

Where to Find Trans41

*Message #1 Posted by **Mark Hardman (LED)** on 12 July 2003, 11:18 p.m.*

I recently had the good fortune of buying a HP-82973 HP-IL ISA card for $20 from a used PC equipment dealer. He had this in a stack of sound blaster audio cards in a corner of his shop.

After a quick look at the MoHPC's articles and forums, I can see that I'll get the most out of this treasure by using the latest version of EMU41. However, it looks like getting EMU41 up and running will be a fair sized project in itself.

I'd like to perform some minimal testing on this card before making a large investment of my time setting up EMU41. I've tried testing the card with a copy of HPLINK from the Museum's FTP site--with no success. Other articles suggest that the HP-82973 can be made to work on faster PC's by using the TRANS41 utility.

I've searched high and low and cannot seem to locate a copy of TRANS41. Is it still available? If so, where?

Mark Hardman (LED)

BTW: I've already turned this fellow's shop upside down looking for other HP-82973's. Sorry, this was a one of a kind find.

Edited: 12 July 2003, 11:25 p.m.

Re: Where to Find Trans41

*Message #2 Posted by **Emmanuel, France** on 13 July 2003, 4:25 a.m.,*
in response to message #1 by Mark Hardman (LED)

```
Dear Mark,
Transfer/41 has been made by:

Tacit Logic Systems Inc.
P.O. BOX 231178
TIGARD, OREGON 97223
(503) 684-6088

I don't if this firm still exists...
However you can use:
With HP-71B, Cross71 (Barizien) and Hpillink (HP)
With HP-41C/CV/CX, Linkplus (Southern Software)
Good luck!

LIF disks: volume label changing and related stuff

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 8:32 p.m.*

Hi HPIL users;

after building one thread with considerable "golden" information, I took both programs (HP41 and HP71) and tried them out so I could add/change "volume name" using them.

To those who did not understand the reason for such "maneuver", that's because I use LIFUTIL running under DOS environment so I can write to and read from LIF disks. The problem is that LIFUTIL somehow uses "volume label" field to identify and handle disk data, and seems to be able to only handle disks with "volume label" field filled with "valid data".

If the disks are initialized by LIFUTIL, "volume label" is requested and there is a suggested default name. I never tried to initialize a disk with LIFUTIL without specifying a name, so I do not know what happens.

There is a program listed in the HP9114B Owner's Manual for the HP71 that allows it to easily initialize disks in the HP9114B. This program asks for a volume label and its input is optional.

The HP41 system offers NEWM, a standard HPIL function that initializes any medium available in its controlled loop. I also found that the HP41 standard HPIL functions using the HP9114B would allow initializing and writing into disks with up to 130KBytes. But the same HP9114B User's Manual had a program listed for the HP41 that would allow it to go further: 630KBytes. This "high-capacity" formatting program uses functions available in the Extended I/O ROM (HP82183A).

The fact is that neither the above mentioned program nor NEWM ask for "volume label" as an input data, so any disks initialized with the HP41 in this case will have other data than an identifier in "volume label" field. When I first got an HP9114B, I initialized three disks with the HP41 and filled them with some programs, mostly ones I typed in the calculator for this particular purpose: storing in disks. Later I installed LIFUTIL in my computer and have other disks initialized with it, because the HP41 "high-capacity" formatter is too long and occupies a lot of memory. The original version uses so much memory that it needs more than the 124 registers available in the standard X-Functions module (or the HP41CX), and I mentioned this fact in another post.

Well, what to do? To "rename" them. After asking for help I tried both programs and I found some interesting facts related to the HP41 program.

First one: the HP71 program allows disks to be fast and safely renamed; thanks, Rodger.

Second one: the HP41 rename program actually changes "volume label" contents for sure, because I used the HP71 "renaming" program and it shows the new name given through the HP41; thanks, Dan McDonald. But if I initialize a disk with the HP41, 130K or 630K, renaming it with the HP41 will not allow LIFUTIL to read/write on it. If I format the disk with LIFUTIL and rename it with the HP41, all's fine. If I format the disk with the HP41 and rename with the HP71, it's either fine! The combination "initialize with the HP41" (NEWM or the "high-capacity program) and "rename with the HP41" will not allow LIFUTIL to read the disk. The HP41 AND the HP71 will, in any case, read disks contents because both can read LIF disks without a specified "volume label".

I'm not sure about what's going on. Renaming programs ("volume label") are fine because both change the disk

name or add it, as confirmed by the HP71.

This is a report only. I'm just posting this information so others can avoid these problems or simply be aware of them. Also, maybe I'm doing something wrong and someone will point this out.

In any case, thank you all who followed and contributed to the original thread about LIF disks. I hope we have that sort of "brainstorm" more frequently here at the MoHPC.

Best regards.

3468B DVM

*Message #1 Posted by **41Jeff** on 12 July 2003, 4:59 p.m.*

I have an HP 3468B digital voltmeter and am trying to do some remote measurement logging with it using my HP 41. The problem is that when I do an IND to get the meter data I get a Transmit Error. However, other Meter command functions work fine, includng the INSTAT command during which the 3468B transmits a data byte back to the 41. So I think the IL loop is OK? But, because the only manual I have is a partial one for a 3468A, I'm thinking I might not have a setting just right. Maybe the DVM is sending back some other form of data? Also, what is the difference between the A and B models?

Thanks

Re: 3468B DVM

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 5:55 p.m.,*
in response to message #1 by 41Jeff

Hi;

I do not have the 3468D, but I was wondering about one thing: IND is Input Data, right? Shouldn't you command TRIGGER before read data?

Just a guess.

Luiz (Brazil)

Re: 3468B DVM

*Message #3 Posted by **41Jeff** on 12 July 2003, 6:05 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz, I tried that also but no luck. I also tried it with the single trigger function but still get Transmit Error. When I power the meter up the self test is Ok also, but I'm wondering if it tests the IL interface?

Thanks for the help. I enjoy your posts on the 41 system very much. I've owned one of several 41c.cv.cx since High School.

Jeff

Re: 3468B DVM - A and B models

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 6:34 p.m.,*
in response to message #1 by 41Jeff

Hi, V;

I wish I could help more, but I have no other source of information except an HP Test and Measurement

Catalog taht simply describes units resources. A and B reffer to workbench and field models. You'll conclude which is which based on yours: if it is a field-like, the A-unit is a workbench designed. As far as I know, both have identical hardware and firmware, but I do not know if their ID is the same, say, if they identify themselves for 3468 only or if they add A or B at the end of the ID string.

Sorry I could not help further more. And thanks for your kind and supporting words :)

Luiz (Brazil)

3468 A/B and manual

*Message #5 Posted by **Renato** on 12 July 2003, 9:03 p.m.,*
in response to message #1 by 41Jeff

HP Journal of Feb 1983 describes 3468A and states that B version is rack mount with identical features.

I know where you can get a manual for 3468 - email me at r_toi at yahoo dot com.

in response to message #2 by Vieira, Luiz C. (Brazil)

So, is this MLDL2000 the same unit? It looks like he is making a new version - I mean, other than the bug fix he refers to in the post. Or was there an original MLDL that is in production?

Thanks for your response, Sean

in response to message #2 by Vieira, Luiz C. (Brazil)

Come to think of it, the 41 m-code book I'm looking at which mentions this is copyright 1985 - so there is definitely an older version of this module. I wonder if anyone has used this version?

Re: Meindert is the name of the man!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 6:28 p.m.,*
in response to message #4 by Sean McNamee

Hi;

As far as I know, Meindert is developing his custom version "from scratch". I've been following his posts, but I'd like being closer to his project. It is a teasing, amazing activity.

Sorry, I have no further information. Meidert maintains a page where all of the developmetn is kept as doc files. I do not have the e-address right now...

Best regards.

Luiz (Brazil)

*Message #6 Posted by **Raymond Del Tondo** on 12 July 2003, 8:32 p.m.,*
in response to message #4 by Sean McNamee

Hi,

of course there are various other MLDL-type hardware extensions for the HP-41. Unfortunately, most of them had been designed and been on the market from 1980/81 to 1989 .

Names which come to mind are: ProtoCoder, ERAMCO-MLDL, MBK ProfiSet, W&W RAMBox, VM HEPAX module, HP-41CY, and maybe more which I don't recall at the moment...

Some only had EPROM sockets, other have RAM, and some have both, like the ProfiSet.

As Luiz wrote, Meindert is building a new MLDL-type ROM simulator or RAMBox from scratch. This is a very cool thing, and I hope to be able to get a unit when he publishes the box:-)

Regards,

Raymond

*Message #7 Posted by **Meindert Kuipers** on 13 July 2003, 3:45 a.m.,*
in response to message #1 by Sean McNamee

I heard my name mention a few times, it almost makes me blush ...

I have a preliminary spec at www.kuipers.to/hp41. I have alomst finished an updated spec which I hope to upload somewhere during next week.

My MLDL is a completely new design. I have learned from other designs, but mine has a different approach. There is now progress (had to fix a serious bug and do redesign) and I am busy simulating the thing. I hope to be able to build a new prototype before I leave for my summer vacation in sunny France (do not despair if you do not see any posts for a few weeks from me) but I will take my notebook and will be able to do some software development.

Please email me for any questions you might have ...

Meindert

re: "... my summer vacation in sunny France (do not despair if you do not see any posts for a few weeks from me) but I will take my notebook and will be able to do some software development."

Now there's the OPERATIONAL definition of geek/nerd!

(And, I bet we all do it! I'm currently debating whether to take a laptop when I go visiting parents and in-laws in a few weeks. I will, at least, take my bookmarks and history files on a floppy so I don't lose my place in this forum.)

SPICES keyboard label

*Message #1 Posted by **Jon** on 12 July 2003, 2:02 p.m.*

I want to inter-change The keyboard labels of some spices. Has anybody experience doing it?. Is heat coming from hair dryer enough to remove it?. Which glue can I use to place it again in other calculator?

Thanks in advance

Jon

Re: SPICES keyboard label

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 2:16 p.m.,*
in response to message #1 by Jon

Hi, Jon;

I observerd that there are two basic raw material used in Soices' kbd labels: plastic and metal (aluminum?)

I succedd removing plastic labels in two Spices' cases easily: simply pulled them out and they almost "popped off". I'm not sure it's gonna happen with others. Also, I never removed metal labels.

You may see the difference when comparing both models: plastic labels have semi-gloss reflective surface, while metal labels have glossy frames. I have an HP38C with glossy frames and an HP31E with semy-gloss surface (plastic).

I am not sure if all plastic labels will be easily removed as well, I am not sure if climatic conditions would weaken the glue, but if you believe you can give them a try... It's a lot more easy to remove them when the crystal-red LED cover is removed. You will see the label border is easily sensed with the use of your own fingernails. And remember: if you decidee to pull the label, be shure it is a plastic one or you will bent it, if it is a metal label.

Success! And please, let us know what happened.

Luiz (Brazil)

HP 17Bii

*Message #1 Posted by **V** on 12 July 2003, 11:13 a.m.*

What specs and characteristics does this calculator have?

ty

"\V/"

Re: HP 17Bii

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 11:51 a.m.,*
in response to message #1 by V

Hi;

It's a second-from-top financial calculator (right below the HP19BII) and has the following characteristics beyond HP12C's related TVM most common resources (Bonds, Depreciation, IRR, NPV, Cash flow, etc):

real-time clock and calendar
Scheduler with up to ten custom-defined appointments
ALPHA messages (same HP42S ALPHA entry style)
Statistics based on lists instead of summations (good to edit)
user-selectable Algebraic / RPN mode
6.5K RAM for the user

and a few more "stuff".

I have the three of them: HP17BII, HP19BII and the HP12C. I like the HP17BII very much, but I preffer the HP19BII because of it's extended math resources (TRIGS, Hyperbolics), currency convertions and graphics.

Hope this clarifies a bit.

Luzi (Brazil)

Hi, Thanks for the details. What about programability? And the equation solver, how powerful is it? what type of equations can it solve?

Thanks again

"\V/"

Re: HP 17Bii

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 July 2003, 5:47 p.m.,*
in response to message #3 by V

Hi, V;

The HP17BII is not exactly programmable; at least I do not see this way because its "custom" expressions do not mean "language" wiht a "sintax". It accepts algebraic expressions and has many resources that allow some "data managment". W. Bruce Maguire II wrote some very usefull expressions that allow trigonometrics and inverses to be computed. Look here and you'll have your own feelings about its "pogramming" style.

Best regards.

Luiz (Brazil)

Re: HP 17Bii

*Message #5 Posted by **jose goncalves (brasil)** on 12 July 2003, 6:38 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I'd like to add that both the 17BII and the 19BII have 2 functions that area used with the solver that can turn them into something we could call semi-programable calculators. They have the IF and the (sigma) functions. Very few persons refer to these functions and it's not easy to find reference to them. You can find them in the pages of the manual that describe the functions of the solver.

Jose

Luiz:

Do you know if the 17bii has the functions LET ang GET as the HP27S?

Thanks in advance

Eric

Re: HP 17Bii

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 13 July 2003, 10:53 p.m.,*
in response to message #6 by Eric

Hi, Eric;

I have the HP17BII in my very hands right now and I do not see any reference in INDEX to them. Now I'm curious: what do they do in the HP27S? Are they related to variables?

I had a look at the SOLVER and I saw nothing about them. Anyway, if they are related to other subject, let me know and I'll search them again.

BTW, does the HP27S have a "programming language"? The HP17BII allows expressions and equations to be written, with a reasonable control level. As mentioned by José Ernesto, it allows IF structures and Sigma functions in expressions, and I agree with him that a "pseudo-programming" capability exists, but I do not see this resource as a "programming language", as I mentioned previously. I'm asking about this because LET and GET make sense in a programming environment; am I wrong?

Sorry not helpping further. Best reagards.

Luiz (Brazil)

Edited: 13 July 2003, 10:57 p.m.

Re: Yes

*Message #8 Posted by **Ron Ross** on 14 July 2003, 7:59 a.m.,*
in response to message #6 by Eric

Yes the Let and Get functions are there for all three calculators, Hp17B, Hp19b, and Hp27s. Not documented in any of the owners manuals but stated in an advanced users manual (for the 19 and 27, but the 17 does have the same solver sans trig). These functions do add rudimentary programming to these models (though the solvers are really outstanding all by themselves).

Re: Yes

*Message #9 Posted by **tony** on 16 July 2003, 4:33 a.m.,*
in response to message #8 by Ron Ross

minor point. the 17b is an exception. it has no let/get. the 17bii does though.

Re: Thanks for the info.

*Message #10 Posted by **Ron Ross** on 16 July 2003, 7:26 a.m.,*
in response to message #9 by tony

I did not know that. My 17Bii had and I mistakenly assumed the only change with the plain 17B was the addition of RPN selection.

Re: HP 17Bii

*Message #11 Posted by **Valentin Albillo** on 14 July 2003, 8:00 a.m.,*
in response to message #6 by Eric

Eric posted:*"Luiz, Do you know if the 17bii has the functions LET ang GET as the HP27S?"*

I'm not Luiz, so excuse me for not minding my own business, but I think this answers your question:

"The solver in this machine is exactly the same as that of the 19bii and includes all 19bii functions even if not documented, including Let and Get."

```
Solver Functions:

G(a)            get value of a
L(a:v)          assign value v to a
```

Source: http://www.finseth.com/~fin/hpdata/hp17bii.html

'I also did not know about the undocumented "L()" and "G()" (Let and Get) functions. I strongly encourage anyone who would like to program the 17BII to buy the CD-ROMs from the HP Museum in order to obtain the "Technical Applications" book for the 27S and 19B. The undocumented "Let" and "Get" functions are described, as well as methods of executing looping---these functions open-up programming options that were not conceivable before! For instance: definite loops and invisible, temporary variable assignments. Definitely a MUST READ!

Source: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=222

Best regards from V.

Re: HP 17Bii LET and GET

*Message #12 Posted by **Eric** on 14 July 2003, 10:16 a.m.,*
in response to message #11 by Valentin Albillo

Thank you all for your answers:

And yes the let and get functions allow to manage assigning values or expressions to variable names and reuse them. Togheter with sigma, solve for, and IF functions they allow pretty good capabilities of seudo-programing within the HP-27s.

What I am wondering also is if the new coming hp17bii plus is going to offer the same, if so added trigs will almost offer an hp27s replacement.

Thanks again Eric

Re: No, the Hp17Bii or + won't replace a 27s

*Message #13 Posted by **RR** on 14 July 2003, 11:13 a.m.,*
in response to message #12 by Eric

And heres why. Hp will keep their business line Algebraic WITHOUT precidence. And that Sucks! And because of this, even if you were to write trig routines, the calculator's algebraic enrtry system is poor. Of course the newer Bii's offer RPN selection which is the only way to go. If the 27s had been RPN selectable, it would have trounced the 32s in sales (at about the same price it should have, since it came with 7 K RAM).

Thanks Valentin, guys!

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 14 July 2003, 4:17 p.m.,*
in response to message #11 by Valentin Albillo

Hi all;

as I mentioned, I had not seen any reference about GET and LET in the original, standard HP17BII manual. But now I know where to find them; thanks.

Valentin and other brainy guys (everyone in here?): please, if any of you have to chance to answer to any question primarily addressed to me, I'd be flattered and honored. Mostly if it is to complete some unfinished answers of mine.

Thank you all.

wow. HP-11c @ $285 what's the highest?

*Message #1 Posted by **gene** on 12 July 2003, 9:53 a.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3034497978&category=11713

12 hours to go.

I'd say near mint, not mint

*Message #2 Posted by **Raymond Del Tondo** on 12 July 2003, 1:34 p.m.,*
in response to message #1 by gene

Hi,

on the photo of the back side, there seems to be at least one scratch near the top right rubber foot. So this isn't what I'd call mint. From the other photos, the machine looks very good, therefore near mint...

There were (at least) two auctions for HP-11C's in Germany which both ended around 250 *Euro*, which currently is more than 250 USD. Here are the links:

First one

and

Second one

Interesting side note: Both auctions were won by the same bidder, and both auctions had very similar bidders.

However, IMHO the final prices are too high. 11C's are relatively wide-spread, compared to 16C's and 10C's, and even 15C's...

Raymond

For some reason the 11Cs sell for more money

Translation: Why the 11C is costlier than the 15C in Germany

*Message #8 Posted by **Karl Schneider** on 13 July 2003, 3:24 a.m.,*
in response to message #6 by bill platt

Bill:

Pretty close --

"God in heaven! what's this?? --"matrix" "dim" "result" "solve", "test"

So many English words to learn! "x>y", et cetera, are much easier to understand!

Of course, the above was strictly a joke...

Six of the eight locations on the keyboard of the 11C, allocated for conditional tests, were displaced on the 15C. For all the extra capabilities of the 15C (see recent posts by Luiz and Valentin), these are the only differences in the functions on the keyboards of the two models. Impressive, huh?

```
11C       15C
======    ======
x<>(i)    x<>
x<>I      Re<>Im
x<0       TEST
x>0       SOLVE
x<y       S_xy
x/=y      MATRIX
x/=0      RESULT
x=y       DIM
```

*Message #9 Posted by **bill platt** on 22 July 2003, 6:09 p.m.,*
in response to message #8 by Karl Schneider

hi Karl,

(on trying to translate) so close! (I should have understood it------;-))

Both the 15c and 11c are amazing. I just bought a 15c recently, finally, after many years of wanting one, and I noticed just that same thing you point out--that by moving the conditionals to the "bakc label" as it were, it is possible to put all those other features on the machine! And as Valentin points out, the multiple uses of the various function names really is cleaver and quite intuitive. and, having been an expert user of the 11c (14 years of continuous use) I find the 15c quite natural to use, as almost all the functions are in the same place, and what has been moved is not to difficlt to find.

Now, if only I had more time, I would try harder to post resonsed to valentin's quizzes---but some of them are pretty difficult, for a rusty tool like myself!

regards,

Bill Platt

Possible scratches?

*Message #12 Posted by **Mike** on 12 July 2003, 5:38 p.m.,*
in response to message #2 by Raymond Del Tondo

I see two spots between the 3rd and 4th 8 and above the 7th 8.

Too many use MINT. Notice when they say MINT in all uppercase or bold, they are emphasizing that it is truely MINT.

It would be nice to hear from the winner on the condition.

MINT should mean absolutely no scratches, in my opinion. The metal bezel should be just like from the factory.

Edited: 12 July 2003, 9:59 p.m.

What is MINT and what is not.

*Message #13 Posted by **Mike** on 12 July 2003, 5:49 p.m.,*
in response to message #2 by Raymond Del Tondo

I hate to put my auction here but here is a 16C that I'm selling. I don't want to pick at another's auction so I'll pick on mine. It's a damn nice 16C. I bet most would call it MINT. But, in my opinion, it's just not MINT.

If you look closely above the right edge of the 4th 8, you will see a tiny spec. That makes it not Mint, in my opinion. You might see some other photos (1st photo, 2nd row) that show very tiny marks that are almost impossible to see in a single photo. Even with photos from various angles, it's still hard to see any flaws. But it's not mint.

Example of one that is not Mint

MINT should not mean really nice. It should mean, no different that if plucked from the assembly line.

Agreed, but...

*Message #14 Posted by **Raymond Del Tondo** on 12 July 2003, 9:03 p.m.,*
in response to message #13 by Mike

...what is 'pristine' related to 'mint' ?

Raymond

It is a fancy word... FLAGS should raise if..

*Message #15 Posted by **Mike** on 12 July 2003, 9:56 p.m.,*
in response to message #14 by Raymond Del Tondo

that doesn't mean much. I use it occasionally but always in conjunction with Excellent or Mint in describing something like contacts and such.

I don't think pristine is a level of overall quality. Just my opinion.

"Really super-dooper" isn't a level of overall quality either.
http://www.msdsite.com/images/smile.gif

It is interesting that people use "Near Mint" which really means "Not Mint." Why not just say "Excellent" rather than "Not Mint?" It is to give the impression that it is Mint, when it really is Not.

But the really odd one is when people do things like:

"This would be Mint, if it were not for the 2 dents and the name scratched on the back." Now this kind of use of Mint is ridiculous. But it happens all the time.

A Flag should go off when people use Mint. If someone says Mint and then doesn't say why it's, you better count on it NOT being Mint. This is especially true of people that don't sell many HPs.

I have bought "Mint" and "Like New" from people that just don't have a clue.

Calculator Buying Tips

And the final bidder, algichar, is inexperienced, and the 2nd place has a new ID.

Interesting to note how andromeda20 and the other near high bidders "tested the waters" incrementally but backed out in the high 100's--which is the price we would anticipate.

The distribution of buyers is definitely gaussian--and these two bidders are out in the wings of the bell curve.

Re: wow. HP-11c @ $285 what's the highest?

*Message #17 Posted by **Dean** on 12 July 2003, 11:46 p.m.,*
in response to message #1 by gene

I bought an 11C at a local resale store just before last Christmas. It had the original box, manual, and registration card. Tested OK. Even had batteries that worked!

All for the fabulous price of $2.00!

(I almost peed down my leg.)

Are HP 32Es cheaper than other spices?

*Message #1 Posted by **Harry (Germany)** on 11 July 2003, 6:44 p.m.*

I didn't really notice the spices until I got that 37E that i am trying to fix now. As i still don't understand the operation of the powersupply and therefor didn't get it working yet, i decided to buy another one to find out how it should work. And i found this:

<A HREF="http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2543341570">HP32E</A>

(btw, why isn't this link working? Is there something wrong with that HTML code I used? I thought it was done like that, but obviously it is not.)

I was surprised i got it that cheap?! Was I just lucky or are they that cheap?

Regards, Harry

Re: Are HP 32Es cheaper than other spices?

*Message #2 Posted by **Raymond Del Tondo** on 11 July 2003, 9:07 p.m.,*
in response to message #1 by Harry (Germany)

Hi,

I think you have been lucky.

According to http://www.hpmuseum.org/collect.htm#diff

from the Spice series, only 31E's are somewhat rare, since they tended to get thrown away...

Regards,

Raymond

Re: Are HP 32Es cheaper than other spices?

*Message #5 Posted by **David Smith** on 12 July 2003, 4:46 p.m.,*
in response to message #1 by Harry (Germany)

Yes, 32E's tend to be the cheapest Spice machine, also the least expensive.

Auctions listed on non-US Ebay sites can easily bring less than 1/3 what the same item listed on Ebay US will bring becuase of their much smaller audience.

OM-D30V: Anyone remember these disks?

*Message #1 Posted by **Mike** on 11 July 2003, 2:02 p.m.*

I have a 9121 that uses the older vintage Sony Disks (OM-D30V) that had the manual shutter. Anyone remember those? The ones shown are marked HP. I'm not sure if these were actually made by Sony or not but I believe Sony was first and they do say "Made in Japan" on the back.

You had to slide the shutter to the open position, where it would be latched (see latch in photo), then afer you removed the disk, you had to pinch the corner to cause the shutter to spring back to the closed position. The center photo shows the latching mechanism. You pinch the corner and the latch releases the shutter.

http://www.msdsite.com/hpcalcs/SonyDisks/openx.jpg http://www.msdsite.com/hpcalcs/SonyDisks/latchx.jpg
http://www.msdsite.com/hpcalcs/SonyDisks/closingx.jpg

When I first obtained this drive, I thought it was broken, since I couldn't insert a floppy. Thought it was jammed http://www.msdsite.com/images/smile.gif . After a little investigation, I found that it used the old Sony drives.

*Message #2 Posted by **David Ramsey** on 11 July 2003, 6:45 p.m.,*
in response to message #1 by Mike

When I moved out to California in 1983, I had a friend working at "Muppet Labs" inside HP. He showed me some of their new DOS touch screen computers, which used these disks. This was before the Mac and there were at least three different types of 3.5" disks at the time, including one that was just like a miniature 5.25" floppy.

The touch screens used a grid of infrared beams to determine where your finger was. The resolution for the entire screen was, I think, 32 x 32.

Re: OM-D30V: Anyone remember these disks?

*Message #3 Posted by **Raymond Del Tondo** on 11 July 2003, 9:15 p.m.,*
in response to message #2 by David Ramsey

Hi,

it was the HP-150 resp. the HP-150II TouchScreen PC

The resolution of the screen was something about Hercules-like, only the touch screen resolution was much lower, but sufficient for finger usage. There were at least two variations of that TouchScreen. One with the grid frame only, where you tapped on the screen glass directly, and another with kinda transparent elastic membrane, so to hide the screen glass from finger prints;-) My HP-150II TouchScreen PC the 'grid frame

only' display frame.

BTW: You could order the grid frame separately. On the motherboard of the HP-150II is a connector for the frame.

Regards,

Raymond

HP 150 -- diskettes and stuff

*Message #4 Posted by **Katie** on 11 July 2003, 10:48 p.m.,*
in response to message #3 by Raymond Del Tondo

I had several of both the HP150's and the HP150II's at my client's offices. They used lower density 3.5" diskettes (around 700KB) but the shutters worked automatically. There was also a program that allowed you to read these on a regular PC and vice versa even thought the formatting was different.

The resolution of the touch screen was pretty horrible. However, the 150's (at least the early ones) were supplied with a demo diskette that had several touch screen games on it. I thought that HP's touch screen was a perfect match for their solitaire game, and was pretty convinced that that was the reason why they invested it! :)

What battery for 11 C?

*Message #1 Posted by **Dave Beverstock** on 11 July 2003, 11:20 a.m.*

I'm remembering 675, but the batteries that came out are energizer EPX76. I can't find my manual. I love this calculator and can't live without it. Worried about causing it harm with wrong battery. Any help is appreciated!

Thanks,

Dave

Re: What battery for 11 C?

*Message #2 Posted by **bill platt** on 11 July 2003, 11:24 a.m.,*
in response to message #1 by Dave Beverstock

1.5 volt button cells:

Silver Oxide, type 357

or

Alkaline, Type LR44

You may also find type SR44---they should work, too.

Re: What battery for 11 C?

*Message #3 Posted by **Dave Beverstock** on 11 July 2003, 12:04 p.m.,*
in response to message #2 by bill platt

Thanks Bill!

Dave

Re: What battery for 11 C?

*Message #4 Posted by **Thomas Cox** on 11 July 2003, 12:29 p.m.,*
in response to message #2 by bill platt

There is a site on Internet that specializes in the SR44. As I remember it is www.SR44.com Bulk packed, but prices and service are good.

Excellent Site!

*Message #5 Posted by **bill platt** on 11 July 2003, 12:43 p.m.,*
in response to message #4 by Thomas Cox

Thanks!

Also, another note:

I do not have my 11-C manual in front of me, but I remember that in it, HP actually showed that the operating length of time after the battery annunciator comes on, is different for the Siver Oxide (SR44, 357) than it is for the Alkaline (LR44) batteries. (I remember this only because I read it first when I was 14 years old and so it stuch with me all these years. Ah, the young brain.....)

If I remember correctly, the Silver Oxide batteries have longer life, but die in only 30 minutes or so after the battery annunciator comes on, whereas the alkalines have a shorter life, but die more gradually.

Can anyone confirm? (I will re-post this evening from home if my statements are incorrect).

Regards,

Bill

Life after asterisk

*Message #6 Posted by **Valentin Albillo** on 11 July 2003, 1:55 p.m.,*
in response to message #5 by bill platt

Hi Bill,

The manual says, that after the asterisk first appears:

```
              Calc ON      Calc OFF
-----------------------------------
Alkaline    > 2 hours     > 1 month
Silver ox   > 15 min      > 1 week
```

Best regards from V.

Re: Excellent Site!

*Message #7 Posted by **Thomas Cox** on 11 July 2003, 3:03 p.m.,*
in response to message #5 by bill platt

If I remember correctly the SR-44 has an anticipated life of about 2 to 2.5 times that of the Alkaline equivalent. I have used SR-44 in HP-42S and HP-32SII and not noticed that behavior -- however, that does not mean it does not happen. I think the SR-44 is probably more cost effective.

As with anything there are trade-offs.

Re: What battery for 11 C?

*Message #8 Posted by **David Smith** on 11 July 2003, 3:52 p.m.,*
in response to message #1 by Dave Beverstock

If you can find them, Vinnic (a Chinese company) makes very inexpensive LR44 batteries. I have seen cards of 10 for between $2 and $3... what a lot of places sell a single cell for. A guy on Ebay seems to always have them at that price. Also Tanner Electronics in Carrolton TX (but he does not do mail order).

are Algebraics more Valuable?

*Message #1 Posted by **bill platt** on 11 July 2003, 10:25 a.m.*

See the following lik:

ebay auction 22s

A 22s for 165 USD. I have also seen 21S and 27S go for high hundreds--and the latter into the 200's. Are these machines rare? Did HP actually sell fewer Algebraics than RPN?

Seems interesting.

-Bill Platt

Re: are Algebraics more Valuable?

*Message #2 Posted by **Gene** on 11 July 2003, 10:34 a.m.,*
in response to message #1 by bill platt

Can't explain the 22S.

The 27S is a great calculator, even if it IS algebraic only. The algebraic mode on the 27S is much more like the old "CALC" mode on the HP-71B than a normal calculator's "algebraic" mode, because you can see intermediate answers as you type formulas in. It was one of HP's efforts at a "do everything" calculator - scientific with built-in TVM.

Personally, there is no excuse for a calculator not to have the 17B/19B TVM code thown in there these days. Engineers DO have to solve $$ problems at times, even if it's for their own personal finances. :-)

The 21S was a specialized statistics calculator that didn't sell all that well at the time, but for which there isn't a great replacement out there right now. Not exactly the same level of uniqueness as the 16C programmer's calculator, but similar idea.

That said, I have a working HP-22S if someone wants it for a discounted $150. ;-)

Gene

Re: No, but these are exceptions

*Message #3 Posted by **Ron Ross** on 11 July 2003, 10:50 a.m.,*
in response to message #1 by bill platt

No, as a general rule. Examples where the algebraics have little value

Hp6s trash (and I am being kind) Hp30s so-so Hp20s great low end calc, directly compariable to an Hp21s Hp10b financial Hp14b financial Hp17b Financial Hp18c Financial Hp19b financial with trig (makes this desirable) Hp38G Graphics Hp39G Graphics

All of the above are usually sold below retail, either past or present. Some are really discounted, ie 38G and 39G are 30 cents on the dollar. I did not bother to list Hp's dual mode calculators, since they are sought after as RPN models.

Now for the exceptions and reasons why.

Hp21s Statistics calculator higher retail therefore less sold than an Hp20s but nearly identical to 20s aside from stats features. Any statician who had one and loses will be desperate to find, no real substitute short of a graphics. Hp22s comparable in functions and cababilities to an Hp32s, Hp quality in an algebraic package. Hp27s comparable to an Hp42s, need I say more (no, however, it is not an Hp42s but best algebraic pocket calculator ever made).

None of the three above have anything compariable available to replace them (very similiar to the Hp32/42 delimma). That is why they command high prices.

Re: No, but these are exceptions

*Message #4 Posted by **Raymond Del Tondo** on 12 July 2003, 6:08 a.m.,*
in response to message #3 by Ron Ross

Hi,

I'd like to say the 27S is a combination of the 17BII and the 32S, more than the 42S.

From the programming part, the 27S uses the same mechanics (lists of expressions) as the 17B(II) .

Regards,

Raymond

BTW: A 22S in this conddition (like new) IS rare, so the price isn't too suprising. I paid 100 Euro for my NewInBox 22S a while ago...

Well, of course even if the 2XS series were quite nice algebraic calcs, especially the 27S that reaches nowadays prices similar to those of the 42S, $165 for & 22S is a lot of money.

Nevertheless this one is considered as (mint) as it is complete in its box with virtualy no usage. I guess a collector would appreciate to have such a sound machine on his shelf.

Now these calcs that used to sell for $10 3 years ago - like the 32SII incidentelly, that was just ignored on ebay when they were still for sale - are not in production anymore prices go crazy... I haven't seen any investment that would levy so much than an HP calc purchased a few years ago...

HP48GX screen replacement

*Message #1 Posted by **Ohneil** on 11 July 2003, 5:08 a.m.*

I have had this precious calculator of mine since it first came out and had the screen crack on me today. I'm wondering if there's anyway to replace this. Would it be cheaper than buying anew 48GX?....

Please help! Ohneil

Re: HP48GX screen replacement

*Message #2 Posted by **unspellable** on 11 July 2003, 12:18 p.m.,*
in response to message #1 by Ohneil

Try http://www.fixthatcalc.com/

This guy just put a screen in my 48SX. Fairly quick turn around. So far looks good.

Re: HP48GX screen replacement

*Message #3 Posted by **Ohneil** on 14 July 2003, 8:45 a.m.,*
in response to message #2 by unspellable

I have checked that www.fixthatcalc.com but the price was kinda unreasonable. I was quoted around $70-$75 which was half of the current price for a new HP 48GX calculator. Is there any other site that is MORE reasonable!?

Thanks

Re: HP48GX screen replacement

*Message #4 Posted by **Ron Ross** on 14 July 2003, 10:12 a.m.,*
in response to message #3 by Ohneil

You could try to fix by yourself, if you are skilled with repairs. You only need the LCD screen from an Hp38G or another 48G (you can buy for about $25-40 for either, the 38G can be purchased new for that). However, you will probalby destroy the first calculator you open, so you should wait until you recieve your replacement calc before you operate.

There is no guarantee of your success either. However, Hp themselves used to offer a replacement policy for out of warrenty calculators of around that cost also. Then you would get a new unit (or just like new as it may be a refurb ie returned for some reason or another).

Ph # 970-392-1001 ext. 0

I haven't dealt with for a couple of years (I had a bad 49G, first issue).

Re: HP48GX screen replacement

*Message #5 Posted by **ohneil** on 14 July 2003, 10:40 a.m.,*
in response to message #4 by Ron Ross

Ron,

What is that number(Ph # 970-392-1001 ext. 0) for? Do you know where to get this LCD replacement for that price?

Neil

Re: HP48GX screen replacement

*Message #6 Posted by **Ron Ross** on 14 July 2003, 11:45 a.m.,*
in response to message #5 by ohneil

Finding a bare LCD is difficult. I am suggesting you purchase another less desirable calculator and robbing from it.

The Phone # is Hp's calculator warrenty and repair number. Hp does not make this number very well known, but I believe they still use it. Hp will want you to send in your calculator and $$$ to replace your calculator. The $$$ part changes from month to month, hence you will have to call and find out what Hp charges to repair (actually replace with new) your calculator.

Re: HP48GX screen replacement

*Message #7 Posted by **Ohneil** on 15 July 2003, 10:33 a.m.,*
in response to message #4 by Ron Ross

Ron,

You seem to know a lot about this sort of repair for the HP. What advice could you give me to help me be successful with the LCD transplant?.... I have all the smaller size screwdrivers and soldering gun. Is there anything else? Do you know any website to help me do this?.... I'm buying a used HP 38G calculator as the donor. I really hate wasting a decent calculator but I really miss that HP 48GX very much!

Ohneil

Re: HP48GX screen replacement

*Message #8 Posted by **Ron Ross** on 15 July 2003, 11:05 a.m.,*
in response to message #7 by Ohneil

There are two ways to get at your screen. I read up on memory upgrades and took a plain old 48G to 128K and found a couple of ways to dissassmble. I drilled out the heat stakes from the back battery compartment and removed my IR lense and cut posts (You have a different IR lens). Then I pried apart. Once apart you will see small twist knobs (I did not go further as I only needed to pull 32K chip and solder a larger 128K chip (a whole other story). These little twist knobs allow you to pull off the main guts and get to the front. You LCD will then be an alignment issue to place back on. Also you will need to be sure your compression pad on the LCD is good as that is a major failure that affects keyboard operation. The great thing about this approach is that IT LOOKS CLEAN WHEN YOU ARE DONE. The downside is my case is not as solid as it used to be (creaks like an old TI). I have other calculators and do not use this one much so I cannot say whether it would hold up to day to day use (seemed okay when I put it

away).

Another more direct way is to peel up the front of the calculator to get directly to the LCD. I believe this is also possible and would be much quicker. However, your faceplate will show this attack and look rather shabbly after this operation. Again, you will have alignment issues and lack of proper pressure on the LCD and keyboard traces could haunt you.

There are a few people here who have repaired broken LCD's but I suspect it can be a cumbersome trial and effort experience.

Which H-P Do I Take Camping?

*Message #1 Posted by **Paul Brogger** on 10 July 2003, 7:15 p.m.*

Situation: You're leaving Saturday to meet your liberal artsy ex-schoolmate on a camping/day-hiking/trout-fishing trip in the high, dry, eastern Sierra. You've mentioned your interest in HP calculators, and want to graphically (no pun) demonstrate the difference between where we are and where we once were.

What do you take along?

This isn't a true back-packing trip, and I don't expect to be carrying a calculator on my hikes, so size isn't necessarily an issue. (That might be a worthy sub-topic, however . . .)

I will be unable to use my charger, but I expect I won't be using it all that much. I'm thinking (and Norm's thinking) a fully-charged HP-34C. If I had a nice 42s, I suppose I'd bring that along too.

Do you take along a TI-30 as well? Is that a "fair" comparison? (That is, to the extent that *any* comparison between classic HP and TI can be called "fair" . . .) I suppose a 6s would do a bang-up job of showing the current state of affairs . . .

Re: Which H-P Do I Take Camping?

*Message #2 Posted by **Randy Sloyer** on 10 July 2003, 8:58 p.m.,*
in response to message #1 by Paul Brogger

If you really want to push the envelope, U could take along all of the above in opened form. Forget the performance numbers, that takes batteries. Who cares, we all know they work, unless it is a 12SP. Just look at the hardware. No chemical reactors needed. Just marvel at the changes and advancements. Just for fun, buy a 10Bii and drill out the four heat stakes, rip it open and take it along as well. You'll be amazed at the last true HP designed machine, a Pioneer on steroids. Gold plated keyboard contacts, wow! And an LCD that is shock mounted, true genius.

And don't forget the 4 weight rod and a few dry flies for the still water pools. The calculators get boring after a a few minutes. Besides, the trout could care less. Yuumm, shore lunches on non-calculating trout...Now where's the beer...

Edited: 10 July 2003, 9:03 p.m.

Easy answer -- take along an HP 49G+

*Message #3 Posted by **NH** on 10 July 2003, 9:30 p.m.,*
in response to message #2 by Randy Sloyer

That's an easy answer -- when camping you take along an HP 49G+ .....

it's too complicated and confusing to do any number work.
But if you break it in half the jagged edges are pretty good for defending yourself against an attacking mountain lion.

Re: Easy answer -- take along an HP 49G+

*Message #4 Posted by **Randy Sloyer** on 10 July 2003, 10:35 p.m.,*
in response to message #3 by NH

Now THAT'S an original answer!! Why didn't I think of that one? I never thought of them as weapons, but, then again, I never did think of any useful purpose for a 49G other than a paperweight. My thirteen year old likes the color scheme. In algebraic mode, at least its useful to someone, but not me.

Paul, I don't really think you where looking for a serious answer, where you?

Norm, thanks for the good laugh :^)

Re: Which H-P Do I Take Camping?

*Message #5 Posted by **Trent Moseley** on 10 July 2003, 11:22 p.m.,*
in response to message #1 by Paul Brogger

What you take along with your "liberal artsy ex-schoolmate" is an HP-67 with a bad gummy wheel so you don't need to fool around with calculators and then have some real fun.

tm

Re: Which H-P Do I Take Camping?

*Message #6 Posted by **ted** on 11 July 2003, 1:44 a.m.,*
in response to message #5 by Trent Moseley

The trick is to make her feel important, and get her involved. Bring along a blanknut, and ask her to help decide where the functions could best be placed. Bring an overlay or two and stickers. I suspect she will remember it as a very memorable day in the mountains! She could even keep the overlay as a souvenir.....

oh, okay... NOW I get it

*Message #7 Posted by **glynn** on 13 July 2003, 1:11 p.m.,*
in response to message #6 by ted

The overlay is for the CALCULATOR. Gosh, that sure clears things up.

;-)

If I were in your shoes ...

*Message #8 Posted by **Valentin Albillo** on 11 July 2003, 4:24 a.m.,*
in response to message #1 by Paul Brogger

Hi, Paul:

Assuming you're serious, here's a serious answer. You must take either an HP-15C or an HP-11C, period. Why ?

- they are extremely small and thin and lightweight, so they won't be a burden to carry
- their batteries last so long you could go round the world and back on foot, several times, and they would still work fine, so no need for a charger or even backup batteries

- they are the finest pure calculators HP ever made (or anyone for that matter), you won't find anything approaching their quality or performance anytime, anywhere (hi, Sarah Brightman!)
- they have the most contrasty, solid-black, best LCD displays HP ever made. All segments are thick and black, and easily read even in very poor light conditions. No straining your eyes to try and see what's on the display.
- they're also beautiful and look incredibly solid and classy. I've yet to find any intelligent woman or man who doesn't feel attracted to them on first sight.
- you can write no-nonsense programs for them that might appeal to your intended companion. For instance, you might easily program a random dice generator, to play some game requiring dice without the risk of losing them out in the wilderness. Or a lotto number generator. Or a calories calculator. Or a biorythm calculator that will provide for much interesting conversation on the subject, etc.
- and last but not least, they're guaranteed to stand to any adverse climatic conditions, no matter how adverse. In my own experience, I had an HP-11C with me at all times for one year in the Sahara desert (extreme hot and cold, sand, dust, etc) while in the military and not only did it survive, but it's the mintest HP-11C in my collection. Matter of fact, you're far more likely to fail yourself than your HP-11C/15C are.

There you are. Best regards from V.

HP41 emulators

*Message #1 Posted by **David Smith** on 10 July 2003, 4:43 p.m.*

Do any of the HP41 emulators out there allow one to load programs from an external ASCII text file? The emulator would need to be either CX or CV+XFUNCTION compatible.

Re: HP41 emulators

> Do any of the HP41 emulators out there allow one to load programs from an external ASCII text file? The emulator would need to be either CX or CV+XFUNCTION compatible.

Warren Furlow's V41 for Windows PC allows loading/writing of FOCAL programs in RAW mode. With the User Code Utility from Leo Duran you can handle ASCII text files.

Regards

Christoph

Re: HP41 emulators for palm

*Message #4 Posted by **Renato** on 10 July 2003, 9:46 p.m.,*
in response to message #3 by Christoph Giesselink

There is a HP-41CX emulator for palm that supports all that.

Take a look at:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=34641

I guess you can get V41 to do all that, but you´ll need to find some other support programs.

Re: HP41 emulators for palm

*Message #5 Posted by **David Smith** on 11 July 2003, 3:57 p.m.,*
in response to message #4 by Renato

I was needing it to run on a PC (DOS or Windows). Basically I have a compiler type program that would generate a HP41 listing that could be loaded into the emulator for further modification and debugging before it would be transfered to the real machine.

Re: HP41 emulators for palm

*Message #6 Posted by **Renato** on 11 July 2003, 4:40 p.m.,*
in response to message #5 by David Smith

Two options:

1. V41, at a site that can´t be listed here. contact me at r_toi at yahoo dot com.

2. You can run p41cv under windows, using a palm emulator.

Renato

Re: HP41 emulators for palm and inquiring minds

*Message #8 Posted by **tony** on 12 July 2003, 7:47 a.m.,*
in response to message #5 by David Smith

Have a look at J-F Garnier's EMU41. You can OUTP a 41 prog to a dos file called emu41out.dat and INP one from emu41in.dat. These .dat files are ascii but not really human readable - they are ascii hex codes. You need to select the DOSLINK device, and need the EXTIO ROM image, for this.

May be a stupid question...

*Message #1 Posted by **Pierre Brial** on 10 July 2003, 9:15 a.m.*

I like to browse the websites about old calculator and computer, particulary about hp, as I have myself a small collection. In some articles, I have often noticed that calculator fanatics are called "geek" or "nerd". As I am french, I am not able to translate exactly these words and they are not in my dictionary. I suppose it is something humoristic. Could you tell me what they mean exactly ? All the best Pierre

Re: May be a stupid question...

*Message #2 Posted by **Thibaut** on 10 July 2003, 9:32 a.m.,*
in response to message #1 by Pierre Brial

Hi Pierre,

A nerd has no translation in French. C'est en fait un "premier de classe", le type plutôt associal, avec des lunettes, plus malin que tout le monde et qui énerve son entourage. Agan, dans les oeuvres de Goscinny et Sempé se rapproche bien de cette définition.

Thibaut.be

Re: May be a stupid question...

*Message #3 Posted by **bill platt** on 10 July 2003, 10:21 a.m.,*
in response to message #1 by Pierre Brial

Hello Pierre

Geek, and Nerds, which may or may not be the same thing depending on when and where you are (like, 1977 at Cal Tech vs 1998 at MIT etc) have the following general characteristics:

Do not care that they either dress different, act different, or think differently from the majority of persons in the school,

Do not participate in parties, drinking, etc

Not athletic

Academically or intellectually superior (or just perceived to be)

Now, it gets complicated, because the athletic part, or any other part of the definition is really not universal---in other words the California Nerd is defined more by his lack of beach savvy than the MIT Eastern nerd...

The one true over-riding "Nerdyness" or "Geekyness" is an extreme interest in something, especially if it is not a mainstream popular culture interest--and especially if you "know too much" about it. So by this definition, people who would seem "tough" or "cool" are in fact truly nerds: for example, motorcycle gang types, or "chopper bike" enthusiasts generally, are in fact very nerdy: they know a whole lot about something that is not

mainstream: motorcycles; they are fanatical about it, and they don't care that they look different. So, take heart all you nerds: You have a lot in common with some of the "toughest" out there!

In american teenage popular culture (which is of course where all of this sort of self-conscious blather starts) it is not cool to know anything in depth. The less you know, the better--except what the latest eminem or brittany (sp?) spears song is---but only in a superficial way. Teenage girls are especially affected--they start to worry more about how they look, and the idea of studying or learning anything useful is considered way uncool. The boys have similar pressure, but really not as much--they don't worry about makeup, and teenage boys are so goofey anyway that it really does not matter how hard they try to be cool, they still look and act goofy.

Now in France, everyone is so worried about passing their Bach and getting into "universite" that it is I imagine more acceptable to be earnest in one's studies.....

Regards,

Bill

*Message #4 Posted by **Dan** on 10 July 2003, 11:22 a.m.,*
in response to message #3 by bill platt

I would tend to disagree with the previous, overly broad definition of geek or nerd. These words can be simply stated as the combination of (1) social awkwardness, and (2) obsession with academics. Other types may be fanatical or obsessive about something else, but I don't think that fits the definition of geek or nerd. Interest in alculators, being linked to academics, might fit one part of the definition but not both. However, if you spend so much time thinking about them that you don't know how to participate in any other topics of conversation, then you are probably a nerd. However, if you have a similar problem with sports or motorcycles, that just makes you a jock or a gearhead, which is just as bad, but still different. Perhaps we should put together some common-sense guidelines, like "You might be a nerd if..."

Thank you all for the responses. So "nerd" and "geek" are quite the same ? I read for the first time the word "nerd" in this very good Bob Noble's article about restoring calculators :

http://www.vintagecalculators.com/html/restoration_of_calculators.html All the best Pierre

Re: May be a stupid question...

*Message #7 Posted by **John Cadick** on 10 July 2003, 11:35 p.m.,*
in response to message #1 by Pierre Brial

Both words have made it into modern American slang and are in the dictionary. Here from the American Heritage Talking Dictionary:

Nerd:

n. Slang. 1. A person regarded as stupid, inept, or unattractive. 2. A person who is single-minded or accomplished in scientific pursuits but is felt to be socially inept.

---------- Excerptedfrom AmericanHeritageTalkingDictionary
Copyright © 1997 The Learning Company, Inc. All Rights Reserved.

Geek:

n. Slang. 1. A person regarded as stupid, inept, or unattractive. 2. A person who is single-minded or accomplished in scientific pursuits but is felt to be socially inept.

---------- Excerptedfrom AmericanHeritageTalkingDictionary
Copyright © 1997 The Learning Company, Inc. All Rights Reserved.

I confess that I have always thought of a geek as more intelectually inclined than a nerd. <An enormous grin>

John

Re: HP 41C - Bombers Edition - MINT???!!!

*Message #5 Posted by **Tom (UK)** on 10 July 2003, 1:49 p.m.,*
in response to message #1 by Tracy Vermeyen

Well at least we can see what this guy thinks is 'mint'.

To quote:

"The calculator is in mint condition, with only a few superficial scratches to the case, but no "wear and tear" that you might expect from steady use. There is a supply label stuck to the back, and another spot on the back with some sticker gum residue, but this will not affect function, and can be removed easily, if desired (or left on to add character.) The battery compartment is immaculate, the calculator having never been stored with batteries installed. The books are in excellent shape, save for signs of being 20 years old. Covers and pages may be slightly yellowed, and some page edges on the Owner's Handbook, as well as the back cover, show

normal wear. I cannot guarantee that this calculator works, since I have never put batteries in it, but it has been treated well and stored carefully, so I don't see why it wouldn't."

Re: New HP Calculators

*Message #6 Posted by **Scuba Diver** on 10 July 2003, 8:46 a.m.,*
in response to message #3 by Patrick

Well, the 17BII + and 19BII + caught my eye.

I wonder what features they will posess? I find it hard to believe that they could improve on either of those calcs, save adding trig to the 17...

Maybe they added some newer bond calculations or something...more memory (not that they needed it...most 19BII users never even use the memory outside of the registers!)

B.

HP 19BII Memory

*Message #7 Posted by **Thibaut.be** on 10 July 2003, 8:54 a.m.,*
in response to message #6 by Scuba Diver

Well, key in your contact list and your RAM will not support it...

A 128K RAM would be more convenient UMHO

Re: HP 19BII Memory

*Message #8 Posted by **Scuba Diver** on 10 July 2003, 12:04 p.m.,*
in response to message #7 by Thibaut.be

True, although with Palms and Blackberries that sync up to your Outlook/Lotus Notes calendar, very few people use it for appointments anymore.

The fact that this calculator was a PDA yeaars before Palm shows just how visionary HP was!!!

B.

Re: New HP Calculators

*Message #9 Posted by **Justin** on 11 July 2003, 6:25 a.m.,*
in response to message #6 by Scuba Diver

I wonder what features they will posess? I find it hard to believe that they could improve on either of those calcs, save adding trig to the 17...

Not that I think they'll do it, but my dream would be PC connectivity so Solver equations could be

typed in/proofed on a computer and then d/l'd to the calc.

To 33S beta testers

*Message #10 Posted by **Patrick** on 10 July 2003, 4:23 p.m.,*
in response to message #1 by Richard Garner

No, I don't expect you to identify yourselves (if you're even out there) nor break your confidentiality agreement. I just would like you to check something for me...

What is the calculator's answer to 0^0?

It would be great if the answer was 1 and not "Error", like it is on the 11C. I mean, 0! is calculated correctly as 1, why not 0^0?

Re: 0! vs. 0^0

*Message #11 Posted by **Paul Brogger** on 10 July 2003, 7:25 p.m.,*
in response to message #10 by Patrick

If I remember right, 0! is not *calculated as* 1, but is *agreed to be* 1. Didn't our mathematical forefathers decide it should evaluate to 1 just to keep the curve smooth?

However, 1^0=1.00, -1^0=1.00, but yes, also on my 34c, 0^0 = "Error 0".

And, 0^1=**0.00**?!?!? In a politician, such inconsistency would provoke outrage!

Calculated vs Agreed

*Message #12 Posted by **Patrick** on 10 July 2003, 7:58 p.m.,*
in response to message #11 by Paul Brogger

In my professional opinion, I would have to challenge you on your distinction of *calculated* vs *agreed*. The definition of any function at any point is something that is *agreed* upon by the scientific community. Whether or not there is an arithmetic or other *calculation* involved is just a particular kind of evaluation algorithm.

So, one *definition* of the factorial function consistent with the scientific literature is:

```
0! = 1
n! = n * (n-1)! for n an integer >= 1.
```

Likewise, the definition of y^x includes certain special cases:

```
0^x = 0 for any x != 0
x^0 = 1 for all x (including zero)
```

There are good reasons for defining 0^0 to be 1 which I believe have to do with the continuity of the exponental function on the complex plane.

I'm surprised Mr. Kahan, with his careful attention to detail in the complexities of the SOLVE and INTEGRATE functions of the 34C, and in all of its algorithms in general, let this one sneak by.

Re: 0! vs. 0^0

*Message #13 Posted by **Definition of n! for 0! = 1** on 11 July 2003, 4:05 p.m.,*
in response to message #11 by Paul Brogger

A definition of the factorial function

n! = product(k) for k =1 to k greater than or equal to n

(My symbols did not survive the posting process.)

Note that if n = 3, we start the product with k = 1 and go up to k =3. n! = 6

If n = 0, we start the product with k = 1. At this point k is greater than n so we stop with the product equal to one. Thus 0! = 1 without treating 0 as a special case.

It is a natural definition of the function as it is usually used to determine the number of possible ways to order a set of n objects. If n = 0 there is one way to order the set. This assumes that whether 0 is considered to be a number or not, it is an object in that it represents the empty set or at least a place holder.

Re: To 33S beta testers

*Message #14 Posted by **Ernie Malaga** on 10 July 2003, 9:36 p.m.,*
in response to message #10 by Patrick

Patrick:

0^0 is undefined by definition -- like 0/0 and 1 raised to infinity. In general, x^0 is 1 because 0 = n - n, so x^(n - n) = x^n/x^n = 1. But if x is 0, the denominator would be 0^n, which is 0, and you cannot divide by zero.

I am not certain if this is the correct explanation for the undefinability of 0^0, but it's a good one anyway. If your calculator reports "Error" when you attempt 0 [ENTER] 0 [y^x], the calculator is only giving you the mathematically correct answer.

Other undefined expressions are ln(x) for x <= 0, tan(90), etc.

-Ernie

0^0

*Message #15 Posted by **Patrick** on 10 July 2003, 11:26 p.m.,*
in response to message #14 by Ernie Malaga

I have to disagree with you, Ernie. The mathematical definition of y^x for y>0 is exp(x ln(y)). The ln(x) function is defined as the integral from 1 to x of 1/t dt and the exp(x) function is defined as the inverse of ln(x).

Since the definition does not provide a value when y is zero, we are free to define it as we like. The natural definition of 0^x for x non-zero is zero. This leaves the hole at x=0, y=0. To fill that hole, one might try to take the limit as either x or y approaches zero with the other one equal to zero. The result is that there is no unique limit, meaning there is no definition of y^x which makes the function continuous. However, there are good reasons to *define* 0^0 as equal to 1, as it makes a number of other theorems easy to state without having to have an exception at that point. This is what actually has been done. In higher mathematics, we define the value of 0^0 to be equal to 1. The function does not end up to be continuous, of course, it cannot be, but it is the *best* value we can choose for a host of other reasons.

As a reference, I direct you to this article written by the mathematician William H. Kahan, the

numerical analyst who consulted with HP on many of their algorithms, including SOLVE and INTEGRATE. You can see on page 10 of that document a definition for the complex power function z^w, which is defined to be equal to 1 whenever w = 0, for all complex z.

Re: 0^0

*Message #16 Posted by **Ernie Malaga** on 11 July 2003, 1:22 a.m.,*
in response to message #15 by Patrick

Patrick:

I'll defer to your obviously greater expertise on the matter. From my long-ago college days, however, I vividly remember that my textbooks specified 0^0 as undefined -- every bit as much as 0/0.

I'll try to read the article you mentioned, but I doubt that I'll understand much of it. I flunked integral calculus, barely learning to integrate e^x. 8^)

-Ernie

Re: 0^0

*Message #17 Posted by **Ernie Malaga** on 11 July 2003, 1:36 a.m.,*
in response to message #15 by Patrick

Patrick:

I checked page 10 of the document. Unless I'm missing something, it seems to confirm what I said:

> Quote:
>
> z^w = exp(w*ln(z)) except z^0 := 1 for all z, and 0^w := 0 if Re(w)>0

Observation 1: There is really no need to state as an exception the case when w=0, since w*ln(z) will be 0 whenever w=0 (no matter what value z may have), and exp(0) = 1 anyway.

Observation 2: "and 0^w :=0 if Re(w)>0" Notice that w is non-zero (otherwise it couldn't have a real portion greater than 0), so the definition given for z^w does _not_ cover the case when both z and w are 0.

If you still disagree with me I'll take your word for it, but that's what I'm reading here.

-Ernie

Re: 0^0

*Message #18 Posted by **Patrick** on 11 July 2003, 2:45 a.m.,*
in response to message #17 by Ernie Malaga

Observation 1: You can't use the w*ln(z) argument because ln(z) is undefined for z=0. You can't argue that a multiplication involving zero has to be zero when the other part of the multiplication is undefined!

Observation 2: The definition *does* cover the case when both are zero since it says that z^0 = 1 **for all z**. Surely, the number z=0 would have to be included in *all*, would it not?

0^0 != 0^0 ????? (edited)

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 11 July 2003, 2:54 a.m.,*
in response to message #17 by Ernie Malaga

Hi Ernie, guys;

There is no reason to discuss this fact. 0^0 is not defined, period. And what Patrick wrote is easily identified as conflicting.

> Quote:
>
> Likewise, the definition of y^x includes certain special cases:
>
> ```
> 0^x = 0 for any x != 0
> x^0 = 1 for all x (including zero)
> ```

Unfortunately, *x^0 = 1 for all x (including zero)* is wrong. Zero is not included. Suppose you have y^x and x^y.

If y == x, then x^y == y^x, right?

Based on what you wrote:

0^0 is not defined when you analise 0^x when x = 0; and

0^0 == 1 when you analise x^0 when x = 0.

So, 0^0 != 0^0. Not consistent, isn't it? And that's enough reason to make it undefined.

My 2¢.

Luiz (Brazil)

Edited: 11 July 2003, 3:01 a.m.

Are you sure ?

*Message #20 Posted by **Valentin Albillo** on 11 July 2003, 5:18 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

Luiz wrote:*"There is no reason to discuss this fact. 0^0 is not defined, period."*

Are you sure ? It's certainly rare to see such a nice, *suave* person like you uttering such a bold, intransigent statement. I usually think that absolutely everything can be discussed, and that denying that possibility is akin to fundamentalism (i.e: "There is no reason to discuss the existence (or non-existence) of God (say). God (say) exists (or doesn't), period." Get the point ?

Also, I tend to think that mathematics aren't invented, but *discovered*, have an existence of their own, independent of human beings or a physical universe existing or nor, and thus tend to be rather impervious to anyone's attempt to "define" or not what they should do. For the case in discussion, x^x when x is 0, look at these results:

```
     x            x^x
--------------------------
```

```
0.1000000000  0.7943282347
0.0100000000  0.9549925860
0.0010000000  0.9931160484
0.0001000000  0.9990793900
0.0000100000  0.9998848774
0.0000010000  0.9999861846
0.0000001000  0.9999983882
0.0000000100  0.9999998158
0.0000000010  0.9999999793
0.0000000001  0.9999999977
```

Does that ring a bell ? Of course, one can argue that when x is *exactly* zero, an indefinition occurs. That's debatable but if it were true, so what ? Any calculation will show the values merrily going to 1 as x goes to 0, and if some mathematician's committee were to *define* that 0^0 = Pi, it would do them no good, for it would generate contradictions at once. If you are *forced* to accept a definite value to avoid contradictions, you're not *defining* anything, you're merely trying to save your face on account of the evidence.

As a further example, consider a function defined thus:

```
f(x) = x / x
```

Now, you evaluate it for all finite arguments, and find that f(x) is always 1. Then you try to evaluate it for x=0 and you claim that 0/0 is undefined, and so assigning the value of "1" to f(0) is a matter of *definition* ... Come on !! Common sense shouldn't be incompatible with mathematics !!

Best regards from V.

O.K.: I started my arguments wrongly...

Thank you , Valentin;

I'd remove the first two sentences in my post and convert it to an open discussion and turn it into my view of the situation: I see as not defined based on what I wrote.

Back to the arena: B^}

Math approaches are (always?) a matter of discussion and definition. And I teach that...

Thanks.

in response to message #21 by Vieira, Luiz C. (Brazil)

I'm not sure this can be done, but I simply extracted part of what's written in the below mentiond site. Particualr attention to the first sentence I set as italic.

> Quote:
>
> Other than the times when we want it to be indeterminate, *0^0 = 1*
> ***seems to be the most useful choice*** *for 0^0* . This convention allows us

> to extend definitions in different areas of mathematics that would otherwise require treating 0 as a special case. Notice that 0^0 is a discontinuity of the function f(x,y) = x^y, because no matter what number you assign to 0^0, you can't make x^y continuous at (0,0), since the limit along the line x=0 is 0, and the limit along the line y=0 is 1.

Extracted from:

Valentin:

Your table of X and X^X values only proves that the _limit_ (not the function itself) is 1 as x approaches zero.

> Quote:

> As a further example, consider a function defined thus: f(x) = x / x
>
> Now, you evaluate it for all finite arguments, and find that f(x) is always 1. Then you try to evaluate it for x=0 and you claim that 0/0 is undefined, and so assigning the value of "1" to f(0) is a matter of definition ... Come on !! Common sense shouldn't be incompatible with mathematics !!

And mathematics shouldn't be incompatible with common sense, either. You can't ignore singularities and discontinuities with special-case definitions and leave it at that. The function f(x) = x/x is a straight line, yes, but it gets interrupted for x=0. "Defining" f(0) as 1 goes against common sense.

[OT] Re: Are you sure ?

*Message #24 Posted by **Valentin Albillo** on 11 July 2003, 8:54 a.m.,*
in response to message #23 by Ernie Malaga

Hi again, Ernesto:

Obviously this discussion could go on a on, and we'll probably end it "agreeing to disagree", but there's one final remark I'd like to bring to your attention: stating that

x / x => 1

for all x, just means (passing the denominator to the right side) that:

x = x

which I'm sure you'll agree it's valid for every conceivable x, be it whatever it may, zero included. That's what the equation and the function are telling us, and trying to see "discontinuities" where there are none, and using "definitions" where none are necessary is just plain silly, a kinf of bureaucratic formalism, that goes against common sense. Also, "defining" that some function has such and such value where no other value is possible at all without inconsistency, is absurd, because if you have no choice, if your are forced, issuing a "definition" is a meaningless act on your part.

That said, don't think I'm blinded to the subleties of mathematical formalism, is just that sometimes I think some of them are pretty stupid, and 0^0 or x/x for that matter just trigger that feeling for me.

On the other hand, I know all too well that you can never prove anything my common sense or intuition alone; logically consistent, formal proofs are always necessary. For instance, assume that you are calculating this infinite sum:

Sum(n = 1, n -> inf, INT(n * tanh(Pi))/10^n)

and the answer you get coincides with 1/81 to 12 decimal places. "How nice!" you think, "I didn't expect this hyperbolic tangent thing to add up to a simple rational fraction as 1/81. Maybe it's just a coincidence ?" and so you duly proceed to compute it to greater accuracy, say 30 decimals.

It still agrees with 1/81 to all 30 decimals. "It's wonderful, let's try that multiprecision package I've got for my 48/49/71 !", you say, and proceed to compute the sum to 100 decimal places. It agress with 1/81. Then to 200 decimal places. It still agrees.

Obviously, common sense would dictate by now that the sum equals exactly 1/81, no doubt about it, right ? 200 decimal places in agreement is more than enough evidence to settle the matter, isn't it ?

Yet common sense would be wrong this time, as the sum does NOT equal 1/81. So much for common sense in mathematics ... :-)

Best regards from V.

Valentin:

> Quote:
>
> Obviously this discussion could go on a on, and we'll probably end it "agreeing to disagree"

Yes, the discussion could go on forever. Which is another way of saying "it's undetermined." If instead of "0^0 = x" it were "2 + 2 = 4" no one would question it and there would be no discussion at all.

It seems, therefore, that we need to agree to disagree.

> Quote:
>

in response to message #20 by Valentin Albillo

Luiz wrote:"There is no reason to discuss this fact. 0^0 is not defined, period."

Then Valentin responded:"Are you sure ?"

Right, here we go...

0^0 is undefined. Period. Simple as that. In fact, we can even go so far as to say that 0^0 is singular. Sometimes it is called an 'indeterminate form', but the outcome is the same.

Now, in certain applications we would like the expression x^x to be continuous. So, we define 0^0 to be 1, which is quite reasonable since lim(x->0) x^x is 1 whether x approaches zero from above or below.

Soooo...the point x=0 where f(x)=x^x is a 'removeable singularity'. Quite simple really.

Can we stop the argument now?

*Message #27 Posted by **glynn** on 13 July 2003, 1:02 p.m.,*
in response to message #26 by WigglePig

Okay, What would all of you do?

"Error (0)" _or_ "1" ?

It would probably confuse heck out of the average user to offer a CHOICE, though this probably could be done, say, via some flag setting. The default might be "error

(0)", but you could flip a bit and make the calc default to 1.

Or, maybe we should have the calculator give predefined answers, but light up a "YMMV" ("Your Mileage May Vary") indicator: "I'm saying this is 1, but it's really not".

I have heard some describe mathematics as "the perfect science". I believe it probably is, but the subtleties and special cases here and there seem to indicate our mathematical grammar has had a hard time perfectly expressing it in toto.

So, what's a calculator to do? ;-)

1/3 × 3 = 1? 1/3 × 3 = .9999999999...?

*Message #28 Posted by **Vieira, Luiz C. (Brazil)** on 13 July 2003, 1:26 p.m.,*
in response to message #27 by glynn

Hi, Glynn;

good reading your posts again.

The title says much of what I want to express, but I'll take the benefit of doubt: 0^0 is not defined.

After reading The Math Forum comments about the limits for x^y when each one tend to zero, what shows it is discontinuous because both limits tend to different values, I embrace the cause.

About programming: I'd set flag 25 in an HP41/42 and test it later, or I'd use an IFERR structure if using an HP-RPL model or any error-trap structure available in other languages to detect this sort of fact, but I'd keep the original math definitions (unless others appear) if I'm developing a new language or compiler. I'd not let the user interfere at this point because it would lead to the development of "conditional programs", that would behave in different ways without specific pre-conditioning. I think the HP49G math approach is already outstanding when allowing the use of many flags to predefine the way the user want an answer to be treated by the O.S. and how it must be shown. The HP48G already gives much control, but after reading some (far from a complete reference) of CAS resources, I can see some interesting possibilities. Nothing I can convert into words right now, but surely new perspectives. About a year ago I posted a message where I criticized CAS without knowing what was it able to do. One of the contributors called my attention and mentioned Urroz' books. I bought four of them and read parts of them in brief. Enough to change my mind about CAS and related stuff.

I still keep math principles as valid and applicable, although many math enhancements have occurred and I'm not aware af them as a whole. For as long as there are math situations with doubtful answers, I'll take them as undefined. As you say, math must be precise all the times, mostly when treating its own lacks.

Re: Sooo... if you were on the programming team...

*Message #29 Posted by **Patrick** on 13 July 2003, 1:55 p.m.,*

in response to message #27 by glynn

Well, I plead guilty to starting all of this brou-ha-ha. I never anticipated this kind of response. But here is what I think would happen...

If you have a company driven by engineering principles (e.g., the old HP) they might consider defining the function to be equal to 1. They would see the mathematical arguments for this, such as the rather important statement that the binomial theorem would extend naturally to the case of n=0.

If you have a company driven by marketing principles (e.g., the new HP) they would no doubt leave the function undefined at (0,0), and to hell with the binomial theorem and its ilk. A marketeer would need no further justification than this thread to convince them that is the right thing to do. You never want to confuse your customers. Not with that 50% rollback in customer support coming next month.

On the other hand, a company that *was* driven by engineering principles (i.e., the old HP) did in fact leave 0^0 undefined in their calculator logic. Earlier, I said that I was surprised that Dr. Kahan let this one slip through. I now believe him to be much wiser than I had ever thought. I now believe this was a conscious decision on his part. He was intimately aware of the *good mathematical logic* behind the reason to set the value to 1 -- he teaches this very fact in his complex analysis course for crying out loud -- so he must have had a very good reason not to do it. I think I might agree with him now.

Re: Sooo... if you were on the programming team...

Message #30 Posted by ***Rodger Rosenbaum*** *on 13 July 2003, 2:42 p.m.,*
in response to message #29 by Patrick

If you look at the sci.math reference: http://www.faqs.org/faqs/sci-math-faq/specialnumbers/0to0/ there you will see: "Kahan has argued that 0.0^(0.0) should be 1, because if f(x), g(x) --> 0 as x approaches some limit, and f(x) and g(x) are analytic functions, then f(x)^g(x) --> 1" As you know, Prof. Kahan was involved in the mathematical behavior of the later HP calcs, reaching its pinnacle, in my opinion, with the HP71. The HP71, when given 0^0, beeps, returns ERRN=6, and returns a value of 1. I guess this is the 71's way of saying "there is disagreement about what 0^0 should return, but we have chosen to return 1, and also return an error message." I'm pretty sure this didn't happen by accident; Prof. Kanan knew what he was doing. My HP48 returns 0^0=1 without error even if I set flags 20 and 21 and clear flag 22 to give it the greatest possibility to generate an error. I prefer the way the HP71 does it.

Re: Sooo... if you were on the programming team...

*Message #32 Posted by **Werner Huysegoms** on 14 July 2003, 1:58 a.m.,*
in response to message #31 by Massimo Gnerucci (Italy)

Indeed. 0^0 (exact) is undefined. It is not because there is a large class of analytic functions for which the *limit* for x approaching zero of f(x)^g(x) equals 1 , that its value should be. Take sin(x)/x. The limit for x approaching zero is 1, but the *value* at x=0 is undefined. The 49G will thus return '?' for 0^0 - but will return 1. for 0.^0. - because of compatibility reasons with the 48, where it was probably chosen because it is a very convenient value to return.

Didn't the IEEE allow for similar situations: I think you can get NAN ("not a number") as the official result from illegal (questionable?) operations such as divide by zero or exponentiations giving results that are outside the range (e.g. 10^+/-99) handled by various computers and/or compilers?

Maybe 0^0 deserves something similar.

Re: Sooo... if you were on the programming team...

*Message #35 Posted by **Rodger Rosenbaum** on 13 July 2003, 11:29 p.m.,*
in response to message #34 by Dave Shaffer

IEEE 854 (IEEE Standard for Radix-Independent Floating-Point Arithmetic) only talks about +,-,/,* and remainder as required Operations. Most of the rest of it is about rounding, infinity arithmetic, normalization, NaN's, etc. The other functions such as trig, exponential, log, are left up to the implementor of a particular computer. Our topic here, 0^0 isn't mentioned at all.

Just for grins, I checked what Maple and Mathematica do. Maple returns 1 without any beeps or error indications. Mathematica returns "Indeterminate".

*Message #36 Posted by **unspellable** on 14 July 2003, 11:41 a.m.,*
in response to message #35 by Rodger Rosenbaum

leaving the theoretical aspects aside, 0^0 is abitrarily defined as 0 in some applications and as 1 in some others. So I'd vote for a three valued flag so you can set the calculator to return 0,1, or undefined as required.

Re: Sooo... if you were on the programming team...

Re: definitions

*Message #40 Posted by **unspellable** on 11 July 2003, 8:42 a.m.,*
in response to message #39 by Juergen (CH)

Some place I have seen a defininiton of the fatorial function, n!, that includes 0! = 1 as a general case rather than a special case.

I'll try to dig it up.

As for 0^0 I don't have any answers just now, but 0 is often viewed as not being a number at all. Of course the thing about that view that bothers me is what do we put on the number line to plug the space between the smallest positive number and the smallest negative number? On the other hand the number line graphs like a function and lots of functions have discontinuities.

Now I have to go read the article on Z^W.

Re: definitions

*Message #41 Posted by **Ellis Easley** on 11 July 2003, 8:33 p.m.,*
in response to message #40 by unspellable

Quote:

> ... but 0 is often viewed as not being a number at all.

Would this one case: on digital computers, zero represents not one number but all the numbers between the positive and negative numbers with the smallest magnitudes that can be represented?

*Message #42 Posted by **Valentin Albillo** on 11 July 2003, 9:20 a.m.,*
in response to message #39 by Juergen (CH)

Ask Dr. Math is a valuable service and 99.99% of the time their answers are accurate and useful. But not always ...

Have a look for instance at the answer they gave to this question:

Why is Pi Everywhere?

quoting from it:

" ... when pi appears, it is likely that some circle is present dictating the overall structure of the problem. If you think you can find a place where pi really does appear without circles around (not made up!), please send it along and I'll try to show you where the circle is."

Needless to say, most math-oriented members of this Forum can name *scores* of places where Pi does appear with *no* circle in sight, myself included.

Best regards from V.

Well, I'm not a Maths specialist, so if you could give some examples, I'd be delighted !

Circles and PI

*Message #44 Posted by **Andrés C. Rodríguez (Argentina)** on 11 July 2003, 12:18 p.m.,*
in response to message #43 by Thibaut.be

At least the PI and/or SQRT(PI) which appears on normal distribution formulas (gaussian distribution) is not obviously related to any circle, but I am prepared to find someone with great math skills who may show the relation.

On the other hand, I do remember a curved surface we studied in my Math II course in Electronics Engineering, which was defined by many arcs (it was kind of part of a hemispheric surface, but with a S-shaped cut). While all its features looked unavoidably very "circular", PI was remarkably absent of it's area formula, obtained as an integration exercise.

I vaguely remember a possible name for such surface, which could be translated as Viviani's Vault (Bóveda de Viviani), but I may be confusing similar exercises from some 27 years ago, and I have no time now to look for more references. Undoubtedly some of the more math knowledgeable people here can offer enlightment and/or corrections to this comment.

Or, I can just wait for a couple of months, because my first daughter is about to take the same course on her first Industrial Engineering year. (She is taking many of the "same" courses than I did, but her calculator is a 32Sii, while mine was a 25 at the time)

Re: Stochastic statistic? (edited)

*Message #53 Posted by **Patrick** on 14 July 2003, 12:54 p.m.,*
in response to message #52 by Werner Huysegoms

The term "random integer" is, of course, not well defined. There is no such thing -- at least none which captures the implied uniformity of the distribution.

However, I believe the statistic of which you speak is obtained as the limit as N->infinity of the probability, P_N, of two random integers in the interval [1,N] being relatively prime. Picking two integers "at random" from a finite interval is, of course, very well defined.

What is the definition for PI?

*Message #54 Posted by **Vieira, Luiz C. (Brazil)** on 11 July 2003, 11:19 a.m.,*
in response to message #42 by Valentin Albillo

Hi Valentim, guys;

this is not a math forum, of course, but computing is always a related subject.

If the definition for PI goes beyond the relation between the radius (or diameter) of a circle and the lenght of a complete arc (360º, 400 grads, 2PI radians), then I see what you mean.

If not, if PI is only related to this particular relation, I think that what Dr. Math states is that wherever PI is used, that radius<->lenght relation is there, too. What he is proposing, in my understanding, is that: found the relation, a circle, as base defintion, is there, too.

My 2¢.

Luiz (Brazil)

Re: What is the definition for PI?

*Message #55 Posted by **unspellable** on 11 July 2003, 2:38 p.m.,*
in response to message #54 by Vieira, Luiz C. (Brazil)

Dr. Math is not always the best source for definitions and the like. For one thing it tends to written for those who have not been exposed to much math theory or higher math.

It's a bit like high school when I was told than negative numbers do not have logs. Utter nonsense, but they did not have the time to explain it to high school level kids.

My calculus text says that e^(x^2) has no integral. Also utter nonsense, but they probably didn't want to spend the time on the question. Made me mad, so I went home and solved the integral myself. Of course this is the sort of exercise all students should be doing. You learn far more this way than doing things by rote.

Once past calculus, the defintions angles (excepting circular angles and ordinary solid angles), trig functions, and the like do not involve circles at all. There is probably some such defintion of pi. After all, the ratio of diameter to circumferance of a circle is only pi if you are talking about plane geometry, a concept that does not exist in the real world. (At least given the thereotical physics models currewntly in vogue.)

For comittee decided defintions I have always heard a story to the effect that some state legislature created a legal defintion of pi as 3.14. I find this quite believable after lookign at some of the other lawas around.

> For comittee decided defintions I have always heard a story to the effect that some state legislature created a legal defintion of pi as 3.14. I find this quite believable after lookign at some of the other lawas around.

That's nothing. According to _Asimov on Numbers_ by Isaac Asimov, "There is always the danger that some individuals, too wedded to the literal words of the Bible, may consider 3 to be the divinely ordained value of pi in consequence. I wonder if this may not have been the motive of the simple soul in some state legislature who some years back, introduced a bill which would have made pi legally equal to 3 inside the bounds of the state. Fortunately, the bill did not pass or all the wheels in that state (which would, of course, have respected the laws of the state's august legislators) would have turned hexagonal."

I've read about that story: the state was Indiana, I believe. Regarding approximations as "definitions", 22/7 wouldn't have been *too* far off the mark, but the HP-35 manual gives the amazingly-good example of 355/113.

> the HP-35 manual gives the amazingly-good example of 355/113

Actually this approximation predates the HP-35 manual a little... ;-)

Tsu Ch'ung-chih (430-501) proposed this value versus 22/7. This was the best approximation until XV century even if the same Tsu Ch'ung-chih computed 3.1415927 as an "excess" approx. and 3.1415926 as a "defect" approx.

[source: ***A History of Mathemathics*** *by Carl B. Boyer*]

Quite impressive, isn't it?

Massimo

Re: What is the definition for PI?

*Message #59 Posted by **Howard** on 13 July 2003, 5:24 p.m.,*
in response to message #57 by Karl Schneider

In 1896 a bill was passed in the Indiana legislature 67-0 to make the value of pi = 3.2. The senate after representation from a Purdue University professor caused the senate to defer the bill "to a later date". It is still deferred.

Re: What is the definition for PI?

*Message #60 Posted by **Ed Martin** on 13 July 2003, 8:16 p.m.,*
in response to message #59 by Howard

The worst part about the Indiana legislature proposing that pi be made equal to 3.2 is that 3.1 would be a better approximation.

Maybe they decided 3.2, being larger than 3.1, was "better". Perhaps it's the same logic that leads modern politicians to spend more than they take in ....

Re: What is the definition for PI?

*Message #61 Posted by **John (Norway)** on 12 July 2003, 11:54 a.m.,*
in response to message #54 by Vieira, Luiz C. (Brazil)

Since 1 radian = arctan(b/a), for e^i written in the form a+ib, and a complete circle is 2pi radians, then it looks like pi can be related to 'e' and 'i'. It is interesting to observe that ln(-n)

also has the form a+ib, where a=ln(n) and b=pi.

Definition of "pi"

*Message #62 Posted by **Norm** on 13 July 2003, 10:24 p.m.,*
in response to message #61 by John (Norway)

Its not about 3.1 or 3.2

The definition of pi is which flavor U like the best.

I think w/o question that chocolate pudding pi with whipped cream topping is absolutely unbeatable, but it needs some chocolate sprinkles to decorate the top.

All together

*Message #63 Posted by **Nenad (Croatia)** on 14 July 2003, 4:12 a.m.,*
in response to message #61 by John (Norway)

1 + e^(i * pi)= 0

In a single equation you related geometry (pi), mathemathical analysis (e), complex numbers (i), 1 and 0 (whatever the last two may mean).

Value × Definition

*Message #64 Posted by **Vieira, Luiz C. (Brazil)** on 13 July 2003, 11:20 p.m.,*
in response to message #54 by Vieira, Luiz C. (Brazil)

Hi, guys;

I read many posts related to PI as a number and its value. Unspellable posted:

> Quote:
>
> *After all, the ratio of diameter to circumference of a circle is only pi if you are talking about plane geometry, a concept that does not exist in the real world.*

I still wonder about its "origin" or "definition" because, as far as I remember, PI is considered an irrational number, together with "e" (:(I can't remember any other irrational constant). As an irrational number cannot be expressed by a relation, PI must be expressed in another way (maybe as a movie...).

I'm trying to keep only "plain" (number) set theory and definitions. I know many of you will discuss what is an irrational number, that all numbers have an infinite set of digits, and all numbers are contained in R-set (real), if Euclid is right/wrong... I think it's a valuable brainstorm, and I'll read all posts. But I still wonder if PI was defined as a relation based on circle elements (plane geometry) or in some other math relation, what leads us to the fact that PI is NOT an irrational number if it is defined as a relation. By definition, of course.

And concepts are mostly related to the "conceptual" world, not the real one, as unspellable stated so well. Algebra and math, in a conceptual, pure number theory, also deal with a conceptual world as well.

I know it's going a bit far from what we are used to, but this is a teasing subject and I'd love

going further.

Thanks.

Comments?

Re: Value × Definition

*Message #65 Posted by **unspellable** on 14 July 2003, 8:02 a.m.,*
in response to message #64 by Vieira, Luiz C. (Brazil)

The square root of two is an irrational number. pi (A capital PI is the symbol for a series product.) and e are transcendental numbers.

Transcendental numbers, among other things, cannot be the roots of a polynomial equation. This is connected with the fact they are represented as an infinite series when evaluated.

Irrational Numbers (Was: Value × Definition)

*Message #66 Posted by **Mark Hardman (LED)** on 14 July 2003, 7:02 p.m.,*
in response to message #65 by unspellable

Let's not forget the golden ratio which is the ratio of height to width of a golden rectangle. It is frequently referred to as phi and is derived with the following series:

phi = sqrt(1+sqrt(1+sqrt(1+sqrt(1+sqrt(1+...)))))

phi = 1.6180339...

Mark Hardman

Re: Irrational Numbers (Was: Value × Definition)

*Message #67 Posted by **Patrick** on 14 July 2003, 9:36 p.m.,*
in response to message #66 by Mark Hardman (LED)

Odd, I've always known the derivation of phi as

```
phi = (1+sqrt(5))/2
```

It, and its reciprocal, are the solutions to the quadratic $x^2=x+1$. It is also the limit of f_{n+1}/f_n, where f_n is the n'th Fibonnacci number.

Re: Irrational Numbers (Was: Value × Definition)

*Message #68 Posted by **Mark Hardman (LED)** on 14 July 2003, 11:50 p.m.,*
in response to message #67 by Patrick

But its so much more fun to derive phi as an infinite series.

Here is another one for phi:

```
1
```

```
phi = 1 + ------------------
                      1
          1 + -------------
                        1
              1 + --------
                    1 + ...
```

One interesting property of phi is that **any** positive integer can be represented as the sum of nonconsecutive powers of phi. For example:

$234 = phi^{11} + phi^{7} + phi^{3} + phi + phi^{-5} + phi^{-9} + phi^{-12}$

You can visit The Phi Numbering System page to try this out on any integer you want.

Mark Hardman (LED)

The Golden Ratio

*Message #69 Posted by **Valentin Albillo** on 15 July 2003, 5:24 a.m.,*
in response to message #68 by Mark Hardman (LED)

Phi's always been a favourite constant of mine, though when I was young and fresh, it was called 'tau' (a greek letter), not 'phi'. This URL has a lot of interesting information on phi:

The Golden Ratio

It seems that the Indian mathematical Genius (with a capital 'G'), Srinivasa Ramanujan was also very fond of it, as he discovered a number of out-of-this-worldish identities and infinite series featuring it. No wonder world-class mathematicians Hardy and Littlewood were so impressed with him:

"In 1913, the English mathematician G. H. Hardy received a strange letter from an unknown clerk in Madras, India [...]Every prominent mathematician gets letters from cranks, and at first glance Hardy no doubt put this letter in that class. But something about the formulas made him take a second look, and show it to his collaborator J. E. Littlewood. After a few hours, they concluded that the results "must be true because, if they were not true, no one would have had the imagination to invent them".

(Source: Srinivasa Ramanujan)

An interesting phi fact rarely mentioned is that the increasing powers of phi are closer and closer to being integer values, something I noticed for the first time when programming a trivial loop on my recently acquired (1976 or so) HP-25, which simply filled up the stack with phi and kept on multiplying it by itself in an endless loop. I noticed at once that the results approached integer values, from above and from below alternately. Look at this 'evidence':

```
phi    =           1.6180339887498948482045...
phi^5  =          11.09 0169943749474241022...
phi^10 =         122.99 1869381244216651252...
phi^11 =         199.00 5024998740641490208...
```

```
phi^20 =       15126.9999 33893038648104029...
phi^21 =       24476.0000 40856349008447407...
phi^30 =     1860497.999999 462509500144429...
phi^31 =     3010349.000000 332187397540912...
phi^40 =   228826126.99999999 5629869660818...
phi^41 =   370248451.00000000 2700889084881...
phi^50 = 28143753122.9999999999 64468136299...
phi^51 = 45537549124.0000000000 21959899450...
...
phi^100 =  792070839848372253126.99999999999999999999 873...
phi^101 = 1281597540372340914251.00000000000000000000 78...
```

Speaking of near integers, Ramanujan knew about the following striking result, where a simple looking exponential expression gives a totally unexpected, very near integer value (less than 1E-12 from being an integer), called 'Ramanujan's constant':

e^(pi*sqrt(163)) = 262537412640768743.999999999999 25...

Certainly the number of amazing mathematical curiosities is inexhaustible, indeed !

Best regards from V.

Infinite Series and Transcendentals

*Message #71 Posted by **Patrick** on 14 July 2003, 9:52 p.m.,*
in response to message #65 by unspellable

There is no link between transcendental numbers and infinite series. While it is true that transcendental numbers can often be expressed as the sum of an infinite series, it is possible to get even rational numbers through non-trivial infinite series.

For those who have never seen it, the proof that sqrt(2) is irrational is quite short. We simply suppose the opposite is true and reach a contradition. Here goes...

If sqrt(2) is rational, then it must be expressed as a fraction of integers. Let a/b be such a fraction *reduced to lowest terms* (i.e., there are no common factors between a and b):

$$\sqrt{2} = a/b$$

Square both sides of this equation and clear denominators to get:

$$2b^2 = a^2$$

Clearly, this says that the square of a is an *even* number. Well, if you square any *odd* number you get an *odd* number, so a cannot be odd. Therefore *a must be even*! This means we can write it as equal to twice some integer, k:

$a = 2k$

Substitute into the earlier equation:

$2b^2 = (2k)^2 = 4k^2$

Divide both sides by 2:

$b^2 = 2k^2$

Well now, lookie here... the square of b is *also* even. Like before, we must reason that *b is even*!

Hold on, now. *Both a and b are even*, which means they have a common factor!! But we assumed right at the start that this was not the case. This *contradiction* proves that our starting assumption, that the square root of 2 was rational, is in error.

QED

Re: Infinite Series and Transcendentals

*Message #72 Posted by **unspellable** on 15 July 2003, 8:40 a.m.,*
in response to message #71 by Patrick

Transcendental numbers are not "often" expressed as an infinite series, they are always expressed as an infinite series. This a property stemming from the fact that they cannot be the root of a polynomial.

They are called transcendental numbers because they are always expressed as an infinite series.

Re: Infinite Series and Transcendentals

*Message #73 Posted by **Patrick** on 15 July 2003, 1:24 p.m.,*
in response to message #72 by unspellable

Every number is the sum of an infinite series whose elments are rational numbers. If you take a number, x, between 0 and 1, say, and let its decimal representation be $0.d_1d_2d_3...$ then what you are really saying is that x can be represented as the following infinite sum of rationals:

$x = \mathrm{Sum}_{(n=1,2,3,...)}(d_n/10^n)$

By adding an extra term to the above sum to represent the integer portion of x, you can easily see how to remove the restriction that x is between 0 and 1.

Of course, the sum isn't infinite if the decimal representation of x terminates, but that is not the point.

The point is that, since *every* number has such a representation, this property hardly distinguishes the ones which are transcendental. The thing about transcendentals is that there are usually *very few other ways* to represent them, such as by giving a rational polynomial for which they are its roots.

The motive for the original mathematician to call that class of numbers *transcendental* was that such numbers *transcend* normal arithmetic (at least,

this is how it was explained to me). You cannot get such numbers from integers through addition, subtraction, multiplication, division and the taking of roots.

Re: HP 11c

*Message #7 Posted by **unspellable** on 10 July 2003, 8:06 a.m.,*
in response to message #5 by Patrick

Actually, I have a manual for the 15C. It's a "one of these days" thing that I have to see how well the 15C manual works for the 11C.

The first programmable calculator I ever bought was a Sharp that served well. I mislaid it and bought a little sort of programmable pocket whazzit as a fill in. One of the guys in the lab had an HP 28S and that was it. Bought one, and later an HP 48SX so the 28 & 48 series became my thing.

I'm considering putting my extra calculators on eBay. they include the 11C, a 12C, a 32SII, possibly a 27, a 48GX, possibly a 48G+, and outside of HP, a TI 83 and a Casio 7000g.

Re: HP 11c with HP15C's manual

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2003, 9:25 a.m.,*
in response to message #7 by unspellable

Hi, unspellable;

I own one of each: HP11C and HP15C. Using the HP11C with an HP15C Owner's Hanbook "in hands" is not hard at all, but some resources described in the HP15C's manual are not applicable to the HP11C, of course. Except for the four extra major enhancements found in the HP15C, being Complex Numbers handling, Matrices arithmetic, numerical SOLVE and Integration, both share the following equivalent points:

- math resources for real numbers, including trigs, logs and hypebolics
- stastics functions and ressources are the same for both, but there is a difference related to statistics registers location: in the HP15C the block is defined between R2 and R7, and in the HP11C it is located in registers R0 to R5;

Some of the differences are:

- memory handling, organization and availability: the HP15C has the equivalent to 67 registers (469 bytes) against 21 registers plus 63 program steps (210 bytes) in the HP11C available for the user
- register arithmetic in the HP11C is limited to [STO] *operation* [R0 to R9 and RI]; the HP15C goes far beyond this
- the hP15C allows RCL RAN# (Randon pseudo-generator seed) and the HP11C does not
- programming resources differ in three aspects:
relational operators - the HP15C has twelve and need TEST n function to access ten of them, while only ten are available in the HP11C
[LBL][.] *n*, [GTO][.] *n* and [GSB][.] *n* are not available in the HP11C
flags - the HP11C has general-purpose flags 0 and 1, while the HP15C has general-purpose flags 0

to 7; flags 8 and 9 in the HP15C have specifc meaning and application;
- [SCI] and [ENG] in the HP11C are not defined for eight and nine digits

I feel as if I'm missing something, but these are the raw differences and equivalences. Reading HP15C Owner's Handbook when using the HP11C demands taking these facts into account.

My 2¢.

Luiz (Brazil)

Re: HP 11c with HP15C's manual

*Message #9 Posted by **Valentin Albillo** on 10 July 2003, 10:24 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Luiz posted: *"[SCI] and [ENG] in the HP11C are not defined for eight and nine digits"*

Indeed they are, IIRC, but only if executed from the keyboard. SCI 8, SCI 9, ENG 8, and ENG 9 cannot be included as program lines because of the limit on just 256 different keycodes. The same happens with the HP-34C (where only 1 keycode is unused out of 256 possible).

"I feel as if I'm missing something"

Yes, a number of things, among them:

- ISG and DSE only work with the I register in the HP-11C, while the HP-15C versions can work with any register, directly or indirectly, including individual matrix elements
- in the HP-11C, you must use GTO . nnn to go to step nnn while in program mode, but as LBL . n is legal in the HP-15C you must use GTO CHS nnn instead.
- in the HP-11C, the x<> swap instruction can only work with arbitrary registers indirectly, while on the HP-15C, you can swap arbitrary registers directly (i.e: x<>3 or x<>.2), indirectly, or even individual matrix elements.
- the HP-11C allows for three levels of subroutine nesting, while the HP-15C allows for seven levels.

there are other minor differences as well.

Best regards from V.

Edited: 10 July 2003, 10:35 a.m.

Minor differences: Recall the current random number

*Message #10 Posted by **Patrick** on 10 July 2003, 4:14 p.m.,*
in response to message #9 by Valentin Albillo

One of those minor differences I just discovered is that you cannot recall the current random number. On the 15C, the sequence [RCL][f][RAN#] gets you the random number returned by the last call to [f][RAN#]. You can do this as often as you like, always getting the same number back. On the 11C, you can store into the random number register (i.e., set the seed), but not recall from it.

Luiz already pointed that out

And "minty" is 20-90% worse than that.

What I love are the Mint.... but...

*Message #4 Posted by **John** on 9 July 2003, 7:14 p.m.,*
in response to message #1 by V

I just love how people try to be creative and insert the word mint on calculators that aren't mint. Like "Mint except for the 2 dents."

My definition of Mint

*Message #5 Posted by **Mike** on 9 July 2003, 7:51 p.m.,*

in response to message #1 by V

"Mint" has a very special meaning. In my opinion, Mint cannot have any scratches, dents or other flaws. Period! All the parts must be original.

"Mint" means used but implies "like new" condition.

"New" on the other hand, means never used.

As far as appearance goes, one should not be able to tell a "Mint" calculator from a "New" calculator.

But people stretch (i.e. exagerate) the description to include Mint, whereever they can.

There are two calculators on eBay right now that use mint. One is described as 9.5 (which is subjective) and not mint, in my opinion, if it has scratches. Another says Mint but has 2 obvious dents.

But, since this is all subjective and not defined anywhere, the only real important thing is does the seller tell you how he defines Mint. If he does, then no harm, no foul.

Edited: 9 July 2003, 7:57 p.m.

Re: What the hell is a Mint Calculator?

*Message #6 Posted by **gifron** on 11 July 2003, 1:40 p.m.,*
in response to message #1 by V

I believe the term comes from numismatics, though more descriptive terms (i.e. grading) are commonly used today. A coin fresh from the mint would be considered "mint uncirculated," shortened to "mint." "Brilliant uncirculated" would be a subset of "mint uncirculated," etc... A coin can have bag marks, and still be "mint."

Based upon this reasoning, I would not require a "mint" calculator to be perfect, but I would not expect it to have any marks that it didn't have when it left the factory, like corrosion, a tiny dent, engravings, etc... Someone mentioned a "bomber" issue calc in another posting, which reminded me of some 35's (I think) listed on The Bull Cabinet, which were issued to Lawrence Livermore Laboratory. These reportedly are heat stamped with "LLL," or some such thing. Since this is a designed in, factory (mint) applied mark (assuming it is - I don't know though), if the calcs are in mint condition otherwise, I think they still could be called "mint."

Saying something is "mint, with a tiny dent and my name written neatly on the back," is just wrong. On the other hand, saying "it would be mint, except for the..." is okay.

IMHO

If you compare to coin collecting

*Message #7 Posted by **Mike** on 11 July 2003, 1:58 p.m.,*
in response to message #6 by gifron

If you use Mint as in coin collecting, then Mint denotes a much higher quality than simply New. On a scale of quality, Mint should be at the top, in my opinion.

HP-31E's thin Owner's Handbook

*Message #1 Posted by **Valentin Albillo** on 9 July 2003, 9:08 a.m.*

Norm posted to the Add section:

"Hi, interested in HP-31E [...] I've got an "owner's handbook" which is small and thin, but Surely there is an "owner's manual" that is bigger and thicker ??"

Nope. The HP-31E is such a simple calculator that its "Owner's Handbook" is correspondingly small and thin, not 34C's "class".

Similarly, the HP-10C Owner's Handbook is also very small and thin, unlike the very thick HP-15C's. This is just to be expected, there's only so much you can tell the user about his 31E or 10C. You may find some relief in comparing it to the pathetic "Owner's Handbook" of HP(?, more like "KP", for "Kinpo") latest models, i.e. that regal, *deluxe*, folded A3-size sheet (or should it be "sh*t" ?).

Best regards from V.

Re: HP-31E's thin Owner's Handbook

Amen to that!

I'm shocked ! bbBBBzzzZZZTT!

*Message #3 Posted by **Norm** on 9 July 2003, 3:13 p.m.,*
in response to message #2 by Art Litka

Thanks for the update, Valentin.

I am shocked! The almighty invincible "HP Gods of the 1970's" seem to be ever more vulnerable to criticism.

The calculators have solderless designs, don't properly accept AA batteries, and now, no decent owner's manual for a 31E ??

Ok I'm looking at it now... that owner's handbook doesn't say much about the 3 storage registers..... there are no cute little "storybook" problems, its too quick and too short.

What got into HP at this moment in time (1978), did Bill Gates work there at the time as an apprentice ? ("lets get rid of the owner's manuals, and unplug the telephones so nobody can call us, derr yuk derr yuk!")

Would we presume that the Charlie Chaplin RPN tutorial guidebook "solving problems with your hewlett packard calculator" would be included in the original box of a 31E ??

Hey I still need a furry case.... I'd even take an extra copy of this 31E manual.....

- Norm

Re: I'm shocked ! bbBBBzzzZZZTT!

*Message #4 Posted by **David Smith** on 9 July 2003, 3:55 p.m.,*
in response to message #3 by Norm

The furry lined cases were reserved for the more expensive machines like the 38C/E... complete with belt loop so the finance guys could now look like a real engineering nerd.

The 31E came with the cloth lined case... the lining was backed with the infamous "disinegrates into black sticky dust" liner.

Some 34C's came with fur others had cloth.

Every 34C case i ever saw

*Message #5 Posted by **Norm** on 9 July 2003, 7:55 p.m.,*
in response to message #4 by David Smith

Every 34C case i ever saw had nice brown fur inside. They did not deteriorate, they are nice even today.

I guess that is the type of case I am looking for. Would take a raincheck on cloth..... wont protect the display as well ..... don't like that special feature where it automatically disintegrates into dust (probably the managers hired a polymer chemist to formulate something that disintegrates the day after the warranty expires).

Re: Every 34C case i ever saw

*Message #6 Posted by **David Smith** on 10 July 2003, 4:16 p.m.,*
in response to message #5 by Norm

Towards the end of the 34C production run, the bean counters got loose and switched to the cheaper cloth lined case.

If the backing to the cloth lining does turn to dust, just toss the case in the washing machine. It will come out looking good as new. Let it air dry with the zipper proped open.

always cracks me up

*Message #7 Posted by **Norm** on 10 July 2003, 5:24 p.m.,*
in response to message #6 by David Smith

always cracks me up, board of directors is sitting in their $3000 power suits, clustered around their $40,000 Mahogany boardroom table, in their $8 Million dollar building, charging a collective hourly rate of $5000 an hour to sit there, receiving perks and bonuses of $800,000 per board member per year. SO THEN WHAT..... they come up with the brilliant plan to deprive the CUSTOMER of 14 cents worth of fur fabric to be sewn into the calculator case.

Impressive psychological behavior. Very, very impressive. I bow down in admiration of these boardroom millionaires, they are so brilliant.

Re: always cracks me up

*Message #8 Posted by **bill platt** on 11 July 2003, 10:41 a.m.,*
in response to message #7 by Norm

Norm,

I have an "observed wisdom" concept which the other day I mentioned to someone, who said they thought exactly the same thing on their own.

The idea is simple: Approximately 10 years after a new "technology" or product type (e.g. VCR, CD player, handheld computer, weed wacker, plutonium beta decay powered hedge trimmer etc) has been introduced, you will reach the pinnacle of that product in terms of quality value for the dollar. The item may get less expensive from there on, but its lifespan or quality will reduce. Before 10 years, you have all sorts of problems or issues that really need to be improved.

The basic idea is that in the lifecycle of a product, you go from a rapid improvement phase, with rising sales, to a more mature phase, where the rate of increase in sales is levelling off. At this time, your corporate resouces have also been growing to meet the demands created by the development phase. So, when the sales growth rate flattens (with sales still rising of course) then the company looks to trim costs, because it is natural to think that (1) we should be able to maintain the same profit per unit, and (2) it sure would be nice to avoid laying off lots of people just yet...so we better cut costs--or, can we "minimize" or "optimise" (and they are not the same thing...).

So, that is why the 1980's HP caclulators are so valuable--and so cherished by us. Voyager, Pioneer, even the 41 (almost---someone-argue this one!) are at the pinnacle. We see the quality falling off already in the Pioneers--but higher reliability so they are "better". Look at the "classics" and "Woodstocks" and "Spices" and you find some really great early "built like a tank" features but you also find certain weaknesses....2 disease.....

yup, like a tree ...

*Message #9 Posted by **Norm** on 11 July 2003, 1:12 p.m.,*
in response to message #8 by bill platt

yup, like a tree ...

trees all grow the same, just like companies .

They go thru a rapid early growth phase and go from sapling to big tall tree.....

then they stop growing, and just sort of exist for awhile..... while moss builds up on the trunk and the limbs....

finally they become diseased..... and the bugs and the worms start gnawing away at the wood....

finally it dies and falls over .

Who are the bugs and the worms ? Why, those critters in the dark blue suits in the boardroom of course..... and their petty little "cost reducers" who steal 14 cents worth of cloth out of a calculator case.

It is the same at most companies.... of course it happens sooner at some companies than others.

Hmmmmmmm and some companies it doesn't happen at all. Those are the truly long-lasting companies and they are the heartbeat of America (since they don't succumb to disease).

Heartbeat of america

Continuing: from another post

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 12:33 a.m.*

Hi, folks;

this is a new post (thread) that continues my reply to Valentin's Qwiz. I was afraid this reply could misdirect Valentin's interesting post and consequent thread. I would not like seeing a not-related thread growing after the starting post because of my answer. Maybe there is no answer and I'm overestimating my lines, who knows...

Valentin wrote in his original post:

> Quote:
>
> Though noone posted a solution to my latest HP-15C Quiz/Challenge, "Matrix Trilogy", and though it's pretty clear to me by now that most people participating in this forum are hardware/collector-oriented, being the unrepentant software guy that I am, here is yet another HP-15C Quiz/Challenge for you to try, the last one for a number of months to come.

I can't agree with your statement as a whole, my friend. I (amongst others?) read all your challenges, and when I figure out that I cannot contribute with some significant solution, I keep waiting till someone shows a reasonable one. Some get closer, some don't.

Now I have a wide open question: what good is a working calculator for if not for using it to accomplish the job it was designed for: computing?

I'm almost sure I'll be flamed for that, but if I have a (programmable) calculator in hands, I'll be scratching my head for as long as I need to understand how to use (program) it. My sin: read manuals from cover to cover, going to the next page only when I understand the one I'm reading now. I printed all manuals I found for the HP71B and I'm reading all of them. I cannot help avoiding this... I know others use calculators differently and I would never criticize them. I'm just mentioning my concerns and procedures.

But I assume: I'm a hardware guy. But God d..: I still want to know what good is a working calculator for if not for using it somehow! Why restore, repair, rebuild... if you are not going to use it the best way?

I wrote a lot of programs in some languages, RPN-like and RPL included. I like to use the "tools" as much as I enjoy repairing them.

Now, for your quiz: I cannot connect my existing knowledge base for the three specific subjects in the same time: polynomial solving, applicable matrix arithmetic/manipulation and HP15C matrix&programming related resources. I think this is because I am a bad Chess player: I cannot think of dynamic relations between subjects from different origins. I deal a lot with digital signals, analog signals and I used to "see" relations between digital data in time charts easily, but this is easy when compared to the three "universes" mentioned above.

Sometimes I delve into the problem till I find a reasonable solution and I post it, as I have done a couple of times. But sometimes I feel like waiting for an answer arise in my head so I can write it down here, but there are moments when I simply wait... and wait... and wait... and nothing! I feel I'm a typical Brazilian "Regular Joe": a specialist in

general subjects. I program, deal with, use and can repair (brief repairment) at least 20 different models of HP calculators and devices. But I'm no expert on any of them.

I wish I was.

Well, that's why I decided to post this "reply" in another thread. I'd be sorry if wasting one possible answer to Valentin's Quiz with non-related subjects.

Please, Valentin, forgive me.

Best regards.

Luiz (Brazil)

Re: Continuing: from another post

*Message #2 Posted by **Valentin Albillo** on 9 July 2003, 5:01 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, Luiz:

Luiz posted: *"Now I have a wide open question: what good is a working calculator for if not for using it to accomplish the job it was designed for: computing?"*

I fully agree with you, but I'll play devil's advocate here: many reasons, for instance:

- a working calculator is preferred for display purposes in most collectors' vitrines; obviously, a cosmetically perfect but otherwise non-working one would do as well, but most collectors will opt for a working unit, even if much more expensive. No collector is really proud of a mint-looking but non-working unit, and they'll jump at every chance to replace it with a working one.

- a working calculator is a much more valuable property than a non-working one, so every collector and seller out there will certainly prefer them, if only for economic reasons.

- it gives you such a warm feeling having that mint HP-70 in your vitrine, even if you wouldn't be caught dead actually using it for anything.

etc, etc. As you can see, there's no shortage of reasons why many people do own calculators they'll never use for computing.

Anyway, I fully agree with your position, which is mine also: I only own handhelds that I actually intend to use, and the ones I do not want to use I do not plan to own, the HP48/49 being the most noticeable permanent absences in my collection. Matter of fact, I wouldn't trade a single Sharp PC-1350, say, for a box full of HP48/49's, not even to sell them for a profit.

"I wrote a lot of programs in some languages, RPN-like and RPL included."

Sticking to a single style of programming will cause stagnation and chauvinism in the long term. I suggest you begin to write programs in BASIC/Forth/Assembler for your wonderful HP-71B and so refresh your programming muscle a little. RPN/RPL are very smart and very cute and all that jazz, but they aren't necessarily the best ways to program there are, you know. Take my advice, you'll be glad you did.

"Please, Valentin, forgive me."

There's nothing to forgive, of course, and much to be indebted to you, indeed. I always read and appreciate your clear, honest, well-meaning messages, and really admire your commitment to try and help your fellow HP fans. If you're really the "average Brazilian Joe" as you put it yourself, Brazil must be a really amazing country and one fully deserving of having a top priority in everyone's travelling agenda.

Best regards from V.

Remember the "Fee avoidance guy"

*Message #1 Posted by **Mike** on 8 July 2003, 11:29 p.m.*

Well, he's back with a new stragegy. He shows two calculators and even quotes shipping on the 2nd implying that he will sell the 2nd one off of ebay.

Fee avoidance

He is also likely counting on someone thinking two are for auction. He lists both serial numbers.

Edited: 8 July 2003, 11:29 p.m.

Must have been an error, or he changed his mind. When I looked, there was information on only one calculator. Description has been changed several times.

Yes, he changed it

*Message #3 Posted by **Mike** on 9 July 2003, 1:46 a.m.,*
in response to message #2 by gifron

I think he is someone who comes here. I received a nasty (read: filthy and physically threatening) gram shortly after posting this here.

He sent two emails. One threatening and one using his normal ebay email address.

I guess he forgot that his IP was recorded for the originator. Both IPs were identical. I'm still debating whether or not to send the threat email to ebay and the police. His IP is easily traced.

Yes, he changed the auction. I asked him why he was listing both shipping prices and that it looked like he was trying to sell both with one auction. So, he changed the auction.

This is the same guy that sold two phones for $10 and tried to charge $110 for shipping a telephone.

Watch the other show up later.

LIF disks: I could use some help here...Dan? Guys?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 8 July 2003, 9:20 p.m.*

Hi, folks;

sometime ago, I read a post by Dan McDonald about renaming LIF disks formatted in an HP9114 with the HP41 as a controller. Disks formatted this way cannot be read by LIFUTIL because NEWM, the 82106A initialize-media standard function, does not require a "media name", or "media ID name". Both the HP41 and the HP71B (I believe the HP75 as well) can read from and write to these disks, but LIFUTIL doesn't even recognize them.

I remember that Dan also mentioned that the "HP41 renaming program" needed an 82183A Extended IO module. I'm lucky having this ROM and I can use this program.

I read the HP71B documentation and found nothing but the mentioning that INITIALIZE is the only means to rename already formatted disks... but it also erases all of their information.

Today I know that disks formatted by LIFUTIL will be assigned a name (optional to the user) but I was not aware of this fact till I had three disks with some HP41 programs. I cannot read them in a PC because LIFUTIl cannot identify them. And I know I have the option to read each file in each of the three disks to the HP71B RAM so I can write them in another "labeled" disk, but I'd rather renaming the disk and copying all files to the computer at once.

Any clues?

Thanks in advance.

Luiz (Brazil)

Why don't you use Tony Duell's HP71/75 HP-IL LIF File Utilities (for Linux)
http://www.hpcc.org/hpil/lif_utils.html

**vp

Thanks!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 12:59 a.m.,*
in response to message #2 by Vassilis Prevelakis

Hey, Vassilis; long time, no see...

Thank you for the valuable tip. I should be asking Tony about these, but maybe you have the answers: instructions included? Say, any readme file with the pack?

I have a workstation running (stand-alone, do MS sharing HD) Linux. I'll unzipp programs there.

thanks again.

Luiz (Brazil)

Re: Thanks!

*Message #4 Posted by **Tony Duell (UK)** on 9 July 2003, 7:18 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Yes, I included documentation with the Lif Utilities for Linux. There is a README file (which basically lists the programs and what they do). There are manpages for all the programs. And of course you get the commented source code if you really want to know what's going on. There may be interesting information in the comments in said source code, by the way -- I think much of it is known to most serious HP calculator hackers, but you might pick up something from reading it. One thing I've not written yet is lifput(1) -- a program to write a file to a lif disk. You can read disks, extract files, get directories, copy disks to/from image files, etc. You just can't write a new file to a disk -- yet. I must get round to writing that sometime.

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #5 Posted by **Rodger Rosenbaum** on 9 July 2003, 3:17 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz,

When you say you want to change the "name" of a LIF disk, are you referring to the "VOLUME LABEL"? If so, then it can indeed be changed by a HP71. I looked at the documentation for INITIALIZE in the HPIL Owner's Manual for the HP71, and I didn't see where it said that INITIALIZE was the ONLY way to change the volume label. Where (page number) did you see that? If it is the volume label you want to change, I can post a little program to do that.

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #6 Posted by **Dan M** on 9 July 2003, 7:38 a.m.,*
in response to message #5 by Rodger Rosenbaum

Hi Luiz,

Yes, the "Volume Label" needs to be changed -- from "nothing" to "something." I came up with a small program for the 41 to do so, based on a program I found in the PPC journals somewhere, but it would be difficult for me to locate it at this time :-(

Rodger, perhaps you could post the program for the HP-71 to change the disk volume label. It seems it is a lot easier for the HP-71 to do things like this to disks than the HP-41.

Tony's programs are an amazing set of very useful utilities, and he has been very kind to share them with the group. I unfortunately remain "linux-impaired" and have not taken the time to either become "linux-enabled" or convert Tony's source code to a less desirable platform.

Luiz, I will look for my 41 program, but I most likely won't find it very quickly.

Best regards,

Dan M

Thanks!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 10:00 a.m.,*
in response to message #6 by Dan M

Hello, Dan;

you see, I'm a "newcomer" to the HP71B world and there are some things I did not get yet. The MoHPC CD set has the three volumes of the HP71 internal specs and I looked at some pages briefly; they are heavy reading, no doubts about it, but the fact HP allowed its internals to be known outside its headquarters was something new at the time it happened.

Thank you very much for your help. As I have an HP71B now (Thanks, Doc) and now I know that it's important specifying a "volume label", I'll do it with all disks and I'll probably need to rename only disks I did not handle. I tried to find a way to rename them through DOS LIFUTIL but I did not find a way.

Please, if you do not find the HP41 program to rename disks and there is a way to do it through the HP71, that's fine for me. Of course I'd like to keep the HP41 program listing that does it; it's information and I kinda collect this sort of "piece".

Thanks again. BTW, the HP9114B is working perfectly fine with the HP71B. I now have a set of disks for the HP41 and another for the HP71B.

Best regards.

Luiz (Brazil)

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 10:00 a.m.,*
in response to message #5 by Rodger Rosenbaum

Hello, Rodger;

thank you very much for your reply.

I found the information in the HP82401A HPIL Interface Owner's Manual, p. 28, bottom of the page, where "Volume Label" is explained. It's mentioned that *(...) you can't change the volume label unless you initialize the medium again"*. It's also stated in page 130 (same document) that INITIALIZE erases the entire medium.

As I'm a "newcomer" to the HP71B world, maybe there is a way to overpass the erasure action while renaming the medium; is it possible? If so, I'd like very much to know how to do it. If the program that allows this sort of maneuver is stored in a file and you can send it to my e-mail box, my e-mail address is:

lcvieira@quantica.com.br

I'm thanked if you can do it. Anyway, if you have it already listed in a file and you can share its contents with all Forum contributors, I'd like to see it listed here, too.

Thank you again.

Luiz (Brazil)

P.S. - I was wrongly writing "media", plural of "medium", in my previous posts; please, forgive me folks.

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #9 Posted by **Rodger Rosenbaum** on 11 July 2003, 2:39 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Luiz, From your post:

"Hello, Rodger;

thank you very much for your reply.

I found the information in the HP82401A HPIL Interface Owner's Manual, p. 28, bottom of the page, where "Volume Label" is explained. It's mentioned that (...) you can't change the volume label unless you initialize the medium again". It's also stated in page 130 (same document) that INITIALIZE erases the entire medium."

Here they are describing what INITIALIZE does. I think that they mean to say that you can't change the volume label with INITIALIZE unless you initialize the medium again. I'll list the program to change volume labels in another posting.

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #10 Posted by **Rodger Rosenbaum** on 11 July 2003, 3:02 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

```
10 CALL VOLUMEDT @ SUB VOLUMEDT
20 INPUT "Which drive? ","1";D
30 D=DEVADDR("%16("&STR$(D)&")")
40 IF D=-1 THEN BEEP @ DISP "Not a drive" @ END
50 SEND UNL UNT MTA LISTEN D DDL 4 DATA 0,0 TALK D MLA DDT 2
60 ENTER :D USING "#,8A";U$ @ ON ERROR GOTO 70
70 LINPUT 'VOLUME LABEL :',U$[3];V$ @ V$=(V$&"      ")[1,6]
80 OFF ERROR @ IF V$=U$[3] THEN END
90 SEND MTA LISTEN D DDL 4 DATA 0,0 DDL 3 DATA 2 DDL 6 DATA V$ DDL 8 DDL 7 UNL
100 S=SPOLL(D) @ IF BIT(S,5) THEN 100
110 IF S=29 THEN DISP "WRITE PROTECTED!"
```

This little HP71 program will allow you to change the volume label on a floppy disk. You obviously have to have an HPIL module to talk to the drive. The program first reads the existing volume label, if any, and then allows the user to type over it with a new label. If the disk didn't have a label, then the label the program reads will be all blanks and the new label can just be typed over them.

The CALL VOLUMEDT @ SUB VOLUMEDT sequence in line 10 is just to preserve any variables from other programs that may have been suspended.

I hope my attempt to use the advanced formatting techniques for the board resulted in a readable listing!

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #11 Posted by **Rodger Rosenbaum** on 11 July 2003, 3:11 a.m.,*
in response to message #10 by Rodger Rosenbaum

Some things I assumed but probably shouldn't have: Connect your 9114 to the HP71 with the HPIL cables. Execute RESTOREIO on the HP71. If you get an error when doing this, execute RESET HPIL and try the RESTOREIO again.

After you have got an error free RESTOREIO to happen, then the volume edit program should work.

A note: Any time you have been doing IO through the HPIL module, you should execute OFFIO when you're done. If you disconnect IO devices like the 9114 without doing this, the HP71 will take a long time to come on when you press the ON button next time. This is because the HPIL module is still active, and it's looking for things on the loop. If the IL loop is not connected, it will take a long time to TIMEOUT. An experiment you can do to see the effect is to connect a single HPIL cable from IN to OUT on the HP71 HPIL module, execute RESTOREIO, turn the HP71 off and back on. It should turn on fairly quickly. Now disconnect the cable and turn the HP71 off and on; there should be a long delay. Now execute OFFIO and turn it off and on; now it should come on much more quickly.

RESTORE IO and OFF IO

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 11 July 2003, 3:37 a.m.,*
in response to message #11 by Rodger Rosenbaum

Hello, Rodger;

I have already verified that, thanks, and I use OFF IO everytime I remember to switch the IL module off :)

What I tried to do these days was inserting an HP41 in the loop to see what happens: HP71, HP41 and 9114. I confirmed that the HP41 is a greedy lady: it does not allow other devices to control the loop, as already stated in other sources ("The loop is mine!", it says). It can play no other role except controller!

I was aware of this fact and I tried some "evasive maneuvers" with the HP71; I did not succeed. I changed the order of the elements in the loop, and was not successful. After a few "Loop broken" messages from the HP71 and [TRANSMIT ERR] from the Hp41, both HP41 and HP71 agree with their roles and everything goes fine: HP41 controls, HP71 talk/listen whenever needed. But I could not do anything else (I actually tried random commands...)

What bothered me was the fact that I could not restore I/O activities in the hP71B later. It did not talk to the 9114B till I initialize in with INIT: 3. Whatever I did - RESTORE IO, OFF IO, RESET HPIL and some other I/O commands I found - was not enough to "wake up" the HPIL. I think that after the so many commands I typed in the HP71B the resident O.S. concluded that there was an insane guy at the steering wheel so it decided to lock the HPIL till some confident driver was assigned... I think I set some internal flag or conflicting condition in the 82401A and it could not restore normal operation.

Question: is there a way to override the HP41 control while it is inserted in the loop?

Best regards and thank you again.

Luiz (Brazil)

Re: RESTORE IO and OFF IO

*Message #13 Posted by **Rodger Rosenbaum** on 11 July 2003, 3:56 a.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Are you saying that when you:

"What bothered me was the fact that I could not restore I/O activities in the hP71B later. It did not talk to the 9114B till I initialize in with INIT: 3. Whatever I did - RESTORE IO, OFF IO, RESET HPIL and some other I/O commands I found - was not enough to "wake up" the HPIL"

you still had the 9114 and HP41 on the loop? A good thing to do if the HP71 seems locked up is to connect the IN and OUT on the HPIL module with a single cable and nothing else on the loop. Then try RESET HPIL, RESTOREIO and OFF IO, etc. Something should wake it up at this point. Also, some commands in progress on the HP71 need TWO pushes of the ATTN button to stop then; this is especially true of IO operations. (Maybe SEVERAL pushes, doncha know. :-))

I don't know if it is possible to override the HP41 control on the loop.

This kind of thing is why I like the HP71 so much. It has the most powerful and easiest to use HPIL controller HP ever made. The HP71 can be powered down and connected in an HPIL loop with other devices; some other device can send IL commands, and the HPIL will wake up and not lose anything that was sent. I don't think any of the other calculator/computer devices can do that.

Thank you, Rodger!

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 11 July 2003, 3:18 a.m.,*
in response to message #10 by Rodger Rosenbaum

Hello, Rodger;

thank you very much! Your listing is completely readable for me, even the number of spaces contained in the string in line # 70. When you use [pre], a monospaced font is used, what means all characters use the same length.

I'll type in my HP71B and run it. Even better, I'll copy the listing, paste it as-is to another file and save it as an ASCII text to a LIF disk (with a non-empty "volume label" field) using LIFUTIL. I'll load the text as LEX and TRANSFORM it to BASIC in the HP71B. Am I hallucinating or my assumptions are correct? I'm reading the HP71B Owner's Manual and swallowing whatever I read. Will it work fine?

Thanks again.

Luiz (Brazil)

Re: Thank you, Rodger!

*Message #15 Posted by **Rodger Rosenbaum** on 11 July 2003, 3:47 a.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Don't load the text as LEX; load it as TEXT. I don't think you could load it a LEX anyway. It would alread be a TEXT file.

If you just type the program into a file called VOLUMEDT on the HP71, you could then transform it into a text file by typing TRANSFORM VOLUMEDT INTO TEXT VOLTEXT, for instance. You would then have a LIF (TEXT) file of the program, while preserving your original file. If you simply typed TRANSFORM INTO TEXT while VOLUMEDT was the current file, then VOLUMEDT would be converted into a TEXT file itself, and you would lose the BASIC version.

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #16 Posted by **Ellis Easley** on 9 July 2003, 5:34 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

This might not have any bearing on changing the volume label, but have you read the information in the 9114 manual (in an addendum for the HP41) about initializing disks for 630K capacity instead of the 128K capacity that the 41C HPIL normally intializes (emulating the tape drive, I guess)? It includes a 41C program that issues HPIL commands to the 9114 - maybe it will be interesting to you.

Yes, thanks!

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2003, 1:15 a.m.,*
in response to message #16 by Ellis Easley

Hello, Ellis;

thank you for your mentioning this program. I have already used it, but I believe it would be better having it in ROM instead of main memory. It uses a big "slice" of main RAM, and this fact may void using it to record long programs.

In time: I remember it was possible to run programs saved in X-memory without copying them to main RAM, mostly because I remember that when I bought my HP41CX (80's) I was already hacking X-secrets, and when inspecting a program in X-Memory I switched the calculator to RUN mode and inadvertently I pressed [R/S] key. The program ran perfectly fine, but gave a [NONEXISTENT] message when attempting to execute a [GTO] *somewhere*. The same program executed error-free in main memory. Does anyone remember the tricks to run programs directly in X-memory?

About the full 630K-bytes for the HP41: I "dried-out" the program so it fits in regular X-memory (124 registers). The original is too big it does not fit in regular X-functions or 41CX: you need an extra X-memory. I replaced all ALPHA labels and related GTO/XEQ for numerical ones, reducing program size. Not necessary to mention, but all global ALPHA labels that replicate HPIL mass storage functions were kept.

Thank you again.

Luiz (Brazil)

Re: LIF disks: I could use some help here...Dan? Guys?

*Message #18 Posted by **Tony Duell (UK)** on 9 July 2003, 7:22 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I know how I'd do it. I'd use the HP71 (which has the best HPIL implementation of any handheld). I'd use a DDT command (look in the _tape_ drive manual for details) to read block 0 into a string on the HP71. Then modify the appropriate bytes (look in the back of the HP71 HPIL user manual for details of what's in block 0) to give the disk a volume label. Then use a DDL command to write it back. Not a difficult program to write IMHO.

That's a starting point; and thanks, guys

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 8:59 p.m.,*
in response to message #18 by Tony Duell (UK)

Thank you all;

Tony, I was somewhat lost because of both: never used the HP82183 X-mass before having the HPIL, neither the 9114B; now I have an HP71B and I felt myself interested on going further. Anyway I could understand what you mean and I'll try the procedure in an empty disk and see what happens. I'll need to read a bit more to go further, but now I have a starting point.

Thanks again. (and you mentioned once you're not an SW man...)

Luiz (Brazil)

"Eureka" -- Found the File

*Message #20 Posted by **Dan M** on 9 July 2003, 9:33 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hello Luiz, my friend...

My filing system has worked and I found the program.

To make a long story short, here is the program I can use with the HP-41, Extended I/O Module, HP-IL Module, and 9114 disk drive to add a Volume Label to an existing LIF disk.

I have forgotten exactly how it works, but it somehow reaches into the disk header block and inserts the alpha name you input, byte-by-byte.

This listing has been hand-typed by me, as I am not currently PC-LIF-enabled, for various reasons. The program is short enough that you can enter it easily. Ask if you have questions about the listing, I can answer them.

Dan M

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 11:58 p.m.,*
in response to message #20 by Dan M

Hello, Dan;

thank you very, very much.

I think other users will use it as well.

There is more in the e-mail I sent you, but the only doubt I have about the listing (I did not try to understand it so far, just a "spell checking") is related to step # 36: the single ' means a space character, an empty-ALPHA line or other "command"? If it is an empty-ALPHA line (but it is more likely not to be), would CLA do the same?

Thanks a lot, Dan; this is gold!

Best regards.

Luiz (Brazil)

Some Explanation

*Message #22 Posted by **Dan M** on 10 July 2003, 10:37 a.m.,*
in response to message #20 by Dan M

Hello Luiz,

I believe that program line 36 is a "space" and not a "clear alpha" register. One character of the alpha register after line 36 is written to the disk header, and I seem to recall that there must be something in the header after the volume label to mark the end of the volume label.

I am currently unable to get this program from a disk to a PC for further examination, so I can't be 100% sure right now but I can do it tomorrow if necessary.

ATOX gives "-1" if the alpha register is empty, and "32" if alpha register has a space. I don't know what OUTXB will do with "-1", so I think it should be a space and not a CLA

Again, credit for this program really belongs to the person who submitted the original version to the PPC Journal, I don't remember the name or the issue number. I revised that program by sticking on the prompt for "VOL NAM" at the start.

I also don't know/remember what the device-dependent-commands for the 9114B are (3, 6, 8 in this program). I think 3 is for "prepare to move to byte location, which will be sent next" and 6 is for "write the next byte sent to the current position" and 8 is for "move to home location" or "close device" or something like that.

This has been a useful program in the past. I will try to find the original author's name sometime and give due credit to him (or her!).

Best regards,

dan

ACK! And thanks again! (n.t.)

MLDL2000 update: bad news and good news

*Message #1 Posted by **Meindert Kuipers** on 8 July 2003, 1:46 p.m.*

A quick update:

The bad news is that there was a fundamental mistake in my MLDL design. The good news is that I fully understand it and allows me to do a redesign of the state machine which will make the MLDL less sensible for metastability and easier to update future enhancements.

For those who are interested: I could not get the WROM instruction to work properly. It seemed to work sometimes, depending on the program that I used for initiating the WROM. After hooking up a logic state analyzer to the prototype the fault was quickly determined. I assumed that the HP41 cycle first transmitted the contents of the C-register, and then the instruction to be executed. In case of the WROM instruction, the C-register contains address and data for the WROM to operate on. This assumption was wrong, the C-register is sent AFTER the instruction.

I am currently redesigning the state machine and will hopefully be able to rebuild and test the prototype during the weekend.

Meindert

Quiz !: Evaluating polynomials [LONG]

*Message #1 Posted by **Valentin Albillo** on 8 July 2003, 1:19 p.m.*

Hi all,

Though noone posted a solution to my latest HP-15C Quiz/Challenge, "Matrix Trilogy", and though it's pretty clear to me by now that most people participating in this forum are hardware/collector-oriented, being the unrepentant software guy that I am, here is yet another HP-15C Quiz/Challenge for you to try, the last one for a number of months to come.

By the way, let me point it out once more that though the challenge's conditions and requirements are meant for an HP-15C, the techniques used in the solution are always equally efficient and thus applicable to other machines, most specially the 42S, 41C/Advantage, and even the 71B/Math, among others. You can attempt the challenge in said machines as well, and the published solution can give you a particularly efficient and novel implementation on your machine as well, which you might easily find useful for your own programs.

The Quiz/Challenge

Let's suppose that we've got some experimental or otherwise dataset and we have have fitted some suitable mathematical function to it, a rational function to be precise:

```
f(x) = P(x) / Q(x)
```

where P(x) and Q(x) are both polynomials of arbitrary degree **n**, i.e:

```
P(x) = a0 + a1 x + a2 x^2 + ... + an x^n
Q(x) = b0 + b1 x + b2 x^2 + ... + bn x^n
```

where the degree, n, is nominally the same for both, but as any of the ai, bi coefficients can be zero, the actual degrees could be distinct.

Now, for the challenge. You must write a subroutine (LBL, ..., RTN) which must use as fixed data the coefficients ai, bi, which will be stored in a (2 x [n+1]) matrix, in the exact way and order shown below:

```
A =  | a0  a1  a2  ...  an |
     | b0  b1  b2  ...  bn |
```

This matrix isn't to be considered a parameter passed to the subroutine, but a fixed data repository at a fixed place, matrix **A**. The degree, n, isn't passed either, the subroutine must deduce it from the number of columns in matrix A.

The only parameter which will be passed, in the X register, is a value **x** for which we want the above expression **f(x)** to be evaluated. The routine will evaluate f(x) = P(x)/Q(x) for such an x, and will return the result in the X register, i.e:

```
x, GSB A  ->  f(x)
```

An example will make it clear: If we have:

```
          -2 + 3x - 5x^2 + 4x^3
f(x) =  ----------------------
           5 - 6x + 3x^2 - 7x^3
```

then our routine must use matrix A, which holds the coefficients:

```
A =  |  -2   3  -5   4  |
     |   5  -6   3  -7  |
```

and **x** = 2.3, to return **f(x)** = -0.3472259...

As the subroutine is meant to be used a number of times to evaluate the function, matrix A shouldn't be altered at all between calls. That given, the primary and main requirement is to **optimize for speed**, i.e., f(x) must be evaluated *as fast as possible*. Once time is minimized, the shorter the subroutine, the better.

Subject to that, there exists a general solution for the HP-15C in *18 steps or less* (including both LBL and RTN) which will evaluate f(x) in just *4 seconds* for polinomials of the 4th degree, and in just *15 seconds* for 19th-degree polynomials.

If you succeed, try to generalize the routine in one or both of these ways:

- instead of a single x value, the routine would accept a vector of x values and would return a vector with the corresponding f(x) values
- instead of evaluating two polynomials, the routine would accept the coefficients of m polynomials and would return the evaluated values at x for all of them.

That's all. Give it a thought or two and let's see your ideas ... :-)

Re: Quiz !: Evaluating polynomials [LONG]

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 12:34 a.m.,*
in response to message #1 by Valentin Albillo

Hi, Valentin;

I started to write a reply, but I saw it was heading to a direction not related to your post's interesting, primary subject. I was afraid a not-related thread could arise and that would be an upsetting fact.

So I decided to post my reply here, O.K.? If there is anything to be added to that particular reply, it will not interfere that much in your original post/thread.

I did this to avoid disturbance and misdirection, and I hope not creating others...

Best regards.

Luiz (Brazil)

Edited: 9 July 2003, 12:56 a.m.

Re: Quiz !: Evaluating polynomials [LONG]

*Message #3 Posted by **Tizedes Csaba** on 9 July 2003, 1:09 p.m.,*
in response to message #1 by Valentin Albillo

I do not see Vieira~s solution, yet... This is my version:

LBL A STO 9 'store x RCL f DIM A 1 STO f DIM B f MATRIX 1 u STO B LBL 9 RCL mul 9 u STO B GTO 9 RCL f MATRIX A RCL f MATRIX B mul u RCL C RCL C div RTN

'mul' mean 'multiply', 'div' mean 'divide'.

I do not measure running times, I do not know how fast this program. But it is works...

Csaba

Re: Quiz !: Evaluating polynomials [LONG]

*Message #4 Posted by **Patrick** on 9 July 2003, 7:14 p.m.,*
in response to message #3 by Tizedes Csaba

Hello All

It will come as no surprise to you all that I have been trying this quiz myself. I have a long-ish solution that is close to the idea of Csaba's above:

```
001 LBL A
002 RCL DIM A
003 EEX
004 DIM B
005 RUP              // Get x back from T register
006 ENTER
007 MATRIX 1         // Prepare for loop
008 EEX
009 ENTER            // Stack is now [1,1,x,x]
010 LBL 0
011 *                // Get next power of x, starting at 1
012 u STO B
013 GTO 0
014 RCL MATRIX A
015 RCL MATRIX B
016 RESULT E
017 *                // E = [ P(x) Q(x) ]^T
018 u RCL E          // P(x), R0, R1 update
019 RCL E            // Q(x), R0, R1 do not update
020 /                // f(x) = P(x) / Q(x)
021 RTN
```

The general idea is to create a column vector (matrix B) consisting of the powers of x:

$B = [\ 1\ x\ x^2\ \ldots\ x^n\ ]^T$

When you multiply A by this column vector, the result, E, is a column vector consisting of the values of the polynomials P(x) and Q(x).

The difference between my version and Csaba's is mostly in the way we generate the matrix B. There is a problem in coding the loop (his LBL 9, my LBL 0) in that the first element of the matrix requires special handling. Csaba handles this by a duplicate STO B instruction, one inside his loop and the other before it. I handle it by creating a stack with values X=1, Y=1, Z=x, T=x. The first time you do a multiply inside the loop, you get 1. Successive times you get the higher powers of x.

While longer, my routine will operate in two conditions where Csaba's fails:

1. When n=0.
2. When the result matrix is not its default value of C

The first is a reasonable limitation, I think, but the second is questionable. If we accept the first limitation but not the second, then Csaba's solution only increases by 1 step.

There is one point in my solution where something of a trick is played. If you look at my step 007, it seems to be out of place. Right in the middle of some stack manipulations we insert an instruction which is aimed at preparing a loop some steps later. Why not do it later? The answer is that the MATRIX 1 instruction has

the useful side effect of enabling stack lift! Without that instruction there, we would have needed an additional ENTER.

Re: Quiz !: Evaluating polynomials [LONG]

*Message #5 Posted by **Patrick** on 9 July 2003, 7:20 p.m.,*
in response to message #4 by Patrick

Another thought occurs to me that you might speed this routine up some more at the cost of more steps by using rapid branching through the I register rather than using LBL 0. I've never used it myself, so I don't know how much of a speedup it would bring. Of course, it also costs you the I register.

Re: Quiz!: Evaluating polynomials

*Message #6 Posted by **Karl Schneider** on 10 July 2003, 4:09 a.m.,*
in response to message #4 by Patrick

Here's a less-elegant and slower program that does not really utilize the matrix-math capabilities, but instead uses a loop-counter (DSE) and subroutine calls (GSB). With a few modifications, it would be more portable to the 11C and 34C, although those machines could accept only 20 coefficients not in a matrix structure.

The "key to acceptable speed" in these calculator routines is the use of Horner's Method to decompose the exponential calculations of polynomials into arithmetic operations. This is implemented in the "looping" code in both Patrick's routine and mine. Horner's Method is explained in the manuals for the 34C and 15C (and presumably the 11C); the 49G has a "HORNER" function.

The "clever trick" in Patrick's routine is the looping code of of lines 010-013, in which the HP-15C is smart enough to stop filling the array and jump out of the loop (by skipping line 013?) when it got to the end. I believe that Valentin's program from "Long Live the HP-15C" exploited this feature, but I'll have to check if it's documented.

So, here's another program:

```
001  LBL A
002  ENTER
003  ENTER
004  RCL DIM A
005  MATRIX 1
006  STO 1
007  STO 2
008  X
009  CLx                 // stack has  0 x x x
010  GSB 0               // calculate numerator
011  X<>2                // store numerator and retrieve # of coefs
012  STO 1
013  CLx
014  2
015  STO 2
016  CLx                 // stack has  0 x x x
017  GSB 0               // calculate denominator
018  STO/2
019  RCL 2
020  RTN                 // return answer
021  LBL 0               // "Horner's Method" loop
022  RCL A
023  +                   // add coefficient
024  DSE 1               // decrement index of coef; check if = 0
025  GTO 1
026  RTN                 // if = 0, done; return
027  LBL 1
028  X                   // if not = 0, multiply by x
029  GTO 0
```

Now, here's a solution using Matlab (if you are fortunate to have it on a PC or Unix workstation at your desk). A private license for one copy is only $1900 -- 10x the price of a 49G!

```
C:> matlab
>> p = [4 -5 3 -2; -7 3 -6 5]   ; note order of coefs
>> x = 2.3
>> f = polyval (p(1,:),x) / polyval (p(2,:),x)
```

Thought required for programming: mimimal
Speed of results: virtually instantaneous
Using the right tool for the job: priceless!

(I would expect only those in America who have seen the TV ads for MasterCard to get the reference. My apologies...)

Of course, the "right tool" is not always available or affordable.

Loop exit trick

*Message #7 Posted by **Patrick** on 10 July 2003, 4:09 p.m.,*
in response to message #6 by Karl Schneider

Hey Karl

Nice to see some new faces in the quiz threads. Maybe Valentin will be encouraged by this and continue to post new ones! (hint, hint)

The loop trick you refer to is documented on page 176 of the HP-15C Owner's Handbook, in the section "Using Matrix Operations in a Program". If you look back at the solutions of some of Valentin's previous quizzes, you'll see this technique used there as well -- it is very handy.

The other useful part of that same feature is that, when the row and column numbers (R0 and R1) get exhausted for a particular series of matrix operations, not only is there a program line skip, but both counters are also reset to 1, obviating the need for another call to MATRIX 1. Steps 018 and 019 in my solution depend on this as well. Note in particular that step 019 is done with user mode **off**. Otherwise the division in step 020 would be skipped!

Patrick has right and a new question: Nested loops

*Message #8 Posted by **Tizedes Csaba** on 10 July 2003, 4:59 p.m.,*
in response to message #4 by Patrick

(Sorry for my poor english, I never learn it...)

Hi Patrick!

You are right in the two limitations! And must be insert 'RESULT C' instruction!

Csaba

Ps.: New quiz question for everybody: How are you programming nested loops on HP15C? I will post in my next response my version. Its not a challenge, just interest me, how it to do with another brain... :)

Csaba

Nested loops

*Message #9 Posted by **Tizedes Csaba** on 11 July 2003, 11:00 a.m.,*
in response to message #8 by Tizedes Csaba

Hi All!

I wrote this program about four years ago.

General method:

```
--------
LBL 0
1
STO I
--------
LBL 1
RCL RR2
STO 2
1
STO + I
--------
LBL 2
RCL RR3
STO 3
1
STO + I
--------
  .
  .
  .
--------
LBL n-1
RCL RRn
STO n
1
STO + I
--------
LBL n
########################
#                      #
# Loop's instructions  #
#                      #
########################
ISG (i)
GTO I
--------
LBL decrement
DSE I
GTO jump
RTN
--------
LBL jump
ISG (i)
GTO I
GTO decrement
--------
```

RR2, RR3, ..., RRn contains original value of loop counters (2nd, 3rd, ..., nth registers of calculator) Before running it must be set.

An example: Calculate how many 3*4*5:

```
LBL 1
RCL 5
STO 2
1
STO + I
LBL 2
RCL 6
STO 3
1
STO + I
LBL 3
1
```

```
STO + 0
ISG (i)
GTO I
LBL 8
DSE I
GTO 9
RCL 0
RTN
LBL 9
ISG (i)
GTO I
GTO 8
```

For running:

```
1.003 STO 1
1.004 STO 5
1.005 STO 6
1 STO I
GSB 1
```

I'll continue on sunday...! I'm running now!

Csaba

Re: Quiz !: Evaluating polynomials

*Message #10 Posted by **Fernando del Rey** on 11 July 2003, 12:20 p.m.,*
in response to message #1 by Valentin Albillo

I don't have a 15C and I'm not familiar with it, but here's a solution to the original problem on the 42S:

```
01 LBL "FB"
02 STO ST L
03 INDEX "MATA"
04 I-
05 RCLIJ
06 1
07 DIM "MATB"
08 INDEX "MATB"
09 LBL 00
10 STOEL
11 LASTX
12 x
13 I+
14 FC? 77
15 GTO 00
16 RCL "MATA"
17 RCL "MATB"
18 x
19 STO "MATC"
20 INDEX "MATC"
21 RCLEL
22 I+
23 RCLEL
24 /      (divide)
25 RTN
```

This one takes about 3 or 4 seconds for polinomials of degree 19.

I have another solution in 17 steps, but it is slower (6 to 7 seconds for the same case).

Regards to all!

My original solution

*Message #11 Posted by **Valentin Albillo** on 11 July 2003, 12:57 p.m.,*
in response to message #1 by Valentin Albillo

Hi all,

Thanks to all of you who posted your solutions and ideas on this 15C Quiz/Challenge. I've read all of them with utmost interest, you're quite a clever audience, indeed ! . My original solution for the HP-15C, which works for polynomials of degree 1 and upwards (a polynomial of degree 0 is a *constant*, and thus hardly needs to be evaluated for arbitrary x arguments), was as follows:

```
01   LBL A
02   STO I
03   RCL DIM A
04     1
05   DIM B
06   MATRIX 1
07 u STO B
08   LBL 0
09   RCL* I
10 u STO B
11   GTO 0
12   RCL MATRIX A
13   RCL MATRIX B
14   RESULT C
15     *
16 u RCL C
17   RCL/ C
18   RTN
```

and as you can see, Csaba arrived at a nearly identical solution, the main differences being:

- he omitted the *necessary* RESULT C. Csaba's solution does use matrix C for the result, but he forgot to add RESULT C, which is needed, as the default result matrix upon initial conditions (memory reset), is *matrix A*, unless otherwise changed.

- he ended the routine with uRCL C, RCL C, /, but my original uRCL C, RCL/ C, using *recall arithmetic*, saves one program step and runs slightly faster.

Apart from that and minor changes in the names of labels, etc, Csaba's routine is basically identical to my original, which reinforces the impression that the solution is very probably *unique* and can't be significantly shortened or altered.

A couple of comments on the solution:

- though this routine runs twice as fast as a direct approach evaluating the polynomials using Horner's rule, it actually performs *more* arithmetic operations, because you must construct the x-powers vector, which needs n extra multiplications. The speed is achieved because the HP-15C is optimized for numeric computations, but not for branching, step-decoding, etc, so the more time we can spend within its microcode program, the better. In this case, once the x-powers vector is created, all the work of actually evaluating both polynomials is done by the single "*" at step 15, thus saving so much time that it more than pays to create the vector in the first place.

- In view of the previous point, we would save even more time if we could avoid the powers loop. However, I've found no way to create all the powers non-iteratively, using some sequence of matrix operations, without external looping. It would be very interesting if some way to do it was discovered.

Thanks again to everyone who did participate, see you in a next challenge.

Best regards from V.

Looking for suggestion on calibration of a HP-3421A

*Message #1 Posted by **Renato** on 7 July 2003, 3:54 p.m.*

```
I got this nice HP-3421A. Both the SLA and Lithium
batteries were bad. After replacing them, the newborn
requests breastfeeding - oops - calibration.
Does anyone have experience with that ? Service manual
suggests using a 6 digit multimeter and a voltage
reference. As i do not have neither of those, what do you
suggest (appart from packing it and sending it to you as a
gift) ? This one will go to a good home (or hospital).
```

Re: Looking for suggestion on calibration of a HP-3421A

*Message #2 Posted by **Lawrence** on 7 July 2003, 7:50 p.m.,*
in response to message #1 by Renato

Renato, Agilent Technologies now handles the HP line of instruments. You can contact them at 1-800-403-0801. I had them check the calibration on my 3421A. The cost is $275 which includes shipping to and from Agilent. I received excellent service and documentation of the accuracy of my unit.

Please bear in mind that if the calibration is due to broken equipment (as opposed to loss of calibration memory due to bad batteries) Agilent may no longer have the obsolute parts.

Good luck.

Re: Looking for suggestion on calibration of a HP-3421A

*Message #3 Posted by **Renato** on 8 July 2003, 10:05 a.m.,*
in response to message #2 by Lawrence

```
Lawrence,
Thank you for your reply. $275 is reasonable for a
professional use unit. Mine is for a hobbist, and $275 would
be too much. Also, in this case, calibration is not a
burden, but part of the fun.
Thanks, anyway.It is good to know that Agilent is still
offering service to this old calculator related HP
instrument.
Renato
```

Re: Looking for suggestion on calibration of a HP-3421A

*Message #4 Posted by **James** on 7 July 2003, 9:01 p.m.,*
in response to message #1 by Renato

It depends on what level of accuracy you are after.

For starters, and if your needs are modest, for a few dollars you can use resistors to divide battery voltage to the voltages required for the reference. Depending on the batteries and resistors used, you might get down to a few percent accuracy.

For more accuracy, you will need access to a voltmeter of (a bit more than) your desired accuracy. You can

then use a potentiometer to set the reference voltage for calibration to the accuracy of the voltmeter. You can probably borrow or rent a voltmeter.

If you want the maximum possible accuracy, it may be best to have a calibration facility (eg. HP, but there may be someone cheaper that is close to you) do it for you.

(I haven't gone through the 3421A calibration procedure, so there may be something else required...)

Good luck!

Re: Looking for suggestion on calibration of a HP-3421A

*Message #5 Posted by **Renato** on 8 July 2003, 10:21 a.m.,*
in response to message #4 by James

```
James,
I took a quick look at 3421A Service manual. It seems that
three itens are required:
1. A HP-IL controller (Hp-85,HP-41) with proper software
2. A multi-scale voltage reference
3. A 6 digit multimeter

I'm doing this for fun. Part of the job is choosing the best
precision for a hobbist budget. Current candidates for
each required component are:
1. HP-41CV with 3421a control module
2. Battery in a temperature controlled situation (Luiz
suggestion). Another possibility is special designed
eletronics
3. Another HP-3421A (old calibration, unchecked)

Exchanging ideas and discussing possibilities is also part
of the fun.

Looking for reference labs around here is a good idea.

Thanks,
Renato
```

Re: Looking for suggestion on calibration of a HP-3421A

*Message #6 Posted by **Christoph Klug** on 9 July 2003, 2:42 a.m.,*
in response to message #5 by Renato

Dear Renato,

may be you find a low price kit for creating a voltage referece from your local electronic shop. You only need a precision reference voltage IC and some precision resistances.

For reference voltmeter you can take a second HP3421 or the HP3468 multimeter.

Actual I have tow HP3421 available, and one needs calibration - like your system :-)

Therefore your results are interesting for my own calibration procedure. Like you I will use HP41 plus DAC module...

Best wishes from Germany - Christoph Klug

Re: Looking for suggestion on calibration of a HP-3421A

*Message #7 Posted by **James** on 9 July 2003, 3:49 a.m.,*
in response to message #5 by Renato

1) HP-IL controller. Yes you need one (or HP-IB) to calibrate the 3421A. Of course you would need one to use the 3421A anyway, so this is not a great burden. However, you don't need the 3421A specific module. I suspect that any HP-IL interface module (41, 71, 75, 85) will be sufficient, along with the usual ability to send commands.

2) Voltage reference. Since the calibration can be done fairly quickly (I hope), the reference does not need good long or medium term stability. I suspect it does need to be clean DC (no AC ripple), so a battery is almost certainly the best choice for a hobbiest. Since the reference would normally be set/checked with the reference voltmeter (3) the accuracy and precision of the voltage reference is likely irrelevant, so long as it is stable over the course of a few minutes.

3) Reference Voltmeter. Since this is what the 3421A is calibrated against, it will be the limiting factor for the accuracy of the 3421A. A $50 3.5 digit DMM is likely good enough for a hobbiest application, but if a 6 digit meter is available, so much the better.

If no reference voltmeter is available, then we do have an interesting intellectual problem...

a) if relative-only measurements are all that is desired, then I think one could make do with a poor reference (eg. new alkaline batteries and 1% resistors). In this case your 3421A could tell the difference between X volts and X + 0.01 volts, but you wouldn't be sure if X was 0.900 or 1.100. Also, X would jump when the 3421A switched ranges. This would be confusing, and perhaps rather ugly.

b) Christoph's suggestion of using a precision reference IC is a good idea if absolute readings are required. This might give 0.1% calibration accuracy. However, I fear the task of building a reference voltage box around the IC is not practical for someone who does not have a voltmeter (due to the variety of voltages required, and the difficulty of maintaining the precision through to the output). Perhaps Christoph will build such a box to add to his product line... CK could be the new HP!

Other ideas?

I thought about something but I wonder if it works

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 11:01 a.m.,*
in response to message #7 by James

Hi, folks;

I had something in mind that I proposed to Renato through an e-mail. It would involve a voltage reference and I'll change it a bit in this post. Please, if there is any lack of reasoning, I'd be glad to know. I do not want this to be a pattern, I want to know if it works. I did not test the procedure, it's a first proposal. Analog-related guys (Norm? Ellis? Others?), support me, please!

Let's take a new, high-capacity fully charged NiCad or NiMH battery and make sure it is in a 0ºC environment, what can be granted by putting the battery inside an insulated plastic bag immersed in melting ice. With the use of a thermometer, the temperature inside the bag may be confirmed, and tracking it's voltage till it does not change for about half an hour will make sure it is stable. Under these circumstances, this battery is measured with the use of a precision instrument and reading value is written down. Then this same battery is sent to someone who wants to calibrate another instrument. The "receiver" will charge it again (let's consider days between sending and delivering) and measure it under the same circumstances: 0ºC (melting ice) environment, so the reading value is adjusted to match the one read with first precision instrument.

Three facts must be taken into account to avoid battery voltage drifting:

- atmospheric pressure; if the sender and receiver locations have considerable highness difference, then it must be checked if battery voltage will vary as well; I think three-digit precision instruments would not be affected, but I'm not sure if five- or six-digit instruments will not.
- recharging method; electronic "smart" chargers of the same type and brand would be strictly necessary in both places OR sending the recharging equipment with the battery so the receiver will charge it in the same way;
- maximum voltage drop after being recharged; I think the first charges will not cause maximum voltage to drop, but after many recharging cycles, battery voltage must be checked again in a precision instrument. If the battery has already been charged many times, then fully charging it, measuring under these circumstances and sending it for a one-shot calibration must be safe as for reference, but if it is recharged again will probably give a lower voltage in its terminals.

I'd like to be able to test these procedures at home. Even if the 3421A is not calibrated it will serve to confirm my proposal: fully charge a NiCad or NiMH, measure its voltage under these circumstances, wait for a few days to simulate mail postage (average in local mail is about two days, and long-distance posting usually goes for two weeks), fully charge it again and measure its voltage. In this case, if there is a difference when reading with the same 3421A unit, this is the difference that must be taken into account when sending the battery to someone else.

In my first proposal, I asked Renato to use a regular, fresh new alkaline battery if the mail time is small (two days), but I thought about a way to use rechargeable batteries and keep precicion, and I think the approaches I mention above may be of use. The 0ºC temperature reference is necessary to reduce the number of external "variables".

Any other ideas to increase precision?

Hope this is of any use.

Best regards.

Luiz (Brazil)

Re: I thought about something but I wonder if it works

*Message #9 Posted by **Dave Shaffer** on 9 July 2003, 11:43 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Why not combine Christoph's and Luiz's ideas:

Somebody build a little precision voltage circuit, based on "a precision reference voltage IC and some precision resistances." This could be (rechargable?) battery powered. WIth a little effort, the temperature coefficient of this unit could be determined. Then, it is mailed around to whoever needs the reference standard.

How accurate could such a unit be?

Re: I thought about something but I wonder if it works

*Message #10 Posted by **Ellis Easley** on 9 July 2003, 6:11 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

I don't know if NiCads have a repeatable output voltage. Just from watching them charge and discharge, their voltage seems to vary quite a bit (in a fairly narrow range, like 1.2 - 1.5V). There is a standard cell that includes mercury for one of the electrodes, I'm not sure what the other one is, the output voltage is about 1.08V I think. I regret forgetting to bid on one on Ebay a couple of years ago. It went for a pretty low bid, <$20 I think. Like most precision instruments, it was probably only as good as its last calibration. My first meter was a Heathkit VTVM I got in high school, it came with a "D" cell (for the ohms range) that also served as a calibration standard: the meter face had a hand-marked spot on it that I was to use to calibrate the meter to the cell on a certain voltage range, after the unit was assembled (and presumably, before the cell was used for ohms measurements).

I have found that very fresh, unused alkaline cells usually measure 1.580 volts, + or - maybe .006 volts. If you believe me and my meters, you should be able to use this information to achieve approximately 0.4% accuracy.

I have a Ballantine RMS voltmeter that measures down to 1 mV full scale. It is basically a high gain AC tube amplifier followed by a ladder circuit with a bunch of crystal diodes that convert AC voltage to an approximation of the RMS equivalent DC voltage, then that voltage is measured by a DC voltmeter. It includes a built-in calibrater that generates a precise AC voltage, analogous to an IC voltage reference. It uses the negative-resistance characteristic of an incandescent lamp to regulate a sample of the AC line voltage, not unlike the way the HP200A oscillator (and its descendants) use that characteristic to regulate the output amplitude.

3421a ranges

*Message #11 Posted by **Renato** on 9 July 2003, 8:07 p.m.,*
in response to message #5 by Renato

```
This is a very interesting discussion.
From 3421a specs, these are the measurement ranges:
DCV: 0.3V, 3V, 30V, 300V
ACV: 3V, 30V
2/4wire ohm: 300,3K,30K,300K,3M,30M

From 3421a Service manual
Recommended accuracy for Voltmeter: +/-.004%(30V,300V)m,+/-.005%(.3V,3V)
For DC Voltage standard: Short term stability: better than .0002%
For AC calibrator: Accuracy:.04%,stability +/-.02%
Resistance standard: +/-.0005% for 100R,1KR,+/-.001 for 10KR,100KR,.01% for 1MR,10MR

Goal is to get as close as possible to those figures, while keeping the hobbist
budget.
```

Re: Looking for suggestion on calibration of a HP-3421A

*Message #12 Posted by **James** on 10 July 2003, 4:35 a.m.,*
in response to message #11 by Renato

From the 3421A service manual, it seems the desired calibration inputs are:

0.3, 3, 30, and 300 VDC

3 VAC rms @ 100 Hz

300, 3K, 30K, 300K, 3M, and 30M Ohms, or 100, 1K, 10K, 100K, 1M, and 10M Ohms (it appears that either the 1x or 3x value from each decade can be used)

There is also temperature calibration using a thermistor.

Presumably the 0.3 and 3 VDC can be generated with batteries and a simple voltage divider (perhaps preset by someone with a high accuracy unit). Perhaps after calibrating these ranges, the 3421A itself can be used (via a 100x divider) to adjust a 30 / 300 VDC source made from rectifying and filtering the AC line (dangerous... use appropriate care, do not try this without supervision, etc.), which can then be used to calibrate the upper ranges.

Generating the 100 Hz AC signal might be easier if it were done as a square wave, but the voltage would need to be adjusted to compensate for the waveshape if the 3421A is not "true RMS". Or, perhaps we can discover if the frequency is not a significant factor, allowing 50/60 Hz to be used. However, the accuracy of the power line sinusoid may be a big problem in some areas/countries, so making a generator independent of the power line waveform seems a better choice. Regardless, it seems that something more than a battery and a handful of resistors is needed to do the AC calibration.

The resistance standards seem to be the easiest; DigiKey having 1% resistors (eg. 311-100HCT-ND) around $1 for 10 pieces of one value, with some 0.1% types available (eg. RR12P100BCT-ND) at $7 for 10 pieces of one value. So you might get 10 each of 100, 10K, and 1M; put them in series to make 1K, 100K, and 10M, and pay only $3 for 1%, or $20 for 0.1%.

tm

Me too...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2003, 2:45 p.m.,*
in response to message #1 by Trent Moseley

Hi, my friend;

I'd guess... What? To be honest, no idea!

Some may say: They're trying to survive!

And I'd say: Survive to what?

And they will say: Market!

And I'll say: And what are they doing to achieve this?

Others will say: They're being profitable!

and I'd say: Why?

Some may say: Because they're trying to survive!

Then, I'll rest.

I just tell you I'll not go that way, thank you!

I'd rather doing something I can tell may grandchildren I did... without being ashamed of.

But this is just me.

Best regards.

Luiz (Brazil)

Re: Want to Know Where HP is Heading?...

*Message #3 Posted by **Renato** on 7 July 2003, 3:17 p.m.,*
in response to message #1 by Trent Moseley

I think it is useless to bash HP, only because we like old
HP and old calculators.
It is like we are knocking on a house door, but the family
that used to live there has moved a long time ago - and the
new residents have the same family name.
These are not the people we want to talk to.
IMO, we should beg for Agilent to try to save the
calculator business.

See below:

Current HP mission statement:

> Quote:
>
> HP is a leading global provider of products, technologies, solutions and services to consumers and business. The company's offerings span IT infrastructure, personal computing and access devices, global services, and imaging and printing.

Old HP statement from a 60s magazine ad:

> Quote:
>
> Many people know us as an instrument manufacturer: we make more than 2,000 products for measurement, test and analysis. Others know us as a computer company: more than 10,000 own our programmable calculators and computers. We prefer to think that our business is to serve measurement, analysis and computation needs . . . in science, industry, medicine and education

Current Agilent statement at their web site:

> Quote:
>
> Agilent's pioneering spirit was kindled more than 60 years ago, when two engineers - Bill Hewlett and Dave Packard - invented the future in their garage. In 1999, Agilent was spun off from Hewlett-Packard Company, and we have continued to support the values so important to the two visionary founders. We have also continued to innovate in territory that matters, blazing trails in the fields that are shaping the modern world.
> While, physically, we have outgrown HP's garage, we continue to live the values handed down from Bill and Dave: uncompromising integrity; trust, respect and teamwork; and innovation that makes a difference.

Re: Daydream

*Message #4 Posted by **Paul Brogger** on 7 July 2003, 3:37 p.m.,*
in response to message #3 by Renato

I visited Agilent's web site recently, and caught myself thinking . . .

What if Agilent saw a need for a personal data collection, collation, reduction and communication device? It would be hand-held, robustly-built, expandable, connectible and configurable.

It would have a simple hook-up to a universal data collection and sharing interface -- perhaps a wireless connection or some sort of "interface loop" -- that would enable collection from various points and delivery to a workstation. It would include the mathematical functions necessary to analyze and reduce raw data and to configure it for delivery to computer-based presentation and storage devices.

It would be built take abuse in the field, and to last as long as the owner was likely to be able to put it to use.

It would be programmable, and have a simple, logical, easy-to-learn and -to-remember user interface, and would be supported by a full array of add-ons and peripherals that made it applicable to a number of uses.

Then I snapped back to reality and said to myself, "You've gotta be half nuts -- maybe fully nuts -- to even think of such a thing . . . "

Opening a Spice machine

*Message #1 Posted by **Randy Sloyer** on 6 July 2003, 9:02 p.m.*

Yes, I know I'm LCD kinda guy, but in a moment of weakness I agreed to help out with a spice machine. I have one missing it's battery contacts that is otherwise dead, so it's time to find out what's inside. I know this is not going to be pretty (shudder).

I've looked through the archives and cannot find anything on separating the lower case halves. I remember reading about a trick with dental floss but can't find the posting. While the new compressed format archives saves bandwidth, I haven't figured out how to search them easily.

Can anyone point me to the Rosetta stone of spice opening? Thanks all.

PS: Heh Norm, this might be your only chance to say "I told you so", or just "LED's rule" :^)

Re: Opening a Spice machine

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 July 2003, 10:43 p.m.,*
in response to message #1 by Randy Sloyer

Hello, Randy;

have a look at the images below. They are not in scale but will help you understand how do Spices are interlocked:

http://www.logeng.com.br/images/spice-interlock.gif http://www.logeng.com.br/images/spice_cut.gif

There are some techniques to open the case, and one of them involves using dental floss. As you may see, what you have to do is slightly and carefuly fasten both halves in the bottom while you pull the back half backwards, so it slides over the small plastic "tab" (is it correct?). The dental floss creates a "path" so the back half slides safely. I use a small plastic cut from new HP-blister case. There are plastic surfaces not thick enough to injure the plastic "tab".

Hope this helps.

Luiz (Brazil)

Randy --

The "dental floss technique" for opening Spice units

On of these days, I'll write an article, complete with my pictures and Luiz' illustrations (he's already assented.)

-- Karl

My pleasure!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2003, 11:27 p.m.,*
in response to message #3 by Karl Schneider

Hey, Karl;

as North-Americans say: anytime, anywhere. You and anyone else are granted to use the drawings. They are so specific that I cannot see another use for them.

I'll correct the drawings (just few "adjustments") but I'll keep the file type and size: they are somewhat small (4K and 34K) and I think this is an advantage.

I did not keep correct scale, because the interlock is, in fact, closer to the "edge", a bit more to the right in my drawings. I thought it would be easier to understand if I exagerated this distance a bit.

Thank you for your (and others, too) support.

Luiz (Brazil

Edited: 7 July 2003, 11:28 p.m.

re:"anytime, anywhere"

*Message #5 Posted by **Ellis Easley** on 9 July 2003, 6:23 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I'm not sure, but I think maybe "them are fightin' words"! (Kind of like "bring them (or was it "it"?) on!")

Re: re:"anytime, anywhere"

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2003, 1:26 a.m.,*
in response to message #5 by Ellis Easley

Hi, Ellis;

you know what? I remember seeing these words in a soft situatuation, but now you made me remember that in other situations it was exactly like this: a call for fighting.

Karl, I hope you did not understand the wrong way... I was trying to let you know that you can use the drawings anytime you need, anywhere you want to.

Thank you, Ellis.

Luiz (Brazil)

Re: Opening a Spice machine -- Thanks!

*Message #7 Posted by **Paul Brogger** on 7 July 2003, 11:15 a.m.,*
in response to message #1 by Randy Sloyer

Like Randy, I remembered something vague concerning dental floss. When I got curious about my working HP-34c, I just wasn't curious *enough* to overcome my squeamish uncertainty about simply forcing things

apart.

The diagram and instructions will enable me to take a look.

Thanks, Luiz and Karl!

Re: Opening a Spice machine

*Message #8 Posted by **Jon** on 7 July 2003, 2:38 p.m.,*
in response to message #1 by Randy Sloyer

It can be done without deltal floss. Remove the screws under the battery cover. Then take one half with the left hand, the other one with the right one and pull firmly. Don´t care I have opened a lot of them and I have never broken anything.

Good luck

Re: Opening a Spice machine

*Message #9 Posted by **David Smith** on 7 July 2003, 4:16 p.m.,*
in response to message #8 by Jon

Yes, just pulling the case halfs apart can work and in some really stubborn cases is necessary. But there is a MUCH safer way to try first. Basically you remove the two top screws and lift the top half of the case up enough to clear the battery contacts. Then place your thumbs in the battery compartment and fingers along the logo strip on the top half of the calculator. Then you squeeze the machine so that the bottom half of the case is slid forward and the internal latch is released.

Spicy stuff

*Message #10 Posted by **Randy Sloyer** on 8 July 2003, 9:10 p.m.,*
in response to message #9 by David Smith

Well, it's open and it's not pretty. Thanks all. David's push/pull method worked fine. Now on to the ugliness of what embodies a Spice.

It is a 32E that is missing it's battery and contacts. No biggy, that's why there are bench power supplies. 3 volts applied shows no sign of life. About 0.5 ma off, 1.0 ma on. Definitely no LED activity here. It is a compression/solderless unit. It has been apart and ravaged before, as there are three ugly solid wires soldered from the battery connector onto the circuit board, bypassing or at least backing up the flex circuit. Everything there is in order, the wires go to the proper locations. The power switch board pads were trashed with extraneous solder balls for no apparent reason. That cleaned up reasonably well, at least now the switch is smooth.

The first thought since it has been apart is: Are the chips in the proper locations? The two 8 pins are at the top and bottom left positions with nothing in the middle location. The top chip is 1MA1-0209, bottom, 1MA304. The 40 pin is AMI 1820-2162. Correct so far?

The next question is: Should I solder them into place? The bottom carrier has some indentations where the chips are. Could the contact be that bad?

I've now got a pile of parts that once was a calculator. Putting it back together mechanically is easy. Doing that so the pieces will work as the engineers at HP intended back whenever it was they designed this monster is very questionable.

Anybody out there with the lumps, bumps, bruises and warts to help me improve my chances at getting this thing to work? It just makes me love the 41 all the more...

Re: Spicy stuff

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 12:42 a.m.,*
in response to message #10 by Randy Sloyer

Hey, Randy;

welcome to the Spice's world. (no music, please...)

I do not own an HP32E, but I see that the 8-pin IC's codes "look" strange; well, as David Smith called our attention many times, seeing these codes leads me to think that it's possible to find RAM-like codes in these 8-pin IC's and no ROM-like code. I placed all data I found (there is some missing data, but I'll find it and post it, too) in one single table (credits given)

ID#	"2"	CT	CPU ID #	1	2	3	OBS
31E	N	SL	1820-2105-B (7922YY)	----	----	1MA301	
31E	Y	S	31E 2438	00031	----	1MA15002	(1)
33E	Y	SL	1820-2105 (7822EX)	----	1MA10204	1MA10003	
34C	N	S	34C/B-2102 00034-69110	1LB902	1MA10014	1MA115	(1)
37E	Y	SL	1820-2122 (7819MO)	00031	no_label	1MA10008	(2)
38C	N	S	38C/B-2102 00038-69110	1LB903	1MA30006	----	(1)
38C	N	SL	1820-2162 (7944DY)	1LB903	1MA305	----	
38E	Y	SL	1820-2122-A (7850MC)	1MA107	1MA10013	1MA10005	
38E	Y	SL	1820-2122-A (7916CS)	1MA105	1MA113	1MA30003	
(Ellis posted these ones)							
34C	Y	SL	1820-2162 A (7906)	1LB5002	1MA1 14	1MA10015	S#1934A
34C	N	S	1820-2162 (8047)	1LB902	1MA1 14	1MA115	S#2051S
(Randy posted this)							
32E	?	SL	1820-2162	1MA10209	----	1MA304	

I see we're growing. Soon we'll have a considerable database that will help others to check their Spice's safely.

About the non-working condition: I had an HP31E that could not charge batteries. After removing the flex circuit completely and placing wires, it worked perfectly fine. Have you inspected or measured (continuity) the flex connections? If you have broken trail(s), it's more likely to happen what you described.

I have no HP32E, but the HP31E seems to have the power board. If you need, I can take some measurements, but let me tell you Ellis' post about the HP34C and its power supply is a must-read.

Success!

Luiz (Brazil)

Edited: 9 July 2003, 12:45 a.m.

you're doomed

*Message #12 Posted by **Norm** on 9 July 2003, 1:46 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Randy you're doomed. The ESD alone is going to blow those chips away. I have written some views about dealing with these units ONLY with anti-ESD precautions. You'll almost certainly catch "2 disease" from the ESD, in my opinion.

I have an article posted about 34C, if you want to do research, you might want to read that over.

You see, I have tried soldering chips down..... and the observations about whether to try it are in the article.

To make SPICE units better, one thing I would definitely recommend is gentle trimming of certain plastic clips with an X-Acto knife, so that they release easier.

This includes the 6 clips that hold the calculator module down. And, it includes the various surfaces on that frightful full-width latch at the bottom edge of the calculator.

The X-acto knife can be used to advantage, for future disassemblies ..... of course, you have to know how much is enough. If you trim away too much then you wreck it.

There are actually 2 full-width locations, both on the bottom-shell of the calculator, that can be trimmed to advantage for future disassemblies of that lower latch.

Norm, did the "plastic" melt?

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 10:18 a.m.,*
in response to message #12 by Norm

Hi, Norm;

I remember I read in one of the first posts about Spices (yours?) about solder the IC's in a solderless unit. I want to know if you used conventional soldering iron and if the flex material (sort of plastic) melted when soldering the chips. Did you use any particular technique? There is an article about using soldering flux and microwave oven to produce regular and safe solder. Have you ever tried this?

Just curiosity.

Best regards.

Luiz (Brazil)

Re: How about "gluing" the chips on?

*Message #14 Posted by **Paul Brogger** on 9 July 2003, 10:48 a.m.,*
in response to message #12 by Norm

I don't have a solderless unit (yet), or I might be tempted to try this . . .

I've fixed a couple of TI's recently with conductive copper fluid from a Permatex "rear window defroster repair kit". The tiny bottle of liquid seems to be alcohol-based, is loaded with very fine copper filings, and dries almost instantly.

I suspect that, if the a chip could be held in position and the circuit not flexed or moved, a tiny drop of this fluid could be introduced separately into each lead/pad joint and surface tension/capillary action would spread it around. After drying the stuff should help insure more reliable electrical bonds.

Buuuut . . . I haven't tried it in this application, so it (or some other conductive ink/glue/paint) might be worth considering, but I've no experience to back up the notion.

Conductive ink???

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 9 July 2003, 11:06 a.m.,*
in response to message #14 by Paul Brogger

Hey, guys;

based on Paul's idea, why not to "paint" the flex tags and the IC's terminals with conductive ink? That would be safe and would allow future replacements and maintenance, what I take as the best advantage for solderless units.

Best regards.

Luiz (Brazil)

answers to Paul and Luiz

*Message #16 Posted by **Norm** on 9 July 2003, 2:51 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Hello,

Yes, the article I posted described that there is a tendency to see melting of the plastic underlay. In fact, it was still quite useable, but nevertheless there was some melting, which was worrisome.

Yes, it was a precision temperature-controlled iron, digital readout, using standard solder, set as low as is fair and reasonable. One could get into specialty low-melt point Indium solders, BUT, those stick lousy so you are back to where you started. You're triple-doomed if you don't have a precision controlled iron.

THE CONCLUSION is that the Luiz "clean it up and oil it and put it back together" is right on-target.

No, I dont think U want to use conductive epoxies. If they get a hairline crack, you are in trouble once again. You have no assurance that they will bond mechanically.

Back to the "keep it solderless" then what oil? A little unsure there, some kind of "tv tuner cleaner", etc. Just enough oily stuff to keep the oxygen from coming in and creating fresh corrosion.

I say keep it like the manufacturer intended. This is true for many situations, including car repairs. The more U modify, the more trouble U got. If you keep it solderless, U have the option of swapping chips later if there is a problem. Solder it, and its all over. Just clean it up enough so that it works OK. The article I posted says that the little 8-pin chips are seen to form a bluish oxide, which may contribute to not making a connection. Probably the oil would reduce the tendency to oxidize.

I use a "Leica Zoom 2000" microscope, a very low power (x7 to x30), yet exceptionally convenient inspection microscope. Just set it to 7 power. Flip the chip upside down and put it on the stage, then U start working on those chips to make the blue oxide go away, and see fresh metal.

What do you use? I dunno, maybe the finest wet/dry sandpaper U can buy at Home Repot.

In all of this, you are at grave risk of wrecking the chips w/o the MAXIMUM

possible ESD protection. I would suggest some of those "chip clamps" from the early 1980's, that had a clip every 0.1" and you clamped it onto the chip. Short all the pins together on the clip. Now you've shorted out every pin on the chip, and can work on its oxidation problems quite freely.

Remember that if all pins are shorted together, ESD damage is impossible.

That STILL leaves you with 100 other issues about dealing with ESD, at other moments in time. But if you want to work on each pin of each IC, try those clamps, shorted out.

Put it back together at the end, avoid ESD trouble to avoid "2 disease" and it should be fine, even as a solderless unit. That's what I learned by trying to solder one.

time for spice news; rubber keycushion

*Message #17 Posted by **Norm** on 9 July 2003, 2:59 p.m.,*
in response to message #16 by Norm

Greetings, when time permits, I have continued to try to solve technicalities regarding spice calculators.

The key cushion pad between the keys and the domes, I am still trying to locate a good substitute. Thanks for those who supplied samples. I am now dealing with a die-cutting shop that is making reasonable effort to match the material.

Firstly, its NOT "Nitrile 60 rubber" because that stuff stinks too much. U dont want your calculator to stink like a tire shop do you ?

And, its NOT the pool liner at Home Depot. That's made of PVC and has no dry lubricants.

The dry lubricants appear to be important. Under the microscope, the white powder is STRONGLY embedded into the black silicone (I'll say silicone until I learn what it really is). Whereas rubber products from a gasket shop has a superficial talcum powder that rubs away easily.

I think the dry lubricant is important . We are still trying to match the material. If anybody KNOWS a supplier for the material, now is the time to talk.

The genuine HP item is about 0.011" thick . I think it could go thicker... maybe 0.015" or even 0.020" thick.

Where I tend to be going, is for a few hundred bucks, they will make a tool and DIE CUT the material and supply me with a boxful. Folks, dont forget the industries where this stuff really comes from (rubber feet folks, paying attention?) you get the material and have it die cut. They want a few hundred bucks to prepare a tool (a bunch of razor blades) then they stamp away... So I'd say that you may spend more time foolin' around with scissors than just getting the real thing (and it wont look homemade either). Then sell the extras to people who need the same item.

After all, one good HP calculator costs a few hundred bucks anyway, why not get the genuinely tooled parts you really need, at least for things as simple as die-cut rubber.

- Norm

time for spice news; low battery

*Message #18 Posted by **Norm** on 9 July 2003, 3:06 p.m.,*
in response to message #17 by Norm

Greetings, We've got a lot of issues with the spice units, including "2 disease", what batteries to stuff in, how to service a solderless unit, how to open them, how to lube the slide switches, and maybe how to trim the plastic clips so they dismantle a little easier.

HOW ABOUT THE low battery indicator?? When I use "AA" Alkaline, whats noticeable is that the indicator seems to light up long before the battery is near the end-of-the-road.

Anybody else notice this? It gets brighter as you illuminate more segments of the display.

I put the batteries on the scope, I saw there is 0.1 volt of noise on the batteries, pretty consistently. It's the chopped loads from the display multiplexer. That right there is enough to perhaps make the low battery indicator less reliable (adds 0.1V of slop).

Where I would go here..... I think the low battery indicator may have a threshold that is TOO HIGH A VOLTAGE and furthermore may be too RAPIDLY SENSITIVE. It should be filtered to turn on only to the AVERAGE BATTERY VOLTAGE, and maybe have a lower threshold. Its enough screwed up that I dont feel happy with it.

ANYBODY GOT A SCHEMATIC? Not a marginal one, but a thorough one... say for an HP-34C. With an exact schematic, I could see what's the deal with the low-batt indicator and clean up the circuit a little (maybe add a cap, or change a resistor).

FACT: If you add 1000 uF across the battery, the low battery light is less likely to illuminate. This means the current spikes are tending to draw down the battery on a spiked microsecond basis, and triggering the low-batt indicator.

- Norm

Re: time for spice news; low battery

*Message #19 Posted by **RR** on 9 July 2003, 4:00 p.m.,*
in response to message #18 by Norm

Well, the low battery indicator was designed to warn you about when a rechargable would fail, not an alkaline. Rechargables of that era would hit the lower voltage level and then take a steep nose dive.

Many people use rechargables for their Hp48's and complain about this problem. What you are seeing is the low charge lite designed for a rechargable, when your alkaline still has as much electrical capacity of the older rechargables with a full charge. Your redesign would probably

work for your alkalines, but ruin its use for rechargables if you ever wanted to return to them.

Re: time for spice news; low battery

*Message #20 Posted by **David Smith** on 10 July 2003, 4:20 p.m.,*
in response to message #19 by RR

On a lot of Spice machines the low battery light will flicker a bit when modern batteries are installed and fully charged. I think the duty cycle of the PWM is shortened to the point where it fools the circuit into thinking the battery is low.

yeah but with a schematic,

*Message #21 Posted by **Norm** on 10 July 2003, 5:30 p.m.,*
in response to message #20 by David Smith

yeah but with a schematic, maybe I could add a filter cap or change a resistor and then it would work fine. That's why I'm interested to look into this further, as time permits.

Problems like this should be fairly trivial to correct..... its really kind of embarassing to HP that they did not accomodate disposable Alkaline batteries in the spice units from day #1 ..... since they were available at the time ..... and since they last so much longer than a charged-up NiCad.

HP34C schematic

*Message #22 Posted by **Ellis Easley** on 9 July 2003, 6:45 p.m.,*
in response to message #18 by Norm

I know it isn't graphical, but the netlist I posted includes every net that contains more than one device pin. All unlisted device pins are no-connects.

Re: time for spice news; rubber keycushion

*Message #23 Posted by **David Smith** on 9 July 2003, 4:09 p.m.,*
in response to message #17 by Norm

I have a couple of machines with a black rubber sheet that does NOT have any white powder. They are slightly sticky and several keycaps lift with up with it. But, it works just fine... mayby even better than the powdered ones since the keys tend to not float around as much. Probably no need for a special powdered liner.

I also found a third type of HP liner material. It is a lot like the yellow foam rubber material but is green and has a slightly higher density.

Re: time for spice news; rubber keycushion

*Message #24 Posted by **David Smith** on 11 July 2003, 4:08 p.m.,*
in response to message #17 by Norm

Based upon the number of machines out there that would need a new sheet, it will probably be much more cost effective to have them laser cut. Lower set up charges and the ability to do smaller production batches.

Re: Spicy stuff

*Message #25 Posted by **Jon** on 9 July 2003, 5:55 p.m.,*
in response to message #10 by Randy Sloyer

Randy:

Some time ago I saw a 37E that had been serviced and didn´t work. The CPU was rotated 180º. After placing in it´s position it worked. May be is worth you try it. I don´t think you will damage the CPU because it didn´t happen with that calculator.

Good luck

Jon

Re: Spicy stuff

*Message #26 Posted by **Randy Sloyer** on 9 July 2003, 10:41 p.m.,*
in response to message #25 by Jon

Hi Jon,

Already looked at that. All pin 1's are toward the top of the unit. I was curious about the empty hole in the middle of the 8 pin devices - I didn't know if the previous fixer forgot a part. Wouldn't be the first time. I later noted that it probably never had a part in that position as the pads where free of indentations unlike the positions that held parts. I'm sorta stuck. Everything looks fine, no oxidation or creepy crud anywhere. Not sure what to try next.

Re: Spicy stuff

*Message #27 Posted by **Ellis Easley** on 11 July 2003, 8:09 p.m.,*
in response to message #26 by Randy Sloyer

Even though there is no corrosion evident, have you cleaned the mating surfaces? Some people say to clean with alcohol, and this might make sense to remove invisible residue from plastic outgassing, etc. but I don't know if it will remove invisible metal oxides that could be causing high resistances. Personally, I like to use the "Pink Pearl" pencil eraser that has been recommended for a long time to clean the gold plated contact fingers of plug-in option boards. When I reworked my unsoldered 34C recently, I used an eraser to clean all the pads of the flexible PCB, the pads on the power supply flex circuit where it mates with the main flex PCB, the mating surfaces of the LED display module pins and the bottoms of the IC pins that contact the main flexible PCB. Then I used a rubber bulb (I'm too cheap to buy canned air!) to blow air to sweep away the eraser crumbs. Also I used the eraser to clean the slide-switch contact surfaces on the flexible PCB and the the little moving metal contacts, too, before lubricating them with Radio Shack Lube Gel. The switch contacts looked like they had never been lubricated - same on my soldered 34C - and on the unsoldered one there was some serious battery corrosion on the slide switches, which I cleaned off first. Basically, I just used a sharp probe to scrape the corrosion down to something shiny, then used the eraser to polish it up.

Re: Spicy stuff

*Message #28 Posted by **David Smith** on 12 July 2003, 4:55 p.m.,*
in response to message #27 by Ellis Easley

Occasionally Fry's has two can packs of "air" for $0.99! Usually limit one pack. Pay cash, take to car, repeat until x<=0.

Re: Spicy stuff

*Message #29 Posted by **David Smith** on 12 July 2003, 4:57 p.m.,*
in response to message #28 by David Smith

Forgot to mention while at Fry's pick up a Caig "Gold Pen". Like a magic marker filled with anti-corrosion stuff. Kinda pricey, but seems to work well on Spice connections, classic keyboards, etc. They also make something called Deoxit pens. Probably filled with the same stuff, but it is red and costs a bit less.

The manual of the Aurora FN1000 (again)

*Message #1 Posted by **jose goncalves (brasil)** on 6 July 2003, 8:34 p.m.*

I've been examining the Aurora FN1000 that is sold as a replacement for the HP12C. Here are some of my findings: a) The manual is a 224 pages booklet full of instructions and examples. Sure it does ! It's a shameless transcription of the Portuguese version of the HP12C manual ! Names and amounts in the exemples have been changed and some exercises had their statements simplified. But it's all there ! It even has a copyright notice favoring the Brazilian distributor ! Copyright of the copy ! Amazing. b) The graphic presentation of the manual is low quality and the Portuguese version displays some language errors. There is a small, 30 pages complement that has the errata for the main manual. c) Now for the main point. Programming instructions were adapted for the keyboard layout of the FN1000. It's to say that the firmware had to be also adapted ! Everything else in the FN1000 is equivalent to what we find in the 12C: number of program lines, number of storage registers, number of keys etc. But the key addresses were changed to comply with the keyboard layout.

Jose

*Message #2 Posted by **Luc** on 6 July 2003, 9:15 p.m.,*
in response to message #1 by jose goncalves (brasil)

Do you know which site I can download the softcopy manual of the Aurora FN1000.

Thank you.

Re: The manual of the Aurora FN1000 (again)

*Message #3 Posted by **jose goncalves (brasil)** on 7 July 2003, 10:40 a.m.,*
in response to message #2 by Luc

No, I don´t know the site from where to down load the manual for the FN1000. I´ve been studying the paper version of it. I looks like if it was composed in a typewriter, because they tried to draw boxes for the keys around the letters and the result is poor.

Since the manual I saw was in Portuguese and had a copyrught notice for a Brazilian company, I would like to know what kind of manual is offered with the FN1000 that is sold in other countries.

If you know, please let me know.

Jose

Re: The manual of the Aurora FN1000 (again)

*Message #4 Posted by **Ellis Easley** on 9 July 2003, 9:16 p.m.,*
in response to message #1 by jose goncalves (brasil)

Can you account for the display in the photo that Joerg posted a link for:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=37597

```
"54-4333 65"
```

On a 12C this means "line 54: GTO line 65"

What does it mean on the FN1000? Or could the photo be from a pre-production unit, before they changed the keycodes?

Meeting II

*Message #1 Posted by **Matthias** on 6 July 2003, 8:50 a.m.*

Hello my dear friends... Now it's one week ago when I posted you wish to organize a meeting here in Basel, Switzerland... Many of you were enthousiastic about that.. Some of you gave possible dates... So let's do a second turn...

My holidays last till 8/10/03, so I propose you the following dates:

16/17 august 23/24 august 30/31 august 6/7 september 13/14 september 20/21 september

I do not know, if saturday or sunday is better for you, so I please you to tell me.. Please post all possible dates directly here in the forum and I will coordinate it...

Wish you a nice summer ...

Re: Meeting II

*Message #2 Posted by **Andreas Stockburger** on 6 July 2003, 10:34 a.m.,*
in response to message #1 by Matthias

Hi,

I would prefer the following dates:

30/31 august 6/7 september 13/14 september 20/21 september

Best regards

Andreas

Does anybody have information on a 30 series power supply?

*Message #1 Posted by **Harry** on 6 July 2003, 8:02 a.m.*

I recently bought a HP 37E. It has lots of corrusion from a leaky battery inside. I cleaned it all up, but it still does nothing. The "power supply" (don't know what you would call it, the part inside the calculator) does not seam to work at all. Now I am am wondering how to fix it. Does anybody have a shematic of it or at least specifications, like what output voltage at wich pin? I would also need information on the LED display. Do they have common Anode? And wich pin is connected to wich part of the display.

Thanks a lot, Harry from Germany, sorry for my bad english, i need some more practice :)

in response to message #3 by Harry

```
Please accept my apologies.
Read your message too quickly.
However it's an extra solution.
I also sometimes use two 1.28V rechargeable batteries that an external standard
recharge.
Good luck !
```

Re: Does anybody have information on a 30 series power supply?

*Message #5 Posted by **Jon** on 6 July 2003, 11:33 a.m.,*
in response to message #1 by Harry

Hi Harry

That calculator doesn´t work without batteries. If you plug the charger be sure you have rechargeable batteries

inside or you could damage it.

These calculators always fail because of broken flex connector. I have found just once one spice non working after repairing this connector. I replaced all the capacitors in the AC/DC circuit and it worked. First of all try to replace the flex connector for wires. And test it with alcaline cells. Take care with the poarity. The contact closest to the top of the calculator is "minus". You have to apply 2.4-3V in the contacts (two alcaline AA batteries work fine as Emmanuel said)

Good luck

Jon

Re: Does anybody have information on a 30 series power supply?

*Message #6 Posted by **Harry** on 6 July 2003, 1:19 p.m.,*
in response to message #5 by Jon

I already did replace that connector with wires. All capacitors seam to be fine. I might have had the batteries in the wrong way round though (this is my first spice), what kind of damage would that do? I can see one bridge that has been cut on the circuit board, i am not sure if it came from HP like that or if somebody else did that. To me it looks like it bridges the "On/Off" switch to test the circuit at the factory. I am quite sure the problem the calculator has is that little power-suply-circuit. I think i will test the transistors next. But i can't read anything on them, so i would not know what to replace them with.

Thanks, Harry

Re: Does anybody have information on a 30 series power supply?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 6 July 2003, 2:33 p.m.,*
in response to message #6 by Harry

Hi, harry;

for as long as I remember, this is the only jumper available in the power board. Compare it to the image below:

http://www.logeng.com.br/images/comma_jumper.jpg

Believe me: this jumper allows you to select if you want comma or dot as radix mark. The relation is:

```
Jumper closed - dot for radix mark
Jumper opened - comma for radix mark
```

In your case, you'll have to use a small wire and connect both terminals if you want to keep north-american number representation. If you check for the serial number, your calculator will have a country ID letter in its fifth position, and the origin COUNTRY is usualy written right below it.

Let us know when you have success repairing your unit.

Luiz (Brazil)

Edited: 6 July 2003, 2:40 p.m.

Thats the jumper i was talking about!

*Message #8 Posted by **Harry** on 6 July 2003, 3:34 p.m.,*

in response to message #7 by Vieira, Luiz C. (Brazil)

Thanks for that interesting information. And for the very good pictures. With the help of the link to the older post I found out that my power-supply is definatly not working as it should. So i will try and find out whats wrong with it.

Regards, Harry

I second Jon's advice

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 6 July 2003, 1:08 p.m.,*
in response to message #1 by Harry

Hi, Harry;

I'm adding an image with a partial view of an HP31 with wires replacing the flex circuit. You can see the points I used to solder the three wires that go to the battery/AC connections assy.

http://www.logeng.com.br/images/repair_.jpg

I did not take any measures in this board, but Ellis Easley made a complete description of what he found in this post, along with some other interesting reports. And be aware of the fact that continuous memory Spices (HP33C, 34C and 38C) have a power board that's different of the ones found in regular units (HP31E, 32E, 33E, 37E and 38E; there is no HP34E).

If you need further advice, let us know.

Luiz (Brazil)

*Message #3 Posted by **Namir Shammas** on 6 July 2003, 7:16 a.m.,*
in response to message #1 by Emmanuel, France

Hello,

I have bought several calculators from Emmanuel. The La Post took its sweet time to ship them, but they made it here, except for one machine (Emmuanuel is asking La Poste for a refund). I also experienced similar delays in shipping from a German eBay seller who sold me TI calculators. I did receive all these TI calculators eventually. Let me assure everyone that Emmanual is not a crook. He is a collector and a hobbiest juts like most of us. I know France well enough (have lived in Paris for a year and visited many times over 40 years) that their postal system is slow and that delays may occur due to custom inspections that seem to take their sweet time.

Re: To those who believe that I am a crook

*Message #4 Posted by **Thibaut.be** on 6 July 2003, 12:03 p.m.,*
in response to message #3 by Namir Shammas

Emmanuel, like *everybody* on this forum, is an asset to our community and a fine guy. I traded with hime some calcs, as a buyer and as a seller without any problem excpted some reasonnable delay.

It is true that recently parcels seem to take more time to reach their destination. I also experienced this as a buyer and as a seller.

It is also true that the opening hours of european post offices do not necessarily match our working hours and that sometimes a parcel remains 1 or 2 weeks in the car boot before being shipped.

More and more the solution seem to be dhl or ups with tracking systems but they are far more expensive : the costs often beats the calc's purchase price.

Maybe some guy who often flies from and to the US could act as a postal service...

Psssssstttt!

I sent a package to Spain on Dec 8th, 2002 and it arrived on May 8th, 2003. Ask Fernando del Rey about that one http://www.msdsite.com/images/smile.gif

5 Months in route to Spain.

Edited: 6 July 2003, 9:44 p.m.

Re: I actually have that beat

*Message #16 Posted by **Valentin Albillo** on 7 July 2003, 6:57 a.m.,*
in response to message #15 by Mike

Mike posted:

" sent a package to Spain on Dec 8th, 2002 and it arrived on May 8th, 2003. Ask Fernando del Rey about that one. 5 Months in route to Spain."

Yes, he told me. The problem was that Mike sent the item *insured*, and because of this seemingly logical procedure, instead of following normal mail treatment and getting duly delivered to Fernando's home is 4-5 days at most, it was sent to some hitherto-unknown company in Barcelona (500 miles apart from Fernando's hometown, Madrid), which seems to be the one in charge of delivering insured packages, and there it stood for a number of months (they have a lot of "work", it seems), till they were "so kind" as to let Fernando know that they had a package for him. Which is more, Fernando had to pay yet another fairly unreasonable fee ($20 or so), in addition to shipping costs already paid to Mike, just to get it delivered from Barcelona (Spain) to his home in Madrid (Spain) !

Afterwards, I suffered the same fate. Some eBay seller sent me an item I had won, and did the same thing, he sent it insured. As you can imagine, it was also delivered to that dreaded company's address in Barcelona, 500 miles from my home, I had to pay $25 extra, etc, etc, etc.

My advice: As the risks of sending items without insurance from the US are minimal (I've never lost a single package out of 100+), *never* ever sent anything insured to Spain, unless you want the buyer to wait a number of months and pay $20-30 for the privilege. I don't know if this happens in every case, but two out of two is enough for me.

Best regards from V.

Edited: 7 July 2003, 7:06 a.m.

Re: I actually have that beat

*Message #17 Posted by **Fernando del Rey** on 7 July 2003, 9:30 a.m.,*
in response to message #15 by Mike

The 5 months en route to Spain is absolutely true!

I don't know if the delay was due to the package being insured, as Valentin suggests, or was rather caused by a general state of turmoil due to the war in Iraq. I suspect the latter rather than the former. I've had a recent package sent by USPS arrive in a question of days.

Unlike Valentin in a similar situation, at least in my case I did not have to make any payment for the company in Barcelona to have my package delivered.

I can only suggest to be patient if you are in a similar situation.

Re: I actually have that beat

*Message #18 Posted by **Jordi Hidalgo** on 8 July 2003, 2:21 p.m.,*
in response to message #17 by Fernando del Rey

I haven't had any problems with insured items from the US (the latest one being a mint-in-box 15C with the leather pouch and the Advanced Functions handbook). In fact, I find it unwise to send valuable items without insurance.

Was Cronopost, perhaps, the Barcelona company? The delay might be due to a failed delivery attempt. They once told me that if the package cannot be delivered at the first or second attempt, it is the receiver that has to go and pick up the item!

By the way, Fernando, what happened to the Spanish chapter of PPC? Any chance to be active again?

Regards,

Jordi Hidalgo

Battery terminals on the HP-35?

*Message #1 Posted by **Karl Schneider** on 6 July 2003, 4:49 a.m.*

"Classic" afficionados --

I have temporary custody of an heirloom HP-35 from 1971 that is not for sale (no, it's not a "red dot" moedel). It has no battery pack or charger, but I am aware that it uses 3x 1.2V cells in series. I also have a copy of an article regarding the fabrication of battery packs for these units.

Looking at the opened battery compartment from the underside of the calc, which terminal is "+"? From a diagram in the article, it seems that the terminal nearer the informational backplate is the "+" terminal. (This would be consistent with the Spice-series units.)

Thanks!

I don't have my Calculator here, but a battery pack....

*Message #2 Posted by **Harry** on 6 July 2003, 10:28 a.m.,*
in response to message #1 by Karl Schneider

So i don't know wich way it is inserted into the Calculator. But i hop this will help you: the Contacts are not centered. If i place it contacts up on the desk and the contacts are more to the left, then its the top one wich is + .

regards, Harry

I just looked at a picture of an HP45, and..

*Message #3 Posted by **Harry** on 6 July 2003, 12:49 p.m.,*
in response to message #1 by Karl Schneider

figured out that you are right. It is the contact closer to the lable (and to the centre of the calculator) wich is connected to +

Regards, Harry

Re: Battery terminals on the HP-35?

*Message #4 Posted by **David Smith** on 6 July 2003, 4:42 p.m.,*
in response to message #1 by Karl Schneider

If you have an ohm meter, you can check which battery contact is ground (negative). It is connected to the middle of the three pins in the charger plug.

Re: Battery terminals on the HP-35?

*Message #5 Posted by **Karl Schneider** on 7 July 2003, 2:07 a.m.,*

in response to message #4 by David Smith

Harry and David --

Thanks for the help. In fact, Figure 1 of the (still-available) article I mentioned Making New Battery Packs for the HP-35 Calculator shows the connections between the calculator terminals for the battery, adaptor plug, and the internal circuitry.

It seems as though either the calculator power switch is bad, or there is a break in the circuitry. All the resistance tests are normal, except that I get "open circuit" between the battery terminals and between the center- and right adaptor terminals with the power switch closed.

It also seems that six screws must be removed in order to take the back off; the middle two are under the thick foil on which the instructions are printed. I would rather not remove the foil, without a replacement available.

Best regards,

-- Karl

Re: Battery terminals on the HP-35?

*Message #6 Posted by **Dave Shaffer** on 7 July 2003, 1:15 p.m.,*
in response to message #5 by Karl Schneider

Karl,

Does your HP35 not turn on, even with good batteries, as indicated by your comment "It seems as though either the calculator power switch is bad ... "?

I have an old HP35 (from 1973) and its power switch barely works - I often have to slide it back and forth several times to get the machine turned on reliably. You might want to spray some contact cleaner down into the switch (using some precaution to not overspray everything else!). Others here may have alternate suggestions for a bad switch.

Re: Battery terminals on the HP-35?

*Message #7 Posted by **David Smith** on 7 July 2003, 4:35 p.m.,*
in response to message #5 by Karl Schneider

You can check a lot of the internal wiring with an ohmeter.

First remove the battery pack and switch the unit on. Next measure across the outer two posts in the charger port. They should show zero ohms becuase they are connected together by a strap when the charger is unplugged... one pin is connected to the battery and the other connects to internal circuitry. If the strap is not making contact the machine will not run on a battery, but should run on a known good charger.

If the machine runs on the charger and the strap is making good contact but will not run on a known good battery then you probably have (often invisible) corrosion on the battery contacts. The battery pack makes contact to the terminals along the SIDES of the tips of the gold contacts. Clean well with very fine sandpaper.

Next measure between the center charger port pin and the negative battery contact. This should always show a connection.

Next measure between one of the outer charger port pins and the positive battery contact. This should show a connection. If not then the power switch probably needs cleaning.

Classic series chargers are notorious for bad connections in their plug. Also well known for a bad main electrolytic filter capacitor. Either problem can cause the machine to not light up.

If you need to open the machine to clean the power switch you can do it without removing the label. You need to peel up the top two corners of the label about 1/2 inch to access the screws. I wet a razor blade with the temporary adhesive releaser called UnDu and slide it under the corners. Be careful not to slice the label or sharply fold it up. Often the label corners will stick back down. Sometimes you need to glue them to keep them down. I never reinstall the screws under the label so that future repairs do not risk further damage to the label.

Re: Battery terminals on the HP-35?

*Message #8 Posted by **Karl Schneider** on 8 July 2003, 1:49 a.m.,*
in response to message #7 by David Smith

David and Dave --

Thanks much for the "tech tips"! I'll try the contact cleaner, but will open the back only with permission from the owner.

BTW, Dave -- I attended UNR part-time during several terms in 1993-94.

Hp 41cx self test

*Message #1 Posted by **Pierre Brial** on 6 July 2003, 1:41 a.m.*

Hello,

A friend give me a broken Hp41cx. With a lot of soldering I succeed to repair this mythical machine. Everything seems to work fine now, but is there a self test like in more recent HP ?

All the best

Pierre (Reunion Island, France)

Re: Hp 41cx self test

*Message #2 Posted by **Ernie Malaga** on 6 July 2003, 2:09 a.m.,*
in response to message #1 by Pierre Brial

To the best of my knowledge, there is no self-test. HP technicians used to use a special plug-in module that contained a test program, but those modules are very difficult to find, since supposedly they never left the hands of HP technicians (they were not sold to the public).

-Ernie

Re: Hp 41cx self test

*Message #3 Posted by **Emmanuel, France** on 6 July 2003, 5:47 a.m.,*
in response to message #1 by Pierre Brial

```
Dear Pierre,
Some modules have programs or MCode routines in order to test HP-41s:
Service module was made for that.
PPCROM DT program tests the display.

eBay Auction - Read The Fine Print

*Message #1 Posted by **Tony Copley** on 5 July 2003, 10:19 a.m.*

I almost pulled the trigger with a “Buy It Now” on this HP-35. Below the series of three photos is an additional, added, photo of what appears to be a red dot. A comment below the three photos, “PLEASE DISREGARD PICTURE ON BOTTOM OF PAGE” is easily overlooked. A mistake in listing or an interesting way of sucking a buyer in with “Buy It Now”? http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3034043964&category=11713

Re: eBay Auction - Read The Fine Print

*Message #2 Posted by **Vassilis Prevelakis** on 5 July 2003, 3:22 p.m.,*
in response to message #1 by Tony Copley

I see that this auction allows payment via PayPal which offers a "buyer's insurance". To use this you pay PayPal a fee and if you do not like your item you can get the money you paid for the item back.

I have not used this feature yet, but it looks a neat way to ensure that you do not get saddled with some mangled piece of hardware that was described as "in mint condition" on the auction page.

Note that this insurance does not protect you against items lost or damaged in transit.

If anybody has additional info/experiences with this feature, please write on.

**vp

I don't believe this was accidental or an oversight

*Message #3 Posted by **Mike** on 5 July 2003, 6:59 p.m.,*
in response to message #1 by Tony Copley

Look... some facts. I suspect this was deliberate.

He "added" the photo, using "add to description". If he wanted to change the photo, he could have just deleted it, instead of saying, "disregard bottom photo." You can edit and delete all you want, until someone bids.

Now, if someone bid, preventing him from deleting the photo, he THEN would not have been able to change the original auction description. But he had that "disclaimer" in the original description. He could not have added the disclaimer, had someone already bid.

So, it appears that he 1) had the disclaimer before he added the photo OR 2) he just added the disclaimer and left the photo in.

Finally, you can check his feedback. He has more than 50 less than positive, including 27 negatives.

I'm finding that there are more and more that are simply using deceptive selling tactics on eBay trying to leverage off of the higher value calculators that collectors sell.

He wound up selling a $50 for $150. I suspect that if you go back and read all his feedback, you will find other negatives because of deception.

Edited: 5 July 2003, 7:00 p.m.

```

Come on Mike, the guy has almost 3800 positive comments from *unique* eBay users.

I'd think that it would be suspicious if he *didn't* have these negative ratings.

**vp

Re: I don't believe this was accidental or an oversight

*Message #5 Posted by **David Ramsey** on 6 July 2003, 11:37 p.m.,*
in response to message #3 by Mike

It certainly did look suspicious, especially after I used the "Buy it now" button and THEN noticed the disclaimer text!

The seller was very accomodating, refused my transaction, and re-listed the calculator noting that it wasn't a red dot.

I feel foolish for making this newbie mistake, though.

I've pulled the trigger a little to quickly myself

*Message #6 Posted by **Mike** on 7 July 2003, 12:24 a.m.,*
in response to message #5 by David Ramsey

When you find something that looks like a bargain, your fingers start moving quickly, trying to beat the other 10 people that are looking at it too. We've probably all been burned once or twice like that.

It's back!

*Message #7 Posted by **Dave Mabry** on 6 July 2003, 11:12 a.m.,*
in response to message #1 by Tony Copley

Well, it appears that the buyer didn't complete the transaction. That HP-35 is back, photos and all, including the one with the serial number. But no red dot photo or disclaimer, and no mention of the last auction in either feedback. Same HP-35, new auction.

Re: It's back!

*Message #8 Posted by **Raymond Del Tondo** on 7 July 2003, 4:19 a.m.,*
in response to message #7 by Dave Mabry

However, the description says:

>In excellent working condition. THIS IS NOT RED DOT MODEL >

So the sentence in capitals is ok. But the first sentence only says that the unit works in an excellent way. Cosmetically the machine is near to trash, IMHO.

I once got a *mint* HP-35 (no red dot) in trade for a new TI35X, which cost about 35 DM (Deutsche Mark) at that time. That was fate:-)

Raymond

Re: eBay Auction - Read The Fine Print

*Message #9 Posted by **Thibaut.be** on 8 July 2003, 5:04 a.m.,*
in response to message #1 by Tony Copley

A red dot simply could not have a S/N starting with 12...

HP AC adapter?

*Message #10 Posted by **Ellis Easley** on 9 July 2003, 8:37 p.m.,*
in response to message #1 by Tony Copley

Is that really an HP AC adapter? I've never seen an HP adapter built like that - it looks like a TI adapter to me. Did HP ship adapters that looked like that one?

Re: HP AC adapter?

*Message #11 Posted by **David Smith** on 10 July 2003, 4:23 p.m.,*
in response to message #10 by Ellis Easley

Yes, that style was used with the earlier HP35 and HP80 machines. The hard cases have a little raised ridge in them where the charger sits. The early model hard cases will not hold the later model chargers properly.

HP15C

*Message #1 Posted by **Thierry** on 5 July 2003, 3:34 a.m.*

I have change the batteries of my HP15C and I have lost the setting. As I have lost the user manual, I have two problem now. I have message "error 3" when I want to use the memories from "2" (no problem with "0" and "1"). And I want to use the virgule to separate the decimal (sorry, i'm french). I know the solutions are in the manuals, because I had the problems the last time I change the batteries, but it's few years ago, and I forget the solutions. Thanks Thierry

Re: HP15C (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 July 2003, 4:13 a.m.,*
in response to message #1 by Thierry

Hello, Thierry;

the problems are simple, so far. To change comma (virgule) for period (dot), do the following:

1 - make sure the calculator is turned to OFF (hors-fonction);
2 - press and hold down the [.] key;
3 - while [.] is held down, switch the calculator ON;
4 - release [.] key

You can perform this set of operations for as many times as you need. They will toggle comma to dot everytime you press the keys in sequence.

About the [Error 3] message, you can choose a few options. Before that, find the [RCL] key and you'll see [MEM] printed in blue in one of its faces. Now, with the calculator switched to ON, please, follow this sequence:

1 - press the blue [g] key and release it;
2 - press and hold the [RCL] key (you performed [g][MEM]);

You'll see something like this:

```
[ 1 fr pr-b ]
```

where:

1 - number of the highest available register; as you cannot access any register above R1, you'll see '1'; this value may reach 65 and is named registers' segment, sort of a memory "share" to hold the numbered registers (*)
fr - number of free (available) registers in the "common segment', i.e., part of the existing memroy that can be occupied with program steps, matrix elements, complex stack and SOLVE/Integrate temporary scratch area
pr - number of hole registers currently used by program(s)
b - remaining bytes from last "assigned" register for program steps storage. b can be in the range 0 to 6
(*) except for registers RI, R0 and R1 that are permanently available

fr, pr and b vary in accordance with memory use register

The HP15C user can manualy specify the first parameter (that we assumed 1 in your case) by using the sequence [f][DIM][(i)] like this:

-enter the number of the highest register you plan to use (not the number of registers you plan to use);
- press [f][DIM][(i)]

Now you can check memory again and you'll see:

[g][MEM] (hold [MEM]-key pressed for as long as you ned to see)

```
[rr fr  pr-b]
```

where rr is the number of the last available register. Remember that you will not be able to specify rr for a value bigger than the existing memory.

The other choice is memory clear [Pr Error]. Consider doing this only as a last alternative. If you want to perform this "master clear", do it:

1 - make sure the calculator is turned to OFF (ors-fonccion);
2 - press and hold down the [-] key;
3 - while [-] is held down, switch the calculator ON;
4 - release [-] key

You'll see [Pr Error], and if you press [g][MEM] right after clearing all memory, you'll see:

```
[ 19 46  0-0]
```

What means you may use any register from R0 to R9 and R.0 to R.9 and the index register RI

Hope this helps for now. If not, let us know.

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Thanks for your help, know I have refind my old good HP15C, I don't know to mork without it. I have need to clear all the memory. I regret have lost the manual. I don't imagine how precious my calculator could be. I have a HP33E, 34C and 41CV, with manuals, so if you need help or informations for there, I could try to help you. Thanks Thierry

Re: HP15C (edited)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2003, 6:22 a.m.,*
in response to message #3 by Thierry

Hey, Thierry;

thank you so much! Help is always welcome.

If I can say the same, count on me (us), too. One of our contributors, Valentin Albillo, will surelly find many additional information for your HP15C daily use. He is an HP15C's expert, no pun intended at all.

Best regards.

Luiz (Brazil)

An HP-65 ebay set to watch

*Message #1 Posted by **gene** on 4 July 2003, 9:21 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3033957060&category=11713

Pretty good set up. Already at $100. Guesses where it will end up?

Re: An HP-65 ebay set to watch

*Message #2 Posted by **Mark Hardman (LED)** on 4 July 2003, 11:16 p.m.,*
in response to message #1 by gene

<SARCASM>Thanks Gene.</SARCASM>

It looks like the $275 I've already bid will NEVER hold up now. I guess I'll have to cash in my now nearly worthless HP/Compaq stock so that I can double that bid.

Mark Hardman

Re: An HP-65 ebay set to watch

*Message #3 Posted by **Gene** on 5 July 2003, 9:59 a.m.,*
in response to message #2 by Mark Hardman (LED)

Sorry about that Mark. But that would only work if no one else had seen it before the end. Since it showed up in my unsophisticated search, that was unlikely. It does look like quite an impressive set. :-)

If you double that bid...

*Message #4 Posted by **Mike** on 6 July 2003, 12:33 p.m.,*
in response to message #2 by Mark Hardman (LED)

you still won't win :-) I estimate it will go for $775.00. Let's see.

Re: If you double that bid...

*Message #5 Posted by **David Smith** on 6 July 2003, 4:51 p.m.,*
in response to message #4 by Mike

I don't think it will break $500. The machine has seen enough use to have trim wear above the display and the hard case is for an HP80. Figure it is worth $250. Add 50 bucks a pop for the boxed pacs. Discount the total value a bit because it is sold as a lot (they would bring more separately). My guess is $450 tops.

Re: If you double that bid...

*Message #6 Posted by **Mark Hardman (LED)** on 6 July 2003, 8:17 p.m.,*

in response to message #5 by David Smith

I've already made it clear that I'm willing to go above $500.

So...

There is no point in anyone else running up the bidding here.

Really...

there is no possible way you can win!

There is not point in trying.

Really...

Mark Hardman (LED)

(Crap, I know Mike Davis is going to take the whole lot. Why am <I> even trying.)

Nope! I'm passing this one up

*Message #7 Posted by **Mike** on 7 July 2003, 12:28 a.m.,*
in response to message #6 by Mark Hardman (LED)

I would like the application pacs but I'm sure it will go higher than I'd bid. I might bid if it stays under $450 but there is no way in that happening.

I might have also bid if the calculator was really nice but it has the normal thumb wear (to the trim) from pulling it out of the case. Because of this, I don't think the calculator itself will be anything but average.

Reading eBay photos is a little like aerial photography analysis.

I know there is an ad forum but Mike did not leave his e-mail address.

Mike, I do have some 65 pacs. (Navigation 1 & Avitation 1 pac. Complete, in their plastic holder. No manual). I don't want to sell them but maybe trade them.

Contact me should you be interested.

Here is my breakdown

*Message #9 Posted by **Mike** on 6 July 2003, 10:34 p.m.,*
in response to message #5 by David Smith

$75 each (unopened) application pack $375 total

$250 HP-65

$30 Standard Pack

$40 leather case

$50 Manual and QRG

$15 Extra battery

Discounting for package deal and you are still at $700+

We shall see.

HP-34 C

*Message #1 Posted by **Jon** on 4 July 2003, 5:12 p.m.*

I have repaired an 34C. It has the 2 disease as posted before but it has also another problem. When I turn it off and on again in few seconds everything is ok. But if I wait more than 5 seconds then it loses the constant memory and displays "Pr error".

Does anybody know the reason?

Jon

I guess...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2003, 6:00 p.m.,*
in response to message #1 by Jon

Hi, Jon;

taking your own reference, position # 1 must be always used by RAM. This 8-pin DIP tab set has a separate +Vcc supply, so the chip positioned there (RAM) is always fed for as long as you have charged batteries installed. I saw your post again and compared the codes you posted: there is a ROM chip in the first position. My HP34C looks like this:

```
34C  N  S   34C/B-2102 00034-69110  1LB902 1MA10014 1MA115    (1)
```

I guess the "unknown" 8-pin DIP chip is the RAM chip, as the other have codes taht are close to the ones I found in mine. Simply exchange chips #1 and #2 in your calculator and tell us what happened. No chance to dammage the chips: except for pin #8, all others are connected in paralell.

Success!

Luiz (Brazil)

Edited: 6 July 2003, 12:15 a.m.

its 4th of july

*Message #3 Posted by **Norm** on 4 July 2003, 7:55 p.m.,*
in response to message #1 by Jon

its 4th of July. Put that HP-34C in a drawer and deal with it tomorrow. Today, get out one of Carly's Kinpo calculators, and stuff some firecrackers underneath it and light the fuses.

:o)

Re: its 4th of july

"2 disease" information

*Message #1 Posted by **Jon** on 4 July 2003, 5:09 p.m.*

Luiz:

Here you have some information of two calculators with the "2 disease" I have dissasembled today.

Hp 33E: Solderless, CPU 1MA4 01 13205(80092) Chips: empty 1MA1204 and 1MA302

HP 34C: Solderless, CPU unknown Chips 1MA114, unknown and 1MA115 (1)

(1) I don´t know why but the reference id of CPU and chip 2 are not readable

When I repair other calcs I will post the info

Sorry but I don´t know how to post the information in rows as you made ...

Cheers

Jon

Re: "2 disease" information

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2003, 5:54 p.m.,*
in response to message #1 by Jon

Hi, Jon;

thank you very much for the valuable info.

About text format: use PREformat text. Start text with [pre] and finish it with [/pre]. Like this:

[pre] one
two
three[/pre]

It will look like this:

```
one
two
three
```

Somewhat easy... when we know. Further info: Advanced format techniques

Best reagrds.

Luiz (Brazil)

HP-34C CPU id number

*Message #3 Posted by **Jon** on 5 July 2003, 4:20 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz:

I have cleaned the HP-34C CPU wit solvent. It had some kind of glue. It should be forbidden some people service these calcs. Ok, id number is: 1820-2162-A (7905BV).

Cheers

Jon

Re: HP-34C CPU id number

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 5 July 2003, 11:52 p.m.,*
in response to message #3 by Jon

Hi, Jon;

thank you again. It seems the HP33E you mentioned in previous post has a paper label or a CPU code that's different of those I saw so far. As you mentioned you had some glue in the HP34C's CPU chip, it probably had a paper label on it, tto.

BTW, is this HP34C the one that had a [Pr Error] problem? Did you read my post about it? If so, did you succeed repairing it by changing the position of the chips (1) and (2)? I'm just curious about it, because if you did not get positive results, you may also have a power supply board with some sort of problem.

Best regards.

Luiz (Brazil)

Edited: 6 July 2003, 12:09 a.m.

HP-34C REPAIRED

*Message #5 Posted by **Jon** on 6 July 2003, 5:43 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luiz:

You are great!!!. I have changed the ICs and now it works great. When I got your answer I was ready to replace every capacitor in the AC/DC circuit. The only fault it has is the “2 disease” and rests of glue everywhere inside, but it coesn´t affect to function and you don´t notice it when reassembled. Another calculator badly serviced with that problem……

Thanks again

Jon

42s manuals

*Message #1 Posted by **Jason** on 4 July 2003, 2:52 p.m.*

Does anyone know what 42-s manuals (english) are going for lately?

Re: 42s manuals

*Message #2 Posted by **Thomas** on 5 July 2003, 4:06 a.m.,*
in response to message #1 by Jason

Hello,

I asked HP for buying books for the HP 42S. OK the support for this calculator ist closed, but maybe the have a few exemplares in the archive.

The sent me an adress from Moravia GmbH. They told me that they have the searched book (German Programmierbeispiele und -techniken).

They told me also that they have some other books for the HP 42S. i.e. an Owners Manual (in German), some Engeneering books in english. If I have right in mind 50? incl. shipping (Owners manual).

Please contact Mr. David Kirchner at calc-d@moravia-consulting.com

Greetings Thomas

My First e.Bay "burn"

*Message #1 Posted by **Scuba Diver** on 4 July 2003, 2:40 p.m.*

Well, I figured it would happen sooner or later.

I bid on an auction for an HP-28S. Here's the description of the item.

"This calculator has been in it's box since I bought it for college but never used it. If you are a collector it doesn't get better than this. It was always stored at room temperature/humidity. I just installed new bateries and it looks and runs like new."

The one thing that I noticed was that although he had a couple of positive feedbacks, his account was less than a month old. The other issue was that the auction was ending in a couple of hours...bad combination!

I sent the seller an email asing "if the item was never used, then are the manuals still shrinkwrapped?" There was no reply, so at the last moments of the auction, I went against my gut and put in a bid...it was high, but I thought it would be worth it for a calculator that is as mint as the seller described.

A couple of hours after the auction, I received a reply from the seller "it's used". Hmmm...I'm a bit dubious...so I ask him how "used" this calculator could be, since he said it was bought for college but never used. His reply was that he opened it to try out the features but that was all.

At this point, I knew I was in trouble, but I had already won the auction.

Anyhow, the item arrived yesterday. The inside of the clamshell is covered in dirt and dust, the rubber feet are worn, and there is a scratch on the top right hand corner, with a small chip missing from the plastic near the battery door.

I gave the seller the benefit of the doubt and wrote him, telling him that I wasn't satisfied, that I don't think he described the item accurately, and that I want my money back. His reply was curt (to say the least), but he agreed. So I asked him to send 1/2 the money now, I'll ship it, then he could send the other 1/2 when it arrives.

Well, he said that he won't send any money until the unit arrives back, because he wants to check the condition! I can already see what the outcome will be...he'll get it, say that it was pristene when he sent it, and that I must have dropped it, and then I'm out both the calculator and the money. He has done nothing thus far to show me that he's trustworthy or that his is a man of his word, so why would I start to trust him now?

I figure it's a case of I said, you said...and there's nothing that can be done. I told him that none of this would have happened if he would have just been open and honest...someone would have gladly paid $80 US for this calc...he went to all of this trouble to lie just for what, an extra $40? It's very sad...if this person thinks that it's worth treating people like that for $40, then they must be really hard up.

I just hope he realizes that what goes around, comes around.

If anyone has any other ideas, I'm listening! Oh, and keep your eyes open on the Classifieds for a "mint" 28S that I might be selling soon! :)

B.

Re: My First e.Bay "burn"

*Message #2 Posted by **Matthias** on 4 July 2003, 3:13 p.m.,*
in response to message #1 by Scuba Diver

I also had problems with sellers. Perhaps some tipps for you:

1) Never bid on a item without seen a picture of the item. 2) Don't trust the word "mint". 3) Don't big on a item, when you are not absolutely shure, that you get what you want. Not in the last minute.

For now, you could send the seller some pictures, holding the calc. So he can check it's condition. I wouldn't give him a negative feedback, cause he will change his user name at ebay and you will get a negative feedback too...

Sorry, that's all I can do for you, but I feel with you as I has the same probleme one year before...

Matthias

Re: My First e.Bay "burn"

*Message #3 Posted by **Scuba Diver** on 4 July 2003, 3:28 p.m.,*
in response to message #2 by Matthias

Thanks Matthias!

I know...usually I ask all of my questions days in advance, get closeups, etc...but this time I didn't and it obviously burned me.

Live and learn, right? B.

Re: My First e.Bay "burn"

*Message #4 Posted by **Ernie Malaga** on 4 July 2003, 4:30 p.m.,*
in response to message #1 by Scuba Diver

I've been advocating against eBay ever since I knew of its existence. You're trusting someone you've never met, who lives you-don't-know-where, who can lie and deceive with impunity by way of fictitious descriptions and phony photographs.

I know that there are many satisfied eBay customers. But, contrariwise, there are many who got burned the way you just did. I have no idea what legal recourse you may have, but I suspect you have none. That's the risk you take.

People, please always remember that eBay is an auction carried out by anonymous people and that there will always be crooks waiting for an unsuspecting fellow to fall in their nets. These crooks can disappear anytime by simply changing their email address, and (pobably) can be anywhere in the world.

I'm sorry you got burned. I hope you won't use eBay ever again.

-Ernie

Re: My First e.Bay "burn"

*Message #5 Posted by **Scuba Diver** on 4 July 2003, 4:40 p.m.,*

in response to message #4 by Ernie Malaga

Well, 98% of my transactions have been completed to my satisfaction. I think that most people are honest, but there will always be people out there who are liars and cheaters who take advantage. When they were kids, they probably wrote the answers to tests on their arms and now that they've grown up (physically, not emotionally or cognitively), they continue.

I think that my lesson learned here is to apply lots more due diligence before making a bid.

B.

Re: My First e.Bay "burn"

*Message #6 Posted by **Patrick** on 4 July 2003, 8:25 p.m.,*
in response to message #4 by Ernie Malaga

I have made some 50+ transactions through eBay with purchase amounts ranging from a couple of dollars to $340. I have had just a few disappointments so far. In most of those cases, the seller has offered to make amends, usually by refunding my money or by re-negotiating a smaller sale amount.

If I had stayed away from eBay like you suggest, there would have been no practical way for me to amass the wonderful machines I now have in my collection, and which continue to give me a great deal of pleasure. I have also met and had wonderful email conversations with a great many of my sellers. There are a lot of very good and kind folks who offer their wares through eBay.

Yes, the possibility (more like probability) exists that I will also get burned one day. Amortized over all of my eBay transactions, it is not much different financially than buying insurance and having the insurance company reimburse my loss. Even Scuba Diver's loss, while disgraceful and lamentable, apparently amounted to only $40.

I personally feel that staying away from eBay is akin to flushing the baby with the bathwater.

Re: My First e.Bay "burn"

*Message #7 Posted by **Valentin Albillo** on 4 July 2003, 8:56 p.m.,*
in response to message #6 by Patrick

I fully agree with Patrick.

I've made 60+ transaction through eBay, always for amounts of $100-$300, and never once have I suffered any obvious scams or attempts to deceive, which would have been even easier in my case, being an international buyer. Should the seller decide not to send the item, or send a faulty one, there's nothing at all I can do from 6 thousand miles across the ocean.

Despite that hard fact of having to purchase entirely on faith, I've had only two very minor incidents, the worst being the seller specified that the machine included new cells and a manual, and the machine came with no cells and no manual, but otherwise cosmetically perfect and working.

On the contrary, I've found a number of extremely honest and helpful sellers, which didn't mind my check taking up to two weeks to arrive (before I got a Paypal account), which were eager to stablish an agreed Buy-It-Now price when I asked if they would, that would deliver items much better than described (even new !), that would take all care to package items properly so that they could withstand the long, hazardous journey. Most of them were also extremely kind and friendly, and left wonderfully caring feedbacks.

I don't think this is just pure luck, but even if it is, I agree with Patrick: there was no practical way for me to get the wonderful machines I now have, and even if one transaction would come off bad every 60 (or even every 30) excellent ones, that's a risk I'm willing to take, and it won't certainly keep me from taking advantage of such an incredible treasure trove as eBay offers every day.

Take care, Scuba, I hope your actual disillusioned state wears out as soon as you get some wonderful machine from an honest, friendly eBay seller, they are the vast majority for sure. I agree that if HP calc prices continue skyrocketing, that may attract an increasing number of scammers and dishonest people in the future, but right now it isn't that bad at all, and if you stick to a number of well-known, large-positive feedback sellers, *and refrain from hunch-driven, impulsive bids on dubious products offered by unknown sellers*, your success rate will improve dramatically and will stay so.

Best regards from V.

I got gypped once... Scuba Diver is missing something

*Message #8 Posted by **Norm** on 5 July 2003, 3:57 a.m.,*
in response to message #7 by Valentin Albillo

eBay is too fantastically powerful a tool to dismiss using it because of the usual human dirt that are out there.

I got gypped once on a portable oscilloscope.

The guy says 'its in great shape' and the photos were arranged to conceal how messed up it was.

The thing shows up.... the lid is taped on with duck tape !! And that's just the tip of the iceberg.

So I'm feeling gypped and I am ready to leave negative feedback but it says 'give the seller a chance to make it right'.

So I talk to the seller, he says "fine send it back and I send you the money back". So I sent it back, and along the way, a cashier's check shows up in the mail. I was surprised how willing they were (even a crooked seller) to cancel the transaction.

Now, here's where Scuba Diver is missing something. He should not fear the other guy. He should not fear that he will say 'you did all that' etc etc. and do not fear that he will not refund the money.

Send it back, and cross your fingers. Why ?????? Because of NEGATIVE FEEDBACK. Negative feedback can be a powerful tool. I suppose its not if the guy is a total fake. That's why you can get real suspicious with sellers who aren't here long term..... who don't have 40+ items of pos feedback.

So the guy accepts the merchandise back, and doesn't refund? Post negative feedback and move on.

Out of about 100 eBay transactions, I've had about 3 total klinkers (person never shipped, drastically worse than said, etc). A few more than that were duds, but the seller made it right in the end.

The biggest losers I've had involve sales of small-time music CD's and maybe a few low-budget DVD's. Those $5 transactions are the WORST for somebody not fulfilling their obligations.

YES, be real cautious and bid with caution and really STUDY that seller before you decide that he's worth it. How much feedback, what other auctions, and trade some e-mail with him. If the jerk won't trade substantive e-mail before the sale, then maybe he won't trade email properly afterwards

either.

In the end, eBay is a blast. Back around 1990, I could NEVER have predicted that the internet could create such an extraordinarily powerful tool. Now, if we could just relocate Carly and Bill Gates to their wonderful new residences on the surface of Mercury (use one-way rockets).

- Norm

Re: I got gypped once... Scuba Diver is missing something

*Message #9 Posted by **Iqbal** on 5 July 2003, 6:21 a.m.,*
in response to message #8 by Norm

Sorry for your bad experience Scuba Diver. My first and hopefully only bad experience on ebay was a little more costly than yours. There was a photo of a Sokkia Set 5F total station with a buy it now feature for $1500. The guy said it was great condition but didn't have a battery to try it out. No problem, I was prepared to have it serviced anyway. I sent a cashier's check, and for the first time in my life I was told that there were problems at the bank and I had to wait 7 days for it to clear. Well at that point I knew something was wrong. Anyway, one week later he shipped it out. To add to the start of my woes, I had to pay duties on entry to Trinidad, West Indies. "It was junk" was the description a service technician gave me. The major chassis was forced open and bent beyond repair. The telescope couldn't make a complete 360 degrees. Any child could see the physical destruction of the instrument. The guy replied to my negative feedback and said that he didn't know anything about surveying. The idiot.

However, ebay is not always a sad story. I did get some good stuff there.

I did learn a "valuable" lesson though. Never pay more than $250 for anything on ebay unless you're postively sure of the seller's description.

Re: I got gypped once... Scuba Diver is missing something

*Message #10 Posted by **Scuba Diver** on 5 July 2003, 8:14 a.m.,*
in response to message #9 by Iqbal

Thanks to everyone who has been posting replies to my "rant".

I wanted to clear something up; I am going to continue to use eBay to purchase items, because to be honest, I can't be bothered going to garage sales and hunting for old calcs.

I will, however, be leary of people who don't have long-term accounts and high feedback rates. This guy's account is less than a month old and has 3 positives; I doubt that some negative feedback will stop him. He'll just close up shop and open a new account...

I'm going to see if he's willing to refund part of the money, otherwise I'll probably just list it on eBay (honestly, of course) and see what I get...

Unless, of course, someone wants a mint 28S...if you're a collector, it doesn't get any better than this! :)

B.

Re: Limitations of Negative Feedback

*Message #11 Posted by **Paul Brogger** on 7 July 2003, 5:24 p.m.,*

in response to message #8 by Norm

From the perspective of someone who sets up a SINGLE eBay account for all his dealings, and who wants to build, over the long term, a reputation as a trustworthy buyer and/or seller, eBay feedback is a powerful tool and incentive.

It sounds, however, as if this seller's account is relatively new. I'm not sure, but I imagine that someone with a number of scams to pull will simply create a new account as soon as the negative feedback starts accumulating.

I don't know what eBay's policies are with regard to multiple accounts to the same person, and/or whether there's a way to abandon an account with a bad reputation and start anew. (But I suspect there is.)

I've seen that an item listed by an established seller with a good reputation can command a significant premium over a similar item offered by a new seller. Bargains are available from the newbies, but **Communicate**^{3} before sending money!

False descriptions are VERY common now

*Message #12 Posted by **Mike** on 5 July 2003, 7:07 p.m.,*
in response to message #1 by Scuba Diver

I'm finding more and more auctions that have calculators that are nothing like the description. Be careful...

There is even one seller, that sells lots of HP calculators that offers a DOA guarantee and sells non-working or partially working calculators and refuses to honor the DOA "because it's not 100% dead."

Here are some **calculator buying tips**.

Never buy a calculator without asking questions. Some givens.

- MINT calculators are almost never MINT
- Any calculator that has a card reader, will have a defective reader, unless the seller says it has been tested.
- Any HP computer that has a tape drive, will be defective, unless the seller says it has been tested
- Phrases like "Worked last time it was used" is code for "probably doesn't work now"
- DOA guarantee that does not cover all forms of non-working calculators, is WORTHLESS

You can find great stuff on eBay but you MUST ASK QUESTIONS.

Don't accept short vague answers. Ask for detailed specifics. Vague terms like "works" does not mean it is 100% functional to most sellers. A classic example on almost every HP-85 sold is the claim that it "works" But most sellers mean "something shows up on the CRT." But 99.99% of these will have defective tape drives and about 50% have printers that are about to die. Both the tape drive capstan and printer belts are prone to disolving. I have yet to find a 100% working HP-85, that hadn't already been repaired and advertized as such.

They all have bad tape drives. eBay is getting really bad. Too many wholesale sellers trying to get collector prices on calculators that aren't even working.

Edited: 5 July 2003, 7:18 p.m.

HP-85 capstan "repairs"

*Message #13 Posted by **Vassilis Prevelakis** on 5 July 2003, 9:27 p.m.,*

in response to message #12 by Mike

```
Mike wrote on 5 July 2003:
> [HP-85s] have bad tape drives. eBay is getting really bad. Too many wholesale sellers
> trying to get collector prices on calculators that aren't even working.
```

And some of the "fixed" ones are ready to fall apart again.

You can test such "repairs" by doing a

```
CTAPE
```

Which does a wind to EOT and then a rewind to BOT, to retension the tape. Most "repaired" rollers will fall apart. Doing a

```
CAT
```

on a tape is not sufficient.

**vp

Mine don't (AFAIK) - Good Tip

*Message #14 Posted by **Mike** on 5 July 2003, 10:38 p.m.,*
in response to message #13 by Vassilis Prevelakis

I haven't ever seen any problems with my tape capstan repairs. At least, no one has ever told me about any problems.

Because of your tip, I just checked my latest repair and I performed **5 CTAPE operations,** in rapid succession and there is no weakening of the bond. Still works great. **Great tip.**

I did have one band come off one time but that was on one of my earlier repairs but that was after about 4 hours of continuous tape copying. I think I put that unit through about a tough a test as one could do. After I reattached the band, it worked great. I suspect I didn't let the bonding agent cure well enough.

The secret is to use the proper material and a good bonding agent. I use a precisely cut band and a very good bonding agent. The bond is very strong. I don't like using o-rings, surgical tubing or heat shrink tubing, for this repair.

Here is a photo of the capstan material I use.

Re: My First e.Bay "burn"

*Message #15 Posted by **Garry** on 5 July 2003, 10:13 p.m.,*
in response to message #1 by Scuba Diver

Sorry about your "bad" Ebay eperience. I've gotten a new "burn" of my own from someone selling eproms off the HP WANT ADS. I think all of us that read the HP FORUM should publish a bad seller's id name, and not buy from these individuals. I also think if a person gets burned buying something off the HP WANT ADS, they should be able to post that person's name, and the person selling not be allowed to use the site to sell.

I don't sell off of the HP Site but...

*Message #16 Posted by **Mike** on 5 July 2003, 10:50 p.m.,*

in response to message #15 by Garry

There is another side to the coin. I don't sell of of the HP Museum site. I try to limit my use of the wantads for "trades." However, I once DID get burnt buying something from the HP wantads **but one can get burnt anywhere.**

The problem with posting names is that I have also had people try to scam me. Someone once bought something from me and said it didn't work. I told them to return the item, for repair, and I discovered that the buyer took out a part that they needed. It was obvious. He tried to get a refund rather than a repair. That was also a giveaway.

I have a real simple process to protect against this now. I take high resolution images of one or two of the screws that hold the cases together. Anyone tampering with them, surely woudln't be able to get everything back as it was. The photos take only a couple of seconds to take.

Bottomline is that one can get burnt as a buyer or a seller. It would be completely unfair to post the seller's name and allow buyers to scam and hold sellers hostage. With vintage electronics, you can't have "buy and try" which is what some buyers like to try and get away with.

The ONLY real solution is to ask questions and ask for photos.

Re: I don't sell off of the HP Site but...

*Message #17 Posted by **Garry** on 6 July 2003, 1:01 p.m.,*
in response to message #16 by Mike

I didn't post anyone's name on my previous post but my own. I apologize for any bad feelings I've generated in this community with my previous post. My intent was to see if others had similar experiences.

Printer Paper

*Message #1 Posted by **Howard** on 4 July 2003, 7:44 a.m.*

From what I've seen HP calculator printer paper (82143a and the 8224a and I suspect the hp 97 series) is very scarse and expensive.

Can I let you into a little secret which works here in Australia and it might work in your neck of the woods.

In Australia they have a huge number of EFTPOS (Electric Funds Transfer at Point Of Sale) terminals - they are everywhere. They even have them in taxis. These machines give a receipt which is generated by a printer which uses the heat sensitive paper that these printers use. I just ask the shopkeeper if they have any spare rolls. They give them to you as the bank gives them to them. Just tonight the cabdriver gave me two rolls of this paper. From what I have seen on ebay he gave over $US20 worth of paper for zilch, zero, nothing.

I don't know if these EFTPOS machines are as numerous in your country as they are in Australia but if they are they are a great free source of heat sensitive paper.

Re: Printer Paper

*Message #2 Posted by **Richard Garner** on 4 July 2003, 12:12 p.m.,*
in response to message #1 by Howard

I have found that just plain thermal adding machine paper of the same size works just fine in my 82162A and 82240B printers. You can get it at any office supply store for about $3 to $5 for a pack of 6 to 8 rolls.

Re: Printer Paper

*Message #3 Posted by **Ellis Easley** on 9 July 2003, 7:23 p.m.,*
in response to message #2 by Richard Garner

Still, Howard's post gives us another great reason to visit Australia!

Replacement for the 32s

*Message #1 Posted by **Matthew Jones** on 4 July 2003, 3:39 a.m.*

Hi folks; I'm an Australian currently doing my honours year research project in organic chemistry. Last year, after my final exams I left my 32s calculator in the bar at our campus and never saw it again. This year I've been using my dads old HP 35 in exams, but I really wish I still had my 32s. I spoke to a boffin in HPs development department a few months ago, and he assured me HP were working on a replacement for the 32s. Several of the calculator specialist shops here in my home town (Melbourne) tell me that this replacement model will be in their store late August, but noone knows much about it. This is what I've heard: named the 33s it will be a real calculator and not a childs toy, ie, it will have RPN entry logic and will offer features very similar to the 32s; but this is all heresay. Does anyone know more? The HP website makes no mention of an RPN replacement for the 32s. Cheers Matthew Jones.

Re: Replacement for the 32s

*Message #2 Posted by **Tom (UK)** on 4 July 2003, 3:50 a.m.,*
in response to message #1 by Matthew Jones

We would all like HP to make a quality (hardware + software + manual) replacement RPN scientific it but I'll believe it when I see it.

HP's recent offerings have been a bit disappointing in different ways (HP6/9/12p/30/49?), but is it too much to expect new calculators that were as good as the oldies?

According to HP marketing the HP30 could be described as a 32s 'replacement' so I wouldn't put too much weight on marketing speak or trade talk until you see and feel the product.

Anyone out there doing beta testing - or will this be done by the customers!

32S nicer than 32Sii

*Message #3 Posted by **Norm** on 4 July 2003, 4:15 a.m.,*
in response to message #2 by Tom (UK)

Although many will disagree, I think the 32S is a nicer calculator than 32Sii. It has a cleaner and simpler layout, with a single shift button. The 32Sii looks cluttered.

So Mr. Jones, if U lost your 32S, think twice before you replace it with 32Sii, or yet another that they release later. HP has been taken over by mafia thugs and does not build what we want anymore. They are unlikely to start selling what U want. Their most recent offering, the HP-12CP (financial calculator for mafia thugs to add up their take) is designed so pathetic that they were too dumb to use reasonable color combinations, such as to choose ink that can be viewed under ordinary lighting conditions against a shiny aluminum back panel.

Based on everything you just said, my recommendation is that U get a used 32S off of eBay, and put it to work.

HP42S beeps all the time

*Message #1 Posted by **John Robinson** on 4 July 2003, 2:53 a.m.*

My 42S beeps at me instead of turning on when I press the ON key. Is this just batteries ?, or does it need a reset, if so how ??. Any help appreciated - Thanks, John

Re: HP42S beeps all the time

*Message #2 Posted by **Thomas** on 4 July 2003, 2:58 a.m.,*
in response to message #1 by John Robinson

Hello John,

please search in the messages. I could remember this problem was discused a little time ago. If I remember right it was a low batterie problem.

Regards Thomas

Chances are...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2003, 6:06 a.m.,*
in response to message #2 by Thomas

... you have a program that runs everytime you switch it on.

Both the HP42 and the HP41 have this option: set flag 11 (SF 11) and when you turn the calculator ON, the current program automatically runs. If the program is something like this:

```
LBL 00
SF 11
STOP
GTO 00
```

then everytime you switch your calculator ON, flag 11 is set and the program stops. The fact is that when you switch it back OFF and later ON, the program runs automatically (flag 11 is set), executes GTO 00, sets flag 11 again and stops.

When the calculator is switched ON and flag 11 is set, the beeper produces a standard tone to remind ist state. Then flag 11 is cleared and the current program automatically starts running.

After you switch your calculator ON again, press these keys: (obs: [SHIFT] is the golden key)

```
[SHIFT][PRGM]
```

If you see:

```
[04 GTO 00    ]
```

then you actualy found the reason. To get rid of it:

```
[HHIFT][PRGM]
[SHIFT][CLEAR][CLP][ALPHA][ALPHA]
[SHIFT][FLAGS][CF] 11
```

Let us know if it changed something.

Best regards.

Luiz (Brazil)

Edited: 4 July 2003, 6:11 a.m.

Re: Chances are...

*Message #4 Posted by **Ernie Malaga** on 4 July 2003, 7:31 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz:

A much more "amusing" program is as follows:

```
SF 11
OFF
```

Now turn on flag 11 and power off the calculator. When you turn it back on, it will just turn itself off. I don't think there's a way out of this nincompoop joke except by master-clearing the calculator.

-Ernie

Re: Chances are...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2003, 8:36 a.m.,*
in response to message #4 by Ernie Malaga

Hi, Ernie;

You bet; this is the smallest one, as far as I know. In the HP41, if you have a fast finger, you can beat it. In the HP42, about 15 times faster in some circumstances (TONE uses about the same time), I'm not sure if it can be done...

Best regards.

Luiz (Brazil)

Edited: 4 July 2003, 8:37 a.m.

Re: Chances are...

*Message #6 Posted by **Thibaut.be** on 4 July 2003, 8:39 a.m.,*
in response to message #4 by Ernie Malaga

Yes, you can beat it : turn it on and off and on quickly enough so that the "boot" program does not have to start.

This is far more difficult with a 42S as this calc is faster.

Re: HP42S beeps all the time

*Message #7 Posted by **Erik Ehrling (Sweden)** on 4 July 2003, 6:35 a.m.,*
in response to message #1 by John Robinson

I experienced exactly the same behaviour when I was upgrading one of my HP-42S to 32K. The reason which I found out was that one of the legs of the RAM chip did not have contact with the PCB (even if it appeared to have so), therefore if you have tried everything else, one last option could be to open it and check the solderings...

Best regards, Erik Ehrling (Sweden)

This I was not aware about...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2003, 8:43 a.m.,*
in response to message #7 by Erik Ehrling (Sweden)

Hello, Erik;

man, thank you for the information. I was not aware about this fact!

If the calculator becomes acting like this for no cause, of course there is no way to "emerge" a program inside it. I even thought about asking John to force a "memory clear" procedure, but I was affraid to cause important data loss inadvertently. In this case, causing a "memory clear" and confirming the calculator is still beeping will lead to no other cause but the one you mention.

Thank you again.

Luiz (Brazil)

HP-30S

*Message #1 Posted by **Thomas Cox** on 3 July 2003, 6:47 p.m.*

Not all is bad about this calculator. It has a good display.

Re: HP-30S

*Message #2 Posted by **Ralf Fritzsch** on 4 July 2003, 12:37 a.m.,*
in response to message #1 by Thomas Cox

I can't acknowledge this in full. I have two of them, which in consequence of having other RPN and RPL HP calculators I use very rarely (One is used once a week to calculate gasoline consumption of my car, the other only very seldom). After three years of marginal use, the display is heavily scratched from the protective cover, since the "ears" of this cover every time rub against the screen. BTW, any TI protective cover hasn't such "ears" and so doesn't scratch the screen.

Ralf.

82120A Battery Pack

*Message #1 Posted by **41Jeff** on 3 July 2003, 1:12 p.m.*

Can someone tell me what nominal charge current the 82120A battery pack supplies to the cells? What type of regulator does the pack use?

Re: 82120A Battery Pack

*Message #2 Posted by **Ellis Easley** on 3 July 2003, 1:59 p.m.,*
in response to message #1 by 41Jeff

There is more than one version, but mine has a 78L12 three terminal regulator (HP P/N 1826-0275) and then an isolation diode and a 365 ohm resistor in series with the battery, so the charging current is about (12-0.7-4.8) volts divided by 365 ohms equals 17.8 mA. There is a 6.2V (or maybe 6.8V) zener diode in parallel with the battery, this is thought to be a failsafe to protect the calculator when the battery leaks and becomes open circuit.

Re: 82120A Battery Pack

*Message #3 Posted by **41Jeff** on 3 July 2003, 2:08 p.m.,*
in response to message #2 by Ellis Easley

Ellis thanks for the info, but if the charger supplies a 17.8 ma current to the batteries and given that the original 1/2 N cells are rated approx. 80 maH, how can you charge them for 12 to 14 hours? Wouldn't the correct charge time be about 5.5 to 6 hours?

Re: 82120A Battery Pack

*Message #4 Posted by **David Smith** on 3 July 2003, 2:44 p.m.,*
in response to message #3 by 41Jeff

Even though the cells are rated at 80mah, they have enough mass so that a 15-20maH charge rate does not cause them to heat up when they reach full charge. It is the heating that causes the most damage to a cell when it is overcharged.

Re: 82120A Battery Pack

*Message #5 Posted by **Ellis Easley** on 3 July 2003, 3:21 p.m.,*
in response to message #3 by 41Jeff

It seems that NiCads are supposed to receive 1.5 times the capacity during recharging, so 80*1.5=120, 120/17.8=6.74 hours. I have no documentation for my battery pack so I don't know what the recommended charging time is (*). Generally, all NiCads can be charged at a current equal to 1/10 of the Amp-hour capacity for 15 hours, and quick-charge capable cells can be charged at 3/10 of capacity for 5 hours, to achieve a full charge. In principle (according to my 1988 Sanyo NiCad databook), quick charge-able cells (everything Sanyo made at that time) could be left charging at 3/10 of capacity indefinitely with no damage. They get warm after charging is complete because of a chemical reaction

that prevents buildup of gas, and this temperature rise can be detected to signal that charging is complete, but leaving the current on is not supposed to be harmful - and I think this is what HP communicates in the Woodstock and Spice manuals, which specify 4-6 hours for full charge but say the calculators can be left charging indefinitely without harm.

I have tried NiCad "N" cells in the standard HP41C battery holder. According to some data in the 2000 DigiKey catalog for Panasonic NiCads, the recommended quick charge rate for their 150 mA-h "N" cells is 38 mA, instead of 45 mA which would be 3/10 capacity, for 6 hours instead of 5, which comes out to 228 mA-h which is close enough to 45*5=225. This suggests that smaller cells shouldn't be charged in 5 hours at 3/10 capacity, now that they think about it. "N" cells are the smallest ones in that catalog, I don't know how much more Panasonic might derate the quick charge current for 80 mA-h cells. 17.8 mA is 0.2225, or 2.225/10 of 80 mA-h. 38 mA is 2.533/10 of 150 mA-h.

They say what ultimately kills NiCads is reverse charging that happens to the weakest cells during "deep discharge". The weakest cell stops pulling its weight (pushing electrons) and the current from the other cells flows through it in the opposite direction from charging current. This is why it is important to turn off NiCad powered equipment as soon as the battery indicator comes on - the system has detected a sudden drop in voltage of about 1 volt from the battery pack, which means the weakest cell has lost its charge and is going into reverse charge. Aggravating this situation (as I have just learned through making measurements on my HP34C) is that the voltage regulation in the DC-DC converter causes the battery current drain to rise as the battery voltage falls, so just as the weakest cell gives up, the (now reverse charging) current jumps up. The reverse charging current causes little needles of metal to be deposited is such a way that they short circuit the cell. Next time you connect the recharger, the shorted cell results in too high charging current for the remaining cells, since HP didn't use constant current charging circuits and depended on some small resistances (~6 or 7 ohms from the transformer winding plus an 8.2 ohm resistor in the case of Woodstock and Spice) and the normal operating voltage of the NiCads to establish the charging current. With the regular charging current being 3/10 capacity, the new excess charging current is more than the cells can withstand without overheating, producing too much gas, and venting the corrosive electrolyte through the pressure relief valve.

(*)I should mention that I got my rechargable pack in corroded form and have never used it! The cells are no good but the electronics cleaned up. I got a set of 110 mA-h (1/3 AA?) cells, which will require trimming the plastic case to fit, and I haven't done it yet. I also have a set of unmarked cells, very close in size to the actual cells, which a local battery store found for me, but I haven't installed those either - I'm waiting till I perfect my own spot-welding technique!

General Voyager display question

*Message #1 Posted by **jimc** on 3 July 2003, 10:01 a.m.*

While running a self test, my 10C showed some annunciators not listed in the manual.

They are: USER g BEGIN D.MY C

I know what the USER, g, and the D.MY are, but what are the others? While I am certain these are in the 11/12/15/16 series, it leads me to wonder why they are displayed as active, if the function is not in the calculator.

Re: General Voyager display question

*Message #2 Posted by **Valentin Albillo** on 3 July 2003, 10:05 a.m.,*
in response to message #1 by jimc

The display hardware is the same for all vintage Voyager models, so probably the software part of the ROM which does the display test is the same as well for all of them.

BEGIN is used in the HP-12C (begin/end), and C is used in the HP-15C (complex mode) and HP-16C (carry) IIRC.

Best regards.

Re: General Voyager display question

*Message #3 Posted by **Thibaut.be** on 3 July 2003, 10:19 a.m.,*
in response to message #2 by Valentin Albillo

Well, your 10C is totally screwed up.

I would agree to buy it as salvage ofr USD 50. Ok for you ?

Thibaut, my friend, don't be greedy! :D

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 12:20 p.m.,*
in response to message #3 by Thibaut.be

Offer a little more or he will salle it to someone else!

You're a bad guy!

About the annunciators: to add a few more information to the one Valentin correctly posted. As a man of Voyagers, he nows it well, I'm just reinforcing.

The "C" annunciator is used bu the HP12C as well, to indicate that odd periods will be considered in compound interest calculations. [STO][EEX] in an HP12C toggles its state from ON (visible) to OFF.

In the HP16C, "C" indicates a carry or borrow condition when arithmetic with binaries is accomplished or any bit manipulation shifts/rotates a "1" bit through (or into) the carry bit.

Valentin's answer is complete, I just want to participate on it :^) (I'm a nosy guy, shame on me...)

Best regards.

Luiz (Brazil)

As Wlodek says in his wonderful "A Guide to HP Handheld Calculators and Computers", "It is remarkably difficult to find". If they were that difficult to find in 1996, just imagine how hard it can be now: dogs chew on them, toddlers throw them against the nearest floor or wall, ex-girlfriends never return them, eBay astronomic prices, etc.

Yet, I own two and Patrick owns three ... so it can be done, it's just a matter of time and a quick sleigh-of-hand when you happen to find one over someone else's table, unattended , kinda that old Woody Allen's movie, "Take the HP-10C and run" ... :-)

Best regards from V.

How rare is it really?

*Message #7 Posted by **Patrick** on 4 July 2003, 1:33 p.m.,*
in response to message #6 by Valentin Albillo

Actually, I don't think the HP-10C is as unattainable as we are all giving it out to be. If you look at eBay activity just over the last couple of months you would have seen maybe 6-8 sold. The mint/nib ones sold very high -- $300+ -- but there were at least two of the others under $200 -- about $150 for one without manual and $173 for one with a manual.

These prices are in the same ballpark as a decent 11C, so if someone **really** wanted a 10C, they surely are attainable -- relatively speaking. For me, and perhaps for others, I sometimes

find it hard to bid on a 10C -- especially a mint one -- when that would take serious money away from what I could bid on a nice 15C! While rare, I like to actually *use* my acquisitions, and the 10C is limited enough to be a little on the frustrating side whenever you have the need to write a program.

And, just to correct the record a wee bit -- Valentin must have confused my thinking about bidding on a 10C with actually having won it. You see, I still have only(!) two 10C's. One was an extremely fortunate Buy-It-Now at $20. The second was a normal eBay auction which I went after primarily to get a copy of the manual. Unless I see another Buy-It-Now, or get lucky at a thrift store, I'm likely to stay with my current holding!

in response to message #7 by Patrick

In response to Patrick's posting, I can't say that it is a calculator that is ALL that rare. What tickled me was the price (and the thrill of the "kill"), but I am seeing the limitations that Patrick has described. Nonetheless, as I stated in my earlier post, I will use this little fellow daily as a replacement for my number crunching when my 41 just isn't convenient. I think I would have preferred a 15, but users can't be choosers...

I tend to look at this not as a shirtpocket 41, but rather like my old 21 Pumpkin. Fairly basic, but excellent for quick and dirty's. Just a little handier in the daylight. That it is slightly rare makes it all the sweeter to use.

(BTW, I found the answer to the original posting in the manual hidden in subtext at the bottom of the page. I guess a fella just has to RTFM). Again, thanks to all for help.

Hi, JimC;

May I?

> Quote:
>
> I tend to look at this not as a shirtpocket 41, but rather like my old 21 Pumpkin. Fairly basic, but excellent for quick and dirty's.

I know you are not comparing, just relating one to another. Your post just called my attention to the fact that I'd compare the HP10C to a sophisticated HP25C or a low-resourced HP33C with LCD display, because the HP10C is programmable and the HP21 is not.

Sophisticated HP25C because the HP10C adds few enhancements you may use or not: memory check, mantissa, dot/comma selection for radix mark, self test, amongst others. I mentioned a low-resourced HP33C because the HP10C does not have subroutine calls, neither available in the HP25C.

And the HP10C available RAM is composed of shared 70 steps/ten registers memory plus nine permanently available program steps (bytes), which is physically less than

what the HP25C has, but if you manage to take advantage over the "automatic movable partition", you can do things with the HP10C you cannot do with an HP25C or 33C: store nine or ten different numbers in memory registers, create programs with more than 49 steps and some unique combinations.

I must confess I'm almost getting to a point that any additional calculator to the ones I have will be greedy possession. Not that I have all models available, instead I own the ones I consider the most significant tools for the job, and oppositely to Norm, I prefer LCD to LED's.

I repeat, I'm no calculator's collector, I rather collect data. I wrote all of this about the HP10C by heart. I do not own one of them and I would not like to, actually, because I'd not use it. I cannot think of having an extraordinary original HP calculator (not a Kimpo-clone) in my possession and not allow it to do what it does better: serve as a top-tech, sophisticated state-of-the-art personal computing device.

I must thank to some contributors, guys I have in great consideration. They helped me a lot in adding some important units to the ones I own. I'm currently taking some spare time (when I have some) to read the HP71B documentation; not that I intend developing sophisticated BASIC programs, but I intend to understand and use it as deep as I can so I'll be able to help HP71B owners if there is no expert available when questions about it start new threads. And I'm waiting for an HP75 to be delivered so I can do the same with it.

I would not feel O.K. with myself if I could only look at these calculators trough glass "shields". I have absolutely nothing against those who keep them this way; I myself would not be able to.

Wow! I wrote too much (whatelse is new...) and I explored subjects ahead of the original thread. If you think this post must be removed, I'll use 12345 for password. (but I'll keep a copy of it in my HD).

Best regards.

Luiz (Brazil)

P.S. - Valentin, have you already written "Long Live the HP10C!"? I think "she" is the one "who" deserves better.

Get an HP-71 Math ROM. Without it, you don't have a whole HP-71B, just 2/3 of it. The Math ROM was to be included internally, but someone decided that it

needed a CALC feature, which gobbled large amounts of ROM, so the matrix functions and complex numbers capabilities had to go. Still, they couldn't remove it completely without rewriting large portions of ROM code, so there are plenty of hooks and remains still left. For instance, try to enter this line:

10 A=(2,3)+(4,5)

and you'll see no syntax error appears, because although the 71B per se can't add those two complex numbers nor assign the result to a real variable, it still recognizes them and enters the line into program memory. Attempt to execute that line will give an "XFN not found" error if the Math ROM isn't present. The Math ROM offers so many advanced capabilites which can be used in so many powerful ways, out of the realm of their nominal use, that no HP-71B is worth its salt without it.

"P.S. - Valentin, have you already written "Long Live the HP10C!"? I think "she" is the one "who" deserves better."

Sort of ... but I can't give any further details without spoiling it all ... :-)

Intergation algorithm

*Message #1 Posted by **rick cameron** on 2 July 2003, 11:54 p.m.*

Hi, all

Several years ago I managed to get a copy of an article that described the algorithm used by HP calculators to do numerical integration. I seem to have lost the article.

Does anyone have an explanation of the algorithm?

Thanks

- rick

Re: Intergation algorithm

*Message #2 Posted by **Patrick** on 3 July 2003, 1:09 a.m.,*
in response to message #1 by rick cameron

The article of which you speak is very likely this one written by William H. Kahan, the numerical analyst who consulted with HP on many of their calculator algorithms.

Re: Integration algorithm

in response to message #2 by Patrick

Thank-you - that's the one!

Re: Integration algorithm

*Message #4 Posted by **Patrick** on 3 July 2003, 4:42 a.m.,*
in response to message #3 by rick cameron

As a calculator fan(atic) and ex-mathematician, I would be interested to know what you had in mind for the algorithm? Do you plan on re-implementing it somewhere, or is it just curiousity?

Personally, I would like to get a flowchart or pseudocode for the solve algorithm. I've read Kahan's article on the matter (you can find it in the same place as the integration article) but there is still lots of holes to be filled in.

Re: Integration algorithm

*Message #5 Posted by **hugh** on 3 July 2003, 2:20 p.m.,*
in response to message #4 by Patrick

hi there,

recently ive been reviewing a bunch of quadrature algorithms. tooling up for version3 of my palm calculator. my search is along the lines of; what is the best numerical quadrature algorithm given a pocket device with a bit more poke than a normal calculator (poke=50-500Mhz).

candidates: simpsons rule, newton-cotes etc., romberg (open and closed), gauss and spectral techniques like clenshaw-curtis and other FFT accelerated forms.

BTW, does anyone have any code or doc for gauss-kronrod? i know what it is but i dont have enough details to write it (gauss-kronrod is adaptive gauss apparently now used by casio).

my test suite (so far)is: sqrt(x), cos(log(x)), exp(-x)/x, sqrt(fabs(x-1)), exp(-x*x), cos(1/x), sin (x)/x.

the most promising so far is a modified romberg in the way suggested by kahan. i've come up with something that i think might well be very similar to the method used on the 15c. ok, you wont get the same answers, but algorithmically.

as a taunt i implemented it on the 9g, like this:

INPUT A,B,E H=2;D=0;M=0;J=1;B=B-A FOR (K=0;K<9;++K) { L=D;F=H/2-1;C=0 FOR (I=0;I<J;++I) { D=1-FF;X=((F+DF/2)*B+B)/2+A GOSUB PROG 9;C=C+DY;F=F+H;} F=4;D=M;M=(M+HC)/2 FOR (I=0;I<=K;++I) { C=N[I];N[I]=(F*M[I]-D)/(F-1);D=C;F=4F } D=M[I] IF (ABS(D-L) < 16E*ABS(D)) THEN { GOTO 1; } J=2J;H=H/2 } Lbl 1: S=3DB/4;PRINT S END

if you find this too worrying you can read it clearer here, http://www.voidware.com/rombint.htm

Re: Integration algorithm

*Message #7 Posted by **hugh** on 3 July 2003, 2:51 p.m.,*
in response to message #6 by David Smith

i did some work on the basic gauss-legendre so that the method calculated the weights and sample points as it went along. thus avoiding storage.

the idea was to see if this would work on real calculators. the trouble was that you have to loop over `n' samples for each coefficient, so you got n^2/2 performance. it flew on a pc, but as you can imagine, after only small n, poor old calculator was too slow.

Re: Intergation algorithm

*Message #8 Posted by **Ralf Fritzsch** on 3 July 2003, 1:09 a.m.,*
in response to message #1 by rick cameron

Googling with the title of the article, "Handheld Calculator Evaluates Integrals", reveals a link at one of the original author's Pages (http://www.cs.berkeley.edu/~wkahan/Math128/), namely

http://www.cs.berkeley.edu/~wkahan/Math128/INTGTkey.pdf

Hope that helps, Ralf.

41CV Card Reader Repair Problem

*Message #1 Posted by **John Smith** on 2 July 2003, 8:43 p.m.*

I recently tried to clean the gummy wheel. Old gummy rubber sleeve has been replaced by fuel line tubing. Appeared to be same OD and ID. Tube was carefully placed on the spindle with a small drop of superglue on the spindle. There was no excess glue leftover. Allowed ample time to dry. After reassemble to the system, now I'm getting the MALFUNCTION message. It pulls the card beautifully. Initially I used to get "weak battery" complain, now I don't see that complain any more. But when I take the card reader out of the calculator, I don't get that "weak battery" message at all. Few times that I saw when the card reader was attached to the calculator. Is it possible that batteries are NOT strong enough to drive the card reader, but still OK just for the calculator alone? If so, should it cause card reader to display MALFUNCTION? Or, is the card reader completely toast?

Before I discard that or auctioning out as out-of-order product, I need your help. Is there any hope left for me to further repair this unit?

Perhaps, you can provide me step by step diagnostic procedure, or maybe outline the steps for the process of elimination.

Please rescue me at your earliest convenience. Thanks.

Edited: 2 July 2003, 8:46 p.m.

Re: 41CV Card Reader Repair Problem

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 July 2003, 9:58 p.m.,*
in response to message #1 by John Smith

Hi, John;

first of all, DON'T throw it away! AFAIC, MALFUNCTION is caused by many reasons, but this is a card-reader exclusive message.

> Quote:
>
> Is it possible that batteries are NOT strong enough to drive the card reader, but still OK just for the calculator alone? If so, should it cause card reader to display MALFUNCTION?

If you have the card reader owner's handbook, have a look at page 51 and you'll see it's possible to happen. But if you simply insert the card reader and switch calcaultor to ON and you see BATT (low battery) indicator lit, than there is something wrong.

If it is actualy toasted, it is more likely to freeze calculator's operation (not even turnning it to off is possible) or not allowing it to turn ON. I had one that is probably turnning around the globe and it used to disrupt calculator operation. After plugging it in and switching calculator to ON, it was necessary to remove batteries because it was not even able to be turned OFF again.

Possible problems are scratched or magnetized head, open coils inside the head (this is impossible to repair) or bad contact somewhere (small daugtherboard, head wires). Also, check if wires are in correct order (I once did it and thought I lost my working unit...). Mechanical problems are more likely to force motor and produce strange noises; as your card passes fine, it is not an issue. Oh, yes; there are two small "flat springs", like metal strips (cooper?), one that alignes the card and another presses it to the head while it is pulled. You should check if they are correctly settled.

If you need more advice, let us know.

Success.

Luiz - (Brazil)

Very elegant causes

*Message #3 Posted by **Mike** on 2 July 2003, 10:27 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

No offense but these are very elegent causes. It still amazes me that people always look for the more exotic causes before looking for the more simple causes. It's a Engineer thing, I guess.

I have a degree in Engineering and also have worked as a technician. I find this same phenomena with some of my Engineer coworkers when they try to troubleshoot electronics. They come up with the most exotic possible problems before looking for the simple ones. I always say, "look for a simple cause before lookig for a comlex cause."

In all the readers that I have ever repaired, I have never found any of these possible causes, to be the cause of any reader problem that I've tried to fix. Doesn't mean it's not possible but I've not seen them and I've repaired over 100 readers. The most likely causes of dirty head or bad cap or misadjusted eccentric isn't even mentioned.

My suggestion:

If there is no reason to believe the reader was bad and all that was done was to replace the drive rubber, then the most likely cause of problems are related to something you did. Possible causes 1) dirty head, 2) misadjusted eccentric or 3) contact problem.

If the reader was already bad, regardless of the drive wheel, then look for other problems. Bad capacitors can cause problems. I doubt very seriously that the head wires are in the wrong place, unless the person doing the repair remembers pulling them out.

Malfunction simply means the reader thinks the hardware is broken. Could be just about anything but start with the simple causes. I have removed these problems with as simple a step as adjusting the card tension.

Re: Very elegant causes

*Message #4 Posted by **David Smith** on 3 July 2003, 10:29 a.m.,*
in response to message #3 by Mike

A dirty head or bad head wiring almost always causes the "CARD ERR" message and not MALFUNCTION. I would check the card sense leaf springs, the internal sense LED, and the reader to calculator contacts. Also make sure the motor is installed properly and is engaging the drive gear properly. Also the worm gear tip should be in its little hole.

Re: Very elegant causes

*Message #5 Posted by **Gordon Dyer** on 3 July 2003, 4:56 p.m.,*
in response to message #3 by Mike

My card reader gave the CARD ERR message and it turned out to be an open circuit coil in the magnetic head.
Luiz helped me get a spare head from another reader which fixed it.
Is this very unusual? (I mean the fault, not Luiz help!!)

Re: Very elegant causes

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 6:37 p.m.,*
in response to message #3 by Mike

Hi, Mike; thank you for your comments.

> Quote:
>
> No offense but these are very elegant causes.

I'm not offended. (is the term "elegant" offensive somehow?)

> Quote:
>
> It still amazes me that people always look for the more exotic causes before looking for the more simple causes. It's a Engineer thing, I guess.

I'm an electrical engineer, and I'm not offended at all.

> Quote:
>
> In all the readers that I have ever repaired, I have never found any of these possible causes, to be the cause of any reader problem that I've tried to fix. Doesn't mean it's not possible but I've not seen them and I've repaired over 100 readers.

I've repaired three myself and helped others to repair I-don't-know-how-many; you're experienced, that's good.

> Quote:
>
> The most likely causes of dirty head (...)

I assume, maybe wrongly, that if someone has already opened the reader, removed the gunk, replaced the gummy wheel for O-rings or fuel tubes and tested it, then the head has probably been cleaned. If the card causes CARD ERR message when reading, I ask him to clean the head.

> Quote:
>
> (...) or bad cap (...)

I knew that bad caps could cause problems in card readers after reading some posts in here.

> Quote:
>
> (...) or misadjusted eccentric isn't even mentioned.

As I mentioned in another post, I used to think the exocentric was not to be touched. Anyway, as we have O-rings and fuel tubes, adjusting pressure is necessary. Also, I believe measuring current drain when pulling cards is an important reference to adjust the eccentric, do you agree?

> Quote:
>
> Malfunction simply means the reader thinks the hardware is broken.

This I did not understand. I used to take [MALFUNCTION], maybe wrongly (again), as generated by the firmware when the reader as a hole was not working properly.

Thank you, Mike; thoughtful and reasoning considerations are always welcome. I did not write this post till now because I did not have the time to elaborate the text.

Best regards.

Luiz (Brazil)

Edited: 3 July 2003, 9:47 p.m.

A simpler suggestion

*Message #7 Posted by **Renato** on 2 July 2003, 11:11 p.m.,*
in response to message #1 by John Smith

I would check if the fuel line tube used is not dragging the gear by rubbing against the inner sides of the gear case. I had that problem (low battery message) when i used two o-rings , but did not glue one ring to the other. As one slipped away from the correct position, it rubbed against the case - I guess it caused too high current drain.

It is possible to test card transportation by connecting a regular AA 1.5V battery to the motor terminals. I tried this, and could check for a smooth card transport before reassembling the inner parts.

Good luck and have fun.

Renato

Re: A simpler suggestion

*Message #8 Posted by **Stefan Hauschild** on 3 July 2003, 3:00 a.m.,*
in response to message #7 by Renato

The most common error during my repairs was a high current through the motor because of wrong o-rings or fuel line. If the pressure is not correct it may transport the card but the motor drains a higher current than normal and may go with external power connected (I test my repair before reassembling with external voltage to the motor) but not with power from the internal battery. The other reasons for errors that are mentioned often (misadjustment) never occured during my repairs because I only remove the two screws from the motor and try to clean the system and to replace the wheel from the top. Maybe I was lucky and the head wasn´t too dirty.

Good luck and best regards

Stefan

Accepted average current drain??? (edited)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 6:28 a.m.,*
in response to message #8 by Stefan Hauschild

Hello, Stefan;

I thihk your approach is very interesting. Based on your figures, what's the acceptable curretn drain when the reader is pulling a card? I do not know if you have the figures in both situations, but I thought about both cases:

1- a 1.5Vcc battery directly connected to the pulling assembly (no electronics connected, just the motor) and
2- the complete set: calculator plus reader

When you measured current drain you probably did it with the complete set, right? Hve worst and best case, or average measurement? It would help (me) a lot.

(Added later:) As we a dealing with particular measurements, reading operation would be better than writing when measuring card-pulling current. If writing is considered, an extra small amount of current will be drained to record data.

Thank you.

Luiz (Brazil)

Edited: 3 July 2003, 6:44 a.m.

Re: Accepted average current drain??? (edited)

*Message #10 Posted by **Stefan Hauschild** on 3 July 2003, 10:30 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I did not make any current drain measurements. An indicator for higher current consumption for me was the "Battery Low" Indicator on an HP97. If the batteries are good and you only run out of power when pulling a card the motor draws to much current. Then I connected the motor only to a regulated power source and saw a significant increase of current consumption short before the system gets stuck. When it is stuck it takes more than 1A at 1,5V.

After disassembling/reassembling all was fine.

Perhaps when I have to refurbish my next card reader (there is one HP97 in the queue) I will make some exact measurements.

Best regards

Stefan

Re: Accepted average current drain??? (edited)

*Message #11 Posted by **Ellis Easley** on 3 July 2003, 10:46 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Luiz, please read the extract from the PPC Journal v13n9p11 that I sent along with the HP41 rechargable pack schematic. It says 170 - 250 mA is the "average" current drain with the card reader motor on, with peaks of 1000 mA. Also it has a good explanation of why alkaline batteries can't run the card reader when they still have plenty of life to run the calculator alone.

Thank you both, Stefan and Ellis...

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 12:10 p.m.,*
in response to message #11 by Ellis Easley

Hi;

I repaired at least three card readers (gummy whell problem) after getting in contact with the HP Museum folks; before that, I had no clue about how to do it. All of them got ready and working 100%, but I was not aware of the fact things could be bad if pressure was too high or not enough over the pulling cam. I saw the excentric since the first time I disabssembled one card reader in the 80's, but I thought that one was for production-line adjustments and never touched it. If I reason about it, maybe I would find the reason.

Excessive current drain or sloopy card pulling action may be directly related to this adjustment, if the pulling gum "replacement" succeed. So, measuring current drain when card is being pulled is one good reference to adjust the excentric and make sure the card is being pulled and there no excesive pressure that will stress the small gears and fastly consume battery poewer. If More than, say, 250mA is measured, then it's time to adjust the excentric or to check for something else that may be wrong.

Thanks, guys; now I'll do that every time I get an 82104A reader (if any) to repair. Very good points, indeed.

Luiz (Brazil)

Re: 41CV Card Reader Repair Problem

*Message #13 Posted by **John Robinson** on 4 July 2003, 3:06 a.m.,*
in response to message #1 by John Smith

Hi John,

I have exactly the same problem with one of my readers, but I do also have a good reader. I swapped the mechanicals (motor, slot etc.) as a whole from the good reader to the bad reader to find the bad reader still had the problem. I therefore deduced that the electronics in the bad reader was cactus.

If you discover that "MALFUNCTION" is due to another cause, I'd love to hear about it.

Cheers, John

*Message #5 Posted by **Les Bell [Sydney]** on 4 July 2003, 1:39 a.m.,*
in response to message #1 by Matthias

Matthias, the problem is that AOL has started blocking large ranges of IP addresses which they feel either are open relays used by spammers or are cable modem or consumer ADSL addresses which should be sending email via their ISP's outgoing mail servers and not directly.

If you are dclient80-218-165-228.hispeed.ch and you are running your own mail server, that's the problem. Like it or not, you are an innocent victim in the fight against spam. Reconfigure your mail server to use the hispeed.ch mail server supplied for you, and all should be well. If it is not, then you should contact both tech support at your ISP and AOL to have the situation resolved.

Best,

--- Les [http://www.lesbell.com.au]

in response to message #5 by Les Bell [Sydney]

Matthias, the problem is that AOL has started blocking large ranges of IP addresses which they feel either are open relays used by spammers or are cable modem or consumer ADSL addresses which should be sending email via their ISP's outgoing mail servers and not directly.

I started getting this about 1 year ago also from AOL when I had my mail server running on my linux server on DSL whenever I tried to email my dad. Even though I had a FQDN. Luckly he finally got rid of AOL.

What I got was "your IP is part of a dialup range of IP adresses and this server does not accept connections from these IPs". There server also directed me to some page with more info about it.

The one thing that got me was that AOL could send mail to my "dialup" server though. So I guess they can spam any server.

Chris

Re: email problem with AOL

*Message #8 Posted by **Les Bell [Sydney]** on 5 July 2003, 9:17 a.m.,*
in response to message #7 by Chris(FLA)

Just having a domain name is not enough. AOL has been constructing lists of network address ranges used for consumer-type ADSL and cable modem connections, where people "shouldn't" be sending mail directly but instead through their ISP's outbound SMTP server. If your IP address falls in one of those ranges, rightly or wrongly, AOL will not accept email from you.

Another problem arises when you're legit, on a permanenet IP address, but your ISP doesn't have any way of doing classless in-addr.arpa delegation. Your mail server contacts another and says "HELO

mail.chris.org" and the other MTA does a reverse DNS lookup and finds that you seem to be cpe-203-35-202-153.some-isp.net and not mail.chris.org. Some MTA's are configured to reject mail if the HELO string doesn't match the reverse DNS lookup result, and you're hosed again.

If you're on some kind of dial-up or consumer-grade broadband connection, then it's just safer all round to send your outgoing mail via your ISP's mail server. It doesn't cost you any more, and it's a little more reliable.

Best,

--- Les [http://www.lesbell.com.au]

hp 21s manual - Scarce commodity?

*Message #1 Posted by **Neil** on 2 July 2003, 5:54 p.m.*

There have been a few auctions on ebay lately for the hp 21s calc and I happened to win one. The calc came without the manual however, and I noticed the other recent 21s auctions didn't offer manuals either.

I get the impression that these manuals are very scarce (the museum CD set doesn't have it). Somebody even put an add in the classified ads section of this site looking for it, and I ended up asking him if he had received it, and if he had and it happened to be in pdf format, could he mail a copy to me. Unfortunately, he hadn't so far gotten any response.

So, what's with these 21s manuals? Does anybody know where or how to get one?

Re: hp 21s manual - Scarce commodity?

*Message #2 Posted by **Ron Ross** on 3 July 2003, 8:37 a.m.,*
in response to message #1 by Neil

The 21s wasn't a very popular calculator (probably due to its price compared to a 20s). It is nearly identical to an Hp20s aside from its statistics speciality and a different set of libraries installed. It programs the same. Key layout is nearly identical for the shared functions (and probably 80% of its functions are shared).

So if you really need a manual, you could probably get by with an Hp20s manual, and just discover the other features and functions. I bought mine via an educalc closeout, minus box or manual also. My wife is using at present for her last course to graduate (a stat course with no graphics allowed, how appropriate).

Re: hp 21s manual - Scarce commodity?

*Message #3 Posted by **Art Litka** on 3 July 2003, 10:15 p.m.,*
in response to message #1 by Neil

Neil,

I happen to HAVE an HP21S manual but no calculator! Since I hope to acquire one for my collection someday, I really do not want to part with it at the moment. I found the manual in a second-hand bookstore in Florida. Whenever I find an HP calc manual in a used bookstore I grab it. Most stores don't take them in, however, because of a very limited market to their way of thinking. (On the other hand, old TI manuals are more easily found in such places.)

I might be able to photocopy some of it for you but you probably want the real item for your collection. The manufacturer's number was 00021-90026-March 1989.

Re: hp 21s manual - Scarce commodity?

*Message #4 Posted by **Neil** on 4 July 2003, 11:54 a.m.,*
in response to message #3 by Art Litka

Hi Art,

Thanks for your generous offer. I have the 20s manual, and Ron Ross is right in saying that most of that manual is applicable to the 21s as well (Ron, thanks for your response) So, the only pages I am missing are the additional statistics and built-in program details. If you are prepared to photocopy just those pages and send them to me I would really appreciate it. Of course, if I come across the real manual, I will buy it for my collection anyway.

Thanks

Neil

New site with HP-42S programs...

*Message #1 Posted by **Erik Ehrling (Sweden)** on 2 July 2003, 5:16 p.m.*

Stumbled across this homepage by chance. I don't know how new it is, but it can't be very old. Although it is all in Dutch it has some interesting HP-42S programs on it

http://www.geocities.com/dreinouter/

Best regards, Erik Ehrling (Sweden)

Re: New site with HP-42S programs...

*Message #2 Posted by **Richard Jones** on 2 July 2003, 11:11 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

And it looks like it starts with a stolen picture too.

Re: New site with HP-42S programs...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 12:26 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Hi, Erik;

I saw the page, but I don't understand dutch. As he mentions Belgium, I felt curious: is it dutch also spoken by the Belgian? Or Reinut Maes is dutch, too? Just curiosity.

I'll try to e-mail him and ask for further information in English; what do you think?

Thank you for the valuable address indication.

Luiz - Brasil

58% of the Belgians have Dutch as their mothertongue 35% French 7% German

Regards, Werner

Re: New site with HP-42S programs...

*Message #5 Posted by **Thibaut.be** on 3 July 2003, 4:02 a.m.,*
in response to message #4 by Werner Huysegoms

That's right, there are 3 official languages in Belgium. Though I feel that the a 7% German speaking population is somehow overstimated, this gives a good picture.

In addition many Belgian people speak 2 or more national languages, and if you add English that is also spoken by a wide percentange of the population, it is not rare to see a belgian person feeling comfortable in 4, 5 or 6 languages.

Native languages in Belgium

*Message #6 Posted by **Karl Schneider** on 3 July 2003, 4:56 a.m.,*
in response to message #5 by Thibaut.be

Werner Huysegoms said,

"58% of the Belgians have Dutch as their mothertongue 35% French 7% German"

Thibault said,

"That's right, there are 3 official languages in Belgium. Though I feel that the a 7% German speaking population is somehow overstimated, this gives a good picture."

I could be mistaken, but I thought that the third official language was Flemish -- a Germanic-type language (as opposed to a Roman(t?)ic language like French).

Anyway, I'm a native fourth-generation American (don't be fooled by the name). When I was a USAF serviceman traveling through Begium on leave in 1989, I visited an Italian restaurant very near the German frontier (and a US WWII cemetary). I didn't speak French or Dutch, but did have a few years of German-language classes.

I walked in speaking German, figuring that the locals there would be conversant, and received a somewhat cool treatment from the young waitress. Afterward, I showed her my USAF military ID, and her friendliness improved markedly. I don't know if this treatment was due to her dealings with German tourists or whether it was rooted in, shall we say, "historical events"...

Re: Native languages in Belgium

*Message #7 Posted by **Werner Huysegoms** on 3 July 2003, 5:18 a.m.,*
in response to message #6 by Karl Schneider

Flanders, where the Flemish live, is a region. We speak Dutch, albeit with a different accent and day-to-day vocabulary than the Dutch in the Netherlands, much as the French of the Belgians is somewhat different than in France, the differences between US and UK English, the German in Germany, Swiss, Austria etc.. But the language is the same, there is but one Dutch spelling.

Cheers, Werner

This is the site...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 6:06 a.m.,*
in response to message #7 by Werner Huysegoms

Wow!

I LOVE culture! Thank you, guys; it's too bad there's an ocean and a low-to-dimes bank

account I need to surpass... If not, I'd find a way to be there (and other countries as well) sometimes.

Cheers.

Luiz (Brazil)

Re: Native languages in Belgium

*Message #9 Posted by **Thibaut.be** on 3 July 2003, 6:55 a.m.,*
in response to message #6 by Karl Schneider

After WW2 Belgium recevied some land from Germany as war compensation.

We adapted our constitution and recognized German as official language.

There are no 1st, 2nd and 3rd national languages, all are national languages.

Officially you are supposed to use a specific langhuage depending on many criterias.

As you were in this part of land Belgium received, people there usually speak German.

Re: New site with HP-42S programs...

*Message #10 Posted by **Reinout Maes** on 4 July 2003, 6:38 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Links to most 41c module rom images?

*Message #1 Posted by **Gene** on 2 July 2003, 10:14 a.m.*

I know that a couple of websites have some, but does anyone have a set of links to many/most of the HP-41 rom images on a webpage? If not, that sounds like it would be quite useful.

Examples might be a single page like this:

CCD ROM ver B - link to rom image

ZENROM ver A - link to rom image

PPC ROM - link to rom image

Finance 1D - link to rom image

etc. Anyone have such a page or feel like trying to help put one together? Would be very useful for things like the HP-41 Palm emulator that lets you use rom images, the Emu41 on the PC that lets you use them, and so on.

HP41 module rom images for EMU41

*Message #2 Posted by **Christoph Klug** on 2 July 2003, 10:25 a.m.,*
in response to message #1 by Gene

Dear Gene,

if you are looking for HP41 rom-image files for EMU41 I can help you :-)

Best wishes from Germany - Christoph

Actually, that AND potentially for your 16k modules

*Message #3 Posted by **Gene** on 2 July 2003, 10:55 a.m.,*
in response to message #2 by Christoph Klug

Since there are uses now for many of these, I thought a central page with links to where each rom image could be found would be a good thing. :-)

Re: Actually, that AND potentially for your 16k modules

*Message #4 Posted by **Matthias** on 2 July 2003, 2:11 p.m.,*
in response to message #3 by Gene

I collected some of these ROM-files as well... (CCD, Hepax, ..) very usefull....

Re: Links to most 41c module rom images?

*Message #5 Posted by **Mike (Stgt)** on 3 July 2003, 5:48 a.m.,*
in response to message #1 by Gene

I would offer copies, alas I did not start yet to ask for permision to do so from the copy right owners. So I only show this: http://ourworld.compuserve.com/homepages/nutem/romim.htm

Ciao.....Mike

Re: Links to most 41c module rom images?

*Message #6 Posted by **Emmanuel, France** on 5 July 2003, 4:32 a.m.,*
in response to message #1 by Gene

```
I have a lot of them.
I think, but may be I'm wrong, that disassembled listings
of ROM such *.LST easily get authorization and problems do not occur.
*.BIN files for JFG's Emu41 are real copies of ROM, *.41R for HP SDS II also.
I'm building a site with those files.
To be continued...
```

Re: Links to most 41c module rom images?

*Message #7 Posted by **Emmanuel, France** on 5 July 2003, 5:13 a.m.,*
in response to message #6 by Emmanuel, France

[pre]Another and smooth solution is to use Kazaa. On my site I'll put a listing of file names and you can download it easily via Kazaa. What do you think about?[pre]

Re: Links to most 41c module rom images?

*Message #8 Posted by **Gene** on 5 July 2003, 9:23 a.m.,*
in response to message #6 by Emmanuel, France

Kazaa? What's that? :-) Seriously, what's the URL for your site again?

Re: Links to most 41c module rom images?

*Message #9 Posted by **Emmanuel, France** on 5 July 2003, 1:36 p.m.,*
in response to message #8 by Gene

[pre) Please visit my site under construction: http://pageperso.aol.fr/xeq41/ About Kazaa: http://www.kazaa.com[/pre]

Re: Links to most 41c module rom images?

*Message #10 Posted by **Vassilis Prevelakis** on 5 July 2003, 3:32 p.m.,*
in response to message #9 by Emmanuel, France

Note that SPACE (ASCII character 32) is NOT allowed in URLs, despite what Microsoft says[1].

So your link:

```
http://pageperso.aol.fr/Xeq41/PANAME ROM.htm
```

will not work with browsers that follow the URL conventions.

**vp

[1] Microsoft also considers \ characters to be path separators (like /) so that DOS/Windows file paths work. However, this is also incompatible with the URL conventions and is not likely to work with other browsers.

Re: Links to most 41c module rom images?

*Message #11 Posted by **Emmanuel, France** on 5 July 2003, 5:28 p.m.,*
in response to message #10 by Vassilis Prevelakis

```
Thanks, Vassilis !
Replaced the wrong URL:
http://pageperso.aol.fr/Xeq41/Paname/PANAME.htm
In case of "space", please replace by "%20".
Yours.
```

reparation

*Message #1 Posted by **ricardo pascual** on 2 July 2003, 8:06 a.m.*

Hello out there:

I would like to know where in Spain I could have repaired a card reader 82104A of a set of HP41C, Quad memory, card reader and thermal printer, in Spain.

I lost the machine memory and I need to recharge the programs from the magnetics card, and the reader is out of service. When I introduce the card, the reader stops so the card does not go through. Then, it spells out some grease that cancells data.

I would be grateful if anyone could inform me about the steps to follow in order to have the machine repair in Spain.

You can write me to the following E-mail rpascual@berriozar.animsa.es

Thanks in avance.

Edited: 3 July 2003, 1:58 a.m. after one or more responses were posted

Re: reparation

*Message #2 Posted by **Valentin Albillo** on 2 July 2003, 8:34 a.m.,*
in response to message #1 by ricardo pascual

[English translation below]

Hola Ricardo, yo que tu probaria a enviarle un e-mail con tu problema a esta dirección de e-mail:

jonjosebaib@euskalnet.net

Este caballero tiene muy buena mano para las reparaciones de calculadoras HP, y no hace mucho reparó una de un amigo mio, que la daba ya por imposible, quedando muy satisfecho.

Por cierto, creo que has puesto mal tu direccion de e-mail de contacto, pone "pacual" y seguro que es "pascual", verdad ?

Saludos de V.

[the promised translation for those interested]

Hi, Ricardo, if I were in your shoes I'd send an e-mail describing your problem to this e-mail address:

jonjosebaib@euskalnet.net

This gentleman is really gifted in all matters concerning repairing HP calcs, and recently repaired some friend of mine's machine, who deemed it hopeless, to perfect satisfaction.

By the way, I think your contact e-mail address is posted wrong, it says "pacual" where correct is "pascual", right ?

Best regards from V.

Re: reparation agradecimiento

HP of old times - recruitment ad for marketing engineers

*Message #1 Posted by **Renato** on 2 July 2003, 1:00 a.m.*

Found this ad in the same Scientific American as the other one. The photo shows one HP engineers talking on the phone.

Quote:

A new approach to engineering

At Hewlett-Packard you can take your engineering training to market.
   There´s little point to designing and manufacturing an electronic measuring instrument unless it´s going to be useful to someone. That´s why, at Hewlett-Packard, many engineers make a career of marketing.
   All engineers at Hewlett-Packard are marketing oriented, but a defined and trained group is assigned the engineering task of helping customers. These engineers work at our headquarters, at operating divisions and in the field, helping customers select, apply and get the best use out of their instrumentation.
   With our concept that every new instrument must make a contribution to the science of measurement, our instruments and marketing engineers create new markets, and the sales engineers finds his stimulation ... and success ... in defining and exploring these markets and in helping to solve the measurement problems found there. And at Hewlett-Packard you can start as a design engineer and later move into marketing.
   If, as an engineer, this type of dynamic work interests you, we´d be interested in talking to you. At Hewlett-Packard marketing is career, and our sales success - over $200 million this year - is an ever growing challenge to our marketing engineers. Would you like to join them ?
   Write Ray Wilbur, Vice President, 1501 Page Mill Road, Palo Alto, California 94304. An equal opportunity employer.

Re: HP of old times - recruitment ad for marketing engineers

*Message #2 Posted by **Raymond Del Tondo** on 2 July 2003, 1:23 a.m.,*
in response to message #1 by Renato

Seems today all of those engineers made their marketing career, and no one was left for the desgn & development part;-)

HP of old times - ad at 60s Scientific American Magazine

*Message #1 Posted by **Renato** on 2 July 2003, 12:39 a.m.*

Found this ad at a 60s Scientific American. The photo shows HP engineers rolling a timekeeping equipment on a airplane ramp. Sorry - i have no scanner at home.. Here is how it begins:

> Quote:
>
> Somewhere...
> between 21 global timekeeping stations...
> we lost a microsecond.
>
> Last year, Hewlett-Packard engineers traveled with two "flying clocks" to 21 different timekeeping facilities in 12 nations, correlating their time standards to within tenths of millionths of a second. During this 31-day journey around the world, these portable clocks, without adjustment of any kind, kept to within one microsecond of each other and of the Hewlett-Packard frequency standard in Palo Alto, California. This is an accuracy equivalent to one second in 88,000 years, an accuracy that could guide an object from earth to the sun with a potential error of only a few inches.

HP atomic clocks

*Message #2 Posted by **Ellis Easley** on 3 July 2003, 9:32 a.m.,*
in response to message #1 by Renato

HP cesium clocks have been used to compare the standard clocks of the different nations that paticipate in generating the Coordinated Universal Time since the program started. The basic model is 5061A. I bid on a service manual for it on Ebay but lost, I just wanted to read about the insides! With "high performance beam tube" and batteries for portability, the unit cost about $40,000 in the 1986 HP catalog. It is better than the national clocks because some countries' standards organizations (including the US) think they can build a better clock (best laid plans!)

I toured the US National Bureau of Standards facility in Boulder, Colorado where the US clock is kept. They told us that the US engineers have designed a clock with a cavity twice as long as other clocks which should theoretically work better. They tune it up and put it in operation as the standard clock but after a while it proves to have poor long-term reliability so they put an older clock back in its place. Then they work on the double-length machine for a while and the process repeats. (It was in the late 1980's that I learned this - they might have worked the bugs out by now.)

As I understand it, the way they accomplish the "coordinated" part of Coordinated Universal Time is by flying a bank of 8 HP clocks to all the national sites, comparing each clock to the HP clocks, then calculating a correction for each national clock to make them all agree. It is a continuous process.

This might be old information, but however they do it now, I'll bet some HP or Agilent clocks are involved!

Re: HP atomic clocks

*Message #3 Posted by **Norm** on 4 July 2003, 4:20 a.m.,*
in response to message #2 by Ellis Easley

Carly should smash all the tooling for the HP 5061A atomic clock. And burn up the schematic diagrams. And throw out the file cabinets where the engineers worked.

That way, the only way for a country to get another HP 5061A is a used one from eBay.

Besides, nobody needs atomic clocks anymore. All U need is an HP personal computer, running Microsoft Windows XP, so that you can trade e-mail and play videogames.

The software people can write an atomic clock simulator for it, so problem solved.

Re: HP atomic clocks

*Message #4 Posted by **Patrick** on 4 July 2003, 8:37 p.m.,*
in response to message #2 by Ellis Easley

I wonder if they take Dr. Einstein's theories into account when they do the comparison?

Seriously, there very well may be some relativistic effects from flying the clocks around. Time should slow down on the plane relative to a "stationary" point on the Earth. These clocks may very well be accurate enough for that to matter.

Relativistic Effects on Atomic Clocks

*Message #5 Posted by **Valentin Albillo** on 4 July 2003, 9:05 p.m.,*
in response to message #4 by Patrick

Thanks for this fantastic link! Really interesting and clear description.

Re: Relativistic Effects on Atomic Clocks

*Message #7 Posted by **David Smith** on 9 July 2003, 4:15 p.m.,*

in response to message #6 by ted

One thing they have to do with the GPS satellite signals is compensate for the relatavistic effects of the signal falling down the gravity well onto a spinning planet. Subtle but important. As Bunky Hunt once almost said... a nanosecond ain't what it used to be.

I once worked on a seismic project that required time sync across the planet on the order of 10 milliseconds. This was almost impossible to achieve. Now with GPS, 10 nanosecond time sync can be had for a c-note and 1 nanosecond for a grand.

Re: Relativistic Effects on Atomic Clocks

*Message #8 Posted by **Dave Shaffer** on 9 July 2003, 8:00 p.m.,*
in response to message #7 by David Smith

David,

It's just the gravity part that GPS worries about (as well as time dilation due to their speed). They offset the satellite oscillator so that the received frequency is "correct." There is a big article about "Relativity and the Global Positioning System" in the May 2002 issue of Physics Today.

Were you doing location of seismic events?

Yeah, GPS has really made precise timing trivial. We used to hope for microsecond time from LORAN (after separating skywave and groundwave) for our Long Baseline Interferometry - and usually were close enough (meaning that it might take only several tries at correlating the data until you "found" the fringes). Nowadays, you plug in the clock offsets (we prefer to let our hydrogen masers do their own thing and measure time offsets against GPS) for all the sites and begin processing.

Re: Relativistic Effects on Atomic Clocks

*Message #9 Posted by **David Smith** on 10 July 2003, 4:35 p.m.,*
in response to message #8 by Dave Shaffer

The project that we had the most problems with had stations in Egypt, New Zealand, Greenland, etc. Loran was not available. We had to use WWV, etc. which was REALLY grim at those distances.

At one time we built a portable clock that was moved to each of the stations for calibration. It was probably one of the most accurate non-atomic clocks ever built... into a 50 cal ammunition can no less. Try bringing one of those on an airplane today.

A much improved later version used the Navy TRANSIT satellites... but just send money for the receivers...

Re: HP atomic clocks

*Message #10 Posted by **Renato** on 6 July 2003, 2:49 a.m.,*
in response to message #2 by Ellis Easley

Current model for cesium frequency standard is 5071 and is a Agilent product. Please take a look at Agilent site, and read about 5071. In my opinion, Agilent looks very much like the old HP.
Why don´t we give up badmouthing current HP and its executives, and try to get Agilent to produce

professional calculators ? They have the brains for doing it much better than HP, and Agilent customers are the target market for scientific HP calcs.

re: Why not ask Agilent to build calculators?

*Message #11 Posted by **Ellis Easley** on 9 July 2003, 7:17 p.m.,*
in response to message #10 by Renato

Does this not beg the question: Why didn't the calculators go with Agilent in the first place?

Maybe Agilent isn't any more interested in calculators than HP is.

However, I did find some pages on the Agilent website a while back with information about porting HP Series 80 programs to their current Windows-based Basic language VXI instrumentation systems. That was refreshing!

HOW ABOUT A PETITION TO AGILENT

*Message #12 Posted by **Norm** on 10 July 2003, 4:42 a.m.,*
in response to message #11 by Ellis Easley

How about a petition

that we send to the board of directors of Agilent,

asking them to buy out the calculator topics from HP.

Everything I personally have noted thus far, in visiting this chat board the last 3 months, suggests that calculators are academic tools of intelligent scientific, engineering, and professional people. Such people are still represented at Agilent, makers of exceptionally sophisticated electronic instruments (impedance analyzers, oscilloscopes, frequency generators, etc etc etc).

Meanwhile, HP ding-dong board of executives is thinking about how to rip people off on the next hula hoop that they sell 20 million units of. Maybe they want to sign a joint merchandising agreement with "incredible hulk" to sell a computer that is painted green with a bottle of green slime in each packing carton.

HP management are idiots with no comprehension of test instruments, technical professionals, engineers, physicists, and other parts of the University (Academic) communities.

They should turn it over to Agilent and quit fooling around with something they know nothing about. Imagine the current crop of HP idiots holding the car-keys to the network analyzer products and infrastructure. They would go 'derrr how do you work it, derrr, lets discontinue it'. They are too dumb to even know how to plug it in the wall, so thats why such instruments are at Agilent.

We should have a petition as such, and send it to both board of directors. No, I didn't offer to do all the work. But I can clearly state that this is what we should do (rather than grouse about how Carly discontinues all the products..... of course she does.... she doesn't understand them, her brain is too tiny, understands only greed, and counting of money).

Put my name on the list!

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2003, 12:15 p.m.,*
in response to message #12 by Norm

Hi, Norm;

put my name on the list, please.

Best regards.

Luiz (Brazil)

[quote]*(...)her brain (Carly's) is too tiny, understands only greed, and counting of money.*[quote]
Touchè!

Re: HOW ABOUT A PETITION TO AGILENT

*Message #14 Posted by **Frank Travis** on 15 July 2003, 11:06 a.m.,*
in response to message #12 by Norm

I strongly support the idea of Agilent taking over the HP Calculator business. Another idea I had was that HP could sell its entire calculator business intact to another company that would be HP Calculator. MICRONPC was part of Micron Electronics Corp. until a few years ago. Their PCs got rave reviews, but Micron was not doing financially well with their PC division. Micron Electronics website www.micron.com sold their PC division (marketting, sales, manufacturing, etc.) to Gores Technology Group which called the division MICRON PC website www.micronpc.com. Micron PCs still got rave reviews. Recently when I got on the website www.micronpc.com I was redirected to www.buympc.com. If HP does not want to continue making quality calculators, they might considering selling their calculator division to another company.

Yes, Serious, we should do this

*Message #15 Posted by **NH** on 15 July 2003, 1:31 p.m.,*
in response to message #14 by Frank Travis

Thanks for nod of approval Frank.

Although this idea has gotten very little replies, deep down, I think any of us on this chat board can see its true.

I didn't volunteer to do all the work..... I suppose its got to be Mr. David Hicks anyway because its about gathering of data online .....

But the essential detail is that "HP" is now a hula-hoop company with no appreciation of scientific instruments or the scientific community. They want to sell wireless internet cell-phones at Starbucks, and that is their mentality. They could be sitting on a cure for cancer and they would throw it in the dumpster so they could concentrate on their hula hoops.

The types of calculators the scientific community appreciates is entirely beyond the understanding of HP, but Agilent would do very well with it, and probably create the models we would be satisfied with.

BTW isn't it humorous that the engineering/scientific community was able to create financial calculator design(s) that are immensely valued by the MBA/business types.

HOWEVER, the converse is not true... MBA/business types are not capable of creating (merely maintaining or selling even) a decent engineering/scientific calculator. I suppose there's no great surprise in that logic..... U wouldn't want to take a ride on a space shuttle

designed by MBA/business types either.

C'mon.... volunteers..... approval..... petition..... lets change the world, let's excuse the diabolical beast (Carly) from a responsibility she does not want..... everybody will get happier.

- Norm analogee@gte.net

What's this?

*Message #1 Posted by **Matthias** on 1 July 2003, 9:16 p.m.*

Hi guys.. you see, I'm on holidays. So I do have much more time for my hoppy... collecting HPs... This night (now it is 3.15 am) is was looking at my PRISMA magazines.. but... I stopped laughing when I read about some items I've never heared about: What is the HP-41CW (I know the CY) and what about the RADIO module (HP82186A). Does someone has one? I allways thought, that HP82184A is the last module. Does a HP82185A also exists?

Matthias

Re: What's this?

in response to message #2 by Raymond Del Tondo

HP-41CW turbo: PRISMA no. 3/1987 page 23: It's a price list of W&W HP82186A: PRISMA no. 3/1983, front (picture) + page 1 (inkl CAT2)

Re: What's this?

*Message #4 Posted by **Raymond Del Tondo** on 2 July 2003, 8:40 p.m.,*
in response to message #3 by Matthias

Yes, you're right. I saw the ad. I think it's a version with 32K RAM box, or simply the Turbo w/o additional RAM.

For the HP82186A: I have nearly all Prisma's, but it seems the 1983 annual is missing from my archives...

Could you provide a scan of these pages of PRISMA no. 3/1983 ?

Raymond

Charger for HP-29C

*Message #1 Posted by **er** on 1 July 2003, 8:21 p.m.*

Recently came across an HP 29C that has a separate charger module. The batteries are in the charger, underneath the tan plastic cover. I can't seem to be able to remove this cover to get the batteries out, to be able to place them into the calculator. There is an indented arrow on one end and when I attempt to gently pry it up, it does not move. It does not slide either. I don't know if it's stuck or what, but I don't want to damage it.

Any ideas?

Re: Charger for HP-29C

*Message #2 Posted by **David Ramsey** on 2 July 2003, 1:03 a.m.,*
in response to message #1 by er

That cover is actually the back side of the battery pack. Push HARD in the direction of the arrow, and the far end of the battery pack should pop up.

First picture: Battery in charging unit. Press hard in direction of red arrow:

http://neko.com/pack1.jpg

Second picture: Battery pack pops out of charger unit:

http://neko.com/pack2.jpg

Re: Charger for HP-29C

*Message #3 Posted by **David Smith** on 2 July 2003, 5:48 p.m.,*
in response to message #2 by David Ramsey

If the battery cells have puked their vile, corrosive guts out then the pack can be very difficult to remove. You may have to use a screwdriver or knife blade to lever the thing out (pry in the drirection of the arrow on the far side away from the arrow). Of course this risks damage to the pack and/or charger.

Re: Charger for HP-29C

*Message #4 Posted by **Ellis Easley** on 3 July 2003, 11:56 a.m.,*
in response to message #3 by David Smith

The only way I can develop enough force to remove the battery pack from my HP25 is to push with both thumbnails against the molded ridge surrounding the arrow. With one thumbnail near the arrow and the other on the opposite end of the box outline, I can apply enough force and control the popping out of the pack.

Re: Charger for HP-29C

*Message #5 Posted by **er** on 4 July 2003, 11:46 a.m.,*
in response to message #4 by Ellis Easley

Thanks for all the good suggestions. The only way I was able to get the battery pack out of the charger was to use latex gloves on both hands and apply the pressure. This kept my fingers from slipping and not being able to reach the required force to release it.

Re: HP41 - PC interfacing and Free Advertising

*Message #1 Posted by **John Smith** on 1 July 2003, 7:37 p.m.*

Hi Sebastian,

Before you jumped on Christoph, did it occur to you that he had been attempting to answer my questions? Did you try to read my post first? In some of my questions I directly asked him for prices and sources.

What the hell is wrong with you? I'm outraged by your insensitive comments to Christoph. Person like you are absolutely disservice to the board.

Do you know how much effort is required for an individual to innovate and design compatible accessories for HP 41 series so that we can still function when HP pulled their plugs (and turned back on us) 16 years ago leaving us high and dry?

If someone's product performs better than what is available today, or even better than what HP came up with, then that individual should be proud of with his accomplishment. Nothing wrong with that. We, all should be proud of Christoph.

John

The HPCC in London has a monthly meeting.

Why wouldn't we join them one time ?

Re: What about a collector's meeting

*Message #11 Posted by **Matthias** on 2 July 2003, 4:09 p.m.,*
in response to message #10 by Thibaut.be

I'm also a member of HPCC, but London isn't that near to Switzerland.. But why not.. Once in my life it would be fine (hehehe)..

Matthias

Only collectors allowed?

*Message #12 Posted by **HrastProgrammer** on 3 July 2003, 2:29 a.m.,*
in response to message #1 by Matthias

Are there only collectors allowed to join the meeting?

Regards.

Re: Only collectors allowed?

*Message #13 Posted by **Matthias** on 3 July 2003, 3:47 a.m.,*
in response to message #12 by HrastProgrammer

Who else would like to join us (if you're not a collector or a user..)?

Re: Only collectors allowed?

*Message #14 Posted by **Mike (Stgt)** on 3 July 2003, 6:08 a.m.,*
in response to message #13 by Matthias

There are others interested in such a meeting: I once organized a meeting in Stuttgart (lasting 3 days with visit of Daimler production in Sindelfingen, guided walk to historical places of Stgt, and some other events) but only few Swiss collectors joined. When I talked about that at a Palmtop meeting (Palmtom = HP200LX, 100LX, 95LX, 700LX, 1000CX <G>) they said 'Ha! Next time you tell us, pls. We would have joined too.' And it came out that several use JF Garniers emu41 on their Palmtop.

So such a meeting would be for emulator programmers and users too, I suppose. (I still have the duty to make a date in Lausanne to meet JFG together with some Swiss collectors <G>)

Ciao.....Mike

Speed

*Message #1 Posted by **bill platt** on 1 July 2003, 1:33 p.m.*

Hi all voyager and pioneer fans,

Just got my copy of a 15c. Just to start the fires, I thought I would make a post about speed.

1.st: My 15c is about 10-15% slower than my 11-C. There is variation from machine to machine (old posts talk about this).

Now, given a simple loop: (pioneer syntax)

LBL A

-1

+

x>0?

GTO A

1.E40

RTN

start by putting a number in the stack, say 50, and when done cycling, display wil say "1 E 40"

Difference in speed:

15c: 50 loops = 24.0 sec

32sii 200 loops = 5.0 sec

or about 19:1

(incidentally I used my 48gx as a stopwatch :-})

So, what is the difference in time between rele4ase of these products? 1981 for voyager, 1988 for pioneer, so 7 years.

Extrapolating linearly, that would mean that today, we should be able to build a caclulator with a speed of 63 times that of the Voyager. I bet it is even faster (but we have to be fair on caoparing at a similar price point).

Re: Speed

*Message #2 Posted by **Patrick** on 1 July 2003, 2:10 p.m.,*
in response to message #1 by bill platt

The famous Moore's law says that speed (and memory capacity) approximately doubles every 18 months, meaning there is exponential growth. Those of you with a calculator handy (!) can compute an equivalent of about a 58 3/4% growth rate, compounded continuously.

Using this rate, one would expect an approximate 25 fold speedup in speed in 7 years, very much in line with the factor of 19 in your experiment.

Extrapolating from 1981 to 2003, we might expect a speedup factor of 26,000! (No, that isn't factorial)

This is where reality sets in and we have to look at whether we are comparing apples to apples. The Voyager series was specifically designed for long battery life. The technology at the time might have supported making a faster processor at about the same cost, but the HP engineers might have sacrificed speed for extra battery life.

A famous scientist once said "Prediction is very difficult, especially when it is about the future."

Re: Speed

*Message #3 Posted by **bill platt** on 1 July 2003, 5:01 p.m.,*
in response to message #2 by Patrick

Patrick,

Thanks for your reply,

so, at the moore's law worked backwards, starting from a 500 MHz Palmtop, I work backwards to find a 19.2 kHz speed for the old 15C. Question is, "what was the processor speed of the old 15C?"

regards,

Bill

Re: Speed

*Message #4 Posted by **David Ramsey** on 2 July 2003, 1:06 a.m.,*
in response to message #2 by Patrick

Actually, Moore's law says the number of transistors on a chip doubles every 18 months. But it's been extended before...

Re: Speed

*Message #5 Posted by **Trent Moseley** on 1 July 2003, 3:11 p.m.,*
in response to message #1 by bill platt

Same results for a 1988 16C and a 1999 32SII. For the record a 1980 67 did 50 loops in 20.5 seconds.

in response to message #5 by Trent Moseley

Fifty loops in 14 seconds! 1978 vintage. No LBL A of course.

tm

Misleading !

*Message #7 Posted by **Valentin Albillo** on 2 July 2003, 5:29 a.m.,*
in response to message #1 by bill platt

Hi Bill,

Bill posted:

"Just got my copy of a 15C"

First of all, congratulations and welcome to the club ! But let me point out that you didn't get a "copy" of a 15C, but a real, genuine *original*, right ? There are no *copies* of 15C's whatsoever, that is until and unless CFKAHP (Company Formerly Known As HP) releases an HP-15C Platinum, Iridium, Praseodimium, or something, though they'll probably release instead a "32SII Platinum" aka 33S.

Now, for the speed issue, this is a very thorny affair, because measuring speed isn't as trival as setting up a loop and timing the seconds it takes to run. There are *serious* problems with that simple approach, namely:

- The coding of the loop can make *all* the difference, because a finely tuned loop can run many times faster than a sloppy approach. For instance, you can code a loop in the HP-15C like you did, with that **-1, +, x>0?** construct, but why not **1, -** instead of **-1, +**, which seems much more natural, or even using the powerful **ISG** or **DSE** looping instructions which are provided in the instruction set precisely for that very purpose, or use **GTO (i)** for rapid reverse branching, thus avoiding the label and the time-consuming label search, or ...

- related to the point above, the best way to code a loop in a particular machine (say a 32S) usually is *not* the way to code same loop in another one, and here the coder can't usually avoid to incur in *language chauvinism* or the constructs he/she is used to in another language and/or machine. Only a user absolutely knowledgeable about a number of different machines and who puts aside any preferences on language or coding techniques (say structured vs. goto) can actually produce optimal tests for a given machine or set of machines.

- finally, the very concept of testing the speed using a simple loop is as *misleading* a concept as one can be. There are machines that will run a 1000-cycle loop blidingly fast, yet will choke to death upon encountering a floating point sine computation, not to mention doing it properly (range, accuracy, etc).

  The HP-15C is optimized for *mathematical computations*, not branching and looping, and at that it excels. Its instruction set includes functions to do almost all things mathematical with as little looping as possible. If you study my past HP-15C Quizs/Challenges, you will see that the matrix operations, for instance, are so powerful that you can do *without loops* many computations that seemed to require them, and even when loops are needed, they can be kept to a bare minimum.

In other words, if you want to make a *fair* speed comparison and learn something about the relative speed of machines, avoid coming to premature conclusions by resorting to the use of an inadequate, quick & dirty test. I'd suggest the following instead:

> Run a test which does significant computation, using a lot of mathematical functions [which is what a calculator such as the HP-15C is optimized to do], operators, storage, etc, and little branching. You should strive for a 90% computing, 10% branching or less. See what figures you get then. I'll bet you *won't* get a 19:1, right ?
>
> If really trying to asses the speed of the HP-15C in particular, try to solve a 7x7 linear equations system

in both your 15C and your 32S, and compare the times. See ?

Of course the 32S doesn't have matrix operations but so what ? That's not the 15C's fault, and we're testing speed in solving real-life math problems, aren't we ? **;-)**

Matter of fact, I've done computations on my HP-15C, in 40+ steps, in a few seconds, that you wouldn't even dream of doing on a 32S, in 200+ steps, in many minutes [see my Datafile article next month], that is, if you could attempt them, which you can't because they won't fit. A comprehensive, well thought, awesomely powerful instruction set more than makes for lack of speed in other areas.

That said, welcome again and enjoy to the max your HP-15C. And I fully **expect** that you'll post a solution to my next HP-15C Quiz/Challenge, to be posted in a few days, you have that much time to learn all the capabilities of your wonderful machine, lest it becomes painfully obvious you simply don't deserve to own one. Do not try it with your 32S, though, it won't work :-)

Best regards.

What is GTO (i)?
Thanks in advance

Raul

Rapid Reverse Branching

*Message #9 Posted by **Valentin Albillo** on 2 July 2003, 1:54 p.m.,*
in response to message #8 by R Lion (España)

Hi, Raul:

Actually, GTO (i) is the correct form for such machines as the HP-67, HP-34C, HP-11C, etc. For the HP-15C, the correct form is GTO I, with a capital "I" instead of "(i)".

GTO I, when register I does contain a negative integer (say -15), branches execution to that program step number (step 15 in this case), instead of searching for a label.

As no label search is performed whatsoever, it executes much faster, and besides it doesn't require a label at all at the destination step. It's a rarely seen technique, but available and powerful nevertheless.

Best regards.

Re: Rapid Reverse Branching

*Message #10 Posted by **gene** on 2 July 2003, 5:00 p.m.,*
in response to message #9 by Valentin Albillo

My guess about why this is a rarely seen technique (GTO I in particular) is because of the overhead required to store the step number into I, particularly when one wanted to change the destination in a program.

And, of course, the difficulty of debugging and maintaining a program using absolute addressing. Yuck! I know it RUNS faster, but the pain involved in getting there is nasty. :-)

Speed is Misleading

*Message #11 Posted by **bill platt** on 7 July 2003, 10:30 a.m.,*
in response to message #7 by Valentin Albillo

Valentin,

Thanks for your excellent response--it is just the sort of dialog I hoped to start!

Just now back from a short vacation---so looking forward to your next 15c quiz.

Regards,

Bill

Re: Speed -- a few more data points . . .

*Message #12 Posted by **Paul Brogger** on 2 July 2003, 11:21 a.m.,*
in response to message #1 by bill platt

HP-97 -- 50 loops in 21.5 seconds

HP-34c -- 50 loops in 21.9 seconds

HP-32s -- 200 loops in 4.0 seconds

HP-28C -- didn't care to figure out RPL (again)

HP-48G -- too lazy to figure out RPL

(I used my watch as a stopwatch . . .)

Lesson: RPL -- Use it or Lose it!

Re: Speed -- a few more data points . . .

*Message #13 Posted by **bill platt** on 7 July 2003, 11:46 a.m.,*
in response to message #12 by Paul Brogger

Paul,

looks good. Notice the correlation between your 97 and Trent's 67---this should be, as they are the same in their guts, yes?

Take a look at Valentin's post---he has great points about the validity of speed tests. I am going to play with some other loop structures and see what happens.

Regarding RPL---I am a newbie to RPL---but yes it seems a bit like "use ot or lose it." But I did successfully figure out how to do an IF-THEN-ELSE recently on RPN, so maybe I will be able to make a REPEAT-WHILE.....

regards,

Bill

Using HP-IB For Mass Storage

*Message #1 Posted by **Mark Hardman (LED)** on 1 July 2003, 12:18 p.m.*

I frequently see HP-IB floppy drives like the 5-1/4" HP-82901 or the 3-1/2" HP-9121 available on eBay. I've even seen HP-IB hard drives come up for auction.

What is the feasibility of using one of these devices for HP-41CX mass storage using the 82169A HP-IL/HP-IB interface?

Mark Hardman (LED)

Re: Using HP-IB For Mass Storage

*Message #2 Posted by **Emmanuel, Normandy** on 1 July 2003, 12:53 p.m.,*
in response to message #1 by Mark Hardman (LED)

```
I save all my HP-41 data onto a PC and recall them easily.
My system includes:
- 1 HP-41CX
- 1 HP-82160A HP-IL module
- 1 HP82183A Extended I/O module
- 1 HP82169A HP-IL/HP-IB interface
- 1 Amd K6/266 with Win95
- 1 HP82335 HP-IB/PC ISA card
I use special softwares and libraries made for that previous card.
Yours.
```

Consider this...

*Message #1 Posted by **Juergen (CH)** on 1 July 2003, 7:23 a.m.*

Sebastian,

please consider the following points, then think about your complaint again.

1. Christoph has invested many, many hours to professionaly rebuild the HP-IL/PC Interface Card. Try to get one on eBay, it's hard and more expensive.

2. To rebuild the interface card, Christoph needs some original IL chips. Without the help of many other HP enthusiasts around the world (which highly appreciate his efforts, too), he would not be able to get enough such chips.

3. Christoph Klug and Jean-Francois Garnier cooperated in adding IL support to EMU41. Now, they can offer a unique and very powerful solution. Nothing comparable out there!

4. Christoph has a very deep knowledge of all the IL stuff and many other HP-41 hardware. I'm absolutly sure he will share his knowledge with us if any "hard-core" question arises.

5. The price of EUR 150.- is absolutely fair. The HP-IL/PC Interface card is hand-made by Christoph, and of very good quality. I don't think it's the big business, it's more like a service to HP-41 enthusiasts.

6. Carefully read all the possibilites of the HP-IL/PC Interface Card/EMU41 package. That's really great! You can archive your HP-41 programs on the PC, you can easily print barcode, you have many ROM modules to play with (even on your "real" HP-41 if it is connected to the PC), you have virtual IL devices, etc.
EMU41 does not have a click-e-di-clack user interface, but that's not a problem. If you get used to it, you can work efficiently.

I highly appreciate the work of Christoph Klug and Jean-Francois Garnier (and all the others working on amazing HP related hardware and software projects). They offer a very powerful and reliable package for HP-41 enthusiasts which I can highly recommend!

Questions about interfacing the HP-41 with a PC appear frequently on this forum, and I really don't see any reason why Christoph should not point to his wonderful solution.

Best wishes from Switzerland,
Juergen

Questions for a 33S Beta Tester

*Message #1 Posted by **Tony David Potter** on 1 July 2003, 6:56 a.m.*

I remember us having several regulars on this board being 12C Platinum beta testers, so I have some questions for anyone who is a 33S beta tester. If necessary, anonymity is better than nothing. Since the tech-service bots still disavowed knowledge of the HP-12C Platinum until last week, I'm hoping we can get some answers to tide us over until the HP-33S is released.

1. What architecture will be used? The Pioneer Series (HP-32SII or HP-42), the Voyager Series (HP-11, HP-15, HP-12C Platinum, the Cosmos series (HP-6S, 9S, and 30S), or something new?

2. Will it be exclusively RPN, RPL, or a dual-system series like the 12C-Platinum?

3 If it has ALG entry, will it be arithmetic (3 + 4 * 5 = 35) or algebraic (3 + 4 * 5 = 23)?

4. Is it programmable? If so, how many programming steps are available to the user? Does using this space cut down on space available for variables/memory registers?

5. What standard features/programs does it have built in? Solving for roots of equations? Definite integration? Statistics packages?

6. Will it have a dot-matrix display of a fixed element display?

7. How much of the stack is visible at a time? One line? Two lines? 4 Lines?

I'm probably forgetting some obvious stuff, which I'm sure my esteemed colleagues will add to this question.

Thanks ahead of time.

Tony David Potter

About Aurora FN1000

*Message #3 Posted by **Renato** on 1 July 2003, 10:50 a.m.,*
in response to message #1 by Joerg Woerner

It looks better in pictures than in real life. I tried one in a shop in Brazil, even tried a short program loop (quite fast execution). The plastic finish, keys and display are not much better than a $30 calc. I´m happy that another manufacturer launches a RPN calculator. Maybe HP (or better: Agilent) do something better that the 12cp. That´s the only positive point of all this.
Being RPN and programmable does not turn a financial calculator in a 12c replacement. FN1000 regular price in Brazil is 60% of 12c price - but discounts on the FN1000 are starting to appear in online auctions.
In a few months, I bet prices will go much lower. At $20 i´d buy some to leave around the house and in the car.

Re: About Aurora FN1000

*Message #4 Posted by **Ellis Easley** on 3 July 2003, 11:24 a.m.,*
in response to message #3 by Renato

The numbers displayed in the first picture look like program steps. Especially "43" which would be the "g" prefix key on a real 12C ("43 33 65" = GTO 65). Is this how they implemented program keycodes - exactly the same as the 12C? How does the user read a program? Do they have a keycode conversion chart?

Re: About Aurora FN1000

*Message #5 Posted by **Renato** on 3 July 2003, 1:26 p.m.,*
in response to message #4 by Ellis Easley

I *think* fn1000 uses the same keycodes as the 12c.
As the price falls, chances are that i´ll buy one. Just allow me to wait for price to be right.

Re: About Aurora FN1000

*Message #6 Posted by **Paul Brogger** on 3 July 2003, 4:43 p.m.,*
in response to message #4 by Ellis Easley

Other ways of asking the question are,

"Did they copy the HP-12C ROM bit-for-bit?"

or,

"Did they simply reverse-engineer the 12c without understanding (!!!) what the keycodes meant?"

One might also wonder, was either of these paths taken with permission from H-P?

Very bizarre . . .

a VHS movie -- Pirates of Silicon Valley

*Message #1 Posted by **Norm** on 1 July 2003, 5:34 a.m.*

Hey folks, thanks a bunch for recommending 'Pirates of Silicon Valley'.

It passes the test of being good and interesting movie material (so many modern movies these days are as rotten as the modern HP calculators).

And there's even that little bit where Wozniak of Apple had been working at HP (with calculators) and had to cut loose of any development rights that HP had priority on.

Although Bill Gates is generally depicted as the great satan, doesn't that prize really go to Carly Fiorina? Or to all business people in general? U gotta love how they portray those jerks in dark suits..... in their big $10M boardroom, can't even understand something like a 'mouse' and haven't got a clue about anything, too dumb to change a lightbulb..... why in heck have they got all the money then?

beats me... but great movie. Looks like the real reason Apple didn't come out on top, was that Steve Jobs of apple was an adopted nut-case who never got to the long couch for a tuneup from a good shrink.

Compaq-HP support

*Message #1 Posted by **Simon** on 1 July 2003, 4:19 a.m.*

Good day,

I had a Compaq laptop of PII model (I don't remember the model, it's been a year) in witch the keyboard controller broke down and the laptop couldn't boot. So I brought it to Compaq Israel the only place that had parts for this laptop and the price offer for the controller I got was 950$!!!! witch is more then a new laptop one of that type costs !!!!!!!! (I believe they didn't wanted to fix it in the fist place so they gave me this price offer). I refused to fix it for that price and since I couldn't take it to another place. So Compaq Israel offered to buy the laptop from me for 100$!!!!!!!!!!!!! And since I had no other choice I agreed with once condition I keep my hard disk. A year had passed since then till today they claim they "lost" my hard disk or so they say and I didn't see the 100$ or even a dollar it in the mail just wait !!!!!!!!!!!!!!!

I am a M.Sc. in Electronic Eng. In past I was a system Admin. in the Army with 1000 end units under my control. I have worked with Compaq support in past and as far as I am concerned it's the worst company to get support from and I never recommended buying anything from Compaq. I don't think that after these years you will change I just build this morning after another iteration with you and decided to write this letter.

Since then I bougth another laptop from Toshiba and these days I am looking for another one and it deffenetly would not be a Compaq (Compaq-HP as you call it today).

Sincerely, Simon Cooper

Re: Compaq-HP support

> I don't think that after these years you will change I just build this morning after another iteration with you and decided to write this letter.

I don't know if you realize this but "you" ("us") is a bunch of users, fans, and collectors of HP calculators - mostly older ones. This is not an HP/Compaq corporate site. There are HP employees who read this forum but not in an official capacity.

I understand your annoyance, but the problem you're describing is quite common to modern electronic devices. Because they aren't all that repairable, the $950 quote was probably for an entire new main board or maybe even a replacement laptop. Of course, the replacement was most likely built and stored back when they made yours, which means it has a terrible price/performance ratio in comparison to anything new. Which of course causes people to take this "opportunity" to upgrade to the new/better machine which discourages manufacturers from going out of their way to make things more repairable - especially anything that would increase the price or weight of a laptop.

If you have a similar problem in the future, here are a couple of ideas: Look for a “laptop repairman” who might be able to fix just the keyboard controller. We have some freelance calculator repairmen who hang around this forum who can work miracles on calculators that HP doesn’t try to repair. I assume there are similar people for laptops.

Another option is to find another dead one (should be easy - laptops live hard lives) and buy it for the same $100 that Compaq offered you and swap parts.

converting magnetic cards

*Message #1 Posted by **Juan Luglio** on 1 July 2003, 1:37 a.m.*

My uncle in South America has an HP41CV with a magnetic card reader and infra red printer that he used in his contact lens manufacturing business. He used a program from Nisel (a company that no longer exists)to calculate dimensions for the lenses. The program is stored on magnetic cards. The calculator is no longer functioning and neither is the card reader. I have an HP41CX that is functioning, but without the card reader I can't do much for him. Is there anyone who can convert the program into a form that can be loaded into an emulator(V41 or similar)?

Re: converting magnetic cards

*Message #2 Posted by **Juergen (CH)** on 1 July 2003, 7:53 a.m.,*
in response to message #1 by Juan Luglio

Juan,

anyone who has a functioning card reader and a PC interface for its HP-41 may convert the program. Basically, a card reader and a printer suffice, but that requires typing in the program.

I offer my help, but I'm far away (Switzerland). Perhaps, there is someone in South America who can do the conversion. Otherwise, don't hesitate to contact me.

Regards, Juergen

Re: converting magnetic cards

*Message #3 Posted by **Chris(FLA)** on 1 July 2003, 10:29 a.m.,*
in response to message #1 by Juan Luglio

The calculator is no longer functioning and neither is the card reader. I have an HP41CX that is functioning, but without the card reader I can't do much for him.

Juan,

Is the card reader just dead or does it maybe have the "gummy" wheel problem? If it has the "gummy" wheel problem it is fixable and you could then use it with your 41CX.

Can you "CAT 2" the card reader when connected to your 41CX?

There are articles here on the site on how to fix card readers with the "gummy" wheel problem.

Maybe you can bring the card reader back to life.

Chris

Re: converting magnetic cards

*Message #4 Posted by **Renato** on 1 July 2003, 11:07 a.m.,*
in response to message #1 by Juan Luglio

Juan,
I have 41cv and card reader, both working ok. I know some other people here in Brazil with 9114 floppy disk drive.
My suggestions are:
Option a- If you mail me a backup of the cards, i can try to read them - i can have the programs printed, scan the listings and mail the files to you. If backup copy of the programas are available, this is the less expensive option, with less risk.
Option b- Buy a functional card reader on ebay (around $60) - I have one here in Brazil, available for trading with HP itens.
Option c- Send the card reader for someone to repair - I can repair, and Luiz can too (better than me).
Option d- Follow instructions for repairing the card reader. High risk of not fixing it, unless done by someone with watch-repairing skills.

Ask your uncle to contact me, I'd be glad helpping

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 1 July 2003, 12:57 p.m.,*
in response to message #1 by Juan Luglio

Hi;

I read the tittle and did not have a clue about what was card convertion; I thought you were using other brands' magnetic cards and wanted to convert them to HP cards. If I read the post at the moment I saw it, I'd offer this promptly.

I have some HP41, a card reader and the means to generate bar codes, list the programs in an 82143A, copy them to disks (text format, RAW or any other) and even translate them to run in an HP48S/G or any other HP RPN/RPL calculator that can hold them. If he wants to give it a try, I can also try to repair both the HP41 and the card reader.

My e-mail is:

lcvieira@quantica.com.br

Your uncle may write in Spanish, English or, if he knows, in Portuguese, but I can only reply in Portuguese or English.

I'm waiting for his contact, if he wants to. Sorry I did not reply earlier, I should read the post instead of wondering about the title...

Best regards.

Luiz C. Vieira - Brazil

Edited: 1 July 2003, 7:31 p.m.

I tried to send you an e-mail...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 July 2003, 3:06 p.m.,*
in response to message #1 by Juan Luglio

Hello, Juan;

I tried to send you an e-mail and I got a "lmper.com host unknown" message.

I'm waiting for any contact from you or your uncle. If you read this, please contact me or. To remove this message, the password is 12345.

Best regards.

Classic Battery Covers

*Message #1 Posted by **John Robinson** on 30 June 2003, 10:19 p.m.*

Is the battery cover for a HP-35 the same as that for a HP-45 ? - Thanks, John

Re: Classic Battery Covers

*Message #2 Posted by **David Smith** on 1 July 2003, 6:20 p.m.,*
in response to message #1 by John Robinson

Yes, the HP35/45/80 covers are the same. Also the same as the HP55 and HP70, except for the color.

The HP65 and HP67 covers are interchangeable.

The HP91/92/97/97S covers are interchangeable. The 82143A printer, 82161A (?) cassette tape drive, and 82162A (?) HP-IL printer covers also match the HP97 covers except for the color. The cassette drive and HP-IL printer were made in both black and dark green colors.

HP 32Sii - How do you open it for cleaning?

*Message #1 Posted by **Kent Harbert** on 30 June 2003, 6:55 p.m.*

Some of the keys on my HP 32Sii are non-responsive, so I wanted to open it up and clean it. But, there are no screws and I don't want to pry too hard without knowing if I will break something or not.

Re: HP 32Sii - How do you open it for cleaning?

*Message #2 Posted by **Randy Sloyer** on 30 June 2003, 7:35 p.m.,*
in response to message #1 by Kent Harbert

Opening the back will bring you no closer to the problem. The keyboard is sealed. The only effective method is to clean in distilled water in an ultrasonic cleaner. But having said that, this is a conditional solution. This applies only if the problem is random keys, usually the enter or a numeric key. Happens most often when the unit is used outdoors in dirt, i.e. Surveying.

If the problem is one or more columns or rows of keys that are non-responsive, cleaning will not solve the problem. In this case, the keyboard has lost contact with the logic board. Instructions for opening the unit can be found here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5

You'll find the problem to be the mylar of the keyboard and foam backing pad. The mylar is going one direction, the pad is to push against. The pad has lost it's spring tension and no longer holds the mylar connector against the logic board. Shimming the pad is the easiest solution.

Re: HP 32Sii - How do you open it for cleaning?

*Message #3 Posted by **Frank B. (Germany)** on 1 July 2003, 11:28 a.m.,*
in response to message #1 by Kent Harbert

Recently I had a 32SII, where the right hand side of the keys wasn't working. Pressing gently at certain spots on the bezel (right hand side, just below the display) the keys started to respond again. Using my fingernails I was able to force apart the upper and lower part of the calculator (on the right hand side) by a millimeter or so, and appplied some pressure to the appearing metal part (housing of the lcd?) using a paper clip. Pressed it from below against the upper part of the calculator. Since that everything is fine again! Just be careful not to damage the plastic with the paper clip, not to damage any of the boards, the display or your fingers ...

Frank.

Re: HP 32Sii - How do you open it for cleaning?

*Message #4 Posted by **Randy Sloyer** on 1 July 2003, 1:55 p.m.,*
in response to message #3 by Frank B. (Germany)

Poking something blindly into a Pioneer will most likely kill it. The keyboard connector can be easily destroyed this way, the LCD can be cracked by applying pressure in the wrong place.

IMO, it's much better to open the unit to see and understand the problem.

Edited: 1 July 2003, 1:55 p.m.

Re: HP 32Sii - How do you open it for cleaning?

*Message #5 Posted by **FrankB. (Germany)** on 1 July 2003, 3:14 p.m.,*
in response to message #4 by Randy Sloyer

I agree, poking around blindly isn't a very good idea. Not only in calculators. That's why I used the word "careful", and that's why one should look where to poke.

If it works the "look-and-poke" method is non-destructive and fast, compared to opening the case by cutting heat stakes. One doesn't need any fancy tools. Maybe opening it is easy, but I haven't dared yet, especially opening a precious 32sii!

Re: HP 32Sii - How do you open it for cleaning?

*Message #6 Posted by **Randy Sloyer** on 1 July 2003, 5:19 p.m.,*
in response to message #5 by FrankB. (Germany)

That's why you buy a few 10B and 20S's to practice on :^)

Re: HP 32Sii - How do you open it for cleaning?

*Message #7 Posted by **Frank B. (Germany)** on 1 July 2003, 6:08 p.m.,*
in response to message #6 by Randy Sloyer

I promise I'll do ;-)

Although - even these two models become more and more rare nowadays ...

Frank.

Details on Christoph's 16K custom module?

*Message #1 Posted by **Gene** on 30 June 2003, 6:00 p.m.*

Saw that he's advertising being able to burn us custom 16k modules for the 41c.

So, what could we put in one?

Ext IL module (SKWID)? 4K CCD? 4k? (or is this 8k)? 1 user code module Zenrom? 4k?

What would you put together? Are there limitations? Wonder what he will charge?

Re: Details on Christoph's 16K custom module?

*Message #2 Posted by **Matthias** on 30 June 2003, 6:43 p.m.,*
in response to message #1 by Gene

I would say, that this is one of the most popular mixture... Perhaps a PPC instead of the CCD? If you have a look at ebay, the prices of PPC modules increases more and more... I would say, CCD is not a very rare module, so keep these 8k free for modules that are rarer... BareCode Generation (SKWID), ASTROROM, AECROM,..

Or what would you say top a Zeprom full of test and diagnostic modules? Would be very helpfull as well...

Matthias

Re: Details on Christoph's 16K custom module?

*Message #3 Posted by **Daniel Diggelmann** on 1 July 2003, 2:29 a.m.,*
in response to message #2 by Matthias

I just got a ZEPROM from Christopg containing the following modules: CCD 8k / EXT IL 4k / EXT IO 4k As I'm mostly interested in HPIL controlling this is the most powerful combination.I'm amazed at the power you can put in just one slot. Two slots are occupied by XMEMORY. The fourth port contains either HPIL or IR Module.

My "16k" module layouts :-)

*Message #4 Posted by **Gene** on 1 July 2003, 4:35 p.m.,*
in response to message #2 by Matthias

Well, here are the ROMS I would want to put into a 16K HP-41 module...I'd want 2. :-)

Module 1 - CCD (debugged one hopefully) 8k; PPC rom (quite right about needing a back up of this one) 8k

Module 2 - Ext IL (primarily for MCPRP and full 1MB HP-IL disk drive access) 4K; SKWID Bar Code printing ROM 8k (is that right?); Ext IO 4k (or is that 8k too?)

My fear is that this would cost an arm and a leg. :-(

I also don't agree that the CCD is all that easy to find!

Re: My "16k" module layouts :-)

*Message #5 Posted by **Raymond Del Tondo** on 1 July 2003, 7:19 p.m.,*
in response to message #4 by Gene

Hi Gene,

what do you mean with 'debugged CCD'? Could it be the 'B' revision? (I consider my private version as rev C. I'll post the FAT in another thread the next few days)

The ExtIL has 4K.

>My fear is that this would cost an arm and a leg. :-(

Maybe Christoph gives kinda 'mass discount';-)

And yes, the CCD module is relatively rare.

A few thousand units were made, many of them went to club members. Maybe for people who have more than one of these modules they aren't that rare;-)

Raymond

Re: My "16k" module layouts :-)

*Message #6 Posted by **Gene** on 1 July 2003, 8:43 p.m.,*
in response to message #5 by Raymond Del Tondo

Hi! Yes, I meant the non-Version A without the deadly space in alpha bug. Having a version C available that could be burned on a ROM would be a great benefit to the community!

Re: Details on Christoph's 16K custom module?

*Message #7 Posted by **Christoph Klug** on 1 July 2003, 5:34 a.m.,*
in response to message #1 by Gene

Dear Gene,

personally I prefer the CCD (8KByte) + EXT-I/O (4KByte) + EXT-IL (4KByte), because I am Fan of HP-IL. And this configuration works nice in combination with EMU41 and HP-IL/PC Interface Card.

Alternatively I use a 4KByte software page with special routines for hardware interfacing measurement data logging control applications with I/O-Board and IL2000 System.

Best wishes from Germany - Christoph Klug

Re: Details on Christoph's 16K custom module?

*Message #8 Posted by **Christoph Klug** on 1 July 2003, 5:39 a.m.,*
in response to message #7 by Christoph Klug

For getting maximally power to your HP41, insert a Double X-Memory Moduel (port2) beside the Zeprom (port 1). Than port 3 is free and port 4 holds the IL-Module

Best wishes - Christoph

Hp Calculator, Hard Choice

*Message #1 Posted by **AC** on 30 June 2003, 1:06 p.m.*

Hi, after all the help ive gotten here, ive decided to go with the HP17 or 19Bii, but those are WAY to expensive.

Is there any calc, preferablly low cost (at least under 80-100$) that has an equation solver and is none programable? ? (teacher wont allow them, sort of ignorant)

Thanks for all the help>

[AC]

Buy one off ebay

*Message #2 Posted by **gene** on 30 June 2003, 1:10 p.m.,*
in response to message #1 by AC

There are almost always 17b (original) and 17bii's on ebay.

Cost for some original 17b's are sometimes near $20-30.

That might be worth the ebay chance.

Re: Hp Calculator, Hard Choice

*Message #3 Posted by **Ron Ross** on 30 June 2003, 1:33 p.m.,*
in response to message #1 by AC

If you have given up on RPN, you should consider an Hp30s. It does have a solver (only one eq. can be in solver at a time). It has lots of functions, but is CHEAP both in quality and price. About $15 retail, and its keyboard is on par with your Hp49G (except they are hard plastic, not rubber, but nowhere near the quality of an older Hp).

Re: Hp Calculator, Hard Choice

*Message #4 Posted by **hugh** on 30 June 2003, 2:53 p.m.,*
in response to message #3 by Ron Ross

solver? where?

not sure id recommend the 30s. and its not really a "perennial favorite" as hp claim either.

the 17bii is a nice machine. very easy to use and you can select either RPN or ALG at your preference. it has a solver, but its not scientific.

the 20s (although the underdog to the 32sii) was, until recently, available. on ebay they are still cheap. its not RPN. the display is fantastic. its scientific & very stylish. sightly programmable.

Re: Hp Calculator, Hard Choice

*Message #5 Posted by **Chan Tran** on 30 June 2003, 3:04 p.m.,*
in response to message #4 by hugh

I think AC problem is that even slightly programable is not acceptable.

Re: Hp Calculator, Hard Choice

*Message #6 Posted by **Chan Tran** on 30 June 2003, 3:08 p.m.,*
in response to message #1 by AC

It's irony that 20 some years ago I had no problem using the HP41 in any of my classes and exams.

Re: Hp Calculator, Hard Choice

*Message #7 Posted by **Luca Passaggio (Switzerland)** on 1 July 2003, 3:16 a.m.,*
in response to message #6 by Chan Tran

I had the same advantage 20 years ago, I lived in Italy at that time and none of my professors were understanding a programmable calculator, therefore I stored my HP-41C with every sort of formulas and programs. Guess who had the best marks ?!?

Re: Hp Calculator, Hard Choice

*Message #8 Posted by **Massimo Gnerucci (Italy)** on 1 July 2003, 1:00 p.m.,*
in response to message #7 by Luca Passaggio (Switzerland)

> Quote:

> I had the same advantage 20 years ago, I lived in Italy at that time and none of my professors were understanding a programmable calculator, therefore I stored my HP-41C with every sort of formulas and programs. Guess who had the best marks ?!?

Imagine me with a 41C in 1979... nobody aware of its power apart from some professors (but I had mine *before* them ;-)).

I never cheated, but it helped me a lot.

Where were you studying at the time?

Greetings, Massimo

Re: Hp Calculator, Hard Choice

*Message #9 Posted by **Luca Passaggio** on 2 July 2003, 4:29 a.m.,*
in response to message #8 by Massimo Gnerucci (Italy)

At that time I lived in Torino and I was eighteen. I have to admit that sometimes I have cheated (only a little bit) but I had no time to study because of girls, beer and motorbikes ! I am not really a collector but I use my HP-41C and my HP-12C every day (I am in R&D, marketing and sales of minimally invasive surgical devices).

Best regards to everybody in this beautiful forum, you have remembered to me very happy moments when men were real men, women were real women and calculators were RPN !

Luca

Re: Hp Calculator, Hard Choice

*Message #10 Posted by **Stephan (Germany)** on 1 July 2003, 4:16 p.m.,*
in response to message #7 by Luca Passaggio (Switzerland)

Unfortunately professors became more knowledgeable in between. I recently visited the web space of Technical University of Munich, where I studied EE a while ago. Guess what? Calculators are not allowed for exams any more today. But slide rules. No yoke.

Re: Hp Calculator, Hard Choice

*Message #11 Posted by **David Smith** on 1 July 2003, 6:23 p.m.,*
in response to message #10 by Stephan (Germany)

Gee, can you use a programmable slide rule?

Re: Hp Calculator, Hard Choice

*Message #12 Posted by **Stephan (Germany)** on 2 July 2003, 12:57 a.m.,*
in response to message #11 by David Smith

As the restriction says "mechanical calculation aids" I guess there are no objections to attaching a motor drive to the slide rule and using one or more abaci as memory.

HP-17BII

*Message #13 Posted by **Renato** on 30 June 2003, 5:37 p.m.,*
in response to message #1 by AC

Andres, 17BII can be found at less than $100. I don´t think 19BII is a good choice (unless you need trigs functions, or find one real cheap). My reasons: 1- batteries for 19bii are not so easy to find, they leak if you are not careful, and they last much less than 17bII, 2-clamshell design it not as convenient or compact, 3- 17bii is a more robust design.
Renato

Re: HP-17BII

*Message #14 Posted by **Thibaut.be** on 1 July 2003, 8:22 a.m.,*
in response to message #13 by Renato

Sorry Renato, i disagree with you.

The 17BII is definitely a very nice machine, but the 19BII is extremely powerful and is really worth the effort compared to a 17BII, even if the 17BII is more attractive on certain characteristics : smaller, lighter, ...

It is not programmable, so it matches AC's choice, but the solver is far faster than on the 17BII and more practical to use.

Ebay should be the alternatvie source for finding one at a reasonnable price.

Good luck !

Re: HP-17BII

*Message #15 Posted by **Jim** on 1 July 2003, 5:06 p.m.,*
in response to message #14 by Thibaut.be

I have a 19BII and I like it a lot. I don't know much about the 17BII. So please explain this statement:

"It is not programmable, so it matches AC's choice, but the solver is far faster than on the 17BII and more practical to use."

To set up the solver you have to program it, right? If the 17BII has a solver, wouldn't it be programmable? Thanks.

Re: HP-17BII

*Message #16 Posted by **AC** on 1 July 2003, 5:34 p.m.,*
in response to message #15 by Jim

Yea, it would be, but not to some teachers!

Re: HP-17BII

*Message #17 Posted by **Thibaut.be** on 1 July 2003, 6:22 p.m.,*
in response to message #16 by AC

Well, on 15C, 34C, 32SII, 42S, ... the solver needed to call a program where you equation was stored.

On the 17BII and 19BII there is a quite powerful equation writer, a bit as if you were storing an excel formula.

pricing on CPU in new HP calcs (Sunplus SPL...)

*Message #1 Posted by **Bill Wiese** on 29 June 2003, 9:55 p.m.*

I lost track of the thread position, but just saw some speculation on the pricing of Sunplus chips in HP calcs.

This is a fairly low-tech chip (slow, prob not a fine-line-size chip (thus maybe .85? 1.0? u), without tricky analog features, and not requiring an expensive reticle, or any features that can affect yield (i.e., flash ROM). Also the fabs involved may be old and already paid for.

Plus the chips are prob bought as 'bare die' and are mounted to PCBs with "COB" (chip on board) technology. Some dimly remembered numbers for small-pin-pitch packages are that these run around 1/2cent (USD) per pin for pin + pkg.

So for a large run of chips (w/given ROM masking) Kinpo is prob paying Sunplus a buck or less. Even $0.70/chip wouldn't be surprising, really, given competition and reduced state of semiconductor market.

HP prob buys HP9x calcs in bulk for $3-$9 ea (9S, 9G).

For a MODERN semiconductor process, say 0.23u or 0.18u without special RF/analog considerations, 1 square mm of silicon probably *costs* less than $0.40 to make, on average, including corp overhead.

Many smal/midsize Asian semiconductor firms/fabs do designs at/near cost and make money on the 'float' of the money paid by the customer. In essence, they are financial organizations, not chip companies!

Bill Wiese San Jose, CA

Re: pricing on CPU in new HP calcs (Sunplus SPL...)

*Message #2 Posted by **Tom (UK)** on 30 June 2003, 7:29 a.m.,*
in response to message #1 by Bill Wiese

Your prices look about right.

We make mixed analogue + digital devices and anything bigger than 0.5um technology is getting a bit out of date!

For smaller geometries the mask costs are very high and need production of 100k+ chips per year to justify. (An estimate)

Asian companies (excluding Japan) in our end of the market tend to be much better than Europeans / US at making user equipment but the US / Europe seems better at designing it, but this may be sector dependent.

Re: pricing on CPU in new HP calcs (Sunplus SPL...)

*Message #3 Posted by **David Smith** on 30 June 2003, 5:44 p.m.,*
in response to message #1 by Bill Wiese

Most low end single chip micros sell for under a dollar in quantity. There are many under 50 cents in million plus quantities.

Re: pricing on CPU in new HP calcs (Sunplus SPL...)

*Message #4 Posted by **Ellis Easley** on 3 July 2003, 11:03 a.m.,*
in response to message #3 by David Smith

WalMart sells a "LeWorld" four banger plus square root, percent and memory, battery and solar, for $1.00 every day. Unless they are doing this as a community service, they must be buying the calculator for about 30¢. They charge $2 for a replacement battery!

Trigonometrics in financial applications

*Message #1 Posted by **Valentin Albillo** on 29 June 2003, 9:06 p.m.*

Karl Schneider posted:

"Just curious: Is there any practical application of trigonometric functions for business/finance (excluding calculation of biorythms and constellation positions for making business decisions)?

Of course. There are many practical applications of trigonometric functions for financial purposes, but they tend to be of a sufficiently high level and complexity that the average financial Joe, with his trusty 12C's 99 program steps and not-exactly-very-advanced programming features, won't be able to cut it.

Trigs are used extensively, for instance, to compute the discrete wavelet transforms in financial time series applications (stock price evolution, volatility, ...) as well as in the creation of financial simulation models, where you need to perform a lot of trigonometric decomposition operations to the large matrices that are usually needed to implement the models, among others.

To deal with such advanced financial computations using a handheld, you'd better put aside your cute little 12C and use a really capable machine, such as the vintage Sharp PC-1421 (sold in the US as EL-5510) Business/Financial Computer.

This beautiful, metallic, very slim and light machine is fully alphanumeric, has a complete qwerty keyboard, all financial and statistics functions, a fast 768 Khz 8-bit processor, 4 Kb RAM on board, expandable via RAM/ROM cards, full serial and parallel I/O for connection to a PC or peripherals such as printer and mass storage, and further it's programmable in an enhanced version of BASIC, including two-dimensional string arrays, long variable names, input/output commands, and of course, all financial functions are *integrated as BASIC commands and can be included in complex BASIC programs* ! All this in a beautiful, solid, very small machine.

If you want to see what it looks like, visit these links:

http://www.promsoft.com/calcs/pc1421.htm

http://pocket.free.fr/html/sharp/pc-1421_e.html

http://pocket.free.fr/images/sharp/pc-1421.jpg

So much for HP chauvinism. As they say: "Never send a kid to do a man's job !"

Best regards.

Re: Trigonometrics in financial applications

*Message #2 Posted by **Trent Moseley** on 29 June 2003, 11:39 p.m.,*
in response to message #1 by Valentin Albillo

Valentin,

I agree. While it doesn't have nearly all the same functions, my 1986 Sharp PC-1500A looks almost like the one you describe.

tm

Amazing. I would've sworn that finance had no use for trigonometric functions. Logarithmic ones, yes. How about hyperbolics? So far I haven't learned of a _single_ use for hyperbolic functions in any field.

-Ernie

Hyperbolics everywhere ! (almost)

*Message #4 Posted by **Valentin Albillo** on 30 June 2003, 6:38 a.m.,*
in response to message #3 by Ernie Malaga

Ernesto wrote:

"How about hyperbolics? So far I haven't learned of a _single_ use for hyperbolic functions in any field."

They're used *all the time* in some *very* important Civil Engineering fields, a few assorted examples:

- electrical transportation (trains and such, which draw power from a suspended conducting wire). The wire's shape is a curve called catenary, which is a hyperbolic cosine, and thus you need hyperbolics to compute lengths, weights, stress, costs, etc. This also applies to high-voltage power lines and, in general, to any kind of chain, rope or wire suspended from two points that hangs freely under its own weight.

- superstructure engineering (suspension bridges and such), where you need to compute the elastic curve and the deflection, also require hyperbolic cosines in spades.

- architecture, specially traditional japanese architecture and civil engineering, where curves have various important social and philosophical meanings (temples and other relevant buildings). Japanese and oriental architects frequently use the catenary shape (hyperbolic cosine) for the upward-pointing curves in their constructions instead of the less-quickly-raising parabolas.

- aerospatial engineering: engineers (from Boeing, for example) face a problem in applying a surface coating to fighter aircraft. The critical feature is the electrical conductivity at the surface. This physical property determines how an electromagnetic wave will scatter when it hits the aircraft. For some fighter parts, the ideal coating varies along the surface according to the hyperbolic cosine function.

etc, etc. Matter of fact, students of the Civil & Environmental Engineering divisions of most universities are required to be confident with the manipulation of hyperbolic functions and the solution of hyperbolic equations. I guess such an student would find himself as much at a loss using a calculator without hyperbolics as you and me would be using one without division, say.

"There are more things in heaven and earth, Horatio, Than are dreamt of in your philosophy."

Except hyperbolic functions are fairly easy to calculate, if you have natural log and exponential functions, I think (I can't find the functions right now! But they are fairly simple).

Re: Hyperbolics everywhere ! (almost)

*Message #6 Posted by **Thibaut.be** on 30 June 2003, 9:25 a.m.,*
in response to message #5 by Ellis Easley

These functions were on the cover of the electrical engineering solution book for the 41C. The artwork of this book was so well designed that even if I never had to use them I memorized the formula for ever. They are geniously simple :

sinh x = (e^x - e^-x)/2 cosh x = (e^x + e^-x)/2 tanh x = sinh x / cosh x (who wouldn't have guessed this one ?)

now go on with the properties of sin, cos, tan and see if they apply to hyperbolics...

Things are not what they seem

*Message #7 Posted by **Valentin Albillo** on 30 June 2003, 9:51 a.m.,*
in response to message #5 by Ellis Easley

Ellis wrote:

"Except hyperbolic functions are fairly easy to calculate, if you have natural log and exponential functions, I think (I can't find the functions right now! But they are fairly simple)."

Yes, the hyperbolic sine and cosine seem fairly easy, being

sinh(x) = (e^x - e^(-x))/2, cosh(x)) = (e^x + e^(-x))/2

but then the derived and inverse functions begin to *complicate* somewhat:

tanh(x) = (e^x - e^(-x))/(e^x + e^(-x))

arcsinh(x) = ln(x + (x^2 + 1)^(1/2))

arccosh(x) = ln(x + (x^2 - 1)^(1/2))

Not having them built-in means, then, that:

- you must *remember* the above expressions (and the ones for the remaining functions not shown) *flawlessly*, or else you'll have to program them, which requires a programmable calculator which isn't usually admitted in most exams !
- if you can't program them (for above reason or simply you don't have a suitable programmable calculator), you must resort to sheer memory and very precise keypunching. After you've calculated more than a few that way, you'll be craving for a calculator which includes them built-in.
- even if you can use a programmable calculator and/or don't mind frenetic keypunching, there's the *big* problem of *accuracy*. Not all calculators have really accurate versions of e^x and, specially, logarithmic functions, at all. But even if they did, there's the catch that for certain arguments which happen very frequent in real-life applications (such as values near 0 or near 1, depending on the function) there's *a lot of cancellation*, and you'll end up losing most significant digits, and so getting *wildly inaccurate results*. That's why the HP-41C (which didn't have hyperbolic functions) did nevertheless include the two rather exotic functions E^X-1 and LN1+X !!

So, you see, if you need to use hyperbolic functions frequently, you *absolutely* need to have them built-in from the start in your choice calculator. Else you'll lose time, effort, accuracy, or even worse, the possibility of using your carefully programmed versions in an exam.

Best regards.

Re: Hyperbolics everywhere ! (almost)

*Message #8 Posted by **Ellis Easley** on 30 June 2003, 9:55 a.m.,*
in response to message #5 by Ellis Easley

sinh(X)=((e^X)-(e^-X))/2

cosh(X)=((e^X)+(e^-X))/2

tanh(X)=sinh(X)/cosh(X)

I found these in the HP35 Math Pac. Beyond this, they use formulas with trig functions [including for tanh(X)], which I guess are easier (if trig is available) than sticking with the log formulas.

I wish I could remember where I saw all three functions and inverses using only log and exponential. (I guess I could try to derive them from the three formulas above, but I wouldn't trust me either!)

And don't even get me started ...

*Message #9 Posted by **Valentin Albillo** on 30 June 2003, 10:37 a.m.,*
in response to message #3 by Ernie Malaga

... on *elliptic* sines and cosines ! :-)

They're tremendously useful in many advanced technological fields (design of *optimum* high-pass, low-pass and band-stop filters comes to mind), unlike their hyperbolic cousins there are *no* simple formulas to compute them, yet I know of no calculator or handheld that did ever include them as built-in functions !

And it's a real pity: it would be very elegant and proper for an advanced 21st-century calculator to have all three kinds of trigonometric functions: *circular* [like sin(x)], *hyperbolic* [like sinh(x)], and *elliptic* [like sn(x)] ... :-)

Best regards.

So, now defend Gradians . . .

*Message #10 Posted by **Paul Brogger** on 30 June 2003, 12:57 p.m.,*
in response to message #3 by Ernie Malaga

. . . they alwasys seemed kind of bogus, and were looked-down-upon by my pure-math pro-HP-calculator professor. (But he looked down upon Degrees, too, and wanted to use Radians for everything -- the formulas are so much cleaner.)

So what's GRAD for? Is it a weird decimal hold-over, or is there some intrinsic value there?

(I think I'm ready to admit that "There are things, Horatio . . . ")

No way ...

*Message #11 Posted by **Valentin Albillo** on 30 June 2003, 1:04 p.m.,*
in response to message #10 by Paul Brogger

I've never used gradians in my whole life, and don't feel like starting now. You'll need another paladin to defend that lost cause, methinks ... :-)

Best regards.

Elementary, my dear Watson...

*Message #12 Posted by **Bob** on 30 June 2003, 3:02 p.m.,*
in response to message #10 by Paul Brogger

The Gradian is a measure that is traditionally applied in the field of surveying. (No pun intended) 100 Gradians is equal to 90 degrees so it is more suited for these calculations. As you can tell from the link below, it is seldom seen in pure mathematics.

http://mathworld.wolfram.com/Angle.html

Unless you are a Civil Engineer, a Surveyor, or just interested in finding out, you probably just learned the conversion (or not) and moved on.

There is also an explanation for the use of Radians and Steradians.

I forgot to add...

*Message #13 Posted by **Bob** on 30 June 2003, 3:06 p.m.,*
in response to message #12 by Bob

...that it is a pretty cool website too. Check out the "Recreational Mathematics" area.

Re: So, now defend Gradians . . .

*Message #14 Posted by **Tizedes Csaba** on 1 July 2003, 11:16 a.m.,*
in response to message #10 by Paul Brogger

I hope it will be post...

---------- Gradians:

It's came from Earth's sizes:

Average Radius of Earth (IAU): R=6371.024km; average circumfence: C=2*R*Pi=40030.3km; 1grad=C/400=100.08km (about 100km) on Earth's surface;

Like nautical mile: 1nmi=1852m=(about)=40030.3km/(360*60); 1nmi=1arcmin on earth surface;

And 1knot=1arcmin on Eart surface/1hour

Csaba

Re: Trigonometrics in financial applications

*Message #16 Posted by **Karl Schneider** on 30 June 2003, 4:55 a.m.,*
in response to message #1 by Valentin Albillo

Valentin --

Great post! -- exceptionally well-presented and informative.

I have no knowledge about the "discrete wavelet transforms" and "trigonometric decomposition operations" for finance, but they sound similar in principle to Fourier analyses. It would certainly make sense to try to identify all significant periodic components of a stock price, and its relationship to multiple factors.

I surmised in my original post the the 19B/ii had trigs (Luiz confirmed "yes"; interestingly, the predecessor 18C did not.

Great effort!

Karl

Re: Trigonometrics in financial applications

HP41 Custom Module ???

*Message #1 Posted by **Randy Sloyer** on 29 June 2003, 7:47 p.m.*

I have an HP41 module that I would love to know what it is. It has no external markings of any kind, the label area on the bottom where the HP label normally resides is a bit smaller and is blank.

When the module is inserted in a CX, the contents will execute upon power up. I see one goose for about a second then the display shows WAIT.. After about 30 seconds to a minute the 41 beeps and shows READY in user mode.

Doing a CAT 2 shows NAVCOM 2. Anybody have any idea what this puppy is ?

Edited: 29 June 2003, 7:49 p.m.

Re: HP41 Custom Module ???

*Message #2 Posted by **Raymond Del Tondo** on 29 June 2003, 8:19 p.m.,*
in response to message #1 by Randy Sloyer

Hi,

it seems to turn the HP-41 into a NAVigation COMputer;-)

Raymond

Re: HP41 Custom Module ???

*Message #3 Posted by **Randy Sloyer** on 29 June 2003, 8:22 p.m.,*
in response to message #2 by Raymond Del Tondo

Via HP-IL? Or ?

Who made it and what else does it need to function?

Edited: 29 June 2003, 8:23 p.m.

Re: HP41 Custom Module ???

*Message #4 Posted by **Raymond Del Tondo** on 30 June 2003, 5:06 p.m.,*
in response to message #3 by Randy Sloyer

Hi,

sorry I don't have this module (so far), but I'm sure the 'hardcore module collectors' Matthias, Mike, or Peter Petersson do have it, and could give more info on it;-)

I think it's a stand-alone solution, which seems to be most practical when sea is rough (not many items which can fly through the cabin).

Raymond

Re: HP41 Custom Module ???

*Message #5 Posted by **Randy Sloyer** on 30 June 2003, 7:43 p.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,

You're right, hard core. Someone offered to buy but no information on what it is. I was hoping for a great story on it's history and use. Oh well.

Thank you for the effort, at least you tried.

HMC - Hardcore Module Collector

*Message #6 Posted by **Mike (Stgt)** on 1 July 2003, 4:08 a.m.,*
in response to message #4 by Raymond Del Tondo

I do not know who you ment with 'Mike', if it's me: I do not regard myself as a "hardcore module collector" as too many third-party modules (the rare birds) are still missing in my collection. What I did is a nice tool to analyse the contents of HP-41 modules, alas it runs only on VM/CMS (IBM mainframe). http://ourworld.compuserve.com/homepages/nutem/aro.htm

If you don't mind, you may send me a copy (hp41cx_at_web_dot_de) and I analyse it like all this: http://ourworld.compuserve.com/homepages/nutem/romim.htm

Ciao.....Mike

HMC - Hardcore Module Collector

*Message #8 Posted by **Mike (Stgt)** on 2 July 2003, 8:12 a.m.,*
in response to message #7 by Emmanuel

Ha! Là il est! Le vrai HMC! Salut Emmanuel! Ca va?

Well, yes most functions seem to be the same as in NAV1B, but there are few new ones. Is it possible that someone copied together what he found useful for his/her own purpouses. Or do you have a manual especially for the NAV2A in your hands?

Ciao.....Mike

PS: More off-list pls.

Analysing ROM images

*Message #10 Posted by **Tony Duell (UK)** on 1 July 2003, 5:34 p.m.,*
in response to message #6 by Mike (Stgt)

If you don't have an IBM mainframe handy (:-)), then you might want to look at the 'rom41cat' program in my LIF Utilities for Linux distribution. It's written in C, and should be reasonably easy to port to other OSes. It doesn't do quite as much, but it will list the function names, whether they are Focal or Mcode, and the entry points. I find it quite a useful tool for looking at unknown ROM images.

Analysing ROM images

*Message #11 Posted by **Mike (Stgt)** on 2 July 2003, 8:13 a.m.,*
in response to message #10 by Tony Duell (UK)

In a few month our IBM host will be shut down for ever. So I'll remember soon your routine, shure <G>.

Ciao.....Mike

Quote:

> Will Pipe http://vm.marist.edu/%7Epipeline/ run in that emu?

Sorry Mike, I really don't know.

I tried this emulator a couple of years back for a short time and had a few problems with it (some errors in the source prevented compilation, but I finally managed to try it a little. At the time I was in a nostalgic mood for the days past... kinda like when I began collecting HPs. No, I won't begin looking for used IBM mainframes: already out of space! **;-)**

I really hope that it can be of help to you.

Massimo

Spices: Internal check for ID # and the "2" disease

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 6:33 p.m.*

Hello guys, Norm mostly;

I summarized below all information I could gather about Spices (some with me, some with other people). If I have the chance to collect more data OR if anyone else can add new info, let's feed this thread and later we can put all of the information together and, maybe, identify common points related to the "2" disease.

Columns are:

ID# - calculator identification number/code.
"2" - "2"-disease occurrence: Y means it has the "2" disease, N means it doesn't.
CT - Construction type - a single S means soldered; SL means solderless.
CPU ID # - CPU Identification number/code - I added the "date code", which is a lot better than calculator's serial #.
1, 2, 3 - position reference for extra 8-pin DIP IC's, being 1 the IC closest to the LED display; ---- indicates no IC present.

ID#	"2"	CT	CPU ID #	1	2	3	OBS
31E	N	SL	1820-2105-B (7922YY)	----	----	1MA301	
31E	Y	S	31E 2438	00031	----	1MA15002	(1)
33E	Y	SL	1820-2105 (7822EX)	----	1MA10204	1MA10003	
34C	N	S	34C/B-2102 00034-69110	1LB902	1MA10014	1MA115	(1)
37E	Y	SL	1820-2122 (7819MO)	00031	no_label	1MA10008	(2)
38C	N	S	38C/B-2102 00038-69110	1LB903	1MA30006	----	(1)
38C	N	SL	1820-2162 (7944DY)	1LB903	1MA305	----	
38E	Y	SL	1820-2122-A (7850MC)	1MA107	1MA10013	1MA10005	
38E	Y	SL	1820-2122-A (7916CS)	1MA105	1MA113	1MA30003	

(1) - CPU ID in paper label; I tried to remove to see the actual chip code, but it would destroy the label.
(2) - the "no_label" means there is a chip and no identification on it.

If the table does not look O.K. for you (screen resolution or other reason) you may edit this post and copy/paste its contents so you can visualize it in any text editor.

If the code found beside CPU's ID number (right side, in parenthesis) is a date code and first two digits refer to the year, then it's easy to observe in this sample that calculators before 7916 (four units) show the "2"disease symptom, and the ones after 7922 (two units) do not. But this is not enough sample to conclude anything about it. One single unit after 7922 with the "2"disease and we start over.

Hope this helps a bit. And please, if someone else feels confident opening their Spices and checking, you can edit this one just to sample the table below and fill with new values, if you think it's well built. If you want to add your information your own way, please, feel free organizing it the best way you find. It will be useful as well.

Best regards

Luiz C. Vieira - Brazil

Re: Spices: Internal check for ID # and the "2" disease

*Message #2 Posted by **Ellis Easley** on 30 June 2003, 9:21 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Here's the numbers from my 34C's. I added the serial number prefix for the units. There are datecodes on the 8 pin IC's, too, but they are in a different format with 5 digits. I have one question: do all units with the "2" behavior also flash the minus sign and random commas while executing built-in functions? (enter -99.9 and press "X!" to keep the machine working for almost 30 seconds)

```
ID# "2" CT      CPU ID #              1       2       3       OBS    UNIT S/N PREFIX

34C  Y  SL  1820-2162 A (7906)    1LB5 002  1MA1 14  1MA1 0015           1934A
34C  N  S   1820-2162 (8047)      1LB9 02   1MA1 14  1MA1 15             2051S
```

> Quote:
>
> (2) - the "no_label" means there is a chip and no identification on it.

The chips with a very shiny black plastic package marked with mettalic-looking ink are sometimes very hard to read. I think this is why they started burning the markings in with a laser! Sometimes if you shine a flashlight from different angles, and change the angle you eye is looking at the chip, you can read the markings.

Calculator stores in Germany/Austria?

*Message #1 Posted by **Eduardo** on 29 June 2003, 6:18 p.m.*

Hi,

I'm visiting Austria (Graz) next week, and Germany the week after (Frankfurt, Koblenz, maybe more). Is there any hope I can find better prices or more variety of (collectable) HP calculators during my trip? Flea markets, electronics stores or other sources? Any help/suggestions would be very welcome. Thanks!

Eduardo

Edited: 29 June 2003, 6:19 p.m.

Re: Calculator stores in Germany/Austria?

*Message #2 Posted by **Raymond Del Tondo** on 29 June 2003, 8:32 p.m.,*
in response to message #1 by Eduardo

Hi Eduardo,

my experience (for Germany) is that on flea markets, HP calcs are rare, and those office suppliers who actually had one or more of the more interesting calcs, wanted to sell them at the regular prices...

However, this way I got a NIB 14B a few years ago.

At least in Frankfurt should be some office suppliers, which you could try.

AFAIK the electronics shops here in Germany don't carry HP calcs at all.

Regards,

Raymond

BTW: Did your friend in Koblenz send you a mail?

Re: Calculator stores in Germany/Austria?

*Message #3 Posted by **Randy Smith** on 30 June 2003, 6:43 p.m.,*
in response to message #2 by Raymond Del Tondo

I was able to find an HP 22S at a flea market in Bitburg for 5 euros. It was dusty but it actually worked. I have been to literally hundreds of flea markets since I have been stationed in Germany and this is the only the 2nd HP calc I have seen. I did find 28S manuals in German at a flea market in Homburg Saar but alas no calc to go with them. So, I would have to agree with Raymond that HP calcs at flea markets are quite rare. I would go farther and say practically non-existant. Almost forgot, found a non-functional 32E in Kaiserslautern for 3 euros.

Questions about the HP71B

*Message #1 Posted by **jose goncalves (Brasil)** on 29 June 2003, 11:41 a.m.*

I've got a couple of questions about the HP71B:

1) What is the charger model for this computer ? Can we use a charger when using no-rechargeable batteries ?

2) How to use the HP-IL port (single type) ? I've been through the Archives and the email I faund for someone that had the information aparently is no longer valid. Can I have the PDF file of instructions for this type of HP-IL device ?

Thanks

Jose

Re: Questions about the HP71B

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 1:18 p.m.,*
in response to message #1 by jose goncalves (Brasil)

Hello, José;

About the HP71B, I asked a few questions to Doc. Mike Meyer a couple of days ago and I was told that the same AC adapter used by the topcats (HP9x), HPIL printer and tape driver, HP9114B and HP82143A (HP41 printer) can be used with it. I tested and it works fine.

I am using four AAA NiCads with mine and I was also told by Doc. Mike Meyer that the HP71B cannot charge batteries. The AC adapter works the same way that the AC adapter for the HP82240A/B: it feeds part of the power, but cannot charge batteries. Kind of "power support".

If you have the MoHPC CD pack, have a look at CD #2 (if I am not wrong) and you will find the book "Controlling the Word with the HPIL". There are many good information there. I read a few parts of it briefly, because I'm still learning hwo to deal with the HP7.

One thing I did so far was to connect the HP41 to the HP71B and execute ID in the HP41 (if I am not wrong, ID is an Extended I/O function, not a standard HPIL funciton; you should check, please) and I could read:

```
[HP71      ]
```

in the HP41 ALPHA register. They talked to each other!

As I'm getting acquainted to the HP71 I'm asking more questions, too.

Hope this helps for now,

Best regards.

Luiz C. Vieira

Oops! Books are in CD #3...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 2:15 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hello, José;

I was wrrong (again): the book I mentioned is in CD #3, BOOKS directory, and the file name is CNTHPIL.PDF.

It's worth taking a look at it.

Best regards.

Luiz C. Vieira

Re: Questions about the HP71B

*Message #4 Posted by **Gordon Dyer** on 29 June 2003, 1:18 p.m.,*
in response to message #1 by jose goncalves (Brasil)

The ac charger model for the 71B with 110v ac input is 820590. The power into the 71B is 8v ac 3W and any psu which supplies this is ok.
It does not charge batteries internally and the ac input is seperate from the batteries, it can be used on the 8v ac input without batteries fitted. Use 4x AAA alkaline batteries only (1.5V) not NiCd.
You need to fit batteries to maintain the memory contents when the ac power is off.
When changing the batteries have the ac power switched on to ensure that the memory contents are retained, otherwise there is only about 30 seconds of memory retention time.

19BII keys

*Message #1 Posted by **Scuba Diver** on 29 June 2003, 11:31 a.m.*

Hello everyone!

I'm an MBA student and I wanted to get a backup 19BII so I've been looking on eBay. I've noticed the following differences between various 19BIIs:

1) Canadian/US models have a different label (on the inside above the alpha keyboard) than international models do. The international ones simply explain how to change the language of the calculator

2) Some keys are double-molded and some are painted..well, at least that's what I assume...some units have shiny keys and others have more of a matte finish (I assume this latter group have painted keys).

Can anyone confirm this? Are the calculators with the matte-finishe keys painted, and if so, do they really have a lower lifespan than double-molded keys? I know that the double-molded should theoretically last longer, but has anyone ever seen painted keys wear off?

I do prefer the double-molded keys (your finger seems to grip the key better), however the two that I've bought recently have painted keys and I don't feel like spending my spare time buying tons of them on eBay until I find one I like, so I think I might settle with what I have.

Insights would be greatly appreciated! Thanks! B.

82163B

*Message #1 Posted by **Malcolm** on 29 June 2003, 4:45 a.m.*

I have a 82163B Video Interface that I would like to sell on ebay but I want to make sure that it will work in the USA. What I mean is - there is a tv output as well as a monitor output. Here in Australia we use pal and in USA is NTSC. Is this just for color or does it apply to Black and White as well. Was there a different version of the 82163 for USA.

Thanks Malcolm

Re: 82163B

*Message #2 Posted by **Chris(FLA)** on 29 June 2003, 10:16 p.m.,*
in response to message #1 by Malcolm

Malcolm,

NTSC and PAL are different with or without color. NTSC is 60Hz. and PAL is 50Hz.

My interface is a 82163A model for the USA.

In the manual is this note.

* One HP-IL Cable.
* One ac adaptor.
* One TV/monitor cable.
* One switch box(inside the U.S.A.) or one cable adaptor (outside the U.S.A.)

note:
This manual specifies the TV channel used by the HP 82163A, which is the version designed for operation in the U.S.A.

Chris

Re: 82163B

*Message #3 Posted by **Malcolm** on 29 June 2003, 11:42 p.m.,*
in response to message #2 by Chris(FLA)

Thanks Chris,

Would I be safe in assuming that the Monitor interface is independant. ie same for 82163A and 82163B.

Also here in Aus most older TV's came with NTSC and PAL inputs, was this the case in the USA as well.

Thanks Malcolm

Re: 82163B

*Message #4 Posted by **Chris(FLA)** on 30 June 2003, 6:29 p.m.,*
in response to message #3 by Malcolm

Would I be safe in assuming that the Monitor interface is independant. ie same for 82163A and 82163B.

The monitor interface is most likely before the RF(TV) output. So they would not be the same on both units. PAL is PAL either composite or RF.

NTSC is 30fps or 60 fields per second. PAL is 25fps or 50 fields per second.

Also here in Aus most older TV's came with NTSC and PAL inputs, was this the case in the USA as well.

No this was not the case with consumer TV's. Atleast I never came across any. The only NTSC/PAL "monitors"(not TVs) that I saw was when I worked in the broadcast/industrial video business. Mainly VERY expensive monitors in studio control rooms and editing suites. Even these were rare to say the least.

I think your "B" model is PAL only and will have very limited use in the USA.

I am not an expert concering HP's different models of this unit though. If anybody can contradict my conclusions on this please do.

I just thought of something when proofing this message Comodore made some NTSC/PAL "monitors". I remember being able to run some PAL programs on my Amiga A1000/A2000 computer. But that was a long long time ago in a far away land...

Chris

I have a couple of computers with PAL output and I can view their output (in black and white) on NTSC monitors that have vertical hold and vertical size controls. The color subcarrier is different, so I can't see the color from my BBC Model B. But both NTSC and PAL use a horizontal frequency of about 15,750 Hz, so the hard part works!

Re: 82163B

Thanks Ellis, Black & White would be fine as you/we know the video interfaces don't do color.

Malcom, there is some hope for being able to use your "B" unit in the U.S. They only slight problem is that the manufactures seem to be removing these controls from monitors. For what reasons I can't think of except cost maybe?

Chris

Re: 82163B

*Message #7 Posted by **Johnny Billquist** on 7 July 2003, 5:57 a.m.,*
in response to message #6 by Chris(FLA)

I wouldn't try to use a 82163B on an NTSC monitor. It is more than the color encoding that differs.

To make a long story short, this is the difference between 82163A and 82163B:

	82163A	82163B
Frequency	61.25 MHz	62.25 MHz
Lines	525	625
Update freq.	60 Hz	50 Hz

(I sure hope that became readable...)

Re: 82163B

*Message #8 Posted by **Ellis Easley** on 9 July 2003, 9:58 p.m.,*
in response to message #7 by Johnny Billquist

61.25 MHz would be within US TV channel 3 (I believe it is 60-66 MHz) and I know the video carrier is near one end of the channel and the audio carrier is 4.5 MHz above the video, which would be 65.75 if I am correct. So I think that frequency refers to the RF modulator output and not the video output. It is true that the vertical frequency is very different but monitors with vertical hold and size adjustments usually have a lot of range, and since the horizontal frequency is almost identical (about 15.75 kHz), that part is no problem.

But I thought the PAL version of the 82163 didn't include an RF modulator. Also, I understand the RF frequency commonly used in the UK, at least, for connecting things to a TV was in the vicinity of US UHF TV channel 33 (around 584 MHz : [(channel - 14) * 6] + 470 MHz) - I first learned this from a friend who ordered the Sinclair 1000 as a kit from England and then later, found the same to be the case with my BBC Model B. Whatever the exact frequency, a TV with adjustable fine tuning can display the black and white signal as long as the vertical is also adjustable. But 62.25 MHz would still be within US TV channel 3.

US TV channels are all 6 MHz wide and are separated into three bands: 2-6 (VHF low) starting at 54 MHz, 7-13 (VHF high) starting at 174 MHz, and 14-69 (UHF) starting at 470 MHz. There used to be a channel 1 but the frequency was given to amateur radio. Also, there used to be UHF channels 70-83, I think those frequencies are now used for cell phones.

HP-12C Platinum's CPU

*Message #1 Posted by **Valentin Albillo** on 29 June 2003, 2:41 a.m.*

Hi all:

There's been much speculation here re if HP's going to re-release 'Platinum' versions of other favorite RPN vintage calcs, such as the 15C, etc. Should that happen, I guess the CPU used would be the same as the one in the new HP-12C Platinum, in which case at least that important factor would be Ok, the only things that could then go wrong being the emulation of the old CPU if the ROM code is still available, or the rewriting of the whole ROM if the old code was lost (as in the HP-12CP), with the more than likely introduction of bugs, non-optimal algorithms (not Mr. Kahan's for sure), or even worse, lessened accuracy and unnecessary inefficiency, i.e: slowness.

As for the CPU itself, the HP-12CP CPU is a high-tech 8-bit beastie, which can work at voltages from 2.4 V to 5.5 V, at speeds of up to 1 Mhz, and which admits up to 30 Kb of ROM, 128 bytes SRAM for CPU working space, and 2 Kb SRAM for data. It features 8 I/O ports, LCD controller/driver capable of handling up to 480 dots or equivalent segments, built-in R-oscillator and 32.768 Khz crystal oscillator, 8-bit reloadable timer/counter, NMI controller, and many more goodies. In other words, if appropriately programmed, it can deliver. And as for programming, its 'SDK' (Software Developer's Kit) does include a translator which will accept programs written in 6502 assembler and translate them into its native CPU machine language as long as they are valid 6502 instructions, thus easing even more the task of HP programmers (or those subcontracted by HP, more likely).

Anyway, those of you more hardware-oriented than me will probably know better, but IMHO, it sounds good enough for the heart of a classic calculator, isn't it ? Specially since the 71B's CPU (and even the HP-85's for that matter) ran at 0.6-0.8 Mzh, and they were quite capable machines. I know their CPUs were of a very non-standard, proprietary design, optimized for BCD math with large CPU 'registers' and specialized opcodes, but even so ...

Best regards.

Edited: 29 June 2003, 3:12 a.m. after one or more responses were posted

I agree, mostly if...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 2:59 a.m.,*
in response to message #1 by Valentin Albillo

... they actualy "emulate" them the right way, something better than the HP12cP: memory enhancement, original Voyagers' digits shape back ;^) and NO BUGS, please!

Based on specs you showed us (thanks, Valentin; where did you get these?), it is fairly able to hold any Voyager and more powerfull machines. I think a mix of the HP15C and the HP16C with at least 256 registers for matrices (16 × 16 elements) would be more than enough for me, but I know the HP16C's features are too specialized, as mentioned in some posts, and will probably be disregarded.

As for the others, digital designers now have the benefit of higly optimized O.S. and specialized software. I believe that a good design will allow very good results.

If they only could keep HP's layout... I am showing the HP71B to my students and other professionals that

work with me. When I mention it's about 16 Y.O. (at least my unit) and that it was designed when I was at the univerity, they express admiration. And it looks as a current design.

Time will tell, HP will show...

Best regards and thank you, Valentin; very good words, indeed. My turn to say: I enjoyed reading.

Luiz C. Vieira - Brazil

Re: I agree, mostly if...

*Message #3 Posted by **Chris Roccati** on 29 June 2003, 5:44 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Do you know that 256 16x16 matrices in the 7 bytes "voyager" floating would need nearly 512KBytes?

Now I'm curious... (edited)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 11:35 a.m.,*
in response to message #3 by Chris Roccati

Hello, Chris;

you let me curious about it. I simply took 16 times 16 (256) times 7 (bytes per register) and thought it would be necessary 1782 bytes, as we have in one HP41 Quad memory module. I know a standard HP42S, 8KRAM, no registers (SIZE 000) can hold a 28 X 28 matrix, leaving 897 bytes free. I did not try to perform any matrix operation, just created it.

Would that 512K be necessary to perform operations?

Thank you.

Luiz C. Vieira - Brazil

Edited: 29 June 2003, 2:17 p.m.

Re: Now I'm curious... (edited)

*Message #5 Posted by **Chris Roccati** on 29 June 2003, 7:20 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I interpreted your statement as enough registers for 256 matrices of 16x16 elements. Now I see what you did really mean...

Re: I agree, mostly if...

*Message #6 Posted by **Erik Ehrling (Sweden)** on 29 June 2003, 2:37 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

> fairly able to hold any Voyager and more powerful machines.

The downside, at least from what I understand of the specs, is that it might be powerful enough to power a Voyager, but it certainly won't be powerful enough to power a high-end Pioneer; so either HP is also considering a more powerful architecture or we won't ever see a replacement for the more advanced Pioneeers...

Can anyone tell me one thing that I cannot understand - why doesn't HP use something more powerful - for example why not base a new calc on the StrongARM microcontroller (or similar)?

Best regards, Erik Ehrling (Sweden)

Re: I agree, mostly if...

*Message #7 Posted by **Meindert Kuipers** on 29 June 2003, 2:54 p.m.,*
in response to message #6 by Erik Ehrling (Sweden)

The current 8-bit microcontrollers are highly integrated and very very low on power, expecially at low frequencies. Very important as well is that the price of these 8-bitters is probably well below $5 in the quantities that HP is hoping to sell. I would choose an 8-bitter myself, even for a high-end calculator. There are 8051's running at 50 MHz that cost $3 in quantities. The Motorola HCx08 is in the same ballpark. A StrongArm would allow you to run a proper operating system (PalmOS, Windows, Linux) but we do not need that in a calculator, do we ....?

On the other hand, Texas is using a 32-bit 68000 derivative for its graphing calculators which is more powerful but requires larger batteries.

Meindert

Re: I agree, mostly if...

*Message #8 Posted by **David Ramsey** on 29 June 2003, 4:04 p.m.,*
in response to message #7 by Meindert Kuipers

You know something? I don't really care what processors any new HP calcs might use. Frankly, performance of even the oldest programmables is sufficient for the limited uses to which they were put (I've wondered why existing graphics calculators, even the 68000-powered T.I. monsters, are so damn slow, though...).

What I care about are the internal algorithms. The HP of old sweated blood making sure the internal numerical algorithms gave the best accuracy possible, handling difficult edge cases and using intelligent rounding and such. All HPs showed a great deal of "orthogonality"-- operations could be generalized. At its simplest this is illustrated by register arithmetic, but was fully realized in calcs like the 28S, in which "+" would do the right thing no matter what was on the stack (numbers, complex numbers, symbols, matrices, strings, etc.)

I think one of these calcs-- perhaps the 71 or 75-- was the first computer of any type to fully implement the IEEE floating point standard.

After reading about how HP has screwed up the relatively simple and well understood financial algorithms in the 12C Platinum, I'm nervous.

Re: I agree, mostly if...

*Message #9 Posted by **Erik Ehrling (Sweden)** on 30 June 2003, 11:40 a.m.,*
in response to message #8 by David Ramsey

> What I care about are the internal algorithms. The HP of old sweated blood making sure the internal numerical algorithms gave the best accuracy possible, handling difficult edge cases and using intelligent rounding and such.

I totally agree on a good algorithm on a low-performance CPU being preferable to a suboptimal

algorithm on a high-performance CPU, but must it necessarily be a forced choice? Can't we have a good algorithms on a high-performance CPU?

I can see two areas that would immediately benefit from good algorithms on a high-performance CPU: 1) Larger numerical problems (larger matrices, higher precision in numerical integration etc.) 2) Symbolics (yes, I am impressed by both Erable on the HP48 and Derive for DOS on the HP200LX but my feeling is that these pieces of software are pushing their respective platforms to their very extremes, I might be wrong but higher performance might actually be a requirement to do much more than these programs do)

Also, one interesting observation about for example the HP-42S is that it only provides restricted access to ML programming and therefore has almost 100% of its program base written in UserRPN. Such a calculator is therefore very suitable for a new CPU platform. (Much more than the HP48 for example, where a majority of the best software is written in ML).

Best regards, Erik Ehrling (Sweden)

Of course good algorithms on a high performance CPU are preferred!

But putting in a faster CPU is easy and cheap. Hiring people capable of doing numerical work of the calibre that was normal in older HP calcs is not.

SysRPL, UserRPL and good, old, plain RPN

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 30 June 2003, 12:33 p.m.,*
in response to message #9 by Erik Ehrling (Sweden)

Hello Erik, guys;

If you allow me to add a few words to your good words, let me also tell you that I liked them very much. Our point of view over some subjects matches in many aspects.

The "hidden" SysRPL/machine code, at least to the average user (*), allows good and bad consequences. As one of our contributors mentioned it well, when he needs some application that already exists as downloadable library, he simply uses it and does not care much about its source code. In fact, we do it when using internal resources: SIN, SQRT, SOLVE, etc. are internally coded and we use them as well, no further inspection.

In other hand, when those of us who want to go further and find "hidden" secrets claiming to be disclosed, then there's no such well locked secret that human mind cannot reveal. It becomes a matter of honor being able to use them and show how deep one can go into a highly dense O.S.

We, poor mortals, can only dare dreaming of having the chance to follow these guys. I'm one of these who dare dreaming of spare time to delve into RPL and Saturn assembly language secrets. When I believe I'll have a few hours to open the door and look carefully inside, some sort of "life call" rings the bell. The world is ours when we are younger, but when we are aged, there are always guys younger than us to claim its possession. Life cycle, no way out...

Oops! Off topic... keeping track... O.K.!

I believe in widely spread documentation. Maybe I'm wrong, but amongst the best calculators (equipments in general, any brand), the most successful are the best documented ones: TI58/59, HP41, HP71, HP48, TI8x series and others as well. Particularly the HP71 that followed the "open architecture" philosophy since its introduction. I remember it well, anyone I knew that was acquainted to HP "restricted architecture policy" was taken by surprise when knowing HP granted access to the HP71 internals documentation.

That's what I believe would help any portable computing device to be successful: flexible, powerful, user selectable O.S. and related algorithms, CPU with compatible, top performance and available, not restricted documentation.

If IBM PC® is not a good example, I cannot find another one.

Best regards.

Luiz C. Vieira - Brazil

(*)I know there are ways to view the source code, but most users do not even have the time to list SysRPL programs and try to understand it, mostly if they are on their way to master UserRPL.

Old HP (and calculators) will never come back

*Message #1 Posted by **Renato** on 29 June 2003, 12:32 a.m.*

The 12C platinum is a (still) living proof of that.

In a 1972 advertisement about the hp-35 you can read:

> Quote:
>
> Many people know us as an instrument manufacturer: we make more than 2,000 products for measurement, test and analysis. Others know us as a computer company: more than 10,000 own our programmable calculators and computers. We prefer to think that our business is to serve measurement, analysis and computation needs . . . in science, industry, medicine and education.

Current HP does not "serve measurement, analysis and computation needs . . . in science, industry, medicine and education". Current HP is a consumer and corporate products company. Former HP was a company providing products for R&D teams, working at customer core-business projects. Current HP printers come with ink cartridges containing 1/3 ink of regular capacity.
IMO, Agilent is all that is still left of former HP. Just read the quote above another time, and I guess you´ll agree that technical calculators (opposed from consumer calculators) should be Agilent products.

Re: Old HP (and calculators) will never come back

*Message #2 Posted by **Wektor** on 29 June 2003, 1:02 a.m.,*
in response to message #1 by Renato

You're right 100% ... there won't be any "new" HP-41C/CV/CX, HP-42S, HP-71B, HP-15C, ... Perhaps they will introduce something like HP-49G+ or HP-49GII but old cals are gone forever.

Re: Old HP (and calculators) will never come back

*Message #3 Posted by **Paul Brogger** on 30 June 2003, 1:13 p.m.,*
in response to message #1 by Renato

We should gather all of our favorite quotes from the old H-P's manuals. I think someone else pointed out not-too-long-ago a quote that I recently found again in the inside front cover of the HP-34C manual (April, 1980 -- Rev. B):

"Each of our calculators is precision crafted and designed to solve the problems its owner can expect to encounter throughout a working lifetime."

Does *ANY* company make such claims these days? I believe I would today reflexively dismiss these words as meaningless marketing hype, in whatever context.

It's amazing that the old H-P could print that in black & white, and then could back it up with a rock-solid piece of equipment that is still operating perfectly, thank you very much indeed . . .

YUP, it lasts a lifetime, HP vs Agilent

*Message #4 Posted by **Norm** on 30 June 2003, 3:47 p.m.,*
in response to message #3 by Paul Brogger

YUP, it lasts a lifetime. A 34C is STILL a preferred tool for dealing with various minor math problems I encounter.

So how do we get these dim-witted mafia-goons called "HP" to release the last plundered remnants of the calculator division to the scientific minds who still exist over at Agilent????

I BOUGHT A 12C - LOOKS LIKES A CRAP

*Message #1 Posted by **John Smith** on 28 June 2003, 9:15 p.m.*

I just bought a brand new HP-12C. It is made in China. It looks like a POS. LCD window background looks dark and a damn unbright. When calculator is turn on, LCD display is black for sure, but that damn thing is black on dark background. I'm pissed. I saw another old 12C made in USA. That one has white LCD window background, thus LCD display apprears black and crisp.

Can anyone confirm this whether Chines made batch of 12Cs are same POS like mine?

They are a POS

*Message #2 Posted by **Mike** on 28 June 2003, 10:11 p.m.,*
in response to message #1 by John Smith

but the display should look like the others. I don't see any problem with the display on my Chinese made 12Cs. Keys are crap though.

Not all are PsOS

*Message #3 Posted by **Patrick** on 28 June 2003, 11:26 p.m.,*
in response to message #2 by Mike

I bought a new one in March (serial #CN14801298) and it has all the appearances of being a fine machine. I use it routinely and it has performed flawlessly over its short life to date. The screen is clear and easy to read, the keys have a good feel to them, and the device has an overall solid feel to it. I have absolutely no complaints so far.

I will leave it to people like Luiz to weigh in on the qualify of their innards, as I have no independent knowledge in that respect.

Re: Not all are PsOS

*Message #4 Posted by **Nenad (Croatia)** on 29 June 2003, 3:57 a.m.,*
in response to message #3 by Patrick

I have the same experience as Patrick. My 12C (#CN 02002514) is a very nice machine and I did not notice any difference in behaviour of the keys compared with the ones of my 11C or the 15C.

Re: I bought a 12C - Looks like a crap

*Message #5 Posted by **Raymond Del Tondo** on 29 June 2003, 10:27 a.m.,*
in response to message #1 by John Smith

Hi,

I'd go for the older US, Brazil, or Singapore made units. I have an Indonesian unit, which still has three battery

cells. The display is a single tone darker than those of the earlier ones.

But the keyboard is really a mess. Not only they 'feel' cheaper, but the quality of the painting of the key legends is very low.

So if you have warranty, try to get your money back, unless you bought it for your collection;-)

Regards,

Raymond

On undiscontinuing products

*Message #1 Posted by **Ernie Malaga** on 28 June 2003, 5:57 p.m.*

"Undiscontinuing," of course, is the opposite of "discontinuing." To us, this means reviving calculators that have been put to sleep and have ceased being made.

HP, like any other company in the world, is out there to make profits. In today's cut-throat market, however, brand-new calculators don't return much for their investment, which may be why HP chose to close APO three (?) years ago.

New products require lots of R&D, and the race for bigger and more, more, more is truly self-limiting. Unless you can hook up your HP-49G to an espresso maker (or a toilet, as one participant in this board wished he could), there isn't much you can add to the 49G.

HP, how about undiscontinuing old products? Some of your products of the past were huge successes, and would have potential buyers even today. You wouldn't have to spend a dime on R&D because everything has been done before. At most, you'll have to make slight changes to accomodate newer vesions of old components no longer being made.

Lots of forum members seem to like the HP-34C, the 15C, the 32SII, and the 42S. Just how much trouble would it be to bring them back -- unmodified?

Are you listening, HP?

-Ernie

Re: On undiscontinuing products

*Message #2 Posted by **John Smith** on 28 June 2003, 6:41 p.m.,*
in response to message #1 by Ernie Malaga

Ernie,

HP is precisely going to do that. They are bringing back the most popular brand with slight cosmetic change for better reasons by incorporating the improvements what found to be were deficient. They also indicated that they would increase the memory size as well. Heck, if they don't enhance the vintage products who cares?

Look at the pricing level at ebay.

HP 11C.....new price was $69.99.....ebay price $300.00

HP 15C.....$89.99.....$400.00

HP 41CV.....$239.00.....$350.00

HP 41CX..... ...$279.00.....$500.00

These are just a few example. My quoted new prices were based on a discount store like "Best Products" what I paid for. Best Products are out of business now.

It is a madness. How much people love these products. They are willing to pay any price.

HP must have noticed that. Since very little to no R&D cost involved to resuurect those madly loved products, why not make money by HP? Prices points would be much lower, as yet their ironclad guarantee will make customers nothing but happy.

Go HP go. Long live HP.

Re: On undiscontinuing products

*Message #3 Posted by **David Ramsey** on 28 June 2003, 8:49 p.m.,*
in response to message #2 by John Smith

> Quote:
>
> It is a madness. How much people love these products. They are willing to pay any price.

Guys, let's get real. Fanatics like us will pay any price. How many of these $300 HP-15s are sold on eBay in a year? A couple of dozen? Does this strike you as a population large enough to market to?

HP may well bring back new iterations of the classic calcs. But it won't be due to eBay prices.

Re: On undiscontinuing products

*Message #4 Posted by **John Smith** on 28 June 2003, 9:32 p.m.,*
in response to message #3 by David Ramsey

<<...HP may well bring back new iterations of the classic calcs. But it won't be due to eBay prices....>>

Amen. I expect them to sell HP-15C about $80, 11C maybe $50, 32SII maybe $70, and 42S maybe $100 etc. etc.....

If the pricing point is not in the affordable range of ordinary public, their comeback will be doomed to fail. I think they know that. They will try to keep or match their original price points.

I quoted ebay price earlier just to show the madness of lunatics. No students will be able to afford that prices. And without the student market, kiss the calculator business goodbye for ever. I think their (hp) marketing guys know that.

Re: On undiscontinuing products

*Message #5 Posted by **Eddie Mabillard** on 2 July 2003, 6:43 p.m.,*
in response to message #4 by John Smith

you are correct when you state that the market is small for calcs and hp will not make profit on calcs, but hp made a wrong decision in keeping calcs and not letting them to agilent, one thing hp should think, customer who are deceived by their policy, like I am, are lost customer for all their other products, I will never buy any more an hp product, I whish I could decide on big contract for millions of$, I'd be pleased to discard HP.

ERNIE is da man

*Message #6 Posted by **Norm** on 28 June 2003, 7:52 p.m.,*
in response to message #1 by Ernie Malaga

Ernie is da man.... Now I got somebody else who says says to un-discontinue the 34C, 15C, 41C, and others.

Imagine what a sweetie of an LED display U could make these days.... instead of wire-bonding all those teeny tiny little LED die together, U could make a strip thats just as wide as the whole dang display... and it could be way more efficient on the power draw also. And to heck with those chinsy LCD's for awhile, imagine how people would glom onto the new ones (yeah I think they'd go along with larger batteries.... esp if the thing can display all 8's for 3 days straight before you have to replace a pair of AA alkaline batteries.)

Hey Ernie, and anybody else: CONSIDER the philanthrophy angle. I BET YOU AN HP OWNER'S MANUAL that HP SPENDS WAY MORE on crack babies and digging latrines in 3rd world countries (charity to white-wash their sinister motives) than it costs to maintain operations of producing those unique earlier models (!) .

And even that statement just made, a TRUE statement, sort of presumes that resurrecting those models is a non-profit deal (what the critics say) in actuality it would probably create modest to medium profits, commensurate with how hard they can push them thru marketing (and face it... its entirely dependent on the young people and the publik skules .... you'd have to return to teaching math with paper & pencil as a foundation, and young people actually learning the math inside of their heads, rather than just nodding their head up and down as they look up briefly from the videogames they are playing on the 49G ....).

Yah, want a 49G with wireless roaming internet access and firewire access to the automatic microprocessor controlled toilet. That way I can flush it automatically when I am way far away clear across town.... makes as much sense as including A=pi*r^2 in a formula database, if U ask me.....

:o)

> Lots of forum members seem to like the HP-34C, the 15C, the 32SII, and the 42S. Just how much trouble would it be to bring them back -- unmodified?

Personally I keep my fingers crossed; hoping that the 42S will be among the calculators HP put in production again.

Unmodified would be great, but if they added 32K RAM (as the original 42S supports 32K!) and a serial port it would be even greater...

Best regards, Erik Ehrling (Sweden)

*Message #4 Posted by **John Smith** on 28 June 2003, 2:18 p.m.,*
in response to message #3 by Raymond Del Tondo

Raymond,

<<BTW: If more pseudos like 'John Smith' are posting here, maybe I'll use the German equivalent in the future: Peter Mustermann...>>

Can you perhaps elaborate on the above statement that you made? May be you can enlighten me and many

of us those who are less intelligent than you are. Sometimes very intelligent people may appear as idiots when they communicate in scriptic fashion.

would some of U intelligent people

*Message #5 Posted by **Norm** on 28 June 2003, 2:47 p.m.,*
in response to message #4 by John Smith

would some of U intelligent people tell the rest of
us boneheads whether or not the 32Sii will be sold again ?

Your link didn't work.

And if they will sell it again, why did they quit selling it?
Did they just need a little time to themselves to mess up the design, the cosmetics, and the feature-set ?

Re: would some of U intelligent people

*Message #6 Posted by **John Smith** on 28 June 2003, 3:09 p.m.,*
in response to message #5 by Norm

Given link on the message is not an active link. It is not just that link, this message window does not recognize any poster's link, period. So, just copy and paste that link to the address bar on your browser and hit return.

Read the article and then make comments.

Re: would some of U intelligent people

*Message #7 Posted by **Wayne Brown** on 29 June 2003, 12:23 a.m.,*
in response to message #6 by John Smith

> Quote:
>
> Given link on the message is not an active link. It is not just that link, this message window does not recognize any poster's link, period. So, just copy and paste that link to the address bar on your browser and hit return.

Well, I tried copying and pasting the link and got a "we're very sorry! The page you requested cannot be found" message from HP's web site. By the way, the link *can* be made active like this: http://www.hp.com/calculators/news/index.html as explained in the advanced formatting techniques link.

As for the possibility of bringing back the old models: No matter what HP says, I'll believe it when I see it. At this point I doubt HP even knows *how* to make good RPN calculators, and I don't trust them to tell the truth about it in any case. HP really doesn't exist any more; it's just another company run by a bunch of money-hungry sharks that are defiling the Hewlett-Packard name.

Edited: 29 June 2003, 1:04 a.m. after one or more responses were posted

Re: would some of U intelligent people

*Message #8 Posted by **John Smith** on 29 June 2003, 1:00 a.m.,*
in response to message #7 by Wayne Brown

I just tried to copy & paste, it worked. You can try again. From time to time website goes down. Hope that was the reason.

Secondly, I would like to thank you for letting me know about the advanced formatting technique. I'll use that from now on.

Regarding your comments, I have no opinion one way or the other. Your argument seems just as convincing as the contrary. No one on this board seems to like the new management team. They are bunch of business hawks as I found out from their resume. Even Carly was neither engineering/science major, nor business in her undergrad. She was a student of foreign history or something. Real passionate and engineering innovators were Mr. Hewlett and Mr. Packard. They built the core engineering team whom I had been closely touched with since 1979. They even had Nobel Laureatte quality engineers and scientists on their payroll at that time. I suspect they still have the strong engineering team, but they are constantly pressured to get the cheap products out of the door to compete with cheap companies like TI, Casio (for calculators), Dell, Gateway (for PCs), and Epson, Lexmark (for printers). For oscilloscopes they have only one competitor, Tektronix. This is the only exception to that the Tektronix makes highest quality products just like HP, thus both products are very expensive (due to uncompromised quality).

So, I don't know whether the old calculators are coming back or not. I wish they did. I sincerely hope, they keep their promise.

John

LEGACY CALCULATORS WON'T COME BACK

*Message #9 Posted by **Peter Mustermann** on 28 June 2003, 9:24 p.m.,*
in response to message #4 by John Smith

I think the author wanted to say that many people may find it more polite to post with their real name, and to read postings of people who don't hide behind their pseudonyms and spread unqualified phrases.

PM

Re: LEGACY CALCULATORS WON'T COME BACK

*Message #10 Posted by **John Smith** on 28 June 2003, 9:40 p.m.,*
in response to message #9 by Peter Mustermann

John Smith is my real time. Why the hell he got the idea of that was not my real name?

everybody stay polite

*Message #11 Posted by **Norm** on 29 June 2003, 1:56 a.m.,*
in response to message #10 by John Smith

everybody stay polite, I sense a war brewing in that last chat post. But we've always avoided wars on this chat board. Everybody is very thoughtful and accomodating.

After all, this is the HP Museum Chat Board, not a Wall Street chat board. If you want to try out that shiny new flamethrower you just bought at the gun shop, you guys should try some posting with the financial nutcases over at the Yahoo financial pages.

Re: everybody stay polite

*Message #12 Posted by **John Smith** on 29 June 2003, 6:25 p.m.,*
in response to message #11 by Norm

Norm,

Your response can be regarded as well advised for the board, but unnecessary because it should be well understood the civility and mutual respectfulness apriori by all posters. Any short of that will trigger anger.

I was angry at Raymond due to his disrespectful remarks quoted below:

<<BTW: If more pseudos like 'John Smith' are posting here, maybe I'll use the German equivalent in the future: Peter Mustermann...>>

I got inflammed by this kind of remarks. Whether 'John Smith' is a real name or assumed name for the board is irrelevant. Important thing should be the content. Personally, whether you are 'Norm' or 'Malcom X" I could care or less. But I deeply try to analyze and try to understand what are you trying to say. Is it your statement, analysis, thesis, monologue, or opinion regardless who you are? My response (if I have any) would be fully based on the content of your post. If I see any deviation from this I try to take corrective action immediately. If I let it go, or ignore those nonsense, it may become an accetable standard which I cannot accept. I'm an engineering faculty of a graduate school where I teach aerodynamics and advanced engineering mathematics mostly to doctoral students. I do not understand much anything deeper outside my field. My visit to this board almost rare to nil. Only time I visit here when I have problems with my 41CV and its accessories. Thus, I do not know most of the posters here except a few those who helped me in the past. In my view, they are highly professional, respectful, courteous, and most importantly, unselfish. They genuinely and generously tried to resolve my calculator's problem by providing wealth of hands-on experienced advice, lack of which I had no other recourse but trashing my equipments. So, I have nothing but good experince from this board.

Re: Legacy calculators won't come back

*Message #13 Posted by **Raymond Del Tondo** on 29 June 2003, 6:58 p.m.,*
in response to message #10 by John Smith

in response to message #1 by John Smith

We've heard it before-----don't put much faith in it. This page signed by MR. "Valdez" (I'm sure he is invented, along with the rest of the HP marketing strategy) has that disgusting neo-commie feel to it--like "we are now making huge successes on our 5 year plan.....etc" (as the children are starving and the proletariat

bosses (there's an oxymoron right there) are enjoying the weekend in their second homes.....).

The fact remains that 2003 is the WORST year ever. Let's see, in January, HP drops the only remaining RPN calculator in its line---with absolutely no explanations. I believe this is the first and only time that HP has ever NOT had an RPN machine in its product line. SO, 2003 is NOT the best year ever!

Perhaps if HP acknowledged that it has been hectic, strange, turbulent, or something, then we could believe. But I don't believe it till I see it.

And I think we are going to see, as NH says, $4.66 KINPO junk. Just look at what they have sent so far---a buggy, inept upgrade of the 12-C.

HP-Compaq is just a pinko-neo commie capitalist pig post structuralist corporate nightmare. Don't believe anything "they" say.

Norm, can you add to this?;-)

Edited: 28 June 2003, 3:23 p.m.

The $4.66 Feigenbaum calculator

*Message #15 Posted by **NH** on 28 June 2003, 3:32 p.m.,*
in response to message #14 by bill platt

Ha Ha, I love it . A non-RPN Kinpo calculator that sells for $4.66 it can be the "Feigenbaum Limited Edition".

Re: WordsWordsWords

Fred is quite real; he came to the London HPCC conference last September.

Re: WordsWordsWords

*Message #17 Posted by **bill platt** on 29 June 2003, 12:53 p.m.,*
in response to message #16 by Frank Wales

I stand corrected! And that is good news---at least there is in fact a real face and name behind the name and face.

I suppose I should apologize for my recalcitrant ranting--but it is too much fun!

So then, is Mr. Valdez a techical professional, or is he a pure marketing type? Or perhaps that question is unfairly stereotyping and should remain unanswered. Rather, did he come accross as being genuinely interested in development and marketing of high quality devices?

regards,

Bill

If they come back as crap...

*Message #18 Posted by **Mike** on 28 June 2003, 4:11 p.m.,*
in response to message #1 by John Smith

who cares. If they come back like the 12 came back, they might as well do nothing.

I'd like to have a new 15C but only if it is as good as the original.

Re: If they come back as crap...

*Message #19 Posted by **Daniel Diggelmann** on 28 June 2003, 5:55 p.m.,*
in response to message #18 by Mike

It looks to me as if HP had lost all knowledge and the calc developers were all gone. This business just doesn't work like most modern software projects. We call them banana software as it ripes at the customer's home...

Re: If they come back as crap...

*Message #20 Posted by **Mark** on 29 June 2003, 10:16 a.m.,*
in response to message #18 by Mike

Reminds me of the Stephen King novel "Pet Sematary." They are dead; you bury them in the special cemetery out in the woods, then they come back a few nights later, but changed, and not for the good. Like the old geezer in the book says, "Sometimes Dead is Better."

Don't expect the old HPs to come back; it ain't going to happen. I hate to say it but I think the calculator, as we knew it, is dead. It was a technology solution to a particular class of problems, and now even though those problems still exist, there are other more widely marketable technologies to solve them (though not as elegantly).

Hang on to your HP collection (if you can), because it's only going to get more rare, and we haven't seen the end of the high prices on eBay.

Re: If they come back as crap...

*Message #21 Posted by **Paul Brogger** on 30 June 2003, 1:33 p.m.,*
in response to message #18 by Mike

H-P won't satisfy all of us, nor all of the "needs" of any of us.

The 12CP is the best indication so far of how HP's will "come back". Very real, very imperfect, with real limitations, and not quite the build quality of The Old H-P. No surpise there.

But I think we could cut 'em some slack on the bugs. The three I've heard are in the final product are: slow TVM computation, a bug with jumps in large programs, and the color used on the faceplate. The last is no doubt a marketing thing, and the first two are very understandable. (I'd ask, did any of the beta testers discover either of those in the beta test stage? Didn't H-P address other problems that *were* brought to their attention during beta test?) Let's see what H-P does about the problems that remain in future versions. You may remember, even The Old H-P released calculators with bugs, and even whole product lines with questionable or even downright lame aspects of design. (Clamshell battery covers and early solderless Spices . . .)

I don't think I can expect resurrection of, for example, the 15c or 42s in their original forms. But add

programming memory (and I/O?), sell 'em even for something reasonable, and for my part I'll be grateful for a current source of purpose-built RPN devices.

Re: LEGACY CALCULATORS ARE COMING BACK

*Message #22 Posted by **Les Bell [Sydney]** on 28 June 2003, 8:15 p.m.,*
in response to message #1 by John Smith

You're dreaming. There is absolutely nothing in that page to suggest what you are proposing, and particularly no mention of specific scientific models (other than the revolting 30S).

HP no longer has the ability to manufacture the processors and other ASICs used in those early calculators. Just look at the 12CP - now based on an externally-sourced processor, with re-written software which provides less performance and more bugs. That's about all you can expect from any "re-released" line of scientific calculators from HP.

Best,

--- Les [http://www.lesbell.com.au]

HP calcs processors

*Message #23 Posted by **jose goncalves (Brasil)** on 29 June 2003, 12:36 p.m.,*
in response to message #22 by Les Bell [Sydney]

Let's talk about the "externally-sourced processor" in HP calculators. I understand for everything that I've been reading and because what I see in the calcs I open and in the pictures that this forum brings us, that many models of HP calculators run on "externally-sourced processors". It's very common that the processor comes with a very clear NEC mark on it. Is it correct ? If so, what other manufacturers have been providing HP with micro porcessors ?

Re: HP calcs processors

*Message #24 Posted by **Bill Wiese** on 29 June 2003, 9:42 p.m.,*
in response to message #23 by jose goncalves (Brasil)

The processors w/NEC markings in later HP calcs (Pioneers, 48, etc. IIRC) were not *designed* by NEC; they were simply *fabbed* by NEC. HP didn't likely have a fab line that was usable (tied up by higher-profit chips or only had power-hungry processes available).

Thus, they prob handed off a netlist to NEC and said "Can you do this for this price, quantity and delivery schedule?" and NEC said "Yup."

Lots of co's do ASIC production to customer specs, esp gate array based design. Customer designs (often at high level, using Verilog or VHDL) tests, synthesizes & simulates using parameters & libraries supplied by the ASIC vendor for that process. Once it's done (perhaps with some real-world simulation via FPGA emulation too) the chips are spun. NEC for example, may have little or no idea how a Saturn CPU runs. It doesn't care, either: as long as chips pass the test vectors all is well.

Bill Wiese San Jose, CA

*Message #25 Posted by **Michael F. Coyle** on 29 June 2003, 11:14 p.m.,*
in response to message #24 by Bill Wiese

The early (1970's vintage) calcs used chips made by Mostek and AMI. They were all custom designs and layouts (no gate arrays, etc.).

Rubber Feet for Voyager

*Message #1 Posted by **Bill Weinman** on 27 June 2003, 8:12 p.m.*

Anyone know a source for rubber feet?

I just got a nice old 12C (2441A86197) but one of its feet is missing. The other feet are badly worn, so I will have to replace them all or it will wobble.

I would try to order them from HP but their web site is seriously dysfunctional.

Anyway, if you know a source of rubber feet, please let me know.

Thanks,

--Bill

Re: Rubber Feet for Voyager

*Message #2 Posted by **jose goncalves (Brasil)** on 27 June 2003, 10:18 p.m.,*
in response to message #1 by Bill Weinman

Well, you looking for rubber feet for Voyagers, right ? I have the same problem, but with my Spices. Their feet look like if they were corroded. The rubber is not desintegrating, but looks like if it rotten. I understand that the feet for Spices are not the same as for the Voyagers, but may be someone can find the way for all of them.

Let's have hope.

Jose

Rubber Feet

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 11:37 p.m.,*
in response to message #2 by jose goncalves (Brasil)

Hi José, folks;

some months ago, Renato sent me a generous piece of hard, thick rubber. I tried to build some feet with it but I found it too thick. Anyway, that rubber was too good to be forgotten.

So I decided to cut two new feet and "slice" the thicky rubber so I could get four feet from two cuts. Care and patience are needed to slice the rubber with a small cutter. Because it was a hard-type rubber, it is not too difficult to cut. And if you get two slices with the same thickness (as close as possible), they will be too close to the original Spice rubber feet thickness.

I think that it will be too thick for a Voyager, but they can be used without troubles with Spices. Hey, Jose, when your other Woodstocks are ready to leave the International Hewlett-Packard Hospital, I'm adding

four of these so you can test them and tell me about it, O.K.? I also have a two-sided adhesive tape that I have been using without trouble. In order to keep it "in place" when the rubber feet surface is not so regular (after being cut), I use superglue to homogenize it. The tape adheres easily in this case.

Please, let me know when you send your "babes" for CICU (Calculator Intensive Care Unit) activities. BTW, is your HP41C doing fine? How did you like the HP22 internal handling?

Best regards.

in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz-

You are so thoughtful and generous.

tm

My pleasure! Also... (edited, with image)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2003, 1:50 a.m.,*
in response to message #4 by Trent Moseley

Hello, Trent;

I must admit your comments (and others as well) make me feel flattered and a bit embarrassed, if you understand me. I feel as if I do not deserve so much, because I also receive so much in here.

Thank you; the sort of comments like yours encourage me to go further.

I will prepare some images (scanned) to show how do I cut the rubber. May others be able to reproduce the procedure, too.

(Off-Topic)

You know, since I was eight I deal with plastic models for fun. I did not specialize myself because it's an expensive hobby if you want to specialize on it. Anyway, I got skills on dealing with plastic parts and when I need to, I rebuild and repair some of them, too. A couple of weeks ago I posted some images showing one Pioneer battery door I "carved" in a piece of plastic from a VHS tape case, the tape protective "shield". I still have the images and one of them I reproduced again right below.

http://www.logeng.com.br/images/pion_door_all_s.jpg

I'm mentioning this because I have an HP1100 Laserjet Printer I use to hardcopy everything I need, HP-calculators documents included, for sure. This printer is a bit old, more than 3 Y.O., and it counts about 11,500 pages already printed (three toners so far). As I am nosy and curious, I decided to service it and carefully removed everything I could to reach paper pulling parts and clean them. Unfortunately I broke the paper sensor, a moving plastic cam with a small and thin tab. I needed to disassemble even deeper parts to remove the cam. While carving it to insert extra tabs to reinforce the one that was broken, the axe also cracked. I glued it again and reinforced it with two plastic slices so I could go further. Shortening: after almost twenty hours I could finally test it again. It

took me extra two hours because I forgot two screws that hold paper sensor assy and I had to disassemble it all again twice. I was not patient enough to generate images (scanned) of the plastic cam after rebuilt because I had to assemble it back in place to see if it was working. I'm posting this extra, O.T. text, because sometimes when original replacement is not available, maybe we should try a custom refurbishment. You know, I finished printing the 303-page HP71 User's Manual... with the repaired cam (hey, Doc; I'm becamming an HP71 user!). If I did not do that, I'd have a stuck HP laser printer. Oh, yes, now it pulls one paper sheet at a time, thanks God!

Slicing thick rubber and cutting it to form a calculator feet is entertaining and useful. Sharing the experience is a personal achievement. Finding people like you who congratulates me for that is outstanding.

Thanks a lot.

Luiz C. Vieira - Brazil

Re: Rubber Feet for Voyager

*Message #6 Posted by **Renato** on 29 June 2003, 12:09 a.m.,*
in response to message #2 by jose goncalves (Brasil)

Jose, Luiz, You both will get adequate rubber sheet for manufacturing voyager, spice and coconut rubber feet. I got it right this time.
I also found a supplier of o-rings for card readers - plus some other itens. Luiz - expect some more surprises...

Renato

Re: Rubber Feet for Voyager

*Message #7 Posted by **David Smith** on 28 June 2003, 2:31 p.m.,*
in response to message #1 by Bill Weinman

Try EPDM roofing membrane... it is 1/16" thick... the same as HP41 feet. You can find it at Home Depot in the garden center as pond liner. Only thing is it comes by the foot in 12-15 foot widths... about $1 a square foot. I got a few square inch scrap piece and made some nice feet out of it, but they are all gone to nice homes now.

Re: Rubber Feet for Voyager

*Message #8 Posted by **jose goncalves (Brasil)** on 29 June 2003, 9:34 a.m.,*
in response to message #7 by David Smith

Well, thank you for your suggestions. Now I have some trial solution to invest my time on. I notice that the Spice feet seem to be slightly thicker than the Voyagers'. I'll let you know about the results.

Jose

Re: Rubber Feet for Voyager

*Message #9 Posted by **OJM** on 30 June 2003, 8:22 a.m.,*
in response to message #1 by Bill Weinman

I recall once seeing a posting to this forum suggesting that rubber cut from a bicycle inner tube would make very good material for Voyager calculator rubber feet.

Re: Rubber Feet for Voyager

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 30 June 2003, 9:20 a.m.,*
in response to message #9 by OJM

Hi, OJM;

I recall that this was suggested by Renato. Maybe someone else did it, but I remember him as pointing it out at least once.

I tested the proposed technique and the thickness is fine for Voyagers, but the tube material was not good and I found no way to keep it in place: the two-sided adhesive tape I use when settling rubber feet never kept the bicycle tube's I used in place. It seems the tube I used has some sort of phenolic component that melts the adhesive.

I believe some brands will fit fine.

Best regards.

KBD faceplate protection: bringing back an old issue.

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 11:50 a.m.*

Hello, all;

some months ago there was a thread about keyboard faceplate protection against scratches. Many solutions were pointed out, and one of the suggestions was creating transparent, self-adhesive, rugged faceplates like the ones found in the HP41 and all clamshells. Well, now I see that the HP71 kbd faceplate also has the same type of protective cover, and the HP97 has none.

I tried to "cover" an old HP11C's faceplate and I did not achieve reasonable, acceptable results. And the worst part is that there is no way coming back: if I try to remove the self adherent plastic cover I used, I'll remove part of the surface printing. I'll have to keep it.

I wonder if that sort of rugged, transparent cover used in the HP41, clamshells and the HP71 (anyone else?) is available in some form, in small, large or custom sized pieces. I saw acetate sheets used as spare cover in custom spiral-bound documents that look a lot like the one used in these keyboards, but it is not self adherent. Adhesive to be used in these cases must also be specific for painted surfaces in a ways it will not react with ink and melt it or dissolve it or fade it out.

Is there any interest on this sort of subject yet? I know it is not exactly what collectors have in mind, mostly those interested on keeping collected pieces exactly the way they live production line, but those who use their calculators somehow (I included) would like being sure their faceplates will not be smeared or scratched.

Comments? Suggestions?

Luiz C. Vieira - Brazil

P.S. - After the first two days of switching it on and off, just to see it "breathing", I began reading the HP71B's documentation. a few days ago in my spare time. Anyway, I cannot help myself not looking at it sometimes, as if it I'm expecting it to vanish and I'd find out it's a mirage. And it looks better "in person" than in the photos. If you like Voyagers' design, the HP71B must be checked out. Thanksalot, Doc!

Re: KBD faceplate protection: bringing back an old issue.

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 27 June 2003, 12:46 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

> Quote:
>
> I wonder if that sort of rugged, transparent cover used in the HP41, clamshells and the HP71 (anyone else?)

I do have them for the HP-48, I've seen the ones for the HP-75C/75D (not transparent, though).

Greetings,
Massimo

You mean...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 3:41 p.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

Hey, Massimo;

do you mean the standard, semi-gloss, rugged original HP overlayer? I have two of them (Thanks, I.M.), one with extended ALPHA characters and another "clear" one. They are fine, but I was thinking about the same product with sort of a contact glue. Is this sort of glue easily found? In this case, would it be easy to apply and settle the protective cover? I thought about a ready-to-apply glue in abig sheet of waxed papper so we could place the keyboard overlayer , remove it with the glue already atached to it and then apply the "glued" overlay to the

calculator's faceplate.

Is it too much imagination?

Thank you for your remind, Massimo. As these overlayers are not self adherent, I did not think of them.

Best regards.

Luiz C. Vieira - Brazil

Re: You mean...

*Message #4 Posted by **Ellis Easley** on 28 June 2003, 2:15 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

> Quote:
>
> I thought about a ready-to-apply glue in abig sheet of waxed papper

That does exist. That is how the adhesive on most self-adhesive products arrives at the factory. It is called "transfer adhesive". It comes on a roll stuck to a "release liner", like wax paper, or more like the plastic coated paper that self-adhesive items come with, protecting the adhesive. There is no substrate, just adhesive, stuck to the release liner. It comes in different thicknesses and strenghts ("high tack", "low tack"). It is difficult to handle except when it is stuck to the release liner, then it is like one sided sticky tape and you can apply it to whatever you want to make self-adhesive. Hopefully, it sticks better to your item than to the release liner. Then you cut the adhesive to size - preferably, you cut both your item and the adhesive with its release liner to size with a very sharp knife or die. The adhesive tends to ball up when you draw a knife across it and it can pull more adhesive from under your workpiece, where you want it to stay, so it is better to use a sharp knife and press it straight down through your material, the adhesive, and the release liner - that way you can cut the adhesive with a clean edge.

I just looked at the 3M website (www.3m.com) and searched for "transfer adhesive" which returned almost 3000 matches. The second one has the title "3M(TM) Adhesive Transfer Tapes with 100 Adhesive Data Page [PDF 30 KB]" and is at this address:

http://multimedia.mmm.com/mws/mediawebserver.dyn?hhhhhhR59twhBLihVLihhh3PPTdHHHH2-#xml=http://www3.3m.com/search/media?request=findPdfInfo&query=transfer+adhesive&k2docKey=http%3A%2F%2Fmultimedia.mmm.com%2Fmws%2Fmediawebserver.dyn%3FhhhhhhR59twhBLihVLihhh3PPTdHHHH2-%40usenglish.dmr

100 Adhesive seems to be a transfer adhesive used on a wide range of products.

The next article is the search results is titled " 4.13, image transfer media with wear coat 8604 ES and 8605 ES [PDF 27 KB]" and is at this address:

http://multimedia.mmm.com/mws/mediawebserver.dyn?cccccc4jvorcx2DcQ2DcccdEXO&CCCCa-#xml=http://www3.3m.com/search/media?request=findPdfInfo&query=transfer+adhesive&k2docKey=http%3A%2F%2Fmultimedia.mmm.com%2Fmws%2Fmediawebserver.dyn%3Fcccccc4jvorcx2DcQ2DcccdEXO%26CCCCa-%40usenglish.dmr

The products in the second article appear to be clear protective sheets that are self adhesive and designed to be printed on the adhesive side (??) so that the sheet can then be applied to a surface and the printing is protected by the outer layer. It is not clear to me whether they come with adhesive on them or if the adhesive must be added - or is assumed to be present on the other surface.

The article talks about laminating equipment. This suggests a possibility: in a stationery or office supplies store, you might find some clear, adhesive sheets used to laminate things (like photos, certificates, documents) so they will last longer with much handling, and still be readable. This might be a starting place - you would still need to figure out how to cut clean openings for the keys.

Re: KBD faceplate protection: bringing back an old issue.

*Message #5 Posted by **Gordon Dyer** on 28 June 2003, 7:41 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

The 71B is a lovely machine and because it can take keyboard overlays , like the 41, it would be easy to protect it. Blank overlays can be obtained, but I am sure it would be possible to scan a keyboard at high resolution and print onto some plastic sheet, like overhead transparency. The cutting is tricky and would need a custom punch made. Any volunteers with these skills?

HP41, HP71 and Clamshells faceplate have a permanent protective coat

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2003, 9:27 a.m.,*
in response to message #5 by Gordon Dyer

Hello, Gordon;

nice reading your posts; as if I don't write like a newspaper reporter... I must be not so nosy!

You know, all clamshells (even my Singaporean HP19BII), the HP41 and the HP71 have a permanent, rugged overlayer already built over the keyboard faceplate. I could not idenfy for sure, but based on the photos I've seen the HP75 also has it.

I think these are the only HP calculators with this permanet keyboard faceplate protection. All others I saw do not have. Even the HP48, that accepts external overlayer like the HP41 and the HP71, does not have the permanent overlayer that is easily identified in the units mentioned obove.

I agree with you that a few molds woud be enough - one to all Voyagers, other to all Pioneers, another one to all HP48, another one to the HP49, all Classics could share the same overlayer, Woodstocks would need one only and Topcats, too. I counted seven of them, because the HP19C would need its own. I'm surely missing someone...

Well, if there is anyone who knows any specialized company that can cut the overlayer and provide an additional adhesive, that would be great. I'd buy a bunch, enough to use in mine and lots of spares for my... patients!

Best regards, Gordon!

in response to message #6 by Vieira, Luiz C. (Brazil)

I am interested in kbd faceplate restoration and/or overlays for Woodstocks... Nothing to offer or suggest yet.

Re: HP41, HP71 and Clamshells faceplate have a permanent protective coat

*Message #8 Posted by **David Smith** on 1 July 2003, 6:36 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The lettering for the HP41 faceplate is actually on a shhet just like a standard HP41 module removeable overlay that is stuck down with adhesive. If you are careful (and have your trusty UnDu) you can remove the overlay and transfer it to a different machine.

Help--Hp Calculator

*Message #1 Posted by **AC** on 27 June 2003, 10:21 a.m.*

Hi everyone

Is there an HP non programable calculator thats really good? Preferably RPN and similar to the HP49g (NONE Programable). Have a teacher that wont allow programables, and, well, im just really used to RPN.

TY

[AC]

Re: Help--Hp Calculator

*Message #2 Posted by **Paul Brogger** on 27 June 2003, 11:21 a.m.,*
in response to message #1 by AC

Nope. RPN is a rare commodity these days, and you won't find a non-programmable *graphing* HP RPN calculator.

In fact, I think you'd have to go back to the low-end Spice LED models (31E, 33E) to get an RPN non-programmable calculator at all. (Not bad calculators to have, I must say -- I'm looking for one of either myself, but certainly they're not graphics-capable.)

Have you offered to excute a "CLEAR PGM" function at the start of each class? (As a way to make a programmable calculator "acceptable", that is.)

Does this instructor give any justification for ruling out intelligent application of automation to iterative and/or repetitive tasks in arriving at solutions?

Re: Help--Hp Calculator

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 11:47 a.m.,*
in response to message #2 by Paul Brogger

Hi, Paul;

just a remind: for sure it's a typo, but the two non-programmable Spices are the HP31E and HP32E.

Best regards.

Luiz C. Vieira - Brazil

Re: Er, YEAH! That's what I MEANT to say . . .

*Message #4 Posted by **Paul Brogger** on 27 June 2003, 1:34 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

. . . and I had the MoHPC list of Spice models open next-door in a second browser . . .

Ooops!

Thanks for paying close attention, Luiz!

Re: Help--Hp Calculator

*Message #5 Posted by **Patrick** on 27 June 2003, 1:27 p.m.,*
in response to message #2 by Paul Brogger

Some school districts provide to teachers lists of the key sequences which clear various models of calculators. If you demonstrate the clear mechanism to your teacher in advance of an exam, s/he might be more accepting.

Suggest you also point him/her at this thread to see that even the "experts" agree that you have to go back over 20 years to find an RPN without programmability!

Re: Help--Hp Calculator

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 3:34 p.m.,*
in response to message #1 by AC

He Patrick, AC, guys...

All "scientifc" HP calcualtors with LCD-display are programmable, even the "humble" HP10C. NO way out. Anyway, low-end financial are not, like the HP14B and HP10B. If I am not wrong, the HP10BII is alos non-programmable. THe fact is that these beauties do not have trigs and some math facilities.

I think Patrick's is the berst solution. His suggested approach may be of immense help. Why not to try?

As a teacher, I encourage students to use calculators the right way. Unfortunately, local students I deal with use Casio, HP6S and other low-end, not programmable, strictly school-use calculators. To be honest, they need to count more on their own than on the equipment. I show them how to compute final calcualtions and reason about the problem as a first step.

Success and good examinations.

Luiz C. Vieira - Brazil

Re: Help--Hp Calculator

*Message #7 Posted by **Richard Garner** on 27 June 2003, 4:13 p.m.,*
in response to message #1 by AC

One argument you might try to make is, that to program the calculator with the equations for entry of the variables, you have to know the equation and how to use it before programming it in. Although with the calculators having equation editors and solvers built in, that is starting to be a very weak argument than in the past.

Re: Help--Hp Calculator

*Message #8 Posted by **Peter Zechner** on 29 June 2003, 9:11 a.m.,*
in response to message #7 by Richard Garner

The simplest solution is...you just don't tell.

My son, now more than 20 years ago, had the same problem that teachers won't allow programmable calculators (forgetting that not the programmable thing but the non programmable does the damage on your thinking)

HP calculators are so rare, that most teachers don't know them! Erase or tape over the "program key" and everthing will be ok.

regards Peter

Re: Help--Hp Calculator

*Message #9 Posted by **AC** on 29 June 2003, 12:33 p.m.,*
in response to message #8 by Peter Zechner

Hi That would be nice, however, i have the 49g, and well, its a bit obvious with that one lol.

I think that the HP 17Bii or 19Bii would be nice, but those are way to expensive. Im willing to spend up to 100$, and alli care for now is an equation solver. What options do i have?

BTW, thanks to all that have helped!

in response to message #1 by AC

You might also consider the HP35, 45, or 21. All nice LED, non programmable models. Also the HP91.

Re: Help--Hp Calculator

*Message #11 Posted by **AC** on 27 June 2003, 6:27 p.m.,*
in response to message #1 by AC

Tried everything, still has to be non programable. I see now that RPN probably isnt an option. But what i would still like a lot is an equation solver built in. and calc fit into this??(none programable+eq solver).

Doesnt have to contain trig functions, but better if it does.

Thanks

[AC]

Re: Help--Hp Calculator

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 6:41 p.m.,*
in response to message #11 by AC

Hi, AC;

any equation solver means equation entry/edit. This way, an RPN/algebraic selectable with equiation solver plus trigs and some more is the HP19BII.

It's a clamshell like the HP28S and is not EXACTLY programmable, you can use the argument that it's a financial calculator with SOLVE and it has algebraic entry to allow equation to be entered/edited to be used by SOLVE.

Good luck. The HP19BII can still be found as almost new.

Luiz C. Vieira - Brazil

Edited: 27 June 2003, 6:42 p.m.

Seems that the 17BII is adequate

*Message #13 Posted by **Renato** on 29 June 2003, 12:02 a.m.,*
in response to message #11 by AC

Don´t you agree ?

If TRIGS are not a must, I agree...

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 12:51 a.m.,*
in response to message #13 by Renato

Hi Renato, Ac, guys;

Mostly based in his last post, where AC mentioned TRIGS are not necessary, I agree with you: the HP17BII is less expensive, smaller and has almost everyhting the HP19BII has, and one of the exceptions is TRIGS.

Anyway, if you have the time and the need, AC, TRIGS can be programmed. Look at this article by W. Bruce McGuire II.

Best regards and good luck.

Luiz C. Vieira - Brazil

Re: If TRIGS are not a must, I agree...

*Message #15 Posted by **Karl Schneider** on 29 June 2003, 6:31 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

None of the HP financial calc's with which I am familiar (I own the 12C, 10B, and 17Bii) have trigs -- maybe the 19B/ii?

Just curious: Is there any practical application of trigonometric functions for business/finance (excluding calculation of biorythms and constellation positions for making business decisions)?

Re: If TRIGS are not a must, I agree...

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2003, 6:45 p.m.,*

> 17Bii) have trigs -- maybe the 19B/ii?

Yes, the HP19BII not only has a complete TRIGS set with DEG/RAD selection (no GRAD angle mode), but also hyperbolics and inverses, polar<->rectangular conversions, nCk and nPk, e^x-1 and ln(1+x).

> Quote:
>
> Is there any practical application of trigonometric functions for business/finance?

This I cannot answer, but HP offered other SciFi calculators (Scientific & Financial, not Science Fiction :), being HP27 (woodstock) and HP27S (Pioneer), both with trigs and the like amongst financial resources. What for? I don't guess, but I'd like to know as well.

Best regards.

Luiz C. Vieira - Brazil

Re: Help--Hp Calculator

*Message #17 Posted by **bill platt** on 29 June 2003, 12:31 p.m.,*
in response to message #11 by AC

AC:

Hold on a minute---you say that your teacher will allow an "equation solver" but not programming? What on earth his he-she thinking? An equation solver IS PROGRAMMING! Actually, it is worse than programming---you have to understand what you are doing in a line interpreted program--but an equation solver--that allows abject abuse of the concept of learning the "fundamentals" of mathematics! Like, all the programming does is do the steps you already know how to do (and did once) to make the program, whereas a "solver" takes all the KNOWLEDGE and THOUGHT out of solving the problem!

I suppose that in fact, maths teaching and learning has fallen to horrible depths, if a math teacher can be making such erroneous reasoning as allowing a solver in a mathematics course.

Regrds,

Bill

Re: Help--Hp Calculator

*Message #18 Posted by **AC** on 30 June 2003, 1:02 p.m.,*
in response to message #17 by bill platt

Absolutely right. But, its a fact that most teachers (high school level), all though not all tend to have little or no knowledge about calculators, if it looks big and nice, its to good, but if its sort of puny, then its usable.

In this case, the teacher only knows about programing, that with it, other things can be done, but has most probably not even heard of equation solvers and stuff like that.

Woodstock logo transplantation

*Message #1 Posted by **Juergen Rodenkirchen (GER)** on 27 June 2003, 1:39 a.m.*

Hi all!

I intend to take an HP-25 logo from a non-working unit and transplant it to a workig one. My plan to doing this is to detach the logo by using a hair dryer to "melt" the glue beneath the logo and then to carefully remove it with a razor blade or sharp knife or so. On the other machine, I thougt I can use double sided adhesive tape. Well, this is just my plan. But I wanted to ask the more experienced in here if there's any reason of concern of doing so or if there's an optional, better procedure ...

Best wishes, Juergen

Re: Woodstock logo transplantation

*Message #2 Posted by **David Smith** on 28 June 2003, 2:41 p.m.,*
in response to message #1 by Juergen Rodenkirchen (GER)

I have succesfully transplanted Woodstock, HP41, etc logos. First thing to do is get a corner of the logo lifted. Many logos will already have a loose corner where the person who installed it had touched the adhesive... almost always the right hand side. Otherwise use a razor blade/knife.

Next I take a strong piece of thread and wet it with a product called UnDu. It is just the solvent heptane (found in many rubber cement thinners... others are hexane). It causes adhesives to temporarily loose their stickiness. I also place a drop under the label corner. Then I use the thread like a cheese knife to slice under the label. Keep the tension on the thread towards the calculator and away from the label.

The label will probably curl. Place it on a piece of adhesive label peel-and-stick backing material. Fold the material over the label and smooth it down with the back of a spoon.

Many labels can be stuck back on directly. On others you can rejuvenate the stickiness by wiping them with 91% isopropyl alcohol. On others you will have to remove the old adhesive and stick them back down with a good spray glue like 3M Super77.

I just found a 10C - woohoo!

*Message #1 Posted by **JimC** on 26 June 2003, 1:40 p.m.*

It's been a long time. After much seeking, I found a 10C (w/ manuals) in an advertisement in a local newspaper. (15 bux! woohoo! No box? - ooh bummer. wait, I don't care if there is a box....)

I can't quite see how it can compete with my beloved 41CX, but I can appreciate (obviously, since I read this group) the simple elegance which defined HP products. And a standard to which sadly, they no longer adhere.

Nonetheless, I'll give it a good home. My trusty 41 gets used every day at work. This little fella will get put to work, too.

Re: I just found a 10C - woohoo!

*Message #2 Posted by **Patrick** on 26 June 2003, 2:47 p.m.,*
in response to message #1 by JimC

Congrats, Jim!

I am a big fan of all of the Voyagers. I only completed my series not too long ago with the acquisition of a 10C. They are nice little machines, no doubt about it. I do like the fact that there is only a single shift key -- makes for a nicely uncluttered keyboard. Unfortunately, it also means the loss of a few functions, but that's life.

The 10C does have something of a tortured past, though. At introduction it already had the 11C and 15C to contend with as competition. The 15C, introduced two months earlier, cost $135 compared to the 10C's $80. Not sure what the 11C was priced at then (originally $135 but must have been reduced when the 15C was introduced). Probably only about $30 to go from 10C to 11C. Eventually, the little guy lost out to the 11C and was discontinued at the tender age of only 18 months.

Not too many of them around. Hang on to yours!

HP-10C/11C/15C relative memory sizes

*Message #3 Posted by **Valentin Albillo** on 27 June 2003, 7:11 a.m.,*
in response to message #2 by Patrick

Patrick posted:

"The 15C, introduced two months earlier, cost $135 compared to the 10C's $80. Not sure what the 11C was priced at then (originally $135 but must have been reduced when the 15C was introduced). Probably only about $30 to go from 10C to 11C. Eventually, the little guy lost out to the 11C and was discontinued at the tender age of only 18 months."

It's understandable at the time. Now, we look at the HP-10C with collector's eyes, knowing it's a very valuable item, the rarest and most scarce of Voyager series' calculators, and so it's become very desirable to the point that most of us would be more than eager to trade an "as new" HP-11C or even an HP-15C for

a similar HP-10C, but back then, when it was introduced, it was doomed from the start. You would look at it with buyer's eyes, and would see this data:

Model:	HP-15C	HP-11C	HP-10C
Max. steps:	448	210	70
Max. regs:	67	21	10
Price:	$135-$80	$135-$65	$80-$70

So it's easy to see that the HP-11C offered 300% the memory of the HP-10C for a very marginal increase in price (20% at most). Which is more, while the HP-15C offered more than 200% the memory of an HP-11C, the latter still had programming features and RAM enough to do very worthwhile programming, so it remained viable and sold very well, specially among the people who considered the extra HP-15C features (namely integrals, rootfinder, matrices and complex values) as too complicated and specialized for them.

On the other hand, the HP-10C has so little RAM and its programming capabilities are so abysmal that very little can be done with it. For instance, most HP-25 programs of any complexity simply won't fit at all, despite the HP-25 being a much older machine, and having just a maximum of 49 program steps. The reason is that it also had 8 permanently allocated storage registers, for a total of 15 registers worth of RAM, versus the 10 registers in the HP-10C, i.e: the HP-10C has 50% *less* RAM than even the HP-25 !!. No wonder it sold badly.

To be fair, the HP-10C would have enjoyed much greater success were it not for the existence of the HP-11C and HP-15C, because as a non-programmable calculator it really delivers. But next to an HP-11C, say, noone in his right mind would have purchased one if a mere $20 more would get you an HP-11C or an HP-15C, and that was obvious from the start.

HP should have done the right thing, releasing the HP-10C before the HP-11C, just as it did release the HP-11C prior to the HP-15C. That would have ensured tremendous sales for the HP-10C !! Instead, HP flopped big time with their marketing strategy for this model and poor little HP-10C was a total failure, undeservedly. It's only fair that now it has regained back the popularity it never enjoyed before, a little ugly duckling turned into a collector's swan ! .-)

Best regards.

Edited: 27 June 2003, 7:25 a.m.

Lucky guy!

in response to message #1 by JimC

Hey, JimC;

keep this babe utp and tunned, wilyah?

I have all Voyagers except the HP10C. To be honest, I'd not have much to do with one of these except scanning its guts and collecting data about it. I preffer the HP 11C for the HP10C. Of course, HP15C for any other.

Congratulations! It's always good news.

Luiz C. Vieira - Brazil

P.S. - I believe those guys who do not feel happy for others happiness and used to coplain for this sort of posts are no longer sniffing around here, so I am sure all posts in this thread will be of... "joy".

Re: Lucky guy!

*Message #5 Posted by **JimC** on 26 June 2003, 5:37 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luiz. Thanks for the words of encouragement!

To those who would be unhappy at my post:

My post is not meant to gloat, but rather to share the thrill after a long period of searching and to perhaps push others who are feeling frustrated - as I have been - in watching the Ebay prices go up and up...bidding and getting scooped. If I can't tell the people on this forum, who am I gonna tell? My wife? My kids? (yeah, right)

This is a unique group and I would not like to be thought of as one who is "rubbing someone's nose in it". That is not the spirit of this forum, and is not my personality type. That I'll leave to television.

If I have offended, please accept my apologies.

Re: Lucky guy!

Oops! My fault, my fault...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 11:35 p.m.,*
in response to message #5 by JimC

Hey, Jim;

please, forgive me not being so clear about this fact in my post.

Some time ago, one particular thread, and a few others in less intensity, revealed this Mr. Hide side in at least one or two contributors that have found their way home. I am sure you were not reading these posts at that time and you are probably not aware of these facts, but others in here remember it well. :-|

I felt so mad about such insane behavior that I politely (as I always try to do) tried to retreat the contributor that gladly posted a message about his last victories. I know this gentle fellow is still with us, but the ferocious agressor seems never been back. qB^(

I'm sorry I didn't explain it too well, I intended others to remember those days and feel glad they are never comming back. I have a cousin that uses two great expressions for the worst moments :|

-'We'll be laughing at this in thirty years from now...' and
- 'What time cannot forget, it embeds'.

Your enthsiasm will never offend anyone in here. Forgive me if I made you feel like this.:^p

And I exagerated a bit when mentioning these facts, too... ;^)

Sorry, guys. My fault. <:^(

Luiz C. Vieira - Brazil

Hi,

I think he or she simply mixed up descriptions, as you can see for the HP-48.

Raymond

Re: HP 41G

*Message #3 Posted by **Michael** on 26 June 2003, 2:04 p.m.,*
in response to message #2 by Raymond Del Tondo

Obviously a "typo" and should read 41C, not 41G.

Re: HP 41G

*Message #4 Posted by **Chan Tran** on 26 June 2003, 8:45 p.m.,*
in response to message #3 by Michael

So we know that the seller doesn't know how to use the calculator. I wonder if it's good or bad.

Re: HP 41G

*Message #5 Posted by **Guillermo Castarés** on 27 June 2003, 9:36 a.m.,*
in response to message #4 by Chan Tran

Thank you all. You confirm what I thought.

But I send him this question:

Spanish: "Podrías revisar el modelo, ya que segun entiendo la HP 41G no existe. Gracias.".

Translation: "Could you check the model name, because as far as I know the model HP 41G does not exists. Thanks.".

And his answer was:

Spanish: "hola, revisado, nada para modificar, salu2".

Translation: "Hello, checked, nothing to update, regards."

Now I asking him for a photo...

HP 41C/CV to PC Interface Question

*Message #6 Posted by **John Smith** on 27 June 2003, 11:37 p.m.,*
in response to message #5 by Guillermo Castarés

Hello my 41C/CV/CX Gurus,

Recently this question is coming to my mind more often than before. I'm good at 41C programming. Back in 1983, I used my 41CV for writing engineering/scientific applications programs due to lack of PC's existence and inaccessibility of mainframes (turnaround time was half a day). Some of those programs are still in magnetic cards. Now I have 6 PCs, but I still love my CV, simply because PC has advantages and disadvantages, so does the CV. Solving a very complicated math with a fewer variables still outweigh the CV over any PC or mainfram even today.

Since I made my case, here is the question. Is there any interface available for 41CV that I can download my programs to PC? If there is, it will open a door for me. I can write new programs in PC domain (utilizing convenience of fullsize keyboard), edit it, and then upload it to CV. If program works, I can delete that from CV to free up memory while I can save the code in the PC hard drive.

You may wonder why am I so concerned when I have a card reader. My friends, I have a bad news. My card reader was spitting goo recently. I tried to fix it per instruction that available in this museum web site, but the card reader is giving malfunction message now. I guess I toasted it. I have either to buy another card reader or borrow one to read off these programs.

Hope, some of my learned friends here can rescue me by providing answer to my original question; or feel free to provide me practical solution perhaps exist today which I may not be aware of. I'll remain open minded to all of your suggestions,and I'll read all of your feedback. Thanks,

John

Why no one is reponding to my question, I would never know. Is it something I said?

Thanks,

John

Luiz, Luiz, Luiz, where the hell are you?

*Message #8 Posted by **John Smith** on 28 June 2003, 4:47 p.m.,*
in response to message #7 by John Smith

I don't know whether you intentionally ignoring me. If you are not, would you please try to respond to my question under the heading "HP 41C/CV to PC Interface Question" message?

John

Re: HP 41C/CV to PC Interface Question

*Message #9 Posted by **Ellis Easley** on 28 June 2003, 4:55 p.m.,*
in response to message #7 by John Smith

HPIL is the only interface made for the 41C, it requires an HPIL Module (82160A) that plugs into a 41 port, and there is also an HPIL card for the PC - HP used to make one (82973A) that you might be able to find on Ebay or in the Museum Classified ads, also Christoph Klug in Germany has designed his own PC HPIL interface board and you can buy one from him. Then you can run an HP41 emulator from Jean-Francois Garnier in France on the PC to write and run HP41 programs on the PC and move them between the PC and a real 41 via HPIL. Here is a link to an earlier thread where Christoph answered the same basic question:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv012.cgi?read=32106

Re: HP 41C/CV to PC Interface Question

*Message #10 Posted by **John Smith** on 28 June 2003, 7:54 p.m.,*
in response to message #9 by Ellis Easley

Ellis,

Thank you for your reply. I have read your response as well as all other Q&A through your link. Amazing how much effort went so early on just to do that what I'm looking for today. It appears to me that the solution is not that trivial as I would like it to be, nonetheless, there is a solution exists. But it may not be practical, due to discontinued product lines. Bits and pieces may be available through auction sites, but there is no guarantee of their working order.

I have not been kept up with the HP-IL side at all, thus this old question has surfaced as new by me, which is the clear evidence of my ignorance.

In conclusion, I see no solution to my problem with reasonable expense and effort. Despite this gloom ending to my expectation, I still hope, someone (hardware nut and 41C lover) will come up with USB cable type solution so that Windows XP can be interfaced with 41C.

Please, keep me in the loop, if it is not too much to ask. I think you, Luiz, and two other guys (I don't remember the names off hand) are most knowledgeable and visible on this board.

Thanks again,

John

Re: HP 41C/CV to PC Interface Question

*Message #11 Posted by **Ellis Easley** on 28 June 2003, 9:41 p.m.,*
in response to message #10 by John Smith

I don't think the HP41 HPIL module is that hard to find, and Christoph's board costs $150, I think - not cheap but not outrageous. You might try downloading the free version of the emulator and see how you like it, I understand it does just about everything except the HPIL communication. You could move some of your programs by hand just to try the system out.

You could also get the PPC (or maybe the HPCC?) CD-ROMs from Jake schwartz and look for an article about something called the "bender coupler" - it was an idea that used the beeper in the 41 as an output device. I think I've also seen articles about using the bar code wand, modified, as a general purpose input device (might have been the timer module). And if I'm not mistaken, you can print bar codes on your PC with the emulator, so you could develop your programs on the PC and print out bar codes to load them into the 41. Somebody with a working card reader and HPIL system could read your cards and put them on disk for you.

Also, I wanted to add to my earlier message that there are other PC programs besides the emulator that can be used to transfer information on HPIL with the PC HPIL card. There is the software that originally came with the 82973A card from HP and another product called LinkPlus, they make the PC look like an HPIL disk drive and printer to the 41 (or 71 or 75) - LinkPlus apparently does it much better than the HP software. But the emulator only costs $20 or $25 for the registered version that works with HPIL - I think that is a bargain! I've downloaded the trial version and I am trying to get an older PC set up to run it on - you need an ISA slot for the HPIL card - but I haven't actually used it yet.

Re: HP 41C/CV to PC Interface Question (edited)

*Message #12 Posted by **John Smith** on 28 June 2003, 10:55 p.m.,*
in response to message #11 by Ellis Easley

Ellis,

Thanks again. Since you have provided wealth of info on this, would it be too much to ask to review the summary that I laid out in terms of plan of actions?

Plan A: HP-IL Module (82160A), HP-IL PC Card (82973A), HP41 Emulator software (third party).

Plan B: HP-IL Module (82160A), HP-IL PC Board (Christoff Klug), HP41 Emulator software (Jean-Francois Garnier).

Plan C: HP-IL Module (82160A), HP-IL PC Card (82973A), LinkPlus hardware (third party),and driver program (HP).

Plan D: Bar code solution direction (which I'm not clear on the flow.....?)

Plan E: HP-IL Module (82160A), HP-IL Extended-I/O module (82183A), HP-IL RS232C (82164A) interface, and Tony Duell's lifutils for Linux.

Plan F: MLDL2000 (Meindert Kuipers). No details are known yet for other parts involved in this solution path. But this solution will lead to use USB cable connection (modern day solution) as per designer's promise.

Can you perhaps fill up the gaps for the accuracy on the hardware and software needed, if I have missed to capture from your response?

John

Re: HP 41C/CV to PC Interface Question

*Message #13 Posted by **Chris(FLA)** on 28 June 2003, 11:46 p.m.,*
in response to message #12 by John Smith

Plan E: HP-IL Module (82160A), EXT-I/O module, IL-RS232C (82164A) interface.

With this setup I use Tony Duell's lifutils for Linux.

Works great with my 41 & 71.

Chris

*Message #14 Posted by **John Smith** on 29 June 2003, 12:17 a.m.,*
in response to message #13 by Chris(FLA)

Chris,

Now we have a good compilation of various choices. Thanks for you to stepped in. I hope, Ellis will be kind to fill up the Plan D, and add more choices if he has any left in his bag.

In the mean time, can you perhaps, provide me HP part number for the EXT-I/O Module?

Are EXT-I/O Module and HP-IL RS-232 (82164A) two separate parts?

John

Re: HP 41C/CV to PC Interface Question

*Message #15 Posted by **Johnny Billquist** on 29 June 2003, 6:30 p.m.,*
in response to message #14 by John Smith

Yes, the Extended I/O module is a separate product HP did, which adds a lot of control to the HP-IL which you don't have otherwise.

The Extended I/O is HP82183A.

Re: HP 41C/CV to PC Interface Question

*Message #16 Posted by **Meindert Kuipers** on 29 June 2003, 9:00 a.m.,*
in response to message #13 by Chris(FLA)

Plan F: use my MLDL2000.

Expansion to this will likely offer USB. This is not an end-user level solution, but those who like hardware and M-code programming will be able to come up with a working solution.

Just wait a few more weeks for all the gory details ;)

Meindert

Re: HP 41C/CV to PC Interface Question

*Message #17 Posted by **John Smith** on 30 June 2003, 1:42 a.m.,*
in response to message #16 by Meindert Kuipers

Meindert,

I'm intrigued by your solution. Would you be able to elaborate your solution ahead of two weeks that you are referring to? Let me pose some questions for you.

1) Do I NOT need HP-IL module 82160A any more?

2) I presume your device is connected to the PC by USB cable, right?

3) Then what kind of cable do I need to connect your device to 41CV?

4) Will there be another adapter from calculator to your device?

5) Or, maybe HP 82160A still needed, but also needs a HP-IL standard cable 82167B to connect your device?

6) Still perhaps a driver program is needed to run not only your device also to communicate with the 41CV, right?

Please respond at your earliest possible time. Thanks.

John

Re: HP 41C/CV to PC Interface Question

*Message #18 Posted by **Meindert Kuipers** on 30 June 2003, 5:53 a.m.,*
in response to message #17 by John Smith

I am busy trying to get my hardware to run and working on finalizing the specifications, that is why I asked you to wait just a few more weeks. Go and download the preliminary specs at www.kuipers.to/hp41 and follow some of the threads on this forum, Searching for my name and/or MLDL will probably get you enough useful threads.

Note that my hardware is not ready for production. I will NOT be able to offer a full working HP41 to USB solution. As my MLDL2000 is still in development there is not much specificics that I can give you. Not that I do not want to, but because I simply do not know, especially about the USB connection. Beware that I will not be able to supply a complete nicely wrapped product, but rather PCB's with programmed components. It is up to the user (you in this case) to somehow plug it into an HP41 (for example by using an old cardreader housing) and provide all the cables.

If you want a working solution now, go get Christoph Klug's nice piece of HP-IL hardware!

Meindert

Re: HP 41C/CV to PC Interface Question (edited)

*Message #19 Posted by **Ellis Easley** on 30 June 2003, 10:40 a.m.,*
in response to message #12 by John Smith

Plan A and Plan B are functionally identical. Jean-Francois's emulator and either Christoph's or HP's PC HPIL card. As Christoph points out in a later post, no HP41 Extended I/O module is needed. On Plan C, LinkPlus is a program that runs on the PC. It should work with either the HP PC HPIL card or Christoph's. The HP software I mentioned is an alternative to LinkPlus (with lesser features, I think) - this software came with the HP card and should be easy to find. Plan D is a one-way solution: use an emulator on your PC to develop HP41 programs and print them out as bar code on your PC's printer (I understand some HP41 emulators will do this but I'm not sure which ones, if any.) Then you can load the programs into your HP41 with the bar code wand (82153A).

Re: HP 41C/CV to PC Interface Question (edited)

*Message #20 Posted by **Dan M** on 30 June 2003, 12:03 p.m.,*
in response to message #12 by John Smith

John:

Here's another option....

HP-IL Module (82160A)
9114 Disk Drive
Leo Duran's User Code Tools
LIFUTIL or LIF software

Also, check out the MoHPC FTP Page

If you are linux-enabled, Tony Duell has written some excellent tools, as mentioned by Chris.

Edited: 30 June 2003, 12:11 p.m.

Plan D (modified wand)

*Message #21 Posted by **Tony Duell** on 30 June 2003, 4:51 p.m.,*
in response to message #12 by John Smith

As for Plan D : It's strictly one way (from the PC to the HP41), but you don't need an HPIL module in the HP41. What you need is an HP82153 wand. You crack open the wand module, and solder an opto-isolator chip inside (the wand remains fully functional, and can still read barcode). You then link the opto-isolator to a little interface circuit which connects to the PC. The PC sends out bytes that correspond to HP41 barcode, and the interface turns them into long and short pulses to the optoisolator. The HP41 + wand module then 'thinks' you're scanning barcode, and, for example, loads a program. The scheamtic of the interface, source and hex files for the microcontroller, details of modifying the wand, and linux-based driver software are hidden in my LIF Utilities for Linux distribution. The interface as given connects to a normal parallel printer port. Personally, if you have the choics between buying a wand and buying an HPIL set-up, go for HPIL -- it's a lot more versatile. But if you already have a wand, and don't mind doing some soldering, it's probably worth making the interface.

I'm sorry... I didn't mean to! I have no such knowledge... (edited)

*Message #22 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2003, 9:44 p.m.,*
in response to message #6 by John Smith

Hey, John;

I'm completely sorry... Actually, I did not read your posts till now. I'm doing something: I'm avoiding to go into themes I have low level of knowledge about.

There is one of our brainy contributors that posted good stuff about this subject a couple of weeks ago. I cannot remember his name, sorry, but it's not gonna be hard to find him. If I'm not wrong, he developed his own version for a daugtherboard that allows the HP41 to communicate directly with a PC.

I'm completely sorry, I'd really like to help. I wish I have the knowledge and the way to assist you doing this. I read the titles and did not even open the posts...

Can you forgive me?

Luiz C. Vieira - Brazil

P.S. - I mean the knowledge to connect the HP41 directly to a PC, as you mentioned in your first post; what I kow for sure is that it involves extra, and in some cases *too expensive*, hardware. I see Ellis has given good and necessary directions: the name of the man is Christoff Klug, as mentioned. Success!

Edited: 29 June 2003, 1:19 a.m.

HP41 - PC interfacing

*Message #23 Posted by **Christoph Klug** on 30 June 2003, 5:34 a.m.,*
in response to message #22 by Vieira, Luiz C. (Brazil)

Dear HP41 enthusiasts,

here I am :-)

Interfacing HP41 to PC is absolutely nice and powerful for today HP41 user !!!

Take the low priced IL-Module from ebay and the original HP82973 PC interface card or the 100% hardwarecompatible replacement solution from me. The price for this (150$) is absolutely fair, because you are not able to create a own hardware solution by yourself, including IL-terminal, IL-transformer and IL-chip, electronic components and a professional designed pcb. This project is only possible by the input of some HP41 enthusiasts from Germany, France, Great-Britain and USA...

You need not the EXT-I/O module, because typically ebay price for this is placed in in the range of 100$...200$.

For software take the absolute fantastic EMU41 from Jean-Francois Garnier (France) : Only this gives you maximal features including HP41CX emulator, plus the complete range of virtual plug in modules including advanced modules like CCD, PPC, Paname, EXT-IL, SkwidInk. Furthermore EMU41 includes advanced RAM-box features and real HP-IL support : You get some virtual IL devicels like printer and mass storage - and you are able to interface your real IL devices (for example a IL-plotter or the HP3468 multimeter)to EMU41. And your real HP41 ;-)

Working with EMU41 is identic to operating a real HP41, and installing the HP-IL/PC interface card to a PC motherboard with ISA slot is done in less minutes. Needed PC operating system is DOS or WIN98 or WIN2000/NT/XP....

Best wishes from Germany - Christoph Klug

Re: HP41 - PC interfacing...(edited)

*Message #24 Posted by **John Smith** on 30 June 2003, 1:59 p.m.,*
in response to message #23 by Christoph Klug

Hi Christoph,

Thank you for responding. I've been getting vote of confidence for your products as one of the reliable solution path.

I have a few questions for you. My understanding of hardware requirements for your solution path are:

1. HP-IL module (82160A) ...procurement source: ebay

2. HP-IL PC Board (Christoph Klug).direct purchase, US$150

Software requirement:

3. EMU41 (by JFG)..Procurement source: unknown; cost:US$?

4. Is my understanding correct? If yes, can you please provide answer to item 3? If my understanding is incorrect, could you please revise it?

5. Where does your board get installed? Is it an external device, or ISA card, or PCI card? Do you have any top level schematics on integration of 41CV, your device, and computer?

6. Will your device work with Pentium-4 PC?

7. Will EMU41 work with Windows-XP? Is GUI DOS? or Windows?

My sincere hope is that you would be kind to take time and answer my questions. Once I understand the top level loop and successfully identify all required parts, I'll start my procurement phase. Thanks,

John

Re: HP41 - PC interfacing

*Message #25 Posted by **Christoph Klug** on 1 July 2003, 5:00 a.m.,*
in response to message #24 by John Smith

Dear John, dear HP41 enthusiasts :

nice discussion about HP41-PC Interfacing. Some different solutions exist, and may be we get some more in future ? Now I want to give you more details about the "HP41-PC gateway & emulator" which is based on EMU41 from Jean-Francois Garnier :

PC-hardware : Unfortunately the former software solution Link Plus is limited to slow PCs like 286/16MHz machines. Software Trans41 is compatible to modern machines, also EMU41. I tested both software solutions with some different PC hardware from 286/16MHz up to fast 1GHZ Athlon machines. You need a motherboard with ISA slot, actual no solution for PCI or USB bus exist. Also today ISA is an industry standard for PC applications and some special and exotic ISA cards exist beside modern PCI systems. If you need an old ISA slot PC, may be you find one in the garage of your neighbour ?

PC-operating system : EMU41 (and Trans41) run with DOS, WIN95 and WIN98SE. For this installation is absolutely easy. For modern operating systems like WIN2000/XP/NT you need an additional address routing software tool (tested from Leo Duran). A text help file which describes installation procedure and first steps is available from me.

Needed equipment : You need your HP41 with HP82160 IL-Module. The non

exotic IL module you get from ebay. Price is placed in the range from 20$ up to 60$. Furthermore you need the HP82973 HP-IL/PC Interface Card – or the replacement unit from me. Price for the last is 150$ plus transfer costs. You also get some documentation and nice software tools. From Jean-France Garnier you get the personally signed full version of EMU41 for a fee of 20$. This includes HP-IL features. The basic EMU41 you download free from Jean-Francois Garnier´s webpage...

Human Machine Interface of EMU41 : Like the real HP41 also EMU41 includes a basic HMI : You get a DOS like screen display and use the PC keyboard. No mouse assistance. No photo realistic graphic design. But compatible to the great range of PCs.

HP41 – PC : EMU41 offers you some different solutions for transfer of data, programms and files between HP-41 handheld and PC : 1. HP-IL (bi-directional) working with virtual mass storage unit 2. HP9114 IL-Disk Drive (bi-directional) Only possible for old floppy drives/PCs like 286 3. HP82161 IL-Cass Drive (bi-directional) 4. Barcode plot with EMU41 and virtual SkwidInk module (only download to HP41) 5. Under development. Actual Jean-Francois Garnier works on it...

Some more information about EMU41 and HP41 software solutions you find on the web page of Jean-Francois Garnier http://membres.lycos.fr/jeffcalc

Best wishes from Germany – Christoph Klug

Hp41 Program question

*Message #1 Posted by **Greg Atkins** on 26 June 2003, 9:42 a.m.*

I have a spiral program that has two codes to it that I don't know how to key in, and am not real sure what they are.

the codes are

1 E2

and

RCL IND 25 or RCL IND25

any ideas?

Re: Hp41 Program question

*Message #2 Posted by **Valentin Albillo** on 26 June 2003, 9:45 a.m.,*
in response to message #1 by Greg Atkins

1 E2

Try [EEX] [2]

RCL IND 25 or RCL IND25

Try [RCL][YELLOW KEY][2][5]

Best regards.

Re: Hp41 Program question

*Message #3 Posted by **Raymond Del Tondo** on 26 June 2003, 9:48 a.m.,*
in response to message #1 by Greg Atkins

Hi,

1 E2: press 1, then the EEX key, then 2

RCL IND 25: press RCL , then the yellow shift key, then 25

HTH,

Raymond

Re: Hp41 Program question

*Message #4 Posted by **db(martinez,california)** on 26 June 2003, 10:23 p.m.,*

in response to message #1 by Greg Atkins

Looks like your question got answered but:

Which spiral program is that? It's not Kirber's, or is it a modified version? I'm just curious because i used Kirber's years ago and did a lot of modifying myself. It was great as written but it did everything for everybody and at over 700 lines it was bulky enough for me to ask "what don't i need". I took out about 40 lines of program and 50 lines of subroutine that i didn't use and then put a few back in (A.K.A. peeing in it to improve the flavor). So DID someone write another spiral routine?

It's great to see someone using "aproriate technology". Theres too many surveyors now a days just getting everything loaded into a data collector by someone in the office and pushing the "next point" key.

Surveying nowadays...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 11:52 p.m.,*
in response to message #4 by db(martinez,california)

Hi, D.B>;

I developed a lot of surveying programs for the HP41CV/CX at the time I was a student. I worked for a professional topographer and all programs he wanted I developed and listed. I have most of them still with me.

What I saw lately was non-topographers using very expensive GPS stations collecting data and sending these data on-line to their offices. They can do a complete survey in one day while it used to be necessary about a week to finish the same job. It's amazing in one side, but if you read again, you'll see the term "non-topographers" doing the job. The guys I saw only knew what was north, south, east and west. And their bank account number.

Too bad, too bad.

Luiz C. Vieira - Brazil

Re: Surveying nowadays...

*Message #6 Posted by **bill platt** on 27 June 2003, 2:32 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

If that is the way surveying is today, then I daresay the maps produced would very likely be garbage. GPS is really not very accurate--certainly not if you are surveying a building plot--it can be of 10's of feet! Unless of course one uses a "differential" GPS system, which uses a fixed ground station system to compare the gps signals, and then send adjustments via UHF radio----but is this being done in the case you are suggesting?

By the way,I will attempt further repairs to my 41CV--but I am going to try to test it one more time, first,--and then get the right glue.....

Regards,

Bill Platt

Re: Surveying nowadays...

*Message #7 Posted by **Michael** on 27 June 2003, 3:13 p.m.,*
in response to message #6 by bill platt

Survey grade differential GPS equipment is easily capable of sub-centimeter accuracy, but even the cheap grade units can measure to within a meter and the really cheap handhelds can get to within 3 meters these days. RTK (real-time kinematic) units are very common with most surveyors today and the maps being made utilizing this technology are very accurate. However, vertical accuracy is only about +/- 2 centimeters with the more accurate units used by most surveyors, but this is usually close enough for most topography surveys, unless you are designing or redesigning a really flat parking lot or something similar.

Re: Surveying nowadays...

*Message #8 Posted by **bill platt** on 27 June 2003, 4:28 p.m.,*
in response to message #7 by Michael

So then this "survey grade" DGPS must be something entirely different from the USCG DGPS that was originally developed for use in harbor navigation (back when selective availability was active).

So, who is transmitting the DGPS differential signals? Are there permanent transmitters I was not aware of? Or is this a portable transmitter that the surveyor sets up somewhere?

Re: Surveying nowadays...

*Message #9 Posted by **db(martinez,california)** on 27 June 2003, 9:46 p.m.,*
in response to message #8 by bill platt

DGPS is usually done with a permanent reciever or sometimes a temporary reciever. Either are set over a point whose coordinates are known more preciseley than is necessary for anything in the staking or topoing to be done. The data at the known station is recorded just like the mobile units and is compaired in the post processing (or in the rtk sometimes now-a-days). This gives to your new points a precision, and hopefully an accuracy, not much less than that known point carries.

USGS first order brass discs are commonly used for this and back in the 80's when the mobile units cost a quarter of a million gollies, Trimble had one running night and day on a known point on the roof at the plant near San Jose California, as a combination test, advertisment, and proof of its robustness. Since almost no one could afford two they also gave away the data to their customers for use in post processing. It wasn't too much help to folks over 60 miles away and way less over a hundred but the price was right. Any large metropolotin area has the same service for a fee and equipment is so cheap now that almost no one even rents.

Local positioning uses local transmitters and there is a mixture for things like GPS on a large subdivision. The recievers will pick up from satalites and a local transmitter. There will be a couple of guys running around using rtk units and putting wood wherever it is usefull.

There will always be the need for people to do things the old fashioned way. I hope. It is getting to be that even heavy equioment is mounted with GPS recievers but that application has a limited use so far. To make money moving dirt you care as much about how as where and GPS doesn't do how.

I'll stick to small jobs if i can and do it with real tools (like a 41) as long as i can. The pay is

a little less but the work is more satisfying. It is also easier to work and get something done than to pretend with a bad terrain model and get blamed just because the computer jocky that made the mistake is in the office and made out of teflon. The saying "mistakes have been made, others will be blamed" comes to mind here.

Someone mentioned accuracy and had it right. Horizontally speaking; sub cm precision is common and sub cm accuracy is possible. As he said; the vertical is only about half that good so you have a spheroid (is that the shape?) about size of a pistachio and the truth is in there somewhere. (That was the single most funky description of residual i have ever heard.)

Anyway, Greg never answered my question: what spiral program is he using?

Re: Surveying nowadays...

*Message #10 Posted by **Chris(FLA)** on 28 June 2003, 12:28 a.m.,*
in response to message #9 by db(martinez,california)

I have a friend who works for the state. All they use is GPS, and lasers. He has an old 41 with a survey module but doesn't use it anymore. He then transfers the data into a CAD program and then they use a plotter to draw maps of land plots.

No he won't part with the 41, I already asked.

Chris

Re: Surveying nowadays...

*Message #11 Posted by **db(martinez,california)** on 28 June 2003, 2:00 a.m.,*
in response to message #10 by Chris(FLA)

Chris; That 41 shows people that he used to have to think for a living. It's image clairification.

One great thing about the hp survey pack; the vertical (parabolic) curve program is best stand alone vc routine there is. Many of the others could have been improved and the most important one on the rom is just badly written but that grades one is good to the last byte.

Re: Surveying nowadays...

*Message #12 Posted by **bill platt** on 29 June 2003, 12:48 p.m.,*
in response to message #9 by db(martinez,california)

Well, that is interesting. I guess the techno revolution proceeds unstoppable.

My use and understanding of GPS comes from a different place---marine navigation--where centimeter accuracy was never an issue, but being off a hundred yards in fog on a narrow fairway is.

So, the USCG (Coast Guard) not the USGS (though maybe they were involved too?) essentially got in a quarrel with the Dept of Defense early on regarding the "selective availability" which rendered GPS considerably less accurate than LORAN C (using TD's) and in fact unacceptably so in the aforementioned situations. Even Lobstermen found early on that their LORAN sets were far superior for briging them back to their pots in thick fog.

But I have not been out navigating in over five years (amazing how time goes by) and so have lost track of what is going on. For instance, I am pretty sure SA is turned off now?

Another interesting isssue which came up in the early nineties when I was using GPS was that of DATUM discrepancies. It was not unusual to find that your GPS would on average put you, say, 100 yards to the east of the chart, for some place overseas. So,it turned out that you had to adjust the chart datum to match the datum of the satellite constellation.

Another interesting thing was that the whole system was in fact only experiemtal, and the satellites were in fact primary for other missions. If you listened to WWV broadcasts, you would hear, "users of GPS are warned that the system is not yet fully operational...". I know that the plan was to go into the next phase by putting up birds whose primary mission would be GPS. I wonder how that process is going?

And then there is GLONASS. Our Magnavox GPS receiver in 1993 was capable of operating with GLONASS, but we never tried it. GLONASS has a web-site, but I don't really know what the status is---I don't hear about it anymore.

-regards and thanks for your post!

" *. . . so you have a spheroid . . . about size of a pistachio and the truth is in there somewhere. (That was the single most funky description of residual i have ever heard.)*"

I thought that was a description of my brain! (Except for the "truth" part . . .)

;^)

That phrase has got to be one of the world's great quotations. Is it yours, db?

yes Paul...

*Message #14 Posted by **db(martinez,california)** on 30 June 2003, 8:55 p.m.,*
in response to message #13 by Paul Brogger

....and the sad thing is; that's the best short one i could come up with. I guess i could have specified that the nut was in the vertical position.

Pistachios

*Message #15 Posted by **Paul Brogger** on 1 July 2003, 10:00 a.m.,*
in response to message #14 by db(martinez,california)

Well, the context was certainly sufficient to suggest its orientation. But " *. . . a spheroid the size of a pistachio, and the truth is in there somewhere . . .* " Now that's one crystal clear turn of phrase! You're exhibiting a considerable gift for the translation of the abstract into the concrete. I applaud your effort!

Re: Surveying nowadays...

*Message #16 Posted by **David Smith** on 28 June 2003, 2:54 p.m.,*
in response to message #6 by bill platt

GPS can also work in a mode called "carrier phase" where you are bacically figuting out how many wavelengths of signal you are from each satellite. At GPS freqs this is less than a foot per cycle. How fine you slice the final wavelength up can be fairly amazing. Long term monironing can give you sub-millimeter accuracy over the width of the planet. You can watch continents drift in near real time.

You can also combine carrier phase operation with differential operation. A reference station is placed at a known location and a roving station takes readings relative to the reference. Real time kinematic measurments can be made to sub-centimeter accuracy.

And every 11 inches of GPS accuracy implies you have absolute time accuracy of 1 nanosecond.

Re: Surveying nowadays...

*Message #17 Posted by **Dave Shaffer** on 29 June 2003, 11:30 p.m.,*
in response to message #16 by David Smith

Actually, carrier phase monitoring doesn't work too well on a planet-wide basis. The baselines are then becoming comparable to the orbit size of the GPS, and you have problems defining the phase center of the GPS antenna system. On baselines up to hundreds of km, you can get accuracies at the few mm level in a few hours of measurement. (The limiting factor on radio and laser geodesy is the Earth's atmosphere - the atmosphere is the equivalent of about two meters thick at radio wevelengths, and the effective path length gets longer at lower elevations, in proportion to both the atmospheric pressure (easy to measure) and the precipitable water vapor (MUCH harder to measure!)

I used to (and still do to a small extent) support a NASA project using very long baseline radio interferometry (VLBI) to do geodesy. On the longest baselines (intercontinental), VLBI is superior to GPS. On the shorter baselines, VLBI is marginally better than GPS, but about 2 or 3 orders of magnitude more expensive for the equipment (hydrogen maser time standards at $250,000 a pop and million-dollar radio telescopes)! So, GPS has just about taken over on the shorter baselines. However, GPS makes its measurements within the (rotating) reference frame of the satellites. VLBI uses quasars billions of light years away for position reference - a stable system at the 10e-10 radian level. So, VLBI is still the ultimate standard for the global reference frame. NASA also uses laser ranging to satellites for geodesy, with comparable precision to GPS and VLBI, but still with the problem of a rotating reference frame.

All three techniques are now used to measure plate tectonics, and with the longest runs of data (back to the late 70s), the formal errors on the plate rates are at the few hundredths of a mm per year. (Typical plate motions are a few cm per year - or about the rate at which your fingernails grow.)

If you have a two-way radio link, you can get the cm-level precision of base-station GPS back into the field. You can plow a field or move the dirt to make a level parking lot with a real-time GPS unit in your (Caterpillar) tractor.

in response to message #17 by Dave Shaffer

That was fascinating Dave, both in content and the way you explained it. So much so that i saved it to read again.

Yes you can do most anything you might want to do in earthmoving using gps but: 1)the cost of making a terrain model still makes a cutoff point where many jobs are too small or too busy to warrent it. 2)The software knows to say raise or lower the tool on your cat but it doesn't know which way it wants to push the material or what to do with varying types(soil/mud/rock). It will eventually. Just as 95% of the art and science has gone out of "the art and science" of surveying, due to overcomputerization, i'm sure that someday all the thinking will go out of sculpting the earth.

I am also sure that automation will not get it done better or faster than experienced people could do it with the eye and hand and brain. Let me use surveyors as an example again because they are 10 or so years ahead in using the same technology. All that the field computers and data collectors which you see surveyors with now days have done is make it so people that can't do math can be surveyors. It is that way it is too much of the time now, both in my union and the non-union area. At least my union still gives classes in math, some of the old methods, and the theory behind what we are doing.

Please let me give one more observation. When i started surveying in 81 there would be a three man crew; one man calcing, one shooting and one pounding wood. Depending on variables like the correctness of the topo & plan and the number of gun setups plus the amount of control that needed to be done a good crew on a good day could get from 70 to 125 points in the ground. Now a two man crew, a gunner and a chainman, go out with a data collector full of coordinates that it took an office worker most of the day before to generate and check and on a good day they get between 70 and 125 points in the ground.....Unless something goes wrong with all the computer equipment or unless the office calculations got rotated or something. Then sometimes nothing gets done because all too often the people in the field are just what the employer was looking for: button pushers.

I am not a technophobe. I am just sick of technology for the sake of technology. I do think that one person gps surveying is the wave of the future. To tie this all into the forum.....too bad that the new hp won't be doing any of this, isn't it?

Re: Surveying nowadays...

*Message #19 Posted by **Michael G. Shackelford, PLS** on 1 July 2003, 2:27 p.m.,*
in response to message #18 by db(martinez,california)

HP "was" surveying in the 70s when I started. The HP3800 distance meter, then the HP3805 for longer range, then the HP3810A was the first "total station" that measured distances and angles accurately in one instrument. The HP3820 was the last of a great era of HP surveying instruments that I had the pleasure of using in the field. All the while, they were making great computers and calculators for surveyors and engineers like the HP-41 that I carried every day in the field and still have one on my desk as I write. Even used the 41s, 71s and 48s as data collectors with total station instruments at one time or another. But that was then and this is now and it is really is too bad that the "new" HP won't be doing any of this in the future. Thanks to those that explained GPS surveying better than I ever could have done.

in response to message #19 by Michael G. Shackelford, PLS

There are still a few die hard old timers out there. A local surveyor had his HP41CX with Sup-R-Rom stolen from his truck. It was like his dog died. It took me around a year to find him a new Sup-R-Rom... which he keeps under lock and key.

Re: Surveying nowadays...

*Message #21 Posted by **Michael G. Shackelford, PLS** on 2 July 2003, 1:51 p.m.,*
in response to message #20 by David Smith

I still have a Sup-r-Rom and a somewhat rare Tom's Rom for surveying along with their original manuals.

HP Think Jet Printer Cartridges

*Message #1 Posted by **Tracy Vermeyen** on 26 June 2003, 1:03 a.m.*

Does any one know if HP Think Jet Printer Cartridges are still available? If so, where can I find them and how much do the sell for?

BTW: I can get my hands on several very cheap if any one is interested in getting one. Most are RS-232, but a few HPIB are also available. I didn't see any HP-IL versions, but then again I'm not sure if there is such an animal.

Re: HP Think Jet Printer Cartridges

*Message #2 Posted by **kim** on 26 June 2003, 11:13 a.m.,*
in response to message #1 by Tracy Vermeyen

The 51604A is the waterfast 'pen' for ThinkJet

I don't knwo where you live but I have bought @ Staples and Depot in the US and Viking/Quill Mail order in Europe. The price should be around $15-17.

Hope that helps

Kim

Hi, Bill:

Bill posted: *"With all this talk about the 15-C and its superiority, I took a flyer and in a moment of indiscretion put in a bid on one---and I won!"*

Congratulations ! You *did* the right thing, and at the prices they're commanding on eBay, it just shows all the more that you've really got what it takes :-) (i.e.: money and a forgiving wife ...)

"now what do I tell my wife---ANOTHER CALCULATOR !!!!!"

Nonononono .. that's not the right attitude. Try instead something like "Hey hon, guess what ? I've just made a smart investment that will get us both a tycoon-like retirement". Trust me, that's not a deceptive statement, the numbers of HP-15Cs can only decrease in time (dogs love to chew on them, you know) and yours will be worth a fortune 20 years from now.

"boyoboy do i need a swiss bank account:-)"

Indeed. IRS clerks won't be very happy in 2023, when they discover you sold that antique for a million bucks and told them nothing. A swiss account would be the right thing.

"But you see, it is all about mental challenges----the fact that I am from Philadelphia, and that the inspiring mathematition Mitchell Feigenbaum is also from there makes me feel like "I can do that too!"

That's a half-hearted attempt to rationalize after the fact. Face the truth: you did it because you felt like it, period.

"But really, I think it is Valentin's quiz posts---I just had to go get a 15-C so that I too can try them!

Me !? Gee, I knew from the start I would play scapegoat in this sad affair of yours ! So much for trying to enthuse people to love the 15C as much as I do ... sigh ...

Well, considering the fact that you've displayed bravery well above and beyond the call of duty in compromising your economic status (and your marriage) just to get a 15C, and considering that you seem to be fond of famous numeric constants, this is the best I can do for you:

http://membres.lycos.fr/albillo/DatafileVA006.pdf

Enjoy !

Best regards and welcome to the 15C club.

I guess I am not crazy

Tradeoffs: dynamic register/program allocation vs. Simply More Memory . . .

*Message #1 Posted by **Paul Brogger** on 25 June 2003, 5:54 p.m.*

I was playing with my 34c today, and got to thinking . . . (Here comes the scary part!)

I wonder how much ROM is devoted to dynamic allocation of a relative handful of memory locations between registers and programs, and how expensive was it to code and debug the relevant firmware?

Certainly at recent prices for memory and/or chip real estate, you'd think they'd Keep It Simply Simple and establish fixed amounts of program and register memory, as in my old 29C. (What, then, explains the HP-32S/SII?)

But was CMOS Continuous Memory *SO* expensive back in the 70's that the "shared" approach (with concomitant ROM space, program development, debugging, testing and documentation costs) was really a wise investment? It's probably a measure of how spoilt I've become, but it seems hard to believe . . .

Maybe someone could fire up the ol' Way-back Machine and clue us in on just how the internals of register vs. program memory management works in the Spice and low-end Pioneer programmables?

Re: Tradeoffs: dynamic register/program allocation vs. Simply More Memory . . .

*Message #3 Posted by **Vieira, Luiz C.** on 26 June 2003, 3:49 a.m.,*
in response to message #1 by Paul Brogger

Hi, Paul;

I'm not delving into the specific subject of how is it done, but just to make a simple recall.

The HP34C and the HP38C/E are the first ones to show the movable partition. In both cases, program memory "request" determines the amount of memory available for storage registers. Except for the HP95C (I don't know how does it work), I think there are no other LED-display HP calculators wiht this movable partition. Both Texas TI58 and TI59 also have it.

The HP41 and all Voyagers show this, being the HP15C the only Voyager that allows user selection for the movable partition. The HP41 and the HP42 show the same control capacity, and I am not sure about the HP32S/SII.

The additional O.S. parts to allow the movalble partition to exists seem to be not so big as expected. The only thing that changes is that instead of checking for a fixed memory position or defining it, the system now

checks for a value stored somewhere else. The HP55 accepts [STO] and [RCL] from [0] to [9] and from [.][0] to [.][9]. The HP33C/E and the HP25/25C accept only [STO] and [RCL] from [0] to [7]. What happens if we key in [STO][8] in an HP25? The system is pre-programmed in such a way that [STO] 8 and [RCL] 8 are neither recorded in a program nor performed by keyboard direct operation. Does the O.s. perform a check or not? What is the diference of checking for [STO] 8 and [STO][CHS]? Both are not allowed in the HP33C/E or the HP25/25C and I don't know if they are both refused the same way. I don't dare guessing. If we take both TI58/59, any key is accepted after [STO] or [RCL], with a few exceptions. In their case, movable partition is user-defined by [OP] 17, no authomatic adjustment available, and [STO]/[RCL] are from 00 to 99 only.

Back to Spices, you can type in a program in the HP38E/C ot the HP34C thats uses any register, i.e., while typing in a program, storage register availability is not checked, of course. At the moment any register is accessed, a "go-no_go" is performed to see if it exists. I think that the movable partition "location" is stored and updated each time one register is turned into seven program steps/bytes. As programs NORMALY do not generate otehr programs, while a program is running the last value assumed for the movable partition is checked, and never updated, everytime a register "position" is called. This is not done in fixed-scheme memory calculators.

I think many considerations can be made, but what actualy happens on each system can only be actually "seen" if the O.S. is debuged. I think that the one with the most complex organization is the HP42S. It probably mannages mamory contents in a way closer to the HP28's way. The HP42S emulates the HP41 in a higher level processor, as we know. A better mamory mannagement is also needed to emulate all particular HP41 operation and data register. And the HP41 has an exclusive user-defined movalbe partition, like the HP15C. This has not been changed in the HP42S.

Comments? Corrections? All welcome.

Re: Tradeoffs: dynamic register/program allocation vs. Simply More Memory . . .

*Message #4 Posted by **Valentin Albillo** on 26 June 2003, 5:54 a.m.,*
in response to message #3 by Vieira, Luiz C.

Very interesting post, Luiz, I've enjoyed reading it, but there's a point I would like to make. You say:

"I think that the one with the most complex organization is the HP42S. It probably mannages mamory contents in a way closer to the HP28's way."

Assuming you're not considering the HP28/28S/48/49 machines, I think the HP-15C has also quite a complex memory management to do, for it has to allocate and administer (quite scarce) memory for all these items:

- program memory (steps 001-448)
- dynamically allocated user storage registers (R02-R65)
- matrices (A-E)
- the parallel complex RPN stack (X,Y,Z,T and LAST X)
- scratch registers for SOLVE (5 registers)
- scratch registers for INTEGRATE (23 registers)

in all their diverse configurations of allocated/deallocated status and variable sizes. To that, you could also add the permanent real RPN stack (X,Y,Z,T,L) and permanent user storage registers (RI, R00, R01), which are available at all times.

Also, there's the fact that there are a number of 'hidden' data stored here and there which also need to be allocated and managed, such as the row and column exchanges done to an LU-decomposed matrix, which have to be remembered together with the actual element values in order to accurately compute in a future moment the inverse and/or determinant of the matrix, or to use it in a 'division' operation.

Finally, SOLVE can call INTEGRATE and INTEGRATE can call SOLVE (though no directly or indirectly recursive calls are allowed) and this has to be managed too, to make them share some of their allocated registers so that no more than 23 are used in that case, too.

The point is, of course, that all this seems complex enough to me. The 42S' management is much more complex, of course, but at least it doesn't have to deal with allocating memory for a parallel RPN stack ! :-)

You're right about the HP15C.

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 12:37 p.m.,*
in response to message #4 by Valentin Albillo

Hello, Valentin;

thank you for your comments. As always, yours are also thoughtful, precise and teasing ;^).

The fact that leads me to conclude the HP42S as having one of the most complex O.S. for an RPN calculator is because it has a different, floating memory organization. Based on some facts, I tell you it uses pointers to existing "objects" instead of available memory to all of them.

As it happens in RPL-structured machines, replicated objects in the HP42S do not use space. Let's take a simple example and start by clearing STACK and LASTX:

```
[CLST] [+]  [×: 0.0000    ]   @ this places 0.0000 in all stack
[MEM]       [6977 Bytes   ]
```

This is what's shown when the calculator is completely cleared. Now type in any floating point number and check memory.

```
123.456     [×: 123.456_ ]
[MEM]       [6963 Bytes  ]
```

See? Fourteen bytes are automatically allocated to hold the new entered data. Now fill the stack with it and check available memory again:

```
[ENTER]
[ENTER]
[ENTER]     [×: 123.4560 ]
[MEM]       [6963 Bytes  ]
```

Should we conclude that the stack occupies 14 bytes? The fact is that *no extra bytes are used to hold copies of the same data in all stack registers*. Now let's clear all stack and enter different numbers at a time and check available memory for each entered data:

```
[CLST] [MEM]      [6977 Bytes  ]
123  [MEM]        [6963 Bytes  ]
[ENTER] 123 [MEM] [6950 Bytes  ]
[ENTER] 123 [MEM] [6936 Bytes  ]
[ENTER] 123 [MEM] [6923 Bytes  ]
```

Each entry consumes as many bytes as needed to hold a new number. The O.S. does not check if I'm entering the same numbers, it only requests new bytes to hold it. Each stack entry uses, in fact, 13.5 bytes, and the half byte called my attention to Saturn architecture and RPL organization. Why not thinking the HP42 is an RPL calculator with a stack limited to four register? It would be easy to implement some new short routines in the existing RPL O.S. to emulate the HP41.

You can go any further by testing what happens when complex numbers are generated and how much memory they request to exist. Also when variables are created. I had done that a long time ago, when I bought my first HP42S (R.I.P., poor girl...), but I cannot find my notes. It's revealing. I also had a complete XROM map for it... all lost.

You see, the HP15C handles a small amount of memory and it does wonders with it. But it is somewhat easier when you know exactly where are all stack registers and their precise location, even if they grow in an exact number of five registers. Also, when computing SOLVE or INTEGRATE, I wonder if the 23 registers needed to accomplish the task are mapped in memory or not. I'm not sure if imaginary stack is created in the same portion of memory everytime it is activated, mostly because SOLVE and INTEGRATE do not use imaginary stack contents unless you explicitly use Re<>Im, and this technique is shown in the HP15C's Adv. Fcn. Hanbook. And one very convenient fact is that if complex mode is active, imaginary stack contents are cleared everytime a function is evaluated by SOLVE or INTEGRATE because both can only sample real data and the stack is filled with this sampled data before to evaluate function to be integrated or solved for. Well, in fact, if you set flag 8 or execute [f][I] or [f][Re<>Im] while computing SOLVE or INTEGRATE is different of activating complex mode before or after computing any of them. Where in memory will imaginary stack registers be created if they are created while running SOLVE or INTEGRATE procedure? In this case, is it possible to "pause" SOLVE or INTEGRATE computing and use complex numbers by direct keyboard operations? I'd like knowing it for sure and I did not test it.

There's more to talk about HP42S memory management and RPL memory "tricks", but I'll do that later, if needed.

Thanks, Valentin; I was not sure about when I'd post something about this.

Re: Tradeoffs: dynamic register/program allocation vs. Simply More Memory . . .

*Message #6 Posted by **Patrick** on 26 June 2003, 2:55 p.m.,*
in response to message #4 by Valentin Albillo

If memory serves(!), I seem to recall reading that some of the management information you refer to (LU stuff) is stored in the registers in non-standard format. The floating point format used in HP registers does not use all of the possible legal bit patterns. Some of these otherwise "illegal" bit patterns are used to denote special information, such as the fact that a register contains a matrix descriptor, or that a matrix is in LU form.

I believe I read this in the HP-15C Advanced Functions Handbook. I'll try to track it down...

Memory allocation: 34/41/15/42/32

*Message #7 Posted by **Karl Schneider** on 26 June 2003, 11:26 p.m.,*
in response to message #1 by Paul Brogger

Paul --

The amount of ROM code devoted to memory management in these units is a question to which I don't know the answer. It must have been a "necessary evil" for HP to address this issue in order to provide flexible products at reasonable manufacturing cost. There's certainly a lot of documentation about it in the old manuals! The RAM probably was comparitively more expensive back in the day. No pure-RPN HP calculator model through the '80s had more than 7 kB, for various reasons, I suppose.

Here are some comparisons between memory management between the RPN units 34C, 15C, 41CV, 42S, and 32Sii. I own and use all of them.

The 34C (and successor 11C) will automatically partition memory between numbered registers and programs. There are 70 bytes (instructions) of permament program memory, and 20 seven-byte convertible numbered storage registers labeled 0-9 and .0-.9. As more instructions are programmed, registers are converted without prompting, one at a time as necessary, to program storage. As programmed instructions are deleted, the memory is returned to data registers.

The 41C/CV/CX allows the user to manually select the number of numbered seven-byte data registers available for use (up to 63 for the C; 319 for the CV/CX) ; the remaining memory is available for programmed instructions. Any data storage (temporary or otherwise) needed by programs or functions will utilize the data registers. Micro-coded routines (e.g., Romberg integration on the Advantage module) will use the highest-numbered registers; RPN programs on the modules will tend to use specific lowest-numbered registers.

The 15C and 42S allow manual partitioning in a more sophisticated fashion. The user specifies how many numbered data registers to allocate (between 2 and 66 seven-byte registers on the 15C; many more eight-byte registers or 16-byte registers for complex values on the 42S); the remaining space is "pooled" and automatically allocated as necessary for all other purposes -- programs, matrices, imaginary/complex numbers, integration, root-finding, etc. This way, space for numbered registers is separate from the space needed for other applications.

The 32Sii has simple managment of its meager 390 bytes or so of memory: There is no "allocation command"; all memory is in a free pool for real-valued variables, programs, equations, and scratch registers for Romberg integration and root-finding (SOLVE). Eight bytes is allocated for a variable only if it contains a non-zero value(!)

The thing I've wondered about in the 34C is the memory requirements for SOLVE and INTEGRATE. For Romberg integration, the 15C requires 23 "free" registers; the 41C Advantage requires 32 available numbered data registers. The 34C, by contrast, requires no extra "scratch" space for these same advanced functions. I've also noticed that the 34C is slower to integrate than the 15C, although the 34C is a little faster interactively. Maybe this non-requirement causes the 34C to perform redundant calculations.

Re: Memory allocation: 34/41/15/42/32

*Message #8 Posted by **Valentin Albillo** on 27 June 2003, 4:39 a.m.,*
in response to message #7 by Karl Schneider

Karl posted:

Wrong. The HP-15C's SOLVE and INTEGRATE algorithms were lifted straight out of the 34C's existing code, and in their turn, were used for the 41C's Advantage ROM and later for the 71B's Math ROM

(improved to account for recursivity, i.e: an INTEGRATEd function can call INTEGRATE itself, and so on up to 5 levels deep).

This means that the 34C's INTEGRATE code *does* use the scratch 'registers' you mention, but they are *permanently allocated exclusively* for SOLVE/INTEGRATE, and thus *never* available to the user for conversion to regular storage registers or program steps.

This is, of course, highly inefficient and was corrected immediately in the next model to implement that functionality, i.e.: the HP-15C, where said registers are only allocated for SOLVE/INTEGRATE if and when needed. Had the 34C memory management code implemented this feature, users would have enjoyed 23 additional registers (i.e: up to 20+1+23 = 44 storage registers) or 161 additional program steps (i.e.: up to 70+7*20+161 = 371 program steps). What a pity ! :-(

(BTW, you *can* actually 'navigate' and see the contents of the 34C's SOLVE/INTEGRATE registers by using some 'black-box' techniques, so to say ! A complete memory map for the 34C was published a looooong time ago in either PPC or Australian PPC Technical Notes (or both) but can't remember or check it now.

Best regards,

Re: Memory allocation: 34/41/15/42/32

*Message #9 Posted by **Karl Schneider** on 28 June 2003, 4:57 a.m.,*
in response to message #8 by Valentin Albillo

Valentin, Johnny --

Jeez, a fella just can't slip a sloppy statement or factual error past these keen-eyed and knowledgeable Forum participants! :-)

I stated imprecisely, "The 34C, by contrast, requires no extra "scratch" space for these same advanced functions."

What I really *meant* was, "The 34C does not require the user to reserve any 'scratch' space for these same advanced functions." That would have been a correct statement, but would have (ahem) required more thought and time to write.

I actually had assumed that the processor had some "scratch" registers available, but wasn't aware that 23 were used, as in the 15C. Valentin states that it was "a pity" that the 23 dedicated registers weren't made available to the user for data and program storage, but to do so without potentially (ahem) "consternating" the user would have required a method of explicit memory allocation -- something the 15/41/42 have, and the 34 doesn't.

This was the essence of Paul's query -- how much microcode is dedicated to memory management on the 34C, when it might have been simpler just to provide more user memory and fix the respective partition sizes?

As for the number of registers used by the Advantage module for INTEG (32) and SOLVE (13), I stand corrected -- by Johnny -- in that the highest available (unused) *program* registers, not numbered registers, are employed. This actually makes sense, if one thinks about it. (Serves me right for relying on my memory, and not consulting the Advantage manual.)

Re: Memory allocation: 34/41/15/42/32

*Message #10 Posted by **Johnny Billquist** on 27 June 2003, 6:05 a.m.,*

in response to message #7 by Karl Schneider

The HP-41 have more tricks in the memory allocation than mentioned so far. Apart from program/register allocation, it also allocates memory for the assigned keys for the user keyboard, memory for alarms (if you have the time module) and some advantage functions.

Anyhow, these things are allocated from the program part of memory, so user assigned keys will reduce the number of registers available for programs. The same for alarms.

If you call the SOLVE function in the Advantage pac, it will not use numbered registers, but unused program registers. 13 of them, to be exact.

The root finder uses 23 numbered registers. But some of thos registers must be set up before calling the function, it's somewhat understandable that they use normal registers.

INTEG also uses program registers. 32 of them.

SOLVE can call INTEG and vice versa, but they are not allowed to recurse.

DIFEQ uses eight numbered registers.

The complex number functions use five registers.

The vector calculator uses four registers.

Coordinate transformation uses 17 numbered registers.

Curve fitting uses 18 numbered registers.

TVM uses 10 numbered registers.

So, in short:

All programs that use numbered registers will use low numbered registers (starting from R00).

SOLVE and INTEG don't use any numbered registers at all, but program memory.

Thanks to ALL!

Module codes

*Message #1 Posted by **Matthias** on 25 June 2003, 5:17 p.m.*

Hi again.. perhaps someone can help me once again.. I do want to get clother infos about the HP-41 module codes. Many of the modules do have a code as 8250xX-Xxx, but can you help me to disassemble this code?

82500A 4k modules produced by HP for companies? 82500B 8k modules produced by HP for companies? 82508 ? 825009 ?

-Axx produced in America? -Bxx produced in Brasil? -Sxx produced in Singapore?

Did I forget something that can be interesting for other people?

Thanks to all, Matthias Matthias

Re: Module codes

*Message #2 Posted by **Raymond Del Tondo** on 25 June 2003, 8:29 p.m.,*
in response to message #1 by Matthias

Hi,

Pquadrat should know. At least he showed me some of those modules, including the Buderus ones, I think ;-)

Raymond

BTW: Since you bought a W&W surveying module some time ago, have you tried the software ? It was much work...

Re: Module codes

*Message #3 Posted by **Ellis Easley** on 28 June 2003, 7:13 p.m.,*
in response to message #1 by Matthias

In my 1986 HP catalog, under the heading "HP-41, HP-71, and HP-75 Custom ROM Modules", I find for the HP-41: 82508A/B and 82509A/B, "Provides 4K or 8K bytes of memory with each module, or nearly 21,000 program lines with up to 4 8K byte modules." Also for the HP-71: HP82491A/B through HP82494A/B, "Provides 16K, 32K, 48K, or 64K bytes of program storage in a plug-in module. May be used in quantities of one to four for a maximum capacity of 256K ROM. (Minimum order: 100 modules.)" And for the HP-75: HP82726A/B through HP82729A/B, "Provides 8K, 16K, 24K, or 32K bytes of program storage in a plug-in module. May be used in quantities of one to three for a maximum capacity of 96K ROM. (Minimum order: 100 modules.)"

Re: Paranoid: Here is a scary auction

*Message #1 Posted by **David Smith** on 25 June 2003, 4:07 p.m.*

For what its worth, I have done business with three or four Ebay people in South Africa without any problem. If they are scum and jack your card you are probably safe... most major cards these days have a 0 dollar fraud limit (not the legally required $50 max).

Re: Paranoid: Here is a scary auction

*Message #2 Posted by **David Smith** on 25 June 2003, 4:08 p.m.,*
in response to message #1 by David Smith

By the way, when those resistors fry expect to find three or four dead transistors on the same circuit board... been there, done that... three or four times before.

HP-41CV KEYBOARD

*Message #1 Posted by **Jon** on 25 June 2003, 2:51 p.m.*

I have an HP -41CV just like new but the "R down" needs a very hard pressing to work. I have tried to clean it with isopropilic alcohol but it doesn´t solve anything. I have used bristles impregnated in alcohol as described in this forum. Must I drop alcohol in the hole?. Is there any alternative method?.

Thaks in advance

Jon

Re: HP-41CV KEYBOARD

*Message #2 Posted by **David Smith** on 25 June 2003, 3:58 p.m.,*
in response to message #1 by Jon

Yes, it really helps to place a drop of alcohol in the hole, wet the wire brush with more alcohol, and scratch around in the hole. It can help to press and release the key while scratching around. On really stubborn keys, you may need to repeat the proceedure two or three times.

Re: HP-41CV KEYBOARD

*Message #3 Posted by **Trent Moseley** on 25 June 2003, 4:29 p.m.,*
in response to message #2 by David Smith

One of the keys on my 15C (1982 vintage) has the same problem. Is this 41CV procedure ok for mine as well?

tm

Re: HP-41CV KEYBOARD

*Message #4 Posted by **David Smith** on 26 June 2003, 5:24 p.m.,*
in response to message #3 by Trent Moseley

Yes, it works fine on every keyboard I have seen that has the access hole under each key (Woodstock, Spice, Voyager series included). Some Woodstock keyboards do not have the hole. On these you can very carefully drill one by hand... avoid the circuitry etches.

Not so Big difference...

*Message #1 Posted by **Ernie Malaga** on 25 June 2003, 10:52 a.m.*

I don't see a big difference at all. Even the most trustworthy companies can hire unethical employees. It may happen at the restaurant, with a sleazeball waiter, or at the well-established electronics mail-order store, with a low-life customer service representative. The problem is that you don't know who stole your credit card information when unknown charges start appearing in your monthly statement.

Mike, you asked for opinions, and I gave you mine. If you disagree with it, just say so -- but there's no reason to patronize.

-Ernie

Re: Not so Big difference...

Re: Paranoid: Here is a scary auction

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 25 June 2003, 10:37 a.m.*

> Anyone here know this seller?

Well - I can help you a tiny bit, as part of the e-mail adress, "Kalle" that is, is as common in the scandinavian countries, as eg. "Jack" or "Joe" in the USA. From my guess though, it appears most offen in Sweden, where from what I remember Donald Duck is called "Calle Anka".

If he really are a person named Kalle living in South Africa, my guess is that he should be easy to locate if you call the country's national telephone service.

Regards from Denmark!

HP-65 helped discovering the Feigenbaum number

*Message #1 Posted by **Juergen (CH)** on 25 June 2003, 8:00 a.m.*

28 years ago, an HP-65 helped Mitchell Jay Feigenbaum in discovering the Feigenbaum number 4.669..., a universal number in the theory of Chaos.

I've found this fact on several web pages (see below). Here is an interesting excerpt:

> Quote:
>
> ---
>
> You might wonder why he (Feigenbaum) would use a small calculator when he had access to some of the largest computers in the world, computers that could produce thousands, even tens of thousands, of numbers in a few minutes.
>
> The reason, he said, is that he liked to play with numbers. Even when he was young he liked to play with numbers, see how they came about, how they changed under various circumstances. It gave him a feel for what was going on. Having thousands of numbers handed to him on a sheet of paper that came from a computer wasn't the same; it didn't appeal to him. And indeed it was this "playing" that allowed him to make the breakthrough that he eventually made. It helped him understand what was going on. With large computers he probably would have missed it.
>
> ---

*Message #2 Posted by **Mike (Stgt)** on 25 June 2003, 11:48 a.m.,*
in response to message #1 by Juergen (CH)

Nice finding.

Thanx.....Mike

that's enough already

*Message #3 Posted by **Carly** on 25 June 2003, 3:18 p.m.,*
in response to message #2 by Mike (Stgt)

That's Enough Already with the mathematical hogwash and the mythical past of HP calculators!!

There was no HP-65. There is only Kinpo calculators !! Just buy one of our HP personal computers. Buy one of our HP cameras. And an HP vacuum cleaner.

Just give us all your money . Give it here, right now. I've got blow-molded trash in exchange. To heck with Floozenbam and HP-65. That's all baloney anyway. 4.99 yeah right. That's what my kinpo calculators cost the corporation wholesale. Have an HP-49G, see if you can come up with some other famous number instead.

Carly Fiorina

COOOL

*Message #4 Posted by **Norm** on 25 June 2003, 3:22 p.m.,*
in response to message #1 by Juergen (CH)

That is very, very interesting. I don't quite understand it yet. It's gonna take a couple of extra reads. Something about the population of rabbits or the orbit of the earth around 2 suns, is a chaotic system.

And that there is some constant kind of like PI that kind of tells U what will happen next.

I'm gonna have to read it twice before I understand the chaos theory number.

Can't somebody kick that Carly Fiorina woman off the chat board? I sure am tired of her.

:o)

- Norm

Prejudiced PIG!!!

*Message #5 Posted by **Carly** on 25 June 2003, 3:58 p.m.,*
in response to message #4 by Norm

Why are YOU BAD MOUTHING a Brilliant CEO such as myself.

I have implemented sooo many new ideas and products. I have increased the synergy of HP greatly. I have brought Hp into the 21st century. Hp made great strides with the millinium bug and other software issues on my watch.

I have merged Hp with Compaq!!! ME, ME, ME!!!

Soooo, I have done it ALL! I am why Hp is SO GREAT. That is why I got such a nice stock option package for this merger. However since times and the economy have been tough, I DID TAKE a 50% pay cut. And I am sure this helped pay for the second jet I had to acquire when I first became a CEO. I need two jets, so that I do not have to share my jet with some of the other jerks on my board. Also I had the forsight to realize that this might be a good perk for any other company that would merge with Hp, but would be to cheap to supply their CEO with a corporate Jet.

As you can readily discern, I am WAY OUT ahead of you, ALL of YOU!! Often, I laugh so hard at your pathetic pleas for better tools. You engineers have always made me SICK!!! BAH-HAA-HAA-HAA-HAAA!!!! Beg, plead, whine, it makes no difference. Oh, I'm sorry, it does. It makes me laugh harder!

Away with you!!

BWAAH-HAAA-HAAA-HAAA!!

Sincerely and Respectfully Yours,

Carly Fiorina

(this was posted in jest, I can't imagine Carly would even waste a moment in reading this post or any of our complaints, Ron Ross)

Re: Prejudiced PIG!!!

in response to message #5 by Carly

Carly,

It's a bloody shame that your mother didn't abort you.

'Nuff said. 8^)

-Ernie

Mama did !

*Message #7 Posted by **Mitchell Feigenbaum** on 26 June 2003, 1:26 a.m.,*
in response to message #6 by Ernie Malaga

Mama did abort her !

But then somebody heard a crying sound coming out
of the dumpster ...

now we are stuck with her

:o(

Re: Prejudiced PIG!!!

*Message #8 Posted by **Chris(FLA)** on 26 June 2003, 9:56 a.m.,*
in response to message #5 by Carly

I have merged Hp with Compaq!!! ME, ME, ME!!! Soooo, I have done it ALL! I am why Hp is SO GREAT. That is why I got such a nice stock option package for this merger.

Ask my father about his pre-merger HP stock and post HP merger stock.

Not a happy person :(

Chris

HP stock ripoff and your old man

*Message #9 Posted by **NH** on 26 June 2003, 10:29 a.m.,*

in response to message #8 by Chris(FLA)

one thing U can take 2 the bank ...
If your old man lost his butt on HP stock,
Carly planned it that way.

These MBA boardroom types, they balance
their books on Joe Truckdriver's back .

So Carly gets a scheme and a dream... she says, hey
I will make HP shares go to zero, and Compaq shares
to go infinity. So she transfers her bank balance
onto the new boat, which is the Compaq shares...
all the little hard-working decent people still hold HP shares.

So the lower HP goes, the harder the little people
cling to them, they won't sell, because they are
decent people. Carly cackles loudly, getting richer
and richer, at the expense of the little people.

That's why their is precious little reason for Joe
Truckdriver to invest in stocks anymore, its all a swindle
and unless his cousin is a Wall Street Tycoon, he doesn't know
whether it will go up or down.

The difference between Mr. Feigenbaum and Carly

*Message #10 Posted by **Juergen (CH)** on 25 June 2003, 5:04 p.m.,*
in response to message #1 by Juergen (CH)

I just wanted to point out that *clever* people (like Mr. Feigenbaum) using the *right* tools (HP-65) can do amazing things.

But I'm also aware that *Carly-minded* people using the *wrong* tools (HP-12C Platinum) can make big mistakes.

My advice: forget Carly, enjoy the story about the discovery of the Feigenbaum number. It's worth it!

ABSOLUTELY RIGHT, JUERGEN

*Message #11 Posted by **Norm** on 26 June 2003, 1:31 a.m.,*
in response to message #10 by Juergen (CH)

I really appreciate Juergen that you brought this to our attention. I am sure it needs to be placed into the HP Museum "articles" section.

Think you could do this ? Its little more than cut & paste, and the title you already used couldn't be better (citing the HP model number and the topic).

Your post was deep enough that U dont want it to fade away like my John Denver songwriting.

YES ISN'T AMAZING THAT THE SMALL, CLEAN NUMBER-CRUNCHING
RED-BRICK CALCULATOR ALLOWED THE MATHEMATICIAN TO FIGURE
SOMETHING OUT.

THATS EXACTLY HOW I FEEL ABOUT MY 34C. I NEED TO RUN

SOME FORMULA AND LEARN HOW IT GOES? THE 34C IS SUPERIOR TO ANY OTHER TOOL, (plus a mechanical pencil and some graph paper) AND HP HAS NO BUSINESS TRYING TO TAKE TOOLS LIKE THAT AWAY FROM THE COMMUNITY OF INTELLIGENT PEOPLE.

Even an HP-49G is too bloated and complex to just casually work with the numbers, IMHO.

Thanks again!

Museum Article

*Message #12 Posted by **Juergen (CH)** on 26 June 2003, 9:19 a.m.,*
in response to message #11 by Norm

Norm,

if time allows I will prepare an article. If you don't mind I will come back to you to review my "swiss cheese" writing.

In the mean time, keep your 34C's running and delve into Chaos Theory, it's really interesting.

Regards, Juergen

Re: ABSOLUTELY RIGHT, JUERGEN

*Message #13 Posted by **bill platt** on 26 June 2003, 10:55 a.m.,*
in response to message #11 by Norm

Norm,

Your songs don't fade away----they live on in the hearts and minds (and ears) of all of us :-}

Bill

I still need song links ..

*Message #14 Posted by **Norm** on 26 June 2003, 10:42 p.m.,*
in response to message #13 by bill platt

I still need song links ... where U click on the link and the song will play.

For Paul Simon "Kodachrome"

John Denver "Take me home country roads"

AC/DC "Highway to Hell"

AC/DC "Money Talks"

See the problem is, I can't write lyrics for AC/DC if people don't know how the melody goes. If you can see where I am headed, Carly's VP would be the lead singer for "Highway to Hell".

EVERYBODY knows the melody for John Denver, thats why that one worked pretty well.

Re: The difference between Mr. Feigenbaum and Carly

*Message #15 Posted by **Mike (Stgt)** on 26 June 2003, 5:10 a.m.,*

in response to message #10 by Juergen (CH)

That reminds me the Olympus ad: "If you won't become a top photographer with this camera - it's not our fault."

So it's _not_ the HP-65 (or HP-41) that I am not as well known as Feigenbaum <G>. But it's nice to see that others use those calculators in a similar way.

Ciao.....Mike

I'm still trying to figure out the Feigenbaum number ...

*Message #16 Posted by **Norm** on 27 June 2003, 3:11 a.m.,*
in response to message #10 by Juergen (CH)

I haven't forgotten about this Feigenbaum number.

So far, when I read up on it, its just kind of perplexing..... I can almos understand what the number IS, but its the logical conclusion that concerns me. I mean, how the heck can a single number constant ($4.66, the wholesale price of a Kinpo calculator) be the SAME constant for a bunch of bunnies in the forest, or for a planet in a multi-star orbit.

I haven't forgotten about this and am still reading it and still trying to figure it out.

Re: I'm still trying to figure out the Feigenbaum number ...

*Message #17 Posted by **Valentin Albillo** on 27 June 2003, 5:15 a.m.,*
in response to message #16 by Norm

Norm wrote:

"I mean, how the heck can a single number constant ($4.66, the wholesale price of a Kinpo calculator) be the SAME constant for a bunch of bunnies in the forest, or for a planet in a multi-star orbit."

That's why it's called a *universal constant*. The same happens with Pi, e, and all other universal constants out there, they keep appearing all the time, in all variety of situations, completely unrelated. For instance,

- what's the ratio of a circle's circumference to its diameter on a flat plane surface ? Pi
- if you drop a needle on a lined sheet of paper, what is the probability of the needle crossing one of the lines on the page ? 2/Pi
- what's the limit of the sum of the infinite series 1 -1/3 +1/5 -1/7 +1/9 -1/11 + ... ? Pi/4
- what is the probability of choosing two integer numbers that have no common prime factors? 6/Pi^2

and so on. The same applies to 'e' (=2.71828+), and many other famous constants.

Best regards.

Edited: 27 June 2003, 8:42 a.m.

yeah but what if nobody told the bunny rabbits

*Message #18 Posted by **Norm** on 27 June 2003, 12:12 p.m.,*
in response to message #17 by Valentin Albillo

yeah, although those are geometrical and mathematical problems. BTW I did not know about the mathematical series for finding PI. That is quite interesting.

When the feigenbaum number is applied to biological systems its kind of perplexing.

I mean, if nobody told the bunny rabbits that their number is 4.66 , then how would they know when its time to quit having more bunnies ?

Same with the high school dance, if the guys dont KNOW that their number is 4.66 then how will they know to quit asking the ladies for a dance ?

Hmmmmmmmmmm.....

Let's whisper 4.66 into Carly Fiorina's ear. Maybe she will not procreate, and we wont have a whole new generation of monstrous little rich lawyer weasels, figuring out how to wreck corporations of their very own ....

Imagine Carly outside the factory gates, with her kid, giving him wisdom of life ..... the great giant assembly buildings, all the cars in the parking lot, the trucks filled with boxed products .....

"someday, son, all of this will be yours to destroy ..."

Are there any mathematicians ... Feigenbaum number

*Message #19 Posted by **Norm** on 28 June 2003, 1:48 a.m.,*
in response to message #18 by Norm

Hello,

I am very intrigued by the topic of the Feigenbaum number (and to a lesser extent, that it was figured out on an HP-65, rather than 100 years earlier by some old ancient looking dude wearing a wig.

I am looking at all the links, but I get some very clear questions where I dont' understand and require clarification.

Does anybody want to chat at length about this topic? Obviously, only if you know exactly what the deal is, and you are willing to take time to explain it to me. My questions will be pointed and you'd have to answer them ...

Re: I'm still trying to figure out the Feigenbaum number ...

*Message #20 Posted by **Trent Moseley** on 28 June 2003, 6:08 p.m.,*
in response to message #17 by Valentin Albillo

Valentin-

Please give us a few examples for 'e'.

[OT]: Examples for 'e'

*Message #21 Posted by **Valentin Albillo** on 28 June 2003, 10:46 p.m.,*
in response to message #20 by Trent Moseley

Trent Moseley posted:

"Valentin - Please give us a few examples for 'e'"

With pleasure. Let's see:

- what's the limit of the sum of the infinite series 1 + 1/1 + 1/2 + 1/2/3 + 1/2/3/4 + 1/2/3/4/5 + ... ? e
- you put $1 into a bank account at 100%, compound interest. If the interest is accrued at the end of the year, you'll have $2. If it's accrued every six months, at the end of the year you'll have $2.25. How many dollars will you get if it's accrued continuously ? $e
- each of two people is given a shuffled deck of playing cards. They then expose simultaneously their first cards. If they do not match, they go on with their second cards, and so forth. What's the probability of finishing both decks without a single match ? 1/e
- if numbers in the interval (0,1) are selected at random, what's the expected number of selections until the sum of all chosen numbers exceeds 1 ? e
- with each purchase, a certain shop gives away a badge with the picture of a playing card on it. You want to collect the entire set of 52 badges. If you make exactly 52 different purchases, what fraction of the set of 52 badges would you expect to have accumulated ? 1-1/e
- such natural entities as the inner structure of a Nautilus' shell, the arms of galaxies, the way a fern leaf curls, and many others are examples of logarithmic spirals. The logarithmic spiral's equation becomes in polar coordinates r = e^aT, where r is the distance of a point on the spiral from its center, T is the angle through which the spiral has grown to that point, and a is a fixed quantity for a given spiral that describes how tightly that spiral winds itself at each turn.
- the shape of the curve described by a hanging chain is called a 'catenary'. The resulting equation for the catenary curve is y = (e^x + e^(–x))/2
- the familiar trigonometric functions sine and cosine are actually derived from e:

  sin(x)=(e^(ix)-e^(-ix))/2i, cos(x)=(e^(ix)+e^(-ix))/2
- are e and pi related in any way ? yes, e^(i*pi) = -1
- the number e is also to be seen in music (J.S. Bach's equally-tempered scale), art (Escher's drawings), biology, chemistry (anything related with continuous growth), radioactive decay, etc, etc.

Best regards.

Re: [OT]: Examples for 'e'

*Message #22 Posted by **Patrick** on 28 June 2003, 11:18 p.m.,*
in response to message #21 by Valentin Albillo

Very, very nice, Valentin. When you see all of these examples in one place, it really hits

home how special is this strange number less than three.

I noticed you carefully omitted the one where you press [1][e^x] on your calculator, for in that case you don't actually get *e*, but a mere approximation to that magical number!

I will add one other from the even more magical realm of calculus...

What functions are the only ones to have *themselves* as derivatives (i.e., the value of the function is the same as the slope of the tangent line to the graph at that point)? *(any constant) * e^x*

Re: Isn't Ms. Fiorina more a Symptom than a Cause?

*Message #24 Posted by **Paul Brogger** on 27 June 2003, 1:03 p.m.,*
in response to message #10 by Juergen (CH)

The rabidly anti-Carly sentiment here seems to have no bounds -- neither in extent nor in editorial decency.

Isn't her position as much as a figurehead as it is as a real leader? Aren't her actions and attitudes more *reflections* of an unfortunate change in corporate values than the prime motivators behind that change?

Correct me if I'm ignorant, but she serves at the behest of a board of directors, right? And don't (the larger) shareholders have a say in who runs the company and how it's run? And doesn't the prevailing business climate in the good ol' USofA influence what is perceived as wisdom and what appears foolish?

I don't remember hearing that Carly Fiorina took the company over at gunpoint, and that the board of directors were being held hostage, and that dissenting shareholders were summarily executed.

But then, I admit, I haven't heard much of anything substantial about the attendant controversies -- just a lot of what sounds like irrational, sour-grapes misogynist rant.

I suppose I am ignorant. Among other things, maybe I'll have to read her book . . .

don't forget to read

*Message #25 Posted by **Norm** on 27 June 2003, 2:13 p.m.,*
in response to message #24 by Paul Brogger

Your right, I'm wrong. She probably didn't say "someday all of this will be yours to destroy". You'll have to tell me what she did say.

Dont forget to read Hillary Clinton's book. I hear its already 50% off , you could probabl find at at the same store that has Carly's book.

Re: don't forget to read

*Message #26 Posted by **Paul Brogger** on 27 June 2003, 6:40 p.m.,*
in response to message #25 by Norm

I didn't realize that Hillary Clinton offered insights into Hewlett-Packard's management in *her* book, too. Thanks for the tip. I'll have to be sure & check it out. (Along with David Packard's *The HP Way*, which is already on reserve.)

By the way, I did reserve *Perfect Enough* at the local library, and I am *really* ignorant -- it's actually a biographical treatment by a Pulitzer Prize winner, George Anders -- not "Carly's book" at all . . .

FWIW

what does

FWIW

*Message #29 Posted by **Ellis Easley** on 28 June 2003, 2:46 p.m.,*
in response to message #27 by Norm

Norm, can you write a rant to sing to the tune of "For What It's Worth" (by the Buffalo Springfield, I think)? The only good line I've thought of so far is "Algebraic strikes deep ... Into your life it will creep" then "It starts when you're always afraid - step out of line, the man comes, gonna take your HP34C away!" As you can see, I've only changed two words - you should be able to do a lot better.

Re: FWIW

*Message #30 Posted by **Ellis Easley** on 28 June 2003, 6:04 p.m.,*
in response to message #29 by Ellis Easley

I found a website with the lyrics and the chords plus lyrics for "For What It's Worth" and other Buffalo Springfield songs:

http://www.geocities.com/SunsetStrip/8385/Buffalo/home.html

It would be nice if there were MIDI files to play some version of the music, but I don't think the fans or artists would like that very much - and I think you would need a place to host them, just like pictures.

in response to message #24 by Paul Brogger

Isn't her position as much as a figurehead as it is as a real leader? Aren't her actions and attitudes more reflections of an unfortunate change in corporate values than the prime motivators behind that change?

Correct me if I'm ignorant, but she serves at the behest of a board of directors, right? And don't (the larger) shareholders have a say in who runs the company and how it's run? And doesn't the prevailing business climate in the good ol' USofA influence what is perceived as wisdom and what appears foolish?

What about Mr. Hewlett's son who opposed the HP/Compaq merger?

There was also someone(can't remember the name) on the board who said they should make custom PCs(like Dell) and Carly herself said no. The person left in discust shortly after.

How is HP's PC business doing now?

Chris

Palo Alto and the rest of the silicon valley (along with San Francisco & Oakland) are suburbs of Martinez but we do keep up with the goings on among the great unwashed. The "Compaq Center for the Preforming Arts" in San Jose reciently changed it's name to the "H.P. Pavilion". No kidding.

Re: Isn't Ms. Fiorina more a Symptom than a Cause?

*Message #33 Posted by **Paul Brogger** on 30 June 2003, 11:22 a.m.,*
in response to message #31 by Chris(FLA)

(This is, admittedly, very O.T.)

Apparently these folks didn't have enough of the corporation lined up behind their arguments in order to prevail. There were disagreements, and in each case, one side "won" and one side "lost".

The point of my post was that we tend to focus on the figurehead, or the most readily-recognized participant in an issue (the proverbial "tip of the iceberg") and ignore the larger forces at work which put that person in place, and which *keep* him/her there.

That, coupled with the vehemence of the anti-Carly rhetoric and the effortless transitions to Hillary Clinton -- a person entirely unrelated to the discussion (except perhaps because she's an intelligent woman who's achieved some measure of power and notoriety, and who is looking for more) make the "Carly" focus very suspect as an avenue of productive discourse . . .

So, yeah, mourn the passing of quality in HP calculators (one small product line of a large, complex company). It may indeed be, however, that a reasonable case can be made that HP as a whole was in need of change. Conversely, there may be a thousand reasons why the company's new directions may be seen as "wrong". But to focus on one individual is (I suspect) to miss many of the actual

causes, perceptions, and values that contribute to any controversial situation.

MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 25 June 2003, 6:36 a.m.*

Just a quick update from my side about the MLDL2000. I was hoping to have some real good news this week, but I have made a terrible mistake in soldering the wiring for the SRAM/FLASH protoboard and that will cost me at least two nights to redo that work and get a new breadboard proto up and running.

What I am doing now is testing a setup with SRAM and verifying two things:

1. WROM functionality

2. Operation of the 3-cycle memory access to SRAM: write L8 word, read packed U2 word, modify U2 word, and writeback U2 word. The last part is really critical for the intended operation of the MLDL.

Above steps are potentially functional before or during the weekend, unless is simply does not work. Simulations however have shown excellent behaviour of the MLDL in this respect and has helped me to correct some other mistakes in the VHDL code.

If the above is working I will start on the I/O interface, critical for programming the FLASH memory (this cannot be done from the HP41). Most effort will be in the software on the PC. For those interested, the I/O interface is implemented using a not very expensive (around EUR 60) USB to parallel interface print. This actually means that the MLDL2000 will offer an optional USB interface! This is done with the USB V1.2 plus product, see www.braintechnology.de. It comes with drivers and an API and I have to make some software (using Delphi in my case) to be able to interface with the memory devices on the MLDL2000.

In the meantime, I have been working on the specifications, including definition of the I/O interface. A new version of this should be online in a week or two with renewed pictures of my developmnet environment and museum at www.kuipers.to/hp41

When the I/O interface is settled and verified, I will be ready to start working on the PCB and get some real hardware out. There will most certainly be a beta-test program but some details will have to be sorted out. I am targeting to have beta-units out around mid-september (conference time remember) but that timing is challenging.

A usual, I will let you all know when further developments are taking place! Do not hesitate to contact me for any questions. I have received many warming encouragements, and it appears that I have put some other fanatics to work on hardware projects as well.

Marketing Redux - One Scenario

*Message #2 Posted by **Bob** on 25 June 2003, 8:41 a.m.,*
in response to message #1 by tianyu

Do you paint pictures on HP calculators ? I can see a great opportunity here.

"...Please paint a portrait of Einstein surrounded by flowers, on my HP41C. Wait, don't let it drip into the keys...NO!, not that way. Keep it off the ----- display. Yes, I know that the "5" key is soft. Hey, that looks more like Elvis than Albert. Now, pull that battery door out of your pocket. You know it's not yours ! It's all sticky! How long until it dries ?...6 - 8 days ?!? AARRRgggggghh."

And some of you insisted that the calculator was dead and that the PDA would rule ! How short sighted. There is always room for another innovation to breathe new life into a mature market.

Re: Paranoid: Here is a scary auction

*Message #1 Posted by **Ernie Malaga** on 25 June 2003, 1:04 a.m.*

Mike:

> Quote:
>
> What do you think? Anyone here know this seller?

Imagine the following scenario. You see a guy having dinner at a fancy restaurant. When the waiter brings the check, the customer pays with a credit card. The waiter takes it away and brings it back for signature. The guy promptly shreds the carbon paper to a million pieces.

What he doesn't know is that the waiter may have copied the credit card number, date of expiration, and even the 3-digit security code from the back.

It's happened many times before, and will keep on happening. No credit card purchase is 100% safe, whether done in person, on the phone, or via the internet.

Now, I would be _especially_ suspicious about any such purchase if the seller is in Africa. Justified or not justified, Africa has gained a bad reputation, as you mentioned. It's always the good guy who pays for the sins of the bad one. Maybe the whole thing is as legitimate as it can be, but the problem is that you can't be certain.

Offer to pay with an international money order instead. If this is rejected, it is almost certain that it's a scam.

-Ernie

12c won´t die , or will it ?

*Message #1 Posted by **Renato** on 24 June 2003, 9:51 p.m.*

The Museum page on the 12C says:

> Quote:
>
> **HP-12C**
> The calculator that wouldn't die. The HP-12C is HP's longest and best selling calculator. Though it has been followed by many newer models, with both more and less features this model continues to sell well. In fact an EduCALC catalog says of the HP 17BII (in bold type): "It's 15 times faster than the HP 12C, and displays more than 4 times as much information." And of the HP 19BII: "It's 15 times faster than the HP 12C, and displays more than 9 times as much information." In addition, both newer calculators can print via infrared to compact printers, have more memory, general purpose solvers, menus etc.

The 17BII and the 19BII did not kill it. Maybe a 12c platinum, with special "features" will .... Problem is that it may kill itself right after that. Then there will be no more RPN HPs. Great plan for producing only kinpo calculators, isn´t it ?

12Cp and New Coke

*Message #2 Posted by **Ellis Easley** on 28 June 2003, 9:14 p.m.,*
in response to message #1 by Renato

That sounds like a theory I've heard explaining the "New Coke" introduction some years ago. It was well known that the formula for Coca-Cola was carefully guarded and sacred - they would never change it. Then suddenly, they replaced Coke - with New Coke. But everybody who liked Coke said New Coke was too sweet and flat - in fact, it tasted like Pepsi! (I used to think I preferred Pepsi, then one day I was in a public place where they were asking people to take "The Pepsi Challenge" - a Pepsi advertising campaign - I took the challenge and the better-tasting drink I chose was Coke! Since then I know the difference.) So, Coca-Cola withdrew New Coke and "re-introduced" Coke Classic, which is all you can get today. It tastes pretty much like the original Coke.

Now for the explanation (as I was told, and which makes sense to me): all of Coke's competitors used sugar (sucrose) and corn syrup (glucose) for sweeteners but the Coke formula required only sucrose. The United States keeps the price of sugar at twice the world price to protect domestic sugar growers (I don't understand it but I know it's true - I've also heard it has something to do with the politics of the Cuban blockade - some time ago it was being debated in Congress, one Representative in favor of the high price held up sugar packets and pointed out that restaurants still give sugar away, so how can it be too expensive?) so if Coke continued to require all sugar, it would be at a cost disadvantage to its competitors, since they used corn syrup because it is cheaper. So Coke needed to find a way to change the formula and they decided to kill two birds with one stone - first they changed Coke to taste like Pepsi, provoking a lot of discussion about how bad New Coke (and Pepsi) taste (at least to people who were accustomed to Coke). Then after a suitable period, they acknowledged their "mistake" and "re-introduced" - not Coke - but Coke Classic, which sounds like the same thing but is a

new trademark, which at least morally releases the Coca-Cola Company from their pledge never to change the formula of Coke! So now they can use sugar or corn sweetenener, like their competitors.

There is one Dr. Pepper plant in Texas that is famous because they still use only sugar in their product and people say it tastes better. I think the Coke served in restaurants - mixed from Coca-Cola syrup and carbonated water - tastes better than what comes in cans or bottles - but I've never done a side-by-side comparison.

Now there is a debate about "high fructose corn syrup", which is used in a lot of prepared foods and drinks and which some people say is not healthy. Fructose was popular in the 1970's or 1980's as a healthier substitute for sugar because it was supposed to be sweeter - so you would use less - and it was metabolized differently. That fad faded away, as immortalized in a brief comment by Kramer on Seinfeld. Now recently I have read that when the body metabolizes sucrose, it breaks it down into glucose and fructose. The glucose is used by the body and the fructose just passes through. So since corn syrup used to be described as just glucose, high fructose corn syrup sounds like it would be about the same as sucrose - except without the necessity of the body breaking it down into the two components - maybe that step produces some side benefit or consumes some other substance that needs consuming.

I think I have strayed from the point - unless it is that maybe HP moved away from RPN to set themselves up to sell generic, outsourced calculators. If this is the case, the process started a long time before Carly What's-her-name was put in charge.

Re: 12Cp and New Coke

*Message #3 Posted by **bill platt** on 28 June 2003, 9:35 p.m.,*

In my life of using HP calculators, I have had "that sinking feeling" 4 times:

1st, when I lost my 11c in 1996 2nd, when I went to buy a replacement, and although I found the excellent 32sii, saw a bunch of ALGEBRAIC calculators (1996) 3rd, when I went to get a new 32sii in 2000 or so and saw the 6s and 30s (this was a MUCH bigger sinking feeling than the previous two) 4th, when I had a premonition this past winter and realized I probably aught to buy a back-up 32sii in case the last "sinking feeling" was true, which it already was!.....

So HERE I AM! ranting with all the rest of us Displaced RPN Users, or in techonymn "DIRPNU"

I read once that the formula of the _original_ Coca-Cola (as in "manufactured in the Roaring '20s") contained cocaine, thus the name "coca" and "coke."

That would explain that beverage's addictiveness.

Was that true? Is it still? Or is this just a defamation rumor started by Pepsi-Cola?

-Ernie

Re: 12Cp and New Coke

*Message #5 Posted by **Karl Schneider** on 29 June 2003, 12:54 a.m.,*
in response to message #4 by Ernie Malaga

Ernie --

True about "Coca" referring to cocaine in the original formulation of Coca-Cola, which actually dates back to the late 19th Century. The US Food and Drug Administration (or its predecessor) put a stop to that a long time ago.

Ellis Easley was right about sugar versus high-fructose corn syrup in the modern formulations. The pre-1985 formulation (before New Coke) didn't have the heavy "syrupy" feel. At self-serve soft-drink fountains, I usually mix "sugared" with "diet" 50/50 to lighten it up.

As for the 12C Platinum, I haven't handled one yet, but but from what I've read here, it appears like a "New Coke" regressive product. I'll never buy one; I have a 1993 Singapore-made original.

Re: 12Cp and New Coke

*Message #6 Posted by **Wayne Brown** on 29 June 2003, 1:00 a.m.,*
in response to message #4 by Ernie Malaga

It's true. At the time Coca-Cola was introduced in the late 1800's it was believed by many people that cocaine had beneficial effects, and some doctors recommended that people take a little cocaine daily to improve their health. So in a sense Coke was an early "health food." There hasn't been any cocaine in Coke for a long time now, of course.

Re: 12Cp and New Coke

*Message #7 Posted by **Ellis Easley** on 30 June 2003, 11:05 a.m.,*
in response to message #4 by Ernie Malaga

As Karl and Wayne said, the original Coca-Cola had a significant amount of cocaine in it - I think it also came in tiny bottles - much smaller than the 8 oz bottles that you find in an old coke machine occasionally. But even today (and this might be an urban legend), Coca-Cola contains some extracts of coca leaves, but no cocaine (unless just a very small trace amount). Since it is a trade secret, I guess nobody else knows!

Re: CokeLore

*Message #8 Posted by **Paul Brogger** on 30 June 2003, 12:28 p.m.,*
in response to message #2 by Ellis Easley

Interested researchers might want to look at "CokeLore".

It seems to be a believable treatment of various aspects of Coca-Cola fact & fiction . . .

*Message #9 Posted by **Patrick** on 28 June 2003, 11:42 p.m.,*
in response to message #1 by Renato

I keep hearing supposition that HP will only be producing the lamentable Kinpo-grade calculators here on. This leads me to wondering, who is the manufacturer of the HP-12CP?

Additional information - Aurora FN1000

*Message #10 Posted by **Renato** on 28 June 2003, 11:59 p.m.,*
in response to message #1 by Renato

More information concerning HP-12C future.
I had a Aurora FN-1000 financial calculator in my hands today. It is being promoted here in Brasil as a HP-12C replacement, by another manufacturer.
It seems to posses all functions from a HP-12c, plus some more - i saw some indecifrable functions on the keyboard.
I programmed a short x-reg increment loop and - wow - it is much (i mean MUCH) faster than the 12c.
Well I could not justify spending $60 just for benchmarking it... Maybe in a couple of days I´ll find a rationalization for that ;-)

Renato

Re: Additional information - Aurora FN1000

*Message #11 Posted by **db(martinez,california)** on 29 June 2003, 2:20 a.m.,*
in response to message #10 by Renato

Someone had said that Mal Wart carries the Aurora brand so I bit the bullet and walked into one. They really do have a human greeter, I got smiled and waved at. Too much. I couldn't find any at the one I checked out. Aurora is carried at Kinkos coppies but not the fn1000.

How were the keys on the one that you used? Please let us know if you figure out the extra functions. Even though i don't need a financial calc enough to have one shipped in from S.A., to me it is very hopefull news that one company has brought out a new rpn. If hp keeps on pretending maybe they will bring out a scientific and start selling it here.

Maybe the next dominant technical culture will be china, and the most discerning market - Brazil.

Re: Additional information - Aurora FN1000

*Message #12 Posted by **jose goncalves (Brasil)** on 29 June 2003, 9:51 a.m.,*
in response to message #11 by db(martinez,california)

Aurora calculators are quite easy to find in certain little "chinese" stores here in Sao Paulo, but not the FN1000. These are sold in very few small places only.

I had one in my hands the other week and I agrre with Renato on his remarks. I would like to add that the general appearance of the FN1000 is rather poor. Even if the color scheme is not so strange as the HP12CPt, the overall looks is no good. It's too "shiny", you know ? The cover will not shut completely (it's a "clamshell" model).

But the manual is very interesting. Even in a very quick glance, you can notice something the size of the original HP12C manual. Not so well printed, but very different from the printed pages that try to emulate a manual in other Chinese models we are exposed to (including the HP9s and 9G).

The other point that I noticed is about the display. Large digits LCD, much easier to read than the new Chinese HP ((series).

May be if we allow Aurora enough time ...

Jose

Re: Re: Coke

*Message #13 Posted by **unspellable** on 30 June 2003, 10:45 a.m.,*
in response to message #12 by jose goncalves (Brasil)

The two principal flavors in Coca Cola are cola from the cola nut as in the various cola drinks, and unique to Coca Cola, an extract from the coca leaf. Thus Coca Cola is a double flavored beverage and is different from other colas in more than just a varient cola recipe. originally a small amount of cocaine came with the coca extract. Then the amount of cocaine was reduced, and later eliminated. Today, the entire legal coca leaf import goes to a plant in Saint Louis where the cocaine is extracted for the Pharmaceutical trade. The pulp is then shipped to Coca Cola where the flavor is extracted.

The much vaunted sacred recipe has been changed any number of times over the years. One of the older recipes has found its way into public knowledge.

Old Coke with sugar does have a slightly different flavor than New Coke with corn sweetner.

Also disguised by the hooraw was the disappearance of the glass bottle and a price hike. The glass bottle was the cheapest way to buy the stuff, even if you threw the bottles away and lost the deposit.

hey un-spell-ab-le

*Message #14 Posted by **db(martinez,california)** on 1 July 2003, 12:54 a.m.,*
in response to message #13 by unspellable

There is one other leagal, or semi legal through a loophole, coca leaf import. There is a tiny company in (i think) California that is licensed by some part of the federal government but is prohibited by the state government to import bagged, individually plastic wrapped, and boxed coca leaf tea from Bolivia. As i remember, they import Windsor brand but the biggest brand down there is Hansa.

Besides selling !DRUGS!, Hansa is also Volkswagen of Bolivia. 10 or 15 million people in that part of the world who live at over 12,000 feet above sea level stubbornly continue to drink !THAT DRUG! The president of the country's mother drinks it. This must piss off the American D.E.A. to no end. The tea is about 1000 times too weak to get high on but it does help aleviate the negative affects of altitude. I have chewed it at 22,000 ft and i can swear it works; i only felt as miserable as i would have at 19,000 ft. It is also an effective remidy for a tummy ache.

How does this relate to HP? Hansa is a big company, there must be someone with a 12c.

Re: hey un-spell-ab-le

*Message #15 Posted by **unspellable** on 1 July 2003, 10:07 a.m.,*
in response to message #14 by db(martinez,california)

So what isn't illegal in The People's Demokratik Republik of Kalifornia?

As it happens, at one time I lived in Bolivia, in Santa Cruz down in the flat part. To my regret, I Never got to the high part. But you could buy coca leaves in the market.

Help needed: HP-12c Display

*Message #1 Posted by **Renato** on 24 June 2003, 9:33 p.m.*

I got this Malaysia unit with a bad CPU. Exchanged the main PCB with another one, and transfered the display. Now I have a dislexic 12c - seems to work, but the display is garbage. I think I need advice on how to align the display on the PCB - or maybe I should send it to the International HP hospital at Araguari, MG Brazil...

Re: Help needed: HP-12c Display

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 June 2003, 10:21 p.m.,*
in response to message #1 by Renato

Hi, Renato;

I cannot see the display, but maybe they are not compatible. Can you generate an image with it so we can check what sort of garbage you see?

Earlier Voyagers had an LCD with many conections on top and a few on bottom. Newer HP12C have an LCD with equaly distributed connections. It´s easy to see and I believe you checked first.

Another cause, and most likely to be, is dirty polymers. I had once to almost scrap an old set of polymers because they simply had an isolating "coat" that refused to leave with alcohol. You could also check if the mainboard connections for the LCD are not dirty (isolated).

Anyway, if you think it´s needed, be welcome, my pleasure. You know the address...

Success (to us all), my friend.

in response to message #6 by Trent Moseley

I have a 1994 Singapore 12C and it looks like the keys are painted, not double-molded; the keys aren't shiny, they have the same matte finish as those currently produced in China.

Did they use painted keys in the past?

B.

Re: help with 12c serial#

*Message #8 Posted by **Mike Sebastian (Texas)** on 25 June 2003, 10:39 p.m.,*
in response to message #7 by Scuba Diver

Yes, HP has sometimes used painted keys in the past. Actually, they used repainted keys. For whatever reason, HP would paint new legends over the ones double-injection molded into the keys. I've seen it on several different 12Cs and a 16C. On the 16C, it looked like some of the keys had been painted over twice, starting out as 11C or 15C keys, then painted to become 12C keys, and finally painted again to become 16C keys.

HP34C "2" disease, flashing, voltages, schematic - long

*Message #1 Posted by **Ellis Easley** on 24 June 2003, 5:01 a.m.*

(*)Note: I edited this message to correct an error. When I measured the output current of the constant current supply, I connected the milliameter between pin 10 and pin 6, not pin 10 and pin 4. 6/24/2003 3:00 pm
(**)Corrected another error - output voltages measured relative to pin 6 and not pin 4. 6/24/2003 6:40 pm

Now that I have an earlier 34C working, I see what the "2" disease is! I would describe the condition this way: whenever you press the "2" key when there is someplace for a 2 to go in the display, or there is a 2 in the display and you press any key, the minus sign and possibly various commas flash momentarily. If you type ten digits other than 2, filling the display, then pressing "2" doesn't cause flashing. If you type a number in scientific notation without any 2's in the mantissa, you can make the flashing start and stop by shifting a 2 through the exponent; in this case the flashing commas are limited to the exponent digits. My newer unit doesn't do this "2" flashing at all.

The other flashing my older unit does is to flash random commas and the minus sign during execution of built-in functions. Calculating the gamma function (! of non-integers) of negative numbers with large magnitude seems to take the longest. My newer unit is completely dark while executing a built-in function. You can make the calculator work longer with the Integrate function, but then both units flash random digits when the user function subroutine is being evaluated.

I measured the power supply outputs and current drain with no load (power supply module on the bench) and in circuit (calculator assembled). I made the no load measurements with two different input voltages to see the effect of the voltage and current regulation circuits in the power supply module.

First, I connected two NiCads in series to the power supply module, (-) to pin 6 and (+) to pin 4 (see the netlist below to see how I numbered the pins). Both pin 7 (the standby supply that powers the 8 pin IC closest to the power supply module) and pin 8 (which supplies power to the other two 8 pin ICs and the 40 pin IC) measured 7.12V relative to pin 6 (**). Pin 10 of the power supply module, which goes to pin 8 of the 40 pin IC and which is driven by a constant current circuit in the power supply module, measured 4.62V and when connected to pin 6 (*) through a milliameter, it sourced 39 mA. The current drain from the battery with no load was 8 mA and when the constant current supply was loaded, the current drain was 106 mA and the voltage on pins 7 and 8 increased to 7.46V.

Next, I added another NiCad, increasing the input voltage from 2.58V to 3.88V. The no load current drain increased to 9 mA. The voltage on pins 7 and 8 was 7.14V. The voltage on pin 10 was 5.22V. Connecting a milliameter between pin 10 and pin 6 (*), I measured 38 mA, the voltage on pins 7 and 8 increased to 7.28V and the battery current drain increased to 76 mA. So the no load output voltages on pins 7 and 8 and the current sourced by pin 10 change very little with a 50% increase in input voltage.

The constant current supply is similar to the one in the Classic recharger. It works by maintaining a voltage drop equal to the emitter-base junction voltage of a silicon transistor (~.6V) across a 16 ohm resistor: (0.6V)/(16 ohms)=(0.0375A) or ~38 mA. The circuit in the Classic recharger (which provides the current that recharges the battery) uses a 13 ohm resistor and provides ~50 mA.

Next, I assembled the calculator and measured the voltages that are accessible that way. I couldn't get to the pins connected to the constant current supply because of the molded plastic frame but I could measure the two voltage supplies. With power supplied by two NiCads, the voltage on pin 8 of the 8 pin IC closest to the power supply

module measured 6.82V and the voltage on pin 8 of the other two 8 pin ICs measured 6.52V, both relative to pin 7 of the 8 pin ICs (which are connected to the negative terminal of the battery).

I also measured the voltages on the other pins of the 8 pin chips with the calculator idle and running a program. Pin 6, which goes to the unknown jumper on the power supply module and to pin 14 of the 40 pin chip, measure 5.33V either way. If the unknown jumper were installed, it would connect the pins to ground. Pin 5 measures 0.65V idle and 0.88V running. Pins 4 and 3 measure 0.86V either way. Pin 2 measures 0.86V idle and 1.35-1.41V running. Pin 1 measures 0.04V idle and 0.3-0.5V running. All were measured with a digital voltmeter with respect to the battery negative terminal (pin 7 of the 8 pin IC's). I'll have to fire up one of my many scopes and see if some of those "quiet" lines have low duty-cycle signal activity on them.

Other than the power supply, the schematic is just connections between the pins of the IC's, LED and keyboard that can be communicated better as a netlist. I've typed that up and include it here:

```
;HP34C Main Circuit Assembly (solderless version) netlist-

;component reference designators and pin numbering
IC1=8 pin chip with standby power (closest to the power supply module)
IC2=second 8 pin chip
IC3=third 8 pin chip
IC4=40 pin chip
PS=power supply module with the flex cable solder pads on its PCB numbered from left
   to right as viewed from the rear. Note: pin 1 only goes to the recharger connector,
   it doesn't go to the main circuit assembly. The pads where the flex cable contacts
   the main circuit assembly flex circuit are PS.2 - PS.10.
LED=LED display with pins numbered from left to right as viewed in normal use
PRSW=Program-Run switch, pin 1=common, pin 2=closed on Run
OOSW=On-Off switch, pin 1=common, pin 2=closed first when switched to "On",
     pin 3=closed second when switched to "On"
KBR=keyboard rows numbered in standard keycode format
KBC=keyboard columns numbered in standard keycode format for rows 3-7,
    offset by -1 for rows 1-2
AC=AC connection from battery contact assembly to power supply module (return is bat-)
   (doesn't go to main circuit assembly)

;memory chip connections
v+standby = PS.7,IC1.8
v+ = PS.8,IC2.8,IC3.8,IC4.12,PRSW.1
bat- = PS.6,IC1.7,IC2.7,IC3.7,IC4.13,LED.22; LED.22 is minus sign cathode, anode of ???
                                              diode with cathode on LED.1 (goes to psin)
mem6 = PS.5,IC1.6,IC2.6,IC3.6,IC4.14; memory bus, ??? jumper connects to bat- if present
mem5 = IC1.5,IC2.5,IC3.5,IC4.15; memory bus
mem4 = IC1.4,IC2.4,IC3.4,IC4.16; memory bus
mem3 = IC1.3,IC2.3,IC3.3,IC4.17; memory bus
mem2 = IC1.2,IC2.2,IC3.2,IC4.18; memory bus

kc2 = IC4.25,KBC.2; "GSB","STO"(column 3),"CHS","7","4","1","0"(column 2)
kc3 = IC4.24,KBC.3; "f","RCL"(column 4),"EEX","8","5","2","."(column 3)
kc4 = IC4.22,KBC.4; "g","h"(column 5),"CLX","9","6","3","R/S"(column 4)

;power switch
psin = OOSW.1,PS.4,LED.1; + input to PS, LED.1 is cathode of ??? diode
                          with anode on LED.22 (connected to bat-)
bat+ = OOSW.2,PS.3; makes first when switch turned "On"
chrg = OOSW.3,PS.2; makes second when switch turned "On",
                    to short out 8.2 ohm current limit resistor on power supply module

;AC adapter (doesn't go to main circuit assembly - goes only to power supply module)
acsource = AC.1,PS.1
```

Now all that's left is a schematic of the power supply module. I will attempt to write a description of the circuits on the power supply module with enough details to draw the schematic.

HP34C Power Supply Module circuit description-

The battery negative terminal and the AC adapter share a common return connection on pin 6 of the power supply module; this is also the return for the main circuit assembly. The other side of the AC adapter is connected to pin 1, which isn't connected to the main circuit assembly. Pin 1 goes to the anode of a rectifier diode whose cathode goes to pin 2. Pin 2 goes to an 8.2 ohm, 1 watt resistor which goes to pin 3. Pin 3 goes to the battery positive terminal. This completes the circuit which charges the battery when the unit is turned off.

Pin 4 is the input to the switching power supply and is connected to the common terminal of the On-Off switch. The switch has two other terminals: one makes contact with the common terminal first when the switch is turned to "On" and it is connected to pin 3, the battery positive terminal. The other switch terminal makes contact with the common terminal second when the switch is turned to "On" and it is connected to pin 2; its purpose is to short out the 8.2 ohm battery charging current limiting resistor when the unit is on. This completes the description of how power from the battery and the recharger is connected to the power supply input.

Pin 5 only goes to a pad which can be connected by a jumper (not installed) to pin 6, the battery negative terminal. On the main circuit assembly, pin 5 is connected to pin 6 of the 8 pin IC's and pin 14 of the 40 pin IC. The purpose of the jumper option is unknown. Pin 7 provides standby power to pin 8 of the 8 pin IC closest to the power supply module. The voltage on pin 7 is supplied by two sources: first, it is connected to the battery positive terminal to provide memory backup when the unit is off - through a diode (anode to the battery positive terminal, cathode to pin 7) on my older unit, or through a 10K resistor on my newer unit. To support this, there is a 22 mf capacitor from the battery positive terminal (cap + lead) to the battery negative terminal to provide backup power while changing the battery. The second source of power for pin 7 is a voltage regulated output of the switching power supply which also provides power to pin 8 for the other chips on the main circuit assembly. Both pins are connected to the supply through separate diodes (anodes to the voltage regulated supply, cathodes to pins 7 and 8). When the unit is on, the voltages on pins 7 and 8 are approximately +7V. Pin 9 only goes to a pad which can be connected by a jumper to pin 8. On the main circuit assembly, pin 9 goes to pin 9 of the 40 pin chip. When the jumper is installed, the calculator uses period as the radix mark; when it is not installed, comma is used. Pin 10 is connected to a constant current supply which sources approximately 38 mA and is powered by the switching power supply. On the main circuit assembly, this supply goes to pin 8 of the 40 pin chip. I believe this current source is used to drive the LED segments. This completes the description of the terminals of the power supply module. What remains

to be discussed is the switching power converter, the regulated voltage supply and the regulated current supply.

The power converter transformer is wired as an autotransformer with a primary winding and two secondary windings connected in series with the primary winding. An additional independent winding provides feedback for the oscillator that drives the primary winding. The power supply input (from pin 4) is connected to the top of the primary winding (= the bottom of the secondary windings) and the bottom of the primary winding is connected to the collector of an NPN transistor with its emitter connected to the battery negative terminal (pin 6). The base of the transistor is biased on by a 680 ohm resistor from the power supply input. One end of the feedback winding is connected to the battery negative terminal and the other end is connected to the base of the NPN transistor through a series network of a 2000 pf capacitor and a 47 ohm resistor. The end of the higher secondary winding in series with the primary winding, with a voltage equal to the power supply input voltage (the battery positive terminal voltage) plus the sum of the voltages across the two windings, is connected to a rectifier diode anode. A 22 mf capacitor (33 mf on my newer unit) is connected from the diode cathode (cap + lead) to the battery negative terminal. This capacitor positive lead is connected to the anodes of the two diodes that supply the regulated +7V to pins 7 and 8 and also to the cathode of a zener diode. The anode of the zener is connected to a 1 mf capacitor (+ lead) with its other lead connected to the battery negative terminal. The anode of the zener is also connected to a 1K resistor which goes to the base of a smaller NPN transistor with its emitter connected to the battery negative terminal. The collector of this transistor is connected to the base of the oscillator transistor. When the output voltage of the supply rises high enough to cause the zener diode to conduct, the smaller transistor turns on and shunts some bias current (provided by the 680 ohm resistor) away from the base of the oscillator transistor, reducing the amplitude of the oscillation and the output voltage. This completes the description of the switching power converter and the voltage regulated supply.

The remaining tap of the transformer - the junction of the two windings in series with the primary winding - is connected to the anode of a rectifier diode. A 22 mf capacitor is connected between the cathode of the diode (cap + lead) and the battery negative terminal. This provides a supply of something less than 7V for a constant current source. The diode cathode and the cap + lead are connected to a 16 ohm resistor which goes to the emitter of a PNP transistor with its collector connected to pin 10, the current regulated output. The base of the transistor is connected through a 2.2K resistor to the battery negative terminal; this biases the transistor on. A smaller PNP transistor has its base connected to the other transistor's emitter, its emitter connected to the other end of the 16 ohm resistor, and its collector connected to the other transistor's base. When the voltage across the 16 ohm resistor exceeds approximately 0.6V, current flows through the smaller transistor's emitter-base junction and it turns on, shunting current away from the larger transistor's base and reducing its collector and emitter current. Since 0.6V divided by 16 ohms = .0375 amps, the circuit reaches equilibrium with about 38 mA flowing out of the larger transistor's collector towards the battery negative terminal.

I dont like "2 disease" either

*Message #2 Posted by **Norm** on 24 June 2003, 1:44 p.m.,*
in response to message #1 by Ellis Easley

I dont like "2 disease" either, but, there doesn't seem to be any cure.

Our latest best guess is that there are 2 kinds of software code, so the problem is in the 8-pin memory chip that holds the firmware then.

That might allow one or two "miracle cures" however the supply of donor patients is inherently low.

Re: I dont like "2 disease" either

*Message #3 Posted by **David Smith** on 24 June 2003, 4:59 p.m.,*
in response to message #2 by Norm

The problem could also be in the 40 pin chip. There was a Keynotes description on the HP65 display system that talked about how the display was formatted by various byte codes in a particular internal register. Certain illegal operations left weird values in the register and could cause funny displays. If the 34C display circuit is similar, then a design bug might be a likely cause of the symptoms.

Re: I dont like "2 disease" either

*Message #4 Posted by **Ellis Easley** on 24 June 2003, 5:54 p.m.,*
in response to message #3 by David Smith

They definitely changed something because my (slightly) newer, soldered 34C doesn't have the "disease". There are differences in the chips. Do you think there would be a difference between "1820-2162 A" (in my 1934A unit) and "1820-2162" (in my 2051S unit)? These are the 40 pin chips, both made by AMI, packaged in Korea, with datecodes 7906 and 8047 respectively. I've never noticed revision letters on HP part numbers (and these seem to be progressing in the wrong direction!) I would think that for custom chips especially HP would assign a new part number, even if there is no change in fit or function, if only to keep things straight with the vendor - look at all the apparently equivalent ACT chip P/N's for the Woodstocks. Another chip difference is in the 8 pin chip with the backup power supply. In the older unit it is marked "1LB5 002", in the newer unit "1LB9 02". I would have assumed this chip was primarily RAM but I realize it could also contain ROM. The other two chips have almost the same part numbers in both units but vary slightly in the leading zeros in the suffix - the older unit has "1MA1 14" and "1MA1 0015", the newer one has "1MA1 14" and "1MA1 15". Looking at all these 8 pin DIP part numbers, it looks like they dropped leading zeros sometimes to fit in the significant digits - I know chip vendors will only put so many digits on custom parts for your purposes, since they need room for their own tracking numbers.

HP-33E "2 disease"

*Message #5 Posted by **Jon** on 25 June 2003, 2:46 p.m.,*
in response to message #4 by Ellis Easley

I had an HP-33E without the disease. Years ago I had to repair battery contacts and replace flex connector for wires. It was my first time so I made several soldering tests (I didn´t know which was + or - wire). Once I made it work it had the "2 disease".

I don´t know the reason but it is something I damaged

aahhhhhhhh HAH! "2 disease" is damage ...

*Message #6 Posted by **Norm** on 26 June 2003, 1:36 a.m.,*
in response to message #5 by Jon

Hi Jon, This is valuable data. It says perhaps ESD into the large 40 pin chip could cause "2 disease".

When Luiz finally swaps firmware chips (the 8-pin chip that holds the program) it will be an important piece of data.

If swapping the firmware does NOT change the problem, then the real problem is damage in the 40-pin chip that runs the display.

We can't forget how ancient these chips are, I mean, fer cryin' out loud, late 1970's. They didn't have a clue how to protect something from static damage. If we can prove that "2 disease" is a static-induced problem, then we will have to do all our work grounded out with alligator clips, everything on tinfoil, even the solder iron and the roll of solder grounded out, and stuff

aluminum foil into your socks and attach alligator clips

(then U get up in a hurry to answer the phone and wow, what a circus!)

ALSO PLZ NOTE that I am suspicious that just running a solderless spice calculator with a dirty connection might be enough to induce "2 disease". IF YOUR SPICE CALCULATOR gets the least bit unreliable, and its solderless, STOP using it because it might damage it if used with loose connections.

There is a LOT of spice calculators afflicted with these problems, and that cuts down the pool of available units.

So we need to resolve what is the real story.

One isolated, confirmed case, so far...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 3:09 a.m.,*
in response to message #6 by Norm

Hi Norm, guys;

maybe I'm wrong, but that would be such a tremendous coincidence that amongst the so many MOS transistors in an average complex digital chip, we have all and all the same set being burnt in certain circumstances and most of all, it does not alter anything but a selectable blinking dots/commas/minus_sign when a highly selected digit, in this case "2" and no other one else, is present in the display and another digit is entered or an operation is performed.

I have seen cases when digital I.C.'s loose part of its operating capability or become completely "off" when submitted to unacceptable operating environment. MOS are likely to suffer more damage because of its own nature. But it's still hard for me to accept that such a highly selected lost of operating characteristic with no other perfomance degradation, not a single keyboard freeze or the like, is simply a hardware problem instead of a firmware problem. I'd actualy like to know how many Spices with this behavior work like this since the day they were 'born'. I have no doubts about Jon's experience, I am sure it happened, I'm not questioning this fact, I just cannot understand such a highly "specialized" hardware problem.

If we consider that part of the existing HW is actualy too sensitive and when fails causes this exact behavior, then it's a matter of time to expect that all Spices that have been serviced to be like this, and there's nothing we can do about it except to feel lucky enough that our calculators never need service.

Analog IC's may show this sort of "partial" performance degradation, and they may run for a long time with internal componentes partialy burnt. Digital IC's are likely to show random "problems".

I have a stuck HP38C that locks the display to 0.00 everytime it comes to life. Sometimes it shows Pr Error when I switch it off and on again. I am waitng for a chance to test another power supply board on it, and I have one HP33C that does nothing. This HP38C is a soldered unit and I am thinking seriously about removing all of its chips and swap one by one with another HP38C so I can see what happens. The other HP38C has no problem with "2" digit.

I know and understand Norm's concerns. I accept the fact that he does not like this behavior

and I do not disagree with him. But to be honest, for as long as [STO][ENTER] returns [-8.8.8.8.8.8.8.8.8.] instead of [Error 9] to the display, I'm confident using any Spice. And I don't care much having a "2" disease calculator: I have three Spices like this.

My thoughts.

Luiz C. Vieira - Brazil

Edited: 26 June 2003, 3:17 a.m.

Luiz, I used to design CMOS chips

*Message #8 Posted by **Norm** on 26 June 2003, 10:34 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz, I used to design CMOS chips, and it is possible for the weakest link in the chain to consistently snap.

They may have used a certain transistor to cause the blanking, and maybe that transistor gets fried from ESD. Maybe the last logic gate is hooked to a very large power transistor that runs the LED's. I'm not saying it DOES, I'm saying that it COULD be that way.

While I would be happy if it is just firmware (maye I can swap a chip and make it work properly?) you cannot presume it is firmware until you have run a comparison. A swap between 2 units would offer some proof. Otherwise nobody knows and you can't fairly say that it is the firmware.

Re: Luiz, I used to design CMOS chips (edited)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 12:51 p.m.,*
in response to message #8 by Norm

Hello, Norm;

> Quote:
>
> They may have used a certain transistor to cause the blanking, and maybe that transistor gets fried from ESD. Maybe the last logic gate is hooked to a very large power transistor that runs the LED's. I'm not saying it DOES, I'm saying that it COULD be that way.

In this case, would the blank be selective or fail in any case the gate is activated?

Taht's what I mean. I did not design CMOS chips, but I also designed actual MOS-based circuits, and taking care of ESD 20 years ago was a matter of protection level and costs. Today, MOS protection is achieved inside chips.

Spices come from a time where MOS protection was achieved outside chips, and we cannot see much of this protection in the circuit board. In fact, there is nothing but chjips and power supply board.

I just wonder of the fact this "disease" is so selective. If blanking is the issue, and should it occur in many circumstances and not in only one, I'd fairly agree with you. I also strongly agree with the fact that Jon's experience is extremely revealing and adds lots of new information. When I read his post I thought exactly what you wrote,

but I was not completely sure if this defective condition woudl be selective as well.

(additional part)

UNLESS there are additional gate and MOS transistor just to blank this particular blinking in new units and they are easily burnt, what would cause exactly this behavior and nothing else. Then we have a disease that allows a firmware problem if "blanking" hardware fails (Wow! Where did I gat this?)

(finish additional part)

So, my friend, I was just enhancing what I see against what you see. I agree with you, maybe I'm having my own doubts and I should consider them in another perspective. Do you understand this? In Brazil we have the expression "Devil's Lawyer" meaning the guy that's always trying to find "reasonable doubts"... The pri..y scumbag that never allows others to agree with anything. I'm feeling as if I'm playing this rule right now... :-(

Best regards, my friend.

Re: Luiz, I used to design CMOS chips (edited)

*Message #10 Posted by **Jon** on 26 June 2003, 5:13 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hello everybody:

I don´t understand anything about electronics but I have repaired the battery contacts of several spices and I can say that when I repair a calculator that nobody has opened they normally don´t have the "2 disease". When I see that the calculator has been serviced by unexperienced people (it´s easy to see it) they always have that problem (four calculators, 100% of my experience, in that condition of different models 37E, 34C, 33E and 32E). Has anybody similar experience?

Cheers

Jon

A few questions:

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2003, 5:25 p.m.,*
in response to message #10 by Jon

Hi, Jon;

once again, thak you for your valuable contribution. May I ask you a few questions?

1 - except for your own Spice, that became sick after being serviced, did you check if any other one became sick as well?

2 - are these serviced units solderless or soldered type?

3 - Did you observe if they have a different number (quantity) of 8-pin DIP IC's?

We are trying to track down the possible origin of this "2" disease, as you have read, and I see one thing and Norm sees other thing. We're lucky because this is never going to interfere in our long lasting friendship... will it, Norm?

That's the biggest advantage of having different views of the same problem when brainy, reasonable and thoughtful guys are involved: everyone learns a bit more. If it not for Norm, this "2" disease was never an issue in here. Thanks to him we're involved in this "crusade".

Best regards and thanks again, Jon.

Luiz C. Vieira - Brazil

Re: A few questions:

*Message #12 Posted by **Jon** on 27 June 2003, 11:57 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Luiz:

1) I have that experience just with my own calculator 2) All of them where solderless 3) The 34C had three chips, 33E and 37E had two and I am not sure about the 32E.

I think I took notes of the identification number of some of them.

Make me know if you need them

Cheers

Jon

If you can, please...

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2003, 3:44 p.m.,*
in response to message #12 by Jon

Hey, Jim; thank you.

I would like to compare the ones you noted with the ones I have. If others who own Spices can also post their ID # and add the fact they have the "2"disease or not, maybe we can find a "common place".

Our crusade starts now... Come you all!

Luiz C. Vieira - Brazil

Here you have the id numbers

*Message #14 Posted by **Jon** on 28 June 2003, 10:59 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hello Luiz:

These are the identification numbers of the chips. As you know there are three holes and I have represented as 1) the place closest to the display, then 2) and 3).

With “2disease” calculators

HP-33E (my own one, in the beginning it was ok) 1) empty 2) 80212 3) 79384

HP-37E 1) empty 2) 80012 3) 790228 (may be 79228)

HP-34C 1) 79364 2) 79334 3) 79324

I can’t find any note of the 32E

I have notes also of two calcs that hadn’t this problem (they had never been serviced).

HP-38C 1) 81221 2) 81212 3) empty

HP-33C 1) 81261 2) empty 3) empty

And I can’t find more notes

Cheers

Jon

Thank you, Jon! ... and Hey, Norm!

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2003, 11:33 a.m.,*
in response to message #14 by Jon

Hi, Jon;

first of all, forgive me using another name instead of yours in my last post; I thought I should ask for excuses and not to edit it.

Second: I can take the numbers of at least eight Spices, some with the "2" disease, others without. I'm posting later because I'll first collect all data then I'll put it all together.

Our crusade is going fine...

Hey, Norm; can you add some ID # too? Let's put all we can at once!

Best regards.

Luiz C. Vieira - Brazil

Hello Luiz,

*Message #16 Posted by **Norm** on 2 July 2003, 5:27 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Hello Luiz,

I am glad you are still trying to understand "2 disease".

I believe it is still the #1 predator and destroyer of the limited population of spice calculators.

I have a single SPICE calculator that has "2 disease". Unfortunately it is fully assembled. Please do not think me lazy if I dont take it apart right now to get numbers, but its a big job to take apart and not right now. I will take it apart after it has a rubber keypad ready for it.

It's serial number is 2051S37556 .

Thank you Luiz for sending the black rubber key pad. I have already taken it to an industrial rubber supplier, though they could not source it exactly. I notice that the smell does not match to rubber. Rubber is stinky, the HP item is not. I think it would be good to get an exact match.

Now I am going to mail it to a company in Minnessota and see if they can match it.

GOOD NEWS.... I do know how to PUNCH HOLES into these materials. U go to the dentist and you beg him for a "dental dam punch". They use rubber sheets that they stick over the tooth while they work on it. The dental dam punch will punch a little hole in the rubber, and its about the right size. Oh, the dental dam material? Not bad, but its too sticky (no white powder) and it stinks too much.

I hope to have more information in another couple weeks. Im not taking the 34C apart yet, because although I am in good pursuit of the answer, I still dont have replacement black rubber key cushions. - Norm

You're welcome.

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 2 July 2003, 11:56 p.m.,*
in response to message #16 by Norm

Hey, Norm;

thank you confirming the rubber pad is already with you. As you mentioned about the smell (I never noticed, but you're right: it smells almost nothing) and

you're suspicious it's not a rubber, what about a blend of different, raw material? There are some sort of mixed material fairly used today, maybe there is something that resembles it.

Another fact: there is another type of *actual* rubber pad used in soldered-type spices. It's thin and has thicker caps molded under each key. I thought about sending this one too, but it is different of the one you needed, that is used in the solderless Spices.

About the "2" disease, you're right: I should reason about all aspects, and the fact that an extra "blanking" circuit was added later and this extra MOS is easily burnt out is an issue, of course. I was observing something that I'm not sure if is a valid fact; if you have the means to check if it is true, I'd be glad. The LED's blanking time after a digit-entry key is pressed in a "2"-disease immune unit is larger than the time observed in a "2"-disease "infected" unit in the same circumstances, i.e., infected units' display blinks faster when digits are entered (did I write it correctly?). If this is considered electronically, I can see two possible causes: there is an extra circuit to ensure the extended "delay", or it is augmented by SW or frimware.

I was beginning to think the "2"-disease was no longer an issue because only Ellis Easley continued the thread I asked for IC's ID #. I know that opening Spices is not a "piece o'cake" operation; and I am sure many interested users are waiting till the chance the calculator needs to be opened so they can check for serial numbers. Then I thought about asking for another request: would Spice owners check for construction type, serial # (first four digits and origin identifier), "2" disease occurrence and, if applicable, any other "misoperation"? 'That would be a starting point, at least to "count" as many "2"-disease occurrences as possible. This way, there's no further need to open the calculator and we can track if after an specific "datecode" for each Spice type (and manufacturing location) the "2"-disease appeared. And Norm, not finding your name in related threads seems to let them meaningless, if you understand me. You announced the "2"-disease, I just suggested the name. And everybody here knows you are a LED/34C addicted :)

I think that's all for now. And Norm, the keypad is a gift, remember? If you send it back to me I'll be p... off! B^(

Best regards, my friend.

Luiz (Brazil)

under the microscope

*Message #18 Posted by **Norm** on 3 July 2003, 4:18 a.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

by the way , Luiz, the black rubber keypad piece is interesting under the microscope. I have just a 7 to 30 power stereozoom microscope. Very nice for modest but detailed inspection needs.

The white dust is very significant. There are a LOT of little white flecks, and they are embedded quite well into the black material.

The rubber material has "talcum powder" on it. This so its not too sticky. But the talcum powder comes off very easy, and there isn't as much of it. Under the microscope, the flakes look about the same.

It's just that the talcum powder is deeply embedded in the genuine material. I think this is so that it remains slippery.

I am sure we will find the match still. And get some bulk material, so we can punch holes in them with the dental-dam-punch.

brief comment (and brief post)

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2003, 6:51 a.m.,*
in response to message #18 by Norm

Hi, Norm;

just passed through my mind: would this talcum powder be a sort of solid lubricating so the rubber will resist friction activity and rests longer? Voyagers' ordinary rubber pad gets rough easily, maybe this is the key.

Just a brief thought. Maybe other sort of material with embeeded solid lubricating would fit fine.

Luiz (Brazil)

2051S 34C

*Message #20 Posted by **Ellis Easley** on 3 July 2003, 10:18 a.m.,*

in response to message #16 by Norm

My 2051S unit is soldered, has no "2" behavior, under the keyboard it has the rubber sheet with the disks molded in for each key. The rubber under the decimal point key has been cut through by the key.

cut thru at the decimal point

*Message #21 Posted by **Norm** on 3 July 2003, 1:01 p.m.,*
in response to message #20 by Ellis Easley

This key-pad layer sounds like the orange-yellow one.

It's made of cellular foam, with molded-in high-spots at each key.

There are at least 2 types shipped with spice calculators, the orange-yellow one, and the one of black rubbery material.

I was immediately concerned that the cellular foam material hasn't got enough strength at the point-contact, where the pressure is too high. Your statement makes this concern more genuine.

The orange-yellow will be great on day #1 when U open the box, but after that, it will 'go away' where its needed, at the point of contact where the pressure is high.

Therefore, obviously, the black rubbery material is stronger and a better selection.

Disappointing if they switched to the orange-yellow material last. This shows a continuum of bad engineering decisions with our almighty 1970's HP Gods (solderless circuit boards, "2 disease", orange-yellow key-cushion material that is destined to fail, etc etc).

Re: cut thru at the decimal point

*Message #22 Posted by **Ellis Easley** on 3 July 2003, 2:16 p.m.,*
in response to message #21 by Norm

No, mine has the dense black rubbery material. I think its original owner just used a lot of fractional numbers! But I think the differences between my 2051S unit and yours are interesting: mine has no "2" behavior and yours does; mine has the rubber pad and yours

doesn't. Is yours a soldered unit? Mine is. If yours is not a soldered unit, has no rubber pad and has the "2" behavior due to different firmware and not chip degradation, then why do these two units have the same S/N prefix? We know the YYMM datecode is not exact but rather should reflect a revision level. How can these two units be so different? Is it possible a previous owner swapped insides with another unit? (I'll allow that possibility on my unit, I can't vouch for it before I got it!) Of course, it could be that the insides were swapped by HP, during repair. All I can say about mine is that the datecodes on the chips are in line with the datecode in the S/N prefix (8047, 80282,8033? ,80182), at least it would appear none of those chips were made after the 51st week of 1980.

you lost me totally, ESD precautions for SPICE

*Message #23 Posted by **Norm** on 3 July 2003, 6:26 p.m.,*
in response to message #22 by Ellis Easley

you lost me totally, but I think I will take a moment and reply anyway, in order to maintain the flow of information.

I know there is a quest to determine which date codes have "2 disease" and which date codes don't etc etc and I am not objecting because you never know what you will learn. You might learn something interesting.

as to me, I dont have date codes available (no open units right now, said units having 2 disease).

Personally I think it is an irreversible symptom caused by some sort of ESD damage when we service them. I believe there is an extra-frail portion of the integrated circuit and it pops and the display doesn't mute properly after that.

It's not just "I think this" but also that other people report that they had a healthy unit which showed "2 disease" after they had serviced it.

THE WAY TO FIND OUT IS TO HAVE A HEALTHY UNIT, AND A DISEASED

UNIT, and just swap chips and see which chip is responsible. I think this would be the best test right now.

WHERE THIS WILL GO IS THAT WE MUST USE EXTREME ESD PRECAUTIONS WHEN SERVICING A SPICE CALCULATOR. You would use aluminum foil underneath the service area, grounded out to an earth ground. YOU would be grounded out by stuffing aluminum foil in your socks, and connecting with alligator clips. YOUR SOLDER IRON must be grounded out, to the tip, and checked with an ohm-meter. ONLY THEN would you dare to open up a SPICE unit, else it will get "2 disease".

What I just described is an example of "hard grounding" where the metal is just fractions of an ohm. Some of that soft blue-plastic or pink-plastic anti-ESD bag material is also an option..... it is common to use meg-ohm resistors in the drain paths for ESD precautions. BUT IF IT WAS my calculator and my money (and it is, next time I open one) then I would favor the hard grounding thru aluminum foil.

And don't be doing all this if some dude with a ham radio antenna is going to key up and pump 20 watts into your workspace. You want to create a truly electrically neutral environment. The aluminum foil would be plentiful, the ground wires would be trustworthy and short. And it would all go to an earth ground, such as your building ground which presumably drives into a stake outside.

the rubber key cushion for SPICE

*Message #24 Posted by **Norm** on 3 July 2003, 6:33 p.m.,*
in response to message #23 by Norm

There are really 2 big problems when dealing with SPICE calculators, IMHO. These problems are worth dealing with, because these are the coolest of the classic HP calculators IMHO (i know, i know, everybody else likes 41C, yeah yeah, fine, keeps demand down on the

ones I like).

Problems with spice:

1. The risk of "2 disease" especially if triggered by a loose connection in the solderless units. Also, the need to have successful anti-ESD precautions when opening it, so that the calculator can be worked on without inducing "2 disease"

2. The calculators need a rubber key cushion inside, but many of them either have none, OR, they have got an orange/yellow foam cushion that isn't going to be as good as a more durable material.

Even the black rubber ones, I measured at .012" thick and this isn't very much material. Tentatively .022" thick would make for a gentler and quieter keypad.

WELL, typical Neoprene rubber isn't a good substitute (like a tire innertube). It's stinky, and the talcum powder isn't bonded permanently like the real HP material. The real HP material has the dry lubricant embedded in real deep, as seen under the microscope.

Somebody said go to Home Repot and buy pond-liner. Well, bad news, the only stuff I saw was black PVC material, which really isn't very similar at all. And worse than that, I had to buy 10' x 10' in a box that included a ceramic frog with a spout in his mouth, and an electric water pump.

HERE'S THE LATEST UPDATE: I am approaching a company that routinely makes cut rubber parts, I am asking them to find a genuine match to the material, AND, I am even considering purchasing of tooling so that they could stamp me a few hundred and be done with it.

Don't rule this out, guys, a few hundred bucks and you can have whatever rubber HP parts your heart desires. You don't have to sit there hand-crafting rubber feet that look crummy when you are done. Pay the money and get the real

thing. And after a year or 2, make the tooling money back by selling these parts to those who need them on the HP Museum.

- Norm

Re: Here you have the id numbers

*Message #25 Posted by **David Smith** on 28 June 2003, 2:44 p.m.,*
in response to message #14 by Jon

The numbers that you gave are manufacturing date codes. The chip numbers should be something like ILA010, ILN123, etc.

Re: Here you have the id numbers

*Message #26 Posted by **Jon** on 29 June 2003, 2:39 p.m.,*
in response to message #25 by David Smith

Oh!. I took those numbers just to avoid mistakes when placing the ICs again after repairing the contacts. So it is a worthless information.

I will take the correct identification in the future. Thanks

Jon

Re: One isolated, confirmed case, so far...

*Message #27 Posted by **David Smith** on 26 June 2003, 5:29 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

I would not recommend unsoldering the chips to try them in a different Spice machine. I have attempted several cross-species Spice transplants and some will work and others will not... even among swaps between the same species. I think that some firmware revisions may not be compatible with some CPU revisions. Also the Spice CPU chips are definitely not as cross-compatible as the Woodstock ACT chips.

support the war against "2 disease"

*Message #28 Posted by **Norm** on 26 June 2003, 10:45 p.m.,*
in response to message #27 by David Smith

Only you can help fight the war against "2 disease".

Across the country, precious spice calculators are being damaged and maimed by this terrible ailment, and so far, there is no cure.

But if you will pick up that telephone, and give generously, the doctors may yet be able to find a cure to "2 disease".

Give generously. The spice calculator you save, might be your own.

Re: support the war against "2 disease" Plus Calculator Commercials

*Message #29 Posted by **Michael F. Coyle** on 27 June 2003, 10:25 p.m.,*
in response to message #28 by Norm

> Quote:
>
> Only you can help fight the war against "2 disease".
>
> Across the country, precious spice calculators are being damaged and maimed by this terrible ailment, and so far, there is no cure.

Great. All we need now is Sally Struthers to do the commercial...

"This neglected calculator is sitting in an attic...won't you help? For only pennies a day you can give it the batteries and health care it needs to become a useful, productive member of society. Twice a year you'll get your very own printout from your calculator. Adopt either an HP or a TI. Please help save a poor hungry calculator today!"

And on a slightly more serious note...

Back in the 1970's Rockwell ran a radio ad for their calculators. It was done by the "Dick and Bert" team who did many hilarious commercials at the time. The commercial was based on a (sung) jingle, which to the best of my recollection went something like:

"Rockwell Calculators / They really can't be beat / They've got big green numbers / And little rubber feet."

Does anyone else remember this commercial? And has any other calculator been the subject of a radio or TV ad?

- Michael

big green numbers and little rubber feet

*Message #30 Posted by **Norm** on 28 June 2003, 1:30 a.m.,*
in response to message #29 by Michael F. Coyle

yeah there was a song, like a happy-go-lucky little radio jingle.

kind of like some college guys singing their campus fight song ...

"its got big green numbers ... and little rubber feet"

See, I think they knew more about making calculators THEN than they know about it now.

What's happening presently, is the people at the company don't use their own product. So what do they care if the little rubber feet stick to the desk, or not. What do they care if the display has big clear numbers or not. They dont use it so they don't care.

I was out changing the oil on my 8 horsepower Bearcat chipper. Now, the thing is, the Briggs & Stratton engine doesn't quite mate to the mount nicely, and w/o some extra plumbing (a horizontal 4" long pipe stub) you wouldn't be able to drain the oil out of the engine without it clearing the engine mount.

So from the factory, these bozo's put the 4" pipe stub, with a REDUCER pipe so it has almost no flow, and then they put a cap on the end.

So..... go ahead and try removing the cap.... the whole pipe turns instead !!!! useless. They don't even use their own product, thats what I am getting at. The only cure was to go on down to the hydraulic pipe shop and buy fancy hydraulic fittings to redo the job PROPERLY with aftermarket fittings. This is the total antithesis of mass production, and the dumb part is, these lunacies are multiplying daily.

People should use their own products, thats why they realized that it should have little rubber feet, and a big display easy to read. Presently, our CEO MBA types would think that insane. I know, I have met these people personally. They are out of their skulls. They dont think it matters whether the product is useful or not. They only think in terms of satisfying a certain amount of product to the market at a certain price.

They count on Joe Six Pack to buy it w/o realizing its junk, and then he gets to put up with it until he chucks it out (because it DIDNT have little rubber feet, or because you can't change the oil w/o repiping the pipe stub, etc etc)

the answer here is to REFUSE to buy product that is not correctly designed, and the trouble is there is so much affluence and way too much production in our culture, that people don't refuse, they buy it anyway even if its junk. So stop doing that, its a bad habit.

Re: big green numbers and little rubber feet

*Message #31 Posted by **Ted** on 28 June 2003, 10:18 a.m.,*
in response to message #30 by Norm

Dear Norm, I always read your tirades with tremendous pleasure, because I generally agree with you all the time. The problem is, that it is much worse than even you portray it. I thought it was mostly me, but the business world seems to be populated by idiots on all levels- and it is getting worse each year. There is a saying here in Holland for it: "you have to be light enough enough to float" i.e.: if you know too much, you'll never get to the top. My neighbor is a management expert, and earns tons coaching companies about restructuring, etc. One day he proudly showed me a powerpoint presentation of one of his classes. "We make products for the clients" Happy faces...."Our goal is to make good products" people hard at work. He gets paid $ 1,500 a day to teach this stuff, can you believe it? It was unbeleivebly depressing. Companies don't make products for customers anymore, their only goal is to make their stocks go up before the year's bookkeeping closes, and then worry about the next year. The HP's we all love are icons not only of their kind, but represent the very best of human effort to be productive, be the best and improve/ add to the world around us. It sounds a bit too lofty, perhaps. But that is my personal opinion, for what it's worth.

yeah i see what U are saying, Ted,

*Message #32 Posted by **Norm** on 28 June 2003, 2:55 p.m.,*
in response to message #31 by Ted

yeah, i see what U are saying, Ted.

They bring in some consultant, who is kind of like a teacher from kindergarten. Pulls up a powerpoint spread sheet on some digital projector, and a bunch of dumb color slides, and says 'we have to meet the demographics of our marketplace'
we need bright smiley faces and happy people

and its just so much horse manure. Yeah I do know what U are saying. I was saying they don't use their own products (they don't) so they don't care if it works. U are saying they do it all with microsoft color slides and a projector.

Yeah it is totally depressing, because they are idiots and also because they have all the money. I just say 'these are not the people who could build and fly a rocket to the moon'.

Enjoyed your comment 'you have to be light enough to float'. Don't think the original Mr. Hewlett and Mr. Packard would agree with that, not in the least. They wanted intelligent technical people at the top. JAPAN has a societal culture that prizes engineering, and their companies have technically competent people near the top.....that's why they do all the innovating now (imagine Carly with a business model that revolved around building 6' flat screen TV's for the world market... requiring massive vision, planning, and world-class technologies and clean rooms, etc etc hah! She just wants to sell junk PC's like any other bunch of MBA idiots in town are doing.

We should export our MBA's with their powerpoint slides and their happy smiley faces and their 'market demographics' to Japan so that they would become infected with the disease, reduce their economy to 3rd world, so that we would no longer have a trade deficit with Japan.

in response to message #32 by Norm

Better English translation of that Dutch phrase: 'the 'light' people get to the top' i.e. if you are really good, they get scared of you, and don't allow you a position of any importance. The airheads get to high positions. HP was just the opposite thank god!

light people to the top

*Message #35 Posted by **Ellis Easley** on 28 June 2003, 3:35 p.m.,*
in response to message #34 by Ted

In English there is a saying, "Cream rises to the top." Now, cream does that because the fat content makes it less dense, but the meaning of the old saying is that just as cream is better (more valuable, more nutritious in the old sense), "better" (more capable) people rise to positions of authority. Nowadays, skim milk is better for you!

I understand that in Japan they say, "The nail that sticks up is hammered down." This saying is supposed to encourage people to conform - the last thing one is supposed to do is stand out! But of course, even in Japan, somebody ends up in charge. BTW, I thought in Japan they built houses, at least, without nails?!!!

It's my deal, Carly!

Am I the only person not surprised to hear that Norm has a Fargo-syle wood chipper? Just kidding, Norm, I envy you - I'm trying to get along with a little electric chipper-shreddder - emphasis on the "shredder".

Bearcat chipper

*Message #37 Posted by **Norm** on 28 June 2003, 8:01 p.m.,*
in response to message #36 by Ellis Easley

Are U telling me that U are running sticks and branches thru your office paper shredder ? Better quit or it wont last very long.

Definitely recommend something with an 8 horsepower motor, its enough for backyard work. Its painful how much it cost. Like $1600 and then add on the 'double V-belt option' so that U got 2 belts not one so the belt wont burn, there goes another $150 and then add on sales tax.

I mean what, I can't drive this thing on the freeway but it costs more than a decent used car.

It helps a little if U buy it in a no-sales-tax state.

I'd say just bite the bullet and get one. As long as you have a significant source of branches to grind up, then you wont ever have to buy beauty bark again. I dare say the output looks prettier than beauty bark. That's because its a golden brown color with white flecks, whereas beauty bark is like coffee grounds. You get some of your money back by not buying beauty bark anymore.

*Message #38 Posted by **Dave Shaffer** on 29 June 2003, 10:54 p.m.,*
in response to message #37 by Norm

Is the chipper an acceptable alternative for calculator "fixing" to the railroad tracks? (Calculator in, plastic mulch out)

Re: Bearcat chipper - repair method

*Message #39 Posted by **Norm** on 30 June 2003, 2:04 a.m.,*
in response to message #38 by Dave Shaffer

Hello Dave Shaffer, I have never tried repairing a calculator with my 8 horsepower Bearcat Chipper.

However, I think this is an outstanding idea, and I would be very agreeable to trying out repairing calculators in this way.

I would like for HP to send me 30 to 40 of the HP-49G. I will personally repair each one using the Bearcat Chipper. At the outlet, I should be able to get beautiful calculator mulch. This mulch could be used to decorate around mailbox posts, along walkways, and next to the streetlamp posts.

I would think the mixture of tinfoil, bits of fiberglass, calculator buttons, and chunks of plastic would add exceptional beauty to any landscaping program.

ONE THING THOUGH.... be sure to install the finer sized chipper screen .... don't want any big chunks getting thru (like the entire corner of a 49G could be unsightly).

I have also heard that the mafia uses chippers to 'repair' people, such as those who owed money and could not pay it back.

Creative "DOA Guarantee" definition

*Message #1 Posted by **Mike** on 23 June 2003, 2:50 p.m.*

Would you think your calculator was "DOA" if it turned on but "nothing worked" or that it "wouldn't program" or that you bought a 29C that had the fried chip syndrome?

There is currently a seller that is selling calculators with his "DOA guarantee". I won't mention his name and there are many that have a "DOA guarantee" so this is no real clue, to his identity.

I asked him about his DOA guarantee because I was interested in one of his items. Another buyer of one of his calculators contacted me (about repairing the calculator he got from this seller) and told me the seller refused to honor a dead calculator as DOA because it still slightly worked.

So, I asked him. He said his definition of DOA is: "Dead as a doornail" If it even slightly works, he says it's not DOA. He says, "that is to be expected with vintage calculators." So, if you buy a 29C that has fried chips, it's not DOA, if a light comes on, to this seller.

The point of the post is to let you know how to ask the right questiion.

Just be sure to **ask all "DOA guarantee" sellers**...

"Does the DOA guarantee includes partially working, barely working or near dead calculators." Ask them to be specific.

By the way, a "DOA guarantee" that excludes **ANY** calculator funtional failures is pretty worthless. So be careful!

Hey, Paul;

always good news, indeed!

Thank you for sharing this news with us. I'm glad "it" (the HP41C) made it!

Best regards.

It's VINYL, you MORON!

*Message #1 Posted by **David Ramsey** on 23 June 2003, 1:22 a.m.*

Sorry.

But if I read one more eBay description touting those cheap little vinyl slipcovers that come with the 10C-16C calculators as "soft leather cases", I'm going to scream.

That pretty much ensures I'm gonna scream, doesn't it?

Are these people total idiots?

in response to message #2 by Fred Lusk

I've often wondered - the plains of North America must have been something to see before the white man came, what with those vast roaming herds of Nauga grazing everywhere.

But once people needed something to cover their calculators, and someone discovered that the dried and tanned skin of the Nauga was ideal, their days were numbered. . . .

Best,

--- Les [http://www.lesbell.com.au]

aint it funny that you used to get a nice case.....

*Message #4 Posted by **Norm** on 23 June 2003, 3:57 a.m.,*
in response to message #3 by Les Bell [Sydney]

aint it funny that on the OLDER HP calculators, U got a nice genuinely FURRY case with a ZIPPER on it.

Then came the 32S and U get a plastic vinyl heat-molded piece of flat-material garbage, with no zipper,

and I recall quite clearly, it was so sticky and badly dimensioned a fit, U couldn't get the calculator into it anyway.

So those MBA's pretended they were giving U a case, a cheap chinsy case with no fur and no zipper, but really there was no case at all.

If HP wasn't run by Carly-freaks, they'd make big furry-cases that were softer and furrier than ever before, with zipper and an HP Logo proudly displayed. But instead they give us cheap worthless Kinpo garbage in a $9 Wal Mart retail-rack package, without so much as an "Enter" button.

Re: aint it funny that you used to get a nice case.....

*Message #5 Posted by **Les Bell [Sydney]** on 23 June 2003, 4:55 a.m.,*
in response to message #4 by Norm

Of course, in the days of the *real* HP calcs, like the 65, we used to get a *real* leather wallet for the calculator, with a little pouch for a plastic case of program cards on the front and a belt loop on the back.

When I say *real* leather, I mean, made from the skin of dead cows, and not dead Naugas, like later cheap stuff such as the . . .oh . . . I dunno . . HP-34C and downmarket stuff like that.

Re: aint it funny that you used to get a nice case.....

*Message #6 Posted by **Paul Brogger** on 23 June 2003, 10:34 a.m.,*
in response to message #4 by Norm

The pioneers came with two types of case -- the padded, stitched, faux leather minimalist case is at least usable and useful.

The pure, solid, heat-welded vinyl beast is indeed so tight & sticky as to be utterly useless. It is indeed astounding that a committee of HP's best & brightest (at the time) could offer such a pointless add-on in place of a genuine case.

By the way, I remember in college attaching the middle of a shoestring to the bottom of my HP-21 case, and tying it around my right leg gunslinger-style, to keep the thing from flapping all over as I walked. I thought it a practical solution, but I suppose it was an example of geekus extremus.

Not to mention Buffalo wings. When I was a kid the skies were *black* with Buffalo!

Re: It's LEATHERETTE, you MORON!

*Message #9 Posted by **Mark** on 23 June 2003, 7:01 a.m.,*
in response to message #1 by David Ramsey

Us marketing types would not stoop to calling this Leather (because it's not and we could get sued by our lawyer buddies for false advertising) nor would we call it "vinyl" because "vinyl" does not 'sell.' No, it's "Leatherette." Fine, Corinthian Leatherette. (you say the word "Corinthian" with heavily rolled R's.

Speaking of furry cases, I have a Woodstock case that's in perfect condition except it has some goopy stuff on the surface that I can't get off. I think it may be from sitting too long on a shelf that was treated with furniture oil. Anyone have any idea how to clean goop off "leatherette?" Without damaging the fine Corinthian surface details?

Re: It's VINYL, you MORON!

*Message #10 Posted by **Wayne Brown** on 23 June 2003, 7:27 a.m.,*
in response to message #1 by David Ramsey

These must be the same people who advertise plastic-laminated wood slide rules on eBay as "antique ivory."

Re: It's VINYL, you MORON!

*Message #11 Posted by **Patrick** on 23 June 2003, 12:41 p.m.,*
in response to message #1 by David Ramsey

The saving grace is that there are just as many buyers who know exactly what the seller is talking about. They'll get vinyl and say "Yep, leatherette, just as advertized."

Don't you just love the way the world all just sort of ... works?

Re: It's VINYL, you MORON!

*Message #12 Posted by **David Smith** on 23 June 2003, 5:28 p.m.,*
in response to message #1 by David Ramsey

Well, it might just possibly be real genuine leather. HP did make some real leather cases for the 15C series and the woodstocks.

Re: It's VINYL, you MORON!

*Message #13 Posted by **Trent Moseley** on 23 June 2003, 11:32 p.m.,*
in response to message #12 by David Smith

No way. I have the original 25C and 67 carrying cases with belt loops. The cases are soft brown plastic on the outside and fur lined inside. Very nice to feel. However they are not made of leather. For some of my Voyagers I bought nice leather cases from EduCalc which have the HP logo.

tm

Online Tracking of Calculator Prices - User input needed

*Message #1 Posted by **Mike** on 22 June 2003, 10:12 p.m.*

Ok, I have added a new page that some of you might find useful. It is an online database that allows anyone to track current eBay prices. The database is searchable by calculator, auction number and condition. I can add other search criteria.

Now, this will only be as good as the data that is entered. However, anyone can enter data. So, hopefully, it will fill up quickly.

The site is at: Online Calculator Price Tracking

If you have any suggestions for making this better, let me know. One thing that I plan is to have a search bring back the High, Low, and Average prices (I think I'll do this). I think that would be preferable to just a list of all calculators. But for now, I'm just listing everything returned by a search.

Edited: 22 June 2003, 11:30 p.m.

Re: Online Tracking of Calculator Prices - User input needed

*Message #2 Posted by **hugh** on 23 June 2003, 6:41 a.m.,*
in response to message #1 by Mike

could it somehow automatically collect the final sale prices for units matching certain key strings?

No, not exactly

*Message #3 Posted by **Mike** on 23 June 2003, 9:36 a.m.,*
in response to message #2 by hugh

It can't do that automatically. That would require a program to be continually running on my server. I can't do that.

Another option would be to manually run a program to gather that information. But then, I'd have to write a program to search for every know HP calculator and that too would be very time consuming.

So, I believe the easiest way is for people to enter the data manually. A simple eBay search or even when people happen to be looking at an auction, is the easiest way to gather the data.

I have two browsers open. One on by page and one on the auction page. I just toggle between them and transfer the info. Fairly easy. I'll be doing that as I get time.

Others can help too.

About the site

*Message #4 Posted by **Mike** on 23 June 2003, 11:38 a.m.,*

in response to message #1 by Mike

This site is meant really to document **current prices vs declared condition**. There is a comment section for the poster to post additional comments like, "includes case and manual" or "obvious dents" or "Not working".

But this is not meant to be just for slamming a seller. **I DO think it is fair** to put incorrect, misleading or false claims by sellers, just as it is fair to list good points.

I had one buyer contact me and say his **"guaranteed not DOA"** was not honored for a DOA calculator, because the seller said, "that is to be expected of 25 year old calculators". That is simply nonsense. This kind of statements are false advertizing but I leave those claims to others to add, if they like. I won't post hearsay claims.

Keep in mind though that this is really mean just to document calculator prices, with a little discretion for notation of flaws or such. These kind of input can help explain the variance in calculator prices and is important information.

Re: Online Tracking of Calculator Prices - User input needed

*Message #5 Posted by **Holger Weihe** on 23 June 2003, 4:00 p.m.,*
in response to message #1 by Mike

Hello Mike,

please have a look at http://www.hpmuseum.org. I have tracked ebay auctions of hp-calculators for nearly a year now. I could give you the data for inclusion in your database if you see the possibility to integrate them. It's an excel-file with over 1000 auctions.

The data doesn't exactly fit in your categories. I did not note the auction number, but the date. Since i didn't buy all these calcs, I also could not verify the advertised quality. I just rated the calculators in 3 categories from what I saw in the description (A: Optical and Technical OK, B: Technical OK with optical problems, C: defect).

So I could only give you: date, model, price, quality (A-C). If that is useful for you, send me an email. By the way: I only covered ebay.de.

Holger

Thanks

*Message #6 Posted by **Mike** on 23 June 2003, 4:55 p.m.,*
in response to message #5 by Holger Weihe

I plan to just track auctions for 3 months. That's about as long as they stay on eBay. I don't find that anything older than that is of much use.

And of course, anyone can simply use the eBay search facility but then they have to find all the ways to search to find calculators.

Entering the data and keeping it updated is too much of a chore to do on a regular basis. That's why I made the site as "User input data" which can be spread out over many users. The program can automatically display only the last 30 days data. So, it "could" be update all the time :-)

Thanks, Mike

How about this for a feature

*Message #7 Posted by **Mike** on 24 June 2003, 5:59 p.m.,*
in response to message #1 by Mike

I've been thinking of ways to make this a better tool. **How about his feature?**

I can put a "**public/private**" checkbox, on the form. I can also have an "**open/closed**" checkbox, on the form.

You can enter your calculator price data. It could be for "open" auction or a "closed" auction. You can check "public/private" and "open" or "closed" depending on the item.

I would also have the ability to "**update**" your entry. You could edit or delete your entries. Your "**comments**" could be the points that make that item of interest to you. You could change that after the auction closed and before it is made public. That way there is an incentive to add items to the database.

Any search would bring up all "public" items and your own "private" information.

This way, you could see the items you are tracking for current auctions, and get a historical perspective of prices on the same form. No one else could see which auctions you are tracking, via a search.

What do you think? Any value in this?

I'm just bored and looking for creative programming tasks :-)

a financial scenario using a 17/19BII

*Message #1 Posted by **Justin** on 22 June 2003, 6:45 p.m.*

Hi there.

I came up with a scenario that I'm not sure how to solve with my 17BII:-

John is retiring in 20 years. He wants to be able to withdraw **the inflation adjusted equivalent of $50,000 a year** for 10 years after retirement. How much does he need to deposit annually up until retirement for his needs to be met, if he can get 8% on his money and inflation is assumed to be 3.5%?

To tackle this I worked out the inflation adjusted payment for each of the ten years after retirement, but as the cash flow isn't a normal annuity (equal payments for each period) I don't know how to work out what the savings schedule should be because I can't figure out the lump sum that gets John his payments while still taking advantage of interest over the 10 years.

Any gurus out there know the way to solve one of these using a 17BII?

****

EDIT:

Actually, I think I've got it....

I would do a CFLO list of the ten payments and use the NPV at an I of 8% for the lump sum target amount.

Can someone confirm this is correct?

Thanks in advance!

Edited: 22 June 2003, 7:14 p.m.

Re: a financial scenario using a 17/19BII

*Message #2 Posted by **Stephan (Germany)** on 23 June 2003, 5:14 a.m.,*
in response to message #1 by Justin

Dear Justin,

before trying to solve the actual problem, I'd like to know if you assume the yield of 8 % as constant over the whole 30 years. It might be reasonable to set the yield rate to 8 % for the saving period (until retirement), but a lower rate should be considered for the time after, e.g. 5 % as John will shift his investment from long term high-yield type to short term safe havens.

In general, if inflation rate is set to a constant figure, you could do all calculations in "today's value" by just considering the real interest rate (after deduction of constant inflation). First step would be to calculate the demand for ten years at the beginning of retirement. Second to calculate the annual saving rate from today until

retirement. Meaning two separate calculations.

Please clearify boundary conditions. Then this problem can be solved either with a financial calc or by geometric series on any calc.

Best regards,

Stephan

Re: a financial scenario using a 17/19BII

*Message #3 Posted by **Justin** on 23 June 2003, 11:05 p.m.,*
in response to message #2 by Stephan (Germany)

Stephan:

Yes, the decreased return is more realistic.

I was more trying to get my thinking around the calculations.

Below, Werner has provided a great working example elaborating the scenario.

I'm going through it now to make sure I fully understand it.

Re: a financial scenario using a 17/19BII

*Message #4 Posted by **Werner Huysegoms** on 23 June 2003, 6:01 a.m.,*
in response to message #1 by Justin

```
I did this once before (albeit a bit differently), so here goes:
0. Data
-------
 . capital build-up during 20 years, with an annual payment adapted to inflation (PMT,
negative).
 . capital depletion over 10 years, again with an annual payment (now received) that is
adapted to inflation (pmt, positive)
 . basically, we'll pay PMT*E^i for i=1..20, then we'll receive pmt*E^j for j=1..10
 . E = 1.035 (inflation), B = 1.08 (intrest rate)
 . we assume payments to be made at the end of each period

1. Depleting the built-up sum
-----------------------------

The first sum to be received will be pmt*E, the second pmt*E^2 and so on.
Call pv the built-up sum, then at the age of retirement the following equation holds:

    0 = pv + pmt*E/B + pmt*E^2/B^2 + ... + pmt*E^n/B^n
or
    0 = pv + pmt/C + pmt/C^2 + ... pmt/C^n

This is the normal TVM equation with 1+i/100 = C = B/E

now we know pmt = $50,000 in today's money.  Adjusted for inflation,
that becomes:

  50,000 * 1.035^20 = $ 99,489.44

with n = 10
   pmt = 99,489.44
  p/yr = 1
```

```
  i%yr = [(1.08)/(1.035)-1)]*100 = 4,347826
    fv = 0
 payments at END of period

this gives a pv of $ -793,155.34, and the first pmt will be $ 99,489.44 * 1.035,
because it will be made a year after retirement.

2. Building up the sum
----------------------

    0 = FV + PMT*E*B^(N-1) + PMT*E^2*B^(N-2) + ... + PMT*E^(N-1)*B + PMT*E^N

after division by B^N, where C = B/E:

    0 = FV/B^N + PMT/C + PMT/C^2 + ... PMT/C^N

or  0 = (FV/C^N)/E^N + ..

of course, FV = -pv

again, solve with:

    n = 20
 p/yr = 1
 i%yr = 4,347826 (no change!)
   pv = 0 (don't forget!)
   fv = 793,155.34 / (1.035)^20 =  $ 398,612.82

PMT =  -12,910.09 $, first PMT will be * 1.035

an overview of the cash flows and capital build-up and depletion:
(CAP[i] := CAP[i-1]*1.08 - PMT[i])

YEAR    PMT             CAP

 1      -13361,94        13361,94
 2      -13829,61        28260,50
 3      -14313,64        44834,99
 4      -14814,62        63236,41
 5      -15333,13        83628,45
 6      -15869,79       106188,52
 7      -16425,24       131108,84
 8      -17000,12       158597,67
 9      -17595,12       188880,61
10      -18210,95       222202,01
11      -18848,34       258826,50
12      -19508,03       299040,65
13      -20190,81       343154,71
14      -20897,49       391504,58
15      -21628,90       444453,84
16      -22385,91       502396,06
17      -23169,42       565757,16
18      -23980,35       634998,08
19      -24819,66       710617,59
20      -25688,35       793155,34
21      102971,57       753636,20
22      106575,58       707351,51

24      114166,42       591758,20
25      118162,25       520936,60
26      122297,93       440313,60
27      126578,36       348960,34
28      131008,60       245868,57
29      135593,90       129944,15
30      140339,69       0,00
```

Re: a financial scenario using a 17/19BII

*Message #5 Posted by **Justin** on 23 June 2003, 11:03 p.m.,*
in response to message #4 by Werner Huysegoms

Werner:-

Thanks for your brilliantly detailed answer.

I am going through it, and may have some questions later if that's OK with you.

Once again, thanks!

****

EDIT:-

Werner:

Am I right in assuming that if you didn't want to adapt the payments in for inflation but instead keep them the same throughout the build up period to give a lump sum of 793,155.34 that that annual figure would be a payment of -17,332.20?

Thanks in advance

10B

*Message #1 Posted by **Stan(Sg)** on 22 June 2003, 4:47 p.m.*

I came across HP 10Bs on closeout today at Walmart. The blister packs were quite dusty and priced at $20 each. There were two types. One with yellow shift functions and the other with dark green (hard to read) colored shift functions. Any thoughts on these algebraic models? Are they worth $20? What did they retail for when they were produced?

Re: 10B

*Message #2 Posted by **Patrick** on 22 June 2003, 5:21 p.m.,*
in response to message #1 by Stan(Sg)

I bought one on eBay for $21.50 and thought I had gotten a reasonable deal. Add shipping costs and I'd say $20 is quite reasonable, if you're in the market for one.

I only bought one to have an example in my collection. I doubt that I'll ever use it.

Re: 10B

*Message #3 Posted by **jose goncalves** on 22 June 2003, 9:03 p.m.,*
in response to message #2 by Patrick

I spent the weekend playing with the HP10B from my collection, just to remember its features. It`s low end and algebraic, I know, but it`s quite impressive anyway. It`s from that distant time when HP knew how to do it.

Re: 10B

*Message #4 Posted by **Randy Sloyer** on 22 June 2003, 9:00 p.m.,*
in response to message #1 by Stan(Sg)

Buy a yellow shift key model for your collection while you can. Buy some more if you have the desire for resale, the price wanders a bit on eBay, but I have seen them go for $30+ New In The Package. Anything HP of good quality is only going up in value, even if it is algebraic.

Re: 10B

*Message #5 Posted by **Holger** on 23 June 2003, 7:12 a.m.,*
in response to message #1 by Stan(Sg)

I have a 10B for daily use. It's nothing out of the ordinary except for the excellent manufacturing quality. 20$ seems reasonable or even cheap. When I bought mine 10 years ago, I paid about 50$.

Re: 10B

*Message #6 Posted by **db(martinez,california)** on 23 June 2003, 9:31 a.m.,*

in response to message #1 by Stan(Sg)

Remember one thing that you get free of charge with every 10b: a spare battery compartment door for your 17b, 32sii or 42s

Norm and guys: about Spices, "2" disease and...

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 21 June 2003, 10:32 p.m.*

Hey Norm, guys;

a few days ago I mentioned I'd be with two Spices in hands for some "transplantation" experiences. It happens that my brother and I have both an HP38E each. I asked him to bring his unit when comming for the regular weekend's "family meeting" and what I wanted to do. Guess what: he brought it!

He is a lawyer and he seldom uses it, but likes it because of its design. He does not like RPN and cannot understand how come a calculator does not have an [=] key! In fact he knows how to use it, but he prefers an HP14B he has and does not give up on the HP38E anyway! I'm trying to take it but he resists doing business...

His HP38E is a "sandwich" type like mine, but... both of ours have the same behavior: the "2" disease. I was almost sure his HP38E was not "infected".

What good would it be exchanging chips so far? Anyway, I'm just pointint out two situations, one of them is just to remember.

I had two HP31E in hands, one solderless and the other with soldered chips. The solderless one did not have the "2" disease and the soldered one did, opposingly to what is expected. Also I had the chance to test two HP38C, also different in costruction, and both showed the same behavior: no blinking 2's while inputing data.

I am posting this because I do not think solderless Spices are the only ones to show the blinking "2" behavior. I called it the "2" disease for fun, I don't take it as a disease.

If you want to test and verify what I call a strange behavior, find a "revision E" 82104A (HP41's card reader)and plug it in your HP41 as usual. To check if your card reader is one of this type, execute [CAT] 2 and wait till the display shows

```
 [CRD RDR 1x ]
```

where x is the revision. If x is equal to G or superior, this will not happen. If it is anything below E or also if it is F, I cannot say it's true. Well, it's a good time for testing, right?

Now execute any function that asks for three digits, like:

```
[SIZE] _ _ _
[GTO][.] _ _ _
[DEL] _ _ _
[LIST] _ _ _ (if you have a printer)
```

Type only two of the three expected digits and press [<-] two times to remove them. Let's say you did this:

```
[XEQ] [ALPHA] SIZE [ALPHA] [2][3] [<-][<-]
```

You'll see:

```
[2       SIZE]
```

To remove this weirdness from the display you should press any key EXCEPT [<-].

Weird, isn't it? I consider this a bug because the system freezes; it does not crash because there's no need to remove batteries so the calculator resumes normal operation and none of the operations involved is programmable. This is a firmware "disease" that was corrected later.

Well, I think that's all for now. I'd be thanked if someone knows any inforamtion about reader versions with this firmware problem and can share with us all

Best regards.

Do the experiment later ... a possible explanation of "2 disease"

*Message #2 Posted by **Norm** on 22 June 2003, 1:42 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,
Well, we can't do the experiment until later... but we can
still do it. Wait until it is easy to swap the firmware
chips between two calculators, see if the problem is in the firmware.

Luiz wrote:
> The solderless one did not have the "2" disease and
the soldered one did, opposingly to what is expected.

That is really wild information. I would not have expected that. There is STILL an explanation (maybe) . Maybe HP was very, very disorganized in the way they produced these machines. We idolize them, naturally, BUT maybe they were a bunch of screw-ups. That is, maybe they would accidentally keep re-releasing an old version of the firmware, and so every once in awhile a bunch of the "2 disease" firmware chips was released, OR, maybe they programmed a million of them, and now and then they found a boxful in the warehouse, and they would put them into service.

So what I'm speculating is that engineering knew about the problem and they fixed it, BUT, production periodically would build the earlier revision, and engineering gave up on production building the right itme. It's possible... very very possible that they were that disorganized. The absolute opposite of "ISO9000" if you know what that is nowadays.

I AM GRATEFUL for this updated information about "2 disease" and I think we still need to prove, once and for all, whether "2 disease" is something in the firmware chip.

Thanks Luiz, - Norm

Card Reader bug

*Message #3 Posted by **Massimo Gnerucci** on 22 June 2003, 5:31 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

> Quote:
>
> If x is equal to G or superior, this will not happen. If it is anything below E or also if it is F, I cannot say it's true. Well, it's a good time for testing, right?

Confirmed: this bug is present in rev. 1E and not in revv. 1F and 1G.

My CRs are from these revisions only, cannot test for earlier or later units.

Well done Luiz!
Massimo

*Message #4 Posted by **Chris(FLA)** on 22 June 2003, 10:30 a.m.,*
in response to message #3 by Massimo Gnerucci

I have 2 card readers.

The "CAT 2" only shows "CARD READER" how do you find the version number?

The units are 2024S & 2007A

They don't have the bug so I guess they are later versions.

Chris

Re: Card Reader bug

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 June 2003, 10:58 a.m.,*
in response to message #4 by Chris(FLA)

Hi, Chris;

their serial number suggest they are very earlier units, dated 1980. As they do not have revision id. and based ontheir serial #, they probably have the first firmware. I remember I saw an 82104A that showed this header after [CAT] 2. I know it because its owner asked me to see what was going on with it: no card pulling. I opened it and saw gum in the middle of the card pulling gear. I was not aware about that at that time (80's) and I told him I was not able to repair. Anyawy I tested it and clearly remember seeing [CARD READER] instead of [CARD RDR 1x } in the display. My card reader's serial # is 2712Sxxxxx and its firmware is a G-revision. Also, my 82143A (printer) shows [-PRINTER-] after [CAT] 2 is executed, no revision ID, and its serail # is 2141Sxxxxx. As far as I know and have used, I identified no bug in regular use. The HPIL printer functions' header is [PRINTER 2x] and the 82242A IR printer module for the HP41 has [PRINTER 3x] as header.

Is there any other information about modifications and upgrades in HP41's peripheral devices and extensions? I know some ROM had updated versions, and the only application ROM (programs instead of functions) I know that was updated and had a remark in teh HP Key Notes was teh Financial Decisions Pack. At least one of the programs was modified in [FINANCE 1C] and the modification was present in [FINANCE 1D]. I also read that MATH ROM had some radical upgrades with XROM number modification. This is something I don't understand why... Well. now it's history, we can only track and identify.

Best regards.

Re: Card Reader bug

*Message #6 Posted by **james (UK)** on 22 June 2003, 12:58 p.m.,*
in response to message #4 by Chris(FLA)

Interesting! I also have an early unit (serial 2025A) which shows CARD READER when CAT 2 is run but it does have the bug - wierd.

Re: Card Reader bug(update)

*Message #7 Posted by **Chris(FLA)** on 23 June 2003, 3:57 p.m.,*
in response to message #4 by Chris(FLA)

Ok, I tried this test again and my 41CX unit with the 2024S CARD READER does exhibit this bug. I must have done something wrong the first time I tried it.

But my 41C with the 2007A CARD READER doesn't exhibit the bug.

I tried the test a few times too. Maybe it depends on what unit the reader is connected to, seeing as SIZE is a 41 function and not a card reader function(shrug)?

Chris

Re: Card Reader bug(update)

*Message #8 Posted by **james (UK)** on 23 June 2003, 5:21 p.m.,*
in response to message #7 by Chris(FLA)

Just had another go with my 2025A serial card reader - I get the bug on all my 41s (2 fullnut CVs serials 2120S and2147S and a halfnut CX serial 2819S)

I guess...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 23 June 2003, 5:53 p.m.,*
in response to message #7 by Chris(FLA)

... that this firmware version "tries to answer" or wrongly answers a system call when this sequence happens, so the system crashes.

Just a guess that would justify the calculator (as a system) behavior. Any attachment/device may interfere in the whole process, I think.

Best regards.

Wierd HP-87 Problem

*Message #1 Posted by **Mike** on 21 June 2003, 10:28 p.m.*

I have an HP-87 that has a sweep problem. I've looked around for obvious damage and have also looked for horizontal sweep adjustments. Can find neither.

Anyone have a schematic for the HP-87?

Problem: Each line starts about 2" from the left border with the cursor shown in the first photo.

http://www.msdsite.com/hpcalcs/hp87/sweep0x.jpg

Then as characters are typed, the letters are shown reversed and move from the cursor position toward the left border. After 4 characters, the charcters are displayed left to right, from the border. These characters overwrite the first 4 characters. The 2nd photo shows the result. I typed "Sweep problem".

I have used the down arrow, after the 4th character, to show what the screen is doing.

http://www.msdsite.com/hpcalcs/hp87/sweep1x.jpg

Here is the way it looks, if I don't use the down arrow after 4 characters.

http://www.msdsite.com/hpcalcs/hp87/sweep2x.jpg

It really looks like the horizontal sweep starting position is moved way to the left. Typing a whole line ends too far from where it should on the right.

I can just poke around till I find the problem but a schematic would help locate this problem.

Anyone ever see this before?

Edited: 21 June 2003, 10:40 p.m.

Re: Wierd HP-87 Problem

*Message #2 Posted by **Ellis Easley** on 23 June 2003, 5:36 p.m.,*
in response to message #1 by Mike

Is there a horizontal hold control, maybe just an internal one? It is usually a coil with an adjustable slug, on any monitors and TV's I've seen. Sometimes it's called "horizontal phase" and that's a clue why it can cause this. In the vertical sweep circuit, the vertical sync triggers a new vertical scan but the horizontal is a phase locked loop and the control adjusts the phase relationship between the sync pulse and the horizontal oscillator. It looks like your horizontal sweep is starting too late for the video.

Re: Wierd HP-87 Problem

*Message #3 Posted by **Tony Duell (UK)** on 23 June 2003, 6:37 p.m.,*

in response to message #2 by Ellis Easley

First rule of electronic repair (Well, almost) : Adjustments do not tweak themselves, so a fault is almost never sured by making an adjustment! In other words, tweaking the horizontal phase control might improve matters _for the moment_, but it's masking the problem, rather than fixing it, and it'll come back. In any case, I am not conviced this is a horizontal phase problem. It might be, but it might also be due to the beam taking too long to fly back, and thus some of the video is displayed during the flyback. I am trying to remember what causes this -- IIRC a deffective capacitor in the horizontal output stage is one possiblity. This assumes the 87 uses a conventional design, of course.

I was thinking cap too

*Message #4 Posted by **Mike** on 23 June 2003, 7:49 p.m.,*
in response to message #3 by Tony Duell (UK)

I have a schematic for the HP-85 and it might be similar. I looked around for something that looked smoked and couldn't find anything.

I guess I will try changing some likely caps, based on the 85 design. Not in any big hurry though. I'll report back when I find the problem.

Mike

Re: I was thinking cap too

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 23 June 2003, 11:50 p.m.,*
in response to message #4 by Mike

Hi;

I have already seen this sort of horizontal sweep (or "shifting") when using old-fashion SVGA monitors and changing O.S. graphics resolution. In many cases it was necessary to re-adjust horizontal "position" and sometimes horizontal "length". As the HP87 has everything built together, I believe there is a part of the circuit where the both image signal and horizontal scan share the same active circuits.

I just want to figure out the capacitor suspicion. What you mean is that part of the signal is getting mixed with horizontal scan signal or there is a DC component "shifting" initial position? If so, chances are that you may have a voltage/current divider with bad component, too. If there is any sort of current or voltage source used as a reference, even a failling resistor or diode may cause it.

I do not have the HP87 circuit; is there anything wrong in my analysis? I tried to consider not a general purpose monitor, but an specific design, as HP designers used to do.

Please, let me know if I'm too off-target.

Re: I was thinking cap too

*Message #6 Posted by **Tony Duell (UK)** on 24 June 2003, 6:54 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

I don;t know much about the 87 (I will have to dig one out and investigate), but I have the

HP85 schematics (from the MoHPC CD-ROMs, of course!). The monitor design is _very_ conventional. It's just like every other single-frequency monitor I've worked on. The video chip outputs a vertical sync pulse, a horizontal sync pulse, and video information. These are kept sepearate (there's no reason to combine them into a composite signal and then separate them out again), so actually, there is no common stage that handles both video and hsync. The horizontal output stage of the 85 is just like that in a TV or simple monochrome monitor, and presumably can be debugged and repaired the same way.

*Message #4 Posted by **Vassilis Prevelakis** on 21 June 2003, 6:31 p.m.,*
in response to message #1 by B. Turner

If the calculator is a "fullnut" then all you need to do is get an HP41C from eBay and swap the circuitboard. Its a quite straightforward operation and can be done in about an hour.

HP41Cs (or even CVs) can be found on eBay at reasonable prices if you take your time.

**vp

Halfnut and Fullnut cases interchange

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 June 2003, 12:39 a.m.,*
in response to message #4 by Vassilis Prevelakis

Hi;

to identify which one is yours, look at the image below:

This is an original MoHPC image.

I successfuly exchanged the case from both fullnut and halfnut with each other. If you cannot find a compatible case, it's possible to exchange but will take a lot more than one hour and will need some service.

The keyboard on each calculator must be removed, what means cutting plastic rivets out and settling the keyboard back in the other case somehow. If you are using a fullnut case and a halfnut circuit, some plastic rivets must be completely removed because the halfnut keyboard does not have all holes existing in the fullnut's keyboard. The opposite situation does not require this operation.

Look at the image below:

http://www.logeng.com.br/images/hn_fn_front_compare.jpg

The board shown in the left is a halfnut's board, and the one in the right is a fullnut's. The black holes in the fullnut's image indicate which rivets must be removed in a fullnut's case when "receiving" a halfnut's board.

Hope this helps.

Luiz C. Vieira - Brazil

Luiz.

How do you fix the keyboard again?. What can be used to replace the plastic rivets?

Cheers

Jon

Re: Halfnut and Fullnut cases interchange

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 22 June 2003, 2:55 p.m.,*
in response to message #6 by Jon

Hi, Jon;

the fact is that I cut only the necessary out of the original rivets. I do not remove the "mushroom" completely, I cut around them. Then I use existing plastic slices (or styrene) and melt some of them back (not all) to settle the keyboard. What I use to melt the plastic is something that works for me: a 220Vac soldering iron (35 to 40 watts) connected to a 110Vac outlet. It heats the plastic enough so it melts but it's not hot enough to burn the plastic. You can also use a rectifying diode (my first experiences) in series with the soldering iron so it will take only half of the AC wave, and in this

case you'll have about the same effect as connecting it to 110Vac. I gave up the diode because in one time its terminals touched each other and I did not see it, so one small plastic burnt out and I inadvertently smell the fumes. Believe me, not a good experience.

After this partial settling, I use a silicon-based glue in the remaining rivets. What makes me sad is that this technique gives good results, but is not 100% perfect. I'm sad to say that in at least two cases I did not get the best results. I reassembled some keyboards in Pioneers, Voyagers, Woodstocks, HP41 and two HP48. Spices have an extra advantage: no melted rivets at all. I also don't know what is the HP49 made of...

The HP41 is a particular case. I have a fullnut HP41C that has no refurbished rivets, the keyboard is solely maintained by the four case screws. I thought about the HP41 and it's a particular case: the keyboard is completely "pressed" by both cases. The two big screws (close to the LCD) lock the keyboard in place because of the BATT/IO assembly, and the two small screws must press the mainboard to the keyboard. The four screws lock both half cases together and the result is that the keyboard remains steady even if all rivets are loose.

I'd like to know what others are doing.

Best regards.

Luiz C. Vieira - Brazil

Edited: 22 June 2003, 4:58 p.m.

Another aid on reassembling keyboards

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 22 June 2003, 6:20 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Jon, guys;

I also remember (have no clue about who, when, how) someone mentioned one kind of glue that is sort of sealing, rubbered material when "dried". It seems to be perfect, but I have never used it and have no idea of what sort of stuff it is.

Maybe the one who posted about it will read this and add the identification.

Sorry!

when i saw your post, i thought you meant this one...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3031160398&category=11713

the Ebay definitions are humorous, but pretty much on the mark.

Re: Truth in advertising...

*Message #3 Posted by **Scuba Diver** on 21 June 2003, 7:18 p.m.,*
in response to message #2 by Bill Smith

Wow is one word...

However most of the words I use to describe the 30S are 4-letters long, not 3! :)

B.

How about this: $425 32sii

*Message #4 Posted by **John** on 21 June 2003, 7:53 p.m.,*
in response to message #1 by jimc

And he says the **List** price is $380. "List" price is that which is set by manufacturer.

List is $59.00

32sii for $425.00 (think he'll get any bidders?)

Not only is that a good deal but $25 to ship it.

Edited: 21 June 2003, 8:08 p.m.

Re: How about this: $425 32sii

*Message #5 Posted by **Patrick** on 21 June 2003, 8:22 p.m.,*
in response to message #4 by John

Actually, I think there are about even odds that there will be a bid. There are relatively few 32SII's available these days and it may not be obvious to a newbie eBayer that this price is out of whack with recent history.

There are always 10 or more on eBay < $250

*Message #6 Posted by **John** on 21 June 2003, 8:40 p.m.,*
in response to message #5 by Patrick

There are more than 10 on eBay at any point in time; all far below that.

There have only been 4 in the past 30 days that sold for over $250 and they were bought by newbies.

$400 is insane for these

There is a guy right now in Canada that is selling them for only a little over $200, and he is doing that on eBay with buy-it-now.

I doubt he will get a bid, unless he bids himself.

Edited: 21 June 2003, 8:41 p.m.

Re: How about this: $425 32sii

*Message #7 Posted by **Art Litka(FLA)** on 21 June 2003, 10:08 p.m.,*
in response to message #5 by Patrick

I recently purchased a used HP32SII from a local dealer for $99 + tax. It works well and is in good shape and I'm happy with it for my collection. I've been dealing with this fellow for over 25 years and would be happy to share his address and phone# with anyone interested.

Re: How about this: $425 32sii

*Message #8 Posted by **Randy Sloyer** on 22 June 2003, 7:00 a.m.,*
in response to message #4 by John

Actually, he wants $40 for shipping due to required insurance of $15.

It's people like this that give eBay a black eye. Just check this sellers feedback - the negative one - was an item he offered for sale with a BIN of $10. The shipping was $110. This is fee advoidance and is not permitted by eBay, but here it is for all to see. Just one more thing to watch out for.

Fee Avoidance (bids $36, shipping $265)

*Message #9 Posted by **John** on 22 June 2003, 10:20 a.m.,*
in response to message #8 by Randy Sloyer

I think you are right on. Check out all the stuff he is selling. His shipping fees seem to reflect the cost of the item.

Other auctions:

- 3029467816 Phone (bid $10, shipping $110)
- 3029189170 Phone (bid $10, shipping $110)
- 2734785968 Drive (bid $10, shipping $25)

- 3419378571 Modem (bid $6, shipping $20)

$36 in bids and $265 in shipping

There are more... (each could be easily shipped for much less than $10

Something that will be bought for $1 (because no one needs these) has a shipping fee of $10-15 (can be shipped for $3). Other items that are a tiny more valuable cost $20 to ship (but can still be shipped $3-4).

He will probably inform the seller that he has to pay $10-$15 insurance too. Insurance on any item of this value costs only $2 or less.

His shipping fees make no sense and do seem to reflect the cost of the item. I suspect this is a new account. He probably sold under a different account till his negatives got too high. I wonder if he will be reported? Send him an email and and ask a simple question (like why are your shippting so high) and see what kind of reply you get.

Edited: 22 June 2003, 10:39 a.m.

Great comedians of our time

*Message #10 Posted by **james (UK)** on 22 June 2003, 1:10 p.m.,*
in response to message #9 by John

I liked the explanation for the high shipping on one of the auctions though - the mercenary gran strikes!

> Quote:
>
> This item has been packed and will be shipped by my grandmother. It took her a full day to do the packaging. She already charged me $110 for S&H. So please take into account the high S&H costs and then bid accordingly. There is No Reserve on this item and the bidding starts at $1. Your $1 bid might win you this auction. However, your total cost would be $111. Think of it like this: you are purchasing a phone for $111 & free shipping. If you already bid on this item by accident, feel free to retract your bid. Have a great day!

Must be some packing if it took a whole day!

"Like NEW" but has a dent

*Message #11 Posted by **Mike** on 23 June 2003, 12:16 a.m.,*

Dealing problem ...

*Message #1 Posted by **Matthias Wehrli** on 21 June 2003, 8:40 a.m.*

About 4 month ago I made a deal with a german HP collector. He wanted me to sell some HP magazines and a port replicator. Cause I had to wait for a very long time for my items he told me, he would send me the items for free (no shipping rate). Ok, that's fine, but.... When I got the "parcel" I was deeply scared, cause he put the magazines and the port replicator in a blank (not even air feeded) envelope. The envelope was teared open by the sorting maschine of the postal service and the port replicator was missing...

A picture can be seen on my webside: http://www.hp-collection.org/envelope.jpg

I told the seller the problem and went also to my post office. They told me, that the seller didn't packed the items savely and that they will not pay anything. I also think, that this is not the right packing material for these items. What do you think? So far so good... The seller told me, that it's not his problem, but the post office problem, cause they delivered me this indured envelope directly in my mailbox without my signature.. I say, that the envelope was damaged before and that this would not make the thing unmade... I told the seller 2-3 possibilities to solve this problem: 1. to solve the problem directly with the swiss post (I gave him the telfefon and faxnuumber but he didn't contacted the office) 2. paying me back the money. (I also sent a item once before like this and it also didn't arrived. I payd back the money, cause it was my fault to send the item like that.)

So, until this problem, the seller seemed to be gentle (but very slow!). All I can do is to warn you, doing such deals with that seller (W.K. from Germany). Please do not care about all the others german sellers. I know some of them and they are very gentle and trustfull..

Matthias

I have good luck with German sellers... but...

in response to message #1 by Matthias Wehrli

Only 21 positives and he doesn't sell much. So, he probably doesn't care what people think.

You can tell a lot about the attitude of the seller.

I think it would be interesting to do a little bit of statistics for ebay selling/buying. Up to now I bought/sold about 140 pieces via Ebay (about 80% of these related to HP-calculators). Bought calculators from the US and from Australia without any problems. Only with one deal I had major problems (seller located in Austria).

The first time I sent him cash in a letter. After a few weeks he told me that no letter arrived. Ok, my fault.

Could have sent it via registered or insured mail, or could have made a bank transfer. So, for the second try I used registered mail. This time at least the envelope arrived, but the seller told me that it was empty. No money in it. So, what should I do? The german postal service refused any responsibility, because the envelope made it's way to Austria. And the seller didn't seem to be very motivated to deal with the Austrian postal service. This way I spent 150 Euros for nothing.

I have no reason to blame the seller for all this, because he seemed to be a honest guy. The thing I've learned is that I'll never ever send money via mail. Even if I have to pay 20 Euros fee for a bank transfer this will be cheaper than loosing all the money once or twice.

What experiences do other sellers/buyers have? What's the percentage of deals went wrong?

Frank.

How about BidPay.com? I would never send cash through the mail. I think postal clerks can smell it.

in response to message #4 by Mark

> Quote:
>
> I think postal clerks can smell it.

Maybe that's why I was advised to wrap cash in foil for mailing! I thought it was for X-rays or holding up to the light. I used the foil from a chocolate bar (both - or all three - times) only because it was thinner, but maybe the smell fooled the clerks!

I was only completely cheated once on Ebay, and the final bid was US$1 - with shipping, handling and insurance US$5. I had trouble with some other deals but received some adjustment. Best was from a brand-new, serious seller who was more concerned about feedback than profit, he refunded all my expenses and let me keep a TI calculator with a broken battery door. My feedback is 95 but my total is more than twice as high because I bought many items of test equipment from one surplus dealer.

I don't think I ever bought anything on Ebay from a European seller except some BBC Computer books from England. I bought other things from people in Europe who listed, or answered my listing, in the Museum Classified ads, and had no problem.

You didn't read my posting exactly.. Not the money was stolen, but the envelope with the items (the port replicator) was damaged... Have a look at my picture...

Re: Dealing problem ...

*Message #7 Posted by **Ellis Easley** on 24 June 2003, 5:10 p.m.,*
in response to message #6 by Matthias

Yes, my response seems to follow a sub-thread about sending cash! But after looking at your picture, I remember that this a major complaint I have against Ebay - sellers who don't pack things correctly. I get a lot of spam email about education for selling on Ebay - I never read any of it - but I wonder if they talk about packing items for shipment and its impact on customer satisfaction? I have had two cases of serious damage - both through the US Postal Service. One package never came to me, the seller told me it was returned to him badly smashed and he just refunded my money, so I don't know if packing had anything to do with that case. But the other item was packed very poorly, an oscilloscope that was wrapped in a plastic garbage bag and put in a diaper box (very thin cardboard) with a very small amount of foam peanuts - no attempt to surround the item with peanuts. Then the box was wrapped in brown paper. The package showed only a small tear about 4" long in the brown paper, but inside I found that some kind of narrow blade had punctured the cardboard box and two layers of sheet metal on the back panel of the oscilloscope! Maybe it was a miracle, but the only electrical damage was to the small "trace rotation" pot. I kept the unit rather than try to make a claim with the post office, which sounded like a lot of work for a small return. Also, I don't blame the post office - I blame the seller! But the only thing he was willing to do was to help with the post office claim.

I think part of the problem is that we are spoiled by having very good shipping companies. I have had very little trouble out of a large number of shipments, including packages that were wrapped extremely poorly but arrived with no damage. Even retail mail order businesses pack things in a way I would consider to be insufficient. They put a boxed item in a large box, free to move around with very little, or no, padding. They are trusting the manufacturer's display box - and the shipping company! (usually the US Postal Service) And usually, nothing goes wrong, but once in a while something does go wrong and I think all packages should be wrapped with the assumption that something will go wrong. With retail items that can be easily replaced, I can understand why a business would take advantage of the excellent performance of the post office and other shipping companies, and save some money on packing materials. But for hard-to-find or irreplacable items, I think it is inexcusable to use sloppy packaging.

I think one other factor is that on Ebay, a seller has frequently bought the item for very little cost at a flea market, or found it in an attic, so he puts a small value on the item. Sometimes the fact that at least two people were willing to pay him hundreds of dollars for the item doesn't alter his valuation!

in response to message #7 by Ellis Easley

QUOTE:

"I think part of the problem is that we are spoiled by having very good shipping companies..."

I think the "very good" ones only applies to the parcel business--UPS, FedEx, and usually the USPS is good but not as good.

When it comes to bigger stuff (using common carrier freight), or international, the game really changes.

I once had two canoes shipped from the US to Canada. They arrived crushed. The loading

instuctions were clear about top-loading only---but the morons that actually loaded those trucks didn't care. I absolutely do not understand how those big freight companies stay in business (Yellow, Old Dominion, etc). They charge almost nothing for shipping (like $90 for the canoes!) and then everything gets damaged. I claimed against them for $1050 and got the money. But the first boat that came, I did not have my claim filed within 7 days and so they refused to pay!

Yes, the shipper should make an effort to pack stuff correctly, but really it is the carrier's responsibility to flag an item that is improperly packaged---in the end it is the carrier who pays for the damage!

regards,

Bill

*Message #9 Posted by **james (UK)** on 24 June 2003, 12:29 p.m.,*
in response to message #3 by Frank B. (Germany)

Most of my ebay deals have been with the US (1 Malyasia, 1 Canada and 2 UK) and all have been fine.

I haven't had any European deals because most European sellers don't seem to take PayPal and as the banks in the UK want at least $35 for making a bank transfer shipping stuff across the Atlantic becomes the better option.

Despite seeing a lot of unfavourable comments about the US Postal Service I have never had any problems with delivery.

Up to now only one fraud in about 20 deals. It was with a bunch in Ulm. All others: no problem, worldwide!

Ciao.....Mike

Re: Dealing problem ...

*Message #11 Posted by **Vassilis Prevelakis** on 25 June 2003, 9:09 a.m.,*
in response to message #1 by Matthias Wehrli

Whenever you are dealing with people you do not know, there is always the possibility of misunderstandings.

I'll give you three examples:

a) I ordered a serial card for the HP-85. The eBay auction showed the card with its box which looked in a very good condition. Well the seller shipped the card in that box (without additional packaging). The card arrived intact, but the box was a mess. Since I wanted the card, I didn't mind, but if I wanted the box, I'd have been furious.

b) I ordered an HP 41 card reader. It never arrived. I contacted the seller and he said that he had sent it, but could not provide any proof. In the end I gave him a negative rating. Some time later I checked and found that he had added a comment after the negative rating to the effect that the problem was resolved (!!!). Needless to

say I never bought anything from that loser, but I did note that others did buy stuff from him and gave him +ve feedback.

c) I purchased an HP 9915B computer and the seller gave me the impression that he did not actually want to sell me that machine (he sent it to the wrong address - he refused to email me the UPS tracking number - he was slow in responding to my email, to allow UPS time to give up and return it to the shipper - when the item was returned to him, he claimed it was my fault and wanted additional money to send it again, etc.). I persisted and in the end I did get the 9915B, although it arrived dead (PSU prob).

The big problem is that these items are rare, so these transactions are not typical. Getting a refund when a rare manual is lost in the post is little consolation. E.g. the 9915B closing price was $10; for this price I was prepared to spend a lot of time to make sure I got the item.

So, to avoid disappointments, its better to deal with people you know and trust. It is often also cheaper, as you can bypass eBay altogether.

It is also important to prepare 1-2 paragraphs with instructions regarding the shipment (your address, packaging instructions, mandatory insurance, tracking numbers, etc.). You have these instructions in a file so you don't have to think about it, you just attach it at the end of your email. E.g.

> Quote:
>
> NOTE: Packages MUST be sent to me with some kind of tracking number (e.g. delivery confirmation for USPS Priority Mail, with some other shipping methods, such as UPS ground, it is included in the price). Please include this in the shipping cost. The tracking number MUST be emailed to me after the package is dispatched. If a package is sent without a tracking number, and is "lost in the post", then I will post negative feedback and demand full refund.

Make sure that the seller understands that these instructions are part of the deal, so that if there is a problem later, you can go back and point to your original email.

What is 41CY? I'm dying to know. How is it different than 41CV or CX?

Re: 41CY

*Message #4 Posted by **Holger** on 21 June 2003, 1:26 p.m.,*
in response to message #3 by John Smith

The CY is not from HP, it's a 'CX on steroids'. Some firm whose name I forgot made them. They were supposed to be twice as fast as a genuine CX and had a 'rambox' which's purpose I don't know. There are some rumours that the configuration was not very stable. They are very rare. Matthias has some info on his website. http://www.hp-collection.org/Rechner/hp-41cy.htm

Re: 41CY

*Message #5 Posted by **Raymond Del Tondo** on 21 June 2003, 5:02 p.m.,*
in response to message #4 by Holger

Forget the rumours about stability, since we're not talking about the 49G;-)

Seriously, the CY worked very well. At least the units I worked with.

The RAMBox can be seen as module simulator, or simply as additional RAM. 64K is much space

for HP-41 programs...

Raymond

Re: 41CY

*Message #6 Posted by **Johnny Billquist** on 23 June 2003, 7:38 a.m.,*
in response to message #5 by Raymond Del Tondo

I'd like to know how this 64K memory worked. The CPU cannot use it in a "normal" manner. Normally addressed memory is read-only in the 41 architecture. The full address range is 64K, but the "OS" itself take a big part of that range, and modules just about can fill up the rest. I don't see how you could have an additional 64K in there. RAM is addressed as a device. But the full address range is only 1024 registers unless my memory fails me. That's 7K. And almost all of it is used if you have a CX and two X-MEM modules.

What's left (that I can see) is that you have a module that have 64K as offline storage. Usable in a similar way as X-MEM or as HP-IL mass storage.

Perhaps someone else can fill me in here?

Re: 41CY

*Message #7 Posted by **Raymond Del Tondo** on 23 June 2003, 8:05 p.m.,*
in response to message #6 by Johnny Billquist

Hello,

the RAMBox of a CY is divided into 2 32K banks. You can programmatically switch them by the W&W RAMBox OS's commands PG<>, PG01, PG10 .

As said in earlier posts, the RAMBox part simulates ROM pages in the HP-41.

For the CPU it looks like ROM, but with suitable software, like David assembler, or RAMBox OS's data functions, you can simply modify it, and use it like a RAM disk.

Regards,

Raymond

HP55

*Message #1 Posted by **Howard** on 20 June 2003, 6:37 p.m.*

I recently purchased a HP55 off Ebay. The advertisement said it works fine but it doesn't. Before I try to get my money back I'd like some advice in case I'm doing something wrong or else it is a simple problem to fix. I don't have the manual but MOHPC site says to Press GTO 00 then move switch to programme and then press the sequence of keys. I do this and the line (with 1 exception) reads "01. -15" for every entry. The exception is that if I press GTO 1, 2 or 3. What is going on??

Re: HP55

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 June 2003, 7:07 p.m.,*
in response to message #1 by Howard

Hi;

I have an HP55 and if I switch it to ON and set mode switch to PRGM and press nothing else I see [00.]. What do you see in yours if you do the same?

The [01 -15] display indicates you pressed [GTO] [1] [5], or GTO 15.

For the records: which keys did you press? Can you list them?

Thenk you.

Luiz C. Vieira - Brazil

Re: HP55

*Message #3 Posted by **Howard** on 20 June 2003, 7:17 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Switch on 00 Press "g" -15 press any key except GTO 1, 2 or 3 gives the same result.

Re: HP55

*Message #4 Posted by **David Ramsey** on 20 June 2003, 7:45 p.m.,*
in response to message #1 by Howard

The HP-55 has 50 programming steps, numbered 00-49.

With the program switch set to "Run", pressing GTO xx where xx is a two digit number between 00 and 49 will set the program counter to that number.

If you press GTO 23, then move the switch to PRGM, the display will read:

23. -00

The "-" is the 55's shorthand way of representing "go to". Thus, when there's no program in the calculator, every step is "GTO 00", represented as "-00".

All GTO addresses must be two digits. If you try to enter an illegal line number, i.e. GTO 56, the GTO will be ignored and the two digits will be entered by themselves. In this case "5" and "6" would be entered as separate steps.

Try this:

1. Turn calc off, then on.

2. Move switch to PRGM.

3. Press these keys: ENTER, 2, /, 5, 2, 8, 0, X, R/S

4. Move the switch back to RUN. Press GTO 00.

5. Enter "23" and press "R/S". The display should flicker and show "60720".

I suspect your calc works fine. Have you used any of the older keystroke programmable HPs before?

To Ellis, D.Ramsey, D. Smith: HP97 card reader flat flex cable - old thread

*Message #1 Posted by **Renato** on 20 June 2003, 5:23 p.m.*

There was a thread a few weeks ago about replacing HP97 card reader flex cable. Ellis wrote:

> Quote:
>
> HP97 card reader flat flex cable
> Posted by Ellis Easley on 5 June 2003, 8:49 a.m., in response to Replacement cable, posted by Renato on 3 June 2003, 1:27 a.m.
> Renato,
> See if they have a cable with 13 conductors, 0.1" between conductors, at least 2.75 inches long - with both stripped areas on the same side of the cable.

I finally went to the store. They had two 13 conductors cable
a- Made by Ensung, L=20cm, 1mm between conductors
b- Made by Dong Ho, L=14cm, 1.25 mm between conductors.
None of them seem to fit. I understand HP97 uses 2.5 mm between wires. Maybe a 26 wires with 1.25 mm between conductors will fit ? What is the cable width ?

Re: To Ellis, D.Ramsey, D. Smith: HP97 card reader flat flex cable - old thread

*Message #2 Posted by **David Ramsey** on 20 June 2003, 7:52 p.m.,*
in response to message #1 by Renato

The cable is 35mm wide, 7cm long, and the conductor spacing is 2.5mm. There's 1.25mm of extra space on each side.

Re: To Ellis, D.Ramsey, D. Smith: HP97 card reader flat flex cable - old thread

*Message #3 Posted by **Renato** on 20 June 2003, 11:46 p.m.,*
in response to message #2 by David Ramsey

Ok, thank you.

If any of you could scan a 1:1 image of the cable, I could use it when I go to the store again. I´ll look for cables that match dimensions, and could be electrically compatible.

Renato

Re: To Ellis, D.Ramsey, D. Smith: HP97 card reader flat flex cable - old thread

in response to message #3 by Renato

Here's the cable:

http://neko.com/~dramsey/hpcable.jpg

It's not being shown 1:1 here; you might have to grab the image directly from my server. Or you could use the measurements I supplied previously...

Re: To Ellis, D.Ramsey, D. Smith: HP97 card reader flat flex cable - old thread

*Message #5 Posted by **David Smith** on 21 June 2003, 2:31 p.m.,*
in response to message #2 by David Ramsey

I think the spacing between conductors is actually 0.10 inches or 2.54mm (some cables are 2.50mm spacing... the difeerence adds up over more conductors). There is a posibility that a fine pitch cable (1mm or less) might work (much like the zebra strip connectors in the HP41) by sharing several conductors with one connecotr pin. Shannon's sampling therom says you the spacing needs to be finer than twice as dense as the normal cable for this to work.

HP-45 Charge

*Message #1 Posted by **David E** on 20 June 2003, 2:26 p.m.*

I have the ac cord and a battery I bought off of ebay that works with the hP-45, 67, etc (battery is 8 months old, and will charge in the hp-67). The battery will not charge however in the hp45 (I have tried it in 2 of my hp45's)....Am I doing something wrong?

Re: HP-45 Charge

*Message #2 Posted by **Erik Wahlin** on 20 June 2003, 3:16 p.m.,*
in response to message #1 by David E

If you mean that the battery works in the HP-67 but not the 45, it may be that the gold plated copper tab at the three pin socket is not short circuiting two of the pins. That must occur before the calc can run on the battery. Does the calculator operate on the ac adapter alone?

Re: HP-45 Charge

*Message #3 Posted by **David E** on 20 June 2003, 3:32 p.m.,*
in response to message #2 by Erik Wahlin

Yes it operates on the ac alone...so do you think I just need to clean the gold plated copper tab? Is that the copper backing?

Thanks

Re: HP-45 Charge

*Message #4 Posted by **David E** on 20 June 2003, 3:39 p.m.,*
in response to message #3 by David E

The contacts are touching after I take the charger cord out, but the battery itself isn't even warm after charging for a few hours....

Re: HP-45 Charge

*Message #5 Posted by **David E** on 20 June 2003, 4:02 p.m.,*
in response to message #4 by David E

I am retarded. The contact was not reaching battery contact....ggh....lol, this took me 2.5 hours to figure out..

Retarded, Huh.....

*Message #6 Posted by **Michael Meyer** on 20 June 2003, 10:53 p.m.,*
in response to message #5 by David E

Get in line.

Actually, much of fixing calculators is the process of looking carefully for a flaw that can be seen with the naked eye.... I'd say more than half that I've fixed have had some basic flaw that could be seen. IMHO, MOST things I fix are a matter of a simple connection, etc.

Michael

P.S. You're talking to a guy who's HP-67 worked for a year with two capacitors soldered in backwards....

Re: Retarded, Huh.....

*Message #7 Posted by **David Smith** on 21 June 2003, 2:33 p.m.,*
in response to message #6 by Michael Meyer

Are you sure the caps were installed on the circuit board backwards? You could have installed the circuit board around the capacitors backwards.

Opinions on P41CX -The HP-41CX Emulator for Palm

*Message #1 Posted by **gene** on 20 June 2003, 12:14 p.m.*

http://www.palmgear.com/software/showsoftware.cfm?prodID=40123

What does everyone think of this HP-41CX emulator running on the palm? Comes with almost every ROM module you can think of, for only $10.

Re: Opinions on P41CX -The HP-41CX Emulator for Palm

*Message #2 Posted by **Daniel Diggelmann** on 20 June 2003, 1:35 p.m.,*
in response to message #1 by gene

Hi Gene,

I bought P41CX just when it came out 1 month ago. I think it's a great emulator and I use it everyday. The price is right and I'm looking forward to new modules and enhancements.

Happy programming Daniel

Re: Opinions on P41CX -The HP-41CX Emulator for Palm

*Message #3 Posted by **Eduardo** on 25 June 2003, 2:40 p.m.,*
in response to message #2 by Daniel Diggelmann

I bought P41CV right before the appearance of P41CX so I paid only $7 *and* got a free upgrade (to 41CX). The author is great, and he e-mailed me the new proggy as soon as it was released ;)

Eduardo

PS: Yes, I *totally* love it, and the price couldn't be more right... I was toying with the idea of buying MathUPro (for $35, I think) until I came across this killer app.

Emulators generally

*Message #4 Posted by **bill platt** on 20 June 2003, 3:01 p.m.,*
in response to message #1 by gene

This is the sort of software/hardware future I have been following, too---I think that ultimately there is the possibility of a decent calculator, if and when the hardware improves as far as interface (buttons) goes.

The Tungsten C is a start in the right direction (but $500!).

I am curious about other emulators, too---HrastProgrammer has a number of them (I am not sure if for palm yet)--and there are others--and even a bunch emulating the 48 series.

Did HP give their rights to the 48 to the public domain? Is the 41 so old that it is automatically public?

Re: Opinions on P41CX -The HP-41CX Emulator for Palm

*Message #5 Posted by **hugo (belgium)** on 21 June 2003, 5:37 p.m.,*
in response to message #1 by gene

Great emulator! I use it now for almost a month as standard calculator on my Sony Clié (T615), for the moment being as unregistered version. All functions are there as well as 2 X-Memory modules and the Advantage module. Only the printer emulator does make mistakes (not a right printout). What i find absolutely well made is the P41CX Memo Compiler, which enables me to download HP41 programs, put them in a memo on the Clié and then directly transfer it to the P41CX. Well done!

regards, Hugo

Tell me more about the memo compiler...

*Message #6 Posted by **Gene** on 21 June 2003, 9:22 p.m.,*
in response to message #5 by hugo (belgium)

I have a clie...tell me more about how you do this. Where do you get the programs, what format do you download them in? Give me the 1, 2, 3's of the process. :-)

Re: Tell me more about the memo compiler...

*Message #7 Posted by **hugo (Belgium)** on 23 June 2003, 3:18 a.m.,*
in response to message #6 by Gene

1) you need the memo compiler (P41CXKC12.zip) from the site where can also download the P41CX. After synchronising this compiler to your Clié you are able to use memo's to write and compile programs for P41CX. 2) i use Microsoft Outlook to synchronise memo's between my Clié and my computer; i assume you could also use other programs like the Palm desktop, but the procedure would be comparable; 3) as an example, let's take the program for the calculation of Reynolds numbers from the Chemical Engineering Solution Book which you can find in the HP41C Sofware library on the MoHPC. Open this page on MoHPC and select the prgram with the cursor; copy to the clipboard; open Outlook, create a new memo and paste it in there. Do not forget to add the following as the first line of the memo: #P41CX LOAD otherwise the compiler will not recognize this memo as a HP41 program to compile. 4) synchronise this memo to the Clié 5) on the clie start the application P41CXKX (the compiler), it will indicate "Loading P41CX program from memo pad... OK" 6) In the menu of this application, choose "Go" "Compile", you will see then the program scrolling as the compiler loads it. 7) start P41CX, start program mode "PRGM" and select the menu of P41CX by clicking the button for menus on your Clie (the one below the Home icon) 8) choose "Edit" "Load" and the P41CX will load the program in its memory (you can follow it on the display)

This way, all programs you can find in the MoHPC program library are "easily" downloaded to your P41CX!

hope this explanation can help you

Hugo

Re: Opinions on P41CX -The HP-41CX Emulator for Palm

*I have it. I use it, it's a dream come true, at a *very* reasonable price.*

Actually the emulator is free under the GPL.

It was ported from Eric L. Smith's nsim emulator for Linux.

The cost is for the addons that Charles Lee added.

Chris

HP-41 CX

*Message #1 Posted by **Jon** on 20 June 2003, 12:04 p.m.*

Hello:

I have bought a HP-41CX halfnut with faulty working "user key". Sometimes it works sometimes not. Don´t worry, I knew it and I got a very good price (good seller). May be somebody knows if it can be fixed anyway. I have also a 41CV halfnut. Could I use it´s keyboard for the 41CX?. If it is possible, can I change the "HEWLETT PACKARD 41CX" logo from the original to the CV`s keyboard?

Thank´s in advance

Jon

Re: HP-41 CX

*Message #2 Posted by **Massimo Gnerucci** on 20 June 2003, 1:15 p.m.,*
in response to message #1 by Jon

You could also use SF 27 / CF 27 to get in and out of user mode... :)
Massimo

Re: HP-41 CX

*Message #3 Posted by **Jon** on 20 June 2003, 2:39 p.m.,*
in response to message #1 by Jon

Oh God!

I didn´t realize there is another thread for the 41 keyboard repair. Anyway may somebody has an special solution for the user key.

Thanks to Massimo for the alternative. It is a good idea if can´t repair the contact

Re: HP-41 CX

*Message #4 Posted by **David Smith** on 20 June 2003, 4:55 p.m.,*
in response to message #3 by Jon

See the threads on HP keyboard repair. The user key is just another key on the keyboard. Its' contact is easily cleanable using the "wire brush" technique.

Thats probably it

*Message #5 Posted by **db(martinez,california)** on 21 June 2003, 1:10 a.m.,*
in response to message #4 by David Smith

David has a good first idea. It may just be me but i have had more dirty on/user/prgm/alpha keys than any other and they can be cleaned out. Be gentle.

SOLVED !!!!!

*Message #6 Posted by **Jon** on 21 June 2003, 10:11 a.m.,*
in response to message #5 by db(martinez,california)

The problem was the plastic foil under the batteries. After cleaning the key several times with isopropilic alcohol I didn´t get any result until I forgot placing that foil. It seems this element produced any bad contact. So I made the hole for the contacts 1 mm wider and now everything works. YAHOO!!! (and I have the cleanest user key of the world).

This is the first time I open a halfnut. Although it works fantastic it seems it has been serviced. There are two diodes and a capacitor soldered one over the other on one side. I see also red wire connecting two points. Has anybody a photograph of one of these calcs opened. In the main page I have only found a fullnut inner photographs.

Jon

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 21 June 2003, 11:47 a.m.,*
in response to message #6 by Jon

Hi;

I posted a photo a few days days ago showing an opened (dismanteled) halfnut and these components are present in at least eight halfnuts I have already opened (two CX and six CV). You may also notice that earlier halfnuts have a post-production cut in the cooper trail where the red wire is soldered, while the newer units have this trail already separated in the PCB layout.

I've been served by a provider that does not care a damm dot for its customers, so the page I was using was removed and created again and all my pictures are gone. I'm lucky I have all of them, so I'll have to upload them all back.

If you want, I can e-mail you the image so you can check if yours is the same type.

Best regards.

Luiz C. Vieria - Brazil

My e-space is back, thanks Lord!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 21 June 2003, 11:55 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi;

look at the picture below:

http://www.logeng.com.br/images/hn_mainboard_back_view.jpg

The extra black&red wires in the top of the image were added to test the unit with an external battery pack, they do not exist in regualr units. I don't know how long will it

survive again, so if you like it, copy it to your HD...

Regards.

Luiz C. Vieira - Brazil

Massimo

Re: SOLVED !!!!!

*Message #12 Posted by **David Smith** on 21 June 2003, 2:36 p.m.,*
in response to message #6 by Jon

The diodes and caps and wires are standard construction for the halfnuts.

BTW, when opening a halfnut be very careful of the speaker wires. They just LOVE to break off the circuit board.

What a design

*Message #13 Posted by **Jon** on 21 June 2003, 5:16 p.m.,*
in response to message #12 by David Smith

Thank you.

I see it hasn´t been modified. It´s no the best design I have seen from HP.

Jon

re; david's speaker wire

*Message #14 Posted by **db(martinez,california)** on 22 June 2003, 1:36 a.m.,*
in response to message #12 by David Smith

I never met an hp41 speaker wire i could not do without. The only time i ever used the noise function on purpose was to set up my 41 with the ppc rom to be a piano. I handed it to a friend who plays keyboard. He hit all the keys once and proceeded to play "Mary Had a Little Lamb". OK, it wasn't Mussorgsky's "Pictures at an Exhibition" but i was impressed.

Re: Thats probably it

*Message #15 Posted by **Ellis Easley** on 23 June 2003, 9:25 p.m.,*
in response to message #5 by db(martinez,california)

Maybe that's because when we first go to the machine, we turn it on and whatever bits are on our fingertips fall off and into the gaps around the On/User switch.

That makes sense Ellis

*Message #16 Posted by **db(martinez,california)** on 23 June 2003, 11:59 p.m.,*
in response to message #15 by Ellis Easley

It has gotten no worse since i started to keep the calc in a baggie. With that tidbit it makes even more sense.

HP42S Face Plate

*Message #1 Posted by **Brendon Hutton** on 20 June 2003, 6:51 a.m.*

Hi Everyone,

I am sure that I am asking the impossible here, but if I never ask, I will never know...

I have an HP42S that I ADORE and the face plate - the metal plate with all the mathematical features - is in serious need of a replacement. I am hoping that there may be someone out there that can help me to source such a precious piece... Can someone help me?

I am also not too sure if I can upgrade the firmware... is this possible? I bought the unit in 1988 and I am sure that it does not have the latest version available.

I hope that there is someone out there which may have a source that I can contact.

Thanks for reading this request.

Rgds, Brendon Hutton.

P.S. Thanks to this place, I managed to purchase an new HP42S also. I have two now and just want to upgrade/facelift my older one...:o)

Re: HP42S Face Plate

*Message #2 Posted by **Randy Sloyer** on 20 June 2003, 6:40 p.m.,*
in response to message #1 by Brendon Hutton

A new 42S faceplate requires the destruction of a new 42S... see where this is going?

The only way to get a replacement bezel in any condition is to remove it from another calculator. At the end of the exercise, you've expended hours, probably put a few wrinkles in the replacement plate and wished you had never tried it. The double sided sticky tape that HP used is absolutely tenacious. IMO, while it can be done, it just is not worth the effort.

The ROM in a 42S cannot be changed without swapping out the entire logic board, it is contained on the cpu chip. The bugs are not serious enough to make it necessary. The known list can be found here http://www.finseth.com/~fin/hpdata/hp42s.html There are a few differences in the menus when using solver, but again, not enough to make a difference in actual use. Purely academic for my 2 cents worth.

Just do what most of us other 42S zealots do - buy several. No, that can't be used as night-lights on the bedside table like the LED machines, but every room in the house still needs one.

Re: HP42S Face Plate

*Message #3 Posted by **Trent Moseley** on 20 June 2003, 11:03 p.m.,*
in response to message #2 by Randy Sloyer

This Forum is so unusual that even an outsider looking in by chance would have to precieve that something very extraordinary is going on here.

12C or 12C Platinum...that is the question

*Message #1 Posted by **Joe** on 20 June 2003, 12:06 a.m.*

I have been the proud user of the original HP-12C for years. Its functionality is exactly what i need, the RPN method works perfectly with my prodigious mind (hence my prodigy.net e-mail address), and its craftsmanship is bar-none (e.g., the fully raised keys, with the exception of the on/off key, which is not as raised so as to limit inadvertent shut-down).

My competitive (i.e., an understatement) roommate recently purchased the 12C platinum. There are definitely more functions and increased memory, but is it a "better" instrument?

Personally, i would assume the "improvements" are rather insignificant, and in some ways, the original 12C may remain the better of the two (e.g., in craftsmanship). For instance, look at the 10B versus the 10Bii. The latter may have a few more functions, but it is surely not "better" than the former. The keys don't even feel as nice.

Does anyone have any input re this quite interesting dilemma?

H-P...H-P...H-P!!!

Re: 12C or 12C Platinum...that is the question

*Message #2 Posted by **Michael F. Coyle** on 20 June 2003, 12:35 a.m.,*
in response to message #1 by Joe

Hi Joe,

Look at this forum for the last couple of months, specifically the 12C vs 12CP posts. It shouldn't be hard to collect all of the problems that the 12CP can't do (due to bugs), or where the 12CP is slower. Then just demonstrate to your roommate why newer isn't necessarily better.

It's kind of sad that this is even possible.

- Michael

Re: 12C or 12C Platinum...that is the question

*Message #3 Posted by **Gene** on 20 June 2003, 7:22 a.m.,*
in response to message #1 by Joe

More functions? An X^2 key is more functions? (well, yes, ONE more function!). Otherwise, no additional functions other than a fairly unusable ALG mode.

Personally, the extra programming memory, particularly now that bugs have been exposed in the GTO statements, does not offset the terrible color choice or much slower speed to solve for i in annuity problems. Go with the original 12c! My opinion.

Re: 12C or 12C Platinum...that is the question

*Message #4 Posted by **Don Nguyen** on 21 June 2003, 11:39 p.m.,*
in response to message #1 by Joe

100% agree! I recently bought a 12C Platinum. I feel the same way. I feel like wormanship is terrible. The g and f key are not stand firm and the Enter key when you press it and release it has a little noise that really bother me. Even now after use it for a while I start to like my 12C Platinum. But I wouldn't recommend for anybody. A little note here: the i function in TVM takes a long time in some problems to get a result. I mean a long long time.

Best Regards.

eBay item linked to Museum image.

*Message #1 Posted by **James M. Prange** on 19 June 2003, 6:34 p.m.*

At: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3031437048&category=11713: "Condition is Very good; comes with original manual. Has no battery cover or batteries. No guarantee it is in working condition." Perhaps you could provide eBayers with a more appropriate picture of what a 28S in this condition really looks like?

Regards,
James

Re: eBay item linked to Museum image.

*Message #2 Posted by **Dave Shaffer** on 19 June 2003, 6:47 p.m.,*
in response to message #1 by James M. Prange

I think we should all send Dave some photos of the most beat-up calculators we can find (perhaps with scatalogical scratchings on them), so he can substitute them (like was done a few weeks ago) on a moment's notice for the Museum pics!

Needed: tit-for-tat images

*Message #3 Posted by **Paul Brogger** on 19 June 2003, 7:35 p.m.,*
in response to message #1 by James M. Prange

I've got a 28s-in-a-basket. I'll take out the battery cover and get a picture of the pile of parts . . .

Re: Needed: tit-for-tat images

*Message #4 Posted by **qyuu** on 19 June 2003, 10:54 p.m.,*
in response to message #3 by Paul Brogger

Sorry I was the one who linked to the picture

I apologize I didn't realize it would cause such a problem

So my apologies to everyone for the problems it caused/causing

Re: Needed: tit-for-tat images

*Message #5 Posted by **qyuu** on 19 June 2003, 11:31 p.m.,*
in response to message #4 by qyuu

I have been politely informed that I should ask permission to use an image. I understand that.

I acknowledge my mistake for not considering that beforehand.

My original intention was to show only what the calculator looks like because my digitals have not been coming out great.

I have promptly removed the listing with that picture.

My apology again to the people I offended

Re: Needed: tit-for-tat images

*Message #6 Posted by **Dave Hicks** on 19 June 2003, 11:39 p.m.,*
in response to message #4 by qyuu

Thanks for ending the original auction.

There are several issues here including IP theft and bandwidth theft but I prefer to concentrate on your potential buyers. They most likely know what an HP-28 looks like and what it does. For those that don't a link to a site like this one can be provided.

However, what your customers really want to know is what **yours** looks like and they want any information you have about cosmetic or functional problems. A description of "very good" with a picture of one that is mint is potentially confusing and worse than no picture at all.

Some of your other auctions use your own pictures. Some of them use my text. Please credit me when you do that like:

The description used in this auction is from The Museum of HP Calculators (www.hpmuseum.org).

Offered: tit-for-tat image

*Message #7 Posted by **Paul Brogger** on 20 June 2003, 7:41 p.m.,*
in response to message #3 by Paul Brogger

It's a little late, but if it's ever needed again, how 'bout this?

(Next: practice using the imaging software to re-size the pictures!)

Hey Luiz ... electrolytic spice caps

*Message #1 Posted by **Norm** on 19 June 2003, 1:15 p.m.*

Hey Luiz,

In your "jumper" picture for spice, there are two electrolytic capacitors (like in a 34C power supply board).

Have you ever taken time to replace those ? It seems to me that electrolytics dry out.

Would you agree that changing them to dipped-tantalum capacitors might be wise ? Then they do not degrade with time .

They had some oddball value, 22 uF and 10V or so. It was a little hard to find, so I was going to order some tantalums probably 22uF and 16V soon. Then I can change them if I work on such a calculator in future.

What do you think ?

Re: Hey Luiz ... electrolytic spice caps

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 1:54 p.m.,*
in response to message #1 by Norm

Hello, Norm;

thank you for your question... Hey, you're the "analog guy"... I'd probably ask *you* about electrolytic caps 8^).

I'd replace them, you bet. Did you read Ellis' post about electrolytic aluminun/tantalum capacitors? It's a "must read", believe me, I recomend. If I am not wrong, Ellis once mentioned that he worked with components technology, as his posts are full of technological information. The way you, Norm, most like to read and post, as well.

There is one thing that scares me about electrolytic tantalum capacitors: if they are overloaded (excessive voltage), their BANG! is too noisy... One other thing: at least where I live, a small 150,000 inhabitants citty where RPN and HP are fairly "unknown", tantalum capacitors are rare. Only a few dealers "have heard about them". I must search in some electronic junk I have at home to find replacements. Oh, yes, in time: I'm lucky having a capacitance metter and sometimes some "capacitor codes" are way beyond my understanding. Any clues?

Best regards, Norm.

Luiz C, Vieira - Brazil

Edited: 19 June 2003, 1:56 p.m.

Someday I'll send you some

*Message #3 Posted by **Norm** on 19 June 2003, 9:23 p.m.,*

in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I was thinking of ordering a bag of 100 tantalum caps.

Since you need some, I will do that, eventually.

Then i will send 2 dozen your way.

Not sure when, sometimes these things take awhile.

I need more than one item, for placing my order with the parts distributor.

- Norm

caps in 34C power supply module

*Message #4 Posted by **Ellis Easley** on 23 June 2003, 8:23 p.m.,*
in response to message #3 by Norm

Here's one paragraph from my 34C report:

> Quote:
>
> I traced out a schematic of the solderless unit including the power supply and compared the two units. I noticed two differences in the power supplies: The newer unit has a 10K resistor instead of a diode to provide the standby power from the battery - I imagine that keeps the memory alive with a lower battery voltage - also, the capacitor that holds some charge for the standby power when the battery is out is 22 mf in the older unit and 33 mf in the newer one.

The 33 mf cap is black, has a rectangular cross section, the only markings are "336" and a red dot to indicate the positive lead. I am inferring this means 33 mf, don't know what the voltage rating is. The fact that it is rectangular might mean that it is a tantalum cap - wet slug vs. rolled aluminum foil, so it can use the rectangular shape for higher density. I think space, especially height above the PCB, is very limited on the power supply module. But for what it's worth, my newer unit seems to have no trouble remembering when I take the battery out for considerably longer than the time required to put in a new one (I'm using one battery pack between both calculators). The other two electrolytic caps are 22 mf in the newer calculator.

Luiz is overstating my experience, I started as an electronics hobbyist and have worked as a technician, manufacturing engineer, diagnostic software engineer, and even spent a little time as a design engineer, and now I'm back to being a hobbyist. I try to share the things I've learned when they might shed some light on issues that arise here in the Forum.

For this and much more, I (and I believe others, too) am humbly thanked, Ellis. Your shared knowledge, along with other contributors', helped me many times.

Let's face it: this forum RULES!

*Message #6 Posted by **Ellis Easley** on 24 June 2003, 4:09 a.m.,*
in response to message #4 by Ellis Easley

I've just finished going over my 34C schematic (you'll see what I mean!) and I realize I was mistaken about the location of the 33 mf cap in my newer calculator. It's not across the battery but rather it is the filter cap for the voltage regulated supply. But both of my units remember their settings (no PR ERROR, anyway) a lot longer than it takes to change the battery.

HP-41 Bar Code Reader

*Message #1 Posted by **Chris Catotti (Florida)** on 19 June 2003, 6:59 a.m.*

Has anyone ever seen a bar code reader with software besides:

- WAND 1F -

How about the HP-IL Module?

-PRINTER 2E

-MASS ST 1H

--

-CTL FNS

Re: HP-41 Bar Code Reader

*Message #2 Posted by **Donald Leonard** on 20 June 2003, 3:39 a.m.,*
in response to message #1 by Chris Catotti (Florida)

My HP documentation indicates that the first released series of Wands had the 1E Rom. The 1F and beyond could read the 'Sequenced Data Bar Codes' (footnote pg 10, 'Creating Your Own Bar Code'). Don

Re: HP-41 Bar Code Reader

*Message #3 Posted by **Chan Tran** on 20 June 2003, 7:37 a.m.,*
in response to message #2 by Donald Leonard

Hi Don, What is the Sequenced Data Barcode? I have never heard of it.

Sequenced data barcode

*Message #4 Posted by **Tony Duell (UK)** on 21 June 2003, 4:11 p.m.,*
in response to message #3 by Chan Tran

It's a special format of data barcode (numeric barcode, alpha replace barcode, alpha append barcode) which includes a sequence number in each row). With normal numeric (say) data barcode, the wand doesn't know what order you're scanning the rows, so WNDDTX could end up putting the numbers in the wrong registers. With sequenced data barcode, the HP41 will complain if you read them out of order

Re: HP-41 Bar Code Reader

*Message #5 Posted by **Tony Duell (UK)** on 21 June 2003, 4:08 p.m.,*
in response to message #1 by Chris Catotti (Florida)

I have 2 HP41 wands. One is a WAND 1F, the other a WAND 1E. The 1E version has 2 major differences. Firstly,, it can't read the sequenced data barcodes (types 9, 10, 11). Secondly, it has problesm withnumeric data barcode over a certain length (which is not sufficient for 10 digits + 2 exponent digits + all the separators, etc). That's why my sdatabar program has a -E flag which attempts to generate readable barcode for the 1E wand, even if this means losing the least significant digit.

Bad Technology Week.....

*Message #1 Posted by **Michael Meyer** on 19 June 2003, 12:37 a.m.*

I'm just writing to share my misery. Normally, things start working when I just look at them.... Not this week.

Saturday I bought an HP 5550C scanner for the automatic document feeder (ADF). My 6250C was just too painfully slow and intermittent.

The 5550C didn't work. Or it would work and quit. Sort of. I spent 5 days looking for upgrades. I tried to download the upgraded software, but my computer was down due to a change necessitating a new cable modem. The place was closed after 2 on Saturday. Then, the USB ver. 2 PCMCIA card I bought for my Compaq (HP) notebook was defective. It took me all day to figure out. I erased a USB backup drive just trying to access it. I exchanged the card on Sunday. The drive worked.

So, I worked on the scanner all weekend with a dial-up connection. And Monday. And Tuesday. And until 10pm tonight. New drivers for my USB ports. Nothing. New system ROM upgrade. Nothing. New drivers for sound, video, and even the Intel processor. Nothing. I looked for answers everywhere. Intel site. Microsoft site. HP site. Compaq site. Nothing.

My kid's computers wouldn't boot. Even my HP-71B decided to do a memory reset. Sitting down to write this, my computer froze. Then wouldn't boot. Finally got it running.

At last: I figured out that after installing the HP software and configuring the hardware and ports, the software must be "repaired" using Windows' "Install Programs" routine... immediately after installing the software.

A zillion re-boots. Finally, the scanner works. It'll scan 50 pages in just a few minutes. It still won't scan at 200dpi... it comes across looking like an old TV with the horizontal hold off. 201 dpi works. 199 dpi works. Just not 200. And if I change from USB 2 to USB 1 ports, I have to reboot repeatedly, reinstall the software, then run the "repair" utility. And reboot. Too bad HP doesn't document this anywhere. (I can't be the only one with this experience.) Oh, and there's no way to save the custom settings. HP's scant documentation says you can from the "preview" screen. Except there's no button to do it. Welcome to the world of unpaid beta testing!

I hope the Museum site doesn't go down from me posting this.

I wonder if my aura is malfunctioning?

in response to message #1 by Michael Meyer

"I wonder if my aura is malfunctioning?"

I think Bill Gates gets most of the credit. I, too, have had similar experiences with USB equipment - Windows seems to forget it exists from boot to boot. Sometimes, you can get away with just trying to reinstall the driver via the control panel/my computer - rather than actually having to insert the relevant CD. Sometimes, just a reboot will do. It seems to depend on whether you power up your peripheral BEFORE or AFTER you boot!?!? ! (let alone when you plug in the USB connection!)

I am sometimes amazed at how easy Windows software loads, but other times, I wish for the good old DOS days, when you knew exactly what you had loaded onto your machine!

And have to fiddle with that bane of DOS users, CONFIG.SYS? Only geeks ever understood it. And remember the 640 KB RAM limitation, which had to be defeated using special software.

in response to message #4 by Ernie Malaga

Aren't we all geeks here?

CONFIG.SYS and I usually get along. The main thing is to never lose the one that worked, and build on it when necessary. Same for AUTOEXEC.BAT. My latest Sony Pentium IV has some roots from a twenty-year old PC/AT (that I still have!).

This is all even more fun when you have a quadruple boot (DOS, Win95, Win98, linux) machine.

Builds character!

Geeks specialize, same as professionals. Although you're a geek (specialized in computing), you may not be able to tell the difference between a journal and a journal receiver in AS/400 terminology -- for example. I can. But I cannot open CONFIG.SYS with a text editor and understand any of it.

Different folks!

*Message #7 Posted by **Wayne Brown** on 20 June 2003, 8:08 a.m.,*
in response to message #4 by Ernie Malaga

I'd prefer CONFIG.SYS to the Windows Registry any day! That's one of the reasons I like Linux (and Unix) so much: Configuration files always should be plain text that can be edited with a simple text editor -- and they should *not* be updated automatically by the system! I don't want anything in my config files that I didn't put there myself.

Re: Bad Technology Week.....

*Message #8 Posted by **Les Bell [Sydney]** on 19 June 2003, 2:17 a.m.,*
in response to message #1 by Michael Meyer

Michael, when you say "USB 2", do you mean the USB 2 that used to be USB 1.1, or the USB2 that used to be USB 2?

See http://slashdot.org/articles/03/06/18/2025210.shtml?tid= if you're not confused yet.

FWIW, I bought an HP2200c scanner to stick on the shelf behind my desk; the Windows software that came with it insisted on treating me like a clueless idiot - no way to manually specify resolution, colours etc, just vague and woolly descriptions of what the user might be trying to do. But recently, I installed Red Hat 9 on my Thinkpad, and out of curiosity, tried the scanning software it installed - marvellous! I once again have full control of resolution, colour depth, colour balance, etc., the way my older scanner used to let me do.

Best,

--- Les [http://www.lesbell.com.au]

> I wonder if my aura is malfunctioning?

Nope. But you may want to consider getting yourself a Macintosh. The _only_ times I have experienced problems comparable to yours is when using a Wintel machine. By far, the worst experience I've had is with a Gateway 2000 PC, about 8 years ago, trying to install OS/2. The PC died and stayed dead for a week. I had to reformat the C: drive 3 times.

Yes, Macintosh is more expensive. Yes, there are fewer software selections to choose from. But it works. And don't compare CPU clocks directly, because that won't give you an accurate comparison. For example, my nephew has a 2.4 GHz PC he's very proud of. My 350 MHz G4 Macintosh runs rings around it.

No kidding.

Repairing HP-41 keyboards

*Message #1 Posted by **Michael** on 18 June 2003, 7:30 p.m.*

The divide key does not work on my HP-41CX. All other keys seem to work properly. Is there an easy fix for this?

Will the keypad from any other 41C or 41CV work or does it have to be a 41CX for all functions to work properly?

Thanks for your replies,

Michael mcshack1@attbi.com

Re: Repairing HP-41 keyboards

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 8:15 p.m.,*
in response to message #1 by Michael

Hi;

the worst part is actualy cleaning the contacts. Under each key there's a small metal cap that bends everytime you press a key and it "snaps". This way, the inner top of the cap touches the surface of the keyboard. It happens that the cap's border are already touching one of the poles of the key contact, and when it is forced down (key pressed) it touches the other pole and closes the key contact.

The most common problem is related to dust. If dust gets inside the cap, it will be between the cap and the mid contact. I did not find the time to draw it, but I hope my description helps.

The good news is that there is a small hole exactly aligned with the middle of each cap. If you open the calculator and locate the hole under the key with bad contact you'll have a chance to clean it. I use a few brush bristles soaked with some sort of cleaning liquid (isopropyl alchool) and tied together as a bundle. I carefully insert them inside the (mentioned) hole, then I rotate the bristles and remove them. I repeat this operation about three to four times. If it does not recover the key's contacts, maybe you have another sort of problem.

About keypad compatibility: there are two basic types of HP41 if we consider their inner parts. Look at the image below (MoHPC original image)

The left LCD refers to the first series, called fullnut. Their keypad is fully compatible with each other.

The right LCD reffers to the halfnut series, newer ones. They have everything built in one single board: LCD, chipset, keyboard... Like an all-on-board computer mainboard. In this case, there's a need to remove and resolder parts if you want to use a "sane" keyboard with bad chipset: you need to remove the bad chipset and resolder another. The worst of this all is taht the "chipest" for the HP41CV and the HP41CX are not exactly

compatible. They are electrically compatible, but there is only one chip that is identical: the processor itself.

Have you checked which HP41 is (are) yours?

I hope this helps for now. If not, let us know.

Success.

Luzi C. Vieira - Brazil

Edited: 18 June 2003, 8:18 p.m.

Re: Repairing HP-41 keyboards

*Message #3 Posted by **Michael** on 18 June 2003, 8:51 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the quick reply. This unit is the half-nut version with rounded corners in the display. I think that you may have right and left reversed in your message? I had heard that breaks usually took out an entire row of keys, this is only the divide key that is affected, so I am hoping that this is good news and that the key needs to be cleaned as you describe. It sounds like the keyboard exchange idea is probably out, but maybe not necessary anyway? Thanks!

Re: Repairing HP-41 keyboards

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 11:45 p.m.,*
in response to message #3 by Michael

That's the third time I write the same message (I lost the first two and I cannot even understand what happened). I'll shorten it this time.

As you have a halfnut, try cleaning the key's contact. Look at the image below.

http://www.logeng.com.br/images/hn_mainboard_back_view.jpg

You'd need to remove the chip in the middle and both the LCD and the hybrid chip (top of the image) an place them in the "donated" keyboard. I think it's worth trying to clena the key's contacts first. And you're 100% correct: I wrote the message without looking at the image, so I actualy reversed left and right references; thank you.

Best regards.

Luiz C. Vieira - Brazil

Cleaning HP keyboards

*Message #5 Posted by **Randy Sloyer** on 19 June 2003, 12:14 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

In my experience, a single key that does not function has about a 99% chance of being restored through cleaning if:

1. The key has the same amount of travel as all others. 2. The key has the proper "snap" - that is the metal dome that forms the moving part of the switch has not fatigued.

While Luiz is technically correct, the last thing (in my opinion) you want to do is to take keyboard

assembly apart as shown in his photos. He is a brave man with several 41's to spare. I would consider it only when every method of cleaning has failed and you know the switch is beyond help without drastic measures. If it is that bad, you'll probably also need a replacement dome from another unit.

Here is (sorry Luiz, I stole your great photo) an image of where you can measure with an ohmmeter to check the operation on the divide key. I purposely point you up to the X key for the one contact so you do not interfere with the divide key center contact. Contact resistance of a good key is less than 1 ohm. If you have really sharp, pointy probes, do not stick them directy into the plated through holes for fear of damage to the dome in the X key. The hole to the left is the common point for the four keys of the bottom row (div,0,.,r/s) and has no dome above.

http://mywebpages.comcast.net/etron/images/divide_key.JPG

I just finished cleaning a CX that had 3 dead keys. It was so full of eraser dust that it was a wonder that any of the keys worked at all. You can start by using canned air with a extension tube and direct the blast directly into the key contact hole after doing a good surface dusting. You'll be amazed at the dust bunnies that have grown inside your machine.

Good luck, post again if you have any questions.

Edited: 19 June 2003, 12:22 a.m.

Be my guest!

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 12:41 a.m.,*
in response to message #5 by Randy Sloyer

Hi, Randy;

I'm flattered for the fact these pictures are of any use for you. Use them as well, for as long as HP does not invite our bosses to close our sites with their images...

You know, I wrote the message three times mentioning how hard it would be exchanging keyboards in a halfnut and that, based on this fact and in the somewhat simple cleaning procedure, cleaning should be performed as many times as needed. Your post is a lot better than mine, thank you.

The halfnut you see in the image (scanned) is the one that recognizes only the first 64 registers. After SIZE 000 it reads [.END. REG 63]. If I use external memory modules, after a SIZE 000 the calculator goes nuts and shows the weirdest registers quantities I've ever seen in HP41: [.END. REG 92], [.END. REG 101], [.END. REG 05]. Each time you press [PRGM] you see a different amount of available registers. After a few [PRGM] press, the caculator goes completely crazy and orders [MEMORY LOST]. If you let it without memory modules, everything goes fine. I had an original HP41C fullnut case and I built this halfnut there. Now I have a custom HP41C halfnut... too bad it's fake.

That's the reson I played brave and removed the keyboard, I was trying to find the problem at the other side of the mainboard. The best chance to scan a halfnut's guts and generate a few images, right? I'm glad you found this one usefull, I intend them to be.

Best regards and thank you.

Luiz C. Vieira - Brazil

Keyboard disassembly

*Message #7 Posted by **Mike** on 19 June 2003, 9:26 a.m.,*
in response to message #5 by Randy Sloyer

I agree, if you take the keyboard apart, you might (likely will) have loose keys when you get it back together.

I have some photos here that show this disassembly.

41 Keyboard disassembled

HP-34C missing led

*Message #1 Posted by **Jon** on 18 June 2003, 5:47 p.m.*

I have a HP-34C with a missing led all along the display. It´s not a problem of bad contacts. I am afraid is the cathode chip with one circuit failing. Does anybody knows if this chip can be repaired with a transistor?. Can I use any chip from other spice calculator? I have spare parts from a 33E.

Thanks

Jon

Re: HP-34C missing led

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 6:03 p.m.,*
in response to message #1 by Jon

Hi, Jon;

it's a common symptom and it is usually observed in the "solderless" spices, the ones I name "sandwich" assy.

I have an HP38C that sometimes comes to "life" with a missing segment in all digits. I currently twist it slightly and gently and it comes back to normal operation. When it first occurred I disassembled it and cleaned all of the surface contacts. It worked fine for more than a month. Then it came with the same missing segment and I instinctively twisted it (gently). It worked fine again.

I'm almost sure it's not an internal chip problem, maybe it's a cracked trail or a bad contact inside the LED module.

If you want to try a gentle twist before opening, go ahead. Otherwise, you should open and check for the type 34C you have. If it's a soldered type, you may also have a cold solder, what is somehow easy to repair.

Hope you have success. Let us know if you need extra advice.

Luiz C. Vieira - Brazil

Luiz is right ... dont give up on that 34C

*Message #3 Posted by **Norm** on 19 June 2003, 3:00 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Jon -- dont give up on that 34C yet.

Luiz is right ....

Rather than presume the semiconductor IC is damaged, it may be that your unit is solderless, AND, one of the solderless connections has become open.

Is the 34C fairly HEAVY? That's one way to conclude it is solderless.

It would be good news for you, because if the chip is blown no, you cannot replace it with one from a 33E . But the bad news is, you need to know EXACTLY what you are doing to get inside of a 34C and succeed in making restorations.

If you are technically inclined then proceed. However you seriously consider boxing it up and sending it to Luiz . He is the best for working with the solderless SPICE calculators and I bet he would like some well-paying evening work. He'd probably quote you a price that would work.

Re: Luiz is right ... dont give up on that 34C

*Message #4 Posted by **Jon** on 19 June 2003, 11:48 a.m.,*
in response to message #3 by Norm

Thanks everybody. I am quite busy these days. As soon as I have time I will "play " with it. If I have success I will post it in the forum.

Thanks again

Jon

OK, but be wary of pitfalls ...

*Message #5 Posted by **Norm** on 19 June 2003, 1:01 p.m.,*
in response to message #4 by Jon

Well, good luck with the 34C Jon.

There are many pitfalls, starting from when you try to open the plastic case halves (it will seem they cannot be separated, and it is very easy to damage the plastic).

After that comes risk of ESD damage to these chips, which are very ancient and not design to be rugged at all. In a nutshell, if you have the wrong pair of socks on, you may fry the chips, and then you are truly stuck.

There are some articles here in HP Museum that will help you with knowledge about servicing the unit correctly. To take a line from the antique radio crowd "any service work should be done carefully and correctly, for the item is an irreplaceable heirloom, and you are not likely to be its final owner."

One question, Jon:

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 12:26 p.m.,*
in response to message #1 by Jon

Hi, Jon;

I read your post again and I see something I did not notice in the first time (I think I read it in a hurry, sorry). It seems you're sure about something when you mention *"It´s not a problem of bad contacts."*. Is there any additiional information about it that you believe would help diagnosing the problem?

Please, let us know. Thanks.

Luiz C. Vieir - Brazil

Re: One question, Jon:

*Message #7 Posted by **Jon** on 20 June 2003, 11:54 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Luiz:

I have opened it. I have the experience with other spices that a missing led is just a problem of bad connection of the display contacts. If you press it the problem comes and goes and is easy to fix. But not this calculator. I though it could be a chip problem because it is described something similar for the HP-67 and I have read the HP-97 service manual where I can see the circuit (spice design is not so different). If somebody is interested I can post the information related to the HP-67 that I found somewhere in internet

With the information you gave me I will investigate further.

Cheers

Jon

*Message #8 Posted by **David Smith** on 20 June 2003, 5:07 p.m.,*
in response to message #7 by Jon

If your machine is a "compression" machine where the chips, etc are not soldered then you can just pull out the LED module. Test it by connecting a 400-1000 ohm resistor to a 3 volat battery pack. Fumble around a while with the leads on various pins and in various polarities. You will soon see a pattern of where the LEDs segments start to light up. The LED segments and digits are arranged in matrix (segments on the rows of the matrix, digits in the columns). Typical failute modes are a missing digit (bad column connection), a missing segment in all digits (bad row connection), or a single segment bad (bad LED segment).

If you can get the offending segment(s) to light, the problem is in the big chip or (more likely) the connection from the big chip to the LED module. Connections between the big chip and the keyboard etches can be hard to get right.

The LED module can be replaced from any other spice machine. The big CPU chip will have to come from another machine of the same type. You may also have to replace the ROM chips from the other machine. Some CPU chips are not compatible with all ROMs.

12C and its financial algorithms

*Message #1 Posted by **Eduardo** on 18 June 2003, 2:49 p.m.*

I found a very interesting article by a UC Berkeley math & engineering professor (W. Kahan) about calculation roundoff errors and poor processor architectures. What's interesting is that he compares HP with TI financial calcs, and he was actually involved in the coding of the *original* 12C's algorithms. I'm posting this as a follow-up on the controversy about the 12C Platinum's "solving for i". Dr. Kahan's article (pp. 14-19) discusses this issue quite in depth (for the original 12C). You can be quite sure the 12C Platinum does not use his beautiful ideas or it would be *at least* as fast as the 12C. I wouldn't be surprised if HP simply "lost" the original coding ideas used for the 12C and tried to reinvent the wheel (and if you read the article, you'll see reinventing *this* wheel isn't quite as simple as it initially appears). The article, called "Mathematics Written in Sand", is linked to from Dr. Kahan's web page at:

http://www.cs.berkeley.edu/~wkahan/

The direct URL is:

http://www.cs.berkeley.edu/~wkahan/MathSand.pdf

*Message #3 Posted by **Tony** on 19 June 2003, 2:55 a.m.,*
in response to message #1 by Eduardo

Yep, that's a great article. The 12CP is really a very interesting machine. Every day I see a new bug!<G>. Today I tried n=1 i=-.001 PV=100 PMT=0 and solved for FV=-99.999 which is correct. But i=-.0009 gives FV=100.0009. Yes, plus 100.0009! The answer should be -99.9991. I cannot imagine the coding that would do this magic. The old 12C does this correctly, so it is not something copied over. yesterday I noticed the 12CP does try and cheat when solving for i - but it only goes ahead and does it if the solution is exact. Today's one only happens if i is between -.001 and 0.

Re: 12C and its financial algorithms

in response to message #3 by Tony

>FV=-99.999 which is correct. But i=-.0009 gives FV=100.0009

I tried this on my 17BII, and the answer I got is FV=100.009!

Re: 12C and its financial algorithms

*Message #5 Posted by **tony** on 29 June 2003, 2:47 p.m.,*
in response to message #4 by eel

here the 17bii is fine, n=1,i=-.0009,pv=100,pmt=0 gives fv=-99.9991.

Re: 12C and its financial algorithms

*Message #6 Posted by **Tony** on 19 June 2003, 3:52 a.m.,*
in response to message #1 by Eduardo

On page 15 of Prof kaplan's "Maths in the Sand" is a "Penny for your Thoughts" example with n=31,516,000 i=3.170979198 E-7 PV=0 PMT=-.01 END: solve for FV=331,667.0067. The 12CP resolves for i in 280 seconds giving i=3.107401823 E-7. That's within about E-4%. The 12C gives 3.197401823 -7 which is 1% out, but it only takes a few seconds. All is not lost on the 12CP though - i did a 250 (the limit, due to a bug) line i-solve program that never seems to take longer than 40 seconds - so the 12CP runs the prog well - and for the above case it resolves the i exactly!! Probably a fluke, but shows what the 12CP can do.

Re: 12C and its financial algorithms

*Message #7 Posted by **Tony** on 19 June 2003, 3:57 a.m.,*
in response to message #6 by Tony

whoops the 12CP gives 3.170982000 E-7 in 280 seconds - a pretty good answer in the end. Only 2.8E-13 too high or about E-4 %

Edited: 19 June 2003, 4:00 a.m.

Re: 12C and its financial algorithms

*Message #8 Posted by **hugh** on 19 June 2003, 4:48 p.m.,*
in response to message #6 by Tony

280 seconds! wait! whats's this. here comes the hp9g, cover flapping in the wind...

"I'll save you rpn mortals from evil tvm errors..."

"finding FV is easy with my 24 digit precision. don't panic kids, i'll just use the textbook formula fv=-amt*((1+i)^n-1)/i" 60*60*24*365->N .1/N->I .01*((1+I)^N-1)/I = 31,667.0067

"ah! that was easy, now to solve for I in only 5 seconds.. just whisk together a quick solver..."

INPUT L,H,E; E=10^(-E) X=L GOSUB PROG 9; A=Y Lbl 1: IF (ABS(H-L) < E*ABS(H)) THEN { GOTO 2; } X=H GOSUB PROG 9; B=Y C=H-B*(H-L)/(B-A) L=H A=B H=C GOTO 1; Lbl 2: X=C END

"and the solve-for subroutine..."

Y=((1+X)^31536000-1)*.01/X Y=Y-331667.0067 END

"put in L=1e-30, H=1e-7, E=8 and presto!"

x=3.1709792e-9 which is correct.

Gee, thanks 9g, i'll never doubt you again.

copying hp 85 tape to another tape

*Message #1 Posted by **NORM** on 18 June 2003, 11:19 a.m.*

i have alot of hp 85 tapes that run instrument tests and calibrations using the hpib bus. i was able to copy the program files by loading the program to the hp85, then putting in a blank tape then doing a store"prog.name" for each program on the tape. however, when it came time to store data type files i could not do it. in this case the data file is called "macro1" i would like to store it but am not sure how to do it. obviously the programs will not run on the newly copied tape without this data file. if anyone out there can help i would greatly appreciate it. thank you in advance, norm

Re: copying hp 85 tape to another tape

Norm,

Is the "new" tape formatted?? I know silly question.

jr

Re: copying hp 85 tape to another tape

*Message #3 Posted by **Vassilis Prevelakis** on 18 June 2003, 9:08 p.m.,*
in response to message #1 by NORM

If you can go via a disk drive, life will be far easier since you can copy everything onto the floppy and then back onto the new tape.

The reason why you are having trouble with the data file is because the HP-85's LOAD and STORE commands are designed to deal with program files, not data, binary, graphic, etc files.

If you know the type and structure of the data file you can write a small basic program to read it in memory and then (after you change tapes) write it back onto tape.

I am amazed, however, that HP did not provide some sort of backup facility for base configuration HP85s. If anybody has another solution, I'd be delighted to hear it.

in response to message #4 by Ellis Easley

```
Ellis Easley wrote:
> Was that one of the reasons for adding the extended memory and RAMDisk code to the
"B" versions?
```

Good idea. I didn't think of the RAMDisk (probably because all my 85's are A models). But, you are right the RAMdisk can be used to hold the contents of the tape during the transfer. However, as the tape can store about 200K, if you do not have any HP82908A or HP82909A memory modules, you may have to do the transfer in multiple steps.

I am not sure what the RAMdisk syntax looks like (you can find about it in the HP85B manual on the MoHPC disks), but to copy stuff from tape to disk you have to do the following.

```
COPY ":T" TO ":D700"
```

Assuming your disk drive's address is 700. Now place a new tape into drive and initialize it using

```
ERASETAPE
```

and, finally copy files to the new tape

```
COPY ":D700" TO ":T"
```

HP 86/87 BACKUP

*Message #6 Posted by **Vassilis Prevelakis** on 19 June 2003, 8:37 a.m.,*
in response to message #5 by Vassilis Prevelakis

A bit off topic but note that if you have an HP86 or 87 with a single disk drive, you can still make backup of disks using the BACKUP utility from the HP87 demo disk.

The demo disk is at http://www.series80.org/Programs/DEMO87/index.html

Instructions on transfering these files to HP 87 disks http://www.series80.org/Programs

Note that for BACKUP to work you need to have at least the following files from the demo disk:

```
r            BPGM   256      1    768  r.BIN
BACKUP       PROG   256      2   1024  BACKUP.BIN
 backup      PROG   256     29   7936  _backup.BIN
UTIL/1       BPGM   256     12   3584  UTIL_1.BIN
ASKIOB       BPGM   256      5   1792  ASKIOB.BIN
```

HP Marketing Strategy

*Message #1 Posted by **Bob** on 18 June 2003, 9:32 a.m.*

I don't know if anybody from HP checks these messages out, but I would like to open a discussion on how to best market the HP calculator line. (a future one, anyway)

I have read the discussions on PDA vs. PC vs. Handheld Calculators and I understand the premise that the calculator is not a strong future contender. Some say they are just commodity items. I just disagree. Just look at TI. They are selling a large number of calculators, especially through the educational market. Some of these are about in the same cost range as the HP's

How would you market, advertise, and sell calculators ? Who is your target consumer, how do you reach them, etc ?

I think that there is a market out there but it has not been reached yet. It does not just consist of us retro-minded folks who bought our first HP in the early '80's.

What are your thoughts ?

Re: HP Marketing Strategy -- Digital Cameras

*Message #2 Posted by **Paul Brogger** on 18 June 2003, 11:39 a.m.,*
in response to message #1 by Bob

It's a good question, especially in light of my recent experience with an HP digital camera.

We found a "Photosmart 812" (4MP) on sale at Circuit City and it looked right, so we bought it. I then picked up a copy of "Digital Photo" (or whatever) to compare what I just paid with prices from the mail-order houses. (I know that's a bit backward, but I don't always exhibit patient buyer behavior!)

Amazingly, I found: no articles reviewing HP cameras (not surprising in a single-issue sample), NO HP advertising (a bit puzzling), and not a *single* mail-order outfit offering HP's (!!??!!??) They've got whole sections devoted to Nikon, Olympus, Pentax, you name it -- NONE of them offer (or, at least, advertised) HP's. Even in a single-issue sample, that seems bizarre. (The only mention of an HP camera that I could find is a single-line entry in a product comparison table.)

I'm going to buy a few more magazines, but that made me wonder whether & how HP plans to play in the Digital Camera marketplace . . .

(Not that I'm disappointed in our purchase -- the camera seems fine, given the tiny bit that I've found time to use it so far.)

Re: HP Marketing Strategy -- Digital Cameras

*Message #3 Posted by **Thomas** on 18 June 2003, 11:45 a.m.,*
in response to message #2 by Paul Brogger

I think they only sell cameras as additional product for theis photo-style inkjet-printers (i.e. like canon or epson). So the orders do - so its a "have to" product if you want to sell printers. In Germany sometimes you can buy a bundle of printer and camera. But the cameras are not build or developed by hp. I think its a kodak or so.

Regards Thomas

Re: HP Marketing Strategy -- Digital Cameras

*Message #4 Posted by **Andreas** on 19 June 2003, 8:14 a.m.,*
in response to message #3 by Thomas

The HP912 (which I bought when I still worked at HP) is a Pentax camera but with some HP electronics inside. The same camera was sold by Pentax as the EL-2000. I expect their current models are also produced in a similar arrangement. The first generation of "HP" cameras where made by Minolta as far as I recall - HP wasn't at all involved in either design or manufacturing.

Re: HP Marketing Strategy -- Digital Cameras

*Message #5 Posted by **Dave Shaffer** on 18 June 2003, 2:32 p.m.,*
in response to message #2 by Paul Brogger

I think there might be some snobbery in play. The camera magazine(s) have been around for a long time, and the Nikons, Olympuses, Pentaxes, etc. of the world have been their bread and butter from the beginning. They can't be bothered with these new upstarts!

Check, instead, the newspaper ads of the Circuit City/Best Buy places. They have a lot of HP and Kodak (not previously known for high-end cameras, either!) digital cameras, at just about the best price/pixel. (I have an HP 318 and am quite happy with it - to the extent that a few megapixels suffice. I was taking real film pictures a week ago (with my ancient, but still very good Pentax ME) and pointed out to my digital friends that I was using my 20 Megapixel camera!)

Somehow ($$$$$ usually work!), HP and Kodak have convinced the retailers to feature their digital camera products.

I suspect HP will have to use a similar strategy (incentives to the retail outlets - and perhaps, rebates to the customers) to get new calculators in front of the populace. Especially, to displace (or at least match) the prominence that the TI 8x series gets.

O.T. - resolution

*Message #6 Posted by **Ellis Easley** on 18 June 2003, 3:44 p.m.,*
in response to message #5 by Dave Shaffer

I read that the original North American Television Standards Committee (NTSC), in the 1920's or 1930's, went to the movie industry for advice on what kind of resolution television should have - just as in recent years, the Motion Picture Experts Group (MPEG) has developed standards for digital television. After the electronics experts explained to the film experts the relationship between picture resolution and signal bandwidth, the movie people said television needed 100 MHz for an acceptable picture. Since this was more bandwidth than the entire usable radio spectrum at that time, the electronics experts did their own research on human vision to find a practical bandwidth. They learned a lot about how the eye sees including color perception - information that was used years later for the compatible color TV system - and came up with the 4.5 MHz signal (in a 6 MHz channel) that has served pretty well until today.

Re: HP Marketing Strategy -- Digital Cameras

*Message #7 Posted by **Paul Brogger** on 18 June 2003, 5:19 p.m.,*
in response to message #5 by Dave Shaffer

Right -- I had no trouble finding online prices for the model in question. (In fact, the Circuit City sale price was better than the best online quote!?!?)

For whatever reason, the magazine advertisers just don't quote HP's.

My "market research" consisted of posting a question on this forum a while ago: "What features do I look for in a digital camera for use in eBay sales?" (The answer from several folks: at least 2MP, a macro mode, a USB connection, and an LCD screen for instant review.)

A few folks went on to praise their HP cameras, so the rest was easy -- especially when we saw the sale price on the model in question. (My wife was suspicious of an HP recommendation coming from this forum, but then Oprah praised an HP camera, too, and so then it was O.K!)

When you want a camera...

*Message #8 Posted by **Mike** on 18 June 2003, 3:58 p.m.,*
in response to message #2 by Paul Brogger

you go to a camera manufacturer, don't you. HP is not a camera manufacturer. They make specialized equipment. They are not a consumer electronics manufacturer, for the most part. Even their PDAs aren't mainstream.

Nikon's, Canon's, etc bread and butter is cameras. It makes sense that they would get the majority of attention. You can bet one thing for sure, if HP had a superior camera than these others, it would be covered.

I own a Nikon digital.

Re: When you want a camera...

*Message #9 Posted by **Paul Brogger** on 18 June 2003, 4:58 p.m.,*
in response to message #8 by Mike

The HP 812 (and others, I suspect) has a Pentax lens, and prominently advertises this fact. It looks as if the HP folks outsourced the part(s) requiring specialized expertise in order to make a relatively high quality CONSUMER electronics product.

No, it's not pro-grade, but it appears to be a good, simple-to-use camera.

Re: When you want a camera...

*Message #10 Posted by **Bob** on 18 June 2003, 8:08 p.m.,*
in response to message #8 by Mike

My brother in law bought a "name brand" digital camera with 3or 4 MP. My lower end HP 2.1 digital looks just as good, cost 1/7th the cost, and I don't worry about it being dropped, scratched, etc

Re: When you want a camera...

*Message #11 Posted by **Thomas** on 19 June 2003, 6:23 a.m.,*
in response to message #8 by Mike

I own a Canon Ixus. This is a simple use camera too. This is that what I want, if I use a digital camera. Canon allows you to connect their cameras direct to the printer without PC. And HP follows that idea. Not all photoamateurs own a PC. And they don't have to.

And it's easy to use - that's it.

Thomas

The future of calculators is dead

*Message #12 Posted by **Mike** on 18 June 2003, 2:47 p.m.,*
in response to message #1 by Bob

With the advent of the PDA, the fate of calculator market is sealed.

PDAs will eventually be the preferred consumer electronic device. It will be your music source, radio source, cell phone, camera and calculator.

For someone who has a PDA, there is NO NEED for a calculator.

Calculators will have a life, only as long as PDAs are costly. But PDA prices are dropping rapidly. Soon, everyone will have one. Think not?

Well, I've been to Japan recently. Japan is years ahead of the U.S. in terms of consumer electronics. You know the new rage picture phones? They have had them for years in Japan.

Everyone over the age of 10 has a cell phone. Eventually, the U.S. will catch up. People are finding that phones don't have to be tiny devices. They are currently putting them in PDAs and PDAs are a great platform for calculators.

I currently carry a Siemens SX56 Cell Phone PDA and that is my working calculator as well. And I'm an HP collector. Imagine what non-collectors will prefer.

The only calculators that will exist in the future are desktops and **very cheap handhelds**. Cheap being defined as below, say $20. Think HP can put out a quality (that we expect) calculator for under $20? Think again.

You know, I can actually recall people saying,

"The CD will never catch on" and **"FM will never replace AM"** and I've heard that people actually used to say, **"TV will never replace the radio."** How many vinyl records have you purchased recently?

Now, for some chit-chat. I have said for years that I should have been a calculator designer. There is always something else that I would put in any calculator that has come along. Or, that there is a different way I would have done this or that.

All that is needed for anyone to fullfil that destiny is to have a programmable box, suitable for a calculator. Well guess what? **A PDA is that box.**

With PDAs the best calculators that have ever been conceived can and will be designed. It is a neverending quest for the perfect calculator **and the box doesn't have to change.**

Think about it. A box not much larger than the size of a 15C, that holds GigaBytes of program, RAM and storage, is currently available. It comes in color, plays your music, calls your friends, takes photos and holds any variety of calculator that you like.

We may like the nice HP buttons, the functionality, the reputation, the RPN the, the, the. But these are irrelevant concerns for the future consumers of the world.

The business model for producing consumer electronics is not governed by a few serious collectors. It is governed by consumers.

Edited: 18 June 2003, 3:13 p.m.

Re: The future of calculators is dead

*Message #13 Posted by **Bob** on 18 June 2003, 3:54 p.m.,*
in response to message #12 by Mike

I also use a PDA and cell phone with built-in calculators. It is not a replacement for a good calculator. No one I know uses those calcs for more than 2+2 math, due to the poor user interface. I work in R&D engineering, and everyone still uses a handheld calc (in addition to PDA's) around here. (I do use a stylish belt clip and leather case, like my 41CV)

I don't think that you have to produce a $5 calculator to compete. After all, all cars don't cost the same as a Hyundai or Kia, all watches don't cost the same as a Timex, etc) Even TI sells a range of calculators at varying prices. I also remember when folks were saying that the (mini-van, SUV, etc) would soon be the only car on the road. That didn't come true either. Many people don't like a compromise, do-it-all part-way device. I believe that there is still a market out there. I am not sure how big, but it is there.

If you produced a good calc at a little more than there price, say, +$5-10, and gave people what they WANT, you could even take market share from the $5 crowd. (even with RPN) Throw in some PDA-like features and you might make another gain. Of course all of the die-hard HP fans would buy one (or more). The bottom line is they haven't figured out the proper marketing for this product in the last two decades. That was way before the PDA came to the public's eye.

My point is, if TI and others can make a decent calc for <$10 (as well as $100+), you should be able to use the same shell, display, and processor, and add good keys and RPN for $5-$10 more.

I for one, do not use my PDA for calculating since I hate the stylus, display, and the calculator programs stink. (Besides, THEY can cost $10-$20 as well.) You'd be surprised how often folks ask to borrow my HP48GX in meetings (by PDA-toting colleagues), so I don't think the need has gone away.

That is calculator collector thinking

*Message #14 Posted by **Mike** on 18 June 2003, 4:04 p.m.,*
in response to message #13 by Bob

I too am a practicing engineer. Have been for 28 years. I remember people saying, "electronic calculators won't replace the slide rule. They are too slow and you make mistakes." I even remember my first experience with calculators. I did calculations 2 or 3 times just to prove to myself that it was correct.

You are looking at this from a collector point of view, not a consumer electronics manufacturer point of view. People will use, what they are trained to use.

Like I said, I too am an EE and I rarely, if ever use a calculator at work. And there is NOTHING that you can do on a 48 that can't be programmed (eventually) into a PDA.

I didn't say the calculator would be outmoded today. I said the future.

Paul is right, Mike is wrong, Bob is right

*Message #15 Posted by **Norm** on 18 June 2003, 4:14 p.m.,*
in response to message #12 by Mike

because:

HP selling calculators is what Peter Lynch called "di-worsification". (the mutual fund manager from the 1980's who did very well with Fidelity Magellan). Many companies in their decline become obsessed with "diversifying". Lynch said they should keep doing what they did originally, and what the management calls "diversify" Lynch calls "diworsify" and he said when a company diworsifies then run for the exits (as an investor).

HP IS CLEARLY DIWORSIFYING. They say screw calculators and their owners (and other things that made the company great) and now they will sell HP Cameras, HP Toasters, HP Vacuum Cleaners, etc. Lynch says it is to "diworsify" because they aren't any good out of their core area, and they need to stick with their core area. In other words, NIKON OLYMPUS AND PENTAX WILL KICK HP'S BUTT. And I would never buy an HP camera (or anything else diworsified) just out of spite for their mistreating the engineering calculator line.

= = = = > > > >

Mike says everybody will just get a PDA and talk on their calculator/cellphone/PDA/car-wash/popup toaster/microwave oven that they tote around with them. That's EXACTLY what I don't agree or buy into. The merchants want to throw all the stuff into one box, and it all works like garbage, but its all-the-garbage-in-one-box.

I say no way, give me ONE GOOD THING (ie a calculator) and give me ANOTHER GOOD THING (ie a cellphone) but dont stuff them all together. That whole concept is ridiculous. Who has time to use junk like that. And when it busts (and believe me, it will bust) then you have NOTHING, instead of like if you have a cellphone AND a calculator, then you still have one of them when there's a breakdown.

I CONCLUDE THAT the HP "RED BRICK" is still EXACTLY where the truth about calculators resides. HP-34C, HP-15C, HP-41C, etc. Try to sell me a combination toaster/microwave oven/calculator/cellphone/DVD player and you'll never make the sale (with me) and the companies just look silly to propose such junk. IF CONSUMERS BUY IT (and that's the main strength of the argument) that's only because the consumers have become exceptionally mentally retarded at this juncture. The people who buy crap like that is just Mr. Beevis and Mr. Butthead, and actually they don't buy it they shoplift it so how much money does Carly make on THAT.

While having some tolerance for the derivatives of the Red Brick HP-LED calculators (32S, 32Sii, etc) there is no advantage to overcomplicating the works, and indeed, that is exactly why I would AVOID buying those units. Too much junk . Too tedious to figure out.

I know a 10 year old kid and I want him to get a headstart in math. Although later he would probably do best with a 32Sii, for starters, what's the best ticket? A 31E . Why? Because its straightforward with not too many buttons. I want him to gradually go thru and learn what all the different buttons do (what's "x to the y", whats "log") etc. When he's learned all of them, I'll graduate him to a more complicated calculator (perhaps a 32S) .

Where does the 49G fit into all that? It doesn't. Its got so much garbage thrown into it, that it is truly just garbage. Huck it out the driver's side window while I'm going 85 mph, for all I care.

And as long as Carly and her mafia goon squad keep cranking out manure like cameras and toasters and vacuum cleaners, I'll just not patronize them thank you very much. Thank God for eBay and the internet, as mentioned before, it allows us to run circles around these indecent corporations when they refuse to serve

their customers.

oops, one of Mike's posts is right ...

*Message #16 Posted by **Norm** on 18 June 2003, 5:11 p.m.,*
in response to message #15 by Norm

I am confused now.

Mike says that he would want a real camera, like a Nikon digital, and to heck with the cameras from HP the maker of superior travel luggage and golf clubs.

BUT Mike also said he wants "all in one stuff", like a combination cellphone/camera/calculator/electric shoe polisher.

Now I am all embarassed because I dont know which is the real story or who is right and who is wrong.

But Mike why own a kick-butt Nikon digital camera ?

I mean you could have a combination Kinpo calculator/camera that sports a 4-function calculator with equals button, and a black and white imaging chip that sports 50 x 75 pixels ? What more could you want than that ?

Anyway sorry that I do not understand your position, guess I only understnd mine. Thats human nature.

Re: oops, one of Mike's posts is right ...

in response to message #16 by Norm

I don't think Mike said he wanted a combo device, he just said that's the way the market is going. I think his argument is pretty good. They talk about disposable cell phones - that takes care of the problem of servicing the unit when it fails. And if you happen to be someone who needs a cell phone and a calculator with you all the time - who wants to carry two things?

I just wonder if there isn't a place for a general purpose pocket information device with a high quality mechanical keyboard with high contrast soft legends on the keys - maybe at a higher price point, given the higher manufacturing cost.

what if ... my combo calculator cellphone

*Message #18 Posted by **Norm** on 19 June 2003, 3:09 a.m.,*
in response to message #17 by Ellis Easley

WHAT IF I am talking on my HP cellphone calculator, and its about a business problem, and I need to type the numbers in that the person is giving me over the telephone.

What do I do? Do I hold it to my ear, or do I hold it in my hand ?

What if I need to toast a bagel at the same time (using the built-in toaster oven) while I do the calculations using the numbers that he gives me over the telephone (so that I wont be hungry by the time the call is over). Can I run the toaster oven simultaneous with the cellphone and the calculator ? Does it also have programming steps so that it will autodial the telephone numbers and not burn the bagel ? Does it also have some buttons for sine and cosine, and 1/x or was that

less important than the built-in autodial directory ? Is it on a nested pulldown menu?

Do I also have built-in formulas incase i forgot that

area = pi * r ^ 2

after all, its not reasonable to expect me to REMEMBER things like that.

*Message #19 Posted by **Paul Brogger** on 18 June 2003, 5:36 p.m.,*
in response to message #12 by Mike

Reading InfoWorld (and perhaps elsewhere), much is being made about the fact that GM is standardizing on a multifunction handset rather than on a PDA.

The thinking seems to be that the PDA is the worst of both worlds: the complexity of a workstation and *less* convenient input capability than the average cell phone. The character recognition capabilities still seem problematic (certainly in the WinCE generation installed in my iPaq) and the folding keyboards are Mickey Mouse in the extreme.

The cell phone / camera bundling is, I think, interesting. It combines two devices whose I/O needs are readily accomodated in a small package: numeric keypad and a mic / speaker for the phone, a lens and a viewscreen for the camera. And sending pictures over telephone lines? (That's sort of what the Internet is . . .) I think there's a future in this combo. (Note: the DOD doesn't want contractors walking aboard a submarine with a photo-capable cell phone!)

The Calculator? I think there's still a limited market for a specialty provider offering a customizable system in a quality, purpose-built but connectible package. (It doesn't seem like a large company like HP, driven by shareholders' aspirations, belongs there.) For **The Rest of Us** (er, ***Them***), a calculator application with a phone-oriented keypad (!) and a few soft keys on a multipurpose handset seems about right.

The future of calculators is dead!

*Message #20 Posted by **Nenad (Croatia)** on 19 June 2003, 3:33 a.m.,*
in response to message #12 by Mike

Mike is right! There is no future for HP calculators as we know them from yesterday. They will certainly be replaced by PDAs. The comparison with slide rules is also right. HP calculators will only live in our memories and in glassboxes of a few nerds (us!). Please be honest, do I look weird to other people when I tell them that I collect HP calculators? They almost always say: Why do you need that old junk at all?

One can make a lot of money on eBay today buying and selling that "old junk". This has nothing to do with the usefulness of calculators today at all.

We love our old HP's. Norm loves his HP34C's. I love my HP67. But, we have to admit: the story ends here. Any calculator's functionality is 1/1000 of the funcionality of any PDA today, or a funcionality of a NOKIA 3650, ...

Mike's post (the subject one!) was written on a basis of reality. Other posts have been written on the basis of our feelings for old HPs (on the basis of our heart). Period.

Nothing of this will prevent me to collect old HPs, learning how to repair them, trying to conserve some old forgottten knowledge, talk to my friends (everybody) here and feel thankful to the curator of moHP who have given us such an opportunity to "meet" each other and share the same feelings ...

*Message #21 Posted by **Valentin Albillo** on 19 June 2003, 7:17 a.m.,*
in response to message #12 by Mike

Caveat *reader*: all that follows is My Humble Opinion, I mean *no* disrespect at all to anyone's opinions, much less Mike's, and I don't claim I'm in possession of the one and only thruth, or that I'm necessarily right and Mike's necessarily wrong. That said, let's begin:

Mike posted:

"For someone who has a PDA, there is NO NEED for a calculator."

That's your opinion. And I'm not so sure you believe it 100% yourself. Don't you ever grab a calculator for a quick math ? Or will you make us believe you actually care to use your PDA to find a percentage, add up something, etc ?

Myself, I do use and need a calculator frequently, not for very complicated things but for such things as computing taxes, discounts, costs, and the like. Such computations require the reliability *only a good keyboard interface can provide*, and I find PDAs most uncomfortable and unreliable in that aspect.

"Calculators will have a life, only as long as PDAs are costly. But PDA prices are dropping rapidly. Soon, everyone will have one. Think not?"

Think not. Not everyone does like and use PDAs, even if they were given for free. But everyone must use some sort of calculator for most everyday math chores, even if simple. Most people make do with 4-bangers, some fortunate people use their 32S, 42S or whatever. But if you've got a suitable calculator *at hand*, you *never* reach for a PDA.

"Well, I've been to Japan recently. Japan is years ahead of the U.S. in terms of consumer electronics. You know the new rage picture phones? They have had them for years in Japan."

Yes, and kids play Pokémon over the phone, so what ? Japan's always been a consumer's craze, where people crave and rave for all kind of gadgets we would consider just plain stupid, to say the least. And ? Are you implying that local Japanese fads are the thing to copycat in the US ? Come on !

"You know, I can actually recall people saying, "The CD will never catch on"

A little biased, don't you think ? Don't you also recall people saying "Quadraphonics will never catch on" or "DIVX (the original DVD rental system) will never catch on", or the many other fads that *never did* actually catch on ? And who's saying PDAs will never catch on, anyway ?

"All that is needed for anyone to fullfil that destiny is to have a programmable box, suitable for a calculator. Well guess what? A PDA is that box."

Fine, go on. Let us know of your progress, please.

"Think about it. A box not much larger than the size of a 15C, that holds GigaBytes of program, RAM and storage, is currently available. It comes in color, plays your music, calls your friends, takes photos and holds any variety of calculator that you like. We may like the nice HP buttons, the functionality, the reputation, the RPN the, the, the. But these are irrelevant concerns for the future consumers of the world."

Sure. Seems to me a book case of the "Hog's Principle", which reads as follows:

```
"If something's good, more is better"
```

Sometimes, just the *right thing* is far better. I would *never* exchange/trade you a single, fine HP-15C for a box choke-full of those wonderful gizmos you describe. And what's more, let's see 20 years from now just *how much* is my HP-15C worth, and how much is your choke-full box of today's PDAs' worth. That also applies to many other classic HPs as well. Care to make a bet ?

"The business model for producing consumer electronics is not governed by a few serious collectors. It is governed by consumers."

Sure. That's why we are seeing more and more garbage products all the time, designed to *not last*, produced as cheaply as possible in China, Taiwan, or somewhere else where labour costs are as low as possible whatever the quality, of abysmal physical characteristics, and instantly obsolete.

I rest my case. And my HP-15C will be with me *long after* you've thrown your 23th PDA to the garbage bin.

Best regards.

I have a IIIx & 2 IIIxe's with 5 calcs on them(all are RPN). I **never** reach for the PDA when I need to bang out some numbers. Actually the PDA calcs are more of a interesting diversion than a real tool. The only thing I really use them for is converting HMS->HR or the reverse. I have a GPS unit for my PDA.

Excellent post Valentin; Nenad is absolutely wrong.

*Message #24 Posted by **Norm** on 19 June 2003, 1:09 p.m.,*
in response to message #21 by Valentin Albillo

Excellently stated, Valentin .

These people running their PDA's dont even know how to solve a problem. Recently I was solving a problem involving vectors of a moving item where a little cable is wrapped around several pulleys.

It was unclear what forces and torques were created as the item rotates.

What was my PRIMARY TOOL ??????? A PENCIL AND PAPER !!!!!!!

Once I created a formula, what did I use to evaluate and plot the formula ? MY 34C !!!!!

DID I SOLVE THE PROBLEM, with pencil, paper, and a 34C ? HELL YES!

If I give you the same problem, and you have your PDA (and presumably no pencil and no paper) can you solve the problem?

HELL NO! I'll just tell U right now U could not solve the problem. That PDA is great for trading e-mail and watching streaming downloads of Beevis and Butthead, but when there's work to do, it will be useless.

The PDA thingy is garbage. The traditional calculator (HP was best) built back in the late 1970's is serving generation after generation, that's how great and useful an item it is .

It is not obsolete, it is completely useful to this day.

PDA's are garbage. Thats 2 things I wont own, a PDA and a cellphone. Gee I am so dumb, I dont want a bone marrow tumor above my right ear. What a loser I am, everybody else has a bone marrow tumor above their right ear, and I don't. I feel so left out.

Ever occur to you that these big nasty corporations are run by the nastiest, meanest, most evil Ford/Firestone creeps the world has ever seen, and that your stupid PDA is just bait to give them your money? The less money you give them the better. All they sell is worthless trash, and that trash is worthless for solving simple vector algebraic problems like I solved the other day with my paper and pencil.

- Norm

Re: Garbage???

*Message #25 Posted by **Paul Brogger** on 19 June 2003, 7:03 p.m.,*
in response to message #24 by Norm

There's nothing keeping someone from implementing a good, easy-to-use, scientific/engineering programmable calculator application on a PDA.

Most of the emulators that I've seen share the fault that they try to simulate a calculator keyboard, taking up all-too-valuable PDA screen space with fancy but illegible renderings of (nearly microscopic) virtual keys

As much as I like to hold my 34C (and other models), it's hard to argue with the utility of a collection of easy-to-use applications, integrated in a single configurable device (whether PDA or handset).

I'm afraid that the future lies with capable, general-purpose hardware running user-selected and user-configured applications. But that doesn't mean it has to have such a sterile, unimaginative feel. Eliminating ALL keys in favor of a touch screen is throwing out the baby with the bathwater.

A row of quality soft keys along one or more edges of a PDA or cellphone screen would make it a much more "tactile" device, without sacrificing flexibility. (Maybe something more like the Xpander, with a basic numeric and navigation keyset, a touch-sensitive screen, and some soft keys for customization?)

Palm tops with buttons

*Message #26 Posted by **bill platt** on 20 June 2003, 9:10 a.m.,*
in response to message #25 by Paul Brogger

http://www.palm.com/us/products/handhelds/tungsten-c/

also saw another brand (maybe it was a Windows CE platform) at radio shack, that also had many buttons.

Seems to me that this Tungsten C device, with the numeric keyboard, could be a decent platform for a calculator.

Of course, it's still not as nice as a proper calculator, but it is getting closer. Maybe a little more time and we'll see a proper hybrid (from the hardware point of view).

Then, it is a matter of the software.....

I've often thought that, as soon as possible, all new homes should come equipped with a central computer that can control all appliances and perform certain remote tasks like putting the garbage can on the curb for pick-up. And no keyboard or mouse, please! Just voice commands.

Can you imagine the following dialog?

You: "Open the microwave door, please Hal." Hal: "I'm sorry, Valentin, but I can't do that." You: "What's the problem?" Hal: "This conversation serves no further purpose. Good bye, Valentin."

Sounds familiar? 8^)

I want a microprocessor controlled toilet

*Message #28 Posted by **Norm** on 19 June 2003, 9:36 p.m.,*
in response to message #27 by Ernie Malaga

It would be controlled by Microsoft software, because after all Bill Gates is going to control everything so why not my toilet.

It will have embedded Windows XP and Intel microprocessors (one extra for back-up).

Face it, you nostalgic calculator collectors, the old way of doing it, with a handle and a valve, is obsolete. The future is softkeys and pulldown menu's. Your toilet is no exception.

I want the toilet to have internet access and its own email address so that I can command it by remote control when I am not there.

And I want a firewire port and a bluetooth so that I can control it wireless from my PDA .

It should automatically notify me if there is any technical problems (low water pressure, plug-up, electronics malfunction, or need for a software upgrade OS to be downloaded and installed off the Microsoft home page).

But the important part is the PDA. That is the future. As long as I can control it from the PDA by pressing on the screen with a stylus, then it is acceptable.

You guys who think it should have a handle and a valve (and no electronics) are living in the past. That's not the way to do it, now that we have got PDA's.

in response to message #29 by Ernie Malaga

Yah !! And I want a big 12" pipe to come up out of the ground and go thru a right angle section and everything splats straight out of the front of Bill Gate's 6 foot wide TV screen .

BLAAAT! And hope he is sitting there to receive the delivery of that software.

Is that what we would call a download to a software port ??

Re: Yah !! Software Port ..

*Message #31 Posted by **db(martinez,california)** on 20 June 2003, 12:52 a.m.,*
in response to message #30 by NH

How about a "wastebasket" to store up a months-worth. Imagine Bill's wall when all that brown spam hits it.

But back to the subject: i like the pda/calculator idea. I can imagine a 3 line screen with a level of hotkey labels OR the fourth level of the stack, a numeric keypad, chs and stack manipulation keys but precious little else -- using off the shelf technology. Most everything else could be accessed through menus and the programming done on a pc. I can see it but i can't do it.

HP is not going to improve on what they have already done; they can't even keep up with their past. Right now there are platforms and programmers good enough to outdo the 42, and do it with mass storage. It will happen and i will finally buy one, but i'll keep using my 41 every day too.

Life is short; use sharp tools.

New unused HP-42S

*Message #1 Posted by **Thomas** on 18 June 2003, 6:25 a.m.*

In German eBay sells one an unused, new HP 42S Calculator. The auctoin still ramain over 7 days, but the price is about Euro 240,- . This is really expensive - maybe this one is in pure gold??

Thomas

Re: New unused HP-42S

*Message #2 Posted by **brp** on 18 June 2003, 9:14 a.m.,*
in response to message #1 by Thomas

sounds like the going rate to me!

Re: New unused HP-42S

*Message #3 Posted by **Thomas** on 18 June 2003, 9:44 a.m.,*
in response to message #2 by brp

The advantage for all other "searchers" is: Some see the high price an want to sell their calculator. Just see: Next week you found 5-10 HP 42S in eBay, but the price is much lower.

Regards Thomas

Re: New unused HP-42S

*Message #4 Posted by **David Smith** on 18 June 2003, 5:33 p.m.,*
in response to message #3 by Thomas

By the time the auction closes, the price won't be... The 43S regularly goes for over $200 in used condition. $300+ if new-in-box

Re: New unused HP-42S

*Message #5 Posted by **Thomas** on 19 June 2003, 6:35 a.m.,*
in response to message #4 by David Smith

Now I follow the auctions in German eBay for a lot of weeks. The price for a used calculator in good conditions is about 100-120 Euro.

The highest price I saw was 289 Euro.

If there only one or two auctions at the same time the price is higher 180-200 Euro.

But I saw now there are 3-4 to sell and the price will be lower. May be the new one will be frozen on 240 Euro???

Thomas

hp32sii rom

*Message #1 Posted by **Axel Bodemann** on 18 June 2003, 5:30 a.m.*

Hello,

does anybody has information if there are different 32sii rom versions? If so, is there any way to check it?

Regards Axel

Re: hp32sii rom

*Message #2 Posted by **Christoph Giesselink** on 22 June 2003, 7:30 p.m.,*
in response to message #1 by Axel Bodemann

Hallo Axel,

because nobody replies to this posting I want to tell the minor what I know.

- does anybody has information if there are different 32sii rom versions?

Sorry no information about this.

- If so, is there any way to check it?

Another difficult question. I had a look into the ROM image symbol file I have and found no hint about a label or function that has something to do with version handling/printing. 2nd I had a short look into the disassembled code of the key waiting routine inside the <ON> <Y^X> single step selftest mode. I had found no key dispatcher which would allow calling other functions inside the single step display test.

BTW, the HP32SII ROM image has a size of 16KB and is fully programmed in assembler. That means no RPL code inside.

Regards

Christoph

Re: hp32sii rom

*Message #3 Posted by **Julián Miranda (Spain)** on 23 June 2003, 10:28 a.m.,*
in response to message #1 by Axel Bodemann

It seems there are different ROM versions. If you look at Craig Finseth's HPDATA (http://www.finseth.com/~fin/hpdata.html) at the end of the file about 32SII some known bugs affecting fractions are mentioned and he says HP offered, back then (1991), a trade in to exchange the bugged machines for upgraded ones.

Re: hp32sii rom

*Message #4 Posted by **Christoph Giesselink** on 23 June 2003, 2:11 p.m.,*
in response to message #3 by Julián Miranda (Spain)

That's correct. I just tested "2) The "Fixed Denominator" mode" with a ROM image and with a real HP32SII from 1999. The ROM image shows the bug, my real one not -> different versions.

Nice marketing piece and efficient marketing strategy !Where do I send payment to ?
Renato

Re: hp32sii rom (longer)

*Message #10 Posted by **Christoph Giesselink** on 24 June 2003, 4:53 p.m.,*
in response to message #9 by Renato

If it would be a marketing piece the picture would be a fake and/or the pay button is missing. But why the pay button is missing? I haven't the rights to distribute any ROM images and to answer another question an extraction from a real calc isn't possible. An emulator without ROM images is useless and will only cause requests for ROM images on differents forums (ie. HP28C ROM images for the published Emu28).

It makes no difference if the calculators are in production or not. We should be glad that HP gratefully allowed us to make ROM images from our personal calculators to use them in emulators. Emulators never dammned by HP. So what about the ROM images that are available (list not complete): HP38, HP39, HP40, HP41, HP48, HP49. The following list is my personal opinion, be free to have your own one.

Let us begin with the oldest one

- HP41, paper ROM sources published under the NOMAS license, do this also allow publishing in binary form? I remember years ago it was difficult to find them on the internet.
- HP49, here it isn't very difficult because ROM update file contain most of the operating system and HP published his own emulator with a ROM image in a seperate file.
- HP39/40, officially only beta versions as emulator and HP49 update images had been available. AFAIK the one non beta which is published somewhere is the one I grabbed from my HP40G with an own written Aplet (sorry eLesson).
- HP48, members of ACO told us that HP48 images can be used freely in non commercial use. I never saw any license and I tried to get one from HP, no answer. This is the reason why I don't distribute any ROM images with Emu48.
- HP38, free interpretation of the the HP48 license, but here I know the case that somebody asked HP to put Emu48 and ROM images onto a book CD (the emulator wasn't the main topic on the CD). This was definitely forbidden by HP because of commercial use.

Another final words to the free available emulators Emu28, Emu42beta, Emu48. Some people think they can get all for free without any payback. Payback don't mean money in all cases. I personally also use free software, so my development on HP emulators is a sort of payback for there work. But in the last time I invested many of my free time on emulator development and that's the most important thing, much money to buy the original calculators, first to get a legal copy of the ROM image and 2nd without the original calculator the emulator development is very very difficult, even if you have some documents about the hardware (BTW, TNX to Paul Courbis for his picture of the HP28C memory layout). This is also one of the reasons why I don't publish a fully working non beta version of Emu42. 1st I hate questions for ROM images, 2nd I invested to much time and money to give it away for free.

Christoph

Re: hp32sii rom (longer)

*Message #11 Posted by **Renato** on 24 June 2003, 5:46 p.m.,*
in response to message #10 by Christoph Giesselink

Christoph,
You are talking to a marketing guy. I don´t usually create fake pics. I am also at finance/administration/sales. As I started career as a SW developer, I understand that engineers have prejudice against many non-technical responsibilities. It is ok for me, but I find it distracting, non-productive, and promotes bad communications.

Having said that, I might add that I do not believe you can turn this emulator production into a business. I learned from Luiz (I met this guy from Brazil in this USA forum 8-0) that by trading (without using money) you can have lots of fun, make interesting friends, and have access to things that would not be available to you otherwise. Luiz taught me how to create good-will among strangers and remote friends.

So my suggestion to you is : share. You can pe picky on the people you share with, but at the end I bet you will get much back.

Renato

Re: hp32sii rom (longer)

*Message #12 Posted by **Raymond Del Tondo** on 26 June 2003, 10:12 a.m.,*
in response to message #11 by Renato

Hi Renato,

I think Christoph has shared many things with the HP-48 (and relatives) community. Without his hard work, Emu48 would be still next to useless, as it was before Christoph took over. And he offered competent answers in software (emu) and hardware questions at no cost.

Regarding the additional emulators, I think it's also a matter of copyright. It makes no sense distributing an emulator for a ROM which you definitely don't have access to;-)

Regards,

Raymond

thank you, Christoph

*Message #13 Posted by **bill platt** on 26 June 2003, 11:18 a.m.,*
in response to message #10 by Christoph Giesselink

Christoph,

I just want to weigh in here and say thank you for your work on emulators. When I first discovered the various emulators a few months ago, I was totally astounded.....it was wonderful to see the old computer culture--with the spirit of cooperation and sharing--still living on!

And I USE these emulators frequently--they are great! I run the virtual 41 and the EMU 48 and also "excalibur" on all my machines--so that I NEVER have to be without an HP....

I think you are right to be careful about the patents and copyrights and to be discretionary---you and your fellow contributors to the "cause" of emulators have given

a whole lot, for very little financial gain. And if you find a way to make commercial gain from your expertise with making emulators--then more power to you!

Best regards,

Bill Platt

Me too: thank you, Christoph

*Message #14 Posted by **R Lion (España)** on 26 June 2003, 4:17 p.m.,*
in response to message #13 by bill platt

Emu48 is THE way for manteining a back up of my 48GX (1280kb)and also THE way for testing my own or third party prgs.

Thanks for your work

Raul

Likely cause of the display problems

*Message #1 Posted by **Karl Schneider** on 18 June 2003, 2:55 a.m.*

Doug --

You mentioned that your unit is likely an "older" one with pressed-together connections. I also have two older 34C's, one of which exhibited the same symptoms.

I'd believe that the cause is poor contacts. The cure would be disassembly and cleaning. Others have done it, but I have only taken the backs off. After all, I developed the dental floss trick...

Re: Likely cause of the display problems

*Message #2 Posted by **DougT** on 18 June 2003, 7:15 a.m.,*
in response to message #1 by Karl Schneider

Thanks, Karl. I've kept handy a printout of your posting with the procedure, from back in October. I'm hoping a little *careful* cleaning will take care of the symptoms. I'll pass on the results after I have time this weekend to "play with those darned calculators", as my wife would say. Regards, Doug

Display problem fixed

*Message #3 Posted by **DougT** on 19 June 2003, 11:49 a.m.,*
in response to message #1 by Karl Schneider

Success! It's working now after gingerly cleaning and reseating things, so apparently it was just a loose connection. I just hope it lasts...

HP-IL problem

*Message #1 Posted by **David Ramsey** on 18 June 2003, 1:43 a.m.*

Although it worked as recently as last weekend, I can no longer get my 82161A cassette drive to talk to a 41. When I try to issue a "DIR" command on the 41, the message TRANSMIT ERR appears. The same thing happens when I plug the HP-IL module into another 41.

I don't have another HP-IL peripheral, but I can plug the drive into my HP-71B...except I have no documentation on issuing HP-IL commands from this machine. DIR certainly doesn't work!

Suggestions, anyone?

Re: HP-IL problem

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 18 June 2003, 3:10 a.m.,*
in response to message #1 by David Ramsey

Is the switch on the lower side of the 41 module in the correct position?
Just a guess...

Massimo

Re: HP-IL problem

*Message #3 Posted by **Christoph Klug** on 18 June 2003, 3:18 a.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

The switch is only for enabel/disabel the internal printer feature of the IL-Module.

Remove the IL-Cass-Drive from the loop and close the loop. Now execute DIR . If you get the message NO DRIVE your IL-Module works nice - if you get the massage TRANSMIT ERR the bug is limited to the IL-Module (not to the IL-Cass-Drive, I hope so).

Best wishes from Germany - Christoph Klug

Re: HP-IL problem

*Message #4 Posted by **David Ramsey** on 18 June 2003, 11:48 a.m.,*
in response to message #3 by Christoph Klug

Damn. Plugging the ends of the HP-IL cables coming out of the module together and executing DIR still gives TRANSMIT ERR.

If I try any HP-IL commands with the tape drive connected and turned off, there's a pause before TRANSMIT ERR appears.

And making sure a new, freshly charged battery is in the tape drive (which was also plugged into AC)

didn't help.

Anyone have an HP-IL module they want to sell?

Re: HP-IL problem

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 1:09 p.m.,*
in response to message #4 by David Ramsey

Hi, David;

TRANSMIT ERR message will also appear if the loop is opened. If you have this message when you close the loop by plugging both ends together, chances are you have a "broken cable". If this is my unit, I'd open it and check if all four wires are integral and conducting alright. You can also slightly move and gently twist the cables close to their ends and repeat the DIR command (assign it to a key to easen the job). Maybe you get NO DRIVE message.

This also means you'll have to find where the cable is broken and repair it (or cut part of it off). In any circumstances, this means an easy repair with some time to be spent...

Success. And let us know what you want or will do.

Luiz C. Vieira - Brazil

Re: HP-IL problem

*Message #6 Posted by **David Ramsey** on 18 June 2003, 1:41 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

I thought about that (simple broken conductor).

I can fix things like that-- I've replaced bad LED modules in classic HP calcs, so I should be able to do this.

How does the module open? Is it snap-apart?

Re: HP-IL problem

*Message #7 Posted by **Vassilis Prevelakis** on 18 June 2003, 9:19 p.m.,*
in response to message #6 by David Ramsey

```
David Ramsey wrote:
> How does the module open? Is it snap-apart?
```

Before taking the hp-il module apart, maybe you should check whether the break is in the plugs on the far end of the cable (the ones that plug into the tape drive). These take a lot of beating as you plug and unplug them.

One easy way of checking connectivity is to stick a pin into one of the conductors in the cable and check connectivity between the pin and the corresponding pin on the plug. Check all four wires and if they work, then the problem is most likely on the connection of the cables with the HP-IL module.

Re: HP-IL problem

*Message #8 Posted by **Ellis Easley** on 18 June 2003, 1:46 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

If you do find that one of the wires is open, look for a multimeter with a capacitance range. I used one the other day on the cord for a Classic battery charger. As it turned out, the break was at the plug end, but the total capacitance between adjacent wires in the 8 foot cord was about 200 pf, easily measured on the meter's 2000 pf range. If the break had been someplace other than at the end, I could have measured the capacitance from both ends and used the ratio of the measurements to narrow down the location. (In fact, I measured 200 pf from one end and 4pf from the other.)

Re: HP-IL problem

*Message #9 Posted by **David Ramsey** on 18 June 2003, 1:50 p.m.,*
in response to message #8 by Ellis Easley

[quote] If you do find that one of the wires is open, look for a multimeter with a capacitance range. I used one the other day on the cord for a Classic battery charger. This goes beyond my simple understanding of basic electronic theory. But I'll make a note of it.

Re: HP-IL problem

*Message #10 Posted by **Ellis Easley** on 18 June 2003, 2:02 p.m.,*
in response to message #9 by David Ramsey

Maybe I should say more properly, the ratio of the capacitance measured at one end to the sum of the capacitances measured at each end. The capacitance should be proportional to the length of the continuous pair of wires. For example, if you measured the same capacitance from both ends (and you knew that there was a break in one of the wires) then the break would be near the middle of the length. If you measured three times as much capacitance from one end as from the other, the break would be about a quarter of the way from the end with the smaller capacitance measurement.

Luiz,

So...how do you open the HP-IL module? Snap together? Fasteners under the label?

-- David

An image of an HPIL opened

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 1:12 a.m.,*

in response to message #11 by David Ramsey

Hello, David;

I opened some HP41 ROM and memory modules to try to repair them. In two cases I was successful after re-soldering a couple of terminals. Unfortunately I found at least three ROM modules that did not respond to calculator's commands, and they seemed to be perfectly fine inside.

The best procedure is testing the cables and checking if there's a chance not to open it. Avoid opening the HPIL module.

Look at the picture below. It's an opened HPIL. The original image is from the HP Journal, January 1983, p. 11. Im calling attention to two very sensitive components:

http://www.logeng.com.br/images/HPIL_int_view.jpg

(1) - Hybrid pulse transformer
(2) - HPIL custom chip (for the HP41)

As you can see, both halves are "welded" (ultrasound) together by teir borders. The best way to separate the case is to use a tool that allows you to gently "break" it exactly in the "jointing" surface. This is a time consumming task and there are some actual cases that are easier to open than others (it seems that some modules are better "welded" than others, what is a great disadvantage when opening). I remember seeing some pictures (private page) of one contributor opening a memory module, and he used a small knife. I think you'll have a better idea and you'll probably find your own way to open it; consider doing this only if needed. I did not need to open an HPIL so far, but I'll not hexitate if I need to.

If it does not give you a good idea, let me know. I have a memory module for the HP41 that was opened once. If needed, I'll open it and scan some images showing the process.

PLEASE, READ

Keep in mind that your module may be dammaged or have a broken case if you force it too much or if you use a tool that's sharp enough to destroy the internal components. Please, go slow and take necessary precautions to avoid it.

Success.

No, the two halves are glued together like ordinary memory modules. Have a look at the following article which explains how to take apart memory modules and follow a similar procedure.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=329

Re: HP-IL problem

*Message #14 Posted by **Johnny Billquist** on 18 June 2003, 8:22 a.m.,*
in response to message #1 by David Ramsey

When I get that error, I normally have low power in the casette drive. My battery is getting bad and I should replace it. You might have the same problem. Is the low bat indicator lit on the drive? I have written a little program to test the memory in the drive as well, which might be useful. It requires that you have the Extended I/O module though. I can post that program if required. I wrote it when I had a problem previously with my drive, which turned out to be a broken memory IC in the drive.

Funky Spice Display

*Message #1 Posted by **DougT** on 17 June 2003, 8:51 p.m.*

Hi folks,

The display of my 38E is acting up. At every digit location, the upper left LED segment does not work. Since it's at every digit, I doubt it's simultaneously burned out LEDs. Perhaps something's amiss with the display driver? This is an older unit that may have the "press-fit" chips. I thought I'd see if the resident experts had run into this condition before, prior to cracking it open (with the dental floss trick). I've done plenty of transplant surgery on my Woodstocks, but this will be my first time digging into a Spice model.

Thanks!

Doug

Re: Funky Spice Display

*Message #2 Posted by **David Smith** on 18 June 2003, 5:41 p.m.,*
in response to message #1 by DougT

This is a very common type of problem with the pressed together spice machines. I have found the problem is slightly more likely to be a bad connection on the 40 pin chip than the LED module. Occasionally the problem could be a fault in the LED module itself... only repairable by replacement from a scraped machine.

Before opening up the keyboard sandwich make a note of the positions of each chip. The little 8 pin ones are easy to get swapped. Also be careful of the battery connector flat cable. The etches in the cable are rather fragile and don't like to be handled much.

After opening up the keyboard sandwich clean the keyboard circuits with 91% isopropyl alcohol.

Re: Funky Spice Display

*Message #3 Posted by **DougT** on 18 June 2003, 6:35 p.m.,*
in response to message #2 by David Smith

Thanks, David! Your advice and everyone else's will be very helpful on my first adventure inside a Spice unit.

interchanging 34c commas and dots

*Message #1 Posted by **Tim Willis** on 17 June 2003, 8:44 p.m.*

I have a *foreign* 34c which uses a comma for a decimal point and dots for digit separators. Is there a jumper or something to reverse this behavior?

Re: interchanging 34c commas and dots

*Message #2 Posted by **Axel Bodemann** on 18 June 2003, 5:33 a.m.,*
in response to message #1 by Tim Willis

"There is a hardware jumper that can change the display to non-US notation (switch the dot and comma). Location is not known (outside of HP)."

(HPDATABase, http://www.finseth.com/~fin/hpdata.html)

Regards, Axel.

Re: interchanging 34c commas and dots

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 8:38 a.m.,*
in response to message #2 by Axel Bodemann

Hi;

sometime ago, Katie Wasserman showed that this jumper is located in the power supply board. In fact, it is located there, but it connects two pins in the mainboard, not necessarily power supply components. I can say that I REMEMBER seeing some Spice's power supplies and found only one jumper, but I cannot say I'm one hundred percent positive about my own memories...

I'll test it and post later.

Luiz C. Vieira - Brazil

Re: interchanging 34c commas and dots

*Message #4 Posted by **Thomas** on 18 June 2003, 11:40 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Please don't laugh - I don't know the HP 34C.

On the voyager-models you can change the comma-dots by holding down the dot-key while turning on the calculator.

Regards Thomas

Re: interchanging 34c commas and dots

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 12:54 p.m.,*
in response to message #4 by Thomas

Hello, Thomas;

if someone laugh, he's the one that's wrong.

The HP34C is something like the HP11C with a LED display, vertical case instead of the horizontal one found in all Voyagers, no nPk (permutation) neither nCk (Combination), four flags instead of two, two direct access lables ([A] and [B] keys) instead of the five ones of the HP11C and its autotest is started with the sequence [STO][ENTER] instead of [ON]&[×] (or [ON]&[+]) of the HP11C. It uses rechargeable batteries and is older than the Voyagers (it was introduced in the same month and year of the HP41C).

When applicable to the place it was commercialized, the Spices (HP34C include, of course) were available with a comma as radix mark. For example, in Brazil it's the standard representation. And to change this "condition" the only way is to change a jumper inside the calculator. I wonder if a small externaly accessible miniswitch would be applicable...

Hope this helps a bit. And never hold a question too long, mostly if there are teachers around you...

Best regards.

Luiz C. Vieira - Brazil

Hello Luiz,

thanks - thanks for the pretty picture. I know the design of the calculator. But nothing about the usage.

It was only an idea. HP do anything for easy usage. :-))

Regards Thomas

Confirmed: jumper identified

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 3:39 p.m.,*
in response to message #1 by Tim Willis

Hey, Tim;

I opened an HP38C that has the separator set to "dot" and checked for the jumper. Look at the image below:

http://www.logeng.com.br/images/comma_jumper.jpg

This is the small power supply board (PS board) and it's the same one used in the HP34C. If you open the calculator (excuse me if this is a silly question: do you have the skills to handle this? I'd not like to know you tried and dammaged your calculator) and fasten the PS board, you'll see the jumper shown above is not present, meaning your unit is set to comma separator. After generating this image I cut the jumper, rebuilt the calculator and switched it to ON: comma as radix mark. The relation is:

```
Jumper closed - dot separator
Jumper opened - comma separator
```

In your case, you'll have to use a small wire and connect both terminals as shown in the picture.

I hope you are successful. Let us know.

Luiz C. Vieira - Brazil

Edited: 18 June 2003, 3:53 p.m.

Damn Luiz, you are red hot

*Message #10 Posted by **Norm** on 18 June 2003, 4:24 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

If you waz a pilot, you'd be flying the SR-71 blackbird.

I am very impressed with your detective work and the photograph of the jumper.

You figured it out very fast for everybody.

I will print it out for my records.

Awesome, absolutely awesome. Good job dude.

SHOULDN'T that go to Dave Hicks for posting into a "service-database" ?? I think stuff like that should be recorded in a big long list, for the model(s) that it applies to. Like a master service index.

Thanks!

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 4:49 p.m.,*
in response to message #10 by Norm

Hello Norm, guys;

thank you, Norm. That's the least I can do.

But I must be fair: I'm supported by giant's shoulders. Katie Wasserman posted this information about one year ago. I have the "bad" habit of not forgetting what I take as a rational and coherent information. I think this is why I still remember some of English from my 1982's classes. Oh, yes, for the reords: the image is a scanned image. I'd like having a camera, but NOT an HP camera...

And if I'm a pilot, I'd surely try to fly a Blackbird... Wonderfull machines: SR-71 and the B-52. Oh, my...

*Message #12 Posted by **Dave Shaffer** on 18 June 2003, 5:14 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Luiz,

Neat picture.

I can identify the (rather amazing) mish-mash of components, except for the circular thing on the right, with the 10 wires coming out of (going into?) it. What is that? An inductor? A switch? ???

Re: Confirmed: jumper identified

*Message #13 Posted by **David Smith** on 18 June 2003, 5:44 p.m.,*
in response to message #12 by Dave Shaffer

That is the switching power supply inductor (transformer).

By the way, there are a couple of different styles of Spice power supply. Your's may look a bit different. I have seen one where the jumpers looked like small surface mount resistors.

Re: . . . but what's the OTHER jumper for???

*Message #14 Posted by **Paul Brogger** on 18 June 2003, 5:46 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Despite the risk of causing mischief, I had to ask.

Feel free to answer, "Open up your 34C and find out!"

(To which I'll have to reply, "I started to open it once, and just didn't have the heart to keep prying the case halves apart -- they seem *sure* to break!")

Have no idea, sorry...

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 5:54 p.m.,*
in response to message #14 by Paul Brogger

Hi, Paul;

all Spices I saw so far have this jumper opened. I was not curious enough to follow it and see what is it related to.

Sorry not giving you a better answer.

Best regards.

Luiz C. Vieira - Brazil

Re: Confirmed: jumper identified

*Message #16 Posted by **Tim Willis** on 18 June 2003, 7:45 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Luiz, thank you very much for the information and the photo. I have the skills, as soon as I get the time I will try this out and report back.

Tim

other jumper

*Message #17 Posted by **Ellis Easley** on 18 June 2003, 8:11 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

For what it's worth, that jumper would connect pin 6 of all three 8 pin chips, and pin 14 of the 40 pin chip, to the negative terminal of the battery, which is also connected to pin 7 of all three 8 pin chips and pin 13 of the 40 pin chip.

Factory test point(s), perhaps?

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 8:23 p.m.,*
in response to message #17 by Ellis Easley

Hello, Ellis;

thank you for the information.

Have you also measured voltage across them? What do you think, could these points be connected together or maybe they are test points?

I know that without knowing precise pin function under each possible situation it's just speculation.

But it's also fuin to exercise the brain cells. Our brain cells...

Best regards.

(long) Storage Register Math in 48GX

*Message #1 Posted by **bill platt** on 17 June 2003, 3:07 p.m.*

I couldn't decide whether to post here or in comp.sys.hp48, but since I am including an RPN program, decided to post here.

(I think Raul Lion will find this question easy to answer).

My problem is (and this will show me to be a real RPL neophyte) that I have not found a clean and easy way to do storage register math with RPL. Perhaps it is just that the "STO + x" mentality is just so engrained, but when I try various combinations of local and global variables in RPL, I keep ending up with problems trying to add a value to an old register---because if the register is not defined, then I cannot add to it! I am not clever enough to figure out a flag or loop control to say, "if the register x does not exist, then make it, else recall it, act on it with the stack, and store the result back in x".

The specific RPN programs which I was trying to convert are shown below. Being a mechanical type of engineer (actually ships and boats etc) I often solve weight and moment computations, and a handy way of doing this repetitively (like when checking a spreadsheet, or on a ship in the bilge, adding up lead ingots or something) is to use the following programs:

Programs for summing moments about the w,x,y axes and finding the arms and total masses.

Will find intermediate summations and allow for continuation.

first, enter data int stack this way:

Mass <ent> arm w <ent> arm x <ent> arm y <ent>, leaving the stack as such:

T z (mass)

z w (arm)

y x (arm)

x y (arm)

01 LBL w (Program for taking mass and arm input, and producing running sum of moments)

02 R ^

03 STO s (stores currently entered mass for temp use)

04 STO + z (stores currently entered mass for summation)

05 X (multiplies the "y" {from orig reg. "t"} arm by the mass

06 STO + y (stores the y moment for summation)

07 R down

08 RCL s

09 X (multiplies the "x" {from orig reg. "z"} arm by the mass)

10 STO + x

11 R down

12 RCL s

13 X

14 STO + w

15 RTN

checksum AD51 022.5 bytes

view any mass or moment sum by reviewing the appropriate register

01 LBL T (program to take sums of moments in w,x,y axes and sum of mass, and finds arms.

02 0

03 ENTER

04 ENTER (clearing stack)

05 RCL y ("y" moment sum)

06 RLC z (mass moment sum)

07 / (solve "y" arm)

08 STO v (store "y" arm)

09 RCL x ("x" moment sum)

10 RCL z

11 / (solve "x" arm)

12 STO u

13 RCL w ("w" moment sum)

14 RCL z

15 /

16 STO t (store "w" arm)

check 089E 025.5 bytes

Note that the w,x,y arms are in the (x,y,z) stack registers and may be viewed with Rdown.

Besr regards,

Bill Platt

A small clue...

*Message #2 Posted by **Vieira. Luiz C. (Brazil)** on 17 June 2003, 5:12 p.m.,*
in response to message #1 by bill platt

Hey, Bill;

try something like:

```
IFERR STO+ THEN DUP 0 STO STO+ END
```

I have no manuals in hands, but what you should take much care is to make sure LAST ARGUMENT is set ON or you'll lost the arguments when STO+ (or any storage operation) fails. Also, storage arithmetic allows variable name in level 1 or 2; in my example, the variable name should bve in level 1.

If my example fails, let me know. I read your post now and I know this is one possibility, but I'm in a rush. I have to teach classes in about five minutes... Gosh!

Bye

Luiz C. Vieira - Brazil

Re: (long) Storage Register Math in 48GX

*Message #3 Posted by **R Lion (España)** on 17 June 2003, 6:18 p.m.,*
in response to message #1 by bill platt

Well, as Luiz said, one way is the IFERR...THEN...END, but the easiest way (IMHO) is define the variables we are going to use at the begining of the program. Why don't do it?

I'll try to convert these prgs to RPL, but, please, help me with a good description of what is exactly you want in my email.

Raul

Re: (long) Storage Register Math in 48GX

HP-75C battery repair

*Message #1 Posted by **Alain Jacques** on 17 June 2003, 1:01 p.m.*

Hello HP lovers,

I am trying to restore a HP-75C S/N 2304... with a rather damaged battery compartment. I am a bit puzzled because it contains 3 contacts and, as far as I know, the corresponding battery pack 82001B only have 2 pads. Refering to the battery compartment on the picture http://www.hpmuseum.org/75int2b.jpg, I have the two left contacts (top=black wire, goes to VN on PCB i.e. ground; bottom=red wire, goes to VB on PCB) and an extra contact on the right side of the top ground (blue wire, goes to VA on PCB). A previous owner apparently has tried to cut it and to solder it to the top ground contact. Does anyone else have the same configuration? Is there a battery pack similar to the 82001B with 3 pads. I assume the third contact is designed to recharge the battery ... should I keep the makeshift jumper to the top ground contact? Any suggestion?

Kind regards.

Re: HP-75C battery repair

*Message #2 Posted by **Ellis Easley** on 18 June 2003, 8:52 a.m.,*
in response to message #1 by Alain Jacques

I have a 75D. It has some extra features molded into the plastic in the battery compartment which I just realized are for a third battery contact. It would touch the negative battery pack terminal, if it had the same shape as the other contacts and was maybe a little longer. I have a 1988 Sanyo NiCad databook which includes a picture of an HP Classic battery pack in a chapter about multi-cell assemblies - it looks identical to the packs I have except that the contact openings in the molded plastic are a little shorter - they go about as far toward the middle but not so far toward the end - my packs are all 82001B, maybe the picture is 82001A. Anyway, the databook suggests that in some applications it is a good idea to have a separate contact to apply recharging current to the pack. I think they are talking about applications that can use either rechargable or regular batteries.

Brainf*ck on the HP41

*Message #1 Posted by **Mike (Stgt)** on 17 June 2003, 12:13 p.m.*

I am looking for a Brainf*ck (bf) implementation for the HP41. If I remember well there once was one, alas no find on Google. About bf see here: http://www.muppetlabs.com/~breadbox/bf/

Re: Brainf*ck on the HP41

*Message #2 Posted by **Valentin Albillo** on 17 June 2003, 12:37 p.m.,*
in response to message #1 by Mike (Stgt)

At the URL you posted:

"A Brainfaq" program has an implicit byte pointer, called "the pointer", which is free to move around within an array of 30000 bytes"

This is going to be hard ... 30000 bytes on an HP41 ... perhaps one of those HP41CY machines will do the trick ... or some HEPAX-assisted machine ... maybe an EPROM box ...

Would you mind it being limited to, say, 1000 bytes instead ? Else the HP-71B + 16 Kb extra would be a better choice.

Best regards.

Re: Brainf*ck on the HP41

*Message #3 Posted by **Mike (Stgt)** on 17 June 2003, 4:47 p.m.,*
in response to message #2 by Valentin Albillo

Every implementation of BF has its limits. I do not regard 30000 as a language defined value.

Ciao.....Mike

Re: Brainf*ck on the HP41

*Message #4 Posted by **Valentin Albillo** on 18 June 2003, 7:43 a.m.,*
in response to message #3 by Mike (Stgt)

Mike posted:

"Every implementation of BF has its limits. I do not regard 30000 as a language defined value."

Agreed, but the fact remains that non-trivial BF programs tend to be extremely large (just generating the constant "100" requires a 26-command program), and furthermore extremely slow. For these two reasons and several others, I think that the HP-71B, with its faster processing, large RAM, larger display, and good string-handling functions, would be far more suited to the task, specially using FORTH.

Of course, this has nothing to do with your original request for an specific 41C/CV/CX version, it's just some rambling of mine ...

Best regards.

Re: Brainf*ck on the HP41

*Message #5 Posted by **Mike (Stgt)** on 18 June 2003, 11:39 a.m.,*
in response to message #4 by Valentin Albillo

I do agree with your worries that the HP-41 is **not** the ideal platform for that task. I just wrote an BF interpreter in REXX and see the trace output of a 49 steps BF scrolling now since several minutes. It shows clearly that the HP-41 may only test some BF code snipets.

BTW, the 49 steps BF was (not my prgm!):

```
+++++[>++++++++++<-],[[>--.++>+<<-]>+.->[<.>-]<<,]
```

and 32 character test input, output is 4528 bytes.

Ciao.....Mike

Instructions here on how to use the HP-80

*Message #1 Posted by **gene** on 17 June 2003, 12:09 p.m.*

http://www.rskey.org/gene/hpgene/HP80.html

Someone wrote to me recently and was looking for instructions on how to do time value of money problems on the HP-80 (HP's first business calculator) since it didn't work like most financial calculators since then. The page above has been on my webpage for sometime now, but folks may not be aware of it. Just an FYI.

Collection photo (very large, 1M)

*Message #1 Posted by **David Ramsey** on 17 June 2003, 11:50 a.m.*

A couple of people have been telling me to put a photo of my collection up here, so here it is. I started collecting HPs in 1983 and pretty much finished the theme (scientific RPN) by 1995 or so. Since then I've been collecting HP-41 accessories, branching out occasionally (the Curta), and in general just having fun.

http://www.neko.com/~dramsey/Calcs.jpg

I have seen the heaven...

in response to message #1 by David Ramsey

1) the TI-58 or TI-59 on the PC-100A in the lower left corner. :-)
2) I myself might have avoided some of the more recent HP's (my personal anti-bias) such as the HP-6S I see and the 39G-style calculators. I want to refuse calling these things HPs!

Re: Looks good...including the ...

*Message #4 Posted by **David Ramsey** on 17 June 2003, 12:26 p.m.,*
in response to message #3 by Gene

Yeah, in college, I couldn't afford an HP, so like many of my peers I bought a 59...

You're right about the non-HPs. I have a 30s, and some 6s solar and non-solar. Free for the shipping, folks, if anyone wants them!

Re: Looks good...including the ...

*Message #5 Posted by **Paul Brogger** on 17 June 2003, 1:44 p.m.,*
in response to message #4 by David Ramsey

My son would take the 30s -- not that he needs it, but it's his favorite & the last one got stolen.

The only hope for the 6s is that they'll make so few of them, and those will die so quickly, that some day they'll be (rightly) rare!

By the way, how do you stand 'em up?

Re: Looks good...including the ...

*Message #6 Posted by **David Ramsey** on 17 June 2003, 5:09 p.m.,*
in response to message #5 by Paul Brogger

Send me your son's address and I'll send him the calculator.

The stands are small Plexiglas things I picked up at a shop in Portland, Oregon. I don't recall the name of the shop but I'll be back in Portland in a couple of weeks and will look it up then.

The stands work well for thinner calcs:

http://www.neko.com/~dramsey/42stand.jpg

...but can handle the thicker ones as well, although they'll fall off easily:

http://www.neko.com/~dramsey/39stand.jpg

The stands themselves look like this:

http://www.neko.com/~dramsey/stand.jpg

Re: Looks good...including the ...

*Message #7 Posted by **David Smith** on 17 June 2003, 5:28 p.m.,*
in response to message #3 by Gene

Yes, dump the 6S... they eminate copious negative waves that causes one all sorts of evil problems... and give cats acid hairballs and scurvy mange.

Re: Congratulations! Mostly for...

*Message #10 Posted by **David Ramsey** on 17 June 2003, 7:12 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

HP-95C? Ha! I wish! It's a 91, actually. Here's the list:

```
Top row:

* HP-35, legends above keys
* HP-35 legends on keys
* HP-45
* HP-55
* HP-65
* HP-67
* HP-70
* HP-80
* HP-45 in security cradle

Second row, back to front, left to right:

* HP-20S
* HP-20S in packaging
* 32SII in packaging
* HP-21, 25, 25C, 27, 29C, 19C, 28C, 28S
* HP-27S, 10C, 11C, 15C, 16C, 200LX, HP-01 watch ($50 from a friend 10 years ago!)

Third row, back to front, left to right:

* HP-31E, 32E, 33C, 33E, 34C, 38G, 48S, 48SX, 48G, 48GX, 48G+
* HP-32S, 32S "50th", 32SII, 42S, 39G, 40G, 49G, Expander, OmniGo 120, Type 1 Curta

Fourth row:

* HP-91, 97, 97S
* HP-75C, 75D, 71B (with card reader & HP-IL)

Bottom row:

* 41C "Blanknut" with overlay
* Early 41C with "high top" keys
* 41CV connected to tape drive and printer
* 82240A printer
* Extra 82143 printer
* 41CX with card reader
```

Where's the HP-12C ?

*Message #11 Posted by **Valentin Albillo** on 18 June 2003, 10:51 a.m.,*
in response to message #10 by David Ramsey

Can't believe you haven't got several of those as well, but it's nowhere to be found in your list ! :-)

Best regards.

Re: Where's the HP-12C ?

*Message #12 Posted by **David Ramsey** on 18 June 2003, 1:47 p.m.,*
in response to message #11 by Valentin Albillo

Valentin,

There's no HP-12C because it's not a scientific calculator. There's also no 17, 18, 19BII, etc.

You will have noticed the 70 and 80. These were in a huge box of classic HP calcs I found in an army surplus store in Pocatello, Idaho, about 15 years ago. The box had about 40 calculators in it that looked as if they'd been stored in a pot of boiling chicken fat! However, after disassembly and cleaning, most of them proved functional. I kept the best ones and sold the rest-- $25 for an HP-35 and $35 for an HP-45 (most of the calcs were 35s and 45s).

Sigh. It was more fun, sometimes, finding these old machines in surplus shops and places like Weird Stuff than it is simply scanning eBay.

Re: Where's the HP-12C ?

*Message #13 Posted by **db(martinez,california)** on 18 June 2003, 5:17 p.m.,*
in response to message #12 by David Ramsey

David; So YOU are why i never find anything at Wierd Stuff! Thats ok; I have my own happy hunting grounds.

btw: you could include the 19bii; it has scientific functions along with the bean counter stuff.

David, are you 100% sure ?

*Message #14 Posted by **Valentin Albillo** on 19 June 2003, 5:49 a.m.,*
in response to message #12 by David Ramsey

David posted:

"There's no HP-12C because it's not a scientific calculator. There's also no 17, 18, 19BII, etc."

I would ask you to please have a careful look at the following "exhibits", just in case you might find it appropriate to reconsider your classification of the HP-12C. Please note that said exhibits do *not* apply to the other models you mention (17, 18, 19BII).

Exhibit A

Exhibit B

Exhibit C

I would be very interested to know what you think once you've read (and even tried) them. My points are:

- a sufficiently programmable calculator can always trascend its intended purpose.
- classifying mathematical algorithms as "financial" or "scientific" is only in the eye of the beholder, they have no intrinsic meaning *per se* so seemingly "financial" algorithms can be used for "scientific" computations as well.

  "Exhibit A" is particularly enlightening, because it shows how a large number of supposedly "financial use only" functions are actually used for purely "scientific" purposes, with no financial meaning whatsoever in sight.

Best regards.

Edited: 19 June 2003, 5:51 a.m.

Re: David, are you 100% sure ?

*Message #15 Posted by **Trent Moseley** on 19 June 2003, 4:01 p.m.,*
in response to message #14 by Valentin Albillo

Another tour de force!

tm

Thank you, Valentin

*Message #16 Posted by **A grateful 12C** on 19 June 2003, 4:10 p.m.,*
in response to message #14 by Valentin Albillo

Many thanks for the pointer towards your excellent articles - most interesting and as I can now do trig I can stop the HP-41s that live with me looking down their noses at me and putting on superior airs and graces.

Re: David, are you 100% sure ?

*Message #17 Posted by **David Ramsey** on 19 June 2003, 10:35 p.m.,*
in response to message #14 by Valentin Albillo

You're quite correct: many of the financial calcs can be used for scientific purposes.

But I guess my point is that I'm just not interested in them. Besides, I have no place to put them!

Re: David, are you 100% sure ?

*Message #18 Posted by **Michael F. Coyle** on 20 June 2003, 12:27 a.m.,*
in response to message #14 by Valentin Albillo

Hi Valentin,

No, the 12C is still a financial calculator, not a scientific, your excellent and imaginative articles notwithstanding.

Just because a butter knife can be pressed into service as a screwdriver doesn't make it one. Nor would I recommend that anyone purchase a knife when what they really need is a screwdriver.

IMHO, pressing a 12C into service as a not-very-good scientific seems like an act of desperation. Does anyone really use a 12C like that?

But since The Future of Calculators is Dead (TM) maybe it's a moot point.

- Michael

Re: David, are you 100% sure ?

*Message #19 Posted by **Trent Moseley** on 20 June 2003, 1:10 a.m.,*
in response to message #18 by Michael F. Coyle

Michael,

I think Valentin's point is to show the potential of an underestimated resource. It's nice to see such a clear exposition of his thoughts.

tm

What's that?

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 9:57 p.m.,*
in response to message #10 by David Ramsey

Hey, David;

is it "my eyes" or you have a "lost" HP75, on the floor, almost hidden in the bottom of the photograph?

You did not mention it... a spare unit? Man, you have an awesome "collection"...

Best regards.

Luiz C. Vieira - Brazil

Re: What's that?

*Message #21 Posted by **David Ramsey** on 19 June 2003, 10:36 p.m.,*
in response to message #20 by Vieira, Luiz C. (Brazil)

It's not lost; its an AT&T relabeled HP-75 in a cradle (I don't even think it comes out!)

It's pretty beat up but does seem to work. You want it?

Re: What's that?

*Message #22 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2003, 11:01 p.m.,*
in response to message #21 by David Ramsey

I'm sending you an e-mail right now...

Re: Collection photo (very large, 1M)

*Message #23 Posted by **Don Williams** on 18 June 2003, 3:43 p.m.,*
in response to message #1 by David Ramsey

Nice collection and display. I have also mounted a fair collection (same as your's plus the financials and many of the desktop's). I have been contemplating some insurance for the collection. It seems prudent to try to protect the actual money and time we have invested but it would seem to me there is a greater value in the whole. Have you or any of the other collectors attempted to find the insurable value of a collection like this ? I would be interested in any of the experience's others may have had.

Calculator Appraisal

*Message #24 Posted by **Michael Meyer** on 19 June 2003, 9:20 p.m.,*
in response to message #23 by Don Williams

Actually, I was thinking of looking into how one would become an official calculator appraiser through the American Association of Appraisers.

Then the insurance companies could "schedule" them with official values.

Just a thought. Any interest? I could make the appraisals with some photos, serial numbers, etc.

Michael

Re: Calculator Appraisal

*Message #25 Posted by **Don Williams** on 20 June 2003, 1:16 p.m.,*
in response to message #24 by Michael Meyer

I have always made an effort to keep records to establish the " Provenance " of the collection. That is at least a starting point for value. A quick glance at those records recently made me realize how " out of control " this penchant had become. (and I don't even bother to bid against booklung or therwil or the other "deep pockets" on ebay. At least I learned to practice a little self control. Better late than never) I think it would be possible to come up with an apprasial value for each individual model but I am not sure the sum of those indivdual values would really reflect the assembled value and I am also not certain you could convince an insurance company to add these items to a policy. Of course the " marketplace " would establish the value immediately, but who wants to sell a collection to find its value. I just realized lately that I probably couldn't afford the time or money it would take to replace these things if anything happened to them. My wife wouldn't allow it. It may be that I am the only one concerned. Just thought I would throw out the question.

Re: Collection photo (very large, 1M)

*Message #26 Posted by **David Ramsey** on 19 June 2003, 10:38 p.m.,*
in response to message #23 by Don Williams

Good idea re the insurance. As you know, it would be very difficult to rebuild this collection in case of a fire or other catastrophe.

But insuring it would be hard, I think. Sure the machines are valuable to you and me, but to the rest of the world they're junk, and so few people collect them that assigning values would seem to be impossible...

Re: Collection photo (very large, 1M)

*Message #27 Posted by **David Smith** on 20 June 2003, 5:09 p.m.,*
in response to message #26 by David Ramsey

Just point your insurance man to Ebay completed auctions and he will quickly learn of their market value.

in response to message #1 by unspellable

Buy another one through Ebay or the classified ads here.

Jeff

Re: HP 48SX quit

*Message #3 Posted by **Daniel Webster** on 17 June 2003, 2:00 p.m.,*
in response to message #1 by unspellable

Ask HP? Ba-boom. But seriously,

1. Check the batteries.
2. Try the master reset under the top left foot.
3. Press on the rasied portion of the bezel above the B and C keys while trying to turn it on.
4. If none of the above work, repost here or roll the dice of eBay.

Re: HP 48SX quit

*Message #4 Posted by **unspellable** on 18 June 2003, 7:29 a.m.,*
in response to message #3 by Daniel Webster

Daniel,

Did all that, no luck.

Re: HP 48SX quit

*Message #5 Posted by **Steven Kutoroff** on 20 June 2003, 9:14 a.m.,*
in response to message #1 by unspellable

Have you tried removing the batteries and any inserted cards, waiting a few hours, and then using the master clear power on sequence? This is what works for mine when it goes brain dead from something I have done. Last time was when I was changing memory card batteries and accidentally pulled the card out with power on. The calculator appeared to be dead. The above sequence fixed it.

Re: HP 48SX quit

*Message #6 Posted by **unspellable** on 20 June 2003, 12:25 p.m.,*
in response to message #5 by Steven Kutoroff

Not sure what you mean by the master power on sequence.

I've tried leaving the batteries out for a couple of days. Tried the paper clip end in the hole on the back. Tried a couple of reset key procedures. No luck.

The calculator stopped responding to any key strokes including resets and had a frozen display. I took the batteries out and have not been able to turn it on since.

If you reply, please specifiy key sequence as I do not happen to have the manual with me at present.

HP48SX keyboards

*Message #7 Posted by **Randy Sloyer** on 20 June 2003, 7:50 p.m.,*
in response to message #6 by unspellable

It sounds like a shorted keyboard. A key that stays closed electrically will lock up any 48 series or Pioneer machine.

Does it get used in a dirty environment? If so, it might clean out with a couple of passes in distilled water in an ultrasonic cleaner.

I have a 48 sized machine if needed, but you'll have to send me the unit as the cleaner stays right here.

Edited: 20 June 2003, 7:50 p.m.

Re: HP48SX keyboards

*Message #8 Posted by **unspellable** on 23 June 2003, 9:50 a.m.,*
in response to message #7 by Randy Sloyer

It has been living in an ordinary room environment, not particularly dirty. Keys feel normal. A few months back it got squeezed (while in the soft case) in the hinge of my brief case. Display was funny for a while but straightened out. Looked as if the it had lost connection to a few bars in the zebra strips, but after a week or so it was back to normal. I'm beginning to view it as a candidate for the parts bin. I have some application cards that supposedly will not work with a 48GX so I'll probably have to find another 48SX.

BTW: I have an HP-12C,. no manual, and an HP-11C with a 15C manual, an Casio 7000G w manual, and a TI-83 with manual, if any one is interested in horse trading.

Thank you! to Julian Miranda (and to Dave Hicks)

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 17 June 2003, 8:33 a.m.*

Thsi message is just to make public my gratitude to Julian, a friend from Spain, who was kind enough to send me an HP25 to replace the one I had and lost. I'm more than happy with this addition to my small collection, which combines my fondness for that particular model (my first HP) with a special quality as a symbol of friendship.

And thanks to Dave Hicks; because this, his wonderful MoHPC, helped us to know friends who share this same interest, and who we would never have met otherwise.

(Please disregard any idiomatic mistake)

Thank you Dave Hicks

*Message #2 Posted by **Julián Miranda (Spain)** on 17 June 2003, 1:32 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Well, this is a surprise for me, I didn't think of being thanked in this forum. As Andrés said if this kind of things happen is because of Dave Hicks who decided to spend his time in building this site.

Thanks Dave.

This is the Dave Hicks Ant Farm

*Message #3 Posted by **Norm** on 17 June 2003, 1:53 p.m.,*
in response to message #2 by Julián Miranda (Spain)

Know those "ant farms" where it has 2 glass windows and sand, and you pour sand and sugar and ants in the top, and watch them run around and make tunnels ?

Well, Dave Hicks always wanted an ant farm. But he probably could not have one when he was a kid because of the worry he would tip it over.

So now, what he did, is he made up this "HP Museum" website. The computer is the ant farm.

The monitor screen is the glass window.

And we who visit, and who post, are the ants. We are running around like little ants in the Dave Hicks ant farm.

And it all happens on the server in the corner of his basement .

And the ant-farm keeps getting bigger ... and bigger ...

Re: This is the Dave Hicks Ant Farm

*Message #4 Posted by **Dave Hicks** on 18 June 2003, 12:22 a.m.,*

in response to message #3 by Norm

You're all welcome and thanks to everyone from the ant keeper!

The "sharing" enthusiastics

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 12:34 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Hi, all;

forgive me K*$$$$-type collectors if I mention these facts, but at the very moment we see e-Bay crowded with calculators being sold by US$ hundreds, some of us still practice the joy of sharing and fair trading. When sharing happens at large, no one looses.

This is a unique, remarkable e-place.

Thanks, Dave.

Matrix Trilogy [LONG]

*Message #1 Posted by **Valentin Albillo** on 17 June 2003, 4:44 a.m.*

Hi ya all, specially HP-15C & RPN lovers:

A new week has begun, so there you are, a new, original HP-15C quiz/challenge I've composed and solved for you to sharpen your RPN teeth. As always, though the actual solutions are particularized to the HP-15C, *the techniques featured can be useful for many other HP models* (HP-71B/Math, HP-42S, HP-41/Advantage) so you may want to have a go at it with said models as well; the intended solutions are certainly rewritable for those models (I've done that for the 71B, actually).

The quiz's theme is as follows: comprehensive and well-designed as the HP-15C's matrix capabilities are, there are some very useful functions that regrettably were *not* included in the instruction set. For instance, there's no "SUM" function which will return the sum of all the elements of a given matrix (!)

So, this week's quiz (kind of a trilogy, actually) centers around the *missing* "SUM" matrix function, asking for a general solution and two particular cases, as follows:

1) Given an arbitrary MxN matrix, which contains *arbitrary* values (positive, negative or zero), write a routine (LBL A, ..., RTN) which takes the matrix descriptor in the X-register as input, and returns *the sum of all the elements in the matrix*. For instance:

```
A =  |  3  -21  7  |  must return S = 3-21+7+2-10+8 = -11
     |  2  -10  8  |
```

The routine must be primarily optimized for *speed*, and subject to that, be as short as possible and consume the least resources (registers, labels, subroutine levels, flags, etc). We are only interested in the *sum* of the elements, *not* the matrix itself (which for all we care, might be destroyed in the main program as soon as your routine has returned, to free RAM).

Under these conditions, there is a solution in *20 steps* or less (LBL and RTN included), which takes some *10 seconds* to return the sum of all 60 elements of a 10x6 matrix.

2) Write an *specialized* routine for the particular case in which all the elements of the matrix happen to be arbitrary *sines and/or cosines* [i.e.: values of sin(x) or cos(x)]. For instance: (values obtained in radians, displayed in FIX 4)

```
A = | sin(2)   sin(4)   sin(1)  |  must return S = -0.1033
    | sin(6)   sin(5)   sin(3)  |
```

(of course you don't have to evaluate any sin/cos, they already come evaluated, you only have to add them up quickly).

For this special case, there is a solution in *13 steps* or less (LBL-RTN included) which takes some *5 seconds* to return the sum of all 60 elements of a 10x6 matrix.

3) Write another specialized routine for the case in which all the elements of the matrix happen to be arbitrary values of the *exponential function* [i.e.: values of e^x]. For instance (result displayed in FIX 4):

```
      A = | e^1.2  e^1.4  e^1.1 |  must return S = 23.4835
          | e^1.6  e^1.5  e^1.3 |
```

For this particular case, there is a solution in *9 steps* or less (LBL-RTN included) which takes only *2.5 seconds* to return the sum of all 60 elements of a 10x6 matrix.

That's all. Give it a fair try, it's quite an interesting, genuinely useful problem, and I eagerly await for your own implementations and ideas (remember to test your routines against the 2x3 numerical cases given, and to time their speed for a suitably filled-up 10x6 matrix).

Best regards :-)

My Solution, Part 1

*Message #2 Posted by **Patrick** on 18 June 2003, 3:07 a.m.,*
in response to message #1 by Valentin Albillo

Once again, thanks Valentin for the opportunity to use the little grey cells.

For pedagogical reasons, I provide the answers to your questions in reverse order. I will also post separate messages for each question to allow the interested reader to pick up and continue the solution.

3) First, we consider a simpler case where the matrix consists of a single row. If you look at the instruction set of the HP-15C, you will find that [f][MATRIX][7] computes the matrix *row norm*. In the case of a one row matrix, this is almost what we want (i.e., the sum of values of the elements of the matrix). The difference is that the row norm takes the *absolute values* of the matrix elements first, before summing. However, in the restricted case of Valentin's question 3, this is not a problem: exponentials like e^1.2 are always *positive*. Putting this together, here is the solution to the problem for a one row, non-negative matrix:

```
001 LBL A
002 f MATRIX 7
003 RTN
```

Like, good thing the 15C is programmable, eh?

Well, consider now the more general case of a multi-row, but still positive, matrix. The solution here is not much harder: we simply re-dimension the matrix to have a single row! Of course, the sum of the matrix elements is not changed by the re-dimensioning operation, so here is the complete solution to Question 3:

```
001 LBL A
002 STO I
003 1              // = number of desired rows
004 RCL DIM I      // X,Y = matrix dimensions
005 *              // Total number of elements = number of desired columns
006 f DIM I        // Re-dimension the matrix to have one row
007 RUP            // Roll up the stack
008 f MATRIX 7     // Row norm = our answer
009 RTN
```

Re: My Solution, Part 1

*Message #3 Posted by **Valentin Albillo** on 18 June 2003, 6:17 a.m.,*
in response to message #2 by Patrick

Hi, Patrick & everyone following this thread:

Absolutely correct. My own original solution was as follows, with comments describing how it deals with

```
      A = | e^1.2  e^1.4  e^1.1  |  which must return S = 23.4835
          | e^1.6  e^1.5  e^1.3  |
```

For this special case (*all matrix elements are >= 0*), there is a solution in 9 steps or less (LBL-RTN included) which takes only 2.5 seconds to return the sum of all 60 elements of a 10x6 matrix

```
LBL A          begins routine. Say we've got 2x3 matrix above in the X-register
STO I          for indirect addressing of the matrix
EEX            1 (EEX is slightly faster than 1 itself)
RCL DIM I      recall matrix dimensions to X,Y: X -> 2,  Y-> 3
 *             total number of elements = 2*3 = 6, Y holds 1
DIM I          redimension the matrix to 1x6
RCL I          recall the matrix descriptor to X
MATRIX 7       find the sum of the absolute values of all elements = 23.4835
RTN            returns to the calling program
```

Of course, this works not only for values of e^x, but for any other values as long as they all are >= 0.

Best regards.

My Solution, Part 2

*Message #4 Posted by **Patrick** on 18 June 2003, 3:32 a.m.,*
in response to message #1 by Valentin Albillo

2) Now to answer Valentin's second question, where the matrix elements consist of the sines and cosines of various angles. Well, this type of matrix is no longer non-negative, so the technique we used in Part 1 does not apply directly. However, the essential attribute of sines and cosines is that they are never less than -1. So, if we were to add 1 to every element of the matrix, we *would* have a non-negative matrix again and the earlier technique could be used. Of course, we've changed the sum of the elements of the matrix by doing this, but in an entirely predictable way: we've added to the sum a number exactly equal to the number of elements in the matrix!

Here is a program which is based on this algorithm. It adds one to each element of the matrix, finds the row norm, then subtracts from that value the total number of matrix elements.

```
001 LBL A
002 STO I
003 1
004 RCL DIM I
005 *
006 f DIM I          // redimension matrix to a single row
007 x<>I             // put num elements into I, matrix into X
008 STO RESULT       // prepare for matrix arithmetic
009 +                // add one to matrix
010 f MATRIX 7       // calculate row norm
011 RCL - I          // subtract num of matrix elements from total
012 RTN
```

Re: My Solution, Part 2

*Message #5 Posted by **Valentin Albillo** on 18 June 2003, 6:34 a.m.,*
in response to message #4 by Patrick

Hi, Patrick & everyone following this thread:

Again, absolutely correct. My own original solution was as follows, with comments describing how it deals with

```
      A = | sin(2)   sin(4)   sin(1)  |  which must return S = -0.1033
          | sin(6)   sin(5)   sin(3)  |
```

For this special case, there is a solution in 13 steps or less (LBL-RTN included) which takes only 5

seconds to return the sum of all 60 elements of a 10x6 matrix.

```
LBL A          begins routine. Say we've got 2x3 matrix above in the X-register
STO I          for indirect addressing of the matrix
STO RESULT     we'll operate on the matrix itself
EEX            1 (EEX is slightly faster than 1 itself)
 -             subtracting 1 from all elements makes them all negative or 0
EEX            1 (again, faster)
RCL DIM I      recall matrix dimensions to X,Y: X -> 2,  Y-> 3
 *             total number of elements = 2*3 = 6, Y holds 1
DIM I          redimension the matrix to 1x6
RCL I          recall the matrix descriptor to X, Y holds 6
MATRIX 7       find the sum of the absolute values of all elements = 6.1033
 -             subtracting it from 6 gives the result sum = 6-6.1033 = -0.1033
RTN            returns to the calling program
```

As you may see, your solution is one step shorter (thanks to that nifty X<>I, RCL-I technique, though the byte count is the *same*, because RCL-I requires two bytes) but there is another difference: you *add* 1 to all elements in the matrix, to make them all *positive* or zero, while my solution *subtracts* 1 from all the elements in the matrix, to make them all *negative* or zero! :-) In this particular case of sines and cosines, it doesn't matter at all, of course. Otherwise, your routine would work unchanged if all elements where >= -1 while mine would work unchanged if all elements where <= +1.

Of course, this works not only for values of sin(x), but for any other values as long as they all are <= 1 (for my solution, or >= -1 for yours). By changing it slightly, it will work as well whenever you know that your values are all of them less than some limit or all of them greater than some limit. The (very easy) details are left as an exercise for the reader. :-)

Best regards.

My Solution, Part 3 (start)

Message #6 Posted by ***Patrick*** *on 18 June 2003, 3:42 a.m.,*
in response to message #1 by Valentin Albillo

1) Finally, to the general question that Valentin posed, his question number 1.

No longer do we have either a positive matrix, nor a matrix nicely bounded below so that we can easily make it positive ... or do we?

It is late here and I do not have the time to give the entire solution right now, so I encourage others to fill in the remainder of the solution. Here is a hint. We've seen what the row norm does for a matrix with a single row. What does it do for a matrix with a single *column*?

Good night for now and happy programming...

HP 12C Platinum - a mystery

*Message #1 Posted by **Luc Chanh Truong Vietnam** on 16 June 2003, 10:56 p.m.*

Hello, my friends.

Yesterday, I read some pages in the HP 12 C Platinum owner's hanbook, i found a mystery:

- in page 61, HP wrote : "Calculating NPV for Grouped Cash Flows. A maximum of 30 cash flow amounts (in addition to the initial investment CF0) can be stored in the HP 12C Platinum.15;

- and also in page 61, at footnote paragraph for note 15, HP wrote:"15.If you have stored a program in the calculator, the number of registers available for storing cash flow amounts may be less than 31"

So, HP said that HP 12 C Platinum has "Capability to handle up to 30 cash flows" (20 cashflows in HP 12C), in fact HP 12 C Plat has to share memories (when store 30 cashflow) with memories of programming (if they are idle).

Besides, HP said that 12C Platinum has more than 130 built-in functions (120+ in classical 12C, I think that 10 new build in functions reserved for algebraic entry keystrote.

In short, what's news in HP 12C Platinum:

- algebraic entry; - Keystroke programming performs up to 400 steps (you need ?); - Sofware source was be rewritten (more reliable than classical 12 C ?).

That all.

Any comment else.

HP 12CP ? That's all? no there's more,

*Message #2 Posted by **Norm** on 16 June 2003, 11:29 p.m.,*

****

Hey wait a minute here !!!! You forgot what else they did !! They came up with a color scheme featuring ugly aluminum front panel they call "platinum", virtually unreadable light yellow lettering on the aluminum, and they changed the color of the plastic to a dark blue.

So don't forget that they put a lot of engineering department resources into that color scheme.

Of course, a monkey throwing darts at a color wheel would've done better ..... we can laugh at the HP execs on this one.... it's THEIR BUSINESS CALCULATOR, THEY have to use it ! har har har . Youd think it was for the engineers when they screw up the colors like that.

Re: HP 12CP ? That's all? no there's more,

*Message #3 Posted by **Luc Chanh Truong (Vietnam)** on 16 June 2003, 11:46 p.m.,*
in response to message #2 by Norm

Hi Norm, And we have to pay more 10 USD to get Platinum instead Classical. :-(((

Re: HP 12C Platinum - (another) mystery

in response to message #4 by Luk

Oh dear !!!!, really ?

Re: HP 12C Platinum - (another) mystery

*Message #6 Posted by **Ellis Easley** on 18 June 2003, 1:38 p.m.,*
in response to message #4 by Luk

I've poked around with my financial calculators just to learn how they work, and I find that that some, like the 12C, let you treat the first cash flow as a member of a cash flow group (n[0]>=1) and some, like the 10B, call it an "initial investment" (n[0]=1). I think in either case, the actual first cash flow (either the first cash flow of the first group or the initial investment) is treated differently - it inherently happens at the beginning of the first period.

But this sounds like another exception to the proposition that the 12C Platinum contains most of the 12C ROM and a Nut emulator. It sounds like they picked something out of the 10B manual.

About displays

*Message #1 Posted by **Julián Miranda (Spain)** on 16 June 2003, 5:44 p.m.*

There have been several threads about displays. I want to ask if anyone knows why are the characters in the displays slightly slanted to the right? I can only think of the 71B which has "squared" dot matrix characters. Are easier to manufacture, or is a question of readability, or ...

Re: About displays

*Message #2 Posted by **Ernie Malaga** on 16 June 2003, 5:56 p.m.,*
in response to message #1 by Julián Miranda (Spain)

As far as I know, there's no justification for the slant other than aesthetics. English is written from left to right, so when one writes by hand, letters and numbers tend to slant to the right. I suppose this may have been the reason. I also suppose that if the Arabs had designed the first calculator, digits would tend to slant to the left. 8^)

Be that as it may, more modern calculators using dot-matrix displays have strictly vertical characters (no slant), such as the 28, 48 and 49.

-Ernie

Re: About displays

in response to message #2 by Ernie Malaga

Ernie> English is written from left to right, so when one writes by hand, letters and numbers tend to slant to the right.

Unless you're left-handed. (Not that there's anything wrong with being left-handed %^)

___ with the left hand (a "lefty" speaks)

*Message #4 Posted by **glynn** on 16 June 2003, 10:16 p.m.,*
in response to message #3 by /Slanted/

What REALLY bites is being a left-handed typist. ;-)

I cannot speak really about the slant of characters-- it seems to me just a decision intended to make the characters seem more "natural" and less machine-like to an audience used to the slant of English handwritten characters. In a world-marketing view nowadays, that's probably less "cricket" than it used to be. ;-) {But thank goodness nobody yet has made the decision to display characters with the least significant digits on the left...}

I will tell you about left-handedness...

My second-grade english/writing teacher used to whack my left hand with her ruler whenever I picked up a pencil in my left. As she told my parents, "it's the mark of the devil".

Aw, I got over it, and I'm still a Lefty despite all the row. My handwriting skills, to this day, approximate those of a rabid squirrel on crack; but hey, it suits my personality. :-D

Needless to say, I had much opportunity to display the marks of the devil to my Drafting teacher in eighth grade. The tendency of a lefty is to drag the ham-end of his fist across every line he draws, leading inevitably to a grey pallor cast over the whole vellum.

Combining that with my lettering skills, lack of math savvy, poor grasp of proportionality, and my tendency to overwork every portion of the drawing, I was able, over the course of a semester, to convince him that early retirement was a viable option.

The great equalizers, of course, are automated tools. Typewriters and word-processors now help me write, and calculators and computers help me do maths I'd be helpless to do on my own. Even me, ME! who art teachers assessed had only the talent to clean brushes, issue aprons and sharpen pencils, has MADE A LIVING from time to time using tools like Illustrator, CorelDraw, Photoshop and such.

Yeah, a mouse makes EVERYONE equally lefty/klutzy. MuuuHahahaha.... <revenge at last!>

And, yeah, on my 15c, I *DO* have to move my hand out of the way a lot, to see the screen. I wouldn't trade it away, though; it's my daily tool-- I have come to feel it is like an extension of myself.

I have half a dozen "standard" calculators at my office, none of which I like. I love all my HPs, though, and the 15c is just too "handy" not to keep within arms reach. (Well, I could have probably made use of an 11c just fine-- I never really have used matrices or complex numbers.)

But dangit, when oh when will American cars come equipped with a lefty-compatible drink-holder? Those stupid things that clip onto the window-sill are just a crime...

> The great equalizers, of course, are automated tools. Typewriters and word-processors now help me write

QWERTY keyboards overwork the left hand (when writing in English) because the most commonly used letters in English are all on the left half (E, T, S, C, etc.) The Dvorak keyboard layout purportedly solves this problem -- among others. I wouldn't know, though; I've never used Dvorak, and am not inclined to learn it.

> Quote:
>
> Yeah, a mouse makes EVERYONE equally lefty/klutzy.

Why's that? I'm right-handed and my mouse sits comfortably to the right of my keyboard, where I can use it with the right hand. I'd say that the opposite is true, particularly in those keyboards/trackball combinations; the trackball is always on the right side and, being one piece with the keyboard, you can't rearrange things to left-handed nirvana.

My sister is a lefty, but she can write (more or less) with her right hand as well. She too suffered from uninformed teachers during childhood. What astonishes me is that she can write with both hands at the same time, going in opposite directions: left-to-right with her left hand, and right-to-left with the other one... you know, mirror-image-like. I've tried it a number of times, and never get the hang of it.

-Ernie (dekstrulo)

mousiness

*Message #6 Posted by **glynn** on 17 June 2003, 2:36 a.m.,*
in response to message #5 by Ernie Malaga

Of course a mouse does not care if you are righty or lefty. I use a mouse, and it suits me fine as a lefty.

I am speaking of the spastic decoupling of hand and screen and eye and ball on desk, that unique artifact of using a mouse freehand that makes most everyone look drunk until they learn the more automated features of their drawing programs.

Get ahold of a PDA with the stylus, and draw the outline of your state or country in its paint program. Now go to your desktop PC, and sketch the same using the mouse. You are decoupled, pointer and image, and that alone is a handicap. Lefty or righty, the mouse drawing will be MUCH harder to do well.

Re: About displays

*Message #7 Posted by **hugh** on 17 June 2003, 2:05 p.m.,*
in response to message #2 by Ernie Malaga

good theory! add to that the fact that HP machines display on the left and not right (like japanse).

Re: About displays

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 17 June 2003, 8:24 a.m.,*
in response to message #1 by Julián Miranda (Spain)

Julian:

I think that the slanted digits are a leftover of seven-segment displays, used in the '70s (such as the Monsanto MAN 1, or the diminutive MAN 3, or Litronix models). Some numerals are more readable with a little slant (specifically, the 7 digit), I think it is an aesthetics issue. BTW, I think the slant is specified as 10 degrees in some display spec sheets.

The slant may also came from CRTs used as numerical displays (i.e.: HP 9100); in such case there may be issues about the electron beam sweeping pattern, which may contribute to the slant. But I am not sure.

In my article in the Memories forum (I know you read it some time ago), there was a reference about unusual patterns on seven-segment displays on those years (i.e.: the Casio Mini-6 calculator with green fluorescent display). However, while the patterns were made to make them distinguihable even after a one-segment failure (sort of a Hamming distance analysis to cope with one-bit errors), some confussion was still possible.

RCA Numitron tubes (circa 1974) adopted a non-slanted, seven-segment pattern. They were an alternative to the classic and very nice (but older) Nixie tubes, with ten individual digit-shaped cathodes. Nixies used high voltage (170 V), but Numitrons were low-voltage devices.

Back to LED displays. On the opposite side from seven-segment, dot matrix displays from the '70s (such as the Monsanto MAN 2) were not slanted, either. But the electronics needed to drive them were expensive, using a ROM to encode ASCII patterns; and also multiplexing was mandatory. The seven-segment displays were easy to drive with cheap TTL parts like the 7447 (for common anode displays)or 7448 (for common cathode); and multiplexing was just an option. There was an issue of Popular Electronics magazine (between April and July 1974), in which a MAN 2 hobby project, which linked a full-size keyboard with a SINGLE CHARACTER MAN 2 display deserved the magazine cover!

HP12-Platinum's Sunplus SPLB20D CPU...

*Message #1 Posted by **Bill Wiese** on 16 June 2003, 1:07 p.m.*

Did some more nosing around the web.

The Sunplus SPLB20D CPU in the 12C Platinum appears to be a full-house 6502. Sunplus does also have a 'crippled' reduced-feature semi-6502 with an X index register but no Y index register - this is for at least their lower-end chips (mouse controllers).

I saw nothing about the Sunplus chips having the newer 65C02 features (bit ops, etc.).

Sunplus apparently keeps lots of their documentation (instruction set, etc.) under wraps as 'trade secret'.

Nevertheless, this sounds like HP/Kinpo will be using these 6502 chips in other calcs. If there's ever an external ROM mode we can re-do a calc the 'right' way!

Now if we could just get someone to make double-injection molded keycaps at a reasonable cost :)

Regards, Bill Wiese San Jose, CA

Woodstocks: ACT chip compatibility? (again)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2003, 10:34 a.m.*

Hello, Woodstock maniacs;

please, just clear this doubt out: which Woodstock is PMOS-technology and has the ACT chip not compatible with others? Not a quiz, I simply forgot... that.

Thank you for your answer.

Luiz C. Vieira - Brazil

9g lamers

*Message #1 Posted by **hugh steers** on 16 June 2003, 8:19 a.m.*

aside from other critisms, which i won't repeat. why oh why doesnt the 9g have solve and numerical integration? it's not really that hard is it. and it would be a sales feature.

even if they can't be bothered, how about having a few rom-based programs that can be called up. like on the hp20s. i know this sucks a bit, but it's better than nothing.

Re: 9g lamers

*Message #2 Posted by **J.Manrique López de la Fuente** on 16 June 2003, 8:24 a.m.,*
in response to message #1 by hugh steers

Perhaps because they are leaving that feature for a more advanced scientific calc.

in response to message #1 by hugh steers

The 9g is not an HP. It might *say* HP on the calculator, but it's not. It's not worth any thought about. 9g,9s,30s,6s, they are all not HP. Don't waste any emotional energy on them.

Buy a used real calulator---like a 34C with Red LED's ....

Re: 9g lamers

*Message #4 Posted by **Norm** on 16 June 2003, 1:18 p.m.,*
in response to message #3 by bill platt

Yah, Yah, right on ! "Get a used real calculator like a 34C with Red LED's" . Lets hire a rock & roll band and cut a hit single "My 34C with Red Leds". It'll be a hit song coast to coast.

Hugh, I dont mean to downplay your work, because you've clearly gone carefully through the unit, tried it out, learned it, which is more than I did.

But isn't a thoughtful analysis of a 9G kind of like a "Road & Track Magazine" studiously analyzing the handling qualities and acceleration times of a Geo Metro ??

Re: 9g lamers

*Message #5 Posted by **Bob** on 16 June 2003, 2:13 p.m.,*
in response to message #4 by Norm

As a person with a former interest in cars, it was depressing to always see tests of race ready, high performance, high dollar vehicles that I would never have a reason to own, when all I wanted was reliable transportation.

It's kind of like saying "We tested the latest model XYZ and, compared to all of the others which are just like it, they were great !" So what ?

Testing a Geo Metro might provide a stark comparison of the state of the art and would add value. It might also make you feel better about your Geo and the extra cash in your pocket.

What's wrong with taking a good hard look at any unit with the HP badge on it ? It might be educational and without it, anyone's HP collection is missing a unit.

Besides when they come out with the new super-dee-duper hp41/42/48/49/YGX later this year, those models will be highly valued on E-bay as the "Tweener calcs" from the desperate years.

...ok, I just made that last part up.

Hey Lady, ya got the calcs I need;

Maybe, more than enough.

Oh, darlin', darlin' Carly

Do some R & D

Ooooh, you've got so much

So much... so much.

Many are displays,

and many times I've bitten

Many cheesy ways,

but none can shine as bright

Many many men,

who make their living with 'em

Pocket full of dreams,

but faltering in sight

Many buttons pushed

But some are way too mellow

I live for the days

When keys don't feel like gum

Many chances passed

You fancied algebraic

But I could show you how

To make a tidy sum.

< long Norm Page solo here >

Many L. E. D.'s

With only numbers in 'em

Many batteries

To make those suckers glow

Much intensity

To never leave ya guessing

Guessing 'bout the thing

You really oughta know,

oooh, oooh,

You really oughta know,

Ya really oughta know...

*Message #10 Posted by **hugh steers** on 17 June 2003, 2:02 p.m.,*
in response to message #4 by Norm

you're quite right about this. and also, i dont regard the 9g nor 9s & 30s as HP machines, badge notwithstanding.

the critic i have against these new line machines is simply how bad some of the things have been done. hp originals were masters of detail. looking closer at features exposed geniune engineering.

lets say a new calculator company sprung up (with an old badge). i can see that we're not going to get such attention to detail. but some of the gaps here are real novice mistakes.

anyway.. im still searching for a 34C :-)

Charging NiMH batteries

*Message #1 Posted by **Tracy Vermeyen** on 16 June 2003, 12:46 a.m.*

Last week I sent a message about a N-size battery charger for NiCad batteries. I found some rechargeable N batteries at Radio Shack (as suggested in this forum), but they are NiMH and the don't seem to charge well. Can someone enlighten me on why not?

tv

Re: Charging NiMH batteries

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2003, 7:14 a.m.,*
in response to message #1 by Tracy Vermeyen

Hi, Tracy;

I'm surprised with this fact. After reading many posts here, I believe NiMH tend to charge the same way as NiCad's with similar capacity. What I read also is that they have some advantages, liek no memory effect.

Is it possible that because of the fact you found NiMH with larger capacity you need more time to fully recharge them? This is a fact, not a bad thing :).

Let us know more about it, please.

Luiz C. Vieira - Brazil

Re: Charging NiMH batteries

*Message #3 Posted by **Chan Tran** on 16 June 2003, 11:27 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I wonder how did you charge the battery? I don't think you can charge it inside the 41 as the charging circuit is built in to the battery pack.

Re: Charging NiMH batteries

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2003, 12:19 p.m.,*
in response to message #3 by Chan Tran

Hello, Chan Tran;

I agree with you, there are no specific componets in the HP41 to charge the batteries. Anyway, based on the existing HP41 rechargeable pack circuit, charger output goes straight to batteries contacts. I do not remember if the fullnuts' DC input (the well know golden ball contacts) also go straight to the batteries contacts or if they have some sort of protection, like a series diode or something else. In any case, if the 82120A charging circuit is externally replicated and somehow connected to the calculator's (+) and (-) poles, the only problem I see is the possibility of bad contact between batteries poles and

the calculator's poles.

Just wondering about it.

Luzi C. Vieira - Brazil

Re: Charging NiMH batteries

*Message #5 Posted by **Tracy Vermeyen** on 16 June 2003, 1:36 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I have a N-size battery charger (HP PN 92266a) which I used to recharge the batteries. I left the new batteries in the charger overnite and still after about 10 minutes in the 41C the BAT indicator came on.

Perhaps the charger is defective?

Thanks for the support!

Re: Charging NiMH batteries

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2003, 2:23 p.m.,*
in response to message #5 by Tracy Vermeyen

Hi, tracy;

do you have the means to measure voltage on each battery separately? Each one should measure from 1.25 to 1.3 Vcc right after being fully charged.

I don't know how does the HP PN 92266a charge the batteries, maybe it charges them as a single 5Vcc unit. If it works this way and if one of the batteries is bad, none of the others will be charged accordingly. On the other hand, if it charges them as four 1.25 units (what is better but unlikely), then each good unit will be charged and if there are bad units, they will not.

In any case, all four batteries are used in series when they are in the HP41, and if one of them is bad, BATT annunciator will appear as the set goes close to 4.5 Vcc.

Let us know if you measure the batteries and what you found.

Best regards.

Luiz C. Vieira - Brazil

Re: Charging NiMH batteries

*Message #7 Posted by **David Smith** on 16 June 2003, 5:27 p.m.,*
in response to message #5 by Tracy Vermeyen

Yes, I think your charger is bad (or the contacts need cleaning). I think the original "N" nicads were 100 maH. Your NiMH cells should be 2-3 times this capacity and a full charge would thus be 2-3 times as long... probably 24 hours should do it (assuming your charger is a standard trickle charger that charges the nicad cells in 10 hours).

Re: Charging NiMH batteries

*Message #8 Posted by **Dave Shaffer** on 16 June 2003, 11:09 p.m.,*
in response to message #5 by Tracy Vermeyen

Tracy,

Do you have an ammeter? If so, try to measure the current while the batteries are charging. (You will have to insert the ammeter in series with the batteries somehow.)

Just as a guess (depends on the intended charging rate), you should probably have somewhere between 10 and 100 milliamps of current running through the system. (Somebody else may have a better value for the charging current - but if the charger is bad, or one of the batteries is bad, the current is probably much less than this.)

As Luiz indicated, the batteries may be in series or parallel. If the charger operates in parallel, you need to check the current in each branch.

Re: Charging NiMH batteries

*Message #9 Posted by **Tracy Vermeyen** on 17 June 2003, 1:05 p.m.,*
in response to message #8 by Dave Shaffer

Using the suggestions to my last post, I found that one of the Radio Shack rechargeable batteries is BAD (surprised?) which Luiz suggested might be the problem. I do not have an ammeter handy.

Another question, the MiMH batteries are listed as 1.2V, but when charged and tested they read 1.5V -- is charging the 1.2V battery to 1.5V safe for the batteries or more importantly the 41CV?

Re: Charging NiMH batteries

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 17 June 2003, 2:50 p.m.,*
in response to message #9 by Tracy Vermeyen

Hi, Tracy;

It's actualy good news. In fact, using an ammeter is the best way to measure, because sometimes measuring voltage in a battery without loading in (connect it to a circuit) may give you unexpected good results. If you can measure current across it in a circuit or its voltage in same circumstances, results are the ones you actualy need.

About 1.2V and 1.5V. Regular disposabble alkaline batteries have a 1.5V working voltage, what means that when NiMH are being charged and reach 1.5V they will be "seen" as regular batteries by the calculator, what means no trouble. And rechargeable batteries must be connected to a voltage source that's higher than their own so they become the "load" seen by the charger circuit. As their chemicals recombine to receive "energy", their voltage raises and their internal resistance alters as well. As they reach full charge, voltage measured at the very moment they are disconnected is higher than their nominal. If you let them "rest" for a while and measure again, a small voltage drop will be observed.

If you need more specific data, I believe it's not hard to find papers from battery suppliers.

Best regards.

Luiz C. Vieira - Brazil

Re: Charging NiMH batteries

*Message #11 Posted by **David Smith** on 17 June 2003, 5:34 p.m.,*
in response to message #9 by Tracy Vermeyen

When a Nicad or NiMH battery is freshly charged the voltage is around 1.35-1.45 V per cell. As it discharges, it quickly falls to around 1.2V per cell where it stays until it is about to die. Then the voltage falls rapidly to 1.0V per cell.

"Constructing" a Pioneer's battery cover

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2003, 10:14 p.m.*

Hi, guys;

Brief reference: I used to build plastic models and I also used to dare changing and building extra pieces.

About a couple of months ago I lost my HP17BII battery cover and I was trying to find a way to rebuild another. After a few "eye research" I found the folding protection that exists in VHS cassettes as a suitable "raw" material source. I cut it, molded, glued small pieces and I got this:

http://www.logeng.com.br/images/pion_door_1.jpg http://www.logeng.com.br/images/pion_door_3.jpg

These images show the final piece with an original "door" I used as model. It's not identcal, but works fine.

http://www.logeng.com.br/images/pion_door_4.jpg http://www.logeng.com.br/images/pion_door_5.jpg

The battery "door" in place. In the last image we can see a... "touching" message for free!

O.K., there is no way to send an infrared command unless I oppen a hole on it. If I have any of the pioneers without the IR,'I'd use it without any problem. But I have an HP17BII and an HP42S. When I need to send data, I remove the cover...

Hope this is , at least, inspiring.

Best regards.

Luiz C. Vieira - Brazil

Re: "Constructing" a Pioneer's battery cover

*Message #2 Posted by **bill platt** on 16 June 2003, 1:04 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz,

That is VERY good work! Now I realize that I better be patient with my 41---I am getting true professional advice from a master of plastic fantastic:-)

But why did you blank out the serial number and place of manufacture---to protect the innocent?

Best Regards,

-Bill

Re: "Constructing" a Pioneer's battery cover

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2003, 6:52 a.m.,*
in response to message #2 by bill platt

Hi, Bill;

> Quote:
>
> But why did you blank out the serial number and place of manufacture---to protect the innocent?

I think I'm afraid of that *Urban Legend* crap... I don't want to see two attorneys knocking at the door and claiming to have the calculator's original (fake) proof of purchase.

Back to the world of living: this subject has already been discussed here. My "original" HP42S no longer works and I was able to build a frankencalc with donated parts from three calculators ant my own stuck 42S, thanks to Renato. Now I have it but I do not remember which back case I used. I thought it would be prudent not to reveal patient's identity, if you understand me...

Thank you for the "master of plastic", but I must confess one thing: I seldom use measuring instruments because I never had precise "length" meters. I use my eyes and similarity. This Pioneer's battery "door" was practically sculptured this way, by "facing" it's original counterpart and testing if it fitted in place. That's why it has some irregularities, it's hand craft. I like building missing parts mostly to exercise my hands and eyes.

Have you seen the other posts about the HP41 screw posts?

Best regards and gook luck with your repairment.

HHC2003 HP Calculator Conference 9/20-21/2003

*Message #1 Posted by **Jake Schwartz** on 15 June 2003, 10:13 p.m.*

Hi,

In case the announcement hasn't made it to the HP forum yet, here is the first one. The HHC2003 HP Calculator Conference will be held over the weekend of September 20-21, 2003 at the Radisson Hotel in Newport Beach, California. We are expecting SIGNIFICANT participation by Hewlett-Packard at this conference.

A website has been created to formally provide information and registration, located at http://holyjoe.net/hhc2003/ . Please consider attending this one, as it looks to be extremely interesting with respect to HP's future plans in the calculator market. These conferences have been going since 1979 when the HP41 was announced, and they've provided an enjoyable and educational time for everyone.

Hope to see you in September,

Jake Schwartz

in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Good work with the photos. I do prefer the older display, though that preference would not keep me from buying a machine with the new one if I had to.

(One thing though: I don't remenber if anyone brought this up in the past, but the fact that the new display doesn't have a "GRAD" annunciator makes it less likely that the 15C (or 11C) are going to be revived. Which is too bad. True, they could make another display for a new 15C, but they lose some economy of scale that way. If they were planning to make several new Voyagers, it would make more sense to design one new display for all of them.)

- Michael

There's a post...

RUBBER KEYPAD under SPICE calculators

*Message #1 Posted by **Norm** on 15 June 2003, 5:56 p.m.*

Hi guys,

there is supposed to be a rubber pad between the keys, and the dome switches, in a spice calculator.

But I learned something, its not that many units have got it. Its definitely better (quieter, less rattling, probably dome switches will last longer). I guess they thought of it only near the end of production?

Somebody said U can make your own out of old bicycle tubes.

What if a person wanted a more "correct" and consistent material than that. Did anybody find it?

Occasionally I buy from "Boker's" and they stamp large quantities of washers, in any and all materials. And I am before too long going to order some flat-stamped round rubber washers from them.

I could find out a suitable material, if anybody's interested. ONE MORE TIME..... if anybody could supply me with a rubber pad I would pay $$ for it. I want one sitting in front of me while I try to line up replacement material. The only rubber pad material I own is INSIDE OF my only working 34C, and NO I am not taking it apart just to look at it again. Hope to hear from somebody, and beyond that, I am going to find a good source of the material by the square foot.

Re: RUBBER KEYPAD under SPICE calculators

*Message #2 Posted by **Randy Sloyer** on 15 June 2003, 7:03 p.m.,*
in response to message #1 by Norm

Can't help with the original, but here's a source for just about anything by the foot:

http://www.mcmaster.com/

Go to Raw Materials then select rubber. Their thickness ranges are a bit limited, but you can usually find something that will work. This is where I found 41 and Voyager feet material.

Re: RUBBER KEYPAD under SPICE calculators

*Message #3 Posted by **David Smith** on 16 June 2003, 5:32 p.m.,*
in response to message #1 by Norm

Get thee to a Home Depot garden center. They sell lining material for garden ponds. First type is 1/16" think EPDM roofing membrane. Makes nice rubber footsies for your your machines. The other is a thinner polyethylene or vinyl material. Looks like the right thickness for keyboard membranes. Only think is the material is sold by the liner foot (it is about 12 feet wide).

Pond liners and such

*Message #4 Posted by **Randy Sloyer** on 16 June 2003, 8:38 p.m.,*
in response to message #3 by David Smith

So a minimum purchase at H-D would make 8,228 HP41 feet?

Even at a 50% yield, (I can't cut straight) I'll still have enough to do a 1,000 complete 41 footies transplants. Yeah, that 'ought to hold me for a while.

Dang, I never have learned how to think in production quantities, no wonder I don't have any money left at the end of the week.

hello David, Randy, LUIZ

*Message #5 Posted by **Norm** on 16 June 2003, 11:10 p.m.,*
in response to message #4 by Randy Sloyer

Hello David, Randy, Luiz

if one of you has already bought the pond liner, and been cutting it to pieces, I got a good idea.

Send me 1 square foot of the material. You can even cut it smaller so it fits into an envelope.

I will pay my way. Let me know. But then I dont have to buy so much I can see it from outer space, and I dont even know if I like the material yet.

I STILL need an authentic pad, so I have something to compare to.

HEY LUIZ I know U got one of the genuine rubber pad pieces, can U send me a real one? I'll pay.

- Norm

analogee@gte.net

Hey, Norm!

Re: RUBBER KEYPAD under SPICE calculators and rebuild notes

*Message #9 Posted by **Ellis Easley** on 18 June 2003, 7:38 p.m.,*
in response to message #1 by Norm

I opened up my 34C's last weekend to lubricate the switches and generally clean up the one that I never opened before. I used the dental floss for the first time and it works great! I used a double loop (a single loop broke the first time I tried it) and tied the loop to a screwdriver handle with a triple half-hitch (I remembered a "dumb criminal" story about a couple of convicts who made a rope out of dental floss and cut their hands up escaping from an upper-story prison window.)

My original unit is the soldered type. I had opened it before with a modified crack-of-doom and twisting operation which resulted in breaking the narrow lip along the front edge, which I had glued back as well as I could. The dental floss re-cracked the end of my glue joint but otherwise didn't affect the front edge. I hadn't remembered some details, such as that the main assembly is a regular fiberglass PCB (its S/N is 2051S)- with so much discussion about the flexible PCB in the solderless design, I though the only difference was some solder! Then I opened the other unit and saw the solderless design up close for the first time (its S/N is 1934A).

My newer, soldered unit has metal disks under clear sticky tape for the keyboard click, like the Voyagers. It also has the thick rubber sheet between the keys and the tape over the disks. The older, solderless unit has a sheet of plastic over the keyboard with printed traces and the clicky domes molded into it - actually it looks

vacuum formed. There is a third layer of plastic between the sheet with domes and the main flexible PCB, with holes under the domes where the column lines make contact with the row lines. There are also five holes where the column lines on the outer layer are "spot soldered" to the main flexible PCB. Now I see how much greater is the travel of the older keyboard. When switching back and forth between them, the the older, long travel keyboard seems tiring, but after using just it for a while, it seems normal.

The sheet of rubber in the newer, soldered unit isn't just flat on my unit. It has disc-shaped regions molded in over each keyboard disk.

My older unit had corrosion on the power switch but was otherwise pretty clean. I removed the corrosion and cleaned the rest of the flexible PCB pads - and the IC and display and P.S. assemply pins - with a "Pink Pearl" pencil eraser. It worked when I lubed the switches and put it back together except some segments of the LED are open. I found that my multimeter diode test range is good for testing the LED display - it puts out just enough current to light up the segments, and the voltage readout should show up segments that are marginal - in fact I thought the minus sign segment was somehow different because it registered a higher voltage when I first lit it up (all other segments had registered about 1.5V), then I found the other terminal that connects directly to the minus sign cathode and determined that the display assembly has a regular diode connected between the two outer terminals - what's that for? It's between the power supply positive (after the power switch) and negative inputs - like a shunt reverse polarity protection diode, except without a fuse - but why is it part of the display?

I traced out a schematic of the solderless unit including the power supply and compared the two units. I noticed two differences in the power supplies: The newer unit has a 10K resistor instead of a diode to provide the standby power from the battery - I imagine that keeps the memory alive with a lower battery voltage - also, the capacitor that holds some charge for the standby power when the battery is out is 22 mf in the older unit and 33 mf in the newer one.

My newer, soldered unit doesn't "flash" (at least not as much) and the older one does, but I don't believe it has anything to do with deterioration of the IC's - they have different IC's. The units have two IC's in common - the two 8 pin packages that are not connected to standby power: 1MA1-14 and 1MA1-15 (-0015 on the older unit but I imagine it is the same as -15). On the older, flashing unit the other 8 pin is 1LB5-002; on the newer unit it is 1LB9-02. The 40 pin IC on the older unit is 1820-2162-A, on the newer unit is is 1820-2162 (no A). The 40 pin IC's are made by AMI and the datecodes are 7906 and 8047 respectively. Who knows if the A means they are different?

Regarding flashing, the difference between my units is this: when executing a function like Sine, the older unit flashes random commas and the minus sign; the newer unit is completely dark until the result is displayed. Both units flash random numbers, commas, periods and the minus sign when a user program is running.

BTW, both units return the same number for the Calculator Forensics test as the 41CX and the 15C - does this mean that the Spice models contain some kind of Nut CPU and firmware?

I also made some current measurements. The battery charging current is 150 mA. This would be the .3C "quick charge" 5 hour rate. With the battery almost discharged (just before the low battery indication starts) the unit draws 150 mA with the display set to FIX 9 just after power on (all zeros) and 190 mA after STO ENTER (all segments lit). With a freshly charged battery, the unit draws 125 mA with all zeros and 160 mA after STO ENTER. Also with a freshly charged battery, it draws 65 mA displaying "1." and from 60 to 75 mA executing the Integration function - the higher current occurs during evaluation of the function in the user program, when random numbers are displayed.

One final thing about my older, solderless unit: it has a mistake in the printing on the keyboard bezel - above the "A" key, both "FIX" and "DEG" are printed in gold! Also, the blue arrows in "->D->R" and "->H.MS->H" have a bit of gold at the very end of the tails.

Can you share the schematics? Ahn? >>8^)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2003, 8:30 p.m.,*
in response to message #9 by Ellis Easley

Hi, Ellis;

I was wondering about to find some time to track Spice's power supply to draw their schematics... If I promse to do it with the E-series (non-continuous memory) and post it here, would you share what you have? Ahn?

Would you be as kind as for sending me the schematics? Please?

Thanks alot!

Luiz C. vieira - Brazil

in response to message #10 by Vieira, Luiz C. (Brazil)

Sure, I'll email it to you after I clean it up.

thats a lot of interesting detail, and hey Luiz,

*Message #12 Posted by **Norm** on 19 June 2003, 9:49 p.m.,*
in response to message #9 by Ellis Easley

thats a lot of interesting detail. U say that your solderless one flashes, and the soldered one doesn't.

I have one solderless that flashes when you enter Sin(45) and another solderless that does NOT flash when you enter sin(45) . I absolutely do NOT care for the extra flashing and consider it a serious problem, although maybe it was just something from the first 3 months of production, I just can't stand it and start looking for the next unit rather than put up with all that ....

Luiz and I determined that the "flashy" ones will blink at each push of "2" if you enter 2.22222222 but not for any other digit.

Try the 2.222222 and let us know if it flashes ?

HEY LUIZ: Maybe the firmware is in one of the 3 little 8-pin chips. Maybe they really did make some firmware that blinked too much. They must've got rid of it fairly early on. What do you think, maybe the problem is from software that was stored as firmware in one of the 3 little chips ?

I think you have a point, Norm.

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 20 June 2003, 2:26 a.m.,*
in response to message #12 by Norm

Hey, Norm;

I think you have a point here. And the best way to determine what is going on for good is to find two Spices of the same type (solderless is better) provided that one of them blinks the "2" and the other doesn't. Then it's time to exchange components and check at which moment the blinking exchanges,

too.

Because of a destiny contingency, it happens that I'm gonna be with some Spices of the same type this very weekend. Maybe we're all lucky enough they fit our needs and I can resume the experiment successfuly.

I'll let you know. Please, warn Captain Zener about any emergency call... I'll be scanning the power supply of the E-series spices (non-continuous memory) and I'll check for both: tantalum capacitors and comma/digit separator selection. Their power supply is different, as you reason about it.

Best regards Norm, folks. Thank you for your advice; I appreciate it.

Luiz c. Vieira - Brazil

The great Luiz Vieira 34C firmware test ....

*Message #14 Posted by **Norm** on 20 June 2003, 3:49 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hey Luiz, If you get 2 such units, and you swap their firmware chips, I want to make a suggestion ....

The main litmus test for the 'blinking' problem is two things:

(a) the 2.22222222 test, everytime you type "2" it blinks, the other digits do not (like 1.11111 or 9.99999 is normal).

(b) Sine or Cosine will blink while its computing the answer.

YES, if you can clearly demonstrate its all in the firmware chip, that would be fascinating to me. BTW, I wonder which chip is the firmware chip anyway??? There are 3 little chips, and then there is the big chip.

The big chip must be a microprocessor with a special display driver.

The little chips must be memory chips, that hold the program, the register, the stack, and the firmware.

I bet you they used cheaper smaller IC's on the cheaper models. For example only, a 512 byte memory was cheaper than a 1024 byte memory. People played around with that a lot, back then. The 512 byte chip was 50 cents cheaper than the 1024 byte chip, so they'd get all excited and build 2 models (instead of use the 1024 byte chip in all models). Kinda dumb really, would be better just to make them all use the big chip for consistency.

SO ANYWAY Maybe all chips are just fine, its just that one of them has substandard firmware..... HMMMMMM ..... then maybe I could find a chip that has the good programming in it... not real likely.

I wonder how the heck they found 8-pin memory chips that would surely be downloading on a serial bit stream.

Obviously then they programmed the microprocessor to accept that sort of data.

Fascinating..... absolutely fascinating. Beats the pants off some laptop or PDA with a 30 Gig hard-drive, I can get more done with the 34C.

Re: The great Luiz Vieira 34C firmware test ....

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 20 June 2003, 9:20 a.m.,*
in response to message #14 by Norm

Hey, Norm;

thank you for your enthusiastic e-mails; both for the HP34C and for the experiments. And, hey: there are people in here that put me in their pockets... I know, I learned a lot with them. I'm just too nosy and curious!

One thing to add: if you examine the PCB's layout, you'll see all three 8-pin DIP chips are in parallel EXCEPT for the topmost (the one closest to the LED display): its #8 pin is separately connected to the power supply. After posting some notes about it some months ago, I remember reading that this is the RAM place, where it is constantly fed (continuous memory). The other positions are ROM places, no order.

If you reason a bit about it, there is no specific place for the 8-pin DIP chips if you have an E-sereis Spice, and if you switch places in a C-type, you'll loose memory contents when you switch the calculator to OFF.

I think this should be also posted.

Best regards.

Calculator Algorithms

*Message #16 Posted by **Michael F. Coyle** on 20 June 2003, 1:03 a.m.,*
in response to message #9 by Ellis Easley

Hi Ellis,

> Quote:
>
> BTW, both units [HP-34C's] return the same number for the Calculator Forensics test as the 41CX and the 15C - does this mean that the Spice models contain some kind of Nut CPU and firmware?

Not necessarily. This just means that the exact same algorithms were used; the underlying hardware can be different. The same Forensics result goes all the way back to the HP-27. So calculators from three different series -- Woodstock, Spice and Voyager, plus the 41 -- all give the same results. But this does not mean that the instruction sets are the same, although they are undoubtedly similar.

The superb HP-15C (adding to archived post)

*Message #1 Posted by **Karl Schneider** on 15 June 2003, 3:01 a.m.*

Valentin Albillo wrote nice short essay in the Forum (3 June, 2003) extolling the HP-15C. I've been meaning to expand on parts of it as a reply, but it's already gone to the archives. Here's a link to his posting:

Voyagers rule ! [LONG]

I bought my 15C in late 1983, and it met my needs through three university-degree programs. Only in the last 15 months did I fill out my HP collection with 12 other models. The 15C is still probably the one I'd take to an exam, if I were allowed to bring only one calculator. It's that capable and useable.

> Quote:
>
> Now, if the HP-11C is amazing, the HP-15C is simply unbelievable, the best pure calculator in the world, hands down. It has everything the HP-11C has, and much, much more.

An excellent HP Journal article about the development of the HP-15C, written by Dr. William Kahan in 1983, is available on the MoHPC CD-ROM/DVD-ROM set, and Dr. Kahan's website. If "pure calculator" implies non-alphanumeric, I'd also agree with the "best in the world" assessment. Otherwise, I'd give the nod to the 42S, while conceding that the 15C has some advantages -- e.g., more-legible display, quick keyboard access to all functions.

> Quote:
>
> Further, everything was so well *(thought through)* in its design .. You felt there were no arbitrary limitations at all .. All features were integrated and complemented each other perfectly, most served for several apparently unrelated purposes.

Exactly! The 15C is a masterpiece of thorough, meticulous engineering, not only in the construction, but the up-front design of algorithms and functions. The engineers packed an impressive amount of functionality onto a keyboard and display that lacked the expandability of named functions and menus, and yet made it all intuitively logical. The detailed, error-free manual is thicker and heavier than the calculator, but I believe that most users, after initially learning how to program and to use the advanced functions, need not consult the manual (or the supplementary Advanced Functions Handbook) in order to perform tasks using the 15C.

I also agree about the lack of "arbitrary limitations" -- something I see in the direct-successor 32S/Sii and the 20S. The 32Sii has less user RAM, and lacks the matrix functions and complete, integrated complex-domain functionality that were specifically provided in the 15C as a design objective. The 20S provides certain functionality of the 15C as "loadable" programs that require usage-instructions and wipe out the contents of user RAM. Both products seem "stripped down" in that respect.

The 15C, by contrast, is "right-sized" -- it has enough resouces and built-in functionality to tackle any problem you'd reasonably want to try on a handheld calculator. Practically anything it can't handle would be better attempted on a PC with the appropriate software. Of course, the 41CV/CX and 42S are better for extensive programming than the 15C, which wasn't really indended for those purposes.

The dual-purpose keys of the 15C were ingeniously intuitive. For example:
-- nPk and nCk keys [statistical permutation and combination; or, "partitioned" and "complex" matrices]
-- I and (i) keys [indirect addressing of registers/labels; or, imaginary (complex) numbers]
-- 1/x [reciprocal or matrix-inversion]

> Quote:
>
> There's never been anything like the HP-15C, there never was before, and there never will be in the future...

Alas, probably so. Modern high-end calculators compute faster and have more fancy capabilities, but I'd doubt that any are as thoroughly well-executed as the 15C. It's more than a still-useful tool; it belongs in a "Hall Of Fame" of consumer electronics.

Re: The superb HP-15C (adding to archived post)

*Message #2 Posted by **David Ramsey** on 15 June 2003, 12:22 p.m.,*
in response to message #1 by Karl Schneider

The orthagonality of the functions in HP calculators was something I always admired. This carried through to their other products. For example, the HP-01 calculator watch is the only calculator watch I know of that actually integrated the time and calculation functions: you could, for example, get a real-time readout of the cost of a long distance phone call after inputting the per-minute cost.

In the HP palmtops (1xx, 2xx), the built-in Lotus 1-2-3 spreadsheet's cells could link to an external routine written in the "Solver", so that the contents of a cell were determined by algorithms you implemented.

I recently started seriously playing with the 82161A digital cassette drive. As I expected, it can easily load and save programs. But it can also load and save a range of registers, as well as a custom keyboard layout on the 41.

They really don't make them like this any more.

We can only hope that the rumored successor to the 32SII isn't as "improved" as the HP-12CP is.

Re: The superb HP-15C (adding to archived post)

*Message #3 Posted by **David Smith** on 15 June 2003, 4:09 p.m.,*
in response to message #2 by David Ramsey

Too bad the HP-01 does not have trig functions... you could then take the sine of the times.

Ouch! arrgh! Gag!

*Message #4 Posted by **Norm** on 17 June 2003, 4:33 a.m.,*
in response to message #3 by David Smith

The sine of the times ! Ouch! arrgh! Gag!

Well, with trigonometry on such a watch, you'd take it with you whenever you COSINE a note at the bank !! har har har

That is quite amazing, to have it do things related to math on a time-basis.

SOON I WISH TO BRING UP CALCULATOR WATCHES. There is a unit being made presently that

can be acquired on eBay. For $40 it can make U every happy. I wear mine daily. It is called Casio CA-602 . No, it is not RPN but other than that its a very sensible little package !! :o)

The seller I have bought from is "IVSHC", and you can trust him. He ships from Hong Kong. Another guy was also reliable, "loose-logic" from Japan, BUT I think he ran out.

Re: Ouch! arrgh! Gag!

*Message #7 Posted by **Euclid** on 24 June 2003, 3:28 p.m.,*
in response to message #3 by David Smith

Time, RPN, now I get it... revolutions per.. uhhhh nanosecond!

the 9g fights back (a bit)

*Message #8 Posted by **hugh steers** on 24 June 2003, 4:19 p.m.,*
in response to message #7 by Euclid

for amusement, i decided to see if i could make the 9g do something useful. no really. and to this end; is it possible to make up for the woeful lack of numerical integration by programming it to do so.

in order to make its ability comparable to the 15c, i wanted a romberg method and for added piquancy, replicate the sampling redistribution performed which avoids evaluation at endpoints and problems arising from fixed width sampling. ideally to beat the 15c.

but does the 9g have any trousers?

originally, i wanted to supply solve and integrate subroutines. however, the 9g has so little memory, only 400 bytes for basic (can you believe it?), that it is impossible to write anything very useful. you can fit in a secant solver and simpsons rule and still have memory for your own function, but not a lot more. i have a very nice ridders solver, but it wont fit with romberg at the same time.

you can see the finished romberg method below. sampling redistribution is incorporated, so expect similar limitations to the 15c. problems mostly arise from infinite limits because the method requires limit scaling to unity then multiplies by b-a (the interval) and b-a is large, consider:

int(x*exp(-x),0,inf)==1. 9g gives 0.99999988 after 2.5 mins using 228 ~ inf. see the 15c advanced manual for this example.

all in, it ought to flatten the 15c, but its so slow that it only just beats it. im seeing something like 2 evals/sec, which is more than the 15c but then the 15c is 20 years old and has the algorithm in rom.

more cpu and memory please.

INPUT A,B,E H=2;D=0;M=0;J=1;B=B-A FOR (K=0;K<9;++K) { L=D;F=H/2-1;C=0 FOR (I=0;I<J;++I) { D=1-FF;X=((F+DF/2)*B+B)/2+A GOSUB PROG 9;C=C+DY;F=F+H;} F=4;D=M;M=(M+HC)/2 FOR (I=0;I<=K;++I) { C=N[I];N[I]=(F*M[I]-D)/(F-1);D=C;F=4F } D=M[I] IF (ABS(D-L) < 16E*ABS(D)) THEN { GOTO 1; } J=2J;H=H/2 } Lbl 1: S=3DB/4;PRINT S END

write function in prog9, for example:

Y=Xexp(-X) END

all the variables are used except for Z :-)

15C History

*Message #1 Posted by **Ted** on 15 June 2003, 2:13 a.m.*

I believe the first release year of the 15C was 1983. Does anyone know is this is correct? Any of our HP experts out there know of interesting bugs or such from the first series versus later series in 86 etc? There's so much halfnut/fullnut history of the 41's internal development through the years; I just imagine that the Voyagers also had some kind of changes (albeit smaller ones) than the 41 did: processors, internal machine instructions, construction, etc.

Re: 15C History

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2003, 10:28 a.m.,*
in response to message #1 by Ted

Hi, Ted;

I have a few scanned images of some different Voyagers' internals, including codes for two different chipsets I found in two HP15C's.

As expected, the one showing more internal changes is the HP12C. There are four different HP12C's internals before the Chinese, 1-buttom battery version, and I have images of three of them.

I'm organizing these images and I'll let them ready to download soon. You'll be able to see the chipset codes and compare. I'm affraid I have almost nothing to say about the chips and their internal structure. All I know is based on Tony Duell's (UK) mentions. There is a "big chip", based on the HP41's "nut" chip, that contains RAM/ROM and Display Driver (R2D2 only; no C3PO) plus processing, and another smaller one that contains keyboard scanner and probably part of ROM (this is the same in all units I saw, exception made to the HP10C that I never saw inside). There is an extra small chip in the HP15C that contains extra 448 bytes RAM (64 registers) and probably ROM.

As soon as I have the images ready to download I'm posting again.

Best regards.

My 15C has a serial number of 2234A03681. If the sn code is correct, the unit was made in 1982. I often purchased these calculators when first advertised. My 16C has a S/N of 2228A08039 - also 1982 Hank

Re: 15C History

*Message #5 Posted by **Vieira, Luiz C,** on 21 June 2003, 11:38 a.m.,*
in response to message #4 by Hank J.

Hi, Hank;

about "clacssic" Voyagers, except the HP12C, there's a hint if you want to know what type of MBoard it has. If the battery compartment has an helicoidal spring for (+) pole and a small tab for (-) pole then it's a newer, one-board only. If it has two metal strips on each pole, then it's an earlier, older model, that has all chips, some passive components and the LCD built in a flex circuit in a small, separate assembly.

Just an additional information.

Re: 15C History

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 21 June 2003, 7:16 p.m.,*
in response to message #6 by Trent Moseley

Hi, Trent;

to be honest, from the user point of view, any of them is good. But if we consider maintenance, there are a few points to be considered:

1 - the earlier models with flex circuit allow LCD maintenance without cutting the plastic rivets;
2 - in the other hand, I'm still scared with my previous flex experience: I was not able to repair the calcualtor because the flex circuit was contaminated with battery leakage and the trails easily popped out when I tried to desolder the IC's;
3 - although the earlier models do not need their plastic rivets to be cutten in this situation, I prefer maintaining and repairing the newer, latest Voyagers mostly because their PCB is not affraid of soldering irons; I successfuly desoldered at least three times.

I know battery leakage corrodes the glue/resine that holds cooper foil over the PCB (fiberglass) as well, and cooper trails may also pop out from rigid boards, but flex circuits need specific maintenance. I'm not sure I can handle these earlier models, and I have an HP16C this type...

Best regards, Trent.

Luiz-

Thank you so much for your knowledge. I have an older 15C which I use all the time. Believe me since it is the only one I own I will be very careful about maintenence, batteries, etc. It's twenty-one years old.

tm

Re: 15C History

*Message #9 Posted by **Patrick** on 21 June 2003, 4:19 p.m.,*
in response to message #4 by Hank J.

Interesting. I have two 15C's with the same serial number prefix: 2234A00113 and 2234A01998. As others have mentioned, the week number is only approximate and did not change each week. They probably left it on 2234 for a while!

My earliest Voyager is a 12C: 2216A05895.

What you don't hear much of is what is the *latest* serial number found on each model. Collectors all seem to concentrate on the early editions. My latest 15C is a 2809A version and my latest Voyager (not including 12C) is an HP-11C 2838A69951. You know, I really don't believe that HP made 70,000 HP-11C's that week!

Which brings up another question, could the same serial number appear on two different models, or did they uniquely identify the item over all of HP's inventory?

fascinating... (31E, spice)

*Message #1 Posted by **Mr. Spock** on 14 June 2003, 9:00 p.m.*

Was just dismantling a 31E, and noticed that it has exactly the same number of chips as a 34C.

There are 3 smaller IC's, and a large IC.

This means that the build-cost for the cheapest and the most expensive in the spice lineup,was completely and absolutely identical.

Fascinating, absolutely fascinating. Marketeers are most illogical. Their only focus is to extract the maximum amount of money possible from each possible customer, using artificially contrived "models" in a product line to force people to make different selections based upon their limited resources.

What a primitive culture that based their manufacturing of scientific tools in this way.

Actually, no, it doesn't...unless the 4 chips used are identical to the chips in the 34C.

in response to message #1 by Mr. Spock

Cheers from an inferior, emotional life form, Mr. Spock;

I would humbly add these facts:

```
HP33E/C - two chips
HP37E   - four chips
HP38E/C - three chips
```

Have not seen an HP32E inside already, cannot say much about it.

Hey, does Norm know you're using his e-mail address? Are you both acquainted? Do you know Captain Zener as well?

If you allow me: Live Long and Prosper...

*Message #5 Posted by **David Smith** on 15 June 2003, 4:13 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

The number of chips in the machines is not a constant. Some later versions of the models combined two of the small chips.

Also, it can be hard to tell if a Spice CPU chip will work with a different model or a different small chip set within the same model. They do not seem to be compatible like all the Woodstock ACT chips are.

Yes, the marketing thing.....

I think their is a name for it, something along the lines of "market insertion at all price points" or something like that.

A story from the bicycle world: The greatest mechanical parts maker in the world is from Italy: Campagnolo (OK so the Japanese have some fine stuff too, I know.....) in the good old days (up through the 80's) the only difference between some of parts in the top of the line and the 2nd and third was how many years had elapsed since the last top of the line release, e.g. a 1988 "Victory" part (3rd down the line) was identical to a 1986 "Record" (top of the line) part, whereas a "Chorus" (second) was the same as the 1987 "Record".

This feature was by no means absolutely consistent and their have always been some parts that are only in one line or another, and then sometimes there was a difference in polishing.

But also although the parts may have been the same, they were 3 years late, so amortisation of tooling etc had already been borne in large part by the first year etc.

I guess there might be a philosophical issue here, but I don't think I completely disagreee with the approach, although it can seem cheezy.....

I guess the best example of this is really in women's fashion. The price is almost *only* a matter of what the market will bear.

Bill

I passed your message on to Dr McCoy, and here is what he said:

I'm a doctor, not a marketeer, but even I know that the price of something has nothing to do with the cost of making it, and everything to do with what it's worth to the buyer to have it.

Just because you green-blooded Vulcans have no concept of using design as a way of making products better, it doesn't mean we humans have to suffer the same grey, boring fate; we stopped driving identical black cars a long time ago.

If you tried some of my Romulan ale sometime, you'd see why it's good enough to be banned in three quadrants, even though it costs the same to make as some of your vile herbal tea. But I suspect it would be wasted on your unemotional heart.

(By the way, you still owe me for the last bottle of ale you said was for your mother's temperament.)

Different bezel on new 17BIIs?

*Message #1 Posted by **Scuba Diver** on 14 June 2003, 10:36 a.m.*

Hello everyone!

I've been looking for a backup 17BII and I've noticed something; the newer units have a different bezel than the older ones...I haven't seen one up close, however the portion that's nearest the display appears to be dark brown in the newer units, whereas it was lighter in the older ones.

Does anyone know if there is a difference? Is the screen or bezel design different?

Just curious.. Thanks! B.

Re: Different bezel on new 17BIIs?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2003, 11:32 a.m.,*
in response to message #1 by Scuba Diver

Hi, Scuba;

I have a newer, Indonesian one and they have a different bezel. Also, their case AND bezel background color is black instead of brown; an ugly duck.

I'm not completely sure about it, but I suspect there are three types: some of the first "top-model" Pioneers had a protective "shield", like the one found in all Voyagers, but the newer models came without the protection and they have a recessed bezel frame around the LCD (you can actualy touch the LCD). I saw at least two HP42S with these different bezels. Also, my new HP17BII has a different bezel when compared to another earlier one I saw these days. The only source of information I have about the first HP17B (not 17BII) is the front-cover photo in my HP17B Owner's Manual, where we can clearly see it has a protection over the LCD. I am not sure if the first HP17BII had this sort of bezel.

Not much information, but I hope it helps a bit.

Luiz C. Vieira - Brazil

Edited: 14 June 2003, 11:40 a.m.

Re: Different bezel on new 17BIIs?

*Message #3 Posted by **Randy Sloyer** on 14 June 2003, 2:38 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

All 17B's had the lens in front of the LCD, all 17Bii's did not.

The original 17B was algebraic only, the 17Bii added a selectable RPN mode.

Luiz, your description of the new color scheme as an Ugly Duck is spot on. The change occurred at about

the same time as the 32Sii/20S switch from brown to black. IMO, the problem with the new black scheme is the shifted key functions are printed in a lighter color yellow rather than the older better contrasting orange. Overall, a poor color choice for a make-over. Brought to you no doubt by the same designers as the new 12CP.

Re: Different bezel on new 17BIIs?

*Message #4 Posted by **jose goncalves** on 14 June 2003, 5:54 p.m.,*
in response to message #3 by Randy Sloyer

I own 2 17BII from Indonesia. One has the old serial number scheme, brown case and keys, light brown bezel and orangeish-yellow shift key. The other one has the new serial number begining with ID, black case and keys, black bezel around the display and a light lemmon yellow shift key. On the backside, the new one has wider rubber feet on the upper part and 2 (instead of 4) wider segments of foot in the lower part. Evolution towards the end ?

slooow 49g

*Message #1 Posted by **Eric Lundgren** on 14 June 2003, 3:50 a.m.*

I have a 49g with 'chotkeh' engineering software pre loaded but it's painfully slow, even for simple stuff. Any ideas? Is there some flag that doesn't need to be checked?

Re: slooow 49g

*Message #2 Posted by **Speck** on 16 June 2003, 10:55 p.m.,*
in response to message #1 by Eric Lundgren

Is there any way to load the ROM without the additional software? I'm not familiar with that software, so I don't know if it's a ROM modification, or added programs (i.e. could you play with the system, but still be able to get the software back?)

I suppose it could be something with a number tolerance somewhere, or it could be that the software (if add-on) is in a wrong port, taking up system resources, and needs to be moved. Surprised someone else hasn't jumped on this one. Course, it might not be enough info to diagnose. What OS is installed (what version, I mean)?

Re: slooow 49g

*Message #3 Posted by **Mark Ordal** on 17 June 2003, 5:18 p.m.,*
in response to message #1 by Eric Lundgren

It just might be that the software package in question was optimized for earlier models of RPL calculator. In my own testing, one of my programs that was highly optimized for the HP28S/48SX took 24 seconds on my 49G versus 9 seconds on my 48G. I made a version of the program optimized for the 49G and got the run time down to 11.6 seconds---still slower than my 48G but not bad.

Incidentally, the program optimized for the 49G takes 11.4 seconds to run on my 48G. So it is evidently possible to have a program that performs equally well on both the 48G and the 49G. (BTW, with my 48SX, the 49G optimized program takes 18.7 seconds while the program optimized for the 28S/48SX takes 14.8 seconds.)

My experience with HP RPL models is that the 48G is the fastest of them all (I've personally owned or tested the 28C, 28S, 48SX, 48G and 49G).

HP's Low-End Competition

*Message #1 Posted by **Paul Brogger** on 13 June 2003, 7:52 p.m.*

I picked up a "SPECTRA SSC-200" scientific/statistical calculator at Target down in San Diego last week -- It cost five (5) bucks in a blister pack, without a manual or instruction sheet.

Two-line screen, 27 memories, plenty of functionality, in a nice, tight little package (by today's standards). It seems to me to be at *least* as good as any equivalent currently put out by Casio, Sharp, or TI, and beats the HP-6S hands down (IMHO).

It's not RPN or programmable -- just another little rubber-button algebraic to pile on my display. But, at only five dollars, it does suggest that HP had better not bother with the low end of the market -- there *can't* be any money to be made there!

Re: HP's Low-End Competition

*Message #2 Posted by **jose goncalves** on 13 June 2003, 9:33 p.m.,*
in response to message #1 by Paul Brogger

It even has the parentheses that the HP 12CP doesn`t have!

in a world of $5 LCD sci-trig calcs,

*Message #3 Posted by **Norm** on 14 June 2003, 4:47 a.m.,*
in response to message #2 by jose goncalves

In a world of $5 LCD sci-trig calcs, if I was boss and feared how to make money with competition like that, I'd be duplicating original HP-34C's and HP-41C's and selling them for $350 apiece factory new.

And I'd spread the wealth with stock options to the employees. With a strategy like that I'd be minting more millionaires than Microsoft.

Re: in a world of $5 LCD sci-trig calcs,

*Message #4 Posted by **Gordon Dyer** on 14 June 2003, 6:28 a.m.,*
in response to message #3 by Norm

Sorry, but you would have a VERY limited low volume market!

Re: in a world of $5 LCD sci-trig calcs,

*Message #5 Posted by **bill platt** on 14 June 2003, 11:50 a.m.,*
in response to message #4 by Gordon Dyer

And you would need to raise the price by an order of magnitude in order to make the "curves" (unit cost, overhead, number of units per shift etc) work out. So then you are at $3,500 and the market is even more limited.

For comparison:

I like rowing--and so do many other people. But "sea kayaking" is much more popular. The popularity of kayaking fueled the development of very low cost rotomolded boats which cost less than $800 for a full-sized 18' (5.5 meter) boat.

By comparison, a hand=made mass produced kayak made of fiberglass, costs about $2,000.

There are probably 10,000 or even 100,000 kayaks sold for every proper rowing boat (I don't mean a small aluminum boat that is really a motor boat, but without the motor).

To build a nice high quality rowing boat that is equivalent in quality and size to the mass produced kayak, built one-off, costs between $5,000 and $7,000. A production rowing boat, built in a limited production environment, goes for about $2,000 to $3,000. So, only those persons who *really* want to row will buy one. And unless you are willing to pony up the $6,000, your selection is severly limited.

Seems like diminishing returns. I think the calculator market is similar in some respects. Look at RPN and high quality as the rowing. Compare that to two other classes--the dominant ones--scholastic calculating, and "handheld" devices (palm) and you see the comparison.

I think the best opportunity for quality RPN in the future will rest in *software* solutions for handheld devices. I have seen two such hardware devices, one a Palm OS, the other WinCE, with very good click buttons. By piggybacking on a mass-produced paltform, the quality will be better at the lower price.

Of course, emotionally, we would all rather have a nice brick with BRIGHT RED LED's....

Regards,

Bill

..... Hey Bill, I like your pricing schedule, that has a little profit margin built into it. Your right, for $350, a corporation cannot be expected to ship anything more than a couple of software CD's in a cardboard box (hold the owner's manual, that would be extra).

I mean, U gotta charge a lot these days in order to make a few nickels profit. I was wondering, can I come over to your house and wash and wax your car, and vacuum the interior? I'll do it for just $3,500 .

:o)

Re: HP's Low-End Competition

*Message #7 Posted by **Andreas Stockburger** on 14 June 2003, 1:55 p.m.,*
in response to message #1 by Paul Brogger

Hi,

Qestion: Who will use a scienific Calculator these days? My Answer: - Students: Low financial budget - Engineers: Mostly works with complex PC-Programs like Catia etc. where calculations are one function out of hundreds - Scienctists: In my opinion same as Engineers ...

Hey - Is there a market for High-Price calculators ?

Next qestion: Who will use vacuum tube amplifiers these days ? My Answer: There are *many* people who spent a lot !!! of money for high-end amplifiers!

Why ???

Why are there many people who spent a lot of money for high-end motor-bikes, high-end computers, high-end what ever ?

I think its the fun - and only the fun !!!!!

If someone builds a calculator which creates fun (I mean really fun - not rubber-key in a hp49 :-( ) I think there will be a market for high-end products !!!!!!!!

We should not search for customer who need the calculators for their work we should search for customers who needs them because of their fun (do we have the right products ????)

Andreas

Mr. Burger is right on !

*Message #8 Posted by **Norm** on 15 June 2003, 12:40 a.m.,*
in response to message #7 by Andreas Stockburger

I liked that last post, a lot !!

Right on !! Dont know why, but the MBA/CEO/marketeers are incapable of comprehending the "fun factor" of an item. Perhaps because those people themselves are no fun. Serious now, I've met a few marketeers. They've got applesauce for brains.

Look at the jukebox industry.... marketeers ruined it by hiding the record mechanism around 1965 . It was decimated after that, and then they trashed what residual of their market was left, by switching to CD's and hiding that mechanism too. Was that fun, to hide the mechanism???? NOO!!

Recreating HP classic "RED LED BRICK CALCULATORS" would be damn fun and they would sell by the millions, and all these young publik skule zombies would re-discover what math is all about.

There was a Mr. Holden browsing this board who was on the team for the original HP-35 and he told me that the marketeers were off by a factor of 1000 in their marketing..... marketeers said the HP-35 would sell like, 100 a year, they immediately got orders for 1000 calculators a week.

Recreating the original HP stuff would be no different. Would sell like wildfire. Because it would be fun .

Re: Mr. Burger is right on !

*Message #9 Posted by **Chan Tran** on 16 June 2003, 11:34 a.m.,*

in response to message #8 by Norm

Andreas is right. Just like vacuum tube amplifier to succeed in high end calculator you have make them with extremely high quality (not only performance as tube amplifiers don't outperform solid state ones but were extremely well built), sell them at a very high price and not making many of them.

Re: Mr. Burger is right on !

*Message #10 Posted by **Mike Sebastian (Texas)** on 16 June 2003, 10:57 p.m.,*
in response to message #8 by Norm

Norm, you are right about the "fun factor." A lot of consumer electronics items now come in clear or translucent cases, including many Sharp calculators. Even something as simple as a clear case adds excitement to an otherwise mediocre product.

Re: Mr. Burger is right on !

*Message #11 Posted by **Speck** on 16 June 2003, 11:05 p.m.,*
in response to message #8 by Norm

In many ways, I'd have to agree. People tend to be drawn to what they like, and not what's best for them. Personal choice. Speaking of which, personally, I always thought something like a 48GX, or some other graphic calc) with a VFD (Vacuum Fluorescent Display, like they use on stereo equipment, for those unfamiliar with the term) would be a lot of "fun." Combined with glow paint on the keys, and it would be a hell of a lot easier to follow along when college profs turned out the lights to use an overhead display.

So it would use a bit more power. That's just incentive to show up early and pick a spot closest to the only outlet in the room! :)

Speck.

Re: Hmmmm . . . Vacuum Tubes . . . . .

*Message #12 Posted by **Paul Brogger** on 16 June 2003, 12:25 p.m.,*
in response to message #7 by Andreas Stockburger

So, the solution is: build vacuum tube calculators!

No,

*Message #13 Posted by **Norm** on 16 June 2003, 2:41 p.m.,*
in response to message #12 by Paul Brogger

No, build a few high-end stereo amplifiers from vacuum tubes and sell them at high prices.

For the calculators use red led's and silicon chips and sell those at high prices. Sell them factory new.

Re: Hmmmm . . . Vacuum Tubes . . . . .

*Message #14 Posted by **bill platt** on 16 June 2003, 3:01 p.m.,*
in response to message #12 by Paul Brogger

Actually, why not?

And why not a wooden keyboard and chassis, with mother of pearl keys?

I was at a maritime music festival this weekend and my young son was so happy to see really good musicians playing his favorite instruments: the accordion and the concertina. We took a close look at some of them and they were really beautiful works of art--and of course the "feel" of the keys is really important, especially as the musician will play her instrument for many hours at a time.

A real calculator *afficiando* will also use his calculator incessantly--and so, the expense, beauty, and feel of a honduran mahogany calculator with ivory-inlaid ironwood keys and vacuum tube circuitry, RED LED's and genuine African Alligator skin case are well justified.

U forgot the solid gold feet

*Message #15 Posted by **Norm** on 16 June 2003, 11:14 p.m.,*
in response to message #14 by bill platt

U forgot the solid gold feet,

each one shaped like a little pointy pyramid, to cut down on material resonances.

have info on new CPU in HP12C Platinum...

*Message #1 Posted by **Bill Wiese** on 13 June 2003, 2:32 p.m.*

The 6502 Lives!!

The SPLB20D2 CPU mentioned in the MSNBC article (there's a link in a forum entry a dozen or so lines below this) is in fact a Sunplus CPU - they call it an LCD controller for data bank.

See this chip & related ones at

http://w3.sunplus.com.tw/products/lcdcontroller/splb.htm

While these data sheets give the specifications for hardware, I/O and memory layout they don't indicate overall CPU architecture other than calling it an "8-bit RISC processor". There's another document around somewhere else that'll go into register layout, opcodes, etc.

From prior searches about Sunplus, I'm pretty sure this is a 6502-based CPU. (Their other low-end 8bit CPU is an 8051, but I think this just shows up as a core in other special function ASIC products like their camera/imaging/speech chips.) A brief look indicates it has 32KB ROM and ?? RAM (I believe this is purchaser-selectable, since RAM takes up a fair bit of die area and thus affects the cost.)

The memory map indicates some vectors in the $FFF0 region, which is consistent w/6502 architecture. (A standard 6502 has 2-byte vector entries for /RST, /IRQ and /NMI in the upper 6 bytes of its 64KB addr space. Peripherals may add some extra interrupt vectors to this design.)

I am not yet sure if this is a plain 6502 instruction set or a improved 65C02 instruction set - or some crazy mix of the two.

This looks to be a ROM'd chip - as opposed to flash or EPROM - and there may not be a way to dump/verify ROM data for reverse engineering.

There is a good chance that much of the HP12C-Plat ROM code is written in C not assembly - making reverse engineering harder. (It can be easier to figure what another engineer does, except when he gets real 'tricky', than to guess what a compiler does.)

In a perfect world, if this were in a PLCC package like orig 12C and there were spare lines for address & data we could just clamp on an EPROM on top, put the chip into emulation mode and have fun. Guess not.

When I know more I will let y'all know... maybe there's room for hacking...

Hope so, as I love the 6502. Been a long time since my Commodore 64 days!

in response to message #1 by Bill Wiese

Hi Bill,

Thanks for pointing out Sunplus. What follows is a combination of things I found on the Web site plus some guesswork on my part.

Yes, the CPU is a 6502 of some sort, but no hint as to whether it has any extra instructions. They call their 6502 core the "CPU14B." According to their FAQ for another product,

> Quote:
>
> The SPL61A/191A CPU is an 8-bit Full Instruction Set microprocessor. It includes 151 instructions with Y Index Register. The ICE environment must be upgraded to v.5.7 instead of ICE v5.1. Note that the ICE command, "CPU F6502", must be applied on ICE command line for Full Instruction Set.

The SPLB20D has 32K ROM, and three areas of RAM: 128 bytes CPU RAM ($80-$FF), 64 bytes display RAM ($00-$3F) and 2K data RAM ($1000-$17FF). I notice that none of the memory is mapped to the 6502 stack area ($01xx); the data sheet shows this area as "Reserved."

There is a Test pin. I suspect it generates an interrupt on one of the three reserved vectors in high memory ($FFF2-$FFF7). The bottom 2K of ROM is reserved by Sunplus for a test program.

The amount of RAM on the chip is probably not customer-selected as you state, but different members of the family have various amounts of ROM and RAM so the customer will pick the appropriate device after he knows how much memory he'll need.

It looks as if there's an emulation board with EPROM for testing. No other details are given.

I think we're out of luck as far as dumping ROM is concerned. The Sunplus test program might include that function but there's no way to know. There is one other possibility though. It might be possible to dissolve the glop covering the chip, photograph the ROM and get the bits from there. Peter Monta did this with the HP-35 ROMs so it's at least possible.

If anyone can find out anything else about this chip or the 12Cp, I'd like to hear about it.

- Michael

Re: Some More SPLB20D Information (long)

Michael..Hi Bill,

> Yes, the CPU is a 6502 of some sort, but no hint as to > whether it has any extra instructions. They call their > 6502 core the "CPU14B."

If it has bit set/clr operations it's a 65C02. There's prob a few extra addressing modes for a few instructions in the 65C02 not in 6502. Don't think there's any new addressing modes though. If not it's a plain ol' 6502.

I wonder if they still have the original Rockwell JMP bug (IIRC, JMP instruction crossing page boundary doesn't increment the PC's MSB. Thus orig 6502 assemblers had to check for this and pad with NOPs).

> SPL61A/191A CPU is an 8-bit Full Instruction Set > microprocessor. It includes 151 instructions with > Y Index Register.

The 151 sounds like 6502 - all valid operations with all valid addressing modes. The "..with Y index register" worries me but it just could be Chinese phrasing: a normal 6502 has both X and Y index registers.

> Note that the ICE command, "CPU F6502", must be > applied on ICE command line for Full Instruction Set.

Now that I vaguely remember, these may be the guys offering a skinny 6502 that has only an X register and few addressing modes. So it sounds like this is a std 6502.

> There is a Test pin. I suspect it generates an interrupt > on one of the three reserved vectors in high memory > ($FFF2-$FFF7).

Hmmm. Maybe this is an old design without JTAG scan test. Wonder if the test pin is just held Hi or Lo or if you can shift stuff in and read stuff back. JTAG scan tests can drive logic with test sequences. Sometimes on CPUs instructions can be shifted in - might be a way of peeking at ROM using an LDA $addr opcode/operand shifted in.

I once wrote a flash EPROM burning routine so a 'naked' (i.e., no bootcode) oddball CPU could burn its own flash by shifting in instructions over JTAG port. Since P/ROM was mapped out, you only had an address space depth of one, so you couldn't branch anywhere. Just loads & stores.

> bottom 2K of ROM is reserved by Sunplus for a > test program.

Interesting. With JTAG that really shouldn't be necessary. JTAG can excercise more of the die than any program code can.

> SPLB20D has 32K ROM, and three areas of RAM: 128 bytes > CPU RAM ($80-$FF), 64 bytes display RAM ($00-$3F) and > 2K data RAM ($1000-$17FF). I notice that none of the > memory is mapped to the 6502 stack area ($01xx); > the data sheet shows this area as "Reserved."... > ... amt of RAM on the chip is probably not customer- > selected as you state, but different members of the > family have various amounts of ROM and RAM so the > customer will pick the appropriate device after he > knows how much memory he'll need.

OK so these are separate RAM sections. From the way I (quickly) looked at the diagram there might have been 3 flavors w/3 differing RAM amounts. Guess not, just different areas.

On pg 5 of 13 on the Sunplus LB20DV12.PDF document I see that "CPU working SRAM" is from $80-$FF so that must be the stack. They put the I/O registers and LCD buffer all below $100 so as to take advantage of 6502's more efficient zero-page addressing opcodes.

> It looks as if there's an emulation board with EPROM > for testing. No other details are given.

That prob means they have a 'bond out' chip. Everything's mapped the same but there are extra pads for external addr/data bus. Perhaps this die could be bonded out...

> I think we're out of luck as far as dumping ROM is > concerned. The Sunplus test program might include > that function but there's no way to know.

Yes. If we found out more about the Test pin that might be useful.

> one other possibility though. It might be possible > to dissolve the glop covering the chip, photograph > the ROM and get the bits from there. Peter Monta > did this with the HP-35 ROMs so it's at least possible.

Yes. However this is likely a much smaller geometry chip than the HP35. What was that, 10+ microns? This is prob something around a .75 or .90 micron process. So might be hard to photomicrograph well without blowing away the glass passivation layer. Even then detecting 1s from 0s may take a bit of effort. Bit/byte addressing may be scrambled/interleaved too so that's another puzzle to solve.

Nimh N-cells

*Message #1 Posted by **41Jeff** on 13 June 2003, 10:44 a.m.*

I am using an Hp41 with card reader and would like to use 360 mah Nimh cells. Does anyone know how I might charge these cells? I have an AA Nicad/Nimh charger from Radio Shack but I think an adapter would be required to charge N cells.

Re: Nimh N-cells

*Message #2 Posted by **David Smith** on 14 June 2003, 2:26 p.m.,*
in response to message #1 by 41Jeff

There are adapters made for charging the N cells in a AA slot. I beleive that Radio Shack has them in their catalog (or did at one time). They are basically just a spring loaded space filler. Should not be hard to cobble up something that would work... even a short piece of metal rod should be fine.

Re: Nimh N-cells

*Message #3 Posted by **Michael Sprenger** on 16 June 2003, 11:30 a.m.,*
in response to message #2 by David Smith

Radio Shack has an N cell holder to adapt N cells to AA size charger ports: catalog #270-405.

HP41 barcode Wand

*Message #1 Posted by **Meindert Kuipers** on 13 June 2003, 3:56 a.m.*

I have been looking for a barcode reader on Ebay, but these are pretty rare and expensive. The wand is mainly meant to prevent typing in a whole lotta code and then transfer it to my PC for more permanent storage. Has anyone ever come up with the idea (and solution) for scanning barcode with a flatbed scanner and making a (PC-based) program to read the barcode straight into the PC?

Meindert

HP41 barcode: Another issue

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2003, 9:46 a.m.,*
in response to message #1 by Meindert Kuipers

Hello, Meindert;

your idea brought another one to my head: why not using commercialy available barcode readers and then create a custom HP41 decoder (or coder)? Aligning the original image, scanning it, reducing image errors and the like would also be fast and SW demanding; I think current PC-based wands and related drivers/software may generate a stream file with a sequence of bytes from the HP41 barcodes. A single program would break the line into bytes and combine them to form an HP41 valid sequence.

What do you think? You'll need more time to read the barcodes (to wand them) but obtaining final listing without much errors is easier. I used to scan program hardcopies and unse an OCR to retrieve ASCII data. In some cases, when original hardcopy had enough contrast and darker printing, a few instructions needed to be corrected. In some cases, with old paper with few contrast and failing characters, keyining in the program was easier. After that, 41UC could generate any equivalent, even .PS barcodes.

Hope this adds a bit to yout original and very good idea.

Best regards.

Re: HP41 barcode: Another issue

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 13 June 2003, 5:51 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz: I think that the coding used by the HP41 does not respond to any of the usual "symbologies" read by commercial wands or barcode scanners of today. If the decoding is done in the scanner, and just serial (decoded)data is passed to the host, there is little chance we can go farther with this approach. If the scanner has a "raw" mode which senses and send upstream just the transitions, then a software piece could take care of them...

Just my 0.5 cents

Re: HP41 barcode: Another issue

*Message #4 Posted by **Johnny Billquist** on 14 June 2003, 3:45 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

You are correct, Andrés. The 41 barcode use a coding I've not seen anywhere else. It's a rather simple coding, though. The 41 only uses the black bars, which are either narrow or wide, to represent 0 and 1. Most barcodes use both the bars and the gaps between bars.

I have a book that fully describes the 41 barcode format.

Re: HP41 barcode: Another issue

*Message #5 Posted by **Hans Brueggemann [GER]** on 14 June 2003, 3:52 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

really nice idea. however,i think it's really easier to take a cheap flatbed scanner instead of an industrial wand, because nowadays even new scanners cost only around $40 AND come with a twain interface. i am close to finishing version 2.0 of my HPILCOM (a small piece of software that faciliates data transfer to/fro a PC and a HP-41C and is solely controlled by the 41). i'll be digging into it to find out whether this feature can be implemented into the program.

cheers, hans

32sII numeric integration

*Message #1 Posted by **Eric Lundgren** on 13 June 2003, 2:27 a.m.*

Does anyone have experience setting up numerical integration on the 32sII? Also, are there sites devoted to this particular machine? Should I buy one of the few remaining 48gx's at my local Fry's before rpn is gone for ever?

Eric

Re: 32sII numeric integration

*Message #2 Posted by **Axel Bodemann** on 13 June 2003, 3:34 a.m.,*
in response to message #1 by Eric Lundgren

Hello,

numerical integration is pretty simple with the 32sii:

- define your integrand in the equation writer (r-shift STO) using A...Z as integration variable - put your limits in the x and y register - push the integrate key (r-shift 8), you will be ask for the integration variable (and the other variables if available)

-> numerical precision (and integration time) depend on the display format (number of digits) -> error estimation (conservative) in the y-register

Regards Axel

PS: of course, you can use numerical integration within programs

41CV corrosion puzzle

*Message #1 Posted by **bill platt** on 12 June 2003, 10:58 p.m.*

To any 41 repair experts:

I recently bought a 41CV (Fullnut) which, other than the battery terminals, is in really beautiful condition. And it has a set of manuals etc.

I got a decent price on account of the terminals, but here is the problem:

After surface cleaning of the negative contact (left side, looking from the back towards the front), the unit would not turn on. even with a little ball of wire smooshed into the contact, no power.

So I carefully took apart the (Fullnut) calculator, and saw that the corrosion had leached down the contact, and dirtied the contact at the printed circuit board. So, I carefully cleaned all the parts that had to touch, using a q-tip and a bit of alchohol. After drying the unit and reassembling, I put the little ball of wire in the negative contact, installed the batteries, and Voila!--it worked!

Unfortunately, after a blissful 10 days or so, she (the calculator, like a boat, is a vessel) locked up--with numbers in the dispay, she would not turn off or respond. So I took the batteries out. A few days later, I opened her up, re-cleaned her, and with more wire, put the batteries in, but the instant the batteries made contact, she let out this horrendous piezo squeek, and the display filled up with segments. Again, no keystroke response.

I am afraid for the worst, but I hope for the best. I took some pictures, but am not sure how to get them up on this site. I read a really great article (on MOHPC i think) about soldering a new terminal on. I suppose I could go for it--but I wonder if I have already "fried" the guts with my impetuous first repair.

regards,

Bill

Re: 41CV corrosion-ADDENDUM

*Message #2 Posted by **bill platt** on 12 June 2003, 11:20 p.m.,*
in response to message #1 by bill platt

I just found two other facts which must be important.

1. one of the screw posts at the bottom of the calculator is cracked through (did I do that when re-assembling? !!)

2. there is very light but noticeable green corrosion visible on the contacts that are in way of the lower screw posts.

I also have a piece of plastic that fell out just now, that I can't for the life of me figure out from whence it came. It is 2.75" (69.9mm) by 1/8" (3.2mm) x 5/32" (4 mm)and shaped like a very long angle iron with caps on each end.

I have pics of this stuff, too, but again, don't know about posting (method, bandwidth, etc.).

a note for Luiz--see, I did need help with a calculator fix-it job--thanks again for your suggestion--but I saved up for a "good one" instead of the lowly 48G--though that will surely come around to the bench, too!

-Bill Platt

Re: 41CV corrosion-ADDENDUM

*Message #3 Posted by **gifron** on 13 June 2003, 2:02 a.m.,*
in response to message #2 by bill platt

In my recent "41CV Gone Wild," I had a similar problem, in that the display filled up, and the keyboard did not respond - Had to remove the batteries to turn it off.

The problem was a slightly cracked post. Per help received here, I fixed the post using Tenax "model adhesive"/solvent from Hobby Town (this is great stuff, by the way). Just drop a little in the crack and squeeze the crack closed for a few seconds, and it's a done deal. Some have suggested using small wire to wrap the post while the adhesive cures, but there's not time. The Tenax bond is complete within about ten seconds, so I just used a pair of needle-nosed pliers to squeeze the crack closed, and then held it for about 20 seconds (10 recommended, plus 10 for good measure). You have to work fast though, as the Tenax evaporates faster than you can say "Jack Sprat."

Hope this helps.

Can't help with the corrosion though.

Re: 41CV corrosion-ADDENDUM

*Message #4 Posted by **David Smith** on 13 June 2003, 4:34 p.m.,*
in response to message #3 by gifron

Although the Tenax appears to evaporate and set quickly this is just the surface material. You should wait 24 hours before reassembling. This gives time for the solvent locked up within the bond time to evaporate and gives the joint maximum strength.

Small plastic piece and broken post rebuilding...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2003, 12:17 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi, Bill;

With the calculator opened, look at the LCD (top). There is a small gap between the LCD assy and the calculator's case. It's where the small plastic piece fits in. Look at the picture bellow and you'll have a better idea.

http://www.logeng.com.br/images/lcd_hp41.jpg

About calculator's complete malfunction, you wrote:

> Quote:
>
> 1. one of the screw posts at the bottom of the calculator is cracked through (did I do that when re-assembling?!!)
> 2. there is very light but noticeable green corrosion visible on the contacts that are in way of the lower screw posts.

These are reasons enough to freeze calculator's keyboard and allow the "horrendous piezo squeek" come to life. I'll find other images, but for now you might want to have a look in a zebra connector (two spare pieces or an assy) between the small mainboard and the keyboard. You should also carefully clean them, but do it only after being sure you can repair the broken post so it can hold both case halves together.

I replaced some broken posts with styrene plastic "custom" posts. Tis styrene is the same one used in plastic models (Revell, Tamiya, etc.). Some are too weak and canot hold a screw thread, while others are hard enough to hold it AND the screw inside.

This sort of repair procedure demands removing the keyboard and the keys, so you should be able to settle a new post without gluing keys or damaging the keyboard. I took some shots when doing it, but almost all photos were out of focus.

The images below show the final stages of the process, when the "new" post is placed with glue to "dry out", and later when a small hole (guide) is drilled by hand. What's the name in English of the tool used to keep the parts together? I know it's not wrench, but this is the name that comes to my mind...

http://www.logeng.com.br/images/post_reblt_10.jpg http://www.logeng.com.br/images/post_reblt_14.jpg

Hope these help, too.

If you need more advice (I know these are not enough) let us know.

Good luck and success.

Luiz C. Vieira - Brazil

*Message #13 Posted by **Meindert Kuipers** on 13 June 2003, 1:58 p.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Luiz,

You HAVE to make a website with all your great pictures and procedures!

Meindert

That's a call I can't decline to attend!

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2003, 5:06 p.m.,*
in response to message #13 by Meindert Kuipers

Hello Meindert, guys;

as it comes from you, Meindert, and I'd say the same if these words came from some other giants in here, I cannot decline to do. Your site and your work are kind of a reference, a model to all of us. In fact I thought about doing something about this, so I can share what I think that is useful. But it MUST be something I'm proud to show. For now, I can only store these images and post messages, maybe a few articles.

Anyway, I'll start the engines and start the tour for building some HTML and trying a few "looks". As I have something to show, I'm posting about it.

Thank you for the encouragement. I'm flattered.

Luiz C. Vieira - Brazil

Edited: 14 June 2003, 11:43 a.m.

Re: Thank you both...

*Message #15 Posted by **Wayne Brown** on 14 June 2003, 11:18 a.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

You're welcome, Luiz. I think an article is a great idea. Most people who deal with the 41 models are likely to run into the cracked-post problem sooner or later, and this would be a big help.

Re: 41CV corrosion puzzle

*Message #16 Posted by **bill platt** on 13 June 2003, 5:00 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Luiz et al,

Thanks for your help so far! I also went back and looked around a bit in the early May post about the "41 Gone Wild" and there are some distinct similarities to my situation. In fact I remember reading either there or somewhere else about how importatnt it is to avoid over-tightening the screw, as it can crack the post, and so I *thought* I was careful--but not enough!

So far all the comments seem good news--I haven't heard any ideas of the unit having been automatically "fried" from having corrosion.

Your pictures are very helpful---I need to upload mine so that you can see them, too.

I had not thought of the LCD being a potential problem, but I will look at those connections, too.

Regarding the broken screw post: mine is cracked right off--right at the plane of the PCB for the brain. I will try to glue it back on, and hope it holds.

Somebody posted some weeks ago about actually replacing the contacts with soldered connections. I am not only mystified by the thought of doing that, but also I do not understand how the contacts work. I don't see any insulators on the intermediate part (the part that looks like two long coils, or two combs).

I guess I better post my pictures to explain (in my work, I deal with drawings and sketches as much as I do with numbers and words, so I always want to make a picture..:-)

Best regards,

Bill

P.S. I haven't had this much fun communicating since I first got my HAM radio license and made contacts all over the world with a tiny little transmitter.....

*Message #17 Posted by **Ed Martin** on 13 June 2003, 11:00 p.m.,*
in response to message #16 by bill platt

Bill,

I would advise against trying to solder permanent wires between the main board and CPU board. I tried it and failed. I'm not saying it can't be done, but it's tricky business and very hard to do well without oversoldering or actually desoldering the traces from the main board.

The zebra connector consists of a bunch of tiny "loops" that connect the main board to the CPU board. They are all isolated from each other, and typically more than one will make contact to each pad on the board. However, because they are isolated from each other, they won't short across to the wrong pad.

I suspect your display problems and squeaky piezo are the result of a bad zebra connection, which is in turn due to lack of sufficient compression because of the broken post. That connection is particularly fussy in fullnuts.

My advice is to clean all contacts and remove any corrosion using isopropyl alcohol, then repair the post as advised in an earlier post (I couldn't avoid using the word "post" twice ... err ... three times). Replace the small plastic LCD support as advised in Luiz's post, reassemble, and good luck.

On another note, I think Luiz's idea to contribute an HP-41 repair guide would be an excellent addition to the Forum. The 41 is a great calculator, and very durable, but it does have some very specific weaknesses, many of which can be quickly diagnosed based on the symptoms. If Dr. Vieira provided us with the appropriate medical texts, we could maintain our machines in better health !

*Message #18 Posted by **Randy Sloyer** on 13 June 2003, 9:23 a.m.,*
in response to message #1 by bill platt

While the green heebie-jeebies under the logic board area are enough to cause the problem, check/resolder/clean the LCD module connections. Check for green fuzz growing there as well. They have to be pristine with no flux or fuzz.

This is another common cause of @@@@@@@@@@@@ displays.

41CV corrosion update

*Message #19 Posted by **bill platt** on 15 June 2003, 11:11 a.m.,*
in response to message #1 by bill platt

To all who have posted,

Thanks much for the advice! I have now gone through round two of the repair. For a brief moment, I thought I might have the repair successfully completed, but alas some more thinking is required.

So, here's how it went. I carefully removed the connection between the board and the keyboard, and cleaned the green gunk off. Then, I thought it would be best to test the contacts before fixing the post, and so I re-asembled and merely squeezed the system back together. And for a brief second or so, I had a happy "memory clear" message, but then it is hard to hold it together.

So at this point I was fairly confident that merely applying some plastic model cement to the cracked off post and reasemblig, and clamping externally, would do the trick. But it did not work.

I did not use Tenax--rather, I used "Testor's".

I tried to do more dry fits, but had no "memory clear" messages.

So, two issues to be explored, next>:

1. Try Tenax this time (have to find some)

2. Figure out how critical the alignment has to be. It seems that the alignment has to be very precise.

3. NOTE: I do not have a merely cracked poset; rather, the post is broken right of at its root.

To Luiz: thanks for the photos of the repair you did. Have you ever had a completely broken of post, or just a cracked one? How would you test the alignment is right? I don't want to glue it back together in a permanently non-workable alignment.

Best regards,

Bill

A brief drawing... (edited)

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2003, 4:12 p.m.,*
in response to message #19 by bill platt

Hello, Bill;

I'm glad you made it!

The "MEMORY LOST" is the best sign that everything is fine. There is a small, tiny chance of failure, but let's first check the post.

http://www.logeng.com.br/images/post_reblt_01.jpg

This is what I need to rebuild a post. Small screwdrivers (jewelers type), drill, cutter, glue (not shown), the "clamp" and a small plastic tube, a piece of styrene found in plastic models. The small black plastic piece at the right side of the cahlcualtor's case is the piece I used to build the missing post in this HP41 (down, right). I also rebuilt two posts with a similar technique in my 82143A, but I had to use small, custom metal "gloves" to hold the plastic tube in place. Look at the drawing below.

http://www.logeng.com.br/images/post_drwng_.jpg

1 - Representation of a "sane" post
2 - an "X-ray" view sowing where the screw fits (no thread, sorry...)
3 - this is how would it look a base remaining from a broken post, say, completely removed; in this case...
4 - I homogenize the surface and drill a hole a bit larger, so I can build...
5 - a new post that fits in the hole...
6 - like this.
7 - After placed (with the glue of your choice), you should drill a new hole that is enough to allow a hew thread when using a screw for the first time.
8 - An X-ray view of the final settling.

About alignment: after settling the new post and before drilling the hole for the screw, put both halves of the calculator's case together and you'll be able to "mark" the precise location of the screw by using it's own hole on the back case. I cannot see a better and faster way, unless you have precision instruments that allow you to precisely locate the place for drilling.

I hope this helps. Success!

Brief drawing... addendum

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2003, 8:32 p.m.,*
in response to message #20 by Vieira, Luiz C. (Brazil)

Hi;

I recovered this image, where two rebuilt posts are shown in the same HP41 case, the ones in the bottom that you can easily see (the ones that go in the top are in the shadow and out of focus). You can see they don't have a regular surface, they are not "pretty" well finished, but they can hold the case. This HP41CV is perfectly fine.

http://www.logeng.com.br/images/post_reblt_13.jpg

The remaining small plastic and the cutter (what's the actual name for this sort of knife, please?) are also shown.

I think this is all I have for now. The remainign data is about measurements, but I cannot find a precise meter.

Let me know if there is anything else I should have posted here.

Thanks.

Re: Brief drawing... addendum

*Message #22 Posted by **bill platt** on 17 June 2003, 9:12 a.m.,*
in response to message #21 by Vieira, Luiz C. (Brazil)

Luiz,

Thanks for your posts! What sort of "glue" are you using---(glue or is it a solvent type cement). Does the regular plastic modelling glue such as "Testor's" work for you? Another person mentioned "Tenax" which I am not familiar with.

I tried "Testor's" but it wasn't the regular stuff in a tube--it was like a felt tip pen. Perhaps the thicker stuff in the tube will work?

Re: Brief drawing... addendum

*Message #23 Posted by **Randy Sloyer** on 17 June 2003, 10:25 a.m.,*
in response to message #22 by bill platt

Heed David Smith's advice on solvent cements in his previous post int this thread, he knows of where he speaks.

There many brands available, DO NOT get the citrus based products. Tenax and Pro-weld are two that come to mind. They should be clear, of a water like consistency and smell pretty nasty.

Regular styrene model cement will not do the job, period. Nor will cyanoacrylates, not to mention the white bloom mess they make. Using anything other than a solvent cerment will only make matters worse. You want to fuse the pieces together, not glue them.

If you can't find any, let me know and I can UPS you a bottle.

Edited: 17 June 2003, 10:27 a.m.

Randy's is the best solution...

*Message #24 Posted by **Vieira, Luiz C. (Brazil)** on 17 June 2003, 11:08 a.m.,*
in response to message #22 by bill platt

Hi, Bill;

I have access only to super glues like SuperBond (Loctite®), I have not found those solvents mentioned by Randy. In this case, to keep the "new post" in place, I sculpt it tight enough to firmly sit in previous post's hole (draws #4 and #6 in my post) and I keep them together with the clamp (vice). Remaining super glue between the new post and the calculator's hole is a thin coat.

I believe solvent will be a lot better, but I could not found it so far. As the (negative) pressure is not too big, super glue is holding bravely.

What I must warn is about glue/solvent quantity: in some cases, a drop is too much. I you can use something that allow you to put a small amount of glue and spread it in the base of the hole (avoid the walls so you can press th new post till the bottom) and let the new post itself to finish

spreading it trhough the rest of the surface. I strongly recomend having the clamp already in position and enough opened. And remember using all necessary safety protecion for your eyes, skin and hands. And don't breath too deep while doing it...

Let us know how things are going. If you have the chance, take some pictures so they will help illustrate for the others.

Success!

cutter

*Message #25 Posted by **Ellis Easley** on 18 June 2003, 12:38 p.m.,*
in response to message #21 by Vieira, Luiz C. (Brazil)

I think that qualifies as a "box cutter". Primary purpose is to cut open cardboard boxes.

Re: cutter

*Message #26 Posted by **David Smith** on 18 June 2003, 5:56 p.m.,*
in response to message #25 by Ellis Easley

I though the primary purpose of a box cutter was to get you busted at the airport... It's amazing how many idiots still try to fly with these things. My next door neighbor is a pilot of American Airlines. DFW still carts away a barrel of such things every month.

type of blade

*Message #27 Posted by **bill platt** on 18 June 2003, 1:11 p.m.,*
in response to message #21 by Vieira, Luiz C. (Brazil)

We call it an X-acto (TM) knife

Re: type of blade

*Message #28 Posted by **Ellis Easley** on 18 June 2003, 2:25 p.m.,*
in response to message #27 by bill platt

Really? It's not the regular X-Acto blade holder with the round aluminum handle - but that's another kind of knife X-Acto makes?

Re: 41CV corrosion update

*Message #29 Posted by **David Smith** on 15 June 2003, 4:21 p.m.,*
in response to message #19 by bill platt

Glues will NOT work. They will eventually give way. Tenax, etc is a plastic solvent. It disolves the plastic and the joint it makes is a weld.

I have fixed several units that have had sheared off bottom posts just by using a longer screw. The case plastic below where the post shears off is quite deep and reinforced by ribs in the keyboard construction. I carefully drill out the hole in the sheared off plastic post so that it is now just a bushing that keeps the CPU board aligned. The screws that you need are 2-28 self tapping sheet metal screws (preferably with a type "B" point)... good luck finding them though.

Re: 41CV corrosion update

*Message #30 Posted by **bill platt** on 17 June 2003, 9:09 a.m.,*
in response to message #29 by David Smith

David,

how far below the bottom of the post can you drill?

Lietz Part ID Needed

*Message #1 Posted by **Mike** on 12 June 2003, 8:44 p.m.*

I got this Lietz tray, with a recent acquisition, but have no clue what it is. It seem interesting. It holds an HP-71 and has an HP-IL interface.

The tray has an integral compartment that has a circuit board with an HP-IL interface, as well as a cable with a circular connector with 6 pins.

There is a 40 pin chip inside that is marked HD63A01V1P. I did an internet search for this but nothing useful came up.

Is there anyone here that can ID this tray?

http://www.msdsite.com/hpcalcs/lietz/trayx.jpg http://www.msdsite.com/hpcalcs/lietz/connx.jpg

Edited: 12 June 2003, 8:46 p.m.

Re: Lietz Part ID Needed

*Message #2 Posted by **db(martinez,california)** on 12 June 2003, 11:03 p.m.,*
in response to message #1 by Mike

lietz (sokia) is a surveying equipment company - transits, total stations, levels, and lots of etc. your tray is probably external memory and ic's to translate the gun language to i.l. is there a hook-like apendage somewhere to help hang it on the tripod? if that 6 pin thinger is a bit smaller than the diameter of a pencil and plain aluminum with a little dip so it can only be pluged in one way it is a standard lietz data collector plug.

you might ask an old timer at servco, or terry nutt at allen precision instruments. i believe they both carried lietz.

Re: Lietz Part ID Needed

*Message #3 Posted by **Michael F. Coyle** on 12 June 2003, 11:12 p.m.,*
in response to message #1 by Mike

I don't know about the device, but the HD63A01V1P is a Hitachi one-chip micro with a little ROM (1K? 2K?) and a little RAM, and some I/O. It's in the 6800 family. Presumably the chip has a program on it to translate data and/or commands between the 71 and whatever your 6-pin connector is hooked up to.

Sorry if the above seems too obvious. Probably not too useful, but there you go.

- Michael

That's probably it

*Message #4 Posted by **Mike** on 12 June 2003, 11:38 p.m.,*

in response to message #3 by Michael F. Coyle

There is also a 27C64 EPROM and a 28 pin device (likely RAM) that has no specific markings. So, it looks like just some electronics to move data from the Lietz interface to the 71B.

Thanks, Mike

Re: Lietz Part ID Needed

*Message #5 Posted by **David Smith** on 13 June 2003, 4:38 p.m.,*
in response to message #1 by Mike

It is an HP-IL interface to the Leica/Leitz GPS equipment. The electronics actually are an RS-232 converter to/from the Leica equipment. Are you sure it is for the HP71? Mine looks the same and is for a '41.

It came with 71B attached

*Message #6 Posted by **Mike** on 13 June 2003, 11:58 p.m.,*
in response to message #5 by David Smith

Well HP-IL is HP-IL but mine came with an HP-71B attached. I don't even see how a 41 could be attached to the one I have. The brackets are angled to match the 71B (see photos below).

http://www.msdsite.com/hpcalcs/lietz/71bx.jpg http://www.msdsite.com/hpcalcs/lietz/endx.jpg
http://www.msdsite.com/hpcalcs/lietz/end2x.jpg

Click photos to see larger image

If it's just RS-232, that might make it still a useful device. Is there any special protocol for operation? Or does the device firmware simply send HP-IL data as RS-232 data?

Edited: 14 June 2003, 12:03 a.m.

It came from outer space with 71B attached?

*Message #7 Posted by **db(martinez,california)** on 14 June 2003, 1:06 a.m.,*
in response to message #6 by Mike

Mike- Surveying software of this vintage usually came on a rom, or eprom. If you have that you can find which instrument it was for and write Lietz in (i think) Overland Park, Kansas. They will know what language the gun talked. RS 232 is very probable. Most did but with different pins doing different things and most mfgrs. using proprietary connectors it was really a babel situation. For instance; i think it was Lietz and Topcon that used the same connectors, but needed different software to read and fire the instrument. Nothing communicated then. Nothing works now. Life was sure simpler when all you had to do was think. - d

Re: 16C Cheap?

*Message #1 Posted by **David Smith** on 12 June 2003, 5:30 p.m.*

Patience, young grasshopper... patience. The price for most HP calculators is determined in the last 10 seconds.

width of 16C display

*Message #2 Posted by **Norm** on 12 June 2003, 5:34 p.m.,*
in response to message #1 by David Smith

wondering why 16C wasn't popular. Maybe because of that narrow LCD display.

It should be twice that width, if trying to display numbers for conversion to binary, etc. esp with formatting spaces.

Narrow display?

*Message #3 Posted by **Mike** on 12 June 2003, 5:36 p.m.,*
in response to message #2 by Norm

Name a calculator that has a longer display.

your question is illogical

*Message #4 Posted by **Mr. Spock** on 12 June 2003, 5:44 p.m.,*
in response to message #3 by Mike

your question is illogical. Naming another width of display, on some other calculator, has no bearing on the optimal width of the display for a "programmers calculator" such as 16C.

The optimal width of the display, may not match to the width of the displays that were sold on other makes and models.

Therefore, even if no display were wider than on 12C, 15C, 16C, there may be an optimal display width that nevertheless is wider.

Manufacturing methods today make it inexpensive to prepare displays of varying widths. Indeed, they may even be paying more for such a small display, in comparison to a larger one (since the small display may be special order, the large display may be a standard item).

"Mr. Spock, your logic is impeccable. We are in grave danger."

Sure it is logical

*Message #5 Posted by **Mike** on 12 June 2003, 6:00 p.m.,*
in response to message #4 by Mr. Spock

The suggestion was that it was not popular because the display was too small.

That pre-supposes that it has any value at all. A valuable item will be used.

That being the case, if such a calculator is of value, and it is suggested that it's not used because of the display length, then the implied implication for not using it is that there is another that has a longer display. Because, something of value that is needed will be used.

I simply asked for the name of the one that had the longer display.

Note: A valuable and necessary device will be used, regardless of display length, if that's the only choice.

people dont like 16C. Point taken. I had no idea, never owned one, am not a programmer.

Could it really be true that they have no value? Somebody must like them, if only on some other planet somewhere .....

People dont like 16C ???

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2003, 9:50 a.m.,*
in response to message #6 by Norm

Hi, Norm;

I'm suspicious, but I have two of them. Think of one of the best tools ever made, but it was too specific and the precise activity it was developed for had only this "dedicated" tool available at the time it appeared. When I was an E.E. student, I was the only one in the hole campus to have one. Guys were amazed how funny it was finding the resulting data in a digital design without building it. In a time the first 16-bit processor were ruling, the HP16C could handle up to 64-bit words, and a few up-to-128-bit-word operations.

As Grant Goodes' post shows, it is still being used in the way it is expected to be. I just imagine that there are few places where it happens.

My thoughts.

Luiz C. Vieira - Brazil

Re: people dont like 16C

*Message #8 Posted by **Wayne Brown** on 14 June 2003, 11:36 a.m.,*
in response to message #6 by Norm

I certainly like the 16C! It was my first HP calc, and if I could keep only one, it would be that one! Besides the sleek lines and solid construction that it shares with the other Voyagers, it has functions I've never seen on any other calculator. While many calculators let you convert between number bases, not many let you switch all operations to a particular base and then use all the calculator's other functions normally with that base, without having

to enter special prefix keystrokes before numeric entries.

Some of us still work with mainframes and have to deal with large dump files full of octal or hexadecimal gibberish. I also work with networks of Unix systems and sometimes have to decipher the contents of TCP packets or debug driver problems. How many handheld calculators allow you to take a string of hex digits, convert them to binary, shift all the bits a specified number of positions, perform a logical AND against a bit mask, etc. -- all after setting the wordsize and complement mode to match the processor of the system you're debugging! All that (and more) is easy with a 16C.

16C and mainframes

*Message #9 Posted by **Karl Schneider** on 14 June 2003, 10:40 p.m.,*
in response to message #8 by Wayne Brown

Wayne Brown wrote:

Hey, that sounds familiar! In the mid-to-late '80's, I maintained Fortran software running on Sperry mainframes. Sperry (which merged with Burroughs to become Unisys during that period) was somewhat unorthodox in many respects, and they used 36-bit words with ones-complement integers. (Even then, twos-complement was favored.) Memory dumps were rendered in octal, which fit the 36-bit words.

One of the programs I wrote for my 15C (purchased in 1983) decoded a 12-digit octal representation of a floating-point number. The program accepted the three-digit exponent and the nine-digit mantissa into the stack.

The 15C program worked fine, but I now see that I could have written a slicker program for a 16C, with its word-size and octal modes. The 16C also had the correct integer conversions built in!

I bought a 16C on eBay a few months ago, but hadn't known of its existence back then. The 16C is the only HP unit I know of that offers ones-complement mode. The 41C Advantage assumes unsigned integers for its base conversions; all other HP's with base conversions (e.g., 42S, 32S/Sii, 20S, 28/48/49) use twos-complement only.

I worked with a Sperry 1100/60 in 1984-85 and did a little Fortran programming on it. At the time I was working as a (civilian) computer operator at an Air Force training base. We were in the process of converting all our applications from a Burroughs system (I believe it was a B3700) to run on the Sperry. I thought it was very funny that Sperry and Burroughs merged shortly after that project was complete. :-)

I didn't get my 16C until a few years later. By then I was working for another employer as a programmer/sysadmin on HP3000 minicomputers and IBM mainframes. The 3000 systems were stack-based machines and failing programs often produced octal stack dumps. The 16C was great for digging through them. It was useful for analyzing CICS hex dumps on the IBM, too.

The HP-16C is way too specialized for most people. I don't have actual figures, but it wouldn't surprise me to learn that the market share for this type of calculator were .001 of the share for all calculators.

That's also, by the way, why HP never created an airline pilot's calculator. Other companies make them and sell them to piloting students, usually through mail-order channels.

For the rest of us, a much simpler calculator that performs the very basic binary operations is sufficient -- and for that there are plenty of choices under $30 at Wal-Mart.

It doesn't make me happy to say these things. I had a 16C myself.

-Ernie

serving .001 of the market

*Message #12 Posted by **Norm** on 14 June 2003, 1:35 p.m.,*
in response to message #11 by Ernie Malaga

well I hear what you are saying, but why not serve that one in a thousand. And maybe its a little better than that anyway. Maybe its 1% of the market .....

Here's the deal, we get this continuous onslaught of greed, from greedy CEO's, who feel if they scoop up 95% of the money by satisfying 95% of the customers, that its enough, and that they dont care about the other 5%, because that would 'not offer enough return on investment'. And we hear that litany so often, that we think it normal that corporations tell their faithful customers to buzz off. Not only that, as we capitulate and try to think their way, then its "give 'em an inch and they take a mile" so they discontinue every calculator worth buying, until they aren't even serving 10% of their market anymore.

Why not serve the .001 specialty applications. I was very unimpressed with pilot's

calculators I saw from the non-HP sources, and would've been delighted if there was one of high integrity and of logical thought processes. And isn't that what market penetration is all about? It is to be deeply entrenched across as wide a marketplace as possible so that all the world beats a path to your door.

So while your words are persuasive, you are just giving a fig-leaf to help this new generation of ultra-selfish MBA/CEO's something to cover up their naked greed, while they run off and buy another 20,000 square foot beach-front designer home.

I would say let HP serve the pilots, and let them serve the computer software people who want a 16C. When HP has already got a calculator engineering dep't, they can keep those people busy implementing a few 'low-popularity' models rather than do something so incredibly innovative such as sign off on coloring changes on a 12CP.

You gotta realize that once the drawings are done by an engineering group, then its 'over the wall' to the production people, and these models can be built for years and years, while the engineering group works on other things. We can understand that, I do NOT think HP's MBA management can understand that. Otherwise they'd keep building HP-15C, etc., using the same production line and the old tools and specifications.

Norm, I think you forgot to take your Valium this morning. That's OK -- we love you nonetheless.

-Ernie

aw c'mon that was so perfect

*Message #14 Posted by **Norm** on 14 June 2003, 10:48 p.m.,*
in response to message #13 by Ernie Malaga

aww c'mon, that was so perfectly true, that the sentence you took a 2nd look at, was written so perfect it was like a snippet of Mozart... every note and beat exactly where it was supposed to be.

Valium, what's that, is that like Lithium?

AS TO THE POINT, its completely true. These damn modern CEO's are so full of greed & selfishness that they dont even care about serving their markets..... it is an absolute embarassment to HP that they never served pilots with a couple of aviation calculator specimens. I'm sure if the MBA's would get out of the way, it would be possible to deliver some really beautiful work that would help all types of pilots from VFR to airline captains.

shame to HP calculator dep't, abandoning their principles and refusing to serve the world's needs. They try to sell us Walmart-Kinpo garbage instead.

aviation calculator

*Message #15 Posted by **db(martinez,california)** on 14 June 2003, 11:22 p.m., in response to message #14 by Norm*

Norm; There was flight planning and nav software for the 97 and 41, and of course the Concord used the 41. HP just didn't make a dedicated unit like the Navtrinic. You'ld like my navtronic. It's got a red LED.

Edited: 14 June 2003, 11:25 p.m.

Navtronic pilots calculator

*Message #16 Posted by **Norm** on 15 June 2003, 12:28 a.m., in response to message #15 by db(martinez,california)*

looked under "navtronic"

and "navitronic"

just didn't find much. Nuthin' on eBay. Got any links ?? model numbers?

Hmmmmmm red led's in a cessna cockpit..... Sounds charming at first, however, I could see a slide power switch with 3 brightness settings.....

off, night, normal, bright.

If they didnt do that, it could be hard to work with that under greatly varying lighting conditions.

Re: Navtronic pilots calculator

*Message #17 Posted by **db(martinez,california)** on 15 June 2003, 9:09 p.m., in response to message #16 by Norm*

I have the Navtronic 1701 r, which has two National Semiconductor I.C.'s in it, among others. Joerg Worner has a 1701 t and yes; 1701 is the Starship Enterprises number. They were made by Specialized Electronics Corp. in Chicago. Mine is a nice solid unit with clicky keys. They refer to it as a "computer" and back then i guess it was. There is a pdf of the manual on Katie Wasserman's website at

http://www.wass.net/manuals

Isn't she wonderful to do that for us?

Re: Navtronic pilots calculator

*Message #18 Posted by **Katie** on 15 June 2003, 10:09 p.m., in response to message #17 by db(martinez,california)*

Thanks for the compliment db!

There were 5 Navtronics that I know of:

The first was the model 16. Then came a series of 4:

```
1701
1701 r - same as the 1701 with area navigation
1701 t - same as the 1701 with up/down timer and alarm
1701 tr - same with area navigation and timer/alarm
```

The marketing people got away with murder on this because as far as I can tell they use the same chip set. The area navigation works on my 1701 (plain) just the keys are not labeled and the chips are identically marked.

However the t and tr versions do have some extra stuff in there: a NS MM5368N oscillator chip, a 32Khz Xtal, a piezo element and a handful of passive components. Since these parts are still available and all the 1701's use the same circuit board it should be quite easy to upgrade a 1701 to a 1701tr for about $10. (I need to try that some day.)

*Message #19 Posted by **Norm** on 16 June 2003, 3:28 a.m.,*
in response to message #18 by Katie

got any pictures ?

Is it good enough to be useful to a modern day VFR pilot ?

Or have the rules changed enough to make it obsolete ?

Here's a picture,

*Message #20 Posted by **Norm** on 16 June 2003, 3:32 a.m.,*
in response to message #19 by Norm

here is a picture,

http://www.datamath.org/Related/Navtronic/1701T.htm

Hey, that does look like a nice little unit.

No B.S. just give me what I need.

So the main question is, are they good for modern usage ?

Were they popular? Do they show up on eBay ?

looks like.....

*Message #21 Posted by **Norm** on 16 June 2003, 4:15 a.m.,*
in response to message #20 by Norm

looks like "jeppesen techstar" is the only game in town.

I see they have a "jeppesen techstar pro" which sports a personal organizer, oooohhh !! wow! will having all my friends telephone numbers in there keep me from flying into a mountain ?

it looks like maybe even if 'techstar pro' was the newer one they discontinued it. Looks like 'jeppesen techstar' is the one pilots are buying.

plz correct if mistaken ...

Re: looks like.....

*Message #22 Posted by **Les Bell [Sydney]** on 16 June 2003, 5:30 a.m.,*
in response to message #21 by Norm

Norm,

I have the 41 Aviation Pac, as well as the Sporty's E6B, which is a purpose-built pilot's calculator with multi-line display. Ignoring the incredibly short battery life of the E6B, I found that the last thing you wanted to be doing while bouncing around in turbulence was diddling little buttons on a gizmo that didn't get everyday use the way our HP calcs do.

So I went back to the trusty Jeppesen CR-5, a shirt-pocket sized whiz-wheel that does everything you'd want, and has extremely simple one-handed data entry. And extremely long battery life, now that I reflect upon it.

But more than anything else, what has probably killed the pilot's calculator market is the hand-held or panel-mounted GPS. These things usually have an E6B data page that will tell you a lot more about winds aloft, fuel usage etc. than your calc would, with far less data entry because GS and TRK are fed into it continually. I have an Apollo Precedus, and it's amazing how it turned flying into something approaching a video game - no more being "temporarily uncertain of one's position".

With the whiz-wheel for backup, that's all you'd ever need.

Best,

--- Les [http://www.lesbell.com.au]

U are way ahead of me..

*Message #23 Posted by **Norm** on 16 June 2003, 1:24 p.m.,*
in response to message #22 by Les Bell [Sydney]

Well, U are way ahead of me in the aviation department.

Sounds like people are none too enamored with the Jeppesen Techstar, although it is "FAA approved for written exams" and I bet U cant take your dash-mounted GPS to the written FAA exams ...

I took about 50 hrs of flying instruction which was probably 50% decent instruction and 50% joyride.

While enjoying it immensely, I came to realize that the #1 mandatory ingredient for successful flight is NOT knowing the exam material and NOT aviation fuel and NOT the horizontal component of lift.....

Nope, #1 mandatory ingredient for flight is money, and measured only by the wheelbarrow full, and lots of 'em. So I have reattached the tie-down ropes for good, until I figure out how to be a better swindler and rip off some unsuspecting working class, like all the MBA's who have got their big stack. Soon as I do, its back to the runway.

Re: U are way ahead of me..

*Message #24 Posted by **Les Bell [Sydney]** on 16 June 2003, 6:38 p.m.,*
in response to message #23 by Norm

In the same boat here, Norm. It was all very well when I was young and single, but now with two kids and the decline of the IT business, I've had my wings clipped as well.

But you've obviously discovered what a lot of aeronautical engineers long suspected: Bernoulli was completely wrong, and what causes lift is *money*.

I hope you are able to get back to it - there's *nothing* else in the world (that you can do with your clothes on) that's as much fun!

Best,

--- Les [http://www.lesbell.com.au]

Re: width of 16C display

*Message #25 Posted by **Les Bell [Sydney]** on 12 June 2003, 8:16 p.m.,*
in response to message #2 by Norm

The 16C really is a product without a proper place in the world. It was introduced at the end of an era when programmers did a lot of bench-checking of assembly and other low-level code, particularly for mainframes, where they couldn't get actual machine time for debugging.

These days, we code in higher-level languages, and we typically code, compile and debug directly on the target platform. The types of calculations the 16C performs are often built-in to the debuggers.

And of course, the floating-point representation used in the 16C was unique to HP minis. The incorporation in the manual of a routine to covert that to and from the now near-ubiquitous IEEE-754 format is a stop-gap solution and not much more.

I have a 16C that I picked up new in 85 or so, but I rarely use it for anything computer-related, other than those occasional hex-decimal conversions. I occasionally wave it around in networking classes when teaching subnet masks, but in practice, I work those out in my head.

Still, it's an elegant toy; I might be able to use it if my son asks me to explain boolean logic and De Morgan's theorem, but that's about it.

Best,

--- Les [http://www.lesbell.com.au]

Re: width of 16C display

*Message #26 Posted by **David Ramsey** on 12 June 2003, 9:15 p.m.,*
in response to message #25 by Les Bell [Sydney]

Yeah, I have to agree...

When I moved out here (SF bay area) to start work as a programmer in the early 80s, the 16C was a godsend. When HP quit making them, I panicked, wondering what I'd do if mine died.

I prowled the streets of San Francisco, where I found dozens of tiny import electronics shops run by people with a tenuous grasp of English. You could often find older HP calcs there. Over a summer I picked up 3 additional units.

So now I have four. They all work perfectly. And I can't remember the last time I used one for real. Sigh.

If anyone here wants one for a collection, let me know.

Sad and truth

*Message #27 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2003, 1:32 a.m.,*
in response to message #25 by Les Bell [Sydney]

Hi, Les Bell;

I reluctantly have to face it and completely agree with you. When I got my NIB HP16C in the mid 80's I used it to test almost every logic design before going to PCB. If programming was needed, no matter: let's exercise the brain.

It definitely replaced protoboard for me when logic design was the issue. After setling logic design, electronic design demanded actual HW.

Sad, instead true: I still use mine because I still design digital stuff. Mostly for my own.

Regards.

Re: width of 16C display

*Message #28 Posted by **Grant Goodes** on 13 June 2003, 2:15 p.m.,*
in response to message #25 by Les Bell [Sydney]

Sorry, but I cannot more strongly disagree with you! Yes, the majority of programmers these days are operating in the nose-bleed echelons of high-level languages, and have no use for hex/bin/oct, but the absolute number of people operating in low-level regions has probably not decreased, nor has their importance to development of new products. I'm an embedded-systems engineer, and most of what I work on is lucky to have an indicator LED, let alone an actual display, and debugging my code involves constant use of my trusty HP-16c. And DON'T tell me I should be using some piece-of-crap calc-tool built in to the all-too-fancy Windoze-running 'scope I am reduced to using these days.

No, most programmers may have turned their backs on the "Bad old days" of manual radix conversions, but there are still lots of programmers who need them, and the HP-16c is the only game in town.

HP-15CP ?? HP-32P ?

*Message #1 Posted by **NH** on 12 June 2003, 3:28 p.m.*

anybody hear any rumors about maybe there would be an HP-15C platinum later on?

Anybody hear anything about a follow-on HP-32Sii maybe a platinum, later on?

U know, for steady production again .

HP-12CP at college bookstore

*Message #2 Posted by **Norm** on 12 June 2003, 5:38 p.m.,*
in response to message #1 by NH

I saw an HP-12CP at the college bookstore today.

The color scheme really is as ghastly as our chat board said it is. The yellow key legends really are invisible against the platinum, for many lighting situations.

I mean, you really had to look twice (three times?) to see what the legend said.

And it had BLUE plastic for the sides..... why not a dark navy blue for the lettering ? To attain a coordination ? instead of baby-diaper yellow ???????

Gotta hope they DONT release an HP-15C platinum, they would probably "improve" the letter coloring by printing them with light grey ink, atop the aluminum metal.

plotters/hp41's

*Message #1 Posted by **Geoff** on 12 June 2003, 1:45 p.m.*

hello

pretty basic question! I have an hp41cx with plotter module, hpil 82160a module, 82162a printer and etc... The question is; I would like to print barcodes on a plotter with the above system. I have with the printer but would prefer the plotter for this and plotting functions. Which plotter (7470, 7550...) and what set of cables are required to perform this (R232 with hpil or r232 with HPIB TO HPIL)etc. In other words what do I need to look for at surplus stores or EBay or here.

from "not a novice" but "not that knowledgeable"!!!

Cheers Geoff

Re: plotters/hp41's

*Message #2 Posted by **Juergen (CH)** on 12 June 2003, 3:21 p.m.,*
in response to message #1 by Geoff

I had a similar question. See thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv011.cgi?read=29203

Hope this helps, Juergen

Re: plotters/hp41's

*Message #3 Posted by **Geoff** on 12 June 2003, 5:15 p.m.,*
in response to message #2 by Juergen (CH)

Well thread 3 seems to have the answer. I have the plotter module and the hpil module. If I find an Hpib to hpil translator and an HP plotter with the HPib I should be okay.

Next question, any one out there with a translator, as it seems the 7450A plotter is aplenty.

thanks Juergen

cheers, Geoff

Re: plotters/hp41's

*Message #4 Posted by **Richard Garner** on 12 June 2003, 5:35 p.m.,*
in response to message #1 by Geoff

Check out V41, it is an 41CX emulator for your PC and additional software at the same site that will generate barcode on your PC's printer. Look in the calculator simulators/emulator section of this web site.

Re: plotters/hp41's

*Message #5 Posted by **Tony Duell (UK)** on 12 June 2003, 6:00 p.m.,*
in response to message #1 by Geoff

The 'correct' plotter is the 7470 Opt 003. This is an HPIL plotter (AFAIK the only one HP ever made) which will plug straight in. It's true plug-n-play -- the plotter module will find the plotter in the loop, etc. Practical tests suggest that an HPIB plotter (I've tried a 7440 'Colorpro' and at least one other) work fine if you connect it using an HPIL-HPIB translator (82169). You then have to SELECT the plotter manually (use MANIO, then enter the address of the plotter and SELECT). I've never tried plotting barcodes with that setup (I do that on the PC), but it works for plotting graphs, etc. An RS232 plotter doesn't seem to work, even with a correctly configured 82164 interface. It appears the HP41 can't read back data from the plotter -- it does this to determine plot size, etc.

HP41 barcode plott

*Message #6 Posted by **Christoph Klug** on 13 June 2003, 2:45 a.m.,*
in response to message #5 by Tony Duell (UK)

Barcode plott is also possible with EMU41 plus virtual SkwidIn barcode plott module and PC laser printer. This solution generates fast and high quality barcodes for HP41...

And EMU41 gives you much more features for printing, mass storage, data transfer to PC world, mcode, Ram-Box... For more details refer to HP-Museum article forum item 311 : "HP41-PC gateway & emulator".

Best wishes from germany - Christoph

Re: plotters/hp41's

*Message #7 Posted by **Donald Leonard** on 13 June 2003, 2:13 p.m.,*
in response to message #1 by Geoff

I have and use the 7470A Opt. 003 plug 'n play plotter and use it only for bar codes. I love it! I highly recommend it as a direct connect HP-IL peripheral, even for just bar codes. A recent 7470 went for only $75 on ebay. When you get tired of the fiber tip pens used on in these machines, switch over to the Koh-I Noor Rapidoplot Archival DPP 'Disposable' 0.35 metal tip pens for Vellum/paper. Although marked 'Disposible', they are supplied in two pieces which can be carefully seperated and refilled with ink-jet ink, just like refilling your ink-jet cartridges. I use the black 64NDS.01F for the bar codes/row/lines nomenclature and the blue 64NDS.07F for the header (program name and register count). Don

*Message #8 Posted by **Geoff** on 14 June 2003, 2:37 p.m.,*
in response to message #7 by Donald Leonard

7470A Opt. 003

this seems to be the best way to convert my programs to barcode. trying to find one is the hardest part, any ideas?? ebay hasn't got one yet.

I have a spare refurbished cardreader and an HP41c fully functional with quad ram and xfunctions module for trades to entice any one.

thanks to every one for their answers, a great forum.

cheers, geoff

Re: plotters/hp41's

*Message #9 Posted by **Geoff** on 15 June 2003, 3:07 a.m.,*
in response to message #7 by Donald Leonard

Thank for all the responses:

seems the easiest way to go is the 7470a opt 003. Does anyone out there know where to find one. I have tried surplus electronics on the web and ebay. I do have a spare card reader (refurbished), printer, hp41c with quad ram and extended functions module for trade.

any takers????

Cheers, geoff

Re: plotters/hp41's

*Message #10 Posted by **Dave Shaffer** on 15 June 2003, 5:16 p.m.,*
in response to message #9 by Geoff

Geoff,

If price is no object, there are any number of surplus/rental electronics outfits that list (note - this is possibly different from "having") HP 7470 and HP7475 (nearly the same, but only two pens instead of (I think) 6 or 8). The last time I bothered to look, the prices were insane: many hundreds of dollars. These are equipment rental houses trying to get rid of their old units. I can't remember a name at the moment (I am away from home), but if you are interested, send me an e-mail, and the next time I get a catalog, I'll let you know. (I get several of these a month.)

I sold an HP 7475 a few years ago on E-bay and felt lucky to get $25 for it. Somebody else in here probably knows whether the '7475 also came in an HP-IL version, but if it did, you can look for one of them, too.

Re: plotters/hp41's

*Message #11 Posted by **Donald Leonard** on 17 June 2003, 3:13 a.m.,*
in response to message #10 by Dave Shaffer

I believe that the 7475A came with HP-IB input, and one was sold on ebay recently WITH the HP-IL to HP-IB converter for a package price of $177.50. Don

Re: plotters/hp41's

*Message #12 Posted by **Juergen (CH)** on 17 June 2003, 7:20 a.m.,*
in response to message #11 by Donald Leonard

Some 7475A come with HP-IB, but most have a serial interface. Many plotter auctions on eBay do not state the kind of interface, so check it before you bid.

An alternative is the 7550A (A3!) which has both a serial AND an HP-IB interface. That's nice! You can drive the plotter with your HP-41 and with your PC (without having an HP-IB interface card installed).

I think the 7470A was the only plotter with the HP-IL interface option.

Regards, Juergen

Re: plotters/hp41's

*Message #13 Posted by **Mark Hardman** on 17 June 2003, 10:30 p.m.,*
in response to message #11 by Donald Leonard

The HP-IL/HP-IB interface (82169A) is frequently available on eBay at a reasonable price. I picked mine up a year ago for $35 (with manual.) A substantial portion of the 82169A manual details interfacing to HP plotters.

LED

Mystery HP-67 cable

*Message #1 Posted by **Patrick** on 12 June 2003, 3:34 a.m.*

Any idea what this mystery cable is attached to an HP-67?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3030204832&category=11713

A (wide) wild guess...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2003, 10:57 a.m.,*
in response to message #1 by Patrick

Hi, Patrick;

I'd not be surprised if the pins are connected to the card reader. I cannot see how many pins are available at the cable end (barely shown) but this would be the easiest way to load and retrieve programs to/from an external source: through the reader's circuits.

I remember when working as a telecom technitian whe a computer was connected to an ESK 10000 command unit (Siemens Switching Network) in order to automate the "analog" equipment. A complete daugtherboard was needed to convert computer data into comands and vice-versa.

Have anyone heard about such possibility? The HP97S has a specially developed data collector, I know, but I wonder if using card reader's input/output would also be possible.

Just a 1¢ "guess". Lluiz C. Vieira - Brazil

Edited: 12 June 2003, 10:59 a.m.

Re: Mystery HP-67 cable

*Message #3 Posted by **David Smith** on 12 June 2003, 5:32 p.m.,*
in response to message #1 by Patrick

It is almost certainly an interface to an external printer or a reader for the blind. There were a couple of articles printed at the time talking about these interfaces.

Re: Mystery HP-67 cable

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2003, 1:21 a.m.,*
in response to message #3 by David Smith

Hi, David;

would this output be an on-line, LED display "tracker" or it would respond to the standard HP97-equivalent "printing" functions? In any case, this is what I call "cool!"

I am curious because it leads me to think that the HP67 was not only able to "blink" the display with "to ptint" data but also could generate the equivalent HP97 printing signals. I used to think that part of the software was dedicated and different to each model, now I'm wondering if the HP67 had extra O.S. routines. Am I doing a bad analysis? Do you have any additional information?

This is amazingly weird!

Luiz C. Vieira - Brazil

Re: Mystery HP-67 cable

*Message #5 Posted by **David Smith** on 13 June 2003, 4:44 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

They spliced into the LED display driver signals. I think the PPC journal had an article on an HP65 printer mod. I remember seeing an HP67 converted to drive a Braille pin driver for the blind.

MLDL 6E O.S. source

*Message #1 Posted by **Donald Leonard** on 12 June 2003, 1:47 a.m.*

I finally received my MLDL, and it contains an O.S. -MLDL 6E. I have no idea what the functions are. Several unique functions are: BEEPMOD, COMPILE, DUMP, PPROM, PUPROM, ROMGO, ROMMOVE, RPROM, RUPROM, PRSYM, MDUMP. Can anyone identify this O.S. and provide a clue where I might acquire a copy of the manual? Don

Re: MLDL 6E O.S. source

*Message #2 Posted by **Meindert Kuipers** on 12 June 2003, 5:27 a.m.,*
in response to message #1 by Donald Leonard

Don,

What kind of MLDL is this? The functions do not sound like the Eramco MLDL. I have some documentation on the Eramco software, but that still needs to be scanned.

Meindert

Re: MLDL 6E O.S. source

*Message #3 Posted by **Donald Leonard** on 13 June 2003, 3:01 p.m.,*
in response to message #2 by Meindert Kuipers

It's a huge case (8 1/2" X 5 1/4" X 3") with a silk screened nomenclature over a painted silver/grey front panel. Interior circuitry has 3 daughter boards of discreat CD4000 series CMOS devices mounted through connectors to a buss board. The front panel contains the 4K EPROM SET (2732 & 2708), a RAM switch marked EIN/1ma at the top and AUS/.005ma at the bottom. I suspect that this switches the 4.5V battery backup out of the circuit when the MLDL is connected to the HP-41. Also on the front panel is a 31 pin test connector marked Port XFFF, sub divided into input 0-9, WPORT, ENOUT, XS, X, MS, and a miniture Digiswitch for 8K RAM Address select, with a 'X2' printed next to the digit.

This unit appears to be a corporate R&D/development unit rather than a home made/hobbiest unit. Some serious cost and preparation time went into the construction of this box. And, the MLDL 6E routine/function list is unusual as well. Besides the sample routine list given earlier, there are a total of 23, one of which is most likely used for developing commercial modules only (CHKSUM) as the HP-41 does not check for a checksum. This box also is from a european source as the HP-41 turns ON with european digit separators/radix when the MLDL is connected.

I would dearly love to find out about these routines as I have a suspision that they are a powerful support to the David Assembler also contained within the same EPROM set, not seperate. Don

Re: MLDL 6E O.S. source

*Message #4 Posted by **Meindert Kuipers** on 14 June 2003, 8:36 a.m.,*
in response to message #3 by Donald Leonard

This model doesn't sound familiar. Your description of the switches re German language (EIN/AUS is ON/OFF). The 3 daughter boards are similar to the Eramco MLDL design. CHKSUM is not all that unusual.

Meindert

*Message #5 Posted by **Donald Leonard** on 14 June 2003, 12:09 p.m.,*
in response to message #4 by Meindert Kuipers

One more difference I noticed last night while playing with the MLDL is that the David Assembler function 'Assembler', which in my MK-2 manual uses the acronym 'ASSM' is 'ASM' in this MLDL. Does this version mean that it is a MK-1, or just a non-Eramco version? David van Leeuwen, in 1985, wrote in a letter to me that Eramco changed some of the function acronyms. Maybe this will help identify the source of this MLDL. And thank you for explaining the meaning for EIN/AUS. It is curious that that was the only German words - all the rest were in english. Could this be a Zengrange unit, or is it still more likely a personal/hobbiest unit built with the traditional German standards of quality and durability? Don

HP N-size battery charger

*Message #1 Posted by **Tracy Vermeyen** on 12 June 2003, 12:36 a.m.*

I have a N-size battery charger (HP PN 92266a) which was for ni-cad batteries used in HP 41Cs. I read that N-size ni-cads are no longer produced. Does this make this charger obsolete? Can some other form of rechargeable battery be used? If so, what kind?

Re: HP N-size battery charger

*Message #2 Posted by **Stefan Hauschild** on 12 June 2003, 9:27 a.m.,*
in response to message #1 by Tracy Vermeyen

They are still available from Panasonic (175mAh)

-Stefan

Re: HP N-size battery charger

*Message #3 Posted by **Randy Sloyer** on 12 June 2003, 9:35 a.m.,*
in response to message #1 by Tracy Vermeyen

Ni-cad N cells are also available from your local Radio Shack.

Re: HP N-size battery charger

*Message #4 Posted by **David Smith** on 12 June 2003, 5:33 p.m.,*
in response to message #1 by Tracy Vermeyen

The cells that are no longer made are the 1/2N cells used in the 82120A battery pack for the HP41.

Voyager cases direct from HP?

*Message #1 Posted by **Patrick** on 11 June 2003, 9:05 p.m.*

eBay seems to always feature some seller or another with brand new vinyl/leatherette cases for the Voyager series. One would think that, with the 12C still on sale, that an individual could still buy these direct from HP.

I have not been able to track these down on their sales sites. Anybody have any experience buying these from HP?

Re: Voyager cases direct from HP?

*Message #2 Posted by **Randy Sloyer** on 11 June 2003, 9:53 p.m.,*
in response to message #1 by Patrick

You would think so... The HP part number for the standard old 12C case is 82174-60001.

http://partsurfer.hp.com/cgi-bin/spi/main?

If you enter this into part surfer, you'll get a "Part no longer supplied" message. They've been NLA for at least 6 months.

PS: You'll get the same result for Pioneer cases: p/n 82243-60001

Voyager cases direct from HP? NOT!

*Message #3 Posted by **db(martinez,california)** on 11 June 2003, 10:28 p.m.,*
in response to message #2 by Randy Sloyer

i called a while back and a young lady said that hp had sold all their cases to third parties. she gave me some names to contact and their prices. up to $20 for a 32/42 slipcase that was $6 a couple of months ago from hp. thanks carly. don't make anything. don't sell anything. just milk the name till it's dead. btw: there are no more battery doors either.

the girl did say that an rpn replacement for the 32sii would be out before the end of the year. she was so nice that i didn't even ask if i have to leave a tooth under my pillow or write santa to get one.

Edited: 11 June 2003, 10:32 p.m.

*Message #5 Posted by **Grant Goodes** on 12 June 2003, 11:12 a.m.,*
in response to message #3 by db(martinez,california)

Any chance you could post the list of places with these cases? I'm actually looking for one of the leather ones, but maybe they have those too?

Re: Voyager cases direct from HP?

*Message #6 Posted by **Eduardo** on 12 June 2003, 3:48 p.m.,*
in response to message #1 by Patrick

What a coincidence! I spent today about half an hour calling HP Parts Direct to inquire about the Pioneer and 48G cases, as well as the Pioneer battery doors. Result? An extremely nice rep who was quite surprised that parts for calculators that HP is still selling haven't been available for years (!!!).

In the end, she gave up. Oh well. But *where can one find these*?!!! (and I mean, for a price that's congruent with their *fair* value...)

Eduardo

9815/9825 tape drive

*Message #1 Posted by **Achim** on 11 June 2003, 6:46 p.m.*

Can anybody tell me, which type of lamp for end-of-tape detection is build in the internal tape drive of a 9815 or 9825? The lamp is burned out and I need to replace it.

Re: 9815/9825 tape drive

*Message #2 Posted by **Tony Duell (UK)** on 12 June 2003, 6:24 p.m.,*
in response to message #1 by Achim

That bulb runs straight off the 5V line, and is not that bright, so it's probably a 6V bulb. I think there's a 6V, 60mA bulb about that size, which I'd try first. There are 2 bulbs in the tape drive, one to detect the hole in the tape and one for the tachometer sensor. They are in parallel electrically, and AFAIK the 2 bulbs are the same type, so if only one has failed you could measure the current through the good one to get some idea of the rating.

HP Management Idiots Make *Another* Bad Decision...

*Message #1 Posted by **Wayne Brown** on 11 June 2003, 2:59 p.m.*

Jean-Yves Avenard is one of the principal authors of MetaKernel for the HP48GX and the operating system of the HP49G. While he worked for HP's ACO division he helped supply the official updates to the flash ROM that were available from HP's web site. Since HP closed down ACO (which means JYA lost his job) and stopped releasing upgrades for the 49G, JYA has been providing FREE support for the 49G, including ROM upgrades, from his personal web site. He posted this article today in comp.sys.hp48:

> Quote:
>
> Dear all.
>
> For the past few weeks I've received several inquiries for why my web site was not accessible anymore.
>
> Well believe it or not my university closed my account due to copyright infringements after they received a request from HP to close my web site (they didn't like that I used their logo and distribute the 1.19-5 ROM).
>
> Thank you very much HP for closing what I believe is a very useful source of information for your own customers...
>
> Jean-Yves

It's clear that HP management is not only malicious, but stupid as well. This sort of thing is only going to cost them more sales. I, for one, will not buy anything HP has to offer. I don't care if they finally release that "dream calculator" we've all been waiting for. No matter how good their promised new calculators are, I will not buy them and I will encourage everyone I know to avoid buying them (or any other HP product).

If even I, who don't especially *like* the 49G, feel this strongly about the matter, imagine how the fans of the 49G will feel about this betrayal...

Re: HP Management Idiots Make *Another* Bad Decision...

*Message #2 Posted by **Dave Hicks** on 11 June 2003, 4:59 p.m.,*
in response to message #1 by Wayne Brown

As I understand it if you make no attempt to protect your trademarks then you risk loosing them.

I heard some grumblings from a number of HP engineers about a year or two ago about his lack of concern for HP's IP and the legal/business issues that can cause. (Note that all of these people were hired long before Carly - you can't blame her for everything :-)) This was brought up in connection with HP denying some of my more recent requests to use their IP. The general feeling I got was that HP wanted to help people but had issues with some people redistributing things without asking, and other people assuming that if they saw someone doing it on the Internet, then it must be OK and assuming that if it was OK to redistribute "that", then it must be OK to redistribute "this" etc. All of this had caused them to become much more conservative about IP than they had

been just a few years earlier.

From that perspective, it seems to me that HP moved slowly on this. It would not surprise me to learn that HP tried to work out something with him before going to the university.

Of course I have no way of knowing and I'm reporting 2nd hand info from people who may have their own axes to grind etc. etc. It sounds to me like it was a "difficult marriage" and a "difficult divorce" so we may never get a single explanation.

How does Greek row fit into all this ?

*Message #3 Posted by **NH** on 11 June 2003, 5:15 p.m.,*
in response to message #2 by Dave Hicks

How does Greek row fit into all this?

During our college years, weren't the Enron and HP blue-suits the same yahoo's who drank their beer from large aluminum alloy pressurized kegs and majored in business?

I think they had it in for engineers, because engineers were smart enough to use their mind to hold formulas, instead of their stomachs to hold beer.

Some of this is demonstrated in the movies "Revenge of the Nerds".

Except the Nerds won in the movie, which is not the case in real life. In real life the business majors all make $8 million bucks a year and they get to pay the engineers $49,000 a year. Then they discontinue all the engineer's calculator products so that engineer's can't get their work done.... and also, blow up the engineer's work (i.e. 2 out of 5 space shuttles)

:o|

Re: How does Greek row fit into all this ?

*Message #4 Posted by **bill platt** on 11 June 2003, 5:30 p.m.,*
in response to message #3 by NH

Hi Norm,

It is all about being close to the money. We (engineers) are far from the money.

Apparently, it really is that simple.

I also think that many engineers like what they do, and so tend to under-charge....

Oh well, better to live a wise and happy life, rather than a sad and ignorant one.

Re: HP 49 OS - Calcs in general

*Message #5 Posted by **Chris(FLA)** on 14 June 2003, 9:39 p.m.,*
in response to message #2 by Dave Hicks

As I understand it if you make no attempt to protect your trademarks then you risk loosing them.

Kleenex - Xerox have to work very hard at this for obvious reasons.

Maybe HP is coming out with a new unit and they don't want the old 49 to keep them from selling the new

unit. I know it sounds like a pipe dream, but it could be another reason why HP did that.

I am beginning to think one of the reasons that calcs aren't as popular anymore is because you can't lock up the software like say a palm unit. No one including HP can make money from software if they can't lock it up.

I think we all know that hardware is a very small amount of the cost of machines these days. Software and services is were the big money is. Look at Microsoft as an example.

Chris

It's obvious...

*Message #6 Posted by **Mike** on 14 June 2003, 1:10 a.m.,*
in response to message #1 by Wayne Brown

that most collectors on this site, forget that HP is running a business and makes decisions based on a business model and not what's best for the few collectors (compared to all the users in the world).

Clearly, he should not have been distributing any ROM data using HP logo or trademark, if he doesn't have HP's permission.

One thing you do not understand about trademark rights. It is incumbent that holders of trademarks, to be vigilent in enforcing the trademark. If HP knew of an infringement and didn't do something about it, they could lose their trademark.

What's so hard to understand about that?

HP 41 X module

*Message #1 Posted by **Howard** on 11 June 2003, 1:04 p.m.*

Can anybody tell me if I can use the X Module (part number 82181A) in my HP41CV? The manual doesn't actually mention this module vis a vis the HP41CV. Thanks in advance.

Re: HP 41 X module

*Message #2 Posted by **Johnny Billquist** on 11 June 2003, 2:13 p.m.,*
in response to message #1 by Howard

That's the X-MEM module. Yes, you can use it in a 41CV. In fact, you can use it in any HP-41. However, to get any use from it, you *need* the X-FUNC module as well. That module is built in to the CX, but an option for the C and CV.

selling a HP 35 in good condition

*Message #1 Posted by **Ingmar Tengler** on 11 June 2003, 11:05 a.m.*

Hello everybody,

i'm about to sell my dad's hp 35. i guess i wont have to tell you anything about that great invention hp made there quite a few years ago... it is in very good condition, only shows a little wear around the on-off switch. it works just like a new one would, and the led's are still quite bright. only the battery has been removed long time ago. so it has to be run with the ac adapter. i still have the original leather case and the original hard plasitc box as well

it is the version where to top buttons are not printed on the buttons...

if you are interested i will send you very detailed pictures... please contact: ingmarusa@gmx.de

Re: selling a HP 35 in good condition

*Message #2 Posted by **Larry Corrado, USA (WI)** on 11 June 2003, 11:22 a.m.,*
in response to message #1 by Ingmar Tengler

I'm sure there are people on this forum who would be interested in your calculator. However, please note that there is a "Classified" section of the HP Museum where you can post an advertisement. Simply click on the "MOHPC" at the top of the page to go to the Museum home page.

May I also suggest that you don't run your calculator on the charger without batteries. You risk damaging the unit. Evidently it has not happened so far, but it could happen.

Good Luck. Larry

Re: selling a HP 35 in good condition

*Message #3 Posted by **David Ramsey** on 11 June 2003, 12:05 p.m.,*
in response to message #2 by Larry Corrado, USA (WI)

Why shouldn't he run his calculator on the AC adapter without batteries? As I recall, even the manual says this is OK...

Re: selling a HP 35 in good condition

*Message #4 Posted by **David Smith** on 11 June 2003, 1:32 p.m.,*
in response to message #3 by David Ramsey

The HP35,45,70 and 80 were designed to be run without the battery installed. There is a small chance that a 65 or 67 card reader chip could be hurt this way. It is the best way to fry a Woodstock series machine. Not good for Spice series machines either.

My Mistake...

*Message #5 Posted by **Larry Corrado, USA (WI)** on 11 June 2003, 4:04 p.m.,*
in response to message #4 by David Smith

I've always taken it as a general principle that one shouldn't run a calulator on the charger without batteries. Of course, the reason is the voltage regulation that rechargeable batteries provide.

Evidently, that's not a problem in some HPs. I stand corrected.

Thank you, David and David.

Larry

Mr. Hicks how about a screen saver

*Message #1 Posted by **Norm** on 11 June 2003, 3:36 a.m.*

I wonder if Mr. Hicks could build us a screen saver. It would have a slide show of HP classic calculators.

Anybody who wants to give thumbs down to the Kinpo/Carly stuff, would download the screen saver and let it run. Esp. at HP headquarters.

Imagine the warfare on this chat board, over which calculators should be included in the slide show !!

I could imagine a near replica of the 25C owner's manual. That is, a 25C silhouetted against the earth shot from space. Then perhaps a 'people' shot of some famous-type guy posing next to one of the suitcase models, in the 70's.

Of course, I would design the screen saver as follows:

First would come the face-on view of the 34C..... then would come the 3/4 view of the 34C..... then would come the 34C framed next to its owner's manual .... then a 34C superimposed atop an engineering marvel such as the 747... then an interior view of the 34C circuit board .....

Re: Mr. Hicks how about a screen saver

*Message #2 Posted by **Jürgen (CH)** on 11 June 2003, 8:58 a.m.,*
in response to message #1 by Norm

Great idea, although the design has to be discussed ;-) I suggest the screen saver has to be highly customizable to meet the collector's individual preferences.
Let me know if Windows programming skills are required. I would be proud of participating this project.

Re: Mr. Hicks how about a screen saver

*Message #3 Posted by **Juan-J** on 11 June 2003, 11:43 a.m.,*
in response to message #2 by Jürgen (CH)

Just wondering, about HP calculators and engineering marvels... What about the HP-41/Space Shuttle ads? The 65 and the Apollo-Soyuz mission? Or perhaps the 9810/20 (not really sure on this) and the Pioneer 10?

It would be great. So many themes on screen savers, some of them hardly attractive, why not HPs?

A little bit off-topic, I once read that Stanley Kubrick had an HP-35 and liked it very much, that's all I remember and have not found the original paper. Has anyone heard about this story or know more about it?

Re: Mr. Hicks how about a screen saver

*Message #4 Posted by **Valentin Albillo** on 11 June 2003, 12:02 p.m.,*
in response to message #3 by Juan-J

Juan-J posted:

"A little bit off-topic, I once read that Stanley Kubrick had an HP-35 and liked it very much, that's all I remember and have not found the original paper. Has anyone heard about this story or know more about it? "

Don't know about Stanley Kubrick himself, but famous sci-fi writer Arthur Clarke (who worked with Stanley Kubrick in the making of "2001 A Space Odyssey") did mention a number of times that he owned (and loved) an HP-9825 programmable calculator. Also, Wendy Carlos (Tron's OST, etc) owns another HP-9825 and does some amazing things with it. See:

http://www.wendycarlos.com/maps.html

Perhaps some forum contributors could name other celebrities owning classic HP calculators/computers ?

MORE screen saver slide show ideas

instead, i want a 'matrix style' one calculating primes or whatever senseless stuff with optional LEDs or 41C-style LCD characters.

cheers, hans

Kubrick and Clarke (Long)

*Message #7 Posted by **Michael F. Coyle** on 11 June 2003, 11:04 p.m.,*
in response to message #4 by Valentin Albillo

Some information about Stanley Kubrick and Arthur C. Clarke and their HP Calculators you might find of interest:

The HP Digest, Volume 2 (1977) has an article by Bernard Oliver. At the end, he says,

> Quote:
>
> Stanley Kubrick, director of *2001, A Space Odyssey*, was an early purchaser of an HP-35. He wrote me a letter of praise and ended by saying that the HP-35 would do for now, but what he really wanted was a pocket machine that told him what to do next. Even at the present rate of progress, I doubt if Kubrick can ever have *that* machine.

(This article is on Disk 4 of the MoHPC set. It is fascinating and well worth reading.)

Arthur C. Clark tells a interesting story about how he got his first HP Calculator. In 1968 he received a postcard from a magazine; they were preparing an article for their Christmas issue. They sent cards to many celebrities asking them what they wanted for Christmas; the best ones would be compiled and published as an article. Clarke threw the card out, then retreived it and wrote "Hewlett-Packard Calculator." The 9100A had just come out and he was impressed with its capabilities. He eventually did get the 9100 -- HP engineers saw the article and took up a collection to buy it for him. (*2001* had just come out, and I guess the calculator was sort of a thank-you.)

This story is told in a book called *Ascent to Orbit*, a collection of Clarke's non-fiction writings published in 1984. It introduces an article called "Hal Jr. vs. the Integers," in which he uses his 9100 to do some mathematical exploration, the details of which I've forgotten.

Just thought you'd like to know.

- Michael

Re: Kubrick and Clarke (Long)

*Message #8 Posted by **Ernie Malaga** on 12 June 2003, 11:05 a.m.,*
in response to message #7 by Michael F. Coyle

I've often wondered whether Sir Arthur ever upgraded or is still using the 9100A. If he still uses it, it must be one of the oldest HP calculators still in use.

The reason why I don't dismiss the possibility of Clarke still using the 9100A is because of a parallel with Isaac Asimov: Asimov never stopped using his TRS-80 computer till the day he died. Of course, Asimov (as much as I respect him) was a total klutz with gadgets. Once he called for repairs when his TRS-80 wouldn't boot up. The technician came to his home, flipped on the wall switch, and the TRS-80 started up as usual.

Man!

-Ernie

*Message #10 Posted by **Michael F. Coyle** on 11 June 2003, 11:15 p.m.,*
in response to message #1 by Norm

Great idea!

You know, you could also get a little subversive -- in addition to the calculator pictures, also scan the *introduction* inside the manual -- with the statement about how HP's mission is to provide high-quality products with service and support...you know the one I mean. Just imagine if that popped up along with the photos on the screens of the PCs at HP. It would be a constant reminder of how HP served their customers back in the good old days, and they couldn't repudiate it, since it's a direct quote from their own manual!

- Michael

Public thanks!

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 2:03 a.m.*

Hi, folks;

I'd like to let you all know how thankful I'm feeling for those who sent me e-mails about the HP71B, and even for those who expressed their support as well. I'll do my best giving it lots of attention and studying it so I can learn HPBASIC the way it is. I have no words to express my gratitude to Doc Meyer, and I hope others that wish having this sort of chance, to get it as well.

What gives me the necessary support amongst the high quality people I have found in this forum is that it exists a bi-directional flow, and I try to keep it flowing both ways, in and out, keeping balanced resources coming and going. And this is gold, too.

Thank you all. I'll write private e-mails as well, but I found a public "thanks" a good remind that I received the mails and I am thanked for them.

Luiz C. Vieira - Brazil

What's CPU of HP 12C and HP 12C Platinum

*Message #1 Posted by **Luc Chanh Truong** on 10 June 2003, 11:58 p.m.*

Hi every body, Do you know what is CPU of HP 12C and HP 12C Platinum. What are differences between them (specially on technology and speed)?

Thank you.

Re: What's CPU of HP 12C and HP 12C Platinum

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 12:27 a.m.,*
in response to message #1 by Luc Chanh Truong

Hello, Luc;

I read here that former Voyagers CPU was based on the HP41 CPU, known as **nut**. This is the explanation for Coconut as HP41 project name, and the later references as fullnut (earlier models) and halfnuts (later ones).

There are at least four major HP12C's "nuts", being three of them from previous 3-cell (4.5Vcc) units provided by HP and the later one, from Agilent, exclusively for the one-cell (3.3Vcc) newer version. I have their ID codes, if you wnat a list of them.

The HP12C Platinum has a bubble-type CPU without any identification at all. I call it a *peanut*, but someone here told me a peanut is not a nut, even being called peanut, and this is enough for me to rename it. So now I call *nonut* the HP12C Platinum processor! d;)

Sorry, but I could not resist...

Hope this helps... except for the peanut/nonut "joke".

Thank you,Vieira, Luiz C. please let me know the list of ID codes of HP 12C.

The (maybe incomplete) list

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 1:49 a.m.,*
in response to message #3 by Luc Chanh Truong (Vietnam)

Hey, Luc;

These are the ID codes for HP12C calculators I had in hands for maintenance. They are in "order of

appearance" and I do not know when they were introduced or discontinued. FIrst one is the earliest.

```
1LH1-0304 + ILF5-0301 (HP original, R2D2 and KBD scanner)
1LQ9-0322             (HP original)
1RR2-0001             (HP original)
2AF1-0001             (Agilent, 3Vcc cell type)
```

These are the ones I know. PLease, if anyone else has information about others, let me know.

Best regards, Luc.

Battery questions

*Message #1 Posted by **Luk** on 10 June 2003, 10:23 p.m.*

Hello,

I am new to calculators collecting and have the following newbie question. I own a few calculators mostly HPs but use regularly only one of them at one time for a couple of months and then switch to another one and so on. I am wondering what would happen to the batteries in the calculators that I do not use for a long time. Would they leak or get corroded? Is there any sort maintenance that I should do? I know if this is a car I would have to turn on the ignition once in a while do I have to do the same with calculators?

Thanks in advance. Luk

Re: Battery questions

*Message #2 Posted by **Randy Smith** on 10 June 2003, 11:14 p.m.,*
in response to message #1 by Luk

I would suggest when storing the calculators you are not currently using to leave the batteries out. That way, if anything does happen, you will only have to rebuild a battery pack or buy new batteries, not have a potentially dead calculator.

I can't speak to exercising calculators. Maybe someone else can chime in.

I second Randy, and I'd add...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 12:46 a.m.,*
in response to message #2 by Randy Smith

Hi Luk, Randy, guys;

First: what calculators do you have, Luk? Not necessarily their ID numbers and quantities, but their type: graphic, scientific, LCD or LED, or even better: Pioneers, Woodstocks, whatever. Batteries characteristics and their "risk" are not the same.

I agree with Randy about any sort of batteries and I'd add the following suggestion: shorten the calculator's batteries poles while they are resting for longer periods of time, mostly if they are newer, LCD type. Their susceptibility to ESD (Electro Static Discharges) make them potencial victims. The well know electrolytic capacitors leakage probably does not occur in SMT (Surface Mounting Technology) components in this case. I know about tantalum SMD capacitors and I want to ask: are there electrolytic SMD capacitors as well? Are they sealed the same way?

Using (exercising) calculators is something I do not have a "technical" position about. All I can see is that leaving batteries inside continuous-memory type (all new models and some "ancient" ones) will feed RAM, a few capacitors and keyboard sensing circuitry, what gives us a few tens of microamps (µA), if not less than ten µA. Replacing batteries with discharged capacitors, and I mean ALL MOS parasite capacitors, will cause a brief current surge through some parts of the circuits. I am not sure how dangerous it is, if it is.

If a chip is burned somehow when a battery set is connected under normal to perfect conditions, I take as a weak link in a chain being broken: it would break someday.

Hope this helps. I'd like to read from others; maybe I added some wrong information here and did not realize it.

Luiz C. Vieira - Brazil

Re: I second Randy... - Thanks

*Message #4 Posted by **Luk** on 11 June 2003, 1:11 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello Randy and Luiz,

Thank you so much for the replies. I currently have the 12C, 15C, 16C, 10B, 17BII, 19BII and Casio CFX9850GB. I had always left the batteries inside the calculators even when they were not in use, but from now on I will take them out as you suggested.

The HP's always retain the memory and all the settings but the Casio always resets to default settings when turned on (after being unused for a while).

Cheers, Luk

SMD electrolytic capacitors

*Message #5 Posted by **Ellis Easley** on 18 June 2003, 10:57 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

First, I want to say that tantalum capacitors are also electrolytic - there are aluminum electrolytic capacitors and tantalum electrolytic capacitors (and probably some other types - for instance, some other chemistry might be at work in the "supercaps" that go up to 1 farad and more in a small, low voltage package, they were intended to provide low current for memory backup as an alternative to batteries - I never actually saw them in any equipment, though). Anyway, I understand that in normal discussions, "electrolytic" means aluminum electrolytic and "tantalum" means tantalum electrolytic.

There are SMD (aluminum) electrolytic capacitors. They consist of a cylindrical can mounted on an SMD base. They are not as compact as the same value tantalum capacitor and are usually tall, since they are basically cylindrical cans with a seal at the bottom. I think aluminum electrolytics need to be built this way because they need a pressure relief valve (built into the rubber seal). Aluminum electrolytics have higher leakage and tend to "form" to the voltage they operate at: if they are used at a voltage much lower than the rated voltage, the dielectric tends to re-form in a thinner layer causing the capacitance to increase. If the applied voltage is increased, the thinner dielectric leaks more for a time until a thicker dielectric layer is built up - through "electrolysis" (that's why they are called electrolytic - there is no dielectric layer when they are first made, it is built up by application of voltage and current at the factory). As the dielectric layer becomes thicker, the capacitance decreases. If the voltage is increased too much-too fast, the leakage is so high that gas builds up to a high pressure in the can and the relief valve must vent it to the atmosphere.

Since tantalum capacitors are also electrolytic, they must have a dielectric layer formed by electrolysis also. One plate of the capacitor consists of a porous slug of powdered tantalum metal joined by heat and pressure (sintered) (BTW tantalum has a high melting point, ~3000 degrees C, it is so named because it tantalized metallurgists who tried to extract it from its ore). The other plate is the conductive electrolyte that saturates the slug and is in electrical contact with the metal container. Tantalum capacitors have much lower leakage and can be made with a glass seal (no pressure relief valve) so

that's why they can be put in molded SMD packages and dipped wire-leaded packages.

Because of the sintered slug, all parts of the plate are electrically close together, compared to an aluminum electrolytic, where the plate is a roll of foil so the ends of the foil strip are electrically far from the terminal. This is why tantalum capacitors have lower inductance and lower ESR (equivalent series resistance - the resistance presented to an AC current).

There are aluminum electrolytic capacitors with extra-low ESR, these are important for use as filters in high frequency switching power supplies. I think they achieve the lower ESR by having multiple connections along the length of the foil strip to the terminal.

Re: Battery questions

*Message #6 Posted by **Alex** on 11 June 2003, 4:27 p.m.,*
in response to message #1 by Luk

Though avoiding battery contact corrosion is a good idea, one should also consider the effect of not having power applied to the electronics for a very long time. It is common for some electrolytic capacitors to fail if left uncharged for a very long time. Thus, the best way to long term store an HP is to periodically take it out and power it up to execise the electrolytic capacitors.

Re: Battery questions

*Message #7 Posted by **Luk** on 11 June 2003, 8:11 p.m.,*
in response to message #6 by Alex

Hi Alex,

Thanks for the information. How often do you think we should put the batteries back in and then power up the calculators? Would once every three months be sufficient? (Because of the nature of my job I only use one type of calculator for a couple of months and then switch to another).

Regards, Luk

Re: Battery questions

*Message #8 Posted by **David Smith** on 13 June 2003, 4:49 p.m.,*
in response to message #7 by Luk

The more often the merrier, but every three months should be fine.

If you have an HP91/92/97/82143A, etc with the printer make sure you run the printer also. This keeps the paper drive rollers from devloping flat spots, etc. Also run the card readers for the same reason.

manual book hp12C

*Message #1 Posted by **Igi** on 10 June 2003, 8:44 a.m.*

I have a calculator hp12C, but i don't have the manual book. Can you give me the manual book (by e-mail) or can you give info where the specific store in my contrie. I live in Indonesia, Jakarta City. Thank you

Re: manual book hp12C

*Message #2 Posted by **Ellis Easley** on 10 June 2003, 12:34 p.m.,*
in response to message #1 by Igi

You can download a "Solutions Handbook" for the 12C from the HP website:

http://h20015.www2.hp.com/en/manualCategory.jhtml?reg=&cc=us&pagetype=manual&prodId=hp12cfinan81575&sw_lang=en&lc=en&docparent=26200492

HP still sells the 12C and you will probably have to order the User's Manual from HP as a spare part or accessory.

Re: manual book hp12C

*Message #3 Posted by **Patrick** on 10 June 2003, 4:45 p.m.,*
in response to message #1 by Igi

You can find the user manual for the new HP-12C Platinum on the hp site... try this link.

Of course, the Platinum has certain features not found on the legacy 12C (such as poor choice of colours), but not that many. For example, the legacy machine could deal with 20 cash flows while the new one can deal with more (30?). The lion's share of the document, though, ought to apply to both.

TL 891 MinLibrary tape storage

*Message #1 Posted by **Yaniv** on 10 June 2003, 8:01 a.m.*

I am using one of your products “TL891 Mini Library storage”, it is a tape library. This library is connected to an Alpha server with VMS 7.1. Is there a way to tell the robot when it finishes using tape number 9 to move back to number 0. Also in the configuration option I have an option to set “Reticule” will it help me for this purpose?

Re: TL 891 MinLibrary tape storage

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 10 June 2003, 8:27 a.m.,*
in response to message #1 by Yaniv

The TL 891 is a DEC => Compaq => HP product, I know it but not from the VMS side.

Please note that this is an amateur HP-calculator site, not officially related to HP, and certainly far from the StorageWorks products.

While it is possible that someone here knows about your question (and in that case, most people here are more than willing to help and share any knowledge they have), I would suggest you to visit the HP-Compaq corporate web site, and look under the support section.

Good luck!. (Please disregard any idiomatic mistake)

RPN/RPL - What?

*Message #1 Posted by **Jack** on 9 June 2003, 11:44 p.m.*

Did HP swich from RPN to RPL at some point or was RPL used only on certain models. Is RPL an official HP term?

My HP 12C manual(The only manual I can find with out unpacking a garage full of boxes) doesnt refer to RPL, but then it doesnt mention RPN either. However, the HP 100LX still refered to setting the calculator to "RPN Mode"

Did I miss a turn somewhere?

Jack

Re: RPN/RPL - What?

*Message #2 Posted by **Ernie Malaga** on 10 June 2003, 2:19 a.m.,*
in response to message #1 by Jack

> Quote:
>
> Did I miss a turn somewhere?

Yep. Around 1987 HP announced the HP-28C, which uses RPL. I am not sure whether the financial HP-18C uses it too (I've never seen one), and the 18C is, I believe, a bit older than the 28C.

In any case, RPL is a bona fide HP acronym, and it names an operating system similar to, but different from, the classical RPN. Other calculators that use RPL are the 48 and 49.

What makes RPL different from its predecessor is (1) the stack is infinite in size. Gone are X, Y, Z, T; now stack levels are referred to by number. (2) Stack registers can contain any kind of data -- even programs. (3) [ital]Everything[/ital] is backwards: not only 2 ENTER 3 +, but also "ABC" STO, which stores Level 1 into variable "ABC".

There is no consensus among users whether we like RPL better than RPN. I'm in the "no" side, but I seem to be in a minority.

Hi from the "yes side" ;-)
I'm a fanatic, lover, maniac, etc.,etc. of the 48... BUT I wouldn't say that "like" is my feeling about RPL: I simply find easily the way for my programs do what I aimed for.
I'm not a programmer, so I'm always sure that my programs could be optimized for any more expert, but they do the work.
This calculator do all I have requested "her".
That's what I need.

Raul

I second Raúl...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 10 June 2003, 10:07 a.m.,*
in response to message #5 by R Lion

Hi, Jack! (Sounds familiar... sorry, I could not resist :)

I second Raúl and I'm at the "YES" side, but I'd never disagree with others choices. I like structured programming and functional paradigm. I would never give-up RPN, and RPL implememted functional, structured programming to an enhanced level.

I'm not calling RPL as an enhanced RPN. Not that I do not think that way, it's to avoid flames and blames.

Most of all, ***personal*** programming is a matter of choice and taste. I'm completely and 100% sure any RPN propgrammer is able to understand and use RPL as well; the reaons many in here decided not to

go for it are their reasons. It's not the same case, but may be "seen" as a personal choice: RPL-only programmers, those who did not get RPN at the time it was a fever, may also not like (or even feel tied for restrictions) to use RPN. Sometimes, when programming in an RPN calculator, I miss another stack register, or a PICK command, or DUP2, or an extra ALPHA register... well, they're not there, I must find another way.

My 2¢.

Luiz C. Vieira - Brazil

Re: RPN/RPL - What?

*Message #7 Posted by **jimc** on 10 June 2003, 11:23 a.m.,*
in response to message #5 by R Lion

I think I'd like RPL a little more if only there was some reasonable documentation! My 48's information on how to program lies somewhere between "inane" and "you really don't want to do this do you?". I am not a programmer by nature or by occupation. I just want an answer. As it stands, I am in the RPN camp.

BTW, if anyone could point me to a GOOD reference to learn RPL from (ideally from the 'net), I'd really appreciate it! It might even entice me into not listing my 48 on Ebay!;)

Thanks.

Learning RPL

*Message #9 Posted by **bill platt** on 10 June 2003, 12:12 p.m.,*
in response to message #7 by jimc

Jim,

I found some very good references at www.hpcalc.org

I have three 5 references copied down to my hard drive at home; I would be happy to e-mail them to you, or put them on my FTP site later.

Three are on my hard drive here at work:

1.) The 48gx users manual (big, PDF)

2.) "An Introduction to Programming the HP 48G/GX Calculator" by Mervin E. Newton (PDF file,

135 kB)

3.) "Programming In User RPL" by Eduardo M. Kalinowski (225 kB, PDF)

Re: RPN/RPL - What?

*Message #10 Posted by **Valentin Albillo** on 10 June 2003, 1:12 p.m.,*
in response to message #7 by jimc

jimc posted:

"I am not a programmer by nature or by occupation. I just want an answer."

That's exactly my point. Classic HP calculators programmable in RPN were designed as tools for technical professionals, like engineers for example, who weren't programmers nor did they want to be, they just needed *answers*. Simple keystroke RPN programming provided those answers *easily and fast*.

On the other hand, RPL is a full-fledged, complicated, object-oriented language, which requires the user to deal with the vagaries and complications necessarily associated with such an OOP language, thus negating all simplicity and requiring its users to become what they'd rather not.

The result ? A divided user base, some loving RPL, some hating it, to the benefit of noone. Most technical users would find RPL unsuitable to get solutions fast, and would look elsewhere, ultimately dismissing RPL for good. The RPL revolution would gain only a very small percentage of people anew, while losing a lot of old timers. Most people saw the HP48/49 machines as *"already too complicated"* and they indeed are. I'm still waiting for someone to claim that any given RPN machine is "too complicated". Even the HP-41CX, with its large instruction set, its many ROM modules, and even its synthetics, still remained perfectly 'understandable', easy to grasp and use. Try that with an RPL machine.

I really feel classic RPN realized the best compromise between simplicity and power, with its 4-level+LastX RPN stack. Three or two level would be insufficient. More than 4 levels would be a book case of diminishing returns. Throwing it all in exchange for infinite levels which could also unexpectedly become *three, two, one, or none (!)*, with no automatic replication, with an overblown "last x" which could also be *non-available*, with all store operations now forced to always being *indirect*, etc, etc, was too high a price to pay for the loss of simplicity and convenience.

In the end, it caused most customers to completely ignore (and dislike) RPL, and RPN suffered as well. Every paradise has its snake.

"BTW, if anyone could point me to a GOOD reference to learn RPL from (ideally from the 'net), I'd really appreciate it!"

IMHO, this is the best, easiest, clearest book on the subject for learning purposes, assuming an user proficient with RPN but not versed at all in RPL:

"HP 48 Programming Examples" (HP Press Series) by Donald R. Mackenroth, paperback, 341 pages, Addison-Wesley December 1991, ASIN: 0201563258)

It includes lots and lots (more than 100) sample programs of all kinds, thoroughly explained and commented by the author, who, BTW, also wrote the excellent HP-25 Owner's Handbook, among others.

Best regards.

Sure I understand your point...

*Message #11 Posted by **R Lion** on 10 June 2003, 2:01 p.m.,*
in response to message #10 by Valentin Albillo

...because I often think that is "impossible" to change my 48GX for the 49G or whatever new calculator or system or expander... When someone feels comfortable, is very difficult taht he wants to change.

I agree with you wholeheartedly. When I was in college a friend had an HP-65. I taught him how to program it and, although he had absolutely no prior experience with computers, he understood everything the minute I said to him, "A program is nothing more than a series of codes that tell the calculator which keys to push -- automatically from the inside. Just imagine the calculator is pushing its own keys."

Boy, was that a revelation! Soon he was writing programs like a pro. [b]That's[/b] what RPN did for users -- provide a simple and efficient environment for either manual or programmed operation.

No longer true with RPL. Now the user is expected to learn the use of local variables, embedded programs, and an incredibly extensive list of operations, functions and commands -- for which there is little documentation.

Many die-hard RPL users scorn RPN calculators because they have so little RAM. Well, part of it is because RPN machines don't use up so much room in memory. Most instructions take up a single byte!

I'm not saying that RPN is perfect. I'm not even attempting to imply it. It has several serious defects (being GTO-happy is the most egregious), but for simplicity and ease of learning, it can't be beat.

-Ernie (PPC# 6594)

Now the user is expected to learn the use of local variables, embedded programs, and an incredibly extensive list of operations, functions and commands -- for which there is little documentation.

This is true when you're talking about RPN and AOS 80's pocket calculators. At the time BASIC and a few C-based pocket appeared, this rule no longer applied to them, too. As I mentioned sometime ago, I take RPN as a user interface, and programs using RPN interface take the advantage of the interface. The first RPN calculators where not even programmable, and they were RPN calculators.

About the little documentation I have nothing to say because I don't know all of them; anyway I have at least seven non-HP RPL-related publications, not counting the one I wrote about RPN-RPL "transition" (I must be careful not using Hicks' title...). But let's face one important fact: RPL stands for Reverse Polish *Language*. A language must be learned in its structures, as any other language. And in most cases (almost all) there is no way to use some languages' specific resources directly through the keyboard. There are exceptions, of course, but programming languages are intended to be used in programs. RPN is not a language; as the name says, it's a notation. And keystroke sequences in RPN-based calculators work fine as programs till the moment you test flags, use labels and gotos, subroutine calls and returns, index registers and control loops... These are of no use when performing direct computations, and you have to abstract when learning them as well as in any other language.

Using an RPL-based calculator as an RPN calculator are the first steps taken in their own user's manuals to introduce them:

```
number [ENTER] number [operation]
```

Or in a general, RPL-related form:

```
object [ENTER] object [command]
```

Using their programming structures and resources demand reading.

> Quote:
>
> Many die-hard RPL users scorn RPN calculators because they have so little RAM. Well, part of it is because RPN machines don't use up so much room in memory. Most instructions take up a single byte!

In any processor architecture, the combination of *n* bytes for instructions lead to an enhanced set of instructions. RISC and CISC architectures are the sign this is a subject for further studies. PIC processors have a 12-bit deep instruction code, allowing 16 times more

codes than the possible 256 with 8-bits only. If you take an HP11C and write down all possible, valid combinations of all keys and their respective prefixes, there is no way to go beyond 256. That's the maximum achieved. In other hand, if you do the same with the HP15C, you'll find there are more than 256 possible combinations. Then it's time to combine codes and select which one will be the prefix code, the one to be combined with the others, the code that will set a second-bank ROM call. Those who programmed Z-80 may remember the prefix codes: I only remember CEh, if I am not wrong.

The use of a single byte in program lines surely enhances memory use, but the fact is that memory was too expensive when programmable calculators first appeared. And some calculators, like the HP55, HP65 and both TI58/59, could merge a few combinations of codes, causing memory space to be consumed fast. And this is another reason I do not like to associate RPN (or even AOS) to programming resources. When we are talking about program-related structures, either RPN or RPL have their own environments, and both need a different approach. You may find both RPL- and RPN-calculator's users that do not know how to program. And both may use their calculators as well.

I know these are considerations based on some tendencies of mine, no doubts about. I just want to express what I see about RPN and RPL, mostly that RPL and RPN are related to each other, and that I repeated some thoughts in a different fashion, and for this I'm sorry. I think I must stop now to wait for comments, blames, flames, suggestions...

Hi Luiz & al.:

Luiz posted:

"I take RPN as a user interface, and programs using RPN interface take the advantage of the interface. The first RPN calculators where not even programmable, and they were RPN calculators."

I think you're confusing terminology. There's no way RPN can be called "a user interface". That would be a keyboard or wand on the hardware level, or a windowing system with icons and menus on the software level. Else, you could call BASIC a "user interface" to the underlying algebraic system. Perhaps you should refer to the RPN programming paradigm by some other name if you're going to consider it a language (I think HP-41Cs brand of RPN programming was called "FOCAL" at some point).

"In other hand, if you do the same with the HP15C, you'll find there are more than 256 possible combinations."

Many, many more. Just considering STO type instructions, there are more than 150 possible. Similarly for RCL instructions.

And some calculators, like the HP55, HP65 and both TI58/59, could merge a few combinations of codes, causing memory space to be consumed fast.

You meant "slow" instead of "fast", right ? Actually, merging codes *saved* memory space, of course; memory space would be consumed fast when keycodes *weren't* merged, as in the HP-55.

"You may find both RPL- and RPN-calculator's users that do not know how to program."

Anything goes in this bizarre world we've got, but I think that using an actual, nowadays existing, RPL calculator *only* for casual 'hand' computations, i.e., no programming at all (because its user "does not know how to program"), is really, really, *overkill*. For such use, I'd rather stick to my HP-11C or 15C, thank you very much. They just don't *consternate* me. :-)

Best regards.

Re: RPN/RPL - What?

Message #15 Posted by ***Vieira, Luiz C. (Brazil)*** *on 11 June 2003, 7:59 a.m.,*
in response to message #14 by Valentin Albillo

Hi, Valentin;

maybe I'm confusing something, I don't know. I call interface whatever exists between (inter) two systems, allowing them to "communicate" with each other. I consider both SW and HW resources necessary to compose an interface. If you take the automobile's cockpit as an interface, it doesn't mean anyone can drive a car, because there is a necessary protocol (driving skills) to make it "run". The cockpit MMI is complete only when there is a human being using it to drive the car, "communicating" with it. Likely, there are also machine-to-machine interfaces, being Hewlett-Packard's Interface Loop - HPIL - one of the very well known. There are both hardware and protocol needs to any equipment that wants to connect to another by means of an HPIL. If I am wrong it's because I'm taking the term in a much general meaning.

Best regards.

Luiz posted:

"Maybe I'm confusing something, I don't know. I call interface whatever exists between (inter) two systems, allowing them to "communicate" with each other."

Agreed. My objection was that you didn't use just "interface" on its own, which is as you just defined, but "user interface", which is rather a different beast in computer jargon.

Else, everything would be a "user interface", including RPN, your love for your wife, etc, etc.

Anyway, very interesting discussion, thanks for it.

Best regards.

User interface × User-level interface

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 10:57 a.m.,*
in response to message #16 by Valentin Albillo

Hi, Valentin;

not to extend the discussion more than enough, after posting it and got the road (I'm back and alive...) I thought I should post "user-*level* interface" instead of "user interface". At the moment it occured to me user interface is something created by the user, than you're right complaining: RPN is not a user interface.

I'd rather writting user-level interface, what would better explain how do I see RPN.

Best regards and thank you too, Valentin; it's indeed a "teasing" subject.

For such use, I'd rather stick to my HP-11C or 15C, thank you very much. They just don't consternate me. :-)

I use a lot of RPL programs *other* people have written (like MetaKernel and Erable) on my 48GX, but I very seldom write any programs on it myself (mostly because I haven't yet been interested enough to devote the time necessary to learn more than a small subset of RPL programming). However, I frequently throw together small, special-purpose (often one-time-use) RPN programs on my 16C and 41CX. I just prefer the keystroke programming of the older models over RPL, though I really like the other features of my 48GX.

My day-to-day work involves dealing with high-level programming languages and I get enough of that at the office, so I've been putting off delving into the depths of RPL, which so far I haven't enjoyed very much. For anything except extremely trivial programs I prefer to go to hpcalc.org and grab whatever package is closest to what I need.

Right on the nail!
Who needs *another* computer language?
IMHO a sort of macro language is all what is needed in a calculator for trivial, everyday, use.

When more specialized needs arise you either have to spend a great deal of time delving in the innards of UserRPL/SysRPL/ML/SynthProg and the like, or searching online for a library/listing that fits your needs or resort to a more specialized device.

It may be fun studying another language... when you have time and you can practice it everyday. No fun at all when time is **not** on your side and have to remember another way to write down an if/then/else.

My 1€¢,
Massimo

I think this is the key to the situation. I suspect high school and college students who were lucky enough to be able to afford a 48-Series machine (and were inclined towards programming in the first place) were able to pick up RPL with no problem because they were at the point in their lives when their job was to learn.

I bought several goodies from EduCalc - like an almost brand-new 41CX and a used 71B - that they had taken as trade-ins on purchases of 48S/SX/G/GX. EduCalc really pushed the 48's. I wonder how many of those buyers regretted giving up their RPN calculators when they were having ...

*Message #22 Posted by **Jack** on 14 June 2003, 2:19 a.m.,*
in response to message #10 by Valentin Albillo

Lutz - Reverse Polish Language.. not Reverse Polish Logic, Thanks, that makes more sense.

I think I get it, RPL is really "Reverse Programming Language", the hazy point in the evolution of the calculator when someone at HP declaired Hey! This is not just recording keystrokes anymore, this is a high level programming language, and it needs a name.

I don't see the more powerful instruction set or merged instructions as being non clasical RPN and I don't think the infinite stack rules out RPN either, although I tend to agree with Albillo, "More than 4 levels would be a book case of diminishing returns"**. Enhancements accompanied each new model, somtimes huge enhancements. Memory increased, new commands were added, program steps became more powerful, but I don't see a point that RPN died or was replaced. RPN never was a language. It had a language though from the very start (HP-65), I just didn't know what to call it. RPL "Reverse Programing Language" works for me. The new calculator programmers with "Reverse Polish Language" RPL can call it RPN if they want, I'll just consider their RPL a newer version of my RPL. After all basic has come a long way from Dartmouth and it's still basic.

Of course I never programed with the "new RPL" so all this is easy for me to say :)

Jack

www.livingsoftware.net

**However, in Euclid's RPN I went with a 5 level stack* because I found that extra stack level often alowed even a poorly planned solution to be completed. *(ok 6 levels, counting the phantom register)

"More than 4 levels would be a book case of diminishing returns"

Perhaps this is true for just keyboard use. One strange use I found for the "unlimited" stack depth of the HP28S/48SX/48G was efficient evaluation of rational approximations for certain special functions. When the approximation polynomial is expressed in Horner's Form, you can put everything on the stack and then run through a FOR loop consisting of just *+ the right number of times. In my testing (about 14 years ago on my 48SX) the speed up was measurable compared with just "brute forcing it". (I didn't keep a record of just how much speed was gained---I just recall that it was enough of an improvement for me to consider this the preferred method.)

--Mark

"diminishing returns"

*Message #24 Posted by **Euclid** on 22 June 2003, 3:29 a.m.,*
in response to message #23 by Mark Ordal

Well.. with an unlimited stack you could from the keypad enter 50 numbers and then press add hmmmm.. 49 times but that's not very not efficent memory wise or ease. Speed is not always everything. Ok I admit programmically, sometimes you need to step outside the box, but I remember reading a quote from Vance Packard where he said "If you had a stack of infinite levels, then you can solve an infinitely complex equation. For all practical purposes four levels is almost infinite."

I guess the point is that your weighing speed vs memory and comming up with a win, but what if you had thousands of itterations, or hundreds of thousands of itterations? Not even HP's RPL had an truly unlimited stack.

Euclid :)

Depends, I used to do this very often with my 48SX when adding long lists of numbers. I would enter all the numbers and then confirm each one (on the Y register) before pressing +

Otherwise you have to double check numbers as you are entering them.

Programmining in RPL vs older calcs

*Message #28 Posted by **unspellable** on 11 June 2003, 1:15 p.m.,*
in response to message #27 by Vieira, Luiz C. (Brazil)

It has been said here that it is somehow more difficult to write a simple program in RPL than with one of the older RPN machines. Frankly, I find it much easier. RPL will handle both RPN and algebraic notation. For a very simple program I can wite it almost as quickly as directly solving the problem. I frequently write a very simple program if the calculation is to be repeated. I do a lot of calculating with complex numbers, and here RPL is vastly easier than the older HP calculator "languages".

On the whole, I find RPL to be more intuitive than the older languages. And I am not a programmer otherwise.

Perhaps part of the problem is confusion on the points that RPN is a notation, not a language or operating system, while RPL is both a language and an operating system.

Black screen on 48GX

*Message #1 Posted by **Scuba Diver** on 9 June 2003, 8:19 p.m.*

Hi everyone!

I have a 48 with the older screen, and I have been REALLY curious to see the new black screen, however I haven't been able to find a 48GX at any store...

Does anyone happen to have any pics of the black screen? I've heard from many people that it's significantly better...would everyone agree?

If it's that good, then maybe I should pick one up while I still can!

B.

Am I too sensitive?

*Message #1 Posted by **David Ramsey** on 9 June 2003, 1:23 p.m.*

I've been collecting HP calculators since 1983. My collection (RPN scientifics) is complete, except for variations like a red dot 35. Recently I've been acquiring 41 accessories, like the cool HP-IL digital cassette drive.

I have one cassette for this drive. As we all know, nothing except a real HP cassette will work. I'd really like to have a couple more cassettes in case this one fails.

I see on the sale boards here that someone has a friend with a large cache of these cassettes that they're willing to sell in 10 packs. That's more than I want or need, but beggars can't be choosy, right? I know the cassettes are almost impossible to find.

Well, I guess they can. In response to an e-mail asking for price, I find the price for one 10 pack is $600, although if I buy two, I can get the second pack for a mere $300.

My reply was brief, and (I think to my credit) did not directly insult the sender or use any swear words. Basically I said I wasn't interested.

I dunno-- the Libertarian part of me thinks if they can get that much, more power to them. The HP collector part is kinda pissed off.

Am I too sensitive?

Re: Am I too sensitive?

*Message #2 Posted by **Paul Brogger** on 9 June 2003, 1:51 p.m.,*
in response to message #1 by David Ramsey

It's O.K. to be pissed off, even though you recognize the proximate cause (i.e., an irritating individual) is acting in a manner roughly consistent with your own philosophical beliefs. (After all, what kind of *philosophy* is it which simply holds "That is o.k. which doesn't cause me any discomfort"?)

Yes, it's unfortunate that "the market" as a whole will sometimes offer more for a desired item than a particular individual can justify. We can believe in the overall utility of letting supply and demand work, even while being occasionally stung by its effects in an arena of personal interest . . .

What seems unfair is that the seller is restricting supply by offering only batches of ten at what is probably a higher price than s/he would obtain were s/he to make them available in smaller quantities. But of course the seller needn't have made his/her supply of cassettes available at all, and you'd be no better off than you are now (except, perhaps, blissfully ignorant of their ready availability at an exhorbitant rate).

Bummer. Looks like you get to either get entrepreneurial (buy ten and try to sell a few to recoup some of your investment) or stay a careful buyer (wait and/or find another source of supply).

Anyone that pays $600 for 10

*Message #3 Posted by **Mike** on 9 June 2003, 2:20 p.m.,*
in response to message #1 by David Ramsey

has too much money. Prices shouldn't be over about $30 for new tapes.

You should be able to find bad tapes just to get the cartridge. Then for about $1 buy a new tape and change the tape media. Punch a couple of holes and you are in business for about $5.00

If you need a bad cartridge to respool, let me know and I'll send you one.

PS: Seller of the tapes. No need to reply to my email, if they are $600 per 10. Don't need anything that bad.

Edited: 9 June 2003, 2:22 p.m.

Hallelujah....

Collectors vs. Business people

*Message #5 Posted by **Michael Meyer** on 9 June 2003, 6:54 p.m.,*
in response to message #4 by David Smith

I remember lots of past threads with this issue: I once expressed my frustration with re-sellers who buy up everything they can only to re-sell at higher prices. It's great for profit, but bad for poorer collectors. (Even with some spendable income, there's a big difference establishing a collection of $30 calculators and $300 calculators.

Frustrating, but reality. Different goals. Both legit.

Only positive: my humble collection keeps going up in value.....though I'm not ready to sell them off yet. (They're... as Luiz says.... "my babies"....)

No, David, you're not being too sensitive. Just facing this now-becoming-age-old frustration.

Michael

Re: Am I too sensitive?

*Message #6 Posted by **Tony Duell (UK)** on 9 June 2003, 7:08 p.m.,*
in response to message #1 by David Ramsey

My first thought (as a user, rather than a collector) is that I've picked up 3 HP9114s for less than $600 total. The 9114 takes relatively easy-to-find 3.5" disks (the 720K DD type), and is a better bet for actually storing programs/data My second thought is that these tapes decay in storage anyway. The pressure pads certainly fail, and the bond between the tape and the leader also sometimes separates. Both these problems can be cured (I wrote an article about it in 'Datafile', the HPCC journal), but in any case, I'd not want to pay $60 per tape for something that needs repairing. I have a few, a very few (like about 5) of these tapes that are not in use (and AFAIK have never been used). I don't want to part with them, since I still use the 82161 sometimes, but if anyone _really_ needs one (as in, they have no other tape) and has something interesting to trade, then I might consider trading them. And I won't expect something worth $60 per tape either!

to heck with the cassettes,

*Message #7 Posted by **Norm** on 9 June 2003, 9:14 p.m.,*
in response to message #6 by Tony Duell (UK)

to heck with the cassettes, ask this Mr. Ramsey to send you a picture of his calculator collection. You will be most envious.

As to the greed thing, the seller sounds a bit greedy, certainly unhelpful. In his defense, it is impractical to just 'give stuff away' to try to be nice to people, but at the other end of the spectrum, greed should be kept down to a dull roar, and focus a little more on whether people are finding the right buyer for the merchandise (i.e. does somebody have a decent use for this thing).

That effect may seem subtle, but say I have a 32Sii to offload, and some guy who is just going to throw it in a file cabinet and never touch it will pay $250, but some starving college student who wishes to continue the HP tradition can only pay $199 . If I can get their respective stories straight, I'd go with the student for $199.

of course, its pretty hard to judge somebody else's need, that's why there is a marketplace with simple price tags attached.

If you bump into a seller who has triple-dosed on greed and wants you to pay his retirement, just smile and move on to another seller.

Re: to heck with the cassettes,

*Message #8 Posted by **David Smith** on 10 June 2003, 4:01 p.m.,*
in response to message #7 by Norm

Yeah, 60 bucks a tape is just way too much. You can often find a drive with a tape or two on Ebay for under that amount. And newish tapes have been bringing around $20 lately, used ones $10-$15.

Everyone needs to have the tape drive and some tapes as part of a collection or for demonstration, but the 9114 disk drive is a whole lot better for actual use... and lately they have been going for under $100.

Re: to heck with the cassettes,

*Message #9 Posted by **David Ramsey** on 10 June 2003, 7:54 p.m.,*
in response to message #8 by David Smith

Well, a fello who saw this thread has offered to sell me some new tapes in the $20/each range, so it's a happy ending for me.

I'll keep an eye out for a 9114 drive!

At $20 per tape they should be new

*Message #10 Posted by **Mike** on 11 June 2003, 5:15 p.m.,*
in response to message #9 by David Ramsey

Old tape are often very unreliable. Just be sure you are getting good or new tapes for $20 each. I have more bad tapes than good tapes. Bad tapes are a dime a dozen.

Michel, are you following this thread?

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 12:16 a.m.,*
in response to message #1 by David Ramsey

Hey, Michel;

I think many of your doubts are exposed, some answered, in here. A lot better than I could. And I think this is the best chance to ask for help...

Please, send me your last two e-mails again, because it seems I lost them. I could not open any of them again and I do not remember their contents quite well, and I know you may not even have their texts.

Thank you and sorry... As it is somewhat private, if you want to remove this post use the password 12345.

in response to message #12 by Richard Freeman (Australia)

The 9865A is a tape drive for the 9800 series of desktop calculator/computers. I wonder if it would work with my 9825A? I was unable to find any pictures of it...do you know how it connects?

Re: Am I too sensitive?

*Message #14 Posted by **Richard Freeman (Australia)** on 12 June 2003, 10:01 p.m.,*
in response to message #13 by David Ramsey

Sorry I dont know anything about it either just that Charles had it listed for sale. I was tempted to buy it on spec but I dont have any use for it at the moment and thought I would mention it here in case anyone here did...

Regards Richard Freeman

Swapping 9825 Keyboards - Possible?

*Message #1 Posted by **Mike** on 9 June 2003, 10:56 a.m.*

I have a 9825 that has the low profile keyboard. As with most of these, there is no snap in a couple of keys. I have two options.

1) To remove good snap switches from another keyboard or,

2) To swap a normal (high profile) keyboard with the low profile keyboard.

Since I prefer the normal keyboard, #2 seems like the better choice. Does anyone know if the normal keyboard is interchangeable with the low profile keyboard?

Same question for swapping from an "A" version to a "B" version or visa versa.

Thanks,

Re: Swapping 9825 Keyboards - Possible?

*Message #2 Posted by **Tony Deull (UK)** on 9 June 2003, 7:11 p.m.,*
in response to message #1 by Mike

I have an HP9825 with the 'full' keyboard and an HP9831 with the 'chicklet' one. Apart from the labels on some of the keycaps, the keyboards are identical -- the same number of keys, wired in the same matrix, with the same connectors. I assume the HP9825 'chicklet' keyboard has the same labels as the 9825 'full' keyboard, and that therefore they can be swapped without problems. The keyboard is essentially a matrix of switches, and AFAIK, you won't damage anything even if the wiring is different, so it's worth giving it a try.

hp48sx RAM module: what type of battery?

*Message #1 Posted by **andy delano** on 8 June 2003, 10:56 p.m.*

Hello,

As the subject states, I want to know what type of battery the RAM modules for the 48 series requires. Is it a CR2025?

I found my long lost 32k ram module while cleaning my garage (no wonder I couldn't find it...how on earth did it end up in my garage?...that certainly made cleaning it well worth the while!). I also found my sparcom ME applications pac which I still have the manual to!

Thanks,

Andy

*Message #2 Posted by **Randy Sloyer** on 8 June 2003, 11:25 p.m.,*
in response to message #1 by andy delano

Hp cards use 2016 3v coin cells. Don't know about the other brands.

I found a set of car keys that had been lost for two years in a box of nails in the garage. Seems it was at the exact height of my five year old, two years prior.

I let her play with car keys, but calculators, never.

Edited: 8 June 2003, 11:30 p.m.

Re: hp48sx RAM module: what type of battery?

*Message #3 Posted by **Thomas Rupp** on 9 June 2003, 5:20 a.m.,*
in response to message #2 by Randy Sloyer

Yes, the HP Cards use Batteries CR2016 - that means diameter 20mm and a high of 1,6mm. So the CR2025 has the same diameter, but is much higher. I own a 512KB for my GX and this card use also the CR2016.

greetings Thomas

Re: hp48sx RAM module: what type of battery?

*Message #4 Posted by **R Lion** on 9 June 2003, 8:41 a.m.,*
in response to message #1 by andy delano

My 128Kb HP card use a CR-2016. The same battery is used for my 512Kb from Cynox.

My 1Mb Klotz card use a CR-1216, much smaller.

Raul

Re: hp48sx RAM module: what type of battery?

*Message #5 Posted by **andy** on 9 June 2003, 11:40 a.m.,*
in response to message #4 by R Lion

This 32K ram card was actually sold by Smith Corona back in 1990-91 for their electronic type writers. They were a lot cheaper then the HP 32K cards and they work just fine (at least they do in my 48sx which has Rev A rom!...first shipment the bookstore received back in 1990).

Thanks for the answers...the CR2016 will fit.

Andy

hp85 hpil question and hp85-->hp75

*Message #1 Posted by **andy** on 8 June 2003, 10:25 p.m.*

I have an hp85 (with i/o rom and 82938a hpil module). The hpil module works fine when setup to for the 85 to be the controller. When the hpil module is set to be the non-controller I get an error 114 (non active controller) which makes sense because the 85 is probably trying to access a drive through the hpil module and in order for it to do that it needs to be setup as the controller.

The reason I have the hpil module set to non-control is because I'm trying to setup communications with my hp75 (with i/o rom). With the 85 on, I turn my 75 on and it beeps and recognizes the 85 automatically as ":C1". However, when I try to send something from the 75 to the 85 with the following commands respectively:

75: output ':c1' ; "hello" 85: enter 9; a$

my 75 acts like it sent the string "hello", but my 85 just hangs until I perform a reset at which time the 85 returns with error 131 "time-out".

I've checked and my hpil module is set to address 9 and non-controller. My hpil cables are working too. I've even run the i/o exercisor program and the hpil module is error free. These are the commands reccomended in the hp75 i/o rom manual for 75->85 communications.

Any advice?

By the way, after writing the above message I re-tried the above commands but this time using my hp71 and everything works fine. Does the 75 not attach a CRLF or something?

Thanks,

Andy

HP41C: successful transplantation (no more high consumption)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 9:56 p.m.*

Latest news: after receiving a donated RAY-xxxxx LCD driver, an HP41C with high-current consumption shows signs of full rehabilitation. Life signals are fine and current consumption lies under expected low values.

Thank you all, WAG mostly, for your support and interest. May these news help others, too. If you want to know more, former thread is: HP41C: High current consumption

Best regards.

Luiz C. Vieira - Brazil

Edited: 8 June 2003, 10:08 p.m.

*Message #2 Posted by **David Smith** on 9 June 2003, 10:43 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

The RAY-xxxx chip is the DC-DC converter/power supply chip. It was manufactured by Raytheon. It is apparently a bipolar (NPN/PNP transistor) technology and not CMOS.

Any possible replacement? Internal design?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2003, 12:01 p.m.,*
in response to message #2 by David Smith

Hi, David;

bipolar technology was supposed to be harder to toast than CMOS under certain circumstances... Anyway, bipolar components may drift and cause instability, too.

Thank you for your information.

Have you ever heard about RAY-converter internals or equivalent? Even if it is not pin-compatible?

Best regards.

Luiz C. Vieira - Brazil

Re: Any possible replacement? Internal design?

*Message #4 Posted by **David Smith** on 9 June 2003, 3:50 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

No, the chip is an HP custom chip. Only source would be another machine.

Heard any rumours about upcoming financial calc?

*Message #1 Posted by **Justin** on 8 June 2003, 8:41 p.m.*

Now that the 12cP is out, has anyone got any juicy info about what's next?

My dream would be something like a 17/19 BII with PC connectivity so one could use the computer for writing/proving Solver solutions and swapping data with the calc.

However, I spoke quickly to a guy at a calc shop here in Australia, and he said he didn't think PC connectivity was on the cards. I don't know what he was basing his info on, however.

Anyone have any bones to throw at all?

Edited: 8 June 2003, 8:42 p.m.

Re: Heard any rumours about upcoming financial calc?

*Message #2 Posted by **David** on 10 June 2003, 3:18 a.m.,*
in response to message #1 by Justin

I found this in an HP "industry analyst" newsletter from February 2003. I don't have the link anymore.

"HP has introduced two algebraic calculators designed specifically for the education market. These powerful new devices, the HP 9g and 9s, are the first products to be launched as part of the company's wider plans to enhance and develop a full range of Reverse Polish Notation (RPN) and algebraic calculators for education and financial users."

I was encouraged HP seems not to have given up on RPN, though I would be more reassured if they'd included "scientific" and/or "engieering" users in the above paragraph.

Change from 17b to 12c Platinum

*Message #1 Posted by **Bart De Keyser** on 8 June 2003, 6:43 p.m.*

Hi all,

It is the first time I have a look at this Forum and I think it is the ideal spot to help me :

1. I own a HP 17b, but the key of the "6" needs to be pushed quite hard to get it displayed. I own this HP since 1988 (sg. like that), so there might have come some dust between the keys, etc.. Is there any way to get this fixed ?

2. Since the 17 B gets more and more difficult to work with (see above - I need to be make sure I push the "6" hard enough, ... just imagine...) I am considering to replace it by the new 12c - platinum, especially because you can change the mode to normal algebraic. Would this be a sensible purchase or is there a better (HP) alternative ?

3. Any good European web sites who sells these things ??

Thanks, Bart

Re: Change from 17b to 12c Platinum

*Message #2 Posted by **Gordon Dyer** on 8 June 2003, 7:27 p.m.,*
in response to message #1 by Bart De Keyser

I would prefer to get a 17BII for algebraic entry as an alternative to RPN. It will me more familiar to you and is a much more powerful calculator then the 12C platinum with the advantage of menus and text prompts in the display. But that is my choice. I do have 3x 12C's and like them a lot, but I find for financial use the 17BII is much more useable and powerful, it just doesnt fit in my pocket!

hold your horses

*Message #3 Posted by **bill platt** on 8 June 2003, 7:32 p.m.,*
in response to message #1 by Bart De Keyser

Bart,

The 12c Platinum appears to have a number of bugs. And the algebraic mode does not have parentheses, nor precedence.

You should peruse this forum and do a search on the subjects that interest you, to see what is up.

The classic 12c is probably a better bet, though you have to make the switch to RPN--which is really a good idea, but then again, I am not biased ;-).

Bill

I agree with Gordon...

*Message #4 Posted by **Scuba Diver** on 8 June 2003, 8:12 p.m.,*
in response to message #3 by bill platt

...I'd go with the 17BII. It's exactly the same as your 17 however it allows you to switch between RPN and ALG modes.

I have a number of 12Cs, a 17BII and a 19BII and I use my 17 the most. At work, I have a 12C because I'm usually just doing some basic arithmetic, however I'm also a part-time MBA student, so I use my 17BII for class.

The 17BII was recently discontinued, so you can probably still find some new ones around. Personally, I'd find an older one on eBay. The newer ones (with darker bezel) aren't made with the same quality as the older ones, IMHO.

B.

Thanks for the excellent advice ! - nt.

Another version of "mint"

*Message #1 Posted by **Scuba Diver** on 7 June 2003, 11:54 p.m.*

I know we've talked about this before, but I thought I would share this one...it made me chuckle.

It's an auction for a "Like new" 17BII:

http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&item=3029346175&category=11712

Personally, I like the description, "Absolutely no scratch. The only difference between it and new one is the plastic cover."

Well, the plastic cover is ONE difference between yours and a new 17BII...I'm also thinking that the two dings in the bezel might be another one...

Maybe I need to reframe my definition of "mint"...

B.

Those are not dings

*Message #2 Posted by **Mike** on 8 June 2003, 12:50 a.m.,*
in response to message #1 by Scuba Diver

They are big friggin dents. :-)

I bought one one time that said no scratches and this showed up.

The seller also said the calculator had some slight corrosion that was removed. This is what showed up.

So, it's buyer beware.

Repairing a 9114 drive - Tutorial

*Message #1 Posted by **Mike** on 7 June 2003, 4:10 p.m.*

I've been working on a tutorial for repairing a 9114 disk drive.

Tutorial on repairing a 9114 drive

What do you think? Is this format helpful?

Re: Repairing a 9114 drive - Tutorial

*Message #2 Posted by **Dan** on 7 June 2003, 4:15 p.m.,*
in response to message #1 by Mike

OMG THanks!

Re: Repairing a 9114 drive - Tutorial

*Message #3 Posted by **David Ramsey** on 7 June 2003, 8:43 p.m.,*
in response to message #1 by Mike

Very nice! The only thing that I would add is that if the drive is like other double sided drives of the era, you should be careful not to drop the mechanism into the "disk inserted" position without a disk. Doing this could cause the heads to crash together, potentially damaging them.

Good tip

*Message #4 Posted by **Mike** on 7 June 2003, 10:25 p.m.,*
in response to message #3 by David Ramsey

The head definitely drops if you actuate the mechanism without a disk and this should not be done.

I will add that to the description.

Thanks, Mike

Re: Repairing a 9114 drive - Tutorial

*Message #5 Posted by **Tony Duell (UK)** on 9 June 2003, 7:29 p.m.,*
in response to message #3 by David Ramsey

I normally put a piece of lens tissue (available from good camera shops) between the heads of a double-head drive when dismantling it. This prevents the heads from damaging each other.

Re: Repairing a 9114 drive - Tutorial

*Message #6 Posted by **Bill Smith** on 8 June 2003, 2:12 p.m.,*

in response to message #1 by Mike

Excellent!

When i can locate a battery pack or power supply for mine, i'll be doing this too. Very helpful.

HP-71B

*Message #1 Posted by **John Kercheval** on 7 June 2003, 2:01 p.m.*

Any other users of the 71B out there? I have the 71, lots of modules and would like to discuss 71 topics with other users.

John in VA

Re: HP-71B

*Message #2 Posted by **Daniel Diggelmann** on 7 June 2003, 2:34 p.m.,*
in response to message #1 by John Kercheval

Hi John, Good idea. I've got only one (MATH) module but I like the HP-71B very much. I think it's the best calculator if you're interested in the HPIL. I'm mostly using it to control the HP 3421A Data Logger or the HP 3468A Digital Multimeter. For data storage I'm using an Omnibook 800CT plus docking station with the HPIL PC Card. EMU41 also works as a virtual mass mem with the HP-71B. I wish more modules were on the second hand market. It's hard to find any. The curve fitting module is one of the best I've seen. I once owned it and gave it away together with a circuit analysis module before I started collecting :(

Re: HP-71B

*Message #3 Posted by **John Kercheval** on 7 June 2003, 4:17 p.m.,*
in response to message #2 by Daniel Diggelmann

I use the Digital Cassette Drive for storage. I also use the HP41 Translator Pac. This is great as I can run all HP41 programs on it and can transfer by the IL. I am using the CMT 64K RAM module in the Card Reader Bay.

Re: HP-71B

*Message #4 Posted by **Tony Duell (UK)** on 7 June 2003, 6:25 p.m.,*
in response to message #1 by John Kercheval

I still use my HP71Bs (I have several of them) a lot. In fact I think it's one of the best HPIL controllers ever made. For that reason, I use it with the 3421 logger, and 82165 GPIO interface for homebrew hardware projects. I have several of the modules -- the 71B I use most of the time has the Forth/Assembler, Maths, AC circuits, and a 32K RAM module plugged in. I also have the 41 translator, finance, curve fitting, and Datacomms ROMs. HP71 BASIC Is a rather good version too, with named subroutines and parameters. Finally, of course, this is an 'open' machine -- all the internals were documented by HP in the IDS manuals -- I think they're on the MoHPC CD-ROMs, but I bought them as paper documents long before there was an MoHPC...

You can't have too many HP-71B

*Message #5 Posted by **Mike** on 7 June 2003, 10:40 p.m.,*
in response to message #1 by John Kercheval

I have 5 to 10 at any point in time. I think I have half a dozen right now. I have a couple that have CMT 128K Card Reader RAM and two 64K RAM in the front ports. Almost 300K.

I also have card readers for most of mine as well.

If I had to pick a favorite HP, it would be the HP-71B. It is still a very practical handheld for everyday use. The only drawback is that it's a little too big compared to a calculator but other than that, it's an awesome and very powerful computer.

I prefer to use the 9114 for mass storage than a digital cassette. Tapes are just too hard to find for the cassette and the 9114 isn't a lot larger. And the 71B can sit on top or right in front for a nice little package.

Re: You can't have too many HP-71B

*Message #6 Posted by **Michael Meyer** on 8 June 2003, 2:29 a.m.,*
in response to message #5 by Mike

I've said it before, but, I AGREE.

I love my calcs, all of them.

The 19C is my favorite for being spiritually admired, and the 67 is also a marvel. The 25 will always be my first love.

But, the 71B was my hobby all through med school. Despite eating left-overs from people's hospital trays and driving military ordinance (Mustang II = Pinto-- explodes on impact), I scraped up the money for a 71B.

I can still remember the first time I held it in my hand and typed in a command at the prompt. What a feeling of power! Prior to this, I had to run a stack of cards to high-level program. Now I could "blow away" those FORTRAN programs in a *personal* hand-held smaller than a stack of those cards.

And, with the 41 emulator, it has 5 calculators: 1. Basic command line math. 2. Built-in algebraic calculator. 3. RPN binary program (my favorite)...with overlay. 4. HP-41 RPN with keyboard overlay. 5. FORTH mode RPN.

(Do THAT on a 67....)

I would spray paint the overlays black, and then use white rub-on letters, followed by a clear-coat. I remember sitting at my girlfriend's apartment (now my wife of going on 17 years...) and carefully making the overlays on a coffee table.

I really only have one HP-71b. How many is too many? I think more than a couple is too many. But you can never have too many "spares"!!!!

RTN2RPN,

Michael

How many is too many?

*Message #7 Posted by **Mike** on 8 June 2003, 1:24 p.m.,*
in response to message #6 by Michael Meyer

When you have more 71b than you have modules and accessories-)

I have some with 128K Card Reader RAM. I don't like swapping things. So, when I want a card reader, I just use a different 71 with a card reader.

Also, you can't plug every module into a single 71B. Most of mine are loaded with RAM and only have 1 or 2 slots for application ROMS. So, I have one for 41 translator stuff and others for other things.

I guess I'd rather be lazy and have more, than efficient and have fewer :-)

Mike

Maybe U need one more ...

*Message #8 Posted by **Norm** on 8 June 2003, 2:40 p.m.,*
in response to message #7 by Mike

Maybe U need one more ...

It looks like a cool unit, but I suppose I have got an extra sitting here.

It's a shame but we all have to pick our favorites.

I am still most favorable to 34C, didn't have time, so far, to try out this 71B.

analogee@gte.net

I'd like to have at least one...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 3:05 p.m.,*
in response to message #8 by Norm

Hi, folks;

I always had the 71's as one of the fanciest designs ever. It looks as Voyagers' dad (or mom?), and Voyagers also have their place.

What bothers me about the 71 is the BASIC language. I know how to program in BASIC but I think it is (sorry, BASIC lovers!) boring... I know HPBASIC is a heavy implementation, and it is closer to HP85/75 BASIC (is it correct?). If it is at least C-based... Well, as a computer, even portable, battery-operated, it should have (and it has) a high-level programming language; RPN would be of no use for such a "big guy".

But it should not look so nice... I confess I'd like having one HP71 more for its look than to its functionality.

I'm being honest.

Luiz C. Vieira - Brazil

Re: I'd like to have at least one...

*Message #10 Posted by **Tom Scott** on 8 June 2003, 3:19 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi,

I like the looks and solid feel of the 71 as well as the functionality. Unfortunately (some 15 years ago) I sold mine along with various modules, etc. Realizing my mistake I purchased a "new" one from Educalc (while they were still in business) a few years ago.

Are modules (e.g., curve fitting) still available anylwhere for the 71?

Tom Scott - Lander, WY

I always thought...

*Message #11 Posted by **R Lion** on 8 June 2003, 3:26 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

...the same!!: it looks very nice, like a big Voyager...but BASIC, and I prefer my 48GX with 1280Kb and RPL (sorry, couldn't resist >:-)

Well you can try here (Sure you knew it yet)

Raul

HP-71B's BASIC boring !?

*Message #12 Posted by **Valentin Albillo** on 8 June 2003, 7:12 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Luiz posted:

"What bothers me about the 71 is the BASIC language. I know how to program in BASIC but I think it is (sorry, BASIC lovers!) boring... and it is closer to HP85/75 BASIC (is it correct?)"

I beg to disagree. HP-71B's BASIC is anything but boring, and for its time, it was (and still is) one of the best and most comprehensive BASIC dialects in the world. By itself, it has more than 240 statements and incredibly advanced features, but when extended with the Math ROM (which was meant to have been an integral part of the machine, ROM ID 2) and the HP-IL ROM, it's simply mind-boggling. Just to name a few:

- Full set of mathematical functions and operations, defined for either scalar values (in three precisions, INTEGER, SHORT, REAL), complex values, real matrices and complex matrices.
- Full 12-digit, 1000-decade range, the only BASIC ever to implement IEEE management of Infinities, NANs, and denormalization. No other dialect or language does it today, AFAIK.
- Single-line and multi-line user-defined functions and subprograms, passing parameters both ways by value or reference, and allowing recursion and separate environments.
- Multi-file, multi-type RAM file system, with independent RAM possible, handles several kinds of program and data files, including language extension files and binary programs and subprograms
- Event-driven programming possible, including programmable timers, errors, I/O events, hardware and software polls, etc.
- Incredible functionality for math, including Solve and Integrate with recursion allowed, Fourier transforms, polynomial root finding, gamma, hyperbolics, random number generation, and base conversions, to name a few.
- Incredible functionality for I/O, the best HP-IL loop controller anywhere, can control

up to 3 loops simultaneously, full range of both low-level and high-level I/O commands, full range of boolean operations.
- Soft and hard configuration to accept any number of external ROMs and RAM, up to 512 Kb addressing range.

and I could go on and on and on ... In short, there's nothing to even touch it, least in such a portable, small machine. I only find two flaws in its BASIC implementation: it doesn't allow two-dimensional string arrays, and it doesn't allow long names for the variables. And I guess even those could be overcome with a suitable LEX (language extension) binary file.

In real life, I've found that I can program most anything math related (incl. engineering problems, etc) in very few lines of HP-71B BASIC, and the resulting program is both easy to create and simple to understand and extend in a future date. Wish the same could be said of other languages/dialects.

As an example, I wrote a chess mate finder (which can in principle solve any "mate in N" chess problem) in some 90 lines of BASIC code. And the program listing is anything but boring, and easily understandable. Try that with your favorite calc language ! :-)

Best regards.

Edited: 8 June 2003, 7:19 p.m.

Re: HP-71B's BASIC boring !?

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 7:28 p.m.,*
in response to message #12 by Valentin Albillo

Hi, Valentin;

thank you for your (as always) clear explanations. I read about HPBASIC in an HP85B folder I have. I was aware of the fact it has many features, but I was not aware of some you posted.

Please, don't be mad! I have no HP71, I do not know HPBASIC; as I wrote, I find BASIC boring, not HPBASIC boring. But I am always ready to try...

I like structured languages, I do not like GoTO's and LaBLe's. I prefer "{" and "}" or "«" and "»" to hold complete clauses and sequences. As mentioned in all RPL-programming manuals (except HP49G's), one start point and one end point only. I know how to program in FORTRAN, BASIC and RPN (FOCAL?) but after RPL and C/C++ I found other programming directives.

Best regards, Valentin.

Luiz posted:

I read about HPBASIC in an HP85B folder I have. I was aware of the fact it has many features, but I was not aware of some you posted.

It's understandable because reading that HP85B folder will mislead you into thinking HP-71B BASIC is very similar to Series 80 BASIC (HP85, 86, 87, ...).

That's far from the truth. HP-71B's is a much improved BASIC dialect, far surpassing the one used in Series 80, even when using plug-in ROMs. Its advantages and distinguishing features are far too numerous to comment, but rest assured that reading about HP85 or HP86 BASIC will not give you an useable idea of the power and advanced capabilities of HP71's BASIC.

If you've got the HP71B manuals (Owner's Handbook and Reference Guide) I suggest you have a detailed look at them. After that, reading the 71B Math ROM Owner's Handbook is an enlightening delight, and further reading the HP-IL ROM manual will show its awesome I/O and controlling capabilities.

I'm confident you will see for yourself just how poor a picture that HP85B folder gave you, and just how HP-71B BASIC is the best BASIC for a pocketable computer, bar none, and one of the best high-level languages for technical applications, if not the very best. Wish it would be available for PCs ...

Best regards.

in response to message #15 by Gordon Dyer

Gordon posted:

"How about posting your Chess Mate program for all of us 71B lovers ..."

Thanks for your interest. A simple post of the listing wouldn't do for me because, as you may know, I'm all for proper, detailed documentation, kinda perfectionist. I'm about to create a web site of mine dedicated to HP calcs, and this particular program will be available there (together with many others), including extensive documentation, diagrams, sample problems solved, the works.

Also, it might be the case that I'll submit it to HPCC to be published in a next issue of their Datafile magazine, so you would be able to read about it there as well, should publication occur before my site gets the green light. In either case, I will post a message to this forum to let you know.

Best regards.

in response to message #12 by Valentin Albillo

Luiz, my friend,

Please e-mail me your address again, and I will see to it that you have an HP-71 to "try out". (Alas, to be honest, I probably do have, "too many". I went a little "overboard" last year as it is my favorite machine, and I now have several "spares".) Thanks to a nice gesture by Mike Davis, who sent me a couple too beat up to sell, I was able to give one to a high school buddy of mine, and still have one left I can send to you. It is certainly not "mint", but is fully functional, and is still a beauty to look at.... in my opinion.... it even has the IL module so you can use your HP-41 peripherals with it.

I want to see if you feel differently about the 71 after you've used it, also!

Giving back a small amount of what I've received here, Michael

You have mail...

$$$ Make money with your calculator junkyard

*Message #1 Posted by **Norm** on 7 June 2003, 1:15 p.m.*

$$$ There is a way you can make money with your calculator junkyard.

Here's how you do it:

Sell me the rubber keypad membrane from a SPICE calculator (i.e. HP-34C) etc. This is a cushioning piece that sits between the keytops and the dome switches.

No, I dont want to make my own out of a bicycle tire. I want a real one, and I am tired of trying to 'use the force' to make one appear out of thin air.

I'll pay you $6 for it and even throw in $1 for postage.

No damaged merchandize, if the kitty chewed the corner off then spare me the anguish.

That is how you make money with your calculator junkyard. Notify me at analogee@gte.net.

Surgery cannot start w/o parts from a donor.

PPC MLDL Project

*Message #1 Posted by **Jeff** on 6 June 2003, 10:26 p.m.*

Recently I began a project to produce the MLDL discussed in the PPC Journal. I have had some success and some failure with the Phase Counter portion of the PPC MLDL. I have narrowed it down to 4 wires that cause problems. Whenever I connect the SYNC to the Phase Counter at the CD4013 pin #5(data), this locks the calculator up. Also, whenever any of the three ground wires are connected to the same IC, CD4013, pins 4,8 and 10 this causes the calculator to phase out, display fades away and then the calc locks up. Any thoughts to this. I have connected everything else up and it seems ok. Also, if you look at page # 35 in this documentation and see the BAT, V+ and GND connections on the cable connector. Then look at page #28 They show the V+, VCC switched from the cable connector. As long as this is how they are connected it is ok but I thought that the V+ and VCC might be mixed. Any thoughts from the HP Community?

Re: PPC MLDL Project

*Message #2 Posted by **Ellis Easley** on 6 June 2003, 10:51 p.m.,*
in response to message #1 by Jeff

Please remind me what issue(s) of the PPC Journal so I can look it up on Jake Schwartz's CD-ROMs!

When the calculator display fades out, has the supply voltage fallen? You mention ground wires on a chip - on CMOS chips, all unused inputs need to be connected to GND or VCC (or a logic level) but not left floating, worst case both transistors on the input circuit can turn on and the chip draws excessive current - maybe enough in this case to pull down the power supply.

Because of the protection diodes on all inputs of CMOS chips (clamps to VCC and GND), and the low current requirement of the chips, input signals can be rectified and supply enough current to power a chip - maybe marginally - if the chip's VCC or GND pin is open.

Re: PPC MLDL Project

*Message #3 Posted by **Jeff** on 7 June 2003, 8:36 a.m.,*
in response to message #2 by Ellis Easley

PPC Calculator Journal V9 N3. Your help is greatly appreciated. There does not seem to be any mention in the documentation regarding the comments that you have made. I am assuming that it is left to the reader to have the full understanding of the CMOS chips. Please take a look at the circuit and let me know what or how you might wire this. Best Regards, Jeff

Re: PPC MLDL Project

*Message #4 Posted by **Donald Leonard** on 8 June 2003, 4:21 a.m.,*
in response to message #1 by Jeff

Now that you have given specific information regarding your problem with the PPC MLDL design, I'll try to give you some suggestions.

First, the comment about CMOS inputs being tied to ground or supply - that is correct, as is the comment that I.C.'s with floating inputs can draw EXCESSIVE current. In fact, ground is the preferred referance/connection in most designs. And my understanding of the port connections is that (looking INTO the calculator port, out of the MLDL plug, or INTO the BACK of the plug) Vbat is the first connection on the left, followed by B4, Vcc, B3, GND, PWO, DATA, FI, ISA, SYNC, 02, 01. Vbat is the battery voltage (RAM sustain voltage) and Vcc is a higher voltage generated by a power converter inside the calculator which powers the active/operational circuits when the calculator is turned on. They are not the same. Don

Re: PPC MLDL Project

*Message #5 Posted by **jeff** on 9 June 2003, 1:47 p.m.,*
in response to message #4 by Donald Leonard

Check out page 32 of the PPC Calculator Journal V9 N3. In this Phase Counter diagram, U1 (4013), Pins 3 and 11 are connected to 01. Pin 5 is connected to SYNC. Pin 6 is connected to the output from U19. Pin 1 is connected to Pin 9. Pin 2 is connected to pin 6 of U19.Pin 13 is connected to pin 5 of U19. Pins 4,8 and 10 are connected to GND. This leaves pins 7, 12 and 14. In this diagram it does not mention that pin 7 and 12 should be connected to GND. Also, Pin 14 is for VCC. Should this be connected to the calculators VCC? This same question holds true for the U19. Should Pin 7-13 be connected to GRN and Pin 14 connected to the calculators VCC? How about the U2 and U3. Should the Pin 8 on both chips be connected to GND and the Pin 16 on both chips be connected to the calculators VCC? In the document it only states that all unused "INPUTS" should be tied to GND. Also to test this Phase Counter, di I need to run all the output from U2 and U3, except CU4 and CT5, to GND? Sorry for all the questions But I am also learning as I go. Best Regards, Jeff

$$$$$$ Nobody wants HP-15C anymore $$$$$??

*Message #1 Posted by **Norm** on 6 June 2003, 8:31 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3028175897&category=11713

Wow, look at that HP-15C.

$455 and still got more than a day to go. Yah, nobody wants any of those.

I think the sellers who proclaim "new mint" just because they have the original carton, still dont have merchandise any better than the regular joe's. So it just becomes a good way to pay triple because the guy has the carton. It'll have the same scratches and cigar smoke odor as anybody else's merchandise.

Better to find a humble seller, than one who says 'its all perfect'. Usually there's something wrong with it anyway, its just that the guy had the original box..

This high-stakes 15C auction is like the horse races.....

and its Hero and Luckyday in a deadhead in the last lap

Hero is lagging behind, Luckyday out in front.....

Look at those hooves pounding folks, look at the dirt fly,

Hero catching up now, almost out front

No wait, here comes a 3rd horse up from behind ..... !

Ohhh .. my .. God .. folks .. this ... is .. un .. believable !

$200 box

*Message #2 Posted by **Mike** on 7 June 2003, 11:41 p.m.,*
in response to message #1 by Norm

The guy bidding it up, joined eBay within a day of that auction being posted. He's only been on eBay for 7 days.

Someone is paying far too much for a box. These 15C can be had in mint condition without a box for $300. That my friends is a $200 cardboard box.

Edited: 7 June 2003, 11:42 p.m.

dont like (0) bidders

*Message #3 Posted by **Norm** on 8 June 2003, 12:45 a.m.,*
in response to message #2 by Mike

Yeah, high bidder is about $510 and has (0) feedback.

Most sellers dont like (0) bidders. They are unverified and they have a high percentage of bozo's who just showed up and dont honor their bid.

I've noticed a seller strategy to "refuse" (0) bidders unless they specifically inquire. It is possible to cancel somebody's bid from your auction.

Last year they were going for $600

*Message #4 Posted by **Michael Meyer** on 8 June 2003, 2:31 a.m.,*
in response to message #3 by Norm

I still have printouts showing $600 sales last year.

Wow!

Doesn't mean someone isn't paying too much

*Message #5 Posted by **Mike** on 8 June 2003, 1:43 p.m.,*
in response to message #4 by Michael Meyer

A top price should be the price at which it's near impossible to find any for a lower price. Anything over that is overpayment.

I have bought many 15C in mint condition, without a box or manual for under $300. That means everything else is costing over $300 or $400.

Close to Mint $330 with better box

Like new 15C $360

But the real way you find the is to look for one that appears mint but not stated as mint. Sometimes you find jewels. Don't know about this one but it looks near mint.

Look near mint for $200

Anyone that pays $600, $800, or $1000 is buying a box for the additional.

I wonder what their definition of mint is. One of the foot pads seems to show a little wear. There also appears to be a scratch on the back on the left above the footpad. If that is the case, it's not mint.

Mint should not mean no big dents or scratches.

Re: $$$$$$ Nobody wants HP-15C anymore $$$$$??

*Message #6 Posted by **james (UK)** on 8 June 2003, 5:39 a.m.,*
in response to message #1 by Norm

And still a day to go - it'll be interesting to see what happens in the last few minutes!

My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #1 Posted by **Michael Meyer** on 6 June 2003, 6:44 p.m.*

Hi.

My community-fixed daily HP-67 is having problems. It turns on OK, and computes, etc., but after a brief time, the display "goes crazy". No, the nuclear lithium battery pack is STILL full voltage. (Same behavior with bench supply at 4.5V)

This was the unit that went through 2 ACT chips already-- Is this an early failure or is it a more common problem such as another capacitor failure?

Thanks!

Michael

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #2 Posted by **Ellis Easley** on 6 June 2003, 10:37 p.m.,*
in response to message #1 by Michael Meyer

This is just speculation -

You mentioned 4.5V, I understand this would be the voltage of 3 alkaline cells - fresh, they might be 4.75V, fresh alkalines seem to measure 1.58V no load. Also, NiCads under charge can get as high as 1.5V each. But the nominal operating voltage is called out as 3.75V, so 4.5V is 20% high, 4.75V is 27% high. The DC-DC inverter has an output of about +6V and -12V. This puts 18 volts across two pins of the ACT and maybe other chips. I don't think those inverter outputs are regulated (NiCads being a pretty well regulated supply) so I think the outputs would increase proportionally to the input, so there might be 21.6V or 22.8V across the ACT etc. with alkalines, at least.

What is the actual voltage of the lithium cells? Factor that into the calculations above.

Now, suppose voltage for these IC's is like blood pressure for the body's organs - necessary, but harmful if too high.

The fact that any number of calculators are working fine on lithium cells doesn't disqualify the argument, because every IC is a little different - how much statistical data was needed before medical science figured out how high "high blood pressure" is? And didn't they announce a few weeks ago that 120/80 is now considered borderline?

Maybe when using lithium (or alkaline) cells, we should wire some diodes in series to drop the voltage to NiCad levels, just to be safe.

It's either that or diet and exercise!

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #3 Posted by **Michael Meyer** on 7 June 2003, 1:56 a.m.,*
in response to message #2 by Ellis Easley

Ellis,

Not a bad idea. Fortunately, none of my other calcs have shown any problems with alkaline or other 1.5v cells. I don't think other forum members have reported any problems either.

But I'll bet you're on the right track... there must be something wrong with the power supply on this one calc. In times like this I miss my oscilloscope... I have to admit: even if it dies, I'll find another ACT chip some day, and I have a couple of other, even better, 67's. But this has been my "'ole faithful" daily machine, and the thought of deceased calculators.....well, I hate to see grown men cry... especially me.

Now this is interesting: As the display acts strange, it'll sometimes still read a card. I guess it could still be a faulty chip, but I'm wondering if it's something else. It always turns on correctly for a couple of seconds before progressively "freaking out."

Ring a bell?

Michael

Don't trust my service ideas, I usually have to rely upon the train tracks..

*Message #4 Posted by **Norm** on 7 June 2003, 2:16 a.m.,*
in response to message #3 by Michael Meyer

Hello,

If it runs good for awhile, and then it goes bonkers, I'd suggest that a bit of heating may be part of the effect. You turn it on and a semiconductor gets warm.

One fairly common failure in a chip, is that the bond-wire has become cracked where it hooks onto the silicon die. And that's all buried inside the epoxy. It works OK at one temperature, but then the temperature changes and the connection separates.

I'd be looking for stuff like that. Bad news if the problem is INSIDE a chip. Gotta find the bad chip and replace it.

GOOD NEWS is when you get the same effect on a circuit board connection. Maybe its at a solder joint, the solder joint is cracked, and with thermal changes, the joint opens.

*** ***

I'd be in there with three things..... a can of freeze-spray, a shrink-tube heat gun, and, my bare hands.

I'd flex the circuit board a bit to see if something is driving it nuts (an open solder joint) AND, I'd be shooting the chips with freeze spray, to see if one specific chip is thermally sensitive. Then just replace that one....

Re: Don't trust my service ideas, I usually have to rely upon the train tracks..

*Message #5 Posted by **Michael Meyer** on 7 June 2003, 2:33 a.m.,*
in response to message #4 by Norm

O.K. I won't trust your ideas.

But I will try them.

Can't do it now (1:30 am here), but I'll try this weekend.

Thanks! Michael

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #6 Posted by **Ellis Easley** on 7 June 2003, 2:39 a.m.,*
in response to message #3 by Michael Meyer

No, I don't have much experience using the 67. But the increased voltage could affect other chips as well as the ACT - in fact, I was reading something just the other day about how the Woodstocks and Spices, running on 2.5V, need to have the inverter generate 4V for the display. I think it was an HP Journal article from the introduction of the Woodstocks and spoke in comparison to the Classics so I guess the Classics powered the display from the battery directly. I wonder what they did on the 67, since it has the Classic battery and Woodstock insides! But regardless, the display driver chip - wherever it gets its power - might be sensitive to the extra voltage. Have you tried the machine on your bench supply at a lower voltage?

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #7 Posted by **Michael Meyer** on 7 June 2003, 2:47 a.m.,*
in response to message #6 by Ellis Easley

No, but I will.

Still, it worked fine for over a year (or so... clocks go so much faster than a few years ago.)

Again, I've not heard of any problems from others on the forum using alkalines in their Woodstocks, etc.

Michael

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #8 Posted by **David Smith** on 7 June 2003, 2:38 p.m.,*
in response to message #2 by Ellis Easley

The voltage converter circuit in the classics positively definitely DOES NOT LIKE overvoltage. The DC-DC converter circuit is trying to generate a 6V regulated supply by upconverting the input voltage. This is one machine where the voltage difference between 3 Nicad cells and 3 alkaline cells is enough to give the machine a case of the heebie jeebies.

HP Power supply inverters

*Message #9 Posted by **Tony Duell (UK)** on 7 June 2003, 6:31 p.m.,*
in response to message #2 by Ellis Easley

Actually, the outputs _are_ regulated (and were, right back to the HP35). The +6V output is sensed, and used to control the inverter oscillator (that's what the second transistor is for). The -12V line (and the +8V display line on the 'classics') just tag along. One feature of this design of PSU is that the +6V output can never be _lower_ than the input voltage (if the oscillator stops, then that output is the input voltage less one

diode drop). So never apply more than 6V (or so) to the battery contacts, or you will burn out chips. Topcats have another circuit to load the input down if it attempts to exceed the +6V line. Which is why if the inverter fails in a Topcat, it will draw a high current from the battery pack (about 1A), trying to bring that voltage down.

Suggestions for tracking down fault

*Message #10 Posted by **Renato** on 7 June 2003, 5:13 a.m.,*
in response to message #1 by Michael Meyer

A friend of mine used freezing spray and hot air (from a hair dryer) to track down faulty components. In your case, you might use hot air to make the problem appear, and then use freezing air to make it go away. This can help locate what component is failing. This friend used to say that a thermal shock, created by freezing a component, then suddenly heating it, could sometimes fix intermittent components.

Good luck,

Renato

Hey Michael, (tracking down a fault)

*Message #11 Posted by **Norm** on 7 June 2003, 12:55 p.m.,*
in response to message #10 by Renato

Hey Michael Meyer,

When they say 'tracking down a fault' dont trust them, that's actually referring to my pioneering method of using tracks.

I think there is even one other way to look at this problem, in terms of troubleshooting.

Philosophically speaking, you've been given one thing that is to your advantage: it works fine initially, then abruptly goes nuts. That's better than if it never even turned on.

When it goes bonkers, the goal is either to get it to return to normalcy, or, keep it from going there in the first place. Beyond that, determine WHY so that it can be repaired genuinely.

HERE is a further example: Put the darn thing in the freezer!! :o) Then run it for awhile from there, does it NO LONGER go bonkers ???? i.e. that proves its definitely thermal once and for all. Beyond that, you still have to find out what is expanding and contracting to open a connection, make a cap go weak, make an inductor coil open up, etc etc.

And you don't even have to take anything apart to put it in the freezer. SAY that it solves the problem (putting it in the freezer) well, after that, try putting it in the fridge. It just gives you add'l data.

Again, the fact that it works for awhile, philosophically, can be used to help troubleshoot it. I fixed a computer monitor for somebody a couple years ago. Worked fine for 30 minutes, then went nuts. The problem was ultimately traced to a cracked solder joint (it didn't flow right, then it cracked as well). After resoldering that joint, it always worked perfect after that. The 30 minutes was a thermal effect.

If the problem is INSIDE one of the chips, well, then you'll need to find replacements.

Just to say "Hi, Doc!" (n.t.)

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2003, 8:18 a.m.,*

in response to message #1 by Michael Meyer

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #13 Posted by **Tony Duell (UK)** on 7 June 2003, 6:39 p.m.,*
in response to message #1 by Michael Meyer

A couple of quick suggestions : (1) Have you checked the output of the PSU inverter (at pins 1 (+6.2V) and 2 (-12V) of the ACT chip with respect to ground (-ve battery terminal) when the machine malfunctions? (2) Check, and maybe replace, all the electrolytic capacitors on the logic PCB. There's at least one across the battery terminals, one in the +6.2V supply, 2 in the -12V supply (capacitive input doubler) and the reset capacitor connected to one pin of the ACT.

Re: My Dyslexic Agnostic Insomniac HP-67 is misbehaving again...

*Message #14 Posted by **Michael Meyer** on 7 June 2003, 7:46 p.m.,*
in response to message #13 by Tony Duell (UK)

Thanks, Tony, I knew you'd know.

I'm glad to hear that 4.5V vs. 3.6 (or so) is still OK. (It's just so darn convenient)

I put the calculator in the freezer, and, Voila (or as I like to say, Viola!) it ran for a couple of minutes without flaw.

I don't know why, but I also suspected one of those pesky capacitors.

I'll work on it tonight.

Michael

OK, Tony, I have the results:

*Message #15 Posted by **Michael Meyer** on 7 June 2003, 10:03 p.m.,*
in response to message #13 by Tony Duell (UK)

Hi Tony!

Well, on a bench suppy, pin 1 reads about 5 volts, but pin 2 only reads -8V, and progressively drops to about -5V as the calculator malfunctions.

Does that narrow down a specific capacitor?

Incidentally, lowering the supply voltage to 3.5 dims the display, but results in the same malfunction.

THANKS AGAIN!

Michael

Re: OK, Tony, I have the results:

*Message #16 Posted by **Tony Duell (UK)** on 8 June 2003, 7:51 p.m.,*
in response to message #15 by Michael Meyer

Well, they're both a bit low, but that -ve bias supply is probably the main problem. Near the top edge of the CPU board there are 2 2.2uF tantalum capacitors (maybe red beads with a green dot on them).Those are the caps for the -ve supply doubler. Check and replace those first. Nearby there's a larger, 22uF tantalum bead capacitor, which is the smoothing cap for the +6V supply. You might as well check that one too.

IT'S ALIVE (again....) THANKS ALL

*Message #17 Posted by **Michael Meyer** on 8 June 2003, 10:55 p.m.,*
in response to message #16 by Tony Duell (UK)

Thanks, Tony.

I hadn't heard from you, so I already fixed it, but with your "hint" about "two capacitors...".

The mystery isn't that it's working again. (Tthough I replaced the capacitors with 1uf capacitors. Do I need to change-out for 2.2?)

The real mystery is why it was working at all for the past year or so.

Yours Truly, "The Genious", had replaced those two capacitors long ago, but installed them BACKWARDS! (I think it was me... hard to say, as this board had repairs on it, I think, when I got it...) They must have worked "well enough"!

Anyway, is the value important enough to swap out for the 2.2's? The voltages now read about 6.1 and -12.something.

THE "DYSLEXIC AGNOSTIC INSOMNIAC" CALCULATOR lives again, thanks to everyone here. It's been quite the "survivor" and has come back from the dead several times now. It really now belongs to the Forum community, but I'll hold onto it for now. It does my finances and taxes, has taught my kids math, and gives me something to do while sitting in "the library" (lavatory). And I like just admiring it too! (It's a sickness)

RTN2RPN,

Michael

About capacitors...

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 11:30 p.m.,*
in response to message #17 by Michael Meyer

Hi, Doc;

Congrats, again! It's always good to receive good news.

About capacitors: inverting polarity is always a dangerous thing to electrolytic capacitors themselves, mostly if you are working close to 1/5, 1/4 (and upper) of their working voltage (it took me a while when I started working with electronics to figure WV meaning out) because they may become conductive, they will get actually hot and, in some cases, they will leak and even explode. If these capacitors are connected to signal lines, erratic operation may happen.

And using 2.2µF instead of 1µF will allow your calculator electronics to work under design specifications. I do not know in what sort of "point" are these guys connected to, but surely their original value will achieve better operation.

In any circumstances should a polarized capacitor (or any other component) be connected to inverted poles. But it happens, what else to do? The worst cases are semiconductors in general (zeners are easily toasted).

I do not know the HP67 internals so I decided to seat and watch.

Best regards, Doc.

Luiz C. Vieira - Brazil

Edited: 9 June 2003, 12:21 a.m.

Luiz-- I followed your advice.

*Message #19 Posted by **Michael Meyer** on 9 June 2003, 1:45 a.m.,*
in response to message #18 by Vieira, Luiz C. (Brazil)

Luiz,

Well, I went ahead and swapped-out the capacitors for 2.2uf. I can sleep nights, now, knowing my 67 is happy.

Make sure you check my post on the HP-71.

Michael

My HP67

*Message #20 Posted by **Howard** on 9 June 2003, 6:04 a.m.,*
in response to message #18 by Vieira, Luiz C. (Brazil)

All these troubles that Michael has been having with his HP67 are something like I'm having with mine. A couple of months ago I wrote in this forum about my HP 67. The problem was that the first seven lines of programe wrote the same incorrect imput. Then after the seventh line all was OK. It was suggested that it was a faulty chip and that there was nothing to be done about it. I put it in the back of my drawer and left it for a month or so. Anyway I took it out about five days ago and - Lo and behold it worked fine. Then a day or so later - the same seven line fault. Anyway I left it on battery charge for three days (I have 1700mAh batteries in it) and it works fine again. Maybe my HP 67 is voltage sensitive. Although when it didn't work properly it didn't make a difference whether it was on the charger or not. This calculator has a faulty card reader so it isn't important that I get it going as I have another. But it has me intrigued and this thread has given me a clue. I will now try it on alternative full and low powered batteries and see if this is the reason for its mysterious behaviour. Any suggestions would be appreciated. I don't have access to, or knowlege of, any sophisticated electronic instruments.

The square pad is "+" on HP calculator component holes...

I keep getting dumber.

*Message #22 Posted by **Michael Meyer** on 9 June 2003, 7:03 p.m.,*
in response to message #21 by David Smith

"The square pad is "+" on HP calculator component holes... "

I've been restoring these things for almost 4 years now. Been able by using my head and help here to get most every dead machine to work again. I have them polished, touched- up, and looking and working like new.

I never figured out the above statement, nor do I remember seeing it posted elsewhere. As I hit my forehead, I can see the square and round holes.

THANK YOU for stating the obvious. I'm not sure I would have ever figured that out.....

Howard: My calc DIDN'T turn out to be a voltage problem, but a "faulty" component problem. (Yep. They don't perform as well when "backwards." Darn Kids!!)

Yours does sound to me like a chip malfunction, but why it's intermittent, is beyond me. If those memory addresses are "fried", I'm not sure how they'd be intermittent.

Again, I defer those more knowlegeable than I.

Michael

And the square pad is pin one on chips...

Re: IT'S ALIVE (again....) THANKS ALL

*Message #24 Posted by **Tony Duell (UK)** on 9 June 2003, 7:16 p.m.,*
in response to message #17 by Michael Meyer

My guess is that the circuit will work fine with 1uF capacitors, but it won't be able to deliver as much current. This may not matter, or it may cause the machine to malfunction when hot, or when cold, or something. Personnally, I'd fit the 2.2uF ones -- they're not expensive or hard to obtain. One thing I forgot to mention last night is that on most HP PCBs (and certainly on this one), the sqaure pad indicates the +ve lead of an electrolytic capacitor, or pin 1 of an IC (or connector), or the banded end of a diode, and so on.

HP-51S Posted

*Message #1 Posted by **Ben Salinas** on 6 June 2003, 10:44 a.m.*

I finally got my calculator design posted. Right now there is no html file linking to the download. I will get around to that eventually. It's posted at www.series80.org/HP51S I would like to thank vassilip@ dsl.cis.upenn.edu (sorry i dont have a name) for the webspace. Basically if you download all the files and put them in the same folder, and run the .pdf. It will take you through and allow you to view all the other files. Sorry there is so many files. Originally, there was a single .zip file, but there was a miscommunication, and lack of explanation on my part so the zip file was unzipped to expose all the files. Hope you like it -Ben

in response to message #1 by Ben Salinas

Congratulations for designing an excellent entry.
I wish I had found the time to do one too, but it would be very similar to yours.

Re: HP-51S Posted

*Message #3 Posted by **Raymond Del Tondo** on 6 June 2003, 5:25 p.m.,*
in response to message #1 by Ben Salinas

Cool stuff. Congrats!

What I wasn't able to see in your pdf (maybe just overlooked it):

Are the keys levered on one side, so that you always have a defined movement of the key when pressed? This is a quality sign, and is the case with nearly all HP calcs prior the 49G. The 49G and its relatives doesn't have a defined movement direction. Please compare, and you'll know what I mean.

Thanks in advance.

Regards,

Raymond

42s dispaly

*Message #1 Posted by **jr ...Italy** on 6 June 2003, 10:10 a.m.*

greetings,

my 42s took a nastey fall from an anteena tower and the led is damaged. can anyone give me a source of repair or where i can get replacement parts. will the display from a 17bii work or any other hp. any suggestions are appreciated.

best regards

Re: 42s dispaly

*Message #2 Posted by **Paul Brogger** on 6 June 2003, 11:13 a.m.,*
in response to message #1 by jr ...Italy

A 17bII display will work fine.

Changing the display is a bit difficult. Seen the notes on "Pioneer Repairs" and Article # 199 in this Museum for some detail & recommendations.

Feel free to ask any more questions you may have, and good luck!

Woodstock Slide Switches

*Message #1 Posted by **Trent Moseley** on 5 June 2003, 3:41 p.m.*

I've been reading posts about lubricating Woodstock slide switchs with "Tri Flow". I have a 25C that is working fine, but I'm wondering if it would be a good idea to oil them. Can this be done without taking it apart?

tm

Re: Woodstock Slide Switchs

*Message #2 Posted by **hans brueggemann [ger]** on 6 June 2003, 11:25 a.m.,*
in response to message #1 by Trent Moseley

trent, the lubricant deposit in and around the switches is normally sufficient for a lifetime. the switches must not be 'oiled', but 'greased'. mineral oils may 'brittle'or deteriorate the plastics over time. teflon grease especially made for plastic parts worked fine for my -67. it is always a good idea to remove the residues of old lubricants completely before applying new lubricants, just in order to prevent mixing (with unpredictable long time results) of different blends.

cheers, hans

Metakernel install on 48gx

*Message #1 Posted by **David F** on 5 June 2003, 9:49 a.m.*

Hi, I have read all the readmes and install.txts, but I still do not understand how to install metakernel. I have the expansion card (how do I know if my hp48 recognizes it?). Could someone post a brief "what to do". Thanks!

Re: Metakernel install on 48gx

*Message #2 Posted by **R Lion** on 5 June 2003, 10:34 a.m.,*
in response to message #1 by David F

This is the way:

1-Merge port1: MERGE1

2-Transfer MKRAM.KER and store it: B STO

3-Transfer RECV.KER and store it: A STO

4-Put the name 'B' inthe stack and run A (push key A)

Mail me if you find any problem

Raul

How widely available is the HP 12C?

*Message #1 Posted by **Stan (Sg)** on 5 June 2003, 8:23 a.m.*

Has anyone seen the HP on sale in the US? The HP press release states the following:

"The HP 12c Platinum calculator is now available at retailers throughout the United States and Latin America and also can be purchased online at hpshopping.com"

It finally showed up as "in stock" on HP's website, but I can't find it on any of the web sites that HP refers to... The Educalc website in Singapore has it... anywhere else?

Re: How widely available is the HP 12C?

*Message #2 Posted by **Ellis Easley** on 5 June 2003, 9:21 a.m.,*
in response to message #1 by Stan (Sg)

A few days ago (Sunday), I tried all three US retailer websites that the HP website "located" for me - Office Depot, Officemax, and Staples. None of the websites had the 12C Platinum, one didn't even have the 12C. Then I called the local stores of all three chains - they never heard of the 12C Platinum.

Re: How widely available is the HP 12C?

Re: How widely available is the HP 12C?

*Message #4 Posted by **Roger** on 6 June 2003, 11:17 p.m.,*
in response to message #3 by adem ordna

The 12C Plat IS AVAILABLE! WWW.HP.COM and either going to the Home/Home Office area and chosing calculators which is HP Shopping.Com OR going to the small medium business (SMB) and then buy direct(upper right) and chose the software and peripherals (new) area. The HP calculators are under 'handhelds'. There is stock available, please feel free to BUY! Here are a couple URL'S. SMB is http://www.smb.compaq.com/sp_Main.asp?oi=E9CED&BEID=19701&SBLID= and look under handhelds then hp calculators and Hp Shopping.com URL is http://www.shopping.hp.com/cgi-bin/hpdirect/shopping/scripts/generic_store/generic_category_view.jsp?BV_SessionID=@@@@1278558680.1054955603@@@@&BV_EngineID=ccdeadcihllkejfcfngcfkmdflldfgf.0&landing=computers&category=calculators then look for the 12c Plat under the Financial ones.

Matrix Convolutions

*Message #1 Posted by **Valentin Albillo** on 5 June 2003, 6:10 a.m.*

Here's another little HP-15C Quiz/Challenge to try your hand with this weekend. Despite being focused on the HP-15C, the techniques used in the intended solution may be applied to many other models, such as the 42S, 41C/Advantage, etc. Also, it's not just a *theoretical* quiz but the solution is *very useful* as well, in the spirit of that wonderful book, "Calculator Tips & Routines", by John Dearing.

The question is, as you may know the Identity matrix is defined as a square matrix with ones on the main diagonal and zeros elsewhere, like this example, particularized for a 3x3 square matrix:

```
1  0  0
0  1  0
0  0  1
```

The HP-71B/Math can assign the Identity matrix to any square matrix using just one command:

```
MAT A = IDN
```

but there's no such operation in the HP-15C instruction set, so the challenge is:

Write a subroutine (LBL A, ..., RTN) which will convert matrix A, of arbitrary dimensions from 1x1 to 7x7, into the Identity matrix. The subroutine may assume that matrix A has already been dimensioned as a square matrix (1x1 to 7x7). The subroutine must be as short and fast as possible.

By the way, this *exact* topic is covered in the amazing "HP-15C Advanced Functions Handbook", page 119, under the title "Constructing an Identity Matrix". There, the very creators of the HP-15C microcode software give their attempt at constructing the Identity Matrix. However, though most of the programs and routines in that book are extremely optimized, that's not so in this case. Their published routine, particularized for matrix A, is 12 steps long (including LBL and RTN), and takes 32 seconds in the case of a 7x7 matrix.

On the other hand, my solution is 2 steps shorter (i.e.: 10 steps long, including LBL and RTN) and some 10 times faster (i.e.: 3 seconds for a 7x7 matrix). Let's see yours !! :-)

Edited: 5 June 2003, 9:24 a.m. after one or more responses were posted

Re: Matrix Convolutions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2003, 7:09 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin, folks;

This is my suggestion. It is 10 steps long when counting program body only (not counting LBL 0) and runs fast. I tested with a 5×5 matrix and it took aprox. 4 seconds. I took the advantage of recalling row number an storing it as line number instead of testing if both are equal. That's the key for speed and size.

Thanks for the challenge; I had to stop and think of it carefully. Hope you like it.

Solution: enter matrix descriptor in X-register and press [GSB] 0

```
001 [f] LBL 0
002      0
003      ×
004     STO I
005 [f] MATRIX 1
006 [f] LBL 1
007     RCL 1
008     STO 0
009     EEX
010   ᵘ STO (i)
011     GTO 1
```

Obs:

1) steps #2 and #3 ensure matrix is cleared and may be suppressed if you are using only recently created matrices
2) step #4 sets descriptor in X-register as index
3) step #10 must be keyed in in USER mode

Best regards.

Luiz C. Vieira - Brazil

Edited: 5 June 2003, 1:38 p.m.

Re: Matrix Convolutions

*Message #3 Posted by **Patrick** on 6 June 2003, 10:55 p.m.,*
in response to message #1 by Valentin Albillo

I have been trying my hand at your latest quiz, Valentin, but I have so far been stumped as to how you get the speed you claim!! Hats off to Luiz for a very credible solution. Luiz, between us we have to beat this guy's time somehow!?

I have an idea for a solution which, alas, does not work for a matrix when all you have is the descriptor in the X register (I call this a paramterized matrix). I think it will work easily enough for, say, matrix "A", but not for a parameterized matrix.

I will describe my algorithm in the case of a 3x3 identity matrix, without providing a corresponding keystroke program:

1. First, create a 1x3 matrix and store all ones in it:

```
A = [ 1 1 1 ]
```

2. Resize this matrix to 4x3. The 15C will automatically supply zeroes for the new elements.

```
A = [ 1 1 1 ]
    [ 0 0 0 ]
    [ 0 0 0 ]
    [ 0 0 0 ]
```

3. Transpose into a 3x4

```
A = [ 1 0 0 0 ]
    [ 1 0 0 0 ]
    [ 1 0 0 0 ]
```

4. Resize to 3x3. When this happens, the 15C will read the elements from the current matrix in "book" order and place them into the new matrix in "book" order. Excess elements are discarded. This gives you:

```
A = [ 1 0 0 ]
    [ 0 1 0 ]
    [ 0 0 1 ]
```

Voila!

Most of this can be done easily with a parameterized matrix and I suspect that this would operate very quickly since most of the functions are native 15C MATRIX functions and not very complex ones at that (not like matrix inverse).

The part that is hard in the parameterized case is to store all 1's into the original 1x3 matrix. You can do this easily with a known matrix but not so simply when the target matrix is parameterized. For some reason, you cannot say [STO][(i)] when X is an integer and I is a matrix descriptor. Of course, you could always multiply the matrix by zero and then add one to it, but that is totally inelegant and I won't go there! ;-)

Try this listing

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2003, 1:34 a.m.,*
in response to message #3 by Patrick

Hey, Patrick;

Thank you for your words, but you know what? Your solution is a lot clever. I implemented it, but I used a large number of steps. Maybe you can reduce it.

```
001 f LBL any
002   STO RESULT
003   STO I
004   0
005   ×
006   1
007   +
008   RCL DIM I
009   1
010   x<>y
011 f DIM I
012   +
013   x<>y
014 f DIM I
015 g R^
016 f MATRIX 4
017   Rv
018   ENTER
019 f DIM I
```

The program will take the number of rows as a reference and consumes a lot of time filling matrix with ones (lines 4 to 7). I tried using these steps when indexed matrix was a single-line matrix, after step #11, but it would increase stack manipulation and a few extra steps, so I decided for a "shorter" routine instead of a faster one.

Again, if step #2 is removed, step #5 (×) returns the matrix descriptor defined as result. Default definition for RESULT is matrix C and I forgot to add STO RESULT in my first listing, so step #5 (in fact, #4 if step #2 is removed) returned [C 3 3] in the display.

I hope this is what you had in mind.

Hey, Valentin, your turn now...

Best regards.

Luiz C. Vieira - Brazil

Edited: 7 June 2003, 3:11 a.m.

A faster, longer version

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2003, 8:08 a.m.,*
in response to message #3 by Patrick

Hey, Patrick;

I tried a faster (and it is) instead larger (2-bytes "plus") version for your algorithm and got this one:

```
001 f LBL any
002   STO RESULT
003   STO I
004   RCL DIM I
005   ÷
006 g LSTx
007 f DIM I
008   RCL I
009   0
010   ×
011   1
012   +
013   Rv
014   +
015 g LSTx
016 f DIM I
017 g R^
018 f MATRIX 4
019   Rv
020   ENTER
021 f DIM I
```

The program will take a square matrix in X-register. Filling a single-line matrix with ones (lines 9 to 12) is somewhat fast (faster than mine), but this routine is 2-steps longer than previous version. Maybe you can still reduce it (I did not try that hard to shrink it...)

Best regards.

Luiz C. Vieira - Brazil

Matrix Convolutions: no one else?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 1:11 p.m.,*
in response to message #1 by Valentin Albillo

Hey Valentin, Patrick;

It seems it's only us in this party. To be honest, I posted to keep it for two more days... Sorry, Dave :)

Patrick, I want to know if you tried the programs I posted. Any comments? I found no other way but the "unelegant" (you called it so...) *0 × 1 +* to fill the indexed matrix with "ones". Have you seen how fast is your solution? Except for feeling the matrix (an internal loop), the absence of "user" loops makes it faster.

Best regards.

Luiz C. Vieira - Brazil

Edited: 8 June 2003, 2:09 p.m. after one or more responses were posted

Re: Matrix Convolutions: no one else?

*Message #7 Posted by **Patrick** on 8 June 2003, 2:03 p.m.,*

in response to message #6 by Vieira, Luiz C. (Brazil)

Hey Luiz

Thanks for your great implementations. I particularly liked the way you used divide to get the value 1 you needed in the second version. Quite clever stack manipulations.

I did key in your program and tried it in SST mode. Quite cool.

I've had another idea overnight that might make things better, although I haven't thought things through yet this morning. The idea is to overcome the difficulty of setting the parameterized matrix to all one's by using a second, non-parameterized matrix. You set, say, matrix "E" to all ones, then you do some sort of operation with E, with RESULT set to your parameterized matrix. It could turn out that "E" is the very same matrix as the parameterized one, but I don't think that matters.

What I don't like about this solution is the fact that you have to use another matrix. On the other hand, you can just barely fit all this into memory. If you think about memory usage you get:

Max size of parameterized matrix = 7x8 = 56 elements. Max size of temporary matrix = 1x7 = 7 elements.

Total = 56+7 = 63 elements out of 64 available. This doesn't leave you much program space, though! This leads me to believe we are on the right track. Unfortunately, Valentin has not been forthcoming on his incredibly optimized solution. We'll just have to wait for the master to educate us!!

If the HP15C has more memory...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 4:01 p.m.,*
in response to message #7 by Patrick

... we'd be claiming for more! Human beings are not easy to satisfy as for their (our) needs...

About the HP15C memory: if we look at the 2×2^n growing ($64 = 2^3 \times 2^3$), than the next step would be a 16×16 maximum matrix, that would lead us to 256 registers and 1792 bytes of memory, what is equivalent to the HP41's Quad Memory Module. Cool!

Back to business: thanks for your comments. I try to keep low-profile, stack-mostly solutions, but there is always a limit. When you have fixed-partition memory (HP65, HP55, HP67/97, HP25, HP33... any others?), using registers is up to you, but when movable partition is the case (HP34, HP38, all Voyagers, Coconuts, HP42... others?) then using numbered registers mean at least nine extra bytes. Yes, nine: the seven bytes used by the register itself and both STO / RCL to access it's contents. A lot of people forget about that: what is a register good for if you do not store something there for later retrieval? The best case is when you manually store something in a register before running a program, so you'll use only one RCL, meaning eight bytes. I thought an article about Stack Manipulation × Storage Registers would be a good reading, but I didn't got through it so far.

In my first version, I considered any matrix descriptor in X-register, so I could not use the

```
   ÷
[f]LSTx
```

trick: X- and Y-register contents might be different, and I mentioned I used column numbers as reference, remember? As it was not an orthodox maneuver, I thought considering a square-matrix in X-register should not be accomplished. In the second version, this is mandatory to reduce program steps. Also, I could use the remaining "1" in LASTx (step #7):

```
001 f LBL any
002   STO RESULT
```

```
003   STO I
004   0
005   ×
006   1
007   +
008   RCL DIM I
009 g LSTx
010   x<>y
011 f DIM I
012   +
013   x<>y
014 f DIM I
015 g R^
016 f MATRIX 4
017   Rv
018   ENTER
019 f DIM I
```

provided matrix in X-register is a square matrix. Anyway, final listing has the same number of steps (I did not check for bytes).

As you mentioned, let's wait for Valentin's final words. I'm curious a lot to see his version.

You know, I tell my students that the best thing in a math problem is the fact that each math problem, in most of the cases, accepts many, many solutions. There are rare math problems with only one solution and others with no solution. Then we can use a human solution that, in most cases, is a simple behavioral change so the original math problem no longer exists and the new one has a solution, now.

Best regards.

Re: Matrix Convolutions

*Message #9 Posted by **Valentin Albillo** on 8 June 2003, 6:43 p.m.,*
in response to message #7 by Patrick

Hi, Patrick, Luiz, & everyone else following this thread:

First of all thank you very much for your interest in my humble 15C quiz, I've found your solutions and ideas very interesting and imaginative, to say the least. You both certainly are accomplished 15C programmers, knowing every hook and cranny.

However, may I point it out that interesting as your code is, it is trying to find a solution under *extended conditions* not originally asked for (such as starting from a matrix descriptor in the X register), which are not required in my original challenge. May I bring to your attention the fact that the only condition explicitly mentioned and required is that the routine expects a square matrix A to have been previously dimensioned (from 1x1 to 7x7). That's the solution the quiz is asking for.

So, you don't need to rack your brains for a general solution which will work for any matrix the user cares to pass in the X-register or I-register or whatever. Just make it work for a square matrix called 'A', which is passed *nowhere*: the subroutine simply assumes it has been previously dimensioned and works with it. Of course, the solution can then be easily altered to work with an arbitrary matrix, but that's not the point.

Under that original condition, I can state that there is a solution in *10 steps* (including LBL and RTN, i.e: 8 steps for the body of the subroutine) that can construct the Identity matrix for any matrix A ranging from 1x1 to 7x7, and taking *3 seconds* for the 7x7 case. (Your routine *must* include a final RTN, as you may not assume it can be placed right at the end of the program, there may be other subroutines as well and not all of them can be placed at the very end)

Luiz's first solution is a worthy first attempt, taking 12 steps (including LBL and RTN) and some 8 seconds for a 7x7 matrix. But you can do better ! Just stick to the original specifications, right ? :-)

I'll wait for any and all improved solutions under the condition given, and in any case will post my own next Tuesday. It really shows just how well all of HP-15C's command set instructions work together, complementing each other incredibly nicely.

Again, thanks for your interest and best regards.

[P.S.] Patrick, I did send you a second batch of documents, but never received your confirmation. Did you get them ?

This must be it!?

*Message #10 Posted by **Patrick** on 9 June 2003, 3:37 p.m.,*
in response to message #9 by Valentin Albillo

I think I have it, Valentin. Here is a 10 step solution which runs quite fast. I think the speed is in the same ballpark as yours, approximately 3.6 seconds for a 7x7: it took exactly 6 minutes to execute 100 iterations, including the timing loop's control code.

Here it is, written specifically for matrix A:

```
001    LBL A
002    0
003    STO MATRIX A     // zero out the matrix
004    f MATRIX 1       // set R0, R1 to 1
005    x<>0             // set R0 to 0, X to 1
006    LBL 1
007    STO + 0          // bring R0 up to the same value as R1
008 u  STO A            // store 1 in next diagonal element
009    GTO 1
010    RTN
```

The small "u" on step 008 means to code this program step in User mode so that the values in R0 and R1 are automatically incremented. This also ensures that step 009 will be skipped at the end of the matrix.

The operation of this routine is quite simple. After storing zero into all elements of the matrix, it steps through just the diagonal elements setting them equal to one. Step 007 is used to make sure the row number keeps up with the (automatically incremented) column number.

It took me a long time to go from a previous 11 step solution to this one, the trick being step 005 which replaced two previous instructions.

Once again, thank you Valentin for providing such an entertaining challenge! Much enjoyed.

P.S.> Valentin... yes thanks for your second mailing. Will respond to you about it shortly.

Re: This must be it!? (parameterized)

*Message #11 Posted by **Patrick** on 9 June 2003, 4:23 p.m.,*
in response to message #10 by Patrick

The solution for the parameterized case is much less elegant, but executes in about the same amount of time.

Assuming a matrix descriptor for a square matrix is in X:

```
001   LBL A
002   STO I          // need to use indirect matrix calls
003   RCL DIM I      // get original dimensions into X,Y
004   0
005   f DIM I        // deallocate target matrix
006   STO 0          // prepare R0 for later iteration
007   Rv             // original dimensions --> X,Y
008   f DIM I        // restore original matrix dimension
009   1
010   STO 1          // prepare R1 for iteration
011   LBL 1
012   STO + 0        // make R0 equal R1
013 u STO (i)        // store 1 into diagonal element
014   GTO 1
015   RTN
```

The loop LBL 1 is pretty much the same as before. What is different is all the kafuffle in getting the matrix to be initially equal to zero. I chose to redimension the matrix to zero and then restore it rather than multiplying the matrix by zero. The latter technique would require fewer program steps but longer execution time -- the traditional tradeoff.

It is really too bad you can't say [STO][MATRIX][I] (or perhaps [STO][MATRIX][(i)]) with a scalar in X. This is just a strange quirk in the 15C's instruction set. Other very similar commands allow the use of the indirect register. Maybe the 15C Plutonium will fix this quirk!

Congrats, Patrick!

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2003, 5:21 p.m.,*
in response to message #10 by Patrick

Hi, Patrick;

if this is not the answer, than Valentin has another solution. Congrats! Great programming.

And Valentin, about this post: your comments are perfectly correct. I just should add "In a math analysis..." at the beginning.

I second Patrick in his words. This was teasing.

Best regards.

Luiz C. Vieira - Brazil

Re: This must be it!?

*Message #13 Posted by **Valentin Albillo** on 10 June 2003, 4:34 a.m.,*
in response to message #10 by Patrick

Hi Patrick, Luiz, and everyone following this thread:

Patrick posted:

"This must be it !? I think I have it"

Yes ! Congratulations !! :-) My original solution was:

```
    LBL A
    CLX
    STO MATRIX A
    MATRIX 1
    X<> 0
    LBL 0
    STO+ 0
```

```
"u" STO A
    GTO 0
    RTN
```

so, as you can see, yours is identical but for the trivial change of "LBL 1" instead of my "LBL 0", and yours using "0" instead of my "CLX". "CLX" executes *faster*, as it doesn't have to roll up the stack, etc, as "0" does.

I think this solution is unique and can't be bettered. Matter of fact, it relies on two happy 'coincidences':

- the fact that the "0" used to blank the matrix is precisely the value needed to initialize the index
- and the fact that the "1" needed to fill up the main diagonal is also the exact value required to sync up the row index with the column index !

Where it not for those two 'coincidences', the routine would be longer.

Now you can also see why I 'insisted' in a specific matrix A, instead of a parameterized, arbitrary matrix in the X or I registers: there's *no* STO MATRIX I or STO MATRIX (i) instruction, so the solution would be longer, less elegant. :-)

As a final remark, if this routine were to be used repeatedly in an actual program, it could be made *one step shorter and somewhat faster* by making use of the rarely seen *rapid reverse branching* technique: the main program would store the proper line number, then it would call the routine, like this:

```
      ...
36    92
38    CHS
39    STO I
      ...
47    GSB A
      ...
63    GSB A
      ...
87    LBL A
88    CLX
89    STO MATRIX A
90    MATRIX 1
91    X<> 0
92    STO+ 0
93"u" STO A
94    GTO I
95    RTN
```

The "GTO I" would branch to step 92, "STO+0", so the loop consists of only three steps, and runs faster. Besides, the GTO itself is *much faster as well*, as it goes *directly* to step 92, without performing a very time-consuming search through memory for "LBL 0".

Very glad that you liked my little quiz, congratulations again for finding the correct solution, and thanks for your kind comments and keen alternate techniques, the transposition trick is really neat.

Best regards.

Edited: 10 June 2003, 5:07 a.m.

To go where no one has gone before....

*Message #14 Posted by **Patrick** on 10 June 2003, 3:02 p.m.,*
in response to message #13 by Valentin Albillo

You know, I already had a program to do this very thing written down in my programming notebook before I read your challenge. Looking back on it now, I shudder at its awkward and inefficient algorithm. However, it was only when I read your challenge that I was inspired to improve upon it.

In fact, it is a common trait of problem solving that it is much easier to find an optimized solution when one is *known* to exist. It is much, much harder to find that solution in the first place, when failure and doubts are your constant companions.

Congratulations to you, Valentin, for deriving such a great piece of code without having the benefit we had of knowing such a thing even existed.

To say the least, I look forward to your next challenge.

Re: Matrix Convolutions: no one else?

*Message #15 Posted by **hugh** on 9 June 2003, 9:24 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

i had a go, but couldnt come up with anything to beat your original posting.

i thought maybe i could divide the matrix by itself. eg DUP / as a cockey answer, but firstly, it doesnt give exactly the identity and secondly you cant set the result to the original.

.. im still wondering if there a mat op that might avoid a loop altogether.

Re: Matrix Convolutions: no one else?

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2003, 12:06 p.m.,*
in response to message #15 by hugh

Hi, hugh;

the ENTER / is actualy a solution, based on identity matrix definition and divide actual operation, that is 1/x × (times the inverted matrix). I thought about it first as a guess, but we have two extra problems:

1 - memory space (only up to a 5 × 5)
2 - running time

And for the HP15C, as you mentioned, the need to define a RESULT matrix. If you do'n't do that you'll get an error message.

Thanks; it's always good to hear from others. When I have no adequate or "competitive" answer, I seat and watch, too.

Luiz C. Vieira - Brazil

Re: Matrix Convolutions: no one else?

*Message #17 Posted by **Valentin Albillo** on 9 June 2003, 1:04 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Luiz posted:

the ENTER / is actualy a solution, based on identity matrix definition and divide actual operation,

that is 1/x × (times the inverted matrix)

Actually, regardless of the horrible timing (more than 1 minute for a 7x7 matrix, if it were possible) and accuracy (rounding errors while inverting and multiplying), it's not a solution at all, because:

- Obviously, filling a matrix with the elements of an Identity matrix must be independent of the actual matrix contents when the routine is called. Else, if the matrix happens to be singular (or nearly so), or even more commonly, has just been dimensioned and thus all its elements are zero, this procedure will fail and will not produce an Identity matrix at all. Matrix inversion is not defined for singular square matrices (analogous to division by zero), and though the HP-15C doesn't give an error and inverts instead a slightly changed matrix, the final result after multiplying is not an Identity matrix in that case.

- The HP-15C only allows the "division" operation between two matrices placed in X,Y if X is *not* the result matrix, so either it won't work at all or else you would need another temporary matrix of the same dimensions and specify the result matrix accordingly.

Best regards.

HP-45 VS HP-67

*Message #1 Posted by **Frederic** on 4 June 2003, 9:21 p.m.*

Hi, i'm not a collector but like led calculators and i'm looking for a HP-65 OR a HP-67 on eBay. I know the HP-67 is newer and more powerful than the HP-65 and were two popular selling market. So when looking at prices on eBay, i saw that the 65 fetch about 50% more than the 67 for the same condition. Today a 65 fetch twice a 67 for same condition! Why? They look like the same quality no? Appart that the 65 is the first programmable on the market, what is driven the price up of the 65?

thans you for answering my newbies question on this Forum

Fred from Canada

That's your answer, Fred. The HP-65 is one of the Great Originals in the HP calculator line, while the HP-67 (while more powerful, versatile, etc.) is just a sequel.

Of course, we're talking about sensible people here. Ebay, however, is an entirely different matter. Just about any crazy price you care to imagine has been asked for just about any piece of trash -- and what depresses me -- there's always someone who pays for it.

Re: HP-(6?)5 VS HP-67

*Message #5 Posted by **db(martinez,california)** on 5 June 2003, 1:43 a.m.,*
in response to message #2 by Ernie Malaga

my guess is that there were more 67's sold. it was in production longer and was cheaper too. it is also possible for a 65 to be almost ten years older than a 67, so the 65 had a lot more time to be thrown away or run over or whatever. being more rare can't hurt the price of the 65.

me, i have fond memories of my favorite boss, good old john lopez, banging out the horizontals on his 67 and copying them by hand onto my 41/thinkjet printout of the elevations. we really felt hi-tek, well hood of the truck hi tek anyway. and back then we were.

i never even held a 65 till i found one at the sal (the writer grins luridly) for three bucks.

Re: HP-(6?)5 VS HP-67

*Message #6 Posted by **Ernie Malaga** on 5 June 2003, 3:56 a.m.,*
in response to message #5 by db(martinez,california)

My only contact with an HP-65 was in college. A friend of mine borrowed one from one of his friends, and I got to teach him how to program the machine. My previous experience with HP calculators was with an HP-25 only, but I had read plenty about the 65.

That machine was already old, and the card reader made the whole calculator vibrate when engaged -- but it still worked. This was 1977, so the 65 couldn't have been more than 5 years old, right?

Shortly afterward I sold my 25 and bought a 67, brand new, which sounded like a baby rattle whenever I shook it. But hey -- at least the card reader was healthier! 8^)

Re: HP-65 VS HP-67

*Message #7 Posted by **David Ramsey** on 5 June 2003, 11:47 a.m.,*
in response to message #1 by Frederic

As others have noted, the 65 was the first handheld programmable calculator, and thus is more interesting to a collector.

But you said you're not a collector, which implies you might actually want to USE the calculator. The 67 is much more powerful than the 65 and is definitely the one to get in that case.

Be aware that in either case you should check to make sure the card reader functions. The rubber roller that pulls the cards through the reader disintegrates in about 20 years and virtually all of the old card reader calcs

you see will have this problem. It's repairable, though.

HP95lx prototype pictures and short commentary

*Message #1 Posted by **Edwin Herdman** on 4 June 2003, 9:10 p.m.*

(Note that the pictures here average ~300K in size, and all are wider than the average PC monitor resolution. Originally posted at the Digital Press Forums, just a few minutes ago.)

http://home.attbi.com/~edoscuro/hp95lx_reboot.jpg

Welcome to Jaguar! I've managed to score a Hewlett-Packard 95lx, one of the pioneering handheld devices that started the "handheld computing craze" in 1991. I made a promise a long while back to post pictures at the web's foremost HP portables museum, and I've finally made good on that promise.

http://home.attbi.com/~edoscuro/hp95lx_sys_settings.jpg

This system prototype dates from summer 1990 at earliest, when the specifications for this system were changed from 512K ROM and 128K RAM and a target price of $595 to a whopping 1MB ROM and 512K RAM, with the target now $699.

http://home.attbi.com/~edoscuro/hp95lx_back.JPG

The apparently ad-hoc nature of the prototype number on this unit (P148) leads one to suspect that this was the 148th prototype from the whole series--not the 148th unit of this type, but the 148th of the whole series. However, according to [url=http://www.palmtoppaper.com/ptphtml/12/pt120055.htm]this page[/url] (alt+w) there were no actual system prototypes made before this point--if March 1990 was the date of the first breadboard's setup. For the moment, the exact meaning of this marking is a mystery to me.

http://home.attbi.com/~edoscuro/hp95lx_sliders.jpg

There is no question, however, that this unused, well-preserved unit is not a normal HP-95lx, as seen above. There's a few quirks--within a few minutes of first recieving the unit, I'd managed to freeze up the unit by messing with the RAM/RAM disk memory slider and had to pull the batteries. There are a number of strange files inside the ROM, but the two most interesting are the PCX images that are usable as a replacement for the "business card" layout you can select to display when you first turn the machine on (since it's an instant-on machine, programs are always loaded into memory and the RAM disk faintly hums even when it's powered off).

http://home.attbi.com/~edoscuro/hp95lx_topcard_pcx.jpg

TOPCARD.PCX is an oddity--a rather poorly constructed screen, with obvious scaling problems in the left hand side icons, and a stray pixel. The next image is a much more pleasing idle screen named ICONS.PCX:

http://home.attbi.com/~edoscuro/hp95lx_icons_pcx.jpg

All files on ROM are dated, so one more look at the system's contents should give me a fairly accurate idea when the system was actually made.

http://home.attbi.com/~edoscuro/hp95lx_jaguar.jpg

Welcome to Jaguar!

Proof of ownership:

http://home.attbi.com/~edoscuro/hp95lx_owner_settings.jpg

Here's a few other pictures that didn't fit in with the text, but are among the best I've got available:

http://home.attbi.com/~edoscuro/hp95lx_open.jpg

When in use, the 95lx would be opened partway to look something like this. As a 95lx owner will notice, the keyboard is identical (I believe in every way) to those in the final production run.

http://home.attbi.com/~edoscuro/hp95lx_top.jpg

The unit's top cover as seen from an angle. Quite a good picture; that lens cover in the background is from my digital camera.

Dave, a guy bought your CDRs, printed and is selling a copy of HP-15C manuals on ebay !!!

*Message #1 Posted by **Emmanuel, France** on 4 June 2003, 5:39 p.m.*

Please visit: http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&item=2733924784&category=17008

Are you sure that's what he's offering?

*Message #2 Posted by **Dave Hicks** on 4 June 2003, 5:57 p.m.,*
in response to message #1 by Emmanuel, France

The alta-vista translation of that page is a little rough. I see mention of CDs and print-outs but I can't tell if he's offering the original CDs with the calculator which would be OK or only the print-outs. Can you tell or is it ambiguous in the original language too?

Re: Dave, a guy bought your CDRs, printed and is selling a copy of HP-15C manuals on ebay !!!

*Message #3 Posted by **bill platt** on 4 June 2003, 6:06 p.m.,*
in response to message #1 by Emmanuel, France

Dave,

My translation (from college french--not a native speaker) which I am quite confident of:

{} are my comments

"This calculator is suitable for a collector {or is good enough to be a collector's item etc}. The keys work well {to the touch...I forget what 'frappe' means but think it is 'to strike' so OK here}. She functions very well. The batteries are OK. No French manual, but have included a cd {printout of--imprime means print but maybe the french use this to mean make cd also} is included in English."

Seems many auctioneers include copies of your CD. Since they bought it to get it (presumably) and are selling the calculator, not hte manual alone, seems ok?

Regards, and thanks to you for the amazing site--actually resource, watering hole, obsession....

Bill Platt

Re: Dave, a guy bought your CDRs, printed and is selling a copy of HP-15C manuals on ebay !!!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 4 June 2003, 8:24 p.m.,*
in response to message #1 by Emmanuel, France

Hi, folks;

as a native Portuguese speaker and understanding some of French (both languages share the basic struture), also having Emmanuel's post as from a native French speaker, I'd like to add that the seller has been at least honest when he mentions hat he does not have the original manuals but he includes a printout of the ones available at the MoHPC CD's:

Je n'ai pas le manuel en français - I don't have the french manual

mais j'ai acheté le cd du site hpmuseum - but I bought the CD from the HPMuseum site

et j'ai imprimé et relié proprement - and I printed and properly bound (added, attached)

les 2 manuels en anglais - both English manuals.

By both manuals he means basic User's Manual and Advanced Functions Handbook. I'm not sure how Dave can deal with this; the fact is that manuals are copyrighted, and he is including a copy of them. Should HP claim it is not right? Is it up to Dave?

My thoughts go beyond these ones, but I was affraid of the French text actual meaning.

My 2¢.

Luiz C. Vieira - Brazil

Another 12c platinum bug from c.s.hp48

*Message #1 Posted by **Gene** on 4 June 2003, 4:47 p.m.*

I can confirm this happens on my beta unit. Tony's 12cp is a production unit (I believe). This is not a good sign. Very strong indication of very little beta testing to have this type of thing happen. Once you go beyond 253 program steps, no GTO in the first 253 steps work any longer.

I only got the unit 8 weeks before it was live, so it's not my fault. :-)

Gene -- * These statements and opinions are mine alone and do not reflect my employer's views. *

Leather Case for Voyagers

*Message #1 Posted by **Grant Goodes** on 4 June 2003, 3:50 p.m.*

I know that HP made a (real) leather case for the voyager series calculators. The hp-partsurfer website lists the part number as 92169A/B/C (different colours), but doesn't let you order it, saying that it is available from another site, but not saying which. Is this part still available, and if so how can I order it? I no longer have the shitty little slip-case for my HP-16C, and since I use it every day, could use a nice case.

Thanks for any information on price/availability.

Re: Leather Case for Voyagers

*Message #2 Posted by **james (UK)** on 4 June 2003, 4:04 p.m.,*
in response to message #1 by Grant Goodes

Hi Grant I don't know about new availability but one went for $72.11 at the weekend

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3026802928

Re: Leather Case for Voyagers

*Message #3 Posted by **Mark** on 4 June 2003, 10:45 p.m.,*
in response to message #2 by james (UK)

Yes, as the seller that price surprised me as well, too bad I don't have any more!

But the case was rather nice, very soft cowhide (despite my title which erroneously said it was vinyl), and in great shape too. It was the cherished cover for my HP-16C, which all too soon alas must find its way to the auctioneer's block along with the rest of my HP collection.

So how difficult would it be to make something like this, sans the HP logo of course? Anyone have any leather-working skills / equipment? I'm sure there would be a market for good working (non-logo) leather cases for the old machines.

Museum Quality Voyagers

in response to message #3 by Mark

Mark

Do you mind my asking *why* are you giving up such wonderful devices on eBay?

Please don't tell me you need the money to gamble is Las Vegas!!!!

Re: Leather Case for Voyagers

*Message #5 Posted by **db(martinez,california)** on 5 June 2003, 1:56 a.m.,*
in response to message #2 by james (UK)

i didn't know they made one for the voyager too. it looks exactly like the one that fits the clamshell models.

Re: Leather Case for Voyagers

*Message #6 Posted by **James M. Prange** on 5 June 2003, 4:55 a.m.,*
in response to message #5 by db(martinez,california)

According to http://partsurfer.hp.com/cgi-bin/spi/main, 92169A/B/C are for the Voyagers, 92169D/E/F are for the Clamshells, and 92169G/H are for the 82240A/B IR printers.

Regards,
James

Re: Leather Case for Voyagers

*Message #7 Posted by **ToddG** on 5 June 2003, 10:20 p.m.,*
in response to message #6 by James M. Prange

Yes, I have several of these cases, in various colors (brown, black, and cordovan). The cases for the Voyagers were harder to find. The one for the IR printer is really neat, and has a leather handle.

I got a bunch of these about 6 years ago from a nice old fellow in California who just gave them to me for free. (I'm not selling any, so please don't ask). He told me he was the one who originally designed them for HP.

IIRC, Educalc also sold a version for the clamshells. Not sure about the Voyagers, though.

I email HP about need a 41CX...

*Message #1 Posted by **Michel Beaulieu** on 4 June 2003, 3:40 p.m.*

I email HP (my email is lower this post) and they send me this answer. I think they have some good stuff comming soon they still "Invent"!

Subj: Re: FW: [USCN EDU WEB FEEDBACK Rv3.0] Date: Wed, 04 Jun 2003 12:07:55 -0600 From: HP Calculator E-mail Support Graphing <calculatorgrph_support@am.exch.hp.com> ---------- Dear ValuedCustomer

We received your mail over the past few days. First of all, let me extend a warm "thank you" for your very loyal and unwavering support for HP calculators and in particular, our RPN technology.

Secondly, it is very important that we reassure you that HP will continue to offer a full line of both RPN and Algebraic calculators. We have currently, under development, an enhanced, new range of financial, scientific and graphing calculators to replace the following: HP17BII, HP32SII, HP19BII, HP38G, HP39G, HP40G, HP48G, HP48GX and the HP49G. Many of you have expressed a strong preference for some of the above products and it is important that you receive this reassurance. Please note, however, that some of these products have been discontinued but will be replaced over the next 6 -12 months, a few as soon as this summer and fall. You should be also made aware that you might encounter difficulty with buying products being replaced, depending on your geographic region.

Sincerely, HP Consumer e-Support

Our advice is strictly limited to the question(s) asked and is based on the information provided to us. in response to message #3 by Erik Ehrling (Sweden)

Well, they haven't mentioned HP-41C/CV/CX, HP-42S and HP-71B :-(

Re: I email HP about need a 41CX...

*Message #5 Posted by **J.Manrique Lopez de la Fuente** on 5 June 2003, 4:45 a.m.,*
in response to message #4 by HrastProgrammer

Should they?

It seems that hp41 had been updated by hp42 and this, had been updated by hp48, but last maybe it is not true, because hp42 is not "as graphic" calculator as hp48.

But hp32sii hasn't been updated by a new model, so, yes, if HP is redoing all its calculator lines, hp32sii will be updated. I hope this update will be a more like a hp42sii than hp32, but who knows. Seeing new hp12c platinum I have started to think that maybe, they will do a mix between hp32sii and hp20s (rpn/alg mode on a scientific calc).

We should have patience... next course seems to be "intense"...

in response to message #5 by J.Manrique Lopez de la Fuente

A HP42 is not a replacement for a HP41, it lacks I/O. HP48 is not a replacement for either, it uses RPL, not RPN.

I refused to get a HP42 when they existed on the market due to the lack of reasonable I/O.

Recently I have obtained two spare HP41CXs, one spare HP48GX (all new) and a couple of used Voyagers. I think I will manage for a long time without having to buy any more calculators. But, should HP start producing a new high end RPN/RPL calculator that interests me, I will probably find it hard to resist it...

Håkan

Re: I email HP about need a 41CX...

> A HP42 is not a replacement for a HP41, it lacks I/O. HP48 is not a replacement for either, it uses RPL, not RPN.

That is exactly my point!

Keep the HP-42S the way it is but add serial I/O and increase the RAM size to 32K... What they definitely *not* should do, however, is to start adding an algebraic mode etc!

I have previously thought that another drawback of the HP-42S is that you cannot call MCODE programs (well, except from entering the debugger) - but I am now seeing it rather as an advantage: as HP is migrating to another CPU platform it is actually still possible to create a 100% compatible version using the new CPU.

Best regards, Erik Ehrling (Sweden)

Re: I email HP about need a 41CX...

*Message #8 Posted by **Robert** on 6 June 2003, 9:24 a.m.,*
in response to message #7 by Erik Ehrling (Sweden)

Guy's It's my opinion that the 42S was more than a replacement for the 41C, at the time of production. Do I like the 41C?.....yes, love it, at it's time the 41 was a lab engineer's dream. It has a good feel and is strait forward to use. Something important happened around the time of the 42S, PC's! It became easy to bring a PC to the problem. This limited the use of all those peripherals.

The 42S had to be smaller, lighter and more powerful than it's replacement. It is. I do not agree with all this IO business for non-graphics, it complicates the machine, and adds cost. Real world users would not use it, in my opinion.

Don't get me wrong, the 41 deserves a place in history. I love mine. The 42S was a perfect replacement. That 42 chewed up matrix based orbital dynamics problems easily, that much I know.

Re: "42s was replacement for 15C"

*Message #9 Posted by **Ron Ross** on 6 June 2003, 9:47 a.m.,*
in response to message #8 by Robert

The 42s was a replacement for the 15c. Hp said so in their advertisements, often. The 42s was supposed to have a an sx version, that is why 32K can be addressed. I/O was also going to be available, but was never finished. The reason none of this happened, "It would rob sales from the Hp48 line and be an extra support item." Marketing made the call, as usual.

Re: I email HP about need a 41CX...

*Message #10 Posted by **Johnny Billquist** on 7 June 2003, 5:51 a.m.,*
in response to message #8 by Robert

The lack of I/O in the 42 is a serious drawback. Saving and transferring programs, as well as doing backups is not possible in the 42, and I'm sure everyone would agree that this is important.

Also, functional expansion is rather important too. The 41 had modules. The 48 was functionally expandable by downloading libraries.

Either way is acceptable, but the 48 solution can gobble up lots of user memory.

The 42 is useful in lots of ways, but I do miss time functions, and you could always come onto a problem where a few new functions would be wonderful.

The 41 is a totally wonderful machine, but I doubt they'd make a similar machine again. (But I would buy it)

Time fuctions in the 42S

*Message #11 Posted by **R Lion** on 7 June 2003, 6:46 a.m.,*

in response to message #10 by Johnny Billquist

> Quote:
>
> The 42 is useful in lots of ways, but I do miss time functions

I succesfully ported this program to the 42S. It was not very difficult.

Unfortunately I never wrote the 42S version in paper and the calc, w/o batteries!!, is crossing the Atlantic in these days...

If I could, anyone can do it.

Raul

Re: Time fuctions in the 42S

*Message #12 Posted by **Erik Ehrling (Sweden)** on 7 June 2003, 12:21 p.m.,*
in response to message #11 by R Lion

> If I could, anyone can do it.

You are being modest! But the simplicity of RPN programming is in my opionion a very good argument for a high-end RPN programmable calculator. If it in addition to this would be backwards compatible to the HP41/HP42S then, bingo!

I am not stating that the HP41/HP42S could not be improved upon, but these high-end RPN programmables do still today represent a state of the art that has not been improved much upon since they went out of production - so using them as a starting point would seem very logical to me. And would probably also make business sense as well!

It could be brought to market relatively quickly and without much design work - as the HP42S is already designed! (Just add memory and I/O). It *must* be much cheaper to migrate a winning concept than starting it all over again!

Best regards, Erik Ehrling

RPL after RPN; what comes next?

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2003, 1:30 p.m.,*
in response to message #12 by Erik Ehrling (Sweden)

Hello, Erik;

I think I got your point here, but i wonder about RPL and RPN. When I got into contact with an HP28 for the first time, I found everything I wish to find in an advanced scientific calculator plus a lot more. I know many RPN-addicted will disagree with me, but I found RPN to RPL transition as a painless process. I still keep programming both styles. I have not yet delve into SYS-RPL and HPCALC Machine code, but I intend to.

Again, I wonder what comes next. If, despite flames and blames, RPL is an RPN evolution form (Pokemon's?), what should we expect if HP and ACO have gonne further and further?

Hard to guess, I think.

Luiz C. Vieira - Brazil

Re: RPL after RPN; what comes next? (O.T.?)

> Quote:
>
> but I found RPN to RPL transition as a painless process

Certainly RPL is not as intuitive as RPN but I've ever thought that the RPL is not as difficult as many says.

I have the Manual and the AUR to hand when programming my 48 and this is not necessary to me when programming in RPN, but this is not a big problem.

I use them both as well...

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2003, 4:26 p.m.,*
in response to message #14 by R Lion

Hi, Raúl;

I use them both as well, mostly to enhnace and optimize HP48 programs. I think the highest level the language is, the bigger is its documentation. I started to use CLEAN and ML about four years ago for post-graduation purposes and I missed C/C++ straight directives. I do not even remember how CLEAN structures are defined, but I can write a C/C++ program without using a programming guide or a C/C++ related book.

I wrote some user RPL programs last year, my own and someone else's use, and it took me more time to refine them than to write them. And I want my programs to be as small and efficient as possible, so I go for it fiercely. And I use manuals all time. I have more calculator related documentation, original press, than calculators themselves, maybe more than 50 publications amongst books and manuals. Once, when I was translating a big HP41 program to an HP48, I counted more than eight books and manuals opened.

And I felt amused!

I thouhgt about posting a message with the title: "Now that your calculator is working fine..." to propose programming techniques to be posted, then I remembered that there is already a Software

Library and a Programming-dedicated page.

Best regards, my friend.

Luiz C. Vieira - Brazil

Re: I use them both as well...

*Message #16 Posted by **Richard Garner** on 8 June 2003, 4:57 a.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

"Once, when I was translating a big HP41 program to an HP48, I counted more than eight books and manuals opened."

This is exactly the point those of us that would prefer RPN calulators are trying to make. RPL may be a much more advanced and powerful OS for calculators, but if you have to have 8, 10, 15 different manuals open to just write a simple program, it does not lind itself to being something that can be done on the fly out in the woods where you need to have a quick answer to a problem. You can't pull it out at a board meeting and in 5 minutes have a quick program that shows what the change in cost for a project is if your cliant decides they want to play the what if game. RPN calculators are much better at these sort of things because the programing is much simpler and more intuative. I have a 41CX, 42S & 48GX, and if I have to do something fast on the fly, I always go for the 41 or 42. The 48 just takes too much time and is too awkward to do what needs to be done a hurry in turms of programing.

Re: I use them both as well...

*Message #17 Posted by **Erik Ehrling (Sweden)** on 8 June 2003, 8:34 a.m.,*
in response to message #16 by Richard Garner

> This is exactly the point those of us that would prefer RPN calulators are trying to make. RPL may be a much more advanced and powerful OS for calculators

That is in my opinion exactly where UserRPN excels over UserRPL - when writing small programs to solve a problem in the field! And this is bearing on a philosophical question, but isn't the "field" (i.e. any place where you don't have immediate access to a computer) the real home for a calculator?

Note that I am not mentioning systems development (e.g. all larger projects aiming at extending the functionality of the calculator) which would probably benefit from a more structured language. It might just as well be that the best solution would be to use UserRPN for user programs and SysRPL for the development of libs?! (i.e. the right tools for the right task)

Best regards, Erik Ehrling (Sweden)

RPN or RPL?

*Message #18 Posted by **R Lion** on 8 June 2003, 9:11 a.m.,*
in response to message #17 by Erik Ehrling (Sweden)

> Quote:
>
> UserRPN for user programs and SysRPL
> for the development of libs

Perhaps you are right.. but I repeat because I'm convinced: I think that to write *small programs* on the fly in the 48 is easy (although RPN is easier)

Raul

Clearing facts and a challenge (long)

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 1:05 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

Hi, folks; let's go again.

It's a "big guy" and I'd ask you please: read it all before getting to a conclusion, O.K.?

Focussing over a particular problem sometimes leads to a leak of specific information that may be interpreted as general case.

I mentioned: *a **big** HP41 program.* There are programs written for the HP41 that take lots and lots of memory and are many steps long. A few days ago, Valentin mentioned Othello, a 1,000 steps long program for the HP41... It is RPN. I do not know what Otlhello does, but porting it to an HP48 might reduce part of its structure in order to use enhanced HP48 features, although enhancing functionality might also cause it's RPL version to be a lot longer than the original RPN one.

Not to extend the subject any farther than it should go, in my case I had to identify what was going on the HP41 program so I could reproduce the same thing in the hP48. And I believe a single translation is sometimes trivial, so I decided to do what is supposed to do: enhance functionality. I rebuilt all loops, I used HP SOLVE instead of custom RPN loop control (by far, the worst part of all), I created a new, friendly in/out interface that used the LCD to show the complete (six values) answer at once, impossible to be done in a single-line LCD. And I did not mention it, but the about eight books were three manuals (HP41CX, HP48 UG and AUG) plus four or five specific books, subject related (surveying).

What for? I'm a teacher, if I can't do the thing or if I don't understand the thing I cannot explain how to do the thing. The only book I wrote (at least so far) and published is titled "From the HP41 to the HP48" (Da HP41 para a HP48), and I wrote because I think if I can do the thing, I can explain how to do the thing and go further: allow others to be able to do the thing, too. That's what teachers are primarily for.

I explain to my students that programming and using a program language are related tasks, instead different ones. You first learn how to program, like communicate, and improve your own programming skills and methodology and this goes with you forever. Some languages come and go, learning them is up to each one of us and the task we're performing. There are some situations where RPN programs need specific structures to be created, while RPL *may* already have them. And this eases the job.

We're dealing with calculators, but we can extend this "analysis" to computers and their O.S. Let's be honest and think both as users and programmers: whom of us would gladly and spontaneously migrate "back" to plain, old text interface instead of graphical one? Some "classical" programmers would gladly accept the task of getting back to their own roots and do magic with assembly language, plain C/C++ and Pascal. I would (I still have two 586 desktops and one 386 laptop to cry over when I'm nostalgic). But as a user I would not like to get rid of high-quality graphics environment, and I have already seen "today's" programmers that are not even aware of what's going on inside their boxes for as long as they command and the box obey.

C'mon, let's face it: there was a time when first computers and handheld calculators were "cool". Many of us lived those days, some did not. I read here that, in some cases, calculators do not even call for curiosity anymore, and we come from a "time" (twenty, twenty five years ago?) when RPN users and programmers were reverenced. Today, youngers do not have the feeling for it anymore. Calculators are no longer "cool", being able to understand problems and solve them is not "cool", survive against tech challenges is neither "cool"...

The HP41 series showed a drastic claim for their own "cool" inner parts when HP decided to call them computers instead of calculators. Coconuts and Voyagers where the last Hewlett-Packard "calculators" made by human hands; Clamshells, Pioneers and 48/49 series were CAD/CAE assisted, they have no "soul" to be maintained. I think Xpanders had passion in their design, and their disastrous hammered finale could not be avoided: they were not part of HP's plans for "the future", whatever it is. In time: I have a feeling that Xpanders would not find their place amongst RPN/RPL addicted, I don't know.

I wrote too much.

My challenge is: write the smallest program in any RPN/RPL calculator that computes interception coordinate P(x,y) of two lines L1 and L2 given line's angles Ø1 and Ø2, both related to the same reference (bearing, trigonometric, clockwise, whatever) and coordinates of two points P1(x1,y1) and P2(x2,y2) belonging to each line, respectively. I found my own solution in an HP48 using matrices and linear system solution, but the program has to handle original values a bit before "building" final matrices. When I tried direct values manipulation I found some "gaps" when lines were parallel to each other and when angles were closed to 90 or 270 degrees (PI/4 or 3*PI/4), so my program does not use any conditional structures. If you already have your own solution let me know it, I'd like to see what others are doing.

Finally, when I pointed out that I used eight books I intended to show that using books is always a good practice. I also want Richard Garner, Erik Ehrling, Raúl Lion and anyone else reading not to take this post as anything but a clearer exposition of the same thoughts expressed in this post. I agree with all views based on personal, particular, professional experiences and analysis. I just thought I should improve the way I expressed my own.

Thank you and forgive me writing too much. I'll accept and read all comments, suggestions, flames, blames without complaining... too much. d;^)

Luiz C. Vieira - Brazil

Othello

*Message #20 Posted by **Ellis Easley** on 10 June 2003, 11:49 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

I'll bet that program was an implementation of the board game "Othello". It is played on a board about the size of a chessboard with black and white discs. You flip lines of discs over by playing a disc at the end of the line ... I forget all the rules. In the 1980's I worked with someone from France who told me many people there competed to write programs to play the game.

Re: Othello

*Message #21 Posted by **Valentin Albillo** on 10 June 2003, 1:25 p.m.,*
in response to message #20 by Ellis Easley

Hi, Ellis:

You're right, Othello is just the game you described, but the name 'Othello' is a modern trademark. The real name of this ancient game is 'Reversi' (as in 'reverse', 'flip', I guess), and it's quite challenging to play. It's very near to be completely solved by computers, if not already so.

As for Luiz's comments, my Othello program, in its RPN incarnation, was far from 1,000 lines long. I can't check it out now but I'd say it was some 300-350 lines long at most.

I don't know how many 'lines' it would take if written in RPL, but I can say that its conversion to HP-71B's BASIC takes just 10-15 lines of quite simple code.

Best regards.

Re: Othello [OT]

*Message #22 Posted by **R Lion** on 10 June 2003, 2:11 p.m.,*
in response to message #21 by Valentin Albillo

I used to play Othello with my brother or my father in the last 70's and first 80's. Now I play with my 7 y.o. son.
I enjoyed playing "Reversi" in my Spectrum in 1984. Actually it was almost the only game I played.
Finally, Quick Reversi (Leon Paulov 1992) is installed in my 48 (although is difficult to find time to play now).
Great game, isn't it?

Raul.

Raul posted:

"Great game, isn't it?

Indeed ! I've always liked it very much since I read an article by Martin Gardner in Scientific American, and then another one in Byte magazine, circa 1980.

That article inspired me to write a version of

Othello for the then new HP-41C, as I felt it had the necessary RAM and peripherals (i.e: card reader, printert) to even attempt it. Afterwards I wrote versions of it for the HP-85 and other Series 80 computers, the HP-71B, and further ones for the wonderful SHARP PC-1211 Pocket Computer (known is the US as TRS-80 PC-1) and other newer SHARP pocket computers.

I still play against those programs occasionally. The one I play the most is my version for the Sharp PC-1350, because due to its large graphic screen (150x32) the program can show the whole 8x8 board at all times (no printer needed) while displaying piece counts, prompts and messages in several fonts. It even allows the user to input moves using either algebraic coordinates or better still, moving a graphic cursor on the screen. It can also play for you, suggest a move, and will recognize draws automatically, among other features. Besides, you can select several strategies to play against, including a randomized one which ensures no two games are alike.

Should HP ever come with a new calculator with enough RAM and a suitably large graphic screen, I would definitely write a version for it as well, it's become my standard test for testing a new machine's capabilities, ergonomics, and ease of programming.

Best regards.

Valentín, please:

*Message #24 Posted by **R Lion** on 11 June 2003, 12:36 p.m.,*
in response to message #23 by Valentin Albillo

could you want send me that Sharp PC 1350 version?
Look here and guess why I want it...(and with a RAM card of 16Kb!)

Not in the 48? ;-)

Raul

Re: Othello vs. Reversi

*Message #25 Posted by **Ellis Easley** on 18 June 2003, 4:19 p.m.,*
in response to message #21 by Valentin Albillo

I remembered the name "Reversi" but I thought it might be a modern trademark! I think I saw it on a game cartridge for a home computer. I'm sure my first experience of the game was the ~1970's set with plastic discs, probably made by Parker Brothers, and called "Othello".

Valentin, your HP-41 Othello program is here!

*Message #26 Posted by **Gene** on 18 June 2003, 4:49 p.m.,*
in response to message #21 by Valentin Albillo

http://www.rskey.org/gene/calcgene/othello.htm

This is your "Othello2" program from the PPC Journal with the only changes that I made all the data storage internal to the program (to remove the need for a data card).

I really love playing this game on my 2X speed HP-42S. Moves by the 42s at that speed dont' take too long!

Thanks for your interest and for hosting it. I'm glad you still like it and play it. The original "Othello" (version 1, say) was quite a sensation when it was published in the legendary Australian magazine "PPC Technical Notes" an eternity ago. I had previously sent it to Richard Nelson's PPC, but he never published it, actually.

Eventually, copies of the program reached australian HP's people, who were equally amazed that it could be done in an HP-41C at all and used it a lot for demo purposes (demonstrating everything: the 41C itself, Memory modules, card reader, and most specially, the printer, with that neat, likeable 'graphic' board output !) with very good results (sales).

They promptly sent copies to HP's headquarters at Corvallis, who were equally amazed, to the point that some person in charge sent me a letter telling me the whole story, and asking for my permission to use it for a number of purposes, which I gladly conceded for free. Nevertheless, they later sent me a prize for 'my efforts', which made me feel great indeed ! :-)

So you see, quite a story behind that "Othello" progam ... By the way, though "Othello 2" features two levels of play and is a much more complex program, I actually prefer "Othello 1", which is much shorter and neater, and thus more 'elegant' from a programming point of view, IMO.

Best regards.

Imagine that!

*Message #28 Posted by **Paul Brogger** on 19 June 2003, 9:26 a.m.,*
in response to message #27 by Valentin Albillo

. . . a company that paid attention to what its customers were doing with its products;

a company that showcased customers' best efforts to increase sales;

and *further*, a company that recognized and rewarded customers for their contribution!

I wonder which management theory book that came out of?

(By the way, are Reversi and Othello related at all to "Go"?)

Re: Imagine that!

*Message #29 Posted by **Eduardo** on 19 June 2003, 11:06 a.m.,*
in response to message #28 by Paul Brogger

I doubt there's any connection between Othello and Go. Go is a millennia-old Chinese game (though it's Japan's national game nowadays). I think I read somewhere that Reversi is European dating back only a few centuries. Other than that the two games are very very different.

Eduardo

Paul posted:

"Imagine a company that paid attention to what its customers were doing with its products; a company that showcased customers' best efforts to increase sales; and further, a company that recognized and rewarded customers for their contribution!"

The HP I admired and loved was exactly that way. That's why it made of me a die-hard customer, who bought many, many products from them, who would recommend their products to everyone, and who placed much larger orders for much costlier items later on life, at the corporate level. And it all began with a tiny, premium-quality calculator.

Their tiny calculators, service, and philosophy of superb, state-of-the-art

quality and commitment really amounted to many, many thousands of dollars earned from me, my friends, and my corporations.

Needless to say, that old, beloved HP is a thing of the past and I'll never ever buy another item from HP again, and will discourage anyone asking me from doing so, as long as it maintains the abysmal levels of quality and service they boast today. I'm too grown-up and knowledgeable to let those wimps take my hard-earned money in exchange for some crap korean or taiwanese piece of junk just because it carries their formerly prestigious badge, now reduced to a dangling carrot in front of the donkey.

"(By the way, are Reversi and Othello related at all to "Go"?)"

Not at all. "Go" is a much more complicated game, I know of no satisfactory program to play against, even for large computers.

Best regards.

Re: Clearing facts and a challenge (long)

*Message #31 Posted by **bonnie** on 13 June 2003, 10:24 p.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

Hi, folks; let's go again.

It's a "big guy" and I'd ask you please: read it all before getting to a conclusion, O.K.?

Focussing over a particular problem sometimes leads to a leak of specific information that may be interpreted as general case.

I mentioned: a big HP41 program. There are programs written for the HP41 that take lots and lots of memory and are many steps long. A few days ago, Valentin mentioned Othello, a 1,000 steps long program for the HP41... It is RPN. I do not know what Otlhello does, but porting it to an HP48 might reduce part of its structure in order to use enhanced HP48 features, although enhancing functionality might also cause it's RPL version to be a lot longer than the original RPN one.

Not to extend the subject any farther than it should go, in my case I had to identify what was going on the HP41 program so I could reproduce the same thing in the hP48. And I believe a single translation is sometimes trivial, so I decided to do what is supposed to do: enhance functionality. I rebuilt all loops, I used HP SOLVE instead of custom RPN loop control (by far, the worst part of all), I created a new, friendly in/out interface that used the LCD to show the complete (six values) answer at once, impossible to be done in a single-line LCD. And I did not mention it, but the about eight books were three manuals (HP41CX, HP48 UG and AUG) plus four or five specific books, subject related (surveying).

What for? I'm a teacher, if I can't do the thing or if I don't understand the thing I cannot explain how to do the thing. The only book I wrote (at least so far) and published is titled "From the HP41 to the HP48" (Da HP41 para a HP48), and I wrote because I think if I can do the thing, I can explain how to do the thing and go further: allow others to be able to do the thing, too. That's what teachers are primarily for.

I explain to my students that programming and using a program language are related tasks, instead different ones. You first learn how to program, like communicate, and improve your own programming skills and methodology and this goes with you forever. Some languages come and go, learning them is up to each one of us and the task we're performing. There are some situations where RPN programs need specific structures to be created, while RPL may already have them. And this eases the job.

We're dealing with calculators, but we can extend this "analysis" to computers and their O.S. Let's be honest and think both as users and programmers: whom of us would gladly and spontaneously migrate "back" to plain, old text interface instead of graphical one? Some "classical" programmers would gladly accept the task of getting back to their own roots and do magic with assembly language, plain C/C++ and Pascal. I would (I still have two 586 desktops and one 386 laptop to cry over when I'm nostalgic). But as a user I would not like to get rid of high-quality graphics environment, and I have already seen "today's" programmers that are not even aware of what's going on inside their boxes for as long as they command and the box obey.

C'mon, let's face it: there was a time when first computers and handheld calculators were "cool". Many of us lived those days, some did not. I read here that, in some cases, calculators do not even call for curiosity anymore, and we come from a "time" (twenty, twenty five years ago?) when RPN users and programmers were reverenced. Today,

youngers do not have the feeling for it anymore. Calculators are no longer "cool", being able to understand problems and solve them is not "cool", survive against tech challenges is neither "cool"...

The HP41 series showed a drastic claim for their own "cool" inner parts when HP decided to call them computers instead of calculators. Coconuts and Voyagers where the last Hewlett-Packard "calculators" made by human hands; Clamshells, Pioneers and 48/49 series were CAD/CAE assisted, they have no "soul" to be maintained. I think Xpanders had passion in their design, and their disastrous hammered finale could not be avoided: they were not part of HP's plans for "the future", whatever it is. In time: I have a feeling that Xpanders would not find their place amongst RPN/RPL addicted, I don't know.

I wrote too much.

My challenge is: write the smallest program in any RPN/RPL calculator that computes interception coordinate P(x,y) of two lines L1 and L2 given line's angles Ø1 and Ø2, both related to the same reference (bearing, trigonometric, clockwise, whatever) and coordinates of two points P1(x1,y1) and P2(x2,y2) belonging to each line, respectively. I found my own solution in an HP48 using matrices and linear system solution, but the program has to handle original values a bit before "building" final matrices. When I tried direct values manipulation I found some "gaps" when lines were parallel to each other and when angles were closed to 90 or 270 degrees (PI/4 or 3*PI/4), so my program does not use any conditional structures. If you already have your own solution let me know it, I'd like to see what others are doing.

Finally, when I pointed out that I used eight books I intended to show that using books is always a good practice. I also want Richard Garner, Erik Ehrling, Raúl Lion and anyone else reading not to take this post as anything but a clearer exposition of the same thoughts expressed in this post. I agree with all views based on personal, particular, professional experiences and analysis. I just thought I should improve the way I expressed my own.

Thank you and forgive me writing too much. I'll accept and read all comments, suggestions, flames, blames without complaining... too much. d;^)

Re: RPL after RPN; what comes next?

:-)

I just hoped that they would use a "zero development, take anything we've already got" approach - and in that case I could not really see why they should make a "HP32SII Platinum" instead of a "HP42S Platinum"!?

Current state of the matters: Let's hope for status quo :-)

Best regards, Erik Ehrling (Sweden)

[quote]Still, HP may come up with a Forth calculator/computer for its next generation.....[\quote]

If I recall correctly, HP made a Forth module for the HP-71B.

Re: RPL after RPN; what comes next?

*Message #37 Posted by **Paul Brogger** on 8 June 2003, 5:53 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

I found the 28s and RPL to be a logical extension of RPN, and had a lot of fun with it.

Now that I do only the simplest programming on any calculator (and infrequently at that), I find RPN with clear mnemonics (rather than key coordinates) to be most accessible. Hence my appreciation for the 32s and 42s. IMO, they just can't be beat for simple, on-the-fly programming. (I suppose the 41 should be mentioned here as well, but I've never used one of those.)

In a calculator designed for ready accessibility, but with gobs of memory for programs of greater complexity, I wonder whether the 32s/42s-style of keystroke programming should be extended by some sort of machine language capability and a PC connection. That way, the larger, more complex applications could be written & tested on a PC with an emulator, then downloaded for final testing & use. (There again, I'm probably talking about a 41!)

Re: RPL after RPN; what comes next?

*Message #38 Posted by **Johnny Billquist** on 8 June 2003, 8:49 p.m.,*
in response to message #37 by Paul Brogger

Yes, you're talking about the 41. The whole thing was invented back in '79 already. Nothing new and better under the sun since then. :-)

Keep smiling.

And for those that complain about RPL. It's not hard. You just have to understand functional programming instead of imperative. That's the big leap. I actually much prefer Lisp (and similar languages) over C, but I can understand that it takes some getting used to.

Get some good book on functional programming, and learn that first, and *then* go for RPL. You'll be amazed how much easier it will be.

Re: Time fuctions in the 42S

*Message #39 Posted by **Johnny Billquist** on 8 June 2003, 8:51 p.m.,*
in response to message #11 by R Lion

That's a nice and neat program. On my 41 I have DATE+ and DDAYS already, so I don't need it. :-)

But if I want to time something, start something at a specific time, or play around in other ways, it will become more difficult with the 42.

Which 41 is yours?

*Message #40 Posted by **Vieira, Luiz C. (Brazil)** on 8 June 2003, 9:11 p.m.,*
in response to message #39 by Johnny Billquist

Hi, Johnny;

Just curiosity: a CX or a C/CV with time module?

For the records, only...

Thanks.

Luiz C. Vieira - Brazil

Re: Which 41 is yours?

*Message #41 Posted by **Johnny Billquist** on 9 June 2003, 6:44 p.m.,*
in response to message #40 by Vieira, Luiz C. (Brazil)

It's a CX. I first bought a CV a long time ago. When the CX came out I lusted for it for over a year before I bought one. Sold my CV at the same time.

S/N: 2519S40501

I've built in my two X-MEM modules as well as my ZENROM. I have the magnetic card reader, Advantage, HP-IL, video interface,

casette recorder, extended I/O and an MLDL. Just about the only thing I really still miss is an RS-232 interface...

I haven't bought a thing except for batteries for a long time. Perhaps I should spend some money on it... :-)

Hmm, I think I'm about my 20th anniversary with a 41... :-)

Re: Which 41 is yours?

*Message #42 Posted by **Johnny Billquist** on 9 June 2003, 6:48 p.m.,*
in response to message #41 by Johnny Billquist

Oh, and I can't help being a bit proud of the old bugger. Everything on it still works fine.

One other modification I have been tempted at times is to speed it up. But I haven't, yet...

And I own a 48SX as well. Not as fun at all, now that the initial fascination have passed. (I've owned that one slighty over 10 years now).

I have Coconut and P41 on my Palm as well. :-)

New 32-SII's

*Message #43 Posted by **Michael Meyer** on 7 June 2003, 2:37 a.m.,*
in response to message #2 by Michel Beaulieu

If so, I'd better sell mine now! <grin>

If not.... I'd better keep mine now!

Michael

Re: I email HP about need a 41CX...

*Message #44 Posted by **James M. Prange** on 5 June 2003, 9:16 p.m.,*
in response to message #1 by Michel Beaulieu

I'm glad to see that they mentioned the 48G and 48GX and not just the 49G for RPL models.

I wonder whether the replacement for the 32SII will be suitable for carrying in a shirt pocket.

Regards,
James

Actually, I bought it with "buy it now" after getting a better photo from the seller. I'm expecting it in the mail in the next couple of days.

HP-15CP ? HP-32P ??

*Message #3 Posted by **Norm** on 12 June 2003, 3:27 p.m.,*
in response to message #1 by GS Leong

anybody hear any rumors about maybe there would be an HP-15C platinum later on?

Anybody hear anything about a follow-on HP-32Sii maybe a platinum, later on?

U know, for steady production again .

Re: HP-15CP ? HP-32P ??

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2003, 4:33 p.m.,*
in response to message #3 by Norm

Hi;

When I saw a USER annunciator in the HP12C Platinun LCD but saw no GRAD, I kinda lost my hopes. Unless they use the old-fashion and a lot better Voyagers "classic" LCD (shapes of the digits' segments are simply the best!), I cannot imagine a scientific without RAD and GRAD angular mode.

But I only "kinda" lost my hopes, I'm not hopeless, if you understand me...

Time will tell.

Luiz C. Vieira - Brazil

shape of the digits

*Message #5 Posted by **Norm** on 12 June 2003, 5:48 p.m.,*

in response to message #4 by Vieira, Luiz C. (Brazil)

Thanks Luiz,

I thought I saw a ho-hum shape of the digits on the newer models.

Well well well, the old classic ones had proper LCD design and the new ones don't.

And with a bank account and ordering power of HP, like they couldn't have the LCD made exactly how it is supposed to be.

I smell an MBA .....

You bet, Norm :)....but

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2003, 8:14 p.m.,*
in response to message #5 by Norm

... do not take it as a general rule! There are brainy MBA's, some of them contribute here.

I wonder about reasons: what for? "Classic" Vouager's LCD are so easy and pleasant to read... Why changing?

They were kept the same till the HP12cP, and I'd never buy an HP15CP (Platinum, Plutonium, Polonium, Petroleum, whatever...) if it does not have the "classical" Voyager's digits. For me, that's a big difference.

Best regards.

Luiz C. Vieira - Brazil

Luiz, a photograph ?

*Message #7 Posted by **Norm** on 14 June 2003, 4:38 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Luiz, if there are 2 shapes of digits, I wonder if you could supply us with photos to show the difference? While it displays all 8's ??

And maybe then the photographs could be included in the 15C description of HP Museum.

Here they are...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2003, 3:15 p.m.,*
in response to message #7 by Norm

Hi Norm, guys;

the first image is from a classic Voyager (any except HP12CPlatinun). There were minor changes in annunciator's layouts for the Chinese HP12C, but the digits kept their shape.

http://www.logeng.com.br/images/LCD_class.jpg

This image was taken from a picture posted by Gene (Thanks, Gene). You can compare the shape. I did not have the time to refine final image...

http://www.logeng.com.br/images/LCD_plat.jpg

At least I think it helps giving an idea. I surely, 100% prefer the classic digits.

Luiz C. Vieira - Brazil

Edited: 14 June 2003, 3:16 p.m.

while I admire that

*Message #9 Posted by **Norm** on 14 June 2003, 3:46 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

while I admire that you are able to spot a difference, and to document it with photographs, the difference does not seem very large.

Perhaps the word indicators are a little smaller on the newer one.

I think they should just add a few digits to it, the display should have more places.

C and GRAD indicators

*Message #10 Posted by **Nenad (Croatia)** on 14 June 2003, 4:00 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Interesting: in the 12CP display indicator of complex numbers (C) has been forseen, though there is no GRAD indicator any more.

Supposing that this display design covers the future scientific platinums, it is not that easy to imagine a scinetific calculator with complex numbers and without the possibility of calculating trigonometrics in radians.

C annunciator is used by the HP12C...

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2003, 5:47 p.m.,*
in response to message #10 by Nenad (Croatia)

Hi, Nenad;

the C annunciator (indicator?) is used in the HP12C to indicate that an odd period (less than a hole period) will be considered in compound interest computations. If you press [STO][EEX] in an HP12C, the C annunctiator toggles its state.

Best regards, my Croatian friend.

Just my 2¢.

Luiz C. Vieira - Brazil

Edited: 15 June 2003, 1:51 a.m. after one or more responses were posted

Re: C annunciator is used by the HP12C...

*Message #12 Posted by **Nenad (Croatia)** on 15 June 2003, 1:32 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Thank you Luiz Claudio. I really did not know this. I tried it on my HP12C and it works as a switch: pressing STO EEX turns the C on. After just a few seconds wondering how to turn it off (once it took a lot more time with my HP15C), I found out that pressing STO EEX again turns the C indicator off ...

Always welcome, Nenad!

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2003, 1:58 a.m.,*
in response to message #12 by Nenad (Croatia)

Hi, Nenad;

these babes have their secrets... Sometimes it is a good surprise knwing something new, ahn? Anyway, did you get the meaning of the "C" in the HP12C? This feature was not available in the HP38C/E.

You know something I also noticed in the HP38C/E? If I am not wrong, it was the first HP programmable calculator to offer PRGM/RUN mode selection by toggle key, too, instead of a sliding switch. Even the HP34C has a PRGM/RUN switch. Advantage? It alwys switch to ON in run mode. All RPN programmable LCD's have a toggle key are like this, but some of the new ones (after Pioneers) switch back to ON in the same state they were when switched to OFF (I know you know that; just illustrating :).

Best regards, my friend. Be well.

*Message #14 Posted by **Gordon Dyer** on 14 June 2003, 6:27 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz, thanks for the pics, and I do prefer the classic voyager display, BUT... were you very naughty and took the platinum pic at a much lower resolution??? Maybe it wasn't deliberate, but it is one of those advertiser's tricks I look out for. Lets's see a comparison of both at the same high resolution and no .jpg compression

Re: Here they are...

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2003, 6:42 p.m.,*
in response to message #14 by Gordon Dyer

Hello, Gordon;

thank you for your comments, my friend. And you are bloody right (is it a dirty expression in English or a reinforcement?) about pictures' quality, but it was not intended.

Unfortunately, the only picture I have showing Platinun's [ON]/[×] final result is the one Gene posted about a month ago. I tried to enhance resolution, but it would reduce readability and fidelity.

I thought about comparing digit's shape and look, instead. Did I accomplish this, at least?

Best regards.

SOLUTION FOR NOT WORKING KEYS.

*Message #1 Posted by **Jon** on 4 June 2003, 1:45 p.m.*

I had read some solutions for this problem all based on “sandpaper”. As I didn´t like it I tried using isopropilic alcohol. The problem was how to apply it. May be it is already reported, but I haven´t read it. Just in case I make an small description of my procedure. ¡¡ It works every time!!. Three keys in my HP-67

Take a piece of thin cloth and cut a 5mm x 30 mm. strip. Slide it under the springy metal's stretched area. Do it pushing with the screwdriver, slowly, be patient, it takes time. When you see it going out pull it with small tweezers. Impregnate the outside cloth with isopropilic alcohol (I used an small paintbrush to apply it to the cloth). Press the key metal down to some degree in the center (but not hard, just enough to catch the cloth) and make several passes. Flip the cloth over.

I hope it can help to somebody

Jon

hp web site - may be it's just me but...

*Message #1 Posted by **Tom (UK)** on 4 June 2003, 1:16 p.m.*

Is that it for HP calcs?? Or has HP got it in for me today (I have had this feeling for several months!) I did a search for 'calculator' from the page at:

http://welcome.hp.com/country/us/eng/welcome.html

ALL the links listed jump to the following page:

http://www.hp.com/country/us/eng/js/hpwpc_utilities.js

Saying:

"we're very sorry!

The page you requested can not be found.

If you typed the URL yourself, please make sure that the spelling is correct.

If you clicked on a link to get here, there may be a problem with the link.

Try using your browser's "back" button or the "return to previous page" link below to choose a different link on that page, or use search to find what you are looking for.

We apologize for the inconvenience!"

P.S.

I _DID NOT_ add the exclamation mark at the end.

Excitement about my new HP34C

*Message #1 Posted by **Larry Corrado, USA (WI)** on 4 June 2003, 11:35 a.m.*

My sister keeps her eyes open for HPs and TIs for me at rummage sales. She recently found and bought, at a typical rummage sale price, an HP-34C in near-perfect condition, with manuals, adapter, and case. I powered the unit up when I got it home, and it seems to work perfectly. The keys feel good, and the display is bright and clear. The most serious problem is a couple of tiny corrosion spots on one of the battery clips. Now I'll have a chance to see firsthand if what Luis, Norm, and db (and others) have been saying about the 34C is true.

The box that came with the unit also contained a near-mint TI-30. There was also a second spice adapter and case, but no sign of the machine they might have come with originally. Maybe if my sister had arrived 10 minutes earlier...

Larry :-)

Enjoy it!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 June 2003, 4:18 p.m.,*
in response to message #1 by Larry Corrado, USA (WI)

Hey, Larry!

Thanks for mentioning my name this way. I keep whatever I posted about the HP34C and I have actualy an image of it when I was at the university, at the Library. The owner bought an HP41CV later, and kept it's old fella. What called my attention was the fancy [f], [g] and [h] prefix keys and the white + gray keyset intead of white + black in all other spices.

The HP34C is a must! I like much because of memory amount, continuous memory, RPN (of course) and both SOLVE and numerical integrate.

Enjoy it!

Luiz C. Vieira - Brazil

Hey Larry,

*Message #3 Posted by **Norm** on 4 June 2003, 9:41 p.m.,*
in response to message #1 by Larry Corrado, USA (WI)

Hey Larry,

How much you want for it ??

analogee@gte.net

I was just kidding. HP-34C is old klunker. Not worth very much. You gonna hate it. Can't see RED LED's in the bright sunlight. Batteries will be dead in 20 minutes. You'll hate it so I can take it off your hands.

Did you read my post in the 'memories' forum.

Look for this title: "HP-34C Better than S*X".

If you understand how to take the case apart (dont try if you dont know how!) then lube the slide switches with a few drops of "Tri Flow" (the teflon version of WD-40).

After 3 months, my unit seems to have accepted that very well as a slide-switch lubricant. They feel silky and smooth.

You dont want to run the slide switches w/o a lubricant, you'll wear out the various surfaces.

I just bought a pair of Photo Lithium AA batteries for $6.00 . I think thats the best way to keep an HP-34C fed. Of course, you could go the rechargeable route also.

Have fun !

Norm, please...

*Message #4 Posted by **R Lion** on 5 June 2003, 11:51 a.m.,*
in response to message #3 by Norm

just curiosity: how do those batteries last in your 34c?

Raul

Batteries (Hi R Lion)

*Message #5 Posted by **Norm** on 5 June 2003, 1:22 p.m.,*
in response to message #3 by Norm

Hi R. Lion,

Well, ideas that sound good, dont necessarily turn into good results. Let me provide battery information, in response to your query.

The idea that I described, is a disposable battery that lasts much longer than Alkaline, and then just reload the batteries when they fail, and to heck with the charger. The cost of such reloading is just the luxury tax on enjoying RED LED's on demand.

OK, well, the idea isn't panning out so far. YESTERDAY I bought Photo Lithium AA batteries. They were "Energizer". Today, as I reached for the package, it felt disturbingly light. It felt like I'd been sold a bunch of air.

I looked for lifespan estimates on the MBA/Marketeer prepared slick chrome-colored packaging, and found none.

I called the 1-800 number, and a stammering and hesitant technical rep finally said this: that Alkaline AA batteries provide 2850 mA*Hr and the Lithium AA that I hold in my hand provide 2900 mA*Hr. What I sense here (but cannot prove yet) is another 'Carly Conspiracy'. They are packaging air into the cells.

FACT, not conjecture: Energizer does this with their "lantern batteries". You know the ones, the big square/rectangular batteries from 'Brady Bunch' era when everybody took their kids camping and roasted marshmallows and sang songs (now they just stay home and listen to rap music and watch 120 channels of Cable TV for $50 a month) Those lantern batteries are supposed to be made of FOUR E CELLS. "E" cells

are bigger than "D" cells.

But Energizer just packs them with "D" cells like for your flashlight, and fills the rest of the casing with cardboard. If you compare the weight, by hand, between a Duracell lantern battery, and an Energizer lantern battery, the difference is immediately apparent. Duracell builds them to original specification and doesn't sell you cardboard instead of a battery.

Back to the conjecture, I speculate that they carefully trimmed the Lithium cell to deliver 2900 mA*Hr so that their marketing MBA advertising can state "delivers more power than Alkaline" (yeah, 2% more). Then they charge $6.00 for these batteries, instead of the 0.70 they would get for a pair of Alkaline.

So, I smell a rat. The only way to fight the Carly types, is to not patronize their junk. So I still have the receipt and I didnt open them, so these go back to the big-box merchant.

THIS IS NOW IN THE DOMAIN OF LEARNING..... can anybody fairly state what the energy density is of Lithium vs. Alkaline, and whether a Lithium cell should fairly deliver more mA*Hr than Alkaline for equal volume ??

I always thought that Lithium did have more energy density. If not, I need to learn this. As to the ripoff on the lantern battery, that is not conjecture, that's established fact.

Re: Batteries and toilet paper :-)

*Message #6 Posted by **R Lion** on 5 June 2003, 1:40 p.m.,*
in response to message #5 by Norm

At least here in Spain you can get that info only in rechargable batteries, but not with normal batteries: I have ever wonder why they are not required by law to put the total charge in the package. I can't understand why the customer must to buy "eyes shut".

The same applies to toilet paper: why don't they say the total length??!!

Raul

Re: Batteries (Hi R Lion)

*Message #7 Posted by **Ron Ross** on 5 June 2003, 1:44 p.m.,*
in response to message #5 by Norm

Li ion batteries do indeed have a higher energy density. But there are two issues to consider. Lithium is much lighter than other metals, so the energy per weight is much greater (not the same as density). But they also DO HAVE a higher energy density, just not the dramatic improvement you were led to believe. Factor in the weight AND volume and you get your great stats (and THAT IS EXACTLY HOW MARKETING DOES THE CALCULATIONS).

But there is one last kicker with Li ion. It is TOXIC and hazardous, hence much better (thicker) packaging. All that adds to cost, without giving you much in way of size advantages for a AA or AAA package (actualy Li ion also have a different natural charge rate and voltage than a typical 1.2-1.5 Volt cell (something like 3.8V). All this adds up to problems to marry older electronics to newer battery technology.

lithium AA replacements

*Message #8 Posted by **Ellis Easley** on 5 June 2003, 1:55 p.m.,*
in response to message #7 by Ron Ross

I don't know if these are lithium ion cells - they are not rechargeable and the voltage is 1.5V. When I first heard of them I wondered if they might contain a small 3V cell and a DC-DC convertor to generate 1.5V! Or just diodes to waste the extra voltage. But David Smith is familiar with them and he says they are a different lithium chemistry that produces 1.5V.

lithium vs alkaline

*Message #9 Posted by **Ellis Easley** on 5 June 2003, 1:47 p.m.,*
in response to message #5 by Norm

I don't know about the energy density but I thought the main attribute of lithium batteries as drop-in replacements for other types of common batteries was the shelf life. I remember ads saying to use them for important things like smoke and carbon monoxide detectors, and I found a lithium 9V rectangular battery in a smoke detector when I moved into my house. But Dr. Mike, who likes to use lithium batteries in his calculators, seemed to indicate that he liked them because of the long operating life. I found what may have been his first post on the subject, and he talks about the long shelf life being one reason for using them, but also states:

> Quote:
>
> These batteries have about 5 times the life of alkaline batteries

I don't know if he means capacity or shelf life. Here is a link to the thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv008.cgi?read=20196

9 volt Lithium has 5x life?

*Message #10 Posted by **Norm** on 5 June 2003, 3:24 p.m.,*
in response to message #9 by Ellis Easley

Hi,

Saying that a 9 volt Lithium has a 5x longer life sounds very, very familiar to me. If this were a democracy, I would vote agreement, until somebody gets me a databook.

Remember that such a battery has got 6 little cells inside of it, at 1.5 volts each.

It may be that the marketeers didn't get much of a profit win by changing to 6 microscopic little cells in (and leaving the rest air) they may be 6 full-size Lithium cells inside that 9 volter,so its got more capacity.

Since the "AA" comprises of only a single-cell, they may have said 'ka-ching' and dollar signs lit up in their retinas, and they cut down the cell-size so that it was the same power output as an AA Alkaline.

the display consumes everything in a SPICe

*Message #11 Posted by **Norm** on 5 June 2003, 3:28 p.m.,*
in response to message #10 by Norm

Hi, you were wondering what uses the most power in the unit, like was it the display.

It IS the display. The display consumes a ton of power. The way to see this, is watch the behavior of the "low battery" indicator when its marginally coming on.

It goes out when the display has few segments lit, glows brightly when the display is well-lit.

Sometimes when I have my HP-34C on, and I'm sort of "in-between" calculating things, but I dont wish to shut it off, I just absent mindedly hit a "1" so that the display is relatively off.

When your running a program all day, the display is substantially off.

When it just sits displaying a number to 4 decimal places, that's actually when your using a fair amount of juice.

IMAGINE the fine displays that could be made nowadays using large chunks of diced silicon wafer, and, the technology of high-efficiency LED's. Can't be doing things like that, after all, 'innovation' is a naughty word.

Re: the display consumes everything in a SPICe

*Message #12 Posted by **Dave Shaffer** on 6 June 2003, 12:12 a.m.,*
in response to message #11 by Norm

Norm,

"I just absent mindedly hit a "1""

To save even more juice, just hit a decimal point - I used to do that with my '35 for the same reason. (Saves wear and tear on the on/off switch - I think I should try some of that lubricant you mentioned the other day - can you get less than a pint of it at a time?!)

that Tri-Flow lubricant

*Message #13 Posted by **Norm** on 6 June 2003, 4:15 a.m.,*
in response to message #12 by Dave Shaffer

Hi Dave, that sounds good, to hit the "." instead of a "1" to extend battery life.

However, with the spice HP-34C, I get a "0." so its still best to hit the "1".

About TRI-FLOW.... its generally superior to WD-40 because it contains teflon powder that clings to the metal after the oils have evaporated. In the case of the electric switch of a 34C, the teflon lubricates it, BUT, the particles dont apparently interfere with making electrical contact. At the molecular level, I find that easy enough to accept.

WD-40... know what that stands for ?? It is a military product and a military spec, last I heard. It stands for "Water Displacement 40". Basically, after the soldier has waded across the rice paddy, he is supposed to shoot WD-40 into the rifle mechanism to clear the water out. That oil has absolutely nothing special about it, its cheap and runny and a lousy lubricant, except it is semi-compatible with water and displaces the water.

So is WD-40 a good lubricant really? No, try some SAE 30 motor oil, or some grease, or some Tri-Flow, if you want to keep something well-lubricated.

Because Carly has cousins who are in charge of Home Depot, you can't go to a place like Home Depot and buy Tri-Flow. They only sell cans of WD-40, because its cheap

and makes a lot of profit, and because it doesn't solve your problems, which is very important to them from a strategic standpoint (they want you to drive back & forth to their store over and over, not solve your problems. If they solved your problems then you wouldn't come back... with a home, that is.)

TRY A BICYCLE SHOP. Try a smaller hardware store, like a "True Value" (maybe). Those in the know like Tri-Flow. Its a lasting lubricant, thanks to the teflon powder, for serious mechanisms, like guns, doorlocks, carkeys. I'd use it in a pinch over WD-40 for a cardoor hinge, although, foaming aerosol spray-grease is the best there. (you can get it from your local underground network of "amsoil" fanatics).

I'm just saying that a minute quantity was just super for the spice 34C slide switches, they are very silky smooth now. I applied with a Q-tip, rubbed it into the circuit board, and the metal contacts. Allowed a little onto the plastic surfaces also. It's very very silky smooth, and because of the teflon particles should stay that way for awhile.

Of course, there may be other good lubricants for that also.

Re: that Tri-Flow lubricant

*Message #14 Posted by **Trent Moseley** on 6 June 2003, 2:23 p.m.,*
in response to message #13 by Norm

Norm-

Can "Tri Flow" be applied externally with a Q-Tip? I have a 25C and a 67.

tm

Nope !!

*Message #15 Posted by **NH** on 6 June 2003, 8:21 p.m.,*
in response to message #14 by Trent Moseley

Nope, you cannot lube the slide switches w/o opening them up.

This is an aerosol can like WD-40 .

Now, if you have a doorlock, or a rifle mechanism, you can stick the wand in there and blast it and you dont really care what happens to the excess. It fizzes and it foams and some of it spills out and some of it runs in.

You can't treat your calculator like that.

You would take it apart, get a drop of the lubricant onto a Q-tip, and carefully apply it to the metal contacts. And also, to the plastic surfaces that guide the switch.

I am friendly to the notion of other lubricants. I dont know that this choice is the best, only that it works. And that you must keep the slide switches lubricated with SOMETHING or you will wear them out.

Re: Nope !!

*Message #16 Posted by **Trent Moseley** on 6 June 2003, 11:25 p.m.,*

in response to message #15 by NH

NH THANK YOU.

I don't use the old 25C that much so I'm just going to be very gentle when I use the old ON-OFF switch. It's working OK so there is no way I'm going to open that baby up for a lub job.

tm

Re: that Tri-Flow lubricant

*Message #17 Posted by **Ellis Easley** on 6 June 2003, 11:22 p.m.,*
in response to message #13 by Norm

> Quote:
>
> Of course, there may be other good lubricants for that also.

David Smith recommends Radio Shack "Lube Gel" - well, he says it is "surprisingly good" - he mentions it sometimes when switches are being discussed, but he might mean on toast. I kind of thought he said it was teflon based, but the tube doesn't say so. I have a tube, haven't used it yet, but this thread had motivated me to open up my 34C and lube the switches with it. Only one thing bothers me - at the bottom of the text on the back of the tube, it says "Product may vary from depiction"(*). Since there are no pictures, just a lot of words saying it is the best lubricant ever made, I guess this disclaimer means it might be no damn good. I worked for Tandy once, and I know some of Carly's cousins work for Radio Shack!

(*) maybe it only works below -45F and above +450F, reacts with salt and fresh water, attracts dust, won't stay in place - it slides, drips off and breaks down, especially under normal temperature and humidity conditions. It might be corrosive and toxic and it might not work on anything.

BTW, they actually refer to it as an "adhesive lubricant".

I'm going to try it anyway!

Re: 9 volt Lithium has 5x life?

*Message #18 Posted by **Ellis Easley** on 5 June 2003, 6:16 p.m.,*
in response to message #10 by Norm

But Dr. Mike was talking about AA cells. Maybe it's like you said about the lantern batteries, maybe some brand lithium AA's have more capacity - well, his post says he's using Eveready.

(completely unrelated) - You know, just change two letters and "eveready" becomes "overeasy".

And on the 9V batteries - they could have three 3V cells in them, couldn't they?

I've got a feeling the 3V chemistry is the one that has long shelf life AND high energy density (seems like it should have a step up just for having 3 volts!)

bad news for lithium battery lovers???

*Message #19 Posted by **glynn** on 6 June 2003, 9:01 a.m.,*
in response to message #18 by Ellis Easley

Hi! Sorry I got into this forum thread late.

Dr. Mike was *(note the use of past tense as a possibility)* perfectly accurate when he stated that his Eveready/Energizer Lithium AA batteries lasted 5 times longer. Norm, you used some and they worked, didn't you? And the weight of the NEW ones tipped you off that there was some difference?

I worked at a battery store for a bit over two years. The Eveready Lithium AA's were a great innovation, and we sold quite a number of them. The chemistry, NOT "Lithium-Ion" but Lithium dioxide, had been around for some time and is at the heart of cr2032 coin cells and 123a photo batteries. It is light and powerful, and-- up until the Eveready innovation-- was a 3v cell (it is the potential difference in the electrodes that determines the cell voltage difference, the chemicals in between are the storage medium).

Eveready did a great thing by creating special electrodes so that they coud make it in a standard form factor, the 1.5v AA. By doing this, they had a battery that would run a digital camera with display about 3-4 times longer. In some devices, like calculators etc., the difference was 5x, and Eveready was not afraid to trumpet this loudly. They had a lock on the patents, and so would be the only source for these 1.5 Lithiums.

We were looking forward to AAA and C and even D 1.5's. As Eveready became "Energizer Corp", what was promised seemed to be always a few months away.

I've left the battery world, but it does NOT surprise me to hear that SOMETHING has changed in the AA. Law-enforcement was warning us to alert them when selling bulk quantities of them, as they found certain home drug-labs were opening them to get at the lithium inside, using it as a catalyst in a reaction for making household "speed". Consumers were reluctant to buy the lithiums because of the price-point of them compared to akalines. And retailers were insufficiently equipped to inform consumers that the particular chemistry involved was classed as "household waste", just as alkalines are, and not a particular hazard unless concentrated considerably (lithium occurs naturally in similar concentrations).

So, has Energizer corp changed the AA Lithium? From the answer given Norm over the phone, it would appear so.

Energizer has slick but confusing packaging. They sell many lines, with "platinum" versions etc... and I would ask Norm to carefully check his packaging for the claims made. But if they have STOPPED saying that it lasts "up to 5 times longer than Alkalines", BE VERY AFRAID.

This may well be a case of Innovate, then Switch.

2900 mA*Hr

*Message #20 Posted by **Norm** on 6 June 2003, 1:34 p.m.,*
in response to message #19 by glynn

The only hard numbers I've got is the 2900 mA * Hr on the "Lithium Energizer AA".

A standard AA Alkaline is 2850 mA * Hr.

I can't prove that I smell an MBA, errrr, a rat,

but it sure looks that way. I am going to look around for a Lithium AA cell that really would have triple capacity (or more) which means it should be above 10,000 mA * Hr .

Let U know if I ever find any.

- Norm

Re: 9 volt Lithium has 5x life?

*Message #21 Posted by **Michael Meyer** on 7 June 2003, 2:14 a.m.,*
in response to message #10 by Norm

Hi.

If you read in this old, and other old threads, these are Lithium Maganese cells, and they do put out 1.5V. Some of the more technically savvy members have described these in detail.

They are lighter, and also have at least a 10 year shelf life.

I can't vouch for the marketers, but if you doubt the "5x's" more energy, try seeing how many photos you get out of your digital camera with the best alkalines you can find vs. the lithium cells. I swear: I don't sell these things. I do buy them: 4 packs are $8.99 at Office Depot, and with coupons, even less. I bought a bunch when they had a buy one, get one free sale.

I can take over 300 flash photos on my trusty old Olympus 3030 camera. Again, I only get a quarter as much out of alkalines.

And even in "high drain" calculators such as my 19C, I'm still on my original sets in all of them. (I'll admit, I don't use most of my calcs more than a few minutes at a time. That's why I like these cells.... I can pick up any calculator from my collection and have it work without having to worry about charge status. I should be able to pick one up in 5 or 10 years and STILL have it work.)

Hey, I don't care what others do. And I still have a stack of freshly NiCd celled packs I can put back in the calcs. But for me, I just really like these lithium AA's.

Michael

Re: 9 volt Lithium has 5x life?

*Message #22 Posted by **Ellis Easley** on 7 June 2003, 2:52 a.m.,*
in response to message #21 by Michael Meyer

I wonder if what we are dealing with here is the same problem with alkaline batteries in the 41C when using the card reader. The battery life is effectively shortened because after some of the charge is used up, the voltage drops under a load that used to receive full voltage. My little digital camera has this problem, I think. When it says alkaline AA's are too low, I can still use them for a long time in a radio - plenty of Amp-hours left but the resistance has gone up. This exact same problem would apply to a 67 (for instance) because of the card reader motor. I don't know how the 34C compares to a radio in terms of current consumption.

Re: Batteries (NiCd)

*Message #23 Posted by **Paul Brogger** on 5 June 2003, 2:53 p.m.,*

in response to message #5 by Norm

I just bought a pair of NiCd soldertab AA's at Radio Shack and rebuilt my 34c's battery pack. I charged 'em up, and have been running a program loop all day (as in over 7 hours so far). Still chugging away. I'll report the final duration if & when the thing ever quits. (No, it's not plugged in!)

So, it seems to me that NiCd batteries will work just fine. Why bother with anything else? (Worried about the recharger damaging the calculator?)

(Say, which should run the thing down faster: entering "all eights" and letting it sit, or running a program?)

By the way, I took most of two of the solder tabs off (one "plus" and one "minus") by bending 'em back & forth a few times. The other two I simply intertwined at the "connected end" of the pack. I made sure the polarity was correct, added some vinyl tape, replaced the battery pack label/sticker, and it seems as good as new.

Re: Batteries (NiCd) -- nearly nine hours run time

*Message #24 Posted by **Paul Brogger** on 6 June 2003, 9:05 a.m.,*
in response to message #23 by Paul Brogger

FYI, the first charge lasted nearly nine hours running.

Today I'm going to punch in all eights & let it sit. Should make for a dramatic comparison.

Re: Batteries (NiCd) -- ~ 5.5 hours "display time"

*Message #25 Posted by **Paul Brogger** on 6 June 2003, 3:32 p.m.,*
in response to message #23 by Paul Brogger

FYI, I punched in all eights and **CHS** ("**-8,888,888,888.**") and noticed the low power indicator at about the 5:15 mark. At about 5:30 I noticed the low power indicator had gone out, but the display otherwise looked normal. At about 5:50 I noticed the display had blanked.

I suppose the other thing to test (given other comments in this thread) is entering "**1.**" and seeing how long *that* lasts . . . Maybe next week.

Re: Batteries (NiCd) -- ~ 5.5 hours "display time"

*Message #26 Posted by **Ellis Easley** on 6 June 2003, 11:29 p.m.,*
in response to message #25 by Paul Brogger

Are those regular NiCads, and not NiMH?

Re: Batteries (NiCd) -- ~ 5.5 hours "display time"

*Message #27 Posted by **Paul Brogger** on 8 June 2003, 5:41 p.m.,*
in response to message #26 by Ellis Easley

NiCd -- I decided against the NiMH because the package specifically recommends a charger made for NiMH batteries. That may be a Tandy ploy to sell chargers, but I didn't want to take a chance. (I suppose that issue has already been addressed in this Forum at some other time, but I didn't take time to look it up.)

NiMH in an HP classic.....

*Message #28 Posted by **Norm** on 9 June 2003, 2:00 a.m.,*
in response to message #27 by Paul Brogger

I wuz wondering about that also, can you just shove a NiMH into the HP classic (25C, 34C, etc) and extend the charge/discharge times w/o a care in the world,

or.....

does the NiMH require a special charger.

I would certainly vote for just shoving them in there and trying it. However, making them leak would not be very encouraging. I am very curious but I too did NOT take the time to look up what's already been said about that.

NiMH powering an HP82143A

*Message #29 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2003, 2:27 a.m.,*
in response to message #28 by Norm

Hi, Norm;

I'm using a rebuilt pack with NiMH cells taken from a Motorolla® battery pack. As you know, NiMH cells have a higher voltage, close to 1.5Vcc, and I noticed that the printer is running fine. What I would like to discuss here, and I thouhgt Captain Zener :) would also like it a lot, is that discharging curve for NiMH cells is different, so I think we would have a longer O.K. working time but a shorter not-O.K. end-of-curve, causing the equipment to fade-out quickly after the first low-batt signalling. I'm still waiting to see.

My first concerns are about voltage. If all HP P.S. designs are based on battery voltage as a reference, than I'll add two diodes, crossed-parallel, in series with batteries, packs of four units. This would lead a .6 to .7 drop when both discharging and charging procedures are taking place. What do you think of it as a safety precaution? I did not use the HP82143A for long printing activities mostly because of this. I just printed a few CAT listings and followed one program in TRACE mode, and it worked fine.

Have you seen my post about batteries a few weeks ago? If not, it's here:

Battery Question (and my e-space is back).

I'd like to further discuss this subject, if you and others want to. I'ts the "heart and soul" of our beloved calcualtors and I think this subject demands special attention always. Discussing power supplies is something to be done for as long as Electronic Equipments exist.

Thanks.

Luiz C. Vieira - Brazil

Re: NiMH powering an HP82143A

*Message #30 Posted by **Norm** on 9 June 2003, 9:55 a.m.,*
in response to message #29 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I guess the thing I dont understand, is that I thought the manufacturers of NiMH had meant it to be a batter that would upgrade equipment designs using NiCd .

That is, the cell voltage was about the same, charging methods are similar, its just the storage capacity was higher ?

I would be trying a direct swap, i.e. a simple upgrade to NiMH without modifying anything.

But I've never tried it, nor did I check mfr. data sheets.

NiMH powering an HP82143A (brief)

*Message #31 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2003, 10:02 a.m.,*
in response to message #30 by Norm

Hi, Norm;

the NiMH four-cells pack measures 5.8 Vcc when resting a few hours after fully charged. When charging, it reaches about 6.5 Vcc and falls to 6.2 when fully charged with 15mAH charging current.

For the records.

Luiz C. Vieira - Brazil

Re: NiMH powering an HP82143A (brief)

*Message #32 Posted by **Chan Tran** on 12 June 2003, 3:26 p.m.,*
in response to message #31 by Vieira, Luiz C. (Brazil)

Luiz, I power my HP82143A printer with 4 AA NiMH cells. It works fine and longer per charge compares to the original sub C cells. I charge them overnight using the original charger. Eveready said that the one think to watch for is not to overcharge NiMH. Otherwise everything should be fine.

Thank you for your feedback!

*Message #33 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2003, 4:26 p.m.,*
in response to message #32 by Chan Tran

Hi, Chan Tran;

my 82143A is still being powered by a NiMH pack. I did not put it to charge yet because there is no low BATT signaling so far. I removed the pack yesterday and measured 5.3Vcc after about 1 hour operation (spare use). This pack had their cells fully charged separately in a "smart" charger.

I'll keep everybody updated when I have more news. After David's warning about NiMH being too close to NiCad as for their operating voltage, I'm reviewing a lot of concepts, notes and mostly I'm finding a way to recalibrate my instruments and to fine-tune my load resistors.

Best regards ant thank you again, Chan Tran.

Luiz C. Vieira - Brazil

Re: Thank you for your feedback!

*Message #34 Posted by **David Smith** on 12 June 2003, 5:52 p.m.,*
in response to message #33 by Vieira, Luiz C. (Brazil)

I would just use high capacity NiCad cells in the 82143A (and especially the HP97). HP's original packs were 1100-1300 maH. AA NiMH cells and modern sub-C NiCad cells are around 1800maH. These units put a pretty good slug of current into the batteries... they charge the cells in about 5 hours. That is why the machines gets so warm. It is also why the HP97 battery packs don't last so long. I think the AA NiMH cells may heat up too much if you left the charging continuously and their life would be shortened. An 8 hour charge should be just fine though.

Sub-C NiMH cells (3200+ maH) should be just fine though. They are rather hard to find and VERY expensive.

Re: NiMH in an HP classic.....

*Message #35 Posted by **David Smith** on 9 June 2003, 10:52 a.m.,*
in response to message #28 by Norm

As long as the charge circuit is a slow trickle charge (like the HP calculators), you can drop NiMH cells into it without modification. I verified this with an apps engineer from one of the major battery manufacturers. If your cells have three times the old capacity, you need to charger them for three times as long. But since NiMH cells do not have nearly the "memory effect" of NiCad cells, you can partially charge/discharge them without affecting their life. 1800maH AA cells are standard these days. 2100-2200maH are available.

I have noticed that different machines sense the battery-low condition a bit differently. My HP67 turns on battery low about 30 minutes before cutting off. Some spice machines indicate battery low for a few minutes after full charge with m odern batteries (NiMH or NiCad).

Re: Batteries (NiCd)

*Message #36 Posted by **David Smith** on 7 June 2003, 2:48 p.m.,*
in response to message #23 by Paul Brogger

My 1800 maH NiMH cells run spice machines for over 15 hours. I have not tried the 2100 maH cells that are just now appearing in public.

One interesting thing about newer batteries in Spice machines. The low battery light can flicker on

for up to half an hour of use after a full charge. Seems modern cells put out a slightly higher full charge voltage than the old ones. The reduced duty cycle of the DC-DC converter pulses seems to fool the low-battery circuit.

Re: NiCd vs. NiMH -- What about Leakage and Corrosion?

*Message #37 Posted by **Paul Brogger** on 9 June 2003, 2:03 p.m.,*
in response to message #23 by Paul Brogger

As I consider replacing NiCDs with NiMH in an infrequently-used collectible, their relative costs, total power capacities, and even the memory effect are of little import. (I don't suppose that everyone will agree with this . . .)

More important is the direction this thread has taken: whether voltage differences can adversely affect the calculator's electronics.

Another aspect is chemical leakage and resultant corrosion. Certainly, NiCDs are capable of causing damage. Does anyone know whether NiMH are more or less likely to spill their guts inside a battery compartment?

Also, are there other trade-offs associated with the various battery options which should be considered?

Re: NiCd vs. NiMH -- What about Leakage and Corrosion?

*Message #38 Posted by **David Smith** on 9 June 2003, 3:58 p.m.,*
in response to message #37 by Paul Brogger

The voltage of the NiMH cells is almost identical to NiCad. Fully charged they output around 1.33V bs 1.42V for NiCads. They both ouckly drop to 1.2V nominal. At 1.0V per cell they are considered fully discharged. The shape of the voltage vs time curves are fairly similar.

Most modern batteries are sealed fairly well, but given time any seal will leak. Most of the battery leakage problems encountered in old machines were caused by the calculator being tossed in a drawer for a dozen years with the battery left in it... you wouldn't do that now... would you?

I think that most of the HP41 alkaline cell leakage problems on the far left terminal were caused mainly by one major manufacturer's cell designs. I think there were only two people who made the "N" cells at the time. Again if you remove the batteries when they are dead or for long term storage you should nt have any problems.

NiCd vs. NiMH -- 2 different stories

*Message #39 Posted by **Norm** on 9 June 2003, 9:18 p.m.,*
in response to message #38 by David Smith

Well, between Luiz and the other guy, there's 2 different stories.

Luiz says the NiMH voltages are higher, the other guy says that the voltage curves are the same.

I had heard the curves are pretty much the same.

But never compared either one.

Re: NiCd vs. NiMH -- 2 different stories

*Message #40 Posted by **David Smith** on 11 June 2003, 1:38 p.m.,*
in response to message #39 by Norm

Rest assured that the NiMH cells are a slightly (0.1V) lower voltage than NiCads thoughout most of their discharge curve. I've designed numerous rechargeable instruments over the last 25+ years and am intimately familiar with their characteristics.

Time to re-evaluate and listen

*Message #41 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2003, 6:50 p.m.,*
in response to message #40 by David Smith

Hi, David;

again, it's time to re-evaluate whatever I've been doing and measuring on batteries. 25+ years is something I cannot face.

Thanks. I'll redraw and reassemble my battery-related measuring devices (a few components and metters). I'm surely getting into mistaken procedures.

Luiz C. Vieira - Brazil

0.1 V Lower ??? no way, gotta be higher

*Message #42 Posted by **Norm** on 11 June 2003, 9:00 p.m.,*
in response to message #40 by David Smith

Your post said NiMH is 0.1V lower than NiCd.

Tell me you meant the other way around. I dont want exact graphs and a science lesson, but just a gut feel. I mean, is the Piper cub faster than the Lear Jet, or is it the other way around. I just need to know which outperforms, not the actual speed data.

I thought for sure that NiCd had too low a cell voltage (the stinkers always wound up at 1.25 V or so, classic 'dim flashlight' appearance which is why nobody likes them and it would be IMPOSSIBLE to go 0.lV lower than NiCd or nobody will want them. I thought NiMH was higher if anything.

- Norm

Re: 0.1 V Lower ??? no way, gotta be higher

*Message #43 Posted by **David Smith** on 12 June 2003, 5:41 p.m.,*
in response to message #42 by Norm

Nope, NiMHs are just a touch lowere than nicads. A fully charged nicad starts off at 1.44V per cell, the NiMH around 1.35V.

This drops to a constant value around 1.2V for most of the discharge cycle for NiCads. The central part of the NiMH cell discharge curve is more highly sloped.

Near the end of the charge both cells drop to 1.0V where they are considered fully discharged.

bleccch

*Message #44 Posted by **Norm** on 12 June 2003, 5:46 p.m.,*
in response to message #43 by David Smith

blecchhh.

I believe you . The NiCd has more voltage than NiMH.

Hard to get excited about a battery that delivers less voltage than NiCd. Display would probably be significantly dimmer for red led's.

Wouldn't be very good with a flashlight either.

my nicad/NiMH uses

*Message #45 Posted by **db(martinez,california)** on 12 June 2003, 8:48 p.m.,*
in response to message #44 by Norm

i think that NiMH are good for peorle who can't be bothered deep cycling their batteries like they should, and/or applications where giving a full cycle is not usually practical like a digital camera. in a camera the battery cycle is usually not in line with the dump-the-card-and-start-over cycle. so they have their place but i would rather use the cheaper, higher capacity, longer lived nicad in a calcer or radio or camping light.

i did get a 4 pack of AA & AAA nimh cells for a song once at the flea and they are great. however, i still deep cycle them out of habit. i should give the AA's to my sweetie for her camera. taking the nicads out and putting them through my smart charger each time she uses it here is a drag.

Display Brightness vs Battery Type

*Message #46 Posted by **Michael F. Coyle** on 12 June 2003, 10:57 p.m.,*
in response to message #44 by Norm

Hi.

> Quote:
>
> The NiCd has more voltage than NiMH.
>
> Hard to get excited about a battery that delivers less voltage than NiCd. Display would probably be significantly dimmer for red led's.

I doubt there'd be any difference at all. The LED's are driven from a constant-current circuit (as far as I can tell), so the display brightness will be constant until the battery reaches end-of-charge.

And while on the subject of different battery voltages, a 0.1V difference in a 2.5V battery pack is just 4%. I can't imagine any circuit in a

calculator that would be that sensitive to the difference. (Besides, the 6V and -12V supplies are regulated.) Except maybe for the low-battery circuit.

So by all means, use NiMH batteries. I am.

- Michael

Re: bleccch

*Message #47 Posted by **David Smith** on 13 June 2003, 4:50 p.m.,*
in response to message #44 by Norm

The difference is totally unnoticeable. The machines up convert the battery to a regulated constant voltage for the electronics and display.

Re: Batteries (Hi R Lion)

*Message #48 Posted by **Michael Meyer** on 7 June 2003, 2:29 a.m.,*
in response to message #5 by Norm

Oh, NO!!

Don't tell me they've changed my favorite batteries! Those bastardos... I mean, those battery-retardos!!!

I'd go stock up on them, but I'd probably get arrested. I'd better stick with powering my calcs with anhydrous ammonia. (Just kidding!)

My only hope is this: if they've really changed the capacity of the lithium AA's, they'll clearly show it in the digital photography arena. Then it's back to the new ultra-capacity NiMH cells. (I hate how they're dead in just a few days rather than a few decades for the lithium ones...)

Michael

P.S. I did get a major "score" on alkaline AA's. A local "one hour photo" store was about to permanently close when I happened to walk in. I asked if they had any boxes of old parts: transformers, etc. They said no. "But we do have this big box of batteries we don't know what to do with..." These were the cells they pulled from disposable cameras before sending them back to be recycled. I must have been given over 500 nearly "full" AA industrial alkaline batteries. For the next few years, it'll be "use and throw!"

Refrigerate

*Message #49 Posted by **Norm** on 7 June 2003, 12:58 p.m.,*
in response to message #48 by Michael Meyer

If you have 500 AA batteries, put them in the refrigerator.

For batteries and film, it effectively stops their aging process, if they are put in the fridge.

Re: Refrigerate IN PLASTIC, KEEP DRY

*Message #50 Posted by **glynn** on 7 June 2003, 3:12 p.m.,*
in response to message #49 by Norm

Before refrigerating, fold some paper towels to put around them in a plastic bag or tupperware.

Moisture (from the air) condenses on the batteries, rusts them. That you don't want.

and also Refrigerate

*Message #51 Posted by **Norm** on 7 June 2003, 5:57 p.m.,*
in response to message #50 by glynn

and also refrigerate pills, medications, and SUNSCREENS i.e. outdoor tan lotions.

Ever got a nasty sunburn from "expired" Sunscreen? After about 3-4 years it loses all effectiveness. I had this happen once. Kept rubbing it on, but kept getting a feeling like "K19 Widowmaker". Had a million blisters by the end of the day. Thanks Johnson & Johnson.

Carly has cousins at Johnson & Johnson, where Sunscreen is made. They don't elaborate on the issue of expiration; and the date-codes typically are so tiny that you dont notice them.

If you refrigerate sunscreen then it becomes a non-issue.

OT and also Refrigerate

*Message #52 Posted by **Randy Sloyer** on 8 June 2003, 8:35 p.m.,*
in response to message #51 by Norm

Hi Norm,

With all that stuff in your refrigerator, where do you keep the beer? :^)

I keep a single bottle

*Message #53 Posted by **Norm** on 9 June 2003, 1:58 a.m.,*
in response to message #52 by Randy Sloyer

I keep a single bottle of beer in between all the boxfuls of batteries, 35mm film, suntan lotion, and bottles of aspirin.

No room for a block of cheese however. Have to do without.

:o)

Luiz and Norm -

*Message #54 Posted by **Larry Corrado, USA (WI)** on 5 June 2003, 2:36 p.m.,*
in response to message #3 by Norm

Luiz, thanks for your note and, in general, for your always-interesting and knowledgeable postings.

Norm, I appreciate your offer to take this antique off my hands, but I think I'll pass. Thanks for the reference to your "Memories" article. I like calculators, but I don't get quite that worked up about them: I still prefer s*x over solving a third-degree polynomial. However, I do think I'm going to like the 34C better than the Woodstocks I used for 25 years.

Thanks for the tip abut the switch. The switches on the 34C are very smooth; however, I have a 38E and 38C that I'll check. I've never had a Spice apart, so I'll read up on what others say about disassembly before doing anything drastic.

Regards, Larry

(O.T.) A necessary acknowledgment

*Message #55 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2003, 5:01 p.m.,*
in response to message #54 by Larry Corrado, USA (WI)

Hey, Larry;

I'm the one to thank you.

You know, I like dealing with technology and my fellow country mates will tell if I am wrong when I say Brazil is not an R&D place, and if you deal (or want to deal) with toptech you'll find many difficulties here. I deal with HP calculators since the 80's and in 2000 I found MoHPC. At that time I had my eight working HP calculators simply spending a few microAmps from their batteries to keep their (empty) memory contents. After the first contact with the MoHPC folks, I put them (the calcs) all back to work. First I was only "listening" (reading). Then I dared writing here and there, I made some mistaken statements and learned that all posts must have a password... Anyway, I found an enjoyable e_place.

You know what? At that time I had no HPIL (thank you, D.M.), I was not aware of HP41 internal modifications, I was not told about CCD, PPC, HEPAX and PANAME modules... I felt as Johnny Castaway after rescue. I got into touch with some sort of information that further extended my own. I know I learn fast, and if the subject is technology, I put my heart on it... my daughter, healthy relationship and s*x come first, of course...:)

I learnt a lot here, and I tried to deserve being amongst the giants, even if I do not consider myself this tall. And believe me, when I open the Forum's page I feel as meeting old friends for the best chat ever. And I know I'm understood, even when my English knowledge fails.

Your words make me think I'm not in the wrong direction.

That's why I'm thanking you.

Best regards.

Luiz C. Vieira - Brazil

(Dave; please, forgive me using this space for a personal relief... I felt as if I could.)

Do you want your HP-32sII back???

*Message #1 Posted by **Paul Brogger** on 4 June 2003, 10:33 a.m.*

Some years ago, while looking into the interiors of Pioneer calculators and sharing my findings, someone offered me the use of a broken HP-32sII. It had been damaged slightly, and at the time wasn't especially valuable.

Since then, HP-32sII values have skyrocketed on eBay, and I've wondered whether the provider has ever second-guessed his generosity. Unfortunately, I don't remember who it was that sent it.

After dismantling and reassembling it, I'd gotten the thing working, and it was my glove-compartment calculator for years. Just lately, it seems to have died again. New batteries haven't helped. If I can't get it working on its own, I think I may replace its circuit board with that from a newer model. (It's an older model with double-shot keys, and is cosmetically in pretty good shape.)

But before I try a repair, I thought I'd give the original owner a chance to recover it. If you can describe the unique details of its condition as delivered and would like to have it returned, I encourage you to take the "NoHormel" out of my email address (above) and drop me a line.

I have an HP-01(complete)... what is the value?

*Message #1 Posted by **Michael Miller** on 4 June 2003, 6:07 a.m.*

I have recieved this HP-01 watch from my father-in-law and am curious as to the worth. He worked as a contractor for HP in the '70's and picked two of the watches up. One he lost over time and the other he has given to me. I am allowed to sell it if I choose. The watch comes with a outer box and an inner container. Inside the container is a warranty registration card, a promotional brochure, a gold pen that still writes, an HP-01 instruction book and the watch. All the paper items are exceptional, not written upon or torn. The watch is gold-tone with a gold band, has the stylus and is in excellent shape with no visible wear. The batteries have been removed from the watch and the crystal is perfect. The outer box has some scuffs from sitting on a shelf for years, but other than that everything looks new. I should be able to get some digital pics if needed for valuation, please email me and I will send them at the soonest. I appreciate any and all help with my questions. Please email me at yoaders@aol.com Thanks again!

Michael Miller

Edited: 4 June 2003, 6:09 a.m.

Re: I have an HP-01(complete)... what is the value?

*Message #2 Posted by **Matthias** on 4 June 2003, 6:46 a.m.,*
in response to message #1 by Michael Miller

Short answer.. It depends on it's condition and accessoires...

steel: $0 (run over by a car) - $1100 (new from the seller, all included [manual, envelope, battery holder, pen, quick reference card, box, paper box], absolutely mint condition..)

steel: $1 (run over by a car) - $1500 (new from the seller, all included [manual, envelope, battery holder, pen, quick reference card, box, paper box], absolutely mint condition..)

Re: I have an HP-01(complete)... what is the value?

*Message #3 Posted by **David Smith** on 4 June 2003, 3:11 p.m.,*
in response to message #2 by Matthias

I think that Matthias's values are reasonable may be a bit on the low side. I have never seen one sell for less than $300 (dead, eaten by a goat, then run over by a truck) to over $2500 - gold (not plated), new-in-box condition.

Re: I have an HP-01(complete)... what is the value?

*Message #4 Posted by **Fred** on 4 June 2003, 9:32 a.m.,*
in response to message #1 by Michael Miller

Not very much, just send it to me and I'll see it gets a good home. (ha ha)

Re: I have an HP-01(complete)... what is the value?

*Message #5 Posted by **Michael Miller** on 4 June 2003, 8:23 p.m.,*
in response to message #4 by Fred

Thank you for your responses, the information is appreciated. Where would I get the best price for this item, this forum in the Want-ad section, on eBay or on a website built specifically for the selling of this watch? Your thoughts on this would be of great value to me. Again, thank you for your time.

Michael Miller yoaders@aol.com

Predictions on where this good-looking HP-70 will end up on ebay?

*Message #1 Posted by **Gene** on 3 June 2003, 10:07 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3028444334&category=11712

This one looks nice. $500? $600?

Re: Predictions on where this good-looking HP-70 will end up on ebay?

*Message #2 Posted by **Bob** on 4 June 2003, 8:33 a.m.,*
in response to message #1 by Gene

I don't know about the HP calc, since my tastes run towards the 41 series and 42S, but the little date and time curser "follower" was pretty cool.

Does anyone know where to get the "follower" ?

clock

*Message #3 Posted by **Ellis Easley** on 4 June 2003, 8:57 a.m.,*
in response to message #2 by Bob

I'm no expert on Java or HTML but I looked at the page with View, Source and then searched for "clock" and found a block of code starting near the middle of the file that looks like it is the clock.

It's neat but things like that or MIDI files attached to auction listings irk me. I just don't appreciate having my computer's response time slowed down. Do they help or hurt sellers? Ultimately I'm sure it's the value of the item on auction that really matters but annoying things like that must drive away some bidders.

Re: clock

*Message #4 Posted by **David Smith** on 4 June 2003, 3:16 p.m.,*
in response to message #3 by Ellis Easley

I can tell you for a fact that they hurt bidders. ANYTHING that has a chance to annoy anybody or that places a restriction on who can bid or how they can pay will drive bidders away. I may be just one bidder, but than can make the difference between an outrageous price or a so-so price.

clock

*Message #5 Posted by **Ellis Easley** on 4 June 2003, 9:47 a.m.,*
in response to message #2 by Bob

I copied everything from:

```
<SCRIPT language=JavaScript>
dCol='red';//date colour.
```

to:

```
if (ns||ie)window.onload=Delay;
</SCRIPT>
```

and pasted into a simple HTML page that I happened to have, and it worked. It worked offline so it isn't downloading anything to run. I put the code just before:

```
</BODY>
</HTML>
```

at the end of the HTML file. I just used Notepad, which is invoked when you select View, Source in Internet Explorer. After selecting and copying the code, I loaded the simple HTML file into Notepad, pasted the code, and saved the HTML file.

Re: clock

*Message #6 Posted by **Dave Shaffer** on 4 June 2003, 11:59 a.m.,*
in response to message #5 by Ellis Easley

re: " It worked offline so it isn't downloading anything to run"

It seems to pick up the time from the PC's internal clock. The display in the ad and my PC time are within a fraction of a second of each other - and several minutes from the correct time.

clock

*Message #7 Posted by **Ellis Easley** on 4 June 2003, 10:29 a.m.,*
in response to message #2 by Bob

I tried changing this line (which I found by searching for "speed" which is used in several lines at the end of the code):

speed=0.6;

It controls the speed at which the clock moves to its new location when you move the mouse. 1.2 makes the clock move quickly but overshoot and then take a long time to settle into its new location - the clock "rings". 0.3 makes the clock move slowly but without overshooting or ringing - I guess it is "overdamped".

You could try this by saving the auction listing on your computer, then loading that copy into your browser, Viewing the Source, searching for "speed", changing the value, saving the file from Notepad, then going back to your browser and clicking on Refresh. But I think that auction listing is probably pretty big! It would save a lot of files along with the HTML. The file I pasted the code into is a free-standing HTML file.

IS 48G+ discontinued ??

*Message #1 Posted by **Norm** on 3 June 2003, 7:55 p.m.*

Is 48G+ discontinued ?????

I bought one and then sold it to my buddy Clive over in the UK. Now it sounds like they are genuinely gone ???

Anybody know if this model was discontinued while people were still wanting them ??

If people value them, maybe I would get more on the cheap from a retailer I know of.

Sure, I can check eBay. I thought I'd ask the true enthusiasts first, about the situation with 48G+ . Are they worth $200 ?? Or are they just fill-dirt.

Re: IS 48G+ discontinued ?? (long)

*Message #2 Posted by **DougT** on 3 June 2003, 9:09 p.m.,*
in response to message #1 by Norm

Norm,

Sad to say, everything I've read says that all the 48 models (G+, GX) have been discontinued [insert favorite HP is clueless rant here]. Some vendors are still clearing out their stock, so I went ahead and bought a GX last month. You can find them for $139.95 at CalcPro and Samson Cables. I think Samson still has some G+ models for $99.95. No matter what model you get, be sure to pick up a serial cable ($15) and the Advanced User's Reference ($30) while you're at it. Even though the 128K of the G+ will be plenty for the foreseeable future, I had that nagging feeling of "what if I want more memory?" and sprung for the GX.

Being a long-time HP RPN calculator owner, I thought long and hard about buying one of them fancy graphin' calculators, especially since my 15C still works fine. To me, the graphing capability of the 48 is bells & whistles, but that big screen is awesome for matrices and looking at a bunch of the stack all at once. I'm sure you've visited hpcalc.org; the number of programs available for the 48 is amazing. Overall it's simply a fun machine to play with. For sh*ts and giggles I installed a "Personal Information Manager", with a calendar, address book, etc. My wife threatens to buy me a PDA, but I insist: "Honey, that may be the easy way, but it wouldn't be the Toolie way..."

Doug

Check discontinued

*Message #3 Posted by **Ted** on 4 June 2003, 4:00 a.m.,*
in response to message #1 by Norm

To see if something is discontinued is really simple: just go to http://www.hp.com/calculators/ You won't see anything of the 48 series there. Of course some satellite sites might not be updated in other countries, but this is the official HP site. When HP deletes products from their site- you know what time it is!

48 discontinued AND MBA's (long)

*Message #4 Posted by **bill platt** on 4 June 2003, 7:22 a.m.,*
in response to message #3 by Ted

I am not so sure that the website http://www.hp.com/calculators/ means much in regards to anything meaningful. In fact, the 48 series has been discontinued for quite a while--at first, you just couldn't buy any accessories, and then, the calculators. Further, there were other conflicts:

About 3 months ago, I decided to give our HP small business sales rep a call, regarding calculators (we have too many HP printers in the office). Just to add fuel to the fire about the Carly thing, I will note that not only did he know absolutely nothing about the calculator line (and told me so) he did try very hard to obtain info for me. He called me back a couple of times (he tried really hard to find a 32sii) and in the end the result was interesting:

On the small business website, the 49g was still listed, and the price was actually very good--$156 US or so, and a discount could be applied. And they had a bunch in stock at the time. I didn't buy one. Reading comp.sys.HP48 lead me to believe that although the 49 is more powerful, it is not always worth the pain and suffering. And the small business website did not list the 48--only the 49g.

But on the main HP calculators page, the 49g was nowhere to be found in the listing, and the 48 was listed, even though we can be certain that the manufacturing had ceased (all accessories, manuals and support had been discontinued).

So, HP/Compaq's head rarely knows what it's tail is doing. The company is a chaotic jumble of divisions, squabbles, territories, duchys, and confusion.

HP/Compaq is clearly a corporate behemoth with no direction. Sure, Carly might be a media darling, and she is certainly intelligent, and might even have good ideas (just not about calculators) but I think at this point she (or any leader) will have a tiger by the tail, and the tiger is winning, to it's own demise.

As an aside: The MBA question really has nothing to do with MBA's but rather with an importatnt division in general business philosophy: There are technology driven business models (which actually include insurance, but that is another story) and then there are merchandising business models (Coc-cola). Trouble starts when one mixes up the philosophies. Merchandising attracts a horde of selfish, greedy, short-term thinkers who's only dreams are getting rich quick with as little original effort as possible. These people think in dollars and moving this or that to milk dollars. (Technology people dream of technical ideas, and how to improve the world. There is a real philosophical difference and the types are incompatible in business.) But truly successful long term merchandising geniuses do not think that way--they think lon-term--it is jus that technology looks generally scary to the greedy short-termers--but this does not stop them from trying occasionally, when a technology company starts to look like a cash cow! This happened to HP because the name became too "valuable" (greedy short-termers put too much emphasis on brand names--remember when www.bank.com sold for $30 million US!?) The problem is obvious though: a technology driven business model must maintain and rely on its technology thinkers (not business ideas but true technical advancement) to move forward, succeed and stay competitive. HP is no longer a technology driven company. It is a merchandising company overlaid on earlier technology.

Although it might seem that we aught to "keep our chins up" as it were, I think we might as well formally recognize that HP (the company, culture, etc)is dead. And this is a good thing, as this is a Calculator Museum, right? Isn't a Chippendale chair, or a Van Gogh painting just as interesting now that those "makers" are dead?

We should stop bashing Carly. We should stop worrying about it. It is over. It was over 2 years ago. It might have really been over the moment they released the 6s (I had a sinking feeling when I saw that thing...)

-Bill

Re: 48 discontinued AND MBA's (long)

*Message #5 Posted by **Iqbal** on 4 June 2003, 7:57 a.m.,*
in response to message #4 by bill platt

I am not sure if the GX was discontinued because I just got a set with serial numbers indicating thy were manufactured this year [ID30601737 for example] Also, I spoke to an HP dealer and he said that the GX will be in production for a while.

Re: 48 discontinued AND MBA's (long)

*Message #6 Posted by **Bill Platt** on 4 June 2003, 8:39 a.m.,*
in response to message #5 by Iqbal

Interesting!

And I guess it makes sense, along the lines of my hypothesis that HP is fragmented and in bureaucratic chaos.

In other words, accurate information is hard to come by.

By the way, was your new 48gx manufactured in China or Indonesia? Does it have the green screen, or the higher contrast black screen? What ROM?

Regards,

Bill

Re: 48 Manufacture and ROM Info

*Message #7 Posted by **DougT** on 4 June 2003, 12:54 p.m.,*
in response to message #6 by Bill Platt

The 48GX I recently bought was made in 2003 in Indonesia, and it's got ROM Version R. Rumors of its demise may or not be premature, depending on who in HP you talk to, but if you want one don't wait!

Re: 48 Manufacture and ROM Info

*Message #8 Posted by **Bill Platt** on 4 June 2003, 1:27 p.m.,*
in response to message #7 by DougT

Black screen, or Green?

Re: 48 Manufacture and ROM Info

*Message #9 Posted by **DougT** on 4 June 2003, 4:54 p.m.,*
in response to message #8 by Bill Platt

Sorry to forget that, Bill - it's a nice black screen.

Well stated Mr. Platt (long)

*Message #10 Posted by **Norm** on 4 June 2003, 1:42 p.m.,*
in response to message #4 by bill platt

Well stated Mr. Platt "I think we might as well formally recognize that HP (the company & culture) is dead. We should stop worrying about it. It is over".

I think this is a good way to look at it. You can't get a Heathkit from Heathkit, they are dead. You can't get an HP calculator from HP, they are dead. You are right, a 'merchandiser' is just a grubby greedy grabby little shoe salesman. They can't think about what the customer really wants in visionary fashion. They only open their store at the beginning of the day and shutter the doors at the end of the day and push their wares arbitrarily during the day. They dont think ahead.

I wonder if it might've worked out better, if Agilent had taken the calculator line. Agilent retains the technology part of HP, most of the goodies (instruments, etc) got put over at Agilent. Calculators should have been no different. They are a technology instrument like a spectrum analyzer. Not Carly's cheap chinese throwaway toy.

My plan is obvious, now that Carly has killed the goose that laid the golden eggs..... keep expanding my growing fleet of HP-34C's. I want a whole squadron of them before I feel "safe".

I was thinking about what to give a kid who is starting to learn his math (algebra, trigonometry). Actually you could darn near give him a 34C. Amazing, I have specimens that are 25 years old, and they are rugged and like brand-new and ready to serve a whole new generation.

I think I'd start with a 32Sii and offer the 34C to the extent that the earlier unit intrigues the younger generation. The 32Sii would be primary, the 34C would be a secondary interest. He can set his own balance between the two. In his lifetime the supply of 32Sii will be adequate, 34C may get ever more impractical to obtain.

One thing I'm sure of.... any kid who knows every button of a 34C (or a 32Sii or a 41C) would have far more reality-knowledge than a kid who knows every button of a graphing calculator (because that would be simply impossible, that any kid will learn more than a few features on those things). Graphing calculators are for kids who watch beevis & butthead, 32Sii calculators are for kids who listen to Mozart.

Hey, 42S with the double display might be a super way for newcomers to learn first-time how RPN works. Other than that, I dont like a double display. Distracting, like when you walk up to the cash machine and its trying to sell you coupons for your groceries. Huh ? Only in a Bill Gates world.

Some of the older pop music (Abba, Boston) was so good that it is now attracting a whole new generation of young listeners... because the crap available right now is so bad (Eminem rap).

I was alive and kicking (a teenager) in the era of Boston, Fleetwood Mac, Abba, and HP-34C / 41C / 25C .

How was I supposed to know it would be like living in Vienna when all the great symponies were written, and the whole culture to disappear leaving only its accomplishments as fond memories. When I was in the 70's, I thought it would stick around for awhile, i.e. the attitude of fresh technological achievement. We should have moon colonies by now. Instead all we have is tilt-up big-boxes full of chinese blow-molded trash (at high prices). Thank you ruling class.

Well better stop rambling, thx Mr. Platt for analogy up top.

Role of Agilent

*Message #11 Posted by **Patrick** on 4 June 2003, 2:53 p.m.,*
in response to message #10 by Norm

I was not an HP watcher during the days when Agilent came on the scene, so I don't really know much about them. From the discussions here, I take it they were either an offshoot of HP or they were an existing company who bought rights to various products from them.

In any event, even if they didn't get calculator technology from HP, if they are an independent company now, surely they have the option to design and build calculators themselves. No, they wouldn't be HP branded, but they could, if they wanted, put every bit as much engineering quality into them as they liked (and we would hope).

What I suspect is that they're not building them because they also don't consider it to be a profitable business.

Re: You are Wrong!

*Message #12 Posted by **Ron Ross** on 4 June 2003, 3:34 p.m.,*
in response to message #11 by Patrick

Agilent sells IC's and other parts to its sister company and probably cannot compete due to marketing contracts, not because it is not profitable. I believe Agilent makes (or made) the IC to the Hp12c.

When the two companies split Hp kept the name, PC, Palmtop, Printer, software, and calculator divisions or groups.

Agilent kept EVERYTHING ELSE: Instrumentation, testers, IC manufacturing, and PATENTS.

That is a big reason Hp cannot continue to produce new products. This happened as Carly came aboard. Actually Lew Platt had arranged for the split and had worked out the details, Carly came in and (new on the job and blindly) rubber stamped the deal.

Can she be blamed? Not entirely, any of us would have jumped at the opportunity to rule Hp. That she isn't a techy, isn't her fault. The powers that be felt she was qualified for the job. To be sure, all of us feel much different about the calculator division than her (not even worth her breath to mention the word).

She is basically a (knowledgable, considering she was a History major) bean counter, who lives off a PDA or laptop (if she uses any computing device). She definitely doesn't feel that the Hp calculator is needed to represent Hp to the up and coming generation. These kids can see the Hp logo on printers and that enough. She is into selling software and service support to high end systems and networks.

However, neither Hewlett nor Packard would have let the riegns of the company rest with someone with so little technical background (moot point, I know). But CEO's look at revenue and the bottom line in the short term (sometimes, very short term). Any thing past 24 months is long term and costs money and R&D and doesn't contribute to any of this years quarters.

Since Hp lost is real R&D to Agilent, no new processors could be developed in house and the older Saturn stock is all that is available (new stock could probably be produced). Therefore, the best you could get is an Hp 49g. Any new calculators will have to be developed on an industry standard CPU (not all that bad, the Ti-89 is a good example). Faster clock cycles will certainly be a plus with low power usage.

Enough of my rants, I will shut up.

How many were made?

*Message #13 Posted by **Dave Shaffer** on 4 June 2003, 5:30 p.m.,*
in response to message #10 by Norm

with regard to Norm's hope "In his lifetime the supply of 32Sii will be adequate, 34C may get ever more impractical to obtain."

Maybe this has been asked and compiled previously, but do we know haw many of the various models were ever made?

I know that in the first year or so, HP sold several hundred thousand HP35s. They generated several per cent of their total revenue in 1973 from this one product. I don't know what the total 35 production run was, and I have no idea what the totals are for the later products. Overall, it must be millions of units.

This might help us decide whether we really need to stock up now, or can wait until the need arises to replace our favorite working (as opposed to "collectible") calc. I'm within a few years of retirement, and have half a dozen functioning calcs (11C, 41C, 41CX, 32SII, 42S, and 48GX, as well as my ancient, somewhat functional 35). Guess I don't need to buy any more. (But, I'd buy a new 15C(P)!)

Re: Well stated Mr. Platt (long)

*Message #14 Posted by **Iqbal** on 5 June 2003, 12:00 a.m.,*
in response to message #10 by Norm

Boston, ABBA, Fleetwood Mac, Wow that was when music was music and an HP calculator was really a work of art.

Can you imagine how it's gonna be in twenty years time? I guess we're living in a disposable world. Nothing is being designed to be repaired again. Simple economics. So blaming Carly or anyone for that matter is irrelevant in my opinion. How long would a 41CX last? I have had mine since 1987. 16 years without any major repairs [except two OEM I/O contacts]. If repair wasn't possible, I would have had to buy another one. So looking at it as a business manager, better make it disposable. That would mean at least I would have had to buy three over 16 years as opposed to one for that period.

Re: Well stated Mr. Platt (long)

*Message #15 Posted by **Bob,** on 5 June 2003, 1:02 p.m.,*
in response to message #14 by Iqbal

They could always try to make it up by selling parts and components at inflated prices like car manufacturers !

That way you could fix it if you wanted and retire it for the memories, just fix it and use it, or buy a new one.

How about a new, slide-in PCB with a faster processor that doesn't require a case cracking to install. (Like 48GX memory cards ?)

Discontinued, but 48GX still being sold..

*Message #16 Posted by **Matt Kernal (US)** on 4 June 2003, 12:25 p.m.,*
in response to message #3 by Ted

here (I realize it's not the 48G+ :-)

MBA Bashing in this forum

*Message #1 Posted by **Mark** on 3 June 2003, 6:39 p.m.*

I am a degreed electrical engineer with 15 years of experience in the hands-on development of embedded systems (hardware, firmware, and software).

I'm a major fan of all the old HP engineering calculators, classic LED, scientific and graphing.

Five years ago I maxxed out my salary in engineering management and went back to night school for an MBA. Let me tell you those three years were no picnic; not a tenth as difficult as getting an engineering degree but still a lot of work. Now as a side benefit, I command a bigger salary with increased responsibility, but I also (more importantly) get to fully understand and enjoy the old HP financial calcs.

Please, let's cut the MBA bashing. Really bad decisions can be made by any moron in a position of power, including morons without an MBA. Remember the Peter principle applies to all organizations, and it is blind to academic degree.

Re: MBA Bashing in this forum

*Message #2 Posted by **Jim L** on 3 June 2003, 7:21 p.m.,*
in response to message #1 by Mark

I don't think that telling engineers that an MBA program isn't even 1/10th as hard yet leads to more money is any way to get them to stop bashing. :-)

That said - I don't think you're the kind of "pure MBA" the bashers have in mind. You're more of an engineer with just a hint of evil. :-)

MBA vs. Engineer

*Message #3 Posted by **Norm** on 3 June 2003, 8:00 p.m.,*
in response to message #2 by Jim L

The best people have deep strength in at least one career area, along with knowledge and respect of other career areas also.

Therefore, the best boardroom people will have knowledge of both Engineering and Business. We might safely say Mr. Hewlett and Mr. Packard very nicely fit the need.

The current crop of MBA's disdain engineering. This is why you get Ford/Firestone deaths, or NASA/Dittermore deaths, or an Enron balance sheet.

I would suggest that the MBA's in power stop disdaining engineering. Engineers did not throw the first rock. Engineers have every respect for proper management of profit, loss, investment, risk, and the balance sheet. It is the MBA's who snicker when somebody says 'lets talk about load margin vs. tire pressure and temperature'.

Mark is not the type of MBA who is the problem, because he has knowledge of both engineering and business. I'll guarantee you Carly doesn't and Dittermore doesn't.

Re: MBA vs. Engineer

*Message #4 Posted by **Gene** on 3 June 2003, 9:54 p.m.,*
in response to message #3 by Norm

Well, my undergrad was computer science, then an MBA in Finance - 60 graduate hours.

Now I work for Ford Credit. Use my 12c everyday, but still dig out my trusty HP-41c.

Dumb decisions are made by people. Period.

Re: MBA Bashing in this forum

*Message #5 Posted by **James Stephens** on 3 June 2003, 10:15 p.m.,*
in response to message #1 by Mark

Perhaps this very reasonable commentary can serve as a nice segue into all-purpose calculators. An hp-12c with the addition of scientific functions should appeal to the lucrative financial calculator market, as well as providing an RPN scientific.

HP has produced an all-purpose calculator or two in the past. If the market does support financial calculators of professional quality, but the scientific and engineering market is too small to justify the models we like, maybe this would be a solution that would make all of us happy.

James... disagree

*Message #6 Posted by **Norm** on 4 June 2003, 1:50 p.m.,*
in response to message #5 by James Stephens

Hi James, there is no reason why they need to keep shaking up the milkshake. They already had their models. They dont need a hybrid of 12C and 15C .

12C is a completed design. 15C is a completed design. Build the 15C on the same production line as the 12C.

Committing to such a project would be trivial. They could call it "15C Classic" and charge $175 a pop and make good money. Then the MBA's and the engineers aren't in disharmony over what buttons to put on the calculator

MBA would say: "derrr, what's this "LOG" button, I am not a logger, I am an MBA" .....

Engineer says: "Hey, why is there a 'fraud estimation' button on my scientific calculator, I never had anything like that on my slide rule".

Better each group get their own calculator, the designs are already completed, they could build them and make money if they choose to.

Why dont they ??

What Gene said "People make dumb decisions. Period."

Need source for HP ScanJet 3C files

*Message #1 Posted by **bowdoin davis** on 3 June 2003, 1:50 p.m.*

I have a scsi scanjet 3C model C 2520A. I got error messages that scanner wasn't installed so I deleted the deskscan II 2.9 from win 98 2ndEd system. I need to download the folders to reinstall it, and can't figure which or where they are on any site, and whether they are on the european site. I don't want to junk the scanner for it used to work, and I haven't given up yet. I don't have a CD, and originally it was installed with diskettes, so long ago, I can't find them. Have you a specific source to suggest either for a CD, and what I should ask for, or for a specific download? Do European site downloads work? I don't know where to start and the technician at HP told me I was unsupportable (too old a machine, but on Soc Sec., I can't run right out and buy another. Thanks, B. Davis.

Re: Need source for HP ScanJet 3C files

*Message #2 Posted by **Vassilis Prevelakis** on 3 June 2003, 4:02 p.m.,*
in response to message #1 by bowdoin davis

From this question and your previous one about ISA/MCA I think that you have got the wrong forum.

This forum is about HP *calculators*, not HP computers/printers/scanners.

Although people here are happy to answer questions on just about any subject (:-), I think that if you submit your questions to a more appropriate forum you are likely to get better/faster answers

I'm sorry if I encouraged him by answering his first post (although apparently it didn't mean anything to him), but I couldn't pass up a chance to drop a Tandy-ism, in this case the fact that Tandy (and as far as I know nobody else other than IBM) built a MicroChannel system! One of my bigger projects was designing a diagnostic board to plug into the MicroChannel bus and exercise all the signals.

Ir ... I have an HP Ir question ...

*Message #1 Posted by **Randy** on 3 June 2003, 1:38 p.m.*

Now that the HP82240B is long gone, compatible printers are still available new, manufactured by Martel Instruments of England. At martelinstruments.com, check out the MCP8850 and MCP9850 which are versions built to the HP Ir calculator interface. These calculators are available at a US distributor at 800-578-9021 (Current Components Incorporated) for about $170. The print speed and clarity is supposed to exceed that of the old HP printers. Martel also makes versions of these printers with multiple interfaces built in and with different power supply options, but I have not yet found a US distributor of such (MCP8830's). But here's my question: Wouldn't it be nice to use the HP Ir calcultor output to send data directly to a PC? Has anyone done this? Is the little HP Ir to RS232 adapter by Aegis (IR-HP5) for about $40 the answer? All this was probably covered by previous questions and answers here or in those old user groups (or is that groups of old users?), but I thought I would ask again because this forum is such a great brain trust. Any observations on HP Ir issues would be appreciated, especially on an HP41 with the Ir module. I see one site discusses building an Ir receiver linked to a parallel port error line using cheap Radio Shack parts, but I wonder if someone knows of a stock PC Ir receiver for either USB or serial that can take in data from an HP calculator Ir transmitter. Thanks.

Re: Ir ... I have an HP Ir question ...

*Message #2 Posted by **James M. Prange** on 4 June 2003, 2:11 a.m.,*
in response to message #1 by Randy

Ok, I see them, at http://www.martelinstruments.com/cased.html#MCP8800. I'd probably go for one of the models that includes RS-232 wired input, if I felt that I could spare the cash. Partly because the 49G, and I think at least one of the algebraic only models, lacks IR output but does have RS-232. The other thing is that the calculators always transmit IR at only 2400 bits per second, but by using wired connections, you can print at 9600 bps. Well, actually, I think that you can transmit by IR at higher speeds by using assembly languge code or perhaps SysRPL, but since the 82240A/B only receives at 2400bps and I can connect to the other calculators by wire, I've never tried that out.

If anyone tries one of these, please do report on your experience.

Yes, I've heard of using the IR to transmit/receive to/from a PC. I've never tried it myself, but the key is that your adapter needs to use plain "Serial IR" (SIR), not the more elaborate IrDA protocols. And making a receiver for the "Red Eye" IR format used for printing sounds quite complicated, and not worth the trouble.

I don't know about the other calculators, but on the 48G series, if you set the flags to print by wire (a mislabeled flag) and I/O by IR, then it prints by IR in the SIR encoding encoding rather than Red Eye encoding.

More information on the 82240A/B Red Eye encoding can be found at http://www.hpcalc.org/details.php?id=4742, and on the 48 series I/O (both wired and IR) at text: http://www.hpcalc.org/details.php?id=1722 or PDF: http://www.hpcalc.org/details.php?id=4741. These last two are for the 48 series of course, but I'd expect the other calculators to share a good deal with them.

Regards,

James

in response to message #1 by Randy

> But here's my question: Wouldn't it be nice to use the HP Ir calcultor output to send data directly to a PC? Has anyone done this?

The protocol information is available at http://www.hpcalc.org/details.php?id=4742.

> Is the little HP Ir to RS232 adapter by Aegis (IR-HP5) for about $40 the answer?

No it isn't, the IR-HP5 is a "normal" IR to wire converter for the normal RS232C protocol. Reason, the product is advertised with max. 57600 baud, the HP Red Eye printer protocol has a fixed baudrate somewhere around 600 baud.

> All this was probably covered by previous questions and answers here or in those old user groups (or is that groups of old users?), but I thought I would ask again because this forum is such a great brain trust. Any observations on HP Ir issues would be appreciated, especially on an HP41 with the Ir module. I see one site discusses building an Ir receiver linked to a parallel port error line using cheap Radio Shack parts, but I wonder if someone knows of a stock PC Ir receiver for either USB or serial that can take in data from an HP calculator Ir transmitter. Thanks.

I wrote a DOS program to decode the data for a dumb IR->Wire hardware interface, something like the Radio Shack one, in the early 90'ties. Therefore I used one of the modem status input lines of the serial interface. But this solution caused several problems:

- Making timing is a big problem because of different speed of PC's
- Only works in real DOS mode, because only here you have real time control to the hardware
- Non standard (but very simple) IR receiver hardware
- Don't worked on all PC's (unknown reason)

But who has nowadays real DOS machines? So my solution and IMHO the only realistic solution nowadays is an intelligent hardware converting the HP-Redeye protocol into another more useable (Serial RS232C, USB, ...) one. My solution for RC232C is very simple from the hardware aspect. A microcontroller, an integrated IR-receiver chip (Temic TSOP1833), inverting the TXD signal, and a very simple power logic. But the software is the expensive part and in my case I haven't the rights to publish them.

Regards

Christoph

a fixed baudrate somewhere around 600 baud.

I stand corrected. I was thinking that the HP Red Eye printer protocol was 2400 bps, but it's actually much lower, and when you consider that the Red Eye protocol includes 4 error correction bits with each byte, then it's effectively about the same as 600 bps RS-232.

I don't know which calculators Randy has in mind, but with the 48 series, you can indeed send and receive in "Serial IR" (SIR) protocol. This is always at 2400 bps. SIR is very similar to RS-232, except that an IR pulse (nominally 52 microseconds, about an eighth of a bit width) represents a 0 bit, and the absence of an IR pulse represents a 1 bit (or idle condition). I don't know for certain, but the IR-HP5 might be suitable for this.

Since IR I/O is half-duplex (because of the likelyhood of reflected signals), XON/XOFF serial flow control isn't available. But of course, if you use the built-in Kermit protocol, then you don't need XON/XOFF.

If you set flag -33 ("I/O directed to IR port"), and set flag -34 ("Printer output directed to serial port if flag -33 is clear"), then your printing will be in SIR protocol instead of Red Eye protocol. The "Fine Manual" leaves a bit to be desired here. Such things as print delay pacing, line termination string, and ASCII translation behave the same when print by SIR as when printing by wire.

See the documents mentioned earlier in the thread for more information.

Re: Ir ... I have an HP Ir question ...

*Message #5 Posted by **Christoph Giesselink** on 5 June 2003, 2:25 p.m.,*
in response to message #4 by James M. Prange

> I stand corrected. I was thinking that the HP Red Eye printer protocol was 2400 bps, but it's actually much lower, and when you consider that the Red Eye protocol includes 4 error correction bits with each byte, then it's effectively about the same as 600 bps RS-232.

This isn't correct, you can't compare the 416us (2400 baud) bit time of the Serial InfraRed protocol with the 427us _half_ bit time of the HP REDEYE HP82240B printer protocol. Both protocols use a complete different framing. The original question from Randy was asking for a receiver to capture the HP82240B printer protocol (HP REDEYE) data and not for a Serial InfraRed (SIR) reader.

The ~600 baud of HP REDEYE HP82240B printer protocol mentioned in my prior posting is calculated by

baud = 1 / ((pulse/freq) * d * hframes) * bitsperbyte

with

- pulse = 7 = no. of IR pulses per half bit
- freq = 32768 = frequency of IR pulses
- d = 2 = pause after IR pulses
- hframes = 30 = no. of half bit frames = 3 + 2*(4+8) + 3 = 3 sync pulses + 2 half bits * (4 error bit + 8 data bits) + 3 half bits pause after each packet
- bitsperbyte = 8 = relevant data bits per byte to make it comparable, you can also use 10 here

when you're thinking about 8 data bit + start and stop bit of the SIR protocol

the final baud rate is

baud = 1 / ((7/32768) * 2 * 30) * 8 = 624

Randy though about the HP17B, HP17BII, HP18C, HP19B, HP19BII, HP27S, HP28C, HP28S, HP41 with Ir printer module, HP42S calculators (hopefully I forgot none) which all only can send data in the HP REDEYE HP82240B printer and **not** the Serial InfraRed protocol.

But these 624 / 8 = 78 bytes/sec are only theoretically, the transmitter routine has to disable interrupts and has the calculate the 4 error correction bits and a little bit more at runtime so you have at least about 70 bytes/sec on these calculators.

> I don't know which calculators Randy has in mind, but with the 48 series, you can indeed send and receive in "Serial IR" (SIR) protocol. This is always at 2400 bps. SIR is very similar to RS-232, except that an IR pulse (nominally 52 microseconds, about an eighth of a bit width) represents a 0 bit, and the absence of an IR pulse represents a 1 bit (or idle condition). I don't know for certain, but the IR-HP5 might be suitable for this.

This is correct, but wasn't asked. Further information about connecting a HP48 over Serial InfraRed protocol to a PC can be found at http://www.hpcalc.org/details.php?id=4856.

Apparently we basically agree on a lot of this, but perhaps I don't understand the definition of "baud". I think of "baud" as "bits per second" or "1/bit time". By "effectively about the same as 600 bps RS-232", I meant that either would send about the same number of bytes per second. The comparison was intended to be a very rough one.

For the RedEye encoding used for the 82240A/B: "A bit time is defined as precisely 28 cycles of an exact 32768 Hz reference, about 854.5 microseconds." Thus, slightly over 1170 bits per second. A 1-byte frame consists of a "start bit", which is 3 half-bits, plus 4 error correction bits, plus 8 data bits, for 27 half-bit times. A delay of at least 3 half-bit times is needed before the next frame begins. Thus, there are at least 30 half-bit times, or 15 bit-times, per 1-byte frame. So 15*28=420 cycles of a 32768 Hz reference, or about 12.8 ms, is needed to transmit one byte. Looking at it another way, 32768/420 yields slightly over 78 bytes per second. Of course, the operating system will no doubt add delays because it has a lot of work to do, but perhaps 78 bytes per seconds might be achieved within bursts. Surely we can expect each individual byte to be transmitted in about 1/78 second.

For 2400 bps RS-232, a bit-time is of course 1/2400 second, or about 417 microseconds. A 1-byte frame (sending from an HP 48 series) is 1 start bit, plus 8 data bits (or 7 data bits plus 1 parity or pseudo-parity bit), plus 2 stop bits, and a 3/16 (0.1875) bit-time delay is added before the next frame can begin. Thus, 11.1875 bit-times (about 4.66 ms) are needed for each byte. Looking at it another way, 2400/11.1875 yields slightly over 214 bytes per second. Of course, when using a file transfer protocol, numerous delays are involved, so you can't expect to achieve an average of 214 bytes per second as the transfer rate. But when using XMIT, without transmit pacing, I've experimentally found that a 48 really does transmit at about the theoretical maximum rate.

Of course the 48 doesn't allow for 600 bits per second. But if it did, then the maximum rate would be about 54 characters per second.

Sorry, I didn't read Randy's mind, but just what he'd actually written in his post. What came to my mind was the 48 series, where data and file transfers are routine, and I've read that someone has very successfully used a relatively simple SIR to RS-232 adapter, without any need to connect a cable to the calculator.

Even if what I've written doesn't help Randy, perhaps it will help others. Not having to connect a cable might be sufficient compensation for having to use 2400 bps instead of 9600 bps, particularly for short transfers. Apparently, HP felt that this was the case for transfers between two 48 series calculators.

Of course a RedEye to RS-232 adapter could be built, but it would be considerably more complicated than an SIR to RS-232 adapter.

Best Regards,
James

James & Christoph, Thanks!

*Message #7 Posted by **Randy** on 9 June 2003, 4:06 p.m.,*
in response to message #1 by Randy

James & Christoph: Thanks for taking the time to share some of your knowledge base. Your insights have been very helpful. A redeye to serial adapter would be perfect because what I use now is HPIL to serial to send ASCII strings to be captured by a PC. I add coma delimeters in the RPN program which I then import into Excel, then into AutoCad because part of the ASCII string generation calculates geographic coordinates. I don't mind having the wire, but it would be nicer without. The HP 41 acts as a paperweight as I move it around on large maps to analyze and collect the data. It's like a very smart mouse I guess. A very smart wireless mouse would be nice. I'm hooked on pure RPN and the just-right feel of the HP classic case, so I remain a couple decades behind in parts of my technology, but the system is productive. I don't think I'll go much further with redeye thinking because the range is so limited. At one website it was said that HP deliberately kept the redeye range low so students wouldn't send cheat sheets back and forth during exams -- an interesting theory. It's fun to visit this site to learn more, and thanks again! - Randy

Re: James & Christoph, Thanks!

*Message #8 Posted by **Christoph Giesselink** on 10 June 2003, 12:25 p.m.,*

> I don't think I'll go much further with redeye thinking because the range is so limited. At one website it was said that HP deliberately kept the redeye range low so students wouldn't send cheat sheets back and forth during exams -- an interesting theory.

Only one minor comment. The website is right, when you compare the possible IR distance between HP products.

The possible distance over IR are normally between

- HP48<->HP48 are some centimeter
- HP48->HP82240B < 0.5m
- HP42->HP82240B < 0.5m

The reason of this limitation is the IR receiver hardware. My REDEYE receiver using the receiver IC Temic TSOP1833 without any cover (placed behind a hole in the case). I made some distance tests with this reiceiver and my HP48SX and I got possible transmitting distances between some millimeter up to 8 meter indoors (the room wasn't bigger, so the possible receiving distance maybe greater)! So the distance is no limitation IMHO.

Hope one of your HP's is working to transfer the European length units into your favorite ones. :)

Regards

Christoph

HP41C: High current consumption

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 12:23 p.m.*

Hi, folks.

I have an HP41C in hands (top keys, not mine) with a dimmed display. I tested another mainboard on it and the display is happily clear and crispy. I brought the original maninboard back and measured current consumption in this unit and in another one with a better behavior. These are the figures:

Operation	41C High-curr	Normal 41C
calc OFF	40 µA	40 µA
calc ON	6.88 mA	760 µA
key pressed	11.20 mA	6.38 mA

I just want to know where to start looking for "bogus". As the display is dimm, I firstly thought about the LCD driver, but with these figures, maybe someone has a better starting point.

Thanks for any guidance.

Luiz C. Vieira - Brazil

Re: HP41C: High current consumption

*Message #2 Posted by **WAG** on 6 June 2003, 3:45 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Very wild guess.... leaky electrolytic capacitor?

Re: HP41C: High current consumption

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 6 June 2003, 9:47 p.m.,*
in response to message #2 by WAG

Hi, WAG;

thank you! Not so wild, could be. I thought about this:

1 - NUT processor is running low-power O.K., RAM/ROM too; at least, 40µA tells me so.
2 - LCD module works fine with other mainboard (I measured the O.K. values with this module).
3 - I'd guess the LCD drive RAY-xxxx (or something like this) is messing up because it's one of the only "guys" that's not running when the calculator "hybernates" in low-power condition.

I want to listen the sort of clever guesses like yours. If there is any capacitor that's short-circuited then I must search for it. Oh, yes; the board is completely clean, it's a beauty! No corrosion or leakage signs! It's an orginal HP41C's board with RAM 1LA701 to 1LA705, in perfect condition, and I think it's owner wants to keep it this way. I have newer boards to replace, but I'll try to fix it.

Thanks a lot!

Luiz C. Vieira - Brazil

PC/MCA and PC/ISA How do I know which I have?

*Message #1 Posted by **bowdoin Davis** on 3 June 2003, 10:51 a.m.*

HP software download distinguishes between PC/MCA & PC/ISA for downloading choices. I am using a Scanjet 3C (SCSI) and have no Idea which software to order/download for deskscan II 2.9 since I have already deleted the prior version's files and thus I can't check. Can anyone tell me which I need to download to use with a SCSI device? Thanks B. Davis

Re: PC/MCA and PC/ISA How do I know which I have?

*Message #2 Posted by **Ellis Easley** on 3 June 2003, 11:07 a.m.,*
in response to message #1 by bowdoin Davis

ISA means Industry Standard Architecture, or the IBM PC/AT expansion bus as ultimately specified by a third party (the EISA group - E for Extended). MCA means MicroChannel Architecture, the expansion bus that IBM introduced with the PS/2 computers and quickly abandoned. Unless you have an IBM model 80 (and 70? 60? maybe even 50?) or a Tandy 5000, you don't have MicroChannel.

Question about HP-9114 disc drive

*Message #1 Posted by **HrastProgrammer** on 3 June 2003, 8:55 a.m.*

I am just finishing HP-IL emulation for my HP-71X MicroCode Emulator for HP-48GX and HP-49G (some details are on http://hrastprogrammer.tripod.com) and now I have a question about HP-9114 disc drive:

What is the real capacity of this device? From the manual, it has 2 surfaces, 80 tracks per surface, 16 sectors per track and 256 bytes per sector. This gives 2*80*16*256=655360 bytes as the total capacity. But LIF files extracted from the HP-9114 drive are 630784 bytes in size. What happened with the missing 24576 bytes ?!?

Best regards.

Re: Question about HP-9114 disc drive

*Message #2 Posted by **Ellis Easley** on 3 June 2003, 9:07 a.m.,*
in response to message #1 by HrastProgrammer

HP says in the 9114B manual (page B-1 in the manual on the Museum CD-ROMs #3) that they reserve some tracks for spares - actually it says all HP computers do. The stated capacity works out to be 77 cylinders so I guess they reserve the remaining 3 cylinders (6 tracks) for spares.

PPC Rom Manual Addendum

*Message #1 Posted by **james (UK)** on 3 June 2003, 8:42 a.m.*

I have just started working my way through the PPC ROM Manual on the CDs. In the forward it is mentioned that it was planned to produce an addendum to the manual. Was this ever produced? My apologies if it is on the Cd - I majored in missing the obvious!

Re: PPC Rom Manual Addendum

*Message #2 Posted by **Ellis Easley** on 3 June 2003, 10:10 a.m.,*
in response to message #1 by james (UK)

I have a skinny (90 pages) PPC book published in 1983 called "HP41 HPIL System Dictionary". I got it from EduCalc years ago. It has a graphical chart of synthetic tones that says it corrects some timings in the synthetic tone table in the PPC ROM manual. Other than that, I don't think it is the addendum that was mentioned. It is an alphabetical list, with brief descriptions, of the most common HP41 terms and functions in the mainframe and some ROMs, plus some additional info like the synthetic tone chart and some PPC Journal reprints. It has more information about synthetic programming than HPIL, IMHO. Both were new at the time.

Ellis, Thanks for the info - I agree it doesn't sound like the addendum - to quote from the forward to the manual

in response to message #3 by james (UK)

No PPC ROM manual addendum was ever produced. It might have, had the PPC club not self destructed in the 1983 timeframe due to the board basically ousting Richard Nelson from the club. Nobody I know ever found out what happened to the quarter of a million dollars in the club kitty when Richard left.

It didn't self destruct, it was plainly, simply, killed, assasinated, murdered, butchered by a bunch of s**s, for lack of a more graphic name.

> Quote:
>
> Nobody I know ever found out what happened to the quarter of a million dollars in the club kitty when Richard left.

Go ask Emmett Ingram or Mr. Kennedy, that may shed some light. Emmett always insisted that PPC should be run as a business. It certainly was. At least for him and the rest of the gang. Does the title of a certain Woody Allen movie ring a bell ? The one with the soap gun.

11c Voyager

*Message #1 Posted by **Ted** on 3 June 2003, 8:05 a.m.*

Well, I'm new here after years of my (continuing) love affair with my HP41C. And I know you guys are all going to yawn at this posting, but anyway here goes:

I just got my first Voyager series: an 11c from 1986. Via eBay. Quality turned out far better than I could have dreamed. Although I had once seen a Voyager type (probably a 12c) years ago, this is the first one I have ever owned- spurred on by the threads here and in archives.

Why this posting: just to comment on the fact that this series seems to be just fantastic for me as a newbie- I now understand completely why so many people are so enthusiaistically loyal. It's layout is wonderful, keys well spaced with secure solid movement, extremely compact, and the screen is very high contrast under all conditions. I truly don't know what you could make 'better' than the Voyager series for a calculator without whistles. And all that in 1986. If any original developers are around, then hats off to you all!

If I may, welcome to the "Voyager" gang...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 8:41 a.m.,*
in response to message #1 by Ted

Hi, Ted;

I'm an unconditional Voyager Fan; the other one I know is a declared fan is Valentin Albilo, that claims to love them. I take it as honest as almost all (if not all) of his proposed "quizzes" are voyager-related. As he, I prefer the HP15C: think of an HP11C with 2.5 × memory space (448 program steps), complex numbers handling, matrices handling, and the HP34C's like numerical integrate and Solver (AKA root finder). The HP11C is something, too.

Except for the HP10C, I have all others. And use them as well.

Best regards.

Luiz C. Vieira - Brazil

Don't you know more fans, Luiz? :-)

> the other one I know is a declared fan is Valentin Albilo, that claims to love them

Umm... thimk a little more: sure you know more Voyager fans...

Raul

Of course, my friend...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 11:12 a.m.,*
in response to message #3 by R Lion

... I just mentioned Valentin because he posted, at least twice here, the words: "I love Voyagers!".

I'm confident many others, you and I included, that have them as preferable ones. I know good mentionings are harmless, but they lead to responsabilities... ;^) As you posted now, I feel releaved.

Thank you.

Luiz C. Vieira - Brazil

(I'm still worried about your HP15C; I sent you an e-mail a few minutes ago)

Voyagers rule ! [LONG]

*Message #5 Posted by **Valentin Albillo** on 3 June 2003, 1:00 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz's right, I've always loved Voyager series calculators since I was presented with a beautiful HP-11C by my good friend Fernando del Rey (hi, Fernando !) some 22 years ago.

I was the proud owner of a fully fledged HP-41C at the time, yet was impressed with the sheer quality of that early, USA model 11C. I found it utterly amazing, elegant, stylish, cool, it transpired overall quality, so much so that I took it with me for a year in the military, out there in the desertic sands of some African region.

It withstood incredibly hot weather, dust, everything, always working and looking perfectly. I wrote several programs for it during my stay, and everyone there (not the most knowledgeable people on calculator matters, to be sure, though they were amenable) was most impressed with it, to the point that I had to *very politely* decline the request of a certain top brass who wanted to purchase it from me. It still is with me, looking mint and working flawlessly, with its recently installed third set of batteries.

Now, if the HP-11C is amazing, the HP-15C is simply unbelievable, the best pure calculator in the world, hands down. It has everything the HP-11C has, and much, much more. Would you believe it has more than 150 different STO (store) instructions, for instance ? Even though the Voyager series were released as a stopgap series while work on the HP-71B continued, to the point of not having any internal codename, the HP-15C was much more powerful than the mighty HP-41 in many ways.

For instance, its batteries would last forever, no NiCd's to corrode contacts. It was better built, its display was much more readable. It had more memory for programs or data than the basic HP-41C, and further most of the instructions took only 1 byte. It had a tremendous instruction set, including all 12 conditional tests and recall arithmetic, hyperbolics, gamma, random numbers, linear regression, 7 levels of subroutines. And to top it all, it had fast, microcode matrix operations, including system solving, full support of complex numbers including a parallel RPN stack and all arithmetic and trascendental functions, and last but certainly not least, Solve and Integrate.

In a word, I could do things with it that would be impossible to do in a basic HP-41C, and would requiere lengthy programming to achieve and a lot of money for extra RAM (no HP-41CV/CX then, no Quad RAM module, no Advantage ROM) to try and achieve them somehow, even if by means of slow and lengthy user code programs. It's no wonder that I would admire and treasure the HP-15C, then. Further, everything was

so well thought in its design that you would normally find several ways to do the same difficult thing with it. You felt there were no arbitrary limitations at all. If some combination would make sense, most probably it was available. All features were integrated and complemented each other perfectly, most served for several apparently unrelated purposes.

There's never been anything like the HP-15C, there never was before, and there never will be in the future, as long as replicators do not enter the scene. I've said it before and I'll repeat it once more: get yourself one before the prices are impossible. Now, they're just very expensive. Soon, they will be unaffordable. And time is *not* on your side.

Re: Voyagers rule !

*Message #6 Posted by **Bill Platt** on 3 June 2003, 1:43 p.m.,*
in response to message #5 by Valentin Albillo

Valentin,

Now you are making such a good case for the 15c that the price will probably double in the next week;)

But seriously, the 15c was the model that I really wanted to get, back in my college days, but the 11c was good enough for my relatively simplistic needs.

It is absolutely true that the layout of the 15c, and also the 11c, is just about perfect--in the sense that the locations of functions are logical, and complementary.

But I have found the 32sii to be nearly as logical--though the menus sometimes still give me consternation (it is so much more straightforward when all functions are on keys). I do not use matrix calcs much, and never complex numbers, and so that is why I am happy with the 32sii. But I really like the 48G for its list operations.....that is another topic. And the menus there *really* consternate...it takes a lot of practice.....

I am very curious about your thoughts on the design and effectiveness of two other calculators---in fact the ones that, I suppose, inherited the 15c market position: the 42s and the 48 series. What are your thoughts?

It seems that HP carried out a major consolidation in their RPN line in the late 80's throug hthe 90's--as they added Algebraics to the mix.

At the beginning of the 80's (correct me if I'm wrong) we had scientifics, simultaneously, 34c, 41C, 10c, 11c, 15c, 16c (sort of a scientific) ,and of course 41v/x later, and 28c/slater and no 10c initially, and dropped 34c. But the point is that they maintained 11c, 15c, 41 simultaneously, then had 32s, 42s, 41 simultaneously, and then we end up with just the 32sii and 48---no "middle ground" or really, no high end pure calculator anymore. Yet all those algebraics proliferated, 20s 21s 22s 27s 10b 17b 19b.

So entering the 80,s there were 4 simultaeous scientific models, and in the mid 90's just 2 (or 1.5, to account for the graphing).

regards,

Bill

Re: Voyagers (also) Rule!

*Message #7 Posted by **Michael F. Coyle** on 3 June 2003, 7:14 p.m.,*
in response to message #6 by Bill Platt

Hi Bill,

I just posted a message in another thread singing the praises of Woodstocks, but I don't think there's a requirement that I be monogamous to one calculator, or even to one product line, so I guess it's okay. Since you also wanted to know how the 48 fits into the big scheme of things, I'll also include my comments on that too, at no extra charge :)

My day-in, day-out machine is an 11C. (I also have a 16C but use it less.) It is actually my third 11C (I lost the first and the second one died). I have never tried the 15C; my work never needs complex numbers and I don't do matrix math very often, so the 11C is all I've ever needed.

The reliability is fine, battery life approaches the infinite, and I find the key layout intuitive. I also like the ability to stuff it into a short pocket.

A few months ago, I decided to get a 48GX, for two reasons: I wanted to leave the 11C safe at home, and I wanted to play with something new and advanced. RPL looked interesting. I decided against the 49G due to its rubbery keys and regretable color scheme. I figured I had better buy now. I was worried that HP might replace the 48 with something of poorer quality, and then I'd be stuck trying to by a used 48. But if HP did replace the 48 with something better, I could always upgrade.

My feelings about the 48 are mixed. I have really enjoyed owning and using it. RPL is a very good language, with good structured programming concepts and support for powerful data types, such as lists. Recently, I had to spend a day at the doctor's office with my father. I used the 48 to compute and plot Fourier transforms of some data relating to a project. I can't think of any other platform this small that would have been as easy to use.

But...the 48 is big. Since it doesn't come with a cover to protect the LCD, I had to buy a hard case. It still fits into my briefcase, but takes up a lot more room than the 11C. It also takes more keystrokes to get simple jobs done. This is a real pain -- on the 11C no function was more than two keystrokes away.

So I'd say that for me, the 48 is a qualified success. It's very powerful and easy to use for large problems but too big and cumbersome to be a truly satisfactory 11C replacement. I don't think that it's just a toy, suitable for students but not real engineers, as some here have suggested. (Though for me, it scores very highly as a truly educational toy -- and here I mean "toy" in it's best sense.)

Fred A. Valdez, HP's head honcho calculator guy, promises new scientific calculators that "...will be offered at *several different price points* in order to give our customers *more options* and more value." (Italics mine.) I sure hope so. Graphing calcs are fine, but we desparately need a simpler high-quality shirt-pocket RPN machine. Hopefully they have something good in the pipeline. (And maybe someone from HP is reading this and will make me a beta tester!)

- Michael

Do you have a dead HP11C?

Message #8 Posted by ***Vieira, Luiz C. (Brazil)*** *on 3 June 2003, 11:29 p.m.,*
in response to message #7 by Michael F. Coyle

Hi, Michae;

You wrote:

Re: Do you have a dead HP11C?

*Message #9 Posted by **Michael F. Coyle** on 4 June 2003, 1:04 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz,

No, I don't have the dead 11C. When it stopped working I sent it in to HP; they sold me a replacement 11C. (Made in Brazil, S/N 2908Bxxxxx, with painted-on key legends. Has worked fine for >= 10 years now.)

I don't have any broken calculators here but I'll try to fix that in the future :)

- Michael

Re: Voyagers rule ! [LONG]

*Message #10 Posted by **Valentin Albillo** on 4 June 2003, 7:02 a.m.,*
in response to message #6 by Bill Platt

Hi Bill & everyone reading this thread:

Bill posted:

*"I have found the 32sii to be nearly as logical -- though the menus sometimes still give me consternation [...] I really like the 48G for its list operations [...] and the menus there *really* consternate"*

That's the problem: I do not want to be *consternated* by my chosen calculator, but *awed*, delighted. Nothing in the HP-15C causes consternation. On the contrary, you feel *awed* by how everything fits and how complete the instruction set is, by the lack of arbitrary restrictions and senseless nuisances imposed not by any sound engineering principles but for the sake of questionable marketing ideas and cost reductions.

"I am very curious about your thoughts on the design and effectiveness of two other calculators---in fact the ones that, I suppose, inherited the 15c market position: the 42s and the 48 series. What are your thoughts?"

Well, answering questions like yours is bound to upset a number of people if they happen to disagree with my views about their beloved calculators, but keeping in mind that *this is just my own, personal, humble opinion and I make no pretense to be the one who is right*, here it is:

Reusing the formerly expressed concept, I find that both models, the 42S and the 48 series do *consternate* me. Big time.

Take for instance the 42S. It could have been a terrific, worthy successor for the 41CX. It has

nearly full compatibility and lots of well-conceived extensions. But then lightning did strike and we were left with much cause for consternation, both minor and major. Among the minor, the dreadful menus, most noticeably the alpha menu, forcing you to press several keystrokes for a single alpha character in a machine that so badly needs to have a quick way of spelling function names to avoid navigating menus all the time.

Among the major, the fact that it has relatively large RAM (7Kb/32 Kb) but *no I/O* is a BIG consternation, if there ever was one. It's such a letdown as to render the machine unsuitable for most of the uses the HP-41C was put to. With my 41CX, I had lots of card holders, and felt comfortable with the thought that I could load any of those wonderful programs in the machine in seconds. No fast changing of batteries. No dread of memory lost when playing with synthetics. No problem erasing a 1,000 line Othello program in order to fit something new, I could reload it most easily. All that is lost with the 42S, and that does consternate me. Also, the fact that its internals uselessly mimic 41CX codes makes it far slower than it should, and it's maddening to know that it's a *completely pointless degradation*, as there's no use in mimicking internal 41C codes if there's no way to load a 41C program recorded on cards, tapes, disks, or some other mass storage devices.

So, the 42S is useless to me. For use as a calculator, I still feel the HP-15C can easily hold against it. For use as a 'program runner', I'll never feel confident painfully keying in a large program or programs, to see them turn into thin air when changing batteries or for some other reason, or having to remove them to make room for data or other programs, at the cost of having to key them again. This is not an issue for 448 bytes of RAM, but certainly *is* for 7,000 or 32,768 bytes for that matter.

And as far as specifications and features go, if I ever need more pocketable computing power than my HP-15C has, I never resort to the HP42S, but to my trusty HP-71C, which together with its 160 Kb RAM, Math ROM, and Forth/Assembler ROM can run rings around anything the 42S can offer in terms of functionality, programmability and ergonomics, not to mention I/O.

As for the 48/49 series, there the consternation reaches epic proportions, but as this message is already way too long, I'll leave that for another suitable occasion. Let me say just one thing: the 48 series is RPN/RPL's "Peter's Principle" come true. Nuff said ! :-)

Best regards.

Edited: 4 June 2003, 7:28 a.m.

Re: Voyagers rule !

*Message #11 Posted by **Ellis Easley** on 4 June 2003, 9:16 a.m.,*
in response to message #10 by Valentin Albillo

It might mean something that the 15C has the highest "list price" at the "hpcalcman" web site (a retail outlet of used HP calculators that is advertising in the Museum classified ads right now).

I agree in almost all...

*Message #12 Posted by **R Lion** on 4 June 2003, 6:34 p.m.,*
in response to message #10 by Valentin Albillo

I agree with you in the 15c!!: the best "pure" calc.

The 42s is a great machine but I agree with you in the big consternation of no I/O with so large RAM. (and it is ugly, isn't it? :-P)

...but I can't feel the same about the 48: be patient with RPL and the menus and you'll be

rewarded with one of the most powerful and incredible machines...

Sure Voyager rules,...and the 48 with good software... wow!

Raul

(as you said: *just my own, personal, humble opinion and I make no pretense to be the one who is right*)

Re: 11c Voyager

*Message #13 Posted by **james (UK)** on 3 June 2003, 8:48 a.m.,*
in response to message #1 by Ted

I've been impressed by the feel and look of the Voyagers as well. I picked up a 12C a week ago to try one out - has a nice quality feel to it but I miss the <-R from my 41, not to mention the letters. Of course, having used the 12 I now lust after a 15C, but not at $300 upwards!

Re: 11c Voyager

*Message #14 Posted by **Ron Ross** on 3 June 2003, 9:53 a.m.,*
in response to message #13 by james (UK)

The 12c is a poor comparision to the 11c or 15c as THEY DO HAVE number delete and NOT X register delete. The 12c would substitute for Stats and is a good financial, BUT IT IS NOT A scientific!

I am a big fan of the 15C also. I actually like the layout of the Voyager's best, nice size, etc.

Re: 11c Voyager

*Message #15 Posted by **David Ramsey** on 3 June 2003, 11:16 a.m.,*
in response to message #14 by Ron Ross

OK, what's so great about the Voyagers?

Fortunately, I started collecting HP handhelds about 20 years ago (triggered by stumbling across my 19C in my garage), and my collection now is pretty much complete. To rub it in I'll note that I was able to simply walk into stores and buy th 10, 11, 15, and 16C off the shelf, and except for the 16C they've never really been used. Wish I'd kept the boxes, but who knew? At the time I didn't even _know_ anyone else collected the things!

The Voyagers are tiny and fit well in a shirt pocket, but I find their "sideways" format less satisfying to hold in the hand. I'd grab almost any "vertical" HP calc first for real use.

Re: Why

*Message #16 Posted by **Ron Ross** on 3 June 2003, 12:08 p.m.,*
in response to message #15 by David Ramsey

First, if you do use a calculator with one hand, the Voyagers will never work that well for you.

But when I carried the 15c, it was in my pocket while I carried my books to class. Then it went onto a desk, either at a library or class or lab. Since it was my first Hp, I grew to love that paticular layout. It is very intuitive and the calculator is better made than anything Hp ever released afterwards (actually, better made than any before as well, and they were made to be repaired, though I suspect they weren't).

However, for power and ease of use, the 42s does blow it away. I use the 42s much more and it is a big step up. However, if all I needed was an RPN scientific, I would go back to the 15c (okay, it really is all I need, but I like my security blanket).

Am I going nuts???

*Message #1 Posted by **Naim** on 3 June 2003, 5:55 a.m.*

I programmed my HP 42S. Then I ran a program [very long 450+ lines]. Then it gives me wrong answers, in fact the calculator doesn't even stop for the last prompt. I ran this program no less than five times looking through the program after each answer. No typos in the program listing. Then without making any changes to the program it starts to work, and give accurate results. Is this possible?

Re: Am I going nuts???

*Message #2 Posted by **Erik Ehrling (Sweden)** on 3 June 2003, 7:51 a.m.,*
in response to message #1 by Naim

Sure you didn't change an modes (e.g. polar/rect, size etc.)?

Best regards, Erik Ehrling (Sweden)

Re: Am I going nuts???

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 8:55 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Hi;

Based on Erik's clever question, I'd add this one: the program itself, doesn't it wrongly change any flag?

I'd like to have a look at it; can't you cpollect it through an HP48 and send me the listing? I'd gladly try to find what's going on.

Do you have any HP48 (G/G+/GX/S/SX) with INPRT program? Or even an image of the program listing?

If you want to give it a try, be my guest.

in response to message #7 by Mike

How many Kill-O-Bites does that calculator have anyway?

It looks like its a ONE kill-o-bite calculator.

Plus a few other bits also.

HP41CY???

*Message #1 Posted by **Ellis Easley** on 2 June 2003, 8:35 p.m.*

Ebay auctions are frequently discussed here (to the dismay of some!), what about a Museum Classified Ad?

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi?read=10080

What in the world is an HP41CY?

Re: HP41CY???

*Message #2 Posted by **Gene** on 2 June 2003, 10:41 p.m.,*
in response to message #1 by Ellis Easley

It was an HP-41c that had undergone surgery to have a 2X speed up installed. Was switch selectable, I think. Had one once...was fairly unstable.

Sorry, completely wrong ! [Was: Re: HP41CY???]

*Message #3 Posted by **Raymond Del Tondo** on 3 June 2003, 6:11 a.m.,*
in response to message #2 by Gene

Hello Gene,

an HP-41CY is an upgraded HP-41CX. These were only available from W&W Software Products.

It has the 'Turbo' switch, of course, which nearly doubles it's CPU clock speed.

But the most important fact: It has a 64K RAM box built-in.

And about stability: Many years ago I helped making some Baustatik (civil engineering?) programs especially for the HP-41CY. Some of the programs forced bank switching to call routines from the other 32K block, and vice versa.

The machines and programs worked very well, and very stable.

Regards,

Raymond

About W&W: another fact

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 9:04 a.m.,*
in response to message #3 by Raymond Del Tondo

Hi;

W&W is the same German co. that produced the desirable CCD ROM (Computer Club Deutschland).

Just a small comment...

Luiz C. Vieira - Brazil

Edited: 3 June 2003, 9:05 a.m.

Connecting 2 HP41 thru HPIL

*Message #1 Posted by **jose goncalves** on 2 June 2003, 7:08 p.m.*

Is it possible to connect 2 HP41 thru HPIL ? If possible, which one will be the controller ? What type of data exchange is possible ?

Re: Connecting 2 HP41 thru HPIL

*Message #2 Posted by **Juergen (CH)** on 3 June 2003, 3:07 a.m.,*
in response to message #1 by jose goncalves

Jose,

this question was discussed some times ago on this forum. Try to search the forum archive.

Regards, Juergen

Re: Connecting 2 HP41 thru HPIL

*Message #3 Posted by **Christoph Klug** on 3 June 2003, 5:18 a.m.,*
in response to message #2 by Juergen (CH)

Hi Jose,

connecting two HP41 by HP-IL is possible with two IL-RS232 interface or two HP82166A IL-Converter units. Exchange of data and programms would be possible.

Today a much better solution would be working with the full version of EMU41 which also includes HP-IL support. Also interfacing a real HP41 to EMU41 is possible - including exchange of data, programms and any type of files (ASCII, matrix, NNN´s...).

Upload data from HP-41 to EMU41 - than change the handheld and download data to the second HP-41. For this you only need the IL-Module and HP-IL/PC Interface Card - that is all. Furthermore this solution gives you much advanced features like emulator, barcode plott, exchange to PC world and web, mass storage, printer....

More about this you read in HP-museum article forum item 311 "HP41/PC gateway & emulator".

Best wishes from Germany - Christoph Klug

Re: Connecting 2 HP41 thru HPIL

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 8:59 a.m.,*
in response to message #3 by Christoph Klug

Hi, José;

the biggest problem is that the HP41 cannot be anything but a controller in its own loop, i.e., two HP41 will conflict if connected with the same "wiring". That's why it's needed extra "logical isolation" through the proposed converters.

I have never testes an emulator becasue it needs that expensive and rare IL board for the PC.

Regards.

(I'm waiting for your package)

Luiz C. Vieira

Edited: 3 June 2003, 9:08 a.m.

Re: Connecting 2 HP41 thru HPIL

*Message #5 Posted by **HrastProgrammer** on 3 June 2003, 9:49 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I have never testes an emulator becasue it needs that expensive and rare IL board for the PC.

Hi Luiz,

Just be patient a few weeks and I think you will be able to test HP-41X with HP-IL support - without need for any external hardware: just your HP-49G and a PC :-)

Best regards.

That's Great!

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2003, 10:56 a.m.,*
in response to message #5 by HrastProgrammer

Hi, Hrast;

great news!

I'm sending you an e-mail right now about other subjects.

$$$$$$ WOW !! $$$$$ HP-15C

*Message #1 Posted by **Norm** on 2 June 2003, 3:33 p.m.*

I was just saying I would take a 32S over a 15C, but look at these wild animals paying the moon for one, on eBay:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3028175897&category=11713

****

The auction has got 6 days to go, and the bid is already at $305 for an HP-15C that is mint. Think it will set a record ?? I encourage everybody to go over and bid. See how high it can go. Lets set a record for eBay mania here. Lucky dog, found it at a garage sale. Like a winning lotto ticket. (Well, I did the same just recently.)

Wow that Carly sure was smart to get rid of all the engineers calculators like this one. Can't have the company making sales and profits, no sirree, when it comes to making money, use stock swindles, not profits from customers. Customers are the worst way to make a buck. they are so whineeyy . They want their 15C 's, they want their 32Sii, they want their 42S, why, they can just go away, lousy old customers. Carly wants $50M right now. Give it here. Customers dont have that kind of dough, gotta find a faster way.

Those customers are so annoying, why, Carly throws the dog a bone, lets them have a 12C. Now the customers say a 12C is not the same as a 15C??? What a bunch of pests, give 'em an inch and they take a mile.

Hey, did they get rid of that HP-15C sticker on the back in the later models? The sticker that talks a little about mathematics? I mean, its probably a 30 cent sticker, I doubt they would want to spend the money on that, owing that it just goes to some stinkin' rotten paying customer. Bet they got rid of it when the production hit full stride.

Re: $$$$$$ WOW !! $$$$$ HP-15C

*Message #2 Posted by **Bill Platt** on 2 June 2003, 4:07 p.m.,*
in response to message #1 by Norm

hi Norm,

That really is mint, though. Like, virtually every other listing is *missing* something--either the box, a manual, a rubber foot, has a scratch, etc.

I would say that it looks flawless and you have to remember, we are now into the collectible phase of the HP--not just the utilitarian.

It is the powerful pull of "I GOTTA HAVE IT!!!"

Also, someone else posted here with an important economics point: Yes, the prices soared when the 32sii went out of production, etc, which would lead you to believe that further manufacturing is justified. But it is not that simple, because if the distribution of potential buyers' prices is gaussian, then a relatively small number of real buyers can drive up the price to a high value. Yet, manufacturing efficiency requires volume, or a certain minimum production per shift etc, and so at some point the "curves cross" as it were and voila, no more manufacturing, yet high trade prices.

I think about this frequently, as this dynamic seems to affect almost all the products I like to use--not just collect. The same thing seems to have happened to classic Campagnolo bicycle pedals.....

Regards,

Bill

Re: 15C and Carly bashing (long)

*Message #3 Posted by **Randy Sloyer** on 2 June 2003, 7:43 p.m.,*
in response to message #1 by Norm

Norm,

While I dislike the current situation with RPN calculators as much as the next person, I just don't understand your Carly rants. What the heck does she have to do with it? I'd be willing to bet a paycheck she personally didn't make the decision to scuttle the calculator business. She was hired by Hp's board of directors to do one thing: MAKE MONEY. Calculators didn't make enough money, it was a economic decision that meshed with their reduction in manufacturing capacity, just like every other business in the world today. Outsource it if you can. Calculators became a casualty of modern business. Her job is to make money for the shareholders of HP and make it she must, based on her salary. If she didn't make it, she wouldn't be earning it. She would be gone in a flash if she didn't produce. Yes, she represents a change in corporate culture and I suspect that is what she was hired to do. If the Board of Directors and the shareholders don't like it, they have the power to change it. Buy just one share of stock so you can go to the meetings and voice your opinion.

Since this opened about a 15C at $300 at counting, a good question is why can't you buy a new 15C today? Because they didn't sell. Period. Ugly truth. Just because they would sell here, today to most of us, does not mean they sold well enough fifteen years ago. They were victims of technology. The 42S, the same thing. When the 48 series was introduced, it replaced all previous models of the same or lesser capacity. Makes sense, doesn't it? Faster, more functions, more memory, cheaper, better battery life, etc,etc. Just as you malign your 32S for collecting dust under the lens, don't forget how it came to be. It was a lower cost, aka disposable model that represented advancements from the previous ones. You know, the ones that glow red in the dark. Every calculator series had its advancements and improvements with the normal trade-offs. It's just that calculator technology advanced to the point of missing the point. It went full circle to where some people felt they were no longer needed. You can get an RPN emulator for a PDA right? Why do we need a silly little calculator. That's something you balance your checkbook with, or figure out how much a mortgage will cost. That still keeps the 12C going. Advanced calculators were far eclipsed in power by a lowly PDA. It made sense to the product and marketing people. Kill the calculator. One only needs to look to a typewriter for a similar evolution. Go try to buy one today. It is ironic that my first HP came from a company that also sold typewriters and office equipment.

I have come to feel the reason for the rarity of new RPN calculators is because HP missed the boat. Not the boat of new, better and lower cost models, but because of the belief that RPN is better. You can't argue the differences in color with a blind man, the same way you can't argue RPN is better when the person only understands what an equals key does. All they want is an answer. Where is the key for that? It's the adding machine mentality. If they had built a dual mode unit years ago, and they could easily have done so, they would have been, in many cases, selected for their higher quality. I'll bet with a good manual, many people with a dual-mode unit would have explored RPN, had the eureka and never looked back. RPN could have been an extra credit course in schools.

I've really gone off topic here with the calculator history as seen by me. I guess all I wanted to say was, enough of the Carly bashing, alright? Sure, you're entitled to your opinion, but I for one, grow tired of the same mantra post after post. Sure, vent it a couple of times, it's good for the soul. But after that, what purpose does it serve?

I enjoyed the adventures of Captain Zener and would prefer it over this kind of stuff.

Re: 15C and Carly bashing (long)

*Message #4 Posted by **bill platt** on 2 June 2003, 9:16 p.m.,*

Randy,

Good point, and also: if only Apple Computer had marketed their Macintosh GUI dually onto their own hardware, and onto 8086 platforms.....

Carly Bashing: Justified

*Message #5 Posted by **J.C. Randerson** on 3 June 2003, 12:20 a.m.,*
in response to message #3 by Randy Sloyer

Whether in the military, royalty or a large corporation, the chief sets the tone. Here, the bean counting of Her Majesty Queen Carly was excessive, in order to pay for the acquistion of Compaq. Most HP old timers, along with the relatives of Bill and Dave, were vehemently opposed to the buying of Compaq. Many old HP traditions and departments, including calculators, were sacrificed to do this. She has started a new bad tradition: an art history major mismanaging a technology based company. She doesn't have the slightest notion of gadgetry, probably uses a Casio to balance her checkbook, sigh...

J.C. Randerson

Re: Carly Bashing: Justified "I second it"

*Message #6 Posted by **Ron Ross** on 3 June 2003, 8:24 a.m.,*
in response to message #5 by J.C. Randerson

It is indeed justified! If you had any dealings with Hp Corporate today vs ten years ago, you would definitely notice a different philosphy now compared to the past. While many may say Hp had to evolve to continue to be profitable (and no company can stand still), it SHOULD NOT have stepped into a 5& 10 direction.

Hp's calculators were more than a profit vehicle. The Hp calculator introduced me to their whole company on a positive note. When I went into the real world (I worked in R&D and process controls for much of my career), I favored HP instruments, because I KNEW they were the BEST.

Now all Hp really sells (they buy clones) is PC's and printers (yeah, they do make those, yet). And, oh, I forgot, Kingpo calculators! And they sell services (software and support).

Back to my point. Is CARLY wholy responsible? No, But she is a major reason why.

I agree with Randy

*Message #7 Posted by **Larry Corrado, USA (WI)** on 4 June 2003, 10:52 a.m.,*
in response to message #3 by Randy Sloyer

I think the Carly bashing is undeserved, and detracts from the Forum.

Larry

Why bash Carly if we can sink her

*Message #8 Posted by **Norm** on 4 June 2003, 9:58 p.m.,*
in response to message #7 by Larry Corrado, USA (WI)

i was just watching Das Boot for my 5th time

(cool movie. Do not make the mistake of watching the German U-boat speaking in a dubbed English. Watch it with subtitles (!) while they speak in natural German. This is one movie where the subtitles do NOT detract from the experience, they contribute to it. 'Das Boot' with subtitles is awesome. 'Das Boot' with dubbed English is a total bore.

So, Carly is a big lumbering fat rusty old tanker. "HP Museum" is a German U2 boat..... We don't 'bash' things, we sink them !!!

LOAD TORPEDO TUBES ONE AND TWO !!

Re: an RPN might-have-been

*Message #9 Posted by **Paul Brogger** on 5 June 2003, 11:32 a.m.,*
in response to message #3 by Randy Sloyer

On the subject of where HP might have gone "right" with RPN, imagine if they'd put ***TWO*** LED sticks in their early models, including a lower-cost (and hence, lower quality) entry-level unit.

Two lines of display would have gone a long way toward simplifying entry-level use of RPN -- the behavior of the stack would have been substantially demystified. Two displays would have been perfectly adapted to RPN, but wouldn't have added as much to an Algebraic interface. (So the competition wouldn't have been able to match the increased value by simply duplicating the hardware.) (To minimize battery consumption, perhaps the "y" display could have been switched off by experienced users.)

And (irrespective of the two-display idea) an inexpensive entry-level model would have enabled head-to-head competition on price in the educational market.

. . . ahhh, if they'd only asked me. (As if I could/would have recommended such in the 1970's . . .)

??? Already at $305 ???

*Message #10 Posted by **Mike** on 2 June 2003, 9:12 p.m.,*
in response to message #1 by Norm

You say **already at $305**, as if there are 40 people bidding it up.

The first bid (minimum bid) was $299.99 so $305 is nothing but two minimum bids. But I can tell you one thing. An HP-15C that is mint with a mint manual, will get $300 by itself, even without a box.

You can take a 15C and hit it with a hammer and it'll still get $100.

This is not a big deal bid.

Edited: 2 June 2003, 9:13 p.m.

Why not sit back and enjoy this?

*Message #11 Posted by **Ted** on 3 June 2003, 2:00 a.m.,*
in response to message #10 by Mike

Guys, I know, I know. We can all get heated up about this. But it would be much more fun to take bets on the fianl price. We all know how it works. Maybe one of you can donate some unusual or interesting file or pic that could go to the winner:) I'll go first: my guess is $560.00 Don't forget, this won't be used, but kept as a showpiece. Which ain't so bad- means there'll be more working machines left in the world of 2100 to show the great great grandchildren someday. Who's next?

Randy----don't agree

*Message #12 Posted by **Norm** on 3 June 2003, 2:20 a.m.,*
in response to message #11 by Ted

Hi Randy,

Dont' agree. There is little justification to discontinue the product AFTER it is already designed, built, being manufactured, and selling if only modestly, to create profits. 12C and 15C could co-exist on the same production line. I can tolerate deleting some of the engineer's calculators, but not ALL of them. Keeping an old design like 12C running for the MBA's, to me, is the smoking gun of proof, that the boardroom can build anything but has disdain for the engineering department.

Saying Carly should just 'make money' as you say, is true, but she should do it by continuing to ship products people are buying. "People" by definition includes engineers. We were buying those items such as engineering calculators. If 15C was discontinued, 42S (or 32Sii) should not have been. The larger issue here is a malicious attitude to force 'graphing calculators' onto all the kids in high school / college. They come home saying 'daddy daddy buy me this TI (HP) graphing calculator, teacher said so'. Daddy ponies over the money, Carly gets rich, kid learns nada zero zilch, genuine and functional calculators aren't available, only graphing monstrosities. They are pursuing a corrupt agenda. Just like when the boardroom annihilated Heathkit in the blink of an eye, this quest to take money from children is wrong, and they are side-swiping the mature adult engineering community at the same time as they make their quest to get the money from the parents of schoolkids.

You mentioned that HP's error is maybe they should not have stuck by RPN for so long. Don't agree, don't follow.

I know a kid who is going to be learning his algebra and trigonometry soon. I intend to introduce him to the 32Sii . Not that it was the best (it wasn't) but in the next 30 years, he'll have best odds of his own unit(s) still working, also eing able to find used items to keep himself supplied. Not that 32Sii was best, it wasn't but it does embody the spirit of the genuine HP calculator (it is a clear descendent of 34C actually... but I prefer the real McCoy).

You mentioned that we can substitute an 'emulator' on a PDA for a genuine calculator. You mean, emulate a 32S, a 34C ?? on a PDA? Man, I'm convinced, send it over (not) !

Randy you are keeping better track of my viewpoints than I am, dude, I mean, you even remembered I got dust underneath the lenses of my 32S, and you remembered the posts of Captain Zener. I am flattered you keep track, sorry, I can't shut off the symphony of noise I make, just because you asked. But I'll try a little bit. If I post too much be assured it bothers me too. I'm a little on the loud side.

IN SUMMARY, I am more with "JC" ------- Carly bashing is justified. Or more generally, a real mean and non-engineering spirit (non technically competent spirit) emanates from many boardrooms so it should be stated as such. You dont need to stick up for Carly. That sour attitude in the boardroom is doing a lot of damage (Enron, Ford/Firestone, NASA) its burnt up 2 of our 5 space shuttles, and its not getting better because its getting worse. All they care about is getting that 15,000 square foot beachfront-home with the showers that have got 6 showerheads. I think that's pretty darn selfish of these MBA's in comparison to the people who gave us the moonshot in '69 (there was a lot of humble living, but a lot of national pride and spirit). This selfishness in the boardroom needs to be challenged.

I will challenge it, with the only weapons I have got: my spending money, and my mouth. I wont buy their stuff I dont want, and will say what I think about these bad decisions.

I know I have to keep it down to a dull roar. I can't shut up completely though. Mr. Hicks has final control over acceptable message content..... the posts are within the passband of the bandpass filter for HP Museum, and I will try to stay in band.

Thanks for chatting, suggest anything further go direct?

Click on blue above to get email address.

Norm,

Thank you for thoughtful response. It's nice to have some dialog, that's what keeps all this interesting. It's not just about calculators.

A couple of points. One, you say

> Quote:
>
> The larger issue here is a malicious attitude to force 'graphing calculators' onto all the kids in high school / college. They come home saying 'daddy daddy buy me this TI (HP) graphing calculator, teacher said so'. Daddy ponies over the money, Carly gets rich, kid learns nada zero zilch, genuine and functional calculators aren't available, only graphing monstrosities.

While I don't care for the form factor of, nor do I need a graphing calculator, I don't think there was anything at all malicious about this. It was a natural evolution in calculators that began in the early nineties, long before Carly was on the scene. One fact that should be considered is that HP currently has no graphing calculator in the product line. Nobody gets rich that way.

I do agree with you and JC that the person at the top sets the tone. I don't think HP is an engineering based company any longer, nor do they want to be. Just look at what has been going on in the last three years or so. Perhaps living off previous engineering efforts like ink-jet and laser printing technologies, yes, but where is anything new? What is the R&D budget compared to ten years ago? Just like the AT&T split, some good things happened for a while, but the end result was anything but good. Know anybody working for Lucent today? Why doesn't anyone ever mention the management team at Agilent Technologies? They seem to be doing okay. If they had gotten the calculator lines, I'm sure we would not be having these discussions. We would all be happy with calculators for engineers designed by engineers. That's what made them so good.

I liked your mention of the situation with Heathkit; I think a lot of similar things went on in their evolution, same as HP. I would be interested to hear what you think caused the demise of Heathkit, other than just an executive decision to kill off a 40+ year old company with a great legacy.

Did it have more to do with boardroom shenanigans or just plain old good business smarts? Don't you think the progress in electronics packaging and manufacturing technology left them building buggy whips when the horses were in the barn and cars were everywhere?

100% Correct!

"I don't think HP is an engineering based company any longer, nor do they want to be."

This one sentence correctly sums it all up. HP has abandoned what made it a success. As far as being a service company, you've hit another nail on the head. Their extended service contracts for pcs are outrageous, $100 a year!

Who knows, maybe HP will be buying old McDonald's franchises. Imagine the scenario: "Hey guy, you want some fries while you're reading the quickstart manual?"

J.C. Randerson

Hi again, Randy, Heathkit,

Hi Randy, I dont understand, There is a 48G+ a 48GX and also something called a "49" . I dont think they were discontinued. I think HP therefore has several models of HP graphing calculator.

Randy wrote:

> I would be interested to hear what you think caused the demise of Heathkit, other than just an executive decision to kill off a 40+ year old company with a great legacy.

Hi Randy, I dont have all the facts, except that Heathkit was built by hard work of decent people going back into the 50's and 60's, it was completely and totally profitable. Then some kind of space aliens sat down in the boardroom, and within a space of about 3 years they destroyed the company, leaving a great gaping hole in a key part of the 1969 'moonshot America' national-cultural landscape.

That's all I really know, so anything else i say is a speculation:

They sat down in the boardroom, said, "here we are, the MBA monstrosities, the takeover kings of a 30 year legacy of people's hard work, hopes and dreams. We have taken over what other people built, consuming their entire lives to build this company, its profits, and its bank account, and we took it over and own it and it cost us not a dime. Thanks to our clever boardroom stock swindles. So now we are millionaires countless times over. We have plenty of profits and plenty of customers and a balance sheet in the black, SO, GENTLEMEN, what do you say we see how quickly we can incinerate this thing.

They did this in three quick ways:

(a) They decided they would compete against the already dominant Microsoft Intel PC consortium, with their "Heath Zenith" computers,and they blew a ton of money on computers,

for the laughable intention to dominate over Microsoft.

(b) With the company pretty well ruined by that decision, they decided to completely and totally eliminate the sale of all kits (apparently, a simple hatred of those types of people who buy them..... like when Carly eliminates all classic engineers' calculators, but retains the 12C for MBA's, this is just stereotypical hate-bias of MBA against engineer) so apparently the management didn't like people who build kits.

(c) With the kits eliminated, the retirement account raided, the customers scattered to the 4 winds (F U all you stinking rotten customers) they morphed the company into something entirely unrecognizable,where it exists to this day. Kind of like when in "X-men" they turned the Senator into a mutant? You start out with a Senator, you finish with nothing but a sploosh of water. Similarly, the MBA mutants mutated Heathkit into something completely unrecognizable to the customers and employees who built it. They set it up to milk community college funds (gov't public school funds) to sell their ho-hum little 3-ring binder educational books.

Similar to TI and HP trying to milk students with their useless graphing calculators. Well, I think those courses might be tolerable or adequate. Even those are goint to be somewhat dated. I saw a community college student using one very recently, in a course. The material is a little dated..... they were explaining how to use glue logic, like 8-bit shift registers. That's cute but the only problem is, who is going to do that anymore. So I think they are just milking whatever remains from the least interesting of an old ancient product line that profitable when it was destroyed, and could have continued to be profitable.

In all my years of enjoying Heathkit (70s, 80s) the 3-ring binder courses were the LAST THING I would ever look at. Hey, I wanted to build a giant clock, or build my own calculator, or my own stereo receiver, etc etc. They got rid of that stuff because it was fun. They kept the 3-ring binder stuff because it was stupid and dull and boring. Classic MBA stuff... MBA's are stupid and dull and boring so their decisions reflect this (they are also very very very selfish, very very very greedy, "gimme my 25,000 square foot home with showers that have 8 showerheads") so that gives you 4 major adjectives for MBA's.

So all that customer goodwill earned over 30 years was incinerated in an instant. Tektronix did the same thing by annihilating all their analog scopes w/o exception, apparently in a simple stereotype-based dislike of the people who used them. HP now does the same thing with engineer's calculators. The country is in a recession and it does not surprise me. This is not an "Osama recession" this is an "MBA Recession". The MBA drunkards scr*wed anybody who invested into stocks, they eliminate products we want to buy, they bring in cheap chinese throwaway trash by the boatload and stock the shelves with it, and charge us like it was made of solid gold. If I want something as simple as the preferred Japanese built calculator watch, I have to import it directly thru eBay, because the merchants wont sell what I want to buy. Helllo recession !

People are now 'hunkered in their bunker' and the economy stinks, but with the foul stink from the boardroom, does it really surprise anybody. Thank you MBA's.

You asked, Randy, so I have answered. This is my opinion about Heathkit (and Tektronix and HP) all destroying some of the most charming products I have ever seen in my life to this day. If my opinion is wrong you are welcome to correct me.

To reduce chat board clutter suggest direct e-mail.

Heathkits and Calculators?? (long)

*Message #16 Posted by **Randy Sloyer** on 3 June 2003, 6:24 p.m.,*

in response to message #15 by Norm

You're right, sort of, as only the 48GX is available through HpShopping.com. The G+ and 49 have been gone for some time. My mistake.

Well, it's clear we agree to disagree. Good fun actually. IMO, I see the demise of the calculator market having several parallels to Heathkit. In the end, it wasn't marketing, or some evil MBA's trashing the hard work of the generations before them. No, not the way I see it. It was technology. It never stops advancing which means things have to change. Sometimes not always for the good from where we stand.

It is very ironic that Zenith was one of the last owners of Heathkit. The last company in the United States that built television set with hand wiring. Remember "Works in a drawer"? But, just like through-hole technology build-it-yourself kits, hand built proved to be loser in the days of mass-produced electronic products. Do you really think the computer kits they sold with increasing complexity could be built by Joe Six Pack with a $5 el-cheap-o soldering iron? It was tough enough to get people to build kits loaded with 0.1" center dips, it was a just matter of time until they had to start including pre-built logic boards due to the density and let Mr. JoeSP put it in the case and build the power supply. This was back in the days before FCC regs. Where would they be today with the required EMI testing? Packaging technology made the kit concept an impossibility.

By 1985 or so, nobody wanted to build their own color TV or stereo when they could buy it cheaper, pre-built. Their audio equipment by 1980 was very limited by what people could build. Nobody wanted a nifty digital clock or thermometer anymore for $100. Sure, a few of us hams would build our own rig, but even that was not enough to keep them in business. They had hurt their ham reputation with the SB-104 and the HW-2026 in the seventies. More birdies in those rigs than a pet shop. How many lamp dimmers did they need to sell to keep hundreds of people working in Benton Harbor? In the end, it was like so many Internet business plans of the nineties, it just didn't work.

Near the end, the three-ring binder kits you refer to made more money being sold into the educational markets than all the kits. It was an 80-20 deal with new kits costing 80% of the budget and generating 20% of the revenue. It didn't take an MBA to make a decision on that one. Enough about Heathkit. Yes, it was fun while it lasted, but now it's over. Time to move on.

My way of simple thinking does not find fault with the MBA's, they were hired by management teams to help companies make money. Not always the old fashioned way through hard work and good business practices, I agree there. They do make an easy target, on that I agree. I also 110% on the boardroom deception, greed and general ugliness with the likes of Enron. Not the kind of companies that we need to build a strong economy. How that gets turned around I'm afraid is in the hands of the lawmakers which is complete topic unto itself. Don't want to go there for now.

Mass marketed consumer products is what HP is about today, our segment of the specialty calculator market is just about off their radar screens. I just see it in simple terms and sum up all the technological advances and what happened to our scientific calculators this way:

As early automotive engineering advanced, the demise of the harness makers followed, the aeronautical engineers while perfecting civil air transport, pretty much decimated the railroads and passenger ship lines. The computers on our desktops that enable us to post these messages from far-far away places make advanced calculators seem unnecessary. Heck, I even have a cheesy calculator in my cell phone, the junkie ones are everywhere.

Just as there are still a few harness makers that survive, there is an opportunity for some company out there to give the customers what they want in the way of a next generation hand-held calculating device. What it is and who makes it remains to be seen.

Heathkit (long)

*Message #17 Posted by **Michael F. Coyle** on 3 June 2003, 5:00 p.m.,*
in response to message #13 by Randy Sloyer

I remember Heathkit's demise very well. It was even reported in the Wall Street Journal and/or the Times.

Heath based their pitch on two claims: 1. You'll learn more about your equipment if you Do It Yourself, and 2. You'll save money if you Do It Yourself. I never bought into the "learn electronics" claim -- all building Heathkits ever taught me was electronic construction technique. (How to solder, how to identify components, etc.) I had to learn my electronics elsewhere. As for saving money, that may have true in the early days, back in the 50's and 60's when manufactoring was labor-intensive but not later, when IC's and automated manufacturing reduced the labor content of consumer electronics.

The plain fact of the matter is that while Heath made good audio equipment (to pick one example), by the late 1970's better, cheaper gear was available from Sony, Panasonic, and other Japanese suppliers. The stuff from Heath was behind the times because they had to limit themselves to designs and components that could be assembled by the average person with simple tools and little skill. Witness the pre-built and pre-aligned fromt ends for the "kit" TV sets -- "building" a Heathkit had become an exercise in final assembly of pre-built pieces.

In the end, the only people likely to buy Heathkits were those who got satisfaction from building them. But this has been a diminishing customer base. No one seems to be interested in tinkering with electronics anymore. The reduction in shelf space for components at Radio Shack and the demise of Heathkit are symptoms of this -- not the cause. There's probably a good long discussion to be had concerning the younger generation's tendancy to buy stuff and be passively entertained rather than open up the boxes and *learn*.

In one of the news stories back in 1992, a Heath Company executive said that their old customers, who had built kits when they were younger, weren't coming back and buying new kits. I recognized myself in that statement -- for whatever reason, uninspired kits or more competition for my leisure time, I had not built a Heathkit in a long time.

I somehow wish that Heath could have found a way to stay in the kit business, but given changes in technology and the marketplace, I guess it wasn't to be. Tradition is nice, but the marketplace is unkind to companies who stick with tradition to the point where sales suffer.

If Therwil is around I reckon, oh say, $910.

If anyone pays $900

*Message #19 Posted by **Mike** on 3 June 2003, 2:13 p.m.,*

in response to message #18 by james (UK)

They are are way overpaying, by double, what eBay normally brings. There is absolutely nothing special about this 15C. Nothing special about having an average box.

I have seen bazillions (ok, a few less than a bazillion) that are in just as nice. I doubt a week can go by without 2 or 3 mint 15C on ebay (without box). Think the box is worth $700? **Hardly!**

This, with box, shouldn't fetch more than $400, but you never know.

A mint or near mint 15C by itself can be had for less than $300, even on eBay.

Here's one that seems just as nice (**$335**)

or

Just missing box, papers and manuals (**Think those are worth $900?**)

Re: Why not sit back and enjoy this?

*Message #20 Posted by **David Smith** on 3 June 2003, 3:59 p.m.,*
in response to message #18 by james (UK)

It takes a minimum of two people who really want an item (and who probably don't know what it is really worth) to generate those astronomical bids.

Really nice and complete 15C's (and all the other voyagers for that matter)are rather common. A 15C that passes for mint-in-box probably shows up every couple of weeks. They almost always fetch in the $300-$400 range... not much more than the $250-$300 dollars that a typical used one brings. A 15C that has been eaten by a dog/goat/troll/yeti/etc does indeed bring at least $100... probably to scrap for parts to fix one or more nice looking corpses.

HP12cP available at EduCalc: US$... <8-O

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2003, 6:25 a.m.*

Hi, folks;

I was searching EduCalc for HP12C Platinum and I found this:

HP12C Platinum: US$ 175.00 + shipment

I also had a look at hpshopping and found this:

HP12C Platinum: US$ 79.95 (out of stock)

It seems EduCalc is following e-Bay tendencies...

HP 32S versus HP 32Sii

*Message #1 Posted by **NH** on 2 June 2003, 5:44 a.m.*

I have a question..... are people starting to favor the earlier 32S, over the newer 32Sii ??

I was comparing them today and found myself liking the 32S better than 32Sii (various small reasons). Then I go to eBay and there are NO 32S for sale. But theres a lot of 32Sii for sale.

So are people concluding that the 32S is the one worth hanging onto ? Or is there some other reason.

HP 32S: fewer, rare units

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2003, 6:52 a.m.,*
in response to message #1 by NH

Hi, Norm;

I'm not sure about usage, but one thing for sure: the HP32S was replaced by the HP32SII soon after being released. I saw an HP32S and it was a lot used. The girl using it was not aware of [ENTER] and was only able to perform DEG, GRAD, RAD, ->DEG, ->RAD, R->P and P->R with it. I tried to show her how to use it and she was always stuck (the girl, not the calculator). I tried to buy it, offer another one, but she resisted fiercely: it was her father's preferred, and he was only able to switch it ON and perform the self test. It was a gift... to ungifted people.

What to do? I offered a new HP32SII and she refused! And she was not even known about the fact it was a rare calculator.

I know it's an isolated case, but many HP32S owners know it is rare and will not give it up easy.

My thoughts...

Luiz C. Vieira - Brazil

Edited: 2 June 2003, 6:54 a.m.

Re: HP 32S versus HP 32Sii

*Message #3 Posted by **Randy Sloyer** on 2 June 2003, 12:59 p.m.,*
in response to message #1 by NH

IMO, it's not a question of favorites. There are far more 32Sii's out there than the 32S. It became the only shirt-pocket RPN in HP's line for at least 6 years after they killed the 42S in '95, resulting in more sales for the one model than any other. Being half the price of a 42S didn't hurt, either.

If you want the best of both models, look for a later 32S with the stepped bezel (without the LCD cover) and you'll get the nice, single shift key and the larger LCD digits of the later 32Sii.

Re: HP 32S versus HP 32Sii vs. HP-34C.

*Message #4 Posted by **Norm** on 2 June 2003, 3:14 p.m.,*
in response to message #3 by Randy Sloyer

How 'bout that. Original 32S is more collectible. I've got 4 of them lying around here. I bought them new, all at the same time around 1989. They are my 'thrasher' calculators. The cats walk on them, I throw junk on them until they are buried. Then I dig them out from under and start over.

Couldn't treat a 34C like that !!

When I compare the 32S to the 32Sii, I definitely find the 32S preferable. Why? Because its a clean elegant appearance. It looks like something where you can master all the functions, rather than spend years studying it and still not know what half the keys do. The single orange-shift key is advantageous to present a cleaner simpler appearance. It looks like a calculator a person can live with. Dont get me wrong, its not awesome. I think the brown color (with orange highlights) looks boring. But its a calculator I can live with.

To me the 32Sii looks cluttered and uninspired. Take one example. THE SQUARE ROOT BUTTON (top left) It's supposed to have the reciprocal (X SQUARED) as its compliment. OK, it does. But can you see it? Just barely. What you see mainly is a big label called "PARTS".

So the button says "square root" and "parts" rather than "square root, and x squared"

The "x squared" is buried. in the very corner, almost invisible. Not clear. Not clean. Not elegant. Looks cluttered instead.

So if I am forced to select calculators I would choose

first place: HP-34C second place: HP-32S third place: HP-32Sii Fourth place: HP-15C

Never liked the horizontal layout of 12C or 15C. It is better to size the width of a calculator to its display. This makes them tall and skinny, not fat and wide. The short display on a very wide calculator looks un-inspired.

So if you force me to live on a desert island and I can only have 4 calculators, those are the ones. ALL discontinued. What would I take from the current production? Nothing. Give me a few extra coconuts instead.

Re: HP 32S versus HP 32Sii vs. HP-34C.

*Message #5 Posted by **Bill Platt** on 2 June 2003, 4:24 p.m.,*
in response to message #4 by Norm

Hi Norm,

I am responding to all your posts today!

Here is a topic that I think is 100% personal style preference, and 0% subtantive or productive.

While I appreciate the "streamlined," "elegant," etc beauty of the 32s and the 27s, I must say that for me, to have as many functions as possible directly accessible on the keys is a tremendous advantage.

!. It means that you can know what you have available for functions--especially valuable when you are doing something you haven't done in a while but really need now, and

@. Direct keyboard access reduces keystrokes, which is to me the Holy Grail of efficient calculation. It

is also very common among other engineers.

I once worked for an international shipbuilding company, and the German guys (our hosts) were teaching us all the fancy ship design programs the company was moving up to, which ran on a UNIX mainframe. It was funny to see how the best engineers there did everything they could to avoid typing --- the unix GUI had two clip-boards--a middle button and a right button clipboard---so you hardly had to type at all!

So anyway, it is fun to discuss the merits/demerits of the cluttered vs uncluttered keyboard, but in the end, I think it is a style question.

Regards,

Bill

*Message #13 Posted by **Paul Brogger** on 4 June 2003, 9:35 a.m.,*
in response to message #4 by Norm

Norm sure is consistent!

Actually, I just got my first HP-34c, and can almost agree that it's the best of the bunch. It's got that red LED thing going, and its classic-like keyboard and overall solid feel are compelling attributes. (Unfortunately, its Roll Down is a shifted function, but that's a relatively minor complaint -- and not surprising, given the complexity of its keyboard . . .)

For everyday use, I vote the 32s first overall, and notably superior to the 32sII (for all the reasons Norm cites). But as a sheer pleasure to hold, the 34c is hard to beat. (Certainly, I can now better understand Norm's outspoken fanticism!)

I admit it Paul, I'm a fanatic

in response to message #13 by Paul Brogger

I admit it Paul, I'm a fanatic. I'm starting the church of the Holy HP-34C.

HEY, you guys are finally seeing it my way..... the nice triple-color keys, the 3 shift functions, AND, that nice heavy "paperweight" feel of the unit. And its nicely sculpted. I think it also accomplishes the most with the fewest physical keys (due to the 3 shift buttons).

The solderless ones are really heavy. Like little battle tanks. But the soldered ones are going to be more reliable, even though they dont feel as good in the hands.

Probably my biggest mistake is not paying more attention to the junior cousins in the same product line..... some of those are just as nice but not as heavily in demand.

- Norm

HP-34C: At the first sign of trouble

*Message #15 Posted by **Norm** on 4 June 2003, 10:08 p.m.,*
in response to message #14 by Norm

Along with using tri-flow on the slide-switches, here's one other important suggestion I can offer:

HP-34C: At the first sign of trouble, stop using it.

If its a solderless unit, then the solderless joints will eventually get unreliable. You can try freshening them 'Luiz Viera' stle by carefully cleaning the whole interior.

If you have a solderless unit and you keep running it while the solderless joints have gone intermittent, my impression is that the main chip gets partially damaged.

Then even freshening up the contacts may not save it.

If it works great then fine, but if it acts flakey then its time to take it to the doctor, if you want it to last another generation.

- Norm

Re: 34c Demand . . . And solderless connections

*Message #16 Posted by **Paul Brogger** on 5 June 2003, 8:41 a.m.,*
in response to message #14 by Norm

Norm, I suspect no single person has done more to increase demand for the 34c than has you. Your impassioned plea for its recognition made me take my first serious look. I'm sure there are others out there who reacted similarly. (We'd better watch what we rant about!)

With regard to solderless connections, I've been thinking . . . I recently used a conductive paint

(an alcohol-based solution of suspended copper powder or filings) to repair a flakey LCD connection in a TI-30XA for my son. This stuff was from a Permatex "rear window defroster repair kit" I found at an auto parts store. I wonder whether this (or something like it) might be used to make the the Spice series' solderless connections more reliable and less susceptible to corrosion? Anyone got any ideas on this? Would introduction of copper between the chip/PCB contacts create an electrolysis situation? (My limited understanding of that phenomenon suggests the answer is "no".)

I haven't taken my 34c apart, but suspect it's a soldered unit, as it's hefty, but not brick-like. Is there any way to tell externally? (Its serial # is 2301S30306.)

I was told this unit would "turn itself off randomly", but after replacing the NiCads, it seems to be working flawlessly. It's a little ironic that I (who will rip Pioneers apart without thinking twice) hesitate to venture inside, but I don't see any need to mess with success.

Key feeling...

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2003, 10:42 a.m.,*
in response to message #16 by Paul Brogger

Hi, Paul;

my best reference for soldereless and soldered units (Spices) is the key feeling. Solderless units have a bubble-like keyboard with cooper trails on it (I don't like to think they can break sometime...) and the soldered units use metal caps that are bent when keys are pressed. If you have the opportuniy to "feel" both types at your fingers, you'll never forget the feeling: solderless units sound as knoking in hole wood, if I expressed myself correctly. Also, they are heavier because there is a generous metal plate to maintain structural balance.

Soldered units are lighter and keys correspond promptly (their movement towards the spinning axle is shorter than the one observed in solderless units) and they "sound" metal touching each other.

I hope my English is well used here so you can understand.

Best regards.

Luiz C. Vieira - Brazil

Re: Key feeling...

*Message #18 Posted by **Norm** on 5 June 2003, 1:29 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

This is interesting Luiz. Thanks for describing that the keyboards feel different.

Which is your favorite? You didn't really say which is "better". Sounds like the later version probably has a "snappier" i.e. quicker to press feeling.

I have an old version right now, I will confess that the keys are a little bit long in the stroke. This makes a guy feell like he's running on a sandy beach, rather than running down a cement sidewalk.

Re: Key feeling...

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2003, 1:50 p.m.,*
in response to message #18 by Norm

Hi, Norm;

for me, both key-feelings are fine, I have no particular choice.

Anyway, the soldered-type Spices have a more reliable keyboard, to be honest. The metal caps are the same ones used in Voyagers and HP41's.

There are many Woodstocks that have broken trails in their bubble-type keyboards, although I have not seen this particular problem in any Spice.

New keyboards, like Pioneers', are also bubble-type, but they do not have cooper trails; instead, they have only a circular carbon "spot" and an interlaced "fork-like" contact right below them. These keyboards are reliable, too.

I prefer Spices' solderless (sandwich type) for maintenance and daily use (you'll be in trouble if you have to remove the LED display or the big µP), but soldered Spice's keyboards are better.

Hope this helps.

Best regards.

Luiz C. Vieira - Brazil

Edited: 5 June 2003, 1:53 p.m.

Hello Paul, one other VERY important

*Message #20 Posted by **Norm** on 5 June 2003, 1:45 p.m.,*
in response to message #16 by Paul Brogger

Paul wrote:

> Norm, I suspect no single person has done more to increase demand for the 34c than has you.

Yeah, now I am losing all the auctions and can't afford one !! Oh well, its not good to keep a fine thing all to yourself, and in the end, I can't own ALL of them

:o(

If you guys are chasing after them now, in your later years, you still can't have the total fun of getting one brand-new back in 1980, for high school calculus. That was really 7th heaven. Gotta feel sorry for all the public school kids nowadays who will never learn to even add 2+3 .

As to how to bring a solderless unit back to fullest performance (if the connections go intermittent) I dont have all the answers there, only some of the problems.

I tried cleaning up one by soldering it with a controlled temperature precision iron

Firstly, the pins themselves build up a blue oxide, esp. on the 3 small memory chips.

So they weren't accepting solder. The only way to fix that was flip the chip on its backside, and rub it for awhile with the iron.

Secondly, even with the lowest controlled temperature, there was tendency to melt the plastic underneath the connection.

Thirdly, you can never undo this type of work, so if a chip blows you can't replace it and the supply of parts rapidly dwindles.

I would favor the Luiz approach..... pull it apart and clean up the contact surfaces with a cleaner. Then use some type of light-oil that would keep the surfaces more corrosion resistant (dont know what oil).

The chips themselves, well, flip them upside down, and look for cleanliness of each pin. Probably a bit of scraping with a jewelers screwdriver is all that's needed. I think Luiz was using a bit of emery paper, which might be OK if followed by a squirt of aerosol degreaser.

A low-power stereozoom microscope is just dynamite for this. You can see exactly what's going on with each pin. I have one..... although they are $800 new, it can be such a fine tool that I say its totally worth the money.

THE LAST THING is ESD. I dont think you stand a snowballs chance in Hell of being able to clean up all the pins on an ancient CMOS chip without frying it. The only way this will work is if you ground yourself out, ground the jewelers screwdriver out, and work on a piece of anti-static plastic or even a piece of aluminum foil while you work each pin of a chip on its backside.

Anyway, clean all these boundaries where the contacts are occurring, a bit of oil on everything, put it back together and cross your fingers.

That's the Luiz approach, and its better than what I tried, or, the thing about 'painting' that you were describing.

Do recommend lubrication of the switches, or they will grind flakey bits of metal where the contacts are sliding. And these are antiques that there's no turning back (unless this whole country gets more traditional in its thinking, from the boardroom on down). So we really need to cherish these items. I think we can take a line from the antique radio crowd..... "you are dealing with a nostalgic item that goes beyond just your personal ownership. Later it will be owned by another person. Do any work so that it will last and ould please the future owners also".

Still recommend "Tri Flow" for slide switches (from the black aerosol can, shake well, but only one drop of the liquid onto a Q-tip and then rub it onto there.)

HEY one OTHER VERY IMPORTANT IDEA about SPICE calculators (dont think people have bought into this yet, but Luiz is starting to). Starting with the extraordinarily difficult case-halves, and continuing with the inner plastic clips that retain the electronics module, this plastic was mis-designed and you have to bend it TOO MUCH to get the plastic ratchets to spring away.

In these situations, get out a fresh X-Acto blade, and trim away just .010 or .020 of that plastic. Do it manually. THEN, the ratchet action comes apart easier, for future service.

If we don't get into doing some of that, the clips will simply break off in future servicings. I know because I'm already seeing bust-offs of these clips inside.

Try it sometime and you will be well-pleased.

Regards,

- Norm

Re: Thanks for relaying your experience!

*Message #21 Posted by **Paul Brogger** on 5 June 2003, 3:02 p.m.,*
in response to message #20 by Norm

Norm, you need to flesh your last few posts out as a "Spice Maintenance" article.

Thanks for all the info. I suspect mine is soldered, based upon its short-throw and relatively quiet keyboard, and its "reasonable" heft. But lubricating the switches is certainly sufficient reason to open it up, so I'll find out soon enough.

Thanks again!

dont know how

*Message #22 Posted by **Norm** on 5 June 2003, 3:32 p.m.,*
in response to message #21 by Paul Brogger

Hi, I dont know how to post technical material as permanent repair postings, but i agree with you.

Good ideas should go into a database for each calculator.

Clearly a few of the ideas I bring up about SPICE HP-34C units, based upon genuine effort and trials and mixed results, are worthy of going into a long-term data base.

I dont know the plan for such postings and figure if anybody is putting it into a big database, they will do it for me.

Maybe it should be pointed out to dgh@hpmuseum.org

Re: dont know how

OK, the HP12cP, what _is_ it?

*Message #1 Posted by **JasonG** on 2 June 2003, 4:31 a.m.*

I've been keeping an eye on the forum lately and have seen much discussion about the 12cP but I'm still a bit confused..

...is it a new piece of hardware that emulates a 12c or is it actually a redesigned 12c with new internals? If it's the former, then I'm hopeful for a 15cP. :-)

regards

JasonG

Re: OK, the HP12cP, what _is_ it?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2003, 5:23 a.m.,*
in response to message #1 by JasonG

Hi;

One of the contributors in here, Gene, had a Beta version and took some pictures showing the HP12cP inside. There is a small resine bubble where probably rests the CPU (I called it a peanut...) and it does not resemble any of previous Voyager, Chinese HP12C included.

So, Platinum is nothing like any other exisiting Voyager when internals are the issue.

As I find Gene's post I'm posting again (if someone else does it, better).

Luiz C. Vieira - Brazil

Gene's post with picturs

Bad news Jason,

*Message #4 Posted by **Norm** on 2 June 2003, 5:23 a.m.,*
in response to message #1 by JasonG

HP-12cP would refer to as an HP-12C that is 'platinum'. This is supposedly the greatest newest thing HP ever thought of (kind of like that burning brilliance of re-releasing 'charlies angels' instead of making a more interesting movie), worthy of the cheering of millions, ticker tape parade, coverage by all major TV networks, etc.

So anyway, bad news Jason, I think it will be a cold day in Hell before you get an hp-15C manufactured by HP again. (and on a cold day in Hell, then all the MBA's will be shivering ??)

Nice thought about HP-15C, I would like that also of course. Best of all would be for them to release an HP-34CG (golden HP-34C). With red LED's. Nice bright glowing RREEDD LED's. Such a calculator is like a glass of finest red-wine.

If you dont see any of these models, go to Wal Mart and buy an HP-9G . You can find it in the 'toys' section of the store, children ages 12 and under.

Re: Bad news Jason,

*Message #5 Posted by **Robert** on 2 June 2003, 10:13 a.m.,*
in response to message #4 by Norm

Norm, Still holding out for the LED's eh?

I really like the idea of a 15C Plat, gold, titanium, or whatever. It would not be so hard, as it shares mechanicals with the 12CP. Tooling is paid for. I would bet that it would run like gangbusters until all us RPN diehards had one.

However, I think that we're looking at a new graphing model. 49GII, in stylish color? No LED's, sorry Norm.

Re: Bad news Jason,

*Message #6 Posted by **NH** on 2 June 2003, 2:59 p.m.,*
in response to message #5 by Robert

I'd settle for a 15C also. However why dont they keep selling HP-32S or 32Sii.

This thing about "platinum" being better than "gold". I never agree'd with that. Gold is an attractive and lustrous color. Platinum, thats just a silver color, yawn, like cheap aluminum.

The fact that Platinum is triple the price of Gold isn't the issue. The issue is that Gold looks coolest of all.

If they want high-priced metals, why dont they make an HP-12C "Iridium". Pretty sure that Iridium metal is more expensive than Platinum and way more expensive than Gold.

Re: Bad news Jason,

*Message #7 Posted by **Patrick** on 2 June 2003, 4:57 p.m.,*
in response to message #6 by NH

How about the best of both worlds? How about a 15C Uranium? You wont need LEDs or LCDs.

Well, you wont need them *eventually*, that is.

Repair questions

*Message #1 Posted by **David Ramsey** on 1 June 2003, 8:13 p.m.*

Going over some of the 9x series desktop calculators in my collection, I've come up with a couple of questions. First, the easy one:

I fired up my HP-91 for the first time in a few years. Many of the keys are VERY bouncy-- that is, if I press "5", it will enter from two to four "5"s in the display. If I press "X", the result is almost always zero since it registers multiple times.

Some of the keys seem to get better if I press them repeatedly. But I've never seen this problem on a 9x keyboard before. I assume the problem is bouncing key contacts...any ideas? Is it fixable?

The second is harder. I've successfully repaired several card readers and am familiar with the mechanism. It's a simple recipe: disassemble the reader, remove the drive wheel, scrape the gunk off, make sure there's no gunk elsewhere in the mechanism, put on a couple of rubber O-rings from a bag I bought on eBay some years back, and it just works.

But this 97 card reader is giving me fits. Everything seems to work, but the card will not pull through. I can see the drive wheel spinning, but the O ring is stationary, the shaft of the wheel spinning beneath it. OK, I've never needed to do this before, but I applied a touch of glue to the shaft and reinstalled the rings. After a few hours they seem firmly affixed.

But the card still doesn't go through. The motor loads down and eventually the glue broke and the shaft spun under the rings again.

If I remove the motor I can feed the card manually and the wheel turns. However, turning the wheel by hand will not move the card through.

I've had the reader apart all weekend and can't figure out why the drag on the card is so high. Any suggestions for this one?

Re: Repair questions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 9:44 p.m.,*
in response to message #1 by David Ramsey

Hi, David;

a few days ago, Katie Wasserman called our attention to one fact I was aware about and forgot because I never needed to use it. Maybe this is not a solution for your particualr case, but why not to give it a try?

If you take a look at the gear where you built the O-rings, you'll see its axe has an extension with a slot. If you use a small screw driver, you can (gently) turn the axe and, as it is asymmetrical, you'll adjust pressure over the O-rings. If it is not correctly settled, cards will not be pulled.

Just look through the mechanism and you'll see if the o-rings are touching the small "free-wheel" over them or

not.

Best regards and success.

Luiz C. Vieira - Brazil

Edited: 1 June 2003, 9:45 p.m.

Re: Repair questions

*Message #3 Posted by **David Ramsey** on 1 June 2003, 11:04 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I never knew that axle did that! I assume the o-rings should just barely be touching the free wheel?

Re: Repair questions

*Message #4 Posted by **Ellis Easley** on 1 June 2003, 11:16 p.m.,*
in response to message #3 by David Ramsey

Are you sure the free-wheel (the little white roller) is free to turn and not glued in place by old goo? The eccentric shaft on the rubber roller didn't make that much difference on my 97 - I couldn't turn it and cause the motor to essentially stall like you are describing - but I used the silicone rubber tubing and not the O-rings. One thing I've wondered about using O-rings - any O-rings that I've seen have had mold flash sticking out from the outer perimeter. Does that rub off right away when you use them in the card reader?

Re: Repair questions

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2003, 5:22 a.m.,*
in response to message #3 by David Ramsey

Hi, David;

and yes: if the O-rings are touching the free whell, than the card itself will do the rest, because of its own thickness. As you mentioned you have already used these O-rings, I thought about the possibility of having different external diam. in some of them, but it seems not.

If you read Ellis post, you'll see another and very important issue there. I used a very, very small amount of silicon glue before "pushing" the O-rings in their assembly shaft. This way, they will not slick off. Anyway, using fuell tubbing seems to be a better choice but I believe tube must be precisely and linearly pushed into the shaft so there will be no irregularities. I have a working card repaired with O-rings and they are not glued, neither they slick (so far). I used silicon glue in another one and, as long as I know, it's still working fine.

Hope this helps, and thanks, Ellis!

Luiz C. Vieira - Brazil

Re: Repair questions

*Message #6 Posted by **David Ramsey** on 2 June 2003, 11:00 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

The card is feeding now, but at an uneven pace-- you can see the card slow, apparently when it hits the second set of ball switches just after it engages the read/write head. This always produces an ERROR on the display.

The edge of these o-rings is very smooth and I think I'll look for some fual tubing today. I have had these O-rings for several years; perhaps the rubber is hardening and becoming less "sticky".

I need to resolve this soon-- these self-tapping screwings into plastic posts things weren't meant to be taken apart as many times as I've been doing it!

screws

*Message #7 Posted by **Ellis Easley** on 2 June 2003, 7:46 p.m.,*
in response to message #6 by David Ramsey

Those screws in plastic work fine over and over if you take two precautions: always drop the screw into the existing thread by turning counter-clockwise at first until you feel it drop in, and never over-torque (that's the hard one for me to remember).

Re: screws

*Message #8 Posted by **Randy Sloyer** on 2 June 2003, 7:49 p.m.,*
in response to message #7 by Ellis Easley

Ellis,

Just remember what they say in Detroit:

"Fully driven and seated and not stripped".

Re: Repair questions

*Message #9 Posted by **David Smith** on 2 June 2003, 3:23 p.m.,*
in response to message #1 by David Ramsey

I have found most people use size 006 O-rings. These ARE too big (and too hard). The proper size is 005 (15/64 OD). Also the two O-rings tend to slip apart and rub on the sides of the reader well. Fuel line is a MUCH better solution.

Also the shaft coupling between the worm gear and motor shaft sounds like it is loose or broken. I use a rubberized super glue called IC2000 tire cement available at many hobby shops. I dip a 1N4148 diode lead in the stuff and put a drop in the worm gear hole. Too much and you cannot push the motor shaft on all the way. Keep it out of the motor bearings.

Re: Repair questions

*Message #10 Posted by **David Ramsey** on 2 June 2003, 10:59 p.m.,*
in response to message #9 by David Smith

I did use some adhesive to reconnect the worm gear to the motor shaft-- it had spun off. That part seems fine.

I found some tubing I think will work and installed it on the drive wheel.

Unfortunately the end of the ribbon cable that plugs into the card reader module has delaminated to the point where it can no longer be inserted-- the metal connectors are separate from their backing, and the

backing's disintegrated enough so that several of the metal connectors no longer have any support.

I see three options:

1. Solder it together. Ick.

2. Find a suitable replacement cable. Unlikely.

3. Use a fairly stiff adhesive film to "relaminate" the end of the cable.

Anyone with any experience here?

Replacement cable

*Message #11 Posted by **Renato** on 3 June 2003, 1:27 a.m.,*
in response to message #10 by David Ramsey

David,

Ribbon cable should be removed with aid from a tool. HP 97 service manual describes a connector tool. I remember that someone mentioned using a brazilian pay phone card (Luiz - was that you ?).

I saw a catalog with samples of ribbon cables for replacement - mostly for microwave oven and other appliances. I was amazed at the quantity - more than 30 types, starting at 5 wires, up to 40 (I guess), with many lengths available. Maybe one would fit the 97. I have a 97, but it is working perfectly, so if you can describe the cable - #of wires, length, width - I can check the store next time (saturday probably).

Also, if I were in your situation, I would consider repairing the cable with adhesive foil. Chomerics and 3M manufature foil (EMI shielding purposes) - useful for 41 battery contacts.

I guess you are having a good time working on the 97 - I had a great time with mine.

Best regards and good luck.

Renato

Re: Replacement cable

*Message #12 Posted by **David Ramsey** on 3 June 2003, 11:34 a.m.,*
in response to message #11 by Renato

I don't think removing the cable hurt anything-- it just pops right out. It's re-inserting it that wears it.

I've taken a photo of the cable with a tape measure against it, but although I know posting photos is possible here I can't seem to figure out how to do it...

Re: Replacement cable

*Message #13 Posted by **Ellis Easley** on 3 June 2003, 11:52 a.m.,*
in response to message #12 by David Ramsey

This is another message in the same thread that deals with what Renato is talking about:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv012.cgi?read=33007

The connectors come with or without the barbs. HP might have used both at different times.

HP97 card reader flat tlex cable

replacing flat flex cable

*Message #16 Posted by **Ellis Easley** on 3 June 2003, 9:20 a.m.,*
in response to message #10 by David Ramsey

Here's an idea I had a while back. I haven't actually done this to my 97 but I intend to next time I have to open it up. (Skip the first part about Molex connectors, the screw machine contact IC sockets are the better idea):

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv012.cgi?read=33029

If you are familiar with this kind of high-quality IC socket you will know what I mean. They come with different diameter pins (that go into the PCB hole) but the 0.020" diameter size pins fit perfectly in the sockets. Make sure you mate gold with gold or tin with tin - never gold with tin.

Re: replacing flat flex cable

*Message #17 Posted by **David Ramsey** on 3 June 2003, 11:37 a.m.,*
in response to message #16 by Ellis Easley

Hmmmm...replacing the cable connectors shouldn't be too hard. I've replaced groups of LEDs in the displays of some of the classic calcs before. Looks like single layer circuit boards...I'll look into that this weekend....hope I can find a usable socket!

Re: Repair questions

*Message #18 Posted by **David Smith** on 3 June 2003, 4:13 p.m.,*
in response to message #10 by David Ramsey

HP recommends that use use the tool for both removing and inserting the flex cable. I made my tool out of a picece of 0.006 inch thick spring stainless steel. I cut one end so it is the proper width for doing HP97 reader cables and the other for doing print head cables.

The delamination of the reader cable is a VERY common problem. I never unplug my cables unless I absolutley must do it. I have fixed some of the cables using IC2000 tire cement (black rubberized super glue used to glue RC model race car tires onto their hubs). The more tracks that have popped loose, the less satisfactory the experience.

I also fixed one unit that was missing a cable by removing the connectors and soldering in a piece of ribbon cable.

Re: Repair questions

*Message #19 Posted by **David Ramsey** on 3 June 2003, 6:34 p.m.,*
in response to message #18 by David Smith

On my cable, _all_ of the contacts have delaminated.

Soldering a ribbon cable sounds like an easy fix...if I used a long enough cable, future card reader repairs shouldn't be hard.

Re: Repair questions

*Message #20 Posted by **David Smith** on 4 June 2003, 3:34 p.m.,*
in response to message #19 by David Ramsey

If I have to do it over again, I think I will go down to the local surplus store and try and find some ribbon cable connectors of suitible size. If they are standard dual row, you can always cut off one row of pins. I think the hard part would be clearances with the case.

Before you go soldering, etc it may be worth trying to glue down the conductors. I have also though of using RTV. A very thin layer, cover the exposed conductor end with teflon sheet, and clamp gently in a vise until set. Hopefully the glue wont ooze all over the conductors.

Re: Repair questions

*Message #21 Posted by **David Ramsey** on 4 June 2003, 7:01 p.m.,*
in response to message #20 by David Smith

The cable's useless as is, so I have nothing to lose by trying to repair it.

A hardware friend thinks I can probably get a replacement cable from DigiKey, but I need to know exactly what to order-- they don't have pictures (with tens of thousands of components, how could they?)

Case clearance shouldn't be a problem-- it can be folded, after all!

flat flex cable ideas - last might be best!

*Message #22 Posted by **Ellis Easley** on 5 June 2003, 8:43 a.m.,*
in response to message #21 by David Ramsey

It shouldn't be hard to specify the cable. It is a standard pitch, 0.1", and has 13 conductors. Just measure the total length and make sure you get something at least that long - I measure 2.75". It might be possible to get them in different "phases" by which I mean whether the stripped part is on the same side at both ends, but I don't think so. The two outer layers are different, the thicker and tougher side isn't meant to be stripped - notice how it is flat and the other side follows the contours of the conductors. I've seen

applications where the stripped portion of the cable is folded over to put the exposed conductors on the other side.

Now that I've measured the cable, I'll post the dimensions as a response to Renato, he said he saw some cable assemblies in a shop.

The only thing I find in the DigiKey online catalog is 500 foot rolls of 0.1" flat flex cable, on the first page of these two (I'd like to know the proper way to strip the cable - I think a vendor once told me they use something like a grinder or a wire brush):

http://dkc3.digikey.com/pdf/T032/0041-0042.pdf

On the second page they have prepared cable assemblies but only in 0.5 mm and 1 mm pitches. These might work via redundancy, like zebra strips, except the widest they have is 31.15 mm (30 conductor, 1 mm pitch). The first page shows the overall width of 13 conductor, 0.1" pitch is 1.4" or 35.56 mm. You might have success with two 36 conductor, 0.5 mm pitch cables (18.5 mm wide overall), letting them overlap a little in the middle - or trimming the extra insulation on the inside edges - with two equal width cables, and an odd number of "destination conductors", the gap in the middle falls right on conductor #7. 0.5 mm pitch has 5 conductors in the space of 1 in a 0.1" pitch cable, so it might work.

I tried one more thing on the DigiKey website - I did a keyword search for "flat flex cable". The search results were divided into categories, I chose " Cable Assemblies - Flat Flex(1194 items) ". That took me to a page with a sort of nomograph - you choose " Contact Termination "," Length "," Number of Contacts " and " Pitch ". For Termination I chose " Solder Tab/Solder Tab " which I assume means just stripped ends [turns out I was wrong - see below]. For length I chose 3", for number of contacts 13. For pitch, the only choices were 0.05" and 0.1", which I chose. Then I clicked on "Apply Filters". It came back with a part number, A9AAT-1303F-ND, and a price, $2.52 for one piece. It also said " Quantity Available 0 - Value Added Item " which tells me DigiKey will make it (or have it made) to order. Electronics parts dealers love this kind of thing - since years ago when TV's and radios were repaired, and a parts shop could build you a potentiometer with switch, multiple sections, etc.

I can't give you a link to the final page, you'll have to start here and make the same choices:

http://www.digikey.com/Scripts/US/DKSUS.dll?KeyWordSearch

Make sure you don't click on " Items in Stock " on that page!

OOPS! They had highlighting on that part number, it took me to a catalog page - these aren't just plain stripped ends, they have flat terminals crimped onto the ends which are about the size of DIP IC pins. Here is that page:

http://dkc3.digikey.com/PDF/T032/0039.pdf

I've seen these before - Tandy used a long one about 1" wide to carry some signals across a board but I can't remember exactly what product it was. But I think this kind of termination is supposed to be an improvement over the stripped ends, because it doesn't have the problems of delamination and "smiling" sockets. They are made to plug into a SIP (Single Inline Plug) socket - like what resistor packs plug into for SCSI termination. They might mate with the existing sockets in the calculators.

I tried some other paths from the "flat flex cable" search results - I zeroed in on the 0.5 mm and 1 mm cable assemblies and the 500 ft roll of 0.1" cable.

Here's an idea - order the terminated cable (maybe a little longer, like 4", in case you try my final idea). If you don't like the way it fits in the existing sockets, you could get some SIP sockets (or cut a DIP socket in half) or you could cut off the ends and try your hand at stripping the insulation from the ends. The more I look at the cable from my 97, I think a Dremel with the 1" diameter wire brush would probably strip it pretty well (bristles moving toward the cable end). I would try to keep the brush just over the conductors and not try to remove the insulation between the conductors.

Ellis,

Thanks for that enormously informative message!

Re: flat flex cable ideas - last might be best!

*Message #24 Posted by **David Smith** on 6 June 2003, 3:42 p.m.,*
in response to message #22 by Ellis Easley

I think you can just cram those crimped on pins into the HP sockets. I found a long 8 conductor at a surplus store and tried it a while back. The pins seemed to hold just fine. Certainly is worth a try.

BTW, I have two SR-60 calculators with serial numbers around 100 apart. One has the bare flat flex cables inside, the later one has the pin style. The bare cables have problems staying put, etc.

Re: flat flex cable ideas - last might be best!

*Message #25 Posted by **David Ramsey** on 7 June 2003, 11:11 a.m.,*
in response to message #24 by David Smith

Hmmm..lemme know if you want to get rid of one of those SR-60s...

In the meantime I'll continue looking for a replacement for the cable.

Re: flat flex cable ideas - last might be best!

*Message #26 Posted by **David Smith** on 7 June 2003, 2:42 p.m.,*
in response to message #25 by David Ramsey

Alas, one of the SR-60 machines is well and truly dead. And the CPU board is not the same. Even though most of the parts are socketed (!) most of the custom chips are different so swapping parts does not help much. Rather strange in a machine that had a production run of probably less than 500 units.

Re: flat flex cable ideas - last might be best!

*Message #27 Posted by **Tony Duell (UK)** on 7 June 2003, 6:49 p.m.,*
in response to message #22 by Ellis Easley

My HP97 came in a pretty beat-up state, and my aim was to get a working machine, rather than one that was 'perfect'. Of couese the reader cable was dead. What I did was desolder the connectors from the logic board and reader and replace them with 13 pin (I think) right-angle pin headers. I then used a piece of 26 way IDC cable and a couple of 2*13 pin IDC sockets to make a replacement cable -- of course I had to thread the cable through the chassis plaate before I crimnped one of the connectors to it. I also had to be careful that I used the right row of holes in each connector (using the wrong one would have made no connections, of course. Works fine, even if it's not as HP did it.

Yes, that opening in the middle plastic is a big limitation on what connectors you can use. There's no way a dual row plug will fit through it. The red (or white - means made in Japan - 2.5mm instead of .1") Molex connectors for single wires are too thick also. The black connectors that you see in generic PC cases for the wires from the front panel that plug into the motherboard will fit through the opening. Molex C-Grid is one brand but I think AMP made them first.

I've studied this a lot (but haven't actually implemented any new ideas yet) but my favorite idea is using strips of screw-machine IC socket contacts with .020" diameter solder tails, which mate perfectly with their own sockets. I'm going to do this but right now I only have a 24 pin socket so I can only make two 12 pin strips. But starting with a 28 pin DIP socket, I will cut it in half ad cut off one pin from each half - or find two 13 pin single row strips - and solder one into the main circuit board (bent to a right angle) as a socket, and connect the other one to the card reader as a plug with 13 wires.

Well, heck, it's just a slot in a piece of plastic. A little Dremel work is all that's needed...

Dremel work ...

*Message #30 Posted by **Ellis Easley** on 5 June 2003, 6:35 p.m.,*
in response to message #29 by David Ramsey

Speaking of Dremel work - if I'm right, and a Dremel wire brush will strip flat flex cable - I can make 2181 of these cables from a 500 foot roll which costs $465 so my material cost per unit would be $0.213 - I wonder how many I could sell?

Heck, I'd buy 5 of 'em at $10/each!

I think I'd try a razor blade, myself, rather than a Dremel tool (to strip the cable)...

in response to message #31 by David Ramsey

Only thing about the bulk flat flex cable and the terminated assemblies with 0.1" pitch - according to the descriptions the copper conductors are not tin plated. The metric cable assemblies (without pins crimped on them) are tin plated.

Need guidance! HP12cP: where to buy?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 3:55 p.m.*

Hi, folks;

I have the chance, this very week, to get in contact with an HP12cP. Avoiding detailed information, I need to know where it can be bought on-line, I mean, an e-address so it can be ordered in the USA.

I know this information has already been available in this forum, and I received an e-mail by Jorgi Hidalgo where he mentions an e-place where it can be ordered, but I cannot retrieve such information.

Please, I have only till Tuesday to confirm the e-place so I can be able to have one. My interest is not specifically in having an HP12cP, but having the chance to know it and how do its new features work in order to develop a professional activity.

If there is anyone that can help me pointing out an e-place where it can be bought on line, I'm extremely thanked.

Luiz C. Vieira - Brazil

Re: Need guidance! HP12cP: where to buy?

*Message #3 Posted by **Ellis Easley** on 1 June 2003, 6:26 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

HP's website, the page that was posted here a few days ago, will find dealers for you:

http://www.hp.com/calculators/financial/12p/

See the button marked "locate a reseller>>". For the United States, it lists three:

Office Depot http://www.officedepot.com

Office Max http://www.officemax.com

Staples http://www.staples.com

They also list Chile, Colombia, Peru and Venezuela - what happened to Brazil? Argentina? HP only likes the west side of South America?

links maybe no good

*Message #4 Posted by **Ellis Easley** on 1 June 2003, 7:12 p.m.,*
in response to message #3 by Ellis Easley

I hope I didn't jump the gun with those links! Office Depot hides calculators under "Office Machines". Here is a direct link to the page of "Business/Scientific Calculators", but it doesn't include the 12cP:

http://www.officedepot.com/ddMain.do?level=SC&id=1002001&location_info=SG_3_DV_10_SC_1002001

Office Max doesn't list the 12c let alone the 12cP - but they do have the 10BII (on the second page):

http://www.officemax.com/max/solutions/product/thumbnail.jsp?BV_UseBVCookie=yes&expansionOID=-536879774

Staples also puts them under office machines and they don't have it either:

http://www.staples.com/Catalog/Browse/class.asp?
PageType=3&ClassID=140514&bcFlag=True&bcSCatId=3&bcSCatName=Technology&bcCatId=9&bcCatName=Office+Machines&bcDeptId=900&bcDeptName=Calculators

That's one of the longest URL's I've ever seen! They must have been taking those pills that are always being offered by email!

Then I called all three local stores - they never heard of it.

Re: links maybe no good

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 9:17 p.m.,*
in response to message #4 by Ellis Easley

Hi, Ellis;

I was told by someone in USA that both Office Depot and Office Max are not aware of the HP12cP, too.

HP is taking desperate measures: announcing sale offices that do not know they are selling.

Funny.. if it was not tragic.

Thanks a lot!

in response to message #5 by Vieira, Luiz C. (Brazil)

I called 1.888.GO.DEPOT to order a 12C platinum and they told me that had them. So, I order two. They arrived the next day - lo and behold - they were regular 12C's :-(

So, I called and bitched and they are picking them up tomorrow. They sales guy I got said he know nothing about them.

I called CA, PA, IL, and emailed Austrailia - nobody knew anything. So, I thought, "What the hell is HP doing?" It seemed to me that the 12C might be crap and they are tring to create mystery and "demand" to get as many out the door as they can before it's known how junkie they really are.

However, I still wanting to get one at least to find out for myself.

Finally, today (June 4th) HP's website has them for $79.95 ea. It's supposed to arrive tomorrow.

I'll let you know what I find...

HP 200C Audio Oscillator

*Message #1 Posted by **Joe McGerald** on 1 June 2003, 1:15 p.m.*

I acquired one of these today from the earliest days of Hewlett Packard. It seems to be complete and in relatively good shape. Does anyone have an estimate of the value and/or know where I might be able to find information about it. A Google search yields a museum in Japan and HP's own web site museum.

Also interested in info about the number manufactured, etc.

Thanks in advance for any information.

Joe

HP12C Platinum Observations

*Message #1 Posted by **Stan (Sg)** on 1 June 2003, 9:28 a.m.*

I decided to go ahead and purchase an HP12 C Platinum. After using it for a short time, here are my thoughts (in no particular order):

* Looks: The HP12CP looks better "in person" than in the pictures that I have seen. After using it for a little while and setting it beside my HP12C, the 12C looks old fashioned. I will give it a thumbs-up on looks.

* Case: The case (leather?) that it comes with the calculator looks nice – much better than the original 12C vinyl case. Thumbs up on this also.

* Speed: Solving a typical TVM problem it is very quick with everything but i (I used PV=100,000, FV=0, n=360, i=6). Solving for PMT takes only a second or two. If I store zero in i and solve for i with the payment calculated above, it takes about 30 seconds. Solving for i again takes another 30 seconds, which implies it does not use the prior solution to start the next problem. For reference my 49G takes <2 seconds to solve for i, the original 12C takes 16 seconds (first time) and 4 seconds (second time) and my 42S takes 5 seconds (first time) and 3 seconds (second time). Note, I programmed the TVM equation into the 42S, so it is subject to my programming skill or lack thereof. I tried some quick programs on the 12CP and it seems faster than the original. Thus, I will call this even.

* Display: The 12CP numbers are taller and thinner than the original and are easy to read.

* Keyboard: The keys feel okay and have more of an audible click than my other HPs. The real test of the keyboard will be its longevity (so time will tell). Regardless of how it compares to older HP models, the keyboard is better than any other brand on the market (IMHO).

* Mistakes on the back label: The mistake on the 31/5/1998 example on the back label has been corrected (5 changed to 05), but two others have appeared. The 1998 and 1999 from the original 12C examples remain, even though the examples have been updated to 2003/2004. Thus, it instructs you to enter 6.0320041999 instead of 6.032004. Oh well. Perhaps these will be corrected in later production models.

In my opinion, this is a good calculator and a step forward from the latest 12C. I applaud HP for producing new models. I would like to see more frequent incremental updates on the new models - how about a 12CP+ with trig functions for 2005 release????

Re: HP12C Platinum Observations

That's exactly my problem with the "new" 12C. For me, "old fashioned" is almost a synonym for "classic." I'm not interested in any "new" Voyagers unless they look just like the old ones.

Re: HP12C Platinum Observations

*Message #4 Posted by **Stan (Sg)** on 1 June 2003, 10:14 a.m.,*
in response to message #3 by R Lion

I agree completely. I would love to see a 15C platinum (or titanium, etc...). My comment was regarding what happens after the new scientifics are released later this year. I am hoping that HP wont stick with that line up for 10 years. Adding a few incremental features each year will help satisfy users and add to sales. eg. how about selling a 15c "as is" next year (for those that didn't get one the first time around), then a platinum version in 2005 (with more memory / faster processor) and a platinum+ in 2006 with I/O capability?

12CP and other (Long)

*Message #5 Posted by **bill platt** on 1 June 2003, 11:35 a.m.,*
in response to message #4 by Stan (Sg)

Stan, R.Lion etc,

First, one of the most fascinating aspects of this newsgroup is that there is a constant (healthy) tension between two worldviews here--the collecting worldview, and the "what should be happening now" worldview in terms of calculators. And even more fascinating, most of the personalities here are living in both worldviews!

I agree that incremental improvements are imoprtant to product sales. This is precicely what has kept microcomputers selling all these years. Except that with calculators, a large part of the market (how large, we do not really know) does not want or need new features--the product has sort of reached a plateau in that respect. It's kind of like knives---good designs have been around for 1000's of years and so the choice of appropriate design is more a matter of taste and specific application, rather than getting a better one.

Second point is that the speed of the older calculators is noticably inferior, and in my opinion unacceptable. I feel this way because of my viewpoint:

I used an 11c for 12 years, until I lost it in'96. Bought a 32sii--and the transition was so absolutely seamless--I barely had to read the manual. And the 32sii had a bunch of new features--which was nice, and I was glad to have them, becasue they did not "interfere" with my core understanding or needs, but they were right on the keys, and handy, and I use them!

Then, recently, like 3 months ago, I finally bought a 48GX. That was also a pretty good transition for basics, though it took a significant amount of time (about 16 hours) of reading the manual and using it, to understand even the basics of the whole new system. And while the speed for the calculations is good, the menus are slow--they feel slower than my 1 Ghz pc. And it really is not as convenient for gneral use, as there are almost always more keystrokes than the 32sii, when looking for handy calculator features.

Finally, I got crazy and bought an old 41cv. Now that gives perspective. Having been in 32sii land, and then 48 land, I can see that there is Never a reason to reintroduce that venerable 41c. Never. It is cool, to be sure; it is easy to program--being regular rpn, but my god, it is clumsy, like an ALpha Register?! That is clumsy, in retrospect. But necessary, when you have not invented sysRPL yet, I guess. And the solve times are slower. And there are no built-in handy functions on the keyboard. But it really was not a calculator--it was a proto-PC sort of--or better yet a blank fully customizable tool. You can see how, (I admit, even today) by using overlays and USER mode, you can make a custom tool for some specific application--like you hand the tool to the guy on the line and say, "now you just do this and that, and then bring the machine in and plug it over there at the end of the day..." But today, you would rather build that onto a pocket pc or a palm tungsten T? or W? (the one with the key board).

I also recently found an old 11c. So nicely made. But having been on the 32sii, I find that it runs REALLY slow---almost unbearably after having gotten used to the modern world. And I have really come to like having the alphanumeric, rather than keycode, programming, and the equation editor/solver. I suppose that if i were an "EE and used complex math, then I would not even consider the 11c (it would have been 15c anyway).

Products do have to keep up with the times. They *must* work faster than old ones. Speed is really important, for the user to accept the product as being up to date.

It seems to me that the new 12CP is headed for failure, if it is taking 30 seconds to solve for the interest rate, on a TVM computation. Like, I could do that faster by hand!

Just my $50. wrth ;)

-Bill Platt

I wish someone would explain to me, using babytalk if necessary, why speed is so important. Even an HP-65 (a really slow calculator) performs calculations a hundred times faster than pencil and paper -- or, perhaps, even abacus.

IMHO, speed is not an important issue. It's nice, yes, but not vital. More important issues are ease of use and physical sturdiness.

Sorry, but I find that I cannot agree with you.

-Ernie

Re: 12CP and other (Long)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 1:30 p.m.,*
in response to message #6 by Ernie Malaga

Hi;

I'm not daring to explain others, instead I'm posting my own view to "the need for speed".

IMHO, speed is important when new features need more and more system cycles to compute final "result", being this result manifested as, for example, a higher-resolution screen. We all, at least most of us, use some sort of graphical O.S. in our computers. Chances are (and we have one of our contributors as an example) we may face a text-only access through a dummy terminal, what would be extremely desirable about fifteen years ago. To support such high-quality images, enhanced O.S. and to handle large amount of memory, speed must be increased so we do not have to pay with "waiting time" for the new enhancements.

Imagine the HP48 with the same clock available in the HP41. It would run as a turtle! There are lots of instructions in an HP48 being performed after each keystroke that simply did not even exist in an HP41. Also, the new enhancements lead to more memory so new data may be stored. And new O.S. are more software dependant, demanding more and more cycles to accomplish each task.

I see the HP12CP as an enhancement in a way it "emulates" an old system in a new design. And this is something some of us (I included) are trying to do. As this old system is partially hardware dependant, I mean, many instructions in the HP12C's original O.S. were based on its internal architecture and had to be "translated" to the new one, the "emulated" system had part of this code adapted to the new HW and part of it was completely rewritten. It could be avoided if the new system emulated the original HW completely, as a virtual machine, what would allow the original HP12C O.S. to be entirely used. In this case, which processor would they use in the HP12cP? I imagine the best cost × performance was chosen. At least when HP's new staff viewing is considered. and if we have the same set of resources being offered by a newer equipment, let's enhance it's performance so we can "see" results almost instantly. At least it is enough to justify the upgrade.

Not that I agree with it, but I cannot deny the fact.

Suggestions, comments, flames...

But Bill's post was not about newer, more advanced machines. He was talking about a HP-12CP. What's the rush, that a 15-second computation is intolerable? That's what I'd like to know.

Next, we'll be using holographic displays and 8 GHz Pentium XII chips on a 4-function calculator that needs no keyboard because it reads your mind. Yeah, yeah, I know -- I'm taking it to an unacceptable extreme. 8^)

For human beings delving into an whatever design, no matter at all! A coffe break, why not! What bothers people is that if someone gives an answer faster than the others, its a wrong analysis to consider him the best; he's been the fastest, at least at that particular moment. But some mannagers (not all of thenm) cannot see this way.

> Quote:
>
> Yeah, yeah, I know -- I'm taking it to an unacceptable extreme. 8^)

You're talking about today, right? If you said "2GHZ microprocessor for home and office application with 80GBytes HD and 512 MBytes RAMM, 266 MHz RAM clock", say, ten years ago, you'd add: *Yeah, yeah, I know -- I'm taking it to an unacceptable extreme. 8^)* too.

Right?

Best regards.

Speed and the TVM equation

*Message #10 Posted by **Karl Schneider** on 2 June 2003, 4:22 a.m.,*
in response to message #6 by Ernie Malaga

I agree with Bill Platt that higher computational speed is important in calculators (though not as much as for PC's), and that updated number-crunching products should keep improving their speed of execution in order to stay modern and competitive.

Slow computational speed is my only criticism of the Voyager series, and it may have been a result of the CMOS technology of the time. The HP-15C takes almost a full second to calculate a trig function -- a minor annoyance. The 32Sii and 42S are about 4x as fast as the 15C, and it shows.

Faster computational speed helps to eliminate this "annoyance factor", makes programs run faster, and makes graphing practical.

Those of you familiar with the TVM equation know that, of the five variables, only %int must be iteratvely solved by numerical methods; direct equations can be written for the other four.

Karl wrote:

"Slow computational speed is my only criticism of the Voyager series, and it may have been a result of the CMOS technology of the time."

On the other hand, you get an utterly incredible battery life, lasting several (many) years from a single set, even using the machine a real lot. I'm still in the third battery change for my 22+ years-old HP-11C, and it has seen very heavy, daily use all the time. Try that with any other calculator at all, past or present.

"The HP-15C takes almost a full second to calculate a trig function -- a minor annoyance."

Very minor. I don't mind at all that it takes 1 second to compute a trig function to 10 places, instead of 0.01 second or 0.000000001 second, I'm never in such a hurry to get my trigs. If I were, I would be using my 2.4 Ghz PC.

On the other hand, wasting time changing batteries which happen to be low when least expected or when most necessary (Murphy's Law) would really amount to a lot of seconds wasted, not to mention the fact that if you're running such complex programs on your calculator that time is paramount, just think how much time you've already used writing, testing, and debugging said programs in the first place. Perhaps the running time amounts to just a fraction of the grand total.

"The 32Sii and 42S are about 4x as fast as the 15C, and it shows."

If running speed were the main concern, you might as well use most any vintage SHARP pocket computers instead, they can run rings around any 32S or 42S. But it isn't, don't you think ?

Best regards.

Yeah! I have a HP-32S that I bought in 1988 (give or take a year) and is **still** on its original batteries.

> Quote:

My point precisely. What's the big rush? I think the "I can't wait" opinion comes from not putting things in perspective. I remember using log tables to calculate trig functions, and **that** was time-consuming. Then I used a slide rule, and although it was somewhat faster, precision wasn't good enough. So what if the calculator takes one second?

Battery life. Was Re: Speed and the TVM equation

*Message #17 Posted by **James M. Prange** on 2 June 2003, 8:32 p.m.,*
in response to message #11 by Valentin Albillo

> Quote:
>
> I'm still in the third battery change for my 22+ years-old HP-11C, and it has seen very heavy, daily use all the time. Try that with any other calculator at all, past or present.

Although they've long been in the "rarely used" category, I have two that are still on the original batteries.

The oldest is from about 1980, a Lloyd's Accumatic 608, model E608, series 713C. Only 8 digits, and the most advanced features are square root and a user memory. Uses a pair of 625R batteries, which are so odd looking that I wonder whether replacements will be available when they die. Maybe the batteries will outlive me?

The newer one is from 1988, a Radio Shack Cat. No. 65-658A, Model No. EC-4004. A 10-digit "scientific" keystroke programmable, uses one CR-2025 cell. I'm pretty sure that it's a re-badged Casio.

Perhaps this says more about the battery quality than the calculators. I'd have thought that these batteries would be dead by now even if they were just sitting on a shelf in their original packages, so I find it rather amazing that they can still run the calculators.

Regards,
James

Re: Battery life. Was Re: Speed and the TVM equation

*Message #18 Posted by **bill platt** on 2 June 2003, 9:37 p.m.,*
in response to message #17 by James M. Prange

Long Battery Life:

My Wife has and still uses her Sharp Elsi-Mate EL-230 (with Auto Power Off) regularly--for instance the checkbook (she keeps the books so that I can logon to calculator forums) and she has used this nifty little rubber-buttoned beauty as a regular use tool since 9th grade. 9th Grade was 1981. That's 22 years, and NOT sitting in a desk drawer. To get to the batteries, you have to unscrew the back. Never been done.

Even more interesting, and perhaps even heretical, is that the buttons are really good. They do not have the positive click, but they have no keybounce, either. And they all

still work perfectly. and they are sensitive--it is pretty much impossible to push a button and not get a number.

So, evidently, HP is not the only maker that has produced quality goods in the past.

The real challenge that I am afraid we all agree on, is whether there will be any good quality in the future.

Need for Speed

*Message #19 Posted by **Bill Platt** on 2 June 2003, 4:45 p.m.,*
in response to message #6 by Ernie Malaga

Ernie et al:

Well, thanks for your replies. Good discussion.

Speed is important for a number of reasons.

1. Because we are trying to always save more time. Speed is a Direct Competitive advantage.

2. Because speed is percieved as being advantageous, better, smarter, or proof of worthy engineering. Partially, this bias is due to item(1) working both consciously and unconsciously in the buyer's mind.

3. Because not all users use functions in single press, occasional fashion. If there is an iterative loop, (which is quite likely with a *programmable* calculator) then a 1 second trig problem goes from being slightly annoying to becoming downright useless.

4. Because the calculator is *always* in competition with other tools. It must be the *best* it can be, in order to be attractive to the user---otherwise it goes away. A slow calculator is a dead calculator. It has to be better than any built-in or freeware PALMtop emulator--and not just the keys. See my other post regarding economics:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=35261

In other words the calculator has to keep market share to exist.

5. Because the market for calculators is over saturated. Look at how many different models are generally available. Look in a wholesale office supply catalog---mind-boggling! So an HP must STAND OUT!

I think it is also important to strip away all of one's nostalgia in this, too--the moving forward part---and consider that for HP or any other (Say PlattCalc? or RossCalc or MalagaCalc, Or SmithCalc or PrangeCalc, or better yer, VieiraCalc {I like the sound of that one;) }) to survive, there must be a singlemindedness about Unity of Design, Function, Price. The product must be better in a functional way, as compared to any other calculator. No, it doesn't have to have the same click. It does not need a particluar color. The equals key does not have to be where it was on the 34. But it has to work better than what came before. Like when I switched up from 11c to 32sii. Better. And that is a *very* difficult goal to carry out.

in response to message #19 by Bill Platt

Bill posted:

*" But it has to work better than what came before. Like when I switched up from 11c to 32sii. Better. And that is a *very* difficult goal to carry out."*

Indeed ! So difficult it doesn't even succeed in most cases. Are you implying that the 32SII is *better* than the older, "slower", HP-15C ?

Well, my old, "slow" HP-15C inverts a 7x7 matrix in 49 seconds, and solves a 7x7 system of linear equations in 25 seconds. Will you please tell me the times for your "newer", "better", "4x faster" HP32SII ? Thank you.

Best regards.

Re: Need for Speed

*Message #22 Posted by **Bill Platt** on 3 June 2003, 1:15 p.m.,*
in response to message #21 by Valentin Albillo

Hi Valentin,

The 15c is superior to the 32sii--it is a higher level model.

The 32sii is superior to the 11c--and was (I think) its replacement. 32sii was less expensive than the 11c and did more and faster.

The 42s would be the replacement for the 15c, yes? And it was slightly less exensive than the 15c?

Regards,

Bill

Scientific, The Next Generation

*Message #23 Posted by **Patrick** on 1 June 2003, 2:37 p.m.,*
in response to message #3 by R Lion

As I've mentioned many times, I am a big fan of the 15C. We see others (in this thread even) who think the Voyagers are too slow, and they are probably right. I'm wondering to what degree the Voyagers were student rather than professional calculators. Can a professional actually solve a real problem with so little speed and, especially, memory?

I think a cross between the 15C and 42S with some enhancements would be a fabulous machine, for a lot of folks. I like the 42S two line dot matrix display. Imagine this packed into the form factor of a 15C. Please, no more graphic displays with the commensurate brick sized device you end up with. The 48GX is a great desktop device, but I never carry one with me.

Now, to this 15C/42S hybrid (HP-45S?) add gobs of memory (and I mean *gobs* ... memory is now cheap). Then add wireless communications. I would suggest Bluetooth since it is low power. You really only need to be able to transfer memory to/from your PC when you are next to it. Now imagine that there was a PC emulator for this machine that came with it upon which you could develop (KEYSTROKE!!) programs for the handheld.

To get really fancy, imagine that processor speed is selectable (and programmable!!). Normally, you would keep the speed low to conserve power. Occasionally, you would floor it to get that 50x50 matrix inverse finished within your lifetime.

Ah, yes... "Hello? HP? I'd like to order 25 of those new HP-45S's please. Yes, that's right, 25 of them... What's that? Well, for your information, I actually *do* have 25 rooms in my house! Ok, here's my credit card..."

Re: Scientific, The Next Generation

*Message #24 Posted by **R Lion** on 1 June 2003, 3:19 p.m.,*
in response to message #23 by Patrick

If I need "more than a calculator" (integrating, solving, CAS...) then the speed (and features) of the 48GX is great. GREAT.

And I don't care if it does not fit in my shirt pocket: I can carry it with my books and diary in my bag.

But when I need "only" a calculator for numbers, I love the 15C.

And it doesn't matter if it is sloooow.

Raul (just MHO)

Re: Scientific, The Next Generation

*Message #25 Posted by **Stan (Sg)** on 1 June 2003, 7:13 p.m.,*
in response to message #23 by Patrick

I agree that a new model with bluetooth, etc... would be great. The problem is that this type of model would require a significant amount of development time and money. Thus, I doubt HP is going to do that. If they did, they would need to get into TI's "mass education" market. It is hard to see how this would happen. The Xpander was an attempt at this, but apparently they concluded they could not tale-on TI even with a completed design. HP's current strategy seems to be capturing the niche high-end professional and college student market (the 12CP sells at a >$50 premium versus a comparable TI). A "platinum" version of an existing model takes less time to develop, and in the case of a 15C, has a proven design (form factor, etc...). Heck, they can even reuse the manual versus writing a new one.

Re: Scientific, The Next Generation

*Message #26 Posted by **JimC** on 2 June 2003, 12:25 p.m.,*
in response to message #23 by Patrick

While I agree with the majority of your post, I must (humbly) submit some minor quibbles. Your ideal

calculator sounds great and would perhaps be a better match for a larger audience, but perhaps not for someone like myself.

I think that we are looking at two different markets here. On one hand, HP needs to capture the youth/student market for growth. I think the student market is another issue that I am not qualified to debate as I believe it concerns a certain compatibility with TI. On the other hand, I believe old folks like me are looking for a classic type RPN calculator. The question is, does HP need to meld these into one Uber-calculator? Personally, I don't think so. My perspective is that I would REALLY LOVE a classic RPN type calculator (41/42 Titanium? Nobelium?) only not bought off Ebay, with the classic HP support.

My 41 does really only one thing but it does it uncommonly well. It crunches numbers easily. (It also looks rather handsome on the desktop but that's another issue). It fits in my pocket and in my hand. As another post mentioned, the 15 is not as comfortable in ones hand. I tend to agree, although it does fit better in a shirt pocket.

I wouldn't mind some connectivity to my PC, and a couple MEGs of RAM. A slightly larger screen for my aging eyes....

David Assembly Manual

*Message #1 Posted by **Jeff** on 31 May 2003, 9:27 p.m.*

Can anyone possibly scan the manual for the David Assembly ROM. I would like to read more regarding this ROM and the possibilities with the MLDL. Thanks, Jeff

Re: David Assembly Manual

*Message #2 Posted by **Donald Leonard** on 1 June 2003, 2:32 a.m.,*
in response to message #1 by Jeff

I have a copy of Eramco's 'David Assembler' manual although my MLDL and EPROMS were stolen. I bought a replacement MLDL reportedly with the David Assembler last month from Germany, but have yet to hold it in my hands.

I would be happy to copy the 70 pages (@.10/pg. plus around $10 shipping) of the manual for you. I will have to go to a copy center to duplicate this as it is not on my computer/printer. This is NOT the correct source for MLDL information in my opinion. My recommendation is a copy of Ken Emery's 'HP-41 MCODE For Beginners' published by Synthetic, ISBN0-9612174-7-2, and used with the hp VASM listings.

I also have a copy of the Eramco ES RSU 1A Operating System QRG and Eramco Systems Products Price list dated 16 Oct. '85. Let me know what you want copied.

I can appreciate the difficulty and frustration of finding info. on these scarce and aged items. I had a similar situation, and all but one refused to step out to help me, giving me 'publishing rights' as a justification to require me to spend up to $30 to get this kind of info. Don

No, I missed it

*Message #4 Posted by **D. Webster** on 31 May 2003, 8:54 p.m.,*
in response to message #1 by Iqbal

Howdy Iqbal!

But it was good for a chuckle. I'm still waiting (as most of us are, I hope) to not hear, but see what HP has in store for us in the way of a real scientific calculator. The 30S - a perennial favorite? ? Honestly now, where do they get their data? I guess it depends on who you pay to collect it. What ever happened to the 32Sii with it's amazing 384 bytes of memory? Eclipsed by the 30S already? The 42S forgotten? The 41C deleted from history? Blink and you'll miss significant happenings in the HP directed calculator time-space continuum.

I think the 12CP got rave reviews here right?

Right?

I guess the air is so thin way up in that ivory tower that it has affected the outcome of their research.

Re: Have you seen this??

*Message #7 Posted by **James M. Prange** on 2 June 2003, 1:12 a.m.,*
in response to message #5 by james (UK)

Or maybe a 48 descendent, with a USB port in addition to the serial port. Some of the newer PCs lack a serial port, so you need an adapter to use them with the 48, and with the amount of memory available in the newer calculators, archiving/restoring by I/O can take a lot of time.

But I wouldn't want to do without the serial port either.

Some features could be borrowed from a sibling, the 49G.

HP 10 keyboard "pop"

*Message #1 Posted by **Scuba Diver** on 31 May 2003, 4:01 p.m.*

Hello everyone!

I found an electronics store that had some old HPs for sale, and I picked up (in addition to a couple of HP 20Ss) a 10B (NOT a 10BII!)

The unit was made in Indonesia in 1996 (S/N 3624M....) and the fit and finish is excellent. There's just one issue; the "0" key seems to make a popping sound when I press it. Other than the interesting sound effect, everything seems to be fine. The calc passes the keyboard test and it registers the "0" every time I press it.

This appears to be the only key that has this effect. I was wondering, is this a big problem? Does this problem exist in many 10Bs, or does this indicate that I'll have problems in the future? Since this was the last 10B they had in stock, I can't get it replaced, so should I be keeping my eyes open on eBay?

Although I LOVE my 17BII, I want to have a 10B for exams; some professors really get their nose out of joint when you take a "programmable" calc into an exam, so this way I'm covered.

Finally, just a question I'm curious about; what is the difference between the 10B and the 14B? Did the 14B have additional features/functions?

Thanks in advance to those who reply! B.

I had an HP14B...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2003, 6:59 p.m.,*
in response to message #1 by Scuba Diver

... and I saw the HP10B manual and I tell you there are differences.

The most significant one is Cash Flow: the HP14B accepts CFj input in the same way the HP12C does, and it holds up to 22 CF input, from CF0 to CF21, with one CF0 restriction: no repetition. From C1 to C21 you may use the Nj feature, j=1 to 21. Also, it adds some extra single SOLVER-like pre-programmed formulas for Cost-Price-Markup, Old-New-%change, Total-Part-%Total an Nom%-Eff%-PP. Each of them can solve any variable given the other two.

The HP14B has many ALPHA messages and input prompts because the display is a 7×5 dot-matrix instead of 7-segments for each digit. Although the HP10B has some error and condition messages, the HP14B's display shows more information. And it has four general-purpose registers - R0 to R3 - against only one - M - in the HP10B.

It is a nice financial Pioneer, even being only algebraic.

If you need extended, rfined information, let me know. The guy that's holding it - my brother - asked me to give him another one, and I'm trying to find something he likes more than the HP14B, and it's getting hard to find. Anyway, I can borrow it for a while, if needed. He is a lawyer and does not like RPN and wants a

programmable algebraic.

I'm still searching.

Hope this helps for now.

Luiz C. Vieira - Brazil

I had a key that popped on my 32sii when it was new, but it eventually went away after two or so months. Hope yours does the same because I know how annoying it is!

Pioneer keyboard "pop"

*Message #4 Posted by **Randy Sloyer** on 31 May 2003, 8:53 p.m.,*
in response to message #3 by GS Leong

Many of the Pioneer models made in Indonesia have that annoying trait. It can happen anywhere on the keyboard, sometimes one, two and maybe as many as four keys in an area will do it. One of my service replacement 42S (Thank you Johnny!) made in 2000 has a poppy + key. It hasn't changed in a year of use.

IMO it is due to a change in the specification or the manufacturer of the biaxial oriented polyester sheet used to form the keyboard dome sheets from.

There is nothing you can do but live with it.

HP14B vs 10B (long)

*Message #5 Posted by **Ellis Easley** on 31 May 2003, 10:08 p.m.,*
in response to message #1 by Scuba Diver

I'm not a regular financial calculator user but I have several including a 14B. A while back I learned how to use them in the process of figuring out how to operate a TI Business Analyst (an LED model in the family with the TI57) without a manual. Later I tried to provide a comparison of the 12C and 14B for someone here on the Forum, and I became familiar with the more advanced functions. So I have reviewed what I learned to give you this comparison of the 10B and the 14B.

First, the 14B has 5 by 7 dot matrix digits like the 32SII instead of the 7 segment digits of the 10B. The annunciators are a little different than the ones on the 32SII, for one thing because the 14B has one shift key and the 32SII has two - maybe the 14B LCD is the same as the 32S.

The 14B uses menus. For a minute, I thought the 14B didn't do cash flow calculations because there is no "CFj" button but it turns out the cash flow list entry is done by pressing "NPV" or "IRR" at the beginning instead of at the end, these keys prompt you to enter a new cash flow list or use the existing one. The 10B lets you enter an initial cash flow plus 14 cash flow groups with up to 99 cash flows per group. The 14B lets you enter an initial cash flow plus 21 cash flow groups with up to 999 cash flows per group. I've always wondered how financial calculators stow away the extra few digits for the number of cash flows per group! Both calculators use some of the cash flow registers for storing statistics data but the 10B uses 6 registers in the middle of the cash flow list while the 14B uses 12 registers at the end of the cash flow list, so the 14B allows

you to share them: if your cash flow list only has up to 9 cash flow groups (plus the initial cash flow), it will be preserved while you use statistics operations.

The 14B has three applications that aren't on the 10B: Return On Investment, Break-Even Analysis and Inventory Turnover Rate. The 14B has a "Compute" button (shift "Input") which is not on the 10B - it is used in the three special applications since their variables don't have their own buttons. The "Compute" button is also used in the "NPV" and "IRR" menus - since those buttons are pressed at the beginning. After you are satisfied with your cash flow lists, you press "Compute" to calculate NPV or IRR.

Both calculators do one or two variable statistics but the biggest difference is that the 14B does curve fitting with four models (linear, exponential, log or power) while the 10B only does linear regression. Under Statistics, Curve Fitting on the 14B you can choose one of the four models or let the calculator choose the model with the best fit. There is a separate Forecast menu that automatically chooses the model with the best fit.

There are some little differences in the way statistics are done in general. The 14B has a menu choice to display "b", the Y intercept (in the linear model, other values in other models); the 10B has you forecast the Y value for X=0 to get the Y intercept. The 10B has buttons for both sample and population standard deviation; the 14B has you calculate the mean and add it to the summation and then calculate the sample standard deviation, to calculate the population standard deviation.

The 14B had four independent storage registers, R0 - R3. The 10B has one, M. The 10B also lets you STO and RCL 0 - 9 and .0 - .4 but these address the cash flow/statistics registers.

Both calculators do conversions between Nominal and Effective interest rates which are important for Canadian mortgages. The 14B has three separate registers that are shared by this function and two kinds of percentage calculations and cost-price-margin calculations. The 10B has four separate registers plus shares the I/YR register to do pretty much the same bunch of calculations. The 10B has an explicit "Markup" button; the 14B does markup as an implicit result of the "% Change" calculation.

Because the 14B uses menus (mostly on shifted keys) to access some functions that are shifted keys on the 10B, some of these functions take three or four keystrokes to access on the 14B instead of two on the 10B - but on the 10B the second functions of function pairs (like "mean of X,mean of Y") take four keystrokes because "Swap", which is like "X<->Y", is a shifted function. The 14B doesn't have a button like "Exit" on the 17BII that always takes you back one level in a menu (although the "backspace" key does function this way in the multi-level menus but only up to the point where you select a bottom level function). So, for instance, it takes three keystrokes to calculate the mean of X values and then another three keystrokes to calculate the mean of Y values on the 14B compared to two keystrokes for the mean of X and then another two keystrokes for the mean of Y on the 10B. But this is alleviated in the Forecast and Statistics, Fit menus of the 14B when forecasting X or Y values for your entered Y or X values - you can press the "down" button to enter another Y or X value without having to start over.

By now I think you can tell that I can operate these calculators but I'm not really familiar enough with the functions to be able to say which calculator has implemented them better!

I left out the TVM program - as far as I can tell it works the same on both calculators - both use "Interest per Year" (as opposed to "Interest per Period" on the 12C) and have a "Periods per Year" variable that defaults to 12 but can be changed. I don't know why the 14B needs 12 registers for statistics unless it is in support of the different models for curve fitting. The 14B has a "Show" button to display all digits of a number, the 10B doesn't.

14B vs 10B and new HP financials?

*Message #6 Posted by **Scuba Diver** on 31 May 2003, 11:10 p.m.,*
in response to message #5 by Ellis Easley

You guys are amazing!! The amount of knowledge that the group posesses is mindboggling!

Thanks to all of you for your insights (espcially you, Ellis!) Although I am not planning on using my 10B all that much (it's really just for exams...my 17BII and 19BII are my day-to-day calcs for school and my 12C sits on my desk at work), the popping 0 was driving me nuts, so I bought a NIB Singapore one on eBay this afternoon for $20.

Now on to something completely different...I was on the HP website today and read a note from the General Manager of HP calculators. I don't know about you, but this guy worries me. Anyone who would describe the 10BII as a "perennial favourite" should have his head examined...anyhow, I was reading an announcement that there will be two financial calculators launched shortly; one is in the next few weeks and the other one later in the year.

I found this news both exciting and disappointing. On the one hand, it was nice to see that HP was going to launch some new calcs to replace the 17BII and 19BII, however I was disappointed because all of their recent launches (the 9S, 9G and 12CP) have been non-events, IMHO. The 9G and 9S are nothing but rebranded junk, and the 12CP was poorly designed and tested. So, in short, I'm not getting too excited about these new financials.

Having said that, I am keeping an open mind. Since there were a few closet 12CP beta testers out there, I was wondering...is anyone beta testing these new HPs? Any insights?

Personally, if they took the 17BII, moved some of the TVM stuff OFF the menus and ONTO keys, added bi-directional IR communication, bumped up the memory and kep it in a pioneer-style case, I'd be happier than a pig in...well, you know...

Comments? B.

Re: HP 10 keyboard "pop"

*Message #7 Posted by **bill platt** on 31 May 2003, 10:44 p.m.,*
in response to message #1 by Scuba Diver

My blue/green indonesia 32sii (which I use every day) has the clicky-pop on some keys. My previous two (singaporean) brown 32sii-s did not. Other than the color change, the clicky-pop sound was the first thing I noticed about it.

I have a brown indonesian 20s which is much more like the singaporean brown 32sii's inb keyboard feel. But really, every one that I have now (one blue/green 32sii, one brown 32sii, two 20s browns, and also two 48g series), have their own slight individual feel.

Calculators are not like McDonalds' burgers...there is some individuality.....

Re: HP 10 keyboard "pop"

*Message #8 Posted by **Scoba Diver** on 31 May 2003, 11:19 p.m.,*
in response to message #7 by bill platt

Hi Bill!

I agree; each one of my calcs is unique...however the clicky pop is not what I would expect from an HP.

Continuing with the McDonald's theme...this 10B is like a Big Mac that has been sitting under the heatlamp for a couple of days...yes, it's a Big Mac, but I wouldn't want to eat it!

B. P.S. I also have two Indonesian 20Ss from 1996 and their keyboards are perfect...just like my calcs from Singapore. Perhaps the reduction in quality was done on a model-by-model basis; first it was the 10B, then came the others...

Re: HP 10 keyboard "pop"

*Message #9 Posted by **David Smith** on 1 June 2003, 12:02 a.m.,*
in response to message #1 by Scuba Diver

I had a 41CV with a clicky pop to a key. I put a drop of Break Free oil on a brush and swished it under and around the key... no more pop.

HP41 and tone generator

*Message #1 Posted by **Ted** on 31 May 2003, 5:54 a.m.*

Some time, mucho eons ago when I used to get the newsletter from the HP group in Switerzerland, there was an article about a program for a tone generator for the HP41; (or I am getting senile?) Various pitches are available in the standard 41; what I would like to do is be able to generate exact pitches at A=440hz, 441hz and 415 and 430 etc. to use as a pitch reference for tuning harpsichords and clavichords, lutes etc. It should also be possible to generate a scale in different temperments as well without too much trouble, I should think. Am unsure however if the tone generator in the 41 is stable enough for that kind of accuracy (less than 3% of 1 cent variation). Anyway, I'll do my homework and dig into the archives, but any tips for searching or sources would be appreciated.

Re: HP41 and tone generator

*Message #2 Posted by **Ellis Easley** on 31 May 2003, 7:00 a.m.,*
in response to message #1 by Ted

Are you talking about machine language programs? Is the sound generated by a "bit banger" port that should be able to generate any frequency up to a limit set by the shortest loop you can execute?

The main things I've seen written about tones on the 41 are the much wider that normal range available through synthetic programming. Even then, it looks to me like some bands of tones, not a full spectrum. Also, I think each tone instruction has a certain frequency and duration. The chart of synthetic tones should be in any synthetic programming book and maybe the PPC ROM manual.

Re: HP41 and tone generator

*Message #3 Posted by **Ted** on 31 May 2003, 7:44 a.m.,*
in response to message #2 by Ellis Easley

I'm a newbie to this after years of being away, so I might sound stupid! But all I'm looking for is a simple way of controlling the pitch of the internal speaker of the 41 to generate tones of an exact pitch and unlimited duration (for a couple of minutes) without resorting to any peripherals. This would make the 41 unbelievably useful in daily musical life and eliminate carrying another box around. Come to think of it, a metronome should also be possible as well.....

Re: HP41 and tone generator

*Message #4 Posted by **Ellis Easley** on 31 May 2003, 7:53 a.m.,*
in response to message #3 by Ted

I'm pretty sure that to do that (unless there is an existing program) you will need to learn machine language programming. Later today, I'm sure people who know what they are talking about will be awake and will answer your question! I predict you will learn that it is easy if you can find a ROM that is almost impossible to find!

any frequency?

*Message #5 Posted by **Ellis Easley** on 31 May 2003, 11:11 a.m.,*
in response to message #2 by Ellis Easley

I completely overlooked the granularity of such a program. If the tightest possible loop (something like "out, xor, jump", with no way out) generates a frequency of F, adding one more instruction in the loop might generate (F*4)/3, if all instructions took the same time. On something like a Pentium, that shortest loop would generate a frequency in the megaHertz (possibly) so you could add a timing loop inside the loop to increase the period (and lower the frequency inversely) proportional to the count of the inside loop to generate any period that is a multiple of a few microseconds. Plus you could add a way out! But the HP41 runs so slowly that the granularity would be much larger - maybe the range of synthetic tones is the practical limit. I found the graphical chart of synthetic tones, it's not in the PPC ROM manual, although that has a table of all synthetic tones - this chart is in another PPC book and says it corrects some times in the PPC ROM manual table. It looks to me like the synthetic tones only include 16 frequencies (in Hertz): 105,113,121,131,143,158,175,197,225,263,315,394,525,629,788,1051. Each frequency is available in 8 durations, varying from 0.02 to 5 seconds depending on the frequency. The chart appears to show that each duration of a given nominal frequency produces a slightly different frequency.

correction

should have said (F*3)/4

Re: HP41 and tone generator

*Message #7 Posted by **hans brueggemann** on 31 May 2003, 3:40 p.m.,*
in response to message #1 by Ted

ted, the 41 is waaay too inaccurate for this application, simply because its master-clock is not quartz-driven, but a simple L-C resonant circuit. the 41 is by far the most "unmusical" calculator i've ever heard. the hp28S seems to be the far better choice for this kind of application, because you can program the generator frequency directly. however, i noticed some funny pitch-bend effects when running it as a random tone generator. also, frequency settings with cents of deviation are also not possible on this machine.

cheers, hans

in response to message #1 by Ted

Ted, you might want to check this link. No promises though!

http://www.irving.org/ftplib/misc/00index.html - the file is mf.zip

I haven't tried running this or even downloading it. Apologies if you have already seen it.

Re: HP41 and tone generator

*Message #10 Posted by **Ted** on 3 June 2003, 6:07 a.m.,*
in response to message #9 by JimC

Thanks Jim, this looks like a handy program, much obliged. The only thing that seems impossible is to hook it up to the HP's oscillator. Hans is correct however- you need accuracy and a little bit of frequency range for that to be of any use. If it were possible it would be a damn handy program for educational as well as musical purposes..sigh. I'll save this program for a long afternoon of inputting.

HP 49G Keyboard and future HP 49g's

*Message #1 Posted by **Nick Nicholas** on 31 May 2003, 2:57 a.m.*

I came across a HP 39G with parital serial number CN022xxxxx which seems to have less stiff keys than the HP 49G with partial serial number CN148xxxxx. Does anyone know if the later batches of HP 49G's manufactured had less stiff keyboards?

I have read some rumours that HP is in the process of re-introducing a version of the HP 49g. I thought that HP let go the developers who designed this and other HP calculators from their Australian operations a while ago. While redeveloping the simpler calculators on different hardware may not require a significant development effort, a redevelopment of a HP 49g on different hardware would be a significant development effort especially if the developers had no previous experience developing the HP 49g. I question the feasibility of redeveloping this model for a market price that is comparable to the HP 49g, especially if the development costs for the calculator are incurred by the company that HP contracts with to design and manufacture this model. I would not be optimistic that a re-introduced HP 49g would be an improvement irrespective if it was developed on a different hardware platform or not. I would appreciate comments on this subject.

HP85 bus signal levels

*Message #1 Posted by **Vassilis Prevelakis** on 31 May 2003, 2:12 a.m.*

I assumed that the HP-85 (and other Series 80 machines) have 0 to +6V levels, but looking at the service manual on the MoHPC CDROM, I see that the clock signals are 0 to +12V.

Can someone post here the levels that are expected on the various pins of the I/O bus?

Thanks

*Message #2 Posted by **Grant Goodes** on 30 May 2003, 4:13 p.m.,*
in response to message #1 by andy

I believe it is just a difference in the casing, with one being a molded plastic case intended for bench-top use, and the other more square and compatible with rack use.

Re: difference between 3468a and 3468b

*Message #3 Posted by **Ellis Easley** on 31 May 2003, 7:04 a.m.,*
in response to message #2 by Grant Goodes

Yes, I verified that in my 1986 HP catalog. A is the portable, B is the rackable. Both were $750 in 1986.

HP-67 CARD READER REPAIR

*Message #1 Posted by **Jon** on 30 May 2003, 12:54 p.m.*

Hello:

Time ago I posted here a question about repairing a HP-67 card reader. It had the known problem of these readers. It records ok but fails when reading (not always). Somebody recommended me to change a tantalum capacitor. I have opened the calculator to do it and... BAD LUCK!!!!.

It is an early version of the reader with three cylindrical silver capacitors on the board.

Does anybody have experience with these models?

Thanks in advance

Jon

Re: HP-67 CARD READER REPAIR

*Message #2 Posted by **Greg** on 1 June 2003, 3:08 a.m.,*
in response to message #1 by Jon

Jon, I am in process of repairing the reader on my HP-65 and my next project is to replace the rubber wheel on my HP-67 card reader. The readers are very similar. Those tantalun capacitors located on the narrow piggy back board are decoupling caps for power supply. Now how can you verify that you can record a program if you can't read it? Since you opned your calculator I recommend you demagnetize the R/W head. Regards, Greg

Re: HP-67 CARD READER REPAIR

*Message #3 Posted by **Jon** on 1 June 2003, 4:45 a.m.,*
in response to message #2 by Greg

It records ok all the times. I have an HP-97 so I can check it. The problem is that in early versions of the HP-67 there aren´t tantalum capacitors. They are cilindrical, with silver surface (they don´t look like electrolitics).

How can I demagnetize the head?

About the capacitors...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 10:54 a.m.,*
in response to message #3 by Jon

Hi, Jon;

I saw many of these capacitors in earlier Woodstocks, too, if we are talking about the same

components. I have two of them in hands right now and I read:

```
+T110
KEMET
22µF
15V10%
7630

150D ±10%
60µF
6DC
7634
```

I used to take them all as electrolytic capacitors, maybe the ones you see are not. Have you checked for their values? Just for checking.

As you may know, tantalum are polarized, have higher internal resistance and do not show value drift easily. In some applications, tantalum are better than electrolytic.

Success.

Luiz C. Vieira - Brazil

Edited: 1 June 2003, 11:03 a.m.

Re: About the capacitors...

*Message #5 Posted by **Jon** on 1 June 2003, 3:10 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz:

Thanks for the fast answer. I have also seen those capacitors in woodstock calculators. The problem is the caps of the HP-67 are much more smaller and I can´t read any value. May be I try to unsolder all of them, measure the value and change for electrolitic or tantalum caps.

If I get any success I will make you know.

Jon

Re: HP-67 CARD READER REPAIR

*Message #6 Posted by **greg** on 1 June 2003, 3:23 p.m.,*
in response to message #3 by Jon

Jon, I don't think your HP-67 is older than my HP-65. The cylindrical caps are tantalum (it does't make any difference tantalum or elctytic both types are polrized) I bought a demagnetizer from Radio Shack P/N 28-07246 it is called HEAD DEMAGNETIZER I used to use it on my cassette recorder heads. Demagnetizing could help the cause but it could be somthing else wrong. You can send me an email to my yahoo addresse. Here is a link with som pictures showing the inside of HP-67. http://www.rskey.org/hp67reader.htm gvgregor@yahoo.com

Re: HP-67 CARD READER REPAIR

*Message #7 Posted by **David Smith** on 1 June 2003, 3:10 p.m.,*
in response to message #1 by Jon

Those cylindrical silver caps are tantalum caps... they are just in a much more expensive package than the

dipped epoxy coated ones. They also are much more reliable. I don't know which of the three is the power supply cap, but two of them are connected to the head circuitry (see the HP97 service manual on the HPMUSEUM CDROM set).

HP67 × HP97: card readers

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2003, 5:43 p.m.,*
in response to message #1 by Jon

Hi, folks;

Despite of size and external structure, are readers the same for both HP97 and HP67? I do not have any of them (so far; I'm about to receive a gifted HP97; thanks D.S.!) and I'd like to know what from one card reader corresponds to the other in the same way and what doesn't.

I remember seeing pictures of the HP67 reader internals (MoHPC? I don't remember) and there are some structures that "resemble" the HP82104A equivalents (HP41's Card Reader). What called my attention at that time was the HP67's one-piece card sensor metal plate, because there are two independent metal plates in the HP41's card reader.

I'm aware of PCBs' design, structural components and their differences because both calculators have different cases and internal space. What I want to know is: knowing about one's internals will help repairing the other? I think this is my biggest question.

Thanks for any information.

Luiz C. Vieira - Brazil

Edited: 1 June 2003, 5:44 p.m.

Re: HP67 × HP97: card readers

*Message #9 Posted by **David Smith** on 2 June 2003, 3:27 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

The reader electronics for the HP67 and HP97 are similar. The HP97 has a different power supply arrangement for its reader. The sense amp chip and head wiring is the same.

HP 42S & 82240B Printing Test?

*Message #1 Posted by **Gregg** on 30 May 2003, 12:32 p.m.*

Hi! I have both of these devices, and cannot figure out how to test to see if the printer will work with this calculator. Obviously I'm doing something wrong. The printer powers-up, and will feed paper, but does not respond to the calculator. I must admit, I cannot figure out how to use this calculator (again, the BA in art proves unhelpful!). I did perform the "self-test," and it seemed to pass. Any clues? Thanks!

Gregg

Re: HP 42S & 82240B Printing Test?

*Message #2 Posted by **Richard Garner** on 30 May 2003, 12:50 p.m.,*
in response to message #1 by Gregg

I don't have the 42s infront of me at this time, but there is a print menu that is accessed by using the orange shift key and I think the minus key. When you have the menu active scroll through the menu until you find the printer on (prton) setting activate this setting. The rest of the menu should be explain itself. Be sure to turn the print mode off (prtoff) when you are done with the printer. This will turn off the power to the IR interface and prolong battery life. Hope this helps.

Re: HP 42S & 82240B Printing Test?

*Message #3 Posted by **Gregg** on 30 May 2003, 6:32 p.m.,*
in response to message #2 by Richard Garner

Richard & Randy, I have concluded you are both geniuses!! Your instructions worked perfectly, and so do the 42S and the printer. Thank you for your help!

Gregg

Re: HP 42S & 82240B Printing Test?

*Message #4 Posted by **Randy Sloyer** on 30 May 2003, 1:11 p.m.,*
in response to message #1 by Gregg

Self test the printer: With the power off, press and hold the form-feed button on the right side. Turn on the power and now release the form-feed button. The unit will self-test and print a character map and the battery level. 5 is the highest. Replace the batteries if you are 2 or below. On the 42S, press:

1. Shift,- (print}. Press the scroll down arrow 2 times.
2. The menu should read PON POFF MAN NORM TRACE.
3. Press the E+ key to activate PON (printer on).
4. Press LOG to set MAN mode.
5. You should now be back to a normal screen.
6. Press shift,- to access the print menu.
7. Press the LOG key to print the stack contents or any of the other menu picks there to do whatever you

want.

As Richard mentioned, don't forget to disable printing when not needed, especially when in trace mode.

Repost if you help more...

HP 38 G problem

*Message #1 Posted by **George Rigas** on 30 May 2003, 6:53 a.m.*

My HP 38G suddenly doesn't turn on.I've tried changing batteries,but nothing happened.Is there a way to disassemble it in order to repair it??

Re: HP 38 G problem

*Message #2 Posted by **Ron Ross** on 30 May 2003, 8:46 a.m.,*
in response to message #1 by George Rigas

Sometimes a 48G will also suffer from this. A quick and dirty solution for a 48G that requires no effort that works, is to push down slightly (very little pressure is needed) just above the 2nd key on the keypad and the LCD display screen.

Let us know if this works, so we know if the 38G has a similiar solution.

A request

*Message #1 Posted by **Ted** on 30 May 2003, 2:28 a.m.*

For my final decision about a halfnut 41 CX purchase, could anyone supply me with a jpg picture of a numeric and alpha string on a CX halfnut? Want to avoid the chance of spending hard earned bucks on soemthing I might not like the look of (after 15 years of fullnut screen!) Thanks again, Ted

Re: A request

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 May 2003, 4:32 a.m.,*
in response to message #1 by Ted

Hi, Ted;

Have a look at the images below. In both images, the first one shown is the fullnut's.

This one in intended to enhance ALPHA string differences.

http://www.logeng.com.br/images/hf_lcd_03_.jpg

This one allows you a complete view of all numbers, [=] and underscore.

http://www.logeng.com.br/images/hf_lcd_01_ret.jpg

I myself have no trouble using any of them, I think it's a matter of taste; for me, after using them fr a long time, differences are not too big. Anyway, you should take them both in hands, because even not precisely "felt" in these images, halfnut LCD characters look weird at first "contact", allowing even a confusion when trying to figure out who is who. It "scares" a little bit, but you may get used to it. I take the extra rounded-edges black frame in halfnut's display as a particular fancy touch. I once tried a custom halfnut-like frame in one of my fullnuts and I liked it a lot, but I removed it to use as reference to cut a few others and lost it; I'll take it back as a near-future design project ;^)

Hope this helps you. And remember: try having a halfnut in hands an you'll have a better "feeling".

in response to message #1 by Ted

Just my $.02

You will not like the halfnut display as well as the fullnut. Mine are not as readable and contrast is worse on the halfnut. But they both calculate just fime

Re: A request

*Message #5 Posted by **David Smith** on 30 May 2003, 4:36 p.m.,*
in response to message #4 by Dave

The contrast is about the same when they are viewed at the intended viewing angle. The halfnut was optimized for viewing at a more horizontal angle. The fullnut likes to be viewed more head on. Also the fullnut's optimum view angle range is larger than the halfnut's.

Re: A request

*Message #6 Posted by **Donald Leonard** on 1 June 2003, 2:45 a.m.,*
in response to message #4 by Dave

I agree. To my eyes, not only does the contrast appear to be lower, the character segments APPEAR to be thinner too. Don

Woodstock ACT Instruction Set

*Message #1 Posted by **Michael F. Coyle** on 30 May 2003, 1:57 a.m.*

I've been delving into my new HP-21. I'm looking at the instructions coming from the ROM and it's clear that there are new instructions, not present in the older 2-chip microprocessor used in the older machines.

Has anyone worked out the instruction set for these machines? I'd like to do a ROM dump someday (some year?) but there seems to be very little information on the internals of Woodstock and Spice calculators. The earlier machines are well-documented due to the patent disclosures (the HP-45 patent and code listing is my favorite bedtime reading these days) and the HP-41 and later machines seem to be well-understood too.

Any solid information, or pointers to same, would be appreciated.

- Michael

Michael, I have no additional information, but can you describe your procedure, setup and instruments for delving into the HP-21 ? If I can, I will try to do it myself.

Renato

Re: Woodstock ACT Instruction Set

*Message #3 Posted by **Michael F. Coyle** on 31 May 2003, 12:00 a.m.,*
in response to message #2 by Renato

Hi Renato,

First, let me describe how I've spent the last three weeks.

I bought an HP-21 on eBay and received it May 10. I spent a couple of days playing with it and charging up some batteries. I then took it all apart and hooked it up to my test equipment. It's been that way ever since.

I have the HP-21 schematic that's been floating around here for a while. I've been using an oscillscope to look at the various signals coming off the chips and I've produced a detailed timing diagram (similar to what's in the HP-97 servide manual but more detailed).

The most interesting signal is the one that carries addresses and data to and from the ROM. I can look at the signals and read some of the bits but the instructions don't match up well to the Classic instructions, as far as I can tell. In particular, addresses have been widened to 10 bits from 8 and some instructions, branches at least, take two words in memory.

My 'scope has analog storage and delayed sweep, so I can sometimes trigger on a repetitive instruction sequence and read off all the addresses and data; it's pretty tedious though. Here's an example of what I have: the idle loop (waiting for a key to be pressed) is apparently a single instruction, two words long:

```
Addr  Data       My Interpretation
----  ----       -----------------
 254  1111011100 (Probably: If no key pressed, goto...)
 255  0011111110 (254)
```

SYNC is asserted during the data read-in at location 254 but not at 255, as we'd expect from a two-word instruction. (By the way, the bits are presented on the bus LSB first; I've reversed the back to their "right" order in the example.)

I'll throw in the other piece of code I have information for: the other part of the idle loop, which runs after your function has been executed but while your finger is still holding down the button. (In other words, it's waiting for you to lift your finger so that it can resume the scan listed above.)

```
Addr  Data       My Interpretation
----  ----       -----------------
 246  1111001100 (Old CPU: 15->p)
 247  0010111100 ???
 248  0110010000 (Old CPU: Select ROM 3)
 249  1011101100 (Old CPU: If p # 11)
 250  0011111000 (248)
 251  1111010100 (Probably: If key still down, goto...)
 252  0011110110 (246)
```

The instructions listed as "Old CPU" are probably wrong for the ACT. What actually happens is that the instructions at 246 and 247 initialize a loop, probably a debounce delay. The instructions from 248 to 250 are executed 7 times in the loop. (The delay would be about 7 ms.) After the loop, there is probably a test that says, if the key is still being held down, then jump back up to 246 and do another delay. If the key was lifted, the CPU presumably executes a one-word instruction at location 253 (I haven't seen that one yet), then waits in the one-instruction loop at 254 and 255.

I've stopped looking at the moment because this is about as far as I can get get with the equipment and knowledge I have. I could build a special piece of hardware to automatically grab the addresses and data on the bus but without better information on the instruction set and opcodes, there's not much point.

If any of the HP engineers who worked on these chips or calculators are lurking on this Forum, now would be a good time to speak out!

Comments, etc. always welcome.

- Michael

HPJournal on Woodstock

*Message #4 Posted by **Renato** on 1 June 2003, 12:50 a.m.,*
in response to message #3 by Michael F. Coyle

Michael, HP designers spoke out in HP Journal, November 1975. I´ve quoted a part of one article below. There is a full article describing woddstock architeture and design. I´ve got a PDF of the HPJ issue on the PPC CD ROM set.

Best regards,

Renato

> Quote:

Design Details

Several improvements in the instruction set of the HP-21-family microprocessor made life much easier for the microprogrammer. Three of the most useful improvements were 12-bit subroutine addresses, the digits-to-ROM-address instruction and the data register instructions.

In the HP-35 microprocessor, the microinstruction address was only 8 bits long. Each 256-word ROM would turn itself on or off as ROM-select instructions dictated. There was only one level of subroutine and the return address had only eight bits. The HP-21 microprocessor uses a twelve-bit address. A given ROM responds only when it sees an address it contains. Subroutines can be located in different ROMs and easily return to the correct next instruction. The new processor can save two twelve-bit subroutine return address. Two levels make it possible for one subroutine to call another.

Re: HPJournal on Woodstock

*Message #5 Posted by **Ellis Easley** on 1 June 2003, 2:22 p.m.,*
in response to message #4 by Renato

That article is also available here online:

http://www.hpmuseum.org/journals/wooda.htm

Also another article from the same year about Woodstocks:

http://www.hpmuseum.org/journals/woodb.htm

This article is mostly about the hardware design and has some paragraphs about each chip.

hp22 patent info

*Message #7 Posted by **Ellis Easley** on 1 June 2003, 6:13 p.m.,*
in response to message #6 by Michael F. Coyle

Mike Sebastion's (Calculator Forensics) website has a page of links to calculator patents. This description is among them:

4055757 HP-22 Financial calculator with annuity begin/end period switch.

Maybe it contains some details you are looking for. He has cleverly hidden the addresses of the individual pages of his site, but if you go to:

http://calcinfo.com/

and click on "Calculator Related Patents", you will see the list. He doesn't have the patents, just links to the United States Patent and Trademark Office.

Re: hp22 patent info

*Message #8 Posted by **Michael F. Coyle** on 1 June 2003, 11:36 p.m.,*
in response to message #7 by Ellis Easley

Hi Ellis,

The patents were interesting; they even included small bits of source code. I've printed them up and will read them tomorrow.

Some of the other patents were interesting, especially 3955074, which is four pages long and covers just the gold key! I wonder how much money was spent doing that!

Thanks.

- Michael

Re: HPJournal on Woodstock

*Message #9 Posted by **Ellis Easley** on 1 June 2003, 7:51 p.m.,*
in response to message #6 by Michael F. Coyle

I just noticed another item in Mike's list of HP patents:

3987290 Engineering notation

According to the HP Journal articles that Renato found, engineering notation was an innovation on the HP25.

Re: HPJournal on Woodstock

*Message #10 Posted by **David Smith** on 3 June 2003, 4:15 p.m.,*
in response to message #9 by Ellis Easley

A a damn fine innovation at that... once you use it, you never go back to SCI.

Re: Woodstock ACT Instruction Set

*Message #11 Posted by **David Smith** on 30 May 2003, 4:38 p.m.,*
in response to message #1 by Michael F. Coyle

You can learn quite a bit about the woodstock architecture from the HP97 service manual on the HPMUSEUM CDROMs.

Re: Woodstock ACT Instruction Set

*Message #12 Posted by **Michael F. Coyle** on 30 May 2003, 10:56 p.m.,*
in response to message #11 by David Smith

Hi David,

Thanks for the tip. I just read the manual. I did get some good info from it, like some signal names, but alas, no information about the ACT instruction set itself. Oh well.

I did also find some good info in some lecture notes for a talk given by Tony Duell.

I'm still looking.

HP-41cv PRGM key not working

*Message #1 Posted by **Tracy Vermeyen** on 30 May 2003, 1:19 a.m.*

I recently found my old calculator had corrosion damage from the batteries. I clean everything and replaced the ribbon strip/power connector assembly (long story in itself) and every thing appears to be working, except the PRGM mode won't come on when the key is pressed. In fact, the USER and ALPHA are unreliable, but will eventually work.

Any suggestions on how to diagnose/repair this problem?

Thanks

Re: HP-41cv PRGM key not working

*Message #2 Posted by **Randy Sloyer** on 30 May 2003, 3:16 p.m.,*
in response to message #1 by Tracy Vermeyen

Sounds like some battery goo got into the switches. You can usually clean them with David Smith's micro-wire brush trick:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=26576

I've seen 41's that would not turn on when the leak got into the on/off switch. David's method worked fine to restore normal operation.

Re: HP-41cv PRGM key not working

*Message #3 Posted by **Tracy Vermeyen** on 30 May 2003, 11:11 p.m.,*
in response to message #2 by Randy Sloyer

Randy,

Thanks for the suggestion. I tried it, but there appears to be a plastic film under the keyboard. Do I try to clean above this film, or do I need to break through it to clean? Also, do I try to clean just the inside the cylinder or to the sides of the hole?

Thanks

Slightly and significant changes

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 29 May 2003, 8:20 p.m.*

Hello, Dave;

your recent changes made easy to recover from errors. And I use them much... :)

- Delete dialog box right after text instead of after the response box and
- Edit after post feature, with an important warning that must be read

I think many others have noticed, but I thought you should know it happened.

Thank you helping us to participate.

Luiz C. Vieira - Brazil

Re: Slightly and significant changes

*Message #2 Posted by **Dave Hicks** on 30 May 2003, 12:12 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

You're welcome Luiz. These changes are in place in all the forums now.

I've also added some new formatting codes which are documented here. Perhaps the most interesting is the [quote] code. I don't expect to see it used very frequently because the threaded nature of this forum usually makes responses obvious, but sometimes someone will post a long message and you'll just want to respond to one (or more) small bit(s). In that case, you can cut and paste the bit(s) into your response surround by [quote] and [/quote] tags like this:

> Quote:
>
> If the automobile had followed the same development cycle as the computer, a Rolls-Royce would today cost $100, get a million miles per gallon, and explode once a year, killing everyone inside.

That was from Robert X. Cringely of InfoWorld magazine, but usually you'll use it to quote someone here.

Re: Slightly and significant changes

*Message #3 Posted by **Katie** on 31 May 2003, 1:53 p.m.,*
in response to message #2 by Dave Hicks

Thanks Dave! These are all great and much appreciated enhancements.

I recently found a very nice spelling program for Internet Explorer, that when combined with your editing features makes posting here a pleasure. For those of you who don't know about this http://www.iespell.com/download.php I highly recommend trying it out.

-Katie

HP 41CX halfnut

*Message #1 Posted by **Ted** on 29 May 2003, 2:54 p.m.*

Hello out there! Can someone tell me exactly why HP made the 41, 41cv adn 41cx in regular and halfnut versions? What evactly (besides the processor board and the display) is really improved/ better /worsws than the regular one? Thank you all for your time in advance with this question, Ted

Re: HP 41CX halfnut

*Message #2 Posted by **james (UK)** on 29 May 2003, 4:05 p.m.,*
in response to message #1 by Ted

Hi Ted

Supposition on my part, but I beleive the halfnut has a lower component count so I'm guessing that Norm's friends, the beancounters and MBAs, at HP changed to the halfnut as it was cheaper to produce.

From comments made on this board, it appears that halfnuts may be more reliable (although my two fullnut CVs - ebay purchases - appear to be fine with no problems even after a trip across the Atlantic (so far - touch wood) BUT the fullnuts are a lot easier to repair as they can be disassembled more readily (not that I've tried).

Functionally I don't think there's much difference, opinion seems to be divided as to which display is preferable but the halfnut display is optimised for viewing at an angle (machine lying on the desk) whilst the fullnut is easier to read from a 90 degree angle (machine in your hand).

Apparently the halfnut can also display lower case characters but this requires machine code (mcode) programming techniques, eprom burners, et al so isn't a practical difference for low tech guys like me.

Hope this helps with a bit of info until the experts can reply.

Re: HP 41CX halfnut

Just a few more info

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 May 2003, 5:34 p.m.,*
in response to message #1 by Ted

Hi;

AFAIK, James pointed out almost all user-related differences and their reason. The only two extra points are:

- key-feeling: halfnuts' keys are a bit "harder" to punch because of a thicker rubber sheet between the keys and the keyboard
- display contrast - using the same extra ROM mentioned by James, you can adjust halfnut's contrast and consequently their viewing angle, not available in fullnuts' LCD.

It's a fact that many other hardware related aspects are not even known, or disclosed as information, but what we can say by observing and describing is about that.

Just an extra 1¢.

Luiz C. Vieira - Brazil

Re: HP 41CX halfnut

*Message #5 Posted by **Ellis Easley** on 29 May 2003, 10:57 p.m.,*
in response to message #1 by Ted

Semiconductor technolgy was expanding so quickly at that time (really just getting into the curve that we are still enjoying), plus the 41C family were in production for so long, that it would have made perfect sense to have changed the design several times as HP did. Cost reduction is almost always reliability improvement. Number one is reducing the number of IC package pins involved (by putting more functions in one chip) because every time a wire is bonded to an IC, the die suffers a severe shock that can ruin or weaken it. This also reduces the number of solder joints which are a potential source of un-reliability. Keeping more functions on a chip reduces total current consumption because the signals that have to go to external pins need relatively high powered drivers to charge the capacitance of PCB traces, which aren't required for internal nodes.

Eliminating some PCB traces also improves radio frequency interference (reduces radiation - makes it easier to pass the test!) FCC and other regulatory compliance can add a lot to the engineering cost because it can require redesign and additional tooling. One Tandy computer that was designed with a plastic case (the last one, I think!) had to have a number of internal sheet metal shields added at the last minute - each one recommended by a very expensive consultant! Shortly after that, the entire department spent two days in school taught by that consultant, learning how to design for compliance.

Also, as semiconductor technology advances, as measured by the "microns" (gate length?) which are always always getting smaller, it is not possible to continue manufacturing older designs - the new equipment is tuned for the new, smaller geometry. So chips that stay in production for extended periods have to undergo "die shrink" - literally reducing the masks and seeing if the logic still works - or be re-designed in the new technology. Since the new technology always allows higher density, it is logical to try to take advantage of it to reduce the chip count, with all the ancillary benefits, one of which is cost reduction.

Re: HP 41CX halfnut

*Message #6 Posted by **Ted** on 30 May 2003, 1:00 a.m.,*
in response to message #5 by Ellis Easley

Well, I really have to thank each and every one of you for your time with this question. I've learned a lot just within 24 hours. Guess the only thing I must decide for myself now is if I can get to love the rounded window as much as I loved the square one on my original HP 41. Thanks guys!

Ted

Re: HP 41CX halfnut_Buy on Ebay

*Message #11 Posted by **Bill Platt** on 30 May 2003, 12:20 p.m.,*
in response to message #8 by Ted

I just bought a used 41 CV fullnut on e-bay.

The seller concealed the fact that the battery terminals were corroded. Would not work until I took it apart, and cleaned--corrosion even got into the contacts on the main PCB.

(By the way, I learned how to open it up safely by going to the excellent write up here in the museum--written by Stefan Vorkoetter, found in the articles forum, under "reapairs")

In every other way, a brand new looking unit. I do not think the original owner ever used it.

Caveat Emptor.

But now she works, anyway.

I also bought a 48g dud, similar situation. Seller said it works, but it didn't. He said "Sorry about your luck--claim it on the postage insurance---which the post office of course refused because the shipping package was pristine.

So now I know what's going on in some cases:

1. seller sells a dud (and buyer is supposed to understand this somehow)

2. Buyer buys, with "postal insurace"

3. Buyer takes package after receiving it, and beats it up a bit,

4. Buyer requests postage receipt, takes mess to post office, and claims!

Seems like a scam, and I bet it happens more and more on EBAY.

Still need assistance in your 48G?

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 30 May 2003, 2:30 p.m.,*
in response to message #11 by Bill Platt

Hi, Bill;

is your 48G still needing assistance or you alredy have it working? If so, let us know. Maybe help is available...

Luiz C. Vieira - Brazil

Re: Still need assistance in your 48G?

*Message #13 Posted by **Bill Platt** on 30 May 2003, 3:55 p.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Luiz,

Thanks for asking. Actually, I have not done anything with it yet.

I have read a couple of different articles on performing surgery on the 48 series, and it certainly seems like quite a bit of work, so I have not started to explore, yet.

As it only cost me $30 USD (inlcuding all costs) I have not been too compelled to go after it, yet. But certainly moral support makes all the difference....

regards,

Bill

Re: HP 41CX halfnut_Buy on Ebay

*Message #14 Posted by **Bill Platt** on 30 May 2003, 3:51 p.m.,*
in response to message #11 by Bill Platt

Well, GOOD NEWS!

The seller of the corroded unit was very apologetic (I wrote him a nice note--not a mean one) and he agreed to either totally refund my money, OR give me compensation for the unknown damage. In fact, we came to a good agreement on the real worth of the machine, and all parties are happy.

So far, in my small e-bay experience, I have only one true "dud" out of eleven (11) purchases.

Ebay is rather remarkable (in a good way, I think)

-Bill

Re: HP 41CX halfnut_Buy on Ebay

*Message #15 Posted by **james (UK)** on 30 May 2003, 5:19 p.m.,*
in response to message #14 by Bill Platt

I'll second that - so far I've only had good fortune with ebay purchases - my first 41CV was in very good condition, perfect battery contacts (with new batteries but shipped outside the calculator) and all covers, including the side cover, present other than for one port which had a real estate module in it, and all 4 rubber feet.

My second backup 41CV was also in good condition, all feet and all covers apart from ports that had modules in. I bought it mainly for one of the modules, it was advertised as a 41C but turned out to be a 41CV.

Also picked up a very good refurbished card reader which looks like new.

The only problem purchase I had was a 12C with 5 non-working keys - the vendor readily offered to replace it but my curiosity got the better of me and with assistance from contributors on this forum I was able to diagnose and fix it.

The only problem with ebay I have had so far is trying hard not to get carried away! Only had limited success with this!

SNIP>>The only problem with ebay I have had so far is trying hard not to get carried away! Only had limited success with this!<<END SNIP

Yes, I already have my wife saying, "not another CALCULATOR!" or, "O.K., what are you buying THIS time?!" or, "there goes the money for our new mattress....."

And I only started buying calculators about 3 months ago when I went to buy a second 32sii and found them out of production.

The world is truly full of temptations. Fortunately some are more benign than others!

in response to message #16 by bill platt

Hi Bill

Yeah, I only started buying a couple of months ago when the battery in my Casio expired (buying a new battery was way to logical for me!). As the house is empty during the day I got my purchases delivered to the office - my colleagues thought I was nuts spending $100+ on a used calculator and that was before they found

out it has no equals key! Their eyes glaze over when I start on stacks and roll-downs / ups!

http://www.msnbc.com/news/918886.asp

Re: 12c Platinum on MSNBC

*Message #2 Posted by **Raymond Del Tondo** on 30 May 2003, 1:04 p.m.,*
in response to message #1 by RB Jones

Thanks for the link.

Excerpt from the article:

"...the Platinum is the first of H-P's financial designs to include two new modes: ALG (Algebraic) and RPN..."

If this statement is in the brochure or in the manual, one could think someone's trying to rewrite history. Maybe the writer never heard of the 17BII and 19BII, which both were switchable from RPN to the dark side of modes...

Raymond

Nope, they mean...

*Message #3 Posted by **Gene** on 30 May 2003, 1:58 p.m.,*
in response to message #2 by Raymond Del Tondo

the new ALG mode, which does not include any hierarchy and does not include parentheses.

the 18c, 19b, 19bii, 17b, and 17bii at LEAST included parentheses.

Give me a break, HP. Putting an = key on a calculator that will solve 1 + 2 x 3 = and give 9 rather than 7, is nuts if you don't have parentheses keys!

Gene

Re: Led Zeppelin on MSNBC [OT]

FYI

http://www.msnbc.com/news/919436.asp?0dm=L12IV

Similarities between HP calculators and Led Zeppelin:

- Both started out in 1968
- Nothing/nobody else like them (before or since)
- Universal appeal, while not being accepted by the general public
- Releasing new versions of originals
- Class act; products/material have stood the test of time
- Both are from our generation

Sorry, couldn't resist.. I've waited nearly 25 years for this (new releases from my favorite band) 8^)

You should see this... Voyager related!

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 29 May 2003, 10:40 a.m.*

Hi, folks;

About two years ago, I found a FESTO catalog and I scanned some images, mostly related to their workbenches and general look. I was checking these images a few moments ago and I found this one particularly interesting.

http://www.logeng.com.br/images/festo_HP.jpg

The image "speaks" for itself.

David, if you need to remove this post because of copyright violation, please do it.

Enjoy it, folk~s!

I know FESTO as a company that makes a lot of pneumatic components like cylinders, valves etc.. I used a lot of their products in my work.

You're right...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 29 May 2003, 8:13 p.m.,*
in response to message #5 by Chan Tran

Hi, Chan Tran;

you're right. FESTO's primary activities are related to pneumatics, but they have gone further and are getting into servocontrolled devices and robotics. I'm not shure if they have "joint-venture"d to some other companies or groups, but I saw some FESTO educative workbenches, from pneumatics to robotics, that made me think seriously about building a complete FESTO-based development lab, educational level. I did not have the time to do it, unfortunately, mostly because the school I was working on for three-and-a-half years (1999-2002) decided to go for other markets (food technology).

It seems to me that FESTO followed today's needs. As a German company, it does not surprise me.

Best regards and thak you for your remind.

Luiz C. Vieira - Brazil

Does anybody want an HP-35 emulator for Palm?

*Message #1 Posted by **Jonathan Purvis** on 29 May 2003, 4:38 a.m.*

I've ported Eric Smith's csim to PalmOS. I've got it emulating the HP-45 and HP-35 (using Peter Monta's extraction of the ROM). Unfortunately the hard disk of the computer i was developing it on died last week so the only version i have is the one on my Treo that emulates the HP-35 only. Does anyone want a copy? I do plan on rewriting it sometime, but i've got to buy a new hard disk and reinstall Linux, etc first.

It's a little slow, but useable. I ported it by simply writing the relevalent Unix calls, which may account for some of the slowness.

Re: Does anybody want an HP-35 emulator for Palm?

*Message #2 Posted by **ToddG** on 29 May 2003, 12:55 p.m.,*
in response to message #1 by Jonathan Purvis

Will it include an X^Y key, and the bugs?

Re: Does anybody want an HP-35 emulator for Palm?

*Message #3 Posted by **Jonathan Purvis** on 29 May 2003, 3:23 p.m.,*
in response to message #2 by ToddG

It's using the original ROM, so it has all the same keys and all the same bugs (hopefully no new ones).

Re: Does anybody want an HP-35 emulator for Palm?

*Message #4 Posted by **Mark Ordal** on 29 May 2003, 5:10 p.m.,*
in response to message #1 by Jonathan Purvis

A nice stack-based calculator program already exists for PalmOS PDAs: "RPN" by Russell Y. Webb (http://www.nthlab.com).

It doesn't emulate HP models. However, being stack-based, it obviously operates in a similar manner. It is programmable, but its scripting language is quite a bit different than programming a real HP RPN or RPL model.

Re: Does anybody want an HP-35 emulator for Palm?

*Message #5 Posted by **Renato** on 29 May 2003, 11:54 p.m.,*

NBC: tongue in cheek?

*Message #1 Posted by **Ellis Easley** on 28 May 2003, 7:21 p.m.*

I just saw the last bit of the last story on the NBC nightly news. It was about video games and whether they are harmful: surprising news... I caught a little (which I have heard before) about how the military is using them to train people who are going to use similar interfaces to operate battlefield equipment. Then they had a clip of an expert who said the experience of video games doesn't help people to solve problems in mathematics. They concluded the story with the statement that there is no substitute for learning the subject the old fashined way, accompanied by video of a student doing math homework with a calculator! (looked like a TI graphing model)

Re: NBC: tongue in cheek?

*Message #2 Posted by **Speck** on 28 May 2003, 9:36 p.m.,*
in response to message #1 by Ellis Easley

I think viewers would think something was up if they dug up some film (if they could find any) of some kid doing his math with a slide rule. Not sure everyone would get it, though.

82161A HPIL tape drive - possible source for tapes

*Message #1 Posted by **Ellis Easley** on 28 May 2003, 7:08 p.m.*

Michel posted the address of a company that sells tapes that look a lot like the ones for the HPIL tape drive in this message:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=34674

I wrote an email to the company and have had the following interchange:

```
to: sales@braemarinc.com <sales@braemarinc.com>

I am interested in these tapes because they look like they might work with a
Hewlett-Packard tape drive (82161A) which HP no longer supports. HP also
called the tape cartridges "Mini Data Cassettes" and the manual for the tape
drive says the cartridges contained "24 meters (80 feet)" of tape. If there
is a chance one of your tapes might work in this drive, I would like to know
how I can buy some to try out.

Thank you,
Ellis Easley

Hello Ellis:

We sell new CMC80 mini-data cassette tapes in packages of 10. The part
number is 600-0057-001 and the price is $19.00 each. These tapes operate
in a CM600 tape drive which is used in many different applications by a
multitude of companies around the world. We no longer manufacture new
units but continue to service units in the field. If you have a serial
number on the unit we may be able to cross-reference it in our data
base. We process these orders on a credit card or COD basis. Please
advise if you would like to order these tapes. Thank you.

Hello Louise,

I would like to try the CMC80 tapes with my drive. Is the price $19.00 for
one tape or the package of 10?

Thank you,

Ellis Easley

Hello Tony [???],

The price per CMC80 mini-data cassette tape is $19.00 each and the
minimum purchase is 10 tapes in one package or $190. Please advise if
you would like to place your order. Thank you.
```

So my question is: would people be willing to spend $19 each for these tapes (assuming they will work *perfectly*

in the 82161A)? I am thinking of writing back to ask if I can buy one tape to verify operation because I know a number of people who are looking for tapes and would be willing to "club together" to but a quantity of them. If this company was actively selling the tapes, they would probably sample me one, but I'm pretty sure they are just supporting a legacy product (remember when companies used to do that?!!!)

EduCalc charged $9.50 each / 10 for $90 for these tapes in the last catalog that listed them. I don't know what they are going for on Ebay.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #2 Posted by **Michel Beaulieu** on 28 May 2003, 7:44 p.m.,*
in response to message #1 by Ellis Easley

Yes it's interesting; it they fint in the drive and have the "mirror" at the end of tape to tell the reader... the end....

so just find 9 others, 8 if you take one!

Thanks!

I found that link when searching fluke replacement data cartridge that also fit the HP drive.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #3 Posted by **Ellis Easley** on 28 May 2003, 7:55 p.m.,*
in response to message #2 by Michel Beaulieu

I bought a box of Fluke tapes on Ebay just to see if they would work. I never put them in the drive but I measured the tape in other ways: The actual thicknes with a caliper (it is thicker that HP tapes) and the length, indirectly by counting turns of the hub (there is considerably less than the HP tapes). The fact that HP says their tapes had a length of 80 feet and this company (Braemar) sells models "CMC80" and "CMC50" makes me wonder if their CMC80 is the same as the HP tape and their CMC50 is the same as the Fluke tape.

I don't know if I want to pay $19 each for these tapes! If enough people do want to, and if the company will sell one tape for test purposes for a reasonable price, it is worth persuing.

Fluke tapes

*Message #4 Posted by **Mike** on 28 May 2003, 8:24 p.m.,*
in response to message #2 by Michel Beaulieu

I have over 20 brand new Fluke tapes and they fit fine but they will not format because, apparently, they are too short.

Of course it could also be because of missing holes or someting. They loaded properly so I assumed the eot holes were fine. Didn't check beyond trying to format them.

The format failed and I just assumed it was length, since the tape ran all the way to the end before an error was given. Then the tape just rewound.

I assumed it saw holes before it was finished formatting.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #5 Posted by **Diego Diaz** on 29 May 2003, 4:36 a.m.,*
in response to message #2 by Michel Beaulieu

I contacted them few months ago, and posted here:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=28647

though nobody shows any interest by those days.

They only offered me the 10 unit box at $21/unit i.e. $210 + shipping, as I live in the Canary Islands and I was only going to make a try... this seemed quite a lot for my budget, of course, they didn't say a word about 82161A compatibility. So it must be done at your (our, mine...) risk.

Anyhow, price has come a bit down ;-)... may be in one or two years...

About Fluke tapes, if the shell fits into the drive and mirrors (at least one of them) is in its place, the tape itself can be substituted with regular audio cassete tape. I'm willing to get a pair of them for testing.

I've done it on two heavily worn out HP cassettes and they are working fine since then:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24244

(I must say that they have only been formatted (NEWM) and recorded and read/verfied twice, as they are only used for long term archiving purposes. 9114B is the *real* solution for HP-IL mass storage)

Cheers

Re: 82161A HPIL tape drive - possible source for tapes

*Message #6 Posted by **Ellis Easley** on 29 May 2003, 5:34 a.m.,*
in response to message #5 by Diego Diaz

I guess I missed your posts. I wonder if the price will keep coming down? $2 every few months - they should be free by next year! I wouldn't even consider buying 10 tapes at these prices, even shared among several people, without knowing that they will work. Even if they are the right tapes, that's a lot.

Wouldn't it be something if they bought up a stock of HP tapes and re-labeled them? There was a rumor (here) that somebody's brother has a huge supply of HP tapes and is just waiting for the right time to sell them on Ebay. I didn't think to ask Jim Carter about them when he had his EduCalc closeout - I did buy several 80 packs of HP41 cards for about $2.50 each.

I don't have my notes at hand, but I'm sure the Fluke tapes had the holes in the tape and the mirrors, the main difference is that the Fluke tapes are made to be turned over - in fact, the Fluke tapes might be the original version - the HP tapes have two mirrors but only use one, and they have some extra plastic so you can only load them one way. I've (only) though about reloading the Fluke (or HP) tapes, is the width of audio cassette tape correct? I would choose a tape that was the same color - all I know about different formulations is that the old 5.25" floppy disks were brown and the later high density ("high [600 oersted] coercivity", the original 1.2 MB diskettes were marked) and 3.5" disks are black. At least cassette tapes come in different lengths and I always heard that the 120 minute tapes were thinner and more likely to jam. I measured the HP tape with a dial caliper and it is definitely thinner than the Fluke tape. I'll have to take a caliper to some audio cassette tapes. The next problem (I thought) was how to punch the hole cleanly without making the tape very weak.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #7 Posted by **Diego Diaz** on 29 May 2003, 6:46 a.m.,*
in response to message #6 by Ellis Easley

Hi,

Ellis, check out the whole thread under my previous post's last link. I think you'll find some useful info regarding tape refurbishing.

Regards.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #8 Posted by **Ellis Easley** on 29 May 2003, 8:52 a.m.,*
in response to message #7 by Diego Diaz

Diego, I did - after I wrote my message! I want to try some of your experiments myself.

Here's some ancient history that might apply: I worked for Tandy and I remember someone talking about the cassette tapes for the TRS80, which used a regular audio cassette tape recorder for storage. It was a factory issue because every unit shipped with a tape (and a recorder) - I think it was a Blackjack game! Radio Shack knows all about audio and knew how to mass produce pre-recorded audio cassettes and so they provided a master cassette and had the tapes made the normal way but they didn't work reliably - or at least the playback volume setting on the recorder, which was critical for success in loading programs, had to be changed from the setting that worked best to load programs recorded on the recorder, to load the prerecorded cassettes. The process for making the pre-recorded tapes involved making a master recording on metal tape and then bringing a blank tape into contact with the metal tape with both tapes in synchronous motion and hot air blowing past them. The advantage of this process is that it can be done at very high speed. They found that they had to increase the amplitude of the signal recorded on the metal tape master to get a pre-recorded tape that worked reliably without changing the volume setting.

The lesson of that story might just be that the recorder that was shipped with the computer recorded at a higher amplitude than it should have. But I give Radio Shack's engineers credit for eliminating that factor. I assume they started out by providing as a master, a typical recording produced by the computer and the actual model of recorder that was shipped with it (BTW, the recording level of the cassette deck was not user adjustable - I'm sure it had an automatic recording level circuit to maximize the level that went onto the tape, to minimize hiss on playback - it was a regular audio cassette recorder, not a high fidelity deck).

The lesson of the story seems to be that a nominally audio recording of digital data works best at recording levels much higher than for high fidelity sound recording. Maybe the optimal signal for digital purposes is what would be considerd a clipped signal for sound purposes. Does magnetic media clip "softly" - without sharp edges that would play back harmonics? If a voice is heavily clipped, you just hear the fundamental frequencies and can't understand the speech, which is mostly conveyed by the harmonics. But this type of modulation doesn't depend on harmonics - in fact, eliminating all other frequencies should make recovery of the data easier. Recording a clipped level on the tape might enhance that.

How did you use a drill bit to make the holes in the tape? Did you clamp the tape between two sheets of something hard for the bit to work through?

I'm curious about Tony's article. I have the HPCC CD-ROM - 20 Years of Datafile. Hopefully it is there.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #9 Posted by **Diego Diaz** on 29 May 2003, 10:16 a.m.,*
in response to message #8 by Ellis Easley

Originally recorded signal in the HP tape (remember it didn't work) was fully saturated, i.e. it shows a flat upper and lower waveform with very fast transitions between them (almost squarewave).

Anyhow it was reproduced in a Hi-Fi deck, so heads are obviously unnapropriated for the task, but for reference only.

The holes at both ends were made with a 0.8mm drill bit (by hand) placing the corresponding portion of the tape with the magnetic coated surface towards a hard plastic flat piece and taped with scoth-magic adhesive tape to this plastic piece, then handle the drill bit carefully to make a centered hole thru the "sandwich", remove the adhesive tape (also carefully) and you'll have a very nice and round hole (little practise helps a lot.)

I'll look for Tony's article and will send it to you. It is a great job about repairing tape's pressure pads, opening the tape case, etc.

Cheers from Spain.

Re: 82161A HPIL tape drive - possible source for tapes

*Message #10 Posted by **David Smith** on 29 May 2003, 5:42 p.m.,*
in response to message #1 by Ellis Easley

When they appear on Ebay the HP tapes usually sell for over $20 each if they are new. I saw a 2 pack bring over $75 and a pack of 10 bring like $275. I have also seen them go for quite a bit less. $19 each seems like a reasonable amount these days.

What is the key consumer noticable for HP ?

*Message #1 Posted by **Bob** on 28 May 2003, 4:35 p.m.*

Although I am a long-term HP user, quasi-collector, and a dedicated RPN fan, I just bought a half dozen TI-36XII's for use in a lab environment that has, historically, been hazardous for calcs. (Yes, I know that it is heresy, but I don't want to fork over a ton of money if the unit will be trashed in a few weeks. Not everyone appreciates the finer things in life!)

My point is, what are the most noticable features that you would need to make you buy something other than an HP if no new models emerge ?

I have to admit that given the number of features on the TI36XII's and the price of $9.99 each, I could easily get along with it if: 1. ...it's keys had more tactile feedback than an over-ripe grape. and 2. ...it used RPN rather than algebraic entry.

...so, for me, it is the feel of the keys and RPN. I have had several calcs for 10 - 20 years and they still work, (TI's included) but if they were even 3X the cost of the calcs I just bought, and included the features above, I would buy a bunch of them and spread them around the house, office, car, briefcase, nightstand, etc. - OK, I made that part up about the nightstand. (I'd buy more if they were the right color - brown!)

Re: What is the key consumer noticable for HP ?

*Message #2 Posted by **GS Leong** on 28 May 2003, 5:05 p.m.,*
in response to message #1 by Bob

I agree, Key feel and RPN are the two dominant features next I would put layout and color scheme. Whats wrong with having an hp by on the nightstand anyway?

Re: What is the key consumer noticable for HP ?

*Message #3 Posted by **Bill Platt** on 28 May 2003, 5:32 p.m.,*
in response to message #2 by GS Leong

I parked an Algebraic there (on the nightstand) just a month ago--to try to slowly acclimatize my wife to the HP way ;)

Re: What is the key consumer noticable for HP ?

*Message #4 Posted by **hugh** on 28 May 2003, 5:38 p.m.,*
in response to message #1 by Bob

for me its the keys and display, assuming no obvious function limitations. being palmsized and pocket sized are also a big bonus. other than hp's i also appreciated the build quality of some of the early casios (and other japanese makers). graphing is something of a minus for me, because it means the unit is bigger and i dont really want to do graphs on a calculator anymore.

an interesting question is; what is nicest machine currently still on sale new?

Re: What is the key consumer noticable for HP ?

*Message #5 Posted by **Les Bell [Sydney]** on 28 May 2003, 10:29 p.m.,*
in response to message #1 by Bob

Huh? Of course you need an HP calc on the nightstand!

Why else do the 41 Time Module and the 41CX have the XYZALM function?

Best,

--- Les [http://www.lesbell.com.au]

Re: What is the key consumer noticable for HP ?

*Message #6 Posted by **james (UK)** on 29 May 2003, 5:35 p.m.,*
in response to message #1 by Bob

Apart from RPN and key feel, I would also say the 'pick-up factor' - when you see a classic HP it calls out to you, you want to pick it up and hold it. Sadly, I can't say the same about the current ones - even the Voyager loses some of its attraction when released in a wierd color scheme.

Re: What is the key consumer noticable for HP ?

*Message #7 Posted by **Chan Tran** on 29 May 2003, 6:18 p.m.,*
in response to message #6 by james (UK)

Look. When I bought my first calculator in late 1975 I picked the HP-25 over others like TI's because of its look. I didn't really know what all the specification meant and definitely not knowing the different between RPN and algebraic. May be that's why RPN is easy for me as I didn't know any other way to use a calculator.

Re: What is the key consumer noticable for HP ?

*Message #8 Posted by **Trent Moseley** on 30 May 2003, 12:13 a.m.,*
in response to message #7 by Chan Tran

Chan Tran, you are three years ahead of me. I had a Commodore.xxxx which one of my sons lost at school. I saw an ad in Scientific American for the HP-25C in 1978 which I bought with some trepidation not having a clue about RPN. What a wonderful surprise!

HPLX Codenames

*Message #1 Posted by **Mike** on 28 May 2003, 9:14 a.m.*

HP95LX is Jaguar, HP100LX is Cougar, HP200LX is Felix(?), HP1000CX is Puma. Now who the f*ck is "Lion"?

Had the SW different codenames than it's HW?

How knows?

Ciao.....Mike

BTW, if you are realy sure about those codenames pls reply to hp41cx at web dot de

TIA

The Lion

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 29 May 2003, 1:23 p.m.,*
in response to message #1 by Mike

I think (not 100% sure) that "Lion" was a sub-notebook PC, with a 386 sx processor and running Windows 3.1 in standard mode (not multitasking). It has all the software in ROM (Windows, Word and Excel) and a very curious "mouse" attached with a plastic arm to the side of the machine. I don't remember the commercial name, but it was one of the first to use the OmniBook label.

These are just imperfect memories from 10 years ago, I apologize for possible errors.

Re: The Lion

*Message #3 Posted by **R Lion** on 29 May 2003, 1:31 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Sorry, you are wrong: I am the Lion

Raul :-)

Re: The True Lion

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 29 May 2003, 5:18 p.m.,*
in response to message #3 by R Lion

Sure, Raul :-)

Re: The Lion

*Message #5 Posted by **Raymond Del Tondo** on 30 May 2003, 1:59 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

You mean the first OmniBooks (the REAL OmniBooks!).

However, there was another variant of the 200LX, the OmniGo 700LX. Maybe this is the Lion? I mean the other Lion, other than Raul;-)

Raymond

Re: The Lion

*Message #6 Posted by **Frank Wales** on 30 May 2003, 2:15 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Unless my memory is broken, I believe that 'lion' was the Omnibook 300, which was the first Omnibook, and indeed as you described it here (mouse on a stick, Windows in ROM, no internal spinning drives, long battery life, etc.).

Re: The Lion

*Message #7 Posted by **Mike (Stgt)** on 4 June 2003, 11:14 a.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Thank you for the info. Was there some special data exchange between "Lion" and the HP200LX? Or some special SW charing databases between this systems?

TIA.....Mike

HP41CV Extended Function Module

*Message #1 Posted by **Todd Templeton** on 28 May 2003, 12:25 a.m.*

Greetings, All:

I'm new to this form and the museum, so maybe this is not the place for this question, but here it goes anyway.

I am a devoted disciple of the HP41CV. I bought mine in 1982 and have babied it for the past 21 years. It recently broke, but I was able to get it repaired and it is as good as new, now. Before I got the HP41CV I had a TI58, which was a piece of junk in comparison, although expensive.

Anyway, I'm looking for an Extended Function Module so I can load in a some programs that would be useful in my work (mostly base conversions). I would also like to find a Math Module for it. I've checked on eBay, but I haven't found anything, yet. I could buy a CX, but my CV is just fine -- I just need the module.

Anybody have any suggestions for me?

Todd Templeton Torus Business Group LLC Phoenix, AZ

Re: HP41CV Extended Function Module

*Message #2 Posted by **Jim L** on 28 May 2003, 12:45 a.m.,*
in response to message #1 by Todd Templeton

Try the classified ads

Re: HP41CV Extended Function Module

*Message #3 Posted by **Todd Templeton** on 28 May 2003, 12:54 a.m.,*
in response to message #2 by Jim L

Wow! That was a fast reply.

I tried the classifieds first, but nothing jumped out at me as possibly what I was looking for. But, I'll go through them more carefully.

Thanks!

Todd

Re: HP41CV Extended Function Module

*Message #4 Posted by **Jim L** on 28 May 2003, 3:14 a.m.,*
in response to message #3 by Todd Templeton

Actually I was suggesting that you post a "want to buy" ad.

I'd suggest buying an HP41CX

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2003, 1:38 a.m.,*
in response to message #1 by Todd Templeton

Hello, Todd;

If you can afford doing this, buy an HP41CX. It's an anhanced model, not only an HP41CV with time and X-Functions module. You can keep your beloved HP41CV and buy the modules, but I believe it's gonna be easier to find an HP41Cx instead of an X-Functions. And prices will probably justify buying a complete calculator.

About the math module: you will be able to use in any of them.

Hope you have success.

Best regards.

Luiz C. Vieira - Brazil

Re: I'd suggest buying an HP41CX

*Message #6 Posted by **Todd B. Templeton** on 28 May 2003, 6:44 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi, Luiz:

Actually, surprisingly enough, I was contacted by a fellow this morning with an X-Function module for sale who is located here in Phoenix. I also just heard from a fellow in Australia with a Math Module for sale, so I think I have everything I'm looking for.

Your point is well taken, though, and I would dearly love a CX. I would have purchased a CX when I bought my CV, but I was a starving college student at the time and couldn't come up with the additional cash. At the time, I think the CX was about twice the price of the CV. I paid $256 for in 1982 (still have the original invoice), which was a considerable sum for a college kid paying his own tuition on a minimum wage job. Since I can afford it now, I may pick up a CX some time just for giggles.

Anyway, I appreciate all the feed back from everyone.

Thank you.

Todd

You'll not regret, believe me!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2003, 10:10 p.m.,*
in response to message #6 by Todd B. Templeton

Hi;

if you really love your HP41CV, you'll feel as betraying it when meeting an HP41CX! I felt like that and it took me more than a month to get back to my old fella 41C after having a CX in hands. Different tastes, I'd say.

Well, take your time. Now you have what you need. I just want to tease you a bit more: my HP41CX has an HPIL, two X-Mem modules and an X-IO connected to it (I have no math module; all I need in

math I have in my HP42S). As it has the X-Functions built in, I can use all ports for other modules. Oh, yes, and I can see if it's time to shoot it off and go bed...

Success!

Luiz C. Vieira - Brazil

Edited: 29 May 2003, 8:19 p.m. after one or more responses were posted

Re: You'll not regret, believe me!

*Message #8 Posted by **Todd B. Templeton** on 29 May 2003, 6:37 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz:

You're a hoot! I'll look out for a good deal on a CX and pick it up.

Thanks!

Todd

HP41CV Help/Advice

*Message #1 Posted by **Steve Gosselin** on 27 May 2003, 11:40 p.m.*

Hi all. I have a HP41CV that I purchased what seems to be many years ago. Some 8 years ago its simply stopped working - it won't turn on using either the ac adaptor or replacable batteries. The calculator was well cared for and prior to that it never gave any indication of problems. It has sat in my desk since. Can anyone tell me what might be the problem and where or how I might get it repaired?

Thanks.

Steve Gosselin

Re: HP41CV Help/Advice

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2003, 1:33 a.m.,*
in response to message #1 by Steve Gosselin

Hi, Steve;

let's first identify which model you have. Please, look at the LCD window and compare what you see to the image below.

This image belongs to the HP Museum (this site).

In both cases, the best starting point is cleaning batteries contacts, the ones in the calculator. If you see they are O.K, chances are you have a small battery leakage and that the residal leak got between the kayboard and the battery connectors assembly. In this case, it's necessary to open the calcualtor. Do you need advice for this?

If so, let us know so we can continue.

Best regards.

HP41CV Display

*Message #1 Posted by **Howard** on 27 May 2003, 6:23 p.m.*

On my HP41CV there is some flakes of dust or something on the display. Does anybody know an easy way to remove it. I was thinking on the lines of how I fixed a sticky key on my HP32SII (on advice from this forum). That advice was to bathe the whole calculator in clean water several times and dry it out with a hair dryer. Does anybody know if this method can be used on the HP41CV? Thank you. PS Wipe the "SPAM" off to email.

HP41 display cleaning

*Message #2 Posted by **Randy Sloyer** on 27 May 2003, 8:34 p.m.,*
in response to message #1 by Howard

If they are black, there is a chance your LCD is leaking. If it's a full-nut, it's replaceable. You're out of luck with a half-nut as the display is not serviceable.

If it just looks like dirt specs, you can open the unit by removing the four feet and the four screws underneath. You can then usually blow the dirt out by directing the flex tube of some canned air in from the sides of the display. If they are really stubborn, you can try a sliding a strip of stiff paper into the LCD area and try dislodging the specs then follow up with air.

The water wash will probably not loosen the dirt and can cause further problems especially with a half-nut by transporting even more dirt to the display area.

In a very desperate situation, you can always unsolder and remove the LCD from a full-nut for cleaning.

Help needed - Woodstock external battery charger

*Message #1 Posted by **Renato** on 27 May 2003, 4:22 p.m.*

I just got a external battery charger for my woodstock collection. It seems to be working, but there is a rattle inside. Also, one terminal is corroded - so i would like to open it, clean and fix the rattle. I don't know how to open this unit - can someone help me ?

Re: Help needed - Woodstock external battery charger

*Message #2 Posted by **Tony Duell (UK)** on 27 May 2003, 5:04 p.m.,*
in response to message #1 by Renato

It's glued together :-(. The main area for glue is between the flat part at the bottom of the battery cavity and the bottom part of the case. You have to carefully prise (pry) it apart. Once the 2 parts of the case have separated (hopefully without too much damage -- mine came apart cleanly), it's easy to extract the little PCB. The circuit is really simple -- 2 resistors, a diode, and the LED.

Re: Help needed - Woodstock external battery charger

*Message #3 Posted by **Renato** on 27 May 2003, 5:54 p.m.,*
in response to message #2 by Tony Duell (UK)

Tony,

Ok, thanks.

Renato

Re: Help needed - Woodstock external battery charger

*Message #4 Posted by **David Smith** on 28 May 2003, 3:19 p.m.,*
in response to message #2 by Tony Duell (UK)

The ones that I have needed to open were glued shut rather well. One had to break the plastic tabs to get them apart. Putting them back together again was a real pain.

Hilarious...I bet the 12c classic outsells the 12cp 2 to 1

*Message #4 Posted by **Gene** on 27 May 2003, 3:05 p.m.,*
in response to message #1 by J.Manrique Lopez de la Fuente

If there's only a $10 difference, I still think the original 12c will sell better than the new one...at least, after the HP nuts, e.g., most of us here, have bought one.

The extra programming steps (400 vs. 100) won't matter a hill of beans to 99.99% of the 12c buyers.

The slower solutions to annuity problems will matter to at least 50% of the 12c buyers.

The ugly color scheme will also be a drawback.

IMO, of course. Gene

What are the extra functions?

*Message #5 Posted by **Tony David Potter** on 27 May 2003, 3:35 p.m.,*
in response to message #1 by J.Manrique Lopez de la Fuente

On the HP Financial Calcualtor comparison page http://www.hp.com/calculators/financial/index.html it lists the number of built-in functions.

HP-12C - 120+
HP-12CP - 130+

What are the extra functions? Trig would be too much to hope for, I'm sure.

--Tony David.

Re: What are the extra functions?

*Message #6 Posted by **Gene** on 27 May 2003, 5:02 p.m.,*
in response to message #5 by Tony David Potter

Extra functions are:

X^2 (wow)

ALG (selects algebraic mode)

RPN (selects RPN mode)

= (of course, have to have an equals function for ALG mode)

Can't really find much else.

Some of us had hoped for something to really compete with the $30 TI BAII Plus calculator. Much more bang for the buck than the 12c, sad to say.

Re: What are the extra functions?

*Message #7 Posted by **NH** on 27 May 2003, 10:30 p.m.,*
in response to message #6 by Gene

The 12C sports a variety of new special MBA boardroom features,

* pay-raise program to determine the highest possible executive pay-raises while a company is going bankrupt. Hit 2nd-shift button to determine corresponding pay-cuts to employees.

* hostile takeover share price calculations

* employee paycut percentage calculator, enter the monetary value of an outstanding employee's corporate contributions, the calculator responds with how much to cut that employee's pay. 2nd-shift button for hack-jobs and non-producing employees, to determine correct amount to raise their pay.

* builtin earnings-sheet fraud generator program

* automatic solve function to determine which is the most profitable and popular product with customers, to target those products for discontinuation.

* foreign currency converter, to check value of Swiss bank account (maximum 11 places plus decimal).

* personal family-member calculation subroutines, example, enter number of creepy MBA sons going to Yale law school, calculator responds with amount of tuition required quarterly (limit 7 figures plus decimal).

* major capital destruction probability programs. HP responded specifically to NASA management on this one, similar to when they responded to NASA on the 41C years ago. So when Dittermore burnt up the 2nd shuttle, he takes his 12C, enters the amount of major capital destruction caused by not listening to engineering, enters the gross annual income of the organization, assets and earnings, calculator responds with most likely payraise to the individual holding responsibility for the capital destruction. 2nd shift to calculate 'bonus' amount and number of share options awarded after media coverage cools off.

I think Carly is pretty happy with the new extra features. NASA is going to try that last feature often, until they run out of shuttles.

Re: What are the extra functions?

*Message #8 Posted by **Dave Shaffer** on 28 May 2003, 1:17 a.m.,*
in response to message #7 by NH

Norm,

You forgot one final function for those MBA types:

The calculator tells them to go lie out on the railroad tracks and wait to be fixed!

Ouch !

*Message #9 Posted by **Norm** on 28 May 2003, 1:55 a.m.,*
in response to message #8 by Dave Shaffer

Ouch !

Thats one MBA who will need a few bandaids.

I could spare a few bandaids for our test MBA... well, one or two bandaids anyway, well, the little round ones at the bottom of the can that I dont use. If thats not enough too bad.

Hope it was Carly .

Be nice, guys, I AM an MBA!

*Message #10 Posted by **Gene** on 28 May 2003, 11:16 a.m.,*
in response to message #9 by Norm

Not all of us are like you make it out to be...seems like only those at HP. :-(

Re: Be nice, guys, I AM an MBA!

*Message #11 Posted by **Ellis Easley** on 28 May 2003, 5:01 p.m.,*

in response to message #10 by Gene

Gene, I hold you in high regard, along with another MBA who has been shaking up the world lately! I have no animosity about it but I wonder why RPN has survived in the 12C but not in the scientific calculator market. In the manner of the optometrist (think of me as an optimistic optometrist!), tell me which of these works better:

a. Accountants like RPN because it is not unlike the old adding machine.

b. Accountants like RPN because it is sort of a secret method that sets them apart (not meaning to imply that only accountants would be motivated this way!)

If it turns out that it was only the gold anodized finish that made the 12C popular, the 12CP is screwed! I know platinum is the natural progression from gold for prestige, but in an actual object, will the extra few dollars make people forget that it is really aluminum?

OK we will be nice

*Message #12 Posted by **NH** on 28 May 2003, 8:47 p.m.,*
in response to message #11 by Ellis Easley

OK we will be nice.

You can have a big band-aid.

Maybe we will even phone 911 for you.

HEY SERIOUSLY, if you are a nice MBA, prove it. I always hoped maybe I would meet one someday, though I hadn't so far.

I am sitting on several multi-million dollar opportunities. NO this is not SPAM. I am an inventive design engineer. I have smaller ones, and larger ones, all clearly legitimate, and sought-after by customers near and far. 2 out of 3 are protected by patent, the 3rd one will be later.

Everytime I sit down with modern management, they are too twisted and braindead to even know how to change a lightbulb. NOT the management from the moonshot era. Now, if they can't even change a lightbulb, you cant exactly talk to them about important enabling technology allowing a huge pile of money to be made, can you. So I have these great ideas but they can't pronounce anything more complicated than "golf" so then I go hungry because the only way I can make money is by inventing cool new things, and they cannot appreciate that process.

Besides, they are busy saying 'rip you off' and you cant talk technicals anyway because they are just figuring out how to swindle somebody (perhaps the inventor, or maybe the shareholders).

So I have 3 specific outstanding ideas, 2 could generate a million bucks a year of sales, the 3rd could generate 20 million bucks a year of sales. Prove to me you are a nice MBA by talking to me about it.

Click on the blue, up top.

- Norm Design Engineer

Mr. Nice MBA

in response to message #1 by J.Manrique Lopez de la Fuente

Despite the mistakes made on colour scheme and bugs, HP need to be congratulated for the support documentation. See the link below for a set of .pdf documents. I hope that they keep this up with newer scientific models, but with traditional colours, no bugs and faster speeds!
http://www.hp.com/calculators/financial/12p/educators.html

Re: HP12C Platinum on hp.com

*Message #15 Posted by **james (UK)** on 28 May 2003, 8:52 a.m.,*
in response to message #14 by Gordon Dyer

Pity the manuals link on the normal 12C page takes you to the 10BII and not the 12C! Maybe the guy who did the website is the same guy who built my Malaysian 12C keyboard!

Re: HP12C Platinum on hp.com

*Message #16 Posted by **Dan M** on 28 May 2003, 4:36 p.m.,*
in response to message #14 by Gordon Dyer

Gordon:

Please note that the pdf documents linked to in your referenced link are credited mostly to Grapevine Publications, and so it is really mostly they (not necessarily HP) who should be congratulated for a job well done.

Now if Grapevine Publications could be contracted to write the HP support documentation, it would be very interesting. And about those colours...

Regarding the documentation about the "algebraic" mode for the HP 12CP: have you read that? It is, indirectly, one of the better arguments for using RPN that I've seen. Try to do one of those problems, and it's almost guaranteed that learning RPN would be easier, even for "those MBA types" :-)

At least this shows that HP wants to produce some decent documentation, even if they've forgotten how to do it themselves.

Dan "cynical? me?" M.

Re: HP12C Platinum documentation

*Message #17 Posted by **Matt Kernal** on 28 May 2003, 8:10 p.m.,*
in response to message #16 by Dan M

Dan> Gordon:

Dan> Please note that the pdf documents linked to in your referenced link are credited mostly to Grapevine Publications, and so it is really mostly they (not necessarily HP) who should be congratulated for a job well done.

I suspect the (RPN part of the) documentation comes from Grapevine's "An Easy Course in Using the 12C" book, which was written many years ago.

And didn't I read the 12CP manual is an updated version of HP's own original 12C manual (ie. Example problems now have updated Interest rates, PV amounts, etc..)? If so, we should congratulate the original writers for a job well done (for the manual they wrote twenty years ago).

Matt

Would someone check an HP41C halfnut, please? (and a new image)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 11:44 a.m.*

HI, HP41 maniacs (like me);

if there is any HP41C halfnut owner reading and with necessary skills, would you please open it and check for the hybrid LCD driver code?

I'd like to know if there are only two of these IC's - 41CV and 41CX - or if the 41C halfnut has a different one. Let me explain why.

When the first halfnuts became available, the HP41C was no longer being produced. Anyway, I read here in this very formum, that some units were released for replacement purposes. This means that the same mainboard is used for the HP41C.

As I have an HP41CV that fails to recognize more than 63 registers and the hybrid IC has the same code of another fully-operating HP41CV halfnut, I am trying to get to conclusion if this hybrid IC is defective or if there is some sort of jumper in the mainboard that would restrict the access to the remaining memory.

I compared this halfnut mainboard to another 41CV halfnut mainboard (newer) and found an additional SMD with an N2(with a slash over both characters) as identification, and it goes straight in two terminals of the hybrid chip. The other mainboard has the pads for soldering it, the one I scanned and posted here doesn't. I thought about removing it and testing it to see what sort of component it is, but I prefer waiting a bit more till I have other references. If there is a third hybrid chip for the HP41C, I will conclude this 41CV is definitely damaged.

The new, additional image is the one that shows the back image of the halfnut LCD. I forgot to add this image to the set shown in my previous post.

http://www.logeng.com.br/images/hn_lcd_back_legends_s.jpg

Thank you for any additional information.

Luiz C. Vieira - Brazil

Re: Would someone check an HP41C halfnut, please? (and a new image)

*Message #2 Posted by **Meindert Kuipers** on 27 May 2003, 3:48 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Check this out:

http://www.kuipers.to/images/open41cx.jpg

I have made some new pictures for my online museum, but did not have the time yet to upload it in a nice format. Put this one online just for Luis. The file is about 700+ K and a picture of my whole opened 41CX.

No Luis, I am NOT NOT NOT (excuse me for shouting) going to disassemble it any further ;)

Meindert

Thank you!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 8:40 p.m.,*
in response to message #2 by Meindert Kuipers

Hi, Meindert;

this is what I call a great big picture!

The paper label over the hybrid chip is the same as the one found in my halfnut CX. Now I want to know if the existing HP41C halfnut have another code.

CV: 5061-7255 CX: 5061-7262 C: ??????

Thank you very much. Not a curse: if you, by any reason, need to dismantle your HP41CX, be sure there is someone that has already done something like this... and has no regrets.

Best regards.

Luiz C. Vieir - Brazil.

More info on 41c card reader problem

*Message #1 Posted by **Steve** on 27 May 2003, 9:54 a.m.*

It looks like it was the alignment of the LED with the card slide hole and sensor. I adjusted the LED (from the board) to be in the center of the opening (near the wheel) and it has started to work. I never realized the positioning was so critical (I only moved it a couple of millimeters) but I guess it is. I believe this would explain why it runs for ~5 seconds: if the sensor does not detect the LED light, it thinks it has a card, but since the card may be stuck, it turns the motor off after a few seconds. I've seen this with bad wheels that can't pull the card through.

Steve

Halfnut dismantled (with images!)

*Message #1 Posted by **Vieira, Luiz C.(Brazil)** on 27 May 2003, 4:17 a.m.*

Hi, guys;

let's see how long will this provider keep my images...

Well, here it comes. This is a comparison between halfnut (left) and fullnut (right) PCB, front view. The small black holes in some of the fullnut PCB's holes (nine) indicate the difference between them, concerning to their respective cases. I have successfully used an HP41CV's halfnut PCB in an HP41C's fullnut case. I had to remove the small plastic "posts" where indicated by the black holes.

http://www.logeng.com.br/images/hn_fn_front_compare.jpg

This is a back view of the halfnut's PCB; that's what you see when opening the calculator. The red-and-black wires shown in the top of the image were added to connect external batteries; they do not actually exist in the calculator. Also, both electrolytic and tantalum capacitors were positioned that way so I could scan the image; actual position is shown in the small additional image.

http://www.logeng.com.br/images/hn_mainboard_back_view.jpg

This shows the halfnut LCD removed from the mainboard. If you look at previous picture, you'll see there are eight small metal strips around the LCD's hybrid chip (upper, part. # 5061-7255), four in the top (easily visible) and four right below the hybrid itself (not so easily visible, they are like dark mark in four round holes). It's necessary to slightly unfold them in order to remove the LCD. What you see below the LCD is the not-usually visible set of connectors from the hybrid 5061-7255.

http://www.logeng.com.br/images/hn_lcd_removed_detail.jpg

I decided to go further and removed the LCD driver from the mainboard in order to try to find sny problems, like short-circuited or open trails, cold soldering... but I found no trouble. This HP41CV's halfnut PCB returns .END. REG 63 after SIZE 000, calculator memory cleaned. It should return .END. REG 319. I rebuilt everything back and it is working fine for an HP41C!

http://www.logeng.com.br/images/hn_hybrid_removed.jpg http://www.logeng.com.br/images/hn_hybrid_b&f.jpg

These images show a sequence where a fullnut LCD is disassembled. The two small "lockers" (black flat fasteners) are made of plastic, and are easily removed. I must warn that it's necessary having careful hand and fingers movements; if you force too much, you may bend the metal bridges or even break their soldering tabs, permanently damaging the LCD assy. After inspecting aligned pads for both LCD's I got to the conclusion that fullnuts' and halfnuts' LCD's are not interchangeable; I mean the LCD itself, the glass parts, not the drivers. (sorry, Gordon)

http://www.logeng.com.br/images/fn_lcd_front.jpg http://www.logeng.com.br/images/fn_lcd_dis_01_s.jpg
http://www.logeng.com.br/images/fn_lcd_dis_02_s.jpg http://www.logeng.com.br/images/fn_lcd_dis_03_s.jpg
http://www.logeng.com.br/images/fn_lcd_back.jpg

As I'm having more information, I'm posting. I hope these images help others.

Feedback is always welcome.

Thanks and enjoy.

in response to message #1 by Vieira, Luiz C.(Brazil)

Impressive piece of disassembly!

Just a question, I have an HP41CX. What is in the PCB that sits above the CPU (at least I think it is the CPU). Are all the extra ROMs in there (time, xfun)?

Meindert

Re: Halfnut dismantled (with images!)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 8:38 a.m.,*
in response to message #2 by Meindert Kuipers

Hi, Meindert;

thaks for your supporting words.

I have both halfnut and fullnut 41CX and as far as I know (and read about), the extra halfnut-exclusive assembly contains TIME and X-Fucntions hardware only. The hybrid RAM/ROM & display driver is not the same for the CX too (ID #: 5061-7261), because CX ROM contents are different, as you know.

Unfortunately this is all I know.

In time: congrats for your amazing MLDL development.

Best regards.

Luiz C. Vieira - Brazil

Re: Halfnut dismantled (with images!)

*Message #4 Posted by **Meindert Kuipers** on 27 May 2003, 3:37 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I am asking this because my MLDL may be small enough to replace the bridge board (it would be bigger, but could fit inside). The only thing it could not (yet) emulate is the time module.

Meindert

Re: Halfnut dismantled (with images!)

*Message #5 Posted by **David Smith** on 27 May 2003, 2:27 p.m.,*
in response to message #2 by Meindert Kuipers

The bridge CPU board in the 41CX halfnuts is the clock circuitry. I think it also contains the clock ROM

functions so that if you transfer it onto a 41CV, you get the equivalent of the 41C Time Module, but I have never done this.

X-Functions in the HP41CX?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 3:08 p.m.,*
in response to message #5 by David Smith

Hi, David;

again, to keep me up-to-date about the internals and not to spread bad information around, where are the X-Functions stored in the HP41CX?

I remember I read once, I'm not sure if it was here, that the HP41CX halfnut had the extra ROM's for both Time and X-Functions in the bridge board, and that the CX-only functions for time and X-Fcn were recorded with basic CX-ROM, in the hybrid chip.

Is it an incorrect information? If so, I must update my own database.

I also found that the CX fullnut has some extra ROM chips, and I remember I saw an extra X-tal. I did not search for any specific clock chip, but I know it must exist.

Thank you again for calling my attetion to these facts.

*Message #7 Posted by **Tony Duell (UK)** on 27 May 2003, 5:12 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

In the fullnut, the timer chip is the 20 pin (I think) IC at the right of the PCB (looking at the component side). That's just the timer, the programs to drive it are in one of the ROM chips). In the halfnut, I beleive. the 'bridge board' hybrid contains the timer chip, the extended memory RAM, and 12K of ROM (page 3 and both page 5s) containing the extended functions, timer functions, and CX specific functions. However, the main 12K ROM (pages 0, 1, 2) in the display driver hybrid is different between CV and CX machines -- adding the bridge board to a CV will add the timer functions (and the time chip), but it will not recognise the extended functions.

hp 65 reader

*Message #1 Posted by **Greg** on 26 May 2003, 11:48 p.m.*

Does anybody can help me with connection diagram for HP65 card reader head. 4 of 5 wires on my card reader came loose. The colors of the 5 wires are: black, red, orange, yellow and blue. I can see three of the wires go to a 20 pin IC (pin 7, 8 and 9). Thanks, Greg

Disposable HP RPN

*Message #1 Posted by **Tom Cox** on 26 May 2003, 9:13 p.m.*

It would seem that the Chinese 3V 12C fits this category quite well. Mine Lasted just past the warranty and then.... flakey keyboard (press a key, it clicks, but no entry).But it is the least expensive currently marketed RPN calculator made by HP. I found the g {blue} front face keys to be essentially unreadable unless the lighting is just right.

For plain mathematical expressions not involving Trig functions it worked OK (for just over a year). It was also good for basic Statistics.

Would prefer to use an HP-32SII, but price on them has gone so high that an old unit in good condition (readable blue and yellow shift functions) is too valuable to use on a daily basis. Hard to believe they bring $300 or more.

Can't imagine the 12C (Chinese) having the life of HP-41C, many of which are still functional after 18 years.

How do we get the message to HP that people are willing to pay a premium price for a premium calculator? Or is the market for such devices so limited as to make this only a dream?

Wish that HP would sell an equivalent to the HP-32SII (the old version -- not the one with the green and magenta shift keys) they would get my money.

Re: Disposable HP RPN

*Message #2 Posted by **Patrick** on 26 May 2003, 9:44 p.m.,*
in response to message #1 by Tom Cox

It only takes a relatively small number of buyers to influence the price of items on eBay. That means that one cannot base a business case for a new, quality (RPN) calculator by pointing at auction prices. So, yes, I think you are right in saying that there is likely no (mass) market for quality devices.

Most people will recognize that you can buy a *series* of cheap items, each lasting perhaps only a few years, and not pay much different than one high quality device. With the rate of innovation in electronics, being able to get the latest and greatest every few years is generally an added benefit.

I would have to say, though, that there appears to have been a certain amount of reverse innovation in the calculator field. It is hard to find a machine with the capability (RPN, complex numbers, matrices, solver, numerical integration, full keystroke programming model) convenience (size, battery life) and support (great manual, advanced guide available) of a 1982 vintage 15C.

Will we see such a beast again? Given how many 15C's I've accumulated, I'd have to say my opinion is no, not in my lifetime.

If this not a statistical fluke, then this is really bad news for current HP calcs. In the business community, everything is a status symbol. Executives that wouldn't be caught dead with a disposable pen, use HP 12Cs both for their looks and functionality.

If HP starts producing cheap (quality) calculators, their users will simply abandon them for ever.

"How do we get the message to HP that people are willing to pay a premium price for a premium calculator?"

The price of a 12C is a premium price! They shouldn't fiddle with the quality too much if they want to keep justifying the high price. The painted key legends is one thing - as long as the colors are readable and the paint sticks reasonably well, they should get by. But if the keys don't respond when you press them, or (most aggravating without a backspace key!) if you get multiple key entries, then it ceases to be a premium calculator.

The Complete Voyager

*Message #1 Posted by **Patrick** on 26 May 2003, 6:03 p.m.*

The way Norm feels about the HP-34C is something like the way I feel about the Voyager series.

I'm happy to report that, with the receipt today of a quite well preserved HP-10C, I am now the proud owner of a complete working set! Woo hooo!!

Just thought I'd share this with you since my family kind of looks at me funny when I am stupid enough to start talking about these sorts of things (I'm sure many of you recognize this phenomenon).

I do apologize to the HP socialists here who have recently expressed the sentiment "One person, one HP calculator!". I'm definitely way out on a limb with regards to these folks... ;-)

Congratulations! Thats quite an achievement.

Re: The Complete Voyager Series

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2003, 9:48 p.m.,*
in response to message #1 by Patrick

Congrats, Patrick; you achieved a good rank by having at least one of each.

For the records: how many of each model you have? If you intend to collect, remember that there are at least 5 different HP12C, Platinum not counting: four different internals with a set of three batteries and the one with the single 3.3V battery. And there are two types of each HP11C, 15C and 16C. I am not sure if there are two types of the HP10C.

I do not collect models or types, I have calculators I can and like to use. I take technology as something I collected.

Best regards.

Re: The Complete Voyager Series

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 12:11 a.m.,*
in response to message #4 by Trent Moseley

Hi, trent;

the trick is in the batteries' connectors: the fastest way to identify the two basic Voyagers "guts".

If your Voyager has metal strips on each of the battery connectors, than it's one of the first types. These ones use the flex-circuit assembly with all chips and the LCD in one package and the keyboard has a separated hard PCB.

If you see a spring in one pole (+) and a small rigid tab in the other (-), then yours is a newer Voyager. There are at least three different HP12C layouts with these "single PCB", but I saw only one of these PCB's in the HP11C/15C/16C. I'm not sure about the HP10C because I have never opened any, but I had the chance to see and use one when I was at the university.

I have some scanned images and I'm yuploading them tonight, if I'm lucky enough finding my e-space active and working. I'll post later.

Hope this helps. If I miss anything, let me know.

Best regards.

Luiz C. Vieira - Brazil

Forgot to mention...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 12:36 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi;

I forgot to mention that the second type, the ones with a spring and a tab in the batteries' compartment, have one single PCB with all components built in.

The three HP12C with a single hard PCB had original HP-coded chips, one of them being the 1LQ09-0322, the other has 1RR2-0001 ID code and the third one I have not seen again (the earlier type). The one with single 3.3V button cell (Chinese) comes with an Agilent chip, ID 2AF1-0001.

There is more data about the HP11C, 15C and 16C, already posted here sometime ago. I'm collecting data (I like it a lot!) to try an article, later.

Best regards.

Hi Luiz

Looking forward to your article, when do you think it'll be ready?

Re: Forgot to mention...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 30 May 2003, 2:35 a.m.,*
in response to message #7 by james (UK)

Hello, James;

I'm just wating to see if I can get more information about the "chipset" used in both HP10C and earlier HP12C. As the HP12C is still in production, the first units are most likely to be thrown away or sent to HP "headquaters" for repair and eventual replacement. I do not like to mention it because of speculation, but I think first HP12C units are as rare as the HP10C, if not rarest.

As I have this information and put it together with my own, I'm setting images up and I'll prepare a text to be collectively handled. I think this is the best way.

Thank you for your ecouragement and support!

Luiz C. Vieira - Brazil

Re: The Complete Voyager Series

*Message #9 Posted by **Patrick** on 27 May 2003, 12:54 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

> For the records: how many of each model you have?

Well, Luiz, you ask a very loaded question. You see, I have been quite active in my collecting recently, especially in the area of Voyagers and (to a lesser degree) Woodstocks. This is my version of a mid-life crisis, I suppose.

I will say that I have at least two copies of each (well, except for the 10C, for which my second copy is still in transit). I have more 15C's though, because I am terribly enamoured with that particular model.

I'm sure, though, that I do not have all the varieties you've been mentioning. I read somewhere, probably here, that some of the early 11C's and 15C's had metal logos, later replaced by plastic ones. In the case of the 12C, I have a copy from the US, one from Brazil and one of the new ones from China (large single battery). I'm not all that interested in what kind of PCB is inside them. No doubt I will should the day come when they don't work anymore!

But then, you'll be here to answer my questions, wont you Luiz??! ;-)

Re: The Complete Voyager Series

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 3:30 a.m.,*
in response to message #9 by Patrick

Anytime, anywhere... be my guest!

I only hope I'm able to help, of course.

About particular external changes: I'm not aware of most of them, I am mostly concerned about their internals and operation. As an example, I have two HP42S: one of them is no longer working, and they are externally different: the earliest one has an LCD protective shield, while the newer one doesn't. Internally they look the same, but their SW version (O.S.) is different, upgraded.

When I realised that external changes may occur without internal subsequent changes (or the opposite), I decided to keep track of the internal ones; I like them most.

Success! And keep these babes in good hape, wilyah?

Re: The Complete Voyager

*Message #12 Posted by **db(martinez,california)** on 27 May 2003, 1:43 a.m.,*
in response to message #1 by Patrick

i am no doubt one of the calculator socialists.

i applaud your recient completion of the voyager series collection. lucky dog. i am not far behind though. what i have refered to in derision is some peoples indescriminate buying of multiples of everything in sight because they can.

i have a few duplicates. i just sold one. i will sell the rest too, but i'll keep my three 41's. i use a 41 daily and would not sleep right if i just had one. several good members of this community have duplicates. they use them to earn a living. others like mike they buy-fix-improve-combine and then resell them as a hobby. they share their repair methods with the rest of us and wouldn't know jack to teach us if they didn't have to fix the wrecks.

socialisim is forced on a population. electing to make yourself a member of a community is a personal decision. i believe that this forum functions as a community.

the following is only my opinion: i do not think that buying a lot of calculators that one found out about here at $100 and selling them for $250 here to the same people who would have bought them at $100 if they were quicker is being a member of the community. i don't think that having the deepst pockets on ebay is bad. i do think that buying the same thing again and again just to have the biggest stack of hp-XX's around is pointless. and since a bunch of people wanted them; i think that redundant buying on the scale of a couple of the jerks on ebay is just being a pig. it also drives up the already insane prices.

ebay doesn't affect me too much. i bought my work units from ol' jim carter and richard nelson at educalc. i have found most of my treasures at the flea market and most of the rest from fellow surveyors and people i

know. what i am saying is that if i had a garrage full of hp calcs all that would do is make a lot fewer people to have something to post about here. it wouldn't do anything FOR me, or this community.

ok, enough phylosophy. lets get back to business.

don't the new hp's suck?

in response to message #12 by db(martinez,california)

Although I was just kidding when proposing the HP socialits party, you perfectly brought it on the point. Thanks!

Re: The Complete Voyager

*Message #14 Posted by **james (UK)** on 29 May 2003, 5:28 p.m.,*
in response to message #13 by Juergen (CH)

Hi guys

I take the true socialist view, everyone else should have one but I can have many (everyone is equal but some are more equal than others!)

I've only recently upgraded to an HP having used a Casio for years (doing very basic calcs) until the battery went. Of course the sensible option was to spend £1 or so on new batteries so I can considered that for at least a second then decided it was a good opportunity to get a new calculator.

When I was at school in the 70s and calculators were just becoming readily available HPs had an awesome reputation (the Rolls-Royce or Cadillac - I'm bilingual! - of calculators) but were way out of my reach. I eventually progressed to a TI-58 at University (don't mock too much - at least it has red leds) and then on to Casios at work because they were cheap.

Having now decided to get a new calculator I thought I would look at HP's current offerings but was disappointed - the move away from RPN, the loss of that unique HP look - cover the logo of the current machines and they could be any brand - the only potential buy being the 12C.

Fortunately I came across this site and started having a look at ebay - although some of the prices are steep, some aren't too bad and it does at least provide a ready source for people outside the States.

I don't see many HPs in junkshops, etc over here - it's possibly a sad reflection of the status of engineers in the UK as the great British engineers of the past came from artisan stock in the working classes so engineers have never had a high status here whereas in Europe they tended to come more from the middle/upper classes and have a higher status - witness the use of Ing as a title in Germany - it is interesting to note that on ebay excluding the USA the majority of HP-41s come from Germany! Probably explains a lot about the state of UK industry!!

Anyway, I got a lovely 41CV just over a month ago and am currently working my way through some of the manuals on the Museum CD - I picked up an X-Functions module recently so am presently working my way through Keith Jarett's X-Funct book.

Of course, paranoia set in when I started reading posts about problems people have with their 41s so of course a back-up one had to be purchased! Didn't hurt that the back-up one had a PPC rom stuffed in the back! Boy, are the office going to be pleased when I print out 500pages of manual from the CD!!

I also like the looks of the Voyager and a UK seller on ebay had a 12 on offer so that has been added to the fleet pending me finding (or saving up for!) a 15.

Of course, I also would like a red led model and am looking out for a 67 or 34C.

Anyway enough insanity from me and well done to anyone who has read this far!

Beware !

*Message #15 Posted by **Randy Sloyer** on 29 May 2003, 11:25 p.m.,*
in response to message #14 by james (UK)

James,

I can tell from your post that the infection has taken hold in your system. Beware.

Treatment for this malady may still be effective if undertaken quickly.

I must admit that I am a bad (or, in your words, a true) socialist and yes, this malady is very dangerous and, in my wife's opinion, is immedicable...

Re: The Complete Voyager

*Message #18 Posted by **Valentin Albillo** on 27 May 2003, 9:17 a.m.,*
in response to message #1 by Patrick

Congratulations indeed !

I completed my Voyager quintet a long time ago, matter of fact I'm now completing my third set, and very proud of them all. As you may have noticed, I also share your enthusiasm for the HP-15C, which IMHO is the best, most advanced, pure *calculator* ever.

Notice I say "calculator" and not "computing system", "advanced graphing calculator", "pocket computer" or whatever. In its class, the HP-15C is unparalleled, every detail, every feature, has been the subject of very careful thought and consideration by the very best calculator designers in the world. Everything in this *advanced calculator* is superb, from its physical characteristics to its documentation. There's never been anything like it, nor will it ever be again, that is unless Star Trek-like 'replicators' make an early appearance in this century. :-)

By the way, Patrick, I'd like you to have a look at some interesting related materials, would you please consider letting me know some suitable means of forwarding them to you.

Best regards.

I think the same about the 15C (no text)

in response to message #18 by Valentin Albillo

I wish, I wish, for HP 15C Platinum^2 "what ^2 ?", you may ask. Well four times more memory and speed than even the HP 12C Platinum, that is 16* (memory,speed). Never mind the batteries will not last!! I want speeeed! (and large matrices + more memory) The same with the 16C and I would buy both in a hearth beat.

The Complete Voyager - another issue?

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 12:28 p.m.,*
in response to message #20 by Veli-Pekka Nousiainen

Hi;

Not exactly the same issue, but I'd prefer an HP42S+ (32KRAM) with I/O capabilities. I know many of you do not like it so much, but the HP42S is already a lot faster than the HP15C, holds a lot more information, ALPHA messages, despite being hard to "type" in, are handy, and I think its Matrix Editor is better input interface than the HP15C's stack entering (my thoughts).

I have two HP15C and two HP16C and I like them a lot. But when I need to work with matrices and I do not know how much "space" will I need, I prefer to make room and use as many matrices names as I want to than to "squeeze" data in five labels and 64 registers tops. If it is a simple four complex variables' linear system solution, like in power lines, I grab the HP15C User's Manual and follow that recipe to solve it. For fun.

Just my thoughts.

Luiz C. Vieira - Brazil

Matrix Reloaded

*Message #1 Posted by **Valentin Albillo** on 26 May 2003, 7:43 a.m.*

Hi to all of you, specially to HP-15C lovers:

Here's a little HP-15C Quiz/Challenge which doesn't just try to be merely enjoyable but useful as well. Though it is proposed and particularized for the venerable HP-15C, the intended solution will be equally applicable to all other HP calculators with matrix capabilities, i.e.: HP42S, HP-71B+Math ROM, and HP-41C+Advantage ROM, among others.

The Quiz/Challenge

Suppose we're dealing with an HP-15C's application that requires a number of matrices holding id codes of some sort, represented as 10-digit integer values from -1E9 to +1E9, say.

The challenge is to write a *general purpose* subroutine which takes two matrix descriptors placed in the X,Y stack registers and must then swap the values of their corresponding matrix elements, subject to these requirements:

1) It must work with *any two distinct arbitrary matrices* placed in X,Y, (i.e: A,B,C,D, or E), of the same, arbitrary dimensions up to a *minimum of 30 elements per matrix*. The routine must not assume any two particular matrices nor any specific dimensions.

2) It must be as short and fast as possible, and use as few registers and resources as possible, preferably just the stack.

For example, if you have C = (3, 1, 4) and D = (2, 7, 1), the code segment:

```
RCL MATRIX C
RCL MATRIX D
GOSUB A
```

(where LBL A, ..., RTN is your subroutine) should result in matrix C and matrix D holding now (2, 7, 1) and (3,1,4), respectively.

Try your hand at it. For the record, my best solution to date is an 11-step routine (not including LBL & RTN), which swaps two 5x5 matrices in 3.7 seconds, and uses no register at all, not even the index registers R0, R1 and RI, just the stack. Let's see yours :-)

Here is my solution

*Message #2 Posted by **Patrick** on 26 May 2003, 2:40 p.m.,*
in response to message #1 by Valentin Albillo

Valentin

Great problem! Anything to keep interest in my beloved HP-15C is very welcome.

Below is my solution. I haven't timed it yet, so I don't know if it is faster or slower than yours, however it is

shorter. Not including LBL/RTN it is 8 steps. Like yours, it uses just the stack, no other resources. It even preserves the Z and T registers!

I never would have thought about this solution had you not mentioned how short was the one you had!

Anyhow, here it is for your consideration ...

```
LBL E
GSB .5
GSB .5
LBL .5
STO RESULT
x<>y
CHS
+
LAST x
RTN
```

Some words of explanation... I chose "E" for "Exchange". I also have the convention to use the dot labels for private routines inside programs and to use the non-dot labels for routines I expect to call from the keyboard. I use 5 because it is private to routine E, the 5th lettered subroutine.

I will post a follow-up where I explain the workings of the routine and post timings.

Thanks again, Valentin... I much enjoyed that!

BTW... I do notice the beginnings of the values pi and e in your example... you should have used your 15C's RAN# function!

Re: Here is my solution

*Message #3 Posted by **Patrick** on 26 May 2003, 5:08 p.m.,*
in response to message #2 by Patrick

Well, it turns out that this solution is considerably slower than yours. For two 5x5 matrices, it takes a little over 6 seconds to execute, compared with your 3.7 seconds. Not having seen your solution yet, I won't hypothesize on the reasons.

True numerical analysts in the audience will also notice that this is truly not a correct solution. It depends on the fact that b = (a + b) - a, which is not always true on a calculator if a and b differ wildly in magnitude (e.g., a=1.0e10, b=1.0e-10).

As to the workings of the algorithm, it is clearly seen that the purpose of LBL E is to simply execute the subroutine LBL .5 exactly three times. Each time you execute this subroutine, the values in the matrices (say, X= matrix A and Y = matrix B) get changed as follows:

```
A <-- A-B
B <-- -B
```

Also, at the end of the routine, the stack is changed so that the descriptors are flipped: X = matrix B, Y = matrix A.

If you do this operation exactly three times, keeping in mind this role reversal of A and B each time, you will see that the contents of A and B are interchanged, thus:

```
A  --> A-B --> B-A --> B
B  --> -B  --> -A  --> A
```

QED.

Re: Here is my solution

*Message #4 Posted by **Valentin Albillo** on 28 May 2003, 4:36 a.m.,*
in response to message #3 by Patrick

Hi Patrick,

Thank you for your input to my Quiz/Challenge, I agree with your remark about raising interest in the HP-15C, it's a real pity this *ubercalculator* has become so unaffordable, resulting in fewer HP calc fans finding it possible to get hold of one ...

Your solution is truly excellent, I don't think a shorter one is possible though my solution, while less elegant, is faster:

```
LBL A
STO RESULT
X<>Y
 +
RCL RESULT
LAST X
STO RESULT
 -
X<>Y
STO RESULT
X<>Y
 -
RTN
```

That's 11 steps (not including LBL/RTN), and swaps two 5x5 matrices in 3.7 seconds in my HP-15C (by the way, yours takes 5.7 seconds in my machine). Why is it faster ? Several reasons:

- my solution has *no branching at all*, it runs straight, thus avoiding the overhead of having to execute two GOSUB, three LBL, and three RTN, as your does. The instruction count reveals that your routine executes *24 instructions* in all, while mine executes only 13. Also, all my instructions are 1 byte each, while your GSB .5 and LBL .5 are *2-bytes each* (the manual's wrong !), so the executed byte count actually comes out as *29 vs. 13*. This accounts for an extra 0.8 seconds. Simply by changing your LBL .5 and GSB .5 to LBL 5 and GSB 5 you would save 3 bytes of program storage (23%), and 5 bytes of execution time.

- my solution performs the swap like this, in HP-71 BASIC code:

  ```
  MAT X = X + Y
  MAT Y = X - Y
  MAT X = X - Y
  ```

  so it's doing two subtractions and one addition, for a total of 75 arithmetic operations in the case of 5x5 matrices. On the other hand yours performs three additions, which amount to 75 arithmetic operations as well, *but also three CHS*, which means changing the sign of said 75 elements. This accounts for the remaining 1.2 additional seconds.

By the way, both your solution and mine are *truly correct* solutions under the quiz conditions, which specified that the matrices would hold *integer* values from -1E9 to +1E9. For those values, B=(A+B)-A holds on an HP-15C.

For arbitrary values, the smaller ones could be rounded or lose accuracy if very different scales are involved. Depending on the application, this could be a *desirable* side effect (!), converting a matrix with very small elements (perhaps some increment in a Newton method applied to matrix equations) in a zero matrix, thus nicely fulfilling the criteria to end the iterations !

However, both your solution and mine have a *weakness* which is easily cured: though they meet the quiz requirements ("two *distinct* matrices"), the fact is that if both matrices X, Y are one and the same, then the matrix will be *zeroed* ! The remedy is to insert these two steps right after the routine's label:

```
TEST 5
RTN
```

this compares both matrix descriptors for equality, and if they happen to be the same, the routine returns immediately, thus leaving the matrix elements *unchanged*, as it should.

A final remark: HP-71/42S/41C owners, take note. The fastest, best way to exchange two matrices is by making use of an auxiliary matrix T, like this:

```
MAT T = X
MAT X = Y
MAT Y = T
```

but if the matrices are so large that there isn't enough RAM to allocate T, the technique above:

```
MAT X = X + Y
MAT Y = X - Y
MAT X = X - Y
```

can save the day if rounding is not an issue. This also works for the HP42S and HP-41C + Advantage ROM. The technique can be also applied to arbitrary objects as long as they allow addition and subtraction.

Best regards.

Re: Here is my solution

*Message #5 Posted by **Patrick** on 28 May 2003, 2:38 p.m.,*
in response to message #4 by Valentin Albillo

Perfect solution, Valentin. The extra few bytes of length over mine are well, well worth it from a pragmatic point of view.

Your comment about the technique applying to other machines and other types of objects which allow arithmetic, keyed a memory for me from my assembler class so many years ago. A standard technique for swapping the values in two CPU registers without using any other memory is to use the "exclusive or" operator three times:

```
XOR A,B
XOR B,A
XOR A,B
```

Assuming XOR does an "exclusive or" of the two named registers and puts the result in the first register, the effect of these three (very quick) machine instructions is to exactly swap the contents of registers A and B, without using a temporary register.

The neat thing about this litte routine is that, to prove it to yourself that it works, you need only consider the simple case of one bit registers. If it works for the four possible combinations in that case, it must work on arbitrary sized registers since the XOR operation is performed bitwise.

Not every having owned a 42S (but still trying!), I don't know if XOR is an operation you can perform on matrices? I doubt it, but if so, this would likely lead to a faster and shorter routine.

Matrices in the HP42S

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2003, 9:58 p.m.,*
in response to message #5 by Patrick

Matrices in the HP42S

Hi Valentin, Patrick, guys;

Compared to the HP15C, matrices are treated differently in the HP42S. You may have two nameless matrices in both X- and Y-registers, i.e., there's no need for a "descriptor" as it happens in the HP15C. In the HP42S, you may have as many matrices as memory can hold, each with your particular choice as a name, and other four other matrices (five, with LASTx) stored in stack registers. It's about the same that happens in the HP48/49: In both systems, matrices stored in the stack have no name.

Based on these facts, swapping all elements from one matrix to another is useful only in the HP15C, that has a predefined set of five "names". I take both solutions as too clever, I could not even start thinking of how to do it. I didn't thought about using RESULT, I tried multiplying by neutral elements but did not succeed anyway. As I saw I could not provide a thoughtful answer, I decided to watch only. I'd like having a good idea to show, but I did not.

I also thought that a particular need to swap elements from one matrix to another in the HP15C was to preserve RESULT setting, but both solutions change RESULT contents.

My congrats to both of you.

Luiz C. Vieira - Brazil

Losing RESULTs

*Message #7 Posted by **Patrick** on 28 May 2003, 11:17 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Both programs leave at least one stack register unmolested. This means that it is possible to preserve RESULT if necessary. One need only RCL RESULT near the beginning of the routine and STO RESULT at the end, sandwiched between whatever Roll-Up or Roll-Down commands are necessary to manipulate the stack correctly.

On the other hand, I don't know if preserving RESULT is worth it. It seems to me that the user should expect RESULT to be lost in any non-trivial matrix subroutine call. It is like the LAST X of matrix operations.

I would be more inclined to document the fact that RESULT is lost, but that (in the case of Valentin's routine, for example) the original Z register is preserved in Y, Z, and T. The user can then choose whether or not to do the RCL RESULT / STO RESULT gymnastics surrounding the call to the matrix exchange subroutine.

A few RESULT comments

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 29 May 2003, 1:57 a.m.,*
in response to message #7 by Patrick

Hi Patrick, folks;

I do not intend to focus a small grain over the whole shore, but I think that if you do not use RESULT correctly, some operations may not occur.

You wrote:

It seems to me that the user should expect RESULT to be lost in any non-trivial matrix subroutine call. It is like the LAST X of matrix operations.

Once, when using the HP15C for the first times, I tried a matrix operation and got successive Error 10 messages. I tried hard to find what was going on and did not get it. After a Pr Error forced condition ([ON]/[-]) it got back to normal, meaning that the exact sequence I tried before could find space to be accomplished. Right after that I saw that I was missing something because RESULT was not properly set. I realized that in my previous unsuccessful matrix operation I did not set RESULT too. And that might be the problem: I was using almost all available registers, and remaining memory was not enough to create a new matrix to hold the resulting one. If I had simply set RESULT as one of the matrices I was working on, I'd have no problem at all.

I take much care about REULT in the HP15C because of this: is not set properly you may generate an error, have no space to accomplish the task or need to search for the result in another matrix. I'm mentioning this all because, as you wrote preiously, RESULT settings for me are not exactly LASTx, instead it's a ***floating*** *X-register matrix setting* because it sets where will the result be placed, and it's a different concept of LASTx, I think.

For me, the hP15C is the best stand-alone calculator ever, and these particularities tease me even more, so I have to read again and again and test new key sequences. As if I did not like this...

Best regards.

Luiz C. Vieira - Brazil

Re: A few RESULT comments

Message #9 Posted by ***Patrick*** *on 29 May 2003, 4:23 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Yes, you are right, Luiz, when you say RESULT plays the role for matrices what a floating X register would do for numbers.

My assertion was about the persistence vs. transience of RESULT. What I mean by this is that, when I call a typical numeric subroutine I do not expect that LAST X will be preserved when the subroutine returns. The value stored there is quite transient. It needs to be in order to play the role that is intended for it. Likewise, I believe the RESULT setting should be viewed in the same manner when calling a matrix based subroutine. In order to do anything non-trivial with matrices, the subroutine programmer will very likely have to set RESULT to something of his/her choosing. When the subroutine returns, I should *expect* that the previous value of RESULT is lost.

Regards, Patrick

O.T.: grammar!

*Message #13 Posted by **Ernie Malaga** on 29 May 2003, 3:49 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Luiz:

Not that you've written it yourself, but I want to mention several very common mistakes:

1. "It's" instead of "its."

2. "I could care less" instead of "I could not [or couldn't] care less."

3. "Alright" instead of "all right."

4. "There" instead of "their."

5. "Too" instead of "to" (and vice-versa).

...and everybody's nemesis...

6. "Who" instead of "whom" (and vice-versa).

Generally it's not the writer's fault, but the language's. English has to be _the_ Western language that is most difficult to learn. Spelling and pronunciation alone are already

chaotic. Add to this a grammar full of exceptions (and exceptions of exceptions), and it's not surprising that we all make mistakes when using the language.

Like you, Luiz, I wasn't born in an English-speaking society. My native Peru speaks Spanish, and it's been an uphill battle to learn this #@*$!! language. (Sorry about my "French.")

I'm still trying to find an exception-free to help me determine when it's "I" and when it's "me" in sentences such as "you and me" (or "you and I"). Sometimes it gets so confusing that I wish we all spoke Esperanto. At least then there would be no irregularities to worry about!

-Ernie

*Message #14 Posted by **Patrick** on 29 May 2003, 4:18 p.m.,*
in response to message #13 by Ernie Malaga

You didn't mention "your" and "you're"... one of my perennial favourites.

I am a native English speaker but not a school teacher. That said, I believe the rule regarding "I" vs. "me" is relatively simple: you should use whatever you would use if there was not another person being mentioned in the sentence.

For example, you wouldn't say "Me went to the store" so you also don't say "Fred and me went to the store."

Even if there are exceptions to this rule (and I actually doubt it), I'm pretty sure no one would complain about this language style in everyday use.

Re: O.T.: grammar!

*Message #15 Posted by **Dave Shaffer** on 29 May 2003, 5:04 p.m.,*
in response to message #13 by Ernie Malaga

Ernie,

re: "I'm still trying to find an exception-free to help me determine when it's "I" and when it's "me" in sentences such as "you and me" (or "you and I"). Sometimes it gets so confusing that I wish we all spoke Esperanto. At least then there would be no irregularities to worry about!"

The absolutely infallible rule is the "I" is subjective (i.e. the subject of a sentence) and "me" is objective (i.e. the object of a sentence or preposition).

Therefore, you use "I" for the subject of a sentence (as decribed by Patrick: Fred and I went to the store - or You and I went to the store.) whether there is one or more than one subject.

Almost everywhere else, you should use "me." As in, "They gave it to me" (again, whether there are one or more than one object - They gave a dinner for Fred and you and me).

The screw up results when what at first glance looks like it is an object should be

subjective. This occurs mostly as a pronoun after the verb "to be." Proper: It is I. Improper: It is me. However, this latter form is VERY common in everyday English usage. Therefore, most English teachers try to stamp it out by correcting at every chance possible - from "It is me" to "It is I." I think the net effect is on those who don't think about it carefully, and who are then scared into thinking that they can never use "I"!!!!

For what it is worth, "who" and whom" are in EXACTLY the same category. "Who" is the subjective form and "whom" is the objective form. If you remember that, you can never go wrong.

All that said, your English is way better than my attempts at foreign language (after five years of French and one of German)!

Re: O.T.: grammar!

*Message #16 Posted by **Ernie Malaga** on 30 May 2003, 3:16 a.m.,*

Re: O.T.: grammar!

*Message #17 Posted by **James M. Prange** on 1 June 2003, 4:15 a.m.,*
in response to message #15 by Dave Shaffer

I agree that "I", "he", and "she" are nominative (or subjective, if you prefer) case, and "me", "him" and "her" are objective case. Any grammarian will tell you that this holds true even for compound subjects or objects.

Personally, I use the rather simple rule of using the word that would "sound right" if I were to substitute a non-compound subject or object. At least, I think that I use this rule; it may be that I sometimes get it wrong when I don't have time to analyse which would be correct, as in casual speaking.

On the other hand, in actual English, in compound subjects, "me", "him", or "her" is very commonly used, probably even more commonly than the "grammatically correct" "I", "he", or "she", and this has apparently been the case for centuries.

Of course, English teachers try to drum the rule into our heads, insisting that we say "He and I...." rather than "Me and him....", but it's as if many people can't seem to learn to use the "correct" nominative case in compound subjects without going too far and using it incorrectly in compound objects. The result is that it's not uncommon to hear (or read) "I", "he", or "she" in compound objects, which

grates on my ears.

Could it be that there's an unwritten rule in English that the objective case is used in compound subjects, and that the grammarians have simply never acknowledged this rule? Should grammatical rules describe the actual language, as complicated as it is, or should they be relatively simple, straightforward, easy to write rules that make sense to the people who make the effort to write them down for the rest of us?

That said, sometimes an entire clause that contains its own subject is the object of a sentence; similarly, sometimes an entire clause that contains its own object is the subject of a sentence. These situations can be a bit tricky, and often the wrong case is used in spoken English and casual (and sometimes even formal) writing.

Regards,
James

I think this happens when people are trying hard to speak correctly and the one rule pops into their heads at the wrong moment!

HP 12C Keys don't work

*Message #1 Posted by **Stan (Sg)** on 26 May 2003, 7:26 a.m.*

I have a Malaysian built HP 12C (1999 model if I am decoding the serial number correctly). The R/S and SST keys (and sometimes the R down key) don't work intermittently (these are all in a row – keys 31, 32 and 33 per the program numbering). If I press the key many times, I can usually get it to work. I have tried removing the batteries for about 15 minutes and it didn't help. The self test comes out fine. The keyboard self test works until I get to those keys, then gives "Error 9" when I get to X<>Y, which indicates that the keys in question are not "talking" to the CPU.

My understanding is that the step of shorting a wire across the batteries is meant for the case where the unit will not respond to any key input. The unit is still under warranty for another couple of months. Should I try anything else before returning the unit? Any thoughts are appreciated.

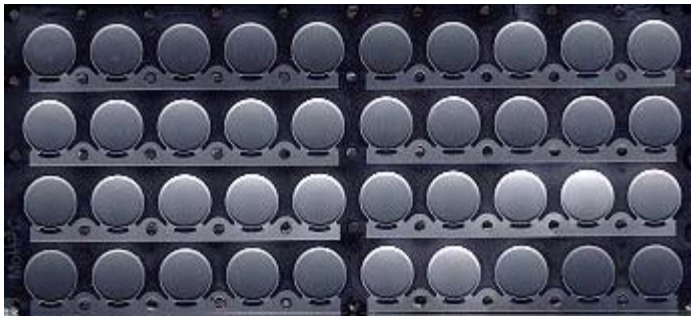
Re: HP 12C Keys don't work

*Message #2 Posted by **Randy Sloyer** on 26 May 2003, 9:25 a.m.,*
in response to message #1 by Stan (Sg)

The battery gymnastics will not solve your problem. Nor will taking the batteries out for 24 hours as HP support recommends to "bleed off static charge". Nonsense stuff.

It's a bad keyboard, plain and simple. The Chinese units would be more likely to have this defect, but it certainly is possible in a 1999 unit.

The row of five keys R/S thru CLX should have the same problem. The keyboard is made up of eight strips of five keys each. If the strip looses contact with the keyboard scanner through the one connection point, the whole row of five will be dead. You might see intermittent behavior when pressing the R/S key, as the common connection is near that key and the force of the key actuation could help make the common connection. Here is Dave's picture of the strips in a 15C keyboard, the same as your 12C:



Get a new one while you can.

That method of repair is only meant to be used on certain flavors of LCD calculators.

If you used that method of repair on a 34C,it would be a grave error, also, it would not fix it.

Re: HP 12C Keys don't work

*Message #7 Posted by **Renato** on 26 May 2003, 5:30 p.m.,*
in response to message #1 by Stan (Sg)

Stan,

I once got this type of problem on a Malaysian 12C. It was on the entire row that contains 7,8,9 (and others) keys. The cause was a bad solder on the single-chip - the pin was connected to all keys. I just checked continuity on the circuit board and checked keys - all ok. Then i pressed the corresponding chip pin, and presto - it started working reliably. I resoldered the pin, and the keys are working ok, although self testing them fails sometimes.

I have also seem a 12c keyboard with corrosion on the metal domes, but have not tried fixing such a problem.

Hope this helps,

Renato

*Message #8 Posted by **Ellis Easley** on 26 May 2003, 7:52 p.m.,*
in response to message #7 by Renato

It would be great if a fairly easy repair will fix it. It's tempting to say get it replaced by HP while you can, but the replacement will probably be a 3V Chinese unit. Maybe you should open it up, being extra careful with the feet, and see if there is a problem like Renato saw. Then if you can't fix it, close it back up and get HP to replace it

Re: HP 12C Keys don't work

*Message #9 Posted by **Stan (Sg)** on 27 May 2003, 8:19 a.m.,*
in response to message #8 by Ellis Easley

Thanks for all of the comments. I am surprised that the Malaysian and Chinese models would be different enough to justify opening this one up and possibly voiding the warranty, but I have never used a Chinese model. The keys on this model do feel pretty good. I will consider your suggestion.

This development is especially disappointing when you consider how much abuse my HP15C (circa 1986) took over many years and still works fine. In fact, I have been using it some since my 12C developed a problem. When I got out my 15c I was surprised how many scratches / etc... that it has - but it still works great.

HP 12C Keys don't work - Help please!

*Message #10 Posted by **james (UK)** on 28 May 2003, 8:18 a.m.,*
in response to message #1 by Stan (Sg)

The plague seems to be spreading - I have got a Malaysian 12C (serial MY93908021) in which the top 5 right hand buttons (CHS, 7,8,9 and division) do not work. From Renato's reply and the picture of the 15C keyboard a broken connection somewhere would seem to be the cause. As the calculator was cheap I am considering trying to see if I can fix it as training for the day to come when I might need to poke around in my fullnut 41CV.

From what Ellis said I'm guessing that like the 41 the casings are held together by screws which are hidden by the rubber feet. Is this correct?

Can anyone point me to pictures of what the innards will look like and the best way of tracking down the duff connection?

Any suggestions gratefully received. As it's rather a long trip to the railroad tracks I would like to try some other methods first.

Help is on the way

*Message #11 Posted by **Randy Sloyer** on 28 May 2003, 9:26 a.m.,*
in response to message #10 by james (UK)

Peel the feet, back out the screws and it's open. Pop the back off and before turning it over, locate the two very small springs that protrude from the front inside small tubes and remove them. They are part of the ESD protection and electrically connect the front and rear metal plates.

Once open, you should be able to figure out where the 5 key strip makes its common connection and trace it. Sometimes on older units, the heat fused tops of the posts that hold the keystrips in contact break off. If you can find the post in question, you can clamp it and glue with gap filling cyanoacrylate.

Sometimes the solder connection fails on the keyboard encoder chip if one sits on their calculator too often. That should cause the loss of 2 strips of 4 keys vertically as they are commoned at the encoder.

Yes, under the feet there are four screws that hold the case together. I assume it will be the single PCB version inside, which means you can see the IC's (maybe just one in a 12C?) above the keyboard area (behind the LCD). From what Renato said, you might expect to find a pin on one of the IC's not properly soldered to the PBC. A tool like a dental probe is good for looking for such a loose pin. A large sewing needle might be a good substitute. Gently press the tip of the probe against the edge of each pin, one at a time, just above the pad where it is soldered to the PCB - in other words, push the pin toward an adjacent pin. If you do this to a loose pin it will give a little. A properly soldered pin will feel quite solid (it will bend if you push it too hard, but don't).

Since you are touching each IC pin with a metal object, it is very important that there is no electrostatic charge on your body. Don't try to do this at all on a cold, dry day. Wait for a humid day. Run some hot water in the shower to raise the humidity (stop working if your glasses fog up!) Breathing on the work will raise the local humidity. Don't slide around on a chair seat. If you hold the calculator in one hand and probe it with the other hand, rather than lay the calculator on a table, there will be less chance of an electrostatic discharge since both your hands are at the same potential. Holding the calculator down on the table with one hand is good because the calculator will be at the potential of your body. If you are working and want to go and do something else, first touch the table top with the hand that is not holding the calculator, then lay the calculator on the table top, then take both hands away from the calculator, then stand up. When you come back to work, first sit down, then touch the table top with both hands, then pick up the calculator. These little habits will make it possible for you to stop worrying about static. Faith is essential!

If you look up an article in the Articles Forum about upgrading a 42S to 32K RAM, I think you will find a good explanation of how to solder pins on a surface mount IC without shorting them together.

I haven't heard of Malaysian HP calculators before - just US, Singapore, Indonesia, Brazil and China. Were other models made there? I guess since the 12C has been in production for so long, it has probably been made in the most factories.

Surgery postponed

*Message #17 Posted by **james (UK)** on 28 May 2003, 6:53 p.m.,*
in response to message #10 by james (UK)

Firstly, many thanks to Randy and Ellis for their advice, much appreciated.

Got held up at work tonight, we're doing a presentation tomorrow and had to do a rehersal tonight so surgery has been postponed until the weekend.

I'll report back on the patient once the op is done.

Once again, many thanks.

Surgery successful - patient recovered

*Message #18 Posted by **james (UK)** on 29 May 2003, 3:55 p.m.,*
in response to message #10 by james (UK)

Hi guys

Just finished open heart surgery on the 12C - many thanks for your assistance. When I opened her up all the joints looked fine, even under high magnification, but after setting up a bench in a steam filled bathroom and prodding the appropriate pin connection with a probe it was obvious the solder had not taken. However, a few tense moments with the iron and connection was re-established. The main self test and the keyboard test were fine and the patient is now happily sitting up in bed crunching negative numbers with 7s, 8s and 9s in them. As far as I can tell all functions seem to be working - difficult to tell with the financial stuff though but a NPV problem gave the same result as that from the Real Estate pac in my 41CV so must be right!

One thing that surprised me was what seems to be a solder bridge between pins 3 and 4 on the bottom left hand side of the chip - I did wonder if this was the fault but figured it must be intentional as if it was a fault presumably a lot more than just the top 5 right hand keys would have been affected. It also looked like the bridge was there on the photo Randy posted so I left it alone.

Once again, many thanks Randy and Ellis - couldn't have done it without you.

Viewpoint about RED LED calcs and batteries ...

*Message #1 Posted by **Norm** on 26 May 2003, 4:18 a.m.*

Here comes a grand idea... and an opportunity for debate :o)

In the past, some debate has been had, about whether RED LED calculators are worth the hassle of keeping them charged up. Also, whether RED LED's are better (bright-sunlight users say 'no', office-cubicle people say 'yes').

But the big thing is, RED LED's draw more power, and the charger had to be used to frequently top-off the NiCad batteries. Some would say that's a reason to call them impractical, or inferior to LCD, or say 'you can't get away from a 120V wall socket'.

BUT..... it just depends on your batteries. In the context of spice-model calculators (HP-34C) I would suggest that somebody who acquires one should just stuff in "AA" Alkaline batteries, and set the plug-in charger aside. That's what I did with my 34C I acquired.... and I haven't had to mess with any batteries since.

I'm saying, dont bother charging them, its a hassle. Just plug-in non-rechargeables, and replace them once in a blue moon when they need replacement (wont be that often).

Now then, to the idea of the day..... why not just stuff in AA PHOTO-LITHIUM batteries ?!? When my AA Alkalines finally quit, someday, maybe a year from now, I'd tend towards the AA Photo-Lithium. Sure, we're talking about some ungodly sum of money, maybe $8 a pair, BUT, then you're done, man. Its like an Atomic Submarine..... it will just keep going and going 'cuz the nuclear reactor wont quit.

And if this takes care of power concerns with the RED LED's, so you can just kick back and enjoy the ride, well, isn't the price of AA Lithium batteries worth the peace-of-mind. I don't use my 34C all that often. I still do the majority of calculating on my fleet of 'throwaway' HP-32S. The cats walk on them, and they get house dust ground into them, etc. I bring out the 34C kind of like bringing out a bottle of fine wine.... finest aged RED wine. At that rate of usage, a set of Photo-Lithiums will probably last 4 to 8 years. So why are we all so frightful about the power consumption issues of classy Red LED calculators ?? (none finer than HP-34C).

*Message #3 Posted by **Ernie Malaga** on 26 May 2003, 7:25 a.m.,*
in response to message #1 by Norm

Norm:

If you like LEDs so much, go for it, man. Knock yourself out. Me, I truly don't care for LEDs because (to my eyes) the slightest moonbeam is enough to diminish their effectiveness, and I do need light to see what buttons I'm pressing. That is the _only_ reason I advocate in favor of LCDs. Other than that, the choice is irrelevant except for matters of taste.

I have an alarm clock with gigantic LED numbers. At first I had no problem using it, day or night. After several years of continuous operation, however, I can hardly see the stupid thing by day. Could this mean that LEDs wear out, becoming dimmer and dimmer?

-Ernie

May I borrow these, Ernie?

Ernie wrote:

> and I do need light to see what buttons I'm pressing. That is the _only_ reason I advocate in favor of LCDs.

I second him in these words and I'll post a few of mine again.

I like *Continuous Memory* and amongst HP LED-based continuous memory calculators, the best one for me is the HP34C. Well, I think it's the LED-display with the best set of features, right? I'm not counting the off-road HP95C, of course.

I don't like the idea of having to recharge batteries for ten to twelve hours so I'll be able to use the calculator for three to four hours. I know, you are talking about disposable cells; I prefer rechargeable.

I use graphics and I prefer having custom ALPHA strings to help signaling conditions. HP LED-display calculators neither have ALPHA capabilities, nor graphics. At least so far.

After reading about Organic LED's and their amazing characteristics, I believe a hybrid display OLED/LCD is the final frontier: lights for those who need enlightment, shadows for those leaving the darkness... Wow!

To answer the question about the LED alarm clock:

LEDs DO diminish over time; they eventually get less and less bright. LED manufacturers do measure a useful life to half-brightness. This happens, in your standard GaAs red LEDs, well after one-hundred thousand or more hours of operation.

Organics are much less long-lived... so far. This is one of the things being worked on.

I dunno how long ago you bought your clock. I imagine though, that it has been on all the time since it became your clock. It should have a useful display life MUCH longer than the hours of operation alone might imply, simply because not all segments are on all the time. I would figure a LED clock should go about 35-40 years before it dims to half-bright, and even then, some segments will fare better than others.

Overvoltage and a punishing duty-cycle when multiplexing might prematurely age LED displays. Conversely, you may NOT be seeing the aging of the LEDs at all-- what you MAY be seeing is the aging of the driver circuit. Remember, LEDs can look a lot less bright if the voltage supplying them drops just a small bit. A failing capacitor, say, in the supply circuit might cause you to think the display was getting weak...

Re: Viewpoint about RED LED calcs and batteries ...

*Message #8 Posted by **Ellis Easley** on 26 May 2003, 8:10 a.m.,*
in response to message #1 by Norm

One problem with using regular size AA cells is that they are a little longer than the flat-top NiCads that HP used. I think a lot of people have tried them at one time or another, I did in my 25 which is tied for first of my LED HPs (I got a 45 and a 25 at the same time on Ebay from Gene, and learned about the HP Museum at the same time!) In the Woodstocks, the springs are long enough that the extra length of the cell isn't too much of a problem (those springs are already mighty strong!) but in the Spices I think it has caused a lot of broken battery contacts.

Re: Viewpoint about RED LED calcs and batteries ...

*Message #9 Posted by **db(martinez,california)** on 26 May 2003, 10:46 p.m.,*
in response to message #8 by Ellis Easley

ellis; hp sold the battery packs with a little spacer held on by two sided tape at the bridged end. it has the springy prongy thingers of the stainless steel wrap around there too. if you just use a piece of aluminum foil as the bridge then regular AA cells are no (or not very much) tighter than the rechargeable pack.

btw: i finally got that resistor. thanks for the instructions and the hand holding.

Re: Viewpoint about RED LED calcs and batteries ...

*Message #10 Posted by **Ellis Easley** on 28 May 2003, 4:42 p.m.,*
in response to message #9 by db(martinez,california)

I've been meaning to ask about your battery charger! I'm glad to hear it's progressing.

I never had a real Spice battery. I've used foil to make the connection and then some neat woven copper tape - that worked but began to corrode a little after a while. Currently I'm using flat top NiCads with an official welded strap to make the connection. I got a 4 cell pack and cut it in two, I use half in my 34C and the other half in my 25 - I filed off every trace of the straps on the new working contacts.

Someone here has mentioned 3 mil nickel tape (with adhesive?), I'd like to try that. I'm always trying to think of uses for the little strips that are inside the "security devices" that are stuck on everything sold nowadays, they look like they would be useful for something. They are very thin and metallic looking. I've never actually taken an ohmmeter to them but they look like metal. They are so thin that they would be good to make the connection in the Spice battery compartment, if they are conductive.

Re: Viewpoint about RED LED calcs and batteries ...

*Message #11 Posted by **Norm** on 29 May 2003, 4:29 p.m.,*
in response to message #10 by Ellis Easley

It is important that such a piece of metal be as thin as possible, so that the "AA" batteries can be jammed into there.

a metal with an adhesive backing sounds clever.

Dont do this, but aluminum-foil ducting tape comes to mind. That adhesive never comes off. But dont do it because aluminum doesn't have resistance to oxidation. The result will be poor.

However, it is nice to be able to replace the home-brew strip of metal that you choose. Therefore I would just grab something and stick it in there, and replace it later with something else.

Very thin nickel-metal-foil should be the ultimate. Copper foil might also be suitable. A bit of an old 'flex' circuit might also suffice.

I dont have any. I just use a bit of copper "solder-wick" such as the technicians use to remove solder. The flux that is mixed into it seems to do pretty well at maintaing gas-tightness, no oxidation, and 100% conductivity of the metal material.

*Message #13 Posted by **Michel Beaulieu** on 26 May 2003, 5:56 p.m.,*
in response to message #1 by Norm

Is LCD with green backlight a good compromise? I mean, you can have a good seeing in a dim environnement and no backlight need in sunlight and you can get all ALPHA and graphic you need AND i think it consumes less power to backlight than to use LED

But i understant, i really LOVE LED calculators is fun and charmy to use in the lazyboy but for "real" business, i prefer the 41c or a 48G...

I agree with Luiz whe he said continuous memory is important and LED don't show this too often (Hp-25C, TI-58C). I will add that i also like when a calculator can hold more than a program at a time and i don't know

any led that can do that without doing a bid program cut in independant one; aother advantage of the 41!

*Message #14 Posted by **hugh steers** on 27 May 2003, 1:24 p.m.,*
in response to message #1 by Norm

im with norm on this. in fact, ive been looking for a simple calculator that emits light (doesnt have to be LED specifically) could be backlit even. using recharge AAA cells thats 1500mAh for a pair which should last some (dry cells are a lot more).

something ive noticed now is that dry cells dont last anymore. i mean last when not being used. is it because they are all manganese dioxide rather than good 'ol zinc carbon? packets have sell by dates that are only a year or two away. duracell claim their quoted shelf life is when its down to 80%. i have some old fashioned zinc carbon batteries in LCD calculators from the 80's that are still going strong. about this time manufactures noticed that they were nuts to put two AA batteries into LCD units and it all switched to button cells.

if you're wondering why i need an led unit, its so i can figure the bill in dark restaurants. in fact, im considering the idea of carrying a pocket slide rule for this. then i wont need the batteries at all :-)

scratches on LCD screens

*Message #1 Posted by **Ellis Easley** on 25 May 2003, 8:55 p.m.*

Is there any way to touch-up (or replace) the anti-glare coating on the protective windows on some LCDs (71B, 75 and Voyagers especially) if it gets scratched? (other than putting the calculator on a railroad track)

Re: scratches on LCD screens

*Message #2 Posted by **Andreas Stockburger** on 26 May 2003, 3:28 a.m.,*

I haven't tried anything yet. Is that something like the scratch remover for CD's?

Re: scratches on LCD screens

*Message #6 Posted by **Hans Brueggemann [GER]** on 26 May 2003, 1:24 p.m.,*
in response to message #5 by Ellis Easley

There are many different sorts of polishes on the market. most of them are sold in 3 categories: 1)chrome (metal) polish, 2) car polish, 3) acrylic glass polish.

for our purpose i recommend acrylic glass polish only. if applied manually (i.e., slowly, in order to keep the temperature down and avoid smearing) and with sufficient patience it will give absolutely perfect results. all other types are too coarse and will leave visible scratches on the surface.

however, if the protective window has some anti-glare coating, the coating will definitely be ruined by any polish or solvent that contains abrasive materials.

cheers, hans

p.s.: always try to make friends with your dentist :o^ dentists have all sorts of wonderful drills, polishes, 2-component glues, etc ask him for some help.

Opening (and repairing) a halfnut

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2003, 8:33 p.m.*

Hi, HP41 maniacs.

I'm opening an HP41CV halfnut because it has a problem I cannot repair without spreading its guts around: after a MEMORY LOST and SIZE 000, it gives me .END. REG 63 instead of .END. REG 319. I did not test regular memory modules (82106A) so far, but I'll do it later. I read in some posts (some time ago) that RAM chips are in the LCD assy, and I'm gonna open it. I'm scanning all intermediate images so far, and I found out two somewhat important facts:

1 - tactile sense in halfnuts is solely due to a thicker rubber sheet between the keyboard and the keys; parts used in both half- and fullnut *keyboards*, i.e., the metal caps, are essentially the same;

2 - based on the ones I have in hands, calculator's plastic case has the same geometry for both types, meaning you can remove the halfnut guts and build a complete fullnut in the same halfnut case. I removed the halfnut guts and tested a fullnut keyboard. Fits perfectly. (in fact, after testing, I could not identify which case was the original one except for a missing post in the fullnut's one)

I am now with a strange thinking: I have an HP41C's case and a fullunt's guts that acts like an HP41C. I'm tempted to keep the halfnut's guts as is and build it as an HP41C. And I'll have a genuine... O.K., O.K., a cheated HP41C fullnut. In any case, I'll open the LCD assy in order to check for the cause of the missing 256 registers. As the plastic rivets were untouched, it's definitely a problem to be solved instead of an original HP41C halfnut in an HP41CV's case.

As I have all images scanned and saved, I'm posting a new message.

Suggestions? Comments?

Luiz C. Vieira - Brazil

Small remark

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2003, 9:47 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi;

just to add an information.

Although the halfnut guts fits in a fullnut's halfcase, there are 7 (seven) plastic rivets that must be removed from the fullnut's case because there are no equivalent holes in the halfnut's mainboard for them. Tha mainboard fits in, but cannot be settle unless they are removed.

When I post the images, I'll indicate which rivets are the ones to be rmoved in this case.

Best regards.

Luiz C. Vieira - Brazil

Re: Opening (and repairing) a halfnut

*Message #3 Posted by **Gordon Dyer** on 26 May 2003, 4:35 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

It is very interesting to hear about the difference in keyboards; I have often wondered if the difference in feel of the case, and the creaking of a halfnut, was due to a poorer grade plastic. Or is it the construction? Anyway I am tempted to send you my halfnut 'as new' CX and ask you to upgrade it to to old fullnut keyboard and display for me!

Unfortunately...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2003, 6:22 a.m.,*
in response to message #3 by Gordon Dyer

Hi, Gordon;

thank you for your always valuable and supporting comments.

But I have to warn you that the inner guts cannot be transplanted. The fullnut's LCD cannot be used in a halfnut mainboard (at least I did not try to...). What I did was using a fullnut's upper halfcase to hold a halfnut internal. But it must be a complete halfnut internal. What can be done is replacing the thicker halfnut rubber sheet, under the keys, for the fullnut's. I tested and the key feeling of the fullnut is kept: it feels as if you are using a fullnut.

I promise I'll go deeper into the LCD's compatibility. I did not disassemble any fullnut LCD so far, but it seems to me there is one malfunctioning LCD comming closer to my hands, and if I need to, I'll open it and compare it to the halfnut. I'll let you know...

Best regards.

Luiz C. Vieira - Brazil

A brief report.

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2003, 6:14 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, HP41 maniacs;

I have concluded my incursion into the inner guts of the HP41 halfnut. I scanned some interesting sites, mostly the hybrid RAM/ROM Display Driver, from what seems to come the Voyager R2D2 + uP. Yes, believe me, I removed the display driver IC in search for a failing jumper, connection or the like, but I was not successful.

Even after being completely disassembled and reassembled, the halfnut insists on seeing only 64 registers instead of the expected 320. I also compared the hybrid code to another existing 41CV halfnut and the codes match. What to do?

I already built the mainboard in a former HP41C fullnut case. Yes, it fits fine. I had to remove eight (not seven as I thought) of the small plastic posts (rivets) used to settle the mainboard in the upper half case. Now I have a custom HP41C halfnut.

I'll post images as soon as the webmaster explains to me why can't I access the page where my previous

images were loaded. I cannot even open the page, not necessary to say I cannot upload the images.

I'll take a little time to treat the images and prepare the one showing which plastic rivets must be removed in a fullnut's case in order to accept a halfnut's internals. The opposite operation - using a halfnut case to build a fullnut internal - needs no further operations; simply stuff it in.

I hope the images to be posted and the information herein help others to handle the halfnuts internals.

Best regards.

Luiz C. Vieira - Brazil

CD audio won't play

*Message #1 Posted by **Dave Trost** on 25 May 2003, 1:16 p.m.*

Here's the scoop and what I have:

1. HP Pavilion 8860 2. ASUS A7V-VM (GAS, GLAS) oem motherboard with onboard sound 3. Onboard sound was VIA, KM133A chipset 4. Phoenix BIOS, recently updated 5. Processor is AMD Athlon 1G with 128 meg PC133 SDRAM 6. Graphics = AGP 4X, TNT2 Nvidia Vanta 7. HP CD Writer Plus LG CD RW- CD 8080B, Hitachi DVD ROM GD-7500 8. *** I installed PCI Turtle Beach Santa Cruz soundcard 9. I had removed the VIA drivers, and disabled the onboard sound in the BIOS per instructions. 10. Sound works fine for MP3, games 11. No sound from audio CDs, in either the CD RW or DVD – they won't play in mediaplayer, realsound, etc. 12. No sound when I plug headphones in the CD burner drive 13. DVDs play OK, sound included, in the DVD drive. 14. CD ROMS seem to read data OK, and I can burn data on a CDR OK. 15. ASUS HP oem motherboard had onboard sound - I disabled in the BIOS 16. CD ROM jumpers – I have tried leaving them in the motherboard, sound card and disconnected – no difference. 17. Games that require sound from CD don't seem to recognize a CD's in the drive.

Any ideas? Hate to take this to the shop!

Which calculator plays CDs? :-)

3. Onboard sound was VIA, KM133A chipset
4. Phoenix BIOS, recently updated
5. irrelevant
6. irrelevant
7. irrelevant
*8. *** I installed PCI Turtle Beach Santa Cruz soundcard*
9. I had removed the VIA drivers, and disabled the onboard sound in the BIOS per instructions.
10. Sound works fine for MP3, games
11. No sound from audio CDs, in either the CD RW or DVD – they won't play in mediaplayer, realsound, etc.

Have you checked for audio cables? Some of them have a different location for ground and signal wires.

12. No sound when I plug headphones in the CD burner drive

This is the "weirdest" symptom of them all. You mean you put an audio CD at the CD recorder and get no sound from its own headphone plug? Id you check if CD is actually "playing"? I mean, does any LED/blinking LED signals it is happening anything?

13. DVDs play OK, sound included, in the DVD drive.
14. CD ROMS seem to read data OK, and I can burn data on a CDR OK.
15. ASUS HP oem motherboard had onboard sound - I disabled in the BIOS.

Have you checked what sort of devices are installed in your O.S. check list? What O.S. are you running?

16. CD ROM jumpers – I have tried leaving them in the motherboard, sound card and disconnected – no difference
17. Games that require sound from CD don't seem to recognize a CD's in the drive.

Seems that logical connections (flat cables) are fine, but you may still have a configuration OR driver problem.

Any ideas? Hate to take this to the shop!

In cases like this, I take a bunch of free time, uninstall everything, remove all boards, and go babe-steps mode ON: one driver and one device at a time. I experienced Plug&PRAY (yes, plug&PRAY) conflict when everything is detected at the same time, but when boards were installed and detected one at a time, interruptions and DMA were satisfactory set at BIOS and correctly followed by O.S. (in this case. MS related O.S.).

Hope this helps a bit... In time: have any HP calculator at home? Office? Anywhere? Ahn?

in response to message #4 by Vieira, Luiz C. (Brazil)

I think maybe the system has no information regarding WHICH CD drive to use to play audio CDs. There is no ambiguity regarding which to use to play DVDs or to burn CDs but either one could play audio CDs and for some reason the system doesn't know which one to use. Once it does know, it probably doesn't need the audio cable connected - Windows nowadays seems to default to playing audio CDs digitally (raw read through the data cable) rather than the old fashioned way. I believe that fact is part of the "Napster" conspiracy. At the same time, your DVD drive is required to note whether you play DVD movies with different Region codes, and only allow you to change regions so many times (5?) until it stops changing and only works with the last region.

Re: CD audio won't play

*Message #6 Posted by **Ben Salinas** on 25 May 2003, 10:32 p.m.,*
in response to message #1 by Dave Trost

This is my area of expertise (computers). Chances are, your cd rom drive isn't plugged in. (WEll it is plugged in, but not all the cables are plugged in) To play Audio CD's in your CD-ROM, you must connect a cable from your CD Drive to your sound card (generally they are blue). I believe the cable comes with the sound card. hope this helps -ben

Problems rebuilding a 41c Card Reader

*Message #1 Posted by **Steve** on 24 May 2003, 7:42 p.m.*

I thought I was beginning to understand the 41c card reader, but this one has thrown me a curve. After assembling the reader (and checking it over several times for lose wires, bad contacts, etc) as soon as I plug it into the 41, the motor runs. It will run for about 5 seconds, then shut off. If I attempt to power on the 41, it will not start (display blank). If I unplug the card reader, I can power up the 41. I've tried 2 41's and I have the same problem.

What could be wrong with the card reader to make the motor run as soon as it's attached to the 41's port? Other than the wheel slipping (what I was fixing), this was a working reader until my last repair attempt. Thanks!

Steve

Re: Problems rebuilding a 41c Card Reader

*Message #2 Posted by **Randy Smith** on 24 May 2003, 7:46 p.m.,*
in response to message #1 by Steve

The contacts that tell the reader a card has been inserted may need adjusting.

Re: Problems rebuilding a 41c Card Reader

*Message #5 Posted by **Randy Sloyer** on 25 May 2003, 5:24 p.m.,*
in response to message #1 by Steve

I initially thought the reader motor start contact was closed. A photo of switch points for reference:

http://mywebpages.comcast.net/etron/images/82104_1.JPG

I tried duplicating the problem by shorting the motor start contact, but it didn't prove out. While the calculator

was dead and would not turn on, the reader motor ran continuously and would not turn off. Different problem than you describe.

I doubt you killed anything in unit as I'm the king of klutz and have never had a reader I was able to render permanently dead.

Still thinking about it...

Re: Problems rebuilding a 41c Card Reader

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2003, 5:52 p.m.,*
in response to message #5 by Randy Sloyer

Hi Randy, guys;

I am not sure, but is there any solid-state switch that would turn motor ON and allow it to go OFF after a few seconds? I think the only common line on it is the "power line".

A few days ago I got the following problem: an HP41 that would turn ON, blink the 0.0000 and than it yould turn off and refuse itself to go ON again. I opened it, clenaed the contacts and rebuilt it. Same problem.

I took the batteries of another HP41 and it did not even switch to NO. I cross-tested the batteries and felt myself confused: the problem was in the batteries.

I tested each one of them and found 1.38 to 1.48 Volts eanch, but when nI tested for current, one of them got less than 1mA, others could go more than 180mA. I placed the "bad" pack back and measured voltage by the small golden balls used for external DC power connection. Voltage was fine till I press ON key: it would drop to about 2.5 V (high resistence from bad battery) while LCD would blink the 0.0000 and then the calcualtor shoot-off. I changed the batteri and everything is fine, now.

What I mean is that electrical connection with bateries is achieved by the HP41's I/O connector, and batteries (+) and (-) lines go stragiht to any external devices. This means there is no way to cut off power to the devices by solid-state control; how come the card reader motor stops working? Are batteries O.K. when extra charge occurs?

Just a suggestion.

Programmables Available Today?

*Message #1 Posted by **Patrick** on 24 May 2003, 6:21 p.m.*

Was at a calculator history site recently and read an article where the author pointed out that there were diminishly few programmable calculators on offer at a retail level today.

I can only think of the 12C, 12CP, 48GX, all from HP! Is the 49 still being sold? Can't think of any programmables from TI, although I don't know their line anywhere near as well as I did in the mid-late 70's!

I always thought that TI's top of the line programmables were very nice machines. Not in the same league as our beloved HP's, but nice nonetheless (am I allowed to say that here? ;-). But, they don't make them anymore, either, eh?

It will be interesting to see if any of the new HP calculators promised for introduction in 2003 will be programmable. I expect not. I wouldn't be surprised if some of them have a SOLVER, though.

Are there people interested in Programmables?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 May 2003, 7:25 p.m.,*
in response to message #1 by Patrick

Hi Patrick, guys;

I'm a teacher and sometimes I face the hard task of answering the question: "Why do we have to learn how to program?"

I sometimes take a big breath and try to explain not the need itself, but the fact that everytime one explains something to someone else he/she is, in fact, programming the other in a way he/she will be able to perform that particular task somehow. When we know how to do something it does not mean we are also able to expand this ability to someone else, as we see many people saying: "I know how to do it, but do not ask me to tell you how do I do it!".

Communication and programming, at a human level, are too close that sometimes they are the same. When you get to know a Computer Scientist you are, in fact, knowing someone that should be able to "communicate" with a machine by means of "programming" it. And the "programming" level we have today for computer languages goes beyond computer abilities by itself. If we look straight at what one can do with a computer when programming in PASCAL or C, we will be able to actually understand what the computer can do. But if we look at what can be done when A.I., Neural Networks, Fuzzy, Object Oriented and related "tools and environments" are used, we go beyond the understanding of the computer; we are, in fact, looking at the programmer instead the machine.

When I bought my HP41 in the 80's, personal computers (Sinclair, Apple and a few others) needed to be programmed to do what the calculator was able to as a plain tool. Almost every math tool was ready-to-use, and whatelse was needed could be, in many cases, programmed in time.

Computers had their magic moment when high definition graphics and higher level programming languages became available and calculators, that once were at the desktop, are now deeply hidden inside the drawer. And

desktop computers are there, now.

Programmers? What do you need to program in your calculator so far? I know how to program in almost all programmable HP calculators (I did not stop to create "programs" in the HP17BII/19BII... yet), some TI, but I was not able to program in those BASIC-related CASIO, SHARP and others. I also never had an HP71 in hands and I know it is BASIC-programming and has an RPN-like calc mode.

I think the problem is not a lack of programmable calculators; instead, it's a lack of programmers. In fact, except for people like most contributors in here, that I believe take programming as a lot more than a cause-and-effect procedure, a few others will see programming as gray matters, reasoning, mind development, amongst other advantages, but never a mind threatening activity.

I hope that not only HP offer programmable calculators, but I also that we find enough reasons to use their programming capabilities to do something useful.

My thoughts, though. Comments, suggestions, critics, add-ons accepted and welcome.

Re: Are there people interested in Programmables?

*Message #6 Posted by **Gordon Dyer** on 25 May 2003, 5:29 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

My first computer program was writing an iterative routine in BASIC on an Open University mainframe to find the value of e.
Very soon the function e^x was available in most scientific calculators and in BASIC so the need disappeared. Programming moved on to a higher level.
Today the need for the level of programmability in 1980's pocket calculators has disappeared because the tasks that they were used for can be performed with a few simple steps in a spreadsheet, which is quicker, easier to learn, gives the ability to plot results, store the "program" and the results, email it to almost anyone else in the world and they will be able to read, understand, repeat and modify that "program" with very little effort or additional training. Try that with a 49G!
Arificial Intelligence will gradually replace the need to type in formulae to a spreadsheet, or input at low level to an application such as Mathematica.
All of this progress is made by having the low level algorithms required to solve our problems programmed in to a machine for us by people in software companies, anf higher levels of useability added to remove us from needing to see the low level problems.
Unfortunately I fear that pupils in school are in danger of never understanding what is happening inside the machines they use because they perform tasks for them so easily. Of course the benefits are that the newer generations will be able to concentrate on higher level tasks, predicting earthquakes or weather patterns, without ever needing to know how to calculate the value of e, or write an algorithm for Runge-Kutta integration. But if they had to do these low level tasks they would not find time for the high level ones.
It is our teachers, such as Luiz, who will have to continue to find the right balance between the low level and higher level learning which will allow progress to continue WITH understanding of the processes involved; this is not going to be an easy task!

My first program(s)

*Message #7 Posted by **gene** on 25 May 2003, 7:39 a.m.,*
in response to message #6 by Gordon Dyer

Besides the do nothing "add 1, pause, goto add" routines on my friend's TI SR-56, my first programs were for the SR-52.

Tried doing a 3x3 matrix determinant. Since each memory reference took THREE program step locations (STO, 0, 0) this was a pain.

Then I wrote a version of a space war game for the SR-52. Never got very far. :-)

BASIC? In 1980, had to write a payroll program.

Assembly? PDP-11 Had to write a program to echo characters typed on a terminal to a line printer.

HP-41? My real "new" programs I have written include Yahtzee and Skunk.

Re: My first program(s)

Re: Are there people interested in Programmables?

*Message #9 Posted by **Ernie Malaga** on 25 May 2003, 9:19 a.m.,*
in response to message #6 by Gordon Dyer

>Unfortunately I fear that pupils in school are in danger of never understanding what is happening inside the machines they use because they perform tasks for them so easily.

On the other hand, Gordon, I do not sadden because kids can't multiply 6 by 7 without counting with fingers or pressing 6 [ENTER] 7 {x}. There has to come a time when we have to bypass parts of what was known as "knowledge" by an earlier generation.

Most forum users here use some kind of solver when they need to solve equations. Would anyone think less of them because they never learned (or have forgotten) how to use matrices and calculate determinants to solve simultaneous equations?

Or, going to a lower level, who cares today to learn how to extract a square (or cube!) root manually. I learned both in my younger days, and I'll be damned if I can remember any of it today. All I remember is how slow, tedious, error-prone, and inefficient it was.

Just my 2 cents.

-Ernie

May I?

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2003, 2:37 p.m.,*
in response to message #9 by Ernie Malaga

Hi, Ernie;

I'd be dammed, too, if I have to do it all the time, but I normally show how to extract a square root step by step to my students everytime I teach math classes, then I ask them to use their calculators and perform the same operation with a single keystroke. This way, they'll understand what's going on.

You may be sure that some of them will ask: "Does it all happen inside the calculator? How come? ", and then it's time to talk about algorithms, Series, etc. See? At least it's a good bait. And when you show them you know how to perform that set of complex operations and that that same set of operations is also performed by a single keystroke, it looks magic. I remember one day a student asked me how to compute sine. I took the remaining time to tell about series and to perform a single sin(PI/4) with about five or six terms only. I had to ask for help computing factorial and division, and ask them to use their calculators. They felt impressed with the hole process and some of them took note and tried later with other values, just for curiosity.

Just let them curious and they will be caught.

My 2¢.

This way, they'll understand what's going on.

Yes, except that what they did on paper is not the same algorithm the calculator uses. It's good for a bait, and interesting as curiosity, but no one in his or her right mind would take the time to take a square root on paper and pencil -- today.

Think of this, too. When I was a kid I learned how to perform addition, subtraction, and multiplication (not division) using _Roman_ numerals. It's an incredibly complicated process, but it intrigued me. Just the same, I wouldn't use Roman numerals for computation when Arabic are available. Further, I wouldn't use paper and pencil if a calculator was at hand.

Especially if it's an RPN one. 8^)

Re: Are there people interested in Programmables?

*Message #12 Posted by **Gordon Dyer** on 25 May 2003, 4:56 p.m.,*
in response to message #9 by Ernie Malaga

You need to read the next sentence to the one which you quoted to see my main point; it is the release from the low level tasks which will allow future generations to do more complex things. But that does not mean that lower level understanding is not still important, and Luiz seems to do well at gaining pupils' interest in learning some of those.
The overall point is that us 80's calculator lovers are pandering to nostalgia, but we enjoy it!
The enduring features of the older calculators (and test equipment) which HP need to recognise as important are the quality and useability, they badly need to learn how to maintin these attributes in their new products.

Re: Are there people interested in Programmables?

*Message #13 Posted by **Dave Shaffer** on 26 May 2003, 2:12 a.m.,*
in response to message #6 by Gordon Dyer

re: "Unfortunately I fear that pupils in school are in danger of never understanding what is happening inside the machines they use because they perform tasks for them so easily"

They are also liable to have a pretty poor understanding of whatever functions they are evaluating. I teach intro college physics, and am amazed every semester at the almost complete lack of understanding my students have of the Sin/Cos/Tan functions. Oh sure, some (!) of them know the basic definitions (opposite over adjacent, etc.), and they can all pretty much punch the buttons on their (sigh, non-HP) calculators. But ask them the value of cos(0), or sin(45), or tan(45), or sin(90) and you get a room full of blank stares. Makes it hard to get them to have a feel for the limiting behavior of various problems!

Is it a plague?

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2003, 4:16 a.m.,*
in response to message #13 by Dave Shaffer

Hi, Dave;

I think we are facing a plague! My students at least start attending classes with me like this, and some of them seem to be cured at the end of the semester. Later, when needing that knowledge, it's simply vanished from their (?) heads. <8^O

As human beings, it's our duty to take necessary meajures to extinguish this plage! Extreme meajures, if needed! B^(

Now I understand why using RPN is so hard for most of them... :(

Re: Are there people interested in Programmables?

*Message #15 Posted by **Gordon Dyer** on 26 May 2003, 4:38 a.m.,*
in response to message #13 by Dave Shaffer

Your right! And there is no substitute for making them draw out the functions on paper BY HAND and look at some of the main values. A pencil on a wheel and pulling a piece of paper past it wa instruvtive to me when I was learning these things...

Re: Programmables Available Today?

*Message #16 Posted by **JimC** on 24 May 2003, 8:51 p.m.,*
in response to message #1 by Patrick

Well, at the risk of sounding like a dinosaur, I think that yes, Virginia there is a need for a programmable calculator. However I would like to add one more point: a programmable does not always need to do high end graphing and graphics (a la 48G series). I have seen some of the applications that the new HP's can do and yes, I am impressed. Do I program? No. I am an engineer, and I would like a programmable (RPN PLEASE!) to remember my "macro" strokes. Something like my 41. I don't need high end calculations, I need something semi-portable. Oh sure, I can use a PDA, but then I have the interface in the way.

Just a number cruncher. That's all I want. Programmable but not with graphics. Black, so's I can use it in the boardroom or the field. Good documentation, so's I can figger the darn thing out and not have to have the book at my side when I want to do a little more advanced calculation. (Imagine if HP brought out a 41/42 "classic" series - wishing....)

Re: Programmables Available Today?

*Message #17 Posted by **Fred Lusk (CA)** on 27 May 2003, 1:17 a.m.,*
in response to message #16 by JimC

Jim…

My sentiments exactly. What I want is EVERYTHING in a 41CX + Advantage ROM + EVERYTHING in a 42S + the ability to handle unit analysis. I also want full I/O capabilities and communication with my PC, lots of memory, a high speed processor, etc. Finally, I want the old HP quality and I would pay a lot of money for such a machine…like $500 perhaps. I still program my calculators as part of my work as a civil engineer, and plan to continue. (As an example, see the listing of HP-41 programs for a Feet-Inches-

Fraction program I wrote.)

I have a 48G+ that I rarely use. It's not as easy or as convenient as my 42S, nor as powerful as my PC. I find that a graphing calculator is not very useful except as something to play with. I can graph faster and better in Excel or Mathcad.

The way I see it, if my 42S dies and I can't find another to replace it, I may just have to retire. 8-)

Fred

TI sells programmables that are also graphing calculators. In fact, they keep selling the same models plus enhancements, like the 83, 83+, 83+SE. I have the 81 and 83+SE. I understand their top end (94?) is quite advanced in terms of math and also contains a 68000 - not new but powerful.

in response to message #20 by Ellis Easley

Interestingly, TI have recently revamped their top-of-the-line TI-92+ to a HORIZONTAL format calculator. The screen is on the upper left, and numeric pad on the right side.

They call it the "Voyage 200"...

Odd choice of name, I thought.

;-)

Re: Programmables Available Today?

in response to message #20 by Ellis Easley

I do software for a living.

Years ago even our text editors where programmable, like EDT for the DEC systems. When a repetitive operation was required, I would program a key to do it and the edit would be complete it seconds. Now, with the wonders of GUI editors, I have to repeat the same operation hundreds of times with my fingers (or suffer Perl).

We also have had to substitute spreadsheets for even simple operations. Sometimes this paradigm works. Sometimes I just need a real calculator, but I rarely have had the need to program my many calculators. Were in the physical sciences, this might be different. The 41 was the best programmable, but I have come to like Basic for this sort of thing, not Visual Basic, but clean and simple 71 and 75 style basic.

*Message #24 Posted by **Mark Ordal** on 29 May 2003, 5:33 p.m.,*
in response to message #1 by Patrick

The HP-49G is still available at some places. I didn't get around to buying one until about a month ago (i.e., April 2003). I got mine from http://www.samsoncables.com.

As for programmable calculators from Texas Instruments, the TI-Voyage200 came out in the fall of 2002 as a replacement for the TI-92/92+. The TI-86 is still available, as is the TI-89. (The TI-89 is essentially a TI-92 in a TI-86 case.) The TI-83 is still available as well, including a new variant with much more memory than the standard model.

All of these TI models are programmable in a dialect of BASIC. The TI-89/92/92+/Voyage200 use a newer dialect that includes upper & lowercase characters and more readable language constructs (e.g., if...endIF instead of if...end). The TI-83 dialect is compatible with the TI-86 and largely compatible with the long discontinued TI-85. (The TI-83 includes functions not present in the old TI-85.) However, the TI-85 & TI-86 include instructions in their BASIC that are not present in the TI-83 version (e.g., mod). (A situation somewhat analogous to an HP32SII relative to an HP42S or the HP41 series.)

Unless HP reverses itself on the termination of its professional calculator line, Texas Instruments will have the only current production programmable scientific calculators with any power. That would be a tragedy! Let's see an improved HP49G with at least 2x the speed of the old 49G!

Re: Programmables Available Today?

*Message #25 Posted by **Patrick** on 29 May 2003, 9:19 p.m.,*
in response to message #24 by Mark Ordal

Hey, Mark, thanks for that.

While the discussion in this thread has been fascinating to me (isn't serendipity great?), your message contains the information I originally sought!

There doesn't seem to be a web site that has the information about detailed machine features for TI's that we have here for HP's. I know about datamath.org but you can't tell, for example, whether a calculator has, say, an x<y? test or a DSE or an index register or what have you.

Maybe there is one out there I haven't found yet, but it is nevertheless a testament to our curator's great work how easy this information is to find for so many models of HP.

Better yet, let's see the 49G software built into the body of a 48GX. (I'll *never* buy a 49 as long they keep the current hardware and color scheme.)

Re: Programmables Available Today?

*Message #27 Posted by **Ellis Easley** on 31 May 2003, 7:19 a.m.,*
in response to message #26 by Wayne Brown

I'm not positive, but I think maybe if you put MetaKernal in a GX you might have what you are looking for. I think to do it requires adding a RAM card to hold it, so it would be an expensive way to go. Apparently MetaKernal was available as a ROM card but some kind of licensing problems make that not available.

Re: Programmables Available Today?

*Message #28 Posted by **Wayne Brown** on 31 May 2003, 10:22 a.m.,*
in response to message #27 by Ellis Easley

Actually, that's what I've done: I have a 128K card with MetaKernel and a 2MB card with Erable and Alg48 and a bunch of other stuff. It gives me most of the functionality of a 49G (which is based on those three packages), but there are some inconveniences. Erable only works in ports 0 or 1, and MetaKernel fills port 1, so I have to move Erable to port 0 when I use it. That nearly fills port 0, so I frequently have to move it to another port (on the 2MB card) when I want to use port 0 for other things. Fortunately, MetaKernel's Filer makes it very easy to move and copy things around from port to port.

The 49G has all the software components much better integrated and there's some added functionality as well, and there's much less problem with running out of memory. However, the

49G's lousy keyboard, the lack of IR port and expansion slots, and the shape & color of the case are so disagreeable to me that I'd rather stick with my 48GX.

48GX Super

*Message #29 Posted by **R Lion** on 31 May 2003, 12:29 p.m.,*
in response to message #28 by Wayne Brown

I'm using a 48GX + 128kb + 1Mb with Metakernel, Erable, Alg48 and many other sofware... All this is *perfectly* integrated with my own Menu System from wich I can access any ROM or RAM command. Probably (sure) I will buy a new 15C or a 32S Platinum, but it will be very very very difficult substitute my 48GX Super

Re: 48GX Super

*Message #30 Posted by **hugh steers** on 3 June 2003, 6:53 p.m.,*
in response to message #29 by R Lion

do you know if there's some way to romify this or the equivalent?

when the 49 came out, i reasoned i'd better buy a 48GX real quick before they stopped making them. basically because its a much nicer built machine and that matters for me. i added in erable, alg48 and that java (not web java) stack replacment thing that lets you scroll fast and everything.

like this its great, until it crashes and you lose it all.

Re: 48GX Super

*Message #31 Posted by **R Lion** on 4 June 2003, 2:45 a.m.,*
in response to message #30 by hugh steers

What do you mean with romify? (excuse my english) Do you mean to protect your installed prgs against memory deleting if calcualtor crahes? I have all libraries instaled in ports>0. Also a Home backup. Those ports are (almost) secure.

Please tell me if I understood your question...

Raul

harvesting email addresses here for spam?

*Message #1 Posted by **db(martinez,california)** on 24 May 2003, 5:45 p.m.*

i have all but abandoned my old email and started using another here and in corospondance because i am tired of wading through 30 to 40 offers each day to buy viagra, enlarge my tool, consolidate my debts, get a credit card, refinance my home, see young girls nekid etc. i just got a spam on my other email (which i have had for 4 years and never got spam on) from a steaming pile named Donald Kayode. he has an "Important business proposal" for me. yea, right. probably wants to help me invest in a large reddish bridge just north of san francisco.

anyway, i was wondering if he harvested my email from here. it is only posted one other place and that is a low traffic site - one that would not be likely to be frequented by frisky girls with names ending in the letter "i" who would write a letter to a stranger asking if i want to see the new movie of her and rover.

anyone else getting offers from mr. kayode?

Snap

*Message #2 Posted by **james (UK)** on 24 May 2003, 6:08 p.m.,*
in response to message #1 by db(martinez,california)

I've had the same email - it's the usual African scam (in the pre email days most of the letters originated from Nigeria)- millions of dollars acquired in dubious means ($33m in this case) which they need to move out and can they just use your bank account - you'll get 20% (yeah right!) - just send you account number and hey-presto - before you know it your account's been cleared out - in the last month I've had similar offers from Rev Kelly Momoh, Mrs Mariam Sese-seko, Dominic Jones, Mohammed Abacha and Patrick Foster - aren't I lucky? The others were all addressed to an email address I use for an Innocenti Mini-Cooper forum but Donald's effort was the email address I use here so you're probably right in thinking your address was harvested here.

*Message #3 Posted by **Patrick** on 24 May 2003, 6:08 p.m.,*
in response to message #1 by db(martinez,california)

Not getting email from said pea brain but there's just no end of these rude jerks. I don't make it easy on them any more in getting my name triple and quadruple times on the same list, which is why you don't see me post my email address here. It is not that I don't want to share with the majority of good folks here, it's just that it takes just one in a thousand to wind up inundated with unwanted crap.

On the other hand, I've started email accounts on the free servers (hotmail, yahoo, etc) and gotten spam on them right away, having NEVER used it even once and having never given the address to ANYONE. Go figure.

Re: harvesting email addresses here for spam?

*Message #4 Posted by **frankin** on 24 May 2003, 6:15 p.m.,*
in response to message #1 by db(martinez,california)

Mostly likely from here. I just received the same email from the person after I posted a ad here a few days ago.

*Message #5 Posted by **James M. Prange** on 24 May 2003, 9:39 p.m.,*
in response to message #1 by db(martinez,california)

Yes, that name looks familiar, I saw it in my inbox a little while ago.

The "Nigerian scam", but with the faintly amusing variation that he's a private investigator in Europe who's been contacted by officials in Africa with a proposal to transfer several million dollars to my account, whence I'm to transfer it to a special account in the Cayman Islands....

Too late to get the details; it's already been trashed.

But I honestly don't know whether he got my e-mail address from this forum. I get one of these every few days. Mostly annoying, but occasionally the lies are outrageous enough to be slightly amusing. These guys should join a "liars club".

Regards,
James

I don't think it's from here...

*Message #6 Posted by **Scuba Diver** on 24 May 2003, 11:16 p.m.,*
in response to message #5 by James M. Prange

I don't think he's getting your address from here; I use my hotmail account when I post here and I don't get any spam there (touch wood).

Of course, my normal email address that I use for day-to-day correspondence gets 40+ emails a day...I'm thinking that I'm going to respond first to the email that guarantees you a salary of a million a year, so that I can afford to buy all of the other products (such as viagara and the "enlargement" tool...not that I need either of those! :))

B.

Re: harvesting email addresses here for spam?

*Message #7 Posted by **Ellis Easley** on 25 May 2003, 12:35 a.m.,*
in response to message #1 by db(martinez,california)

Yes, I got that email today. I also got email last week from "support@microsoft.com" with an attachment - the same morning I read a news story about a new virus that was attached to an email like that - also in the news story, Microsoft reminded everyone that they never send unsolicited email with attachments! I minimized my preview pane - I understand that is the only way to keep Outlook Express from opening an email if, for instance, the item is at the end of the list when you start OE. When I right-clicked on the attachment, it showed the envelope icon, like an email attached to an email - I've never figured out how to open those! So I guess it wouldn't open automatically, like a jpeg or a gif. I'll bet there's exceptions, like if there is Java code in the email telling it to open the attachment.

Are there email readers that work like news readers - that don't automatically download every item but just the headers so you can decide what you want to download?

Re: harvesting email addresses here for spam?

*Message #8 Posted by **Laurence Carr** on 25 May 2003, 5:28 a.m.,*
in response to message #7 by Ellis Easley

HI

I use mailwasher pro http://www.firetrust.com/products/mailwasherpro/

This actually lists mail on your servers and allows you to delete without downloading, you can read the mail on the server as well. Also it can create blacklists and create fake "bouce" messages.

Works well for me

Thanks, I'm going to look into that!

mailwasher pro

*Message #10 Posted by **Ellis Easley** on 25 May 2003, 9:18 p.m.,*
in response to message #8 by Laurence Carr

I downloaded mailwasher pro this morning and have already bounced a bunch of spam, which makes me feel like I am accomplishing something, at least! There is a 30 day free trial and then it will cost $30 and I just might bite the bullet and buy it.

Re: harvesting email addresses here for spam?

*Message #11 Posted by **James M. Prange** on 25 May 2003, 10:48 p.m.,*
in response to message #7 by Ellis Easley

I've been getting a lot of those e-mails from "Microsoft Support" and such "helpful" folks with an attached infected file for the last few weeks. I've noticed that the "To" or "CC to" often includes the addresses of a lot of folks that I recognize from comp.sys.hp48; I suspect that someone on the newsgroup has a virus.

What's really nice is that sometimes, right after Norton AntiVirus notifies me that it's taken care of it, a sender's ISP e-mails me a warning that it's detected that an infected e-mail has been sent to me. Seems to me that they could detect the virus and *not* send the e-mail, simply notifying the sender.

Re: harvesting email addresses here for spam?

*Message #12 Posted by **Dave Shaffer** on 26 May 2003, 1:59 a.m.,*
in response to message #7 by Ellis Easley

re: "Are there email readers that work like news readers - that don't automatically download every item but just the headers so you can decide what you want to download? "

Depends on where/how you get your mail. I get most of my mail via a non-PC, non-browser-based UNIX system. The e-mail address I give here goes to that system. I read it within an ascii window, using a mail program called pine on the nevada.edu server. I --> NEVER <-- worry about PC viruses with such a system. I do get my share of spam, however!

I also have an Earthlink mail box, which I access via my ancient Netscape 4.78 browser. This version of Netscape is so old that Earthlink mail doesn't support it. It then does what I think you want: it offers to let me look at the headers, at which point I can click on a header and then read the associated mail. I use this so little (pretty much just to get my Earthlink messages) that I have never had any spam there. And nobody has that address in any address book, so I've not gotten any viruses either. The address would be hard to get from a random address generator: I use my ham radio call, consisting of a letter, a number, and three more letters. A blind searcher would have to try 36^5 possible "names" to be sure to get it. (A quick check with my trusty '41CX shows that this equals 60,466,176 possibilities.)

So, all you need is an ancient browser and/or a non-windows e-mail system. (Another reason to hate Microsoft!?)

Re: harvesting email addresses here for spam?

Message #13 Posted by on 25 May 2003, 7:52 a.m.,
in response to message #1 by db(martinez,california)

There is no doubt that someone/s is/are harvesting email addresses from here. I had no spams for years! I tried to avoid posting my email address wherever I could. Since I posted my WTB red dot (7th April) I get more and more of these annoying messages. Could there be an easy way to get in contact with other HP-minded people without crying out our addresses or names around the world?

*Message #14 Posted by **Bernhard Emese** on 25 May 2003, 11:59 a.m.,*
in response to message #13 by

I discovered the HP Museum Forum only about one week ago, and had the same offer to receive 33 Million US$ from Nigeria (20% is for You). But I remember that I got a very similar offer two years ago, at that time I didnt know anything about the HP Museum. Bernhard

Spam is increasing in general

*Message #15 Posted by **Dave Hicks** on 25 May 2003, 1:50 p.m.,*
in response to message #1 by db(martinez,california)

And there are a lot more "spammer-tools". I have an ISP account that was used ONLY for receiving billing statements for years. Several months ago it started receiving several spams a day. One of the new spammer tricks is to do "dictionary attacks" on ISPs. They basically combine a huge list of names, exhaustive or randomly generated character strings, user names known from OTHER ISPs etc. and flood an ISP with emails to each one of them. The 0.00001% that don't bounce are the real addresses. So never giving out an email address doesn't protect you any more. (And you wonder why your net access slows down sometimes...)

My ISP reacted to this by installing SpamAssassin and it seems to be working quite well. My hpmuseum address goes through spamcop which is also pretty nice. All email to this address if forwarded to spamcop.net which holds most spams (for up to 2 weeks in case you want to review them) and deletes viruses (all so far).

I'm working on a couple of modifications for the forum software right now. The big one is message editing. (Another feature was improving the speed of the archives. That one's in place now.)

I'm also **thinking** about some sort of email obscuration and/or total invisibility (ie, clicking on a poster would present a form that you could fill in with your message and return address but you would never see the actual poster address unless you receive an email reply.) If anyone has any thoughts on this, I'm open to ideas because I haven't throught it through yet.

email obscuration

*Message #16 Posted by **glynn** on 25 May 2003, 9:53 p.m.,*
in response to message #15 by Dave Hicks

The system has worked pretty well for me-- just don't fill in the email address blank, or if you do, fill it in like "imacollector@NOSPAMyahoo.com". If you want to get REALLY elaborate, just tell people they can contact you if they hold a mirror to "moc.oohay@rotcellocami".

A harvester has a pretty hard time with that; but presumably, a calculator enthusiast could figure it out.

You can implement whatever you want, of course-- but, quite simply, it should remain up to the user to protect his own... whether mail address or whatever. I would think that obscuration will only lead to requests for you to provide feedback, i.e., an email to me stating whenever someone had requested my email, etc. Or other complications of that sort.

On a philosophical note: I think we are going eventually to see this spam-boom hurt the entire Internet, either through increased regulation, or fees, or some much more complex mail-system. A few bad apples...

Re: email obscuration -- Seems to Work Fine!

*Message #17 Posted by **Paul Brogger** on 26 May 2003, 12:34 p.m.,*
in response to message #16 by glynn

I saw someone here (maybe Glynn) inserting "NOSPAM" in posted email addresses, and decided to try it myself. My old hotmail account is still a target of all the spam offers mentioned in db's opening post, but my newer EarthLink address is clean and unmolested.

I assume it's because I've been posting it as "*pjbrogger**NoHormel**@earthlink.net*" . (I chose "NoHormel" because I think the harvesters may catch on to "NoSpam" sooner or later.)

So, for what it's worth, my experience is that obscuration definitely helps.

Re: email obscuration -- Seems to Work Fine!

*Message #18 Posted by **db(martinez,california)** on 26 May 2003, 11:01 p.m.,*
in response to message #17 by Paul Brogger

paul; ....and when they catch on to nohormel you can change it to "bloody vikings".

btw all: i tried the firetrust program and so far it has only confirmed that i don't speak geek.

mail washer pro

*Message #20 Posted by **Ellis Easley** on 28 May 2003, 6:07 p.m.,*
in response to message #18 by db(martinez,california)

I don't know about speaking geek but I was intrigued by some of the mannerisms of speech on the firetrust website such as "the ONLY way to deal to senders of junk e-mail" - the use of "deal to" where I would say "deal with". The company is in New Zealand and that must be the way they say it there.

I think the program is great! Basically, it is just an independent (of your regular mail program) way to preview your mail without really opening the files. I don't know why this program can clearly download the data without the mail server noticing, but it's bound to have something to do with the protocol of internet mail - maybe something akin to the way a merchant inquires about your credit card balance at the time of the transaction but doesn't actually charge your account until the time of shipping.

I especially like that mailwasher lets you "bounce" unwanted emails instead of just delete them - the way they describe it, they are able to make your mail server respond in a way that causes the sender to think your email ID is invalid. Whether it really makes a difference or not, it makes me feel that I am doing something! Time will tell if it really reduces the amount of spam delivered to me.

The only thing you have to remember is to run mail washer before you run your email program, or at least before you tell your email program to get your mail from the server. Use mail washer first, let it get your new mail, mark the no good mail to be bounced, mark the emails from those you want remembered as friends, then tell mail washer to "process mail". It then does the bouncing and remembering. When it has finished, it starts up your email program and you tell it to get your mail - which will only be the good items that you said you wanted to receive. Over time, mail from sites you have bounced mail from before is automatically marked "blacklisted" and pre-selected to bounce, mail from "friends" is highlighted. You can read all the text in the message from within mailwasher so you can decide if you want to go ahead and receive mail that would otherwise be bounced.

One thing I have to train myself to do is to click on "Send All" instead of "Send/Receive" when I send an email, otherwise I bypass mail washer for any messages that arrived since I last used mail washer (or since mail washer last automatically checked for new mail).

I started out the hard way when I installed mail washer: I went looking for the items it needs to identify your email accounts (I only have one). It needs your email user name (the left part of your email address), your incoming mail server, your outgoing mail server (you can find both of these under "Tools / Accounts / Properties / Servers" in your mail program [at least Outlook Express]) and your email password (only you know this, although your mail program has probably been remembering it for you, but it won't tell mail washer!) I went and gathered all these things and got mail washer working before I noticed it has an "Import" buttom that would have found everything but my password!

speed of Archives index loading

*Message #21 Posted by **Ellis Easley** on 26 May 2003, 7:57 a.m.,*
in response to message #15 by Dave Hicks

Dave, that's a great improvement! I was thinking of suggesting that it go straight to the "customize" screen but what you have done is better.

HP-82161A cassette type?!?

*Message #1 Posted by **Frederic** on 23 May 2003, 8:00 p.m.*

I found a cassette drive for my HP-41C but i have a problem : I cannot find any cassette that fit the dreve. I tried "microcassette" but too small, i tried Dictaphone cassette but the distance between holes is too small. "mini cassette don't enter too because of a notch in the drive no present on the cassette.

What kind to use and WHERE to find these?

Thanks Fred

Welcome to world of antique computers. I hope you don't expect to be able to get supplies at Office Depot.

I believe that these tapes are no longer produced, so your best bet is eBay. Instructions on how to maintain old tapes may be found in the MoHPC Forum archives.

Check the MoHPC archives, I remember an exchange last year with the same subject. I recall that the verbatim model number was given then, but I don't remember what it is now.

The tape drive has low capacity, scarce consumables, and access takes forever. Use a 9114 diskette drive instead.

Of course. The cassette drive you have is 20 years old, the floppy is slighly newer (15?), but still an antique.

You can still get them on eBay, recent prices range from around $80 to $130, so they are not *that* expensive. Note that the mechanism inside the box cannot be replaced/repaired using modern PC drives, but at least Double Density floppies are still readily available.

Re: HP-82161A cassette type?!?

*Message #7 Posted by **Frank Winter** on 27 May 2003, 2:29 p.m.,*
in response to message #1 by Frederic

Last week I started to study catalogs from business suppliers here in Germany and found a promising tape from Philips (www.speech.philips.com): 0005 Executive (2 x 15 min). It arrived yesterday and after a first examination I can state (for now) following:

1) It has the same size,

2) Drilling the two holes and cutting the notch on the back seems no problem (neither drilling the holes into the tape),

3) Further investigations are needed for the pressure pad (replacement?) and

4) getting a mc repair kit (for the leading celluloid tape).

I will leave a message, if I can achieve something (or not).

Re: HP-82161A cassette type?!?

*Message #8 Posted by **db(martinez,california)** on 27 May 2003, 10:28 p.m.,*
in response to message #7 by Frank Winter

good luck and you may have found an un-needed small sideline business. let us know.

Re: HP-82161A cassette type?!?

*Message #9 Posted by **Frank Winter** on 29 May 2003, 11:05 a.m.,*
in response to message #8 by db(martinez,california)

Today is a public holiday in Germany and so I started this morning to examine the Philips cassette. It's a dead end. (You can't open it without destroying the cassette, the "pressure pad construction" is completely different from the original HP cassettes).

But this new thread looks interesting: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=34976

Re: HP-82161A cassette type?!?

*Message #10 Posted by **Ellis Easley** on 29 May 2003, 7:32 p.m.,*
in response to message #9 by Frank Winter

Just as a matter of Forum techniques, let me say that the newer thread is really just a continuation of this thread, triggered by Michel's post - I started a new thread in hopes of drawing attention. There were a few responses but no groundswell of people ready to spend $19 for a tape! But David Smith thinks it's probably near the market price for HP tapes. So the problem remains determining if these are really usable in the HP tape drive, without having to buy a box of 10. I bought a box of 10 Fluke tapes on speculation but they only cost $14 total! I'm steeling myself to write back and ask if they could possibly break open a box and sell me just one tape.

in response to message #2 by Gordon Dyer

That is an incredible collection! It looks as if it might be on display for the public to see as well. Wonder how many years it took to assemble and where he found some of those machines at.

Re: Who's got something this guy doesn't?

*Message #5 Posted by **Paul Brogger** on 23 May 2003, 8:00 p.m.,*
in response to message #2 by Gordon Dyer

"BIG Collection" indeed! And so well presented -- sure would be nice to see it in person.

I looked through the alphabetic-by-manufacturer page, and found at least one item I've got that he doesn't: a Litronix 2260 "exponential". (But he does have several close relatives.) I'm sure there are others, but I wonder how many?

That collection may not represent truly *comprehensive* coverage of the subject, but it's got to be at least representative of just about every facet one might be likely to consider. Wow!

(I'm going to show this to my wife -- maybe she'll get the idea that it could be a lot worse!)

And re: the "original TI" -- where's the display????

TI Prototype

*Message #6 Posted by **Michael F. Coyle** on 23 May 2003, 9:05 p.m.,*
in response to message #5 by Paul Brogger

This looks like the demonstration calculator Jack Kilby *et al* at TI put together in the mid 1960's. It didn't have a display -- it printed on a thin strip of paper that exited on the left side of the machine. (It was a thermal printer. LED's weren't quite ready in 1965.) The design was produced in 1970 as the Canon Pocketronic.

The original "Cal Tech" prototype is in possesion of either TI or the Smithstonian, so I suspect this one is a replica.

- Michael

Re: Big Collection

*Message #8 Posted by **Holger Weihe** on 23 May 2003, 8:42 p.m.,*
in response to message #1 by Gordon Dyer

These fotos have been taken in the "Heinz Nixdorf Forum". That is a (real world)-museum for computer history, located in Paderborn, Germany.

You may visit this museum at http://www.hnf.de. There also is a VR-tour through the exhibition where you can see the "calculator-wall".

I never visited the exhibition, but since it is only 120 kilometers away from where I'm living I definitely should go there!!

Would be nice to touch these calculators or even better run them. :-)

Holger

Re: Big Collection

*Message #9 Posted by **GS Leong** on 23 May 2003, 9:36 p.m.,*
in response to message #8 by Holger Weihe

There is a picture of the Cal Tech Prototype in the HNF forum and underneath this quote appears " As is illustrated by the display, products became both more widespread and more powerful. Hewlett Packard from the USA in particular, has dominated the market for high performance calculators, whereas companies from eastern Asia have been sucessful with low-cost mass products."

Such a shame that this is no longer true!

Re: Big Collection

*Message #10 Posted by **db(martinez,california)** on 23 May 2003, 9:41 p.m.,*
in response to message #8 by Holger Weihe

there is an even better photo of the cal tech on page 14 of the guy ball/bruce flamm book and i have wondered since i first saw it: since there is no "=" key but there is an "E" key, was the first t.i. an rpn? and if so; why did they dumb it down? i guess the "E" could be "equals". btw: they date it as 1967.

P41CV for PALM Devices

*Message #1 Posted by **Daniel Diggelmann** on 23 May 2003, 5:24 p.m.*

I just discovered this very interesting HP 41 Emulator for Palm Devices:

http://www.palmgear.com/software/answernew.cfm?sid=49F26072-53CE-464D-AA6BF6EBF78B2DBB&quicksearch2=p41cv&CFID=8931780&CFTOKEN=97339376

Programs written on the memo pad can be compiled. And there is an PORT manager which allows to try out different ROM combinations in the four ports. I like it very much. Until now I was using COCONUT for Palm. But the free version always cleared memory on exit. There never was a registered version.

Any one have experience with P41CV?

Happy Programming from Switzerland

Re: P41CV for PALM Devices

*Message #2 Posted by **Bill** on 24 May 2003, 9:49 a.m.,*
in response to message #1 by Daniel Diggelmann

I use this emulator daily - great program. The accessory Rom programs allows you to choose four modules from a list of 17 which include the Advantage and PPC modules. I think the Rom Program only comes with the registered version. I think the developer, Charles Lee, is considering updating it sometime for the CX.

There is another good emulator for Palm, called Coconut. It emulates a HP-41CX and works very good. I don't think it's available anymore. I just tried accessing his web site, and the page is no longer avalable. I know he had pulled is from the PalmGear site. Too bad since it is a very nice emulation.

The best part is that I always have my Sony Clie with me and thus I always have access to the 41!!

Re: P41CV for PALM Devices

*Message #3 Posted by **Daniel Diggelmann** on 26 May 2003, 7:10 p.m.,*
in response to message #2 by Bill

Just today I received an upgrade to the HP41CX. I'm totally amazed about this Emulator. It now supports time an XMEM functions. It can even print to the memo pad. Congratulations to Charles Lee

Re: P41CV for PALM Devices

*Message #4 Posted by **Johnny Billquist** on 27 May 2003, 5:25 a.m.,*
in response to message #1 by Daniel Diggelmann

P41CV is nice, but it's sad it don't emulate the font of the HP41. If that was implemented, I'd love it. Otherwise it's really great. I'll have to try the CX version, now that it's out.

Coconut (yes, I have a registred version) is very nice in the look and feel, but it do have some bugs. I used to report them in the beginning, but it seems as if the product was terminated instead. Sad.

Re: P41CV for PALM Devices

*Message #5 Posted by **Johnny Billquist** on 27 May 2003, 6:16 a.m.,*
in response to message #4 by Johnny Billquist

I'll have to correct myself. It was too long ago since I looked at P41CV. The font is now there. Looks great.

I'll have to do some more evaluation of it, but I think I'm changing from Coconut...

41CV Gone Wild!

*Message #1 Posted by **gifron** on 23 May 2003, 2:11 p.m.*

See the original post of the same title at 17 May. This is a follow up.

The solvent recommended is methylene chloride, aka methylene dichloride (MDC), aka dichloromethane (DCM). I've found out that it is used in paint strippers, as a blowing agent in polyurethane foams, and as a decaffeinating agent, and that it causes cancer (depending upon whom you listen to). Nevertheless, I can't find any to use on my calculator. I found some paint strippers that contain it, along with a host of other unpronounceables, but not the straight stuff. As expected, any time I ask a store employee for help finding dichloromethane, they look just as lost as I do. Where can I find this stuff? Is there a brand name I can ask for?

Thank you in advance.

Re: 41CV Gone Wild!

*Message #2 Posted by **Randy Sloyer** on 23 May 2003, 2:24 p.m.,*
in response to message #1 by gifron

Look for plastic welding solvent cement sold in hobby stores. It is a clear, water-like liquid found in small bottles with a brush in the cap. It is the only thing that will penetrate the small cracks in the posts.

The right stuff usually says it causes cancer. But then, what doesn't?

Might not be available in all countries.

Re: 41CV Gone Wild!

*Message #3 Posted by **David Smith** on 23 May 2003, 4:09 p.m.,*
in response to message #1 by gifron

The stuff I use is called TENAX (X7R?). I get it at Hobbytown for about $3 for a small bottle. At one time there was a person on Ebay selling 2 liter bottles of reagent grade for around $10.

Re: 41CV Gone Wild!

*Message #4 Posted by **gifron** on 28 May 2003, 12:05 a.m.,*
in response to message #3 by David Smith

I found the Tenax at Hobby Town. Seems to have done the trick! Thanks to all who have had input. Hopefully I will be able to pass this or other information along to others in the future.

Re: AMBROID "ProWeld"

*Message #5 Posted by **Paul Brogger** on 23 May 2003, 4:37 p.m.,*
in response to message #1 by gifron

I found it as "Ambroid ProWeld" at a hobby shop -- clear, in a small glass bottle with a brush for ~$3.00 .

I'm not sure whether this is PURE methylene chloride -- I think it "contains" that key ingredient.

Incidentally, I (re)discovered a way to tighten up stripped screw posts in my still-not-working (#*&%$*&@!) HP-41CV: I shaved a sliver of plastic from inside one of the port covers, inserted it into the post hole, brushed around liberally with ProWeld, and then used a toothpick to hold the sliver against the interior post wall while the solvent did its thing. Where the screws used to simply turn ineffectually, they now bite nicely.

What's wrong with your HP41CV?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2003, 5:23 p.m.,*
in response to message #5 by Paul Brogger

Hi, Paul;

as you may have noticed, I don't like bad news and stuck (HP) calculators. What's wrong with your HP41CV?

Can we help anyway?

Success!

Luiz C. Vieira - Brazil

Re: What's wrong with your HP41CV?

*Message #7 Posted by **Paul Brogger** on 23 May 2003, 6:27 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

It's a fullnut.

The behavior (it does *behave* at least!) is consistent, but consistently bad. The leftmost columns of keys seem to have been randomly reassigned. They seem to consistently invoke the wrong operations.

For example, the 8, 9, EEX and back-arrow keys work correctly. But the 1 acts instead like the 9, and the 2 acts instead like the EEX. The shift key turns on the SHIFT annunciator, but the next keypress will consistently result in the wrong operation. Some of the unshifted keypresses will invoke operations which *should* be shifted(!?!?) (For example, the LOG key shows and executes the "ATAN" function.) Some keys cause non-alphanumeric symbols to be inserted into the display.

I can go into ALPHA mode, and start pressing the keys in sequence. I don't remember what comes out (I could reconstruct that easily enough), but in general, it's as if the keys generally on the left side and middle of the keyboard are "offset" in their alpha values by 4 or five places in the alphabet, while the rightmost keys give the proper letter. Very weird!

I've chased keyboard traces and tried to see whether the "1", for example, looks electrically like the "9" has been pushed, but to no avail. Within the capabilities of my limited diagnostic resources, the keyboard and display seem to be functioning fine.

Anyway, there's no way (that I know of) that such a cross-connection in the keyboard could explain the mapping of unshifted keys to shifted functions. I suspect a zapped ROM, with a scrambled jump- or lookup-table has caused a random reassignment of key functions.

I've messed WAY too much with the lower screws, posts, and zebra connector. I've tried soldering the CPU board to the keyboard, first with wire-wrap wire, then with ribbon cable. I've brushed and

cleaned, and scraped around solder pads and . . .

None of that seemed to change anything. It's consistently behaved the same, so I'm suspecting ROM damage. If anyone has any other suggestions, I'd LOVE to hear 'em!

Damaged ROM

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2003, 9:13 p.m.,*
in response to message #7 by Paul Brogger

Hi, Paul;

I have what left from three HP41's I could rebuilt two. This remaining carcass has two damaged ROM chips and one that is probably good.

If you look at the DIP 8-pin chip codes in your fullnut's mainboard you'll see three of them are 1LE90X and the others (RAM) are 1LA701 (all of the full-nut have it) and a set of five 1LB70x. If data is consistent, I can send this suspiciously good ROM of mine (worthless) so you can test in your HP41CV.

The one I have is the mid one, if I am not wrong it's an 1LE907 (not in fornt of me right now). E-mail me your actual address and I'll send it for you. If you test it and it does not change situation, keep it with you anyway and do whatever you want.

If it works fine, consider it a gift. As I mentioned before, I have no use for it. I was waiting for an actual chance to use it in a fair "mission".

Best regards and let's hope it's a solution.

Luiz C. Vieira - Brazil

Re: Damaged ROM (?)

*Message #9 Posted by **Paul Brogger** on 27 May 2003, 9:53 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Luiz:

You wrote:

"*If you look at the DIP 8-pin chip codes in your fullnut's mainboard you'll see three of them are 1LE90X and the others (RAM) are 1LA701 (all of the full-nut have it) and a set of five 1LB70x*"

Your description sounds as if there are a total of ten or more 8-pin chips on the fullnut main board. I only see seven on mine: five attached directly to the board, and two more, each stacked on top of one of the other five.

With the capacitor to the upper left, and the 8-pin chips across the top, reading from right to left, their numbers are:

```
ILG901 (attached directly),
ILA701 (stacked on another -- can't read its i.d. code),
ILH502 (attached directly),
ILH503 (attached directly), and
ILH505 (stacked on another -- can't read its i.d. code).
```

Also on the board are:

```
  a large 30-pin DIP across the middle
    (the CPU? – I can't see the numbers because of the buzzer disk);
  a 14-pin DIP running along the "left" side, below the capacitors
    ("1826-0953-1" / "RAYL8336"); and
  there are pads for a 20-pin DIP on the right side, but no chip there.
```

Thie 8-pin chip set doesn't sound very much like what you described. Perhaps you can advise me as to what I'm dealing with (and whether your ROM is likely to help)?

Thanks,

Paul B.

Re: Damaged ROM (?)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 12:04 p.m.,*
in response to message #9 by Paul Brogger

Hi Paul, folks;

as I like making public all of the informaion I can get here or anywhere, I'll reproduce the e-mail I sent you so anyone else that needs the information will ahve access to it, O.K.?

It seems to me yours is a newer HP41, maybe the newest of them all. As you post, I understand that yours has only one ROM chip, and I guess it's the 1LG901. The 1LA701 is a RAM chip and it has the sixteen system registers (stack, ALPHA, flags, controll, etc.) and the remaining 1LH50x are the remaining RAM, being the 1LH501 the first 64 registers (you do not see it) and the 1LH505 the last 64 ones. The other one you do not see is the 1LH504.

In my description, the set 1LE906/7/8 compose calculator's ROM, and they sem to be replaced by the new 1LG901, available in your model. In this case, the 1LE907 I was about to send you would be of no help at all. You need the complete set - 1LE906/7/8 - or another 1LG901.

Thank you for your valuable information. I was not aware of this new "chipset". As I collect information, this is something to be saved.

Thak you again and success! If you need anything else, be my guest.

Luiz C. Vieira - Brazil

HP-25 Repair

*Message #1 Posted by **Bernhard Emese** on 23 May 2003, 2:01 p.m.*

I bought my HP25 in 1978. Till now it is my calculator, it belongs to me, i love it. But in the 80th I had to send it for repair to HP because something was wrong, sometimes the display showed nonsense, sometimes there was only one digit visible. They repaired it and sold me a new battery as well. But it was not really repaired it had just some good days during the repair, because some days or weeks later, it was the same. I was not able to send it again to HP, which I should have done. It waited many years in a vitrine or somewhere else. Now I discover gradually that there are more people like me, which have this special relationship to their HP calculator. I see also these ebay auctions, where HP calculators were sold for high prices and I found this wonderful private HP Museum.

Now I stop these long history and come to the question. Is anyone able to reactivate my HP-25, by giving me those chips from his calculator, which is probably totally damaged in other parts, display or keyboard or else, so we can make one running into life by using two of them. Or does anyone have an idea where those chips can be bought, does HP have them in some old forgotten store. I can replace them be myself with a good soldering iron. Or does anyone have an better idea. Of course, I can buy a HP25 in ebay if I wait and find one and have enough money, but I would not be able to replace those chips from a functioning calculator into mine, by destroying the other one. How can I bring my old HP25 into life again?

Battery pack for HP29C?

*Message #1 Posted by **Steve Inselberg** on 23 May 2003, 1:41 p.m.*

Where can I obtain replacement battery packs for my 20-series (HP29C) and 30-series (HP34C) calculators?

Re: Battery pack for HP29C?

*Message #2 Posted by **David Smith** on 23 May 2003, 4:14 p.m.,*
in response to message #1 by Steve Inselberg

If you have your old packs, they can be rebuilt with new cells at battery stores like Batteries Plus or Batteries, Etc. I rebuild all my packs with high capacity (1800maH) nickle metal hydride cells. They will run the machine for three times as long (if you charge them three times longer).

Otherwise you will need to try the classifieds here or find them on Ebay.

The 34C battery can be faked very easily. It is just two AA rechargeable cells side by side. Again, the battery store can whip you one out for cheap. To get really fancy you need to fill one side of the valley between the cells totally with epoxy. The other side has only the top half of the valley filled. This prevents you from being able to install the pack backwards.

What to use with Alcohol when cleaning PCBs?

*Message #1 Posted by **Paul Brogger** on 23 May 2003, 1:31 p.m.*

I've been using Q-tips with 90% isopropyl alcohol when cleaning contacts on PCBs, keyboard traces, etc. But that leaves strands of cotton all over.

What do the experts recommend I use to apply the alcohol & "scrub" surfaces? (I assume something lint-free -- lens tissue?)

Thanks . . .

Re: What to use with Alcohol when cleaning PCBs?

*Message #2 Posted by **Randy Sloyer** on 23 May 2003, 2:41 p.m.,*
in response to message #1 by Paul Brogger

Household Q-tips will do that. Industrial cotton swabs with wooden handles are less prone to that annoying habit, as the cotton is wound tighter and glued better.

One place you can them order online:

www.techni-tool.com Item 758CH016 $11.10 for 1000 pcs

A Lab supply company should carry them as well. If you want to go all out, you can buy foam tipped swabs at 13X the cotton price. 758CH3160 $71.10 for 500 pcs..

Re: What to use with Alcohol when cleaning PCBs?

*Message #3 Posted by **Gordon Dyer** on 23 May 2003, 3:09 p.m.,*
in response to message #1 by Paul Brogger

I use lens tissues or lint free lens cloth.

Re: What to use with Alcohol when cleaning PCBs?

*Message #4 Posted by **David Smith** on 23 May 2003, 4:17 p.m.,*
in response to message #1 by Paul Brogger

The electronics industry uses "acid swabbing" brushes. These are made of bristles crimped into a hollow metal sleeve for a handle. Trim the bristles down to about 1/8 inch long. You can get them at many hardware stores, West Marine, and Harbor Freight Tools, etc.

Re: What to use with Alcohol when cleaning PCBs?

in response to message #1 by Paul Brogger

us hillbillies use the old toothbrushes that we done wored out.

Re: Toothbrushes

*Message #6 Posted by **gifron** on 24 May 2003, 1:03 a.m.,*
in response to message #5 by db(martinez,california)

You knew the toothbrush was invented in Arkansas, didn't you? If it was invented anywhere else, it would have been called a teethbrush! Wacka, wacka, wacka! ;) ;) ;)

But seriously, folks - We real hicks use a pocket knife to scrape each little leg till it's nice an' shiny. This method may not be very efficient, but at least there's a good chance you'll bend or break off a leg.

Oh, you asked about alcohol. One of those little sponge "brushes" that comes in a mascara case, or a sponge wedge, also used in makeup application. These are just ideas - I haven't actually used either one, but they seem to have the right firmness, with no cotton fibers to worry about.

Ok. Help for idiot (me) with HP-49 on PocketPC

*Message #1 Posted by **Gene** on 23 May 2003, 12:02 p.m.*

I've tried several times and have not been able to get the HP-49 emulator (Emu49) running on my PocketPC.

Could someone post idiot-proof instructions to help me out?

:^)

Re: Ok. Help for idiot (me) with HP-49 on PocketPC

*Message #2 Posted by **Chris Randle (UK)** on 23 May 2003, 2:57 p.m.,*
in response to message #1 by Gene

I'm using Emu48 (not 49). It all worked smoothly for me with one notable stumbling block:

On the initial startup screen, it asks you to enter OK which I kept trying to do by pressing the PocketPC's OK button. I think you have to type OK and return on the keyboard - at least it finally worked for me when I did that.

If that's not the problem then what's happening or not happening?

deskjet 6122

*Message #1 Posted by **qim** on 23 May 2003, 9:40 a.m.*

PC Win98SE connected Deskjet and to router w/ RJ45 cable Laptop XP connected to router with RJ45 cable

what drivers do I need for each of the computers?

qim

Re: deskjet 6122

*Message #2 Posted by **Ellis Easley** on 23 May 2003, 10:21 a.m.,*
in response to message #1 by qim

Is a "router" very different from a "hub" or a "switch"? I have managed to connect several Windows ME computers and one Windows 95 computer in a peer-to-peer network through a "switch" using only the Windows networking Wizard and the diskettes/CD-ROMs that came with the network cards or motherboards (those that have Ethernet onboard). The Windows 95 computer has a small Panasonic laser printer attached (a "Win [95] Printer" - no newer drivers to be found!) and it is accessible from the other computers as an HP LaserJet IIp. The WinPrinter has two modes of operation (on its host system): GDI or PCL. The PCL mode is shared, and is what shows up as a IIp on the other systems.

Re: deskjet 6122

*Message #3 Posted by **qim** on 23 May 2003, 6:49 p.m.,*
in response to message #2 by Ellis Easley

He ellis

well I got it going the same way and it has been working fine for a while.

But now i am having problems with Word and Dr. Watson reckons it is something to do with the HP driver.

But the driver download page does not seem to apply to my set up, so I don't know how to proceed.

I thought I would come to the experts...

Is there another forum that deals more specifically with this type of pquestion?

thanks

qim

Re: deskjet 6122

*Message #4 Posted by **Ellis Easley** on 24 May 2003, 5:50 a.m.,*

in response to message #3 by qim

There are some independent websites that archive drivers of all types - maybe that's what you mean by "the driver download page"? I can't think of the names of such sites but I'm sure Google would find them if you just ask for "drivers".

You might try calling HP customer service and saying you need the CD-ROM (or whatever they have) for the product. They sent me the latest CD-ROM for a digital camera that I bought as a clearance item without the accessories, and they didn't charge me anything.

Pioneer (17B,17BII,27S,42S) ROM image download?

*Message #1 Posted by **Christoph Giesselink** on 22 May 2003, 5:59 p.m.*

Hello I'm wondering if there are any interests in a quicker download of ROM images from the High End Pioneer calculators HP17B, HP17BII, HP27S, HP42S.

The ROM dump way from Jean-Francois Garnier published in HP-42S: New Facts is quite slow and needs lot of manual work.

My way needs also a HP48 as receiver with 70KB or 103KB (depends on the ROM image size (64KB/96KB)) of free memory, so a HP48G+, HP48GX or any other HP48 with merged 128KB RAM card is necessary. Further you need of course the calculator which ROM you want to copy.

The trick for the faster download is, that I use a binary data capable receiver program on the HP48 and machine written code on the Pioneer calculator. This machine code must by entered by the integrated memory scanner and may destroy the current RAM content. I takes about 5 - 10 min. to enter and verify this code. The program (~50 bytes) needs the ROM point entry of the IR transmitter function.

I know the entry of

- HP17B rev. B
- HP17BII rev. B
- HP27S rev. B
- HP42S rev. A
- HP42S rev. B
- HP42S rev. C

so far.

I have written a short description how to search for this address on unknown systems, most of the addresses from above have been detected by this way.

The automated download from the Pioneer calculator to the HP48 takes about 16 - 17 min. for a 64KB ROM image. Finally you have to transfer the captured string from the HP48 to a PC and decode the string on the PC with a command line program into the final ROM image. The whole process without searching for the ROM entry on unknown software revisions takes about 40 - 45 min, most time automated. The battery consumption is quite low on both calculators comparing to Jean-Francois way.

Is this interesting? I ask because the software is working, but writing the manual takes much time I wouldn't spend if there is less or no interest.

ROM images are necessary if you want to explore the operating system internals or you want to work with an emulator. I will update the HP42DEMO emulator in the next time allowing the usage of all four calculators above.

in response to message #1 by Christoph Giesselink

Christoph,

Thank you for all your hard work. I have a copy of your demo 42S emulator, it is most impressive.

I would be interested in this utility. I have downloaded my 42S C version with the time consuming and error prone manual method.

I would also be interested in a pre-compiled disassembler for the PC for working with the images. I have never been successful in compiling any of the sources available on the web, so I've been using my own very limited hacked together AWK program. As a result, I've never gotten very far with the study of the internals. I'm most interested in adding I/R input to the 42S.

Re: Pioneer (17B,17BII,27S,42S) ROM image download?

*Message #4 Posted by **Richard Garner** on 25 May 2003, 4:46 p.m.,*
in response to message #1 by Christoph Giesselink

What I am looking for is an HP 42s Emulator that is in an executable file that looks and runs like the v41 emulator on the PC. I do not have any of the java, C, Visual Basic or other compilers nor do I know how to ues them. Is there suca a program for the PC?

Re: Pioneer (17B,17BII,27S,42S) ROM image download?

*Message #5 Posted by **Christoph Giesselink** on 26 May 2003, 1:42 p.m.,*
in response to message #1 by Christoph Giesselink

Because there is so less response on this request I wouldn't make the work to describe the ability of faster ROM upload.

So the links from the GPL alpha version sources of Emu42 for Win32 article are still valid.

Changes to this article

- emulator update from 0.01alpha1 to 0.10beta1
- compiled EXE file now included in the package
- now works also with unpacked ROM images

Some additional remarks to the new emulator version:

The state file format is incompatible with the old emulator. I wrote a migration tool some time ago to handle different state file formats of the emulator, but I don't know if the migration tool can handle state file from 0.01alpa1. If somebody has spend many hours on entering program data to his emulated HP42S on Emu42 v0.01alpha1, and only then, and want to use this programs on the newer version, the old state file can send to

me. I will validate my migration tool with this state file then. My email address can be found on my homepage. Sorry for the inconvenience, but I hate spammers.

Old KML files need also some additional work, the "Model" argument changed from "P" to "D" at the HP42 and 2nd there's the new keyword "Hardware" with the argument "Lewis" to distinguish the KML files from different emulators. This allows to copy all KML files from Emu28, Emu42 and Emu48 into one directory, but this isn't recommended. The latest KML script file documentation can be found here. The KML file in the package contain already these changes.

The emulator Emu42 base on the sources of Emu48 and is published **without** any support. The emulator needs a ROM image. Because of license reasons ROM images aren't part of the emulator package.

Whither HP-11C Solutions Handbook?

*Message #1 Posted by **Patrick** on 22 May 2003, 4:43 p.m.*

I cannot find a .pdf version of the HP-11C Solutions Handbook (HP part # 00011-90009) in the Museum's CD set. I can't even remember seeing one being auctioned on eBay. Is this a rare beast?

Too bad HP doesn't supply .pdf versions of these manuals like they do for the 12C...

Re: Whither HP-11C Solutions Handbook?

*Message #2 Posted by **james** on 22 May 2003, 5:19 p.m.,*
in response to message #1 by Patrick

Patrick

My newly arrived set of CD's (Version 4.00) has it on CD4 in the Pacs directory - 11csoln.pdf - #00011-90009 - April 1981 - 101 pages.

Incdidentally, I'm very impressed with the CD's - amazed to find the PPC Rom manual was on it - excellent!

Regards

It's in my CD4, too!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 May 2003, 11:17 p.m.,*
in response to message #2 by james

Hi and thanks!

I was not aware of this book's contents. it's amazing! A lot of good stuff, indeed.

As James mentions, if you have your MoHPC set, this is the first PDF in a name-sorted directory listing.

Go there!

Best regards.

Luiz C. Vieira - Brazil

*Message #4 Posted by **Patrick** on 23 May 2003, 2:40 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

It turns out I hadn't copied CD4 to my work computer. I am such a dunce. In future, I recommend you not responding to anything I ask for a good 24 hours... gives me a chance to answer my own questions...

Thanks for not laughing, guys!

BTW... If you like the 11C book, check out the 15C Advanced Functions Handbook. It is quite incredible. Better than several numerical analysis course curriculums I've seen. I've actually got a paper copy of that one and I curl up with it just before going to bed some nights.

Ok, now you can laugh.

Great issue!

in response to message #4 by Patrick

Hi, Patrick;

In my "close encounter of the third kind" with an HP15C (the one I bought in the 80's) I was not aware of the Advanced Functions Handbook because Brazilian version simply removed all mentions about it. When I bought an HP15C Owner's Handbook (English version) and I read that I started to search for it and could not buy it at that time. This manual was THE one I mostly wanted in the MoHPC and my brother (that was in USA last year) ordered the complete set for me. First thing was to entirely print the Advanced Functions Handbook (except cover) in its original size, scan the HP15C Owner's Handbook cover and print it in color with Advanced Functions Handbook as title. The first time I could read one... Amazing.

Again, I was not aware of the HP11C's Solution Handbook, mostly because the original HP11C Owner's Handbook and Programming Guide has an excelent programming section that extends, as for applied techniques, to both HP15C and HP16C. I'd never imagine such a Solutions Book was available.

Thanks again for your kind advise.

Best regards.

Luiz C. Vieira - Brazil

*Message #10 Posted by **Valentin Albillo** on 27 May 2003, 6:18 a.m.,*
in response to message #9 by Trent Moseley

Diana Roy, Robert Barkan and Hank Schroeder wrote the HP-15C Owner's Handbook.

Professor William Kahan wrote a portion of the HP-15C Advanced Functions Handbook. Paul J. McClellan and Joseph P. Tanzini are the coauthors of the HP-15C Advanced Functions Handbook.

Source:

Hewlett-Packard Journal, May 1983, 11-page article "Scientific Pocket Calculator Extends Range of Built-In Functions" featuring the (then) new HP-15C, written by Eric A. Evett, Paul J. McCLellan and Joseph P. Tanzini.

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2003, 12:11 p.m.,*
in response to message #10 by Valentin Albillo

Hi, Valentin;

thank you!

I never understood why User's Guides and Owner's Manuals authors are not mentioned in the books themselves. Maybe it's a contract clause, but I do believe they should be mentioned.

In the HP15C Advanced Functions Handbook there are two mentions to the authors, but they refer to other publications, not specifically their credits for the Adv. Functions itself.

I have a few HP Journal issues, and I do not have this one. I did not find the time to "dig" the MoHPC completely; is this issue coppied there?

Thank you again.

Luiz C. Vieira - Brazil

*Message #14 Posted by **Gunnar Degnbol** on 27 May 2003, 3:05 p.m.,*
in response to message #10 by Valentin Albillo

William Kahan talks about the hp-15c and the Advanced Functions Handbook in this very interesting paper on his site:

MATHEMATICS WRITTEN IN SAND - the hp-15C, Intel 8087, etc.

http://www.cs.berkeley.edu/~wkahan/MathSand.pdf

The stuff in the AFH was not included in the standard manual because "a prudent marketing specialist" told them that users would get scared if they looked in the box and saw a tiny calculator and a huge manual.

There is much else in the paper.

Re: I am a dunce.

atan

*Message #1 Posted by **hugh steers** on 22 May 2003, 2:11 p.m.*

i see luiz has an article on trigs for the 16c (possibly also the 17bii). sorry, i missed this thread.

however, on the subject of inverses, i spent a while some time ago developing a fast arctan (but only single precision accuracy) using a limited pade approximation. not sure whether this is accurate or compact enough to be useful when converted to a calculator program, but here it is:

(sorry about the bad formatting, it gets mangled)

#define M_PI 3.141592654f

#define A0X 0.2388229612f

#define A1X 2.445205396f

#define B1X 3.943529789f

#define A2X 1.314747223f

#define B2X 1.798249626f

float atan6(float x) { /* correct to 3e-7. 4 multiplies/divides */ float x2; float v; x2 = x*x; if (x > 1.0f) v = M_PI/2 - (A0 - A1/(x2 + B1 - A2/(x2 + B2)))/x; else if (x >= 0.0f) v = x*(A0X + A1X/(x2 + B1X - A2X/(x2 + B2X))); else v = -atan6(-x); return v; }

HP15C emulator for the PocketPC

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 22 May 2003, 1:54 p.m.*

A seemingly interesting HP15C emulator for the PocketPC appears in:

http://microsoft.handango.com/PlatformProductDetail.jsp?siteId=75&jid=BF2C84CABF6633A5832424CAAEE298C3&catalog=0&sectionId=0&productType=2&platformId=2&productId=49174

I have not used it, this is just a pointer for who may be interested...

Please, somebody build this for PALM!!

*Message #2 Posted by **Patrick** on 22 May 2003, 4:46 p.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

It sure looks great, and the 15C *is* one of my favs. Alas, I have a Palm and I'm certainly not switching to another cumbersome Microsoft platform.

I just hope somebody eventually makes this for Palm. The KK-12C from KKtechnologies.com is a decent 12C emulator, but we need emulators for the out-of-production machines, too!!

Re: Please, somebody build this for PALM!!

*Message #3 Posted by **hugh** on 23 May 2003, 7:36 a.m.,*
in response to message #2 by Patrick

i wouldnt mind trying to build a palm version. are the roms available. ie free from copyright?

OmniSolve [Was: HP15C emulator for the PocketPC]

*Message #4 Posted by **Raymond Del Tondo** on 23 May 2003, 6:34 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

Too bad the 15C emulator is only for 'Pocket PC 2000/2002' . If there were a version for Handheld PC Pro, with WinCE 2.11 , it would be more interesting.

However, since my Jornada 690 has OmniSolve is built-in, there's not much need to 'upgrade'.

For those who don't know what Omnisolve is:

It's a very nice RPN calculator emulation, switchable between RPN and algebraic.

In RPN mode, it looks like an 11C or 15C, with minimal differences.

And best of all: It's FREE. You only have to have the Handheld PC, of course;-)

Raymond

Re: OmniSolve

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 23 May 2003, 8:28 a.m.,*
in response to message #4 by Raymond Del Tondo

Omnisolve was available as a software product from Landware (if I recall correctly), but was included in some HP Jornada handheld PCs indeed. Other brand (non HP) handhelds needed to buy it.

HP 85 gummy wheel repair

*Message #1 Posted by **hugh steers** on 22 May 2003, 1:31 p.m.*

i have a lovely hp85 microcomputer. however, inevitably the age has rotted the pinch wheel to gunge. is there an article on diy repair for this (i found ones for 67, 97 but not 85) or does anyone know the ideal sized part for replacement.

thanks for helping, -- hugh.

Re: HP 85 gummy wheel repair

*Message #2 Posted by **andy** on 23 May 2003, 4:18 p.m.,*
in response to message #1 by hugh steers

I repaired mine using heat shrink. It takes a little trying to get to it and you have to be very careful because there are some small parts which can fall out while trying to access the part the needs heat shrink.

Also, don't use Radio Shack heat shrink because its too smooth (and isn't very good for anything). I used 3M. I has a nice grippy surface and works great. I even found some in red which somewhat matches the original gummy wheel.

Best of luck...

Andy

Re: HP 85 gummy wheel repair

*Message #3 Posted by **Tony Duell (UK)** on 23 May 2003, 6:29 p.m.,*
in response to message #2 by andy

I took my 9915 tape drive apart recently -- AFIAK it's the same unit as in the HP85. Although there are some small rollers, etc that will fall out if you take the top section apart, it's easy to remove the capstan without doing that. All you do is remove the tape drive from the machine, disconnect the tachometer lamp leads from the PCB (some machines have these soldered in place -- my 9115 did, others have them plugged into little pin sockets on the PCB). Unplug the motor wiring from the PCB. Remove the 4 screws round the motor on the underside of the unit. Remove the motor and capstan complete. Undo the 2 Allen screws (0.050" key) holding the capstan to the spindle, and pull it off. Take great care not to damage the tachometer disk. I need to rebuild the capstan in this drive (and in some other similar HP drives I have here) -- can you tell me what the outside diameter of the capstan should be?

Re: HP 85 gummy wheel repair

*Message #4 Posted by **hugh steers** on 24 May 2003, 1:46 p.m.,*
in response to message #3 by Tony Duell (UK)

thanks for the help tom, i am following your instructions. i have removed the motor unit. the capstan is 3/8".

i am thinking of using some heat shrink like andy suggested, although i can only find the smooth stuff (maplin). also the capstan wont pull off, i've undone the two allen screws (i had to buy another set to get the small 1/20") should i just pull harder? although if i use skrink, i figure there's no real need to remove the capstan, now i have the motor out.

recommendations for shrink or another idea most welcome. thanks.

mistake

*Message #5 Posted by **hugh steers** on 24 May 2003, 1:56 p.m.,*
in response to message #4 by hugh steers

..oops, tony, why did i call you tom. this is what happens when you're fixing your hp's and cooking the dinner at the same time :-)

Re: mistake

*Message #6 Posted by **Tony Duell (UK)** on 24 May 2003, 6:09 p.m.,*
in response to message #5 by hugh steers

Don't worry about it -- I've been called many worse things than that :-)

Re: HP 85 gummy wheel repair

*Message #7 Posted by **Tony Duell (UK)** on 24 May 2003, 5:57 p.m.,*
in response to message #4 by hugh steers

The setscrews raise little burrs on the motor spindle which makes it hard to get the capstan off. What I had to do was remove the setscrews completely (they're not hard to handle on the end of the Allen key), then support the capstan under the capstan roller part (NOT the tachometer disk) with a pices of hard plastic (nylon?) clamped in the vice. I then used a soft metal (brass) drift and hammer to tap the motor spindle out. Oh yes, have some way of catching the motor when it finally does come free. For reassembly, I smoothed out the burrs on the spindle with 1000 grit wet-n-dry paper. When you say the capstan diameter is 3/8", I assume this is the diameter of the rubber part, not the metal hub (which is still intact, of course, in my drive).

Re: HP 85 gummy wheel repair

*Message #8 Posted by **Vassilis Prevelakis** on 24 May 2003, 7:05 p.m.,*
in response to message #7 by Tony Duell (UK)

But why go to all the trouble of removing the spindle, when you can replace the plastic coating of the capstan roller part while the spindle is still attached to the rest of the motor assembly.

Of course the first time you go through such an operation you may go a bit too far (I took the whole tape drive assembly apart and then had to put it together while all the little plastic bits tried to escape). Now I leave this alone and only remove the motor.

**vp

Re: HP 85 gummy wheel repair

*Message #9 Posted by **hugh steers** on 26 May 2003, 6:49 a.m.,*
in response to message #7 by Tony Duell (UK)

thanks. yes, i noticed looking down the holes that the spindle has been dented by the screws. i'll try a bit more force as you've suggested otherwise i'll give up and try to repair it whilst attached to the motor, which should be ok, unless i need to do something scary.

i measured 3/8" after i've cleaned off all the old rubber residue. my motor looks *exactly* like the picture here from vassilis (even the stray wires on the left).

It Works!!

*Message #10 Posted by **hugh steers** on 26 May 2003, 1:33 p.m.,*
in response to message #9 by hugh steers

i have fixed it with some heat shrink and it works. i can load programs and they run. what fun!

it rumbles somewhat whilst spinning the tape. was it originally real silent? i didnt know the original rubber thickness, so i put on two layers of shrink and hoped.

anyone interested can see by bodges here: http://www.voidware.com/calcs/hp85rep.htm

many thanks to people on this thread for their help!

Re: HP 85 gummy wheel repair

*Message #11 Posted by **Vassilis Prevelakis** on 26 May 2003, 2:54 a.m.,*
in response to message #3 by Tony Duell (UK)

```
Tony Duell (UK) wrote:
> can you tell me what the outside diameter of the capstan should be?
```

Here is a picture of the capstan. This is the *original* material which has turned into goo, but it is still retaining its original shape. The scale of the items in the picture can be extrapolated from the diameter of the metal spindle (which I assume is the same on all drives).

```
> Take great care not to damage the tachometer disk.
```

This is the semi transparent disc at the far end of the spindle.

thats *exactly* what it looks like. except i've cleaned off all the goo. the capstan head is 3/8".

Re: HP 85 gummy wheel repair

*Message #13 Posted by **Katie** on 25 May 2003, 12:49 p.m.,*
in response to message #2 by andy

Here's how I fixed the tape drive on my 9815:

In the plumbing department at Home Depot I found some stuff called Magic Wrap, it's a roll of very thin

rubber 1" x 16'. I cut a 2" x 1/4" piece of this stuff stretched it out to about the width of the roller then wrapped it around (several turns) the cleaned off roller as tight as I could. Then I smoothed it out by spinning the drive wheel at high speed and grinding down the rubber with an emery board. This sort of melts the rubber and fusses it to itself getting rid of the overlap and making the whole thing perfectly symmetric. To spin the drive wheel I disconnected one of the motor leads and put it on a variable power supply. You can use up to 12 volts but I found 5 or 6 volts ran the wheel plenty fast with tons of torque. Basically, you want to use it like a lathe and I found that the tape head makes a good tool rest!

Re: HP 85 gummy wheel repair

*Message #14 Posted by **hugh steers** on 26 May 2003, 6:54 a.m.,*
in response to message #13 by Katie

thanks. that sounds like a possible alternative idea. i dont have a home depot (i'm in london uk) but there might be something similar to magic wrap in my local diy store.

its sunny today and just for fun, i attached the motor to my 12v solar panel. it really spins! my alternative energy plan is on hold currently until i figure out how to make inverters happy with inductive loads :-)

Re: HP 85 gummy wheel repair

*Message #15 Posted by **rhahm** on 30 May 2003, 1:42 p.m.,*
in response to message #1 by hugh steers

I use 3/8" latex tubing from Lowes Hardware and LockTite glue. I also leave the capstan on the motor during the repair.

RH

compaq presario 2500 (2505EA) with windows 2000 has no proper video drivers!!

*Message #1 Posted by **Carlos** on 22 May 2003, 10:10 a.m.*

Hi all there,

I have just bought a brand new Compaq Presario 2500 (model 2505 EA) with Windows XP Home Edition preinstalled.

Unluckily (and unconciously) I have realized that I cannot install the windows 2000 professional on it. I have found in the Internet the drivers for the network card, but not for the video card (ATI Mobility Radeon 9000). I have found the drivers but, when I install them, the system tells me that "default VGA drivers MUST be loaded to be able to install the Mobility ones".

I have called the technical support and they have told me that this specific computer is designed for the Windows XP Home Edition :(. They have even told me that those drivers for ATI Mobility Radeon 9000 and Windows 2000 don't exist.

Has anyone have that problem as well?, can anybody help me?.

Thanks in forthcoming.

Re: compaq presario 2500 (2505EA) with windows 2000 has no proper video drivers!!

in response to message #1 by Carlos

Carlos,

Welcome to the wonderful world of Microsoft: you can only go forward, as in marching off a cliff; you can't go back.

You might check the discussion from a week or two ago about operating systems and old hardware.

If you are not wedded to the new video card, you might try an old card. I got an "XP only" Sony PC about a year ago, which the Best Buy folks said would work ONLY under XP. I tried putting Win98 on it, and it sort-of, barely worked - mostly because, like you, I couldn't get reasonable video. (I just swapped in a hard drive which had a complete Win98 system on it.) I finally put in a truly ancient PCI video card (STB Velocity 3D, borrowed from a Gateway PentiumPro), and it worked fine! These and similar video cards are available now on Ebay for basically the cost of shipping (under $10). If you don't need fancy graphics, they are fine. Typically, they have 2-4MB of video memory, and will drive a 1024x768 display in full color.

Moral of the story: if you want to be retro in your software, you probably have to be retro in (at least some of) your hardware!

HP19C & HP29C

*Message #1 Posted by **Howard** on 22 May 2003, 10:04 a.m.*

Does anybody know if the HP29C charger can be adapted to be used in the 19C?

Re: HP19C & HP29C

*Message #2 Posted by **David Ramsey** on 22 May 2003, 12:03 p.m.,*
in response to message #1 by Howard

Maybe. The HP-19C adapter outputs 8 volts AC; the 29C adapter outputs 10 volts AC. Perhaps just connecting wires from the output of the 29C adapter to the input pins on the 19C would be enough...

Re: HP19C & HP29C

*Message #3 Posted by **David Smith** on 22 May 2003, 4:33 p.m.,*
in response to message #1 by Howard

Probably not a good idea. The 29C charger is designed to charge 2 cells. The 19C has 4 cells. The 19C charger (82059A/B/C/D) is readily available on Ebay, etc. for very reasonable prices. It is the same charger used for the HP91/92/97/41C series accessories, etc.

Ebay
*Message #1 Posted by **Howard** on 22 May 2003, 12:28 a.m.*

I hope that the buyer was a sniper and only put in a plenary bid to win this item. See - http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3024706892&category=11713&rd=1 The item went from $78 to $159.28 in the last 10 seconds.

Re: Ebay
*Message #2 Posted by **james** on 22 May 2003, 8:08 a.m.,*
in response to message #1 by Howard

Ah, Therwil strikes again! At least he has something to put in his nice new box!

Re: Ebay
*Message #3 Posted by **DougT** on 22 May 2003, 12:14 p.m.,*
in response to message #1 by Howard

It's always entertaining to watch the bidding on choice HP items, even items I can't possibly afford. Some poor sap thinks his high bid will stand...but...denied! Therwil swoops in! I'm thinking that he HAS to have an addition on his house to hold all the HPs he's scored.

Worn out ENTER key
*Message #4 Posted by **Michael F. Coyle** on 22 May 2003, 1:28 p.m.,*
in response to message #1 by Howard

The enter button has been pushed a lot and the white paint on the "R" is worn off.

Does this mean that the 97, from the Golden Age of HP, has silkscreened key legends, not double-shot molded? Tsk tsk, HP.

Re: Worn out ENTER key
*Message #5 Posted by **David Smith** on 22 May 2003, 4:40 p.m.,*
in response to message #4 by Michael F. Coyle

There is a range of production dates for the HP97 that are prone to a nasty little key problem. The white shot molding step on the right hand keyboard keys was not done properly and the plastic for the white lettering was not only thin and incomplete but tends to decompose. What looks like worn lettering is actually missing or decomposing plastic. Then ENTER key is particularly prone to this problem.

On the subject of HP97 plastic problems... I have now seen three machines from the same date code series with identical cracks in the plastic case on the left hand vertical side of the case near where the printer sits.

*Message #6 Posted by **Juergen (CH)** on 22 May 2003, 1:41 p.m.,*
in response to message #1 by Howard

Some months ago, there was another guy (don't remember his eBay nick name) who bought many HP items for very high prices. And now, it's therwil. Sometimes I dream to be one of these guys having (too) much money to spend on eBay, but when I wake up, I have to admit that using HP calcs makes much more fun than just buying them. And when you buy dozens of calcs, you cannot use them all. Most of them end in (nice) boxes and wait for getting alive again... I think we have to found the HP socialists party: One HP calc for everybody! ;-)

Juergen

HP Socialist's party

*Message #7 Posted by **james** on 22 May 2003, 5:46 p.m.,*
in response to message #6 by Juergen (CH)

I think we need a mandate for two HP's for everyone - I wouldn't want to lose my 41 but I yearn for some red led's - but not much joy on ebay as most of the sellers only ship to the US and no doubt when I find an international shipper therwil and texaspyro will be there too with their sackloads of greenbacks!

Still - roll on the glorius revolution with the Carly-types swinging from the lamp-posts!

A thought: are therwil and texaspyro minions of Carly tasked to buy-up all proper HP calculators in a vain hope that the world will forget how great they are and start lusting after Kingpo's?

Must go and take my medication now.....

Re: HP Socialist's party

*Message #8 Posted by **Frank Wales** on 23 May 2003, 3:10 p.m.,*
in response to message #7 by james

...but not much joy on ebay as most of the sellers only ship to the US...

I have found that sellers whose auctions say this are generally willing to ship overseas if you say you'll pay the extra. However, it might also be good to identify a friend in the U.S. who will be willing to be sent things on your behalf, just in case the item of your dreams is being sold by someone who won't go for the extra postage.

...are therwil and texaspyro minions of Carly tasked to buy-up all proper HP calculators in a vain hope that the world will forget how great they are...?

Fear not; they don't have enough money.

Thanks for the advice

*Message #9 Posted by **james (UK)** on 24 May 2003, 5:16 a.m.,*
in response to message #8 by Frank Wales

Frank

Thanks for the tip - I had just assumed that they didn't want the hassle of someone across the pond subsequently complaining that the item didn't work properly, etc (although I couldn't reconcile this

with items such as books and manuals!)

Mind you, it'll help my bank balance if they don't sell internationally - until I get a friend in the States!

Re: Ebay

*Message #10 Posted by **Garry** on 22 May 2003, 2:10 p.m.,*
in response to message #1 by Howard

See my post of 13 May 2003. Seriously, Ebay only shows a bid 1 step higher than the previous high bid. If I bid a maximum amount of say $100, and the starting bid is $5.00, you have to bid at least $101 to snipe me. I always use a fairly high proxy bid on items I want. If you snipe me, you pay above what I was willing to pay. If you don't bid against me, I get the item for whatever the bidding went up to. Sniping is a loosing game. You have to pay more than everyone else is willing to pay, as Ebay shows time and time again...G-man

Re: Ebay

*Message #11 Posted by **James M. Prange** on 24 May 2003, 7:56 a.m.,*
in response to message #10 by Garry

Sniping is a loosing game. You have to pay more than everyone else is willing to pay, as Ebay shows time and time again...G-man

Well, the "winner" always has to pay more than everyone else bid ("Dutch" auctions excepted). But some buyers apparently don't bid what they'd really be willing to pay, apparently thinking that they can always put in a higher bid if someone tops their bid; I guess that they just don't "get" the proxy bidding system. So a sniper does have the advantage over those folks.

If there's a losing game, it's first off, bidding early, second, not using the proxy system sensibly, instead waiting until someone tops your bid before you raise your bid, and worst, getting into a bidding war and ending up paying more than you wanted to just to keep someone else from "winning" an item that you're bidding on.

On the other hand, the "winner" has to fork over his money, while the "loser" gets to keep his, so maybe the terms should be reversed. If I always "won" everything I bid on, I wouldn't be able to bid on so many things.

Regards,
James

*Message #12 Posted by **Trent Moseley** on 25 May 2003, 12:43 a.m.,*
in response to message #10 by Garry

My question is about the "gummy wheel". I just got my 67 back for the third time for card reader repair in 20 years. Even though this Ebay machine has been sitting on the shelf all this time, is the gummy wheel any good. I thought it deteriorated over time whether it was used or not.

tm

Re: Ebay

*Message #13 Posted by **Ellis Easley** on 25 May 2003, 1:12 a.m.,*

in response to message #12 by Trent Moseley

My 67, which had been attacked savagely with a screwdriver, looked otherwise like it had never been used. I think someone went crazy trying to figure out how to open it in order to figure out what kind of battery it needed (at least the voltage and polarity). Anyway, the copper springs that keep the cards lined up showed zero wear. The rubber wheel was completely gummy but also clear and adhered to the nylon roller in one spot (I never tried using the reader before opening it up). The wheel actually came off in one piece - it looks just like a pineapple flavor gummi lifesaver.

HP-67 for $885

*Message #14 Posted by **Juergen (CH)** on 23 May 2003, 2:38 a.m.,*

in response to message #14 by Juergen (CH)

Amazing - whatever next?

How long before the first $1,000 dollar case (in brand-new condition in original wrapping mind you!)?

Re: HP-67 for $885

*Message #16 Posted by **Ellis Easley** on 23 May 2003, 6:03 a.m.,*
in response to message #15 by james (UK)

Was it a 65 NIB that went for $1300 a few months ago? Also a new 35 without the hard case went for about $650, the seller said in the ad that he got it for free in a trade. The same time frame, tomd (I think) grabbed a (red dot?) 35 for $69 BIN. Another good topic for Archive summaries! (Actually two topics - Ebay and complaints about Ebay discussions!)

NIB=New In Box, BIN=Buy It Now

Re: HP-67 for $885

*Message #17 Posted by **David Smith** on 23 May 2003, 4:20 p.m.,*
in response to message #15 by james (UK)

It has happened many times already. The last two NIB HP67's sold for $1300+ and $1500+. Therwil got him a bargain! The last NIB HP65 went for $1900+.

Re: HP-67 for $885

*Message #18 Posted by **ToddG** on 23 May 2003, 8:07 a.m.,*
in response to message #14 by Juergen (CH)

The next highest bidder (k6ad) bid $875, up from the third highest bidder (texaspyro) of $478.

k6ad is probably still shaking his head and wondering what hit him.

Re: HP-67 for $885

*Message #19 Posted by **Howard** on 23 May 2003, 8:29 a.m.,*
in response to message #18 by ToddG

This sure makes my snipe look small fry. I hope k6ad was a friend of the seller and the ambit bid by him was to trap therwil. This might be the way to stop him.

What's the problem ?

*Message #20 Posted by **Bob** on 23 May 2003, 10:16 a.m.,*
in response to message #19 by Howard

What is the issue with "Therwil" buying calculators at higher prices ? They are only worth what he is willing to pay for them.

I doesn't really seem to drive up all of the other auctions as far as I can see.

Complaining about someone elses good fortune to be so wealthy to be able to afford whatever he wants is poor manners. The fact that he swoops in at the last minute and grabs the item from another's grasp is the nature of an auction, isn't it ?

I think that suggesting that there should be an attempt made to "stop him" is sour grapes and probably wouldn't work. As I said, they are worth what he is willing to pay. If he wants it, he has demonstrated that he has the resources to buy it and you can't cover every auction. Besides, showing that HP calcs are highly prized could have a postive effect on future offerings.

Bottom line is, the jealousy doesn't fit with the general atmosphere of the forum.

Re: What's the problem ?

*Message #21 Posted by **Patrick** on 24 May 2003, 12:37 a.m.,*
in response to message #20 by Bob

I totally agree, Bob.

It is reasonable to lament one's misfortune at not being able to afford (or not wanting to pay) $885+ for a nice item, it is quite another to insinuate that there is something wrong with someone who can.

Like it or not, this is the freemarket system at its best.

What's the problem???

*Message #22 Posted by **Mike** on 24 May 2003, 1:20 a.m.,*
in response to message #1 by Howard

I think he got a bargain. Absolute bargain.

The application packs alone are worth over $100 (5 at a low $20 each). The external battery charger could get $40. The AC Adapter $20 The manual $40

So, not counting the 97, he got $200 worth of items (very conservatively), for a bid of $159.00.

Keys can be replaced. I have at least 5 machines that I use for parts, so keys could have been replaced easily.

This was a very good buy!

HP25C survives ROM transplantation; donator is kept frozen

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 11:53 p.m.*

Latest news!

After about one hour span time since surgery room preparation to the few minutes post-surgery set of severe tests at the Intense Care Unit, the HP25C Serial # 1511Axxxxx recovered its full operating capabilities. Unfortunately, donator HP25 (ID not revealed so far) is kept frozen for later replacement as it becomes available.

Thanks to specialist advisors Ellis Easley, David Smith amongst intl. cooperators around the world not mentioned here because of a small lack of information, the offended ROM was identified as being the one at the left side of the ACT chip. A brief report mentions that the removed ROM was also tested at the donator's "guts", which showed the same behavior observed in the HP25C before transplantation: a blank display followed by a complete set of "zeroes" after any key pressed except number keys, [STO], [RCL], [f] or [g] and full operating RAM, registers and program steps. This ROM (1818-0154) is definitely toasted.

Thank you all for your attention and patience... reading this silliness.

Luiz C. Vieira - Brazil.

(This story is based in actual facts; original identity of both calculators was not revealed to respect their privacy)

good surgeon

*Message #2 Posted by **Norm** on 22 May 2003, 3:38 a.m.,*

Hearing HP-IL

*Message #1 Posted by **Renato** on 21 May 2003, 11:17 p.m.*

I got a 3421a unit. Nice one - three 10ch cards. As the sealed lead acid battery is bad, i decided to try reviving it. First approach is to let the 3421a try to recharge the battery, while monitoring voltage using the front panel inputs.

The point is: using the DCV routine, the 41cv is monitoring voltage on the battery continuously - late at night (you ´d guessed it...) I am certain that i can hear HP-IL module humming, in sync with the voltage readings. My guess is that HP-IL is using serial communications at around 2KHz. Does anynone know about it ? If I´m right, i´m not taking my ears to calibration :^)

Also, NiCd battery replacement is a popular subject here. What about SLA batteries replacement ? The 3421a uses a 3.2 AH 6V Panasonic. I found a Powersonic equivalent, at US$15.00. See http://www.power-sonic.com/, model is PS632. If anyone knows another alternative, please let me know.

Re: Hearing HP-IL

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 May 2003, 12:05 a.m.,*
in response to message #1 by Renato

Hi, Renato (lucky one!).

Congratulations! You have a nice data acquisiton system!

Just one information: the HPIL is electrically (de)coupled by a set of three independant toroid-core transformes built as one single unit with many terminals. You bet you're hearing them.

Keep them fine!

Luiz C. Vieira - Brazil

Re: Hearing HP-IL

*Message #3 Posted by **Christoph Klug** on 22 May 2003, 1:53 p.m.,*
in response to message #1 by Renato

Dear Renato,

the HP3421 IL-Data Logger is a nice HP-IL device. From a German supplier for model cars I get a replacement battery which is compatible to the original battery. Same batteries are used in the IL-Disk drive and the HP3468 IL-Digital Multimeter.

When you replace the battery do not remove the internal option cards than you need a new calibration of the system. Replacing the battery is possible with special screw drivers and tools.

Last not least for advanced data logging and measurement applications also I/O-Board and IL2000 System exist. This includes some nice features like, much digital input/output lines, some analogue input/output lines

with 12bit resolution, some different voltage supply lines, a modular hardware desing, solar charger option, control software for HP41. If you want to realise a data logger application which is limited by the features of the HP3421 than take the I/O-Board or IL2000 system. For more details refer to HP-Museum article forum :

003 HP41 Hardware Interfacing Activities
192 Interfacing IL2000 System to Analogue World
311 HP41-PC Gateway & Emulator

Best wishes from Germany - Christoph Klug

*Message #7 Posted by **Christoph Klug** on 26 May 2003, 4:49 a.m.,*
in response to message #6 by kim

Dear Massimo,

I want to help you with your HP-IL/PC installation. Please give me informations about your operating system and the software like Link Plus, or TRANS41 or EMU41 ?

Best wishes from Germany - Christoph Klug

Re: Hearing HP-IL

*Message #8 Posted by **Renato** on 23 May 2003, 12:52 a.m.,*
in response to message #3 by Christoph Klug

Dear Christof,

Thank you for the information. Do you know the brand and model# for the replacement battery you found ? Maybe I can find it here in Brazil . This would me much more convenient than the US source I found.

I did remove one internal option card, to remove the battery. I did not disconnect any cables for that - I guess recalibration will not be necessary . Do you agree ?

Thank you for the articles refs. I´ll look at them. I got this 3421a just for fun - I mean, I don´t have a specific application for it. Looks like other HP-IL itens might bring more fun ...

Best regards from Brazil,

Renato

Replacement battery for HP3421

*Message #9 Posted by **Christoph Klug** on 23 May 2003, 2:54 a.m.,*
in response to message #8 by Renato

Dear HP3421 enthusiasts,

yes the IL-Datalogger is a nice unit - also EMU41 with HP-Il/PC Interface Card have the power to control the HP3421.

For ordering a replacement battery refer to www.batt-mann.de In the list of the shop you will find :

Blei Akkus - 6V / 2,4Ah / 66 x 33 x 99mm

The identical battery is used by the IL-Disk Drive. About this you find some messages in the HP-Museum forum. When I remember correctly Raimund del Torno created a message about an alternative battery supplier in Hamburg...

Best wishes from Germany, and now realise your interfacing applications "to the world" (Gary Friedman) - or "to the future" (my own idea) - Christoph Klug

Re: Replacement battery for HP3421

*Message #10 Posted by **Ellis Easley** on 23 May 2003, 6:19 a.m.,*
in response to message #9 by Christoph Klug

The 3421 came with a slightly larger battery, 3.2 A-H. The replacement that a local battery store found for me (exact fit as original Panasonic battery) is "Power Patrol SLA0895", 6V 3.8 A-H.

Found a replacement battery for 3421a

*Message #11 Posted by **Renato** on 24 May 2003, 2:18 p.m.,*
in response to message #8 by Renato

I just bought a Unipower 6V 2.8AH SLA battery. It is shorter than the original panasonic, but H and W are the same - it fits perfectly in the 3421a. Paid around us$9.00

self-monitoring battery

*Message #12 Posted by **Ellis Easley** on 23 May 2003, 9:26 a.m.,*
in response to message #1 by Renato

Did you connect the low input to the battery negative terminal? If so, you have shorted out the battery fuse with your test lead! The fuse is between the battery negative terminal and ground. There is also a diode connected with its cathode to the battery positive terminal and anode to ground, between this diode and the fuse, if you accidentally connect the battery backward, the diode will conduct and the fuse will open, protecting the system.

In general, it is not a good idea to measure anything in a test instrument with itself unless it was designed to do so for test purposes. In this case, it would probably be acceptable to measure the battery voltage by connecting just the high input to the battery positive terminal, with a small error due to the voltage drop of the fuse. You would fail to sense an open fuse, but that is impossible anyway because the negative terminal of the battery charging circuit is connected to ground which is ultimately connected to the "analog ground" which the low input is connected to. I haven't yet determined from the service manual just where the analog and digital grounds are joined but I'm pretty sure they are connected, at just one specific point to avoid ground loops affecting the accuracy of the readings. These grounds are not connected to the power cord ground, there is only a spark gap between them.

With your mux board, you could measure the positive terminal and the negative terminal of the battery (with just the high inputs) and accomplish two things: (1)correct the reading from the positive terminal by subtracting the voltage on the negative terminal, which is the voltage drop of the fuse and the wire and (2) detect an open fuse, which would show up as a unusually high voltage on the negative terminal: even if the battery is fully charged and measures over 6V without any charging current, the positive battery terminal will be driven to 7.2V by the charging circuit so you would measure up to 1.2V on the negative battery terminal if the fuse was open.

Another measurement you can make regarding the battery charging circuit is the voltage across the current sense resistor, R705, a 0.27 ohm resistor located between the power transistor Q700 and the power transformer T700. One end is connected to ground and the other end is connected to the negative terminal of the bridge rectifier and its filter capacitor, C700. The negative lead of C700 is a good place to connect to it but it is hard to reach if you have the HPIB board installed, the resistor is easy to reach. I have been using my 3421A to charge some different size 6V lead-acid batteries and so I am very familiar with this circuit right now! After you let the battery run the system for a few minutes (my unit draws about 200 mA - this doesn't show up at the current sense resistor if you disconnect the AC and just let the battery power the unit), if you then turn the unit off and connect the AC again, the charging current goes to the limit right away (on my unit), I measure -136 mV on R705 which is about 1/2 Amp. While the current limit circuit is operating, the voltage is not being

regulated (they work through the same pass transistor). After a while the current starts dropping from the limit value and at this point the voltage regulator circuit starts working. My unit puts about 7.2 V on the battery at room temperature (there is an NTC thermister in the voltage regulator circuit that reduces the voltage as the temperature inside the cabinet rises). If you have one of the Panasonic batteries, it should have a description of the charging specifications printed on it. Mine says "Constant voltage charge - Cycle use: 7.25~7.45V (25 deg. C) - (Initial current: less than 1.28A [always .4 times the A-H rating on different size batteries] - Standby use: 6.8~6.9V (25 deg. C)" I have some different size Panasonic batteries that have slightly different voltages printed on them (10 A-H: says 7.3~7.5V for Cycle use). It appears that HP has chosen a voltage between the Cycle and Standby ranges. The different batteries that I have measured finally settle to a charging current corresponding to about 4 to 10 mV across the current sense resistor (about 15 to 40 mA).

With all my oscilloscopes, I need to connect one to this charging circuit so I can understand the function of one component: a capacitor connected to the outputs of the voltage regulator and current limit comparators. There is an LM393 dual comparator with open collector outputs doing both jobs. The voltage regulator comparator drives its output low when the battery voltage rises above its limit. The current limit comparator drives its output low when the current rises over its limit. The two outputs are "wire-ORed" together. At the outputs there is a 33.2K pullup resistor to the unregulated supply (12-18V) and a 1 microfarad capacitor to ground and the base of an NPN transistor with its emitter going to ground through a 200 ohm resistor (feedback, current limit?). The collector of the NPN goes to the base of a PNP power transistor whose emitter goes to the unregulated supply and collector to the positive battery terminal through a forward biased diode (I think this diode is to keep the charging circuit from draining the battery when the AC is disconnected). So the NPN is a phase inverter and voltage level shifter for the PNP pass transistor. When a rising voltage on the base of the NPN turns it on, it drops the voltage on the base of the PNP and turns it on. As long as either comparator output is low (voltage or current too high), the transistors are off. When both comparator outputs are high (voltage and current below their limits), the 33.2K pullup resistor starts charging the 1 microfarad capacitor. If the unregulated supply is at 18V, the 33.2K resistor would source .54 mA which would take a little over 1 ms to charge the 1 microfarad capacitor to 0.6V, at which point the NPN would begin to turn on. The capacitor would continue to charge, shunting some of the current that would otherwise turn the transistor on more quickly. This is where the feedback from the 200 ohm emitter resistor comes in, because as the NPN collector current (= PNP base current) rises, so does the NPN emitter current and emitter voltage and base voltage, which allows the capacitor to keep charging. If the NPN emitter was grounded and the 200 ohm resistor was between the NPN collector and PNP base, providing current limiting, the NPN base voltage wouldn't rise much after the transistor started to turn on, so the capacitor wouldn't charge much more and the transistor would turn on more quickly. When either comparator output goes low again (current or voltage rising above limit), its open collector output transistor turns on and shorts the capacitor to ground, quickly discharging it and turning off the NPN transistor and the PNP pass transistor. Now the 200 ohm emitter resistor might make the NPN turn off more quickly, because its voltage drop raises the emitter voltage and causes the base voltage required to keep the transistor turned on to be higher. Drawing a comparison to a music synthesizer, the capacitor (and the 200 ohm emitter resistor?) cause the battery charging current to have a slow attack and a fast decay. I suspect the voltage at the comparator outputs is a sawtooth wave.

Maybe the capacitor is there to slow the circuit down and prevent uncontrolled oscillations that might occur due to the lack of hysteresis in the comparator circuits. IIRC, the 9114 battery charging circuit has a comparator with hysteresis to turn on a sensitive gate SCR (gate driven with DC, load driven with pulsating [unfiltered] DC). You can see the comparator limits by monitoring the battery voltage and watching the LED (which provides a trickle charge current when the SCR is off).

Re: self-monitoring battery

*Message #13 Posted by **Renato** on 23 May 2003, 10:57 a.m.,*
in response to message #12 by Ellis Easley

Ellis,

Thank you for so much information.

You said: "Did you connect the low input to the battery negative terminal? If so, you have shorted out the battery fuse with your test lead!" My comments: I did connect low input on ch 0 to battery negative. Consequence is that when when a measurement is started on ch 0, 3421a locks up, and needs off/on cycle. There seems to be no further consequences (I hope...).

Connecting battery terminals to front panel input seems to be ok - DCV readings are consistent. Do you know if there is any risk from doing this ?

Re: self-monitoring battery

*Message #14 Posted by **Ellis Easley** on 24 May 2003, 5:21 a.m.,*
in response to message #13 by Renato

Only a possible ground loop. Bypassing the fuse is a potential safety (at least to the machine) issue but other than causing a ground loop I don't think it would affect the reading. I'm surprised that connecting to the negative terminal through the mux causes a problem! Unless it is that when the relay on the mux closes, it causes a transient on ground that leads to a CMOS chip latching up. I verified that analog ground (for instance, the low input on the front panel) does go back to power supply ground (like the fuse on the battery negative terminal) but if you track it down in the PCB traces, I think you will find that there is exactly one point where the analog ground connections join the power supply, or digital, ground. Adding another wire from the battery negative terminal to the low input creates the ground loop that can cause problems.

I've been thinking some more about the 1 microfarad capacitor and the 200 ohm resistor in the charging circuit. Now I think that the capacitor's main job is to integrate the pulses on the comparator outputs and the reason for the feedback from the 200 ohm resistor is to do a voltage to current conversion from the capacitor voltage to the NPN transistor collector current. So the comparators are generating a pulse width modulated error voltage reflecting the battery's voltage as compared to a reference, which the capacitor integrates to an analog voltage level, and then the NPN transistor and the 200 ohm resistor convert the capacitor voltage to a current to drive the PNP base, thereby controlling the voltage at the battery.

Re: self-monitoring battery

*Message #15 Posted by **Renato** on 24 May 2003, 2:29 p.m.,*
in response to message #14 by Ellis Easley

Ellis, Although I don´t fully understand your explanations, I agree that connecting ch0 low input to battey negative does not cause harm. About locking the 3421a, maybe this unit is not perfect - I just got it, and do not have a assesment about its condition.

Thank you.

Renato

Re: self-monitoring battery

*Message #16 Posted by **Ellis Easley** on 25 May 2003, 2:48 a.m.,*
in response to message #15 by Renato

I don't expect it will cause harm to the machine but I still believe it can cause erroneous operation because of a ground loop. Also, although you are using an instrument to measure inside itself which is really not a good idea, since the battery negative terminal is in fact

connected (through the fuse) to the digital ground and to the analog ground and the low input, you don't need to connect it with another wire to measure the voltage at the battery positive terminal. If fact, if you want to measure the voltage between any two points in the 3421A with itself it would be best to measure the voltage on each point separately using only one wire to the high input and then calculate the difference between the two readings. And there are plenty of points in the analog input section that it would be a very bad idea to connect to the high input.

The thing about the ground loop is that inside the 3421A HP has gone to pains to make sure everything connected to the low input of the sensitive input circuit is isolated from the electrically noisy ground of the logic circuits and power supply. By running a wire from the battery negative terminal to the low input, you are defeating HP's isolation efforts and exposing the input circuitry to all that noise. It's completely different from connecting the low input to a noisy ground on another piece of equipment because the 3421A is designed to only measure the difference in voltage between the low and high inputs and ignore the "common mode" voltage upon which is riding every signal in the equipment under test. The manual has a description of how the instrument even works to average out the differential mode noise (originating in the AC power mains) that comes in on a signal to be measured, which is the reason for the 50/60 Hz switch on the back panel.

Here's an example of what can go wrong: I have some HP equipment that have voltage regulators with pass transistors in the negative side of the supply - not negative voltage supplies but positive voltage supplies which are regulated by having pass transistors between the negative side of the unregulated supply and ground. The positive output comes directly from the positive side of the unregulated supply. The 3421A has something a little like this in that it has the 0.27 ohm current sense resistor between the negative side of the bridge rectifier and ground. The significance is that there is a point (in an otherwise positive-voltage-with-respect-to-ground circuit) more negative than ground. If the 3421A had such a negative side voltage regulator, with a pass transistor between the negative battery terminal and ground, and you connected the low input to the battery negative terminal, you would short out the pass transistor and all the circuits in the unit would be exposed to a higher voltage than they were supposed to see.

Re: self-monitoring battery

*Message #17 Posted by **Renato** on 27 May 2003, 1:50 a.m.,*
in response to message #16 by Ellis Easley

Ouch. I guess I was pretty lucky.

Thanks for the information. BTW: is your 3421 being useful ? What for ?

Renato

Re: self-monitoring battery

*Message #18 Posted by **Ellis Easley** on 28 May 2003, 7:28 p.m.,*
in response to message #17 by Renato

Currently it is just charging batteries! (or should I say "constant voltagely"?) Actually, one of the projects I have in mind for it is to test batteries - discharge, recharge, monitor voltage and current, calculate capacity, etc. - just for self-edification.

Re: self-monitoring battery

*Message #19 Posted by **Renato** on 28 May 2003, 10:01 p.m.,*

in response to message #18 by Ellis Easley

Ellis, Quite interesting ! I could have written your exact words. Battery charging was a important issue for me in the 80s. It is important again now - my woodstock collection is almost complete, and if I succeed on efficiently handling batteries, i will try to use a 21 daily.

Best regards from Brazil.

Renato

HP-97 printing problem

*Message #1 Posted by **Juergen (CH)** on 21 May 2003, 4:39 p.m.*

I've got an HP-97 which only works partly. I can calculate, but whenever I press any key that causes a printing action, the calc turns off :-(Any idea what's wrong with the calc?

Thanks, Juergen

Re: HP-97 printing problem

*Message #2 Posted by **Chan Tran** on 21 May 2003, 5:19 p.m.,*
in response to message #1 by Juergen (CH)

Is it possible that the battery is low. Or the printer mechanism is jam

Try the ADV buttom

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 5:37 p.m.,*
in response to message #2 by Chan Tran

Hi;

based on Chan Tran's precise advice, you can simply press the ADV button, the one at the right side of the printer, and see if the paper advances. If the paper goes without trouble, than both batteries and mechanics are fine; otherwise, Chan Tran's advices are correct and it's most likely to be.

If the problem happens only when a printing command is attempted, than you may have electronics problems.

Let us know about what you get.

Success!

Luiz C. Vieira - Brazil

Re: Try the ADV buttom

*Message #4 Posted by **Tony Duell (UK)** on 21 May 2003, 6:49 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Another possiblity is a shorted transsitor in the H-bridge driver circuit for the printer motor. When the other transistor in that side of the bridge is turned on (to run the motor for either the printing command or the ADV button), then the circuit effectively shorts out the power line. Needless to say if this is the problem, then the ADV button won't work either. I have seen this once, not in a 97, but in another Topcat that I repaired for somebody. A rather rarer machine than the 97, too...

Re: HP-97 printing problem

*Message #5 Posted by **Juergen (CH)** on 22 May 2003, 5:47 a.m.,*
in response to message #1 by Juergen (CH)

The battery should be OK. It's a rebuilt one, and I've charged it over night.

The printer mechanism looks fine.

The ADV button does not work. If I press it, the calc turns off.

So it looks like it may be the problem Tony described. I don't know much about electronics. Anyway, is there a chance to fix this?

Thanks, Juergen

Re: HP-97 printing problem

*Message #6 Posted by **Erik Wahlin** on 22 May 2003, 10:38 a.m.,*
in response to message #5 by Juergen (CH)

Is the print head located in the far right position? It may be that the reed switch (activated by position of print head) is not properly set. I can't remember if this would cause the problem you are seeing.

Re: HP-97 printing problem

*Message #7 Posted by **David Smith** on 22 May 2003, 4:47 p.m.,*
in response to message #1 by Juergen (CH)

If the HP97 printhead cannot be made to return to its "home" position the machine will lock up in a loop looking for the "HOME" signal. HOME is generated by a small magnetic reed relay.

There are two main causes of the problem. First is a jammed print head. The other is a bad printer gear. The gear was made of a soft plastic that likes to loose its teeth. See Katie's piece in the Articles section for a possible source of a replacement gear.

HP-97: HOME sensor loop? Interesting!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 22 May 2003, 11:48 p.m.,*
in response to message #7 by David Smith

Hello, David;

I found very, very interesting this fact. If the HOME sensor is not triggered, than the display blanks and stays like this? Say, you you have the mottor wires simply removed when the head is not at HOME position, than you'll have the same symptom?

Just wondering about it. If so, maybe it's gona be easier to repair if this is the situation

Juergen, have you noticed where is the head parked? Left- or right-most position?

Let us know.

Success.

Luiz C. Vieira - Brazil

Re: HP-97: HOME sensor loop? Interesting!

*Message #9 Posted by **David Smith** on 23 May 2003, 12:37 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Yes, the machine will lock up in one of several different ways. It can give a blank display or an "Error" display. It may also light up but go away the first time you hit a key.

If the head is not a HOME when you power it on, the machine tries to move the head to HOME. If it is jammed, HOME never happens, the machine gets hung up.

Re: HP-97 printing problem

*Message #10 Posted by **Juergen (CH)** on 24 May 2003, 2:02 a.m.,*
in response to message #7 by David Smith

This really seems to be a problem. I made the following test:

1. I manually moved the print head to its home position by turning the gear with my fingertips.

2. I turned on the calc, entered any number and pressed 'print'. The number gets printed, but then the print head stops and does not move back to its home position.

3. Same test with ADV button. The print head stops in the middle.

I closely looked a the printer mechanics. Did not see any problem.

Any idea why the print head does not move to its home position is highly appreciated.

Thanks, Juergen

Unobtainium or Neverexistedium ?

*Message #1 Posted by **GE (France)** on 21 May 2003, 4:13 p.m.*

While browsing the MoHP CDs, I remarked in the preface of the PPC ROM User's Manual (not a "guide" !!) that the author had a chance to play a bit with a prototype EPROM version of National Semiconductor's never released NS7100. Sure this machine must be very very rare, as all unreleased models. So comes up the question : which is the rarest ? The top contenders must be the HP95C, the TI88 and the NS7100. I think this is the right order from "most common" (!) to the rarest. Does anyone have EVER seen an NS7100 ? Never heard of such an encounter. V.Thoth has a TI88, the only publicly advertised ever. Probably less than a dozen of these leaked from TI. If I recall correctly from posts here the HP95C is in the less-than-100 league. Do you know other such very-very-hard-to-find models ?

Re: Unobtainium or Neverexistedium ?

*Message #2 Posted by **Ron Ross** on 21 May 2003, 4:37 p.m.,*
in response to message #1 by GE (France)

I suggest you switch the order of the 95c with the Ti-88.

My thoughts, the Ti-88 made it to store shelves, to be immediately pulled. Therefore, there must be more of them, but these very Ti calculators were pulled because of failure rates and poor life history. Therefore, most probably did make it back to Ti, but even a small % would probably be higher than a 100. Now how they were treated by their owners??? "$#%^& Ti doesn't work!! I'll throw this piece of $%^& right in the Garbage and buy an HP!"

Well maybe anyway.

Well, I'm still looking for a commodore!

*Message #3 Posted by **Gene** on 21 May 2003, 4:40 p.m.,*
in response to message #1 by GE (France)

I have been searching for an M55 calculator for years. Have yet to see one on ebay.

Anyone have one for sale? :-)

There was one of these on ebay...closed today or yesterday.

Re: Well, I'd take a TI SR60 desktop off someone's hands :)

*Message #6 Posted by **David Smith** on 22 May 2003, 4:55 p.m.,*
in response to message #4 by Bill Wiese

I paid 10 bucks for a nice working SR60 at the Tucker Electronics in Dallas a few years back when they had their surplus store. One pops up on Ebay once or twice a year.

For the real exoitca freak, I snagged some TI calculators that were modified with different displays for market research studies. At the time TO only offered red LED's. These freaks had LCD, green LED, and orange displays. The machines were tossed in the TI trash, rescued by a scrounge, and sold for a pittance and the Dallas electronics sidewalk sale.

Re: Well, I'd take a TI SR60 desktop off someone's hands :)

*Message #7 Posted by **GE (France)** on 23 May 2003, 3:35 p.m.,*
in response to message #6 by David Smith

We want pictures !!! ... of the insides would be even better... Thank you !

Do the 'bout 200 Xpander count?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 11:30 p.m.,*
in response to message #1 by GE (France)

Hi;

I'm not such an equipment collector, instead I search for technology and information. Mostly because technology and information, once disclosed, remain with the keepr and may spread around everywhere without "fading", instead it is reinforced.

Anyway, I thik the most recently come-to-be-rare piece of technology is the Xpander. It is very well known and documented, also those who posess one of it will keep them with another perspective.

I compare all of them, HP95C, TI88, Xpander and now the NS7100 with each other, no way to try to reason about these "guys" as regular equipments that were never released. At the moment they become "Unobtainium or Neverexistedium", they go to another level of existence...(?)

I like more reading about them than reasoning about them. They are already history, and at this point, history cannot be changed. Also, I'd like to thanks to each one of those brave keepers who disclosed these dazzling, rare pieces of information I like so much to keep in mind.

My thoughts... Oh, I have 1¢ in my pocket!

HP41-CV

*Message #1 Posted by **Dan Coll** on 21 May 2003, 3:44 p.m.*

Using an HP41-CV with Financial Module I: when in "user" mode - I press the function key and then the "CHS" key to start a payments program, but instead the display show "ISG". How do I get out of this and back to normal program operation? Will appreciate assistance. Thanks in advance.

Re: HP41-CV

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 4:06 p.m.,*
in response to message #1 by Dan Coll

Hi, Dan;

try this:

1- go to normal mode, if needed (Press [USER] untill USER annunciator is off)
2- press [SHIFT] (golden key) [ASN] [ALPHA][ALPHA] [CHS]
3- Try [CHS] key again in USER mode

You probably had [ISG] assigned to [CHS] once and this assignment is still active. Unless you have a SHIFT key pressed before [CHS], what is most unlikely, because you did not press it.

When the callculator is not in USER mode, does [CHS] work fine? if so, the sequence above may return [CHS] to its normal operation while in USER mode.

Let us know if you succeed doing this.

Best regards.

Luiz C. Vieira - Brazil

Re: HP41-CV

*Message #3 Posted by **Dan Coll** on 23 May 2003, 11:55 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Your fix did the trick! I had to be in USER mode; [SHIFT][ASN][ALPHA]typed in "money"[ALPHA][SHIFT][CHS]. That did it. The MONEY program is now at the CHS key when in USER mode = where it is supposed to be.

Thanks so much for your help on this.

Best regards, Dan Coll

HP41-CV - another USER mode trick

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2003, 2:02 p.m.,*
in response to message #3 by Dan Coll

Hello, Dan;

I'm glad you made it!

Another small notice about USER mode and assignments.

There are two basic types of "programs" in any HP41: those writtne by the user and those available in ROM modules. Financial Decisions Pack is a ROM module wiht many programs that you can use, list and load into RAM (COPY function).

While these programs are sored only in ROM, their "label" is treated by the system as an XROM function and may be assigned to as many keys as you can asign their name to. But if you have a program in RAM with a global labels, i.e., lable with ALPHA characters, these labels can only be assigned to one key at a time.

If you create a program with a LBL'GO anywhere, each time you assign 'GO to a new key will clear previous assignment. This is because global labels store the assignment in the LBL function itself, and general functions store their assignments in part of the calculator RAM (one register is needed to hold two assignments).

If you already know about this, forgive me; maybe others will find it helpful.

Cheers.

HP-71B-Programming ROWDRV (Display driver)

*Message #1 Posted by **Alain (Canada)** on 21 May 2003, 11:26 a.m.*

Hello all,

I'm studying the HP-71B internals, especially the display driver. To do that, I try to modify/improve existing LEX and got stuck with one particular entry. While studying the DSPLEX that changes the behaviour of the display (such as "small fonts, invert etc) I was surprised how easy the implementation of the small font feature was. Changing fonts from normal to small is achieved just by setting ROWDRV to the value "0000800360041008".

What does the ROWDRV entry point for the HP-71B. The IDS volume 1 says : "Row lines (16 nibbles). Should be set by software as follows: 8001400220041008". This is set accordingly in "LCDINI" (see IDS volume 3 page SB&DVR-34) and says "Bit pattern for driving display".

Notice that the hex sequence is symmetrical from the middle (: 80014002 Vs 20041008).

Is there anybody that can give a definition of the pattern and how it affects the display behaviour ?

Thanks

Alain Robillard

*Message #2 Posted by **GE (France)** on 21 May 2003, 1:39 p.m.,*
in response to message #1 by Alain (Canada)

Is this operation possible with the bare bones machine ? Thank you.

Re: HP-71B-Programming ROWDRV (Display driver)

*Message #3 Posted by **Alain (Canada)** on 21 May 2003, 2:06 p.m.,*
in response to message #2 by GE (France)

Hello,

Is it possible with the bare bones machine? I would guess so, the operations to switch to small font is :

```
SMA    LCHEX  0000800360041008 * Small constant
STORE  D1=(5) ROWDRV           * Point to row driver
       DAT1=C 16               * Write out C and return
nxtstm GOVLNG NXTSTM           * return to main loop
```

so, technically, just a poke to ROWDRV (E2350) with the proper value is required.

Regards

Alain Robillard

Re: Ooopps Wrong Address !HP-71B-Programming ROWDRV (Display driver)

*Message #4 Posted by **Alain (Canada)** on 21 May 2003, 2:26 p.m.,*
in response to message #3 by Alain (Canada)

Opps!,

wrong address for ROWDRV, it is NOT E2350 but 2E350.

ROWDRV = 2E350.

Also, a simple poke does the joke as far as SMALL is concerned. But, you must enter the reverse string :

Poke "2E350", "8001400630080000" will put the HP-71B display in small font mode.

Regards !

Alain Robillard

HP17BII wanted

*Message #1 Posted by **inmasan** on 21 May 2003, 6:36 a.m.*

I'm looking for a financial calculator which is out of catalogue: HP17BII. I need it urgently as my chief lost his and cannot learn a new users-guide everytime he changes the machine. Can anyone help me?

Re: HP17BII wanted

*Message #2 Posted by **Dave Shaffer** on 21 May 2003, 12:29 p.m.,*
in response to message #1 by inmasan

Try E-bay. I searched with this string: " hp 17* calc* " and found a dozen or so for sale at the moment. Other permutations will probably find additional items.

One of the best deals appears to be this one (and the seller ships internationally)

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3025902428&category=11712

Good luck.

Hello Mr. Sus

*Message #1 Posted by **Mike (Stgt)** on 21 May 2003, 3:48 a.m.*

Hello Mr. Sus!

Your father told me that you are in HP-Museum minimum one hour daily to watch nice pictures of old calculators. If you buy the CDs here you may watch them as long as you like. <G>

And if you like some real old calculators just let me know.

Greeting from Stuttgart to Asperg :-)

.....Mike

From hp12c platinum owner's handbook

*Message #1 Posted by **J.Manrique Lopez de la Fuente** on 21 May 2003, 2:49 a.m.*

I received my hp12c platinum yesterday, and I've read this on backside of cover from the Owner's Handbook:

```
Manufacture's name: Hewlett-Packard Co.     KINPO ELECTRONICS
                                             (CHINA) Co., LTD
```

Ok, everybody knows that new HP calculators (9 series and 12c) are being made by Kinpo, but I couldn't imagine that HP would officially put it on their products.

This is my first «Voyager», and I like it very much, specially its keys feedback. Nice to see that Kinpo can do this kind of keys. I will send some of my impressions and photos I've taken to Jordi Hidalgo for his review for next HPCC Datafile.

Best regards,

J.Manrique

Re: Where can the 12c plat be purchased now?

*Message #4 Posted by **Richard Garner** on 21 May 2003, 1:59 p.m.,*
in response to message #2 by Gene

The only place I have seen them so far is eBay.

Re: Where can the 12c plat be purchased now?

*Message #5 Posted by **Stan (Sg)** on 22 May 2003, 8:40 a.m.,*
in response to message #2 by Gene

I have seen them at a specialty store in Singapore. I was going to buy one until I saw the discussion about how slow it was solving the financial equation. I wonder if the 12C Platinum that I saw could have been a preproduction model? It was in an unopened blister pack, so perhaps not...

As mentioned in other posts, it's too bad that trig functions were not included in the new version. Having said that- I am really glad to see a new RPN model.

Re: HP12c platinum -- But Does It Turn Itself Off Regularly???

*Message #6 Posted by **Paul Brogger** on 22 May 2003, 8:52 a.m.,*
in response to message #1 by J.Manrique Lopez de la Fuente

As (only) an observer, I'd think the major question is whether they fixed the automatic shut-down at the end of each program execution. That seemed easily the most damning "feature" of the version used for Beta test.

. . . so, to any of you who've obtained an off-the-shelf, retail-ready model: Does it turn itself off?

Apparently Not . . .

*Message #7 Posted by **Paul Brogger** on 23 May 2003, 1:09 p.m.,*
in response to message #6 by Paul Brogger

FYI, Jordi Hidalgo amswered this question via email with a reference to this message. From this I take it that his unit does not exhibit the turn-off problem.

Finance and Statistics Pacs for HP-71B

*Message #1 Posted by **Wektor** on 21 May 2003, 2:01 a.m.*

Hello!

I am searching for Finance and Statistics Pacs for HP-71B to use them with the HP-71X emulator for HP-49G. I was able to find JPC, Math and HPIL ROMs from various sources (and on the ftp server on this site, among the others) but wasn't able to find Finance and Statistics. Are they available anywhere on the web?

Regards.

HP 25 Display

*Message #1 Posted by **Charles** on 20 May 2003, 6:08 p.m.*

I have an HP 25 which works well but the display is a bit dim certainly when compared with my HP 35 and HP 33E. Is there anything I can do about this or could it be terminal ?

Re: HP 25 Display

*Message #2 Posted by **Michael F. Coyle** on 20 May 2003, 10:15 p.m.,*
in response to message #1 by Charles

If you feel like going into your calculator and doing a small modification, you can make your display brighter.

Open your machine. At the top of the main circuit board there are two IC's, one with 18 pins, one with 20. Pin 6 on the larger IC is connected to ground through a 3K resistor. This resistor sets the display current and hence the brightness. Replacing it with a somewhat smaller value will brighten the display.

I tried this on an HP-21. I didn't remove the existing resistor but temporarily put a 4.7K resistor in parallel with it, giving an equivalent resistance of about 1.8K. The increase in brightness was modest but noticable.

Warnings: Don't do this unless you are very comfortable about disassembling your calculator and replacing components. Don't overdo it -- too much current could damage the display or its IC's. Finally, more current will reduce battery life and increase recharge time while the calculator is on.

Have Fun!

HP 25 question (again...)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 11:26 p.m.,*
in response to message #2 by Michael F. Coyle

Hi Michael;

you mentioned both IC's under the LED assembly (viewing from the top). Which one is the HP25 ROM? I always forget that, and it's been mentioned so many times... q:o)

Not a "senior moment", instead a lazy guy. :(

Thanks... :)

Luiz C. Vieira - Brazil

Re: HP 25 question (again...)

*Message #4 Posted by **Ellis Easley** on 20 May 2003, 11:35 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz, I don't have my 25 open in front of me, but an HP memory chip should have a part number beginning with 1818-. Other digital logic IC's like the ACT will start with 1820-. Of course, there are the parts with alphanumeric part numbers (like the 1LB3-0003 HPIL chip for example, also most of the 41C chips including the memory chips) which seem to be HP manufactured chips. The "other" chip (not the ROM) under the Woodstock display might be such a chip but I think the ROM will have an 1818- part number. So will the other ROM and the RAM(s) on a 25, while the ACT will have an 1820- part number

Re: HP 25 question (again...)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 12:40 a.m.,*
in response to message #4 by Ellis Easley

Hi, Ellis;

thanks for your help. I have mine in hnads right now and it's convinientely without the two small screws.

On the top of the smallest IC, 18-pins, I read

```
MK60030N (MOSTeK)
MALAYSIA
1818-0163
```

The other one, 20-pins, allows the reading of a faded "**20**" and nothing else. This "**20**" comes from 1820, I guess.

May I consider this 1818-0163 the ROM chip, with almost all HP25 internal resources? I want to xchange the 25 ROM with the 25C's to verify if the 25C's can be repaired. AFAIK, they are interchangeable, right? If so, I prefer having an HP25C in hands and save the HP25 as for spare parts. It also has a damaged LED display.

Thanks again, Ellis.

Luiz C. Vieira - Brazil

Re: HP 25 question (again...)

*Message #6 Posted by **Ellis Easley** on 21 May 2003, 3:35 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

The only thing I have an opinion on is that 1818- means a memory chip! I don't know what's interchangeable except what David Smith has said - including that the "only" ROM in a 21 (under the display) isn't the same part used in the 25. Another thing, the 25 should have two ROMs and one or two RAMs. The RAM or RAMs are nearest to the ACT, I believe, and the second ROM is at the bottom of the PCB but further from the ACT.

Re: HP 25 question (again...)

*Message #7 Posted by **David Smith** on 21 May 2003, 2:48 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

The HP25 has two ROMs. The first is included in the 18 pin display driver chip under the display module. The other is the vertical chip on the left side of the big 22 pin ACT chip. This one seems to be the one most likely to die.

Thanks (again...) David, Ellis. (n.t.)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 4:08 p.m.,*
in response to message #7 by David Smith

HP15c - HELP

*Message #1 Posted by **Mitch Linne** on 20 May 2003, 3:45 p.m.*

I have a "c" annunciator on the display and don't know what it means. It may be coincidental that the calculator works unpredictably also. What is it and how do I turn it off? I dont have a manual handy. Thanks

Re: HP15c - HELP

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 3:49 p.m.,*
in response to message #1 by Mitch Linne

Hi;

this annunciator means your HP15C is operating in Complex (numbers) mode.

To clear it and return to normal operation:

[g] [CF] ([5] key) [8]

It should disappear.

Best regards.

Luiz C. Vieira - Brazil

Re: HP15c - HELP

*Message #3 Posted by **Patrick** on 20 May 2003, 3:57 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Listen to Luiz. Not only is he faster off the mark, he's also more accurate. Of course, you set and clear flags with the [g] prefix, not [f]. Didn't have the machine in front of me...

On the other hand, Mitch, if you really can't be bothered, why not send the 15C to me and be done with it? I'll certainly pay your shipping charges.... ;-) It'll save you a trip down to the railroad tracks.

Re: HP15c - HELP

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 4:43 p.m.,*
in response to message #3 by Patrick

Hello, Patrick;

I consider myself as playing in the best team: ours.

It was a matter of about 1 minute. And your answer called the attention to the one of three possible ways to set Complex mode ON; mine didn't.

Best regards fornm a "forumate".

Luiz C. Vieira - Brazil

(A curiosity of mine: what's the story behind the railroad tracks?)

Re: RailRoad tracks

*Message #5 Posted by **Ron Ross** on 20 May 2003, 4:50 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Seems like people on one side of the tracks can afford an Hp or even better, lots of Hp's.

On the other (wrong) side of the tracks, one can only afford one Hp, or worse, have to use a Ti.

railroad tracks

*Message #6 Posted by **Ellis Easley** on 20 May 2003, 5:05 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I think this was a reference to Norm's advice on how to repair a 32SII:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=33664

Time sweeps our sins away - into the Archives!

Re: railroad tracks

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 5:37 p.m.,*
in response to message #6 by Ellis Easley

Hi, Ellis;

that was my first guess... A mention to Norm's post or a possible "name"/person confusion.

Best regards.

Luiz C. Vieira - Brazil

i have fixed clock radios

*Message #8 Posted by **Norm** on 20 May 2003, 10:39 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

U guys are really skeptical of that advice about using train tracks to repair stuff.

Listen, I have fixed clock radios, televisions, and old modem boards using the same techniques.

I did it mostly when I was a teenager in high school, but even nearing 40, I still occasionally fix things by the same method.

Definition of "FIX"

*Message #9 Posted by **glynn** on 20 May 2003, 11:02 p.m.,*
in response to message #8 by Norm

-- To make stable or unchangeable.

Yeh, I can see how that would do it. ;-)

Ever heard of Dictionary.com ?

*Message #10 Posted by **Norm** on 21 May 2003, 3:20 a.m.,*
in response to message #9 by glynn

Ever heard of Dictionary.com ?

http://www.dictionary.com

I've been using it ever since my dictionary got buried underneath a landslide of old vinyl records and dirty laundry.

"FIX" as a term comes up fine:

fix P

Pronunciation Key (fks) v. fixed, fix·ing, fix·es v. tr.

1. a.To place securely; make stable or firm: fixed the tent poles in the ground. See Synonyms at fasten.

1. b.To secure to another; attach: fixing the notice to the tracks.

2. a.To put into a stable or unalterable form: tried to fix the conversation in her memory.

2. b.To make nonvolatile or solid.

2. c.Biology. To kill and preserve (a specimen).

3. To direct steadily: fixed her eyes on the railroad ahead.

4.To capture or hold: The train engineer with the long beard fixed our attention.

5. a.To set or place definitely; establish: fixed her residence in a coastal village.

5. b.To determine with accuracy; ascertain: fixed the date of the repair of the calculator.

5. c.To agree on; "I will fix your calculator using that train track method".

Re: HP15c - HELP

*Message #11 Posted by **Patrick** on 20 May 2003, 3:50 p.m.,*
in response to message #1 by Mitch Linne

The machine has gone into "Complex" mode wherein it performs operations with complex numbers. There are a number of reasons why it might do this, the most common being that you pressed: f I

To go back to normal calculation mode (Real mode), clear flag 8: f CF 8

HP42 S - Latest Generation?

*Message #1 Posted by **Brendon Hutton** on 20 May 2003, 11:54 a.m.*

Hi All,

Please excuse this VERY stupid question.

I have used an HP42S for many years and finally, I want to get a new HP calculator...

I LOVE the HP42s and the complex function/speed/ease of use that I experienced with this calculator.

I also have the 48SX but have been very unhappy with this and do not really use it much...:o(

PLEASE can someone advise what I can buy now that is VERY VERY similar to the HP 42S and offers ease of use, robust, complex features and RPN.

Thank you for your time...

Re: HP42 S - Latest Generation?

*Message #2 Posted by **Dave Shaffer** on 20 May 2003, 12:09 p.m.,*
in response to message #1 by Brendon Hutton

Brenda,

Unfortunately, it appears that there isn't any good news. At the moment, your best (expensive!) bet is to buy ANOTHER 42S on Ebay.

There are rumors of new HP RPN calculators, to appear "real soon now," and we are all waiting hopefully, but not too optimistically, that they will be the equal of past products.

Re: HP42 S - Latest Generation?

*Message #3 Posted by **D. Webster** on 20 May 2003, 12:13 p.m.,*
in response to message #1 by Brendon Hutton

As a long time 42S user, IMO there is simply nothing else like it. HP has no current RPN scientifics. Not a one. "New ones coming" is the marketing speech. No dates, no models. Ugly situation, but then the ugly truth is better than a pretty lie.

Buy a used 42S and be happy. Buy a new one and be happier. HP made a batch of service spares as late as 2000. They can still be found, albeit at high prices.

I second the others...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 2:12 p.m.,*
in response to message #1 by Brendon Hutton

Hello, Brendon;

your question is not stupid at all. We all in here that already have an HP42S and, mostly, those who had and/or still have an HP41 are waiting for this day long before you post your question.

There is nothing like the HP42S so far. The only upgraded version is a custom HP42S with 32KRAM, but this is not an official HP upgrade (I call it HP42S+). I am not sure about who was the first one, but names like Paul Brogger, Tony Duell and Randy Sloyer, amongst others (if I mispelled someones' names, please, correct me; thanks) are directly dealing with this. I myself have upgraded at lesast three HP42S to 32KRAM, and it's a stable upgrade (except for my own HP42S that is not working but I guess it's another cause). Your HP42S will be able to hold extra 24KBytes, and it's quite cool.

Many things have been discussed here about the HP42S, and both I/O (mostly) and expandability are the most desirable features we would like to see in an upgrade. So far, nothing official comes from HP headquarters. Gen. Fiorina signed no signs.

As mentioned above, we're waiting for new models. If they are following existing ones, most of us in here will remain waiting. Me included.

Best regards. And keep using your HP42S; do not get tired of it.

Luiz C. Vieira - Brazil

Thank you

*Message #5 Posted by **Brendon Hutton** on 20 May 2003, 3:26 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Dave, Mr/Mrs Webster, Vieira,

Thank you so much for this insight. I thought that I was way behind the times... I guess now that I am not so... I LOVE the 42S and would not want to change it for anything else.

Thanks to the three of you, I am up to speed.

Kind regards, Brendon

H-P: Are You Listening?

*Message #6 Posted by **Paul Brogger** on 20 May 2003, 4:54 p.m.,*
in response to message #5 by Brendon Hutton

Another vote for appropriate technology, exhibiting the kind of loyalty that you just can't engender by outsourcing *every*thing in a half-hearted attempt at playing the other guy's game . . .

Re: HP42 S - Latest Generation?

*Message #7 Posted by **Ernie Malaga** on 20 May 2003, 10:24 p.m.,*
in response to message #1 by Brendon Hutton

Brendon:

If you can work with a calculator that has less features (but otherwise works like the 42S), you can try to get a 41CX. The 42S was designed to be "41-compatible", so that programs written for the 41 could be ported to the 42 with a minimum of effort.

It works the other way too, provided that you're not using any of the features available to the 42 only -- like hyperbolic functions, variables, and alpha strings longer than 24 characters.

Check the museum's information about the 41 and see if it fits your needs. I believe that getting a 41 is somewhat easier than a 42.

-Ernie (a happy 41CX owner)

Re: HP42 S - Latest Generation?

*Message #8 Posted by **Johnny Billquist** on 21 May 2003, 8:01 a.m.,*
in response to message #7 by Ernie Malaga

The HP-41 is both more and less than the HP-42. Variables and long alpha strings. Larger display and soft keys are HP-42 stuff you won't find in a HP-41.

On the other hand, the HP-41 have more computer-like functionality. Very extensive I/O, ram disk, clock and calendar functions, extended functionality with modules...

Personally, I'll take the 41 over the 42 any day of the week, but that's just my very personal opinion.

But in order to have a very good HP-41, you really want a CX with the Advantage module. You might want to throw in the MATH and STAT modules as well. A card reader, and you have a nice setup.

A better approach, indeed

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 21 May 2003, 1:57 p.m.,*
in response to message #8 by Johnny Billquist

Hello, Johnny;

I'm a devoted HP42S user, mostly because I'm an Electrical Engineer, I deal with surveying data and programming and I like having "redy-to-use" tools. The HP42S has a set of resources that ar hard to beat: matrices and complex arithmetic plus numeric integral, and these are desirable tools for an electrical engineer. Also, the BASE set is handy if you want to develop a concise set of programs to deal with binary data.

Still the biggest handicap: no I/O facilities. Increasing RAM to 32K and stuffing it in creates a headache bomb: if memory is cleared somehow, you'll have to stuff it in again by the keyboard.

The better approach I'm refering to is the Advantage module. Brendon's first request was about complex and matrix abilities, and the Advantage is the closest answer. There are other ROM's that allow some matrix arithmetic, like the CCD, but the Advantage adds significant power to the stand-alone HP41CX.

Just my thoughts.

Luiz C. Vieira - Braxil

Re: A better approach, indeed

*Message #10 Posted by **Chan Tran** on 21 May 2003, 5:25 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

I believe matrices, complex arithmetic and numerical integral are the strong points of the 48 series.

Re: A better approach, indeed

*Message #11 Posted by **Johnny Billquist** on 22 May 2003, 7:10 a.m.,*
in response to message #10 by Chan Tran

Well, with advantage, the 41 have very nice matrix operations. Complex math works fine too, as does numerical integration.

What the 48 have is the ability to do symbolic stuff, a large stack (with complex numbers, the 41 only have two levels), and graphing.

But I must say, that after using my 48 for about ten years, I'm now back with my 41.

Re: A better approach, indeed

*Message #12 Posted by **Ernie Malaga** on 22 May 2003, 11:50 a.m.,*
in response to message #11 by Johnny Billquist

>But I must say, that after using my 48 for about ten years, I'm now back with my 41.

I don't blame you. I _tried_ to use a 28C, a 48GX and a 49G, but RPL drove me absolutely up the wall. Maybe I'm myopic or old-fashioned, but to me there's nothing like the 4-level-stack RPN.

And the HP-41 keyboard is superb.

-Ernie

Re: A better approach, indeed

*Message #13 Posted by **Ernie Malaga** on 22 May 2003, 11:48 a.m.,*
in response to message #10 by Chan Tran

Chan:

Brendon wanted to know an RPN machine, not an RPL. That's why I didn't mention the 28C/S, 48S/SX/G/GX, 49G, and all that nonsense. 8^)

-Ernie

HP-48GX <==> Macintosh: help, please!

*Message #1 Posted by **Simon Lockyer** on 20 May 2003, 11:52 a.m.*

I would like to connect my HP-48GX to my Macintosh (blue & white G3, OS 10.2.6); would some kind and knowledgeable person, or persons, please e-mail me some information to assist me in this endeavour? I am not familiar with either the software, or the hardware involved. When I search the HP site, there is a choice of more than one cable that appears to be designed for this application, but there is no accompanying information about which model(s) of Mac they are intended for, or with which OS the software is intended to function. In short, I am no wiser for having visited the HP site.

As all readers will know, there is also the problem of obtaining the part(s), if they are HP, so I would also appreciate some pointers on where to obtain what it is that I need.

I know I'm asking a lot, but HP customer support referred me here, so I am hoping that the answers will be found here.

Please e-mail: slockyer@cox.net

Many thanks in advance, Simon

Re: HP-48GX <==> Macintosh: help, please!

*Message #2 Posted by **Steven Kutoroff** on 26 May 2003, 10:16 a.m.,*
in response to message #1 by Simon Lockyer

I have an HP-48SX with a similar (not same) serial cable and I used to use it with my older Macintosh computers. Let me offer what I know.

The calculator to Mac cables used the Apple serial round connector. The calculator to PC cable used the 9-pin D shell serial style connector for PCs. This connector is not compatible with your Blue and White (or any other recent Macintosh) which use USB ports and not serial ports.

A company (name is out of head for the moment) makes serial to USB converters. I have used the original model of this adapter to mate my calculator, printer, and Newton to the computer (years ago now). The later versions of the USB serial adapter offered both Apple style and PC style connectors.

That may help you solve the physical connection problem. Now comes the software problem. You need a program to talk to a serial port. In the old days, Mac OS 7, 8, and 9, this was done with a modem program like KERMIT or the terminal application in the older AppleWorks program.

The HP-48SX used KERMIT file transfer, the GX may be similar.

The last time I did any of this stuff was under OS 9 on an iMac long before even the beta release of OS X!

I may look for my old serial to USB adapter and try it out, but I think the version I have is no longer supported and I haven't even thought about how it might work under OS X (I too used 10.2.6 now).

If I have an answer, I will add a new post. Contact me if you wish.

Good luck.

Re: HP-48GX <==> Macintosh: help, please!

*Message #3 Posted by **Steven Kutoroff** on 26 May 2003, 12:18 p.m.,*
in response to message #1 by Simon Lockyer

I found the USB to Serial converter! It is made by a company called Keyspan. The model I have is the USA-28 and I know it was replaced by one called the USA-28A and probably others. Look for www.keyspan.com (I haven't bothered yet).

I also dug up my HP-48SX serial cable and the software disks, but the HP disk is the old 800K flavor and my USB floppy disk drive only reads the 1.44MB flavor disks. I will be taking the disks to work and converting them. I am going to see if the program it came with the cable will run under Classic (now I am curious). Then I will see if the old Keyspan will work with OS X at all.

This is something I have been wondering about myself. I have an old Macintosh in the basement that the software and the cable will work with, but that is no use to you nor is it of interest to me.

I can confirm that the 48S series and 48G series use the same Kermit protocol and the same cable. The 48G series also includes a built-in XModem protocol that the 48S series doesn't have. I may be able to help on the various I/O settings on the calculator, but I've never had a Mac, so I can't help you at that end of the connection

Re: HP-48GX <==> Macintosh: help, please!

*Message #5 Posted by **Steven Kutoroff** on 31 May 2003, 7:48 p.m.,*
in response to message #4 by James M. Prange

There was a post last week or so on using the HP48 calculators with a Mac, I have been playing with this for a week now.

You need a KeySpan USB to serial adapter as well as the cable for the calculator. I have a KeySpan USA-28. The latest software from them installs and behaves as they describe. In OS X, the two ports appear in the /dev directory as soon as the unit is plugged in.

If you have the KeySpan USB adapter and the latest software from them, you may be able to use AppleWorks 5 for OS 9 to link to a HP48G series. AppleWorks 5 (but not 6) had a communications module with XModem, but not Kermit. I have an HP48SX and could not test this.

I have searched for OS X applications that support modem operation and have two candidates.

One is the original C-Kermit program, but this is a terminal (no GUI) application and it is anything but user friendly, just installing it from the download takes several not so obvious commands.

Not only that, but the command to connect to the port is not accepting any of the device names I have tried. I have a trouble report open with them asking about this.

There is an alternative called PowerTerminal, and I trying to get the demo version to download, but it times out each time I try. You can find it with Version Tracker by searching for "terminal emulation".

If anyone has this or tries it, let us know. I will be trying again.

Once I get something to work, I'll be back with a post.

Voyager Logo Transfer

*Message #1 Posted by **Patrick** on 19 May 2003, 3:52 p.m.*

I have two HP-15C's. One is in very nice condition, other than the fact that it is missing the HP logo / badge. The other is in ok condition (some scratches/indents on the metal bezel) but, you guessed it, it has a pristine logo.

Of course, I would like to move the logo from one machine to the other.

Does anyone out there have experience doing something like this? How is the removal performed safely? Am I likely to ruin the badge? There are so many Voyagers on eBay with missing logos that I'm thinking it can't be *that* hard to get the darn thing off!

Re: Voyager Logo Transfer

*Message #2 Posted by **Ellis Easley** on 19 May 2003, 3:57 p.m.,*
in response to message #1 by Patrick

I once got some replacement logos from EduCalc that came with very thin double sided foam tape on them, I've never been able to find foam tape that thin (not just clear double sided tape which would be too thin).

From what I have seen, HP used something like RTV to attach them at the factory. That's the kind of job where you need to make sure you apply just enough, and not too much, to stick without creating a mess. (in a factory setting)

Someone here has recommended using ShoeGoo for the purpose.

Re: Voyager Logo Transfer

*Message #3 Posted by **Ellis Easley** on 19 May 2003, 4:00 p.m.,*
in response to message #2 by Ellis Easley

Forgot to say, it should pry off pretty easily with your fingernail or something narrow to get in the gap. You should find that the logo is "floating" in a shallow pit.

Re: Voyager Logo Transfer

*Message #4 Posted by **Katie** on 19 May 2003, 7:43 p.m.,*
in response to message #2 by Ellis Easley

The tape that I use for this and lotS of other calculator repairs is carpet tape. It's very thin, super strong and incredibly cheap. Try it you'll like it!

Re: Thin Double-stick

*Message #5 Posted by **Paul Brogger** on 19 May 2003, 7:48 p.m.,*
in response to message #2 by Ellis Easley

I've been using "carpet tape" in some applications, and it works very well. It's thin, heavier than regular "Scotch tape", clear, and very double-stick. It comes in a too-big roll, with white backing. (It's meant to hold rugs in place so they won't slide.)

I think it would be adequate for holding logo plates on pampered Voyagers . . .

Re: Thin Double-stick

*Message #6 Posted by **Randy Sloyer** on 19 May 2003, 9:29 p.m.,*
in response to message #5 by Paul Brogger

Some of the Voyager logo plates are etched zinc, not molded plastic. They are commonly found on early versions, before big production quantities got cranking.

You'll need to use glue, as the badge is hollow. The edges will not provide enough surface area for a secure bond with double-stick'em.

the problem is getting it off.

*Message #7 Posted by **NH** on 20 May 2003, 1:35 a.m.,*
in response to message #6 by Randy Sloyer

You guys are telling him how to stick it back on. That's easy, doublesided 3M tape, but the problem is how to get the logo OFF.

I will now speculate, having zero experience:

Method #1: Get the frame taken all the way apart, bend the tar out of the metal, until the logo peels away from the metal.

Method #2: Use a brand-new single-edged razor blade to gently slide under the logo, presumably, cutting thru the doublesided tape or the epoxy that is already there.

Method #3: X-acto knife, cut into at just one edge, then use it as a pry-bar , if its an epoxy-bond, it will all of a sudden pop-off of there.

dont forget about method #4

*Message #8 Posted by **NH** on 20 May 2003, 1:44 a.m.,*
in response to message #7 by NH

dont forget about method #4

this can solve no end of calculator ailments:

1. Carefully balance the calculator atop the train tracks of the mainline Burlington Northern going thru town.

2. Wait for the train to come thru.

3. After the train has passed, everything should be okey-dokey.

:o]

Don't forget, since there are two rails, it is possible to fix two calculators simultaneously using this technique.

why not epoxy

*Message #9 Posted by **NH** on 20 May 2003, 1:48 a.m.,*
in response to message #7 by NH

also, there is a push here to use 3M double-sided tapes, BUT, arent they kind of goooey , and a little too thick?

Whats wrong with gently roughing up the metal surface, and also, roughing up the back of the plastic logo (sandpaper roughing is needed for establishing a mechanical bond with epoxies). When roughing the metal, could use some masking tape to rough only the area where the bond is desired. (oooooh smarter yet, drill little teeny holes that allow the epoxy to push thru)

Go ahead and use a colored 2-part epoxy. Shucks, use clear if that suits. Apply a sufficiently thin amount that the logo can be pressed down the correct amount, such that the side-squeeze-out is not objectionable, so that you dont get into trying to touch the epoxy and smooth it over (bad idea) try to get a bead that is slightly squeezing out, then leave it alone.

All things considered, I think thats what I would do. Any 'big box' home hardware store has got 2-part epoxies in all sorts of color blends.

Re: why not epoxy

*Message #10 Posted by **james** on 20 May 2003, 8:29 a.m.,*
in response to message #9 by NH

Be very careful to use only a very miniscule amount of expoxy if using method #4 to prevent too much side squeeze out as your pride and joy might get stuck to the rest of the train and disappear.

Re: the problem is getting it off.

*Message #11 Posted by **Ellis Easley** on 20 May 2003, 5:43 p.m.,*
in response to message #7 by NH

"Method #1: Get the frame taken all the way apart, bend the tar out of the metal, until the logo peels away from the metal."

I don't know whether this would alter your plans, but the logo is actually glued to the plastic of the case top. It sits in a square hole cut in the aluminum bezel.

Re: Thin Double-stick(HP41 feet)

*Message #12 Posted by **Chris(FLA)** on 20 May 2003, 9:42 a.m.,*
in response to message #5 by Paul Brogger

I've been using "carpet tape" in some applications, and it works very well. It's thin, heavier than regular "Scotch tape", clear, and very double-stick. It comes in a too-big roll, with white backing.

I have my originaly bought 41 (2051AXXXXX - high top keys) that I opened years ago (I like to know how things like this are made). I opened the unit a couple more times and then used a double sided tape that turned to goo and the feet feel off. The tape also softened the feet. I will get the "carpet tape" but my question is:

What do you folks use for new feet? I read awhile back about bicycle tubes. But this seems like it will

be somewhat ugly. You know tire tubes aren't designed to be seen and have powder on them.

Has anybody found anything better for this fix?

This is my prized unit that never leaves the house and I would like to return it to "near" new looking condition.

Any suggestions very, very welcome.

Thanks,
Chris

Feet -- Consider getting them made

*Message #13 Posted by **Norm** on 20 May 2003, 1:01 p.m.,*
in response to message #12 by Chris(FLA)

When U bring up the topic of new rubber feet, this seems quite pertinent. I sold an HP-25C to a happy buyer, but in noting that the unit was well-worn, one of the most worn portions was the feet, and I wished there was a way of replacing them.

So far, I have just felt lucky and thankful, everytime I buy a used HP-34C and the feet are in pretty good shape. But perpetual hope is not the way to build a railroad .

HERE's my suggestions:

1. If there are units that have ivory feet (hp-25C) then be willing to substitute black material. That is, always go with black, even if it wasn't originally. That type of alteration is too minor to perceive, and it avoids trying to locate oddball colors.

2. At least some products could use ordinary "3M" rubber feet, which are extremely mass-produced, stuck to the bottom of millions of items made currently, and available from Digi-Key etc etc in many shapes and thicknesses.

3. Even if you could locate the material (a sheet or roll-stock) I doubt you could cut it acceptably by any manual method. It would look terrible. You need a cutting die that cuts under pressure.

4. Expecting that you CANNOT get a suitable match, and noting that the original feet were die-cut, here is what I personally would suggest doing..... Go to an authentic die-cut shop (they make labels and other cutouts on roll-stock) and PAY THEM to make authentic rubber feet. The problem is your tooling charge. Well, they might want $400 to prepare dies that cover a variety of HP calculators. Well, make sure that the top 10 HP applications are covered, thru a variety of die sizes. NOW, find 9 buddies who feel the same way, and split up the costs, so its only $40 each, and now you have got rubber feet.

I can't think of anything else on this subject. Maybe somebody else knows where to buy an authentic exact match without creating it full-custom.

It would be fairly trivial to locate the bulk (sheet/roll) stock, just by asking a rubber foot vendor to part with some material, or locating it as a commodity. The problem is cutting it up.

Which ones would be most popular ?

*Message #14 Posted by **Bob** on 20 May 2003, 2:26 p.m.,*
in response to message #13 by Norm

I have access to the expertise required to fabricate a cutting die. If I had a set of die cutters made, what would the most popular footprints ?

I assume: 41, 42, 34, 45. What else ?

Bob

Re: Which ones would be most popular ?

*Message #15 Posted by **Patrick** on 20 May 2003, 3:11 p.m.,*
in response to message #14 by Bob

Since I started this thread about Voyagers, I have to say that the Voyager series would be a good one to support!

There are a bunch of models in the series, all of which take the exact same feet. The fact that one of the models (12C) is still in production and selling well means that there would likely be even more demand for this foot than others (I dunno if 12C platinum uses the same feet... anybody?).

One of my (pampered) Voyagers is missing a foot as well that I would sure like to fix with a quality replacement.

Re: Which ones would be most popular ?

*Message #16 Posted by **Ellis Easley** on 20 May 2003, 5:38 p.m.,*
in response to message #14 by Bob

71B, 75C/D, 82143A printer for HP41C, 82161A tape drive and 82162A printer for HPIL all use the same type of rectangular, flat rubber foot, in different dimensions.

Also, Pioneers had different rubber feet at different times or on different models (all made as strips with rounded ends). Of the ones I have, most have one long strip about 1/4" wide near the top, then two short narrower strips at the bottom, side by side. But one of mine, a 14B, has a narrower long strip at the top and two pairs of even narrower short strips at the bottom (one of each pair above the other). I don't know if this variation is by model or by year, since you would think the different models would share the case bottom, and all the feet fit in recesses molded in the case bottom.

BTW, the original feet (at least the rectangulat flat ones) are made in two layers: thin vinyl on the inside, rubber on the outside. I guess this is to match adhesives to materials better. The joint between the vinyl and the rubber is another layer of adhesive.

Re: Which ones would be most popular ?

*Message #17 Posted by **Holger Weihe** on 20 May 2003, 6:30 p.m.,*
in response to message #14 by Bob

I have about 20 HP calculators now. Only one of them is missing a rubber food: The HP-49G which is the newest of them all. And it's not only missing one food - ALL OF THEM have dissapeared...

I hope that the rubber keys also dissapear over time. ;-)

To stay with the subject: If there was a self-adhesive rubber sheet of the right thickness, it

should be possible to cut out fitting feet with a sharp knive. Would they really look so terrible?

Holger

Re: Which ones would be most popular ?

*Message #18 Posted by **Ellis Easley** on 20 May 2003, 11:42 p.m.,*
in response to message #17 by Holger Weihe

I don't think so - especially the rectangular ones, you should be able to do about as well as a die with a sharp knife blade.

Re: Thin Double-stick(HP41 feet)

*Message #19 Posted by **David Smith** on 20 May 2003, 4:34 p.m.,*
in response to message #12 by Chris(FLA)

Go to the garden center of your local Home Depot. You will find a big roll of EPDM roofing rubber for use in lining garden ponds. A linear foot (15 feet wide!) costs $15. If you are carful, you can probably cut more than one calculator foot out of it.

For Woodstock feet used a Sanford eraser from an office supply store. They come in several styles and colors. One is a very close match for them birdie feet.

Re: Voyager Logo Transfer

*Message #20 Posted by **Erik Wahlin (USA)** on 20 May 2003, 1:39 a.m.,*
in response to message #1 by Patrick

Patrick I have a spare unused logo I got from Jim Carter a while back. Contact me if you would like to purchase at a reasonable price. Regards, Erik

Re: Voyager Logo Transfer

*Message #21 Posted by **David Smith** on 20 May 2003, 4:37 p.m.,*
in response to message #1 by Patrick

To remove all things adhesive use a substance called UnDu available at most office supply stores. It causes adhesives to temporarily become unsticky. Place a drop in the logo well and a drop on a exacto knife blade. Slide the blade under the logo and (if it was held down with sticky adhesive and not glue) it should come up easily. Keep the UnDu off of the keyboard background as it can leave "water" marks.

Re: Voyager Logo Transfer

*Message #22 Posted by **dave** on 21 May 2003, 1:45 a.m.,*
in response to message #1 by Patrick

From my experience, either of the following is likely to liberate the logo:

1) Use the calculator in a public place. Pay no attention to the logo (this is important). It will fall off. Have a friend follow you to look for the logo.

2) Spend days restoring your more worn calc to pristine condition. Show it off to a friend. The logo will fall off.

Good luck,

Dave

More eBay Madness!

*Message #1 Posted by **Todd G** on 19 May 2003, 2:07 p.m.*

I know we've beaten this dead horse, but this as got to take the cake:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3024550097&category=11713&rd=1

Re: More eBay Madness!

*Message #2 Posted by **Patrick** on 19 May 2003, 2:12 p.m.,*
in response to message #1 by Todd G

That guy has been outbidding me all over eBay. He's really annoying. ;-)

I just wish he'd run out of money.

If we keep seeing prices like this, maybe the counterfeiters will get into the act!?

Re: More eBay Madness!

*Message #3 Posted by **hugh** on 19 May 2003, 2:14 p.m.,*
in response to message #2 by Patrick

... or even hp maybe :-)

Re: More eBay Madness!

*Message #4 Posted by **ToddG** on 19 May 2003, 5:41 p.m.,*
in response to message #2 by Patrick

Well, if you're a seller, he's the guy you want to sell to.

Looks like he's paid several hundred dollars for a couple of 41C wands. A bit much, IMHO, but to each his own. I got mine a few years ago from an Educalc closeout for $20 NIB. I think I got a few 41 ROM wallets for free in the deal too.

Re: More eBay Madness!

*Message #5 Posted by **Chan Tran** on 20 May 2003, 11:22 a.m.,*
in response to message #4 by ToddG

The company that I work for is in business making boxes similar to the HP97 box. So I HP decides to make money selling boxes we can make them cheap and it's 100% legal. It's kind of genuine counterfeit.

Copyright infringement ??

*Message #6 Posted by **NH** on 20 May 2003, 1:04 p.m.,*
in response to message #5 by Chan Tran

Are you really sure that you could legally re-print the HP logo on such boxes, without infringing on their copyright ??

I think the Carly types have got a roomful of lawyers just waiting eagerly to tell you that you cannot do what you just said.

Remember, when they got rid of their engineering staff, they hired lawyers to replace them, so that the chairs would stay warm.

Re: At double $$$

*Message #7 Posted by **Ron Ross** on 20 May 2003, 2:03 p.m.,*
in response to message #6 by NH

And at double the salary of the engineers, since they are so valuable to keep around.

try ten times

*Message #8 Posted by **Norm** on 20 May 2003, 8:26 p.m.,*
in response to message #7 by Ron Ross

Try 10 times, the lawyers make 10 times what the engineers make. Thats because Carly-types figured out that they can make more money by manipulating the corporate world (mergers, staged bankruptcies, selloffs, bonuses, perks) than by building better products.

Since their primary personal money-engine involves the boardroom shake-ups, then sure, the lawyers make 10 times. All the engineers do, after all, is build things, make them better, figure out how to keep a rocket-engine from collapsing under the stress, etc etc. And nowadays, who gives a rip about stuff like that.

Re: Copyright infringement ??

*Message #9 Posted by **Chan Tran** on 20 May 2003, 7:06 p.m.,*
in response to message #6 by NH

Oh Norm! You did not read my post correctly. Let me rephrase it. I said IF HP(not us) wants to get into the business of selling empty boxes (instead of selling calculators), they can contract us to make the boxes for them (They sure didn't make the original boxes either). We can guarantee supply them with boxes that are identical in quality and appearance of the original boxes. Thus I would call them boxes GENUINE (sold by HP) and yet COUNTERFEIT (they are not the original boxes).

Re: More eBay Madness!

*Message #10 Posted by **Mike** on 19 May 2003, 10:06 p.m.,*

Bid higher!

Re: More eBay Madness!

*Message #11 Posted by **Ellis Easley** on 19 May 2003, 2:15 p.m.,*

in response to message #1 by Todd G

That's what I paid (+/- $1) for a 97 with the original open-air AC adapter, brand new manual (still had chad stuck to the punched holes), and two boxes of blue printer paper.

Well, the box DOES look perfect!

*Message #12 Posted by **Gene** on 19 May 2003, 2:24 p.m.,*
in response to message #1 by Todd G

Some collectors want everything. I've seen calculators traded for BOXES before, so this isn't too surprising (to me) given the box looks great.

I have boxes for several HP's...29C...25C...25...97...67 etc.

I got some boxes

*Message #13 Posted by **NH** on 19 May 2003, 2:30 p.m.,*
in response to message #12 by Gene

That is impressive, an empty HP-97 box for $138 . The bidders must've all won the lottery.

I got some perfect boxes, nice big perfect cardboard boxes,

I got one says 'Campbell Soup 4 dozen" got another says 'Dole Bananas'

Any takers?

Re: I got some boxes

*Message #14 Posted by **gifron** on 19 May 2003, 3:56 p.m.,*
in response to message #13 by NH

Mint condition????

Re: I got some boxes

*Message #15 Posted by **Patrick** on 19 May 2003, 4:58 p.m.,*
in response to message #14 by gifron

I have some "After-8" boxes which are "minty" ?

Re: More eBay Madness!

*Message #16 Posted by **David Smith** on 19 May 2003, 7:29 p.m.,*
in response to message #1 by Todd G

With very few exceptions, very nice calculator boxes are worth more than the contents.

Re: More eBay Madness!

*Message #17 Posted by **Ellis Easley** on 20 May 2003, 6:03 p.m.,*
in response to message #16 by David Smith

Does that (higher value put on boxes than contents) apply to other kinds of collectables?

I can think of one explanation for the phenomenon: boxes tend to get thrown away (more than the contents anyway), so at any point in time you can probably find more contents than boxes, making the boxes more rare and so more valuable (to someone who wants one!)

Is the value of boxes more pronounced for HP calculator boxes? Some of them (like the Classics) have fairly plain graphics but use stylized numbers and text that are representative of the times. TI boxes tend to have photographic images showing affluent office settings (seems to me).

Re: More eBay Madness!

*Message #18 Posted by **David Smith** on 20 May 2003, 7:22 p.m.,*
in response to message #17 by Ellis Easley

Most certainly... particularly in things like old toys and any item where the box gets thrown away. An old toy in its original box can be worth easily 2-10 times as much as a bare toy. Watch your Antiques Roadshow for many other examples.

The box looks mint

*Message #19 Posted by **Mike** on 19 May 2003, 10:09 p.m.,*
in response to message #1 by Todd G

Do you have a mint box you want to sell for what you think is a fair price? If you do, I'll give you the $20 you probably think a Mint box is worth.

Didn't think so!

Do you even have a mint box? Do you even care if you have a box? Many collectors want everything mint or near mint.

but does it taste minty fresh?

*Message #20 Posted by **db(martinez,california)** on 20 May 2003, 12:22 a.m.,*
in response to message #19 by Mike

mike and david; i believe that you guys know what you are talking about when you say something is or can be worth a (to me) seemingly crazy price. if someone wants to bid a hundred and thirty bucks on a box it doesn't affect me either way. people think that i'm nuts for having a display cabinet full of obsolete technology that i usually paid a few of bucks each for. well, maybe there are a few other reasons. anyway, i live in a glass house so i won't throw rocks.

however i would like to say this: therwil, meet texas pyro. texas pyro, meet therwil. you two have a lot in common. you both have seventeen of everything hp ever made. now can you both go somewhere and bid against each other so a few people can get one of something.

I'll sell you mint boxes

*Message #21 Posted by **NH** on 20 May 2003, 1:30 a.m.,*
in response to message #20 by db(martinez,california)

I'll sell you mint boxes,

an affordable $35 a box, and the mints will even still be in the boxes !!

:o)

My favorite is "after eight".

HP41 Brain Transplant (CV vs CX)

*Message #1 Posted by **Michael Fink** on 19 May 2003, 11:51 a.m.*

I recently "inherited" a used 41CX with a sticky keyboard and corroded battery contacts. After some inside cleaning and soldering the battery contacts, it seems to be almost working. It does not recognize the Math module in any slot, though, but it works well with the card reader and the printer.

Well, there is still the sticky keyboard. So I wonder if I can risk upgrading my good old 41CV to a CX by transferring the CX's logic board into the CV? Both models are fullnut. Any suggestions?

Sincerely, Michael

Re: HP41 Brain Transplant (CV vs CX)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 12:29 p.m.,*
in response to message #1 by Michael Fink

Hello, Michael;

if both 41's are fullnut, the LCD assy is exactly the same for both of them. The CX's mainboard should work fine in any C/CV keyboard/LCD, provided they are fullnuts, of course.

You should take special care with both:

1- the zebra connectors between the mainboard and the keyboard
2 - the pressure over them;

in the second case, using plastic washers will help if you build the CX's mainboard in the C/CV case and have problems switching the "franken"calc on. I do not know the thichness, but others in here will surely post the measure. The washers are required only if after rebuilding it, the calcualtor does not switch to on or freezes/shoot off by its own.

Oh, yes; if you can, keep the original CX's back plane. The CX's back label shows active ED's keys instead of regular ALPHA keyboard, shown in the C/CV's back label.

Success!

Luiz C. Vieira - Brazil

Re: HP41 Brain Transplant (CV vs CX)

*Message #3 Posted by **Randy Sloyer** on 19 May 2003, 1:49 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

If the keyboard zebra is a single piece with round connectors, you shouldn't need the washers. If they are two separate flat pieces, the washers used by HP were 0.015" thick. These are impossible to find in the standard places. I believe they were HP custom. You can find 0.032" nylon washers of approximate ID/OD

in most hardware stores. The extra thickness will result in less than perfect case tightness, but the CPU board will certainly be in positive contact. You will absolutely need longer screws (3/8") when using the washers, or you'll strip the posts out.

I have found #2 x 3/8" sheet metal screws in the lower posts without the washers will do the job. They have enough engagement to prevent striping and provide more clamping pressure.

You can find #2 hardware in hobby shops in the R/C model section in small quantities.

Re: HP41 Brain Transplant (CV vs CX)

*Message #4 Posted by **David Smith** on 19 May 2003, 7:32 p.m.,*
in response to message #1 by Michael Fink

The 41C/CV/CX fullnut CPU boards are interchangeable. Some very early 41C CPU's for use with the LCD modules that have the square black epoxy blobs over the chips are an exception.

A little work with some UnDu adhesive "remover" and a strong thread will let you remove the front CX label and transfer it to the new machine.

Re: HP41 Brain Transplant (CV vs CX) - Thanks

*Message #5 Posted by **Michael Fink** on 21 May 2003, 7:58 a.m.,*
in response to message #1 by Michael Fink

Thanks all for your kind replies and suggestions! The surgery was successful, the patient is alive (and via card reader even got back part of its previous personality :-)).

Sincerely, Michael

12c platinum again - from comp.sys.hp48

*Message #1 Posted by **Gene** on 19 May 2003, 10:05 a.m.*

Saw this over the weekend. It confirms the "bug" in the solution for the interest rate in an annuity. I had called this to HP's attention, but doesn't seem like they could or wanted to fix it. --Gene

---

There is something very strange about the new 12c platinum. Resolving for i is, one could say, no longer possible. My one displays "running" for so long I have to press the ON key. I have tried many simple examples now.

If indeed it does resolve, before running bateries flat, it must take a very long time.

Oh, it did work n=10 i=10 pv=100 fv=0 solve for pmt=-162.745 resolve for i ... it seems to take 40 seconds. [Gene: Note, on my 12c platinum, it returns 10 for i almost instantly...however, if I store 0 into i and then resolve for it, it takes about as long as the poster indicates]

On the classic gold 12C it takes 4 seconds.

This is, believe me, an example that is favourable to the 12c platinum.

Unfortunately this does make it a returnable item, unless one really likes bugs like this.

Re: 12c platinum again - from comp.sys.hp48

in response to message #1 by Gene

This might not be a good sign for Hp's testing or coding for the new machines. The 12c should have been a piece of cake to get on the market since they already have it there to begin with. Just imagine Hp's NEW RPN entries onto the market. I SHUDDER!!!

I hope for a decent pocket RPN calculator that advertizes Hp's quality and is a product that is both a pleasure to use and has great features.

My 49G has great features, but it is not all that great to use (My 48G is a nice machine, BUT IT DON"T FIT IN A POCKET). I would love an Hp15c with 32K (hell 128K!!!!) and Hp48 units conversion and misc. other Hp48 features (clock, beeper, 48g type programming with a selectable RPN/RPL programming flag, etc) with ONLY a TWO line 42s type display and a serial port. Every thing else would come via third party programs if something like this were available.

What we'll probably get is a LOSER HP9G RPN piece of CRAP that we'll have to be glad to get THAT!

I would be happy with an Hp15c retro (I'd like some extra RAM), but I'd take it the way it was for $40-$50 ($30 sounds even better). Price it any higher (and while I would still buy one) people will buy algebraic and suffer, since PC's do most of the serious number crunching.

Hp makes the new 12c BS model, why not a retro Hp15c (and I'd be happy with the BS colors if I had no choice, though again, I would prefer the more elegant and mature OLDER Styling).

Re: 12c platinum again - from comp.sys.hp48

*Message #3 Posted by **Tom (UK)** on 19 May 2003, 1:21 p.m.,*
in response to message #1 by Gene

If the 12c is sold as a premium product, how do HP think they are going to get away with this kind of problem?

If the calc doesn't do one of the examples in the manual then I'd want my money back.

(OK HP might just try to take the money and run, but is HP realy that bad now?)

More from c.s.hp48 - 12c plat

*Message #4 Posted by **Gene** on 19 May 2003, 4:12 p.m.,*
in response to message #3 by Tom (UK)

Example f CLEAR FIN n=10 pv=100 pmt=-20 solve for i. On the original 12C this takes 15 seconds. Solving for i again takes 4 seconds, as the original 12C uses the existing i as part of its initial guess.

On the new 12c platinum it takes 35 seconds.Pressing i again takes another 35 seconds. This implies that the new platinum 12c does not re-use the existing i as part of the initial guess strategy.

Re: More from c.s.hp48 - 12c plat

*Message #5 Posted by **james** on 22 May 2003, 5:35 p.m.,*
in response to message #4 by Gene

In a spirit of scientific investigation:

For clear fin, N=10, PV=100, PMT= -20 and solve for i, my calculator takes 15 secs as for the original 12C, but solving for i again takes another 15 secs so it doesn't seem to use the original i as part of the initial guess - sort of hybrid between the 12C and the 12CPt.

My calculator - a HP-41CV running the Real Estate module.

Thanks for the info on the HP 12CPt - very interesting if saddening seeing HP losing it in such a big way. Don't think I'll be giving Carly any of my money soon.

A question: are you using a Beta HP12cP?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 22 May 2003, 11:40 p.m.,*
in response to message #1 by Gene

Hi, folks;

I read these posts and I felt myself confused: are u running final, commercial HP12cP versions or Beta ones?

I just wnat to know, because Gene posted some info in here about a Beta unit, that would switch to off when runnning a program and finding [R/S] or [GTO]000 step code. Maybe other Beta models contain other, different bugs. As Gene mentioned, I also hope HP is carefull enough as for detecting and correcting these bugs before putting HP12cP units for sale.

Thank you.

HP quality

*Message #7 Posted by **Renato** on 23 May 2003, 12:58 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

This "feature" proves that we should not expect "old hp quality" from "current hp". These two entities are completely different animals.

It is sad, and brings mixed emotions: 12CP looks like a voyager on the outside and maybe even internal HW, but sadly "intelligence" on it is on the 30s/6s/... league

I wonder: will the product manager get yelled at for this "feature" ? Not at "current HP", I think.

Renato

41CV Repair Service

*Message #1 Posted by **John Smith** on 18 May 2003, 3:46 p.m.*

Does anyone know on this board whether HP still service their vintage product like 41CV calculator? If yes, what is their web site address, and phone number?

I searched HP web site, but I could not locate any info on 41CV at all?

Thanks.

Re: 41CV Repair Service

*Message #2 Posted by **John Smith** on 18 May 2003, 4:07 p.m.,*
in response to message #1 by John Smith

I did not mention in my original post why did I need service to my 41CV?

The condition of my 41CV is just like I opened it from the brand new box just came out from the factory even though I bought it in 1983. It has been just well kept. No corrusion in the battery terminal at all. A few months ago when I tried to turn the calculator on, it did not come on. Immediately I changed the batteries, still did not come on. What a disappointment? I guarded this calculator with my life all this time, now I'm at a loss. That is the reason I posted the original message.

If there are any 41CV technical expert on this board, your help or suggestion would be greatly appreciated.

41CV Repair Service: unfortunately...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 May 2003, 4:23 p.m.,*
in response to message #1 by John Smith

... HP no longer support the HP41. But you may read this post first:

HP41 Gone Wild!

It's not the same situation as yours, but the first steps you should take in order to repair (at least start) are described there. Please, read the posts in that thread and reson about the mentioned procedures. Also, check if your HP41 is a fullnut or a halfnut.

Chances are we can get your HP41 repaired if you have the skills to delve into the solution.

Best regards and success.

Re: 41CV Repair Service: unfortunately...

*Message #4 Posted by **John Smith** on 18 May 2003, 6:16 p.m.,*

in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz, I think I found the problem. I unplugged all four modules from the compartments, then I cleaned them with ethylene alcohol and dried them, and then plugged all the modules back. Then put the battery chamber back in and turned the power on. Nothing happened. Then I put the calculator back on the table and hold it by left hand and turned the power on by right hand. It came back on. As soon as I lifted my left hand power went away. I pressed with my left hand again, power came back. After I searched through I found out that the left bottom corner is no longer snuggly fit the back layer of the calculator from the keyboard layer of the calculator. They are coming loose.

However, I could not see any screw anywhere. Screws are not visible at all from the outside. And I don't have any service manual for how to take a part without damaging it. Do you know how to get to that screw? Anyone? Can any hardware expert guide me through this operation? If can give me a link for step by step operation would be highly appreciated.

John

Re: 41CV Repair Service: unfortunately...

*Message #5 Posted by **Ellis Easley** on 18 May 2003, 6:51 p.m.,*
in response to message #4 by John Smith

As it says on the cover of a great book, "DON'T PANIC"

The screws are under the rubber feet. Peel them off carefully and stick them on the paper that stickers come on, like the ones that come with a video cassette. The feet are actually made with two layers: the outer one is rubber and the inner one is thinner vinyl. Peel the vinyl layer from the plastic case.

More help is on the way!

Re: 41CV Repair Service: unfortunately...

*Message #6 Posted by **Tony Duell (UK)** on 18 May 2003, 6:57 p.m.,*
in response to message #4 by John Smith

The HP41 is assembled using connectors that are clamped together by the case -- if this is older ('Fullnut') unit, there's a connector between the logic board and the keyboard PCB at the front of the machine. All machines have a connector between the 'I/O assembly' (the battery contacts and the module connectors) and the keyboard PCB. The case is held together by 4 self-tapping screws under the feet. Peel off the feet and remove the screws. Carefully separate the case parts, and clean the contacts with propan-2-ol (ispropyl alcohol). Then put it all back together. Don't overtighten the screws, but you do need to ensure the case is clamped together tightly. It often helps to turn the screw 'backwards' (counterclockwise) so as to engage the original threads before tightening them -- this will reduce the risk of stripping the threads in the plastic case. If the threads are stripped, or the plastic pillars in the top (keyboard part) of the case are damaged, then often all you need to do is fit a longer screw (it's a #2 self tapping screw), which I suspect you can get from a local hardware shop. Oh yes, please take anti-static precautions when working insde the 41 -- this machine uses relatively delicate CMOS circuitry, and _all_ the chips are HP custom and unobtainable.

Re: 41CV Repair Service: unfortunately...

*Message #7 Posted by **Ellis Easley** on 18 May 2003, 7:19 p.m.,*
in response to message #6 by Tony Duell (UK)

If the plastic pillars are cracked, and this is causing the screws to be loose, there are some

techniques that can be used to repair them. They involve using a solvent that will melt the surface of the plastic. By binding the parts together so the broken edges are in contact, and then applying some solvent, the edges will melt a little and then when the solvent evaporates, the pieces will be welded together - as strong as when they were newly made, I have read. Some people recommend wrapping the pillar with fine wire to make it even stronger, but it must be very fine so the diameter of the pillar is not increased much, or things won't go back together as they should. I think the reason the pillars tend to crack is because HP designed them with a smaller diameter than was most wise. The type of self-tapping screws HP used were new at the time and all the design requirement might not have been known.

The solvent is methylene chloride, also known as dichloromethane. It is sold in small bottles at hobby shops, I found some at a plastic distributor that sells primarily to sign companies.

If the pillars are broken off and not just cracked, there is a contributor here who has a way to replace them with a piece of plastic rod (I think that's what he is describing!)

*Message #9 Posted by **John Smith** on 20 May 2003, 12:11 a.m.,*
in response to message #8 by John Smith

Luiz, Ellis, and Tony,

I would like to ask a dumb question. Please don't laugh. Just give your honest and expert opinion.

As you all advised for fixing the broken or cracked plastic post, indeed an excellent one. How about if I press and hold the left corner such a way that the display starts to appear, then I apply just enough super glue at the meeting line of the upper and lower case (of that corner and its close proximity) and long enough to dry the super glue completely. Danger that I see of that I won't be able to take a part this calculator again. Is there any other downside for this permanent sealing?

Thanks, and waiting to hear from you.

John

Re: 41CV Repair Service: unfortunately...

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 2:40 a.m.,*
in response to message #9 by John Smith

Hello, John;

I am almost sure everybody else will tell you the same: don't!

You'll leave watermarks, it's gonna be almost impossible to open it again without cracking the case and the separator, you'll need to "glue" twice or in both surfaces at the same time, chances are you'll experience the same problem later because you did not actualy solve it... and you're gonna do nothing but cause dammage to your calculator. If the glue leaks to the keyboard or internals it's gonna be hard to clean the mess.

What's bothering you, afterall? If you believe you can't accomplish the task in an easy way, others (me included) will offer to do it. I know, I'm in Brazil, it's a bit far from you, but I succeed repairing some calculators for a few fellows in here. Exception made to Scott Pritchard because I am still working on two of his calculators. And there are others closer to you than I am that would gladly offer themselves to repair your "unit". Mostly because it is working, it's only a craft job you need there.

Please, do not risk it. It "sounds" so easy to repair...

Anyway, if you want to do it, go for it. I would not, and I would never suggest this sort of solution to anyone. I used superglue sometimes to repair broken parts and even to replace broken posts because I did not find the type of glue that people at this forum use. It's a chemical "melting" solution that fuses plastics with each other. But I got good results when broken parts are kept under pressure for about three hours with superglue. And I never used any sort of glue to do this sort of "joining" you are trying to.

Be patient and I am sure you will succeed repairing your HP41 the best way.

Luiz C. Vieira - Brazil

Re: 41CV Repair Service: unfortunately...

*Message #11 Posted by **Ellis Easley** on 20 May 2003, 6:11 p.m.,*
in response to message #9 by John Smith

If you are not ready to do the permanent repair now, instead of superglue, why not use a rubber band? If it goes just below the display, or just below the top row of switches, or both, it wouldn't interfere with operation. The top feet would tend to keep it in place. Be sure to keep you programs backed up, because the rubber band might give up at a bad time! (So might the superglue)

Decoding new serial numbers

*Message #1 Posted by **jose goncalves** on 18 May 2003, 2:29 p.m.*

Ok, I understand the structure of traditional serial numbers for HP calculators. But what about the new format ? Those numbers that begin with IDxxxxxx or these with CNxxxx. Those Chinese numbers are quite strange ! They are too low to really individually identify several calculators manufactured in a high volume production line. For instance, s/n for my HP9S is CN0246 and for my 9G it is CN0248. One of my HP17BII's s/n is ID04901440. What to this all mean ?

Re: Decoding new serial numbers

*Message #2 Posted by **Scuba Diver** on 19 May 2003, 12:55 a.m.,*
in response to message #1 by jose goncalves

Well, as I understand it, this is how you decode the new serial numbers:

First two characters; country of manufacture (US, CN and ID are the ones I've seen)

Next character is the LAST digit of the year of manufacture (ie. ID0 would be 2000 in Indonesia)

The next two characters are the week, then finally the last digits are just like the last 5 digits on the old serial number.

Hope that helps! B.

Re: Decoding new serial numbers

*Message #3 Posted by **jose goncalves** on 19 May 2003, 8:15 a.m.,*
in response to message #2 by Scuba Diver

Hi, Scuba

So I have to conclude that those short Chinese numbers (CN0268, for instance) are really truncated numbers. The last portion (the real serial part of the thing) is missing, right ?

Re: Decoding new serial numbers

*Message #4 Posted by **Julián Miranda (Spain)** on 19 May 2003, 10:36 a.m.,*
in response to message #3 by jose goncalves

I have a HP30S with serial number CN0043, that is similar to the HP9x you mention. My guess is the first two digits (00 in my 30S) are the year and the last two (43) are the week, and there is no actual serial number. I don't know if HP has keep the serial number the way Scuba described in more "important" machines as 49G or the new 12C which are also manufactured in China.

Re: Decoding new serial numbers

*Message #5 Posted by **Scuba Diver** on 19 May 2003, 7:27 p.m.,*
in response to message #4 by Julián Miranda (Spain)

Well, I don't have a calculator with the new numbering sequence, but I thought that there was more than just the CN0043...

I've seen a few Chinese 12Cs, and their serial numbers are something like:

CN20812345

Where 208 means 2002 and the 08 means the 8th week...

I could be wrong, however...as I mentioned I don't have any calcs with a new serial number, but I'm pretty sure that this is how it works...

Hope this helps! B.

Re: Decoding new serial numbers

*Message #6 Posted by **James M. Prange** on 19 May 2003, 9:23 p.m.,*
in response to message #4 by Julián Miranda (Spain)

Close. CN is the country (China, apparently using ISO two-letter country codes). The first digit is the year code. I guess that they don't expect to continue manufacturing the same model in the same country for more than ten different years, or they could rely on a changed serial number format or some other way of identifying the calculator. Wierd color schemes come to mind. The next two digits are the week code, and the last five digits are the unit (serial) within that week code.

Re: Decoding new serial numbers

*Message #7 Posted by **James M. Prange** on 19 May 2003, 9:12 p.m.,*
in response to message #3 by jose goncalves

Well, perhaps some people don't like to let everyone know their calculators' serial numbers, so post only the country, year, and week codes, CN026, for example, and leave off the last five digits (the serial part). In other cases, perhaps the serial part doesn't seem relevant, so is left out for the sake of brevity. After all, it seems reasonable to expect that if the country, year, and week codes of two units of a given model are the same, then they should be very nearly identical.

Re: Decoding new serial numbers

*Message #8 Posted by **jose goncalves** on 19 May 2003, 10:05 p.m.,*
in response to message #7 by James M. Prange

Almost, almost. My 3 calculators from China that I mentioned have only the first, non serial part of the serial number. IMHO, this should no longer be called serial number but only source id number or something for that purpose. I also think that even if the calculators manufactured in the same week of the same yaer in the same manufacturing facility are suposedly quite similar, they should be individually for identification purposes, But this would be the case for high quality products that deserve and are served with good repair services, if they are needed. I'm afraid recent HP calculators will not fit in this last classification, so there is no need for such elaborated control scheme. Umph !

Key Click

*Message #1 Posted by **Howard** on 18 May 2003, 1:58 p.m.*

Does anybody know how to put the click back into the keys of HP Calculators. My HP65 barely clicks at all on the 0-9 keys most probably from use. The other keys have the normal crisp click.

Re: Key Click

*Message #2 Posted by **David Smith** on 18 May 2003, 9:14 p.m.,*
in response to message #1 by Howard

MOst likely your HP65 key strips have developed vertical splits on the left hand side of each place whre the strip rises up into the key "dome" contact. Onlt fix is VERY drastic and not at all easy to pull off properly. You must find another machine with good click (an HP35 or 45 will do), slice the key strips off the keyboards, and transplant the good ones onto the HP65 keyboard. The old strips were spot welded in place. You need to solder the new ones down.

Using HPIL/RS232 converter and PC

*Message #1 Posted by **Harold Climer** on 18 May 2003, 11:10 a.m.*

I have just aquired a HP IL to RS232 converter. Are there any programs for the 41 and PC to allow one to talk back and forth to each other? Is this capibility built into the converter? I am also thinking of connecting my 41 to a Vernier Universal Lab Inteface and taking temperatur or other type of measurments.

Re: Using HPIL/RS232 converter and PC

*Message #2 Posted by **Alain** on 18 May 2003, 11:33 a.m.,*
in response to message #1 by Harold Climer

Hello Harold,

if you get LifUtils from Tony Duell, a subdirectory called "Hardware" has all the requiered information to transfert files from and to HP-41 using RS232/HPIL converter (HP41-PC-serial-transfer).

The link to get LifUtils is below :

http://www.hpcc.org/hpil/lif_utils.html

Regards !

Alain

Re: Using HPIL/RS232 converter and PC

*Message #3 Posted by **Dave Shaffer** on 18 May 2003, 7:17 p.m.,*
in response to message #1 by Harold Climer

Harold,

I'm as HP-biased as anybody here, but ....

If all you want is to interface to Vernier equipment, you might be ahead to get a (voice of doom here) TI-8x series calc. Vernier equipment can interface directly to these TI calcs. I think all you need extra is a $5 cable.

HP41 / PC / hardware measurement

*Message #4 Posted by **Christoph Klug** on 19 May 2003, 3:49 a.m.,*
in response to message #1 by Harold Climer

Dear Harold,

nice solutions for interfacing HP41 to PC is the HP-PC gateway & emulator solution. Refer to HP-museum articles forum item 311.

For advanced hardware interfacing with HP41 there exist I/O-Board and IL2000 system. This powerfully interface hardware includes digital and analog input/output and some power supply lines. Two manuals (300 + 150 pages)describes the systems

Best wishes from Germany - Christoph Klug

HP-41 CV Charger?

*Message #1 Posted by **ValHallA|SW** on 18 May 2003, 10:44 a.m.*

Hey, I've got an HP-41 CV, an i want to let it run from the power outlewt... i know i have toput a connector in de hole on the left side (with cap over it), but what foes that connector look like? Anybody got a pic? I already know ill heve to put 8V~ on it.

Re: HP-41 CV Charger?

*Message #2 Posted by **Diego Diaz** on 18 May 2003, 12:41 p.m.,*
in response to message #1 by ValHallA|SW

There are one only type of connector for the whole 41 system (82240A/B printer apart), anyhow, and regarding the 41C, earliest models had a gold plated small balls with springs that allowed the calc to be powered (directly) thru a suitable connector. Those components were removed somewhere along 1980, the corresponding PCB golden contacts remains during the Fullnut production run so, if this is your case, you can still open your calc and place a pair of apropriated sized balls and springs (I did). Halfnut design changed the keyboard PCB layout and the required pads were no longer present.

AFAIK HP did never release such a connector to the market, tough lots of users made their owns (I also did... ;-). The power thru this kind of connector MUST be 6v DC.

HP 82120A is a rechargeable battery pack that fits into the 41's N-cell battery compartment, and it's thru this pack how the calc obtains its power. Inside the 82120A are the corresponding rectifier and charging circutry that provides the 41 with the apropriate 6v DC power supply. Thus, 82120 carries the male connector where the female plug fits.

If you need further info, please post back with some details about your calc.

Kind regards from Spain.

P.S. I'll send you a picture of the HP-82066B (it's 220v, 8v AC, 3VA according to Europe's standard), you can see the connector there.

Re: HP-41 CV Charger?

*Message #3 Posted by **ValHallA|SW** on 18 May 2003, 2:37 p.m.,*
in response to message #2 by Diego Diaz

Hey, thx, i rcvd your pic, but how can you put it in the calculator? I reckon there isnt enogh space for it... :-?

Anyways, about the balls, you need to clear that up for me, i dont really understand i guess.... maybe another pic would help :)

Anyways, yuor pic for avry1 else: <img src="http://home.hccnet.nl/orion.boot/junk/HP41_Power.jpg"> <-- if HTML-tags work ;) else: http://home.hccnet.nl/orion.boot/junk/HP41_Power.jpg

Cheers, ValHallA

Re: HP-41 CV Charger?

*Message #4 Posted by **Ellis Easley** on 18 May 2003, 3:57 p.m.,*
in response to message #3 by ValHallA|SW

If you have the balls, or can find the balls, or can even use the balls (what's happened to this discussion group?!!), I can send you an article from the PPC Journal detailing how to use an even earlier HP calculator AC adapter to power the 41C via the connection Diego is talking about. You just need a stable 6VDC but this article show how you can make the connector to mate with the... balls!

Re: HP-41 CV Charger?

*Message #5 Posted by **Diego Diaz** on 18 May 2003, 5:08 p.m.,*
in response to message #4 by Ellis Easley

Well... er... about the balls, I can swear I've got no pics of'em... Ok, just kidding, let's say first I used a pair of seteel balls out from a bearing, they are 3'15mm diameter, the springs are 8mm length x 3,25mm diameter, I know for sure as I still keep a pair of each as spares.

The main question here, prior to attepmt any task, is to determine if your 41 is a Halfnut or a Fullnut, Half's have a rounded corner bezel in the display... (Luiz, some of your great pics may help a lot in here!) while Fullnuts have a squared corner display.

If yours is a Halfnut theres nothing you can do with the "balls/spring" solution, unless you *really* want re-engineering your 41 guts (Well, not that serious but somewhat messy). If it's a Fullnut then the PPC article Ellis mentioned should be of great help.

The standard HP connector shown in the picture I sent you comes into the 82120A Battery Pack installed in the calc thru the rigth side small port. This is obviously useless if you dont have the said 82120A. Anyhow if you remove this small port cover you'll see two small holes from wich the said balls shows a bit and make their contact with the (so called) "DIY" unnofficial connector.

I'm sorry but I've got no pictures of my calc (neither... ;-) nor my camera handy.

Keep the contact and kind regards.

Re: HP-41 CV Charger?

*Message #6 Posted by **Chan Tran** on 18 May 2003, 8:51 p.m.,*
in response to message #5 by Diego Diaz

Why not just use the 82120 battery and charger? If you don't want the battery you can remove the battery and install in the pack regulation cicuitry to regulate the power. That way you don't have to mess with the inard of the calculator.

Re: HP-41 CV Charger? (sorry I'm late...)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 12:41 a.m.,*
in response to message #5 by Diego Diaz

Hi folks;

I simply did not pay enough attention to the thread's main theme, only now I woke up for it.

I think all important issues have already been discussed here: the stable 6Vcc power supply, the (originally golden plated) connecting balls and springs, the difference between full- and half-nuts, and so.

There is only one thing I'd like to mention about Chan Tran's suggestion of using the regulator only. I thought about using the 82120A without batteries and simply plugging it in so it would rectify and stabilize the inward voltage. The only problem is that the rechargeable cells are "part" of the regulating circuit. You can remove them and the only active component that will keep voltage under the 6.2 Vcc is a single zener diode. It goes in parallel with the batteries. I'm affraid it's too much responsability for a single component. If it fails, 12Vcc through a low-value resistor (about 300 ohms) will reach the circuits...

I think I understand that Chan Tran suggests not to open the calcualtor to add balls and springs (is it correct?), and I agree with the fact that it's necessary a bit of care and skills to accomplish the related tasks. Hey, ValHallA (from Switzerland, sounds "godish"), do you have the skills to open it and try? I have some pictures that show an HP41 being disassembled. I'll find them and post them soon.

Good luck!

Luiz C. Vieira - Brazil

Re: HP-41 CV Charger? (sorry I'm late...)

*Message #8 Posted by **Chan Tran** on 19 May 2003, 8:54 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Yes Luiz. I suggest not to open the calc to intall balls and contacts. I think if we install a 3 pin voltage regulator and a capacitor we can be quite sure that we will get a stable supply.

Re: HP-41 CV Charger? (sorry I'm late...)

*Message #9 Posted by **Ellis Easley** on 19 May 2003, 12:32 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Also, the internal charging circuit in the 82120A will only provide about 16 mA, not enough to run the card reader.

*Message #11 Posted by **ValHallA|SW** on 19 May 2003, 8:26 a.m.,*
in response to message #10 by Diego Diaz

Got both a halfnut (my new HP-41) and a fullnut (my old HP-41) :)

Uhm, i'm from the Netherlands by the way, ValHallA|SW is jus a bit stolen from RedHat: ValHallA is 7.2 and SW = SeaWolf=7.1, im not sure 'bout the versions ;)

Where can i find a battery with charger? ATM there arent any @ ebay I guess...

and 'bout the balls, if i'm right, you put those springs IN those holdes with a ball on top of it? :)

Re: HP-41 CV Charger?

*Message #12 Posted by **Diego Diaz** on 19 May 2003, 9:40 a.m.,*
in response to message #11 by ValHallA|SW

Right: one end of the springs relys on the keyboard PCB golden pads, the othed end pushes the small balls against the case hole, making them to rise about 0,3mm wich is enough for the appropriated sized connector to have a good electrical contact.

I'm sorry not having pictures of the "real thing", anyhow you seem to got the main idea.

Remember this is only suitable for the Fullnut!

One more thing, if you decide to face the task, remember to check the screw-post and make sure they are in good shape, as springs will require a little more strength to hold both case's halves tighten.

I agree with Luiz regarding the battery-less 82120. By the other hand regulated 78xx circuit re-design, though simple in concept, may fall far beyond the common user skills. Please ValHaLa, let's know if you feel comfortable with soldering irons and pliers in your hands, if this is the case, we may have a lot more to talk about.

Kind regards from the Canaries.

Diego.

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 12:40 p.m.,*
in response to message #13 by ValHallA|SW

Hello, ValHallA;

just to tell you that exactly in the same direction of the square hole there is a "male-type" connector so you can directly connect an original AC adapter; this AC adapter is the one reated 8VAC, 3W, as you mentioned in your first post. I'm not sure you'll be able to drill it, otherwise you can remove the 82120A male connector, instead. I'd suggest, if you don't mind, keeping it as it is and try to build a connector to be used with the existing 82120A male connector. Just another possibility, you're the one that knows better what to be done. As you mentioned, what matters is your HP41 working.

A bit off-topic: I have many Philips tape-decks form the 70's, some of them disassembled and others ready to play/rec. They are still good equipments, and looking at their schematics, you could teach how to design basic amplifiers, pre-amplifiers, oscillators and (in some cases) power-supplies. I still have an operational N-2510, a stereo-cassette recorder that uses a motor with a mechanically-coupled generator. Bothe are built in one single piece and share the same axes. It's a piece of engineereing design. I am shure Norm would like having a look at it.

I hope you have success, my friend.

Best regards from Brazil.

<getting-tired@check-one-of-my-earlyer-posts.com> :-)

I rcvd it, dont worry 'bout the size, i got DSL :) (btw, it was only 700K)

Uhm, i dont really understand it i guess.... if i understand it right, the idea (part 1) is to make a connector for those golden balls (???) part 2 is for the charger adaptor (if i'm right)--

I guess a pic woukld help :(

Re: HP-41 CV Charger?

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 3:36 p.m.,*
in response to message #16 by ValHallA|SW

Hello;

you're right: these are different subjects.

The "golden balls and springs" connectros allow you to directly connect a pure, glitchless, noiseless 6VDC directly to the batteries terminals. SPECIAL care is needed here. I use a spare set of four D-size cells so when I have to read cards or use the wand I simply plug it in, regular batteries inside or not. Works great.

The 82120A rechargeable battery pack use an 8VAC, 3W AC adapter. The first thing you have is a four-diode complete-wave rectifier and an electrolytic capacitor. At its terminals you have about 18VCC. After this you have a 12VCC regulator, a 1W, 390 ohms (about that) resistor, a 6.2V zener diode and the four rechargeable batteries.

The rechargeable pack uses AC current, and you MUST use DC in the balls connectors.

Hope this clarifies a bit more.

Success!

Re: HP-41 CV Charger?

*Message #18 Posted by **Ellis Easley** on 19 May 2003, 4:23 p.m.,*
in response to message #16 by ValHallA|SW

ppcv7n2p25-27 is an early article describing how to modify an AC adapter for an HP Classic calculator so it can be used to run an HP41C via the "balls connector". The pictures aren't very good but the description of how to build the plug to mate with the balls is very detailed.

pssch is just the schematic of the original Classic recharger from this article.

ppcv13n9p11-12 is a later article discussing the reason why the card reader causes alkaline N cells to have a very short life in the 41C. At the end of the article is a discussion about a possible AC adapter to run the 41C and another description of how to make a connector to mate with the balls.

82120sch2 is my schematic of my 82120A rechargeable HP41C battery pack charging circuit (I've heard there are different versions). Chan had suggested you could just use this circuit, without the NiCads, to run the calculator. It biases a 6.2V, 400 mW Zener at about 100 mW, so I think it would be reliable, but it will only provide about 16 mA which is enough to run the calculator but not the card reader (6mA, 250 mA per ppcv13n9p11a). This would only be an option for you if you had an 82120A anyway.

Re: HP-41 CV Charger?

*Message #19 Posted by **Howard** on 20 May 2003, 7:47 a.m.,*

I must have missed something. How do the gold balls get the power from the charger plug into the calculator circuits? Do they perform the same sort of function as the gold (brass) plate does on the HP45,

HP67 etc.? If so how?

Re: HP-41 CV Charger?

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2003, 8:50 a.m.,*
in response to message #19 by Howard

Hi;

the golden-platted balls are connected to the keyboard by two golden-platted springs that also keep them in place. Only the fullnuts are "balls-ready", what means they already have the (-) and (+) pads under each "ball+spring" set. You can use an external 6Vdc power supply to "feed" the circuits.

Many fullnuts and all halfnuts do hot have the balls, and no halfnut has the pads. One can use extra self-adherent copper trails and create these pads, taking care not to shorten existing trails, and connect these extra pads to the batteries connectors with extra wiring. I have not done it so far, but I have fed halfnuts under repair through external batteries set. Not hard to add.

Hope this answers your questions. If not, let us know.

Best regards.

Re: PDF files (yes, the Reader is a different story)

*Message #1 Posted by **James M. Prange** on 17 May 2003, 6:40 p.m.*

The PDF files are often huge, but I expect that a lot of this depends on how the file was made. PDF does have its advantages, but sometimes a plain text or HTML file would serve just as well.

Regarding Acrobat Reader, it seems to exit ok if I use it for a local file, but if I click on a URL and then go to something else or close the browser, I still have a process, acrord32 if memory serves me, that keeps running until I kill it myself. If I don't stop acrord32 and click on another PDF URL, I'll have yet another instance of it running.

I don't know whether the problem is really in Acrobat Reader or in MS Windows 98SE or the browser, but certainly something isn't working the way it should. But for know, I've gotten in the habit of killing acrord32 myself.

Regards,
James

My stock answer is "Don't like it, don't use it." :-)

Seriously, Windows 95/98/ME is a pathetic collection of legacy code and band-aid fixes that sort of work.

Use a real operating system such a Windows NT or 2000, or if you cannot afford one of them, an Open Source Unix clone (e.g. Linux or one of the BSD varieties).

41CV Gone Wild!

*Message #1 Posted by **gifron** on 17 May 2003, 6:15 p.m.*

I just bought a 41CV from the other side of the world (I like to take risks). Supposedly it worked great, but here's the rest of the story...

Usually, it works. Sometimes though: 1. The tan key (and less often, the sin and cos) has to be pushed several times for it to function. After it works one time though, it does fine for a good little while. 2. The display goes crazy, displaying weird symbols, lots of dim commas, this is especially true when I use the card reader (but sometimes it works just fine with the reader). 3. When the display goes crazy, I usually (but not always) can't CLx or turn it off. I have to remove the batteries. It maintains its short term memory, so that if I replace the batteries pretty quickly, it will once again display the weirdness. 4. Sometimes, when it goes crazy, I can hear a faint buzzing/tweeting sound. 5. There haven't been any crop circles in my back yard for over three months now, so I doubt that has anything to do with it.

There's no visible damage or corrosion.

Any help will be greatly appreciated.

Re: 41CV Gone Wild!

*Message #2 Posted by **Diego Diaz** on 17 May 2003, 8:11 p.m.,*
in response to message #1 by gifron

X files apart (wich includes the classical "User error. Please replace user and press any key" (excuse me for the old joke), the 41 trouble-shooting is usually a question of:

a) Chemical (Corrosion -visible or not-)

b) Mechanical (Case tightness)

c) Electrical (Cap's, Transistors, IC's...)

a) and b) beeing the *winners* for a huge score. Symptoms you've described are more likely to be also on their count.

In the c) case Fullnuts still have some chances for minor repairments, while Halfnuts are mostly "unserviceable".

So my advice should be:

Take your 41 apart, clean thoroughly every contact area you see (Iso-Propyl Alcohol, diluted venegar, etc.) Make sure the plastic poles where screws fit are in good shape, without cracks and every hole have a good thread for the screws to thighten properly, fix them if needed.

Once you've cleaned and checked/fixed the above, chances are you get a nice working 41 after reassembling.

Hope this help in anyway.

P.S.: O.K. I'll tell my "coleagues" to stop "circling" in your backyard. ;-)

Diego

Re: 41CV Gone Wild!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 17 May 2003, 11:04 p.m.,*
in response to message #1 by gifron

Hello, Gifron (I remember I saw your name in posts here sometime ago... Is it correct?);

I'd ask you where does your 41 come from, but I prefer this to be kept between you and the seller.

I agreee with Diego Diaz, but I want to ask you: is yours a fulnut or a halfnut?

This image is an original MoHPC.

If yours is a fullnut (original, earlier HP41 LCD) that you may also check for the zebra connectors (there are at least four types) between the mainboard and the keyboard.

The main difference from both types is not the LCD, but the LCD "look" is the best way to identify both types. For their guts, fullnuts have a separate mainboard with all components except LCD assy, while hafnuts (except for the CX) have only one PCB with keyboard, main "nut" CPU (not a nutz CPU... thanks to Doc. Mike, I could not resist; sorry) and LCD assy built in. This characteristic makes the fullnuts "serviceable", while halfnuts allow minor maintenance.

If you need extra advice, provided the type you have, let us know.

Success!

Luiz C. Vieria - Brazil

Re: 41CV Gone Wild!

*Message #4 Posted by **Wayne Brown** on 18 May 2003, 1:47 a.m.,*
in response to message #1 by gifron

You've already gotten good advice from Diego and Luiz, but I wanted to bring up one more possibility. You said sometimes the problems are worse when you use the card reader. Do you leave the card reader plugged in all the time, even when you're not using it? If so, try removing the reader (and any other modules) and see if the problems still happen. Many of the symptoms you describe (especially the "faint buzzing/tweeting sound" and weird displays) can appear when a module is not making good contact in one of the four module ports. The port used by the card reader is especially susceptible to this kind of problem, because the reader only fits one port and people usually remove and reinsert the reader more often than other modules, so the contacts in this port may suffer more wear and tear than in the other ports. If the problems *only* happen when something is plugged into one of the ports, then try gently cleaning the contacts on both the module and the port and see if that makes a difference. (You may find that some modules work better in some ports than in others, so it might help to switch them around a bit. Unfortunately you don't have a choice with the card reader.)

Since testing the ports doesn't require opening the calculator, I suggest that you try my suggestions first beofre looking for more serious problems.

Very good points, indeed! Read this first.

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 May 2003, 2:31 a.m.,*
in response to message #4 by Wayne Brown

Hi Gifron, Wayne, folks;

Wayne is 100% correct, and I must admit I was lazy with this concerns. Nothing else to add, just my complete support.

Good reminds, Wayne; thanks.

Luiz C. Vieira - Brazil

Re: Very good points, indeed! Read this first.

*Message #6 Posted by **Diego Diaz** on 18 May 2003, 7:24 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

I have to agree, Wayne's and Vieira's advices are really on the good track.

They've both pointed out what I simply express by: "every contact area", thus including I/O ports block as well as zebra strip connectors between processor board and keyboard PCB (I should have been more precise indeed on my first post, excuse me).

Anyhow, it's my opinion that *every* unknown, previosly owned, 41 (or whatever) MUST be taken apart, thorougly cheaned/checked, and reassambled, even if it works perfectly at first glance. Well I'm a "hardware nut" after all... ;-)

This is to be sure that no hidden corrosion is eating your precious 41's guts and to prevent minor cracks in the screw poles to become a bigger problem when they (sooner or later) fully break down.

Please confirm if our advice has been of any help.

Cheers from the Canaries.

Re: 41CV Gone Wild!

*Message #7 Posted by **gifron** on 19 May 2003, 10:46 a.m.,*
in response to message #4 by Wayne Brown

Thank you all for your suggestions.

1. The module ports looked good as far as I could tell.

2. The screws were tight, but I took it apart and checked the posts for cracks anyway. No cracks found.

3. I cleaned all the contacts and reassembled to test. Screws held tight. Turned it on. Different garbage than before, but still garbage. I figured I needed to clean it a little better.

4. Disassembled, and recleaned. Reassembled. Different garbage #3. Hmmm...

5. Wondering about making good contact along the zebra strips, I pressed hard on the lower portion of the

keyboard, and the garbage changed to a regular display! Kept up the pressure while running a card through the reader - No problem!

6. Disassembled. Sure enough, the left bottom post was cracked. I guess I didn't check it good enough. There's also a teensy tinsy crack at the top of the right bottom post.

7. Next step is to repair the posts. I've seen several suggestions for this repair, from longer screws to plastic weding solvent, to adhesive. Which is best? I know, it depends who you ask ;) Any STRONG opinions though?

Thanks.

Re: 41CV Gone Wild!

*Message #8 Posted by **Diego Diaz** on 19 May 2003, 10:57 a.m.,*

My answer goes to the top of the forum...!? I can't really tell what has gone wrong!!

Anyhow you can follow your thread there.

Sorry about the "misplacement".

Regards.

Re: 41CV Gone Wild!

*Message #9 Posted by **David Smith** on 19 May 2003, 11:12 a.m.,*
in response to message #7 by gifron

Do NOT use superglue. It will not hold for long. Use the plastic welding solvent.

Longer screws (if you can find them) are definitley a good idea. The screws are a #2-28 selft tapping screw. If they are long enough they can reach into the reinforced area of the keyboard frame below the posts. I have fixed several machines with totally sheared off posts with longer screws. The posts are now only bushings that keep the CPU card centered in the screws.

Plastic washers!

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 12:59 p.m.,*
in response to message #9 by David Smith

Hi;

some fullnuts come with two plastic washers thicky enough to maintain pressure over the mainboard. They come between the mainboard and the back case, having the screw posts "inside" it. I built at least three sets with the same plastic used in current calcualtor "blisters", their thickness is enough. If you cannot find washers that precisely fit around the screw posts, you should anly take care when cutting the "custom" washers so they are not large enough so they will fit right under the back case screw holes and supports, as you'll easily see.

I can add some scanned images, if you need so.

Success!

Luiz C. Vieira - Brazil

Re: Plastic washers!

*Message #11 Posted by **David Smith** on 20 May 2003, 4:46 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

First came HP41's where the CPU board was held down by two nuts. Problem was you could only undo the nuts once and still be able to have them hold the board down. These machines have two flat bottom screw bosses that touch the top of the bottom screw posts.

Next came the fat washers. They replaced the nuts. They are a teeny tiny bit taller than the screw posts. The flat screw bosses touch the top of the washers that hold the CPU board to the zebra strip.

Next came the no washer units. They had a modified screw boss with an indention in it that was as deep as the fat washers were thick. The CPU board was held down by the screw bosses.

Next the CPU boards were made of a slightly thinner material. Then appeared two very thin little shim washers to take up the slack.

Finally came the half-nut machines that had no CPU board to hold down agains those pesky little zebra strips.

And now it comes...

Re: Can't find the solvent!

*Message #13 Posted by **gifron** on 23 May 2003, 10:25 a.m.,*
in response to message #9 by David Smith

The solvent recommended is methylene chloride, aka methylene dichloride (MDC), dichloromethane (DCM). I've found out that it is used in paint strippers, as a blowing agent in polyurethane foams, and as a decaffeinating agent, and that it causes cancer (depending upon whom you listen to). Nevertheless, I can't find any to use on my calculator. I found some paint strippers that contain it, along with a host of other unpronounceables, but not the straight stuff. As expected, any time I ask a store employee for help finding dichloromethane, they look just as lost as I do. Where can I find this stuff? Is there a brand name I can ask for?

Thank you in advance.

Re: Can't find the solvent!

*Message #14 Posted by **Frank Wales** on 23 May 2003, 5:23 p.m.,*
in response to message #13 by gifron

I bought some recently over the counter in a pharmacy. The smallest size they sold was 500ml, and they had to order it in from their supplier, so it took a day to get. No hassle, though.

Re: 41CV Gone Wild! - Update

*Message #15 Posted by **Diego Diaz** on 19 May 2003, 10:49 a.m.,*
in response to message #1 by gifron

As far as I've got to understand those crack's must not be too conspicuous, otherwise you'd have seen them at first glance.

So may be a single Superglue drop should be enough, let it fill the gap in the crack, then, wire-wrap the pole to turn it to its original shape and let it dry overnigth.

Longer screws are a good idea, but remember they are self-tapping, so you must screw them whith extreme care going back and forth in no more than 1/8 or 1/4 of a turn on each step as the new thread is forming, take your time.

Even the original shorter screws must be treated with the same care, due to possible Superglue filling of the old thread inside the plastic post.

This is my approach, hope it helps you.

Cheers!

Diego.

Two versions of the HP-17BII ?

*Message #1 Posted by **jose goncalves** on 17 May 2003, 1:33 p.m.*

I read somewhere in the Museum that there are two versions for the HP 17BII: one is English and the other is International. Is this correct ? How can we tell the difference if we can check the machines ? What are those differences really ?

Re: Two versions of the HP-17BII ?

*Message #2 Posted by **Neil** on 17 May 2003, 6:47 p.m.,*
in response to message #1 by jose goncalves

Hi Jose,

In the international version, you have an extra option in the modes menu called 'INT'. When you select this, you come to a menu with the choice of German, English, Spanish, French, Italian, and Portuguese languages. Additionally, when you run the self-test, there is an extra ROM called ROM2 (I guess this is where all the international stuff is kept.

Re: Two versions of the HP-17BII ?

*Message #3 Posted by **jose goncalves** on 17 May 2003, 8:21 p.m.,*
in response to message #2 by Neil

Well, I assume then that the English version will not have neither this option nor the second ROM. Is this correct ? I'm pretty shure both my HP17BII are int version.

Are there any other HP calc with such particular variety of choices ?

Re: Two versions of the HP-17BII ?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 17 May 2003, 10:37 p.m.,*
in response to message #3 by jose goncalves

Hello, Jose; tudo certo? (kinda Howdy? in Portuguese)

I was not aware of this Intl. HP19BII against the English-only. I have an HP19BII (Clamshell, like the HP28) that has the international choice (messages and menu labels in five languages, Portuguese included). I am not sure if there is an English-only HP19BII since it offers this international choice from it's very first appearance.

Good to know about it.

Hey, have you updated your HPcalcs timeline? There are a few new addings, and you may insert the HP12C Platinum... unless they find a parking place and smash the existing units with a hammer. And Gene, keep yours for now! No one knows what passes over HP's staff. Maybe they are, in fact, testing hammers' marketplace since the Xpander.

Best regards.

Luiz C. Vieira - Brazil

Re: Two versions of the HP-17BII ?

*Message #5 Posted by **James M. Prange** on 18 May 2003, 4:49 a.m.,*
in response to message #3 by jose goncalves

Well, the 49G doesn't come in different language versions, but it does have some multilanguage message tables. Some tables are English, French and Spanish, some are English and French, and some are English only. If you set it up for French or Spanish and the particular message table doesn't have the chosen language, then it will default to English.

I gather that for any 48 series or 49G, it's not all that difficult to install your own message tables, but I've never tried it as, being rather language impoverished, anything but English would be pretty much "Greek to me". If you're interested enough to write your own message table, then I suggest that you contribute it to hpcalc.org; other users may appreciate it.

Regards,
James

Re: Two versions of the HP-17BII ?

*Message #6 Posted by **jose goncalves** on 18 May 2003, 10:23 a.m.,*
in response to message #5 by James M. Prange

Hi. Thanks for all your comments. As always, I learn a lot every time I visit the Museum. Well, my main interest is as a calc collector. I don't have the intention or the knowledge to write my own messages or tables. What I know now is that I have to look for an English only HP17BII to include in my collection.

Re: Two versions of the HP-17BII ?

*Message #7 Posted by **Christoph Giesselink** on 18 May 2003, 4:19 p.m.,*
in response to message #3 by jose goncalves

Well, I assume then that the English version will not have neither this option nor the second ROM. Is this correct ? I'm pretty shure both my HP17BII are int version.

You can also check the version numbers of the ROM(s).

```
- Press <CLR> + <SK4> for single test mode
- Press <- to enter memory browser.
- Press . to eval shown address (021E8:71...)
```

On the top left side you see one or two letters, the 1st is the ROM rev. of the main ROM, the 2nd is the ROM rev. of the language ROM.

Both of my HP17BII (Malaysia/Indonesia) have rev. BA.

BTW, the number on top right is an error code (of last restart?).

> Are there any other HP calc with such particular variety of choices ?

Yes, there are. The predecessor of the HP17BII the HP17B was also build in these two versions. My

two HP17B (both Singapore) have rev. BB.

The HP19B and HP19BII was always sold in the international version. Here it had make no sense because the was enough room (128KB) in the ROM for the international version, whereas the international versions of the HP17B(II) need the additional 32KB ROM chip.

Christoph

The HP-17BII also has a memory browser !

*Message #8 Posted by **jose goncalves** on 18 May 2003, 7:14 p.m.,*
in response to message #7 by Christoph Giesselink

Here I go again ! Learning all the time. I knew the HP42S had this feature, but the unsuspected HP17BII too ! That's something ! Well, then my natural question is this: which other Pioneers have the memory browser ?

Re: The HP-17BII also has a memory browser !

*Message #9 Posted by **Christoph Giesselink** on 18 May 2003, 7:24 p.m.,*
in response to message #8 by jose goncalves

HP17B, HP17BII, HP27S, HP42S

So all high end Pioneer series calculators base on the Lewis chip.

Minor difference, the HP17B amd HP27S don't support arrow up and down for #01000 steps like the HP17BII and HP42S do.

Christoph

Recalibration of HP-01

*Message #1 Posted by **Thomas Reins** on 17 May 2003, 12:30 p.m.*

Hi. I have a 1977 model HP-01 watch that is losing much more than the 30 seconds per year these were originally calibrated for. I'd like to recalibrate it, if possible. Does anyone here have any knowledge, either direct or as a web reference of this procedure? I can't seem to locate any potentiometers on the board at all, there seems to be no adjustments to tweak - though admittedly I've been unwilling to completely disassemble it without further information... I'd really like to get this thing back up to specs - as it is now, it loses about a second per day - 00:06:15 per year. Does anyone here remember anything about the method to correct this?

The crystal oscillator engineer speaks

*Message #2 Posted by **NH** on 18 May 2003, 4:28 p.m.,*
in response to message #1 by Thomas Reins

Hello,

I have done design work on little crystal oscillator circuits previously. Some of them were for 32.768 kHz, others were for 14.31818 MHz .

Anything I came up with was strictly ho-hum, using a dedicated CMOS cell that was designed on a silicon chip layout software. Little more than a 2-transistor logical inverter really.

You bias it to the halfway point, like, if it is a 3V supply, then you bias it to 1.5V . It acts like a little amplifier, and with the right load capacitors, you get a reliable oscillator. If you mind your P's and N's, maybe low-current consumption also.

BACK TO YOUR CALCULATOR WATCH, I have 3 suggestions, and the 3rd suggestion is the one to focus on:

1. you might conceivably try to change out the crystal. Probably it is in some tiny oddball metal-can, but I have seen some very small packages for 32.768 kHz. NO, I dont even know if your HP-01 runs on 32.768 kHz it might be something else. Also, if you did replace it the result may be worse than if you left it alone. You could solder the original back in, unless you had destroyed it with the extra handling, which is a 50-50 chance.

2. If you can see little load capacitors (typically there are two) each of which goes from either terminal of the crystal, to ground, then you may have something. Increasing the capacitance typically slows it down, less capacitance increases the speed. Since yours is running too slow, you'd need to have less capacitance. BAD NEWS, these capacitors are often integrated onto the custom silicon die (thats how I did the ones I designed).

3. You could leave it alone. If you lose one second per day, that's nuthin'. Twice a year you have to reset it for daylight savings time. And what most of us do with a watch that runs a little slow, is you set it about 3 minutes fast. After a couple months, it will be right on, and after that, it will be a little slow.

Perfectionism is a dangerous game when dealing with old nostalgic items. You have something thats pretty good, and it works. Start messing with it and you break it, then you have nothing (because its been discontinued by those clueless marketeers so there is no factory building you more).

Good luck,

- Norm

Re: Recalibration of HP-01

*Message #3 Posted by **Ellis Easley** on 18 May 2003, 5:33 p.m.,*
in response to message #1 by Thomas Reins

30 seconds per year is less than 1 part per million! The "pretty good" canned oscillators that go in computers are spec'ed 100 ppm, I think - I don't know how that compares to "broadcast standards". My DigiKey 2000 catalog has oscillators in +/- 100, 50 and 25 ppm. Also 32768 cylindrical can crystals in three sizes: 5.1mm long X 1.5mm dia, 6.2 X 2.1 and 8.2 X 3.1.

I wonder how they got such a high accuracy on the HP-01? It must have some kind of adjustment, but as David Smith says the module is non-repairable, maybe it is a thick film hybrid, laser trimmed.

Re: Recalibration of HP-01

*Message #4 Posted by **Dave Shaffer** on 18 May 2003, 7:07 p.m.,*
in response to message #3 by Ellis Easley

I've never seen the inside of an HP-01, but many other digital watches, even the cheap Casios, have a little variable capacitor somewhere inside for diddling the oscillator frequency. If you can get inside, look for something with a screwdriver-like slot. Try turning it (carefully, and not too much!) and track the time for a few days to see if things got better or worse. Repeat as necessary.

If you just want accurate time, for $30 you can get a desktop clock that receives the low frequency (60 kHz) signals from WWVB. It stays within a few microseconds.

If that's still not good enough, let me know. I'll take you with me the next time I go (radio astronomy) observing. We know the time to within a few billionths of a second at most of our stations. After we do a Very Long Baseline Interferometry experiment, we know the relative time betwen antennas all over the world to about 0.1 billionth of a second. (Or, at least what it was a week ago, when we did the experiment!)

Re: Recalibration of HP-01

*Message #5 Posted by **Chan Tran** on 18 May 2003, 8:58 p.m.,*
in response to message #4 by Dave Shaffer

I didn't know that the HP01 has such a good accuracy. Most of the watches I can find have the spec of +/- 15 seconds/month which is a lot worse. May be the 01 was calibrated using software similar to the AF factor in the 41 clock module. By adjusting the AF factor in the 41 I can achieve similar accuracy. Actually my 2 HP41 gain less than 5 secs a year.

Re: Recalibration of HP-01

*Message #6 Posted by **David Smith** on 18 May 2003, 9:19 p.m.,*
in response to message #1 by Thomas Reins

The HP01 crystal is not 32768KHz. I think it is 768KHz, but dont know for sure. It has been ages since I opened up my HP01. I seem to remember that the crystal is one of the few components that could possibly be changed. I don't remember if there is a tuning cap on the crystal either.

Re: Recalibration of HP-01

*Message #7 Posted by **Thomas Reins** on 19 May 2003, 12:01 p.m.,*
in response to message #6 by David Smith

Well, it's cased in plastic at the moment, and I don't even know how it's supposed to be removed, whether it pops out or screws out, and I don't want to force it either way. Most of the electronics I've calibrated/repaired were larger things - oscilloscopes, spectrum analyzers, &c... Bigger parts, and a schematic diagram... How did you go about getting the innards out of the case without damaging the whole board?

HHP EPROM

*Message #1 Posted by **Kim** on 17 May 2003, 11:28 a.m.*

I have just bought myself a HHP combo 64k Ram 32k Rom (what would life have been without ebay). The RAM works great in port 5 (01 & 02) and it even tells me with SHOWPORT that port 5.00 has 32k (type 2=ROM). Has anybody here tried to program an EPROM for HHP (or know how it's done), what type EPROM is it 27256?.

I have considered using it as a hardwired or memory mapped I/O.

Kim

Re: HHP EPROM

*Message #2 Posted by **Ellis Easley** on 17 May 2003, 12:56 p.m.,*
in response to message #1 by Kim

My Hand Held Products brochure comes in Handy again! It says the following:

```
Using Your EPROM Carrier

  If you wish to add EPROM capability to your
HP71, three different Memory Modules are
available:

* 32K EPROM Carrier
* 32K EPROM Carrier with 32K RAM
* 32K EPROM Carrier with 64K RAM

  EPROM functions are identical in all three
versions.
  You may install up to 32K of EPROM in your
71M/M EPROM Carrier. The Carrier will accept the
following: Intel compatible, CMOS, 27256, 200
nanosecond or faster.

  Addressing the Memory ...
  Memory in each EPROM Carrier version is parti-
tioned in 32K increments and addressed in these
locations:

* 32K EPROM ... Port 5.0
* 32K EPROM/32K RAM ... Ports 5.0 and 5.01
* 32K EPROM/64K RAM ... Ports 5.0, 5.01, and 5.02

  Programming the Memory ...
  Hand Held Products offers SDS (System
Development Software) for programming your 71
M/M EPROM. The EPBURN SDS may be pur-
chased for a nominal charge if you wish to burn
your own programs into EPROM.
  Hand Held Products can also perform quick
EPROM burns for you at our facilities. Call or write
if you'd like additional information on this low cost
service.
```

prices (August-September 1988 discount letter):

```
32K EPROM Carrier - $95 reduced from $115
32K EPROM Carrier with 32K RAM - $225 / $275
32K EPROM Carrier with 64K RAM - $300 / $375
  (typo - says "32K RAM/64K EPROM" - in letter only)
```

I have a Psion Organizer which comes in a slide-out case, has a two line LCD display and a rectangular-array keyboard and runs on a 9V battery. I bring it up because one of the types of memory modules that can be plugged into it is EPROM modules and the Organizer has the ability to write to the EPROM. It treats it as write-once mass storage. The modules have the quartz window exposed so you can erase the EPROM and start over. Psion sold a UV source for this purpose.

Psion (O.T.) question

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 17 May 2003, 3:09 p.m.,*
in response to message #2 by Ellis Easley

Hello, Ellis;

I remember I saw a Psion Organizer that follows your description, but it happened in the 80's (earlier version?). Anyway, I remember that the owner told me (and showed me) it was able to instantly recognize modules connected to it while it was switched to ON, smoething like PCM_CIA management. Do you (or anyone else) know if this is indeed a correct procedure? I remember he showed me the current configuration and then he plugged a RAM module in and checked again the configuration: instead of EMPTY it had an 8KRAM. What I want to know if this sort of procedure is correct.

Best regards.

Luiz C. Vieira - Brazil

Re: Psion (O.T.) question

*Message #4 Posted by **Ellis Easley** on 17 May 2003, 8:27 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I would call that "hot-swapping" although that is a term usually applied to high power devices like disk drives. I don't know if that is allowed or possible with my Psion, I'll have to look for the manual and see.

Re: Psion (O.T.) question

*Message #5 Posted by **Ellis Easley** on 19 May 2003, 2:07 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I looked in the Psion Organizer manual. It never says in so many words that it is OK to plug in a module while the unit is on, but it never warns you not to, as many manuals for many products do over and over!

In some procedures, it does imply strongly that you can plug in modules without turning the machine off. For example, the manual describes invoking the procedure to save a file to the internal RAM, called device A. Without any warnings to turn off the machine, it says if you now plug in a module into the socket for device B, and press "MODE", the destination displayed for the pending operation will change from A to B. Not only that, if the module you plug in is a never-used (since erasure) EPROM module (called a "Datapak"), when you press "MODE" the machine first displays "SIZING PACK B PLEASE WAIT". "Sizing" creates the file system on a blank sevice.

So I would say the manual takes pains never to express surprise that it is OK to plug in a module with the machine turned on! It does advise against pressing any keys while inserting a module.

My machine is the Organiser II model CM (note UK spelling of "Organiser"). It is the bottom of the line with 8K internal RAM. Then there is a model XP with 32K internal RAM. Both have LCD displays with 2 lines of 16 characters. Some of my application program pack manuals mention models LZ and LZ64 which have 4 line LCD displays - maybe the LZ64 has 64K RAM?

There are three kinds of modules that can be used in the two device sockets: Datapaks, which are blank EPROMs in sizes from 8KB to 128 KB (only up to 64 KB usable with the CM), Program Packs, which are just Datapaks with commercial programs stored on them, and Rampaks which contain 32K battery backed RAM. The manual for the machine says the Rampaks come with instructions that must be read and followed before use - maybe they have a power sequencing requirement.

They must have run out of space in the mainframe ROM: it contains the trig functions SIN, COS, TAN and ATAN. The Maths Program Pack adds ASIN and ACOS! along with numerical integration, root finding, hyperbolic functions and more.

Psion calls the process of erasing the EPROM in a Datapak "Formatting" and they sold a UV light source called a "Formatter"! I don't know what they charged for the Formatter but they also provided a mail order Formatting service, charging £5 to Format one device! The price of the Datapaks was US$100 for a 64KB and $60 for a 32KB, according to an insert that came in my package. The copyright dates in the various manuals are 1986 - 1989.

Psion (O.T.) question - thank you

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 May 2003, 3:45 p.m.,*
in response to message #5 by Ellis Easley

Hello, Ellis;

I've been curious about Psion since I saw one of them when I was at the university. I remember I already had mi HP41 and the guy with the Psion told me he wuold never trade its Psion for an HP41. I kept that in mind, but I never saw another one again.

What about nowadays? Any e-address so I can have a look at the new models? Or Psion also quit calculators as well?

Thank you. Good, valuable information you post here.

Luiz C. Vieira - Brazil

Re: Psion (O.T.) question - thank you

*Message #7 Posted by **Ellis Easley** on 19 May 2003, 5:20 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The last I remember hearing of Psion was in the EduCalc catalog. I just looked at my oldest one (#42, 1988) and it has my model! I didn't know that, I got my Psion in a set from a closeout catalog, just out of curiosity. It has an interesting programming language like structured Basic and can be programmed in machine code (Hitachi 6303, based on Motorola 6800). The same ad is in the 1989 EduCalc catalog(#43) , then in 1990 (#48), they added the LZ models, they have 32K and 64K of RAM. EduCalc dropped some of the prices in #49 (1990). In my next catalogs, #53 and #54 (1991) they only have the LZ (32K) along with a smaller assortment of accessories

than before. Then in #56 (1992) they introduce the Psion Series 3, a V30 (8086/Z80 compatible processor from NEC) based clamshell palmtop with graphics - which they have extended their OPL language to include - and an MS Word compatible word processor, 384K ROM, 256K RAM, two slots for some kind of Flash memory cards and RAM cards, QWERTY keyboard, 8 lines X 40 characters text display. The same ad is in #57 (1992) and #61 (1993), my last catalog.

Museum CD-ROM 5 has catalog #29 (1985) which doesn't have any Psion products - it pretty much only has HP and TI. BTW, it has the HPIL parts from the 82166C kit listed separately on page 23. Catalog #66 (1995) and #72 (1996) on the Museum CD-ROM has a Psion Series 3a with double of most specs of the Series 3, plus a Lotus 123-compatible spreadsheet.

There is a Psion website:

http://www.psion.com/

with the same logo, now they specialize in mobile connectivity and digital radio.

Re: Psion (O.T.) question - thank you

The Psion website has a link for an online store, you can see some of their recent/current products:

http://www.expansys.com/psion.asp

Re: HHP EPROM

*Message #9 Posted by **Ellis Easley** on 17 May 2003, 8:44 p.m.,*
in response to message #2 by Ellis Easley

I don't have any HHP product - the brochure came to me in a box with a 71B. But after reflecting on the description in the brochure, I think it would not be very hard to make a custom ROM because of what appears to be an equivalence between the RAM and ROM implemented in the combo device. First, I would build the set of files I want to ultimately have in the ROM, in a 32K block of RAM. Then I would write a program using PEEK to copy all the bytes out of the 32K block of RAM and save them in a binary file. Then I would use that binary file (converting into S-records or whatever is required by my EPROM burner) to burn a 27256. It sounds like there is a socket inside the module so you can change the EPROM at will. My scheme probably falls apart because there is some kind of file system written in the block of memory that makes it not relocateable. In that case it would be necessary to figure out where the pointers are and change them before burning the EPROM. The hardest part of my scheme is getting the data out of the 71 - I hope you have an 82164 HPIL/RS-232 interface (I wish I did!) If you do, and a freestanding EPROM burner with serial port, you could run everything from the 71.

Re: HHP EPROM

*Message #10 Posted by **Kim** on 18 May 2003, 11:27 a.m.,*
in response to message #9 by Ellis Easley

Thanks a bunch Ellis (again).

The thought I had was to make my own JPC image on an EPROM, the content is fun and good.

I would believe (NOT know) that the JPC is made for ROM which should make things a bit easier. The location 5.00 is taken care of by the firm:, hardware, so in it goes (socket at will).

Making an image of the JPC should be relatively accomplishable.

Now the next issue is to make the DUMP to the RS232 port and the connected burner. (Got the RS232, not the burner).

would anyone know where to get a cheap burner (and the ROM) could FRYs help? Maybe I could find one @ebay

Thanks again for you help, awesome place this is...

Kim

Re: HHP EPROM

*Message #11 Posted by **Ellis Easley** on 18 May 2003, 4:56 p.m.,*
in response to message #10 by Kim

There have been a lot of them on Ebay, I have bought a few myself! When I was shopping, the greatest interest seemed to be in certain small systems that plugged into PC's - I think Jameco might have been one brand that was commanding high prices - I remember them as a mail order electronics company. I was mainly interested in programming PLDs and I bought a standard Data I/O mainframe model that I had used before - I want to say 29C but that is an HP calculator! - anyway, what I got came with a PROM/EPROM plugin and I hoped to find a LogicPak plugin later to do PLDs The unit was in very bad shape, at least the plugin, it wouldn't reliably read an empty EPROM.

The problem with professional equipment like that is that it needs to be calibrated and sometimes isn't supported by the manufacturer's website unless you first pay to bring it up to a certain revision level. (The voice of my experience with Data I/O and Advin Systems) All this is compounded by the fact that in-circuit-programmable logic devices (including Flash EEPROM) are putting the manufacturers out of business.

There is a very simple EPROM burner that plugs into an old ISA PC slot and has a ZIF socket on a ribbon cable that sits next to the computer, made by Needham's Electronics. They have moved on to bigger and better things but were still supporting the little unit last time I looked. I bought one of these new a long time ago for $130 and it still works fine. It is very general purpose in design and they have been able to add new devices (not all!) via software and sometimes simple socket adapters (they do some EPROM microprocessors this way).

I just looked up Needham's and they are still in business, I even downloaded software for my unit which is called PB-10. They don't sell it any more, or any unit that needs a bus connector, but they have a number of systems that plug into a parallel port. The bottom end system is called EMP-10 and they call it an upgrade to the PB-10 (the software I downloaded includes files with EMP in the name), it does a limited number of devices and sells new for $220. I can only vouch for the PB-10, it is easy to use and reliable and well supported, and the company has been in business for over 10 years.

I'm looking at the software I downloaded (the machine is in another room) and it can use binary files or Intel Hex or Motorola S-records or two other file types I don't recognize.

Here is Needham's web site:

http://www.needhams.com/index.html

Re: HHP EPROM

*Message #12 Posted by **Ellis Easley** on 18 May 2003, 6:44 p.m.,*
in response to message #10 by Kim

On the EPROM (I assume it needs a 28 pin DIP - Dual Inline Plug - part) - the Fry's near me has a small selection of electronic parts in individual bags hanging from pegboards, including some EPROMs. Not the "NTE" replacement line, which Fry's also carries, but just Fry's own bagged parts. That might be as good a place as any to get one part. Or you could try DigiKey:

http://www.digikey.com/

This page has Fairchild DIP EPROMs for $3.62:

http://dkc3.digikey.com/pdf/T032/0459.pdf

Note that "OTP" means "one time programmable", an erased EPROM in a plastic package without a quartz window that can't be erased again. This page has Atmel DIPs for $1.94, but they are OTP:

http://dkc3.digikey.com/pdf/T032/0463-0464.pdf

Another place is Mouser Electronics:

http://www.mouser.com/

This page has ST DIPs for $3.30:

http://www.mouser.com/catalog/614/164.pdf

This page has Fairchild DIPs for $6.44:

http://www.mouser.com/catalog/614/32.pdf

This page has Atmel OTP DIPs for $3.30:

http://www.mouser.com/catalog/614/170.pdf

Both catalogs have 32 pin PLCC OTP's. My HHP brochure doesn't specify, so I assume it uses 28 pin DIP EPROMs.

If it does have a PLCC socket - they do (or used to) make PLCC-type EPROMs in ceramic packages with quartz windows, but they never fit in the sockets very well - the "P" in PLCC means plastic and the real similar part in ceramic is the "leadless chip carrier", so the compromise ceramic PLCC is really a leadless chip carrier with "J" leads brazed on, it just doesn't take the socket's spring force as well as a real PLCC.

The Mouser website is better - you can browse lists of part numbers for categories like "EPROMs", then after selecting a part, you go to a PDF of the catalog page with prices and more specs.

You can find EPROMs in various old electronic equipment like VGA boards, motherboards, disk drives - if it has a paper label, peel it off and see if it has a quartz window and the right part number. Then you'd need to erase it - I've heard you can erase EPROMs by leaving them in the full sun for some time (days?) Whether with sunlight or a proper eraser, to erase it completely you have to remove every bit of adhesive left by the label, 91% rubbing alcohol is good for this.

BTW, DigiKey carries the Needham's programmers, this pdf is the page from their online catalog:

http://dkc3.digikey.com/pdf/T032/0264.pdf

Why Adobe is a good thing

*Message #1 Posted by **Bill Platt** on 16 May 2003, 3:32 p.m.*

I forgot to mention one of my opinions regarding ADOBE Acrobat.

Considering that Microsoft has a(n increasing) monopoly on more of the business of software every year, I am glad that some other company is out there with a universally accepted business product---ACROBAT! And for business, it is great--as is HTML mail by the way---Plain text does not have bold, italic, fonts and all that stuff, which is so very necessary at times when doing business.....

But the KISS system is a good system, which is what *is* good about plain text.

Interesting fact: Many of the (U.S.) Federal government sites are set up with a clear understanding of the advantages both in bandwitdh and universal access, of plain text.

If you go looking for tax info, or CFR (code of federal regulations) info, or United States Code info, you have a choice whether to fetch plain text, or PDF.

regards,

Bill

Re: Inventions . . .

*Message #1 Posted by **Bill Platt** on 16 May 2003, 2:00 p.m.*

Paul,

That's not such a bad idea. What do you think of mine: You know how microwaves leave some foods soggy? I think a microwave oven with built-in alpha/beta ray surface charring would be great. And the slight increase in radioactivity of the food will help with treating stomach and colon coancer.

Re: Inventions . . .

Announcing the new HP-10U!

*Message #1 Posted by **Ernie Malaga** on 16 May 2003, 1:09 p.m.*

Hello, all:

We minimalists believe that less is better, and that least is best. So we are proud to present the HP-10U, a minimalist's dream come true.

It's so minimal that doesn't have numeric input keys except for 0 and 1 -- which is no handicap, as the HP-10U works in binary only. It can perform the 4 basic operations (algebraic entry, neither precedence nor parentheses), change the sign of the number, enter the -- uh -- binary point, and that's about it. To clear the calculator, you press 0 and then =.

That said, there's no more to say about the machine. Only what the "U" in the model number stands for -- useless.

-Ernie

Re: New HP-10U!

*Message #5 Posted by **Ellis Easley** on 16 May 2003, 2:04 p.m.,*
in response to message #1 by Ernie Malaga

Might not the name be confused with "IOU" as in "I owe you", or does the name mean that after you buy it, HP still owes you a calculator?

Would it be possible to add programmability based on the Turing machine?

Re: Announcing the new HP-10U!

*Message #10 Posted by **Gordon Dyer** on 16 May 2003, 5:01 p.m.,*
in response to message #1 by Ernie Malaga

Maybe it should be called HP-10Bin
It is either of 2 states: either in the hand or in the bin...

I have added it to my collection of minimalist designs.
Any one got others?

Re: Announcing the new HP-10U!

*Message #11 Posted by **Patrick** on 16 May 2003, 5:04 p.m.,*
in response to message #1 by Ernie Malaga

I think it is a real travesty that the only information you can get about this new model is here on-line. HP used to write such *good* user manuals! How is anyone supposed to figure out, say, how to do backward error analysis using the HP-10U?

Obviously, just another Carly-esque sign of the times...

Re: Announcing the new HP-10U!

*Message #12 Posted by **Christof** on 17 May 2003, 11:39 p.m.,*
in response to message #11 by Patrick

what's the 0 key for?

101 is easily entered as 1 + 1 + 1 + 1 + 1

Re: Announcing the new HP-10U!

*Message #13 Posted by **glynn** on 18 May 2003, 2:09 a.m.,*
in response to message #12 by Christof

That's right! Heck, no numeric buttons at all. Just shake the calculator, until the number you want comes up on the display! Come on, 111... baby needs a new pair of shoes!!

Re: Announcing the new HP-10U!

*Message #14 Posted by **Ernie Malaga** on 18 May 2003, 5:06 a.m.,*
in response to message #12 by Christof

>what's the 0 key for?

Well, if it comes to that, the truly minimalistic HP-10U would have just one key. To operate the machine, you tap that key using Morse code!

Or, no keys at all -- just a microphone, so you can tell the calculator what you want to do...

8^)

-Ernie

You could design one simpler, the HP-0C

*Message #15 Posted by **NH** on 18 May 2003, 4:17 p.m.,*
in response to message #14 by Ernie Malaga

You could design one much simpler than the HP-10U.

It would calculate only in base 0 . Therefore, the only number it would accept is 0.

Since no matter whether you add or subtract or multiply by zero, then the result is still zero, so it doesn't need any buttons at all. Also it doesn't need any display, since you can just presume that the display, if it had one would be reading "0".

I think HP executive management is working on a close cousin to a calculator of this nature....

reflecting the need for increasing profits while having less to manufacture, they may soon release a virtual base zero calculator. You buy it for $150, and when you open the cardboard box there is nothing inside.

I hear that marketing and management are very favorable to the increase in projected quarterly earnings that this new model might create, with executive perks and bonuses all around .

:o]

If anybody should question the wisdom of such a unit, like, wonder if they got a good deal, they would have to take that up with the virtual online owner's manual. Since the website disconnects when you try to access it, then there wont be any complaints from the customers.

I think it is going to be called the "HP-0C" .

Re: You could design one simpler, the HP-0C

*Message #16 Posted by **james** on 18 May 2003, 5:13 p.m.,*
in response to message #15 by NH

ROTFLMAO - I like it! C in honor of Carly presumably?

Sounds good James, HP-0C

*Message #17 Posted by **NH** on 19 May 2003, 1:45 a.m.,*
in response to message #15 by NH

Yes, I think "C" should stand for Carly on that HP-0C .

It's going to really boost profits. She is going to get a $50M bonus perk as soon as the first 100,000 HP-0C units are manufactured

Also, since there actually isn't anything coming off the production line, and there isnt anything inside the box, then it is presumed as soon as the ink dries that the first 100,000 were already manufactured from the first day.

So Carly's $50M bonus perk is assured on this one from the moment this brilliant idea popped into her head (unlike other boardroom deals where there might be some uncertainty about getting the perk).

Carly's bonus for the HP-0C

*Message #18 Posted by **james** on 19 May 2003, 2:29 p.m.,*
in response to message #17 by NH

Yeah - the one thing that won't be virtual will be Carly's slice of the action!

Re: PDF files (yes, the Reader is a different story)

*Message #1 Posted by **Bill Platt** on 16 May 2003, 12:00 p.m.*

Glynn,

Thanks for your description of the problems with AR5.1. Sorry I took so long to respond--had a business trip (and i didn't bring a lap-top and sure didn't miss it!;).

What you describe regarding trouble with your acrobat installation is a perfect example of the **nonlinearity** of the current "windows" / "INTELx86" architrecture/OS approach. I have on numerous occasions, with various windows systems, had a crash or an error event which was unrepeatable. In other words, starting with a set keystroke sequence, the first time, a crash happens; next try, identical key sequence after boot, and no crash.

So, "computers" are now so complex that they are actually chaotic systems. Your system especially ;-0(.

But I also noticed one certain fatal flaw--you allowed yourself to get bullied into installing a software item "on the fly". In my experience, this is a very dangerous activity and often leads to trouble (as foreshadowed by the spooky music..).

I think you are stuck with the only real solution:

Format & Reload.

BTW, I have over the years found that ALL windows systems degrade (inexplicably) over time, and that a Format & Reload will bring performance back up dramatically. I have even done testing of this business in the past, for instance, time to load and open an excel file-----before F&R, say, 30 seconds, after F&R, say, 15 seconds.

Apparently, the "registry" system in windows just gets corrupted a little bit further every time you use your computer.

I have not even started to discuss a favorite aspect of this business, but will mention it: software compatiblilty and load sequencing i.e. which software should be loaded first. It can make a HUGE difference on post W95 systems.

Note that I am not a true compudude, but just another regular (like mechanical type) engineer who has been trying to make computers do my bidding since 1983.

-regards,

Bill

Windows system deterioration

*Message #2 Posted by **Ellis Easley** on 16 May 2003, 1:58 p.m.,*
in response to message #1 by Bill Platt

I haven't had access to "inside information" since just before Windows 95, and I didn't understand most of what I heard before that, regarding how Windows works. But I remember that Windows 3.X had a control

panel where you could specify how virtual memory is handled - how Windows uses space on the hard disk to swap programs in and out of RAM to facilitate multitasking. You could tell it to use a fixed amount of contiguous disk space and if Windows could find such a chunk, it would allocate it as a file (something.386, I think) and only use that for disk swapping - or you could let Windows manage it on its own. The latter seems to be the only option on Windows 9x+. I think Windows now uses any part of the disk it wants any time it wants. The more RAM you add, the greater the volume of disk swapping needed (it seems) and as the disk gets fragmented, the more thrashing is involved in the simplest operations. Newer versions of Windows seem to do much more of all this, it seems like each revision attempts to maintain a constant response time on the latest generation of hardware - I suspect this is Microsoft's effort to sell new computers, since that is the only time most people upgrade their OS. You use your computer until the hard disk is full, then you get a new computer with a much bigger hard disk and copy everything over. It's like buying a new car because the ashtrays are full, then emptying the old ashtrays into the new ones! I'm keeping Windows 95 on this computer, mainly because I can't get a newer driver for my little laser printer. I have upgraded the MS browser several times but I think I'm at the point that MS doesn't support it with newer versions for Windows 95 any more. That's OK with me, this one is working pretty well. I also need to reformat and reinstall periodically - that is much easier now with a newer computer with a huge hard disk connected via $10, 100 Mb/s Ethernet cards, to use as temporary storage! Also, my little printer works fine via the network - it shows up on the other computers as an HP LaserJet IIp.

I love how cheap computers get when the new chip, etc. comes out (plus the economy slows!). I'm astonished by what you can get for $300-$400 for a not-very-latest-generation PC compatible with bigger hard disk than I'll ever need, CD-R, DVD, new OS, etc. The latest motherboard I bought came with a CPU (2.4 GHz) literally more than 10 times the speed of the one I'm using right now (233 MHz) [which is nominally more than 100 times the speed of the first personal computer I worked with, the TRS-80 (model 1), 1.77 MHz, and that cost 600 old dollars]. The only truly awful part is the little speakers they sometimes include.

win system thermodynamics

*Message #3 Posted by **glynn** on 16 May 2003, 11:04 p.m.,*
in response to message #1 by Bill Platt

Bill;

Oh, yes. I am indeed aware of the degradation over time of a windows installation. I am on maybe my eighth reload of W98se. This is a great improvement of reliability over W95, though.

Microsoft wants, of course, to sell me on the improved reliability of XP. But each and every time they come out with a new system, I go through the "new needs" syndrome: I must buy a new printer, because my old one is no longer supported. I must buy a faster processor and more memory, in order for it to run. I must give up on the motherboard that still had that one EISA slot, because none of the new processors will fit the old board, and the new boards don't have EISA. The $600 EISA DAC board, thus, must go-- and the new PCI-based boards are only $600 to do the same thing.

I estimate that my cost of going "current" is NOT the $150 or so for the OS; it is four to five times that, and I would spend considerable time getting it all "right".

Are my experiences unusual, or am I alone there? I dunno. All I have heard of XP has left me underwhelmed when not dismayed.

Apparently, it IS somewhat more reliable, when the installation has gone right. But that does not mean it will not suffer "degradation" and get progressively flakier over time, just like its predecessors.

Go Linux? Possibiity-- except Linux, as yet, hasn't got all the applications I want, or drivers for the devices I want.

And now I see SCO is suing or threatening to sue, over what they claim is pieces of ATT Unix code in the Linux kernel. So the Linux community may well be held hostage to a court battle over whether some who participated in Linux development should have been ALLOWED to.

(note that, if SCO *REALLY* wanted Unix and Linux to coexist, they would have HELPED replace whatever offends them in the kernel-- or given the opportunity for the Linux community to do so. They're not protecting the sanctity of intellectual property for U and Me... Litigation means they want the licensing of Linux and royalties. That's ALL it means.)

Oh well. Yeah, I'll probably go through reload hell again, see if Acrobat works afterward. Wish me luck.

;-)

Re: win system thermodynamics

*Message #4 Posted by **Dave Shaffer** on 17 May 2003, 10:42 a.m.,*
in response to message #3 by glynn

Glynn,

re: " I must give up on the motherboard that still had that one EISA slot, because none of the new processors will fit the old board, and the new boards don't have EISA"

I, too, yearn for that EISA slot. I am using an old Logitech bus mouse, which has the best feel I've ever experienced for a mouse. which requires an EISA slot. I figure I am destined to live with PII/PIII architecture for the rest of my life, although I have seen a celeron motherboard at the local Frys which has a single EISA slot. I have plenty of old PC boxes in which to try putting a new-fangled board.

I'm also sticking with 98SE as long as I can, with my old Gateway Pentium Pro's (3 of 'em, one with an overdrive to get to 333 MHz). I have a newer Sony with XP, and despite its 5x speed advantage, I hardly ever use it 'cause I can't stand an OS that thinks it is smarter and knows better than I do what I want to do next!!! I've been using computers for 40 years, and am quite capable myself, thank you. Well, usually - I have yet to reliably write a CD with XP! Besides, it's easy to crash XP, too.

EISA?

*Message #5 Posted by **Ellis Easley** on 17 May 2003, 11:04 a.m.,*
in response to message #4 by Dave Shaffer

glynn, Dave:

Just out of curiosity, do you guys mean EISA or ISA?

I've got a Tandy EISA system and some EISA bus SCSI adapters for it, but I never heard of a special EISA bus mouse! (not that I'm saying there never was one)

Also, the things you say apply equally to ISA - it has pretty much disappeared from motherboards. Another reason I am keeping this 233 MHz system running - my scanner needs an ISA slot (and I probably can't get a driver for it above Windows 95).

Re: EISA?

*Message #6 Posted by **Dave Shaffer** on 17 May 2003, 1:24 p.m.,*
in response to message #5 by Ellis Easley

Ellis,

I don't think it matters: ISA or EISA. My mouse has a card which plugs into an (E)ISA slot, and the mouse connects to the card. Mine's a Logitech, but (at least) Microsoft also made several versions of bus mice. I think the original intent was to save the serial connector for other devices. The intro of the PS2 version of mouse connection ultimately superseded all other kinds of mice.

I don't know how complicated it is to put the (E)ISA slot on a motherboard, but it sure would be nice to have it. Another option would be some kind of a PCI/ISA adapter. I have no idea if voltages and logic are compatible, but if so, somebody should make one and I'd buy it (I might buy three of them, for my various PCs).

Re: EISA? ==>ISA, sorry...

*Message #7 Posted by **glynn** on 17 May 2003, 2:04 p.m.,*
in response to message #6 by Dave Shaffer

My current mobo is just that-- Has one ISA slot, but that is the one consisting of two connectors-- sort of a long slot followed by a shorter one. I can see the card in my mind, though I haven't got the box open. I presume there is something out there called EISA I just borrowed the name from, which is totally different.

The mobo, BTW, is a Tyan Trinity 400, which has been rock-solid, a great machine. 4 PCI slots plus one combo slot area (that has a PCI AND a ISA, but you use one or the other, not both). It is a slot 1 system and could also use a socket 370 cpu (again, not simultaneously; it is not a dual-cpu design). But alas--my combo of Peripheral stuff in it will not run faster than a 66MHz bus speed without the odd occasional lockup, which I can't permit. So I am running a Celeron 533. If I boosted the bus to 133, I could drop a Pentium up to 1024MHz in it.

But what I have has been just great for what I do. I am loathe to mess with new memory, new DAC, new SCSI card, etc. If only it had a nice stable OS that would not crumble like a sand-castle in the rain.

I've been dreaming, in fact, of a product a friend of mine told me about.. He works for a school district, and oversees a bunch of PCs in classrooms. They apparently bought a product (Win-based) that allows the kids to use the machines, mess around, stick their own software in it, and basically wreak havoc on their OS installations.

At the end of the day, the PCs are rebooted, and this software returns the PC *magically* to exactly the same as before the kids got hold of it. A special set of directories on a network drive holds files the kids generate for class; but the PCs themselves stay pristine. The software sounds simply wonderful. But I think it is likely fairly expensive.

OS_protection

*Message #8 Posted by **Bill Platt** on 17 May 2003, 4:29 p.m.,*
in response to message #7 by glynn

glynn, Please post the name of the software that you mentioned that protects the OS--it sounds very interesting indeed!

Re: OS_protection

*Message #9 Posted by **James M. Prange** on 17 May 2003, 6:01 p.m.,*
in response to message #8 by Bill Platt

The name of the product is GoBack Deluxe Edition, recently sold from Roxio to Symantec. http://www.roxio.com/en/products/index.jhtml lists it for US$29.95. The feature referred to is "autorevert", and I can see that it could be very useful for classroom PCs or demonstration items, but I don't think you'd want to use that feature on your home PC. But you can also use GoBack revert your PC to some time of your own choosing, as long as the drive hasn't changed so much that GoBack hasn't been able to keep track of all of the changes. If you defrag your hard disk for example, you probably won't be able to revert to a time previous to the defrag. You may have to disable GoBack before installing some MS Windows updates. You can also use the deluxe edition to recover files that have been deleted or overwritten, subject to the same limitations. It's definitely not a replacement for backing up your hard drive, but it has saved me considerable grief a few time. It's very useful for recovering from recent changes, for example, a software installation gone bad, or a file inadvertently deleted or overwritten. It does have its limitations, but even so, I highly recommend it if you're using an MS Windows system that it supports. Norton SystemWorks 2002 came with GoBack Personal Edition which, if I recall correctly, doesn't have the autorevert or file recover options. I think that there may be a trial version available on the Roxio site.

I do hope that Symantec continues to improve and market this product.

Regards,
James

Re: OS_protection

*Message #10 Posted by **James M. Prange** on 17 May 2003, 6:20 p.m.,*
in response to message #9 by James M. Prange

PS:

Actually, GoBack keeps track of changes in a "hidden" "system" file, gobackio.bin, in the root directory of the drive. I think that the default size of this file is about 10% of the drive size. GoBack also begins running before MS Windows itself, so you can recover from changes that prevent MS Windows from running. If I recall correctly, it modifies the partition table, so you should check on compatibility before using it with multi-boot systems.

Regards,
James

Re: OS_protection

*Message #11 Posted by **glynn** on 17 May 2003, 9:09 p.m.,*
in response to message #10 by James M. Prange

The one my friend recommended was Deep Freeze Professional. Don't know how exactly it differs from GoBack, but I think it IS a differnt system.

Re: OS_protection

*Message #12 Posted by **James M. Prange** on 18 May 2003, 4:22 a.m.,*
in response to message #11 by glynn

Thank you. I meant to mention that I thought that there was more than one

application that does this. Looking at the Deep Freeze web site, I get the impression that Deep Freeze always reverts to a a particular state at reboot, rather like GoBack with autorevert enabled. Good for classroom and public access computers, but not what I'd want on my own personal computer. Single-copy pricing is higher than GoBack, but I notice that Deep Freeze offers discounted pricing for corporate-government, library, and educational licensing. The Roxio site is offline at the moment; I suppose that Roxio might offer discounts for site licences, but I really don't know.

Regards,
James

Re: win system thermodynamics

*Message #13 Posted by **unspellable** on 19 May 2003, 1:21 p.m.,*
in response to message #4 by Dave Shaffer

Cotter's law:

The length of time it takes a desk top computer to perform a given task is directly proportional to the speed of the processor.

(Processor speed increases linearly with time, while the software to be processed increases as the square of the time.)

Cotter's Law-Win Sys Thermodynamics

*Message #14 Posted by **Bill Platt** on 20 May 2003, 10:19 a.m.,*
in response to message #13 by unspellable

That sounds about right. Why is it "Cotter's" law?

Re: win system thermodynamics

*Message #15 Posted by **unspellable** on 20 May 2003, 1:26 p.m.,*
in response to message #13 by unspellable

It's Cotter's Law because that's my last name.

The name is Noël Cotter. The first name, Noël, is Noel with a dieresis (Two little dots as you see on Christmas cards.) over the "e". Software people, not being members of the real world, tend to view this mark as something found only in French and German whereas it is really a perfectly legitimate part of English spelling as well. Hence, a lot of software chokes up when given this character. Specifically, when I first joined a Yahoo group the Yahoo software choked up, and in a fit of pique I chose the handle "unspellable". Tha Yahoo software has since improved somewhat on this point.

HP 41C fixes?

*Message #1 Posted by **Paul Pickett** on 16 May 2003, 11:26 a.m.*

Thanks for all the responses!

On second thought I'm beginning to think that maybe reviving my 41 to its original glory is the way to go. Can I apply a little 409 to the body and keypad or is 409 a calculator solvent?

I put the card reader on and slipped a card and yuck. It went halfway through and came out gunky. I've browsed the articles forum and I see some instructions on how to repair card readers. My question is could some first-timers tell me how their experience at using these techniques worked? The whole sequence looks a little daunting to me. Is this something "anyone" can do if he follows the instructions?

Also I have some corrosion on the battery contacts. It still works but it's ugly. Is there anything to do besides rub it off?

Re: HP 41C fixes?

*Message #2 Posted by **Randy Sloyer** on 16 May 2003, 12:13 p.m.,*
in response to message #1 by Paul Pickett

Never use 409. It contains sodium silicate. Etches glass, discolors plastics, especially old black 41's. Mild glass cleaners without additives are best. Don't soak them, spray lightly and invert to allow it work so it does not get into the keyboard.

The hardest part of card reader repair is avoiding loss of the little bits that come out upon disassembly. Take it slow, make notes if you feel the need. Cleaning the goo just takes time. It must be spotless with no stickiness remaining or you'll have problems. If you run into trouble, don't panic, put it aside and ask questions. Re-visit with a clear head and it will go back together.

Best to clean the battery holder out of the calculator in a dilute solution of vinegar. Follow up with a solution of water and baking soda to neutralize. It should remove the green without scraping. You may have to resort to a copper foil patch if the original gold/copper is gone.

Re: HP 41C fixes?

*Message #3 Posted by **Ellis Easley** on 16 May 2003, 12:29 p.m.,*
in response to message #1 by Paul Pickett

On the battery contacts, this recent thread mentioned two ways to repair serious corrosion:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=33949

I haven't rebuilt a 41 card reader yet but I have done a 97 and a 67 which have a similar mechanism, although I understand the 41 card reader enclosure is a little tricky to open. Actually cleaning the goo was not difficult and you need to get rid of all of it. I used a lot of Q-Tips and 91% isopropyl alcohol. I used silicone rubber tubing to replace the wheel and it was very easy. I found the tubing at an RC model shop, they didn't have the

sizes marked, just large and small, so I bought some of both and one was right. The pieces I used are not as concentric as they might be (machines "chug" a little) and since I have several feet of tubing, I'm going to select some more concentric bits some time and put them on.

I wouldn't use 409 on my calculators. I don't know what's in it or other cleaners that are intended to be used without rinsing. I use dishwashing soap solution on a clean sponge squeezed almost dry. For the keyboard, I use a brush with short bristles (~1/2") bigger in area than the calculator (~5" X 4") and load it with just soap suds - just damp with water and a little suds. I hold the brush with bristles up and lower the keyboard onto it and move it in small circles. Then keeping the keyboard facing down (laying it on a towel) I rinse the brush, shake out all the water I can, and use it to rinse the keyboard in a similar manner - I do this two or three times. Then, still holding the keyboard facing down, I use a vacuum cleaner with the small brush attachment (cleaned for the purpose!) to dry the keyboard and remove any water, suds, or loosened crud.

Re: HP 41C fixes?

*Message #4 Posted by **David Smith** on 16 May 2003, 4:40 p.m.,*
in response to message #1 by Paul Pickett

I used to use Novus plastic cleaner on my keyboards, but ran out. I also use Windex. Spray it on (I dont worry too much about it getting under the keys... HP keyboards are fairly well sealed against minor spills), clean with a soft toothbrush, wipe off with small wads of paper towels (change often, like between each row of keys). Blow keyboard with canned air, wipe off liquid blown out of keys. Repeat. If you can find it, do a final cleaning with a lens cleaner called ROR (residual oil remover).

Re: HP 41C fixes?

*Message #5 Posted by **Ellis Easley** on 17 May 2003, 9:31 a.m.,*
in response to message #4 by David Smith

I got a pamphlet about Novus plastic care products at the plastic supply house I went to recently. It is a system - cleaners and polishes. Are you talking about "Novus No. 1 Plastic Clean and Shine"? The place I went to is called Regal, it is on the east loop in Fort Worth and they have a place in Dallas on Merrell Rd. (also San Antonio, Austin and Houston, and that's just the southern region!) They have a $25 minimum but I might go back because they have a scrap pile of plastic sheet odds and ends they sell for 75¢ a pound.

Re: HP 41C fixes?

*Message #6 Posted by **David Smith** on 18 May 2003, 9:24 p.m.,*
in response to message #5 by Ellis Easley

Yes, that's the stuff. I usually buy it from a place on Ebay that sells it for cleaning up pinball games. They also have a coarse and fine plastic scratch remover good for cleaning LED/LCD windows... but I don't like it becuase it is hard to get it out of the corners of the window.

Re: HP 41C fixes?

*Message #7 Posted by **Paul Brogger** on 16 May 2003, 5:40 p.m.,*
in response to message #1 by Paul Pickett

I just did my -97's card reader for the first time a few weeks ago. It all went pretty smoothly, but I had to do it twice -- the first time thru, I left some ArmorAll on the read/write head, and maybe that was enough to keep it from working. (It passed the cards fine, but gave an Error with each read attempt.)

Also, one of the references suggested I lightly sand the ends of the "little gold fingers" (switch contacts) inside. So, somewhere between a cleaner read/write head and cleaner switch contacts, the second time worked

like a champ.

Re: HP 41C fixes?

*Message #8 Posted by **Ellis Easley** on 17 May 2003, 9:17 a.m.,*
in response to message #7 by Paul Brogger

I had to clean the fingers too but I used the famous "Pink Pearl" pencil eraser that is frequently recommended for cleaning the gold plated card edges on option boards.

Thanks to everyone!

*Message #9 Posted by **Paul Pickett** on 19 May 2003, 4:40 p.m.,*
in response to message #8 by Ellis Easley

My 41C is looking and feeling like new again! And with no etching from 409!

I've assembled my tools for the card reader and will do that soon.

Re: Thanks to everyone!

*Message #10 Posted by **Patrick** on 19 May 2003, 4:59 p.m.,*
in response to message #9 by Paul Pickett

With a name like yours, Paul, why aren't you collecting slide rules??

Re: Thanks to everyone!

*Message #11 Posted by **Paul Pickett** on 19 May 2003, 6:23 p.m.,*
in response to message #10 by Patrick

I started to ask how Paul was a good name for collecting slide rules but then I got it! Obviously I'm hanging out with a sophisticated crowd here and I'm going to have to think before I reply to anything!

If I had been born about five years earlier I might have used a slide rule. Perhaps even one of those famous PAUL slide rules! :-)

in response to message #9 by Paul Pickett

Congratulations! Ain't it great?

Re: Tools for Card Reader Repair

*Message #13 Posted by **Paul Brogger** on 19 May 2003, 8:02 p.m.,*
in response to message #9 by Paul Pickett

I should have mentioned, some of the cross-head screws on my '97 card reader were surprisingly tight. I had to exert more force than I would have expected to keep the screwdriver in the slots and get enough torque to loosen them.

So, Get yourself a good array of quality screwdrivers with sizeable handles. I found the regular jeweller's screwdrivers' handles were way too small for the kind of pushing and twisting that was

required. (And take this all slow -- the kind of pushing I'm talking about was performed with the card reader "body" in my left hand -- you don't want to be stressing other parts unnecessarily, but neither do you want to punch a driver through your palm . . .)

Also, I never quite understood the pinch roller hub. It's kind of a hard nylon axle with a screwdriver slot at one end. It's supposed to help adjust the pressure on the pinch roller, but I couldn't come up with a theory as to how. (Maybe some knowledgeable person could hold forth on this topic?)

Re: Tools for Card Reader Repair

*Message #14 Posted by **Katie** on 20 May 2003, 11:03 a.m.,*
in response to message #13 by Paul Brogger

The white nylon axle that the pinch roller rides on is actually call the "eccentric cam". Take a close look at it and you'll see that it's not quite symmetric. By turning it (that's why the screwdriver slot is there) you can very slightly vary the distance between the pinch roller and the head.

Great stuff! Thanks!

*Message #15 Posted by **Paul Pickett** on 20 May 2003, 3:41 p.m.,*
in response to message #14 by Katie

I'm ALMOST ready to attack this.I'm going to get some better screwdrivers tonight.

HP 48gx scatterplot?

*Message #1 Posted by **Karen Gibson** on 16 May 2003, 10:54 a.m.*

Any help with this question is greatly appreciated. I apologize now for my lack of knowledge on this calc. I've only had it a month, I've figured most of the things out on my own, but this one has me stumped.

I am doing a scatterplot, that part I have down. I need to get the equation for the data after I have plotted it. I've tried using the STATL button on the menu, then FCN VIEW to get the equation. For some reason it is returning an incorrect equation. I know this because I've tried several out of my Algebra book and do not get the correct answer. When I do the STATL instead of following the data plotted it does a diagonal line accross the screen and this is the equation it returns. Can anyone help? Thank you, Karen

It was 20 years ago today...

*Message #1 Posted by **Patrick** on 16 May 2003, 2:54 a.m.*

With all due respect to Sargeant Pepper...

In May of 1983, HP published articles introducing and describing the HP-15C and HP-16C, two of my current favourites.

Despite HP's current inert state with respect to quality RPN engineering calculators, I'd still like to say Thank-You, HP, for the wonderful legacy you have created. These old but still functional machines have provided this engineer with a lot of joy over the years.

Re: It was 20 years ago today...

in response to message #5 by J.Manrique Lopez de la Fuente

"Time for hp15c platinum? Or perhaps, full Voyager Platinum line :-)"

I think that would be a really good idea *if and only if* the keyboard would be as reliable as in the original Voyagers. Else, with the extremely many keycodes and key combinations available in the HP-15C (more than 400), it would be a nightmare to try and discover just what key didn't register properly at what step. Just think of RCL A, RCL+A, RCL DIM A, RCL MATRIX A, RCL (i), RCL + (i), RCL DIM (i), RCL 9, RCL .9, etc. to see what I mean ... :-)

Thanks for your interest and best regards.

HPCC

in response to message #2 by Valentin Albillo

I am an ex-PPC member (#4820) but don't know much about HPCC. I'd love to read the articles you mention but I suspect this requires membership/annual dues?

Re: HPCC

*Message #8 Posted by **Valentin Albillo** on 16 May 2003, 10:02 p.m.,*
in response to message #7 by Patrick

Patrick wrote: "I'd love to read the articles you mention but I suspect this requires membership/annual dues?"

I'm afraid you're right. HPCC is an HP-fan club, more or less in the same spirit as old PPC and CHHU, trying to survive in the not-so-favorable-for-HP-calcs present, though somewhat scaled down, of course. If you want additional info, please visit

http://www.hpcc.org

My only relation to HPCC is trying to help it survive: I contribute funds by being a member, and I contribute materials by writing articles/programs for publication, but I have no responsibilities or 'charge', nor do I have a say as to publication or pricing policies. Ideally, I would prefer that HPCC would not charge anything for membership, but I understand this is simply unrealistic, if only to help compensate the cost of publishing Datafile six times a year.

Anyway, I intend to make available online in a near future all of my articles so that anyone interested will be able to download them for free. I'll post a message to the list announcing it when ready.

Thanks for your interest and best regards.

Re: HPCC

*Message #9 Posted by **Frank Wales** on 17 May 2003, 9:06 a.m.,*
in response to message #7 by Patrick

Valentin is correct about needing membership of HPCC to get current *Datafile* issues.

If you want to read articles from 1982-2002, Jake Schwartz has scanned the first 20 years of *Datafile* onto CD-ROM.

http://www.waterw.com/~jakes/ppccdrom.htm

A full table of contents for all issues is on the HPCC web site:

http://hpcc.org/datafile.html

You've obviously done a huge amount of work on this, and I for one am very interested in seeing the fruit of your labour.

I wish I had the ability to host this for you; I'd do it in a heartbeat!

Are there any generous members out there that can help???

B.

Re: Design Submitted--ya hadda be there

*Message #4 Posted by **glynn** on 18 May 2003, 6:59 p.m.,*
in response to message #3 by Scuba Diver

Rick, David, everybody--

What Ben said, and S.Diver applauded, was a submission to HP's Design-A-Calculator Contest, held in concert with Scholastic Magazine. It was only open to students, but typically these affairs are full of pie-in-the sky NON-STARTERS (i.e., "I'd like a calculator that has built in OCR and printer, so that you slide it over a math paper and it fills in the answer automatically"...).

But Ben Salinas is a savvy calculator user, deep into real utility and KNOWS WHAT HE IS DOING. His design, which he gave us a peek at before he submitted it (rare, and Thanks, Ben, for doing so) was both doable and quite useful. He really researched and made design selections that HP designers themselves would be proud to have made.

If Ben doesn't win, there's no justice in this world. If the contest were up to me, I'd grant him a scholarship and a date with Kelly Clarkson.

Anyway, that's what the hell it's about. ;-) Go Ben!

What's the Datamath Museum?

tm

www.datamath.org - great site

*Message #2 Posted by **Gene** on 15 May 2003, 5:32 p.m.,*
in response to message #1 by Trent Moseley

There ARE other good calculator sites out there besides Dave's museum, you know.

www.rskey.org (Viktor's site) www.rskey.org/gene (My site) www.datamath.org (Jorge's site)

and Craig Finseth's site and Rick Furr's site, etc.

Check out the Museum's link section.

Re: TI-1786 & the Datamath Museum

*Message #3 Posted by **Trent Moseley** on 15 May 2003, 6:43 p.m.,*
in response to message #1 by Trent Moseley

Joerg,

I gather that the Datamath Museum dosn't have the TI-1786 listed.

It is solar powered about the size of a credit card and about two thicknesses. It has the usual four functions plus a memory register that you can add or subtract from; plus square root and percent keys. On the front in big letters is printed: TI CARD. It was assembled in Taiwan. On the back in the corner is a serial no. I-0586. I bought it new in the mid-eighties.

Great little machine.

tm

Re: TI-1786 & the Datamath Museum

*Message #4 Posted by **Joerg Woerner** on 16 May 2003, 6:39 a.m.,*
in response to message #3 by Trent Moseley

Thanks for your comments...

If you just compare the different calculators introduced by TI and HP between 1972 and today, you'll

notice a ration of more than 10:1. That's the reason why it is much more difficult to locate a specific product in my TI museum than in Dave's HP museum. (A great "Thanks" to Viktor, his RS-KEY site inspired me to define the Datamath layout).

The TI-1786 is featured here:

http://www.datamath.org/BASIC/LCD_Modern/TI-1786.htm A good friend of mine, Otto Herzig donated me pictures of it. I own "only" the ESSO promotional model.

How to locate the TI-1786 in the Datamanth Museum ?

Two possibilities:

Click the Datamath as Icon for "Basic calculators - the four-bangers" and scroll down to the 1985-1987 time frame.

OR

Click the Alphabetical list and scroll down to TI-1786 TI CARD. If your Internet access is slow - the list some 100kBytes...

Thanks for visiting the Datamath Museum.

Regards, Joerg

Re: TI-1786 & the Datamath Museum

*Message #5 Posted by **Ellis Easley** on 16 May 2003, 12:57 p.m.,*
in response to message #4 by Joerg Woerner

Joerg, your promotional model is especially interesting since the company changed its name to Exxon. As I heard it, either "Esso" or "Enco" sounded like a bad word in Japanese, so they selected a word that meant nothing in any language. Since then a lot of companies have done the same thing. I'm sure "Agilent" is an example - "agile" has a good meaning in English (my pocket dictionary says "nimble; quick" - just like Jack, who jumped over the candlestick!) but I'll bet they checked to make sure it didn't imply anything negative in any language. I heard the following horror stories relating to marketing to Spanish speaking people in the US: The Chevrolet "Nova" automobile - "nova" in Spanish can mean "it doesn't go". And once a local Coca-Cola distributor in Florida wrote an advertisement in Spanish, the way they translated the slogan "Coke Adds Life" suggested that Coke contained evil spirits!

Re: apocryphal marketing translations

*Message #6 Posted by **glynn** on 16 May 2003, 7:47 p.m.,*
in response to message #5 by Ellis Easley

The "No Va" is at least based on some resemblance to the language-- so we'll give that a thumbs up.

Of course, in English, we have partisans who will tell you what F.O.R.D. is supposed to mean, so take at least a little of the supposed marketing errors with a salt-rimmed margarita. More incomprehensible might be why Toyota would have marketed a "Cressida" in English-speaking countries, naming the car after the main female character in a Shakespeare play, the archetypal unfaithful lover.

"Enco" was the word that the Japanese were said to have had trouble with. I do not know the situation to be fact, though; babelfish doesn't help here, but maybe babelfish won't repeat smut.

The story *I* heard about a soft-drink parallels yours, except in the details. I was told (by a marketing guy) that when Pepsi first marketed their product in China, their slogan was then "Pepsi... Lifts your Spirit"-- which was duly literalized into chinese pictograms, without regard to the meaning imparted. The Chinese were supposedly bemused and disturbed at the exhortation that "Pepsi-Cola will bring your Ancestors back from the grave."

Ahhh, those urban legends. How can you track down the truth, when the legends sound so good? ;-)

Re: apocryphal marketing translations

*Message #7 Posted by **Joerg Woerner** on 17 May 2003, 4:22 a.m.,*
in response to message #6 by glynn

European language creates similar things:

Toyota introdudes in the 80's a sporty two seater with mid-placed engine. They called it MidRace2 or MR2. If you read MR2 in french it it "merde" - the translation of SHIT !

Mitsubishi introduced same time the Montego (I believe this is US name of a 4WD utility) in Europe as "Pajero". If you read Pajero in spanish language - sorry can't tell you the translation here ;-))

Greetings from Germany,

Joerg

I know Florida is a US state, if that's what you mean. It's one of the 7 states I've actually been to, and not just passed through! I saw the SkyLab take off, at the time it was the biggest payload ever launched. We were supposed to get to see two launches, but as you might remember, things went wrong on the SkyLab so they didn't send the crew up for a

while.

There is a company, General Steel, that advertises all the time on the radio. They sell steel buildings and they have been having a half price sale for a while. At one point in their ad, the announcer is describing the different facings you can have applied to the walls of your steel building and he says "... you can have brick ...", every time I hear that I remember the Marx Brother's movie "The Coconuts" and Groucho's sales pitch: "You can get brick or you can get stucco - boy, can you get stucko!"

Re: HP-28S -- Are Connecting Pins Mushroomed, Glued or ???

*Message #1 Posted by **Paul Brogger** on 15 May 2003, 2:43 p.m.*

I'm hoping to eventually fix my broken-apart HP-28s, but I'm wondering, if I were to try to dismantle one, would I be forced to break all of the plastic connecting pins?

Put another way, does anyone know for sure whether the pins are mushroomed (melted over) or glued to hold the calculator halves (*quarters?*) together, or is it a "snap fit"?

I've not taken the labels up on my unit to see what's underneath. There are three pins apparently intact on the back of the alpha side, and those don't show obvious signs of melting or glue. The broken-off ends of most of the posts are still in their inside-faceplate sockets, and some rattle around, but won't come out. This leads me to believe there is no glue involved, and makes me suspect no melting either.

Has anyone successfully dismantled and reassembled an HP Clamshell calculator? Is there a reference on the subject available? (My internet searches have turned up nothing.)

9114A vs 9114B disk drive

*Message #1 Posted by **Jon** on 15 May 2003, 1:08 p.m.*

I would like to buy a 3"1/2 disk drive. I have seen auctions for these two models. Does anybody know the diference?

Thanks in advance

Jon

Re: 9114A vs 9114B disk drive

*Message #2 Posted by **Grant Goodes** on 15 May 2003, 1:42 p.m.,*
in response to message #1 by Jon

THe 9114B is preferrable, but it's not that major: It has lower power-consumption, so will last longer on a single charge (I believe this is due to a different floppy-drive unit being used). There are some other minor differences.

grant..

Re: 9114A vs 9114B disk drive

*Message #3 Posted by **Mike (Stgt)** on 16 May 2003, 4:05 a.m.,*
in response to message #1 by Jon

The 9114B acts a bit faster (not measured, just an impression).

Ciao.....Mike

Re: 9114A vs 9114B disk drive

*Message #4 Posted by **Diego Diaz** on 17 May 2003, 12:08 p.m.,*
in response to message #1 by Jon

There are also differences regarding the power supply and the battery charge gauge.

9114A uses 88014A battery pack with a very simple charging circuit.

9114B uses 88014B wich includes a more alaborated circuitry.

Anyhow you can swap them as they both have the same physical dimensions and the same connector.

9114A has one only led to display battery/power status, while 9114B has a three led gauge to tell the users the "amount" of charge still remainig in their batteries.

Also the drives are different, both mechanical and electrically.

Cheers.

HP-01 Repairs

*Message #1 Posted by **Randy Sloyer** on 15 May 2003, 12:00 p.m.*

Does anyone out there know of any repair resources for a dead HP-01?

Any help or information appreciated. A post here or direct email is fine.

Thanks in advance.

Re: HP-01 Repairs

*Message #2 Posted by **David Smith** on 15 May 2003, 4:38 p.m.,*
in response to message #1 by Randy Sloyer

Basically the electronics module is not repairable. About all you can do is swap the keyboard/case/electronics module with another unit. Occasionally one can fix a bad battery contact or stuck key.

Re: just ugly

*Message #1 Posted by **Chris(FLA)** on 15 May 2003, 8:17 a.m.*

I agree with you Patrick & Wayne. That has got to be the most eye effending thing I have ever seen.

Whomever designed that thing must have been on some wierd drug that affects eye sight.

Luckily it is a 12C. If that was a 41 and I had to spend the time I have programming my 41 I probably would be seeing white flashes for days after a heavy session of banging on the keyboard.

HP has lost its way and I have no confidence that they will find there way back to a simple utility device that does a job. This is just sad.

HP is just another PC box company thanks to Carly.

There is no way I am going to buy one.

Chris

Agree it's ugly, but how do we convince HP?

*Message #2 Posted by **Gene** on 15 May 2003, 9:19 a.m.,*
in response to message #1 by Chris(FLA)

If they fired any and all designers of their recent calculators, they'd improve 100%.

Consider:

```
12c platinum - enough said.

49G - Frozen Hampster? Terrible contrast of shift functions?

10B - who on earth thought teal would work on a dark background?

32SII - teal again?

48GX - I consider the colors a step back from the 48SX and 48S
```

Why not just make things that work?

Who needs to hear this and how do I/we speak to them?

Re: Agree it's ugly, but how do we convince HP?

*Message #3 Posted by **Ernie Malaga** on 15 May 2003, 12:59 p.m.,*
in response to message #2 by Gene

>Who needs to hear this and how do I/we speak to them?

Your question makes the assumption that someone at HP cares. I'm convinced they don't.

And it was such a nice company before. Here's a paragraph from the HP-65 Owner's Handbook (July 1974), which pretty much shows the enormous difference in attitude since then:

"If the manual does not answer all of your questions, contact your nearest HP Sales and Service Office, or, if you are in the U.S. dial (408) 996-0100 and ask for Customer Service. We want you to be completely satisfied with your HP-65."

Can anyone imagine finding _that_ today? Too bad Messrs. Hewlett and Packard aren't running the company anymore.

-Ernie

CONVINCE HP LIKE THIS.....

*Message #4 Posted by **Norm** on 15 May 2003, 1:44 p.m.,*
in response to message #3 by Ernie Malaga

You can convince HP like this:

1. DONT buy their crummy HP home PC's that they sell to the masses, and if you know any masses personally, tell those masses not to buy crummy HP home PC's, and tell them why. I have seen people buy them and be fairly unhappy. The same brain-damaged losers that designed the last of the calculators have also put out a fairly unpleasant combination of popup advertisements, bad software, and lack of help on those #$%#$% trash HP home PC's. You would do MUCH better not to buy one.

2. DONT buy their latest calculator garbage like 48G+, and if you own one, SELL IT, to reduce HP's profitability.

3. IF YOU ARE AN ENGINEER, DONT buy their test equipment. Need a scope, and RF generator, a spectrum analyzer? Just buy somebody else's.

WHAT'S THAT SPELL? bye bye customers. If all the customers say 'bye bye' thats got to have an effect, someday, when the crooks in the boardroom run out of stock swindles to feed their paychecks.

Don't exagerate, please

*Message #5 Posted by **R Lion** on 15 May 2003, 2:04 p.m.,*
in response to message #4 by Norm

The 48 series is not garbage. If you don't like RPL, well, but it is not garbage. If you don't like its colours, well, but it is not garbage. The fact: one of the most powerful calculator in the world.

Greetings

Raul

Re: CONVINCE HP LIKE THIS.....

*Message #6 Posted by **Ernie Malaga** on 15 May 2003, 5:10 p.m.,*
in response to message #4 by Norm

>You can convince HP like this:

Unfortunately, none of those methods would tell HP _why_ customers are unhappy. It takes actual communication between customer and manufacturer, using one-on-one talk, to drive the point home. If HP's profits suddenly disappear, the company disappears and we've gained nothing.

>1. DONT buy their crummy HP home PC's that they sell to the masses,

Oh, I haven't bought one ever. I'm a Macintosh user myself. 8^)

>2. DONT buy their latest calculator garbage like 48G+, and if you own one, SELL IT, to reduce HP's profitability.

Norm, I fail to see how selling a calculator you've already bought and paid for would hurt HP's profits. They've made their profit already (as soon as you ka-chinnng flash your credit card). They don't care if you use the machine, give it away, use it as doorstop, or drop it from the top of the Empire State Building.

>3. IF YOU ARE AN ENGINEER, DONT buy their test equipment. Need a scope, and RF generator, a spectrum analyzer? Just buy somebody else's.

Unfortunately, HP _does_ make good scientific/technical equipment, and it's hard to find others as good as theirs.

No, what we need is a friendly ear somewhere at HP -- someone who will listen carefully, take notes, really care, and take whatever action is necessary to satisfy the customer's needs. The trouble is that that person seems to be on sabbatical or got fired!

-Ernie (Just my 2 cents)

DON'T Convince HP like this...

*Message #7 Posted by **Michael F, Coyle** on 15 May 2003, 8:30 p.m.,*
in response to message #4 by Norm

Sorry Norm, I can't agree with you here.

1. DONT buy their crummy HP home PC's that they sell to the masses, and if you know any masses personally, tell those masses not to buy crummy HP home PC's, and tell them why. I have seen people buy them and be fairly unhappy. The same brain-damaged losers that designed the last of the calculators have also put out a fairly unpleasant combination of popup advertisements, bad software, and lack of help on those #$%#$% trash HP home PC's. You would do MUCH better not to buy one.

What should we tell them? That their PC's are crummy? Or not to buy their PC's because we don't like their calculators?

It's been a while since I've used an HP PC. Are they really worse than everything else out there or are they all this bad?

2. DONT buy their latest calculator garbage like 48G+, and if you own one, SELL IT, to reduce HP's profitability.

Sorry...I like the 48; a lot of other people do too. Many of us consider it the Last Of The True HP's.

3. IF YOU ARE AN ENGINEER, DONT buy their test equipment. Need a scope, and RF generator, a spectrum analyzer? Just buy somebody else's.

WRONG! Agilent now has the old HP Test & Measurement business. Agilent != HP. Two separate companies. By all means buy Agilent whenever possible. (They make dandy LED's too.)

WHAT'S THAT SPELL? bye bye customers. If all the customers say 'bye bye' thats got to have an effect, someday, when the crooks in the boardroom run out of stock swindles to feed their paychecks.

A little angry, are we? If the customers go bye-bye will HP management ever learn why? And that would kill their calculator business as a side effect. Sinking the ship is kind of a drastic way to kill off the rats.

How about this: if you don't like what HP is doing with their calculators, buy someone else's. Then write a polite letter to Carly, explaining what you bought, why, and why HP machines are not meeting you needs. Send a copy of the letter to that guy who's in charge of the calculator business, I forget his name, you know, the guy who keeps issuing all those press releases.

You may get just a form letter back, but at least you'll have the satisfaction of having taken the high road with your complaint. And maybe, just maybe, someone may listen.

Sorry to get down on you like this, but I usually like your posts and I feel this one is way, way off the mark.

- Michael

Agilent

*Message #8 Posted by **Ellis Easley** on 15 May 2003, 8:55 p.m.,*
in response to message #7 by Michael F, Coyle

It's too bad the calculators didn't go with Agilent, they are set up to sell to a small but discriminating market. I was poking aroung the Agilent website a while back and they had some information files on porting HP85 programs to their VXI systems. Imagine anything like that on HP's website today! (Does anybody know if there are still some old goodies on any HP FTP site?)

Does HP care?

*Message #9 Posted by **Patrick** on 15 May 2003, 7:57 p.m.,*
in response to message #3 by Ernie Malaga

I think it is an unfair comparison to look at the HP-65 handbook and point to the level of customer service it supports.

I'd wager that most people here would scoff if asked to pay the equivalent in today's dollars what that machine cost for a unit with similar quality and functionality. HP's products had a higher profit margin in the past, which allowed them to offer the services they did. Today, expectations are that calculators are cheap. You can't fuel a huge customer support department based on the money people are currently willing to pay.

Re: Does HP care?

*Message #10 Posted by **Ernie Malaga** on 16 May 2003, 12:06 a.m.,*
in response to message #9 by Patrick

>I think it is an unfair comparison to look at the HP-65 handbook and point to the level of customer service it supports. [snip] . HP's products had a higher profit margin in the past, which allowed them to offer the services they did. Today, expectations are that calculators are cheap. You can't fuel a huge customer support department based on the money people are currently willing to pay.

Good point. But the point I'm making is that, although the level of Customer Support offered originally for the HP-65 was extremely high, the level of today's support is virtually zero. Heck, there doesn't seem to be even an email address anywhere to voice your opinions, compliments, complaints -- whatever -- about HP calculator products.

Today it's considered okay to sell calculators without a decent manual. Need a manual? You better have access to the Internet so you can download a huge PDF file that probably won't answer all your questions. Is this level of "support" acceptable?

But you're right; today, no company would publish the CEO's private cell phone number so that any Joe Schmoe with a question can call for help at 3:30 AM.

-Ernie

Re: just ugly

*Message #11 Posted by **Ernie Malaga** on 15 May 2003, 12:52 p.m.,*

I'm Jealous D.B.

*Message #1 Posted by **Norm** on 15 May 2003, 6:24 a.m.*

I'm jealous D.B., found at a garage sale where nobody wanted it.

Sounds like it works normally.... it is supposed to forget the 4 stack registers when U shut it off.

It remembers the display format (F sci 4 or whatever) and the registers and the program.

Try typing in 8.8888888 You will see the display go dark each button press. Now try typing in 2.2222222 Do you see the display flash (and the minus flash) each press? Luiz is calling that "2 disease". Its a weird bug present in only some units.

Try typing in sin(45) does the display blink with commas & stuff, or is it dark until displaying the answer?

You want display blanking. It seems like if it has the bug, the display is not blank all the time.

The healthiest units would not have the bug. Suggest at the first hint of trouble (most of these units were built w/o solder joints) dont use it unless it is restored by somebody.

Personally I think the display drivers DEGRADE into that condition when the connections all start getting loose and the chip subjected to flaky voltages, so dont run it if it acts squirrely.

Oh yeah and clean the power switch contacts and lubricate the metal with a drop of tri-flow each on a Q-tip.

Re: Nuts about HP41's

*Message #1 Posted by **Johnny Billquist** on 15 May 2003, 5:08 a.m.*

1. Yes. Halfnut or Fullnut doesn't have any functional implication. You might stumble on to different revisions of the ROM code in a CX, but that isn't related to the nutty-factor of the calculator. (I have a fullnut CX with the latest rev. rom that i know of).

2. It might. Execution speed is pretty varying any way you put it. And people have speeded them up themself as well. I believe that you can speed the fullnut more, but that's a very vague memory.

3. Sortof. Nothing from a normal user point of view. But if you program machine code, the halfnut have some new stuff that isn't in the fullnut.

4. My fullnut is very happy with it self, and it's stuffed with every goodie you can think of.

Bascially, from a normal users point of view, the fullnut/halfnut comes down to a slightly different look of the segments in the display, and the rounded corners of the display. There is no other externally visible way of telling wether it's a halfnut or a fullnut. If you open it up, it's more obvious. And if you program in machine code, there are some new things to play with in the display, but that's it.

Re: Why II, que?

*Message #1 Posted by **Frank Wales** on 14 May 2003, 10:33 p.m.*

I can see how the HP calculator suffix thing can be confusing, but it's all really quite straightforward, if you understand the big picture.

'II' just means 'second edition' or 'second version'. Hence, the 32SII followed the 32S just as the 19BII followed the 19B and the 10BII followed the 10B.

Early machines' part numbers did end in 'A', but they weren't designated that way on the calculator faceplates, mainly due to the Great Alphabet Famine of 1973.

Of course, 'C' started to be used when the miracle of continuous memory first arose as a magic distinguishing feature. The Spice models were originally 'E' for "it's the Economy, stupid", but even they got some 'C's eventually; so the 33E become the 33C, the 38E became the 38C, and 'Mel E' became 'Mel C'.

After the 41C, everything got continuous memory, so 'C' lost its differentiating purpose. This allowed various bits of early plot-losing to happen: the 75C has a variant called the 75D, but it doesn't have some amazing distinguishing feature beginning with 'D', it was just the letter after 'C'. Similarly (but more obscurely), the 71B was so-called because there was a 71A (with less RAM) in the works along with the 71B, but the 'A' version got canned. So, by the miracle of retro-active continuity, 'B' came to mean 'BASIC'.

I have heard it rumoured that the true meaning of the 94F is too disgusting to report in polite society. So if any of you know about it, please post it in a follow-up to this message.

Always the early pioneer, the 41C begat the 41CV, which had fives times as much RAM as the 41C, hence 'V', which is Roman for '5', which is Arabic for 'five' (except apparently it's really Indian, but that's not important right now). The 41CV then begat the 41CX, which incorporated eXtended functions and memory, thus starting the great 'E'-avoidance tradition that continues to this day, due mainly to the War on Drugs.

Then the real Pioneers came along with the 'B' 'S', and ran off with the 'X' for their piece-de-resistance, the 48SX, which was both 'Scientific' and 'eXpandable'. Wooo.

By the early 1990s, HP seem to have settled on 'II' for all their second editions. So, the second edition of the 48S was the 48G, the second edition of that was the 48G+, the second edition of the 12C is the 12C Platinum, and the second edition of the already-second-edition 19BII looks like it'll be the 19BII+.

Seems all pretty consistent to me, at least compared with things like 'V42 bis', where 'bis' is International Standard Lingo(*) for "second edition, but in a smug, smartypants kind of way".

I hear that the second edition of the 9S will be the 'Richard Feynman special quantum edition 9S+ Unobtanium turbo, with extra bongos too'. How all this will be printed on the face of the calculator is left as an exercise for the reader. God knows, the designer won't get it right. At least it will finally allow the support staff who run HP's price list system to forget about the long-standing bug that prevented the entry of hyphens in calculator product names.

----- (*) Strictly speaking, this should be "International Lingo for Standardisation", but I just worked out the number of people who actually care about this on my new 12C Platinum, and the answer was 0.000000000000531,

which is pretty close to zero, even for accountants.

Re: Why II, que?

*Message #2 Posted by **Ellis Easley** on 15 May 2003, 8:45 p.m.,*
in response to message #1 by Frank Wales

"I hear that the second edition of the 9S will be the 'Richard Feynman special quantum edition 9S+ Unobtanium turbo, with extra bongos too'. How all this will be printed on the face of the calculator is left as an exercise for the reader."

Maybe the name will be molded into the slide-on cover.

Thanks for explaining the 71B and 75C, I didn't know where they fit in the discussion. Could it be there was a 75B (for Basic) that was scrapped when they added the slot for the 8K memory upgrade behind the battery?

Re: Why II, que?

*Message #3 Posted by **Raan Young** on 16 May 2003, 1:22 p.m.,*
in response to message #2 by Ellis Easley

>> Thanks for explaining the 71B and 75C, I didn't know where they fit in the discussion. Could it be there was a 75B (for Basic) that was scrapped when they added the slot for the 8K memory upgrade behind the battery? <<

Frank asked me to comment...

First, the "C" designation on the "75C" actually did refer to continuous memory -- the design goal for the HP-75 was to package the features of the HP-85 (a desktop BASIC computer with tape backup that lost all memory when turned off) in a portable form which kept everything in memory even when off. Further, HP-75 development was well underway when the 41C came out and "C" designation was still a big deal.

Anyway -- as far as I know there were never any serious plans for a "B" version (altho I remember a few prototypes floating around with that label). And, again AFAIK, the 8K memory expansion module was part of the plan, not added later (remember the days when 8K was considered a big enough perk to bother making it an option).

On the other hand, minor changes such as "B" vs "C" and adding 8K memory modules don't stick in my memory like watching the design concept evolve from a palmtop/docking-station to the final product that hit the shelves.

Speaking with some authority, but probably not enough...

75 vs. 71

*Message #4 Posted by **Ellis Easley** on 16 May 2003, 2:22 p.m.,*
in response to message #3 by Raan Young

Maybe you can comment on this: I have been struck by the "terseness" of the 75 OS, for example the inability to catalog ROM modules or display program lines containing non-present XROM references, both of which I believe the 71 can do. Is this because of the limited addressing range of the Series 80 type CPU in the 75 vs. the 512 KB addressing range of the 71's CPU? In other words, is that distinction the reason the 75 didn't have a bigger OS ROM (possibly via page swapping) or is it the fact that it's design took place earlier, when larger ROMs would have had a big impact on cost? Or is it just that the 75 is meant to be a computer user's system as opposed to an engineer's system (as the 71 can

certainly be described).

Re: 75 vs. 71

*Message #5 Posted by **Raan Young** on 16 May 2003, 4:38 p.m.,*
in response to message #4 by Ellis Easley

Boy, you are really testing the old memory cells. I think most of this is correct, but that was 20-odd years ago.

By today's standards, "terse" is an understatement. The HP-75 had a maximum address space of 64KB -- you can't sneeze in that much space these days, let alone write an entire OS. And that space includes the RAM!

The address space was allocated thusly -- 32K of fixed ROM for all those "gotta be there" routines. 8K of swappable ROM, 16K of RAM and 8K of optional RAM. The final system had 48K of ROM, so two 8K segements swapped in and out of the 8K window -- along with every plugin ROM (all of those having 1 or more 8K chunks).

When code in a swap ROM wanted to call something in the 32K block things worked pretty easily. When code in the 32K block wanted to call a routine in a swap ROM, it had to make sure the right ROM was enabled, but it still wasn't too bad. But when a swap ROM wanted to call another swap ROM things started to get interesting -- there's a reason why we had routines with names like xyzzy and plugh. I'll leave it as an exercise to the reader to imagine what it's like when you are several layers deep into this swapping business.

So -- yes, the limited address space caused a lot of problems and yes, fixing that in hardware was outside the realm of yesterday's reality, because of costs, scheduling and so on -- it would have required redesigning the CPU (which was a custom chip). Physical size was another big issue -- an 8K ROM was a LOT bigger in those days.

The 71 project started about 3 years after the 75, with all the benefits of improved technology and learning from previous mistakes.

As far as listing program lines linked to missing ROMS -- the 75 ROMS had the parse table (ASCII listing of keywords, used to parse input and "decompile" tokens for listings) stored at the head of each ROM. As a result, it was pretty much impossible to display a program line if the ROM wasn't plugged in.

As far as a ROM catalog, that could have been done, but wasn't because we needed the room for more important things. Somewhere, floating around the internet, there are copies of the HELP LEX file I wrote long ago, which does do a catalog of any and all ROMS in the machine. (No, I can't send you a copy, I have yet to get that old stuff into a form that is communicable in today's world -- it's on my todo list, just after ...)

Re: 75 vs. 71

*Message #6 Posted by **Ellis Easley** on 17 May 2003, 10:31 a.m.,*
in response to message #5 by Raan Young

Thanks for all the answers! I understand Dave Hicks has lots of notes detailing the 75 design that are very interesting and fun to read, maybe they will make their way onto the CD's - or DVD - or ExD! - one day.

Regarding the missing ROM references, I understand why they can't be listed explicitly but the

41 (at least, I'm not sure about the 71) displays them as "XROM xxyy" so you can figure out which ROM is missing. Not only does the 75 not do this, it won't display any part of a program line that contains such a reference (it just beeps and says there's a ROM missing). Since the line might contain other statements, you can miss a lot if a ROM is missing!

I think your HELP LEX file is on the SwapDisks and one way or another, I'm going to get them so I can use them! (I have a few that I got from EduCalc years ago.) The SwapDisks are on the HP Museum FTP site in two forms: separate LIF files, and images of the complete disks that Tony Duell made, along with Linux utilities to reconstitute the disks.

It's the files on the SwapDisks that prompt my question about missing ROMs: many of the HP75 programs on the SwapDisks and the PPC Journal need the I/O ROM and when it is missing, it is very hard to work around it because of the "quiet". But if all goes well, I'll have an I/O ROM soon and all will be revealed!

I'm not complaining, just curious. I like all the calculating machines HP made and I understand nothing is perfect, the world is full of limitations. I think the uniqueness of each HP model (along with the consistency of the RPN operation in those models) is what makes them so interesting - you get the feeling that people sweated over the details trying squeeze in a little more value. I applaud the effort!

Thanks again.

Re: 75 vs. 71

*Message #7 Posted by **Christof** on 17 May 2003, 12:59 p.m.,*
in response to message #4 by Ellis Easley

I seem to recall that the 75 (which I love, by the way) was pretty much compatible (at leas tin thinking about doing stuff) with the series80 machines.

If maintaining some - if not code compatibility, at least style compatiblity- with the series 80 machines was desirable, it would help to explain some of the design choices.

Re: Why II, que?

*Message #8 Posted by **Frank Wales** on 16 May 2003, 2:19 p.m.,*
in response to message #2 by Ellis Easley

Maybe the name will be molded into the slide-on cover.

I doubt it. According to my grapevine, for environmental reasons, and not at all in order to keep costs low, the RFsqe9S+UoTweb2 will come with three sheets of multi-coloured Saran Wrap (a.k.a. 'cling film') in place of a cover.

Unless they're planning to use the documentation that will be printed on these sheets as the identification for the calculator, of course.

No more insulting the coyotes and raccoons

*Message #1 Posted by **Norm** on 14 May 2003, 10:16 p.m.*

no more insulting the coyotes and raccoons,

I never saw no coyote or raccoon that was ugly as a "WALMART 9G" or a "PLATINUM 12C"

In fact, the average coyote or raccoon is pretty kool looking. I mean, a raccoon looks like a bank-robber..... hmmmm... so does Carly.

HEY I just figgered it out, I saw a digital wristwatch for 8 year olds and the digits all looked like they were melted. I mean, on purpose, they were all different sizes and crooked and warped. To make it look cool.

WELLLLL HP should feature a "MELTED" display on their new calculators. After all, its boring and stodgy and dumb of those engineers to want the digits all in a neat tidy row.

Time to give them something else.

Freeware RPN Windows Calculator

*Message #1 Posted by **Patrick** on 14 May 2003, 8:15 p.m.*

There are a number of Windows-based calculator emulators out there which try to look and behave like various HP models. For the last few years I have used Excalibur for Windows. It doesn't try to look like anything else, which for me is fine, and it does everything I ask of an RPN calculator. It is an amazing piece of freeware and the developer is definitely one of the good guys.

Recommended.

Re: Freeware RPN Windows Calculator

*Message #2 Posted by **GS Leong** on 15 May 2003, 11:25 a.m.,*
in response to message #1 by Patrick

I have the hp 41 issued by Warren Furlow which I got off the museum web site and it is really nice

Re: Freeware RPN Windows Calculator

Serial number question

*Message #1 Posted by **Eric Davis** on 14 May 2003, 5:09 p.m.*

I was wondering how old a calculator is. Its an HP 15C with the serial number 2326A02031. Also any idea on its value?

Thanks

Re: Serial number question

*Message #2 Posted by **Holger Weihe** on 14 May 2003, 5:25 p.m.,*
in response to message #1 by Eric Davis

This calculator is from 1983. The first two digits of the serialnumber are the years since 1960.

I think this HP has no value at all. You should give it to me for recycling. :-)

To be honest: The value depends very much of the calculators condition. At Ebay germany you get an average price of 164 Euro. (1 Euro = 1,16 US$ yesterday) Even defect HP-15s go for 60 Euro or more. The prices at ebay.com are even higher.

Holger

Re: Serial number question

Is RPN dead?

*Message #1 Posted by **Paul Pickett** on 14 May 2003, 4:47 p.m.*

I use a HP41C RPN calculator but when I went to buy a new calculator I couldn't find one except for a business model. Am I looking in the wrong places? Some people I talked to didn't even know what RPN was. What happened? Did HP drop the ball? Is there an upgrade for my beloved 41?

Re: Is RPN dead?

*Message #2 Posted by **Michael Meyer** on 14 May 2003, 5:24 p.m.,*
in response to message #1 by Paul Pickett

"RPN is dead. Love live RPN!" Yes. For the most part, IMHO, RPN is dead.

Latin is also a dead language. Does that mean that it's forgotten? It is still studied, used, and appreciated by many, and it's influence remains.

Even if HP releases some RPN calcs, it will never again be seen as the quintessential calculating language.

It will live on in the hearts, minds, and machines of those who still love it.

Michael

Re: Is RPN dead?

*Message #3 Posted by **Ernie Malaga** on 14 May 2003, 5:25 p.m.,*

> use a HP41C RPN calculator but when I went to buy a new calculator I couldn't find one except for a business model. Am I looking in the wrong places? Some people I talked to didn't even know what RPN was. What happened? Did HP drop the ball?

Unfortunately for us, RPN is not popular and, therefore, calculators that use it are not good sellers. In a profit-driven industry such as electronics, that spells trouble. Poor sellers stop being marketed and manufactured; as a result, HP calculators nowadays typically offer Algebraic entry only (although there are exceptions).

>Is there an upgrade for my beloved 41?

Nope. You could try to get a second-hand HP-42S, which also uses RPN, or some of the newer models such as a HP-32S, but for the most part you're out of luck. The graphing models (example, the HP-48GX) use a variation of RPN called RPL (unlimited stack registers and a different way of approaching problems), but it's not the same and, personally, I dislike it. I've had 3 RPL calculators and have kept only one for sentimental reasons (HP-28C).

For everyday use, I still pull out my trusty HP-41CX or the 32S.

Good luck.

-Ernie

Re: Is RPN dead?

*Message #4 Posted by **Rick** on 14 May 2003, 5:39 p.m.,*
in response to message #1 by Paul Pickett

According to HP, RPN is not dead. The successor to the 41 is the 48G series. These can be found, but are in short supply. HP has indecated that they will be releasing some new RPN scientific calculators this fall. If you can't find a 48G/G+/GX at a local store try Calcpro.com for mail orders. If you are looking to replace your 41C, or looking for a different HP RPN calculator look at eBay. Prices and compition can be steep, but it is the best place to get some of the older HPs.

Welcome to our HP Tree Fort

*Message #5 Posted by **Norm** on 14 May 2003, 10:27 p.m.,*
in response to message #1 by Paul Pickett

Hello Paul, welcome to our HP tree fort.

Man U have got some catching up to do.

Carly Fiorina, some mafia boss woman, took over HP and is getting rid of anything classy or cool. She hates engineers because we flew a rocket to the moon. To get revenge, she will make us all type on 'HP' personal computers that crash every 30 minutes.

YES, there is still ONE HP Classic calculator still being made. The HP-12C. It's the one for MBA business majors like Carly Fiorina. All other such classics were discontinued (like the ones for engineers).

YES, RPN is the best thing on Earth, NO, they had no business dropping it, or 32S or 42S or even the ones with the RED LED's.

YES, HP could've made a killing if they would just keep making them.

NO, the graphical calculators aren't worth their weight in landfill.

NO, there is nothing to replace your 41C from the factory, Carly Fiorina left U high and dry and she is laughing at you.

YES, you may now begin to drain your bank account, to fight with the other tree-fort members of the club, over a dwindling supply of used units going for ever-higher prices on eBay.

That process is somewhat like the original movie 'Highlander'. We're friends in between fights, and we chat and compare notes, but then comes the next battle over a classic HP calculator and we have to fight each other to the death for it.

- Norm

Secretly, Carly has stocked that old HP garage full of NOS HP-41CXs and peripherals. She will use the sale proceeds for an even cushier retirement than you might have expected.

Re: Is RPN dead?

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 15 May 2003, 4:09 a.m.,*
in response to message #1 by Paul Pickett

Hi, Paul;

there is always a way when HP41 is the issue.

If you wnat to know about the HP12C have a look here. This calculator is still being produced, but it has been "upgraded" recently to be an HP12C Platunim. Love "her" or hate "her", it's the only one RPN available from HP so far. There is a possible HP12C's clone found by Renato comming from another brand, but it's still being hunted.

If you are lucky finding, there is a Financial Decisions Pack, ROM module included, where many of the HP12C's features are available in the well-known HP41 style.

Module's major subjects are:

Compound Interest Solutions
IRR
Modified IRR
NPV
Loan Amortization Schedules
Straight Line Depreciation - SL in the HP21C
Declining Balance Depreciation - DB in the HP12C
S.O.Y.D. Depreciation
Bonds
Date Arithmetic

Module's # ID is 00041-14026.

As mentioned by Rick, RPN is not dead, and the HP48G has standart TVM menu with [n] (# of periods), [i] (interest rate), [PV] (Present Value), [PMT] (PayMenT) and [FV] (Future Value) softkeys plus AMORTization features. If you know how to deal with the HP41, you'll need a bit of time and practice to hold the HP48G's new functionality. Although many others in hear stated against this, I have both of them and I feel no harm usnig the HP41 or the HP48 anywhere.

Hope this helps.

Best regards.

Luiz C. Vieira - Brazil

Re: Is RPN dead?

*Message #14 Posted by **unspellable** on 15 May 2003, 8:32 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

I will draw a distinction. RPN is a form of notation, or in the case of a calculator, a form of entry.

RPL is a language and also an operating system that uses RPN.

A number of computer languages use RPN.

We should not confuse the notation with the language.

Re: Is RPN dead?

*Message #15 Posted by **Robert** on 15 May 2003, 9:11 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

I'm with Luiz. The 48 may be the last "professional" quality RPN/RPL machine produced by HP. (I REALLY hope I'm wrong.)You can pick up one for 1/3 the price of a 32SII these days.

It does take some getting used to though. The good news is that there is info all over the web on how to make it go.

Try the emulator EMU48 first to see if you like RPL.

Re: Is RPN dead?

*Message #16 Posted by **JimC** on 15 May 2003, 9:48 a.m.,*
in response to message #1 by Paul Pickett

Sorry Paul, but as others have told you, there is no joy in RPNville tonight. Some have indicated that you can easily/happily move on to the 48 series as the next step (RPN as a subset of RPL). Maybe its 'cause I'm old, but I tried moving to the 48GX. I disliked the display (mine was blue), the colour scheme, the keys(!) and the length (it wouldn't fit in my shirt pocket - not that my 41 did though - I seem to make a lot of excuses for the 41 - must be true love....).

I was also underwhelmed with the documentation. Tons of software though (www.hpcalc.org)

In a (half)nutshell then, from my perspective, your quest for the 41 replacement will be fraught with hardship and danger. Oh, and if you should want to buy a 48GX, I've got one for sale.

Jim U sound just like me...

*Message #17 Posted by **NH** on 15 May 2003, 1:31 p.m.,*
in response to message #16 by JimC

Jim U sound just like me...

U tried using the graphing calculator and said 'whats the use'.

I was using 48G+ ..... Couldn't stand it.

The solution, my friend ? SELL IT! You reduce HP's profits if you dont let their graphical paperweight gather dust at your house.

Re: Is RPN dead?

*Message #18 Posted by **DougT** on 15 May 2003, 12:01 p.m.,*
in response to message #1 by Paul Pickett

Newbie here. Norm's description of the current state of HP RPN is accurate, and yes, somewhat depressing. As others have pointed out, right now Paul is limited to buying a 12C for RPN capability, or trolling eBay or thrift stores for used calculators.

It's hard to believe how HP has let RPN, or at least, *scientific* RPN, fall by the wayside. This really snuck on me, sad to say. Luckily, I bought a 15C back in college and have babied it for two decades. It stays in my desk at work, and ten years ago I bought a 32SII just to balance my checkbook at home!

Thanks to everyone for the helpful and entertaining information posted on the site.

Re: RumPelstiltskiNs

*Message #20 Posted by **Paul Brogger** on 15 May 2003, 4:37 p.m.,*
in response to message #1 by Paul Pickett

We've had a few people surface recently, wondering why they couldn't find an HP RPN replacement unit after years of faithful service from a much-loved earlier model. Makes one wonder how many others are out there . . .

I guess "both HP's" could read their own lessons from the experiences of these folks:

The Old H-P would take satisfaction in the fact that even though several generations of product have come & gone, an older model has quietly soldiered on for the customer, satisfying their needs completely, and leading them to think of *nothing other than H-P* when it finally came time for a replacement.

The New H-P will take umbrage at the realization that for all these years a crusty old rock-solid calculator has been so dependable that the customer hasn't seen the need to buy any more product in the interim. (A TI user might have had to buy 4 or 5 calculators in the same time period!)

Re: RumPelstiltskiNs

*Message #21 Posted by **Bill Platt** on 16 May 2003, 12:51 p.m.,*
in response to message #20 by Paul Brogger

I am one of those who found this museum and group while looking in vain for a currently in production RPN calculator. I was astounded that the 32sii was taken out of production with no replacement.

Re: Is RPN dead?

*Message #22 Posted by **Euclid** on 16 May 2003, 11:49 p.m.,*
in response to message #1 by Paul Pickett

Fear not, RPN will never die, it's all over the web in the form of software. As computers continue to decrease in size and weight, they are replacing the need to carry a separate calculator. So..

CheerUp,

Euclid

www.livingsoftware.net

*Message #23 Posted by **Robert** on 17 May 2003, 7:53 a.m.,*
in response to message #22 by Euclid

There are at least a couple decent RPN calcs for the palm OS, if you want to go that rout. I find it hard to do any real engineering "crunching" on the Palm, but it's always with me (like my 42S used to be). The Palm is darn handy on it's own anyway.

Re: Is RPN dead?

*Message #24 Posted by **Mitch** on 20 May 2003, 6:32 p.m.,*
in response to message #1 by Paul Pickett

It's wonderful to see how many die-hards there are. I still have the 41CX I bought in the early '70's and would not part with it. I acquired a 15c when an office where I worked closed. I now feel "blessed" to have a choice of RPN units. I had no idea that HP had dropped the whole system. I knew when they discontinued the 41 series and nievely assumed they replaced it with bigger and better. Until recently I figured I was operating in the old world of some system which had advanced well beyond. Instead I find I am one of the fortunates who retained one of the best. Thanks for all of the info. I'll check in once in a while. Also, I have an extra Advantage Pack still in the wrapper somewhere. Looking for a trade for another useful module or other stuff. I also have the catalog of hp41 programs if anyone could use it for nostalgia purposes. I hate to admit that I also had an IL cable, printer and cassette recorder that went somewhere (dump?) long ago. Wish I had known!

Re: Is RPN dead?

Help with 9114A disk drive?

*Message #1 Posted by **Peter Buff** on 14 May 2003, 4:14 p.m.*

Hi,

I have a disk drive that appears to be dead. I think the battery may be the entire problem with it but it's a very strange battery. Is there a common replacement?

Re: Help with 9114A disk drive?

*Message #2 Posted by **David Smith** on 14 May 2003, 4:19 p.m.,*
in response to message #1 by Peter Buff

There is a 6 volt sealed lead-acid battery in the battery holder. It is a very common battery. Take the battery holder to your local battery store (Batteries Plus, Batteries, Etc, etc) and they will know what to do.

You can buy the battery here:

*Message #3 Posted by **Gene** on 14 May 2003, 4:36 p.m.,*
in response to message #2 by David Smith

http://www.batterystation.com/gelcell.htm

But, sadly, I can't remember which one it is! It's either the PS-628 or PS-632...I think it's the PS-628. I should know, since I bought one 2 months ago, but I can't. Can anyone help me help Peter?

Online Photo Album - Update

*Message #1 Posted by **Mike** on 16 May 2003, 10:56 a.m.*

UPDATE: I've changed the idea from Online Museum to Photo Album but it serves the same purpose. I've combined a couple of posts and have deleted the previous post on this subject.

I've made some improvements to the Photo Album software. It now vBCode, to add color, bolding, URLs, Images, etc to the description area and , **can be seen here.**

If you don't know what BBCode is **go here for examples**. It's similar to the "advanced formatting techniques" used on this forum.

I have also added a "**More Information**" field in the upload form that allows inserting a link to get more information on the subject. This **can be seen here.**

Uploads require an account and password verification.

If you wish to test this, you can log in with the following temporary information, just for today:

Username: **test-photos**
Password: **testph7**

Note: If I run into problems with multiple people using the password simultaneously, I may have to block this account. But for now, we'll see how it goes.

Online Photo Museum

What's coming?

- Automatic resizing of photos (to 500 pixels wide max)
- Searchable database
- Add, Edit, Deleting of photos and information

Anyway, I'm open to suggestions. Let me know what you think.

Mike

HP41 MLDL2000 website update

*Message #1 Posted by **Meindert Kuipers** on 14 May 2003, 3:16 p.m.*

For those who are interested, my website now contains the updated information on the MLDL2000 developments:

- working (you will have to believe me) prototype photographs, schematics and VHDL design files. The prototype is a simple interface to use the 'old' L8 and U2 EPROMs

- updated specifications for the final product

- current design files for the final product

All is available at www.kuipers.to/hp41 under the GNU license and with no warranty or support ;)

Meindert

Re: Inconsistent results #1: 12c vs. 12c Platinum

*Message #1 Posted by **hugh** on 14 May 2003, 2:16 p.m.*

i get fv = 25*(1.15^40-1)/(1.15^(1/26)-1) = 1,237,786.9304496213

By "correct" answer, I meant...

*Message #2 Posted by **Gene** on 14 May 2003, 3:22 p.m.,*
in response to message #1 by hugh

The answer listed in the PPC Journal. You're quite right.

I note that the calculators with greater precision (19BII, 48GX, etc) give the answer similar to the one you show.

The 12c and 12c platinum really should give the same answers, especially if they are sold as "compatible".

Stack Holding in Continuous Memory Calc

*Message #1 Posted by **Katie** on 14 May 2003, 2:02 p.m.*

Curiously, the 29C and 19C hold the X register in continuous memory but not the Y, Z, T nor LASTX registers. I wonder why they didn't go for the whole shebang? Or why they didn't even bother holding the X register in the Spice "C" machines.

My guess is that all the stack registers in the Woodstocks are on the CPU (ACT) chip. But in the 29C and 19C they keep a copy of it in the CMOS chip as well. (Probably this was a design compromise between CMOS storage space cost and wanting to keep the whole stack in CMOS.) Upon power-up they copy back from the CMOS chip. In the Spice machines they went for low cost and consistency of design so gave up on this idea.

And the 25c only saved LASTX

*Message #2 Posted by **Gene** on 14 May 2003, 3:23 p.m.,*
in response to message #1 by Katie

I never understood THAT choice at all. :-)

Re: And the 25c only saved LASTX

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 May 2003, 4:08 p.m.,*
in response to message #2 by Gene

Hi;

after Katie's wise words and your observation, I add the fact that the ACT chip, if containing stack registers, may not contain the LASTx. Both HP21 and HP37E have no LASTx access, maybe no LASTx register too. Are there others without LASTx?

Then we conclude (hopefully in a correct reasoning) that the LASTx register is in fact in RAM, not in the ACT chip, what explains the fact it is kept in the HP25. As it is not so practical, maybe a remanagement in the HP19C/29C exchanged their places. I agree with Katie but I believe that as RAM was an expensive resource at that time, they have simply used LASTx holding feature and rearranged addresses so users would take the advantage of having at least the X-register back.

Wrong reasoning? Maybe. This would not need a new internal ACT design, just new ROM coding with the X-register addressed in RAM and LASTx addressed inside ACT.

My 2¢ (now I know how to get it...)

Luiz C. Vieira - Brazil

Re: And the 25c only saved LASTX

in response to message #4 by Trent Moseley

Hello, Trent;

thank you. If it is not for you, I'd never notice it.

You, guys, are gold!

Best regards.

Luiz C. Vieira - Brazil

Re: And the 25c only saved LASTX

*Message #6 Posted by **David Smith** on 14 May 2003, 4:31 p.m.,*
in response to message #2 by Gene

The ACT and ROM chips in the 25 and 25C are identical. The only difference is the RAM chip and it's backup supply connection. Therefore the HP25 must save LASTX in the RAM chip and the stack in the ACT which is not backed up with the battery.

Re: Shockingly new HP41CX !

*Message #1 Posted by **Mark Ordal** on 14 May 2003, 12:22 p.m.*

I just read this thread about Randy Woodbury's recently purchased, but dead, 41CX.

One possible option for repairs might be:

http://www.internationalcalculator.com/

They specifically say that they do repairs of both the 41 series and the peripherals. I have a recently deceased 41CX myself and am eager to learn if anyone has experience with these guys.

Randy: if you give up on the idea of repair and decide to use this pristine 41CX for parts, I might be interested in the upper part of the case if the price is right. (-:

Back when I got my 41CX, I deliberately defaced it by applying a white plastic-based paint to the edges of the top of the case---I figured that way any cretin stupid enough to steal my 41CX would at least have to avoid using it in public on campus. Now I'd kind of like the "original look" back for my 41CX.

My interest in the top part of the case may be premature---I need to find out if my 41CX is repairable first!

Re: Shockingly new HP41CX !

*Message #2 Posted by **Randy** on 16 May 2003, 10:59 a.m.,*
in response to message #1 by Mark Ordal

I spoke (by email of course, no one actually speaks anymore it appears) with said company, and they seem very good. But, they ask a fair price just to have a look that is more than the calculator is worth (not their fault of course), and many in-the-know on the halfnuts have got me convinced that any repair attempt would be a lost cause. Having looked inside my working halfnut, I can see that it would not be unreasonable to have that standard note, "No Servicable Parts Inside." And, there is about 3,000 heat-fused posts to unfuse even to have a look at the other side of the PCB. I probably won't get rid of any or all of it -- I think having it encased in a Lucite block would be cool for a paperweight, either in its pristine assembled state or taken apart to simulate a holographic exploded view. Then it could go on ebay under Art Sculptures instead of Vintage Scientific Calculators. Thanks for your comments, and best regards.

Re: Did the 34c precede the 41c?

*Message #1 Posted by **Gene** on 14 May 2003, 10:40 a.m.*

Thanks, Valentin.

It appears that was the same date as the 41c, since Craig's database lists 7-1-1979 as the 41c's intro date too.

34c - 7/1/1979

41c - 7/1/1979

Re: Did the 34c precede the 41c?

*Message #2 Posted by **Valentin Albillo** on 14 May 2003, 12:08 p.m.,*
in response to message #1 by Gene

They both were certainly introduced at the same time here in Spain, decades ago.

Though I was primarily interested in the HP-41C at the time, I clearly remember that I also borrowed and HP-34C from local HP, for which I wrote a Solutions Book ("HP-34C Advanced Mathematics") which Hewlett-Packard published locally, and in the process I grew to appreciate the HP-34C a lot, it still is one of my favorite HP calcs.

The book was introduced at a large trade show and sold very well, so HP wanted a couple of similar Solutions Books for the HP-41C, "Advanded Mathematics" and "Advanced Physics". Regrettably, even though both were duly written, some changes at the top of local HP resulted in them not being published. Both original manuscripts are still fondly filed in my cabinet ...

Schematic and Woodstock Data

*Message #1 Posted by **Michael F. Coyle** on 14 May 2003, 10:25 a.m.*

Hi Gordon,

Yes, it's very interesting. I just got back into collecting by getting a 21 last week. This is a very timely contribution.

The schematic does contain one error. On the ACT (big chip), pins 13 and 14 are shown connected to two capacitors in parallel. That should be a capacitor and inductor in parallel. According to a message in the Archives, the values are 330 pF and 150 uH, giving a resonant frequency of 715 kHz.

I've been going through the Forum Archives looking for Woodstock-related material. I'm thinking of summarizing it all as an Article. Two questions: is there any interest in such a summary? And, would it be necessary to cite each individual message for each item I report? It could be done but would add substantially to the effort. I could cite contributions by name instead, to give proper credit. How about that?

Thanks again for the schematic.

- Michael

Archive summaries

*Message #2 Posted by **Ellis Easley** on 14 May 2003, 11:08 a.m.,*
in response to message #1 by Michael F. Coyle

Luiz and Dave Hicks and I have talked about finding a way to group info from the Archives into FAQs or something like that. It's a daunting task in general! My interest originally arose because I was searching the Archives to look up specific subjects and thought I would just keep an index of the useful messages I found categorized by the subject. I'm afraid I haven't made any progress on the big project. However, I have a system I use to save interesting threads: rather than just save an HTML file for each message, I copy the text from the subject line to the end of the body of the message and paste it into a Word document (to preserve fonts, etc.). I type two newlines between messages and put a complete thread in one document. By copying as much as I do, there is enough information to see the order of the messages in the thread. I want to experiment with automating this process, then grouping threads on the same topic with a keyword search. The problem I always come up against when I ponder this idea is that to summarize to any degree, I would need to apply some editorial judgement. But Dave pointed out that he won't be able to keep the complete set of Archives online forever, so some kind of summarization will have to take place in order to keep the most useful information available online. The Articles Forum is the logical place to put such summaries. I wonder if there is some way to make this interactive or a group activity - so anybody who uncovers a useful thread or message in the Archives can add it to the relevant FAQ, for instance.

Indeed...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 May 2003, 12:49 p.m.,*
in response to message #2 by Ellis Easley

Hi, Ellis;

some months ago, last year, I sent an e-mail to David telling him I was p... off because I lost a large text file, about 8MB large (text only) with colllection of calculators usage posts. I simply overwrote it for a new 100K without seeing. Waste of about three months of work and I decided to give a break for a while. It's indeed a daunting task...

My primary interest was collecting realted data in a "big file" allowing subjects being read separately.

Ellis wrote:

I wonder if there is some way to make this interactive or a group activity - so anybody who uncovers a useful thread or message in the Archives can add it to the relevant FAQ, for instance.

At the moment format is stablished and contributors can do it in a regular basis, it is actualy great idea! Fun and obscure, unrelated comments are inportant at the moment the subject is rising, but when other subjects come to the arena, it's good idea to "filter" existing texts, allowing a faster read.

I'm getting back to business soon...

Luiz C. Vieira - Brazil

FAQ alternative

*Message #4 Posted by **Katie** on 14 May 2003, 1:42 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

At least some of the more useful threads end up as articles in the "articles" area here. There's quite a bit of useful information already there, so why not simply add to it by condensing other useful threads into articles. Editorial oversight would be provided by whomever is condensing that set of articles, hopefully someone on this forum who has expertise in that area.

Re: Archive summaries

*Message #5 Posted by **Michael F. Coyle** on 14 May 2003, 11:26 p.m.,*
in response to message #2 by Ellis Easley

Thanks all, for your comments so far.

You're right -- indexing the entire Archives is a daunting task. That's why I'm not doing it. By concentrating on just one topic, I think I can reduce the task to something reasonable.

Katie, with all due respect, I don't think the contents of the Articles really reflects the knowledge base out there. In the time I've spent here (about three months active participation preceded by perhaps six months of lurking), I have seen many people write stuff of lasting value. Others chime in and suggest that the material be reposted as an Article. This is almost never done. The material is not exactly lost, but it's not really accessible unless someone spends the considerable effort to wade through the Archives. (You are the exception, someone willing to take the time to make your information readily available as an Article. I've found them very helpful. Thanks!)

I've only looked through the last two archives so far, yet I've found lots of interesting material. Much of it consists of little tidbits; not enough to justify an Article. Yet the sum total of all the tidbits is not inconsiderable. And who knows -- some little fact sitting around in Archive 4 might hold the key to someone trying to bring, say, an HP-25 back to life. If only they could find it.

I don't want to solve the problems of the whole world, or even of this Web site. But since I've always had a thing for Woodstocks, gathering all the existing material on them would be useful. It would also allow me

to give something back to this community and make it better. And, yes, it would also serve my sefish desire to learn as much as possible about these wonderful machines. Which around here, I suspect, needs no explanation nor apology.

- Michael

Re: Archive summaries

*Message #6 Posted by **Dave Hicks** on 15 May 2003, 12:03 a.m.,*
in response to message #5 by Michael F. Coyle

I too would like to see more postings show up in the articles forum in some fashion. Luiz and Ellis are struggling with doing something in the broader sense but I'm sure they'd be happy to have someone take on the Woodstock part. (And they probably wouldn't mind a few more volunteers...)

Authors should be cited if you quote anything directly (unless you talk to them and they tell you they don't care). If instead of quoting, you learn from posts and then rephrase it in a cohesive article of your own words, then a detailed list of citations is not strictly necessary but I would really like to see people who contributed major ideas getting credit.

As Ellis mentioned, it's best to suck everything into an article rather than pointing into the archives. The archives are still a manageable size but I can't guarantee they'll stay that way "forever".

Re: Archive summaries

*Message #7 Posted by **Michael F. Coyle** on 15 May 2003, 10:19 p.m.,*
in response to message #6 by Dave Hicks

I would paraphrase the stuff I use. Original authors would be credited. I may include my own comments where appropriate.

I don't think I'll end up with a "cohesive article," to use Dave's phrase. It will probably end up as a collection of small items, similar to MIT's old HAKMEM. (Recommended reading if you're really into math and computers.)

Here's a possible sample; found near the end of Archive 9, 29 Aug 2002.

Covering Charger Port
(Dave Smith) To keep from accidentally plugging the battery charger into a calculator, cover the charger port with Kapton tape. (Used when flow soldering printed circuits; leaves no residue.) Especially useful if lithium batteries are being used. *[If I want to add my own comment, it would be in this format - mfc]*

I'm trying to keep it simple. Anyway, I'm going to start collecting material now. Maybe in the future, when the Archives are indexed my compilation will still be useful.

I do have a couple of questions about the Articles Forum. When something is posted there, is it possible to revise the article later? Or are we stuck with it forever? And is there any way to include drawings, diagrams, or photographs in Articles?

- Michael

Re: Archive summaries

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 16 May 2003, 1:18 a.m.,*
in response to message #7 by Michael F. Coyle

Hi, Michael;

as mentioned, I and Ellis offered ourselves to build "something" related to ease the job of finding literature based on existing contributions. I wrote *build "something"* because part of our discussion was exactly the way subjects would be found and shown.

I think final documents in plain text with related graphical support (as you wrote) is the best when memory use is also an issue. As an example, if we have specific articles about usage and programming techniques in FAQ format (as Katie mentioned in this thread) mainly based on facts found in posts, these articles should complement already existing Dave's database for each calculator series. You see, how many times I wrote posts (I already have the basic text saved, for instance) when newcomers or even regular contributors ask about how to change comma for period in some models, or how to perform sef-tests, or how to change number format, or... If we have these subjects already condensed in one or more articles (calculator basic operation), it would be easier to add the link. Also, at the Forum's Welcome header, Dave could add a fourth line to the three existing ones ("Classified Adds", Advanced Format Techniques" and "e-mail me") inviting people to [italic]"check for existing FAQ-like articles at the MoHPC site"[/itlaic] for main subjects because maybe the answer for their question is already there, among other important facts. I believe this would be complementary data, and the name of those who contributed would be relevant only when actual addition (something not found in manuals) is made; something like: [itlaic]"According to Peter's researches..."[/itlaic] and the text describing Peter's founds. This would lead to further corrections, changes for additional credits and new material whenever needed.

I think final read-me text with existing MoHPC format is fine, but a more elaborated PDF to be downloaded, with specific TTF and additional text format, would also be desirable. This sort of document could be generated after we have a concise, refined, error-free (or almost) document. And this is what I think that should be a goal, because existing HP related material is available at the MoHPC CD's/DVD's, but MoHPC own PDF's or part of them might be available to be downloaded directly from the site and also available at the CD's/DVD's. And this would lead us to complete documents, with authors and contributors. Something to be thought about.

Well, I had a large plain text with many basic posts (main text) already "set-up" and ready to be refined when I inadvertently overwrote it! I wish I could kick my own a.. for that, but thanks God I have no such ability. More than a month of spare time on reading, collecting, comparing, cutting-and-pasting... thrown away. Tha heck! I'll do it again. I was a lot p... off at the time it happened, now I just need to synchronize watches and start again.

At the time, a brief discussion about finding themes was the starting fire, as we have in this thread. I thought I could show a first concluded task and ask for comments, suggestions, etc., so we could focus on each and every additional suggestion over an existing start point. Sometimes it's easier having a reference so we can build our own concept. In this case, there are already many good suggestions and no place to make them happen; if at least an actual text is ready as a target, shooting would be easier, don't you think?

I'll soon find a way to get something ready.

Thank you all and best regards. I'm willing to read more and more suggestions.

Luiz C. Vieira - Brazil

*Message #9 Posted by **David Smith** on 14 May 2003, 4:28 p.m.,*
in response to message #1 by Michael F. Coyle

I don't know if 715KHZ is the right freq unless the ACT then divides it by 4 to get the 180 KHz PHASE1 and PHASE2 clocks.

Woodstock Clock

*Message #10 Posted by **Michael F. Coyle** on 14 May 2003, 9:17 p.m.,*
in response to message #9 by David Smith

Hi David,

My 21 is in pieces so I measured it. The oscillator frequency (ACT pins 13 and 14) is 695 kHz and is divided by 4 to get 174 kHz on the phases (ACT pins 16 and 17). (I don't know which pin is which phase though.)

The Classics work in exactly the same way.
