in response to message #1 by Cameron Paine

Hi Cameron, please keep up the great work and complete your simulator. The f MEM function seems the next best thing to do and I agree that if you are going to limit or clamp memory to 203 bytes for authenticity, then an option to go way beyond 203 would still be very nice to have.
Extending labels and flags is a great idea. The test functions would be a neat way to complete the simulation of the real calc, but then how about some useful extensions beyond the real thing.
How about being able to bring up an extra window showing the dynamic contenets of the stack, memory registers and program by pressing the hp 16C badge?

Re: HP-16C sim update (I've implemented the most-requested functions)

*Message #5 Posted by **Namir** on 17 June 2004, 10:50 p.m.,*
in response to message #4 by Gordon Dyer

Cameron,

How about using the sequence of clicking the [f] key, the [g] key, and then any other key to support additional operations. You can also support even more additional operations reference the sequence and click the [g] and then the [f] and then another key.

Namir

Re: HP-16C sim update (I've implemented the most-requested functions)

*Message #6 Posted by **Gordon Dyer** on 17 June 2004, 8:13 p.m.,*
in response to message #1 by Cameron Paine

I have just found that pressing the badge shows the back. This is a lovely touch which you shouldn't change, so we need a different way to open a stack and memry content window, so I suggest a menu option, but then also an instant on-off toggle button by clicking on the display?

Hp45 microcode

*Message #1 Posted by **klaus** on 16 June 2004, 11:45 a.m.*

Whoever has problems squeezing the microcode instructions in the rom of a ucontroller, can try the following to save space: There are 1024 possible instructions, but only about 526 are used. The Roms 1,5 and 6 use a similar subset of only 254 instructions. So you number the 254 instructions from 0 to 253 and store them instead of the original 10bit instructions. Next you have to build a translation table which translates the 8 bit number to the original opcode.

If you only have the choice between 8 and 16 bit words, you can save space:

before: 8Roms*256Instructions*16Bit

after: 5ROMS*256Instructions*16Bit+ 3ROMS*256Instructions*8Bit+ 1Translation*254Instructions*16Bit

HP34C on tv commercial

*Message #1 Posted by **marais** on 16 June 2004, 7:21 a.m.*

The HP-34C can be seen for a split-second in the new EDF spot shown on french TV and cinema. The spot basically features how electric appliances accompany a young man throughout his life. The 34C evidently appears early in the spot, when the young man is in his 20s studying. Great commercial, great calculator.

Re: HP34C on tv commercial

*Message #2 Posted by **J-F Garnier** on 16 June 2004, 7:40 a.m.,*
in response to message #1 by marais

I saw the spot, too. Are you sure it's a 34C? My guess was a HP-67...

J-F

Re: HP34C on tv commercial

*Message #3 Posted by **Namir** on 16 June 2004, 9:01 a.m.,*
in response to message #2 by J-F Garnier

I remember seeing a French movie (while I lived in France in 1978) starring Jean-Louis Trintignant who was a statistician for an insurance company and used an HP-65 to calculate the probability that people around him would die what "seems" a natural death (I may be off on the plot ... it's been a while since 1978). The movie was certainly a big plug for the HP-65. It even had a nice closeup shot of the calculator. It made you want to go out an buy one. Of course in that year the HP-67 was being sold. I remember staying glued to the TV set.

*Message #10 Posted by **marais** on 16 June 2004, 1:50 p.m.,*
in response to message #9 by Antoine M. Couëtte

Well, I admit not being 100% sure, but owning both the 67 and the 34, I am still pretty certain - if anybody can get a record of the spot and post a screenshot, we could solve the riddle.

Re: HP34C on tv commercial

*Message #11 Posted by **Jérôme Grandjanny** on 17 June 2004, 9:47 a.m.,*
in response to message #1 by marais

I've found the clip at : http://pubsservice5.free.fr/EDF-La_vie.zip Unfortunately, it's a DivX movie and the screen-copy doesn't work, so I can't show you the photo. The HP calculator can be seen at second 21 from the

beginning of the clip. It can't be a 34C because upper keys are black instead of grey. From the position of f and g keys and the presence of the PRGM/RUN switch, it's a 33E or 33C.

Re: HP34C on tv commercial

*Message #12 Posted by **Massimo (Italy)** on 17 June 2004, 11:07 a.m.,*

Raymond, I just sent you the image. I have yet to find a way to transfer the video; it's huge (6MB). Will you make the image available to the community, so we can answer the question once and for all which model was featured?

Regards Andreas

HP33E/C on tv commercial

*Message #19 Posted by **Raymond Del Tondo** on 29 June 2004, 7:13 a.m.,*
in response to message #18 by marais

Hi Andreas,

thanks for the picture.

It's an HP-33 (E or C) . This can only be distinguished if seen from the front.

It can be viewed here: http://rdelt.bei.t-online.de/jpgs/hppub.jpg

For the video: You could slice it into two or three pieces
with WinZip or ARJ, then send me the pieces one at a time.

Regards,

Raymond

For the other pictures, an online comparison between
the displays of the SX,G(X), and 49,
all in the same type of machine,
please refer to the following article:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=56518

Re: HP33E/C on tv commercial

*Message #20 Posted by **Massimo (Italy)** on 29 June 2004, 7:55 a.m.,*

Raymond

Re: HP33E/C on tv commercial

*Message #22 Posted by **Massimo (Italy)** on 29 June 2004, 3:09 p.m.,*
in response to message #21 by Raymond Del Tondo

It could be a codec problem.
Do you have a recent Divx release?

The Spice appears around 20" in the movie.

Massimo

Re: HP33E/C on tv commercial

*Message #23 Posted by **Raymond Del Tondo** on 29 June 2004, 9:55 p.m.,*
in response to message #22 by Massimo (Italy)

Hi,

and thanks for the codec hint. I downloaded DivX 5.11 and now it works fine.

Never thought that a video would run for ten seconds
with a wron codec...

Raymond

Re: HP33E/C on tv commercial

*Message #24 Posted by **Massimo (Italy)** on 30 June 2004, 1:28 a.m.,*
in response to message #23 by Raymond Del Tondo

Glad you can see it now.
This actually is a little OT but (on the same PC) I've seen (*no pun intended*) some videos fine using one reader while another gave only audio rendering and a third nothing at all.

;-)

Massimo

Re: HP33E/C on tv commercial

*Message #25 Posted by **marais** on 29 June 2004, 3:53 p.m.,*
in response to message #20 by Massimo (Italy)

Mine's an avi file; I suppose that's the same quality as divx?

Re: HP33E/C on tv commercial

*Message #26 Posted by **Massimo (Italy)** on 29 June 2004, 7:07 p.m.,*
in response to message #25 by marais

Divx files have an **.avi** extension...

Use an editor and look at the beginning of your file: do you see "vidsdivx" and "DX50" strings?

Massimo

Re: HP33E/C on tv commercial

*Message #27 Posted by **BatteryBoy** on 29 June 2004, 11:03 a.m.,*
in response to message #19 by Raymond Del Tondo

Yes,

as the 34c has three shifts (f, g, h), and this one only has the f and g.

Re: HP33E/C on tv commercial

*Message #28 Posted by **David Smith** on 29 June 2004, 12:23 p.m.,*
in response to message #19 by Raymond Del Tondo

Notice that the power cord is fake... it does not go where it should. Or mayby the battery contacts were corroded and somebody soldered the cord directly to the circuit board... and added internal filter and regulation circuitry.

HP-12C(?) in recent news photo regarding Enron

*Message #29 Posted by **Karl Schneider** on 18 June 2004, 1:51 a.m.,*
in response to message #1 by marais

A news photo from 2000 of Enron's energy trading center in Houston accompanied an article that ran in the June 15, 2004 edition of the (Portland) *Oregonian*. A blond, bespectacled trader in the foreground of the photo has a Voyager-series HP calc in front of him. I would suspect that it is a 12C, given its availability and the (ahem) "business" work being performed in the center.

The credit for the photo is Phillippe Diederich of Getty Images. The article is by Richard A. Oppel of the New York Times News Service.

The content of the article is more interesting than the image of the HP calc...

Writing notes into HP49G+

*Message #1 Posted by **Andrew** on 16 June 2004, 6:30 a.m.*

hi

are there any tutorials that show how to add notes(save them) - text & formula into the calculater so you can recall them later?

This is my first programmable/graphic calculator.

i have been to hpcalc.org but haven't found anything there as yet.

thanks for all help

Re: Writing notes into HP49G+

*Message #2 Posted by **Eddie Shore** on 16 June 2004, 3:34 p.m.,*
in response to message #1 by Andrew

So far the only way I know is to create a string variable with your text and store the text you write. While creating your notes, you can press TOOL access STYLE [TOOL] [NEXT] [NEXT] |Style| to highlight, bold, itlicize (sp?), or underline text. Use the [LS] [BEGIN], [LS] [END] to select your text.

hpcalc.org may have text writing programs for the HP49G+.

Good luck,

Eddie

Re: Writing notes into HP49G+

*Message #3 Posted by **GE (France)** on 16 June 2004, 7:22 p.m.,*
in response to message #2 by Eddie Shore

Why oh why should it have to be stored in a "text" kind of object ???

Just create a program and type away freely whatever you want. As long as you don't execute it, no one will ever know !

This works on ANY alpha-enabled programmable calculator...

Re: Writing notes into HP49G+

*Message #4 Posted by **...** on 17 June 2004, 4:01 a.m.,*
in response to message #3 by GE (France)

no.

Most calculators tokenize the program as you write it, or after you press enter. The HP will most likely say 'syntax error' after pressing enter.

Making a string is no harder then making a program.

Type the "", and put your text in between the quotes. Press enter. Type the note name. Press STO.

"I'm using this to cheat on a test because I am dishonest "

CHEAT

STO

Re: Writing notes into HP49G+

*Message #5 Posted by **GE (France)** on 19 June 2004, 6:50 p.m.,*
in response to message #4 by ...

>> This works on ANY alpha-enabled programmable calculator... > The HP will most likely say 'syntax error' after pressing enter.

? Usually when I don't know, I refrain from objecting. However, the objection of tokenization is interesting. Please quote a precise model where this doesn't work ? Personally I can't.

Re: Writing notes into HP49G+

*Message #6 Posted by **.** on 20 June 2004, 10:26 p.m.,*
in response to message #5 by GE (France)

<<Why won't this work?>>

Basically, things like mismatched brackets or """"s, or accidently mentioning control commands (DO/IF etc) and so on.

While for small notes you can probably avoid these problems easily, why would you bother?

Its just as easy to use a string without possible problems.

HP15C emulator or simulator

*Message #1 Posted by **Silvia** on 16 June 2004, 3:24 a.m.*

Hi guys,

This is my first post here. Please, do not offend if I have missed the topic, or this is not the right place to ask the following question.

Trying to find a HP15C (or a HP41, in fact any scientific HP RPN calculator) emulator (or simulator) for my HP Jornada 710, I have been wandering and searching along and across the Web, but with no final result.

The Jornada built in Omnisolve is not a good calculator at all. For instance, it gives erroneus results if I use polar/rectangular conversion, which I need a lot.

The HP48 emulator is not a good solution for me, as I am used to RPN, not to RPL.

Hope somebody would help me to find a good enough RPN calculator for my HP 710.

Thank you.

in response to message #1 by Silvia

Check this out: http://www.applian.com/hpc/CoolCalc/

Re: HP15C emulator or simulator

*Message #3 Posted by **bill platt** on 16 June 2004, 10:40 a.m.,*
in response to message #1 by Silvia

Hi,

this may sound too patched together, but you can also run HrastProgrammer's 41 emulator on the emu48 emulator on your Jornada! And, because EMU48 uses kml scripts with bitmap "skins" you can actually make up a "skin" that looks more like the 41 so that it feels right--you will never even need to use the 48 RPL except to turn it on and off.

Begards,

Bill

I think this the best!

*Message #4 Posted by **Artur - Brazil** on 16 June 2004, 11:29 a.m.,*
in response to message #1 by Silvia

Please, follow this link. You'll get the exact HP15C with much more memory and faster!

http://www.lygea.com/pocket15cdetail.htm

It works in my Toshiba E-740 (Strong ARM).

GOOD LUCK!

Re: I think this the best!

*Message #5 Posted by **Valentin Albillo** on 16 June 2004, 11:52 a.m.,*
in response to message #4 by Artur - Brazil

It is not "exact", as it's a *simulator*, not an *emulator*. So there are differences both in functionality and in numeric results.

That said, it certainly is the best available and mimics the HP-15C extremely well, with clear advantages in speed and memory. Highly recommended.

Best regards from V.

programming

*Message #1 Posted by **harrington** on 15 June 2004, 9:20 p.m.*

This is written in basic specifically TI basic : progm() clrIo dialog request "enter y(x)",a enddlog expr(a)->a expand(a)->f disp f pause (integrate f,x,1,3)->G disp G endprgm

This is a quick basic code for what I'm thinkin doing in RPL for the 49G+ how is this achived in RPL

I was to have y(x)described aboved be simplified using partial fraction which ofcourse in Ti function that will do that is the "expand". Now the solution is stired in "F" then F is displayed. The program is halted with pause.. but what is interestin is that I have stored F which is the residue into built in function integrate, is store in G ... g is displayed. How do you work this out in RPL for the 49 G+.. I know how to prompt the user and think like . what I don know is storing the ans from 1 into step 2 , which is integrating . I be glad to give more clearification thansk

USB connector???for HP 95lx connectivity cable???

*Message #1 Posted by **Bruno Geuth** on 15 June 2004, 7:24 p.m.*

Hi,

I just re-installed F1001A PC-connectivity pack for my HP 95LX.

Now I have the serial cable and the software installed BUT...my laptop has NO serial port (like most laptops nowadays) Question: Is anybody familiar with a solution, e.g. will a USB connector on the HP serial cable work? Where can I buy/order it?

Thanks a lot for your help!

Bruno +32 494 785597

Re: USB connector???for HP 95lx connectivity cable???

*Message #2 Posted by **Steven Kutoroff** on 15 June 2004, 9:02 p.m.,*
in response to message #1 by Bruno Geuth

Back when the iMac came out as the first home computer with no serial ports and support for USB peripherals only, I bought a serial adapter from Keyspan to use with my old printer. I used it until I bought a USB printer. They still seem to update their drivers, but use with PC computers is for you to investigate.

I just checked their website, http://www.keyspan.com/ and they still have such products.

HP 41CV or CX? how can I tell

*Message #1 Posted by **Peter Benton** on 15 June 2004, 4:46 p.m.*

I have an HP 41CX calculator that had broken, I sent it to HP for repairs (Several years ago) and it works fine, but... they appear to have put it in a HP41CV case? How can I confirm it's a 41CX, It has the clock functions, but some CV's also had this feature.

Thanks!

Re: HP 41CV or CX? how can I tell

*Message #2 Posted by **Mike H** on 15 June 2004, 4:56 p.m.,*
in response to message #1 by Peter Benton

From the MoHPC "The HP-41CX was the same as the HP-41CV but added the Time module (stopwatch plus clock with alarms), an Extended Functions / Extended Memory module, a text editor, and some additional functions"

What a dis-service they did...

Mike 1111

Re: HP 41CV or CX? how can I tell

*Message #3 Posted by **Guillermo Castarés** on 15 June 2004, 5:10 p.m.,*
in response to message #1 by Peter Benton

If I remember well you can try:

[Shift] [catalog] [4]

If you get "DIR EMPTY" or file names then it's a HP-41CX.

If you get the same as function's catalog ([Shift][catalog][3]) then it's a HP-41C or CV.

Regards.

Re: HP 41CV or CX? how can I tell

*Message #4 Posted by **Randy** on 15 June 2004, 5:43 p.m.,*
in response to message #3 by Guillermo Castarés

A CAT 2 on a CX with no modules installed will respond with:
-TIME 2x
-CX TIME
-EXT FCN 2x
-CX EXT FCN

A CX will show 219 regsisters available in prgm mode after a memory lost, a CV will display 46.

Re: HP 41CV or CX? how can I tell

*Message #5 Posted by **Peter Benton** on 15 June 2004, 9:21 p.m.,*
in response to message #4 by Randy

Thanks Randy!

It's a CX in a CV wrapper... Soon it will be for sale, I gotta find all the extra modules etc.

Peter

Re: HP 41CV or CX? how can I tell

*Message #6 Posted by **Peter Benton** on 15 June 2004, 9:20 p.m.,*
in response to message #3 by Guillermo Castarés

It appears to be a CX then...maybe it's worth more since it says CV, but acts like a CX? Like one of those stamp proofs, huh?

Thanks!

Re: HP 41CV or CX? how can I tell

*Message #7 Posted by **Randy** on 15 June 2004, 11:38 p.m.,*
in response to message #6 by Peter Benton

Check out the 41 variations athttp://www.hpmuseum.org/collect.htm#variations

If it's a halfnut, well, it's just different. Worth more? Not sure, it's still just a CX. If it's an original fullnut, it's just a repaired machine and no big deal, anybody can do that by swapping internal parts.

Re: HP 41CV or CX? how can I tell

*Message #8 Posted by **Peter Benton** on 16 June 2004, 10:50 a.m.,*
in response to message #7 by Randy

Thanks again Randy, looking at the display, it's a fullnut I guess..... Where can I find the value? what's your opinion of the best place to sell, ebay or in the forums?

Peter

geometric progression

*Message #1 Posted by **Jim Kimes** on 15 June 2004, 3:09 p.m.*

I'm trying to establish a geometric progression formula for the following series but I'm not sure it's a geometric progression. I need to be able to solve the nth term of the following series:

(364/365) * (363/365) * (362/365)...

I want to use 'a' for the changing numerator and 'b' for unchanging denominator and r for the ratio. I know the formula for a geometric progression but it's not that simple. What is the answer here? I need a formula that will fit all similar conditions that I can program on an HP 41. Right now I'm getting the answer by looping but I think there's a better way. Thanks.

Re: geometric progression

*Message #2 Posted by **hugh steers** on 15 June 2004, 6:49 p.m.,*
in response to message #1 by Jim Kimes

how about (aPr)/b^r for r terms. where aPr means permutations of a taking r. ?

Edited: 15 June 2004, 6:51 p.m.

Simplified form

*Message #3 Posted by **Tizedes Csaba [Hungary]** on 16 June 2004, 3:48 a.m.,*
in response to message #1 by Jim Kimes

Hello,

try this:

```
FACTORIAL(n-1)/n^(n-1) = GAMMA(n)*n^(1-n)

in your case n=365
```

Csaba

Simplified form - I think I was crazy...

*Message #4 Posted by **Tizedes Csaba [Hungary]** on 16 June 2004, 3:56 a.m.,*
in response to message #3 by Tizedes Csaba [Hungary]

```
FACTORIAL(n-1)/n^(n-1) = GAMMA(n)*n^(1-n)
```

I'm so sorry, I think my mind is not workin today... And I can't to delete my message... Sorry again!

Cs.

Re: Simplified form - I think I was crazy...

*Message #5 Posted by **Jim Kimes** on 16 June 2004, 2:33 p.m.,*
in response to message #4 by Tizedes Csaba [Hungary]

The problem with factorials is that calculators and computers can't handle super large factoials. They overflow. Besides I'm looking for a partial or a truncated factorial. Logs of factorials may be able to handle that. With your proposed solution, when a = 364, b = 365 and n = 23, do you get .493? If not the real problem isn't solved. Try the problem manually, doesn't take that long, and verify the .493 answer and then formulate it for any value of a & b & n, and then you will feel comfortable with working on a solution.

Won't this series go on for 364 cycles, decreasing all the time, and at an increasingly rapid rate, until you get to (0/365) at whcih point it goes disjointly to zero?

You could very easily write a loop, using i as a counter variable, and loop 364 times.....what am I missing here?

Regards,Bill

"You could very easily write a loop, using i as a counter variable, and loop 364 times.....what am I missing here?"

You're under the impression that I haven't solved my problem. Oh, I've solved it. I have a loop routine that works very well on a 41 but I can't loop with a 19BII and so I want to use some kind of progression formula that will find partial factorials. At n = 23 the ratio becomes .493. I'm beginning to think there is no formula. I haven't heard back from Dr. Math yet.

A solution to Jim's problem [LONG]

*Message #8 Posted by **Valentin Albillo** on 17 June 2004, 4:58 a.m.,*
in response to message #7 by Jim Kimes

Hi, Jim:

Jim posted:

"I can't loop with a 19BII and so I want to use some kind of progression formula that will find partial factorials. At n = 23 the ratio becomes .493. I'm beginning to think there is no formula."

Yes, there is. A "partial" factorial is technically called a ***Pochhammer Symbol***, which itself is nothing

more than a Gamma function divided over another gamma function, like this:

```
(x)n = x*(x+1)*...*(x+n-1) = Gamma(x+n)/Gamma(x)
```

This is the clue for solving your problem non-iteratively. In HP-71B BASIC (i.e.: nearly plain-vanilla English), your problem would be solved like this:

```
10 B=365 @ N=23
20 DISP FACT(B)/FACT(B-N)/B^N
```

where FACT is the factorial function. However, upon running this results in an *overflow*, as FACT(365) exceeds the range for real numbers in the HP-71B and in most any other calculator or system.

What can we do, then ? Easy. Just use the *asymptotic series* for the factorial function, aka **Stirling's series**, to compute the natural logarithm of x! instead of x!. This computation won't overflow for your arguments, and once we have the logarithm, we just use the exponential function EXP (aka *e^x*) to deliver the final result. Stirling series is:

```
x! = (x/e)^x*Sqrt(2*Pi*x)*(1+1/(12*x)+1/(288*x^2)-139/(51840*x^3)+ ...)
```

so its logarithm will be:

```
z = ln(x!) = x*ln(x)-x+ln(2*Pi*x)/2+ln(1+1/(12*x)+1/(288*x^2)-139/(51840*x^3))+
...
```

and of course your final result is simply *e^z*. The resulting, non-iterative HP-71B BASIC program is:

```
10 B=365 @ N=23
20 DISP EXP(FNF(B)-FNF(B-N)-N*LN(B))
30 END
90 DEF FNF(X)=X*LN(X)-X+LN(2*PI*X)/2+LN(1+1/12/X+1/288/X^2-139/51840/X^3)
```

where DISP is the statement used to show a result on the display (aka PRINT, VIEW, etc), EXP is the exponential function *e^x*, LN is the natural logarithm function, PI is 3.14159265359, and FNF is a user-defined function, which can be substituted for a subroutine in other languages, passing it the appropriate parameter. Upon running, it promptly returns:

```
>RUN
      .492702772644
```

which agrees well with your .493 and is accurate to nearly 8 decimal places (actually, the exact result is 0.492702765676014592774582 77+). If still more accuracy is desired, you can use some additional terms to the Stirling's series, have a look at this link:

Stirling's series numerators

and its twin for the denominators. You can get easily 12+ decimals by using more terms. On the other hand, if you don't need that much accuracy, you can save RAM and execution time by deleting terms from the Stirling's series above, like this:

```
90 DEF FNF(X)=X*LN(X)-X+LN(2*PI*X)/2+LN(1+1/12/X)
```

though you should test if the accuracy you then get is adequate for your intended purposes, particularly for large N. For your specific numeric example, you still get 8 decimals !

Hope that helps. Best regards from V.

Re: A solution to Jim's problem [LONG]

*Message #9 Posted by **Jim Kimes** on 17 June 2004, 5:36 p.m.,*
in response to message #8 by Valentin Albillo

This is rich stuff! We're definitely on the right track. I've got a monthly newsletter to get out after which I'll try to digest this. Thank you, Valentin. You just may have solved my problem. I never in my life have heard of a Pochhammer Symbol. It sounds like a novel by Frederick Forsyth.

The "Birthday Problem"

*Message #10 Posted by **Karl Schneider** on 17 June 2004, 12:32 a.m.,*
in response to message #6 by bill platt

This problem has an application in the well-known statistical exercise called the "birthday problem".

"Among 25 randomly-selected people in a room (with no twins), what is the probability that at least two people in the room have the same birthday?"

To answer this question, determine the probability of no one sharing a birthday. (Ignore leap year):

```
prob = (364/365)*(363/365)*...*(341/365)
     = Perm(364,24) / 365^24
     = 0.43130
```

So, the chance that two of 25 random people have the same birthday is (1-0.43130) * 100% = 56.87%

Rather counter-intuitive, no?

Of course, for larger values in the quotient, a term-by-term looped approach must be programmed.

-- Karl S.

*Message #11 Posted by **John Mosand (Norway)** on 17 June 2004, 11:40 a.m.,*
in response to message #10 by Karl Schneider

When I saw the original posting, it immediately reminded me of the 'birthday problem'. About 20 years ago, I tried it out at our office. We were 20 persons at that time. And yes, there were two with the same birthday. Happened to be a girl who had recently started to work with us and myself. The counter-intuitive side of it appears because one may tend to think of the chances that two particular persons share birthdays - which is something quite different!

Re: The "Birthday Problem" (drifting OT)

*Message #12 Posted by **Cameron** on 17 June 2004, 1:26 p.m.,*
in response to message #11 by John Mosand (Norway)

My first sweetheart's dad pulled that trick at a dinner party when I was in my mid teens (he was a statistician who worked for ICI). The occasion is etched on my mind to this day. I was convinced that professionals that played with numbers were either demigods or magicians--a feeling reinforced when I read some of the postings on this forum.

Suffice it to say that I never could cut the mustard in the numbers game whic is probably why I remain in awe of those that do. ;-)

*Message #13 Posted by **Jim Kimes** on 17 June 2004, 5:29 p.m.,*
in response to message #11 by John Mosand (Norway)

It is indeed. I've written a very provocative manuscript I'm trying market. I can't tell you all much about it now for the sake of confidentiality but when it's published, everyone is welcome to it.

Re: The "Birthday Problem"

*Message #14 Posted by **Jim Kimes** on 25 June 2004, 8:45 a.m.,*
in response to message #10 by Karl Schneider

Karl, this is the best approach for solving this problem. Not only is it easy to program for a calculator with a SOLVER, it is also easy to explain to groups as to what is going on mathematically.

I'm grateful to you and everyone for your interest in this topic. It has fascinated me for years. I've had one paper published on it and I have a newspaper interested in an update.

I think this is really a great forum. Extremely helpful!

Re: geometric progression

*Message #15 Posted by **bill platt** on 17 June 2004, 10:12 a.m.,*
in response to message #6 by bill platt

Hi,

I couldn't resist, and so I wrote a loop lat night, both on the 32s and the 11c. The 11c is much slower. The 32s prompts for the number of terms (i) and the starting numerator (A). The 11c must be hand-laoded to I and 0 respectively before GSB A to start. 32s starts with xeq M.

Here is the 11c: hERE IS 32S:

```
LBL B       LBL B
365         365
/            /
RTN         RTN

LBL E       LBL E
RCL 2       RCL B
RTN         RTN

LBL A       LBL M
RCL 0       INPUT A
GSB B       INPUT i
STO 2       RCL A
1           XEQ B
STO-0       STO B
RCL I       1
X<>Y        STO-A
-           STO-i
STO I
GTO C       GTO C

LBL C       LBL C
```

```
RCL I       RCL i
X=0?        X=0?
GTO E       GTO E
RCL 0       RCL A
GSB B       XEQ B
STO * 2     STO * B
1           1
STO - 0     STO - A
RCL I       STO -i
X<>Y         GTO C
-
STO I
GTO C
```

regards,

Bill

A better 11/15/34 routine for "geometric progression"

*Message #16 Posted by **Karl Schneider** on 19 June 2004, 3:29 a.m.,*
in response to message #15 by bill platt

Bill --

I just couldn't resist writing a tighter program for the HP-11C/15C/34C for the "birthday problem" that is shorter and simpler in flow, requires no initialization of memory, uses fewer labels, and utilizes the built-in loop-counter function "DSE":

```
LBL "A"
STO 0       store number of people
X<->Y
INT
STO 1       store integer number of days
LST x
FRAC
STO 2       store fractional number of days
RCL 1
RCL 0
-
EEX
3
/
RCL 1
+
STO I       loop counter variable is set
RCL 2
STO + 1     replace days in year with full floating value
1
STO 3       initialize answer variable
LBL "0"     start of processing loop
DSE I
GTO "1"
RCL 3
RTN         display final result and stop
LBL "1"     calculate term
RCL I
INT
RCL 2
+
RCL 1
/
STO x 3
GTO "0"

Usage:
(number of days in year -- may be non-integer)
ENTER
(number of people)
GSB "A"
```

```
⋮
(read probability of all unique birthdays)
```

This program can accommodate leap years by representing 365.25 days (or a more precise value) in a year.

This is somewhat useful, because you can't do

```
Perm(365.25,25) / (365.25^25)
```

Re: A better 11/15/34 routine for "geometric progression"

*Message #17 Posted by **bill platt** on 21 June 2004, 5:35 p.m.,*
in response to message #16 by Karl Schneider

Hi Karl,

Thank you very much for your post. I was really hoping to get a critique / response!

I figured I would get a response regarding the possibility of using DSE. The thing was, I can never remember the format for DSE without checking the manual--so I made my own counter on the spot.

I discovered that you can run my 32s version on the 20s---with no modification except the Loop being " / 365 =" instead of "365 /" (There is no DSE/ISG on the 20s).

The other conundrum (my weakest part with loops) was getting the count right---you know--the "when do you count--before or after the action" and so when I tried later to convert to DSE and use a single loop, I ended up with a program that ran fine, except that the counter was off by one.

So thank you for the chance to see how to make it work correctly.

Logic and problem solving are interesting. My solution I posted was very much the first attack---and I programmed it in that classically useful way of doing it manually and recording what you do. It is for that reason that I ended up with an initial solve, store to a result variable, then go into a loop and add to the result variable. I knew it should be possible to do it in one fell swoop---but I couldn't see it right then and there.

But programming is a skill, and you only get better with practice. and to that end, this was a very good exercise.

The problem for me is that I am not a programmer---yet every year, or sometimes after 2 or three years, I find myself needing to write programs---in a very specialized languege----and so while rusty, I do need to know what I am doing. (The language is written for developing stability caclulations for ships---and only infrequently do I need to write a custom program to attack an unusual problem).)

So, thanks again!

Best regards,

Bill

Thanks, Bill...

OK, my newsletter is mailed so I can get back to the 'birthday paradox.' Below is my contribution to the recent spate of programs to solve the birthday paradox. My program appears to be beefy at first glance, but it does a lot of things automatically, including prompts. First, in this problem, what you're really solving for is the following:

1 ~ [(364/365) * (363/365) * 362/365)…]

So that leaves us with three variables: 365, or what I call 'max'; number of iterations, which I call 'group': and the probability at a certain group count. You would never want to solve for 'max' but you have to input it.

This program can possibly be done with fewer steps by taking 'max' to the group number power. You can try that; it would be interesting, but I don't think you're going to cut down very many steps. I'm not a proficient BASIC programmer but I'm sure a shorter program can be written in either in Virtual or old BASIC. There is no pride of authorship here so have at it. We can all learn.

Here's the way the program looks on the HP 19BII, using the solver:

1 – (Perm (X:Y) / (365^Y)) = P where X = universe (365), Y= no. in group (23, and P = target or resultant probability of a matching birthday.

ebay games pac too expensive!

*Message #1 Posted by **Gonzalo Fernandez** on 15 June 2004, 1:57 p.m.*

See: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58042&item=5703836427

$172 for a games pac is too much :-)

Re: ebay games pac too expensive!

*Message #2 Posted by **Vassilis Prevelakis** on 15 June 2004, 3:32 p.m.,*
in response to message #1 by Gonzalo Fernandez

Here we go again.

What do you mean by "too expensive" the seller shouldn't be selling it for all this money? or that the buyer (or rather buyers, because 2-3 people were willing to go that high) shouldn't be bidding so high?

I believe that you can get both the games and manual on the MoHPC CDROM, so playing the games was presumably not the reason the buyers were willing to spend all this money.

But its their money, and they can do whatever thay want with it, so spending it on the Games pac is none of your (or my) business.

Besides, raising the prices is good for us since it raises the value of our collections.

**vp

in response to message #11 by Valentin Albillo

Thx for the thread link. It seems that Lyngea simulator is not bad.

BTW, you wrote "The real HP-15C does perform some Sigma-Plus and Sigma-Minus operations and related statistics with extra precision, and this can be cleverly exploited in very specific user programs, as the one featured in "Advanced Functions" to accurately solve a most difficult case of 2nd-degree equation. I don't think that such program would run in your simulator, it would be necessary to key it in and see what the output is. "

What program from "Advanced Functions" do you mean ? I will try to enter the code and test the results.

Re: Testing the HP-15C simulator

*Message #13 Posted by **Valentin Albillo** on 29 June 2004, 1:02 p.m.,*
in response to message #12 by Pavel Korensky

Don't have the "Advanced Functions" manual at hand to look it up, Pavel, but I remember that said program was located nearly the very end of the book, it was one of the last programs featured, if not the very last.

The section where it appears describes several types of problematic quadratic equations and discussed how to tackle them. The program using extended precision is then listed to cater for the most difficult cases.

Hope you'll find it. Anyway, Lygea's simulator has much greater precision than even the internal HP-15C's one, so this program is probably rendered irrelevant, and a normal, much shorter approach will likely produce the correct results as well.

But as a compatibility test, if might be revealing.

Best regards from V.

Re: *Simulator* -- has Eric Smith dumped the 15C ROM yet??

*Message #15 Posted by **Bill Wiese** on 29 June 2004, 7:59 p.m.,*
in response to message #8 by Valentin Albillo

Yes, this is a _simulator_ which just imitates the HP15C overall behavior from an upper-level viewpoint.

The math operations used may be more (or less) accurate; most assuredly they will be DIFFERENT, and reflect the behavior of an X87 FPU or C floating-point software library.

An _emulation_ will _exactly_ mimic the 15C's behavior since it is running a virtual CPU that exactly mimics the 15C's execution. A prerequisite for this is to have a ROM dump of the 15C ROM.

As I recall, forum poster Eric Smith had some success dumping Spice-series ROMs, figuring the changes to the CPU and opcodes over the Classic CPUs, and was making some headway on the other Nut-based calculators.

Given we know the Nut instruction set, we're only hobbled from true emulation by lack of a 15C ROM dump. Perhaps he needs access to some 11C/15C/16C calcs that have an external ROM separate from CPU...

HP 95 LX: Connectivity pack

*Message #1 Posted by **Bruno Geuth** on 15 June 2004, 11:36 a.m.*

Hi,

Back in '91 I purchased the connectivity pack for my HP 95 LX from HP. It was of great use for me. I now found back the serial cable but I cannot use it since the software is gone since I threw away the laptop it was installed on. Can someone send me the software as attachement of mail or does anybody know where I can download it from the web?

Thanks a lot for your help!

HP 82153A Optical Wand barcodes?

*Message #1 Posted by **Brian Ayling** on 15 June 2004, 8:03 a.m.*

I have acquired a HP 82153A Optical Wand without any documentation (it came with a working 41C and card reader). I don't have a printer for producing barcode. Does the Museum's CD with manuals include printable barcodes for scanning with the Wand? Or is there another source of the barcodes? Thanks, Brian Ayling.

Re: HP 82153A Optical Wand barcodes?

*Message #2 Posted by **Miki Mihajlovic** on 15 June 2004, 1:30 p.m.,*
in response to message #1 by Brian Ayling

Leo Duuran's excellent hp41uc utility has an option to print the bar code of any HP-41 program. You can find it here.

A New Small HP-15C Challenge (Prize awarded!) [LONG]

*Message #1 Posted by **Valentin Albillo** on 15 June 2004, 7:37 a.m.*

Hi all,

To spice the week a little, exclusively for HP-15C owners and lovers (i.e., most of us; no other calculators allowed), here's a **New, Small HP-15C Challenge**. As always, it's very small yet it tries hard to be both entertaining and educational as well. But this time there are a couple novelties:

- You must have *a real pro attitude* this time. You'll be "commissioned" to develop a solution *strictly* according to a series of compulsory requirements, and you must deliver, as in real life.
- There's a (small) Prize awarded this time to the person who writes the best routine which unfailingly meets all specifications. 'Best' is intended to mean the routine is as short, fast, and uses the least resources as possible. If several solutions are equally deserving, all with be awarded the prize, myself being the final and sole judge.

The (small) Prize is your choice of a complete, very high-quality scan of your preferred *rare* vintage HP brochure to choose among these three:

```
HP-65 brochure (in English, rare!)
HP-55 brochure (in Spanish, very rare!!)
HP-01 brochure (in French, extremely rare!!!)
```

You can click the above links to see (purposely low-quality, lo-res) samples of all three. The scanned brochures themselves are marvelous, large, hi-res scans, multiple pages for each brochure, to be delivered to you electronically. They're certainly a pleasure to behold and read (though it also makes you a little sad and nostalgic to see what superb products and marketing brochures HP produced in its prime ...)

Even if you're not (!?) that interested in the scanned brochures, have a go at the Challenge. Though it seems simple enough, you'll quickly realize it's far from trivial to come up with even a working version according to the specifications, let alone an optimum one.

The Challenge

The owner of a small business wants, given a certain discount percentage rate between 10.00% and 99.99% (both included), to compute both discounted amounts from a series of non-discounted amounts and vice versa. She also wants to be able to total both types of amounts for a series of conversions, plus be able to specify the percentage rate at any time.

To that effect she's commissioned you to write a routine (LBL A ... RTN) for her trusty HP-15C, which will be called either from the keyboard or from some other main program, and must *EXACTLY* meet the following specifications, to-the-letter.

1. **To specify the percentage rate** (P), your routine will be called with the percentage (between 10.00% and 99.99%) in the X register, will likely store it somewhere else for later computations, and must return with that

same value unchanged in the X register, like this:

To set a 10.00% discount:

```
10 [A]  ->  10.0000
```

2. **To convert non-discounted amounts to discounted amounts**, your routine will be called with matrix C (which will hold a certain number of non-discounted amounts, arbitrary dimensions) in the X register. . Your routine must replace them in-place with the discounted amounts and return with said matrix C in the X register, like this:

   Assuming that P = 10.00% and with C = (20, 30, 50), to compute the discounted amounts:

   ```
   RCL MATRIX C [A]  ->  [C  1 3]
   ```

   where now C holds the discounted amounts, C = (18, 27, 45)

3. **To convert discounted amounts to non-discounted amounts**, your routine will be called with matrix D (which will hold a certain number of discounted amounts, arbitrary dimensions) in the X register. Your routine must replace them in-place with the non-discounted amounts and return with said matrix D in the X register, like this:

   Assuming that P = 10.00% and with D = (36, 63, 81), to compute the original, non-discounted amounts:

   ```
   RCL MATRIX D [A]  ->  [d  1  3]
   ```

   where now D holds the original, non-discounted amounts, D= (40, 70, 90)

4. **To totalize the discounted amounts in matrix C to the grand totals stored in matrix E**, your routine must expect matrix C to be in Y and matrix E to be in X, like this:

   ```
   RCL MATRIX C, RCL MATRIX E [A]  ->  [E  1 3]
   ```

   Assuming C = (18, 27, 45) and that E was (10, 20, 30), E is now (28, 47, 75)

5. **To totalize the original, non-discounted amounts in matrix D to the grand totals in matrix E**, your routine must expect matrix D to be in Y and matrix E to be in X, like this:

   ```
   RCL MATRIX D, RCL MATRIX E [A]  ->  [E  1 3]
   ```

   Assuming D = (40, 70, 90) and that E was (15, 20, 25), E is now (55, 90, 115)

Notes:

- in (4) and (5) above, notice that clearing matrix E before totalling is *not* the responsibility of your routine. This will be done in the calling program or from the keyboard [0, STO MATRIX E] if desired, it's not a functionality that your routine must implement.

- you must not assume that the stack (X,Y,Z,T,Last X) will hold any specific contents before calling your routine other than the exact required parameters specified above. Same goes for storage registers' contents, flags setting or modes (except for the place where you stored the percentage rate, which is assumed to still be there, of course).

- you must not assume any specific storage register allocation [DIM (i)], so your routine must work on the assumption that only the permanently storage registers are allocated.

- and last, but certainly not least, it should be clear by now that LBL A is the *one and only* entry point to your routine. The calling program will always use **GSB A** to invoke all your routine's functionalities or else **[A]**

will be used from the keyboard. Your routine must then assume that it will always be entered at LBL A, with the required parameters on the stack as per the desired function's specifications.

It shall also assume that all variables and matrices are named *exactly* as specified and contain the specific kinds of amounts or totals described above.

Well, let's see if you're up to the task. Of course, the least resources your routine uses, the better. There's a solution fulfilling all specified requirements in 24 program steps or less (including LBL A ... RTN), which I will post after the Challenge is over, within a few days. Hope you'll enjoy it and ...

Best regards from V.

>
> and must *EXACTLY* meet the following specifications, to-the-letter

You won't allow me to cheat again, will you? ;-)
Well, don't worry; I don't have an HP-15C (still waiting for Chris).
However, I did think about the assignment and I therefor did read the manual from Dave's CD set, but I just need the feed back from the real device to test and evaluate the solution(s).

(waiting for the next (non-matrix) problem -)

Re: A New Small HP-15C Challenge (Prize awarded!) [LONG]

*Message #3 Posted by **RMillán** on 16 June 2004, 11:57 a.m.,*
in response to message #1 by Valentin Albillo

Well, here is my try:

```
01 ·f LBL A
02  f MATRIX 7
03  GTO B
04  STO RAN#
05  RTN
06 ·f LBL B
07  CLx
08  LSTx
09  STO I
10  STO RESULT
11  1
12  RCL RAN#
13  -
14  GTO I
15 ·f LBL D
16  1/x
17 ·f LBL C
18  *
19  RTN
20 ·f LBL E
21  Rdown
22  +
23  RTN
```

Notes:

1. Register RAN# can only be used, and saves a few lines, because of the discount percentage is >=10% and

<100%. Storing it in RAN#, which zeroes the exponent for numbers >=1, effectively divides it by 100. This trick wouldn't work for numbers smaller than 10.

2. I don't know if indirect label addressing with matrix indicators is documented. I tried it and it worked.

3. The only thing I don't like about this solution is leaving the number 1 - P/100 in registers Z and T for cases 4 and 5, but, as long as I understand the challenge requirements, it is allowed.

4. I did it in 23 steps, so I'm afraid I made some mistake. But it seems to work as required...

5. Wow! I hadn't programmed with keycodes for a long time!

Best regards from
Rafael Millán.

Re: A New Small HP-15C Challenge (Prize awarded!) [LONG]

*Message #4 Posted by **Valentin Albillo** on 21 June 2004, 11:47 a.m.,*
in response to message #3 by RMillán

Hi, Rafael:

Rafael posted:

> **A perfectly correct solution !**

to my little HP-15C challenge. Congratulations, your solution is virtually identical to mine, with the improvement of being one step shorter by the neat trick of making a routine fall down on another and thus saving a RTN instruction !!.

Just for the record, here is my original solution, commented:

```
01  LBL A       the mandatory entry point
02  MATRIX 7    we need to discriminate if we're being passed a matrix
                or an scalar. The HP-15C has two instructions which can
                do that, namely MATRIX 7 (the Row Norm) and MATRIX 8 (the
                Frobenius Norm). Both take a matrix in X and return the required
                norm, and both skip the next step in program memory if the
                value in X is not a valid matrix descriptor. I use
                MATRIX 7 because evaluating the Row Norm is faster.
03  GTO 0       The value in X was a matrix, branch to deal with it.
04  STO RAN#    The value in X was an scalar; as it should be in the range
                10.00 to 99.99, we can store it in the RAN# register, which
                saves a register and further normalizes the number to the
                range 0.1000-0.9999, thus effectively dividing it by 100.
05  RTN         percentage stored; return to the calling program
06  LBL 0       internal entry point for matrix processing
07  RDN         get rid of the unneeded Norm
08  LAST X      bring back the given matrix, which was stored in LAST X
                when MATRIX 7 computed the Row Norm.
09  STO I       store the matrix descriptor in Register I, for later indirect
                addressing
10  STO RESULT  specify this same matrix to hold the result
11    1         to compute 1-Percentage ...
12  RCL RAN#    ... recall normalized percentage
13    -         done with the computation
14  GTO I       with a matrix descriptor in Register I, this line
                transfers execution to the label indirectly specified
                by the same letter as the matrix descriptor.
15  LBL C       matrix C was specified in X
16   *          MAT C = C * (1-Percentage)
17  RTN         done; return to the calling program
18  LBL D       matrix D was specified in X
19   /          MAT C = C / (1 - Percentage)
```

```
20  RTN         done; return to the calling program
21  LBL E       matrix E was specified in X
22  RDN         get rid of the percentage
23   +          MAT E = E + C or E + D
24  RTN         done; return to the calling program
```

Rafael's solution saves one step (RTN) and another RTN can be saved at the very end, so the specifications can be met with just a 22-step routine. I think this is a very fine example of just how powerful and comprehensive the HP-15C's instruction set is, not to mention, if I may coin a word, *"finetuneable"*. :-)

I've enjoyed creating this challenge, and sincerely hope you enjoyed solving it or reading the solution's details. I would certainly have preferred to gather more inputs, but I guess Rafael's solution, being so close to my own, it's proof enough that the solution is *unique* and so, after Rafael posted his, noone could improve on it or give an alternate one. Congratulations, again !

As for you, Rafael, please tell me what's your choice brochure and a valid e-mail address for me to send it, or else you can download it from a site of mine which I'll tell you privately if you would provide an usable address.

Best regards from V.

Re: A New Small HP-15C Challenge (Prize awarded!) [LONG]

Message #5 Posted by ***RMillán*** *on 22 June 2004, 1:53 p.m.,*
in response to message #4 by Valentin Albillo

Valentín:

I must say that the challenge requirements were so narrow that I was literally pushed towards the solution:

- Just an entry point? So, there must be a function which can tell a matrix from a number. I looked for and I found it. I didn't know before there was one.
- So few program lines suggested some kind of indirect addressing, but it would have to work with matrix descriptors, which I would have never tried otherwise. I tried, and it worked. Also, I didn't know this before.
- Etc.

Of course, I enjoyed the challenge: I learned so much in just one hour.

I think I will go for the HP65 brochure. Please, send me the address for downloading the files to ramb arroba textodigital punto com.

Best regards,
Rafael Millán.

Where did HP build the 95lx in ''91???

*Message #1 Posted by **Bruno Geuth** on 15 June 2004, 4:05 a.m.*

Hi,

My HP95LX was build in the U.S. in September '91 week 36. (Serial number ABB3136A01037.)

I know that HP moved production of Palmtops to Singapore in '95. I can also guess that HP headquarters moved from Orlando to California at some point in time.

Question: Where in the U.S. has my 95LX been build in '91? (State, city etc.) How many 95LX's did HP build each week? How many 95LX have been build/sold in the complete career? When exactly was the 95LX discontinued? ('95 or '96???) Thanks a lot for your help!

Bruno Geuth

Re: Where did HP build the 95lx in ''91???

*Message #2 Posted by **Raymond Del Tondo** on 15 June 2004, 4:59 a.m.,*
in response to message #1 by Bruno Geuth

I think they were made in Corvallis, Oregon, since there was HP's mobile computing center back then. AFAIK the first (aka REAL) OmniBooks were developed and made there, too.

Raymond

Programming astronomical data

*Message #1 Posted by **Michel Beaulieu** on 14 June 2004, 8:15 p.m.*

I recently bought a book call " Practical Astronomy With Your Calculator" by Peter Duffett-Smith. I'm very interesting to put all these calculations on a calculator but i don't really know if it will fit the memory of my CX.

I don't know if it's me but i search at HPMUSEUM, HPCALC and TICALC and astronomy programs are not very present. I found interesting programs for the HP-48 but it's not really what i want. I need non graphical astronomy calculations with a calculator and no need of a PC; it'S for "sur le terrain" with my telescope i will use it. No battery problem please ;-)

You know the kind of simple, but lovely programs, that you enter step by step your location and date and time and you get coordinates of planets, messiers objects etc. on of the program can also make coordinates transformation, handling many time remefence.

I read the book and i'm sure that all these programs can be very short even be user friendly. But there is a lot of them!

The 41CX is my favorite calculator but i think the main memory is too small for my needs this time for that project...

Is it possible that the new HP-33S that became the tread leader of this forum will be the one i need for this project?

Any suggestions for the choice of a calculator or a site that already have some astronomy programs for HP or TI.

Perhaps a readers will already have codes of some astronomy programs that i can use for my project?

(I'M sure if i choose a 41, Luiz will help me! :-))

Re: Programming astronomical data

*Message #2 Posted by **Palmer O. Hanson, Jr.** on 14 June 2004, 8:53 p.m.,*
in response to message #1 by Michel Beaulieu

I think that there were some astronomy programs in TI's PPX Exchange. Unfortunately, most of the programs in the exchange are no longer available. I did make about 200 of the PPX programs available to Gene Wright to be put on the net. I can't remember if any were for astronomy. I don't think that work is done yet. Gene can tell you the status.

Hewlett Ladd, who was a subscriber to TI PPC Notes, wrote a number of astronomy programs for the TI-95. I will have to search for those.

Finally, I have a dim recollection of a book of astronomy programs published in the 1980's. If you have access to old EduCalc catalogs you might want to look there.

*Message #3 Posted by **Tom Sherman** on 14 June 2004, 9:09 p.m.,*
in response to message #1 by Michel Beaulieu

Michel,

The HP Navigation Module for the 41CX has an almanac that gives the celestial coordinates for the sun, moon, Venus, Mars, Jupiter, Saturn, and 58 bright stars used in navigation. It also contains formulae for solving the navigational triangle, and will hence transform celestial coordinates into local coordinates of altitude and azimuth. Unfortunately, the module seems to go for rather high prices on eBay ($50 - $100 or more), but it is a nice package of navigation/astronomy

software.

I wrote a program once for the HP Users' Library that makes use of the Navigation Module software and the Time Module of the 41CX to automatically generate, for any given latitude and longitude, the local coordinates of the celestial bodies referenced in the almanac. I would be happy to send you a copy of the program listing if you thought you might have use for it (but it is only useful with the Navigation Module).

Others on this Forum are much more expert on these matters than I am. I hope that you hear from them, and have success with your project.

Cheers, Tom

I have started writing some astronomy programs for the 33S. It has the memory for many programs, but the limited number of variables/labels is a problem. I would be happy to collaborate or share on writing some from various source books, including the Duffet-Smith text.

A more comprehensive source for astronomical programs that can be customized to your geographical location can be found in many books written by the Belgian astronomer/mathematican Jean Meeus. Many of his works have been published by Willmann-Bell, Inc. in the U.S. In addition you might need the annual publication "Astronomical Almanac" available in both the USA and the United Kingdom from their respective government printing offices. Other good sources are Oliver Montenbruck (Springer-Verlag, Brelin), and Aubrey Jones FRAS (John Wiley & Sons, New York).

I have had no problems in writing programs for my RPN HP calcs.

*Message #7 Posted by **Karl Schneider** on 14 June 2004, 11:52 p.m.,*
in response to message #1 by Michel Beaulieu

Michel --

Well, you're in luck. I undertook a similar task last year, got stalled, but plan to resume soon...

I bought the same book, bought an HP-41 Navigation Pac for my 41's, and received Tom Sherman's program from 1985 (see his post above this one). His program seems to give accurate answers, but runs slowly. This is due mainly to the Nav Pac software, which consists entirely of RPN routines, not machine-code functions.

To run Sherman's program without modification requires the following:

```
HP-41C with at least one memory module (not X-memory) +
```

```
Time Module +
Navigation Pac

OR

HP-41CV +
Time Module +
Navigation Pac

OR

HP-41CX +
Navigation Pac
```

The Time Module could be eliminated if the program is modified to require the user to manually enter date and time.

My objective is to write a program that will calculate the position of the sun and moon only, given complete information of date/time and location (latitude/longitude).

I am developing two versions of the program: one for the 42S and one for the 41C/V/X without any plug-in Pac's. The user-interface code will be different, but the computational engine will be the same. I used the equations in Duffet-Smith's book as the basis for my programs.

The main purpose was to be able to "locate" the two large, bright navigational beacons, using programs that will fit on a 42S and a 41CV/X, and do not require the costly Time Module or Nav Pac.

My software is partially complete, but has bugs that I need to fix. After such a long hiatus, I need to review my work. Therefore, I'm not presently ready to provide to you my work to date.

If you have the money, I'd recommend that you get a 41CV + Time Module or a 41CX, a Navigation Pac, and Sherman's program. That will provide a package that can locate the sum, moon, Venus, Mars, Jupiter, Saturn, and a number of major stars.

-- Karl S.

in response to message #7 by Karl Schneider

June 15, 2004

Hello to you all,

Michel, all the advice and recommendations hereabove in this thread are very clever and sound. All seem realistic solutions within reasonable reach timewise.

****

Just let me add 2 more options which I will be glad to discuss with you in particular if you so desire.

OPTION 1

I would encourage you to take a look at a wonderful, concise, and very clever HP41 program written by Dr Paul Schlyter and named " PUT THE SOLAR SYSTEM IN YOUR POCKET ".

Probably Dr Paul Schlyter (pausch@saaf.se) can provide you with a copy. If he is unable to do so - and as this program was earlier published in PPC USA some 20 years ago - I can dig out my PPC files and burn a copy to you. (By the way, can anybody confirm me that it is "legal" since I certainly do not want to infringe anybody's copyright), unless this program is already available in some archive file (Again: help needed here please) .

" PUT THE SOLAR SYSTEM IN YOUR POCKET “ computes the positions of Sun + Moon + 7 main planets. Any other planet / or comet can be easily added on. From program structure, I think that any other celestial body (star or Messier object) can be easily added on, at the expense of some additional (and probably limited) programming instructions.

For your own use, PUT THE SOLAR SYSTEM IN YOUR POCKET “ computes bodies coordinates in either heliocentric/ecliptic, or geocentric/equatorial, or geocentric/local (i.e. height and azimuth) reference frames.

In the version I have- very slightly modified for my own use from the original one - Minimum Size to run this program is SIZE 092 with registers 00 to 19 used for computations and registers 20 to 91 used for planetary data. And 2 programs are required, one with 753 bytes and the other one with 350 bytes. It means that you need to commit a total of 250 memory registers to this software, leaving you with 69 registers for other use, including fine tuning this software to your needs.

Accuracies on geocentric coordinates now: in the time frame 1900-2100 I have found that " PUT THE SOLAR SYSTEM IN YOUR POCKET “ gives the following results at 3 sigma - i.e. 99.5 % of the time –

• SUN: +/- 1.5 arc minute around true value • MOON: +/- 6.0 arc minutes around true value • MERCURY and VENUS: +/- 1.5 arc minute around true value • MARS, JUPITER, SATURN, URANUS, NEPTUNE: +/- 3.0 arc minutes around true value • PLUTO (not included in the original software and I have included it at the expense of 7 additionnal data registers so my own version requires SIZE 099): +/- 15.0 arc minutes around true value with the “ osculatory elements ” I am using. Here one can do certainly much better with better - but time limited - osculatory elements.

As regards accuracy over time frame validity , this is by far the best trade-off between accuracy over program size I ever found for the plain HP41CX. You most probably will not find any equivalent anywhere else. This is why in my opinion " PUT THE SOLAR SYSTEM IN YOUR POCKET “ is one unequalled master piece and I never miss an opportunity to praise and advocate it.

For your information, accuracies delivered by " PUT THE SOLAR SYSTEM IN YOUR POCKET “ are definitely insufficient for celestial navigation for which it has been customary to use data accurate to +/- 6 arc seconds. Such accuracies require over 50.000 bytes, so you can guess that in this range a significant increase in accuracy is achieved at the expense of a very important increase in size.

OPTION 2

As you do require a “ hand held “ solution, and if you own an HP48GX with additional memory cards (One 128k + I think another 128k at the minimum for the full non free version), or an HP49G - and subject to confirmation an HP49G+ - I would strongly encourage you to take a very close look at Hrastprogrammer HP41X/Z Emulator. (Are you with me Hrast?)

One version is free on the web and it can emulate a plain HP41CX.

These emulators are absolutely fantastic!!! For most if not all my applications they run 3 times faster than the standard HP41CX. And I almost totally stopped using my HP41’s when I purchased my own custom made version.

Standard non free version will give you 680 Extended Memory Free registers, 3292 Program/Data registers + 8 times 4K blocks for your own programming needs! It is over 20 times the standard program space of the HP41CX with over 95% of it protected from MEMORY LOST! And you can also choose to allocate any HP41 module into these 4K blocks, including the NAVIGATION Module, thus leaving you with the option of following one of the advices given you hereabove in this thread!

For more details, go to http://hrastprogrammer.tripod.com/ and if you want to directly contact Hrast, let me know.

You may also have a look at the following HP Forum thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=51496

Hope all this information is useful to you.

Best Regards from Antoine M. " Kermit" Couëtte

Re: Programming astronomical data (are you with me Hrast?)

*Message #9 Posted by **HrastProgrammer** on 16 June 2004, 12:52 a.m.,*
in response to message #8 by Antoine M. Couëtte (France)

Are you with me Hrast?

Of course :-)

I really don't have anything to add to your post except that all my emulators are ported to HP-49G+ as well (but I just don't have enough time to put some info on my homepage) ...

Best regards.

Re: Programming astronomical data

*Message #10 Posted by **Valentin Albillo** on 15 June 2004, 5:17 a.m.,*
in response to message #1 by Michel Beaulieu

Hi, Michel:

Michel posted:

"Is it possible that the new HP-33S that became the tread leader of this forum will be the one i need for this project?"

Absolutely **not**. Don't be fooled by the "32 Kb RAM", there are *only* 26 labels and *only* 30+ registers for variables, and astronomical programs are exactly the kind to exhaust both almost immediately. You'd get just a few programs in before running out of both, not to mention the frustration, the cluttered keyboard and bizarre lettering color. If using it "sur le terrain", presumably at nigth, you're all set up for a monumental disillusion.

"Any suggestions for the choice of a calculator or a site that already have some astronomy programs for HP or TI."

Yes. For your kind of application, the best model by far is the HP-71B. Why ? Easy:

- Truly handheld and portable, you can easily hold it with one hand while keying data with the other.
- Extremely robust and sturdy. It will withstand most any weather conditions, be it rainy or cold. I know, I've used it in the field very extensively.
- The best keyboard there is, perfectly lettered, plus QWERTY disposition *and* separate numerical keypad. You can't enter data more comfortably than that.
- Large RAM available for your programs, starting from 16 Kb built in, and going up all the way to more than 400 Kb if needed. Even the minimal 16 Kb RAM should be more than enough for your stated purposes.
- Fast (from 7x to 14x times faster than a 41C) and precise: 12-digit mantisa with exponents up to 499, only model to implement IEEE standards, can denormalize exponents up to 510, if needed. You'll get the best accuracy in your results.
- Extremely easy to program, in its native BASIC language, which is a superset of standard ANSI BASIC but with extremely powerful extensions, such as subprograms and user-defined functions, both single-line and multiline, accepting parameters by value or reference, and allowing recursion.
- It's got a filesystem which will allow you to create any number of program files in RAM, as well as text files, data files, and other types.
- Full I/O supported. You can interface it to any number of peripherals such as printers, tape storage, disk storage,

even connect it to other HP-71Bs, HP-41Cs or even PCs with the appropriate connection kits.

- And last but not least, you can find lots and lots of astronomy programs written in BASIC which can be keyed in the HP-71B with just minor changes. Many years ago, I did exactly that with the programs featured in this excellent book:

  Celestial BASIC

  which can be obtained second-hand almost inexpensively.

I've used the 71B in the field for a number of purposes, mainly cold nights, and there's no better machine in the world for this. Further, a number of friends of mine are quite good (much better than me) amateur astronomers and do use their 71Bs whenever they go star gazing.

Get one as soon as you can. There are plenty of 71Bs out there, so prices aren't high at all. I got three last year for some $90-100. For so much power, convenience and reliability, that's a real bargain.

Best regards from V. *A picture of the 71B as well as a complete listing of the BASIC programs available in "Celestial BASIC" follow:*

Moon and Planet Programs

- o Right Ascension and Declination - provides the approximate right ascension and declination of the moon for any date and time.
- o Umbral Eclipses - for a start date of any year, this program tells you when the next umbral eclipse of the moon occurs, gives the magnitude of the eclipse, the local time of mid-eclipse, and the rise and set times of the moon for the day of the eclipse.
- o Dates and Times of Lunar Phases - provides a table of lunar phases for any month with the choice of local or universal time for the phase.

- o Right Ascension and Declination of the Planets - is divided into three parts. The first gives the right ascension and declination based on the 1960 epoch and using the equation of the center. The second gives more accurate right ascension and declination based on the 1980 epoch and uses Kepler's equation. The third gives hard-copy printout of the 1980 epoch data. Each also provides angular distance from the sun and distance in astronomical units from the Earth.

- o Planets/Sun/Moon Finder - This program helps you locate the planets, sun, and moon relative to the stars for any date. The program calculates the position of the object and selects a star map for the appropriate part of the sky, shows the constellations, and plots the chosen planet (or the sun or moon). It also plots other planets in the same region of the sky. You may plot a series of intervals to show the motion of the planet across the star field.

- o Planets/Sun/Moon Rise and Set Times - provides times when the planets, sun, and moon rise, transit, and set for any location on Earth, for any date.

- o Mars Oppositions - This program offers two alternatives: The first finds the next opposition of Mars. The program asks for a start year and month, displays a plot of sun, Earth and Mars seen from above the solar system, counts off month by month and in smaller time intervals as opposition approaches, until the date of opposition, and then provides details such as angular size, constellation Mars is in, distance from Earth, and so on. The second alternative provides observational data about Mars for any date.

- o Mercury and Venus - has three sections: The first tells you when the next eastern or western elongation of either Mercury or Venus occurs after a selected date, and provides information about the planet selected. The second shows graphically how Mercury and Venus swing from side to side of the sun. The third is used to find out when it is best to observe Mercury and Venus at any date and for any locality by indicating the rise times before and after the sun.

- o Jupiter's Satellite Configurations - For any date, and time, this program provides data on the configuration of the Galilean satellites of Jupiter and makes a graphic display of the configuration.

- o Worldwide Horizon Plots - An advanced graphics program which allows you to display the night (or day) sky on the monitor of your computer for any time and date and any location on Earth. In addition, the program displays Halley's comet for the 1910 and 1986 apparitions for times when it is expected to be visible in amateur telescopes. The tail is sized and oriented as expected. A planetarium-type horizon silhouette is displayed on each skyplot. You can select north, south, east, or west horizons, each of which overlaps those on either side and covers 180 degrees of azimuth. This is the most advanced and realistic skyplot program available today and it is updated to 1980 coordinates.

Time and Tutorial Programs

- o Sidereal and Mean Time Conversion

- o Julian Day from Calendar Day

- o Updating Star Coordinates - provides right ascension and declination for any epoch given the right ascension and declination of another epoch.

- o Transits of Pole Star - provides the time for any date when Polaris transits the meridian and is at eastern and western elongation.

- o Astronomical Conversions - provides rapid conversion of astronomical measurements including: light years, parsecs, astronomical units, telescope resolving power, and metric units.

- o Dates of Meteor Showers - provides details of annual meteor showers and shows a graphic star chart for you to identify the point from which the meteors appear to radiate (the radiant).

- o Solar System Data - a long program, loaded with information about the solar system, its planets, and their rings and satellites.

- o Recognizing the Constellation - a tutorial program which teaches you to recognize the constellations in the night sky. Bright stars in many constellations are also presented for you to identify.

- o Photographing the Planets - You are asked to identify your photo configuration - camera at prime focus, camera with eyepiece, or projection with eyepiece - focal lengths involved, and aperture of objective mirror or lens, film speed, and planet being photographed. The program provides advice on size of image obtained and exposure needed.

Re: Programming astronomical data: To you Valentin what are stated accuracies of "Celestial BASIC" ?

*Message #11 Posted by **Antoine M. Couëtte(France)** on 15 June 2004, 5:57 a.m.,*
in response to message #10 by Valentin Albillo

June 15, 2004

Valentin,

Your suggested "HP71+Celestial BASIC" solution seems outstanding and thank you for sharing it with us.

Going onto the "Celestial BASIC" Web link you indicate, I could not find any information on its accuracy. Could you indicate which accuracies versus validity time frame can be achieved by " Celestial BASIC " ? Any information about the Astronomical Theories themselves (Newcomb, or Leverier/Gaillot or VSOP , or ELP ???) and their degree of truncation, would be an interesting information, as well as any information on their published source also (Jean Meeus ???).

With the main exception being Jean Meeus's publications, I have often noticed that accuracies versus validity time frames are seldom adequately covered (if ever adressed) in a number a celestial publications related to disseminating astronomical data to a wide variety of users.

Thank you in advance for your reply, and

Best Regards from

Antoine

Re: Programming astronomical data: To you Valentin what are stated accuracies of "Celestial BASIC" ?

*Message #12 Posted by **Valentin Albillo** on 15 June 2004, 6:23 a.m.,*
in response to message #11 by Antoine M. Couëtte(France)

Hi, Antoine:

I'm at work right now, but will try and find the book at home tonight and let you know within 24 hours.

Best regards from V.

Re: CELESTIAL BASIC book, details

*Message #13 Posted by **Valentin Albillo** on 16 June 2004, 6:39 a.m.,*
in response to message #11 by Antoine M. Couëtte(France)

Hi, Antoine:

I did find the book ("Celestial BASIC") and had a look at it, to see if the author would mention the data you're interested in (accuracy, formulae, etc). As far as I can see, each program has a number of pages dedicated to explain its innards and how it does work (besides the commented BASIC listing). The following digested extracts are typical of the author's comments on methods and accuracy:

```
Program 7: PSTAR

   Transits and elongations of Polaris
```

```
     Starting from epoch 1980 the program uses right
     ascension of Polaris, the hour angle and the sidereal
     time for a given date to determine the local time at
     which the transits and elongations take place.

     The accuracy is sufficient to set a polar axis except
     for a very large telescope (10 min. accuracy for any
     date).

Program 8: RADEM

   Right Ascension and Declination of Moon for Any Date and
   Time

      The program determines the position of Moon in its
      orbit by counting from its position at epoch 1960.
      It eliminates complete revolutions and also adjusts
      for the motion of the nodes and the perigee position
      during the period since or before the epoch. Then it
      adjusts for the eccentricity of the Moon's orbit and
      for the inclination of the orbit to the plane of the
      ecliptic.

      The program prints out the right ascension and
      declination and repeats for the requested number of
      intervals.

      For most purposes, this program provides sufficient
      accuracy in locating the approximate position of the
      Moon among the stars for any date and time.
```

Just the same, I think you might find interesting to read the following digested excerpts from the book, which include intesting comments on the why's and how's and on the intended accuracy and purpose:

Introduction

... the programs in Celestial Basic provide amateur and armchair astronomers and students with important aids to observing and understanding the configurations, motions and apparitions of our Sun and Moon, the planets and stars, planetary positions as well as the rising and setting times of all the planets, Sun and Moon, can be quickly found for any locality in the world, at any time, on any date. Astronomical (star) times can be converted to local times and vice versa. Circles can be set on equatorially mounted telescopes, and true north can be determined with the aid of polaris. you can find out when the next lunar eclipse will occur and how much of our satellite will be covered by Earth's shadow. You can learn when Mars will be in opposition next and how large it will appear in a telescope, or when Venus or Mercury are favorably placed for observation in the morning or evening sky. ...

... this book originated as a practical tool. I began to share the programs with others and the interest was such that I decided to incorporate them into a handbook. in addition to providing current information, these programs provide the convenience of checking observations in the past and predicting them into the future. I have compared the results of several of these programs with my observational notebooks that extend back to the 1930s, and I find them sufficiently accurate for everyday observations.

... it is possible to add further steps within the structure of the program to increase the accuracy ... the references cited in the bibliography provide the information necessary to achieve higher orders of accuracy.

About the author:

An author, consultant, lecturer and journalist, Eric Burgess's byline has appeared internationally in newspapers and magazines for over 40 years. He helped found the British Interplanetary Society in the 1930s and the International Astronautical Federation in the 1950s. He is a Fellow of the Royal Astronomical Society and has held official positions in several amateur astronomical societies. He has written extensively for NASA, providing educational materials and books on the missions and their results.

Observer's Guide to the Programs

In preparing for an evening of observations you might select the following programs:

- 1. Run TIMES to find the sidereal time at the beginning and end of your planned observations.
- 2. Use RISES to tell you the times of sunset, sunrise, moonrise, and moonset.
- 3. PHASE will tell you the phase of the Moon so you can find out if a bright Moon will interfere with your observations.
- 4. If the Moon is full you can find out if there will be an eclipse by using ECLIP.
- 5. Use SKYSET/SKYPLT to show you the sky at the tome you plan to begin observing. You can see which planets will be in the sky when you plan to observe, as well as the constellations that can be seen.
- 6. If a planet you are interested in is not above the horizon, you can use RISES to tell you when it will rise. PLNTF will tell you where in the zodiac it is located.
- 7. Use PRISE to find out if Mercury or Venus is visible as an evening star, and how much time after sunset will be available for observation.
- 8. If either Mercury or Venus is visible the evening you plan to observe, use MERVE to provide details of distance, phase, and angular diameter.
- 9. If neither planet is visible you can use MVENC to fin out when the next suitable elongation will take place.
- 10. If you are interested in Mars and you have found out that it is visible, you can ascertain its distance and angular diameter by using MARSP. This program will also tell you when Mars will next be close to Earth at opposition.
- 11. If you plan to observe Jupiter, you can use JSATS to idntify its large satellites.
- 12. SSTAR will tell you if there is a major meteor shower on the night of your observations.
- 13. When resetting the polar axis of an equatorial mount, you can find the direction and elevation of the pole by observing transits and elongations of Polaris. PSTAR will tell you the times to do this.
- 14. Searching for a faint nebula or other celestial object ? Look up its right ascension and declination in your star atlas and then convert to the current epoch using EPOCH. By using TIMES to get sidereal time, you can then set the hour circle on your tlescope and point to the correct right ascension and declination to bring the faint object within the field of view of a finder telescope.
- 15. If you want to use PHOTO to photograph one of the planets, you can find the angular diameter of Mercury and Venus from MERVE and that of Mars from MARSP. Angular diameters of Jupiter, Saturn and Uranus are found by dividing 190, 158, and 68 respectively, by the distance of the planet in astronomical units, obtained from RADEC.
- 16. If you are planning to observe a solar eclipse, you can find out which planets and bright stars will be visible during the eclipse by running SKYSET/SKYPLT for the time and date of totality, changing the latitude and longitude to your observing site. This will provide a guide for you to identify objects surrounding the Sun.
- 17. Making a trip into another hemisphere ? Learn the constellations in advance by using CONST and CONSH. Use SKYSET/SKYPLT to show you what the familiar constellations will look like from the opposite hemisphere, and in which direction to look for the planets.

Hope you'll find some of this useful.

Best regards from V.

Re: CELESTIAL BASIC book, details : to VALENTIN and MICHEL

*Message #14 Posted by **Antoine M. Couëtte (France)** on 16 June 2004, 1:01 p.m.,*
in response to message #13 by Valentin Albillo

June 16, 2004

Hello Valentin and Michel ,

Valentin, thank for your quick and kind reply.

From the data indicated, I can see that, at least for the Moon - and I should say without great risk for all other bodies also given the information on the (quite low) accuracy of Polaris - the "Celestial BASIC" software is not more accurate than " PUT THE SOLAR SYSTEM INTO YOUR POCKET ". Both have several arc minutes accuracy which I understand is sufficient for telescope settings.

For you Michel, given your last post (Jun 2004, 08:24 am), you are left with at least two viable options:

- either get an HP71B (or an emulator on Hp48GX with 2 ram cards/or HP49G no ram card / or HP49G+ + maybe an SD ram card : ask from somebody who knows the HP49G+) and get the Celestial BASIC Software which offers a number of advantages : it is written by a dedicated and enthusiastic telescope user and you will certainly get there everything you will need, with a lot of flexibility and ease, and even more.

- or use your old faithful HP41CX with " PUT THE SOLAR SYSTEM INTO YOUR POCKET " and you will be able to compute positions of all main planets, while still have sufficient space for adding any extra body given its elliptic orbital elements: either asteroid, comet, minor planet. If you need to compute position of a star or a Messier Object or a different " deep sky object ", let me know. I will be able to program for you (free of charge) within the remaining space of your HP41CX their coordinates accurate to +/- 1 arc minute as long as you can provide their Catalog elements.

Best Regards to both of you,

Antoine

Re: Programming astronomical data: running " Celestial BASIC " on HP71 Emulator by Hrast Programmer

*Message #15 Posted by **Antoine M. Couëtte (France)** on 15 June 2004, 7:46 a.m.,*
in response to message #10 by Valentin Albillo

June 15, 2004

Michel,

And also, further to the excellent suggestion made by Valentin about using HP71 with the " Celestial BASIC " software, I should add that - in the case you would own an HP48GX or HP49 - there also exists a superb HP71 Emulator by the same Hrastprogrammer. I think it also runs faster (x2 ?) than the original HP71 which is already very fast when compared to the HP41.

I personnally do not use HP71 . However I think that it would be very easy to transfer " Celestial BASIC " onto this HP71 Emulator - maybe it has already been done - in order to get all the benefits of this very clever solution indicated earlier by Valentin.

Best Regards from

Antoine

Re: Programming astronomical data

*Message #16 Posted by **Tom Sherman** on 15 June 2004, 9:17 a.m.,*
in response to message #10 by Valentin Albillo

Valentin's suggestion of transcribing Celestial Basic to the HP-71B is a really nice idea.

Still another possibility is to run the programs, just as Eric Burgess wrote them, using GWBASIC on an HP 200LX. I keep Celestial Basic on a PCMCIA memory card, along with lots of other programs, to be used with the 200LX.

Cheers, Tom

Michel, have a look at this link ! :-)

*Message #17 Posted by **Valentin ALbillo** on 15 June 2004, 10:02 a.m.,*
in response to message #10 by Valentin Albillo

Hi, Michel:

While you get hold of a copy of "Celestial BASIC" and reinforcing my advice that you use an HP-71B for in-the-field ("sur le terrain") astronomical computations, have a look at this superb link:

```
Generic BASIC Astronomy-related programs from "Sky And Telescope"
```

Here you'll find several dozen plain-vanilla, generic BASIC programs which you can run in the HP-71B with minor modifications, if at all. I think it can be an *excellent* start in order to fulfill your needs, and at the very least it will give you a lot of ideas and sample code.

Best regards from V.

in response to message #18 by Johnny Bjoern Rasmussen

Thank you all for links and books. I still hesitate between a HP-41CX and HP-71B. I still don't have the navigation pac for my 41; perhaps i should take the 71.

Thanks again!

Re: Programming astronomical data

*Message #20 Posted by **JMB** on 16 June 2004, 4:19 p.m.,*
in response to message #19 by Michel Beaulieu

Hi! I've written "Astronomical Ephemeris" programs for the HP-41 which are listed in the HP-41C sofware library. They may be usefull for you. Best regards. JMB

Re: Programming astronomical data

*Message #21 Posted by **Norris** on 17 June 2004, 8:39 p.m.,*
in response to message #1 by Michel Beaulieu

By the way, EKSI still markets the HP48 Astro*Card, which is used by surveyors. It only works with the sun, Polaris, and certain other stars. Observation of these features is the most accurate way to locate true north.

http://www.rollanet.org/~eksi/softprod.htm#card

EKSI also prepares the annual Sokkia "Celestial Observation Handbook and Ephemeris" book, which is available at low cost (less than $10) at places where surveying equipment is sold. The older editions of this book included program listings for the HP48, HP41, and HP42S. Don't know if the newer editions still have the calculator programs.

HP-38G Questions

*Message #1 Posted by **Michel Beaulieu** on 14 June 2004, 7:53 p.m.*

1- Can someone tell me what is an Applets? It is like an application on TI graphing calculators or more like a library on the HP-48S? or just a normal user programs that have a kind of programming language that is not Basic?

2- Where can i find the user manual for that calculator in PDF format?

Re: HP-38G Questions

*Message #2 Posted by **Jonathan Purvis (NZ)** on 15 June 2004, 12:18 a.m.,*
in response to message #1 by Michel Beaulieu

An Applet is most like a library on the HP-48S.

I don't know of a location for the user manual online, but HP has the manual for the 39G+ online (at http://h10032.www1.hp.com/ctg/Manual/c00045564.pdf) and Colin Croft has written a book called "Mastering the HP 39g+" (currently at http://members.iinet.net.au/~ccroft/zipfiles/Mastering%20the%20hp%2039g%2B.pdf). A previous version of that book for the 38G is still available for sale, see http://hphomeview.com/ for details and much more information on the HP-38G.

Auction for an 11C or is it a 15C?

*Message #1 Posted by **Chris Woodhouse** on 14 June 2004, 5:29 p.m.*

Has anyone seen this before? This guy has what appears to be a 15C with an 11C name badge. The auction says he got it at a garage sale. The keyboard and graphic on the back are consistent with a 15C

Auction for HP 11C or 15C

Re: Auction for an 11C or is it a 15C?

*Message #2 Posted by **Raymond Del Tondo** on 14 June 2004, 5:40 p.m.,*
in response to message #1 by Chris Woodhouse

Seems the origanl logo fell off once, and someone replaced it with an old spare 11C logo. Better than vice versa;-)

Raymond

BTW: The logo isn't centered very well...

*Message #8 Posted by **Arthur Dent** on 16 June 2004, 2:46 p.m.,*
in response to message #7 by bill platt

He's got a ton of items out there for sale. All are buy now only items. Most prices are quite high. It's greed like this that is making it harder for many of us true collectors. If you want to sell them, fine, but make them an auction, not a buy now only sale. Unfortunatly, suckers out there who do not know any better are buying them from him.

Take a look at the following link... http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=burlin&include=0&since=-1&sort=3&rows=50

Burlin

*Message #9 Posted by **bill platt (les Estats Unis d'Amerique)** on 16 June 2004, 3:04 p.m.,*
in response to message #8 by Arthur Dent

I do not see what is wrong with asking for your price (And his prices, while high, are not unreasonably so). I have seen auctions for every item I saw there go for more than he is asking. Heck, I myself paid $50 for a perfect condition Brazilian 12c---I'd rather that than $50 on "clearance" for a new kinpo. And mid 300 for a 41cx---I've seen auctions of used ones go for that.

"Suckers?" Like, it's on e-bay---what do you expect! Seriously though, that is the buyer's--not the seller's--problem. If he is on ebay, then the buyers are fully capable of doing the price research--it is all there in front of them.

If you sum up all his "buy it now" prices, you get $12,222.70 (cut and paste into quattro pro---do not add up on your calcualtor!). We know where he gets them---from e-bay auctions for a large part---and we know he will pay quite high for them. So, let's assume that he does an average 100% markup---that means he has $6000 US cash tied up in his inventory. And YOU think you have the right to tell him what he should ask---or dare to accuse him of "gouging" or somesuch nonsense? Are you willing to tie up that much on old calculators?

The fact is, if his prices are too high, they will sit.

regards,

Bill

Re: Look a little deeper

*Message #10 Posted by **Ron Ross** on 16 June 2004, 3:17 p.m.,*
in response to message #8 by Arthur Dent

While I do not know Burlin and have lost a few auctions to him also, I do not believe he is speculating as you believe.

I think he suffers from the very sickness most all of us have of Hp calculator addicition. He is selling some of his excess to refinance his need for more Hp calculators. And since he is so attached to his FOR SALE calculators to put up high reserves, he then discourages their sale, unless he receives the reserve price.

He usually pays premium via ebay and has been active for quite a while now. So I do not believe he is profiting greatly from his purchases. Therefore I concluded he is just sick (I share that same disease).

Do I like him, hell NO! but then I don't even know him. Is he despicable? Certainly, especially since he seems to have much deeper pockets than me!!!! 8o(

But that is more my problem than his (he wins the calculator and gets the toys!!!)

Ebay doesn't care who has the highest bid, just that there is a bid. The guy who can bid (and pay) the most, gets the prize. When I used to go crazy on ebay, I would also win my share of Junk (ie calculators in less than described shape). I am sure he suffers the same. Does that consoul you any (it does me. 8o)).

Re: Look a little deeper

*Message #11 Posted by **Harry Dunn** on 16 June 2004, 3:58 p.m.,*
in response to message #10 by Ron Ross

Ron... I think you are right. Burlin does have a sickness... he's a greedy pig.

I refuse to even bid on anything on ebay any longer when it has to do with HP calculators, because BURLIN always has to out bid just aboput everything I try and buy. I remember the good ole days when you could pick something up for a fair price.

I'm not against someone making some cash. That's what this country is all about. But when you start taking advantage of the situation, it becomes a problem.

Ok.. so I dopn't buy anything from ebay any longer. Will that hurt BURLIN... I doubt it. Some other person (or sucker as the other guy stated) will stumble across the item he wants, and not know the real value of the item and pay the highly inflated price.

This will hurt all of us. Personally, I don't care what my collection is worth. I own my HP's because I love them, not because I want to retire off of them. The true HP fan will understand that. Those of you who are more interested in the value of your calculator would most likely sell the family pet for a buck too.

Anyhow... just my two cents.

Re: Look a little deeper

Data on SD card?

*Message #1 Posted by **Standa(CZ)** on 14 June 2004, 2:29 p.m.*

Can I use my 49G+ with 64MB SD card for transport other data (MP3, .exe, etc.)? Exist some utility for this event?

Re: Data on SD card?

*Message #2 Posted by **Arnaud Amiel** on 14 June 2004, 4:57 p.m.,*
in response to message #1 by Standa(CZ)

You can use the SD card to transport any kind of data that fits in it. However the hp49g+ calculator can not cope with objets bigger than 128Kb and support for exe or mp3 is not built in. There are however some pretty good text readers, someone has the whole bible to download to the SD card for the 49g+.

Serial number logic

*Message #1 Posted by **Bruno Geuth** on 14 June 2004, 8:10 a.m.*

Hi,

Can anybody help me understand the serial number on my HP 95 LX (made in 1990 or 1991): S/N on back: ABB3136A01037

I have been reading articles on HP serial number logic on this forum but these do NOT seem to apply on the 95 LX...

Any suggestions very welcome!

Thanks,

Bruno Geuth

the

Re: Serial number logic

*Message #2 Posted by **Raymond Del Tondo** on 14 June 2004, 8:32 a.m.,*
in response to message #1 by Bruno Geuth

Hi,

the ABB is only the product localisation code. Should be here in the museum, too.

The codes I know from memory:

ABA = US

ABB = Somewhere in the EU, maybe Great Britain

ABD = Germany

The remaining chars are the normal serial number code, using the schema HP used up to the mid nineties. In detail, your machine has a date stamp of the 36th week in 1991, was made in the U.S.A. , and the running batch number is 01037.

HTH,

Raymond

HP-80

*Message #1 Posted by **Bram** on 14 June 2004, 5:50 a.m.*

In general surfing is fun.
Especially when you find something like this.

(DM 2100.= would be about 1000 euros today)

Re: HP-80

*Message #2 Posted by **Carola Weisheit** on 14 June 2004, 9:09 a.m.,*
in response to message #1 by Bram

But it seems to be a HP35. A HP80 lokks differently and would not have made much sense for their applications.

CW

Re: HP-80

*Message #3 Posted by **Bram** on 16 June 2004, 3:33 a.m.,*
in response to message #2 by Carola Weisheit

You're right, but would an HP-35 have cost that much?
I think they just couldn't find an HP-80 picture and they did buy the latter for the financial capabilities.

(May be I'll send an e-mail one day and just ask....)

Re: HP-80

*Message #4 Posted by **Dave Shaffer** on 17 June 2004, 5:00 p.m.,*
in response to message #1 by Bram

HP-35, or HP-80, I doubt that they managed to buy one in 1971! The first one (the '35) came out in 1972 (according to the MoHPC listing - which also matches my memory).

Re: HP-80

*Message #5 Posted by **Raymond Del Tondo** on 18 June 2004, 1:53 a.m.,*
in response to message #4 by Dave Shaffer

Maybe they just took a look onto the serial number, which started with 1143A on early machines, and adapted that date? Just a guess.

Raymond

hp 48 prog and 49G+

*Message #1 Posted by **harrington** on 14 June 2004, 1:58 a.m.*

I have a 49G+ plus is it possible to convert the 48's program for the 49G+??

Re: hp 48 prog and 49G+

*Message #2 Posted by **.** on 14 June 2004, 2:34 a.m.,*
in response to message #1 by harrington

what is the name of the program?

user RPL can be transferred easily. sysRPL will need to be recompiled (eg you need the source).

Re: hp 48 prog and 49G+

*Message #3 Posted by **James M. Prange** on 14 June 2004, 2:45 a.m.,*
in response to message #1 by harrington

Which "48"? There are significant differences between the 48S series and 48G series, and from what I've heard, the 48gII is really a 49 series as far as using it goes.

But (for UserRPL code) if you do an ASCII transfer from a 48 series to a PC, and again from the PC to the 49 series, most programs will work with no modifications. To avoid having "Real numbers" (type 0) on the 48 changed to "Exact integers" (type 28) on the 49, have the 49 in "Approximate" mode when transferring 48 series programs to it. Something to watch out for are global names on the 48 that happen to match command, function, or XLIB names on the 49.

If you run into one that you can't get to work, post it on the forum, and I'll try to help.

By the way, for information on the "advanced formatting techniques" available for this forum, see http://www.hpmuseum.org/artfmt.htm.

I found some really neat programs on the site today unfortunatly it is written for the 48 series. I was jus curios if there are possibilities for the 49 G + which I owned.

Re: hp 48 prog and 49G+

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 15 June 2004, 12:01 a.m.,*
in response to message #5 by harrington

Hi, Harrington;

as mentioned in this thread (I don't know who, no name, just a dot), if the program is written in User RPL, I mean, if it uses only "regular" functions and commands, you can transfer or use original programs written for the HP48S and/or 48G in an HP49G+. I remember that some minor changes related to empty lists dealing made me change two or three programs that ran in an HP48 and did not run correctly in an HP49G (not G+).

HOWEVER, if the program uses exclusive internal calls, like SYSEVAL with specific addresses or low-level coding (assembly), big chances are that it will not work properly. In some extreme cases, running such programs may cause display and keyboard freezing or even a memory loss. So, it's a good idea trying to find the User RPL equivalent, if available, and recompile it with specific sofware (as mentioned by the unknown colaborator above).

Hope this helps you finding the appropriate program for your needs.

Cheers.

Luiz (Brazil)

HP-IL Thinkjet printer.

*Message #1 Posted by **Ray** on 13 June 2004, 5:53 p.m.*

Hello,

I have recently aquired a HP-IL Thinkjet Printer, with box and all acessories. I hooked everything up as directed by the intstructions, but it doesn't seem to power up. I switch the power switch, and the yellow indicator light blinks three times, and then the entire Printer seems to shut down. I checked the battery, and it seems to be giving off voltage. (but I don't really know the correct voltage, does anyone here?)... The battery also has enough power to start the printer, but just like the AC adapter, the power light won't come on, and pressing the power button on the top does no good.

I'm hoping there is a simple way to get this printer working, any suggestions?

Thanks in advance.

Re: HP-IL Thinkjet printer.

*Message #2 Posted by **Garth Wilson** on 13 June 2004, 8:32 p.m.,*
in response to message #1 by Ray

IIRC, it has 6 NiCads, right? I made a 7.8V power supply to replace my bad NiCads not long after I got my ThinkJet. (I hate NiCads anyway. Why can't they just make things to optionally use alkalines?) I've even run the printer off a common alkaline 9V battery, although a brand new little 9V becomes unable to supply enough current after about six pages. Without a load it still measures to almost the voltage you would expect for a new battery, but it just can't keep it up under load.

Re: HP-IL Thinkjet printer.

*Message #3 Posted by **Ray** on 13 June 2004, 11:13 p.m.,*
in response to message #2 by Garth Wilson

What's the actual voltage it's supposed to take, like 7.8V? My batter only gives out 5.8 or something... That must be the problem. Anyone know how I can reubuild one of these battery packs? It's encased in heavy plastic, so I don't really know how to get inside (nor WHAT is inside), so a step by step guide would be good. Better yet, if you know where I can get one of these battery packs, I would be willing to buy one.

Thanks for your help.

Re: HP-IL Thinkjet printer.

*Message #4 Posted by **db(martinez,california)** on 14 June 2004, 12:36 a.m.,*
in response to message #3 by Ray

As i remember; you have to jimmy it open. It would be easy to open but the batteries have that two sided tape and you have to slice it as you are prying the battery case open. You will need a small screw driver, a butter knife, and an exacto knife

I popped in some lightly used cells i got from an 8-pack and it works good. There was a PCB in there too. I had no corrosion so i had no problems.

Re: HP-IL Thinkjet printer.

*Message #5 Posted by **Garth Wilson** on 14 June 2004, 2:55 a.m.,*
in response to message #3 by Ray

If it's only 5.8V without a load, it probably looks just about dead under load. Six NiCads in series, fully charged, will be about 7.5V. It might quickly get down around 7.1V for much of the discharge cycle, and then drop quickly at the end.

http://nicdlady.com/sendingus.html is one battery pack rebuilder I've seen at the local swapmeets many times. They have quite an operation. You can send your own battery pack (since in this case it's probably not one they stock) and they'll rebuild it for you and it will look like a factory job.

Re: HP-IL Thinkjet printer.

*Message #6 Posted by **Chris Woodhouse** on 14 June 2004, 9:46 a.m.,*
in response to message #5 by Garth Wilson

> Quote:
>
> Six NiCads in series, fully charged, will be about 7.5V

I thought I would expand on that a little. for NiCads or NiMH batteries the nominal voltage is 1.2 per cell, so 7.2V for a 6 cell pack. Even under load for an extend period they should read higher than that.. A full charged cell should read about 1.45V. However, that voltage will drop rather quickly even if it isn't under a load, to about 1.3V. A 6 cell pack should read between 7.8 and 8.7 when fully charged and not under a load. For reference here is a discharge graph for a 7.2V pack from my Dewalt screwdriver.

http://cdw.homelinux.com:8087/hp/7.2vpack.jpg

Programming Question!!!

*Message #1 Posted by **Harrington** on 13 June 2004, 1:38 p.m.*

Ok this is what I have so far : <<" enter function""" input obj->-> a <<a partfract "y(x)"->tag->str MSGBox>> now I'm getting what I expect to see from the above what I really want to do is Dtag y(x) into another function (Intergration function) in function to excutes the solution to y(x) by intergrating it . I know it is holding what ever the anwere is, for input (a) in stack. have any ideas?

Re: Programming Question!!!

*Message #2 Posted by **James M. Prange** on 14 June 2004, 2:23 a.m.,*
in response to message #1 by Harrington

Well, yes, my idea is that it would be a lot easier to help you if you were careful to post exactly what you're trying to do. In particular, pay very close attention to capitalization, spelling, and spacing, both on your calculator and when posting online. I suggest that you use a Conn4x "Text" file transfer or "Edit as Text", then copy and paste it into the post, and (for this forum) enclose it between [pre] and [/pre] "BBCode" tags. Doesn't:

```
%%HP: T(3)A(R)F(.);
\<< " enter function" "" INPUT OBJ\-> \-> a
  \<< a PARTFRAC "y(x)" \->TAG \->STR MSGBOX
  \>>
\>>
```

seem a lot better than:

> Quote:
>
> <<" enter function""" input obj->-> a <<a partfract "y(x)"->tag->str MSGBox>>

Also, note that if you use the copy and paste method, I can just download your code to my calculator and try it out, rather than trying to key it in, correcting errors at the same time.

Regards,
James

Re: Programming Question!!!

*Message #3 Posted by **harrington r** on 14 June 2004, 2:38 a.m.,*
in response to message #1 by Harrington

oka thanks for the idea: my question was is it possible to excutues partfrac and call the solution into intergration in the same program . which the syntax yet has not been written.

Re: Programming Question!!!

*Message #4 Posted by **James M. Prange** on 14 June 2004, 3:02 a.m.,*

in response to message #3 by harrington r

Do you mean that you want to use the result from PARTFRAC for something else in the program? Why not just DUP it and leave that copy on the stack for later use? Like this:

```
%%HP: T(3)A(R)F(.);
\<< " enter function" "" INPUT OBJ\-> \-> a
  \<< a PARTFRAC DUP "y(x)" \->TAG \->STR MSGBOX
  \>>
\>>
```

in response to message #4 by James M. Prange

yes but I inten to implement another built in function integrate to slove the residues from the Partfrac get it

Galling and appalling!!!

*Message #6 Posted by **Karl Schneider** on 15 June 2004, 12:18 a.m.,*
in response to message #5 by Harrington

"Harrington" --

An excerpt from James Prange's reply to your first post:

> Quote:
>
> Well, yes, my idea is that it would be a lot easier to help you if you were careful to post exactly what you're trying to do. In particular, pay very close attention to capitalization, spelling, and spacing, both on your calculator and when posting online.

Your three posts, verbatim:

> Quote:
>
> Ok this is what I have so far : <<" enter function""" input obj->-> a <<a partfract "y(x)"->tag->str MSGBox>> now I'm getting what I expect to see from the above what I really want to do is Dtag y(x) into another function (Intergration function) in function to excutes the solution to y(x) by intergrating it . I know it is holding what ever the anwere is, for input (a) in stack. have any ideas?
>
> oka thanks for the idea: my question was is it possible to excutues partfrac and call the solution into intergration in the same program . which the syntax yet has not been written.
>
> yes but I inten to implement another built in function integrate to slove the residues from the Partfrac get it

I doubt that you're illiterate, but it doesn't seem that you value the time and effort spent by people from whom you ask assistance.

I own the 28C, 48G, and 49G, but freely admit that I don't know RPL well enough to help (nor do I desire to become more proficient). If I were James, though, I wouldn't take the time to provide further counsel. I just don't think you "get it".

-- Karl S.

Re: Programming Question!!!

*Message #7 Posted by **James M. Prange** on 15 June 2004, 4:02 a.m.,*
in response to message #5 by Harrington

No, I'm not at all sure that I "get it". By "Partfrac", do you mean that your program is named "Partfrac"? If you really mean "PARTFRAC", then write it that way.

Please do make an effort to write standard English. Try to write not only in a manner that can be understood, but in a manner that can't be misunderstood.

Doesn't having the result from PARTFRAC on the stack help? You can use that result as the argument for something else that could follow what you have so far.

For what you're doing, it seems to me that it may be better to have the INPUT command force the Algebraic/Program-entry mode and start an algebraic object, and you may as well have it check the syntax of the algebraic object too. So how about:

```
%%HP: T(3)A(R)F(.);
@ Results from BYTES:
  @ # B716h
  @   104.5
\<<
  " enter function" { "'" 2. ALG V } INPUT
  OBJ\->
  \-> a
  \<<
    a PARTFRAC
    DUP
    "y(x)" \->TAG \->STR MSGBOX
  \>>
\>>
```

Also, there's no need to use a local variable structure for this program. The above program takes an object from the stack, stores it to a local variable, and then puts the contents of the local variable back on the stack and uses it for the argument to PARTFRAC, and finally removes the local variable when it's done. Why jump through so many hoops? Maybe try:

```
%%HP: T(3)A(R)F(.);
@ Results from BYTES:
  @ # 78EEh
  @     88.
\<<
  " enter function" { "'" 2. ALG V } INPUT
  OBJ\->
  PARTFRAC
  DUP
  "y(x)" \->TAG \->STR MSGBOX
\>>
```

That's smaller and faster, and ends up accomplishing the same thing.

Regards,
James

49g+ slower than 48gx

*Message #1 Posted by **helge gabert** on 13 June 2004, 10:26 a.m.*

Here is an example where the new, 49g+, running at 75 MHz on ARM chip is actually slower than the venerable 48gx (running at 4 MHz).

Try plotting a PS-Contour plot of 'sin(sqrt(X^2+Y^2))/(X*Y)'

Keep the default plot window values, or change them, if you want, it doesn't matter. Have both calcs side by side, ready, set, go! Amazing, the 48gx is actually faster!

Is this a shoddy porting of the ps-contour plotting algorithm from the 48 to the 49g+, or what?

(Of course, this is just one example. For the most part, the HP49g+ runs circles around the 48, and I like the 49g+. But it's interesting this could occur.)

HP27S/17BII: How to sort saved equations?

*Message #1 Posted by **Jens** on 13 June 2004, 5:41 a.m.*

Hello!

I have a few equations with names on my HP 27S and HP 17BII, which I want to have sorted alphabetically.

How can I do this?

Jens

Re: HP27S/17BII: How to sort saved equations?

*Message #2 Posted by **Raymond Del Tondo** on 13 June 2004, 6:42 a.m.,*
in response to message #1 by Jens

Hi,

if there's no SORT functionality, you have to name your equations in an appriorate way to have them sorted;-)

Ok, maybe this is not of too much help, but did you RTFM ?

Raymond

Re: HP27S/17BII: How to sort saved equations?

*Message #3 Posted by **Jens** on 13 June 2004, 8:34 a.m.,*
in response to message #2 by Raymond Del Tondo

>>if there's no SORT functionality, you have to name your equations in an appriorate way to have them sorted;-)

Well, that's the problem: The equations are not sorted by name!

Jens

Re: HP27S/17BII: How to sort saved equations?

*Message #4 Posted by **Tom Sherman** on 13 June 2004, 12:40 p.m.,*
in response to message #1 by Jens

Jens,

The 27S provides no automatic sorting of equations -- at least I have not found one in the 15 years I have used mine. Any sorting has to be done manually, by deleting an equation and re-entering it where you want it. The rules of that game, which you may well already have discovered, are:

1) If the display reads "<Top of List>", a new equation will go at the top of the list.

2) If the display reads "<Bottom of List>", a new equation will go at the bottom of the list.

3) If the display shows one of your equations, a new equation will go immediately BELOW that equation.

Once they are entered, the equations are like fossils in the sandstone. One has to chip them out by hand in order to move them.

Cheers, Tom

HP 41C Battery Contacts Repairable?

*Message #1 Posted by **Mike H** on 12 June 2004, 8:46 p.m.*

Hello all. I just got my hands on a very nice 41C. Although you could say it does not have any "blemishes ;)", the battery contacts are toast. Is this repairable. Since I got it for cheap, I need to determine if I want to send it back, sell it for parts, are try a repair. Thanks 1111

Re: HP 41C Battery Contacts Repairable?

*Message #2 Posted by **db(martinez,california)** on 13 June 2004, 12:07 a.m.,*
in response to message #1 by Mike H

If you want to try the sticky copper foil method of repairing the contacts i can mail you enough sheet to do a couple of calcs (you know: enough to do it once, and some more to do it right the second time :-)

Re: HP 41C Battery Contacts Repairable?

*Message #3 Posted by **MIke H** on 13 June 2004, 12:27 a.m.,*
in response to message #2 by db(martinez,california)

Thanks db. Email me at the adress above and we can set it up. Mike 1111

Re: HP 41C Battery Contacts Repairable?

*Message #4 Posted by **Marx Pio** on 13 June 2004, 7:51 p.m.,*
in response to message #2 by db(martinez,california)

Hi db,

I Neet it too. How can I get it? Do you have a kind of tutorial to make it easy for a simple man? Thanks. Pio

Re: HP 41C Battery Contacts Repairable?

*Message #5 Posted by **Randy** on 13 June 2004, 9:04 p.m.,*
in response to message #4 by Marx Pio

The best way to repair 41 battery contacts is with 1/8" (3 mm) brass channel that is available in hobby stores. Cut a 1/4" (6mm) long piece for each terminal and solder over nasty, rotted battery connection points. Repaired in this way, the connector will outlast the remainder of the calculator.

If the connector is really rotted, you'll need to scrape the film off where the long flat sides of the brass meets the connector to be able to solder it in place. You must use a good, temperature controlled soldering iron or you'll destroy the connector.

http://www.fixthatcalc.com/images/41_terminals.JPG

*Message #6 Posted by **Marx Pio** on 13 June 2004, 9:54 p.m.,*
in response to message #5 by Randy

Randy,

Thanks a lot for the real visual thing.

Pio

Re: HP 41C Battery Contacts Repairable?

*Message #7 Posted by **db(martinez,california)** on 14 June 2004, 12:57 a.m.,*
in response to message #4 by Marx Pio

The photo that Randy sent is a prettier version of what i did. That solid chanel looks like a great improvement over the bendy sheet that i have. You might use conductive paint instead of soldering to a plastic ribbon connector.

I'll email you Marx.

HP 33S Turn off Thousands Separator

*Message #1 Posted by **Sammy** on 12 June 2004, 12:41 p.m.*

I don't mind so much that the 33S decimal point is small. But when it shows that PLUS the thousands separator it just makes things messy and hard to read. So I thought of using "," as the decimal point (which is easy to read) and getting rid of the "." thousands separator. Anyone know how to do this?

Re: HP 33S Turn off Thousands Separator

*Message #2 Posted by **Bram** on 12 June 2004, 1:31 p.m.,*
in response to message #1 by Sammy

Good idea, but you cannot switch it off on an HP-32SII, its predecessor; I guess it can't be done on an HP-33S either.

Re: HP 33S Turn off Thousands Separator

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 13 June 2004, 2:06 a.m.,*
in response to message #1 by Sammy

Hi, Sammy;

I had a look at the User's Manual and found nothing about how to supress the thousands separator in the HP33S. I thought about flag control, like we have in the HP41/42, or using ALL digits, like the STD in the HP48/49 to do that, but I found only fraction control with flags 7,8 and 9.

Other than trying the manual, I tested some possible configurations and (sadly) confirmed that as the HP33S has no "integer" mode for base convertions, the DEC representation for numbers is the same standard representation with thousands separator.

BTW, have you seen how messy is the display when you fill X or Y registers with "2"s? You hardly see any separator between consecutive "2"s.

Sorry not helping that much.

Cheers.

Luiz (Brazil)

Re: HP 33S Petition

*Message #4 Posted by **Sammy** on 13 June 2004, 1:28 p.m.,*
in response to message #1 by Sammy

Someone with some money to host a website should start a petition to force HP to take back all the 33S and fix these rediculous problems--I'll be the first one to sign up.

At $65 MSRP, none of these problems should even exist! I mean, didn't they even look at the final product before releasing it?

FDISP Mode + SHOW

*Message #5 Posted by **Tizedes Csaba [Hungary]** on 14 June 2004, 3:06 a.m.,*
in response to message #1 by Sammy

Hello,

on a HP32SII in FDISP mode the thousand separators is not seeing. And if you want fractional part in decimal format, use SHOW.

It's not really best solution, but works.

Csaba

Re: FDISP Mode + SHOW

*Message #6 Posted by **Arnaud Amiel** on 14 June 2004, 9:30 a.m.,*
in response to message #5 by Tizedes Csaba [Hungary]

It also works on the 33. But as you said I don't think it is really the best solution.

Thanks for the tip

Arnaud

Similarly SCI n Then SHOW

*Message #7 Posted by **rsenzer** on 14 June 2004, 7:22 p.m.,*
in response to message #5 by Tizedes Csaba [Hungary]

Of course, with SCI you know where the decimal place is. Use SHOW if you need more details. I use SCI 4 with the 33s. Once again, not an ideal solution.

Edited: 12 June 2004, 1:48 p.m.

Re: I have tunnel covers

*Message #4 Posted by **FELIX G. MARRERO** on 15 June 2004, 2:57 p.m.,*
in response to message #3 by Mike

Mike, I am one of your customers on Ebay. I purchased a set of batteries to rebuild the pack for my 41cx recently. It worked beautifully, thank you. I am willing to purchase a tunnel cover and up to four port covers if you have any available. I read your string on the copied photo and agree with you. Stick to your guns, your argument has merit.

How do you come to that conclusion?

*Message #5 Posted by **Mike** on 12 June 2004, 11:47 a.m.,*
in response to message #1 by Jim Creybohm

Based on what is stated in the auction, I don't see how you can think this is necessarily a bad bid. $100 for a 41CX that might be fixable and in excellent condition, doesn't sound like a bad deal.

If the battery contacts are good, the calculator can likely be repaired very easily.

Perhaps the bidder asked questions. That is the #1 thing that bidders should do, before bidding.

Some of my best buys are broken items.

PS: The real problem is that tom3151 is simply running up the bid, 4 days before it is necessary. That is the problem with bidding early. It just runs the bid up. However, even if he waited 7 days, the bid would still be at $100+. Since he didn't become the high bidder, you can bet the final bid will be higher than the current bid.

Edited: 12 June 2004, 11:50 a.m.

Not silly at all

*Message #6 Posted by **Randy** on 12 June 2004, 5:24 p.m.,*
in response to message #1 by Jim Creybohm

IMO, that's not far off the average for a dead, good shape fullnut CX. I've seen them as low as $80 and as high as $150. Once you think you have figured out eBay prices, an auction will come along and leave you scratching your head. Here was the last one I saw: A Very Expensive Manual I've seen decent 15C's with both manuals sell for less. Seems like prices have ratcheted up in the last two to three months. Funny, I thought the 33S might lower prices on more recent LCD models. How wrong I was...

Re: Not silly at all

*Message #7 Posted by **martin cohen** on 12 June 2004, 9:13 p.m.,*
in response to message #6 by Randy

It is definitely weird.

I saw a notice on comp.sys.hp48 about an HP IR printer (model 82240B) for sale on eBay, and ended up getting it for $38 plus shipping!!

Now if only I can get a $100 42s.

Re: OK, this is just plain silly

*Message #8 Posted by **CalcKidd** on 13 June 2004, 11:06 a.m.,*
in response to message #1 by Jim Creybohm

I got a "won't power up" 42S for $50. on Ebay last year. Seems it just needed fresh batteries!

Better than Christmas!

Help with HP-25

*Message #1 Posted by **Jamie Cox** on 11 June 2004, 9:59 p.m.*

I recently acquired a nice-looking HP-25. It was languishing in a pile of junk. It was in the original case. I didn't find a charger for it. The battery pack looked to be in good condition -- no corrosion. It must have been replaced. I removed the battery pack from the calculator and charged it with a NiCad battery charger. It holds a charge. The battery contacts are okay, too.

I put the charged pack into the calculator and powered it on.

The calculator didn't work. The display behaved erratically when turned on. It has never displayed correct digits, even for a moment.

Is there any hope for fixing an HP-25 with this type of problem? Any ideas? Thanks.

Re: Help with HP-25

*Message #2 Posted by **Bram** on 12 June 2004, 6:03 a.m.,*
in response to message #1 by Jamie Cox

Are you sure that the batteries are OK? After a long period of non-use they may need a couple of charge/discharge cycles to operate correctly. When both my HP-21 and HP-29c gets too low power, their display is kind of randomly activating the segment LEDs. I'm not sure if your HP-25 behaves similarly.
If the batteries indeed are OK, then I fear the device itself is in error, but I have no experience with that.

Tapes for HP 82121A

*Message #1 Posted by **Artur - Brazil** on 11 June 2004, 6:37 p.m.*

Hello I've just bougth the mass storage unit for HP41 and, as I don't have the tape for it and its price is something high in Ebay, I would like ask your help in taking the measures of the original tape: the case - heigth, width, deep, distance between center of holes. The tape itself - the width. I'll try to make my own tapes.

Some pictures would be of helpfull.

By the way, has anyone tryed the old answering machines tapes or the mini-cassetes for mini-recorderes in the HP units? Should this be possible to use them? Or the data tapes used for backup in computers systems?

Take a while and visit my site: www.elibertas.com.br , link "Tecnologia". Thank you very much

Re: Tapes for HP 82161A

*Message #2 Posted by **Artur - Brazil** on 11 June 2004, 7:48 p.m.,*
in response to message #1 by Artur - Brazil

The device number was wrong ... HP 82161A. Thanks! Artur

Re: Tapes for HP 82121A

*Message #3 Posted by **David Smith** on 12 June 2004, 2:25 p.m.,*
in response to message #1 by Artur - Brazil

Data cassettes and standard microcassettes use different cases. No way to make them compatible. You can fix a bad data casette with tape from a microcassette. Watch out for leader type, reflective foil, and being/end of tape holes.

Calculator Logic Systems, Part Ia

*Message #1 Posted by **bill platt (les Estats Unis d'Amerique)** on 11 June 2004, 2:22 p.m.*

OK,

To start out, I am merely posting an outline as I see it, of calculator logic systems as currently in use.

This is "Part Ia" because of my previous post:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=38678

The idea here is that I will first post this, so everyone can see it, and then in a few days I will post my "treatise" as it were.

Please post any glaringly obvious omissions, and i wil ledit this list (within my prerogative, of course) so that we have a nice "seminar outline" as it were....is this getting to be too academic; oh well!

Note that I am trying to stay away from the more advanced and specialized features---this icludes PMT IRR etc on financials, Statistics, unit conversions etc on scientifics etc.

Best regards,

Bill Platt

```
Calculator Operating Systems:  (Leaving out matrices and other special or utility functions eg
conversions, units etc)

Group 1:  Stack Based
RPN  (postfix except for register work which is infix)
     programming is essentially machine code level
RPL (postfix everything)
     programming is essentially high-level (except assembler hacking!)

Variations:
   stack depth
   variable handling
   data types
   exponentiation direction of entry
   compex number handling
   register handling
   register arithmetic
   programming features
   statistics/special features handling

"Adding Machine"  (in between group 1 and 2)
    postfix for addition and subtraction; infix for multiplication and division

Group 2  (also known as "Direct Calculation" as opposed to "Formula Entry")
"Algebraic with precedence" with postfix "1 number functions"
"Algebraic" without precedence (and postfix "1-number functions")
Ordinary 4-function infix arithmetic, postfix "1-number" functions)

Variations on algebraic:
```

```
   "history" stack
   "last" (sometimes called "ANS")
   "swap"
   "input" for "2-number functions" and other special features (e.g. statistics)
   handling/display of intermediate results
   chain computation
   computation with a constant
   complex arithmetic

Note that these variations are by no means universal.  The meaning of "swap" "k" et cetera may
differ greatly from one maker to another or even from one model to another.

Numerous variations exist on the handling of:
   clearing & cancelling
   m^n  (y^x, x^y, x_Root-of_y etc)
   %
   statistics
   permutation & combination
   variables and or registers or memories
   register/memory  arithmetic
   programming rules
   use of parenthesis in non-precedence machines

Group 3: Formula Based
"Formula Entry" (infix everything except usually x^2 is usually postfix and y^x is infix)
"Formula Entry" with "implicit multiplication" (again infix everything except x^2)

Variations on Formula Entry (Sometimes called "direct algebraic logic," "visually perfect
algebraic logic" etc).
   history stack
   scrollable edit
   intermediate results
   use of previous results ("ANS")
```

Edited: 11 June 2004, 2:25 p.m.

Stolen auction? (slightly Off-Topic)

*Message #1 Posted by **Mike** on 11 June 2004, 10:19 a.m.*

Not a biggie. Just another example of lazy people that can't create their own auctions.
http://www.msdsite.com/images/smile.gif

So, what do you think. Copied? http://www.msdsite.com/images/smile.gif This link, brings up both auctions.

My auction

The other auction

Edited: 11 June 2004, 11:02 a.m.

Re: Stolen auction? (slightly Off-Topic)

*Message #2 Posted by **Chris Woodhouse** on 11 June 2004, 11:25 a.m.,*
in response to message #1 by Mike

I don't see that for a product like that, that it makes any real difference. Unless I had my digital camera out taking photos of other stuff, I would just find a photo anywhere I could to add to my auction. Now if it was something where the cosmetic condition was important, I would certainly provide a photo of the actual item and I would provide a much higher resolution image (1024x768 or more) than most people on ebay do.

Chris W

Nevertheless...

in response to message #2 by Chris Woodhouse

It is a violation of ebay rules to steal a photo. It is also against the rules to use another person's "title" and "description". **Yes, it's against ebay rules.**

The fact is, people that use other people's photos, likely don't deliver exactly what is shown. Who knows what you actually get?

The fact is, that he would likely not be able to sell his item, for a much, without a photo.

The fact is, I and others have to invest in a camera to take our photos.

It is not merely a question of cosmetic condition. It is a matter of his leveraging off of other peoples expenses. This may not be a big deal to buyers, but nontheless, it is against ebay rules.

Re: Nevertheless...

*Message #4 Posted by **Joe Edwards** on 11 June 2004, 12:11 p.m.,*
in response to message #3 by Mike

I agree with both of you:

1. In regards to photos. I really don't think it is a big deal. If the seller includes a disclaimer stating the photo is represenative of the product, who cares. As Chris said, it if was in reference to specific condition, that would be different.

2. In regards to the layout. I can see Mike's point.

The catch is, can you prove, beyond any question of doubt that those are your photos Mike. Unless there is some type of digital signiture, you really cannot prove that you took them, merely that you had them on your auction first.

My main question is this; why are you even asking folks what their opinions are? Not trying to troll here, but if you have a problem with it and you feel ebay will shut down the other person's auction, report him. That is your call.

In the long run, I don't think it really matters that much, but that is just my opinion.

Absolutely!

*Message #5 Posted by **Mike** on 11 June 2004, 12:27 p.m.,*
in response to message #4 by Joe Edwards

You say: "The catch is, can you prove, beyond any question of doubt that those are your photos Mike. Unless there is some type of digital signiture, you really cannot prove that you took them, merely that you had them on your auction first."

I say: Absolutely! I have the original 2272 x 1704 image. I bet he can't produce one. If he simply tried to expand it, it would be obvious. But aside from that, eBay has a backed up database that will show my photo on ebay, before he ever joined. http://www.msdsite.com/images/smile.gif

You say: "My main question is this; why are you even asking folks what their opinions are? Not trying to troll here, but if you have a problem with it and you feel ebay will shut down the other person's auction, report him."

I say: Already did. I'm sure his auction will be pulled. The way I look at it, there is no such thing as only "slightly" violating the rules. There are two issues:

Buyer point of view: No big deal, perhaps.

Seller point of view: This is just as much an abuse of my photos, title and description, as if he used a photo of one of my mint calculators and sold and average calculator. No gray area here.

eBay rules against photo and description theft

But the point you are missing is this is about leveraging off of another persons auctions and expenses. That is the issue. This is a black and white issue. It's no different than if someone used an HP Museum photo to sell their product, without giving credit for the source.

I just bring this up as a general issue. I am fully capable of dealing with it and have.

There is a reason to discuss this here, it is an interesting topic and relevant to others who may be selling calculators on eBay.

Oh, please...

*Message #8 Posted by **Richard Estmer** on 11 June 2004, 1:20 p.m.,*
in response to message #1 by Mike

Not to play the devil's advocate, but...

1) This is a sealed tape, if the other seller had made its own picture, it would look all the same, excepted maybe your blue towel which nicely prevents light reflection;

2) the other seller doesn't get any advantage in using your picture, and you don't loose a cent in having your public picture cloned;

3) above all, you (and other sellers of vintage material) make huge, repeated profit on collectors' items. Nothing against that, but considering the amount of eBay transactions you make, and your oh-so-high prices, this is a huge, no-tax, easy money scheme for you. Why whine on a copied photo, then?

4) such tapes can regularly be found (any other vintage material, btw) in bulk sets in government auctions, military surplus sales (wink), old import/export shops, and bankrupt shops, just to name a few. Selling them one at a time on eBay generates lots of easy money (good legal scheme : I do it, too) which imho doesn't need claiming "intellectual property" of vintage stuff.

Just my two cents; nothing personal.

You are off on a tangeant

*Message #9 Posted by **Mike** on 11 June 2004, 2:22 p.m.,*
in response to message #8 by Richard Estmer

You seem to want to discuss this based on who is the target rather than the principle, envolved.

You say: "2) the other seller doesn't get any advantage in using your picture, and you don't loose a cent in having your public picture cloned;"

I say: So, using that logic, why should anyone, including Dave, if someone uses an HP Photo, without giving credit? Advantage, has absolutely zip to do with this issue.

There is a principle here that is completely oblivious to you.

I have invested thousands of $ in cameras for my photos. Might seem silly to you but my photos are mine. And without "credit" is simply wrong behavior. It really has zip to do with who, if anyone, is making any money on something.

I have asked that he give credit for the photos used. We shall see if he complies.

I guess I better drop this thread, since you'd rather make it personal issue than simply sticking to the principle here.

So that wasn't me. Someone stole by initials (well, I guess they could have the same initials as me, but it is still poor form to post in the same branch of a thread as my message).

Anyway...I don't know about that jacka$$, but I was being sincere in my response that you probably do pay taxes.

Re: No, you don't pay taxes ...

*Message #17 Posted by **thebullcabinet** on 13 June 2004, 2:09 a.m.,*
in response to message #14 by a b

I do. Seems like there's a law or something about that.

Re: Stolen auction? - 100% with Mike

*Message #18 Posted by **Jim Creybohm** on 11 June 2004, 3:04 p.m.,*
in response to message #1 by Mike

I agree 100% with Mike on this. To me, it is the PRINCIPLE involved, not the actual items. To do this in this manner tells me that the person who has hijacked the images/code is either lazy or crooked. Either way, not a strong recommendation for a person I want to deal with. I most likely wouldn't have noticed it as I am not in the market for tapes.

That having been said, I am not sure that this is the correct forum for bringing it up - however as we are almost all Ebayers here, I think it is good to be aware that this type of nonsense goes on. I'll be more careful

when posting pictures of the items I am selling.

I believe the Mike actually thought he was doing the readers of this board a service - I don't think he thought this was advertising his product, nor do I think he was whining.

HP41 rechargeable packs - another query

*Message #1 Posted by **james summers (UK)** on 11 June 2004, 8:39 a.m.*

.....or three!

Having rebuilt my first pack, I managed to get hold of another (much earlier pack - serial number 21xxS) and was rather disconcerted to see it had a three pin contact for the power supply cable rather than the two pin contact I had expected. There is also a copper blade that appears to make contact with the middle pin closing a circuit when the power cable is disconnected.

There was further consternation when on opening the pack I discovered that the metal spring strip contact on one side that conencts with the internal contacts in the calculator does not make contact with the top of the rechargeable battery (as I had expected having rebuilt a 'two pin' pack) but was insulated from it and instead was connected via a flexible ribbon to the circuit board in the pack.

Can anyone enlighten me as to the logic behind the 'three pin' pack?

Now to the rebuild:

One of the metal spring strips which form the connection between the pack and the internal contacts in the '41 was badly corroded and broke in two on removal - any ideas where I can get a replacement? (worst comes to the worst I should be able to use a coil spring)

The printed circuit track on the flexible ribbon mentioned above has corroded away in a number of places and will need replacement - any ideas on a suitable source? (worst comes to the worst I can run a cable from the metal spring strip connector back to the circuit board)

Re: HP41 rechargeable packs - another query

*Message #2 Posted by **Randy** on 11 June 2004, 9:30 p.m.,*
in response to message #1 by james summers (UK)

The three pin pack disconnects the battery from the calculator when the wall wart connector is inserted.

The small TO-92 three terminal regulator in the three pin version is a 78L05 or 06, I forget which. It provides regulated DC to the calculator while the battery charges, disconnected from the calculator. In the two pin version, the TO-92 regulator is a 78L12 and only provides the charging current to the battery. The calculator is powered from the batteries. In these versions, there is a 6.2V zener across the battery to prevent overvoltage from reaching the calculator. It becomes a fail safe should the battery ever open as the thermal rating is exceeded and it fails shorted.

With a little work, you can convert a three pin to a two pin version and completely eliminate the flex circuit that always gets eaten by the battery leakage. It involves replacing the regulator, the series charge limiting resistor and adding the zener. Yes, a fair bit of work but then you'll have a safer battery with fewer parts in the end.

BTW - tinned beryllium copper is the material of choice for the contacts. I don't know a source in the UK (I

doubt RS has it) but here in the US - http://www.smallparts.com/products/descriptions/bcs.cfm is one source of supply.

Many thanks, Randy - 2 pin seems the way to go (n/t)

Hp42 xfunction

*Message #1 Posted by **Fulcrum** on 10 June 2004, 5:25 p.m.*

Hello, Can anyone tell me how can I enter some hp41 extended functions like regmove, etc? Thank you

Re: Hp42 xfunction

*Message #2 Posted by **Gene** on 10 June 2004, 6:03 p.m.,*
in response to message #1 by Fulcrum

Either a function is in the 42S function catalog or its not.

There are no "x" functions as such in the 42. There are just functions.

Go into the function catalog and scroll through until you get to the "R" functions. If it's there, press the menu key. If it's not, then it's not built in.

Not all HP41 functions from modules are in the HP42S (time functions, etc).

HP 33s - Dead or Alive?

*Message #1 Posted by **Philbert** on 10 June 2004, 11:46 a.m.*

Greetings:

I have not seen the 33s in stock at any online source. At one location, a notice was posted that the item has been discontinued. Is that true or false? If the 33s is generally available, does anyone know a reliable, in-stock source for the item?

TIA, Philbert

Re: HP 33s - Dead or Alive?

*Message #2 Posted by **Philbert** on 10 June 2004, 11:52 a.m.,*
in response to message #1 by Philbert

Sorry to reply to my own post, but I wanted to add the link to the site that claimed the HP 33s was discontinued.

http://www.officequarters.com/product.php/item/HEW-33S/HEW33S.html

Carry on.

Re: HP 33s - Dead or Alive?

*Message #3 Posted by **Norris** on 10 June 2004, 12:13 p.m.,*
in response to message #1 by Philbert

Seems a bit unlikely that the 33S would be discontinued already, since HP formally introduced it on April 20, 2004, less than 2 months ago. See

http://www.hp.com/hpinfo/newsroom/press/2004/040420c.html

The 33S appears to be available from amazon.com, or from calculator dealers like samsoncables.com, commerce.hpcalc.org, or calculatorsource.com

Oddly enough, it seems to be out of stock at hp.com

Re: HP 33s - Dead or Alive?

*Message #4 Posted by **Valentin Albillo** on 10 June 2004, 12:20 p.m.,*
in response to message #1 by Philbert

It hasn't been discontinued, for sure. Here in Spain, you can find it available in numbers at every major department store, such as "El Corte Ingles". Price is 80 euros, i.e.: some US $90.

I don't know whether it's doing well or not, might ask the clerk. And no, I didn't buy one. After looking at it

very carefully, having one in my hand, and trying it thoroughly, I decided it was sheer rubbish and there's no way I would pay 80 euros for that crap, though I fully respect that other people are entitled to think otherwise, of course.

Best regards from V.

Re: HP 33s - Dead or Alive?

in response to message #4 by Valentin Albillo

V.
What about the 33S led you to your negative impression? Was it the chevron-style keyboard, the small "ENTER" key in the "wrong" place, small radix/comma in the display, other, or some combination? Aside from these attributes, the 33S (in RPN mode) seems to be a near identical functional reproduction of the 32Sii, with the benefit of much more memory. Many HP users feel that the 32sii is a pretty decent calculator. Have you ever used a 32sii, do you have an opinion on its capabilities?

I am not a great fan of the 33S, but I own one and have a much more favorable opinion of it than you. I certainly consider the attributes specifically mentioned above to be definite shortcomings and sympathize and respect the opinions of those that don’t like it because of them. The biggest negative is that it would have been relatively easy to avoid the problems and produce a calculator that many more people would have liked.

Re: HP 33s - and Logic Systems

*Message #6 Posted by **bill platt** on 10 June 2004, 1:14 p.m.,*
in response to message #5 by Jeff

Hi Jeff,

I should let Valentin speak for himself, but with all do respect to you, he is absolutely correct that at $90 the 33s is rubbish. You can buy a 32s (or even a 32sii for that if you are lucky) and there is no comparison in terms of tactile behavior. The 33s has clicking buttons, but they are really too clicky with too much travel, compared to the Pioneers, voyagers, and even to the 41. Also, the rubber feet are so soft on those little stilts that it squirms around on the table wen you use it. I bought one, and liked it at $40, especially for travel, but lost it the other day and I am (trying to) be patient about buying another. I do find that the 11c 15c 48gx and 32s are fine for me right now (I liked the extra memory in the 33s---and that is the one thing that may drive me to buy one again some time).

However, what I suspect Valentin may find interesting is the Algebraic system on the 33s---it is somewhatunlike most others out there (see some threads with my name on them from the recent month), and it would be interesting to see a comparison made with a variety of Sharp algebraic systems (of which I unfortunately know less).

So, (Valentin) if you are listening, I am remembering a very interesting series of posts regarding RPN vs ALG in which you made a number of very important points---especially that RPN is by no means the only or best logic---a good logic but not the only way--and I think I remember some Sharp logic systems mentioned.

In fact I intend to post a short treatise on this topic sometime in the next month.....and your input would be valuable.

Regards,

Bill

Re: HP 33s - and Logic Systems

Hi, Bill:

Bill posted:

"So, (Valentin) if you are listening, I am remembering a very interesting series of posts regarding RPN vs ALG in which you made a number of very important points---especially that RPN is by no means the only or best logic---a good logic but not the only way--and I think I remember some Sharp logic systems mentioned. In fact I intend to post a short treatise on this topic sometime in the next month.....and your input would be valuable."

Sure, go ahead. And assuming it's minimally honest and serious (as I'm sure it will, being you the one treating the subject), putting the hard facts over the table instead of the usual bunch of RPN-addict ramblings (which I don't usually bite), you can count me in to discuss it in all its gory detail :-)

Hopefully this time it *might* be a useful and enlightening thread from which useful conclusions can be extracted, and devoid of the typical and topical oh-so-rational *mantras* such as "I hate algebraic calcs", "RPN is best, period", "I wouldn't touch an algebraic calc with a ten feet pole", "I can't survive without RPN", "I can't use alg calcs anymore", "RPN rules!", "RPN should be mandatory at schools", etc, etc, etc. :-)

Best regards from V.

Re: HP 33s - and Logic Systems

*Message #8 Posted by **Chris Woodhouse** on 11 June 2004, 12:01 p.m.,*
in response to message #7 by Valentin Albillo

I am looking forward to reading this post as well. I have found the discussion of alg vs rpn on this and other HP forums puzzling. I honestly can't see any advantage to alg entry. The only thing I have heard that would make me think there is any advantage to alg is the argument that rpn is more difficult. While I won't completely discount that it is possible for to write an equation that is easier to do using alg, I have never seen one. So I am very interested if someone can show me where alg is better than rpn.

Bring Back the HP 15C

Re: HP 33s - Dead or Alive?

*Message #11 Posted by **Valentin Albillo** on 10 June 2004, 1:53 p.m.,*
in response to message #5 by Jeff

Hi, Jeff:

Jeff posted:

"What about the 33S led you to your negative impression? Was it the chevron-style keyboard, the small "ENTER" key in the "wrong" place, small radix/comma in the display, other, or some combination?"

Right, you've nailed it. First of all, let me insist that I mean no disrespect to those people who like this machine, my opinions are my own and I don't claim them to be absolute truth. To summarize:

- Inconvenient form factor, far too large and bulky for a 'pocket calculator'. If there's something I don't need is yet-another-bulky-calculator. Seems that the trend is "bigger is better". Nonsense. It doesn't feel right in my hand, let alone in my pocket.

- The small, misplaced ENTER key is a real show-stopper. I did try such simple things as basic arithmetic, and the ENTER key was so misplaced that it hurt. I couldn't stand it after a while.

- The chevron-style keyboard together with the ultra-cramped legends and the awful color scheme were also unbearable. Used to classic HP machines, such as the Voyager series, the Classic series, the HP-41 series, and the HP-71B, among others, there's no way I would suffer such garish-colored, cluttered lettering surrounding those distorted concoctions which passed as keys.

- The display I find less fault with, but the small radix/comma is yet another nuisance.

- And last but not least, the general feeling of a cheap, unpolished, uncared-for product, where no attention whatsoever has been put by anyone. You read Mr. Kahan's detailed descriptions of how the HP-15C team put the best of themselves to achieve utmost quality and functionality in very limited hardware, then you see this HP33S where noone has bothered in the least to achieve even the minimum specs to make use of its much more powerful hardware. It's an insult to their intended customers, to say the least, to make you pay and swallow a less than half-cooked product that absolutely underutilizes its capabilities.

"Aside from these attributes, the 33S (in RPN mode) seems to be a near identical functional reproduction of the 32Sii, with the benefit of much more memory. Many HP users feel that the 32sii is a pretty decent calculator. Have you ever used a 32sii, do you have an opinion on its capabilities?"

You can't "aside" these attributes, they are extremely significant and important, at least to me. If I'm not wrong, we are proud to be HP fans because we felt that their machines were the best bar none, and we felt justifiably proud to own and use one. If that feeling is sadly lost (I simply can't feel 'proud' of owning and using an HP33S, at all, I'd feel silly), what remains isn't worth the trouble, to me.

Also, re the HP32S, I concede that it has 'the benefit of much more memory' but there's no need to repeat that said memory is nearly unusable in its entirety, because HP didn't see fit to make the changes in the firmware that would allow a user to actually use it. You can bet that the HP-15C team would've given anything for even 100 more bytes, yet the 33S team would waste 32 Kb without batting an eyelid.

One of the tests I made was to solve a 7x7 system of linear equations. It runs fine in the 33S while it wouldn't on the 32S because of its extremely limited RAM, roughly 1/3rd the HP-15C's RAM. But that's just about it. Though 32 Kb would allow you to solve up to 50x50 systems, you just can't because noone at HP gave a damn for your convenience. Why would you care for this product, then ?

Anyway, I don't have a problem with this product, at all. I don't like it, I don't buy it, period. Fortunately I have a large surplus of really good models, such as several HP-15C, 41CX, 42S and 71B, to name a few, not to mention my SHARPs which are every bit as good if not better. My needs are fully covered and I remain a proud HP user, proud of my collection, which I proudly show everyone. To place an HP33S next to an HP-15C, say, or a SHARP PC-1262 would be tantamount to heresy. But different people think differently and I am all the most respectful of yours and anyone else's opinions and feelings.

Best regards from V.

Valentin wrote: "You can bet that the HP-15C team would've given anything for even 100 more bytes, yet the 33S team would waste 32 Kb without batting an eyelid."

Gene: You're being quite unfair, IMO.

It appears the ONLY goal of the 33S was to replace the 32SII, which could no longer be made. The objective appears to have been, quite reasonably, IMO, to do so as easily/quickly as possible, but adding a couple of functions and algebraic mode so that it would sell beyond the 1000 people who visit the museum.

Regarding the memory issue...HP could have put in a 4K or 8K chip, but since the 32K chip was probably only pennies MORE, they dropped it in...after all, who knows what those enterprising HP users might make of extra room.

If HP had the time to invent extra functions to take advantage of that extra room, would I have been glad? Certainly.

BUT that is not the stated purpose of the 33S.

Say this a few dozen times over and over...

"This is a 32SII clone"

Anything beyond that is extra.

Gene

33S memory issue

*Message #13 Posted by **Norris** on 10 June 2004, 3:29 p.m.,*
in response to message #12 by Gene

Two questions come to mind:

(1) To 33S Haters: Would the 33S be improved if HP/Kinpo swapped out the 32KB memory chip for a smaller 4KB chip? After all, then there wouldn't be such a dreadful mismatch between the large memory and the small number of labels and variables. Would you like the 33S *better* if the memory was *reduced* ?

(2) To 33S Defenders: Is it fair for HP (and resellers) to advertise the 33S as having 31KB of memory, without any mention of the limitations caused by the small number of labels and variables? For practical purposes, isn't it true that the effective memory size is only a fraction of the advertised 31KB value ?

My opinion: Don't complain about the 33S memory. Even if the effective memory size is only 3-5KB, that's still way better than the 32SII, 15C, etc. But do complain about the misleading and unethical way that HP advertises it.

Re: 33S memory issue

*Message #14 Posted by **Gene** on 10 June 2004, 4:33 p.m.,*
in response to message #13 by Norris

I do agree it is DIFFICULT to use the 32K of ram, but that doesn't mean you can't do it...you just have to learn a new way to program.

Everything you thought you knew about writing programs before the 33S must be relearned.

1) GOTO branching? Nope. Set a flag and continually test the status of the flag in a long string of steps to take.

Example:

Old way: X>Y? GOTO B BLAH BLAH BLAH GOTO C LBL B HO HO HO...

New way: X>Y? SF 1 FS? 1 HO FS? 1 HO FS? 1 HO FC? 1 BLAH FC? 1 BLAH FC?C BLAH

2) Efficiency? Why do that? Just repeat code segments - never do subroutines.

Example:

Old way: X>Y? XEQ A RTN LBL B XEQ A RTN LBL A YADA YADA RTN

New way: X>Y? SF 1 FS? 1 YADA FS? 1 YADA RTN LBL B YADA YADA RTN

It's not exactly "easy", but I've seen programs over a thousand lines long this way that work.

Gene

P.S. Don't get me wrong, I too want better ways of using the memory, but I'll ALWAYS take extra memory - there might always end up a chance to use it better.

Re: 33S memory issue

*Message #15 Posted by **Norris** on 10 June 2004, 5:23 p.m.,*
in response to message #14 by Gene

<< Everything you thought you knew about writing programs before the 33S must be relearned.>>

But doesn't this strike you as a significant limitation? Wouldn't it be appropriate for HP to explicitly acknowlege this drawback in their advertisements, or even in the user manual?

Your point is valid, but a 33S buyer who doesn't know about it in advance may understandably be disappointed. And HP certainly isn't calling anyone's attention to it.

Re: 33S memory issue

*Message #16 Posted by **Gene** on 10 June 2004, 6:01 p.m.,*
in response to message #15 by Norris

Since when did ANY manufacturer do such a thing? What kind of world do you think this is? The reaction you indicate may just make HP decide next time to just put a 1k ram chip in...they may say, "Remember those people who were upset at the memory they said was hard to use? Well, let's don't bother this time".

I doubt >0.1% of any buyers would be disappointed. Let's face it, studies show an incredibly small number of buyers EVER program their machines.

I think a company would be nuts to say "We go 0 to 40kph quickly, but we really stink going around curves"

Might as well wait for pigs to fly.

Gene

Re: 33S memory issue

*Message #17 Posted by **Norris** on 10 June 2004, 7:14 p.m.,*
in response to message #16 by Gene

I'm afraid that you're wrong about the 0.1% disappointment factor, and here's why: an unusually high percentage of 33S buyers *do* want to program it (typically for exams where graphing calcs are banned, such as NCEES exams).

This is most obviously true for those who prefer algebraic calculators. Why on earth would an algebraic user pay $50-60 for a 33S, when equally capable scientific calcs are widely available from Casio, Sharp, TI, and even HP for a fraction of the price? (e.g., Casio FX-115MS, $14.99). The *only* reason to pay three or four times as much for a 33S is for its programming capability. The 33S offers nothing else to justify its super-premium price, relative to other algebraic scientifics.

Check the amazon.com customer reviews, the ppi2pass.com NCEES exam forums, and even here at hpmuseum.org. You will see repeated posts from dissatisfied 33S buyers who ran out of labels long before they ran out of memory. That's not what they expected when they purchased a 31KB machine.

If HP had advertised the 33S as a 4KB model, then slipped in a 32KB chip instead, nobody would have complained. The customers would have perceived the extra memory as a free bonus, and they would have been happy.

Instead, HP advertises the 33S as a 31KB model, without disclosing that most of the memory is difficult or impossible to use effectively. Many customers have perceived this as a ripoff, and it is hard to blame them.

Is it good marketing to annoy your customers by creating misleading expectations ? The 33S would have sold just as well if it was advertised as a 4KB model, and customers would have been happy, rather than angry, about the extra, hard-to-use 27KB.

Re: 33S memory issue

*Message #18 Posted by **Gene** on 11 June 2004, 12:41 a.m.,*
in response to message #17 by Norris

Read the amazon reviews - same stuff we've all talked about - decimal point, uneducated consumer who thought it would have an infinite floating stack, etc. AND quite a few people who really liked it.

If you read HP's advertising, they do not sell the 32K of ram as some sort of cure-all. The mention it - it does have 32K after all, and it IS possible to fill it up (try typing + a few thousand times).

Again, this is a 32SII replacement. plus algebraic plus 32K of ram.

If I were an HP business executive reading this forum with the way so many here are complaining about the extra ram, I wouldn't do it next time - I'd give you the small amount the HP32Sii had. It was NOT in the cards to get a machine with more labels. Period! So, do you want a couple of hundred bytes of ram or more than that?

Gene

P.S. I too agree with comments on the decimal point, key shape, etc.

Re: 33S memory issue

*Message #19 Posted by **Norris** on 11 June 2004, 4:14 p.m.,*
in response to message #18 by Gene

<< It was NOT in the cards to get a machine with more labels. Period! So, do you want a couple of hundred bytes of ram or more than that? >>

I want as much RAM as possible. But if there are any limitations that affect my use of that RAM -- and there clearly are on the 33S -- then I think that these limitations should be disclosed prior to purchase.

I'm genuinely surprised to find that this position is perceived as unreasonable. But I'll drop it; this has gone on long enough.

This is not really true. You can program the 33s exactly how you would the 32s. The only difference is that you don't have to worry about running out of memory.

Of course if you want to use all the memory, you will have to change the way you program. For me, I use my 33 exactly the way I would my 32 except that I am not so careful with it.

Arnaud

Re: 33S memory issue

*Message #23 Posted by **martin cohen** on 22 June 2004, 4:57 p.m.,*
in response to message #22 by Arnaud Amiel

I agree.

However, the essentially unlimited program space combined with the (imho) rediculously limited label and data space has led me to make these changes:

1) Use equations in programs.

2) More statements of the form "x=0? do-something".

3) Unfold loops.

4) Use the user-settable flags in code of type (2), above.

I have also found the new integer divide and remainder functions very useful in routines I wrote (and posted here) to do bit-fiddling (and, or, not, xor, ...).

Right now, my only real complaint about the 33s is the difficulty in distinguishing between the comma and decimal point. I sometimes have had to look quite carefully to see if an answer was, e.g., 4.096 or 4,096.

My wish list for 33sII (all, I believe, easily accomplished):

1) More labels and variables (allowing the prefixing of letters with a single digit would allow 11*26=286 (or more) labels and variables while preserving compatability with existing code).

2) Make the decimal point more visible.

3) Allow the comma to be turned off (this might make (2) unnecessary).

4) Allow a lot of the memory to be used for variables (along with (1), let i get big - a thousand or so).

(The following are optional, but would be useful)

5) Add bit-fiddling operations (and, or, not, ...).

6) Extend complex operations to 1/x, sqrt, x^2, STO, and RCL (complex sto A would be like sto A x<>y sto B x<>y; complex rcl A would be like rcl B rcl A).

"Way better": Are you sure, Norris ?

*Message #24 Posted by **Valentin Albillo** on 11 June 2004, 6:55 a.m.,*
in response to message #13 by Norris

Hi, Norris:

Norris posted:

"My opinion: Don't complain about the 33S memory. Even if the effective memory size is only 3-5KB, that's still way better than the 32SII, 15C, etc."

Way better ? Let's see. For the sake of argument, let's assume the 33S's "effective memory size" (by golly, what an euphemism !) is 5 Kb. Good.

Now, we also know that the HP-15C's "real memory size" for programs/data is only 448 bytes, aka 0.43 Kb. Fine.

Yet you *can* invert an 8x8 matrix in a 0.43 Kb HP-15C, but you *can't* in a 5 Kb 33S. Does that ring a bell ?

"Way better" !? Don't make me laugh.

Best regards from V.

Re: "Way better": Are you sure, Norris ?

*Message #25 Posted by **Norris** on 11 June 2004, 2:47 p.m.,*
in response to message #24 by Valentin Albillo

Your point is valid -- for people who want to invert 8 x 8 matrices. I will grant that the 15C is also better for handling complex numbers.

But for many other practical applications, the 33S is still the better choice, simply because it has more memory. For example, there is already a commercial package for surveying calculations on the 33S (Survey Stakeout 33S). It's 5KB in size. Obviously this could not be duplicated on the 15C, because the memory just isn't large enough.

For some people, including many civil engineeris and surveyors, greater memory is more valuable than matrices and complex math. For other people, such as electrical engineers, it may be the reverse.

In the US, one of the primary reasons that professionals buy an HP calculator is for use on state licensing exams. But civil engineers and surveyors are much more likely to take such exams than electrical engineers. In fact, civil engineers and surveyors probably take more licensing exams than all other branches of engineering combined. For such users, the 33S may well be a better choice than the 15C (although the 48G, which was tragically banned on the exams, remains the favorite)

Re: "Way better": Are you sure, Norris ?

*Message #26 Posted by **Valentin Albillo** on 14 June 2004, 5:52 a.m.,*
in response to message #25 by Norris

Hi, Norris:

I posted and you posted:

Me:*"Yet you can invert an 8x8 matrix in a 0.43 Kb HP-15C, but you can't in a 5 Kb 33S. Does that ring a bell ? "*

You:*"Your point is valid -- for people who want to invert 8 x 8 matrices [...] But for many other practical applications, the 33S is still the better choice, simply because it has more memory."*

I see that the bell *didn't* ring loud enough as you still don't seem to get the point at all. The 8x8 matrix inversion is but an *example*. The real issue has nothing to do with matrix inversion or complex numbers of whatsoever advanced functions in ROM but with the *RAM memory* needed to perform them.

To invert an 8x8 matrix requires 64 data storage registers (variables, memories, whatever). The 33S, which you point out it's the better choice *"simply because it has more memory"*, for all its whopping "32 Kb RAM" has *only* but 27 named data storage registers, plus a handful more for statistics. That is *half* as much as the HP-15C.

And as any surveyor will tell you, the more data points you can store and process, the better. There are surveying applications you could run on an HP-15C which you'd *never* be able to run on a 33S, with its meager A-Z plus "i" variables. That is, unless you resort to the tried-and-true, hi-tech method of writing some numbers down, then re-keying them in when needed. On an HP-15C you can program a 119-step routine, yet still have 50 registers available for the data.

And please, surveying is but an example, as matrix inversion was. The same applies to many other disciplines, because it's not about surveying or inverting matrices, but

pure and simply RAM usability. Having 32 Kb (or 120 Gb for that matter) will do you little good if you can't use them for such essential purposes as allocating 40 or 50 data storage variables.

Got the point now ?

Thanks for the interesting discussion and

Best regards from V.

Re: "Way better": Are you sure, Norris ?

*Message #27 Posted by **Norris** on 14 June 2004, 7:10 p.m.,*
in response to message #26 by Valentin Albillo

Yes, I get your point. To prove it, I will reiterate your point: the 15C has more data registers than the 33S. This is obviously valuable for applications that use many variables, such as (but not limited to) large matrices. For such purposes, the 15C is clearly superior. The 15C is also much more elegant, and is in nearly all respects a more impressive design.

Now I will reiterate my point: the 33S has much more memory available for relatively simple programs and equations. For most 21st Century calculator buyers, the ability of the 33S to store a large number of simple programs and equations is more valuable than the ability of the 15C to manipulate large numbers of variables.

Why? Because most people don't use calculators to manipulate large numbers of variables anymore -- they use computers for that. So what do they use calculators for? They use them on exams (college and professional) where computers aren't available.

Let's consider surveying again. For field surveying purposes, the 15C and 33S are both useless; neither model has enough storage registers and neither has any means of data output. However, the 33S is better for surveying exams (college, FLS, PLS), because it can store and solve far more of the many equations that surveyors need to use during such exams. For example, the commercial "Survey Stakeout" software for the 33S that I mentioned is intended for exam use.

Summary:

The 15C is an elegant, technically impressive calculator that can be used to manipulate large numbers of variables. Unfortunately, this ability is no longer valuable to most people, because they prefer to use computers for such work.

The 33S is an ugly, poorly designed calculator that can store large numbers of relatively simple equations and programs. This ability is of value to many people, because it is helpful in exam situations, where computers cannot compete.

So the 33S, while a generally less impressive design than the 15C, is the better calculator for the 21st Century market.

You sure, Gene ?

*Message #31 Posted by **Valentin Albillo** on 11 June 2004, 5:25 a.m.,*
in response to message #12 by Gene

Hi, Gene ! :-)

Gene, don't get angry with me ! An opinion is never "unfair", everyone of us has his/her own tastes ("horses for courses", as they say), and most specially if there are *plausible* reasons to substantiate it. Let's answer your points:

"The objective appears to have been, quite reasonably, IMO, to do so as easily/quickly as possible"

I can't speak for you, but I didn't buy HP calcs because they were produced by HP as "easily/quickly" as possible, but because they were produced at the highest possible quality. The "easily/quickly as possible" motto may be great for HP but their customers of old couldn't care less. That's an HP issue, not a customer issue. The mottos who made us all devoted HP fans were "the highest quality", "state-of-the-art", "cutting edge" and so on. Maybe some people will settle for "as easily/quickly as possible", and lower their expectations accordingly. Not me. I was drawn into HP for their "best quality in the whole world" and I'm too spoilt by now to settle for less. HP of old taught me to think so, and rightly so.

"Regarding the memory issue...HP could have put in a 4K or 8K chip, but since the 32K chip was probably only pennies MORE, they dropped it in...after all, who knows what those enterprising HP users might make of extra room."

You are experiencing a case of self-delusion if you really believe that thought crossed HP minds. There are only two reasons why HP decided to put in the 32 Kb chip. The first and foremost is because it's *cheaper* than 4K or 8K. Those are actually harder to get in quantity, because manfucturers find it easier to produce and sell the larger chip.

Just for instance, this same week my company needed to get hold of a number of 4.2 Gb hard disks to honor a maintenance contract. The disks must be that exact size because of an automated replication process. Guess what ? They are nearly impossible to get, everyone is offering 120 Gb HD and the like. And the very few we found were *more expensive* than brand-new 120 Gb HD !!?!

So don't indulge in HP kindly fitting the 32 Kb chip because "who knows what those enterprising HP users might make of extra room". C'mon ! You're an adult ! Current HP doesn't entertain those blissful thoughts for a moment !!

As for the second reason, plain and simple: marketing. "Let's fool our customers into thinking they're getting 32 Kb for their money. They can't sue us because indeed the machine does have 32 Kb RAM. And nowhere did we put in writing that they would be able to actually use it as they rightly expected to."

"Say this a few dozen times over and over... "This is a 32SII clone""

Aw ! So you think that repeating something a large number of times, mantra-like, makes it truer ?? Fascinating ! ...

"I do agree it is DIFFICULT to use the 32K of ram, but that doesn't mean you can't do it...you just have to learn a new way to program."

Fascinating again ! HP will really make a bunch of followers this time. A new way to program, RPL wasn't good enough after all. They've improved on it. Let's see this superb, amazing paradigm of structured programming:

"Everything you thought you knew about writing programs before the 33S must be relearned."

Good. After spaghetti BASIC programming we had to learn structured, GOTO-less programming, which was better, then object-oriented programming, which also was an improvement. Re-learning is good, it will shape our programming minds for the better. Let's see:

"1) GOTO branching? Nope. Set a flag and continually test the status of the flag in a long string of steps to take."

Uh ?!

"2) Efficiency? Why do that? Just repeat code segments - never do subroutines."

Double-Uh ??!!

And you want me to take this seriously ? Not only do I get a freakish, grotesque, misshapen, garish-colored calculator whose keyboard will do nothing for my fingers, whose size will do nothing for my pocket, whose display will do nothing for my eyes, whose very style will do

nothing (good) for my reputation, but it will also *_completely ruin_* my hard-earned good-programming habits ??!?!?!

That's what HP is promoting now ? The *worst* programming style possible ? That's what you want your children to *learn* ??

Come to think of it, it should be *forbidden*. Maybe someone can sue HP for *ruining* their children's programming education and make a little fortune. It's a dead ringer, you'll make millions !! :-)

Best regards from V.

Well, HP would have just bought the larger chip and kept the firmware the same if price was of the essence. They changed it so you can use 32kb, just not very easily with programs.

How much would a 15c cost in todays dollars when it was new?

Re: You sure, Gene ?

Message #33 Posted by ***Richard Garner*** *on 11 June 2004, 10:42 a.m.,*
in response to message #31 by Valentin Albillo

The problem with programming goes back further than what HP is doing now. It goes back to Mr. Bill and the Kingdom of Gates. If Microsoft had adhered to the the programmers code to keep the program code clean and compacted, Windows would only be about a third for its current size, run 10 times faster and have few if any security problems. The marketing mentality of, we must have a new product on the shelf every 12 months or less overshadows the keep it clean and compact concept. It has become a copy and past world when it comes to programming. New programmers would rather copy a section of code two dozen times than set up a subroutine to go to each time they need it. RAM is cheep, hard drives are large & cheep, and processors are fast, so why bother. Programs I have created start out with a lot of spaghetti code, but when the program is running like I want it, I go back and clean up the code.

*Message #34 Posted by **martin cohen** on 14 June 2004, 12:27 a.m.,*
in response to message #11 by Valentin Albillo

How did you solve (or even enter) a 7x7 system of equations?

The only way I can thonk of doing this is to have the values in program code, not data memory. You might have a subroutine that is passed the indices and returns the values. This would be quite slow, though.

Re: HP 33s - Dead or Alive?

*Message #35 Posted by **Valentin Albillo** on 14 June 2004, 9:52 a.m.,*

```
"There are more things in heaven and earth, Horatio,Than
are dreamt of in your philosophy" [from Hamlet (I, v, 166-167)]   :-)
```

Now, seriously, there's no problem at all, nor any need to resort to such cumbersome methods. The program is straightforward, it wouldn't run on the HP32S/32SII just because after entering the program no memory whatsoever was left for data, at all. The program itself took most of the 384 bytes available.

No such problem in the case of the 33S, after keying in the program you're still left with enough RAM for all 27 variables plus statistics.

Best regards from V.

in response to message #38 by martin cohen

There's no mystery in this, Martin, just plain performing the usual diagonalization and back substitution algorithm (Gauss), that's all. I can't see why you consider it so interesting, unless you don't know a thing about that ultra-well known algorithm and think that some kind of fancy matrix inversion or solution by determinants or the like are needed. Please consult any primer book on numerical methods.

I have no HP33S right now (nor will I ever buy that crap, rest assured) but if (and when) I can borrow one, I'll re-translate the program for it on the fly (as I did last time, when testing the machine), record the exact program steps in 33S notation, with checksums and lengths and all, and post the resulting program here, with some examples. Right now I do not have the machine to do this and frankly, not much interest either.

Best regards from V.

Re: 7x7 system on the 33s

This is getting tiresome. You avoid answering my questions.

Please answer just this one:

How do you store the coefficients of a 7x7 linear system of equations on the 33s?

Re: 7x7 system on the 33s

*Message #41 Posted by **bill platt** on 21 June 2004, 5:16 p.m.,*
in response to message #39 by Valentin Albillo

Hi Valentin,

I am *really* rusty (and wasn't highly proficient to begin with) with matrices.

And I am interested in how you carried out this business.

I might mention that your quizzes and postings, often involving matrices, have, though puzzling, tended to provide impetus for me to fianlly master them. (I have in fact started to look over some of my books---but there is only so muich time....).

The problem is that when I do (and this is fairly often) find myself with a simultaneous system of equations, I just go after it by hand (usually just 2 variables). I do remember very much enjoying, and being good at, "synthetic substitution" back in 9th grade [over 20 years ago!]...and I saw in one of my books that the matrix approach to linear systems is in fact not far removed from that approach. So I know there is hope yet...and I know that it would help immensely for making progress towards transition to using Finite Element Methods (I daresay matrix algebra becomes essential then)....

The interesting thing is that when I was in college, matrix algebra was not in the early courses for some reason. And I never took it later on. As I progressed in my field to becoming an engineer, I never felt any need to know matrix math---everything I do is possible without matrices--and my field is so large and wide ranging that there is no possible way to know everything--you give up something when you take something else.....it seems like one of those tools which is only essential once you know it (except of course fEM which is a subspecialty anyway).

At any rate, please take no offense--if you have the time, I would be very grateful for the answer. But I understand if you do not answer---as you are bound to be working on something else of even greater merit for all of us.

Best regards,

Bill

Re: 7x7 system on the 33s

*Message #42 Posted by **Valentin Albillo** on 22 June 2004, 5:28 a.m.,*
in response to message #41 by bill platt

Hi, Bill:

Bill posted:

"I might mention that your quizzes and postings, often involving matrices, have, though puzzling, tended to provide impetus for me to fianlly master them. (I have in fact started to look over some of my books---but there is only so muich time....)."

You tell me ! :-) My Number One problem is time. Even sleeping just 4 hours or less a day, I still don't get even 10% of the time I need to do the things I want to do. So priorities must be stablished, regrettably. Anyway, I'm truly glad if my postings are useful for other like-minded people like you to get interested in such enjoyable (and useful!) matters.

"As I progressed in my field to becoming an engineer, I never felt any need to know matrix math---everything I do is possible without matrices---"

I, on the other hand, have used them extensively in a number of engineering and architectural tasks, where they were mandatory for exact mathematical solutions (instead of 19th-century 'approximations', intended for manual computation).

"At any rate, please take no offense"

For what !? None taken, certainly. Perhaps this is a 'challenge' you're issuing on me, to try and find out what's the offending paragraph in your posting ... :-|

"--if you have the time, I would be very grateful for the answer."

As stated, time is always a problem, but in this particular case the real problem is I do not have an HP33S at hand, don't own one and don't intend to [really, can you imagine me, a man who has seen with his very eyes an HP-25, HP-67, HP-41 and HP-15C brand-new at the store, the very day they were released, that has had them in his hands, that was enthralled by their absolutely-new-top-quality *smell*, buying and owning that ungodly KinHPo crap !? Please ... :-)].

That being so, it can take a while till I finally get one to enter, double-check and record the actual program steps, but as soon as I am able and get the time, you'll see the listing posted here, with a couple examples for good.

Of course, if you're in such a hurry to see the program, just send me an HP33S free of charge and you'll have the listing within two days. After that, I'll get rid of the monstrosity as fast as I can, rest assured. I don't want it to contaminate my valuable HP & SHARP collection. :-)

Best regards from V.

Message #43 Posted by ***martin cohen*** *on 22 June 2004, 1:07 p.m.,*
in response to message #42 by Valentin Albillo

Oh come on - I think you are trolling.

Just tell us approximately how you would store the coefficients of a 7x7 linear system of equations on the HP-33s. The code does not have to be perfect - a rough idea would be fine.

You do not need a 33s to do this.

HP33S 7x7 systems: I've had enough

*Message #44 Posted by **Valentin Albillo** on 22 June 2004, 1:22 p.m.,*
in response to message #43 by martin cohen

Martin posted:

"This is getting tiresome. You avoid answering my questions."

and further

"Oh come on - I think you are trolling."

This is getting tiresome, indeed. And further, I don't like your attitude, at all. Your wording seems to imply a deliberate attempt on my part to avoid giving you some answers or even that I am pretending to have achieved something I actually haven't. Enough.

First of all, I'm under *no obligation whatsoever* to answer your questions or anyone else's for that matter, so a little *netiquette* on your part would be most appropriate. As for answering your questions, I've done that a number of times, and you don't see to understand my answers (see your "27" question earlier in this thread).

Second, if I say I've done something, I've done it. Period. I don't need to prove my skills great or small to you or to anybody else. If you think I'm "trolling" that's your problem, I have nothing to prove, least of all to you.

Also, I didn't start this thread, nor was I interested in discussing 7x7 systems on the 33S or any other calc for that matter. I just posted a reply re the 33S's quality (or lack thereof), in which I mentioned a simple, system-solving test I ran on it, out of curiosity. You then got completely out of the original thread's topic and began asking question after question about that particular test, oblivious to the fact that I've clearly stated that I do *not* own this machine and thus I *can't* write down that program right now, even if I wanted.

I've offered to do it so in a near future, mainly because of your insistence, though I'm not interested at all in 33S programming. Yet you still insist with question after question, as if it were my duty and obligation to satisfy your requests, completely disregarding my statements of not being able to, right now, or if I actually have the time or want to.

How do I store the coefficients of a 7x7 linear system of equations

on the 33s ? Using the "i" register for indirect addressing (STO+ "i", RCL- "i"), row after row, beginning with the first equation, in a simple loop, that's how ! What could be easier ?? Is there any other way of doing it, bar using non-indirect register addressing (STO+ A, RCL- J), unless resorting to your "data-as-program-steps" technique !?

Anyway, if you still can't figure out how to do it and want the *exact* program I used, you'll have to wait till I get a 33S and find the time and the mood to enter and write it down. In the meantime, there surely must be a lot of people in this forum that will obligue and provide you with any necessary details. I'm just about tired of this sub-thread I was dragged into, and here it ends for me.

Best regards from V.

HP33S 7x7 systems: I've had enough

*Message #45 Posted by **Veli-Pekka Nousiainen** on 22 June 2004, 3:04 p.m.,*
in response to message #44 by Valentin Albillo

```
since a 7*7 system needs 49 register plus a
possible index
this is simply not possible with the absolutely
maximum 27 registers (A..Z + i) of the hp 33s
calculator.
(VPN)
```

Re: HP33S 7x7 systems: I've had enough

*Message #46 Posted by **martin cohen** on 22 June 2004, 4:37 p.m.,*
in response to message #45 by Veli-Pekka Nousiainen

Exactly my thought!

Beside, the i register would get stepped on when (i) is 27 (see page 13-21 of the 33s manual).

He may have been misled by the fact that indices (in i) can be from -33 to 33 (excluding 0). However, the sign is ignored, so that +10 and -10 in i both make (i) refer to J.

A way of storing a read-only array would be to have code such as this:

You pass the desired index in the x reg, do XEQ A. If x/=0 upon return, the index was not found. If x=0, then do Rv (rotate down) to get the value.

LBL A

value1 x<>y 1 - x=0? rtn

value2 x<>y 1 - x=0? rtn

...

valuen x<>y 1 - x=0? rtn

rtn

A little more work (left as an exercise) would have to be done if the index could be any value (essentially implementing a MAP function).

Re: 7x7 systems and non-verified assumptions

*Message #47 Posted by **Andrés C. Rodríguez (Argentina)** on 22 June 2004, 5:52 p.m.,*
in response to message #46 by martin cohen

First of all: While I learned matrix algebra and operations as part of my EE curriculum (that was about 25 years ago), it would be a big mistake to consider myself a current expert on the subject. My apologies.

Valentín showed many times his impressive command in mathematics and calculator programming; so I would not doubt he is able to do what he says. Of course, as a 7 x 7 matrix has 7^2=49 elements, it is fairly obvious that a calculator with less than 49 registers cannot handle all the elements of any (....Who said ANY?) 7 x 7 Real (in the mathematical sense) matrix ... AT THE SAME TIME.

1) If the coefficients can be converted to integers in the range [-49999, +49999], a simple technique can be used to store two values in a single register, with a packing/unpacking routine using the integer and fractional parts as independent values, and an offset routine to care for negative values.

2) If the matrix can be diagonalized (a task I´m not prepared to teach, for sure!), it would have only 28 non-zero elements, a number not impossible to handle on a 33S. The program may be cumbersome, but there will be plenty of RAM for the many unelegant steps needed to move contents here and there, and to skip the non-regularities of indirect adressing.

3) I vaguely remember a program I developed for my HP41 in 1980, to solve linear equations for the Simplex optimization method. While I cannot give any details, I think I used a pivoting technique to work with a part of the matrix at a time, and later with other columns and rows; so not all the values were in memory all the time.

A weak conclussion:

```
IF the matrix has integer coefficients in a
[-49999, +49999] range (it may be enough if
its coefficients could
be mapped in such range by means of linear
transformations),

OR, IF the matrix can be diagonalized
(perhaps as part of a preprocessing routine
at data entry time),

OR, IF data is to be entered not just at
program start, but in certain pauses during
program execution,

THEN it MAY be possible to invert such matrix
on a 33S
```

While I cannot offer any details on how to do it; I would like just to suggest that it may be not as impossible as it seems at first sight.

In Stock at HP SMB (was: HP 33s - Dead or Alive?)

*Message #48 Posted by **Jeff** on 10 June 2004, 12:26 p.m.,*
in response to message #1 by Philbert

A so-called English/Canadian/French version, which apparently includes English and French Canadian operators' manual seems to be in stock and available from HP SMB. Click on "Shop for calculators at HP's SMB Store", then scroll down to the "HP 33s scientific calculator (Eng/Can/French)" item. (I tried to link directly to the product, but the link did not seem to want to work.)

*Message #49 Posted by **Eddie Shore** on 10 June 2004, 1:00 p.m.,*
in response to message #1 by Philbert

Try Fry's Electronics. Fry's carries all of the current HP calcualtors. If not, maybe your university (either your alma mater or a school you cheer for) will have some in stock.

Re: HP 33s - Dead or Alive? (why i bought/don't like...)

*Message #50 Posted by **Bill Wiese** on 10 June 2004, 1:39 p.m.,*
in response to message #49 by Eddie Shore

I got mine at Fry's in Sunnyvale, CA for $49, IIRC. At that price I bought it as a lark, had no real reason to do so - but it came out of my 'toy' budget (guns, gadgets, electronics...) so there's no real harm done.

It'd be quite attractive at first blush without the chevron keyboard layout. I don't care for the chevron layout but it doesn't affect use that much. But for me usage without a large ENTER key above the numeric area is a real weakness; all RPN calcs should have ENTER, CHS, EEX, <-/CLx keys above the numeric area, and Rdn should be nearby too.

Only later did I note I had to hunt for the small decimal point. The LCD could use some more contrast too...

I have not (nor would I ever) use the algebraic mode. And I don't do programming on 32S... 41C/42S if I need to whip up some specialty calculations...

*Message #53 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2004, 1:40 a.m.,*
in response to message #1 by Philbert

Hi, all;

I see that most guys, many good friends here are upset with the HP33S.

I remember that since I got the chance to put my hands on my first HP calculators (I was lucky having an HP41C) I thought that having the "top" ones was always the best choice. At that time I was not able to go for financial calculators at the same time I was going for scientific ones.

After some time (about four to five years) I had an HP15C, an HP16C, an HP41CX, an HP41CV, an HP28S, an HP48SX and an HP42S. I remember I used to develop programs for the HP11C, the HP41C/CV and the HP42S. Once I was asked to write programs for the HP28S and two times for the HP48. And I remember seeing some guys using the HP20S, the HP32S, the HP27S and other financial ones, mostly the HP12C, the HP18C (I saw one) and a few others. I remember feeling curious about the HP32S at the time it was introduced, along with the HP22S, but I was so interested on having an HP42S that I did not actualy pay enough attention to them. I see now that they have their merit.

Some weeks ago (present days) I had the chance to put my hands in my HP33S. I use HP calculators since 1982, and I know others in here are in contact with them since longer than that, so I am no specific "expert". I saw some deficiencies, most if not all of them already mentioned here, but I also saw these characteristics:

-> controllable operation over fractions in a way I was not aware of; the HP48S/G allow us to control the fraction based on rounding operations, but the HP33S seems to be better. If you deal with inches, it's a must;
-> a "constants library" that allows the use of the constant reference (name, characters) in programs and in equations/functions; I see this as an extension of the use of PI, although PI is dimensionless and almost all others refer to some sot of unit (Yes, Neper's constant "e" is obtained with the sequence 1 [e^x], but there is no specific key that returns its value directly without changing an existing value);
-> and I guess many of you will not agree with me, but I feel confused about one thing: if a calculator accepts equations and functions as input data, why not adding algebraic notation as one of its operating modes? And the HP33S actually does: Algebraic mode and function/equation input.

I'm completely fond to RPN, but I always try to understand Algebraic operation in any calculator I have that offers it. The first algebraic-only HP calculator I bought (and I guess the only one I have so far) was the

HP14B. I remember reading the manual from the first to the last page, trying all examples and mostly trying hard to understand how does LAST work in algebraic models. Now all of the calculators I recently acquired are "hybrid", i.e., Algebraic/RPN selectable. And I want to understand how and use them in both Algebraic and RPN modes. I remember that I wrote programs for the HP48 that had extensive use of expressions. The first version was RPN only, and it took me a while to find the last cause of a final computing error. So I decided to write it differently: I used the expressions as they were, so all stack manipulations for loops and input/output data were kept. It ran without errors in the first attempt. And if it had problems, I guess it would be easier to find them because I'd not need to follow each step and rebuild the expressions in order to find the errors.

Back to the HP33S: it's not an HP-like calculator (related to the old timers), it has not the key-feeling, I'd particularly choose a different layout, I'm not confident with the key labeling (every time I pull it out or push it in the protective case, I force the case sides a bit so the front face slightly "bends out" and the keys to not rub it) but I do not regret buying it. And I hope it lasts long enough I can give it my daughter or to my grandchildren so they can collect it as an item.

Sorry writing too much.

Cheers.

Luiz (Brazil)

Re: HP 33s - Dead or Alive?

*Message #54 Posted by **Ed Look** on 12 June 2004, 1:00 a.m.,*
in response to message #53 by Vieira, Luiz C. (Brazil)

Luiz, that was a very balanced view.

In fact, I have ordered a 33S myself, with the view to using it as a calculator that I can toss in my briefcase, yet having that delightful power and relative ease of use of a 32SII, which I will not let leave my house.

I have tried to use my 48G as a "programmable 4-banger" that I can throw in my briefcase, and found that for some things, all that extra jazz like a constants library, open ended stack, powerful programmability, multiline display, and even the much-maligned "only" 32K RAM was quite handy.

But other times, it was too clumsy to use, owing to its relatively large form factor and relatedly expansive keyboard, for some quick calculations or very simple programming or in some places where a large calculator is inconvenient. But I'll never bring my 32SII in to work! And I so use the 48G only because I got through Randy Sloyer (fixthatcalc.com) a 48G+ that I can use and won't let leave my house. (I'm still figuring out how to effectively use the attractively mysterious but oh-so-powerful 49G+.)

So, I am hoping the 33S can complement the 48G for me at work. It is good to hear from you that you did not regret buying the 33S. I hope likewise for me; if so, I will carry both the 48G and 33S. Calculators of each of these types have their place and use.

And to be totally honest, I think from what I've read (or especially because of it) the 33S is a worthy piece for collection!

HP48GII

*Message #1 Posted by **Naim** on 9 June 2004, 5:18 p.m.*

Just got my hands on a HP48GII. The buttons are beautiful. I spent more for a 49G+ and the buttons are trash. Anyone else has a 48GII?

Re: HP48GII

*Message #2 Posted by **bill platt** on 9 June 2004, 5:36 p.m.,*
in response to message #1 by Naim

Hi Naim,

So, can you describe the difference between the 48GII and the 49G+ buttons in more detail? The machines look identical except for color--I wonder what they did differently?

What is the serial number on your 49G+? on your 48GII?

Do you have a 33s? If so, can you describe the difference between the 48GII and the 33s?

How do you like the 33s and hte 48GII against earlier models? For instance, the 48GX? or against the pioneers? etc etc.

Best regards,

Bill

Re: HP48GII

*Message #3 Posted by **Naim** on 9 June 2004, 8:56 p.m.,*
in response to message #2 by bill platt

Bill, My 49G+'s serial number is CN33305934. The 48GII isn't mine but the serial number is CN40505929. The best keyboard I used is probably my new in box HP41CX. The pioneers and GX are great. But although the GII's key were not as good as these mentioned, it's really an improvement on my G+. I mean it's fast, pretty and the buttons are quiet [a real conversation starter]. Honestly if my 49G+ had buttons as good as these, I won't complain. I'd drop my GX in a second. I think [maybe it's my imagination] that the 48GII runs a bit faster than the 49G+. Anyway, I should have my 33S by Monday next week, so then I'll judge it's keyboard. Other than that, if someone could confirm that the 48GII's keyboard better than the 49G+ that would be great.

Programming a Matrix(hp49G+) ?

*Message #1 Posted by **Barry** on 9 June 2004, 9:18 a.m.*

Hi

I would like to take a value from the stack place it into a matrix, and get an ouput value.

I have tried << -> x '[[cos(x),sin(x)][sin(x),cos(x)]]'>> I get a "bad argument error' Normal equation work.

Does anyone know how to do this?

Thanks

Barry

Re: Programming a Matrix(hp49G+) ?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2004, 9:55 a.m.,*
in response to message #1 by Barry

Hi, Barry;

I remember that till the HP48, all arguments possible in an array are numbers, even complex (not sure if bunaries are allowed as well... I think not). I don't recall having algebraics as array "arguments".

anyway, you can arrange your expressions in lists and disassemble/reassemble: turn lists into arrays. If I am not wrogn, the HP49G+ has some new features for this.

Also, having the expressions organized in lists, like

```
{{cos(x) sin(x)}{sin(x) cos(x)}}
```

allows you to use a handy command: DOLISTS (also DOSUBS may help, depending on what you want).

I guess SYS RPL guys may have other possibilities. I'm starting to read about SYS RPL, and there are many interesting things there... It's a new world.

Hope you succeed. If not, post again.

Cheers.

Luiz (Brazil)

Re: Programming a Matrix(hp49G+) ?

*Message #3 Posted by **Vepa** on 9 June 2004, 9:56 a.m.,*
in response to message #1 by Barry

```
<< -> x '[[cos(x),sin(x)][sin(x),cos(x)]]'>>
 I get a "bad argument error' Normal equation work.

You need an ALGebraic side trick:
<< -> x << `[[COS(x),SIN(x)]
            [SIN(x),COS(x)]]` >> >>
BYTES # 917Bh  92.5
`[V,P,N]`
```

Re: Programming a Matrix(hp49G+) ?

*Message #4 Posted by **Veli-Pekka Nousiainen** on 9 June 2004, 10:03 a.m.,*
in response to message #3 by Vepa

```
You could also use a pure RPN program:
<< -> x <<
[[ 'COS(X)' 'SIN(X)' ]
 [ 'SIN(X)' 'COS(X)' ]] 'X' x
= SUBST ->NUM >> >>
BYTES # D351h  109.5

You may leave the ->NUM away if you want to do it manually.
[V P N]
```

Survey & Announcment: Which CCD module fcns are most wanted

*Message #1 Posted by **Raymond Del Tondo** on 9 June 2004, 4:19 a.m.*

Hi all,

my long-time project has reached a new stage. I made a 4K (single page) version of the CCD module, which mainly consists of the operating systems extensions, like extended CAT, XEQ, ASN, LC ALPHA, direct complete register access (e.g. RCL M), and some utilities, like CON(trast for halfnut). Matrix stuff has been abandonned, so far included are the following CCD module fcns:

CAS & SAS ABSP ARCLI CLA- CODE & DCD F/E PMTA PMTK

and some others from other people: B>BCD, BCD>B, CFX, CVIEW, HEXKB, HEXKN, MSGE, PTC, PTS, REVX?, ROM>X, SFX, X>$, XQ>GO

There are still about 250 bytes left for more functions.

So here's the question: Which functions of the original CCD module would you want to have included, or in other words, which are the user's favourite fcns of the CCD module (except matrix stuff, of course;-)

Regards,

Raymond

Re: Survey & Announcment: Which CCD module fcns are most wanted

*Message #2 Posted by **Ángel Martin** on 9 June 2004, 10:05 a.m.,*
in response to message #1 by Raymond Del Tondo

Raymond, good to hear from you on this great subject ;-?

If you ask me, I'd approach it as a purely OS enhancements project. If you think about it, it's always possible to taylor a set of MCODE functions into a custom ROM, however it isn't trivial at all to write OS extensions like those on the CCD.

So my *ideal* scenario would be: forget about any standard function, and leave the page as a "silent" one; and to put the icing on the cake, place it on address #4h - so it doesn't take up any space on the address bus.

This would be akin to the FORTH ROM, which does the same (although it messes up by using address #5h as well, something yours won't have to).

My next-to-ideal scenario would be also from the system extension perspective: if you must include standard functions, make them so that they are "natural" extensions to mainframe functions. Some examples that come to mind are: FC?S, FS?S, CFX, SFX (all 55 flags), CNT, CNT? (contrast stuff), etc.

I wouldn't put the strength on MCODE-related functions (like B>BCD and BCD>B in particular), nor would I worry about yet another set of CODE and DECODE (let me count the ways these two show up in the

libraries...).

And finally, my two favorite functions from the CCD, which I also consider in the "natural extensions" category, are: PMTA and PMTK. These two would have to make it!!

One last thought: whatever set of functions (if any) you decide to include will be fine, and is entirely up to you. Just make it soon so we can enjoy your work!!

Best, Ángel

Re: Survey & Announcment: Which CCD module fcns are most wanted

*Message #3 Posted by **DavidMY** on 9 June 2004, 1:21 p.m.,*
in response to message #2 by Ángel Martin

I think your choices are the best. The only one I would add is "PMTH". I find it and the other PMT functions very useful.

Generally, I'd agree with Angel and say focus in on those functions truly unique to the CCD.

Just out of curiousity: Why 4K? And, have you considered using paging to add another 4K of code space without taking up module/slot space? Using the second page is relatively easy (pgs. 3&4 aren't) and while it dosen't help the 64 function limit it does alow for almost 4k of code.

Re: Survey & Announcment: Which CCD module fcns are most wanted

*Message #4 Posted by **Angel Martin** on 9 June 2004, 2:50 p.m.,*
in response to message #3 by DavidMY

Yes, PMTH is great as well, but it has the dependency on WSIZE, and its corresponding buffer in memory; thus IMHO better stay away from it.

As per the 4k, I think it's much better like this, because a small foorprint makes it really more convenient and flexible: you can allocate it on any page (hopefully #4h) and doesn't require other supportive page.

In fact, striping the ARRAY functions off the CCD module is doable (I know it for a fact), but condensing its OS extensions on a single page is a real feat, not for the faint of heart - I cannot do it.

Bank switching would definitely be a great accomplishment, but I'm afraid would take quite some effort even for Raymond's prowess!

Best, AM.

Update: 4K CCD OS/X

*Message #5 Posted by **Raymond Del Tondo** on 10 June 2004, 5:31 p.m.,*
in response to message #1 by Raymond Del Tondo

Hi,

and thanks for your responses.

The idea putting the OS/X on page 4 isn't bad, but unfortunately it won't work w/o a helper page in the range 5-F. This is because page 4 is flat, w/o the normal ROM structure, interrupt services are only available from page 5 on (see =ROMCHK).

The functions I mentioned in my initial posting are already included. CODE/DCD are in because HEXKB/HEXKN need it. HEXKB is similar to PMTH, but was more suitable for my purposes back then. More to follow;-)

Raymond

ZENROM anyone?

*Message #1 Posted by **Meindert Kuipers** on 9 June 2004, 4:07 a.m.*

I am looking for the (scanned) manual of the HP41 ZENROM, or maybe a description of the operation of the basic functionality. As far I as know it is not available on the net or on any of the CD's.

Thanks,

Meindert

Re: ZENROM anyone?

*Message #2 Posted by **Christoph Klug** on 9 June 2004, 5:02 a.m.,*
in response to message #1 by Meindert Kuipers

Dear Meindert,

I can make available a paper copy of the Zenrom manual :-)

Regards - Christoph Klug

Three new TTF files (HP33S LCD characters included...)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2004, 2:05 a.m.*

Hi, all;

(not) for the fainted heart users, here goes:

New True-Type Fonts®

The zipped file includes:

-two pdf explaining some features of the new fonts
-one TTF with the HP33S LCD characters I found (if there is anything missing, please let me know)
-one TTf with the complete set of characters of the small standard font (mini font) of the HP48/49
-one TTF with the menu characters for the HP48/49 (now it is complete; replaces the pre-evaluation file)

The included pdf files also contain the map of all characters available with the 33S TTF and the menu mini font. The regular minifont has no specific pdf file.

I hope you enjoy using these fonts. It took me some time to manage the small characters because reading them all the time tires the eyes somehow. As I am working with a new software to manage the TTF files, some features must also be mastered first. And I lost a few TTF sets trying to "understand" the bolts and nuts...

Cheers.

Luiz (Brazil)

Edited: 9 June 2004, 6:07 a.m. after one or more responses were posted

Updated file: please read (if you have already downloaded...)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 June 2004, 2:47 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, all;

sorry for the inconvenience.

After uploading the zipped file, I observed that the HP33S PDF file firstly available did not have the character map. At aprox. 02:35 AM (June 9th) the new zipped file (~135K)was uploaded, replacing the previous one (~94K). The new file has the same name of the earlier one, so the link in the starting post is also valid for the new file. If you downloaded the first zipped file, please update it with the new one.

Thank you and forgive me.

Cheers.

Luiz (Brazil)

Edited: 9 June 2004, 2:49 a.m.

HP33S TTF needed adjustments

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2004, 12:07 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi all;

sorry for the "news", but it was not hard to find that the character spacing used in the HP33S CharSet ttf was not good. Characters were too close to each other. I had a look at the calculator's LCD and I found that they were not so close. So I stretched the space between them about 1 dot column and it seems to me they look better now.

I'd like to know what do you think about this: should I keep dots and commas like the original LCD? I'm not sure if I made the right decision as for that changing places.

Let me know what you think.

New HP33S Character Set TTF

Cheers.

Luiz (Brazil)

Re: HP33S TTF needed adjustments

*Message #6 Posted by **Gordon Dyer** on 11 June 2004, 4:08 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Thanks for the update.
I don't have a 33S but I am surprised by some of the characters.
The lower case i, q, u and w are strange, why are they dropped and not small upper case?

Re: HP33S TTF needed adjustments

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2004, 8:19 p.m.,*
in response to message #6 by Gordon Dyer

Hello, Gordon; thanks for your comments.

About these characters: the HP33S has only the standart upper-case set. All others were taken from the constants names and "menus". As you can see, 'j', 'q', 'u' and 'w' were used for holding other existing charaters (one of the most "dramatic" choices of mine was placing the index 'i' for 'j', because there is no 'J' in menus). Many of the "strange" characters are used in the HP33S Constants "catalog". And I guess this is a very good feature.

I decided to do so in order to avoid unused spaces in the font "pack", as you can see when using any font viewer, like MSWindows® Character Map: the complete character sequence has only two gaps, if I am not wrong. It's easier to use when you are picking characters with "Insert Symbol" (MSWord®).

What gave me more trouble was defining dots and commas. Gee! The rest was "piece of cake".

Thank you, Gordon; as aways, your words are very welcome.

And please, guys, feel free suggesting any change. Let's try a new arrangement, if so. As I mentioned before, these TTF files are ours, I'm drawing them for all of you.

Cheers.

Hp 15c keyboard

*Message #1 Posted by **j.serra** on 8 June 2004, 5:09 p.m.*

Hi all,

I've found recendly a 15c. It's in a very good condition but some of its keys have an excesive movement, I mean, if you shake the calc it sounds like a maraca.

Is there any solution for that ?

Thanks

Re: Hp 15c keyboard

*Message #2 Posted by **Raymond Del Tondo** on 8 June 2004, 5:29 p.m.,*
in response to message #1 by j.serra

Hi,

as long as they have the tactile feedback, I wouldn't care about the rattle. Do the keys all have the same straight travel way, and same angle when depressed?

Raymond

Re: Hp 15c keyboard

*Message #3 Posted by **JDH** on 8 June 2004, 7:58 p.m.,*
in response to message #2 by Raymond Del Tondo

Sounds like the calculator has been opened up in the past and not put together again properly. If your game you could open up the back of the calculator to confirm it.

Re: Hp 15c keyboard

*Message #4 Posted by **Trent Moseley** on 8 June 2004, 9:22 p.m.,*
in response to message #3 by JDH

If it works don't fool with it!

Re: Hp 15c keyboard

*Message #5 Posted by **Randy** on 8 June 2004, 10:39 p.m.,*
in response to message #1 by j.serra

If you open it, you may find some of the heat stake mushroom heads have sheared off. The result is a loose circuit board, which makes keys in those areas loose and feel soft when pressed. Once they start to fail, it is like a zipper or a crack in plastics. The forces get transferred to the next rivet in line and then it fails, so on and

so on. This is common on Voyagers that have been pounded heavily.

The best solution is to glue the loose areas with a drop of rubber toughened cyanoacrylate on each post that is missing the mushroom. Loctite 410 is good choice if you can get it. ** BE CAREFUL ** Too much and you'll glue a key in the up position!

Re: Hp 15c keyboard

*Message #6 Posted by **Karl Schneider** on 8 June 2004, 11:14 p.m.,*
in response to message #1 by j.serra

J.S. --

It's difficult to tell if the movement is truly "excessive" from the description. Is it that the keys rattle a bit when the calc is shaken, or that some keys travel excessively when pressed?

I have three Voyagers -- a 15C from 1983, a 16C from 1985, and a 12C from 1993. On the 15C and the 12C, the keys have a bit of freeplay in their "slots"; they rattle when shaken.

On the 16C, the keys stay firmly in place until pressed -- no rattling.

None of these show any sign of having been pounded, and they all work perfectly.

Re: Hp 15c keyboard

*Message #7 Posted by **j.serra** on 10 June 2004, 6:57 a.m.,*
in response to message #6 by Karl Schneider

First of all thanks for your answers.

The question is that nearly all the keys have some freeplay in their slots, but in the case of the ENTER is specialy high, is not a problem for to play with, the only thing that bother me is the long term durability.

I've opened the machine and the plastic welding are perfect so I assume that nobody has opened it before.

What about FixthatCalc, could be a solution?

Re: Hp 15c keyboard

*Message #8 Posted by **Karl Schneider** on 10 June 2004, 11:32 p.m.,*
in response to message #7 by j.serra

J.S. --

Just to clarify: When I mentioned "free play", I referred mainly to side-to-side movement, not up-and-down movement, of the keys.

FixThatCalc.com (Randy Sloyer) does excellent work; I have used his services once and plan to do so again.

HP9815 paper??

*Message #1 Posted by **marais** on 8 June 2004, 2:00 p.m.*

At the risk of sounding stupid: Does anybody out there know what kind of paper the 9815 needs? Any chance to buy a suitable replacement, or to cut one from a still available paper? Any hint highly appreciated!

Andreas

Re: HP9815 paper??

*Message #2 Posted by **Katie** on 8 June 2004, 8:51 p.m.,*
in response to message #1 by marais

NCR makes this. It's 165' x 2.25" thermal paper and you can get it at most of the on-line office supply places. Staples has it here: http://www.staples.com/Catalog/Browse/Sku.asp?PageType=1&Sku=226290

It works perfectly in the 9815.

Re: HP9815 paper??

*Message #3 Posted by **marais** on 9 June 2004, 12:57 p.m.,*
in response to message #2 by Katie

Thank you Katie! I'll order on my next trip to the States, as Staples Europe does not list the item. There's hope for my 9815!

Re: No more NCR paper???

*Message #4 Posted by **David Smith** on 9 June 2004, 5:15 p.m.,*
in response to message #2 by Katie

The last time I went to Staples, Office Max, and Office Depot NONE of them carried the NCR paper anymore. They had all replaced it with various private label store brands. Some looked like it came from the NCR source (same paper core and markings on the end of the roll), others were from obviously different sources.

I know the NCR stuff was very compatible long term with all the HP machines. No telling about whatever they are shipping now. There is the possibility (probably small) that it could damage the printheads.

Re: HP9815 paper??

*Message #5 Posted by **Claudio** on 13 June 2004, 9:37 p.m.,*
in response to message #2 by Katie

Hi, I cut a standart thermal fax roll, it works great.

Anyone have a user manual for a HP9815?

Thanks

Claudio

Re: HP9815 Manuals

*Message #8 Posted by **marais** on 22 June 2004, 1:37 p.m.,*
in response to message #7 by marais

Ok, got mine. Upon a closer look it seems that the thermal paper is exactly the same used on the 82240A/B printer. Could anybody confirm this? Anyway, I got the complete manual, it is in german however. If you're still interested, I'd scan the 4 pages you were asking for. I would need your email address then.

Regards Andreas

Re: HP9815 Manuals

*Message #9 Posted by **Katie** on 24 June 2004, 12:11 p.m.,*
in response to message #8 by marais

You can use the same paper as the 82240 printers use, they're just shorter than the rolls that normally go into the 9815A. The IR printers use 85' rolls while the 9810/9815/9825 use 165' rolls. NCR makes (I think that that still do) 2.25" thermal rolls in both of these lengths that work great.

Taking the 16C out of float mode

*Message #1 Posted by **Joe Edwards** on 8 June 2004, 10:14 a.m.*

Well, the subject pretty much states my question. I figured out how to put the 16C into float and Sci mode, but I cannot get it back into interger mode other than by resetting the machine (and wiping the memory).

Anyone have a clue. I definately need the manual. :)

Joe

Press one of the radix keys (more)

*Message #2 Posted by **Cameron** on 8 June 2004, 10:37 a.m.,*
in response to message #1 by Joe Edwards

Just press one of the four radix keys: HEX, DEC, OCT or BIN.

When it comes out of float mode the word size is left at 56 bits regardless of what you had set it to before you went into float mode. X and Y contain a representation of the FLOAT value that was previously in X.

Cameron

Joe

Grab yourself a set of museum CDs.

*Message #4 Posted by **Cameron** on 8 June 2004, 11:31 a.m.,*
in response to message #3 by Joe Edwards

You *will* need a manual if you are going to do more than skim the surface of its capabilities. Aside from the sheer number of functions and modes that it has (I've lost count but there's more than 80 function) quite a few of the functions are infuriatingly idiosyncratic.

David has a scan of the Owner's Handbook on the museum CDs. A trip to Kinkos with the PDF file any you'll have a spiral-bound manual for substantially less than you'll get a collectable manual from eBay.

If you want to play with some programs I have a handful of listings on the HP-16C site. Have a look

on the "calculator" page.

49G+ programming features

*Message #1 Posted by **Standa(CZ)** on 7 June 2004, 11:15 p.m.*

Hello, sorry for my bad english... I want buy 49G+, so I have some questions: 1. Is possible to create dialogs similar to TI-89 (strings, inputs and outputs in one dialog) ? 2. Can I create user-defined menu? 3. Functions, that are be able to return value directly, not only into variable (like ClassPad). 4. Possibility to store and recall variables from SD card by commands in programs. 5. Functions similar to TI: Try - EndTry and ClrErr. Thank you for your answers :) Standa(CZ)

Re: 49G+ programming features

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2004, 11:41 p.m.,*
in response to message #1 by Standa(CZ)

Hi, Standa;

I think I have answers to some questions of yours:

```
2. Can I create user-defined menu?
```

Yes. Features for custom menu allow you to associate a custom string to a key and allow different actions to each:
press a menu key directly
[left-shift] and
[right-shift] prior to press the key

```
3. Functions, that are be able to return value directly, not only into variable (like
ClassPad).
```

All internal functions (O.S. defined, like LN, SIN, etc) that return values place them in the stack, i.e., they are not necessarily associated to variables. Some applications change or use values in variables that already exist, like TVM or CAS functions. If you mean custom-defined functions, it depends on the way you create/define them.

```
4. Possibility to store and recall variables from SD card by commands in programs.
```

Yes. Storing and recalling (and purging) variables in SD cards are merely a question of adding :3: (designator to port 3) as the first "character" of the variable's name. If you want to store an object (already in level 1) in an SD card with the name 'DATA1', you type in:

```
:3:DATA1 [STO]
```

This sequence can be part of a program as well.

Sorry, but I have no answer for the other ones.

Cheers.

Luiz (Brazil)

41C mCode routines

*Message #1 Posted by **DavidMY** on 7 June 2004, 9:34 p.m.*

If anyone is interested in 41C mcode routines (besides Angel and myself) I have a some code to offer:

I have written a series of functions to implement recall math on the 41 something I always missed. Like code for multifunctions in the HEXPAC module you program a function and follow with a number in the next line designating the register. Example 12 RCL+ ,13 010 which means add the number in User Register 10 to the X-register without pushing the stack. The functions include direct: RCL+, RCL-, RCL*, RCL/ and indirect: RCLI+, RCLI-, RCLI*, RCLI/. Also allowed is recall FROM a stack register and indirect FROM a stack register by using .00 to .05 to indicate registers T to L (the code limits stack/status register access to these register only for safety's sake).

Because a general purpose routine was developed to capture the next program line(s) other functions were able to be developed: <> a register exchange function: 10 <>, 11 010, 12 001 for exchanging contents of User registers 10 and 1. I<> exchange indirect the content of register given by the first register number with the contents of the second register. I<>I exchange indirectly the content of User registers given by data in the given registers.

Once again by using .0n (where n=0-5) Stack/Status registers may be used. One general limitation is that you CANNOT INDIRECT TO A STACK REGISTER; i.e., the indirect register can hold the number of a user register but not a .0n number to a stack register.

Also because a general capture routine was available a general multifunction routine was developed allowing for 1 to 999 subroutines to be called; i.e., 10 Multi1 11 001 calls subfunction 1. mCoders simply build a jump table to the subfunctions and set a guard byte to the size of the number of the subfunctions and compile the code.

There are limitations: 1) As stated the Indirection can only be from Stack registers not to them. 2) At the moment these functions are ONLY PROGRAMMABLE because the code acts on the following line(s). 3) After inserting these functions and before running the FOCAL program the user MUST PACK THE PROGRAM. (Technical: if nulls have been inserted between the function line and the line(s) of digits unforseen results will occur!)

1,2,and 3 will be addressed in future code as I get to it.

So, if anyone is interested in code for a discontinued,20+ year old calculator I'll be glad to publish it. You can comment here or email me. I have a general "test image" I use with emulators and if there's enough interest and if Warren allows maybe I can package up source and mod image and ship it off to him for posting on "that other site." Or if only a few want I can probably email the file(s) but this is slow as my day job is busy and tends to turn into a day and night job. (Plus I'm a single dad with a 12 yr. old son and those of you with kids know that at that age chasing after them is a full time job in itself)

Re: 41C mCode routines

*Message #2 Posted by **Ángel Martin** on 8 June 2004, 5:52 a.m.,*
in response to message #1 by DavidMY

Hi David, good to hear from you again.

As you stated, I'm interested for sure. I was wondering whether you've made enhancements to the image you sent me a few months ago. At that time you were still working on refinements to your RCL math routines, so I imagine there's improvements made now.

I'd like to add your code to a couple of functions in the 41Z project, for the STO and RCL of complex numbers, using two standard registers at a time. Could you send me the new code?

And as far as making it available, I'd say it is a great idea. The 41 archive site is perfect as repository for this type of works, so I'd encourage you to go ahead with it.

Best, ÁM.

HP-85 Boot Up

*Message #1 Posted by **Jeff** on 7 June 2004, 9:19 p.m.*

What could be the problem when you receive the "Error 23: Self test" when trying to boot the HP-85? Is this an error caused by not having the "autost" program or any tape inserted in the computer? Please let me know. Jeff

Re: HP-85 Boot Up

*Message #2 Posted by **Vassilis Prevelakis** on 7 June 2004, 11:27 p.m.,*
in response to message #1 by Jeff

The HP-85 manual says that "Error 23: Self test" means that the machine needs repair.

You need the service ROM to be able to diagnose the problem further.

Since the machine mostly functions (otherwise it would not be able to display the message), I would think that the problem is either a memory error (bad memory chip), or a ROM checksum error.

If you have anything plugged in the back of the machine (esp. the ROM drawer or the extra 16K RAM), try removing them and powering up the machine again.

**vp

more info on the HP-85 can be found at www.series80.org

HP-41 doesnt see any plug-in modules

*Message #1 Posted by **Miki Mihajlovic** on 7 June 2004, 9:08 p.m.*

Well my HP-41CX halfnut doesn't seem to be sensing any plug-in modules. What I done is I have rebuilt the battery pack a few days ago. It seems that the pack is just a bit thicker now and I might have forced it inside a bit but not much. Then I charged the pack and after that none of the modules show up on CATALOG 2. The same modules work fine in other 41CV. I am not sure is there any thing just beneath the battery pack in halfnuts so that I have maybe cracked something, or is it maybe related to the charging. The charger says it is 8VAC but I measured more like 12VAC. I have put the same rechargeable pack into 41CV and it seems to work fine.

Anybody can give me a good advise before I start dismantling things.

in response to message #1 by Miki Mihajlovic

Hi:

Probably you have forced the upper assembly screws, and now there is a faulty contact. You should open it, and look for cracked assembly plastic nut (sorry, I don´t know it´s name in english, but I am sure that you understand). The voltage is ok.If the pack is thicker, take care, you could damage the other calculator.

Regards

Jon

HP 16c logo needed

*Message #1 Posted by **Joe Edwards** on 7 June 2004, 4:08 p.m.*

Hey folks, I just got a MINT HP-16c off ebay for about $100.00. Well, almost mint. Physically and Mechanically it is mint. Cosmetically someone wrote 16c on the back and the HP-16c logo is missing. What are the chances that I can find someone who has or can get a 16c logo? I am sure I might as well be spitting in the wind, but I thought I would ask.

Joe Edwards

Re: HP 16c logo needed

*Message #2 Posted by **Cameron** on 7 June 2004, 4:39 p.m.,*
in response to message #1 by Joe Edwards

I'm envious, Joe. That's a good price.

If you have no luck getting a label, I have several photos of my label that I've scanned to make icons for my simulator. A couple of those would probably print up nicely on photographic paper in a high-res ink jet. Yeah it's a pretty lame solution but I thought I'd offer.

What's the S/N of yours? Does it have the F-mark beside the battery icons on the rear? I ask only because I'm trying to work out when HP got VDE-871b certification for the 16C.

in response to message #4 by Trent Moseley

Hopefully one of our German friends can help me out here. I don't read German so I can only fall back on some hand-waving.

I gather it was a West German (this is before 1990) EM emmission control/RFI standard. Probably much the same as the FCC Class "B" device standards. It would have been superseded by the EU's CE RFI standards but CE didn't appear until well after the 16C was out of production. I seem to recall CE marks appearing on devices around 1994.

Here in Australia we use what's called the "C-tick" for much the same thing. We've contrived our emissions standards to embrace those applicable in other jurisdictions which obviates the need for imports from those jurisdictions to be re-certified.

This is not unusual so I can only conclude that the German standard that the 16C was tested for was more restrictive than those in other markets where it was sold.

Your S/N and Joe's bracket 1984 and 1987. This gets me a little closer. Previously I had narrowed it only to 1982-1988. Thanks for your help.

Cameron

PS: anyone else with a 16C (or maybe any Voyager) want to help us get closer?

in response to message #5 by Cameron

```
Earliest Voyager (Gordon's 12C): 2537
Earliest 16C: 2625
Earliest 15C: 2550
Earliest 12C: 2537
```

It's possibly OK to assume that all Voyagers were certified at the same time. Assigning that to a date depends on whether you are persuaded by the HP-financial-year-in-serial-number argument or not. Either way, 2537 is the first half of 1985.

I wonder when they shipped the first retail batch to Europe.

Thanks for joining in. If anyone who hasn't contributed can narrow it down further, please add to the list.

Cameron

FCC - North American EMI Verification
The U.S. Federal Communications Commission (FCC) enacted electromagnetic-interference (EMI) regulations for various products such as transmitters, receivers, information technology, and similar microprocessor-based equipment. To streamline authorization procedures for computers and similar devices, and to align FCC requirements with those of world markets, the FCC amended Parts 2 and 15 allowing manufacturers' self-authorization. NI products comply with U.S. FCC and Industry Canada EMI Verification requirements for a Class A digital device according to FCC Part 15 and ICES-003.

(FCC Mark not applicable for Class A products)

Re: The road to Damascus

*Message #19 Posted by **Gordon Dyer** on 15 June 2004, 6:13 p.m.,*
in response to message #18 by Cameron

I might have mislead you!
I assumed 871b was a US mark and searched for FCC 871b, but the documents I found didn't refer to 871b. So you may be correct about it being a German requirement before the CE mark was introduced. I have searched for it and have not found any references. Also, the US FCC pages seem to be lacking in a record of the history of FCC regulations. Can anyone help?

...about as far as I can go (can any German colleagues take us further?)

in response to message #19 by Gordon Dyer

http://www.vde-verlag.de/normen/grafik/Anhaenger-VDE-EMV.gif

Apparently I can buy 1,000 of these tags for Eu 27.50. If you'd like to stock up yourself, visit this page

Seriously though, the standards organisation is called: Verband Deutscher Elektrotechniker (which the babel fish translates as "Connected German electrical

engineer"). I suspect that 871b is too old to be documented on the web. The fact that it's been superseded by the CE mark doesn't help either. Our only hope for a definitive end to the trail is for a German EE who was working in consumer electronics during the 80's to step forward and join up the dots for us.

Cameron

in response to message #20 by Cameron

VDE 871 (also known as DIN 57871) is a norm defining electromagnetic compatibility of electronic devices, both in terms of far field radiation emitted and resistance to exposure to radiation. You certainly knew that already. It defines two classes of devices (a and b) with different thresholds. The newer european EN55011 handles the same issue, but I don't know if it covers 871 entirely or goes beyond.

Thank you Marais.

stat pac for Excel

*Message #1 Posted by **Jim Kimes** on 7 June 2004, 11:19 a.m.*

I find the regression application for the HP 19B II really easy to use and helpful, enabling me to do forecasting for exponential, power and logarithmic curves as well as linear. It returns the formulas for these curves. Howver, I do find the process slow and cumbersome. I don't think the standard MS Excel offers what I'm talking about so I'm looking for a reasonably priced stat pac that will do this that works as an Excel Add-in. Has anybody had any experience with exactly what I'm talking about here? I've researched several packages on the I-net but none of them actually address the applications I need. It wouldn't necessarily have to be an Excel Add-in but I think it would be easier to work with. Thanks.

Re: stat pac for Excel

*Message #2 Posted by **Chan Tran** on 7 June 2004, 12:29 p.m.,*
in response to message #1 by Jim Kimes

Excel from version 5 and up has an addin for regression. However, I think it's only for linear. I guess you can write and addin or VBA program to do this in Excel. I think I will do just that...

Re: stat pac for Excel

*Message #3 Posted by **Miki Mihajlovic** on 7 June 2004, 12:42 p.m.,*
in response to message #2 by Chan Tran

As a matter of fact the Excel regression add-in has 5 standard types: Linear, Log, Polynomial, Power and Exponential. There is also the sixth type - moving average but that can't give you the equation.

1234

Re: stat pac for Excel

*Message #4 Posted by **Jim Kimes** on 7 June 2004, 7:48 p.m.,*
in response to message #3 by Miki Mihajlovic

If this is true, how do I access these other regression methods? I've loaded every applicable add-in I have and I still don't see these capabilities.

Re: stat pac for Excel

*Message #5 Posted by **Miki Mihajlovic** on 7 June 2004, 10:27 p.m.,*
in response to message #4 by Jim Kimes

Create a plot of your X vs Y. Right click on the points on the graph (so that they are selected) and choose Add Trendline. You should see six Trend/Regression types. I don't think that you actually need to activate any add-ins for this.

1234

Re: stat pac for Excel

*Message #6 Posted by **Jim Kimes** on 15 June 2004, 3:00 p.m.,*
in response to message #3 by Miki Mihajlovic

I have loaded every add-in available and I can access correlation and regression but I see nothing like you're talking about. I need more detail.

Re: stat pac for Excel

*Message #7 Posted by **Jim Kimes** on 7 June 2004, 7:46 p.m.,*
in response to message #2 by Chan Tran

I don't have VBA skills. Wish I did.

Re: stat pac for Excel

*Message #8 Posted by **Namir** on 7 June 2004, 10:55 p.m.,*
in response to message #1 by Jim Kimes

Excel allows you to perform linear and multiple lieaner regression using the Regression add-in. The Regression Wizard offers you a dialog box that has many options. The regression add-in offers the ANOVA table and confidence intervals for the regression coefficients. You can transform your dat aand create new columns that enter into linear or multiple regression.

Excel also allows you to access statistical functions such as CORREL, SLOPE, INTERCEPT to calculate R, the slope, and the intercept. Other functions are also available to obatin the coefficients and statistics for multiple linear regression.

Consult a good Excel book like the Excel (version) Bible or Excel (version) Inside Out ... or even check the Excel online help!

Re: stat pac for Excel

*Message #9 Posted by **Jim Kims** on 10 June 2004, 11:17 a.m.,*
in response to message #8 by Namir

I never found within Excel exactly what I was looking for so I took the equations for the four different types of regression, linear, exponential, power and logarithmic and built my own solver. I tested it using my HP-14 and it works fine. Not as slick as a macro but is OK. Thanks all.

Yet another Emulator... sort of

*Message #1 Posted by **Chris Woodhouse** on 6 June 2004, 8:12 p.m.*

All of you out there working on emulators have inspired me to write some code myself. But I don't think I would really call this an emulator. I'm not very motivated to just emulate a certain calculator. I would much rather create one that does exactly what I want it to do. The end result should have some features of the 12C, 15C, 16C, 42S, and just unit conversion/calculation stuff from the 48 series. So just for some experimentation I put this together last night Calc.exe it is no where near even alpha yet, but I thought I would throw it out there anyway. You have to use a combination of the keyboard and mouse. For anything that is on the numeric keypad you have to use the keyboard, except enter will work with both the mouse and keyboard. None of the shift functions on the numeric keys work. A good test to see if a shift function works, is to hit shift and then a key, if the little ‘g' indicator is still on, that key doesn't have a shift function yet. The keyboard shift keys will turn the ‘g' shift indicator on, as well as hitting the button with the mouse. The up and down arrow keys work as Roll Up and Roll Down. No registers are there yet. Finally to enter exponents you have to use the ‘E' key on the keyboard. Note if you want a negative exponent the only way to do it is to use the ‘-‘ key that is NOT on the numeric keypad after you hit ‘E' and before you enter the exponent, CHS will NOT work with exponents. If you want to see some of the details of how stuff is working just resize the window so it is taller and you will see the whole stack, an edit window, and another enter button (don't click on that extra enter button with the mouse or you will have to reselect the edit window before you can enter any more numbers.

I plan on creating a complex type that works similar to the way it does on the 42S only with a better way to enter complex numbers. I am also planing on adding a 2D and maybe 3D vector type that will work in a similar way as the complex type. Then add unit conversions and unit calculations like the 48 series. I doubt I will make it programmable though. I also hope to have both a window and linux version. I am using the HP DotMatrix 2 font by Luiz, (I hope you don't mind) so be sure you have that font installed, but if you don't it will just use some default font. The main reason I am making it is to teach people how to use RPN. That is also one of the many reasons it has a two line display. I think it is easier to learn RPN with the second line. I may add a mode where you can open another window and see the whole stack and all the other registers.

Chris W

Be my guest, the fonts are ours!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 June 2004, 8:44 p.m.,*
in response to message #1 by Chris Woodhouse

Hi, Chris;

please, use it as you wish. That's what I inteded when creating them: seeing them being used this way. And if you want to add the font to the pack (like a tar.gx, or standard zipped file) for distribution, I'd be glad as well.

Best regards.

Luiz (Brazil)

Communication between HP49G+ and HP 41 via IR

*Message #1 Posted by **kalle neccka** on 6 June 2004, 12:08 p.m.*

Hello!

I like to think some time back

- the HP48 series with IR can receive the data from an HP41 with an ir-module - the name of the famous (translating-)program was INPRT.

Is somewhere any adaption for the 49g+ calculator?

Regards

Kalle

New additions to the Series-80 site

*Message #1 Posted by **Vassilis Prevelakis** on 6 June 2004, 4:49 a.m.*

I have added a new section on the HP9111A digitizing tablet in the www.series80.org site. Both manuals and software for the HP-85 and HP-86/7 are included.

To go directly to the new section, use this link http://www.series80.org/hp9111a.html

Best Regards

HP 25 not working

*Message #1 Posted by **Marcos de Escobar** on 5 June 2004, 9:21 p.m.*

Hi everyone! Maybe someone could help me. My HP25 was left unused for a long time -- battery pack removed. I've recently tried to put it back to use, unsuccessfully. The original batteries are now worthless and a regular alkalines were installed. I switch on the calculator and it seems to be ok, numbers can be entered and are shown in the display, etc. However, if any other key is pressed, the display sort of turns off for one second and, then, it's filled up with just zeros. What could this be? Any possibility of fixing this? Many thanks for your help, whoever you are!

Re: HP 25 not working

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 10:47 p.m.,*
in response to message #1 by Marcos de Escobar

Hi;

I had one with this very problem, but a few functions operate as well: [STO], [RCL] and two others I can't remember.

I concluded that the only possible "bad guy" should be a faulty ROM. I removed the two of them, one by one, and tested in other working calculator. Bingo: one of them was faulty. I did not even checked for possible broken copper tralis because I used the ROM from the other calculator and the one that was faulty worked fine.

But let me tell you that in your case you may have problems with broken trails, why not? I remember that under the LED assembly you have one LED driver (the biggest chip) and one ROM (the other one). In the lower part of the mainboard you see (components side) a big chip (the Arith/Control/Timer, or ACT), the RAM at its right (or upper) side and the other ROM ath the left side. I don't remember one thing: the RAM position is related to the caculator type: HP25 or HP25C. I know it is in the upper side for one type and at the right side for the other. In both cases, the second ROM is in the left side.

Searching for broken trails (and eventual cold soldering) is a time consumming task, and you'll need a good magnifying lens. If you intend using a measuring instrument, use a voltmeter and carefully check for zero volts at both ends of each copper trail, calculator ON. I'd not use an ohmmeter to check copper trails unless all IC's are removed (voltage across measuring terminals when measuring resistence may exceed the IC's tolerance).

Success. And let us know if you need more advice. There are some gurus here that will guide you much better and with measurement details.

Cheers.

Re: HP 25 not working

*Message #3 Posted by **Renato (Brasil)** on 6 June 2004, 3:12 p.m.,*

in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

I have exchanged some emails with Marcos about his 25. Unfortunately, before I could warn him, he connected the AC adapter without batteries in the calculator. I suggested him to contact you, and told he would probably need spare parts for his calc. I guess he has a bad rom, due to using the AC adapter.

To all the nay sayers!

*Message #1 Posted by **Chris Woodhouse** on 5 June 2004, 10:45 a.m.*

First the people reading this forum aren't really the ones I need to reach. I believe the biggest market for the 15C is among engineers. I have reached many through other forums and judging from the comments people leave on the petition most find the 15C about the best tool for the job to do quick calculations. Most people here are probably more like me, we love electronic gadgets, and the more powerful and more features the better. But not just any gadgets, we want quality products that serve a useful purpose. Everyday when most people need to preform a calculation they reach for a pocket calculator. Right now HP doesn't make a pocket scientific calculator. I sit in front of a computer for many hours a day, and I still prefer a calculator to using the computer for quick calculations. If I don't have a calculator handy my second choice is a calculator emulator on my PC. However where the 15C comes in the most handy, is when I am not near my computer and no calculator made today can match it's versatility. The fact is that HP is currently planning on making more calculators. It is obvious that they didn't do to well on the last one (33S). Saying we need 300,000 people to sign the petition before HP will take notice is ridiculous. If anywhere near that many people signed the petition the calculator division would be working on a new 15C as fast as they could. The signatures on the petition will never be more than a fraction of the number of calculators that HP would sell. I have been in contact with someone that works with the calculator planning division at HP and from talking to him I believe we can have a significant impact on the design of new calculators made by HP. While they may not make a new 15C, I would be willing to bet money they would build something similar.

Now for why it is going to be hard to get a lot of signatures on the petition. It has been a long time since the 15C has been made and not very many people have had the pleasure of using one. I also have not yet found a way to reach a significant portion of my target audience, engineers. I need to put together a survey to find out what people want in calculator and I plan on doing that soon. I think we will find that except for college students, the 15C fits what people want pretty well. I also believe HP would sell a lot more of them if HP and people in this forum would put a significant effort into dimpling the myths that RPN is hard to use, hard to learn and unnatural. My goal for the petition is to get 20,000 or more signatures. I believe this is attainable and I also believe that it is enough for HP to take notice. I'm not going away :)

Bring Back the HP 15C

If they ever bring back the 15C

*Message #2 Posted by **Mike** on 5 June 2004, 12:50 p.m.,*
in response to message #1 by Chris Woodhouse

I hope they don't F' it up with the color scheme of the 12C Platinum. What a joke!

It would also be a great disservice to bring the 15C out of retirement, if they don't put the same quality of workmaship in a new mode. If it is the crap like they put in some of their newer HPs they might as well leave it retired.

Re: To all the nay sayers!

*Message #3 Posted by **Patrick** on 5 June 2004, 1:47 p.m.,*
in response to message #1 by Chris Woodhouse

One of the issues for HP will be in the expense to duplicate / re-invent the HP-15C's firmware. As others have pointed out, it is likely that no one at HP has that knowledge any more.

Why not use your contact at HP to strike a deal? Have HP divulge whatever it does have on the HP-15C code base and offer that the HP Calculator enthusiast community port it to a modern calculator architecture in an open-source undertaking. I'd certainly be interested in being a part of that. I'm sure a lot of other folks would as well. HP could

take the resulting code and build the 15C's successor from it. I think that would be very cool.

Surely there is a way for HP to protect whatever IP is involved.

Re: To all the nay sayers!

*Message #4 Posted by **Bill Wiese** on 5 June 2004, 2:09 p.m.,*
in response to message #3 by Patrick

While I'd dearly love to see a 15C-like calc or similar RPN calc (maybe w/some 16C + 42S features and a text display) I think you're making some fundamental mistakes in your assumption.

You're thinking like an engineer, not a businessman, and a fair of engineers are notoriously poor businessmen; good ideas only go so far:

(1) That an engineering market is actually worth pursuing.... there are very few engineers to make such a market esp for an item that realistically can't cost more than $50 (or it gets into price segment where it cannibalizes sales of 48/49 type calcs).

HP's calc division is a mere pimple on HP's financials. In fact I wonder about its relative profitability. By the time employee costs are considered I really wonder if HP will eventually keep on making calcs. After all, for similarly priced people, they could be participating in some other area w/fatter margins and less distribution costs. Sub-$100 consumer electronics is a nasty biz to be in; adding specialization to this makes it even worse.

All calc makers are primarily focused these days on the so-called 'educational' market. And given that so many math teachers and NCTM folks have gravitated to TI calcs, AOS, etc. HP let TI eat its lunch in this segment in the mid80s. Being an 'engineering driven' company only gets you so far: sometimes you gotta rope in customers, too, to pay the bills.

Consumers unfortunately buy sizzle, not steak, many times. A 15C-like calc sitting next to a TI-8X or 33S in blister pack prob won't make the sale - and RPN will scare off folks. (Why do you think they put algebraic on 33S?)

(2) Comment about 15C firmware: co's with established software development practices (like HP) would likely be horrified at a 15C firmware emulation strategy. Why? Because there is no way for them to appreciably/fully understand the 15C firmware now that all Coconut people are gone from HP. (Hell, there's a good chance they prob don't even have the commented source code anymore!!)

And that's regarded as risky - they'd rather rewrite such 15C firmware from scratch in C and maybe a bit of assy, even though that problem really is a harder one, esp if you're gonna exactly mimic 15C behavior.

(3) HP midlevel management prob sees calcs as something that's a "fill-in" product until PDAs take over. Remember, HP/Compaq sells lotsa PDAs w/far higher margins than calcs, and it wouldn't surprise me if they sold as many PDAs as calcs!

All calc design will be farmed out to the Kinpos, et al. Kinpo just ain't gonna wanna reverse engineer old HP Coconut firmware.

(4) The 200K-300K number might be low. It might be more like 500K, and require a lifespan of 2+million calcs sold to be worth developing these days.

San Jose

Re: To all the nay sayers!

*Message #5 Posted by **Garth Wilson** on 5 June 2004, 9:23 p.m.,*
in response to message #4 by Bill Wiese

We keep hearing this 300,000-unit figure. I'm sure there weren't that many HP-41's, even though that was a more complex model. After selling maybe somewhere between a few hundred and a few thousand HP-75's, they went ahead with the HP-71 which was a much more complex project than all of these. How many of those did they sell? A few thousand max? Granted, they probably did lose money on that one, but I'm convinced it's because the marketing was grossly mismanaged. It was supposed to be for technical professionals; and yet of technical professionals, not one in ten knew it existed. Of those who knew it existed, not one it ten had any idea how much power it had (albeit partly thanks to the user groups).

As for tool-up costs, our company looked into a set of the double-shot keys in the late 80's, and found it to be a few thousand dollars IIRC. The lexan overlay NRE will be under 2K. The 12c case is already there, the FCC testing is just over $1K, and even the custom LCD doesn't bring the NRE to $15K yet. We're not talking about a million-dollar project here. By far the greatest part of the development cost would be software if indeed they threw all that out-- which I sort of doubt-- and they could take a short cut by getting copies of the HP-41 and -71 IDS and VASM back from the users.

Re: To all the nay sayers!

*Message #6 Posted by **Jim L** on 5 June 2004, 10:35 p.m.,*
in response to message #5 by Garth Wilson

Wlodek's book puts the minimum number of HP-41Cs sold at 1.5 million but that was in an earlier era when HP was a smaller company and calculators were much more "high tech" and sold for a lot more money. An HP-41 cost about $800 in today's dollars and was just the start of a typical person's expenditures. Add ROMs, RAM, an HP-IL loop and some other gadgets and you could be well into multiple thousands of today's dollars.

The 12C has sold in the millions, which is why they keep it around. (Even so, they've come close to cutting it several times.)

HP had revenues of 76 billion dollars last year. If you want to get a company excited over a small NRE to sell twenty thousand units, you'd do better to find someone a lot smaller I think. In my experience, when you propose products that are much less than 0.1% of corporate revenues it's just hard to get traction.

Sony just announced that it's getting out of the PDA business in the US and Europe. I think they were doing in the 500K units per year and at relatively high prices.

Re: To all the nay sayers!

*Message #7 Posted by **Peter Cohen** on 6 June 2004, 12:21 a.m.,*
in response to message #6 by Jim L

Also, HP even raised the price of the 12C to try to ease people over to their newer, faster, more powerful and often cheaper follow-on calculators. But buyers wouldn't budge. That's why the 12C is still around and the 15C isn't.

Re: To all the nay sayers!

*Message #8 Posted by **Les Bell [Sydney]** on 6 June 2004, 2:19 a.m.,*
in response to message #4 by Bill Wiese

All good points, Bill; but I think that the prospects of the source being around - or at least able to be regenerated - are better for the 15C than for most HP calcs. Wasn't there a west-coast academic involved in the development, who published a few papers on the algorithms involved? If so, mightn't he and other external consultants still have copies of, if not the complete source, at least some fragments?

Best,

--- Les Bell

Re: To all the nay sayers!

*Message #9 Posted by **OpenRPN** on 5 June 2004, 4:27 p.m.,*
in response to message #3 by Patrick

Considering the goals of OpenRPN, I certainly hope HP will consider the fact that firmware will be fully developed and under a GPL!!!

If not, I am even exploring the production of upgrade kits for older calcs. No matter how things eventually pan out, excellent quality RPN calculators are finally on the horizon again. I'm excited to see things such as Qonos, HP showing some effort to improve keyboards, etc. Things are finally looking up for what was once an endangered entry method.

Best Regards, Hugh Evans OpenRPN Project Manager

Re: To all the nay sayers!

*Message #10 Posted by **Bram** on 5 June 2004, 4:29 p.m.,*
in response to message #1 by Chris Woodhouse

I shouldn't be reading this, because I said yea. ;-)

Anyway, if you're aiming at 20000 signers I do hope that in the meantime HP is keeping track of your countings to make up their minds and perhaps already preparing the reintroduction. I understand that timing is essential in business and that waiting too long may be fatal.

Apart from this, I think there are 2 options for a new 15C. Either a really new one with ALG and text display and and and... , but then only the size and layout remain. I think that wouldn't do for a commercial success.
Or an "old" one, identical to the original. Without any new features. If HP has archived the design, it could become a really cheap one. Some effort then may be made on supplying some extra's: firm pouch, application book, to name a few.
I hope HP will opt for the second choice. And after that, who knows, eventually, more Voyagers?

Do you need worldwide support?

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 6:30 p.m.,*
in response to message #1 by Chris Woodhouse

Hi, Chris;

first, I hope that my words written in this post were not read as bad feelings, instead my point of view. Please, if I let you think I don't support your site and/or idea, believe me it's exactly the opposite: I want the HP15C back too, even if it is exactly the same. I guess it is the most powerful stand-alone calculator of its class, other brands included. It would be better if it has more memory and/or a two-line display (showing real and imaginary parts simultaneously after pressing [f][(i)] in complex mode would be a great achievement, don't you think?), but the plain HP15C is perfectly fine.

Do you believe names collected worldwide to sign the petition would be a good idea? I guess some "foreigner" of us would be able to show (translate to) the petition in our own languages, making it easy to local users to sign it. This way, HP would understand that foreigners are signing something they are reading in their own languages, validating the petition elsewhere.

About showing RPN as "hard to understand". I'm a teacher, and some of my students use the HP12C. I showed them the 12C Platinum and told them that it has an additional Algebraic mode, that allows operations to be performed in one of both methods: 2 [ENTER] 3 [+] leads to answer, or 2 [+] 3 [=] leads to answer. Their question was the same: "Why? 2 [ENTER] 3 [+] is good enough!" Others comment: "After using the HP12C for a while, the other calculators with [=] key are harder to use again." You know what bothers me here in Brazil? Is the fact that the students go for

the cheapest calculator available. These ones that bought their HP12C are attending Financial and Management classes, and they always buy an HP12C for their classes. Not that we, teachers, tell them they MUST buy an HP12C and no other, but we recommend the HP12C. When I'm teaching Electricity (complex numbers for AC studies), Electronics (numeric SOLVE and Integration are very welcome), Digital Electronics (there, an HP16C is also good, and I use mine in classes) and other number-based subjects, I ask for which calculators they have, take their manuals and I dedicate one whole class for teaching them how to use their calculators. Two good consequences: they "ask for more" ("How can I do this?", "How can I do that?") and they don't complain like "I can't use my calculator efficiently" or "I didn't understand the User's Manual". I'd like they all have a single RPN, like an HP11C or even an HP33S, or a powerful HP15C, so they would spend some of their time by developing programs, and I use myself as a reference: it forces your brain to go ahead. Unfortunately the HP calculators cost about 12 times more than the calculators they buy on the streets. And I cannot tell them that those calculators cannot be used, because they are no programmable or because they are not RPN. After concluding their courses and achieving their certificates (diploma), they will not care much for their calculators (any calculator) because they were not given a chance to have a top-quality model. When I tell them I have something around 40 HP calculators, they ask me "Why? What do you do with them all?" My best answer so is: "I learn how to use them and help as many people as I can to do the same." I'f I'm given the chance as well, I'd teach how to use them in a regular basis. When I was at the University, HP calculators were a very good sign. Now I guess that they are seen as curious, resourceful tools by the students. And you are completely, 100% right: we must show calculators as they actulaly are so they change their minds for their own, not because we want to, instead because they don't actually know what actual HP calculators "are made of". If HP only had a US$15/US$25 RPN model that was easy to find anywhere, I'd tell my students to buy it "as a starting unit" so they could learn RPN and how to use it efficiently. Later, after achieving professional skills, they'd be ready to go further and buy powerful units.

Time will tell. I'd love having a newly-designed HP15C, mostly if others are able to have their own themselves.

Let us know what we can do.

Cheers.

Luiz (Brazil);

Why do students buy (cheap) calculators?

*Message #12 Posted by **Cameron** on 5 June 2004, 7:42 p.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Your revelations were very interesting, Luiz. Why do you reckon your student's buy calculators? I get the impression, from the comments posted on this and related subjects, that calculators are mostly irrelevant. I know that's heresy but stay with me.

The calculator (and the slide rule) used to be *essential* tools for most of the readers of this forum. Today they've been usurped by software on ubiquitous devices. The current generation of students in the pre-university through under-grad range only use calcs because they don't have the "cheating potential" of PCs and they don't have the time (or inclination?) to do it long hand on paper.

Because we grew up with calculators (I don't know about you but I didn't see a computer until I was in my 20's) and we now have access to tools like mathematica, we have a point of comparison. We can see all the advantages of a portable, robust calculating device. For the (young) student though, the calculator is simply a stop-gap until "cheating" is no longer an issue.

Young people are also desensitised to gadgets. Devices that to us would have been eye-popping and/or mind-boggling are routinely given away in packets of breakfast cereal. I suspect that there was a magnetism between calculators and us "oldies" simply because we could *own* them. Today, for less than the price of a 70's programmable calculator, I can buy a portable music player that will hold my entire CD collection or a communications device (aka cell phone) the size of a matchbox or a 5-mega-pixel digital camera. With all these things competing for their dollars, why would they bother to duplicate the (perceived) functionality of their

computer?

Cameron

xyzzy

Our reality in a classroom (was: Why do students buy (cheap) calculators?)

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 9:32 p.m.,*
in response to message #12 by Cameron

Hello, Cameron;

your assumptions are perfectly clear for me and I agree with you and your analysis. If you read the post (in other thread) I refer to in my prior post (this thread), you'll see that part of what you wrote I pointed out, and you have gone deeper and faster, while I simply pointed them (some) out. I'll write some stuff here that's mostly based on my own observations and conclusions based in facts I saw and read about, so I'd invite those who do not agree with to expose their own view. Mine is not intended to be final, I may fail in my conclusions.

About calculators in Brazil and other countries. I teach classes at the local University and I'll tell you that teaching today is far from teaching at the time I was a student. I'm 42 Y.O., and I firstly saw a personal computer when I was about 20 as well, but I guess my "20's" are different of yours in terms of absolute calendar: it was in 1982/1983. In Brazil , at least in Petrópolis (Rio de Janeiro) we did not have a computer lab at the university till 1986, if I am not wrong. 8 PC XT running D.O.S. 3.3... And I remember that my HP41C with one memory module was still something to be proudly shown!

At that time, a teacher's word was enough to make a complete class to be in silence. Today, there's always a bargain involved. If you do not offer what they (supposedly know what they) want, you, as a teacher, are excluded. No place for a teacher inside the classroom that are not willing to transform a classroom into something beyond knowledge, communication, interesting subjects and interesting exposition. And we must survive to this with dignity, because if you "lower your shields", they (students) will also reach you in a demonstration of weakness. Sorry, this is not the subject.

Now I teach at the local university that's not the one I was graduated, and the "reality" is also different. Here we have two computer labs running LINUX (RedHat distribution) and MS Windows XP® in both of them. 28 computers total count, all 800MHz CPU with 128 MBytes RAM, 20GBytes HD. And no computer in any classroom. The classrooms are for plain classes, only. And I'd not be reasonable enough getting all students to the labs anytime I want them to perform computations. That's when I tell them that they'd better buying their calculators (a suggestion, not an imposition), but except for those attending financial related classes, I suggest them to buy the best Scientific calculator they can afford buying. Close to Araguari there's another town, Uberlândia, and their reality is somehow different: many universities, many different courses, many social realities as well. I know many students have their HP12C, PDA's, HP48GII, HP49G and other personal computing devices.

But in all cases, I can tell you that they are not conscious about what you mentioned: *all the advantages of a portable, robust calculating device. For the (young) student though, the calculator is simply a stop-gap until "cheating" is no longer an issue.*

Here it's not different, but while some computing gadgets are easily found and easy to buy in some places, final prices in here (and other countries) make some of these gadgets a "wish" instead of a possibility of acquisition. They are sold here, of course, but not necessarily to those who'd use them as computing-aid devices. There's still a "tech-appeal" here that turns these gadgets into some sort of "pheromone" that non-tech guys like to show... off. And this is market, sales... unfortunately.

Maybe it's a bit off-topic, but some background helps understanding other "point of view".

Cheers.

Re: Our reality in a classroom (was: Why do students buy (cheap) calculators?)

*Message #14 Posted by **Ljad** on 6 June 2004, 4:14 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

When I see my daughter studying for her exams in civil engineering she uses Mapple on her laptop. A calculator (TI 83+) comes only in the second place (and when she sees my "clumpsy" new HP 49G+ she even is not interested in HP and she would more likely want a new TI 89 Titanium perhaps). Why: first it took her a lot of time to master Mapple and then you have to use it frequently.Then it is much more powerfull (seeing 3D images in colour rotating) and faster. I believe this helps in understanding the problems. But they are also sending mapple files among students to compare their solutions, to give explanation.They are downloading solution files and exercises. they use copy and paste... Talk on the forum while working with Mapple. They save their files on a floppy disk or memory stick and can use them anywhere at the university or on a friends PC. So it is much more adapted towards their normal way of working. I think this is a problem for the calculator market. Perhaps the new Qonos (?) project will help to fill the gap between PC's and Calculators. Yust my toughts. Ljad

Re: Our reality in a classroom (was: Why do students buy (cheap) calculators?)

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 6 June 2004, 11:41 a.m.,*
in response to message #14 by Ljad

Hi, Ljad;

interactions like these are A MUST when student's development is the issue. For me, if results are the goal, the instrument itself is not the first target. I know MathLab, Mapple (did not use) and Mathematica (is it spelled correctly?) and I know what you mean. Mostly because their needs are different of ours while they are students. Let's face the facts: our fathers saw us learning things they did know taht exist. We are having the chance to, at least, understand and reason over what our children are doing at school. When we were using calculators while some of our fathers could not even understand what were slide-rules for, we were using sort of "alien", "unknown" technology. Of course, some of these fathers were the ones bringing that technology to the living souls, and this words do not apply to them. Because of technolgy growing, our kids MUST learn how to use graphics environment in a computer in order to survive and have better jobs. In our time (again: I'm 42 Y.O.), using computers was a choice, for Engineers, not necessarily a must (at least here in Brazil). If you don't know how to use a 3D SW, how to draw with a CAD somehow and how to scale, you're in trouble when Civil Engineer is your area. And these are taught in school today.

When I was a student in 1979 (first year), no one recommended me to buy a slide rule. I saw none amongst classmates. I saw one teacher showing his old fellow to his students and I got closer, and he showed me how to compute logs to five digits. It took him about twenty minuts with complete explanations, and about one minut by his own. He was considered a fast user.

One minute to compute log with five digits mantissa.

How many logs with five decimal places a calculator can compute today in ten minutes? Which computing device exists today that makes us laugh of calculators when compared them both while computing logs? It seems to me that the story goes repeating again. And I feel as if I'm that teacher with his slide rule, but now I understand him.

No conlcusions from my own about this.

Cheers.

Re: Our reality in a classroom (was: Why do students buy (cheap) calculators?)

*Message #16 Posted by **Chan Tran** on 14 June 2004, 11:13 a.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

I believe the real reasons why students bought cheap calculators are as followed. First the cost of college now is so high that the price of a calculator is just a drop in the bucket so affordability isn't an issue here. The main reason is that students today see the calculator as the neccessary evil, something that they have to have for the classes, so they just want to get whatever to get them through the classes. Back in our time we (at least many of us) saw our calculators not only as useful tools in and out of the class we also saw them as toys that we loved to play with. So we would save money somewhere and spent the greatest amount of money we could to buy our calculators.

What you say remember me... myself: I see calculators like pretty toys to play with since 1982, when I was 16.

Hi, Luiz:

Luiz posted:

"I know MathLab, Mapple (did not use) and Mathematica (is it spelled correctly?)"

"Mathematica", yes. "Mapple", no. It's "Maple" :-)

"One minute to compute log with five digits mantissa. How many logs with five decimal places a calculator can compute today in ten minutes?"

It's not the quantity of logs that matters, but the *quality* of said logs.

Seems to me you benchmarked your poor HP48/49 to see how many logs it would produce in ten minutes and naturally enough, after watching so many logs you can't see the wood for the trees. Perhaps they're maples ? :-)

Best regards from V.

Hello, Valentin;

you're "tha" man! Thank you for your always welcome corrections; Maple is noted!

About logs... you see, I know you understand it, but I'm sure others may need some background (not exactly regular contributors in here...). When you asked for "quality" I guess it means both precision (number of CORRECT digits) and speed. And I guess how many FLOPS can be measured in a pocket calculator.

BTW, I think that *any*FLOPS should be followed by processor clock, system arrangement, etc. It's like telling an automobile (?) runs many mph without considering its engine specs, design, etc. If not, it's an empty measurement... Am I right in these considerations?

Regards from Brazil.

Logs and accuracy

*Message #22 Posted by **bill platt (les Estats Unis d'Amerique)** on 14 June 2004, 5:25 p.m.,*
in response to message #21 by Vieira, Luiz C. (Brazil)

On logs:

If I use my 15c to compute logs, for the purposes of figuring annual rate of return (like, "I bought it in 1970 for $100, and sold it for $1000; what's the annual rate of return?") and then with the answer, I fill the stack and multiply the beginning purchase by the requisite n, I get a number whiuch is *almost* the ending point. On the 15c, it is off by about 2 parts in the 9th decimal place, whereas in the pioneers/charlemagnes, it is off 3 parts in the 12th

decimal place. Incidentally, if I use simple star/end numbers which make simple logs in base 10, and compare resultes to those in base e, the base 10 results are slightly better--as one would expect--as there is no rounding in the 1st parts of the problem.

Just htought it is interesting how for most things, you never even see these efects, but occasionally precision is visible.

Regards,

Bill

Hi, Luiz:

Luiz posted:

"you're "tha" man! Thank you for your always welcome corrections; "

Glad to hear that because it's ***"da" man***, not ***"tha" man*** ! :-)

"When you asked for "quality" I guess it means both precision (number of CORRECT digits) and speed. And I guess how many FLOPS can be measured in a pocket calculator."

Actually, my whole post was an (admittely lame) attempt at silvan humor, loosely based in the fact that, according to the dictionary, "logs" are "trunks of dead *trees*", the sentence "you can't see the wood for the *trees*" (also featuring "trees") means that someone is wandering in details instead of focusing in the important facts, and "maple" is a kind of *tree* ! Notice the pattern ?

So I couldn't resist making all the (arguably wrong) connections and issuing the post, in a misguided attempt to make you laugh, which I failed miserably :-)

Best regards from V.

in response to message #1 by Chris Woodhouse

Chris,

It's real simple. You call HP and place an order for a considerable number of calculators (10,000 units or even more). The more units you order the more of HP's attention, cooperation, and compliance you get. That's all there is to. You put the money down, you get the order, and HP makes a profit. We get what we want and HP gets what it wants -- income!

Money talks!

I once spoke to Chris Wallin from ACO about bringing back the 42S. And he said it would be possible if they got an order for 100,000. Cost price would be about $50 [guess] for calculator in non retail brown box. That would lead to an overall cost of around 5M. Any one with that resource and willing tio take the chance?

Re: Who has 1.1 x 10e6 US$?

*Message #28 Posted by **Wlodek Mier-Jedrzejowicz** on 7 June 2004, 10:23 p.m.,*
in response to message #27 by Iqbal

Iqbal says that HP would have been willing to restart the HP42S line for an order of 100,000. I believe it was just 10,000 as they already had the production line, just not enough incentive to produce a large batch.

Restarting HP-15C production is much more difficult, even though a 12C production line exists. I too talked with Chris Wallin about this and his point was that restarting a product after years means that it has to be certified again in every jurisdiction it is sold under (all those CE marks, 871 numbers, and so on).

The 1.5 million HP-41s sold mentioned in my book comes from a different time, as others have already mentioned on this thread. Just the same, I'll bring an HP-15C with me next time I talk to some of the HP calculator team :-)

*Message #30 Posted by **Chris Woodhouse** on 6 June 2004, 10:09 a.m.,*
in response to message #1 by Chris Woodhouse

I don't think I am getting my point across. I don't care about college students, or college. Heck I didn't care about college when I was in college. I think we can all agree that college is not at all like the real world. As I sit here in the real world, and want to find how many feet of 4 inch PVC I need to hold 50 gallons of water, I don't run Maple or Mathematica, and I certainly don't run derive, I pickup my calculator. If I want to know how many gallons per minute of hydraulic fluid flow I need to spin a 4.92 cubic inch displacement hydraulic motor at 2300 rpm, I am going to reach for my calculator. There are many times I want to find answers to similar questions in a place where a computer is not available and not practical, and where the best tool is a small durable calculator like the 15c. The questions I need answers to have to get much more complicated than the examples I just gave before I will want or need to use a computer to answer them. Am I the only one here who uses a calculator like this? Did anyone read my new argument on my site as to why it was the right thing to stop making the 15C in 89 and why it is the right thing to start making it again now?

WARNING! Off topic rantings to follow. . .

With all this talk about college and students I have to digress from the topic for a minute. I didn't like college that much, it was really the fact that I needed to go to college that I didn't like and the more time I spent at college the less I liked it. Here is the reason. If I see someone with a college degree from almost any college, it tells me one of several things about the person that has it. One, they learned how to cheat really well. Two, they went to a lot of effort to find incompetent, sympathetic, bleeding heart pushover part time instructors that would give them a passing grade (I was amazed at how well one particularly manipulative person I met at college was able to do this). Three, some combination of the previous two. Forth, they did the work and learned a few things while they learned how to learn and actually earned that degree they have. I find that the people in the Forth category are a small minority. <getting off soap box>

You should try to get a job in HP marketing. Then you could apply your marketing skills to the mountain of proprietary data that HP already has plus you could create focus groups and studies to see whether HP really should recreate your beloved calculator. Until then, it's just typical Internet "I know better than anyone else and I can prove it by typing stuff."

I haven't read your site. I see you pushing it so often here that I instinctively resist going there. But that has nothing to do with whether I would like to see a new 15C, which has nothing to do with whether HP should make one. I don't think you understand that distinction but I think going to work at the company and being in charge of making such a decision would help you see it.

Re: To all the nay sayers!

*Message #32 Posted by **Chris Woodhouse** on 6 June 2004, 9:07 p.m.,*

The 15C is my favorite calculator, I don't know where you got beloved from. It should be obvious from my recent posts that I would be just as happy, if not more so, with an improved version of the 15C. What I really want is a POCKET size RPN calculator, if the 33S would fit in my pocket, I would probably buy one and be reasonablely content, but it won't fit in my pocket. There is a market for a pocket size scientific RPN calculator. You don't need market research or focus groups to tell you that, it is obvious (I won't go into why). It may not be a big market and it may be too small for HP to bother with, but some will. I also don't believe that all the market research in the world could make an even remotely accurate prediction of how big the market is. Sure it could tell you that the market is at least X, but there is no way of knowing how much that market will grow once the product is in the hands of the public. I can guarantee you that no one at HP, or anywhere else, had any idea that the 12C would last for over 20 years. By the way has anyone else noticed that the last three 15C's on ebay went for $405, $385, and $405? Some one out there likes these things even more than I do.

People keep talking about the huge production costs of making a new calculator. This is 2004 not 1980. We don't need to design and build a new proprietary processor, or come up with clever, efficient assembly routines to find the sin of a x. That stuff has been done by countless people on countless platforms, there is no reason or need reinvent the wheel. You can buy an off the shelf processor and off the shelf display, add the keyboard from a 12C, a few thousand man hours of programming and some slave labor from China ;) and you have a new calculator. Except for the slave labor from China, that is almost exactly what is going on at OpenRPN.org, what they are working on is much more ambitious than what I want, but it will certainly fit my needs, I plan on being one of the first to get one. The Hydrix Qonos is interesting too. I think people try too hard to merge two different products into one. Kind of like the flying car that has been tried over and over, you either end up with something that doesn't fly very well, doesn't drive very will, or more likely neither drives nor flies very well. Or in the case of this thing, can't fly at all. But now I am starting to ramble so I will shut up.

Yeah if HP could reintroduce the HP-15C and not tell anyone then they could probably sell five a week on ebay for $400. But if word gets out they'll need a new marketing strategy. By the way those were the last 15Cs described as mint/superb. I've seen mint HP-65s top $2000. However if you just want any pocketable RPN calculator then now I'm getting you. I don't know whether it makes any sense to HP but make it a 42S and I'm with you in wanting it :-)

I didn't mean to imply that HP could sell them for that much, I was just commenting on how high they have been getting lately. I got one in mint condition a few weeks ago for a little less than $250, it just didn't have a manual with it. In any case I think instead of 5 a week for $400, 100 a week for $40 would be more like it.

You think it's obvious that there is a market for a pocket-size RPN calculator. Unfortunately, it also seems obvious that HP doesn't agree, since they haven't marketed anything of the kind since the 11C and 15C were discontinued in 1989.

Your best bet might be to try another company. How about Aurora? They've done a reasonable job of copying the 12C with their FN-1000, so presumably they could copy the 15C as well. Plus they can sell their products for much less than HP; an FN-1000 is only $24.99 at Outpost.com, which is only a fraction of the cost of an HP 12C ($69.95).

Presumably Aurora is a much smaller and hungrier company than HP, and would be satisfied with much lower sales volume and much lower profit margins. So they might be willing to sell a 15C copy even if the market was small (which I suspect it would be)

That is not entirely accurate, the 42S, 32S and 32SII could all be considered pocket calculators, though not as well fitted as the 10C series. Just because HP no longer makes a pocket scientific calculator doesn't mean they don't think there is a market for it. It could be that they just think the market is too small, or maybe they just don't care. Since in the big picture that is now HP you would need to look close to see any calculators. My intension is to make either HP or someone else care enough to make a pocket scientific RPN calculator.

In regards to your other post about the 48 series. I do love the units on my 48GX, but I still use my 15C more. For the calculation you sited though, that is a common one for me so I already know that there 231 cubic inches in a gallon. If you look at my other posts what I would really like to see is a new calculator that starts with the 10C form factor, lengthens it ever so slightly to add another column of buttons, increase the display to 2 lines and much longer with a dot matrix display, add menus and text the way the 42S did, and add the unit conversion/calculation features from the 48 series. We have been making calculators bigger, better and faster for a long time. I believe that was the right thing to do, but I also believe that it is time to reexamine the way calculators are used out side of college, and take a bit of a step backwards.

http://cdw.homelinux.com:8087/hp/hp15cII.jpg

Yes I know it has a 7 segment LCD display, but making it dot matrix with the cad software I was using, makes the file too complex and slow to work with, the two rows of 16 digit 7 segment LCD was bad enough.

I'm confused.

You say you want a pocket-sized RPN calculator. Your definition of "pocket-sized" apparently includes the 32S, 32SII, and 42S. But there isn't much difference between these older models and the current-model 33S. Based on the available specs, the 33S is only 0.35 inches longer than a 32SII, and basically identical in width, depth, and weight. So why isn't the 33S "pocket-sized" ?

Your website says "Bring back the 15C". But now you're proposing a new design entirely -- something like a 48G, minus the graphing, in a 15C-like form factor. Nothing inherently wrong with that, of course, because the size and weight of the 48G is its biggest drawback. However, this is not a 15C. It's a new design, and it would likely be far more expensive to develop than it would be to simply recycle the old 15C.

Although this proposed model would be attractive to many professionals (including me), I doubt that HP (or any other major calculator manufacturer) would pursue it, simply because it would have little appeal in the education market. You've made it clear that you don't care about this market, but I'm afraid that HP (and all other major calculator manufacturers) care a lot.

In the US, about 4 million students enter the 10th grade every year. And about 60,000 students graduate with a BS in engineering. Notice how the latter market is only about 1.5% as large as the former. HP needs to succeed in the education market -- the professional market may be too small to sustain their calculator division. If they can't sell to students, then they may very well stop selling calculators altogether. So don't knock the education market -- it may be HP's last best hope.

I don't know how you got that idea. The ONLY feature I want to take from the 48 series is the Unit conversion/calculation. You could say I am looking for a 42SII in the 15C form factor. I meant to indicate that while the 42S could be considerd pocket size, it pushes the limit, and the 33s clearly goes beyond the limit. It is wider, and the 42S tapers in thickness to .42". From what I have read, the with the plastic cover on, the 33S is a lot tighter in the pocket than the numbers on the website indicate. Combign that with the lack of quality and poor design, and it makes the 33s something I wouldn't even consider.

Re: 33s

*Message #45 Posted by **Norris** on 7 June 2004, 3:06 p.m.,*
in response to message #44 by Chris Woodhouse

That's a misleading charge. It's true that the firmware of the 33S is not optimal; it can't take full advantage of the expanded memory in this model. And yes, there has been a lot of griping about this limitation. But even so, the 33S still has far more available memory for programs and equations than any other entry-level

HP calc (such as the 11C, 15C, or 32SII).

The 33S has about 31,000 bytes of memory. But it has a relatively limited number of variables and labels (like its direct ancestor, the 32SII). In practice, the 33S will run out of variables and/or labels long before all 31,000 bytes can be used. So the effective memory size for progams/equations is probably more like 3,000 to 5,000 bytes. For example, the commercial "Survey Stakeout" package for the 33S is about 5,000 bytes in size.

Is this a problem? Well, it's certainly not ideal. But in terms of programmability, the 33S still a huge improvement over the 32SII (384 bytes) or the 11C (281 bytes) or even the 15C (448 bytes).

In other respects, the firmware of the 33S is similar or identical to that of the 32SII, which was a well-respected and successful model.

in response to message #42 by anon

Hi Anon,

I am glad the 33s exists. I bought one (and lost it already but that's another story!).

But it is a shame that is was not properly worked out. There are so many near misses with its design. I have posted here about them before, and at comp.sys.hp48.

A number of limitations in the 32sii were not removed and could have/should have been.

Pocketability of 33S ?

*Message #48 Posted by **Norris** on 7 June 2004, 3:29 p.m.,*
in response to message #41 by Chris Woodhouse

I don't have a 33S (haven't even seen one yet) so I can't really evaluate its pocketability. The published specs indicate that it is only 0.35 inches longer and 0.05 inches wider than a 32SII, which doesn't seem like much difference.

For what it's worth, HP certainly thinks that the 33S is pocket-sized. Their recent 33S press release, at http://www.hp.com/hpinfo/newsroom/press/2004/040420c.html , boasts that the 33S is "a shirt-pocket-sized unit weighing only 119 grams (4.2 ounces)." Online vendors routinely advertise the 33S as pocket-sized.

Any 33S owners care to comment on its pocketability, particularly relative to a 32SII or 42S ?

Pocketability: I wouldn't put it or any calculator in my pocket. I have enough problems with what's in my pocket protector falling out whenever I bend in the slightest. My 33S does, however, fit neatly into a briefcase's calculator pocket. What it doesn't need is a hip holster.

I didn't buy it for pocketability, though, I bought it for PE-exam-ability...

BTW, I got my Business 2.0 refund check the other day (if you buy a 33S you can either take the free subscription to the magazine or request a $9.99 refund, I did the latter).

Rebates

in response to message #49 by Fubar Vikinghelmet

Yo Fubar!

Do you remember how long they are offering that deal? I lost my 33s---and would like to get $10 back on the next one---but I didin't make a copy of the business 2.0 offer, so don't remember how long it is going.

BTW I got my rebate check yesterday, too.

Regards,

Bill

I think they're good through June of 2005.

Is that an HP33S in your pocket or are you just glad to see me?

*Message #52 Posted by **Wayne Stephens** on 7 June 2004, 4:20 p.m.,*
in response to message #48 by Norris

The 33S is not, in my opinion, "pocketable" (is that even a word?). It is too large in nearly every dimension.

Of course, the 32S, 32SII, 42S, etc., are also too large to comfortably put in your pocket.

The 11C, 15c, 12C are small enough, and correctly shaped, to fit just about perfectly in the pocket of a button-front shirt (I don't think anyone is really talking about putting one in their pants pocket, are they?).

However, I do not "pocket" ANY of my calculators since that fateful day when my 11C slipped out of my shirt pocket and plunged into a sweage pump station wet well as I leaned over the edge to get ahold of a float switch. That was about 14 years ago and I haven't put a calculator in my shirt pocket since (by the way, after some serious clean-up in the laboratory of a wastewater treatment plant, it was brought back to life, and it still works to this day).

Any of them (even more than one of them at once) fit very nicely into my briefcase.

Take care.

Wayne.

Origins of pocketable

*Message #53 Posted by **Norris** on 7 June 2004, 4:32 p.m.,*
in response to message #52 by Wayne Stephens

Of course "pocketable" is a word. It was coined by Japanese transistor radio salesmen, who wore custom-made shirts with extra-large pockets to ensure that their products would fit.

http://www.sony.net/Fun/SH/1-6/h2.html

Maybe HP should change the coupon that comes with the 33S. Instead of a magazine subscription, they could offer a coupon for a free shirt with an appropriately sized pocket

Edited: 7 June 2004, 4:41 p.m.

Re: Origins of pocketable

*Message #54 Posted by **OpenRPN** on 9 June 2004, 12:49 a.m.,*
in response to message #53 by Norris

Believe it or not, this question is 100% serious: Would anyone be interested in buying a shirt if it had a long pocket to hold 42/32s sized calculators? If yes, would you prefer it to have pen loops?

We're actually considering such things as merchandise from OpenRPN, so your opinion is greatly appreciated.

Re: Origins of pocketable

*Message #56 Posted by **Andrés C. Rodríguez (Argentina)** on 9 June 2004, 9:59 p.m.,*
in response to message #53 by Norris

While I cannot confirm the source, I remember vaguely that, somewhat before the time of the HP 35 introduction, Bill Hewlett spent sometime in a hospital due to a minor accident (sports, skiing?). He used some of this forced rest time to look at this project, and became very interested about it.

It was told that he insisted about the importance of designing the upcoming portable scientific calculator (i.e.: HP35, as said before) to fit his shirt pocket, setting a form factor criteria which had to be met.

Indeed, the HP Journal article about the HP 35 was titled "The Powerful Pocketful", as a possible clue to such influence.

So, the HP 35 (and the following Classics) should be considered "pocketable".

For me, the slim Casio calculators of the 80's like the fx-4000p are REALLY pocketable. And my dear 15c.
Pioneers, too large.
Hp33s, toooo large.

in response to message #58 by Raul Lion

And that is another big + for the 15c size as the absolute cutoff in size for a pocket calculator. That (and lack of real I/O) is my big gripe about the Hp42s. It is just a 1/2 in (1 cm) to damn tall.

The Hp48G is a great desk calculator, but hey, I could also use a computer at my desk. Yeah, I use my 48G a lot at my desk because I like the keyboard and access to math functions via direct entry (over memorizing lots of keystrokes for my PC). But my 48G doesn't really travel off my desk. My 42s goes everywhere, but I would like it better if it were just a bit smaller ie the same size as a 15c.

in response to message #40 by Norris

[quote:]

But there isn't much difference between these older models and the current-model 33S. Based on the available specs, the 33S is only 0.35 inches longer than a 32SII, and basically identical in width, depth, and weight. So why isn't the 33S "pocket-sized" ?

[quote/]

I disagree. I own all three types: 11c/12c/15c; 32s/20s/17bii/10b; 33s. There is no doubt: the 33s is too big for my pocket--and I'm 6 feet 200 lbs. If I take it out of its case, yes, I can put it in my pocket---but it is noticeably big----the change from voyager to pioneer is noticable, and the change to the 33s is even more so in actual experience. Of course I do carry the 48gx in my coverall chest pocket when I need it enough!

It is interesting that "miniaturization" has carried on to the extreme with phones, to the point where they are actually *too* small to work correctly (the gain on the mics is too high, because you cannot put your mouth right to them--thes leads to lots of background noise being picked up; you cannot cradle them between cheek and shoulder etc) whereas with calculators, we have seen "supersizing" going on! It is all bass-ackwards from a useability/usefulness standpoint!

The craziest thing is that at the (low) price of all these devices these days, there is no reason not to have more than one calculator--a big one for the desk, a small one for your pocket, even another one for your exams.....

one day I had an experiment to conduct on a ship---and I had some useful programs on one of my 32sii's and realized I didn't have enough memory for another program---so I just took another one with me! (Time is money so you want to be prepared---be able to adjust things efficiently and fast on the fly when needed with no surprises etc---that's getting your money's worth out of the calculator. BTW the laptop goes too but it does not walk the deck with me! And the batteries *always* die on those da** things when you need them most.).

regards,

Bill

If I put the 33s in the 32sii case (with a little difficulty), it fits in my shirt pocket.

The problem is the case, not the calculator.

However, I use the 33s case (out of my pocket) since it protects better.

A pity. Do you remember the 80's slim Casio calculators?

Casio Slims

*Message #63 Posted by **bill platt** on 10 June 2004, 1:02 p.m.,*
in response to message #62 by Raul Lion

Hi Raúl,

yes, you mean the little tiny silver metal ones? I always thought that an RPN version on that physical platform would be really cool. I would like to find one of those in working condition.

Actually, my boss just retired his early 80's TI-30, which was also silver metal and very small--it was one ofgthe ones that used to come in a little vinyl booklet. He replaced it with a new TI-30, wich has a sliding cover. He is a bit disappointed---it is much larger, and he says the tactile feedback was better on the old one----so even among TI users there is a sense of this:^)

Best regards,

Bill

Re: Ti-30

*Message #64 Posted by **Ron Ross** on 10 June 2004, 1:26 p.m.,*
in response to message #63 by bill platt

I believe I have a Ti-30 (who wouldn't, but I mean Ti's first LCD Ti-30). And it still had the tactil type feedback of the earlier LED versions, along with the notorious keyboard bounce. So nothing lost there by my count. Still a sorry calculator no matter how you punch the buttons. That is what made me an Hp fan(antic). My first Hp49G+ reminded me so much (and not fondly) of my Ti calculators.

Just a bit of input, whether wanted or not.

That is exactly the calculator my wife purchased when I bought my Hp15c. She loved that little calculator and would not have ever parted with it (she used it for years and I still have it wrapped up and stored away) except her manager felt she should use something else while at work. He offered to pull something from stock to replace it. But her own ethics made her feel compeled to buy a new calculator.

She then bought an Hp27s and never looked back.

*Message #67 Posted by **GE (France)** on 10 June 2004, 7:09 p.m.,*
in response to message #66 by Ron Ross

The 4000P has the nice classic metal case, but the later plastic 4800P is better with 4 lines on screen and 4500 bytes available. If you like beautiful metal tiny marvels (even at the cost of non-programmability), here is Casio's proposal :

http://www.hknebel.org/Museum/Museum/Rechner/Taschenrechner/Casio_FX-98/casio_fx-98.htm

I vote for not believing in a HP15C come-back (however interesting it might be).

*Message #73 Posted by **Norris** on 6 June 2004, 11:04 p.m.,*
in response to message #30 by Chris Woodhouse

I've never owned a 15C, but I've had an 11C for nearly 20 years. The 11C still works perfectly, and it has sentimental value, but it sits in a drawer most of the time. Why? Because I eventually got a 48GX, and for real-world problems it's replaced the 11C as my calculator of choice.

I readily admit that my 48GX is much bigger, heavier, and uglier than my elegant, pocket-sized 11C. And I will concede that some of the 48GX's features, like graphing and computer algebra capabilities, may have limited real-world relevance. But some of its other advanced features, like the multilevel stack display, the unit support, the equation solvers, and the I/O ports, have real-world value that an 11C or 15C can't match.

It's true that a calculator may be better than a PC for problems like the ones in your post – but the best calculator for the job is one that supports units, like the 48 or 49. On a 48GX, for example, your PVC pipe problem would be solved by dividing 50_gal by pi*2_in^2, then adding 0_ft to force a conversion from _gal/in^2 to _ft. No conversion factors required. Sure, you could also solve this problem on an 11C or 15C, but only if the applicable conversion factors were looked up or memorized. Why not use a calculator that supports units for calculations that involve units?

Over the several months, there has been an experiment regarding the potential marketability of old HP models to professionals. In August 2003, NCEES announced that the HP 48 and 49 would be banned on the April 2004 professional engineering and surveying exams. Thousands (perhaps tens of thousands) of exam candidates were forced to scramble for old RPN models that met the NCEES criteria. The most readily available alternatives were the 32S/32SII, 11C, and 15C (a few people managed to get a new 33S, but this model was not widely available in time for the April 2004 exam).

The reaction to this situation (which has been well documented on many forums, including this one) has been overwhelmingly negative. There is widespread resentment over the perceived downgrade in calculator technology. The reality is that the 48 has been the de facto standard for engineering calculators over the past 15 years or so. Older models – including the 15C – just don't meet professional expectations any more.

To all the nay sayers!

Metal overlays for HP-41

*Message #1 Posted by **Matthias** on 5 June 2004, 2:57 a.m.*

Some weeks ago I bought 10 new metal overlays from a Austrian doctor for 2Euro a piece. After receiving the overlays I contacted him, cause I am absolutely not satisfied with the quality of the overlays. Have a look at the two pictures.
http://www.hp-collection.org/OVfront2.jpg http://www.hp-collection.org/OVback2.jpg
The frontside is coloured and scratched from the machine. The backside has terribly scratched and has small pieces of liquided metal on it. If you put this on your calculator you will have scratches on it immediatly. This is his answer:

```
1. You are a collector and so you have higher demands that my other clients.
2. All other clients are satisfied.
3. After consultation with the manufactor he told me, that no more quality is possible.
```

Dr. X told me, I could send back the overlays, so I could cancel the deal, but I will not, cause shipping price would cost nearly the same as the overlays. I only want to inform you about this. It's your decision to buy such overlays.
Matthias

OpenRPN Announces Cheese Overlays for HP-41

*Message #4 Posted by **OpenRPN** on 7 June 2004, 10:09 a.m.,*
in response to message #3 by Matthias

Precision cut cheese overlays for the HP-41 calculator will soon be made available to the public. A full production run has been complete for several months, but distribution has been stalled out of concerns over releasing the cheese before it is properly aged. You can also look for aersolized cheese spray-on overlays in the coming months.

Re: OpenRPN Announces Cheese Overlays for HP-41

*Message #5 Posted by **bill platt (les Estats Unis d'Amerique)** on 7 June 2004, 12:06 p.m.,*
in response to message #4 by OpenRPN

There is also a choice of cheese: Provalone gives a rubbery feel and is quite tough and puts up with abuses; for high contrast in below freezing work, camembert gives good resutls as it is not brittle- just be sure not to use it as the temperature rises.

HP67 battery

*Message #1 Posted by **Billie Abraham** on 4 June 2004, 10:15 a.m.*

Where can I get a battery pack for my HP67? Or a kludge to use in its place?

Re: HP67 battery

*Message #2 Posted by **Miki Mihajlovic** on 4 June 2004, 11:25 a.m.,*
in response to message #1 by Billie Abraham

Mark Hoskins (waterhosko) sells those batteries on ebay for about $20. They are nicely rebuilt NiCd with about 600 mAh capacity. However, you can do it yourself with 3xAA pack NiMH batteries that fit into Panasonic (and some other) cordless phones. You get more capacity - 1300 mAh, I think. All you need to do is trim the little wires (black and red) and solder them to two metal tabs that you should shape and put between the cells. I have made several of these packs and they work great. You also need to make couple of spacers around the cells since the batteries are smaller then the original plastic pack so they stay in place and don't move around. I can send you some photos if you would like.

1234.

Re: HP67 battery

*Message #3 Posted by **DougT** on 4 June 2004, 1:13 p.m.,*
in response to message #2 by Miki Mihajlovic

That's exactly what I've done - it works great. See over in the "Collecting & Using" area for numerous articles on battery pack rebuilding. In addition to repurposing the occasional cell phone battery, I've had good luck with the Digikey batteries that Katie Wass lists in her article. Self-adhesive rubber weatherstripping serves as an excellent spacing material to stick on the ends of your assembled Classic pack, just trim it so it's nice and neat.

ZEPROM (for HP-41) at Ebay ?

*Message #1 Posted by **Ray Colle** on 4 June 2004, 6:28 a.m.*

There are two GUNZEN Artillery HP-41 at ebay. They are still extremely cheap (28 bucks):

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=2247933429&sspagename=STRK%3AMEWA%3AIT&rd=1

and

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=2247933648&sspagename=STRK%3AMEWA%3AIT&rd=1

Does anyone know if they carry these extremely rare and valuable ZEPROM modules ?

I think one GUNZEN normally carries two ZEPROM modules with 48 kByte total. Ebay value of one ZEPROM is 250 Euro I believe.

One ZEPROM has 24 kByte of re-programmable Eprom placed in a normal ROM module. It can be reprogrammed by ZEPROM burner or by some guy (maybe Matias Werli or was it someone else?) who offers such a service to burn them.

Thanks, ray

having problem

*Message #1 Posted by **harrington** on 4 June 2004, 1:29 a.m.*

where in this program should this be :BYTES => #B61Ch 78.

Program Frac: << "Enter Fraction" { "" ALG V } INPUT OBJ-> -> a << a PARTFRAC >> >> BYTES => #B61Ch 78. <---- ????(where I have the questions) key in after ' 1/(X^2+3*X+2 Press ENTER Result: '1/(1+X)-1/(2+X)' {VPN}

Re: having problem

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 June 2004, 1:42 a.m.,*
in response to message #1 by harrington

Helo, Harrington;

as explained by VPN, after you typed your programs in you can use BYTES to check for their size (in Bytes) and for a checksum sequence. If you have a program listed somewhere and it includes the values obtained with BYTES, you simply type your program in, store it, retrieve a copy of it in the stack and execute BYTES. If you see in the display the values you see in the document you copied the program from, then everything is fine. However, if you by mistake type one single character wrongly, it means that you may have the same quantity of bytes used by the original program (in your example, 78 bytes) but you'll surely have a different checksum (in your example, the original checksum is #B61C h, where #B61C is a binary number and h means it is shown in hexadecimal format). So, BYTES is not part of the program, you just use BYTES in order to check if your program was correctly typed in. BYTES is used only after the program is completely typed in and stored. And you also don't need to use BYTES to run the program after confirming that it is O.K.

Hope this helps.

Best regards and success.

in response to message #2 by Vieira, Luiz C. (Brazil)

when this sum is checked at the end of the program. next enter the input ?

Re: having problem

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 4 June 2004, 11:51 a.m.,*
in response to message #3 by Harrington

Hi, Harrington;

the checksum made by BYTES is external to the object that's been computed. You can apply BYTES to anything that can be placed in the stack: a number, a list, a string, a program... So, the argument for BYTES is "any object", and the checksum counts the whole object, not its results.

Please, keep posting if you still need advice.

BTW, what sort of documents you have with your calculator? By knowing this information, I could also add the pages you could read to complement what's posted here. Only the Owner's Handbook?

Cheers.

Luiz (Brazil)

Re: having problem

*Message #5 Posted by **Only The owner handbook** on 4 June 2004, 11:36 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

yes that will be helpful. I type BYtes after inputting the entire program, but don see how the ans is derived,all I get is the memory location. maybe give me line to line analysis on the program please this will give me a better understanding.

Re: having problem

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 2:01 a.m.,*
in response to message #5 by Only The owner handbook

Hello, Harrington;

I don't remember which calculator is yours (Sorry!), but PARTFRAC is a CAS function, so you may have an earlier HP49G or one of both HP49G+ or HP48GII. Neither the HP49G nor the HP49G+ basic manuals (User's Guide) are references to BYTES. I also download (sometime ago) the HP49G Advanced User's Reference Guide and found nothing about BYTES. Unfortunately I have no HP48GII, so I downloaded its Owner's Manual and found nothing, too.

The best references I have for BYTES are the HP48G Series User's Guide and the HP48G Series Advanced User's Reference Manual. In the HP48G User's Guide, you'll find references to BYTES at appendixes G (Operation Index, p. G-5) and H (Stack Diagrams for Selected Commands, p. H-2). In both cases, the use of BYTES is as follows:

with any object in Level 1:, executing BYTES remove the object from Level 1: (as it happens with almost all RPL coamnds) and returns a checksum number in Level 2: (like #B61Ch) and the number of bytes used by the object in Level 1: (like 78).

The only additional information found in the Advanced User's Manual refers to flags and using BYTES with built-in functions: returns checksum # 0 and size 2.5 always.

Hope this helps for now.

Cheers.

Re: having problem

*Message #7 Posted by **James M. Prange** on 5 June 2004, 5:19 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Huh? The downloaded 49G Advanced User's Guide PDF file has the BYTES command in it, but look under "Other Commands" instead of "CAS commands". It's available for download at http://www.hpcalc.org/details.php?id=2998.

A scanned PDF of The 48G Series Advanced User's Reference Manual is available at http://www.hpcalc.org/details.php?id=6036, but note the file size before starting a download.

Re: having problem

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 9:18 a.m.,*
in response to message #7 by James M. Prange

Hello, James;

you mean that "pack of three" Other Commands along with the single "CAS Commands", pdf, right? I always forget those... I took the one shot, single printed "Advanced User's Guide", black cover, that's standard in the newer HP49G units (it was available as "download only" in the earlier units). I have the ones you're talking about, too, but as they are the "actual" reference guides and are almost like the reference part of the HP48G Series Advanced User's Reference Manual, I failed to refer to them; sorry!

The original HP48G Series Advanced User's Reference Manual has many important examples and information about programming, mostly input-related commands that were not kept in any HP49G manual; a pitty. And this pack-of-three HP49G AUG sometimes mentions features not available in the HP49G, only in the (original) HP48G...

Thanks! I'll try to keep them in mind form now on.

Cheers.

Luiz (Brazil)

Oops!

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 5:45 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi James, all;

I had a look at the HP49G Adv. User's Guide (pack with three of them) and I found one small note of mine under VISIT: it reads "HP48S only ???" VISIT is found as a "See also:" reference after EDIT. I remember I did not find references to VISIT in the HP48G Advanced User's Reference Manual neither in the HP49G. I remember I did not test it because I thought ti was a keyboard operation only. I was surprised by noticing that VISIT exists in the HP49G and it is programmable! I added VISIT in a program with a valid name in Level 1: and the program halts while you edit the object you're "visiting". If you press [ENTER], the program resumes and everything else after VISIT is evaluated. I tried the same withthe HP48G (ROM version R) and

VISIT is not identified, it is placed in the stack as a name. I tried the same in the HP49G+ and it behaves the same as the HP49G: VISIT exists.

What I wrote in my last post is exactly the opposite!!! Sorry!

Cheers.

Problem with program conversion?

*Message #1 Posted by **Iqbal** on 3 June 2004, 9:11 p.m.*

I converted all my GX programs to my 49G+. The problem is when the result is displayed, the last prompt also remains on the display. Is there a way to get rid of this last prompt and only have the result displayed?

Check out this example. The program uses Trapezoidal rule to calculate the area.

« 0 0 0  N D L « 0 LIST 'L' STO "Strip Width?" PROMPT 'D' STO "No of Offsets?" PROMPT 'N' STO 1 STD N FOR i "Offset " i + PROMPT L + 'L' STO NEXT 4 FIX L HEAD L TAIL 'L' STO L REVLIST 'L' STO L HEAD + L TAIL IF N 3 SAME THEN HEAD ELSE …LIST END 2 * + 2 / D * 1 FIX "m" + ² + " Area = " SWAP + CLLCD 3 DISP 7 FREEZE 4 FIX » »

When the area is displayed, the last prompt [the 3rd if there are 3 offsets] is also displayed. Only solution is diosplayed in GX

Problem with program conversion?

*Message #2 Posted by **Veli-Pekka Nousiainen** on 4 June 2004, 3:18 a.m.,*
in response to message #1 by Iqbal

```
You have no solution if you insist on using PROMPT
since it uses the new header area and thus behaves differently.
Use other input methods or use SysRPL
<< VPN >>
```

Re: Feigenbaum number

*Message #1 Posted by **Valentin Albillo** on 3 June 2004, 6:12 a.m.*

Hi all:

A few days ago, Csaba posted:

"what was the program, what used by Feigenbaum originally(!), to calculate this number on his HP65? [...] The greatest problem, how to isolate the bifurcation points on the diagram..."

Actually, it's quite simple. Have a look at this small 4-line, 174-byte *ad-hoc* program I've written for the HP-71B (which can be very easily ported to most any other HP calc, Feigenbaum's own HP-65 included):

```
10 DESTROY ALL @ DELAY 0,0 @ F=3.2 @ M=0 @ N=1
20 FOR K=2 TO 9 @ P=N+(N-M)/F @ X=FNROOT(P,P,FNB(2^K,FVAR)) @ F=(N-M)/(X-N)
30 PRINT "K=";K;"F=";F @ M=N @ N=X @ NEXT K @ END
40 DEF FNB(K,A) @ B=0 @ FOR I=1 TO K @ B=A-B*B @ NEXT I @ FNB=B @ END DEF
```

When run, it will perform 9 iterations of a procedure designed to calculate an increasingly refined value of Feigenbaum's constant, starting from a rough initial approximation (3.2). Just press [RUN] and you'll get these results (K = #iteration, F = estimated value for Feigenbaum's constant):

```
    K            F
-------------------------
    2       3.21851142201
    3       4.38567759894
    4       4.60094927695
    5       4.65513048088
    6       4.66611150124
    7       4.66855134603
    8       4.66905077160
    9       4.66921465563
```

After some 200 seconds, the last result at the end of the 9th iteration is **F = 4.66921+**, correct to 6 digits within 1 ulp (err = 0.00001+). For comparison purposes, the value of Feigenbaum's constant is *4.66920 16091029906718+*.

Within the constraints of HP-71B's 12-digit precision and speed, this is more or less the best result you can get. A further 10th iteration would take much, much longer for no real improvement, as the running time grows exponentially with every iteration (there are a number of easy ways of speeding my 4-liner, of course, but I prefer to keep it at its simplest for didactic purposes, if nothing else).

By the time it reaches the 9th iteration, it is finding a root of a *512th-degree* (!) polynomial, which takes a lot of time and incurs in growing cumulative rounding errors when evaluating it a number of times as part of the search for its root. A 10th iteration would mean solving (i.e.: evaluating repeatedly) a 1,024th-degree (!!) polynomial, and cumulative rounding errors mean 6 correct digits is the best you can do in 12-digit arithmetic.

However, if you have access to an arbitrary precision package either for a PC (Maple, Mathematica, etc) or even your HP-71B, you can easily get more correct digits using this algorithm, albeit at a heavy time penalty.

Best regards from V.

[OT] Re: Feigenbaum number

*Message #2 Posted by **Olivier De Smet** on 3 June 2004, 8:57 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Btw I search actually as much as possible information on the HP8x series (processor, memory controller, ...).

I have an HP85A, an HP86B some 91{3/5}3 HD and a 9121 floppy. To use the 91xx I need an EMS rom, but can't find one. So I think about dis-assembling the rom, patching to allowed relocation and re-assemble sources to allow them to be loaded as binary. I think it's feasible but I need some more information on the 8x series. Actually I have a python programm who can de-assemble an HP8x binary in a quite usefull form. The assembler will be easier to write.

For example after searching the web I still have some questions:

- What does SAD and PAD opcodes exactly ? (octal 232 and 237)

- Is there an opcode for octal 326 and 336 ?

- What are the vectors for interrupts in the capricorn processor ?

- How the rom and ram paging works in an HP86 (preciselly)?

- I partially understood the structure of a binary program, but I miss informations for the rom structure ...

I get some informations from HP journals, from HP75C programs and from assemblers globals (HP85 and HP86)

Thanks in advance if you could help me.

Olivier

Re: [OT] Re: Feigenbaum number

*Message #3 Posted by **Valentin Albillo** on 3 June 2004, 9:34 a.m.,*
in response to message #2 by Olivier De Smet

Hi, Olivier:

Olivier wrote:

"Btw I search actually as much as possible information on the HP8x series (processor, memory controller, ...)."

I did read your request the first time you posted it. Unfortunately, it's been more than 15-18 years since I last had anything to do with an HP86 and all materials I once owned (manuals, ROMs, listings, binaries, etc) are now irretrievably missing. And, regrettably, my memory is of no help for such accurate details after so long a time lapse.

Anyway, should I find any materials of information, by sheer luck, I'll let you know promptly.

Best of lucks in your plausible search and

Best regards from Valentin Albillo

Feigenbaum for the HP-15C [LONG]

*Message #4 Posted by **Valentin Albillo** on 4 June 2004, 6:48 a.m.,*
in response to message #1 by Valentin Albillo

Hi,

Just to prove the point, here's a conversion of my 4-liner HP-71B program to the HP-15C !

Despite the obvious (and large) differences in language level (low-level RPN vs. high-level BASIC), numerical precision (10-digit vs. 12-digit) and above all, speed (15-30x slower), the HP-15C is perfectly up to the task, delivering Feigenbaum's constant correct to 4 digits in 18 min., which fares well compared to the 71B results (6 digits in 3.3 min.).

Also, the HP-15C program is much more compact, at 60+ bytes (47 steps) versus 71B's 174 bytes (4 multi-statement lines), i.e. just 1/3rd the size (RPN strikes again!). Listing follows with a few pertinent comments:

```
01  LBL A       14  LBL 0       25  RCL- 1      36  GTO 0
02  MATRIX 1    15    2         26  RCL 4       37  RTN
03  CLX         16  STOx 5      27  RCL- 0      38  LBL 1
04  STO 1       17  RCL 0       28    /         39  RCL 5
05   7          18  RCL- 1      29  STO 2       40  STO 6
06  STO 3       19  RCL/ 2      30   R/S        41  CLX
07   2          20  RCL+ 0      31  RCL 0       42  LBL 2
08  STO 5       21  ENTER       32  STO 1       43   X^2
09  3.2         22  SOLVE 1     33  RCL 4       44    -
12  STO 2       23  STO 4       34  STO 0       45  DSE 6
13  FIX 6       24  RCL 0       35  DSE 3       46  GTO 2
                                                47   RND
```

To use, simply press **RUN** with no inputs. The program will compute and display the increasingly accurate value of Feigenbaum's constant for each iteration, stopping for you to see it. Press **R/S** to go on with the next iteration. After completing all 7 iterations, the program will stop displaying the last computed superstable *a* value, **a = 1.401146+**, which is the SOLVEd root of the corresponding 256th-degree polynomial.

Results:

```
Iteration   F value   Iteration time
-------------------------------------
    1      3.218510        17 sec.
    2      4.385687        50
    3      4.600945        65
    4      4.655086        83
    5      4.666256       162
    6      4.667830       234
    7      4.669803       477

    Last result is 4.669+, accurate to 4 digits within 1 ulp.
```

Notes:

- As the HP-15C uses 10-digit precision instead of HP-71B's 12-digit, we can't get a result accurate to more than 4-5 significant digits, so just 7 iterations will suffice. Besides, we don't need to find the high-degree polynomials' roots to full 10-digit precision, thus steps **13 FIX 6** and **47 RND** provide early termination for **22 SOLVE 1**, saving *much time* at no cost in final accuracy.

- The high-degree polynomial that is being SOLVEd is computed at steps 38-47. Notice the very tight loop 42-46 which is once again a *superb* practical demonstration of classic RPN's stack capabilities at its best: no matter how high the degree of the polynomial, the repeated subtraction at step 44 *never* exhausts the provision of *a* values, thanks to top-level replication, where T is replicated continuously as the stack

drops and drops. If literally coded in RPL this loop would collapse the stack in no time !

- The ever bigger polynomials' roots are found using the powerful **SOLVE** instruction at step 22. In a running program, SOLVE behaves like a test: if a root is found, the next step is executed, else it is skipped. Normally this must be taken into account, but for this particular program, the root always exists and SOLVE always finds it for the number of iterations considered, so there's no need to code the possibility of it failing.

- Last but not least, notice how every advanced feature of the HP-15C instruction set helps to reduce step count and increase speed, from the matrix instruction at step 02, to recall arithmetic everywhere, to being able to use any numbered register for loop indexing purposes.

In conclusion, I hope you'll agree that the mere fact that this kind of computation is feasible in the HP-15C in reasonable times and with such a small, simple program, is but another proof of the outstanding quality of this wonderful machine. As "Moulin Rouge!"'s Zidler himself would say on behalf of the HP-15C: "A magnificent, opulent, tremendous, stupendous, gargantuan success"

Best regards from V.

Edited: 4 June 2004, 7:55 a.m.

Re: Feigenbaum number

*Message #5 Posted by **helge gabert** on 4 June 2004, 11:38 p.m.,*
in response to message #1 by Valentin Albillo

I ported Valentin's Feigenbaum program to the HP49G+, and it runs a little faster (as it should, compared to the 71B), i.e., 9 iterations in 1 min 35 sec.

However, it seems to be less accurate (more prone to rounding error).

After 7 iterations, F= 4.66854950126, after 8 iterations, F= 4.6690698451, after 9 iterations, F= 4.66915720392. (only accurate to 4 digits)!

Even after 10 iterations, F=4.66903301492. The CAS mode (approximate or exact, Real or Complex) doesn't matter.

Strange, I thought the 49g+ was also using 12 digit precision internally, so the results should be identitical to those obtained on the 71B.

Here is the 49G+ program:

FEIG: << CLLCD TIME 'T' STO 3.2 'F' STO 0. 'M' STO 1. 'N' STO 2. 9. FOR k N M - F / N + 'P' STO << 2. k ^ 'X' FNB EVAL >> 'X' P ROOT 'X' STO N M - X N - / 'F' STO "K = " k + 1. DISP "F = " F + 2. DISP "Time = " TIME T HMS- 100. * + 3. DISP N 'M' STO X 'N' STO NEXT 7. FREEZE >>

FNB: << -> K A << 0 1 K START DUPDUP * NEG A + NIP NEXT >> >>

Any suggestions on how to improve the accuracy?

Re: :)

HP15C will HP do it again?

*Message #1 Posted by **Karl Fred** on 3 June 2004, 5:40 a.m.*

http://hp15c.org/

I don't know if this action will have future, but I will buy 3 of them if HP starts doing them. Please do teh Petition.

Re: HP15C will HP do it again?

*Message #2 Posted by **Namir** on 3 June 2004, 2:01 p.m.,*
in response to message #1 by Karl Fred

Karl,

for HP to budge you need to pledge to buy 300,000 units (and not just 3 units)!!!! Otherwise, let's stop dreaming. We are beginning to look silly and out of touch with the workings of the world!

N

Re: HP15C will HP do it again?

*Message #3 Posted by **marais** on 3 June 2004, 4:11 p.m.,*
in response to message #2 by Namir

Is that so? We are talking about remanufacturing a machine which has already been designed and whose fellow-machine (12C) is still in production. That's what I call a bargain at minimal cost. Take a look at the market, there's NO alternative - and little room for improvement over the 15C.

Re: HP15C will HP do it again? No, but it's so great a dream

*Message #4 Posted by **Etienne VICTORIA** on 3 June 2004, 4:32 p.m.,*
in response to message #3 by marais

Why not dream anyway??

I have signed the petition and would buy :

- 3 if the display is LCD (one for me, one backup, one for my children)

- 5 if the display is LED (just dreaming) as I love my Hp 67s and use my 41 thanks to Clonix

- 0 (Zero, Null, None, nada, aucune...) if HP labels it Hp Platinum...

Thanks to all dreamers and those who make it happen.

Sorry for being long...

cheers from France

Etienne

Re: HP15C will HP do it again? not likely...

Yes, except "the market" is for a few calculator goons like us plus a few techies. Few students will buy it since their math classes have 'tracked' them into TIs.

I suspect the existing 12C will be allowed to die out and be replaced by 12C-Platinum with its Sunplus 65C02 CPU. It'll be harder and harder to get old 12C Coconut CPU silicon produced - fabs w/that old technology have mostly been shut down, and it's not worth the cost of doing a die-shrink. That's a major, costly project that won't be taken on as there's a suitable 'alternate path'.

Yes, the existing 12C case, display, etc. could still be used. You'd have to do some new keycaps and a new silk-screen (or whatever) keypad panel w/shifted function legends. Nonrecurring setup/production (NRE) costs for these 2 items alone would pretty high and would require quite a few calcs to be sold at reasonable margin to suitably amortize these costs.

Also, remember that there's probably NO ONE at HP who understands the 15C firmware anymore, or even the old Coconut CPU. So it'd be officially difficult for them to write a true CPU emulator on the SunPlus, and they'd have to rewrite the new "15C-Platinum" code from scratch in mixed C and 6502 assembly. That's more error prone than emulation - look at the 12C vs 12C Platinum.

Even if the 15C calc hardware and labor costs were absolutely FREE - that is, Carly just magically found a warehouse full of new, assembled HP15Cs - the sales, marketing, support, packaging and distribution costs to re-roll out this calc again could be prohibitive for small volumes.

Too many folks have been blindsided by AOS & formula entry calcs to even know/remember why RPN is good and for it to have a big following. That's why I'm so surprised they put a new RPN calc out (33S), but then that's just one calc out of their line. If HP could sell 200K-300K of these "new" 15Cs it might get their attention, but I'd betcha marketing surveys would not bear this out.

Yours are very good words, Bill!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2004, 2:56 a.m.,*
in response to message #5 by Bill Wiese

Hello, Bill;

although I'd like to think of people needing computing tools like the HP15C, HP16C and the like, I must admit that I no longer "dream" of it. Today's needings in most cases are beyond calculators abilities, and current computing devices show amazing resources.

OK, ok, don't throw stones on me, folks, please! (I hope this is the correct construction, so I'll deserve it only once...;) I own about 40 calculators and I'd never trade any of them for these new gadgets. I'm still reading manuals and learning how to use some earlier models "in deep" (HP71B, HP75D), mostly because I like reading those manuals: good reading, conciseness, care for the reader and user... These are not found in the new manuals and guides.

So I look the new PDA's and palms and see nothing but consuming products, graphic O.S. oriented "driven" by non-tech (and don't wannabe) users that simply touch their palms screens with a small stylus and see what's going on around the world without leaving their seats. What to do? That's today's needings, and Compaq, HP and others are keeping track with these consumers. I'm not one of them, but surely there are thousands of them that actually do not even know about us, Dave Hicks, the MoHPC and this Forum. Unless we are a great market opportunity... 300,000 units of HP15C's to be sold here? Yeah, maybe they "hear" us.

I'd like to be more "positive" about this, but I see no other way than going the deepest possible into the existing "live" units and try a "reversed-engineering", custom development. What amuses me is the fact that most of us (I include myself) are trying to create with today available technology what HP had already achieved ten, fifteen, twenty years ago. And in some cases, wee still need to sweat and get hard work to achieve.

That's technology. Amazing technology. and many of us understand what does it mean. In fact, this

is the issue here. The calculators are, in fact, the materialization of a whole process where brain activity and brainy guys are the actual master pieces. And the calculators are what we have in order to preserve their memories, and we don't actually want these memories to be lost.

Cheers.

Luiz (Brazil)

in response to message #2 by Raymond Del Tondo

Notice it has the large ENTER above, and a small one below. . . I guess that will satisfy everyone. . . =)

Re: HPcalc.org's intersting Update

*Message #4 Posted by **Matt Kernal (US)** on 3 June 2004, 3:06 p.m.,*
in response to message #3 by Tim Wessman

Can't figure out why anyone would need a Space key as big as Texas. Please enlighten me.

Also, you'd better hold on to it tight... looks pretty top-heavy with the keyboard open, don'it? Not to mention (how much worse) with the Expansion Skid attached.

Where can I buy one?!?

Matt

p.s. I know "Maths" is a common European/Australian expression for Mathematics, but feel free to save a byte (and some ink) on the american model by shortening "MathsExplorer" down to "MathExplorer", if for no other reason than just plain easier pronunciation. It just flows smoother off the tongue. I guess this would be a comment for JYA's survey, huh?

Oh, BTW, thanks to the immediacy of the E-mail culture, it's typical for americans (sadly, these days) to shorten words down to the least possible number of words/letters that still conveys a phrase or

meaning, like BTW (By The Way) or MathExplorer (Mathematics Explorer) above :-).

in response to message #1 by Tim Wessman

I think the "possible designs" are ugly. But it doesn't really matter to me, as I don't anticipate buying one anyway; too many "bells and whistles" for my tastes, though I *might* be a little interested if not for the objectionable shape.

Re: HPcalc.org's intersting Update

*Message #13 Posted by **Steve S** on 3 June 2004, 6:23 p.m.,*
in response to message #12 by Wayne Brown

Sadly, count me among those that don't particularly like this design. Having used handheld analytical instruments, I've got a just a little experience with fold-down keyboards. Holding the device near its center-of-mass and pressing keys near the lower edge of the fold-down leads to a very "spongy" feeling regardless of how crisp the key is; you simply cant hold the device rigidly.

I, for one, hope that the final design isn't along these lines, or (unlikely, I know) offers an alternate form factor.

All I ask is that the ir transmitter not be crippled. I consider the ability to use the device as a remote control a necessity.

Ugly device in a poor design

*Message #24 Posted by **Marx Pio** on 4 June 2004, 11:54 p.m.,*
in response to message #20 by Eddie Shore

IMHO. I think that it looks like the old(really old) PT550 cel phone from motorola. ;).The fold keyboard is a bad choice it makes this thing too long when open and you have to be very carefully when handling it. They should include a mini trackball or mini joystick(like the Etrex Vista GPS) instead the four arrows for direction. The LCD should be designed in order to be positioned at the desired angle for best viewing. I can

design a better device in fews sketchs. If they want, I'll do it for free... ;)

Pio

Re: Ugly device in a poor design

*Message #25 Posted by **Jean-Yves Avenard** on 6 June 2004, 1:59 a.m.,*
in response to message #24 by Marx Pio

Don't get fooled with the scale. Opened the device is less long than a 49G!

Also the rendering is with a 3.5" screen, final product is using a 3" screen, it is not wider around the screen area.

I'm sorry if it's technically quite difficult to put so much features and a big screen in something that has to look different than a HP15C

Re: Ugly device in a poor design

*Message #26 Posted by **Wayne Brown** on 6 June 2004, 8:02 a.m.,*
in response to message #25 by Jean-Yves Avenard

> Quote:
>
> Also the rendering is with a 3.5" screen, final product is using a 3" screen, it is not wider around the screen area.

Do you mean that it has a rectangular form factor, with straight sides and no bulges or curves around the screen? That would be a considerable improvement.

Re: Ugly device in a poor design

*Message #27 Posted by **Jean-Yves Avenard** on 6 June 2004, 12:46 p.m.,*
in response to message #26 by Wayne Brown

With a 3" screen then yes.

There's very little you can do to fit a 3.5" screen except if you want a keyboard overly large that doesn't fit comfortably in the hand... So you may find it ugly but if you have a better solution, please feel free to submit it!

Re: Ugly device in a poor design

*Message #28 Posted by **Wayne Brown** on 6 June 2004, 3:57 p.m.,*
in response to message #27 by Jean-Yves Avenard

In that case, I'm glad you switched to a 3" screen. Perhaps I'll be interested in this device after all...

Pretty Device with a Good Design

```
Jean-Yves Avenard aka Gherkin wrote:
" if you have a better solution, please feel free to submit it!"
```

```
I guess it's too late to persuade you to change the design at this point.
If do, then I suggest the following for the next generation of Hydrix
calculatrice:
1) Put a second row of function keys below the LCD and a second menu line
in the display.
   This will help if/when you deside to do a vertical model similar to the
HP-200LX,
   because you can then easily have F1...F12
   and that is needed with many terminal programs, etc.
2) Use a flip-up LCD - light and thin - over the keyboard
   That design would make the device even smaller and
   would allow many other things to be done easier
   (sled, batteries, SDIO card location, etc.)
   It would be also quite easy to use a color screen later on and
   any repairs to the LCD would be much easier.
3) SOFTWARE:
   The key assignment routine should use strings for key locations
   so that if you will have a different layout later
   the programs will still function without a rewrite.
   KEY$ or KEYSTRING
   => "A"..."Z", "SPACE", "ENTER", "0"..."9",
   The shift keys and cursor keys might be as follows:
   "ALPHA", "LS", "RS", "ON" and "UP", "DOWN", LEFT", "RIGHT"
# VPNh
```

Re: HPcalc.org's intersting Update

*Message #30 Posted by **Tom (UK)** on 8 June 2004, 12:22 p.m.,*
in response to message #1 by Tim Wessman

I would be more interested if it had an RPN calculator (67/15/42 etc) rather than an RPL (48/49) version.

For a neat case design look no further than the Psion 3/5 series of PDAs - not sure if it would work in the 'vertical' or handheld format.

I guess the folding keyboard is so the display can be seen at all times (with a few keys operable) so alarms / quick functions can be done without opening the case. If the display folded over, the device would have to be opened to see what was causing an alarm etc.

Also price is listed as >$350. This would be OK if the 'correct' conversion to Euros / UK Pounds was done, ie from about 300 Euros or 200 UK Pounds. I don't feel like buying any product if the conversion looks poor. Just look at books (VAT free in the UK) - quite often the Dollar and Pound price is the same!

Which HP

*Message #1 Posted by **Joe Edwards** on 2 June 2004, 11:23 p.m.*

Hey folks, I recently tried a few different models of HP calcs. I find that I like the Voyager and Pioneer series calcs. I have 2 HP 27s (with one more on the way) and a 42s. I have been looking at the 11,15, and 16c models as well. I am sure there are folks who would choose one style over the other. I am curious as to the advantages of both types, Pioneers vs. Voyagers. If you have an opinion, viewpoint or story regarding the use of either type, I would love to hear it. I have pretty much settled on the 27s as my day to day machine, but the Voyagers seem...interesting. Any info on the Voyagers would be appreciated. Thanks in advance.

Joe

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2004, 12:29 a.m.,*
in response to message #1 by Joe Edwards

Hi;

Let me just start by mentioning that all the text below is based on the newer, not hard to find LCD units.

I have some HP calcs as well, and based on your current calculators and on the fact you use one of the algebraic only as for daily use, you have no specific preference for algebraic or RPN, right?

Anyway, let's put things in this perspective: HP calculators are mostly RPN-based, and some recent models are either algebraic only (some financial models like the HP10B, HP14B, some scientific ones like the HP20S, the fin/sci units like the HP27S, and some non-HP inside, like the HP6S, HP30S) or offer them both (like the financial models HP17B/19B and HP12C Platinum, and some scientific ones, like the HP49 and the HP33S) giving the user the chance to use the calculator the way he wishes or finds better. I guess that having a choice, an option, is always better than having only one possibility.

About functionality: many financial models are resourceful, with extra clock and calendar like the HP17B/BII, HP18C and HP19B/BII and also the new 'plus' ones, while others offer some sort of "basic pack", like the HP14B, HP10B and HP10BII. But the one with the most comprehensible set of useful and handy financial tools is the HP12C. I'm mentioning the financial ones because you use an HP27S daily and it offers almost all resources available with the HP12C plus the scientific ones.

If you are fond to scientific calculators as well, the choices are bigger, if we consider that each family of HP calculators has more scientific models than financial ones. As a reference, let's take the Voyagers: five different models, only one is a financial model while others are scientific. The HP10C is an interesting calculator. It has all basic scientific functions plus programmability. It is a "simple set" taken from the HP11C, an Advanced Scientific Calculator. I'd guess that the HP11C is one of the golden choices for scientists, along with many other models like the HP65/67/97, HP55, HP34C, HP41, HP42S and others. I take these models, as "flat" units (no extra devices, only the calculator as is) as the most impressive models ever made. But we must add the extremely powerful HP15C. This is a hell-of-a calculator. Matrix operations with the ability to handle data from complex matrices, full-operational complex algebra, numerical root finder (SOLVE) and integration. Programming skills are easy to achieve and all possible functions are available in the keyboard, meaning you don't need menu-driven procedures.

The HP16C is a class for itself. The only Computer Scientist exclusive calculator designed by HP. It's hard to describe any features in the HP16C without mentioning the others: operation in any of the four numeric bases with TRUE 64 bit maximum word size in any of them, extensive bit manipulation with rotating and shifting (carry bit included or not), Boolean algebra and arithmetic, unsigned or 1's or 2's complement mode representation, double-precision addition, multiplication and reminder (up to 128 bits), programmable... and can be used as a floating-point, regular RPN calculator anytime you need to. Amazing!

The HP42S is a heavy post-implementation of the giant HP41 with the lack of I/O ports ("If I only had a port..."). I guess that the only one that beats the HP15C when complex matrix operations are the issue is the HP42S. I know that the HP15C is THE calculator for many contributors in here, but I cannot dare denying some facts related to the HP42S: it handles matrices with complex numbers while the HP15C handles real representations equivalent to complex matrices (the HP15C software design is far beyond clever, indeed, I am completely convinced about that, but the HP42S goes further...); it handles complex numbers without the need to activate a complex mode, meaning complex numbers and real-only numbers share stack registers at the same time (I am aware of the fact that the HP42S is actually a big RPN emulator running in an RPL-oriented processor, and that the former concepts applied to fixed four registers stack, RPN calculators do not apply to the HP42S, with a "virtual" stack that mainly handles pointers to objects). The HP42S programming follows the same RPN paradigm found in earlier RPN models, meaning if you know how to write a program for any RPN model, you'll easily write programs to the others.

I guess I'd write some more, but from now on I'd need reading some manuals or take some calculators in hands to check for available resources or particular operation, but I guess others will add many new information as well. I hope I did not loose focus.

Best regards and good "hunting" for other models.

Luiz (Brazil)

Veli-Pekka Nousiainen opined,

> Quote:
>
> Then maybe a new HP-43S is what we really need

If we want to design something new, this is what I would do. Take the form factor of the 15C, add a second line to the display which will easily fit. Put the functions of the 42S with soft menus and a dot matrix display. Then add the unit conversion and unit calculation ability of the 48SX. Give it a long battery life, a little more speed than the 42s, lots more memory, add the functions of the 16C (mostly via soft menus. A variable size stack would be a nice addition too. Maybe a mini USB connection or a SD slot so data and programs could easily be backed up on a PC. Now that is about the perfect calculator. Anything that I couldn't do with it I would be doing on my desktop computer.

http://cdw.homelinux.com:8087/hp/hp15cII.jpg

Voyagers, rank-ordered

*Message #6 Posted by **Karl Schneider** on 3 June 2004, 3:50 a.m.,*
in response to message #1 by Joe Edwards

Joe --

You've been visting for quite a while, now... god to see that you are still interested and involved in the hobby.

The Pioneers, introduced in 1988, were the successors to the Voyagers, which were introduced in 1981-82. The Pioneers are a little longer, and feature the Saturn processor that is about 12x as fast as the one in the Voyagers. Also, there are 11 models of Pioneers: 10B, 14B, 17B, 17BII, 20S, 21S, 22S, 27S, 32S, 32SII, and 42S. ("B" = business; "S" = scientific)

There are only five Voyager models: 10C, 11C, 12C, 15C, and 16C. ("C" = continuous memory). All are scientific models except the business 12C.

If you are collecting, the "must-haves" are the 15C and 16C. These are, respectively, the most-advanced and the most-distinctive models.

The 10C, an acceptable workaday calc, is only a stripped-down 11C that didn't sell very well during its brief production run from 1982-84. Although it features that fine Voyager quality of construction, its limited function set and crude programming capabilities render it a substandard product. It is expensive on eBay due to

its rarity.

The 11C is a fine scientific calc, implementing the functionality of the 34C (but omitting Solve and Integrate) in the excellent Voyager package.

The 12C is the commonplace and classy-looking business calc that is still manufactured today, with lower quality. It is useful with general business and calendar functions, but rather slow. It shares the crude programming capability of the 10C.

The 15C is a masterpiece of engineering -- alongside the 42S as perhaps the finest non-expandable scientific calculators ever made. It is the 11C, expertly developed to its ultimate potential. It added the Solve and Integrate functions from the 34C, as well as complete complex-number support and matrix functions, both built-in and easy to use. More user RAM, 4 more conditional tests, and direct exchange with any numbered register were also added. Even with all this additional development, the calc is bug-free, and the manual is near-flawless. There is also a supplementary Advanced Functions Handbook that is worth getting.

The 16C is unique -- a computer-science calc developed for programmers of low-level hardware. There is nothing else like it. It has a full set of bit-manipulation and logic functions, variable word sizes from 1 to 64 bits, and can represent integers in base-2, base-8, base-10, and base-16 as unsigned, 1's-complement, or 2's-complement. (Many of the Pioneers and other manufacturers' calcs offer integer representation in base {2, 8, 16}, but only in 2's-complement and a fixed word size.)

Expect to pay more than $150 on eBay for a good-looking specimen with manual for any of these models, except the 12C ($50 or so).

I have the 12C (from local seller, $50); the 15C (bought new in 1983 for $109), and the 16C (eBay, $186). I refuse to pay eBay prices for the 10C and 11C, but I'd buy them for much less.

> {VPN}
> ```

What the heck is that nonsense supposed to mean, Veli-Pekka?

No, I made no *ERROR* or <SYSTEM FAILURE>. I simply implied that the functionality set of the 34C (introduced in 1979) was the starting point for that of the 11C (introduced in early 1982), and the "Compare Features" function of the MoHPC website certainly bears that out.

I find it not coincidental that the following features are exactly or nearly the same on the 34C and 11C, but are different on the 15C (introduced in late 1982):

- Automatic register-to-programming memory conversion
- Same 8 conditional tests
- "x<>(i)" provided, but no direct exchange-x-with-numbered-register function
- 210/203 bytes of RAM

The 11C had a few things that the 34C did not (e.g, hyperbolics, permutation and combination, random #), but still did not quite stack up to the 34C in every aspect.

An HP Journal article (available on the MoHPC CD/DVD set) makes clear that the 15C was developed from the 11C, with the following specific objectives:

- Implementing the 34C's Solve and Integrate functions
- Implementing matrix- and complex-number functionality

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 4 June 2004, 2:25 a.m.,*
in response to message #8 by Karl Schneider

Hi, Karl;

just to add that I also consider the HP34C closer to the HP11C instead of being closer to the HP15C. About the extra hyperbolic with inverses, combinational analysis related functions (nCr, nPr) and built-in pseudo Random-number generator (I guess this is the cause of the missing 7 bytes/1 register in the HP11C) you mentioned, I'd also add the extra three direct-access labels (A to E in the HP11C against the single pair A and B in the HP34C) and the USER mode. The only reductions suffered in the HP11C related to the HP34C I can think of are related to flags (two in the HP11C against four in the HP34C) and the display control [h][DSPI] function. SOLVE and integration are not counted here, of course.

If we consider available resources, I'd classify the HP34C "in between" both 11C and 15C. Closer to the HP11C, I'd dare saying, but still "in between".

Cheers.

in response to message #9 by Vieira, Luiz C. (Brazil)

Luiz and Veli-Pekka --

I apologize for the "snarkiness" that my posts exhibit from time to time, but quasi-coherent challenges or criticisms do irritate me.

My statement was not whether the 34C was *more like* the 11C or the 15C; it was that the 11C was *developed from* the 34C.

The functional similarities I pointed out strongly suggest that a fair amount of ROM code (or at least, the underlying algorithms) from the 34C was "borrowed" for development of the 11C. It would not surprise me, either, if HP deliberately omitted Solve and Integrate from the 11C, so as to "leave something" for the 34C until the 15C could be released.

Remember: in 1982, HP re-engineered the 34C to fix its primary design flaw of unsoldered circuits. Giving Solve and Integrate to the 11C might have sabotaged HP's 34C efforts, and cut into subsequent sales of the 15C.

When I bought my 15C in November 1983, the improved 34C was still offered for sale. In fact, the 34C is what I had intended to buy, until the salesman showed me something better...

Makes perfect sense. (nt)

Maybe not the 16C

*Message #13 Posted by **Cameron** on 3 June 2004, 7:27 a.m.,*
in response to message #1 by Joe Edwards

Hello Joe. I can't improve on the excellent dissertations offered by Luiz and Karl. Chris is biased <VBG> so take what he says with some salt (however almost everyone agrees with him so you won't need too much salt ;-)

The 16C, as Luiz and Karl have described is both unique and highly specialised. This makes it expensive and probably less than useful unless you actually need it--and then you can hardly work without it!

I encourage you to purchase Dave's (the MoHPC curator) CD or DVD set. The discs contain the manuals for the calulators you're considering and a wealth of supplementary material. You'll need the manuals, for any of the calculators, before you can seriously evaluate them.

If you want to try a 16C before you buy, I have a modest simulator that you can download and run on your windows desktop or PPC. You'll need the 16C Owner's Handbook to make any sense of it though.

Cameron

Bring Back the HP 15C

Re: Which HP

*Message #15 Posted by **bill platt** on 3 June 2004, 10:41 a.m.,*
in response to message #1 by Joe Edwards

I can't decide what I like best--which is why my collection keeps growing!

Seriously though: the Pioneers are much faster than the Voyagers. This is sometimes important, but often not--depends on what you are up to!

I absolutely LOVE the user mode in the Voyagers--giving one-button custom functions---in the Pioneers, you have to do Xeq __ (2 buttons) except for the one program that is at the top of the list, which will work with R/S.

The program/memory management of the 32s is great--I like it very much more than the voyagers, which are keycode machines.

But you like the 27s---a model I would love to see. I have a feeling I would like it, too. I like the solver in the 17bii very much, and I wonder if the 27s feels similar?

Since you have so many 27S machines, would you mind swapping with me for a while?

take your pick:

```
32s 50th anniversary
11c
48gx with expansion and MetaKernel and Erable ALG48
20s
17bii
12c
10b
(I'd loan you a 15c but its already loaned out)
(I'd loan you my new 33s but I dropped it on the road and watched it get picked up!)
```

Best regards,

Bill

HP49G+, is it good in Statistics?

*Message #1 Posted by **Karl Fred** on 2 June 2004, 7:22 p.m.*

That's my question, just for knowing. Thanks.

Re: HP49G+, is it good in Statistics?

*Message #2 Posted by **Tim Wessman** on 2 June 2004, 8:34 p.m.,*
in response to message #1 by Karl Fred

Built in capabilities, not really. With my statpack49, equal/better than the TI-83. With StatPro49, the best statistics calculator around.

Re: HP49G+, is it good in Statistics?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2004, 11:29 p.m.,*
in response to message #2 by Tim Wessman

Hi;

are these packs available? When you mention "my Statpack49", are you refering to some pack deveopped by your own? I'd like to know if they (any of them) also deal with Sthocastic Statistics as well.

Cheers.

Luiz (Brazil)

Re: HP49G+, is it good in Statistics?

*Message #4 Posted by **Tim Wessman** on 3 June 2004, 12:49 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Yes. It is basically a clone of the 83's stat capability. StatPro49 was made by Scott Guth, both are availible on hpcalc.org. As to your second question, I don't really ahve muhc knowledge about statistics, so I cant really say.

Many thanks!

I'd like to know what you think. (TTF related, long)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2004, 12:59 p.m.*

Hi, all;

except for some time dedicated to repair calculators from dearest friends (hi, M.B. and J.E.) , I'm taking part of my spare time to build the TTF I mentioned previously. I took some time delving into the matter of creating characters in True-Type fonts® with codes that are normally used as reference to control commands in most advanced MS Windows® word processors. This particular issue has already been resolved.

In spite of this fact, rearranging characters to meet the needs of HP42S users was sort of a fight: I was not able to find the "perfect" combination, so I organized characters and their codes the best way I could.

Now it's time to find the best balance between "extended" features and a set of "hard to see" characters. I'm "rebuilding" most of the HP DotMatrix 1 Menu font in order to match the new menu characters available with the HP49G-series. The fact is that when I first created this font I had an HP28S, an HP48S and an HP42S. These are the ones I had (at that time) with Menu features. Later I had the chance to have an HP48G and the characteristics remain.

For these models, the menu labels use only upper case, unaccented alphabet characters. Lower-case, accented characters are replaced by their upper-case unaccented equivalents. Also, most of the "Greek" and extended characters available as size 2 and 3 are not available as size 1, so I simply did not consider them when I created the first "version".

The HP49G has a set of lower-case characters already defined. So, I'm adding all the lower-case and some "extended" characters to the existing TTF. BUT there are some issues I'd like to discuss with you so I can hear (read) other thoughts and suggestions.

Many characters in this particular TTF have their size variable to match the space occupied by this character when in a sequence. A "safe" 1-column is kept at the left of each character, but this helps nothing with regard to the label size and the right-side conclusion. Because of this, three "dummy" characters were added to the font: one with a single dot column (code #192d or character À), another with a two-column dot matrix (code #193d or character Á) and a third one with a four-column dot matrix (code #194d, or character Â). These column-related characters are used to adjust label size if - and when - needed.

Another feature is the possibility of adding the directory identifier (overbar) with any label. I draw two 0-size characters that are written at the left size of the cursor position (sort of a backward typing).I draw two of them - one with two dots (code #178d, character ²) and another with four (code #179, or character ³). These "backward" characters are suitable to compose directory names (HP28S, 48 and 49). All of these characters are available with the sample font already available for download.

The choice for the codes was based on the fact that the characters "pointed" by them already had their upper-case counterpart, so it would not be a big problem to use the other ones (A, 2 and 3). What I'm worried about now re simply the new set codes. Some of the extended characters (from 128d to 255d) are unreadable when part of a menu label, others look exactly the same. If you are willing to conform, try this simple program:

```
« {"string with the characters you need" "another string" "..."} MENU»
```

You can check all lower-case accented o's: all of them look exactly the same in an HP49G menu label.

I started with all lower case letters, then I used CHARS to add all others, from 128 to 255. CHARS is a lot welcome in these moments... In the HP48, I can "stuff" about three to four characters in one menu label. But when we are using an HP49, four to five characters can fit in a single menu label (it's possible to create a menu label with seven upper-case I's or "!" or "|" or any mix of them). This is because in the HP49G some menu characters use less columns than the same ones in the HP48. We can take as an example the symbol for PI in a menu label: in the HP49 it uses three columns, and in the HP48 it uses five Another one is the Sigma Greek letter used to identify statistics and summations: it is one column narrower in an HP49G menu label (it looses the leftmost column).

Two questions arise from these facts: which set to use?

I made a decision, but I would like to know your thoughts as well: maybe there is a better choice. I think that keeping the existing characters and adding only the new ones that actually do not exist in the original HP48 set will allow any existing menu label to be precisely reproduced with this font. Also, building menu labels with any new character will also be possible. BUT HP49G menu labels with a mix of existing and new characters will not look exactly the same. And there is the issue of the extra five characters (directory bars and adjusting columns) that must be placed with a valid code. So: where to place them? There are some new characters that are somehow confusing and I guess they add no extra functionality as menu labels: for example; try ¼, ½ and ¾. They are unreadable as an HP49G menu-label character.

I'll announce the DotMatrix Menu TTF with "my understanding" of a better solution as soon as it is ready (possibly today later) so you can "taste" it as it is. As you see other, better possibilities, let me know so I can give them a try. Till then, please have a look at your HP48 and HP49G menu labels and reason about this.

I'm sorry for the extension of this text, but I take documentation very seriously, and when a document has a pleasant good look, it is easier to read it, it doesn't tire the reader so much. So I like to know what others think of using specific TTF like the ones I'm creating, and I'm creating these TTF files not only for my own use, instead I prefer having them available to anyone that wants to use them. I'm only one, you are many, so I believe that it's better to create a TTF that fits your needs instead of simply offering my version and expect you all to adequate your needs to my TTF.

Cheers and thank you.

Luiz (Brazil)

Help help help !!!!! please

*Message #8 Posted by **Harrington** on 4 June 2004, 12:57 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

I see all the syntax my question is here : where should I type or key in this BYTEs=> ???Capitalization MUST be as shown ** Program Frac: << "Enter Fraction" { "" ALG V } INPUT OBJ-> -> a << a PARTFRAC >> >> <=======)I know this is the program BYTES => #B61Ch 78. <==========) now this is my question key in after ' <=======) key what in 1/(x^2+3*x+2) 1/(X^2+3*X+2 Press ENTER Result: '1/(1+X)-1/(2+X)' {VPN} what is happening is that I don know where that supposed to be in program clearify a bit here

How does BYTES => #B61Ch 78 slove this problem

*Message #9 Posted by **Harrington** on 4 June 2004, 11:55 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

I get the memory location how does it slove the problem. why should I be worried about this location?

Re: How does BYTES => #B61Ch 78 slove this problem

*Message #10 Posted by **Cameron** on 5 June 2004, 1:27 a.m.,*
in response to message #9 by Harrington

This isn't my bag, but...

It doesn't *solve* the problem. It's not supposed to.

And it's not a "memory location". I suspect that you've gone off on a tangent. It's not machine code; it's not tricky programming. It is simply a mechanism for confirming that you have keyed in VPN's

program correctly.

The first number (#B61Ch) is a checksum of the program you keyed in (in base 16). The second number is the amount of storage consumed by the program. If you get the same numbers as VPN you know you've keyed it in correctly.

Try an experiment. VPN stressed that you must match the character case of his listing *exactly*. Re-key the program and change just one character. The program won't work (of course) but when you use BYTES you will get a *different* value to VPN's. That tells you that you made a mistake (although it doesn't show you what the mistake was).

I hope that helped.

Cameron

PS: I know nothing of these new-fangled RPL calculators so I probably can't help you much more.

xyzzy

Edited: 5 June 2004, 1:29 a.m.

I keyed in these correctly(1/(x^2+3*x+2))

*Message #11 Posted by **Harrington** on 5 June 2004, 3:10 a.m.,*
in response to message #10 by Cameron

what is interesting is that hp49G+ was programed under this condtion for built in function of this kind.n(x)/d(x) where n(x)=0 and d(x)=0 are true .cuz it work for any function of this kind x^2+3x+6/(x^3+3*4*x+8) rational function will pass, any thing short will not perhap I have a bug in my calculator ..... I typed this proble over and over .

please help see if this work in ya calculator as well mine it is not while I'm posting this again.

Creating NiCD pack for HP-41

*Message #1 Posted by **Cococollector (Germany)** on 2 June 2004, 10:59 a.m.*

Hi,

as I've got several HP-41s, which I activate only from time to time, maintaining battery power is either a hassle. Either I switch calcs with only one complete pack or I have to buy quite a lot of these expensive N cells. I wasn't yet lucky (or willing) enough to get a NiCD rechargeable pack.

Has anybody come around DIY instructions how build a NiCD pack from a normal battery holder? The only things I've seen so far were REbuild instructions, but, as it says: rebuilding is not possible without the building :-)

N sized cells are not too hard to find, it's the connection to the charger, that troubles me.

Thanks for any help. Klaus.

Re: Creating NiCD pack for HP-41

*Message #2 Posted by **David Smith** on 2 June 2004, 11:16 a.m.,*
in response to message #1 by Cococollector (Germany)

Easy, just buy four nicad "N" cells and an external charger. If you need to keep the machine alive while they charge buy eight.

Re: Creating NiCD pack for HP-41

*Message #3 Posted by **Richard Garner** on 2 June 2004, 12:00 p.m.,*
in response to message #2 by David Smith

I found, that as long as you don't press any keys, especially the ON key, the HP-41 will hold its memory for at least a day or longer without batteries. This is for a unit that is used daily though not one that is in storage and is powered up on occasions to keep the circuits alive.

Re: Creating NiCD pack for HP-41

*Message #4 Posted by **David Smith** on 3 June 2004, 12:50 p.m.,*
in response to message #3 by Richard Garner

Most HP41C machines can hold up for several days without batteries. CV's at least a week. I have CX machines that lasted over a month.

Re: Creating NiCD pack for HP-41

*Message #5 Posted by **Miki Mihajlovic** on 2 June 2004, 3:33 p.m.,*
in response to message #2 by David Smith

I agree with David. In North America Radio Shack caries those (part no: 23-521), they are ~$9 for two

NiMH N batteries (in Canadian dollars). As for the charger I use the regular Energizer (or Duracell) with battery charging module for N cells. That is just a spacer to convert N size into AA size, also sold at Radio Shack for $2 for 4 pieces (part no: 23-137).

NiCd AAA on 49G+ or 48GII

*Message #1 Posted by **Leucas** on 2 June 2004, 10:27 a.m.*

Good afternoon...

I have both calculators, and I use too much both.

Can I use NiCd AAA rechargeable normaly? I haven't found nothing in internet about it... Can these calculators work with a 1,2V baterry or they will get "low batt" error??

ps: here, in Brazil, AAA alcaline are much expensive for an eletrical engeneering student... so I designed a AAA/AA NiCd charger, it works well with my discman's baterry...

Thanks

Leonardo Leucas

Re: NiCd AAA on 49G+ or 48GII

*Message #2 Posted by **Dave** on 2 June 2004, 10:54 a.m.,*
in response to message #1 by Leucas

I am sure you will be fine, but... NiCads voltages drop rapidly so you will not have much warning as they lose charge. Of course I think there are backup batteries in the newer designs and you can always make sure you keep a charged set handy...

Actually nicad voltage starts off at around 1.4V, drops rapidly to its nominal 1.2V where it stays until just before they die when it drops to 1.0V

Why not recharge alkalines?

*Message #4 Posted by **Tom (UK)** on 2 June 2004, 12:52 p.m.,*
in response to message #1 by Leucas

You CAN recharge alkaline batteries but only with a special charger designed for this. The manufacturers don't like this as they then sell less batteries. In the UK stern warnings are given not to recharge alkalines at all - I'm not sure if other countries have these warnings - Germany is more 'green' and may have a different warning. I think the chargers use a charge/dicharge cycle to build up energy in the battery.

There are some 'rules' you must try to follow, one of them is to not alow the batteries to fall below 30% charge as they won't recharge very well if you allow them to fall below this. Estimating this is difficult so I usually recharge them after every few weeks. You could look at the battery voltage to estimate the remaining charge,

however the battery indicator in the HP calcs is far too late to use for this.

Perhaps a small program could be written for the HP48/49 to estimate the running time and give an output of charge left (assuming fully charges batteries were inserted) an alarm could be made whe 70% discharge was reached.

Recharging only works 10 to 20 times (but thats 5 to 10 times more use than if you threw them away after one complete discharge).

Just like NiCads, you will need to keep a spare set of batteries to use while the others are charging.

Please remember: DO NOT RECHARGE ALKALINES IN A NiCad CHARGER!

Re: Why not recharge alkalines?

*Message #5 Posted by **Gordon Dyer** on 2 June 2004, 3:43 p.m.,*
in response to message #4 by Tom (UK)

I have an Alkaline re-charger and it works well on good quality alkalines (e.g. standard Duracell). Some cheap alkalines like Rayovac have a habit of leaking easily so be careful! Special high power alkalines like Duracell Ultra do not seem to re-charge so well.
Usually standard Duracell alkalines will re-charge 3 or 4 times, although the charge retained reduces a lot with each re-charge. I think I reduce my battery cost by 50% to 70% using the re-charger.

Re: NiCd AAA on 49G+ or 48GII

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 June 2004, 4:27 p.m.,*
in response to message #1 by Leucas

Olá, Leo Leucas; tudo bem? (is it everythign fine?)

Just to let you know that I found some interesting NiMH AAA cells that were no so cheap, but also not too expensive (if we consider that they will last longer than a regualr Alkaline pack...) It's the SONY® Cyber-shot (DI HR 11/45, 1.2V 750mAh). It works pretty fine with the HP49G, I guess it will do also well with the HP49G+.

If you want to go for BR/PO and further contacts, feel free: lcvieira@quantica.com.br (e vamos papear...)

Good luck and success.

Bring Back the HP 15C Update!

*Message #1 Posted by **Chris Woodhouse** on 2 June 2004, 9:02 a.m.*

Great news! I finally have the site moved to a real server. So you will no longer need the :8080 port number to access the site. I just changed the DNS entry late last night so some DNS servers may not be updated yet but they should be soon. To go to the site just go to hp15c.org The port number will still work too but if you have a link to it somewhere updated so the port number isn't there anymore.

HP49G+ & HP82240A IR-Printer

*Message #1 Posted by **Michael Kaiser (Germany)** on 1 June 2004, 4:07 a.m.*

Hello out there,

I newly bought an HP49G+ and tried to print with my old HP82240A IR-Printer - at first it didn't work at all but now - after a few weeks and after using the OLDPRT command - it works. BUT: the maximum possible distance between printer and calculator is 45 mm (less than 2") (the batteries of both machines are new - and the HP82240A works well together with my old HP28C from a distance from more than 500 mm). Who knows something about that - Has it to do with the difference between IR and IrDA ?

Thanks for your helpfull information!

Edited: 1 June 2004, 6:17 a.m. after one or more responses were posted

Re: HP49G+ & HP82240A IR-Printer

It's just the way it is.
Well, at least the basic system voltage is down to 3.3_V from 5.0_V
Remeber that you still don't need any wires,
Remeber to set the print delay, too.
{VPN}

Is it possible that...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2004, 6:39 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

... the HP49G+ uses less power when transmitting?

I mean, given the lower distance, is it possible that the IR emitter consumes less power? I completely agree with you, VPN, that there are many advantages in using IR "connection", and I myself prefer not worring about wires and physical connections that must be made and undone anytime we want to send (or even receive) data. Did anyone measure the current when the HP49G+ is using IR for output data? And when the HP48 is also sending so we can compare?

I remember that some people complained about the power consumption observed when the HP48 was constantly used to transmit through the IR output (not here at the MoHPC), and that there was no such a reason (except in some particular cases) to use the printer so far from it. Maybe people at Kinpo (with th eHP staff) decided that battery life was more important than printing with a printer far from the calculator.

Anyone measuring the current?

Cheers.

33E with bad keyboard

*Message #1 Posted by **Chris Woodhouse** on 1 June 2004, 12:37 a.m.*

I noticed a non functioning HP 33E on eBay today and it is going for over $50, are these really worth anything? I have two of them with keyboards that are not making reliable contact with the keys. Can they be fixed?

Chris W

Bring Back the HP 15C

Re: 33E with bad keyboard

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 June 2004, 1:09 a.m.,*
in response to message #1 by Chris Woodhouse

Hi, Chris;

I remember having a "bad time" with an HP29C in the 80's. It had a bad [ENTER] key that sometimes worked, and most of the times didn't. I sadly confirmed that the keyboard was faulty in a way I was able to repair at that time. Today I'd be able to, I guess.

Now with the Spices: there are two main types of Spices, being them solderless (sandwich-type assemble) or soldered with respect to the IC's. The solderless units have a flex circuit "board" that is folded over itself and goes from the IC's pads and connections to the keyboard. In fact, the flex circuit itself composes all key contacts. Under each key there's a dome molded in the flex board, sort of a sphere cap with a recesed center. Inside this "inversed" surface is located the contact pad. BUT there is also a copper trail that connects each contact pad with all others in the same alignment (matrix-like arrangement) and them to the respective pin in the main processor. The soldered-type units have metal caps under each key.

This "plastic bubble like" keyboard assy used in the solderless Spices is the same one I found in that HP29C. The problem is that the copper trail and/or the plastic cap may crack (?) and no contact is made when the key is pressed. That's what happened with the HP29C. And I guess it happens with other models as well.

The HP48 (and others, like Pioneers) uses the same plastic caps molded in one flex circuit, but they don't have copper trails. Instead, the caps have a single conductive "island" inside them that is pressed over a fork-like contact pair in the flex circuit counterpart. It is a lot more safe and reliable.

I hope this gives you an idea. If you have Spices, it's always a good chance to keep a "working spare" somewhere in the house.

Success! and Cheers.

Luiz (Brazil)

HP 41 emulator problem

*Message #1 Posted by **Jim Kimes** on 31 May 2004, 11:40 a.m.*

After not using my 41 emulator for a while, upon accessing it to write a program I get the message: "Unable to load the font file: LCD.fon." Upon clicking OK, I get another message: "Unable to load font file LCD4.ttf." Upon clicking OK, the calculator comes on but the display is garbled. Anyone ever have this problem? Although I've tried several fixes recommended by the developer, none of the fixes so far have worked. Need some help here, folks. Thanks.

Re: HP 41 emulator problem

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 12:00 p.m.,*
in response to message #1 by Jim Kimes

Hi;

the LCD4.ttf is a True-Type® font necessary to show information in the display. There's a way to get it back, but you need to find the original zipped file with the emulator files, unzip them and use Windows Control Panel, Fonts application and manually install the LCD4.ttf font back. It's more likely that somehow this font has been erased or uninstalled from your current system (have you upgraded it lately?). The process of restoring it is easy, you just need to have the TTF file.

Have you found it but succeed, post a message again and we'll try to step you through the solution.

Best regards.

Luiz (Brazil)

Re: HP 41 emulator problem

*Message #3 Posted by **Jim Kimes** on 31 May 2004, 3:03 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

OK, I did that. I took the font sent to me by the developer and copied it into the font bank (control panel, etc) and rebooted. Also, LCD4 shows as being present in the V41 emulator file (Program Files, etc). Still same error message.

Re: HP 41 emulator problem

*Message #4 Posted by **Steve S** on 31 May 2004, 12:09 p.m.,*
in response to message #1 by Jim Kimes

Jim, this has happened to me, too. It's apparently connected to updating (which I do fairly frequently). Rather than repair the font file, I simply uninstall and re-install the emulator. Although this may not be necessary, my experience is that you never know what other mischief may have occurred. A clean install resolves all issues...

Re: HP 41 emulator problem

*Message #5 Posted by **Jim Kimes** on 31 May 2004, 3:12 p.m.,*
in response to message #4 by Steve S

I did this. The V41 program does not have an "uninstall" feature but I deleted the file and then reinstalled it to no avail. Apparently the LCD4 font is present, the message is just saying that it can't load it. What I suspect is that that something in regards to trouble I had recently with a new HP printer driver. I bought a new printer and had to download a new driver. It didn't want to work. A repair shop was unable to help. So I sat down one day and tried everything possible. I finally got the driver to load and the printer now works. ?????? I don't know what I did right or wrong. You know how those things go. Supposedly other apps are not supposed to interfere with this emulator program but when it works one day and the next day it doesn't, something strange is wrong.

Re: HP 41 emulator problem

*Message #6 Posted by **Richard Garner** on 31 May 2004, 12:37 p.m.,*
in response to message #1 by Jim Kimes

This problem arises when the SP4 update to Windows 2000 is installed. The emulator developer has a corrected font on his web page that will do the trick. You will have to delete the old font from Windows 2000 and install the new one. You may still get the error message but the emulator should work fine after the new font is loaded.

Re: HP 41 emulator problem

*Message #7 Posted by **Jim Kimes** on 31 May 2004, 3:18 p.m.,*
in response to message #6 by Richard Garner

The developer is aware of the problem and what you're suggesting is one of the first things we tried. I'm using Windows ME but supposedly that's not an issue. I will continue to work on it and report if I make any progress. I appreciate everyone's help.

Re: HP 41 emulator problem

*Message #8 Posted by **DavidY** on 31 May 2004, 5:35 p.m.,*
in response to message #1 by Jim Kimes

Jim:

Actually v41 does have an "uninstall". Unless something really trashed your files you should be able to go to START->SETTINGS->CONTROL PANEL->ADD/REMOVE PROGRAMS scroll the window down to find "v41" and click on the "CHANGE/REMOVE" button.

I've run v41 on all Windows O.S's from Win98 to XP professional. It is true that Win2000 needs one different file but Warren does provide instructions. Windows ME--for me--installed both the current vs.7 and the vs. 8 beta without problem with the current installers available on "the other site".

Also, if you just uninstalled the font file and the executable you probably haven't cleared all the used files. Even clearing the program's folder--usually in "Program Files" may not clear all the ".dll" files as some could be left in the Windows or Windows/system(32) folders.

The best way to clear out everything is to download the latest files then install them. Because font files and dll's are considered system files be sure that in a ME system the "System Backup and Restore" is turned off before you start. This is Microsoft's way of protecting us from ourselves and will save and restore system files

it things you shouldn't be deleting. If you delete a "system" file--outside of an "unstall script" -- the OS will often save it and restore it. It can even "restore" over a newer, just installed version.

When the installer asks where to install to: be sure that the new install is directed to the existing program directory. After this do a re-boot (it's Windows after all!) and then go to the control panel and uninstall the program. Re-boot again, and check that all references to v41 are removed from the system: any lingering folders, etc. Oh, also be sure you purged the "Trash Bin" so files are really gone.

Finally, reboot again (you know, Windows!) and then run the Window's "Error Check"(i.e.scandisk) tool and the defragmenter tool.

After all this you should be able to re-install the latest version without problem.

By the way, don't blame Warren's software. Things like this are generally Window's problems and as with most Windows problems are a b.tch to fix.

Re: HP 41 emulator problem

*Message #9 Posted by **OJM** on 1 June 2004, 8:17 a.m.,*
in response to message #1 by Jim Kimes

I have a similar problem with V41 after changing over to Win2000. I never got the font to work properly, but I found that by going into the "Settings" menu (found under "Options" in the menu bar), and unchecking the "Use TrueType LCD Font" option, I got the emulator to work again. The display isn't as realistic as before, but it's no longer garbled and it appears to run ok.

Re: HP 41 emulator problem

*Message #10 Posted by **Jim Kimes** on 1 June 2004, 12:32 p.m.,*
in response to message #9 by OJM

I tried this early on at Warren's behest and while the display did change, it still wasn't right. I am currently investigating what David Y. recommended to see what that yields.

Some new TTF fonts

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 2:01 a.m.*

Hi, all;

you who are in the need for TTF with characters related to the HP48/49 LCD (and internal code), here goes:

New Font Set

There are three TTF files packed in this zipped file:

hpchr2n.TTF - font name: HP DotMatrix 2
hpchr3n.TTF - font name: HP DotMatrix 3
hpchr1i.TTF - font name: HP DotMatrix 1 Menu (still under development)

Except for the DotMatrix 1 Menu, the other two fonts are considered as Beta release, and I'd like you to tell me what do you think of them, please. The DotMatrix 1 Menu is a inverse-video, Size 1 character set that I developed sometime ago and I'm working on it so it can be improved. The new set WILL CONTAIN all lower-case alphabet (this version still has only upper-case) so it matches the HP49G menu set; also, some characters are in the wrong place (wrong code) but I decided that you're the best judges so I can fix any bugs now instead of redrawing all characters later.

The most important aspect about this Menu font is that it does not match the scale used to draw both DotMatrix 2 and 3. I draw a first sample with the same dot shape, but it didn't work out> It was hard to read because both dots and charactesr were too small for an inverse-video simulation. This particular fact lead me to enlarge all characters typed with DotMatrix 1 Menu after typing them in so they match regular text size with the first font. Now you can mix the KeySet 4 with this DotMatrix 1 Menu i regular text with all characters set to the same size that they coexist peacefully. I'll draw a complete DotMatrix 1 regular later so its charactesr can figure with the other TTF characters already existing.

Please, keep in mind that this DotMatrix 1 Menu set is far from being a Beta release. Not because it has bugs, instead it's because it is not yet finished.

Let me "hear" from you about them, please.

Cheers.

Luiz (Brazil)

Slow HP48GX

*Message #1 Posted by **Rick** on 30 May 2004, 8:33 p.m.*

Sometimes after running a lot of programs my GX tends to get extremely slow. I can come out of this by doing a warm start.. ON and C together. Is there a reason for the sluggish behavior?

Re: Slow HP48GX

*Message #2 Posted by **Wayne Brown** on 31 May 2004, 6:54 a.m.,*
in response to message #1 by Rick

Are these programs leaving a lot of stuff on the stack? If so, clearing the stack probably will speed it up without having to do a warm start.

Re: Slow HP48GX

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 7:08 a.m.,*
in response to message #1 by Rick

Hi;

I observed this behavior when running thirdy-part programs written in SYS RPL or Assembly. And although Wayne is completely correct calling the attention to "trashed" data stuffing the stack (that would indeed slow the calculator down), I'd like to know if programs written this way are able to create variables or to "slice" memory in a way that the used space is not claimed back after the programs resume execution. If so, I guess that a warmstart would do. Anyway, are you willing to perform a test I was not able to so far? Before executing a warmstart, try [MEM], [ON][C] and [MEM] again. If the first [MEM] fix things out, you'll probably notice that the calculator is running in regular speed. If not, please check if the amount of free memory from the second [MEM] is bigger than the first one (I guess it will be).

And please, let us know what did you get!

Cheers.

Luiz (Brazil)

Re: Slow HP48GX

*Message #4 Posted by **Rick** on 31 May 2004, 9:57 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz, you found the problem. After running the problem continuously I found that there was 1032 bytes less. Each time I run the program after that there was still less bytes available until I 'Killed' the program. Then it cam back to the original memory. Thanks. Even though the program created local variables it was just halted and this appears to have the 'variales ' in memory still. Thanks, now all I'll do is include a 'KILL' function at the end of the program.

Re: Slow HP48GX

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 10:41 a.m.,*
in response to message #4 by Rick

Hi, Rick;

That's good news. Anyway, there's something else to add to this particular fact you wrote about. Try this program: please, type it in and save it with any name.

```
« HALT 1 100 FOR X
  X 1 DISP I FREEZE
  NEXT X
»
```

Run it after saving it; it will halt prior to execute any command, right? At this very moment, purge it from memory. The program no longer exists, right? But the HALT indicator is still there. So go for it: press [left_arrow][CONT] and... What the h...!

Yeap! Any program you run in fact is copied in RAM and the copy is the one used to perform the program operations. I found this when debugging a program (late 80's) in an HP48SX and I realized that the altered program was not the one used after being saved, instead the original one. It was necessary to KILL program execution and start it again so the alterations made became effective. Than I tested the purging procedure I suggested above and I found that, in fact, the program is copied and maintained till it ends or is stopped. A halted program means a copy of it stored in memory and ready to go ahead.

Interesting, isn't it? You can write a program that purges itself as the first step and it will run anyway. Is it an impression of mine or I'm actually feeling some eyes widely open here...>>>8^O

Cheers!

Luiz (Brazil)

Edited: 31 May 2004, 11:54 a.m.

Re: Slow HP48GX

*Message #6 Posted by **James M. Prange** on 31 May 2004, 3:51 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

True. At least, it won't be completely removed from memory as long as there's a pointer to it (or any element of it) on the stack. For example, with a program stored in 'TempVar', you can start it with \<< 'TempVar' PURGE .... This is useful for running programs on a Kermit server from another calculator with the PKT command or from a Kermit program using REMOTE HOST, when the sequence is too many bytes for a single host command packet. For example, you can use the sequence 'TempVar' SEND "TempVar" "C" PKT.

Regards,
James

Re: Slow HP48GX

*Message #7 Posted by **James M. Prange** on 31 May 2004, 4:04 p.m.,*
in response to message #4 by Rick

Maybe the program in question had a HALT command inserted for debugging purposes? If so, then

just edit out the HALT. Or use LeftShift CONT (on the [ON] key) to resume execution of a suspended program. Using KILL in a program will work, but it's rather drastic, as it applies to all suspended programs, not just the current one.

Regards,
James

LCD replacement on 11C,12C,15C,16C

*Message #1 Posted by **Chris Woodhouse** on 30 May 2004, 2:53 p.m.*

Correct me if I am wrong, but I believe the way you replace or clean the LCD from 11C, 12C, 15C or 16C is to open the back and remove the all or most of the little plastic rivets that hold the keyboard down, then you can pull the LCD screen out. The main disadvantage being it is hard to get the little plastic rivets back in place to hold the keyboard tight. I read that one person started an attempt to pull up the brushed aluminum sheet that surrounds the display but they stopped because it was going to destroy the face plate. My question is, once you get the face plate off can you then get the LCD out? The reason I ask is because even though the face plate would be destroyed in the process, it is a pretty simple bent aluminum sheet that could easily be remade with the right tools.

Chris W

Bring Back the HP 15C

Re: LCD replacement on 11C,12C,15C,16C

*Message #2 Posted by **Randy** on 30 May 2004, 4:20 p.m.,*
in response to message #1 by Chris Woodhouse

If it is an early Voyager, cleaning or replacement is straight forward as the logic board is seperate from the keyboard, you simply lift it out from the back.

If it is the more common single board model, removing the front aluminum bezel will get you access to the LCD for cleaning but leave you with a bent bezel. It is **very** difficult to remove without some distortion. Better to use canned air from the back and blow it out. Stubborn specs can sometimes be dislodged with a small strip of coated paper. Don't use anything metallic or really stiff as it is very easy to scratch the lens or the even softer polarizer on the LCD.

If you goal is to replace the LCD, the entire pc board must be removed for access, and yes, all 40 heat stakes must be cut away to get it out.

Re: LCD replacement on 11C,12C,15C,16C (earlier models)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 May 2004, 6:55 p.m.,*
in response to message #1 by Chris Woodhouse

Hi;

although I had myself a bad experience with this earlier "construction" type, the first Voyagers had a separate assembly with all "active electronics", meaning all IC's, the LCD and three passive components (two capacitors and one resistor) built in one flex circuit board and "housed" with the LCD metal frame and a plastic structure. This assy is easily removed and there is no need to cut any of the plastic rivets out.

I consider handling this LCD assy very time consuming and you'll surely need some special tools to avoid destroying (wrapping or even tearing apart) the flex circuit.

Now, based on my own experience too, I removed at least three of these aluminum face plates, but even when you take care, as Randy stated (and I second him completely), it is too d... hard not bending it or causing irreversible distortion. About building replacement parts: that would be an idea and I must confess I liked it a lot. What I don't understand is why HP cannot sale this frame separately? It's still being produced somewhere (HP12C) and it's not too expensive, I think. Well, I'd rather see one of my Voyagers with a golden faceplate instead of a damaged one. The HP12C Platinum frame is different and is designed to hold the new HP Invent logo, but I'd not care using this one, too.

Is there anyone here that can contact HP and request information about the source of these faceplates? Please, let us know.

Cheers.

Re: LCD replacement on 11C,12C,15C,16C (earlier models)

*Message #4 Posted by **Chris Woodhouse** on 30 May 2004, 9:15 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

> Quote:
>
> What I don't understand is why HP cannot sale this frame separately? It's still being produced somewhere (HP12C) and it's not too expensive

Well it is not hard to make, the only thing I don't know for sure is where to buy aluminum sheet that already has the brushed finish but I'm sure it wouldn't take too long to find that. Then I could have my brother machine the hole for the LCD on his mill and then anybody with a small sheet metal break can bend it. Now if you want to just get one for the 12C, we just need to find out where the factory that makes them is, get to know someone who works there and buy about 500 of them. They Probably only cost $0.50 each and we could sell them on ebay for $10 each :)

Someone reading this forum is bound to know where the factory is or can find out and then someone else is bound to live near the factory and can find someone that works there. . . .

Bring Back the HP 15C

Protective glass (shield)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 12:28 a.m.,*
in response to message #4 by Chris Woodhouse

Hello, Chris;

Still keeping track with your original and very welcome idea, I'd also add that there is a coated "glass shield" (not a glass-made shield, instead some sort of polymer) that is "glued" to the aluminum frame. If we find the original manufacturer, I guess that this protection will be already built in all sold units. If the replacement is produced by the process you pointed out, than the "discarded" frame must donate the original glass.

Have you ever seen one of these frames removed? Did you notice the protection? The original protection is coated with some transparent material that enhances transparency. Someone once

mentioned what is this coat made of. (if you scratch the protective "glass" you'll notice that the coat cracks)

Best regards.

Luiz (Brazil)

Re: LCD replacement on 11C,12C,15C,16C

*Message #6 Posted by **JDH** on 30 May 2004, 10:33 p.m.,*
in response to message #1 by Chris Woodhouse

On a related topic, I had an HP 15c that had a number of bad scatches on the silver plate. I ended up using a fine grade sandpaper to get it back to the bare aluminium. If done carefully and polished evenly (same direction) it looks as good if not better than a new one. This is a good fix for badly scratched calculators.

Re: LCD replacement on 11C,12C,15C,16C

*Message #7 Posted by **Alex** on 31 May 2004, 12:31 a.m.,*
in response to message #1 by Chris Woodhouse

Let's assume that you have a HP-15C that is not available anymore in stores and is going for about $300 to $400 at eBay. Let's assume again that you want to fix/repair or even just clean the LCD lens only.

Buy a new HP-12C for about $70 at Office Depot. Remove the entire LCD/chip module on both calculators and replace your 15C LCD with the LCS from the 12C. It works. I did it. Instead of messing around trying to clean it and in the process you risk of damaging the entire machine. True, it will cost you about $70 but now you have a brand new LCD on your supper 15C machine. Also you can replace the aluminum silver plate if your has scratches. You can also switch the name plate from your 15C to the new silver plate if you want to be perfect.

Re: LCD replacement on 11C,12C,15C,16C

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2004, 12:47 a.m.,*
in response to message #7 by Alex

Hi, Alex;

I knwo that the newer HP12C have a different type of LCD. Did you manage to put the newer LCD working with the earlier HP15C hardware? The contacts' alignment do not match, and there was a discussion here about different working voltage: newer HP12C use a 3-volt cell, while the earlier Voyagers (HP10C, 11C, 15C, 16C and some HP12C) work with 4.5Volt (3×LR44 cells).

I'm very interested to know what did you do. That would solve a lot of problems for many of us.

Cheers.

Re: LCD replacement on 11C,12C,15C,16C

*Message #9 Posted by **Alex** on 31 May 2004, 1:22 a.m.,*

in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I did exchange my LCD a couple years ago. I simply got a new 12C from the store and did the replacement myself together with the silver and the name plate. I did not got any problems while aligning the contacts. But, if you do see that the alignment is off then you can make then match if you are into the electro hobby stuff. Now, on the new 12C that you can get it in stores today for about $70 it may be that the contacts and the voltage doesn't match but still you can go around this problem.

Get an older 12C from eBay for about $25 (that's the average price for a 12C) and you will have many spare parts to do the rebuilding on your supper 15C machine. The older 12C is running on 4.5 volts and the construction of the LCD is identical.

Using linear regression to find the intersection of two lines

*Message #1 Posted by **martin cohen** on 30 May 2004, 12:16 p.m.*

Using linear regression to find the intersection of two 2-d lines.----------

Linear regression can be used to find the line through two 2-d points as follows:

```
1. Clear the stats.
2. Do y1 ENTER x1 sigma+.
3. Do y2 ENTER x2 sigma+.
```

Then (on the 33s), do L.R.; the line is y = m*x + b, with m and b displayed.

To get the value into the x-reg, get the value displayed and press ENTER.

Since, projectively, two lines determine a point just as well as two points determine a line, we should be able to use linear regression to determine the intersection of two lines.

The problem is to determine a representation of lines such that we can easily enter the representations of two lines and get their intersection.

L.R. is given (xi, yi) (i = 1..2) and returns (m, b). We would like to enter (mi, bi) (i=1..2) and get (x, y).

We can't quite do this, but if we write b = -x*m + y, we see that b corresponds to y and -m corresponds to x.

That is, y = m*x + b b = x*(-m) + y

So, if we enter (-mi, bi) for each line as the (x, y) input for sigma+, we should get x for m and y for b from L.R.

Example: Find the intersection of y=6x-1 and y=3x+2.

The (m, b) values are (6, -1), (3, 2), so we enter (-6, -1) and (-3, 2) (i.e., CLEAR sums(4) -1 ENTER -6 sigma+ 2 ENTER -3 sigma+). The result is m=1, b=5, so the intersection is (1, 5)

Bit fiddling on the HP33s

*Message #1 Posted by **martin cohen** on 30 May 2004, 12:11 p.m.*

Bit fiddling on the HP33s

One of the omissions on the 33s is bit fiddling commands - and, or, not. This is odd, since numbers in bases 16, 8, and 2 can be entered and used. So, I decided to fix this.

The routines shown here work on 32 bit unsigned integers, though any number of bits (up to 35) can be used. The method used is to get the corresponding bits of the 2 words to be operated upon, get a value from 0 to 3, and use that as a lookup in a 4 bit table. Separate tables are used for and, or, and not. Any 4 bit table can be used.

The routine uses the integer divide and remainder operations on the 33s; I do not know if they are on the 32sii.

The routine uses only integer values, so it can be run in hex, oct, or bin mode. However, you have to be in decimal mode when entering the "y^x" command.

The code uses lbl H to return the number of bits to process.

The registers used are:

```
V: First operand
U: Second operand
T: 4 bit table
S: 2^k for k from 31 to 0
R: Result

Usage:

And: V U xeq A
Or: V U xeq O
Not: U xeq N

Result in X, U in Y, and V in Z (so you can roll down to get parameters)

General; V U table xeq B

Code: (comments indicated by "//")

And:
LBL A
8 // decimal - 1000 binary
gto B

Or:
LBL O
14 // decimal - 1110 binary
gto B

Not:
LBL N
```

```
5 // decimal - 0101 binary
gto B

Number of bits:
LBL H
16 // or 8 or 32 or ...
rtn

Bit fiddler:

LBL B
sto T // the 4 bit table
Rv // roll down
abs sto U // make it unsigned
Rv abs sto V // got the operands and table
2 xeq H 1 - y^x sto S // bit extractor
0 sto R // the eventual result

LBL C // start of the loop
rcl V rcl S int/ // integer part of V/2^k
2 rmdr 2 * // 2 times the bit
rcl U rcl S int/ 2 rmdr // same for U
+ // 2*v_bit + u_bit
2 x<>y y^x // 2^u_v value
rcl T x<>y int/ // x<>y could be saved if T loaded earlier
2 rmdr // that's the bit
rcl* S sto+ R // scale up and store
rcl S 2 int/ sto S // get next lower power of 2
x>0? gto C // if anything there, continue
rcl V rcl U rcl R // load inputs and output
rtn // done
```

Possible improvements/enhancements:

1) Get 2 bits at a time, and use a 16-bit table. This would cut the running time by about 50% - it is now about 4 seconds on a 33s.

2) have 3 or more parameters - an arbitrary truth table of up to 5 parameters (n parameters takes 2^n bits) could be handeled.

My usual statement: All comments and suggestions will be considered.

One nice thing about the 33s - you can't run out of program space - you will run out of labels first!

Martin Cohen 5/4/04

Note added later: I have written a 2-bit version, as mentioned in (1) above. If anyone is interested, I can post it.

solve 3x3 system on 33s

*Message #1 Posted by **martin cohen** on 30 May 2004, 11:57 a.m.*

Here is some code for the 33s (originally written for the 32sii) for solving a 3x3 linear system of equations.

The code uses Cramer's rule (with determinants) and does not change the coefficients.

```
Solve a 3 x 3 system of linear equations

A*X + B*Y + C*Z = D
E*X + F*Y + G*Z = H
I*X + J*Y + K*Z = L

DET =
|A B C|
|E F G|
|I J K|
=
A * (F K - G J) - E * (B K - C J) + I * (B G - C F)

D_X =
|D B C|
|H F G|
|L J K|

Same for D_Y and D_Z

x = D_X/DET,, ...

================================================================================

S: do via determinants and column swapping
(20 steps, 43.5, E8A7):

LBL S
XEQ U; STO W; VIEW W
1; XEQ V; XEQ U; RCL/ W; STO X; 1; XEQ V
2; XEQ V; XEQ U; RCL/ W; STO Y; 2; XEQ V
3; XEQ V; XEQ U; RCL/ W; STO Z; 3; XEQ V
RTN

U: determinant of [ [a, b, c], [e, f, g], [i, j, k] ]
(33.0, A5DB)

LBL U

// DET = A * (F K - G J) - E * (B K - C J) + I * (B G - C F)
RCL F; RCL* K; RCL G; RCL* J; -; RCL* A;
RCL B; RCL* K; RCL C; RCL* J; -; RCL* E; -
RCL B; RCL* G; RCL C; RCL* F; -; RCL* I; +
RTN
```

```
V: swap column in x reg (1..3) with [d, h, l]
(24.0, 8BD5)

LBL V

STO i;
RCL D; X<> (i); STO D;
4; STO+ i;
RCL H; X<> (i); STO H;
4; STO+ i;
RCL L; X<> (i); STO L;
RTN

I: input a 3x3 system (also uses lbl J)

lbl I
1.012 STO I
LBL J
INPUT (I)
ISG I
GTO J
RTN
```

Hypothetical HP 12CII, 15CII and 16CII

*Message #1 Posted by **Chris Woodhouse** on 29 May 2004, 9:52 a.m.*

How do you like this idea. I got the idea from a remote control aircraft transmitter I have (JR 8103). How about have a 12CII a 15CII and a 16CII where the internals and functions of all three were exactly the same. The ONLY difference would be that the keyboard is labeled differently. So if you were to buy the HP 16CII you would get a keyboard overlay for when it was in 15CII mode and another keyboard overlay for 12CII mode.

http://hp15c.org:8080/hp15cII.jpg

Bring Back the 15C

Great idea.

*Message #2 Posted by **Eddie Shore** on 29 May 2004, 10:00 a.m.,*
in response to message #1 by Chris Woodhouse

So the idea is that you are really buying three calculators in win: logic (16C - if I remember correctly), scientific (15C), and finance (12C). If you were to add the programming feature, I would put a catalog button that can access all the commands from all the modes.

When can I buy? ;-) (nt)

*Message #3 Posted by **Raul Lion** on 29 May 2004, 12:09 p.m.,*
in response to message #1 by Chris Woodhouse

Very nice calculator

*Message #4 Posted by **Walter B** on 29 May 2004, 4:54 p.m.,*
in response to message #1 by Chris Woodhouse

I would buy such a 15CII immediately, also without the keyboard overlays. As I see it, you have an alphanumeric display with 2 lines, showing better contrast than the HP 42S ;) Then I expect program listings like in the pioneers, too.

Please tell me the date of product launching ... ;)

Re: Hypothetical HP 12CII, 15CII and 16CII

*Message #5 Posted by **Karl Schneider** on 29 May 2004, 6:13 p.m.,*
in response to message #1 by Chris Woodhouse

Chris --

Interesting concept, though representing the keyboard layouts and legends for three very disparate models, using overlays, would be real problematic. Really, the 12C, 15C, and 16C have little functionality in common.

The overlays were cumbersome for the 41-series, and this would be no different.

Also, I would call any upgrades of these classic models simply the 12B, 15S, and 16S -- just as the 28S replaced the 28C after Continuous Memory becase a standard feature.

Let's talk calculator condition

*Message #1 Posted by **Mike** on 29 May 2004, 1:05 a.m.*

Let's talk about what is excellent, good, poor, etc.

I recently purchased an HP-41CV that was supposed to be in excellent cosmetic condition. I specifically asked the seller to check the contacts. It was advertized as **"Excellent condition"** and more importantly, **"almost completely free of blemishes"**. Remember... the seller did check the battery contacts.

Here is what arrived: **Click image to enlarge**

http://www.msdsite.com/hpcalcs/tips/bat-coverx.jpg http://www.msdsite.com/hpcalcs/tips/bat-openx.jpg
http://www.msdsite.com/hpcalcs/tips/bat1x.jpg http://www.msdsite.com/hpcalcs/tips/bat2x.jpg

I'm curious if you would see this as an **"excellent condition"** and **"almost completely free of blemishes"**. Remember, the seller specifically checked the contacts and still says it's that condition. Do you agree? Comments?

Would you consider this exaggerating the "cosmetic" condition? To what degree?

Edited: 29 May 2004, 1:14 a.m.

Re: Let's talk calculator condition

*Message #2 Posted by **Patrick** on 29 May 2004, 3:00 a.m.,*
in response to message #1 by Mike

IMO, the seller's comments are fraudulent in the extreme.

```

User feedback

*Message #4 Posted by **Mike H** on 29 May 2004, 10:41 a.m.,*
in response to message #1 by Mike

How was this sellers feedback? How long had they been a member? How good were the pictures? Regardless of what a seller may say... these three factors set my price more than anything. If it is a new seller, and the price is worth the risk, I may bid, otherwise I pass. Ask for your money back. Mike 1111

Not making this an ebay issue

*Message #5 Posted by **Mike** on 29 May 2004, 11:10 a.m.,*
in response to message #4 by Mike H

I'm not trying to discuss this as an ebay issue or how to deal with ebay bidders. It is simply a discussion about calculators and what any reasonable person would see about the condition of this particular calculator.

The seller still maintains that the broken battery cover and contacts still falls under "almost completely free of blemishes". He is trying to claim that these defects are insignificant and still claims that the calculator is "almost completely free of blemishes.", including these blemishes.

My point was simply to see if others would classify a calculator in this condition, "almost completely free of blemishes."

Edited: 29 May 2004, 11:12 a.m.

rip this bastard a new orifice

*Message #6 Posted by **bkr** on 29 May 2004, 6:56 p.m.,*
in response to message #5 by Mike

I've had a few sellers who were no-good liars over the years. They will try to sell ANY bit of junk, no matter how broken. They will say ANYTHING to try to brush you off. They count on people not thinking it's worth fighting. This guy is a prime example.

If there is a defect, it is a defect. Defect, defect, defect. No amount of denial can change that.

Demand a full refund, including shipping both ways, or give him a big, fat negative. Don't worry about retalitory feedback - everybody gets some of that. Just write your feedback comment clearly and people who read it will know you were in the right.

Re: Let's talk calculator condition (Long)

*Message #7 Posted by **Steve S** on 29 May 2004, 11:37 a.m.,*
in response to message #1 by Mike

Regarding your broad question of "how should condition be assessed?" there are many examples of systems that can be readily (and rationally) applied by anyone other than a complete idiot. The one that springs to my mind is the approach applied to used audio equipment at such sites as AudiogoN.com. In these systems, a number assignment (9/10, or "9 out of 10") is used to denote conditions. NIB is 10/10, 7/10 might be "shows signs of use and may have minor cosmetic dings." You can visit the site and view the definitions for yourself.

More generally, there is the "Mint / Excellent / Very Good / Good / Fair / Poor" type of system which seems more common on sites like eBay. There are definitions for this system, too, but most eBay (and other sellers) seem to have a more arbitary approach to applying them. Like you, I have bought "Mint! NIB!" items that were really only deserving of a "good," or "very good," rating. As (I think) Patrick said, I look at feedback, but I also explicitly ask: "Does this item have any dings, dents, or scratches?" Generally, I'm not disappointed too often, and I have stopped bidding in midstride if I develop the feeling that the Seller may not be too honest.

Now we come to your experience. Your Seller is an IDIOT! Demand your money back and / or leave negative feedback. The issue is simple; the item has been misrepresented, and I can't imagine that many ordinary people would disagree...!

Re: calculator condition comments

*Message #8 Posted by **Randy** on 29 May 2004, 11:43 a.m.,*
in response to message #1 by Mike

Yes, it is "almost completely free of blemishes" but it does have a few. That deception is bad enough. But, a very destroyed battery connector that was specifically asked about, well, that's inexcusable.

Condition? Ask anybody here and I think you know what the answer would be. It's trashed. Cost more to repair it than you probably paid for it. Ask somebody that has no idea what an HP calculator should look like and you might get a different answer, but I know you ask questions, good, clear questions before bidding.

You asked "Would you consider this exaggerating the cosmetic condition?" My response: Absolutely.

To what degree? To the extreme. I would stop short of calling it a lie since that always invokes a bad response from anyone but here's a case that I really think it deserves to be called that.

I know you don't want to make this an eBay issue but I just have to add my two cents worth:

I think I know why the previous auction of the same unit had "fallen through". Deceptive seller you got there. A very good example of why the eBay feedback system does not work.

Previous sale didn't have anything to do with condition

*Message #9 Posted by **Mike** on 29 May 2004, 12:22 p.m.,*
in response to message #8 by Randy

You say: "I think I know why the previous auction of the same unit had "fallen through". Deceptive seller you got there. A very good example of why the eBay feedback system does not work."

Actually... I did contact the previous seller to find out why it fell through. He said he never saw the calculator and by mutual agreement, both decided to call the auction off. He said it had nothing to do with the condition of the calculator. I have sold to the previous buyer and have no reason to doubt his statement.

Edited: 29 May 2004, 12:26 p.m.

Re: Let's talk calculator condition

*Message #10 Posted by **Gordon** on 29 May 2004, 12:41 p.m.,*
in response to message #1 by Mike

I would not call this "excellent" with no reservations. If the rest of the calc is excellent then it would be fair if the seller called it "excellent except for poor and corroded battery contacts and damaged cover". There is no substitute for more detail in the description if there is damage.

Re: Let's talk calculator condition

*Message #11 Posted by **james summers (UK)** on 29 May 2004, 2:43 p.m.,*
in response to message #1 by Mike

Mike

No way would I call that excellent condition or almost completely free from blemishes.

If a calculator was described to me as almost completely free of blemishes I would expect it to be in almost perfect condition and to look the same, certainly no major damage like the melted battery compartment; missing corners off the battery holder and damaged battery contacts, with light signs of wear/use like the odd

scratch, slight dings in the plastic where it might have been knocked against sharp edges, etc and the odd worn patch on keyboard lettering, etc.

I agree 100% with the other posters that the descriptions quoted applied to the 41 you bought are fraudulent. My commiserations. (It pains me to think someone can treat a 41 that way, I've seen military surplus 41s in far better condition than that!!)

Re: Let's talk calculator condition

*Message #12 Posted by **Wayne Stephens** on 29 May 2004, 3:15 p.m.,*
in response to message #1 by Mike

Yes, it is ALMOST completely free of blemishes...

Except for the M-80 full of battery acid that was apparently detonated inside it.

I believe I'd be asking for/demanding a refund on this one. I'm pretty easy-going about minor defects on the calculators I purchase off of ebay; but you specifically ASKED about this sort of defect.

Take care.

Wayne.

Re: calculator condition proposal

*Message #13 Posted by **Jim Creybohm** on 29 May 2004, 3:35 p.m.,*
in response to message #1 by Mike

I think what is really being asked is how can we, as a group of persons interested in HP calcs, define conditions of calcs. I would like to propose we examine a standard. Please note, this proposal is a sketch, not a blueprint.

OK, so an opinion:

NIB - aka the holy grail New in box. Unused, plastic wrap, complete - 'nuff said.

Mint As NIB except has been opened/used albeit briefly. No visible defects, blemishes or grime.

---- this is where a certain amount of subjectivity comes in

Excellent Has been opened and used lightly. May have minor visible defects, blemishes, but should not have keyboard grime, nor scratches on the screen.

Good Has been used, and will show normal wear and tear of calculator commensurate with its age. For example, a used 21 might be in worse condition than a used 48GX. May have grime, scratches but is working and could continue as a working calculator.

Fair Used, may or may not be working. Scratches, grime are expected.

Poor Non working or partial operation, visible damage.

Parts only or non-working Enough said.

There can be some crossover if describing components e.g., excellent overall condition, with a poor battery compartment. This might be how I would describe the above mentioned unit.

What might be a good idea might be to create a table or spreadsheet of important componentry (keyboard / screen / battery compartment / manuals) and use this as a general guideline to determine value.

anyways, I'd be interested in hearing from other more knowledgeable persons on this subject, but I think it is an excellent topic.

*Message #14 Posted by **Chris Woodhouse** on 29 May 2004, 11:10 p.m.,*
in response to message #1 by Mike

I generaly expect things I get used to have some exageration of the condition. However, I would consider it a stretch to say this calculator is even in fair condition.

HP-16C sim Pocket PC testers wanted

*Message #1 Posted by **Cameron** on 28 May 2004, 8:11 p.m.*

I've done it! I finally got the "real" layout working on the Pocket PC. If you use a PPC and you know the 16C and you can be bothered, read on.

I only have one PPC (actually I have 2 but the old Casio doesn't count). I wonder if you could download the sim and give it a try in LANDSCAPE mode. I think it's fantastic, but them I would, wouldn't I ;-)

Here's a preview to whet your appetite (yeah I only have a h3650. Sigh).

http://members.optusnet.com.au/~cbpaine/hp-16c/img/ptrait-h3650.jpg

You can download it from the sim page on my 16C site. Thanks in advance for your time.

How do you set the 16 C in a mode to do floating point math? I tried a divide by 7 and a C showed up on the display, what does that mean? I guess I should get a manual somewhere.

Re: HP-16C sim Pocket PC testers wanted

*Message #3 Posted by **Cameron** on 28 May 2004, 11:16 p.m.,*
in response to message #2 by Chris Woodhouse

LOL!

f FLOAT 0-9 (preferred sig digits)

f FLOAT . (EXP format)

There is no SCI format.

The C was either: the carry flag telling you that the integer division produced a remainder. Flag annunciators appear in a similar place to the 15C; or hexadecimal 12 if it appeared where the digits are displayed.

*Message #5 Posted by **Cameron** on 30 May 2004, 10:17 a.m.,*
in response to message #4 by Veli-Pekka Nousiainen

I really don't know. I must also confess to not knowing what processor it uses. If you have one, we might be able to give it a try. I have X-compilers for MIPS, SH3 and StrongARM. In theory the latter generates code that will run on the XScale. The 720 has been around for a while so it's probably one of the first three.

Cameron

Edit: I've just learned, from David Y, that it does run on the XScale. There may be some XScale issues that impact on responsiveness of the UI.

Re: HP-16C sim Pocket PC testers wanted

*Message #6 Posted by **DavidY** on 29 May 2004, 5:50 p.m.,*
in response to message #1 by Cameron

Cameron, I downloaded your simulator the other night. I've got the PC version running on a Dell Notebook (P4 2.4gig/512megRam) with no problems to date.

I've got the PocketPC version running on a Dell Axim 5. It seems to work both in Landscape mode and vertical mode. Except for a little lag in touch screen-to-keydown response everything seems to work OK.

I have been running the Pirrama Pocket 16C commercial HP16C simulator since it was released and yours matches up quite nicely. I really like the fact yours uses the entire screen area in landscape mode.

The Pirrama version, though, has a few nice touches: they put the OFF (which acts as EXIT) on a [f] shifted key, they also use the far right of the display for a (switchable) display of the x,y,z and t registers in small font.

I've been running some "side-by-side" comparison calculations between the two and can't see any diference so far. I think you've done a great job. Congradulations!

Re: Axim 5 digitizer sluggishness

*Message #7 Posted by **Cameron Paine** on 30 May 2004, 10:39 a.m.,*
in response to message #6 by DavidY

Thanks for your kind words, David.

I'm perplexed by the digitizer sluggishness that you report. On my H3650, when I enable the screen tap sound effect, the difference between the tap sound and the display update in imperceptible. I can tap as fast as my hand can move and there is no lag on *digit entry*. If I rapidly use the roll-down (Rv) button with the stack loaded with values that fill the display I can detect a slight lag.

It occurs to me that a lag in *function execution* might be due to the StrongARM binary running on your XScale processor. I've read that SA code can run slowly but I've not found a description of what runs more slowly.

I did build a new binary yesterday that fixed a double-tap issue. If you're running 0.300, please download 0.302 and try it again. That will eliminate that issue as a possible explanation.

If you have the time and patience to work with me on this, perhaps you could drop me an email and we'll take it out of the forum.

BTW, I didn't know about the commercial sim. Thanks for the heads-up. I'm still contemplating how I might use the On button--which is why it's just a place-holder. I like the shifted idea; what do they use it for when it's not shifted? The stack display is a good idea too.

HP-49g Kernel

*Message #1 Posted by **Michel Beaulieu** on 28 May 2004, 6:13 p.m.*

Hi, i have a newly acquired so i don't know the history. When i reset it, i can see briefly on the screen a picture saying somthing like "POWERED BY ...KERNEL, v 3.00".

When i type VER, which give the CAS version, i can read "HP49 CAS by Parisse, Heiswkanen & Fiechter", and "4.19990729" on the xreg line

Here are my questions :

Is is the standard CAS that HP install on the calc or a third party CAS?

If it's not a HP one, can i use the HP manual to learn the clculator without change?

How can i uninstall that CAS and install the original one?

Is there adevantave of having that CAS insted of the original one?

Thanks

Michel

HP-49g Kernel

*Message #2 Posted by **Veli-Pekka Nousiainen** on 29 May 2004, 8:51 a.m.,*
in response to message #1 by Michel Beaulieu

```
Hi, i have a newly acquired so i don't know the history. When i reset it, i can see
briefly on the screen a picture saying somthing like "POWERED BY ...KERNEL, v 3.00".
VPN: It is an advance version of the original 3rd party MetaKernel developed by a small
group of ingenius french programmers.
VPN: HP hired these people to form ACO and they integreted the new V3 into the 49 series
in less than two years (including other software).

When i type VER, which give the CAS version, i can read "HP49 CAS by Parisse, Heiswkanen &
Fiechter", and "4.19990729" on the xreg line
VPN: That's the other software included = Computer Algebra System.
VPN: The people mentioned were also hired by HP (subcontracted) to integrated ALG48 and
Erable to a new advanced CAS for the 49 series.
VPN: It's "Heiskanen" and I know Mika.
X
Is is the standard CAS that HP install on the calc or a third party CAS?
VPN: Both

If it's not a HP one, can i use the HP manual to learn the clculator without change?
VPN: I would load from the HP calc web site the latest 49g+ manuals.

How can i uninstall that CAS and install the original one?
VPN: You can not (unless you're are extreme hacker)
```

```
Is there adevantave of having that CAS insted of the original one?
VPN: Yes - too numerous to mention here

Thanks
VPN: You're welcome

Michel
VPN: {VPN}
```

*Message #3 Posted by **James M. Prange** on 29 May 2004, 6:42 p.m.,*
in response to message #1 by Michel Beaulieu

> Quote:
>
> When i type VER, which give the CAS version, i can read "HP49 CAS by Parisse, Heiswkanen & Fiechter", and "4.19990729" on the xreg line

Also try the VERSION command.

With a revision 1.18 ROM, the VER command gives me 4.2000031 on level 1, and with a revision 1.19-6 ROM, VER gives me 4.20010912 on level 1, so I think that your ROM must be an old one.

You ought to upgrade your ROM. Revision 1.18 is the last officially released by HP; revision 1.19-6 is the latest "beta" revision released by the developers. Don't let the beta designation put you off; 1.19-6 really is much better than 1.18. It looks to me as if HP management decided that 1.18 was "good enough", but the developers decided to continue improvements on their own.

Revision 1.19-6 is available at http://etud.epita.fr/~avenar_j/hp/49.html. Several different revisions can be found at http://www.hpcalc.org/hp49/pc/rom/.

A newer CAS is available, but you'll have to compile it into a new ROM image yourself. Search at http://groups.google.com/advanced_group_search?group=comp.sys.hp48. See http://groups.google.com/groups?threadm=6b643d1.0404050522.1c865372%40posting.google.com for example.

You'll need connectivity software. In my opinion, Conn4x (Xmodem based) is the best; get it from this HP page.

But for upgrading the ROM on a 49G, you might need HPComm (Kermit based), which you can get from another HP page.

For manuals, get the 49G "user's guide" and "advanced user's guide"; see http://www.hpcalc.org/search.php?query=guide&hp49=1. It's also good to get information on the system flags, see http://www.hpcalc.org/details.php?id=4884, and reserved variables, see http://www.hpcalc.org/details.php?id=4922.

As Veli-Pekka mentioned, the 49g+ documentation mostly applies to the 49G as well. The main differences from a user's viewpoint are the different communications I/O ports and the MMC/SD card capabilty on the 49g+.

Also see this HP page.

Note that a lot of the information for the 48 series and even the 28 series still applies to the 49 series.

The comp.sys.hp48 newsgroup can be accessed from http://groups.google.com/groups?q=comp.sys.hp48, but the archive is updated only a few times per day, so for active participation it's better to find a different usenet server.

Of course a lot is available at http://www.hpcalc.org/. Also see http://page.mi.fu-berlin.de/~raut/ and http://m.webring.com/hub?ring=hp48.

Regards,
James

> Quote:
>
> I'm no sure to install the 1.19 version; it is written that i will have less "user" memory or something like that if i install this version; what it is really?

You will lose 64KB of user flash memory to the operating system when you upgrade to 1.19-5 or newer, but that still leaves you with 1MB of user flash memory for storing libraries and "backup objects". I doubt that many of us will ever actually fill up the flash memory, and you can always move some things that you don't really need on the calculator to your PC.

Of course, once you have things on the calculator that you don't want to lose, it's wise to back it up to another device like a PC anyway.

Use LeftShift FILES (on the [G] key) to see your current memory situation.

See the "What's New from Release..." notes with the upgrades. I believe that the bug fixes and improved features are well worth losing the 64KB flash bank.

Regards,
James

Feigenbaum-number

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 28 May 2004, 6:09 p.m.*

Hello,

know anybody, what was the program, what used by Feigenbaum originally(!), to calculate this number on his HP65?

Thanks for answering!

Csaba

Re: Feigenbaum-number

*Message #2 Posted by **Julian Miranda (Spain)** on 30 May 2004, 1:22 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

I don't have the program. From the book "Chaos. Making a New Science" by James Gleick, I can tell you the equations he was working with.

First he worked with x(t+1)=r·x·[1-x(t)]. A quadratic equation. y=rx-rx^2.

You start with a value for "r" and a value for "x" and the result is the next value for "x" if you keep iterating finally you get always the same value. With some pairs of values you end in an alternation between two values. He searched for the values of "r" that produced this duplication.

Samples of values r=2.7 x=0.02 that ends in 0.6296. r=3.5 x1=0.850 x2=0.3828 x3=0.8269 x4=0.5009, in this case there is a double duplication so we end with four x values.

Then he repeated the process with the following equation x(t+1)=r·sin PI·x(t). Where PI is 3.14159... as you may supposse.

I hope that can help you a little.

Re: Feigenbaum-number

*Message #3 Posted by **Valentin Albillo** on 31 May 2004, 5:44 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

I don't think the exact HP-65 program is available, but it can probably be reconstructed from the equations he worked with (see J. Miranda's post) and the very detailed (and to the point) info on this URL:

Period Doubling Ad Infinitum

Best regards from V.

Re: Julian and Valentin - Bifurcation diagram on 28C

*Message #4 Posted by **Tizedes Csaba [Hungary]** on 31 May 2004, 6:19 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Thanks for your answers! I read that book some years ago, and I wrote a little program in PASCAL. The next prg is the HP28C version:

```
FEIG:

<< (2.63,0) PMIN (4,1) PMAX CLLCD 2.63 4 FOR R .3 'X'
STO 1 20 START R NEWX NEXT 1 12 START R NEWX R X R->C
PIXEL NEXT .01 STEP >>

NEWX:

<< -> R << R X * 1 X - * 'X' STO >> >>
```

Press 'FEIG' to start. Running time is about 12 minutes. (Slow, but nice... ;))

The greatest problem, how to isolate the bifurcation points on the diagram...

Csaba

RPN with Alarm Clock - HP ???

*Message #1 Posted by **Joerg Woerner** on 28 May 2004, 2:00 p.m.*

A great hello to the HP community.

Just an easy question: When was the first HP calculator featuring an ALARM CLOCK introduced ?

Do you know the Garrett 2002 calculator from 1972 ?

Just 16 keys, some switches but a combination of RPN calculator and ALARM CLOCK.

(Dennis - you know it - I found it in your collection...)

Interested ?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5701395407

Regards, Joerg

Re: RPN with Alarm Clock - HP ???

*Message #2 Posted by **db(martinez,california)** on 28 May 2004, 8:01 p.m.,*
in response to message #1 by Joerg Woerner

It's not just the clock. Both the 2000 and the 2002 are impressive units. The key feel is equal to or better than the HP Topcat series, the hardwood cabinetry is classic and all those discreet components it took to make it work before the era of the "calculator on a chip" are very impressive. I hope it goes to a good home.

Dead 41C - Slight Progress!!!

*Message #1 Posted by **Joanne** on 28 May 2004, 1:17 p.m.*

Hi again! The messages seem to have been split up in the list so I put as a new one. I felt so excited about all your comments and suggestions that I decided try the esoftwaref ones myself before the big step of opening it up. Yes, it does have square corners so it must be efullnutf. I shook it very slightly but there isnft anything broken off and rattling around inside. I cleaned again the springs/coils and battery contacts. I tried to stretch slightly the coils to make better contacts. Then I tried combinations of backarrow (©); R/S; backarrow then ENTER then ON, etc as suggested. Something happened!!! If I leave the calculator to sit (with batteries in) for about 30 minutes, then press any of the following keys (but only these specific keys) (ENTER, -, +, ~, €, 7, 4, 1, 0) the display flashes for a split second a row of @ signs. Each time I press one of the above keys again, it flashes but for less time and much weaker. After about 4 or 5 attempts, nothing happens at all (as if it were dead/turned off). Then I leave it about 30 minutes and the same thing happens again. Does this give anyone a better idea of what might be the problem? Youfve been incredibly supportive so far! Thank you all. Best wishes, Joanne

Re: Dead 41C - Slight Progress!!!

*Message #2 Posted by **Tony Duell** on 28 May 2004, 2:22 p.m.,*
in response to message #1 by Joanne

This sounds very like bad internal contacts. The Fullnut HP41s consist of 4 main parts -- the 'I/O assembly' (the flexible PCB that connects to the batteries and the module ports ; The keyboard PCB ; The logic PCB (contains the CPU, ROM and RAM memory chips, power supply, etc), and the display. The display is connected by soldered jumpers to the keyboard PCB, the logic PCB and I/O assembly are connected to the keyboard PCB by pressure connectors that are clamped together when the case is assembled. Bad contacts on the latter are common, I have (once) had a bad soldered connection to the display.

If you are happy working on delicate, static-sensitive CMOS electronics, then the next thing to do is take it apart and clean the contacts. Remove the battery pack, peel off the feet and undo the screws under them. Lift off the bottom case and the U-shaped 'middle case' (this must go back the right way up!). Then lift off the logic board, noting any washers on top of it (some very early units have 1/4" nuts here). Take off the connector under the logic board. Clean the contacts on the logic board (2 rows), the contacts on the keyboard PCB (2 rows for the logic board, one row for the I/O assembly), the logic board connector, and the I/O assembly's contacts with propan-2-ol (isopropyl alcohol).

Put it all back together. Take great care when putting the screws back in. If you crack a post, you will have a lot of work to repair it (and unless the case is properly assembled and clamped, the machine will not be reliable). The best way is to put the screw in the hole, then turn it counterclockwise until you feel it engage, then screw it home. Tighten the screws evenly, do not overtighten.

I hope this gets it going again.

Auto OFF on HP-41

*Message #1 Posted by **Miki Mihajlovic** on 28 May 2004, 11:49 a.m.*

A friend of mine has a fullnut 41CX that has its auto OFF shut the calculator in about 10 seconds instead of normal 5 min or so. XEQ "ON" works but only for the current session since the flags 44 clears when manually turned OFF. What I noticed is that after XEQ "ON" and manual OFF/ON, calculator stays ON for a bit longer, say 1 min. However, it falls back to about 10 sec after next OFF/ON.

Does anybody have an explanation for this.

1234

Edited: 28 May 2004, 12:21 p.m.

Re: Auto OFF on HP-41

*Message #2 Posted by **Tony Duell** on 28 May 2004, 2:54 p.m.,*
in response to message #1 by Miki Mihajlovic

The power-off time of the 41 is controlled by the display driver hybrid, but it also uses a capacitor on the logic board. The normal cause of the machine turning off too quicking is (as ever for a 41) is bad contacts between the logic PCB and the keyboard PCB, so the capacitor is effectively not connected.

Hypothetical HP 15CII

*Message #1 Posted by **Chris Woodhouse** on 28 May 2004, 10:50 a.m.*

I thought I would see what everyones reaction to this is. . .

http://hp15c.org:8080/hp15cII.jpg

for a quick reference it is the same height and thickness as a 15c but .088" or 2.2mm longer. The keys are .06" or 1.5mm closer to the sides, the key spacing is .01" or .25mm closer together and we have one extra row of keys.

Feel free to comment on where various keys should go and what other functions should go on the extra keys. Please note the INV key that is there so there is no need to label the inverse for SIN, COS, TAN . . . functions, that way you also clear up space on the keyboard where those functions would be for other blue g shift key functions.

Re: Hypothetical HP 15CII

*Message #2 Posted by **Namir** on 28 May 2004, 11:01 a.m.,*
in response to message #1 by Chris Woodhouse

Cool design!!! I like the INV button idea. Any space for alphanumerics??

Re: Hypothetical HP 15CII

*Message #3 Posted by **Chris Woodhouse** on 28 May 2004, 2:12 p.m.,*
in response to message #2 by Namir

Namir opined,

> Quote:
>
> Any space for alphanumerics??

I'm glad you asked that. There are 43 keys on that design. If you subtract the ENTER, ON, f, g, INV, and an ALPHA key that leaves 37 keys. If you also omit the numeric keys, which many would want to not be part of the alpha shifted set, that leaves you with 27. That is enough, but I really don't think I like the idea. I am thinking this should be more of a basic scientific calculator, in the tradition of the 10C series. I added the second line on the display because it would fit with out moving any keys. While I don't think the second line really makes RPN easier to use, I do think it makes it easier to learn. Personally I also have a little bit more of a "warm fuzzy feeling" if I can see both numbers I am about to act on and I think it gives you one more chance to notice a potential error in your previous result. The INV key wasn't my idea. I read about it in the comp.sys.hp48 forum, and I thought it sounded like a great way to keep keyboard clutter down and get more functions on the keyboard.

Some of the other things I would change from the 15C are, speed and memory those are no brainers. I would keep the 20 directly addressable memory registers exactly the way they are, but I would change the stats functions so they stored their data in their own dedicated registers (we can easily have enough

memory for that on a simple scientific calculator today). You may have noticed that PI has it's own key, I really like that. Other than that I don't see where I would change much else on the 15C I just added the extra buttons to allow for more functions that other people might like to see. Maybe add the most common financial functions of the 12C, so all the engineers that switch over to the "dark side" can do all the TVM stuff with their scientific calculator.

Re: Hypothetical HP 15CII

*Message #7 Posted by **Dave Shaffer** on 28 May 2004, 1:12 p.m.,*
in response to message #1 by Chris Woodhouse

It might offend the purists (moving the "INV" function away from its (almost) current location, but it seems to me that it should be placed next to (to the left of, for those of us right-handed folks who dominate the world) the SIN, COS, TAN buttons (and very close as well to the other INVertable operations (i.e. 10^x, e^x, etc.)) What happens if you push INV before the wrong button (i.e. something that doesn't have an inverse operation)? I guess you should get an error message.

It might look impressive, but do you really need all those digits for display? As has been mentioned here recently, do you ever need 10+ digits of precision? Perhaps when taking differences between comparable sized numbers. (I occasionally deal with very precise timing - picosecond precision for millisecond intervals, but that gets done in the computer with double or even quadruple precision.)

I'm glad you asked. Actually I was the one that mentioned that more than 10 digit precision isn't necessary. So why the 16 digits? Well I thought you could use it to show both the real and imaginary parts of a complex number on one line. Or if you wanted to display more precision than that you could use both lines to display a complex number. I was also thinking you could do something similar with 2D vectors. Have a vector mode that worked very close to the way the complex mode works on the 15C.

*Message #9 Posted by **Eddie Shore** on 29 May 2004, 10:04 a.m.,*
in response to message #8 by Chris Woodhouse

I agree, I'm not a favorite on how complex numbers are displayed nor calculated on the HP33s.

Re: Hypothetical HP 15CII

*Message #10 Posted by **Britt** on 28 May 2004, 2:35 p.m.,*
in response to message #7 by Dave Shaffer

You get the 16 digit display for free because the HP-15Cii uses the same LCD module as the new HP-16Cii. The HP-16Cii needs them to display 16-bit binary numbers.

Britt (who really wants a HP-16Cii)

Re: Hypothetical HP 15CII

*Message #11 Posted by **Chris Woodhouse** on 28 May 2004, 2:51 p.m.,*
in response to message #10 by Britt

Maybe we could use the extra room on the keyboard provided by the INV key and extra keys to add the functions that the 16C had? Maybe role up the 15C, 16C and 12C in to one calculator. Maybe as OpenRPN suggested we could have a small overlay for 4 user buttons and it could come standard with a CS and Financial overlay.

Chris W

Re: Hypothetical HP 15CII

*Message #13 Posted by **Veli-Pekka Nousiainen** on 29 May 2004, 5:57 a.m.,*

in response to message #11 by Chris Woodhouse

```
Combining the 12+15+16 = 43 would be best idea since sliced bread, gun powder and
compass combined.
The 16C top row of keys A..F should be different in the financial mode.
Maybe we simply need one more row of keys and put them slightly closer each
other.
I recommend that a second press on any of the three shift keys would invoke the
inverse (or special chars).
Three shift keys are needed of which one is ALPHA to use the equation editor.
I simply want a better 33s, which is 43s and it will be more like 12+15+16
combined, except that the LCD will be full dot matrix for A..Z labels and
"textual" programming eg. no more keycodes.
{VPN}
```

Re: Hypothetical HP 15CII

*Message #14 Posted by **Bill P** on 29 May 2004, 5:02 a.m.,*
in response to message #7 by Dave Shaffer

It might look impressive, but do you really need all those # digits for display?

Well, we could give it 41C style display segments and have the program editor display function names instead of key codes.

Also, a 33S style equation list and solver would be nice to use the extra segments. Even with only 5 variable names, this would be nice.

Re: Hypothetical HP 15CII

*Message #15 Posted by **Veli-Pekka Nousiainen** on 29 May 2004, 5:49 a.m.,*
in response to message #14 by Bill P

```
hp 33s display is great (once you fix the decimal point size).
16 places (including sign place) is enough for sixteen hex digits.
It is also enough for sign+15 digits of internal accuracy shown using SHOW to view
mantissa only.
You can used for sign+mantissa+[E/small E&sign]+exponent, eg: 1+10+1+3=15.
Two lines will show X&Y or a complex pair or (setting a flag) X&Y using "compressed"
complex pair with reduced number of digits shown
{VPN}
```

*Message #16 Posted by **OpenRPN** on 28 May 2004, 1:21 p.m.,*
in response to message #1 by Chris Woodhouse

Nice work. I think the best thing for the extra keys is to leave them user defineable. Perhaps that column of keys could be left as a sort of blank-nut section with a small overlay strip.

INV is a good idea, I've been planning to do the same thing to the position of CHS with some of my initial keyboard layouts.

Best Regards, Hugh Evans

HP45 Keys

*Message #1 Posted by **Paul Marin** on 28 May 2004, 10:29 a.m.*

Just some help on key board buttons. I have a HP45 unit which has some of its keys on the numberpad, which when depressed, dont make the "click" sound. They feel soft and dont confirm the keystroke. Any suggestions of what may have caused this and how to fix it if possible? I know someone at some stage asked the same question, but I can't backtrack and find the infomation. Thanking anyone for their help

Paul

Re: HP45 Keys

*Message #2 Posted by **David Smith** on 28 May 2004, 12:44 p.m.,*
in response to message #1 by Paul Marin

The key strips probably have cracks in them. Each row of key contacts is made of a thin stainless steel strip that is spot welded to the circuit board between each key. Best bet is to replace the keyboard with one from another unit. Next best is to remove the bad strips and replace them with ones salvaged from another unit (requires soldering). Worst fix is to attempt to fix the cracks with solder... it will break again very shortly.

Re: HP45 Keys

*Message #3 Posted by **Jon** on 28 May 2004, 1:35 p.m.,*
in response to message #1 by Paul Marin

Hi:

I have repaired one with excellent result. I used 0.5 mm. steel foil. It requires soldering, of course

Re: HP45 Keys

*Message #4 Posted by **David Smith** on 28 May 2004, 4:23 p.m.,*
in response to message #3 by Jon

Be aware that many types of stainless steel do not solder. The key strips the HP45 are usually gold plated. Those in the HP65/67/etc are not (but they solder just fine).

HP41 MLDL2000 Update

*Message #1 Posted by **Meindert Kuipers** on 27 May 2004, 10:42 a.m.*

At this moment I am doing some final tests and checks on the MLDL2000 design. I will upload the new specifications (version 1.3) within the next 8 hours or so to www.kuipers.to/hp41.

There are some details to be fixed in routing of the PCBs but that seem to be pretty trivial.

I now have the final quote from the assembly house I will be using. The final price will be very close to EUR 250 (USD 300 at the current rate) if no redesigns are required. Anyone who is sincerely interested should contact me at meindert_at_kuipers_dot_to. Those who communicated with me before about the MLDL2000 do not have to do this, I will contact them personally in the next few days.

I hope to be able to order the proto's and beta units within 2 weeks. If these work out OK the plan is to order a first production batch in 2-3 months from now, depending on feedback from the beta testers.

The MLDL2000 consist of 3 PCBs: - Interfacing and power, HP41 connector is soldered to this PCB - USB interface - Main controller and memory

All 3 PCBS will fit together in a cardreader housing, and some assembly/soldering will be required. I will NOT supply a cardreader housing or HP41 connector, but I will offer the service of assembling the unit to those who do not have the required skills. Once I have the proto's I will make some pictures to show the actual assembly process and how it fits in the cardreader. Any other housing will work as well with a short flatcable connecting to the HP41. Note that the cardreader will need two holes in it: one for the USB connector or cable and one for access to the configuration switch (a smd dip-switch). But then, who would need a cardreader if you have the MLDL2000?

Regards,

Meindert

HP49G+ to HP48GII

*Message #1 Posted by **Rick** on 27 May 2004, 10:41 a.m.*

Just wondering if I can transfer programs made for the 49G+ to a 48GII using the infared. Will it work? Thanks.

HP49G+ to HP48GII

*Message #2 Posted by **Veli-Pekka Nousiainen** on 27 May 2004, 4:39 p.m.,*
in response to message #1 by Rick

Yes

Re: HP49G+ to HP48GII

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2004, 8:15 p.m.,*
in response to message #1 by Rick

HI;

I guess that using ASCII mode without translation will cause any program to be transfered without troubles. I remember that I hhd problems tranfering programs from one HP48G to an HP48S whan in binary mode, but in ASCII there was no problem. And the exclusive HP48G commands were kept as unchanged names, meaning they would be placed in the stack instead of being executed (and generate some error later). If you keep binary mode, some internal calls to addresses not defined may appear.

I guess that´s the only problem: using binary mode. BUT if you are sure that your HP49G program has only valid commands for the HP48, I see no trouble.

Cheers.

Luiz (Brazil)

What about 49G+ to 48G (original series)

*Message #4 Posted by **Eddie Shore** on 27 May 2004, 10:41 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Should I use ASCII or Binary?

in response to message #4 by Eddie Shore

```
Orininal 48 series requires you to send the data to a PC using ASCII and then
receiving it to a 49/48GII using ASCII
The HP-SIR & IrDA do not work together...
SOmebody should port the old 28 to 48 read Printer IR program to the 49 series
{VPN}
```

Re: What about 49G+ to 48G (original series)

*Message #6 Posted by **James M. Prange** on 28 May 2004, 1:53 a.m.,*
in response to message #5 by Veli-Pekka Nousiainen

In general, an ASCII file from a 48 series works well on a 49 series, but there can be problems with a global name matching a new command name. Also, the 49 series should be in approximate mode when downloading a 48 file to avoid compilng reals as integers.

> Quote:
>
> SOmebody should port the old 28 to 48 read Printer IR program to the 49 series

Called INPRT as released by HP, though I know that there are variations that don't do any remapping from Roman 8 to ECMA 94.

This wouldn't apply to the 49G of course. Maybe from a 28/48 to a 49g+/48gII.

Re: What about 49G+ to 48G (original series)

HP 97 Fixed number format question

*Message #1 Posted by **Mike** on 26 May 2004, 9:38 p.m.*

I have just recieved an HP 97. The fixed number format displays only two decimal places. I have tried to change it, but still only two? Am I doing something wrong?

Mike 1111

Re: HP 97 Fixed number format question

*Message #2 Posted by **Randy** on 26 May 2004, 10:18 p.m.,*
in response to message #1 by Mike

I dunno. What'cha do? {Sorry, couldn't resist}

[FIX] [DSP] [4] should yield a 0.0000 display. Change the number of places to suit.

[ENG] [DSP] [n] [SCI] [DSP] [n]

for other formats were n is the number of decimals you want.

Enjoy one of the best...

And, if you want only...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2004, 2:32 a.m.,*
in response to message #1 by Mike

... changing the number of digits after the separator (i.e., keeping current format), [DSP]n will do as a stand-alone operation. OR, if you want changing only the number format (i.e., keeping current number of digits after the separator), [IFX], [SCI] or [ENG] will do, as stand-alone keystrokes.

I just wanted to add to Randy's explanation that the key sequences can be used separately.

Success!

Luiz (Brazil)

big jump in counting

*Message #1 Posted by **Bram** on 26 May 2004, 5:04 p.m.*

Just happen to notice:

The counter of "pre-ordered" HP-15Cs on Chris Woodhouse's site was (too) slowly approaching the magic number of 1000 for the last few days, but suddenly someone somewhere seems to be interested in about 400 machines to buy should they become available again.
Good news!

Chris' site

Re: big jump in counting

*Message #2 Posted by **Chris Woodhouse** on 26 May 2004, 5:39 p.m.,*
in response to message #1 by Bram

Yes there was a big jump. As I write this the count is currently 184 signers from 30 different countries claiming they would buy 1,378 HP 15C calculators if HP started making them again. Seems a few people want to buy a lot of them. A quick check of the DB reveals that 11 people are going to buy 1,050 of the 1,378. With 7 of those buying 100 or 150 each.

The interesting thing is that everyone claiming to be willing to buy more than 20 lives out side the USA, maybe they know of a big market over seas that HP has no clue about. However if you drop out those 11 people and their 1,050, you are left with about 1.9 calculators per person. Which I think is reasonable. I have some comment that they would buy one for every engineer at their company and one in Germany that said he could make it the standard at his University.

My favorite quote is from Paul in NC, "my 15c was the nerve center of my greatest achievements."

Why RPN?

*Message #1 Posted by **Ignorant Student** on 26 May 2004, 2:08 p.m.*

OK, perhaps I'm just an ignorant student who's been lulled into the security of using algebraic calculators, but I think I have a legitimate question that others may benefit from.

One of the key selling points for HP versus other companies among communities like this seems to be RPN. Why is it considered so much better? I have seen that you can make the same calculation in less key strokes than in an algebraic mode. So, it saves memory in programs, providing more room for other programs, and may even save a few seconds in solving a problem during an exam. But honestly, in these days with cheap memory, is that really that important? What other benefits does RPN provide that you can't get from an algebraic calculator?

Here's another question: I'm betting that RPN is exclusive to HP for a reason, perhaps something related to copyrights or patents. But if another company were able to produce an RPN calculator, say TI, would people in this community take it seriously? Or do we just hold on to HP calculators out of nostalgia or something like that?

I think you can see my confusion, anyway. I've followed some of the threads here, and it seems to me that there's a real demand for a powerful scientific calculator out there that's just not being provided for. I know I'd love to have this "dream calculator", and I keep hoping perhaps a group of people could make a case to any of the companies (either HP or TI or anything else, for that matter) to produce that calculator. Maybe someday. Who knows, maybe this hydrix calculator I've heard about might become what we're looking for.

Edited: 26 May 2004, 2:09 p.m.

Why RPN? Because...

Re: WhyALG Because...

*Message #3 Posted by **bill platt** on 26 May 2004, 2:48 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Hi VPN,

Try it this way, too:

on a 20s:

```
2 + 3 =
9 - 3 =
* <LAST> =
```

or on a 33s ALG:

[pre] 2 + 3 <ENTER> X<>Y 9 - 3 <ENTER> * X<>Y <ENTER>

(Notice that the 20s is actually more natural and versatile than the 33s ALG system here---you can start a 2nd calc chain without having planned to, and still go back and bring in the last chain result. Not so with the 33s, where if you don't consciously swap the 1st chain result back to the background ["y"] you will lose it).

(But I agree with you, the RPN is so much mre natural and elegant and *exactly* like on paper!)

regards,

Bill

Re: Why ALG? Because...

*Message #4 Posted by **Matt Kernal (US)** on 26 May 2004, 7:38 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Because.. (;-)

none of my other friends work from the inside (to) out.

who wants to have to remember Order-of-Operations (Precedence) anyway?

I just want the answer, I don't care how it got it.

I don't care if intermediate results seem reasonable or not.

if I make a mistake, I can just start over again.

Sorry. I was just reacting to the attitude of a new college-grad Industrial Engineer that told me he couldn't stand HP calculators because of that "reverse entry stuff".

Matt 12345

Re: Why ALG? Because...

*Message #5 Posted by **Gabe** on 26 May 2004, 8:43 p.m.,*
in response to message #4 by Matt Kernal (US)

You say an argument for algebraic is so you don't have to remember order of operations--but remember that not all algebraic calculators are like graphing calculators. Take any simple, non-graphing, single line calculator, especially one without parentheses on it. Order of operations is still required to get the right answer on these calculators.

Perhaps one benefit to algebraic entry is that it more naturally matches what people learn to do in math--you think about the entry in the same way you think about the algebra. For many people, it can be hard to keep track of where in the stack everything is, and an algebraic system seems more intuitive to them.

Re: Why ALG? Because...

*Message #6 Posted by **Matt Kernal (US)** on 27 May 2004, 2:18 p.m.,*
in response to message #5 by Gabe

Gabe wrote:

Aha! You said it, right there.. "without parentheses"! That's the whole point we've been trying to make: Parentheses, who needs 'em? Or to borrow from an old song: Parentheses, what they good for.. absolutely nuthin'!

Gabe later said:

> Quote:
>
> For many people, it can be hard to keep track of where in the stack everything is, and an algebraic system seems more intuitive to them.

Au contraire mon frere (please excuse my French :-)! Using that same simple, non-graphing, single line calculator, let's assume it has one memory location (i.e. register). An equivalent simple RPN calculator can be viewed as having multiple automatic, albeit temporary, memory registers (i.e. stack).

On an RPN calculator, once you're finished with the first calculation, you just start working on the next (second) part of the expression. The first result will simply be bumped up a level. No need to Store it anywhere. When the second calculation is finished, guess what? The first result is right there waiting for an operator to be pressed that will "operate" on the first and second results. No need to Recall the first result from memory.

Isn't that simple? Isn't that intuitive? If a person were to learn this (RPN/stack) methodology as a youngster, I believe later exposure to algebraic entry would be seen as being counter-intuitive (less efficient). This person might say "You're telling me I have to store intermediate results manually? Why? My HP does it automatically."

If you're unsure of what's currently on-the-stack, it's easy to Roll the stack to view each of the four registers. It's also easy to exchange (Swap) values in different registers. In other words, it's not hard to keep track of what's on the stack.

Finally, to learn how to use an RPN/stack-oriented calculator, I feel a person needs to be open-minded enough to unlearn (or temporarily let go of) Algebraic-entry long enough to see the merits of a different way of calculating expressions. In doing so, a person might very well come-out saying "Hey, this is a better, more efficient way". At least that's what I found.

Matt

Re: Why RPN?

*Message #7 Posted by **Bram** on 26 May 2004, 2:36 p.m.,*
in response to message #1 by Ignorant Student

I've several brochures in which RPN is explained with benefits as less key strokes, so efficient and fast to get results.

My opinion is that the threshold to get used to RPN is somewhat higher than for "normal" systems and after this, much is a matter of personal preference. Also, I think that any system can be justified with a specific example that precisely that system handles best.
So what then is the real advantage? It is mentioned in the brochures, though never as first one: error correction. I must admit, it's not a good one to start with but unless you'll never make any mistakes, this is where RPN proves its value. In algebraic systems you better start all over when making a typing error like pressing a number before an operator (previous number will be lost) or pressing the wrong operator (cannot always be overwritten by the correct one without wrongly performing part of the computation). A mistake can easily be reversed in RPN. With RPN you just feel that you're in control over what you're doing.
If possible, give it a try, and you'll be convinced.

Re: Why RPN? Error Correction

*Message #8 Posted by **bill platt** on 26 May 2004, 2:53 p.m.,*
in response to message #7 by Bram

Bram,

Yo uare absolutely right. I have used "LASTx" countless times over the years in order to correct mistakes in entry---it is a really important point---and you are right.

Indeed, that is the beauty of RPN, it is a totally efficient, logical and consistent entry system for carrying out computations---and it is way more "natural" than algebraic for on-the-fly work---precisly for the reasons you mention: since the operator is LAST, you can be sure EVERY TIME that you are sure of what the operator is doing---you can even review with SWPA just before! And if you lose your train of thought, you can check LASTx to see where you had been (and then clear it out--sometimes this will mess thing up if you are using the whole stack, though).

regards,

Bill

Re: Why RPN?

in response to message #8 by bill platt

I have used both over the last 30 years. It depends a little on the implementation. HP 27S, one of the few classical algebraic HP machines, has such a great implementation that I like it a lot. Here I found the "9-3" example not so convincing.

When calculating expressions with many nested brackets and functions however, you really will love RPN. You can not use different type of brackets and it is just too easy to get lost....and than you start the calculation over again. Never a problem with RPN.

I too was an ignorant undergrad, back in the early '80s. Luckily for me, my TI-55 was stolen, and I bought an HP-15C to replace it. Haven't been

back to algebraic since. Once I got used to RPN, I said, "Gee, why did I wait so long?"

I personally have HP RPN calculators for daily use. I also have the nagging fear of someday not having one if my modest collection starts going Tango Uniform, so I keep an eye out for units in decent working condition. I can't afford mint!

As to RPN itself, there are other non-HP RPN calculators out there - various Novus/National Semiconductor and Soviet models are probably the easiest to find. However, IMHO they aren't nearly as well made, nor as functional, as classic HPs.

Lots of great replies so far. First I point you to the first page in what I plan to make several pages of an RPN How To. RPNHowTo

Also keep in mind that RPN isn't the only reason most people here prefer HP. In the past HP has always had a much higher quality machine. The keyboard feel and layout more well thought out than most if not all other calculators.

There are Russian made RPN calculators and I think one other brand made in the USA. Also math coprocessors all use RPN because it is the most natural way to do it for a computer too.

My final reason and I think the best reason is this. I was taking a test one day that relied heavily on complex calculations. Calculations that you couldn't program in a head of time. Keep in mind that while I generally know the material on a test better than most people I am a slower test taker than most. On that test I was finished long before anyone else in the class was. The only reason I was done first is because of my RPN calculator.

in response to message #1 by Ignorant Student

I like RPN because:

-Error correction

-It shows intermmediate results!

-Don´t need of parentesis (less keys/no mental parentesis count)

-I feel that it´s less probable to make a mistake

For a smart programmable system like HP-41C: You can write code that acts exactly like built in functions. For example you can redefine all the math functions to work with complex numbers or with fractions or (as I did) with numbers that have an associated error; and asign the new functions to the original keys. Its easy to do: the programs take the values from the stack and return the results to the stack. Easy, Beautiful, Smart.

Two RPN calculators where made in my country (Argentina) in the ´70s. See www.calculators.com.ar

We RPN fans always have to justify why we like RPN. Let's turn the tables... "Why Algebraic?" We have all heard the advantages of RPN over algebraic, but surely there must be some advantages to using Algebraic Entry (after all, so many people use it)

Here is what I see as being possible advantages for Algebraic. You can essentially "copy-paste" from a math problem. It doesn't require you to think much at all (and consequently, the resulting information is less powerful (no intermediate results) and more complicated to enter (using parentheses)

It is kind of like the battle between those who make websites by programming and those who use a WYSIWYG (what you see is what you get) environment. It is considerably easier to design something in WYSIWYG provided it is simple. It gets much more complicated in some cases (when adding several frames and tables) to use WYIWYG. With WYSIWYG, you also have lower quality sites, with more wasted space

(innefficient code)

Essentially Algebraic entry is taught in our schools because anyone can do it. A monkey could be trained to use an algebraic calculator (if you see an open parentheses, press open parentheses). RPN requires thought, but essentially is more intuitive than algebraic mode (you get 2 pieces of information and then decide what to do with them).

After the short learning curve, RPN makes much more sense than Algebraic. If you are doing extremely complicated math problems for the sole reason to do extremely complicated math problems (like if you are just doing arithmetic), then RPN is the only choice. Let me give you an example.

Download this file: http://texasmath.org/DL/CA03C.pdf It contains a UIL (University Interscholastic League) Calculator test. 99% of the people taking this test use a HP 32sii. Go to about the 5th page of the problems (or even the second page). In sheer number of keystrokes, RPN could finish either of these pages almost twice as fast as an algebraic calculator. This does not even include the extra thinking involved for algebraic (have I closed that parenthese yet... did I store that value in mem 1 or 2?!?)

Just my thoughts. Give it a try... I have used both RPN and Algebraic and I will give you 2 guesses as to which I use now (and which I like better). I won't be going back anytime soon (I am starting to sound like an "Apple Switch" commercial)

in response to message #14 by Ben Salinas

Whoa. What are the non-calculator tests like?

Why would there be a competition involving the ability to do rote calculations, which is what that test you linked to is?

Are there ones that test math ability?

Re: OT: Calculator Contest Questions

*Message #16 Posted by **Ben Salinas** on 27 May 2004, 12:05 a.m.,*
in response to message #15 by Sam Hughes

There are tests in many subject areas (the mathematical related ones: Science (a test covering biology, chemistry and physics), Math (a test covering algebra 2-Calculus), Calculator (as shown there), Computer Science (in Java), Number Sense (mental math... you may not have any scratch work, only the answer)). There are also literary events (spelling, literary critism, etc), but I don't do those.

The calculator test is really a silly one, but in preparing for it I have learned how to use my calcualtor lightning fast (helpful for the other events) and since I started using the 32sii for the UIl tests, I took it one step further and learned every feature on my calculator. The math test is a good test (decent). Some of it is knowing short-cuts, but they are shortcuts that are somewhat helpful in real life. It's a lot of word problems.

The Science test measures information in all 3 subjects. The biology section is mainly trivia, and about 1/8 of the physics and chemistry sections are each trivia also.

The computer science test is worthless (in my opinion). It does not test how well you can program, or how well you know theory even. It tests if you can make pretty messages print out (i.e: "What does System.out.println("\t\\\"THIS");), or if you can find errors. Our school has a decent computer science program (we can write some fairly complicated programs that work) but we don't do well on these tests.

Hmm this rant is getting a bit long.

Basically the UIL tests, at least for me, acted as an introduction to new math topics, new calculators (with UIL, I would not be posting here... I would be doing my homework with my TI-30xa... ughh), provides a way for me to keep my old math and science in practice

But yes, the calculator test is pretty pointless (we sometimes refer to it was "monkey" practice (calculator practice))

Texas has long been famous for competitions that measure the speed, agility and accuracy with which contestants can *perform* calculations, rather than the ability to determine *how* to solve problems (there are other competitions for problem-solving). Before calculators came along these competitions were held with slide rules. The contests were so popular that one of the major slide rule manufacturers, Pickett, came out with a model designed especially for competition. The Texas Speed Rule had scale layouts designed to make chain calculations as efficient as possible by limiting the amount of slide and cursor movement necessary. (Saving a second or two on a long calculation could make the difference between winning and losing.)

I started with the TI-58c (with AOS, not RPN) and liked it a lot. It kind of bugged me that the RPN ads would give misleading examples about how much more efficient RPN was. They would show some complex calculation that ended with half a dozen sets of parentheses to close, if you could remember how many you had open. In the TI's AOS, you could close them all at once by pressing the = key.

When I got the HP-41cx and began doing far more than calculations with it-- file operations, using it as a controller for electronic instrumentation, etc.-- RPN suddenly was not just another way to do it, but was clearly superior.

As for programming, RPN does make for cleaner parameter-passing for subroutines and so on, but it would have been nice to have a stack of more than just the four positions that we inherited from the days before calculators were programmable or could handle really complex programs.

If you are in an H-P site you can expect to see mostly material that tells you why RPN is better than algebraic (AOS). It's a lot like going to a Chevy dealer and asking him if Chevvies are really better than Fords.

Many years ago in the heyday of the HP-67 and HP-97 the H-P folks came up with a Mach Number calculation that they believed showed the advantages of RPN over AOS. They were so sure of it that the equation was on the cover of the manuals for those devices. But, for another view you should go to www.woz.org/letters/general/57.html and read to the end to find a description of using an AOS machine by Bill Wozniak, the co-inventor of the Apple computer:

"... At Hewlett Packard we were so proud that our calculators, the first scientific ones ever, were years ahead of competition. They used postfix partly because the least logic or ROM chips were quite expensive back then. It would have taken extra keys and an infix to postfix translator to use infix. Also, a larger and more expensive desktop HP machine from the division in Colorado Springs used postfix, for the same reasons. The HP-35

was an attempt to miniaturize this machine.

Our marketing department had a card with a monstrous formula to demonstrate how powerful our calculators were and what postfix calculation was capable of. They challenged people to solve it on a slide rule the normal way. Well, we could all solve it on our HP calculators but it took a few tries to get the steps accurate enough, there were so many of them.

Finally Texas Instruments introduced an infix 'algebraic entry' scientific calculator. The first one showed up in our lab one day. We were all pooh-poohing it and laughing at the arithmetic entry as being too weak for engineers. Someone pulled out our big formula challenge and we all laughed, sure that nobody could ever do it with the TI calculator. A challenge went up for someone to try. After a short silence I said that I'd try.

Well I started staring at the formula and looking at the keys and trying to decide which steps to calculate first, as you would do with an HP calculator. I finally realized that I'd never be able to solve the formula this way. With my fellow engineers watching I was very self conscious but I wanted to succeed. I managed to let go of my thinking and then came up with a very amazing concept. I just copied the formula from left to right! This was such an incredible concept that I pressed the keys as fast as I could on the TI calculator, risking a wrong press but impressing my colleagues. I had to guess whether this calculator used the square root button as prefix or postfix but I guessed right and got the proper answer the first time.

My colleagues couldn't believe it. I told them that you just copy the formula from left to right but not one of them could see through their postfix fog. After all, these were the calculator experts of the world. They are well accustomed to thinking ahead and analyzing an expression to come up with the order of steps to take on an HP postfix calculator, and they had to remember which sub-expressions were in what order on the calculator's stack. None of them could do what I had done, forget that they have to be smart."

One of the curious aspects of the selection of the Mach Number calculation to demonstrate the superiority of RPN over AOS was that the problem was exactly of the level of difficulty which allowed it to be easily performed by the least capable machine in the TI inventory at that time, the TI30!

Once I was part of a "competition" between HP and TI. I was one of very few persons to have an HP-21, and many times I had discussions with fellow students, who owned a TI-53 (if I recall the number well). Neither one could convince the other to have the better machine on a theoretical basis, but in real life (well, perhaps you wouldn't consider the "lab" a real world, but that's another discussion. For calculating it surely was) my 21 proved to be a nicer companion. True, the TI had more functions, memories and decimals, but my results appeared sooner, easier and mostly first time right.
The HP-21 has only 1 memory, but I hardly ever needed it in a computation. Sometimes, to hold a result for later use in a different computation. The TI-ers almost always needed 1 or 2 memories.
What I DID notice during these "fights" was that a taller stack could have meant an improvement. I discovered after some time that the 4 levels were just the right number when working from inside out; more aren't required. Would you have more levels you could also work from left to right. For example, the Mach number needs 5 levels, in case you insist on starting with the number 5 right inside the squareroot function.
It was only a thought; I never really have desired to have more levels.

and this

> Quote:
>
> Well I started staring at the formula and looking at the keys and trying to decide which steps to calculate first, as you would do with an HP calculator.

I was expecting something much more complex than that. You don't even need the full 4 levels of the stack to calculate that.

Steps as performed on an HP 15C

```
350 ENTER
661.5 /
2 y^x
.2 *
1 +
3.5 y^x
1 -
6.875 EEX 6 CHS ENTER (First time 3 levels are needed.)
25500 *
1 x<>y (that's x y exchange)
-
5.2656 CHS y^x (back to only 2 levels being used.)
*
1 +
.286 y^x
1 -
5 *
sqrt
```

answer: 0.8357

Maybe I have been using RPN for too long but that was easy, was very natural, and took almost no thought.

Chris W

in response to message #29 by Bram

Yes, I have learned a lot. It seems that the arguments are the same, but at the same time those arguments seem to have more validity. What it seems like to me is that the only way to find out whether or not RPN is better for you is to try it. Which means either blowing $50 on what could potentially not be the calculator you want, or else to borrow someone else's. I don't know anyone who uses one, unfotunately, at least that would let me take it for an extended period of time.

That's probably one of the main arguments algebraic users have against switching--the cost. Anyone know of a good way to expose someone to a fully functional RPN calculator without having to commit to spending lots of money?

Emulators

*Message #31 Posted by **bill platt** on 27 May 2004, 5:02 p.m.,*

Re: Why RPN?

*Message #32 Posted by **Ron Ross** on 27 May 2004, 5:20 p.m.,*
in response to message #30 by A More Enlightened Student

Yeah, $50 is what it takes, but you can buy a lot for $50.

ie You could buy an Hp28s, Hp48G or a new HP33s. And if you are not tied to the scientific line, an Hp12c or an Hp17Bii can all be purchased for about that amount or less via ebay.

An Hp33s isn't bad (actually the best non-graphics calculator available, new). An Hp48G is also a good buy for what you would get. The new Hp48GII (which is really an Hp49G minus) can be found on the web for $80 plus S&H. That makes it the best bargain out there esp compared to the Ti line for price to features. And the new Hp's can always be set into the algebraic mode should you not like RPN (hard to believe, but some people NEVER learn to like or appreciate, period.).

Re: Why RPN?

*Message #33 Posted by **Chris Woodhouse** on 27 May 2004, 7:19 p.m.,*
in response to message #30 by A More Enlightened Student

Some hear have eluded that while RPN is clearly more efficient, it is more difficult to use and requires more thought to figure out how to proceed. An example was given as difficult to solve in RPN, and easier, although requiring more key strokes using algebraic entry. I strongly disagree. If you do nothing more that add a list of numbers it is a tie as far as efficiency goes. If you do anything more complicated RPN is more efficient, natural and easier. I will concede that it may be possible to write an equation that would be more difficult in RPN, but I have never seen one, and I challenge anyone to give me a real world example of one. If you insist on using both algebraic and RPN, I can see where some might think that RPN requires a lot of thought. If you decide to give RPN a try I strongly recommend that you put your algebraic calculator in some place that is very difficult to get to, and don't even think about it for a week or so. If you are using RPN multiple times a day, one week is more than enough to make you realize that RPN is in reality better than algebraic entry for performing calculations. If you are looking for an in expensive way to try RPN, and you can live with doing it at a computer, I would recommend one of the emulators, V41 is one I like. It is easy to install, has skins of different sizes so it runs well at various different screen resolutions. The 41 is a good one to learn on because it is one with a 4 level stack and once you learn on a 4 level stack the newer ones that have an unlimited stack are easy to pick up. Going the other way is not as easy. I have a short intro to RPN on my sight you may want to look at too. I plan on expanding it some time soon. So take a look at this page. RPN How To

Why RPN with adjustable stack size 1-10 (STK_0 => 10)

in response to message #33 by Chris Woodhouse

```
Anything requiring more than 4 levels of stack is more complicated:
A) You may loose the top level unnoticed
B) You need to do STOre and ReCalL
C) You may not remember the right point for RCL
D) Many stack levels makes it hard to do manipulation
E) New commands like FILL (shift ENTER) are needed
F) ...
{VPN}
```

Re: Why RPN with adjustable stack size 1-10 (STK_0 => 10)

*Message #35 Posted by **Garth Wilson** on 28 May 2004, 2:48 a.m.,*
in response to message #34 by Veli-Pekka Nousiainen

Ah, but now you're thinking of just one equation done by hand. Think of a program where you're using let's say 3 levels on the stack, and you want to run a subroutine to get the next number to work with. Let's say that subroutine needs 3 levels as well, and futher, that subroutine calls another one that needs 2 or 3 or 4, etc.. As you're programming, you don't have to care what's beyond the few levels you're working with at the moment. Each routine is concerned with only its few stack levels, even if there are 23 other things on the stack below. It doesn't matter. You won't get confused. We do this in Forth all the time, and most things work the first time we try them, unlike the case with other languages. Stack comments in the code only mention the few things that are relevant to the particular routine, regardless of what else uses that routine and leaves other numbers pending on the stack. The maximum stack depth is deep enough that we never have to worry about overflowing it.

Re: Why RPN?

*Message #36 Posted by **OpenRPN** on 28 May 2004, 12:33 a.m.,*
in response to message #33 by Chris Woodhouse

I used algebraic entry for years and was hooked on RPN the first time I tried it. For me the implications of the entry method were immediately clear, and I still seem to be hooked on it ;-)

There are several reasons I think people refer to RPN as "too hard." Humans are lazy animals and creatures of habit. Once you learn to do something, even if it's not the most efficient way, you will typically have a hard time changing. The other problem is that most people only carry out very simple math operations... so the efficiency of RPN vs. algebraic is basically equal. That makes for a hard sale.

Most engineering/science students these days avoid RPN. If only they knew those parentheses could be avoided...

Best Regards, Hugh Evans

Re: Why RPN?

*Message #37 Posted by **Norris** on 28 May 2004, 12:40 a.m.,*
in response to message #30 by A More Enlightened Student

One easy way to realize the advantages of RPN is to ask yourself a very simple question: what are the “rules” for using an algebraic calculator? For example, what actually happens when you press the + key?

Well, depending on the circumstances, pushing the + key can perform a wide variety of arithmetic operations. These include subtraction (example: 5 – 3 +), or multiplication (5 * 3 +), or division (5 / 3 +), or exponentiation (5 ^ 3 +). Sometimes the + key even performs addition (example: 5 + 3 +; the second push of the + key performs an addition, although the first does not).

In other circumstances, pushing the + key does not perform any arithmetic operation. It simply sets up a pending addition, which may be performed later when the = key is pressed (5 + 3 =), or in some cases by a right parentheses (5 + 3), or in some cases by a second push of the + key (5 + 3 +), or in some cases by the subtraction key (5 + 3 -). In other cases, subsequent presses of the right parentheses, + and – keys may not perform the pending addition, depending on the configuration of parentheses; for example 5 + (3 + 4 – 2) will not perform the first addition.

The same rules also apply to the – key. However, the rules are different for the * and / keys, and they are different again for the y^x key. Also, the rules may be different for unary operations like cos or log; on many algebraic calcs, unary operations are performed immediately, and are not affected by the = key, or by parentheses, or by any other operations.

Now read through all that again. Is it correct? Doesn’t it seem just a bit complicated when you think about it?

Now let’s consider the rules for an RPN calculator. They may be summarized as follows:

Pushing the + key immediately performs an addition. All other operator keys behave in the same way.

OK, that's it. Any questions? Would it be fair to suggest that the RPN rules are simpler?

Norris,

That was the best explanation of RPN over ALG I have seen in this "thread" so far; possibly the best I have ever read/heard.

I threw away a malfunctioning algabraic calculator (threw it out a dorm window, actually) more than 20 years ago. I got an 11C because I liked the way it looked, the way it was laid out and its "heft" and "feel". Also, a couple friends had been going on about how great RPN calculators were. I practiced RPN until I could use it efficiently (it took about two days) and I have never looked back. RPN "logic" just seemed so incredibly intuitive (it still does, by the way). I've never tried to figure out WHY before, but your explanation sums it up pretty darned well.

Take care.

Wayne.

I would like a copy if possible.

John

Re: Why RPN?

*Message #41 Posted by **Les Bell [Sydney]** on 27 May 2004, 7:48 p.m.,*
in response to message #1 by Ignorant Student

I've held off giving my answer, but no-one else has suggested this, so here goes:

RPN is better than algebraic because it clearly mirrors the mental model one would use when performing arithmetic calculations. This is what people are getting at when they say it models the way you would perform addition, etc. on a piece of paper. It is easy to visualise what's on the stack, and there's no hidden "state" information for the user to keep track of - at any time, you can take what's in the stack and use it in a calculation, change direction, think about things for a moment and then resume, etc. The calculator and the mental processes are in tune, and in step.

An algebraic calculator has a stack, too - but it's hidden from you and manipulated indirectly via arithmetic precendence rules and use of (and) keys. It's difficult to know exactly what's in that stack and what operations are pending, and you can't easily do things like saving intermediate results for re-use the way you can with RPN.

In addition, algebraic calcs often have strange inconsistencies like relying on an M+ operator rather than simple STO and RCL operations. I've tried to use my son's school-issued Casio calc, but it's just *weird* and makes no sense to me.

Algebraic notation is the way we all learn to perform symbolic manipulations, and so perhaps it has a place in educational graphing calculators which do that kind of thing. But it's not the way we do arithmetic, whether in our heads, on the back of an envelope, on a spreadsheet or on a real calculator, which - of course - uses RPN.

Best,

--- Les Bell [http://www.lesbell.com.au]

HP34C

*Message #1 Posted by **Italo Foradini (Brazil)** on 26 May 2004, 11:26 a.m.*

Dears Friends,

I win an "old Lady" HP34C calculator but I don't have Manuals. Any body help me...???

Best regards,

Italo Foradini

italo_foradini@yahoo.com.br

Re: HP34C

*Message #2 Posted by **Cococollector (Germany)** on 27 May 2004, 1:57 a.m.,*
in response to message #1 by Italo Foradini (Brazil)

Hi,

Dave, the museum's curator, provides you with a choice of CDs or a DVD to meet your needs. CD1 or 2 contains the HP-34C's manual. See the CD section of the museum. I recently got my DVD...

Regards Klaus.

Buy the Set

*Message #3 Posted by **Wayne Stephens** on 27 May 2004, 9:17 p.m.,*
in response to message #1 by Italo Foradini (Brazil)

I've said it before and I'll say it again: the Museum CDs are a BARGAIN at twice the price. I bought the complete set a month or so ago.

It has almost all the manuals available for all HP calculators (the ones not currently available from HP). Now, when I get "new" calculator, I just print out the .pdf of the manual and put it in a three ring binder.

I have printed about 10 of the manuals so far (many trees shall die before I am finished...), and the scans have been virtually perfect on every one.

Plus, the CD set has all sorts of other cools stuff like photos of all the calcs, HP Journal articles and even a book or two.

I highly recommend it.

Take care.

Wayne.

PS - Please note that I DO use both sides of the page when printing the manuals. I would not want anyone to get the idea I HATE trees or anything ... ;^)

49G+ Bugs in ROM 1.23

*Message #1 Posted by **helge gabert** on 26 May 2004, 10:32 a.m.*

So far, the HP 49G+ Rom 1.23 appears to be pretty stable, although the alarm and time-related bugs (alarm comes on, even when not scheduled, and the clock loses a couple seconds each day)are annoying.

I called HP to ask what they are doing about it but haven't heard back from them. It seems to me, if a product is advertised to have certain features, such as a functioning alarm, the company making that product owes it to the buyer to either make an honest effort to correct the problem or give the money back.

It seems that all time and alarm functions are directly ported from the 48, so maybe the problem is with the clock on the ARM chip. In that case, it may not be possible to correct anything at all.

Any comments, and is anyone aware of other serious bugs in the 1.23 ROM?

49G+ Bugs in ROM 1.23 will be fixed in 1.24

*Message #2 Posted by **Veli-Pekka Nousiainen** on 26 May 2004, 11:14 a.m.,*

Re: 49G+ Bugs in ROM 1.23 will be fixed in 1.24

*Message #3 Posted by **helge gabert** on 26 May 2004, 11:44 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Allright, lets hope for the best and that you're correct. The release of 1.24 could take a while, though.

Re: 49G+ Bugs in ROM 1.23 will be fixed in 1.24

*Message #4 Posted by **James M. Prange** on 26 May 2004, 3:32 p.m.,*
in response to message #3 by helge gabert

But as for the clock drifting off a few seconds per day, I wouldn't expect that to be fixed, as it would require hardware improvements. Note that this is normal for the 48/49 series; they aren't intended to be precision timepieces.

If it really bothers you that much, you might try an application like TIMEKEEP on Goodies Disc 9 (see http://www.hpcalc.org/hp48/compilations/horn/) or Timeman (see http://page.mi.fu-berlin.de/~raut/WR49/index.htm). On second thought, these time correction applications depend on control alarms, so perhaps better to wait until any alarm bugs are fixed before trying them.

Regards,
James

Re: 49G+ Bugs in ROM 1.23

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2004, 3:18 p.m.,*
in response to message #1 by helge gabert

Hi, Helge;

just reasoning about your post. I don't have an HP49G+ (yet!) but I woudl like to know about one thing. Are these clock-related bugs also observed with previous O.S. version? (1.22, right?) I'm asking this because if the bugs are related only to the 1.23 version, would they be with the ARM clock as well?

I understand that it's possible that the ARM has some specific HW or firmware bug that may be observed (or not) when some particular feature is used. I mean, if the 1.23 version uses resourses not used by 1.22 version and because of this the bugs are observed, that would explain what's going on.

Any other information about this clock/alarm bugs?

Cheers.

Luiz (Brazil)

Re: 49G+ Bugs in ROM 1.23

*Message #6 Posted by **James M. Prange** on 26 May 2004, 3:44 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

See http://bugs.hpcalc.org/query.cgi. But the "new" hp calculator developers don't seem to be responding to the bug list, so perhaps the users are neglecting it too. Of course more information about the current RPL models is available in the comp.sys.hp48 newsgroup.

Regards,
James

Thanks! I'll check it! (N.T.)

Re: 49G+ Bugs in ROM 1.23

*Message #8 Posted by **helge gabert** on 27 May 2004, 10:28 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hello Luiz,

yes the alarm-related problems also occur with previous ROMs of the 49G+. I hoped that they would have gotten fixed with 1.23. Unfortunately, that didn't happen.

I really like the 49g+, though, it's quite a bit nicer than the 48 in term of response, speed, and the CAS is fantastic. You just can't use the alarms (sigh).

HP9100 schematics

*Message #1 Posted by **John Larkin** on 25 May 2004, 7:54 p.m.*

Hi,

Has anybody ever seen the detailed schematics for the 9100? I have two dead units that I'd like to fix. The HP service manual that I have only has docs on the power supply, not the real goodies. I contacted the HP historian a few years ago, and she said that 1) she has all this stuff and 2) I can't see it.

I'd also love to talk to anybody who was involved in the design of the 9100s. They are amazing gadgets.

Thanks,

John

jjlarkin@highlandtechnology.com

Re: HP9100 schematics

*Message #2 Posted by **Katie** on 25 May 2004, 10:21 p.m.,*
in response to message #1 by John Larkin

I would love to have a copy of this as well to help me fix my broken 9100A. I didn't realize that HP actually had this in their library -- I thought that it was lost --perhaps we (as a group) might be able to persuade HP to release this information. Dave, have you ever tried to get the 9100 schematics from HP?

Re: HP9100 schematics

*Message #3 Posted by **Tony Duell** on 26 May 2004, 7:13 a.m.,*
in response to message #2 by Katie

HPCC has a reverse-engineered schematic of the 9100B (only -- if somebody wants to give me a 9100A...). Some of this might be applicable to the 9100A as well, but some sections are very different...

Re: HP9100 schematics

*Message #4 Posted by **John Larkin** on 28 May 2004, 11:35 p.m.,*
in response to message #2 by Katie

Katie,

You might email the HP archivist and add your influence to my recent request to see this stuff. These masterpieces will wind up in dumpsters if we can't fix them. Heck, I want to *use* my 9100s!

John

Re: HP9100 schematics

*Message #5 Posted by **Katie** on 30 May 2004, 12:08 a.m.,*
in response to message #4 by John Larkin

John,

Can you post the email (or snail mail) address of the HP archivist here? This way, those of us who are interested in trying to get HP to make these available can do a (small) letter writing campaign and make sure that the same person receives them.

Thanks,

Katie

Dead 41C - Help...

*Message #1 Posted by **Joanne** on 25 May 2004, 4:39 p.m.*

I hope someone can help me out here!I bought a 41C back in the 80s but it sat unused during the 90s.I took out the batteries and the contacts are clean.The other day I tried to put in 4 new N batteries (1.5v each) and expected it to turn on and work again!!!It is completely dead.Any ideas as to what I can do or check.My son would give anything to get it up and working again (for him this time).Thanks!

Re: Dead 41C - Help...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2004, 5:30 p.m.,*
in response to message #1 by Joanne

Hi, Joanne;

considering that the batteries are fresh and properly installed, I'd suggest a "first step" by opening the calculator": four screws, each one under each rubber pad. If your son has skills, let him go for it. Otherwise, experienced people to advise is always recomended. In all cases, make sure electrostatic discharge (ESD) precautions are taken prior to any internal procedure: the MOS circuits inside the HP41 are somehow easily damaged by ESD.

After that, with the calculator opened and both case halves separated, check all screw posts for cracked surfaces or (worst case) broken/dettached post. If so, repair posts. Then, cleaning all contact surfaces is recomended, mainly:
- exposed conductors in flex circuit connecting batteries and I/O module connectors to the mainboard;
- mainboard conductive surfaces related to the flex circuit mentioned above;
- all connectors under the small circuit board that is assembled in the lower part of the calculator, inside the case, below batteries compartment.

Next step: build it back and test again. If no activity is still observed, post a message again; then let's take other measures.

Hope you succeed.

Cheers.

Luiz (Brazil)

Re: Dead 41C - Help...

*Message #3 Posted by **Artur** on 25 May 2004, 5:37 p.m.,*
in response to message #1 by Joanne

Why don't you try to open it and clear the internal contacts? But before doing this, touch something of metal, to discharge electricity from your body. In my HPs 41, the base (hole) from the screws in the top of back were

broken and I only could see that when I removed the extension ports conector from the back part. So, when removing this part, do it on a table and carefully, for not lose any part and being able to use a super-glue to remake it, if this is the case.

Good luck!

Artur

Re: Dead 41C - Help...

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 25 May 2004, 5:53 p.m.,*
in response to message #1 by Joanne

Excuse me for asking the obvious but, as opening,cleaning and closing is not so simple, I would rather start by the reset sequence (keep pressed the CLx/A key and press ON) Try many times, if nothing happens, then an internal bad contact may be the suspect. Just in case, recheck batteries regarding voltage and polarity, and bad contacts on the battery holder.

If you decide to open it, etc., then be very cautious with the rubber feet (to be able to set them back after a successful repair), and also with the screws: any excess force while unscrewing or screwing will damage or break the plastic posts which act as "nuts" or bosses for the screws. You should be able to gently rotate them (Phillips head) while allowing for them to naturally came out (I mean: don't press down!).

There should be many assembly-disassembly information for HP-41C in the Internet, take enough time to read before beginning. Yours should be the variant usually known as "fullnut", in case you see the term. All 41C are "Coconuts", but later models have a smaller circuit board inside, and are called "halfnuts".

Good luck! Keep trying to revive this jewel which, in your case, will have an additional value for your son, as something passed from one generation to the next.

In case you decide not to open by yourself, there are some respectable repair shops, and you will find useful information in this site and in this Forum. Welcome!!

I vote for Andres' fix: Reset.

*Message #5 Posted by **Matt Kernal (US)** on 26 May 2004, 4:50 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

Since the battery contacts were clean, and she didn't mention any other problems (loose pieces rattling inside), I can't understand why someone would want to take apart a perfectly sound 41 without first trying multiple Resets first.

FWIW, in my case, if any of my 41's didn't power-up after changing the batteries, a few Resets always did the trick. Please let us know what fixes it. Thx.

Matt

First, a correction...

*Message #6 Posted by **Matt Kernal (US)** on 26 May 2004, 4:55 p.m.,*
in response to message #5 by Matt Kernal (US)

Firstly, please first disregard my multiple use of "first", in my first response.

Matt

Be gentle!

*Message #7 Posted by **Cameron** on 26 May 2004, 12:30 a.m.,*
in response to message #1 by Joanne

I'd like to underscore the caution expressed by the other guys.

If you decide to open it, be gentle.

If your son is going to open it, remind him that it requires *much* *much* more delicacy than putting a new graphics card in his PC. It will live again and give him years of service but *only* if it is treated with the respect that its 20+ years deserve. :-)

Cameron

Re: Dead 41C - Help...

*Message #8 Posted by **Joanne** on 26 May 2004, 8:18 a.m.,*
in response to message #1 by Joanne

Thanks so much everyone for your ideas!I'll pass them on to my son when he is home on the weekend.Forgive the obvious,but should he clean the contacts and other parts you have mentioned with just plain alcohol or should I buy something else?Thanks again!

Re: Dead 41C - Help...

*Message #9 Posted by **David Smith** on 26 May 2004, 3:17 p.m.,*
in response to message #8 by Joanne

I use 91% or stronger isopropyl (rubbing) alcohol. Best to keep it off the display window. It will leave a white stain (that can be polished off).

Search the archives of this forum

*Message #10 Posted by **bill platt** on 26 May 2004, 9:51 a.m.,*
in response to message #1 by Joanne

There are many really good help discussions on the 41 that have been posted here over the years---including some that Luiz posted for me over a year ago. Lots of details and imortant pitfalls, methods etc----go to "Archive" and then pick one (try at least the last three) and then search on:

```
 41
hp41
hp 41
hp 41c
Vieira ("posted by")
platt ("posted by")
fullnut
halfnut
full-nut
half-nut
etc
```

Note that the fullnut and halfnut are really different inside--and require different repair tactics.

Best regards,

Bill

in response to message #12 by bill platt

Hi Bill, I have just spent the past couple of hours reading through the archives.Wow!There are some really great guys out there!I saw 'my question' asked a couple of times and have kept all the different answers for my son to go through.Probably should have read through them first before just jumping in.Thanks again.Will keep you posted on progress (or possible lack of ...) Best wishes, Joanne

Re: Search the archives of this forum

*Message #14 Posted by **bill platt** on 27 May 2004, 12:35 p.m.,*
in response to message #13 by Joanne

Hi Joanne,

> Quote:
>
> Probably should have read through them first before just jumping in.

well, that might be the general rule in usenet, but here, we just eat up anything that has to do with fixing an old HP-41C! (BTW my 41CV still is not fixed, but someday I am going to try again--you probably saw my pleas for help--and Luis' et al responses!).

Do let us know how the progress goes--we all live vicariously through the successful repairs of others (especially those of us who still haven't fixed the broken ones...)

Best regards,

Bill

My pleasure!

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 27 May 2004, 3:05 p.m.,*
in response to message #14 by bill platt

Hello Bill, all;

first of all, thank you for your kind words and remindings. It's been -and will always be- my pleasure to be around and helpping the way I can. I take these words of your as the best rewarding, Bill.

Cheers.

Luiz (Brazil)

Re: Search the archives of this forum

*Message #16 Posted by **james summers (UK)** on 27 May 2004, 8:31 a.m.,*
in response to message #11 by Joanne

Hi Joanne

From the serial number I would guess that you have a fullnut (if the lcd display has square corners rather than rounded corners it's a fullnut) - the first two digits (22) give the year of production when added to 1960 - 1982 in your case which will be a fullnut (the earliest halfnut according to the museum is 1985) - the fullnut on my desk at the moment is also a 1982 (serial 2222S..).

Forgive me suggesting the obvious, but have you tried taking the batteries in and out for a few times - I've found that this will sometimes wake a 41 that has been sleeping for a while?

See also Resetting an HP41 which lists some ways of resetting a 41.

Re: Search the archives of this forum

*Message #17 Posted by **Frank** on 27 May 2004, 10:26 a.m.,*
in response to message #16 by james summers (UK)

Occam's razor may apply here! My 41c almost invariably appears dead if unused for long periods.Stretching the springs in the battery compartment never fails to bring it back to life.I think the small batteries and their correspondingly small terminals need all the help they can to make a good contact.

Edited: 27 May 2004, 10:27 a.m.

Re: Dead 41C - Help...

*Message #18 Posted by **Renato (Brasil)** on 26 May 2004, 10:25 a.m.,*
in response to message #1 by Joanne

There is a very good article at: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=2

Soldering wires as described might be too radical, but instructions for repairing the posts are very good.

Renato

Specialty Calculators

*Message #1 Posted by **bill platt** on 25 May 2004, 3:06 p.m.*

A thread (or two, or three, or twenty!) below debates the viability of the 42s etc in the current marketplace.

May I suggest that we may indeed find a maker of these specialty High-Power non graphing calculators--and the "company" will be close at hand----

Open-RPN!

Keep an eye on what Hugh and company are up too-and get involved!

regards,

Bill

Re: Specialty Calculators

*Message #2 Posted by **OpenRPN** on 26 May 2004, 1:20 p.m.,*
in response to message #1 by bill platt

I would say you hit the nail on the head regarding the high-powered non-graphing calculators. After all, that's where the whole OpenRPN idea started... No one is catering to scientists/engineers who need a durable, reliable machine. (Hydrix appears to be working in that direction) So I thought about it for a while, realized it could be done, and here we are.

The great thing about it is that everyone can have what they've always wanted as every keyboard and overlay will be a one-off.

As far as the 42s goes, I am getting very close to having a developed case and keys for the voyager-like form factor... With all of those logistics ironed out a pioneer based type will show up in renderings soon after. So stayed tuned.

Best Regards, Hugh Evans

Wish list for the 33SII (long)

*Message #1 Posted by **Bill P** on 24 May 2004, 11:52 p.m.*

First, let me say that I love my 33S. It is the best scientific available, and I find it very useful. That said, we all know it needs some improvement

Here is what I think the 33SII, if there ever is such a beast, should include.

1. Fix the bugs from the 33S

2. Fix the display

3. Allow GTO.Label Line number to be used as a program instruction.

4. Allow indirect addressing of registers beyond 33, dynamically allocated, of course.

5. Allow use of left, right and insertion in the equation editor.

6. Add FC? (do if flag is clear) as a test in the flags menu.

7. Move the unit conversions (not including the rect, polar conversions) to their own menu, say a shifted function of the Display key, call it CONV. Also, add the unit conversions we have come to expect from simpler scientifics like the Sharp EL-506 series. While we're at it, add a few things to the CONST menu, like the number of meters in an AU(astronomical unit) and the number of kilograms in a Solar Mass.

7. Add bit manipulation functions like AND, OR, NOT, and XOR where the unit conversions are now.

8. Add numerical differentiation.

9. Allow more operations that make sense in context but currently don't work, like squaring a binary integer and taking the square root of a complex number.

10. Keep the color scheme and the aluminum bezel, but can I hear you all say *Go back to the rectangular key layout*? Thank you.

11. There's still room for three more commands where the conversions were. I'm sure we can dream up something to put there. For instance, many would like to see matrix manipulaion as a standard functionality.

Well, that's what I want. I don't think most of these changes would take much to implement, with the exceptions being the key layout and posibly matrix operations. But, even if they just did 3, 4, 5, and 6, we would have a very powerful calculator that could easily take advantage of 32K or 64K of memory.

Honestly, I don't think we would need more labels if we could GTO to line numbers. I like being able to run programs with only two keystrokes. And if we could indirectly address registers up to the limits of memory, we could write our own matrix manipulation routines, even complex ones.

As far as key placement goes, those of us who use 48's know how to use the SPACE key on it, and can make the

transition easily. Also, the new position of the R/S key is good when in SOLVE mode.

All in all, it wouldn't take much to turn the good 33S into a great 33SII.

Does anyone have any other entries for the wish list? :-)

Re: Wish list for the 33SII (long)

*Message #2 Posted by **Norris** on 25 May 2004, 1:05 a.m.,*
in response to message #1 by Bill P

No disagreement here with any of these suggestions. However, there is one additional modification that may be critical to the future success of the 33S: it needs to be priced lower. In the long run, it may not succeed at a $50-60 price point.

What is the current competition for the 33S? Well, the 33S is particularly popular with NCEES exam candidates. Other choices that are often recommended in the exam forums are the Casio FX-115 MS PLUS and the HP-9G. These alternatives are much less expensive than a 33S (Casio is $14.95 from Amazon.com; HP-9G is $29.99 from HP.com).

Granted, the 33S has some important advantages that the others lack: RPN of course, and greater programmability. Many professional engineers and scientists are willing to pay extra for these features, especially since the 48 and 49 were banned on licensing exams.

But the 33S is clearly targeted at the education market (hence the "cool" cell-phone look). Most students are not going to pay two or three times the going rate for a scientific calculator just to get RPN (which they don't understand) and programming (which they don't do).

The 33S is not going to succeed in the education market -- despite its obvious coolness -- unless it is priced more competitively. And if it doesn't sell to students, its survival will be in jeopardy, because the professional market is relatively small. There has been high demand for the 33S in the NCEES exam market, but the demand will crash as soon as all of the old 48s and 49s are replaced.

Re: Wish list for the 33SII (long)

*Message #3 Posted by **OpenRPN** on 25 May 2004, 2:11 a.m.,*
in response to message #2 by Norris

If HP *really* wants to get back on top they need to make an investment. Price the 33s to compete with the high-end TI scientifics. Advertise the living bejesus out of RPN like it's a new technology that allows one to enter complex calculations without parentheses. They can't get away with a $50 price point without making a sleek black rectangle to demand it.

Wish list for the hp 37g+ (short)

*Message #4 Posted by **Veli-Pekka Nousiainen** on 25 May 2004, 7:22 a.m.,*
in response to message #3 by OpenRPN

```
To get back to business HP should release a numerical only hp 39g+, the hp 37g+.
What I mean is: strip away symbolics!
No symbolic solve, only ROOT
No symbolic Integration, only numeric
No symbolic Differentation, only numeric
Increasing plotting functions to the max.
The ROM should be in Flash, so bugs can be ironed out
and even new features introduced.
That price should be clearly below 99 euros/dollars.
[VPN]
```

Re: Wish list for the hp 37g+ (short)

*Message #5 Posted by **Bill P** on 25 May 2004, 7:05 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

Would this be to make it legal in some country/jurisdiction for taking school tests? Somewhere where symbolics aren't allowed?

I suggest that to make such a beast economically viable, HP should make the calculator thin enough for a pocket, and price it for the same market niche as TI's now defunct TI-80.

Re: Wish list for the 33SII (long)

*Message #6 Posted by **Mark A. Ordal** on 25 May 2004, 10:50 a.m.,*
in response to message #1 by Bill P

I like all of Bill's suggestions for an HP33SII. One minor improvement that I would like to see on it (or even on just a bug-fixed 33S) would be changing the "x" in the Clear menu to "Stk". I miss the stack-clearing "Clear" command of the RPL models like the 48/49 and I don't see why the 33S has to have three distinct ways of clearing only the X register!

--Mark

clear x

*Message #7 Posted by **bill platt** on 25 May 2004, 1:15 p.m.,*
in response to message #6 by Mark A. Ordal

Hi Mark:

The clear x is very important----but only for progamming. You need it for programming a "clear x" condition. Clearing the stack can be easily accomplished with 0 ENTER ENTER ENTER, which you can also program if you like.

Regards,

Bill

Edited: 25 May 2004, 1:16 p.m.

That's better than my way.

*Message #8 Posted by **Wayne Stephens** on 25 May 2004, 2:09 p.m.,*
in response to message #7 by bill platt

I hadn't thought of doing it that way. It's better & a full 3 steps (42.86%) shorter than the stack clearing program which I assigned to LBL C (for clear), which goes: CLx, Roll Down, CLx, Roll Down, CLx, Roll Down, CLx.

Although, with all that memory, I guess it doesn't matter that much, does it?

Still, thanks bill platt for showing me a better way.

Take care.

Wayne.

Re: That's better than my way.

*Message #9 Posted by **Wayne Brown** on 25 May 2004, 5:00 p.m.,*
in response to message #8 by Wayne Stephens

How about **CLST** instead? That clears X, Y, Z and T in a single operation, and can be assigned to a key or used in a program. (Or is that a 41C-only command?)

Only 41

*Message #10 Posted by **Wayne Stephens** on 25 May 2004, 6:37 p.m.,*
in response to message #9 by Wayne Brown

That is only for the HP41 series, and I believe the 42s.

As far as I know, there is no way to invoke a Clear Stack command on a 33S (or a 32S or 32SII either, for that matter).

Take care.

Wayne.

Re: That's better than my way.

*Message #11 Posted by **GE (France)** on 25 May 2004, 7:30 p.m.,*
in response to message #9 by Wayne Brown

This is nice, but WHY CLEAR THE STACK ???

And in the first place, what is 'cleaner' in a display of 0 as compared to for instance -3.2355344E-06 ?? It's always a good laugh to read (usually old 4-bangers') manuals stating with great care how to 'clear' a register : by storing zero in it ! (P.S. : yes, I've heard of ST+ NN)

If I want to use a zero, I usually press that key down there (and if you think of it, the constant zero is very seldom used anyway).

If there is something on the stack that I don't use, why bother if it is zero or not ?

Let's free ourselves from the zero-tyranny !

Re: That's better than my way.

*Message #13 Posted by **bill platt** on 26 May 2004, 9:36 a.m.,*
in response to message #11 by GE (France)

Hi GE,

I agree---except in fairly rare circumstances, I never feel the need to clear the stack--for the very reasons you mention.

One of my favorite first reactions to HP machines--and my reply---is, "how do you clear it? " to which I reply, "you don't need to; just start calculating." The visible consternation is priceless. Then they look for the equals sign.....

Best regards,

Bill

Re: That's better than my way.

*Message #14 Posted by **Wayne Brown** on 27 May 2004, 7:23 a.m.,*
in response to message #11 by GE (France)

> Quote:
>
> If there is something on the stack that I don't use, why bother if it is zero or not ?

If you make a mistake (like hitting an operator key once too often) then having zeros in the stack levels immediately above your calculations can be useful. Some operations (like addition and subtraction) have no effect with zero, while others (like multiplication and division) give very obvious errors with zero. For instance, if I accidentally multiplied **4832564.23565** by **0.1** I might not notice the difference, but I certainly would notice if I multiplied it by **0**. So I'd rather not have any non-zero numbers on the stack that aren't part of whatever I'm doing at the time.

HP33S Program Labels

*Message #15 Posted by **Dave A** on 3 June 2004, 5:19 p.m.,*
in response to message #8 by Wayne Stephens

Am about to start on a set of about 20 programs for land and engineering survey calcs for the 33S. They should total 2/3000 steps. Because of no 33S data comms port steps must be limited. One has fair amount of experience with 41C, 42S and 32SII but it mystifies me how to use only 27 labels as addresses when 20 will be needed as global labels leaving 7 for local labels. If steps cannot be addressed by GTO or XEQ commands, how are numerous subroutines addressed? You would expect with 31K of space that the addressing system would match it. Guess one should start and find out but if someone has written a suite like this or individual longer programs I would be glad to share the experience. Glad to pass on a copy of the finished suite in return.

HP33S Program Labels

*Message #16 Posted by **Veli-Pekka Nousiainen** on 3 June 2004, 5:55 p.m.,*
in response to message #15 by Dave A

[pre] Just DROP me a LETTER. Basically I would not worry about any subroutines. Write everything reasonable inline. Why? You have >30KB memory, but <30 labels. {VPN}

Re: HP33S Program Labels

*Message #17 Posted by **Dave A** on 4 June 2004, 3:43 a.m.,*

in response to message #16 by Veli-Pekka Nousiainen

Thanks - was starting to think that way. Also a great tip is to start program with GOTO step number to conserve labels.

Re: HP33S Program Labels

*Message #18 Posted by **Norris** on 3 June 2004, 10:55 p.m.,*
in response to message #15 by Dave A

One ugly way to conserve labels on the 33S is to avoid using them at the beginning of programs. With this approach, you don't use XEQ [label] to launch a given program -- instead, you use GTO . [line number] to move the program pointer, followed by R/S to start the program.

For example, start your first program at line A0000, the second program at line A0100, the third at line A0200, etc. Fill in any extra lines between programs with RTN statements.

Then you can launch program 1 with GTO . A0000 R/S, program 2 with GTO . A0100 R/S, program 3 with GTO . A0300 R/S, etc.

By the way, there is already a package of 33S surveying programs in commercial distribution. Search for "33S COGO" on eBay. It's about 5K in size and costs $33.

Re: HP33S Program Labels

*Message #19 Posted by **Dave A** on 4 June 2004, 3:32 a.m.,*
in response to message #18 by Norris

Thanks great tips. Where there's a will there's a way.

Re: Wish list for the 33SII (long)

*Message #20 Posted by **Tizedes Csaba [Hungary]** on 25 May 2004, 11:42 a.m.,*
in response to message #1 by Bill P

Hello!

My wish list (I haven't got 33s, only 32sii):

```
1.) All functions let be two, three or four character long-
named, like 'SIN()', 'COS()', etc... Forget '1/x, x2,...'

2.) Add a list for user definied functions, like EQN-LIST:
forexample cotangent function: 'CTG(var)=INV(TAN(var))' or

3.) RPN-like EQN list: for cotangent function: 'var CTG :
var TAN INV'

4.) Multiple integrals

4a.) Integrals with infinity limits ;)

5.) SOLVE and INTEGRATE at same time

5a.) Multiple SOLVE for optimisation, like least squares methods
```

```
5b.) New curve fitting formulas: linear with b=0, or fixed
m, or fixed b; quadratic; z=z(x,y) like, etc...

6.) Built in UTPN, and other statistical integrals and functions

7.) All of complex-functions

8.) IR-port and 'memory scan-editor' like on 17BII

9.) Pixel graphic (131x15 - GREAT!!!)

10.) Two character long varable-names 'AA, AB, ..., ZZ' or

11.) One character and one number variable-names 'A0, A1, ..., Z9'

12.) etc...
```

Best wishes!

Csaba

Re: Wish list for the 33SII (long)

*Message #21 Posted by **Eddie Shore** on 25 May 2004, 12:27 p.m.,*
in response to message #1 by Bill P

1. Full complex number support: be able to take square roots of negative numbers for example.

2. "Clear Stack" button.

3. String functions: using messages as equations is just too funky.

4. Numeric differentation

5. Numeric summation

6. Numeric product; product(eqn,low,high)

*Message #23 Posted by **Tom** on 28 May 2004, 3:53 a.m.,*
in response to message #1 by Bill P

Yeah I agree with you about the HP-33S, HP should go back to the regular straight keyboard layout instead of that wacky "chevron" layout. They should be able to make a calculator look modern without making it look weird. Take the new Texas Instruments TI-36X Solar, for example, it sports a silver case just like the HP-33S,

but it has oval shaped buttons in a regular straight layout, far more attractive than the dorky chevron design used in the 33S. C'mon HP, you can do better!

Cleaning an hp48 keypad

*Message #1 Posted by **andy** on 24 May 2004, 3:31 p.m.*

I have an hp48s which appears to have had a coke spilled on it. Fortunately the battery compartment looks to have been spared but the keypad has several keys which do not operate.

I noticed a previous posting which advocated soaking a 32s in distilled water overnight, however, I've seen the inside of a 48 and there are electrolytic capacitors on the PCB.

Any suggestions?

Thanks,

Andy

Re: Cleaning an hp48 keypad

*Message #2 Posted by **Randy** on 24 May 2004, 7:54 p.m.,*
in response to message #1 by andy

Distilled water will not bother them, 15 minutes max each rinse is all you need. There is only one electrolytic, the 1000uf battery bypass/backup cap.

Warm water is better (95-100°f max. Remove the battery and port covers, soak, take out, shake out water, push all the buttons, resubmerge in same water then repeat with fresh water three times. Shake out well, leave to dry in a warm place for two days. A fan blowing on it helps.

Pop usually washes out okay. You need the warm water to dissolve the sugar. Pushing the buttons alot while submerged helps drive the crud out of the keydomes.

If the batteries where left in and it was really, really saturated with liquid it could be toast as the ON switch traces will open due to electrolysis. If it's dead after it's dry, that's usually the reason.

Edited: 24 May 2004, 7:58 p.m.

Re: Cleaning an hp48 keypad

*Message #3 Posted by **andy** on 24 May 2004, 10:43 p.m.,*
in response to message #2 by Randy

Thanks for the advice. Its not dead yet...it turns on but ~40% of the keys don't work (some work some of the time). Actually, to turn it on I have to hit on-C (the system halt sequence). The on key by itself won't turn it on. Hopefully that's not a portent of doom.

I'm going to try the distilled water. One more question:

Will distilled water damage the display? Should I only submerge the keypad section?

Thanks again,

Andy

Re: Cleaning an hp48 keypad

*Message #4 Posted by **Randy** on 24 May 2004, 11:34 p.m.,*
in response to message #3 by andy

Any time a key is made electrically, it will not power up correctly. That may explain the behavior you see, I can't say for sure. The just get plain weird when full of stuff as the on resistance of a good key is about 8 to 10k ohms.

Dunk the whole thing so long as the batteries and cards are out of it, no worries about getting things wet, they just take a while to dry out thoroughly.

Re: Cleaning an hp48 keypad

*Message #5 Posted by **David Smith** on 25 May 2004, 12:45 p.m.,*
in response to message #1 by andy

If you have an ultrasonic cleaner, all the better.

Most people do not realize that most electronics boards go through the equivalent of a big dish washer after they are soldered. Some compenents like dip switches and some piezo beepers are sealed with tape that is removed after the bath.

Short & Sweet Math Challenges #6 [LONG]

*Message #1 Posted by **Valentin Albillo** on 24 May 2004, 1:28 p.m.*

Hi everybody, here we go (again):

Say you've just got that powerful, new HP calculator for your collection (say an HP33S or some HP48/49 model) and you're itching to test it on some interesting problem. Here's one of my own devising for you to try. Apart from being interesting in its own right (IMHO), it might actually be useful ! Consider for instance its use by someone teaching math to prepare interesting problems for his/her students (i.e.: K = 7.041776 anyone ? :-) Read on ...

Before we begin ...

We all know Pi is a *transcendental* number. By definition, this means Pi *cannot* be the root of any polynomial equation with *integer* coefficients, whatever its degree (this is also true of all other transcendental numbers such as e, sin(1), log(2), etc). In particular, Pi cannot be a root of a cubic equation with integer coefficients, such as

```
A*x^3 + B*x^2 + C*x + D = 0
```

where A,B,C,D are all of them integer. However, this doesn't preclude the fact that such an equation might have a root which is as close an approximation to Pi as desired for sufficiently large A,B,C,D. And thus, here is

The challenge:

"Write a program for your preferred HP calculator to find the integer coefficients A,B,C,D of the cubic equation:

```
A*x^3 + B*x^2 + C*x + D = 0
```

which has a root that best approximates a given positive constant K (say, K = Pi), where the coefficients are less or equal in absolute value to a maximum given integer value, M (say, M = 9)."

Notes:

Without loss of generality, the A coefficient will always be *positive* (i.e: it goes from 1 to M, both included) while the B,C, and D coefficients can be *either positive or negative* (i.e: they go from -M to +M, both included). Your program must *input* K (say Pi), M (say 9) and a very loose initial interval for the root (say [3.1, 3.2]) and must *output* the coefficients A,B,C,D of the "best" equation, the value X of the root, and the absolute difference between the root X and the given constant K.

For instance, given the inputs K=Pi, M=20, Interval= [3.1, 3.2] it might output something like (not the best solution, of course):

```
A= 1, B= -10, C= 19, D= 8, X= 3.14162732179, DIF= 0.00003466820
```

which means that the cubic equation x^3 - 10*x^2 + 19*x + 8 = 0 has a root x= 3.14162732179, which differs from Pi by only 0.00003466820.

You are expected to deliver a general program, that will work for any positive constant K, maximum coefficient M and given initial interval [X1,X2], but for the purposes of testing the efficiency and accuracy of your solution you should try these two cases:

- Case 1: constant K = Pi, Max. coefficient M = 9, initial interval [3.1, 3.2]
- Case 2: same but with Max. coefficient M = 20

Hints:

- Absolutely *refrain* from using a PC. You'll learn *nothing* about writing and optimizing programs for your HP calculator and will ruin the pleasure of seeing your efforts and ingenuity succeed with your little HP machine. This is intended for *real* programmers using *real* HP calcs, not the "brute-force-using-a-zillion-Ghz-PC" kind.
- Though most any HP model can be used to successfully solve this challenge, it is advisable that you use a suitably fast HP calculator, say any model using a Saturn CPU (HP33S, HP32S, HP32SII, HP42S, HP48/49, HP-71B, etc), in order to attain reasonable running times.
- Even so, you'll need to exercise your ingenuity to achieve bearable running times. A brute-force approach is doomed to failure. Consider this:

  - for M = 9, your program will have to choose among no less than *61,731 possible cubic equations*, from (1,-9,-9-,9) to (9,9,9,9)

  - for M=20, your program will have to choose among *more than 1 million possible equations*, (namely 1,378,420) from (1,-20,-20,-20) to (20,20,20,20)

In a few days, I'll give a solution for the HP-71B, which will be a 9-line program (300+ bytes), with the following running times:

- For the case constant K = Pi, Max. coefficient M = 9, initial interval [3.1, 3.2], it takes *7 min. 16 seconds* to find the solution among the 61,731 cubic equations possible, output it *and* stop.
- For the case constant K = Pi, Max. coefficient M = 20, initial interval [3.1, 3.2], it takes *3 hour 4 min.* to find the solution among the 1,378,420 cubic equations possible, output it and stop.

Now's your turn. Just put that brand new shiny HP33S, that wonderful classical HP42S, that ultrapowerful HP49, or that venerable HP-71B to the task, *plus* your ingenuity and RPN/RPL/BASIC/FORTH/Assembler programming skills of course. After all, if the good old HP-71B can do it in 3 hours using BASIC, what incredible times will you be able to achieve with much faster machines using RPN/RPL, say ? Emulators very welcome too, of course.

Best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #2 Posted by **Bram** on 26 May 2004, 9:06 a.m.,*
in response to message #1 by Valentin Albillo

I've written a program for my HP
a real one (HP-32SII)
I found a result for M=8 as well as for M=20. The latter took about an hour for each value of A, evaluating B,C&D. (think I need new batteries now...)

I must confess however, that I didn't fulfill the assignment to the letter; I haven't "rooted" the equation for each set of parameters. I know I make a principle error here, but I think the final results will turn out the same.

Am I supposed to put my answers here?

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #3 Posted by **Valentin Albillo** on 26 May 2004, 9:16 a.m.,*
in response to message #2 by Bram

Hi Bram:

Bram posted:

"I've written a program for my HP a real one (HP-32SII) I found a result for M=8 as well as for M=20. [...] I think the final results will turn out the same. Am I supposed to put my answers here? "

Yes, the results *and* your program for the 32SII, if you don't mind. That way we'll be able to see if your computed best solutions agree with mine and fully appreciate the programming ingenuity you used for the task, I'm pretty sure many people will be delighted to have a look at it.

As for the times, I understand it took your program some 20+ hours for the M=20 case, right ?

Thanks for your interest and best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #4 Posted by **Bram** on 27 May 2004, 7:47 a.m.,*
in response to message #3 by Valentin Albillo

By now I know that my answers are right and here's how I got them.

I already announced that I kind of cheated. Considering that the root finding part will take a lot of computing time, I decided to skip it by evaluation the function for point K for every combination of ABCD within the given limits. The combination for which the function is closest to zero, the real root will most probably be closest to K. "Most probably", because it isn't necessarily so, but as we have integer coefficients and hence the function is kind of stepping through its possible values, I thought it very likely to get the right answers all the same.
During the process every ABCD evalution that is better than the best so far, is set apart.
I realized this curious thinking in my program
When you follow the computing progress, there are times that you would like to say to the machine: "hey, don't evaluate this part any further. It's no use". Those are the parts where the program could be speeded up. F.e. when for any combination of ABC the function is already to much positive for D=-20, then you may skip the entire D-range. (I may squeeze this speed-up into the program some day).
When I finally found an ABCD combination, I did compute the real root of the function using the Solve program of my HP-32SII (EQN: D+X*(C+X*(B+X*A)))(I hate brackets ;-))
Then I subtracted Pi
and it appeared I got the right answers:
1,-1,-8,4 root=3.14133611565 err= -.000252653794
6,-16,-15,19 root=3.14159104610 err=-.00000160749

Indeed, the latter took almost 24 hours to complete, but it wwas a vary nice day.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #5 Posted by **Valentin Albillo** on 27 May 2004, 9:35 a.m.,*
in response to message #4 by Bram

Hi Bram,

Bram posted:

"By now I know that my answers are right and here's how I got them. [...] The combination for which the function is closest to zero, the real root will most probably be closest to K. "Most probably", because it isn't necessarily so, but as we have integer coefficients and hence the function is kind of stepping through its possible values, I thought it very likely to get the right answers all the same."

You're right, very good idea. This kind of shows how plausible heuristics can go a long way toward making feasible and successful an otherwise hopeless brute-search approach.

"... when for any combination of ABC the function is already to much positive for D=-20, then you may skip the entire D-range."

Right, too. Another very good heuristic. This speeds the program immensely by essentially removing the innermost loop and thus halving (or better) processing time.

"Then I subtracted Pi and it appeared I got the right answers:"

You certainly did.

"Indeed, the latter took almost 24 hours to complete, but it was a vary nice day. "

I'm glad you took some enjoyment from my 'challenge', thanks for submitting your clever program to this forum, for using up so much juice from your batteries, and last but not least, for your interest in my humble ramblings.

Best regards from V.

Re: Short & Sweet Math Challenges #6 [(not) LONG]

*Message #6 Posted by **Bram** on 30 May 2004, 3:56 a.m.,*
in response to message #5 by Valentin Albillo

I've speeded up the program. I thought it wouldm't make a big difference, but it surely does. Now I get (the same) answers in only 3 hours in stead of almost 24. The new program is with 3 lines more code significantly faster. You'll find the extension in the D-labeled part.

in response to message #8 by Bram

No luck. This time it says "Service Unavailable".

May I suggest you simply include the whole listing in a normal post, between opening and closing "pre" codes to preserve the formatting ? It would be much simpler ...

Thanks for your efforts and

Best regards from V.

Hi, Bram:

Much better, thanks for your considerable efforts to create and share this program, which is a fine example of problem solving using a little HP32-class machine and a lot of user's ingenuity.

Let's hope you'll find my future challenges equally interesting and so you'll be tempted to contribute as well.

Best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #12 Posted by **Rodger Rosenbaum** on 26 May 2004, 11:12 p.m.,*
in response to message #1 by Valentin Albillo

Ok, here's my go at it.
It's an HP71 program, 9 lines, 344 bytes.
The print statement alone takes up 72 bytes.
I didn't use an input statement to input K and M, but just inserted them in the program
I also left in some statements to compute the time and error as it goes along.
It could have been made shorter by leaving those out.
For K=PI and M=9, it takes 2 min, 44 sec to find A=1, B=-1, C=-8, D=4, err=-.00025653792
For K=PI and M=20, it takes 26 min, 52 secs to find A=6, B=-16, C=-15, D=19, err=-.00000160749

```
10 K=PI @ M=9 @ E=MAXREAL @ T9=TIME
20 FOR P=1 TO M @ T0=P*K
30 FOR Q=-M TO M @ T1=(T0+Q)*K
40 FOR R=-M TO M @ T2=(T1+R)*K
50 IF ABS(T2)>M+.5 THEN 70
60 T=ABS(FLOOR(T2+.5)-T2) @ IF T<E THEN E=T @ A=P @ B=Q @ C=R @ D=FLOOR(.5-T2) @
PRINT E
70 NEXT R @ NEXT Q @ NEXT P @ S=(3*A*K+2*B)*K+C @ X=K @ Z=MAXREAL
80 Y=((A*X+B)*X+C)*X+D @ IF Y=Z THEN 90 ELSE Z=Y @ X=X-Y/S @ GOTO 80
90 PRINT "A=";A;"B=";B;"C=";C;"D=";D;"X=";X;"DIF=";X-K;"TIME=";TIME-T9;"SECS"
```

The program even works for M=30, but the simple little root finder in line 80
gets stuck in an infinite loop because the computed value of Y is dominated by round-off error
Replacing 'IF Y=Z THEN 90' with 'IF Y<1E-9 THEN 90' gets out of the infinite loop
but returns a less accurate root

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #13 Posted by **Valentin Albillo** on 27 May 2004, 6:54 a.m.,*
in response to message #12 by Rodger Rosenbaum

Hi, Rodger:

Rodger posted:

"Ok, here's my go at it. It's an HP71 program, 9 lines, 344 bytes. [...]For K=PI and M=9, it takes 2 min, 44 sec to find A=1, B=-1, C=-8, D=4, err=-.00025653792 --- For K=PI and M=20, it takes 26 min, 52 secs to find A=6, B=-16, C=-15, D=19, err=-.00000160749"

Congratulations ! Your solutions are absolutely *correct* and your program is as *short and fast* as it gets, very good work indeed !

Just for the record, the solutions are:

M = 9

$$x^3 - x^2 - 8x + 4 = 0$$

x = 3.14133611565 (0.00025653794)

M = 20

$$6x^3 - 16x^2 - 15x + 19 = 0$$

x = 3.14159104610 (0.00000160749)

Just in case it might interest you, here is an assortment of results for larger values of M:

M = 49

$$19x^3 - 47x^2 - 30x - 31 = 0$$

x = 3.14159235658 (2.97E-07)

M = 99

$$33x^3 - 92x^2 - 65x + 89 = 0$$

x = 3.14159264441 (9.18E-09)

M = 199

$$37x^3 - 114x^2 - 36x + 91 = 0$$

x = 3.14159265383 (2.39E-10)

Best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #14 Posted by **Dave Shaffer** on 27 May 2004, 11:33 a.m.,*
in response to message #13 by Valentin Albillo

Valentin,

Have you enough results (or can you generate them easily) to indicate whether the results get monotonically better (i.e. more and more accurate) with larger and larger values of M?

Actually, the answer must be NO, since for M=199, your biggest coefficient is only 114, so this must also have been the best solution for M = 115 . Similarly, for your other large-M results, the answers do not bump up to the limit set by M.

To what extent are these solutions local minima? i.e. do some of these solutions repeat for other values of M? I would think so, again based on your M = 199 solution. If I understand the challenge correctly, this solution must be the best FOR ALL VALUES OF M FROM 115 to 199. Otherwise, your answer would have a larger coefficient than 114 in it.

How far beyond 199 do you have to go until there is the next better solution?!?!

[*EDITED*] Re: Short & Sweet Math Challenges #6 [LONG]

*Message #15 Posted by **Valentin Albillo** on 27 May 2004, 1:28 p.m.,*
in response to message #14 by Dave Shaffer

Hi, Dave:

Dave posted:

"Actually, the answer must be NO, since for M=199, your biggest coefficient is only 114, so this must also have been the best solution for M = 115."

That's correct ...

"To what extent are these solutions local minima? i.e. do some of these solutions repeat for other values of M? I would think so, again based on your M = 199 solution. If I understand the challenge correctly, this solution must be the best FOR ALL VALUES OF M FROM 115 to 199. Otherwise, your answer would have a larger coefficient than 114 in it."

Again correct. But please, don't shout ! :-)

"How far beyond 199 do you have to go until there is the next better solution?!?!"

I didn't test it extensively, but the solution for M=114 is good until M=255 (inclusive), at least. Also, a run with M=360 gives

M	a	b	c	d	x	Diff=ABS(*Pi*-x)
360	132	-319	-229	-225	3.14159265348	0.00000000011

which clearly is also the best solution for M=319 to M=360. The solution cubic is thus:

$$\mathbf{132x^3 - 319x^2 - 229x - 225 = 0}$$

which has a root

x = 3.1415926534831+

which agrees with Pi to almost 11 digits. Here's some extra data for you to ponder about, this time for *e*:

For K = *e* = 2.71828182846+

M	a	b	c	d	x	Diff=ABS(*e*-x)
9	3	-5	-6	-7	2.71823262630	0.00004920216
49	6	-4	-25	-23	2.71828239152	0.00000056306
99	29	-63	-64	57	2.71828183050	0.00000000204
255	75	-179	-15	-143	2.71828182831	0.00000000015

The last line features a solution valid from M = 179 to at least 255, and the resulting equation:

$$\mathbf{75x^3 - 179x^2 - 15x - 143 = 0}$$

has a root

x = 2.71828182831+

which is extremely close to *e*, despite the simple 3rd degree equation with integer coefficients. Either using greater degrees (say 5th-degree equations, aka *quintics*) and/or greater values for the maximum coefficients, you'll be able to achieve roots arbitrarily close to any given constant. For

instance, the simple-looking equation:

$$4x^3 - 26x^2 - 11x - 30 = 0$$

has a root

$$x = 7{,}041776+ .$$

Does it ring some bells ? :-) It would make a very fine, *patriotic* assignment for any US students to solve, right ? It could also be used to construct some puzzle-like problem where after telling some story a number of conditions are given resulting in this equation, then its real root is precisely that most famous date.

Thanks for your thoughtful insights and your interest, and

Best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #16 Posted by **Olivier De Smet** on 29 May 2004, 6:56 a.m.,*
in response to message #12 by Rodger Rosenbaum

Hi,

Just some optimizations on the same topic:

With UTIL/1 binary (AWRITE) and an HP86B:

```
10 K=PI @ M=9 @ N=M+1 @ O=N*K @ P=N/K @ E=1.E99 @ CLEAR

20 FOR A=1 TO M @ T0=A*K @ IF ABS(T0)*K*K-N>O*(K+1) THEN 100

22 AWRITE 0,0 @ DISP A; T0

30 B0=MAX(-M, INT((-P-M)/K-T0+0.5)) @ B1=MIN(M, INT(P+M)/K-T0+0.5)) @ IF B0>B1 THEN 100

32 AWRITE 0,40 @ DISP B0; B1

40 FOR B=B0 to B1 @ T1=(T0+B)*K @ IF ABS(T1)*K-N>O THEN 90

42 AWRITE 1,0 @ DISP B; T1

50 C0=MAX(-M, INT(-P-T1+0.5)) @ C1=MIN(M, INT(P-T1+0.5)) @ IF C0>C1 THEN 90

52 AWRITE 1,40 @ DISP C0; C1

60 FOR C=C0 TO C1 @ T2=(T1+C)*K @ D=-INT(T2+0.5) @ IF ABS(D)>M THEN 80

62 AWRITE 2,0 @ DISP C; T2

70 IF ABS(T2+D)<E THEN F=A @ G=B @ H=C @ I=D @ E=ABS(T2+D) @ AWRITE 5,0 @ DISP F; G; H; I; E

80 NEXT C
```

90 NEXT B

100 NEXT A @ AWRITE 6,0 @ END

First it avoid looping on non-feasible A, B and C parameters.

Second it doesn't really solve the polynom, it can perhaps find a minimum.

Otherwise it's quite efficient (you can remove lines 22, 32, 42, 52, 62).

Bye,

Olivier

*Message #23 Posted by **Olivier De Smet** on 1 June 2004, 2:05 a.m.,*
in response to message #17 by Valentin Albillo

Hi,

Sorry for the delay:

For the HP86B it take about 50 sec for M=20, and 29700sec for M=200 with a better optimized program.

Anyway here is a version for an HP49G+ with all the optimizations:

```
%%HP: T(3)A(R)F(.);
\<< \pi SWAP MAXR OVER 1. + DUP 5. PICK DUP2 * UNROT / DUP 6. PICK + 7. PICK / {
} \-> K M E N O P Q F
  \<< CLLCD K 1. M
    FOR A A 1. DISP
      IF DUP ABS K SQ * N - O K 1. + * \<=
      THEN DUP M NEG OVER Q + NEG 0. RND MAX DUP UNROT + K * SWAP M Q 4. PICK -
0. RND MIN
        IF DUP2 \<=
        THEN
          FOR B
            IF DUP ABS K * N - O \<=
            THEN DUP M NEG OVER P + NEG 0. RND MAX DUP UNROT + K * SWAP M P 4.
PICK - 0. RND MIN
              IF DUP2 \<=
              THEN
                FOR C DUP 0. RND
                  IF DUP ABS M \<=
                  THEN
                    IF DUP2 - ABS E <
                    THEN DUP2 - ABS DUP 6. DISP 'E' STO DUP NEG C B A 4. \->LIST
REVLIST DUP 'F' STO 7. DISP
                    END
                  END DROP K +
                NEXT
              ELSE DROP2
              END DROP
            END K +
          NEXT
        ELSE DROP2
```

```
        END DROP
      END K +
    NEXT DROP E F OBJ\-> \->ARRY DUP 'S' STO
    \<< S X PEVAL
    \>> 'X' K ROOT K
  \>>
\>>
```

It take 5sec for M=9 and 40sec for M=20. Sorry I didn't test other M.

Olivier

P.S. all the results are ok with yours.

Edited: 1 June 2004, 2:08 a.m.

*Message #24 Posted by **Valentin Albillo** on 1 June 2004, 4:17 a.m.,*
in response to message #23 by Olivier De Smet

Thank you very much, Olivier ! Magnificent effort !!

I see you master a jaw-dropping range of machines, from such an old timer as an HP-86 to the very latest HP49G+. Amazing indeed !

I did write a lot of commercial engineering programs for the HP86 and HP87 machines back in their time. Most of them were written in their built-in dialect of BASIC, but laced with a number of binary programs I wrote myself, thanks to the Assembler ROM, lots of documentation and the wonderful fact that you could have as many as 5 binary programs loaded at a time versus just one in the former HP85 models.

It was great fun when your new keywords did work ok. I specially remember a big binary I wrote which accomplished all kinds of matrix operations (at assembler speeds) but with very large, sparse matrices represented in a special format as strings ! :-) Regrettably, all those materials are "missing in action" right now. Those were the days ...

Hope to see you contributing in future S&SM Challenges I may issue, and

Best regards from V.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #25 Posted by **Olivier De Smet** on 1 June 2004, 4:53 a.m.,*
in response to message #24 by Valentin Albillo

Hi,

Btw I search actually as much as possible information on the HP8x series (processor, memory controller, ...).

I have an HP85A, an HP86B some 93xx HD and a 9121 floppy. To use the 93xx I need an EMS rom, but can't find one. So I started to dis-assemble and re-assemble roms to allow them to be loaded as binary. I think it's feasible but I need some more information on the 8x series.

For example after searching the web I still have some questions:

- What does SAD and PAD opcodes exactly ? (octal 232 and 237)

- Is there an opcode for octal 326 and 336 ?

- Is there interrupts in the capricorn processor ?

- How the rom and ram paging works in an HP86 ?

- I partially understood the structure of a binary program, but I miss information for the rom structure ...

Thanks in advance if you could help me ,

Olivier

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #26 Posted by **Eamonn** on 5 June 2004, 3:57 a.m.,*
in response to message #16 by Olivier De Smet

To recap, the challenge is to:

> Quote:
>
> "Write a program for your preferred HP calculator to find the integer coefficients A,B,C,D of the cubic equation:
>
> A*x^3 + B*x^2 + C*x + D = 0
>
> which has a root that best approximates a given positive constant K (say, K = Pi), where the coefficients are less or equal in absolute value to a maximum given integer value, M (say, M = 9)."

I was looking at the programs offered as solutions for this challenge. While the solutions are certainly clever and very fast, they don't always find the correct polynomial. I don't have all the calculators for which the basic language solutions are provided (HP-71, HP-85, etc.), but I have tested these programs on my Sharp EL-5500III.

The cases originally chosen to test the solutions are:

> Quote:
>
> Case #1: constant K = Pi, Max. coefficient M = 9, initial interval [3.1, 3.2] Case #2: same but with Max. coefficient M = 20

For K = pi, the solutions presented do seem to return the optimal coefficients. However there are large number of values of K for which the programs do not offer the correct solution.

For example, here are two polynomials for M = 9:

f1(x) = x^3 - 5x^2 + 5x -2, which has a root at **x = 3.831177207...**

f2(x) = 3x^3 - 9x^2 -8x -6, which has a root at **x = 3.832075690...**

An exhaustive search shows that there is no other polynomial for the M = 9 case that has a root between these two roots. The midpoint of the roots of these two polynomials is **x = 3.831626449...**

Now, a correct solution to the challenge would find the coefficients for f1(x) if K is in the range **3.831177207... <= K <= 3.831626449...** and the coefficients for f2(x) if K is in the range **3.831626449... < K <= 3.832075690...**.

However the programs offered as solutions to the challenge find f1(x) for K in the range **3.831177207... <= K <= 3.83192945...** and f2(x) for K in the range **3.83192946... <= K <= 3.832075690...**.

In other words, the incorrect solution is returned for more than 33% of the values of K in the range **3.831177207... <= K <= 3.832075690...**.

The reason for this is that the programs are trying to find function f(x) that has the minimum value for f(K). This does not necessarily mean that the root for f(x) is closest to K. In this case, the value of K at which f1(K) == f2(K) is not **K = 3.831626449...** (the midpoint of the two roots), but instead is **K = 3.83192945...**

I haven't tried the HP-32s solution or the HP-48 solution, but they seem to search for the polynomial in the same way to the Basic language solutions and thus have the same problems. It would therefore appear that the challenge still remains unsolved and that a different approach to an efficient solution is required.

Note that in the original post, Valentin says:

> Quote:
>
> Your program must input K (say Pi), M (say 9) and a very loose initial interval for the root (say [3.1, 3.2]) and must output the coefficients A,B,C,D of the "best" equation, the value X of the root, and the absolute difference between the root X and the given constant K.

Since none of the solutions ask for a loose interval for the root, perhaps that is a clue to obtaining an efficient solution.

Re: Short & Sweet Math Challenges #6 [LONG]

*Message #27 Posted by **hugh steers** on 6 June 2004, 3:47 p.m.,*
in response to message #26 by Eamonn

thats most interesting indeed. ive been trying to come up with another way for a submission, but this point throws a spanner there too.

using the same search process, i was going to select vmin, so that whenever f(k) <= vmin, i would run a quick newton solve for f(x)=0 and compare |x-k| minimising this error. the idea was to have vmin small, so that the newton step is quick (eg one iteration). this would give the right answer...

BUT as you've pointed out f(k) could be large and yet |x-k| small with f(x)=0.

so, given its cubic and the M bound, is there is tidy upper bound for vmin that makes this work. naturally, vmin still needs be to quite small otherwise the newton process kicks in on a lot of search cases.

the other question ive been mulling, is whether there's better way altogether than the search process. i had decided to wait for valentin's answer (its less bother if you dont bother).

the only idea i came up with to accelerate the existing search idea is to note that the sign of the coeficients must change at least once when k>0 (eg for pi). this might help eliminate searches when m is larger.

Hi Hugh,

I think you have some good ideas there. One way to get around the problem of large values for f(K), even when f(x) has a root close to K, may be to calculate v = |f(K)/f'(K)| and compare that to the most recent v_min.

There are not a whole lot of extra computations involved, since f'(K) is straightforward to compute (f'(x) = 3ax^2 + 2bx + c). Dividing f(K) by f'(K) should have the effect of 'normalizing' v, making it possible to do the comparison. If f'(x) is a lot less than one, then letting v = f(K) may be fine, avoiding errors that may arise from dividing by a small number.

I'm guessing that it would be necessary to compare |f(K)/f'(K)| to some multiple (2, 3 or more?) of the most recently calculated v_min to ensure that some potential solutions are not eliminated.

It also seems necessary to invoke a root finder each time a suitable polynomial is found to ensure that the correct solution is found. I don't see any easy way around that at the moment. Once a polynomial with a root closer to K has been found, v_min is updated to the v that is calculated for that polynomial.

The fastest solution will eliminate as many of the candidate polynomials as possible before calculating v. Olivier's program does a good job of reducing the number of candidate polynomials, allowing for fast execution times. Your observation of the requirement for a change of sign of at least one of the coefficients could also help execution times.

I probably won't have any time to implement these ideas myself this week, but I'm curious to see what you (or anyone else for that matter) may be able to come up with.

By the way, thanks to Valentin for formulating yet another thought provoking Short & Sweet Math Challenge.

Eamonn.

in response to message #28 by Eamonn

Hi, Eamonn & Hugh:

Eamon posted:

"By the way, thanks to Valentin for formulating yet another thought provoking Short & Sweet Math Challenge."

Thank you very much, I'm truly glad someone appreciates my humble challenges. Of course it would be great if more people would contribute their ideas, but I guess not so many people as I would desire are keen with things mathematic. Me, it's my #1 lifelong hobby since I can remember.

As for the challenge and the posted solutions you're right, clever and fast as they are they actually minimize the wrong quantity so they'll fail in a large number of instances, as you very cleverly notice. However, the solutions found, while not optimal, have roots very close to the desired value and also very close to the actual optimal solution. In a "production" environment (i.e.: to concoct nice problems for students to solve and such) they would be perfectly ok. But for the theoretical challenge of finding the one optimal solution they don't always deliver.

As stated in my challenge, my original solution was an HP-71B, 9-line BASIC program (314 bytes), which can solve the two test cases I gave in 7 min. 16 seconds and 3 hour 4 min. respectively. While slower than the posted solutions, mine does actually work in all cases. It goes like this:

```
  1 DESTROY ALL @ DELAY 0,0 @ DIM M,D,F,X,T,P,C,B,A,K @ INPUT
"K,M,P,T=";K,M,P,T
  2 FOR A=1 TO M @ IF SGN(((A*P-M)*P-M)*P-M)=1 THEN END
  3 FOR B=-M TO M @ IF SGN(((A*P+B)*P-M)*P-M)=1 THEN 9
  4 FOR C=-M TO M @ FOR D=-M TO M @ F=SGN(((A*P+B)*P+C)*P+D) @ IF
F=SGN(((A*T+B)*T+C)*T+D) THEN 6
  5 X=FNROOT(P,T,((A*FVAR+B)*FVAR+C)*FVAR+D) @ T=ABS(K-X) @ PRINT
A;B;C;D;X;T @ P=K-T @ T=K+T @ GOTO 7
  6 IF F=1 THEN 8
  7 NEXT D
  8 NEXT C @ NEXT B
  9 NEXT A
```

As you can see, it's just a straightforward search with several (four) heuristics added for good measure to speed the search to the point where it is manageable. It does compute the roots of the candidate polynomials, so avoiding the pitfall you demonstrated. For your example, these are the results:

```
RUN -> K,M,P,T=

       K    M  P   T               A  B  C  D        X               Err
-------------------------------------------------------------------------
-
   3.831626,9,3.8,3.9  [INTRO] ->  1 -6  7  5   3.83424318431   .00261718431
                               ->  1 -5  5 -2   3.83117720720
.00044879280

                                                (305 seconds)

   3.831627,9,3.8,3.9  [INTRO] ->  1 -6  7  5   3.83424318431   .00261618431
                               ->  1 -5  5 -2   3.83117720720
.00044979280
                               ->  3 -9 -8 -6   3.83207569042
.00044869042

                                                (306 seconds)
```

which are correct. P and T are the lower and upper limits of the "very loose" initial interval. The program is very simple and can be optimized further but that wasn't the intention of my challenge but to see your ideas and make you have a good time pondering it all.

By the way, Eamonn, congratulations for owning (and obviously liking) such a superb machine as your Sharp EL-5500III. I'm also a Sharp collector and like them a lot. They

clearly meet and surpass many HP models past and present, in quality, features and usability as well. May I recommend you also get hold of a Sharp PC-1475, which has all the functionality of your EL-5500III plus a large two-line display and 20-decimal, double precision. Also, the Sharp PC-1350, with its 4-line, fully graphic display is a wonder to behold and use.

Thanks again for your incredibly keen observations and interest and

Best regards from V.

Actually, I rather suspect that there are many out there like me who appreciate these challenges, and read them, along with the remarkable answers, with great interest---we merely do not have the skills....but we enjoy watching genius unfold, and hope to glean at least a few grains from the experience.

Of course I hope that someday I will manage to have a good attempt that will be worthy of posting!

Best regards,

Bill

I too, want to add that these challenges are great entertainment. Usually I catch up on the forum while finishing my morning coffee at work. But unfortunately work always presses, and I don't presently have home internet service to pursue the challenge on my own time.

Someday I hope to have a chance to put my solution efforts here, so keep the challenges coming! Thanks, and best regards,

bs

Thank you very much, Bill & Bill :-)

*Message #32 Posted by **Valentin Albillo** on 10 June 2004, 12:30 p.m.,*
in response to message #31 by Bill Smith

I do really appreciate very much your kind feedback, as it lets me know that my humble efforts do really reach like-minded people, even if they don't choose to post a reply to the particular challenge.

I always aim to be didactic (though at times I may sound 'bombastic' instead) so "readers" are as precious to me as "contributors", to be sure.

More are on their way, stay tuned ! :-)

Best regards from V.

in response to message #1 by John Gerlach

Best regards from V.

Re: Execute CF 8 (Clear Flag 8) [No text]

*Message #3 Posted by **John** on 24 May 2004, 11:20 a.m.,*
in response to message #2 by Valentin Albillo

It did not remove it. Not sure if I understand the instructions. Thanks for your help.

Re: Execute CF 8 (Clear Flag 8) [No text]

*Message #4 Posted by **Valentin Albillo** on 24 May 2004, 12:00 p.m.,*
in response to message #3 by John

It can't fail ! :-O

With the calculator turned on, you must press exactly these keys:

```
[g]   (the blue key)

[5]   (the 5 key, which has CF printed in blue)

[8]   (the 8 key)
```

The complex mode annunciator "C" in the display should disappear and your HP-15C will be out of complex mode. Else there's some keyboard or hardware problem.

Best regards from V.

What is the CAS?

*Message #1 Posted by **Karl Fred** on 24 May 2004, 8:32 a.m.*

I would like to know what is the CAS in the 49G+, because I have the possibility to buy a 48GX or a 49G+. Is the CAS so important? what difference gives the CAS to a 49G+ from the 48GX? Thanks.

Re: What is the CAS?

*Message #2 Posted by **Ron Ross** on 24 May 2004, 10:38 a.m.,*
in response to message #1 by Karl Fred

CAS actually was first introduced with the Hp28 series and the Hp48 series has many extensions from that. However, compared to the Hp49 series the 48 has next to nothing in this area. CAS was first a simple algebraic manipulation tool. The 48 series allows you to expand and collect terms (try it on any 48). On the 49 this has evolved into symbolic solutions for integration and summation series solutions in variable notation (symbolic solutions), just to name a couple.

However, all the CAS developed for the 49 series was originally developed on the 48 and the older versions of this software are free and available for the 48. The CAS is called Erable and the faster and better OS is called Metakernal. Both make a 48 faster and more powerful for CAS and general operations (not all operations are faster) and you will need at least a 128K RAM card to use Metakernal. This can make a 48 into a 49 low end clone. It will cost you the additional price of a 128K card (You need the 128K card, but you may also want to buy a larger card for Port 2 and above also, another additional cost). And you will still lack speed. And the smooth integration of this software. And you will lack RAM (you may be RAM starved, if you don't buy memory for port 2 and higher), because all this gobbles up the RAM you bought vs the 49G has this RAM available because the OS and CAS are part of the calculator ROM.

But I use a 48 at home without any of these and feel it is a great calculator. I still like it and use it more than my 49 (both flavors), but I may change my mind after my 49G+ comes back from Hp. Missing keystrokes can be extremely expensive when I am crunching numbers (and not help my reputation either). Error of magnitude is fairly straight forward to catch, but an error in addition may make me off by merely 20-30% and unfortunately on the lower end of scale below my safety factors (not good).

But if the new keyboard proves itself, I must say the 49G series is probably the way to go. It is faster and the CAS is a nice tool (though perhaps not really all that neccessary). I am involved in engineering and almost always interested in a numerical answer, not any theoretical solution. CAS is still not a mature feature either. Also, many of my calculations have to be duplicated or available for review and therefore force me to use spreadsheets or Mathcad on a PC. My general work though is easily done with either, and I favor a calculator as it is very light and portable (my laptop is certainly portable as well, but not in the same league).

If you do a lot of high end calculations (matrix, screen manipulation or any large solver application), the speed of the 49G+ is 3-5 times faster (acceptable, to pleasant to use), where often the 48 series is slow (to painfully slow). Number crunching and straight forward vector calculations are fine and actually easier on my 48.

I feel that the overall durability of the 49 is probably a bit better than the 48 due to a lens cover over the LCD (the 48 is bare and exposed).

Both have advantages, the 48 series was designed to be very versatile and it still is!

I would say this, buy both if you can, but if you have to choose, what are your criteria? Desk calculator with no travel and access to a math package? Hp48

Desk calculator that will double as a math package (and travel) (ie a student) Hp49

Accounting type work or general addition every so often (adding or crunching numbers) I have to say an Hp48, because you cannot count on the 49 to register every key click!!! (even once in a 1000 is too much!!) And I don't believe Hp has completely resolved this issue, only greatly improved a keyboard problem.

The speed and keyboard layout are much better on the 49 for alpha entry (program development). This is no surprise as the 49 evolved from the 48 by program developers and NOT engineers. (not bad mouthing this, it is just how it is! This often determines how a calculator or anything evolves). This explains why certain keys are moved off of the keyboard and into shifted functions. Many direct key punches on the 48 became shifted functions on the 49 to ease program usage and versatility. They are still there, just buried or obscured by the newer additions and features.

Just a brief review and not a detailed explanation of the CAS. But I would suggest downloading the Hp49G+ manual and reviewing the CAS features and deciding whether they are invaluable or not.

One thing you will give up on the 49 that is on the 48 is the eq lib. I like it! One is available for the 49 via download, but still not quite as nice to use (not built in and therefore needs to be run every time to use).

Hope this information helped (or more likely confused).

Re: What is the CAS?

HP-34C Pr Error

*Message #1 Posted by **LAGET** on 24 May 2004, 4:35 a.m.*

My HP-34C is always running Pr Error when I put the switch on (except when I trun It very quickly). I try hundred of pages on the web without succes. Connector are clean, but the ribbon (the one which is connected to connector of the battery pack) seems not properly rebuild (!). Does anybody know how to keep permanent memory (ie no Pr Error when the calculator is ON) ? Perhaps a photo of the connection could help me in case of a non properly rebuilt ribbon. Or also the disposition of the three ships not soldered. Sorry for my poor English (I'm living in France) Thank you

Needs new NiCd batteries

*Message #2 Posted by **Paul Brogger** on 24 May 2004, 9:59 a.m.,*
in response to message #1 by LAGET

It's probably a bad battery pack that doesn't hold charge.

I bought my 34C with this problem, but after rebuilding the pack, it's like new.

Directions for rebuilding battery packs are found elsewhere at this site.

Good Luck!

Re: HP-34C Pr Error

Offopic: Douglas Adams and the Hitchhiker's Guide to the Galaxy

*Message #1 Posted by **Ben Salinas** on 24 May 2004, 12:25 a.m.*

Those of you who have read The Hitchhiker's Guide to the Galaxy series (the trilogy of 5 books) will be interested in this post (I am sure some of you have).

As you very well know, Douglas Adams, author of this series, died on May 11, 2001. That year, the online community organized a Towel Day for May 25 (2 weeks after his death). This was a day where fans carried around a towel (considered by Douglas Adams in his book to be the "most useful object in the universe")

I just thought I would remind all of you fans to carry your towel on Tuesday, and remember, Don't Panic!

(If you haven't read the series, you really should... they are wonderful books)

-Ben Salinas

12345 to delete

(Personally, I can't wait for the movie. http://hitchhikers.movies.go.com/main.html)

Re: Offopic: Douglas Adams and the Hitchhiker's Guide to the Galaxy

in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz posted:

"I read two of Douglas Adams' Hitchhiker in Portuguese, but I was not aware of these other two."

If you've read them in Portuguese then you haven't read them, at all. Trust me, these books do have so many verbal tricks and word play that they simply can't be translated with any accuracy to any other languages (such as Spanish and Portuguese). I've read both the original English version and the Spanish one, and I can fully sympathize with the translator: the task was impossible. So do yourself a favor and read them in their original English. You'll see, you'll rediscover them and notice a miriad subtle and marvelous innuendos that never made it to Portuguese.

"I thouhgt they were only three. Can you, please, post their titles? (the complete series would be even better)"

It's a trilogy in five volumes. The books in the trilogy are named:

```
The Hitchhiker's Guide to the Galaxy (1979)
The Restaurant at the End of the Universe (1980)
Life, the Universe and Everything (1982)
So Long, and Thanks For All the Fish (1984)
Mostly Harmless (1992)
```

Best regards from V.

in response to message #5 by Valentin Albillo

Yep, there is also one more though (actually half of one more). When Adams passed away, he was working on another book. This was released last year along with some other works in progress (including part of the script for the movie) They were released as: Salmon of a Doubt

As far as the 42, it is the answer to life the universe and everything. A quick overview of the book.

Arthur Dent, an earthling, wakes up one morning to find a bulldozer outside his house. His house was to be buldozed to make way for a bypass. Arthur is mad when his friend Ford Prefect (who is actually a martian who was stranded on Earth for 15 years) asks him to go to the pub because the world is about to end. It turns out that the earth needs to be destroyed to make way for an interstellar bypass. Arthur and Ford hitch a ride on the "bulldozer ship," and make their way through the universe.

It is a book of witty humor which stretches science to its limits.

As far as 42, a large computer was created to calculate the answer to life the universe and everything.

After 7.5 million years, it reluctantly gave the answer: 42. Everyone was outraged. Another computer was then created to calculate the question. This computer was the Earth, which was paid for by mice (who ran experiments on humans by seeing how we/they reacted when they completed a maze etc). Unfortunately, the Earth was destroyed about 5 minutes before the program was complete. In the 2nd or 3rd book, the question is discovered. It turns out that the question is: "What do you get when you multiply 6 by 9?"

Its a great read. I reccommend it to everyone.

OT (but desparate): Is there a support group for folks who just don't get it?

*Message #9 Posted by **Paul Brogger** on 25 May 2004, 10:18 a.m.,*
in response to message #6 by Ben Salinas

I've been a closet Hitchhiker's non-enthusiast for quite some time now, and wonder if there's anyone else out there with the same affliction?

I tried, genuinely tried, to get through the first book, but it just overwhelmed me with affected silliness. (Exactly like the overload I experience when trying to read anything beyond a short article by Dave Barry.)

I suppose it deserves a second shot, but I must say I've always been "on the outside looking in" on this one.

(There! I've done it! I've publicly confessed to the sorriest case of nerd-comic laughter dysfunction imaginable. I wonder if there's hope for treatment available -- perhaps a sense-of-humor Viagra analogue?)

Which of the following do you find funny:

```
Dan Akroyd
Saturday Night Live
Laugh-in
Bill Murray (ignoring his recent "Lost in Translation")
Rowan Atkinson (as Mr Bean)
Steve Martin (ignoring his first film, The Waiter)

John Cleese
Rowan Atkinson (in Black Adder)
Not the Nine O'Clock News
Terry Gilliam
Stephen Wright
Fawlty Towers
```

Were your answers from predominantly the same group? In which group would you put:

```
Robin Williams
Stephen Hawking
Pedro Almodovar
Billy Connelly
```

I'm curious, tis all.

Rather than tackle the Hitchhiker Trilogy Paul, I suggest you find a copy of "Dirk Gently's Holistic Detective Agency" and see if you can get "into" that.

*Message #11 Posted by **Paul Brogger** on 25 May 2004, 1:46 p.m.,*
in response to message #10 by Cameron

I'd say I'm more partial to the second group, though I don't think I've seen more than 5 mintues of "Fawlty Towers".

I'd include Robin Williams in that group (disregarding everything "Mork").

The latter two I'm not familiar with, and *Stephen Hawking??* (That IS funny!) (Unless, of

course, I'm tragically missing something . . .)

Into which group would you put Firesign Theatre? The Bonzo Dog band? The Simpsons (excepting episodes of late)? Donald Rumsfeld whining about those naughty "foreign fighters" abusing Iraq's territorial integrity?

Do yourself a favour. Fawlty Towers is possibly the finest British "sit com" ever written. There's only 6 episodes IIRC. The writing is exquisite; the acting preposterously beievable. Basil (Cleese) is the quintessential "loser" in this piece. Many of the themes that are discussed here (WRT Carly's HP) are explored.

> Quote:
>
> I'd include Robin Williams in that group (disregarding everything "Mork").

I'd put him in the second group too. There's a few other roles I'd add to Mork though. ;-)

> Quote:

> The latter two I'm not familiar with, and Stephen Hawking?? (That IS funny!) (Unless, of course, I'm tragically missing something . . .)

Douglas Adams, Stephen Hawking and string theory have a *lot* more in common than you might think. Almodovar is a Spanish film director/writer (Women on the verge of a nervous breakdown; Tie me up, tie me down) with a very black sense of humour. I'd put both of these into the second group.

> Quote:
>
> Into which group would you put Firesign Theatre? The Bonzo Dog band? The Simpsons (excepting episodes of late)?

Firesign Theatre is new to me. The Bonzo Dog Band belongs in the second group (IMO). Discussion of Donald Rumsfeld might be better had in email given the current state of affairs and the fact that this is a politically neutral forum. :-)

Hello, Valentin!

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 25 May 2004, 9:05 a.m.,*
in response to message #5 by Valentin Albillo

Hi, Valentin; long time no... read!

I was about to post a message asking about news from you. Good reading your posts again. Hope everything is fine.

Now for the matters: thank you so much for the additional information. I remember having such good moments and laughing out loud when reading The Hitchhiker's Guide to the Galaxy and Life, the Universe and Everything, both in Portuguese. And yes, I'll try to find the others, mainly in the original Language, because I know what you mean about translations and "versions": even the most competent team will, at some point, feel the lack of the language when trying to find some terms or equivalent expressions. For example, I remember reading one issue of a classic MAD magazine when a storm is shown with falling cats and dogs. We don't use "It's raining cats and dogs" in Brazil, instead we use the equivalent to "It's raining penknives" (it doesn't necessarily mean that our storms are deadly...;). If the reader is not aware of the English expression, this particular drawing has no meaning (BTW, I was told about the origin of this expression, so it made perfect sense since). And this is only one single example.

Well, I hope my one-year-and-a-half English (the total time I spent attending English classes) is enough to understand Adam's subtle expressions and language tricks.

Thanks again.

Cheers.

Luiz (Brazil)

(P.S. - I did not spell check the message, so please, forgive any errors... I edited the message to add this, only)

in response to message #14 by Vieira, Luiz C. (Brazil)

Hello, Luiz !

Luiz posted:

"Hi, Valentin; long time no... read!"

Yes, it's been indeed. More than two months ...

"I was about to post a message asking about news from you. Good reading your posts again. Hope everything is fine."

Thanks a lot, you're always far too kind. It's just that I was extremely busy, out of my usual environment. Back to normal (if there's such an state).

"I remember reading one issue of a classic MAD magazine when a storm is shown with falling cats and dogs. We don't use "It's raining cats and dogs" in Brazil, instead we use the equivalent to "It's raining penknives"

Same here. The equivalent Spanish is "Esta lloviendo chuzos de punta" with more or less same literal meaning as your Brazilian version.

"Well, I hope my one-year-and-a-half English (the total time I spent attending English classes) is enough to understand Adam's subtle expressions and language tricks."

Judging from your usual proficiency here, I daresay you're sure to understand and enjoy it to the most. As for the problems inherent in translating "Hitchhiker ..." from English to (say) Portuguese, try these examples:

- "I am so amazingly cool you could keep a side of meat in me for a month. I am so hip I have difficulty seeing over my pelvis." (Zaphod Beeblebrox in "The Hitchhiker's Guide to the Galaxy")
- "The other Shaltanac's joopleberry shrub is always a more mauvy shade of pinky russet." ("The Hitchhiker's Guide to the Galaxy")
- "Oh freddled gruntbuggly thy micturations are to me -- As plurdled gabbleblotchits on a lurgid bee. -- Groop I implore thee my foonting turlingdromes. -- And hooptiously drangle me with crinkly bindlewurdles, -- Or I will rend thee in the gobberwarts with my blurglecruncheon, -- see if I don't!" (Prostetnic Vogon Jeltz's poetry, "The Hitchhiker's Guide to the Galaxy")
- "It's unpleasantly like being drunk." -- "What's so unpleasant about being drunk?" -- "You ask a glass of water." (Ford Prefect and Arthur Dent (Douglas Adams, "The Hitchhiker's Guide to the Galaxy")

Did you notice the beautiful *double-entendre* between the first "drunk" and the second "drunk" ? These books are choke-full with such things and some you can translate accurately, some you can translate approximately and many you can't translate at all, just pathetically adapt them and hope the magic is preserved, which alas, it usually doesn't.

Thanks for your kind post and best regards from V.

LOL! Thanks! (I think I got it...) (N.T.)

Hi Valentín! I also missed you. Also I was very busy to post anything for quite a time, but I managed to find a little time everyday to read at least some of the topics.

I noticed that the two "drunk" examples you give could be translated acceptably well into Spanish (even into our Buenos Aires variation), as "estar bebido" o "estar tomado" are close enough for the two meanings.

Regards,

A

Drunk

*Message #18 Posted by **Veli-Pekka Nousiainen** on 25 May 2004, 11:38 p.m.,*
in response to message #17 by Andrés C. Rodríguez (Argentina)

I still don't get it (some lack of Spanish skills)?!
Drunk is being intoxicated by alcohol beverage.
What else could it be?
{Vertical Polish Notation}

Re: Drunk

*Message #19 Posted by **Cameron** on 25 May 2004, 11:59 p.m.,*
in response to message #18 by Veli-Pekka Nousiainen

Drunk is both noun (intoxication) and verb (past participle of drink) en anglais.

If an idiom for intoxixation was "kicked", the conversation would have been something like:

Arthur: it feels something like being kicked. Ford: what's wrong with being kicked? Arthur: have you ever asked a football? [what it thinks about being kicked].

In context, the "drunk" dialogue is slightly more powerful because we know that Ford is fond of a tipple and Arthur had just said that "bits of me keep passing out".

Maybe you knew that... if so, sorry to labour the point.

in response to message #20 by Veli-Pekka Nousiainen

See ? Now translate *that* sentence to finnish, while preserving the brilliant double-meaning of "drunk" ! ... (let alone the other three examples I gave !!)

... no way, this author really must be read in English, else you're losing far far far too much, no matter how good the translator.

Best regards from V.

But wait, there's (a lot) more...

*Message #22 Posted by **Cameron** on 26 May 2004, 12:52 p.m.,*
in response to message #20 by Veli-Pekka Nousiainen

> Quote:
>
> He was not feeling intoxicated, but like someone was drinking him!

You've almost got it. Your statement tells me that you've grasped the ingredients of the meaning. I'll paraphrase the exchange.

Background: Arthur and Ford have just had an unpleasant physical experience. Ford is a "man of the world" who likes the good times; he likes to party. Arthur is quite sub-urban, pedestrian, (a bit of a lamer in net parlance). He's led a quiet life until just before this conversation takes place.

Ford asks what Arthur thought of the experience.

Aurthur replies: "It's unpleasantly like being drunk."

The key word is "unpleasantly"--not pleasant; not something you like to do. However Ford likes to party and we can assume that he likes to get intoxicated--drunk. So he takes mild offense at Arthur's use of intoxication as a simile for the unpleasant experience. He then poses what he (Ford) considers to be a rhetorical question:

"What's so unpleasant about being drunk?"

This structure is often found in English idiom. The poser of the rhetorical question is both chiding the other person for suggesting that the subject (intoxication in this case) has negative connotations (unpleasant) while at the same time asserting that they have no negative feelings towards the subject. The rhetorical question, of course, requires no response.

Arthur is familiar with the idiom and the "rules" of the exchange but his character is quite good at what we might call the "witty rejoinder". He's also disinclined to accept the subtle rebuke implied by the use of the idiom. So he responds:

"You ask a glass of water."

As you observed, he's proposing that Ford ask a glass of water what it feels like to have someone drinking it.

This is a neat, witty riposte for which Ford has no come-back. It's also the reason that some of us derive great pleasure from the writing of the late Douglas Adams. His work is full of this style of interchange. It leaves the reader feeling: "I wish I could have said that".

Cameron

But wait, there's (a lot) more...

*Message #23 Posted by **Veli-Pekka Nousiainen** on 26 May 2004, 2:10 p.m.,*
in response to message #22 by Cameron

"You ask that from a glass of water."
And I would have understood it an instance
It was the short form of the answer that got me.
I was unable to see the connection. [VPN]

Re: But wait, there's (a lot) more...

*Message #24 Posted by **Wayne Brown** on 27 May 2004, 7:41 a.m.,*
in response to message #22 by Cameron

That's a good analysis, but you have something backwards: It was *Ford* who was warning *Arthur* before making their first "Jump" that traveling in hyperspace was "unpleasantly like being drunk." This was Arthur's first time on a spaceship and he had no idea what to expect, so Ford was trying to give him a familiar example of what it felt like, while at the same time setting up a chance to make a witty remark. He knew quite well that Arthur, with his limited experience, would assume the wrong meaning of "drunk" and that would give Ford an opportunity to be both clever and enlightening at the same time.

Re: But wait, there's (a lot) more...

*Message #25 Posted by **Paul Brogger** on 27 May 2004, 2:39 p.m.,*

. . . I think I'll have to pick that one up & give it another try!

My thanks to those of you who've taken time to contribute.

Re: Hello, Valentin!

*Message #26 Posted by **Valentin Albillo** on 26 May 2004, 4:43 a.m.,*
in response to message #17 by Andrés C. Rodríguez (Argentina)

Hi Andres:

Andres posted:

"Hi Valentín! I also missed you."

Thank you very much, same here. I also read postings from time to time and noticed yours were sadly absent.

"I noticed that the two "drunk" examples you give could be translated acceptably well into Spanish (even into our Buenos Aires variation), as "estar bebido" o "estar tomado" are close enough for the two meanings."

Yes, because "bebido" in Spanish is related both to a person being drunk ("bebido") and a glass of water being drunk by somebody. But in this case the problem is *not* with "drunk" but with "being" !

Because "being drunk" (a person) translates perfectly as "estar bebido". But "being drunk" (a glass of water, by a person) *cannot* be translated as "estar bebido" but must be translated as "ser bebido" ("ser", not "estar"). And that completely ruins the subtle word play, i.e. the magic.

Close but no cigar. :-) Thanks again for your kind words and

Best regards from V.

No cigar...

*Message #27 Posted by **Andrés C. Rodríguez (Argentina)** on 28 May 2004, 5:33 p.m.,*
in response to message #26 by Valentin Albillo

Valentín:

As you said,

Close, but no cigar!

As I never inhale any kind of gaseous emissions from burning leaves of tobacco or other plants, whatever the size or format, I think I would say:

"It's unpleasantly like being smoked." -- "What's so unpleasant about being smoked?" -- "You ask a salmon."

:-)

Best regards!!

Just for those who may like an explanation: In Argentina, we use "fumado" (smoked) for someone with unreal ideas or dreams, presumably like coming from a drug session. A spent cigar or cigarette would also be "fumado", as the second "drunk"; but for smoked meat we use "ahumado".

[OT] Re: No cigar...

*Message #28 Posted by **Valentin Albillo** on 1 June 2004, 5:05 a.m.,*
in response to message #27 by Andrés C. Rodríguez (Argentina)

Hi Andres,

Here in Spain, the colloquial term for the exact meaning of your first "fumado" (estar

fumado) is "colgado" (estar colgado, to be hung) which regrettably has nothing to do with smoking, though I'm sure we would be able to concoct some word play around this term, such as:

"Es desagradablemente similar a estar colgado" -- "¿ Y que tiene de malo estar colgado ?" -- etc, etc,

Best regards from V.

Re: Offopic: Douglas Adams and the Hitchhiker's Guide to the Galaxy (not short)

*Message #29 Posted by **Tom (UK)** on 25 May 2004, 7:26 a.m.,*
in response to message #1 by Ben Salinas

The Hitchhiker's Guide to the Galaxy series come in 3 flavours (soon to be a fourth), they are (in order of first appearing and perhaps descending order of merit):

Radio play (12 parts) Books (5 1/2 books) TV series (6 episodes) Film?

The radio play is by far the best rendition and is more of a complete and contained story - highly recommended. I think it is available as a 2 CD set from the BBC. If you can get hold of it do. The first 6 episodes are very close to the earlier books, the second series of 6 episodes tell a slightly different story (in my opinion a bit better).

The books are the 'definitive' story but loose some of the twists and turns and spontaneity of the radio play.

The TV series copies the first few books quite closely but looses more of the flavour of the original. IMHO this is quite weak and not recommended as the story seems to drag unlike the radio play and books - the pictures in your head are always better than those on a screen, especially when it's done on a budget as it was with this series.

I'm not sure how the film will turn out, Douglas Adams is sadly now dead. Looking at the cast list at: http://www.imdb.com/title/tt0371724/ tells me some characters are new or have been deleted - time will tell if this rendition will be any good. Don't assume a big budget will improve the original - the backers will want bums on seats.

As far as translation goes how do you translate Slartibartfast??? You will just have to find yourself a babel fish.

Re: Offopic: Douglas Adams and the Hitchhiker's Guide to the Galaxy (not short)

*Message #30 Posted by **Ben Salinas** on 25 May 2004, 5:31 p.m.,*
in response to message #29 by Tom (UK)

Actually, I read on the official site that most of the changes from the book were made by Adams himself (He had most of the script completed when he died). I too was worried about the new characters, but if Adams put them in then I will trust him to do what is right.

-Ben

Enhanced HP-41C

*Message #1 Posted by **Juergen (CH)** on 23 May 2004, 3:09 p.m.*

Recently, I aquired an HP-41C. At first glance, it seemed to be a normal one. But during function testing, I noticed that it had 319 memory registers. I also discovered that it understood the Time Module commands!

Well, I guess you understand that I had to open the calc. And that's what I've found:

Enhanced HP-41C

A thin PCB (green) is connected to the extension port contacts on the 41 PCB. The 4 memory modules are soldered onto the green PCB, near the border of the case so they perfectly fit into the upper part of the case. The time module is also connected to the green PCB by thin wires.

The green PCB is labeled with:

(C) HP CLUB AUSTRIA
VERSION II
BERNYTRONIX

Does anybody know some details about this BERNYTRONIX thing? Or does anybody know of similar HP-41C modifications?

Regards, Juergen

Nice piece! Inspiring nice piece...(N.T.)

Hello Luiz,

This arrangement could let the expansion ports free? Great work! Artur

Re: This could save the ports?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 24 May 2004, 6:33 p.m.,*
in response to message #3 by Artur

Hi, Artur;

I guess it would, because if we consider that this is what we (should) have in an HP41CV, then the addresses are consistent and there are no conflicts.

At least, this is what I guess.

Cheers.

Luiz

Re: Enhanced HP-41C

*Message #5 Posted by **DavidY** on 24 May 2004, 8:27 p.m.,*
in response to message #1 by Juergen (CH)

If you want to know see the PCC Calculator Journal, Volume 8, No 1. for an article (with diagrams) explaining how to dissemble a memory module and wire it into a HP41C. It explains circuit board contacts for the port bus and the hardwire mapping for memory modules.

The article shows using wire-wrap wire but apparently in your case some enterprising user(s)developed a circuit board.

It was possible to stuff 4-6 bare modules into the 41. Standard memory modules (single or Quad), Time, X-Functions,and X-memory modules were the usual candidates.

With a Quad Memory, Time, X-Functions/X-memory and two X-memory modules you had the equivalent of a 41CX with the full amount of X-memory registers added. The only thing lacking were the extra functions in the Xfunctions of a CX. And at the time of the article I don't even think HP was selling the CV never mind the CX.

Thank you!

HP 97 problems

*Message #1 Posted by **Wilhelm Loidl** on 23 May 2004, 10:54 a.m.*

Hello!

Could someone help me?

I use an HP 97 calculator, and have problems with the cardreader: The reading is OK, the wheel is replaced but the writing brings error in the display!

So i want to make the capacitors on the cardreaderboard new, but i dont know the range and the type (tantalum, ...).

What should/can I do? Many thanks in advance!

Wilhelm

Re: HP 97 problems

*Message #2 Posted by **Randy** on 23 May 2004, 3:01 p.m.,*
in response to message #1 by Wilhelm Loidl

Check that both head windings are okay, 50 ohms between red/yellow and blue/orange. Be sure to clean the head well and check that the card detection switches are closing, you will get a write error if the write protect switch is not making contact. It is more likely to be a switch problem than a capacitor based on your problem, but, since you asked:

The small cap closest to the transistor is 6.8uf, the cap next to it and above the diode body is 3.3uf. The two next to the IC are 22uf each. The bypass cap across the motor should be replaced as well, it is 3.3uf.

The square pcb pads are +. All caps are tantalum, 10 volts.

Good luck.

Re: HP 97 problems - a question

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 May 2004, 6:20 p.m.,*
in response to message #2 by Randy

Hello Randy, folks;

what is the "fucntion" associated with each head windings? I remember that there are two tracks on each side of a magnetic card, and I guess that one is a "sync" sequence (is it recorded everytime a card is recorded?) and the other is the very data sequence. Is it correct?

I'd like to know what sort of action is performed by each winding when reading and recording cards. I repaired some 82104A card readers but I never needed to follow the circuits and check if the head windings were O.K.

Thank you.

Luiz (Brazil)

Re: HP 97 problems - a question

*Message #4 Posted by **Tony Duell** on 24 May 2004, 2:43 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

For the 65, 67, 97 and 41, there are 2 tracks in each direction on the card. A magnetic transition on one track is a '0', a transition on the other track is a '1'. It's a simple self-clocking scheme. The same idea, BTW, is used for the tape cassettes on the 9830, with a transition on both tracks being an end-of-byte marker.

For the 71 and 75 I believe there's a timing track and a data track in each direction.

For the 9100, 9810, and I believe 9820, there are 4 tracks in each direction. 3 data tracks and a timing track. This suits the 6-bit keycodes used by the 9100 and 9810 (odd bits, even bits split, BTW!) but is less suitable for the 8 or 16 bit words of 9810 data or 9820 characters.

in response to message #1 by Wilhelm Loidl

If it reads OK, then the head is fine, the capacitors are most likely fine too.. The problem could be due to the write-protect switch not making as the card goes through. so the 97 thinks the corner is clipped (I assume you're using an unclipped card!). You need to take the card reader apart, clean the contacts (rub them _gently_ with an ink eraser, then clean with propan-2-ol), then set them as documented in the service manual (on the MoHPC CD-ROM). This is not hard to do, from what I remember you put a continuity tester between points on the card reader PCB, then screw in an asdjusting screw until the contact just closes, then unscrew 1/8 of a turn.

Re: HP 97 problems

*Message #6 Posted by **Wilhelm Loidl** on 24 May 2004, 2:30 a.m.,*
in response to message #5 by Tony Duell

Thanks to all the posters, my problems are solved!

The mayor problem was the write-protect-switch! (Other problems: the wheel and massive dirt)

I've testet last night about 200 mag-cards, no drop out!!!!!

Remember: the machine is 25 year old!

Wilhelm

in response to message #6 by Wilhelm Loidl

You may find that in a few weeks you need to adjust one or more of the reader switches again. The adjustments tend to interact with each other and occasionally "drift" after being adjusted.

in response to message #7 by David Smith

I had that problem (drifting adjustments) in the '97 from hell' -- an HP97 I was given with just about every known fault and then some!. It got to the point that I could set them up, and they'd not work next morning.

In the end I took the reader apart and _really_ cleaned the contacts (rubbed them with an ink eraser, then with propan-2-ol). Put it back together and made sure the fixing screws for the leaf contact (the 2 at the end) and the PCB were properly tightened. It was OK after that.

Re: HP 97 problems

in response to message #11 by David Smith

And presumably no results either ;-)

Anyway, in the case of my 97 it almost became a matter of honour to fix it. I was not going to be beaten by a darn calculator (actually, I am not going to be beaten by faults in any electronic or mechanical device, but I digress). The fact that this had more faults than is reasonable is irrelevant -- dirty keyboard contacts, dirty card reader contacts, decayed roller in the card reader, printer feed roller not gripping properly, paper feed switch wires needed resoldering, dead ACT chip, battery contacts broken away from the chassis, etc, etc, etc.

Oh well, I _did_ fix it in the end...

Faulty HP33S

*Message #1 Posted by **Ken Emmens (Auckland, New Zealand)** on 22 May 2004, 6:19 a.m.*

My ten day old HP33S has, since day one, had the following problems and I was wondering if anyone else has experienced them. The display suddenly dies and is replaced by a line of horizontal dashes, sometimes thick (3 pixels) and other times narrow. The line gradually gets dimmer from the right-hand end and over about a minute it slowly disappears. The line appears randomly anywhere on the screen each time this happens (about every 10 - 15 minutes on average). The keyboard doesn't respond and pressing "C" and "LN" doesn't reset the calculator. New batteries haven't fixed the problem. The other problem is that the calculator sometimes won't turn on. The only thing that gets the calculator working again for both problems is by pressing the reset button on the back. The self-test does not indicate any problem with the calculator.

I'm 99% sure I've got a dud HP33S, but before returning it for service or replacement I would appreciate any suggestions as to possible cause and/or fix. Thanks in advance.

Dud!

*Message #2 Posted by **Wayne Stephens** on 22 May 2004, 9:37 a.m.,*
in response to message #1 by Ken Emmens (Auckland, New Zealand)

This is the first I have heard of any of those problems. If it was mine, I'd return it for replacement.

Take care.

Wayne.

Return it right away!

*Message #3 Posted by **Karl Schneider** on 22 May 2004, 5:18 p.m.,*
in response to message #1 by Ken Emmens (Auckland, New Zealand)

I bought mine from a small US retailer that allows return of defective merchandise for only 10 days after purchase. I'm sure that there's some time limit in your case -- don't delay.

I seriously doubt that there's a user fix for the problems you describe, or even that HP would be able to fix it. A replacement is in order.

Edited: 22 May 2004, 5:19 p.m.

Re: Faulty HP33S

*Message #4 Posted by **Ken Emmens** on 22 May 2004, 11:31 p.m.,*
in response to message #1 by Ken Emmens (Auckland, New Zealand)

Thanks your your answers guys. I will return it tomorrow. I thought perhaps shorting the battery terminals or something like that "may" fix the problem but it is probably unlikely although I haven't tried it.

All the best and thanks again.

Ken

Why NOT??? Shoot this idea down

*Message #1 Posted by **Ron Ross** on 21 May 2004, 2:35 p.m.*

Of course none of us get to make these decisions, but....

Why doesn't Hp just recode an Hp17Bii+ for the Hp42s, keep the clock and add an USB port and a crude transfer program. Keep the price about the same as the present Hp17B's price and release.

Cost of development would be small, production line is basically there (USB port being the only addition, and I suspect the 17Bii could also incorporate and also sell).

Cost to Hp is basically nothing and Kinpo has another widget to put on the market.

Any reasons why this could NOT BE EASILY DONE?

I would like more, but that would still be a great pocket calc.

I want one of those, Ron (nt)

Re: Why NOT??? Shoot this idea down

*Message #4 Posted by **Bill Wiese** on 21 May 2004, 4:35 p.m.,*
in response to message #1 by Ron Ross

I'd love it too.... but you're thinking like an engineer, and not someone who wants to turn a profit.

...the cost of marketing and packaging (meaning box, manuals, warranty card, etc.) and promotion likely exceed the cost of electronics/hardware in the calc!

Let's take an HP33S. Betcha that calc's 65C02-based microcontroller is $0.35-$0.60. LCD's prob $2.20. PCB maybe $0.45. Batteries + terminals another $0.75. Keys+casing prob a buck or so. So maybe we're somewhere around the $5 league. For HP to get this on the shelf, blister pack it, arrange for distribution, returns, warranty support, etc., and make money for expected volumes for this type of calc, they've gotta add *at least* another $15-$20 for a calc, as this is not a normal 'consumer' channel but more of a special (reduced) interest item. Add markup for distributor and retailer and that's how you end up with a $50 calc.

These days it's cheap & easy to do ANY calculator for hardware & firmware, although one-time costs

(keytops, case die setups, custom LCD screening, etc.) are big NRE up-front costs. But would HP sell enough to recover costs for these individual flavors of calc? Hmmm, wish it were true but probably not: the 33S was a pretty good composite for we RPN 'traditionalists' other than keyboard arrangement...

*Message #6 Posted by **Norris** on 21 May 2004, 5:29 p.m.,*
in response to message #1 by Ron Ross

We can safely assume that that HP/Kinpo could recycle the 42S design if they wanted to. After all, they've recycled the 32SII (as the 33S), the 48GX (as the 48GXII and the 49G+), the 17BII (as the 17BII+), and the 12C (as the 12CP). From a technical standpoint, they are surely capable of recycling the 42S as well.

But from a marketing standpoint, it may not be worthwhile to do so. The 42S was discontinued in 1995, presumably because of poor sales. If the 42S had sold well, HP surely would've kept it on the market -- just as they did with the 12C.

Are current market conditions favorable for reintroduction of the 42S? No, they have only deteriorated since 1995. The education market has been conquered by graphing calcs. PCs have become cheaper, and have claimed the central position on every professional desktop. PDAs have become more powerful and more portable than calculators. The 42S has even been banned from NCEES exams.

So who (other than rabid collectors) would be the target market for a revived 42S for $80-90 ? Well, it could be of interest to people who:

(1) Want a powerful, flexible, portable number cruncher, and

(2) Find current graphing calculators too bulky, and who would sacrifice a large display, large keyboard, and other bells and whistles for greater portability, and

(3) Don't like to crunch numbers on Palms or other PDAs, due to lack of a real keyboard

Such people might actually exist (in fact, I could be one myself). Unfortunately, there probably aren't very many of them. From HP's standpoint, a small market niche like this may not be worth pursuing.

Re: Why NOT??? Shoot this idea down

*Message #7 Posted by **OpenRPN** on 21 May 2004, 7:31 p.m.,*
in response to message #1 by Ron Ross

I completely agree. With enough arm twisting HP *might* think about a reissue of some classics (42s, 15c, etc.) It would be a brilliant marketing move as the only development costs would be for silkscreening and perhaps a mold or two. At under $100 science professionals will stockpile them gladly (I know I would).

Re: Why NOT??? Shoot this idea down

*Message #8 Posted by **Naim** on 21 May 2004, 7:39 p.m.,*
in response to message #7 by OpenRPN

You know I have often heard that the 42S never sold well. But I beg to differ. In 1994/95 a GX sold for $200+. A 42S went for $120. I could tell you of a whole lot of surveyors that used the 42S and never thought about a GX until the 42S was unavailable. So my point is that I honestly believe [until I could see some actual figures] that the 42S was a really affecting sales of the 48 series.

Re: Why NOT??? Shoot this idea down

*Message #9 Posted by **Norris** on 21 May 2004, 8:01 p.m.,*
in response to message #8 by Naim

We will probably never see any figures. However, I doubt that HP would discontinue a successful model, even if it was cannibalizing sales of others. Notice that HP has kept the classic 12C on the market since 1981, even though this undoubtedly hurts the sales of HP's more recent financial models. In fact, the old 12C apparently outsells the new 12C platinum even today.

Shrinking markets - or - where did all the calculators go?

*Message #10 Posted by **Randy Sloyer** on 21 May 2004, 10:55 p.m.,*
in response to message #1 by Ron Ross

I have read here many times that all HP has to do is come up with some silk-screens and some different keytops to re-issue some of the old classics. Yes, okay, so I overstate and oversimplify. Yes, there have been some good, detailed and thought provoking treatments here. I'm not taking issue with good, clear and IMO sometimes wishful thinking.

But, consider this when thinking it would be easy to re-issue your [insert favorite model here] calculator:

** The Source Code ** aka ** Microcode ** aka ** Thousands of man years of software engineering **.

From all reports, it's gone, as in dropped into the dumpsters in Corvalis and ACO.

How to you re-issue a classic when you have to start over with the only reference being an operators manual? That's how Kinpo did the 33S. Ask yourself this question: If they had it, why does the 12CP behave so differently from it's ancestor? And the 33S? It's not a port, it's a re-write from scratch, not a Saturn emulation running the original 32Sii code. After all, it took almost two years from the time HP started saying the 32Sii replacement was on the way to the time it arrived. That was sure more effort than new artwork and keytops.

Before we all start drooling over the prospects of a 43S and a 15CP, lets remember there more to it than just tweaking some hardware. I'm not trying to be Chicken Little but if it were that easy, I think they would have done it by now, no matter how few they thought they might sell.

Just my 0.02¢ worth on another topic:

The theory the 42S was killed off because it cannibalized the more profitable 48 sales: I used to think it was the case, anymore, I'm not so sure. In the early nineties, connectivity was becoming an issue. Computers were everywhere. Spreadsheets were doing a lot of number crunching. If I had been in the market for a new machine in 1992, would I have picked the 48G over a 42S? Probably. It was the gadget of the day. The newest, the bestest. The 42S didn't have input ability and there was no room for serial i/o from a hardware standpoint. If I had lost my 42S back then, what would I have done? I can't honestly answer the question because I didn't need another calculator. My pile of HP's at the time was a daily use 42S, a 25C that always seemed to have dead batteries and a 16C to balance the checkbook at home. We'll never know what the sales

figures were, but with the 32Sii selling well at the bottom end and the 48GX covering the top end, why maintain so many models? That same 42S is still on my desk. Would I buy a 43S if it came out tomorrow? Probably not. It's not that I'm assuming it would be uglier than the 33S - it's just that I don't need it. For most, it's a tool. Once you have a good lawn mower (assumes you have a lawn), do you need another? You can only use one at a time. Where do the new unit sales come from? Certainly not the 7th grade algebra students out there.

Here's a statistic I'd like to see:

In the total population of HP RPN scientific calculator users out there today, how many know that that they cannot go out and buy an exact model replacement for the machine they use everyday? Assume it is an LCD model after the 41 series.

I'll bet it's less than 25% of the users. That's 3 out of 4 owners living blissfully in the lack of knowledge that their favorite number juggler is long ago out of production. Until they break or loose what they currently own, why would they buy something new?

Until there is a new generation out there that want RPN handhelds, where is the market? Replacements for exsisting users? That's a contracting, not expanding market.

So maybe the MBA types are right after all...

Source code

*Message #12 Posted by **Bill P** on 22 May 2004, 1:11 a.m.,*
in response to message #11 by Chris Woodhouse

Have you ever tried to read the output from a disassembler? It looks like total garbage.

Without the original source code, all we have is the raw machine code instructions, which are designed to be read by machines.

We don't have the original formatting of the code, the macros that were used in the assembler, or, most importantly, the comments on the code that tell us exactly what the pieces of code actually were supposed to do.

It might be possible to work directly from the machine code on an older, simpler model like the 11c,

but the 42s? Not likely.

Just my $.02

Take care

Re: Source code

*Message #13 Posted by **Bill Wiese** on 22 May 2004, 9:18 p.m.,*
in response to message #12 by Bill P

I've done a lot of disassy/reverse-engineering of 8/16-bit microcontroller code.

For me, it's harder to read the output of *compiled* code (i.e, from C or other HLL) than from code written in assembly (with or without macros, constructs, etc.) - just easier to crawl in the other programmer's head with out the disintermediating influence of a compiler...

Some HP-41 and -71 users have the complete internal design specifications, including complete source code. Granted, I don't think HP made the source code available on _all_ modules, but there are thousands of pages of documentation in the hands of a few who paid for them, and others who got copies later.

Voyagers are doable

> How to you re-issue a classic when you have to start over with the only reference being an operators manual?

According to my diary I've spent about 900 hours (just don't tell my wife ;-) building the 16C simulator. My diary doesn't give me the split between the time spent on the calculator engine and the UI (they're completely decoupled). Let's assume that interfacing the logic to the hardware is as complex as writing a windows UI (I seriously doubt that it would be). Let's bog it up a bit to a nice round 1000 hours. That's about 6 months for one SE.

The important point is that I only had the user manual as a "specification" and a working model as a reference.

I reckon you could usefully employ 3 SEs on the task, which probably cuts elapsed development time to 400 hours (3 x 400 = 1200 == 200 hours talking and documenting--the necessary overhead of multi-person projects). I'm sure most of you have observed products from inception to market so you can extrapolate to the additional resources that would be required. It certainly seems doable inside a year at a human resource cost of less than $500K.

Bill (Wiese) reckons (above) that the on-the-shelf cost for the hardware would be about $50/unit. Others have suggested that $50 is a "sweet spot" for price so we can't afford to push it too high. If we add $10 for the software, you'd have to sell 50,000 units to recoup the development cost.

I'm not convinced that there is a market for that many units. I enjoyed working through the analysis though.

Cameron

HP-16C simulator

Would HP dump? True story about another BIG computer company. (Names have been changed to protect the innocent!)

Back in the early 1970's a friend of mine start work after college with a/the BIG computer company in the Northeast U.S. His group was a mixed unit--hardware and software engineers. He and his office mate were in charge of writing I/O microcode for a new processor; the rest of the group was doing chip design and other microcode. Other company

groups in the South and West were also working on chip designs. Fast foward 30 months: the 3 groups meet in New York to present designs to upper management. After several days of presentations management call all 3 groups in and basicly says: "Thanks for all the work. You guys are really sharp--great designs. But, we know this hardware company with a completed cpu chip that we can license. So you guys are going to be re-assigned and we don't need your designs any more."

And, Poof!, the work was gone. My friend was so frustrated he took a leave of absence for a while to teach.

The moral: Management has its own ideas on what to do and never ever expect those ideas to be common sense.

in response to message #20 by Chris Woodhouse

While a former Engineer may well indeed have this, he/she would be breaking laws to divulge it! Why? Because it is not his/hers to release. It is Hp intellectual property. Worse, Hp prided itself (the OLD HP) on its and its employees integraty. Therefore, these former engineers (Former is definitely MOST LIKELY) are honor bound to not divulge this information. AND THEY WON'T!!! This bunch isn't filled with Carly lacky's, but people who abide by their signatures on Non-disclosure agreements.

Sadly the great organization they used to belong to is gone, but most of these engineers will still honor their agreements and we are the less fortunate because of it.

One or two may break ranks, but don't hold your breath.

breaking laws to divulge it!

I am advocating that HP make the 15C again.

Bring Back the http://hp15c.org:8080/hp15cBadge.jpg

So how on earth could they be breaking any laws to provide the new team at HP that will bring back the 15C with the specs on the original 15C? That was a rhetorical question by the way.

Why??? Why a 33s and not a real 42SX

*Message #1 Posted by **Ron Ross** on 20 May 2004, 12:08 p.m.*

I have a lot of gripes about the 33s. Yes, I am glad its here, and I know Hp has the NCEES rules to sneak under, but....

An Hp42sx with the awkward alpha keyboard entry probably would have been allowed if Hp were to re-release it and educate the board at the NCEES (as they did with the 33s). Rip out the IR and leave only a serial port and release an SDK (simple text entry via PC) and give it an algebraic mode for the masses. Toss in a clock and you would have a pocket data collection system. Its capabilities are far better than the 33s and it would be a professional tool and not just a calculator in a small pocket calculator package (much like the Hp41c series).

Actually, the NCEES probably wouldn't crunch this market that much anyway as most Eng grads don't bother for licensure and the oversees market doesn't care. A great pocket calculator is missing from the market, period.

Hp used to make the best and let everyone else, "Catch up". Now they try to please a fashion style market. Guess What? That moron who wants a red slide on cover for his Ti, isn't going to ever buy an RPN priced calculator. He will buy the red cover for his $15 calculator because he doesn't care about math or features, JUST LOOKS and LOW price.

I'd love the Hp33s if it were $20-30 and so would the fashion kid I just mentioned. But at $50 you have excluded the very market you designed the style of the calculator for. Talk about a marketing bunch that should be cut to save $$$$.

Now an Hp42sx would be worth the price of the Hp48GII that is now out. Certainly it would be less complex, so it should sell for no more ($100) and perhaps less ($60 is more realistic). And it would sell as there is still no real equalivent to the 41/42 line.

Re: Why??? Why a 33s and not a real 42SX

*Message #2 Posted by **Gene** on 20 May 2004, 12:13 p.m.,*
in response to message #1 by Ron Ross

How many would it sell to?

While you and I want one, there must be a very solid business case to build a 43S or 42SX.

The HP32SII was a solid seller, it appears (and HP has the market data not me). When they could no longer make it, they wanted a replacement because it sold so well.

HP of today does not have the fairly large resources they used to have aka Corvalis days.

The HP42S was discontinued because (from all appearances) it did not sell well.

Ask yourself: Why was the 42S discontinued but the 32SII was still sold?

Sales. Period.

There can't be any other reason.

If there are 50,000 people who buy the 33S vs. 5000 who buy the 42SX, then the 33S will be built.

To paraphraise Metallica, "Sad but true".

Marketing to Blame AGAIN!

*Message #3 Posted by **Ron Ross** on 20 May 2004, 12:45 p.m.,*
in response to message #2 by Gene

They kept the price of the 42s artificially high and features low (ie no I/O) So as to not rob from the 48G line of that time.

Now I hear about poor sales. Whose fault is that? In this case it is not really the consumer. The 42s costs no more to make than an Hp27s or Hp17B and both of these were $70-90 calculators at THAT TIME. Price the 42s at $120 and an Hp48G at $99 (I remember as I bought both) and which is a student going to buy?

But later and after school which would find more use?

Don't blame the consumer in this case. It was marketing who pushed the 32s then, and marketing that now comes to the wrong conclusion and is pushing the 33s now. Not that the 33s is bad, it just could have been better and for what it is, truthfully, should be cheaper (if they want that great styling to be appreciated, that is).

A 42/43s would be worth the $60, but a $60 33s that has less features than a graphics and costs more??? Hp sold the Hp20s for $30. Why not continue to keep that price range and quadruple sales (that would more than double profits as these calculators probably cost HP $4-6 max packaged).

Just my $0.02

Just my guesses...

*Message #4 Posted by **Gene** on 20 May 2004, 2:40 p.m.,*
in response to message #3 by Ron Ross

I have no idea how marketing worked back then and I'm just guessing now.

I have no idea of the absolute sales level.

Lowered prices would of course sell more units, but how many more?

1000 units @ $60 = $60,000 revenue

to set the price at $30 requires 2X the number of units.

Might be a tough sell to the decision makers.

Now if only I WERE the one making the decisions...then we'd have a 42SX tomorrow! :-)

*Message #5 Posted by **Fubar Vikinghelmet** on 21 May 2004, 12:18 p.m.,*
in response to message #2 by Gene

"To paraphraise Metallica, "Sad but true"

Excellent metaphor...

I prefer Metallica circa 1989 AND HP circa 1989.

Though I want my 28S without the IR port. Stupid, stupid, stupid.

Re: Why??? Why a 33s and not a real 42SX

*Message #6 Posted by **Charles Perry** on 20 May 2004, 12:42 p.m.,*
in response to message #1 by Ron Ross

Put a serial port in your 42sx and NCEES will ban it. They don't want calcs that have any communication capabilities at all.

Would I like to see an updated version of the 42S? You bet. But don't kid yourself into thinking that the NCEES would allow its use.

Would it sell? Maybe, but not nearly as many units as the 33s.

Re: Why??? Why a 33s and not a real 42SX

*Message #7 Posted by **Norris** on 20 May 2004, 3:51 p.m.,*
in response to message #1 by Ron Ross

Sorry. There is no market for calculators as "professional tools" anymore. Professionals now rely on computers, not calculators.

The only significant market for expensive calculators is in education. Most high school students and undergraduates don't have computers on their desktops, so they still rely on calculators. But they want graphing calculators. The 42S is not a graphing calculator. In today's education market, the 42S would fare about as well as a DOS computer.

The NCEES exam market, as you suspect, is too small to be significant. It's true that there's a lot of demand right now for the 33S, but it's not sustainable. Tens of thousands of people who were already involved in the exam process were suddenly forced to replace their 48s and 49s because of new NCEES rules. The demand for the 33S will fall sharply as the replacement process is completed.

In any event, the 42S wouldn't get NCEES approval even if the IR port was replaced by a serial port. NCEES doesn't like any ports. They will only approve calculators that have no communications capability, like the 33S.

I agree that the 33S is overpriced. HP can get away with this for now, because so many existing NCEES exam candidates have to replace their old models. But the number of new exam candidates that appear each year is relatively small, probably too small to sustain the production of this model. In the long run, the 33S will have to sell to students to be successful, and it may be too expensive to succeed in that market.

Method of use???

*Message #8 Posted by **Ron Ross** on 20 May 2004, 4:35 p.m.,*
in response to message #7 by Norris

I realize there are two arguments to this paticular issue and you are at the extreme end of one side of the table with me on the other extreme.

I just can't see myself going to every meeting to prove my points or calculations with MathCAD or Excel

on my laptop or if I chose, a PDA. Heck, I don't even like to bandish my graphics calculator (it sits in my desk drawer). But I have no qualms about bringing in a pocket calculator to various types of meetings. Yes, I often see other's bring in their laptops and PDA's, but these are most often the business types or are monitoring their email. Its rather annoying to hear the beep of incoming mail.

And in my line of work, I am sometimes jumped for answers on location. And gee, I left my laptop with my MathCAD and Excel worksheets back at the office. Yeah, I could have carried it into a hazardous envioronment, but I didn't want to for that type of work.

For the engineering done soley at a desk or the business type who love their PDA's, a pocket calculator is both redundant and not neccessary. But I feel for my needs, otherwise.

Unfortunately for me, Ti, Casio, Hp (Carly and Co.) feel like you and like your argument best. I lose.

Still I feel that there is a market and it is overlooked. However, the Big guys are not betting on me, but holding with you.

Re: Method of use???

*Message #9 Posted by **Norris** on 20 May 2004, 6:39 p.m.,*
in response to message #8 by Ron Ross

This is not an argument that I want to win. As it happens, I also take my 48GX in the field instead of a laptop. And I would love to have a 42S. So I agree that there is a niche for powerful portable calculators.

Unfortunately, a big company like HP is not interested in "niches". They want to sell to a mass market. The only mass market for calculators is in education. The 42S cannot compete in the education market, so HP will not bring it back.

Yet it's possible for small companies to profit from niche markets. For example, look at Calculated Industries (www.calculated.com). They sell a wide variety of specialty calculators (ElectriCalc, ConcreteCalc, KitchenCalc, NautiCalc, GradeMatic, etc.), which are obviously targeted at niche markets. They are successful and have been expanding their product line.

If some small company could acquire the rights to the 42S hardware and software from HP, they might be able to find a market. That's the best hope for reviving this model. But don't expect HP to do it.

Re: Method of use???

*Message #10 Posted by **db(martinez,california)** on 23 May 2004, 8:51 p.m.,*
in response to message #9 by Norris

I looked at the "GradeMatic" calculator that Norris mentioned, thinking that it might be an updated version of the heavy construction calc from Calculated Industries. Instead; i found a calculator made for teachers who can not figure a simple average. I hope that it is a very small nitch but after years and years of single digit SAT scores, who knows. Some of those slow students may have become dumb teachers.

BTW: I have played with the "Heavycalc" and it is a nice package for those who do gradeing (sculpting the earth) as their trade. Unfortunately it is not RPN so i'll just keep my 41cx/survey pac/math pac/conversion programs. Still; if they ever come out with an RPN i am buying it, even if it is just an update of that company's 1970's vintage "Loan Arranger".

Re: Method of use???

*Message #11 Posted by **Fred Lusk (CA)** on 21 May 2004, 11:29 p.m.,*
in response to message #8 by Ron Ross

Ron…

My experience is almost the same, it seems. I am a civil engineer, and I use Excel and Mathcad quite a bit. I have emulators on my laptop for the HP-41CX, HP-48, and several other models. I have an emulator for the HP-41CX on my Palm Tungsten T, plus CSIM for the HP-35, -45, and -55. But, I almost never have my laptop at a meeting, and I only use my Palm at a meeting for checking my schedule or finding a phone number. On the other hand, I almost always have my HP-42S, or sometimes my HP-48G+.

However, I don't see a calculator as redundant when I am working at my desk. For certain things, I prefer it to my computer. It is true that over the years, I have transfered much of my calculator work to the computer. There are two main things I still use a calculator for: quick number crunching and running programs I have written, some dating back over 20 years. The most important programs I still run on the calculator are "interchangeable solutions" like the old TVM from the HP-41 basic solutions (?title?) books I have written interchangeable solution programs for hyraulics (Hazen-Williams Equation for water flow under pressure, Mannings Equation, for water flow under pressure pressure, Mannings Equation for open channel flow in pipes and for open channel flow in rectangular/triangular/trapezoidal chaneels, etc), sizing rebar for reinforced concrete, and other such mundane tasks. Excel and Mathcad do not handle these types of "what if" calculations like the HP-42S. I prefer the interchangeable solution for certain problems because, even though the program is much longer than a solve routine would be, it is far more flexible and much faster.

I do see myself as a dying breed--an engineer who still programs and uses a calculator in a significant way, while also using computers for bigger problems.

Fred

Dying Breed

*Message #12 Posted by **Wayne Stephens** on 24 May 2004, 9:21 a.m.,*
in response to message #11 by Fred Lusk (CA)

Dear Mr. Dying breed,

Would you be willing to share your programs for Mannings, Hazen Williams and rebar sizing with another member of the dying breed? I've been using HP calcs for 25 years but got ahold of my first 41C just a few months ago. Since then, I've been messing around with writing programs for all of the above, but am far from optimizing any of them. I would be interested in studying someone else's programs to see where I may have gone wrong or where I can improve my own. I will certainly understand if you do not wish to share them. Thanks.

Take care.

Wayne.

PS - I have written a pretty good Vertical Curve program which I will share with you if you are interested. I know there is one on the Survey module, but I don't have the module so I wrote my own program.

W.

Re: Dying Breed

in response to message #12 by Wayne Stephens

Wayne…

Please send me an email at fel3@pacbell.net to remind me. I am in the process of creating a new office at home and it will take me a bit of time to find everything…plus, this week is stuffed full. I may have a chance to get to this on Saturday.

Fred

Re: Method of use???

*Message #14 Posted by **Eddie Shore** on 25 May 2004, 12:44 p.m.,*
in response to message #11 by Fred Lusk (CA)

I'm an accountant and most math is done through Excel, some accounting package, or the ten-key (with not much invovlment with an outside calculator). Unfortunately, I haven't had the pleasure of going to clients on assignments so I really can not say much about the use of calculators in that arena.

Still, I carry a calculator around (usually the HP49G+ and on occasion 20S/33S/17BII+) because I like the caluclator's portability, easy access to complex functions, and the reliability (calculators last longer than most PCs!). At work, I used my calculator for quick calcuations of payments of annuity, depreciation, and percent change.

Re: Method of use???

*Message #15 Posted by **bill platt** on 25 May 2004, 2:56 p.m.,*
in response to message #8 by Ron Ross

Hi Ron,

> Quote:
>
> And in my line of work, I am sometimes jumped for answers on location.

My feelings exactly. Now, of course, I can usually do all the math in my head.....but there are times where either (a) I am too tired to do that well, or (b) it takes so long as to break the train of thought. Most times, a "meeting" is sufficiently high-level that a calculation is not required.

BUT, it does happen where you are suddenly being asked "what if", or you are ship-board and something needs to be figured out immediately---Excel is not going to help here.....

AND if you cannot give some good numbers immediately, sometimes you lose the deal! When an engineer is trying to make a sale to another engineer, truth and viability is in the numbers....not the color scheme!

Regards,

Bill

voyager keyboards

*Message #1 Posted by **hugh steers** on 20 May 2004, 11:07 a.m.*

can anyone tell me how the voyager keyboards were/are made. im interested in keyboard quality and lifetime. also, are the newer keyboard mechanically worse and how they might stand the test of time?

thanks for any input,

Re: voyager keyboards

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 20 May 2004, 12:39 p.m.,*
in response to message #1 by hugh steers

For my experiences with voyagers:

```
1) gold-plated dual face PCB with circles and a dot inside for each key
2) steel domes (strips with 5 connected in line, 4 strips on the left half, 4 on the right
half - I don't know if they are plated inside)
3) adhesive tape
4) thin rubber layer (removable)
5) articulated keys with a center "pin" that presses the rubber/steel dome
6) plastic case
```

I noticed when the keyboard is very used the rubber layer develop holes when the key "pins" touch it, creating a "lower" and a little loose key.

I can provide high-resolution scans from my 15C and 11C if you want. This information is from the mid-aged voyagers, with a single PCB with the keyboards and chips, serial <= 27xxxXxxxxx.

Best regards,

Nelson

Re: voyager keyboards

*Message #3 Posted by **hugh steers** on 20 May 2004, 6:07 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

very interesting, thanks.

is it the gold plating that makes it reliable? ti keyboards also used metal domes, their action was much more clicky, and they used to fail too quickly. were they not gold plated?

Re: voyager keyboards

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 20 May 2004, 6:38 p.m.,*
in response to message #3 by hugh steers

I have some TIs (TI-30, 55, Programmer, MBA - all LED ones). The keyboard also uses some kind of metalic domes in stripes, but the contact isn't gold plated as of the HPs. This particular series of calculators from TI uses a weird keyboard - wires inside a molded plastic holder, and the domes glued with adhesive tape on top of it. The domes made contact with the wires... I can make some scans of it this weekend, to compare to the HP - I have a TI30 "sacrificed" for the Calculators' God...

Best regards,

Nelson

Re: voyager keyboards

*Message #5 Posted by **hugh steers** on 21 May 2004, 6:57 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

i tried to repair a ti57 once that worked fine, except the keyboard bounced horribly (especially the '5' key). basically, this made it unusable.

inside the metal domes hit wire segments (as you've explained), and the whole module is molded together. i gave up, although some people have said it can be done. i was interested to know why this design was faulty. i didnt see anyt gold inside, so maybe that was it.

best wishes.

Re: voyager keyboards

*Message #6 Posted by **Nelson M. Sicuro (Brazil)** on 21 May 2004, 12:50 p.m.,*
in response to message #5 by hugh steers

I repaired one of these weird keyboards (corroded contact), but it is *very* bouncy. But mostly by the de-bounce routine, I think. I have some experiences with keyboard scanning routines (particulary with this TI-30 keyboard), and in the software you can minimize the bounce effect - but the average keyboard quality of this "Majestic" series from TI is simply horrible! I have 6 "Majestic" from TI (2xTI55, TI programmer, TI-MBA, TI-Money Manager, TI-30) and my best one is a mint TI-55, but its keyboard bounces sometimes.

Best regards,

Nelson

Re: voyager keyboards

*Message #8 Posted by **OpenRPN** on 20 May 2004, 3:51 p.m.,*
in response to message #1 by hugh steers

The important parts (mechanically) are that the keys were hinged at the back and rested against stainless steel

domes which provide both contact and positive tactile feedback. Heat stakes holding the keyboard PCB in place created further rigidity, contributing to the solid feel of keypresses.

Steel domes are the main part of the "feel" over time and will age with use. Most are rated for >1,000,000 presses. There are some good voyager series dissections online if you search around a bit.

Best Regards, Hugh Evans

12C, buy new or search for an older one?

*Message #1 Posted by **Matt** on 20 May 2004, 10:09 a.m.*

I need to pick up a 12C and I was going to just buy a new one, until I read some reviews and comments about the new 12Cs not being as sturdy as the older (Made in USA) models. Is it worth trying to find one of these older models on eBay, or should I not worry about it and buy a new 12C from Amazon or the like? How long ago did HP stop making the 12C in the US? Thanks!

Re: 12C, buy new or search for an older one?

*Message #2 Posted by **hugh steers** on 20 May 2004, 10:17 a.m.,*
in response to message #1 by Matt

hi there,

are you set against the 12cp? they are reasonably priced new and you get a real manual. there are pros and cons tho'.

good luck,

Re: 12C, buy new or search for an older one?

*Message #3 Posted by **Matt** on 20 May 2004, 10:28 a.m.,*
in response to message #2 by hugh steers

Hi,

From what I've heard, the 12CP isn't necessarily an upgrade from the 12C. People have said it's not built very well, and is actually slower performing some calculations. I don't need (or want) algebraic notation, so I'm not sure what I get with the 12CP vs. the 12C.

What you get with the 12cp

*Message #4 Posted by **Gene** on 20 May 2004, 10:57 a.m.,*
in response to message #3 by Matt

The 12cp is slower solving for i in annuity problems.

The 12cp does have nearly 2.5 times the usable programming memory (unless the goto bug has been fixed, then it has nearly 4X the program memory).

The 12cp is faster running programs that do not involve solving for i.

I don't have any real qualms about its quality, and I have used it alot. ;-)

Gene

Thanks...

*Message #5 Posted by **Matt** on 20 May 2004, 12:12 p.m.,*
in response to message #4 by Gene

I'll be using it for my MBA courses, so I probably won't be doing much programming on it, just typical financial math. That's why I'm a little weary of the slower calculation speeds.

I suggest the Hp17BII

*Message #6 Posted by **Ron Ross** on 20 May 2004, 12:51 p.m.,*
in response to message #5 by Matt

I suggest the Hp17Bii then, because it is much more versatile and useful. The 12c is popular because it is a classic with a great layout, but feature wise and function wise the 17Bii BLOWS IT AWAY!!!

I would even suggest the older discontinued 17Bii over the newer 17Bii+, but whatever (I like the larger enter key and 7 K RAM is way more than the 12c or cpee) and this RAM is used by a very easy to use solver which much easier to use than programming a 12c.

Ron is absolutely right...

*Message #7 Posted by **Karl** on 20 May 2004, 2:10 p.m.,*
in response to message #6 by Ron Ross

I have both a well-made classic 12C and a 17BII (both made in Singapore during 1993)

The 17BII is much more capable and is substantially faster. The only drawback is that few functions are directly assigned to keys -- menus must be navigated, in order to provide a "clean, uncluttered" layout.

The 12C Platinum is an inept "upgrade" in my estimation.

- It has more RAM for programming as Gene said, but the limited programming capabilities -- carried over from the 12C -- are still so crude that the additional memory has little practical value.
- Algebraic entry was added without parentheses(!)
- The TVM algorithm is apparently not as mathematically robust as before.

12C's made in China during the past few years are cheaply made, with printed key legends that wear off.

The 12cp...

*Message #8 Posted by **Gene** on 20 May 2004, 2:38 p.m.,*
in response to message #7 by Karl

is not as "inept" as you make it out to be. :-)

The programming GOTO problem and i solving issue aside...

The algebraic without parentheses requires one to think differently, but it did not cause those of us who worked on the 12cp solutions manual any real difficulties. If you haven't pulled down the newly revised 12cp solutions manual, do so and study the algebraic solutions. Some of them are quite ingenious, if I say so myself. :-)

That said, I prefer the 12c or 12cp to the 17bII for the reason Ron mentioned...I have keystroke access to all functions without having to go through lots of menus.

The solver is nice, but I just don't use that too often.

My 1 cent. :-) Gene

Re: The 12cp...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 20 May 2004, 4:58 p.m.,*
in response to message #8 by Gene

Hi Gene, folks;

just a brief add: I had a TI BA55 (or 55C?) that is also financial, programmable, algebraic and has no parenthesis. I thought it would be better in the hands of a very good friend, also contributor in here, so I no longer have it.

About the HP12C Platinum "parenthesisless" algebraic features: if we think RPN in most cases, that will do. Even the stack features (WITHOUT the extremelly desirable duplication of the x-contents with ENTER) are kept somehow, with [x<>y] performing some interesting tricks. Try this:

in RPN mode you can fill the stack with 50 (T), 40 (Z), 30 (Y) and 20 (X) with the sequence:

```
50 [ENTER]
40 [ENTER]
30 [ENTER]
20
```

You can use [Rv] (roll-down) to check the contents. Now try this:

```
[f] [ALG]
50 [x<>y]
30 [ENTER]
40 [x<>y]
20
```

Only one [ENTER] and you have the same stack contents. You can use the same sequence above, as in RPN, to fill the stack in Algebraic mode, but [x<>y] somehow "locks" stack automatic lifting. Tricky, isn't it? Anyway, you still cannot duplicate with [ENTER].

I enjoy using the HP12C Platinum, but I barely use Algebraic mode. Mostly to show former HP12C users the difference of using the Algebraic mode against RPN and what's new on the HP12C Platinum. Most former RPN users prefer using RPN istead of algebraic. But I had the chance to show someone that does not own an HP calculator that the HP12C Platinum uses Algebraic as well. He told me: "Now I'll consider buying one." Well, he told me that in Portuguese, in fact.

Cheeers.

Luiz (Brazil)

Re: I suggest the Hp17BII

*Message #10 Posted by **hugh steers** on 20 May 2004, 5:50 p.m.,*
in response to message #6 by Ron Ross

yes indeed, the 17bii is also one of my faves.

or even consider the 19bii. relatively recently i acquired one, thinking ho hum, another financial calculator. but i was wrong. its a very nice machine indeed. i have always been a fan of the book-style fold back case, also seen on the 28c/28s. you get a dedicated alpha keyboard which make programming and especially formula entry (for the solver) a pleasure. euros are missing tho'

19biis dont fetch a great deal either. are they still in production?

The 19bII

*Message #11 Posted by **Gene** on 20 May 2004, 6:20 p.m.,*
in response to message #10 by hugh steers

No, they are not in production any longer.

The very late-model 19bII's I really don't like.

Low contrast LCD.

Early 19bII's are much better.

Gene

Re: 12C, buy new or search for an older one?

*Message #12 Posted by **John Smitherman** on 21 May 2004, 12:40 a.m.,*
in response to message #1 by Matt

Matt, I recommend you buy either a 12C or a 12CP / TI BAII+ combination. The TI will help confirm the accuracy (or inaccuracy) of the 12CP.

John

Re: 12C, buy new or search for an older one?

*Message #13 Posted by **Gene** on 21 May 2004, 12:50 p.m.,*
in response to message #12 by John Smitherman

I'm not aware of any "inaccuracies" in the 12c/12cp.

Do you have any specific problems where the answers differ to a significant degree? (Meaning, more than 1 or 2 places in the last digit?)

Re: 12C, buy new or search for an older one?

*Message #14 Posted by **tony** on 21 May 2004, 10:34 p.m.,*
in response to message #13 by Gene

Gene, I agree the 12cp is accurate. The gto bug can be worked around - for example I have MEM=P-399 r-7 and just cannot do a programmed gto into 111 lines 145-255. I still use all the lines. Manual GTO into that range is still possible as is programmed GTO out of that range. Would be nice to have

the bug fixed though.

Re: 12C, buy new or search for an older one?

*Message #15 Posted by **bill platt** on 24 May 2004, 5:40 p.m.,*
in response to message #14 by tony

Hi,

But if you are used to programming the scientific voyagers, e.g. 11c, the programming method for the 12c is just insanely unfrindly---unable to edit lines--having to do weird trickw with GTO to repair or revise---who needs that aggravation!

regards,

Bill Platt

Re: 12C, buy new or search for an older one?

*Message #16 Posted by **John Smitherman** on 25 May 2004, 11:02 p.m.,*
in response to message #13 by Gene

Hi Gene. I'm not aware of any more inaccuracies other than what you've already reported, such as:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv012.cgi?read=33913

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv012.cgi?read=33912

Did you ever determine whether or not you received a 12cp beta? Do you know if HP has fixed some of this?

Thanks,

John

Go for a 17BII/17BII+ instead.

*Message #17 Posted by **Eddie Shore** on 25 May 2004, 12:48 p.m.,*
in response to message #1 by Matt

Several advantages of the HP17 Series:

* The HP17 has a lot more memory than the HP12 series. * Appointments and clock. * The HP17 series does not cost much more than the HP12 (difference $10-$20)

One drawback, you have to navagation through a lot of menus due to the HP17's under-cluttered keyboard.

HP 33s Serial Number ?

*Message #1 Posted by **AL** on 19 May 2004, 10:43 p.m.*

Why do all the references I see on this board to the serial number start with a CNA.....

Mine looks clearly like CN404.... (the 3rd and 5th character are clearly the same).

What is the serial number pattern?

Lastly, what does that imply in regard to the discussion of bugs, particularly in algebraic mode?

(my $0.02....the algebraic mode is pure blasphemy anyway)

(my $0.02....the algebraic mode is pure blasphemy anyway)

*Message #2 Posted by **Wayne Stephens** on 20 May 2004, 7:39 a.m.,*
in response to message #1 by AL

I couldn't agree more.

All the memory/CPU space taken up by the ALG mode "capabilities" could have been used to add additional functionality or programmability for RPN users.

Take care.

Wayne.

PS - If two of us agree, does that make it $0.04 ?

PPS - I believe CN means China (place of manufacture). I'm not 100% sure what the numbers mean, but I think the 404... machines are from the first "run" which were sold through Walmart.com in late-February/March 2004; the 414... machines appear to be from the second "run", which arrived mid to late April; just in time for a lot of the NCEES test takers to not be able to get ahold of one for the test... or something like that.

Re: (my $0.02....the algebraic mode is pure blasphemy anyway)

*Message #3 Posted by **Gene** on 20 May 2004, 9:22 a.m.,*
in response to message #2 by Wayne Stephens

Probably true, Wayne.

Question is:

How many units would HP sell if RPN only?

vs.

How many if RPN and algebraic?

Apparently, they have come to the conclusion that algebraic is what will sell, but at least they still include RPN.

We'll see what the market does. Gene

Good point

*Message #4 Posted by **Wayne Stephens** on 20 May 2004, 9:36 a.m.,*
in response to message #3 by Gene

That is a good point, Gene. I suppose I should just be happy there is still a good, functional, reasonably powerful calculator available with RPN capabilities. HP has to be able to sell them; and there's no law that says I HAVE to use ALG mode.

I do like the 33S, but I just can't help thinking about the wasted opportunity to provide the RPN "hard core" with a TRULY memorable machine.

At least it's in RPN mode when you turn it on fresh out of the package!

Take care.

Wayne.

Re: Good point

*Message #5 Posted by **Gene** on 20 May 2004, 10:13 a.m.,*
in response to message #4 by Wayne Stephens

I too hope for an HP43S-like calculator some day. No, that's not "insider" information, but a wish.

If there ever is such a beast, I'm 99% sure it will also have algebraic as a mode too.

Gene

P.S. However (heresy), there are a FEW things that are easier in algebraic, e.g., complex numbers are easier in many ways on the 33S in algebraic than RPN since you can only have 2 complex numbers on the 33S stack at once. RPN loses quite a bit of efficiency with only a 2-level stack.

Re: HP 33s Serial Number ?

*Message #6 Posted by **Jeff** on 20 May 2004, 12:53 p.m.,*
in response to message #1 by AL

My first batch "Walmart" unit is also CN404....
It appears that the first batch used the “ccywwnnnnn” serial number format, where:
cc = country of manufacture (CN for China)
y = year of manufacture after 2000
ww = approximate week of manufacture (I have always postulated that this was the week that the first units of a production were made, then they stuck with it until they made 99999 units, at which point they incremented the week code to the then current week. I have no proof, just a theory.)
nnnnn = 00001 to 99999 sequential count of units in that production run.

The second batch of units seem to have adopted a new serial number format of "ccAywwnnnnn" where:

cc = same as above
y = same as above
A = ? (I believe it has been postulated that this would indicate the decade of manufacture in the 21st century, but it seems like it would have been better to go back to a two digit year code)
ww = same as above
nnnnn = same as above

I don't have any thoughts or theories on the bugs.

Norm will like this

*Message #1 Posted by **db(martinez,california)** on 19 May 2004, 10:34 p.m.*

I get funny email. A while back there were several threads on MBA's and managment types. Judging by the participation; there are a few here that will like this:

MBA's think this way. So does management

A Japanese company and an American company decided to have a canoe race on the Missouri river. Both teams practiced hard and long to reach their peak performance before the race.

On the big day the Japanese won the race by a mile. Afterwards, the American team became very discouraged and morally depressed. The American management decided that the reason for the crushing defeat had to be found. A "Measurement Team", made up of senior management was formed. They would investigate and recommend appropriate action.

Their conclusion was that the Japanese had 8 people rowing and 1 person steering, while the Americans had 1 person rowing and 8 people steering. So American management hired a consulting company and paid them incredible amounts of money. They advised that too many people were steering the boat and not enough people were rowing.

To prevent losing to the Japanese again next year, the rowing team's management structure was totally reorganized to 4 steering supervisors, 3 area steering superintendents and 1 assistant superintendent steering manager. They also implemented a new performance system that would give the 1 person rowing the boat greater incentive to work harder. It was called the "Rowing Team Quality First Program", with meetings, dinners and free pens for the rower. "We must give the rower empowerment and enrichments through this quality program".

The next year the Japanese won by 2 miles. Humiliated, the American management laid off the rower for poor performance, halted development of a new canoe, sold the paddles, and canceled all capital investments for new equipment. Then they gave a High Performance Award to the steering managers and distributed the money saved as bonuses to the senior executives.

It would be a lot funnier if it was not so true...

*Message #2 Posted by **Wayne Stephens** on 20 May 2004, 7:42 a.m.,*
in response to message #1 by db(martinez,california)

Take care.

Wayne.

PS - Was the American team from HP?

HP 25 repair

*Message #1 Posted by **Marcos** on 19 May 2004, 3:25 p.m.*

Hi there! Could someone help me? I've got a HP25 which has not been used for a few years. The battery pack is now worthless. When I connect the machine -- via ac adapter -- to the mains the display's numbers flash quickly but the machine does not work. Is it possible to have it repaired? Does this happen simply because there are no batteries? What can I do? Many thanks in advance! Marcos

Re: HP 25 repair

*Message #2 Posted by **Tony Duell** on 19 May 2004, 3:39 p.m.,*
in response to message #1 by Marcos

NEVER connect a Woodstock (HP2x) or Spice (HP3xE, HP3xC), or an HP67, machine to the ac adapter without a known-good battery pack in place. You can damage chips. This is more likely in machines with continuous memory, but it can occur in any of them.

The HP25 will not work correctly without a good battery. It's worth rebuilding it to see what happens, though.

Re: HP 25 repair

*Message #3 Posted by **Renato** on 19 May 2004, 11:45 p.m.,*
in response to message #1 by Marcos

Marcos,

Where are you ? If you are in Brazil, maybe me or other brazilian may help.

Renato

Go with regular Alkaline AAs

*Message #4 Posted by **Wayne Stephens** on 20 May 2004, 7:56 a.m.,*
in response to message #1 by Marcos

If you have the original plastic battery pack holder you can easily convert it to use regular AA batteries by removing the little plastic "strip" which runs longitudinally along the holder and "secures" the rechargeable batteries. Without the strip in place, the holder is wide open, and it is a simple matter to insert and remove regular AA batteries (use the "stock" springs). Just remember to pay careful attention to polarity (I marked my holder with a "+" and "-" just so I won't screw up.

In a non-continuous memory machine this is a very simple and economical way to go, since you are not concerned with losing programs/settings when your batteries completely die.

Take care.

Wayne.

PS - To some, it is considered blasphemy to alter an original Woodstock battery holder, but I decided a while back that I'd rather have my HP 21 working than to have it useful as nothing but a paperweight. I can go back to rechargeables if I choose, and I even saved the little plastic "strip".

PPS - Some also say that you should not use brand new AA batteries because they produce more than the "stock" rechargeable batteries' voltage. Others have told me it makes no difference. Just to be safe, I use my AAs in a flashlight or something for a little while before installing them in the HP 21.

OLD HP corporate statement

*Message #1 Posted by **Joe Edwards** on 19 May 2004, 3:17 p.m.*

It is funny. I just read the 1979 HP 41c Owner's Handbook. On the inside cover you can find this statement...

"The sucess and prosperity of our company will be assured only if we offer our customers superior products that fill real needs and provide lasting value, and that are supported by a wide variety of useful services, both before and after the sale."

Hmmmmm.....

Re: OLD HP corporate statement

*Message #2 Posted by **Walter B** on 19 May 2004, 5:54 p.m.,*
in response to message #1 by Joe Edwards

Well, those were the days, my friend ... !

;-)

Re: OLD HP corporate statement

*Message #3 Posted by **Les Bell [Sydney]** on 19 May 2004, 8:36 p.m.,*
in response to message #2 by Walter B

We thought they'd never end. . .

;-(

Re: OLD HP corporate statement

*Message #4 Posted by **Dave** on 19 May 2004, 9:19 p.m.,*
in response to message #3 by Les Bell [Sydney]

"HP is working on a jaw dropping pile of machines taking full advantage of all the technology advancements in hardware and software they can. I think we all have to commend them on their innovation and commitment to development. There are no less than seven new models in the works and we have the scoop."

This is a quote from a different part of their business.

They are still focused, just on today's technology and not yesterday's.....

I think it is time to commend them for staying in the calculator business and providing an opportunity to build on their history. It is a long shot they can recoup all their former glory but at least they have made some progress (better than the rehashed 48Sx/48GX/49G which had no added practical capabilities)

Re: OLD HP corporate statement

*Message #5 Posted by **Joe Edwards** on 19 May 2004, 11:36 p.m.,*
in response to message #4 by Dave

Hmmm. That would be fine and dandy if I could pick up one of their new calcs and feel and see the same level of quality that was present in the old HP calcs. I could care less if Kinpo makes them, as long as they are as reliable and sturdy as the old machines. This comes from a person who is too young to have used the HP calcs the first time around. Nonetheless, anyone can hold the calcs and see the difference. It comes down to one word, quality.

Joe

P.S. It would also help if HP would stop trying to make their calcs "snazzy" in appearance. The 33s is okay in appearance, but would have looked so much better (and would have been easier to use) had the just implemented standard keyboard shape).

Re: OLD HP corporate statement

*Message #6 Posted by **Dave** on 20 May 2004, 10:04 a.m.,*
in response to message #5 by Joe Edwards

If they are not "snazzy" to stand out, they will not sell and will be forced to stop production. (do we really want this result? At times this forum is into HP bashing)

I have yet to see TI, Casio, Sharp or other calc manufacturer in recent years provide any tactile feedback to their keyboards let alone implement RPN as an option or choice.

Re: OLD HP corporate statement

*Message #7 Posted by **Garth Wilson** on 20 May 2004, 11:29 a.m.,*
in response to message #6 by Dave

> If they are not "snazzy" to stand out, they will > not sell and will be forced to stop production.

We've had so much talk about the great HP quality of yesteryear making their products irresistable. If HP is having trouble selling now, it's partly because they abandoned that quality which you can partly see and feel. As for modern styling, I see it as being like trying too hard to be funny. It doesn't come across as more humorous-- just stupid and irritating. I wouldn't mind buying something unattractive if it's that way because very little styling effort went into it. But I definitely will not buy something that looks stupid because they tried too hard in the styling and got carried away with their 3-D CAD. HP has fallen from great heights.

Re: OLD HP corporate statement

*Message #8 Posted by **GE (France)** on 20 May 2004, 4:45 p.m.,*
in response to message #7 by Garth Wilson

I agree that HP machines were of high quality at the classic age, and even later.

We must recall however that this came at a price. I for one could'nt afford these machines.

The problem is that nowadays the vast majority is not really to pay for a quality item. Who hasn't seen someone at the supermarket deciding against an item for $0.10 ?

We've all become bean counters. This is a losing strategy. Is that sad ? I don't thing so !!

Re: OLD HP corporate statement

*Message #9 Posted by **Garth Wilson** on 22 May 2004, 1:32 a.m.,*
in response to message #8 by GE (France)

I think it's that they've gone for sales volume in numbers of units and not necessarily dollars. They got at least a couple thousand dollars out of me over a period of a few years from the 41cx and 71 and all the accessories I bought, and a similar amount from a friend of mine. You can figure nearly $5000 from just two customers! Where I was working in the mid-80's, virtually every engineer in the lab had his own HP-41. Now HP is selling cheaper units and trying to make the money by finding more customers-- even customers that are not as likely to come back to make another purchase from HP.

Re: OLD HP corporate statement

*Message #10 Posted by **Robin (CH)** on 23 May 2004, 11:36 a.m.,*
in response to message #8 by GE (France)

just make the calculators capable of sending sms - make phonecalls, nice color tft display with customizing background pic's etc. - and the price doesn't seem to high, for joung nor older people..

so, shall we integrate a handy in a calc or otherwise ;-)

A cheap PDA with reliable, usefull keys and with phone-cababilities and much more.. something like this Hydrix thing could be a step in the right direction, maybe they will grow extremly and aquire HP ;-)

And for NCEES's sake - they're fooling them self because they could make the exam in a such manner where calcs and communication abilities wouldn't be a topic to talk about - hey, which century do we live in.. to be shure no one has manipulated ANY calc, they must prohibit all of them..

Just my opinion. Robin

123456

Re: OLD HP corporate statement

*Message #11 Posted by **Tom (UK)** on 24 May 2004, 7:42 a.m.,*
in response to message #10 by Robin (CH)

The buisiness plan of old was make a dollar today and plan to make a dollar tomorrow.

The buisiness plan of today is make 1 dollar 10c today and forget about tomorrow (because by then you will have sold your stock options).

This is the main reason why HP (and every other listed company) has changed.

I'm rescinding my positive review of the 17BII+

*Message #1 Posted by **Scuba Diver** on 19 May 2004, 3:14 p.m.*

Hello everyone!

Back in January, I wrote a positive review about the HP 17BII+ calculator. Granted, it's no Pioneer, but it's not a bad financial. I like the screen, the keys have a decent feel, and it's fast.

I have a recurring problem with the calculator; I'll take it out of my bag and try to turn it on, and it won't work! I'm forced to reset the calculator; it will then function, however I lose my memory in the process.

I finally decided to call HP support. They told me that this is a "feature" of the calculator to save battery life! Can you believe it?

I didn't get all the details, but if the machine times out and then senses keypresses (or something like that), it "locks up" and requires a reset...this is meant to prevent the calculator from turning itself back on, thereby reducing battery life.

The support tech told me that they've heard through customer feedback that this feature may not be of value to their customers, so they may remove it.

Gee, with features like that, my 17BII+ is more of a doorstop than a calculator. Since when are batteries more important than the data I store in memory? I can just imagine that design meeting. Although it was probably more like a Dilbert cartoon than a design meeting!

Done my rant! Thanks for listening! B.

Re: I'm rescinding my positive review of the 17BII+

*Message #2 Posted by **jose gancalves (brasil)** on 19 May 2004, 3:26 p.m.,*
in response to message #1 by Scuba Diver

I had the same problem with my HP17BII+ (I still cannot understand why having so many versions registered in the title!). I noticed, however, that the new model of protective cover and the position of the ON key on the keyboard often makes the key to stay pressed for long time inside the cover. Despite the much better quality of the cover in terms of material and style, pressing that key continuously prevents the calculator to turn off automaticaly after some time. Then the device that shuts down the calculator. I left my calc without the cover (or anything that pressed the ON key) for long time and the problem never happened again.

May be this is the idea behind the strange behavior. A problem with the position of the ON key AND a bad cover design.

Jose

Memory

*Message #3 Posted by **Wayne Stephens** on 20 May 2004, 8:06 a.m.,*

in response to message #1 by Scuba Diver

Do you lose YOUR memory, or does the calculator lose ITS memory.

If you lose YOUR memory, then I suspect HP is lying to you, and that they have snuck (sneaked?) some sort of "neural disruptor" into their calculators; possibly as part of some secret government experiment, or maybe just in an effort to make all of us "old time" HP geeks forget HP's former glory.

If the calculator loses ITS memory, then I suspect HP is telling you the truth, however stupid it may be. It does make me yearn for HP's glory days, though ....

I better turn on the "neural disruptor"

Take care.

Wayne

PS - ;^)

What about static discharge?

*Message #4 Posted by **Gene** on 20 May 2004, 10:53 a.m.,*
in response to message #3 by Wayne Stephens

That type of thing can play havoc with a calculator.

You could, however, keep your calculator in an anti static bag for a few months to verify that it is an ESD problem. This would be a trivial thing to do and quite conclusive.

Everyone here should remember the mysterious crashes from the old HP41 days.

Gene

Re: What about static discharge?

*Message #5 Posted by **Garth Wilson** on 20 May 2004, 1:31 p.m.,*
in response to message #4 by Gene

I've never heard of the 'mysterious crashes from the old HP41 days', and I've used a 41cx for nearly 20 years. I still use it every day. It has never crashed-- not once-- and the only time it gave me the "memory lost" display was when I did something wrong in synthetic programming. So was this crashing thing a problem with earlier 41's?

We should be able to test this...

*Message #6 Posted by **Gene** on 20 May 2004, 10:54 a.m.,*
in response to message #1 by Scuba Diver

Are you saying that if we leave the 17bII+ on and let it turn itself off, that if we then press keys OTHER than the ON switch, it will lock-up and not turn on?

Can anyone here duplicate this behavior?

Gene

I'm rescinding my positive review of the 17BII+

32SII Program Question

*Message #1 Posted by **Charles Perry** on 19 May 2004, 12:19 p.m.*

This is probably a dumb question but I am just starting to take an interest in programming my 32sII (and 33S) calcs. Up to now, I have only written any programs for the 28 and 48 series. I found a program for the 32SII online with the following section:

M15 +/-

M16 29.5361111

M17 \:-

M18 FP

M19 SF 10

M20 ENTER

What is M17????? I cannot figure out what that represents.

Thanks (sorry if this is a really dumb question).

Re: 32SII Program Question

*Message #2 Posted by **Bram** on 19 May 2004, 1:00 p.m.,*
in response to message #1 by Charles Perry

Just a shot in the dark:
it looks like the author has tried to "draw" the divide-symbol. Perhaps the backslash was meant to "print" the colon and the hyphen on the same place. Not every function makes sense on the line in question, but division does in my opinion.

Re: 32SII Program Question

*Message #3 Posted by **Mark Hardman** on 19 May 2004, 2:55 p.m.,*
in response to message #2 by Bram

Actually the author is using a standard escape sequence for the division symbol. I believe a canonical list of these \ sequences can be found in Craig Finseth's HPDATABase at http://www.finseth.com/hpdata/chars.html.

Mark Hardman

33s bug list

*Message #1 Posted by **Dave Olson** on 19 May 2004, 11:26 a.m.*

Has anyone compiled a list of known bugs in the 33s yet? It would be interesting to see what is known, how serious they are, etc.

Re: 33s bug list (A START)

*Message #2 Posted by **Mike** on 19 May 2004, 2:00 p.m.,*
in response to message #1 by Dave Olson

Here is a pretty good start gleaned from this forum. (Sorry I did not cite the sources, all of whom are much smarter than I)

*****FRACTION ANONALY IN PROGRAM MODE If you try to enter a fraction in PRGM mode it comes out with commas in the wrong place. Try this: enter program mode and enter the fraction 1234/567. It'll come out looking like this: 12,34/,567. If you enter the same fraction on RPN or ALG mode it works just fine. (My newer 33s does not do this, older model may)

**** STAYS IN RAD AFTER RESET I realized today while doing my physics homework that my calculator was operating in radians mode, even though the RAD annunciator was not on. I did a bit of research, and realized that if you use the self-test (C and 1/x), the LCD screen reverts to its default state (only says RPN), but the calculator does not revert to the default state.

***** SWAP FUNCTION DIFFERENT IN OLDER AND NEWER MODELS In algebraic mode

Press: 24 divide 12 X<>Y ENTER and what do you get?

Does your HP33S show 0.5? or Do you get a divide by zero error?

The older (first run Calculators, SN CNA40…) result in 0.5, while the newer CNA41… result in divide by 0 error.

**** ALL CLEAR PRODUCES ODD DISPLAY

Switch to algebraic mode, and make sure the stack/display is clear by pressing the <C> (ON) key.

Press: 24 then press the Minus key. Your display should have "24-" in the top line and "24.00" (assuming FIX 2) in the bottom line. Now clear the calulator's memory by pressing the green <leftshift> key, followed by the <clx> key (you know, the <backspace> key just below TAN). Using the big "wobble" key, navigate to: 3ALL, and press <ENTER>. At the "CLR ALL? Y N" prompt, navigate to "Y" and press <ENTER> Finally, press: 24 then press the ADD key. What do you see? On my calculator, the top line is "-24+" and the bottom line is "-24.00". What's up with that?!?

Here's another one in alg mode: Press: 24 then press the Divide key. Your display should have "24/" (/ is the divide symbol) in the top line and "24.00" (assuming FIX 2) in the bottom line. Now clear the calulator's memory by pressing the green <leftshift> key, followed by the <clx> key (you know, the <backspace> key just

below TAN). Using the big "wobble" key, navigate to: 3ALL, and press <ENTER>. At the "CLR ALL? Y N" prompt, navigate to "Y" and press <ENTER> Finally, press: 24 then press the Divide key (or the Multiply or Minus or Plus key). What do you see? On the newer calculator, the top line is "0/" and the bottom line is "0.00". BTW, if you had pressed the any of the other keys (Multiply, Minus, or Plus), the top line would be "0x", "0-", or "0+", respectively, and the bottom line is "0.00").

**** COMPLEX NUMBER ANOMALY

Do a complex function in ALG Mode. Say, (3 +4 CMPLX) x (4 + 5 CMPLX). Now, you know that the real portion will show up in the display like "Re= -8" and you have to push the down arrow to see the imaginary part: " Im=31"

So this begs the question: how do you get to the imaginary part in a program? (since the down arrow is not a programmable function). You push x<>y! But look what happens when you do this manually: If you push x<>y, you then see "Re=31" and the top line will say "(31 -8i)" If you hit x<>y again, you get back to the "Re=-8"; the top line returns to "(-8 + 31i).

So, this x<>y is how you can use the results of complex number actions in a program. You STO to a variable, X<>Y, STO to another Variable and carry on from there. Note that only the value is stored in the variable---the "Re" part is stripped (this is consistent with the way the 32sii works, too, with say the results of an equation solve).

***** PROBABILITY ERROR

2000 Enter 1000 nCr and the calculated result : 1.8099e499 The correct answer is: 2.048151626989490*10^600, which on an HP 33s would be an overflow.

HHP Portable EPROM

*Message #1 Posted by **Jeff** on 18 May 2004, 7:35 p.m.*

I have been able to collect several HP-41 ROM images that I would like to burn onto a set of EPROMS for this unit. I have also recently purchased an EPROM Programmer. Can anyone let me know the preferred method to take these ROM images and put them together on the EPROM set? Much Thanks, Jeff

Re: HHP Portable EPROM

I remember Harley Davidson being owned by AMF (American Machine & Foundry). They also had their name on the bowling-pin equipment in the bowling alleys.

AMC (American Motors Corporation) made such famous cars as the Javelin, Matador, Gremlin, and of course, the Pacer. On the other hand, AMC did make Jeeps.

Your site brought back a fun memory. I spent a lot of time looking at the HP21 in the student store at NC State University in 1976 and 1977, but I could not afford it. In the summer break of 1977 I had a job working as an intern for a power company, and I earned enough to order the new HP29C. Soon after I ordered, I was asked to work the "night watch" schedule for a few days. My new 29C arrived just as I was leaving for an evening sitting at the watch desk, so I had a full evening of being paid to do nothing but sit and learn this new toy. After years of use, it was stolen from my desk at work in 1986. Although I could buy just about any calculator or computer I wanted today, nothing could match the feeling of that summer evening in 1977. I would pay well to have it back. Don 1234

Thanks for the link to my site. In another week or two I should have it moved to a server where I won't need the non standard port. I have added some content, such as why the landscape layout is better than portrait. If you think portrait is better and want to keep thinking that way I suggest you do NOT read and try the method I describe for using the landscape layout calculators. Feel free to suggest changes or additions to the site.

Bring Back the 15C

View of a Heretic

*Message #12 Posted by **rsenzer** on 20 May 2004, 1:42 a.m.,*
in response to message #8 by Chris Woodhouse

The landscape view, particularly if the viewing area is sufficiently long, is preferable for a modern algebraic calculator. It simply allows for a longer expression.

As for finger placement, I don't find one preferable to the other, i.e., landscape vs. portrait.

I regularly switch between my only landscape model, the 15C, and my other non-landscape RPN models. I once owned a 71B as well.

As for a 15C without the contemporary features of the 32/33, forget it. I believe a new model should incorporate fraction capability, better accuracy, 3 digit exponents, etc. HP should INVENT a better 15C, although, hopefully, NOT the way they invented a better 32SII.

My advocacy of the HP 15C is for use as an everyday real world use calculator. NOT as a calculator for college or high school students. I guess it is possible that there are applications where you need to use numbers that have more than 100 digits or 10 digit precision, but I am at a loss as to think of any. In fact when theory and design are taken from the drawing board to real life you are hard pressed to get even 5 digit precision in a manufactured item. 1.0 E99 is large enough to calculate the volume of 100 trillion, trillion, trillion, trillions of planets the size of earth in cubic millimeters. If I did find myself needing numbers like that I would be using a desktop computer not a calculator. Out side of math class

I have never seen much need for fractions on my calculator. As far as your ability to be equally comfortable using both portrait and landscape calculators, I didn't mean to imply that portrait couldn't be used comfortably, just that the landscape layout is more efficient if you know how to hold it properly.

The most common request for change from people who signed the petition is more memory and faster processor. Only a few have requested that.

Ok "toss it in"

*Message #14 Posted by **Ron Ross** on 20 May 2004, 2:45 p.m.,*
in response to message #13 by Chris Woodhouse

I am all for any minor improvements and fraction support is actually quite useful to many (not me either). Where you may ask? Why any archetect, builder or carpenter and if you add them up, you may get even more advacates for your 15c. A feature that can be implemented w/o cost should be considered.

Actually you should also consider an algebraic option (with precidence and parenthasis) to widen your market while not closing any doors. Hp is very bad at this. Almost every upgrade Hp ever introduces may or may not be two steps forward, but they ALWAYS take one step back.

A few classic examples:

Hp11c- Hp32s Hp15c- Hp42s

Both were big steps forward, but both replacements are actually somewhat bigger (longer) and don't travel nearly as well.

Hp32s - Hp33s

Bigger Again. Lost the nice enter key (earlier post, this is probably inevitable). Did not bother to replace the 42s and therefore an actually superior product has never been replaced.

Lest I praise the 42s too much, it could have been a nice substitute for the ageing 41c line. Sadly, without I/O, it cannot.

41c - 48G

Nice upgrade, much better in nearly all areas, BUT the typical Hp41c customer DIDn't want a oversized Graphics for the features they acquired. Yes Graphics took over or created a market, but the portable pocket calculator market is left void of any real product.

That is why I always crusade for a small portable calculator such as the 15c (I like its size best) or a 42s style calculator that can be expanded much like the 41c series.

Hp made a low end Hp20s for 15 years for $30. They have made the Hp12c for over two decades (many people would buy an hp15c off the same line). Why not.

Re: View of a Heretic (long)

*Message #16 Posted by **Walter B** on 21 May 2004, 8:20 a.m.,*
in response to message #13 by Chris Woodhouse

I want to support Chris's view. In real life I need a small and reliable calculator, capable to do precise calculations with just a few clicks (no complicated menus to go through). My Background:

I owned a repaired HP 25C as my first real scientific calculator in the late seventies and early eighties. It took me almost to my Ph.D. in nuclear physics, and the only feature I was really missing at that time was linear regression. When I missed it to much, I bought an HP 11C, which had everything I wanted then for a reasonable price. Sadly, this item got lost some years later. Then, since HP 11C was not available anymore, I switched to an HP 32S and was quite happy with it. It was bigger in size, but I could not get anything smaller with RPN - and to read my programs turned out to be a lot easier.

Now I own an HP 48SX, HP 42S and HP 15C, too, and managed to get again an HP 25C and HP 11C. Looking at all these and summing up, my results are:

- HP 48SX is to big and complicated for using it. I certainly would have graded it differently, if I still would have to do complicated mathematical calculations everyday. But even then it is really to big to carry it everywhere. In my opinion, this holds for the newer models, too (HP 48G, HP49 etc.). No more pocket calculators.

- HP 42S is very nice (2 lines display, readable programs, lots of useful functions, covers almost everything). For me, however, the menu (or catalog) way of accessing functions is somewhat indirect. I prefer the blue and gold buttons instead. And the pioneers are a bit bigger than shirt pocket size. And, so far, I was not able to adjust display contrast of my HP 42S the way it comes as bright as in my HP 11C or HP 32S.

- HP 15C has everything necessary in a nice and small and reliable package. According to my experience, it contains all the scientific and technical math I needed in science studies at university and in professional life (and for more exotic applications I can program it). With a modernized user interface (high contrast dot matrix display, alphanumerical messages, readable programs instead of button codes, more memory, maybe (!) 6 stack levels) it would cover almost every wish I can think of for a real pocket device. For more, I would turn to a notebook or PC today. Or I will take a pencil and a sheet of paper ...

- Earlier models (LED) are still nice to look at (I've collected some of them), but their performance is outdated.

A modernized HP 15C as sketched above will find a market, taking into account all the people needing some bigger amount of math and being able to control it, appreciating good design and reliable quality. It could be THE scientific pocket calculator.

Nevertheless, this only my personal view. Good luck!

Programming speed on 48GX

*Message #1 Posted by **Naim** on 18 May 2004, 4:20 p.m.*

Just wondering, but do program run faster in Port :0: or faster in the home directory?

Re: Programming speed on 48GX

*Message #2 Posted by **Raymond Del Tondo** on 18 May 2004, 7:36 p.m.,*
in response to message #1 by Naim

No speed difference, since both port0 and HOME reside in main RAM.

Differences will be there if you store your program in a port>0, or worse, a port>1 . Ports 2 to n are always bankswitched, so code run from there will always be slower.

Port 1 is online (not switched) in most cases. IIRC, there were occasions when even port 1 is hidden, but i'm not sure at the moment.

However, most of my software libraries reside in port 1, and the programs run very fast from there.

Raymond

Re: Programming speed on 48GX

*Message #3 Posted by **HrastProgrammer** on 19 May 2004, 2:58 a.m.,*
in response to message #2 by Raymond Del Tondo

code run from there will always be slower

The code will run at the same speed but program loading will be slower because it has to bo copied from port >=2 into main memory before execution (unless you execute it directly from the port as in the case of my emulators).

Code from port 1 usually don't have to be copied to main memory and can be executed directly.

I have measured the machine code execution time in main memory and RAM cards in port 1, 2, ... and I haven't noticed any difference in speed.

Best regards.

Re: Programming speed on 48GX

*Message #4 Posted by **Naim** on 19 May 2004, 5:48 a.m.,*
in response to message #3 by HrastProgrammer

Thanks. When I call the programs I need to also press EVAL. E.g. :0:quadratic . Is there any alternative way of doing it? Thanks, Naim

Re: Programming speed on 48GX

*Message #5 Posted by **Raul Lion** on 19 May 2004, 2:44 p.m.,*

I use to store my programs in libraries and call them from menus (choose boxes or softkeys): does this help to you?

Re: Programming speed on 48GX

*Message #6 Posted by **Naim** on 19 May 2004, 5:59 p.m.,*
in response to message #5 by Raul Lion

Hi Raul, If you were running a program and it calls up a subroutine [subprogram] stored in port:0: , how would you call it? Thanks, Naim

Re: Programming speed on 48GX

*Message #7 Posted by **Raul Lion** on 20 May 2004, 2:19 a.m.,*
in response to message #6 by Naim

with EVAL, as you said in your previous post

Re: Programming speed on 48GX

*Message #8 Posted by **Veli-Pekka Nousiainen** on 20 May 2004, 4:41 a.m.,*
in response to message #7 by Raul Lion

Why do you store it in port 0 anyway?
It uses the same RAM as main RAM.
{VPN} now using the new 49g+

Re: Programming speed on 48GX

*Message #9 Posted by **Raul Lion** on 20 May 2004, 9:09 a.m.,*
in response to message #8 by Veli-Pekka Nousiainen

I answered a question... but sure I don't store my libraries in port 0. (...but Erable "fixed addreses") For saving free memory in the main RAM, I store my programs grouped in libraries in ports>=2. So for running a program, just key in its name. Not EVAL is needed. Or use menus...

Re: Programming speed on 48GX

*Message #10 Posted by **Veli-Pekka Nousiainen** on 21 May 2004, 12:21 a.m.,*
in response to message #9 by Raul Lion

Sorry Raul!
I should have answered the previous post...
Iqbal gave actually a good answer to my question
with best regards {VPN}

Re: Programming speed on 48GX

*Message #11 Posted by **Iqbal** on 20 May 2004, 4:19 p.m.,*

in response to message #8 by Veli-Pekka Nousiainen

I store my programs in port :0:. I started doing so because someone I gave my programs gave another person [that I didn't approve of] and I started to think of a way to prevent stealing of my programs. It works, because they have to call it out of port :0: and then send it across and then send it back to port :0: because some programs call back programs from port :0: [bit confusing :)] . So if it's not there they'll have a problem. I have in fact written an installation program to transfer my programs to port :0: and it's purged after installation. It looks good when it's being installed and secondly, it makes it very tedious to transfer.

Do nothing at $20005 (HP-42S Assembly programming)

*Message #1 Posted by **Erik Ehrling (Sweden)** on 18 May 2004, 4:13 p.m.*

Hi!

I have recently started to look at the possibility to program the HP-42S in Saturn Assembly. One of the first tasks I have been been trying to achieve is to return safely to the RPN context from the language ROM area, called by the XFCN (therefore the subject of this posting: "Do nothing at $20005").

The snippet below seems to work fine in Emu42 (I have also tested it on a rev A HP-42S with the 2 x 32K RAM upgrade as suggested by Nelson M Sicuro), but is this the correct way to do this?

```
* Language ROM Detect Constant
    CON(5) #5AC3F
* Return to RPN context, drop one stack level
    A=C    A
    C=RSTK
    C=A    A
    A=DAT0 A
    D0=D0+ 5
* Rev A = 10D5F, Rev C = 10DE1
    GOVLNG #10D5F
```

Or just entered directly into the monitor:

```
20000: F3CA5DA07D61421648DF5D01 (Rev A)

20000: F3CA5DA07D61421648D1ED01 (Rev C)
```

Best regards,
Erik Ehrling (Sweden)
Homepage:http://www.hp42s.com

Re: Do nothing at $20005 (HP-42S Assembly programming)

*Message #2 Posted by **HrastProgrammer** on 19 May 2004, 2:17 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Hello Erik,

Don't do anything except GOVLNG #10DE1 (or #10D5F) because D0 points to the next byte of the instruction and not to the next RPL address! In the case of XFCN (and all instructions from this category), D0 points to the first byte of the alpha argument.

For example, if you execute XFCN "ABCDEF", D0 points to F7 F1 41 42 43 44 45 46 sequence of bytes. You don't have to restore D0 or manipulate (drop anything from) the return stack in your code because the firmware will do this for you.

BTW, I am usually returning with GOVLNG #15D8A (Rev C) which is the same as =xNEXT (#10DE1) but it enables stack lifting as well.

Best regards.

+/- key on RPN calcs

*Message #1 Posted by **Bill P** on 18 May 2004, 3:53 p.m.*

What was the first HP calc to have a +/- key?

Before the +/- key, what was the best way to multiply what was in the x register by a negative number?

Re: +/- key on RPN calcs

*Message #2 Posted by **Dave Shaffer** on 18 May 2004, 4:11 p.m.,*
in response to message #1 by Bill P

From the beginning (the HP 35) there was the "CH S" (change sign) key - although its operation depended on what keys you had most recently hit. From the Museum description of the HP 35:

"The HP-35 allowed the user to press the CHS sign before or during number entry. If a number was in the display as a result of something other than digit entry, pressing CHS negated it, but if the CHS key was then followed by a digit, the calculator assumed the CHS was actually meant for the following entry. Thus the previous number displayed was pushed onto the stack without the (already displayed) sign change. This feature could be confusing and later models required the CHS key to be pressed after the first digit of a number."

Re: +/- key on RPN calcs

*Message #3 Posted by **Dave Shaffer** on 18 May 2004, 4:14 p.m.,*
in response to message #2 by Dave Shaffer

P.S. "This feature could be confusing and later models required the CHS key to be pressed after the first digit of a number."

It was, indeed, confusing. To this day, I still have some trepidation as to what will happen when I hit +/- on my newer (than the HP 35) calculators! Does anybody else share this remembrance (and concern)?

Re: +/- key on RPN calcs

*Message #4 Posted by **Bill P** on 19 May 2004, 2:22 a.m.,*
in response to message #2 by Dave Shaffer

Silly me. I am, as you have certainly guessed, new to HP calcs.

In fact, I've only been using them for 8 years. All I've actually owned are the 48GX and the 33S.

Thanks for the correction.

Re: +/- key on RPN calcs

*Message #5 Posted by **Charles Perry** on 18 May 2004, 4:18 p.m.,*
in response to message #1 by Bill P

The first HP calcs with a +/- key seem to be the 32s and 42s. Before that all HP calcs had a CHS (change sign) key with the same function. The HP35 had a CHS key that functioned a little differently as Dave pointed out in his post. Soooooo, HP calcs have basically always had a way of changing the sign of a number.

Re: +/- key on RPN calcs

*Message #6 Posted by **Charles Perry** on 18 May 2004, 4:23 p.m.,*
in response to message #5 by Charles Perry

Correction: Looks like the 18C had the first +/- key in 1986. It is odd that the 28C had the CHS key since it is from the same time frame and same platform.

The HP01 in 1977...Re: +/- key on RPN calcs

*Message #7 Posted by **Gene** on 18 May 2004, 4:45 p.m.,*
in response to message #1 by Bill P

+/- is a shifted function. :-)

Re: The HP01 in 1977...Re: +/- key on RPN calcs

*Message #8 Posted by **marais** on 19 May 2004, 3:28 a.m.,*
in response to message #7 by Gene

...but technically, that's not an RPN machine :)

Re: +/- key on RPN calcs

*Message #9 Posted by **Tony Duell** on 19 May 2004, 8:17 a.m.,*
in response to message #1 by Bill P

Not a handheld, but the very first HP calculator -- the HP9100A -- has a Change Sign key.

Re: +/- key on RPN calcs

*Message #10 Posted by **Gene** on 19 May 2004, 10:30 a.m.,*
in response to message #9 by Tony Duell

It wasn't really the change sign key, but a specific +/- (instead of a CHS label). :-)

Gene

HP33S at Walmart ?

*Message #1 Posted by **Bob** on 18 May 2004, 10:46 a.m.*

I have been away from the forum for a few weeks, so if the answer to my question is already posted, sorry I didn't see it in my search.

Am I missing something or is the HP33S no longer available from Walmart.com ?

If there is a link that I am missing, can someone provide that ?

I know that it is now available from other online sources, but I have some room left on a Walmart gift card.

Re: HP33S at Walmart ?

*Message #2 Posted by **Jeff** on 18 May 2004, 1:38 p.m.,*
in response to message #1 by Bob

Here is the link. Still shows as out of stock.

Re: HP33S at Walmart ?

*Message #3 Posted by **Mike** on 18 May 2004, 4:46 p.m.,*
in response to message #1 by Bob

Amazon has then for a new low price 50.34 with free shipping, but wont ship for one to two weeks. They must be out also.

Re: HP33S at Walmart ?

HP 200LX self-test Plis

*Message #1 Posted by **raze** on 18 May 2004, 2:27 a.m.*

Hello everyone,

Please help... Does anyone know how to perform the self-test procedure for a HP 200 LX 2mb ??

Any help will be greatly appreciated

Thanks, Raze

Re: HP 200LX self-test Plis

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 18 May 2004, 5:20 a.m.,*
in response to message #1 by raze

With the 200LX off, press and hold ESC, press ON, release ON, release ESC. It'll show the self-test screen.

Regards,

Nelson

33S: nCr weirdness
Message #1 Posted by KC on 18 May 2004, 1:42 a.m.

I newly acquired a hp 33S, and tested its speed for nCr operation. I entered the following:

2000 Enter 1000 nCr

and the calculated result : 1.8099e499

I compared with my 32SII. To my surprise, my 32SII showed an Overflow message and displayed 1e500. My 48G displayed 9.99Be499. Apparently, the result of 33S is strange. I continued increasing the value, everytime keeping r=n/2, and see how large the number goes before it gives an overflow message, and the result:

2000C1000 = 1.8099e499

3000C1500 = 1.7674e499

5000C2500 = 2.000e499

7000C3500 = 2.2301e499

8994C4497 = 9.9827e499

8995C4497 = Overflow = 1e500

So the largest value for n without getting an overflow message is 8994, with r=n/2=4997. IN all cases, the 32SII gave overflow message. Does anybody have any idea what happens with this nCr operation?

MY second question: I examined my equation library of 33S, and found the following equation preinstalled at the time of buying: V=.25pi d^2 L This is the equation explained by the 33S manual. Does anybody also have such equation in their 33S? My serial: CNA4110.

KC

Re: 33S: nCr weirdness
Message #2 Posted by Ralf Fritzsch on 18 May 2004, 6:56 a.m.,
in response to message #1 by KC

KC wrote:

>... a hp 33S, and tested ... >2000 Enter 1000 nCr >and the calculated result : 1.8099e499 >... my 32SII showed an Overflow message and displayed 1e500

E.g. Mathematica shows:

N[Binomial[2000, 1000]]

2.048151626089849*10^600

which is also shown on calculators which allow greater exponents than 10^499.

Whereas the old 32SII and 48G give correct answers (Overflow), the new 33S has obviously a problem with the nCr implementation, or, in other words, there is a bug.

Many greetings from Hamburg, Ralf.

Re: 33S: nCr weirdness
Message #7 Posted by James McFadyen on 18 May 2004, 8:42 a.m.,
in response to message #1 by KC

Based on the combination formula:

nCr = n!/[(n-r)!*r!]

I wrote a 33S program based on the following: If we write it out sort of longhanded:

nCr = [(n)(n-1)(n-2)...(n-r+1)(n-r)(n-r-1)...(1)]/[(n-r)(n-r-1)...(1)*(r)(r-1)(r-2)...(1)]

There are terms on the numerator and denominator that cancel leaving us with:

nCr = [(n)(n-1)(n-2)...(n-r+1)]/[(r)(r-1)(r-2)...(1)]

If these terms are done separately, you can be dividing while multiplying individual terms thus preventing an overflow condition on relatively small values of n and r. I can write the program listing for anyone interested, but I doubt anyone is. Anyway, here are the results:

1600C800 = 8.8676E479

1650C825 = 9.8316E494

1660C830 = 1.0037E498

1662C831 = 4.0125E498

1664C832 = 1.6040E499

1666C833 = 6.4122E499

1668C834 = 1.0000E500(?)

1700C850 = OVERFLOW

The results from the built-in combination formula differ from mine starting at 1666C833 where the calculator's built-in gets 1.6021E499 as a result (which seems to be a bit low).

My 33s also had the same formula pre-loaded in the equation library. (just got it yesterday, S/N CNA4130XXXX)

Anyway, I was bored and thought this would be a good excuse to write a program for my new 33s. I'll have to compare results with my old 32SII.

James McF.

More 33S weirdness - polar conversions
Message #8 Posted by V. Taylor on 18 May 2004, 9:20 a.m.,
in response to message #1 by KC

Here's another 33s weirdness. You can calculate an even root of a negrative number, as discussed elsewhere in this forum, using complex operations. This leaves the real part in the x-register and the imaginary part in the y-register. I wrote a small program to do this similar to others that have been posted:

C0001 LBL C

C0002 RPN ;Just to be sure

C0003 0

C0004 X<>Y

COOO5 CMPLXy^x

C0006 RTN

Given a negative number in the y-register and a fractional exponent in the x-register, say -4 and .5 this returns the correct square root, 0 in the x-register and 2 in the y-register representing the complex number 0+2i in rectangular form. The weirdness comes when you try to convert this to polar form using the ->theta,r key. If I just type 2 <enter> 0 ->theta,r I get the expected result, magnitude 2 and angle of 90 deg. But if I perform the same operation on the result of the complex operation, seemingly the same x=0,y=2 ordered pair, I get a magnitude of 2, which is expected, but at an angle of 270 deg which is very unexpected. Normally for any ordered pair on the stack the range of theta is -180 < θ < 180 which makes the result of 270 deg even stranger. If I run the reverse ->y,x operation on the result I get y=-2 and x=0 which would be expected from an angle of 270 deg. Performing another ->theta,r gives the expected result of r=2 and theta=-90 deg (as opposed to 270 deg as before). I'm sure this is due to the algorithm used to compute the angle and its determination of the sign of the angle, but the result seems to imply that the calculator knows that it is working on a complex number, or at least that the number in the y-register is not a normal number. I didn't think there were different data types allowed on the stack of the 33s. Is there an undocumented flag or something that indicates a complex stack? I was under the assumption that the complex key just caused the stack to be treated as a pair of complex numbers for that particular operation but the numbers in the actual stack levels are still just real numbers. In any case the angle of 270 deg outside the normal range of the function and is weird!

in response to message #9 by Jordi Hidalgo

Am I missing something?

Are you writting d^2L or d^2 x L? Because d^2L is certainly not going to give you the volume of anything.

Mine has the preloaded equation as written in my subject line. I believe it is there as a "training" tool for those who work through the exercises in the manual.

Take care.

Wayne

Leather Case For Voyager Series - HP 15c etc

*Message #1 Posted by **JDH** on 17 May 2004, 7:55 p.m.*

I found this link recently for a custom made leather case for the Voyager series ie. HP 10,11,12,15,16c series. HP use to make a leather case for this series but this seems a resonable alternative for a quality case over the standard slip case by HP. Wonder whether they make them for some of the other popular series?

http://www.calculatorshop.co.uk/acatalog/Accessories.html

Does anyone else know of other places that make custom leather cases for this series?

Regards,

John.

Silicone grease beneath the sliding switches on classic models

*Message #1 Posted by **Miki Mihajlovic** on 17 May 2004, 5:50 p.m.*

This weekend I "restored" an old but good looking HP-67. Restored for me as a total ignorant in hands-on electronics means I took it apart, cleaned the keys with alcohol dusted off the PCBs, replaced the gummy wheel and assembled it back together. Then I realized that the sliding switches are a bit harder to push. They do slide but not smooth. Then after the fact I read on this web site that you are not supposed to clean the grease under the sliding switches. My question here is should I dismantle it again and put some silicon grease under those switches. Is it worthwhile? Could the little metal tabs that actually glide on top of the contacts get worn off sooner if there is no grease? My questions can go on and on.

The reason I am hesitant to open it again is the back label already looks not so perfect from lifting the edges to access two middle screws. I am afraid that I will ruin it totally.

Re: Silicone grease beneath the sliding switches on classic models

*Message #2 Posted by **Randy Sloyer** on 17 May 2004, 9:03 p.m.,*
in response to message #1 by Miki Mihajlovic

You should absoultely grease the metal to metal contacts of a classic with a plastic safe grease. A small bit on the top of the plastic part of the switch helps reduce friction and makes the switch move easier. Be sure to clean all the old crud off first as they collect so much dirt the switches no longer work properly. This is one of the "classic classic" problems.

Just leave the two screws out from underneath the label and it does not matter how many times you open it.

Re: Silicone grease beneath the sliding switches on classic models

*Message #3 Posted by **Miki Mihajlovic** on 17 May 2004, 9:37 p.m.,*

Libraries in What Port

*Message #1 Posted by **Helge Gabert** on 17 May 2004, 11:14 a.m.*

In which HP49G+ port should you install libraries if you want to conserve as much useable RAM as possible? Obviously not in port 0, but is port 1 (ERAM) or port 2 (FLASH) preferred? The user manual is not clear about that. Thanks.

Re: Libraries in What Port

*Message #2 Posted by **Gene** on 17 May 2004, 11:18 a.m.,*
in response to message #1 by Helge Gabert

I put them in port 2 (flash).

Gene

Re: Libraries in What Port

*Message #3 Posted by **Helge Gabert** on 17 May 2004, 12:34 p.m.,*
in response to message #2 by Gene

Yes, but why? Any clear advantages, or only personal preference?

Re: Libraries in What Port

*Message #4 Posted by **Gene** on 17 May 2004, 1:34 p.m.,*
in response to message #3 by Helge Gabert

1) It's bigger, so it can hold more before being filled up.

2) Flash is very secure from erasure by accident.

Re: Libraries in What Port

*Message #5 Posted by **Helge Gabert** on 17 May 2004, 2:35 p.m.,*
in response to message #4 by Gene

OK, thanks.

One more thing: Could libs in flash be overwritten by rom updates?

Re: Libraries in What Port

*Message #6 Posted by **Gene** on 17 May 2004, 3:26 p.m.,*
in response to message #5 by Helge Gabert

Only if it is very poorly written.

Personally, if I were the FIRST person to install a flash update...I'd be very careful. If one has been out for weeks, then I wouldn't worry.

Very low risk, IMO.

Gene

41 Rechargeable Battery Packs

*Message #1 Posted by **james summers (UK)** on 17 May 2004, 8:50 a.m.*

I've just been given a couple of dead rechargeable battery packs which I plan to rebuild (with 1/3AAA cells as per Katie's article 335) and just wanted to check how the packs come apart - I'm assuming that the obvious seam that runs around the middle of the pack is the seam that I need to cut?

Is it glued around the full length or just in parts?

Are there any clips or other traps I need to be aware of?

Many thanks

Re: 41 Rechargeable Battery Packs

*Message #2 Posted by **Bill Smith** on 17 May 2004, 2:56 p.m.,*
in response to message #1 by james summers (UK)

The following are a few notes i cut and pasted from this forum while rebuilding my own pack. My apologies for not providing proper attribution to the various contributors. The information would be available by searching the archives.

You will find some good advice below. Best of luck, BS
++ Sorry if this has been covered before, but I'd like to rebuild a ni-cad pack for a recently acquired 41C. Everything cleaned up okay and is functional. I've read Katie's notes in the articles section on replacement cells for the pack. She states the 1/3AA cells from Digikey fit with room to spare. That's where I would like to double check with the group at large.

The original 1/2N cells are approximately 0.50" x 0.60" including the heat shrink cover. The Digikey catalog lists the 1/3AA's as 0.57" x 0.69". I'm just a bit unsure of "having room to spare" as it looks like the internal max length of the case is 0.685" and at that dimension, there are case bosses in the way. This is not taking into account the welded tab thickness as well. I'm either going to have to cut away part of the case, or perhaps Panasonic has changed the dimension specs since Katie wrote the article last year.

Can anyone explain the seemingly obvious lack of volume to me? ========== Sorry all, I see now Katie did say 1/3AAA, not 1/3AA. The Digikey catalog no longer lists 1/ 3AAA, only 1/3AA. My mistake.

Ah, to now turn over a few rocks to find the elusive ni-cads in question... ========== I have found that Gold Peak makes a 1/2N ni-mh 180mah battery. This is an exact physical replacement and 2X the capacity of the 1/3 AAA mentioned earlier. I'm still trying to track down a distributor with stock. I hope I can find some as it is a 1000 pc order direct from the factory. I'll post here when I know more. I also have to check that the HP charge rate will be okay for the ni-mh cells. Spec sheet says (slow rate) 18ma for 14hrs.

As for opening the pack, I used a plastic hot knife, fitted with an x-acto #11 blade. The case at it's thickest point is only 0.075" thick. There is a divider between the charger circuit board and battery area, so only go as deep as necessary with the knife to part the halves. It's not at all difficult. ==========

Some years ago I got a 82120A with replaced cells from Richard Taylor (www.taytec.com ; rick@taytec.com). The cells are *smaller* than the original ones, but have higher capacity. It still works very well.

Maybe you could ak him for more info on this.

Raymond ========== I have used Sanyo N-50AAA batteries, recently purchased, to rebuild one of the 41C packs. They are rated at 50mah. I'm not sure the rated capacity of the original batteries but these work fine. They are physically smaller than the originals, and that probably helps to make the installation easier. My only problem was that I received the batteries without solder tabs on them so making them into a pack meant spot welding tabs onto them. Soldering directly to the battery buttons would have heated them up too much, I think.

BTW, the Sanyo N-50AAA cells are NiCad. ========== You can open the pack by slicing around the three sealed sides with a single edge razor blade. It can be tough going but does not risk damaging the case with a hot knife. I start at the back/side seam joint and try to cut into the corners. Then I work along whatever joint seems to be going easiest. Sometimes a little tapping with a hammer helps. Wear safety glasses and keep your fingers in one piece. I use el-cheapo 2 cent razor blades from harbor freight and usually break a couple on each pack. ========== I started with the x-acto knife much the same way. I tried braking corners to part the seam, but it was really fused together. I knew sooner or later my fingers would pay the price, so I switched to the heated version of the same blade.

The resulting gap is perhaps a bit fatter in places than the ideal, but I figured I would stick the whole thing back together with household "goop", a sort of rubber cement on steroids. Fills the gap fine and the pack will not be any thicker than it started out due to the internal divider acting as a spacer to set the height. May not be the prettiest pack around when I'm finished , but it sure beats spending $60 on a battery pack for a $40 calculator. ========== Hi;

I have an 82120 pack already oppened, but I was not lucky enough to find rechageable batteries that small to replace the original ones. The ones I found are big and "fatty" and do not fit in place. There is no number, they came from an assembly pack with three, to form a (almost) AA- size pack. But they are biger than the third part of an AA-size battery.

What I observed is that the pack has a small freedon of side movements (at least mine has), what leades me to think of a small, thin plastic sidewall to recompose the gaps after cutting. Did anyone observed this fact and/or tried to do something like this?

Just reasoning about it. ========== The hope of finding the 1/2N in ni-mh seems pretty slim. I checked with the master distributor for Gold Peak and the problem is lack of demand. It is a very low volume part and nobody wants to get stuck with a case quantity (1440 cells!). He does have about 10 original replacement 1/2N ni-cad packs made up for the 41 series machines if anybody wants them. Cost is $29.50/pack. Email me for his phone # if you want it, I don't want to post it.

On a more positive note, The Battery Station (listed under the battery section here) has Gold Peak ni-mh cells in 1/3AAA size which will fit fine. They are 120 mah, which is better than the original 70 mah ni-cads. I've ordered enough for 3 packs. That will leave me with some spares if anybody wants them. Cost was $2.50/cell.

Many thanks, Bill (N/T)

Disk Drive (9114) battery pac: Refresh, replace or retire?

*Message #1 Posted by **Cococollector** on 17 May 2004, 2:22 a.m.*

Hi all,

when trying to reactivate a 9114 disk drive by loading the accu pack, the latter seems to be exhausted. The drive only shows a flashing "low bat" sign, the "test" light shines continuously, while the "disk active" light remains off. Two days of loading didn't change a thing. I tried two packs, one only some years old (approx. '99).

So far the facts. The questions: 1. Do lead-acid packs age over time? 2. Can they be reactivated by several charge/discharge cycles (if so, how to discharge, when the device doesn't work)? 3. If reactivation doesn't help: How can the charger be connected directly to the drive's contacts (instead of the accu pack's drawer)? 4. If the aboce doesn't help: (esp. German) Readers, do know a source in the vicinity?

One could muse lots about whether devices decades old are worth reactivating, but it makes me merry watching a small machine like the 41 controlling a bunch of others, feeding output, sending control signals, getting input.

Gruß aus Deutschland, Klaus.

Re: Disk Drive (9114) battery pac: Refresh, replace or retire?

*Message #2 Posted by **Tom Sherman** on 17 May 2004, 9:09 a.m.,*
in response to message #1 by Cococollector

Hi Klaus,

There are at least two good possibilities:

1) Read this posting by Dale Richmond: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=23806

Thanks to Dale, I have a Radio Shack AC/DC adapter, part number 273-1695, which supplies 6.5 DC volts, and successfully drives a 9114B disc drive. Make sure that the polarity is correct in making the connection: the lower slot within the disc drive is positive (+). The HP charger that comes with the disc drive supplies AC, and the wrong voltage, so do not try to use it for a direct connection that by-passes the battery.

2) A new 6V lead acid battery can be obtained from InterstateBatteries.com -- part number SLA0902. Alain on this forum kindly told me about this. It is not much of a job to replace the original battery, though I found on my unit that I had to lengthen the connecting wire within the battery pack just a bit.

Success in getting it fixed! I agree that it is too nice a set-up to let it be retired.

Cheers, Tom

Thanks: Disk Drive (9114) battery pac: Refresh, replace or retire?

Hallo Klaus,

es gibt hier in Deutschland einen Laden der den benötigten Akku führt, aber ich weiß nicht mehr welcher; Sch... Aber die Adresse ist hier in einem früheren posting genannt worden(ca. 1/2 bis 1 Jahr her). Ansonsten kannst Du auch 3St. Cyclon Rundzellen von Hawker nehmen (2V/2.5A). Das klappt hervorragend, ist aber etwas mehr Aufwand. Gruß, Andreas

PS: Prüfe mal den Typ 491250-13 bei Conrad

*Message #7 Posted by **Tony Duell** on 17 May 2004, 1:51 p.m.,*
in response to message #1 by Cococollector

To answer your questions :

(1) Yes, lead acid packs do 'go off' with time, whether used or not. I doubt that any of the original 9114 batteries are still any good.

(2) Not really. You need to replace the battery.

(3) You can't connect the HP charger directly to the drive, but you can connect a 6V _DC_ power supply to the 2-pin mini-jones plug in the battery compartment. If you open up either the battery pack or the drive, the polarity is obvious (black -ve as usual), but if you're not sure I'll check the schematics.

(4) Take apart the battery pack (2 Torx screws on top, and clips round the edges of the cover). You'll see the block battery and the charger PCB. I am told you can still get suitable replacement batteries. However, 3 off 2.5Ah Cyclon cells (2V Lead Acid cylinderical cells) fit perfectly (they're available from RS components, and elesewhere). Wire them in series, fit them into the pack (terminals away from the charger PCB) and connect them to the wires that went to the original battery. All (3) my 9114s have Cyclon cells in them, and I've never had any problems.

As to whether it's worth doing, I _love_ the 9114, and regard it as the only worthwhile storage for the 41, 71 and 75 machines. Since I use those a lot (yes, they're old, but they're beautiful), I use my 9114 a lot too.

A new set of TTF files is about to come...

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 16 May 2004, 1:47 a.m.*

Hello, all;

I'm sure that any TTF that replicates LCD and keyface characters is handy to those who want to enhance documents related to electronic devices, mostly calculators. In our particular case, HP calculators.

The good news is that a limitation that does not allow characters to be added to some specific codes (a Windows® limitation?) has been surpassed and I'll reorganize all fonts I draw so these codes will be filled with their correct characters. Almost all fonts I announced and allowed to be downloaded need to be reorganized, and I think only the HP41, Voyagers and the General LCD fonts will be kept "as is". This is because their characters actually don't use these codes, if I am not wrong.

As soon as I have the new fonts I'm posting about them and where to download them from.

Cheers.

Luiz (Brazil)

Edited: 16 May 2004, 1:52 a.m.

HP71B and HP82143A new TTF

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 May 2004, 9:23 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, all;

as I mentioned, here are the first two TTF files of the new set.

HP71B Character Set TTF (this one is particularly dedicated to Gordon Dyer d8^)

HP82143A Character Set TTF

Please, let me remind those who have already installed the HP82143A earlier TTF file that this earlier version must be removed prior to install the new one. Also, many characters have new positions so if you have used the earlier 82143A character set TTF with some documents and you added characters with codes from 160 and above, please reorganize the documents so the characters match their new positions, now from 128 and above. The new TTF files are set so in order to fill the gaps between character groups it had before. I'd like you to inspect the new character organization with any font viewer prior to change your documents.

Also, if any PDF has been generated with the earlier 82143A Character Set, please check if it is unchanged. If the Embedded Fonts list was active and the 82143A Character Set was in the list when the documents were created, then these documents will keep their original character set, meaning they need no change.

Please, let me know as you have tested them. And just wait for a while because others, reviewd and brand-new

ones, are coming soon...

Cheers.

HP-42S font with internal ASCII codes? (was: HP71B and HP82143A new TTF)

*Message #3 Posted by **Erik Ehrling (Sweden)** on 17 May 2004, 3:31 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

> Quote:
>
> And just wait for a while because others, reviewd and brand-new ones, are coming soon...

Do you intend to create a HP-42S font with exactly the same ASCII codes as the ones used internally within the calc? (This could for example be useful in conjunction with Emu42)

Best regards,
Erik Ehrling (Sweden)
Homepage:http://www.hp42s.com

Re: HP-42S font with internal ASCII codes? (was: HP71B and HP82143A new TTF)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 17 May 2004, 3:46 p.m.,*
in response to message #3 by Erik Ehrling (Sweden)

Hello, Erik;

In fact, I will reorganize the exisitng HP42 Character Set TTF to match the original mapping, but I guess taht at least three TTF will be needed:

- one that exactly matches the internal so you can use it with the emulator; this is particularly dangerous to some word processors because some "active" characters will be defined with control codes, like line feed and carriage right (10dec and 13dec, if I am not wrong);
- another one using ASCII predefined positions after code 32dec that's suitable for printing documents based in word processors like MS Word® and others;
- and a third one that follows the IR output remapping with inprt and modified inprt.

Anyway, I'd like to know what you all guys suggest for this particular HP42S font. All characters are already drawn and all I need to do is changing places and set new codes for the existing characters. I just need guidance.

I'm looking forward to hear form you.

Thank you, Erik, for your comments.

Cheers.

Luiz (Brazil)

> Quote:
>
> In fact, I will reorganize the exisitng HP42 Character Set TTF to match the original mapping, but I guess taht at least three TTF will be needed

Hmm... on the other side it is convenient to have a consistent mapping between the fonts. Then it would be possible to change between fonts easily (e.g. within a word processor) without having to adjust the special characters.

If I had to choose only one format, I would therefore vote for a format that is word processor friendly. Because you would most likely want to be able to edit files within a word processor (e.g. MS Word) at some point... A small user tool could be written in addition to the fonts to convert to this single format from both HP-42S internal and INPRT formats. So one common format might not be that much of a limitation after all...

Best regards,
Erik Ehrling (Sweden)

Dead 67 & Woodstock ACT chips & Prevention

*Message #1 Posted by **John Garza** on 16 May 2004, 12:58 a.m.*

Although 20+ years is a commendable lifespan for a handheld calculator, I keep reading about ACT chips going south, and it gives me the willies.

Does anyone know the cause of this? Some sort of internal corrosion in the chip, or failing PSUs that eventually fry the poor thing?

Seeing that HP will never remanufacture the chips, what can be done in the interests of preserving the remaining working machines? Somehow upgrading the PSUs with more reliable components, or perhaps developing a fancy "socket" for the chips that isolate them from out of spec inputs? This should be something on the mind of every collector of the afflicted machines.

As for me, I'm in the process of "re-capping" (replacing all capacitors) in my woodstocks. I used to refurbish antique radios and one of the first things done in a restoration job was to replace all the caps as there was always a high probability of failure in units 30+ years old. Also, I only use alkaline batts in my woodstocks - NEVER using the recharging circuitry. I'm fortunate enough to have external chargers for my classics and topcats so I charge those batts outside the machines.

cheers,

-J

Re: Dead 67 & Woodstock ACT chips & Prevention

*Message #2 Posted by **Tony Duell** on 17 May 2004, 1:57 p.m.,*
in response to message #1 by John Garza

I don't believe it's any external event that kills the ACT. I've never had a replacement fail shortly after fitting it in place of the dead one (if, say, the PSU was the cause, you'd expect it to kill the replacement too). I think it's just old age of the chip (chips do _not_ last for ever, no matter what some people believe).

I also don't believe in blanket recapping (not of vintage valved equipment -- yes, I work on that too -- nor of HP calculators). Certainly replace capacitors that are causing problems, but I don't find replacing good ones does anything at all. I've actually had stuff where some caps have needed replacing several times (and yes, I do use good replacements, I had to replace them every 10 years or so), while others are still the originals.

Alkaline batteries have a higher voltage than the original NiCds. While this shouldn't cause a problem (the power converter is a regulated circuit, and should be happy with 3V rather than 2.5V input), I don't do it. Mind you, I do have the reserve power packs (external chargers) for the classics, woodstocks, spices and topcats :-). If you don't have the woodstock one, just use a junk 21 (say with a dead ACT or ROM chip). All you need is the charger connector, resistor and diode down one side of the PCB, and the battery contacts.

On non-C machines, there is _no_ risk to charging batteries in the machine with the switch turned off. There is then no connection from the +ve side of the PSU or battery to the rest of the machine. I've seen the schematics...

Re: Dead 67 & Woodstock ACT chips & Prevention

*Message #3 Posted by **John Garza** on 18 May 2004, 5:30 p.m.,*
in response to message #2 by Tony Duell

I was afraid you would say something like that -- we're all DOOMED!! (by some arcane law of semiconductor physics, no less) Yikes. Ah well, nothing is forever. I guess we should enjoy them while they last. BTW, I do have a woodstock charger, but it gets hot when charging, so I never used it, I just boxed it up and forgot about it years ago. At the time, I didn't want to dig into it and alkalines were all to easy. I always liked the look of those 'blank' woodstock cases HP used to make the chargers.

PS: Thanks, I appreciate your ongoing advice, and I'm sure everyone else does too.

cheers,

-J

*Message #4 Posted by **GE (France)** on 18 May 2004, 5:54 p.m.,*
in response to message #3 by John Garza

This is very interesting and frightening. What age could a normal chip reach ? Are older machines (bigger components and lesser integration) less prone to failure ?

Should machines be kept powered ? Hot / cold storage place ? I'm also very much worried about LCD displays.

Obviously there must be people here who know. Pardon the dumbness, this is a real question !!

Why chips fail (long)

*Message #5 Posted by **Dano** on 19 May 2004, 12:38 a.m.,*
in response to message #4 by GE (France)

It’s not a dumb question at all. There are in fact several reasons why ICs fail. Most of them begin with heat and/or thermal cycling. What actually ends up failing on a particular IC as a result of this tends to vary by generation ie: the process tools used at the time of manufacture. In almost any IC fabrication process there is a point where the semiconducting layer must be “doped” to provide the proper junction type in the material; be it a transistor, a diode, or even a resistance in the proper location of the circuit. Such doping (be it n-type or p-type) may be accomplished in several ways such as thermal diffusion or ion implantation with an “impurity” such as boron, etc. This doping causes a change in the energy levels of the conduction (or more commonly: semi-conduction) band of the material. The trick is to put just enough of the doping material, just deep enough to make the circuit behave as desired, too little or too much causes various problems: speed, power, voltage thresholds, etc. The point is that the ions are not necessarily permanently fixed in the lattice but they may continue to diffuse in the material over time under stress of operation or thermal stress. Eventually a portion of the circuit has an improper balance in a critical location and that portion of the circuit stops working: a bit (voltage level) won’t change states reliably when needed.

Another problem is the difference in coefficient of thermal expansion between various parts of the IC: substrate, metal interconnect layers, and more common: the package materials (die to package interface, wire bond leads, etc). Over time these stresses cause a mechanical break somewhere in the die itself or in its connection to the outside world.

Re: Why chips fail (long)

*Message #6 Posted by **Veli-Pekka Nousiainen** on 19 May 2004, 4:41 a.m.,*
in response to message #5 by Dano

Does this mean that the new 90nm process used in the Intel Precott CPUs will fail much sooner as it all ready has severe power leakage problems?!
Presumably the IBMs Silicon On Insulator is safer?

Re: Why chips fail (long)

*Message #7 Posted by **John Garza** on 19 May 2004, 1:57 p.m.,*
in response to message #5 by Dano

Hmmm... a cold, stable environment. Would the PCBs withstand a gradual reduction in temp to say, that of liquid nitrogen? Just keep those babies in a vat until needed.

Re: Why chips fail (long)

*Message #8 Posted by **Dano** on 19 May 2004, 9:35 p.m.,*
in response to message #5 by Dano

sorry guys I was half brain dead on allergy medicine and lack of sleep when I put up my first post. The IC designers have come up with some very clever and impressive ways to improve their yields and long term reliability even as they push the limits in line width and feature size. And yes, SOI is one of those methods. Also, phase shifting masks for the photolithography processes which allow you to have feature sizes smaller than the wavelength of the exposure source. The masks look truly bizarre but when exposed with the correct wavelength of light, provide constructive and destructive interference where necessary to yield perfect lines and features. They have even started using the back side of the wafers (thinner now of course) and doped them with “getter” compounds which actually draw some of the impurities and contaminants in the wafer back away from the active devices. It is my understanding that many of the motherboard failures blamed on the CPU are in fact cause by poor power supply by-passing of the cheeper mother board manufactures. The CPUs now (particularly the Intel devices) have such stringent limits on noise at the supply pins (of which there are dozens on each CPU) whose voltages keep dropping (under 3 V now) that they require many dozens of expensive tantalum and ceramic capacitors located all around the CPU to keep them happy (the power up sequence is a nightmare too - can’t have this Vcc powered up within Xns of that Vdd, etc) The cheeper board manufactures put just enough capacitors of just sufficient quality that they keep the warranty returns to a bearable level and then 6 mo to a year after the warranty is out, the capacitors start to give it up and you’re on borrowed time.

But I digress. There are actually many many sources of IC failure, but don’t forget that there are sometimes hundreds of process steps to fabricating even a pedestrian IC like the simple brain of our beloved calculators. When they start up a new process (whether it’s the 70’s or 30 years later) once you’ve tweaked the process to provide adequate yield, you crank up the production rate as fast as you can, and sample for infant mortality rates as necessary. The fact is, any step along the way could be using a wet etchant, reaction gas, or other material that is not quite up to the required purity or you don’t quite remove all the stuff you needed to in just one step and...well, you’ve left the door open for those contaminants (leftover resist, etc) to start migrating around buried in your IC. The thermal cycling helps them ooze a few nanometers and eventually it gets where it causes a problem and your done. By-the-way, once an IC from a particular lot fails after the infant mortality period is over, almost all the rest that fail will do so

from the same defect assuming they were exposed to similar environments (not too much static discharge, etc). That's one reason why they do thermal life testing and burn-in on ICs before they leave the factory (on some of the more expensive devices anyway). If it doesn't fail in a few hours or days, it's probably good for years and years. They call the mortality curve (ratio of good/bad devices from a particular lot) for ICs an upside-down bathtub. It shoots up quickly at the beginning then holds steady for years before they start dropping like flies.

You could possibly improve your odds by keeping things cool (or cold) but that could cause its own problems like condensation or coef of thermal expansion problems. The best thing is probably just keep them at as constant a temperature (and low humidity) as possible and try not to subject them to static discharge or too much mechanical shock.

Very Informative

*Message #9 Posted by **Trent Moseley** on 20 May 2004, 12:44 a.m.,*
in response to message #8 by Dano

in response to message #1 by Michel Beaulieu

I know of the following non-graphing programmables (apart from the 33s) that are still in production. They are available in Europe but i do not think they are available in the USA.

Casio:

fx-4500PA: 1103 steps, Display: 1 segment line + 1 dot matrix line

fx-4800P: 4500 steps, 4 line display, solver, bulky (in japan available as fx-4850P, with 32k)

fx-3650: 360 steps (only four programs) 1 segment line + 1 dot matrix line

Sharp:

EL-5120: 1211 steps, solver, 3 line display.

/Jonas

in response to message #1 by Michel Beaulieu

How about the HP-12C/CP and the Aurora Fn-1000?

Their programming facilities are minimal, and they're financial, rather than scientific, so they may be unsuitable. The Aurora, however, may be the lowest-priced programmable on the market.

The TI's have a quite usable Basic for programming. Their classification as "graphing" calculators shouldn't (alone) rule them out as programming platforms. (I suppose price is the more significant factor?)

Do let us know what you decide!

Re: Programming calculator brand new?

*Message #7 Posted by **Ron Ross** on 17 May 2004, 11:01 a.m.,*
in response to message #1 by Michel Beaulieu

I believe you can still find the Hp20s fairly easily and especially in CANADA. It is a quality calculator and if you used it successfully last year, it should be fine this year. Yes the Hp33s is better, but may still be twice as much (and unavailable at the momemt) and if cost is an issue, cheaper is usually better.

Re: Programming calculator brand new?

*Message #8 Posted by **Michel Beaulieu** on 17 May 2004, 11:56 a.m.,*
in response to message #7 by Ron Ross

Well, i think i will try to get some HP-20S somewhere. It's a shame that nor TI, HP, casio or sharp produce no more scientific keystroke programmable calculator. I should have buy 1000 HP-11C or TI-66 years ago...

HP should have made the HP-30S programmable for a good low end calculator that students like the looks

and fonctionnality. I present them the calculator and they told it's great 2 lines calculator better than TI BUT it's not programmable so...

Re: Programming calculator brand new?

49G+ Display

*Message #1 Posted by **Helge Gabert** on 15 May 2004, 11:31 a.m.*

How do I achieve it that complex numbers, lists, and vectors have a multiline display, if they are on the first level of the stack? I have flag -52 "Show many lines" on, and also flag -65 "Level 1 multiline" on. However, a complex number displays on line 1 in a single line with an arrow at the right end. I'd like to see the whole number (without having to press the downarrrow and scrolling to the very right), similarly to how the 48 displays it. Ditto for lists and vectors.

Thanks for any suggestions.

Re: 49G+ Display

Re: 49G+ Display

*Message #5 Posted by **Helge Gabert** on 15 May 2004, 3:58 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

Thanks, but again, that doesn't work either. One problem is that complex numbers now all convert to vectors. If you have access to a HP 48gx, try it. -52 CF

(2,2) sqrt

Or try

{3 6 2 5 8 9 33333 2587}

With flag -52 cleared "Show many lines", long lists, and complex numbers with std format on stack level 1 "show many lines."

Unfortunately, this doesn't happen on a HP 49g+. You get only one line with a filled arrow on the right. Flag -52 seems to work differently here.

I think the only way to show multiline is to turn off the stack textbook display by setting flag -79 or by using the display modes input form.

Dave

Re: 49G+ Display

*Message #8 Posted by **Helge Gabert** on 17 May 2004, 10:24 a.m.,*
in response to message #7 by Dave

Yes, setting flag -79 does it! (Who would have thought?) Thank you!

It's too bad, though, I like the textbook display. I guess you just can't have it all. . .

15C Display bleeding

*Message #1 Posted by **Pio** on 15 May 2004, 3:10 a.m.*

My 15C display is bleeding black ... Is there any way to fix it ?

Thx in Advance

Marx Pio

Re: 15C Display bleeding

*Message #2 Posted by **Randy Sloyer** on 15 May 2004, 8:35 a.m.,*
in response to message #1 by Pio

A replacement LCD from a 12C is the only way to repair it. Finding the right one can be quite a challenge as there are three versions. Post the first five digits of your serial number and I can tell you which 12C's to look for.

You may need to remove the keyboard from your unit to access the LCD. It's involved and problematic to get it back together without loose keys but it can be done. Early units (date codes starting with 21 and 22) do not have this problem since the logic module is seperate from the keyboard.

Re: 15C Display bleeding

*Message #3 Posted by **Marx Pio** on 18 May 2004, 8:06 p.m.,*
in response to message #2 by Randy Sloyer

Hi Randy, can I, with the tree ones make only 15C work better?

15C - 2720B03619 12C - 3334S03513 11C - 2711B12472

Thanks in advance

Pio

Re: 15C Display bleeding

*Message #4 Posted by **Randy Sloyer** on 18 May 2004, 8:35 p.m.,*
in response to message #3 by Marx Pio

Pio,

Open the 15C. If it is a one chip version unit, the LCD from the 12C will work.

I do not know which version 11C you have as I have seen only a few Brazilian units. I suspect it is a two chip model which will work in a three chip 15C.

You can refer to this thread for more info on the LCD differences: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=46995

I hope that helps.

Edited: 18 May 2004, 8:37 p.m.

33S: new programming strategy

*Message #1 Posted by **KC** on 15 May 2004, 2:13 a.m.*

For all of us who have learned programming, be it computer or calculator programming, the two most important keys to writing good programs are (1) to maximize program running speed; and (2) to minimize program space. With the introduction of HP 33S, a totally new strategy comes up where nobody have never meet: to minimize the use of label while not worrying too much about program space. For instance, in the past, when you want to write a program to loop several times, you'd write something like: Lbl L 1.07 STO Z Lbl M Xeq A ISG Z Gto M RTN

And now, you'd rather save one label by writing something like: Lbl L Xeq A Xeq A Xeq A . . Xeq A RTN (Of course, whether it should be changed depends on how many times it loops and how long is the program code in between the loop)

When I got the HP32SII, I looked at the manual, and found out that most example programs in the manual already occupied most of the memory. Now I've acquired the 33S, and look at the manual, and found out most of the programs use up a lot of labels! So limitations are still there, though they are different. I wonder if there would come up in this forum, or new books about techniques that could minimize the use of labels for programming 33S.

KC

My take on why calc programs use lots of labels (slighty OT)

*Message #2 Posted by **Cameron Paine** on 15 May 2004, 2:58 a.m.,*
in response to message #1 by KC

This doesn't apply to the 33s per se.

For many of us HLL programmers, the most succinct and unambiguous expression of an algorithm is in the HLL with which we are most conversant. Sometimes this is laziness; oftentimes it's because we've solved that class of problem before and we know that our coded solution works. (As an aside, cut and paste remains the dominant method of code reuse IMO).

If you attempt to hand-convert an algorithm expressed in a HLL to low-level code for an assembler, you will find that you end up with a *lot* of labels. I encounter this often as I go from Java or C++ to H8 ASM. So, to optimise for memory footprint, you *have* to re-implement the algorithm for the target platform (calculator, ucontroller or PIC).

Perhaps the writers who created the 33s examples simply re-implemented them from existing HLL code.

Cameron

HLL - high-level language

Re: 33S: new programming strategy

*Message #3 Posted by **bill platt** on 15 May 2004, 10:13 a.m.,*
in response to message #1 by KC

Some have definitely already though about this, and their ideas have been posted here on this forum (some stuff at comp.sys.hp48 too but more here!)

Go to the latest archives, and search for 33s and you will find many threads.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?reconfigure

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?reconfigure

Also search in the current forum, and you will find more.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?reconfigure

One idea is to use equations as space-holder labels for programs that are being "stored" but not actively run. The can describe what follows. Of course The line-numbering is strange when you do this----but it can work---thoug hyou really need a little notebook to keep track (which the 33s slipcase is great for carrying with the calc--along with a pencil!).

There are definitely at least one post which directly discusses how to turn subroutines into one program.

Good luck in your search!

Regards,

Bill

HEX PAX

*Message #1 Posted by **Thomas Cox** on 14 May 2004, 9:33 p.m.*

I have been offered the HEX PAX (I am not sure of spelling) for HP-41. I understand it is essentially a RAM module. Can anyone point me to more information on this? Have a 41-CV and 41-CX, both FullNut. Should that module work with either unit?

Re: HEPAX

*Message #2 Posted by **Miki Mihajlovic** on 14 May 2004, 11:06 p.m.,*
in response to message #1 by Thomas Cox

Thomas if you don't know what to do with it, I will gladly take it :)

Seriously, you have been offered the most glorious HP-41 module of them all. This module does almost everything an HP-41 user wishes to do. It is a file system, RAMBOX, assembler, editor, multi function etc all in-one module. Instead of me listing its numerous functions you can go to Warren's site (search the web for V41 emulator) and have a look at its manual. Alternatively, I can send you (two) .PDFs, price will be - the Hepax module :)

It will work with either of your calcs. A rare and precious find indeed.

PS Please forgive my envy, but as someone has said earlier in this forum Hepax is the Holly Grail of all HP-41 modules and every HP-41 enthusiast wishes to have one. You are extremely lucky to have found it as they are very rare. As for the rest of us, we are anxiously awaiting for Diego to finalize his clone.

in response to message #1 by Thomas Cox

HEPAX? I know people that would sell their digital souls to the binary devil for one of those :-)

Grab it!

Re: Advanced HEPAX

*Message #4 Posted by **Diego Diaz** on 16 May 2004, 12:21 a.m.,*
in response to message #3 by Angel Martin

Hi,

First of all, a "real" HEPAX module is a rare bird, and my advice is (as Miki and Ángel have previously

said) Get it!!

Anyhow, if you have to pay for it, and your interest is functional instead of collectionism, take into account that:

- The Advanced HEPAX NoVRAM emulation is a reality right NOW... (I've got three of'em running at the moment)

- It's quite less power-hungry than the *real* HEPAX.

- It doesn't erase its RAM contents when disconnected, as it uses Non Volatile RAM. (No battery back-up either)

- It allows two extra ROM pages to be loaded in the same physical module, i.e. 6 ROM pages + 4 Non Volatile RAM pages in total.

- It will cost 120€ (same as Clonix for the previous Clonix customers) or 175€ (for non-Clonix customers, programmer and adapter will be 25€)

- The NoVRAM is intended to emulate *any* 16k RAM box software ever produced for the HP-41. (Though HEPAX is the Holly Grail ;-) and thanks to Ángel Martín's effort, HEPAX-1D ROM version is available for NoVRAM emulation (Thanks again Ángel. Yes, it works flawlessly!! :-)

- The schematics, software and PCB layout of the NoVRAM project will be freely available for everyone willing to build his/her own module, as it is for the Clonix.

- The first "For Sale" NoVRAM will appear on June 1st, as a small HP-41C 25th anniversary contribution.

Kind regards from the Canary Islands.

Diego.

P.S. Remove "NOSPAM" from my *new* mail account if you want to contact me.

15C backplate lifting up

*Message #1 Posted by **Mike Head** on 14 May 2004, 9:16 p.m.*

Any suggestions on the best way to glue back down the aluminum reference plate on the back of a 15C. Do I try a full removal and re-glue, or just repair the edges. Both Sigma and Matrix sides are lifted up. There is only a minor bend, I think it would glue down. Any recommendations of type of glue to use?

Thanks

Re: 15C backplate lifting up

*Message #2 Posted by **Randy Sloyer** on 15 May 2004, 8:28 a.m.,*
in response to message #1 by Mike Head

When it's just a one corner lift, superglue has worked for me about 75% of the time.

When all attempts to glue fail, you can try this:http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=40910

Re: 15C backplate lifting up

*Message #3 Posted by **bill platt** on 15 May 2004, 10:02 a.m.,*
in response to message #1 by Mike Head

Hi Mike, and Hi Randy (tnx for finding my old thread w/your answers!)

Yes, I successfully repaired it---but there are some things that I did wrong:

1. Do not use acetone (what was I thinking!) for the glue removal--the case is styrene, which dissolves in acetone. Use denatured alchohol and be patient.

2. In "peeling" the aluminum up, I created ridges in the aluminum, which are still visible---I was a bit impatient, and I used a very thin (but not thin enough!) knife as a wedge--driving through the crack as I wet it with alchohol. Be very patient with the peeling up part---don't peel! Let it soak for a loooong time---maybe randy can weigh in on this.

3. I used the 3m "carpet tape" to put everything back on--and that worked well---except I lost a couple of feet---because the residue of the old glue "slimed" in contact with the 3m adhesive---and so the feet slid off. The rubber feet which I had thoroughly cleaned of residue stayed on.

4. I have some photos of this calc around--email me and I'll send them back at you.

find my e-mail address by going to my website:

http://plattdesign.net

Good luck!

Expander Module & TabletPC's ??

*Message #1 Posted by **Steve S** on 14 May 2004, 7:19 p.m.*

Does anyone here know if the Expander software module (intended to be installed and run on PocketPC's under Windows CE) will run on a TabletPC under Windows TabletXP? It would seem that a tablet has all the necessary features, but I don't know to what extent the Expander software was tailored to the specific features of CE...? Thanks in advance.

Re: Expander Module & TabletPC's ??

*Message #2 Posted by **Raymond Del Tondo** on 14 May 2004, 9:28 p.m.,*
in response to message #1 by Steve S

Hi,

I'm not sure, but I'd say CE software wouldn't work under TabletXP, unless TXP has a CE compatibility mode, which I doubt. As if this wouldn't be enough, most WinCE applications are written for a specific version of the OS, so mostly WinCE 2 apps won't run under CE 3, and CE 3 apps won't run under PocketPC 2003. For this bullsh*t you'll have to blame MS;-)

Aside from this, same suggestion as for Hugo:

The link below will lead you to a list of hp discussion forums for the 'normal' products, like inkjet printers, and PDAs.

http://forums.itrc.hp.com/

For WinCE / TXP software support, there are various MS related forums and newsgroups.

HTH,

Raymond

Re: Expander Module & TabletPC's ??

*Message #3 Posted by **David Ramsey** on 14 May 2004, 10:01 p.m.,*
in response to message #1 by Steve S

Win CE software won't run under any desktop version of Windows, since no Win CE device has ever used an X86 processor. All current WinCE devices use ARM variants. You'd have as much luck trying to run Mac software.

wince emulation

*Message #4 Posted by **Cameron Paine** on 15 May 2004, 3:16 a.m.,*
in response to message #3 by David Ramsey

David is right--there is no binary compatibility between wince/PPC and the desktop/server versions of windows. However, Microsoft offer a PPC emulator to developers that runs on wintel platforms and which should run on the tablet.

There are several emulators available:

```
wince 3.0/PPC 2000, 2002
PPC 2002/2003
PPC.NET
```

I run the first of these on my laptop. However that version runs native x86 code so you'd have to recompile the source of the program you want to run. The latter emulators, as I understand it, are complete virual machines. Perhaps that's a solution for Steve.

Spend 30 minutes on the Micro$oft Mobile developer site and you might find an inexpensive solution.

Cameron

in response to message #1 by R Eierman

Hi;

try this: (make sure to locate both [ON] and [.] keys)

```
- with the calculator switched to OFF, press and hold the [ON] key;
- while the [ON] key is held down, press and hold the [.] key;
- release the [ON] key first, then release the [.] key;
```

This sequence toggles between dot and comma anytime you want.

Cheers.

problems with photosmart c200

*Message #1 Posted by **calin b** on 14 May 2004, 2:21 p.m.*

Does anybody know why my computer with Win 98SE doesn't see the camera photosmart c200. I have installed the software and it doesn't connect to the camera. I search it with Add hardware and nothing.

Re: problems with photosmart c200

*Message #2 Posted by **Richard Garner** on 14 May 2004, 2:46 p.m.,*
in response to message #1 by calin b

If it is connected using a USB port, you may have to go into the CMOS to activate the port.

Re: problems with photosmart c200

*Message #3 Posted by **calin b** on 15 May 2004, 1:04 a.m.,*
in response to message #2 by Richard Garner

It is connected to a serial port. I have to serial ports available and both are enabled. What else I can do?

Re: problems with photosmart c200

*Message #4 Posted by **Richard Garner** on 15 May 2004, 2:25 p.m.,*
in response to message #3 by calin b

Which COM port are you using and are you using an internal dial-up modem? Most internal modems are set to use COM2 and will also block COM4. It may be in conflict with you modem. Try moving it to COM1 if it is not already there and check all of the port settings in Windows as well as the software you are using.

33S ALG features Overview and Fun

*Message #1 Posted by **bill platt (les Estats Unis d'Amerique)** on 13 May 2004, 4:46 p.m.*

Hello all MoHPC readers,

I have attached some portions of some of my e-mails from yesterday regarding the 33s; you may find this interesting.

Portions were sent to a number of different MoHPC contributors, who will remain anonymous though they may admit to involvement if they so desire!

Where I have added editorial comments to earlier e-mails, they are enclosed in Brackets []

----- Original Message ----- From: William R. Platt To: r***@***.net Sent: Tuesday, May 11, 2004 13:10 Subject: HP 33s tricks

Hi *****!

Try this on the 33S:

Do a complex function in ALG Mode. Say, (3 +4 CMPLX) x (4 + 5 CMPLX). Now, you know that the real portion will show up in the display like "Re= -8" and you have to push the down arrow to see the imaginary part: " Im=31"

So this begs the question: how do you get to the imaginary part in a program? (since the down arrow is not a programmable function). You push x<>y! But look what happens when you do this manually: If you push x<>y, you then see "Re=31" and the top line will say "(31 -8i)" If you hit x<>y again, you get back to the "Re=-8"; the top line returns to "(-8 + 31i).

So, this x<>y is how you can use the results of complex number actions in a program. You STO to a variable, X<>Y, STO to another Variable and carry on from there. Note that only the value is stored in the variable---the "Re" part is stripped (this is consistent with the way the 32sii works, too, with say the results of an equation solve).

BTW the X<>y works generally in ALG--you can carry on two independent chain calculations. The LASTx also functions in ALG, but not well--I have not been able to figure out its "logic" in ALG.

[later, I begin to understand it a little bit--when you X<>Y, you clear the lastx register. There is more to be learned about Lastx in ALGmode]

I did not find any of this in the Manual---did you?

If you have a 20s, it is interesting to compare the ALG of the 33s to the 20s. They are not the same, yet both allow you to carry on two chain calculations. In some ways I think I like the 20s implemention better, especially the SWAP key--which is missing from the 33S -- because of its multiline approach. The 20s, though algebraic, allows you that stack-like flexibility of typing in a number, then a function, then a number, then saying, "oops! that one should have been first", hitting SWAP and along you go.In other ways the 33s ALG is much nicer---interesting anyway. [Note that this is the feature that Gene and others, including an anonymous personality, discovered varies from machine to machine...]

BTW have you figured out what the Rdown variables x1 x2 x3 x4 are for in ALG mode, and how you can get to them/use them? It seems like if you solve an equation, you get the result in x1 and x2. But I haven't figured out how to extract them to the stack, or to a storage register.

*****

[A littler later learned from another esteemed but anonymous MoHPC Contributor:] Once the X3 [or X1 or X2 or X4] is put into a program, there is no longer any manual manipulation. Try this in a program in algebraic:

LBL X

then press RollDown [be sure the machine is in ALG mode] while still in program mode. I see the x1 x2 x3 x4 screen displayed in program mode. Then press right arrow to move over to x3. Now press enter. The second program line is entered as:

x3

Now press RTN [now you see "X3" as a program instruction]

When I XEQ X, the program will perform the "x3" instruction.....[I (Bill) later made a program which used this successfully-----First I solved an equation which left a value in the X3 variable, and then I wrote an ALG program:

LBL X

ALG

X1 (built as described above)

PSE PSE

X3

PSE PSE

X (times)

X2

ENTER

RTN

And it works!]

[Further regarding the X1 X2 X3 X4 business: remember how when in RPN, if you run the solver, the answer is left in X, the last estimate is in Y, and the value of the function at the solution is left in Z? Well, that's exactly what the x1 x2 x3 are doing in ALGebraic---X1 is like X, X2 is y etc. I haven't investigated it yet, but something will go in X4 at some point---maybe with integration--mentioned obliquely in the manual]

****

[Yet even later that day, further correspondence from me to our mystery personality:]

This is interesting! [regarding the difference between X<>Y behavior from one machine to another]

I (Bill Platt) go On-Ln (reset). ALG 27 <divide> 2 <x<>Y> {at this point I see " 27/" top row and "0.0000" bottom

row} <enter> "DIVIDE BY 0"

Serial Number CNA41109118 I bought from Amazon Last week. Is your one of the Walmart Pre-release? Or earlier?

Thanks for the x1 x2 x3 x4----great!

Now, the thing about this X<>Y is that I cannot see how one could make a coherent system that worked as yours does [the one which would give .0741 in the above example], considering how the pending operations are handled in this [33s] machine----that top row writing everything down---and then only at enter do you have an answer---what would be "flipped" in X<>Y if you were in the middle of a chain? Try it on yours and tell me what happens.

Another thing you should check: If I keep pressing <enter> after completing an ALG aritmetic, I will get an "action with a constant" effect---like some cheap 4-function machines (or sim to the K on a 10b--a great feature on that machine btw):

27 / 2 ENTER ENTER gives 6.75----in other words <ENTER> rolls the answer up onto the top line, and keeps the last subset to act on. So with parenthesis: 27 X (2+1) ENTER [81] ENTER [243] ENTER [729] etc

Top Line: "27X(2=1)

Bottom Line: 3.0000

now press enter

Top Line "27X(2+1)="

Bottom Line 81.0000

Now enter again:

Top Line "81X3="

B.L 243.0000

Regards,

Bill

***

[Yet later that day...]

[from our distinguished contributor] The X<>Y trick does not work on my 33S in a chain. 1 + 2 / 3 X<>Y ENTER does not give 2.5, but 1.67, as if the X<>Y never happened. However, it does work on 24 divide 12 X<>Y ENTER. Maybe HP fixed it?

The 4-function "constant" functionality is present on my machine.

*** Finally, wrapping up (Bill):

So, the dual chain calculation feature is really quite nice. You can do thus:

ALG CLEAR X<>Y CLEAR . Then do 2 + 2 ENTER X<>Y 5 +5 ENTER + X<>Y ENTER. You will see that the answer is 14----in other words, you did two independent chains, and then "tied them together. If you now go X<>Y again, you see that the "10" is still there ready to be used. This can go on forever---unless you do something that

uses both registers--like stats--which BTW is labelled as needing the x<>y.

I hope this e-mail interchange is an enjoyable read---and that it stirs on further experimentation!

Best regards,

Bill

Edited: 13 May 2004, 4:51 p.m.

After this fun, will you really ever put it in ALG mode again?

*Message #2 Posted by **Newbe** on 13 May 2004, 10:29 p.m.,*
in response to message #1 by bill platt (les Estats Unis d'Amerique)

If I perform a function say 2+2=, then x<>y the 4 is moved out and I will get a zero under the equation. Then perform a second function 3+3=, 6 shows under, if I swap, the 4 from the previous equation swaps with the 6, subsequent x<>y key stokes will swap the 4 and the 6. If I recall lastX it will be 0.

See email below when I ask hp.

Thank you for contacting HP Total Care.

The swap function works in Algebraic mode, but the stack functions do not.

The swap function can be seen by the following:

5 / 3 gives the display:

5 / (divided by sign) 3_

At which time, if I press x<>y it swaps 3 and 5, giving the display:

3 / 5.0000

Pressing x<>y again gives:

5/ 3.0000

{This does not work on my calculator}

If I now press ENTER I get the following:

5/3= 1.6667

If I now press x<>y I get the following:

3.0000

which means it swapped the last two data items, the 1.6667 and the 3.

Pressing x<>y again gives:

1.6667

so it is swapping between the last two arguments. That could be useful when one needs to keep a complex answer and use it with a number of similar operations.

The stack operations, like R down or up arrow, etc. do not work in Algebraic mode. That might be by design, but it looks like it isn't because the R down arrow, for example, appears to be able to choose any of the four stack elements. Unfortunately, they are all zeros.

I should mention, too, that in RPN mode, the keys =, (, and) do not function because they have no use in RPN mode.

The engineers have not responded to us about why the stack operations in Algebraic mode do not function as we would like them to, so I don't have an answer to give you.

If you have further questions, please reply to this message and we will be happy to help you.

Sincerely, Mike HP Total Care

Re: After this fun, will you really ever put it in ALG mode again?

*Message #3 Posted by **Charles Perry** on 14 May 2004, 9:27 a.m.,*
in response to message #2 by Newbe

I will likely NEVER put my 33s in ALG mode. I didn't pay close to $60 for an algebraic calculator. I can buy those for much less. I will stick with RPN.

Mike@HP Care has the old 33s version

*Message #4 Posted by **bill platt** on 14 May 2004, 9:53 a.m.,*
in response to message #2 by Newbe

Hi "Newbe",

Very interesting. The tech guy ("Mike") knows less about the machine than we do---he should bloody well know that the "stack" x1 x2 x3 x4 in ALG is there for the very specific purpose of allowing review of solve results, integrate results etc. Further, that x1 x2 x3 x4 allows one to program with those elements--as I describe at the top of this thread. (To give the tech some credit---he probably is a generalist--fielding calls for all sorts of hpJunk incl ipaqs and malfunctioning ink jets...). Without the x1 x2 x3 x4, you would never be able to write a custom error-trapping solving program in ALG mode, because you would have no access to the last estimate and the function value.....but with these registers, you do have access equivalent to the stack access in RPN mode.

Now, that earlier example of the 33s which the Tech guy has may be less useful than these newer ones: on the newer ones like you and I have, the swap is allowing two independenent calculator lines. On his, it only swaps the last args in/out of the calculator line. I also think he is mistaken about the complex mode---I think you need the "newer" functionality we have for that to work correctly---see my 1st paragraph of my 1st post at the top of this thread regarding complex results.

Regarding <LASTx> in alg mode:

It is not as simple as you say---try this:

(I use "SWAP" here to mean "X<>Y")

```
clear it so that swapping gives zeros both x and y
Action          X contents   Y contents
3.14
SWAP             0              3.14
2 + 2 ENTER      4              3.14
SWAP             3.14           4
3 + 3 ENTER      6              4
```

```
SWAP            4               6
LASTx           3.14            6
SWAP            6               3.14
LASTx           4               3.14
SWAP            3.14            4
LASTx           6               4
SWAP            4               6
LASTx           3.14            6
SWAP            6               3.14
and on and on---you can repeat this ad nauseum
```

The "X" and "Y" here refer to the two independent calculator lines----for lack of better terminology, I use "x" for the lower line that you can see, and "y" for the line that you cannot see (the one that has been swapped into the background).

If you experiment (see my 1st post) you will see that you can pull the results from the "background" chain into the foreground for an operation, thus: 2 + 2 ENTER SWAP 4 + 7 ENTER DIVIDE SWAP ENTER

will give 2.75-----you have done 2+2, realized that you meant to do 4+7 first, so you sWAP over and do that, and then divide 11 by 4.....what you cannot do (but can on the "older" 33s) is say "4 / 7 oops I meant 7 / 4" ENTER....

See, unlike earlier models, this one is writing the whole expression to the top line, until an ENTER fianlly finishes it. I believe this is why the newer models were "fixed" to givethe results I get----because the older "swap" paradigm will only work on this newer pending operation method, in the very 1st operation---after that it is bogus...

This is interesting---and it seems consistent.

What we need to know is how in detail the two versions of the 33s behave----I can only test the "newer" version.

Why care? Because unless we understand the nuances of the ALG data handling, we cannot effectively program with it---and that would be too bad---as there are advantages in readability of an "Algebraic" program.

Perhaps this entire thread aught to go to HP.

Best regards,

Bill Platt

HP48GX

*Message #1 Posted by **Roger** on 13 May 2004, 11:55 a.m.*

Thank all of you who answered my question concerning me not knowning which way to go on the calc card or RAM card. I am a construction management marjor who is not the best in math but learning more everyday. I bought the 48gx for my surveying classes and has done really well. I have a calculus class starting in two weeks and a physics class in the fall. I don't know how to program this calculator, I am trying to get better at math and at the same time maintain a respectable GPA. That is why I needed one or the other. Again thank all of you. Roger

Re: HP48GX

*Message #2 Posted by **V. Taylor** on 13 May 2004, 1:45 p.m.,*
in response to message #1 by Roger

Roger,

No matter what decision you make, if you are going to be using your 48 for a calc class I STRONGLY recommend Erable and Alg48 as these programs will address just about everything you will encounter in an entry level calc class. Also there is a great newsgroup comp.sys.hp48 that is dedicated to the 48/49. You can post just about any question there and someone will have an answer, in fact many of the people that post there have authored much of the software available on hpcalc.org. You can access the newsgroup either through the news reader in your e-mail client software or by going to google - http://groups.google.com/groups?hl=en&lr=&group=comp.sys.hp48 - This forum is also a great resource for answers. I also recommend picking up a copy of the User's Guide and the Advanced User's Guide for help with built-in functions and programming. These are available from several places, ebay, samsoncables.com, and commerce.hpcalc.org. Good luck!

*Message #3 Posted by **bill platt (les Estats Unis d'Amerique)** on 13 May 2004, 2:33 p.m.,*
in response to message #2 by V. Taylor

BUT you will spend an inordinate amount of time just trying to learn how to use all those ALG48 and Erable features, instead of putting your time into concentrating on actually learning calculus!

Avoid the trap of believeing you NEED the calculator to do well in maths. Calculators are good for computation and arithemtic (and programming--that is fun) but math is not computer programming, nor is it arithmetic. Mathematics is most definitely NOT arithmetic---it is really logic and philosophy----physics is arithmetic (well, heavy duty arithmentic)!

While these "CAS" (Computer Algebra Systems) are very intereting and also powerful, unless you have already learned them along the way, they are too complicated to apply suddenly to your college learning needs--when you are not accustomed to them.

Having taken calculus the old fashioned way in the 80's I cannot speak for the current curriculum, but I bet

you don't HAVE to have a calculator?? Perhaps ask the professor---"what's with this calculator thing all about?" (Am I just way out of touch here?).

Regards,

Bill

in response to message #3 by bill platt (les Estats Unis d'Amerique)

Hmmmm. My university, UNT, doesn't even allow calculators in the calculus classes, which is actually a good idea IMO. Too much dependence on the calc can stunt your understanding of the subject. That being said, I missed the postman by 15 mins today. He has my new HP48gx, in hand. Now I have to wait til tomorrow morning to pick it up. :(

Joe

Bill,

I remember calculus the same way. I took calculus in the early 80's and only remember using the calculator to run through a few arithmetic problems after doing the mathematics by hand.

My view has always been, one does not learn something unless you have first hand experience. Then you really don't learn something until you teach it to someone else. Using a calculator or computer to solve problems for you doesn't teach you HOW and WHY it works, it just teaches you to push buttons.

Re: HP48GX

*Message #6 Posted by **V. Taylor** on 13 May 2004, 6:19 p.m.,*
in response to message #3 by bill platt (les Estats Unis d'Amerique)

Bill is absolutely correct! Concentrate on learning CALCULUS first instead of learning a CAS. All those neat things a graphing calc will do can be done using calculus methods and you will be much better served by establishing a strong background and an intuitive understanding of what is going on, especially in your later classes. The best way to learn it is to do it, over and over and over and over again =)

Come to think of it, I took my intial calculus classes in 1991 and we weren't even allowed a four banger back then - not that there were any calcs with a CAS in those days (I hadn't even imagined a calulator that could do calculus!). There were a few upperclassmen with 48SX's but other than that the only other graphing calcs were the early TIs and Casios which I didn't feel were worth the trouble of learning.

I suppose I was speaking from the perspective of someone who took Calc I 13 years ago and has had to re-learn many of the differentiation and integration techniques that I've forgotten over the years. I used my calculator to check my work (as well as the intermediate results) but I still use my old calculus book far more often. I agree that it would have been almost impossible for me if I hadn't learned the fundamentals well in the beginning. You have to know what you are doing in the first place to make use of the power tool that is an HP calculator. BTW, my favorite is still my old HP 42S and it sees way more action than the 48GX.

Listen to the wise advice here and learn the math first!

*Message #7 Posted by **Brad** on 13 May 2004, 3:29 p.m.,*
in response to message #2 by V. Taylor

Roger, I am a structural engineer who took calculus in the early-mid 90's. I am an HP user and I swear by them for everything BUT calculus (though the HP48 did better at plotting slope fields than any calculator I had at the time). If you are taking calculus, I recommend the Texas Instruments (sorry HP) TI-89, which is a far far superior calculator for calculus. Most importantly, consult the math department at your school and find out what they recommend. And yes, they will most likely require a graphing calculator, though times have changed in the last 10 years with regard to teaching methodologies in calculus classes. When I took it, graphing calculators were fairly new and my school jumped on the TI wagon, and I agree with those who caution about "needing" a calculator. They can (like computers in engineering analysis) become quite the crutch...follow your school's recommendations as the courses can be taught around the calculator, and you can be quickly left in the dust if the instructor is guiding the class through a calculator exercise and you have a different calculator than her/him.

in response to message #7 by Brad

I recently completed my second calculus class and i was using my 49g. I agree with bill as far as not needing a graphing calculator there is very little computation needed to solve the problem but there is alot of theory and symbolic manipulation involed. I used my 49g to check my answers especialy graphing the limits and finding the minimums and Maxiums. This was only in the beginning of the first course.

Re: HP48GX - no TI, but 49g+

I would recommend the faaast hp 49g+ instead.
It's in par with the TI-89 and is faster, has SD, AND
it is both Algebraic and RPN plus EQW is now very fast.
Also the IO is now fast with USB operating at 115,200.

hp48gx downloads.

*Message #1 Posted by **Johann** on 13 May 2004, 11:39 a.m.*

Do I just need the cable to connect the 48gx to the pc, or do I need to purchase some pc software to tranfers files from the pc to the 48gx.

thanks

Re: hp48gx downloads.

*Message #2 Posted by **Raymond Del Tondo** on 13 May 2004, 1:25 p.m.,*
in response to message #1 by Johann

Hello,

you need the cable, the software can be downloaded from www.hpcalc.org (kwd: connectivity kit, or alike) .

Actually, you only need a PC program called KERMIT, or alternatively a PC program whch supports the XModem protocol, which most terminal programs do.

There are programs with a complete environment for writing, managing and transferring files from and to the HP-48GX, like HP-IDE (Tom Wellige, IIRC), all available on www.hpcalc.org

HTH

Raymond

Re: hp48gx downloads.

*Message #3 Posted by **Jim Creybohm** on 13 May 2004, 3:55 p.m.,*
in response to message #1 by Johann

There is also a very nice program called hp28 explorer available on www.hpcalc.org. Once you have installed it, you can browse the 48 just like a windows object (drive, folder, etc). Very nice!

Kermit is very good, however it does not come with Windwoes. If you are running linux however, depending on the dist. you have, you should have kermit available.

Mac? Not knowing.

HP Deskjet 5850 color inkjet

*Message #1 Posted by **Nick** on 13 May 2004, 11:26 a.m.*

I bought this printer 1-2 months ago and was working fine until yesterday evening, the printer dissapeared totally (not exactly). I can't see it anymore in the printers list and can't add any new printer anymore telling me each time "can't complete the task" so even conecting an old one was refused to install I started manually the Spool to be sure but couldn't resolve it, I went to the device Manager and I can see the printer there! 5800 series it said, but can't delete it anymore (whatever I try, even in safemode) It says it is being Used by windows on startup I checked but can't seem to find it in any startup menu, it's Windows XP Home edition.

I went to the HP site but there is no information on my problem for that printer, the HP Deskjet 5850 color inkjet is my model. I can format but would be great to avoid this...

Thx for helping.

Turtle/Hare benchmarks for the new HP-71X running on HP-49G+

*Message #1 Posted by **HrastProgrammer** on 13 May 2004, 8:11 a.m.*

While testing my HP-71X emulator ported to HP-49G+, I have executed all Turtle/Hare benchmarks (published by Valentin Albillo on this forum some time ago) and here are the results:

```
(Test 1) Matrix operations:

  ---------------------------------------------------------------
  Dimensions   MAT A=INV(A)        MAT A=A*A       MAT A=A+A
  ---------------------------------------------------------------
    10x10             1.46 (2.48)      1.26 (2.37)     0.07 (0.15)
    20x20            10.34 (18.02)     9.61 (18.38)    0.25 (0.58)
    30x30            33.16 (58.93)    31.98 (61.69)    0.55 (1.27)
    40x40            76.68 (136.81)   74.93 (145.53)   0.98 (2.25)

(Test 2) Polynomial solver:

  334.47 (597.76) seconds

(Test 3. Integrate & solve combined:

  7.4 (12.81) seconds (with precision 1E-5)

(Test 4) Double integrals:

  (I1) 2.68 (5.37) seconds (with precision 1E-3)
  (I2) 5.51 (10.59) seconds (with precision 1E-3)

(Test 5) Triple integral:

  193.75 (382.11) seconds (with precision 1E-3)

(Test 6) Complex-valued matrix operations:

  MAT W = INV(Z) in 33.25 (58.85) seconds
  MAT W = Z*Z    in 18.36 (34.60) seconds
  MAT W = Z+Z    in  0.26 (0.60) seconds

(Test 7) Solving a definite integral of an implicit function:

  71.44 (128.05) seconds (precision 1E-3)
  127.19 (228.18) seconds (precision 1E-6)

(Test 8) Integrating a recursively defined function:

  15.66 (28.55) seconds (precision 1E-3)
  31.62 (57.67) seconds (precision 1E-6)
```

```
(Test 9) Polynomial solver for roots of high multiplicity:

  4.33 (7.98) seconds

(Test 10) A probabilistic theoretical application:

  3434.05 seconds / 57 min 14.05 s (6590.23 seconds / 1 h 49 min 50.23 s)
```

All tests were performed with 33.5K RAM version (only version possible on HP-49G+) with a special object containing Math, Finance and Circuit Analysis ROMs in port 5 (usually occupied by Forth or HP-41 Translator ROM). The numbers in parenthesis are times for HP-71X running on HP-48GX/49G. The numerical results of all calculations are the same as on the real HP-71B and HP-71X running on 48/49. This was a good test of Saturn/ARM emulation and a good way to prove that arithmetical instructions with decimal numbers in decimal mode are correctly emulated.

I expected a more linear increase in speed over HP-48GX/49G but, obviously, some Saturn instructions have been more efficiently emulated on ARM than the others because the HP-49G+ speed increase over HP-48GX/49G goes from about 1.8x to 2.2x with an average of 2x so the emulated Saturn/ARM is approx. twice as fast compared to the real Saturn. I am talking about pure Saturn emulation, not about RPL/SysRPL execution where many Saturn code have been patched and rewritten in pure ARM machine language. I haven't yet made any extensive benchmarking of HP-41X and HP-42X but I suspect the results would be very close to the HP-71X.

Hope this will be interesting to someone especially to the ones who hoped that HP-49G+ will be 6-7 times faster than HP-48/49 (as I read somewhere). The truth is: The speed increase isn't that significant when working with application written completly in machine language (like are all those emulators).

Best regards.

I think its funny... An ARM emulating a Saturn emulating the HP-71.

All you need to do now is have an Apple running Virtual PC, running a 49G+ emulator.

Nice work!

I recommend you to study the possibilities of using the main RAM for HP-71X RAM (or ROM), It is - after all - 256KB

Did you read this: *"... with a special object containing Math, Finance and Circuit Analysis ROMs in port 5 (usually occupied by Forth or HP-41 Translator ROM)"*? If you read HP-71X description on my page, you will find that port 5 in HP-71X has been stored in Port0 of HP-48GX/49G/G+ so I am, obviously, using main RAM. This area is currently occupying 96K but can be increased to support more modules if I find a need to do so in the future. Main RAM is also used to store virtual "magnetic" cards which are saved from HP-71X or have to be loaded into HP-71X.

Anyway, thanks for the advice, but I have studied a possibility of using main RAM a long time ago. In the case of HP-71X, it is only suitable as a ROM storage. Unless you want to end in 'Memory Clear' every time you exit the emulator, main RAM in 49G/G+ cannot be properly CONFIGured and used as a RAM storage in HP-71X. I think we have already discussed this just a 2-3 weeks ago.

sequence Graphing

*Message #1 Posted by **Harrington** on 13 May 2004, 3:35 a.m.*

This is what I want accomplish, I know Hp can graph sequence. This is what I want to see . prompt the user to input at least two sequences. Then graph each on different set of axis. The whole idea is to do discrete convolution with the input . most effective methos will be ?? any comment how to do this effectively??

Dead HP-67

*Message #1 Posted by **Imran Farooq** on 13 May 2004, 3:33 a.m.*

Hi,

I've been using several HP calculators for over 20 years without a single problem. Yesterday I was using my HP-67 to perform scientific engineering calculations at work.

After I performed a calculation I switch the machine off, to conserve batteries. I switched it on to perform another calculation and was greeted by a blank display. I repeatidly switched the machine on and off with no joy.

I noticed that each time I switch the machine on or off the battery low LED flickerd. I have not opened the HP-67 yet, therefore, this problem isn't a result of anything I have done. The machine is in immaculate condition, hence, it has not been used much by the previous user. Even the blank magnetic cards and standard application cards look unused.

Is it possible that this problem could be related to an active component in the switch mode power supply breaking down or a passive component such as a capacitor becoming more resistive through aging?

If it is a power supply problem, then could it cause any damage to the circuitry of the HP-67?

The battery packs been checked and is OK. The machine is only used by me and no one else, mainly, because non of the people in the analogue design section understand RPN.

Any advice would be greatly appreciated.

By the way, this is the same HP-67, mentioned in the forum, with the missing display segment, but it does not affect my calculations because I round of all calculations to 3 significant digits. Nevertheless I still plan to replace the defective diplay module when I acquire a classic series machine. Many, many thanks to all who helped in solving that problem.

Thanks & Best Regards

Re: Dead HP-67

*Message #2 Posted by **David Smith** on 13 May 2004, 1:11 p.m.,*
in response to message #1 by Imran Farooq

The problem could be related to a dirty power switch contact, charger plug bypass strap (that gold strip that connects the two outer pins of the charger port when the plug is removed), corrosion, etc (often invisible) on the battery contacts, etc. The battery touchs the EDGES of the contacts near their tips. Does the machine work on the charger alone? Perhaps the battery is dead (can be rather unobvious if the charger has problems).

Could you tell me more about this shortening strip? I have a dead 67 that does not have such a strip in the charger port. Do all 67s have this thingy? What does it look like?

Andreas

in response to message #3 by marais

Andreas -

A good description of the shorting strip is over in the "Collecting & Using" section on this website:

http://www.hpmuseum.org/batts/battery.htm

Scroll down to the Classic series. There's an illustration, as well as a link to a photo of the battery compartment, which shows the charger port at the top (in an HP-67 the battery compartment is not adjacent to the port, of course).

The strip just connects the two outboard pins when the charger connector is not in place. You should be able to fashion a strip out of a small piece of thin brass or beryllium-copper stock, folded over to give the proper "spring" action. Unfortunately, to stay in place it has to clamp onto a plastic lip in the calculator. This lip is readily accessible in an HP-35,-45,-55, but may require disassembly of a -67 to reach. There are articles in "Collecting & Using" on getting to the innards of a -67, and I'll let the experts weigh in...

Good luck,

DougT

in response to message #1 by Imran Farooq

Your fault could be one of many things, some easily repairable, others would need parts from another HP calculator.

Here's what I would do. Open up the machine. To do this, take out the battery pack, flick out the 2 plasitic plugs near the charger connector, and peel up the rear (battery pack end) corners of the back label. Take out the 6 screws (2 under the label, 2 under the plugs, 2 under the front feet which can be lifted to get to them). Take off the bottom case.

Now power it up from a bench PSU clipped onto the battery contacts. I am pretty sure the rear one, nearest the display/charger connector, is -ve, but you can check by looking for continuity between the battery contacts and the middle pin of the charger connector. The one that's directly connected to the middle pin is certainly -ve. Use about 3.75V to 4V.

Now check the power converter outputs. The easiest place to find these is on the pins of the ACT (CPU) chip. This is the 22 pin, 0.4" wide chip on the logic PCB. The common reference point for all measurements is the -ve battery terminal. Anyway, pin 1 of the ACT (Vss) should be at about 6.2V, pin 2 (Vgg) at about -12V. Check these, and if you have a 'scope, look for ripple too. They should be stradyt DC voltages.

If those are right, the PSU is working. If not, then it's not. In the latter case it can most likely be repaired

(FWIW, 2N3094 transistors are suitable replacements for the ones in the power converter).

If the PSU is fine, I'd then look at the 2-phase clock outputs from the ACT. These, IIRC, are pins 16 and 17 of the ACT. If they're missing, then most likely the ACT is dead, but check the LC tank components connected to pins 13 and 14 of the ACT.

If you've got this far, then most likely you have either a dead ACT (HP custom, you can get a replacement from an HP21, 22, 25, 25C, 29C, 19C, 91, 92, 97 or 97S -- NOT a 27 though), or ROM0 (the 18 pin chip on the logic board, and this has to come from another 67).

Thank you Tony, that's extremely valuable information. I'll report after the operation!

Andreas

Re: Dead HP-67

*Message #7 Posted by **Imran Farooq** on 17 May 2004, 4:10 a.m.,*
in response to message #5 by Tony Duell

Hi,

Thanks for the info Tony. During the weekend I opened my HP-67 and probed the test points: -

pin 1 6.199v pin 2 -11.659v Frequency measured on pins 16 and 17 - 177.9KHz

During probing I had an earth strap around my wrist to prevent any damage to the ICs. Futhermore, I used a fixed battery supply of approx. 3.7v to power the HP-67 during test. I have an analogue oscilloscope but did not use it to view any of the above signals. If you think it necessary then I will do so.

Are the above voltages and frequency within the design limits. During test I found that the display intermittently switched on but I was not able to use the keys. Other than that it returned to the state where the low batt led would flicker when the machine was switched on or off.

Is it possible that none of the ICs are damaged and the capacitors may have aged outwith their designed specifications? John Garza mentions this in another forum message. I know that ageing electrolytic capacitors may cause product failure but does the same apply to tantalum capacitors? Do you think that replacing the tantalums may help? Are there any electrolytic caps on the display board? Is there a separate clock that is used to drive the LED display board? (this clock may rely of a capacitor)

I cannot make out all of the capacitor values on the PCBs. Would you or anyone have a list of the capacitors and their values? I will not replace the capacitors until I am absolutely certain they need to be replaced? (I am very tempted!)

I have not disassembled the HP-67 any further and will only do so if necessary.

I would also like to hear from Marais - what were your findings?

I know I sound over cautious, but, thats because I realy admire the HP-67 and don't wish to do anything in a hurry that may cause it serious or irreversible damage.

Thanks & Best Regards Imran Farooq

Re: Dead HP-67

*Message #8 Posted by **Tony Duell** on 17 May 2004, 3:15 p.m.,*
in response to message #7 by Imran Farooq

Those voltages and clock frequencies sound spot-on. I would be suprised if the problem was a capacitor, but you can replace them if you really want to. The tiny ones (2 in the Vgg voltage doubler, one in the CPU reset circuit) are 2.2uF. The one on the Vss line (often yellow or brown) is 47uF. Tantalum caps do fail with age, but normally you either have problems reading cards (noise on the supply lines) or the Vgg line is missing/incorrect. It can't hurt to look for ripple on the Vss and Vgg lines with your 'scope. If they're smooth then the caps are almost certainly fine.

There is no separate clock on the display board. The display board contains 2 chips. One is HP custom and is the display cathode driver (scanner). The other is a heptal (7 stage) transistor array (it's either a CA3081 or a CA3082, I forget). The only clock in the machine is the LC tank circuit on the ACT.

I hate to say this, but your machine is showing the classic symptoms of ACT (CPU -- the 22 pin chip) or ROM0 (the 18 pin chip on the logic board) failure. The easiest way to check is to replace them. You can try figuring out what's going on by grabbing the ISA line with a good logic analyser, but without a ROM source listing you are not going to get very far.

in response to message #8 by Tony Duell

Hi,

You speak very often about Tantalum caps on the motor driver card/board, but: what are the values of these caps? Thanks,

Albert

Re: Dead HP-67

*Message #10 Posted by **David Smith** on 17 May 2004, 4:26 p.m.,*
in response to message #7 by Imran Farooq

The only bad caps I have ever seen in an HP machine are the little blue dipped tantalum cap on HP65/67/97 card reader board. When it goes bad the reader will write but not read.

The only other one was a filter cap in an HP29C power supply. It was a physical break in the cap lead bonding.

If it ain't broke, don't fix it... you can easily do more harm than good.

ACT chips in the HP67 and HP97 almost never go bad. These machines have real power supplies unlike the chip gobbling travesty in the Woodstock machines.

Re: Dead HP-67

*Message #11 Posted by **Tony Duell** on 17 May 2004, 6:31 p.m.,*
in response to message #10 by David Smith

I have had bad caps in HP power converters. In particular I've seen an HP29C that would

intermittantly mis-write to program memory (it always read consistently, but sometimes the wrong keycode was written) that turned out to be a bad cap on the Vss or RAMVss line (I forget which, I replaced the pair). But it's not a common fault. As regards dead ACTs, I've had at least one 67 and one 97 that needed a new ACT. Actually, I think I've seen every chip on a 67 logic board fail apart from the card reader controller. I've certainly replaced ACTs, ROM0s, other ROM/RAMs. There is also little difference between the power converter in the Woodstocks and the 67s. Apart from the well-known problrm in the -C models if the battery pack goes open-circuit with the charger connected, there is _no_ reason why a woodstock should kill mroe chips than a 67.

Re: Dead HP-67

*Message #12 Posted by **David Smith** on 18 May 2004, 3:45 p.m.,*
in response to message #11 by Tony Duell

At least the HP67 charger has some electronics in it. When running off the supply it has filtered and regulated juice. The woodstocks get slammed with whatever that unregulated beast throws at them. I have had one bad ROM0 chip. I suspect that this chip seems to fail because it sucks a lot of power to drive the display. Also had a bad 8 pin ROM in an HP97 and a bad PIK.

I have collected over 20 bad HP25 machines. Almost all with bad ACT's, many also with bad RAM chips. Strangely, HP21 machines seem much more robust. Out of a couple dozen only two or three had problems. .

The bad cap in the 29C power supply caused the power to be a square wave. The display was dim and flashing. A meter showed proper voltage. A scope showed the evil.

Re: Dead HP-67

*Message #13 Posted by **Imran Farooq** on 19 May 2004, 9:10 a.m.,*
in response to message #12 by David Smith

Hi,

In my previous posting when I measured the voltages on pins 1 & 2 and the frequency on pins 16 & 17, on the ACT chip, everything checked out OK. I used a true RMS digital multimeter.

This time I think I'll probe the supply rails with my analogue oscilloscope to see if there is any noise. Maybe, just maybe, a bad cap or contact may be inducing noise on the supply rails. This noise maybe enough to force the digital logic into some corrupt state.

Thanks & Best Regards

Re: Dead HP-67

*Message #14 Posted by **marais** on 18 May 2004, 3:25 p.m.,*
in response to message #7 by Imran Farooq

>I would also like to hear from Marais - what were your >findings?

I won't be able to report before mid-june. My test equipment is in my parents' house; and I don't go there very often. I'll spend a week there in June, with my 67, and another week in July with my most recent acquisition, the 9810. I'll report then! (And thanks again to Tony)

Hp48gx Problem

*Message #1 Posted by **Roger** on 12 May 2004, 11:47 p.m.*

Hello, I have some serious questions concerning the hp 48gx. Like I wanted to purchase a calculus and Physic card but I don't know if these cards are worth the money or time to get one! I have been told to purchase a 1mg RAM card and download free math software from free HP sites such as this one. I am running out of time and need to make an informed decission and can't seem to find any answers, if anyone out there has any helpfull advice that would be great.

Re: Hp48gx Problem

*Message #2 Posted by **Anon** on 13 May 2004, 12:06 a.m.,*
in response to message #1 by Roger

How much does a 1mb RAM card cost?

If it's more then $135, then it would be cheaper to buy a HP49g+ with all this software built in (and much faster to boot).

Unless you are really attached to your HP49gx, this is probably the best option for a student.

Re: Hp48gx Problem

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 13 May 2004, 1:06 a.m.,*
in response to message #1 by Roger

Hi;

Based on what I have already done (programming), I would like to know what do you intend using the 48GX for. I mean, what do you want it to hold in order to accomplish your needs.

Data stored in an RPL-based calculator (HP28C/S, HP48/49) may occupy significant amount of space if not well organized, but the existing 128KBytes allow you to make wonderfull things! Also, you can always connect it to your personal computer (maybe a palm?) and save spare data from time to time.

As you mentioned calculus and Physic, have you already tried the Equation Library and the extensive Unit Objects management? Well, I guess there's a lot of already existing tools that are not taking into account, sometimes. You can use them in programs or even directly, what eases the job.

About downloading exisitng software: I downloaded almost everything I saw that was interesting for me, and all of the unzipped data does not fill half of a standard 650MBytes CD.

I'm writing all of this words because most of the times we use such a small part of what HP calculators have that we even do not believe all of the rest that can be done. You'd gladly add a calculus and Physic card and you'd also have all of the rest available anytime you want.

You just need to find them out.

Success.

Luiz (Brazil)

Re: Hp48gx Problem

*Message #4 Posted by **V. Taylor** on 13 May 2004, 8:36 a.m.,*
in response to message #1 by Roger

I have a 48GX w/ a 128k card running the following libraries available from hpcalc.org:

AllMem - memory browser

Java 3.6 - Stack replacement

Alg48

Erable - absolute address version

Qpi - better version of built-in Q command

Miniwriter - text editor

Matrix 1.2 - matrix editor

SIunit - excellent unit conversions

All of these fit in memory leaving me ~20k free which is plenty for everything I've had to do so far. For symbolic math it is good to have both Alg48 and Erable because one will handle some types of expressions that the other won't and vice versa. Installing them both on a 48GX does provide most of the functionality of a 49 but they aren't as well integrated. I've had to write extensive custom menus and small programs to more easily utilize the power that is there. You also need to examine the documentation carefully to understand the capabilities and limitations of each library to determine the correct commands to use, since they won't be organized the same way they are on the 49. I've never used one of the specialized cards on the HP (mainly because I've never needed them). I do have the DaVinci EEPro software on my TI 89 (which used to be available from Sparcom as the EEPro pac for the 48) and while its a pretty neat toy for a few hours, I never use it for anything real. If you already have the 48GX then I would skip the calc pac and get Alg48 and Erable as they are free and extremely powerful. As far as physics, with a little effort you can program just about anything you will need yourself and then you have the added bonus of having it organized in a way that makes sense to you. This is the approach I've followed all the way through EE school and by now my 48 is pretty highly specialized and very adapted to the task (read very useful). Incidentally, I did try out a 49G for a little while and it was great for symbolic stuff but it seemed to lack the feel of a real calculator, more like a palmtop computer or something and I found it awkward for straightforward calculation. I sold it and returned to the trusty old 48GX. That's my $(ln(exp(2))*.01) worth.

in response to message #1 by Roger

Hi,

You can get cards from here:

http://www.uuhome.de/oklotz/index_e.html

I have three of them: a 2MB and (2) 128 kB.

Yes, it may cost more than a 49G+; however, the professional surveyor's who crave 48GX machines will keep the prices of those machines high, and so an "investment" in cards really should hold its value.

More HP 33S algebraic bugs? Try these..

*Message #1 Posted by **Matt Kernal (US)** on 12 May 2004, 8:08 p.m.*

Inspired by Gene's findings in his post "HP33S question:POLL - Try this in algebraic mode", I found a few more strange results on my S/N: CNA4100... 33S.

** WARNING ** The following key sequences involve CLEARING your 33S's memory. Only those who DON'T CARE IF THEY LOSE THEIR CALCULATOR'S CONTENTS should try these steps **

1. Switch to algebraic mode, and make sure the stack/display is clear by pressing the <C> (ON) key.

2. Using Gene's number, press: 24 then press the Minus key.

3. Your display should have "24-" in the top line and "24.00" (assuming FIX 2) in the bottom line.

4. Now clear the calulator's memory by pressing the green <leftshift> key, followed by the <clx> key (you know, the <backspace> key just below TAN). Using the big "wobble" key, navigate to: 3ALL, and press <ENTER>. At the "CLR ALL? Y N" prompt, navigate to "Y" and press <ENTER>

5. Finally, press: 24 then press the ADD key. What do you see? On my calculator, the top line is "-24+" and the bottom line is "-24.00". What's up with that?!?

Here's another one:

1. Do step 1 above.

2. Using Gene's number, press: 24 then press the Divide key.

3. Your display should have "24/" (/ is the divide symbol) in the top line and "24.00" (assuming FIX 2) in the bottom line.

4. Do step 4 above.

5. Finally, press: 24 then press the Divide key (or the Multiply or Minus or Plus key). What do you see? On my calculator, the top line is "0/" and the bottom line is "0.00". BTW, if you had pressed the any of the other keys (Multiply, Minus, or Plus), the top line would be "0x", "0-", or "0+", respectively, and the bottom line is "0.00").

I know these are really, really obscure key sequences, but aren't these bugs? I wonder if the original Walmart units are the same/different?

Matt

Remember, not all bugs are created equal

*Message #2 Posted by **John** on 12 May 2004, 9:53 p.m.,*
in response to message #1 by Matt Kernal (US)

The HP41 had bugs that happened in obscure situations too.

Not every bug is serious enough to warrant a big deal. They are often curiosities, nothing more.

Re: More HP 33S algebraic bugs? Try these..

*Message #3 Posted by **Les Bell [Sydney]** on 13 May 2004, 4:16 a.m.,*
in response to message #1 by Matt Kernal (US)

> Quote:
>
> I know these are really, really obscure key sequences, but aren't these bugs? I wonder if the original Walmart units are the same/different?

I wouldn't say these are really bugs, so much as inelegantly handled errors. The problem is that when you press "24 -" the calculator is now in an intermediate state. It expects the next thing you input to be a (what? term? - it's so long since I studied parsers, recursive descent, etc) number, or something that can be evaluated to a number, like sin() or open-paren. When you clear the memory right in the middle of an incomplete expression, this is the equivalent of a syntax error - you shouldn't be expected to do that.

Obviously, the calculator is not clearing the algebraic stack state correctly for some reason. It's annoying to us, because in RPN, the calculator maintains all state information in the form of the numbers on the stack, and there are no pending operators or other state information hidden away anywhere - so that type of error can't really arise.

Best,

--- Les Bell

HP48gx vs HP49g

*Message #1 Posted by **Joe Edwards** on 12 May 2004, 4:12 p.m.*

Hello, Well, I have a new 48GX on the way, including a 128mb memory card. My question is how does the 48 compare to the 49 if I install Erable48 and Alg48? Do I need to install anything else to make the two comperable? How is the speed difference? Thanks.

Joe

Re: HP48gx vs HP49g

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 May 2004, 1:23 a.m.,*
in response to message #1 by Joe Edwards

Hi, Joe;

I don't have an HP48GX because I thought that two HP48G+ would be better (having a spare is, sometimes, a life saver...). Anyway, for me the best characteristic shown in the hP49G that beats the HP48 is the upgradable O.S. (flash memory). Other than that, I see no significant advantage. In fact, I think that the keyboard organization in the hP49G is not good, the key-feeling is also bad and sometimes it's better typing a function/command name instead of trying to find where in the h... did they hide it! The [CAT] key in the HP49G allows a "fast" input mode, but the HP48 menu organization is hundreds of times better and more intuitive.

There are many other internal considerations that must be taken int account as well, but they are too specialized and I have not found myself in a situation where thay made a big difference (SYS-RPL programming, assembly lnaguage, etc.). And about the speed, I observed that in some programs the HP49G is faster, but it doesn't happen in all cases. Maybe because it has some routines optimized (it becomes faster) and the "bigger memory" ends up requesting extra bits for addressing (slowing it down). But these are only guesses, maybe I wrote a bunch of nonsense here... q8^(

I think that you'd find it a good experience testing them both the way you need, so you'll be able to add your own impressions to the ones I placed here (and others surely will), and even disagree with them.

Best regards.

Luiz (Brazil)

Re: HP48gx vs HP49g

*Message #3 Posted by **Raymond Del Tondo** on 13 May 2004, 8:53 a.m.,*
in response to message #1 by Joe Edwards

Hello,

congrats for your decision!

I'd suggest to install at least two additionally packages, namely the Filer48 from Raul Del Cid Lopez, and the SpeedBrowser (from me;-)

This way you have the best file manager (Filer48) around, and the fastest configurable browser for the built-in equation library and more (SpeedBrowser). With SpeedBrowser, you can easily create your own browser windows.

Filer48 looks and feels similar to the filer in the 49g/g+ .

In general, number entry will be faster on the HP-48, because of the reliable keyboard action, you can even type relatively fast, the HP-48 has a key buffer. You can even type without looking at the calc (once you know the kbd layout), since you can be sure that what you type is what you get (on the HP-48 only).

The input forms on the 49g are faster due to many code optimizations, but the ROM upgradeability isn't a real plus for the 49g against the HP-48, because the OS of the HP-48 is simply stable, and the very few flaws are well documented, and don't affect the user in most cases.

Raymond

Do you MEAN HP49g+??!

*Message #4 Posted by **Ron Ross** on 13 May 2004, 9:02 a.m.,*
in response to message #1 by Joe Edwards

I would take a 48GX with a Koltz RAM card (any size, but a 128K and a 1 Meg together cost less than $100 including S&H) over a plain Frozen Hamster Butt Blue Hp49G. But the new Hp49G+ is much faster than either. And it has enough memory out of the box to be useful. If you mean the New Hp49G+, the older 48Gx doesn't really compare in speed and high end features.

When I was a field tech, I would strongly consider the older 49G because it has a RS-232 serial port which the new Hp49G+ has replaced with USB. For PC use only, that is great, but in controls you can link up with lots of instruments and download data with an older Serial connection. The older Hp49G was probably tougher and more durable than the older 48G series, but the keyboard bothers me (though it isn't bad, it just doesn't feel nearly as good as an older Hp).

Read up further about someones experience with their 48GX and a 128K RAM card. The feel and quality of the 48G series is still better than the newest 49G+'s but Hp has closed that gap.

Re: HP48gx vs HP49g

*Message #5 Posted by **Wayne Brown** on 13 May 2004, 10:54 a.m.,*
in response to message #1 by Joe Edwards

I'd recommend installing MetaKernel (on which the HP49 operating system is based) also, but that will take up an entire 128K card by itself. On my 48GX I have a 128K card and a Klotz 2MB card, with MetaKernel, ALG48, Erable, and a bunch of other software from www.hpcalc.org.

33s Slip Case

*Message #1 Posted by **Trent Moseley** on 12 May 2004, 3:59 p.m.*

Another thing I like about the new 33s is its slip case. A big improvement over the ones supplied with the Voyager and Pioneer series.

tm

Re: 33s Slip Case

*Message #2 Posted by **db(martinez,california)** on 12 May 2004, 7:12 p.m.,*
in response to message #1 by Trent Moseley

True. It protects the buttons from being pressed accidentally. The two seperate batteries to protect the memory is a good feature too, if it works. The only things that have anoyed me so far about it is the decimal (worse for me because i keep it in a baggie at work) and the enter key location (but not the size).

I haven't programmed it yet, I'll wait for the 43 for that. I have my 41 to run programs anyway.

Re: 33s Slip Case

*Message #3 Posted by **Bill Wiese** on 12 May 2004, 7:23 p.m.,*
in response to message #2 by db(martinez,california)

It's a shame when we're evaluating a calc to have to stoop to complementing its slip case ;)

I bought it on a lark. Right now I use a 16C and 41C at my desk.

The 33S would be far far more palatable to me if:
- standard non-'chevron' keyboard layout;
- [Enter^] key above the numeric area along w/CHS,EEX,CLx - larger displayed decimal point!!

Otherwise KB feel is OK.

Actually this'd be great if they packaged this calc in an HP10B-II package...

in response to message #5 by Paul Brogger

And anyway, if you don't like the 33s, just throw it away. But keep the case; it makes a great upgrade for your 32SII for 42s, and it's cheaper than the $75 plastic cases I've seen for sale ;-)

Dano

Send them to me.

*Message #7 Posted by **Wayne Stephens** on 13 May 2004, 7:02 a.m.,*
in response to message #6 by Dano

Don't throw them away, send them to me (I'll even pay shipping). I like the calculator and don't really give a rat's a*% about the case.

Take care.

Wayne

It doesn't really protect the "on" button

*Message #8 Posted by **bkrownd** on 14 May 2004, 5:18 a.m.,*
in response to message #2 by db(martinez,california)

Actually several times now I got my slip-covered 33s out of my bag and found it to already be "on". The main problem is that the "on" key is too exposed down in the corner, with no protection against being pressed, which happens easily despite the slip cover. On the 15C the "on" key is protected by the ridges along the sides of the calc that are taller than the keys. Well, just a quibble there...

Re: It doesn't really protect the "on" button

*Message #9 Posted by **Arnaud Amiel** on 14 May 2004, 8:57 a.m.,*
in response to message #8 by bkrownd

Also, the ON key does not seem to be as depressed (if it is at all) as on other calculators

Arnaud

Overclocking HP49G+

*Message #1 Posted by **Marc** on 12 May 2004, 3:06 p.m.*

Is it possible to do it ? sure it is. But it is sure by hardware or by Software changes? Thanks.

Re: Overclocking HP49G+

*Message #2 Posted by **Naim** on 12 May 2004, 4:43 p.m.,*
in response to message #1 by Marc

Pardon my ignorance, but why? Could it be any faster? What kind of applications are you running?

Re: Overclocking HP49G+

*Message #3 Posted by **Anon** on 12 May 2004, 7:43 p.m.,*
in response to message #1 by Marc

Yes it is possible in software. Someone in comp.sys.hp48 hinted that they were working on such a util.

Fast Discharging Batteries in HP11C

*Message #1 Posted by **TomG** on 12 May 2004, 2:08 p.m.*

My HP11C has suddenly starting using up its 357 batteries very quickly. A set of 3 batteries will go dead in about 2 days, even if the calculator is left off. Its like there is some sort of internal short happening. Has anyone ever run into this problem before? Is it fixable?

Re: Fast Discharging Batteries in HP11C

*Message #2 Posted by **Tony Duell** on 12 May 2004, 3:09 p.m.,*
in response to message #1 by TomG

I've seen this happen in an HP42S. The fault is either a short in one of the chips (which is not easily repairable unless you have another 11C to take parts from), or more likely a leaky capacitor across the battery. In the Voyager series, this is the only tantalum bead capacitor on the board (either on the flexible PCB on the original series, or on the only PCB in the later series). In the Pioneers, it's a surface mount capacitor near the battery contacts. I think it's something like 10uF or 22uF

Re: Fast Discharging Batteries in HP11C

*Message #3 Posted by **David Smith** on 12 May 2004, 3:47 p.m.,*
in response to message #2 by Tony Duell

I also have a 42S that does this. The fault is in the CPUchip. All the external components are OK.

Re: Fast Discharging Batteries in HP11C

*Message #4 Posted by **Randy Sloyer** on 12 May 2004, 6:21 p.m.,*
in response to message #1 by TomG

With all due respect to Tony, I've never seen a leaky battery backup capacitor. Easy enough to swap out but my money would be on a bad processor chip.

If you have the two chip version 11C, you're in luck as you can use the processor from a 12C. Any made in USA 12C will have the cpu you need (1LF5-0301). The later 1LM2-0001 will work as well.

If you have a later model (serial starts with 28), you might be out of luck as they changed to a single chip version (1LQ9-0321). They're rather rare and the only source would be from an identical age 11C.

Minus-sign on HP34C

*Message #1 Posted by **Cococollector** on 12 May 2004, 12:09 p.m.*

Hi there,

I just made a weird discovery: the mantissa of my HP-34C shows negative values with a precessing dot (the one which shines bright, wenn BAT's low), not with the standard horizontal dash. I have no manual, couldn't find anything in the MoHPC and have currently no access to my MoHPC-CDs.

Could anyone tell me whether this is a feature or a bug? Is the LCD going where only LCDs go? It sure has one or the other segment not working, but this has proven to be a reliable state.

The exponent's minus sign works, though.

Clues?

Thanks Klaus.

Re: Minus-sign on HP34C

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 12 May 2004, 12:18 p.m.,*
in response to message #1 by Cococollector

First, it isn't a LCD, it is LED! To some people this is blasphemy! :D

If the red dot that shows the low bat lights together with the minus sign, I think that it can be a bad contact or misaligned contact on the display pins - if your calc is that "solderless" version.

Best regards,

Nelson

Ashes on my head...

*Message #3 Posted by **Cococollector** on 12 May 2004, 12:31 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Phew, what a BAD BAD slip. Spent to much time mesmerising my 41...

They seem hard to open (at least the people say), so I won't venture this, but as there are funny effects, when I twist ist, this points towards the solderless type.

Again: the minus sign doesn't light at all! When typing in "2 ENTER 3 -", I get ". 1" (the dot being in the upmost quarter of the Light Emitting Diode :-) Display. No MINUS sign at all; same goes with "1 CHS": gives ".1"

I take from your answer, that HP provided the classic dash for negative numbers...

Hmmm...

Re: Ashes on my head...

*Message #4 Posted by **Tony Duell** on 12 May 2004, 3:11 p.m.,*
in response to message #3 by Cococollector

Yes, there is a normal -ve sign on the Spice series, and yes, I think your problem is bad contacts to the display, particularly if this is the solderless version. This is a very common problem

Spice series machines are not hard to open. The procedure has been given here many times, and once you've done a couple, or seen them being taken apart, there's no worry at all.

HP33S question: Poll - Try this in algebraic mode

*Message #1 Posted by **Gene** on 12 May 2004, 10:53 a.m.*

In algebraic mode (distasteful, I know) :-)

Press:

24 divide 12 X<>Y ENTER

and what do you get?

1) Does your HP33S show 0.5?

or

2) Do you get a divide by zero error?

Make sure you're in algebraic mode. Gene

HP33S question: Poll - Try this in algebraic mode

*Message #2 Posted by **Veli-Pekka Nousiainen** on 12 May 2004, 11:47 a.m.,*
in response to message #1 by Gene

```
"DIVIDE BY 0"

Test using two different calculations...
[VPN]
```

Re: HP33S question: Poll - Try this in algebraic mode

*Message #3 Posted by **Mike** on 12 May 2004, 11:51 a.m.,*
in response to message #1 by Gene

From the manual Appendix C-7 ; In normal operation in ALG mode, the stack in ALG mode differs from the one in RPN mode. (Because when you press =, the result is not placed into X1, X2 etc.) Only after evaluating equations, programs, or integrating equations, the values of the four registers will be the same as in RPN mode.

Re: HP33S question: Poll - Try this in algebraic mode

*Message #4 Posted by **mike** on 12 May 2004, 12:07 p.m.,*
in response to message #3 by Mike

I can not figure how to change the stack in ALG mode, x1, x2, x3, and x4 stay the same even after evalauting an equation. x4 in my stack is 0.00, so when I perform the fuction x<>y 0 is place in the operation an I get a divided by zero error.

Re: HP33S question: Poll - Try this in algebraic mode

*Message #5 Posted by **Matt Kernal (US)** on 12 May 2004, 12:10 p.m.,*
in response to message #1 by Gene

I get "DIVIDE BY 0" error. Are you sure the 33S uses the xyzt stack in algebraic mode? I don't think it does. Are you assuming when the top line displays "24 /", that the 24 is the value of the y register?

If the 33S doesn't use the stack, then pressing x<>y, with the resulting "DIVIDE BY 0" error, is correct, because the y register (or z and t) do not "exist" (ie. it's null or 0) in algebraic mode. Of course, I could be wrong, I don't have my manual handy.

In algebraic mode, try "populating" the four registers as follows: 1 <ENTER> 2 <ENTER> 3<ENTER>. Now try Rolling the stack with the <RV> (roll down) or <R^> (roll up) keys. The top line of the display shows: x1 x2 x3 x4, but rolling the stack shows 0 in each location, which to me, indicates the stack isn't being used. Somebody correct me if I'm not understanding this operation; as I said, I don't have my manual handy.

Matt 12345 to delete

in response to message #5 by Matt Kernal (US)

I think the ALGebraic "stack" is 14 slots in size
[VPN]

I got 0.5

*Message #7 Posted by **Wayne Stephens** on 12 May 2004, 2:16 p.m.,*
in response to message #1 by Gene

I've never operated it in algabraic mode before....

Take care.

Wayne

More info.

*Message #8 Posted by **Wayne Stephens** on 12 May 2004, 2:48 p.m.,*
in response to message #7 by Wayne Stephens

On my machine, in ALG mode, after keying in "24" then "divided by", the top line shows 24 followed by a "divided by" sign, and the bottom row displays 24.0000 (the calc is in Fix 4 display mode). I then key in 12, which shows up on the second line.

Keying in "x<>y" (swap) causes the numbers to reverse: 12 followed by a "divided by" sign on the top row and 24.0000 on the bottom row

Hitting the "Enter" key (which I assume is the "=" for algabraic mode?) results in '12 "divided by" 24 =' being displayed on the top row and 0.5000 on the bottom row.

No divide by zero error.

Interestingly, keying "x<>y" from there causes the top row to clear, and the bottom row to display 24.0000.

Keying it again displays 0.5000 on the bottom row, again displays 24.0000, etc. etc.

That is how my machine, which was one of the very first ones sold by WalMart.com, behaves. I cannot explain why some are getting the divide by zero error.

Take care.

Wayne.

Re: More info.

*Message #9 Posted by **r. d. baertschiger** on 12 May 2004, 3:07 p.m.,*
in response to message #8 by Wayne Stephens

I also get the same results as Mr. Stephens.

rdb.

STILL MORE Info. - Intriguing

*Message #10 Posted by **Wayne Stephens** on 12 May 2004, 7:49 p.m.,*
in response to message #8 by Wayne Stephens

When I got home from work this evening I tried Gene's recommended calculation on my "new" 33S (purchased from the "second" batch of Walmart.com calcs, about three weeks ago).

With this calculator I get the "Divide by 0" Error. The first x<>Y "swap" entry results in 24 followed by "divided by" in the top row, and 0 in the bottom row, which certainly will result in a "Divide by Zero" error when one pushes the "Enter/=" key. The question is, why is my "newer" 33S treating the "stack" differently from my "original" 33S.

Obviously there is some difference between the "first run" and "second run" of these calculators; or at any rate there are two different "versions" out there.

By the way, I would never have found this little glitch in a million years on my own, because I stubbornly and irrationally refuse to recognize the legitimacy of "algebraic entry" calculators. I am willing to admit they EXIST, I'm just not willing to USE one of the wretched things. Before today, I literally had never put either of my 33S calcs into ALG mode.

I have not yet found any differences between the two when operating in RPN mode, but that doesn't mean they are not there. Thanks A LOT, Gene, now I'm going to be up all night doing "side by side" calculations on these two machines.

Take care.

Wayne.

I still haven't found any differences in RPN mode.

*Message #11 Posted by **Wayne Stephens** on 13 May 2004, 7:04 a.m.,*
in response to message #10 by Wayne Stephens

And boy am I tired...

Take care.

Re: HP33S question: Poll - Try this in algebraic mode

*Message #12 Posted by **Julián Miranda (Spain)** on 12 May 2004, 3:57 p.m.,*
in response to message #1 by Gene

I press "CLEAR" then I try and get "DIVIDE BY 0", trying again, without clearing, I get 2.

HP Customer Support

*Message #13 Posted by **Mike** on 12 May 2004, 5:04 p.m.,*
in response to message #1 by Gene

I called HP calculator customer support, the technician's calculator swap X<>Y correctly. He got 0.5 when he did the calculation. Said he would send me a new one to try. His Serial # was CNA40..., mine is CNA413....

Re: HP Customer Support

*Message #14 Posted by **John** on 12 May 2004, 5:06 p.m.,*
in response to message #13 by Mike

I'm not sure it is a mistake one way or the other.

It is certainly not something to rush off to replace a 33s for.

I get 0.5, too!

*Message #15 Posted by **Mike Sebastian (Texas)** on 12 May 2004, 5:13 p.m.,*
in response to message #1 by Gene

I get 0.5. My 33S is one of the early Walmart units (CN404*****).

Re: I get 0.5, too!

*Message #16 Posted by **Chris Catotti (Florida)** on 12 May 2004, 9:56 p.m.,*
in response to message #15 by Mike Sebastian (Texas)

24 divide 12 X<>Y ENTER

I get 0.5

From WalMart.com in the first lot,

Serial Number CN40401230

Divide by 0!

*Message #17 Posted by **Robin** on 13 May 2004, 11:44 a.m.,*
in response to message #16 by Chris Catotti (Florida)

Serial 41109..

..but I don't mind, I'm never using ALG.

Robin

12345

I Get 2.0 & DIVIDE BY 0!

*Message #18 Posted by **Trent Moseley** on 14 May 2004, 6:27 p.m.,*
in response to message #16 by Chris Catotti (Florida)

First I go into ALG mode from RPN. Key in: 24 divide 12 X<>Y ENTER. I get 2.0. So then I hit the left arrow button. Key in the same sequence and I get "DIVIDE BY 0"!!! Bought direct from HP May 5th. Ser. No. CNA4110....

HP 33S Program question

*Message #1 Posted by **Mike** on 12 May 2004, 9:30 a.m.*

HP 33S Programming question “Dice roll”

It has been 20 years since I tried any programming. That was back in college when I had a 41cv and a lot more free time. Any way, I want to simulate roll of two dice, and then display both values on the screen (X and Y registers).

```
I wrote this program and it works fine;

D0001   LBL D           Label D for Dice
D0002   RANDOM          Generate Random number for seed
D0003   SEED            Input seed
D0004   RANDOM          Generate random number for dice (die)
D0005   6
D0006   *
D0007   1
D0008   +
D0009   IP              Take integer portion

D0010   RANDOM          Roll second dice (die)
D0011   6
D0012   *
D0013   1
D0014   +
D0015   IP
D0016   STOP
```

My question is how could I reduce the program length.

I know it is not a big deal for this program, but would be very helpful for a larger program. Thanks Mike

Re: HP 33S Program question

*Message #2 Posted by **Paul Brogger** on 12 May 2004, 10:07 a.m.,*
in response to message #1 by Mike

The obvious thing to do is make the repetitive die rolls into a single subroutine, and execute them via XEQ:

```
D0001   LBL D     Label D for Dice
D0002   RANDOM       Generate Random number for seed
D0003   SEED
D0004   XEQ  R        Roll one die
D0005   XEQ  R        Roll the other
D0006   RTN             (Like STOP when executed from kbd)

R0001   LBL  R    Roll Die
R0002   RANDOM       Generate random number for die
R0003   6
R0004   *
R0005   1
R0006   +
R0007   IP
R0008   RTN
```

This is a good technique in general, and has many applications.

Remember, however, that on the 33s an unusual set of tradeoffs may be at play. Its most limited resource is LBL values -- you've only got 26 of 'em. So in this particular case, saving a few bytes may not be worth the cost of a label. (That is, if you plan to fill your calculator with programs and will use as many labels as possible.)

Re: HP 33S Program question

*Message #3 Posted by **Bram** on 12 May 2004, 11:17 a.m.,*
in response to message #2 by Paul Brogger

I think that lines D0005 and D0006 can be removed for an even shorter program.

Re: HP 33S Program question

*Message #4 Posted by **r. d. baertschiger** on 12 May 2004, 3:02 p.m.,*
in response to message #2 by Paul Brogger

The following should also work:

```
D0001   LBL D     Label D for Dice
D0002   RANDOM    Generate Random number for seed
D0003   SEED
D0004   XEQ  R    Roll one die
R0001   LBL  R    Roll Die, fall into next roll of die.
R0002   RANDOM    Generate random number for die
R0003   6
R0004   *
R0005   1
R0006   +
R0007   IP
R0008   RTN
R0009   RTN
```

Re: HP 33S Program question

*Message #5 Posted by **Richard Garner** on 12 May 2004, 4:07 p.m.,*
in response to message #4 by r. d. baertschiger

The following should also work:

```
D0001   LBL D     Label D for Dice
D0002   XEQ  R    Roll one die
R0001   LBL  R    Roll Die, fall into next roll of die.
R0002   RANDOM    Generate random number for die
R0003   6
R0004   *
R0005   1
R0006   +
R0007   IP
R0008   RTN
R0009   RTN
```

Unless the previous line D0002 RANDOM and line D0003 SEED are necessary for the program to work, this should be it. The calculator will generate 10,000,000 random numbers off of a single seed that the calculator stores in nonvolatile memory. If there is no initial seed, as in a system reset, the calculator will generate its own random number seed.

Re: HP 33S Program question

*Message #6 Posted by **Paul Brogger** on 12 May 2004, 7:29 p.m.,*
in response to message #4 by r. d. baertschiger

Why two RTN's? Falling into R for its second execution will cause the first RTN to be executed as a RTN (or STOP) for program D. You don't need R0009.

Re: HP 33S Program question

*Message #7 Posted by **Charles Perry** on 13 May 2004, 10:35 a.m.,*
in response to message #6 by Paul Brogger

I tried the version suggested by Richard Garner, but without R0009. It works fine. As you said, I don't think the second RTN is needed.

Re: HP 33S Program question

*Message #8 Posted by **Richard Garner** on 12 May 2004, 10:08 a.m.,*
in response to message #1 by Mike

I don't have a 33S, but you could remove line 2 and 3 to make it shorter. Most HP calculators will hold and use a given seed to generate about 10^7 random numbers before repeating. Next you might look at setting up a loop to calculate both die rolls eliminating duplication of code. I did something similar when I wrote a program to generate totals from a given number of die rolls for the 42S.

Charging Batteries

*Message #1 Posted by **Wayne Stephens** on 12 May 2004, 8:02 a.m.*

An old, non-HP (gasp!) RPN calculator has recently come into my possession. It is powered by 3 "AA" sized rechargeable batteries wired in series. The output voltage for each battery is specified as 1.25 volts (They are brand new and I believe they are NimH?). There is about 3.8 volts present at the charging port when the calculator is turned off and the batteries are fully charged, which they were when I received the calculator.

The problem is, the original recharger unit was not with the calculator and the manual gives no information about it other than that it takes "about five hours" to reach full charge starting with dead batteries.

I have a bench-top variable voltage DC power supply which I intend to use to recharge the batteries. However, I do not have a lot of experience with rechargeable batteries (at least not beyond charging them with the original factory charger). Can someone who is more electrically/electronically astute than I recommend a charging voltage? The highest I have dared turn the power supply while connected to the charging port is 4.00 volts, but for all I know it will take a year to fully charge the batteries at that voltage. Is there a "rule of thumb" ratio of charging voltage to design output voltage? I just want to be able to fully charge the batteries without damaging them or the calculator.

Thanks in advance to any/all who can assist me with this.

Take care.

Wayne.

PS - The calculator is a National Semiconductor 4640 in truly outstanding condition (other than the missing battery charger).

Re: Charging Batteries

*Message #2 Posted by **unspellable** on 12 May 2004, 8:25 a.m.,*
in response to message #1 by Wayne Stephens

The proper charging rate is in terms of current, not voltage. If your power supply has a current limit set it to 50 mA. Any AA sized Ni-Cd or Ni-MH cell will take at least 50 mA during charge. Do not set the voltage higher than 4 V. If your power supply does not have a current limit I would put a resistor in series with it to limit the current to 50 mA. In this case the voltage can be set somewhat higher to allow for the drop across the resistor.

HP 11c

*Message #1 Posted by **Dave** on 11 May 2004, 9:58 p.m.*

The lower line(USER, decimal, and comma) of my LCD screen on my HP 11c has become very dim, almost unreadable. Is there anything I can do to fix this problem. Thanks.

Re: HP 11c

*Message #2 Posted by **Stephan (CH)** on 12 May 2004, 2:11 a.m.,*
in response to message #1 by Dave

Have you tried with new batteries? Not ment to be offensive, but somtimes one looses the focus for the easiest. Happend to me before. Hope that helps. Greetings Stephan.

(1234)

Re: HP 11c

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 12 May 2004, 2:53 a.m.,*
in response to message #2 by Stephan (CH)

Hi Dave, Stephan;

I agree with Stephan that it is a plausible solution. But if fresh, new batteries don't work, it's more likely that you have a bad contact (cold soldering) in one of the terminals of the R2D2 (RAM-ROM Display Driver), the big chip that drives the LCD segments and status indicators. I had many Voyagers I repaired with this problem. Cleaning terminals and fast resoldering (VERY fast) was, in all cases, the solution.

The only one I had troubles with was an earlier model with the LCD, IC's and electronic components built in in a separate unit with flex circuit. Battery leakage corroded part of the copper trails and the flex circuit was simply lost. but this is a rare case... (sorry, I didn't mean to let anyone down, just facts)

If Stephan's suggestion does not happen to succeed (I hope it does), opening the calculator and cleaning IC's terminals is the other solution. At least, there are possible solutions, right?

Best regards and success.

Luiz (Brazil)

Transferring LEX,BASIC and TEXT files from SWAP

*Message #1 Posted by **Jeff** on 11 May 2004, 7:14 p.m.*

Recently I have been trying to load my HP-71B and HP-75C/D calculators with files from the SWAP ftp site. I also read the HP Archives Forum article "HP-IL Files: Where, What, Why, How, etc. I have downloaded several files to work with on the HP-75D. I open the files with a hex editor and note the file type e0-89 for the HP-75 LEX file and then the 20 20 20 20 for the file implementation. I then delete the first 32 bytes which is the first two lines in the hex editor. Then save the file. When I Initialize a 3.5" disc on my 9114A with the HP-75D, I can load the file to the disc using the LIFUTIL program. I follow the procedure for the LIFUTIL but when I try to load the LEX file to the HP-75D it accesses the 9114A but just sits there forever. Obviously I have missed sosething. Can anyone Assist in this process? Best Regards, Jeff

Re: Transferring LEX,BASIC and TEXT files from SWAP

*Message #2 Posted by **J-F Garnier (France)** on 13 May 2004, 6:29 a.m.,*
in response to message #1 by Jeff

Hi Jeff,

My experience is that some files in the lif/swap/... folders are corrupted, and it is better to start from the LIF disc images in the hpswap folder.

Regards.

J-F

Another Slice of PI

*Message #1 Posted by **Bill (Smithville, NJ)** on 11 May 2004, 2:32 p.m.*

For those who are curious....

I entered the PI program from PPC V7N5 Page 9 & 10 into the 42S. Just ran it for 500 digits in standard speed mode.

Took 1 hour and 20 minutes.

Now to do a 1,000 digits in both normal and Fast modes.

I'm learning a lot about the 42S command set from just typing in these listings. I'm diffintely getting faster on program entry. Only typed one error this time. :)

Fastest HP41 PI program...

*Message #2 Posted by **Gene** on 11 May 2004, 11:59 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

(that I know about) is a revision to the one you're running that Ron Knapp himself made.

PPC Journal V8N6P69 Aug-Dec 1981

found on "that other site". :-)

On the original HP41C, it cut the run time from over 10 hours for 1000 digits to 8.5 hours.

If I can, I'll run it for 1000 digits on my 2X HP42S soon and get a time for everyone.

Gene

Re: Another Slice of PI

*Message #3 Posted by **Bill (Smithville, NJ)** on 13 May 2004, 10:41 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Okay, Here's the results for the PPC V7N5 program run on the HP-42S:

500 Digits - Normal Speed 1 HR 20 Min 1000 Digits - Normal Speed 4 Hrs 50 Min

500 Digits - Fast Speed 40 Min 1000 Digits - Fast Speed 2 Hrs 20 Min

So the Fast Speed is double the normal speed.

Gene - I tried to get the revised program in PPC V8N6 to run. It ran for a while, then quit with error. I may not have entered it correctly since I really don't have a very readable copy of the listing. Do you have a clean copy of the listing that you could e-mail to me at

bjunk.....vpes.com. (Put @ in place of dots).

Thanks.

Re: Another Slice of PI

*Message #4 Posted by **Gene** on 13 May 2004, 11:13 a.m.,*
in response to message #3 by Bill (Smithville, NJ)

Great work! That's about what I was expecting in the 42S.

The copy online at "that other site" is the only one I have access to right now.

Jake Schwartz of course has them on his great CD roms.

I have a printed copy at home I can check, but the GIF of that page on the "other site" looks pretty clear.

Are there instructions you're not sure about? Gene

HP calculator user websites: Mortality planning?

*Message #1 Posted by **Gene** on 11 May 2004, 2:31 p.m.*

Sorry to bring up this subject, but I'd like to encourage the user community to consider a subject that will hit us sooner or later.

What if Dave Hicks passes away tomorrow? (May it never be!)

What happens to all he has here on the museum site?

What if something happens to Viktor Toth's www.rskey.org site? Or Joerg's www.datamath.org site? Or ____ 's site of HP material?

I think it wise if the owner of each of these sites (and you if you have a site) to determine some way for the materials on your site to live on in case something happens to you.

Dave, I would encourage you to find a backup person who could still pay the bills for the site if something happened to you.

Viktor, the same.

Everyone should plan. It's simply insurance against horrible events.

Gene

Re: HP calculator user websites: Mortality planning?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 May 2004, 4:39 p.m.,*
in response to message #1 by Gene

Hi, Gene;

I completely agree with you. And I'd even add the fact that some younger guys, like Ben Salinas (anyone else that's also so young?), that has proven to be one of the possible ones to go ahead. I'm not telling that older guys, like many of us (passed the 40's) are not electable, just want to think that having youngers to go ahead will also call youngers to join them. And what is a good site for if no one even knows what is it for? Let the young people "touch" RPN and take care of it, if applicable.

Also, I think that mirror sites would be another plausible achievement. If the original site fails, the "mirrors" may take each their own way ahead.

I think I'm finding a definitive place to hold my files, and if so, I'll add links to other sites. And having a copy of their contents, like the CD packs, would make it easier to allow data to be "spread around". As you mentioned, building a mirror or an original site if the ones above fail, is not gonna be hard IF their "legacy" is made available for those who want to keep them "alive".

Would that be possible?

My 2¢ (I hope it wort)

Luiz (Brazil)

Re: HP calculator user websites: Mortality planning?

*Message #3 Posted by **bill duncan** on 11 May 2004, 5:43 p.m.,*
in response to message #1 by Gene

Actually, others besides the obvious should think about it. I know that if anything happened to me, my wife wouldn't have a clue what to do with all the equipment, documentation, newsletters etc. She has suggested in the past that it would all possibly just get thrown out!! (This is usually when she just wants to get my goat..) And what if we both go at the same time in an accident? (We're "empty-nesters", so wouldn't have anyone to "leave them to" really..)

Nevertheless, it is something I've been thinking about for awhile. How to ensure that it all finds a worthy home? I think I'd prefer that it not just end up on Ebay. Maybe an HP Calculator scholorship program? <g>

Anyway, it's more than just an "academic" issue..

Cheers.

Thanks, Dave! (. . . and to All!)

*Message #4 Posted by **Paul Brogger** on 12 May 2004, 10:26 a.m.,*
in response to message #1 by Gene

Quite apart from whatever arrangements any of us may or may not make, I will reinforce what I think is an underlying sentiment: I'm grateful for what all of the community's participants have helped to build, however long it may last.

Thanks!

Such achievements must last longer than us... (N.T.)

HP-41Z update available.

*Message #1 Posted by **Ángel Martin** on 11 May 2004, 11:28 a.m.*

A new version of the HP-41Z Complex Number Module is already available for downloading (see the web's other site).

The new version includes 64 Complex Numbers functions, expanding on the original set. Now with full LASTZ support in every function. It includes a mass-key assignment option (ZKEYS) for all Complex versions of the standard functions. It also fixes the "SST discrepancy" - wrong results in SST execution.

This version is pretty much the *final* one. A complete source code listing is also available, in case you're interested in looking under the hood.

I'll welcome any feedback you may have!

Best, ÁM.

Re: HP-41Z update available.

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 May 2004, 1:25 p.m.,*
in response to message #1 by Ángel Martin

Hi, Angel;

Congratulations! What a master piece! The "blue print" is almost a "low-level programming how-to". It's a quality document and the additional comments made it a must to those (like me) who want to understand and dare on HP41 machine language.

Thank you!

Luiz (Brazil)

I would also like to have to source to finally kick of my pre-Saturn assembler learning
phase.

[V. <)P. <)N.]
```

Re: HP-41Z update available.

*Message #4 Posted by **Ángel Martin** on 12 May 2004, 2:52 a.m.,*

in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz, thanks for your kind words. The 41Z project was a lot of fun, and I've learned a couple of tricks while doing it, it isn't rocket science (most of the functions are logical extensions to the 41 OS), but I'm glad it's all documented now in an open forum.

Now it's time to "cast it on Clonix-stone"! (although its V41 incarnation is of course much faster!)

Best, ÁM.

Re: HP-41Z update available.

*Message #5 Posted by **Matthias** on 12 May 2004, 4:37 p.m.,*
in response to message #1 by Ángel Martin

Hi Ángel

Very impressing your work on HP-41 programming. I would be glad to understand only 50% of what you do. But as you know I´m a collector. In the past you released about 2-3 versions of Sandrom and arround 2-3 versions of 41Z. Did you add a Version code in CAT2? Otherwise it would be difficult for me to see, what version I have... Is this a stupid idea or a small thing to do for you?

Greetings from Switzerland

Matthias

Re: HP-41Z update available.

*Message #6 Posted by **Angel Martin** on 13 May 2004, 1:26 a.m.,*
in response to message #5 by Matthias

Matthias, if you execute the first function (XROM 01,00) that will give you the version info on the display.

But I don't see a reason to keep the previous versions around, anyway. Just save the last one.

Best, 'AM

Re: HP-41Z update available.

*Message #7 Posted by **Sean** on 13 May 2004, 2:34 a.m.,*
in response to message #6 by Angel Martin

Angel - what is the URL for this? Sounds interesting...

Thanks!

Re: HP-41Z update available.

*Message #8 Posted by **Ángel Martin** on 13 May 2004, 8:06 a.m.,*
in response to message #7 by Sean

I cannot post the URL here, per a request of this museum's curator - that I respect.

You can find it in google, search for "v41 emulator" (without quotations).

Best, ÁM

Re: HP-41Z update available.

*Message #9 Posted by **Sean** on 13 May 2004, 7:38 p.m.,*
in response to message #8 by Ángel Martin

Are you the author? I found one by Warren Furlow...

Re: HP-41Z update available.

*Message #10 Posted by **Ángel Martin** on 14 May 2004, 2:57 a.m.,*
in response to message #9 by Sean

I'm the author of the 41Z Complex Number Module. Warren's the author of the emulator.

HP-67 Interface & Display Segment

*Message #1 Posted by **Imran Farooq** on 11 May 2004, 3:44 a.m.*

Hi,

I've just purchased a HP-67 thats in immaculate condition. Other than the card readers gummy wheel, and a display problem, it seems to function fine.

When I first switched the machine on, and performed some calculations, the LED display functioned OK. After about 30 seconds, one segment (top segment) on the 10th digit from the left flickered and then switched off. The next morning I switched the machine on and the segement was OK again, but after 10 seconds it switched off. Other than this the HP-67 functions without any problems.

I don't wish to open the machine and cause some irreversible damage, hence, does anyone have any theories as to what this could be. I think it could be an aged component, such as an electrolytic capacitor, but thats my theory and I may be barking up the wrong tree.

The other thing about this machine is that it has a 7-pin connector on the left of the top panel. The previous owner of the machine acquired the machine from a friend, hence, he has no idea what this was used for. Is this a printer interface?

I have not opened the machine yet, but will do so to repair the card reader and, hopefuly, the display problem. Only then I will know where the internal connections of the 7-pin connector are terminated. I can tell from the back of the machine that it has been very carefuly opened. Maybe it was opened to install this interface. Does anyone know whether HP installed interfaces on HP-67s on request. Furthermore, would anyone know what type of interfaces could be fitted to the HP-67.

Any help would be appreciated.

Thank you & Best Regards

Contact problems

*Message #2 Posted by **Franz Hubert** on 11 May 2004, 7:12 a.m.,*
in response to message #1 by Imran Farooq

I don't know if your problem is a contact problem, but it's easy to find out: Turn the calculator on and wait till the display dies. Then you have to produce an electric spark near the calculator. Piezo-lighters can do this, or switch on the light. With a piezo-spark about 10 cm from the device, I have "repaired" many devices (they work for some time, then quit again). To switch on the light seems to work at greater distances, but no scientific proof yet.

Remember the old radios that sometimes lost the channel? Switching on the light worked as well as a hit by hand.

I think you should give it a try!

Re: Contact problems

*Message #3 Posted by **Imran Farooq** on 11 May 2004, 10:51 a.m.,*
in response to message #2 by Franz Hubert

Hi Franz,

In the evening I will try the Piezo electric effect.

I have also tapped the calculator while it is switched on with no change to the missing segment. Is it possible that the bonding wire for the missing segemnt may have become loose?

The only solution to this problem would be to replace the 5 digit 7 segment display module. I don't think these are available anymore and would have to be retreived from a scrap calculator.

Thanks & Best Regards

Re: HP-67 Interface & Display Segment

*Message #4 Posted by **David Smith** on 11 May 2004, 11:24 a.m.,*
in response to message #1 by Imran Farooq

If a single segment in only one digit is bad then the way the display is scanned in the HP67 means it almost certainly a bad LED module. If a whole digit or a segment in every digit is wonky then the problem would be in one of the display driver chips.

Re: HP-67 Interface & Display Segment

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 11 May 2004, 1:31 p.m.,*
in response to message #4 by David Smith

Hi;

just to add to David's post that the "LED module" is a sealed unit with five complete digits (three of these compose the display). Thus, as David explained, if one segment is missing/flickering, it's more likely to be an internal problem. After the Classics (Woodstock, Topcat and Spices) the LED display as a whole is composed of a single unit. The HP67 is the exception: internally it's a mix of Woodstock architecture with a case and LED modules borrowed from the Classics.

My 2¢

Luiz (Brazil)

Edited: 11 May 2004, 1:34 p.m.

Re: HP-67 Interface & Display Segment

*Message #6 Posted by **Albert** on 11 May 2004, 5:08 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Imran,

According some tips regarding HP-67 display problems, you can find a spare part for the anode driver. The 1858-0050-1D has the following spare part: CA3082 NPN transistor array (common collector), available in any Radio Shack. The cathode driver is an HP full custom integrated circuit 1820-1749.

Good luck,

Re: HP-67 Interface & Display Segment

*Message #7 Posted by **Imran Farooq** on 12 May 2004, 3:05 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi,

Luiz mentioned that the LED modules were borrowed from the Classic series. What are the calculators in the classic series?

Do the classic series also comprise 3 of the 5 digit LED modules? Is the PCB that holds the LED modules identical to the one in the HP-67?

Would it be possible for me to purchase a classic series claculator and swap the LED modules or the LED PCB for the one in HP-67?

Is it also possible to purchase the LED modules from HP or compatible modules from another manufacturer? (as long as they don't cost more than purchasing a scrap classic series or HP-67)

What a life - thats 2 calculators I have with the same problem. (The other ones a HP-34C, for which a very kind forum member has forwarded me a replacement HP-34C, LED module in exchange for the defective one. I will keep everyone posted)

Thanks & Best Regards

Re: HP-67 Interface & Display Segment

*Message #8 Posted by **David Smith** on 12 May 2004, 3:56 p.m.,*
in response to message #7 by Imran Farooq

The only source of replacement LEDs is another calculator. The HP35/45/55/65/67/70/80 all use pin compatible LED modules. They all have the same part number, but those with gold and silver leads have slightly different size digits. Best to keep them matched. Also there is a letter code digit on the back of each package that indicates brightness. I have seen them from "G" - "M". Try and keep them within a couple of letters for best appearances. The keyboard printed circuits are rather fragile. It is best to use a good vacuum desoldering station. You will probably have to remove the inductor package(s) to get to the LED pins. The inductor packages are not identical.. don't mix them up.

Re: HP-67 Interface & Display Segment

*Message #9 Posted by **Randy Sloyer** on 12 May 2004, 6:26 p.m.,*
in response to message #8 by David Smith

Nit-picky factoid: 67's don't have inductors on the display board. But those pesky transistors and resistors do get in the way.

Bring Back The HP 15C

*Message #1 Posted by **Chris Woodhouse** on 10 May 2004, 11:29 p.m.*

I have my new web site up with a petition to bring back the HP 15C I give some of my thoughts on why I want HP to bring back the 15C on the site, so please check it out and if you think the 15C is worth an other go around sign the petition.

http://hp15c.org:8080

Note that if you are using IE you MUST include the http:// part or it will get confused by the :8080 part.

Chris W

Re: Bring Back The HP 15C

*Message #2 Posted by **Bill P** on 11 May 2004, 1:26 a.m.,*
in response to message #1 by Chris Woodhouse

I'd buy three if they cost the same each as a new 12c.

Re: Bring Back The HP 15C

*Message #3 Posted by **Karl Schneider** on 11 May 2004, 1:46 a.m.,*
in response to message #1 by Chris Woodhouse

Chris --

I agree with the cause, and would sign your petition after you post on your site how you plan to use the information the signatories provide (privacy, security, etc.) I would hope that it will go directly to HP when enough signatures are obtained.

Personally, I would like to see a re-issued 15C called a "15S" with a few very minor upgrades. Unfortunately, some functions would have to be sacrificed to allow AOS, and Eric Smith might be the only one who has the 15C ROM code. (There was a recent thread about the preceding.)

I've already asked NCEES via detailed correspondence to approve the 11C, 15C, and 20S for the PE/FE exams. If I can't convince them to take action, I'm considering an on-line petition (perhaps hosted on MoHPC, if Dave is willing) to help sway them.

-- Karl S.

And the 28S also, please!

*Message #4 Posted by **J. C. Boco** on 11 May 2004, 7:48 a.m.,*
in response to message #3 by Karl Schneider

Bring this sweet baby back into production, and also clear it for the tests.

Re: Bring Back The HP 15C

*Message #5 Posted by **hugh steers** on 11 May 2004, 7:49 a.m.,*
in response to message #3 by Karl Schneider

i agree. i would very much like a new 15c that was faster. that was really its only limitation.

Re: Bring Back The HP 15C

*Message #6 Posted by **Charles Oxford** on 11 May 2004, 9:54 a.m.,*
in response to message #3 by Karl Schneider

The NCEES only bans calcs with text editing or communicating capabilities. The 15c has neither and is therefore allowed.

Re: Bring Back The HP 15C (NCEES Allowance)

*Message #7 Posted by **Jeff** on 12 May 2004, 7:30 a.m.,*
in response to message #6 by Charles Oxford

It is the stated intention of the NCEES to produce a list of approved calculators, rather than a list of banned calculators. Only those calculators on the approved list will be allowed in the tests. (See page 8 of this issue of the *Licensure Exchange* publication of the NCEES.) To keep things simple, they will likely not research every calculator ever made to determine if it meets their requirements. They will also not want to have a list of hundreds of calculators that would meet their requirements that they would then have to check each and every test taker's calculator(s) against. It may be possible to petition the NCEES to put the 15C on their "approved" list, but it should not be assumed that they will automatically allow it.

Edited: 12 May 2004, 7:43 a.m.

Re: Bring Back The HP 15C (NCEES Allowance)

*Message #8 Posted by **Fubar Vikinghelmet** on 13 May 2004, 1:44 p.m.,*
in response to message #7 by Jeff

This is a sore issue with me...

I just downloaded and read the NCEES December 2003 document that's linked in your post. Here's the money quote (page 9, "Make proctors' lives easier"):

"...On exam day, we had to confiscate 10 to 12 calculators, which gave us the opportunity to get acquainted with these models."

Doggone it, why didn't the NCEES people simply spend a weekend geeking-up on this and other websites if they wanted to "get acquainted" with whatever calculators? The knee-jerk response is "they don't have the time to..." and my multiple fist-in-the-face response is a) you certainly had time to think up the ban, b) you certainly had time to think up what constituted an unacceptable calculator, why not expand on that?, c) you came up with a rule that disqualified calclators whose ports were covered; did you even think about what those ports could do in a big room full of people?, d) you folks are engineers, right? that would imply more than a passing interest in calculating devices, eh?, e) etc.

I've had the "why don't you, Fubar, make up a list/document/screed of calculators and their characteristics and present it to the NCEES. And the fist-in-the-mouth response is: that is not my

job - the NCEES people are either paid or have committed themselves to such issues; they should have been on top of this since day one and established protocols for calculator evolution vs. the tests.They're also unreasonable; who the heck am I in their pecking order? (a customer?! ha! we don't work that way!) After all, there is an experience element factored into one's being accepted to take the test in the first place! So if someone worked for four years using, say, an HP-42S, sorry, gotta change it for this test.

The bottom line is that the NCEES people are obeying the first rule of personnel management, i.e., punish everyone.

But, I've got my HP-33S and am happy, so the issue is moot - but the NCEES ought to be sacked nonetheless.

Re: Bring Back The HP 15C

*Message #9 Posted by **Chris Woodhouse** on 11 May 2004, 10:04 a.m.,*
in response to message #3 by Karl Schneider

I'm sorry I forgot to address privacy concerns on the web site. I will add some information to that effect shortly. I can tell you that all I plan on doing with this information is giving it to HP for the sole purpose of convincing them to bring back the 15C. I may decide to send a message to those who provide email addresses and inform them of any progress I make in that regard also.

Chris W

2007: 35th anniversary of the HP-35 . . .

*Message #10 Posted by **Paul Brogger** on 11 May 2004, 11:50 a.m.,*
in response to message #1 by Chris Woodhouse

. . . and the 25th anniversary of the HP-15C (according to the dates posted in their respective MoHPC articles).

If H-P were interested in calling attention to their heritage of invention, those anniversaries should be commemorated in some appropriate way. (But that's a pretty big "if"!)

33S is better

*Message #11 Posted by **David Ramsey** on 11 May 2004, 12:55 p.m.,*
in response to message #10 by Paul Brogger

I dunno, guys. I bow to no one in my admiration for the old HP RPN machines.

But the 33s is better than we have any right to expect. It's got a huge, very legible two line display. It's MUCH faster than the 15C. It's got a lot of constants built in, can display with 12 digit precision, and the clever menu system makes great use of the limit-resolution display required in a low-end machine. And after years in the wilderness we finally have an HP calc with a keyboard so good we're reduced to arguing about the nuances of key feel as compared to decades-old machines.

And don't forget algebraic mode. Yes, even having this as an option is a win.

If I were going to change things about the 33s, here's what I'd do:

* Fix the keyboard. Lose the chevron shape and use angled keys like the financial calcs so the mess of tiny legends could be cleaned up a bit.

* Enlarge the display's decimal point

* Make the manual spiral-bound (sigh)

* Restore the [Enter] key to its place of glory.

That's about it, really. I haven't set my two machines side by side and gone over all the functions, so there may be something critically important to you that the 15C does and the 33s does not.

I realize a lot of you really like the 15C form factor. Personally I never did...

Re: 33S is better

*Message #12 Posted by **bill platt (les Estats Unis d'Amerique)** on 11 May 2004, 1:24 p.m.,*
in response to message #11 by David Ramsey

Hi David,

Good points, but I will put a different stress on it:

> Quote:
>
> (1.) Fix the keyboard. Lose the chevron shape and use angled keys like the financial calcs so the mess of tiny legends could be cleaned up a bit.
>
> (2.) Enlarge the display's decimal point
>
> (3.) Make the manual spiral-bound (sigh)
>
> (4.) Restore the [Enter] key to its place of glory.

(1.) OK

(2.) OK!

(3.) Oh well, I like these too, but, well, oh well!

(4.) No. keep it in the new spot. It really is not so bad--and it matches the 17bii and the "space" on the 48.

I would stress that the more important issues are:

(A.) The Equation List should have been revised to allow editing---not backspacing to get to errors. With all the memory, this would have made a great tool--but who wants to enter a long Equation only to be unable to fix it! And it could have been implemented like the 17bii---so that the variables come up on line one when you use the equation in the solver. Instead, we have the same incomplete thought of the 32sii.

(B.) Solve call Integrate---a major 15C capability that is lost (sadly) in the 32 world...

(C.) Why not a real Algebraic History stack?

(D.) The Algebraic mode is interesting, but it is very poorly documented, and it is confusing to have two different "algebraic" methods on the same machine--the "equation list" method (all infix) and the

"ALG" method (infix/postfix). Seems to me a collision rather than a union of logic systems. The 48 series "algebraic object" on a stack was a much more unified way of thinking. This 33s is sort of two unrelated machines in one: The 32sii+ blended with the HkinPo ALGIE.

(E.)(Complex) Matrix support built-in. There is more than enough memory. There is already a menu system. Eliminate the stupid key functions (cube root, x root y, down arrow end, up arrow end) and you have plenty of room! I believe they just don't want to do matrix on a non-graphing---but it would make a more complete system. Of course the documentation would really grow.....

I could be happy without matrices.....but I know Valentin would disagree!

(F.) Why was "Horner's method" transcribed to Algebraic using registers?!! sheesh!

(There are more documentation issues but I won't go into them now).

But I do like it---it is growing on me....

regards,

Bill

Re: 33S is better

*Message #13 Posted by **Gene** on 11 May 2004, 2:27 p.m.,*
in response to message #12 by bill platt (les Estats Unis d'Amerique)

The algebraic mode is documented to a degree in the 33S learning modules on HP's site.

Wlodek and I tried to do problems both ways, in algebraic and RPN.

If you haven't taken a look at them, you should go through the lists.

Gene

P.S. I like Algebraic's complex number abilities better than the RPN equivalent on the 33S.

Re: 33S is better

*Message #14 Posted by **Raymond Del Tondo** on 12 May 2004, 2:13 a.m.,*
in response to message #12 by bill platt (les Estats Unis d'Amerique)

Response to Bill's answer to (4.): No, move the ENTER key back where it is in the 17BII (and all other serious HP calcs). The 17BII (not the 33S) is one of the best examples for an RPN&ALG machine. It has the right ENTER bar in the right position AND the equal ('=') key in a position where the '=' usually is in alg-only machines, and where it doesn't disturb RPN users. The 17BII (NOT the '+') was, in some respects, the best of both worlds, only lacking TRIG fcns.

When you wrote '...It really is not so bad...' it implies that it isn't that good, and since it's not that good, let's move it back where (nearly) all HP calc fans found it to be perfect;-)

This is not because of the 'good old times', it's just more ergonomic. There were various discussions about this topic in the past, beginning when ACO introduced the 49g, so I think there's no need to repeat it here.

in response to message #11 by David Ramsey

...than the 15C? In certain ways, definitely yes, but overall, I'd say not. In the near future, I plan to illustrate how KinHPo's 33S did not observe the fundamental design principles that the 11/15/32 models exhibited. HP really knew their stuff in the 1980's.

David posted,

> Quote:
>
> *But the 33s is better than we have any right to expect.*

All in all, it's worth having as a "32SII+" that is unconstrained by limited RAM.

> Quote:
>
> *It's got a huge, very legible two line display.*

It would have been a lot more legible if there were more interstital space between digits, if the decimal and comma were larger, if there were weren't so much "shadowing" of the pixels, if the display window weren't reflective, and if the annunciators were larger and not shadowed. None of these issues were problems with the one-line display of the 32SII.

> Quote:
>
> *It's MUCH faster than the 15C.*

Right on there. The 32SII is about 12x as fast as the 15C, and the 33S is faster than the 32SII.

> Quote:
>
> *It's got a lot of constants built in, can display with 12 digit precision,*

Another nice feature, but the 48G* models with large display had many physical constants with their names and units in SI and English.

> Quote:
>
> *and the clever menu system makes great use of the limit-resolution display required in a low-end machine.*

I thought the 32S/32SII menu system was more elegant -- "hit the key that is pointed to", instead of "hit the corresponding number" or "move the cursor and hit enter".

> Quote:
>
> *And after years in the wilderness we finally have an HP calc with a keyboard so good we're reduced to arguing about the nuances of key feel as compared to decades-old*

> *machines.*

If I hit the "8" key off-center on the upper-right corner of my new 33S, I can often induce a missed entry, even as the key clicks. Yesterday, I induced 50 consecutive misses! (Can anyone else do that on theirs?) That is just unheard-of on the old HP's.

> Quote:
>
> *I haven't set my two machines side by side and gone over all the functions, so there may be something critically important to you that the 15C does and the 33s does not.*

TheMoHPC website offers a "calculator comparison" feature. The main advantages of 15C functionality are its complete complex-number support, its matrix functions, and the ability to use INTEG inside SOLVE, or vice-versa.

However, the 15C also is tremendously better in clarity of display and keyboard, and of logical grouping of functions.

> Quote:
>
> *I realize a lot of you really like the 15C form factor. Personally I never did...*

The horizontal layout is better if the calc is placed on a desk near the user. If the user must hold the calc for any reason, the vertical layout is better.

On one of my 45s I can do that as much as I want with the [1/x] key and its original owner told me

it was the case when the calc was new as well.

33S Keyboard Misses

*Message #18 Posted by **Wayne Stephens** on 12 May 2004, 8:15 a.m.,*
in response to message #15 by Karl Schneider

Nope, I can't induce a "miss" anywhere on the keyboard unless I fail to hit the key altogether (and I guess that doesn't really count as a miss). As near as I can tell, the keys are pretty near perfect.

I really tried to dislike the 33S, with its flashy "non-HP" look and its chevron shaped keyboard, but I just couldn't do it. It just works too well.

My only real complaint (and remember, this is from someone who has just turned 40 and has the commmensurate "failing eyesight") is the tiny decimal point; and in a previous posting (2 months or so ago) I mentioned that the decimal becomes much easier to see if you adjust the display so that it is as light as you can possibly stand. It definitely works (at least for my "old" eyes).

Take care.

Wayne

Vertical is ***ONLY*** better if you ***must*** hold the calculator with one hand and hit the keys with the other hand. The ***right*** way to do it is with a horizontal layout. Hold it with both hands, and press the keys with both thumbs.

Chris W http://hp15c.org:8080

P.S. I hope to move the site to a standard port (drop the :8080) in a few weeks, and I have fixed some problems with posting data with certain extended characters.

Hi Karl,

> Quote:
>
> The horizontal layout is better if the calc is placed on a desk near the user. If the user must hold the calc for any reason, the vertical layout is better.

I actually find that it is not quite so straightforward. For me, the 10c (voyager) series is actually *easier* to one-hand than many vertical format machines. The reason is the balance point. On the voyager, you place the machine resting on your fingers, and you push the buttons with your thumb. The machine is turned about 20 degrees horizontally, but this does not bother me. I can comfortably reach any key on the board without feeling like I am going to drop it.

On the other hand many vertical machines, including the new 33s, have a heavy screen all the way at the top, which means it is tricky to maintain balance when pressing the lowest row of buttons with your thumb. And since this is where (on), 0, (.), Enter and + are, you find this quite a pain sometimes.

Separate issue:

You (Karl) posted, and Raul Lion reminded me, of a simple and ingenious way to use Indirection in the 15c to make it possible to solve for *any* variable in an RPN equation, using the solver---- which makes it VERY versatile!

Best Regards,

Bill

Re: The "Karl's solver" - HELP VPN

*Message #24 Posted by **bill platt (les Estats Unis d'Amerique)** on 13 May 2004, 6:34 p.m.,*
in response to message #23 by Veli-Pekka Nousiainen

Hi Veli-Pekka,

OK, here's the deal: You have to tell the machine which variable is going to be solved for, before running solve. You do this by STOring the register address in to <I> before calling f<solve> <address> (It is exactly backwards of the 32sii model, where you 1st tell the machine which function is to be solved, and then when you press solve, the machine asks for the variable to be solved for).

You also must tell the machine what the declared variables values are first, before you do the f<solve> <address> call

[quote] from Karl: Use the I register in a general program. For example, to solve or integrate a function with variables x, y, and z:

(x) STO 1; (y) STO 2; (z) STO 3 {here you are storing the delcared values to the appropriate registers--this can happen before or after you make the program--here it is shown before}

```
001 LBL "A"   {in program mode, make an program address}
002 STO (i)  {this is the command which makes it all work}
(use RCL 1, RCL 2, and RCL 3 each time a variable is used)
nnn RTN
```

Key in n STO I (n = 1,2 or 3) and STO each of the parameters (fixed variables) as above prior to executing SOLVE or INTEGRATE on the program "A".

Any numbered registers may be used; the 15C won't use your choices for its own purposes.

That having been said, the 32Sii and 42S *are* much faster number-crunchers. While the 32Sii allows equations to be solved and integrated, RPN programs run faster.

[/quote]

OK, so like S=1/2at^2 + vi*t goes like this: make 1/2at^2+vi*t -S = 0

```
t STO 1
a STO 2
vi STO 3
S STO 4

LBL A
STO  i
RCL 1
<ENTER>
<ENTER>
<ENTER>   {Horner's method.....not really needed entirely}
RCL 2
*
2
/
RCL 3
+
*
RCL 4
-
RTN
```

So to solve for S, start by storing all the acceleration, time intitial velocity etc, then 4 STO I, then f<solve><A> of course you can also store an initial guess in register 4 and etc.

To solve for another variable, just STO its register address in (I) and proceed with f<solve>A

I don't have my 15c in front of me but it should work.

Have fun!

Best regards,

Bill

The "Karl" says 'thanks'...

*Message #25 Posted by **Karl Schneider** on 14 May 2004, 2:56 a.m.,*
in response to message #24 by bill platt (les Estats Unis d'Amerique)

... to Raul and Bill for acknowledging and explaining my fairly-straightforward technique for using SOLVE and INTEG for different variables of multi-variable programs without modifying code. (I admit that I could have explained it in a more-detailed fashion.)

This year, I plan to write several articles:

1. Practical uses of SOLVE and INTEG functions on RPN HP calc's (15C; 32S; 32SII; 33S; 34C; HP-41C/Advantage; 42S)

- Area between two curves
- Solving for one limit of integration
- Using SOLVE and INTEG for multii-variable functions

2. Benchmarking of built-in Romberg's Method INTEG function on HP calculators

- Short discussion of Romberg's Method vs. other common methods
- Results and speed for one specific problem on all RPN models equipped with the method (and a few RPL models and other calc's or software)

Edited: 15 May 2004, 2:06 a.m. after one or more responses were posted

Re: The "Karl" says 'thanks'...

*Message #26 Posted by **Ángel Martin** on 14 May 2004, 8:01 a.m.,*
in response to message #25 by Karl Schneider

Slightly off-topic, but also related to SOLVE.-

I wrote a short routine to calculate matrix (real) Eigenvalues, using SOLVE to find the roots of its definition equation.

It combines the matrix functions of the advantage (to calculate the matrix determinant on each iteration) with SOLVE. A bit of brute force, but works like a champ.

Here's the RPN listing, where the matrix is assumed to be created in XMem (labeled "AA"). The routine "MIDN" makes the current matrix into an identity matrix.

Let me know if you'd like further details.-

```
LBL "EIGEN"
"LOW'VAL=?"
PROMPT
"HI'VAL=?"
PROMPT
"*VP"
SOLVE
TONE 4
"VP="
ARCL X
PROMPT
RTN
LBL "*VP"
STO 00 -'stores current iteration value "IDN"
XROM "MIDN" -'makes matrix IDN an identity Matrix
RCL 00
"X"
MAT* -'multiplies [IDN]* X
"IDN,AA,IDN"
MAT- -'obtains [AA]-X*[IDN]
"IDN"
MDET -'calculates its determinant
RTN
```

E-values on the HP-42 w/Advantage

*Message #27 Posted by **Karl Schneider** on 15 May 2004, 4:46 a.m.,*
in response to message #26 by Ángel Martin

Angel --

I entered the eigenvalue program, except for the "MIDN" command, which does not seem to exist on the Advantage ROM. Am I using the wrong one?

-- Karl S.

Re: E-values on the HP-41 w/Advantage

*Message #28 Posted by **Angel Martin** on 15 May 2004, 10:53 a.m.,*
in response to message #27 by Karl Schneider

Karl, rather than posting it here I think it'll be much more efficient if I sent you the rom image (SandMath-III). In this way you can run the programs on V41, and of course copy them without issues.

There are two programs that use the Advantage SOLVE and INTEG that you may be interested in taking a look at. One is the above mentioned EIGEN (and yes you're right, MIDN isn't in the Advantage but a sub-routine within the SandMath). The other is a brute-force Fourier coefficients using SOLVE.-

In general there are many examples using INTEG to solve math problems, (Bessel functions, Beta function...) but they're normally slower than other techniques. Besides, they take another global label (for the function to integrate or solve), which means a precious FAT entry in a ROM!.

So send me an e-mail at "ovolacteo@onlinehome.de" and I'll reply with the rom image.

Best, AM

Calculator Confustion....What I need vs. what I want

*Message #1 Posted by **Joe Edwards** on 10 May 2004, 9:18 p.m.*

Hello folks, I have posted on and off here for about a year or so. Mostly I just lurk and try to gain as much insight as I can into the HP calcs. It seems I have a problem for which I hope everyone can provide some good advice. First, I am working on a dual degree in mathematics and geography, with a dual minor of japanese and secondary education. Yes, I will probably end up teaching math at the high school level. In 1988 or 89, I purchased my first HP calculator from the UTA bookstore. I didn't really know anything about the machine, but it seemed like a quality product compared to what else was being sold. That calculator stayed with me until 2002 with the original batteries finally being replaced in 1999 (10 or 11 years..wow). How I miss that little calculator. Anyhow, it wasn't until 2001 or 2002 that I learned of the history of the HP calculator products. It is difficult to accept that I missed out on a great opportunity to use these machines as I was just a little young and I left college back in 1990. Had I known about the 15c, the 41c/v/x models, I would have jumped at the opportunity to own one. But, at that time I was still playing around with the Atari and Amiga computers. And we all know how much of a foothold Commodore and Atari have on the computer industry today! :) Now I am back in college working on the math and geography degrees. The most common calculator is the TI 8* models. I cut my teeth on the 83+ and owned a 89 for a short time (no log button...grrrrr). While these two machines are fine...the 89 moreso than the 83, as I like the symbolic manipulation capabilities of the 89. I feel as if I am missing out on something. In fact, I recently bought a used 49g and have been using it for about a week. I prefer it over the 49g+. Those rubber keys are great...SERIOUSLY...call me crazy. But, it is so much slower than the 49g+. :(Okay, here is what I need to figure out. What do I really NEED for my degree? Maple and mathematica are right out for the next year or so...simply too expensive. Plus, my university doesn't even allow calculators in the first two calculus classes, and I agree with that idea. There really doesn't seem to be a need for them right now, other than to check my work. I guess I could just pick up a 33s and a 49g+ and call it a day. Get the most current hardware and be happy with it all.

OR...

Should I consider looking at the older RPN equipment such as a 32sII, a 42s, a 41c something or other, and a 48gx with Alg48? For quick calculations, it is a pain to pull out the big honking graphing calc, so I want a smaller scientific one to use as a backup machine. Am I being unreasonable to consider the use of a 32sII, 42s, 41c, or 15c versus the current models? Is the old 48GX just too dated? Money isn't too much of an option as my wife is a Pharmacist and therefore we make a decent living. So, should I look at these older machines? Did I truly miss out on a bygone opportunity with the vintage HPs in 80's and 90's? Is it worth the effort to even consider using them?

Any and All opinions are welcome. Thank you for your help and consideration.

Joe

Re: Calculator Confustion....What I need vs. what I want

*Message #4 Posted by **Joe Edwards** on 10 May 2004, 10:11 p.m.,*
in response to message #3 by Les Bell [Sydney]

I should have made it clear that I really have no desire to buy any laptop to run such a program at school. I commute 110 miles, round trip, and therefore don't have access to my home computer til the evening. I need a graphical solution at school, but I also have a (misplaced?) interest in this old technology.

Why? No clue, as I didn't even know of its existance til two years ago. I guess my question should partially be, "is it of any importance anymore?" Is it simply too late to be learning to program a 48gx or (better yet!!!!) a 41c model?

Joe

Re: Calculator Confustion....What I need vs. what I want

*Message #5 Posted by **Veli-Pekka Nousiainen** on 11 May 2004, 4:49 a.m.,*
in response to message #4 by Joe Edwards

```
The HP 49g+ has about everything that the earlier models since 28C have.
No need to buy an old model to learn programming.
You may want to leran ARM assembler with the 49g+.
The 49g+ is very fast compared to the older models.
I recommend sticking with it.
BUT
From the old models you may want to buy a HP-41CX or a HP-42S
OR
You may want to buy a HrastProgrammer's emulator for HP 49G
(yes the older slower sister - the emulators do not work with the new 49g+)
You could then use both the 41CX & 42S using a 49G (which has Flash to keep your
work)

That would/is personally my preferred choise,
BUT (again)
nothing beats the joy of using the good old HP-41CX
You can add HP-IL, use Clonix etc for machine language development - do synthetic
programming.
THUS
I revert to
1) use 49g+ for work
2) use 41CX for fun & learning
```

in response to message #6 by HrastProgrammer

Thanks for the effort.

Using the 49g+ is so much more pleasant than the old 49g.

Gene

It's not too late.

*Message #8 Posted by **Wayne Stephens** on 11 May 2004, 7:31 a.m.,*
in response to message #4 by Joe Edwards

Joe,

In my opinion it is NEVER too late to learn to use the 41C series. They are easy to program (more difficult to program efficiently) and they are fun. They are also sturdy and relatively easy to repair and keep running (at least the "full-nut" versions are).

I've been using HP calcs for over 20 years and own about 18 of them. For some reason (I really do not know why), I just got involved in the 41 series in the last few months. I have been playing with a 41C and a 41CV quite a bit recently, and I think they may be my favorite HP calculators of all time (seriously challenging the 42S for that honor).

Take care.

Wayne.

PS - I also like the 48GX a lot and have no compelling reason to upgrade to the 48GII or 49G+ or whatever the latest is. The speed difference just isn't enough to entice me.

Ah. . . I was assuming you already have the computer, and only the cost of the software was a barrier. . .

> Quote:
>

Something is important if it will help you get the job done faster/easier/better. If a good calc is what it takes, then it's important. As for whether it's too late, I'd say a 41C/CV/CX *with the manuals* is easier to learn than the 48GX. It's a matter of the quality of the manuals: the 41 manuals are much better written, especially since the 48GX is so much more complex with a smaller manual. To me, the 41 series was the pinnacle, and the sweet spot that maximises the ratio of power over complexity.

Best,

Re: Calculator Confusion....What I need vs. what I want

*Message #10 Posted by **Steve S** on 10 May 2004, 10:45 p.m.,*
in response to message #1 by Joe Edwards

Joe, if you want a relatively recent machine with power and expandability, buy an 48GX. Expansion cards can still be bought at Klotz and Cynox in Germany. calcpro.com still sells the old SparCom - DiVinci firmware like CalcPro, etc. and other 48 reference books.

If you want a more "classic" RPN experience, buy a 42s.

Re: Calculator Confusion....What I need vs. what I want

*Message #11 Posted by **Karl Schneider** on 11 May 2004, 1:22 a.m.,*
in response to message #1 by Joe Edwards

Joe's questions:

> Quote:
>
> *Should I consider looking at the older RPN equipment such as a 32sII, a 42s, a 41c something or other, and a 48gx with Alg48?*

Yes, I certainly think you should. My HP general-purpose scientific models include the 15C, 20S, 28C, 32SII, 33S, 34C, 41C/V/X, 42S, 48G, and 49G.

In my opinion, the models introduced between 1979-88 represent HP's best-engineered, most useful and usable calculators -- no-nonsense tools for professionals at affordable prices. (Note that today's 33S traces its origins to the 32S of 1988.) Most of these models have classic RPN, instead of the syntax-intensive RPL of the

28/48/49 models.

> Quote:
>
> *Am I being unreasonable to consider the use of a 32sII, 42s, 41c, or 15c versus the current models?*

Not at all. In fact, most of us would consider these four models the "best of the bunch":

15C -- Best combination of built-in capability and ease of use for routine problems.

32SII -- Compared to 15C, it is also easy to use, 12x as fast, having less advanced functionality but a few more built-in minor functions, and is much better for programming. The earlier 32S is comparable to the 32SII, but without equation editor and fraction math, and relies more on single-level menus.

42S -- Most capable built-in functionality by far, and as fast as 32SII, but less easy to use and has a hard-to-read display.

41CX -- Upgrade one with an Advantage ROM to provide the missing functionality that is built into the other three models. A fine classic tool, but can be cumbersome for some basic tasks, as compared to the others. The real strength of the 41 series is its expandability and peripheral support.

> Quote:
>
> *Is the old 48GX just too dated?*

Not really. Although less intuitive and more complicated, it has some impressive built-in functionality that no RPN model has -- e.g., physical units, equation library, symbolic calculus, multiple integrals. Some of this functionality -- as well as the "serious-tool look and design" -- is missing from the 49 series (HP and KinHPo) and "new" KinHPo HP-48G+.

> Quote:
>
> *So, should I look at these older machines? Did I truly miss out on a bygone opportunity with the vintage HPs in 80's and 90's? Is it worth the effort to even consider using them?*

The very late '70s, the '80s, and the early '90's was HP's "golden era" of calculators. I doubt that it will ever be that good again. You'll probably have to spend some money on eBay to find out -- I certainly have.

-- Karl S.

Re: Calculator Confustion....What I need vs. what I want

*Message #12 Posted by **Chan Tran** on 11 May 2004, 8:59 a.m.,*
in response to message #1 by Joe Edwards

If you know what you want then get what you want. Forget about what you need. I don't even think a calculator is needed for school.

Re: Calculator Confustion....What I need vs. what I want

*Message #13 Posted by **Joe Edwards** on 11 May 2004, 9:22 a.m.,*

in response to message #12 by Chan Tran

True. Just consider how many folks have study mathematics before the calc was invented. I think that a 41c/v/x is in the future.

Re: Calculator Confustion....What I need vs. what I want

*Message #14 Posted by **Guillermo Castarés** on 11 May 2004, 9:36 a.m.,*
in response to message #1 by Joe Edwards

As a collector I have the following models at hand: HP-97, HP-33E, HP-33C, HP-41C, HP-41CV, HP-41CX, HP-10, HP-11, HP-12, HP-15, HP-16, HP-28C, HP-28S, HP-32S, HP-32SII, HP-42S, HP-48SX, HP-48G.

Since last year I´m studying for a MBA. I have a lot of calculators to choose, but I always take the HP-42S. I feel it is compact, simple, powerfull and easy to program formulas and simple algorithms (but it supports complex programs too). My second choice would be HP-41CX + Math module.

I hope it helps.

Guillermo

Re: Calculator Confustion....What I need vs. what I want

*Message #15 Posted by **Bill Smith** on 11 May 2004, 11:55 a.m.,*
in response to message #1 by Joe Edwards

my 2 cents...

my favorite combo is a 15C and a palmtop. for pure calculator work a shirt pocket unit is always close to hand, and any of the 11C,15C,32S,42S excel in this regard. if graphing and advanced functionality in a portable form is important, consider adding a 95LX, 100LX, 200LX to your backpack. the builtin tools alone are great (123, RPN, Solver), and i have programmed in BASIC, fortran, & perl (C is available for those who know). also, emu41 and emu71 run on the 100LX and 200LX, maybe the 95LX as well? the 95LX has a lousy display compared to its successors (and limited PCMCIA), but they are readily available for under $50. i could have saved $3000 and skipped having a 486 in grad school...

Re: Calculator Confustion....What I need vs. what I want

*Message #16 Posted by **Ron Ross** on 11 May 2004, 1:39 p.m.,*
in response to message #1 by Joe Edwards

My favorite all around pocket calculator is the HP42s for power and features. However the 15c is a close second because it is just a bit smaller and fits in a pocket even better, and I like the horizontal layout better. But I like the extra power and RAM of the 42s MORE.

A 41c series or Hp33s would do fine for a general pocket calculator, but I am spoiled to the extra RAM and long variable names on my (expanded) 42s.

Will someone please correct the spelling of "Confusion"?

*Message #17 Posted by **Wayne Stephens** on 12 May 2004, 8:19 a.m.,*
in response to message #1 by Joe Edwards

Thank you.

in response to message #17 by Wayne Stephens

I got halfway through last night, and can heartily recommend it to all of the "sticklers" out there.

No.

*Message #20 Posted by **Wayne Stephens** on 13 May 2004, 1:23 p.m.,*
in response to message #19 by Paul Brogger

Paul,

I have not heard of it. Is it a book? Who is the author?

Take care.

Wayne.

It's a book, by one Lynne Truss . . .

*Message #21 Posted by **Paul Brogger** on 13 May 2004, 4:35 p.m.,*
in response to message #20 by Wayne Stephens

. . . a book about the importance of proper (or at least well-thought-out) punctuation, of all things. IMHO, simply hilarious.

I'm guessing a spelling-aware person (like you) might agree.

Got it!

*Message #22 Posted by **Wayne Stephens** on 14 May 2004, 6:33 a.m.,*
in response to message #21 by Paul Brogger

I just found it on ebay for a very reasonable price. It looks like a great read.

Take care.

Wayne.

Re: Re(lated?): Have you read "Eats, Shoots & Leaves" yet?

*Message #23 Posted by **Les Bell [Sydney]** on 15 May 2004, 6:16 a.m.,*
in response to message #19 by Paul Brogger

The original joke concerns the wombat, a native Australian mammal which eats roots, shoots and leaves. The line is said to also apply to the typical Australian male, who, when invited to his girlfriend's place for dinner:

* eats (dinner)
* roots (Australian slang for what some have termed "horizontal folk dancing")
* shoots (Umm, errr. . . reaches a climax)
* leaves (thank you and good night)

Best,

--- Les [http://www.lesbell.com.au]

surveying on eBay

*Message #1 Posted by **RABIH Cyril** on 10 May 2004, 9:01 p.m.*

Just a question. I really don't understand why hp calculators with surveying pacs are so expensive on eBay. I can understand the price of rarities like W&W rambox or hp-82216A for gx but not for a surveying pac. If someone has an answer, you're welcome.

Re: surveying on eBay

*Message #2 Posted by **Randy** on 10 May 2004, 10:00 p.m.,*
in response to message #1 by RABIH Cyril

Simple: Supply and demand. They stopped making them years ago and they remain a very good tool. Sure, lots of users have moved on to newer gadgets but they still can get the job done.

They do tend to get run over by trucks, left on job sites, encased in concrete, dropped in muddy trenches, etc which makes some desperate for a replacement and will pay high prices so they can go back to work.

Just my 2 cents worth.

PS: Seen what's happened to 48GX prices lately? Same logic can be applied. Now that they've been discontinued, it's just one more HP selling used for more than new prices a year ago.

Re: surveying on eBay

*Message #3 Posted by **Johann** on 13 May 2004, 3:35 p.m.,*
in response to message #2 by Randy

Yes the surveying program that is seen on ebay is a valuable tool for college students taking surveying classes. My teacher promotes doing everything by hand but also likes to see the use of the HP Calcs using these programs. They provide an excellent way to check all of your homwwork and test problems in a surveying course.

Deep Pi - 42S - Some Results

*Message #1 Posted by **Bill (Smithville, NJ)** on 10 May 2004, 1:12 p.m.*

The two HP-42S's are busy runing the deep pi program and printing their results. The following is the first 24 hours:

Note: FAST refers to Fast Speed, NORM refers to the standard speed. Also, I was using a HP-41CX to print the date and time every 10 minutes. I lost some time marks when my timer printing program didn't adjust for rolling over to a new day at midnight. So there's several hours where the 42S printed results, but I don't know the time frame. This is noted as NO-TIME in the list.

The times given are from the start time to the next ten minute time mark. Thus the actual time will be less that that indicate - up to a maximum of 10 minutes less.

Digit	Fast	Norm
1	10 Min	20 Min
7	20 Min	40 Min
13	40 Min	1 Hr 20 Min
19	1 Hr 0 Min	No Time
25	1 Hr 30 Min	No Time
31	No Time	No Time
37	No Time	No Time
43	No Time	7 Hr 20 Min
49	No Time	9 Hr 20 Min
55	No Time	11 Hr 40 Min
61	No Time	14 Hr 20 Min
67	8 Hr 10 Min	17 Hr 20 Min
73	9 Hr 50 Min	20 Hr 40 Min
79	11 Hr 40 Min	24 Hr 30 Min
85	13 Hr 40 Min	28 Hr 00 Min
91	15 Hr 50 Min	
97	18 Hr 20 Min	
103	21 Hr 0 Min	
109	23 Hr 50 Min	
115	27 Hr 00 Min	
121	30 Hr 20 Min	

It looks like it'll take a long time to reach the 1000th digit. Wonder if the batteries will hold out.

The Fast Mode is a little more than double the speed. At least with this program.

Guys, aren't these times awful?

*Message #2 Posted by **Gene** on 10 May 2004, 1:29 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Perhaps I'm confused. (Wouldn't be the first time).

These times are awful. There was an HP41 program (that would work fine on the 42S) that found 1000 digits of PI in under 10 hours.

What am I missing here?

Gene

12345

Re: Guys, aren't these times awful?

*Message #3 Posted by **Bill (Smithville, NJ)** on 10 May 2004, 1:54 p.m.,*
in response to message #2 by Gene

Hi Gene,

Well.... Hugh did say his program wasn't optimized :) I was mainly running it to see what dfference the fast mode made on the 42S in program execution and battery consumption.

Do you have copy of the HP-41 program? Did it just use standard 41 functions or did it make use of synthetic fuctions? If standard functions, then the 42S should execute it quicker.

Just re-read your posting and you do say it would run on the 42S. Could you post the program and I'll give it try. Thanks.

Re: Guys, aren't these times awful?

*Message #4 Posted by **Gene** on 10 May 2004, 2:09 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

PPC V8N2P4 (March/April 1980)

A graph of PI calculation times is found in the above PPC Journal. The program was written by Ron Knapp. It was published before the graph date, but not sure when.

He later revised it.

1000 digits in 8 hours, I think.

Since the 42S in fast mode is about 4-8X faster than a vanilla 41c, that should be between 1-2 hours for 1000 digits.

Program is PPC Journal V7N5P9

*Message #5 Posted by **Gene** on 10 May 2004, 2:15 p.m.,*
in response to message #4 by Gene

It can be found on "that other site".

Gene

P.S. I know the other program might could compute digits 100-110 without doing the first 100 digits, but since Knapp's program can give you all 110 of those digits in much less time, it's more efficient.

42S Fast Mode

*Message #6 Posted by **Trent Moseley** on 10 May 2004, 3:32 p.m.,*
in response to message #4 by Gene

Gene,

I have the 42S Owner's Manual right in front of me. I don't see anything in the index about a fast mode. What am I missing?

tm

Re: 42S Fast Mode

*Message #7 Posted by **Bill (Smithville, NJ)** on 10 May 2004, 3:41 p.m.,*
in response to message #6 by Trent Moseley

Hi Trent,

Early versions of the HP-42S Rom could be programmed into a "Fast" mode by using the built-in debugger. See the following page:

http://www.rskey.org/gene/hpgene/hp42fast.htm

Re: 42S Fast Mode

*Message #8 Posted by **Gene** on 10 May 2004, 3:50 p.m.,*
in response to message #7 by Bill (Smithville, NJ)

The 42S rom was changed around late 1989 (?) and this no longer worked.

It uses battery power but makes games/programs a joy to run.

Old 42S calculators are worth more as a result.

Gene

Re: 42S Fast Mode

*Message #9 Posted by **Veli-Pekka Nousiainen** on 11 May 2004, 4:03 a.m.,*
in response to message #8 by Gene

I can confirm taht with Serial 3330S...
[VPN])-`:

That means you have an updated 42S rom

*Message #10 Posted by **Gene Wright** on 11 May 2004, 7:52 a.m.,*
in response to message #9 by Veli-Pekka Nousiainen

sorry, but a "size error" means you have one that does not work in fast mode.

I have never seen/heard of a 42S that was capable of fast mode with a SN after 3100sXXXX.

All of them are 1990 vintage or earlier.

Happy hunting...it's worth it! Gene

Re: That means you have an updated 42S rom

*Message #11 Posted by **Trent Moseley** on 11 May 2004, 2:37 p.m.,*

in response to message #10 by Gene Wright

Thanks for information. My 42S must be one of the last to be made, serial 3515S...

tm

Re: That means you have an updated 42S rom

*Message #12 Posted by **Massimo (Italy)** on 11 May 2004, 7:01 p.m.,*
in response to message #11 by Trent Moseley

One of the ones I have around here is an "ID027..." replacement unit.
I think those were among the the last to be built.

Massimo

Re: Guys, aren't these times awful?

*Message #13 Posted by **Bram** on 10 May 2004, 2:12 p.m.,*
in response to message #2 by Gene

If I remeber well, the special thing about deep-pi was that it computes a bunch of decimals without computing the ones before them. I can imagine that it takes extra computing time to do so. The program you are referring to may be more "straight forweard" and computes decimals in order.

Hence, perhaps no real practical use for deep-pi, but that wasn't the point here.

Re: Deep Pi - 42S - Timing Correction

*Message #14 Posted by **Bill (Smithville, NJ)** on 10 May 2004, 2:28 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Note - The times are the total time to that digit INCLUDING the time to calculate ALL the previous digits. So, 8 HR to Digit 67 also includes calculating and printing the previous digits up to 67. I don't think my original post was real clear on this.

Re: Deep Pi - 42S - Some Results

*Message #15 Posted by **hugh steers** on 10 May 2004, 10:13 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

hi guys,

thanks for posting your results. you're right, this is very bad indeed. 24 hours and only just a hundred digits or so. i was hoping we'd get to 1000 in that time. the algorithm is O(n^1.5) so this is bad news for more digits.

firstly, its unlikely that this or similar algorithm will beat the 8 hours for 1000 whatever it does. this is because the method is fundamentally slower than a straight fixed size calculation. i have a few ideas on how to speed up the current method, but it will be a *2 or so if im lucky. i think there is a more recent algorithm that has slightly better order, but its more complicated and may, in fact, be slower for these numbers. i'll look into it.

in the meantime, im most grateful that you've got these results as it gives an indication into whether this approach stands a change at all of being feasible (or not).

in response to message #4 by bill platt

...spoken by someone who doesn't like obsolete limitations :)

Re: HP 33s Keypad

*Message #6 Posted by **Sam Hughes** on 10 May 2004, 9:50 p.m.,*
in response to message #5 by Anon

What would appease everybody is a user-adjustable stack depth -- anything from two to nine.

And w/ named variables more than one letter long -- and numbered registers too (but really they'll be internally same as named vars, why not).

And STO 0 7 will really be the same as << 7 UNPICK >> on the HP 49 (and 48 i would presume). And RCL 7 would be the same as << 7 PICK >>. It would be a nifty way to add more stack

operations. And instead of Rv and R^, there would just be R^ followed by a number, with R^ CHS number being in the opposite direction.

Too bad I didn't finish my entry for that design-a-calc contest.

Re: HP 33s Keypad

*Message #7 Posted by **mpar** on 12 May 2004, 2:35 a.m.,*
in response to message #6 by Sam Hughes

or it would be nice to have instead of R^ or Rv to be able to use the top/center 4 way directional button to rotate through the stack

Re: HP 33s Keypad

*Message #8 Posted by **bill platt** on 10 May 2004, 11:26 a.m.,*
in response to message #1 by René Stäbler

Hi René,

The keypad is more than worth it for the money. In the states, we can buy them, with shipping, for $53.00 (and there is a rebate of $10 too but I don't know about that in Europe). It has a good click and I have not had any missed keystrokes.

I would not say it is as good or better tan the 41 though. The keys are larger, and the foot pads are compliant rubber stilts, and so it feels different than a 41c on a talbetop.

However, I would agree that from a practical standpoint the key action is equivalent to the 41C in the most important ways.....but for nostalgia's sake it is hard to say it is better than the 41c---almost heretical to allow such a thought! ;>)

regards,

Bill

Re: HP 33s Keypad

*Message #9 Posted by **Tom Scott** on 10 May 2004, 2:43 p.m.,*
in response to message #1 by René Stäbler

The key click feel is very good. My only complaint (besides the very small decimal point) is that the lettering for the alpha characters (A...Z) is black in color which makes it difficult to pick out from the other lettering. Perhaps they should have used yellow or other distinctive color.

Tom Scott

Re: HP 33s Keypad

*Message #10 Posted by **Joe Edwards** on 10 May 2004, 8:56 p.m.,*
in response to message #9 by Tom Scott

I played with one for an hour or so and overall it is an okay machine. The keys don't feel bad (compared to the 49g+), but they are not quite as nice as my HP-20s models. I actually like the silver faceplate, BUT the chevron style key layout was unnecessary and is rather bothersome. The extra silver keys and cursor key up top are the only thing that I wish they had left out. If they hadn't put those things on the 33s, then they could have left the keys horizontal. I will probably still end up owning one sooner or later.

Joe

HP-41: Data Transfer to PC via modem?

*Message #1 Posted by **Cococollector** on 10 May 2004, 4:10 a.m.*

Hi all,

while playing with the thought, how to exchange data between my 41 and my PC, I came up with the following:

Why build up this complicated chain of devices hard to get: 41 - HP-IL-module - IL-RS232-Interface - PC, when there's this 300-baud-modem (also hard to get, I know).

I don't yet know how it works, but shouldn't it be easier??? AND: my 41 would be part of today's electronically interconnected world :-)

I'm curious ...

Regards Klaus.

Re: HP-41: Data Transfer to PC via modem?

*Message #2 Posted by **Ángel Martin** on 10 May 2004, 5:18 a.m.,*
in response to message #1 by Cococollector

Klaus, if you use the Modem (also called Data Coupler) that's also an HP-IL device, thus you still need the same length chain:

HP-41 - HP-IL Module - Data Coupler - PC

The only thing you save is the PC IL-Card, however and as you said the IL-Data Coupler is hard to get. It also presents you with the software problem, what would you use to manage the communication?

Best, ÁM

Re: HP-41: Data Transfer to PC via modem?

*Message #3 Posted by **Cococollector** on 10 May 2004, 5:25 a.m.,*
in response to message #2 by Ángel Martin

Here's, where it's going to become interesting.

- What data is submitted over the coupler: IL? - Is software available that translates the ominous modem data into useful stuff? - Do I even have to interpret the data, if I have e.g. a 41-emulator running?

Got no clues so far, though I searched the web and literature thoroughly...

Klaus.

Re: HP-41: Data Transfer to PC via modem?

*Message #4 Posted by **Claudio** on 10 May 2004, 6:25 a.m.,*
in response to message #3 by Cococollector

I think that you can use it like the RS232 converter. You must do two programs (one on the HP41 and one on the PC) with your protocol to transfer the data.

But I think that the true problem is the coupler itself. It only accept a phone (it's an acoustic coupler), so you can't use it like the RS232 converter. It hasn't electrical wire to connect to the PC.

Claudio

P.S.: remove the double "_nospam_" from my address! :-)

1234

Re: HP-41: Data Transfer to PC via modem?

*Message #5 Posted by **Cococollector** on 10 May 2004, 7:26 a.m.,*
in response to message #4 by Claudio

That's the clue of it. Modems for PC are widely available, so I "only" need a way to find a means of transporting the data on the physical layer

Re: HP-41: Data Transfer to PC via modem?

*Message #6 Posted by **Garth Wilson** on 10 May 2004, 4:38 p.m.,*
in response to message #5 by Cococollector

If you had a modem that worked with the HP-41, then you'd still need to either go through the phone service, or emulate the phone service with your own equipment that would provide the +48VDC and the pull-up resistors so the voltage drops into the area of 6V when you're off hook, and the 60VAC 20Hz ring signal. I've heard there are new computers without RS-232, but I think this is absurd. I wouldn't buy a computer without it.

Re: HP-41: Data Transfer to PC via modem?

*Message #7 Posted by **Vassilis Prevelakis** on 11 May 2004, 11:06 p.m.,*
in response to message #1 by Cococollector

You may want to have a look at a comms program for xfering files between the HP41 and the HP85. It was published in the PPC Journal (V10N2). Unfortunately you need the the XIO module on the 41, although I suspect that you can get the program to work (more or less) without it.

Re: HP-41: Data Transfer to PC via modem?

*Message #8 Posted by **Meindert Kuipers** on 12 May 2004, 2:54 a.m.,*
in response to message #1 by Cococollector

It will not be too long before it is possible to use USB to talk between the HP41 and a PC. The MLDL2000 is making good progress, only a few tests are remaining and then it is a matter of finishing the routing and

making the PCB's!

Meindert

Complex Square Root on 33s

*Message #1 Posted by **Bill P** on 10 May 2004, 1:15 a.m.*

On comp.sys.hp48 lately, several people have been complaining about the absence of a direct complex square root function on the HP 33s. Here is my solution:

```
G0001 LBL G
G0002 0
G0003 0.5
G0004 CMPLXy^x
G0005 RTN
```

This puts the complex square root on the calc as an effective extra command for the SQRT(x) key. This may be useful if the command is needed often.

HP 33s Keypad

*Message #2 Posted by **René Stäbler** on 10 May 2004, 11:11 a.m.,*
in response to message #1 by Bill P

I'm an old 41cv user and used to an excellent key-pad - has anyone already experienced the type / feeling of the 33s keys? thanks in advance, rene

Re: It is not working (input is ex:2x+3=6)

*Message #3 Posted by **Veli-Pekka Nousiainen** on 10 May 2004, 1:27 p.m.,*
in response to message #2 by René Stäbler

```
33s key feedback is better than in my 42S and 32SII. I like it.
Coloring or the general shape is another issue. 48G colors are worse IMO

```

Re: Complex Square Root on 33s

*Message #4 Posted by **Karl Schneider** on 11 May 2004, 2:13 a.m.,*
in response to message #1 by Bill P

Bill --

In fact, I was just reviewing this today. Your program is the logical work-around.

I believe that the complex-number capability of the 33S (and of its ancestral 32SII/32S models) was based upon the routines provided in the HP-41C Math Pac. This ROM also lacked direct complex-argument support for x^2, sqrt, hyperbolics, and inverse trigs. "Z^N", "Z^1/N", and "Z^W" could be used for the first two, but the others would require a bit of work.

Among the RPN models, only the 15C and 42S have complete complex-number support.

Re: Complex Square Root on 33s

*Message #5 Posted by **Ángel Martin** on 11 May 2004, 7:08 a.m.,*
in response to message #4 by Karl Schneider

A small correction: now also the 41 has a full support of complex functions, and even more complete than those mentioned (15C and 42S).

See the HP-41Z ROM available on the web's other site. Just a few days ago I uploaded the last revision, with source code available as well.

Best, ÁM.

Hp 48gx software

*Message #1 Posted by **Johann** on 9 May 2004, 10:55 p.m.*

I am looking to buy calculus and physics software, for a HP 48gx. I am unable to find any except on ebay. Does anyone know of a website or person that is willing to sell any of these. Thanks

Re: Hp 48gx software

*Message #2 Posted by **Anon** on 9 May 2004, 11:02 p.m.,*
in response to message #1 by Johann

Get a memory card and put on erable/alg48.

It will probably be cheaper for you just to buy a hp49g+ or ti89. These can do symbolic mathematics without external software, and offer a boost in speed and better screen (but a poorer keyboard)

Re: Hp 48gx software

*Message #3 Posted by **Veli-Pekka Nousiainen** on 10 May 2004, 2:19 a.m.,*
in response to message #2 by Anon

```
I also recommend to buy the faaast HP 49g+.

Look for programs at www.hpcalc.org

```

Re: David, Once again, someone is using your pictures on ebay.

*Message #2 Posted by **Patrick** on 9 May 2004, 3:23 p.m.,*
in response to message #1 by Emmanuel, France

I have a suggestion, although it is a bit of work....

Why not put a watermark on top of your pictures here? Provide the originals (without watermarks) on the Museum CDs. That way, if someone absconds with your photos, they either advertize your site (watermark) or they provide you with a bit of income (bought CDs). It also provides something of an incentive for others to buy your CDs, too.

Re: David, Once again, someone is using your pictures on ebay.

*Message #3 Posted by **John Ioannidis** on 10 May 2004, 2:00 p.m.,*
in response to message #2 by Patrick

That's a terrible idea.

While it is bad form to use the HP museum pictures on ebay, it does not really hurt us, and we are not in the business of providing buyer protection on ebay.

/ji

hp48gii bug? (lengthy)

*Message #1 Posted by **Dwight L. Myers** on 9 May 2004, 1:19 a.m.*

I just received an hp48gii on Thursday. (I also got an hp33s at the same time, more on that in a later post.) If I understand the user's manual, the main softkey menu (which is accessed by the TOOL button) should read:

EDIT VIEW RCL STO> PURGE CLEAR

Which is what I got when I first put the batteries in. The calculator came up in algebraic mode at first, so I naturally switched to rpn mode. After various operations, an attempt to return to the main menu using TOOL gave:

EDIT VIEW STACK RCL PURGE CLEAR

(STACK being the STACK menu). After many fruitless attempts to return to the proper menu, I removed the batteries, and started over. Same result. Eventually I did find out that switching to algebraic mode causes the TOOL button to give the proper menu. As soon as I go to rpn mode, I get the Stack menu in place of the STO command.

Has anyone else with a 48gii experienced this? I was just wanting to confirm that this bug is unique to my calc, and not common to all?

In spite of this bug, I am favorably impressed with the 48gii so far. I haven't had a chance to use it very much, but at least the keys have a comfortable feel with good tactile feedback. The KB layout seems reasonable enough. I'd prefer the enter key in its original place and bigger, but the current layout seems workable.

Dwight Myers

Re: hp48gii bug? (lengthy)

*Message #2 Posted by **Arnaud Amiel** on 9 May 2004, 4:58 a.m.,*
in response to message #1 by Dwight L. Myers

The tool menu will change to give you the most appropriate commands for the environmnet you are in, if you are in the equation writer, it will again be different.
This is not a bug but a feature.

Arnaud

Re: hp48gii bug? (lengthy)

*Message #3 Posted by **Tim Wessman** on 9 May 2004, 5:51 a.m.,*
in response to message #2 by Arnaud Amiel

Yes indeed, a feature. In algebraic mode you don't need the stack manipulation commands, STO> is a more important command used more often. In RPN, you'll need your DUPs, SWAPs, DROPs, etc. so it always changes to fit your current settings and active applications. Try it in various things to see what you have.

Re: hp48gii bug? (lengthy)

*Message #4 Posted by **Dwight L. Myers** on 9 May 2004, 10:26 p.m.,*
in response to message #3 by Tim Wessman

OK, I see the different results for the TOOL button, thanks. Did you find this out by trial and error, or is it in the user guide? I'm not too good at reading a manual on the screen, and I haven't worked up the courage to print 2 reams of paper yet!

Woodstock capacitor values?

*Message #1 Posted by **John Garza** on 8 May 2004, 3:20 p.m.*

Does anyone have a list of the values for those pesky tantalum caps in woodstock series machines? (A real schematic would be excellent, but I've never seen one with all the component values listed.) I'm working on a hp-27 and a hp-25c and I'd like to replace them.

-John

Re: Woodstock capacitor values?

*Message #2 Posted by **Tony Duell** on 8 May 2004, 3:59 p.m.,*
in response to message #1 by John Garza

For the one across the switched battery line : 60uF (68uF is fine). For the ones in the Vss supply : 47uF (some machines use 22uF, but 47uF is fine in all cases). For the little ones in the Vgg supply (and elsewhere) : 2.2uF. Rmemember that the HP27 uses NMOS ICs, so the power converter is different to that in other machines. BTW, HPCC has reverse-engineerd schematics of all the Woodstocks...

Re: Woodstock capacitor values?

*Message #3 Posted by **Albert** on 9 May 2004, 6:52 p.m.,*
in response to message #2 by Tony Duell

Hi Tony,

How can I download these Woodstocks reverse-engineered schematics from the HPCC?

Thanks in advance, Albert

Re: Woodstock capacitor values?

*Message #4 Posted by **Tony Duell** on 9 May 2004, 10:20 p.m.,*
in response to message #3 by Albert

I said we had reverse-engineered these machines, I said nothing about having scanned the schematics and put them on the web site. Most of them exist as hand-drawn diagrams on paper (sometimes people forget that not everythign has to involve a computer!)

Re: Woodstock capacitor values?

*Message #5 Posted by **John Garza** on 10 May 2004, 12:05 a.m.,*
in response to message #4 by Tony Duell

Thanks for the values! Looks like I'll be going parts shopping tommorrow. And I thought I hadn't seen any schematics in Datafile... :)

I also noticed one of the diodes has that waxy "glazed" appearance (overheated?). Looks like it says 20642 and I can make out the Motorola logo. It's located below the wound toroid, next to a 680 Ohm resistor. And by the way, under magnification that resistor has faint hairline cracks throughout it's body. It looks sort of the way an antique china dinner plate does. Ah, my babies are showing their age!

-J

Re: Woodstock capacitor values?

*Message #6 Posted by **Tony Duell** on 10 May 2004, 2:37 p.m.,*
in response to message #5 by John Garza

Be careful. If that's the black diode (all the others being white with coloured bands), it's a zener used as part of the PSU regulation circuitry. I don't have the schematics in front of me, but basically, one transistor is an oscillator, the other removes the base voltage from it if the output voltage gets too high. Now, Vss is around 6.2V, you want about 0.6V be-drop across the base-emitter junction of the regulator transistor, so I guess it's a 5.V zener. But I don't know. What I do know is that it's not just a normal diode!

Re: Woodstock capacitor values?

*Message #7 Posted by **John Garza** on 11 May 2004, 12:32 a.m.,*
in response to message #6 by Tony Duell

Yep. That's the one. One lead traces right to the Base lead of a transistor marked "4-071". Thanks for the heads up warning.

A funny thing: I've been reading in the archives and found a good article entitled "A Common Woodstock Problem and Repair Suggestions". In the last paragraph, mention is made of an uninstalled U5 chip on the HP27. My 27's board doesn't have this. I don't know if the author (Katie) was writing about another HP, or perhaps there were several "versions" of the HP27 circuit boards produced.

cheers,

-J

HPCC?

*Message #8 Posted by **Wayne Stephens** on 9 May 2004, 7:45 p.m.,*
in response to message #2 by Tony Duell

Sorry to display my ignorance, but what is an "HPCC"?

Take care.

Wayne.

HP 49g has a CREAKY case

*Message #1 Posted by **Joe Edwards** on 8 May 2004, 12:20 p.m.*

Hey again, It seemed prudent to seperate my questions. I am sorry if this is inappropriate and takes up too much room. I have a 49g that works flawlessly. I have tried two (2) 49g+ models....the bad keyboard and the new/improved keyboard models. The speed difference is fantastic, but I cannot get past the gold faceplate. Why the heck did they even create the 48GII? They should have simply used the siver faceplate on the 49g+. Sorry, I think gold is gaudy and just as "unprofessional" as the blue case of my 49g model. In addition, they keys do feel MUCH better and are significantly quieter than the first 49g+ models, but IMHO, the keys still look and feel "cheap". Yes, I am crazy, but I actually like the look and feel of the rubber keys on the 49g model (they remind me of the keys on my RCA remote control). They solid feel that they has is quite comfortable, but that is me. Sorry...rambling here.....Am I the only one who feels that the 49g was a nice machine? Now, the real point of this post: did the 49g have issues with the case developing a creaky sound to them or worse, did they ship this way? My TI-89 is solid and quite. So is my three 20s models and my 15c. The 48g models I have toyed with were all solid as well. It would be nice to know whether to expect this off all the 49g models, as I may pick up an extra one as a back up in the next few months.

Thanks. Joe

Re: HP 49g has a CREAKY case

*Message #2 Posted by **Ben Salinas** on 8 May 2004, 3:10 p.m.,*
in response to message #1 by Joe Edwards

When I first got my 49g+, I noticed that it felt cheap. I think it is because it does not feel dense. In fact, most of it feels hollow. I compared it to the TI-89 (they are almost hte exact same size), and without its batteries the TI-89 weighs more than the 49g+ does with its batteries.

The 49g+ is a very lightweight calculator. DVD players have a much larger footprint than they need. (For example, most DVD players are nearly the size of a VCR, but they make DVD players (without the screens) the size of a DiscMan). Most of the space in a DVD player is empty. Also, most of the weight in a DVD player is to prevent it from feeling "cheap" They literally put in chunks of metal only to weigh it down.

Personally, I prefer the lighter calculator than one that feels solid (such as the 39g... that thing is a brick)

-ben

Re: HP 49g has a CREAKY case

*Message #3 Posted by **Joe Edwards** on 8 May 2004, 5:17 p.m.,*
in response to message #2 by Ben Salinas

But do you know if the 49g has an inherently creaky case?

no, not the two that I have
{VPN} AXL
```

Re: HP 49g has a CREAKY case

*Message #5 Posted by **mpar** on 9 May 2004, 2:17 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

I also love my 49g i have used for the past 2 years and it has performed perfectly. Mine has also developed a creak since i have droped it about a year go. The keys were also an issue and the begining but after some use they are no longer an problem. It is way better than the TI-89 that all of my clasemates have i can not count the amount of errors they have had because of ALG entry.

Re: HP 49g has a CREAKY case

*Message #6 Posted by **Tom (UK)** on 10 May 2004, 12:15 p.m.,*
in response to message #3 by Joe Edwards

Mine developed a creaky case after a few months of light use. I'm think it may be because of a combination of poor construction and stiff keys. It doesn't sound, look or behave like it cost...

There I go again, moan moan moan about the '49G - wish I'd bought the '48 first.

HP 48 SX or GX

*Message #1 Posted by **Joe Edwards** on 8 May 2004, 12:12 p.m.*

Hey folks, I am in the market for another calc. and I would like to buy a 48 *x model. I currently have a 49g (old model) which I love (except for the creaky case). I have played with the the 48g models, but what I want to know is what are the differences between the 48 S/GX models besides memory. Speed? Does the SX run all the expansion cards that the GX does? Also, what is the largest memory card the SX can hold. Why do I even ask? Price and I have heard some folks say they prefer the SX model. Keyboard layout? Construction quality? Thanks in advance.

Joe

Re: HP 48 SX or GX

*Message #2 Posted by **Raymond Del Tondo** on 8 May 2004, 3:28 p.m.,*
in response to message #1 by Joe Edwards

Hi,

I'd go for the GX, of course. Almost all things are better in the GX compared to the SX, the most important points are the much better display, the speed increase, and the 128K of built-in RAM (the SX has only 32K).

For the display, take a look into this thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=56518

There you'll have a direct side-by-side comparison of the 3 different displays used in the HP-48 series. Seen from today, the SX display is absolutely the worst possible.

The only drawback for some people is the color schema of the GX, but hey, nearly every other HP calc has a better and more ergonomic color schema than the 49g (blue & red letters on 'metallic' blue...;-)

In most cases, expansion cards are interchangeable between the SX and GX, but there are some cards, mostly preprogrammed software, which are made for the SX or GX specifially.

There were so-called multi-memory cards (multiple bankswitched 128K blocks) for the HP-48SX from TDS (e.g. 256K), I don't know which one was the largest, I assume that you can use up to two multi-memory cards in the SX at the same time, so you had a maximum of 512K independent memory, and the 32K main memory.

There were (and still are) also various RAM cards for the GX, theoretically up to 4MB, but due to an addressing bug in the 48GX ROM to a max of 2MB. These cards can only be used in port 2 of the GX, wheras only 32K or 128K cards can be used in port 1 .

Theoretically you can use the TDS multi-memory cards in port 1 of the GX, but IMHO it doesn't make too much sense, because I doubt you'll ever need that much memory. Apart from that, you'd have to write your own driver software for the bank swwitching in ML, because I'm sure the TDS drivers won't work in the GX.

Summary: Forget the SX, go for a GX, preferably for a unit with the black&white display of the 49g.

HTH

Raymond

Re: HP 48 SX or GX

*Message #3 Posted by **marais** on 8 May 2004, 6:26 p.m.,*
in response to message #2 by Raymond Del Tondo

I own both and prefer the SX. The display is almost the same, both are worse than my 28S - I notice there must be some later 48G display that is significantly better than the two displays I have. Anyway, the keyboard of my SX has the high quality I'm used to, while the 48G has a weird tactile response. And the color scheme is of course much more logical on the SX than on the G.

Re: HP 48 SX or GX

*Message #4 Posted by **bill platt** on 8 May 2004, 6:46 p.m.,*
in response to message #3 by marais

Hi marais,

Could you tell us where your 48G is made? I suspect it to be Indonesia. Did you buy it new or used? II have noticed that the Singapore made 48g/x/+ are different (better perhaps) from the Indonesian (newer) machines.

regards,

Bill

> The only drawback for some people is the color schema of the GX, but hey, nearly every other HP calc has a better and more ergonomic color schema than the 49g (blue & red letters on 'metallic' blue...;-)

The 48GX adds some input forms and choose boxes, which I often find more a hindrance than a help, but the old "soft-key" menus are still available for most things.

> Quote:
>
> There were so-called multi-memory cards (multiple bankswitched 128K blocks) for the HP-48SX from TDS (e.g. 256K), I don't know which one was the largest, I assume that you can

> use up to two multi-memory cards in the SX at the same time, so you had a maximum of 512K independent memory, and the 32K main memory.

I have a 1997 EduCALC catalogue (#74) that lists the TDS cards in 256KB and 512KB sizes, and I have one 512kb bankswitched card. It works in either slot 1 or slot 2, so yes, I assume that you could use two at once in the 48SX. But note that you can use only one 128KB bank of the card at a time, and if I recall correctly, switching banks means doing a warmstart too.

> Quote:
>
> There were (and still are) also various RAM cards for the GX, theoretically up to 4MB, but due to an addressing bug in the 48GX ROM to a max of 2MB.

Actually, Klotz markets a 4MB card. I understand that the addressing bug makes accessing the last port of a 32 port card impossible, but on the Klotz 4MB card, you can switch which two 128KB banks of the 4MB card will be used as the last two ports.

> Quote:
>
> These cards can only be used in port 2 of the GX, wheras only 32K or 128K cards can be used in port 1 .

Also note that with the 48SX, you can merge both slots with system memory, for a maximum that approaches 288kb, but with the 48GX, only slot 1 can be merged, for a maximum that approaches 256kb.

> Quote:
>
> Theoretically you can use the TDS multi-memory cards in port 1 of the GX, but IMHO it doesn't make too much sense, because I doubt you'll ever need that much memory. Apart from that, you'd have to write your own driver software for the bank swwitching in ML, because I'm sure the TDS drivers won't work in the GX.

I'm not sure whether I've ever tried the TDS card in a 48GX. Better to use a 128KB card in slot 1 and the larger cards designed for the 48GX in slot 2, and save the special bank-switched card for the 48SX.

Regards,
James

HP-41 Brain Transplant

*Message #1 Posted by **Paul Goertz** on 8 May 2004, 11:30 a.m.*

I have acquired 2 HP-41's over the recent months. The first is a 41C, in excellent cosmetic condition, but non-functioning.

The second is a 41CX that functions well, but has damage to the keyboard; the most pronounced problem is that the ENTER key looks as though it got heated to the point that one end twisted and sagged.

My question is: is it possible (& relatively painless) to perform a "brain transplant" from the 41CX to the 41C? That is, retain the 41C's case, keyboard & LCD, but replace the circuit board(s) with those from the 41CX?

I know that there are a couple of places that will repair these, but I want to try my hand first (not to mention save a few $).

Thanks, Paul

Re: HP-41 Brain Transplant

*Message #2 Posted by **Randy Sloyer** on 8 May 2004, 1:43 p.m.,*
in response to message #1 by Paul Goertz

The answer is probably yes, if:

1. Both units are fullnuts.
2. The C is not an early steep key version - the LCD's are incompatible with later models.

If the C has pink polymer zebras (early models had them), toss them and use the gold wire connector(s) from the CX. You may need to pry the spacer off the CX lower posts to use them, depends on the version.

Re: HP-41 Brain Transplant

*Message #3 Posted by **Paul Goertz** on 10 May 2004, 5:56 p.m.,*
in response to message #2 by Randy Sloyer

Bummer . . . the C has "steep keys", and the CX is a half-nut. At least I'll know what to ask for if I buy another machine for parts.

Many thanks,

Paul

Re: HP-41 Brain Transplant

*Message #4 Posted by **Randy Sloyer** on 10 May 2004, 6:07 p.m.,*
in response to message #3 by Paul Goertz

I've got a half-nut CX here with a broken lcd, the keyboard/logic board is otherwise a-okay. I could build you a frankin-calc with this one and your trashed keyboard unit. Email me if you want to try. etron at comcast dot net

Re: HP-41 Brain Transplant

*Message #5 Posted by **Tony Duell** on 8 May 2004, 4:04 p.m.,*
in response to message #1 by Paul Goertz

You need to check if they're 'fullnut' or 'halfnut' machines. The easy way to tell is that the halfnuts have a black border to the display, under the window. If it's one of each, forget it. They're very different inside. IfThey;re both halfnuts, it's non-trivial to do this. You have to dismantle the heat-staked keyboard, and this is not easy to get back together so that it stays together and feels right. If they;'re both fullnuts then most likely the logic boards will just swap over. Keey any washers, etc with the case they go with. Some very early C's have a different display driver, which needs a different capacitor on the logic board. I can check exactly what needs to be done if you have problems after putting the CX board into the C case. Remember these machines use CMOS circuitry and can be damaged by static discharge.

Self-Healing LCD

*Message #1 Posted by **bill platt** on 8 May 2004, 10:13 a.m.*

Hi all you fellow calculator hounds,

An intersting anecdote: I sold a new 20s to a co-worker about 9 months ago---he had a singapore made 20s, and though it worked fine, there was a black "spot" in the lcd, along one edge.

Well, by and by, one day he pulls it out of the slipcase, and it's gone! The LCD is back to normal.

Anyone else ever seen this before?

Regards,

Bill

I had already see this one on a watch, but not on a calculator. Maybe I can keep some hope for my Xpander which has the same problem.

Arnaud

Re: Self-Healing LCD

*Message #3 Posted by **Larry Corrado** on 9 May 2004, 11:45 a.m.,*
in response to message #1 by bill platt

I wonder if this could be a thin film interference effect. If you have two parallel reflecting surfaces very close together (with a gap somewhat less than 1/2 the wavelength of light apart), incident light can be reflected with destructive interference, yielding little or no reflected light. There would be internal reflection from the top surface and external reflection from the bottom. A 180 degree phase change takes place from the external reflection (as I recall), causing destructive interference in the two reflected rays, yielding a dark area. Perhaps there was a problem in the physical spacing of layers in the display, and, for some reason, the components got moved backed to their proper spacing.

Hope this explanation is clear. Anyway, it's a possibility.

Larry

Re: Self-Healing LCD

*Message #4 Posted by **bill platt** on 9 May 2004, 3:45 p.m.,*
in response to message #3 by Larry Corrado

Hi Larry,

Nice theory.

However I do not think that theory will hold, for a very simple reason. If you had this gap, you would necessarily also have a vanishing edge of the gap where the void disappears. Therefore, you would see the fringing effect, including rainbow colors, as the constructve interference sets in going through each 1/2 wavelength portion narrowing down from say a 2 wavelengths thick (800 nm) void. At 1/4 wavelength and less, you get total transmission/ no reflection, and at half wavelength you get total reflection (I think this is reverse of what you said but it is only the priciple of the thing we care about here and it is easy enough to derive it).

So the point is, I did not see the fringing effect, threfore I don't think it was a void.

Actually maybe if the whole void were less than 1/4 wavelength for all visible light (even violet) then you would not see the fringing.

So maybe you are correct!

Fun thought experiment---thanks!

Regards,

Bill

Re: Self-Healing LCD

*Message #5 Posted by **Larry Corrado** on 10 May 2004, 10:12 a.m.,*
in response to message #4 by bill platt

Bill:

Yes, you're right: colored fringes would be expected to be visible around the outside of the area/point of actual or near contact, where the interference effects would be wavelength-dependent.

I think I had something like this on one of my TIs. I'll have to keep my eyes open for it.

Regards. Larry

Re: Self-Healing LCD

*Message #6 Posted by **John Smitherman** on 9 May 2004, 2:12 p.m.,*
in response to message #1 by bill platt

Hi Bill. My 9s had a black spot show up on the LCD shortly after I received it. At first, the black spot looked like an LCD defect. I was ready to return the calculator to HP when I noticed that the black spot starting moving around. At that point I assumed that the black spot was not an LCD defect but instead was a black speck of foreign material. Finally, out of frustration I shook the calculator vigorously and the black spot disappeared and has not returned.

I hope that this helps.

John

Deep Pi on the HP-41cx

*Message #1 Posted by **Mark Taylor** on 8 May 2004, 12:09 a.m.*

I was not able to run the Deep Pi program after keying in the program steps as listed on www.voidware.com/calcs/hp41cv.htm

Should X<>0? (a nonexistent function) actually be X<> 00 (X swap with register 00 ?)

The program lines are not numbered but this step occurs, by my count, at lines 321, 338, and 408, of 511.

The flying goose justs runs forever when I execute the program.

Are there perhaps some typos in the program listing?

Any help would be greatly appreciated.

Thanks, Mark Taylor

Re: Deep Pi on the HP-41cx

*Message #2 Posted by **Richard Garner** on 8 May 2004, 12:34 a.m.,*
in response to message #1 by Mark Taylor

The code looks correct. Are you sure you are let it run long enough for an answer? I ran the code in V41 with turbo on and it took a minutes or two to run. Try starting it off on say the first set of numbers and let it run for about 5 minutes and see if it finishes.

Re: Deep Pi on the HP-41cx

*Message #3 Posted by **Garth Wilson** on 8 May 2004, 1:32 a.m.,*
in response to message #1 by Mark Taylor

X<>0? does exist on the 41cx (using the not-equals sign which you key in with <shift>H).

Re: Deep Pi on the HP-41cx

*Message #4 Posted by **Mark Taylor** on 9 May 2004, 12:36 a.m.,*
in response to message #3 by Garth Wilson

Thanks Richard and Garth!

It took my 41CX over 30 minutes to generate the first set of 6 digits. The fourth set of 6 digits took over 2 hours to generate!

Comments anyone?

Re: Deep Pi on the HP-41cx

*Message #5 Posted by **hugh steers** on 9 May 2004, 7:19 p.m.,*
in response to message #1 by Mark Taylor

hi mark,

sorry if this was confusing, but X<>0? is not a memory exchange but a compare against zero.

good luck,

Re: Deep Pi on the HP-41cx

*Message #6 Posted by **Mark Taylor** on 9 May 2004, 8:52 p.m.,*
in response to message #5 by hugh steers

Thanks Hugh!

Please see my earlier post. My 41CX has been running set after set of 6 digits all weekend. Currently calculating digits 55 to 60. Each set has been taking 2 hours or so to generate. Should it take that long?

Thanks again, Mark Taylor

Re: Deep Pie on the HP-41cx

*Message #7 Posted by **'Carly' ;-)** on 10 May 2004, 12:27 p.m.,*
in response to message #1 by Mark Taylor

I'd get a new cookery book as my 'pies' (note the spelling) take about 1 hour to do. As far as depth goes about 6 inches (150mm) is good, any deeper and the filling doesn't cook properly (for a 12 inch / 300mm pie dish).

Whats this HP-41cx thing? A new kind of programmable microwave or food mixer 'my boys' at HP have been developing?

To think some people think I don't know anything outside of company financing.

P.S. If you are making goose pie, best not let it run forever round the kitchen - it makes a horrible mess.

My 33 has gone wobbly

*Message #1 Posted by **Kirk** on 7 May 2004, 2:26 p.m.*

I'm pretty happy overall with my new HP 33 but I have noticed one thing lately that is bugging me a little. My HP has gone wobbly. The case is slightly warped so when you press the keys on the lower left side it makes a little bump noise as the rubber foot touches the table.

I don't know if I did this when I packed it in a case with 30 books for the PE exam or if it came this way. I think I might have warped it a little but now I wonder.

Does anybody else have a wobbly 33?

Kirk

fixed it...

*Message #2 Posted by **Kirk** on 7 May 2004, 5:59 p.m.,*
in response to message #1 by Kirk

I just sort of twisted the calculator back the other way and now its flat again. It seems these calculators have the ability to get a little "bent out of shape".

Kirk

Deep PI - On a 42S

*Message #1 Posted by **Bill (Smithville, NJ)** on 7 May 2004, 8:47 a.m.*

Started playing around with the Deep PI routine that Hugh had posted. Entered it into two HP-42S, one of which is the earlier ROM which supports "Fast" mode. I've been curious about how fast is fast mode and thought the Deep PI routine would made a good comparison.

I set up a infrared printer with a HP-41CX and the two HP-42S pointed at it. The 41 is running a short endless loop program that prints the date and time every 5 minutes so that I have a time trail on the printout. One 42S is running normal mode and one is running in fast mode. Both running the PI loop (1, 7, 13, ...) and then print the results.

Ran it for an hour last night and the Fast 42S was calculating about 2.5 times faster.

I plan to load new batteries into both 42S tonight and then I'll just let them run until the batteries die. Be interesting to see how many decimals they calculate and how long the batteries last.

The printer I can run on an AC adapter.

The 41CX has a rechargable battery pack. If I run the 41 with the AC recharger pluged in, will it basically run for ever?? Or should I load up the 41CX with fresh regular batteries to get maximum constant on time? I don't want the 41 to run down before the 42S batteries die.

I'll post the results next week for anyone who's courious.

Re: Deep PI - not on a 32SII :-(

*Message #2 Posted by **Bram** on 7 May 2004, 9:30 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I had already converted the program into 32sii format (on paper). It has just enough LBLs and STOs to fit. I started keying, but not even half way I got the memory full message.

pity.

curious about the 42s results.

Re: Deep PI - not on a 32SII :-(

*Message #4 Posted by **Bram(nl)** on 9 May 2004, 7:36 a.m.,*
in response to message #3 by Veli-Pekka Nousiainen

No objection to publish my conversion, but as mentioned, I´ve done it on paper. I would have to scan it. Conversion is fairly straight forward, though. I downloaded www.voidware.com/calcs/pi.txt, printed it and replaced every label and storage number with the `matching` letter. 01 becomes A, 02 becomes B aso. 00 became Z and 05 became i, because RCL IND 5 translates to RCL (i). I wrote a little routine for MOD (32sii hasn´t) and began typing, but as the machine complained so soon, I judged it to be too ´simple´ to cope.

Re: Deep PI - not on a 32SII :-(

*Message #6 Posted by **Bill (Smithville, NJ)** on 7 May 2004, 1:46 p.m.,*
in response to message #2 by Bram

Bram,

I wonder if the code could be optimized to fit into a 32SII. Not necessarily optimized for speed but for space. I don't have a 32SII any more - I tried one for a while, but just couldn't get used to it. I did love the large display!!

Probally could be adapted to the new 33S.

Re: Deep PI - not on a 32SII :-(

*Message #7 Posted by **hugh steers** on 7 May 2004, 2:27 p.m.,*
in response to message #6 by Bill (Smithville, NJ)

i can make it smaller and, in fact, faster if you dont mind not having the first 76 decimal places!! i was tempted to do this on the original version. but i wanted the whole set of digits. you could, of course, store the first 76 places in the program manually.

hey bill,

you are trying the experiment i want to try soon. basically i have a 41 and a mains adapter but no printer. my plan was to acquire a printer and leave it for two weeks or so. im keen to see how it compares on speed. i'd like to think it will give the first 1000 places in 12 hours, but i could be completely wrong here.

if it is really really slow, i might try to speed it further. i have some ideas but they require considerable work.

good luck with your tests, and please post your findings.

Re: Deep PI - not on a 32SII :-(

*Message #8 Posted by **bram(nl)** on 9 May 2004, 7:42 a.m.,*
in response to message #7 by hugh steers

>i can make it smaller

Even then I think it won´t fit in an HP-32SII. The machine already complained at about a third of the program. Each number takes 9.5 bytes and there are a lot of numbers and too few registers left to hold them all or even some. Better to follow Veli-Pekka´s advice (or accept a current offer for an HP-42S for 60 euros. Thinking about it).

Re: Deep PI - not on a 32SII :-(

*Message #9 Posted by **Veli-Pekka Nousiainen** on 9 May 2004, 8:15 a.m.,*
in response to message #8 by bram(nl)

33s has more memory

Re: Deep PI - On a 42S

*Message #10 Posted by **David Smith** on 7 May 2004, 12:52 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

The 41CX will run forever on a rechargeable pack that is plugged in (or at least until the battery physically cells go bad).

Re: Deep PI - On a 42S

*Message #11 Posted by **Bill (Smithville, NJ)** on 7 May 2004, 1:51 p.m.,*
in response to message #10 by David Smith

Thanks David,

That's great news. I won't have to worry about the 41 running down before the 42S. I'm really curious at how long a 42 can run on a set of batteries. Also, will be able to see what difference Fast mode makes on battery consumption. Of course, having the printer IR port turned on will reduce battery life.

Question: On the 42S, does having the IR port turned on reduce battery life IF one never prints with it? Does it consume power even if not printing?

Re: Deep PI - On a 42S

*Message #12 Posted by **Richard Garner** on 7 May 2004, 3:20 p.m.,*
in response to message #11 by Bill (Smithville, NJ)

Yes,if the IR is in trace mode it is sending information even though there is no reception by the printer.

I would say no, if trace mode is off and you are not using any commands that would activate the IR to send to the printer.

. . . how about rigging an external supply to the 42s?

*Message #13 Posted by **Paul Brogger** on 7 May 2004, 6:44 p.m.,*
in response to message #11 by Bill (Smithville, NJ)

Someone here could suggest the correct voltage -- something like 4.5 V or less. Connecting the right leads from, say, a Radio Shack AC-to-DC converter (or maybe just a few D cells?) should enable you to test for significantly longer . . .

Re: . . . how about rigging an external supply to the 42s?

*Message #14 Posted by **Tony Duell** on 7 May 2004, 7:09 p.m.,*
in response to message #13 by Paul Brogger

The 42S runs off 3 cells at about 1.5V each, so 4.5V should be fine. However, those little wall-wart mains adapters are often not regulated and the off load voltage can be as much as double what you expect. For that reason, and because I've had them catch fire, I won;t allow them in my workshop! Use a decent, regulated, bench power supply and you'll have no problems. 3 D cells in series should be fine as well.

Mastech HY 1500

*Message #15 Posted by **Wayne Stephens** on 8 May 2004, 11:33 a.m.,*
in response to message #14 by Tony Duell

Yesterday the UPS man brought me the Mastech HY1500 regulated power supply which I purchased off ebay this week ($85 including shipping). I have been playing with it quite a bit.

It has analog V and A meters, and provides adjustable 0-15V and 0-3A, offering restricted current protection.

Thus far I have used it to power a 32E with broken battery terminals (2.5 v); a 11c (4.5v); and an old 9V Novus Mathemetician.

It works GREAT. I highly recommend it. One of these units will power virtually any calculator indefinitely.

Take care.

Wayne.

HP9810 schematics on museum CD?

*Message #1 Posted by **marais** on 7 May 2004, 7:29 a.m.*

I have to repair a 9810/A. Does the museum DVD contain useful data for this purpose, like a service manual or schematics? If not, do you know of other sources? Thank you in advance,

Andreas

Re: HP9810 schematics on museum CD?

*Message #2 Posted by **Wayne Brown** on 7 May 2004, 10:23 a.m.,*
in response to message #1 by marais

You can find the complete list of the contents here. After a quick look all I see are:

```
HP 9810 Operating and Programming
HP 9810 Alpha Rom (HP 11211A)
HP 9810 Math Block (HP 11210A)
HP 9810 Math ROM (partial)
```

HP9810 service manual

*Message #3 Posted by **marais** on 7 May 2004, 1:39 p.m.,*
in response to message #2 by Wayne Brown

Thank you, should've found that list myself. Looks like almost all the service manuals are there, 9805, 9815, even the 9100 - only the 9810 is missing. Can anybody here help? I think the 9810 manual would make a nice addition to the museum CDs (hint, hint).

Re: HP9810 service manual

*Message #4 Posted by **Tony Duell** on 7 May 2004, 2:18 p.m.,*
in response to message #3 by marais

HP desktop calculator service manuals never seem to contain full schematics. If you're lucky you'll get a schematic of the PSU section, but not of the interesting stuff like the processor and memory.

However, all is not lost!. Most of the desktop machines, including the 9810, have been reverse-engineered. I am pretty sure HPCC has a 9810 schematic.

Cassette tape supply?

*Message #1 Posted by **Klaus** on 7 May 2004, 3:27 a.m.*

Hi,

I'm about to (re)discover my HP-41 collection. It seems that the HP-IL tape machine still works, but the media cannot be formatted (or at least aren't accessible afterwards). Maybe the cassette tapes are damaged due to age. Does anybody know a supply source in Europe or even Germany. Can I use any of the classic dictaphone tapes that fit in size or are there hidden differences?

Thanks Klaus.

Re: Cassette tape supply?

*Message #2 Posted by **Tony Duell** on 7 May 2004, 7:15 p.m.,*
in response to message #1 by Klaus

No dictating machine tapes that I've found will physically fit in the 82161 tape drive, and in any case, the 82161 uses optical end-of-tape detection and requires reflective blocks in the cassette and a hole in the tape near each end. I wouldn't have thought dictating machine tapes had this feature. The magenetic tape iteslf may well be different too. The normal failure mode of the cassettes is that the pressure pad, behind the tape, and which presses the tape against the head, fails. It consists of a metal spring, woth a layer of foam, and then a layer of felt on it. You can repair this using double-sided adhesive foam tape, felt from a sewing shop, and a bit of time. You crack the cassette open, lift out the spring, clean off the old pad, stick the new stuff on, and put it back togetner. I have an article I wrote for Datafile (HPCC journal) on how to do this. If you are serious about data storage on HPIL machines, though, I'd advise looking out fro an 9114 disk drive. The media (double-desnsity 3.5" disks -- 720K disks) is a lot easier to find than the tapes, it stores about 5 times as much data, and it's easier to maintain.

Programming Question

*Message #1 Posted by **Harington** on 7 May 2004, 2:52 a.m.*

how do you call a built in function? for example I want to use the function "sloveVx" in a program. Mode is RPN calculator is 49G+ Ex: << " Enter a """input obj-> " enter b """input obj-> ->a b << a b + solvevx>> >> input are : a->2x^2+3x=10 b->0 or integer

perhap vice versa: the outcome should be a sloultion to the equa if b =0 and a= 2x^2+3X=10 I'm not getting the correct solution need some help please

Re: Programming Question

*Message #2 Posted by **Vieira, Luiz C.** on 7 May 2004, 6:57 p.m.,*
in response to message #1 by Harington

Hello, Harington;

I'm not sure about what sort of result you're getting, but I'd guess a change in your program. Instead of:

```
 << " Enter a """input obj->
    " enter b """input obj->
->a b
 << a b + solvevx>>
     >>
```

try:

```
 << " Enter a """input str->
    " enter b """input str->
->a b
 << a b + solvevx>>
     >>
```

The [STR->] is an original HP28/HP48S command that removes the string delimiters ["] that may also be available in the HP49G+ (it is available in the HP48G series). I'm not sure it's gonna solve your problem, but it's worth a try. I'd guess the program evaluates your expression after [OBJ->] instead of simply getting it like an expression. Also, you may have a setting (mode flags) that cause the expression to be automaticaly evaluated after [OBJ->]. If so, changing this set might cause the program to work the way you need.

My assumptions are vague because I have no calcualtor neither any manuals in hands; I'm not home now, but I'd like to post these suggestions.

Sorry not helping the way I'd like to.

in response to message #2 by Vieira, Luiz C.

do you know which flag that will be ? please post this for me it is taking me too long to figure the solution to this problem . I appreciate this Harrington(USA)

It is not working (input is ex:2x+3=6)

*Message #4 Posted by **Harrington** on 8 May 2004, 9:54 p.m.,*
in response to message #3 by Harrington

The input to this problem should be any equa in firt and second oder EX 2x^2+3x=10 or 2x=10 I expect to see the correct sloution to these problem it is taking the input. slotion to these are wrong . that is where I have the problem the operating mode is PRN.

Re: It is not working (input is ex:2x+3=6)

*Message #5 Posted by **Veli-Pekka Nousiainen** on 8 May 2004, 10:24 p.m.,*

'2*X^2+3*X=10' SOLVEVX will work.
Note that lower and UPPERCASE are different and that you need explicit multiply.
{VPN} AXL
```

This is what I get on stacks:1. {} 2. 3 and 3 2^x+2

*Message #6 Posted by **Harrington** on 8 May 2004, 11:13 p.m.,*
in response to message #5 by Veli-Pekka Nousiainen

Those are the ans I get when I use the input on stack 1 2 and on 3 for input 2X^2+3=10

on 1 it is just {} on 2 3=x on 3 2^x+2

wrong !!!

in response to message #7 by Vepa

Hello, Veli-Pekka;

I am curious about your previous post. I have an HP49G, not an HP49G+ (at least so far... 8^), and I saw you used a RCLVX in your last listings. Is it a new implemantation in the HP49G+? I read that the 49G+ O.S. can be used with earlier 94G models, but I didn't give them a try yet, so I don't know if RCLVX is something new (retrieve the expression last used with SOLVEVX ?).

Just that.

Thank you. And thatnk you also for posting a better answer for Harrington's question. I didn't take the "case" into account... q8^(

Luiz (Brazil)

Re: Veli-Pekka, I am curious! (was: This is what I get...)

*Message #9 Posted by **Veli-Pekka Nousiainen** on 9 May 2004, 7:33 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

```
RCLVX and STOVX plus pretty print LIMIT as lim
are all found in the latest 1.9-6 ROM for the old 49G
No need to get the new 49g+
BUT
I still recommend it for the speed
For example switching between pplot modes is faster
CATalog is faster, booting your own STARTUP is faster
Naturally plotting is faster, too.
AND
Then the I/O via USB is 12*faster
plus you have an interface for a SD/MMC card.
The thing also eats up batteries faster...

Nowadays I only use the 49g+ (and the 33s)
[VPN]
```

Re: It is not working (input is ex:2x+3=6)

*Message #10 Posted by **Veli-Pekka Nousiainen** on 9 May 2004, 7:39 p.m.,*
in response to message #9 by Veli-Pekka Nousiainen

```
In case someone does not want to flash their 49G for the latest
ROM you can always program the RCLVX command
Now depending on your ROM you may have either VX directly at HOME
or in subdir called CASDIR
<< { HOME VX } RCL >> 'RCLVX' STO
<< { HOME CASDIR VX } RCL >> 'RCLVX' STO
<< PATH SWAP HOME 'VX' STO EVAL >> 'STOVX' STO
<< PATH SWAP HOME CASDIR 'VX' STO EVAL >> 'STOVX' STO
[VPN]
```

in response to message #9 by Veli-Pekka Nousiainen

Hey, Veli-Pekka; thanks!

I'm waiting to put my hands in an HP49G+, and after what you wrote I see that I'll have a lot of new things to reason about... BTW: I updated my HP49G to the new(est?) 1.9-6, but I was not aware of these new features. Are they listed somewhere?

In fact, is there any e-doc about the new features since the original O.S. that first

came with the HP49G? I saved all "New features list" in the HP site with all updated O.S. I downloaded, but the information is not so "explained", I mean, only a brief description of each new achievement. I don't remember them completely...

If you know (or anyone else knows) where to find it, I'd like to be "told" about... Please?

Tnanks a lot.

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 8 May 2004, 10:52 p.m.,*
in response to message #4 by Harrington

Hi, Harington;

Please, follow Veli-Pekka very correct warning about upper case charactes. I see that your input string "Enter a" starts with an upper-case "E" and all of the rest of the program goes lower-case. Maybe you typed it correctly in your calculator, just a concern of mine.

Now, please, change your program so it looks like this one:

```
<< " Enter a " {"" ALG} INPUT "'" SWAP + OBJ->
   " enter b " {"" ALG} INPUT "'" SWAP + OBJ->
   -> a b
   << a b + SOLVEVX>>
>>
```

The (not elegant) additional

```
"'" SWAP +
```

will make sure that whatever you type in is converted to an equation prior to be stored. If you already typed the expression with a starting ', please remove this sequence. Also,

```
{"" ALG}
```

(instead of simply "") activates ALGebraic mode, that's helpfull when entering equations.

I ran it and the program finds the following roots:

```
{x = -(3+sqrt(89))/4  x = (-3+sqrt(89))/4
```

Is it what you expect? BTW, mine is an HP49G, not an HP49G+. I'm not sure this is relevant, but if it still does not work, let's try something else.

Let us know.

Success.

Luiz (Brazil)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 8 May 2004, 10:11 a.m.,*
in response to message #7 by Jose

Hi;

Original HP printed material has an HP identifier: the HP part nº. The HP48G Series AUR Manual I have (in hands right now) reads HP Part Nº 00048-90136, Ed. 3. The HP48S Programmer's Reference Manual reads Mfg Nº 00048-90053, July 1990, Ed. 1, and a Reorder Nº 00048-90053 (curious!). I could not find an ISBN in neither of them.

Cheers.

Luiz (Brazil)

Re: 48GX AUR languages

*Message #9 Posted by **Arnaud Amiel** on 8 May 2004, 10:54 a.m.,*
in response to message #6 by Arnaud Amiel

I got the ISBN wrong, it is actually: 2-909737-11-X

It is not made by hp, it seems it was translated by hp but published by pole editions. I could not find a part number.

Arnaud

That's even more interesting!

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 8 May 2004, 1:58 p.m.,*
in response to message #9 by Arnaud Amiel

Hello, Arnaud;

I have a few books (of the many thousands I don't have...) related to HP calculators that are not published by HP. But that's the first time I've heard about an HP-related manual that's not published (neither printed) by HP.

This is interesting!

Thanks.

Luiz (Brazil)

Re: 48GX AUR languages

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 7 May 2004, 12:24 a.m.,*
in response to message #2 by marc

Hi;

I know that the the HP48G User's Guide has been printed in many languages, Portuguese included (I have an original "Manual do Proprietário" still in its original shrink-wrapped package, that I was given by a friend a few weeks ago), but I don't remember reading anythign about the AUR manual in other languages but English. What I think that's strange is the fact that many important programming information and techniques are shown there, in almost 140 pages. And if the AUR is only in English, these pages are also only in English (what a clever conclusion!).

I'd like to know more about this. I would also like to know which HP48 manuals are available as e-docs and where to find them. I know hpcalc.org has some good material, I'd like to know if there's anywhere else with related stuff.

Cheers.

HP 32SII ailments

*Message #1 Posted by **Andrew** on 6 May 2004, 3:27 p.m.*

I have 3 HP32SII's in various states of ailments. The ailment on two of them is non-responsive keys. On one the "R/S", "3", and "6" work 50% of the time. On another, the "4", "5", and "6" don't work at all and some others work only sporadically. The third machine won't even turn on. All 3 have been used in an office setting, and the first two are in good cosmetic condition. Any suggestions for quick fixes and/or repair locations? Any help would be appreciated -- these are needed for the California engineering exams (to replace 48G's that have been banned). Thank you in advance, Andrew

Re: HP 32SII ailments

41C and 41CV won't power up...

*Message #1 Posted by **Ron** on 6 May 2004, 3:10 p.m.*

Both worked when last used, about a month or two back. Been stored w/o batteries. There's no battery corrosion. Batteries are good. Any suggestions?

Many thanks.

Re: 41C and 41CV won't power up...

*Message #2 Posted by **Wayne Stephens** on 6 May 2004, 8:23 p.m.,*
in response to message #1 by Ron

I suggest the following:

After removing the batteries, wrap the fingers of one hand loosely around the lower end (bottom of keyboard); wrap fingers of other hand loosely around the upper end (across the display). VERY gently twist the calculator about its "longitudinal" axis (remember, VERY gently is the key) back and forth a few times. You will probably hear and "feel" it creaking a bit.

Reinstall batteries and see if it powers up. Sometimes the gentle twisting will "reconnect" some of the press fit connections between the front and back halves of the calculator.

If this doesn't work, the next thing I would try is separating the case halves and cleaning every visible contact with alchohol (rubbing alchohol, not vodka). Be very careful removing and reinstalling the four screws (which are under the rubber feet) because the screw posts will break fairly easily and they are a royal b*#@$ to fix. In fact, you may want to check for loose screws before you separate the case halves. The pressure of the tightened screws is essential to the two halves making good contact, but there is a fine line between poor connections and over-tightened, broken-posted screws. You want to be right there in between the two situations.

Good luck. That is the extent of my knowledge of "repairing" 41C series calculators which will not power up.

Take care.

Wayne.

PS - It is curious that they BOTH worked a few months ago and that they BOTH don't work now. Were they stored together? Could they have both been exposed to stray static charges or Electromagnetic frequencies? Was there any atmospheric nuclear testing in your neighborhood recently?

Re: 41C and 41CV won't power up...

*Message #3 Posted by **Jeff** on 7 May 2004, 7:03 a.m.,*
in response to message #1 by Ron

Perhaps one of the techniques presented here would be helpful.

Re: 41C and 41CV won't power up...

*Message #4 Posted by **Stefan Hauschild** on 9 May 2004, 1:01 a.m.,*
in response to message #1 by Ron

Maybe corrosion of the springs in the battery holder? I face this problem from time to time. The springs do not give much pressure on the batteries and from time to time I have to clean them and do some readjusting. Hope it helps....

Stefan

Re: 41C and 41CV won't power up...

*Message #5 Posted by **David Smith** on 10 May 2004, 12:17 p.m.,*
in response to message #1 by Ron

Take apart the machines and clean all the pressure contact areas with 91%+ isopropyl alcohol. Don't forget the contacts under the CPU board in fullnut machines.

How to teach children RPN

*Message #1 Posted by **Ben Salinas** on 5 May 2004, 11:07 p.m.*

It has come to the time when my sister must learn to use a calculator (she is starting to use one in class in 6th grade). Next year she will probably be taking Algebra, or at least Pre-Algebra. The question is, how do I teach her RPN.

I realize that many will object at using a calculator at all in 6th/7th grade, but her teacher wants her to use a calculator, and the preaching about buying a TI-83+ is already beginning. So, I have a few months to get her addicted to RPN.

She doesn't mind learning RPN because then she gets to use the "pretty silver calculator" (hey, the new design attracts some people at least... new RPN users). I plan on giving her the 33s (at least for the next year while I still have my school's 32sii), so it is simply a matter of teaching her to use the calculator.

I have a few questions/thoughts. Should I teacher her only the 4 functions (and few other functions) so that she learns the math, or teach her the quick way now (ie: equation solver, base conversions, etc)?

Also, what is the best way of teaching RPN? In the past, to my peers, I explain the stack system and do a few sample problems. After that, I generally just give them some problems to try. Is repetition enough? (I learned by using the 32sii all the time in my math class, even though at first I was slower with it and would make errors)

Finally, once I get this "project" going, I plan on writing a "How to teach kids RPN" paper. I would like any suggestions that you all can give.

-Ben Salinas

Re: How to teach children RPN

*Message #2 Posted by **Steve S** on 5 May 2004, 11:29 p.m.,*
in response to message #1 by Ben Salinas

Ben, by coincidence, I am in the process of teaching my daughter (14, in the 8th grade) and my son (11, in the 5th grade) about RPN and HP calculators. I have been pondering the same questions that you raise.

Thus far, my approach is slightly different because the two children are different. For my son, I am focusing only on the 4 basic functions. He is of course aware that the calculator does much more, but except for occasional demos, I am steering him away for them, for now. The most important thing, for both children, is that I am using a 48 so that they can see the stack in operation. I had originally intended to use one of the many RPN aplets available on the Internet, but it turned out that the 48 was simply easier. Every few days, I work with him a bit, doing elementary operations, and I make sure to leave the 48 out and readily available to him so he can "play" with it any time he wants.

For my daughter, who is literally light years more mature, I am slowly going over most of the numerical functions, including (eventually) solve and probably plot. Again, it is the same routine, but over a greater span of functionalities. My daughter has already been exposed to TI's and AOS, so for her it's also a question of "unlearning" some things. She's no RPN fan, yet, but I think it's starting to dawn on her. I overheard her tell

her brother that she's probably going to have to make use of the calculator next year, when she starts high school. She knows the 48 is capable of doing symbolic math, but hasn't gotten into it enough to really see the advantages.

So, my bottom line is 1) use spaced, rather than massed, learning and 2) be sure they have free access (including possible breakage!) Make it a long term project and go slowly...

Re: How to teach children RPN

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 5 May 2004, 11:56 p.m.,*
in response to message #1 by Ben Salinas

Hello, Ben;

I guess the best way of teaching a kid how to use RPN is showing that calculators using RPN (or "the [ENTER] key") allow them to perform simple operations like they do with pencil and paper. And this is the main "explanation" HP used to write in the calculator's manuals.

Think of the way kids learn how to add two numbers. They are not introduced to algebraic notation in the very beginning, instead the teacher "stacks" the two numbers to be added FIRST (and when the first number is finished you tell the calculator so with the [ENTER] key...) and then he writes a + (plus) sign in order to indicate what to do with them. There is no [=] sign used when we actually "perform" a math operation. I always use the [=] sign to refer to the algebraic NOTATION, that is a way to represent a math OPERATION.

RPN is a notation as well, but it is closer to the operation performed by kids when learning math. And I guess addition is the very first of them, right?

I guess Steve has a point when using the HP48 and showing the stack contents. That's very important. Anyway, after having the RPN "mechanics" understood, going further is easy. I guess that the "power tools" you mentioned must be mastered after having a better understood of them without the calculator. I'm not against using the calculator to "understand" the process of finding a root; in fact I think it may even make it easier to understand, but I would try having her effectively using the calculator after knowing what is a "numeric root finder" about. I don't know the HP38G, but I guess it would be the best tool for this particular job.

Back to RPN: try this:

```
        2  (finished? tell the calculator so with [ENTER])
        3  (finished? Now tell the calculator what you want it to do)
      _____+

        5  (see? That's what happens with paper and pencil...)
```

I would let her try for a while. If she does not get acquainted with the [ENTER] key after a while, at least the "pretty silver calculator" can also be used as an algebraic, right? As a teacher (although I'm in Brazil and you're in USA), I'd never let a student without a second option. Algebraic notation is also a powerful tool, and using it depends on knowledge. As RPN also does.

My 2¢.

Cheers.

Re: How to teach children RPN

*Message #4 Posted by **Garth Wilson** on 6 May 2004, 2:39 a.m.,*
in response to message #1 by Ben Salinas

I have tried to pattern some of my own manual-writing after HP's manuals for the 41 and 71. When I got them, I just started at the beginning of the first manual, and just kept going. When I got to the end, I felt like I knew the material, even though I never got to "the hard part". Unfortunately good manual-writing is a rare art.

When I started in Forth (which is stack-oriented and RPN), I used Leo Brodie's book, "Starting Forth". Some time later after getting some experience in Forth, I read "Thinking Forth" (which is really more about programming philosophy). I mention these books because of the sense of humor and all the simple little cartoons with characters that keep coming up, illustrating various concepts. They're almost enough to make it worth reading the book even for someone not interested in Forth. These books have been out of print for many years, but do take a look at them if you ever find access to them.

Before your booklet is written however, I would just keep it simple. It sounds like your goal is to make them think in RPN, not necessarily understand everything the calculator can do. The basic four functions and a couple of extras like square root or log should do the job. I mention the extras as examples of functions that only operate on one stack item, not two.

I would call the "+" "add" (not "plus"), the "-" "subtract" (not "minus"), and so on, because you're telling the machine what you want to do. It should make it seem more natural instead of "backwards." That will help with the acceptance. In Forth the IF-THEN condition is RPN too, and beginners think it makes no sense until it is explained differently. Instead of IF <condition> THEN <actions>, it's <condition> IF <actions> THEN. You make the illustration: You're going to put your shoes on. First you ask the question, "Are you lacking socks?" IF so, put socks on, and THEN put the shoes on.

Re: How to teach children RPN

*Message #5 Posted by **Veli-Pekka Nousiainen** on 6 May 2004, 5:33 a.m.,*
in response to message #4 by Garth Wilson

This post is for everyone, not a direct answer to the previous post.

"Instead of IF <condition> THEN <actions>, it's <condition> IF <actions> THEN.
You make the illustration: You're going to put your shoes on.
First you ask the question, "Are you lacking socks?" IF so, put socks on, and THEN put the shoes on."

More Forth like sentence would be:
Are you lacking socks IF put socks on THEN

Sorry, but Reverse Polish Notation does not make much sense in English or any other (human) language.
That's just the way it is.

Actually you can put IF anywhere before the THEN in the same program block when using RPL in HP calcs.
<< -> n << n DUP IF THEN DUP SIN SWAP / END >> >>
<< -> n << n IF DUP THEN DUP SIN SWAP / END >> >>
<< -> n << IF n DUP THEN DUP SIN SWAP / END >> >>
BUT not before the "<<"
Yes, RPL is not pure Forth.
The earlier machines like the HP-41 series used RCL__ STO25 SF13 etc. non-RPN structure.
These are now more Forth like in the 48/49 series:
15. 'X' STO

-55 SF

I think I will take a look at my HP-71B Forth/Assembler ROM in my Summer vocation...

A little OT--

> I think I will take a look at my HP-71B Forth/Assembler ROM in my Summer vocation...

The 71 is where I got started in Forth. It was not the easiest, because in spite of what I just said in the last post about HP manuals, this particular one assumed you already knew Forth and only needed to know the particulars of Forth on the 71, while the book "Starting Forth" assumed you had something to practice on. So in a way, the two books were left pointing at each other. This might have some relevance to the original poster's desire to write a book to help kids learn RPN.

I have nothing but praise for the HP-71's BASIC implementation, especially when the many contributions from the user groups are added. After using it, I was _extremely_ disappointed with the Rocky Mountain BASIC HP used on the bigger computers. It was a step down. Unfortunately the 71's implementation of Forth was not nearly as good. After learning Forth though, I was able to drastically improve the performance of many built-in words-- up to 13x-- even without using assembly language!

"Remember, you may cripple them"

*Message #7 Posted by **Ron Ross** on 6 May 2004, 10:20 a.m.,*
in response to message #1 by Ben Salinas

While everyone here thinks how GREAT RPN is, just remember, "If someone never has, they don't miss." I personally prefer RPN, but I don't mind using AOS all that much. I detest EOS, but guess what? That is exactly how math is Taught! It wastes keystrokes and is the slowest way to work problems, but with todays calculators, memory is so cheap and 90% of your students don't care and don't mind. This herd rules the market place. Hp could make a calculator that would sell to 5% of us (guarenteed and it would be a nice sized chunk of the overall pie), but marketing would flip, because they want a product that can concievably sell to 95% of the market (but with Hp's pricing policy, only us 5% who like quality over quantity, would even be interested).

Sadly, I believe Hp Marketing has only pulled their heads halfway out of that dark warm crevice.

I wish Hp would subscibe to the old philoshy of offering the best calculator available instead of looking at market niche.

I would suggest only 3 calculators, an entry level RPN based upon the Hp20s (RPN/algebraic selectable w/2-8+K RAM or just keep making the present Hp33s), an Hp43sx high end pocket calculator, and their present high end 49G+.

I wouldn't bother to make anything else as the price difference between the present 48 and 49 doesn't warrent this ($35-???). Who buys a 48 unless they need a serial port (I like that feature though myself) and the calculator may be in harms way a lot. Regardless, $35 to step up to a much faster calculator, means the 48g is really just a white elephant.

But most professionals don't want a huge graphics calculator (heck, even in college, I liked my 42s better, I

just missed units conversions in Physics and ME courses).

A graphics calculator is really nothing more than a sophisticated cheap math package in a portable case that can also serve as a calculator. But it doesn't travel well, its just that no one likes to toss out a well know tool, but I prefer the smaller package of a real calculator. But I don't want to sacrifice much more than graphing either.

"I would suggest only 3 calculators, an entry level RPN based upon the Hp20s (RPN/algebraic selectable w/2-8+K RAM or just keep making the present Hp33s), an Hp43sx high end pocket calculator, and their present high end 49G+."

I disagree.
You need several models (all programmable):
0) A Basic *non*-programmable scientific - a crippled 33s
1A) An approved calc for test: the 33s (make it slightly narrower)
1B) A financial scientific combo model: 33B
2G) A Basic graphing with numeric solve/integrate only. (Flash ROM)- make it small and name it HP-37G
3GX) Advanced graphing with all the goodies (Flash ROM/RAM)- name it HP 50GX (good serial port)

That is the minimum list in my opinion

"An Apology"

*Message #9 Posted by **Ron Ross** on 6 May 2004, 1:43 p.m.,*
in response to message #8 by Veli-Pekka Nousiainen

Hello Veli!

I have an overdue apology to make as I never actually expected to see the Hp 49G+ and accused you of taking some type of mental stimulants for thinking such.

That said, I feel that the Hp39/40G calculator is a wasted marketing adventure, since it doesn't offer RPN and is basically a Ti clone that will lose to Ti.

Therefore, I feel the basic graphics calculator market is lost to the Ti-83. Give it up and don't bother to pursue. Would you buy an Hp39G and not buy an Hp49G+. Sell only one high end Graphics and dump everything else.

As far as pocket calcs, I would have never bothered with the 33s, but made an Hp20s w/RPN and limited programability w/o alpha numerics. This should have allowed it on nearly every exam.

Since Hp now makes and distributes an Hp33s, continue to sell, but my main gripe against the 33s is PRICE and features. Truthfully that is what hurt the 32s also. These are $30-40 calculators selling for $50-60 and failing to sell.

An Hp43s on the other hand could justify an $80+ price (much like the Hp17Bi+ presently does). But an Hp43s released now would rob lots of sales from the Hp48GII (maybe all). Therefore, I still say an ideal product line doesn't bother to address product niche but offer the best at three levels.

The best at three levels is a low end pocket programmable that the 33s could fill, but would have to be priced at $30 to be that calculator.

The best possible pocket calc (fabled 43s) $60-90 price range.

The best possible graphics: an Hp49G+ or newer evolution.

Hp has the 33s on the market as the highest end pocket calculator available, and if there were never nothing better, I would embrace it. However, I just so happen to own an Hp42s and therefore have tasted better. There is no comparision for features and capabilities. People with a 32s who think its the best, just never had to bump into the upper limits of the 32s or need extensive use of matrix functions or use the superior soft menu system of the 42s.

The 33s is truthfully a low end pocket programmable which just happens to rule the roost because there are no challengers and the NCEES is effectively nailing an artificial ceiling on calculator development here in the USA.

I rant on too much.

Thanks for your input.

Re: How to teach children RPN

*Message #10 Posted by **Fubar Vikinghelmet** on 6 May 2004, 11:17 a.m.,*
in response to message #1 by Ben Salinas

I recommend reporting the teacher to the school board for severely hindering your daughter's ability to learn mathematics by-hand... Especially with a TI, yuck.

Many years ago, my dad gave me a TI-30 for Christmas with a book called "Calculator Math Made Easy" or something like that. The book had nifty illustrations and lots of examples (e.g., "plan your trip across the country... how many miles is it to X and Y, how long will that take if you're travelling an average of 60 mph..." etc.) Of course, solving these problems by the book included hand-holding the TI AOS way...

You know what? I could solve every problem in the book wth my TI-30! But when it came to trig in high school, I was, um, a bit lax... Because doing them by hand isn't the same as using an appliance.

Here's my suggestion: put together a comic book with basic sixth-grade (or higher?) problems all solved using RPN with an HP-whatever you have at-hand. That'll fix those TI-loving landlubbers!

Re: How to teach children RPN

*Message #11 Posted by **Eddie Shore** on 6 May 2004, 3:32 p.m.,*
in response to message #1 by Ben Salinas

I have been using RPN for a few years now. Maybe this will help you out:

* I like the suggestion of using the HP48/49 series to let the student see how the stack works.

* Practice, practice, practice; the HP manuals are good with a few practice manuals.

* Start with arithmatic and roots. Then build from there. In her case, it might be a slower build than most of us (who know the trig/equation operations).

* Patience, patience, patience

List entry in the 33s (long)

*Message #1 Posted by **Bill P** on 5 May 2004, 3:42 p.m.*

One of the things that I wish the 33s had is a list data type similar to the ones in HP and TI graphing calculators.

While the lack of registers past 33 prevents implementing this in full, I have found an alternative for entering data to be used, but not modified, by a program.

I'm sure someone else has discovered this before, but here's my trick:

Enter the following program:

S0001 LBL S ;I use label S for speed of entry of ISG's S0002 1000 S0003 / ;DIVIDE S0004 STO S SOOO4 ISG S S0005 (any number here) SOOO6 ISG S S0005 (any number here) . . . RTN

The trick is that you put the index on the stack, XEQ S, and the program at S puts every value in the list up to your index on the stack. I also use some variables to store stack values before executing the list program, and it could be more elegant. However, I have found this particular format to be the fastest on data entry, since ISG and S are on the same key. I just write:

S0001 LBL S S0002 1000 S0003 / S0004 STO S S0005 RTN

and then I fill in all of the ISG S's, then I GTO S and from S006, I enter a number, hit down, enter a number, hit down, etc.

It may not be terribly fast on entry, but it does let me take more advantage of the 33s's memory in my programs.

I hope this trick is useful to those of you with the 33s.

Bill, please read! (was: List entry in the 33s (long))

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 May 2004, 1:15 a.m.,*
in response to message #1 by Bill P

Hi, bill;

I took the liberty of adding the preformat comand to improve your post contents (program listings). Please, if you want this post of mine removed (and forgive me being nosy), the password is: 123456.

Now, the part of it with program listings looks like this:

I'm sure someone else has discovered this before, but here's my trick:

Enter the following program:

```
S0001   LBL S     ;I use label S for speed of entry of ISG's
S0002   1000
```

```
S0003   /         ;DIVIDE
S0004   STO S
SOOO4   ISG S
S0005   (any number here)
SOOO6   ISG S
S0005   (any number here)
  .
  .
  .
        RTN
```

The trick is that you put the index on the stack, XEQ S, and the program at S puts every value in the list up to your index on the stack. I also use some variables to store stack values before executing the list program, and it could be more elegant. However, I have found this particular format to be the fastest on data entry, since ISG and S are on the same key. I just write:

```
S0001   LBL S
S0002   1000
S0003   /
S0004   STO S
S0005   RTN
```

and then I fill in all of the ISG S's, then I GTO S and from S006, I enter a number, hit down, enter a number, hit down, etc.

Cheers.

Hi, Bill;

there is another way: have a look at the "message coding" (the ones I added and any others) by simply clicking [Edit Message] while seeing the message you want to edit. If you don't know the password you won't be able to save the edited message, but you can see what codes are there and even copy it the way it is. I think there will be no "Copyright Violation" if you use someone else's "tricks" around here... q8^D

Just to let you know.

Cheers.

Luiz (Brazil)

Unit conversion the ISG method

*Message #7 Posted by **Bill P** on 6 May 2004, 11:23 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I have a few applications for the ISG list method. While it may be rather slow, it does have a niche. I have found that it is useful for adding numerical commands to the 33s.

My favourite is using it to make an RPN unit conversion command.

The one thing I miss about my Sharp 506 is the extensive unit conversions it came with. But I need pine no more! I can just make an index card listing the numbers of the conversions I want, and make an ISG list program that stores the stack, hunts for the conversion I want, and multiplies it by what was in the Y register. The program then returns the former contents of the T and Z registers, then the converted former Y register. Simple as that.

The great thing is that I can have all the conversions I want in whatever order I want.

Ahh, the beauty of programmable RPN :)

Re: Inprt with HP49G+ ???

*Message #2 Posted by **Raymond Del Tondo** on 5 May 2004, 6:32 p.m.,*
in response to message #1 by Robin

I think the version for the HP-48 doesn't work with the 49g/g+, mainly because the used RAM entries have moved from the 48 to the 49, and maybe the one or other system call address is different.

Did you take a look at www.hpcalc.org ? Maybe there's a version for the 49g+...

However, I don't know if the IR port of the 49g+ is even compatible to the IR port of the HP-48.

Raymond

MIB HP41CX no more?

*Message #1 Posted by **Tom (UK)** on 5 May 2004, 7:34 a.m.*

Hi,

I have seen 1 or 2 mint in box HP41CX calcs on ebay for over a year, as soon as one is sold another is listed. They seemed to go for about $200 each.

I've just noticed that there ISN'T one on www.ebay.co.uk so has this stash run out now?

I wonder what will happen to MIB 41CX prices now if this ready supply has now dried up.

Tom.

Re: MIB HP41CX no more?

*Message #2 Posted by **Raymond Del Tondo** on 5 May 2004, 9:58 a.m.,*
in response to message #1 by Tom (UK)

Hi,

the ones I watched over the last months, nearly all went for more than $350 ;-) The last one went for $406, and another for $415... If I remember right it was more than 30 units, and from more than one seller.

Medium price seemed to be about $380.

HP-34C LED display

*Message #1 Posted by **Imran Farooq** on 5 May 2004, 5:12 a.m.*

Hi,

One of the segments in my HP-34C LED display no longer illuminates. I removed and tested the LED display and found that the segement of the last digit on the right hand side was still not illuminating, hence, this confirmed that the problem lay with the LED display and not the HP-34C drive electronics.

Would someone have a spare LED display or know if HP or another manufacturer can supply a compatible LED display that I could purchase.

I realy love this machine and would like to get it working again. Any help would be greatly appreciated.

Thank you, & Best Regards

Re: HP-34C LED display

*Message #2 Posted by **Imran Farooq** on 5 May 2004, 7:40 a.m.,*
in response to message #1 by Imran Farooq

Hi,

I had a wee search through the archive but didn't find any messages regarding a single segment failure in the LED display of a HP-34C. Most display failures were contact related.

Best Regards

Re: HP-34C LED display

*Message #3 Posted by **Katie** on 5 May 2004, 10:00 a.m.,*
in response to message #2 by Imran Farooq

I don't know of other manufacturer's replacement for this display, but you can use the display from any other Spice series calculator. They all used the same part for the display and you can often get a poor quality 33E or 38C/E for not too much on ebay.

Re: HP-34C LED display

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 5 May 2004, 10:29 a.m.,*
in response to message #3 by Katie

The display isn't corroded in some way due to battery leakage? I have 2 "dead" spices with great corrosion, in one of the displays the silicon chips simply disapeared! Anyway, DO NOT try to open the plastic lens to do anything, you'll ruin the rest of it (I have some bad experiences with cleaning of old NOVUS LED displays... now they have several missing segments...)

Good luck!

Nelson

Re: HP-34C LED display

*Message #5 Posted by **Imran Farooq** on 5 May 2004, 11:54 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Hi,

Thanks Katie, I like the suggestion that I could purchase a Spice series HP, in poor condition, for its LED display. This was also suggested by Viktor T. Toth.

I will do the above, but please contact me if anyone has a spare LED display.

Thankyou & Best Regards

Re: HP-34C LED display

*Message #6 Posted by **David Smith** on 5 May 2004, 11:53 a.m.,*
in response to message #1 by Imran Farooq

This is a very common fault in Spice series displays. Your only source of another one is another machine. You may have to go through a couple of "bad" machines to find a good one.

Re: HP-34C LED display

*Message #7 Posted by **Imran Farooq** on 5 May 2004, 12:13 p.m.,*
in response to message #6 by David Smith

Hi Dave,

Thats unfortunate that I may have to purchase more than one machine before I find one with a functional LED display.

Have you experienced this type of problem with a spice LED display?

Thats life!

Thanks & Best Regards

Re: HP-34C LED display

*Message #8 Posted by **David Smith** on 6 May 2004, 1:14 p.m.,*

*Message #9 Posted by **Imran Farooq** on 10 May 2004, 9:48 a.m.,*
in response to message #8 by David Smith

Hi Dave,

Do you think the source of the bad displays in the spice series may be due to electrlyte (or whatever) leaking on to the LED display below?

Best Regards

Re: HP-34C LED display

*Message #10 Posted by **David Smith** on 10 May 2004, 12:15 p.m.,*
in response to message #9 by Imran Farooq

Some of the faults are obviously caused by corrosion. Many others just seem to be normal LED faults such as bad bond wires or bad LED's. LED displays were a fairly new technology at the time and there was a learning curve to overcome in their mass production. The chip-on-board displays in the Woodstock and Spice machines seem rather prone to random display faults.

Re: HP-34C LED display

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 5 May 2004, 5:38 p.m.,*
in response to message #1 by Imran Farooq

Hi, Imram;

keep in mind that there are two "spice spieces": one with soldered IC's AND LED assembly, and another one built as a "sandwich", where IC's terminals are pressed to a flex circuit. As you have already opened your 34C (great calculator!) you may tell which one is yours.

I replaced a corroded (as Nelson mentioned; by leakage, no hope for them...) LED assembly in one solderless spice for another one removed from a soldered unit. It seems to me that they are electrically equivalent, but I'd like to know from other contributors, please, if there is any sort of limitation or incompatibility. At least for it worked pretty fine, but you must clean the LED assembly terminals in a way you do not experience bad contact further problems. Don't use any sort of scrapper or sand paper, instead carefully use alcohol to remove soldering flux and after that, apply some metal polisher to obtain a smooth, regular surface, better for contact with pressure; remember cleanning it well after this. If yours is a soldered unit and you are going to use a LED assembly from a solderless one, you'll just have to solder it in place. JUST be carefull aligning it well, if so.

My 2¢.

Luiz (Brazil)

in response to message #11 by Vieira, Luiz C. (Brazil)

As far as I know, the solderless and soldered Spices (of the same model, of course) are electically identical, and the display, ICs, etc will interchange between them. I've never had any problems doing this.

48gx question

*Message #1 Posted by **Johann** on 5 May 2004, 1:15 a.m.*

I recently purchased a hp 48gx new in the box which my screen produces black numbers while both my friends have 48gx which have the bluish colored numbers. Are they different models? Is that the only difference?

Re: 48gx question

*Message #2 Posted by **Raymond Del Tondo** on 5 May 2004, 1:47 a.m.,*
in response to message #1 by Johann

From the user's point of view, the screen is the main difference. Be happy, latest production runs of the HP-48 were made with that high contrast black screen, like in the 49g. Internally there should be nearly no change, maybe a different display driver hardware.

This b/w screen was the main reason for me to purchase another HP-48G+, my several other HP-48 machnes all have the blue-green (G/GX), or worse the bad blue (S/SX). I also have a GX with the low contrast SX display.

Raymond

Re: 48gx question Raymond how many?

*Message #3 Posted by **marc** on 5 May 2004, 7:37 a.m.,*
in response to message #2 by Raymond Del Tondo

Raymond how many 48 do you have

Re: 48gx question Raymond how many?

*Message #4 Posted by **Raymond Del Tondo** on 5 May 2004, 1:46 p.m.,*
in response to message #3 by marc

3 x GX (one of them Rev L, with SX display!),

2 x G (one w/384K, one with 2304K !),

1 x G+ (NIB w/b&w display, 1280K & speedup),

7 x SX (amongst them the one with the earliest known serNo #3003A00131),

2 x S (Rev E, Rev J)

If I counted right, 15 units...oops, I forgot my Rev ZERO prototype SX. This unit has no ROM, but an EPROM socket. So we're at 16;-)

What I'm still looking for are units with ROM rev: B, C, D, H, N, O, and P

I also have some 38G, 4 x 49G (1 used pre-prod, 3 new pre-prod. these hardly count as collectible), 1 49g+

Raymond

"VPN, you can do the same, I know that you have lots of 48. Photso pleas Veli. Thanks"

BUT I do NOT own
A) A scanner
B) A digicamera
C) A mobile phone with a digicamera
D) Anything similar
Just an analog camera, sorry!
{VPN} AXL

OT: {VPN} listed or arrayed?

*Message #9 Posted by **Matt Kernal (US)** on 6 May 2004, 12:38 p.m.,*
in response to message #6 by Veli-Pekka Nousiainen

There's nothing wrong with being a list, why would you want to be an array? {VPN} -> [VPN] stack diagram of AXL. On the other hand, if you were an array, I can understand why you'd want to be a list ([VPN] -> {VPN} also via AXL).

You always leave us guessing.. (what's he gonna do next? 8^)

Matt

Re: 48gx question

*Message #10 Posted by **Raymond Del Tondo** on 6 May 2004, 1:37 p.m.,*
in response to message #6 by Veli-Pekka Nousiainen

No problem;-)

On the 1st pic from left to right: HP-48GX Rev L with SX display,
then GX Rev M with GX display, then my new G+ with b/w display and 1280K RAM.

On the 2nd pic the same arrangement, from a slightly different angle.

The 3rd pic shows the GX with SX display in the center. THAT's a BIG difference.
Even the GX display viewed from the side is much better, but the best is the b/w display, of course.

The 4th pic show the calcs from the back. Left is my first GX, bought in USA in 1993 for a (back then) discount price of $259.
In the middle is the special GX with SX display. This unit was a present given to me from Vern Lindsay of Firmware Systems, Inc ,
when I was in Corvallis in 1999 to help them with some PDL HP-48 UI programming stuff.

On the right is my new G+, which has nearly all bells and whistles;-)
You can see the hole for the write-protect switch, which applies to the ports > 0.
Speed up will be performed by pressing and holding the ON key for a specific time.

The 5th pic shows the same (and my 3rd GX), from a slightly greater distance.

Note: The software which is shown on the displays is the built-in equation library,
activated with my SpeedBrowser in small font mode and sliders instead of arrows.
Both features are switchable, of course.

The white spot on the SI menu key of the unit with SX dipslay is just a big piece of dust.

Raymond

Ti to HP

*Message #1 Posted by **Johann** on 5 May 2004, 12:31 a.m.*

I started out using TI calc's and then I purchased the HP 33s which I loved so much that I just bought a brand new HP 48 GX with the TDS COGO surveying card. By far I fell in love with the RPN style. GREAT MACHINES!

Re: Ti to HP

*Message #2 Posted by **Tom (UK)** on 5 May 2004, 7:37 a.m.,*
in response to message #1 by Johann

What took you so long? ;-)

Did you ever try the HP32S(ii)? or the HP42S? Or did these look so drab you waited until the jazzy HP33S before trying?

Tom.

Re: Ti to HP

*Message #3 Posted by **Johann** on 5 May 2004, 11:07 a.m.,*
in response to message #2 by Tom (UK)

I really wanted to buy the 42s but due to the prices that I found I went to the 33s for now. I do plan to get a 42s this summer when I get a little extra cash saved.

nigerians answering FS ads

*Message #1 Posted by **barry** on 4 May 2004, 10:19 p.m.*

just posted a FS ad on the classified board, it only took less than 5 minutes for one of the nigerian scammmers to email and ask for a price on "10 quantity" (i only have and advertised one); anyone else get inquiries by these fine gentlemen?

Re: nigerians answering FS ads

*Message #2 Posted by **Ray** on 5 May 2004, 1:30 a.m.,*
in response to message #1 by barry

I got a email from one of these guys, he wanted 10 of my Avaition modules. When I told him I only had one he offered me $60 for the single unit. I told him I would have to wait a week to think on it, and being suspicious, also told him I could not ship item until payment is recieved. (thats a given on nearly any transaction).

Anyway, I take it they're not to be dealt with?

Re: nigerians answering FS ads

*Message #3 Posted by **Ray** on 5 May 2004, 1:45 a.m.,*
in response to message #2 by Ray

Update:

The guy just asked me for a HP laptop as well, and he would like me to ship this with the order. I think he thinks we represent HP in someway, perhaps he thinks we are an HP outlet? lol.

Re: nigerians answering FS ads

*Message #4 Posted by **barry** on 5 May 2004, 1:54 a.m.,*
in response to message #3 by Ray

be wary ray; they do send payment - a BAD check or m.o., or ask you to accept payment for a couple thousand dollars, claiming their "friend" in this country who they owe a bunch of money to will accept the items PLUS the overage! they are constantly changing their methods of scamming, they hit my websites now and offer to buy large amounts of goods for shipment to nigeria; they are not to be trusted in any fashion!

Re: nigerians answering FS ads

*Message #5 Posted by **Ray** on 5 May 2004, 2:09 a.m.,*
in response to message #4 by barry

Ah yes, the same group. I should've known.

Eitherway, I did not send them anything, nor did I plan too. I always investigate overseas transactions thoroughly, and it turns out that's a good thing, not just a paranoid habbit. :)

Thank you for the warning,

-Ray

Re: nigerians answering FS ads

*Message #6 Posted by **Garth Wilson** on 5 May 2004, 3:15 a.m.,*
in response to message #2 by Ray

A common trick they try to play especially with larger merchandise (like tandem bikes) is to say that they have someone waiting to take the product on its final leg to its destination, so they want you to send a check to that party along with the product, the amount of which will supposedly be covered in their payment to you. The scammer sends you a money order that they hope you will think is as good as cash, you send the merchandise, and then find out that the money order was bogus, perhaps as much as a few days after you deposited it. Our bank is now working with the FBI and other agencies to break a Nigerian ring that uses deceitful E-mail to try to get people to tell them their card numbers and PINs. If anything doesn't seem 100% right, make sure you do _not_ give the other party the benefit of the doubt.

Scam the scammers

*Message #7 Posted by **Wayne Stephens** on 5 May 2004, 7:16 a.m.,*
in response to message #1 by barry

These contacts are definitely the prelude to a scam. There are entire web sites dedicated to exposing these frauds. Most of these scams are for a lot more money than the "gentleman" from Nigeria seems to be fishing for on this site, and many are tied to "charities".

Some of the people who run the sites spend large amounts of time and effort "scamming the scammers". The results are often hilarious. There is a VERY funny site called www.419eater.com which some of you may enjoy perusing. I am not affiliated with it in any way, I have just enjoyed reading of their escapades.

Beware, there is language on the web-site that may offend some people.

Take care.

Wayne.

32S Serial number (or lack thereof).

*Message #1 Posted by **Wayne Stephens** on 4 May 2004, 9:10 p.m.*

My HP 32S has no serial number. Does this mean it will be ostracized by its peers at the annual convention? Will it be made to feel inferior? Will it ever be able to collect Social Security? Why would Hewlett Packard DO such a thing?

Seriously. Does anyone know why this calculator would have absolutely NO serial number of any kind? It just says "USA" on the back.

Thanks in advance for your help. Take care.

Wayne

Re: 32S Serial number (or lack thereof).

*Message #2 Posted by **Karl Schneider** on 4 May 2004, 9:42 p.m.,*
in response to message #1 by Wayne Stephens

Wayne --

This issue of a "serial-numberless" calc comes up occasionally. The most likely explanation is that it was a service-replacement unit.

-- Karl S.

Re: 32S Serial number (or lack thereof).

*Message #3 Posted by **bill platt (les Estats Unis d'Amerique)** on 5 May 2004, 3:08 p.m.,*
in response to message #2 by Karl Schneider

It is not a real hp. Do you remember when you used to be able to buy a "Rolex" on the streets of Manhattan for $20? For a little while, there was an hp knock-off fraud going on, too. Except that they didn't hawk them in Manhattan, where there were no engineers to appreciate them. Rather, they used to come around the JPL once in a while, driving an old Toyota Corona. they would park out about halfway out to the southeast in parking lot "B" and when they saw someone wearing a slide rule on the belt, they would come out and strike up a conversation... ;^)

Regards,

Bill

Re: 32S Serial number (or lack thereof).

*Message #4 Posted by **Dave Shaffer** on 6 May 2004, 12:50 a.m.,*

in response to message #3 by bill platt (les Estats Unis d'Amerique)

Bill,

Were the knock-offs any good? Maybe we should get these guys (if we could figure out who they were!) to help build the open RPN version.

PS Were you at JPL? When? I was a Caltech grad student in the early 70's and used to go across town on occasion to see somebody at JPL. I was never offered an HP knock-off, but this was probably too early - I had my HP 35 for about the last year I was in school, beginning about a year after they first came out. Paid a whole month's grad student stipend for it!

Psssst, Hey kid, wanna buy a calculator? Cheap?

*Message #5 Posted by **Wayne Stephens** on 6 May 2004, 7:02 a.m.,*

HP-67 batteries

*Message #1 Posted by **Miki Mihajlovic** on 4 May 2004, 5:48 p.m.*

Would an HP-67 work on alkaline batteries of any kind or are the rechargeables a must?

1234

Re: HP-67 batteries

*Message #2 Posted by **Jeff** on 5 May 2004, 7:30 a.m.,*
in response to message #1 by Miki Mihajlovic

From an electrical perspective, I believe the general consensus is that there would be no problems with using three 1.5 Volt alkaline batteries to power a 67. The 4.5 Volt output of the three batteries is basically the same as the charger/AC adapter puts out.
from a practical perspective, it may be a bit tricky to use alkaline cells. The battery pack does not really lend itself to having such cells installed and uninstalled. You could use an external pack with wire leads clipped to the battery terminals, just make sure to get the polarity correct.

Re: HP-67 batteries

*Message #3 Posted by **Tom (UK)** on 5 May 2004, 12:55 p.m.,*
in response to message #2 by Jeff

If you are worried about 4.5V being more than the 3.6V then put a diode in series with the batteries as this will drop the voltage by about 0.7V (for a silicon diode). You must use a high capacity diode (5A safe?) for driving the peak load when the card read motor is on.

Please note that this will not stop you connecting the battery the wrong way round (unless you solder it to the calculator) as the diode doesn't know what lead you just connected the battery to!

Perhaps you could make up a battery pack with a diode and some flying leads ending in small crocodile clips - suitably marked so you get the polarity right!

Different MEM number for newer 33s?

*Message #1 Posted by **Paul Brogger** on 3 May 2004, 8:52 p.m.*

I just got my second HP-33s (this time from Amazon). I copied all my vector manipulation programs from the first unit (yes, serial or robotic input would be nice!), verified all the lengths & checksums, and cleared the EQN lists.

They seem to have identical weight. ;^)

In response to MEM, the old one (ser. # CN 404nnnnnn) gives 30,556 (only the comma is MUCH smaller!) The new one (ser. # CNA412nnnnn) gives 30,542 .

Is there a firmware change to account for this difference, or is there some other minor memory-grabber that I haven't dealt with yet?

Of course, it doesn't make any difference. (If I was truly dedicated, I'd compare MEMs after paper-clip-resets, and type it all in twice more!)

I'm just curious . . .

Re: Different MEM number for newer 33s?

*Message #2 Posted by **bill platt (les Estats Unis d'Amerique)** on 3 May 2004, 9:25 p.m.,*
in response to message #1 by Paul Brogger

Can you post your program listing? We'll try it here, too!

Regards,

Bill

Re: Different MEM number for newer 33s?

*Message #3 Posted by **Paul Brogger** on 4 May 2004, 2:32 p.m.,*
in response to message #2 by bill platt (les Estats Unis d'Amerique)

Well . . . I suppose I could -- that would mean actually *documenting* my programs . . . I'm not *used* to behaving like that, but I suppose I could *try* . . . ;^)

But I don't think the programming is the issue. I claim to have entered the same code (as evidenced by identical lengths and checksums) into both calculators. The only other memory impactor that I know of is the EQN list -- and that's been cleared on both calculators. For good measure (even though I think they're pre-allocated) I've CLEARed VARS and Sigma.

And yet, the memory is 14 bytes lower on the newer model. I heard somewhere that one of the bugs in the early units had been fixed in the later ones. (Does anyone know this for a fact?) If so, a difference in the firmware might account for a slight reduction in available RAM.

(More likely: there's some memory-grabber that I don't know about and haven't cleared.)

Surely, the thing to do is fully reset both calculators and then compare them, but I don't want to re-key the programs again.

Perhaps those of you with one of the newer models could post your MEM number after a full reset? (I posted mine when I first got the original unit: 31,277)

Re: Different MEM number for newer 33s?

*Message #4 Posted by **Frank B. (Germany)** on 4 May 2004, 4:31 p.m.,*
in response to message #3 by Paul Brogger

After a full reset: 31277 (serial# CNA411...)

Frank.

Re: Different MEM number for newer 33s?

*Message #5 Posted by **Matt Kernal (US)** on 4 May 2004, 4:58 p.m.,*
in response to message #3 by Paul Brogger

After paper clip reset: 31257

After 3-fingered reset: 31277 (Same as yours and Franks)

Serial #: CNA41001002

Matt

*Message #7 Posted by **Brandon Del Bel** on 4 May 2004, 5:11 p.m.,*
in response to message #3 by Paul Brogger

31,277

CNA412...

Re: The memory mystery . . .

*Message #8 Posted by **Paul Brogger** on 4 May 2004, 7:11 p.m.,*
in response to message #7 by Brandon Del Bel

Everyone seems to be getting the same number, so I must have something somewhere in the newer unit that I don't in the old one.

Were the older calculator to have the reduced memory, I'd suspect garbage collection, but it's the newer model with 14 fewer bytes.

Again, it just don't mean nuttin', in the big picture. But it is curious.

Re: Different MEM number for newer 33s?

*Message #9 Posted by **Jeff** on 4 May 2004, 7:31 a.m.,*
in response to message #1 by Paul Brogger

Paul,
Have you swapped the R/S and ENTER keys on either of your units yet? How about posting some pictures of a disassembled unit? (We all know you have disassembled one of them by now.)

Re: Different MEM number for newer 33s?

*Message #10 Posted by **Paul Brogger** on 4 May 2004, 2:26 p.m.,*
in response to message #9 by Jeff

I already posted pictures of my first unit: some and some more.

No, I haven't swapped the keys. I'm not sure I'm going to. As nice as it would be if HP had done it "right", I have gotten used to the new positions.

And, swapping the keys' functions would mean I'd have to mentally translate the function key actions each time I used LASTx, SHOW, PRGM & PSE. Maybe that would be easy, but I'm not sure it's worth it.

Re: Different MEM number for newer 33s?

*Message #11 Posted by **Richard Garner** on 4 May 2004, 3:55 p.m.,*
in response to message #10 by Paul Brogger

Not having a 33S or knowing how it uses memory. Could you have any numbers stored in memory or any numbers in the stack or flags that are set non-default? If the memory is used as a pool for all memory use, that could be throwing the totals off between the two.

Re: Different MEM number for newer 33s?

in response to message #1 by Paul Brogger

You mention the comma is much smaller on the older 33s. What about the decimal point? Is there a difference between the older and later versions?

Re: commas are the same

*Message #14 Posted by **Paul Brogger** on 4 May 2004, 6:55 p.m.,*
in response to message #13 by Neil

That was a lame joke. I meant the comma on the calculator display was much smaller than the one I typed into the Forum message . . .

The displays look essentially identical -- maybe a bit less greenish and more bluish on the newer model, but that's probably my imagination.

BTW, reducing the contrast does help with the shadowing -- so the decimal point & comma are the only serious drawbacks to the 33s, as far as I'm concerned.

Re: Different MEM number for newer 33s?

*Message #15 Posted by **Ben Salinas** on 4 May 2004, 7:42 p.m.,*
in response to message #13 by Neil

Here's another thing to try on the new one, to try and find the missing memory.

Put your calculator into radians mode. Press C-y^x (to initiate the test), then press C-LN (to clear the test). What do you see on the screen (is the RAD annunciator on). Try 45 sin. Do you get .8509 or .7071?

-Ben

42s and 15c

*Message #1 Posted by **V. Taylor** on 3 May 2004, 6:54 p.m.*

I've seen several statements in this forum and in other places that the 42s and the 15c are very different calcs. I realize that the layout and display is different, but as far as functionality are they really that different? They both do complex numbers, matrices, and programming, right? I still use my 42s on a daily basis but is it worth investing the $150+ to find out?

Re: 42s and 15c

*Message #2 Posted by **Eric Smith** on 3 May 2004, 7:34 p.m.,*
in response to message #1 by V. Taylor

The HP-15C does complex numbers, and it does real matrices, but it does not do complex matrices. You can use "tricks" to simulate some operations on complex matrices. See the "HP-15C Advanced Functions Handbook" (available on the Museum CD-ROM) for the details.

Rarely do I have the inclination to differ with Eric Smith's excellent posts, but here's a minor exception...

It's true that the 15C stores only real-valued variables as matrix elements, which requires the user to represent complex-valued matrices as real ones with twice the number of elements. However, the user may perform many of the same matrix calculations for complex-valued matrices, by executing mathematical transformations that are done internally by software that handles complex-valued matrices.

The designers of the 15C supported complex-valued matrix operations by providing these necessary *transformation utilities* (not "tricks") as built-in keyboard functions.

The utilities are reasonably intuitive for anyone who is sound in linear algebra; are easy to use; and are documented in the excellent, standard Owner's Handbook as well as in the optional, extra-cost Advanced Functions Handbook.

IMO, the built-in utilities for using complex-valued matrices is an excellent example of how HP "went the extra mile" to develop a fully-engineered and functionally-coherent tool for professionals. In that regard,

the successor 32S/32Sii and 33S, despite their advantages, don't quite measure up.

-- Karl S.

*Message #4 Posted by **bill platt (les Estats Unis d'Amerique)** on 3 May 2004, 7:49 p.m.,*
in response to message #1 by V. Taylor

The 15c has a very small memory compared to the 42s. THe latter is large enough to take any 41CX program (a 41 withyout Zenrom or other super-whizbang aftermarket add-ons).

The 15c is a beautiful thing, period. But if you are used to the 42s, I think you will find the 15c a step backwards in time.

Every command is on a key. There is no alpha mode. That is part of the beauty.

Since I don't have a 42s, I dont't have that problem! :-)

regards,

Bill

Re: 42s and 15c

*Message #5 Posted by **Dano** on 3 May 2004, 8:38 p.m.,*
in response to message #4 by bill platt (les Estats Unis d'Amerique)

Ah bill..... I read your insightful posts often. Never would have guessed you don't have a 42s. I like the 15C as a handy, sturdy calculator but when I want to get serious I even skip the 48 and go for my 42s...sorry, one of my two 42s (never saw the need to use them both at the same time ;-)

in response to message #5 by Dano

Hi Dano!

Thanks for your nice note. Well, I would love to have a 42s--but it is hard to get one at a small price! I did miss one for $102 about a week ago, though. Someday.....

Best regards,

Bill

Re: 42s and 15c

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 4 May 2004, 12:32 a.m.,*
in response to message #1 by V. Taylor

HI;

I see others have already found their words to express what is between both HP15C and HP42S. I guess that we can all add one or another extra information, because they are so many. I think I can post about a lot of them: plenty of memory "space (standard 8KBytes, upgradable to 32Kbytes or 64KBytes) IR output, control

and system flags, enhanced programming with ALPHA labels instead of keycodes, menu-driven (I like it very much, although some users hate it), variables AND numbered registers, enhanced statistics with standard four curve fit plus BEST (auto setting for best correlation coefficient), full dot-matrix LCD with graphics capabilities (I never understood why some guys mentioned the HP42S is not a graphic calculator... if graphics can be drawn in the display, why isn't it graphics?). About math capabilities, Eric Smith mentions a very important difference between them both: the complex matrices. The fact is that when the HP42S is dealing with complex matrices, it uses half the number of registers needed in the HP15C to accommodate the same data in order to perform some complex matrix operations. Yes, the HP15C arrangement is clever, thoughtful, a true brainy accomplishment. I'd be proud of working with the team that developed the HP15C firmware. Ï remember that once I measured how much each matrix uses of the HP42S available memory and, as expected, matrices have a different scheme of memory usage. I took some (hand written) notes but I cannot imagine where are they (time to start again or look for this information somewhere), so I cannot see a way to compare memory usage in this case.

I just would like to add that I own each of both, and I like very much using each of them. Heavy duty work with the HP42S (faster and with more memory), but for daily enhanced tasks, I see no other better and easier as the HP15C.

Wow! Too much words, not so much additional information. But I hope these posts actually help you finding your own answer.

Cheers.

Luiz (Brazil)

HP 41 Bar Code Language

*Message #1 Posted by **Cristiano** on 3 May 2004, 6:07 p.m.*

I have been looking to write some bar code for the HP-41 optical wand. I am trying to understand the format used. I snooped around the web and found some Windows software to write it; however no clear explanation on how to associate instructions or alphanumeric input to the bars. My goal is also to be able to read information barcoded in other languages (e.g. UPC-A etc). Any input or link on where to look? Thanks CC

Re: HP 41 Bar Code Language

*Message #2 Posted by **Eric Smith** on 3 May 2004, 6:59 p.m.,*
in response to message #1 by Cristiano

You want the manual "Creating your own HP-41 Barcode", which is available on the museum CD-ROM set.

The manual on the 82153A bar code wand describes functions that can be used to read "foreign" barcode formats. There are some limitations; I'm not sure whether UPC-A can be read.

Re: HP 41 Bar Code Language

*Message #3 Posted by **Miki Mihajlovic** on 3 May 2004, 6:59 p.m.,*
in response to message #1 by Cristiano

I am not sure about the other bar code languages but HP-41 is rather simple. Bars simply mean 0 or 1 bit. 0-bit is a thin bar while 1-bit is a thick bar. White space is of same thickness as 0-bit. Absolute thickness is not important (although there might be some limits) since the wand reads only pulses and their duration. Beginning (two thin lines)and the end (hick-thin) of the bar code sequence (line) is marked so the wand knows if it reads left-to-right or right-to-left. I think that I have seen a detailed description in one of the PPC journals but I am not positive about it.

Re: HP 41 Bar Code Language

*Message #4 Posted by **Tony Duell** on 4 May 2004, 2:39 p.m.,*
in response to message #1 by Cristiano

My 'LIF Utilities for Linux', available from the HPCC web site (http://www.hpcc.org) include programs to generate HP41 program and data barcode. You'll need the 'Creating your own HP41 Barcode' book in order to understand them, but these programs may clarify a few points (they're commented C source, should be fairly portable).

Re: HP 41 Bar Code Language

*Message #5 Posted by **Ray** on 5 May 2004, 1:39 a.m.,*
in response to message #1 by Cristiano

The barcode also uses two bars of data on each side to indicate whether data is being read left to right, or right to left. I think it works like this in a string of data:

00DDDDDDDDDDDDDDDDDDDDDDDD10

Where: D=data string itself (could be anything) 0=thin bar 1=thick bar

This shows how the ends of the data are organized, so the reader knows whether it is reading right to left or left to right.

Someone correct me if I'm wrong. Hope this helps.

Robot Arm Programming HP-42S??

*Message #1 Posted by **Bill (Smithville, NJ)** on 3 May 2004, 3:43 p.m.*

I've started wondering if a robot arm could be used to program a HP-42S by pressing the keys. Do these arms have the motor skills to do this? Anyone here familar with the relatively cheap (say $200-250) PC controlled robot arms?

I know it wouldn't be a fast way to enter a program - but wonder how fast a robot could type. For a long program, I could envision using a text program listing, interfaced to the arm and let it do the programming over night.

What do you think -possible? - or would I just end up with a broken keyboard?

Re: Robot Arm Programming HP-42S??

*Message #2 Posted by **David Smith** on 3 May 2004, 4:16 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I know a person who did this using a modified pen plotter.

Re: Robot Arm Programming HP-42S??

*Message #3 Posted by **Bill (Smithville, NJ)** on 4 May 2004, 2:38 p.m.,*
in response to message #2 by David Smith

That's interesting - how would a pen plotter do it? I guess the raising and lowering of the pen arm could press keys. That might be a cheap way to go. I've seen old flat bed plotters at ham fests for almost no cost. And I'd think the pen arm could move up/down and relocate itself at fairly high speed - as compared to a robot arm. I just might give that a try. I'll keep my eye open at the next hamfest. I'm WD9EQD for you Hams on the list. Thanks.

Hi Erik,

>>serial I/O (developed by programming the extended ROM area) instead >>

This would be great. But.. I wouldn;t have the fun of the robot arm :)

feed-back (was: Robot Arm Programming HP-42S??)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 4 May 2004, 1:26 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi;

one of the limitations was a big "what... if": what if a key fails or repeats? Not simply fail to be pressed, this is easy to check; I mean a contact failure or bouncing. It would be necessary to use some sort of visual checking, an image processor with a camera following the changes in the display to confirm a key is correctly pressed and no wrong code is added. Imagine the sequence

```
[STO]12 [ENTER] [X^2] [+]
```

being recorded by the mechanical device without back checking and the [2] in [STO]12 fails: the recorded sequence would be

```
[STO]01 [X^2] [+]
```

instead, and the program would probably fail.

I remember this fact amongst others (using an external contact array in parallel with the keyboard contacts, for instance) because I was the one asking about this particular handicap. I remember I thought about this when I bought my HP15C in the 80's, and I found that one missing key would cause many steps not to be inserted. At the end, the sequence would somehow find its own "track", but the entire program would need to be checked. By doing so, why not typing it all at once??!!

Forgive me being such a "Devil's advocate"...

Cheers.

Luiz (Brazil)

Re: feed-back (was: Robot Arm Programming HP-42S??)

*Message #7 Posted by **Nill (Smithville, NJ)** on 4 May 2004, 2:49 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Luiz ,

Good points on the not knowing if the keys were actually pressed. I'm assuming I'd have to check the program after entering. Could print the program to a 48GX using the IR and then upload to a PC and have a program compare it to the original. Be a fairly painless way to verify it or at least know what needs to be corrected before running it.

My other concern is the mechanism of striking the keys just the correct amount without distroying the keyboard. Another question - do all the keys on the HP-42S keyboard take exactly the same amount of key movement to register? Or would some take a slightly longer keystroke. If different keystroke lengths then might prove difficult to calibrate a single key pressure that would work for all keys.

I guess I just want to drum up a reason for getting a robot arm to play with :)

Adaptive pressure (was: Robot Arm Programming HP-42S??)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 4 May 2004, 5:24 p.m.,*
in response to message #7 by Nill (Smithville, NJ)

Hi, Bill;

about the IR output, you'd need another calculator OR (even better) an IR sensor (transistor) connected to the system so it would check it for you. The worst of it (I think) is the power consumption when the IR output is active. And when I considered the checking, I was thinking of a Voyager (no output of any kind...).

Have you considered a system that adapts to the pressure by... "learning"? Cursor sensing/positioning would be enough to create a database with small fuzzy and neural net SW.

The domes used in the keyboard (under each key) are essentially the same (design) and each key has the same surface area to act over their respective domes. I think that you'd not confirm such a big difference from one key to another.

The "programming" systems grows too much in size and complexity, but I guess it's no reason to give up reasoning about it. And this IS a good reason to use a robot arm; why not?

I guess yoú're not in the wrong way. The fact is that if the HP42S had a single IR input with the equivalent SW, nothing would be necessary... But I also guess that HP considered the amount of extra "customers" would go for the HP42S and probably none of them would try the new RPL models: HP28S and HP48SX/S. Well, maybe HP just wanted to give the HP41 fans the feeling that they have not been forgoten by introducing the HP42S prior to discontinue the HP41. That would be easy to take both HP41 and HP42S out of the market later, without so much "trauma".

Cheers.

Luiz (Brazil)

Re: feed-back (was: Robot Arm Programming HP-42S??)

*Message #9 Posted by **Holger Weihe** on 6 May 2004, 3:31 p.m.,*
in response to message #7 by Nill (Smithville, NJ)

To be on the safe side with to long key-strokes I would simply put the calculator on a slightly elastic surface which allows the calc to move down if the pressure becomes to strong.

Re: Robot Arm Programming HP-42S??

*Message #10 Posted by **Wayne Brown** on 4 May 2004, 6:34 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I don't have an answer for your question, but you reminded me of something I saw back in the '80s when I first was fooling around with microcomputers. There was an ad in one of the hobbyist magazines (I think it was *Kilobaud Microcomputing*) for a gadget to convert an IBM Selectric typewriter into a printer. It clamped over the keyboard and used pistons to push the keys and "type" the output from the computer. I wish I could have seen one in action!

HP 33s for non-engineers

*Message #1 Posted by **Dave Olson** on 3 May 2004, 3:13 p.m.*

I recognize that most people here are probably engineering students, and see the HP 33s as a good calculator for the NCEES exam. I'm a physics student, rather, and am looking for a good calculator to replace my old TI-36. Does anyone have any thoughts on the 33s in that light?

Re: HP 33s for non-engineers

*Message #2 Posted by **bill platt** on 3 May 2004, 3:27 p.m.,*
in response to message #1 by Dave Olson

Hi Dave,

I am a little baffled--what is the difference between engineering and physics in regard to calculators? Is it which built-in constants are chosen?

What other features would be distinguishing?

Regards,

Bill

http://plattdesign.net

Edited: 3 May 2004, 3:27 p.m.

Re: HP 33s for non-engineers

*Message #3 Posted by **Dave Olson** on 3 May 2004, 3:48 p.m.,*
in response to message #2 by bill platt

Just to point out I'm not looking for a calculator specifically for an exam. I'm looking for something that helps in my studies--the TI I've used worked great, but doesn't have enough memory to hold all the numbers I need when solving problems for class exams and whatnot. The programming capability will help in my math classes (primarily numerical analysis) as well, but I don't need anything too powerful, like a large, expensive graphing calculator. Whenever I have a problem that needs that capability, I'm using Maple or Matlab.

So, I'm just curious especially to hear what people who have used this new model think about it.

Re: HP 33s for non-engineers

*Message #4 Posted by **bill platt** on 3 May 2004, 4:56 p.m.,*
in response to message #3 by Dave Olson

Hi Dave,

I used an 11c all through college, including physics, and it was a splendid tool. I replaced it with a 32sii, which was really the same, only better, especially for programming.

The 33s has all the features of the 32sii, with a lot of additional memory, and some additional "scientific constants" built in.

The programming is identical with the 32sii. However, it also works in Algebraic mode if you so choose (including in programming).

I enjoyed using my 11c in college, as I used to program it frequently on the fly, which was great in physics. The 32sii is much easier to edit, as it has a memory management system with checksums and the ability to erase pragrams one by one. The 33s has this as well.

And although it does not do matrices automatically, and the complex number handling is not optimal or super like the 15c or the 42s (which are different from each other by the way) it does work.

It should be a good tool, and it is relatively inexpensive for a programmable machine.

As an engineer, I don't see any difference between its use in physics as compared to engineering. The 11c, then the 32sii, and now the 33s are all good.

Of course you can buy a TI-30 for like $9 but forget programming then.

Regards,

Bill

Re: HP 33s for non-engineers

*Message #5 Posted by **rsenzer** on 4 May 2004, 2:05 p.m.,*
in response to message #3 by Dave Olson

Hi Dave,

Except for the fact that in algebraic mode, the parenthesis are on shifted keys, once in algebraic mode, this is a far better calculator than the TI-36. Also, note that the TI-36 has a defective logarithm algorithm. When calculating ln(1 + x) where |x| < 1E-5 or so, the result will lose accuracy. On my TI-36, I just use x - x^2/2 in such cases.

TI has been informed of the bug/feature, but refuses to fix the problem.

If you like AOS as opposed to EOS, the 33S may be your only real scientific calculator alternative. The 33S uses a nice hybrid, of AOS and EOS, however, the editing capabilities are not state of the art.

BTW, I use both the RPN and ALGebraic mode, depending upon the problem that I am working on as well as whether I'm showing a calculation to someone who is unfamiliar with RPN.

Re: HP 33s for non-engineers

*Message #6 Posted by **Dave Shaffer** on 3 May 2004, 3:43 p.m.,*
in response to message #1 by Dave Olson

Dave,

Unless your instructors expect you to do a lot of calculator-based graphing, the 33S should be fine.

I teach physics (and astronomy) at our community college. In physics, we have both algebra/trig based courses and full-blown calculus-based courses. I use either a 32SII or a 42S for working out the homework questions that I assign, although most of my students have TIs or Casios.

Throughout my research and teaching career (some 35 years, going back to graduate student days), I've seldom felt the need for anything more powerful than that. I've had, and used extensively, first an HP35, and then HP-11 and HP-41CX. That was always enough hand-held power. For anything tougher, it was time to use the computer.

Best wishes for your career,

Dave

Re: HP 33s for non-engineers

*Message #7 Posted by **Norris** on 3 May 2004, 5:54 p.m.,*
in response to message #1 by Dave Olson

The 33S has two features that are hard to find in competitive models:

(1) Optional RPN mode. If you can adjust to RPN, then you can crunch complex numerical expressions faster and more accurately than on a standard algebraic calculator. If you plan to use the 33S in algebraic mode, like your old TI, then RPN doesn't matter.

(2) Programmability. It's difficult to find a non-graphing calculator that has significant programmability. The 33S is about the only option on the market today.

HP graphing calculators, like the 48 and 49 series, have two significant advantages over the 33S:

(1) The 48 or 49 can be easily loaded with a wide variety of existing scientific and engineering software. Suggest you check www.hpcalc.org to see if there is anything of interest to you there. In contrast, there is little pre-existing software for the 33S, and long programs have to be entered manually because it has no communication ports.

(2) The 48 or 49 can easily attach units to numbers, and calculate with them. For example, a 48 or 49 can quickly tell you that the product of "50_kg" and "9.81_m/s^2" is "490.5 kg*m/s^2", and that this is equivalent to "0.4905_kN" or "110.3_lbf". This is an extremely useful feature for engineering, especially when using non-SI units.

Re: HP 33s for non-engineers

*Message #8 Posted by **Arnaud Amiel** on 4 May 2004, 2:00 a.m.,*
in response to message #7 by Norris

> Quote:

in response to message #1 by Dave Olson

The 33s is perfect for you. It is powerful enough to be more than you will ever need, but not so powerful that it is TOO much. You will be absolutely amazed by the speed. Compared to the TI-36 that my sister has (and that I used to use). For example: try 69! (the highest factorial that the TI-36 can do). On the TI-36 it takes 5 seconds (just by me counting) while the HP-33s takes less than half a second. It also includes all the constants of the TI-36, and 20 more. Plus it will have more than enough memory for storing numbers (27 compared to 3) and is programmable.

You will love it.

-Ben

Re: HP 33s for non-engineers

*Message #10 Posted by **Dano** on 3 May 2004, 8:50 p.m.,*
in response to message #1 by Dave Olson

Dave, I think you are either an RPN kinda person or your not. If your not, it really doesn't matter what kind of infix calc you use. Personally I always thought the SHARP or CASIO's were superior to the TI's. Either way, you have lots of choices and calculator power for very little $$. If your an RPN person, as most of us are, you really don't have much of a choice. I can't use anything but RPN for more than a minute or two with out getting frustrated. I thought the 6s was a nice little calc - it would be perfect for 90% of what I do if it was RPN. I now have a 33s and while it's an OK calculator, I think $50 is a bit steep for what you get. BTW, for you other 33s owners (or soon to be), I found the adjusting the contrast on the LCD has a significant impact on the visibility of the decimal point (and comma). If you get the contrast just right (and learn to hold your head just so), the parallax and ghosting of the cheep display is greatly reduced. I still use my 41 every day.

Re: HP 33s for non-engineers

*Message #11 Posted by **Fubar Vikinghelmet** on 4 May 2004, 9:02 a.m.,*
in response to message #10 by Dano

The HP-33S has h-bar built-in... That could be useful.

For programmability, robustness and cost, I think the HP-33S is a fine calculator for cranking out physics problems. As was already mentioned, if you're not used to RPN, you may or may not like it. After many years of being an RPN person, I find algebraic calculators to be frustrating, really! The price I paid, including a $9.99 "rebate" instead of the "free" susscription to Business 2.0 that comes with th epurchase of a new HP-33S, was - this includes shipping and tax (New York requires sales tax to be paid on internet sales) - $48.07. That's $1.93 less than the $49.99 advertised price off HP's website... Also as was already mentioned, it's a bit pricey for what you're getting. In my case, I paid for an RPN calculator that I can use on the PE exam in November.

On the other hand, I am an evangelist for the non-PE-acceptable HP-28S. You should purchase two of them off eBay. While it's not the 48GRX or whatever, I found that it's the best calculating device I've yet

used.

Nonpareil release 0.44

*Message #1 Posted by **Eric Smith** on 3 May 2004, 5:26 a.m.*

Alpha release 0.44 of Nonpareil is now available. This release adds annunciator display for the HP-41 family, substantially improving usability.

The scanned image of the HP-41CV has been replaced by a stylized rendering from my older NSIM simulator with graphical improvements by Maciej Bartosiak.

Re: Nonpareil release 0.44

*Message #2 Posted by **Vincent Weber** on 3 May 2004, 7:16 a.m.,*
in response to message #1 by Eric Smith

Hi Eric, I would love to see the Windows version that you mentionned last time. Is it available ? Thanks a lot, cheers, Vincent

Re: Nonpareil release 0.44

*Message #3 Posted by **Eric Smith** on 3 May 2004, 4:38 p.m.,*
in response to message #2 by Vincent Weber

The Windows version is still in development. Although it was easy to get it basically working, there are some bugs in display updating that render it not very usable just yet. I believe these are bugs in GTK+, but will have to do some testing to try to pin them down further and hopefully fix them.

Re: Nonpareil release 0.44

*Message #4 Posted by **J-F Garnier** on 4 May 2004, 8:12 a.m.,*
in response to message #3 by Eric Smith

Hello Eric,

Do you know if the HP-33 and HP-33C share the same code (same for HP-25/HP-25C)?

Any plan to include the HP-67, HP-29C and HP-34C?

J-F

Re: Nonpareil release 0.44

*Message #5 Posted by **Tony Duell** on 4 May 2004, 2:41 p.m.,*
in response to message #4 by J-F Garnier

I am pretty sure one of the 2 ROMs is the same in the 25 and 25C. And there are also some common ROMs between the 29C and 19C. If the ROMs have the same part number, they presumably contain the same code.

Re: Nonpareil release 0.44

*Message #6 Posted by **Eric Smith** on 4 May 2004, 5:29 p.m.,*
in response to message #4 by J-F Garnier

> Quote:
>
> Do you know if the HP-33 and HP-33C share the same code

The 33E and 33C use different code, as do the 38E and 38C. The main reason for this appears to be the use of the cold start constant, and the way the RAM is initialized. The NMOS RAM had an instruction to clear a bank of 16 registers, but it appears that the CMOS RAM does not respond to that instruction.

The 38C code seems to be considerably rearranged from the 38E, much more than I would have expected for just the RAM change. Technical problems have prevented me from obtaining a complete 33E ROM dump thus far; the 33E I've tried to dump is more sensitive to loading on the clock lines than any of the other calculators I've dumped. I'm rebuilding the romsucker with a very high impedance front end using JFET opamps as voltage followers.

> Quote:
>
> (same for HP-25/HP-25C)?

I haven't dumped those yet. They have two ROMs, one of them integrated with the anode driver. (The other ROM is the same chip type, but the anode driver is disabled in the metal mask layer to save power, and the chip is bonded out in an 8 pin DIP.) The non-anode-driver ROM is the same in all HP-25 and HP-25C units I've examined, part number 1818-0154.

Of the units I've examined, the HP-25s contain the 1818-0153 ROM/anode driver, and the HP-25Cs contain the 1818-0168 ROM/anode driver. The 1818-0168 fixes some bugs, and might also change the RAM initialzation, though I haven't verified that. I'm told that some HP-25s (non-C) have the 1818-0168. I do not know whether any HP-25Cs use the 1818-0153.

> Quote:
>
> Any plan to include the HP-67, HP-29C and HP-34C?

Yes. I have a ROM dump of the HP-34C, but it does not behave well on the current Nonpareil simulation code. I believe there is at least one significant bug in my Woodstock processor simulation, which may also be the cause of the HP-25 exponential/logarithmic function problems. I need to spend some time capturing and studying traces.

The Nonpareil HP-38C simulation diverges from the real calculator after a few hundred cycles; a condition branch instruction takes the opposite path and I have not been able to determine why because I don't know what's in the A register of the real calculator at that point.

Simulating the HP-67, HP-91, HP-92, HP-95C, HP-97, and HP-19C will require at least a partial understanding of how the PIK chip works, since the keyboard is tied to that rather than directly to the ACT. The PIK printing instructions are described in general terms in the HP Journal article about the HP-91. The card reader of the HP-67 and HP-97 will also be a challenge. I suspect that getting the HP-67 and HP-97 running without card reader and printer will not be so hard.

Re: Nonpareil release 0.44

*Message #7 Posted by **David Smith** on 5 May 2004, 12:00 p.m.,*
in response to message #6 by Eric Smith

I have one 25C with the earlier (buggy) ROM0/driver chip. This machine came from the estate of an HP engineer and had several "weird" machines in itsuch as a 25C without the "Continuous Memory" label and one with a plain HP25 front label. Also had some machines with serial numbers earlier than those recorded in the HPMUSEUM survey. I suspect that they were pre-release internal test machines.

Re: Nonpareil release 0.44

*Message #8 Posted by **Tony Duell** on 5 May 2004, 2:50 p.m.,*
in response to message #6 by Eric Smith

The HP25 I've had in bits recently (and the HP22, which is electrically identical) have both ROMs in 18 pin DIL packages. The one at the rear end of the PCB has the anode driver pins used, connected to the display. The one at the front (CPU) end has them not connected (and I assume the anode driver circuits are disabled in that chip).

Why a 33s instead of a 43s?

*Message #1 Posted by **Joe Edwards** on 2 May 2004, 11:31 p.m.*

I am sorry if this has been discussed at length, but I would like to hear everyone's opinions regarding this issue. HP brought back the HP32 models in the guise of the HP 33s. That is fine. Heck, I ordered one (should arrive tomorrow) to replace my lost HP 32s. :(What I don't understand is why they didn't just make a 43s version based off of the HP 42s model. Does anyone have any insight or even actual knowledge as to HP's reasoning? Did they feel it would have cut into the sales of the 48/49 models? Thanks.

Joe

Re: Why a 33s instead of a 43s?

*Message #2 Posted by **Karl Schneider** on 3 May 2004, 12:21 a.m.,*
in response to message #1 by Joe Edwards

Joe --

There are probably many reasons why the 32SII was the basis for a new non-graphing scientific model.

1. Continuity

The 32SII was made until 2002; the 42S was discontinued in 1995, quite probably due in part to some cannibalization of 48G/GX sales at the time. I'd bet that all the microprocessor code was available to KinHPo for the development of the 33S; the 33S functionality deviates very little from that of the 32SII. (BTW: The 32S was discontinued in 1991.)

2. Market niche

The 33S "bisects" the gap between the 30S and the 48GII more evenly than a 43S would.

3. Product development costs

The 32SII micro-code would be much simpler to work with for adding AOS mode than the 42S code would have been.

I bought a 33S a week ago at Portland State University bookstore for $49.95. My impressions are similar to those of others:

- Certainly not a *bad* calc.
- It's good that the RAM limitation was removed.
- Shadowy LCD readout with tiny decimal/comma is inexcusable.

In the not-too-distant future, I'll elaborate on those thoughts, and also post a new user-library program for the 33S/32SII/32S.

-- Karl S.

Re: Why a 33s instead of a 43s?

*Message #3 Posted by **Ben Salinas** on 3 May 2004, 12:23 a.m.,*
in response to message #1 by Joe Edwards

Perhaps it was simply cheaper to produce a 33s rather than a 43s. Maybe (we can hope) they were making the 33s to test the market (Judging how it was the top selling portable electronic item on amazon for a long while, I think the market likes it), and now they will make a 43s (hint hint HP).

I don't know if there is any truth behind that, just my thoughts

-Ben

Re: Why a 33s instead of a 43s?

*Message #4 Posted by **Richard Garner** on 3 May 2004, 12:35 a.m.,*
in response to message #1 by Joe Edwards

Others here can correct me if I am wrong. As I see it the 42S was discontinued in the mid 1990's. That left the 32SII as the only RPN scientific calculator on the market until it was discontinued about 2002. All others HP calculators were RPL or AOS. Sense most people wanted an RPN calculator that would fit into their pocket and not off their belt like the RPL's, the 32SII was all there was to have. The 32SII sold really well, being the only thing available in what people needed, not wanted. So what HP did was look at what the last RPN scientific calculator that sold really well was and reproduced it with modifications and ignored everyones pleas on what they really wanted and needed, the 42S.

Re: Why a 33s instead of a 43s?

*Message #5 Posted by **Norris** on 3 May 2004, 12:56 a.m.,*
in response to message #1 by Joe Edwards

There are two markets for high-end calculators in the US today: education and professional. A revived "43S" simply wouldn't have the features to succeed in either one.

The education market is by far the most important today. High school students and undergraduates will readily spend $100+ for a calculator -- but they expect it to be a "graphing" calculator. A "43S" would have no significant graphing capabilities, and would therefore be obsolete as far as the education market is concerned.

The professional market has withered away since PCs became inexpensive and ubiquitous. For most young engineers, the only reason to buy a high-end calculator is for use on professional licensing exams, where PCs are banned. There has been strong demand among professionals for the 33S for exactly this reason: it is the most powerful model that can legally be used on these exams. In contrast, the 42S was banned in 2003, and a "43S" would presumably be banned as well. This would cripple its sales in the professional market.

The 42S was discontinued in 1995. A "43S" would face market conditions that have deteriorated, not improved, since that time. That's the unfortunate reality.

Re: Why not a HP 37G?

*Message #6 Posted by **Veli-Pekka Nousiainen** on 3 May 2004, 1:50 a.m.,*
in response to message #5 by Norris

I guess you're right.

BUT
what HP is missing is a more simpler, cheap graphing calclulator.
You may have EQW and Matrix Writer and ROOT plus Integrate,
but no symbolics at all!
That is: no symbolic integrate, no derive, no symb. diffy, no symbolic SOLVE.

What you should have is Graphing and more Graphing!!!
Applets are fine. Programming them in both user & sys level directly on the calc would be a bless!

Re: Why not a HP 37G?

*Message #7 Posted by **rsenzer** on 3 May 2004, 3:09 a.m.,*
in response to message #6 by Veli-Pekka Nousiainen

One other important feature which is essential in any "modern" calculator is an update capability. To meet "test" requirements, this update capability would have to be by a physical wire as opposed to IR, wireless, etc.

I believe that one of the biggest flaws with the HP-33S is this lack of some form of flash memory.

I would also like to see reassignable keys and user customization of menus in any model.

Re: Why not a HP 37G?

*Message #8 Posted by **Veli-Pekka Nousiainen** on 3 May 2004, 8:08 a.m.,*
in response to message #7 by rsenzer

You are quite right!
The HP-37G should have USB and a Flashable ROM (1MB) 256KB RAM is enough...
Maybe they could include the Equation library
once they remove all the symbolics like SOLVE, Integrate and Diff-Solver
(numerical methods should stay)

Re: Why not a HP 37G?

*Message #9 Posted by **Richard Karnesky** on 3 May 2004, 12:53 p.m.,*
in response to message #7 by rsenzer

The problem being that this would bar it from being acceptable on the FE/PE that Norris successfully argued was a key scoring point for the current 33s.

Re: Why not a HP 37G?

*Message #10 Posted by **Norris** on 3 May 2004, 5:11 p.m.,*
in response to message #9 by Richard Karnesky

I am afraid that you are correct.

If you want to sell an expensive calculator to a professional engineer or surveyor in the US, then it needs to be legal for use on NCEES licensing exams. This is an important selling point.

But NCEES will ban *any* calculator that can (a) store text, and (b) transmit that text to a computer. The 33S is arguably capable of storing text (as an "equation"). If the 33S also had a

USB port, it would also be capable of outputting that text, and would be banned immediately.

The announcement of the NCEES calculator policy in August 2003 may go down in history as the final nail in the coffin of the high-end professional calculator. As long as this policy is in place, there is no real reason for HP (or any other manufacturer) to offer anything more sophisticated than the 33S to the professional market (in the US anyway). The most advanced models will be marketed exclusively to students.

Re: Why not a HP 33s+?

*Message #11 Posted by **Marcel Pelletier** on 3 May 2004, 7:26 p.m.,*
in response to message #7 by rsenzer

... may be next year...a new and improved hp 33s whit a full control of the memory (partition...), many letters labels and many letters memory names or number memory limited only by the memory of the calculator...so a 41c-42 in a 33s!

Re: Why a 33s instead of a 43s?

*Message #12 Posted by **Fubar Vikinghelmet** on 3 May 2004, 9:44 a.m.,*
in response to message #5 by Norris

I got my two HP-33s' a couple of weeks ago - ordered direct from HP. I'm happy in that they're RPN and all...

1. It's all related to the NCEES exams. They've banned calculators with alpha-numeric keys and/or commo ports, IR, USB, etc. So if you're an HP user and like RPN, you either already have an older model (e.g., 32-S) or you buy this new one.

2. I really dig my HP-28S. But... since it has an IR port and an alpha keypad (not QWERTY, though) it's no good.

3. I wish that my HP-33S was/had:

Unlimited stack Unlimited labeling Matrix operations built-in Bigger ENTER key in the "right" place.

I can do without the graphing, but would like a four-line display, though I'm getting used to the two-line display.

I agree with the features request & would add I wish it had better complex number support.

A 43s wouldn't have to be banned

*Message #14 Posted by **Bill P** on 4 May 2004, 5:22 p.m.,*
in response to message #5 by Norris

The only thing that makes the 42s unacceptable on the PE exams is its IR output. Some misguided souls think that every one of us with a 42s would copy all of the test questions onto our calculators and print them out on the IR printers we all have (wink wink) for profit. If the 43s didn't have i/o, or if there were (ex.) two versions, the 43s without i/o and the 43sx with i/o, then there would be a market for the 43s

without i/o for the PE exam. Just my $.02

>Would a compact flash/sd-card (but no IR/serial/usb >connection) be considered as I/O?

Only if the calculator couldn't write to the sd card. If one can take data input at the PE exam and somehow load it onto one's computer, then it would be banned.

If, however, the sd cards could only be used to put programs onto the calc and not to remove data, then it might not be banned.

I suspect, however, that that is not a likely scenario, unfortunately.

Re: A 43s wouldn't have to be banned

*Message #17 Posted by **Norris** on 5 May 2004, 2:18 a.m.,*
in response to message #14 by Bill P

OK, it is possible that a "43S" without an IR or USB port might be acceptable to NCEES. No guarantees, but it seems possible.

But even if a "43S" was NCEES-compliant, this still doesn't address the bigger problem: a "43S" wouldn't be able to compete with graphing calculators in the education market. And the education market is the only one that really counts today.

It's true that the professional demand for the 33S is currently high -- but it's artificially inflated. The recent NCEES calculator policy forced large numbers of exam candidates to replace their old models: anyone with an HP28, HP41, HP42, HP48, HP49, TI86, TI89, etc. has been forced to find a replacement. But the replacement process will be essentially complete after a few more exam cycles, and then the demand will subside.

In the long run, professional demand for the 33S will be related to the number of new examinees that begin the licensing process each year. But this is a relatively small number.

The first step in the professional licensing process is to take the Engineer-in-Training or Land Surveyor-in-Training exam. Here in California, about 6,000 EIT/LSIT exams are administered every year. The actual number of examinees is lower, because the exams are offered twice per year, and some

people take the exam repeatedly. There are probably fewer than 5,000 new NCEES exam candidates in California per year.

For comparison, about 475,000 new 10th-grade students are enrolled in California public schools every year. Many others are enrolled in private schools or home schools, and so the actual number of new 10th graders probably exceeds 500,000 annually.

So to really sell well, a high-end calculator has to appeal to teenagers. That's why HP designed the 33S to look like a cell phone. And in the long run, even the NCEES-approved 33S will not be successful unless students buy it. The NCEES exam market is just not that big.

*Message #19 Posted by **Norris** on 5 May 2004, 8:37 p.m.,*
in response to message #18 by deleted

I agree that an "43S" with no I/O would be silly. And I would certainly like NCEES to consider reversing their policy.

But even if NCEES agreed to drop their current policy, there still might not be a niche for a "43S". If NCEES allowed calculators with I/O, then HP could offer three RPN calculators to examinees: the 33S for $55, the 48GII for $100, or the 49G+ for $135 (prices from hpcalc.org). Realistically, there might not be much room for a fourth model in this lineup.

Furthermore, the market for new HP calculators would shrink if NCEES reversed itself, because then people would stop replacing their old models. For example, I expect to buy a new 33S for an upcoming PE exam -- but only because my 48GX has been banned. If NCEES were to drop the ban, then I would happily go back to my 48GX, without buying a 33S, a 43S, or anything else.

HP 42S printer annunciator

*Message #1 Posted by **Forrest Switzer** on 2 May 2004, 8:55 p.m.*

I have a question / problem. Any time I execute a shifted key other than math operations, the print icon comes on the screen. The icon does not go off if I use the "POFF" command. It only goes off when I key the shift print followed by the "PRsummation" selection. Then I get a "Printing Is Disabled" message. But the next time I key a shifted command like clear, it's back again.

Help would be appreciated.

Forrest

Re: HP 42S printer annunciator

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2004, 10:28 p.m.,*
in response to message #1 by Forrest Switzer

Hi;

I'd guess your HP42S is set to TRACE mode, but the annunciator would go off by itself after printing. Have you placed an HP82240A or B in front of it to "see" if there's anything actually being sent to the printer?

Also, have you considered a memory clearing (Memory Lost) procedure? I mean, if you don't have it filled with long programs or important data (all data and programs are iomportant, but if they can be keyed back in, then it's a matter of having the time and pacience...), a clearing procedure may restore original condition. The HP42S has no external access to a hardware reset, but the [EXIT]/[SIGMA+]/[XEQ] should be enough. If not, short circuiting the battery terminals (remove batteries first) for five to ten seconds would also be fine. Of course, if you want to give it a try. This is just a guess, I'm not sure if the memory clearing will also solve the problem. BUT if it doesn't, I also cannot think of anything else but IC terminals with external short circuit (any sort of durt) or a faulty IC.

I wish I could help more.

Luiz (Brazil)

HP42S LCD Character Set TTF will be updated

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2004, 7:10 p.m.*

Hello, folks;

as I mentioned in my post when introducing new TTF files, some "adaptation" is required when using actual uploaded files from an HP42S (IR output with PRP "*program_name*") to an HP48G running INPRT (48S/SX) or inprt.gx (G-series).

After a few experiences, I got to the conclusion that extra characters are needed in some positions so the listings "collected" with INPRT are easier to handle. If those "forbiden" positions are also easier to define, there would be no problem, but I don't know any way to do that.

So I decided to generate a copy of the existing HP42S character set and reorganize some character positions. Unfortunately this is not a "complete" (neither better) solution, and I'm ready to hear from you. The "new" TTF is named HP42S CharSet 3 INPRT and it uses the same pattern used to create the previous HP42S CharSet 3. Using each of them will be up to the user: if one has an HP42S-related text already typed in and he/she is using a "popular" text processor, adding non-regular LCD characters demands the same procedure as adding any symbol character.

I decided to let both TTF available instead of trying to find one single "best" solution that would partially compromise each procedure. If any of you test both fonts and find a better way to organize the characters, please let me know. I'll promptly change one of the fonts till the final solution is actually the one that fits all needs possible.

The INPRT version is not ready yet, but it will be soon announced (I'll use this thread).

Cheers and sorry for the inconvenience.

Luiz (Brazil)

HP-16C sim has new UI features

*Message #1 Posted by **Cameron Paine** on 2 May 2004, 5:35 a.m.*

Inspired by the comments and suggestions I've received from some of the visitors to the museum, I've added the following UI features to the simulator:

- you can hide/show the window decoration.
- you can drag the window around your desktop by clicking on any non-active area of the window.
- your UI settings (rendering and decoration disposition) are preserved between invocations.

In addition, this release (0.214) re-aligns the desktop and PPC variants.

I have updated the zip files and release notes on my site. Thanks for your support.

Re: HP-16C sim has new UI features

*Message #2 Posted by **Arnaud Amiel** on 2 May 2004, 6:08 a.m.,*
in response to message #1 by Cameron Paine

Naked mode is great, but it would be even better if you could terminate the program by pressing the [ON] key. Unless of course if there is a good reason not to do it.

Arnaud who wishes he could afford a real 16

"Naked mode is great, but it would be even better if you could terminate the program by pressing the [ON] key. Unless of course if there is a good reason not to do it."

Maybe rather make it then an icon into the lower right corner beside the clock.
If you really want an exit button why not use the hp logo!!
The old HP is dead so that would also symbolize the end of Corvallis team and the good old days <sniff>.

Re: HP-16C sim has new UI features

*Message #4 Posted by **Giuseppe Marullo** on 2 May 2004, 9:24 a.m.,*
in response to message #1 by Cameron Paine

Cameron, wow, are you actively developing it? What kind of licensing are you thinking about it?

Should you decide for a GPL one, put a "Donate" button on your webpage, I am pretty sure we could surprise

you much the way you surprised the community with such a great project.

Yes I ended up buying a real HP-16C, but I do like the simulation the same...

The on key should definitively act as End/minimize I agree.

Naive question: Did you implement the self tests too?

BUGS A possible bug to review. Please click a button and then hover around without release the mouse button...and don't even dare to answer with a snipplet of code.... :)

The resizing of the window is not remembered on my pc, it remembers classic or portrait, but the size is always landscape (I simply owerwrote the files maybe is not correct). Aren't you able to make the naked without ANY border?

IMPROVEMENT Do you know InnoSetup? it is a fairly straightforward installation program, without any hassle and free (not GPL). http://www.jrsoftware.org/isinfo.php

Yokes! That's not a feature. Corrected version available.

*Message #5 Posted by **Cameron Paine** on 2 May 2004, 12:14 p.m.,*
in response to message #4 by Giuseppe Marullo

Giuseppe found the bug I'd cunningly left in the code just to see if anyone was paying attention.

> Quote:

> The resizing of the window is not remembered on my pc, it remembers classic or portrait, but the size is always landscape (I simply owerwrote the files maybe is not correct).

Seriously though, that was caused by a lapse of attention on my part. I'm afraid my enthusiasm to share the new version clouded my judgement. Sorry for the inconvenience.

Cameron

Re: Yokes! That's not a feature. Corrected version available.

*Message #6 Posted by **Giusepe Marullo** on 2 May 2004, 12:39 p.m.,*
in response to message #5 by Cameron Paine

Cameron, we will spare some time to you, because we could perform some basic testing, so please distribute even if you are not sure about it.

Do not worry, we are eager to find bugs to make the project even better, not to blame you for errors.

Re: HP-16C sim has new UI features

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2004, 11:16 a.m.,*
in response to message #1 by Cameron Paine

Hello, Cameron;

this is mostly to congratulate you for your excellent simulator. As I hve seen so many people taking their time to test your HP16C sim at the same time I've been working with some TTF, I decided just to follow the thread and read. I still have the Beta sim installed and running (will it someday, about ten to fifteen years from now,

be as valuable as a vintage HP calculator? Yeap, for sure! I'll keep it "as is": mint, no scratches... d8^).

Thank you for this gift, Cameron.

Best regards.

Luiz (Brazil)

16C decimal mode usage: A question

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 2 May 2004, 6:02 p.m.,*
in response to message #1 by Cameron Paine

Cameron:

First of all, congratulations for an interesting and very well done emulator. I'm glad that some of my suggestions have been considered by you for the keyboard mapping.

As I am not familiar at all with the real 16C, I would like to ask a question. I am sure that the answer will be obvious for many of you but, frankly, I admit I need to ask it. I have not been able to use the calculator outside the "integer world", apart from moving into and out of hex-oct-dec & bin modes. Is it possible to use it for things like "3 Enter 2 / 2 SQRT -" or is it just constrained to integers? I noticed the "Float" function, but my attempts to benefit from it have been unsuccessful.

Thank you in advance. I'm sure this question deserves a qualification similar to those about changing radix symbol between dot and comma, but such is life...

It's a little idiosyncratic...

*Message #9 Posted by **Cameron Paine** on 2 May 2004, 6:47 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

Try:

```
[f][FLOAT]digit

Where digit is:

0 - for scientific notation (there's no engineering mode)
1-9 to select number of displayed digits
```

To get back to integer mode, just press one of the radix keys. The float number in X will then get converted to an integer representation (I won't bore you with the details).

NOTE: on exit from float the word size is set to 56 bits. The complement/unsigned mode you had previously is retained.

Cameron

Re: It's a little idiosyncratic...

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 2 May 2004, 7:16 p.m.,*
in response to message #9 by Cameron Paine

Hi, Cameron;

the orignal HP16C uses:

```
[.] - for scientific notation (there's no engineering mode)
0-9 to select number of displayed digits
```

It's the same scheme used with the HP12C. Is it on purpose or you actually missed the [FLOAT] sequence?

Just a question... If you changed the [FLOAT] scheme, it's good to know about this.

Cheers.

Luiz (Vieira)

D'oh!

*Message #11 Posted by **Cameron Paine** on 3 May 2004, 8:01 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Er, what he said...

Luiz is correct...

...so is my program--it behaves exactly as Luiz described.

I was having a "senior moment".

Thank you Cameron & Luiz !!

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 2 May 2004, 7:53 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

I'm getting old... perhaps 25 years ago I would tried that sequence (is not very intuitive, but it seems logical now, specially when you realize there are no other display functions like FIX, SCI, DSP, etc.).

Thank you again !!

hp 28s, hp48 sx, hp 48gx

*Message #1 Posted by **elgar** on 1 May 2004, 1:06 p.m.*

I look for programs that generate (randomly) n natural numbers without repetitions with n greater or equal to 1 and smaller or equal to N (N being a positive integer.) Thank you for your help.

Re: hp 28s, hp48 sx, hp 48gx

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 May 2004, 1:27 p.m.,*
in response to message #1 by elgar

Hi, elgar;

All the calculators you mentioned already have a built-in pseudo Random Number generator that uses a seed you can type in. The command to generate a pseudo Random number (to level 1) is [RAND] and the command to "collect" a seed (a real number in Level 1) is [RDZ] (randomize).

Using RPL

You can type in the following program:

```
« -> N
  « RAND N * IP
  »
»
```

You can store it with a private name (e.g.: 'MYRAND' [STO]). Also, maybe you probably know about this, but there is no harm mentioning: the [->] symbol refers to the single right-arrow, not a composition of a minus with a greater-than sign. Just for the records and for my own sake...

IP returns the integer part (truncates, no rounding) of the resulting value from RAND (pseudo Random number) times N (your "range"). In this case, N must be in Level 1 prior to execute the program. If you want the program to use an specific N everytime you run it, use only this part:

```
« RAND N * IP
»
```

You should store a value in N prior to execute it. Anytime you need to change the range, you simply type the new value for N and press 'N' [STO]. Also, for changing the pseudo sequence, you just type in a real number and execute [RDZ].

Hope this helps.

Luzi (Brazil)

Re: hp 28s, hp48 sx, hp 48gx

*Message #5 Posted by **Veli-Pekka Nousiainen** on 1 May 2004, 7:00 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

That sounds good.
BUT
If you need to exthaust the 1..N until there are no numbers left, then you could use a list pre-filled with numbers from 1..N
Then you pick one number at time, first 1..N range, remove it , then pick another randomly in the range 1..(N-1), and so on, until the list is empty.
You may gather the results into another list (or vector)
[VPN]

Re: hp 28s, hp48 sx, hp 48gx

*Message #6 Posted by **elgar** on 2 May 2004, 1:58 a.m.,*
in response to message #5 by Veli-Pekka Nousiainen

Thank you both for your kind help. I should have specified that n=[k.N], k being a real fraction< or=1/2. I look for a aprogram (or programs) the input of which (variables) are n and N and the outcome (result) is an array (of size n) of randomly generated integers all in the range 1,...,N with no repetitions.

Re: hp 28s, hp48 sx, hp 48gx

*Message #7 Posted by **Veli-Pekka Nousiainen** on 2 May 2004, 4:02 a.m.,*
in response to message #6 by elgar

I will give you an example of a code, which is how I first understood the problem.
I hope you have the ability to modify it to your needs.
First:
<< RAND * CEIL >> 'NRAND' STO
Then:
<< -> n
<< n 1. { } -> l
<< DUP2 SWAP
FOR k k
NEXT n ->LIST UNROT
FOR r r NRAND DUP2 DUP2 1
- 1 SWAP SUB UNROT 1 + OVER SIZE
SUB + UNROT GET 'l' SWAP STO+
-1.
STEP DROP l AXL
>> >> >> 'LRAN' STO
'LRAN' RCL BYTES => # 830Dh 166.5
Note:
I wrote this in the wee-wee hours.
It works (for all 1..N) but is not optimized.

You could also use the randomizer to pick up an item to be "sorted" as the first element of a list, then the second, etc.
[VPN]

Re: hp 28s, hp48 sx, hp 48gx

*Message #8 Posted by **elgar** on 2 May 2004, 5:52 a.m.,*
in response to message #7 by Veli-Pekka Nousiainen

Thank you very much indeed for your kindness and patience. I have not yet coded it in, I hope it will work.

Re: hp 28s, hp48 sx, hp 48gx

*Message #9 Posted by **Veli-Pekka Nousiainen** on 2 May 2004, 6:24 p.m.,*
in response to message #8 by elgar

Be aware! This "solution" simply picks randomly all numbers between 1..N

HP 41 Emulator

*Message #1 Posted by **Rick** on 1 May 2004, 6:31 a.m.*

Is the 42S faster than a HP48SX with HP 41 Emulator? Thanks

Re: HP 41 Emulator

*Message #2 Posted by **Erik Ehrling (Sweden)** on 1 May 2004, 4:43 p.m.,*
in response to message #1 by Rick

Hi Rick!

I have actually never used a HP-41 emulator on any HP-48 (neither the Zengrange emulator card nor the HP-41X), but the HP-42X emulator runs in equal speed to the real HP-42S on a HP-48SX, so I would guess that a HP-41 emulator would be roughly equal in speed to a HP-42S. (But then again the HP-42S also has a FAST mode, which is programmable on the rev A, that is double the standard speed).

All in all I think taste and what you are used to is more important than speed. There are a lot of people out there that regard the HP-15C as one of the better calculators ever made even though it is actually quite slow.

Best regards,
Erik Ehrling (Sweden)

unknown opcode in Voyager ROM

*Message #1 Posted by **Eric Smith** on 1 May 2004, 5:44 a.m.*

In the course of trying to get Voyager ROMs running on http://nonpareil.brouhaha.com/, I've found one unknown opcode, 030 hex (0060 octal).

The Voyager calculators use a mask variant of the same 1LF5 CPU as used in the HP-41C family. (Earlier 41Cs used the 1LA5, and later Voyagers use the 1LM2 or more integrated parts). Since this opcode is not defined in the 1LF5 specification, I suspect that it is implemented by the 1LE2 or 1LH1 "R2D2" chips (RAM/ROM/Display Driver). But I haven't yet figured out what it does.

Anyone out there have the inside scoop? Anonymous contributions of tips or documents gladly accepted. :-)

Re: unknown opcode in Voyager ROM

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 May 2004, 9:20 a.m.,*
in response to message #1 by Eric Smith

Hi, Eric;

can you give us an idea about "when" does this code "happen to appear"? I mean, RAM/ROM reading, keyboard scanning, LCD "drawing", etc. I'd not dare guessing this is some new feature available with Voyagers, instead some feature not used in other models. Sort of a "hidden" code that was not mentioned before because it was not yet used. Maybe the context under which it appears may help reasoning about what is it for.

My 2¢ (I'd like to know enough to go further...)

Cheers.

Re: unknown opcode in Voyager ROM

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 1 May 2004, 10:04 a.m.,*
in response to message #1 by Eric Smith

If I recall right, in an article from Tom Revere (7/14/81) he states that the only difference from 1LF5-0301 and 1LF5-0002 are in the metal mask 7 (CMOSV) of the chip regarding only the VCI, VCO circuit [voltage control in/out], the Power On circuit and possibly on the keyboard scanning circuit.

I'm not too familiar with the ML of the NUT CPU, is there any other "related" instruction (same class)? Or it is some coprocessor instruction? On what ROM did you discovered it?

Best regards,

Nelson

Re: unknown opcode in Voyager ROM

*Message #4 Posted by **Monte Dalrymple** on 1 May 2004, 10:56 a.m.,*
in response to message #1 by Eric Smith

This instruction is KEY=C. It causes digits C[4:3] to be placed in the keycode register. It must be followed by a NOP becasue the transfer is not direct. Rather, the instruction causes the key correspdonding to the keycode to be pulled Low by the CPU for one instruction cycle, which then is read into the keycode register in the normal fashion. This information is from Appendix XI of "Inside the HP-41" by Dodin.

Re: unknown opcode in Voyager ROM

*Message #5 Posted by **Eric Smith** on 1 May 2004, 2:47 p.m.,*
in response to message #4 by Monte Dalrymple

Thanks for the pointer to chapter XI of "Inside the HP-41", it's fascinating. I must confess that I'm somewhat skeptical of the claim that the processor runs code while in deep sleep mode; in deep sleep the processor clock is completely stopped. The author indicates that this information was provided by HP; I wonder whether it might not have been part of an emulation system used by HP engineers for development, rather than the actual Nut CPU chip. The fact that none of the instructions described in that chapter are listed in the 1LF5 specification

In the HP-16C ROM, this instruction occurs in the code sequenct that displays the flashing "running" during self test. The code does a bc ex w to save the C register, c=0 w, a series of lc (load constant digit), and write to register 9, followed by a similar sequence writing a different constant to register 10. These are the display registers, and the constants are the segment maps that form the "running". Then the code does another bc ex w to restore the original C register, the mysterious 0060 (octal) instruction, then a return.

For thousands of following cycles, there is no reference to the keyboard, and eventually when the keyboard flag is tested, it is not set. Thus I don't believe the 0060 is behaving as KEY=C. Instead, I think it is turning on the display blink mode. There's no corresponding mystery instruction to turn the blink off, so I suspect that is done by either the display off or display toggle instructions, as when the self-test is completed they do a sequency of those two instructions even though the display is already on.

Since the display blink is under user control on the HP-15C (flag 9), I should be able to confirm whether this is really what the 0060 instruction is doing the next time I have an HP-15C hooked up to the probulator.

Thanks! Eric

Re: unknown opcode in Voyager ROM

*Message #6 Posted by **Monte Dalrymple** on 1 May 2004, 2:59 p.m.,*
in response to message #5 by Eric Smith

The assertion that the "boot code" listed in the appendix runs while in deep sleep mode is obviously incorrect, because as you say, there is no clock present. I think that the code may actually be present in the CPU and is executed on start-up to determine what kind of wake-up actually occurred, as described in the text. Since this code has to be switched out during normal operation it is always possible that the few special instructions executed there might only be enabled during this boot operation. The way to tell would be to capture the clock cycles on startup to determine if it looks like the CPU is executing something internal. Unfortunately I don't have the means to do this, so I have assumed that the description is correct and have implemented this in my clone of the NUT processor. Implementing the KEY=C instruction was a pain because teh row outputs now have to be I/O instead of just inputs and the timing is messy too. If this instruction is present but is switched out except during bootstrap it could very well be used by the display.

Re: unknown opcode in Voyager ROM

*Message #7 Posted by **Eric Smith** on 1 May 2004, 7:56 p.m.,*
in response to message #6 by Monte Dalrymple

> Quote:
>
> I think that the code may actually be present in the CPU and is executed on start-up to determine what kind of wake-up actually occurred, as described in the text.

I won't say that it's impossible, but it seems quite unlikely. If it does run the Appendix XI code, the hardware has to know what kind of wakeup it is anyhow, in order for the ?WKUP instruction to work. The Appendix XI code doesn't do anything that the hardware couldn't do more easily by simply setting the carry flag directly, which is what I'm pretty sure that it does. The only use for the Appendix XI code appears to be for emulating the power off/deep sleep state on a processor that doesn't actually go to sleep.

> Quote:
>
> The way to tell would be to capture the clock cycles on startup to determine if it looks like the CPU is executing something internal.

By capturing traces, I have verified that the 1LF5-0301 CPU used in the Voyager calculators does not do anything mysterious between power-up and starting to execute external ROM code from address zero. The 1LF5 specification enumerates the differences between the -0002 version used in the 41C family and the -0301 version used in the Voyagers, and there is no mention of any difference in code execution at startup. It's remotely possible that the earlier 1LA5 or later 1LM2 processors could behave differently.

On the 16C (using the 1LF5-0301 CPU), the 0060 octal (030 hex) instruction definitely does not perform a KEYS=C operation.

Best regards,

Eric

Hugh,

If you're in any industry that's even remotely related, you'll probably qualify to receive Job Shop Technology, an industry trade magazine paid for by the advertisers. See http://www.jobshoptechnology.com/ . It covers all kinds of machining, molding, forming, stamping, extrusions, coating, fastening, etc., etc., etc., and has loads of advertising for companies that do some of the exact things you're looking for with the openRPN project. You'll also find out about trade shows around the country where you can visit the booths of these companies and see plenty of them all at once.

Garth

Linear Programming

*Message #1 Posted by **Guillermo Castarés** on 30 Apr 2004, 3:19 p.m.*

I want to know if is possible to find a calculator program to solve "Linear Programming" problems. I didn´t studied the Simplex algorithm yet, so I am not sure if is possible to put it on HP-41/42 series. Any comment?

Re: Linear Programming

*Message #2 Posted by **Jean-Marc** on 30 Apr 2004, 3:50 p.m.,*
in response to message #1 by Guillermo Castarés

Hi! I can recommend you my "simplex" HP-41 program in the HP-41C Library... Regards.

Re: Linear Programming - some questions ;)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 Apr 2004, 5:00 p.m.,*
in response to message #2 by Jean-Marc

Hi, Jean-Marc;

first of all, congrats! Your Simplex program for the HP41 is a nice piece of art! Clean, concise and explores many of the HP41 software capabilities.

I did not have the time to go further and analyse it, but I wonder about one thing: have you used synth instructions in order to use system registers and leave all numbered registers available OR is there any particular need? I mention again that I did not analyse the program "in deep", but I decided to ask you first before getting to wrong conclusions ;^)

Another issue: have you thought about Operational Research and Linear Programming as well? Simplex is one of the methods. I've been reasoning about developing some sort of a portable GAMS (or LINDO) version to run in an HP49G; as I am about to get an HP49G+ with extra RAM memory, so I think it's something to be considered. I used an HP49G to hold some small programs to be used in Fuzzy Logic and Artificial Neural Networks, but I never put them together in order to form a complete system. I'm daring to go ahead with Operational Research. Have you done something in this area as well?

BTW, folks, if there is anyone interested in this subject, let's just start a thread.

Cheers and thanks.

Luiz (Brazil)

Re: Linear Programming - some questions ;)

*Message #4 Posted by **Arnaud Amiel** on 1 May 2004, 2:36 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

> Quote:

Careful, the 49g+ has actually less RAM available to the user than the 49. But it is much faster.

Arnaud

Re: Linear Programming - some questions ;)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 1 May 2004, 9:08 a.m.,*
in response to message #4 by Arnaud Amiel

Hi, Arnaud;

thank you for your warnning!

If you plug a RAM card on an HP49G+, how is it this RAM seen by the O.S.? I'm asking this because if its contents can be handled as some sort of "extension" (as it happens in BANK 1 of the HP49G), I guess it will do fine running programms in main memory and data in this "extra" RAM. I remember that I was worried about speed in this case, but I never took any performance measurement. Any information about this?

Thank you again.

Cheers.

Luiz (Brazil)

Re: Linear Programming - some questions ;)

*Message #6 Posted by **Arnaud Amiel** on 1 May 2004, 9:34 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

The 49g+ has 256K RAM in port 0 128K RAM in port 1 as the other 128K are used by the ARM in some way about 765K FLASH in port 2 Whatever you want in SD card port 3

However the size of programs or data is limited to 128k and no library can be executed from the SD card.

I hope this helps

Arnaud

Perfect! That's what I needed to know! d;^)

*Message #8 Posted by **Jean-Marc** on 1 May 2004, 4:15 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi! Thank you! I've used synthetic registers for 2 reasons: 1°) Larger problems can be solved. 2°) The

1st coefficent is stored in R01 and finally, x1 is in R01 ... xn is in Rnn which is more logical. I do not have an HP-49 but I do have an HP-48 and I've written a Simplex program for the HP-48GX a couple of weeks ago. If you are interested, I can send you a copy of this program (I think it will work on an HP-49 too). Regards.

Re: Linear Programming - some questions ;)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 1 May 2004, 7:30 p.m.,*
in response to message #8 by Jean-Marc

Hello Jean-Marc, Velli-Pekka, folks;

Yes, I'm much interested on your program (I added my e-mail address in the end of the post). Can I "dig it" and try to reason over the algorithm you use?

I'm actually starting to deal with Operational Research for academic matters, and there are other solution methods I'm gonna work with. Simplex is one of them, and I would like very much to see how did you accomplish the task of programming it in RPL. As I'm getting through it I'm posting messages, if there is any interest on this subject by you or others.

Veli-Pekka, are you dealing with related subjects as well? Just curiosity of mine.

Cheers.

Luiz (Brazil) lcvieira@quantica.com.br

Re: Linear Programming - some questions ;)

*Message #11 Posted by **Veli-Pekka Nousiainen** on 2 May 2004, 4:21 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

"Veli-Pekka, are you dealing with related subjects as well? Just curiosity of mine."

No, I have been in IT business about 20 years, programming professionally using several languages:
Basic (MS Visual ; 71B), Cobol, EasyTrieve, Eiffel, FAS (Fortran-Assembler - developed in Finland), K-mies (K-man), SQL, Survo scipts
AND semi-pro:
Assembler (71B), Comal (Commodore Pascal), SysRPL (49G), UserRPL (48GX)
Official Training on following:
C, Cobol, Eiffel, Fortran, Mixal, Pascal, RPG II, SQL, UNIX shell scripts
Hobby: ARexx, Assembler, Basic, Forth, Macro or script languages (Amiga, DOS, Unix), DOSUserRPL, SysRPL

I may have forgotten a few (both from the list and "how to program" of those in the list)
As a semi-pro I currently help 4x users in Finland.

It's a mug's auction

*Message #1 Posted by **Julian Bucknall** on 30 Apr 2004, 10:51 a.m.*

Check out this eBay auction for a coffee mug celebrating that its owner loves his/her HP 49G+. It's a shame that "Hewlett" is wrongly spelt. I wonder how many he has? Will it be subject to a recall? Will it be collectible because of the error? Inquiring minds want to know.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=50577&item=3094393241&rd=1

Cheers, Julian

Re: It's a mug's auction

*Message #2 Posted by **Chan Tran** on 30 Apr 2004, 11:16 a.m.,*
in response to message #1 by Julian Bucknall

Is it possible that he made the mugs himself. I which case the mug has little value. I doubted that HP would make misspelled mug.

Re: It's a mug's auction

*Message #3 Posted by **Richard Garner** on 30 Apr 2004, 11:30 a.m.,*
in response to message #2 by Chan Tran

Actually this is exactly what I would expect from the New Hewllett Packard run by Carly.

Re: It's a mug's auction

*Message #4 Posted by **Arnaud Amiel** on 30 Apr 2004, 11:49 a.m.,*
in response to message #2 by Chan Tran

If it was made by hp it would have the hp logo and not Hewl(l)ett Packard written on it.

Arnaud

Re: It's a mug's auction

*Message #5 Posted by **Raymond Del Tondo** on 30 Apr 2004, 12:11 p.m.,*
in response to message #2 by Chan Tran

Unfortunately, today it's even possible that someone made it for HP, but I think it's homebrewn. The 'new hp' uses lowercease initials, a different font for the company name, and the logo. And, of course, they should know how to spell the name of the company.

However, even in the 49g+ manual, or was it the 33s prelim manual, were errors: The writer did actually write the company name with wrong letters !!!

Raymond

*Message #6 Posted by **james summers (uk)** on 30 Apr 2004, 12:21 p.m.,*
in response to message #2 by Chan Tran

I wonder if the use of capitals for HP and the spelling is a misguided (and probably unsuccessful) attempt to foil hp's legal eagles from trying to do him for copyright

or it could be just plain carelessness...

LOL

*Message #7 Posted by **Hans Brueggemann** on 30 Apr 2004, 1:01 p.m.,*
in response to message #2 by Chan Tran

"I doubted that HP would make misspelled mug." ----> well, did you ever take a closer look on the frontplates of agilent digital scopes? on some of them you find the brand name "infiniium", while on boot-up, the display is showing "infinium". what a wonderful world. single letters can get "en vogue". maybe next intel processor is then named "pentiiiium", although i'd rather prefer "pentivm" for the 4GHz version, just in order to avoid punishment from my former latin/greek teacher...

cheers, hans

(designers, get out of your deliriium!)

Re: LOL

*Message #8 Posted by **kamyar** on 30 Apr 2004, 4:36 p.m.,*
in response to message #7 by Hans Brueggemann

There is a very good chance that the Mug or the calculator manuals are contracted to non-HP individuals or companies. Hey, since the merger with Compaq, some of that cross-breeding should affect the performance of HP :)

Re: LOL

HP-16C sim now has keyboard support

*Message #1 Posted by **Cameron Paine** on 30 Apr 2004, 3:45 a.m.*

The simulator now has a (user definable) keyboard mapping capability. The new version is available at my site and the download includes a sample key mapping file. The sim has a built-in default mapping based on suggestions made by:

```
Andrés C. Rodríguez
Miki Mihajlovic
Victor
```

I have to confess to being a little overwhelmed by the positive messages and suggestions I've received from many of you. Thanks a lot.

I'll leave another note here when I've implemented a few of the things you've asked for.

```
Cameron

in response to message #1 by Cameron Paine

I'd liketo change the "decimal point"...

Re: HP-16C sim now has keyboard support

*Message #5 Posted by **Cameron Paine** on 1 May 2004, 3:59 a.m.,*

in response to message #4 by Raul Lion

You can do that. Maybe you could tell us what you'd like to change it to. Then I can give you step-by-step instructions.

One thing though: you can't just change a single key. You either need to use the defaults or replace them with a mapping for *all* the keys. In other words, the two maps--user and default--are mutually exclusive.

If that's not evident from the documentation, I apologise. Let me know and I'll also fix the docs.

Cameron

Re: HP-16C sim now has keyboard support

*Message #6 Posted by **Raul Lion** on 3 May 2004, 5:30 p.m.,*
in response to message #5 by Cameron Paine

Sorry, because my first post was very bad... When I said "I'd like to change the decimal point" I was referring to use "comma" instead "period" to separate the integral and fractional portions of a number. In my 15C I use [ON]/[.] for that...

digit group and radix separators

*Message #7 Posted by **Cameron Paine** on 3 May 2004, 8:27 p.m.,*
in response to message #6 by Raul Lion

The 15C and 16C are similar in that respect.

The 16C had four functions "bound" to the On key: suspend/run, test ROM, test UI and separator swap. The last three were two-key functions. I plan to implement these but I'm not sure how best to simulate them.

My first thought was to ignore suspend/run (which is what File->Exit does) and make the other three functions two-click sequences. This opens the possibility of binding other functions to the On key--makiing it a bit like another shift key. One such function would be to swap between IEEE-745 and IBM decNum floating point arithmetic. Obviously such "extra" functions could be bound to menu items.

Several forum contributors have asked to have On shut the application down. That's not an unreasonable request. Consequently I am re-evaluating how I might use On in the final version.

Incidentally, I started using On as a shift key that gives me access to debug functions long before I had any menus. So until I rewrite that code, On is not available.

HP-33s

*Message #1 Posted by **Geoff** on 29 Apr 2004, 6:40 p.m.*

Just got my HP-33s from HP - I bought direct from the www site. $49.95 + shipping

BTW - the decimal point is sure small

Re: HP-33s

*Message #2 Posted by **Ángel Martin** on 30 Apr 2004, 3:47 a.m.,*
in response to message #1 by Geoff

Does it look any better if you change the radix type to a comma?

Re: HP-33s

*Message #3 Posted by **Robin** on 30 Apr 2004, 6:40 a.m.,*
in response to message #2 by Ángel Martin

If you look at the display in a right angle, the problem doesn't seem so serious. But if you move the calculator display about 40cm(~15 inches) away from you(thats where I usually would have it), you'll get - depending on the light sources around the calc - an unwanted shadow right below the display on the reflecting surface, which disturbs the clear view of the the LCD-segments. Changing the radix type isn't usefull from my sight - the shadow of the decimal point makes the radix look very similar to it. Usually, I'm not having viewing problems if I keep the display (not the calc) in a viewing angle of max. 20 degrees.

Robin

Re: HP-33s

*Message #4 Posted by **Dano** on 3 May 2004, 8:56 p.m.,*
in response to message #3 by Robin

Robin, I've found that if you adjust the contrast on the display, it helps a lot. It seems the default contrast (on mine at least) is full in the "+" direction. Hold the "ON" key while pressing the "+" or "-" keys several times to adjust the contrast. BTW in response to an earlier post, the comma seems as difficult to see (and distinguish between) as the decimal point.

Re: HP-33s display, keys and quality

*Message #5 Posted by **Robin** on 5 May 2004, 5:34 a.m.,*
in response to message #4 by Dano

I've tried that, and the result was maybe slightly better, but still not satisfying at all. So i often have to lift it to read the numbers - and especially the proper position of the decimal point, so I dont

mistake it with the commas. As I already mentioned, it depends strongly on where the light source comes from. When I'm working in front of a window, it's the worth case, if the ligth comes from behind or straight over you-it's usuable.

I like the keys, get used to the enter is no problem if you just ar willing to it. But it happens on fast typing that some keys aren't responding - even very seldomly - it makes blind typing to risky. It seems to be a software debouncing issue, because it happens only wenn you press the keys quite fast, even if they are pressed down to the stop. My about 14 Years old 42s doesn't have this behave at all! But maybe the most of you don't have this problem, it's hard to reproduce and maybe only mine has this behave (but I don't think so) BTW: My 33s has the serial number CNA41109232.

I couldn't resist to open the 33s, and as i saw the soldering of the battery cables, it made me feel quite dissapointed.They would for sure not have kept connected for years, what a "timebomb"! I resoldered all off them, it made me feel safer even if I just use it for spare in exams (I need a working spare calc, not a dead one).

HP have made progress in the RPN-Sector, but not enough to catch up the retrogression they've made thru the past years. Electronic devices have decreased extremly in costs, what has increased for shure are the engineering/developing cost. But this usually are compensated with extremly cheap high-volume production nowadays, so no excuse for HP. For many company's, profit seems more important than image. Sometimes it's usefull to have a non-profit (or not so high)product to keep a good image(and that's the cheapest, best advertising you can get) and make more money with other products, but many managers fail to think so far, after my opinion.

So HP may never reach the level of they're older calcs again (quality, durability, efficiency). Maybe OpenRPN does somehow, as a non-profit organisation?

Regards, Robin

Re: HP-33s display, keys and quality

*Message #6 Posted by **Raymond Del Tondo** on 5 May 2004, 8:16 a.m.,*
in response to message #5 by Robin

Quote: ---------- Sometimes it's usefull to have a non-profit (or not so high)product to keep a good image(and that's the cheapest, best advertising you can get) and make more money with other products, but many managers fail to think so far, after my opinion. ----------
:Endquote

Ten or twenty years ago, the 'old' HP was one of these companies, where the entry product was an HP calculator, and since customers were satisfied in most cases, they tended to buy the more expensive stuff, like HP9000 workstations. Especially the HP9000 series 300, which were made like tanks, and flexible like an HP-41, and there are companies and institutes where these machines are still used.

These machines were *really* good, but in many cases they were bought because of the good reputation of the company.

What would you see as a good 'hp' entry level product today, which makes more appetite for the adanced stuff ?

At least the current calculators and printers are no good examples to push their reputation. Maybe they're not bad, but nothing special compared to other companies products (except

maybe the 49g+ and the HP-48GX, where the 48GX was the perfect quality high-end calc, and the 49g+ finally is what the 49g always wanted to be but never was: a product. And in many respects the 49g+ is the only successor of the HP-48 (all IMHO;-))

Raymond

Re: HP-33s

*Message #7 Posted by **Namir** on 1 May 2004, 9:59 a.m.,*
in response to message #1 by Geoff

Amazon seems to be the cheapest place to buy the HP33s because the purchase qualifies for free shipping!

Re: HP-33s

*Message #8 Posted by **DougT** on 1 May 2004, 6:07 p.m.,*
in response to message #7 by Namir

I finally decided to order a 33s for myself, tiny decimal point and all! www.officemart.com has them for $49.41. Order a pen or something else cheap to get the tally over $50.00, and shipping is free. They were out of stock a few weeks ago, but I successfully called in an order by phone yesterday.

German Website Help

*Message #1 Posted by **Steve S** on 29 Apr 2004, 4:39 p.m.*

Is there someone here who can read technical prose in German and who would be willing to scan a website for me? I am trying to ascertain if Stolte-EDV is still selling HP-compatible RAM cards (they've got excellent prices). Their website has German and English variants, but the English version appears to be down. Looking at the German version, I can't translate enough of the text to be sure of anything.

I've also e-mailed, but have received no response, so I'm either being ignored or they are not actively in business. Perhaps the website explains this, I can't say.

If someone could take a quick look at this and tell me what they think, I'd appreciate it. The URL is:

www.stolte-edv.com (or simply Google "stolte-edv")

Thanks in advance.

Re: German Website Help

*Message #2 Posted by **Stephan** on 30 Apr 2004, 1:51 a.m.,*
in response to message #1 by Steve S

Good morning Steve. I visited the website you are interested. As it appears to me they got what you where looking for. On the fist tab (HP-Taschenrechner) the list an option for internal expansion cards which are enlarging the BASIC memory to 128/256KB or more. This is for a HP 48 SX7GX. The cards are usable as internal or non-proprietary memory via RAM/ROM-port. The cards have an optional write protection switch. In a SX calc you can use either port one or two for both purposes. On a GX calc port one is for both purposes and port 2 would be non-proprietary memory only. In a S or SX version you have to add the memory for good (not exchangeable) and you get a G or GX respectively as a result. The prices they announce in the adds are including labour for the calcs and you would have to expect a 5 day delivery period. I hope that the answer you are looking for is somewhere in my text. If you have a specific question please feel free to contact me again. Greeting from Switzerland. Stephan

Re: German Website Help

*Message #3 Posted by **Frank Boehm** on 30 Apr 2004, 1:54 a.m.,*
in response to message #2 by Stephan

I think these are *internal upgrades* not *memory cards*. The prices mentioned are only valid with the purchase of a new calculator - that would only make sense for internal upgrades...

Re: German Website Help

*Message #4 Posted by **Steve S** on 30 Apr 2004, 9:44 a.m.,*
in response to message #2 by Stephan

Stephan and Frank, thank you both for your assistance. Based on both of your comments, it looks like I

need to talk to Stolte directly, if possible.

As I mentioned, I tried to e-mail them once (at least I think the e-mail got to them...) but there was no response.

Stephan, could you submit an e-mail to them through their website for me? Simply say that I'm trying to contact them and give them my address, SLSeto@aol.com. If they don't respond to that, I'm going to assume that they are no longer in business.

Thank you both again for your kind assistance...

Re: German Website Help

*Message #5 Posted by **Stephan** on 4 May 2004, 2:44 a.m.,*
in response to message #4 by Steve S

Good morning Steve. Sorry for answering so late. This morning I wrote an e-mail to Stolte and copied you in. Basically I told him that you are interested in Memory cards that you weren't able to reach him and asked him to send you a mail. I hope we have any success. Let me know if it worked out. Read you soon Stephan

Edited: 4 May 2004, 2:47 a.m.

Revised HP12c platinum solutions book now online

*Message #1 Posted by **Gene Wright** on 29 Apr 2004, 11:20 a.m.*

http://h10032.www1.hp.com/ctg/Manual/bpia5184.pdf

This revision of the book has updated several things:

1) Algebraic instructions and program listings for the 12c platinum. Interestingly, some of these are shorter than the RPN counterparts.

2) Dates updated from the 1980s to the 2000 era.

3) Stock portfolio program now accepts prices as $40.16 rather than in 1/8's or 1/32's.

4) Brand new (to the book at least) Options pricing program.

The team that worked on this included me, Tony Hutchins in New Zeland and Luiz Viera in Brazil.

Re: Revised HP12c platinum solutions book now online

OpenRPN Updates

*Message #1 Posted by **Hugh** on 29 Apr 2004, 11:14 a.m.*

Hi all,

I know I promised to stop by with updates from time to time... So how about an update?

We have a couple of major things happening right now. One is that we're leaning towards the use of a 60MHz ARM processor as the basis for the design and are discussing some of the options associated with this. Please contribute to this thread with anything opinions: http://www.cradleofintrigue.com/OpenRPN/viewtopic.php?t=17

Second is that I have posted the first rough (and I emphasize rough) drafts of the first form factor, which is similar to the voyager series. Next will be a traditional vertical layout and finally a graphing machine. Case material will be either cast aluminum or carbon fiber composite (negotiations and quotes are in the works almost constantly) http://www.cradleofintrigue.com/OpenRPN/viewtopic.php?t=16

Finally, OpenRPN.org will be going live within the next couple of weeks. This means an actual page in addition to the forums, so it will be a lot easier to check our progress. It's a personal priority of mine to keep the page updated as close to real time as possible (it always drives me nuts to see projects that are updated a few times a year).

I would like to thank everyone for your continued interest and support in the OpenRPN project. So far I have been suprised myself at the progress we have seen already. I feel that we have a very talented group, all of whom are great individuals, with some excellent individuals. You wanted the perfect RPN calculator, and we will deliver.

Finally, I invite you all again to stop by and register at our forums. The more input we can get the better. Your ideas, no matter how crazy, are appreciated. Off the wall ideas keep us from thinking inside the box!!! http://www.cradleofintrigue.com/OpenRPN/

Hope to see you there. Allow me to also express my gratitude to this forum! Without it, I don't know how I would go about finding people who would be interested in this project.

Best Regards to All, Hugh OpenRPN Project Manager

Worldwide HP-33S for $59.99 !

*Message #1 Posted by **Emmanuel Verbeeck** on 29 Apr 2004, 6:35 a.m.*

This is what I call good news : the era of overpriced 33S on eBay is over !

HPcalculators.com (I am not affiliated with them, just a happy, returning customer) is selling this brand new model worldwide at $59.99, via both their website and eBay.

Just for fun : this 33S is scheduled for June at Brussel's FNAC (Belgium) at €149.99, which is equivalent to $177.

Ah, the internet ... :-)

Re: Worldwide HP-33S for $59.99 !

*Message #2 Posted by **Ted** on 29 Apr 2004, 1:22 p.m.,*
in response to message #1 by Emmanuel Verbeeck

Thanks for the tip, I just ordered one!!

Re: Worldwide HP-33S for $59.99 !

*Message #3 Posted by **Martin** on 30 Apr 2004, 1:51 p.m.,*
in response to message #1 by Emmanuel Verbeeck

Its £49.99 UK Pounds at Classic Calculators in the UK which INCLUDES VAT (which you will have to pay extra on an HP33S imported from the USA). THe unit I got from them was in an HP box, not a blister pack! Dont know if this means there is any difference in the Euro units compared with the US Units?

Re: Worldwide HP-33S for $59.99 !

*Message #4 Posted by **Jordi Hidalgo** on 30 Apr 2004, 2:15 p.m.,*

HP41 MLDL2000 Update

*Message #1 Posted by **Meindert Kuipers** on 29 Apr 2004, 3:53 a.m.*

All interested in the MLDL2000,

There is good news and bad news. The bad news is that there will be some delay due to a significant redesign. In the process of preparing for PCB design and production it turned out that the selected 8-bit memory components (FLASH and SRAM) are becoming very hard to purchase and more expensive. I therefore need to switch to 16-bit memories, which are cheaper and are stock items. The IC's themselves are larger and routing the PCB is a bit of a challenge, so that will take more time.

Using 16-bit memories also allows me to remove all multiplexing of the famous L8 and U2 data bits and requires a redesign and verification of the state machine and memory access engine, also taking some time.

The good news here is that the design is much more straightforward and requires less resources in the CPLD and I may be able to switch back to a smaller CPLD, with still room for additions. Even better is the news that there will be much more memory in the MLDL2000. The current design has 512kByte, allowing for 63 ROM images in FLASH, I am now looking at a 1M * 16 bit device, allowing for four times as much room. SRAM will probably be a bit less, depending on what suitable devices I find in stock.

The specifications (now at version 1.2) will be updated in due time, but the old version is still available for download at www.kuipers.to

So far the response has been pretty good and there are enough commitments for a sizable production run. The more I can produce however, the lower the price will be! Again, this project is for fun, not for profit!

Regards,

Meindert

Re: HP41 MLDL2000 Update

*Message #2 Posted by **Veli-Pekka Nousiainen** on 29 Apr 2004, 7:28 a.m.,*
in response to message #1 by Meindert Kuipers

"the MLDL2000. The current design has 512kByte, allowing for 63 ROM images in FLASH, I am now looking at a 1M * 16 bit device, allowing for four times as much room. SRAM will probably be a bit less, depending on what suitable devices I find in stock. "

So the SDRAM could be like the old Flash and only the Flash is quadrubled?
Sounds good to me...

The new TTF files are here!

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 29 Apr 2004, 12:43 a.m.*

Hi, guys;

you can download the zipped file with all four new TTF files form here:

New TTF files

I think I have finally corrected all glitches in all fonts. Some of the first "versions" had characters too close to each other (printer) and I saw that they were not so close by observing their printer hardcopy. I had to alter each character size (no need to draw them back) in all three printer fonts. Already done.

About the HP42S character set. As you saw, many characters are repeated in some different positions. This is because I thought abouot something that did not work, so I redraw them all as a sequenced block starting at position 160d. If you have programs already typed in and saved as ordinary text files (ASCII coded), it's not gonna be hard to use the HP42S character set and "convert" the listings. If you are going to "upload" from the HP42S to an HP48S/G (does the HP49G+ has its own INPRT program?), keep in mind that some characters are remapped and their codes are changed. The arrangement I made (those loose characters above 192d) allows faster convertion, because these characters occupy positions equivalent to the remapped positions. unfortunately a few ones did not follow the rule...

Some character codes were not possible to redirect (at least I found no way to do it). The ones I wish to find a better solution are the up-arrow (replaced by ^) and the down-arrow (replaced by lower-case v). When showed as spare characters there is no particular prblem, but when they are together with R, in [R^] (roll-up), [y^x] ('y' raised to 'x') and [Rv] (roll-down), I'd prefer seeing the arrows instead of the characters chosen as remapped solutions. It's possible to use search-and-replace while using a text processor, but I tested a few programs to run in an HP48S/G that do the job (still under development and size reduction), but if the program is too big, they spend a lot time running. I thought about some machine-language solution (character detection and replacement seems to be not hard) or even SYS-RPL (I guess it is still slow), but I should read some material and remember some concepts before creating SYS-RPL programs again (I still have the original goodies disks form Educalc...).

Wow! I wrote too much (again). As I have some HP48S/G to remapp the characters that worth a try, I'm posting again.

Best regards.

*Message #5 Posted by **Richard Garner** on 29 Apr 2004, 12:50 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Fonts look great. Looks as if these are a little darker than the first ones. This makes for easier reading. Very nice work.

Re: The new TTF files are here!

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 29 Apr 2004, 3:47 p.m.,*
in response to message #5 by Richard Garner

Hello guys;

thank you for your comments.

And yes, Richard, I used "square dots" bigger than the ones used in my previous TTF for the HP82143A. Also, clearance between these dots is smaller and I allowed them to overlap each other when subsequently neighbors (horizontally aligned only). This way, horizontal lines look like continuous lines, what is closer to what we see in hardcopies.

I saw that the printing characters look closer to their original printing source when their size is selected to 10 or 11 if you are using MS Word for Windows® (BTW, what sort of measure reference is that?). If too large, they tend to look "weird".

I'm working on some new fonts... I'll let you know soon.

Thanks again.

Luiz (Brazil)

in response to message #1 by Vieira, Luiz C. (Brazil)

Thanks for the lovely accurate fonts. Very much appreciated.

Re: The new TTF files are here!

*Message #8 Posted by **Fred Lusk (CA)** on 30 Apr 2004, 8:49 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz…

Another excellent set of fonts. I need to get back to documenting all my 41 and 42 programs, and this will help a lot. Thanks.

I hope all is well with you and your family.

Here, I am trying to work myself into an early grave…fortunately, the current crunch ends next week and maybe I can take a few days off, which would be a good time to use your fonts.

Take care, Fred

Re: The new TTF files are here!

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 1 May 2004, 9:15 a.m.,*
in response to message #8 by Fred Lusk (CA)

Thank you, Fred; it's always good to "hear some known voices"...

Thank you for your continuous support and encouragement, as many others have already shown here. I guess I can contribute this way for now, as I see many others are running HW designs I'd like to be following as well. No problem: at least these fonts may help producing pro-like final PDF documents.

Please, send me an e-mail; I lost many of my good, old contact addresses: (and many precious e-mails)

lcvieira@quantica.com.br

I'll also take this Saturday morning to complete the HP71B character set, as my friend Gordon Dyer remembered me (an old yet forgoten promise...). I guess it'll be announced briefly from now.

Best regards.

Luiz (Brazil)

HP 41CV Weirdness - Sort of Long

*Message #1 Posted by **Wayne Stephens** on 28 Apr 2004, 9:39 p.m.*

I want to start out my story by stating that I know, from reading the various postings on this forum, and from reading the HP literature, that the 82106A memory modules from a 41C do not work in the 41CV. It already has 320 registers (00-319) of memory, etc.

However, today I had an unusual problem with my 41CV. It suddenly went from having 320 registers to having only 192; and it lost several programs in the process. It also exhibited other weird behavior (showing all "@" signs across its display, ON switch becoming non-functional, USER toggle stuck "ON", etc. etc.) which resulted in me doing several complete resets, losing all my programs, and eventually removing the back from the calculator. I cleaned all the contacts, etc. which I could get to, but could find nothing visibly wrong (it was, in fact, already one of the cleanest calculators I have ever opened). However, it still only had 192 registers of memory upon reassembly.

On a hunch, or in the interest of stupid experimentation, I inserted two 82106A memory modules into ports 1 and 3 of the calculator. It immediately began showing 320 memory registers. If I remove the 821067A modules, the calculator will retain 320 memory registers until either A) the power is shut off, or B) the SIZE command is used, whereupon it reverts to 192 memory registers. Reinserting the two 82106A modules will re-establish 320 memory registers.

Does anyone have a logical (or even illogical) explanation for this bizarre behavior? Thanks.

Take care.

Wayne.

in response to message #1 by Wayne Stephens

Isn't there any faulty memory chip? I don't know how to test them - can you get some spare ones and try to replace? Just a crazy idea...

Best regards and good luck!

Nelson

Re: HP 41CV Weirdness - Sort of Long

*Message #3 Posted by **David Smith** on 28 Apr 2004, 10:43 p.m.,*
in response to message #1 by Wayne Stephens

It sounds like you have a bad memory chip. The machine checks it memory size when powered on. If you pull out a module while it is on, it will not know it until you cycle power (or possibly perform some operation that repartions memory). Clean the CPU board very well with 91%+ isopropyl alcohol and a stiff brush. A lot of

times solder flux or invisible crud on the board will cause problems like this.

Re: HP 41CV Weirdness - Sort of Long

*Message #4 Posted by **Miki Mihajlovic** on 28 Apr 2004, 11:56 p.m.,*
in response to message #1 by Wayne Stephens

It definitely sounds like your U10 (possibly U11 too) D/S IC are faulty. Service manual says:

```
...
4. Execute [SIZE] 191. If TRY AGAIN -> U9  is bad.
5. Execute [SIZE] 255. If TRY AGAIN -> U10 is bad.
...
```

If you have a service module 5061-7221 (unlikely since they are rare) it will test all of the D/S ICs. Alternatively you can use Clonix with the test module image, available from Diego.

Re: HP 41CV Weirdness - Sort of Long

*Message #5 Posted by **Diego Diaz** on 3 May 2004, 10:55 a.m.,*
in response to message #4 by Miki Mihajlovic

Hi,

I've heard my name here... ;-)

Well, I'm still on holidays in Seville, will be back next Wed. Just wanted to advance a point regarding the Service modules emulation: as some of you already know these modules were not fully emulated by the previous Clonix-41's code version, but such limitations no longer exist. Now both service modules are fully functional, including the Card Reader test features. Two .HEX files, to load Clonix's EPROM with, will be posted at my site and at the other site... one file emulates the 41196 while the other is for the 5061-7221.

The unavoidable counterpart is that Service modules emulation will RUN all the time so the power consumption is somewhat high... (you may want to power your 41 from AC adapter, instead of batteries, while running your tests)

Best whishes from Seville.

Diego.

HP 48GII as a 42S?

*Message #1 Posted by **Bill P** on 28 Apr 2004, 1:34 p.m.*

I have need of a cheap substitute for a 42S. Can the 48GII run any 42S emulator?

Thanks

Re: HP 48GII as a 42S?

*Message #2 Posted by **Erik Ehrling (Sweden)** on 29 Apr 2004, 1:00 a.m.,*
in response to message #1 by Bill P

The cheapest alternative might be a HP48SX + 2 x 128K RAM cards (e.g. Klotz)...

Best regards, Erik Ehrling (Sweden)

Re: HP 48GII as a 42S?

*Message #3 Posted by **Bill P** on 29 Apr 2004, 1:30 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

OK, where can I get two 128k cards for the 48GX I have for less than my $100 budget? For the prices I saw on Froogle, even if I could find two 128k cards, together they'd run me as much as a 42S off Ebay. Add to that the fact that I need my 48gx for another application, and I'd need to get a 48sx too, running me to the price of a 42S and a post-PE exam 32SII.

So really, can I even get a handheld 42S compatible for <$100?

I'd settle for a 49G+ program that allowed the calc to be used for other things too, BTW.

Re: HP 48GII as a 42S?

*Message #4 Posted by **Jeff** on 29 Apr 2004, 7:29 a.m.,*
in response to message #3 by Bill P

Bill,
You can get high quality, inexpensive memory cards here. The 128 k cards are currently 30 Euros, I guess about $37.50 at current exchange rates. For only 15 Euros more, you can get a 1 Meg card, which I would highly recommend as then you would have a bunch of ports for storage and backups. Of course, you also need to buy the 42S emulator, current price is $75. There would be no need to buy a 48SX. You can switch back and forth between the 42 emulator and standard 48GX operation at the touch of a few keys. However, to answer your question, it does not appear that you could get a 42S compatible for less than $100. Probably more like $175 minimum with shipping and money transfer fees.

Quote:

> I'd settle for a 49G+ program that allowed the calc to be used for other things too, BTW.

From the applications that I have seen at hpcalc.org and other places, it sure seems like a clever person ought to be able to create an application that would mimic the desirable operating features of the 42S and/or other calculators.

Thank You (Re: HP 48GII as a 42S?)

*Message #5 Posted by **Bill P** on 29 Apr 2004, 10:00 a.m.,*
in response to message #4 by Jeff

Wow, I'd never seen that site before. If I'd known about prices like that, I'd have purchased them some time ago, and would still be using the 48GX daily.

Hmmm...

*The 49G is the *ONLY* HP calculator, which have 128K+128K extra RAM for two emulators (42S, 71B) at the same time while retaining almost full 256KB main RAM.*

Correct. Unfortunatelly, HP-49G+ cannot execute any FULL or EXTENDED versions of my emulators because Port1 is only 128K. I really don't know why HP did this but, in my opinion, that was a very stupid decision.

Re: HP 48GII as a 42S?

*Message #10 Posted by **anon** on 30 Apr 2004, 6:04 a.m.,*
in response to message #9 by HrastProgrammer

Why was it a stupid decision?

The emulator needs RAM to execute. Also that memory is supposedly usable by native ARM asm programs.

Hardly anyone is going to worry about 128kb when they have 700k flash + hundreds of MB on SD.

Re: HP 48GII as a 42S?

*Message #11 Posted by **Veli-Pekka Nousiainen** on 30 Apr 2004, 8:24 a.m.,*
in response to message #9 by HrastProgrammer

"Correct. Unfortunatelly, HP-49G+ cannot execute any FULL or EXTENDED versions of my emulators because Port1 is only 128K. I really don't know why HP did this but, in my opinion, that was a very stupid decision."

They just had to do it for the ARM9 to emulate Saturn.

Could you kindly import your work to the new 49g+, please!
I would be glad for just a 71B Emulation.
You could use the Main RAM for extra storage (as an option).

Thank you for your efford!
[VPN]

Re: HP 48GII as a 42S?

*Message #12 Posted by **HrastProgrammer** on 30 Apr 2004, 11:02 a.m.,*
in response to message #11 by Veli-Pekka Nousiainen

They just had to do it for the ARM9 to emulate Saturn.

I know that. But why did HP put 32K of RAM into HP-33S which obviously cannot make efficient use of such large amount of memory and decided to cut the Port1 on HP-49G+ to 128K? Why didn't they just install another 32K of RAM into HP-49G+ and leave Port1 intact?

Could you kindly import your work to the new 49g+, please! I would be glad for just a 71B Emulation.

I am still waiting to receive my HP-49G+ (as a gift) and until then I cannot do anything regarding this. And even after I receive it there will probably be many weeks/months until I sorted out all problems and incompatibilities of HP-49G+ - memory configuration, timers, display, serial and IR ports, etc, etc, ... Currently I really don't have much time for this because I must do my regular work.

You could use the Main RAM for extra storage (as an option).

Port1 has the advantage that it can be configured (mapped) to the address #00000 which is essential for the emulators like HP-41X/42X/71X to work properly because this is the only way to intercept the interrupts (and without interrupts everything is useless). Ports 2 & 3 (SD) don't have this possibility. Of course, I can configure the main calculator RAM to the address #00000 but this is too complicated for everyday use and there is a great chance of 'Memory Clear' with some badly behaving programs running on the emulator. I would have to store the emulator to Port0, then exchange its contents with RAM starting from #80000 (in order to save system memory starting from #80000), then configure RAM to #00000, then run the emulator core ... after exiting the emulator RAM had to be configured back to the #80000 and memory should be exchanged back with Port0 ... What if some program running on the emulator resets the whole system? The memory will be corrupted and everything will be cleared. So, this approach won't work.

So far, the best platform for my emulators is HP-48GX with two RAM cards - in the case of >=1024K RAM card in Slot2 all my emulators (including all programs and modules I currently have access to) can be installed without problems. This isn't possible on the 49G/G+.

Re: HP 48GII as a 42S?

*Message #13 Posted by **Veli-Pekka Nousiainen** on 1 May 2004, 5:06 p.m.,*
in response to message #12 by HrastProgrammer

"But why did HP put 32K of RAM into HP-33S which obviously cannot make efficient use of such large amount of memory and decided to cut the Port1 on HP-49G+ to 128K? Why didn't they just install another 32K of RAM into HP-49G+ and leave Port1 intact?"

A) the 33s has the minimum size Static RAM chip: 32KB
B) The 49 already has 2*256KB RAM chips. Static RAM is expensive and did not make that model for your emulators (which are loved by many)
X
"Currently I really don't have much time for this because I must do my regular work."

I'm willing to wait until Xmas (-:

VPN> You could use the Main RAM for extra storage (as an option).

<clipped a detailed explantion>
"So, this approach won't work."

What I meant was not for the ROM, but for modules.
You might be able to store them under the Hidden Directory at Home.

Re: HP 48GII as a 42S?

*Message #14 Posted by **Raymond Del Tondo** on 30 Apr 2004, 7:41 a.m.,*
in response to message #8 by Veli-Pekka Nousiainen

Yes, maybe the 49G has a good RAM config for some purposes, but compared to the 49G+'s

(and the 48xx of course) keyboard the 49G still has no keyboard (IMHO). The 49G+ is much better in *every* aspect. Except the keys, which are better on the HP-48 series.

Maybe HrastProgrammer could provide a version which is able to run from SD card?

Raymond

Re: HP 48GII as a 42S?

*Message #15 Posted by **Ron Ross** on 30 Apr 2004, 10:05 a.m.,*
in response to message #1 by Bill P

I feel the 48GII would make a fairly decent subsitute for the 42s. But I also used a plain 48G instead of a 42s and just wrote a few simple programs and made use of the solver for field work.

The 48G worked fine, was expendable, but is probably not nearly as tough as the 48GII probably is (guessing, but it is nearly the same as a 49G+, and that looks pretty durable). The LCD's is the older 48G's Archille's heel and the new LCD lense cures that!

Aside from the form factor, I like the 48G series best. I would be happy if Hp re-released the 48G without a graphics LCD and in a thinner, smaller model much like the Hp9G (or even better, a Pioneer case AND Keep the keyboard quality!!!!!). I really like the units conversion, serial port, equations library and the amount of functions. Equip the basic model with 256K RAM and use standard, not propriatory components.

I have noticed that my Hp42s is much more thrifty with the RAM than the 48 series ie a similiar program in the 42s seems to use only 60-70% of the RAM that the same type of program uses in a 48/49 series. However, my 32K RAM upgrade is really no big improvement over the original 8 K without any I/O (I would cry, if I loaded 10-20 K of programs and then seen a memory clear, and that can happen on a battery change).

I would like to have it with external I/O ports and modules but the basic calculator would be a maxed out 42s type machine. Add any periphials you want (ie like the 41 series via output moduals through a couple standard ports and a speciality ports) 4 standard ports I can name would be a mouse/serial port (give it two), a keyboard port, a USB port and a multi-channel custom port that could accept a VGA low end box. Make this small pioneer able to function as a low end PC/data collection tool if called upon. But the simple to market calculator would be a 42s like calculator with I/0, RAM and some extra goodies in functions (last part can be corrected with RAM) with the potential to do anything.

Just my idea of what an ideal calculator should be.

Re: HP 48GII as a 42S?

*Message #16 Posted by **Erik Ehrling (Sweden)** on 1 May 2004, 5:16 p.m.,*
in response to message #15 by Ron Ross

Before we have I/O for the HP-42S (fortunately there is active work done in this direction!) this will of course be an issue, but still you are able to have both 8K of programs *and* several larger matrices in memory at the same time with the 32K upgrade.

Personally I think the 32K upgrade is a great improvement of the HP-42S. What most user's of the HP-33S

wish they could do is actually possible on the "HP-42SV": to use the whole memory for programs...

Best regards,
Erik Ehrling (Sweden)

New TTF files - I'd like to hear from you

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 28 Apr 2004, 12:53 a.m.*

Hi, all;

after some "fresh" and "insidious" ideas (some of my own, some based on former observations) I created four new TTF files with CorelDRAW!® 6.0. I prepared a PDF file showing all characters available with these fonts and their respective character codes. You can download the zipped file from here:

New TTF files - zipped

One of the "major" changes is related to the former HP82143A TTF I created and Dave hosts here at the MoHPC. I read some suggestions that I found valuable, and I redraw the characters having in mind that they should look like printed characters instead of dot-matrix charactes. At first I added some "noise" to them, but the file grew too fast after each new character and final results were only visible when characters were enlarged, so I abbandoned the idea.

There are a few "glitches" I'm still working on, but I would like to hear from you prior to release them. If there are any suggestions about characters and their organization (character code), let me know so I can chage them and see the results.

I knosw it's not the same as having the fonts for testing in your own documents, but as soon as I have the gitches fixed and having applicable suggestions applied, I'm posting again.

Hope you like them.

Cheers.

Luiz (Brazil)

in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

On first impresison I think I prefer the LCD-like characters. I was never too fond of the printer fonts, although I must say your font mimics those almost perfectly.

Anyway, just one data point!

Best, ÁM.

in response to message #1 by Vieira, Luiz C. (Brazil)

Thanks for a nice birthday present! (Yes it is today).
Keep up the great work on those fonts, they are all very useful to anyone who wants documents on HP calcs to look authentic, and I am looking forward to you posting the final versions (or send by email).
As you might remember from the past, I am also using your HP-41 display fonts. A complete font of the HP-71B display characters would also be very useful, and did you progress with the font for HP calc keys?
Best wishes from England....

Re: New TTF files - I'd like to hear from you

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 28 Apr 2004, 11:32 p.m.,*
in response to message #5 by Gordon Dyer

Hello Gordon, guys; are you well? (I did not forget it...)

And (a bit late), happy aniversary! I wish the best.

Thank you (and thanks to Ángel, Erik and all of you who even had a look and found nothing to add about the fonts ;^); I'm glad you like them.

I'm just making the last few corrections (character size for printer output) and I'll post a message with the links for the final TTF files, O.K.? Dave, should I send them to you as well? I'd gladly add another article mentioning these new fonts, or replace the existing one for another, with links to each of all fonts "at once". Any suggestions?

About the HP71 character set: I thought about using the same pattern for the HP42S LCD characters. In fact, I thought about changing a copy of the existing HP42S TTF file and add/replace all necessary characters so it matches the HP71B character set. What do you think? At least, about 60 characters would not be changed, and I'd not have to draw these all again. Anyway, if there is something you believe that must be changed, let me know. Redrawing all characters and create a complete font this way is not as hard

as having a complete drawing for each one. I simply create the pattern (a 7×5 square-dot matrix) and I remove the dots not needed. The resulting set is the one I use to create each character for each font.

BTW, Im still in the need of knowing a way to use those "forbiden" positions in TTF fonts. Does anyone know anything about this?

Cheers Gordon, folks!

Luiz (Brazil)

in response to message #6 by Vieira, Luiz C. (Brazil)

Your idea of basing a HP-71B font on the 42S file is good, the basic characters do look the same. Do you need a hi-res scan of the manual char set pages or do you already have a copy?

Re: New TTF files - I'd like to hear from you

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 29 Apr 2004, 11:42 p.m.,*
in response to message #7 by Gordon Dyer

Hello, Gordon;

thank you so much for you kind offer. I am sure you'll agree with me when I tell you that the HP71B LCD itself is the best source of information. And yes, my friend: I was lucky enough having a very good soul that helped me having a complete unit (HPIL, reader, 2×4K RAM modules... a wonderful machine!). In fact, the basic unit was a "gift", and the "fancy", complete, cosmetically perfect unit was accomplished by trading (an HP42S). I'm a happy owner!

I printed the Owner's Manual available at the MoHPC CD set (I have a former 5CD set) and it's not gonna be hard to change/complete/alter the existing HP42S Character Set TTF, as I have briefly checked already.

There is another TTF I'm willing to draw: the HP75C/D. Mostly because of its natural, unique "italic" look. The only other "place" I've seen such an italic effect is in the HP9x printer: the characters are "italic" as well. I myself do not like them too much, but their "nostalgic" look makes us remember that those wonderful machines were top-of-line, state of the art devices at their time, and they still have their magic. What about that? I'm daring to "twist" a copy the existing HP42S character pattern and see what happens. Again, I'll let you know.

As I have the HP71B TTF I'm telling you.

Once again, thank you for your kind (and much appreciated) offer.

Best regards.

HP 48GII and 49G+

*Message #1 Posted by **Joe Edwards** on 28 Apr 2004, 12:26 a.m.*

Hey folks, I am a bit confused as to why HP decided to build both the 48GII and 49G+. The calcs seem identical except that the 49g+ includes: 1. More memory 2. Flash ROM 3. Bigger LCD 4. SD card slot 5. USB vs. serial port 6. Gaudy gold vs. nice silver color (IMHO)

Okay, what gives? It seems that the two calcs overlap each other. What was the point in even building the 48gII other than to give the machine a serial connetion? Also, why leave out the flash ROM on the 48GII? If there are any bugs in the machines, what can possibly be done to fix the problem? I would love to hear everyone's opinions on this. Oh, I am looking at getting an HP graphing calc to accompany my TI 89 (and HP 33s!!!). Should I go with the 49g+, 48gII or the older 49g? I met another student who uses the older HP 49g. I played with it and (suprisingly) I liked the keyboard and rubber keys on it better than the 49g+ I bought last November...which I returned the same day thanks to the crappy keyboard. Has there been an improvment in the keyboard of the new 48/49 models? Also, if I go with the older 49g is there any "gotchas" I need to know about? Thanks for all the help in advance.

Joe

Re: HP 48GII and 49G+

*Message #2 Posted by **Ron Ross** on 28 Apr 2004, 10:53 a.m.,*
in response to message #1 by Joe Edwards

I to feel Hp is making some design mistakes with the 48GII, but at the price they offer it, it looks to be a very good buy. Especially if you subject a graphics calculator to extreme use and do not need to modify it too much.

I feel Hp should have named this something else, but marketing doesn't want to call it what it is, a 49G minus. While it is probably faster than the original 49G, it lacks memory and a true RS232 port. But Hp has improved the keyboard ie same as the 49G+ and it does look better than anything except perhaps the Hp39G+ (I haven't seen either in person, but the dark blue of the old 39/40G was much better than the FHB (ice???) Blue of the original Hp49G).

The flash rom you mention has already cost HP millions because the Hp48GII was released about the same time as the Hp49G+ and had the same battery drain bug, which could not be corrected, so Hp had to pull the 48GII from distribution. And since none of the new calculators are actually repairable or flashable, probably all were destroyed.

Re: HP 48GII and 49G+

*Message #3 Posted by **bill platt** on 28 Apr 2004, 11:08 a.m.,*
in response to message #2 by Ron Ross

Hi Ron,

Can you elaborate on the RS-232? You say it is not a "true" rs-232. How does it differ from (a) 48GX and

(b) any old laptop RS-232?

regards,

Bill

Re: HP 48GII and 49G+

*Message #4 Posted by **Ron Ross** on 28 Apr 2004, 11:44 a.m.,*
in response to message #3 by bill platt

It provides no power, it has to ride along or piggy back onto a true RS232 device. But it cannot control any devices as it is presently made (most controled devices require the master to supply the voltage on the cable). Its cable has to rob the 5 volts (actually 3.3 or so works) from the PC to work. Therefore it isn't as versatile as a 48G or older 49G in this regard either. Works great hooked up to a PC, but cannot really tie into data acq systems unless you provide a 5 volt supply and splice into cable.

Nice isn't it? Hp worries about battery drain from the RS232 port, but leaves a bug in the OS (originally).

Re: HP 48GII and 49G+

*Message #5 Posted by **Cameron Paine** on 28 Apr 2004, 12:19 p.m.,*
in response to message #4 by Ron Ross

I'll bet the hardware guy that did the 232 implementation, probably cutting it down against his better judgement, was truly pissed when he discovered that the software people had porked the O/S.

cbp

Re: HP 48GII and 49G+

*Message #6 Posted by **Ron Ross** on 28 Apr 2004, 1:13 p.m.,*
in response to message #5 by Cameron Paine

Probably saved 30-50 cents per unit by skimping on the serial port. I understand another 50-80 cents is saved by not having flash ROM.

Total savings to cost $1-1.50. I am sure we are all happy they can pass that cost to us.

Of course a few dollars were lost when they could not upgrade the ROM since the OS had an error that caused a battery drain.

Re: HP 48GII and 49G+

*Message #7 Posted by **Richard Garner** on 28 Apr 2004, 3:15 p.m.,*
in response to message #6 by Ron Ross

About 2 years ago I bought a 48GX for $35. I inquired about the price. Office Depot told me that they were getting rid of all of their HP calculator at their cost (what they paid for them). If you work the math backward from retailer to wholesaler/distributor to manufacturer and each doubled (2X) there price as they moved forward from the manufacturer. It only cost the manufacturer about $5 to make the 48GX.

Think about it. The retailer was selling it to us for about $120 and it cost the manufacturer $5 to make in (X) number of volume. A $1.50 more might have cut too far into the

manufacturers profits to put a fully functioning RS-232 port in the 48GII.

Re: HP 48GII and 49G+

*Message #8 Posted by **Veli-Pekka Nousiainen** on 29 Apr 2004, 7:22 a.m.,*
in response to message #5 by Cameron Paine

"was truly pissed when he discovered that the software people had porked the O/S."

The Software people were truly pissed when they discovered that the Samsung's hardware people had porked the CPU pins (changed from the original design announced before the 48gII project).

*Message #9 Posted by **James M. Prange** on 29 Apr 2004, 8:16 a.m.,*
in response to message #8 by Veli-Pekka Nousiainen

Well, no doubt they were. But if you were making a new product, wouldn't you do very thorough testing on the first units from your new production? I can sympathize with the problem of having a supplier make undocumented changes, but not with the problem of letting defective units from a new manufacturing process actually getting out to the market.

Regards,
James

Re: HP 48GII and 49G+

*Message #10 Posted by **James M. Prange** on 29 Apr 2004, 8:05 a.m.,*
in response to message #4 by Ron Ross

Actually, the 48 series and 49G don't comply with RS-232 either. Their output is about +/- 3.5V, possibly as low as +/-3.0V; see: http://www.hpcalc.org/details.php?id=4741. To meet RS-232, the transmitted signal would have to be at least +/-5.0V. But RS-232 specifies input levels of +/-3.0V, and the calculators are usually used with short cables with little signal loss, so it's probably fair to say that they're "RS-232 compatible". I think the manuals never actually claim this, calling it a "serial port" instead. The only problems I recall reading about were with some Macs, which I expect were actually equipped with RS-422 ports instead of RS-232 ports.

My understanding is that the 48gII signal level without the special cable is practically identical to the 48 series and 49G, so if you supply your own non-amplifying cable, you can probably use it wherever the older calculators would work.

Regarding the lack of an upgradable flash ROM, yes, it seems foolish to expect to get a reasonably bug-free ROM, especially in a hurry with practically the same complicated ROM used in the 49 series and the processor emulated. What were they thinking?

And it has less RAM available than the 48 series, and no expansion card capability. Too expensive for a "low-cost" model in my opinion. I wonder who would buy it; it's hard for me to imagine the niche in the market that it fits into. But who knows? I'm no marketing specialist.

Still having an RS-232 compatible serial port does sound good though.

The USB port on the 49g+ is nice, but I'd much rather they'd added a USB port and kept the RS-232 compatible port instead of replacing it.

Regards,
James

HP 48GII RS-232 info

*Message #11 Posted by **Matt Kernal (US)** on 28 Apr 2004, 3:51 p.m.,*
in response to message #3 by bill platt

To elaborate on what Ron mentioned, see the following Post " 48GII RS-232C problems solved" from comp.sys.hp48.

Here's a quote from the author of the post, Bob Roberts (October 30, 2003):

"Took one for the team. My suspicions were realized as I cut open the molded plastic cover on the D-sub end of my brand new (now non-returnable) 48GII cable and dug through the potting material to see active components hidden underneath. Looks like (in order to save cost/power???), HP decided not to include a functioning RS-232 port on the unit itself. Instead, they have included the RS-232 transceivers in the custom cable they supply with each unit. They simply drive the logic levels of the uP UART out of the connector on the back of the unit. The active components within the cable then convert the logic levels to RS-232 signal levels. Problem is they did not supply the power necessary to drive these active components. Instead, they are stealing power from the modem control lines of the RS-232. This is fine as long as you 1) use the supplied cable, 2) don't use an additional cable extender that does not support the modem control lines and 3) connect your 48GII to a PC using HP's driver software which will toggle either the DTR or RTS lines of the PC to the proper levels."

"If you are attempting to connect the 48GII to any other RS-232 device you will need to make sure that it can supply the signals necessary to power the cable circuitry. This will probably include making sure it supports the modem control lines (many current RS-232 devices do not) and making sure the device's firmware/software drivers keep the modem control signals in a state that keep the cable powered properly. This may require a rewrite of the device's serial drivers. In some cases (such as a modem that uses these lines for it's operational functionality), you may be out of luck.

Bob"

Hope that helps,

Matt

Re: HP should have new graphing calculator with serial and USB ports

*Message #13 Posted by **Frank Travis** on 28 Apr 2004, 1:55 p.m.,*
in response to message #1 by Joe Edwards

TDS website www.tdsway.com has a handheld device called a RECON that has both USB and serial ports in the same unit. HP should have both serial and USB ports in their next graphing calculator. It could be called the HP 49GX or HP 49GX+. There would then be no need for a separate graphing calculator to succeed the HP 48GII.

Re: HP should have new graphing calculator with serial and USB ports

New HP-16C "tribute" web site.

*Message #1 Posted by **Cameron Paine** on 27 Apr 2004, 6:46 p.m.*

I've put together a modest web site to commemorate the HP-16C. It also serves as a distribution point for my (free) 16C simulator.

http://members.optusnet.com.au/~cbpaine/hp-16c/

The simulator software is of "beta" quality but visitors to this museum are welcome to try it out. I have no plans to commercialise it but I will continue its development until I consider it finished. I've been tinkering with it for two-and-a-half years now and I figure it's time to let others have a play with it. Hey, you might even find it useful.

My thanks to Paul Brogger, Luiz Cláudio and Raymond Hellstern for testing earlier versions of the software.

Cameron

PS to David (Hicks): once I get the version number above 1.0 (it's currently 0.211) you will be welcome to a copy for the museum's simulator/emulator page.

You have mail;-) (n/t)

Re: New HP-16C "tribute" web site.

*Message #3 Posted by **hugh steers** on 27 Apr 2004, 8:50 p.m.,*
in response to message #1 by Cameron Paine

excellent! i really like the "classic" mode.

some things i noticed quickly tho' (windows version). is there a way to use the keyboard for input. 0 ENTER 0 / (what does it give on a real 16c)?, 2 ENT .2 + .2 + .2 + .2 + .2 + 3 - isnt zero.

best of luck with the project!

Edited: 27 Apr 2004, 8:52 p.m.

Re: New HP-16C "tribute" web site.

*Message #4 Posted by **Miki Mihajlovic** on 27 Apr 2004, 9:18 p.m.,*
in response to message #3 by hugh steers

Cameron,

Great site indeed. Excellent emulator, to say the least. I also like the "classic" look and would like the keyboard input too. Suggestion: there should be some kind of save state mode so if user chooses the

"classic" view, it always gets it on the program restart. Other things could be saved too like the window position etc.

To answer Hugh's question 0 ENTER 0 / gives Error 0, just like the emulator. And your arithmetic sequence IS zero if you are in the floating point mode. In decimal (or any other integer mode for that matter) it isn't as it shouldn't be. You really need the manual, as is stated in README file.

I am looking forward to the improvements. Now if someone would just do the same thing for 15C ;)

1234

Re: New HP-16C "tribute" web site.

*Message #5 Posted by **Cameron Paine** on 28 Apr 2004, 4:09 a.m.,*
in response to message #4 by Miki Mihajlovic

Thanks for the kind words Miki.

On the subject of keyboard input, perhaps you could read and comment on my reply to Hugh (above).

As for state saving--I sort-of concur. The calculator "engine" is decoupled from the user interface. The engine preserves its state just like the device I'm simulating. Window/scroll position is not something that gets preserved. The engine knows nothing of its UI so it cannot save UI state elements.

I have yet to build any persistence into the UI layer. I do plan to though. To date I've simply hacked the code to make the rendering I prefer the default. Since we have two "votes" for persisting the rendering setting, I think I'll do that next.

This does raise a question though. You don't find the classic rendering consumes too much of your windows display?

I ask because I thought I'd pinch an idea from Warren Furlow's HP-41 emulator and offer small and large classic views. The support for this is in the code--all I have to do is build the smaller bitmaps.

How small would you go? I can't crank it down too far because we'll lose the legibility of the keypad legends (and my artistic ability is too limited to do a convincing job of retouching them). I welcome you suggestions.

Cameron

Re: New HP-16C "tribute" web site.

*Message #6 Posted by **Cameron Paine** on 28 Apr 2004, 3:37 a.m.,*
in response to message #3 by hugh steers

Thanks Hugh. You don't say what mode you have the calculator in but I'll assume you're familiar with the real thing.

In floating point mode, zero div zero produces an IEEE quiet NaN which I was simply converting for display. This is incorrect behaviour. I had overlooked the fact that this "special" case bypasses the FPU's div-by-zero handling. I'll trap this case in the next release. In integer mode zero div zero produces Error 0 (as does X div 0 in either mode if the dividend is non-zero).

Your 2 ENT .2 + .2 + .2 + .2 + .2 + 3 - calculation intrigues me. In the version you have, the displayed result is zero (in floaring point mode). However the value in X is actually 8.881784-16. You can get a hint

that it's not zero if you do [f][PREFIX] while the result is in X.

The simulation (it's not an emulation) uses the IEEE FPU to do the floating point ops. I considered doing my own BCD FLOPS (and I may yet do so) but this would have taken the project in a direction that I haven't had the time or energy for.

I have an experimental routine that rounds out small "errors" in the display while maintaining the real value internally. I think I'm aware of the issues and arguments surrounding BCD vs binary floating point. Although math isn't my game, I understand (some of) the ramifications of binary FP representations and I'm not sure that hiding them is a good idea. However I would like the simulator to come close to the 16C.

Any thoughts? I'd like to know what you (and others) feel about this.

I'll turn the display rounding off in the next release.

Cameron

Re: New HP-16C "tribute" web site.

*Message #7 Posted by **hugh steers** on 28 Apr 2004, 3:20 p.m.,*
in response to message #6 by Cameron Paine

hi Cameron,

my points were minor as overall the simulator is excellent. here's how you fix the zero problem without BCD. change the top-level add & subtract routines to perform relative supression as follows:

add(a, b) = a + b or 0 if |a+b| < |a|*2^-k eg k = 40 for 12 digits. similar sub(a, b) = a - b or 0 if |a-b| < |a|*2^-k. this is what i do, so does the hp9g.

best of luck with the simulator,

Thanks for the algorithm

*Message #8 Posted by **Cameron Paine** on 30 Apr 2004, 3:54 a.m.,*
in response to message #7 by hugh steers

Thanks Hugh. I've implemented your algorithm. I like the results. The new version's up on my site. I think that will tide me over until I have a lazy week to incorporate the IBM decNumber BCD routines.

Cameron

PS: did you ever work for infocom?

Simulator keyboard input

*Message #9 Posted by **Cameron Paine** on 28 Apr 2004, 3:51 a.m.,*
in response to message #3 by hugh steers

You (and Miki) touch on a point that has bothered me for a while. On the PPC the keyboard is not an issue which is why I've not implemented anything. However, on the desktop, keyboard input presents a real design challenge.

I figure if you're going to use the keyboard you want to keep your hands on the keys. Therefore, all input keys and functions would need to be mapped to the keyboard. That's about 130 bindings.

I'm interested in your idea of what the mapping would look like. Is the mouse OK for some functions? If so, which functions?

TIA

Cameron

Suggestions for simulator keyboard input

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Apr 2004, 5:25 p.m.,*
in response to message #9 by Cameron Paine

On a previous message posted about a week ago, related to Eric Smith's Nonpareil emulator, I suggested some ideas about basic keyboard mapping for PC usage of HP calculator emulators. My ideas were mostly oriented to 4-level stack models.

Number entry (including decimal point) should work from the numeric keypad.

The four basic arithmetic functions should work from the numeric keypad.

Enter should work from the numeric keypad.

The minus key on the numeric keypad, in combination with shift, should act as change sign (CHS or +/-)

The cursor-down key should work as Roll Down. Optionally, cursor-up may work as Roll Up in appropriate cases.

Cursor-right should work as X<>Y (or SWAP).

Cursor-left may work as CLx. Veli-Pekka Nousianen suggested that the main keyboard Backspace key may be a better choice, and I think he may be correct, depending on individual choices.

The preferable manner to handle these issues is to have an editable "PC keyboard to calculator-key" mapping file, because there may be issues with international PC keyboard layouts (for instance "<" and ">" or "," and "." are some of the keys that change from one layout to another); and there is also a case for notebooks, which do not have a separate numeric keypad.

With these considerations, at least the basic calculations could be handled with little or no mouse usage (with the hands on the keyboard, that is). However, less intuitive assignments or mouse clicking will be needed for specific functions as logs, trigs, stats, etc.

Re: Suggestions for simulator keyboard input

*Message #11 Posted by **Victor** on 29 Apr 2004, 3:41 p.m.,*
in response to message #10 by Andrés C. Rodríguez (Argentina)

I like these suggestions. In addition, the letters a through F should correspond to the A-F keys on the HP-16C, since hexadecimal input is frequently used.

Simulator now has keyboard input

*Message #12 Posted by **Cameron Paine** on 30 Apr 2004, 3:48 a.m.,*
in response to message #11 by Victor

Thanks for the suggestions Andrés and Victor. They've now been implemented.

in response to message #14 by John Cadick

Thank you John. I hope you find it useful (or at least amusing ;-).

On the subject of sticky views, you've offered the second "vote" for view persistence. I'll do that for the next release.

Perhaps you could also read my reply to Miki (above) and share your thoughts about the size of the classic rendering.

Cameron

*Message #16 Posted by **John Cadick** on 28 Apr 2004, 4:48 a.m.,*
in response to message #15 by Cameron Paine

Hi Cameron:

I have a pretty high resolution screen -- 1400 x 1050, so the current classic size is pretty good for me. Having said that, I can see where a slightly smaller version would be useful for screens with less resolution. (Of course with my old eyes larger objects are useful <G>)

John

in response to message #16 by John Cadick

I have a beautiful screen using Sony F-520 21" monitor in 2048x1536 resolution.
A slightly bigger version would preferable.

*Message #19 Posted by **Giuseppe Marullo** on 28 Apr 2004, 10:05 a.m.,*
in response to message #1 by Cameron Paine

Wow, really great work. I was really missing a HP-16c simulator, now I could leave mine at home (sometimes).

Font I noticed that the font is not exacly the same. Is there someone that could provide a [even] better one?

Classic view Could you draw the form without the border and Title? I have mostly 1024x768 displays and I LIKE classic view. Please make available a 1024x768 version! :)

Emulation Pressing 'f' function lights the 'f' annunciator, but pressing again should not hide it. Same as above for 'g'. Am I wrong?

Keyboard You will use mostly with the mouse, but using the mouse for number entering is slow and weird sometimes. Just very basic stuff, like '0..9','a..f','.', clx/BSP basic operation and enter. Other bindings could be defined, as long they don't cause problems.

Known issue Sorry but I don't uderstand what is not fixed, I would rather prefer a single repository.

Your work is really appreciated.

"Emulation Pressing 'f' function lights the 'f' annunciator, but pressing again should not hide it. Same as above for 'g'. Am I wrong?"

Tested on a real HP-16C, the second press on f or g just leaves it on. You may change from f to g or vice versa.

So I found a bug into the emulator...or is the Hp-16C in error? :)

The emulator should follow the original anyway...

LOL

*Message #22 Posted by **Cameron Paine** on 28 Apr 2004, 11:30 a.m.,*
in response to message #21 by Giuseppe Marullo

Giuseppe and VPN have me laughing out loud. I'll let the source code tell the bulk of the story:

```
if (compatible(SHIFT_KEYS_STRICT))
{
  // On the real 16C, the shift keys would toggle each other's state
  // so you had to use the (gold-shifted) PREFIX function if you
  // wanted to clear an inadvertant shift. Assuming that we've got a
  // handler for PREFIX installed, that's the behaviour we're modelling
  // here.
  shiftState.gold = key == KEY_GOLD;
  shiftState.blue = key == KEY_BLUE;
}
else
{
  // It always puzzled me why an inadvertant shift couldn't simply be
  // cancelled by either pressing the same key again, thereby releasing
  // the latch, or by pressing the other shift. I guess the latch must
  // have been hard-wired in some way, in which case the PREFIX function
  // was an ugly kludge. Since this is software, we can be much more
  // flexible. Pressing the key toggles the latch. Which introduces a
  // different problem: it's then possible for both shifts to be latched
  // which we really *do* *not* want. So, to be safe, we toggle the one
  // that was pressed and we clear the other.
  if (key == KEY_GOLD)
  {
    shiftState.gold = !shiftState.gold;
    shiftState.blue ^= shiftState.blue;
  }
  else
  {
    shiftState.blue = !shiftState.blue;
    shiftState.gold ^= shiftState.gold;
  }
```

Note the test for SHIFT_KEYS_STRICT? One day there will be a options page that allows you to toggle a small set of behaviours between "strict" (exactly like the real thing) and "loose" (my view of what would be a better way). Until I bind the options to a UI element I have default values that suit me. Developer's privilege ;^)

Now that I have your attention, should I implement the right-scroll bug? (I'll be chuffed if anyone knows what I'm talking about--is that the sound of 100 16C's being slid from their vinyl wallets?)

Cameron

PS: Giuseppe, thanks for noticing. :^)

Re: LOL

*Message #23 Posted by **Giuseppe Marullo** on 28 Apr 2004, 3:56 p.m.,*
in response to message #22 by Cameron Paine

Cameron, this is a issue I know for sure deserves many attentions. On one hand, I do like an emulation as real as possible (BTW, does the battery indicator...joking), on the other hand we are not tied to old problems. Anyway, I do like emulation because they can revive the real thing, so emulating it, with all the defects, make it a better emulation. When it make sense, sure improve/fix it, just make it user switchable.

I don't know much about the 16C, but if the right-scroll bug would make a 16c program behave differently, I would like to experiment the same behavior.

looks like a duck; quacks like a duck...

*Message #24 Posted by **Cameron Paine** on 30 Apr 2004, 4:25 a.m.,*
in response to message #23 by Giuseppe Marullo

Giuseppe, it's funny that you should mention the battery indicator--I flirted with using it on the PPC. I can't find an API that will give me the battery level though. They have one--there's a standard M$ screen that shows the level.

Seriously though, my desire for the sim is to simulate the behaviour of the real thing as closely as possible. From my POV it's a document of the state of technology at a point in history. However the software is a work in progress and I felt like sharing it with people before it was complete. There is also the practical limit of how much time I can spend on it. Originally I hoped to have it complete for the calculator's silver anniversary. The way I'm going it might just be ready for the gold jubilee.

As for the right scroll "bug". I can't think of a way of exploiting it. I surmise that HP used two nybbles for the scroll position counter. They only needed 6 bits but they didn't range-check or mask the result. Consequently there are 256 scrolling positions. If you work at it long enough you can scroll a number off the right side and back on the left.

Should I implement something like that? How about the 68-bit index register. In the real calculator it renders the ISZ instruction next to useless since the wrap-around that causes the skip happens nowhere near where one might expect it to. Should I implement that?

Last week I would have said yes to the index register and no to the scroll behaviour. But several posts in this thread have caused me to re-evaluate my position. I'll continue to do so.

Throughout the code I have comments tagged with COMPATCHECK. Many of these will be turned into a user-configurable option. In this way we have both a document of the past and a tool that is (slightly) more useful today.

Re: LOL - Function Keys sticky?

*Message #25 Posted by **Gordon Dyer** on 28 Apr 2004, 8:46 p.m.,*
in response to message #22 by Cameron Paine

I agree with you that HP made a mistake with sticky function keys. It is one of the very few things which has annoyed me on my 11C ever since I bought it in 1983.
The HP-71B has toggle function keys - so the designers at HP fixed that 'bug' on their last "super-voyager".
I vote for keeping the functions keys as toggles until the options are implemented.
I like the classic view and a smaller version, linear reduction by about 2/3 would be useful in addition to the one you have now.
Should the ON key turn it off? or close it down like File Exit? I haven't made up my mind.
It is a great piece of work and keep it going...

Re: New HP-16C "tribute" web site.

*Message #27 Posted by **Cameron Paine** on 28 Apr 2004, 12:09 p.m.,*
in response to message #19 by Giuseppe Marullo

Hello!

The font is rendered using GDI routines. The PPC doesn't support 2D transformations or sideways fonts. It also doesn't have the dot density to do justice to the slightly slanted LCD segments on the real 16C--whether they're rendered with a font or with the GDI. So, I compromised.

Classic view without window decoration (title and menu bar) is in the works. The only thing that's really holding it up (aside from the enemy of us all--time) is the fact that I'm working on the context menus for the PPC. Until I finish the menus I can't afford to get rid of the decoration.

Would you like that 1024x768 version in 24-bit colour? David has a truly beautiful 1627 x 1171 image on the museum CDs. I wonder if he'd let me use it?

As for the shift keys, you're absolutely right. See my response below.

Thanks for your suggestion about the key bindings. That makes sense. Did you ever use the MS-DOS

XACT-16C simulator back in the '80s? It had an abomniable mapping that treated a 4 x 10 block of keyboard keys as the calculator keys. It was almost impossible to drive.

Cameron

Re: New HP-16C "tribute" web site.

*Message #28 Posted by **Miki Mihajlovic** on 28 Apr 2004, 1:04 p.m.,*
in response to message #27 by Cameron Paine

Cameron,

As for the window size, there are different opinions here depending on the screen resolution people have. I don't think that you should go out of your way and provide 5 different sizes to suit everybody. Your WOFTAM can be spent elsewhere improving this product.

If I may suggest the following key bindings:

Yellow (f) functions to <shift> keys described below, blue (g) to <ctrl> keys.

All the numbers to numbers on PC, A-F also to A-F on PC, same for the 4 basic arithmetic operators as well as for Enter and BSP. HEX, DEC, OCT and BIN to F1-F4 on PC. RDN to down arrow (RUP can go to up arrow), X<>Y to either left or right arrow (or both). STO to S and RCL to R. Now this leaves out GSB, GTO, R/S and SST. In a lack of better suggestion they can go to F5-F8, retaining 'compatibility' with V41 by assigning SST to F6 and R/S to F8.

My 2c worth.

Re: New HP-16C simulator and Linux

*Message #35 Posted by **Wayne Brown** on 30 Apr 2004, 10:48 a.m.,*
in response to message #33 by Cameron Paine

I haven't had time to give it a full run-through, but it looks good right now. As far as I can tell the keyboard mapping seems to be working just fine and I haven't found any other problems either.

I'm running it on an IBM ThinkPad 600X with a very old Slackware installation that initally came with kernel 2.2.16. However, I've upgraded bits and pieces of it over the years to get it to kernel 2.4.21-pre1. (At that point I decided that it would be easier to reinstall a whole new version from scratch than to keep upgrading in pieces. Some day I'll get around to that. :-) My version of Wine also is old -- 20020605 -- but I use it only for a very few applications, and I'd need to upgrade some other things before bringing it up to date, so as long as it keeps working for me, I'm satisfied.

Classic Battery Packs and Voltage

*Message #1 Posted by **Charles** on 27 Apr 2004, 5:25 p.m.*

Hello,

I rebuilt a 67 battery pack with new cells. I charged the batteries offline then put it in the calculator and it showed the low power light. My first assumption was that it was due to high voltage drop across the wires I had used to the replace the external power / battery leads (these had melted when a line had been cut and shorted !). The calculator worked well except for the light. After a few weeks, numbers started to flash across the screen as if the charge was low. I recharged it and it didn't make any difference.

I then changed the pack to one I had rebuilt for a 45 and the 67 then worked perfectly and the 45 started to behave strangely when used with the 67 pack. The interesting point of all of this is that the 67 pack (bad) has a voltage of 4.1 V while the 45 pack (good) has 3.7 V. Can there be problems with too high a voltage or is this likely to be something else (bad contact) ? I'd appreciate any comments.

Regards Charles

Re: Classic Battery Packs and Voltage

*Message #2 Posted by **Tony Duell** on 27 Apr 2004, 8:45 p.m.,*
in response to message #1 by Charles

No, too high a voltage (within reason) won't cause problems -- 4.1V will be fine What you need to do is measure the voltage _on load_ inside the calculator (you could start, actually, by measuring the voltage between the middle pin on the charger conenctor and either of the outside 2 (which are shorted together if the charger is not plugged in) with the machine turned on. If you get too low a voltage there, check your battery contacts. If that's fine, check the voltage at the logic PCB pins (the pinout is in my 'HP67 notes' in the articles forum on this site I think).

HP-48GII on sale @ $77

*Message #1 Posted by **Eduardo** on 27 Apr 2004, 4:20 p.m.*

On Outpost.com

http://shop1.outpost.com/product/3833347

Is this a hot deal? I haven't seen the 48-GII anywhere else for less than ~$100, so this is a ~23% savings... not shabby!

Eduardo

Re: HP-48GII on sale @ $77

*Message #2 Posted by **Charlie O.** on 27 Apr 2004, 8:36 p.m.,*
in response to message #1 by Eduardo

Is the GII compatable with the GX?

Re: HP-48GII on sale @ $77

*Message #3 Posted by **Gene** on 27 Apr 2004, 10:32 p.m.,*
in response to message #2 by Charlie O.

The 48gII is a good machine.

It is compatible with the 48gx, as much as the 49g and 49g+ are.

It has been called a 49g-, since it is the same as the 49g+ but without USB and without flash ram and with 80K of available user ram.

I happen to like this little guy.

To see what it can do, go and download some of the 48gII learning modules from the hp calculator website:

www.hp.com/calculators/graphing

Choose the 48gII page and then click on the categories of learning modules on the right side of its page.

Gene

Re: HP-48GII on sale @ $77

*Message #4 Posted by **Veli-Pekka Nousiainen** on 28 Apr 2004, 5:29 a.m.,*
in response to message #3 by Gene

The price/performance is best when you buy the hp 49g+.

It's not only faster than the 48GX or 48gII,
but it also has an SD card interface, more RAM, Flashable ROM, even User Flash.
[VPN]

Re: HP-48GII on sale @ $77

*Message #5 Posted by **bill platt** on 28 Apr 2004, 10:11 a.m.,*
in response to message #4 by Veli-Pekka Nousiainen

But at $77, the 49GII becomes a worthwhile alternative--you don't mind so much taking it on a ship or a survey job and destroying it. It's standard price is too high.

I will bet that what is going on is HP is exploring to find the best price point--and I hypothesize that they will make much more money on this model if they sell it cheap.

True, it cannot compete with the 49G+ on absolute performance,

But,

The serial port alone makes it extrememly valuable to all those people out there who MUST use serial connections because of either (a) legacy equipment or (b) specialty instrumentation/data collection equipment which continues to be produced with serial interface.

We deal with this in my line of work (marine engineering).

So, at a significantly lower price, it becomes a real workhorse, potentially. I had no interest at all at its original price--I can keep using my 48gx (with MK and extra ports) happily at that price!

I might just get one! It is handy to have a small device with a serial interface. It just might do in some cases--our laptops are so easily damaged or batteries drained--especially in airport security!

Re: HP-48GII on sale @ $77

*Message #6 Posted by **bill platt** on 28 Apr 2004, 2:37 p.m.,*
in response to message #5 by bill platt

Maybe I aught to rethink my sanguine thoughts on the 48GII--apparently the serial connection really is not up to the task.

See the thread, http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=56055

"HP 48GII and 49G+" posted by Joe Edwards and answered (down the thread) by Ron Ross.

Re: HP-48GII on sale @ $77

*Message #7 Posted by **Joe Edwards** on 29 Apr 2004, 2:27 p.m.,*
in response to message #1 by Eduardo

BE CAREFUL WHEN SHOPPING AT OUTPOST.COM!!!

I decided I would like a back up calc and thought that the 48GII might fit the bill. With the nice price, I decided to order it with overnight shipping.

Airborne/DHL attempted delivery at the wrong house!!! I called them after noticting a delivery attempt was

mentioned on the Airborne website. They contacted the driver and he came to the correct house, but the package was late, by Airborne's very standards.

I spoke with Airborne and they said yes, that they would refund the money back to Outpost.com since the package was late. I next called Outpost.com two (2) different times.

The first guy stated that the delivery was okay as long as it arrived by 5pm and that I needed to recheck the delivery type again. I rechecked the info (overnight AM delivery) and proceded to call them back.

This time a woman told me that they would NOT refund my delivery fees for a package that was 5 minutes late. It was actually 25 minutes late. ALSO, it wouldn't have arrived at all today if I hadn't gotten on Airbornes case to redeliver the pack TO THE CORRECT ADDRESS.

I pushed the issue with the woman since I used to work as a liaison between two differnt companies and the major delivery carriers. She called airborne and then agreed to refund me the difference between overnight and 2-day delivery. Strange, a minute before she stated they wouldn't do anything for me! I refused the offer and now I a waiting for a supervisor to call me back. I have a strong feeling I will be taking this directly to the BBB and my credit card company.

Now, I KNOW that Outpost is going to file a late delivery refund request, so they will get $13.00 back from Airborne, yet they are only willing to offer me $3.00. What is wrong with this picture?

Lesson learned. It is ironic that the very company that clearly states, "Any Questions? Just Call Us! We're known for our unparalleled customer service. We're friendly, knowledgeable, and efficient", would act in such a manner.

Joe

HP 41C - Converting From Radians to Degrees

*Message #1 Posted by **Mark McLean** on 27 Apr 2004, 1:25 p.m.*

I have an old 41C calculator and do not have an instruction manual. Somehow I got it to display in radians when doing trigonometry functions. Does anyone know how to change the display so that when you input a number it will read it as degrees, not radians? How do you change the display between radians,degrees, and grads?

Re: HP 41C - Converting From Radians to Degrees

*Message #2 Posted by **Ray** on 27 Apr 2004, 1:40 p.m.,*
in response to message #1 by Mark McLean

Execute DEG (keystrokes: XEQ, ALPHA, D, E, G, ALPHA), then it is in degrees (0..360).

Execute RAD in a similar way, then you are in radians mode (0...2pi).

Execute GRAD, and you are in that mode.

To convert between degree and radians, use R-D (from radians to degrees) and D-R (other direction).

If you want to have one of these instructions as one keystroke only, use key assingment instruction by using ASN instead of XEQ.

e.g. ASN, ALPHA, D, E, G, ALPHA, ENTER

Now the RAD function is placed on the ENTER key.

Regards, Ray

Re: HP 41C - Converting From Radians to Degrees - bit add-on

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2004, 3:45 p.m.,*
in response to message #2 by Ray

Hi, Ray;

of course you did not see this: you wrote:

> Quote:
>
> e.g. ASN, ALPHA, D, E, G, ALPHA, ENTER
>
> Now the RAD function is placed on the ENTER key.

and the actual performed operation is assigning DEG to [ENTER^] key, right?

Another fact: Mark, you probably know about this, but keep in mind that angles (degrees) must be entered with the fraction part expressed in decimals, not in minutes-seconds. Adding to what Ray wrote, use:

[XEQ][ALPHA] HMS [ALPHA] to convert from decimals to hour (degrees). minutes seconds (no separator between minutes and seconds)

[XEQ][ALPHA] HR [ALPHA] to convert from hour(degrees]. minutes seconds to decimals

Degrees coded in minutes and seconds are only used with [HR] or with [HMS+] and [HMS-].

My 2¢.

Luiz (Brazil)

Re: HP 41C - Converting From Radians to Degrees

*Message #4 Posted by **bill platt** on 27 Apr 2004, 3:45 p.m.,*
in response to message #1 by Mark McLean

Also, the 41Cx manual is available free online. It is at a site that is dedicated to the 41. search for "hp41" on Google and you will find it!

You can also buy a copy of lots of 41C stuff from this museum--see "museum on CD"

regards,

Bill

Museum on CD is a BARGAIN at twice its current price.

*Message #5 Posted by **Wayne Stephens** on 27 Apr 2004, 8:34 p.m.,*
in response to message #4 by bill platt

In my opinion, the museum on CD is an absolute bargain for anyone who owns more than one kind of old HP calculator (or if you ONLY have the 41 series). It has virtually every manual ever released (and that's a lot for the 41 series what with all the modules and ROMS) in .pdf format so you can print them out, put them in a 3 ring binder, and save wear and tear on your original manuals (or allow you to do without an original manual).

All the other stuff... photos, Digest and Journal articles, etc is just a bonus on top of all those manuals.

Take care.

Wayne.

PS - Legal disclaimer: I paid full price for my set of CDs and have not been compensated in any way for this endorrsement.

Re: Museum on CD is a BARGAIN at twice its current price.

*Message #6 Posted by **Cameron Paine** on 28 Apr 2004, 4:25 a.m.,*
in response to message #5 by Wayne Stephens

I second what Wayne just said.

```
> PS - Legal disclaimer: I paid full price for my set of

TI Programmer Battery

*Message #1 Posted by **john taylor** on 27 Apr 2004, 11:10 a.m.*

I know this is a HP site but I hope you can help me ... I need a battery for an old (30yrs) TI Programmer calculator ... any suggestions ?

Re: TI Programmer Battery

*Message #2 Posted by **Ron Ross** on 27 Apr 2004, 11:23 a.m.,*
in response to message #1 by john taylor

You can rebuild the pack (fastest, easiest solution), if you still have the walwart charger. If it has a 9V battery plug (some do), you can just gut the battery pack and then use a 9 V battery.

Else check with a Ti site (forget off hand, but a google search should give you one). You can buy rebuilt packs or buy a Ti-55 or compatable calculator and rob its pack for your calculator. I only give the Ti-55 as an example, its pack may not be compatable (I have a cross reference chart, but it is at home and I am at work). The Ti-55 is usually cheap and readily available, but be warned, all these calculators are 30 years old and their battery packs are also probably shot.

You could have someone rebuild you unit here as there is nothing really tough about rebuilding a battery pack and it is best done with a resistive welder vs solder (though I use solder often, since I no longer have access to a resistive welder). Actually, I try to buy battery packs of the cells I use from Radio Shack in cell packs which works best.

The best work is usually done by those who do it most often. If you value this somewhat rare Ti, and want a professional job, contact an Hp repair guru for best results. Older Ti's do not generally warrent the fees or attention of these guys, but the programmer is a more rare model than most.

Re: TI Programmer Battery

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 27 Apr 2004, 11:49 a.m.,*
in response to message #1 by john taylor

Take a look at this, look for the BP8 battery pack for the TI-30 family (TI Programmer included).
(just for the curiosity, I have them both)

Best regards,
Nelson

Re: TI Programmer Battery

*Message #4 Posted by **Palmer Hanson** on 27 Apr 2004, 10:23 p.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

The battery packs such as the BP-7 and BP-8 use two rechargeable NiCad cells with a circuit board which bootstraps the 3 volt output of the cells up to the 9 volts used by the calculator. When the cells go bad the

typical result is damage to the paths on the circuit board. I have about two dozen of the battery packs but only a couple which have workable circuit boards. I suggest that you arrange to patch in a nine volt battery.

Re: TI Programmer Battery

*Message #5 Posted by **Andreas(Sweden)** on 28 Apr 2004, 7:22 a.m.,*
in response to message #4 by Palmer Hanson

Hopefully this will be the only time I'll have to retype this - I'm at a library, and the internet access computers run Windows 98, so not suprisingly, the computer decided to hang as I tried to post this message the first time.

There is more info on fixing these battery packs on, not suprisingly, the TI calc collector website:

http://www.datamath.org/BP_Repair.htm

This also contains a link to a site where replacement converter PCBs are sold. I've been meaning to buy one or two myself.

HP 82106A memory module

*Message #1 Posted by **cesar** on 27 Apr 2004, 7:47 a.m.*

Hi, Can anybody tell me how can I check if a HP 82106A memory module for the HP-41C is working? Thanks a lot, Cesar

Re: HP 82106A memory module

*Message #2 Posted by **Raymond Del Tondo** on 27 Apr 2004, 11:05 a.m.,*
in response to message #1 by cesar

Set SIZE 000, then switch to PRGM mode, note the amout of registers. Turn off the calc, insert the memory module, switch on, then go to PRGM mode, compare the amount of REGisters to the first one. If the difference is about +/- 64 registers, the module is working;-)

Raymond

Could someone do a couple HP 33S calculations...

*Message #1 Posted by **Roy** on 27 Apr 2004, 6:43 a.m.*

I would like someone with a HP 33S to do a couple of calculations and post the exact results.

Please take the Sin of 3.141592654 Radians...(Do not just use the Pi key but key in exactly 3.141592654)

Also take 3 to the 201st power...3^201

Thanks.

Re: Could someone do a couple HP 33S calculations...

*Message #2 Posted by **Jeff** on 27 Apr 2004, 7:10 a.m.,*
in response to message #1 by Roy

Sin of 3.141592654 Radians: $-4.10206761537 \times 10^{-10}$

3^201: $7.96841966626 \times 10^{95}$

Any particular reason for these tests?

By the way, the above results agree exactly with my 48GX.

Edited: 27 Apr 2004, 7:12 a.m.

Re: Could someone do a couple HP 33S calculations...

*Message #3 Posted by **Fubar Vikinghelmet** on 27 Apr 2004, 8:39 a.m.,*
in response to message #2 by Jeff

HP-33S screen (not "show") reads:

sin(3.141592654) radians = -4.102068e-10

3^201 = 7.968420e95

Excel tells me this:

sin(3.141592654) radians = -4.10206856980497E-10

3^201 = 7.96841966627624E+95

Re: Could someone do a couple HP 33S calculations...

*Message #4 Posted by **Roy** on 27 Apr 2004, 10:04 p.m.,*
in response to message #2 by Jeff

Yes, these are 2 accuracy issues or "problems" that were outlined in the back of the "HP 15C Advanced Functions Handbook"...to get 3^201 correct to 10 digits a calculator must compute to 14 internal digits, and at the time the 15C did it to only 13, so the 10th digit was a 4 instead of the proper 6...if a calc has 15 internal digits it then get the answer of 3^201 to 11 correct digits.

The Sin of 3.141592654 rad is also mentioend in the 15C Advanced Handbook...most cals get only a couple or a few of the correct digits on this one....on HP cals get it right to all 12 digits...(It is interesting to note that the HP 30S that has 24 internal digits only get the Sin of 3.141592654 accurate to 11 digits, wheil the HPs with saturns architecture and apparently the HP33S also, gets it correct to all 12 digits. So comparing that with the 24 internal digits of ther 30S that gets 11 correct i would prsume the HP 48, 49, 33S etc use Pi interrnally to 25 digits to get the Trig functions so accurate.

DC Power Supply

*Message #1 Posted by **Wayne Stephens** on 27 Apr 2004, 5:36 a.m.*

I have always gotten good and interesting advice from the folks who post to this forum, and this is at least peripherally related to HP calculators, so...

I am in the market for a variable voltage DC power supply for bench testing calculators and other small electronic devices. I want to be able to plug it into a wall outlet (in the U.S., so 110-120 V AC, 60Hz). I also do not want to pay an enormous sum for it ($100 or less would be preferrable).

I have found a company called Mastech which sells a unit with adjustable output (0-30v,0-3amp) and digital readouts for around $100.

Does anyone have any experience, comments, etc. regarding this company's power supplies. Any other suggestions for a power supply?

Thanks.

Take care.

Wayne

Re: DC Power Supply

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2004, 12:33 p.m.,*
in response to message #1 by Wayne Stephens

Hi, Wayne;

I built many worbench power supplies for my own use and some for commercial applications (private users) and also for a particular employer.

What bothers me most about variable DC voltage sources is the possibility of fault. In most cases, protaction against faulty operation is a lot efficient, but when we are dealing with a 0 to 30V output, I am not sure if the output protection will be so accurate to go further.

The fact is that when I'm dealing with too low power consumption devices (calculators, in this case), I decided using rechargeable battery packs and keep a multipurpose charger. Batteries are my "power supply", and the worst case is that they may be low in voltage, never up. No transients, no AC-DC fault, no bad contact when adjusting voltage (variable resistors, unless it is digital). And the calculators are actually designed to use batteries as power supplies, so it's not such a waste. I build a pack with four regular D-size batteries (not rechargeable) to use with my HP41 (fullnuts with external DC access) when reading cards or using wand or IR module (printer). It's about a year since I built it, I read a lot of cards, tested and loaded many of my own programs in barcode printout (using 41uc.exe)... and the batteries show no fatigue. Amazing. As I'm dealing with LCD models, they already use regular 1.5V batteries, and their average current is low enough.

If I'm dealing with older LED models, I use 1.1Ah NiCAD or 1.6Ah NiMH AA-size rechargeable (I bought

four Panasonic 1.95Ah and I intend using three of them to power an HP75D). Anyway, about two days ago I found and bought four NiCAD D-size marked 5Ah! That's a lot more than enough for any portable application, devices included, I guess.

This is what I can tell you based on my own experiences. I never used a DC power supply with any calcualtor I ever repaired. I guess batteries are safer...

Cheers.

Luiz (Brazil)

Re: DC Power Supply

*Message #3 Posted by **Wayne Stephens** on 27 Apr 2004, 1:37 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thank you, Luiz.

I had not really considered the effects of minor variations in the low voltages needed for calculator testing. And once again I appear to be over-complicating things.

Perhaps I will go ahead build my own "bench" supply using batteries. D cells are cheap. And I've been using 2 slightly used AA cells with quite a bit of success in my old 30 series LED calcs. I can probably throw together some kind of holder with leads on it to contain those as well. It'll be considerably less money than buying a commercial grade power supply.

Take care.

Wayne.

Re: DC Power Supply

*Message #4 Posted by **Tony Duell** on 27 Apr 2004, 2:00 p.m.,*
in response to message #1 by Wayne Stephens

I use a Velleman kit bench power supply. It was _not_ cheap (about \pounds 220 I think!) but it's rated from 0-30V at up to 8A _continuous_. Way overkill for running handhelds, but I do a lot of other electronics besides, and I have needed a fairly high current supply for that.

One thing that IMHO is essential is an adjustable current limiter. You don't want the current supplied to the calculator to go through the roof if there's a fault (Topcats, in particular, will draw a couple of amps in an attempt to pull the supply voltage down if the power converter doesn't run). A NiCd pack will easily supply this sort of current, and it may cause damage elsewhere.

FWIW, I've seen TI calculator (SR51A IIRC) with melted tracks on the PCB due to the current supplied by its NiCd pack when something shorted out!

I have no experience of the supply you mention, but I have had experience of some of the cheaper supplies available in the UK. They ranged from positively lethal (no earth (ground), no short-circuit protection, etc) to just useless (one I remember would put a spike of about 35v on the output during power up / power down and would routinely cook whatever it was connected to as a result).

Re: DC Power Supply

*Message #5 Posted by **Eric Smith** on 27 Apr 2004, 6:49 p.m.,*

in response to message #1 by Wayne Stephens

I don't know anything about that power supply specifically, but if the current limit is adjustable, it should be OK. The current limit serves to prevent damage to the DUT (device under test) if there are fault conditions. For instance, if you know that the DUT should draw no more than 200 mA at 2.5V and set the power supply to those limits, but there is a bad component causing it to draw more, the power supply will go into current limiting. This will prevent other components of the DUT from being stressed beyond their ratings.

A current-limited DC power supply has two independent limits, voltage and current, and two mode. Normally the power supply operates in constant voltage mode, where it provides the set voltage at a very low impedance, so it maintains voltage regulation with a variable load. But if the load exceeds the current limit, the power supply switches to current limit mode, in which it has a higher output impedance, and regulates the current. This results in the voltage being lower than the voltage limit. Many bench power supplies have "CC" and "CV" indicators, though the same information can be inferred from the meters.

If you were to draw a voltage-vs-current graph, it would have line segments at V=Vlimit for C=0 to Climit (CV mode), and at C=Climit for V=0 to Vlimit (CC mode).

Of course, this description is for an ideal power supply. A real power supply will deviate slightly due to imperfect line and load regulation and finite transient frequency response. In particular, highly inductive or highly capacitive loads may significantly reduce the regulation performance of the power supply. (For testing calculators this should not be an issue.)

For non-printing LED models, set the current limit to about 200 mA. Printing models need much more current while they are printing (>500 mA), but they should initially be tested without printing at the 200 mA limit. Once you've determined that the non-printing functionality works correctly, increase the current limit to 600 mA and test printing. Models equipped with a card reader will also draw more than 200 mA when the card reader is in operation; I haven't yet done any characterization of the current requirements.

The later all-CMOS calculators (41C family, Voyager family) should be tested at a much lower current limit, except when using the 82104A card reader. However, I normally just test those with disposable alkaline batteries.

If the power supply doesn't have a direct method of setting the current limit, you can do it by shorting the output (which puts the supply into constant current mode), then adjusting the current limit knob until the measured current reads the desired limit.

I use an HP E3631A programmable triple power supply, but that is much fancier (and more expensive) than what you need.

Re: DC Power Supply

*Message #6 Posted by **Eric Smith** on 27 Apr 2004, 6:53 p.m.,*
in response to message #5 by Eric Smith

I forgot to add that you're actually better off with a power supply with ANALOG meters rather than digital. Though they might not have as much effective resolution, they are far more useful in the sense that you can see exactly what is going on with a quick glance.

The reason I have the E3631A power supply I previously mentioned, which has digital meters, is that I needed a programmable power supply, and there aren't (AFAIK) any inexpensive ones with analog meters. I routinely use the E3631A in combination with a separate analog meter.

Edited: 27 Apr 2004, 8:32 p.m.

Re: DC Power Supply

*Message #7 Posted by **Renato (brasil)** on 27 Apr 2004, 10:44 p.m.,*
in response to message #1 by Wayne Stephens

Wayne, Have you considered getting a vintage HP DC bench power supply? There are very nice, analog meter units at ebay, many in what appears to be good shape. I am waiting for one to be delivered to my doorway here in Brasil, but Santa thinks I´m not a good boy. In my opinion, a vintage HP power supply would be THE choice for testing vintage HP calcs.

Renato

Re: DC Power Supply - best choice!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 28 Apr 2004, 12:32 a.m.,*
in response to message #7 by Renato (brasil)

Hi Renato, all;

I did not consider this option (neither was known about this fact), but after Eric's wise, very good remarks about current limits, I'd vote for these vintage HP, too. I never found any calculator in the condition Eric mentioned (severe short circuit), but it is indeed something to be taken too seriously. (thanks, Eric)

Ahn... Renato, if Santa knocks at your door, you know my actaul address.. don't you? ;^)

Cheers.

Luiz (Brazil)

Edited: 28 Apr 2004, 12:35 a.m.

Re: DC Power Supply - best choice!

*Message #9 Posted by **Renato (Brasil)** on 28 Apr 2004, 8:16 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I´ll include your request in my next letter to Santa. Will you come around here ? J. Ernesto and me would be very happy to host you.

I had a interesting situation with a HP-27 once - it was Ok when it arrived, but quitted working in a few days. I opened it and discovered that the copper PCI trace to one of the battery terminals had become a fuse - it melted and opened circuit. It was a easy fix, but just imagine what would have happened if I tried to charge batteries..

Renato

Re: DC Power Supply - best choice!

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 28 Apr 2004, 11:57 a.m.,*
in response to message #9 by Renato (Brasil)

Wow!

I cannot imagine. I don't like horror movies, mostly when the good guys die at the beginning...

I'll let you know as soon as I'm planning to go. it seems a new condition is about to take place, so...

Cheers and best regards.

Luiz

Re: DC Power Supply

*Message #11 Posted by **David Smith** on 28 Apr 2004, 3:42 p.m.,*

I use a Harrison/HP 6101A thai I paid 5 bucks for...

Re: DC Power supply

*Message #12 Posted by **Renato (Brasil)** on 28 Apr 2004, 8:38 p.m.,*
in response to message #11 by David Smith

David,

5 bucks ? If there are more available, I could save my xmas wish (and Luiz too). Would there be chance for two units be sent to Brazil ?

Renato

Edited: 28 Apr 2004, 9:01 p.m.

Re: DC Power supply

*Message #13 Posted by **David Smith** on 28 Apr 2004, 10:47 p.m.,*
in response to message #12 by Renato (Brasil)

I bought the last one. Until last week he had a 6102A. Shipping to Brazil would probably be a whole lot. They are kinda heavy. They do show up on Ebay quite a bit. I would like to get the manual for it someday. The voltage meter needs to be calibrated.

Re: DC Power supply

*Message #14 Posted by **Katie** on 29 Apr 2004, 1:36 a.m.,*
in response to message #13 by David Smith

Here's a great, small and very lightweight power supply that's perfect for working with all the HP calculators. I've used these supplies many years ago in a research lab and they're exceptionally reliable. There are several other supplies in this series that go to higher voltages but won't supply enough current to run the printing calculators -- this one just barely makes it on the HP-97.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58286&item=3812004606&rd=1&ssPageName=WDVW

$30 is about the going rate on these.

Keyboard after reassembling

*Message #1 Posted by **Michael Reinold** on 27 Apr 2004, 3:19 a.m.*

In the last few months I repaired the card readers of two HP-65s and one HP-67. The most difficult task for me during this was to reassemble the calculator after the repair.

It seems that the keys are now not so tight on their metal domes as they were before. When I shake the calc, the keys make some noise. Is this normal? Did a brand new HP-65 also make noises when I would have shakened it?

What do you think? Do you have tips for reassembling?

Michael

Re: Keyboard after reassembling

*Message #2 Posted by **David Smith** on 27 Apr 2004, 11:03 a.m.,*
in response to message #1 by Michael Reinold

Did you get the plastic sheet (sneeze guard) and the plastic grating back in properly?

Re: Keyboard after reassembling

*Message #3 Posted by **Michael Reinold** on 27 Apr 2004, 2:10 p.m.,*
in response to message #2 by David Smith

Hello David,

I worked very carefully and the sheets with its two holes is exactly in place.

Perhaps I'm a little bit confused now because the HP-65 is my absolute "superstar" but I think the haptic feeling of the keyboard was better before my attempt to repair it.

Is it normal that the keys are making noises (is "rattling" the correct word in english?) when I shake the machine a little bit?

Thanks for your answer.

Michael

Re: Keyboard after reassembling

*Message #4 Posted by **Trent Moseley** on 27 Apr 2004, 4:50 p.m.,*
in response to message #3 by Michael Reinold

It's normal for a 67 to make a lot of noise when shaken; also a 25C.

tm

Re: Keyboard after reassembling

*Message #5 Posted by **bill platt (les Estats Unis d'Amerique)** on 27 Apr 2004, 5:06 p.m.,*
in response to message #3 by Michael Reinold

Hi,

Yes, "rattling" is correct. In fact, some voyagers do this, to varying degrees--and the new 12c that happens to be made in China rattles most---I don't know about its Indonesian predecessors.

It seems like all these machines have their individual personalities.

So most importantly, does your 65 work properly?

regards

Bill http://plattdesign.net

Re: Keyboard after reassembling

*Message #6 Posted by **John Hele** on 28 Apr 2004, 12:14 a.m.,*
in response to message #5 by bill platt (les Estats Unis d'Amerique)

Bit off topic, however I own a USA made HP 15c & 12c with no rattle in the keyboard, however the 1994 HP 12c made in Singapore the keys rattle a little bit but the latest HP 12c made in China rattles the most of all and it is new, does anyone no what change HP made between the original and the latest HP 12c that causes this to happen?

Re: Keyboard after reassembling

*Message #7 Posted by **Michael Reinold** on 28 Apr 2004, 1:20 a.m.,*
in response to message #5 by bill platt (les Estats Unis d'Amerique)

Hi Bill,

perhaps I was a little bit over-motivated. You're right. The main thing is that the machine works. It is in wonderful condition and the card reader performs every operation very silent. That's most important.

I thought, perhaps some members of this forum made similar experiences and have some tips to avoid errors while reassembling.

Regards, Michael

Re: Keyboard after reassembling

*Message #8 Posted by **David Smith** on 28 Apr 2004, 3:46 p.m.,*
in response to message #3 by Michael Reinold

Yes, all the LED machine keyboards rattle some since the keys just fit loose in the case. One thing to make sure of is that all the screws are in the keyboard (especially the two up at the top near the display). Also make sure that the little pins sticking up out of the plastic keyboard grill are aligned with the holes in the keyboard.

HP 33 First impression

*Message #1 Posted by **Kamyar** on 26 Apr 2004, 10:28 p.m.*

I bought my first HP (-11c) in 1981, I graduated to -48 and for day to day use, a -32S. All of those are still functional. When I found out, HP has gotten out of calculator business, I searched eBay for future replacements. A -32S goes for about $200. During my recent searches I was surprezed to see that -33S is out. However, I disappointed. WE are Engineers and scientists, we are practical people. We drive Volvos, Hondas and Subarus. The aesthetics of the new machine is horrible. Functinality has given way to fad. A shallow "v" key in the middle, serves no fucntion, and if ergonomics were in mind, , shouldn't the overall keyboards scheme follow an inverted "v" pattern? I was hoping HP's return to the engineering/scientific calculator world would have been more effective.

*Message #3 Posted by **Fubar Vikinghelmet** on 27 Apr 2004, 8:51 a.m.,*
in response to message #2 by deleted

I've gotten used to the location of the ENTER key pretty quickly on the HP-33S.

1. Due to its exterior shell, it looks like a TI-30 circa 1980. That is, it's gray metal, not the brown/black we've come to know as the HP colors. However, it feels like an HP, the keys are solid plastic, not rubber and the manual is written for engineers and scientists.

2. I'm a die-hard HP-28S fanatic, but I've given it up in order to be razor-sharp with the NCEES-ordained HP-33S for the October PE exam.

I've been pretty nasty and snarky in past posts about the NCEES and HP-33S, but... I think that in lieu of purchasing a 32S on eBay for a ridiculous sum, you can buy two (or three) brand-new HP-33S' from HP directly, today. I decided that would be the right way to go.

As a digression, I picked up the book "Perfect Enough" - about HP under the CEO-ship of Carly Fionia. The book says very little about calculators, but a lot about the company's recent history.

HP Xpander

*Message #1 Posted by **Artur - Brasil** on 26 Apr 2004, 9:48 p.m.*

Hi, did someone download the Xpander software for PocketPC from http://www.saltire.com/xplogin.html and could provide a link where I could get a copy?

Best regards Artur

Re: HP Xpander

*Message #2 Posted by **CalcKidd** on 27 Apr 2004, 7:51 p.m.,*
in response to message #1 by Artur - Brasil

I have a REAL Xpander (just for collection sake).

:-)

Re: HP Xpander

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2004, 9:56 p.m.,*
in response to message #2 by CalcKidd

KEEP IT! (I would)

But, if by any reason, you decide to get rid of your collection... ;^)

Congrats!

Luiz (Brazil)

Nonpareil on Windows!

*Message #1 Posted by **Eric Smith** on 26 Apr 2004, 5:58 p.m.*

I've now got Nonpareil running on Windows, cross-compiled from Linux. It's not yet ready for release, but it shouldn't take too much longer. My friend Dan is going to work on an installer script for me using the Nullsoft installer NSIS. I've been able to build NSIS to run on Linux, so I'll be able to just say something like "make windows" and have a ready-to-distribute Nonpareil installer pop out automatically.

On Windows, Nonpareil requires the GTK+ 2.2.4 runtime to be installed. Fortunately there is a nice easy-to-use installer from Alex Shaduri. In fact, that's where I learned about NSIS. Eventually I'll include the GTK+ runtime in the Nonpareil installer.

Since I'm going to sell the Windows version rather than give it away, I'll do my own scans. Dave Hicks has graciously allowed me to use his photos for the free Linux version, but I don't think it would be fair to use them commercially.

I'll put together a no-cost crippleware/nagware demo version that only simulates one or two models, is not customizable, and at startup and every few minutes puts up a dialog asking the user to buy the real thing. Of course, potential customers could switch to Linux and not have to pay me anything, but I wouldn't mind that. In fact, I think I'd prefer it. But I doubt that many people will switch just so they can run Nonpareil.

hp41 vs hp42 memory

*Message #1 Posted by **fulcrum** on 26 Apr 2004, 3:15 p.m.*

Hello UI would like to know how big is the hp42 memory in comparison with a hp41cx with 600 registers (xmemory x 2 module) Thank you

Re: hp41 vs hp42 memory

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 26 Apr 2004, 4:27 p.m.,*
in response to message #1 by fulcrum

If I recall right, 600 registers of 7 bytes =~4.1Kbytes. The 42S have almost 6.7KB (I don't remenber well, mine has 31KB now!).

Best regards,

Nelson

Re: hp41 vs hp42 memory

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 Apr 2004, 4:35 p.m.,*
in response to message #1 by fulcrum

Hi, Fulcrum;

the HP42S comes with 8KBytes of direct use RAM, I mean, no need for "extended" memory handling. Anyway, it can be upgraded to 32Kbytes "direct" RAM and up to 64Kbytes, whre the upper 32K is not "seem" as user RAM; instead, there is a "hidden" XFCN (thanks to J. F. Garnier) that allows system routines to be run there (I know Nelson is dealing with this, too).

As you may see, the HP41 has:

320 × 7 bytes main RAM (2240B) and
600 × 7 bytes maximum extended memory (4200B)
what gives us a maximum of 6440 bytes, fewer than the standard HP42S. Well, many other things must be also considered: resident functions (HP42S) against ROM expandability (HP41), but this is another history. Iprefer the HP42S, mostly because I use complex and matrices a lot.

Hope this helps. Cheers.

Luiz (Brazil)

Edited: 26 Apr 2004, 4:36 p.m.

Re: hp41 vs hp42 memory

*Message #4 Posted by **Ray Colle** on 27 Apr 2004, 8:12 a.m.,*

in response to message #3 by Vieira, Luiz C. (Brazil)

Hi,

HP41 can easily be expanded to 47 KByte by inserting two hepax modules.

HP41 standard ram = 2240 bytes + internal registers

HP41 ext memory (e.g. one double xmem module) = 4200 bytes

two hepax-modules = 40000 bytes

(32 kwords à 10 bits each: 32 kbytes with user code, 40 kbytes with machine code with higher complexity command space)

++

With addressing via bank switching more is possible. Available rambox systems allow

a] extra 80000 bytes (64 kwords à 10 bit/word)

b] extra 160000 bytes (128 kwords à 10 bit/word)

This extra ram is not made by HP but only made by Eramco and by Corvallis, CMT. Maybe there were more unknown small maunfacturers but I do not know.

In principle the architecture of HP41 allows even more rambox space to use if not only regular pages 8,9,A,B,C,D,E,F are used but also pages 0,1,2,3,4,5,6,7 via four times bank switching.

In principle 297 kbytes is maximum: 64 pages minus 6 pages for operating system of HP41CX (each page is 5 kbyte or 4 kword) plus 7 kbyte of standard ram + ext memory ram + internal register ram. But there was never built any real application.

++

So, the maximum ram configuration that can be realized with a real product is:

167 kbytes !

HP41 standard ram = 2240 bytes + internal registers

HP41 ext memory (e.g. one double xmem module) = 4200 bytes

rambox = 160000 bytes

That is much more than 64 kbytes of HP42s !

Cheers, Ray

Re: hp41 vs hp42 memory

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 27 Apr 2004, 9:53 a.m.,*
in response to message #4 by Ray Colle

How much do you spend to get this amount of RAM on the 41? I have my 42S with 32K+32K for

about nothing, using chips "retired" from junk hard disks... And a bit of soldering...

:8)

Best regards,

Nelson

Re: hp41 vs hp42 memory

*Message #6 Posted by **Ray Colle** on 27 Apr 2004, 11:05 a.m.,*
in response to message #5 by Nelson M. Sicuro (Brazil)

I don't own that "mega"-configuration (e.g. I have no hepax) but I wanted to show what is principally possible.

But I own a 64 kword Eramco rambox that cost me only $200 and this item alone already gives me already 87 kbyte of total ram ! And that for less money than one standard 8-kbyte-HP42s costs at ebay these days !!!

So what ?

Regards,

Ray

Re: hp41 vs hp42 memory

*Message #7 Posted by **Miki Mihajlovic** on 27 Apr 2004, 12:23 p.m.,*
in response to message #6 by Ray Colle

Have you checked the prices for RAM boxes on ebay lately. In the last two years I haven't seen one for less than $500. Of course, if you are willing to sell yours for $200 I will gladly take it ;>

1234

Re: hp41 vs hp42 memory

*Message #8 Posted by **Ray** on 27 Apr 2004, 12:48 p.m.,*
in response to message #7 by Miki Mihajlovic

e.g. for only 290 EURO:

http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&category=42794&item=3277358268

(oh I forgot W&W. This is another rambox manufacturer with top products)

There were more ramboxes from Eramco for less than this price during the last months!

So prices have fallen due to new ram modules for HP41 like CLONIX, NOVRAM and MLDL2000.

With the new development MLDL2000 from Meindert Kuipers you will have something around 256 kBytes of ram !!!! Or even more ??

And he will sell it for only 200 Dollars or something around this price !!!

And last not least ... the MLDL 2000 has USB connection to PC. So you can load and save your ram and programs.

But how to save the stuff you typed into a HP42s ?? Yes, you can only load data via keyboard !!! So 32 kbyte or even 64 kbyte are completely useless ! You need years for filling 64 kbytes by keystrokes. And then suddenly your battery fails ...

oh wow, let's begin typing in the stuff again ... :-)

This all really blows away that tiny HP42. HP42 is nothing against the hyper calc HP41 !!!

Ray

Re: hp41 vs hp42 memory

*Message #9 Posted by **Nelson M. Sicuro (Brazil)** on 27 Apr 2004, 12:57 p.m.,*
in response to message #8 by Ray

I have a project to build a serial RS-232 and MMC card interface to my trusty HP-42S(X?) and replacing one of the 32K SRAM chips with 64K SRAM or FLASH ROM. I'll publish any news here in the next month(s).

As soon I learn the Saturn Assembler I will "upgrade" the OS of the 42S to allow the use of I/O and storage.

Best regards,

Nelson

Re: hp41 vs hp42 memory

*Message #10 Posted by **Ray** on 27 Apr 2004, 1:05 p.m.,*
in response to message #9 by Nelson M. Sicuro (Brazil)

That is a great project, congratulations !!! Maybe this can make HP42s to become a rival to HP41.

Still one question:

Does HP42s also have the absolutely great capabilities to be programmed in a very complex way of synthetic programming which is extremely efficient ?

And can it be programmed in machine code like HP41 ?

In principle the latter should be possible with any computing device, but I am not sure if the easy access to do so is guaranteed with HP42s in the same great way as with the HP41.

Regards,

Ray

Re: hp41 vs hp42 memory

*Message #11 Posted by **Nelson M. Sicuro (Brazil)** on 27 Apr 2004, 1:14 p.m.,*
in response to message #10 by Ray

I don't know yet if the 42S is able to use any type of "synthetic" instructions, as they are "collateral" instructions based on "bugs" of the ROM. But assembler is the way to go, and I have tested some small routines on my 42S to prove that is possible. I have to learn the internal OS functions of the 42S to be able to extend it and add more functions. I know that the Saturn CPU is much more capable than the NUT CPU (from 41, voyagers). This can take a long time...

Maybe someone else can help me with this challenge? I'm already committed with the "OpenRPN" project, and this can be another good project to work with.

Best regards,
Nelson

Re: hp41 vs hp42 memory - memory browser

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2004, 3:59 p.m.,*
in response to message #10 by Ray

Hi;

the HP42S has an already built-in memory browser. Try this:

```
- start the interactive self-test with [ON]/[LOG]
- press [<-] (back space)
```

What you see is something like:

```
[023F5:710D1F....
```

If you knwo what you're doing, you can change anything that's in RAM and produce most combinations. Some of them mean nothing. J.F. Garnier found that [XFCN] (a hidden instruction) allows the execution of "X"tra functions (maybe this is sort of a XROM version for the HP42S). Nelson also has gone a lot deeper into this subject.

I'm following form an observer distance for now, but I'm trying to get as close as I can to participate. I prefer listenning before talking... Teacher's point of view.

Best regards.

Luiz (Brazil)

*Message #15 Posted by **Garth Wilson** on 27 Apr 2004, 6:47 p.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

The ZENROM provides the same kind of thing for the HP-41.

Re: hp41 vs hp42 memory

*Message #16 Posted by **Meindert Kuipers** on 27 Apr 2004, 3:59 p.m.,*
in response to message #8 by Ray

Correct amounts of memory: 512 KByte SRAM, 512 KByte FLASH eprom.

Both memory types are to be used for ROM images, but some ROMs support the SRAM banks to be used for storage as well. Eventually all of the memory will be accessible with a special mcode sequence. The final pricing is not yet fixed however.

And yes, the fortyone is by far the best thing that HP has ever done, I think the HP41 averages about one machine per day on ebay changing hands.

Meindert

Re: hp41 vs hp42 memory

*Message #18 Posted by **bill platt** on 27 Apr 2004, 12:22 p.m.,*
in response to message #4 by Ray Colle

Now I see yet one more reason that the HP41 system fails to die.....it has almost unbelievable capabilities---especially considering all of the basic capability was developed in 1978! Imagine, a handheld personal computing device, produced in the same time period as double-knit slacks, that was in principle capable of using more memory than any desktop microcomputer produced through roughly the mid-80's. That is extraordinary.

No wonder so many scientists and engineers put so much effort into programming it--it really did save valuable mainframe time, and could actually process meaningful amounts of data with suitably large and complex programs!

Bear in mind I am not an experienced 41 user--in fact never even held one until last year, and have not bothered to use it to capacity.

I am just pleasantly amazed by all this.

Latest HP 49G+

*Message #1 Posted by **Jack Neely** on 26 Apr 2004, 12:51 p.m.*

Before I say anything about the HP 49G+, let me state that I am a avid fan and user of the HP 48 series (HP 48 GX & SX) and have been since the HP 48 series was introduced in 1990. However, I have just purchased another HP 49G+ (I bought an earlier model when they came available in late 2003) and I am very pleased to annouce that it is actually usable!

The keyboard is easier to press which reduces data entery errors although some errors still occur (this is due to the keys being hard to press and when pressed the connection is not made). Also because I purchased a new 49G+ I did a little destructive testing on the earlier model (not usable :( ) and discovered that th HP 49G+ is very tough! I dropped it from 5 feet above a concrete floor multiple times and hit it with a small hammer and it took the abuse and kept working like a HP48! As a matter of fact, the 49G+ was very hard to break. I finally hit it with a larger hammer (3 lb) and it died.

The point of my story is: THe new HP calculators are not the classic HP's that we love, however, they are still are pretty good and it seems that HP is addressing the problems with current models and hopefully will end up with a model equalivalent to a classic HP.

Keep the faith people.

Re: Latest HP 49G+

*Message #2 Posted by **Art Litka** on 26 Apr 2004, 2:29 p.m.,*
in response to message #1 by Jack Neely

Talk about "hammering" the point across!!!

Re: Latest HP 49G+

*Message #3 Posted by **Roy** on 26 Apr 2004, 10:49 p.m.,*
in response to message #1 by Jack Neely

Not untill there are HP branded cals with the former "molded in key lettering" will we have the Classic HP Quality back. As an aside note, I have a HP 20S that does not have the molded in key lettering yet the manual that came with it says it does...in that past case HP was too cheap to change the manual, although they changed the keys...pathetic IMHO.

Personally i think we wil have a Pope become a Presbyterian, before we get molded in key lettering HPs again...in other words wil never happen.

Re: Latest HP 49G+

*Message #4 Posted by **Naim** on 27 Apr 2004, 4:06 p.m.,*
in response to message #1 by Jack Neely

Jack Neely said "The keyboard is easier to press which reduces data entery errors although some errors still

occur ". I don't know about others, but in my line of work [Surveying], errors aren't tolerated. No matter how much positives I hear about the 49G+, once the keys are still unreliable, I will still be using my 48GX, and 42S.

TI 84+

*Message #1 Posted by **Jim Creybohm** on 26 Apr 2004, 12:09 p.m.*

New TI released. While not a TI fan, I have to admit that they are doing some things well. For example, I rather like the keyboard concept - it makes it more like a PDA...Oops, I opened that can of worms again....

But I also like the data collection on this. It remains to be seen however if the data collection is robust for the real world, or if it is designed for students only.

Nonetheless, there are a lot of features to have a hard look at. I think I might have to pick one of these up.

http://education.ti.com/us/product/tech/84p/features/features.html

Re: TI 84+

*Message #4 Posted by **John Smitherman** on 26 Apr 2004, 11:21 p.m.,*
in response to message #1 by Jim Creybohm

I am a long time RPN user (since 1976) but thought that I would comment on the TI 8x.

My children starting working with the TI83+ line at their schools and eventually bought their own. These are pretty powerful devices. I would classify them as handheld computers.

Positives: They are loaded with many useful functions (math, stats, finance, etc.) and are accurate. Good documentation. Highly programmable - TI Basic, Z80 assembler (http://www.ticalc.org/pub/text/z80/).

Interface well with the PC for adding and transfering applications, upgrading firmware and moving data back and forth. The 83+ Silver Edition is very fast. TI has maintained compatibility with the various 83 models.

Negatives: The ink colors and stenciling on the 83+SE are terrible, especially with the clear plastic background. The 83+ is much better. The keys feel more like a childs Fisher-Price toy than a $130 calculator. The overall layout and EOS take a lot of getting used to. These devices are not intuitive - a good manual is a necessity.

It makes me wonder how HP let this part of their business fall behind. I believe that HP was forecasting the demise of handheld devices in light of the booming PC business and just stopped investing. We will see how well they play catch-up!

John

Re: TI 84+

*Message #5 Posted by **Fred** on 27 Apr 2004, 7:47 a.m.,*
in response to message #4 by John Smitherman

I have a HP-48GX and a TI-83+ and i find TI graphing is more intuitive than the HP. I can do the majority of the functions on the TI without the manual but even if i'm a HP for a lot of years, my 48 is still difficult to use after some years of using, yet more powerful. I even prefer the TI-89 it's intuitivity against the 48.

announcing "deep pi"

*Message #1 Posted by **hugh steers (the other hugh)** on 25 Apr 2004, 2:34 p.m.*

greetings all.

a while back on this forum there was a discussion of various calculator efforts to find 1000 digits of pi. there were some good results, but it seems that after about 1000 digits, too much space is required and so the programs competed on speed.

i had an idea for a different kind of pi calculation. here is "deep pi" for the 41c. it only calculates 6 digits of pi but it can do this starting from any given point of the decimal expansion. for example 1 XEQ "DPI" gives 141592 and 999 (the 1000'th digit counting the 3) XEQ "DPI" gives 893809.

so, in order to get as much pi as you like, start at 1, then 7 then 13 and so on. the start of the program could be modified into a simple loop that prints out successive 6-digits onto the print roll indefintely (until its out of paper). there is no state retained between each run and the internal numbers do not become large or overflow. however, and this is catch; it gets slower the further along you start. the 6 digits at 999 take some time indeed.

if you'd like to try this program. here is a text file compatible with the excellent V41 emulator http://www.voidware.com/calcs/pi.txt its not very well commented and i recommend liberal use of the "turbo" mode. if you're interesting in improving the algorithm or the program, feel free to do so.

this is the first attempt and this version1 could well have bugs. ive tested it enough to know its not completely wrong, but there's always one somewhere. also note that i do not format the output string in any way, so for example 307 xeq gives 6606 which really means 006606!.

here are the first 1000 digits (after 3) found using this method:

14159265358979323846264338327950288419716939937510582097494459230781640628620899862803482534211706798214808651328230664709384460955058223172535940812848111745028410270193852110555964462294895493038196442881097566593344612847564823378678316527120190914564856692346034861045432664821339360726024914127372458700660631558817488152092096282925409171536436789259036001133053054882046652138414695194151160943305727036575959195309218611738193261179310511854807446237996274956735188575272489122793818301194912983367336244065664308602139494639522473719070217986094370277053921717629317675238467481846766940513200056812714526356082778577134275778960917363717872146844090122495343014654958537105079227968925892354201995611212902196086403441815981362977477130996051870721134999999837297804995105973173281609631859502445945534690830264252230825334468503526193118817101000313783875288658753320838142061717766914730359825349042875546873115956286388235378759375195778185778053217122680661300192787661119590921642019 89

good luck,

Re: announcing "deep pi"

*Message #2 Posted by **Katie** on 26 Apr 2004, 10:12 a.m.,*
in response to message #1 by hugh steers (the other hugh)

Hugh,

This is *very* interesting! Which algorithm are you using, I don't think that anyone has found an O(NlogN) in base 10 yet. The BBP base 16 algorithm doesn't generalize to other bases but there has been some recent work on direct-digit computations using other methods. Here's the best paper tha I know of that discusses all this: http://numbers.computation.free.fr/Constants/Algorithms/nthdigit.html

Thanks for writing and posting this! More comments in your 41C program would be much appreciated, it's pretty hard to understnad as is.

-Katie

Re: announcing "deep pi"

*Message #3 Posted by **hugh steers** on 27 Apr 2004, 6:34 a.m.,*
in response to message #2 by Katie

thanks! i'm glad you like it.

i dont take any credit for the algorithm. the results are from the same paper you have cited. when i read this originally, it occurred to me that the low memory requirement would make it a good example for a calculator program. at first, i planned a 71b version, but then i decided it would be more fun to do a 41c version, albeit quite slow.

the first step was to take frabrice bellard's original program here http://fabrice.bellard.free.fr/pi/pi1.c and start experimenting. although i havent changed the algorithm, there was substantial hackery required to prepare it for calculator consumption.

one of the problems is that some parts of the calculation overflow 10 digits. after some investigation, it turns out that this only happens for case 2. the algorithm has to walk the primes from 2. what i then did is unroll case 2 and write a special purpose a*b mod 2^n subroutine. for other primes, p, a*b mod p^n did not overflow (much) so it works with normal precision. if i had not done this, the whole thing would have been really really slow indeed. i also simplified the 2 case somewhat.

anyone interested in investigating the program should get my hacked around C version here: http://www.voidware.com/tmp/pi3.c and continue hacking! following the 41 program should then make sense.

if i can lay my hands on a 41 printer, i'd like to run a test leaving it going for a few days and see how far it gets.

incidently, does anyone know a neat way to format the output so leading zeros are not suppressed. ie 1234 -> 001234?

best wishes,

Re: announcing "deep pi"

*Message #4 Posted by **Veli-Pekka Nousiainen** on 27 Apr 2004, 7:32 a.m.,*
in response to message #3 by hugh steers

I would love to see both
A) 71B version
B) 28/48S/48G/49 version
Too lazy to do it myself

Re: announcing "deep pi"

*Message #5 Posted by **hugh steers** on 27 Apr 2004, 4:28 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

i am very tempted to write a 71b version. it would be a lot clearer to understand and somewhat faster.

Re: leading zeroes

*Message #6 Posted by **Paul Brogger** on 27 Apr 2004, 10:18 a.m.,*
in response to message #3 by hugh steers

Move the decimal point [n] digits to the left before display/output?

Or, display (for example) six-digit results only after adding them to 1,000,000, and ignore the leading "1".

Edited: 27 Apr 2004, 11:30 a.m.

Re: announcing "deep pi" - ALPHA register?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 27 Apr 2004, 4:08 p.m.,*
in response to message #3 by hugh steers

Hi, Hugh;

I'd like to congratulate you as well, O.K.?

About leading zeroes: I saw the listing but I did not read it. I guess it can be changed so that instead of building the output data in X you could do it in ALPHA; this way, leading zeroes would be visible.

I cannot try it right now, but I promise I'll try to do it later, if no one else tries it.

Best regards.

Luiz (Brazil)

Re: Jan Lucasiewicz Lives!

*Message #6 Posted by **Erik Ehrling (Sweden)** on 26 Apr 2004, 12:46 a.m.,*
in response to message #5 by Les Bell [Sydney]

I think we shouldn't give up hope altogether, I would guess that a 42S successor (e.g. a 42S Platinum, 42S+, 43S etc...) is still something that HP considers; especially if the demand for the 33S turns out to be high.

Let us only hope for 32K RAM, I/O and large ENTER key (in its traditional position).

128K Flash ROM would also be a nice feature for anyone that likes to play with Saturn Assembly. (N.B. the standard ROM is 64K so the additional 64K could then be used for user-customisations...)

Best regards,
Erik Ehrling (Sweden)

hp41 programming questions

*Message #1 Posted by **fulcrum** on 25 Apr 2004, 10:37 a.m.*

Hello, The first question is that when I am executing a program I have a subroutine program stored in xmemory so I recall it with the getsub command to free the main memory, but after it is used, I want to delete it from main memory from the main program itself, but I cant because the function clp says nonexistant (as the subroutine is yet only in extended memory and not still copied in the main memory) and can't register that clp function in the main program. Can this be done in another way? the other is if is there any way to run programs directly from extended memory i mean unofficially or something Thank you very much for you wise answers and help

Re: hp41 programming questions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 Apr 2004, 12:06 p.m.,*
in response to message #1 by fulcrum

Hi, Fulcrum;

Tha HP41 main memory has some "concepts" that sometimes must be well known so you can use it completely.

As you are using X-functions, the possibilities are even bigger, and main memory organization is now under X-functions "extra" possibilities as well.

There is always one "last program in memory" since you turn an HP41 for the first time or after performing any operation that causes [MEMORY LOST] condition. As you may know, the HP41 has 320 registers of RAM available for the user; in fact, three bytes are already holding the permanent .END., so you can only convert 319 of these 320 registers into numbered registers by using SIZE nnn; right?

This "last program in memory" will also contain all instructions of the actual last program; this program is the one without the END as its last step. If you execute CAT 1 and follow the last entries, you'll see that you may have both cases:

- last global label, [nnn END] and [.END. REG mmm]

or

- last global label and [.END. REG mmm]

If you note the second case, then you can press [SHIFT][GTO][.][.] that an END will be added to the set of instructions that actualy compose the "last program in memory". Now you have all eisiting programs with their own END and, again, a permanent .END. with all remaining memory available for the next program.

When you execute [GETSUB], this whole process of adding an END to the existing last program in memory is performed so it is kept for future use, then the new program (from X-memory) is now the last program in memory;

If you execute [GETP] instead, the last program in memory is deleted prior to loading the new one from X-

memory.

About deleting programs from a running program: you should CAREFULLY use [PCLPS] (Programmable CLear ProgramS], that clears the current running program AND ALL SUBSEQUENT PROGRAMS IN MEMORY if ALPHA is empty, or clears the program that contains an ALPHA label that matches ALPHA contents AND ALL SUBSEQUENT PROGRAMS AFTER THIS PROGRAM in main memory. If ALHPA contains an ALPHA string without a matching global label in main memory, [PCLPS] will not clear any program and [NAME ERR] message is shown. [PCLPS] is available with X-functions ROM module and can be executed directly from the keyboard as well. As everything except X-register contents in an HP41, all information lost with [PCLPS] cannot be recovered, i.e., [PCLPS] cannot be undone, so use it carefully. If you execute [CAT] 1, stop it at the very first entry, clears ALPHA contents and execute [PCLPS], all programs in memory are wipped out definitely.

And there isa way to run programs in X-memory without the need of loading thaem in main memory first, but I am not so sure about how to do it. Many wizards in here have this knowledge...

Hope this gives you a brief start.

Cheers.

Luiz (Brazil)

Re: hp41 programming questions

*Message #3 Posted by **Miki Mihajlovic** on 25 Apr 2004, 1:32 p.m.,*
in response to message #1 by fulcrum

Luiz has given a comprehensive explanation to your first question and there is little to add to it. To answer the second question, yes there is a very simple program "EXM" that allows programs to be run directly from Xmemory. It is given on page 191 of Keith Jarett's book "Extended Functions Made Easy", that I would recommend if you are using Xmemory extensively. However, there is one severe limitation - the program you are about to execute from Xmemory must completely reside in Xfunction/memory module, it can not spill over into another Xmemory module. Here is the listing:

```
LBL "EXM"
190
CLA
XTOA
RDN
ASTO b
END
```

So, the program in Xfun/mem module can't be bigger than 127 registers, must be the first program in Xmemory and you just XEQ "EXM". You can still execute the second etc. program in Xmemory if you know the absolute address of the second etc. header register of the program you want to execute. Use that number instead of 190 (line 2).

Thank you Luiz and Mike Can you tell me how to insert the asto b command? Thank you

Re: hp41 programming questions

*Message #5 Posted by **Virgilio Guillen** on 25 Apr 2004, 5:17 p.m.,*
in response to message #4 by fulcrum

Hi,

To learn how to type ASTO b and other useful instructions read the Synthetic Programming section on the museum.

http://www.hpmuseum.org/prog/synth41.htm

Re: hp41 programming questions

*Message #6 Posted by **Miki Mihajlovic** on 25 Apr 2004, 6:34 p.m.,*
in response to message #5 by Virgilio Guillen

To give you a quick heads up the sequence to create ASTO b after you have the Byte Grabber is:

```
ENTER
STO IND 26
MEAN
```

Of coures, it is all much simpler if you have Zenrom, CCD Rom or even better - Clonix.

HP-41 card reader producing strange sounds

*Message #1 Posted by **Miki Mihajlovic** on 24 Apr 2004, 8:45 p.m.*

My (20+ years) trusty card reader started producing strange rumbling sounds when card is pulled through. It reads the card fine but I have never heard this sound before. It sounds like some screws got loose and something vibrates when the motor is running. My question here is should I go open it and tighten (what?) something. I have never opened one of these things so I would like to hear from some of you that have (way) more practical experience. BTW, I do have all the documents about replacing gummy wheels and PPC CD's with detailed description of opening the CR, but I don't remember reading anything about this strange rumbling sound.

Re: HP-41 card reader producing strange sounds

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 Apr 2004, 11:46 p.m.,*
in response to message #1 by Miki Mihajlovic

Hi, Miki;

I remember having the same problem, but mine did not write cards correctly, although sometimes it could read.

As you have the documents about replacing the gummy whell, note that there is a worm gear (endless thread) mounted in the motor's axle that rotates the driven (pulling) gear and I had two readers with this wornm gear slipping when the axle rotates. But as I mentioned, the most immediate symptom is that the cards slow down their speed when pulled. When the reader is reading cards it may not be a big problem if the speed does not vary too much (there is a separated "sync" track recorded beside the data track), but when the reader is recording cards, these cards may not be easily read. In fact, even if the sync track is not be uniform, the reading process may be performed by a "normal" card reader, but it may be way too irregular that the reader with problems may loose data when reading them back.

Have a look at the article about the gummy wheel under the heading "All clean?". Read the last paraghaph and you'll have tips on how to fix this with cyanoacrylate glue.

Hope this helps.

HP-41CV battery pack

*Message #1 Posted by **Paul Kronfield** on 24 Apr 2004, 3:40 p.m.*

Arghhh! My venerable 41CV battery pack just gave up the ghost. Reading previous threads here, I realize I really don't need rechargeable. Where can I get the alkaline battery holder for my old buddy?

Another questions: what do they make today that is comparable to the 41CV. I really like RPN, and have surveying packs and other software that I like and want to continue to use.

Re: HP-41CV battery pack

*Message #2 Posted by **db(martinez,california)** on 24 Apr 2004, 8:38 p.m.,*
in response to message #1 by Paul Kronfield

1) You can advertise in the ads forum here for a battery holder or follow Katie's instructions in the articles section to rebuild your old one.

2) HP has been trying to make something comparable to the 41 since the mid '80s. They haven't. Don't hold your breath.

3) D'Zign software makes the best of HP's modern high end offerings for surveyors, and others have written programs for the new 33s.

4) If you buy something please review it here so we know what you know.

Re: HP-41CV battery pack

*Message #3 Posted by **Wayne Stephens** on 24 Apr 2004, 9:33 p.m.,*
in response to message #1 by Paul Kronfield

Paul,

The HP 48 GX (also discontinued but still widely available) makes an excellent survey computer/data collector. There is a company in Maryland called RAMSS (www.ramss.com) which has a very nice survey package for the 48GX. They also sell hydrology/hydraulics software for the 48GX.

RAMSS has been around awhile, and at one time sold survey software (and a LARGE extended memory module) for the 41C. Unfortunately, they began selling these items at about the same time HP stopped selling the 41C series.

Good luck in your pursuit of a suitable replacement for the 41C.

Take care.

Wayne.

*Message #4 Posted by **Paul Kronfield** on 25 Apr 2004, 12:29 a.m.,*
in response to message #3 by Wayne Stephens

Well.. a little good news. I went over to the lcoal Interstate battery service center who rebuilt my rechargeable battery pack for $12.98. They used AASC0994 1.2 V 100mAh NiMH 1/3AAA CE batteries.

The old HP 41 is back to working like a champ!!

Isn't $12.98 less expensive than the original battery pack was from HP? And they have a full 1 year warranty for the batteries.!!

$18.00

*Message #5 Posted by **Wayne Stephens** on 25 Apr 2004, 7:35 p.m.,*
in response to message #4 by Paul Kronfield

I have a box from an original battery pack. It has an $18.00 price tag on it from the "Portland State" bookstore. So yes, $12.98 is cheaper than the original price.

Wayne.

PS - If you are a surveyor, and you haven't tried out a 43GX, you should. Even if you intend to keep on using the old 41C.

Re: $18.00

in response to message #6 by Veli-Pekka Nousiainen

Sorry. That was due to my very poor typing skills.

Take care.

Wayne

Re: $18.00

*Message #8 Posted by **David Smith** on 26 Apr 2004, 12:02 p.m.,*
in response to message #6 by Veli-Pekka Nousiainen

If you would love to see a 43GX, just take one 48GX and a sharp object. Scrape the left edge

of the "8" off and voila... instant 43GX.

Re: HP-41CV battery pack

*Message #9 Posted by **Karl Schneider** on 26 Apr 2004, 2:05 a.m.,*
in response to message #4 by Paul Kronfield

Paul --

Good to hear that you got your 41CV fixed instead of "throwing in the towel" on it.

Just curious: How many "AASC0994 1.2 V 100mAh NiMH 1/3AAA CE batteries" were used for the rebuild? The non-rechargeable battery holder takes 4 1.5V "N" cells, which are readily available in electronics departments, but not generally at regular stores.

I still think it's worth it to get a battery holder from a scrapped HP-41. The rechargeable batteries are economical and convenient only if the user employs the HP-41 extensively to drive peripherals -- something that probably hasn't been done much since the mid-80's, when PC's became commonplace. You might advertise on the MoHPC Classifieds.

The HP-41CX (1983-1990; fullnut until 1985; halfnut afterwards) would provide a modest upgrade to the 41CV, with time functions and extended-memory functions built in as well as more-convenient catalog listings.

There are plenty of HP-41 experts on this Forum; I personally have an early fullnut 41C, a halfnut 41CV, and a late fullnut 41CX, plus a few peripherals and ROM Pacs.

-- Karl S.

Re: HP-41CV battery pack

*Message #10 Posted by **Paul Kronfield** on 26 Apr 2004, 5:25 a.m.,*
in response to message #9 by Karl Schneider

I still have somewhere an IL loop, wand, tape drive, three printers, two card readers, survey pak, home management pak (great checkbook balancer), and even other stuff. I actually used the 41C and printer to produce navigation pre plots for ships operating in the S.China Sea, and even used it for survey navigation on a minefield clearance project in Egypt's Gulf of Suez in 1983.

I really loved my suite of HP gear.

*Message #5 Posted by **Karl Schneider** on 24 Apr 2004, 2:59 p.m.,*
in response to message #4 by fulcrum

1. "7GSBi" is a routine that resides only on the HP-41 Card Reader, which must be inserted in order for the command to execute the HP-67/97 function "GSB (i)", which uses the HP-67/97's I register for indirect control. "7GSBi" uses register #25 on the HP-41 (which has no I register) for indirect control. An HP-41 equivalent of "7GSBi" not requiring a Card Reader would be "XEQ IND 25", with register 25 containing a numbered local label. (Of course, any existent numbered register could be used.)

If you don't have a Card Reader, your program as entered will not run. If you do not have the Card Reader documentation, the program will be hard to adapt for an "unaccessorized" HP-41.

2. Plug-in numerical-integration routines for the HP-41 are available on the following ROM's: Advantage Pac, Math Pac, and Math/Stat Pac. The one on the Advantage Pac is the best: a microprocessor-coded Romberg-method function that works like the ones on the 15C and 34C. The

one on the Math and Math/Stat Pacs is an RPN program that uses Simpson's Rule.

Check the HP-41 program library on this MoHPC web site for integration routines that you can key in.

About [7GSBI] and [7GTOI] (was:hp41 integration)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 25 Apr 2004, 12:34 a.m.,*
in response to message #5 by Karl Schneider

Hi all;

I took the 82104A Owner's Handbook in order to remember any possible difference between [7GSBI] and [XEQ IND 25] (also [7GTOI] and [GTO IND 25]) and I found only two specific references about using one or another in an HP41 program. Both refer to the fact that rapid reverse branching is not possible in an HP41 program, i.e., negative numbers in R25 will always cause [NONEXISTENT] message and program halting if either [7GTOI] or [7GSBI] are executed (unless flag 25 is set). Anyway, if [XEQ IND 25] or [GTO IND 25] are executed when a negative number is stored in R25, a label with a value equivalent to the absolute contents of R25 is searched for in the current program.

I'm mentioning these facts because when I read Karl's complete and precise answer, I thought "What are [7GSBI] and [7GTOI] good for if one can use [XEQ IND 25] or [GTO IND 25] instead?"

Now I see the truth of it... If an HP67/97 program uses rapid reverse branching and its translated version has its [7GTOI] or [7GSBI] replaced by [GTO IND 25] or [XEQ IND 25] respectively, it may give wrong results instead of showing [NONEXISTENT], what is actually an accurate behavior. I wrote "may give wrong results" because if the equivalent label with a value that is equal to the absolute contents of R25 exists, the program will branch (jump) to that label without any warning. In other hand, this supposed label may also not exist in the original program, so either [GTO IND 25] or [XEQ IND 25] will result in [NONEXISTENT] as well d;^) (I hope my analysis is not too confusing)

Thank you, Karl; I'd never figured that out before

Cheers.

Luiz (Brazil)

Edited: 25 Apr 2004, 12:40 a.m.

Re: About [7GSBI] and [7GTOI] (was:hp41 integration)

*Message #7 Posted by **Karl Schneider** on 25 Apr 2004, 2:31 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi, Luiz --

Well, I'm not sure if I gave the most comprehensive answer, even if it was precise. You dug deeper than I did, and found a potential pitfall of simply replacing "7GSBI" with "XEQ IND nn". My objective was simply to identify a means of adapting the program so that use of the

Card Reader would be unncessary. It is quite likely that "Fulcrum" would need to make multiple revisions to the program in order to make it functional.

I'll admit that I prepared the answer directly from the CR quick reference guide; I was too lazy to dig out the manual.

-- Karl S.

I'd like to add that...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 25 Apr 2004, 2:43 p.m.,*
in response to message #7 by Karl Schneider

Hi, Karl;

just to add that I'd never get to that point if you did not post your answer, because I did not even remember that a [7GSBI] (or a [7GTOI]) existed in the card reader. I vaguely remember that I replaced some of them in the past, when converting HP67/97 programs to the HP41 system as a regular activity when I was a student. Your post called my attention to the question I posted about [7GSBI] and [XEQ IND 25]. If I dug deeper, that's because of your observations.

That's one of the main reasons I am always reading answers from brainy guys like you and other regular contributors: there's always something hidden, but there must be someone to call our attention to the possibilities; and sometimes we are the ones calling others attention.

This site rules...

Best regards, Karl.

Luiz (Brazil)

HP-33S arrived!!

*Message #1 Posted by **Fubar Vikinghelmet** on 24 Apr 2004, 12:45 p.m.*

Got 'em from HP by UPS yesterday!

first impression: boy is it hard to get it out of the plastic... Second impression: cheaply bound user manual, but I printed out the pdf version and put it in a binder anyway. The calculator itself is lighter than I'd expect from HP. First play around, it's really powerful. The screen is bigger than it looked in the online photos. the keys have the solikd HP-feel when they're pressed down.

There's an added bonus: a coupon for a free subscription to Business 2.0 (a $9.99 value). BUT, it says the following on the coupon: "if you do not wish to receive the magazine subscription, you can obtain a $9.99 refund by completing this card..." include the UPC label, offer good thorugh 25 Jue 2005. That means I get nearly a ten dollar rebate, thusly, the shipping ends up being free and I get a reduced price on the calculator! All right!

HP34C - Jon Ibarra

*Message #1 Posted by **Wayne Stephens** on 23 Apr 2004, 6:42 p.m.*

Good evening,

I was wondering if anyone here has any experience having one of their 3x series calculators repaired by a Mr. Jon Ibarra in Spain. He offers very good rates, has sent me pictures of some of his repairs, and seems to specialize in the old 30 series units. I am considering sending him a 34C for repairs.

Apparently he has worked on calculators for some who post to this forum so he has invited me to "check his references" here.

Any comments from anyone?

Thanks.

Take care.

Wayne

Re: HP34C - Jon Ibarra

*Message #2 Posted by **gozost** on 24 Apr 2004, 12:16 p.m.,*
in response to message #1 by Wayne Stephens

Hi, Jon Ibarra repaired my HP 41CX (broken key and corrosion on battery contact). This was a very good work, not expensive, and my calulator is now like new. I recommand this guy.

41CV to 48G+

*Message #1 Posted by **Robert Tomlinson** on 23 Apr 2004, 5:23 p.m.*

Is there anyway to get the programs from a 41CV to a 48G+? I have programs stored on cards that took years to develop that I would like to be able to use on the newer model.

Re: 41CV to 48G+

*Message #2 Posted by **bill platt** on 23 Apr 2004, 6:02 p.m.,*
in response to message #1 by Robert Tomlinson

Yes. What you need to do is get one of Hrastprogrammer's emulators. They run on the 48G+, and give you a 41cv (or cx etc as you choose). They are awesome. I only use the free one, and it is impressive; for you, there might be an advantage to buying the full-fledged version--it might give you more IO or something (I don't I/O my 41 programs on my 48).

check out

http://hrastprogrammer.tripod.com/

Best of luck!

Bill

Re: 41CV to 48G+

*Message #3 Posted by **bill platt** on 23 Apr 2004, 6:05 p.m.,*
in response to message #2 by bill platt

A little more:

Since you have a 48G+, you can use the full-fledged version, as you have 128 kB, so look at the info for the 48GX.

Re: 41CV to 49G

*Message #4 Posted by **Veli-Pekka Nousiainen** on 24 Apr 2004, 1:05 a.m.,*
in response to message #3 by bill platt

You might even consider the 49G version.
The HP 49G advantage is the internal RAM of 256 Main and 256K extra
- perfect for these emulators
Also there is 1MB of Flash, which does not need batteries.
The Equation Writer is incredibly faaast and it has a CAS HELP system for the commands

Downsides: [ENTER] is small, keys have a different feeling, Equations library has to downloaded from net, IR is missing, there are no slots.

(but the extra RAM and Flash compensates that and are of great value compared to the price of the extra Modules for the 48GX)

I can recommend that model for your purposes. I don't know if the very fast 49g+ can use the emulators? If there is somebody that have tried them with the 49g+ let us know...
[VPN]

Re: 41CV to 49G

*Message #5 Posted by **Massimo (Italy)** on 24 Apr 2004, 3:45 a.m.,*
in response to message #4 by Veli-Pekka Nousiainen

No, they currently don't work on the 49G+.

Massimo

HP-41CX Needs help

*Message #1 Posted by **Raymond Beehler** on 23 Apr 2004, 2:04 p.m.*

Hi, I recently got a barcode reader for my HP-41CX, and I tried using it with my setup. I had a card reader, and a Clonix module installed. I used a simple "configuration builder" posted on some website to make My Clonix config, because I'm just learning the ropes and not so good at all the fancy configuration options.

Anyway, I plugged in the barcode reader into port 3, and it locked up the calculator. I think there was a address conflict or something? At any rate, Port 3 on the 41CX no longer works, it just emits a high-pitch buzzing sound anytime I plug something into it. I tried a continous memory reset, and even removed the battaries to totally kill the main memmory, yet nothing worked. I've put the calculator away for now and decided to seek profesional help, before I make a bad problem worse.

Can anyone explain to me whats going on? I need a solution pretty quickly here, because I need to use this on a test in a few days.

Thanks!

Edited: 23 Apr 2004, 9:33 p.m. after one or more responses were posted

Re: HP-41CX Needs help

*Message #2 Posted by **Raymond Del Tondo** on 23 Apr 2004, 7:06 p.m.,*
in response to message #1 by Raymond Beehler

Hi,

not sure if it's the solution, but you could try to clean the contacts with a dry Q-tip. Take the batts out for safety first.

And you could take a look at the contacts of the wand plug. Is one of the contacts sharp edged, or otherwise damaged?

Raymond

Re: HP-41CX Needs help

*Message #3 Posted by **Raymond Beehler** on 23 Apr 2004, 9:25 p.m.,*
in response to message #2 by Raymond Del Tondo

Everything is in like new condition... It's... Well, weird. The buzzing sound is coming from the lower side of the calculator, right under the label that displays the alpha abilities of the keyboard.

I'll try cleaning it anyway... Hope it works. :/

Re: HP-41CX Needs help

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 24 Apr 2004, 3:37 a.m.,*
in response to message #3 by Raymond Beehler

Hi, Raymond;

I usualy hear this mid-to-high pitch (audible) "buzz" when putting batteries in some halfnut 41CV after leaving them resting for some days (your location is correct: for full- and halfnuts, this is the region where a coil is located). In this case, they don't switch to ON and it's necessary to remove and reinsert the batteries once or twice. And this happens when there is nothing connected to the calculator.

I also heard this same buzz other times when inserting some modules in some particular ports, like it happenen a few times with a card reader. Everytime I plugged the reader in one particular 41CV it started the "buzz" and crashed: [MEMORY LOST]. The same reader in other calculators worked fine.

The "remedy" was opening the calculator and cleaning the contacts between the IO/BATT assembly (one single piece) and the keyboard PCB. At least two contacts have different arrangement on each port, sort of a "two-bit" addressing; if one line for these contacts has a bad contact, two ports may share the same addressing and the system may result in "bus lines short circuitted". Think of two different devices that share the same data bus being "read" at the same time (same address for both, in this case) and one of them sends a "zero" while the other one sends a "one" in the same data line... I guess you know what is this about.

What I have no idea is how the Clonix ROM "shares" port addresses with ordinary, standard devices. At this point. I stuck.

My 2¢.

Luiz (Brazil)

vectors multiplication

*Message #1 Posted by **Dennis** on 23 Apr 2004, 1:08 p.m.*

Hello, I have the Hp49G calculator and I have a problem:

There is no problem writing [[1,2,3][4,5,6]*[[7,8][9,10][11,12]] and the calculator gives[[58,64][139,154]].

But if the two matrix are two vectors ((n*1) and (1*n)) the multiplication insn't possible. [ERROR: invalid dimension!!!] (instead I should obtain a number). How can I do for solve this operation?

Re: vectors multiplication

*Message #2 Posted by **Tom Sherman** on 23 Apr 2004, 2:36 p.m.,*
in response to message #1 by Dennis

Dennis,

Go to the math menu, select the vectors menu, and then select DOT. If you are in RPN mode, you will want to enter your vectors before doing this; if you are in algebraic mode, the vectors are entered after selecting DOT. If you have a manual, see page 8-5.

I hope it works for you.

Tom

Re: vectors multiplication

*Message #3 Posted by **Dennis** on 24 Apr 2004, 6:30 a.m.,*
in response to message #2 by Tom Sherman

Thank you very much Tom,

it works poperly.

HP45 battery pack

*Message #1 Posted by **Paul Marin** on 23 Apr 2004, 10:31 a.m.*

Can anyone help me with the way I could replace the rechargable pack for a HP45 with alkaline units and connect them to touch the contacts within the calculator. I know their are three batteries in the pack and that they have an unusual connection method with contacts inside the calculator. Or would it be better to just place the alkalines within the pack by cutting it open and throwing out the rechargable units?? Thanking anyone in advance for their help

Paul

Re: HP45 battery pack

*Message #2 Posted by **David Ramsey** on 23 Apr 2004, 12:05 p.m.,*
in response to message #1 by Paul Marin

Rebuilding the battery pack is not hard if you're handy with a soldering iron. You need to get three new NiCad or NiMh "AA" batteries (solder-tab preferably, rather than the standard batteries), cut open the plastic holder along its seam, cut away the copper contacts, solder them to the new batteries, solder the other contacts of the batteries to complete the circuit, then put the whole assembly back in the battery case and figure out some way to hold it together.

I've done it many times, but these days I just pay $15 for very nice packs from this guy:

http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&category=11713&item=3092490998&rd=1&ssPageName=WDVW

Heck, just a set of 3 solder tab NiCads cost almost this much!

Calculator Support at HP website

*Message #1 Posted by **Brent** on 22 Apr 2004, 6:23 p.m.*

Has anyone else noticed that they started posting the 11c, 15c, 16c and 42s in the support area? It does say retired models as well, but they were not there before. The 41CX isn't there and it retired after the 15c -- according to the museum.

Link to HPSupport

Re: Calculator Support at HP website

*Message #2 Posted by **Ben Salinas** on 22 Apr 2004, 9:18 p.m.,*
in response to message #1 by Brent

Wow... I don't think that was there yesterday when I looked. It is definitely a step in the right direction for HP. There isn't much substance to them (how to change batteries and Windows XP support statement for those calculators discontinued before Windows was even invented), but it is a sign that there may be more soon. Maybe HP is trying to get people to remember their glorious past, and if it means a 43s, then I'll keep reminiscing (sp?)

-Ben

Re: Calculator Support at HP website

HP 41 rechargeable batteries

*Message #1 Posted by **Mark Monica** on 22 Apr 2004, 11:07 a.m.*

Can someone provide a source for rechargeable batteries for HP 82120A. I carefully opened the case, now I will attemp to replace the 4 cells. Thank You

Re: HP 41 rechargeable batteries

*Message #2 Posted by **David Smith** on 22 Apr 2004, 11:47 a.m.,*
in response to message #1 by Mark Monica

The original 1/2N cells are no longer made. Your best bet is to use 1/3AAA cells and some shimming since they are a different size. Try to find NiMH cells, Nicads have a rather small capacity and will not last long and tend to overcharge.

Re: HP 41 rechargeable batteries

*Message #3 Posted by **Andreas** on 22 Apr 2004, 12:53 p.m.,*
in response to message #2 by David Smith

I had the same question a while ago and abandoned the idea of rebuilding my batt back. The 41C runs sufficiently long with normal batteries, so why bother...

Re: HP 41 rechargeable batteries

*Message #4 Posted by **Veli-Pekka Nousiainen** on 22 Apr 2004, 1:08 p.m.,*
in response to message #3 by Andreas

"...abandoned the idea of rebuilding my batt back. The 41C runs sufficiently long with normal batteries, so why bother... "

Have you ever used a Magnetic Card reader or IL drive extensively?
I would certainly use NiMH batteries, if I could find them...hmmm...perhaps Lion (3V) or a camera 2-pack with 6V would be great?![nl} [VPN]

Re: HP 41 rechargeable batteries - another suggestion

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 22 Apr 2004, 1:29 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

Hi, all;

I just want to add the following: for those of you who own fullnuts, there is always the possibility of adding the contacts (small balls and related springs) for external power supply by using the two circular holes in the rectangular tunnel used for connecting the charger when rechargeable batteries are being used. I use the regular N-size alkalines but when I need to use magnetic cards, wand, IL or IR printer (the most power consumming "extras") I plug the external pack and go ahead.

Just a suggestion.

Luiz (Brzil)

Re: HP 41 rechargeable batteries

*Message #6 Posted by **Garth Wilson** on 22 Apr 2004, 4:03 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

> Have you ever used a Magnetic Card reader or IL drive extensively?

Card reader or bar code reader, no. HPIL, yes. At the last place I worked, in about 1986-87 we tested the first $2,000,000 of a product with an HP41cx controlling a rack of IEEE-488 equipment through the HPIL-to-HPIB interface converter. It was running the program 8 hours per day, making heavy use of HPIL, and a set of alkaline batteries lasted for weeks. With the way I use it now, a set of alkalines probably lasts a couple of years.

OTOH, the 41c had very little memory compared to the cv or cx, so I can understand why you'd be needing the card reader more often. I have the tape drive, and virtually never need it because everything I need fits in my 41's memory all at once, all the time.

Re: HP 41 rechargeable batteries

*Message #7 Posted by **Juergen (CH)** on 22 Apr 2004, 4:48 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

I use GP 12AAAM NiMH cells (130mAh) to rebuild 41 battery packs. They are available at http://www.accu-profi.de/, part nr. 74010165, EUR 1.95 per cell.

For the normal battery compartement you can use GP 50NH NiMH cells (520mAh), also available at the same web site, part nr. 74010168.

Regards, Juergen

Re: HP 41 rechargeable batteries

*Message #8 Posted by **Charles** on 22 Apr 2004, 6:57 p.m.,*
in response to message #7 by Juergen (CH)

Low tech answer

You can find cordless phone packs (Uniross 84 H BC 102171- only 3 cells so you need 2 packs) quite readily with the right size (2/3 AAA size NiMh ?)rechargeables and fit these into the conventional battery holder. You need to split them up and can charge outside the calculator in an AA size charger using a nut and bolt as a spacer.

I have ordered 1/3 AAA rechargeables to rebuild the rechargeable pack but am still waiting for them after 4 weeks !

in response to message #1 by Mark Monica

You are likely out of luck if its important to continue using the HP 82120A however a set of rechargable n-

size batteries are available on eBay for about $20.00 USD. Here is the link...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=3093062065&rd=1

I can't vouch for these but I've used similar rechargable batteries in my CV for several years.

Re: HP 41 rechargeable batteries

*Message #10 Posted by **Hans Brueggemann [GER]** on 22 Apr 2004, 3:02 p.m.,*
in response to message #1 by Mark Monica

Ha! same old story all over again. i am truly tired of disposing of of used batteries, how ever environmentally "healthy" they might be. but that's only one side of the coin. i am currently thinking of making a new rechargeable pack of my own, containing just *one* single 1.5V NiMH cell and a boost converter, let's say an ON-Semi NCP1400, or a SIPEX SP6648. This should give a real energetic advantage over the original battery pack. Question is: what is the biggest available NiMH-cell (in terms of mAh rating) that will fit into the rechargeable pack (together with the boost converter, *and* the charging circuit, of course). any suggestions??

cheers, hans

in response to message #1 by Mark Monica

See Article 335.

I replaced with 1/3AAA NiMH cells. If I can do it, anyone can. Cells were cheap!! about $10 as i recall. there are several places online to buy.

in response to message #1 by Mark Monica

A lot of stores that handle radio control airplanes will have the 1/3AAA cells. They are used in micro-light models.

Density of Encoder strip for HP 600c

*Message #1 Posted by **Eugene Lugovoi** on 22 Apr 2004, 6:21 a.m.*

Dear professionals,

Does someone know exactly a thickness and distance between black lines on the Encoder Strip for HP 600C?

Accoding to my estimation it should be something about 90 um.

I have found this strip should be an ideal object for calibration of the scale in my microscope for an precise measurement of the microobject sizes.

Thanks for an answer in advance.

Help with indentifying this rare model

*Message #1 Posted by **raze** on 22 Apr 2004, 3:38 a.m.*

Hello All,

I just go an HP bag that I have never seen before. The leather bag is the same quality of a calculator tanned leather case, but the size is too big for a regular calculator. But the logo is exactly of the vintage calculator leather bag.

I wonder what type of bag is this? is this for a big calculator bag or a bowling bag?

The shape and size matches a bowling bag, but this is a HP, and judging from inside, it is not a bowling bag becuase it has different compartments.

Check the picture here: http://img11.photobucket.com/albums/v33/acmeonline/HPbag.jpg

I wonder if this one worth to eBay it.

Any help will be greatly appreciated, Thanks in advance, Raze

Re: Help with indentifying this rare model

*Message #2 Posted by **Arnold Steekelenburg** on 22 Apr 2004, 4:27 a.m.,*
in response to message #1 by raze

Hi Raze,

This is a bag used to carry a HP-9x series calculator. These were calculators with built-in printer e.g. HP-97, the printer version of the HP-67.

Re: Help with indentifying this rare model

*Message #3 Posted by **David Ramsey** on 22 Apr 2004, 8:56 p.m.,*
in response to message #1 by raze

As another reply mentions, it's a bag for carrying a HP 9x series desk calculator-- the 91, 92, or 97.

And it's VINYL, for heaven's sake, not leather. I'm amazed so many people can't distinguish plastic from cow skin. Every time I see one of these type cases on eBay it's advertised as "leather".

Re: Help with indentifying this rare model - "leatherette"

*Message #4 Posted by **Bill Wiese** on 22 Apr 2004, 10:54 p.m.,*
in response to message #3 by David Ramsey

Sometimes this fake leather is called "leatherette" - as in advertising for a product: "...comes with a nice leatherette carrying case."

Large expanses of fake leather with cloth backing are sometimes called "naugahyde". So when your friends get a cheap leather-look sofa from Ikea, you can ask them, "How many Naugas did you skin to make that sofa?" ;)

Bill

I think it's for the 9815A, not for the 9x

*Message #5 Posted by **Raymond Del Tondo** on 23 Apr 2004, 9:39 a.m.,*
in response to message #3 by David Ramsey

Hi,

at least my 'leatherette' HP-97 bag looks quite different, and it only has one compartment inside: the one for the calculator, and the handle straps (?) don't go around the case.

I think the bag on the photo is for another (heavier) machine, like the 9815A or alike.

Raymond

Re: I think it's for the 9815A, not for the 9x

*Message #6 Posted by **Dave** on 23 Apr 2004, 10:43 a.m.,*
in response to message #5 by Raymond Del Tondo

Your right is not for the 9X series calcs.

Re: I think it's for the 9815A, not for the 9x

*Message #7 Posted by **David Smith** on 23 Apr 2004, 12:02 p.m.,*
in response to message #5 by Raymond Del Tondo

Without something for scale it is hard to tell what it goes with. It may be for a '97. There were some minor variations in the case design. I have a 9100A case and have seen a purported 9815 case, but they are off-white in color.

Re: I think it's for the 9815A, not for the 9x

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Apr 2004, 2:24 p.m.,*
in response to message #5 by Raymond Del Tondo

I have one of the 9x original bags and it is not like this one. I 100% agree with Raymond's message.

Isn't the correct term for that stuff "Pleather"?

*Message #9 Posted by **Wayne Stephens** on 23 Apr 2004, 6:45 p.m.,*
in response to message #3 by David Ramsey

Take care.

Wayne.

Re: How about "Feather" or "Leatheraux"?

*Message #10 Posted by **Paul Brogger** on 23 Apr 2004, 10:08 p.m.,*
in response to message #9 by Wayne Stephens

Faux leather.

I think "leatheraux" sounds much more elegant than "leatherette".

AND, I did a Google search on "leatheraux" and got ONE result! And that's a contraction/abbreviation serving as a qualification level in a web directory at a Korean chemicals firm (I believe). I may have just invented a word!

HP 33S NCEES - PE EXAM ..CAUTION

*Message #1 Posted by **INSIDER** on 21 Apr 2004, 7:19 p.m.*

For all those users of the new hp-33s scheduled to take the ncees / pe test. Please study it and get used to your calculator. Lots of errors have been reported and recorded as calculator errors. 98% of mistakes are due to not being familiar with the calculator itself. This is the best calculator available for the test but, please be sure to practice and get used to it. Many have negatively spoken about the availability of this unit, Some HP shipments are stuck in customs. Large misc, bookstores and electronic stores are taking orders but do not deliver in time. Others are honest and advise that the calculator won't be available for the next exam. Please prepare accordingly and spend time practicing.

INSIDER DELETE ABC123

Re: HP 33S NCEES - PE EXAM ..CAUTION

*Message #2 Posted by **Fubar Vikinghelmet** on 22 Apr 2004, 11:22 a.m.,*
in response to message #1 by INSIDER

1. HP shipped the two I bought from their website two days ago. I have an e-mail stating such as well as a tracking number. I expect to receive them in the mail tomorrow.

2. Are you saying that "lots" of errors are due to the calculator? Is there no time to check work?

3. What is the point of your post? "Calculator error" certainly isn't an excuse for getting the wrong answer, is it? Sure wasn't when I was in engineerng school... Is there a check box on the PE exam that you can mark if you suspect calculator error?

4. What makes the 33S better than the other's "unofficially allowed" by the NCEES? In my opinion, it's that HP is selling them right now, rather than relying on eBay for a 32S. By inspection of the images, I'd say the HP-33S' enter key is too small and in the wrong place, but how hard is that to get used to?

Re: HP 33S NCEES - PE EXAM ..CAUTION

*Message #3 Posted by **Veli-Pekka Nousiainen** on 22 Apr 2004, 12:55 p.m.,*
in response to message #2 by Fubar Vikinghelmet

I have the 33s now! Very nice! The main keyboard is flawless regarding to keyclick and response. The cursor keys need some adjusting. The V shape actually helps to find the functions. [R/S] and [ENTER] have been swapped.
The massive memory let's me forget about the earlier models restrictions. I just wish that each "main" program from A..Z could use subprograms LBL_01..99 and that a program call could be made using mm.ss notation, eg label 77 in Z is called by XEQ(i), where i is 26.77, and there is no LBL_00, because that would just mean start of the other main program.
BUT there is no such thing...)-:
The manual is very good
I even like the new ALgebra history line above the calculation line. You just have try it!

Re: HP 33S NCEES - PE EXAM ..CAUTION

*Message #4 Posted by **Norris** on 22 Apr 2004, 7:01 p.m.,*
in response to message #2 by Fubar Vikinghelmet

<< 4. What makes the 33S better than the other's "unofficially allowed" by the NCEES? >>

NCEES has compiled an official list of "approved" calculator models, which is at http://www.ncees.org/exams/calculators/#approved

It's not a very long list. Most of the "approved" models are algebraic and non-programmable. The only "approved" models with RPN are the 32S (which includes the 32SII) and the 33S.

The 33S is regarded by many as the single best calculator option for NCEES exams, because (1) it has been explicitly approved by NCEES, so it is guaranteed acceptable to exam proctors; (2) it has both algebraic and RPN modes, so anyone can use it easily; and (3) it has much more memory for programs and equations than any other NCEES-approved calculator.

It is currently possible to use older calculator models that are not on the "approved" list, as long as they comply with certain security criteria. However, this could change. In the future, NCEES may require all candidates to use only calculators from the "approved" list.

NCEES has compiled an official list of "approved" calculator models, which is at http://www.ncees.org/exams/calculators/#approved >>>>

I know that, hence the scare quotes around "unofficially approved;" what are you, a shill for the NCEES? If you are, get this straight: Publish a comprehensive, exhaustive list of approved calculators. The research has been completed on this website and others, it's not such a hard task to put one together, now is it?

It's also hogwash. Put an unlimited stack on the HP-33S and I'll consider trashing my NCEES-unacceptable HP-28S, thank you very much. The best calculator for the PE exam, other than a well-oiled slide rule or solar-powered party favor, is the one I've been using for 14 years, bro. But, as I indicated in another post, I bought two HP-33S' from HP's website the other day, for $50 a piece. Some poor sap's getting stuck paying more than $120 for one off an eBay auction in a couple of days...

Unlimited stack ain't RPN, Bro! (NT)

Nope, I have no connection with NCEES, except that I take their exams.

If you think that it would be relatively easy to prepare a "comprehensive, exhaustive" list of NCEES-compliant scientific calculators, then perhaps you should take the initiative, prepare one yourself, and submit it to NCEES for their consideration.

However, you may find that a comprehensive, exhaustive list of all NCEES-compatible scientific calculators that have been marketed worldwide over the past 30 years would include hundreds, and possibly thousands, of models from scores of manufacturers.

Might actually be somewhat difficult to put such a list together. I acknowledge that this website provides sufficient data for HP models, but you may not find equally good "museums" for every other current (and former) calculator manufacturer.

*Message #9 Posted by **Fubar Vikinghelmet** on 23 Apr 2004, 9:33 a.m.,*
in response to message #8 by Norris

<<If you think that it would be relatively easy to prepare a "comprehensive, exhaustive" list of NCEES-compliant scientific calculators, then perhaps you should take the initiative, prepare one yourself, and submit it to NCEES for their consideration>>

I knew that was coming... Come on! That IS the job of the NCEES. They're the test administrators! They're the ones who put out the ban in the first place! And what is your problem?! The research has already been done - as I indicated in the last post - it's been done as a labor of love by this website and others! All the NCEES has to do is gleen the info from here and go with it!

Sheesh, f-in people who just don't use their brains.

Vikinghelmet out.

Re: HP 33S NCEES - PE EXAM ..CAUTION

*Message #10 Posted by **Norris** on 23 Apr 2004, 1:14 p.m.,*
in response to message #9 by Fubar Vikinghelmet

<< Come on! That IS the job of the NCEES. They're the test administrators! >>

A few comments:

(1) A major part of the problem is that NCEES is *not* the test administrator, contrary to your statement above. NCEES develops the test, but the state boards are responsible for actually administering the test and enforcing the calculator policy. Unfortunately, NCEES does *not* have the job of determining whether each examinee's calculator is acceptable. And that's probably why NCEES has been slow to realize how impractical and ambiguous their current policy is.

(2) You want NCEES to produce a comprehensive, exhaustive list of approved calculators. The exam proctors and the state boards want exactly the same thing. But be careful what you wish for, because you just might get it.

The good news is that NCEES will probably propose a complete "approved" list at their annual meeting in August 2004. The bad news is that it will probably be restricted to a few current models. *All* other models will be banned, even if they are technically compliant with the NCEES security criteria, in order to simplify enforcement for the state boards and exam proctors.

(3) If you have advice or recommendations for NCEES on their policies, then it perhaps it would make sense to contact NCEES directly, rather than the Museum of HP Calculators. (I'm tempted to add: "Sheesh, f-in people who just don't use their brains", but I'm too polite to do that)

By the way, I'm not defending NCEES here, just trying to provide some relatively accurate information. Personally I do not support the NCEES calculator policy. I prefer the California Board's policies, which still allow HP48s and 28s for state-specific exams. In fact, I just used my 48GX on a California non-NCEES PE exam last week. For NCEES exams, the 33S is probably the best legal choice, for either RPN or algebraic users, from any manufacturer.

NCEES has acknowledged my letter...

*Message #11 Posted by **Karl Schneider** on 24 Apr 2004, 4:41 a.m.,*
in response to message #9 by Fubar Vikinghelmet

...which provided a detailed listing of which HP calc models were compliant, and which were not -- excepting that I specifically excluded the NCEES-approved 32S/ii and 33S from my discussion. I asked that the compliant models be added to the Approved list.

The e-mail response I received was that NCEES would prefer to keep the Approved list short and concise. I responded by e-mail, asking NCEES to add only the 11C, 15C, and 20S to this list, in the interest of maximum benefit to HP users. The RPN 11C and 15C (1982-1989) were big sellers that are still used today; the AOS 20S (1988-2002) is a high-selling quality model that was retailed until fairly recently.

So far, no response or action by NCEES. I will press the matter prior to the August meetings, now that the April exams are over. It may be a good idea to prepare an electronic petition for us to sign and submit to NCEES, asking for these three models to be specifically approved.

BTW, I don't think norris has any "problem", as evidenced by his response just above.

Edited: 24 Apr 2004, 4:43 a.m.

Personal tastes vary, but the all-time most popular calculator model for the PE exam is probably the 48GX. The best calculator available under the current NCEES rules is probably the 33S. Sorry about your 28S, bro.

spare brain required

*Message #1 Posted by **hugh steers** on 21 Apr 2004, 3:32 p.m.*

does anyone know a neat way to calculate a*b mod 2^r on a calculator? where a & b are integers < 2^r.

let's say i set c = 2^r and do a*b mod c on a 10 digit machine. is there some way to recover the lost remainder that might shift off the low digits?

the other way would be to write some sort of double precision subroutine. this would work but could be horribly slow.

any ideas appreciated.

Re: spare brain required

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 21 Apr 2004, 3:55 p.m.,*
in response to message #1 by hugh steers

There is an easy way to do the 2^n mod, in assembler, with some bit-shifting by n bits to the right. The bits that "pops" out on the right (LSBs) you can save to use as the reminder right-shifting them on another register. Please correct me if I'm wrong.

Best regards,

Nelson

Re: spare brain required

*Message #3 Posted by **Paul Brogger** on 21 Apr 2004, 4:46 p.m.,*
in response to message #1 by hugh steers

Repeatedly subtract c from a*b until the remainder is less than c. The remainder is then, by definition, a*b mod c.

(. . . or am I missing something?)

Re: spare brain required

*Message #4 Posted by **Sam Hughes** on 21 Apr 2004, 5:06 p.m.,*
in response to message #1 by hugh steers

I am not sure which calulator you intend to use, so use this Q-BASIC program of mine for inspiration:

```
10 INPUT "n1: ", n1
20 INPUT "n2: ", n2
30 INPUT "r: ", r
40 LET s = 0
50 LET k = r
60 LET s = (s + (((n1 MOD 2) * n2) MOD (2 ^ k)) * (2 ^ (r - k))) MOD (2 ^ r)
```

```
70 LET n1 = INT(n1 / 2)
80 LET k = k - 1
90 IF k > 0 THEN GOTO 60
100 PRINT s
```

How it works: Suppose its inputs were 23, 58, and 6.

Thus, you're multiplying 010111 by 111010 (in binary), mod 1000000.

```
Normal binary multiplication

     010111
    x111010
     111010 <- bottom number multiplied by top's ones column
    111010  <- ... multiplied by top's twos column
   111010   <- ... by fours column
  000000    <- by eights column
 111010     <- by sixteens column
000000      <- by 32 column
xxxxxxxxxxx <- these columns are added to get some sum.

Binary multiplication mod 64:
     010111
    x111010
     111010 <- bottom number multiplied by top's ones column (mod 64)
     11010  <- ...etc... (mod 32)
     1010   <- mod 16
     000    <- mod 8
     10     <- mod 4
     0      <- mod 2
     xxxxxx <- the columns are added to get some sum.
               - In calculating the sum, the program
                 adds the row into a cumulative sum and
                 takes the result mod (2^r) each
                 time.
```

I assume you need an answer for when 2^r is near the calculator's precision

*Message #5 Posted by **John Ioannidis** on 21 Apr 2004, 5:32 p.m.,*
in response to message #1 by hugh steers

for an ordinary calculator with 10 decimal digits of precision (a tad more than 33 bits), you don't have a problem if both a and b are < 2^16; the trick is how to do this when a and b are more than five decimal digits and still not lose precision.

wlg, assume that r is even, r <= 32, and a, b < 2^r; a and b are at most 32 bits long

rewrite a and b as a1 * 2^(r/2) + a0 and b1 * 2^(r/2) + b0, where a1 = int(a / 2^(r/2)) and a0 = a mod 2^(r/2).

a0, a1, b0, b1 are at most 16 bits long

then a*b becomes a1*b1*2^r = (a1*b0 + a0*b1) * 2^(r/2) + a0*b0.

and a*b mod 2^r becomes:

(((a1*b0 + a0*b1) mod 2^(r/2)) * 2^(r/2) + a0*b0) mod 2^r

the partial products are at most 32 bits long, and at no point do the partial sums exceed 33 bits, so it all fits in a standard 10-digit calculator.

I hope you don't really need that translated into RPN!

/ji

Re: I assume you need an answer for when 2^r is near the calculator's precision

*Message #6 Posted by **hugh steers** on 22 Apr 2004, 12:26 p.m.,*
in response to message #5 by John Ioannidis

thanks very much, all, for your help. john is right. the problem i have is indeed when 2^r is near the calculator's precision, and the calculator is decimal.

on a binary computer, i simply do; a*b AND (2^r-1) where a & b are machine integers. when wordsize is 32 (r < 32), the overlow == 0 (mod 2^r) anyway. that's the logic i already have, but i need it to work on a calculator (hp41c in this case).

john's way is what i have to do. i dont think there's any special trick to exploit with 2^r. this is the bit i needed:

(a1*b0 + a0*b1)*2^r/2 mod 2^r = (((a1*b0 + a0*b1) mod (2^r/2)) * 2^r/2) mod 2^r

as pointed out, it doesnt overflow.

thanks!

Re: spare brain required

*Message #7 Posted by **Renato (brasil)** on 21 Apr 2004, 5:47 p.m.,*
in response to message #1 by hugh steers

The remainder can be recovered as c * (frac(a*b / c)). Maybe you could set c = 100000 * 2^r . This would get you with a 5 digits remainder- just remember to divide by 100000. I am not sure if this is useful, maybe with some more information about the usage, I might help a bit more. Renato

32S vs. 32Sii

*Message #1 Posted by **Wayne Stephens** on 21 Apr 2004, 3:24 p.m.*

Can someone briefly brief me on the differences between the 32S and the 32Sii. I have a couple of 32Sii's (with manuals) and a 32S on the way. I am not getting a manual with the 32S. Is it similar enough to the 32Sii for the 32Sii manual to be helpful in learning the 32S capabilities? If not, is there somewhere I can download a 32S manual as a .pdf file?

Thanks.

Take care.

Wayne.

Re: 32S vs. 32Sii

*Message #2 Posted by **Raymond Del Tondo** on 21 Apr 2004, 5:35 p.m.,*
in response to message #1 by Wayne Stephens

Hi,

in general, the 32S has *one* shift key;-) It has no fraction mode, and some other maybe minor stuff I don't recall from memory... All in all this leads to a less cluttered keyboard legend layout on the 32S. Unfortunately most 32S units have a display with slightly smaller pixels than in the 32SII. Maybe on this site could be a comparison of the 32S vs 32SII, and the manual of the 32S should be on the CD/DVD set.

Regards,

Raymond

Re: 32S vs. 32Sii

*Message #3 Posted by **Karl Schneider** on 22 Apr 2004, 2:11 a.m.,*
in response to message #2 by Raymond Del Tondo

Wayne --

As Raymond pointed out, the 32S was designed under the 42S paradigm, with only one shift key and heavier reliance on menus, for a neater keyboard appearance. Users asked for more functions to be more-directly accessible, so the 32Sii included two shift keys in order to "unpack" some functions from menus. The resulting arrangement is not as well-organized as that of the 15C, which was designed to have two shift keys.

The 32Sii added the fraction-arithmetic and, more importantly, the simple Equation Editor that could be used with XEQ, SOLVE, INTEG, and for what you commented about with, "Shhhhhhhhhh!".

Brain Fade

*Message #4 Posted by **Wayne Stephens** on 22 Apr 2004, 7:22 a.m.,*
in response to message #1 by Wayne Stephens

I must have been suffering from brain fade yesterday. I HAVE the museum CDs and the 32S manual is on them. I guess I was assuming since the 32Sii isn't there yet the the 32S wasn't either. It never hurts to look, though.

Thanks for your help, guys.

Wayne.

Re: 32S vs. 32S 50th anniversary

*Message #5 Posted by **CalcKidd** on 23 Apr 2004, 11:16 a.m.,*
in response to message #1 by Wayne Stephens

Was there a difference between the 50th anniversary 32s and the regular 32s?

Re: 32S vs. 32S 50th anniversary

*Message #6 Posted by **Raymond Del Tondo** on 23 Apr 2004, 11:31 a.m.,*
in response to message #5 by CalcKidd

The only difference on the calc itself is the golden '50' logo, and the slip case has 'Hewlett Packard' and the '50' logo embossed.

Ah, and another difference: AFAIK of the anniversary version only a few thousand units were made.

Raymond

Re: 32S vs. 32S 50th anniversary

*Message #7 Posted by **David Smith** on 23 Apr 2004, 12:04 p.m.,*
in response to message #6 by Raymond Del Tondo

Not all the 50th anniversery machines had "50th" cases... apparently they had more machines than cases and shipped some with the regular case.

Re: 32S vs. 32S 50th anniversary

*Message #8 Posted by **Raymond Del Tondo** on 23 Apr 2004, 7:01 p.m.,*
in response to message #7 by David Smith

Hmm, maybe that's the reason why you paid only $70;-)

Raymond

OpenRPN board goes live

*Message #1 Posted by **Hugh** on 21 Apr 2004, 12:16 p.m.*

Hey all, the board went live last night. I still have some graphics to update, but everything is otherwise ready to go. It's hosted by one of my good friends as a directory, so don't let the name throw you.

http://www.cradleofintrigue.com/OpenRPN/

I'm accepting suggestions for what distinct forums should be made beyond what I already have up there. I look forward to seeing you all there.

Thanks!!

*Message #2 Posted by **Wayne Stephens** on 21 Apr 2004, 3:29 p.m.,*
in response to message #1 by Hugh

Thanks, Hugh.

You have been putting a lot of time and effort into this project and I wanted to let you know I appreciate it. I am not sure what I can offer the project. I am a Civil Engineer, not an electronics guy or a programming genius, but if you need any help, just place a post here (or on the new site), or email me, and I will assist where I can.

Take care.

Wayne

PS - I will definitely be there to purchase the end product, you can count on that.

Re: Thanks!!

*Message #3 Posted by **Hugh** on 21 Apr 2004, 4:10 p.m.,*
in response to message #2 by Wayne Stephens

You're very welcome, and any contribution you can make is appreciated. We need as much input as we can get, as I want the most ideal calculator possible. Feel free to jump in and help whenever you have an opinion, knowledge, or even just an idea (the crazier the better).

Thanks for your contribution and interest in the project. I promise I won't let anyone down.

Re: OpenRPN board goes live

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 22 Apr 2004, 1:32 a.m.,*
in response to message #1 by Hugh

The site is now telling "The requested URL /OpenRPN/index.php was not found on this server."...

:(

Best regards,

Nelson

Re: More thanks...

*Message #6 Posted by **DougT** on 22 Apr 2004, 7:38 a.m.,*
in response to message #1 by Hugh

Hugh,

I feel obligated to offer some additional words of encouragement for you and the other dedicated OpenRPN folks. Like Wayne, I'm a non-electrical engineer (aerospace in my case), but I'm eagerly following the project as it progresses. I'll be glad to offer my opinions, when appropriate, and help out if I can. I'm definitely looking forward to being one of the first purchasers of a fresh, new RPN calculator.

Regards,

Doug

Re: More thanks...

*Message #7 Posted by **Hugh** on 22 Apr 2004, 9:16 a.m.,*
in response to message #6 by DougT

A ha! I can certainly find a use for you, Doug. I'm attempting to use as much knowledge as I can in aircraft instrumentation (since everything is made to be high contrast, reliable and useable). Also, the materials being used for construction come from the aerospace industry.

I have so far focused on using aluminum for the entire case, but I am also considering titanium (although it will most definitely be more expensive... probably just make it an option).

If you wouldn't mind reviewing some of the designs, it would be a big help! Also, some of the manufacturing processes being explored (high pressure water cutting, etc.) may be to your liking. Please join in. I encourage anyone to use what skills they possess to improve any aspect that your training lends itself to.

Re: More thanks...

*Message #8 Posted by **Veli-Pekka Nousiainen** on 22 Apr 2004, 12:41 p.m.,*
in response to message #7 by Hugh

"I have so far focused on using aluminum for the entire case, but I am also considering titanium (although it will most definitely be more expensive... probably just make it an option)."

Some mobile phones and some notebook PC manufactures seem to use magnesium...

[VPN]

Materials

*Message #9 Posted by **Richard Karnesky** on 22 Apr 2004, 7:47 p.m.,*
in response to message #8 by Veli-Pekka Nousiainen

A nice Al alloy is probably the best bet due to price, strength, and weight. Mg is also a very good choice. Even lighter, though more expensive. It has been somewhat popular in automotive/aerospace because of this, though is used more frequently in laptops & the like. Ti is starting to get heavier & I wouldn't think it would be worth the cost. Some are considering using bulk metallic glass (amorphous metal) for consumer electronics. Cool, but expensive.

I would think the cost of using more than a single material wouldn't be worth it, especially when it dwindles the size of an already small production run. I would go with your first choise of Al. It is sound.

But I'd also probably keep plastic in consideration--it is inexpensive & lightweight. Metal does have a "wow" factor & it would add durability, but I am more willing to pay for the way the calculator functions.

Re: More thanks...

*Message #10 Posted by **Jim Creybohm** on 22 Apr 2004, 10:16 a.m.,*
in response to message #6 by DougT

I'd kinda like to second (third?) my thanks for displaying the initiative necessary to go forth with this project. I'm really looking forward to seeing some of the concept vehicles that come out of the discussions.

I also can render only modest assistance, being an oil engineer, not an electrical/electronics type.

In the meantime, I have some ideas (never let common sense or rationality deter) - I'll just have to post them on the board!

12345

Registration/Posting issues

*Message #11 Posted by **Hugh** on 22 Apr 2004, 9:08 a.m.,*
in response to message #1 by Hugh

I'll also post this up on the OpenRPN board. We are currently aware of error messages in signing up/signing in/ signing out/posting. Despite the error messages, everything is physically working... But there are a few lines of code we need to patch up. Thanks to all for pointing this out to us quickly.

In the meantime, don't be discouraged. The board will stay up, although you will get occasional errors which don't actually mean anything.

Sorry for the inconvenience.

HP85 parts

*Message #1 Posted by **Mark Myers** on 21 Apr 2004, 11:33 a.m.*

We're in need of a RAM Controller IC (U8) for an HP85B.

The 40 pin IC is labeled as 1MC4-0003

Our chip was soldered on the board.

Wondering if anyone out there has one of these, or a dead HP85B, or a recommendation of locating such a part?

Mark

HP25 repair

*Message #1 Posted by **Lars** on 21 Apr 2004, 5:19 a.m.*

How do you take apart a HP25? There are screws under the upper rubber feet, but it seems something is holding it together in the lower end as well, what is that? Any help appeciated!

--Lars

Re: HP25 repair

*Message #2 Posted by **Tony Duell** on 21 Apr 2004, 6:45 a.m.,*
in response to message #1 by Lars

I've dismantled many Woodstock series (HP2x) calculators. You do it as follows :

Take out the battery pack

Take out the rear (display end) feet, and the screws under them.

Press on the charger pins with a small screwdriver until they're free of their holes. The display end of the machine will separate when you do this, of course.

Now press the front (0-key) end of the keyboard towards the back (charger socket end) of the bottom case. The idea is to slide the keyboard slightly towards the rear end. This frees the hook at the front end. Separate that end too

Slide the keyboard back towards the front end of the bottom case so that the battery contacts fit through the holes in the bottom case. Remove the bottom case completely.

Unplug the logic PCB from the keyboard, unplug the display from the logic PCB, remove the black fishpaper insulator from the battery contacts.

Re: HP25 repair

*Message #3 Posted by **Lars** on 21 Apr 2004, 7:10 a.m.,*
in response to message #2 by Tony Duell

Thanks, I managed to take it apart! I'll post some pictures, eventually.

hp33e display fault

*Message #1 Posted by **Dave chadderton** on 21 Apr 2004, 12:55 a.m.*

Hi All I've recently got a hp33e but it has a display fault where parts of the display segments go out to whole digits and other various combinations a slight flexing/twisting of the case returns the dispaly to normal. How hard are these calcs to get apart has anyone seen this type of thing before and might it be a relatively easy fix. Thanks Dave

Re: hp33e display fault

*Message #2 Posted by **Tony Duell** on 21 Apr 2004, 6:55 a.m.,*
in response to message #1 by Dave chadderton

I would guess (without seeing it) that you have one of the old-series 33Es that were built with minimal solder. The ICs, display pins, and flexiprint from the power converter (this module is soldered together) are clamped against a foam-backed flexible PCB by a plastic frame.

In time, the contacts oxidise or get dirty and you get faults like display digits, or segments, missing, some keys fail to work, the whole machine is dead, and so on.

You have to take it apart and clean the contacts. Dismantling a Spice (HP3xE or HP3xC) machine is not trivial until you've done a couple, and there's a lot of misinformation out there about separating the case halves. Here's how to do it :

Remove the battery cover, battery pack, and the 2 screws inside the battery compartment.

Ease the case apart at the battery pack end. Do NOT keep on separating the case here (as is often recomended) -- this is a good way to break something.

Now put your fingers in the battery compartment and your thuimbs on the front edge of the top case. Squeeze hard. The idea is to move the bottom case towards the front (0-key) end of the machine. It'll suddenly move with a sharp click.

Now carefully remove the bottom case, making sure you don't damage the battery contacts.

Free the battery terminal PCB from its mounting

Unclip the logic assembly from the hooks down each side. Take care here, if you break them off, you'll be looking for a new top case. At this point the keys, switch sliders/contacts are loose in the top case. Put it all aside so you don't scatter parts everywhere. If the switch contacts are stuck to the logic assembly, remove them and put them back in the sliders.

Remove the metal clips from the sides of the logic assembly

Now, with that assembly keyboard side up, lift off the keyboard/flexible PCB. You'll be left with a plastic frame containing the chips, the PSU module, and the display.

Clean the contacts on the flexible PCB, clean the display pins. Put it all back together.

This is a very common problem with early Spice machines

Re: hp33e display fault

*Message #3 Posted by **David Smith** on 21 Apr 2004, 3:26 p.m.,*
in response to message #2 by Tony Duell

It is a VERY good idea to note where each chip is and its orientation before you open up the keyboard sandwich. It is very easy to get things messed up when the sandwich comes apart. Also be very careful handling the battery conenctor/cable. The conductors in the flex cable are VERY prone to cracking... then you will need to trace wthe wiring and replace them with pieces of standard starnded hookup wire.

Re: hp33e display fault -- IC locations

*Message #4 Posted by **Tony Duell** on 22 Apr 2004, 3:43 p.m.,*
in response to message #3 by David Smith

About getting the ICs back in the right places (and the right way round). In all HP3xE and 3xC machines, all ICs have the pin 1 end (notched end) at the rear -- display end -- of the machine. And it's obvious where the 40 pin chip (CPU, keyboard interface, display interface) goes!

In an HP3xE, all the 8 pin locations are equivalent. You can put the chips in any order. In an HP3xC, the rearmost --nearest to the display -- location is different, it receives the backup supply to maintain continuous memory. So you must put the right chip there in a 3xC machine.

The difference between 3xE and 3xC machines (other than the 8 pin memory chips) is the power converter board. The +ve supply pin of the rearmost memory chip position is wired to a separate pin on the power coverter. On 3xE machines this is strapped to the main +ve supply on the power converter board/flexiprint. On 3xC machines there are a couple of diodes and a resistor on the power converter board to supply the backup supply.

Re: hp33e display fault -- IC locations

*Message #5 Posted by **David Smith** on 22 Apr 2004, 8:33 p.m.,*
in response to message #4 by Tony Duell

Some of the "E" series machines seem to have "C" series keyboards where the RAM chip slot is wired differently. I always thought the backup pin was a no-connect on the normal RAM chips and it did not make any difference. Then I opened up a machine and dumped the chips without looking... had to open up another machine to get them right.

Re: hp33e display fault -- IC locations

*Message #6 Posted by **Tony Duell** on 24 Apr 2004, 6:15 a.m.,*
in response to message #5 by David Smith

All the HP3xE and 3xC machines that I have worked on have the same keyboard PCB. The +ve supply pin (pin 8 IIRC) of the front 2 memory chip locations goes to the one pin of the PSU module (and also to the +ve supply pin of the CPU chip). The +ve supply pin of the rearmost memory chip goes to a different pin on the PSU.

On the 3xE PSU, these 2 pins are linked together, so all the chips get the same supply (and all memory chip locations are the same). On the 3xC PSU there are a couple of diodes and a resistor (10k IIRC) to provide the constant supply to the rearmost (RAM) memory chip

Or at least that's how I remember the schematics...

Re: hp33e display fault -- IC locations

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 24 Apr 2004, 10:08 a.m.,*
in response to message #6 by Tony Duell

Hi, folks;

I didn't work with so many Spices, some solderless, some with soldered IC's (less than 20 units), but what I saw is closer to what Tony mentions. I remember looking closer at the PCB's layout and finding that, except for pin #8 of the first one, all 8-pin IC's were connected in paralell, like the common "piggy back" found in some HP41 fullnuts. Not too hard to figure out that that was the RAM position, C-type units, of course.

I did not notice any other missing connection. But when checking the ROM connections in an HP41 fullnut, there is a NC terminal I used to think was for WR (write) purposes, but later I found the HP41 schematics and it is labled "DATA" (I'll have to read about his later...). In this case, a RAM IC would not work in a ROM IC position. Based on what David wrote, I'll take extra care when dealing with Spices. David, did you see this difference in both solderless and regular (soldered) units as well?

Cheers.

Luiz (Brasil)

Re: hp33e display fault -- IC locations

*Message #8 Posted by **David Smith** on 24 Apr 2004, 12:56 p.m.,*
in response to message #6 by Tony Duell

The machine that I was working on could easily of had the connection between the the two power supply pins open. I seem to remember it had a bad case of the green fuzzies/white powder/broken contacts/bad cable/etc that we all are so fond of in our Spice machines. I have only seen one or two machines with the very early keyboard that was not "C" compatible.

HP-12C Programming

*Message #1 Posted by **Graham Fraser** on 20 Apr 2004, 4:45 p.m.*

I'm inputing a program from the user guide, I follow the guide by the letter. My sum still comes out to zero as in the program is not working or it hasn't registered?

Re: HP-12C Programming

*Message #2 Posted by **Graham Fraser** on 20 Apr 2004, 5:02 p.m.,*
in response to message #1 by Graham Fraser

the program in question is on page 137 of the user guide, i'm trying to solve for yield and to solve for yield with a 10% residual

Re: HP-12C Programming

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 20 Apr 2004, 11:53 p.m.,*
in response to message #2 by Graham Fraser

Hello, Graham;

I'd like (and I want) to help you, but I think the owner's handbook you have is different of the one I have. Just for checking purposes: the one I have in hand is: "HP12C Owner's Handbook and Problem-Solving Guide" (English), dated May 1984, Revision F. Is it the same as yours? If so, the program you're talking about is the example shown under "Multiple Programs"; is it correct?

I guess my "HP12C OH&PSG" is not the same as yours. In this case, may I ask you what program are you typing in? A brief description would help us (me?) locating it.

I also have the "HP12C Platinum OH&PSG" (English) in hands, and it has a program listed in p. 137 that is meant to be used when you're computing a depreciation by using Declining Balance ([DB]) method when acquisition time occurs any time during the year. Is it the program you're talking about?

Anyway, I found a keystroke sequence in the "HP12C Platinum OH&PSG", now in P. 127, that is related to annual yeld computing. Any possibility that this is the one you're talking about? A misplaced "3" instead of a "2" when typing the page #, perhaps?

Another question (forgive asking questions when you're actualy looking for answers): are you using an HP12C or an HP12C Platinum?

Sorry not answering your question, instead adding four others. No help, I know, I just want to "locate" myself so I'll try to help you anyway.

Best regards. (I almost did not post this...)

Luiz (Brazil)

Re: HP-12C Programming

*Message #4 Posted by **Graham Fraser** on 21 Apr 2004, 12:58 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luis I have the HP-12C standard My Book is the Owners handbook and problem solving guide dated Nov 94 edition 3. This is type of scenario I'm trying to get my machine to do: " Equipment worth $5000 is leased for 36 months at $145 per month. The Lessee has agreed to pay the first and last month's payments in advance. At the end of the lease, the equipment may be purchased for 10% (1500) what is the annual yield to the Lessor if the equipment is purchased? I send a lot of lease transactions to leasing companies that are structured as 10% PUT (Purchase upon termination) and I want to check that the yields are not excessive to the customer. Thanks in advance! Graham

Re: HP-12C Programming

*Message #5 Posted by **tony** on 21 Apr 2004, 9:19 p.m.,*
in response to message #4 by Graham Fraser

Graham - that example is on page 177 of my old 1986 12C manual. HP give a keystroke solution - no program. Note 10% of 5000 is 500, not 1500??

Hi to Luiz!

*Message #3 Posted by **Fubar Vikinghelmet** on 20 Apr 2004, 1:19 p.m.,*
in response to message #2 by Fubar Vikinghelmet

I got two of them!

I can't wait to sell them a year from now for $500 each on eBay!

Re: 33s's Available at HP SMB site

*Message #4 Posted by **sleeekone** on 20 Apr 2004, 2:12 p.m.,*
in response to message #3 by Fubar Vikinghelmet

do you realy think they will go for that much because if that is so why not buy more than two

Edited: 20 Apr 2004, 2:15 p.m.

Re: 33s's Available at HP SMB site

*Message #5 Posted by **Fubar Vikinghelmet** on 20 Apr 2004, 5:19 p.m.,*
in response to message #4 by sleeekone

There's a difference between spiteful and greedy. I want two of them for the October P.E. I prefer my HP-28S, though, and once it conks out I'm going to use a PDA running an emulator.

I would offer them up on eBay for a ridiculous sum purely out of spite. A beat-up HP32-SII is going for $167.50 right now on eBay. I despise speculator-collectors and by gosh they're going to pay my price the next time around! Of course, that's half the price Amazon is offering them for...

There is no need for me to purchase, say, a hundred 33s'. Sure, if I sold 'em for $100 a piece to desperate EIT-takers I have a chance of making a nice profit. On the other hand, they may sit in my house for years and years because NCEES came to their senses and allowed anyone to use anything

that can be resonably considered a calculator.

Re: 33s's Available at HP SMB site

*Message #6 Posted by **John Smitherman** on 20 Apr 2004, 2:44 p.m.,*
in response to message #1 by Hp Lover

Thanks for the heads-up Hp Lover. I looked at HP's web site last night and they had not yet added the 33s. I thought that it was strange that they had never sold nor even advertised this model on their site yet it was available for sale from other sources.

Also, I find it interesting that HP is using the 6502 CPU. TI is using the Motorola 68000 and Zilog Z80 CPU's in some of their calculators. These handhelds are using these CPU's 15 - 20 years after they were used to run microcomputers.

For more information on the 6502 see:

http://www.6502.org/

John

6502

*Message #7 Posted by **Andreas** on 21 Apr 2004, 9:49 a.m.,*
in response to message #6 by John Smitherman

Where did you find a reference about the 6502? I thought they were using an ARM cpu. Must have misunderstood something in your post.

Re: 6502

Re: 6502 - Sunplus microcontroller variant...

*Message #9 Posted by **Bill Wiese** on 21 Apr 2004, 1:41 p.m.,*
in response to message #8 by John Smitherman

Actually it's a microcontroller based on the 6502.

It's a Sunplus SPDxxxx (forgot the actual #).

It has RAM, mask ROM, GPIO/LCD port, maybe a serial port IIRC, and a timer. Prob equivalent to a collection of chips that was in a Commodore PET or VIC20 (except for video controller) but may run at a faster clock than the orig 1MHz on Commodore/Apple/Atari home computers of early 1980s.

Has plenty of horsepower to run a decent calculator - or even a software emulation of a prior calc architecture (i.e., a Saturn CPU emulation layer running on a 6502 native engine).

Sunplus has quite a few 6502 variants. Some cut down the instruction set (Y register use?) for simpler tiny/ultra-low-cost apps like mouse controllers.

Bill Wiese
San Jose CA USA

Re: 6502 vs. ARM

*Message #10 Posted by **Paul Brogger** on 21 Apr 2004, 1:45 p.m.,*
in response to message #7 by Andreas

Here's a few CPU-to-Calculator associations I know about:

```
  6502 -- HP-33s
   ARM -- HP-49G+, HP-48Gii (& others?)

  Z-80 -- TI-83 line
M68000 -- TI-89 & derivatives
```

(Note I don't mention the Saturn! Maybe someone would like to expand this list.)

Re: 6502 vs. ARM

*Message #11 Posted by **Tony Duell** on 21 Apr 2004, 2:04 p.m.,*
in response to message #10 by Paul Brogger

An odd (if somewhat irrelevant) one :

Motorola 6800 -- HP9815

(No I don't mean 68000). I think this is perhaps the only example of a classic HP desktop calculator that used an off-the-shelf CPU.

Re: 6502 vs. ARM

*Message #12 Posted by **Andreas** on 21 Apr 2004, 3:15 p.m.,*
in response to message #11 by Tony Duell

Thank you, that's very interesting. I wouldn't have thought that the 6502 made it through the times and is still alive. I must have written thousands of assembler lines for this neat cpu.

6502 is still around and going strong...

6502-flavor CPUs are all over the place, primarily in embedded microcontroller form (that is, with RAM/ROM/timer and I/O all on one chip). Sunplus is one vendor, I think Winbond is another.

Many, many modem chipsets use 6502s as their controller (the part that parses the Hayes 'AT DT nnnn' commands if they don't use host controller setups (which I hate).

Some of my Icom ham radio gear uses Mitsubishi M57000 chips which are 65C02 flavor microcontrollers.

1990s US Mitsubishi cars use, of course, Mitsubishi 6502 flavor CPUs in their engine control units (ECU; controls fuel injection & spark timing). Also some mid-to-late 1990s lower-priced Nissan automobiles in the USA used a Mitsubishi 65C02 CPU variant in their ECU. (Maybe it was a 16-bit 65816, can't remember now...)

That means there's gonna be 6502-flavored CPUs in lots of Mitsubishi TV sets, VCRs, remote controls, etc.

6502 was fun to program.

Not only do I remember the KIM-1 (from Commodore's captive MOS Technology chip co), I remember its predecessor from which it was cloned, the SYM-1 from Synertek.

Synertek & Rockwell were other big producers of 6502 family chips beside MOS Technology, who primarily made chips for Commodore.

Do you remember the Rockwell AIM-65? Had a real KB, single line VFD display, a good BASIC, Forth and ROM assembler. Lusted after one in high school. Really should pick one up!

Re: 6502 -- Remember the KIM-1?

*Message #16 Posted by **David Smith** on 22 Apr 2004, 8:43 p.m.,*
in response to message #15 by Bill Wiese

KIM came before SYM.

I had KIM-1 serial number 24. Turned it into a serial interface to an Analex 600 line/minute printer from a CDC-1604. This was then used on an EAI-640 hybrid computer.

Remember MicroChess... a fairly decent early chess program that ran on a standard 1K KIM-1. I still have that around somewhere.

And another thing... back in the good ole days one could see his bits. Round bits in paper tape. Square bits in cards. Torrodial bits on boardse. Now thems were bits... none of todays leaky capacitor invisibits.

Re: 6502... RCA COSMAC 1802, anybody ?

*Message #17 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Apr 2004, 9:39 p.m.,*
in response to message #16 by David Smith

There are Elf emulators in the web...The CMOS 1802 was my favorite and it allowed for "continuous memory" designs.

*Message #18 Posted by **David Smith** on 24 Apr 2004, 12:51 p.m.,*
in response to message #16 by David Smith

And then there was the Fairchild F8 (which wound up as the Mostek 3870). A hideously slow and bizzare machine. The instruction set was rather byte-efficent though. Marginally more fun to program than the RCA 1802 and the Intel 8008.

Re: 6502 -- What about the 6809? TMS9900?

*Message #19 Posted by **Paul Brogger** on 23 Apr 2004, 9:07 p.m.,*
in response to message #15 by Bill Wiese

I remember articles in BYTE magazine (I think) about the development of the Motorola 6809. It impressed me as having an exceptionally logical, symmetrical instruction set. I believe it's the cpu that was used in the Radio Shack Color Computer.

Does the 6809 live on in any form?

I also remember the Texas Instruments TMS 9900 (used in the TI 99-4A home computer) as an elegantly-architected 16-bit cpu. (The "registers" were actually in memory, right?) I wonder if it is still in use?

For a KIM-1-style device, working at the assembler (or lower) level, it would be nice to have a logical, easy-to-remember instruction set without a lot of quirks & exceptions. (For example, if I remember right, certain features of the 6502's indirect addressing applied only to certain registers and not to others, right?)

Some answers for Paul

Right. A register in the CPU just pointed to the "registers block" in RAM, because silicon real state was too scarce for a 16 bit CPU... Context switching was, well, fast!

Do you remember the Logo Turtles in the TI 99/4 ? :-)

Re: Some answers for Paul

*Message #21 Posted by **David Yeka** on 23 Apr 2004, 10:29 p.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Actually it wasn't lack of on CPU space that caused the TMS9900 to have off chip registers. The design was so it could to fast interrupt processing. More so, fast multiple interrupt processing. I remember you could code for interrupts within interrupts each with their own full register set effectively preserving machine state from interrupt to interrupt. It was a great processor for real-time processing.

Also, I loved the KIM-1. It was the first microprocessor I learned programming on. Actually taught myself so I could serve as a lab instructor for a new course at University. You could do quite a bit with the board and some extra chips.

TMS9900 (was Re: Some answers for Paul)

> could to fast interrupt processing.

Actually if you the published interviews with the designers, keeping the silicon area down was in fact an important reason for the off-chip registers. The fast interrupt (or context switch) was a nice side effect, although since it came at the cost of making all instructions slower, it's not clear that it was really a very good tradeoff.

The team that developed the 9900 originally had something much more impressive in mind, but found that it was going to be too big for cost-effective fabrication using the technology available at the time.

TMS9900 (was Re: Some answers for Paul)

*Message #23 Posted by **Eric Smith** on 24 Apr 2004, 12:04 a.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Regarding the TMS9900:

> Quote:
>
> Context switching was, well, fast!

Sure, but at the cost that everything else was slow, since everything that would be a simple internal register access in a normal processor became a slower external memory reference.

It was a nice architecture, and this was an interesting tradeoff, but the performance wasn't competitive when other 16-bit microprocessors showed up. TI was also unable to get the enhanced versions they needed to compete completed and onto the market quickly enough.

IIRC, the 99000 was to have an on-chip cache of the register window, which would have helped a lot. Of course, flushing dirty register cache entries would have lost some of that fast context switch advantage, but the general speedup would have more than made up for it.

in response to message #19 by Paul Brogger

> Does the 6809 live on in any form?

The 6800 family has progressed a lot-- not so much in speed as the 65 family has, but in microcontrollers with a lot of nice features. (See the 68HC11 family.)

> (For example, if I remember right, certain features of the 6502's indirect addressing applied only to certain registers and not to others, right?)

<end quote> Some of the indexed indirect and indirect indexed instructions' operands are only one byte, meaning that first you refer to an address in zero page. Others like JMP(addr) (an indirect) or JMP(addr,X) (an indexed

indirect) have 16-bit operands to start with any address in the 64KB space. The 6502's zero page (addresses 0000-00FF) are basically 256 processor registers, and they offer more flexibility and can can be accessed faster than the rest of the memory map. It's part of what gives the 6502 a surprisingly high power-to-complexity ratio.

The to follow the 6800 to 6809 progression in the 65 family would be kind of like going from the 6502 to the 65816. Actually the '816 takes the progression a lot further. It has 16-bit accumulator and index registers, and a 16MB address space. The "zero page" is now called "direct page" because it can be moved around to anywhere in the first 64KB of address space instead of being stuck in page 0. The '816 has extra instructions and features that make it more suitable for relocatable code, multitasking, and other things, without really giving up the simplicity.

The TI 8-bitters were all very poor in performance as far as I know. Even the TMS370 has a minimum interrupt latency that's almost ten times as slow as the 65c02's-- 3 microseconds for the TMS370, versus 0.35 for the 65c02, both running at 20MHz. (Actually, with a certain trick, the 65c02's minimum is only a little over .05us (50 nanoseconds) at 20MHz, but you can't do that for every interrupt.

The 1802 someone else referred to had certain advantages in its time which made it a good choice in some spacecraft and low-power applications. It was one of the first CMOS processors and rad-hard. It had enough onboard registers that for some tiny applications you didn't have to use any external RAM. It was slow as molasses in January though.

Maybe H-P/Kinpo was just trying to make it more "educational" by more closely approximating the theoretical definition of a "point" (that is, a dimensionless location on the LCD plane) with the smallest pixel possible?

Re: 33s decimal point

*Message #35 Posted by **Robin** on 25 Apr 2004, 2:53 p.m.,*
in response to message #34 by Paul Brogger

..the decimal point on the 33s is about 1/2 the size of a regular pixel from the 33s-Digits (using MODE 4).

Just to compare: My 42s uses a 4 pixels square as a decimal point, so it is about 5 times bigger !!!

They could have tried to use some pixels(wasting one digit) in the 33s display, too(maybe future versions will??). I can't think of normal reasons that they have left it like this, HP must have had some good reasons (probably not do delay it's release anylonger).

Additionally, the shadows from the LCD-digits on the display makes it even more difficult to recognize the decimal point and the digits, too.

But we can't expect everything at once, can we :-) I'm happy with the keyboard and some other features, but compared with the 42s programming is annoying(->labels). I'm glad the 33s is only for spare since we've still got the permission to use the 42s :-)

You are in Switzerland, yes? What is with the "permission" to use a 42s?

Re: 33s decimal point

*Message #38 Posted by **Robin** on 26 Apr 2004, 4:29 p.m.,*
in response to message #37 by bill platt (les Estats Unis d'Amerique)

I should better say: it's not prohibited until now, I'm the only one who is using a HP 42s. All the others use TI.

BTW I'm just in a one year preparation study (TBM) for the engineering school I'm (hoply) going to start with in oktober. The preparation is very usual in Switzerland and get's more and more popular.. I'm not familar with other country's engingeering school/university-system. The "PE" study will take me 3 years in Switzerland if I do it full-time and 4 years if I only go to school in the evenings,friday and eventually saturday. I prefer 3 years.

They're calc rule says: - battery powered - no printing ability (the 42s has, but only in combination with a printer)

not so long ago, they've also added: - no graphic ability (because some students thought they had a disadvantage because they coulnd't afford a Graphic) - max. 2 line-display

Regards, Robin

Do you work for HP? Just curious.

*Message #39 Posted by **Matt Kernal** on 20 Apr 2004, 7:16 p.m.,*
in response to message #1 by Hp Lover

Hi HP Lover,

Thanks for the tip! I was scrolling through the forum, and by chance, I just noticed a previous post from HP Lover. It is this one : Re: Where is the 33S .

Because the post says "thanks for such interest!", it seems that HP Lover is associated with HP. As far as I'm concerned, that's great! The more HP folks that read these messages (and respond to our desires that HP return to calculator supremacy by leading and not following the competition) the better!

A funny thing I noticed at your smb link above, is that the web designer got ahead of the proof reader. The following two comments (in parentheses) probably weren't supposed to make it to the product description:

"your choice of RPN (please link to RPN page)"

"reducing the number of keystrokes. (NOTE: Please add link to RPN on “RPN” text)"

Thanks again for the notification,

Matt

ps. Everyone: don't forget to use the $9.99 rebate that is in the fine print on the free Business 2.0 subscription flyer (inside the 33S package).

Press Release

*Message #40 Posted by **Juergen (CH)** on 21 Apr 2004, 2:36 a.m.,*
in response to message #1 by Hp Lover

Press Release

Now I know why it is twice as expensive in Switzerland than in the US: sales taxes and shipping.

Re: Press Release - A comment

*Message #41 Posted by **Andrés C. Rodríguez (Argentina)** on 21 Apr 2004, 5:46 a.m.,*
in response to message #40 by Juergen (CH)

Quote from the HP33S press release:

"The predecessor to the HP 33s calculator, the HP 32sII, was extremely popular. Of all the calculators that we have made, the HP 32sII has been the one most mentioned by name by our customers," said Fred Valdez, general manager, calculators, Personal Systems Group, HP".

Most mentioned? IF (and this is a big IF) this is so, there should be hope for a 43S (a much asked for 42S successor)!

OpenRPN CPU opinions

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 20 Apr 2004, 10:22 a.m.*

Hi to all,

I'm thinking in create a virtual CPU for this project, that can be implemented on any hardware platform and that can run the same OS without modifications on these platforms. This can be easily done as we are used to deal with emulators, the difficult part will be the CPU definition (capabilities, speed, bus width, size of its numeric representation - BCD, IEEE floating point, constructive reals??), memory size, expansion capabilities, I/O capabilities, storage, display.

My idea is a CPU capable of deal with something like the "constructive reals" mentioned elsewhere in the forum, or at least a large BCD precision (>15 digits mantissa, 4 digits exponent) and a very orthogonal instruction set and generic registers (RISC like) with some especialized instructions to deal with keyboard and display and some type of "plug-and-play" for memory,I/O.

Any other ideas or suggestions?

Best regards,

Nelson

Re: OpenRPN CPU opinions

*Message #2 Posted by **Hugh** on 20 Apr 2004, 10:56 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Everything's sounding good here. One question though, can we get away with emulation without major efficiency losses? Or is it possible to just port the OS directly to other processors? Just curious, I don't know quite as much about this particular area of design, so I'll be listening closely and see if I can't learn a few things myself.

Carry on, it's exciting to see this part of development beginning!

Re: OpenRPN CPU opinions

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 20 Apr 2004, 3:22 p.m.,*
in response to message #2 by Hugh

My idea is to create a RISC CPU dedicated to math, easy to implement and emulate. The idea is first emulate it on PC and after the concept has proven good on a protoboard with some microcontroller (I'll start with PICs as I have some here ready to go). With a 20MHz clock PIC I guess I can achieve more than 100.000 emulated instructions per second on it, and with other platform (MSP, AVR) even more. This CPU will need to be projected also keeping in mind the FPGA idea, if someone wants to create a hardware CPU (VERY fast!).

I was thinking at first to use 80 bit or even 128 bit internal registers to store temporary data, but I think that I'll choose some more dedicated to pointers on external RAM to implement any-size numeric operators (RAM is cheap!) and creating instructions to deal with this any-sized operators.

The idea to port the OS directly to the hardware platform is OK too, I just found more fun to create a new CPU! Of course this can be a very good challenge to port the math routines from, say, HP-42S or HP-15C, to the new CPU - but its ROMS are "small" and "easy" to do the reverse engineering. Of course we can also emulate directly the Saturn CPU, but the precision will be stuck on 12/15 digits.

Any ideas from the emulator's Gurus out there?

Best regards,

Nelson

Re: OpenRPN CPU opinions

*Message #5 Posted by **Renato (Brasil)** on 21 Apr 2004, 2:26 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

Nelson, Have you considered implementing a HP CPU, instead of a RISC CPU ? Motivations, in my opinion, are: 1. It would be FUN. I heard that Stephen Wozniak of Apple was a chip designer at HP, early in his career. I have studied some parts of Apple II design, and it amazed me. Woz has done miracles with the Video, RAM refresh and Floppy circuits. I think Apple II inherited some ideas from HP calcs CPUs (extensive use of state machines, very clever timing techniques).

2. Implementing the HP cpus instruction set would help documenting and preserving the design. Emulators help, but a hardware implementation of the CPU would provide ultimate documentation of the design

3. It would be a better platform for the original HP algorithms. If instructions are the same as HP cpus, word size could be changed without major modifications to algorithms

4. The emulator guys could help you debug the CPU. They understand the instruction set, the registers architeture and the execution flow. I think they would be very happy to interact with you during CPU debugging.

5. You could use original HP ROMS for testing the CPU design, and for using it in a real calculator.

Good luck ad have fun. Renato

Re: OpenRPN CPU opinions

*Message #6 Posted by **Anon** on 20 Apr 2004, 7:29 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

I am getting worried that this project will never get off the ground. While I'd love to see this device produced, it seems that the amount of complexity is becoming huge.

For instance, why exactly is a new virtual CPU needed? That is a huge amount of (possibly uneeded) work. why not just use a pre-existing bytecode language, and use a CPU with a bytecode interpreter already made?

As for the physical processor, how about an underclocked TI MSP series CPU? 16 bits at pretty low power.

Re: OpenRPN CPU opinions

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 20 Apr 2004, 8:03 p.m.,*
in response to message #6 by Anon

I opted for the CPU emulation to be more flexible. I have some TI MSP430 here and I'm planning to use them in the next prototype. But I think that mantain an OS in multiple platforms is more complex that maintain an emulator and using the very same OS on all of them. But it is only my idea, it is not the final decision yet.

The MSP430 is very good for this purpose but it can't use external memory directly and it has a small internal SRAM - but it is good for batteries, less than 1uA in standby. The units I have are MSP430F449, 60KB FLASH 2KB SRAM, good enough for an emulator but small for a good calculator. To access external memory with an emulator is easy and transparent to the OS code.

For the MSP430 I need to buy a prototype/development board - I have the bare chips - to start the programming. for the PIC I have it already and can create/debug the I/O code right now (display/keyboard/serial/SD card). I have some "dead" calculators(HP-11C, HP-17B, 41CV) to use their keyboards and bodies.

As I run this project on my spare time this can take some time to get this done (and if I need to spend some $$$ this can take longer...).

Best regards,

Nelson

Re: OpenRPN CPU opinions

*Message #8 Posted by **Hugh** on 20 Apr 2004, 11:15 p.m.,*
in response to message #6 by Anon

A large amount of work, yes. But in my opinion necessary. It would be easier to just pick a processor and develop around it specifically... but inevitably it will become obsolete. With a virtual CPU we can ensure the project's perpetuation, which is one of my major goals. If it isn't sustainable, then we're just wasting our time. It also allows us to define a standard more readily, which is a big plus!

This direction has my vote.

By the way, OpenRPN may look daunting, but it can be done... and I will see that it comes to life. Allow me to paraphrse: We chose to develop OpenRPN not because it is easy, but because it is hard. It will get off the ground.

Keep up the good work everyone, I can't wait to see this phase going into motion!

" It would be easier to just pick a processor and develop around it specifically... but inevitably it will become obsolete. "

The HP33s is based on the 6502, which has been around since 1976. The most popular type of microcontroller core today, the 8051, is from 1980. The PIC was first designed in 1976.

My PC is based on the intel *86 design, which was introduced in the late 70's and is still going strong. Code written for an XT will probably still run today.

While I admire your project, I don't think you really have to worry about a CPU core becoming obsolete - as long as you are careful. Chips themselves may become obsolete but the core will be around for ages. And if the particular CPU you use becomes obsolete, you'd need to rewrite the emulator anyway.

I think that as long as the core is not single-sourced, you have nothing to worry about.

I wish you all the best

"My PC is based on the intel *86 design, which was introduced in the late 70's and is still going strong.

<end quote> The 6502 family (which has had many improvements since 1976) is still going strong, and the IP holder, WDC (Western Design Center), has no plans to ever discontinue it. Their 65c02's will all do a guaranteed minimum of 14MHz, and most will do 20MHz (which is worth about 40MHz of a PIC16 if the PIC can do the job at all. I have plenty of experience with both). I understand that one of WDC's licensees has a 65c02 core running at 200MHz in a custom IC, meaning about 50 MIPS, with maximum total interrupt latency of 70ns (finishing an instruction and carrying out the interrupt sequence), and minimum of just over 5ns with a special trick. The 65c02 does have STоP and WAIt instructions, and have guaranteed spec.s from 5V down to 1.2V, so it's good for battery-powered operation. The 16-bit version is the 65816. What has always attracted me to the 65 family is the surprisingly high power-to-complexity ratio. WDC has standard microcontrollers based on these processors, but they don't have a lot of versions like you can find with some of the other families. Most people don't realize they own 6502's, because they're embedded in so many products, from camcorders and VCRs to even life-support equipment. In fact, more 6502 cores are going into products today than at any previous time in history--200,000,000 per year, according to WDC.

in response to message #1 by Nelson M. Sicuro (Brazil)

hello nelson,

i am currently writing a calculator program for the palm pilot that uses range arithmetic explained here: http://www.voidware.com/range.htm this is a predecessor to constructive reals and i am deliberately trying to

keep a lid on complexity.

with regard to the ideas here, i would say that from a software perspective, a general indication of cpu capability is required. my project goes out from the direction, "what can be achieved on a pda" and i have upgraded my notions from 20Mhz to 200Mhz this time round. at 20, i chose fixed length 30 digits but they were too slow for programming. at 200, im not planning more digits, but error tracking and programmability.

there are two paradigms. come in from hardware and fixate the number system and representation, write your custom code. or come in from software, punt on the actual cpu and port your code as required to the general purpose chip that looks good/cheap/low-power that day.

an emulator looks like a good way to define a chip, at least logically. you also need to know that your design isnt dominated by something general and already out there at low cost etc. that makes the former approach feasible.

*Message #12 Posted by **Jonathan Purvis (NZ)** on 21 Apr 2004, 3:27 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

Dare i suggest basing the OpenRPN calculator on RPL? Rather than emulating an entire CPU, with it's limitations on memory space and word size, why not just implement the few primatives necessary and run the rest of the operating system and programs through the magic of Forth-style code?

Since the stack is entirely pointers to objects, there are no worries about memory limits, just choose the appropriate address word size. The same code can run on CPUs from the 6502 to the PowerPC 970 and beyond!

Decompiling a program to transfer to different hardware is just a matter of looking up the addresses in a table (if you avoid the HP-48's problem of undocumented entry points, easy in an open operating system). Then just recompile for the target machine.

RPL is one of the easiest languages to target a compiler to, so there will be no shortage of higher level languages to write programs in for those who don't like to write their code "backwards".

If you take up this idea, i personally volunteer to write a "keystroke programmable calculator" front end for those that prefer the traditional RPN way of doing things.

Re: OpenRPN CPU opinions

*Message #13 Posted by **Paul Brogger** on 21 Apr 2004, 1:55 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

This topic should definitely be moved to a thread on the OpenRPN board. (Maybe these MoHPC Forum entries could be copied there for starters?)

For my part, I can't understand why, if the goal is a programmable RPN calculator, one would start at the CPU level. There are PLENTY of options available which include documentation, assemblers, compilers and development/debug tools.

One example: using an ARM core (if possible & economical) would confer tremendous spinoff benefits as it would be the same CPU as is employed in the 49G+ line.

It may be fun to do, and it may mesh nicely with someone's skill set, but I don't see how the benefits can possibly outweigh the added cost, delay, and dearth of software support that seem to me inevitable.

But, I'm a rookie in all this . . .

HP-38C ROM bank switching

*Message #1 Posted by **Eric Smith** on 20 Apr 2004, 3:22 a.m.*

I've been trying to get the HP-38C working in Nonpareil. In the Spice series, the HP-34C, HP-38E, and HP-38C all have more than 4 Kwords of ROM. Since 4K is the addressing limit of the processor, they use bank switching. The HP-38E/C have two banks for quad 1 (1 Kword from 2000..3777 octal), for a total of 5 Kwords. The HP-34C has two banks each for quads 1, 2, and 3.

I've been trying to figure out the details of the bank switching by comparing Nonpareil traces to captured traces from the real thing. My first guess was that the instruction 1060 octal did an immediate switch of the quad the instruction was fetched from. This was quickly disproven.

The next guess was that it did the bank switch of the current quad, but delayed by one instruction cycle to allow time for a branch instruction to be fetched from the original bank. This is probably not completely correct, as the 38C isn't functional, but it does now display "Pr Error", so I think I'm on the right track.

I'll have to continue capturing traces for comparison. Currently the comparison is a fairly labor-intensive process, but I'll write a script to partially automate it.

Prior to the Spice series, the HP-19C, HP-67, HP-92, HP-95C, and HP-97 used bank switching. I suspect that the technique will be the same as that of the Spice series, but won't know until I can dump the ROMs. Before Spice, the calculators did not have a self-test, so dumping the ROMs of those will be much more difficult. With the self-test, I simply passively monitor the Phi2, SYNC, and ISA signals to grab the ROM addresses and data as the ROM checksum is computed.

Re: HP-38C ROM bank switching

*Message #2 Posted by **J-F Garnier** on 20 Apr 2004, 6:36 a.m.,*
in response to message #1 by Eric Smith

It is amazing to see that successive calculator generations use bank switching at some point: 4k Spice, 64k CocoNut, 512k Saturn.

Addressable memory space seems always to be too small...

Thanks, Eric, for these very interesting information.

J-F

Re: HP-38C ROM bank switching

*Message #3 Posted by **Eric Smith** on 20 Apr 2004, 2:43 p.m.,*
in response to message #2 by J-F Garnier

The Classic series started with a 256 word ROM address space, and used bank switching from the beginning to expand that to 2 Kwords (up to 8 ROMs). That wasn't enough for the HP-65 and the HP-55, which each used 3 Kwords. So they added a second level of bank switching to allow for two groups of

eight ROMs (up to 4 Kwords possible).

The HP-9805 was developed by Ft. Collins division using the Classic chip set. It needed even more ROM than that, so they added more bank switching logic external to the CPU and ROMs, as well as a second instruction set (in a sense, a precursor of the "intelligent peripheral" concept used by the Nut CPU, the 1LB4 NPIC chip in the 82143A printer interface, and the 1LB6 PIL chip in the 82160A HP-IL interface).

The HP-46 and HP-81 designs appear to be derived from the HP 9805, but since they don't need nearly as much ROM as the HP 9805, they probably don't use the external bank switching. I haven't studied the HP-46 internals yet and don't have an HP 9505 or HP-81 to examine.

Re: HP-38C ROM bank switching

*Message #4 Posted by **Christoph Giesselink** on 20 Apr 2004, 2:43 p.m.,*
in response to message #2 by J-F Garnier

The Saturn CPU don't use bank switching, the CPU use "covered" technology in connection with then "CONFIG" and "UNCFG" commands.

The difference is,

- Bank switching is normally realized by switching address lines, so each bank has the same size.

- Covered technology overload parts of the accessable memory and each mapped controller can have a different address and size. Covered technology is priority controlled.

But back to bank switching, some Saturn based calculators use bank switching to select memory banks of the 2nd card slot on the HP48GX or selecting banks of the flash ROM on the HP49G. In both cases bank switching provided by external hardware.

Cheers

Christoph

Re: HP-38C ROM bank switching

*Message #5 Posted by **Eric Smith** on 22 Apr 2004, 5:52 a.m.,*
in response to message #4 by Christoph Giesselink

Christoph Giesselink writes of some later Saturn-based calculators that use a form of bank switching:

> Quote:
>
> In both cases bank switching provided by external hardware.

In the Classic, Woodstock, Spice, and Nut series, the bank switching is also provided by external hardware, which is built into some of the ROM chips. The CPU has no idea that there are multiple banks, and executes the bank switch instructions as NOPs. The bank-switched ROMs watch the instructions the CPU fetches and handle the bank switching on their own.

Re: HP-38C ROM bank switching

*Message #6 Posted by **Eric Smith** on 22 Apr 2004, 3:31 a.m.,*
in response to message #1 by Eric Smith

I spent several hours over the last few days studying traces captured from a real 38C trying to figure out the details of the bank switching. Sometimes the 1060 instruction seems to switch banks and other times not, yet it doesn't appear to be data dependent. At least not in any obvious way.

Just after I got to bed last night, another possibility occurred to me. I've only confirmed a part of the supporting evidence so far; I'll have to revise my code that extracts the ROM image from the raw romsucker log in order to fully test it.

What I realized is that during the execution of the checksum instruction, which checksums a 1K block of ROM, the bank instruction probably still takes effect when it is read out, and that it probably does in fact always take effect immediately as I'd originally guessed. If that's the case, rather than the self test doing the checksum over a single coherent 1K bank, and then the other, it is just doing it twice starting from opposite banks but toggling back and forth within the block.

For that to work and still be able to do a comprehensive checksum of each bank, it would be required that the 1060 instruction always be present at the same location in both banks. And it would be quite likely that there would be an even number of 1060 instructions in each bank.

So far tonight I've verified that both the 38E and 38C ROMs do contain an even number of 1060 instructions in both banks of block 1 at corresponding addresses.

Tomorrow I'll hack the log extraction problem and Nonpareil to test the theory.

Re: HP-38C ROM bank switching

*Message #7 Posted by **Eric Smith** on 22 Apr 2004, 5:47 a.m.,*
in response to message #6 by Eric Smith

Not only was that theory correct, but ALL bank-switched ROMs track a single bank switch state, and toggle on every 1060 instruction, regardless of from what ROM address the 1060 is fetched. This is unlike the bank-switching on the HP-41C, where every 4K address block that supports bank switching tracks its own independent bank switch status.

Now the 34C, 38E, and 38C limp along somewhat. Most basic math functions on the 34C are working correctly. The 38E and 38C aren't working quite as well. In a 38C trace from a cold start ("Pr Error") through two presses of the "1" key, I can see some differences. I'll have to study the traces to figure out what instruction(s) I've implemented incorrectly. It may be the same bug that's keeping the logarithmic and exponential functions of the 25 from working correctly.

I hope the bank switching on the 19C, 67, 92, 95C, and 97 works the same way, as that will save me a lot of effort.

Re: HP-38C ROM bank switching

*Message #8 Posted by **Eric Smith** on 23 Apr 2004, 3:19 a.m.,*
in response to message #7 by Eric Smith

The trace shows a branch on no carry instruction not branching in the simulator though it does on the calculator. The instructions leading up to the branch instruction do in fact set up conditions such that the branch should not be taken, which means that there's something going wrong earlier leaving incorrect state somewhere. This will be hard to track down, so I'll take some more traces of various operations and hope that some of them show a discrepancy closer to the actual problem.

HP82240A vs HP82240B IR

*Message #1 Posted by **Miki Mihajlovic** on 19 Apr 2004, 6:53 p.m.*

This might have been asked before ... what is the difference between HP82240A and HP82240B IR printers.

1234

Re: HP82240A vs HP82240B IR

*Message #2 Posted by **Eduardo** on 19 Apr 2004, 7:49 p.m.,*
in response to message #1 by Miki Mihajlovic

As far as I know, the main (only?) difference is in the character set that the printers can, well, print. The "B" model has more characters, and if I recall correctly some of those common to A & B are remapped in model B. I found it quite annoying that the differences were so minor, and that model A didn't work so well with the 48 series (I bought model A it for my 28S first, then sold the 28S to buy a 48GX and I realized the printer wasn't totally compatible, bummer!)

Eduardo

Re: HP82240A vs HP82240B IR

*Message #3 Posted by **Steve S** on 19 Apr 2004, 11:25 p.m.,*
in response to message #2 by Eduardo

Eduardo, I can't remember the precise details, but I was lead to believe that the GX is compatible with the 82240A, but that you have to change one (or more) of the calculator settings...??

Re: HP82240A vs HP82240B IR

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 19 Apr 2004, 11:44 p.m.,*
in response to message #2 by Eduardo

Hi;

there is a [OLDPRT] command available in the HP48 that allows you to use the A-type. The calculator remaps the character (if applicable) so you can use the A-series without any problems. (...) O.K., yeap! Let's go further.

The HP82240A uses the Roman8 character set, while the HP82440B allows you to choose between the Roman8 and ECMA94. If you are using the HP28S or any other Pioneer with IR output (HP42S, HP27S... I'm not sure about the HP18C, 17B, 17BII, 19B and 19BII), the B-series will work fine if you're not use the upper character set (ECMA94 is the default for the B-series).

The HP82440B was introduced later and the new character set (ECMA94) fully supports the HP48 character set. As you may have noticed, if you print a string from an HP48 to an HP82240A containing characters with codes above 128 (decimal), some printed characters do not match those in the LCD. If you

execute OLDPRT prior to printing, almost all of them will match (only a few exceptions will not print). If you want to use an HP82240B after that, you should purge the exisitng PRTPAR variable. This variable contains the remapping string and if you do not purge it before using a B-series, then you'll have the same problem: no WYSIWYG effect!

The weirdest thing of all is that the HP49G (not G+) O.S. version 1.19-6 offers OLDPRT, and it indeed creates a PRTPAR with the remapping string. Well, the HP49G has no IR output, so the only meaningfull use for OLDPRT would be "printing" to a file, transfer it to an HP48 and print the file directly to an HP82240A or an HP82240B set to Roman8. As I don't own an HP49G+ (at least so far...), I guess that it may also have a "hidden" OLDPRT command that will allow the use of an HP82240A. Anyone trying it out?

Other differences are related to power consumption and extra space between text lines.

Hope this gives you a glimpse. If I miss something or added a wrong infromation, please forgive me. Again, I wrote by heart...

Cheers.

Luiz (Brazil)

Re: HP82240A vs HP82240B IR

*Message #6 Posted by **James M. Prange** on 20 Apr 2004, 3:02 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

The 49g+ indeed still has the OLDPRT command. I suppose that they left it (and everything for printing via IR except the IR hardware) in the 49G in the expectation that the same basic code would be used on other calculators.

When an 82240B is first turned on (or after a printer reset escape sequence), it uses the Roman-8 character set. When the 48 or 49 series does any printing (except the CR command) to the 82240A/B, it starts with the escape sequence to tell the 82240B to switch to using the (modified) ECMA 94 Latin No. 1 character set. This escape sequence isn't defined in the 82240A, so the 82240A simply ignores it. To get the 82240B back to using the Roman-8 character set (for use with a 28 series, for example), the simplest method is to turn it off and back on, though you could send it the escape sequence to switch to Roman-8 or the printer reset sequence.

Search the Forum Archives, I'm sure more details are in there.

Regards,
James

Thanks!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 20 Apr 2004, 6:43 a.m.,*
in response to message #6 by James M. Prange

Hi, James;

I read my e-mail and it has wrong information. If ECMA94 is the default, all earlier models would have problems printing, and it does not happen.

Thank you again.

Luiz (Brazil)

Re: HP82240A vs HP82240B IR

*Message #8 Posted by **Tony Duell** on 20 Apr 2004, 7:22 a.m.,*
in response to message #2 by Eduardo

To a user, the main difference is the character set(s) that are available. But they're also quite different inside -- they use different IR receiver chips (the -A uses a Philips one, I forget what the -B uses). This makes quite a difference when you're trying to fix the thing!

Re: HP82240A vs HP82240B IR

*Message #9 Posted by **Gonzalo Fernandez** on 21 Apr 2004, 7:11 p.m.,*

Please let me know if when turned on the 82240B has a red led permanently ON, and the 82240A has no led.

thanks

Re: HP82240A vs HP82240B IR

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 21 Apr 2004, 7:56 p.m.,*
in response to message #9 by Gonzalo Fernandez

Hi;

this is one information I thought to ask about. I had an HP82240A for a while, so I bought a B-type when it was released and sold the A-type. But I am quite sure the A-type had no LED, and I remember that althought a LED is an extra power consumption component, it's a good way to remind the user that the printer is still switched to ON. It effectively may reduce power consumption, then.

I think your observation is correct, but in order to identify the model type, you can also turn it upside down: there is a 82240B "written" in the identification space ("label"?), closer to the IR sensor.

Cheers.

Luiz (Brazil)

Edited: 21 Apr 2004, 7:57 p.m.

Re: HP82240A vs HP82240B IR

*Message #11 Posted by **James M. Prange** on 21 Apr 2004, 8:35 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Yes, the red LED takes some power, but there might be internal changes (besides the "low-power" mode) that compensate.

Of course when actually printing, the highest power use would be the printhead / paper advance motor and the thermal printhead. As both models are rated for the same number of print lines per battery set, I'd infer that it's the same in both models.

Regards,
James

Re: HP82240A vs HP82240B IR

*Message #12 Posted by **James M. Prange** on 21 Apr 2004, 8:19 p.m.,*
in response to message #9 by Gonzalo Fernandez

The 82240A has no LED. The indication that it's on (other than that it receives a signal and prints) is the switch position and the red dot visible on the switch. It stays on until it's turned off or the batteries go dead, whichever comes first.

The 82240B has a red LED visible through the IR window (as well as the red dot) when it's on and able to receive IR signals. When an external power source is used, it stays on and "ready" indefinitely. When running on the internal 4 AA cells, it switches to a "low-power" mode after about 10 minutes of inactivity. In this mode, the LED goes out and it won't receive IR signals, but memory is retained, so anything in the buffer is still there, and underline, expanded width, and ECMA 94 character set modes are retained. To return to the full "ready" mode, press the paper advance button.

I haven't measured the battery current draw in the two 82240B modes, or for that matter, the 82240A, but it would be of general interest. For that matter, the manuals say that even with external power, some current is drawn from the batteries, in particular during "heavy printing". Both manuals state:

> Quote:
>
> Battery life for alkaline batteries is approximately 6000 print lines of continuous printing.

The 82240A manual only goes on to say:

> Quote:
>
> If the printer is left on without printing, battery life is approximately two days.

Regards,
James

RESET button STUCK...

*Message #1 Posted by **Fernando Volpato** on 19 Apr 2004, 11:38 a.m.*

Last thursday, I was trying to update the 49G+ BIOS from 1.20 to 1.23... Following the instructions, press and hold + and - button while pressing RESET for 3 seconds. When I turn the 49g+ to see the other options in LCD. Nothing appears...

I tried to turn on and no answer... I alread changed the batteries changed for new ones... even the backup battery. I verified several times if the batteries are placed correct.

Is there anyway that the RESET button is stuck? any suggestions?

Thank you Fernando

Nonpareil 0.42

*Message #1 Posted by **Eric Smith** on 18 Apr 2004, 3:35 a.m.*

Nonpareil 0.42 adds Nut processor support, and specifically simulation of the HP-41CV. Some Voyager support is present but not yet debugged.

The annunciators are not yet displayed. There is not yet any way to save the calculator state (including RAM), so it always starts up with "MEMORY LOST". Thus it doesn't yet obsolete NSIM, though it will in the near future.

I've bribed a friend to do a Windows port. However, I'm considering selling it rather than making it free software. (The Linux/Posix version will remain free.) I'll have to check whether there is any issue with proprietary software dynamically linking to the GTK+ toolkit and related libraries. I'll also have to provide my own scans of the calculators.

Re: Nonpareil 0.42

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Apr 2004, 3:33 p.m.,*
in response to message #1 by Eric Smith

Eric:

I would very much like to (eventually) have the Windows version, even if a not-so-large amount is to be paid. Please, in such case, use PayPal or a credit card accessible for international users.

I would suggest two features for your "product":

First: No need to recompile, etc; it should run from the distributed files with a simple install process (standard user mode). However, enough details should be available for tweaking/learning/trying things in a "what if" manner, like ROM entry points, ROM editing by the user, etc. This may be an "Expert mode" sort of feature. A tutorial would be nice, too.

Second: If you like to run the emulatd calculators just as virtual replicas for everyday use, then the numeric keypad on the PC keyboard should allow at least for number and decimal point entry, Enter, and the four standard arithmetic operations. Roll down should work from the cursor down-arrow (I think there are no roll-ups you need to care about in these models, but eventually up-arrow would do). Cursor right arrow may mean X<>Y, and cursor left arrow may be CLx. While the rest of the keys man need the mouse to operate with on the GUI, these assignments would make for a rather usable calculator. An editable keyboard mapping file would also be a great addition (keep in mind the different language-specific keyboard layouts, ans the fact that notebooks have different layouts by themselves).

Best regards ans congratulations for such an important development.

Yes, Paypal is what I have in mind.

> Quote:
>
> First: No need to recompile, etc; it should run from the distributed files with a simple install process (standard user mode).

Yes, it will most likely be distributed as a ZIP file containing a .EXE installer.

> Quote:
>

Nonpareil does not know or care about ROM entry points. It uses separate files containing ROM code, so these can be edited by the user as desired, although Nonpareil will not particularly help (or hinder) such modification.

> Second: If you like to run the emulatd calculators just as virtual replicas for everyday use, then the numeric keypad on the PC keyboard should allow at least for number and decimal point entry, Enter, and the four standard arithmetic operations.

Already done.

> Quote:
>
> Roll down should work from the cursor down-arrow (I think there are no roll-ups you need to care about in these models, but eventually up-arrow would do). Cursor right arrow may mean X<>Y, and cursor left arrow may be CLx.

I hadn't thought of those, but that seems like good defaults. I'll put them in.

> Quote:
>
> An editable keyboard mapping file would also be a great addition (keep in mind the different language-specific keyboard layouts, ans the fact that notebooks have different layouts by themselves).

Already done. Nonpareil uses a extended/modified variant of the KML files used by Emu48. The keyboard mapping is configurable.

Thanks for the suggestions!

OLDER QUOTE:
" "Roll down should work from the cursor down-arrow (I think there are no roll-ups you need to care about in these models, but eventually up-arrow would do). Cursor right arrow may mean X<>Y, and cursor left arrow may be CLx." "

I strongly disagree with cursor left arrow as CLx !!
It is not only prone to accidents, but that keys "usually" invokes the Graphics screen!!!
The one-digit corrector eg. backspace acts CLx when there is no command line OR on non-RPL models it IS the CLx

The other suggestions seem good on "standard" environment. [VPN]

For the forseeable future, Nonpareil only simulates calculators that predate the Saturn processor. I may someday add support for Saturn-based calculators including those using RPL, but since other people have already written simulators for those, it's not high on my priority list.

None of the pre-Saturn calculators have any concept of a graphics screen. And none prior to the HP-41C have a backspace for number entry.

In any case, you will be able to customize the keyboard layout if you don't like the defaults.

Key assignments

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Apr 2004, 8:42 a.m.,*
in response to message #4 by Veli-Pekka Nousiainen

Backspace may be a better option for CLx. If keyboard assignment is configurable, then each person may have his/her choice; which is the best possible situation.

What I would not like:

a) The need to click with a mouse on the screen, specially for number entry. And better yet, if the "Stack Group Keys": Enter, X<>Y, Rv, CLx could be "pressed" without the mouse. There may be issues with CHS (as different from the subtraction "minus"... may "Shift minus" be an option?) and, to a lesser extent, with EEX ("E" may be a logical choice, there may be others).

b) The usage of some keys like "<" or ">" on the main PC keyboard, which vary in location due to national language layout variations (for instance, this was a big problem for me when I used MS Flight Simulator with a non-US keyboard some years ago)

c) As notebooks usually don't have a separate numeric keypad, the full keyboard default may be

inconvenient (Flight Simulator comes to mind again, and not for good reasons). Other configurations may be needed.

d) Problems arising from the use of "," (comma) or "." (period) as decimal separator, set on the Windows Regional Configuration applet. There are pieces of software affected by this kind of selection. So, in my humble opinion, the keyboard "dot" should be the decimal separator, without caring for the other Windows settings.

Again, if the mapping is configurable, each of us can choose freely.

Thank you again, Eric.

33 cogo

*Message #1 Posted by **B** on 17 Apr 2004, 10:37 p.m.*

The guys with the 33s and cogo were going nuts today at the fls. They hated it. I have neither a 33 or any cogo so I cant comment on it but these guys seemed unable to work it. Maybe sometime between now and October (if I have to take it again) there will be some better programming available.

Re: 33 cogo

*Message #2 Posted by **Arnaud Amiel** on 18 Apr 2004, 4:14 a.m.,*
in response to message #1 by B

An advanced calculator is only useful if you now how to use it. I guess I would be infuriated if I bought a $300 piece of hardware and didn't know how to use it for the exam, but I would have only myself to blame as the manual is pretty good. I just guess these ones didn't read it.

Arnaud

*Message #6 Posted by **George Rose** on 18 Apr 2004, 5:27 p.m.,*
in response to message #1 by B

I have only had good reports on my COGO programs. Only one person has had any trouble, and that was entering the programs into the calculator. He had never done ANY programming before. So I talked to him on the phone and I have not heard any more from him. I am hoping that "no news is good news". I have been writing cogo programs, (for my own use at first) for almost 20 years. I think the way my programs prompt for data make them really easy to use. I hope the individuals you refer to were not using my programs. If so, I would like to discuss the matter with them to see what could be done different.

Re: 33 cogo

*Message #7 Posted by **b** on 18 Apr 2004, 7:23 p.m.,*
in response to message #6 by George Rose

The programs were not yours it came from another writer.

The main gripe they were having was that you couldnt enter as angle right. It was either bearing/azimuth or angle left for some odd reason..

If you can crank me something out that works in angle right I will probably buy from you. If its in anything other than angle right however it would probably do more damage than good for me.

Re: 33 cogo

*Message #8 Posted by **George Rose** on 18 Apr 2004, 8:48 p.m.,*
in response to message #7 by b

My Casio programs work in Angle Right, Bearings, and Azimuths. Writing a program for the 33S to work in angle right is not difficult. But do to the way the HP32S and HP33S memory works, labels are a precious item. Also the fact that the HP can not add an alpha-string to the prompt makes it difficult for the user to PLAINLY see what the program is asking for. The 33S has one big undivided memory that uses 26 'labels', A-Z, which are key points to jump to in the memory. But with the Casios, if you have 50 programs, you can use labels A-Z and 0-9 for a total of 36 labels in every program. The 33S has plenty of memory. The biggest challenge is getting around the label issue. If I figure something out I'll post it on MoHPC for other programmers to make use of.

Re: 33 cogo / a painfully obvious suggestion - sorry

*Message #9 Posted by **db(martinez,california)** on 18 Apr 2004, 9:25 p.m.,*
in response to message #8 by George Rose

Mr. Rose;

Please excuse my butting in. I don't know how you have written your program but: Are you burning up two different labels and two different memory registers for quadrant one bearings and azimuths? If so, can you combine them? I know entering an az as a bearing will add another step for old fogies like me who work in azimuth but that would free up one letter. Anyone who can't get it that they are the same should not be sitting for the exam.

BTW; What's with that other guys program? He should re-write his algorythm so it'll use negative and positive field angles. - d

Re: 33 cogo / a painfully obvious suggestion - sorry

*Message #10 Posted by **George** on 18 Apr 2004, 9:46 p.m.,*

in response to message #9 by db(martinez,california)

No, I don't use 2 separate registers. But I do use 3 labels to work with bearings, such as: IF Q=2 GOTO 'X' ... ... LABEL 'X' 180 'ANGLE' - STO 'ANGLE' Thanks for the input though. I am always open to new ideas. All of my "ideas" are self-taught through trial and error.

Re: 33 cogo / a painfully obvious suggestion - sorry

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 18 Apr 2004, 10:41 p.m.,*
in response to message #9 by db(martinez,california)

Hi folks, D.B.;

BTW: what does COGO stand for? I remember reading the answer for this question in earlier posts, but I forgot...

I also wrote some programs (HP41 with X-memory, HP42S, HP48) that compute bearing, distance, azimuth angle and coordinates in a wilder choice of input data, so I am also curious about the actual purpose of a COGO program. Any enlightments?

What I'd like to add is that I used complex data to record each new pair of coordinates that were stored in a complex matrix ([n × 2]) in the HP42S' version. This arrangement helps computing distance and bearing from one point to another.

I have no HP33S, but it seems it's close to the HP32S when programming is the issue, right? If the programs I wrote (mostly surveying) are of any help, I can post them. The problem is that most expressions are in Portuguese (brazilian) and maybe I'll not find the correct English equivalent term... So, I may need help translating them.

The programs and computing techniques used on them are of my own; I added basic survey to my Electrical Engineering classes, so I remember the basics. (it was a long time ago, but I guess I can take it back...)

Thanks.

Luiz (Brazil)

i don't understand

*Message #1 Posted by **troy** on 17 Apr 2004, 3:05 p.m.*

ok, i'm just starting with this calculator, and still learning a lot (i just acquired the hp 33s). i'm trying to do this:

in DEG mode:

9 sin cos tan atan acos asin = 8.99999986001

in RAD mode:

9 ->RAD sin cos tan atan acos asin ->DEG = 9.00000000009

9 pi x 180 / sin cos tan atan acos asin 180 x pi / = 9.00000000009

does that mean RAD mode is more accurate?

thanks for the comments!

Re: i don't understand

*Message #2 Posted by **Mike Sebastian (Texas)** on 17 Apr 2004, 7:44 p.m.,*
in response to message #1 by troy

While the first step (sin) is numerically equivalent to the degrees calculation, the input angle for second step (cos) is equivalent to approximately 8.96303461718 degrees (compaired to 0.15643446504 degrees in the "degree mode" evaluation of the algorithm). Except for the first and last steps, the actual magnitude of the angles in radians for the intermediate steps are much larger than they are in "degree mode," and the algorithms used to calculate the trigonometric functions are much better behaved with those larger angles.

hp25 on/off switch

*Message #1 Posted by **thaddeus boruta** on 17 Apr 2004, 2:46 p.m.*

My hp 25 on/off switch has given up the ghost.(It used to repond after 1 or 2 on-off cycles, eventually it took many off-on cycles, now it does not respond.) I had taken the circuit board out, and found the switch location, but it looks like i would have to cut through the welded plastic attachment buttons to get at the switch. I fear that that would create a bigger problem than my off-on switch. Does anyone have any suggestions? Thank You, Thad

Re: hp25 on/off switch

*Message #2 Posted by **David Smith** on 18 Apr 2004, 3:05 p.m.,*
in response to message #1 by thaddeus boruta

If your keyboard version is the type with the holes under each key you may be able to clean the switch contacts using a small wire brush made up of three bristles twisted together, inserted into a pin vise, and trimmed flush. Place a drop of 91% isopropyl alcohol onto the hole under the switch contact, dip the brush into more alcohol, and gently "scritch" around in the switch hole. Some HP25 keybaords have a hole near each end of the switch contacts. If so, do both holes. This technique is not nearly as effective on HP25 power switches as it is on the key contacts...

Re: hp25 on/off switch

*Message #3 Posted by **Thaddeus Boruta** on 19 Apr 2004, 12:05 p.m.,*
in response to message #2 by David Smith

Thank you; I will try it.

Re: hp25 on/off switch

*Message #4 Posted by **Jon** on 18 Apr 2004, 4:37 p.m.,*
in response to message #1 by thaddeus boruta

I have repaired that problem removing the full keyboard. You have to eliminate the less possible plastic. If you do it properly you will have material enough to fix the keyboard again using a hot tool.

Re: hp25 on/off switch

*Message #5 Posted by **Thaddeus Boruta** on 19 Apr 2004, 12:13 p.m.,*
in response to message #4 by Jon

Thank You for the help. Are there many loose pieces that fall out when you take the back of the circuit board off?

Re: hp25 on/off switch

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 19 Apr 2004, 2:14 p.m.,*
in response to message #5 by Thaddeus Boruta

Hi, Thadeus;

I was about to post something too, but David and Jon already managed to help you. (this site rules...)

About loose parts: all keys become loose, so don't turn the upper case "up" again unless you plan to hold the keys; also, four others: the two black, plastic sliding switches themselves ([ON OFF] and [PRGM RUN]) and the metal contacts underneath them.

The "function" keys may sometimes be held in place by a sheet of flexible plastic that is found in most Woodstocks (2X series), so you may also keep them in place easier. If you decide to remove the keyboard PCB in order to clean the upper case, beware of two important facts: if using water and some sort of neutral detergent, some inks used in some models may smear and fade; avoid this procedure if you don't need to clean the upper case. When placing the keys back, make sure to check their positions before "gluing" the keyboard back in place; sometimes it happens that some keys are placed in wrong position, and returning them back to their original place after fixing the keyboard means removing the keyboard PCB again... So, double and triple checking means no headache.

The metal contacts in both [ON OFF] and [PGM RUN] keys are sometimes grasped to the keyboard by the "grease" used to reduce the friction between the metal contacts and the printing board.

Hope this helps a bit.

Dear Mr. Luiz, Thanks for the tips. I will try the "no cutting" method first. . . . . this calculator has been so much a part of me, that I will have to "get my courage up" before i can start "operating." Thanks again, Thad

Re: hp25 on/off switch

*Message #8 Posted by **David Smith** on 20 Apr 2004, 1:20 p.m.,*
in response to message #7 by thaddeus Boruta

I have never seen a disassembled keyboard that went back togther again quite the same. One thing that is worth a try may be to give the keyboard a bath in an ultrasonic cleaner. I use three baths of fresh distilled water between each cycle. Shake as much water out of the keyboard after each bath. Dry the keyboard in an oven on low (like 140 F) overnight.

Cleaning an HP 32S

*Message #1 Posted by **Dennis Brunnenmeyer** on 17 Apr 2004, 1:37 p.m.*

Help....!!!

One of my precious HP 32s calculators was subjected to a full load of cafe latte (coffee and milk) last week. I quickly rinsed it with water and dried it off as best I could. Unfortunately, that wasn't good enough. It's now deader than a door nail.

I'm convinced that, if I could open the case, I could clean it. Is it possible to do this without damaging it? Anybody's help would be appreciated.

Thanks....

Re: Cleaning an HP 32S

*Message #2 Posted by **db(martinez,california)** on 17 Apr 2004, 10:28 p.m.,*
in response to message #1 by Dennis Brunnenmeyer

Several people who know more than i do have suggested :

1) Remove the batteries.

2) Soak it in distilled water and then shake it out. Ultrasonic cleaners have also been advocated.

3) Repeat this several times with fresh water each time.

4) Let it dry at least three days before powering it up. Drying it in an oven with only the pilot light burning has also been tried with success.

5) I'd carefully blow it out with canned air too, to help speed the drying and get any last poop out of it. Good luck.

Edited: 17 Apr 2004, 10:32 p.m.

Re: Cleaning an HP 32S

*Message #3 Posted by **Randy Sloyer** on 17 Apr 2004, 11:33 p.m.,*
in response to message #1 by Dennis Brunnenmeyer

If you didn't remove the batteries while it was wet no amount of cleaning will bring it back to life. Electrolysis from the combination of liquid and voltage destroy the on/off traces in the otherwise sealed keyboard.

Once the traces are open, replacement is the only solution. It can be done but it takes a lot of time and a good keyboard circuit from another Pioneer series calculator. Replacing the entire calculator is usually the far easier method.

If you had the foresight to remove the batteries, DB's post is the normal cleaning method. Opening the calculator is not needed, there is nothing more you can do with the unit opened from a cleaning standpoint.

Tubing need

*Message #1 Posted by **Michel Beaulieu** on 16 Apr 2004, 7:37 p.m.*

Hi, some time ago, Kattie post a part number at smallparts.com for a tubing replacing the roller in card reader. I try to buy it, but because i live in Canada, they do not ship there. Also, i don't really need their minimum order for that tubing; a 6 inches of that tubing is all i need for all my life! So if someone have this tubing in extra, can you sell me 6 inches please - My HP-97, 67 and 41 readers will really appreciate!

By the way, i tried other solutions but the replacing roller is always slowly slipping off the shaft. "you" told me that it is because the inner dia. is incorrect. Kattie wrote here that this smallpart.com tubing is the best for the job...

PLED/OLED display (OpenRPN)

*Message #1 Posted by **Hugh** on 16 Apr 2004, 3:38 p.m.*

It's a fairly recent technology, and I've had a devil of a time finding any. But I'm curious if anyone around here has any experience using them. Here's the place where I've found some OLED/PLED displays: http://www.crystalfontz.com/index.html As far as I can tell, these are really the way of the future, and I think they may be a good choice for OpenRPN.

I'm drafting up some basic CAD renderings at the moment, as I think it helps people to see things are actually materializing! Anyways, let me know what you think. I'll draw up a couple of good possibilities (16x1 and 16x2) and try to post them sometime soon.

I'm still having a bit of a pain getting hosting, but one of my friends may be able to donate some space for a while. If so, I'll have a site and nice php driven forum up next week!

Re: PLED/OLED display (OpenRPN)

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 16 Apr 2004, 4:16 p.m.,*
in response to message #1 by Hugh

I like very much the OLED technology, but it is in an early stage of development, and its life span isn't very long. But those displays mentioned share the common interface with any other character LCD or VFD display, so it is easy to develop with one type and use another later.

BTW, I vote for a display at least 20x2 or 24x2, or a small graphic one like 42S' display. I have with me some matrix LED displays, without controller, and I'm building a prototype with them. It is a beauty! Soon I'll get some pictures. I'll create a controller for it using the very same interface used on those LCD character displays, for the sake of compatibility...

<thoughts on>
I think that the hardware part of this project will be very "assorted", and the software will need to deal with that. Once again, my idea is to create a "virtual" CPU that will run the core OS and applications, and the emulation layer will deal with any hardware we put on it. The virtual CPU will report its capabilities to the OS, and the OS enables or disables its features based on that "report", in a standard way. This way some of us can develop the emulator on any platform (PIC, MSP, AVR, PCs, Palm, etc) and others can develop the OS and applications - as soon as we define the CPU and OS API. This way we can have very good calculators on any platform we choose.
<thoughts off>

Best regards,

Nelson

Re: PLED/OLED display (OpenRPN)

*Message #3 Posted by **Garth Wilson** on 19 Apr 2004, 1:04 p.m.,*
in response to message #1 by Hugh

PLED/OLED takes way too much current for a calculator. I looked at the spec. sheet online and then wrote them the following question:

"I was looking at the PLED/OLED spec.s and saw that it says 0.6mA for supply current. Since it is my understanding that this puts out light, I'm sure that is either a mistake or maybe only the current for the logic or something like that. Can you explain?"

Their response came this morning:

"Please find a graph of our current-sweep of one of our PLED displays here:
http://www.crystalfontz.com/backlight/PLED/CFAP_Current_Sweep.pdf

The maximum current used was less than 45mA for logic+brightness. It is likely that the .6mA is for the controller only."

The graph shows that typical text takes 10-19 mA, and the module may take up to nearly 45mA max. I expect it's still not sunlight-readable either like reflective LCDs are.

Not bad, but I expected more from it.

Best greetings.

Re: RCL 20 - Nice little thing

*Message #7 Posted by **Wlodek Mier-Jedrzejowicz** on 16 Apr 2004, 11:28 p.m.,*
in response to message #6 by Guy François

Hi, it's nice to see people are still "discovering" RCL 20. I hope you have as much fun reading it as Frank and I had preparing it. We were incredibly lucky (and honored) to get articles from stars such as Bill Wickes and Dean Lampman. Amazon _should_ have it both in the UK and in the US - thanks for the warning that they do not have it in the US. I hope Dave does not mind my saying that should all else fail, it is OK to email me or Frank (frank@limov.co.uk) to order a copy. And if you are not happy with it, let us know what else should be in the sequel :-) Thanks, Wlodek

hp serial number codes on later models

*Message #1 Posted by **Charlie O.** on 15 Apr 2004, 8:58 p.m.*

This question may have gotten lost in another thread:

Which digits indicate the year and what do they mean? I've been searching everywhere and all I can find are the old codes. 2345S02345 vs ID12345678. Many thanks.

ceo

Re: hp serial number codes on later models

*Message #2 Posted by **Scuba Diver** on 16 Apr 2004, 2:13 p.m.,*
in response to message #1 by Charlie O.

ID12345678

ID = Country code (ID is Indonesia, CN is China) 1 = last digit of year of manufacture (I guess this is 2001) 23 = 23rd week 45678 = sequential number

Hope that helps, and please, anyone, correct me if I'm wrong! B.

Re: hp serial number codes on later models

*Message #3 Posted by **Charlie O.** on 16 Apr 2004, 2:43 p.m.,*
in response to message #2 by Scuba Diver

That all sounds reasonable to me. Was 2001 the year of the color changes? like brown to black plastic, brown to silver bezel and orange, blue keys to purple, green keys?

Also, did hp make several thousand calculators per week or did they run numbers for full production period?

in response to message #1 by deleted

Make sure you check your references before you go making accusations. I also saw this a few days ago on Amazon.com but if you'll look down at the bottom of the ad in the comments section you'll see that he states that the calc for sale is in fact the 32SII and he explicitly states that it is NOT the 33s. I've dealt with Samson Cables several times and have never found them to be anything but honest and professional. This is a fair proposition considering that he's offering a new old stock 32SII still in the box (in fact you can get them at the website for the same price) and it would go for at least that much on E-bay... I think perhaps if Chris does see this that he will be very offended not just at your harsh words but at the your lack of faith in his integrity. Very sloppy research Joe...

Last I checked at http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=363, he's still offering a preorder price of $59.95. Checking on your first link, http://www.amazon.com/exec/obidos/tg/stores/offering/list/-/B0000DK6G9/all/qid%3D1082075271/sr%3D8-

3/ref%3Dxs%5Fap%5Fbun3%5Fxgl23%5Fa/102-5958248-9635333, he clearly states in the comments that this is for a 32SII, not a 33S.

When the first batch of 33S came out in February, he fulfilled a lot of the orders, including mine (I preordered in September.) Whether he's scalping the 32SII's is a matter of opinion (the prices are a littke high compared to to E-bay's auctions, but you get the added bonus of dealing with someone with some knowledge of HP calcualtors, and besides, you're going to get the calculator.)

I'm sure if you ask him to cancel your preorder, he'll do it. It's your perogative.

Tony David Potter.

OpenRPN - A Dissenting View

*Message #1 Posted by **Steve S** on 15 Apr 2004, 7:50 p.m.*

...Since I've written in the Forum recently about new calculator design activities, I won't bore any of you by rehashing old material. But I would like to articulate a couple of thoughts, just for the record. In terms of presentation, a tip of the hat to Nelson for suggesting a clever writing approach!

<Thoughtful Mode On> 1. Reading the existing discussions, it still seems to me that most people here are simply looking to resurrect a slightly improved version of an existing HP design, like an HP-41++ or an HP-16++. I think it would be a terrible waste of time and talent to settle for such a thing! It's the 21st Century! Can't we collectively think of something a bit more clever than how rounded keys should be or building it out of aluminum? 2. Rhetorical Questions: If HP thought this way, would they have ever leapt from HP9800 to HP-35? Or produced the HP-75 / 71? Or even the HP-48? Didn't all of us look to HP to make quantum leaps in product design and capability over the years? Why should we settle for less? <Thoughtful Mode Off>

<Personal Preference Mode On> 3. I like crisp, double-shot keys as much as the next guy. 4. Keyboard label clutter beyond a certain point is undesirable. 5. More display area is ALWAYS, ALWAYS better. 5a. Color displays are better than monochrome. 6. A folding design (a la LX100) is an acceptable form factor for a dedicated calculator. 7. Well-implemented soft keys are a good way to preserve access to functions while avoiding clutter. 8. An original calculator design is more appropriate as a project than a warmed-over redesign of an "old classic." <Personal Preference Mode Off>

<Crazy Mode On> ...In my mind, it's long past time to think beyond calculators as we know them today. My ideal design would be a slate, 8.5 x 11 or somewhat smaller, that you would WRITE numbers, calculations and equations on. Hand writing recognition would convert these to characters and solve the problems. Graphs would be interactive and would pan and zoom just as CAD systems do (and as easily!). As each "page" filled up, a new one would scroll up, and all previous pages would be saved, JUST AS YOU DO WITH PAPER.

Well, OK, that's crazy talk.

How about this: An LX-100-sized case with a large color LCD screen, flanked by two or four (2 left and 2 right) columns of soft keys. The other half of the case would have a conventional arrangement of one-per-function keys with, say, one or at most two shift keys. And YES, put the damn ENTER key right where it belongs!

Calculations acummulate and scroll on the screen, saving to one of those nifty small disc drives. As various functions and modes are invoked, labels along BOTH right and left edges of the screen change to "label" the adjacent soft keys and maintain the one-per-function approach. USB connectivity assumed, and windows-like file manipulation to load and swap libraries of functions and data.

Now, THAT would be a calculator worthy of our combined talents..! <Crazy Mode Off>

...Hey, wait a minute! This damn key is stuck down!

Oh, no.....

Re: OpenRPN - A Dissenting View

*Message #2 Posted by **Hugh** on 15 Apr 2004, 11:53 p.m.,*
in response to message #1 by Steve S

Steve,

First, I would like to say that I appreciate your input. Dissenting views are at least as important as votes of confidence and support (often more so). Now, allow me to respond and explain some of my logic behind the direction of this project.

Indeed, a large portion of what has been seen thus far may appear insignificant or that we will be slightly modifying older designs. But there is quite a bit more involved. The key to innovation is looking closely at what has been done before and finding ways to embellish upon it. So we're accordingly starting with a solid base from which to work. People have voiced a nearly unanimous desire for something extremely durable with a timeless appearance and tactile keys.

In terms of software, this project is an open book. I have a strong feeling that with the community developing what the community wants... everyone will be suprised by the level of innovative ideas. For lack of better words, give it a little time. I just hatched this egg, so give it a chance to grow and develop (even the case design may suprise you).

I agree that a 8.5x11 tablet would be a great way to do math. I also think that I speak for a lot of people around here when I say that it's nice to have a solid scientific calc in your front shirt pocket for straight number crunching.

Looking over you post as a whole, I'd say we're more on the same page than not. Again, thanks for your opinion! I hope to hear more of them as the project progresses.

Best Regards, Hugh OpenRPN

Quantum Leaps?

*Message #3 Posted by **Wayne Stephens** on 16 Apr 2004, 7:31 a.m.,*
in response to message #1 by Steve S

Thanks for the dissenting opinion, but I thought we were having a free-form discussion about building "the calculator that HP refuses to build". That would, by definition, require that it be a CALCULATOR, not a handwriting recognition tablet.

I especially didn't realize we were trying to make quantum leaps in anything. Now I'll have to dust off my Physics texts...

Seriously, I don't think most of us are necessarily trying to generate any great advances in technology. We're trying to use materials we can acquire, and to take the best features from the best calculators, and put then all into one package. In fact, all some of us WANT is an upgraded/updated/super fast HP 41/42/43?, etc.

Perhaps I am small minded, but my impression was that we were trying to design/build something WE want, not something we think someone else might want, or which might be some new breakthrough. I know that's why I've entered the discussion.

Take care.

Wayne.

Re: Quantum Leaps?

*Message #4 Posted by **Steve S** on 16 Apr 2004, 8:54 a.m.,*
in response to message #3 by Wayne Stephens

<<I thought we were having a free-form discussion about building "the calculator that HP refuses to build". That would, by definition, require that it be a CALCULATOR, not a handwriting recognition tablet.>>

...A handwriting recognition tablet, if it is optimized to perform calculations, is, BY DEFINITION, a calculator. It's just uses a different interface...

<<In fact, all some of us WANT is an upgraded/updated/super fast HP 41/42/43?, etc.>>

...Yes, I know. My point is, if that's all you figuratively want, then simply emulate a 41/42/43 on a Pocket PC. Project over.

My experience is that it's really hard to design and build real hardware, and make it work (nearly flawlessly. Reliable computation is essential for a calculator, no??). Spending so much time and energy simply to build a faster HP-42 is a trivial exercise. Why not exert nearly the same time and energy trying to build something a BIT more ambitious??

<<my impression was that we were trying to design/build something WE want>>

...Yes, that is correct. If we design and build it, won't it BY DEFINITION, be what we want it to be? And if all that anyone wants is a fast HP-42, then that's OK.

I'm just suggesting that we could all aspire to something a bit better. And I did say this was a dissenting view...

Re: Quantum Leaps?

*Message #5 Posted by **Wayne Stephens** on 16 Apr 2004, 9:48 a.m.,*
in response to message #4 by Steve S

I HAVE an emulator on my Pocket PC. It's okay, but on my CALCULATORS I want a KEYBOARD.

Be as ambitious as you want; but please do not try to make the argument that a Pocket PC or a writing tablet interface is acceptable on a calculator for people who have stated over and over again that they WANT a keyboard.

I still think you are misunderstanding the reason for the exercise. I don't think that a bunch of "regular" folks planning, designing and (hopefully) constructing a sturdier, faster, better calculator based on the classic HP designs of the past is a trivial exercise at all.

I for one do not have access to modern, high-tech research or manufacturing facilities. I also don't have thousands of dollars to pay someone else to build prototypes. I am, however, prepared to volunteer to participate in hand assembling whatever device we end up with. I think it will be quite an accomplishment if we can get anything built at all.

Take care.

Wayne.

Uggh!! Calcs are for 'playing with numbers'. Real keyboards on real calcs let you do that quickly, gracefully and effectively - and mentally transparently. I see Palm people using their calcs and pulling out the stylus and pecking and it's just not smooth.

As I've written before, the hardware and firmware are (relatively) trivial these days. Hardware's way more reliable, and we can readily write firmware that is too. There are probably 100+ off-the-shelf microcontroller variants that have adequate specs for the job - and that can support a C compiler if you don't wanna write in assembler. Lotsa cheap LCD displays out too. Many of us know how to scan keyboards, drive LCDs, and understand microcontroller power managment, etc; some of us have a grasp on BCD floating point math & CORDIC issues - at worst case we could just emulate existing HP transcendental code.

Building a tolerable-looking case, keyboard+keycaps, etc. is the hard part. Building a million of something is sometimes far easier than building 250 of 'em - other than the money ;)

Re: OpenRPN - A Dissenting View

*Message #7 Posted by **Grant Goodes** on 16 Apr 2004, 9:23 a.m.,*
in response to message #1 by Steve S

The reason that people are discussing an HP-41+ or HP-16+ (I don't even think most of us are going even as far as a "++" version) is that those calculators represent in some sense the pinacle of calculator design for their areas of application, and as another poster said, HP refuses to make them anymore. This whole idea that if it isn't a quantum leap ahead in technology then it isn't worth considering is just so much 21st Century BS, in my opinion. Yes, HP _did_ make massive strides when going from their early behemoths to the petite HP-35, and forward to the HP-41 series, but those were the early days of the development curve and I would claim that as the technology reached a certain level that we started to see a honing and polishing rather than a vast rethinking. And it is simply inappropriate to throw out all those years of incremental fine-tuning just to adopt the latest buzz-word technological gim-crackerery.

For what it was designed for (napkin-size programming tasks and number crunching on the fly), calculators, particularly HP calculators, are just a fantastic tool. And I DON'T want a built-in cell-phone and digital camera (though a plug in peripheral port with such options would always be welcome). It's a calulator, not a hair-drier. And in that area HP developed considerable expertise, and refined the product to the point where further improvements (aside from more memory or faster CPU, lower power consumption, etc) become tough

to make. In fact, I would argue that modern "improved" devices are just cheaper to make (as if we care: I was happy to pay for the quality I got in 1981, and am appalled at what I get today) and have features which I frankly don't want (like a colour display, or speech-to-text, or whatever) and have a crappy physical interface (cramped and low-quality buttons).

Bottom line: What _I_ would like to see developed for RPN should provide a high-quality physical platform (case quality, keyboard physics, and display legibility matter VERY much) to ressurect the already very highly developed HP calculator IP (mathematical routines such as SOLVE and even just trig functions that work), and go from there.

grant..

Re: OpenRPN - A Dissenting View - comment to Grant's comments, about cellphones...

*Message #9 Posted by **Bill Wiese** on 16 Apr 2004, 3:29 p.m.,*
in response to message #7 by Grant Goodes

Grant,

Your comments about cellphones are well-taken and apropos to this calc discussion.

I don't need/want all those extra features. Camera? Hah, I have a real one (Sigma) for real digital pix. And it works at night too ;)

They keep making phones smaller - there's one Siemens model that's almost suppository-sized.

The only innovations for me that count in cellphones are (1) battery life/current drain
(2) ease of use of keyboard
(3) ease of storing #s while in middle of call
(4) LCD viewability/angle, etc. & sunlight readability
(5) not dropping calls-in-progress (sometimes a
system-dependent configuration - how bad does
the call get before dropping out?)

I wish we could get today's low-power electronics in a thin Motorola mid-1990s "flip-phone" (*not* StarTac) style. (Those were GREAT keyboards.) That way we'd have a nice big battery for lotsa talk/lotsa standby and fewer recharge cycles.

Digital (nonanalog) cellphones (and their networks) need also to have something I call a 'survival vocoder'. Typical cellphone voice compression methods compress 3kHz bandwith speech down to 8-13kilobits/sec depending upon system in question. Supposedly these voice coders are trying to be 'near-toll-quality' when

there's a good signal path.

When the RF path btwn phone & cellsite isn't good (too far, obstructions, noisy channel, adjacent channel interference, etc) the vocoder doesn't get all the bits it needs to reproduce the speech adequately. When more than a few bits can't be error-corrected, you get all sorts of squeals & artfacts. The cellphone companies believe they should just drop your call rather than have you suffer.

But I'd much rather have the phone & cellsite drop down into a different low-bit-rate (800-2000bps) military-style voice coder when the RF channel's signal/noise ratio (SNR) drops appreciably. Sure, it sounds raspy & buzzy (ever hear tapes of US military pilots talking on some of their radios?) when compared to a properly operating higher-bit-rate coder but it may get thru fine when the channel can only support 1/4 the usual bitrate. And this is not too hard to do - just some different DSP firmware.

Of course, Harvard MBAs would never think of that.

HP-15S

*Message #10 Posted by **Karl Schneider** on 17 Apr 2004, 9:59 p.m.,*
in response to message #7 by Grant Goodes

Grant --

Well stated! Amen, brother!

Philosophically, there's nothing I could add to that.

Regarding details of implementation, I do have one idea:

HP-15S

A resurrected 15C, with the following improvements:

1. Faster (Pioneer speed at least -- about 12x as fast)
2. More RAM -- at least 100 numbered registers (with 98 allocatable)
3. Make "LN" unshifted, rather than "10^x" (as on Pioneers)
4. Make programming keycodes show "A"-"E" when appropriate (as on 16C and 20S)
5. "ENG +" and "ENG -" functions to shift engineering-format exponents by +/- 3 (as Casios can)
6. Glare-free, dust-resistant display window (as on later Pioneers)
7. Scratch-resistant, durable bezel with printed model insignia (as on 12C Platinum)

12-digit display and higher computational accuracy would be nice. However, this would require a redesigned display unit and, quite possibly, extensive revisions to ROM microcode. (Note: I wonder if KinHPo even has the microcode. If not, maybe Eric Smith could provide them his 14-kword scan if requested...)

True, this product spec does not provide for data communication or AOS, but its form factor with 7-segment display and fully-utilized keyboard doesn't allow for much else.

I have some other ideas for a "12B" and a "32Siii" -- what the 12C Platinum and 33S ought to have been. However, KinHPo had other ideas...

-- Karl S.

Re: HP-15S

*Message #11 Posted by **Eric Smith** on 20 Apr 2004, 2:03 a.m.,*
in response to message #10 by Karl Schneider

> Quote:
>
> I wonder if KinHPo even has the microcode.

I've been told by usually reliable sources that HP no longer has most of the old calculator ROM code in either source or object format. They do still have the 12C source code, though that was apparently nearly lost and required a significant effort to recover.

Each time the calculator responsibility moved from one HP division to another (from Corvallis to Singapore to Australia to San Diego), huge amounts of records were either lost or deliberately destroyed.

> Quote:
>
> If not, maybe Eric Smith could provide them his 14-kword scan if requested...)

My original report of a 14 Kword ROM size for the HP-15C was incorrect. I had not noticed a 2K gap in the self-test trace, so it's really 12 Kwords. Each of the R2D2 chips (1LE2 or 1LH1) has 6K of ROM aligned to an 8K boundary. One is from addresses 0000-17FF hex, and the other is from 2000-37FF hex.

I doubt very much that HP would ask me for a copy. Even if they don't still have it themselves, I doubt that they'd want to do anything with it. However, I'd be happy to discuss it with them. They'd most likely require me to sign an NDA first, as they did a few years ago when they considered having me write a 12C simulator for a product that was under development (but got cancelled).

Re: OpenRPN - A Dissenting View

*Message #15 Posted by **Bill Wiese** on 16 Apr 2004, 3:01 p.m.,*
in response to message #1 by Steve S

Hi all,

Well, your dissenting view is fine, you seem to want a calculator to do what a computer readily does better.

Many early prog calcs were designed for folks who needed some number crunching but couldn't get time on the minicomputer.

That's moot now. When I need big number crunching, matrices, etc. I'll be near a computer - Excel, Matlab or quickie C programs all do their part.

Keystroke programmability is important as that lets you essentially have custom functions for quick one-button solutions. (I'm gonna load up my HP41C w/keystroke external ballistics programs to deal w/custom cartrdige loads - though I hesitate to take calc to the rifle range.)

But a calc is for playing with numbers on a smaller scale. Gotta be easy on the hand/fingers/eyes. That's where real RPN + a well-designed keyboard + form-factor help.

So, yes, I don't mind staying in the past. Making a calc into a full-house computer that can plot, etc. doesn't do anything for me...

My dream calc: - larger Woodstock form-factor (size of HP55); - Woodstock case, keyboard layout, keytops/legends; - backlit LCD text display; I can live w/one line, or 1 main line and 1 smaller line of upper-row labels like the 42S; - use 2x"AAA" cells for decent batt life w/backlite; - standard HP sci calc functions; - hex/bin/oct/dec conversions & arithmetic; - some financial functions (at least PV/FV/PMT/i etc) - keystroke programmability; - I/O connector for up/download of prgms/data;

Might have to tweak the dead HP25C I have.

Re: Proper quantum leaps

*Message #16 Posted by **Andrés C. Rodríguez (Argentina)** on 17 Apr 2004, 12:42 a.m.,*
in response to message #1 by Steve S

It should be noted that a "quantum" is the SMALLEST possible quantity for a energy exchange, step, charge, or whatever.

While brisk because of being a discrete quantity (instead of continuous), the much famous "quantum leap" should be a very small one!

Re: Proper quantum leaps

*Message #17 Posted by **Arnaud Amiel** on 17 Apr 2004, 2:57 a.m.,*
in response to message #16 by Andrés C. Rodríguez (Argentina)

I got some problems with this one when I first arrived in England and quite offended some people when I told them I had heard their work didn't amount to much.

Take care.

Wayne.

Re: Proper quantum leaps

*Message #19 Posted by **Mark A. Ordal** on 17 Apr 2004, 2:14 p.m.,*
in response to message #16 by Andrés C. Rodríguez (Argentina)

I just wanted to point out that the famous "quantum leap" has nothing to do with already being quantized and changing things a quantum at a time. Rather it refers to the HUGE conceptual leap from the non-quantum universe of Galileo, Newton, etc. to the quantum universe of Bohr, Heisenberg, Fermi, etc.

In other words, "quantum leap" refers to the conceptual leap from "classical physics" to "quantum physics" (also called "modern physics"). You can't make such leaps on a routine basis---hence the reason for its notoriety, and the use of the term outside of physics.

--Mark

Quantum mechanics is BIG, but quantums are small...

*Message #20 Posted by **Andrés C Rodríguez (Argentina)** on 18 Apr 2004, 11:11 a.m.,*
in response to message #19 by Mark A. Ordal

Then, why not "Bohrian advance" or "Planckian leaps", or "relativistic jump", or "Columbus journey" or "Armstrongian moonstep" ... all them are important stages of discovery and knowledge advance. (Penicilin, Rosetta Stone, transistors, celestial mechanics and many others also come to mind).

I think that "quantum leap" is used more for it's discrete, discontinuous character (to oppose to just evolutionary, which seems rather continuous), than for the importance of modern physics (which I did studied and very much admire, indeed).

I am afraid that most of the social communicators, journalists and politicians who regularly talk about "quantum leaps" had not been exposed enough to the Schrodinger wave function, Dirac works, permitted levels of energy, or other concepts, to so fully understand the "dramatic" change implied by the transition from classical to modern physics.

I would suggest that we may, from now on, adopt the "HP35 dawn" as a manner to signify a radical change in human knowledge!

Thank you all for a lively and stimulating discussion!!

Re: Quantum mechanics is BIG, but quantums are small...

*Message #21 Posted by **Veli-Pekka Nousiainen** on 18 Apr 2004, 11:31 a.m.,*
in response to message #20 by Andrés C Rodríguez (Argentina)

It's quantum leap in macro scale.
[VPN]

Re: Quantum mechanics is BIG, but "quanta" are small...

*Message #22 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Apr 2004, 2:45 p.m.,*
in response to message #21 by Veli-Pekka Nousiainen

So, the next step will be at least as big as it? Or, perhaps, a whole multiple of it? (fractions would not be allowed; whether macro or not)

I'm correcting my previous error: many quantum"s" are "quanta" and not "quantums" as I wrongly wrote before

Exploded batteries

*Message #1 Posted by **Lance Pierre** on 15 Apr 2004, 6:52 p.m.*

After leaving my 48G with batteries for about one year, they exploded and now the battery compartment has this whitesh deposit on it. Is there any way it could be brought back to life?

Re: Exploded batteries

*Message #2 Posted by **Randy Sloyer** on 15 Apr 2004, 7:35 p.m.,*
in response to message #1 by Lance Pierre

If it was keyboard up when the batteries leaked, it has a chance. The evidence will be on the removable battery door. If it is covered in a white powder, that's good, it was keyboard up. If it is clean, it was keyboard down, not a good sign as the electrolyte gets into the keyboard through the lower battery tab and usually destroys the decimal, spc and + keys.

You can try cleaning up with a q-tip dipped in a 50-50 solution of vinegar/water. Let it soak for a while and follow up with plain water to rinse.

Re: Exploded batteries

*Message #3 Posted by **Steve S** on 15 Apr 2004, 11:09 p.m.,*
in response to message #1 by Lance Pierre

I agree with Randy, with one minor difference.

I once had the batteries in a rare type of remote control leak, coating the spings and metal contacts. Because I couldn't just replace the RC, I set off to restore it as best I could. I wrote to Duracell (I believe it was) and asked for their recommendation. They suggested a ~5% solution of boric acid in water, followed by a quick rinse with deionized (or distilled) water.

It turns out that the actual concentration of the boric acid solution isn't overly critical. I just mixed up an approximate guess at the concentration and IT WORKED LIKE A CHARM! The electrolyte was completely removed and the metal parts were left with only a slight amount of surface corrosion and discoloration.

I've not tried vinegar, so I have no opinion about it. But I can recommend the boric acid, it worked great!

PS If you have to wash the foam rubber pieces, be sure you rinse them well. Have a hair drier handy and use it to GENTLY Heat the washed are to accelerate the drying. Don't let it get too hot!!!

Re: Exploded batteries

in response to message #2 by bill platt

The links to the images no longer work. Did anyone save copies? Luiz?

Rebuilding a battery cover

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 16 Apr 2004, 4:53 p.m.,*
in response to message #1 by Mike

Hi, all;

thank you guys; being remembered this way is an honor! 8^)

Here is an image of the final "work":

http://www.logeng.com.br/images/pion_door_all_s.jpg

These are references to other images:

http://www.logeng.com.br/images/pion_door_1.jpg
http://www.logeng.com.br/images/pion_door_2.jpg
http://www.logeng.com.br/images/pion_door_3.jpg
http://www.logeng.com.br/images/pion_door_4.jpg
http://www.logeng.com.br/images/pion_door_5.jpg

As you can notice, I used a protective (movable) cover from an old VHS tape. It's easy to be seen by the known advice (Do not touch the tape inside).

I "carved" it till it fit in place, then I added the small parts that serve as "guides" for holding in place. I used a small clamp to make sure the parts were hold together while the glue was drying out. About the glue: I used super glue, but there are better choices. The irregular surface was obtained with thin sandpapper with a (latter applied)solvent (thinner).

I don't have the main text from the original post, but I may add more information if needed.

Hope this helps for now.

Cheers.

Luiz (Brazil)

Keyboard opinions (OpenRPN)

*Message #1 Posted by **Hugh** on 15 Apr 2004, 1:06 p.m.*

Decisions, decisions, decisions... Okay everyone, it's really a toss-up here so I need some help! What kind of keys do you prefer. They will be using stainless steel domes for positive tactile feedback. The main choices we're faced with are: classic/voyager shape, pioneer, or we design something new.

I, personally am leaning towards creating a new design... Basically like those found on the voyager models but with more rounded edges.

The only major difference in construction is that they will be made using epoxy resin and will be molded directly into an EPDM rubber sheet/gasket that will form a watertight seal at the edges of the face plate.

Let the flood begin!

Re: Keyboard opinions (OpenRPN)

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 15 Apr 2004, 1:39 p.m.,*
in response to message #1 by Hugh

I really like the Voyager's keyboard and format, and the mode rounded design can be interesting if we can print on the key the normal label and the "blue" label, leaving the aluminium(?) plate less cluttered. On the other side, if we print only the primary function on the key we can leave the second/third(?) functions on replaceable overlay (plenty of blank overlays ready to print on inkjet printers??)

<crazy mode on>
How 'bout a transparent keyboard that we can insert below the printed overlay of ALL functions, inclusive the key tops? The transparent key must behave like some lens to the top function appear on the top ;) I have a old Ericsson cell phone that use this concept, and it is easy to build a retro-illuminated keyboard... The cell phone keys evolved much more than the calculators' keys. This Ericsson keyboard is composed of a transparent silicon rubber layer with the contacts and molded (welded, melted, glued???) rigid keytops - it is hard to describe, I can send some pics.
<crazy mode off>

Another concern about keyboards is the servicing. The keys or the entire keyboard must be replaceable, or composed with individual contacts (domes? micro-switches like some cell phones?) that can be replaced and/or cleaned. I really like the idea of being water-proof, just wash the whole thing on the sink! BUT it must cover its I/O with some rubber cover and the battery (lithium coin?) must have a screwed cover with some rubber O ring, like water-proof watches.

Talking of water, the principal reason (as I remember) to a leaked LCD display is moisture and battery leakage (as I saw on many Voyagers). The battery compartment must be sealed, as long as any other compartment (SD card?). IF the think gets wet the moisture doesn't enter in the circuit, is only a matter of drying the thing with a hair-dryer (BUT the LCD is heat sensitive, isn't? care must be taken!).

Best regards,

Nelson

Re: Keyboard opinions (OpenRPN)

*Message #3 Posted by **Garth Wilson** on 15 Apr 2004, 2:51 p.m.,*
in response to message #1 by Hugh

Alright, this is totally opinion, but I prefer the keys on the later 41's and the 71 and the many others that had that kind. I hate the newer styles where designers, whether of calculators, cars, alarm clocks, or anything else, got carried away on their 3-D CAD and made slanted elipses and so on. It's like when someone tries to be too funny-- instead of becoming more humorous, it just gets stupid.

Having the lines at right angles and using the rounding only just enough to keep corners from being sharp gives a simple impression of neatness and order.

Re: Keyboard opinions (OpenRPN)

*Message #4 Posted by **Wayne Stephens** on 15 Apr 2004, 3:08 p.m.,*
in response to message #1 by Hugh

I also like the newer 41 type keys. I wonder if it would be possible to make the keyboard modular and replaceble form the top of the unit. Mounted w/ a rubber o-ring type gasket and four SS screws, one at each corner. This would be handy for keyboard replacement/repair, as well as giving a sort of industrial look.

Take care.

Wayne.

PS - Or even crazier, interchangebale keyboards which latch into place that would allow changing the calc from scientific to financial (or custom) based on the board which is used. (I think someone already mentioned something simliar to this).

Re: Keyboard opinions (OpenRPN)

*Message #5 Posted by **David Yerka** on 15 Apr 2004, 3:50 p.m.,*
in response to message #1 by Hugh

I'd vote for the 41 style keys. I'd also suggest keeping the layout simple, i.e. keep the key labels big and clear and only having a top and front label. Keep surface labels simple and basic and provide overlays (in writable plasic preferably).

It should be remembered that command and function design should drive labels and single/shifted key access. As the number of available ROM functions grow the keyboard confusion can also.

As an example look at the transition from the HP41/42 to the HP48/49. After using a 41, jumping to the 48/49 can produce quite a level of frustration.

Since a new software will undoubtably have as many functions as the 48/49 line (or more) access is very important. Do you want multiple shift keys, alpha shift, etc. Is "arrowed" navigation of the screen important. Is direct access, indirect access (XEQ "alpha") or menus most important?

The simplest solution might be a keyboard of 1 on/offkey, 26 keys (alpha mode: the 26 letters) plus oversized enter key plus 1 shift key plus 4 navigation keys. Then allow the user true capability to create their own keyboard maps.

Re: Keyboard opinions (OpenRPN)

*Message #6 Posted by **Veli-Pekka Nousiainen** on 17 Apr 2004, 10:05 a.m.,*
in response to message #5 by David Yerka

HP-200 LX keyboard, but calculator functions on keytops and a large vertical ENTER (like in the 71B)

A vertical model could be an extended 48SX style with maybe a Motorola type flip-up display.

Re: Keyboard opinions (OpenRPN)

*Message #7 Posted by **Miki Mihajlovic** on 15 Apr 2004, 4:52 p.m.,*
in response to message #1 by Hugh

I would cast my vote for 41/Voyager style keys. I prefer 3 labels per key in WYB style, regardless on whether Blue will be alpha or function. And it spells HP. Although this is, technically, not an HP project I think it is, more than HP itself.

Re: Keyboard opinions (OpenRPN)

*Message #8 Posted by **Jim Creybohm** on 15 Apr 2004, 7:46 p.m.,*
in response to message #1 by Hugh

I lean towards the 41 style, and I have one other item to add; the use of a separate on/off key as opposed to a Clx/Off shifted function.

It may be just my age, but using a newer HP with the shifted off/on/cancel keys is really frustrating for some reason.

Re: Keyboard opinions (OpenRPN)

*Message #9 Posted by **James** on 18 Apr 2004, 5:19 a.m.,*
in response to message #1 by Hugh

I like the original "high-top" 41C/Spice/Woodstock series keys...

The sharper angle between the front and top surface of these keys keeps my finger from slipping when I push a key a bit forward (towards the display) as opposed to straight down.

I think I might go so far as to say this edge of the key should be even smaller radius (sharper) than the HP design.

Of course this is only a useful consideration if the key has the hinge at the front. Otherwise the front face of the flatter keys is easier to read.

Regardless of the key shape decision, I do quite like the front hinge design. Is that under consideration?

Re: Keyboard opinions (OpenRPN)

*Message #10 Posted by **Hugh** on 18 Apr 2004, 3:49 p.m.,*
in response to message #9 by James

Front hinge with tactile stainless steel domes is exactly what I'm using. Randy Sloyer is graciously sending me some voyager and 41 keys from which the design will be based. The final keys will be a modified version of the originals, but with more rounded edges for comfort/aesthetics.

I'll be posting some proposed renderings of the keys and the case very soon. I'm actually working on their designs in SolidEdge at the moment. It's looking *very* nice, I just know everyone is going to love how it's turned out. This first design is based on the voyager form factor, next up is the vertical pioneer/41/42 type.

Once these drawings are done I can finally get some good quotes from some machine shops too.

Re: Keyboard opinions (OpenRPN)

*Message #11 Posted by **Ben Salinas** on 18 Apr 2004, 6:43 p.m.,*
in response to message #10 by Hugh

Depending on what format the files are in (if you can give me CNC code), I could probably run some prototypes for you, just to test out the key before you send it off to a machining shop.

Just to make sure I understand, you are designing a mold cavity, correct? The keys will then be produced via injection molding?

We have 2 (relatively small) CNC mills at school. I have access to these, but the way they are set up they only allow for material up to about 4x4 inches to be used.

-Ben

Re: Keyboard opinions (OpenRPN)

*Message #12 Posted by **Hugh** on 18 Apr 2004, 7:58 p.m.,*
in response to message #11 by Ben Salinas

Correct, I'm setting up molds. Although no injection molding unless some remarkable deal comes along. I'll be using epoxy resin instead. The files will be in SolidEdge format, and I will make them available to all. My university has laser sintering (both plastics and metal), CNC and injection molding capabilities... So I'll be seeing if they can cut me a good deal.

By the way 4x4 is plenty! I could run a full set of keytops with that. The only problem is detail, the text on each key is very fine... probably best left to laser engraving.

Re: Keyboard opinions (OpenRPN)

*Message #13 Posted by **Dave Shaffer** on 19 Apr 2004, 3:03 a.m.,*
in response to message #12 by Hugh

Here is a gizmo that might help you make arbitrary key shapes and/or markings: http://www.versalaser.com (as well as slicing out HP41 keyboard overlays - another recent topic).

The versalaser has been advertised in PC Magazine for the last several months. It appears to be a CO2 laser cutter that looks like a printer as far as the PC is concerned.

It ain't cheap ($10 grand!), so it probably isn't suitable for prototypes, but depending on its capabilities and speed, it might be able to crank out small production runs.

Re: Keyboard opinions (OpenRPN)

*Message #14 Posted by **Hugh** on 19 Apr 2004, 9:40 a.m.,*
in response to message #13 by Dave Shaffer

Funny you should mention that grimble, one of my best friends has been looking into getting one to start a small business. I'll bring this up to him. Between etching keys and keyboard overlays he could probably pull in a moderate income pretty quickly.

That said, great suggestion!!! Going that route could save a large amount of two things: time and money. Plus, we get excellent detail and fully customizable keytops! I will definitely be looking into this option, it solves so many logistical issues and it's a very simple solution.

Thanks again for your contribution. I'll report back soon with my findings.

Re: Keyboard opinions (OpenRPN)

I'd recommend *not* rounding the edges of the keys. The 41 keys are ***perfect*** just as they are, and the closer you come to duplicating them *exactly*, the better they'll be. In fact, the rounded keys are the only thing I dislike about the keyboard of my 48GX.

I concur

*Message #16 Posted by **Wayne Stephens** on 19 Apr 2004, 1:53 p.m.,*
in response to message #15 by Wayne Brown

I agree with Wayne Brown. The keys on my 41C are the best I have ever touched on any electronic device. I think an exact replica of these would be just fine.

Take care.

Wayne

Re: I disagree

*Message #17 Posted by **bill platt** on 19 Apr 2004, 3:34 p.m.,*
in response to message #16 by Wayne Stephens

I actually like the rounded keys of my pioneers and charlemagnes BETTER than the keys of the voyagers and 41---I was resistant at first, but I think the feel is actually better--though that may be due more to the design of the spring sheet than to the keys themselves. Appearance-wise I am quite partial to the older keys; however my most objective "designer's sense" sees no advantage from an appearance standpoint.

The big advantage of the old trapezoidal keys was that you could put the shifted label on the oblique facet. However, if you are tending towards an overlay system, I would keep the functions OFF the keys and make space for the info on the overlay.

Regards,

Bill

Re: I disagree

*Message #18 Posted by **Hugh** on 20 Apr 2004, 8:58 a.m.,*
in response to message #17 by bill platt

Nothing is final on the keys yet, but I do want everyone to keep an open mind about it and at least take a look at the renderings when they are ready. I don't want to give up the key labels, so *the keys will still have two faces*. Just give it a chance and we'll see how all the opinions pan out.

Re: Keyboard opinions (OpenRPN)

*Message #19 Posted by **bill platt** on 19 Apr 2004, 3:26 p.m.,*
in response to message #1 by Hugh

Hi Hugh,

1) I would make the ENTER key the same size as the rest--the large ENTER wastes space.

2) I feel that the operators should be to the right, just as is the case with the Pioneers, Voyagers, Charlemagnes (and most other brands as well). The 41 series, Classics etc have the left side format--which is fine except that most of the world is on the other side, and so compatibility is not there.

3) I would leave generous space between the keys. The 41 is superb in this respect, the Voyagers are inferior. In fact, I would rather give up keys to do it--as the customization and overlay seems to be a central concept--so leave space for the key notation. I would even leave the keytops blank for all but arithemtic operators, numbers, and stack functions.

I happened to ask my wife's opinion the other day on keyboards--I laid out a 20s, 15c, 41cv, and 48gx next to each other. She said she thought the 20s was the very best display, best over-all, very readable, but the 41 had an even more readable keyboard. She also said it looked "old fashioned" like from the 60's or 70's (not far off!). She said the 48gx was just horrible--especially the screen (Of course I had Metakernel with 5 lines running so the text was really small). She also rated the 15c display nearly as good as the 20s, but she thought it not so easy to read the shifted functions--in other words the 41cv and 20s were easier to read.

Personally, I like a good condition singapore 48 keyboard mechanical feedback most of all out of all the machines I have used. Except for the nostalgia of a mint 11c. The 48 keys are really perfect in the snap, travel, resistance, force vs distance curve, sound, speed.....I say this only after having used a voyager more than any other, and then a Pioneer for 10 years straight.

A worn voyager is actually pretty lousy for table top use (but fine in-hand where the thumb is opposing the fingers in the squeezing). I find that If I use an old voyager after having used a pioneer or charlemagne, I tend to miss a few keystrokes! (Mint new voyagers are nice--I don't miss keystrokes with them).

I am becoming more and more excited about this project!

One "radical" departure that I considered I some sketches I did some time ago was to put the sin cos tan ln etc, along with ENTER buttons BELOW the numbers, and the stack operators above the numbers----this makes a vertical machine balance better in one hand for number entry (what you do most). The enter key is then literally central and directly below the "0".

Regards,

Bill

*Message #20 Posted by **Veli-Pekka Nousiainen** on 20 Apr 2004, 2:37 a.m.,*
in response to message #19 by bill platt

I disagree with Bill (both)!

"1) I would make the ENTER key the same size as the rest--the large ENTER wastes space."

It's the trademark of RPN! No way!

"3) I would leave generous space between the keys. The 41 is superb in this respect, the Voyagers are inferior. In fact, I would rather give up keys to do it--as the customization and overlay seems to be a central concept--so leave space for the key notation.
"
I Disagree.
The 48-series has overlay option.
I would like to ALPHA and cursor keys operation at the same time, which requires one more row of keys.

"I would even leave the keytops blank for all but arithemtic operators, numbers, and stack functions."

I Disagree.
This would make the user even more confused.
There are keys that you never assign anyway.

"I happened to ask my wife's opinion the other day on keyboards"
I understand that you value your wife's opinions, but the rest of take her as only one user poll in the statistics.

More opinions from all of you and your wifes, friends, collegues, etc. are needed.
Keep them coming!

Re: Keyboard opinions (OpenRPN)

*Message #21 Posted by **Hugh** on 20 Apr 2004, 8:48 a.m.,*
in response to message #20 by Veli-Pekka Nousiainen

I've been meaning to reply to this part of the thread. A double length enter key makes a lot of sense to me, hell look at the keyboard in front of you as you read this... How big are the enter keys? at least double length. It makes entry much easier. I say this as a former TI user, where all I ever had was a little "=" button. Then I got into RPN a few years ago while I was studying mechanical engineering.

After aquiring an 11c, it was all over, what a well thought-out great feeling calc. Since that time I have pondered a good way to make a similar calc with some needed updates

Having said this, I am doing my best to keep form factor, keytops, etc. as easy to play with as possible. Thanks to laser cutting and etching, it will be possible to create any format of keys one could desire within reason. This also makes my life easier in terms of casting the keys in resin. Plus, the end result will have the same appearance as the triple injection molded keys we're used to.

Why am I going to so much trouble for all of this? I've said it before, I will fight divisiveness any way I can, it's the great pitfall of most open dev. projects. Perhaps my favorite thing about OpenRPN is that I can feel sure that superior quality RPN calculators will be perpetuated. The would of science *needs* mil-spec calcs! Regardless of their profitability.

While I'm at it, I'll make an announcement here and will post a bigger thread soon. I have secured a hosting agreement! A phpbb based board will be up by the end of the week, and I will work on the main page to show up to date progress.

That's all for this rant. Keep brainstorming all! If I can find a way, your ideas will all come to life.

"Worry not, I want both options to be available (although I will be using the big one myself) "

OK, if user rips of the keytop from the big [ENTER]
and replaces it with two smaller keytops then you will have one more key to play with,

[ENT] and say [PRV] for previous (or [BST] for backstep)

*Message #26 Posted by **bill platt** on 20 Apr 2004, 12:01 p.m.,*
in response to message #19 by bill platt

Hi,

By all means, keep the BIG ENTER key if all but my opinion is in favor of it!

Regarding Overlays: Yes, the 48 has overlays, and I use them, but they are CROWDED. The 41 keyboard is much more roomy.

The reason for the idea of having no keytop stuff on all but the basic functions and stack, is that if you are going to have an open architecture thing going, then the physical keyboard will be more versatile--and if you have ample space between keys, then there is no need for any markings on the keys. Make the keys small (like a 41) and pleanty of wspace between!

For example, maybe a "financial" version will want no Sin Cos TAn but PMT FV etc. If you make this an open architecture thing, then switching back and forthe would be simply a matter of changing the overlay and choosing the ROM (or ROM equivalent), or am I missing something?

Best regards,

Bill

HP-32SII for sale!

*Message #1 Posted by **Fubar Vikinghelmet** on 15 Apr 2004, 12:30 p.m.*

http://www.amazon.com/exec/obidos/tg/detail/-/B00000JBMH/102-1788129-3772928?v=glance&vi=customer-reviews&me=standard

Amazon dot com has one with a price tag of $245 and another at $349.99.

Thank you NCEES!

Re: HP-32SII for sale!

*Message #2 Posted by **Randy Sloyer** on 15 Apr 2004, 7:42 p.m.,*
in response to message #1 by Fubar Vikinghelmet

They were selling for $250 and up long before the NCEES ever threw their helmet into the arena... New 41CX's are still selling for $400... And then there is the used 15C on eBay tonight at $350...

What's your point 'o cloaked one?

Re: HP-32SII for sale!

*Message #3 Posted by **Fubar Vikinghelmet** on 15 Apr 2004, 9:15 p.m.,*
in response to message #2 by Randy Sloyer

I didn't know that. I figured these mid-end calculators wouldn't be so super-expensive - they're not worth it. I assumed the high prices were due almost exclusively to the NCEES. Who would want to pay more than $50 for one of these?

I'm going to use my high-speed Casio fx-250c on the PE exam, anyway.

Re: HP-32SII for sale!

*Message #4 Posted by **David Smith** on 16 Apr 2004, 12:11 p.m.,*
in response to message #3 by Fubar Vikinghelmet

The point is they don't make them any more. People will pay what it is worth to them to have their favorite tool. Personally, I would not pay $20 for a 32SII. If I did not have a few already, I would pay $400 for a 41CX.

Re: HP-32SII for sale!

*Message #5 Posted by **Fubar Vikinghelmet** on 16 Apr 2004, 1:05 p.m.,*
in response to message #4 by David Smith

Excellent point. Paradigm shift, too.

Re: HP-32SII for sale!

*Message #6 Posted by **David Smith** on 16 Apr 2004, 6:02 p.m.,*
in response to message #5 by Fubar Vikinghelmet

On an HP-67, is the paradigm shift the gold, blue, or black one?

Re: Paradigm Shift

*Message #7 Posted by **Trent Moseley** on 20 Apr 2004, 1:26 p.m.,*
in response to message #6 by David Smith

The black one before "space".

tm

Re: HP-32SII for sale!

*Message #8 Posted by **Britt** on 16 Apr 2004, 1:56 p.m.,*
in response to message #4 by David Smith

I have about 12 HP calculators including a 34C, a 41CV, and a 42S. If I had to choose only one to keep it would be my 32Sii.

hp28 emulator

*Message #1 Posted by **Jake** on 15 Apr 2004, 11:29 a.m.*

Does anyone know where I can get an hp28 rom image? I e-mailed HP asking them, but they said they didn't have a copy of it and that I should try this site.

Re: hp28 emulator

*Message #2 Posted by **Christoph Giesselink** on 15 Apr 2004, 2:07 p.m.,*
in response to message #1 by Jake

Nice joke,

only HP itself can distribute there ROM images without copyright violation.

These's a posting at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=50027 how they can be extracted from a real calculator.

Christoph

Re: hp28 emulator

*Message #3 Posted by **James M. Prange** on 15 Apr 2004, 9:47 p.m.,*
in response to message #2 by Christoph Giesselink

But if HP told him to try this site, wouldn't that amount to permission? Or would it have to be in writing?

Re: hp28 emulator

48SX ROM version?

*Message #1 Posted by **unspellable** on 15 Apr 2004, 10:26 a.m.*

What's the key sequence to display the ROM version on a 48SX or on a 48GX?

Re: 48SX ROM version?

*Message #2 Posted by **Massimo (Italy)** on 15 Apr 2004, 10:42 a.m.,*
in response to message #1 by unspellable

Just found this here (http://wwwbzs.tu-graz.ac.at/~fleischh/computer/hp48/horn/postings/faq.txt):

2* How can I tell what ROM revision I have?

Do the following:

1. Turn the calculator on (press ON and then release).

2. Press ON again, and while holding it down, hit the "D" key (the fourth white key in the top row) and then release the ON key. You should get three vertical lines in the display, one down the middle.

3. Hit the backspace key (it says DROP and CLR over it). You should get some meaningless hexadecimal in the first line of the display. (Mine says 705D9:1B8D...).

4. Press and hold down the EVAL key. It should say:

Version HP48-* Copyright HP 1989

where the * is an uppercase letter (A, B, etc.) indicating the ROM version.

5. Release the EVAL key. Hold down ON and hit "C" (the third white key in the top row. This is a general reset operation that returns the calculator to normal from the diagnostic stuff (which is where ON-D puts you).

(The above was mostly taken from a posting by Mark Adler -- madler@tybalt.caltech.edu)

Re: 48SX ROM version?

*Message #3 Posted by **James M. Prange** on 15 Apr 2004, 12:12 p.m.,*
in response to message #2 by Massimo (Italy)

Exactly Right for the 48SX/S.

With the 48G series and 49 series, just type in VERSION and press ENTER.

The 49 series has an additional command VER that gives information on the CAS part of the flash ROM.

On the 49g+, at least in revision 1.23, when you start the ON-D or ON-F system test screen, a different version and build number are briefly displayed.

Also on the 49g+, if you start as if you were going to update the flash ROM from the SD card, the boot version and internal serial will be displayed.

Regards,
James

*Message #4 Posted by **Massimo (Italy)** on 15 Apr 2004, 12:50 p.m.,*
in response to message #3 by James M. Prange

Oooops! I missed the GX part of the question... I stopped on the subject line, I fear.

Sorry,
Massimo

Re: 48SX ROM version?

*Message #5 Posted by **Matthias** on 15 Apr 2004, 3:50 p.m.,*
in response to message #3 by James M. Prange

As I think, the command "VERSION" only works with newer 48s´, earlier versions might have problems. I propose the following command for all 48series:

[SPACE] 30794h SYSEVAL [EVAL]

Re: 48SX ROM version?

*Message #6 Posted by **James M. Prange** on 15 Apr 2004, 10:33 p.m.,*
in response to message #5 by Matthias

Yes, the VERSION command isn't available on the 48SX/S, so if you type it in, it will be compiled to a global name.

30794h SYSEVAL is the equivalent of the SysRPL command VERSTRING. It gets you the binary transfer header string (similar to HPHP48-A) on any 48, but a warmstart on a 49. On a 49, the VERSTRING equivalent is # 2F389h SYSEVAL.

Enter key in WRONG PLACE!

*Message #1 Posted by **Ron Ross** on 15 Apr 2004, 9:15 a.m.*

AND always has been for ALL the vintage machines. I like the original placement, and HATE the new location, but guess what. We are accustomed to a mistake! I don't use my new Hp's (and don't yet have a 33s), but the enter key placement is more natural for a new user. Dinasours like us will forever complain, but if you reflect upon the placement and effeciency, you will realize that the keyboard placement has evolved (not the actual quality) and to someone with a fresh start, would immediately say, why reach across a keyboard for an entry, when it should be on the corner.

Production is also simplified due to the manufactur of one less speciallity key.

I miss my double wide enter key, but with this thought in mind and no one left at HP to argue for our beloved wide key, no practical engineer would re-introduce this feature. Therefore, I conclude that if you want this key, you will have to aquire older calculators and not expect to see HP re-introduce the wide enter key ever again. A new and improved Hp pocket calc may replace the 33s someday in the future, but it too, will also lack the large enter key with these thoughts in mind.

"Of course I could be wrong." to paraphase Dennis Miller.

Re: Enter key in WRONG PLACE!

*Message #2 Posted by **bill platt** on 15 Apr 2004, 9:26 a.m.,*
in response to message #1 by Ron Ross

Hi Ron!

I totally agree with you. I first learned this when I switched from my 1st calc (11c) to the 32sii. (The voyager ENTER is directly next to the number keys). Then, when I got a 48 last year, I started using the SPACE instead of ENTER, and it was much more natural. Then recently I got a 17bii and again, the ENTER in the lower right, immediately next to the number keys, made more sense!

Speaking of 17bii, that is a really neat machine, with only a few flaws. Just think how much nicer the 33s would be if it had the 17bii style of equation editing! (BTW, does the 42s handle equations the same way as the 17bii?)

Best regards,

Bill

Re: 42s and 17Bii!

*Message #3 Posted by **Ron Ross** on 15 Apr 2004, 9:38 a.m.,*
in response to message #2 by bill platt

No, The 42s uses an RPN solver (I believe the 32s uses the same solver, and the 32sii can use its solver in two ways, with the algebraic solver, the much more popular way to go).

You can look at an example of how the solver works with my example in the programming section.

The 17Bii is the favorite of many Engineers for some reason, and it it had simple trig, would be a great calculator (even if the trig functions were available via solver only, but alas, this is not to be). Oddly and fortunately, Pi is included so trig functions can be implimented to as accuately as you wish via the solver.

49g+ lithium battery

*Message #1 Posted by **Troy** on 15 Apr 2004, 8:54 a.m.*

About a month ago, I upgraded from a 49 to a 49g+. ALREADY, I have a warning for a low battery(s). I changed the alkaline batteries and still get the warning. This leads me to believe that the lithium battery is dead or dying. Is this a normal battery life? I have been using the calculator heavily in the past month, but it seems that the battery life should be longer than this. Any suggestions?

Re: 49g+ lithium battery

*Message #2 Posted by **James M. Prange** on 15 Apr 2004, 12:33 p.m.,*
in response to message #1 by Troy

The ROM in the very early units had a bug that used up the batteries much faster than expected, in particular drawing significant current even with the calculator turned off.

If your 49g+ ROM version is less than 1.23, download the latest ROM from HP's web site.

Well, they say that the real bug was that the processor supplier made a change without informing them, but I'd say the the bug involved not thoroughly testing that the very first production units actually worked as expected. What were they thinking?

I would hope that the 49g+ would draw current from the backup battery only when the AAA batteries were low or removed.

Did you check the batteries before putting them in? It's rare, but a brand new battery can be bad.

Of course the battery life depends on a lot how you use it. Writing to the flash and I/O take a lot of power. In general, the 49g+ seems to go through batteries faster than previous models.

Regards,
James

Early 41C Keyboard

*Message #1 Posted by **41Jeff** on 15 Apr 2004, 7:44 a.m.*

I am currently attempting to repair an early fullnut 41C keyboard (Ser. 2036A) and have run into a problem during disasembly. I have stripped off all the heads on the heat stakes but cannot remove the board because of a black plastic strip at the bottom end that seems to be permanently attached to the two screw posts holding the circuit board in place. This part lies directly under the sandwhich connector for the CPU board. Does anyone know how to handle taking this apart?

Re: Early 41C Keyboard

*Message #2 Posted by **David Smith** on 15 Apr 2004, 1:19 p.m.,*
in response to message #1 by 41Jeff

You can usually slide a wide Xacto knife blade under the strip near each post and gently pry it free. If your posts have been stressed they may come off with the strip...

HP 9s

*Message #1 Posted by **John Smitherman** on 14 Apr 2004, 10:07 p.m.*

I recently needed to replace a 14 year old Casio with a calculator capable of dec/bin/oct/hex arithmetic and conversions. Looking around I decided to give the 9s a try. For $15 (including tax + shipping) I did not think that it was much of a risk.

For an algebraic calculator I believe that it is a good buy. It feels as good as anything that TI makes but of course does not measure up to the HP quality of yesterday. It is quick, fairly accurate and is loaded with useful functions. My only two complaints are not having a comma separating the 000's and a decimal point that is microscopic in size.

I will stick with my RPN models for most of my work but have a decent solution for meeting a special need.

John

HP 48GX Calculator

*Message #1 Posted by **raze** on 14 Apr 2004, 9:53 p.m.*

Hello All,

I have a HP 48GX calculator, but it does not turn on as it should. In order to turn it on, I have to press around the fifth key area and press the on button simultaneously. And the same procedure to turn it off.

When the item is on, I would like to know if there is a way to test for its full functionality. I have randomly tested it (mindlessly I would say) and all buttons work and it seems like some advance functions work.

I tried with pressing [on] and the fifth key on the top row, but it seems like the calculator needs to be in clear mode in order to test it, or at least this is what it suggesting because it thinks (think?!!)that I am asking for a specific function.

1.In short, do I have to reset the calculator in order to run the self-test function? 2.If so, how do I reset it? 3.Can I run the self-test under such circumstances? 4.How to run the self-test correctly?

Thanks all for any help!!

Re: HP 48GX Calculator

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Apr 2004, 1:15 a.m.,*
in response to message #1 by raze

Hi, raze;

please, locate both [ ]$_C$ and [ ]$_E$ keys in the top key row. Use the following procedure so you can start a complete, "circular" self-test:

```
- while the calculator is ON, press the [ON] key and hold it down;
- while [ON] is held, press and release [ ]E;
- release [ON]](this is called [ON]/[E])
```

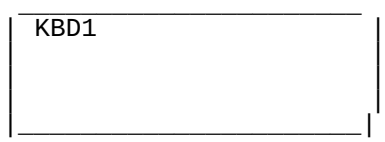
the calcualtor starts a self test that con only be interrupted with the sequence:

```
- press the [ON] key and hold it down;
- while [ON] is held, press and release [ ]C;
- release [ON](this is called [ON]/[C])
```

To activate the specific keyboard test, locate the [ ]$_D$ key in the top key row. Now, while the calculator is ON, do this:

```
- press the [ON] key and hold it down;
- while [ON] is held, press and release [ ]D;
- release [ON]; (this is called [ON]/[D])
- press [ ]E
```

When you perform the [ON]/[D], an interactive "step-by-step" self test is started. When you press [ ]E, you see:



At this point you should press each key in the first row, left to right (i.e. [ ]A to [ ]F), then repeat pressing all keys on each row, always left ot right, a complete row at a time, top to bottom.

I am worried about the possibility that you have a faulty (with a possible fissure) contact sheet (not a PCB, instead a "plastic", flex sheet with printed circuit) that seems to "retouch" edges when you press the mentioned area.

Hope this helps. Let us know wht happens.

Cheers and success.

Luiz (Brazil)

Re: HP 48GX Calculator

*Message #3 Posted by **James M. Prange** on 15 Apr 2004, 1:19 a.m.,*
in response to message #1 by raze

No need to do anything before for running a self-test, although of course it will clear your stack, local memories, and so on.

The repeating self-test should run if you press and hold [ON], press and release [E], and release [ON]. To get out of the self test, you'll need to force a warmstart (system halt). To do the warmstart, press and hold [ON], press and release [C], release [ON]. Or you can force a warmstart with a "paperclip reset". On a 48G series, the reset hole should be under the upper right foot. Remove the foot, and you should see an R next to a hole. Insert something like a partially straightened paperclip straight in until it stops, I suppose a half inch or so, and remove it.

Regards,
James

Re: HP 48GX Calculator THANKS A LOT FOR GUIDANCE; HOWEVER...

*Message #4 Posted by **raze** on 15 Apr 2004, 2:10 a.m.,*
in response to message #3 by James M. Prange

Thanks Vieira and James for your help.

Performed your suggestions, and it seems the machine works accordingly.

It displays: 1. OK-48 2. KBD1 OK

Does this mean that the machine is OK?

However, in order to do the self-test, I had to press around the fifth key to make it work. I had to press around the fifth key, not the button. This mean press around the plastic case.

It seems like the [on] button does not work properly, but when pressing [on] and pressing around the fifth key, it works perfectly. The same procedure I have to follow in order to turn it off or turn it on. The arrow

key and press around fifth key and press [on] to turn it off.

In short, pressing the fifth key takes precedence for all other functions except when the machine is already on. Unless there are specific functions that require the [on] key except for turning it on,off and self-test procedures.

Any indications? Does it worth something on eBay? I will auction them next week if possible.

Thanks a lot for your help. Greatly appreciate this board. BTW, the "around fifth key" I learned in this board also =)

Re: HP 48GX Calculator THANKS A LOT FOR GUIDANCE; HOWEVER...

*Message #5 Posted by **James M. Prange** on 15 Apr 2004, 6:25 a.m.,*
in response to message #4 by raze

What about CANCEL and CONT? Do you have to use the same technique to get them to work?

By "around the fifth key", do you mean "on the face plate near the [E] key"? I'd suspect a poor internal connection. Maybe it could be fixed, if you care to take it apart and do some repair on it. As for eBay, I don't know how much the 48GX has been going for lately. If you were to offer it for sale, you'd have to make it clear that it has this defect.

Regards,
James

What impresses my about the 33S

*Message #1 Posted by **Eddie Shore** on 14 Apr 2004, 1:56 p.m.*

1. The manual is a deatiled one (I can say this about the 17BII+ also).

2. When you press a key, you can actually see the function you are implementing.

What's weird: The ENTER key is simular to the DUP function on the 48/49 family and there is no button to just to put the number on the x stack.

Other than that, the HP33S is a good buy (considering I missed out on the 32/42).

Re: What impresses my about the 33S

*Message #2 Posted by **Ron Ross** on 14 Apr 2004, 2:53 p.m.,*
in response to message #1 by Eddie Shore

Not to rain on your parade, but the 33s manual is nothing more than a slightly modified Hp32sII manual. And that manual was written in/prior to 1995, before the Calculator division was shut down in Corvalus (sp?).

Re: What impresses my about the 33S

*Message #3 Posted by **bill platt** on 14 Apr 2004, 3:14 p.m.,*
in response to message #2 by Ron Ross

Hi Eddie, (and also hello Ron!)

The 17bii+ manual is also taken directly from the 17bii -- also a Corvallis product.

Your observation about ENTER being like "DUP" in the 48--that is true. But you give yourself away as a non-RPN person! (that is OK BTW). The 33s is "classic" RPN. The 48 is "RPL" which is a language rather than a notation. In a 48, there is a "command line" and then ENTER puts anything on the command line into level 1. If nothing is on the command line, then it will push the stack and DUPlicate level 1 into level 2.

An RPN stack does not have a "command line." Rather, any time you start typing, you are in the 1st stack level (called "x"). ENTER will push the stack, and duplicate your value into level 2 (called "y"). The stack is X--y--z--t.

Because RPL (28 and 48 series) allows operations between the "command line" and level 1, it behaves almost identically with RPN, with a few exceptions. The most notable difference is as you noted--On an RPL machine, you have to push ENTER twice after typing a number, in order to get it into the 2nd level. This means that on an RPL machine, to manually "square" a number, you go "v" ENTER ENTER *. But in RPN, all you have to do is "V" ENTER *.

Be careful with one thing in RPN mode on the 17bii series---after a master clearing or switch from ALG, the stack will be only one level deep to begin with, and will not feed a constant----see the Museum, and

also Craig Finseth's site for a good description of this quirk. (BTW it also happens to the "history stack" wneh you come bact to ALG out of RPN).

Regards,

Bill

Re: What impresses my about the 33S

*Message #4 Posted by **Mike Sebastian (Texas)** on 14 Apr 2004, 11:06 p.m.,*
in response to message #3 by bill platt

A modified/updated Corvallis authored manual is far superior to the jumbo-sized sheet of paper filled with cryptic instructions printed in a 6-point font that comes with the 9G, 9S, 30S, and many other low and moderate priced calculators. I certainly don't see anything wrong with HP updating an already existing manual.

Re: What impresses my about the 33S

*Message #5 Posted by **Veli-Pekka Nousiainen** on 15 Apr 2004, 1:20 a.m.,*
in response to message #4 by Mike Sebastian (Texas)

"I certainly don't see anything wrong with HP updating an already existing manual."

That's what they should have done with the 49 models:
use old 48 manuals and make a new volume for the new features
[VPN]

That explains it, thanks, Ron.

Slight change in HP Serial Number coding

*Message #1 Posted by **Matt Kernal (US)** on 14 Apr 2004, 1:17 p.m.*

I have received two new HP calculators in the last month or so. The first is a warranty replacement 49G+, and the second is a 33S. Here are the serial numbers:

```
49G+:    CN40204986
33S:    CNA41001002
```

Either the country code has expanded to three characters, or the year has expanded to two hex digits (A4). Anyone know if 164d on the Chinese calender is the same as 2004? ;^)

Matt
12345

Re: Slight change in HP Serial Number coding

*Message #2 Posted by **Scuba Diver** on 14 Apr 2004, 4:45 p.m.,*
in response to message #1 by Matt Kernal (US)

I was always concerned that the year code was only one digit long; although it's probably doubtful that a model would span more than 10 years, it's possible...

My hope is that the A refers to the year; so perhaps A4 represents 2004, B4 would represent 2014, etc...

Re: Slight change in HP Serial Number coding

*Message #3 Posted by **Charlie O.** on 15 Apr 2004, 12:56 p.m.,*
in response to message #1 by Matt Kernal (US)

Which digits indicate the year and what do they mean? I've been searching everywhere and all I can find are the old codes.

ceo

Re: Slight change in HP Serial Number coding

*Message #4 Posted by **Matt Kernal (US)** on 16 Apr 2004, 2:53 p.m.,*
in response to message #3 by Charlie O.

Look here: Decoding Serial Numbers

Re: Slight change in HP Serial Number coding

*Message #5 Posted by **Charlie** on 16 Apr 2004, 4:27 p.m.,*
in response to message #4 by Matt Kernal (US)

Thanks Matt but I was there. I was looking for the new number like on the last 32s ii with the country

code first. I reposted the question and it seems the year now starts at 2000 rather than 1960.

Re: Slight change in HP Serial Number coding

*Message #6 Posted by **Matt Kernal (US)** on 16 Apr 2004, 7:14 p.m.,*
in response to message #5 by Charlie

Now I know why you didn't find it... You were there, but just didn't look far enough down the page.

Just follow the link in my last post, then simply scroll down a little with your vertical slider or wheel mouse, and you will find the Serial Number Decoding for the newer HP's.

Matt

Re: Slight change in HP Serial Number coding

Just go out and buy a Mint-in-Box HP-16C and use it to do a hex to decimal conversion on the date code... after you get the answer, just send the machine to me and I will dispose of it properly.

would HP still be making good calculators if they were a japanese company.

*Message #1 Posted by **bill platt** on 14 Apr 2004, 11:17 a.m.*

I read that in the US computer makers won't make a laptop model unless they think they will sell 100,000 or more units. But Japan often "microbrews" and will make laptops models planning on only sell 10,000 or so. one only has to look on www.dynamism.com or another importer's website to find specialty computers. I wonder if this would be true for calculators

This is a different bill platt from usual!

*Message #2 Posted by **bill platt** on 14 Apr 2004, 5:20 p.m.,*
in response to message #1 by bill platt

Hello other Bill Platt! (are you the Bill Platt that writes a lot in the computer field?)

Yours is a good point---and it is certainly a good question. Perhaps there IS a japanese maker lurking here already. I will note howvere that among contributors, Japanese names are conspicuous in their rarity here on this forum.

regards,

Bill

Re: would HP still be making good calculators if they were a japanese company.

*Message #4 Posted by **Roy** on 14 Apr 2004, 11:19 p.m.,*
in response to message #3 by db(martinez,california)

It's said at the linked web site about that RPN from Japan that it is very accurate with Trig functions, better than the HP41. HPs after the 41 though like the 28, 48, 42, 20s etc are more accurate regarding Trig functions than the HP41. A good example is where the HP 48 models, and other saturn based calcs, give the correct result to 12 places for the Sin of 3.141592654 Radians, that being -4.10206761537 E-10. As far as I knoiw the newer HPs are the only cals ever made that gives this correct result.

Re: would HP still be making good calculators if they were a japanese company.

*Message #5 Posted by **Garth Wilson** on 15 Apr 2004, 2:06 a.m.,*
in response to message #4 by Roy

I'm no expert at the calculators' innards, but I expect the "problem," if you can call it that, stems from the fact that the Saturn uses more digits internally than the 41 does. Saturn's processor registers are 64-bit, not 56 like the 41's. Most engineers have no use for that much precision though. I don't remember ever needing more than about 5 digits.

Thoughts on early HP and early TI accuracy

*Message #6 Posted by **rsenzer** on 15 Apr 2004, 2:03 p.m.,*
in response to message #5 by Garth Wilson

In fact, even with some of their algorithm flaws, many of the early TIs had significantly more accuracy than the comparable HPs. For years, HP produced brochures criticizing TI for its algorithms, but really didn't produce a calculator with comparable accuracy until the "BASIC' calculator/computers and later series were released with 12 digit computation.

You can still see that old TI level of accuracy in the BAIIPlus. Unfortunately, TI has used inferior algorithms, chips, and/or software in many of their models such as its current crop of non-graphing scientific calculators. Similarly for their original LED TI-30 and related models. The SR-51-II from that vintage has excellent accuracy, but the later TI-5X series were disasters.

HP-41 HEPAX poll (for the NoVRAM module)

*Message #1 Posted by **Diego Diaz** on 14 Apr 2004, 9:32 a.m.*

Hi all,

I have to make some decissions regarding the final design of the NoVRAM module, intended to minimize the parts count...

Just to summarize for those not yet aware:

NoVRAM is a 16k (for now) RAM box in a standard HP-41 module enclosure.

It fully emulates the Advenced HEPAX module (including auto allocation in the lowest available page and RAM write protection) while provides two extra ROM pages, in a Clonix-like way

The question I'd like to poll you is about the automatic mapping ability of the Adv HEPAX. i.e. the 4 RAM pages are mapped to 8 - B if you plug the module into ports 1 or 2; or mapped to C - F if the module is plugged into ports 3 or 4.

I've been trying to figure out a good reason for keeping this feature in the NovRAM emulation (NoVRAM prototypes actually have it implemented), but so far it only takes some code space and requires two extra resistor for the B4 line sensing, and a somewhat more complicated PCB routing.

I've prepared a new prototype without B4 sensing (it always placed its memory in 8 - B pages, and have been unable to find any illegal configuration (appart from those stated in the HEPAX manual, which BTW have nothing to do with the mapping feature)

As I'm not one of those fortunate "real" HEPAX owners/users I'd like to ask you all if is there any reason for what such a feature should be preserved or not?

Thanks in advance.

Diego.

PS. I'll leave for holidays in a few hours, but will take a look to the 'net everynow and then.

Oh, Just a good news I've managed to re-shrink the code so the 6th page is again available!!

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #2 Posted by **Ángel Martin** on 14 Apr 2004, 10:34 a.m.,*
in response to message #1 by Diego Diaz

Diego,

The RAM mapping is in my opinion a convenience thing. It is much better to have the RAM mapped to the position where the module is plugged in (and its adjacent one).

When writing MCODE or uploading programs to HEPAX RAM it's always important to know where you are (address-wise). Consider otherwise the confusion that it can create, when actual ram location has no linking to its physical position. Say that you want to plug in a module into an apparently "empty" slot (nothing there or aside), but it turns out to be "occupied" by the module *underneath* it !

Having said that, a couple of differences between HEPAX and NoVRAM (BTW, how will you christen it?) apply:

1. NoVRAM isn't volatile when unplugged. This can advise for a flexible mapping as well.
2. HEPAX could add more RAM, up to 32 kB. In this case it was imperative that the addressing was linked to the actual port location!

So my conservative 2 cents is: well worth the admission price, go ahead ad add those 2 transistors!

Best wishes and enjoy la feria!
Ángel

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #3 Posted by **Bill Holes** on 14 Apr 2004, 6:37 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Like you, I'm not one of those fortunate few that own a real HEPAX... However, I believe this will all change after the release of NoVRAM, which in my opinion will be far better than owning a real HEPAX.

Having said this I must agree with Angel's vote to go ahead with adding the "two extra resistors". I see no sense in limiting any of it's functionality after all the hard work you've put into this effort. I doubt the extra two resistors and additional board traces will increase the cost beyond an affordability level for anyone who understands it's true value.

Enjoy your very much deserved holidays!!!

Best Regards,

Bill

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #4 Posted by **Lawrence Hood** on 14 Apr 2004, 7:59 p.m.,*
in response to message #1 by Diego Diaz

Diego,

As a proud owner of a STD HEPAX I recommend the inclusion of the additional resistors. I'm looking forward to purchasing your latest creation!!

Thank you for your continuing efforts, Lawrence Hood

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #5 Posted by **Christoph Klug** on 15 Apr 2004, 5:24 a.m.,*
in response to message #4 by Lawrence Hood

Dear Diego,

yes - please add the two transistors to your hardware design. May be you are able to use a small double transistor array or two transistors housed in one case...

For easy installation we want two adjacent ports, like a 16KByte straight ZEPROM...

Regards - Christoph

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 15 Apr 2004, 12:08 a.m.,*
in response to message #1 by Diego Diaz

Hi, Diego;

Congrats; as many HP41 users, reading about your achievements leads us to "dreams-come-true" about to happen...

Now for the "questions". My only experiences out of the HP41 Owner's Manual are related to Synth Programming (Bill Wickes) in the late 80's. After that I was known about the CCD, PPC and HEPAX ROM's after reading some posts here about three years ago. Yeas, a big lack in time. All I know about the inner HP41 is after that.

What I want to know is mostly related to something I read (if I am not wrong) about the HEPAX modules. Is it a fact that you can plug two of them in one HP41 so one module uses the other one's RAM? I am not sure if this is actual information, but if it is, would one of the operation modes (with or without resistors) missallow this particular behavior?

As I am not even sure if this is what I read about the HEPAX, please consider that this very information may also be unaccurate.

I wish you "boas férias" también, Diego.

Cheers.

Luiz (Brazil)

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #7 Posted by **Ángel Martin** on 15 Apr 2004, 3:15 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Luiz,

There were (are?) two types of HEPAX modules. The first one has a combination of both ROM (its O.S. so to speak) and RAM. There are two sub-types, depending on whether there is 8k or 16k RAM included.

The second type is RAM-only HEPAX, also with two modalities: 8k or 16k.

And yes, you can plug one of each type together, for a total of 32k RAM plus its OS ROM, camuflaged in the internal ports (assuming space is available - it is a 16k ROM, but because it is heavily bank-switched, it uses only one page).

You could also use the RAM-only HEPAX modules in conjunction with Eramco MLDL, RamBOXes, or any other "system" that can access Q-RAM space (i.e. RAM in the ROM addresses). For example, the David Assembler can be used to program that RAM.

Plugging two of the first type together doesn't make sanse, and probably won't work at all.

I'm almost sure that Diego's NoVRAM will also be capable of using the RAM-Only HEPAX, for those few guys who have them, but honestly this is not the main point here: the NoVRAM by itself will be a superb replacement of the HEPAX, with the added bonus of having two extra ROM pages available (Clonix-like).

Best, ÁM

Re: HP-41 HEPAX poll (for the NoVRAM module)

*Message #8 Posted by **Werner (Germany)** on 18 Apr 2004, 3:05 p.m.,*
in response to message #7 by Ángel Martin

Dear Diego and dear Ángel,

first of all I would also be glad if you added the extra effort to having the opportunity to have a deterministic port occupation behaviour. As you may remember some time ago I had a severe problem with my W&W-RAMbox II but with the help of my ADV HEPAX I was able to fully recover it at last.

This was only possible as the port occupation could always be taken into account because I had to use the HEPAX in conjunction with other ROM modules in order to mask some internal address space.

Second, I do not know but I believe that you could use two HEPAX with RAM+ROM. Probably the ROM of one of them would cover the other identical ROM, and all RAM from both HEPAX modules would be acquired and mapped to different addresses.

I cannot test this scenario but I believe it could work because my ADV HEPAX also acquires the RAM of the W&W-RAMbox if I plug it into my HP-41CY. It auto-detects all available Q-ROM and assigns all*) 4k blocks to different address pages. So, this seems to be a special property of HEPAX functionality. This is why I believe that a HEPAX-ROM/RAM-module will also detect an acquire the RAM pages of another HEPAX-ROM/RAM-module and not only of the special pure-RAM modules.

*) of course not both parallel 32k-layers of a RAMbox II can be allocated.

Best regards,

Werner

Are older HPs date code based on Fiscal year?

*Message #1 Posted by **Roy** on 13 Apr 2004, 8:57 p.m.*

There is a HP calculator web site that says the older HP date codes are based on HPs Fiscal year, and not the actual year. It says the fiscal year starts on November 1st..so in other words a HP calc would be 2 months newer than if using January as the start of the year...Is this true? I ask since the HP Museaum seems to claim the year starts in January, while the site I am referring to says it starts the previous November for the HP Fiscal Year.

The URL site that speaks of the November start of the fiscal year for the date codes is

http://www.finseth.com/~fin/hpdata.html

Re: Are older HPs date code based on Fiscal year?

*Message #2 Posted by **DougT** on 14 Apr 2004, 1:49 p.m.,*
in response to message #1 by Roy

Roy,

I can vouch for the fiscal year/serial number deal with at least one data point. I purchased my cherished HP-15C in late fall 1982, yet the S/N indicates 1983. These calculators sold very well back then, so I'm not surprised that I nabbed one fresh out of the US factory, before the end of the calendar year.

Regards,

Doug

Calculator Designs

*Message #1 Posted by **David Yerka** on 13 Apr 2004, 6:06 p.m.*

Personally I like the "4-line" stack display concept--so long as the lines are true alphanumeric and able to display at least as much info as the 41's alpha register. 4 lines displaying labeled results should be enough for most programs. Has anyone considered a "pop-up" concept for a graphing display. Sort of like the Palm Tungsten PDAs. The display slides into the body with only enough of the top showing for 4+ lines. For graph/graphics display it pulls out fully. Granted this makes for a less durable body but allows for a more compact package.

Of course, with generalized I/O (calculator as a master USB controller) it shouldn't be too difficult to create a lcd display, battery powered, to serve as a graphic display. After all the 41 w/IL had a CRT controller.

Re: Calculator Designs

*Message #2 Posted by **Eddie Shore** on 14 Apr 2004, 1:53 p.m.,*
in response to message #1 by David Yerka

Haven't thought of that. I'd favor the idea and add:

* the graph has to be fully functionable. I can trace, lable, make a table of the function etc...

* there should be a one button switch between the graph and the RPN stack.

Thoughts on OpenRPN - Long and Rambling

*Message #1 Posted by **rsenzer** on 13 Apr 2004, 1:22 p.m.*

Some general thoughts about OpenRPN:

I like the concept, however, ...

My thoughts are that an initial step would be to develop an ironclad design specification with a high level of minimal requirements that would receive an "endorsement" as "OpenRPN compliant". Then bid out the design. Let the people with the best resources build it to the desired specifications.

Provide the specs to known calculator companies, computer companies, etc. A small startup electronics company may want to build the products. For that matter, put the specifications on a website along with FAQs, etc. If companies want to add bells and whistles, e.g., algebraic capability, no problem. That doesn't preclude individuals on this board from forming their own company to produce a compliant calculator.

The other advantage is that we could provide different level of specifications for distinct calculator forms. I would like to see three separate specs for 3 different purposes:

1. All encompassing: Graphing calc, etc., with a more HP-41 style programming language. Would like to see some provision for argument passing mechanisms and local variables for procedures and more structured constructs.

2. Two liner: Compact calculator, perhaps the size of a 33S or 32SII but with power of 42S and external interfaces and flash memory.

3. One or Two Line Calculator for examination purposes. This would have battery backed solar power, multiple non-volatile memory registers, have unit conversions and scientific constants built in. Essentially equivalent to a 33S with no programmability and no non-volatile equation storage. This calculator should be really cheap. It would compete with the HP-30S, TI-3X, CASIO fx-XXX models.

All would have an ENTER key in the appropriate place and the appropriate size. All would have full RPN with RollUp, RollDown, LastX, X<>Y, and at least a four register non-volatile stack. All would have the NULL feature that would show the function and cancel the function if held for an extended period of time. All would have a 3 digit exponents and a degree of accuracy comparable to the latest models of HP calculators.

Also, provide an update cycle so that the specification can be appropriately amended from time to time as appropriate.

Issues:

1. Mechanism for creating and updating the document

2. Parties involved in creating and updating the document

3. Mechanism for tracking the progress of the document and companies interested in creating associated products.

4. Marketing: Convincing companies that this is a worthwhile endeavor and a money making proposition.

... As I said, just my thoughts

Re: Thoughts on OpenRPN - Long and Rambling

*Message #2 Posted by **rsenzer** on 13 Apr 2004, 1:49 p.m.,*
in response to message #1 by rsenzer

The 2 top end models should incorporate financial functionality as well as scientific functionality.

Re: Thoughts on OpenRPN

*Message #3 Posted by **bill platt** on 13 Apr 2004, 2:51 p.m.,*
in response to message #1 by rsenzer

Hi rsenzer,

Nice write-up.

To me, the idea of "OpenRPN" is all a "mutual compatibility" issue---meaning that all the "models" will be interchangeable from a programming standpoint. This means that there are no "extra" commands in one level---only differences are memory size. I suppose one might allow different commands if they are part of a logical "module" that could be loaded as an option--but then that module better work on all models in the family.

To me, an annoying thing about existing HP's is the not quite compatibility in some cases---(of course this should exist from 25c to 41---but why should the 32sii use a different equation editing than the 17bii for instance). It would be nice to create a robust basis language--and I think RPN is mature enough now to do it!

Regards,

Bill

Re: Thoughts on OpenRPN - Long and Rambling

*Message #4 Posted by **Hugh** on 14 Apr 2004, 8:10 a.m.,*
in response to message #1 by rsenzer

Great ideas! I hadn't thought of creating a compliance standard, but that is an excellent way to ensure the highest end quality. It's probably inevitable that a company will want to produce at least one of the models devised by the group... A uniform set of quality standards should really help to keep them from being produced with diminished capacities. We'll probably just want to include a clause about compliance in an open license.

Re: Thoughts on OpenRPN - Long and Rambling

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 15 Apr 2004, 12:16 a.m.,*
in response to message #4 by Hugh

I have a suggestion: This project must be hardware-independent, and the specifications must take in account all kinds of input/output (at first display and keyboard). Something like the "core" system querys the hardware ("drivers"?) to know what kind of I/O it has and enable/disable functions regarding it.

To be hardware-independend I think on creating a "virtual CPU", well-defined to satisfy the needs and easy to implement its emulation on any hardware (from PIC microcontroller to Palm and PCs). It'll be great to have the very same calculador on your hand (fisically) and on your palmtop or desktop computer, and it'll be easy to develop programs for it. This way anyone could build a prototype on a breadboard and "play" with it, helping to debug and develop it.

I have the possibility to project custom-made LCD displays, but it'll cost some $$$, but lets define the "core" first! I plan to build a prototype with LED matrix display, by the way... I have something almost done, I'll publish some pictures later.

This can be the "Linux" of calculators, let's keep the idea growing!

Best regards,

Nelson

Announcement: OpenRPN Project

*Message #1 Posted by **Hugh** on 12 Apr 2004, 2:43 p.m.*

Greetings all,

I posted a week or so ago proposing the ground-up development of a new calculator. Current news is that I'm hammering out details finding a host and will have a forum up and running within the next couple of weeks. Anyone with any interest is encouraged to contribute. Thanks in advance to all, I look forward to working as a community to design the perfect calc.

Re: Announcement: OpenRPN Project

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 12 Apr 2004, 5:16 p.m.,*
in response to message #1 by Hugh

As I said before, count on me!

As a side note, I just quoted a local LCD display maker, to build a prototype display is about US$900 (machinery to build more than one)... ouch... but it is at least possible...

Best regards,

Nelson

Re: Announcement: OpenRPN Project

*Message #3 Posted by **Hugh** on 12 Apr 2004, 10:02 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

I've already thought of a solution for that, actually. If we use a dot-matrix LCD, the lowest row can be covered with a white silk screening leaving the desired characters clear so that "deg" "rad" "grad" etc. will appear. That way we can get away with a $10-20 LCD instead (at most).

PCBs can be made using toner transfer sheets, eyelets for through-holes, double sided alignment with some clever fixturing. Surface mount components can be applied using solder paste and a toaster oven.

I've found a source for cast aluminum cases, and am getting in touch with some resin modellers about making keytops. This should keep total costs under $100. As a side benefit, it will be waterproof and fire resistant.

Re: Announcement: OpenRPN Project

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 12 Apr 2004, 11:20 p.m.,*
in response to message #3 by Hugh

The 16x2 or 20x2 LCD is fine, and cheap. I was only thinking in a more "elegant" solution in the future, and this custom-building isn't too expensive if you can reuse it for hundreds of displays. Just an

idea... I really like 7 or 14 segment displays ;) They can do matrix displays too, with controller (COG also), very thin.

Fire and water proof is awesome! I like the idea of metal case with solid plastic inside as some (old) Sharp or Casio are, the feel is pretty good and the circuit is well protected. And with screws, NOT melted plastic pins!!

As we won't(?) profit with this project, there isn't the need to sell a new calculator every time the old one is damaged, if the old one doesn't get damaged at all... IF we can build a very good hardware.

I was thinking on www.olimex.com to build the PCBs, they are very good and cheap.

For the keys... do you have any solution? Here are some silicon-rubber makers that can do a good job, but is silicon-rubber... It won't last long enough and doesn't have THE click! Double molding isn't necessary if we can "engrave" the signs on the keys with laser and fill in the traces with epoxy paint. Even if the paint goes off, is only a matter of repainting and cleaning.

I'm "polishing" some ideas to discuss later.

Best regards,

Nelson

Re: Announcement: OpenRPN Project

*Message #5 Posted by **Hugh** on 13 Apr 2004, 12:49 a.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

It certainly seems the best way to make the keys themselves in epoxy resin in a silicone mold. Very high detail, low cost, durable, and avaiable in many colors. The only hard part about "the click" is finding a good source for dome-sheets. It will need to be stainless steel or kevlar like HP has used before. I've found a few sources for these before, but I'll have to see if they can sell small enough runs.

All in all, things sound good so far. I really want these to be easily serviceable if they need it, but design them to be indestructible in the first place.

Once the forum is up we should be able to better organize a general design path and layout all of the important milestones.

Best regards, Hugh

Dome Sheets

*Message #6 Posted by **bill platt** on 13 Apr 2004, 9:59 a.m.,*
in response to message #5 by Hugh

What about those lettle switches that are used on so many things today--like control buttons on printers, on RC toys etc. They have a very powerful CLICK. ?

regards,

Bill

Re: Dome Sheets

*Message #7 Posted by **Hugh** on 13 Apr 2004, 11:27 a.m.,*
in response to message #6 by bill platt

Absolutely. Tactile dome sheets are still readily available. One of my favorites is actually the keypad on my cell phone! So it's really a matter of finding a mfg who is willing to produce limited runs at a reasonable cost, or sell us surplus. It may even be worth getting in touch with kinpo as we may be able to source them "from the horse's mouth."

In all honesty, the most challenging parts to make will be the keyboard assembly and the lcd. Like I said, I've found a good way around the keytops... so we're down to just the dome sheets.

Re: Dome Sheets

*Message #8 Posted by **Hugh** on 14 Apr 2004, 4:58 p.m.,*
in response to message #6 by bill platt

More good news, I've found a major supplier of stainless steel domes used in tactile keyboards. In the process of getting a quote right now. If anyone is interested, here's a link:

www.molex.com/product/switch/domes.html

I've also gotten in touch with Randy Sloyer about some keytops to use as a basis for the molds (just a bit of reverse engineering). I'll be making some modifications, the main one being a rubber membrane will be fused to the edges of each key during the casting process. This can be taken out to the edges to function as a gasket, providing a watertight seal... Coffee spills, pink lemonade, dirt, dust, mold, no problem: put it under the sink for a few minutes!

Keep the ideas coming! So much of the logistics in making the case, keyboard, etc. are solved that we'll need to choose all of the necessary, processors, controllers, and I/O stuff soon.

Re: Dome Sheets

*Message #9 Posted by **James** on 14 Apr 2004, 6:06 p.m.,*
in response to message #8 by Hugh

A few configurations of off-the-shelf snap-dome keypads are available from Pac-Tec.

Since these are only rectangular arrays with fairly large spacing, they would not be ideal for a final design, but might be good for a prototype, or to scavenge some domes.

See: http://www.pactecenclosures.com/MSOV/standard.html

I also like the idea of using off-the-shelf tact switches: these would be easy to replace, come in a variety of tactile forces, and aren't all that expensive.

Tactile feedback switches

*Message #10 Posted by **Renato (Brasil)** on 17 Apr 2004, 12:45 a.m.,*
in response to message #6 by bill platt

ALPS manufactures tactile switches for games, phones , toys, etc.

There are many types, travel distance, force, etc. Some examples:

http://www3.alps.co.jp/indexnpv_sw-e.html

I was able to order a few samples from the local (Brasil) ALPS subsidiary.

Re: Announcement: OpenRPN Project

*Message #11 Posted by **Meindert Kuipers** on 13 Apr 2004, 3:12 a.m.,*
in response to message #3 by Hugh

I am in for this project, just don't make everything as cheap as possible. We are going for the perfect calculator, remember. Pick a fast processor with plenty of memory space. Most important for me is to offer I/O expansion and connection to a PC (USB???)

Meindert

Re: Announcement: OpenRPN Project

*Message #12 Posted by **Yanis** on 13 Apr 2004, 8:38 a.m.,*
in response to message #11 by Meindert Kuipers

You can now buy quite cheap SMD single chip USB drivers. Use a mini USB connector.

Will the ROM be flash? Easily upgradeable. Use the USB port.

Re: Announcement: OpenRPN Project

*Message #13 Posted by **Hugh** on 13 Apr 2004, 11:19 a.m.,*
in response to message #11 by Meindert Kuipers

LOL, I think the possibly the best thing about a project like this in the HP community is that everyone is pretty unanimous about what they want. I've been finding the absolute best/most durable components I can. Like I said, I alreday decided to make the case waterproof and fire resistant!!!

Everyone wants tactile keys and a big enter key, plenty of flash rom space and low current requirements.

The one thing I fully anticipate is something that all open-development projects encounter (and I want to make this flexible enough to prevent a major schizm) is that sub-projects will result. The three major ones I can already see are just form factors: horizontal (voyager), upright (pioneer), and graphing. If we keep the components as modular as possible, we can certainly satisfy everyone involved.

I personally think this may need to go as far as creating a piece of software to allow each individual to build a custom rom by selecting key locations, and it generating a printable overlay. We certainly have the resources, the time, and the committed individuals to make this happen.

Keep the ideas coming!

If it simplifies things, I'd be happy with something that looks and functions like a lightning fast 41cx (but with a true two line display). I can count the number of times I've used the graphing function on my 48GX on one hand.

Take care.

Wayne.

in response to message #14 by Wayne Stephens

I too rarely use the grpahing capabilities of my calculators. More often, I use the table feature, when analyzing graphs. It allows you to really "see" what's going on easier than with the picture itself. Perhaps a simple "table" app could be added in.

I believe the best way to go about designing this calculator is to have a single (or a few) calculator bodies, and then, via different roms and keyboard maps, make 2 or 3 different models (maybe like the 16c, 15c, and 12c were: all the same body, but different applications). I don't know too much about electronics, but if an uprgadable ROM is included, then it should be fairly simple to make the basic, fast, scientific calculator, the financial calculator, and the ultra-powerful uber scientific better than graphing calculator.

Just my thoughts

-Ben

*Message #16 Posted by **Jeff** on 13 Apr 2004, 12:51 p.m.,*
in response to message #13 by Hugh

I agree with Wayne, the high-powered graphing capabilities of the so-called graphing calculators do not do much for me. I would like to lobby for a "super" 42S display. Normal display would be the whole 4 level stack, and Last X. If soft-labels will be used for the top row of keys, then display of the soft labels should be included simultaneously with display of the above registers, i.e., the soft labels do not reduce the number of stack levels that are displayed. If I recall correctly, the 42S display is 16 X 131 pixels for a two line display. So based on the above concept related to the 42S display, it would take a 48 X 131 pixel display to do the above, not counting any pixels used for annunciators. This pixel grid could then also be used for the rudimentary *graphics* capabilities of the 42S display.
Of course the above assumes that a 4 level stack will be used. I can see that some might want a 5, 6 or ? level stack. Stack height might be user definable feature. Some might even want an RPL-style “infinite” stack, although I am not a fan.

in response to message #16 by Jeff

Jeff,

Excellent suggestions. My only concerns with a four or five line display are:

1) Fragility of a large screen. 2) Size of the calculator if it includes a large screen. 3) Cost of large screen display.

I also really like the 42S display. Perhaps compromise by adding one line to it (for a total of 3) to allow showing soft-key labels while still displaying x and y registers?

Take care.

Wayne.

PS-I do like the idea of an aluminum or steel body.

in response to message #18 by deleted

Although not worth a huge amount of extra effort, I think a 7 segment (or dot matrix) LED option would be nice.

In my limited experience, LEDs usually have a much longer practical life than LCDs; my junk box has a significant quantity of LCDs that have gone black etc.

(And then there are nixie tubes for that "retro" feel :-)

Perhaps the display unit can be a separate module. This might help divide the effort too.

*Message #20 Posted by **Garth Wilson** on 15 Apr 2004, 2:33 a.m.,*
in response to message #19 by James

I have a lot of LCDs, some up to 20 years of age, and they're all in perfect condition. The calculator packaging should protect the LCD from being poked or twisted, but only common sense will keep it from sitting in the sun for long periods of time or getting the deadly high heat/humidity combination. The circuit design must make sure the LCD is not fed with DC. One of my LCDs is in a cheap (under $2) little clock I had on the car's dashboard for 12 years, from 1985 to 1997. The car was always parked outside and got awfully hot in the sun, but no humidity at the same time and little UV. There are different grades of LCDs too though. The widest specified operating temperature range I have is -20 deg C to +70, but my testing found it still somewhat useful from -25 to +85. At -25, it took a looooong time for the dots to turn off or on. At -27, it turned clear so you couldn't see anything. At +85, it was virtually negative. It all returned to normal when it got back into the specified operating range. I ran the temperature down to about -50 and up to nearly +100 for perhaps 15 minutes, and did not damage it.

LCDs are sunlight-readable, take very little battery power, and make less electrical noise than something like a LED matrix or vacuum-fluorescent, which should make it easier to get the FCC certification for the product.

*Message #21 Posted by **Hugh** on 15 Apr 2004, 12:39 p.m.,*
in response to message #19 by James

Like I've said before, I think it's essential to uphold a rigid standard that each major component be modular. In many open development projects, other projects with almost identical goals will break off and do their thing... There's no point in being divided when we can commit to pooling our talents.

That said, displays seem to be generating the greatest controversy as of yet. The two that I find most attractive are VFD's and LCD's. It's a real tradeoff of power consumption vs. reliability and visibility. I'm intrigued by the possibility of using lithium cell batteries as a power supply, as it may improve the unit's ability to handle a VFD.

I'd love to get some opinions (aside from single/double/graphing size, etc. don't worry, as I'm certain this project will grow to encompass plenty of options).

Re: OpenRPN Display Considerations

*Message #22 Posted by **Garth Wilson** on 15 Apr 2004, 3:00 p.m.,*
in response to message #21 by Hugh

Even a small VFD module can take a couple hundred milliamps, meaning that operating from small batteries is pretty much out of the question. It still won't be sunlight-readable either. The good news is that there are standard modules in almost any kind of display. You can get modules with the same mounting holes and interface requirements from many manufacturers, with the drive circuitry built in.

I cast my vote too for this project. I used to me a member in PPC in the 80s and we did the PPC-ROM which showed the power and talents of a community likes ours. I also learned by attending the various PPC conferences that when folks like ourselves meet in person, the rate of communications goes through the roof!!

Here is what I feel we need to get organized a bit:

1. Have a more permanent forum to discuss this subject further. Maybe Dave Hicks can create a new area on his server. This way we stay on this site.

2. Have a group of voluneteers who are core organizers.

3. Plan for a conference so that all those who can travel and get together can meet in person.

4. Have fun doing this project!

Namir

in response to message #27 by Eddie Shore

I have no knowledge worth sharing except to say that you can count me in to purchase a calculator that this community develops. It might be worth having someone start collecting names/email addresses of those of us who would be willing to purchase one of these future calculators when they're finished (might help justify paying to develop necessary parts knowing you had 1000 future customers right from the start). I would pay a few hundred dollars to buy a one of these RPN calculators developed for reasons other than making a quick buck.

I'd pay even more if you can get NCEES Approval for use on the PE Exam :)

Re: Announcement: OpenRPN Project

*Message #29 Posted by **Hugh** on 14 Apr 2004, 10:16 p.m.,*
in response to message #28 by Warren Lavery

You raise an interesting point, when the design reaches completion it may be worth seeing how many units we can move. Since development costs will be sunk and non-existant, the final price would reflect actual production cost... at most with a very small markup with profits going directly to a fund for further development (prototyping does cost money after all).

One thing that is absolutely essential to me is that all of the information needed to build a fully-functioning unit be freely available.

I'll get in touch with my university, they have rapid prototyping, cnc, laser sintering, etc. as well as injection molding equipment. Perhaps I can pull some strings to help lower production costs further (if we choose to take that step).

Again, thanks to all for your ideas and contributions!

Re: Announcement: OpenRPN Project

*Message #30 Posted by **Dave Shaffer** on 15 Apr 2004, 4:34 p.m.,*
in response to message #28 by Warren Lavery

Warren makes an interesting point:

"I'd pay even more if you can get NCEES Approval for use on the PE Exam :) "

Should our new calculator be modularized so that you can remove whatever it takes to make it NCEES approved? Or, will there be a low-end model without all the bells & whistles (a la the '32S or 33S)? This might be a significant market share.

Re: Announcement: OpenRPN Project

*Message #31 Posted by **Nelson M. Sicuro (Brazil)** on 15 Apr 2004, 5:37 p.m.,*
in response to message #30 by Dave Shaffer

As I don't live in the USA, what is the 'NCEES' after all? How frequently do you need to execute its 'tests'? For what purpose?

I think that this project will be totally modular, but how do the guys at NCEES check what (software) modules is installed on the calculator? We can build a version with segment LCD display, but it is also capable of showing alpha characters.

OR they provide a SD/MMC card with the modules allowed for use on the test...

Best regards,

Nelson

Re: Announcement: OpenRPN Project

*Message #32 Posted by **bill platt** on 16 Apr 2004, 11:01 a.m.,*
in response to message #28 by Warren Lavery

PLEASE forget about the NCEES business. Let us design a machine that is unencumbered by *artificial* limitations.

Also, I doubt that a beauraucracy such as the NCEES would ever "approve" a non-mass produced electronics item!

Also, count me in!

Regards,

Bill

Re: Announcement: OpenRPN Project

*Message #33 Posted by **Hugh** on 16 Apr 2004, 3:01 p.m.,*
in response to message #32 by bill platt

Agreed, even if we were to *try* for approval (this is purely hypothetical) we would never get it. Think about it... fully flashable rom, open source code, user configured keys?!? One unit will invariably differ from the next.

I will say this, however. If someone is able to get it approved, I'm all for it. More power to you.

38E Batteries

*Message #1 Posted by **Wayne Stephens** on 12 Apr 2004, 12:24 p.m.*

I have an HP 38E en-route to my house right now. It will include two battery packs, one of which "will not hold a charge".

This will be the oldest HP in my collection and I have no prior experience with rechargeable battery packs, but I am willing to give them a try. My questions are as follows:

1) Is there a type of alkaline disposable battery on the market which can be safely used in the 38E? If so, will they last more than an hour or two powering those LEDs?

2) Of all the battery pack rebuilders out there, who is considered the best/most reliable/most economical? Should I attempt to rebuild one myself?

Thanks.

Take care.

Wayne.

Re: 38E Batteries

*Message #2 Posted by **Eric Smith** on 12 Apr 2004, 2:40 p.m.,*
in response to message #1 by Wayne Stephens

> Quote:
>
> 1) Is there a type of alkaline disposable battery on the market which can be safely used in the 38E?

Some people have reported success using alkaline AA cells in the Woodstock series (e.g., HP-25), but others have reported damage. I haven't heard of anyone doing it on a Spice. AA alkaline batteries are nominally 1.5V, as compared to 1.2V for NiCd. So you'd be running the calculator on 3.0V rather than the 2.4V for which it was designed. I wouldn't care to do that to mine.

> Quote:
>
> Should I attempt to rebuild one myself?

Yes. You can use a pair of NiCd or NiMH AA cells.

Re: 38E Batteries

*Message #3 Posted by **db(martinez,california)** on 12 Apr 2004, 8:46 p.m.,*
in response to message #1 by Wayne Stephens

f) I always have some slightly used AA cells hanging around and i bet so do you. So the fully charged battery problem is no problem. I've used them this way and have had no regrets.

g) When you see the Spice battery pack you'll see that no matter what you use; this is the easiest battery pack to rebuild. Hell, just use a couple of regular slip in Ni Cad or NiMh AA cells if you want and charge them in a wall charger. The stainless steel clip holds them and makes the connection between them.

Nice to Hear from db

Hi Wayne,

I'm currently running a 33E on two alkaline batteries with no problems. With approximately 3/4 hour per day of use, they were put in about 3-1/2 months ago and still going Paul

Thanks!!

*Message #7 Posted by **Wayne Stephens** on 13 Apr 2004, 10:05 a.m.,*
in response to message #1 by Wayne Stephens

Thanks to all who responded. I am looking forawrd to getting the 38E.

Take care.

Wayne.

Re: 38E Batteries

*Message #8 Posted by **David Smith** on 13 Apr 2004, 11:46 a.m.,*
in response to message #1 by Wayne Stephens

A fully charged fresh nicad will put out 1.43V, so two 1.5V alkaline cells (fresh 1.57V) should not be too much of a problem. Strangely, they may fool the "low batery" light into comming on.

As far as rebuilding packs, get your local Batteries Plus or Batteries Etc to do it with 1800 maH NiMH cells. They will run the machine for three times as long as the original nicads (if you charge them three times longer). They are better for the environment and you don't need to worry about fully discharging/charging them.

38E is Here

*Message #9 Posted by **Wayne Stephens** on 16 Apr 2004, 10:59 a.m.,*
in response to message #1 by Wayne Stephens

My 38E is here and it is COOL!! This is my first experience with the old 30 series and I am impressed. In fact, I've got a 34C on the way already.

Take care.

Wayne.

PS - The battery packs both seem to hold a charge, so it looks like I lucked out.

Re: 38E is Here

*Message #10 Posted by **Ed Look** on 16 Apr 2004, 4:17 p.m.,*
in response to message #9 by Wayne Stephens

Ah, yeah! There is no calculator to me that can replace the feel of the Spice series (34C in my case). It's just too bad mine is on the fritz (I think it is a solderless unit) and can't afford at this time to service it.

It's a nice unit from a design standpoint, too, in my eyes. It looks a serious tool, but a cool one (geek? what's that?? Tell me the 48G series and the newer TI aren't geeky! The Spices are cool)!

HP34C (was: 38E is Here)

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 17 Apr 2004, 12:04 a.m.,*
in response to message #9 by Wayne Stephens

Hello, Wayne;

most of all, congrats! I'm mostly fond of LCD and "Continuous Memory" calculators ("memory contents holder", if I may...), but I know that LED's have their special... charm?

I own some LED' units: HP55, HP97, HP31, HP34C, HP38C and an HP38E, and using/programming them is a must. Also, I own two LED TI units (thanks, M.B.) and I like them as well.

The main "theme" here is the HP34C. Although Norm Hill is the one to be talking about it with "genuine passion" (has anyone "heard" from him? Norm, are you there, pall?), I personally take it as a great achievement. Many HP fans in here do not like Spices too much, and I guess it's because their design has founds on "cheap units". I am not quite sure if "cheap units" applies to both production cost AND unit price, because I remember the HP34C was somehow expensive when introduced. Maybe "profit needs" caused Spices not be exactly an "HP quality" series. Or maybe I wrote a lot of bull so far! If so, sorry folks!

Anyway, I remember when I was about to by a "dreamy" HP41C, I was offered an HP34C for an about 30% lower price, if I am not wrong. The last HP41C was supposed to be sold the day before, and I was completely "desolated". I gave up buying the HP34C and I was leaving when the owner of the store asked about what was going on. Well, there was one HP41C with one memory module that was not brought by

someone (maybe he gave up). Well, there I was with my first (still with me) HP41C with one memory module. Last year I was able to put my hands in some Spices for the first time as a user and owner (I realized I never used any before that, although I repaired at least three units a long time ago), the HP34C included, and the feeling was great! One can see that the HP34C offers almost all math and programming resources available with the HP41. I think the HP34C is, in fact, closer to the HP11C, but it was released between the HP67/97 and the HP41C.

Too many words, wow! Enjoy it. It is a powerful unit, a very good calculator. If you liked the HP38E and you deal with scientific calcs as well as financial ones, you'll surely like the HP34C.

Cheers.

Luiz (Brazil)

*Message #3 Posted by **Tim Wessman** on 12 Apr 2004, 6:31 p.m.,*
in response to message #2 by Hp Lover

I just got one a few days ago from my university bookstore. They ran out that day, but got a few more in. As of today there were 4. If anyone is interested I could buy one. They cost 60(59.95) + 7.5% tax. Pay me that (64.5) + (1.50 for gas to go to the store and drop it off) + shipping (your choice) and I'll go get some (I've never done e-bay or anything so I don't know how paypal or anything works). I don't want to take advantage of anyone for this, but gas is ridiculous so I think a dollar or two is fair. I'll even include the recipt from the bookstore so you can cash in on the 10$ rebate if you opt out of the free magazine offer.

email me if interested.

Tim Wessman

what rebate?

*Message #4 Posted by **Kirk** on 12 Apr 2004, 8:00 p.m.,*

Program Development Link still available?

*Message #1 Posted by **Chad Wagner** on 11 Apr 2004, 9:05 p.m.*

Hello, Is it still possible to get the full version of the Program Development Link for the 48GX?(not the demo) I have several cables, just need the software. I believe I would need a computer with Windows 2000(not XP) in order to run it. Thanks in advance, Chad Wagner

Re: Program Development Link still available?

*Message #2 Posted by **Chan Tran** on 12 Apr 2004, 7:41 a.m.,*
in response to message #1 by Chad Wagner

I have a copy of HP's Program Development Link but it's a DOS based software. It works fine running under all versions of Windows I have tried. I don't know if it's still available. I am tempting to send you a copy but I am afraif of violation copyright law.

Nonpareil 0.32

*Message #1 Posted by **Eric Smith** on 11 Apr 2004, 6:15 p.m.*

I found and fixed a bug in the pointer increment/decrement instructions, and now the HP-32E and HP-37E seem to work correctly in my simulator. I've released Nonpareil 0.32 which now includes those models.

http://nonpareil.brouhaha.com/

Nonpareil 0.33

*Message #2 Posted by **Eric Smith** on 13 Apr 2004, 4:45 a.m.,*
in response to message #1 by Eric Smith

Yet another new release, 0.33. The display code has been completely reworked in preparation for merging in HP-41C and Voyager support. The comma (digit group separator) for Spice now works. (You can swap the period and comma in the KML file.)

Random observation: it's annoying that they did away with partial key sequence prompting in program mode in the Spice series. For instance, with the HP-25 if you press "f" in program mode, it displays "14" (the keycode of "f") on the right side of the display. Similarly for "g", RCL, STO, and GTO. But the HP-33C does not do this. Of course, they brought it back in even better form in the HP-41C.

Nylon balls for HP65/67/97 card readers

*Message #1 Posted by **Tony Duell** on 11 Apr 2004, 2:28 p.m.*

Those of yuu who repair HP65/67/97 card readers will know of the 4 little plastic balls under the leaf contact. And how they seem to always get lost. I've found a source of replacements. They're not cheap, but they are available. 'The Precision Plastic Ball Company' (http://www.theppb.co.uk} can supply 1/8" nylon 66 balls at 32p each + postage + VAT (sales tax), the minimum order is 100 balls or so. As I said, not cheap, but they do work well. I have no connection with this company other than as a satisfied customer.

in response to message #1 by Veli-Pekka Nousiainen

You might try Opera. Though I have never used the newsreader part of it, the rest of the browser is by far the best one I have ever used. It is noticably faster than IE and has mouse gestures, which are just awesome. Of my friends who started using it, every one of them is still using it.

Hey, its kind of like RPN... once you try it, you're hooked.

When it runs under Linux with Squid as local proxy server installed it is absolutely super-super-fast. Opera is by far the best browser available (I have installed and used Mozilla, Mozilla-Firebird, Netscape, KDE Konqueror (which is quite good), etc, nothing comes even close to Opera, as far as web-browsing is concerned, years ago it already had a fully integrated pop-up killer. As stated, once you have used it, you will know what you have been missing all this time.

in response to message #1 by Veli-Pekka Nousiainen

Forte Agent is superb.

News Rover (Win) - Pan (Linux)

*Message #7 Posted by **Guy François** on 11 Apr 2004, 2:10 p.m.,*
in response to message #1 by Veli-Pekka Nousiainen

For Windows: undoubtedly News Rover: can read through multiple newsgroups, search for messages containing chosen words, makes thumbnails of pictures, is very highly configurable and its installlation procedure is one of the very best.

For Linux (which I use most frequently): Pan: yEnc embedded newsreader, very, very fast (multiple downloads of messages and attachments through real multi-threading) (rebelbase website) - can be installed through compilation or Vendor-specific rpm's.

Best Greetings.

Which glue to put labels back

*Message #1 Posted by **Arnaud Amiel** on 11 Apr 2004, 8:07 a.m.*

I have a couple of classics on which the back label corners are sticking (or more exactly not sticking) up. This is due to either old age or surgery. I wonder which glue would you recommend to put them back without compromising surgery in the future. Thanks

Arnaud

Re: Which glue to put labels back

*Message #2 Posted by **David Smith** on 11 Apr 2004, 2:47 p.m.,*
in response to message #1 by Arnaud Amiel

I always leave out the screws under the label after opening a machine. HP just replaced the label after a repair. Repeatedly lifting the label corners to open a machine now just means the label will become more and more damaged.

But to stick down stubborn corners, I first remove the old label residue with white gas (camping fuel/cigarette lighter fluid). Then I use a neoprene rubber contact cement (Elmer's brand). It is a green liquid. Brush it on the label corner and the plastic case. Don't let it pool in the crease between the label and the case. Let it dry until it turns clear, then rub the corner down from the seam outward. I use a soft cloth and the back of my finger nail to burnish the corner and seam down. Any residual glue is easily rubbed off with your finger. This glue can easily be sliced open with a razor if you do need to get under the label again.

Another 33 review

*Message #1 Posted by **Kirk** on 11 Apr 2004, 12:23 a.m.*

I finally found a new HP 33s for sale and purchased it for $65.00. I was expecting to be disappointed after the commentary I read here, but I was desperate to get an RPN calculator that I could use on the upcoming prof. Engineers exam, since the 48's are now illegal (kiss my engineering butt NCEES).

I have spent some time with this thing now and I can comfortably say this is a good calculator. It is very reminiscent of my old 32 (before I ran it through the washing machine).

The key layout is admittedly a little bit goofy but does not particularly bother me. The decimal is small but this does not cause me problems. The only other complaint so far is the location of the entry key (this has been mentioned by others). I'm getting used to that now as well, its not a bad place for it, its just different than my 48 and takes some getting used to. Its also only half of the size it used to be. Oh yeah, they also removed the swap function for the stack, which is slightly irritating. There appear to be other ways to manipulate it though so I will figure that out.

I like the two line display a lot, big improvement over the old 32 in my opinion. I also appreciate how they have put the left and right parentheses under separate keys, unlike the 48 where you had to select both right and left perens and delete the one you weren't ready for when editing in the middle of an equation. Everything else seems pretty straightforward. The buttons feel great, as good as those on my 48 and way better than anything put out by Casio, TI, Sharp et all. Construction feels good and solid and the manual seems adequate (although slightly dumbed down).

The very best thing about it is that it still smells like new HP's did right out of the box. I don't know why but I have great associations with that smell. Anybody else notice that?

Anyway, they also had the new 49 on sale there and it looked pretty good to me. I have to find a good reason to buy that though and my 48 shows no signs of giving up soon. I feel hopeful about HP calculators again. Perhaps they did drop the ball for a bit but they were so far ahead of everybody else that people are still catching up. Measured against their old products, this first new generation seems pretty good to me. There is still room to improve, but compared to everything else out there that I have tried, their calcs are still the best.

Kirk

Swap

*Message #2 Posted by **John** on 11 Apr 2004, 10:16 a.m.,*
in response to message #1 by Kirk

Kirk wrote: "Oh yeah, they also removed the swap function for the stack, which is slightly irritating."

I don't have a 33s, but I believe that the SWAP on the 48 is the same as the "x<>y" key on the 33s.

Re: Swap

*Message #3 Posted by **Kirk** on 11 Apr 2004, 12:45 p.m.,*

in response to message #2 by John

Thanks John,

I found that last night. It appears they have changed the names of several functions that essentially do the same thing.

Kirk

Re: Swap

*Message #4 Posted by **Wayne Brown** on 11 Apr 2004, 1:58 p.m.,*
in response to message #3 by Kirk

"x<>y" is actually the key name from some of the older RPN models. I don't recall seeing SWAP until the RPL models came along.

Re: Swap

*Message #5 Posted by **Wayne Stephens** on 11 Apr 2004, 2:29 p.m.,*
in response to message #4 by Wayne Brown

Hey, I was going to say that!!

Seriously, Wayne, I too do not recall seeing SWAP until the RPL calcs came out. It was always x<>y on the older calcs.

Take care.

Wayne.

Re: Swap

*Message #6 Posted by **Dave Shaffer** on 11 Apr 2004, 7:16 p.m.,*
in response to message #2 by John

It took me a while to find it on my 48GX, too.

But, why oh why did they make it a shifted function?!?! Of all the keys I use every day, x<>y (or SWAP) is one of the most common - typically more than trig or log/exp. Now it takes an extra key press. Not very efficient.

Re: Swap

*Message #7 Posted by **John** on 11 Apr 2004, 8:39 p.m.,*
in response to message #6 by Dave Shaffer

Actually, the HP Museum Site explains when and why the change from x<>y to SWAP occured in its explanation of RPL. It says:

"Stack Size Limited Only By Memory ...

The large stack requires a new labeling scheme so level 1 replaces what used to be called X, level 2 replaces Y etc. SWAP replaces X<>Y, LAST replaces LAST X, DROP effectively replaces CLX and additional stack manipulation commands were added. "

for the full explanation on RPL go to the following link: http://www.hpmuseum.org/rpl.htm

PS Thanks Dave!

Re: Swap

SWAP is available on the 48GX without having to press [left-shift] in most of the situations where you'd want it. For example, try:

1 [Enter] 2 [Enter]

Now press the right-arrow key, and you'll see levels 1 and 2 of the stack swap. You only need to press the [left-shift] key to get to SWAP when you're in some editing mode, e.g. entering a program.

Best,

--- Les Bell, RHCE, CISSP
[http://wwww.lesbell.com.au]

But it's not shifted... (?)

*Message #9 Posted by **Gene** on 12 Apr 2004, 7:01 a.m.,*
in response to message #6 by Dave Shaffer

The 33S has X<>Y as an unshifted function.

On the 48/49 series, the SWAP function is performed in RPN mode by pressing the right-arrow key.

No shift needed.

One less keystroke! :-) Gene

41C Keyboard Overlays

*Message #1 Posted by **Wayne Stephens** on 10 Apr 2004, 9:58 p.m.*

Does anyone know of a current source for blank keyboard overlays for the 41C/CV/CX? I'd like to have a few. I have only one right now, and it is in bad enough shape that I cannot even use it as a pattern to make my own.

Thanks. Take care.

Wayne

PS - I also need a couple "blank" module covers, if anyone knows where I can find them also.

Re: 41C Keyboard Overlays

*Message #2 Posted by **Richard Garner** on 10 Apr 2004, 11:59 p.m.,*
in response to message #1 by Wayne Stephens

I have a blank overlay that I scanned in. It has a black background to help with cutting out the key slots. The JPEG file is just over a Meg in size. I could send it to you if you like.

Re: 41C Keyboard Overlays

*Message #3 Posted by **Artur - Brasil** on 11 Apr 2004, 5:01 p.m.,*
in response to message #2 by Richard Garner

Hello I'm trying, with an American enterprise of laser cutting, if they could make some blank overlays to me. It would be great if other people interested on getting new overlays (HP41, HP15/11/10, HP42, HP 48) to contact me or them and request information. This may bring them to give more carefull in this matter.

Iäm willing to trade a bunch of original HP overlays for a working HP 15C
[VPN]

Re: 41C Keyboard Overlays

*Message #8 Posted by **Donald1800** on 16 Apr 2004, 10:51 p.m.,*
in response to message #5 by Meindert Kuipers

Excellent suggestion. I too would like to obtain about 25 of them. If they WERE inkjet printable, that opens up multi-color, multi-label key labels. With this possible, I now would prefer a somewhat light grey matt surface - just light enough to properly contrast with the black ink. I never did like the usual tan color used by HP.

AutoCad Overlay .dwg

*Message #9 Posted by **Wayne Stephens** on 12 Apr 2004, 12:30 p.m.,*
in response to message #2 by Richard Garner

Thanks, Richard.

Your overlay looks great and it is scaled perfectly. I may try to "trace" over it in AutoCad to make it into a .dwg (or .dxf) file, then see if Artur's contacts could use it as a basis for making some laser-cut plastic ones.

Take care.

Wayne

Re: AutoCad Overlay .dwg

*Message #10 Posted by **Richard Garner** on 12 Apr 2004, 12:50 p.m.,*
in response to message #9 by Wayne Stephens

Glad I could help. I have also used it to make overlays to use on V41 emulator.

Re: AutoCad Overlay .dwg

*Message #11 Posted by **Wayne Stephens** on 12 Apr 2004, 2:36 p.m.,*
in response to message #10 by Richard Garner

How does that work? I was just wondering about overlays for the emulator this morning. Thanks.

Take care.

Wayne.

PS - Has anyone designed any modules for the V41 emulator yet?

Re: AutoCad Overlay .dwg

*Message #12 Posted by **Richard Garner** on 12 Apr 2004, 2:55 p.m.,*
in response to message #11 by Wayne Stephens

What I did to make things work with V41 was to superimpose the overlay on a copy of the LARGE.BMP file from V41 in Adobe Photo Shop. Saved the new file with the program name it would be used for as a bitmap file. Then when I wanted to use that overlay with the program, I would use a batch file to swap the overlay file with the LARGE.BMP file. When finished I would use another batch file to swap them back.

Re: AutoCad Overlay .dwg

*Message #13 Posted by **Wayne Stephens** on 13 Apr 2004, 7:36 a.m.,*
in response to message #12 by Richard Garner

That's cool. I will try it.

Take care.

Wayne.

41CX alpha mode challenge (help!)

*Message #1 Posted by **Paul** on 10 Apr 2004, 11:34 a.m.*

I have a 41CX that is otherwise working except for the alpha toggle, which is totally inoperable. Can anyone come up with a way to enter alpha mode without using the toggle? I don't have a card reader or wand, either. Thanks.

Re: 41CX alpha mode challenge (help!)

*Message #2 Posted by **David Smith** on 10 Apr 2004, 12:26 p.m.,*
in response to message #1 by Paul

Your most likely problem is a dirty switch contact for the ALPHA key. These can be cleaned fairly easily if you open up the machine (one screw under each rubber foot).

Beneath each key dome is a tiny hole in the circuit board. Make a tiny wire brush out of three wire brush bristles twised together, mounted in a pin vise, and trimmed square. Place a drop of 91% isopropyl alcohol on the hole, dip the wire brush in more alcohol, and gently "scritch" around in the hole with the brush. In stubborn cases you may have to repeat a few times.

While the machine is open, clean all the board and battery contacts with alcohol (including those ender the CPU card in fullnut machines).

Without the ALPHA mode... C|8^(

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 10 Apr 2004, 3:00 p.m.,*
in response to message #1 by Paul

Hi, Paul;

I am somehow worried, now. Except for what you already have available through the keyboard, I cannot think of anything else... Two of the "keys" that are more often used in an HP41 are [XEQ] and [ALPHA]; then you have all ALPHA keyboard as an aid to type in the function you want to. What might help you is a card reader with cards that contain assigments to keys so you can use other resources in USER mode OR a wand, but you have none, right? This is because you don't need to perform any specif [XEQ][ALPHA] something [ALPHA] to load from both of them. Also you might load programs with ALPHA messages... Oops, sorry! No further bad mood...

David's suggestions are the ones you must follow. Cleaning the key contacts seems to be the only way out.

Let us know if you need advice. I have some pictures of a disassembled HP41 (in time: is yours a half- or a fullnut?) that may be of help.

Success!

Luiz (Brazil)

Re: 41CX alpha mode challenge (help!)

*Message #4 Posted by **Wlodek Mier-Jedrzejowicz** on 11 Apr 2004, 11:11 p.m.,*
in response to message #1 by Paul

Paul wrote: I have a 41CX that is otherwise working except for the alpha toggle, which is totally inoperable. Can anyone come up with a way to enter alpha mode without using the toggle?

Is this a trick question? Why not just use the AON command? Assign it to a key for use in USER mode for faster access.

Surely the challenge is how to get _out_ of Alpha mode ;-)

Regards, Wlodek

Re: 41CX alpha mode challenge (help!)

*Message #5 Posted by **Miki Mihajlovic** on 11 Apr 2004, 11:47 p.m.,*
in response to message #4 by Wlodek Mier-Jedrzejowicz

Neat, but how do you assign AON if ALPHA doesn't work?

1234

Re: 41CX alpha mode challenge (help!)

*Message #6 Posted by **Angel Martin** on 12 Apr 2004, 1:49 a.m.,*
in response to message #5 by Miki Mihajlovic

Well, you can use its function id (AON = 048C) and use the CCD or any other synthetic method...

Also, to get out of alpha mode, switch the calc off, then on again. Cumbersome, better to get the toggle key cleaned!!

Re: 41CX alpha mode challenge (help!)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 12 Apr 2004, 2:00 a.m.,*
in response to message #6 by Angel Martin

Hi, Angel;

Now I'm curious: is there a way to activate any other function by it's ALPHA name with the use of regular keyboard? I mean, does the CCD allow a way to access a ROM address withou the use of ALPHA? If so, this is something I'd like to know about! 8^)

In time: Paul, this image is available to download. I guess you know it well, but it is probably easier to locate the contacts for the ALPHA key. It is about 120K large.

http://www.logeng.com.br/images/hn_mainboard_back_view.jpg

Hope it helps.

Luiz (Brazil)

Re: 41CX alpha mode challenge (help!)

*Message #8 Posted by **Angel Martin** on 12 Apr 2004, 4:08 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Yes, you can always use the function id# to invoke it, no need to spell its full alpha name.

If you use the FDATA function in the SandRom, that will give you any function's (or program) hex id# (end of the info string). For instance AON = 048C hex = 004.140 dec.

The CCD Module has extensions to the normal XEQ function that allow the function digit entry in either dec or hex. Have you ever used it? it's quite nice.

Best, AM.

Re: 41CX alpha mode challenge (help!)

*Message #9 Posted by **Johnny** on 12 Apr 2004, 9:49 a.m.,*
in response to message #8 by Angel Martin

And how do you plan to run the FDATA function, or any other function without pressing ALPHA?

In short. Without ALPHA, you're pretty stuck. You only have the functions that are already assigned to keys to start with, and possibly functions that modules make available as extensions to the OS.

Such things are the Wand (which gives you the whole keyboard), the Card Reader (which have some functions started by feeding a card) and some extensions in CCD or ZENROM, such as synthetic stuff. But unless I've missed something in CCD, it will not by default change the behaviour of the keys so that you can get any function without first running a function in the CCD. The 41 still works as a 41 by default.

Re: 41CX alpha mode challenge (help!)

*Message #10 Posted by **Angel Martin** on 12 Apr 2004, 1:47 p.m.,*
in response to message #9 by Johnny

Johnny,

The CCD extensions work making use of the interrupt vectors, thus no need to call them using Alpha. In other words, it alters the normal behavior of the calculator, so the XEQ key for instance always presents the digit prompts as "default".

But of course I agree with your that without a working Alpha key you're pretty much stuck, it was just as a work-around.

Best, AM.

Re: 41CX alpha mode challenge (help!)

*Message #11 Posted by **Johnny** on 17 Apr 2004, 6:36 a.m.,*
in response to message #10 by Angel Martin

Yes, the ZENROM also uses the interrupt vectors. But it's all to extend the ability to do synthetic stuff. The actual functions in the module cannot be accessed without

pressing alpha. But you have the ability to do such things as RCL d. GTO gets one more mode, ALPHA mode is extended with full lowercase capability, and so on. But these are all just extensions to the functionality. None of these extensions can help you run functions not assigned to a key. You still need to press XEQ ALPHA name ALPHA to call other functions, including AON.

Now, as I've implied above, I have a ZENROM in my 41, and have no experience with the CCD (unless you count a little playing on an emulator), but I believe the same is true there. You still need a working ALPHA key to call any function not assigned to a key. The fact that the rom hooks into the interrupt vector don't help. It's used to extend the functionality of the calculator, not change it.

But correct me if I'm wrong.

How about just a keystroke summary on how to do AON without using ALPHA?

Re: 41CX alpha mode challenge (help!)

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 12 Apr 2004, 10:14 a.m.,*
in response to message #8 by Angel Martin

Hi, Angel;

I don't own a CCD (I wish... and an HEPAX, and...), but I have a copy of the CCD quick reference guide. I think I got it: [XEQ][ENTER] gives an alternative two-byte (dec or hex) entry (ROM address), so you can use [XEQ][ENTER]004.014; is it correct?

Thank you! That's pretty "neat"!

Cheers.

Luiz (Brazil)

Re: 41CX alpha mode challenge (help!)

*Message #13 Posted by **Angel Martin** on 12 Apr 2004, 1:44 p.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Exactly. And if you press "H" the prompts change to: XEQ '_ _'_ _' meaning hex input is expected.

This is the "normal" behavior of the XEQ key when the CCD is plugged in.

Also, to execute FDATA without switching to Alpha, you can use its own id#: A3:69.

Best, AM

Re: 41CX alpha mode challenge (help!)

*Message #14 Posted by **Johnny** on 17 Apr 2004, 6:38 a.m.,*
in response to message #13 by Angel Martin

Ah. Well, ignore my previous question. Here we have the answer. The CCD module is really neat. I wish I had known about it when I got my ZENROM, since the CCD

looks even better.

Re: 41CX alpha mode challenge (help!)

*Message #15 Posted by **Poul Kaarup (Denmark)** on 17 Apr 2004, 8:46 a.m.,*
in response to message #13 by Angel Martin

Another clever thing about the CCD is that you can single-step CAT'2 until you see the function you want, and then press XEQ, and the function is run. - or you can press the A-button to assign the function! Unfortunately it doesn't work with CAT 3...so it won't solve the original ALPHA-key problem.

/Poul

*Message #16 Posted by **Lars** on 12 Apr 2004, 4:21 p.m.,*
in response to message #1 by Paul

I had a prgm key starting to go; I squirted a little alcohol into it and pressed it a few hundred times, repeating two or three times, holding the calc upside down to avoid the alcohol spreading into the rest of the electronics, then waited a few days before putting the batteries back in. It works fine.

Not that I wouldn't open a 41 if necessary:

Re: 41CX alpha mode challenge (help!)

*Message #17 Posted by **Wlodek Mier-Jedrzejowicz** on 12 Apr 2004, 9:18 p.m.,*
in response to message #16 by Lars

OK, apologies for my previous AON suggestion :-)

Here's a serious one.

Find someone who has a card reader, who would write a card or cards for you and would loan the card reader to you for a few minutes.

Ask them to make key assignments of the functions and programs that you regularly use that are not on the keyboard. Also create a program 01 LBL "ALPH" 02 AON 03 R/S 04 AOFF 05 END and assign this to a key.

Save the assignments and the program on cards. Read those cards into your HP-41CV. Give back the card reader :-)

Then use USER mode to execute the functions and programs you need.

To enter ALPHA mode for writing text in the ALPHA register, not function names, press the key to which program ALPH is assigned.

To quit ALPHA mode, press R/S which will run the second part of the ALPH program, and turn ALPHA mode off.

If you use more programs and functions than can be assigned to the keyboard, you need a second level of trickery. Write a big program with each function or command you need given its own label. For example 01 PRGM "LABELS" 02 R/S 03 LBL 01 04 FACT 05 R/S 06 LBL 02 07 BEEP 08 R/S 09 LBL 03 10 FS? 17 11 R/S 12 LBL 04 13 XEQ "THING" 14 R/S and so on

Assign this program to a key for execution in USER mode.

To execute any of the commands in prgram LABELS, press the key for LABELS in USER mode, then type XEQ 01 for FACT, XEQ 02 for BEEP, XEQ 03 for FS?17, XEQ 04 for XEQ "THING", and so on.

This will work. If you can borrow a card reader and an HP-41 with a working ALPHA key. Admittedly it is far more complicated than having a working ALPHA contact and I hope that one of the methods described for cleaning the contact will work.

Good Luck!

Wlodek

Re: 41CX alpha mode challenge (help!)

*Message #18 Posted by **Wlodek Mier-Jedrzejowicz** on 12 Apr 2004, 9:23 p.m.,*
in response to message #17 by Wlodek Mier-Jedrzejowicz

Oops, sorry, my second method - storing in a program - will not work for tests. Test functions will have to be assigned to keys. That includes DSE. ISG is on a key anyway :-)

Wow, what a problem for a software approach! I hope one of the hardware fixes works for you.

Wlodek

A Hardware (dirty) approach. Nelson and Luiz: please read

*Message #19 Posted by **Renato (Brasil)** on 12 Apr 2004, 9:05 p.m.,*
in response to message #1 by Paul

Maybe you can try connecting wires to the column x row traces of the keyboard, to allow a external switch to replace the ALPHA key. The schematic diagram of the 41c says that at J2B (a connector), pin 4 is column C5, and pin 6 is Row R5. At C5 x R5 guess what ?

At the CPU chip, C5 is pin 13 and R5 is pin 18 (again according to the schematic).

I know Nelson has a 41C keyboard open, and Luiz would be another source of information.

I think it will work, if done correctly. You could probably get wires out of the case using the side AC adapter slot.

HAVE FUN ! I´LL BE VERY HAPPY IF IT WORKS AS EXPECTED!

With best regards from the small and happy community of HP fans in Brasil.

Renato 1234

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 13 Apr 2004, 1:53 a.m.,*
in response to message #19 by Renato (Brasil)

Hello Renato, folks;

I'll give it a try and let you know. Yeap, I have (my own) at least one halfnut I can try that. It seems reasonable to me.

Anyway, why not to consider also a cold soldering? It's not too hard to happen, and maybe a single resoldering at the nut CPU terminals would solve the problem. As you have already described the pinout, Renato, following them and checking for fissures with a god lens would also be of help. I've done it and succeed many times, mostly with Voyagers and HP41 halfnuts.

Just another suggestion.

Best regards, folks.

Luiz (Brazil)

Feedbak issue at ebay

*Message #1 Posted by **Chris Catotti (Florida)** on 10 Apr 2004, 2:35 a.m.*

Dear HP Museum Community,

I always try to leave feedback as soon as I mail an ebay item, it helps me keep track of what I have mailed. This has worked well for over 500 different buyers/sellers. Today I got my first negative: "Misrepresented the Product, Never Responded to Emails, I received a useless Prdt" Buyer rikkus_98 (3) Apr-08-04 21:59 3088182751

I will telephone the buyer to see where we had a disconnect. I do not recall any e-mails, and the book was mailed quickly with DELIVERY CONFIRMATION. I tried to describe the book accurately, so I am very puzzled by the buyers feedback to me. When I have had any issues with buyers, I have always offered 100% refund of all costs, and even let on buyer keep the item that was damaged in transit, with no payment required by the buyer.

The original item is at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3088182751

I have "archived" a copy of the ad at:

http://home.earthlink.net/~kd4ace/Item3088182751.htm

Any helpful comments appreciated, here in the forum, by e-mail kd4ace@earthlink.net , or I can give you my cell phone number via e-mail if you would like to talk.

Thanks!

Re: Feedbak issue at ebay

*Message #2 Posted by **Hugh** on 10 Apr 2004, 4:11 p.m.,*
in response to message #1 by Chris Catotti (Florida)

As annoying as it is, you're pretty much stuck with that feedback. I've gotten two negatives in my 3-4 years with ebay, one by mistake, the other by some punk kid... as a result I've found ebay's feedback system to be fundamentally flawed. The only way to have feedback removed is through a court order, or one of their $20 mediation services in which both parties sign a legal document. Pretty rediculous if you ask me. I would just advise leaving appropriate feedback to the other user.

Re: Feedbak issue at ebay

*Message #3 Posted by **James M. Prange** on 10 Apr 2004, 4:32 p.m.,*
in response to message #2 by Hugh

You can also leave a response to the feedback you get. Whenever a seller has any negative feedback, I always check his response to it, if he's made one. Sometimes negative feedback is mistaken or from an unreasonable person.

In the past, I've had problems with my ISP blocking e-mail from an entire domain, so if I don't receive an e-mail that I'm expecting, I try to send an e-mail from an alternate address.

Regards,
James

Re: Feedbak issue at ebay

*Message #4 Posted by **Chris Catotti (Florida)** on 11 Apr 2004, 12:53 a.m.,*
in response to message #3 by James M. Prange

I telephoned the buyer this morning . . .

I had listed the solution book as being for the HP-28C and HP-28S. Indeed it was only for the HP-28S, and he only has an HP-28C. My mistake on the ad, and he is very new to ebay. I refunded his payment, and we mutually aggreed (at my suggestion) to withdraw our feedbacks.

So the negative goes away, and my feedback score is back to 100%, and the feedback history shall always say:

"Misrepresented the Product, Never Responded to Emails, I received a useless Prdt" Buyer Apr-08-04 21:59

Reply by kd4ace(at)earthlink(dot)net: "Typo in ad. Item for HP-28S NOT HP-28C. E-mail problems, Full refund to buyer." Apr-10-04 07:09

Rating Withdrawn: Buyer and seller mutually agreed to withdraw feedback for this item. Learn more.

New "Inside 9G" Handbook

*Message #1 Posted by **Norris** on 10 Apr 2004, 2:00 a.m.*

Until last year, there were still two vendors selling HP calculator software for use on NCEES exams: chotkeh.com and leehogan.com. I figured they would be out of business after NCEES banned the 48 and 49.

But Chotkeh has adapted. They simply switched to the next best HP model: the 9G, of course. The complete package, including the "Inside 9G" handbook, problems & solutions book, and a genuine 9G calculator, is only $135.

Another vendor is now selling 33S software for NCEES surveying exams: go to eBay and search for "33S COGO". You apparently get about 5KB of formulas and programs for $20. Estimated programming time = 2 hours

So the commercial market for calculator software isn't quite dead yet...

HP33s Are All Gone!

*Message #1 Posted by **J.C. Randerson** on 9 Apr 2004, 5:03 p.m.*

The three HP33s I sold at cost + shipping to help other students needing one for the FIT/PE are all spoken for. The flood of emails I'm getting now are simply being deleted. Best of luck on another source.

J.C. Randerson

Re: HP33s Are All Gone!

*Message #2 Posted by **Driscoll** on 9 Apr 2004, 6:53 p.m.,*
in response to message #1 by J.C. Randerson

The good news for HP (and for RPN calculators generally) is that the 33S seems to be selling well. Anecdotal evidence suggests that the demand for this model is substantially greater than the available supply.

But the apparent market success of the 33S comes at a price. It seems likely that the demand for the 33S is driven, to a large degree, by the new NCEES calculator rules. But these rules also ban the 48GII and 49G+.

So it is quite possible that the 33S is "cannibalizing" the sales of HP's higher-end models. Many engineers and surveyors that would have bought the 48GII or the 49G+ for NCEES exams are getting in line for the 33S instead.

Re: HP33s Are All Gone!

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Apr 2004, 10:30 p.m.,*
in response to message #2 by Driscoll

As the price of the 33s is rather low (just a little more than a dinner for two at Denny's, I mean), any professional engineer (who, by the way, is paying much more for a exam) will not consider its purchase as a reason for not buying a superior instrument IF she/he feels such instrument IS WORTH using for her/his professional performance.

Whether the HP current "graphing" calculators deserve such qualification is an open question, at least for me. I would endorse a 41/42 rather than a 48xx/49xx; but that is just my personal opinion.

Re: HP33s Are All Gone!

*Message #4 Posted by **Driscoll** on 10 Apr 2004, 1:35 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

Your point is valid. But for many professional engineers today, the *only* reason to invest in a high-powered calculator is for use on licensing exams. Many younger engineers would be unable to imagine any other situation where it would be necessary to do serious number-crunching without a computer. In such cases, the 33S will replace the 48 or 49, not supplement it.

Re: HP33s Are All Gone!

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Apr 2004, 8:14 a.m.,*
in response to message #4 by Driscoll

Thank you for your comment.

If, as you said, "... the *only* reason to invest in a high-powered calculator is for use on licensing exams..." (I assume it is so), then high-end calculators will have little success indeed.

But that may be "right" because for they to sell well, they should offer real and perceivable value.

On the other hand, the fact that the NCEES rules are the ones that shape the market is something I don't feel comfortable with, but that is difficult for me to evaluate from this far. In some manner, those "niche" rules are shaping the global offer for scientific calculators, as no manufacturer today will develop a model that cannot be successful in markets as important as the USA.

"who R we kidding?"

*Message #6 Posted by **Ron Ross** on 12 Apr 2004, 9:23 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Two calculators will be bought.

Students will buy a graphics, because it is far superior to a pocket calculator for most Engineering problems and if they do not own or buy math software for a PC or laptop.

In their Senior year, when they discover that their precious graphics calculator cannot be used, they will buy a pocket calculator. A wise student may have already bought the Hp9G (one of the few graphics specifically allowed on the exam), but most will assume it to be RPN, it isn't. Most engineering students today do not use RPN. Sad, but true. Most stay with the Ti they purchased in High school. And this is their tool until it is stolen, breaks down, or doesn't have the horsepower needed ie Ti-83 for an EE would be replaced as a sophomore or junior. But most Ti users will stay Ti users.

Yes the 33s will sell well, but only because it has no competetion in the Pocket calculator market. If Ti were to release a clone Hp27s without IR (ie Ti-68 with 8+ K RAM and four letter variables, it would stomp on an Hp33s in the market place.

Re: "who R we kidding?"

*Message #7 Posted by **GE (France)** on 12 Apr 2004, 7:42 p.m.,*
in response to message #6 by Ron Ross

The TI68 is not programmable in the classical sense, only stores formulas. I won't go into finding which TI model is the best for reincarnation a-la HP33S.

Re: "who R we kidding?"

*Message #8 Posted by **Ron Ross** on 13 Apr 2004, 9:49 a.m.,*
in response to message #7 by GE (France)

I merely used the closest Ti calculator to an Hp27s that could be morphed into the more sophisticated Hp27s, if more RAM were used and more variables made available with some file type system for numerous programs. Actually the Ti-68 also could handle a 5X5 matrix (very crudely, no great amount of matrix functions).

I still consider the Hp27s to be superior to the Hp33s in nearly every way minus the RPN interface. AND I suspect one could use the 27s on the US NCEES exam (technically, it would be cheating) without a problem as it is not specifically mentioned and looks very simple and shows no alpha capability on the keypad.

Help with a 41/42 program

*Message #1 Posted by **Raul Lion** on 9 Apr 2004, 2:14 p.m.*

I'm trying to use this program in my 42s. It was ported from the 67 to the 41 but look at line 32 and 94 (and many others)... Is it really ported? Are these valid 41/42 tokens?

Re: Help with a 41/42 program

*Message #2 Posted by **Raymond Del Tondo** on 9 Apr 2004, 2:41 p.m.,*
in response to message #1 by Raul Lion

Hi Raul,

these tokens only work with the 82104A card reader plugged in. The card reader ROM has some functions which allow the usage of HP-67 programs on an HP-41 without the need to reprogram them, substituting some functions of the 67 which are not in the basic HP-41.

Line 32, 7DSZ is like DSE on the HP-41, maybe jou have to adjust the register usage.

AFAIK 7P<>S swaps the primary and secondary registers on a 67, for more information please take a look to the appriorate pages here in the museum, or on the museum CDs.

I think most of these adapted 67 functions an be rewritten or replaced by genuine HP-41 functions without too much work. Maybe a nicepuzzle for the easter days;-)

Regards,

Raymond

Re: Help with a 41/42 program

*Message #3 Posted by **Massimo (Italy)** on 9 Apr 2004, 2:42 p.m.,*
in response to message #1 by Raul Lion

As stated on the page you are referring those are 67/97 instructions translated by means of the 41 card reader. As written this program will work only with a card reader plugged in (or with its ROM loaded in a Clonix module, for example).

Sorry,
Massimo

Thanks to you two...

*Message #4 Posted by **Raul Lion** on 9 Apr 2004, 2:54 p.m.,*
in response to message #3 by Massimo (Italy)

I didn't know the card reader added new commands to the 41... As Raymond says, I'll take a look to the 67

manual...

A bit of this and that...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 9 Apr 2004, 9:09 p.m.,*
in response to message #4 by Raul Lion

Hola, Raul; como estás?

Just to add a few info about the HP67/HP41/HP42 set.

as mentioned, the HP41 is added 36 new functions when the 82104A (Card Reader) is attached. Three of them are not programmable and 26 (all starting with "7___") are meant to provide HP67/97 compatibility.

The main characteristic present in both HP67/97 is the memory organization. Both offer 26 registers, but only 16 (1-nibble addressing?) can be directly accessed: R0 to R9, RA to RE and RI. R0 to R9 are named "Primary" registers, while the "hidden" set of extra ten register is called "Secondary". It's common to see Pn (n form 0 to 9) as a reference to a primary register and Sn (n from 0 to 9) as a reference to a secondary register. When using the HP41 to run HP67/97 applications, all 26 registers are available. The relation is:

```
 HP67/97       HP41
P0 to P9    R00 to R09
S0 to S9    R10 to R19
RA to RE    R20 to R24
Index (RI)      R25
```

The purpose of "7P<>S" in the HP41's Card Reader ROM is to exchange the contents of R00 to R09 (primary) for R10 to R19 (secondary). Both HP67 and HP97 have their equivalent to "7P<>S", and it actually exchanges primary with secondary contents. I think that an extra "7P<>S" program in an HP42S that allows this register contents changing might be a better (and faster) solution to run an HP41 "translated" programs in an HP42S. I also guess that GETM and PUTM are the best choices... d;^)

One interesting fact: statistic data is always saved in the "hidden" area, so you can use the "main register set" completely while collecting statistical data. I guess this is the main reason the HP41 stands for this particular statistic registers arrangement: from R11 to R16. It's necessary to keep in mind that programs written for the HP67/97 that use "P<>S" in order to access the statistics summations (S4 to S9) must be carefully inspected and updated. If you collect statistic data in the HP41 by using (SIGMA)+ and (SIGMA)- and execute "7P<>S", the statistic data will be positioned in the block from R01 to R06. When programs containing statistical functions are read from cards, the card reader automatically adds a "(SIGMA)REG 14" in order to set the statistical registers to the appropriate location. So , in order to keep the closest relationship between both calculators while dealing with statistics, it's necessary to manually execute "SIZE 026" and "(SIGMA)REG 14" prior to perform any manual operation.

Some important differences: GTO(i), GSB(i) and LBL

Both HP67/97 allow the use of 20 labels: LBL 0 to LBL 9, LBL A to LBL E and LBL a to LBL e. Each alpha label has its numeric equivalent for indirect purposes:

```
  LBL     GTO(i) GSB(i) (RI must contain)
A to E       10 to 14
a to e       15 to 19
```

The HP41 structure does not allow indirect addressing for local ALPHA labels (A to E and a to e). In order to allow the same functionality, the HP41 card reader firmware "translates" programs originally

written to both HP67/97 and adds numeric equivalent labels before any HP67/97 alpha label when a program card is read. The translation process also replaces GTO IND 25 and XEQ IND 25 to GTO(i) and GSB(i), respectively.

Other minor differences are related to display control ("7DSP0" to "7DSP9", "7ENG", "7FIX" and "7SCI"), printing and automatic review functions, "7ISZ" and "7DSZ" and the rapid reverse branching/jumping. The HP67/97 allow the so called "rapid reverse branching", that accomplished when you store a negative number in RI and execute GTO(i) or GSB(i). This sort of jumping is not allowed in the HP41, and programs written for the HP67/97 that use this feature may be hard to be rewritten.

Well, this time I read some parts of the HP82104A and both HP67/97 manuals. I own an HP97 (no HP67) and sometimes I prefer using it to run its own programs.

I hope I did not confuse things up... And please, if there is anythign wrongly posted, let me know.

Cheers and success, Raul.

Luiz (Brazil)

Saving op-code space...

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Apr 2004, 9:47 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Luiz:

While I have no specific knowledge of HP67/97 internals, I feel pretty sure about some of the instructions being chosen to be able to fit (at least most) instructions in one-byte opcodes. The usage of P<>S saves al least 60 opcodes (10 registers with RCL, STO, STO+, STO-, STOx, and STO/). Similarly, the usage of FIX, SCI, ENG, and DSPn allows to control the display with 13 opcodes, instead of the 30 which may be needed using FIXn, SCIn, and ENGn combinations.

As I have no complete reference of the 67/97 instruction set, I cannot confirm or deny if there are any two-byte instructions; but even the fixed number of available steps suggests there are no two-byte opcodes.

I recently analyzed the op-code space for the HP25 and HP29C (some registers cannot be addressed directly on this last model for these same reasons), and checked the one-byte hypothesis on them. By the way, GTO and GSB pointing to labels are not only justified for program structure and editing convenience; but also for saving opcodes. For instance, LBL, GSB and GTO with 15 possible label values requieres 45 op-codes, while GTOnn (as used in the HP25) requires as many opcodes as available steps are (50 in the HP25, even more in the more advanced models)

Makes perfect sense...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 9 Apr 2004, 11:07 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

Hey, Andrés;

thank you for your thoughtfull post.

Just to make sure my reasoning make sense as well: if we consider that all of these possible

combinations mean ROM "entry points", than it would not be a mistake to consider that others exist, but they are used internally.

Let's consider that [FIX] and [DSP][4] cause the same effect as a nonexistent [FIX][4], but there are only ten direct [DSP] possibilities (not considering [DSP][(i)]) plus the other three [FIX], [ENG] and [SCI], right? But what code effectively uses less space? I mean, what does it actually happen in microcode? I guess [DSP]n is closer to current ROM contents than [FIX]n, [SCI]n and [ENG]n.

But I can't tell a line without guessing. I never stopped to consider an actual implementation. What actually goes on? And this is just display-format matters!

Just reasoning...

Cheers. And thank you again, Andrés!

Luiz (Brazil)

Re: Makes perfect sense...

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Apr 2004, 8:36 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz:

You are right, perhaps I should explicitely refer to "user opcodes"

For instance, in the HP25 you have:

```
11 digit entry and decimal point
 4 arithmetic functions
 1 constant (pi)
 6 Enter,x<>y, roll down, LastX, CHS, EEX
 3 Clear (Reg, Stack, X)
48 store, store arithmetic and recall operations
 6 trigonometrics
 8 logarithmics and power: y^x, 1/x, sqrt, x^2
 7 conversions (HMS, HR, INT, FRAC, ABS, R>P, P>R)
 4 statistics (E+, E-, mean, sdev)
 1 percentage
50 GTO (including GTO 00)
 8 conditionals
 3 program control (Stop, Pause, NOP)
30 display modes
 3 angular modes
```

so there are 193 "user op-codes", well below 255 or 256.

There may be much more "sys op-codes" or ROM entry points, not available for the user.

Best regards!!

Edited: 10 Apr 2004, 8:47 a.m.

Re: Saving op-code space...

*Message #9 Posted by **Eric Smith** on 10 Apr 2004, 2:33 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

You are correct, the HP-67 and HP-97 use only single-byte opcodes. They use 250 codes out of the possible 256. The extras include tantalizing "SF 4" and "CF 4" instructions, however there is

no "FS? 4". All six extras appear to function as NOPs. This was all published in the PPC Journal back in 1977-1979.

On the HP-25, many of the undefined opcodes will cause the calculator to hang. In order to conserve ROM space to keep the cost low, they had to put code in table entries that would be used for decoding those opcodes. On the HP-25, if you somehow managed to get an undefined opcode into memory and cause a hang, you could just turn if off then on again to clear the memory. On the HP-25C you'd probably have to remove the battery, possibly for a few minutes.

in response to message #1 by Raul Lion

Raul,

For a couple of programs that obtain roots of polynomials you can use those included in the SandMath-II ROM, posted on "the other site". They include:

- CVIETA, direct formulas for a cubic equation
- POLYN, iterative for a generic degree N, Real coefficients
- CPOLR, ditto with Real or Complex coefficients

They are almost self-explanatory, just follow your instinct...

Best, AM/

Re: Help with a 41/42 program

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Apr 2004, 9:30 p.m.,*
in response to message #12 by Raul Lion

I assume most people are referring to the "other site" because:

There is kind of a "legal issue" between such "other site" and an important "company" (I just wonder if it is one which manufactured high quality scientific and financial calculators some years ago...),

and ...

... such legal issue prevents Dave Hicks from allowing the mere name of such "other site" to ever appear on *his* MoHPC site.

Otherwise ...

... he would get involved about the "legal issue" (it may be enough if any of us eventually posts here the 8-character domain name of the "other site", God forbid!).

Perplexing? Well, these are XXI-century-world rules (!)

33S Availability

*Message #1 Posted by **Ron** on 9 Apr 2004, 1:32 p.m.*

When is the next batch of 33S supposed to be available?

Re: 33S Availability

*Message #2 Posted by **Norris** on 10 Apr 2004, 6:07 p.m.,*
in response to message #1 by Ron

The 33S seems to showing up, in small numbers, in certain college and university bookstores. Mail order sources currently say the following:

Samson Cables: "We were told on March 23, 2004 that the current ETA is April 20th 2004."

HPcalc.org: "Preorders made through February 18 have shipped. No more will ship until late April; preorders still accepted."

Calculator Source: "3/24/04 - This item is not yet in stock. We currently expect it to be available on 4/16/2004."

Very very early 42s?

*Message #1 Posted by **Raul Lion** on 9 Apr 2004, 6:08 a.m.*

My 42s has the serial number 2839A*****. I've read here in MoHPC, that the lowest known number is 2832, so the mine has only seven weeks more, hasn't it? This unit has not the COMB bug described here

Less early 42s?

*Message #2 Posted by **Karl Schneider** on 10 Apr 2004, 1:55 a.m.,*
in response to message #1 by Raul Lion

Hi, Raul --

I own an older-design 42S (S/N 2939Snnnn) and have a newer-design 42S with recessed display made about a year later. The COMB/PERM bug appeared on all the earlier-"new" (1990-91) designs I tested, but not on my older one. I think a firmware revision coincided with the face changes.

Re: Anyone Needing HP33 For EIT/PE: Cost+Shipping

*Message #2 Posted by **Wayne Stephens** on 9 Apr 2004, 6:09 a.m.,*
in response to message #1 by deleted

J.C.

That is a very admirable thing to do. I hope you are successful in getting these calculators to real students or test takers.

Now, a bit of unsolicited advice (feel free to ignore it if you wish): If you get as wound up every time you run across a regulation with which you disagree as you are about the NCEES, then you have a very tough road ahead in your life and your professional career. I strongly suggest you calm down a bit, and practice making reasonable, rational arguments to make your case. If you lead off all your discussions with personal attacks and vulgar rhetoric, it will almost always result in the people you are trying to convince "digging in their heels" and fighting, no matter how unreasonable their position/regulation/rule is. I say this from personal experience. Politeness, persistence and logic will get you much further than frontal assaults.

Take care.

Wayne

PS - People who sell things on ebay are not scalpers. No one is forced to bid these calculators to the ridiculous prices for which they have been selling. It simply means someone wants it enough to pay that price. This is neither good nor bad; it just IS. In any case, YOU are doing right by your fellow test takers and I commend you for it.

Actually, it's just supply and demand

*Message #3 Posted by **John** on 9 Apr 2004, 8:14 a.m.,*
in response to message #2 by Wayne Stephens

Perhaps J.C. would do well to take an introductory economics course?

Re: Actually, it's just supply and demand

*Message #4 Posted by **Wayne Stephens** on 9 Apr 2004, 8:27 a.m.,*
in response to message #3 by John

Perhaps, but they are his calculators, and if he wants to help others out that is his right. It is a free country (or mostly free anyway... okay, more free than most other countries).

Personally, when I was getting ready to graduate from college, I had $25,000 in student loans that needed to be paid back, so I could not afford to be as altruistic as J.C. I still think it's a nice thing he is trying to do, though.

Take care.

Wayne.

Re: Actually, it's just supply and demand

*Message #5 Posted by **Generous** on 9 Apr 2004, 12:48 p.m.,*
in response to message #4 by Wayne Stephens

I'm so sick and tired of this injustice. These calculators should not be over priced so, to help the cause and to help my fellow engineers trying to better themselves, I offer 7 free calculators. One per customer please. Proof of student status/copy of test registration will be required. I will also pay for shipping. Along with that I will ship an introductory economics course on DVD. Got an empty tank?, I'm sick of gas prices too; I can also help you on that as well. Home loans ? Student loans? ....

Re: Actually, it's just supply and demand

*Message #6 Posted by **Wayne Stephens** on 9 Apr 2004, 1:47 p.m.,*
in response to message #5 by Generous

Ahhhh sarcasm.... beautiful, delicious sarcasm... Where would we be without it?

Take care.

Wayne.

PS - Thanks anyway but my student loans were paid off years ago. I will take you up on the free calculator, though.

Scalpers (eBay and otherwise)

*Message #7 Posted by **Karl Schneider** on 10 Apr 2004, 3:08 a.m.,*
in response to message #2 by Wayne Stephens

Wayne --

I concur 100% with your "unsolicited advice".

> Quote:
>
> *People who sell things on ebay are not scalpers. No one is forced to bid these calculators to the ridiculous prices for which they have been selling. It simply means someone wants it enough to pay that price.*

On your second point, I would disagree in that there is such a thing as "scalpers". They are the low-lifes who deliberately hoard a legitimate product with the sole intent of re-selling it, unimproved, at a high profit to those in the same market who have an urgent need for it. Scalping is beyond what is termed speculation (as in real estate) or simple "supply and demand". It is just parasitic profiteering. In many locales, scalping of sports tickets is also illegal.

Those who deny other buyers the direct access to a good, and then, without adding any value, demand a profit by charging a high markup under the pressure of urgency, are not worthy of much respect as I see it.

What if someone "cornered the market" on snow shovels or emergency supplies before a blizzard, and sold the items for a king's ransom? What if medical care could be scalped?

In 2002, I could have bought the last four 32Sii's a main regional retailer had in stock -- knowing that they were to be discontinued -- then re-sold them for high profit at my leisure. But I didn't even consider doing that -- I bought just one for myself instead.

J.C. was right to exclude scaplers and limit the product to one per buyer. I would only hope that he bought three initially to prevent such profiteering.

-- Karl S.

Deny access?

*Message #8 Posted by **Wayne Stephens** on 10 Apr 2004, 8:59 a.m.,*
in response to message #7 by Karl Schneider

Karl,

I see your point regarding hoarding of items, but I still don't quite understand how anyone has the power to DENY others access to a given product. If they are in fact physically preventing others from purchasing a given commodity, then jacking up the price, then I believe it qualifies as racketeering (which is a crime in and of itself).

My point about ebay is this (and I still stand by it): No one is forcing anyone to bid on anything. It is a self-regulating market. If everyone decides at the same time that an HP 32sii is no longer worth $225+, but is only worth $100, then anyone who recently bought up a bunch at $150 each in hopes of making a killing will be stuck with a bunch of calculators or forced to take a $50 loss on each of them.

I have been trying like heck to get my hands on a reasonably priced HP 41CV for about two months now. But I do not want to pay $150+ for a well used 20 year old calculator without a case. I am waiting, watching and exploring all my options. Perhaps I will have to give up on finding one or reassess my opinion of their value, but I cannot blame the people who are selling them for the fact that more than one person is willing to pay $200 for them. I think the people who offer "Buy It Now"-Only auctions at $389 are insane, and I urge everyone to NOT pay that much for a 41CV. However, if someone does then there is nothing I can do about it.

As far as your snow shovels in a blizzard analogy, it is not valid here. HP calculators, as much as we may wish to believe otherwise, are NOT one of life's necessities, and I sincerely doubt anyone has ever died for want of one.

As for the test takers, if they have to, and it pains me to say this, they can always buy a $15 Casio and practice ALG input to take the test.

Take care.

Wayne.

Yes! -- "Deny access"

*Message #9 Posted by **Karl Schneider** on 10 Apr 2004, 11:52 a.m.,*
in response to message #8 by Wayne Stephens

Wayne --

I think we're talking about different things -- high eBay prices for vintage calc's vs. the snapping-up of limited retail stock of urgently-desired new calc's for undeserved, no-value-added profit.

For me to have bought out the remaining 4 HP-32Sii's at the Fry's store 18 months ago would have denied access to others. To have then re-sold them at high markup would have been scalping.

-- Karl

No! -- "Deny access"

*Message #10 Posted by **Wayne Stephens** on 10 Apr 2004, 12:09 p.m.,*
in response to message #9 by Karl Schneider

Karl,

I still think you are missing my point. If you had bought up the 4 remaining HP32sii's at Fry's, and offered them for sale at ridiculously inflated prices, and no one bought them... then what?

Well, then the market has spoken and you can either lower your price, or own 4 identical calculators until the market will bear your price. If they PAY your inflated price, well then the narket has also spoken.

You have not denied anyone access to anything, because anyone else in the country could have done the same thing if they got there before you, or they could pay your price if they want the item badly enough.

In a free market economy you simply cannot stop this from happening. Limits can be placed on exhorbitant mark-ups for necessary items (food, gas, snow shovels in a blizzard, etc) in the name of social stability. It STILL runs counter to a true free market system, but I'm willing to concede on the things people need in order to live.

However, prohibiting what you call scalping on non-essential items is economic/social engineering and has no place in a capitalist society. As I have already said, if the price is too high, do not buy.

Take care. I've enjoyed our little discussion.

Wayne.

*Message #11 Posted by **Veli-Pekka Nousiainen** on 11 Apr 2004, 5:18 a.m.,*
in response to message #10 by Wayne Stephens

A student may have just enough savings for the original price,
but not enough to bid the item at a higher price.
When somebody buys more calcs that he needs and then sells them at great profit
preventing some persons from buying them at retail price and
thus having no RPN calc for the test
THAT IS SCALPING !!!!
[VPN]

(deleted post)

Re: No! -- "Deny access"

*Message #12 Posted by **Wayne Stephens** on 11 Apr 2004, 11:13 a.m.,*
in response to message #11 by Veli-Pekka Nousiainen

Thanks for the inpuit, but I still say they can't sell something at "great profit" if no one is buying.

If people are concerned about exhorbitant prices on used (or new) RPN calcs then they should simply shun these so-called "scalpers". Of course, not everyone will do this; and the prices will stay up. So the only thing to do is let the market regulate itself.

As I already said, even though it pains me to say it again, the test takers can always practice their algabraic (ugh) entry and buy a $15 Casio or Sharp if there are no reasonably priced RPN calcs available. No one has a RIGHT, constitutional or otherwise, to an RPN calculator. If you want to survive in the world, you learn to adapt.

Take care.

Wayne

Wayne, I still think you are missing my point -- which was that scalping (as I clearly defined it) is generally unethical, and perhaps even immoral in some cases, but not necesarily preventable or something that ought to be criminalized.

> Quote:
>
> *If you had bought up the 4 remaining HP32sii's at Fry's, and offered them for sale at ridiculously inflated prices, and no one bought them... then what?*

"Then what"? I'll tell ya -- I'd demand only modestly inflated prices -- say $150 instead of $250. If I could have sold 'em for that, I'd have still cleared about $90 profit for each. And what value or useful service would I have provided to a local buyer who might have gotten one if only I hadn't beaten him to the store? -- none whatsoever!

> Quote:

(deleted post)

> *Well, then the market has spoken and you can either lower your price, or own 4 identical calculators until the market will bear your price. If they PAY your inflated price, well then the narket has also spoken.*

Perhaps grudgingly, and questioning my parentage while doing so... ;-)

> Quote:
>
> *You have not denied anyone access to anything, because anyone else in the country could have done the same thing if they got there before you, or they could pay your price if they want the item badly enough.*

Sure, if anyone else in the country had unbounded access to transportation or had ample discretionary income.

> Quote:
>
> *In a free market economy you simply cannot stop this from happening. Limits can be placed on exhorbitant mark-ups for necessary items (food, gas, snow shovels in a blizzard, etc) in the name of social stability. >
> *However, prohibiting what you call scalping on non-essential items is economic/social engineering and has no place in a capitalist society. As I have already said, if the price is too high, do not buy.*

I never advocated legal prohibition of scalping (yes, that's what it's called, not just my term). I did, however, point out that some municipalities prohibit, by ordinance, the practice of scalping event tickets -- selling them for more than face value. Sure, people can shun the ticket-scalper, and hope that he gets "stuck with the ducats". However, there is an element of duress -- time and opportunity. Once the show or the big game is over, gone forever is a subsequent chance to attend it in person.

There is similar duress associated with getting a compliant RPN calc in time for upcoming NCEES exams, although there are alternatives -- AOS calc, taking the exam later, etc.

I don't believe in the infinite wisdom of the unfettered free market, or that those who pay the most for an item are necessarily the ones who value it most. Ability to pay, and opportunity to acquire, play key roles in the economic calculus.

> Quote:
>
> *Take care. I've enjoyed our little discussion. Wayne.*

What, did you declare a victorious conclusion? :-)

Karl S.

Re: No! -- "Deny access"

*Message #15 Posted by **Wayne Stephens** on 12 Apr 2004, 8:00 a.m.,*
in response to message #14 by Karl Schneider

Karl,

No, I did not intend to declare a victorious conclusion at all; I simply recognize that we will not see eye-to eye on this issue. I could refute each of your statements with more free-market arguments, declaring that I never said those who can afford things value them more (I think in a lot of cases the opposite is true), etc.; then you could make more counter-arguments, and we could have several more postings about it; but that would be a pointless waste of time for both of us. Along with believing in free market economies I also believe in free-market thought and in respecting each other's opinions (perhaps even occasionally "agreeing to disagree").

More importantly, I also recognize that this is a calculator forum, not a world economics forum. I have mentioned this to people before when they get into extended "off-topic" discussions, so it would be hypocritical of me to continue to use up David's WebSite memory with additional arguments about economics.

Besides right now I am trying to perfect a "vertical curve" program for my 41c which I wrote myself this weekend. There is a really nice one on the 41C Survey Module, but it has a bunch of stuff on it that I'd never use, and those things are selling on ebay for more than I am willing to pay. I've got it running very well and am now working on scaling down its size. Fun!

Take care. Let's talk calculators. How many HPs do you own? I've got about 10 plus a few Soviet made RPNs and a 2 Novus RPNs. My favorite is the 41C.

Wayne.

Re: No! -- "Deny access"

*Message #16 Posted by **GE (France)** on 12 Apr 2004, 8:02 p.m.,*
in response to message #15 by Wayne Stephens

Hello, speaking of 'on topic', is it very hard to find a vertical curve ? Is there more than one ? Do you need a program for that ? This is quite puzzling.

Vertical Curves

*Message #17 Posted by **Wayne Stephens** on 12 Apr 2004, 9:18 p.m.,*
in response to message #16 by GE (France)

This is civil engineering road design stuff. Vertical curves are used in road designs to smooth out the transition as a section of road switches from one grade (slope) to another.

I do not know if the standard is the same throughout the world, but in the U.S., a vertical curve is described by a parabola which is tangent to the incoming slope at one end, and the outgoing slope at the other. Since there are an infinite number of possible incoming slopes, outgoing slopes, starting elevations and curve lengths (minimum curve length is usually based on the desired sight distance along the curve); and since the elevation at various stations along the road is

needed in order to construct it, then a calculator or computer is used to derive the characteristics of the curve.

There is software available now that can automatically compute road designs and draw them in AutoCad, but I still like to be able to spot check road designs. I use an HP calculator for that. I've been using a 48GX, mostly, but I just got a 41C and wanted to have a vertical curve program for it, so I wrote one.

Feel free to email me if you are interested in further information (you probabaly won't be though, it's pretty boring to anyone but a civil engineer).

Take care.

Wayne.

Spice series extra RAM

*Message #1 Posted by **Eric Smith** on 8 Apr 2004, 10:03 p.m.*

Based on microcode simulations, it appears that some of the Spice series calculators have much more RAM implemented in the hardware than is actually made available to the user. It's not uncommon for a few extra registers to be used for various internal purposes. But the HP-33C appears to have 32 hardware registers, of which 8 are available as user registers and 7 provide the 49 program steps. One is probably Last X, but even if there are a few used for internal status, there are still quite a few unaccounted for.

The register count of 32 was determined by observing the cold-reset memory initialization sequence, which appears to check values in registers 08 and 14 (hex), then zeros all registers from 1F down to 00, then writes initialization constants to registers 08 and 14.

The Spice series, like later Woodstock and Topcat models, uses chips that combine ROM and RAM. Thus the amount of RAM in a Spice is to some extent determined by the ROM size. Possibly the amount of user memory made available was restricted for product positioning purposes.

Simulations of the HP-32E and HP-37E seem to indicate that these models have 32 and 48 registers, respectively. However, this is less conclusive because the initialization in these models is performed by the use of a "clear data registers" instruction that clears an entire 16-register chip in one cycle.

The HP-32E at startup selects and clears the RAM chips at address 10 hex then 00 hex. The HP-37E selects and clears 10, 20, then 00.

Re: Spice series extra RAM

*Message #2 Posted by **Wayne Stephens** on 9 Apr 2004, 1:51 p.m.,*
in response to message #1 by Eric Smith

Is there any way to make it usable? Also, does this apply to the 38E as well?

Take care.

Wayne.

in response to message #2 by Wayne Stephens

> Quote:
>
> Is there any way to make it usable?

Only by hacking the microcode. This would take a pretty substantial amount of word, both in making the microcode changes, and in building and installing a suitable replacement for the ROM/RAM chip.

> Quote:
>
> Also, does this apply to the 38E as well?

I'm not yet certain. The 34C, 38E, and 38C have more ROM than the processor can directly address (7K, 5K, and 5K, respectively). I need to implement ROM bank switching in the simulator before I'll be able to log what memory locations the microcode initializes.

in response to message #4 by Raymond Del Tondo

> Quote:
>
> did you count in the RPN stack (X,Y,Z,T) ?

No, because those are part of the processor. Last X is normally stored in RAM, though.

The Nut processor, as used in the HP-41C and Voyager families, was the first processor HP designed for handhelds calculators that did not have a hardware RPN stack.

Re: Spice series extra RAM

*Message #6 Posted by **Wlodek Mier-Jedrzejowicz** on 9 Apr 2004, 10:30 p.m.,*
in response to message #5 by Eric Smith

Eric, since you have already mentioned the HP-41 family in this context, maybe I should add a reminder that the HP-41C microcode had instructions to clear all addressable RAM memory (if it assumed memory was corrupt because the cold-start-constant was incorrect). Yet only an HP-41 with a full complement of Extended Memory really had all that RAM. (Apart from Jim de Arras' HP-41C to which he added memory himself...) Maybe the Spice calculators played the same trick of clearing more memory registers than actually existed :-) Regards, Wlodek

Hyperterminal

*Message #1 Posted by **Naim** on 8 Apr 2004, 7:43 p.m.*

Anyone ever used Hyperterminal to connect their HP49G+ to their PC? I have used it successfully with my HP48GX. But I can't seem to get the USB ports to show up. ANy help would be appreciated. Thanks.

Re: Hyperterminal

*Message #2 Posted by **James M. Prange** on 8 Apr 2004, 9:31 p.m.,*
in response to message #1 by Naim

Same here. Perhaps there's some software that would make the USB port appear as a COM port to other applications? I'd very much like to use HyperTerminal with the 49g+ just like I do with the 49G and the 48 series.

Or maybe some other terminal emulator that works with a USB port?

Regards,
James

28S Programming

*Message #1 Posted by **John Morast** on 8 Apr 2004, 7:23 p.m.*

I have a question on programming my HP 28S. I am following the procedure in the owners manual, but upon solving the equation, the wrong answer is provided. The equation I am solving is a fluid flow problem:

Q = 1.49/n * A * R^2/3 * S^1/2

HP no longer offers support for the 28S. I am taking the PE exam and they outlawed the 48GX, so I'm dusting off my 28S. Anyone aware of another method of programming or previous issues with programming the 28S? Thanks!

Re: 28S Programming

*Message #2 Posted by **J. Lopez** on 8 Apr 2004, 8:02 p.m.,*
in response to message #1 by John Morast

In the 28S's operator hierarchy rules, raising to a power is done before division/multiplication; so, 'R^2/3' is different from 'R^(2/3)'. Also, without parenthesis in the equation, your last term becomes 'S/2' instead of 'SQRT(S)', which is probably what you intended. Hope this helps.

Re: 28S Programming

*Message #3 Posted by **J Morast** on 9 Apr 2004, 2:41 p.m.,*
in response to message #2 by J. Lopez

I thought I'd tried that in my many iterations of equation input. I will double check. Thanks.

Re: 28S and the NCEES - can it be used?

*Message #4 Posted by **Randy Sloyer** on 8 Apr 2004, 8:42 p.m.,*
in response to message #1 by John Morast

I would not be surprised to hear the NCEES banned the 28 series as well for it has alpha editing ability and IR transmission, two very big no-no's.

Has anyone out there been able to use a 28?

Re: 28S Programming

*Message #5 Posted by **Norris** on 8 Apr 2004, 9:05 p.m.,*
in response to message #1 by John Morast

This question has come up in other forums, like the PE exam forum at ppi2pass.com. It is widely assumed that the 28 series is implicitly *banned* under current NCEES rules.

It's true that the 28 is not explicitly listed on the NCEES "banned" list (which includes the 41, 42, 48, and 49). But NCEES has never claimed that this list is all-inclusive. In fact, NCEES has banned *any* calculator that

meets the following general description:

"Of great concern is the ability to type in text, store it in memory, and then communicate via wireless or cable connections to another calculator, personal computer, printer, or other electronic device. If a calculator model can be made to communicate through the use of modules, software, and/or other add-on devices, then this calculator is deemed to possess communication capabilities and will be prohibited."

The 28S can clearly do these things, so it appears to be unacceptable under the current NCEES rules.

The new NCEES calculator policy takes effect with the April 2004 exams, which will not occur until April 16-17. So no one has "tested" the ban with a 28S yet. In practice, enforcement of the policy will be up to the exam proctors, who may or may not be able to recognize the features of the 28S. It's entirely possible that some proctors would disallow it and that others would let it pass. However, the 28S appears to be technically illegal in either case.

In the future NCEES may ban all calculators except for those on a relatively short "approved" list, in order to simplify enforcement of the policy. The only RPN calculators that NCEES has explicitly "approved" to date are the HP 32 and 33 series.

28S on PE exam?? No way !!

*Message #6 Posted by **Driscoll** on 8 Apr 2004, 10:41 p.m.,*
in response to message #1 by John Morast

Time for a reality check. You plan to take a device with an alpha keyboard and a wireless transmitter into an NCEES exam? Why do you think the 48GX was banned?

Re: 28S Programming

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 10 Apr 2004, 1:05 a.m.,*
in response to message #1 by John Morast

Hi;

the HP28S (and all RPL calculators) identify an "expression" (a general term for any equation) when it's surounded by ['']. As you were able to use the SOLVER and got a wrong answer, I'd ask you, please, to try this one:

```
'Q=1.49/n*A*R^(2/3)*S^(.5)'
```

The "S^(.5)" may also be written as S^.5 or you can type the square-root ([SHIFT][-]) and S; either of each will work fine.

I am not sure about what you see after typing the equation in and pressing [ENTER], but if you get no error and all variables appear as menu labels when you activate the SOLVER (i.e.: [Q][N][A][R][S][LEFT=]), then there is something alse missing.

Is it possible to go further, now?

Success.

Luiz (Brazil)

Has anyone lost any messages?

*Message #1 Posted by **Dave Hicks** on 8 Apr 2004, 5:06 p.m.*

Someone reported that he made two posts that appeared to go normally but they never appeared. Has this happened to anyone else in the last couple of days?

If so, please email me with:
A brief description of the post
Some words, what time, who it was in response to - whatever you remember
Whether you would like me to resurrect it
(I may be able to using some log info)
What browser you're using.

I see a few posts that didn't make it past the preview stage but I don't want to just post them because you might have changed your mind and decided not to post!

I'm not sure what has been going on but I've made a change that MIGHT have fixed it.

Re: Has anyone lost any messages?

"NEW" Calculator Disappointments

*Message #1 Posted by **David Yerka** on 8 Apr 2004, 4:07 p.m.*

I know this may upset people but the day of the "super calculator" is past. All this agony about the latest HP models and their lack of tradition to the past is wasted.

First, the HP of the 70's and 80's is gone. They are no longer a source of inovation. Those individuals who provided the inspiration for the products we fondly remember are gone--driven out by bean counters. Hp is now a company which makes the bulk of it's profit selling inkjet printers cheap, so they can profit by selling expensive inkjet cartridges. This is the way of the industry. It is sad but common.

Second, the "calculator" has passed its "golden age." With the exception of certain small nitch areas; the onset of cheap processing power on the desktop has killed it. Look at TI and Casio: their major sales are to students, and probably the bulk are high school students. These students aren't interested in spending to much money--except for the geeks (I was a geek) and the geeks now want the best COMPUTER on the block. Most students in engineering and science expect/know that notebooks and desktops with amazing processing power await them in the work area. Much as I would wish it otherwise a company equiping its engineering/technical staff is going to invest in workstations and software--there is just so much more bang for the buck from an accounting point of view.

All this is a factor of Moore's Law:(to broadly paraphrase) processing power doubles and costs drop quickly in the computer industry. Add economies of scale and consider rationally and its amazing that any company would think it could make an expensive line of calculators and make a profit.

So, of course, a company is going to farm out design and production, Of course, more concern is going to be placed on "looking cool and different"--marketing, you know--and the cheapest cost of production is going to be most important. How many of us are there really? (Calculator fanatics!!) 100,000 world wide? That's not enough for a major company to even consider a study for a new design proposal.

Like it or not, there really isn't any money in calculator design for major companies. So, don't get so upset about "eye catching" designs (ouch); the amazing thing is that HP is still trying to produce calculators at all. That RPN/RPL is still arround is amazing--'cause it isn't taught in high school, math teachers have enough to do without bucking the general teaching ideas.

On a slightly different topic: I've said this before but for all those who want a prototype development calculator for emulation, etc.: Why not the HP49G+? It is already running a calculator emulation on top of a industry standard ARM CPU. It's got I/O, lots of memory, flash memory, an adequate screen, a fairly good keyboard and there are industry standard assemblers out there for ARM processors. Also there are much much faster ARM CPU's available when looking toward the future. It's available now for proof of concept.

I hope a haven't offended but all the discussion about the new calculators just seems so negative. I think the fact we're even getting some choice is amazing.

Re: "NEW" Calculator Disappointments

*Message #2 Posted by **bill platt (les Estats Unis d'Amerique)** on 8 Apr 2004, 4:30 p.m.,*
in response to message #1 by David Yerka

Hi David,

Your points are "spot-on" (and in fact tehy have been made before here, but yours is an eloquent essay).

Indeed, I have been thinking lately about what attracts us here---most of the steady contributors come because this is a MUSEUM, and we are interested in MUSEUM PIECES!

Let me put another way of seeing all of this: I think it is in fact wonderful--and remarkable, too--that I can choose to sell my more current calculators (32sii) and step back in time, using "antiques" as it were, for my daily calculating needs. Indeed, for heavy computing, I use the computer. For light stuff, or especially for portable convenience, I use the calculator. And of course, for FUN!

So, just as watches are obsolete (they really are--time is everywhere--I haven't worn one in at least 8 years), so are calculators---and so for the uses for which they are still good--and always will be good---we can "express ourselves" in the vintage equipment we use daily. Some wear a MOVADO, and others carry an HP-45. I just think it is totally fun!

And you are right, in the scheme of things, it is remarkable that there are still any new HP's and especially new RPN HP's at all!

So, we will keep dreaming of the super-calc, the HP-15C platinum, the HP 41 superduper etc---and it is healthy---and some amazing people (Christoph, Christoph the other, Nelson, Hrastprogrammer, Smith, the list goes on, Kuipers, Sloyer, Brogger, and the Spanish Influence: Diaz, Martin,etc.....) will actually BUILD either virtual antiques, or MODERN actual RPN kits/upgrades/homebrews.

It is great sport!

Best regards,

Bill

Re: "NEW" Calculator Disappointments

*Message #3 Posted by **Steve S** on 8 Apr 2004, 5:16 p.m.,*
in response to message #1 by David Yerka

Count me in, too, at least up to a point. I have also said that desktop computers and other platforms with embedded computing capability are stiff competition to the idea of "yet another" stand-alone hardware calculator.

But... and I think this is important... there is still room for new dedicated calculating hardware IF they feature a better, more natural interface with the user. An interface that couldn't be, for example, emulated on a typical PC or Mac.

This is a point I've tried to make before, but it seems to fall on deaf ears in this forum. Maybe that's to be expected. As Bill Platt points out, this is a MUSEUM, and people are here, in large part, because of their nostalgia over past HP glories. No wonder many people here think only in terms of pursuading HP to build an HP-41+++ (or insert the HP of your choice here).

When you imagine what could be done with a graphic / user interface, I think it's really a shame that most of us can only complain about how the "ENTER" key is in the wrong place!

Hi Steve,

But do note that there are some hardware heavies that are around here, too---just search on Nelson Sicuro and you will see lots of interesting developments for making new equipment.....

computers and calculators

*Message #5 Posted by **brooks rownd** on 9 Apr 2004, 11:53 a.m.,*
in response to message #3 by Steve S

WRT computers vs. calculators. You cannot carry a computer around the lab or in the field in your pocket like a calc, and in the few cases that you can the battery performance and interface are far inferior. Computers have poor user interfaces for calculation, and are extremely inefficient in that role. The good old calculator is a reliable go-anywhere tool that still reigns supreme for banging out calculations on the fly. I don't see myself giving up calculators anytime soon...or anytime.

As far as a GUI on a calculator, the very thought makes me want to cry. Get a fricken palmtop if you want that junk. They already make them, so be my guest. I'll stick to the good old clicky keys.

Long rambling answer to David Y

*Message #6 Posted by **db(martinez,california)** on 8 Apr 2004, 10:11 p.m.,*
in response to message #1 by David Yerka

1) It's great that two companies are making RPN calculators at all.

2) I work in one of those "nitch" areas; i build stuff. Right now it's our 3 sections of an airport. Like most projects there are parts that are flat un-buildable if you go by the drawings. It's too easy to run off a set of plans by computer now-a-days. Just download a disk of data, hit a few buttons and it vomits up plans that have nothing to do with this Earth which can't be built in three dimentional space. Designers/engineers/technicians trust those expensive computers and fancy programs too much. If they had to do some math along the way they would not try to pass off this kind of junk. Using a calculator makes you think.

The problem today got solved by by two construction engineers from my company and me (the flunky with a calculator) walking a bunch of city people and contract engineers around while showing them our basic arithmetic skills. That and reminding them that if we build it the way it is planned; there will be 1.5 to 1.8 foot high speed bumps, "duck ponds" at the underpass and curves that bank the wrong way (so the cars slide off). The surveyors were no better. When i asked them to fix the problem the head cheese computer user asked me if i could just "make it work" (..and take his liablity for free i suppose). We did the hard part; i found the problems and put numbers on them.

On the good side; i am learning to be more political. I did not tell the ernest city folks to stop promoting the terminally lazy, i did not tell the hard working surveyor that he should keep the EEO cases & drinking buddies in the office and send someone with a brain out into the field, and i did not tell the obviously inteligent engineers that i have seen better design on kraft paper in crayon.

Anyway; the point to all my sniveling here is this: In my nitch (and many others) the calculator is still necessary; "the onset of cheap processing power on the desktop" has not killed it. I believe that computers are only better for repetative plug and crank jobs. Those jobs may be in the majority but none of us here want to fill them.

Re: Long rambling answer to David Y

*Message #7 Posted by **Art Litka** on 8 Apr 2004, 11:31 p.m.,*
in response to message #6 by db(martinez,california)

Well said, db! I'm with you on this-the programmable calc (along with the geek who operates it) still has a role to play. As an educator in the physical sciences, I try to get my students to "think" their way through problems and use their machines (alas, mostly TI algebraics) as tools rather than crutches. Some have been brought along to just blindly "plugging" numbers into formulas and never challenging the result or the assumptions leading up to it. They do this with computers too and are even more apt to accept whatever "answer" it gives. However with a calculator they are, in my opinion, more in touch with the problem and can be taught to think while using it in a very interactive way. If properly done during the formal education process, the student can conveniently learn fundamental concepts and test various "what if" scenarios with the calculator more readily than with a computer operating a "canned" program. Once this skill is acquired, it can be applied on the job as well.

Art, I'd be interested in your views on the use of Mathcad, Mathematica and free equivalents such as Octave (http://www.octave.org) in education. They strike me as excellent tools for visualization - much better than calcs, in fact, on account of speed, improved interface (keyboard, color, etc.) and interactivity.

Is the problem one of providing computers in the classroom? I can see how computers could be distracting, take up space, etc. and they're more expensive than a calc. But I sometimes think we're approaching the point where every student will require a notebook computer because of its general applicability. That day might well ring the death knell of the calculator - especially the graphing calculator - as a pedagogical tool.

Best,

--- Les Bell, RHCE, CISSP

Re: Long rambling answer to David Y

*Message #9 Posted by **Art Litka** on 9 Apr 2004, 2:59 p.m.,*
in response to message #8 by Les Bell [Sydney]

Les,

Thanks for responding to my post. It seems to me that computers are TOO available in many schools these days. It is a trend that administrators love to push and use as bragging rights. Please don't get me wrong, they are great tools and have their place in the modern world of education and

training. My concern is that they are overutilized for the wrong purposes and underutilized for the appropriate ones. That however, is a separate discussion topic and need not be argued here. Students do use many software packages such as Math-Cad, Graphical Analysis etc. My point is that the calculator can offer a closer connection to the mathematical/physical problem than glitzy and sometimes intimidating software can. Besides, even laptops are still heavy and inconvenient (let alone expensive)by comparison. For many fundamental problems and concepts I feel that the calculator is still a superior tool, especially if a user developed program is involved. This is a talent that seems lost on current students who think "programming" is just learning to use a commercial software package! I'd be happy to discuss this further if you wish and compare our experiences.

Art

Re: Long rambling answer to David Y

*Message #10 Posted by **Ed Look** on 9 Apr 2004, 3:53 p.m.,*
in response to message #9 by Art Litka

I'd agree with the assessment that schools often implement computers, usually PCs (sometimes out of date ones), more as bling-bling than bang for the buck. In fact, I find that sometimes, my kids only draw pictures on the ones at school. Higher education likes to use PCs to automate experiments in lab courses, but that really prevents students from knowing how to truly handle data.

I am a staunch believer in keeping computer involvement in math and science courses to a minimum, until proficiency is satisfactorily proven, then at the next level, the student may try to mimic "real world" or "industrial" or "research" conditions. In non-technical fields, however, writing IS tedious, given the amounts of it required, so for writing and keeping records, it's wonderful.

Re: Long rambling answer to David Y

*Message #11 Posted by **Les Bell [Sydney]** on 9 Apr 2004, 7:43 p.m.,*

Art,

Thanks for taking the time to comment. I think you've hit the nail on the head when you say:

> Quote:
>
> My concern is that they are overutilized for the wrong purposes and underutilized for the appropriate ones.

My concern is really as a parent; I can see how, for many kids (and teachers) there's a tendency to become focused more on interacting with the computer than on the experiement/creative writing/etc. that is the real purpose of the exercise.

It strikes me that the calculator is more appropriate in the classroom - it's less obtrusive on the lab bench. And, as you say, there's real value to the student in the exercise of developing a short program to solve a problem. It's analogous to "the best way to learn something is to explain it to someone else" - if you can "explain" it to a 'dumb' device like a calculator or computer, then you must have achieved some degree of familiarity with the problem.

Best,

--- Les Bell, RHCE, CISSP

Programming worked for me!

*Message #12 Posted by **Michael Meyer** on 10 Apr 2004, 1:56 a.m.,*
in response to message #11 by Les Bell [Sydney]

In college (Northwestern), I programmed every computer science assignment on my TI-59... and went through an entire year without missing a single point. Not on homework, quizzes, or exams.(I guess I'm a bit compulsive there....) There were and are people with computer knowledge light years beyond mine, but no one had ever done that before.

I programmed all of my physics on my 59, and again, pulled the highest grade in the class... all year. The key to my grades was that I would write down all the equations for each exam question first, and then go back to the start to plug in numbers. While others wouldn't have time to even finish the exam, I got most of the points on questions I didn't even have time to solve... because I'd listed the equations needed. I knew the equations well, thanks to my having programmed and played with them.

I still wonder if a statistics class is angry with me. I showed the instructior all of the equations I'd programmed, but he announced before the final that, he "wrote this exam with Mr. Meyer in mind." Though calculators were allowed, the final exam was all theory. Not a single problem. Again, having programmed them, I knew them well. Again the highest grade.

I attribute all of this success to my enjoyment of programming my calculator.

So, 1. I do think it's a great way to learn. 2. That's why I'm still a calculator fanatic.

Of course! Michael

Re: Programming worked for me!

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 10 Apr 2004, 2:47 a.m.,*
in response to message #12 by Michael Meyer

Hi, Doc;

may I borrow your lines?

I had a few difficulties while attending classes at the Electrical Engineering course that I actually surpassed without much trouble when I decided to write programs to all of them. The ones I was sure I wasn't able to push inside the "HP41C + 1 mem module", I tried to find a reasonable approach. And that made my life as a student a lot easier.

I believe that (now it's up to you) I actually "built" some neural links related to reasoning that are still active till now. Whenever I face a numerical problem I actually reason over it in some sort of RPN-related style. I even realize that my inner thoughts changed from {"value" plus two, times four} to {"value" two add, four times}. That's true, Doc, believe me. No "equals to" at the end of the reasoning.

Best regards.

Luiz (Brazil)

Re: Programming worked for me!

*Message #14 Posted by **Ben Salinas** on 11 Apr 2004, 12:53 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Wow... I too think in RPN. It really freaks everyone out when I am doing math aloud. For some reason it seems to make even mental math easier (for me it is easier to multiply 58 by 32 when I think of it was 58 enter 32 times)

-Ben

Re: Programming worked for me! (edited)

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 11 Apr 2004, 2:15 a.m.,*
in response to message #14 by Ben Salinas

Hi, Ben;

you bet! You're lucky you're "still" a student. When you're a teacher, pupils seem to be afraid of you when you're doing that... Anyway, it's a good sign knowing that brainy "youngers" are walking this path. Thanks!

Keep your way doing good things "right", Ben!

Cheers.

Luiz (Brazil)

(P.S. - for those friends of mine and users I don't know, who own, use and prefer Algebraic calculators instead of RPN/RPL: I own some HP algebraic models, one Casio fx7000GA (bought a couple on months ago) and I was given some TI calculators: TI59 with printer and some magnetic cards (local friend), TI58C + TI55 + TI82 (thanks, M.B.) and I use them and program them as well; what matters is always keeping our HP (Head Power) up and going... I prefer RPN/RPL, but I never give up Algebraic calculators, any brand)

Edited: 11 Apr 2004, 11:15 a.m.

Long rambling backup to db's long rambling answer to David Y

*Message #16 Posted by **Wayne Stephens** on 9 Apr 2004, 7:49 a.m.,*
in response to message #6 by db(martinez,california)

Thanks db,

I am sorry you are dealing with such incompetent engineers. I am a civil engineer who was fortunate enough to spend my younger days working at firms that stressed designs that can actually be built. It disgusts me to see engineers (or at any rate, people with engineering degrees)using their computer software as a crutch and a place to lay the blame for their poor designs.

Just the other day, I asked another engineer how he was intending to size the pumps for a water booster station he was designing. The answer? "Oh, WaterCad tells us which pumps to use". This same person was adamantly proclaiming that two identical pumps, pumping in parallel, in a relatively high head application

of centrifugal pumps, would put twice the flow into the system as a single pump. I guess he's never compared the pump curves to an actual system curve? While it is true two pumps in parallel will pump twice the flow at the same head, in the real world the head will not BE the same when two pumps are pumping instead of one. By the way, that person has a PE license and designs these thing for a living.

The truth of that matter is, if you don't know how to compute it by hand, you shouldn't be allowed to compute it on a calculator; and if you don't know how to compute it on a calculator, you certainly shouldn't be turned loose with powerful (but often flawed) computer software.

One key to being a good engineer is being so well versed in the physics and the math that you can use calculators and computers as TOOLS, not as your entire design procedure. Another key is to have enough common sense and knowledge of what you are designing to be able to tell when the computer software is churning out junk. What's the old cliche? Garbage in, garbage out.

Take care.

Wayne.

PS - I use my HP41C, 33S and/or 48GX almost every day. I write most of my own programs for them.

* The HP49G+ is a great place to start.

* The calculator age hasn't past yet! I'm a young HP calc fan (since 2001).

Some Response to Reponses (long...)

*Message #18 Posted by **David Yerka** on 9 Apr 2004, 1:26 a.m.,*
in response to message #1 by David Yerka

Thanks for commenting on my post, folks. It appears that some got the point and some didn't. So...

I wasn't arguing that we don't need calculators; I was arguing that the "market" (what ever that is) is blocking the production of new calculators. It's cost/benifit analysis. The profit just isn't there. Look at what is going on now: TI, HP, Casio aren't really developing NEW calculators they are just improving (!) older models. What is the HP49G+ after all, just a HP48/49 series running in emulation on off the shelf hardware.

And, yes, no amount of hardware will subsitute for brains, experience and common sense. My business is consulting on hardware and software for individuals and business. All to often I see people who are getting the wrong results from technology. Often the comment is, " well the software/hardware SHOULD do this!" rather than understanding what the technology in question really can do. If the person at the workstation cranking out the blueprints doesn't understand "real world situations" it is a HUMAN problem not a technological problem. Making the guy use a calculator isn't going to fix the problem. And your ability to "make it work" doesn't derive from your calculator. It comes from your brain; and if you had a laptop you'd get your answer there and if you didn't you'd use paper and pencil. The technology is a TOOL no matter how good, cool, etc. it is.

My sister and brother-in-law are teachers. He is a high school math teacher. My son is an amazingly bright 5th grader with a talent for math (yes, bragging, I know). Between tutoring my son (and several of his classmates) in math--they're at high school level at this point--and many discussion with my brother-in-law, I well know the needs for developing math skills. Again, the calculator is a tool here, using it can help but it's use doesn't guarantee understanding. Nor can some wonderful software available to teach and visualize math,

geometry, trig, calculus. I had paper, pencil, slide rule, log tables, and references when I learned math. My son and classmates have computers, calculators, paper and pencils. But more importantly I had great math teachers, great mentors. My son had and has great teachers in school and an OK mentor in me. Most important of all is that my son (and classmates) think learning is fun and want to learn.

And yes this is a museum, and yes most of us are "playing" with obsolete devices. But that doesn't mean they aren't useful. I often write microcode and when I do my PDA with a HP16 emulator is right next to me on the desk along with pad and paper even though most of the time code goes directly into the workstation. In fact there are a couple of emulators running on the workstation. Tools, you see. There are many tools to solve problems but some remind us that the best tool is our brain. Inovative tools are like that and for a time HP calculators were defined by inovation and that is what grabs us.

Perhaps a new human friendly interface might make a better calculator but it isn't going sell more calculators in the long run. Does anyone think that Windows drove the personal computer boom? It put a friendly face on the C: prompt yes but Michael Dell (and others) put the under $1000 (now under $500) computer into the home. Inovation is nice but ultimately profit drives mature companies. And, what made the personal computer was versitility: it could be adapted to communications, calculation, data logging, control,etc. cheaply. Economies of scale again. Filling the nitch market is expensive and unfortunately if you're in the nitch you get screwed.

So, don't look to HP for inovative calculators; look at lean and hungry startups, the Kimpo's who can make a profit on a smaller margin, look here for people who consider the result greater than the cost in time.

Finally, I see some promise in the way calculators are going. The hardware is becoming more generalized and off-the-shelf; more adaptable. And after all, the soul of our tools is in the software, it's the code that does the math.

On c.s.hp48, JYA has been hinting very strongly to an imminent announcement of a revolutionary tool (calc?) not related to hp. I would guess an hydrix system is around the corner and may be very interesting.

*Message #21 Posted by **Garth Wilson** on 9 Apr 2004, 5:24 a.m.,*
in response to message #18 by David Yerka

I hang onto my 41cx not for its museum (ie, antique or nostalgic) value, but because of its practical value

for my work _today_. Could I use a bigger display? I suppose; but I seldom have any use for graphics for it. As for schools, visualizing a function on a color monitor will often do no good if the student does not understand _why_ the function graphs out the way it does. It just becomes more Greek-- just cool Greek. Here again, the computer cannot do the thinking for the person. If it could, there would be no need for the person to learn the math. However HP is now taking advantage of the perception that these student calculators are somehow going to improve learning.

A few people are clamoring for notebook computers in the classroom to get a full monitor because a graphing calculator is not big enough, while cell phones with internet access, cameras, and color monitors built in have, in the name of modern advancement, gotten so small they're not practical. I saved an article telling of an experiment in the midwestern U.S. where a school district was allowed to spend incredible amounts of money to improve learning. In the high school, every student had his/her own laptop. Interestingly, every one of the major performance indicators failed to improve.

Addressing niche markets is not what big companies want to do. These companies are driven by profit, the only demand of the shareholders who have no interest in the product or niche. Actually that's what keeps my niche company in business. If it weren't a niche, Sony and other big engineering powerhouses would put us out of business making a better product for a fraction of the price. There is another niche computer market I would like to get into. If or when I do, I can tell you my company will not go public, because that would spell the end of the niche. Personal income was not my interest in getting into engineering. This may be the kind of mentality needed to make the HP-41 of the 21st century since HP is no longer interested.

*Message #23 Posted by **Ben Salinas** on 9 Apr 2004, 11:26 a.m.,*
in response to message #18 by David Yerka

I agree. The calculator market is definitley dying, and yet, it will still be around for a long time in the high school level. Just in my peers (which do not represent the normal high school students as I attend a math and science magnet school), I see a huge reliance on calculators. But, the best students do not trust their calculators. I use a 49g+ to check my integration, but I do all my own graphing, integration, differentiation (is that a word?), factoring, eqaution solving, etc, and for that reason I really don't want to use maple, or mathematica, or YACAS, or any of those other pieces of software.

In my opinion, the whole purpose of a calculator is portability and specialization, while still being relatively cheap. PDA's are not at a place in which they can be cheap enough for me to use, and they are not as specialized for what I want. I want arithmetic to be done quickly, and that is what I get with a calculator.

As far as playing with "old" calculators, I do it because they are better. If I had to choose between a TI 89+

(or whatever the new one is), a 49g+ and a 32sii (or the equivalent... 42s), I would definitely choose the 32sii. Do I want more memory... more programability... more screen.... more functions, YES, but as of now it is the best calculator I have access to that fits this description.

The calculator market outside of schools is definitely dying, and the only reason it is surviving there is because students do not work in a single office (to use mathematica) and generally cannot afford PDAs. In addition to schools, I think that standardized tests will keep a small production of calculators coming out.

I am just glad I own the ones that I do, because it might come to the 49g+ being the 41 of the future.

in response to message #23 by Ben Salinas

Ben, hehehe...

... this is just because you've never used a 34C as your standby. Now THAT was a wonderful calculator, except for the fact that in those days, the LEDs ate power like it was free or something.

(What I won't tell you is that I found the 32SII to be, in basic function, just about as good as the 34C, except I preferred the 34C's implementation of register usage and the physical feel if it, especially the keys. But the 32SII has the superior display and battery life.)

HP-48 AUM Download ??

*Message #1 Posted by **Steve S** on 8 Apr 2004, 1:04 p.m.*

Does anyone know if the HP-48G/GX Advanced User's Reference Manual (AUM) is available as a download, and if so, where?

I've searched the usual places, including Amazon, for used copies, but no luck! Thanks...

Re: HP-48 AUM Download ??

*Message #2 Posted by **Les Bell [Sydney]** on 9 Apr 2004, 2:25 a.m.,*
in response to message #1 by Steve S

An individual made his own HTML equivalent to the command reference part of the AUR. It can be downloaded from http://www.hpcalc.org - the filename is hp48gaur.zip, if that helps. But it's not a scan of the full, original HP48G AUR.

Best,

--- Les Bell, RHCE, CISSP [http://www.lesbell.com.au]

Hi,

see the update ...

Best regards

Andreas

Re: List of all Models ever made ?

*Message #9 Posted by **Walter Lockhart** on 8 Apr 2004, 7:03 p.m.,*
in response to message #1 by Andreas Stockburger (Germany)

Add 19c, a printing hand held.

Re: List of all Models ever made ?

*Message #10 Posted by **Andreas Stockburger (Germany)** on 12 Apr 2004, 10:17 a.m.,*
in response to message #9 by Walter Lockhart

Hi,

I know the 19C. But its an "old" one: http://www.hpmuseum.org/19.jpg

Best regards

Andreas Stockburger

Update: Re: List of all Models ever made ?

*Message #11 Posted by **Andreas Stockburger (Germany)** on 12 Apr 2004, 10:22 a.m.,*
in response to message #1 by Andreas Stockburger (Germany)

Hi,

here is the update:

hp6s hp6solar HP9g HP9s HP10bII HP12C-Platinum HP17BII+ HP19BII+ HP30s HP33s HP39g HP39g+ HP40g HP48g+ HP48gII HP49 HP49g+

Is this Ok now ?

Best regards

Andreas

Re: Update: Re: List of all Models ever made ?

*Message #12 Posted by **Johnny** on 12 Apr 2004, 10:28 a.m.,*
in response to message #11 by Andreas Stockburger (Germany)

I don't get it. Should that be a list of all HP calculators ever made???

Re: Update: Re: List of all Models ever made ?

*Message #13 Posted by **Andreas Stockburger (Germany)** on 16 Apr 2004, 1:46 a.m.,*
in response to message #12 by Johnny

Hi,

No, this is NOT a complete list. I want to know which NEW Calculators are on the market now. The "old" ones are clear an well documented on this site: http://www.hpmuseum.org

Best regards

Andreas

Re: Update: Re: List of all Models ever made ?

*Message #14 Posted by **Veli-Pekka Nousiainen** on 13 Apr 2004, 7:44 p.m.,*
in response to message #11 by Andreas Stockburger (Germany)

The new models seem to have the hp letters not HP
so some corrections:
hp 12c platinum financial calculator
hp 17bII+ financial calculator
hp 19bII+
hp 33s
hp 39g+
hp 48gII
hp 49g+
While the older models have big HP
HP 39G
HP 40G
HP 49G
Although the marketing says HP, the calc reads hp
[VPN]

Re: List of all Models ever made ?

*Message #15 Posted by **Matthias Wehrli** on 13 Apr 2004, 12:26 p.m.,*
in response to message #1 by Andreas Stockburger (Germany)

Have a look at my website. I think I have all presend and past models there...

www.hp-collection.org

By the way. In a few weeks I will present my new website with new layout and better documentation of all accessoires..

Matthias

Re: List of all Models ever made ?

*Message #16 Posted by **Andreas Stockburger (Germany)** on 16 Apr 2004, 1:52 a.m.,*
in response to message #15 by Matthias Wehrli

Hi Matthias,

i visited your site but could not find the required information. Please help me: I need to know which calculators where made after the HP48. This is what I found:

hp6s hp6solar hp9g hp9s hp10bII HP12C-Platinum hp17BII+ hp19BII+ hp30s hp33s HP39g HP39g+ HP40g HP48g+ hp48gII HP49 hp49g+

Is this correct now ?

Best regards

Andreas

Re: List of all Models ever made ?

*Message #17 Posted by **Ron Ross** on 16 Apr 2004, 10:35 a.m.,*
in response to message #16 by Andreas Stockburger (Germany)

I don't think you can name the Hp19Bii+ yet. Beta's may be available, but I doubt that also.

Nonpareil release 0.30

*Message #1 Posted by **Eric Smith** on 7 Apr 2004, 7:53 p.m.*

The first alpha release of Nonpareil, a multi-architecture microcode-level calculator simulator and microassembler, is now available:

http://nonpareil.brouhaha.com/

Nonpareil obsoletes CASMSIM. Initially it supports the same Classic series calculators (HP-35, HP-45, HP-55 and HP-80), and one Woodstock series calculator, the HP-25.

There are known bugs; for instance, the logarithmic and exponential functions of the HP-25 are not working correctly. I expect to fix that in the next release.

Future releases will include HP-41C and Voyager series support, based on code from NSIM. And possibly Spice series support; I have to investigate how much Spice differs from Woodstock architecturally.

The display interface between the GUI and the processor simulation is still not very general; in order to add HP-41C support I'll probably have to completely replace it.

Edited: 8 Apr 2004, 3:18 p.m. after one or more responses were posted

Re: Nonpareil release 0.30

*Message #2 Posted by **Jonathan Purvis (NZ)** on 7 Apr 2004, 11:44 p.m.,*
in response to message #1 by Eric Smith

I get errors compiling proc_classic.c and proc_woodstock.c. GCC complains "field `ram' has incomplete type". It's refering to the line which says:

reg_t ram []; /* dynamically sized */

Did you mean "reg_t *ram" or "reg_t ram[0]"? (Possibly not, it doesn't run the HP-35 with either of those changes.)

Re: Nonpareil release 0.30

*Message #3 Posted by **Eric Smith** on 8 Apr 2004, 3:04 a.m.,*
in response to message #2 by Jonathan Purvis (NZ)

reg_t ram[0] should work. reg_t *ram definitely will not.

Having a struct with an element declared explicity as zero length is not allowed by the C standard, although many C compilers do accept it. Omitting the length entirely, as I have done, is officially permitted by the C99 standard.

I'm using GCC 3.3.2. I've just verified that it works for me either with or without the zero. What version of

GCC are you using?

Re: Nonpareil release 0.30

*Message #4 Posted by **Jonathan Purvis (NZ)** on 9 Apr 2004, 2:23 a.m.,*
in response to message #3 by Eric Smith

I always thought "int *foo" was the same as "int foo[]". You learn something new everyday. :)

I was using GCC 2.95.4 (the default on Debian stable). I tried it with 3.0.4 and it compiles.

Re: Nonpareil release 0.30

*Message #5 Posted by **Bill Wiese** on 8 Apr 2004, 4:40 p.m.,*
in response to message #1 by Eric Smith

So, Eric,

You don't have Woodstock (HP25) exp/log functions working yet but basic math, 1/x, sqrt(x) and trig functions do work??

Nice. What new/changed instructions have you found btwn Classic & Woodstock architectures??

Regards, Bill

Re: Nonpareil release 0.30

*Message #6 Posted by **Eric Smith** on 8 Apr 2004, 6:37 p.m.,*
in response to message #5 by Bill Wiese

> Quote:
>
> but basic math, 1/x, sqrt(x) and trig functions do work?

Yes. There's probably a single microinstruction I've implemented wrong that is breaking the logarithmic and exponential functions. (And might have a more subtle effect on other functions.)

> Quote:
>
> What new/changed instructions have you found btwn Classic & Woodstock architectures?

Almost all of it is described in the HP Journal article: http://www.hpmuseum.org/journals/woodb.htm

The ALU can be switched between BCD and binary. There are more flag bits. There are two 56-bit temorary registers rather than one, and a new four-bit register. There are instructions to directly read and write external registers in a single step, just like the later Nut processor.

I've just tried running the HP-32E, HP-33C, and HP-37E ROMs. The keyboard and display mapping is wrong, but it comes close enough to working to confirm that Spice uses the same processor architecture. They do use the 0520 (octal) instruction; I don't yet know the function of that although it may be circular shift left A.

On the weekend I'll capture traces for comparison.

HP-33C works!

*Message #7 Posted by **Eric Smith** on 9 Apr 2004, 6:16 a.m.,*
in response to message #1 by Eric Smith

I've now got the HP-33C working in Nonpareil. As I suspected, the 0520 instruction is rotate left A. I'll try to get a 0.31 release out within the next few days.

I've only done limited testing, but the 33C seems to work correctly, including the logarithmic and exponential functions that are not working on the 25.

On the other hand, the 32E and 37E have problems. On the 32E, number entry always thinks there's a decimal point after the first digit, and addition and subtraction always seem to overflow. Multiplication and division work correctly though, as do many other functions. On the 37E number entry is OK, but it has the addition and subtraction problem, and e^x doesn't work. I suspect that these problems are all due to the same bug causing problems on the 25.

I have not yet implemented a way to save the continuous memory, so for now the 33C always starts up with "Pr Error". And I haven't yet added the instruction that checksums the ROM (1460 octal), so the self-test always gets "Error 9".

I knew the Spice architecture was fairly similar to the Woodstock, but I have been pleasantly surprised at how easy it was to get the 33C going.

I can't try the 34C, 38E, and 38C yet because I haven't implemented the necessary ROM bank switching. I don't know how it works, although I suspect that fetching the opcode 1060 simply toggles the bank selection for the ROMs containing the current address.

Fixed digit entry on the 32E

*Message #8 Posted by **Eric Smith** on 9 Apr 2004, 3:03 p.m.,*
in response to message #7 by Eric Smith

The digit entry/decimal problem on the 32E turned out to be an easy fix. The 31E and 32E do not have the slide switch that is used for PRGM/RUN or BEGIN/END on the other Spice models.

The switch works by forcing a CPU flag bit to be set if the switch is on. If the switch is turned off, the CPU flag doesn't automatically get cleared. To read the switch setting, the microcode tries to clear the flag, then checks the result.

Since the 32E doesn't have the switch, they used that flag as the "decimal seen" flag for digit entry. After toggling the switch in the simulator, digit entry works correctly. I've removed the switch from the KML file for the 32E.

Unfortunately this doesn't fix the overflow from addition and subtraction. I'll work on that tonight.

Re: HP-33C works!

*Message #9 Posted by **Eric Smith** on 10 Apr 2004, 5:02 a.m.,*
in response to message #7 by Eric Smith

Just put up a new release including the HP-33C support:

33s First Impressions

*Message #1 Posted by **J.C. Randerson** on 7 Apr 2004, 7:07 p.m.*

My bookstore had about a dozen, snagged one. There was a run on them once the word got out, completely sold out in no time.

To whoever designed this keyboard: it's failure, you moron! This V shaped crap is complete BS. The Enter key is hard to find, and poorly placed. The keys themselves are a cheap knockoff of the old rocker pivot.

The display is adequate, but the decimal point is almost invisible. Lots of mistakes will come from this.

The added memory is a plus, you can have a root finder program and a matrix program at the same time, unlike the pathetic memory of the 32sii.

This might be a decent machine if the designers had put the keys in a straight line, kept the big Enter key, and had a visible decimal point.

Thanks a bunch for what you've done for HP calcs, Carly!

And a big thanks to the NCEES for helping make this POS an indispensable item.

J.C. Randerson

Re: 33s First Impressions

*Message #2 Posted by **Ben Salinas** on 7 Apr 2004, 7:29 p.m.,*
in response to message #1 by J.C. Randerson

I am preparing myself for a new spamming of messages flaming the keyboard of the 33s. It really isn't that bad. Use it for a while and you will get used to it. Anything new is weird.

I understand that these are your first impressions, but don't stop using it entirely because of your first impressions. What would have happened is the first calculator users had thrown out (or set aside) the HP-35 because it used a "weird" entry system?

in response to message #2 by Ben Salinas

Hi,

of course no flames, only some thoughts.

I think you can hardly compare any of the classic HP calcs up to and including the 48GX with the newer

ACO and post-ACO stuff.

So far the only new machine with some potential could be the 49g+ (except the kbd layout, of course;-)

As we all know, there were some reasons for the entry system of the HP-35 and sucessors. One of them is it's high efficiency for input, another that it was much cheaper to produce. RAM as expensive back then.

And I doubt that the first calc users would have thrown away these machines, because they offered new methods of calculating logs & trigs, etc, thus omitting the tables, combined with an ergonomic way of entering data, using the ENTER key. It was a big step forward!

IMHO the 33S isn't much of a step forward, except the ALG/RPN switch, but you could see in the 12Cpt how serious ALG mode was...

Instead, it's just a design experiment, like many mobile phones.

Why do you think the SonyEricsson T630 (and T610) are so successful? Because they have a straight keyboard layout and a user interface that simply works. There's not much to 'get used to', instead just use it;-)

BTW: What do mean with 'It really isn't that bad' ? Is it as good as the kbd of a 32SII, or is it just a bit better than some people feared?

Raymond

LOL!! I hope it's better. I haven't found one yet!

Re: 33s First Impressions

*Message #5 Posted by **Ben Salinas** on 7 Apr 2004, 8:50 p.m.,*
in response to message #3 by Raymond Del Tondo

By no means can it compare to the classics. But compare it to say the 9s, or even the 30s and tehre is no competition. Each age has its calculator.

The keyboard is definitely better than the 32sii, in my opinion (not layout, but clicking quality... the layout, it is a bit worse).

The 33s is a POS. The V shaped keyboard is the bucktoothed grin of the designer laughing at the user. The

size and position of the Enter key is the worst I've ever seen. The invisible decimal point is inexcusable. Here's an acronym for the 33s: CCC, Cheap Chinee Crap.

Just to save some time and bandwidth

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Apr 2004, 1:34 p.m.,*
in response to message #8 by J.C. Randerson

While Mr. Randerson views about the 33s may be as interesting as those from other users; I would say that there is little hope in asking him to be respectful for other persons, opinions, or national origins. He seems to be a young and very smart person who may not have been exposed to some of the multiple aspects of the contemporary world yet.

As a similar and futile discussion with him, about the usual respectful attitude in this Forum, had already happened around January 15, 2004 (check the Archives Forum, http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=50022, and follow down the thread for some 20 enlightening messages), I suggest we can save a lot of time and resources avoiding such a fruitless path this time.

I apologize again if my imperfect command of the English language prevents this message from conveying its fully friendly intention.

in response to message #8 by J.C. Randerson

Ever heard of civil discourse? This is a private forum (not a public one) and so your free speech rights would *not* be abridged if you were disinvited and your posts deleted. Personally I think you've posted more than enough offensive language here, and that this would not be a significant loss.

Furthermore, I take issue with your characterization of the HP33S as "cheap". It costs about $60 (if you can even find one). It is, in fact, far *more expensive* than any other current-model NCEES-approved calculator.

For comparison, another widely-recommended (and widely available) calculator for NCEES exams is the Casio FX-115MS Plus. It has a 2-line display, solar power, logical operators, complex numbers, probability distributions, a solve function, numerical differentiation, and numerical integration. Granted, the Casio is not programmable and lacks RPN. On the other hand, it only costs $15. Now that's cheap. The 33S, at $60, is not.

*Message #12 Posted by **Wayne Stephens** on 8 Apr 2004, 8:14 p.m.,*
in response to message #8 by J.C. Randerson

Hey J. C.

If you really hate your 33s that much why not quit complaining about it and sell it on ebay. I'm sure someone will buy it for about twice its suggested retail value.

Since you're such a problem solving genius, you should be willing to back up your previous boast that you can pass the PE exam with your father's slide rule. That'll show those pinhead Luddites. Of course, if it doesn't work out, you can always use the profits from the sale of your 33s to pay to take the exam again.

Good luck.

Wayne.

Re: Let's hope that's not what it reads like

*Message #13 Posted by **Norris** on 8 Apr 2004, 8:44 p.m.,*
in response to message #12 by Wayne Stephens

Anyone with a spare 33S should be able to resell it for a significant profit -- at least before April 16-17, which are the dates of the next NCEES exams.

But the profit probably won't cover the exam costs. In California, for example, it costs $ 275 to take (or retake) a PE or PLS exam.

Re: Let's hope that's not what it reads like

*Message #14 Posted by **Wayne Stephens** on 8 Apr 2004, 8:56 p.m.,*
in response to message #13 by Norris

Norris,

Apparently I am living in the past. I took the PE in VA (only had to take it once) in 1994 and I believe it cost $65.

Oh, well.

Take care.

Wayne.

J.C.
Could you post the first 5 characters of the serial number of your unit? Just want to see if it is the same as the "Walmart" batch, which was "CN404" (at least mine is, I presume they are all the same). Many here hoped that the delay between the Walmart batch and general release was so that hp could make changes in the design of the 33s. One of the hoped-for changes was to fix the tiny decimal point, which they obviously have not done. If they made a new batch, signified by a new serial number series with no upgrades, it probably means that they are not going to change it anytime soon.

*Message #19 Posted by **Arnaud Amiel** on 8 Apr 2004, 8:18 a.m.,*
in response to message #18 by John Smitherman

From the pictures parenthesis are [RS] [+/-] and [RS] [E]. Having them shifted will hopefully convert more people to RPN.

Arnaud

Re: 33s First Impressions

*Message #20 Posted by **John Smitherman** on 8 Apr 2004, 12:56 p.m.,*
in response to message #19 by Arnaud Amiel

Thanks Arnaud. Knowing where to look helped as I didn't see the parenthesis during my initial look. Having to use a shift key to access a parenthesis would probably deter me and others from using them. The alternative on this model is to use RPN with an undersized Enter key. :(

I wanted to buy a new RPN calculator to take some of the load off and potentially extend the lives of my existing 34c, 15c and 32sii. Also, I'm starting to do more IRR and NPV calculations with my current job. After reading impressions on the 33s and 12c platinum I decided to purchase a 12c. It is great for doing the basic arithmetic that makes up most of my daily calculator needs and of course has NPV and IRR buit in. The calculator seems to be well made. The keys feel good and in particular the Enter key has a much better "pop" compared to my 15c. Overall, it was a very good purchase. :)

John

Re: 12C First Impressions

*Message #21 Posted by **Arnaud Amiel** on 8 Apr 2004, 3:49 p.m.,*
in response to message #20 by John Smitherman

I recently acquired a cheap 12C from ebay just to see what the fuss was about. Having no use whatsoever of the financial functions, I enjoy that calc quite a lot anyway and would love to have a calc that would be only its right hand part. Of course, I think I would really enjoy a 15c but they are currently out of my budget.

Arnaud

Re: 33s First Impressions

*Message #22 Posted by **Paul Brogger** on 8 Apr 2004, 7:35 p.m.,*
in response to message #1 by J.C. Randerson

I think a fair comparison is the 33s-as-32sii replacement vs. the Aurora FN1000-as-HP12c replacement.

The Aurora's 7-segment LED has better contrast and little or no shadow, with a readable decimal point. (But, it does have the weird apostrophe-commas rather than commas on the character baseline.) The Aurora's keyboard layout is more conventional (i.e., rectilinear), but no more logical in its *placement* of keys than is the 33s'.

I think that in all other respects, the 33s is superior -- certainly in key feel and overall quality.

Neither new model is "as good as" the H-P model they replace, and neither was created by "the old H-P". But I think the 33s is, overall, a better-realized piece of work than is the Aurora.

(If they'd just gotten that display right, I wouldn't have a serious complaint with it.)

Re: 33s First Impressions

*Message #23 Posted by **Matt Kernal (US)** on 9 Apr 2004, 6:35 p.m.,*
in response to message #22 by Paul Brogger

Just got my 33S (S/N CNA41001002) yesterday from Oregon State University Bookstore (Corvallis).

I'm pretty happy with it. I like the way it shows the function/operation name (in the X register line) while your finger is pressing the key, but doesn't execute the function/operation until you release the key. Reminds me of the 41, except it doesn't NULL if you hold it too long.

I have more confidence in this keyboard than my 49G+ (which is supposed to have the improved keys).

The chevron keyboard layout isn't too bad, except for the busyness of all the shifted key legends. I held it up and asked my wife what she thought. She said "now that's a cool looking calculator" (and she's not impressed with my HP collection.. I don't understand why ;-). It kind of has that left-it-out-the-sun-too-long-and-it-melted look to it.

However, it does exhibit all the bugs Ben Salinas mentioned in his post: First(?) HP 33s bug

Overall, this ones' a keeper.

Matt

HP-9114 Floppy disk replacement

*Message #1 Posted by **John Pierce** on 7 Apr 2004, 5:16 p.m.*

Does anyone know of a source for a floppy drive for HP-9114. My drive just quick working mechanically.... the diskette won't seat and the ejector button fails to do anything useful, all the electronics seem to work properly. If you have replaced a floppy I would appreciate any advice you may have. Thanks. John PIerce

Re: HP-9114 Floppy disk replacement

*Message #2 Posted by **Tony Duell** on 8 Apr 2004, 6:51 a.m.,*
in response to message #1 by John Pierce

You don't state whether this is a 9114A or a 9114B. They use different drive mechanisms which are not interchageable. I would guess the former, since this is a known problem with the drives, though.

A PC floppy drive will not work in the 9114 (or in most other HP drive units). The original drives rotate at 600rpm, not the 300rpm used by PC drives. Therefore the data rate is twice as fast. Many other HP systems, Apricots, and a few other machines use the same drives (they're original Sony mechanisms) as the 9114A. The 9114B's drive is also a Sony, it's used in the HP9153. It shares many parts (head carriage, stepper motor, analogue IC, etc) with the Apple Mac 800K drive.

I an puzzled as to why you think you need a new drive, though. These drives, like most other real computer devices can be _repaired_. The problem is generally due to the grease on the eject mechanism going hard with age. If you're unlucky the mechanism won't latch correctly when you try to eject a disk and the top head will get caught in the disk shutter and get ripped off. If this has happened then you need a replacement head carriage. I've done this repair (took the head from another drive with electronic problems) and it's non-trivial.

Anyway, let's hope that's not happened. Start by taking the drive out of the 9114A. To do this, take out the battery pack, then undo the 4 screws on the bottom and lift off the cover. Undo the 4 screws on the controller PCB, lift up the PCB and unplug all the cables. Take out the 4 screws holding the drive to the bottom case. Take out the 4 screws holding the mounting plate on the drive.

OK, you now have the bare drive. Take off the cover by undoing the screw on the back. Look at the upper head. If it seems to be sitting straight and in the right place, then all you need to do is sort out the eject mechanism. If it's twisted or hanging loose, then you need a new head carriage :-(

If it's OK, then take out the 3 screws on the bottom, and take off the screening cover (it looks like silver cardboard). Ease up the drive PCB and unplug all the cables. Take out the 2 screws at the front inside the chassis casting and remove the front panel, eject button and spring.

Back on top, take off the eject damper (rear left corner, held on with one screw). Take out the 2 screws holding the head load solenoid bracket in place (one also holds an earth tag), put a piece of clean paper between the heads and remove the load solenoid assembly. Feed its cable through the chassis.

Now undo the 4 screws inside the chassis casting on the bottom and take off the complete disk holder/eject mechanism.

To take this apart, IIRC, you undo a screw at the left side, then take off a couple of E-circlips. It comes apart into the left sideplate, the disk holder, and the right sideplate with the eject levers. Oh, there are some rods and spacers. The first time I did this, the spacers on one of the rods were stuck fast with the grease and I didn't realise they were separate parts!

Unhook the springs on the eject levers so you can move them around. Then clean off all the old, hard, grease with propan-2-ol. Clean up all the parts, put a little new grease on the levers, and put it all back together. It probsbly took me longer to type this than it does to do it...

If you need to replace the head, and can get one, then I can talk you through doing the alignment...

HP41 editor

*Message #1 Posted by **Fulcrum** on 7 Apr 2004, 5:05 p.m.*

Hello, ca nanyone tell me whats the actual utility (i mean in the daily use or programming) of the text editor in the hp41cx, and how can one edit similarly in a hp41cv that lacks of it? Thank you

Re: HP41 editor

*Message #2 Posted by **Jim Creybohm** on 7 Apr 2004, 7:00 p.m.,*
in response to message #1 by Fulcrum

I'm not sure if I understand this correctly, however...

For programming, the editor is the keyboard. You use the functions of the keys to insert steps into a program. The Clx key works to delete, and this is the same in the C, CV, and the CX. There is no specific editor per se.

For text editting, on the CX only I believe (C/CV w/ extended functions/memory? not sure) enter the name of the text file into the Alpha register and then XEQ [Alpha] ED [Alpha]. If you don't have a file in the extended memory, you will need to first create one using CRFLAS. (Name of file in Alpha reg, size in X reg, and then XEQ [alpha] CRFLAS [alpha].

there is a lot of excellent information on the museum's CD's and if you are looking for manuals, that would be an excellent place to start. You can also check over on another website (that I can't name here, honestly) for additional information. In addition, there are a LOT of knowledgeable individuals here who can fill in the rather large gaps I probably have left.

Re: HP41 editor

*Message #3 Posted by **Garth Wilson** on 7 Apr 2004, 7:07 p.m.,*
in response to message #1 by Fulcrum

I've used it for several things. Long text strings for applications that use a printer are quite impractical without the text files and editor. I also have a "daytimer" program in the 41cx. When I turn the calculator on for any reason, the program auto-executes and checks the DAYTMR text file to see if there's anything coming up that I need to be reminded about. If there is, it gives two very short beeps (with synthetic programming) and shows me what's on the schedule. Another use is the phone directory, with a program that does the search. The slow speed makes it impractical to have really long lists, but it _is_ useful. I use a NOTES text file to jot very short notes if I don't have note paper with me, or if I want to keep it there for longer than I can keep track of a little paper. I have the ZENROM but I haven't done any assembly-language programming. I expect the source code for it would need to be in a text file. There are probably a thousand other uses for the text editor too. When I first started getting into machine-language programming for another processor and bought an RS-232 EPROM programmer in the mid-80's, I did the assembly by hand (as many beginners start), and entered the machine-language code into the 41cx, and used it to control the EPROM programmer. I don't think there's any way to do all this on a cv.

82162A printer

*Message #1 Posted by **Graham** on 7 Apr 2004, 2:49 p.m.*

Hi I have recently acquired a 82162A printer. My HP-41CV's (three of them)don't recognise it (flag 55=no).

I'm not sure if it is the printer or the interface cable, as I have no other equipment to check the cable with.

The printer just came out of long term storage. The nicads were dead, and I have rebuilt the pack. It charges, and holds a charge. It won't talk to the calculator, however.

Does anyone have any suggestions on what I might be doing wrong if it is software (me), or where I can get the hardware tested/fixed.

Thanks, Graham

Re: 82162A printer

*Message #2 Posted by **David Smith** on 7 Apr 2004, 3:35 p.m.,*
in response to message #1 by Graham

There is a tiny slide switch on the HPIL module that turns on or off the HPIL printer functions (so you can use the 82143A printer)

Re: 82162A printer

*Message #3 Posted by **graham** on 7 Apr 2004, 4:23 p.m.,*
in response to message #2 by David Smith

Thanks David, but it doesn't work with the switch in either position.

Graham

Re: 82162A printer

*Message #4 Posted by **Tony Duell** on 8 Apr 2004, 6:53 a.m.,*
in response to message #3 by graham

Set the switch to the 'Enable' position (as shown on the HPIL module label) and do a CAT 2. Do the printer functions show up in the catalog?

If so, what error do you get if you try a PRX or some other printer function?

Re: 82162A printer

*Message #5 Posted by **Graham** on 8 Apr 2004, 5:55 p.m.,*
in response to message #4 by Tony Duell

Hi Tony, Cat 2 gives a whole list of printer functions. Seems to list out normally. When I try a EXQ PRX, the message is TRANSMIT ERR.

I'm afraid I've got a bad printer, or one of the wires from the interface is bad.

Thanks for your suggestion.

Graham

Re: 82162A printer

*Message #6 Posted by **Tony Duell** on 9 Apr 2004, 6:13 p.m.,*
in response to message #5 by Graham

Plug the 2 cables from the HP41 IL module together without connecting the printer (or anything else) between them. Try a PRX now. If you get NO PRINTER as the error message, then the HPIL module is most likely fine, and you have a problem with the printer. If you still get the TRANSMIT ERR message, then you have a problem with the IL module (probably a broken cable).

Re: 82162A printer

*Message #7 Posted by **Graham** on 13 Apr 2004, 6:10 p.m.,*
in response to message #6 by Tony Duell

Hi Tony,

Your suggestion has me on the right track now. Your hint enabled me to track the fault to one of the wires coming out of the IL module. The printer is OK, and I'll probably be able to patch the wire.

Thanks, Graham

Re: 82162A printer

*Message #8 Posted by **hans brueggemann [GER]** on 9 Apr 2004, 10:45 a.m.,*
in response to message #1 by Graham

hi graham, do a "MEMORY LOST" on the 41 and try again. the problem you run into is most likely (assuming that all hardware is doing fine) due to some erroneous flag settings, especially flag 33 and manio/autoio.

cheers, hans

(HP-33s & HP-49G+) ENTER key size & position -- It's insidious . . .

*Message #1 Posted by **Paul Brogger** on 7 Apr 2004, 12:11 p.m.*

Apparently (for me at least), RPN/RPL operation is far more significant than the actual position & size of the Enter keys.

I just picked up my trusty HP-32s -- my former favorite knock-around calculator -- and kept pushing "R/S" when I meant to push "ENTER".

I could bemoan my (d)evolution, but I must admit that I've become accustomed to the new layout.

Re: (HP-33s & HP-49G+) ENTER key size & position -- It's insidious . . .

*Message #2 Posted by **Raymond Del Tondo** on 7 Apr 2004, 1:05 p.m.,*
in response to message #1 by Paul Brogger

Congrats!

But you also must admit that you don't have a choice if you want to use one of those new calcs.

I don't think I'll ever seriously use one of the newer hp calcs without that ENTER bar. However, my SE T630 has the 'ENTER' key in the middle of the top row, because it's where you need it;-)

HP-41CV - problems

*Message #1 Posted by **Artur** on 7 Apr 2004, 8:36 a.m.*

I received my recent acquisition - one old HP-41CV - but, connecting the batteries it didn't work at all. I've checked the batteries contacts and could see problems on them. I fixed that. Tryed again - nothing. So, I get the back off and wired to the main circuit board an external 6V batteries. When I insert the last battery, the display gets on with the message MEMORY LOST, or only LOST, or some symbols and the keyboard completely locked. Is this calculator dead? Please , HEEEEEEELLLLP!!!!!!

Re: HP-41C - problems

*Message #2 Posted by **Billie Jones** on 7 Apr 2004, 12:37 p.m.,*
in response to message #1 by Artur

I have been using this calculator for 20 years and I have never had a problem.

When I turned it on this morning, the decimal has been replaced with a comma. I believe that it is in the Euorpean Mode. However, I don't know how to change it back to the decimal Decimal Mode.

Can anyone help?

Everything seems to be working properly, except my decimal has been replaced by this frustrating comma.

*Message #3 Posted by **Raymond Del Tondo** on 7 Apr 2004, 12:56 p.m.,*
in response to message #2 by Billie Jones

Please take a look at the user flags...because this is really RTFM.

SF 28 does the job.

Re: HP-41CV - problems

*Message #4 Posted by **Raymond Del Tondo** on 7 Apr 2004, 12:58 p.m.,*
in response to message #1 by Artur

Try with pressing and holding the ENTER key, then press and release the ON key, then release the ENTER key. This is a reset (also RTFM;-)

Re: HP-41CV - problems

*Message #5 Posted by **Artur** on 7 Apr 2004, 2:02 p.m.,*
in response to message #4 by Raymond Del Tondo

I'll try the ENTER-ON-ENTER. Thanks, Raymond! Artur

Re: HP-41CV - problems

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 7 Apr 2004, 2:41 p.m.,*
in response to message #1 by Artur

Hi, Artur; (tudo certo?)

Have you checked if yours is a fullnut or a halfnut? Look at the image below:

Raymond's comments are very important. A simple reset may solve the problem. What worries me is the already exisiting [MEMORY LOST] message and the fact it is broken and shows unusual characters.

If your 41CV is a fullnut (earlier, "original" HP41 display), chances are you have a common bad contact between the small mainboard and the keyboard contacts. In most cases, a simple cleanning procedure is enough.

Tell us (ou me manda um e-mail) if you need extra advice.

Success.

in response to message #7 by Artur

Lift the CPU board off the posts, gently remove the zebra strip connectors. Clean everything with 91% isopropyl alcohol. Reassemble. Pray to your favorite diety. Turn on. Hopefully enjoy.

Re: HP 110

*Message #2 Posted by **Raymond Del Tondo** on 7 Apr 2004, 4:52 a.m.,*
in response to message #1 by deleted

The HP-110 is an Intel architecture based portable computer. Use the normal AC adapters with 8V output which all HP HP-IL device use, like HP 82066B, or the suitable model for your country.

Raymond

Computers and Calculators

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Apr 2004, 8:06 p.m.,*
in response to message #1 by deleted

IMHO, even the HP-41C is a computer !

:-)

I consider that a digital electronic device which:

- is programmable,

- can operate on at least two types of data (numbers and text), and

- has some mean of Input/Output which could be connected to other devices (using a documented protocol),

... qualifies for the computer "genre"

So, the HP-41C qualifies as a computer, while the 42S does not, due to the lack of suitable I/O (specifically "I", since there is at least some "O" to the IR printer).

Again, it is just an opinion...

HP-67 Key Strokes

*Message #1 Posted by **David P Smith** on 6 Apr 2004, 7:48 p.m.*

I am trying to enter the base conversion program listed here and listed there are a couple of things I don't know how to key in. What key strokes do I use for the following;

```
Line   Key      My guess
031    PRT SPC
043    X!=Y?
072    PRTX     (f R/S) or -X-
080    X<>Y     (h 7)?
081    X>Y?
135    X<=Y?
138    X!=0?
```

Is there a list some where?

Thanks, David

Re: HP-67 Key Strokes

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Apr 2004, 9:08 p.m.,*
in response to message #1 by David P Smith

Hi, David;

these "regular" characteres help a lot when you have no equivalent to the "non-regular" characters found in some calculators.

In the HP67, you have:

```
PRT SPC -> try [h][R/S]; you'll see the [SPACE] inscription in the key frontface;
X!=Y?   -> this is: "X not-equal to Y?"; try [g][+]
PRTX    -> this is Print X; not so easy to "guess": try [f][R/S]. The [-X-] stands for
Print X;
X<>Y    -> this is "X exchanges Y" (contents only); try [h][7]
X>Y?    -> try [g][÷]
X<=Y?   -> try [g][×]
X!=0?   -> again: "X not-equal to zero?"; try [f][+]
```

In fact, all comparisons with the "?" are the same as the ones without the "?" in the keyboard; the fact is that they are supposed to "ask" if the comparison is true of false, but the keyboard has no "?" sign. Maybe that's why you did not link them with each other. The "!=" (not equal to) is easier to realise when you have already programmed in C or C++ ;^)

Hope this helps. If you still need advice, let us know.

Success.

Re: HP-67 Key Strokes - additional info

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 6 Apr 2004, 11:34 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi;

just to add that (somehow obvious...) as the HP67 doesn't have a printer, the following functions are "related" to the actual printing functions available with the HP97:

```
  HP97         HP67
PRT SPC    -> "do nothing"; just for card reader equivalency purposes
PrtX       -> halts program execution for about five seconds while showing X-register
contents
Prt Stack -> automatic review of stack-registers' contents
```

Maybe you already know about these equivalences; if so, just disregard.

Cheers.

Re: HP-67 Key Strokes

*Message #4 Posted by **David P Smith** on 8 Apr 2004, 9:29 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I re inputted the program listing and it still would not run. I took the listing and put it in a spread sheet and as I keyed in the program I recorded what was on the display. Then stepped through it just to make sure there were no typos. All looks as it should.

I made a chart with the keystrokes and display readings at http://www.smrn.com/dsmith/HP-67%20Base%20Conversion.pdf

Re: HP-67 Key Strokes

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 9 Apr 2004, 9:19 p.m.,*
in response to message #4 by David P Smith

Hello, David;

I typed the Base Conversion program in an HP97 and ran it. I had problems as well, but I identified them so I want to post about this particular experience.

The HP67 has some "particular" key sequences that allow the insertion of labels from a to e and set branching to these labels as well. I take these sequences as "tricky", but they are in fact, clever seqeunces. If you want to add any label from a to e you need to use:

```
[g][LBLf] {[A to [E]}
```

. If you want to add a call to any of these labels as if they were subroutines you need to use:

```
[g][GSBf] {[A to [E]}
```

. But if you want to simply add a jump to any of these labels, you can add:

```
[GTO][f][{[A] to [E]}
```

. I guess that as you get acquainted to the HP67, these procedures become more intuitive and less "weird". As I don't have an HP67 (I have an HP97), I cannot say that based on any previous experience... What I can tell you is that I wrongly typped both in the HP97 when reading the listigns (shame on me...) and the proram stopped with [Error] message. it took me some time to figure out what was going wrong...

Please, have a look at the pdf files I wrote, included in HP67_baseconv.zip. You can download them from here. They show the Base Conversion program in a different "way". Let me know what you think.

BTW: there may be errors in these listings as well; if anyone detect any, please, let me know so I can correct it.

Thanks.

67 fonts for leds and keys

*Message #6 Posted by **Renato** on 10 Apr 2004, 6:46 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Luiz,

As always, you did a impressive work. Did you develop fonts for the LED key codes, and for the 67 keystrokes ?

Renato

Re: 67 fonts for leds and keys (edited with new references)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 10 Apr 2004, 9:20 p.m.,*
in response to message #6 by Renato

Hello, Renato; thank you very much. I'm glad you liked it!

Yeap! They are "mine" (at least I draw them...) I draw the characters with the use of CorelDRAW! The 7-segment LED TTF in both PDF was also rewritten today. I enhanced the space between characters and added a [.] (dot) and [,] (comma) that can be added between characters. The original TTF had only the original classic "dot" that occupies the space equivalent to one character. Soon I'll be posting about them.

The keyset is not exactly for the HP67, it's meant to be a general-purpose keyset font. Please, have a look at this pdf and you'll see what is this about.

I'm redrawing the font for printers: HP82143A and both sets for the HP82240, the ECMA 94 set and the ROMAN 8. There is a TTF available for the HP82143A at the MoHPC (look here)but I'll replace it for the new one. It does not look the way characters are actually printed.

I'm also finishing a TTF for the HP42S and I intend to go further. To be honest, I also draw four other fonts suitable for all HP48/49 standard characters, but they were created as ordinary fonts and must be completely "reloaded" as symbol fonts. Any suggestions?

Renato, do you want to try these already existing TTF? Please, guys, anyone reading this post that want to try them, be my guest. I'd never be "building" these fonts if there is no HP calculator, and you (us), as users, are the ones HP are producing them for. If someone had these

fonts available and I did not write them, I'd like to have them, too. I'll let them available to download from the following links:

Key Set TTF
7-segment LED display characters TTF

The keyset seems to be complete, but characters may be added anytime (there's a lot of "free space"). I think I'll add those rounded cursor keys available with the new HP48 and HP49 soon, and I'll let you know about this. Also there is a "up arrow" missing to refer to the HP27S and HP17/19B softkeys. I'll add it, too.

As the other TTF are available at the MoHPC, I'll ask Dave to have these new ones, too. I'm just finishing them and I'll send the complete pack. Is that O.K. for you, Dave?

I hope you like them. Please Renato, folks, use them as you wish. No need to mention my name or origin. I'd like to see as many papers as possible with them. Also, I'd like to thank Tony Hutchins whose inspiring comments and suggestions allowed me to enhance the key set.

Best regards.

Luiz (Brazil)

Re: HP-67 Key Strokes

*Message #8 Posted by **David P Smith** on 13 Apr 2004, 3:58 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

That looks much better than my listing. I verfied that I have keyed in the program as stated but it still will not run :-(I guess I will keep looking. -- This all started when I fixed the gummy wheel problem and was able to read cards. I bought a bunch of blanks as was going to put various programs on them and the conversion looked like it would be a good one to have but.... I am wondering if there is a book where these probrams are available? As I understand it when these calculators were popular HP had a library of these things and I wonder if they are available in book form? Cheers, David

Program Library and other sources

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 14 Apr 2004, 7:42 a.m.,*
in response to message #8 by David P Smith

Hi, David;

I am willing to help you the way I can and you need; please, keep posting so we can identify what's going wrong, O.K.?

I succeed running the base-convertion in my HP97, as I mentioned in previous post. Have you checked key codes? When I first loaded the program, it didn't ran because I typed three [g][GSBf] instead of [g][LBLf]. As the program stopped at each [g][GSBf] without the equivalent [g][LBLf], it was easy to correct. After that, a [RCL]D instead of a [RLC]C (line# 037) caused wrong results. I'm posting this because it happened to me, and maybe it will help you, too.

About programs: do you already have the MoHPC CD set? It's crowded of application books

that might give you a good source of information. These are the titles available for the HP67 in PDF format (I openned some of them and they have program listings from an HP97 printer):

Re: HP-67 Key Strokes - magnetic cards (edited)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 14 Apr 2004, 10:29 a.m.,*
in response to message #8 by David P Smith

David;

send me an e-mail with your actual address and I'll send you a card with the program recorded on it. I am not sure if the post office's devices will "destroy" the magnetic information contained in the card, but we can try this.

My e-mail is:

lcvieira@quantica.com.br

If you know someone else that can do it inside the USA, it would be better. I mentioned the post offices because as USA internal security is a lot more concerned about anything that comes from other countries, maybe packages sent from within the USA will not be so deeply scanned for metal contents, so magnetic information is not so easily lost in this case.

Let me know what do you want.

Cheers.

Luiz (Brazil)

Edited: 15 Apr 2004, 12:57 a.m.

Re: HP-67 Key Strokes - magnetic cards (edited)

*Message #11 Posted by **David P Smith** on 20 Apr 2004, 6:23 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Luiz,

I sent an email to the address listed on 4/15, here is the text;

I have checked the LED listing with yours and I have a question on step 045. The step shows (RCL C) and the LED for that is [34 13] when you key it in. Your listing shows [34 14] which when keyed in is (RCL D)

If I can get a correct listing and manage to key it in correctly I should be able to make it run. I don't know anyone around me with one of these 67's.

Cheers, David

Re: HP-67 Key Strokes - magnetic cards (edited)

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 21 Apr 2004, 12:30 a.m.,*
in response to message #11 by David P Smith

Hi, David;

You're right. The LED representation is wrong, but the keystroke is correct. I'll update the file ASAP (very soon).

I checked it many times based on the HP67 image (key position) and, when needed, I looked at the information found in Appendix E, "Calculator Functions and Keycodes", P.324 of the "HP67 Owner's Handbook and Programming Guide". Mine is dated December 1976, Revision C.

I typed the program in an HP97 and checked if the keycodes were correct. When the program ran correctly, I took the original listing from the MoHPC Forum, added/removed the necessary characters and changed font type so it looked like an HP67 keystroke listing. Then I manually added the keycodes and checked as many times as I thought there were nothing wrong. I have a spreadsheet build by one of the forum contributors, but I did not find it in my computers hard disks (about ten HD's)... I'd rather checking my own listing once more.

Thank you for pointing this typo out. I hope this is the last one d;^)

BTW, the program should run correctly with [RCL] C in step #45, keycode [34 13] (I am with my HP97 in hands right now and I loaded with the program that is already recorded in a magnetic card; it runs perfectly fine and step #45 is indeed [RCL] C). Didn't you manage to run it O.K.? Remember: a magnetic card with a program recorded

in an HP97 can be read and ran perfectly well in an HP67 and conversely. Both have interchangeable software. I ensure you that the Conversion Program ran fine in my HP97, and I recorded it on a magnetic card that can be used in your HP67.

Let me know if I can be of further help.

Cheers.

Luiz (Brazil)

(in time: I did not see your e-mail, maybe it's been inadvertently trashed somewhere in the transfer)

Edited: 21 Apr 2004, 12:34 a.m.

Re: HP-67 Key Strokes

*Message #13 Posted by **David Ramsey** on 6 Apr 2004, 9:11 p.m.,*
in response to message #1 by David P Smith

"R/S" is a good substitute for the PRT command on an HP-97.

I don't know what "X!=Y?" represents, other than a typing error. Same for "X!=0?" They _probably_ mean "X is not equal to Y" and "X is not equal to zero", but the notation used is from the C programming language.

The "X<>Y", "X>Y", and "X<=Y" are all directly available on the HP-67 keyboard. The "not equals" relation, shown here as "X<>Y", is represented on the keyboard by "X (equals sign with a slash through it)Y".

HP 48 Calculators-Serial Numbers and Keyboards

*Message #1 Posted by **Warren Lavery** on 6 Apr 2004, 5:49 p.m.*

Does anyone know which of the 48 style calculators have better keyboards (48s, 48sx, 48g, 48g+, 48gx) compared to early HP calculators? Did any of these 48's use molded keys or were they all made with painted on keys as is the current practice? It's interesting to read the HP Museum's list of Earliest Serial numbers. Does anyone know the year when each 48 was discontinued?

I prefer my 28s keyboard feel to many HP's I've used and owned (despite the clamshell design). Not sure how the 48 keyboards compare?

Re: HP 48 Calculators-Serial Numbers and Keyboards

*Message #2 Posted by **Randy Sloyer** on 6 Apr 2004, 6:28 p.m.,*
in response to message #1 by Warren Lavery

All the early S and SX models made in the USA had molded keys. Other 48 serial numbers that have an S in the fifth position were made in Singapore and should have molded keytops. There were a few that began with SG later in the life cycle, they had printed keys. ALL Indonesian machines had printed keys.

The Clamshell keyboard design was unique. While it was similar in concept to the 48, they were quite different internally. The Clamshell keyboard flex dome was only a dome, it had no conductive material. When you press, the dome deforms and ultimately the actuation pin of the key forces two conductive sheets together. In the 48 and Pioneer machines, the flex dome has conductive material inside. Flex and deform the dome far enough and the conductive material touches a grid underneath, making the cross point.

Re: HP 48 Calculators-Serial Numbers and Keyboards

*Message #3 Posted by **Brian** on 7 Apr 2004, 5:59 p.m.,*
in response to message #2 by Randy Sloyer

I didn't think any of the 48's were made in the good old USA.

I know HP shifted to the different (IMHO Harder to read) colors with the 48g. Is this shift to the new colors when they also dropped the molded keys (ie. do any of the 48g series have molded keys)?

Re: HP 48 Calculators-Serial Numbers and Keyboards

*Message #4 Posted by **James M. Prange** on 7 Apr 2004, 8:54 p.m.,*
in response to message #3 by Brian

I have a 48SX with a serial 3107Axxxxx, and another with serial 3117Sxxxxx, so the manufacturing move was someone between them.

I believe the older 48G series have molded keys. The newest (Indonesia manufatured) one I have has slightly different printing on the keys from my older (Singapore manufactured) ones.

Regards,
James

Re: HP 48 Calculators-Serial Numbers and Keyboards

*Message #5 Posted by **Mark A. Ordal** on 8 Apr 2004, 9:33 a.m.,*
in response to message #3 by Brian

My 48G with serial 3425Sxxxxx definitely has molded key legends. So the switch to the new colors on the 48G did NOT coincide with the move away from molded keys.

--Mark

Re: HP 48 Calculators-Serial Numbers and Keyboards

*Message #6 Posted by **bill platt** on 8 Apr 2004, 12:49 p.m.,*
in response to message #1 by Warren Lavery

I have four 48G series:

48G Singapore, molded double-shot keys

48GX, Singapore, molded double-shot keys,

48GX, Singapore, molded double-shot keys, SN 3507S02514

48 GX, Indonesia, Painted Keys

(I only have the one in front of me).

The Singapore in near new condition (the 3rd in the list) has the best keys wothout a doubt. The Indonesian has a different feel--a bit easier pushing. The other Singapore GX shows some definite differences between one key and the next--sone are crisp like the near new one, and others are rather softer--the end-snap is not as pronounced.

The indonesian keys are all same feeling--except the ENTER key which has broken one of its hinges :--((.

So, wear and tear is important. I would say that with teh exception of the broken ENTER key, my Indonesian unit (which shows lots of use) ages more gracefully than the heavily used singapore. Of course, this is only the story of 4 particular calculators!

Question about different colors of 48s vs. 48g

*Message #7 Posted by **Brian** on 8 Apr 2004, 4:34 p.m.,*
in response to message #6 by bill platt

What're your preferences for the color schemes for the 48's? Do you prefer the look of the 48g or the 48s?

Re: Question about different colors of 48s vs. 48g

*Message #8 Posted by **Arnaud Amiel** on 8 Apr 2004, 5:43 p.m.,*
in response to message #7 by Brian

The 48G was my first HP, so that is the one I prefer. I find the 48s so boring to look at (kind of lost in the 80s). However, I guess most of the readers here prefer the serious colours of the 48s

Arnaud

48SX vs 48GX (long)

*Message #9 Posted by **James M. Prange** on 8 Apr 2004, 10:15 p.m.,*
in response to message #7 by Brian

I guess I'd call the 48SX color scheme white primary labels on the keys themselves, with orange and medium blue for the shifted labels, on a dark brown background.

For the 48GX, the primary labels on the keys themselves are still white, but the shifted labels are sort of medium purple and medium blue-green on a dark blue-green background.

Yes, I know there are special names for the colors, but I never did find much use for all of the 16 colors in my Crayola box.

I suppose that some might consider the 48GX color scheme to be more "aesthetically pleasing", but what matters to me is how easy it is to read the labels, and the 48SX is definitely easier. With the 48GX, the purple labels in particular don't contrast enough with the background.

I don't need a calculator to be pretty, I just need it to be useful. Offhand, something like white, fluorescent orange, and neon blue on a black background might be my first try for a functional color scheme. Or maybe white, black, and neon blue on a fluorescent orange background? Well, I guess I'd settle on good contrast, but not dazzling colors or contrasts, which I suppose describes the 48SX pretty well.

But I wouldn't decide based on the colors alone. After all, once you've become accustomed to a particular calculator, you pretty much know where the keys are, even without carefully reading their labels.

The 48GX is noticeably faster than the 48SX.

The 48GX has better display contrast than at least most 48SXes. I believe that the improved display was added near the end of 48SX production. I've read that very late model 48G series have an even higher contrast display, but haven't actually seen one.

Some functional improvements to the EquationWriter were made near the end of 48SX production, most noticeably to backspacing (painfully slow on my 48SXes), and I believe improvements to plotting and solving speed too. These are in the last ROM version, J, of the 48S series. Of course they're also in the 48G series, which started with ROM version K. If you intend to use these much, the 48GX may be the better choice.

The 48GX has 128KB RAM built-in, compared to the 48SX's 32KB, and in slot 2 it can take up to almost 4MB compared to the 48SX's maximum 128KB there. On the other hand, with the 48SX you can merge the RAM from both slots with system RAM, but with the 48GX, only the RAM in slot 1 can be merged with system RAM, so the maximum merged system RAM on a 48GX is about 32KB less than on a 48SX.

The 48GX has both a flag browser and a character browser which the 48SX lacks; I find them useful.

The 48GX has what they call "parallel" processing with lists. Basically, use each element of a list as an argument and return a list, or with matching list sizes, use corresponding elements from the lists as arguments. Also there are commands for summing or multiplying all elements of a list. It does save some steps in a program, but "parallel" is perhaps inaccurate; I find it at least as fast (when executing the program) to use a loop to process list elements and accomplish the same things, which I believe is

exactly what the so-called parallel list processing really does.

Most of the 48SX equation library, an add-on ROM card, is built-in with the 48GX, but not the periodic table. Later versions of the equation library ROM card have a Tetris game, which also didn't make it into the 48GX ROM.

The 48G series has several new commands. For me, perhaps most useful are the commands for inserting, deleting, or re-arranging rows or columns in matrices.

The 48G series has several built-in input forms (on right-shifted keys), perhaps useful when several parameters have to be set for what you what to do, but I sometimes find them more of a hindrance than a help. The regular menus are on the left-shifted keys.

Most UserRPL programs for the 48S series (and even the 28 series) work just fine on the 48G series. One thing to watch for are global names that match command names on the newer calculator. Another thing is would be that some commands, particularly with the 48G series' enhanced list processing, actually behave a little differently.

Libraries and SysRPL programs for one series may or may not work on the other, due to some changes in the entry points and a different memory management scheme.

Overall, I've come to prefer the 48GX to the 48SX, but I do think that they took a few steps in the wrong direction too.

But I expect that anything I've ever done on a 48GX I could also accomplish on a 48SX, although sometimes using more steps and ending up with a bigger and slower program.

Perhaps the biggest problem for me is switching back and forth among the various calculators. I have the 28C, 28S, 48SX, 48GX, 49G, and 49g+, and although they do have a lot in common, they're different enough that I have to think about where the various keys and menus are on the particular calculator that I happen to be using, and which commands are available with it.

Oh, I have a 16C too, but I use that only for working with "binary" integers, and even for that, the RPL calculators usually suffice for my purposes.

Regards,
James

New ROM for HP-49G

*Message #1 Posted by **zaff** on 6 Apr 2004, 10:39 a.m.*

From comp.sys.hp48:

New ROMS for HP49G:

http://groups.google.com/groups?hl=es&lr=&ie=UTF-8&frame=right&th=b9971a66f8e06e70&seekm=d1f73478.0404010329.4ea74cb6%40posting.google.com#link1

How to Compile your own HP49G ROM (1.24) from the LGP...

http://groups.google.com/groups?dq=&hl=es&lr=&ie=UTF-8&threadm=7kscc.10776%244N3.815%40newsfe1-win&prev=/groups%3Foi%3Ddjq%26as_ugroup%3Dcomp.sys.hp48

In my HP49G I´ve got:

VERSION: "Version HP-49-C Revision #1.24" "Copyright HP 2003"

VER: HP49 CAS by Parisse, Heiskanen & Fierchter 4.20031005

Re: New ROM for HP-49G

*Message #2 Posted by **Arnaud Amiel** on 6 Apr 2004, 10:57 a.m.,*
in response to message #1 by zaff

Note that the ROM itself can't be distributed so you will have to compile it yourself. Also I guess this is the last ROM for the 49G ever, although the CAS could possibly be improved by whoever feels like doing it.

Arnaud

HP95LX palm - manual and price

*Message #1 Posted by **Tizedes Csaba** on 6 Apr 2004, 3:51 a.m.*

Hello,

know anybody where can I find manuals for this machine? And what is the real price of this computer? (Just the machine, in used condition, but looks well, and works well.)

Thank you! Csaba

Re: HP95LX palm - manual and price

*Message #2 Posted by **Holger S.** on 7 Apr 2004, 10:53 a.m.,*
in response to message #1 by Tizedes Csaba

You don't really need a manual for this baby unless you want to use the Lotus spreadsheet software. Otherwise, it has a comprehensive help system but it is really easy to use - I never needed the manual of my 100LX.

Prices for a 95LX without goodies such as a SRAM card should be in the 20-30 Euro range at ebay, sometimes even cheaper. Without the card, however, the 95 is not so useful. There's no way to install TP or Word in the limited internal memory.

41C ROM question

*Message #1 Posted by **Kathy** on 5 Apr 2004, 9:31 p.m.*

Hi, in a box of 41C materials I found a ROM called the MILENG1/UTIL ROM. It calculates demolition charges for a variety of things to be blown up. It's labeled PROP US GOVT so I assume the army created this. Does anybody know anything else about this?

Re: 41C ROM question

*Message #2 Posted by **Namir** on 6 Apr 2004, 12:43 a.m.,*
in response to message #1 by Kathy

Hi. I had one like that that I included in a recent eBay auction of an HP41C. Since I had no documentation, I was able to deduce the same thing you did, but nothing more.

Adv Hepax price to go down... ;-)

*Message #1 Posted by **Diego Diaz** on 5 Apr 2004, 9:04 p.m.*

Yeah, sure you've got it!!

I've finally (a moment ago) managed to replycate the ADV HEPAX module (AKA 41's Holly Grail) in a standard module enclosure.

Pros:

- FeRAM real non volatile RAM (no battery)

- Auto relocation on the lowest available page.

- 16k (four pages) RAM available space.

- Auto relocation of RAM according to port nr. (B4 driven)

- <18mA when RUNning <1mA Stand by.

- Still one extra 4k ROM page available for a .ROM image to be loaded.

- Fully compatible with Clonix programming interface both HW and SW

Cons:

- Only available for standard speed (360kHz) 41's, as serial FeRAM interface is far too slow to cope with a 1.7x (610kHz) turbo-ed 41.

- If things go *really* messy with the RAM you cannot erase it by simply unplugging the module. A special program (supplied) is requiered for zeroing back the FeRAM.

Some pictures and more info will soon be available at my site, just can't wait to tell you... ;-)

Hopefully a first production RUN will go right after my holidays.

Best wishes from the Canary Islands

*Message #2 Posted by **Daniel Diggelmann** on 6 Apr 2004, 1:09 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Congratulations for your success. It's amazing at what pace you bring us new technology. This is e real renaissance for the HP-41. Since using your CLONIX with my preferred ROMs loaded, the HP 41 is my favorite calc for every day use not just for collecting.

I'll buy one of the NoVRAM Modules as well.

Best wishes from Switzerland Daniel

You are a genius !

Re: Adv Hepax price to go down... ;-)

*Message #8 Posted by **Wayne Stephens** on 6 Apr 2004, 7:15 p.m.,*
in response to message #1 by Diego Diaz

Diego,

Please pardon my ignorance as I am new to the 41 series (I just got my first one a month ago). Exactly why is this ADV HEPAX module the "holy grail"? What can it do? Will it work in "box stock" Hp 41C with a 19--series serial number? Please respond if you have time. Thank you.

Take care.

Wayne.

Re: Adv Hepax price to go down... ;-)

*Message #9 Posted by **Diego Diaz** on 8 Apr 2004, 12:32 p.m.,*
in response to message #8 by Wayne Stephens

Hi all, Wayne,

First, thanks for your kind words.

Regarding the Adv HEPAX, Wayne, it's been the unreachable star for lots of 41's enthusiast over the last 15 years or so. (me included)

Some of the main reasons are:

- It places itself in the lower available memory page, thus freeing as many user addressable space as possible.

- It uses a unique Bankswitching scheme allowing a 16k ROM to physically use a single 4k page.

- The ram memory can by increased up to 32k by additional modules.

No other module or RAM-Box accomplished such an amazing range of specs and... apart from that, its ROM functions are the most complete set for m-code programming, file managing, mass storage, etc. etc... in a single package.

If the above wasn't enough, the number of these beauties out there is *really* small, wich makes a very sought after collectible piece out of them, and even harder to come through. (I've seen it only once at eBay... going for over $600 IIRC, -please Matthias correct me if I'm wrong ;-)

The collectible value of the "real thing" will probably remain unchanged, but now there is a chance for all of us to work/play with an exact functional replica... including the non-volatile RAM "extra", a quite more reduced power drain and the possibility of using it as a normal Clonix module or any other type of 16k (32k?) RAM-Box if required.

For now I'm going to have my holidays, I just deserve a rest ;-)...

Will be back by early May

In the meantime, have a good time!!

Cheers, Diego.

Congratulations! / Hardware Emulator ?

*Message #10 Posted by **Werner (Germany)** on 12 Apr 2004, 8:16 p.m.,*
in response to message #1 by Diego Diaz

Congratulations again, Diego !!! I really cannot believe that nearly every month there is a new great achievement by you. And the HEPAX CLONE is really an amazing achievement !

As you are indeed excellent in realizing HP41-ethusiasts' dreams, I have the following question:

Could you think of a new project building a fast hardware emulator of the HP-41 ? What I mean is a replica/clone of the HP-41 as its ROM image in some modern chip technology, some microcontroller technology plus the RAM and interfaces, which one could insert into an empty HP-41 housing with original keyboard (and maybe an original display - or alternative display). Such a device could be like a HP-41 but could be much faster by using modern chip technology and, e.g., a Li-Ion battery in order to address the enhanced power consumption.

Do you think that this would be possible? This topic has already been discussed at the forum some months ago. If this were possible, it would be the fulfilment of the ultimative dreams of us HP-41 enthusiasts. A PC based emulator is nice but a real hardware emulator in a real housing is better. The OS to drive the microcontrollers could even be some existing emulator software.

What do you think? I think this could be the most challenging HP41 project one could imagine.

Best regards,

Werner

P.S.: Oops, after having posted this message I just found another thread dealing with this sort of question: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=54827

HP to PC

*Message #1 Posted by **Andre Schan** on 5 Apr 2004, 5:04 p.m.*

I have data files that were created on an HP-71 with a surveying program chip (stored on floppies). Is it possible to download them in a usable form to a PC CADD program, and if so, how?

Re: HP to PC

*Message #2 Posted by **Christoph Klug** on 6 Apr 2004, 3:51 a.m.,*
in response to message #1 by Andre Schan

Dear Andre,

yes it is possible. Use the EMU71 software from Jean-Francois Garnier (which supports real HP-IL features) and a HP82973 HP-IL/PC interface card (16 bit ISA -slot).

Regards - Christoph Klug

Re: HP to PC

*Message #3 Posted by **J-F Garnier** on 6 Apr 2004, 6:40 a.m.,*
in response to message #1 by Andre Schan

Hi Andre,

You can even use the freeware Emu71 version, which can directly read LIF discs (you will have to use a "not so new" PC and OS: LIF access doesn't work on NT or Win2000, but works well on Win9x, and DOS of course). Then you can write DOS files from Emu71.

Of course, feel free to get the registered Emu71 if you like it :-)

edit 48 programs with computer

*Message #1 Posted by **Chad Wagner** on 5 Apr 2004, 4:05 p.m.*

Hi, I have 48 programs I wrote. I want to send them to my computer, edit them with my computer and send them back to my 48GX. I am running XP professional. I downloaded debug 4 and the help for it. I cannot get it to install. What are the steps I need to go through to do this? Am I trying the right program? Thanks for any help! Chad

Re: edit 48 programs with computer

*Message #2 Posted by **James M. Prange** on 5 Apr 2004, 7:36 p.m.,*
in response to message #1 by Chad Wagner

Why not just use HPComm, do an ASCII transfer, and simply edit your programs in a text editor?

Or use Conn4x, install the XModem Server library on your 48GX, and do a "Text" transfer.

Regards,
James

Re: edit 48 programs with computer

*Message #3 Posted by **Chad Wagner** on 8 Apr 2004, 4:19 p.m.,*
in response to message #2 by James M. Prange

James, Thanks for the hint. I shall try to figure out how to do that.

MLDL2000 Update

*Message #1 Posted by **Meindert Kuipers** on 5 Apr 2004, 2:44 p.m.*

Hello all,

The development of the MLDL2000 is now in a stage that I am preparing to have the PCB's built for the prototype run. Part of that process is to get a quote from the manufacturer for the final production, and I would like to have your feedback if you are sincerely interested in acquiring an MLDL2000. The quantity of the production run obviously influences the price. A very rough estimate is between 200 and 300 EURO ($250-$375 depending on the currency rate). I have updated my website with the features of the MLDL2000, so please have a look at www.kuipers.to/hp41 or just ask me. The MLDL2000 project is not for profit but for fun. You will pay only for the actual production cost (including setup) and shipping.

The MLDL2000 will consist of 2 PCB's (3 with the optional USB interface) that will all fit in a cardreader housing. The cardreader housing is NOT included, and the HP41 connector is also NOT included. Some assembly and soldering will be required, but the PCB's will be fully tested and functional when you receive them.

Again, let me know if you are interested. I do not expect a commitment but your inoput will help me settling the final price of the unit.

Thanks,

Meindert Kuipers, meindert_at_kuipers_dot_to

Re: MLDL2000 Update

*Message #2 Posted by **Daniel Diggelmann** on 5 Apr 2004, 3:18 p.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert, please let me first express my admiration for your project. I'm, looking forward to using your MLDL. You can count me in for ordering one MLDL incl. USB interface. Many thanks for keeping us updated. All the best for a successful completion. Best Regards from Switzerland Daniel

*Message #5 Posted by **GE (France)** on 5 Apr 2004, 5:58 p.m.,*
in response to message #4 by David Smith

A nice offer, very interestong.

One question : as my only card reader housing houses my only card reader, is it possible to salvage an ordinary module and use it as a plug with a cable linking it to the MLDL ?

Thanks for a clarification.

Re: MLDL2000 Update

*Message #6 Posted by **Meindert Kuipers** on 6 Apr 2004, 2:49 a.m.,*
in response to message #5 by GE (France)

This is certainly possible, but you will have to make your own box to fit the PCB's in.

When I have done the final routing of the PCB I will create a document describing the mechanical aspects. I also had some questions regarding the USB interface: it is possible to use the MLDL2000 without USB, but USB it the best way to load ROM images in FLASH or SRAM. It is possible to create your own I/O interface, but that is a lot of work. USB software to manage the MLDL2000 will be available for Windows.

Meindert

Re: MLDL2000 Update

*Message #7 Posted by **Diego Diaz** on 6 Apr 2004, 3:08 a.m.,*
in response to message #6 by Meindert Kuipers

Hi Meindert!!

Nice to know about your MLDL2000 progress! I bet you knew, anyway I wanna say I'll be happy to get one of them (my CR housing is waiting... ;-)).

Best wishes from Spain

Diego.

Re: MLDL2000 Update

*Message #8 Posted by **Christoph Klug** on 6 Apr 2004, 3:57 a.m.,*
in response to message #7 by Diego Diaz

Dear Meindert,

I will order two of your MLDL2000 units - including the USB option.

Would it be also possible to upload/download rom images to MLDL2000 by using HP-IL ? Or is the upload/download only possible with USB ?

Best regards - Christoph Klug

Re: MLDL2000 Update

*Message #9 Posted by **Meindert Kuipers** on 6 Apr 2004, 9:43 a.m.,*
in response to message #8 by Christoph Klug

Up/download to SRAM can be with any tool that supports the WROM instruction, so IL is perfectly OK. At this moment it is not possible to program FLASH from the HP41, that is to be done through the USB interface. It is actually possible to use something different than USB that supports bitbanging a few signals, but my support will only be for USB (that is much easier ;-) and Windows.

In addition, the MLDL2000 configuration is stored in a special section of SRAM or FLASH, and these settings need to be programmed as well, again intended through USB. A special ROM would be required for bootstrapping the MLDL2000 if done without USB, but once that is done it would work just like any device with RAM emulation ROM images. I am preparing a User Manual that descibes this in more detail, but the current specifications cover this as well. Note that the I/O interface in the current spec is not valid anymore. I hope to release V1.2 within a few days.

Meindert

Re: MLDL2000 Update

*Message #10 Posted by **Ángel Martin** on 6 Apr 2004, 5:01 a.m.,*
in response to message #1 by Meindert Kuipers

Meindert,

Of course you can count me in as purchasing one, maybe two units with USB interface.

I can't wait to get my hands on it!

Re: MLDL2000 Update

*Message #11 Posted by **Poul Kaarup (Denmark)** on 6 Apr 2004, 5:09 a.m.,*
in response to message #1 by Meindert Kuipers

Hi, I'd also like to buy one. How big is the PCB? I haven't got a CardReader to use for it, but the connector won't be a problem.

/Poul

Re: MLDL2000 Update

*Message #12 Posted by **Meindert Kuipers** on 6 Apr 2004, 9:45 a.m.,*
in response to message #11 by Poul Kaarup (Denmark)

There are actually two PCBs, both approximately of the size that would fit as a sandwich in the cardreader. I have not finalized the exact mechanics yet. The USB interface is a 3rd PCB the size of a 24-pin DIL IC.

Meindert

Re: MLDL2000 Update

*Message #13 Posted by **Miki Mihajlovic** on 6 Apr 2004, 12:00 p.m.,*
in response to message #1 by Meindert Kuipers

Congrats Meindart, we never doubted that this will materialize soon. Of course you can count me in too for at least one of the units. I never read the MLDL technical specs in great detail so my question might be redundant but will there be a battery backup power for the unit or is that not needed for the type of chips you are using.

1234

Re: MLDL2000 Update

*Message #14 Posted by **Meindert Kuipers** on 6 Apr 2004, 1:53 p.m.,*
in response to message #13 by Miki Mihajlovic

Battery backup is planned but not really required. The CPLD and FLASH obviously keep their contents, and SRAM can survive on the HP41's battery. When removing the MLDL2000 from the HP41 it is advised to use a battery, or connect it to an external power supply (for example USB .....)

My plan is basically to supply tested and fitted PCB's and the user is required to add any extra's, like the battery, Card Reader Housing etc. I might add a service to assemble everything if the user sends me the CR housing.

Meindert

Re: MLDL2000 Update

*Message #15 Posted by **Meindert Kuipers** on 6 Apr 2004, 4:37 p.m.,*
in response to message #1 by Meindert Kuipers

I have just uploaded the MLDL2000 Specifications version 1.2 to the wesite at www.kuipers.to/hp41.

Comments are more than welcome!

Meindert

Re: MLDL2000 Update

*Message #16 Posted by **Werner (Germany)** on 12 Apr 2004, 8:32 p.m.,*
in response to message #1 by Meindert Kuipers

Again thank very much you for your great efforts, Meindert!

Of course I would like to buy one of your amazing MLDL2000 with USB !

HP41 ROMs

*Message #1 Posted by **Bill Holes** on 5 Apr 2004, 10:55 a.m.*

Two months ago I purchased Christoph Klug's HPIL/PC card and Jean-Francois Garnier's emu41 to use in resurrecting and preserving the ROM's I had saved to EPROM and/or cassette tape during the early '80s. These highly professional and top quality tools performed flawlessly and now several of the resurrected ROM images and scanned manuals are available on "that other site" for all to download, learn from, and enjoy. Permission to make these images public was graciously granted by my good friend and "partner in crime" ;-), microcode guru Nelson F. Crowle (Prototech). Hopefully I'll be making several other unique images available in the near future, including the one we successfully used to 'beat the casino's' at the game of 21 - see Nelson's write-up on http://www.hamfon.com/blackjack/blackjack.htm.

in response to message #1 by Bill Holes

Hi, Do you know if that downloaded ROM images (*.ROM files) may be recorded again into EPROM ICs? If so, do you know how to do this? Best regards Artur

Re: HP41 ROMs

*Message #3 Posted by **Tony Duell** on 5 Apr 2004, 2:05 p.m.,*
in response to message #2 by Artur

It should be possible. What you need to do first is work out how the 10 bit HP41 words are packed into bytes of the file. Sometimes the file lenght gives a clue here. If it's 8192 bytes for each 4K ROM block then it's almost certainly 2 bytes for each word (8 bits in one byte, 2 bits in the other, and a look with a hex editor will tell you which way round they are!). If it's 5120 bytes for each 4K block, then it's probably packed 4 words into 5 bytes (4 bytes containing the low 8 bits of each word, 1 byte containing the 4 2-bit high bit fields). The latter is more common in my experience, and I've got a program (C, for linux) to extract the data from the files saved by the Eramco MLDL-OS system.

When you've got the data out, you then probably need to split it into high and low bytes, and repack the high bytes (of which only the 2 LSBs are significant) into the format your EPROM box expects (this may well be packing 4 of 2-bit fields into a byte). Then send to an EPROM programmer (may have to convert to Intel-hex first, it depends on your programmer) and burn the EPROMs.

I've done it from files on an HP41 LIF-format disk, but I have no idea if the .ROM files you're talking about are the same format.

Re: HP41 ROMs

*Message #4 Posted by **Bill Holes** on 5 Apr 2004, 2:33 p.m.,*
in response to message #2 by Artur

I believe it is possible, as Tony has outlined, although I've not tried it. Just off hand I'd think the best and

easiest method would be to program the images to a CLONIX plug-in module (see http://www.iespana.es/clonix-41/). The images on "the other site" are in .MOD format. Using the module configuration tool (also available on "that other site") one can easily create the necessary HEX file to program the CLONIX. Once in the CLONIX the images can either be used "as is" (in a handy plug-in module) or subsequently burned to an EPROM using an HPIL EPROM programmer.

Re: HP41 ROMs

*Message #5 Posted by **Christoph Klug** on 6 Apr 2004, 4:07 a.m.,*
in response to message #4 by Bill Holes

Dear Bill,

thanks a lot for transfering / saving this nice rom-image pages "to the other side" and to the future world of HP41 system.

Actual some people are working on different HP41 plug in module solutions (Angel, Raymond). And in parallel we get new hardware solutions like Clonix and MLDL2000 (Diego, Meindert). EMU41 (Jean-Francois)is a helpfully gateway tool to bring this new technologies together...

Anyone use an HP-IL modem with a 41?

*Message #1 Posted by **Jim Creybohm** on 5 Apr 2004, 9:47 a.m.*

I was reading about the HP-IL the other day and came across the modem. I am curious to hear if anyone has experience using the modem and a 41. I can see how the 71/75 might be used as they run BASIC, in which you can open and access serial ports.

The 41 however, has no way to push data out a serial port. So, does the modem have a command superset that the 41 can access and use? What type of program would be running on the server side? A DOS type BBS?

The passing of any experiences with this (and applications) would be of interest.

TIA

12345

Re: Anyone use an HP-IL modem with a 41?

*Message #2 Posted by **Garth Wilson** on 5 Apr 2004, 1:09 p.m.,*
in response to message #1 by Jim Creybohm

I used my HPIL-to-RS232 interface converter a lot with my 41, but it was a cx. If you had a c or cv without the extended memory and extended functions and text files, the usefulness of a modem would be all the more limited. I think the he Extended I/O module should have been part of the HPIL module too. I got mine built into it in order to save a port.

Another microcode simulation in development

*Message #1 Posted by **Eric Smith** on 5 Apr 2004, 3:58 a.m.*

I've just gotten the microcode of the HP-25 sort of limping along on an experimental version of my microcode simulator. This has been more challenging than my previous efforts because there is no publicly available documentation on the Woodstock instruction set other than an HP Journal article giving a brief overview of how it compares to the Classic architecture, and a snippet of the HP-25 ROM listing in a US patent. Neither source has sufficient details.

Most of the calculator functions do not yet work correctly. But the PRGM/RUN switch works, and SST and BST in program mode step throught the default "GTO 00" instructions correctly. Pressing the f or g shifts in program mode show the prefix keycode. But instructions can't actually be entered correctly.

R/S in RUN mode displays the correct step number and GTO 00 instruction when held down, and executes it when released. Other than that, in RUN mode almost nothing works correctly.

Low battery detect works, although since there's not much point to having low batteries in a simulator, I've now hard-coded the battery status to good.

In either mode, many operations cause a hang.

I suspect that there are fairly minor bugs in the simulation code that are causing these problems, but it may take some time to track them down. Once it is working, a new release of the simulator will be made available, although under a new name rather than CASMSIM.

A screenshot of two instances of the simulator running simultaneously, one in run mode and one in program mode showing step 01, may be seen here:
http://www.brouhaha.com/~eric/software/casmsim/experimental/hp25_screenshot.png

Warning, the image is about half a megabyte in size.

Re: Another microcode simulation in development -- Congrats!

*Message #2 Posted by **Bill Wiese** on 5 Apr 2004, 11:38 a.m.,*
in response to message #1 by Eric Smith

Hi Eric,

Congrats on your forward progress so far. Even if your HP25 can't add or subtract, you've still made a big step :)

A few questions:
1. Do you have the ability to hardware-emulate
an HP Woodstock serial ROM?
2. Can you capture/track ROM address flow for each
function or keypress?
3. For the unknown Woodstock instructions, do you

know which are opcodes vs. operands/arguments??

Tweaking the hardware ROM emulation to jump to/'bank in'/ somehow introduce-into-code-flow some register & status dump patch code after an unknown opcode might be quite helpful to find out what gets disturbed...

If you've answered "yes" to question #3 above, you might be able to use some opcode frequency charts to see if any statistical correspondences btwn Classic & Woodstock opcodes exist.

I am wondering if backing up and working on emulating the HP21 (first Woodstock) might be useful - smaller/simpler than that of HP25, perhaps there are some similarities to HP35/45 firmware organization.

Regards,
Bill Wiese
San Jose CA

Re: Another microcode simulation in development -- Congrats!

*Message #3 Posted by **Eric Smith** on 5 Apr 2004, 10:14 p.m.,*
in response to message #2 by Bill Wiese

I've done some more debugging. Now everything seems to work except the logarithmic and exponential functions (including y^x).

Bill writes:

> Quote:
>
> 1. Do you have the ability to hardware-emulate an HP Woodstock serial ROM?

Not yet. Soon.

> Quote:
>
> 2. Can you capture/track ROM address flow for each function or keypress?

I can capture traces from the simulator. I'll be able to capture traces from the real hardware soon.

> Quote:
>
> 3. For the unknown Woodstock instructions, do you know which are opcodes vs. operands/arguments??

All ACT instructions are a single word except for ten conditional test instructions, for which all ten bits of the second word are the branch target (within the current 1K of ROM space). I do have the encodings for those. As with the Nut processor used in the HP-41 and Voyager families, the ACT processor does not assert SYNC during the second word of a two-word instruction.

There are three ACT instructions for which I don't know the encodings. None of them are used in the HP-25. One is used to switch from 12-digit to 14-digit display mode. One loads a key code into the A register (the HP-25 uses a direct keys->rom address branch instead), and one rotates the entire C register left by one digit. I believe that these are opcodes 0120, 0320, and 0520 octal, not necessarily in that order.

There are seven instructions implemented by the PIK chip for printer control in the HP-91, HP-92, HP-95C, HP-97, and HP-19C. I believe those are xx20 opcodes from 1120 through 1720 octal.

I expect that there are other instructions used by the CRC chip (card reader control) in the HP-67 and HP-97, but I don't have any information on them.

The HP-19C, HP-67, HP-92, HP-95C, and HP-97 use bank-switching of ROMs. I believe the instruction 1060 octal is used; certainly that's the instruction used on the Spice series. I don't know exactly how it works. It might be as simple as toggling the ROM bank for the current PC address.

The Spice series seems to use basically the same instruction set, with the addition of the ROM checksum instruction (1460 octal) used by the self-test. However, there may be other new instructions. And there may be other architectural differences; for instance, perhaps they've increased the depth of the subroutine stack. There is even less published information about Spice internals than about Woodstock.

Eric

ReBuilding a Calculator using Microcode simulation

*Message #4 Posted by **Klaus Hinderer** on 6 Apr 2004, 8:27 a.m.,*
in response to message #3 by Eric Smith

Hi! Has someone ever tried to run a simulator in Hardware? I am currently rebuilding a HP 67 Calculator using a PIC MICROCHIP 16f877 which reads the keys of a keyboar similar to the original and executes Instructions. So far displaying the stack works and all the floating point ops work (these come with the c compiler I am using).

Once my calculator works, the floating point single precision must be improved, perhaps with bcd-arithmet.

But it would be great if one could simply write a Microcode simulator, load it on the microchip, and provide all Functions in external EPROM.

Could that possibly work?

Greetings!

Re: ReBuilding a Calculator using Microcode simulation

*Message #5 Posted by **Nelson M. Sicuro (Brazil)** on 6 Apr 2004, 11:04 a.m.,*
in response to message #4 by Klaus Hinderer

Yes, I think is possible. I'm trying to do the same, and to build a *new* calculator using *old* case/display/keyboard configurations (from HP-12C perhaps).

I have tried some keyboard/display routines on my PIC16F628 with success, but I don't have an emulator yet. I was thinking of a NUT CPU emulator or a Saturn one.

The emulation can be executed on a PIC, is only a matter of "stuffing" it on the very small amount of FLASH of it. The speed will be similar or a little slower than the original calculator speed.

If you need help I can contribute, but I only program PICs in assembler ;)

Best regards,

Nelson

in response to message #4 by Klaus Hinderer

> Quote:
>
> Has someone ever tried to run a simulator in Hardware?

Yes, I had the HP-45 microcode simulated on a PIC back in 1995. It was just a proof-of-concept, and was not 100% completed.

Since so many people have Woodstock calculators with bad chips (due mainly to the terrible power supply design), I've been considering selling replacement logic boards for those. The main stumbling block is fabricating equivalents to the bifurcated contacts used for solderless connections to the display and keyboard PCB. I suspect that they are stamped beryllium copper with gold plating. I have not been able to find a commercial equivalent, and am not sure what it will cost to have them made.

> Quote:
>
> I am currently rebuilding a HP 67 Calculator using a PIC MICROCHIP 16f877

As you're no doubt aware, that uses the same ACT processor as the Woodstocks. Simulating it should be easy as long as you don't need the card reader to work.

> Quote:
>
> But it would be great if one could simply write a Microcode simulator, load it on the microchip, and provide all Functions in external EPROM.

Why wouldn't you just put the microcode in the flash memory of the microcontroller? I don't see any value to having it in a separate chip.

Re: ReBuilding a Calculator using Microcode simulation

*Message #10 Posted by **Klaus Hinderer** on 6 Apr 2004, 4:50 p.m.,*
in response to message #9 by Gordon Dyer

Hi to all interested!

This thread gets quite a lot of response. If anyone could provide webspace, I could publish my Hardware design and my Program for 32 bit float-precision (Still incomplete, but math works). I can only speak for myself, but if the Microcode emulator should work, we could perhaps publish that too (If that's OK with everyone).

Re: ReBuilding a Calculator using Microcode simulation - NO BINARY F.P.!!!

*Message #11 Posted by **Bill Wiese** on 6 Apr 2004, 6:39 p.m.,*
in response to message #10 by Klaus Hinderer

Klaus,

Thanks, but 32-bit floats are NOT as good as even a cheapie calc offers today, and most all of us expect a calc to deliver proper BCD math results: 10, [1/x], 10, [X] should give 10, not 9.999999999, which often happens even in higher-precision binary FP implementations!

Also 32-bit float likely has 24 bit mantissa w/implied sign; we have 3.322 bits per BCD digit (that is, 1/log(2)) so we have 32/3.322 = 7.2 digits of precision. Log/trig transcendentals using these functions even for range reduction will likely have problems too.

This is why many BASIC interpreters of the past on 8-bit machines (Commodore, Atari, Apple, etc.) used 5-byte floating point: 32-bit mantissa + an exponent byte: this allowed about 9.6 digits, which is somewhat better.

I'm much more comfortable w/HP's 10-digit BCD math, along with CORDIC transcendentals: very comfortable behavior.

I think if we start "updating" an HP calc w/new innards, we should emulate its instruction set/microcode. Any existing bugs can be trapped/fixed and we won't introduce new ones (if there were a problem in an emulator, it will not likely be a spot error but would most likely systemically affect use of an instruction(s), making the error readily apparent.)

Remember, the people who wrote the math routines knew a LOT about calculations, accuracy, error propagation and roundoff issues. And we have much more simulation horsepower available (they had to grab time on an IBM mainframe). Let's not throw that away - otherwise we're no better than HP + Carly + Fred Valdez + Kinpo.

Bill Wiese

Re: ReBuilding a Calculator using Microcode simulation - NO BINARY F.P.!!!

*Message #12 Posted by **Nelson M. Sicuro (Brazil)** on 6 Apr 2004, 9:51 p.m.,*
in response to message #11 by Bill Wiese

I agreee on this: we should (at first) use an emulation of some CPU (Saturn) and use the well-tested routines for it (ripped from ...HP-42S??) to prove the concept, and IF we manage to build some decent calculator THEN we can optimize its code (non-emulation native 16 or 32 bits code???).

I was thinking in create a "new" CPU based on the best of the NUT, Saturn, Capricorn on an emulator, and using more register space (more precision, 16 digits? 18 digits internal?). This is not difficult, the worst part will be creating software for it (compiler, for a start). BUT it can be at first implemented on emulation and after the concept proved, implemented on FPGA or similar chip (full speed and power!!).

This are just my thoughts... I'll appreciate other ideas!

Best regards,

Nelson

the NUT, Saturn, Capricorn on an emulator, and using more register space (more precision, 16 digits? 18 digits internal?).

Hah! Yes, it'd be fun to have HP41/42 features & routines inside a Woodstock case ;)

I don't think speed's too much of an issue anymore. With a TI MSP430 running at a reasonable clockrate (6-8 MHz), emulation of Nut, etc instructions should take only a relatively few clocks.

No need for FPGA. Besides, this allows us to use other kinds of memory w/software 'drivers' patched into interp.

Re: ReBuilding a Calculator using Microcode simulation

*Message #14 Posted by **Klaus Hinderer** on 9 Apr 2004, 3:05 p.m.,*
in response to message #13 by Bill Wiese

Hi to all HP-fans!

There were already some attempts to rebuild/create a better Calculator, but it seemed most ended in discussion on the forum. I think we should do the following to begin with the project:

-Collect and read information about the technical issues and the general architecture -Decide what we want to build -Decide which hardware we want to use -Start implementation!

If we differ in any point, we could split up in groups that exchange information. I think, we will never see any result if we keep discussing the hardware we want to use. Instead we could implement the Microcode Interpreter in Pseudo-Code (or C or PASCAL, whatever) and then groups could implement that high-level code on different hardware. Anyway, before choosing a hardware, I would like to get an overview of all the possibilities that piece of hardware provides. Perhaps everyone should give a brief description of his favorite platform (Price, needed hardware, clock speed, interesting features).

I think, together we have a very big knowledge base, we only have to exchange our ideas and skills.

Let's start the project!

Greetings to all! Klaus

Floating Point Library

*Message #15 Posted by **Renato (Brasil)** on 11 Apr 2004, 9:26 p.m.,*
in response to message #11 by Bill Wiese

I agree, trying to recreate HP algorithms would require recreating the work of people like Prof. Kahan. I have deep respect for the technical expertise of this community, and think their energy would provide better results if applied to other areas (HW, emulation). Having said that, I can say that an arbitrary precision FP library on a handheld calculator would be an interesting step beyond what has been done before by HP - see:
http://www.hpl.hp.com/personal/Hans_Boehm/crcalc/CRCalc.html

Oh God, it is a HP employee work....

Renato (1234)

Re: Floating Point Library

*Message #16 Posted by **Eric Smith** on 12 Apr 2004, 12:33 p.m.,*
in response to message #15 by Renato (Brasil)

Yes, arbitrary precision is nice, but for a calculator it's much better to use decimal floating point rather than binary.

http://www2.hursley.ibm.com/decimal/

The actual IBM implementation can be downloaded but costs money for commercial use. The specifications are useful.

Re: Floating Point Library

*Message #17 Posted by **Renato (Brasil)** on 12 Apr 2004, 11:13 p.m.,*
in response to message #16 by Eric Smith

It yelds exactly 0 to 9-asin(acos(atan(tan(cos(sin(9))))))

Why would it matter if the implementation is binary or decimal ?

Re: Difference Binary-Dec

*Message #20 Posted by **Klaus Hinderer (Paraguay)** on 14 Apr 2004, 2:21 p.m.,*
in response to message #19 by Renato (Brasil)

Well, the user should trust no machines but use them only while using his mind too.

Of course bcd-calculations cannot be beaten by flp. But while people are constantly discussing details of projects I have a calc that is nearly finished. It can do sqrt, log, ln, e**x, pow, sin, cos, tan, arcsin,acos, atan, sinh, cosh, tanh, +,- *,/. It will take half a year for me to do numerical approx. for all the functions, and I will do that after I have build my floating point calc, because I want to see some results of my work. Besides, I will have working key and display routines for the Bcd-calc.

If someoune had bcd-Routines for that functions or is willing to do some for me, we can start the bcd-calc immediately.

I really don't like all the discussion. We could build a machine doing all the calculation together, and then anyone could add his own display and key Routines.

I really hate these endless discussions about details without having started the Project. That doesn't get us any further.

I don't just tell anyone of building a calculator, but I do build one, and then I will improve it.

Only GOD can judge me and my Calc!

Salut! Klaus

Warning: This is just my opinion, I don't want to insult anyone !

HP49G+ USB file transfering?

*Message #1 Posted by **Cliff B** on 4 Apr 2004, 6:28 p.m.*

I recently purchased a HP49G+ but having trouble transfering ASCII from my PC via the provided USB cable so that they run on the calculator. Could somebody please describe the procedure and software required to do this.

Re: HP49G+ USB file transfering?

*Message #2 Posted by **James M. Prange** on 5 Apr 2004, 1:35 a.m.,*
in response to message #1 by Cliff B

Get the latest "48gII and hp49g+ PC Connectivity Kit and USB Drivers" from HP's web site. While you're there, if you don't already have the most recent ROM (build 31), also get the "HP49G+ ROM upgrade". Note that Conn4x also works with the 48G series.

But note that Conn4x text transfers differ from Kermit ASCII transfers in the way they translate NUL, literal " (that is, " within a string, not as a string delimiter), and literal \. Outside of a quoted string, you may need to substitute the translation code \092 for literal \, to prevent it being treated as an escape character (part of a translation code).

If you have an MMC or SD card and a card reader/writer for it, you can use my programs for Kermit ASCII compatible transfers via the card. If anyone wants them, let me know and I'll send them to you as an e-mail attachment.

Regards,
James

Installing Emu48

*Message #1 Posted by **Steve S** on 4 Apr 2004, 4:28 p.m.*

Can someone give me a quick explanation of how I go about installing Emu48 on my PC? I have the Emu48 download and a download of the GX ROM. However, I can't seem to find the installation instructions anywhere, neither at the download site nor within the download itself? Also, I'm aware that the ROM contents may need to be "translated" prior to linking it to the emulation. I could use some advice about that, too.

Thanks very much...

hp 33s programming

*Message #1 Posted by **marcus channell** on 4 Apr 2004, 12:55 p.m.*

does anybody know if there is a way to get around the limited number of LABELS you can use. right now only A...Z are allowed. I need more for the programs I am using.

Re: hp 33s programming

*Message #2 Posted by **Bram** on 4 Apr 2004, 2:21 p.m.,*
in response to message #1 by marcus channell

I'm not familiar with HP33S, but with my HP29C I used several labels twice when I needed more than the maximum of ten. When the one GTO would skip only a few lines and another would do the same thing elsewhere, I could give them both the same label number. GTO doesn't scan from the beginning of the program, but from its own line downwards. Perhaps something similar is possible for you?

Re: hp 33s programming

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 4 Apr 2004, 4:26 p.m.,*
in response to message #2 by Bram

I have no direct experience with the 33s but, based on previous posts, I understand that duplicated labels are not allowed. There is an article by Paul Brogger on the Articles forum, with ideas about this issue.

Re: hp 33s programming

*Message #4 Posted by **Brent** on 4 Apr 2004, 4:41 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

There are several ways of reducing the number of labels
used. If the subroutine (Label) is short you can use
a conditional statement before each statement.
You can do it in a long subroutine, as well, but it gets
messy and not very elegant. For example, flags 1 thru
6 are user defined; You could use those in conditional
tests to perform subroutines without using a label.
You can also use no labels and have RTN statements at
the end of each individual routine and then use the
GTO. nnn to move the program cursor at the beginning
of a routine. Unfortunately that cannot be programmed.

...just some ideas.

Brent

Re: hp 33s programming

*Message #5 Posted by **Norris** on 4 Apr 2004, 6:06 p.m.,*
in response to message #1 by marcus channell

You can't use duplicate labels on the 33S.

If you have a lot of small programs, you can save labels by using GTO . [line number] R/S to launch them, instead of XEQ [label].

Say you have 10 different programs. Start the first one at line A 0000, the second at line A 0100, the third at line A 0200, etc. Don't label the beginning of the program. Fill in any extra lines between programs with RTN statements.

Then to start the second program, you would enter:

GTO . A 0100, followed by R/S

The GTO will move the program pointer to line A 0100, and the R/S will start the program that begins there. It's not as easy as typing XEQ A, but it works

ROM dump for emu42

*Message #1 Posted by **V. Taylor** on 4 Apr 2004, 10:21 a.m.*

I have a 42s and a 48GX and I've read the article on this site about dumping the 42s ROM to the 48. I've been able to do this but my question is what to do with it after I get it transfered to the PC. I recently found emu42 and since I have the ROM image available I'd like to use it to run emu42 but I need to know how to convert these text strings from the 48 to something that emu42 can use. What's the best way to concatenate the pieces and what else has to be done? It appears that what the 48 receives is just a copy of the LCD from the 42s since every line is preceded by the XXXX: address location. Are these addresses part of the actual ROM? Do I need to remove them to use with emu42? I'm sorry if this subject has been covered before, I'm rather new to this forum (I've only been lurking for about a month or two, but I've been using HPs for years =). Thank you in advance.

Virgil Taylor

Re: ROM dump for emu42

*Message #2 Posted by **Erik Ehrling (Sweden)** on 4 Apr 2004, 2:52 p.m.,*
in response to message #1 by V. Taylor

Hi!

1) Once you have all the pieces, put them together into one large file that should look something like

00000:236B9308DCE30005
00010:B087FB0020386FBF
00020:061371F120051557

... and so on, all the way up to ...

1FFD0:8445028405021393
1FFE0:838300F4B4D24323
1FFF0:35D254245600204E

(The file size should be 192KB)

2) Then run "DMP2ROM" from the command prompt on your file. A binary ROM file (size 64KB) should then be produced.

3) Also from the command prompt, run LEWISCRC on your new binary ROM file. LEWISCRC will compute the checksum of the ROM and tell you whether the dump is valid or not. If it is not then there is most likely some small error that has happened during the ROM dump. Check your dump file and try again. If LEWISCRC says "CRC ok!" then you're ready to go for the last step.

4) Put your ROM binary alongside a suitable KML. (Remember to make sure that the name of the ROM binary is identical to the name referred to in the KML). Then just run Emu42 - voilà!

Welcome to the club!

Erik Ehrling (Sweden)

Does anyone have 16C S/N 2236A03277?

*Message #1 Posted by **Cameron Paine** on 4 Apr 2004, 8:46 a.m.*

I was cleaning up this afternoon and I found the box of my first 16C (it was stolen along with my briefcase many moons ago). The serial number was written on the box. The box contained the protective foam "wallet" that the calculator came in, the Registration Card and the Service Card.

I wonder if it found a new home in any of your collections? The circumstances of its loss are no longer of consequence to me so please don't feel uncomfortable if you have it. The box made me a bit nostalgic so I thought I'd ask here because I'm sure you can appreciate the memories such a find dredges up.

If you have it, it will probably have my initials--cbp--etched (with a fine-tipped soldering iron IIRC) into either the rear of the case above the battery cover or inside the battery compartment.

If you do have it and it has no sentimental value to you, perhaps you'd consider swapping it for a near mint 16C (S/N 2840A87839). I'd love a picture of it even if you're not willing to part with it.

Thanks for reading, people.

Cameron

Re: Does anyone have 16C S/N 2236A03277?

*Message #2 Posted by **Patrick** on 8 Apr 2004, 3:34 a.m.,*
in response to message #1 by Cameron Paine

I have checked my collection and I'm sorry to say I don't have it. I would hope that if I did, I would have the moral fiber to return it to its proper home. I have been the victim of theft and it is something I don't think I'll ever get over, so I can imagine what you are feeling.

My condolences on your loss, Cameron, regardless of how long ago it might have been.

Patrick

Why are the shift keys labelled f and g?

*Message #1 Posted by **Arnaud Amiel** on 3 Apr 2004, 4:22 p.m.*

As the subject says, I am wondering why on older HP calcs the shift keys are labelled f and g when the colour should be enough. And why f and g and not any other letters.

Thanks for enlightening me.

Arnaud

f(x) and g(x)... Maybe? (No text)

*Message #2 Posted by **Brent** on 3 Apr 2004, 5:28 p.m.,*
in response to message #1 by Arnaud Amiel

...

Re: Why are the shift keys labelled f and g?

*Message #3 Posted by **Ben Salinas** on 3 Apr 2004, 5:29 p.m.,*
in response to message #1 by Arnaud Amiel

This is just a guess, but perhaps they originally used f as "function" (which makes sense). So, when another function key was needed, the next letter was used. Or perhaps it is because f(x) and g(x) are the two most common function names used.

As far as not just having the color, that is probably for the manual writers and tech support people. It is probably easier, and faster, to say "f 3" rather than "mandarin 3" Personally, I wish the 32sii had letters instead of arrows. I find myself referring to the shift keys by their location (top arrow) or their color (press blue 5) too much, especially when the two models of the 32sii have different colors. For me, it is just to hard to think that is the right arrow, that is the left arrow, even though the arrows make sense for the location of the key label (perhaps arrows were used for colorblind people. If you had 2 labels in different colors, it might be hard for those who are color blind to distinguish as to which shift key accesses which functions.

Just some thoughts,

-Ben

Re: Why are the shift keys labelled f and g?

*Message #4 Posted by **Karl Schneider** on 3 Apr 2004, 5:35 p.m.,*
in response to message #1 by Arnaud Amiel

Arnaud --

I remember that this topic came up once before. Single letters offer convenient shorthand reference for the shift keys, instead of printing colored squares or printing "(yellow)".

"f" and "g" (and "h") are accepted mathematical notation for functions, and the shift keys generally offer access to additional functions. These letters also do not conflict with capital-letters A-E made available as program labels.

Models having only one shift key and (in some cases) also lower-case alphanumerics (41C*, most Pioneers) dispensed with the "f" notation.

Is the 16C the only one with both an "f" shift key and "F" for hexadecimal 15 and program label?

-- Karl

Re: Why are the shift keys labelled f and g?

*Message #5 Posted by **J-F Garnier** on 5 Apr 2004, 6:34 a.m.,*
in response to message #1 by Arnaud Amiel

f as function makes sense, because the HP65 used a f-1 (inverse function) key.

An other reason may be that first programable machines had A to E function keys, and f, g, h are a logical extension. BTW, the HP67 was recognized as the only one to have A to (i) key labels ...

J-F

Re: Why are the shift keys labelled f and g?

*Message #6 Posted by **David Smith** on 5 Apr 2004, 4:45 p.m.,*
in response to message #1 by Arnaud Amiel

F is for Function. G then H were added later as the keyboard became more cluttered on the later models.

HP49G+: How do I sent text strings to the Picture screen?

*Message #1 Posted by **Eddie Shore** on 3 Apr 2004, 1:56 p.m.*

Any help will be appreciated. I want to build a game board on the picture screen

i.e.

$ 350 $ 500 $ 1000

LUCKY $ 850

PRIZE MOVE1 $ 475

Re: HP49G+: How do I sent text strings to the Picture screen?

*Message #2 Posted by **Raymond Del Tondo** on 3 Apr 2004, 2:34 p.m.,*
in response to message #1 by Eddie Shore

Hi,

PICT {#x #y} "Your String" 2 >GROB GOR

does the job.

Step by step: Place the name PICT on the stack (Menu: PRG->[PICT]->[PICT])

Then enter the pixel coordinates as HEX strings in {}.

After that place your string on the stack, choose the font size (1 or 2) and perform >GROB (Menu: PRG->[GROB]->[->GRO])

Then perform GOR or GXOR, and take a look at your PICT.

However, this is all explained in the manual, at least in the HP-48 manuals, so maybe you should read it.

Raymond

HP25C died??

*Message #1 Posted by **Walter B** on 3 Apr 2004, 3:59 a.m.*

Seems I need some help:

I'va got an old HP 25 C with an old accu pack. It didn't hold charge, only some minutes, but with the adaptor connected to the mains it did work until 3 months ago. So, i left it standing on my shelf (just the calculator with the accus inserted, no connection to the adaptor). Now I wanted to use it again - and the diodes just run blinking, even after some minutes charging. I tried a new accupack which works in another woodstock - doesn't work in my HP 25 C. Assume something destroyed in the calculator - don't know where and why. Adaptor seems to deliver 10 V AC perfectly.

What can I do to save this old calculator? Any advise will be appreciated.

Walter

P.S.: Just found Eric Smith's message of Mar 31 about bad HP design: <...Using the battery pack to filter and regulate the power from the AC adapter. Some models, most notably the Woodstock series, can be damaged by operation from the AC adapter without a good battery pack installed. Or if the battery contacts get corroded.> Seems that's what happened to me. What kind of damage is caused? Chances to repair?

Edited: 3 Apr 2004, 4:35 a.m.

Re: HP25C died??

*Message #2 Posted by **Jon** on 3 Apr 2004, 8:59 a.m.,*
in response to message #1 by Walter B

You have probably fried any chip. When that happens the calculator works when you press numbers´ keys but when you try any operation you get a display like 00000000. Is that what happens to yours?

I am afraid you need another unit for spare parts

Best Regards from Spain

Jon

Re: HP25C died??

*Message #3 Posted by **Walter B** on 3 Apr 2004, 2:32 p.m.,*
in response to message #2 by Jon

Thanks, but this is bad news.

Just for sake of clarity: The display does not show a stable 000000000, but it looks like the zeros running around in the background (meaning they do not get power all at the same time). Sometimes, after switching on, only the least significant digit shows up (the rightmost) as 8. with reduced brightness. Don't know

whether this changes the diagnosis.

Re: HP25C died??

*Message #4 Posted by **David Smith** on 3 Apr 2004, 12:51 p.m.,*
in response to message #1 by Walter B

Usually the ACT chip is killed. When this happens the most common fault is a display of 000000000. Quite often the RAM chip(s) is destroyed also. The ACT chip can be salvaged from any HP21/25/25C/29C/67/97. The RAM will need to come from another HP25C or possibly a 29C. Some machines have a single RAM chip, others use two chip. To use a single chip in a machine designed for two chips, you need to add a pullup resistor to one of the pins.

Re: HP25C died??

*Message #5 Posted by **Tony Duell** on 3 Apr 2004, 2:11 p.m.,*
in response to message #4 by David Smith

No idea why the ACT chip fails (I agree it does!), it's the RAM that gets excessive voltage (around 12V) from the PSU if the battery goes open-circuit with the machine _off_ (it's a lot safer to have the machine turned on, the rest of the electronics will load the PSU somewhat).

AFAIK, you can also use an ACT from a 19C, 91, 92, (and even a 95C). But those machines are a lot rarer than a 25C. What you can't use is an ACT from a 27 -- that machine uses NMOS chips (all other ACTs are PMOS) and has the supply rails 'upside down'.

I never run -C Woodstocks and Spices off the charger, or charge the battery pack 'in place'. I am lucky in that I have a good regulated bench PSU that I use to run calculators for testing (clipped onto the battery contacts) and the 'Reserve Power Packs' (external battery holder/charger units) for the Classic, Woodstock, Topcat and Spice series. If you don't have those (and the Spice one is really hard to find), then consider using a cheap non-continuous-memory calculator (a 21 or a 32E) to charge battery packs. Doesn't even have to work, all you need is the charger circuitry (one diode, one resistor, connectors)!

Re: HP25C died?? - AM radio diagnostic tip

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 4 Apr 2004, 12:19 p.m.,*
in response to message #1 by Walter B

It is possible that your calculator have suffered severe damage, as many posts had suggested before; but I encourage you to read (in the MoHPC Articles forum) an article by Katie Wassermann about Woodstock common faults and repair, since there are some repairable problems (clock signal malfunction or noise) which may cause symptoms similar to your description. I have worked with an HP27 (Woodstock) from a friend which seemed to have been damaged, but after some warming-up and some battery discharge (!), it started to work fine.

Diagnostic tip, specially useful for LED based calculators:

Put your calculator (powered by batteries) near a working AM radio receiver, turn the calculator on, and hear the electrical noise induced in the radio. You may need to play a little with the tuning dial, but there is no need to be precise about tuning a specific frequency.

Press different keys and hear the noise changing. If the noise and the changes are there, then it is not a case of "no brain activity" death (flat EEG): At least the power supply is partially working, there are clock pulses and keyboard scanning signals (which also are closely related to display operation). As the keyboard and display scanning is run by firmware, at least some CPU and ROM activity can be confirmed.

You may still have noisy clock lines, clock instability, faulty RAM, faulty display drivers, etc.; but this is a simple , cheap, fast and safe test you can do by yourself and after this first screening you can take better decisions about asking for help, validate diagnostics or try repairs by yourself.

Good luck!

Re: HP25C died?? - AM radio diagnostic tip

*Message #7 Posted by **John McLeod** on 5 Apr 2004, 6:33 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

Try replacing the batteries in the pack with garden variety AAs. I did this with my 29C, as suggested by Randy at Fix That Calc, and it revived it. Now it needs new batteries now and then, but I only keep it for sentimental reasons anyway.

Re: HP25C died?? - AM radio diagnostic tip

*Message #8 Posted by **Eric Smith** on 5 Apr 2004, 10:20 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

> Quote:
>
> As the keyboard and display scanning is run by firmware, at least some CPU and ROM activity can be confirmed.

Actually not. The ACT processor continuously scans the keyboard and display even if the firmware is completely corrupted or missing. The firmware can control the content of the display (obviously) and turn it on and off, but it is scanned continuously regardless of what the firmware is doing.

And since the display scannning also scans the keyboard, that is automatic as well.

The scanning works by the cathode driver chip advancing the column drive once every word time (56 phase 1/phase2 clock periods). Once every 12 or 15 word times, the ACT asserts the RCD signal to Reset the Cathode Driver.

The ACT powers up in 12 digit mode, but has an instruction to switch to 14 digit mode (reset every 15 word times). So an ACT in a Topcat or HP-19C with missing or bad firmware might only scan a portion of the display.

If power is good and the oscillator is running but the RCD signal is not being generated, the ACT is bad.

AM-radio coarse test - Correction

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Apr 2004, 6:07 p.m.,*
in response to message #8 by Eric Smith

Eric: Thank you for the correction. I previously understood that the scanning needed some initialization from firmware, it seems I was wrong (at least for the ACT processor).

Now, it should read : ... at least some CPU (and Cathode driver chip) activity can be confirmed...

Help with 42S Programming

*Message #1 Posted by **Bill (Smithville, NJ)** on 2 Apr 2004, 1:37 p.m.*

I'm trying to write a subroutine that will be called in several locations from the main program loop. There are three basic variables: DBx, WBx and PSx - where the 'x' is a number from 1 to 3 (i.e., DB1, DB2, DB3...)

Each time I call the subroutine, I'd like to place the variable number (1, 2 or 3) in the X register and then have the subroutine perform the calculations based on that set of variables.

How do I go about setting up the RCL instruction so that it would recall the correct varaible set when needed?

I came up with the following brute force method, but there has to be a smaller or more elegant method:

ALL

"DB"

ARCL ST X

ASTO 01

RCL IND 01

FIX 02

Thanks for your help. 12345

Re: Help with 42S Programming

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Apr 2004, 4:33 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi, Bill;

I think that you have at least two alternate methods. I'm just pointing them out now, and I can scratch some steps to perfrom them; just a matter of time right now.

First: consider using ordinary numbered registers instead of ALPHA ones; there is a memory issue (less memory), but the indexes should be restablished;

Second: create three [1×3] matrices: DB, WB and PS. Whenever you want to use one or another, you simply INDEX it and use [->] or [RCLEL] to recall their contents.

These are the ones I thought about for now. Others surely exist, and someone will probably post about it soon. If you need guidance:

lcvieira@quantica.com.br

Anyway, I'll be back in a couple of hours.

Success.

Luiz (Brazil)

Re: Help with 42S Programming

*Message #3 Posted by **Bill)Smithville, NJ)** on 3 Apr 2004, 6:22 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks for your ideas.

I'm familar with using numbered registers - I usually prefer them over alpha ones. I'm trying to convert a program written for the HP-48GX to the 42S. Was using alpha ones to maintain redibility of the code.

I had totally forgotten about matrices. I seldom have a need to use them and just forget that the 42s can work on them directly. Since I have several subroutines that will need to operate on multiple variable lists, matrices may just be the way to go. I'll have to read up on them in the manual and give it a try. Thanks for reminding me of them.

in response to message #1 by Elio

Hi, Helio;

in most cases, this sort of message appears when there is a bad contact between the keyboard's PCB and the calculator's mainboard (circuit board, where all components escept the LCD and drivers are assembled). Please, have a look at the image below:

Compare this image to your HP41's LCD and see if you can identify. It's more likely that it is a fullnut. In this case, what's written above is applicable, and in this case it's necessary to open the calculator and clean the contacts between the boards.

Halfnuts usually do not show this message this way, unless you have faulty components or a cold solder in one or more of the CPU's teminals.

The other possible (and very remote) case happend once with my old HP41C. Suddenly it did not do anything but showing a slightly blinking [MEMORY LOST], almost one blink at a second. In this case, the calculator was sent to HP in order to be repaired. It was necessary to turn the calculator against light to see the slightly blinking. It was a faulty RAM IC. THe fullnuts HP41C have two RAM IC's: one with 16 registers used by the system and another one with the 64 registers available for the user. Yes, we all "see" 63 registers, but there is a 64th. one that must provide 3 bytes for the permanent .END. and consquently let 4 bytes always available. This one cannot be a numbered register.

Let us know if you need guidance. Otherwise, Fix That Calc is always a second choice.

Success.

Re: Memory Lost 41CV

*Message #3 Posted by **Eric Smith** on 2 Apr 2004, 2:44 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

> Quote:
>
> THe fullnuts HP41C have two RAM IC's: one with 16 registers used by the system and another one with the 64 registers available for the user.

Many HP-41C calculators have five RAM ICs (1LA7), all with 16 registers. One is for the status registers, and four are for the user. The 64-register chip (1LE7) was introduced with the HP-41CV, which used five of those for 320 user registers, and one 1LA7 for the status registers. The HP-41C continued to be manufactured using five 1LA7 RAMs until stock of the 1LA7 was depleted, then switched to one 1LA7 and one 1LE7 as you describe.

The 1LE7 was later replaced with the functionally equivalent 1LH5, probably as a cost reduction.

Re: Memory Lost 41CV

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 Apr 2004, 1:20 a.m.,*
in response to message #3 by Eric Smith

Hello, Eric;

thank you for adding these facts. I remember I saw some earlier HP41C motherboards, mostly those units with "top keys" (is it the correct term for those tall keys?). And I also remeber seeing the same motherboards in some earlier HP41Cv's as well. If I am not wrong, all RAM IC's are lined side by side in the "top" of the mainboard (the side that's closest to the LCD assembly), no "piggy back" soldering, right? One weird fact: the CX fullnuts have a mainboard arrangement that's even closer to these earlier C and CV's mainboards. (thank you , Renato...)

Man, I "love" having these "pictures" in my head and talk about them. Too bad I could not follow all of the HP41 "saga" when it happend. I "was" there, being time a reference, but I "wasn't" there, being place a reference.

Time to make things up, now.

Cheers.

Luiz (Brazil)

HP41CX 24hour time format

*Message #1 Posted by **Mike** on 1 Apr 2004, 10:33 p.m.*

I just purchased an HP41CX. I've never owned one before. I'm trying to set the time to 24 hour format and the command is "CLK24". I can't seem to get the calculator to accept the numerical part of the command, it gives me the "nonexistent" error message. I'm probably not keying in the command properly. If someone could email me the proper key-by-key sequence I would really appreciate it.

Thanks, Mike

Re: HP41CX 24hour time format

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Apr 2004, 11:17 p.m.,*
in response to message #1 by Mike

Hi, Mike;

first let's lead you to a litlle trip. Get one of your fingers ready to press [R/S] and execute:

```
[SHIFT][CATALOG] 2 [R/S]
```

You must be fast pressing [R/S] as you immediately see

```
[-TIME 2x   ]
```

where "x" may be some letter (firmware version; the "2" means CX-ROM). Keeping your attention to [R/S], now you press:

```
[ENTER] [R/S]
```

and you are ready to navigate through the Time Functions by using [SST] (single step) and [SHIFt][BST] (back step) keys.

The first function you should see is

```
[ADATE    ]
```

that allows a value in the X-register to be appended to the ALPHA register current contents with a date format. Of course, this number must represent a valid data.

Press [SST] five times and you'll see [CLK12]; one [sST] more and you'll see [CLK24]. O.K., you have the correct spelling. Now, press [<-] key (left-arrow) and your display returns to current X-register.

To actually execute CLK24 you must press:

```
[XEQ][ALPHA] C L K {SHIFT] 2 [SHIFT] 4 [ALPHA]
```

If you look at the small label in the back of the calculator, you'll see that all numbers are shiftted related to their keys when the ALPHA mode is ON. If you are executing [ED], the ASCII-file editor, there is a way to "invoke" the number keyboard by simply "deactivating" ALPHA (i.e. pressing [ALPHA]).

I hope this helps for now. Let us know if you succeed.

Cheers.

Luiz (Brazil)

(Please, if something goes wrong, let me know; again, I wrote by heart... No calcs in hands right now)

Re: HP41CX 24hour time format

*Message #3 Posted by **Fulcrum** on 9 Apr 2004, 4:22 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hello, is there any way to navigate in the catalogs t is way in the catalogs and in the extended memory files in a hp41cv wit the extended fubctions module

Re: HP41CX 24hour time format

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Apr 2004, 9:24 p.m.,*
in response to message #3 by Fulcrum

Hi;

I know that these "navigation skills" are also found in the CCD module, but I am almost sure other modules may offer it (HEPAX?). Simply using the X-Functions with an HP41C or CV will not give this sort of functionality.

Sorry!

Luiz (Brazil)

*Message #5 Posted by **Johnny** on 12 Apr 2004, 10:34 a.m.,*
in response to message #3 by Fulcrum

I don't remember exactly how EMDIR behaves, but that's the only thing you have.

Re: HP41CX 24hour time format

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 12 Apr 2004, 12:31 p.m.,*
in response to message #5 by Johnny

Hi, Johnny;

you're right: EMDIR is a "no-stop" directory for the Extended Memory; by "no-stop" I mean it cannot be stopped so you can use [BST] and [SST] as it happens with [CAT]4 in the HP41CX or with the CCD's [CAT'] "extension"; EMDIR goes straight ahead till it finds the last EM entry. It also returns the number of available registers at the end of the listing (the EMROOM in the HP41CX is faster for this particular purpose).

Cheers.

Sharp PC-E220

*Message #1 Posted by **bhakosha** on 1 Apr 2004, 6:19 p.m.*

what do you think about this machine? Thanks

Re: Sharp PC-E220

*Message #2 Posted by **Holger S.** on 2 Apr 2004, 3:39 a.m.,*
in response to message #1 by bhakosha

I cannot say anything about the E220, but I had a E500 which seems to be a slightly upgraded version of the former. I have to say that I didn't like this beast too much. It has an enormous amount of built-in functions and programs as well as a sophisticated basic implementation. But somehow, these components fail to form an integrated entity. The built-in engineering software is nice, but I didn't find an easy way to adapt it to my needs and use it in my own programs (I have to admit that I didn't try very hard).

Other than that, it's a good pocket computer with a large display - a serious engineering tool. Maybe my dislike is due to the fact that I'm not an engineer.. Anyway, speaking of basic programmable pocket computers, I like the HP 71B or the Sharp PC-1262 much better. An even better choice would be the HP 100LX or 200LX. These are MS-DOS-based XT computers even somewhat smaller than the E500 and you can use your favourite programming language.

Re: Sharp PC-E220

*Message #3 Posted by **GE (France)** on 2 Apr 2004, 5:24 p.m.,*
in response to message #2 by Holger S.

Actually the PCE-500 is much better than the PCE-220, they are not in the same league. Strange that you don't like the 500, it is the top of the line for Sharp Basic machines (and all Sharp machines for that matter...).

The 220 has a Z80 processor and an embedded assembler, it is very much oriented towards ASM. The machine is much thicker than the 500, being made with a less classy plastic. Also, the display sports plain 5x7 character matrices (four 24 char lines I think) with no graphing capability. BASIC is standard with no extra features like a built-in library. It has a calculator mode, quite like a scientific calculator (like the PC-1401 or PC-1403).

I think I recall it has a built-in RS232, but this is the only thing going for the poor beast.

If you are a collector anyway, prepare for a long search (albeit your question seems to imply that you found one), because it is much much rarer than the 500. So get it, but don't expect too much. HTH.

Casio FX-880P

*Message #1 Posted by **bhakosha** on 1 Apr 2004, 4:18 p.m.*

I know that it is not normal to ask for this item. I have 6 HP48Gx , but now i have the opportunity to buy the FX-880P calc and the SHARP PC-E220, what do you think? Prices are good. Will you buy them? I have looked for information, but i want opinions. Many thanks

Re: Casio FX-880P

*Message #2 Posted by **Tizedes Csaba [Hungary]** on 1 Apr 2004, 5:26 p.m.,*
in response to message #1 by bhakosha

Dear Bhakosha,

My first calculator/computer was an CASIO FX-850P. This calc was brillant tool in chemical technician school, and other areas at home.

The power consumption of it was very low: runs on original batts 19 months (see the manual: they wrote 4.5 months - I used it on every day.)

The keys are works perfectly, it had good feeling when I typing.

The LCD had good contrast, and it adjustable. (It haven't got graphical LCD, it's not a very good... With user definied characters it is solvable, but not perfect.)

It have got built in library, all programs wrote in BASIC, and the list of this progs are available on the WEB.

The CASIO BASIC is perfect for this little machine. I wrote many-many progs on it.

Then - when I went to the university - I bought an HP32SII, then an HP48SX (and a HP15C, and HP17BII, and so on... ;)), and I forgot my old calc. The HP's SOLVER was very powerful, the RPN, and 'keystroke programming' was the vinner. Sometimes I write little progs on the CASIO, but not really use it.

I think the CASIO FX-850P/880P is a great machine. Slim, with metal house, fast program running, good language, enough memory, etc...

I like my CASIO!

Best wishes: Csaba

*Message #3 Posted by **bhakosha** on 1 Apr 2004, 5:37 p.m.,*
in response to message #2 by Tizedes Csaba [Hungary]

Thanks,for your comments, Tizedes. I will see tomorrow.

Re: Casio FX-880P

*Message #4 Posted by **GE (France)** on 2 Apr 2004, 5:28 p.m.,*
in response to message #3 by bhakosha

From a pure calculator collector point of view, just run for the PCE-220, as the Casio is currently on sale (not too expensive).

However, the Casio is better on ergonomy alone, is thin and has the lovely metal case we would wish any decent machine. It has only 2 lines of 5x7, non graphical, characters. A good machine.

HP 41CV turn on

*Message #1 Posted by **Chuck Westen** on 1 Apr 2004, 3:05 p.m.*

I have a HP 41CV that I purchased in 1983. Used it until I purchased a HP 32Sii. I left the 41 in a drawer with the batteries in it. I went to use the 41 and 1 battery had started to leak, for how long I don't know. It was only one battery on the left side if you are looking at the back. I took the battries out and cleaned the it out, but never did by new batteries to see if it still worked. This was back in 1993 or 1994. Last week I found the 41 again so I went a bought batteries, put them in and tried to turn it on and nothing happened.

Is there a trick to getting it to turn on after laying dormant for so long. Do you think the leaking battery damaged it. Is it worth sending to someone to try and fix it.

Thank you for your help

Re: HP 41CV turn on

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Apr 2004, 3:14 p.m.,*
in response to message #1 by Chuck Westen

Hi;

it's more likely that your HP41CV needs service. Battery leakage is dangerous to the conductive components. There is a link yuo may want to try:

Fix that calc

It seems they are the closest choice you have.

Success.

Luiz (Brazil)

Did someone forget?

*Message #1 Posted by **Dave** on 1 Apr 2004, 10:29 a.m.*

Where is the calculator of the year????

I can hardly stand not having a new design to drool over and speculate about.

Lets go, there still is time, the day is not over yet....

Are you talking about...

*Message #2 Posted by **Vieira** on 1 Apr 2004, 3:09 p.m.,*
in response to message #1 by Dave

... the newly designed HP3SII? Well, I thought tyhose NDA's people are signing and agreeing not to talk about should be enough to keep the secret.

Well, for as long as I was told, the newly designed HP33S has a new keyboard design: instead of a "V" shaped keyboard, now it's a "^" (upsided V) shape, so it would "lift up" the bad image it passed in the first moments. I guess that the rumors about not destroying the "V" shaped keyboards and keeping them to redesign the X-Pander are getting bigger... At least there will be no need to hammer these keyboards for once, right?

There is more, but I'll allow others to add the complementary information. And I can see that, sadly, the definitive dealine - April 1st - to relaunch the HP33SII was not achieved. Too bad... 8*(

For the records: whatever is written in here is true for the current day, unless others can prove it is not.

Best regards.

Vieira

HP-13C Ultra-Platinum Super-Voyager

*Message #3 Posted by **Britt** on 1 Apr 2004, 3:40 p.m.,*
in response to message #1 by Dave

I read that HP division of Kinpo is going to release the HP-13C Ultra-Platinum Super-Voyager this summer. It will effectively combine all HP-12C, HP-15C, and HP-16C functions inside a HP-71B style case with a 256 color display (still one line). It will have 128Mb program memory (but no PC interface) and an IR printer port (but no IR printers are planned).

I read this in something called a “non-disclosure agreement” but it has is too much lawyer language in it for me to understand the rest of it. I think I’ll send it back without signing it.

Re: HP-13C Ultra-Platinum Super-Voyager

*Message #4 Posted by **Matthias** on 1 Apr 2004, 3:56 p.m.,*

in response to message #3 by Britt

It´s April first, isn´t it?

OGS Drilpro Module

*Message #1 Posted by **Graham** on 1 Apr 2004, 9:12 a.m.*

Hi,

I just acquired an OGS Drilpro module for a HP-41, manufactured by O'Brien-Goins-Simpson & Associates. Copyright 1986. It didn't come with a manual.

Does anyone have information on this accessory?

Thanks, Graham

Re: OGS Drilpro Module

*Message #2 Posted by **Bill Holes** on 1 Apr 2004, 11:35 a.m.,*
in response to message #1 by Graham

Hi Graham,

I recognized the company name as it's not too far from where I used to work. I wish I could help you with info on the module but regretfully cannot. I can however provide you with the following:

15730 Park Row Suite 500 Houston, TX 77084 Tel: 281-599-1300

info@ogslab.com

Maybe someone at the company can provide the answers you are looking for... hopefully even a manual!! I hope this helps.

Re: OGS Drilpro Module

*Message #3 Posted by **Jim Creybohm** on 1 Apr 2004, 11:40 a.m.,*
in response to message #1 by Graham

Hi Graham.

I don't recall this module, however I suspect it is a drilling engineering module built along the same lines as the Petroleum module - arguably designed for reservoir engineers. If it is to be used for drilling engineering (as the Drilpro software), then there would be programs for BHA, cost/ft, ROP, direction, and drilling mud hydraulics. If these twig or look similar, then if you email me a listing of the programs, I'll try to work through some of the stuff with you.

I will see if I can find a manual. Being in an oil patch area, I might be able to find one somewheres...

12345

Re: OGS Drilpro Module

*Message #4 Posted by **MAtthias** on 1 Apr 2004, 1:31 p.m.,*
in response to message #1 by Graham

Hi Graham

I´m working on a update of Wilson´s and Diego´s module list for HP-41. Could you please give us the exact datas of this module:

Label on the top: Label on the back: Module size: What says CAT2:

You would help all of us.

Matthias

Re: OGS Drilpro Module

*Message #5 Posted by **Bill Holes** on 1 Apr 2004, 3:15 p.m.,*
in response to message #4 by MAtthias

In addition to Matthias request, the size (4k, 8k, 12k, ??k) and the XROM number(s) would be helpful as well.

18C, RTC trouble

*Message #1 Posted by **Thomas Radtke** on 1 Apr 2004, 9:02 a.m.*

Hi all,

this is not an april fool: Starting today, the real time clock of my 18C is going wild. It insists on today being the 4th instead of the 1st, no matter how often I try to readjust it. Ok, I know I'm not able to fix it, I only wanted to share this info. Heck, I really got used to this nice and easy to use calculator:(.

Thomas

Re: 18C, RTC trouble

*Message #2 Posted by **bill platt** on 1 Apr 2004, 10:57 a.m.,*
in response to message #1 by Thomas Radtke

Hi Thomas,

Yes, you are not going crazy---that is an Easter-Egg. If you have the machine set to commas rather than periods, when you get to April 1, the machine starts to give faulty time. All you have to do is set it to periods and then run a self-test. Then it will work correctly.

regards,

bill

Re: foolish 18C:)

*Message #3 Posted by **Thomas Radtke** on 1 Apr 2004, 5:12 p.m.,*
in response to message #2 by bill platt

Now I'm glad to be such a patient person, not having thrown away that joker:).

Thanks a lot, Bill!

Is this HP16C worth worth a new 49G+?

*Message #1 Posted by **Al Borowski** on 1 Apr 2004, 4:03 a.m.*

Sorry if this should be in the adds section - but I have no idea if I am asking for a reasonable price.

Hi,

I have a battered HP16c which I never use, and I'd like to know if its worth anything.

Some photos are at http://alpage.ath.cx/hp16c/

As far as I can tell, it works perfectly. It looks like its been in the wars though - the badge is missing, there is an 'M' and a star shape scratched into the metal near the screen, and paint is coming off in 2 places (between the OCT and BIN keys, and between the 2 and 3 keys). The keys seem to be fine. The back is in good condition - I took a photograph but it didn't turn out. I will take more later.

It was made in the USA, serial number 2741A12807.

It includes the manual, in fair condition (Some ink stains, the cover is a bit creased and it is a litle dog-eared).

Is this calculator worth anything? Would anyone be willing to trade it for a 49G+ with the good keyboard? If its not worth that much, I could include a little currency - but I can't afford too much.

The ideal situation for me would be to send the calculator plus some cash if necessary overseas, and the buyer would send payment to www.hpcalc.org . www.hpcalc.org would then send me a new 49G+.

Am I being reasonable?

thanks,

Al

Edited: 1 Apr 2004, 4:19 a.m.

Re: Is this HP16C worth worth a new 49G+?

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 1 Apr 2004, 5:23 a.m.,*
in response to message #1 by Al Borowski

No. Not as I see it. Getting a replacement metal front, a new bezel and a new keyboard overlay is next to impossible. Being april 1. I hope there is some kind of explenation. On second thoughts, he could had written something like: 'Would anyone be willing to trade it for a space shuttle ticket?'

Happy april 1. Regards! Johnny

PS.: Remove hpcalc from my adress...

Re: Is this HP16C worth worth a new 49G+?

*Message #3 Posted by **Al Borowski** on 1 Apr 2004, 5:40 a.m.,*
in response to message #2 by Johnny Bjoern Rasmussen

I'm serious - No april 1 joke.

I thought despite it not being in mint condition, someone might be interested. Oh well.

Al

Re: Is this HP16C worth worth a new 49G+?

*Message #4 Posted by **Johnny Bjoern Rasmussen** on 1 Apr 2004, 6:05 a.m.,*
in response to message #3 by Al Borowski

Sorry Al. I didn't want to offend you. It's just - well, this place is mainly read (as far as I know of) by vintage collectors, at least I regard my self as one. In the case of your HP-16C, of which I do not own any (not even in 'war condition'), it would have been great, for somebody with a broken unit. So if anyone have a broken unit...

Sorry again, if I offended you. Regards! Johnny

Re: Is this HP16C worth worth a new 49G+?

*Message #5 Posted by **Al Borowski** on 1 Apr 2004, 6:27 a.m.,*
in response to message #4 by Johnny Bjoern Rasmussen

Hi,

No offence taken! I asked for opinions :-)

As for the face, I belive 2 tiny dabs of black paint would make it look much better - it's not quite as bad as the photos make out (the flash shows every tiny nick). The metal part near the display would need to be replaced to improve its looks. If that was replaced, and the paint was dabbed on, it would look much better.

The only other blemish is a hairline scratch on the LCD. Perhaps this could be fixed; I don't know. It is not very deep.

Do you think it is worth $100 USD? Ebay prices seem to range from 100-150.

cheers,

Al

Edited: 1 Apr 2004, 7:09 a.m.

Re: Is this HP16C worth worth a new 49G+?

*Message #6 Posted by **Raymond Del Tondo** on 1 Apr 2004, 9:11 a.m.,*
in response to message #5 by Al Borowski

Hi,

ok, IMHO you should keep this unit, as it's in fair condition. Like Johnny wrote, maybe a collector which can make use of the CPU or display board would like to take the unit, or someone who definately wants to have a 16C, regardless of it's condition.

This is a heavily used unit, and the manual can tell a story of it;-)

From a collector's (my) view, the front is simply trash, the 16C logo is missing, so no fun to look at.

You can't replace the bezel w/o having another one, and the logo will only be available on another 16C, so this doesn't seem to make much sense. The faceplate (keyboard overlay) has dings & dents, even the keys seem to have suffered much (GSB, GTO, etc...)

Another option is to put it on eBay wih a starting bid of $10. If your auction title catches collector's views, you'll know the actual value after the auction end.

Regards,

Raymond

Re: Is this HP16C worth worth a new 49G+?

*Message #7 Posted by **Al Borowski** on 1 Apr 2004, 6:06 p.m.,*
in response to message #6 by Raymond Del Tondo

Hi,

Thanks for your opinions, but I have had several offers :-)

Thanks,

Al

Re: Is this HP16C worth worth a new 49G+?

in response to message #1 by Al Borowski

Hi Al,

I recognize your name--but can't remember if it is from here, or c.s.hp48, or both.

I think you are being a bit low-balled here---on e-bay there is a sucker born every minute.....

If you watch e-bay for a while and make sure to track every 16c that comes up--then you will have a good sense for the trading value. It might take over a month, as there are very few 16c machines in circulation on e-bay.

regards,

Bill

Re: Is this HP16C worth worth a new 49G+?

*Message #9 Posted by **Curtis Quist** on 1 Apr 2004, 11:14 a.m.,*
in response to message #8 by bill platt

You can also look on ebay, on the left hand side, down a few inches under "Display", for the link to "Completed items". You will need to log in but it will show you what the various HP 16Cs have gone for and you can look at the condition of each. You should also note the strategy the person had in selling the calculator, what price to start at, whether there was a reserve or not, what time of day or week to end it, etc.

On another note, I have my old 16C which I came across, used, a few years ago and still use it. Years ago I had a chance to trade my "like new" 42S in for a 48G and $100. I wish I had it back. The 48G was good, but that 42S was just a clean pure calculator and when I need to calculate something, I usually just punched out the number and I was done with it. With the 48G, there was more clutter then it was sometimes worth. I am not refering to the keyboard as much as items like "sto" is now alpha based, in specific directories, and remains there until you delete the variable.

Good luck

Re: Is this HP16C worth worth a new 49G+?

in response to message #8 by bill platt

Hello,

I use comp.sys.hp48... I'm not really a collector!

"I think you are being a bit low-balled here---on e-bay there is a sucker born every minute....."

What does 'low balled' mean? Sorry, I have never heard of that phrase before.

I have already gotten an offer that suits me nicely with a minimum of hassle, so I might go with it.

Thanks,

Al

*Message #11 Posted by **RABIH Cyril** on 3 Apr 2004, 5:44 a.m.,*
in response to message #10 by Al Borowski

HP-16C are quite hard to find. So I think you could have at least 150 US$ with your unit. It works well, quite good condition with a manual, I think that's enough. The price range for 16c is 160/260 US$. Sell it on eBay, and with the money, buy a 49G+. I bought my 16C 200 euros 2 years ago and it's not in pristine condition, and I think there are several collectors who would accept to pay a good price for yours.

Re: Is this HP16C worth worth a new 49G+?

*Message #12 Posted by **Raymond Del Tondo** on 3 Apr 2004, 2:46 p.m.,*
in response to message #11 by RABIH Cyril

It depends: I got my NEW and unused 16C w/case & manual for about 60 Euros a few years ago, and last year I got a used one with case & manual, but missing logo, which looks much better than Al's unit for about the same price (60 EUR). Ok, they have no box, but someday someone will have a spare box...

Not to discourage Al: Get as much as you can for your 16C:-)

But please take a look at the auction which just ended: eBay 3087936313 . THAT is a really nice 16C, and it went for less than $136...

Raymond

Cynox vs Klotz vs...?

*Message #1 Posted by **Steve S** on 31 Mar 2004, 4:26 p.m.*

Does anyone have any opinion about RAM cards by Cynox, Klotz, Epson / HP or anyone else? Both European suppliers seem to have their proponents, but I haven't noticed any taunting about one product vs the other (In fact, the problems seem to be more or less common to all, shielding aside.) My overall impression is that Epson / HP are well finished, but expensive and rare in the larger sizes. Klotz and Cynox appear to be nearly comparable (maybe Cynox provides a simple plastic "slipcover" so the RAM card isn't completely naked...)

Does anyone else have any issues or preferences???

Re: Cynox vs Klotz vs...?

*Message #2 Posted by **bill duncan** on 31 Mar 2004, 6:13 p.m.,*
in response to message #1 by Steve S

I don't have any comparison data, but I found Klotz to be courteous and fast service. The products I bought (a 128K and a 1 Meg card) each work very well and were nicely priced.

Re: Cynox vs Klotz vs...?

*Message #3 Posted by **Norris** on 31 Mar 2004, 9:02 p.m.,*
in response to message #1 by Steve S

My Cynox cards are neatly covered so that you can't see the internals. The cover might be beneficial if you frequently swap cards in and out of the calculator, since it could prevent damage when when the card was outside the calc.

But if you simply plan to leave the card in the calculator as a permanent memory upgrade, then it may not matter if it has a cover or not.

Re: Cynox vs Klotz vs...?

*Message #4 Posted by **Raul Lion** on 1 Apr 2004, 1:11 a.m.,*
in response to message #3 by Norris

I have a 128kb from HP and another from Klotz. Also an 1M from Klotz and a 512kb from Cynox... the four work w/o problems...But I paid more for the original HP than for the other three :-(

HP 41CV

*Message #1 Posted by **Linda Osborn** on 31 Mar 2004, 2:24 p.m.*

Product is HP Calculator 41CV. After using this calculator for the past 10+ years, I have accidentally hit a combination of buttons that eliminated the customary readout of numbers with a decimal point followed by more numbers (000,000.00). Can someone tell me how to get back to just a normal screen. Thank you.

Re: HP 41CV

looking for information on a Casio OH 7000 G, Overhead calculator

*Message #1 Posted by **Dave Falkenberg** on 31 Mar 2004, 10:41 a.m.*

Hello, I recently purchased a Casio Model OH 7000G, overhead calculator and am looking for information and somewhere I can obtain a manual. I've tried Casio's web site but it doesn't recoginize that particular model number. I also own 5 hp calculators and read the posts on HP Musuem's site daily. I thought if anyone knew someone or somewhere that would point me in the right direction to acquire my Casio information, it would probably come from one of you. Thanks in advance Dave

Re: looking for information on a Casio OH 7000 G, Overhead calculator

HP-41CV

*Message #1 Posted by **Axel Wingen** on 31 Mar 2004, 4:41 a.m.*

Habe einen HP-41CV vor mir, der sehr unbenutzt aussieht, aber weder der Drucker (82143A) noch der Kartenleser(82104A) arbeiten am Einschubfach-4. Der Rechner spinnt dann rum. Drucker funktioniert an anderem Fach, Kartenleser passt aber nur in Fach4. (Drucker und Kartenleser arbeiten an meinem HP41CX einwandfrei).Irgendeine Idee was da sein könnte? Chance auf Reparatur? Antwort wenn möglich auch per e-mail an info@axelwingen.de Wäre für Hinweis sehr dankbar (31.3.2004)

Re: HP-41CV

*Message #2 Posted by **Axel Wingen** on 31 Mar 2004, 10:56 a.m.,*
in response to message #1 by Axel Wingen

Das Problem ist gelöst: Raymond Del Tondo gab den entscheidenden Hinweis, die Kontakte von Schacht-4 zu reinigen. Habe ein Q-Tip mit einer sauberen Zange flachgedrückt und mit Benzin (Aus der Apotheke!) getränkt. Damit kommt man prima an alle Kontaktflächen ran. (Batterien natürlich erst rausnehmen!!) Dann hat alles wieder prima funktioniert.

Re: HP-41CV

HP 10B

*Message #1 Posted by **fran** on 30 Mar 2004, 5:13 p.m.*

I bought an HP 10B calc from a garage sale for $1.00. Replaced the batteries but it does not work any ideas? PS the calc has no sound when you hit the " on" button what so ever!

Re: HP 10B

*Message #2 Posted by **Karl Schneider** on 31 Mar 2004, 2:15 a.m.,*
in response to message #1 by fran

Fran stated,

> Quote:
>
> *I bought an HP 10B calc from a garage sale for $1.00. Replaced the batteries but it does not work any ideas? PS the calc has no sound when you hit the " on" button what so ever!*

$1 and it doesn't work? Demand a refund!

Seriously, though:

Be absolutely sure that the replacement cells are charged adequately and are installed correctly.

If OK, here is the paraphrased procedure from p. 120 of the manual:

1. Reset the calculator by holing down the [C] key while pressing [PV] at the same time.
2. Erase memory by holding down the [C] key while holding down both [N] and [E+] keys at the same time. "ALL CLr" should be displayed when all 3 keys are released.
3. If that doesn't work, remove all battery cells and jumper the battery contacts together using a coin or other conductive object. Reinstall batteries and turn the 10B on. It should display "ALL CLr".

If these steps fail, service is required.

BTW, the 10B has no speaker, so it won't produce any audible tone when turned on.

-- Karl S.

Re: HP 10B

*Message #3 Posted by **Arnaud Amiel** on 31 Mar 2004, 5:31 a.m.,*
in response to message #2 by Karl Schneider

I may be worth trying pressing just under the display in the middle of the calc while pressing ON. This is a problem of old pioneers, although I am not sure the 10B is one.

Arnaud

ELI-41 ???

*Message #1 Posted by **Giuseppe Marullo** on 30 Mar 2004, 2:13 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3086533943&category=50577

What is this? Please enlight me!

Re: ELI-41 ???

*Message #2 Posted by **Raymond Del Tondo** on 30 Mar 2004, 5:12 p.m.,*
in response to message #1 by Giuseppe Marullo

Hi,

the link shows an auction for an 49g...

However, AFAIR ELI-41 is part of TRANS41. Check the TRANS41 manual;-)

Raymond

Re: ELI-41 ???

*Message #3 Posted by **Giuseppe Marullo** on 30 Mar 2004, 5:28 p.m.,*
in response to message #2 by Raymond Del Tondo

Randy, sorry about the mistake, this should be correct:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3086155007&category=58039

It does not seem to me that this is included into TRANS41, but I cannot check at the moment...

Re: ELI-41 & TRANS41

*Message #4 Posted by **Christoph Klug** on 31 Mar 2004, 4:06 a.m.,*
in response to message #3 by Giuseppe Marullo

Much better than ELI41 + TRANS41 is EMU41, this includes some advanced features like 64KByte RAM-Box and real HP-IL support...

Refer to HP-Museum articles forum item 311 HP41/PC gateway & emulator.

Regards - Christoph Klug

Re: ELI-41 & TRANS41

*Message #5 Posted by **Giuseppe Marullo** on 31 Mar 2004, 6:21 a.m.,*
in response to message #4 by Christoph Klug

Christoph, I am a registered EMU41 user already :)

Just wonted to know what ELI-41 is, I have read somewhere about eli as a file/data format.

I don't know if it is a valuable as an emulator by itself, but usually is worth to investigate as long a 41 emulator is involved.

Cheers!

Giuseppe

HP 48 Libraries Disappearing

*Message #1 Posted by **Helge Gabert** on 30 Mar 2004, 11:07 a.m.*

Hello,

I'm wondering if other people have also noticed disappearing libraries on RAM cards. I have a 48gx with a 512 KB card, with libraries stored in ports 2-5. Sometimes, at irregular intervals, after a couple months or so, one library or two will disappear. I can't discern a clear pattern to this behaviour, it's not the battery, nor the card (I bought a second one from a different manufacturer), nor is it the same library which disappears.

Thanks for any ideas you might have,

Helge

Re: HP 48 Libraries Disappearing

*Message #2 Posted by **bhakosha** on 30 Mar 2004, 1:42 p.m.,*
in response to message #1 by Helge Gabert

I never had this problem in a 5 year old ram card with no battery change, it is 1Mb card from Cynox, and always works fine.

Re: HP 48 Libraries Disappearing

*Message #3 Posted by **Helge Gabert** on 30 Mar 2004, 1:58 p.m.,*
in response to message #2 by bhakosha

Yeah, it's strange. I'm running version R (so that should be good), but also have a 128KB memory card in slot 1 (which is merged with main memory). So perhaps the problem lies here, don't really know.

Well, it's no big deal, since I can always install the libraries again, and it happens infrequently enough, but it's just a little irritating.

Re: HP 48 Libraries Disappearing

*Message #4 Posted by **Wayne Brown** on 30 Mar 2004, 2:55 p.m.,*
in response to message #3 by Helge Gabert

Do you ever get "Invalid Card Data" messages? If so, the card might not be seated all the way in the slot or the contacts might be a little dirty. I've seen the contents of ports disappear (and sometimes reappear) if a card isn't all the way in the slot, but that usually produces an error message.

Re: HP 48 Libraries Disappearing

*Message #5 Posted by **Helge Gabert** on 30 Mar 2004, 3:48 p.m.,*
in response to message #4 by Wayne Brown

No, I don't get that message. I also tried the PINIT command. Alas, the lost library doesn't reappear. It's gone, and the memory it used to take up is now free in the port.

But thanks for your suggestion.

Re: HP 48 Libraries Disappearing

*Message #6 Posted by **Raymond Del Tondo** on 30 Mar 2004, 5:09 p.m.,*
in response to message #5 by Helge Gabert

Just an idea: Is it commercial software with a limited usage time?

Raymond

Re: HP 48 Libraries Disappearing

*Message #7 Posted by **Helge Gabert** on 30 Mar 2004, 5:58 p.m.,*
in response to message #6 by Raymond Del Tondo

No, it's also not that. What disappeared yesterday was Stat48 Pro 1.0 by Scott Guth (downloaded three years or so ago from hpcalc.org). To my knowledge, there are no time limitations.

One thing is for sure, though: Whatever I store in Port 0 (i.e., main memory) will not disappear.

Maybe it's a hardware problem of my particular unit, or maybe certain libraries can't co-exist together peacefully? Who knows.

Wayne

*Message #8 Posted by **Raul Lion** on 31 Mar 2004, 11:05 a.m.,*
in response to message #4 by Wayne Brown

I have a Klotz RAM card that ONCE moved a little and I had to reconnect it... I had no lost of memory, but I didn't want that problem again. A very little drop of super-glue in one of the card sides was the solution. It fixes the RAM card and makes impossible its movement but whenever I have needed to extract the card, I have had no problem for unsticking.

RAM cards

*Message #9 Posted by **Wayne Brown** on 31 Mar 2004, 11:29 a.m.,*
in response to message #8 by Raul Lion

One of the Klotz cards in my youngest son's 48GX moved a little after being carried around in his backpack for a few months, and it lost the contents of one of the ports. (I just did a PINIT on it and restored from a backup.) My oldest son has a "genuine HP" card in his 48GX and the same has happened to him at least once. I've never seen any problem with cards moving unless the calculator was dropped or handled roughly.

(I just ordered three more Klotz cards yesterday, so now all four of our 48GX's will have Metakernel and plenty of extra memory.)

hp 49 for $450????

*Message #1 Posted by **Bill Lee** on 30 Mar 2004, 10:58 a.m.*

Am I missing something, Or is this man insane?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3086533943&category=50577

Re: hp 49 for $450????

*Message #2 Posted by **Ernie Malaga** on 30 Mar 2004, 11:30 a.m.,*
in response to message #1 by Bill Lee

> Quote:
>
> Am I missing something, Or is this man insane?

Anyone who buys it at that price will deserve a different adjective: idiotic. The HP-49G was one of the worst calculators ever made by HP. And there's no justification for buying one now that the 49G+ is out with a much better keyboard and features -- for 1/3 of the price.

Long ago I bought a 49G, hated it, and traded it for a 41CX. I haven't missed the 49G for a single minute.

Worst H-P Ever Made? (Nominations?)

*Message #3 Posted by **Paul Brogger** on 30 Mar 2004, 1:15 p.m.,*
in response to message #2 by Ernie Malaga

The 49G sounds like a good candidate, but I've never owned one, so I can't speak from experience.

My nomination: the 6s/6s Solar. Truly worthless. (But then, one could argue that H-P didn't actually "make" it . . .)

Re: Worst H-P Ever Made? (Nominations?)

*Message #4 Posted by **Neil** on 30 Mar 2004, 3:56 p.m.,*
in response to message #3 by Paul Brogger

I second Paul's nomination. The 6s solar is a piece of junk. I originally bought one for shirt pocket use. I had hardly used the damn thing before lcd segments started failing. It started off with one segment, then another, and another... When it got to the point that I couldn't even guess the answer, I threw the calculator away.

The thing is I bought this calculator because I used to have a tiny casio scientific wallet type calc, more or less credit card sized. It was so light and convenient, and useful. Unfortunately it fell out my shirt pocket,fell 30 meters and broke. I was never able to find another one to buy (but come to think about it,

I haven't searched ebay). I thought the 6s would be an ideal replacement, but it's actually too big.

Re: Worst H-P Ever Made? (Nominations?)

*Message #5 Posted by **GE (France)** on 31 Mar 2004, 6:43 p.m.,*
in response to message #4 by Neil

That tiny Casio must have been a fx98 (see http://www.hknebel.org/Museum/Museum/Rechner/Taschenrechner/Casio_FX-98/casio_fx-98.htm). A pure jewel !

On the worst HP ever, my vote goes to the HP-10BII, because of the horrible keyboard. Keyboards MUST be reliable.

Re: Worst H-P Ever Made? (Nominations?)

*Message #6 Posted by **John Smitherman** on 1 Apr 2004, 11:27 a.m.,*
in response to message #4 by Neil

Hi Neil. You may want to look at the Casio FX-260. It is not a beloved high quality HP but for $10 it is a decent buy. It is solar powered, fits nicely in the shirt pocket, is quick, fairly accurate and has many useful functions. Also, if it is dropped or lost you won't be out much money.

http://www.casio.com/index.cfm?fuseaction=products.detail&catalog=Calculators&section=Scientific&product=FX%2D260#

John

Re: Worst H-P Ever Made? (Nominations?)

*Message #7 Posted by **Ron Ross** on 30 Mar 2004, 4:23 p.m.,*
in response to message #3 by Paul Brogger

Tough call, Agree that the Hp6s was junk (rubber keyboard), but the early Hp10Bii had failed LCD segments shortly after I acquired (can't say about present build). Poor keyboard from day one, as some keys had no click while others felt fine. AND all that for a calculator that never left a pampered shelf. My Hp6 was used by my daughter in a bookbag, took punishment and held up well. Some keys were gouged out??? but worked when it was put away after a school year of abuse.

My vote: Hp10Bii

Re: Worst H-P Ever Made? (Nominations?)

*Message #8 Posted by **Jeff** on 30 Mar 2004, 5:10 p.m.,*
in response to message #3 by Paul Brogger

Isn't nominating one of the post 1990, outsourced models kind of like shooting fish in a barrel? How about a nomination from the time when they were supposed to be good? I'm thinking of a series that was basically ruined if you just happened to plug it into its charger without a battery pack, or maybe even if you plugged it in with a pack that was not making good contact. Don’t get me wrong, I like the woodstock calculators. I had a 29C until it got lost between the time I got a 15C to replace it and realized that I HAD to have one of every model ever made. But HP should never have let such a design out of the door.

Re: Worst H-P Ever Made? (Nominations?)

*Message #9 Posted by **Katie** on 30 Mar 2004, 6:41 p.m.,*
in response to message #8 by Jeff

I'm going to go against the likely grain of this thread and nominate the HP-55. Although it was novel in having an accurate timer and a limited program memory, every one that I've run across has LED segment problems to some extent and I really don't like the volatility of the program memory. You could use this argument against the HP-25 too, but it was half the price and was offered for sale during the same time period.

HP55

*Message #10 Posted by **Tony Duell** on 31 Mar 2004, 5:24 a.m.,*
in response to message #9 by Katie

The HP55 has the same display devices (5 digits in a package) and display driver chips as the other classics (35, 45, 65, etc). There's no reason why it should have any more problems with missing segments than the other machines -- and in fact my 55 was perfect last time I turned it on, and has never been repaired.

Re: HP55

*Message #11 Posted by **Katie** on 31 Mar 2004, 9:14 p.m.,*
in response to message #10 by Tony Duell

I realize that the 55 uses the same components as the other "classics", but for whatever reason all 4 of the ones that I've had had 1 or 2 segment problems and I've corresponded with other collectors who have seen the same thing. I don't generally find these problems on other classics. I wonder if the problem is due to the calc being used in timer mode for extended periods of time which might cause certain segments to fail.

Re: HP55

*Message #12 Posted by **Alex** on 2 Apr 2004, 1:58 p.m.,*
in response to message #11 by Katie

I've experienced the same sort of thing as Katie, both of the HP55s I have had bad segments when I got them. The LED modules are the same part number as the rest of the classics, but the inductors that provide the charge dumped into the segments are different (they may be the same value, though, I've never measured them).

Re: HP55

*Message #13 Posted by **Tony Duell** on 3 Apr 2004, 12:39 p.m.,*
in response to message #12 by Alex

Most HP55s have those 4-inductor modules in them (Note, the 2 modules are not the same, one contains 4 inductor of the same value, the other has an odd one for the (smaller) decimal point (period) segment). They're also used in the HP65. AFAIK they are the same value as the inductors used in the 35 and 45.

Re: HP55

*Message #14 Posted by **David Smith** on 3 Apr 2004, 1:07 p.m.,*
in response to message #11 by Katie

Yes, for some strange reason the HP55 is a rather failure prone machine. The HP55/65 introduced the silver lead LED packages. Earlier LEDs had gold leads and a slightly bigger LED character.

Besides the bad LED problems (also seen in a lot of HP65 machines), there are many with CPU problems. I don't know why they would fail more than HP35/45 machines. It is also interesting that the HP21 has a much lower ACT failure rate than the HP25, even though both machines share the same icky power supply design.

Also the green plastic HP55 case does not seem to be as stable as the original black cases. In particular, the latches on the battery door like to disintegrate.

The silkscreening on the keyboard is not very stable. Many machines have worn off labels... particularly the blue ones.

The keyboard key click tends to go mushy. (the HP65 key contacts tend to split vertically along one edge).

Finally the silver trim below the display window is almost always worn completely off on the HP55.

I think most of the problems are related to "cost reduced" manufacturing techniques over the earlier machines. I suspect the case problems are due to some minor change in the plastic formulation to make it green.

Re: HP55

*Message #15 Posted by **Tony Duell** on 3 Apr 2004, 2:18 p.m.,*
in response to message #14 by David Smith

AFAIK the 2 types of LED package are interchageable, although the 3 packages in one machine should all be the same type. Mind you, it works fine if they're not, it just looks odd.

My HP45 has a mix of display types!. I kludged that machine together from a box of bits given to me by a fellow HPCC member. It's worthless to a collector (silkscreen rubbed off, battery contacts home-made, odd display packages, etc), but I love it because I got it working the hard way. The logic board was built from bits of 2 -- I had to work out what was dead on one board and hope it was OK on the other one. Fortunately it was!

The same displays are used in the later (09810-66542) display board for the 9810 desktop calculator. The older board (09810-66541) has individual digit modules -- a total of 45 of them!. Both boards have yellow and brown handles (to match the card guides in the chassis), AFAIK this is the only time where the handles in a 98x0 machine don't give the last 2 digits of the PCB part number using the obvious code.

Re: HP55

*Message #16 Posted by **David Smith** on 3 Apr 2004, 3:47 p.m.,*
in response to message #15 by Tony Duell

All the HP display modules seem to have the same part number even though they are not exactly interchangeable due to the digit size. The leads in the 9810 (and the HP46/81) are trimmed differently becuase the modules are tilted down in the hand helds and up in the desk tops.

One should also check the display brightness code letter on each package. Usually in the range J..M, a difference of a single letter is not really noticeable, two letters and the casual user will not know, three or more can be noticeable.

I have an HP55 with chips and displays salvaged from HP35 and HP45 machines. About the only thing original in it is the passives and the ROM chip. The battery door and contacts are from a '35.

My 55

*Message #17 Posted by **db(martinez,california)** on 3 Apr 2004, 7:24 p.m.,*
in response to message #16 by David Smith

My 55 (ser # 1704s) is the only one i have ever used so i don't have a lot to compare it to. It has no problems with the display or anything. It is "well used" and has numerous dents and a big scratch but no worn off lettering. It's good that it functions well 'cause i paid a whole dollar for it and it would be a drag if it didn't work well.

BTW: i have noticed that a battery with just the right level of almost-drained-out-ness will run my 35 fine, run my 45 but it has a bunch of decimals, give ghost a display that drains in seconds on the 55, and won't even turn on my 65. The 67 runs but has the low battery light. I'm not complaining; just mentioning it.

Message "hidden" in board handle colors

*Message #18 Posted by **Andrés C. Rodríguez (Argentina)** on 4 Apr 2004, 12:43 p.m.,*
in response to message #15 by Tony Duell

Tony:

You said that the 9810 display board handles (yellow -brown) are the only cases of not compliance with the obvious part number code. As Yellow-Brown means "41", I would like to suggest that a secret message for true RPN believers may have been hidden there for almost a decade !!

Fortunately enough for my "theory", the 9820 (not RPN) used a different display.

Also, I would never accept any Red-Gray (28), Yellow-Gray (48) or Yellow-White (49) combinations as a valid message for RPL justification!!

But ... I wondered why the 28 series used a red shift key and gray keyboard plate; instead of keeping with the usual yellow over black ... May here be a clue for shifted key color changes over time? If so, the 48G series should have been the "57" (green-violet)!!

Re: Message "hidden" in board handle colors

*Message #19 Posted by **Tony Duell** on 5 Apr 2004, 1:49 p.m.,*
in response to message #18 by Andrés C. Rodríguez (Argentina)

I don't have a 9820 (YET!!), but I suspect the display board is a 09820-66541. HP subassemblies have part numbers consisting of 2 groups of 5 digits. The first group gives the model number where it was first used. For the 98x0 machines, -6654x numbers seem to be display PCBs. The 09810-66541 and 09810-66542 are the 2 versions of the 9810 display, the 09830-66541 is the 9830 display and the 09830-66542 is the 9830 display driver.

Hi,

how does the extreme color scheme of the HP-70 fit into your theory? Of the classic type calcs, it's by far the ugliest combination (IMHO), although key groups on the HP-70 should be visible even to color-blind people;-)

Raymond

Re: Message "hidden" in board handle colors

*Message #21 Posted by **Andrés C. Rodríguez (Argentina)** on 5 Apr 2004, 8:45 p.m.,*
in response to message #20 by Raymond Del Tondo

I pretended to make some fun about the colors and model numbers (really part numbers, as pointed by Tony). But, just to let it make an extra turn, the color scheme of the HP70 may be decoded as:

Orange Keys => 3

Pale Green Body => 5

I suppose it means that the "secret wish" of the HP70 was to be as important as an HP35 !!

For those not familiar with it, the electronics color code, used mostly for resistors but also for other components is:

```
0 Black
1 Brown
2 Red
3 Orange
4 Yellow
5 Green
6 Blue
7 Violet
8 Gray
9 White
```

Worst H-P Ever Made? (Up to & incl. 48g)

*Message #29 Posted by **Paul Brogger** on 30 Mar 2004, 6:53 p.m.,*
in response to message #8 by Jeff

Ok, say HP-48G & earlier. ("True" H-P.)

I then nominate the 28c. A dramatic departure, but hobbled by that legendary battery compartment door and WAY too ambitious an operating system (RPL) for the available memory.

The 28s fixed the memory problem, but then *begged* for serial I/O. (That and a programmed "wake up/alarm" function would have given them a PDA before the "PDA" acronym had even been coined -- though the battery compartment door remained a perennial issue.)

Re: I second the 28C

*Message #30 Posted by **Ron Ross** on 31 Mar 2004, 8:38 a.m.,*
in response to message #29 by Paul Brogger

I second the 28C for the same reasons if we are going to restrict ourselves to true HP calcs.

Actually the 18C was every bit as poor, but its intended audience probably did not complain about its shortcomings because they wouldn't use the memory except for note taking.

I like my 28C...

*Message #31 Posted by **Britt** on 31 Mar 2004, 2:13 p.m.,*
in response to message #30 by Ron Ross

I have a USA manufactured HP-28C (purchased new in 1988) and I like it very much. While I don't like the size N batteries, I've never had a problem with the battery compartment door.

The main reasons I like it are its display layout and its support for number base conversions and logical operations using an adjustable (1-64 bit) word size (a la HP-16C). As an embedded systems programmer, these features are much more important to me than

graphics, complex numbers or matrix operations.

Britt

Worst HP Calculator Design Decisions

*Message #33 Posted by **Eric Smith** on 31 Mar 2004, 3:14 a.m.,*
in response to message #3 by Paul Brogger

I'm not going to nominate any for worst calculator overall, but I do think they have made some surprisingly bad design decisions at times. Most of the ones on my list are relatively recent, but even back in the good ol' days they didn't get everything right:

1. Using the battery pack to filter and regulate the power from the AC adapter. Some models, most notably the Woodstock series, can be damaged by operation from the AC adapter without a good battery pack installed. Or if the battery contacts get corroded.

2. Press-fit solderless assembly used on the Spice series (HP-31E etc.). US patent 4,197,586 describes this, and gives as the rationale that it avoids the possibility of damaging the chips due to soldering temperature. Sorry, I don't buy it. Most electronic products made since the 1960s have had the components soldered in, and the failure rate due to that is very low. On the other hand, the failure rate of the press-fit solderless calculators was extremely high, and HP did finally give up on the idea and retool to use conventional soldered assembly.

3. The AC adapter connector on the Spice series. Junk. The earlier and later ones are much better.

4. Eliminating double-shot injection molding of keyboard legends. Now the legends wear off over time.

5. Eliminating the snap-disc keyboards. The snap-disc has the property that the tactile response is guaranteed to occur if and only if the contact will be made. Other inexpensive keyboard technologies such as membrane keyboards offer poor tactile feedback, and the tactile feedback can occur without electrical contact or vice versa.

6. Replacing the traditional HP color scheme of gold and blue for the shifted functions with green and purple on the HP 48G/GX, and various other combinations since. Being partially color blind, I could barely tell the colors apart, while I'd had no trouble with gold and blue. Reportedly a focus group of high school students picked the colors. Since it's a calculator for engineers, how about letting engineers pick a reasonable color scheme that's functional, rather than attempting to look "cool". Looking cool is OK when it doesn't make the calculator harder to use. Let high school students pick colors for calculators targetted to the high school market. I doubt that they sold a single extra 48GX or 48G due to the colors, and in fact I bought more used 48S calculators rather than buying a new 48GX. They do seem to have gotten better about this on the latest models.

7. Replacing the large, prominent ENTER^ key with a small key in the far corner. C'mon, guys, it's the most important key on the whole calculator.

8. Putting the HP name on commodity calculators from China. (I don't mind Chinese manufacture of HP designs, but HP shouldn't have branded calculators they didn't design.)

9. Poor documentation on HP 49G. The HP 49G+ documentation is much better, but still not up to traditional HP calculator documentation standards.

10. Insufficient QA before release. Especially noticable on the 12C Platinum.

Re: Worst HP Calculator Design Decisions

*Message #34 Posted by **Veli-Pekka Nousiainen** on 31 Mar 2004, 4:08 a.m.,*
in response to message #33 by Eric Smith

The winner is the HP-48GII - even HP pulled it out.

When (if) they bring it back it still will not have Flash for bug fixes,
it still will have only 128K RAM leaving 80K for the user
AND THERE IS NO Equation Library build-in EVEN though the "48" is used as a model name.
The display is small.
The Serial port is a special mini-B clone, which needs a HP cable (unlike the 49g+ model, which takes any (video)camera cable.
The RS-port can NOT be used for controlling devices, since it pulls the power from the lines where only a PC (or other similar controller) offers it.

All the bad things in the 49g+ will also apply to the 48gII
Like: the IR is not 48 compatible
[ENTER] is small and in wrong place
Colors are horrible - as in ALL the new HP models
etc..ad infinitum
[VPN]

Re: Worst HP Calculator Design Decisions

*Message #35 Posted by **Tony Duell** on 31 Mar 2004, 5:30 a.m.,*
in response to message #33 by Eric Smith

A few more..

The connectors in the HP41 fullnuts that are held in contact by the case screws. I must have fixed 50 or 60 of those darn machines.

The flexible PCB in the HP41 that connects the batteries, I/O ports, and keyboard PCB. That thing suffers terribly if the batteries leak.

[Not strictly a calculator..] The battery pack/charger circuit for the 9114 disk drive. The charger can't keep up with the current taken by the drive, so the battery goes flat when the drive's in use, even with the charger plugged in. You just can't run it continuously using HP-provided stuff (OK, hackers connect the battery connector in the drive (pack removed) to a bench supply).

Not putting an RS232 port on the 49G+. Have USB as well if you insist, but RS232 is useful for connecting directly to peripherals (printer, data logger, etc). I can't be the only person who uses a

calculator without having my PC nearby.

Re: Worst HP Calculator Design Decisions

*Message #36 Posted by **Raymond Del Tondo** on 31 Mar 2004, 7:02 a.m.,*
in response to message #33 by Eric Smith

Hi,

nearly full ack, and your point 10 also dramatically refers to the 49g (NOT +) which is still beta after all those years.

For the 48G series: I admit that the color schema isn't as good as on the S series, but since I used the G series very much, I know where the menues are;-) And the overall keyboard layout is similar to the S series, with only a few exceptions.

Raymond

Re: Worst HP Calculator Design Decisions

*Message #37 Posted by **Bill Wiese** on 31 Mar 2004, 1:41 p.m.,*
in response to message #33 by Eric Smith

I generally concur with all of Eric's comments about various poor HP design decisions over time.

I would add these items:

- the excellent Woodstock-style case should have been retained for HP41C;

- use of size-"N" batteries for the 41C;

- the "zebra" connector connecting a fullnut HP41C PCB to the keyboard PCB can be flaky;

- HP41C should have had sturdier support columns w/metal inserts - these can crack on overtightening, or be too loose and cause contact loss when the 41 "sandwich" spreads open a bit;

- "heat staking" keyboard PCB to front panel even in old calcs which were designed to be repaired (these were high-cost items to begin with and should be fully repairable);

- machines w/ *any* I/O (HP41, 71B, etc. and later) should have had standard UART serial I/O and associated support firmware. An external level converter to swing btwn +12/-12vdc for true RS232 levels would be OK.

- not having a "true RPN mode" (4-level XYZT+L stack) available on the 48 series;

- not using a true emulation layer of prior calcs' firmware for 33S and 12C-Platinum.

Bill Wiese

Re: I disagree about the 48 and RPN

*Message #38 Posted by **Ron Ross** on 31 Mar 2004, 1:55 p.m.,*
in response to message #37 by Bill Wiese

I have to disagree about retaining an RPN stack for the 48 series. While it does make it more complex, it is more also more powerful. The 28/48 were supposed to expand the envelope and the 4 level RPN stack constricted that.

The 48 was to be much more than a 41. That said, there was still a real market for a 41 type replacement that was never filled and actually just plain abandoned. The 42s didn't have I/O and the 48G was way to BIG! and cumbersome because of its size and the complexity of RPL.

Just my $0.02.

Re: I disagree about the 48 and RPN

*Message #39 Posted by **Tony Duell** on 31 Mar 2004, 2:44 p.m.,*
in response to message #38 by Ron Ross

I feel that which of {4 level RPN} or {'infinite' level RPN/RPL} you prefer depends on which you learnt first.

Although I had an HP41CV when it was current, I didn't use it that much (I was doing serious hardware hacking on the Sharp PC1500...). I really started using HP machines when the 28C came out.

I find that I actually prefer the RPL stack, named variables, different object types, etc. I love my 41s (don't get me wrong...) -- heck I like the 3-level RPN stack of the 9100/9810 as well. But I have no problems with RPL either.

Re: I disagree about the 48 and RPN

*Message #40 Posted by **Raymond Del Tondo** on 31 Mar 2004, 4:51 p.m.,*
in response to message #39 by Tony Duell

Hi Tony,

>I feel that which of {4 level RPN} or {'infinite' level RPN/RPL} you prefer depends on which you learnt first.

>

Not always.

The calc I learnt the phantastic RPN with was a 33E which a friend lent me for a few days. After that experience, I bought my first HP-41C and HP-11C, and used and programmed them (especially the 41) every day, mainly in ML.

Writing RPN programs with optimal stack usage was a nice game, at least at the user code level. The automatic T duplication or seamless stack roll feature were (and are) very handy sometimes. But it can lead to a very dirty program style, because you never have to clean up the stack mess your program left.

With the event of the first RPL machine (28C) I (and many other people) had to learn the new stack concept. First it seemed a bit difficult, but after all it's as easy to handle as the traditional RPN stack.

When programming in RPL, you have to watch your stack parameters, and take care of other programs' stack parameters.

However, both worlds have their advantages. For programming I much prefer the HP-48 (RPL and ML), for daily adding of a few values the HP-41 is more handy, but I sometimes ask myself how I could be satisfied by a single line display for all these years;-)

Regards,

Raymond

*Message #41 Posted by **Charles** on 31 Mar 2004, 5:19 p.m.,*
in response to message #40 by Raymond Del Tondo

I have particularly bad memories of my relatively expensive HP33E routinely going crazy in university examinations. HP didn't seem to be able to fix it so I went to the dark side of the force (TI58) for the next three years.

The lack of protection of the screen on the HP48 also seems poor to me. How many people have broken that ? Even Casio and TI give you a protective cover for graphing calculators.

On the other hand, my HP41CV is still going after 20 years and my HP11C has lasted 15 and I wouldn't change them. It's just that we have such high expectations of HP's engineering.

That would have really been nice. The whole thing could be interanl, but there should be a way to shut the RS-232 drivers down so you don't have to keep disconnecting the cable every moment you're not using it, since RS-232's power requirements are a bit heavy for small batteries.

I do have the FSI164A HPIL-to-RS232 interface converter though, which is similar to an HP82164A with an extra RS-232 channel (and optionally up to 8 channels). I've used it a lot with both the 41 and the 71.

Quote:

---

the excellent Woodstock-style case should have been retained for HP41C;

The Woodstock series clearly had the best industrial design of a calculator **ever**. Given how atrocious the industrial design of the Spice series was, I can only guess that the industrial designers didn't want to move to Corvallis, Oregon when the calculator division moved there in 1976.

In my opinion, the 41C industrial design is fairly good. The real problems are the internal connections, as Tony Duell has pointed out.

And the Voyager industrial design is very good, provided that you don't mind the horizontal layout. Some people love that, some people hate it.

The one that surprised me was the 38G. They put a lot of effort into the industrial design of the flip cover, but the calculator itself is just a rectangular box with keys. I thought this model was supposed to appeal to high school students, but I can't imagine that it particularly did unless there was some fad for boxy products that I haven't heard of.

HP-48 G user interface in calculator mode [error messages (DROP: Too few arguments) instead of a NULL keystroke nullifier] and RPL fundamentalism (everything in reverse notation: 1 10 FOR...)

The HP48 is not a bad product at all but, in my humble opinion, it was a lost opportunity, with that much power...

I feel someone's compass failed while approaching high latitudes...

A Classic RPN emulated mode, would have eased some pains.

For me, it is not fundamental enough: << 1 10 FOR I >> instead of << 1 10 I FOR >> and << IF test THEN...>> when you have << test IFT ...>>

*Message #48 Posted by **Andrés C. Rodríguez (Argentina)** on 2 Apr 2004, 7:19 a.m.,*
in response to message #47 by Massimo (Italy)

view your support I

...or...

weiv ruoy troppus I

RPN was good not because it being backwards, but for being intuitive, practical and understandable. But I don't want to start this old discussion again; I understand there are people who like RPL as much as I like RPN, and who think of RPN as something as sad as parenthesis in a calculator keyboard. I respect such positions, but I liked just to give my humble opinion.

What about the "Drop" error message

Re: Worst HP Calculator Design Decisions

*Message #49 Posted by **Massimo (Italy)** on 2 Apr 2004, 8:45 a.m.,*
in response to message #48 by Andrés C. Rodríguez (Argentina)

Hi Andrés,
mine were not meant as flames to start another fire: I agree that each one has his/her preferences; mine are not RPL oriented but this is **my** fault since neither do I have the time nor the will to master *another* language. As far as calculators are concerned I started with RPN and do not need more but YMMV, of course...

The looping excerpt got my attention since last week I took my 49G+ for a quick and dirty benchmark against some of its ancestors and, well, I found that I forgot the right syntax!

And yes, I got that "drop" error too many times ;-)

Take care,
Massimo

*Message #51 Posted by **GE (France)** on 3 Apr 2004, 3:05 p.m.,*
in response to message #50 by Paul Brogger

It is impossible for a simple theoretical reason to have "1 10 I FOR" instead of "1 10 FOR I".

The reason is that if you take the first 3 steps of "1 10 I FOR" you have a perfectly valid program which pushes 3 elements on the stack, while for the third this is not what you want : you want to declare a local variable.

QED.

1 10 I FOR . . .

*Message #52 Posted by **Paul Brogger** on 3 Apr 2004, 11:23 p.m.,*
in response to message #51 by GE (France)

One implementation of a "proper" behavior for << 1 10 I FOR ... >> might be if the "I" pusheS an *identifier* on the stack, and then FOR uses the identifier in declaring the local variable for iteration.

However, the interpreter writers out there may have a more informed opinion to share . . .

Re: 1 10 I FOR . . .

*Message #53 Posted by **Arnaud Amiel** on 5 Apr 2004, 7:31 a.m.,*
in response to message #52 by Paul Brogger

You are right, what I really meant was: << 1 10 'I' FOR ... >>. As far as RPL purity is concerned I really prefer sysRPL but it is slightly more troublesome than UsrRPL so I stick to the latest on for a quick little program on the side.

Re: hp 49 for $450????

*Message #55 Posted by **Randy S;oyer** on 30 Mar 2004, 6:06 p.m.,*
in response to message #1 by Bill Lee

Missing something? Yes, it's not your everday, ordinary run of the mill HP49G - it's preloaded with "Directional Drilling" software... Just in case you have an oil field in the back yard... Of course if you do, then you don't care about the $450... Chump change.

In that case, I've got an oil dowser for $10,000 should you need to find the proper place to drill... IMO about as useful as a 49G.

Re: hp 49 for $450????

*Message #56 Posted by **Jim Creybohm** on 30 Mar 2004, 7:42 p.m.,*
in response to message #55 by Randy S;oyer

Just a minor clarification Randy; the directional drilling software does not tell you "where to drill", rather it tells you "where you are drilling to". Some interesting trigonometric calculations based upon depth, deviation from vertical and azimuth - but something easily duplicatable in a 41 with reasonable accuracy. Mind you, a 41 might bring that price in as well - and it is arguably more robust!

Your dowser would be better served in the seismic industry;)

HP 82240A Infrared-Printer

*Message #1 Posted by **Michael Kaiser** on 30 Mar 2004, 2:50 a.m.*

Can someone help me, please ?!

I just bought a new HP49g+ but it doesn't work together with my (old) IR-printer HP82240A. (The printer works together with my HP 28C - so it's o.k.)

It's garuanted that HP49g+ works with IR-Printer HP82240B.

Is this possible, I can't believe that I now have to buy an new IR-printer ??? - What is the difference between HP82240A und HP82240B?

Can someone discribe the differences of the IR-language of this two printers ?

I asked the lokal dealer in germany and the support hot-line for germany (which is located in tschechia) but noone knows anything exactly.

Thanks for your help !!!

Re: HP 82240A Infrared-Printer

*Message #2 Posted by **Raymond Del Tondo** on 30 Mar 2004, 4:49 a.m.,*
in response to message #1 by Michael Kaiser

AFAIK the main differences between the A and B version are the character set used, and the reduced battery drain of the B . The IR protocol should be identical. Is it stated in the manual that the 82240 IR printer will work with the 49g+, or do you simply assume it?

These printers work well with any real HP-48, but the 49g+ has not much to do with an HP-48.

Raymond

Re: HP 82240A Infrared-Printer - and reasoning...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 Mar 2004, 6:56 a.m.,*
in response to message #1 by Michael Kaiser

Hi Michael, Raymond, guys;

Raymond is correct in all aspects; I just want to add some data, O.K?

The HP82240B offers two character sets, being ECMA94 and ROMAN8, while the HP82240A has the ROMAN8 set, only. ROMAN8 is closer to previous HP82143A (HP41 standard peripheral printer) and HP82162 (HPIL portable printer), and I am not sure if it is, in fact, the same.

The "early" HP48 series (S/SX/G/G+/GX) allow the use of both printers: A or B. If you want to use the A-

series, there is the need to remap the IR output, and you need to execute OLDPRT. If you want to use the B-series after that, you need to purge PRTPAR so the remapping feature is reset.

I guess that if the HP49G+ manual states that the IR output is defined for an HP82240B and if there is no OLDPRT command available, then you may use the HP82240A but some characters coded 128d to 255d will not print correctly (in fact, the standard ASCII character set, from 32d to 127d, doesn't need remapping: A to Z, a to z, 0 to 9 and standard punctuation). As both printers use the same "IR" protocol, I see no trouble using an HP82240A with an HP49G+. Maybe you should test first to see if there is nothing wrong.

The only additional characteristic is that there is an extra blank "pixel" row between strings when printing text only. You may have noticed that there is almost no clearence between text lines in an HP82240A listing. This is because of its graphics capabilities, so there is only one blank pixel row between lines. In the HP82240B, all characters are one row "shorter", but it eases reading.

I think that's all. Hope this helps.

And please, if I missed some code or equipment ID, forgive me: I just have no manuals in hand right now, this is all written "by heart". (I edited the message to add this)

Cheers.

BTW, the reasoning is: is there any chance that the HP82240B is getting back in production? A new design perhaps? Or it's alreadyhappening and I am not aware of this? Anyone taht knows something about this?

Luiz (Brazil)

*Message #4 Posted by **John Cadick** on 30 Mar 2004, 10:44 a.m.,*
in response to message #1 by Michael Kaiser

The printer should work. The problem is probably range of the IR on the 49G+. It only has a useful range of a few inches. Some have reported two or three inches maximum. Make sure that you have the two very close together and try again. It should work.

John

Re: HP 82240A Infrared-Printer

*Message #5 Posted by **Chan Tran** on 1 Apr 2004, 9:20 a.m.,*
in response to message #4 by John Cadick

Even though the 49G+ has an IR port I don't think it would work with either the 82240A or B. HP has discontinued the 82240A/B when they introduced the 49G+. I think the 49G+ IR port is only compatible to the IR port on a PC. I don't have the manual of the 49G+ so I can't confirm this.

Re: HP 82240A Infrared-Printer

*Message #6 Posted by **unspellable** on 1 Apr 2004, 3:03 p.m.,*
in response to message #5 by Chan Tran

I've had a hard drive crash and lost the website, but the company that made the HP 82240A still sells them under their own name. These printers were used in other areas. I have a chronograph that uses an IR printer. It looked so much like an HP 82240A that I made an enquiry and the guy at the chronograph

works admitted it was the same printer. So I have been using my HP 8220A with my chronograph.

meanwhile I stumbled across the website of the outfit that actually makes the printers, but lost it with my hard drive crash. (Backup, backup, backup, and then backup the backups!)

Re: HP 82240A Infrared-Printer

*Message #7 Posted by **Tom Scott** on 1 Apr 2004, 8:08 p.m.,*
in response to message #5 by Chan Tran

The 82240B printer works fine with the 49G+ as long as the distance between the printer and calculator is less than a few inches and the delay time set to 1.8.

33s Modifications???

*Message #1 Posted by **Doug Clark** on 29 Mar 2004, 8:39 p.m.*

What is the possibility that HP is delaying the release of the 33s so that they can change the display to correct the microscopic decimal point, that they are changing to keyboard back to a non-chevron layout and/or that they're making other small modifications as suggested by the HP community as a result of beta testing?

How long would it actually take to make these kinds of changes from start to finish and get a calculator off the production line, shipped across the ocean, and into the stores? Maybe I'm just dreaming....

Re: 33s Modifications???

The possibility exists. The _probability_, however, is close to zero. HP no longer designs the calculators sold under its name. Besides, I'm pretty sure that there is no one left at HP who gives a damn. 8^(

*Message #4 Posted by **Mike Sebastian (Texas)** on 29 Mar 2004, 11:08 p.m.,*
in response to message #1 by Doug Clark

I suspect that the ROM bugs that have been found will be fixed first. Increasing the size of the decimal point at some future date is a possibility. I expect the chevron keyboard layout is here to stay.

Look at the collector potential. The early "Walmart" 33S with ROM bugs and small decimal point will be very rare. The 33S with the small decimal point will be somewhat rare.

For *you*, maybe. For some of us, it is not at all "nice." If you don't like that, perhaps *you* need to "Get over it."

Re: 33s Modifications???

*Message #13 Posted by **Anon** on 30 Mar 2004, 7:40 a.m.,*
in response to message #12 by Wayne Brown

Don't worry Fred.

Suppose HP came out out with a HP15c with a selectable RPN or RPL mode, a keyboard that rea your mind and adjusted itself the way your wanted, a terabyte of memory and a 5 gigahertz CPU. Also it would have all the math functionality of Mathematica, but still be easy to use. It would also run off a single cell for 50 years and be available in your choice of colors / styles.

If HP came out with such a calculator, a few people here would still complain about mindless things and say they prefer ugly brown things. Its called the *Museum* of HP calculators for a reason.

Exactly!

Re: 33s Modifications???

*Message #15 Posted by **Ben Salinas** on 29 Mar 2004, 11:40 p.m.,*
in response to message #1 by Doug Clark

I am guessing that they will fix the ROM (most likely because that would be simple to do) and they might, if they do anything with the body, make the screen less "glarey". This could probably be achieved without too much trouble and would fix some of the issues with the decimal/comma.

The keyboard is probably here to stay, and that's okay by me (not my first choice for keyboard, but it is good)

-Ben

Re: 33s Modifications???

*Message #16 Posted by **Frederic** on 30 Mar 2004, 7:45 a.m.,*
in response to message #15 by Ben Salinas

Me too i find the calclator is good. At first i dislike the keyboard and look, but now i'm use to it and find it more ergonomic than my 32S. The look is not so bad too; a LOT of coworkers that see it said that this is the beautiful HP calculator they ever saw... Well i'm not goint this far but it looks great finally... I think the majority of pepole here like this calculator too, even those who has negative comments on it before having one in hands.

> Do you really think that a calculator encased in black nerd-material is prettier?

I'm not sure "pretty" is a description I'd *want* to apply to a calculator. "Elegant," "sleek," "classic" -- like a black tuxedo or a basic black evening gown -- that's more what I have in mind. Remember the Monolith from "2001: A Space Odyssey"? Massive, black and perfectly rectangular, with sharp edges and corners -- now *that* was a classic design! So I suppose I should add "imposing," "impressive" and "intimidating" to my list of adjectives for describing the perfect calculator.

HP seems to trying to get people to react to their new models by saying, "Awww, isn't it *cute*?" I'd prefer a reaction more like, "Wow! I'll bet you need a PhD just to switch that thing on! Nobody but a real science-and-math nerd would ever be interested in something like that."

Re: 33s Modifications???

*Message #22 Posted by **KC (Hong Kong)** on 31 Mar 2004, 4:33 a.m.,*
in response to message #21 by Wayne Brown

Suppose HP's original calculator models are all HP33S like, then suddenly, a new model comes out that looks like HP32s/42s, I'm sure at least some of the people will say something like "Woo, it's such an ugly, un-stylish, and silly calculator".

My first calculator is a Casio calculator, and it looks thin, shiny, beautiful, small, but with a lot of buttons (at that time, I thought more buttons mean more powerful). And then my classmate got a HP22s. Do you know what I thought? "Oh, how ugly it is!" Then I got a chance to play around with the calculator. I was impressed by its functions, and its positive key-touching feels. I became to think that afterall the calculator was not so ugly. Now, I cannot live without an RPN HP calculator, and I think HP calculators are beautiful.

So the conclusion: why people think that old HP calculators are beautiful? It is because the old ones are SO good that we fall in love with them, and then we WOULD think they are the most beautiful ones in the world, objectively.

Btw, I never fall in love with Texas calculators, and I think they all look ugly.

Re: 33s Modifications???

*Message #23 Posted by **Wayne Brown** on 31 Mar 2004, 10:58 a.m.,*
in response to message #22 by KC (Hong Kong)

Perhaps that's why *some* people think they're beautiful, but that's not my reason. I love the looks of models like the HP-41 because they would fit right in with equipment like this:

http://www.apolloexplorer.co.uk/photo/html/as11/10075282.htm

http://www.apolloexplorer.co.uk/photo/html/gt7/10074151.htm

http://www.apolloexplorer.co.uk/photo/html/as8/10074953.htm

http://images.jsc.nasa.gov/luceneweb/fullimage.jsp?photoId=S83-34270

HP is trying to make their products look "friendly" and non-threatening to the average non-technical person, and *that's* what I dislike so much about them.

Re: 33s Modifications???

*Message #24 Posted by **Eric Smith** on 1 Apr 2004, 12:33 a.m.,*
in response to message #23 by Wayne Brown

> Quote:

They're failing. The HP 33S is the most threatening-looking calculator I've ever seen. The awkward angles of the keys are very disconcerting, and somehow bring to mind the Cthulu mythos.

NASA pix

*Message #25 Posted by **Karl Schneider** on 1 Apr 2004, 1:43 a.m.,*
in response to message #23 by Wayne Brown

Wayne --

Thanks much for the NASA mission pictures. Several things I noticed:

1. The rotary telephone dial on several of the consoles --even two years or more after the touch-tone phone was invented.

2. The UK web site, from which your first three pix came, gave dates of photos and had no &^*%# big banner image to download -- unlike NASA's site.

Re: NASA pix

*Message #26 Posted by **Wayne Brown** on 1 Apr 2004, 8:13 a.m.,*
in response to message #25 by Karl Schneider

Karl,

The picture from the NASA site was taken 1983-06-18. Here's a link to a smaller version of the picture with a lot more information about it:

http://images.jsc.nasa.gov/luceneweb/caption_direct.jsp?photoId=S83-34270

I'm afraid it still has the big annoying banner, though.

Re: NASA pix

*Message #27 Posted by **Matthew Riehl** on 6 Apr 2004, 10:03 p.m.,*
in response to message #25 by Karl Schneider

You can see several pictures of HP calculators in orbit. Go to the web page:

http://images.jsc.nasa.gov/luceneweb/search.jsp

In the "NASA Photo ID Search" block put "STS51F-17-011" to see an HP-41.

In the "NASA Photo ID Search" block put "STS052-25-027" to see an HP-48 (the other fellow is holding an ancient woodworking adze, for some odd reason).

Matt

Re: 33s Modifications???

*Message #28 Posted by **Paul Brogger** on 30 Mar 2004, 8:44 p.m.,*
in response to message #1 by Doug Clark

Perhaps the best way to fix decimal point problem would be with ROM changes, rather than a new LCD.

Simply use one digit position for a decimal point, with a big fat four-pixel point (or six-pixel comma) in the bottom middle of the character matrix. (How unmistakably visible is the decimal point on my HP-97!)

And it doesn't look like there'd have to be many updates to the documentation -- the decimal points in the simulated displays there look much clearer than the real thing!

Eric Smith - I Need Your Help - HP41C

*Message #1 Posted by **Wayne Stephens** on 29 Mar 2004, 8:11 p.m.*

Hey Eric (or anyone else that may know),

I am trying out the Hp 41C Memory Testing program you posted here last week.

Line 38 of the program reads: x/=y?

I assume this means "x not equal to y?", which is indeed a conditional test listed on page 171 of my manual.

However, I cannot find any way to invoke this conditional test. It is not on the keyboard (nor are the < or > signs available in ALPHA mode as far as I can tell), I cannot find instructions in my manual on HOW to execute it (the manual sinply lists the fact that it exists) and I have tried hundreds of different keystrokes without hitting upon the correct one.

Please help me. I hope you will excuse my ignorance on this issue as I am very new to the HP 41C.

Thank you.

Take care.

Wayne.

Yes, that's correct.

> Quote:
>
> However, I cannot find any way to invoke this conditional test. It is not on the keyboard (nor are the < or > signs available in ALPHA mode as far as I can tell),

The angle brackets are the shifts of I and J (COS and TAN). The not-equals symbol is the shift of H (SIN). These should be shown on the label on the back of the calculator.

Let me know how things go. I hacked that program together very quickly and only gave it minimal testing, but I think it works.

Re: Eric Smith - I Need Your Help - HP41C

*Message #3 Posted by **Wayne Stephens** on 29 Mar 2004, 9:05 p.m.,*
in response to message #2 by Eric Smith

Thanks, Eric.

I'll go try it now.

I think the back of the calculator is the only place I DIDN'T look to try to figure out how to type in those characters. I feel kind of silly now.

Take care.

Wayne.

HP41C/CV and HP41CX back label

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 Mar 2004, 10:23 p.m.,*
in response to message #2 by Eric Smith

Hi;

I know all "veterans" know about this, but it's just a matter of finding the best moment to post about.

The HP41CX back label figures the CX-exclusive [ED] keyboard. It's different of teh one found in both HP41C and HP41CV. In this case, both back labels figure the "/=" (not-equal-to) symbol, but some shiffted functions are changed.

My 2¢.

Luiz (Brazil)

Re: HP41C/CV and HP41CX back label

*Message #5 Posted by **Wayne Stephens** on 30 Mar 2004, 5:30 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thank you Luis,

I really like my 41C and am actively looking for fullnut versions of the CV and CX to add to my small collection, so I am eager to learn all I can about all of them.

It is slow by today's standards, it doesn't have equation lists or a SOLVE feature like some of the later models, but despite these shortcomings I am starting to think the 41c series is the best calculator HP ever produced. It definitely has the best heft and "feel" in your hand (I think substantial is the correct word).

Take care.

Wayne.

Re: Eric Smith - I Need Your Help - HP41C

*Message #6 Posted by **Wayne Stephens** on 30 Mar 2004, 6:49 p.m.,*
in response to message #2 by Eric Smith

Eric,

The program runs, and displays "STO OK:###", then stops. When I hit R/S again, it kicks out of the program (usually with the number 25 displayed).

I assumed hitting R/S would start the "RCL OK:___" test. Is this what the program was supposed to do?

I have checked several times and I'm pretty sure I have it entered exactly as you posted it. i will check again, though.

Thanks.

Take care.

Wayne.

Re: Eric Smith - I Need Your Help - HP41C

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 30 Mar 2004, 11:48 p.m.,*
in response to message #6 by Wayne Stephens

Hello, Wayne;

I hope you forgive me posting instead of Eric (and I hope Eric forgive me, too), but I think there is no problem on what you're getting after you press [R/S].

I don't see Eric's listing, but there is one fact we probably agree with: unless the circuits are faulty, you can either use [RCL] or [STO] to make sure a register exists. If you use [RCL] instead of [STO], you'll change stack contents unless the register you recall the contents from does not exist. You probably have one or more [FS? 25] or [FS?C 25] instruction somewhere in Eric's program to detect the occurrence of a "nonexistent" register. When this happens, the program stops and shows a compreensive message, like "STO OK:###".

I guess you typed the program in and you did it without using any specific "synthetic" procedure, I mean, only regular keystroke sequences. So I must tell you that the HP41 has a "standard" behavior when you run a program: the program becomes the "current" program. if you run a program and right after it stops you press [PRGM], you'll see something like this:

```
[00 .REG. ### ] (if you press [SST] you can navigate)
```

or

```
[ PRIVATE     ] (protected program; can't navigate)
```

or

```
[00           ] (ROM program; can navigate but alter)
```

It's not unusual to start running a program and stop somewhere else; in this case, you can also see a step number and some mnemonics after pressing [PRGM], meaning the program actually stopped somewhere but the last step (an END). The fact is that the "current" program is completely available to be edited if you press [PRGM] (unless it's a protected program or a ROM program). The best procedure to position the "calculator" (i.e. program counter) in an unused part of the available memory is pressing:

```
[GTO][.][.]
```

after you finish using any programs. You might do that only when you are not running programs taht

compuse a particular computation that's still being performed at the moment, because [GTO][.][.] sets some internal pointers to default condition, and also clears some internal references like subroutine return addresses, if applicable (and if I am not wrong...). If you are in the middle of some particular computations with the use of programs AND you need to briefly stop, don't use [GTO][.][.]. You'll probably need to start over or find some mid point to continue. In ***most*** cases, switching the calculator to OFF and back to ON later to continue where you stop without the need to start over is enough and safe.

Sorry writing too much. I think that as a beginner, you must go for the most common cases and then getting deeper into particular ones. I hope I did not confuse you much.

Luiz (Brazil)

F1 (off topic)

*Message #9 Posted by **Wayne Stephens** on 31 Mar 2004, 5:43 a.m.,*
in response to message #8 by Wayne Stephens

Luiz,

I meant to ask before. Are you an Formula One fan?

Wayne

Re: F1 (off topic)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 31 Mar 2004, 3:48 p.m.,*
in response to message #9 by Wayne Stephens

Hey, Wayne;

Thank you for asking. To be honest, I like the cars, the technology, the "apparatus", the beautiful women d8^D ... but I don't follow the races themselves. I don't even follow the scores... Sorry! Did it happen something about it for these days?

Some Brazilians used to like F1 when Sena was alive and running and no longer follow it after he left us. I am honest telling you I was never a race fan, but I like the technology... and the girls, of course.

I hope you're not disappointed... :^|

Cheers.

Luiz (Brazil)

Re: F1 (off topic)

*Message #11 Posted by **Wayne Stephens** on 31 Mar 2004, 4:39 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

No particular reason for asking other than that you are from Brazil. I have been told it is second only to World Cup Soccer (Futbol?) in popularity among Brazilians.

I follow it pretty closely every season and am continually amazed at the technology and the overal spectacle of it all. I have a Brazilian friend who stopped watching after Senna was killed. I think a lot of people in Brazil may have done the same.

I occasionally travel to a race, but have not been to the Brazilian GP yet.

Take care.

Wayne.

Re: Eric Smith - I Need Your Help - HP41C

*Message #12 Posted by **Eric Smith** on 31 Mar 2004, 3:21 a.m.,*
in response to message #6 by Wayne Stephens

When it displays "STO OK: nn", the program should still be running, even though it's not displaying the goose. You can tell it's still running because the PRGM annunciator is still on. If you hit R/S, you're stopping the program. It should just run by itself for about the same length of time it took to get to the "STO OK" display, then display "RCL OK: nn" and stop.

I've only tested it on a 41CX, but it should work the same on a 41C or 41CV. If there are no other programs in memory, you should be able to execute "SIZE 044" on a 41C beforehand, and get a "STO OK: 44" display. Add 64 for each single memory module, or 256 for a quad.

Re: Eric Smith - I Need Your Help - HP41C

*Message #13 Posted by **Wayne Stephens** on 31 Mar 2004, 12:05 p.m.,*
in response to message #12 by Eric Smith

Thanks, Eric. I assumed when the first results were displayed, and the "flying goose" went away, that the calculator was waiting for something (input from me?).

I had forgotten that the program is still running as long as the PRGM annuciator is on.

That will teach me to be a bit more patient.

Thanks again. You have been immensely helpful.

Take care.

Wayne.

Where to find HP-48GX RAM / ROM??

*Message #1 Posted by **Steve S** on 29 Mar 2004, 5:42 p.m.*

I recently purchased an HP-48GX and would like to explore some expansion possibilities. Other than the obvious (eBay), where else might I look for RAM and ROM cards, either new or used? Based on what little looking I've done to date, these cards aren't very easy to find...??? Thanks.

Re: Where to find HP-48GX RAM / ROM??

*Message #2 Posted by **Jeff** on 30 Mar 2004, 7:07 a.m.,*
in response to message #1 by Steve S

Very nice ram cards at good prices are available from Klotz Electronic. The cards are "naked", i.e., they are basically bare circuit boards without the outer case of the HP cards, but since they are usually inside your calculator, that should not matter. Service from Germany was excellent when I bought a couple of them a year or two ago.

I second Koltz

*Message #3 Posted by **Ron Ross** on 30 Mar 2004, 7:48 a.m.,*
in response to message #1 by Steve S

Koltz as stated above is an excellent source. I bought a 128K and a 1 Meg.

The 128K is needed to run Certain applications such as Meta-Kernal. Else for storage the 1 Meg is a much better buy. 2 and 4 Meg cards are also available.

Vectors on 15c?

*Message #1 Posted by **Ron Jones** on 29 Mar 2004, 11:05 a.m.*

I know the 15c did matrices but could it do vector math as well. Or did it have to be programed to do the cross product, spherical, and angle between vectors?

Re: Vectors on 15c?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 Mar 2004, 12:26 p.m.,*
in response to message #1 by Ron Jones

Hi, Ron;

it may seem obvious, but if you are dealing with 2D vectors (plain), you can use some complex functions that will give equivalent NUMERICAL results. Just for the records: do you already use complex numbers in the HP15C?

If you are dealing with 3D vectors (as you mention spherical), I think some small programs would help.

What I am not sure is if some matrix operations could help if you consider [1×3] or [3×1] matrices as 3D vectors. I don't remember it well (it takes a long time since I needed it), but I think some matrix operations apply to 3D vectors and give numerical equivalent results as well. One of the contributors that has one of the deepest knowledge about the HP15C and applied math is Valentim. I know that others know it as well, but Valentim is always bringing some tricky challenges to this forum and his answers are quite clever and thoughtful.

For sure someone else will post something more. Sorry not helping that much.

Cheers.

Luiz (Brazil)

Re: Vector calculus on the HP-15C?

*Message #3 Posted by **Karl Schneider** on 30 Mar 2004, 12:45 a.m.,*
in response to message #1 by Ron Jones

Ron --

No, unfortunately, the HP-15C did not have specific vector-calculus functions built in, as did the HP-42S. However, one could use the built-in matrix functions for performing dot product and angle between vectors of any dimension within memory limits:

1. Load vectors into two (n x 1) row-vector matrices.
2. "A dot B" (e.g.) would be A^TB -- use "MATRIX 5".
3. Angle between A and B would be $\cos^{-1}$ of ("A dot B" over the product of magnitudes of A and B) -- use "MATRIX 8" (Frobenius norm) to get the magnitudes.

Vector cross product could be calculated using built-in determinant function ("MATRIX 9") three times, but it would be faster and more space-efficient to calculate it directly from stored vectors. Use "RCL g {A-E}" and "STO g {A-E}".

Coordinate conversion would be a programming task. I'd recommend getting a HP-48* for that. (HP-41C* with Math Pac would also work.)

Calculator

*Message #1 Posted by **Nancy Hintz** on 29 Mar 2004, 10:09 a.m.*

Could you tell me what the closest comparable to your model 19BII would be?

Re: Calculator

*Message #2 Posted by **Ron Ross** on 29 Mar 2004, 10:53 a.m.,*
in response to message #1 by Nancy Hintz

Do you use your Hp19Bii in RPN or algebraic mode?

Makes a big difference in what I would recommend to replace with.

If you use in algebraic mode, you could buy the earlier Hp19b, find via ebay fairly cheaply. RPN is a different story.

Re: Calculator

*Message #3 Posted by **Namir** on 29 Mar 2004, 11:01 a.m.,*
in response to message #1 by Nancy Hintz

Nancy,

An HP17BII would be a replacment that I suggest. You can use it in both RPN or algebraic modes.

Namir

41CX Features.

*Message #1 Posted by **Ray** on 29 Mar 2004, 2:04 a.m.*

Ok, a dumb question, but I'm curious none. I saw this on RSkey.org

"The CX model of the HP-41 line was the most advanced, offering extra built-in memory, timer functions, and other features."

Anyone care to describe to me what those "other features" are in specifics? I'd kind of like to know what my 41C is missing.

You know where this is going... I gotta get another calculator. :)

-Ray

Re: 41CX Features.

Re: 41CX Features.

*Message #3 Posted by **Karl Schneider** on 29 Mar 2004, 3:08 a.m.,*
in response to message #1 by Ray

Ray --

Please do take a look at the 41C* link on the MoHPC site as Raymond pointed out, as well as the "Compare Features" link on the home page -- there is much useful, well-presented info. The differences are fairly subtle, but this should cover most of them:

- Maximum 319 (64*5-1) registers of RAM, instead of only 63 (64*1-1)
- Built-in contents of Extended Functions Module ROM and other CX-specific Extended Functions
- Built-in contents of Time Module ROM and other CX-specific Time Functions
- Text Editor for Extended Memory text files
- More types of catalog listings, including keycode assignments
- Desired catalog listing can be selected for display (instead of waiting for it to come around in sequence)
- Program catalog listings show size of program as well as the beginning external label (name).

Since the CX was made from 1983-89, and HP-41 models shifted to the Halfnut design in 1985, most 41CX's are Halfnuts -- unlike the 41C (1979-85?), which are (all?) of the older Fullnut design.

Fullnuts have better-designed displays and are much more repairable, but are more complicated and tend to require more service.

-- Karl S.

full- and halfnuts

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 Mar 2004, 5:41 a.m.,*
in response to message #3 by Karl Schneider

Hello Karl, guys;

after wondering about the same question (Are there any HP41C build as halfnuts?) and exposing this subject sometime ago, I read that there were indeed some HP41C build as halfnuts mostly for replacement purposes (maybe some other purpose?). It seems to me it's a rare "piece", a true collectible.

I was given (a very good friend) an HP41CV halfnut that's faulty: it shows only the first 1/5 memory space, as it happens in an HP41C. It's memory "chips" (the hybrid under the LCD) are not reliable as well, because they tend to cnage their contents from time to time, i.e., programs stored in this calculator have their codes changed and barely work. I had an old, not-operative HP41C fullnut and I found out that the cases may be exchanged with a bit of extra work: after removing the keyboard, both full- and halfnut main PCB's fit each other's keyboard cases, but some plastic posts (rivets) must be removed (about eight, if I am not wrong). Now I have a fake/faulty HP41C halfnut! And that's neat!

My 2¢.

Luiz (Brazil)

Edited: 29 Mar 2004, 5:42 a.m.

Re: full- and halfnuts

*Message #5 Posted by **Tony Duell** on 29 Mar 2004, 12:44 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

The HP41 service manual lists (and gives a parts catalogue and schematics for) a halfnut HP41C. The difference between it and the halfnut CV (at the component level) is the display driver hybrid (it's not just a link that you have to swap). But I am told that these machines were never on general sale, only used as service replacements.

For a real rarity, how about an HP41 test calculator. I have never seen a genuine one. I have one, but it's home-made...

Any watch collectors here?

*Message #1 Posted by **Who cares** on 28 Mar 2004, 3:37 p.m.*

Below is an interesting replica of a 70 yrs old pilot watch:

http://www.hanhartusa.com/hanhart_fliegerchronograph_replika.htm

Although I don't own this watch as we speak, I know the reputation of the firm and I have no doubts this is a quality instrument. It is less precise than a modern mass-produced watch, doesn't have a calendar, doesn't beep or play jingles. It's also kinda clunky and costs a bundle.

If I confessed that I have this thing on order (not that I do, of course), am I going to be dismissed as a senile old fool with more money than sense? More important: might there be a "point" here that escapes the dull bureaucrats at a certain calculator firm that shall remain unnamed?

Re: Any watch collectors here?

*Message #2 Posted by **Trent Moseley** on 28 Mar 2004, 5:11 p.m.,*
in response to message #1 by Who cares

For a lot less money try the Swiss Glycine "Airman Special" with a real 24 hour dial.

tm

I would like to be one!

HP42S: [GTO][.] in PRGM mode

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 28 Mar 2004, 1:29 p.m.*

Hi, all HP42S users and owners d;^)

When I started using an HP42S (80's), I found myself with an "interesting" challenge/task. Let me just remember the HP41 before going further.

When the HP41 is in PRGM mode, [GTO][.] allows the user to go to an specific step number in the current program AND also allows the use of [ALPHA] for searching any glogal label WHILE the calculator is in PRGM mode, i.e., [GTO][.] is not programmable. The only problem of using [GTO][.][ALPHA] is the need of correctly spelling the ALPHA label.

The HP42S adds a PRGM catalog that is active anytime you press [GTO] or [XEQ], and both allow [ALPHA] to be activated so you can either use a softbutom or spell the ALPHA label. In both cases, they area programmable.

What if you want to "navigate" through programs while you are in PRGM mode? This means using [GTO][.][CATALOG]... Oops! A short BEEP tells me CATALOG cannot be active while using [GTO][.] in PRGM mode. After some "trial and error" I was able to find a way to see the PRGM catalog with [GTO][.] in PRGM mode.

I added an extra post in this thread with my keystroke sequence to accomplish the task, but I'd like to know if someone else have already tried to do this and what is the sequence they use to accomplish this task. I'm not posting my own sequence in this post so it will not misdirect others that want to try their own way, but the next post in this thread has it.

Any comments?

Cheers.

Luiz (Brazil)

[GTO][.] in PRGM mode: my suggestion (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Mar 2004, 1:35 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi;

maybe someone has already done it with the same sequence shown here, so I want to apologize for a possible "closed file".

In PRGM mode:

[SHIFT][GTO][.] [ENTER] [SHIFT][CATALOG][PRGM][label]

and there it is: you can navigate through programs (global ALPHA labels) without leaving PRGM mode. Of course, there is one additional keystroke if you compare to:

[SHIFT][PRGM] [SHIFT][GTO][label] [SHIFT][PRGM]

and the sequence is not so intuitive, but at least it's possible.

Comments?

Cheers.

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

Hello, Pardon me since this is not an actual reply to your post. I am searching for two unavailable 42s program books that were put out by Software by D'Zign. They are "Urban Survey Programs" and "Spiral Curves". I would like to purchase the books or scanned copies of them so I could get them into one of my 42s calculators. I apologize if I am bothering you with this. Thank you for any help you might be able to provide. Chad Wagner

would someone mail me a 28C ROM?

*Message #1 Posted by **Javier Goizueta** on 28 Mar 2004, 11:58 a.m.*

Ok, I know I'm risking to be flamed... There are license issues, but does anyone consider it relevant? does HP care for it? I just want to try emu28 (I just happen to like calc-emulators). I own two 28Ss, and could get their ROM via my 48GX, but emu28 doesn't emulate the 28S hardware...

...well, if I'm missing any important reason why I really should not use emu28 for fun not having a real 18C I'll pay attention.

Note that I ask for a 28C rom and I own two real 28S that is an improvment of the 28C model, I don't ask for 18C ROMs since I don't have any business model.

Edited: 28 Mar 2004, 12:06 p.m.

It's just as well that you don't ask for the 18C ROM, because I don't think anyone has managed to dump it, nor those of the 19B and 19BII. If someone has, please speak up! :-)

Trans41

*Message #1 Posted by **Ray** on 27 Mar 2004, 8:59 p.m.*

Hi,

I don't post here much, but I do have a question. I've come in contact with a lot of HP-IL equipment, and have a HP-IL interface card for the PC.

I want to use this card to communicate with my calculator and tranfer programs. I've heard there is a program that works with modern pc's called "trans41" that can do this, but I can't find it anywhere!

Does anyone have a copy of this they can send me via email, or something?

I would appreciate any help I can get,

Thanks,

-Ray

Re: Trans41

*Message #2 Posted by **Miki Mihajlovic** on 27 Mar 2004, 9:03 p.m.,*
in response to message #1 by Ray

I can do that.

Re: Trans41

*Message #3 Posted by **Bill Holes** on 27 Mar 2004, 10:22 p.m.,*
in response to message #1 by Ray

Hi Ray, I recently purchased an HPIL/PC interface card from Christoph Klug for a similar reason. I had many ROM's, programs, and data files on EPROM and Cassette that I wanted to preserve (and contribute to this still great community of HP41 enthusiasts). Thus far I've had very good success getting these to the PC with a great product called emu41 produced by Jean-Francois Garnier. You can download a free copy of emu41 from JFG’s homepage at:

http://membres.lycos.fr/jeffcalc/

The HPIL capable version is available on the same site for a minimal fee.

I don’t know which flavor of card you own but I can testify that Christoph Klug’s interface card working in conjunction with JFG’s emu41 application is hard to beat. Even if you have "that other brand" of card I'd highly recommend you take emu41 for a spin while you are trying trans41 out.

Edited: 27 Mar 2004, 10:27 p.m.

Re: Trans41

*Message #4 Posted by **Claudio** on 28 Mar 2004, 4:49 a.m.,*
in response to message #1 by Ray

Hi Ray, I can send you if nobody already sent it to you. Confirm me via e-mail.

I have some troubles with this program. With my HP75 I can read files from the emulated mass storage, but I can't write anything. :-(

Any suggestion?

Claudio

Re: Trans41 or EMU41

*Message #5 Posted by **Christoph Klug** on 31 Mar 2004, 4:20 a.m.,*
in response to message #4 by Claudio

Hallo HP-IL enthusiasts,

for today applications with HP41 (or HP71) take EMU41 (or EMU71) from Jean-Francois Garnier. Because this really nice software tool is the worlds leading system solution for interfacing your handhelt to PC world.

Please also refer to HP-Museum articles forum item 311 HP41/PC gatway & emulator.

The newest version of EMU41 now includes advanced 64KByte RAM-Box features and two virtual mass storage devices.

EMU41 is the worlds first software emulator which includes real HP-IL support. It is compatible with 16 Bit ISA slot HP-IL interface cards...

Regards from Germany - Christoph Klug

Re: Trans41 or EMU41

*Message #6 Posted by **Claudio** on 31 Mar 2004, 5:24 a.m.,*
in response to message #5 by Christoph Klug

Hi Christoph, thanks for your "hundredth reply" like this! :-)
You are the best advertising agency of the J.F.Garnier's software. ;-)
(Naturally I'm joking) :-D

I have already bought EMU41 (I am waiting that Jean has received the payment) but however I'm curious to work with Trans41, so you should not be surprised if in this forum there are some thread like this.

Best regards
Claudio

Re: Trans41 or EMU41

*Message #7 Posted by **Christoph Klug** on 31 Mar 2004, 10:15 a.m.,*
in response to message #6 by Claudio

Dear Claudio,

you are right : I am a real HP41 & EMU41 enthusiasts, and the idea about implementing HP-IL features corresponds directly with the rebuild HP-IL/PC Interface Card which is available from me :-)

Fortunately, today different HP41 software and hardware projects exist from some well known persons, but the HP41/PC gateway & emulator solution is the nice result of team-work from HP41 enthusiasts from different countries :-)

Furthermore Jean-Francois is the first HP41 emulator designer who realises, that the fourty one is much than a handheld, because this machine is the core of an complete system including HP-IL.

If someone wants the fusion of HP41 and PC technologie, up to now EMU41 is the worlds best solution for getting a advanced software/hardware system solution for this application...

Regards from Germany - Christoph Klug

Re: Trans41 or EMU41

*Message #8 Posted by **Massimo (Italy)** on 31 Mar 2004, 11:00 a.m.,*
in response to message #7 by Christoph Klug

Christoph,
first of all thanks for your work: I own one of your cards and it always performed flawlessly.

BUT... right now, **everybody** here knows about its "perfect fusion" with JFG's EMU41. If somebody was unaware of it you already reminded this many times.

Since I see that I am not the only one who noted this thing may I kindly ask you to limit your reminders? :-)

Greetings from Italy,
Massimo

Does the new 33S have the same accuracy as the 30S?

*Message #1 Posted by **Roy** on 27 Mar 2004, 4:21 p.m.*

The HP30S does calculations to 24 places...does the new 33S also do that?

An easy way to tell is to calculate 3^201..then subtract from that 7.968419666 E 95 and if the result strats with 276 then it has the extra accuracy. thanks.

Re: Does the new 33S have the same accuracy as the 30S?

*Message #2 Posted by **Wlodek Mier-Jedrzejowicz** on 27 Mar 2004, 8:49 p.m.,*
in response to message #1 by Roy

The HP33S is mostly an emulator of the HP32SII, and like the HP32SII it works to 12 digit precision, with exponents between -499 and +499. Internally it copies the HP32SII too, with 15 digit precision and 5 digit exponents. So the result of the calculation is 260, not 276. The HP30S has wonderful precision if that's all you need :-)

Wlodek

Re: Does the new 33S have the same accuracy as the 30S? [33S is an emulation??]

*Message #3 Posted by **Bill Wiese** on 28 Mar 2004, 8:14 p.m.,*
in response to message #2 by Wlodek Mier-Jedrzejowicz

Hi folks.. So do we really know that the 33S is an emulation of the 32S CPU? That is, there's a little byte-code interpreter running on its 6502, fetching Saturn code, and appropriately patched for new I/O architecture??

Thanks,
Bill Wiese
San Jose CA

Re: Does the new 33S have the same accuracy as the 30S? [33S is an emulation??]

*Message #4 Posted by **Arnaud Amiel** on 29 Mar 2004, 5:16 a.m.,*
in response to message #3 by Bill Wiese

The fact that the 33s does not give exactly the same results as the 32sII would make me believe that it is not a CPU emulation as in the 49g+ which gives the same results as the 49G.

Arnaud

PRIDE - a semiconductor ROM for the HP41 on ebay - seen this before?

*Message #1 Posted by **Gene** on 26 Mar 2004, 7:50 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3086479294&category=58039

For the collector who has to have everything! :-)

Note: I'm not selling this or related to whoever is selling it.

First time I've ever seen this particular 41 rom. Gene

Re: PRIDE - a semiconductor ROM for the HP41 on ebay - seen this before?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Mar 2004, 3:11 a.m.,*
in response to message #1 by Gene

Hi Gene, folks;

Thank you for this "call", Gene. That would be nice working with this ROM and a nice HDL (e.g. Verilog) to develop IC's. In fact, as all HDL intend to generate a final IC by using "description language", this PRIDE (I wonder what does PRIDE stand for...) ROM allows designer to define IC's components final dimensions.

As a poor comparison, HDL is somehow a "high-level" development language, while PRIDE allows "assemble-level" development, being IC design the main subject. At least, if I understood it well.

I'd like at least having this ROM image. Will anyone here try to "get it"?

Cheers.

Luiz (Brazil)

HP-71B developed before HP75C ?

*Message #1 Posted by **GE (France)** on 26 Mar 2004, 5:50 p.m.*

"Although the basic card reader design was originally developed for the HP-71B, the first version appeared in the HP-75 computer".

This sentence appears on page 20 of the July 84 issue of HP Journal.

Can anyone explain this ?

Re: HP-71B developed before HP75C ?

*Message #2 Posted by **Eric Smith** on 27 Mar 2004, 4:45 a.m.,*
in response to message #1 by GE (France)

There's nothing particularly mysterious about it. The 71B and 75 were each in development for a long time. It's my understanding that the 71B project expanded considerably beyond its original scope. It's not surprising that something developed for the 71B (possibly before the "71B" designation was even chosen) might have first shipped in a different product.

There's a long history of such occurrences in the computer industry. The transitor circuits and packaging and the core memory units IBM originally developed for their Stretch computer were first shipped as part of the 7090 computer in 1959, two years before the first Strech (7030) shipped.

Re: HP-71B question

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Mar 2004, 8:17 p.m.,*
in response to message #2 by Eric Smith

Why there is the "B" in 71B? I assume that is from BASIC, but as far as the 75, the C was customary for CMOS Continuous Memory (The 75 C had BASIC too... but it evolved into the 75"D"...)

Re: HP-71B question

*Message #4 Posted by **Eric Smith** on 28 Mar 2004, 2:52 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

The HP-75C was actually almost introduced as the HP-75D. They changed the suffix to "C" at the last minute, and some of the publicity photos showed the "HP-75D" legend of a prototype unit. Some prototypes were marked "HP-75CX", and I think there were other designations as well.

It is not uncommon for the final name or model number of a product to be decided only weeks before product launch.

I've never heard any explanation of the "B" in "HP-71B", though "BASIC" is as good a guess as any. At various times HP seemed to adopt naming conventions, but they never stuck to them very well until the "S" for scientific, "B" for business, and "G" for graphing that they have used for the last decade or

so.

Re: HP-71B question

*Message #5 Posted by **Tony Duell** on 29 Mar 2004, 1:18 p.m.,*
in response to message #4 by Eric Smith

And the HP71B was almost called the HP44 (another machine in the HP41 series...). There are copies of documents in the HPCC library that refer to the HP44 (and it's clearly the same as the HP71B that was actually sold).

Spice series - keyboard repair (long)

*Message #1 Posted by **Holger Weihe** on 26 Mar 2004, 12:00 p.m.*

Hello,

Yesterday I got a HP-34C with the "1" key not working. Some time ago I fixed the keyboard of some 32Es. During these repairs some questions and some discoveries occured.

In the following text I will talk of a "foil" and a "board". foil means the plastic-sheet that contains the small raised bubbles which are pressed by the keys above. The board is the plate connected to the foil, but without the chips etc. (At least at the solderless version)

1.) It is possible to swap the keypad (board plus foil) between HP-32E and HP-34C. I think this is possible for all spice-series calculators. Both calculators were solderless versions. Does the keypad exchange also work between a solderless and a soldered calculator? (I didn't open a solderless spice until now. Are the chips soldered to the "board"?)

2.) Keypad connection repair: Sometimes several keys fail at once. I found out that this happend when one (or more) of the connections between the foil and the board get separated. The connections are 4 or 5 circular spots between the bubbles with a diameter of about 3mm.

It helps to place a small piece of tape over the connections, so that they are pressed together with the calculator closed.

It also helps to press a soldering iron on the connection spot. (This burns through the foil). But if the spot gets to hot, the circuit path comes off the board. AARGGH!

Principially it is possible to completely remove the "foil" from the "board" and resolder it. But only once or mabe twice!

Are there better repair techniques? And is it possible to restore the circuit pathes with a silver-pen or something like that?

3.) "foil"-repair The HP-34C had another problem with only one key not working. I found out that the small sheet of conductor which is placed inside the key-bubbles was broken. I tried to glue some aluminium foil of the same size in place after removing the "foil" as mentioned above. The aluminium foil didn't get electrical contact with the original conductor strip. So I soldered a very small connection between them. This worked, but flattened the bubble, so that the key-click dissapeared for that key.

The HP-34C repair ended with the former bad key working and several other keys not working due to losened circuit pathes. :-(So I slaughtered an HP-32E and successfully worked with a donator keypad...

Does anyone of you know better techniques for the "foil"-repair?

Please excuse my english and the wrong technical terms; my language abilities aren't the best today. :-)

Holger

*Message #2 Posted by **David Smith** on 26 Mar 2004, 12:56 p.m.,*
in response to message #1 by Holger Weihe

I believe that some early "E" series machines had a different layout to the keyboard. On these machines the battery backup connection to the RAM chip is not present. You might be able to do some cutting and jumpering to provide it though.

28s / 48sx similarity

*Message #1 Posted by **Charlie O.** on 25 Mar 2004, 2:56 p.m.*

How similar are the 28s and 48sx? I have manuals for the sx but not the 28s.

Re: 28s / 48sx similarity

*Message #2 Posted by **Andreas** on 25 Mar 2004, 3:47 p.m.,*
in response to message #1 by Charlie O.

Being used to the 28S, I found the 48 quite different. The keyboard layout is entirely different, keys are just not where they're supposed to be. But I suppose a 48 user would claim the same of the 28. The programming model is the same, however, so if you're already used to RPL you'll have no problem programming the 48. I am quite disappointed of the 48, but I know many out here will disagree.

PMT function...

*Message #1 Posted by **eclectic_echidna** on 25 Mar 2004, 1:06 p.m.*

I would like to put a few excel functions into my 15C, but I do not know how they are derived.

For example, the PMT function in excel will calculate "the payment for a loan based on constant payments and a constant interest rate".

So my question for this group. Where on the net is a good place to see how the PMT function (and other 12C like function) were derived?

When you Google for PMT and excel, you get dozens and dozens of "Excel for dummies" sites. I can't find any "the PMT function comes from this" sites.

-- ee

Do the 12C manuals on the Museum DVD have it? Hmm...

Re: PMT function...

*Message #2 Posted by **Miki Mihajlovic** on 25 Mar 2004, 1:37 p.m.,*
in response to message #1 by eclectic_echidna

You can look at the Warren's site, Library->Application Pacs->Standard Applications Pac Manual, images 18,19 and 20. Program is for 41C but it shouldn't be hard to get it to work on 15C.

HP-15C Time Value of Money

Re: PMT function...

*Message #4 Posted by **bill platt** on 25 Mar 2004, 1:58 p.m.,*
in response to message #1 by eclectic_echidna

Hi,

You need to look at the Excel help for "PV" to see the formula they are using.

An excerpt from Excel Help:

[quote]

PMT See Also

Calculates the payment for a loan based on constant payments and a constant interest rate.

Syntax

PMT(rate,nper,pv,fv,type)

For a more complete description of the arguments in PMT, see the PV function.

[quote/]

Best regards,

Bill

Re: PMT function... HP15C Adv. Fcn. Handbook

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 25 Mar 2004, 2:57 p.m.,*
in response to message #1 by eclectic_echidna

Hi, e._e. (may I?)

There is an oustanding, original HP book for the HP15C named "HP15 Advanced Functions Handbook", that's also available as one of the e-books at the MoHPC CD pack. In this book, pages 26 to 44, one can find MANY examples of how to use the HP15C to solve Time-Value-of-Money problems and also discounted cash flow's Net-Present-Value and Internal-Rate-of-Return. It's worth taking a look at them.

Hope this helps, too.

Cheers.

Luiz (Brazil)

Edited: 25 Mar 2004, 3:00 p.m.

Re: PMT function... also HP-34C Handbook

*Message #6 Posted by **Karl Schneider** on 25 Mar 2004, 9:49 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

e-e:

Luis is right, that the HP-15C Advanced Functions Handbook contains a documented Time Value of Money (TVM) program written expressly for the 15C. The MoHPC CD/DVD set is probably your best bet for getting this manual, which tends to be an expensive collector's item.

Also available, in the HP-34C user's manual, is a documented program written for the 34C. The program is directly portable to the 15C.

A hardcopy 34C manual should be cheaper to obtain, but it also is available as a scanned image on the MoHPC CD/DVD set.

Lex files PC <-> HP75

*Message #1 Posted by **Claudio** on 25 Mar 2004, 10:45 a.m.*

While I'm waiting for my registered copy of Emu41, I wish to transfer a LEX file to my HP75C via the HP82973A interface. How can I create a LIF file for Trans41 with the LEX file into it?

Thanks Claudio

(remove the double "_nospam_" for my e-mail address)

Re: Lex files PC <-> HP75

*Message #2 Posted by **Raymond Del Tondo** on 25 Mar 2004, 11:41 a.m.,*
in response to message #1 by Claudio

Hi,

here in the museum are either articles and/or other forms of descriptions how to deal with LIF media, and how to get files onto and out of the media.

Raymond

Re: Lex files PC <-> HP75

*Message #4 Posted by **J-F Garnier** on 26 Mar 2004, 6:48 a.m.,*
in response to message #1 by Claudio

With your next registered Emu41, it will be very easy: use LIF image file (such as found on this site) in HDRIVE1/2 declaration, and use HP75 functions (CAT, COPY) to access it through Emu41.

Actually, Emu41 with HPIL acts as multiple HPIL devices (display/mass storage units/printer/DOSlink) for ANY HPIL controller (41/71/75).

J-F

Re: Lex files PC <-> HP75

*Message #5 Posted by **Claudio** on 26 Mar 2004, 8:32 a.m.,*
in response to message #4 by J-F Garnier

Hi Jean, I'm happy to hear your info, but before this I need to transfer a LEX file from my Hard-Disk to the LIF image file. When the LEX file will be into the LIF image file, I'm sure that I will can transfer it to my HP75 with your program.

Now I must do manually the first step of this transfer, but I'm finding for an automatic system. :-) However thanks for your suggestion.

HP-41C Card-stock Paper keyboard overlay

*Message #1 Posted by **Chris Catotti (Florida)** on 25 Mar 2004, 10:35 a.m.*

Has anyone seen a precission die-cut card-stock overlay for the HP-41C before? I believe they came in a tablet, and each overlay is about the thickness of a 3 x 5 inch index card. Does anyone have any idea what it would cost to make more? It looks like:

http://home.earthlink.net/~kd4ace/images/PaperHP-41.JPG

Re: HP-41C Card-stock Paper keyboard overlay

*Message #2 Posted by **bill platt** on 25 Mar 2004, 10:50 a.m.,*
in response to message #1 by Chris Catotti (Florida)

These days, you see CNC type or even LASER CNC used for jewelry and trinkets---these sorts of devices should not be very expensive.

regards,

Bill

*Message #4 Posted by **Bill Wiese** on 25 Mar 2004, 3:14 p.m.,*
in response to message #3 by Raymond Del Tondo

I went to college with this dude who created these!!

The guy is John Hudson, who came up w/the idea. John wanted these for experimentation/development, etc. and didn't wanna use up his existing 2 plastic overlays which were all set up for his USER-key profiles. I think it was around 1984?, and I believe these even got into the EduCalc catalog.

I've lost contact w/John for ages now, but he was the dude!

Bill Wiese

*Message #5 Posted by **Wlodek Mier-Jedrzejowicz** on 27 Mar 2004, 9:01 p.m.,*
in response to message #4 by Bill Wiese

I think several people had the idea of card overlays independently, not only John Hudson. The blocks of overlays were sold by a company called Star Fleet Engineering by someone who was also a PPC enthusiast so they were available via PPC as well as EduCALC. I think it was David Shier, but would be happy to be corrected. These overlays had two double-size holes in the row where the ENTER key was, so they could be used either way round - an idea that Richard Nelson pointed out HP had missed when designing their plastic overlays.

*Message #6 Posted by **David Yerka** on 26 Mar 2004, 1:22 a.m.,*
in response to message #1 by Chris Catotti (Florida)

I still have some blank ones. Got mine through PPC when I was a member. I came accross them in a file folder with sheets of rub on letters a few weeks back. As I remember it was some kind of deal because I think I got a couple of hex table/byte code reference cards for synthetic programming as well. I still remember painstakingly rubbing on discriptors for keys then spraying on several coats of fixative-top & bottom-to preserve them. Susprisingly, they held up pretty well & I remember how impressed engineering students were that I had a "customise-able" calculator.

HP trade-ins

*Message #1 Posted by **Tom (UK)** on 25 Mar 2004, 7:29 a.m.*

I think HP used to do trade-ins where you sent back an old calculator and they gave a discount on a new one. Does anyone know what the history of this is? If they did this do they still do it? If not when did they stop?

I'm thinking of trading in an HP49G for the '+' version.

With the value of old HP calculators HP could make a profit out of this by selling them on to a repair company who could fix up some of them 8^)

Re: HP trade-ins

*Message #2 Posted by **Chris Catotti (Florida)** on 25 Mar 2004, 10:23 a.m.,*
in response to message #1 by Tom (UK)

EduCALC offered TIP (Trade In Program). I could look through old EduCALC catalogs if you wanted the particulars of what credit was given for each model.

As far as I know, this was strictly an EduCALC thing, and was not offered by HP.

Re: HP trade-ins

*Message #3 Posted by **Raymond Del Tondo** on 25 Mar 2004, 11:35 a.m.,*
in response to message #1 by Tom (UK)

Hi,

the problem could be: to whom should 'hp' sell a 49G ? Since the 49G isn't that asked for, and in no way comparable to an HP-41, HP-71, or any other more classic HP calc, regarding overall value, including repairability, I doubt that 'hp' will take back these one-way toys;-)

Raymond

linear eqauations on 15c

*Message #1 Posted by **JaSon** on 24 Mar 2004, 3:01 p.m.*

I just bought a used hp 15c and I can't figure out how to use the matrix features. (I got it at a pawn shop for $15 so there was no manual) The most important thing I want to know is how to use the matrix functions to solve linear equations. Thanks JaSon

Re: linear eqauations on 15c

*Message #2 Posted by **bill platt** on 24 Mar 2004, 3:04 p.m.,*
in response to message #1 by JaSon

You need a copy of the manual.

The museum sells it for $15 on CD.

Or you can buy the whole collection for $30.

Best regards,

Bill

Re: linear eqauations on 15c

*Message #3 Posted by **Namir** on 24 Mar 2004, 5:43 p.m.,*
in response to message #2 by bill platt

I agree with Bill. The matrix operations on the HP15C definitely need a manual, because they are like nothing seen in previous models. While the calculator's memory is limited, the matrix operations are impressive!

Re: linear eqauations on 15c

*Message #4 Posted by **Yanis** on 25 Mar 2004, 7:15 a.m.,*
in response to message #3 by Namir

Absolutely. I can remember battleing with the darn thing untill I bit the bullet and read the manual. Once you have done it once it is dead easy but you have to read the manual.

I used to revel in solvoing AC network analysis problems using complex matricies. Absolutely brilliant - until someone stole it. Lost my 41C the same way.

HP12C Article

*Message #1 Posted by **OJM** on 24 Mar 2004, 12:21 p.m.*

Interesting short article on HP, the 12C, and the 12C Platinum.....

http://www.business2.com/b2/web/articles/0,17863,592662,00.html?cnn=yes

Re: HP12C Article

*Message #2 Posted by **Driscoll** on 24 Mar 2004, 12:51 p.m.,*
in response to message #1 by OJM

Includes the following:

"TI now holds two-thirds of the $503 million calculator market, while HP's share has slipped to less than 2 percent."

Re: HP12C Article

*Message #3 Posted by **Namir** on 24 Mar 2004, 2:29 p.m.,*
in response to message #2 by Driscoll

Yep! TI is king .. and they did not get there by asking Kinpo to create these calculators either!

Re: HP12C Article

*Message #4 Posted by **Driscoll** on 24 Mar 2004, 3:41 p.m.,*
in response to message #3 by Namir

The marketing material for the forthcoming book "TI-84 Plus Graphing Calculator For Dummies" claims the following:

"Texas Instruments has a ninety-five percent market share for graphing calculators, and its TI-83 Plus models have estimated lifetime sales of ten million units".

http://www.wiley.com/WileyCDA/WileyTitle/productCd-0764571400.html

Re: HP12C Article

*Message #5 Posted by **Ben Salinas** on 24 Mar 2004, 9:34 p.m.,*
in response to message #3 by Namir

Well, they did not get there by making good calculators either. They got their with their marketing department (giving away free calculators to teachers... sending them propaganda, giving them posters, making sure their calculators are carried in every single chain, etc)

Just because there are more TI calculators does not make any better, and most of us will attest to this.

In fact, often, quite the opposite is true. Think of computers. Is the basic Best Buy $400 computer better than the custom built computer? Definitely not, but more people have the Best Buy one. Let's face it, the public doesn't always make the best decisions.

On a different note, does anyone actually subscribe to this magazine so that they can click on the "wireless network" link? I am curious as to whether they mean IR or a real wireless network.

-Ben

Re: HP12C Article

Need help with my HP-17BII

*Message #1 Posted by **Selma** on 24 Mar 2004, 8:13 a.m.*

My 17BII, the one I use daily is malfunctioning. I replaced batteries, but the behavior did not change: after turned on, all dot in the display looks darker, but nothing happens. On-Menu1-Menu6 does nothing, On-Menu4/5 does nothing. I tried shorting the batteries contacts three times. Before opening and checking contacts, I decided to ask for help here.

Thanks. Selma

Re: Need help with my HP-17BII

*Message #2 Posted by **bill platt** on 24 Mar 2004, 11:23 a.m.,*
in response to message #1 by Selma

It sounds like you may have a problem with the buttons. There have been many threads on this forum in the past and the recent past about either whole rows or whole columns of "Pioneer" calculators going dead, and how to repair them. (The 17bii, along with the 17b, 32s, 32sii, 20s,21s,22s,27s,42s, 10b, and 14b are all "Pioneers").

Try the "search" routine both for the current forum, and the most recent two archives, searching for "pioneer" "keys" "pioneer keys" "32sii" etc. and you may find some interesting stuff.

Also look in the articles forum, and browse the other areas of the museum--there is a lot of information there!

Best regards,

Bill

Re: Need help with my HP-17BII

*Message #3 Posted by **John McLeod** on 31 Mar 2004, 6:28 p.m.,*
in response to message #1 by Selma

I had something similar happen with my first 32SII. When I lost my second one, and found HP has essentially abandoned the RPN calcualtor market, I sent the first to http://fixthatcalc.com/ and they fixed it. They also told me how to resurrect my 29C, and my wife found my second 32SII. Life is good.

HP-34C Display Looks All Matrix-Like

*Message #1 Posted by **Joe D'Andrea** on 23 Mar 2004, 10:34 p.m.*

Greetings! I received an HP-34C to sell on eBay (from my father-in-law). It looks like it's in excellent condition _physically_ but, when I plug it in, the display is flashing all manner of numbers and sometimes I see "Error 0" or "Error 3" flash by quickly. It really does look like something out The Matrix with everything going by so rapidy. Is it DOA and not worth saving, or is there some key combination I should press, or is it a problem with the battery pack in the back of it perhaps? Suggestions welcome!

Re: HP-34C Display Looks All Matrix-Like

*Message #2 Posted by **Katie** on 23 Mar 2004, 10:52 p.m.,*
in response to message #1 by Joe D'Andrea

If you're seeing an Error <anything> it's not DOA. This message is produced by the CPU in response to various invalid operations, etc.. Since the calc display is intermittent I'd guess that the chips are nor making good contact with the circuit board inside the calc. Some versions of this calc have the CPU chip and the 3 RAM/ROM chips held in place against the circuit board with spring steel clips. You need to take the calculator apart and re- seat the chips, display, keyboard and circuit board itself -- they all go together in a sandwich-like structure.

There are many references as to how to do this on this site.

Here are some of them:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=361

Viewing TEXT75 files

*Message #1 Posted by **Vassilis Prevelakis** on 23 Mar 2004, 2:15 p.m.*

I was trying to view a bunch of TEXT75 files from the swap disks in the HP Museum site and was frustrated by the control information that surrounded the data. So I put together the following program which should work on most systems.

I have probably rediscovered the wheel, so if there is something better, do let me know and I will remove this posting.

Program takes a single argument which is assumed to be a TEXT75 file and prints the converted contents on standard output.

```
/*
 * pr_text75 -- convert TEXT75 files to ASCII
 *      Vassilis Prevelakis, CS Dept, Drexel University (2004/3/10)
 *
 *      TEXT75 files use a format similar to that of BASIC programs.
 *      They have a short header, followed by lines of the format
 *              2-byte line number in BCD
 *              1-byte line length
 *              printable text.
 *
 *      pr_text75 has been put together so as to skip the header and
 *      then print the contents of the file by printing the line number
 *      followed by the text.
 *
 *      Unprintable characters in the text are printed in expanded form
 *      i.e. character code 8A will be printed as [8A].
 *
 *      Quick hack to deal with swap-file format files. These have an
 *      additional 32 byte header. The hack involves looking for
 *      a bunch of zeros in the TEXT75 header in the file, and if this
 *      fails, look for the same info 32 bytes later.
 *      Given the richness of LIF files (i.e. loose standards), this hack
 *      is bound to fail on some file, so it should be replaced with something
 *      more decent.
 */
#include <stdio.h>
#include <stdlib.h>

char tohex(char c)
{
        return((c < 10) ? (c + '0') : (c + 'A' - 10));
}

int get_str(char *cp, int n, FILE *fd)
{
        int c;
        while (n-- > 0)
        {
                if ((c = fgetc(fd)) < 0)
                        return(-1);
                if (isprint(c))
                        *cp++ = c;
                else {
                        *cp++ = '[';
                        *cp++ = tohex(c >> 4);
```

```
                        *cp++ = tohex(c & 0xF);
                        *cp++ = ']';
                }
        }
        *cp = '\0';
        return(0);
}
int rd_short(FILE *fd)
{
        int msb, lsb;

        if ((lsb = getc(fd)) < 0)
                return(-1);
        if ((msb = getc(fd)) < 0)
                return(-1);
        return((msb << 8) | lsb);
}

main(int argc, char **argv)
{
        unsigned char buf[1025]; // worst case of a string with unprintable characters
        int l, c;
        char *fname;
        FILE *fd;

        fname = argv[1];
        if ((fd = fopen(fname, "r")) == NULL) {
                fprintf(stderr, "Could not open %s.\n", fname);
                perror("fopen");
                exit(1);
        }

        // if its just the file then we need to skip 24 bytes,
        // if its a swap file, we need to skip another 32
        fseek(fd, 26, SEEK_SET);
        if ((l = rd_short(fd)) != 0)
        {
                fseek(fd, 30, SEEK_CUR); // two bytes we have read + 30 = 32
                if ((l = rd_short(fd)) != 0)
                {
                        fprintf(stderr, "File is not TEXT75?\n");
                        exit(1);
                }
        }

        for(;;) {
                // read line-number
                if ((l = rd_short(fd)) < 0)
                        break;
                // read string length
                if ((c = getc(fd)) < 0)
                        break;
                // read string
                if (get_str(buf, c, fd) < 0)
                        break;
                // if End-of-File sequence, exit
                if (l == 0xA999 && c == 2)
                        break;
                // print line-number: string
                printf("%04x %s\n", l, buf);
        };
        exit(0);
}
```

Re: Viewing TEXT75 files

*Message #2 Posted by **Tony Duell** on 29 Mar 2004, 1:24 p.m.,*
in response to message #1 by Vassilis Prevelakis

There's also a text75 program in my 'LIF Utilities for Linux' (available from http://www.hpcc.org/). It reads an

HP75 text file on standard input and outputs a more sane version to standard output. It's written in C and should be fairly portable. There are other translation filters there too, for HP LIF1 text files, HP41 programs, and so on...

RPN Program for Eigenvalues?

*Message #1 Posted by **Ángel Martin** on 23 Mar 2004, 7:50 a.m.*

Hello Math-heads,

I've been looking for an RPN program that calculates all the Eigenvalues for a generic case, NxN square matrix. Tthat is to say not limited to 3x3, or 4x4, etc.

I'd appreciate your hints if you know of such a program being available somewhere.

BTW, the program below will solve for real eigenvalues, but of course won't find complex values, nor there's a fool-proof method (depends on initial guesses, etc. It is nevertheless an interesting example of the power of the advantage matrix functions, combined with solve.

LBL "*VP" STO 00 "IDN" XROM "MIDN" RCL 00 "X" MAT* "IDN,AA,IDN" MAT- "IDN" MDET RTN LBL "EIGEN" "DIM=?" PROMPT "AA" MATDIM XROM "IMR" DIM? "IDN" MATDIM E ENTER^ 50 "*VP" SOLVE "VP=" ARCL X AVIEW END

Re: RPN Program for Eigenvalues?

*Message #2 Posted by **Bill Holes** on 23 Mar 2004, 9:35 a.m.,*
in response to message #1 by Ángel Martin

PPC-TN V1N3 Oct. 1980 may help a bit. A 214 step RPN program to compute all eigenvalues of a real symmetic matrix up to 22 x 22 using Jacobi's method is listed on page 12. I believe it was submitted by Valentin Albillo.

Re: RPN Program for Eigenvalues?

*Message #3 Posted by **Ángel Martin** on 23 Mar 2004, 10:22 a.m.,*

Contrast adjustment on a 42S

*Message #1 Posted by **Ángel Martin** on 23 Mar 2004, 7:42 a.m.*

Can someone let me know how to adjust the display contrast on a 42S? I can't believe it is not possible, but I've got no manual for the one I'm using on loan.

Thanks, ÁM.

Re: Contrast adjustment on a 42S

*Message #2 Posted by **sjthomas** on 23 Mar 2004, 8:56 a.m.,*
in response to message #1 by Ángel Martin

While holding the [ON] key, press the [+] key to darken the display or the [-] key to lighten the display.

Alright! Finally a question I can answer!

Keyboard problem with 32SII

*Message #1 Posted by **Henry Nurse** on 22 Mar 2004, 10:27 p.m.*

My 32SII works fine, but lately the number '1' button seems to have a little 'play' to it. The play is from side to side. Anyway to get it back rigid?

Re: Keyboard problem with 32SII

*Message #2 Posted by **Randy Sloyer** on 23 Mar 2004, 12:30 a.m.,*
in response to message #1 by Henry Nurse

No, there is no way to repair a broken hinge. It will be time for a 33S when it dies. May take a while, but it will happen.

Reference http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=53965 for some other keyboard tidbits. Second paragraph in particular.

Why Not Emulate a New Calculator Design? (Long Again...)

*Message #1 Posted by **Steve** on 22 Mar 2004, 7:45 p.m.*

...To continue from my previous posting, I'd like to suggest an idea. Several people have posted here about how neat it would be to create "an HP-41 (or 48GX or 49G+...) for the new millenium," so to speak; Ben Salinas being the most recent example.

I'd like this as much as anyone, but as I have already said, I see these discussion threads as sad pipedreams, at best. The simple fact is that there seems to be no subset of this group sufficiently motivated to undertake such a task AS AN ACTUAL HARDWARE EXERCISE. For those who can remember, the creation of the PPC ROM so many years ago turned out to be a Herculion-seeming task, which involved a significant portion of the PPC Users Group for MONTHS. And they really only did software, relying on an in-place Hewlett Packard program which handled the actual creation of the hardware modules. (Some will also point out, rightly, that like many such projects, when push came to shove, only a small handful of diehards did the key day-to-day coordination and finally tied up all the loose ends. However, at the outset, a large group of PPC'ers was involved...)

Today's product R&D revolves around suites of virtual design tools which create and allow evaluation and vetting of concepts without ever creating actual hardware. Effects-based simulation, systems engineering and cost analyses can all be applied without ever touching a real double-shot-molded key.

If this is the way "adult" industry operates, why not do the same thing? If no one here is willing to tackle real hardware, why not do the next best thing and create a simulation or emulation of a new calculator design which everyone can get involved in by either contributing concepts, software snippets / aplets or simply doing beta testing? With virtual hardware, no one has to be stuck buying anything or worrying about reconfiguring ASIC's...

One seeming advantage of this approach is that the sim can be built one step at a time (e.g., Work out a tentative packaging and display, then implement arithmatic functions on one data type first, then transcentental functions, then more data types, then RPL progamming, then...). Think of it as a GUI where only some of the keys work at first, then more and more. If the imagined physical form becomes unwieldy or obsolete, it can be revised in an instant. New features or approaches can be added (but with increasing difficulty as the design builds up). If a core group of responsible individuals is ambitious enough, the current version can even be "demo'ed" to outsiders (like HP or their Asian OEM) who might be interested enough to transition it to a real product... ***NOTE: Who would profit from this would DEFINITELY be a problem. Maybe Dave Hicks would have to be trusted to work this out.

Finally, if we all run out of steam, the sim could be left here at MoHPC until another group (or a set of diehards) decided to finish it up. Again, the fact that there is no real hardware would liberate the creation process.

So there it is. I don't imagine that this is a perfect idea, but I think it's a workable way to harness all the pent-up creativity that we (apparently) have here.

UNLESS, of course, someone else has a BETTER idea...???

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 23 Mar 2004, 12:12 a.m.,*
in response to message #1 by Steve

I liked very much your idea, as I'm planning to do it myself as a hobby project (real hardware, that I build). I think that the concept must be tested on an emulator or as algorithms in some high-level language (platform independent). The implementation then can be build in any platform (as my Sharp PC-1260 soon-to-have FLASH ROM).

I as a computer programmer (assembler of several CPUs, pascal) I will support this idea (in my spare time!).

If we let the hardware platform open and focus on the algorithms it will be easy to build the real thing on any hardware we can get.

I'm in a "crusade" of getting the best algorithms for all functions, using reverse engineering and learning on math papers... I just began, I haven't any "solid" yet.

Best regards,

Nelson

*Message #5 Posted by **Namir** on 23 Mar 2004, 6:52 a.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Fred,

You can check eBay for my HP41 GUI application which represents an HP41-based GUI Windows app calculator that does matrix calculations, support linear, multiple and polynomial regression, offers many additional functions (Bessel, sine integral, cosine integral, and so on), SOLVE, INTEGRATE (and the last two work with user defined functions) AND does graphics plotting. It took me several weeks to build it, but it's a real simulator that kicks a*s. The GUI part replaces a single-line LCD with multiple list boxes that display the stack, commands, memory registers, flags, and programming steps. You can even single-step through a program using a timer, so you can sit back and watch the program execute in that mode. The simulator supports 1000 memory registers and offers many operations that process data in those registers. In addition, the simulator has 27 predefined matrices that you can dynamically resize. You can perform the usualy matrix operations such as transpose, invert, solve equations, and so on.

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #8 Posted by **Bill Wiese** on 23 Mar 2004, 2:37 p.m.,*
in response to message #1 by Steve

Well, Steve...

This has raised its head several times on this Forum. You're looking at the wrong part of the problem.

After the hardware and firmware are done, we have everything we need except money ;) to build a replicatable, *usable* calc. We have all the "fine" skills in hardware, software, etc. but don't have mfg clout to do the plastics work.

And I'm not talking about marginally useless Palm/WinCE emulations. Close, but no cigar.

There's sufficient resources here (firmware, hardware, math skills) to readily take an HP calc and emulate it - even at the instruction level! - and also add improvements, changes, etc. We can do the PCB, have it stuffed w/parts.

But that's not the real work. 30yrs ago, it was - tremendous silicon constraints, yield problems, programming in a restricted environment was difficult, etc. Nowadays, many of us do that kinda stuff everyday and have more headroom for ROM code, faster CPUs, etc.

But what about a case? Keyswitches? Keytops w/injection molded of keytops? Silkscreen overlay for shifted-key legends? These are cheapie items for a large-scale mfgr, but take big NRE/setup costs upfront.

Let's say we wanna "revive" the HP41CX or 42S. (That's what I want.) We can find an LCD unit that'll work. We can use any of a variety of microcontrollers (H8, Z80, ARM, etc.) to emulate the 42S CPU. Writing this emulation layer - esp using C - is not terribily difficult, and writing an I/O abstraction layer to deal with differences in I/O to new LCD, keypad, etc. is not rocket science either. Several months' collaborative work, but eminently doable.

But I don't think anyone has the capability in his garage to build click keyboards domes, injection mold keytops w/legends, etc. or wants to pay $100K setup for molds/jigs for the case.

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #9 Posted by **Steve** on 23 Mar 2004, 4:36 p.m.,*
in response to message #8 by Bill Wiese

Bill, thanks for your comments, but I think you missed a key point in my initial argument. I agree with you completely regarding the difficulty of working a COMPLETE hardware project. The cost of creating molds, dies and other tooling, ESPECIALLY for "small" production runs is simply prohibitive.

That's why I suggested that only the concept be developed; really, just enough to show a perspective manufacturer, like HP or KIMPO (is it??), and let THEM take it from there. You'd license the concept or sell it to them outright (really, only the latter is likely plausible). The big problem, of course, is who would get the money... I have no good suggestions on how that would be resolved unless everyone "donated" their work and all the money was funneled back into the MoHPC website for maintenance / improvements...

Finally, I'm both surprised and intrigued by the people who only view this as an opportunity to "reopen" the 41 or 42S (or whatever) assembly line. To me, ALL of these devices have significant limitations and could all stand dramatic impovements. My concept of a "next generation" calculator is radiacally different from anything that I've seen here... (BUT, I haven't read the entire archive...).

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #10 Posted by **Bill Wiese** on 24 Mar 2004, 1:10 p.m.,*
in response to message #9 by Steve

Steve,

It is unlikely that HP or Kinpo or TI will listen to us in the detail that we would want. The calc market is unfortunately driven by the so-called 'educational' market, NCTM (Natl Council of Teachers of Mathematics), etc. The biggest bone that has been/will be thrown to us was the new HP33S that has RPN (but no large ENTER key :( )

What an engineer does with a calc at his desk is of little importance to HP now.

And there's really no 'concept' to license for the calcs most of us here want. RPN with a big ENTER key is 31yrs old now. Calcs have been doing exotic math ops for some time...

Perhaps if we offered guidance/firmware services a Kinpo could integrate an "HP devotees" calc into their production, w/real RPN, etc. But that's a longshot esp given they're a bulk mfgr selling millions of calcs a year and surviving on thin margins.

> I'm both surprised and intrigued by the people who > only view this as an opportunity to "reopen" the 41 > or 42S (or whatever) assembly line. To me, ALL of > these devices have significant limitations and could > all stand dramatic impovements.

The problem is, if you're doing math that requires that kinda horsepower, you've got a PC that runs Excel, Matlab or Maple.

The 41/42 calcs were, in many of our humble opinions ;) the epitome of balance between capability, complexity vs. efficiency and "reasonable" computational power. Any more oomph, I'd use a PC. Keystroke programming was useful for intuitively making a "custom calc" for various functions, not replacing a computer (although in early 70s no doubt HP prog calcs did save some mainframe/minicomputer time...)

A decent calc is a good tool to 'play with numbers' in a small intuitive way. To deal with larger

problems, data sets, etc. a computer is the way to go. Fancy calcs like the HP48, TI8X, etc. exist because they're at a cheaper price point - and portable - for students.

I had an HP48 once in the mid-90s. Gave it away after a week. Wasn't worth the grief. Too complex to solve little problems (and no 4-level stack) and too simple for big problems, esp when I have a PC at my desk.

My concern now is that calcs are so 'generic', easily obtainable, cheap, etc. that no one thinks about the answers they provide, and folks trust them implicitly - even though errors do exist. I really do wonder if the cheap Asian calc firmware writers really know the fine art of calculating transcendentals (what you learned about 'em in high school is *not* really useful), error propagation, range reduction, etc.

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #11 Posted by **Steve** on 24 Mar 2004, 3:52 p.m.,*
in response to message #10 by Bill Wiese

Bill, no denying that you make some good points, here. If I were just a touch more pessimistic, I'd probably agree with you line-for-line.

In particular,

>> I'm both surprised and intrigued by the people who > only view this as an opportunity to "reopen" the 41 > or 42S (or whatever) assembly line. To me, ALL of > these devices have significant limitations and could > all stand dramatic impovements. <<

>The problem is, if you're doing math that requires that kinda horsepower, you've got a PC that runs Excel, Matlab or Maple.<

...I actually agree with you completely about the "horsepower" issue. NOBODY should be trying to invert 40x40 (much less 20x20) matrices on a hand-held device! However, I think I disagree on another important aspect of computing devices, which is the user (or man-machine) interface. I think I can imagine better things that could be done than have yet been mass-produced. For example, I think that a dedicated device the size of an LX-100, with function keys on one half and a screen the size of a 3x5 card on the other, where calculations accummulate as you do them (exactly as they would if you were using a pencil and paper) would be... interesting.

You may not agree, but the point is things like bigger displays can facilitate increased functionality...

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #12 Posted by **Ben Salinas** on 24 Mar 2004, 5:14 p.m.,*
in response to message #11 by Steve

Actually, I didn't use the 49g+ for a 20x20 matrix, but I did use it for a 5x5 matrix with each cell containing a 3rd degree polynomial. It took it a full 2 minutes just to calculate the determinant and then another 2 minutes to calculate the zeroes of the resulting function. (I was performing a complex Sylvester Matrix problem)

I wouldn't try it again.

-Ben

How 'bout using H-P keyboard components?

*Message #15 Posted by **Paul Brogger** on 24 Mar 2004, 3:59 p.m.,*
in response to message #8 by Bill Wiese

It seems to me the *only* thing that can't be implemented relatively easily is the keyboard. For that, just utilize one of H-P's grand old designs. I'm playing (or, should I say, *briefly played*) with an HP-41CV keyboard soldered to a TI-83+SE. Flash-upgradable electronics with plenty of memory, a computer interface and an IDE, tied to one of the all-time favorite keyboards ever manufactured.

If I ever get serious about putting the things together in a nice package, I'll trim the edges of the 41's front case, and epoxy (or otherwise fasten) the 41's keys to another case -- perhaps the TI's.

Another candidate might be the 28s. Not a lusted-after model, generally available, with more double-shot keytops than you can shake a stick at, implemented as modules that should be fairly readily adapted to a new installation . . .

Re: How 'bout using H-P keyboard components?

*Message #16 Posted by **Ben Salinas** on 24 Mar 2004, 5:18 p.m.,*
in response to message #15 by Paul Brogger

I might get flamed for this, but how about using the 33s's body. The keyboard itself is actually quite decent (as good, if not better than my 32sii). It has a large, good quality (resonably) LCD screen (though the glare is pretty bad) and if that wasn't enough, it could be replaced. It is fairly simple to open (it uses screws I believe). Plus, best of all, it will soon be available to the masses for fairly cheap. Perhaps it would be as simple as stripping teh CPU and mainboard out of it and building another.

Just a thought

-Ben

33s is probably too small

*Message #17 Posted by **Paul Brogger** on 24 Mar 2004, 7:22 p.m.,*
in response to message #16 by Ben Salinas

I suspect that a homebuilt project will likely require a little bit of extra space, as it will not enjoy the benefits of custom VLSI chips and high-density circuit boards typical of a mass-produced piece of consumer electronics.

And, while I agree that the 33s keyboard is more than adequate, die-hard return-to-RPN types will want a wide Enter key in its proper place. Heck, if you're going to work on something in your spare time, it may as well be something you really want!

Re: 33s is probably too small

*Message #18 Posted by **Bill Wiese** on 24 Mar 2004, 7:27 p.m.,*
in response to message #17 by Paul Brogger

No, 33S would be fine size-wize - remember, we're just needing one surface mount QFP microcontroller and maybe some small serial RAMs/EEPROMs... all small & thin.

Only prob w/33s case is "chevron" keyboard and lack of large ENTER key above numeric area...

Bill Wiese
San Jose CA

Re: 33s is probably too small

*Message #19 Posted by **Ben Salinas** on 24 Mar 2004, 7:35 p.m.,*
in response to message #18 by Bill Wiese

I am just curious, have you actually used a 33s (like really use for more than 10 minutes)? When I got mine, I had a problem with the keyboard for about a day, but then I got used to it and had trouble going back to the traditional enter key (I am used to the large enter key again). The "Cheveron keyboard" (actually a few of my friends noticed that immediately about it) really isn't that bad, it just takes some getting used to.

-Ben

12c Sounds Great!

*Message #20 Posted by **Paul Brogger** on 25 Mar 2004, 4:13 p.m.,*
in response to message #18 by Bill Wiese

Hey, if it can be made to fit, then the 12c is the prime candidate. There are TONS of 'em!

I suppose it shouldn't make much difference which of the several versions is used, unless they differ in the amount of room available inside.

So, what would a "custom calculator kit" look like?

```
 * A small PCB with 1-3 chips & an I/O jack, including
 * a minimal firmware loader with I/O functions,
 * directions for de-populating the original PCB and
   wiring the new one into its keyboard matrix, display and
   power connections,
 * a hole to drill to mount the serial I/O connector, and
```

```
 * a web site with a shared code base & documentation.
```

Where do I get one? (Two!!)

Re: 12c Sounds Great!

*Message #21 Posted by **Nelson M. Sicuro (Brazil)** on 25 Mar 2004, 5:41 p.m.,*
in response to message #20 by Paul Brogger

Count on me! I only need a *cheap* 12C to start with... The rest I have, but it can be very slow to develop as I need to make a good PCB project and order some samples on a local PCB maker.

My idea is to replace the PCB, if I can make a PCB good enough to mount the key-domes and display. If not, I'll try to make an "add-on" PCB to replace the chips (get rid of them and make wired conenctions - this can be a difficult task).

The "BIOS" of the machine can be a very basic one, just the basic math functions and a program loader from RS-232 (and plenty of room on FLASH).

I have experience with 7-segmented displays showing characters, it isn't so bad.

Best regards,

Nelson

Re: How 'bout using H-P keyboard components?

*Message #22 Posted by **Nelson M. Sicuro (Brazil)** on 24 Mar 2004, 8:27 p.m.,*
in response to message #16 by Ben Salinas

How about using a HP-12C? It stills in production, there is space inside even to put a SD/MMC slot, and need only a PCB recplacement with the key metalic domes (using the original ones - the new 12C still use them??) and the display. The need for a alphanumeric display can be "downsized" to a 7-segment display capable to show "stylized" characters. I have some microcontrollers suitable to the challenge: a Texas MSP430F499 (yes, Texas...), it has LCD driver, 60KB FLASH ROM, 2K RAM, serial, and capable to direct conection to SD/MMC cards.

Best regards,

Nelson

Re: How 'bout using H-P keyboard components? - yes, use a 12C!

*Message #23 Posted by **Bill Wiese** on 25 Mar 2004, 7:12 p.m.,*
in response to message #22 by Nelson M. Sicuro (Brazil)

Yep Nelson that's the way!

I'd be happy with a 12C-style device.

All we'd need are *some* keytops. The MSP430 you mentioned is a GREAT little CPU. The display opening in the case would handle a 16-char dotmatrix LCD of appropriate character size.

Bill

Re: How 'bout using H-P keyboard components? - yes, use a 12C!

*Message #24 Posted by **Hugh** on 29 Mar 2004, 2:26 p.m.,*
in response to message #23 by Bill Wiese

I've toyed with this idea before. I think the best way of handling keys (without injection molding) would be to use epoxy and molds. It's a very common practice amongst model builders, especially in small runs. Keys are really the only great barrier I've found to homebrew calculators. PCBs with the lead sizes needed can be made with a laser printer and an iron. LCD's are cheap. SMCs can be installed easily using a toaster oven. Labels to replace the original 12c could likely be made using the same epoxy techniques as the keys, or laser engraving could do a fine job as well.

Sorry for such a rant on my first post here, but this is a very exciting and do-able possibility.

One other idea I've had for the case would be the use of sandwiched layers of sheet metal assembled in much the same way as an old padlock. It's cheap, durable, and will allow the cases to be made thinner than plastic allows.

If anyone is interested in actually organizing and making this happen please reply.

in response to message #24 by Hugh

I'm interested, but not in full time ;)

I'm searching on eBay for a "candidate" 12C for the "surgery"...

I have the processor (MSP430F449) with segment-LCD controller, but it has only 60KB of ROM FLASH. I need only to build one prototype PCB to try this on (and exercise my MSP430 assembler). Oh, I'll need to build a JTAG interface for it.

This is very "do-able" indeed, is just a matter of spend some time (and money) on the idea.

If I cannot build myself a prototype PCB and JTAG I'll try to buy them (from Olimex?), up to US$100 (if I can reserve such amount!:).

The operating system of it will be a good team challenge.

Anyway, I'm in!

Best regards,

Nelson

Count me in . . .

We can start with some hardware-relative issues, can we discuss this here or another place to avoid the "pollution" in this forum?

You guys have my email, I can send my ICQ and MSN contacts by request.

Best regards,

Nelson

Re: Sounds good

*Message #29 Posted by **Hugh** on 2 Apr 2004, 2:28 p.m.,*
in response to message #28 by Nelson M. Sicuro (Brazil)

It would probably be best to find/setup a place to start development. First, we'll probably want to decide on a format, what hardware to base it on, and any mandatory specifications. I've already begun research into producing epoxy resin based, triple injected keys. There are some alternative epoxy types that may be suitable for fashioning cases.

I have a friend who probably can offer some web space at least while we get started.

Re: Sounds good

*Message #30 Posted by **Nelson M. Sicuro (Brazil)** on 3 Apr 2004, 4:39 p.m.,*
in response to message #29 by Hugh

We need to exchange some ideas to define the hardware platform. I received an email from Paul Brogger and I don't know if he received the reply due some email server problem (my email is hosted on my own server and is blocked on some ISPs thinking it is spam!).

I have several ideas to start with.

I was thinking in call this project "OpenCalc", but this name is already used in some Linux Calculadors as well... :(

Best regards,

Nelson

Re: Sounds good

*Message #31 Posted by **Hugh** on 6 Apr 2004, 12:31 a.m.,*
in response to message #30 by Nelson M. Sicuro (Brazil)

Should have a basic website up sometime next week. I think you will all be pleasantly suprised with my solutions for building a case, molded keys, and producing the pcb for very little $$$. (and it looks about like a panel out of an apollo command module) No point in spending $100 on a pcb prototype when you can make it for under $10 yourself.

In the meantime, everyone start brainstorming about what you want in a calc.

-Hugh

33S is propably too big...

*Message #32 Posted by **Raymond Del Tondo** on 25 Mar 2004, 2:27 a.m.,*
in response to message #16 by Ben Salinas

Hi,

I'd vote for using a Pioneer case and keyboard for such a project.

They have some advantages: They are still easily available in huge amounts, have a very aestethical and classical design, have the ENTER key where it belongs, are of the right quality of keyboard & case (even the ID models...), have the right form factor (the 33S is too BIG), and maybe some more I don't recall at the moment. And generally: Why should someone want to design a new calc if it's not like a classic HP calc with the ENTER bar? 'Normal' calculators are available in nearly any shape (see 33S) and for various tastes.

Raymond

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #33 Posted by **Garth Wilson** on 23 Mar 2004, 2:39 p.m.,*
in response to message #1 by Steve

Steve said, "I'd like this as much as anyone, but as I have already said, I see these discussion threads as sad pipedreams, at best. The simple fact is that there seems to be no subset of this group sufficiently motivated to undertake such a task AS AN ACTUAL HARDWARE EXERCISE."

That kind of hardware is probably too big an undertaking for a single person or small group of enthusiasts to do-- _IF_ you want it to look like the HP's of 20 years ago.

It wouldn't have to look like HP did it though. The size of the job drops dramatically if you use off-the-shelf LCDs available from any number of manufacturers, off-the-shelf hand-held cases like Pac-Tec and others make (and offer custom milling on), and so on. We don't need to spend $100,000 of tooling to make a funcional unit that offers the possibilities desired for the next couple of decades.

For myself, a laptop is much too big. It has to fit in a corner of the atache case. And if it doesn't have HPIL or USB or something like it with available interface converters to interface to a lot of lab equipment at once, I'm not interested. Emulators don't cut it. I have no use for a supercalculator. I personally want a controller.

I develop products for our company all the time, so I have an idea of what's involved. We definitely are not at the HP product development budget level though. I haven't done much digital design either. I have made small custom workbench computers and used them heavily, and am seriously thinking about making a hand-held, nearly-pocket-sized one as a product. It's definitely for a different market, although partly inspired by the HP-41 and 71.

I initiall posted this yesterday and the system dropped it again. Fortunately I learned from previous experience and kept a copy. Since then someone else said "Why don't we just ask HP to make it again?" That probably makes the most sense. It appeared to me that HP management started to change a lot in the late 80's, and they made some really stupid market decisions. It might be good to rub their noses in it and bring them back to their senses.

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #34 Posted by **Bill Wiese** on 24 Mar 2004, 1:14 p.m.,*
in response to message #33 by Garth Wilson

Garth...

It's not a worthwhile exercise at this point because the hardware is simple (a cheap microcontroller, PCB, LCD) but the final realization thereof wouldn't have a good KB or case that fits the hand. The software is easy to do, even emulating an existing HP architecture.

I agree that a little prog calc w/decent I/O could be quite useful in a lab setting.

Bill

Re: Why Not Emulate a New Calculator Design? (Long Again...)

*Message #35 Posted by **Garth Wilson** on 25 Mar 2004, 1:14 a.m.,*
in response to message #34 by Bill Wiese

The type of keyboards HP had in those years truly are expensive to tool up for. Other comparatively low-NRE options might include rubber keypads (a couple grand NRE, and $.25/ea after that) and membrane switches with tactile feel and raised edges (unlike the flat one of the Timex/Sinclair ZX-1000).

The off-the-shelf case would not look nearly as nice as say an HP-41, but there's hardly any reason it really has to be any bigger although the battery compartment might make it slightly thicker. The only thing I'm not sure how you'd implement would be the ports and the covers for ports not being used.

To answer someone else's post, a home-made calculator with something like wire-wrap would indeed be very thick; but done correctly, I was surprised to find how really easy it is to solder SOIC's and QFP's with really fine pitches, even using a soldering iron that covers several pins at once. My first try netted a result that looked like it was done by machine.

Originalmessage:----------

It's not a worthwhile exercise at this point because the hardware is simple (a cheap microcontroller, PCB, LCD) but the final realization thereof wouldn't have a good KB or case that fits the hand. The software is easy to do, even emulating an existing HP architecture.

Garth,

It's not too hard soldering fine-pitch surface mount ICs on to a PCB using a heat gun and alum. foil/sheetmetal "horn" air director, along w/appropriate SMT paste.

Remember this calc is gonna only require one large-pin-count chip, maybe (not necessarily) one or two 8-pin SMT "microDIPs" for serial EEPROM/SRAM.

HP41 "Terminal Blocks" - where

*Message #1 Posted by **Jim Creybohm** on 22 Mar 2004, 5:46 p.m.*

I am looking for a (possibly two) battery terminal blocks for my 41's. I read on this board a while back about someone who re-builds/re-furbishes them, but I can't find it anywhere. I have also tried to re-build the terminal blocks using HO connectors from the local hobby shop (little brass tabs that darn near fit on the end pieces), and I have it working, however it seems to be a stopgap solution. I would prefer something more permanent.

Anyone know who does this, and how much? Or point me to an article that has good diagrams on doing this so I don't butcher the poor 41 anymore than I already have.

HP41 battery connector repairs

*Message #3 Posted by **Randy Sloyer** on 22 Mar 2004, 8:28 p.m.,*
in response to message #1 by Jim Creybohm

AFAIK, the brass cap solution was David Smith's solution for corroded battery terminals, he did offer it here in a post many moons ago for $20 or so. It works very well, it's easy to do and does not wear out like copper foil solutions. I don't see it as a stop-gap solution, it will probably out last the calculator as a repair.

It of course does not address damage beyond the four battery points. Once the port connectors or the main logic board connector are damaged, it's toast. Repair is pretty much out of the question. Buy a used C or CV, rob the connector and resell the rest as it is now about the only way to get a replacement.

Perhaps this is something of an abberation. Note that the acution inflated in a bidding war between just two players: Yankeemo and RafaelGuerra, the latter winning. Yes, the emblem is definitely missing!

Note also what other stuff the winner is buying: EXPENSIVE fountain pens and watches---this guy LOVES nice stuff and is willing to pay for it (I love fountain pens, too, but I prefer to find them in junk piles....and I used to use them every day before the computer was invented!).

Note also that the highest bid outside these two players was $250, which is still high? for missing an emblem. Very interesting.

-Bill

Re: 15c values

*Message #7 Posted by **Norris** on 24 Mar 2004, 3:09 p.m.,*
in response to message #1 by bill platt

It's possible that the market value of old HPs may spike as April 16-17 approaches. Those are the dates for the NCEES professional licensing exams for engineers and surveyors. The April 2004 exams will be the first where the new calculator restrictions are in effect.

Tens of thousands of people are currently preparing for these exams. It's safe to suggest that thousands of examinees nationwide have been forced to set aside their banned HP 41, 42, 48, or 49 series calculators, and have been in the market for other NCEES-compliant RPN models.

Most of these people have probably found alternative calculators by now. But if you haven't, then your options are very limited, since the 33S is still not generally available. An old HP model from eBay may be your last hope.

HP 48 TV Remote Control

*Message #1 Posted by **db(martinez,california)** on 22 Mar 2004, 12:24 a.m.*

Well, two weeks ago i finally bit it and got a TV. I could have held out another 48 years without one but nobody near by will let me watch the new Star Trek at their house every week. So i got an old Zenith at the flea for $10 and even though it doesn't need it i'd like to download an HP 48 remote control. I found one but it needs "win zip" to save it. Win zip will not work on my computer. Does anyone know someplace that i can download a remote control program without having to play pc games?

Re: HP 48 TV Remote Control

Re: HP 48 TV Remote Control

*Message #5 Posted by **Katie** on 23 Mar 2004, 9:56 a.m.,*
in response to message #1 by db(martinez,california)

db-

I agree that the only reason to have a TV is to watch Star Trek, but surely you don't intend to watch that horrible Enterprise show that claims to be the most recent of the ST genre. You'd be much better off playing a ST game on your HP48 -- there must be a couple of them out there.

As far and WinZip goes, it shouldn't be a problem on your PC unless you're still running DOS 6.2 or Windows 3.1. Are you that much of a Luddite? :)

-kt

Re: HP 48 TV Remote Control

*Message #6 Posted by **db(martinez,california)** on 29 Mar 2004, 12:42 a.m.,*
in response to message #5 by Katie

Katie;

I have to admit that going over to the dark side and getting a tv was to see Enterprise. It's interesting, has believeable charac..... Oh who am i kidding. It's the hot Vulcan babe. Ever since the time i first saw an aquaintances tape of "Broken Bow" i've found myself going to the beach in the summer watching the girls' ears and hanging around hospital emergency rooms during flu season looking at the sexy green ones.

About my computer; it's a Toshiba 2105cds, the one which turned out to be so abysmally bad that Toshiba refunded about half the purchase price to us lucky buyers. Someday i'll get another laptop but theres no hurry since i don't use it for anything real; i have an hp 41 for that.

Btw: What is a luddite? I have a Websters Encyclopedic and an American Heritage dictionary. Neither one has that word and i've been curious since a luddite thread a while back.- d

Luddites and Star Trek

*Message #7 Posted by **Jeff** on 29 Mar 2004, 7:31 a.m.,*
in response to message #6 by db(martinez,california)

According to the Merriam-Webster Online Dictionary (http://www.m-w.com/netdict.htm)

Quote:

```
One entry found for Luddite.
Main Entry: Ludd·ite
Pronunciation: 'l&-"dIt
Function: noun
Etymology: perhaps from Ned Ludd, 18th century
Leicestershire workman who destroyed machinery
: one of a group of early 19th century English workmen
destroying laborsaving machinery as a protest;
broadly : one who is opposed to especially technological
change
- Luddite adjective
```

As for Star Trek "Enterprise", I'll admit to watching it too. Yes, it's full of contradictions, inconsistencies and often preachy plot lines. But so were all of the other incarnations. (At least the "star date" isn't in code.) I wonder if there is a forum where such questions are hotly debated. Nah, I doubt it.....

Re: HP 48 TV Remote Control

*Message #8 Posted by **James M. Prange** on 29 Mar 2004, 10:13 a.m.,*

hp 34c continuous mem

*Message #1 Posted by **Herbert Markle** on 21 Mar 2004, 8:49 p.m.*

I recently bought a 34c as a backup, but with no manual. The batteries have been out for a long time, and I have lost the continuous memory. My manual for 15c is not helping.

Can anyone help?

Thanks

Re: hp 34c continuous mem

*Message #2 Posted by **Ernie Malaga** on 21 Mar 2004, 9:12 p.m.,*
in response to message #1 by Herbert Markle

Herbert:

The loss of continuous memory is only the result of having left the calculator turned off for who-knows-how-long. All you need to do is recharge the batteries and (if the batteries are still in working order), you'll again have continuous memory.

("Continuous memory" is just what HP did so the calculator doesn't suffer from amnesia when you turn it off.)

If the batteries are no good anymore, you'll have to replace them or, more likely, rebuild them, since the 34C is no longer in production.

-Ernie

34c

*Message #3 Posted by **Herbert** on 22 Mar 2004, 1:24 a.m.,*
in response to message #2 by Ernie Malaga

Thanks, Ernie.

Yes we have new batteries. But that did not do it.

The seller said that this item had been in a drawer for some time. She found it in her fathers stuff.

I vaguely remember from many years ago, when I had a 33E, that there was a punch sequence which you could use to restore this after the batteries had been out for too long.

Each time I turn the unit on, it comes on with a pwr error, which clears when you "clr X" or hit ant other key. All is normal, excepting that the display is in four decimals "0.0000", and you must set up at each turn-on, the number of decimal points, and the type of notation--e.i. sci, fixed, or eng. The thing dosen't which setting which you had it in when yoy turned it off.

My memory could be faulty, so would welcome any opinions.

Again, Thanks

Re: 34c - reasoning over the symptom

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 22 Mar 2004, 2:01 a.m.,*
in response to message #3 by Herbert

Hi, Herbert;

for what I can think of possible faults:

1 - Power board with faulty component - If I am not wrong, all C-type Spices (HP33C, HP34C and HP38C) have a few extra components in the power board to provide continuous memory; some contributors in here (I remember Katie Wasserman as a first reference) have already dealt with this power board and they may give you guidance;

2 - IF the calculator has already been opened AND it is a solderless Spice, chances are that it's been disassembled and reassembled with the ROM/RAM chips out of order. The fact is that the HP34C has at least one RAM chip and this chip must be positioned in the correct "chip slot", otherwise you'll always have a [Pr Error] when you turn it off and on again. No damage if the chips are mounted following the correct orientation, but if the "privileged" chip mounted in the "continuous power supply" position is a ROM chip instead of the RAM chip, then... [Pr Error]!

Have you performed the [STO][ENTER] internal test? If not, please do it, and check for a

```
[-8,8,8,8,8,8,8,8,8,8,]
```

display. If you need guidance to open the calculator and check for this possible fault, let us know.

BTW, there are two major Spices' assembly types: the solderless (main logic components touch a flex circuit board in a "sandwich"-like assembly) and the soldered one (main logic components are soldered in a regular PCB). The best way to know which type is yours is by comparing: the soldered-type units WITH batteries are about the same weight the solderless-type units WITHOUT batteries, because they have an extra rigid metal plate to assure flex-circuit "physical linearity", if I can say so. Another way to compare is by carefully pressing the keys. Keys in soldered-type units move just a little bit in order to operate, while keys in solderless-type units almost level themselves with the keyboard faceplate to operate. If you can compare different units, it's easier to "feel" the difference.

I know that by tracking serial # it is possible to check for internal construction type, but I have no information about serial numbers, sorry. Anyway, the back case of any Spice fits in any other, so if the calculator has already been repaired or refurbished outside HP, there's no guarantee that the serial number actually follows internal construction.

I hope I did not confuse you; if so, forgive and post again, so we can find a better way to help you.

Cheers and success.

Luiz (Brazil)

Reality, Emulation and New Calculators (Probably Long)

*Message #1 Posted by **Steve** on 21 Mar 2004, 2:17 p.m.*

I spent some time yesterday loading Charles Lee's fine HP-41 emulation on my new Palm Tungsten E, the Tungsten being a replacement for a Vx that had finally "cashed in its chips." To make the story short and to the point, I was suddenly struck by the fact that I (now) had a 41 emulation on my Tungsten, and on my desktop PC and on my company laptop at work. I use these emulations frequently. The incongruity was that I also have a REAL HP-41CX, sitting in a drawer! And I use IT only occasionally! My thought was that with the proliferation of capable platforms, emulations possess a degree of reality that can "exceed" ACTUAL reality! Why carry a REAL HP-41 and a laptop when I can simply host the 41 on the laptop... or the Palm... or...?? Especially when the emulations are as good as the real thing? (Maybe better, if you happen to be lugging a carry-on and one personal item through the airport of your choice...)

This brings me to my thoughts about new calculators, as discussed by members of this group. There have been at least two such discussions in recent months, at least one of them thought out to the extent that the original author had a 50-page (or so) product description. I've always read these threads with a vague sense that they are futile. I just don't see it happening, and the reason why crystalized in my mind yesterday.

Emulations. Emulations are too good, too flexible, and too damn convenient! Why buy another piece of physical hardware when I can simply load an emulation and customize every aspect of it to my desires? (And re-customize it when I tire of it?) Now, I realize that there are other tangible and intangible issues, including such things as the feel of keys, but I'd argue that, taken collectively, they still aren't enough to justify the cost and trouble of working real dedicated hardware.

More importantly, what is the point of SINGLE-PURPOSE hardware in today's multi-tasking world? Would any of us lug around separate devices, one to write documents, another to access the internet and yet another to track our home finances? (Silly example, but you get the point.) If we wouldn't do this, WHY would we want to carry a laptop and a large-ish HP-XX? (And don't talk to me about convenience, the point isn't about trying to compute something while standing in a telephone booth... in the rain...)

I just thought that this was... an interesting set of connected thoughts. Submitted for your approval, in the HP Zone!

in response to message #1 by Steve

Wrong, wrong and wrong! I think it is clear for all of us here that the point of having/using a 15C or a 41 or a 67 or whatever machine is not its functionality, but its style and haptic qualities. An emulation does not touch these issues.

in response to message #1 by Steve

The obvious problem with emulation is that you first need to have a PC or PDA. Most high-school students

and undergraduates don't have these things, so they get powerful calculators instead. There will be a market for calculators until every student is issued a notebook PC as standard school equipment.

As for the professional market, it has already evaporated. PCs have displaced calculators from the desktops, PDAs have displaced calculators from the field, and NCEES has displaced calculators from professional licensing exams. Sad but true.

*Message #4 Posted by **Ben Salinas** on 21 Mar 2004, 5:16 p.m.,*
in response to message #1 by Steve

There is a reason to have a calculator instead of a laptop (or in addition to a laptop)

I have a laptop and when I do carry it around, I do not open up Maple to do math; rather I take out my HP-32sii even if it means walking across the house. Why? Computers have loading time. If you want to know what 58.3723392*pi is, you do not want to wait more than a minute for an answer. It is easier to go and grab a calculator and have the answer in 20 seconds.

I could understand that for simple calculations some people might prefer to use an emulator on their palm, but if you are going to be pressing any more than 5 buttons it probably is still faster and easier to carry an extra device.

I can also understand not wanting to carry an expensive 41 or bulky 48 (or 49g+ for that matter). I will seldom carry my 49g+ because it doesnt fit in my pocket, but I will very often carry my 32sii in my pocket.

I still don't think that emulation is to a point that it can overtake the calculator industry, but perhaps in the future (perhaps even not too distant)

Along these lines, though not exactly along these lines, a few weeks ago there was a mention of a customizable calculator. That day I typed out a description of my ideas (and the ideas of others). You can read it at: http://www.geocities.com/piguy31415926/calculator.html

I originally wrote it to be read by someone at HP, but it is very difficult to find any e-mail addresses to any real people.

Just my thoughts

-Ben

*Message #5 Posted by **Jonathan Purvis (NZ)** on 21 Mar 2004, 6:08 p.m.,*
in response to message #4 by Ben Salinas

That's a very good plan, Ben. Do you feel like designing the computer software? I'm sure with the help of everyone here we could have it ported to desktop computers, PDAs, cellphone and even my 38G (which i don't use much as the algebraic interface is too slow).

As to the way to redefine the keys, if you have a keyboard where the keys can be rearranged, that would solve it. Creates a market for selling packs of new keys with labels for different uses (and when they wear out) too. Or have clear keys with a slot for replacable paper labels.

The only thing i'd add is to have 2 models, one with a 2 line LCD screen the size of the 32SII and one the size of the 48G (though thinner).

Re: Reality, Emulation and New Calculators (Long)

*Message #6 Posted by **Driscoll** on 21 Mar 2004, 7:20 p.m.,*
in response to message #4 by Ben Salinas

For a quick calculation, it is obviously faster to turn on a calculator than to boot up a computer. But even in this case, there are two points worth considering:

(1) In most professional offices, the desktop computer is on *all* of the time. It gets turned on in the morning and stays on until the end of the day; maybe it even stays on overnight. You might have to "wake it up" if it's been in power-saving mode for a while, but that doesn't take a minute or more.

And it's the same way in many homes as well. It's not unusual for some people to turn on the home computer when they return from work, and leave it on until they go to bed. So again, the computer is readily available if they need it.

(2) Even so, let's assume that calculators are still handier for quick calculations. But this niche is best filled by simpler, smaller models like your 32SII. Is there still a niche for more powerful, but bulkier models like the 48 or 49? In other words, do you really need a 48 or 49 to quickly calculate 58.3723392*pi ?

Re: Reality, Emulation and New Calculators (Long)

*Message #7 Posted by **bill platt** on 23 Mar 2004, 1:16 p.m.,*
in response to message #4 by Ben Salinas

Ben,

You are a great contributor to this forum. You are also darned smart, full of ideas, perceptive, and young. And you have somehow caught the calculator bug. You are like a window or portal for us old codgers <g> into the world of youth computation--and the future.

I enjoyed reading your article regarding the HP001 and indeed it is a good idea--one that has been here before--the 41c"blanknut" but perhaps it is time to make it really shine (41c blanknut was perhaps ahead of its time--not a smooth implementation).

In that you are interested in design (specifically of calculators) and that they are a "hands-on" device, do you have any other calculators to compare and learn design from? Do you have any classics?

Being a designer myself (but not of calculators) I feel that one will always do a better job if one has a sense of history--and other solutions. To that end, I think you need to have "in hand" some of the great classics. I have a 15c that is worn but still totally functional--If you like, I will lend it to you along with a PDF'd manual so that you can see what it is all about.

I wish I had a 71-B I could lend to you, too, but I don't own one. Apparently the old Sharps were quite something, too.

Also, our company president has a 200LX and that is really something--though it seems to be "obsolete" in today's marketplace. I don't (and at the same time I do) know why--it is really neat!

The point is that one needs to know "the market" as it were, but also, and especially for the creative person who will create a market---one needs to know good design.

Perhaps someone else who frequents this forum will have some of the other devices that you really need to

see?

Best regards,

Bill Platt

Thanks!

I own a 33s and a 49g+. My school lends me a 32sii, so I have had that in my possession for 2.5 years, and will have it until May 2005. I have used, in short intrevals, a 12c (belongs to a friend). I was at the local museum once and on the entry desk was a 17b (I think), so I picked it up and starting using it (I was tempted to leave it in RPN mode, but I returned it to ALG before putting it down).

I would love to borrow that 15c. Thanks for the offer.

And btw, the whole 001 wasn't really only my idea. It was a compulation of several peoples' opinions.

I'm not trying to steal any credit from Charles Lee, but as the core simulation is a port of my "nsim" I'll assume that you are happy with my work as well.

I see that Mr. Lee is selling the program for $10. I'll point out that I receive none of the revenue generated thereby. Although the GPL allows him to sell my program or derived works, it would have been nice if he had offered me some portion of the proceeds.

*Message #11 Posted by **Christoph Giesselink** on 22 Mar 2004, 2:15 p.m.,*
in response to message #1 by Steve

Some personal remarks as author of some published and unpublished emulators to this topic.

First of all I think we must distinguish between PC (desktop / laptop) and PDA based emulator systems.

1) PC

This is the area where most people know my name, especially as maintainer of Emu48 (Win32 version). I must confess I'm one of the persons where a PC runs all the day. In the company from the morning to the evening and at home from the evening until I go to bed. So especially the emulation of the high end calculators completely replace the usage of the real ones. Replace means here, replacing the Windooze integrated calculator for simple math like pi*4 and on the other side for HP program developing purpose. The only real calculator I use quite often is the HP32SII in my jacket. Especially for program development PC based emulators are my first choice.

All my DAY calculation routines for the HP42S published on www.hp42s.com were developt with an emulator. I never tested them on a real machine, it's just too clumsy to type them in or to maintain them on a real machine.

On the other side emulation of low end machines on the PC like HP10B, HP20S or with some restrictions the HP32SII makes not too much sense. It was fun for me to program them, also like Emu28, the HP28C emulator but I don't really use them on the PC.

2) PDA

This is area where my name is unknow. The reason for this is simple, I haven't published my emulators for PocketPC 2002 (Jornada 565).

Reason for this, I got many support requests on Emu48 and much more on Emu48CE. I have nothing to to with any Emu48CE version! A test platform, especially when you write software for PocketPC like me, is quite expensive. How should I test my software and give support to a platform I haven't? Would you spend much time and money into such a project? Selling each copy isn't possible because some source code parts are published under the GPL.

Now back on topic again, on one side we have the emulation of the high end graphical calculators like the HP48 or HP49 on the other side emulations of Pioneer series calculators or other smaller machines.

2.1) HP48, HP49

IMHO not very useful (even if you have a fully working and a more or less bug free version like me), the display is too small, the keyboard has no tactile feedback and depends on the KML script it's sometimes also too small. Also not very useful for developing purpose.

The only useful thing maybe that you have special programs or libraries (navigation tools, ...) which you have to use frequently outside home.

2.2) HP42S, HP28S

I'm personally not such a friend of the HP42S, I use the HP32SII emulaton more often. For more complex calculations I prefer my HP28S emulation on the PDA (display in landscape mode). It's a litte bit faster than the HP48 emulation and the relationship between display and keyboard size is IMHO much better.

2.3) HP32SII

This is an emulator I like very much. The PDA has quite the same size like the orignal, the display is big enough and the size of the keys is acceptable. The emulation speed is about 10 times faster than the original

one.

But here we have to ask, what think HP about this? Such an emulator will be a competitor in some areas to there new HP33S. But it's useless to discuss this at the moment, ROM images aren't available.

2.4) Simulators

Can be adapted especially to the needs of the users and onto the situation on the host system. No problems with firmware copyright. Take no care on the restrictions of the original hardware.

Regards

Christoph

*Message #13 Posted by **Christoph Giesselink** on 23 Mar 2004, 12:55 p.m.,*
in response to message #12 by Nelson M. Sicuro (Brazil)

From a person who has it.

BTW, I had a discussion with Eric Smith a while ago. It _should_ be possible to extract them from the real calculator. I know from my documents that the Lewis and Bert chips have "mode" pins, where the chip can be switched into the Verbose Mode. In Verbose Mode every Saturn bus activity is also viewed on the six external Saturn bus pins. The Sacajawea chip of the HP32SII (and others) is very similar to the Lewis and the Bert chip, so we can expect that it has also external test and Saturn bus pins. Finally I know that every Pioneer calculator has an integrated ROM test where every ROM address is read minimum once. The problem is, I have no information or idea where on the chip the necessary pins are.

Regards,

Christoph

Emu Pictures on PDA

Re: Reality, Emulation and New Calculators (Probably Long)

*Message #15 Posted by **David Yerka** on 22 Mar 2004, 4:37 p.m.,*
in response to message #1 by Steve

As I have been using emulators on a PDA for a couple of years I thought I'd give my 2 cents. I started using Charles Lee's 41 emulator on the Palm platform almost 2 years ago and it re-kindled my interest in the 41. A year later my Palm died and I move up to a Axim 5 and Frank B.'s 41 emulator. I finally have ended up with the 41 emulator, a 15C emulator and a 16C emulator on my PDA. I find I use the 15C most often as the horizontal orientation makes it almost a 1:1 match. I love the 16C emulaton--when you need it nothing else will but a real one can beat it. The 41 emulation is nice but too small and it doesn't have printing--Charles' emulation at least could print to a text file on the Palm. But, it can run 95% of the FOCAL programs I used during the time I really used my 41C. But... There is no I/O, no IL loop, no printing--and probably there won't be; its just too much programming to maintain for too little return. And, touch screens are OK but feedback from virtual buttons just doesn't make the grade.

Emulators on the PC are also nice but if I'm going to program a real-world user program and am sitting at the workstation or notebook I'm gonna use Excel, Maple, Basic, C,etc. what ever fits the situation. I use a 41 emulator on my PCs but mostly for hobby purposes: developing machine code rom routines.

Finally, I agree with Christoph Giesselink that emulating the 48/49 series on a PDA is crappy. Not because of the emu48 emulator but there is no way--horizontal or vertical--that you're going to get a usable display on a PDA screen. On the PC emu48 is again great for development of libraries, etc. and for someone to decide if that level of calculator is for them but even with keymapping,etc. actually using it can be very frustrating.

The dream would be perhaps something close to the current HP49G+: an machine code emulation running on a device with a good screen and good sized keyboard. Add the ability to really use SD memory cards as libraries, modules, extra RAM, etc. Really decent I/O; perhaps USB to a tiny interface box having an IL controller (or other general purpose interfaces). With open low level interface drivers other emulators could be loaded from SD cards: One day its an 49, the next a 41 using only a portion of the display.

It probably could be done with the 49G+. After all the 49G+ is really only that: an emulator running on a specialized platform using a CPU designed for PDA devices. It has a crappy I/O interface and a limited SD card interface but the potential is there. It would be a labor of love but it is possible.

HP-41C/CV/CX, HP-42S and HP-71B Emulation on HP-48GX/49G

*Message #16 Posted by **HrastProgrammer** on 23 Mar 2004, 1:28 a.m.,*
in response to message #15 by David Yerka

With open low level interface drivers other emulators could be loaded from SD cards: One day its an 49, the next a 41 using only a portion of the display. It probably could be done with the 49G+.

It has already been done with HP-48GX and HP-49G. Look at the http://hrastprogrammer.tripod.com for more information ...

Basically, I have all my emulators (HP-41X + HP-IL, HP-42X and HP-71X + HP-IL) installed on one HP-48GX with two RAM cards and I can switch between them with just a few buttons (3 button presses, to be more precise). Furthermore, I have all modules (which I currently have access to) stored on the RAM card and ready to load. This is a lot of calculators in the pocket ...

I have yet to receive an HP-49G+ as a gift from Douglas Rohm (thanks Doug) so I can modify them to work on this calculator.

Further plans include HP-12/15/16 emulators (if I manage to get them for a few bucks and find a way to extract the ROMs) and TI-95 emulator (Windows version has been finished and has yet to be ported to HP-48/49) ...

Best regards.

Re: HP-41C/CV/CX, HP-42S and HP-71B Emulation on HP-48GX/49G

*Message #17 Posted by **David Yerka** on 23 Mar 2004, 6:25 a.m.,*
in response to message #16 by HrastProgrammer

HrastProgrammer-- Actually, I was thinking of your emulators when I was writing my origional post. I didn't mention them for a couple of reasons: First, since I was sort of "damning with faint praise" emulators on PDA style platforms I didn't want to imply a link to your work and second, I didn't want to imply a link between your emulators and the 49G+ platform. It is great to hear that you are considering moving them over to the 49G+ but that is your business--not mine to imply.

In point of fact, your emulators are the best for small platforms. If I can't have a 41 but want to use one in the real world it certainly makes sense to run on a platform that is "calculator shaped" with a "calculator keyboard" and runs on long-lasting battery power. The only obvious problem is that HP no longer makes or supports the 48GX/49G and pricing for units, memory cards, etc. are to expensive.

I think what I was leading to was the concept that while a PDA is NOt at it's base a "hand-held PC" but rather an organizer/calendar device heading toward the HHPC concept; the HP49G+ is at its base general purpose "calculator" hardware. We have a screen (big enough to display graphs or a "print-out of several lines), a calculator keyboard, long-life battery operation, multiple I/O (if somewhat primitive), and add-in "module" possibilities. With flash ROM the "OS" for the device is changable at the base software level.

If I can dump all the 49G+ code and emulator code existing, keeping only the machine code routines for screen access, keyboard polling, I/O, and RAM memory access then I could load a 41 emulation written in machine code, the 41 OS roms, and probably a fair number of ROM modules into flash

memory. By re-writing portions of the OS routines--as you have demonstrated with your emulator--full use of the existing RAM memory is possible. With custom code in the emulator and extensions to the 41 OS roms SD cards could be used as mass-storage devices and more. Add a keyboard overlay and you have the closest thing to a new 41 possible.

And, of course, that is only doing a retro calculator. For all those who wish to design a "new" calculator the 49G+ holds out the actually of a prototype hardware platform. IDE platforms exist for the CPU, reverse engineering the existing code to determine low level device drivers is possible (and possibly illegal). It's also one of the best ways to go for projects that would never be commercially viable: use "off the shelf" components.

When I had a Palm PDA with the OS3/4 I was able to use available tools to hack and customize the flash rom code--replacing certain applications with others I found better suited and adding certain application into flash to customize the user interface. I was able to maximize RAM memory and have a personalize interface. There exists that possibility for the 49G+.

I can imagine a 49G+ with alternate flash ROM files on SD. The origional stock code. A "41" image or perhaps an image with several emulators: 41, 15C, 16C, 42S, 71 and the code to switch between. Add keyboard overlays, load user programs to RAM from SD files and you effective can carry 1/2 a dozen calculators in your (big!) pocket. Of course, switching flash images would take time so you might generally keep the emulator flash in place and load the stock image only when needed. Switching between various emulator if in flash would be very quick.

Real world, though, if you do re-code your emulators for the 49G+ platform, and can implement them as libraries which can easily be switched from/to SD card memory to calculator memory; this will be the best available solution. Even better would be if you can eventually re-write the emulations in CPU machine code so they don't need to draw on the 49 code emulator. That is too much to expect though; too much work for you with too little return for your time. In the end, I guess the question is how many here would buy a 49G+ and an emulator package from you if it meant they could have the 49 RPL machine plus 41,15C,16C and other emulators--running faster than the origionals--at the touch of a button.

Re: Emulation on PDA

*Message #18 Posted by **Arnaud Amiel** on 23 Mar 2004, 5:37 a.m.,*
in response to message #1 by Steve

For me the main advantage of a calculator is that I can carry it around so the only alternative is emulation on a PDA. Now, do I really need a PDA? Not at all so I have a 49g+ that covers very efficiently all the PDA needs I have. And this gives me for a fraction of the price and about the same size a calculator, with a real keyboard for convenient input, and a PDA. I am sure many people are in my position. I don't deny that lots of people have PDAs but usually these people do not require an advanced calculator, or actually don't need a PDA (I guess this is most of them).

I am quite sure that there is a market for advanced calculator and a market for PDA and that althought they do overlap, it is only slightly.

Arnaud

installing and using libraries 49G+

*Message #1 Posted by **Dan** on 21 Mar 2004, 9:18 a.m.*

I never really used libraries with my 48G, 48GX and now my 49G+. I really like the HP line. However, I have become extremely use to the equation library on the 48 series. I have researched on hpcalc.org. They indicate that Libman was a good program to manage libraries and eql49r27 was a good library to replicate the equation library. However I have no idea what I am doing with the libraries, how to install them or how to run them. the directions for the programs are clearly for someone who knows what they are doing. Please help me with any advise. Thanks.

Re: installing and using libraries 49G+

*Message #2 Posted by **Raymond Del Tondo** on 21 Mar 2004, 10:14 a.m.,*
in response to message #1 by Dan

Hi,

since you have at least two HP-48G type machines, you propably still have the user manuals. Installing of libraries should be explained there. I don't know the quality of the 49G+ manual, but if it's like the 49G manual, then go for the 48G manual.

However, there are FAQs on www.hpcalc.org covering the topic of libraries.

Raymond

Re: installing and using libraries 49G+

*Message #3 Posted by **James M. Prange** on 21 Mar 2004, 9:07 p.m.,*
in response to message #2 by Raymond Del Tondo

As for installing the libraries, I agree with Raymond. It's essentially the same since the 48SX.

There are a few differences though. The 49g+ has the SD card as port 3, but libraries won't work from there, you have to use ports 0, 1, or 2 for active libraries. The File Manager application is perhaps an easier way to move the library to a port. For the 49 series, turning the calculator off and back on no longer executes the library configuration routines. Do an ON-C warmstart after storing the library in a port to run the configuration routines.

If you have a misbehaving library, you may want to have them all detached so you can find and purge the buggy one. On the 49 series, hold down the backspace key while doing a warmstart, which bypasses the configuration routines, so no libraries will be attached.

Except for I/O and the SD card, the 49g+ is very much like the 49G, at least as far as UserRPL goes.

As for the 49g+ user's guide, in some ways, it's a big improvement over the 49G, but it lacks an "Advanced User's Guide" with information on each command. I suggest using the 49G Advanced User's Guide with it. See http://www.hpcalc.org/search.php?query=advanced+user%27s+guide&hp49=1 Even then, you still want information on system flags and reserved variables, see http://www.hpcalc.org/search.php?

query=Federico&hp49=1

In general, keep in mind that most of the information on older model RPL calculators still applies to the newer models.

What is a warm start? and HP48 rant

*Message #4 Posted by **bill platt** on 22 Mar 2004, 5:09 p.m.,*
in response to message #3 by James M. Prange

Hi James,

I have been using a 48gx for a year or so now (finally got MetaKernel and ALG48 up and running thanks to R. Lion--wow! what a difference MetaKernel makes! Totally cool! The filer is an exceptional improvement--it makes the task of acutally using all the memory fun rather than daunting--and totally simplifies backing up stuff to cards--its just like copying a file on a computer. And the equation writer actually works fast enough to be useful now--and allows implicit multiplication! And the ALG48 seems to make some interesting things possible [like this exact integer business]---just have not really explored it yet. Begs the question: just why did HP leave so much room for improvement, anyway?)

But I keep hearing this term "warm start" and I don't know what it means---it doesn't say that word anywhere in the manual that I can find. Can you please explain this term? And how about the other starts--if there is a "warm one, is there also a "cold start"? I must be doing it, because all my "libraries" are obviously attached!

Didn't Bill Wickes once write "Life is short and ROM is full."?

The 48 series calculators are still amazingly useful products with just the built-in operating system. Sooner or later, you have to abandon or shelf the project or else decide that the current design is good enough and start manufacturing and marketing the product. How many products would be available if we waited until all designs were beyond improvement? It seems to me that we'd still be "naked apes", perhaps discussing what the "perfect" design for some sort of clothing would be. Maybe chimpanzees are the real perfectionists.

And how about the other starts--if there is a "warm one, is there also a "cold start"? I must be doing it, because all my "libraries" are obviously attached!

Sorry about that. I think that the manuals mention the [ON] and [C] keypresses together operation to exit the system tests, but I don't know that they bother to give it a name. And yes, the 48 series automatically does the warmstart for you, if you haven't already done it yourself.

I suppose that a "cold start" would be just turning the calculator on when none of the conditions (mentioned below) that would cause a "warmstart" are present. Or maybe that would be a "hot start", with a "cold start" being a complete Memory Clear.

What's commonly referred to as a "warmstart" is what Bill Wickes calls a "system halt" in his "Insights" series. The "Try To Recover Memory?" event is commonly called a "TTRM". This will tell you more than you asked for, but I think that it's all good to know. The "father of RPL" explains it better than I could, so plagiarizing from "Insights":

Quote:

Calculator Resets

The HP48 provides a special operation, called a *memory reset*, that clears all global and port 0 variables and restores all of the calculator's default modes. Part of the memory reset is a *system halt*, that by itself resets the HP48's execution without affecting stored objects.

A system halt is obtained by pressing [ON] and the [C] menu key together. This operation does all of the following:

- Aborts all current execution;
- clears the stack, the return stack, all local memories, last arguments, the recovery stack, the command stack, and the graphics display;
- turns off user mode;
- sets the last error number to zero and the last error message to an empty string;
- detaches all libraries currently attached to the home directory, and executes the configuration programs of all libraries in the various ports;
- reestablishes the home directory as the current directory;
- activates the MTH menu;
- leaves global or port variables, alarms, and key assignments unchanged. All flags are also left unchanged, except flag -62, which is cleared.

A system halt is performed automatically when you turn the HP48 on, if you have stored or removed any libraries from any ports since the previous time the HP48 was turned on, or if you have inserted or removed memory cards, or changed a RAM card's write-protect switch position. This ensures that there are no references remaining to library objects that you may have removed.

A *memory reset*, for which you press the [ON], [A], and [F] together, starts by executing a system halt. Then the HP48 displays

```
Try To Recover Memory?

 YES              NO
```

If you see this display when you turn the calculator on, or at any other time when you have not deliberately performed a memory reset, it indicates that the calculator has detected a corruption of memory contents such that it can not continue normal operations without at least a partial memory reset. This corruption can be caused by a hardware fault, including the effects of static electricity, by the execution of a SYSEVAL with an incorrect system address, or just by defective built-in or add-in software.

> If you choose [NO], the HP48 performs a complete reset, deleting all global variables, port 0 variables, key assignments, and alarms and resetting all flags to their default values. The calculator displays **Memory Clear** when it is ready to resume manual operation.
>
> If you choose [YES] at the **Recover RAM** prompt, the HP48 attempts to recover or restore as many user memory and port 0 variables as it can by scanning through memory for recognizable objects. If it detects a valid user memory, then it can usually restore it unchanged, except that key assignments and alarms are always lost. If it finds invalid objects, it discards them and rebuilds as much of the user memory structure as it can. In some cases when the home directory itself is corrupt, subdirectory objects there can be reconstructed, but they lose their names. The HP48 makes up variable names for these directories, naming them D.01, D.02, and so forth. When the automatic reconstruction process is finished, the standard display is restored. Then you can inspect the VAR menu to determine how much of user memory is intact.
>
> During variable reconstruction, the HP48 looks for library objects in memory to try to determine where port 0 begins. Unfortunately, if it encounters a library that was stored in a global variable, it takes that as the start of port 0, which means that some part of user memory will be discarded. For this reason, you should not keep libraries in user memory for long term storage--store them in a port instead.

Note that the 49 series don't do a warmstart on turn-on just because libraries stored in the ports have changed since the last turn-on, so you have to force the warmstart, and it seems that purging a library from a port automatically detaches it first. Of course, if the new library doesn't have a configuration routine, you'll have to use an ATTACH command, and if all that the configuration routine does is to attach the library (the usual case), then you can use ATTACH instead of a warmstart. And of course the 49G doesn't have cards, and although the 49g+ has an SD card, you can't have an attached library in the card.

Ordinarily, all keys except [ON] are put into the key buffer as soon as they're pressed, and execution continues, and the buffer is accessed when the system is next ready to take something from it. But the [ON] key is different; when you press it, all execution (except changing the LCD darkness for [+] or [-] and system tests) stops until you release [ON] (and all other keys pressed while it was down), and which operation occurs then depends on what (if any) other keys have been pressed while the [ON] key was down. Note that in the [ON]-[A]-[F] memory reset operation, you have to release the [F] key before the [A] key, or else you'll go into the [ON]-[F] test mode. If you've pressed [ON] and some other key, but change your mind before you've actually released [ON], then press and release [B] before releasing [ON] to cancel the operation.

A warmstart may be needed if a buggy operating system or misbehaving program (or library) "hangs" the calculator. Or if you happen to assign keys such that you can't otherwise get out of user mode, such as 0 DELKEYS 'S' DELKEYS for example. It's also used for getting out of the various system tests.

But sometimes the crash is so bad that even the [ON]-[C] operation won't work. A warmstart can also be forced with a "hardware" (AKA "paperclip") reset through the hole marked "R" under one of the upper feet on a 48 series, or the hole in the back of a 49 series. Note that, as long as memory hasn't actually been corrupted, this doesn't cause a TTRM, just a warmstart.

A paperclip reset also adds an entry similar to "C-03/20/04 21:35:31" to the warmstart log (execute WSLOG to put it on the stack), where the "C" indicates "Hardware reset occurred (for example, an electrostatic-discharge or user reset).", and of course the rest is the date and time that it occurred. A

warmstart invoked from the keyboard, or a warmstart due to a library or port change at turn-on, doesn't affect the warmstart log.

As I mentioned in my earlier post, on the 49 series, holding down the backspace key through a warmstart bypasses the library configuration routines.

Most libraries seem to include an ATTACH command as part of their configuration routines. But sometimes libraries use "unsupported" entry points, and when a new flash ROM is released for a 49 series, the entry point will have moved, so the library doesn't work anymore. Trying to use a library intended for a different model may well be a problem too. And of course some may be corrupted or are just plain buggy. Sometimes the library will auto-attach and hang the calculator immediately after a warmstart, or repeatedly warmstart, or repeatedly TTRM regardless of whether you press YES or NO, before you can purge the library or even turn the the calculator off, and those are the main reasons for bypassing the configuration routines.

On the 49G, [ON] and [D] together gets you to the "Tests" screen, and from there, pressing [Q] for "Reboot" does a warmstart. On the 49g+, [ON] and [F] together gets you to a different tests screen, and from there, pressing [ON] for "REBOOT" does a warmstart. I find it easier to hold down the backspace while pressing one of these warmstart keys than doing [ON] and [C] together and then (trying to) press backspace after releasing [ON] but still early enough in the warmstart routine to be effective.

The 48 series doesn't have a built-in way to bypass the library configuration routines, but there are applications available to do this; try hpcalc.org if you want one.

Regards,
James

Re: What is a warm start? and HP48 rant

*Message #6 Posted by **Wayne Brown** on 23 Mar 2004, 12:52 p.m.,*
in response to message #4 by bill platt

James Prange gave a great explanation of warm starts as they relate to HP calculators, but I thought I'd add a bit of other HP trivia. Some of these terms probably were borrowed from HP's HP3000 minicomputers and their operating system, MPE (**M**ulti-**P**rogramming **E**xecutive). Back when I was an HP3000 system manager, this was the procedure we followed after an unexpected crash (**system halt**):

(1) Perform a memory dump to tape so HP Support could look at it if necessary.

(2) If possible, bring the system up with a **warm start**, which preserves in-memory tables, temp files, spool (print) files, etc.

(3) Print the spool files or dump them to tape.

(4) Shut the system down again.

(5) Bring it up again with a **cool start**, which clears spool files and temp tables, and loads the operating system into memory from disk.

(6) If the system wouldn't come up with a warm start or cool start, the next option was a **cold start** (also called **cold load**) which copied the essential parts of the operating system from tape to disk

and then proceeded like a cool start.

(7) If all else failed it was time for a **reload**, which cleared the disk packs and loaded everything from tape. This was a drastic last resort and usually was the time that you discovered one of your backup tapes had a read error. :-(

After a normal shutdown (as opposed to a crash) a warm start was all that really was necessary, but we usually did a cool start because it took very little more time and we liked knowing all the temporary stuff had been cleaned up.

An HP3000 warm start was much like a normal "power-on" for an HP48, the 3000 cool start was similar to a 48 warm start, and a 3000 cold load was something like a 48 TTRM. I guess the closest 48 equivalent to a 3000 reload would be clearing all the ports on a 48 expansion card and reloading them from a PC backup.

Hi,

if it's mainly the filer you like, then I'd suggest to try Filer48 from Raul Del Cid Lopez. THAT is the best filer for the HP-48, far more advanced than that of the MK.

Regards,

Raymond

HP-71B Libraries?

*Message #1 Posted by **Matthias** on 21 Mar 2004, 2:16 a.m.*

For the HP-41 there are several "user´s libraries solutions". I thought that there are also some libraries for the HP-71B system but I didn´t find any list. Does someone has a list of them?

Matthias

Re: HP-71B Libraries?

*Message #2 Posted by **Raymond Del Tondo** on 21 Mar 2004, 7:06 a.m.,*
in response to message #1 by Matthias

Hi Matthias,

maybe the keyword 'CHHU' could help? However, the HP-41 was ways more successful than the HP-71, and it seems HP didn't support the HP-71 like they propably did with the HP-41 . A good indicator for this were the IDS, which said between the lines 'Here you are. Don't bother us (HP) with further questions' ;-)

48 Application Card "DLG"

*Message #1 Posted by **Ron** on 21 Mar 2004, 12:36 a.m.*

I came across a 48GX applications card which says simply, "DLG Rev. D." Anyone know what it is???

Thanks.

Re: 48 Application Card "DLG"

*Message #2 Posted by **Raymond Del Tondo** on 21 Mar 2004, 6:59 a.m.,*
in response to message #1 by Ron

Normally there is a menu key like [ABOUT], or [VERSION], or some other kind of copyright notice. Maybe just start the application on the card, after backing your calc up, of course. That should tell something about the software;-)

Compare HP 48G/GX, 49...?

*Message #1 Posted by **Steve** on 20 Mar 2004, 12:29 p.m.*

For various reasons, I would like to better understand the differences among some of HP's late model calculators, in particular the 48 series and the 49. I've looked through the site, but the 48 references don't focus much on differences and there are no obvious 49 comparisons. Could someone write a brief sentence about each to highlight the most significant differences? The 48GX was the same as the G except it could take an expansion card? The G+ was ??? The 49 was more powerful and had flash memeory update capability? Was that about it???

Re: Compare HP 48G/GX, 49...?

*Message #2 Posted by **Neil** on 20 Mar 2004, 2:53 p.m.,*
in response to message #1 by Steve

These sites have some details of differences between the 48 series models and possibly 49 as well:-

http://www.rskey.org/hp.asp

http://www.hpcalc.org/

Re: Compare HP 48G/GX, 49...?

*Message #3 Posted by **Norris** on 20 Mar 2004, 3:07 p.m.,*
in response to message #1 by Steve

The traditional 48G lineup included three models: the G, G+, and GX. The G had 32KB of memory and no expansion slots. The G+ had 128KB of memory and no slots. The GX had 128KB of memory and two slots. They were otherwise similar.

There was also an older 48S series. The S had 32KB memory and no slots. The SX had 32KB memory and two slots. The S series lacks some of the bells and whistles of the G series.

HP48GX enthusiasts ultimately developed some major improvements for the GX, including an alternative operating system (the Metakernel) and greatly enhanced symbolic math software (Alg48, Erable). A 48GX can, in effect, be upgraded to another level by purchasing memory cards and loading this software. However, the memory cards significantly increase the overall cost of the calculator.

HP ultimately incorporated the improved software into a new generation of graphing calculators, including the discontinued 49G and the current-model 48GII and 49G+. These newer models are faster and less expensive than a 48GX plus memory cards. However, I still use an old 48GX with cards, so I will leave the description of the newer models to others.

Re: Compare HP 48G/GX, 49...?

*Message #4 Posted by **Steve** on 20 Mar 2004, 4:12 p.m.,*
in response to message #3 by Norris

Norris, thank you for your comments. That was exactly the sort of clarification that I was hoping for.

As you seem to imply, the 49 series may be more powerful but the 48GX looks like the device of choice when all other factors (quality, cosmetics, etc...) are included.

Now, would anyone else care to make the case for the 49 series (at least what we know of it to date)???

Re: Compare HP 48G/GX, 49...?

*Message #5 Posted by **James M. Prange** on 20 Mar 2004, 5:48 p.m.,*
in response to message #4 by Steve

More fun to play with? But seriously, the new "CAS" commands may be useful for students of advanced math, and the new editor capabilities such as "find", "replace", "copy", "cut", and "paste" are generally useful, as are the commands SREPL (substring replacement), UNROT, UNPICK, PICK3, and NIP. The 49 series has built-in non-volatile user flash memory, and the 49g+ can use an SD card.

But so far, for getting any real work done, I still prefer a 48SX or 48GX. But the keyboard on my replacement 49g+ isn't as bad as the early production unit; I might actually start using it for "real work" eventually.

Regards,
James

Re: Compare HP 48G/GX, 49...?

*Message #6 Posted by **Norris** on 21 Mar 2004, 12:14 a.m.,*
in response to message #4 by Steve

Don't get me wrong -- I am not suggesting that the 48GX is superior to HP's current models. I bought the 48GX several years ago, when it was still the top of the HP line. I upgraded it with memory cards, Java, Erable, Alg48 etc. and it's worked out fine for me. Since I'm basically satisfied with it, I don't have a compelling reason to upgrade to a 49G, 48GXII, or 49G+.

But if I had to replace the 48GX today, I would most likely get an 49G+ instead. A used 48GX is probably in the $150 to $200 range. I have 128KB and 512KB memory cards from Cynox; the combined cost is currently 93 euros, or about $115 plus shipping from Germany. So it would probably cost some $250 to $300 (or more) for a similarly-equipped 48GX today.

That's twice the cost of a brand new 49G+, which is in the $130-$150 range. And the 49G+ is much faster, has 2.5MB of memory, an SD card slot, a larger display, and flash memory upgrades. And all the software improvements are preinstalled.

I suspect that the 48GX is more attractive and has a better keyboard; don't know for sure since I have not actually seen a 49G+. But I also expect that the appearance and keyboard of the 49G+ are at least adequate. Given the lower cost and other advantages of the 49G+, it seems like the better choice today. I suspect that if I actually tried one, the old 48GX would seem impossibly sluggish in comparison.

If you want to do general scientific or engineering number crunching, then any 48 or 49 series calculator will be fine. But if you also want to handle symbolic math, then you are probably better off getting a newer model like the 49G+. You can add symbolic math capability to the 48GX, but you will pay a lot more for less memory and slower performance.

Actually, if I was starting over today I might choose the 33S. I originally got the 48GX for use on the NCEES engineering license exams. All 48 and 49 series calculators have since been banned on these

exams.

Re: Compare HP 48G/GX, 49...?

*Message #7 Posted by **Joesph** on 21 Mar 2004, 1:45 a.m.,*
in response to message #4 by Steve

Here are some of the benefits of the hp49g+, compare to the hp48gx.

-Speed. It's much faster, and the gap is growing as people rewrite commands.

-Third party programs. 99% of new interesting programs will be written for the 49g+ instead of the 48gx.

'Al Borowki' has released a program that will calculate 1000 factorial exactly, in under 3 seconds. 'Douglass Ripper' has just released a program to draw flickless greyscale density plots.

-Larger screen with a plastic cover, so it's less fragile

-Vast software improvements built in. Symbolic Exact math is included.

-SD expansion cards are extremely cheap compared to 48 ram cards

-Price. Work out how much a decent 48gx will cost compared to the 49g+. Remember the cost of ram cards, and even then it will still be much slower.

If HP hadn't stuffed up the keyboard, the 49g+ would be a steal.

IR wavelenghts

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 20 Mar 2004, 5:15 a.m.*

Hello,

know anybody, what is the main wavelenght of HP's IR ports? And where I can find some about the HP calc's communication methods?

Thank you! Csaba

Re: IR wavelenghts

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Mar 2004, 10:20 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

While the IR wavelenght (from an optical point of view) is not critical at all, the frequency and coding of the pulses certainly is. The first IR models used an HP proprietary format, sometimes refered to as "RedEye"; some newer units as the LX100/200 PC Palmtops used the standarized IRDA (which is similar to an IR asynchronous serial port).

An article about the RedEye protocol appeared in the HPJournal in 1987, I think it was mentioned here before many times, and certainly is part of the CD set from the Museum. In the Archives forum you will find many references, including an interesting article (around 2000)from Steve (Australia) who managed to receive the pulse stream from an HP calculator on a PC, by means of a phototransistor connected to the input of the PC sound card.

Re: IR wavelenghts

*Message #3 Posted by **David Smith** on 20 Mar 2004, 12:37 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Most IR LEDs from that time period emitted at 750-900 nm.

Re: IR wavelenghts

*Message #4 Posted by **James M. Prange** on 20 Mar 2004, 4:42 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

You don't mention which models, but I guess that the IR I/O would be similar for most models, excepting the 49g+ using IrDA I/O. For "Serial IR" I/O, see http://www.hpcalc.org/details.php?id=1722 (plain text) or http://www.hpcalc.org/details.php?id=4741 (PDF). For "Red-Eye" output (used for printing), see http://www.hpcalc.org/details.php?id=4742.

Fixing an HP 32SII

*Message #1 Posted by **Boyd Zander** on 19 Mar 2004, 7:11 p.m.*

My recent Ebay bought 32SII has become troublesome. The screen is not visible. I can see by looking at it from an angle that the machine is being turned on and off because there is some slight illumination of the screen. I can see that characters are being input but I cannot see what they are.

Is this a fixable item? Any suggestions? I thought perhaps some of the keys were hit in just the right order to turn the contrast way down to become non-visible.

Re: Fixing an HP 32SII

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 19 Mar 2004, 7:21 p.m.,*
in response to message #1 by Boyd Zander

Did you verified the contrast with the key combination ON/[+] or ON/[-] or a reset? The batteries are good?

Good luck!

Nelson

It's Fixed!!

*Message #3 Posted by **Boyd Zander** on 19 Mar 2004, 7:50 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

I emailed Randy at Fixthatcalc.com and he sent me to the following link with instructions for what turns out to be a common problem. I performed the step and sure enough, my screen is back in action again.

http://fixthatcalc.com/try.htm

Thanks for the suggestion Nelson. I did try C(+) and C(-) and I could see contrast changing but no characters would be visible.

hp71 death, please help!

*Message #1 Posted by **t-bone** on 19 Mar 2004, 6:38 p.m.*

I could manage to save one thanks to Luiz! Thanks again Luiz! I did the reinit procedure ON and / and it started an memory lost. Great. But it did not work on the other one. When it's powered, all the elements of the display are lit and it's insensitive to any key : I tried to do On and / but nothing happens. When I remove the batteries and press on for about 30s, it starts a kind of display test then the image vanishes and it's the same when I put batteries back: all lit! Do you have any idea? In any case, I really want to thank Luiz cause one is already ok. All the best, T-bone.

Re: hp71 death, please help!

*Message #2 Posted by **Garth Wilson** on 20 Mar 2004, 1:31 a.m.,*
in response to message #1 by t-bone

This message was somehow lost the first time I tried to post it, so I'll write it again (and keep a copy this time!)

I crashed the 71 royally a few times when I was new to Forth. (I knew it could happen, so I had everything backed up, and a program to re-load everything from tape and do all the custom set-ups.) At least once I had to remove the batteries and short the end terminals together while pressing ON for half a minute or more to get things discharged enough to ensure a real reset.

I should make a side comment here. A few times I got the dredded "Memory lost" message at unexpected times when I turned the 71 on. I told this to the friend who got me into it, and he said he did too, and suspected it was from keys getting pressed while it was in the soft case in his atache case. Acting on that tip, I had a woodworker friend make me a little one-piece box that I could slide the computer and soft case into the end of, which fit just snug-- not tight. I've never had a memory-lost condition since then. That was ten or fifteen years ago.

Hard cases for the 71B

*Message #3 Posted by **Tom Sherman** on 20 Mar 2004, 3:11 p.m.,*
in response to message #2 by Garth Wilson

A colleague once expressed surprise at the old Dutch Masters cigar box which accompanied me in my backpack when I bicycled to work. I opened it up to show him my HP-71B. Those who have not inherited cigar boxes from a previous generation will find that some of the school pencil boxes (made by Rubbermaid and others) fit the 71B (and soft case) perfectly.

Cheers, Tom

HP-41 Extended memory

*Message #1 Posted by **Jon** on 19 Mar 2004, 6:13 p.m.*

Hi everybody:

Just wondering if anybody knows how to check the extended memory installed. I mean how to look at the registers that the calculators has in the extended memory (in order to verify that the modules work 100%)

Thanks in advance

Jon

Re: HP-41 Extended memory

*Message #2 Posted by **Richard Garner** on 19 Mar 2004, 6:46 p.m.,*
in response to message #1 by Jon

Try doing a Catalog 4 (shift Enter 4). That should return how much extended memory you have installed. On the base 41CX with the extended function/memory built in, you should have 124 registers. Each extended memory module will have 238 registers up to a maximum of 600 with 2 extended memory modules. I think the extended function/memory module for the 41C/CV has 127 registers and you can add 2 extended memory modules to that for a total of 603.

Re: HP-41 Extended memory

*Message #3 Posted by **Mark Hardman** on 19 Mar 2004, 8:40 p.m.,*
in response to message #2 by Richard Garner

If you have an HP-41C/CV as opposed to an HP-41CX, you will need to used the EMDIR command rather than CAT 4. CAT 4, CAT 5 and CAT 6 are only available on the CX.

On a C/CV with the X Function module alone or a CX with no X Memory modules, EMDIR will return 124 registers. Adding one X Memory module will return 362 registers and adding two X Memory modules will return 600 registers.

Re: HP-41 Extended memory

*Message #4 Posted by **Wayne Stephens** on 21 Mar 2004, 4:48 p.m.,*
in response to message #3 by Mark Hardman

Hi,

I have an early 41C, and executing EMDIR results in a "NONEXISTENT" message. Is there some other way to check the memory on a 41c?

Thanks.

Take care.

Wayne

> I have an early 41C, and executing EMDIR results in a "NONEXISTENT" message. Is there some other way to check the memory on a 41c?

The HP-41C and HP-41CV do not have any extended memory unless you have plugged in an HP 82180A Extended Function Module, in which case they have 128 registers of extended memory. One or two HP 82181A Extended Memory Modules may then be added, which each increase the extended memory by 239 registers. (These counts do not match the output from EMDIR because some registers are consumed by overhead.)

The HP-41CV has 320 registers of standard memory, which is the maximum.

The HP-41C has 64 registers of standard memory. It can be expanded to a maximum of 320 registers of standard memory by adding up to four HP 82106A memory modules (64 registers each) or one HP 82170A quad memory module (256 registers).

If you're asking for a way to test the memory, the easiest way would be to write a small program to test it. For instance:

```
01 LBL "MEMTEST"
02 DEG
03 FIX 0
04 0.999
05 LBL 01
06 ENTER^
07 INT
08 360
09 /
10 SIN
11 SF 25
12 STO IND Y
13 FC?C 25
14 GTO 02
15 RDN
16 ISG X
17 GTO 01
18 LBL 02
19 RDN
20 INT
21 "STO OK: "
22 ARCL X
23 AVIEW
24 1
25 -
26 1E3
27 /
28 LBL 03
29 ENTER^
30 INT
31 360
```

```
32 /
33 SIN
34 SF 25
35 RCL IND Y
36 FC?C 25
37 GTO 05
38 x/=y?
39 GTO 04
40 RDN
41 RDN
42 ISG X
43 GTO 03
44 INT
45 "RCL OK: "
46 ARCL X
47 PROMPT
48 LBL 04
49 RDN
50 LBL 05
51 INT
52 "RCL ERR: "
53 ARCL Y
54 PROMPT
55 END
```

Use "SIZE" to set the number of registers to the maximum you can after entering this program. If the memory is initially empty, you can use "SIZE 044" on an HP-41C with no memory modules, or "SIZE 300" on an HP-41CV or HP-41CX. Then use "XEQ MEMTEST" to run the program. It will store a unique number in each register, display the count of registers it stored into, then recall and verify each number. It will take a while.

Re: HP-41 Extended memory

*Message #6 Posted by **Wayne Stephens** on 22 Mar 2004, 7:56 a.m.,*
in response to message #5 by Eric Smith

Thanks. I'll give the program a try.

I neglected to mention in my first posting that my 41c has two HP 82106A memory modules. They appear to be functional since the sum of the number of storage registers allocated and programming registers remaining (when no programs are stored) is 191. I was just curious as to why EMDIR does not work on my calculator, and was looking for a way to check memory when programs are stored without having to manually count bytes for each individual program.

I should also note that this 41C is a new acquisition and is my first experience with the 41 series. So, there may be an easy work-around which I have not yet stumbled upon or learned from the experts on this forum.

Take care.

Wayne.

Re: HP-41 Extended memory

*Message #7 Posted by **Wayne Brown** on 22 Mar 2004, 11:52 a.m.,*
in response to message #6 by Wayne Stephens

The HP 82106A modules are not *extended* memory modules. They provide additional *conventional* memory for a 41C. The 41CV and 41CX cannot use the 82106A modules because they already have the maximum conventional memory installed. However, you can add extended memory to any of them with the 82181A modules. The 41CX has built-in software support for extended memory, but the 41C and 41CV do not. So, if you want to use extended memory in a 41C or 41CV you need the 82180A Extended Functions module,

which has 128 registers of extended memory *plus* the additional software functions (like EMDIR) that support extended memory. The maximum memory configurations for each model are:

41C: One 82170A Quad memory module (the equivalent of four 82106A conventional memory modules, but only takes up one expansion port) plus one 82180A Extended Functions module plus two 82181A extended memory modules.

41CV: One 82180A Extended Functions module plus two 82181A extended memory modules.

41CX: Two 82181A extended memory modules.

These configurations result in the same amount of memory for all three models, but the 41C will have all four expansion ports filled, the 41CV will have three ports filled, and the 41CX will have only two ports filled.

You can think of a 41CV as a 41C with four 82106A modules (or one 82170A quad module) built in, and a 41CX as a 41CV with an 82182A Time Module and an 82180A Extended Functions module built in. (The 41CX also has a few additional built-in functions not included in the other modules.)

Re: HP-41 Extended memory

*Message #8 Posted by **Wayne Stephens** on 22 Mar 2004, 12:58 p.m.,*
in response to message #7 by Wayne Brown

Thanks for the education, Wayne. That's the clearest explanation I have gotten as to how the memory works among the 41c models.

Take care.

Wayne

PS - You don't have a spare Quad Memory module you want to sell, do you?

Re: HP-41 Extended memory

*Message #9 Posted by **Wayne Brown** on 23 Mar 2004, 1:08 p.m.,*
in response to message #8 by Wayne Stephens

> Quote:
>
> PS - You don't have a spare Quad Memory module you want to sell, do you?

No, I'm afraid the only memory modules I have are Extended Memory and they're both in use in my 41CX.

One more question

*Message #10 Posted by **Wayne Stephens** on 22 Mar 2004, 1:03 p.m.,*
in response to message #7 by Wayne Brown

Do I have to "max out" my conventional memory on the 41C before I can use extended

memory module(s), or can I install an extended memory module and/or the Extended Functions module and take advantage of extended memory with just "base" conventional memory?

Thanks again.

Wayne

Re: One more question

*Message #11 Posted by **Eric Smith** on 22 Mar 2004, 1:58 p.m.,*
in response to message #10 by Wayne Stephens

You can use an Extended Function module, which includes 128 registers of extended memory (slightly less usable due to overhead), without having the full complement of conventional memory.

On an HP-41C or HP-41CV, you can't take advantage of Extended Memory modules without having the Extended Function module.

The HP-41CX has the equivalent of the Extended Function module built in, so you should not put one in a port. But you can use the Extended Memory modules in an HP-41CX.

You can have at most two Extended Memory modules. They must not be installed one above the other. They can be side by side, or diagonal from each other.

Re: One more question

*Message #12 Posted by **Wayne Stephens** on 22 Mar 2004, 3:25 p.m.,*
in response to message #11 by Eric Smith

Thank you, Eric.

You and Wayne have been very helpful in getting me up to speed on the 41C. I really like the one I just picked up. It is apparently a pretty early one (Ser.# 1942A00288), and is the "steep key" model. I just started messing around with programming it this past weekend. It's fun.

I am already shopping for another one; hopefully a later model CV or CX.

Thanks again.

Take care.

Wayne.

Re: HP41CX + Clonix

*Message #13 Posted by **Christoph Klug** on 23 Mar 2004, 5:20 a.m.,*
in response to message #12 by Wayne Stephens

The today configuration is a HP41CX (with internal X-Functions + Time-Module), a Double X-Memory / XX-Memory (two X-Memories housed in one module case) and the CLONIX.

Load the CLONIX with rom images like CCD + EXT-I/O + EXT-IL and you get an really advanced handheld computer configuration.

Add the IL-Module, the HP-IL/PC Interface Card and EMU41 and you have a absolutely great system solution....

Regards from Germany - Christoph Klug

the guilt of ownership

*Message #1 Posted by **Chris** on 19 Mar 2004, 2:42 p.m.*

The downside of outrageous prices:

I recently obtained a 15c after many years of going RPN-less. My 11c was lost long ago, I don't know where. The 15c showed up at a surplus store here in town. I think I paid something like $25 for it. I knew it was a good deal, but I had no idea!

Now I'm starting to feel kind of guilty that I have this $200-$300-$400(!) device in my desk drawer that I rarely use.

Re: the cure for guilt

*Message #2 Posted by **Paul Brogger** on 19 Mar 2004, 3:35 p.m.,*
in response to message #1 by Chris

I'm sure there are plenty of "needy" lurkers out here more than willing to relieve you of that cursed albatross. (And for as little as $25, if it makes you feel any better!)

;^)

Re: the guilt of ownership

*Message #3 Posted by **bill platt** on 19 Mar 2004, 3:47 p.m.,*
in response to message #1 by Chris

Chris,

Let the swooping, diving, circling and skyweaving begin!

I'd gladly pay $25!

-Bill

Actually, instead of feeling guilty, just search the archives for "valentin" then read all his posts, do all the challenges, and go to his website and read "long livethe 15c!" and you will not feel guilty any more--you will feel awestruck as you realize how much power fits in that little pocket.

Re: the guilt of ownership

*Message #4 Posted by **Paul \marin** on 21 Mar 2004, 6:52 a.m.,*
in response to message #1 by Chris

Don't despair Chris, as I traded a 15C for a 48G from the USA without realizing what it was worth over there at the time. No regrets mind you :). I'm very happy with the 48G. But the prices of a 15C when I bought it was $100 Aus and it was only 4 years old. Now $$$???? who cares! If you've got it use it. If you don't want it,

sell it, that simple

Paul

Re: the guilt of ownership

*Message #5 Posted by **CalcKidd** on 21 Mar 2004, 9:46 p.m.,*
in response to message #1 by Chris

I got an 11C from a local thrift shop last X-mas - with box and cover and manual - all for.....

$2.00.

No guilt here!

:-)

HP 42S Book

*Message #1 Posted by **Dennis** on 19 Mar 2004, 10:54 a.m.*

I recently acquired a HP42S with only the user guide. I ordered the hpmuseum CD1 to get the programming guide.

Is it worth it to get this book I found on amazon? It is called "An easy course in using the HP-42s". Or is the programming guide enough?

Thanks!

Re: HP 42S Book

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 Mar 2004, 3:10 p.m.,*
in response to message #1 by Dennis

Hi, Dennis;

If you're talking about Grapevine's Coffin&Coffin publication, beleive me: it's a must! This is the funniest way I have ever seen a calculator being explainned. Dan and Chris Coffin have also written other "An Easy Course In..." gemms, realted to the HP41, HP12C (still being printed), HP48 and many others. They actually show the best of the calculators the best way. I have both "An Easy Course in Using the HP42S" and "(...) the HP48S", both original printing, no copies.

Even if you are an experienced user, Dan and Chris will find a way to show you something the calculators can do in a way you were not aware of. Reading is believing.

There is another book you'd like to have, if you are an Electrical Engineer or if you deal with Electricity. I have it in hands right now, but I don't knw where in h... did I see its front cover (at least I am sure I did not throw it away...) and I don't remember its title. I'll find it and post its title later, O.K.?

Cheers.

Luiz (Brazil)

1/24/23 5:14 PM RE: MAGIC SQUARE (5x5)

CALCULATING MANY DIGITS OF PI
Message #0 Posted by **Gene Wright** on 19 Mar 2004, 10:45 a.m.

Gene: This is a write-up I just received from Palmer Hanson, who edited the TI PPC Notes for many years in the 1980s - early 1990s. Thought it might be interesting. Looks like the sort-to-1000-digits on a mainline print so 1980-ness belongs to TI? Can see how the 5.01 hours on the TI95 with the HP7SIU! :-)

CALCULATING MANY DIGITS OF PI by Palmer Hanson, editor of TI PPC Notes

Students of calculus may remember that converging series can be used for calculation of trigonometric and exponential functions; e.g.,

$\sin(x) = x - x^3/3! + x^5/5! - x^7/7! + \ldots$

$pi - \pi/4 = 1/1 - 1/3 + 1/5 - 1/7 + 1/9 - \ldots$

where the series for $\sin(x)$ converges rapidly but the series for pi converges very, very slowly. That equation for finding pi is ascribed to Leibnitz and is a special case of the series for finding the arc tangent

$\arctan(x) = x - x^3/3 + x^5/5 - x^7/7 \ldots$

evaluated for $x = 1.0$ radian. For more rapid convergence pi may be calculated as the sum of two arc tangents

$pi = 16*\arctan(1/5) - 4*\arctan(1/239)$

In June 1988 the PPC Calculator Journal (CTNPPC-11) presented an 68K-byte program by Ron Knapp which would calculate 1000 digits in 3.13 hours and 1100 digits of pi in 15.23 hours. Editor Richard Nelson wrote to Maurice Seymour, the editor of TI PPC Notes, saying "... if the TI-59 club wants to accept a real challenge, compare the first 1,000 digits of pi in 5.23 hours. Editor Richard Nelson wrote to Maurice Seymour, the editor of TI PPC Notes, saying "... if the TI-59 club wants to accept a real challenge, compare the first 1,000 digits of pi in 5.23 hours. Editor Richard Nelson also included a table of the first 10,000 digits of pi (0.3786/DP28).

In February 1983 TI PPC Notes (5/HSP/2/E) reported that Jouni Pomoni of Yugoslavia had found a way to calculate 1,000 digits of pi with a TI-59, but even with his program running in four-mode the solution required eighty hours. The program uses the same equations as that of Bob Prosi and proceeds in three stages. First the arctan(1/5) portion is calculated and stored on magnetic cards. This requires about 62 hours. Second, the arctan(1/239) is calculated and stored on magnetic cards. That requires an additional 18 hours. Finally, a short routine combines the two intermediate solutions. It seemed likely that 1100 digits was about as much as could be obtained considering the memory limitations of the TI-59.

In April 1983 TI PPC Notes (1983/04) reported that Bob Prosi had actually pursued Nelson to Ted and published a program by Bernard Ivo Le Taille which could deliver 1207 digits of pi on a TI-59. The solution occupies 10 ddgm per-data-register-three-99-registers for the total of 1207 digits with only one data-register (868) reserved for this control. The program is partially 0 - 1 - 11 - 9! - it runs for 24.01 days! In June 1983 TI PPC Notes (V/HP/4P/U) published the program and instructions for its use. In August 1983 TI PPC Notes (V/HP/4P/U) published a Master Systems's translation of the Science or Vie article which explained the method of calculation as follows

"The entire art consists of finding the right formula in order to design a short and simple program, and to use the largest possible number of memory registers. ... - start with the series

$pi/2 = 1 + 1/3 + (1*2)/(3*5) + (1*2*3)/(3*5*7) + (1*2*3*4)/(3*5*7*9) + \ldots$

Then $pi/2 = [(2*4)/(3*5) + 2]*[(4*5)/(3*5*7) + 2]*[(6*7)/(3*5*7*9) + 2]*\ldots$

This method avoids the addition of terms in the series to the preceding sums. The resulting program contains only a multiplication and a division. ..."

The same issue of TI PPC Notes presented Palmer Hanson's modification of the Science et Vie program to run in less mode and complete the calculations in 13.39 days. Palmer's modification also provided automatic calculation of the number of registers and iterations to be used when calculating fewer than 1207 digits. Correspondents of Science et Vie start similar techniques with other programmable calculators and reported the following results

250 digits of pi on an HP-67

576 digits of pi on a TI-58

and, finally, 3600 digits of pi on an HP-41, a calculation which requires four months! The longest continuous calculation for a TI-59 may have been a search for "amicable numbers" by Bob Prosi. V/HSP/2/1 of TI PPC Notes reported that he ran his search program for 2042 hours ... nearly 111 days. If nothing else the successful completion of calculations which extend to more than one hundred days attests to the reliability of the devices used.

In 1986 Robert Prins of the Netherlands published a book "Extended Precision Programs for the TI-59". He included a modification of Jouni Pomoni's program which allowed the user to calculate fewer digits than 1200 and a minor modification of the last mode version of the Science et Vie program. He also included a TI-66 program which could calculate 484 digits of pi in about 7.5 days

In mid-1987 Hewlett-Laabb reported that he had translated the Science et Vie TI-59 program for use on the TI-58. His translation would calculate up to 575 digits. He did not report run times at that time. His program was resurrected for this historical account. It will deliver 1000 digits of pi in 40.95 hours.

An HP-32SII program by Katri Wanzenman which will evaluate 99 digits of pi in 11 minutes appears at hpmuseum.org as Arctcbn Fmum No. 281 submitted in June 2002. That program uses a different formula for pi

$pi = 20*\arctan(1/7) + 8*\arctan(3/79)$

One might think that a savings in execution time would result because the first term would converge more rapidly; however, the second term will converge more slowly such that the total execution time will be expected to be very similar to that with the equation used by Knapp, Prah and Pramvic.

In early 2004 Palmer Hanson noted that the first-fold increase in speed of Hewlett-Laabb translation of the TI-59 Science et Vie program for the TI-95 suggested that a conversion of Bob Prosi's TI-59 program for use on the TI-95 might yield results which were faster than the Knapp programs on the HP-41. That turned out to be true. The resulting program will deliver 30 places in 30 seconds, 90 places in 3 minutes 5 seconds, 99 places in 3 minutes 43 seconds, 200 places in 13 minutes 30 seconds, 400 places in 1 hour 8 minutes, 1000 places in 5.01 hours, 1100 places in 7.21 hours and 2070 places in 24.61 hours.

Sydney

Other discussions of methods for finding or remembering pi were reported in later issues of TI PPC Notes:

V/HSC/P/H reported that George Thomas had recognized the editor's fascination with pi by addressing letters to "Palmer PI Hanson" and pursuing on a mnemonic for remembering the first thirty digits of pi which had appeared on page 3695 of the April 1969 issue of Datamation, where one counts the letters in each word to obtain each successive digit of pi.

Now I, more I, would celebrate in rhymes may; The great immortal Syracuses, rivaled nevermore, Who in his wondrous lore passed on before, Left men his guidance how to circles mensurate.

V/HSP/4/4/U discussed a method for finding pi through the use of another numbers which appeared in A. K. Dewdney's column "Computer Recreations" in the April 1985 issue of Scientific American. The analogy is to a canoe living into a square field which includes an inscribed circular pond. If the canoe is fired many times and the hits are distributed uniformly over the area of the square then the ratio of the number of hits in the pond to the total number of hits in the square should approach the ratio of the area of the circle to the area of the square which is pi/4. The simulation on a calculator or a computer is performed by using a random-number generator to determine the position of each hit. Clearly, such a method for finding pi depends upon the quality of the random-number generator. John Von Neumann's admonition that "Anyone who considers mathematical methods of producing random numbers is, of course, in a state of sin" (Donald Knuth's The Art of Computer Programming, Vol. 2, page 1) may be applicable here.

V/HSP/2/8 noted that approximating pi with the fractions 22/7 or 355/113 were well-known techniques. Ron Wagner had obtained another technique known as the Hick's (or maybe Hicks') method for calculating pi. Ron Wagner had obtained another technique known as the Hick's (or maybe Hicks') method for calculating pi. On the HP-41 the Hick's method yields 3.14159202 which is within one in the tenth-digit of the value of pi used in that device.

V/HSP/4/8 reported that Larry Landis had used a decimal to fraction converter on his Model 100 to search for fractions and fractions followed by square roots which would return the first thirteen digits of pi. He found three fractions: 427594/136125, 5419551/1725033 and 6395827/1995885. He also found three fractions followed by a square root: 3944667/1880685, 37007406/11732345 and 2614088/2.8648617. He did not find any fractions which when combined with two square roots would yield thirteen correct digits of pi. The first thirteen digits of pi: 3.14159 26535 89 (obtained by truncation) are NOT the same as the rounded value 3.14159 26535 90 which is obtained in response to the pi key on the TI-59, TI-66 and TI-88, which our treasured thirteen digit arithmetic, some are internal value for pi which is a thirteen digit rounded value. It seems likely that memorizing thirteen digits of pi would be easier than memorizing any of those methods.

The discussion in V/1/86/P/L also proposed a simple minded search which would compare the decimal equivalent of fractions against the value of pi (or any other number to be converted) loaded to the accuracy of the machine. Start with the fraction 1/1. If the value of the fraction is greater than the decimal to be converted then add a 1 to the denominator and try again. If the value of the fraction is less than the number to be converted then add a 1 to the numerator and try again. Sample programs for a TC-40 were included. Use of the simple minded search to a TI-95 yields two fractions of interest: 5419551/1725033 = 3.14159 26535 8985 ... which becomes 3.14 32 bus than the defined value so machines that round to thirteen digits such as the TI-59 and TI-88 and 6395827/1995885 = 3.14159 26535 9009 ... which becomes the defined thirteen digit value whether truncated or rounded. The same technique on an HP-41 yields fractions such as 1543451/491221 and 2098531/667613 which will yield the ten digit value used for pi on that device.

Hi Gene,

Do you have this PI calculating program for TI-95? I would like to test it on my TI-95 emulator --

Best regards.

Email me! --

In response to message #2 by Gene

I have a printout of the PC-324 printout of the program. It includes about 750 steps so I don't want to go through the labor of typing them all in. I haven't figured out how to transmit material like the passtop through the mouseum to if you will send an e-mail address I will send it as an attachment.

In response to message #3 by Eduardo Duenas, Jr.

In high school I wrote a program (FORTRAN) for calculating 1 million digits of pi on an IBM1130. It actually calculated arctan(1/5) and multiplied it by 4. It ran over Christmas break (around two weeks).

Message #5 Posted by **Nelson M. Vincent (Brazil)** on 19 Mar 2004, 1:38 p.m.
In response to message #0 by Gene Wright

I have a Pascal (DelphI) program that calculates PI with any decimal places (initially, with 1000, easy to change) using ONLY INTEGER OPERATIONS!

If there is someone interested, I post here (code not so big).

Best regards,

Nelson

I am interested in your Pascal code for PI. Please post it in here.
Thanks.

Routine to calculate PI using only integer math [LONG, Pascal code]
Message #8 Posted by **Nelson M. Vincent (Brazil)** on 19 Mar 2004, 5:43 p.m.
In response to message #6 by Gerhan Zarr

There is the routine (in a pascal unit, need to be called from another [main] program).

```
unit uspi;

interface

function CalcPi(numdig:integer): string;

procedure TestUnit;

implementation
{$A+,B-,D+,E-,F-,G+,I-,L+,N-,O-,P-,Q-,R-,S-,T-,V+,X+,Y+}
{$M 16384,0,655360}
{ This program uses Gauss as a result standard method to find the first 1000 decimal
  digits of PI. Written by Nelson M. Vincent, Brazil, 2004 }
{ This program would processes the first 1000 digits of PI, using
  Gauss method, in about 1 minute and 30 seconds on a Pentium 166 }
{ Implementation is based on Delphi 4 code by Mario Ohki, Japan }
{ Ported to Free Pascal by Nelson M. Vincent, Brazil, 2004 }
{ My implementation is placed into the public domain, by its author
  Nelson Vincent, no copyright me, nada }

{ I have not seen the original article, only that Pascal implementation,
  so I cannot explain the method. Only that it is based on Gauss method.
  Program should be accurate to at least 10 million digits, when using
  the $A+ option. Change the value of "numdigits" to increase the
  variables to store"from after" a "one hundred digits".
}

const
  numdigits=1000;
  arrsize=numdig
  zero=integer;

procedure SetLength(a:Len:integer);
var
  b:array[0..1] of integer;
  i:integer;
begin
  b[0]:=Len+zero;
  b[1]:=zero;
  SetLength:=integer(b);
end;

procedure Dodiv(dig:integer);
var
  i:integer;
begin
  for i:=0 to arrsize-1 do
    a[i]:=a[i] div dig;
end;

function CalcPi(numdig:integer):string;
var
  i:integer;
  arrsize:integer;
  len:integer;
  a:array of integer;
  b:array of integer;
  c:array of integer;
  d:integer;
  e:integer;
  f:integer;
  g:integer;
  h:integer;
  s:string;
begin
  arrsize:=numdig+10;
  len:=arrsize;
  SetLength(a,len);
  SetLength(b,len);
  SetLength(c,len);
  for i:=0 to arrsize-1 do
    a[i]:=2;
  while len do // converted for to while
  begin
    g:=0;
    f:=a[len]*(len*2-1); // converted b4 to a variable ^] (FPC optimization only)
    d:=f mod len;
    e:=f div len; // eliminated mod (which is a division)
    b[len]:=d;
    dec(len);
    a[len]:=g+e;
    g:=e*len;
  end;
  len:=arrsize;
  repeat
    i:=len-1;
    while b[i]=0 do
      dec(i);
    if i<>0 then
    begin
      b[i]:=b[i]-1;
      i:=i-1;
      while i>0 do
      begin
        b[i]:=9;
        dec(i);
      end;
      a[len]:=g+a[len];
    end
    else
      a[len]:=g+a[len];
    dec(len);
    g:=a[len] div 10;
    a[len]:=a[len] mod 10;
  until len=1;
  s:=inttostr(a[1]);
  for i:=2 to numdig do
    s:=s+inttostr(a[i]);
  CalcPi:=s;
end;

procedure TestUnit;
var
  s:string;
begin
  s:=CalcPi(1000);
  writeln(s);
end.
```

Best regards,

Nelson

Approximating PI on a IBM 1130
Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Mar 2004, 6:58 p.m.
In response to message #0 by Gene Wright

Coincidence!. In 1978, in my first programming course (Fri! 3rd year), I wrote a FORTRAN program to calculate PI approximations, running on a IBM 1130.

Only I had to use punched cards for the 1130, but, at the same time, I was doing similar things on the HP-25 (one long year before)

In response to message #10 by David Smith

Exactly the same, but as far as I recall, our IBM had no printer... And we were not allowed to program anything using the console (100% batch, cards with data followed the program cards). All output was hardcopy.

Main memory was 16 K, and the large rotating disks (looked like our schools) held a mere hundred K... (less than 1 MBy, I mean)

Re: Approximating PI on a IBM 1130
Message #12 Posted by **David Smith** on 20 Mar 2004, 12:43 p.m.
In response to message #11 by Andrés C. Rodríguez (Argentina)

Actually the disks bigger than 10MB... at least big enough to store 1 million digits. Our machine only had 8K of memory. It could still run Fortran though. A 2d pass compiler. It could even run ECAP.

Re: Approximating PI on a IBM 1130
Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 20 Mar 2004, 5:02 p.m.
In response to message #12 by David Smith

You are right, I think they held "a mere hundreds of K", but I recalle a mistake omitting the "s" without noticing the error. Thank you

---

Re: CALCULATING MANY DIGITS OF PI
Message #7 Posted by **Gerhan Zarr** on 19 Mar 2004, 11:50 p.m.
In response to message #0 by Gene Wright

A much faster way is by Gauss-Legendre.

Here is the algorithm:
define numbers a,b,t such that at the initial state:
a=1
b=1/sqrt(2)
t=1/4
x=1

then iterate:

y=a
a=(a+b)/2
b=sqrt(b*y)
t=t-x*(a-y)^2
x=2*x

such that pi=(a+b)^2/(4*t)

This algorithm doubles the numbers of pi every iteration!
Therefore, to calculate 1 million digits of pi, you just want to calculate up to n-digits, arctrovation errors of the order log2(n) is sufficient.
E.g. 16 times for 1 million decimal digits, 32 times for 3.2 billion decimal digits.
(This algorithm is used for the world record on calculating pi!!)

Re: CALCULATING MANY DIGITS OF PI - HP-42S
Message #14 Posted by **Gerhan Zarr** on 20 Mar 2004, 12:27 p.m.
In response to message #7 by Gerhan Zarr

Here is an HP-42S program for the Gauss-Legendre method.
Registers used are:
00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39,

```
57 0
58 x
59 6553.84
60 BCL 59
61 BCL 60
62 x
63 0/2
64 BCL 63
65 4
66 x
67 /
68 PAUC
69 PAUC
```

PI approximation by the Monte Carlo method (long, examples)
Message 612 Posted by **Emilio G. Rodriguez (Argentina)** on 19 Mar 2004, 11:36 p.m.
In response to message 611 by Gerrit Wright

Gents:

VAHUPLS #2 discussed a method for finding pi through the use of random numbers which appeared in A. K. Dewdney's column "Computer Recreations" in the April 1985 issue of Scientific American. The analogy is to a cannon firing into a square field which includes an inscribed circular pond. If the cannon is fired many times and the hits are distributed uniformly over the area of the square then the ratio of the number of hits in the pond to the total number of hits in the square should approach the ratio of the area of the circle to the area of the square which is pi/4. The simulation on a calculator or a computer is performed by using a random number generator to determine the position of each hit. Clearly, such a method for finding pi depends upon the quality of the random number generator. John Von Neumann's admonition that "Anyone who considers mathematical methods of producing random numbers is, of course, in a state of sin" (Donald Knuth's The Art of Computer Programming, Vol. 2, page 1) may be applicable here.

Such problems and a proposed solution appeared in the documentation of the TI-52, circa 1977. The TI-58 was (more or less) in the HP-25 class, and the TI-52, with its magnetic cards, was TI's not-so-good answer to the HP-65.

The problem was used to illustrate the MonteCarlo method, and the usage of random numbers.

Below you will find a couple of HP-25 ports of the solution (just from my old memories, not for actual usage). This congenerial random number generator is supposed to pass the spectral test as per Knuth Vol. II, variations of it appeared in HP-25 and HP-41 manuals.

The first version:

```
01 RCL 31: random number seed
02 RCL 3: contains 9821
03 *
04 RCL 2: contains 0.211327
05 +
06 FRAC: obtain first random number, also used as seed
07 STO 0: saved as new seed
08 RCL 0: the first random number stays in 'x' register
09 RCL 1
10 x
11 RCL 2
12 *
13 FRAC: obtain second random number
14 STO 0: saved as new seed
15 R/S: = PI: converts the random numbers in X and Y in a "circle"
16 1/X: a cheap mecate' to normalize results and separate "0" from "1" i.e. "no" or "one" of the pond
17 LSTX: x<>y, bring back, if desired RCL 1 and FRAC can be inserted here to show progress
18 LSTX:STO, loop back, if desired RCL 2 and FRAC can be inserted here to show progress
After running the program for some time, the MEAN function will give an approximation to (1-(PI/4)). The summation registers should be cleared before each run.
The second (not very different) version:
01 RCL 31: random number seed
02 RCL 3: contains 9821
03 *
04 RCL 2: contains 0.211327
05 +
06 FRAC: obtain first random number, also used as seed
07 STO 0: saved as new seed, also kept in the X register
08 ENTER: and the first random number is also kept in the Y register
09 RCL 1
10 x
11 RCL 2
12 *
13 FRAC: obtain second random number
14 STO 0: saved as new seed
15 R/S: = PI: converts the random numbers in X and Y in a "circle"
16 1/X: a cheap mecate' to normalize results
17 STO+ 1: incremente iteration counter
18 LSTX: x<>y, bring back, if desired RCL 1 and FRAC can be inserted here to show progress
19 GTO 01: "..... not count the "in" shots
20 GTO 01: loop back, if desired RCL 2 and FRAC can be inserted here to show progress
In this case, after running the program for some time, the MEAN function will give an approximation to (PI/4). The RCL and R/T registers should be cleared before each run.
The small differences between the programs appear in steps 07-08 and from step 16 on.
Edited 20 Mar 2004, 10:14 a.m.

Re: CALCULATING MANY DIGITS OF PI
Message 613 Posted by **Oliver De Smet** on 20 Mar 2004, 7:02 am.,
In response to message 610 by Gerrit Wright

Just for for an adapted program from a 32Sii: one for HP48G+ (using infinite integer):

```
%%HP: T(3)A(R)F(.);
\<< .000 DUP x 1.0
   DO 1 + 2 / DUP 4 * 'N' STO 1 \-> y
      DO y 1 + DUP 4 * 'N' STO 2 \-> y' x'
         DUP 'x' STO
         IF x' 0 > THEN x' DUP 'N' STO 2 \-> y
      UNTIL x' 0 <= END
      x' y' + x' y' * DUP 'N' STO 3 \-> y
      UNTIL DUP x <>
   END DROP
\>> 4 *
```

gives 1000 decimals of PI in 233 sec:

```

In response to message 612 by Emilio G. Rodriguez

Hi Oliver,

Very useful. RPL and infinite integer arithmetic sure makes that algorithm a lot more understandable.

Katie,

I just remembered where I found the original 32SII program, in the Articles Forum (PI Digits of Pi on an HP-32SII) and just saw that you were the author of it ... :)

Thanks again for this nice algorithm

Olivier

In response to message 615 by Oliver De Smet

Olivier,

I'd love to take credit for the formula, but it's one that Euler came up with 250 years ago using the idea that Machin suggested 50 years earlier (see "A History of PI"). I just did the tweaking to get it into an easy to express algorithm.

-Katie

Very impressive everybody. I would like to learn how to do that.

Hmm ;)
Message 618 Posted by **Tizoks Cuda (Hungary)** on 21 Mar 2004, 2:21 p.m.,
In response to message 617 by Oliver De Smet

Okay, this is VERY beautiful, but I think the 7293's haven't got 'infinite integer' long variables... :)

So, what about if we want to use traditional variable formats..?

Cuda

Little challenge - I'll provocative
Message 619 Posted by **Tizoks Cuda (Hungary)** on 21 Mar 2004, 3:00 a.m.,
In response to message 612 by Emilio G. Rodriguez

So, that is seems to me, the calculating 1000 digits of PI is run big-bin anybody here, with no-infinite-long variables...? :)

Let's make a challenge, and try me to push down the 57's record!

The youngest cub is usable for the HP48 series!

Good working!

Cuda

The same prog with no-infinite integer :

If PPT warning 50 is the number of digits divided by 10 (i.e. 100 for ~1000 digits)

Only valid for bigFlag=1 and not very optimized (NIP, BEHAVIOURS, ...)

I'll try an bigBig one later...

Olivier

```
%%HP: T(3)A(R)F(.);
\<< .000000000 'PPT' SWAP 10000000000 / DO 4 x. 'N' \->STO NIP ABS =
   DO
      DO 1 + 2 / DUP 4 * 'N' STO 1 \-> y
         DO y 1 + DUP 4 * 'N' STO 2 \-> y' x'
            DUP 'x' STO
            IF x' 0 > THEN x' DUP 'N' STO 2 \-> y
            UNTIL x' 0 <= END
         x' y' + x' y' * DUP 'N' STO 3 \-> y
         UNTIL DUP x <>
      END DROP
   UNTIL DUP PPT <>
   END DROP
\>> 4 *
```

Here is an Infinite PI prog for the HP-71B.
I inherited this on some mag cards I bought but I haven't deciphered the algorithm yet.
The value of PI is stored into a env this called PI

HP-71B Program PI1/A1:

```
10 ON ERROR GOSUB 'ERR'
20 DISP "PI1/A1"
30 DESTROY ALL
40 L=13 @ FS 0.0/L
50 DIM A(2800),B$[7200
60 T1=TIME @ T0=T1
70 B=.09202062\\ @ TS=.1/60^20
80 FOR I=1 TO L-1
90 T2$=T1$ @ T1$=TIME$
100 FOR N=1 TO 29
110 T$=T2$[1,2]&T1$[3,9]&"(T1-T)=(T2-T)+(T1-T)MIN:
120 IF N=1 THEN 170
130 IF N<>2 THEN 150
140 FS=46/B(TS,14^5000)
150 FOR K=1 TO 2800 @ A(K)=TS^-2.5^(-.4)^-.125
160 DISP USING ".#{3}E,K{5}E,#{5}E,T$;B(B(B(
```

```
                                        ; check for end of loop
                                        ; and do it if I'm
                                        ;
                                        ;
                                        ;
```

world's ugliest 15c about to die?

*Message #1 Posted by **Charlie O.** on 19 Mar 2004, 8:44 a.m.*

The world's ugliest 15c, (http://www.geocities.com/cjoxford2/) after more than 20 years of daily use as a surveyor's tool, now requires heavy pressure to use the keys. Is there a fix for this short of replacing the calculator?

Charlie O. in Phoenix

It can probably be rebuilt with a 12c

*Message #2 Posted by **Ron Ross** on 19 Mar 2004, 8:58 a.m.,*
in response to message #1 by Charlie O.

Fix that calc.com might be able to repair. At the cost of Hp15c's it might even be worth it (though that paticular 15c may not except out of a perverse pride).

Older 12c's should work for a keypad donor.

First problem is the WD40... Wanton Destruction 40 is a wax... it will gum up just about anything it touches including key switches.

Your best bet is to open up the machine and clean each key switch contact. Make a small wire brush out of three bristles inserted into a pin vise, twist together, and trim the end square with cutters. Under each key is a breather hole. Place a drop of 91% isopropyl alcohol on a hole, dip the brush in more alcohol, and the "scritch" around in the hole with the brush. Be careful not to break a bristle off in the hole. You will probably have to rebuild the brush every few holes.

If it were mine I would first run the machine through three cleaning cycles of an ultrsonic cleaner. Use distilled water and change it each time. Shake the unit as dry as possible between each cycle. Finally dry it for around 24 hours in an oven on low (<140 degrees). This technique does have the potential of damaging the machine, but it has worked wonders on some really bad cases.

re: "Finally dry it for around 24 hours in an oven on low (<140 degrees)."

Or, since you live in Phoenix, just wait until this summer and leave it out in the afternoon!

Dave - who lives in Las Vegas - we appreciate Phoenix in the summer because seeing the temperature

there almost makes us feel cool!

in response to message #4 by Dave Shaffer

A closed up car in the sun will do just fine. Keep the machine covered. Don't leave the dog or kid in there with it.

HP2225B Printer cartridge

*Message #1 Posted by **Jeff** on 18 Mar 2004, 8:07 p.m.*

Is there any way to get one of these cartridges to start working again? I have one that has not been used in a long time and would like to revive it. Please let me know. Jeff

Re: HP2225B Printer cartridge

*Message #2 Posted by **db(martinez,california)** on 18 Mar 2004, 9:01 p.m.,*
in response to message #1 by Jeff

I cleaned one with alcohol and jammed a toothpick into the area between the case and the bag once and got a bit more mileage out of it. Be careful to not put too much pressure on the bag or it will just keep bleeding out ink all the time.

Last i heard; HP was selling plain paper cartriges again. You had to buy two @ $15 ea to get over the $25 minimum but shipping was included in the price.

hp 16C

*Message #1 Posted by **Dan** on 18 Mar 2004, 5:21 p.m.*

Greetings, Was cleaning dads garage and found this robust calculator. Not sure if it is even functional because all I seem to be able to understand on the keyboard is "on". If I can determine whether or not it works I'd like to stick it on ebay. Can someone tell me what to punch in on it to determine if it functions properly? Thanks - Dan

PS: does somebody here want to buy it?

Re: hp 16C

*Message #2 Posted by **Art Litka** on 18 Mar 2004, 7:18 p.m.,*
in response to message #1 by Dan

I would love to give you a good and fair price for it! Please email me ASAP!

Thanks,

Art Litka

Re: hp 16C

*Message #3 Posted by **Les Bell [Sydney]** on 18 Mar 2004, 10:21 p.m.,*
in response to message #1 by Dan

With the calculator off, hold down the [ON] key and press [X], then release the [ON] key. The calculator should show a flashing "running" for 15 seconds or so and then display -8,8,8,8,8,8,8,8,8,8, with all the status indicators turned on. If you see Error 9 or a blank display, or indicators are missing, the calculator will need fixing.

You can test the keyboard by holding the [ON] key and pressing [divide] then releasing the [ON] key. A pattern appears in the display; now you press each key in turn, starting with the top row and going from left to right, then the next row down, and so on (press the Enter key twice - once for each of the bottom two rows). At the end of the process, the display should show '16'. If you press a key out of order, you'll see 'Error 9'.

Best,

--- Les [http://www.lesbell.com.au]

Yup that's what HP called them RPN calculators at one time. Calculators without equal.

Re: hp 16C

*Message #6 Posted by **Les Bell [Sydney]** on 19 Mar 2004, 5:08 p.m.,*
in response to message #4 by Dan

Dan, the HP-16C is also known as the "Computer Scientist" - almost all of the functions on it are useful only to computer programmers, and of those mostly people doing very low-level programming on embedded systems, communications equipment, etc. Mine sits underneath my computer monitor (see http://www.lesbell.com.au/pix/desktop.jpg) and hardly ever moves from there. The good news is that for those who need them, there is no substitute, so you should get a good price for yours on eBay or private sale to a collector here.

Best,

--- Les Bell [http://www.lesbell.com.au]

Emu41 update

*Message #1 Posted by **J-F Garnier (France)** on 18 Mar 2004, 2:26 p.m.*

Hello all,

A new update of Emu41 is available. It includes some improvements, supports ROM image format compatible with V41, and emulates the W&W 64k Rambox II.

More details in the "What's new" corner on my page at: http://membres.lycos.fr/jeffcalc/emu41.html

Recent registered users already received an update. If you didn't receive it, ask me (see my new email address on my site).

Best regards from France.

Jean-Francois

Re: Emu41 update

*Message #2 Posted by **Ángel Martin** on 19 Mar 2004, 5:36 a.m.,*
in response to message #1 by J-F Garnier (France)

Jean-Francois,

Good news indeed, a good product just gor better!

Thanks for your work on this wonderful platform, Emu41 support of the HP-IL makes a great difference to all of us still using the system!

Best, ÁM

Re: Emu41 update & Clonix

*Message #3 Posted by **Christoph Klug** on 22 Mar 2004, 4:23 a.m.,*
in response to message #2 by Ángel Martin

Dear HP41, EMU41 and CLONIX enthusiasts,

Actual Jean-Francois added new advanced features to EMU41 : The new RAM-Box features includes two software selected 32Kbyte banks, compatible to W&W RAM-BOX II or the well known HP41CY.

Furthermore now we get a second virtual mass storage drive HDRIVE2. Using this we are able to copy and transfer files between different drives – also with your real IL drives – now also the advanced commands of the EXT-I/O module (MCOPY and COPYFL) implemented. Now EMU41 is nice for creating back up files from your real tape and disc storage mediums, and for creating virtual mediums, needed for fast email exchange with other HP41 enthusiasts.

Disassembling ROM-image pages with help of virtual ZENROM works correctly. Using the RAM-Box features of EMU41 you are able to create your own ROM-images and to design your own user code or mcode plug in module solution. By using the new CLBIN41 tool from Jean-Francois you create .rom files, needed for programming the new CLONIX from DiegoDiaz. EMU41 is an easy to use software tool for developing your individual CLONIX plug in module solution for your real HP41.

Again Jean-Francois updated the worlds leading "HP41-PC gateway & emulator" system – and we take it for programming CLONIX by using only minimal equipment. Works really great – thanks a lot Jean-Francois for your amazing work :-)

Regards from Germany – Christoph Klug

hp71 death, please help!

*Message #1 Posted by **t-bone** on 18 Mar 2004, 1:59 p.m.*

hello,

my 2 hp71s stopped working. I was not using them for a while because I was using my 41s and when I wanted to power them up, they were simply dead! One show the system prompter and is not sensitive to any key and the other does not show anything... do you think they are really dead or is there a way to wake them up?

Thanks in advance, All the best, T-bone.

Re: hp71 death, please help!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 Mar 2004, 12:07 a.m.,*
in response to message #1 by t-bone

Hello;

have you tried any memory reset procedure? Or simply keep them without batteries for some time? I've been using four rechargeable NiCad's (Panasonic P-4SPA, 250 mAh) and if I leave them inside the HP71 after completely charged (intelligent, 3-hours full charge charger), they usually keep it "alive" for about two months; after the Low Batt indicator is ON, they rest no more than a couple of days, computer OFF. The first time I used the rechargeable batteries, I simply let the HP71 stored for about three weeks after extensively using it for a couple of weeks. It did not turn ON even after charging the batteries.

If you have the Owner's Handbook, have a look at pages 273/274 and try the [ON][/], [1] or [2] and [ENTER] to initialize it. If it's not enough, you can try removing batteries and keep [ON] key pressed for some seconds. You may see that 30 seconds is suggested to be enough to cause a Memory Lost condition (p. 274).

Let us know if you succeed.

Best regards.

Luiz (Brazil)

Need 15C advice.

*Message #1 Posted by **eclectic_echidna** on 18 Mar 2004, 12:44 p.m.*

After months of reading about the greatness of the 15C, I decided to spend $400 and get a neat new 15C from the local ebay broker.

The calc arrived in perfect condition. No a scratch or blemish anywhere to be found. No dust under the lens. Even the rubber feet look unused. It practically defines "museum" quality, and because of that I put it in a plastic zip loc bag, and have only calculated maybe 10 things on it, without taking the bag off.

I must have some sort of disease.

Anyway, the question for the group is... should I sell it for the 250-350 that it is really worth (I can't imagine ANYONE would be dumb like me and pay $400). Or keep if in my drawer for the next ten-twenty years and hope that the price for “Mint Condition” will at the very least recover my "investment".

I would like to use it, but it is just too darn sexy. At the very, very least, I know think I have a small understanding of what it must have been like when they first came out. Great form factor/great keys.

Pinch yourself, I am crazed... I will keep it, my preciousssss…

Re: Need 15C advice.

*Message #2 Posted by **David Smith** on 18 Mar 2004, 1:17 p.m.,*
in response to message #1 by eclectic_echidna

Keep it and buy a not so nice one for day to day use. I am in a similar position concerning HP16C's. I have two MINT in box ones. One was sold that way, the other was supposed to be used. I bought the "used" one to actually use, but the seller was quite dishonest and sold me a brand new one (for quite cheap). Buyer beware...

Re: Need 15C advice.

*Message #3 Posted by **bill platt** on 18 Mar 2004, 2:19 p.m.,*
in response to message #1 by eclectic_echidna

I think I remember seeing that auction!

See, all it takes is one exuberant bidder to create a run-up ;-0 . How long berfore calculators outstrip tulips in value... ;-)

Seriously, if you use your calculator kindly, alway cover it to keep dust out of it, don't eat and drink aroun it, have clean hands etc, and of course don't pound on the keys, then I believe you will have a great machine for use, and collecting---it won't wear out if you are not hard on it.

But here is one question: I bought a nice 11-c, and was amazed to discover that it still had the original factory smell! I couldn't beleive it! You know how smells are the strongest memories. At any rate, I put it in ziplock when not using it to preserve the smell---and amazingly, I can smell it outside the ziplock! That factory smell

can permeate LDPE quite easily.

Any super HP geeks know what that factory smell really is?

Best regards,

Bill

Re: Need 15C advice.

*Message #4 Posted by **Chan Tran** on 18 Mar 2004, 3:48 p.m.,*
in response to message #3 by bill platt

Since you asked and I say use it. I won't buy anything unless I can use it. If you want to make a profit in the far future I think other investment would serve you better.

Re: Need 15C advice.

*Message #5 Posted by **dave** on 18 Mar 2004, 3:55 p.m.,*
in response to message #4 by Chan Tran

Put it away and let it increase in value and get an emulator for your PDA. See

http://www.lygea.com/pocket15cdetail.htm

its only $12.99 and looks great on my HP 5550!

Re: Need 15C advice.

*Message #6 Posted by **hugh steers** on 18 Mar 2004, 6:14 p.m.,*
in response to message #5 by dave

aha! you have the 15c emulator.

do you know if it truely emulates the original or is it a re-make (ie reverse engineered). ive yet to see a proper 15c emulator. even most of the 12c emulators are, in fact, logical copies which, incidently, get different answers from a real 12c.

another thing i'd really want (apart from the lemony smell) is a high-speed 15c. that was the one thing i found a drawback to the original model.

best wishes and thanks,

Re: Need 15C advice.

*Message #7 Posted by **bill platt** on 19 Mar 2004, 12:36 p.m.,*
in response to message #6 by hugh steers

I think you are right, all the Lygea's are logical simulators and in fact they may have additional features.

I also believe that Nelson Sicuro, contributor to this forum, and some other esteemable personalities as well, are working to crack the ROM out of the voyagers....so keep your eyes out!

Re: Need 15C advice. - Smells...

*Message #8 Posted by **Jim Creybohm** on 18 Mar 2004, 5:12 p.m.,*
in response to message #3 by bill platt

Yep, I do remember the smell of a new HP. Not just HPs though, I seem to remember the smell with just about any new electronics - mostly from the 80's era. It seemed to permeate the books especially though - and that's part of the reason why I dislike the CD's and the brochures that pass for manuals these days. Limited tactile satisfaction - VERY limited olfactory satisfaction. (*sigh* - I know - I must seek help for "HAS" - HP acquisition syndrome)

Re: Need 15C advice. - Smells...

*Message #9 Posted by **Dave Shaffer** on 19 Mar 2004, 4:33 p.m.,*
in response to message #8 by Jim Creybohm

I suspect the smell of electronics in general is about the same as "new car" smell.

What you are enjoying are the fumes emitted by all the plastic as it outgasses. It smells even better when it warms up because even MORE gas comes out.

Perhaps you shouldn't breath too deeply, but given all the other crap in the air nowadays, it's probably no worse than whatever you breath most of the time.

Re: Need 15C advice. - Smells...

*Message #10 Posted by **Jim Creybohm** on 19 Mar 2004, 8:17 p.m.,*
in response to message #9 by Dave Shaffer

Yeah, I know about the outgassing of the plastics, etc. Even so, I still enjoy the new car smell, and I still enjoy the smell of an HP. (But, I also enjoy bacon!)

Re: Need 15C advice.

*Message #11 Posted by **hugh steers** on 18 Mar 2004, 6:26 p.m.,*
in response to message #1 by eclectic_echidna

the 15c is one of my all time favourite calculators. i still use the one i bought over 20 years ago. its battered now, of course :-)

so if you bought this one for 400, you must want it. it seems to me that you have two options. (1) sell it for ~400 and buy a less perfect one. (2) use it. keeping it for an investment might backfire.

in your place, i would use it. but i would acquire a special case for it. the original case on mine has gradually worn the metal face will the many many times it had been used. a hard case or a quality leather case would be cool.

i recently saw an excellent protective leather case for a hp75. does anyone else know the one i mean. it was a true hp case, or did all 75's have one? something designed like that for a voyager would be awesome.

best wishes and good luck,

Keep it for the joy of owning a jewel

*Message #12 Posted by **Emmanuel Verbeeck** on 19 Mar 2004, 1:27 a.m.,*
in response to message #1 by eclectic_echidna

I would suggest that you preciously keep it, and even use it from time to time, even if it is just to enjoy its sheer engineering quality.

Altough I think you paid it way too much (I bought a really mint one, leatherette case included, for $225 on eBay, and the two HP-15C books for $30), yours will increase in value with time.

To me, it is the same as owning and daily enjoying a $15,000 Krell or Mark Levinson hi-fi system : of course you don't absolutely need it, but isn't life just more beautiful and enjoyable with it?

Just my two cents ;-) Happy calculating !

use it

*Message #13 Posted by **Brooks Rownd** on 19 Mar 2004, 1:39 a.m.,*
in response to message #1 by eclectic_echidna

Use it, though carefully. Maybe keep it in a plastic baggie and use it sparingly, if you prefer, and be careful not to "pound" on the keys. The thing is, it won't last forever. My 11C just mysteriously died one day without any abuse or cause-of-death - it happens. No sense in letting it just sit around waiting to die in its sleep.

Re: use it--but don't lose it

*Message #14 Posted by **bill platt** on 19 Mar 2004, 12:38 p.m.,*
in response to message #13 by Brooks Rownd

Send it to Randy so that it may someday become alive again!

Re: use it--but don't lose it

*Message #15 Posted by **Brooks Rownd** on 19 Mar 2004, 1:16 p.m.,*
in response to message #14 by bill platt

The 11C? I multimetered the traces inside and confirmed the keys were working, but the only response to the "on" key was most of the LCD segments stuck "on" one time, otherwise no response. I'm assuming one of the IC's is shot, since there isn't much else inside. I didn't cut off the 111 plastic rivets that hold the PCB in place to check the LCD connection, though.

Re: Need 15C advice.

*Message #16 Posted by **Gordon Dyer** on 19 Mar 2004, 3:24 p.m.,*
in response to message #1 by eclectic_echidna

I advise you to make sure it is in an anti-static bag with silica gel dessicator.
An ordinary plastc bag may cause static damage, particularly if you are using it in the bag.
Personally, I would not be able to resist using it (carefully!).

hp12c problem

*Message #1 Posted by **Kipp Butler** on 18 Mar 2004, 12:35 p.m.*

I have been usig my HP12c for 11 years and love it. Just last week my display suddenly shows 0,00, if I hit f 4, then is shows 0,0000 . I have lost my decimal and can't seem to get it back. I don't know if one of my kids accidentially did something to it or if it has come to the end of its life cycle. I would really appreciate any advice on how to clear this out. Just moved and can't find my user manual. Thank you.

Re: hp12c problem

*Message #2 Posted by **Miki Mihajlovic** on 18 Mar 2004, 12:57 p.m.,*
in response to message #1 by Kipp Butler

I guess anybody who frequents this forum has answered this question at least once, here is my chance: turn it off, press and hold the decimal point, pres ON, relese ON, relese decimal point. It works like a toggle.

Re: hp12c problem

*Message #3 Posted by **Barry M** on 18 Mar 2004, 1:01 p.m.,*
in response to message #1 by Kipp Butler

C'mon.....only 11 years???!!!!!! That thing's barely even broken in yet!! :)

Regarding the comma in the display, see page 17 of your owners' handbook. Your "digits separator" has been changed from a "." to a ",". To change it back, turn the calculator off. Hold down the "." key while pressing the ON button. Repeating this procedure toggles back and forth between the two settings.

Hope this helps.

Re: hp12c problem

*Message #4 Posted by **bill platt** on 18 Mar 2004, 2:25 p.m.,*
in response to message #1 by Kipp Butler

BTW, if you ever need a user manual, you can of course check on e-bay, but you can also check the classifieds here, or post an ad, and you can also download the 12C "Platinum" manual from HP---just ignore the stuff in there about Algebraic and some of the other added functions.

Someone here might be able to steer us to the link....

Or you can search the "archives" (probably the second archive back) for "12cp" and "12c platinum"

Also check Samsoncables.com --- they often have manuals and stuff for sale, or fixthatcalc.com--also often have manuals around for sale.

Re: hp12c problem - the [f] [number_key] sequence

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 Mar 2004, 11:51 p.m.,*
in response to message #1 by Kipp Butler

Hello, Kipp;

as the others helped you with the other subjects, please take the sequences:

`[f] and any [number_key]`

or

`[f][.]`

as the standard sequences to customize number representation. ([number_key] means any key from [0] to [9])

As you can see, there's no golden inscription in the keyboard under each number key and the [.] (dot key), neither any suggestion in the keyboard that these [f][number_key] or [f][.] define the number representation.

With [f][2] you restore default "financial" representation: two fixed decimal places. Any other [f][number_key] sets another number of decimal places (digits). The [f][.] sequence sets "scientific" representation, with a ten-digit mantissa and a two-digit exponent of ten. About mantissa digits: seven are directly visible, and if you want to see all ten digits you press [f]CLEAR[PREFIX] and hold the [ENTER] key down for as long as you want to.

My 2¢.

Luiz (Brazil)

buying 49g+

*Message #1 Posted by **hugh steers** on 18 Mar 2004, 9:43 a.m.*

i am thinking of buying a 49g+ from samson cables. does anyone know if their units are the new ones with the keyboard fixes - couldt get a straight answer from them. otherwise i will buy one from eric.

thanks for any help,

Re: buying 49g+

*Message #2 Posted by **Mike Mander** on 18 Mar 2004, 11:28 a.m.,*
in response to message #1 by hugh steers

I would buy from hpcalc.org since I have not heard of anyone getting an older unit from them recently. I have heard recently however, that people have been getting units with CN334 serial numbers from Samson Cables. You want at least a CN352 unit. In Samson's defense though, it is really not possible to tell from the package what they are selling you (serial number is not visible and the plastic blister-pack cannot be opened without destroying it) and they are at the mercy of HP and/or the distributor they deal with in sending them the latest units. Not sure how hpcalc.org manages...

Good luck! Mike Mander

Re: buying 49g+

*Message #3 Posted by **hugh** on 18 Mar 2004, 6:07 p.m.,*
in response to message #2 by Mike Mander

thanks mike. this explains why samson's weren't able to verify the fact.

best wishes,

Life expectancy of Pioneers?

*Message #1 Posted by **Warren Lavery** on 17 Mar 2004, 10:33 p.m.*

While reading a through the archives I found it a little bit discouring to learn that my Pioneer calculators (32s and 32sii) have very limited lifespans. This brings the following question to mind: if I were to have placed a brand new 32s or 32sii away in storage 10-15 years ago without ever using it would I still encounter the same problems with it as if it had been used all along?

I think I read about problems with the Pioneers that occur as they age (something to do with internal foam pad compressing with time that can be corrected by taking it apart). Does this happen with heavy usage or will this occur regardless of how well I treat my calculators? I think this was a post by Paul Brogger but unfortunately I have not been able to locate it in the archives.

I'd like to pick up another 32s on ebay, put what's the point if it'll only last another 5 years anyway. Any insight to the life expectancy of the 32s/32sii would be welcomed.

Edited: 18 Mar 2004, 7:19 a.m.

Re: Life expectancy of Pioneers?

*Message #2 Posted by **Ernie Malaga** on 18 Mar 2004, 8:49 a.m.,*
in response to message #1 by Warren Lavery

I have a 32S that I bought in 1988 or 89 (not sure when), and it still works like the day I got it, some 15 years later. In fact, it still has the original batteries.

I suppose it's just a matter of taking good care of the machine, never subject it to stressful situations (like dropping it or putting it close to a source of heat)... and having good luck.

-Ernie

Re: Life expectancy of Pioneers?

*Message #3 Posted by **Ben Salinas** on 18 Mar 2004, 12:05 p.m.,*
in response to message #2 by Ernie Malaga

Wow... the same batteries?

Is the 32s just more effecient with power than the 32sii, because I have gone through 2 sets of batteries in about 3 years on my 32sii.

-Ben

Re: Life expectancy of Pioneers?

*Message #4 Posted by **bill platt** on 18 Mar 2004, 12:23 p.m.,*
in response to message #3 by Ben Salinas

Hi Ben,

No, you are just a power user!

Re: Life expectancy of Pioneers?

*Message #5 Posted by **Paul Brogger** on 18 Mar 2004, 2:39 p.m.,*
in response to message #1 by Warren Lavery

Warren:

Pioneers just don't have many problems, period.

That said, the most common *age*-related problem seems to be shrinkage of a rubbery pressure strip that maintains contact between the keyboard traces and gold pads on the printed circuit board. This is a VERY fixable malfunction. Disassembly/reassembly/ of the Pioneers may be done without cosmetic damage. Removal of the PCB is a bit tricky, but again, needn't be cause for alarm. Fixing the contact strip itself is simple. If you don't feel up to such involvement on your own, I think Randy Sloyer (who often posts here) will perform such a fix for a reasonable fee -- check with him.

The most common *use*-related problem is wearing of the keyboard's internal conductive pads. That's significantly harder to fix, and is directly related to the amount of use the calculator gets, and not so much to its age. (In fact, the keyboard's conductive ink may be less durable as it gets older, but I don't know about that.) This too, however, may be repaired, provided you have parts from a little-used replacement unit. (Say, a 14b or 20s.)

Other than those two things, I've heard that LCD displays, by their nature, have a more limited lifespan than do LEDs, and that they may be cause for concern over a span of something like 35-50 years. (Someone correct me here if I don't remember correctly!)

If you like the 32s, do take a good look at the 33s when it becomes readily available. I think most of us will be pleasantly surprised, when all is said & done. (And it's reassuring to know that an RPN keystroke programmable should be generally available for some time to come.)

Re: Life expectancy of Pioneers?

*Message #6 Posted by **bill platt** on 18 Mar 2004, 2:45 p.m.,*
in response to message #5 by Paul Brogger

For a real interesting read on calculator longevity, search the archives (either the last one or the 2nd back) for a long back-and-forther between Valentin Albillo and Norm (where are those guys!).

Regards,

Bill

Pioneers/48 life extension

*Message #7 Posted by **Randy Sloyer** on 18 Mar 2004, 8:45 p.m.,*
in response to message #1 by Warren Lavery

The foam pad problem occurs in a *very* small percentage of the population. As Paul mentions, it is quite repairable. It's not something I would be overly concerned with. This is hardly a consolation if it happens to yours where the sample size is typically one :-(They don't have to be old for it to occur as most times it is caused by the pad having been installed just a smidge out of position. The 48's have the same design and

hence the same problem. Yes, they can loose their spring force over time but most often it is caused by manufacturing process variations with pad position and how well the lower twist tabs were closed.

Keyboards are the real Achilles heel of a Pioneer or 48 machine. Keep them clean and don't stab the keys with any more force than necessary and it should last for a good, long time. Most dead keyboards I see have been used outdoors. Fine dirt works it way inside the keyboard layers and acts as an abrasive. I've also seen ash from cigarettes do the same thing. The result is either a key that does not register with each key press or in extreme cases, a shorted key with the resulting dead calculator. Either way, it's not something that can be repaired easily. Pounding heavily on keys can break the keytop hinges. Once broken, it will lead to a shorted key, killing the unit. It may take years to occur once the hinge is broken but it will happen at some point. That's something to always ask a seller, although it is hard to describe the condition. I think it is best said that any key that wobbles like a loose tooth is broken. Pushing lightly on one side will result in the other side popping up with about the same amount of travel as it pivots about the actuation pin underneath in the middle. The ENTER key seem more prone to this failure due to it's width. Once a key is broken, it's shelfware or eBay fodder for the unknowing.

One note I must mention on prolonging the life of any Pioneer or 48 series machine: If they ever become saturated with liquid, remove the batteries immediately. Don't think twice about losing your programs because if you leave the batteries in, you'll loose the calculator as well. The combination of voltage and liquid results in electrolysis which will destroy the ON switch keyboard conductor. If the liquid was anything other than water, rinse the unit in distilled water a couple of times, shake all the excess out and leave to dry for two or three days. This is very important when the liquid has any acid content, juices and soda are killers. This is of paramount importance with these machines:

- 14B
- 17B
- 17Bii (except for the last two years of production)
- 22S
- 27S
- 32S (not the 32Sii)
- 42S
- 48S or SX

The reason here is the cpu chip is not encapsulated in plastic, but is exposed. Yes, the actual silicon die is open for all to see inside the case. Any acidic content and it will eat through the aluminum leads on the chip in a couple of hours. It is great design for shock resistance but it really falls short on environmental resistance.

Above all, don't loose sight of the fact that the 41 was the last machine designed by HP to be repairable. The Voyagers and Pioneers, from the start, were considered a disposable item. While the Voyagers are the most reliable machine they ever built, the Pioneers/48's are a close second and far ahead of all previous machines. While we hope they will work forever, it just can't be. But, with some common sense and a little TLC, they'll still be working to hand down to the next generation. Hopefully, they'll understand the actual math behind the graph on their <gasp> graphing calculator.

in response to message #7 by Randy Sloyer

Hi Randy,

> Quote:

> ...rinse the unit in distilled water a couple of times, shake all the excess out and leave to dry for two or three days. This is very important when the liquid has any acid content, juices and soda are killers. This is of paramount importance with these machines:
>
> The reason here is the cpu chip is not encapsulated in plastic, but is exposed. Yes, the actual silicon die is open for all to see inside the case. Any acidic content and it will eat through the aluminum leads on the chip in a couple of hours. It is great design for shock resistance but it really falls short on environmental resistance.

Why not the:

17Bii (except for the last two years of production)

32S (not the 32Sii)

48GX???

Are do these have a CPU that is encapsulated?

Best regards,

Bill

in response to message #8 by bill platt

Yeap, thats the deal. They are "normal" epoxy packaged surface mount IC's instead of the TAB packages.

Re: Life expectancy of Pioneers?

in response to message #1 by Warren Lavery

Hi, can you please send me a copy to use with V41?
Thanks.

Re: Life expectancy of Pioneers?

*Message #11 Posted by **Michael Lapsley** on 22 Mar 2004, 4:06 p.m.,*
in response to message #10 by Gordon Dyer

I've just take the back off my 32sii following the instructions here, and removed the PCB. Nerve racking, but so far so good: it still works if I re-assemble it and hold it together!

The reason for the repair attempt is a dead column of keys, and the problem does indeed seem to be poor contact with the mylar strip. Just tightning the hold-downs did not solve the problem reliably.

What should I do now? Should I be trying to do something with the foam pad? Above in this thread someone says that the pad is 'easy to deal with', but I can't find a reference on searching the forum.

I dont want to be doing and undoing the twist tabs repeatedly so I'd like to get it fixed first time. Please help!

Thanks in advance,

Michael

Pioneer keyboard repair

*Message #12 Posted by **Randy Sloyer** on 23 Mar 2004, 12:27 a.m.,*
in response to message #11 by Michael Lapsley

Add two layers of vinyl electrical tape on top of the pad, cut to approximately the same size. Not real critical, you just need to add some height to the pad and it will be fine. Clean the PCB and mylar connector with isopropyl alcohol - use a q-tip. Don't rub too hard. Blast with canned air to remove any dirt/fibers. Reassemble.

Close the two outer bottom tabs first - it centers the board.

Re: Pioneer keyboard repair

*Message #13 Posted by **David Smith** on 23 Mar 2004, 11:36 a.m.,*
in response to message #12 by Randy Sloyer

I would find a different tape than vinyl electrical tape. It outgasses something awful and the adhesive likes to ooze really badly. You don't want goo loose all over your machines' innards.

Re: Pioneer keyboard repair

*Message #14 Posted by **Paul Brogger** on 23 Mar 2004, 3:17 p.m.,*
in response to message #12 by Randy Sloyer

There are probably as many approaches as people who've had a Pioneer apart.

I rolled a strip of "Scotch" tape back on itself lengthwise to create a sticky cylinder about 3mm in diameter (IIRC) and as long as the foam pad. I stuck it UNDER the foam pad (between the front case and the taken-out-and-reinserted foam strip). After putting things back together, everything works fine. (I imagine a strip of that double-stick white foam stuff would work too, but again I'd put it beneath the original foam, not on top of it.)

The alcohol is good, the compressed air sounds good. The LCD and keyboard contacts do need to be CLEAN and free of foreign matter. (Do avoid using too much alcohol -- I seem to remember posts about it causing a white stain or discoloration on certain displays -- maybe those referred to plastic display windows, but I'd still use it sparingly.)

I flatten and straighten the metal hold-downs, and re-twist 'em with the "knee" of a small, angled, needle-nose plier. (The bend keeps the rest of the plier free of the PCB -- a little flat square-nosed plier should work as well.) In twisting, I try to get the "fingers" on the ends of the larger metal tabs to obtain maximum purchase on the PCB -- sometimes they want to fold up or stay in the PCB slot where they're not doing any good.

By far the most important part -- minimize the number of twist cycles on the metal tabs. I haven't had one break yet, and I don' wanna!

Edited: 23 Mar 2004, 3:23 p.m.

Re: Pioneer keyboard repair

*Message #15 Posted by **Michael Lapsley** on 27 Mar 2004, 11:00 a.m.,*
in response to message #14 by Paul Brogger

I completed the repair to today. I used a thin roll of micropore medical tape underneath the foam pad and cleaned things up with isoprop alcohol as suggested.

Everything clipped back together easily (and I did not break a twist tab!) and it all works beautifully.

We have three of these in our family: I bought one each new for my two girls when they started secondary school and one of them was distraught when she thought it was hers that was broken! Nice to know now how easy they are to fix.

Many thanks to all who offered advice.

Regards,

Michael

Introducing... The HP-41Z !! (Kinda long)

*Message #1 Posted by **Angel Martin** on 17 Mar 2004, 3:58 p.m.*

Hi Everyone,

If the teaser has worked then you're here to know more about the HP 41Z: is it a new model? an enhanced 41CY? a mispelling?

well, all and none of the above at the same time:-

The 41Z is a new HP-41 ROM dealing with Complex Numbers operation. It has 44 MCODE functions (plus header), including all trigonometric, hyperbolic and their inverses. They are all programmable, and the result is shown on the ALPHA display as well as left in the X and Y registers.

Fundamentally it allows the calculator to work like a Complex-mode machine, albeit there is no need to set it in complex mode - just a few key assignments do the work.

I said it is a MCODE ROM. That's true, but a word on the particulars is in order. In this case MCODE stands more for Macro-Code than for Micro-Code. Many functions make extensive use of the mainframe math routines, so much so that to all effects it is more like an MCODE-version of RPN.

Of course it isn't slower than a well-conceived FOCAL program, but because of the heavy subroutine calling, in some cases the functions aren't much faster either. Speed isn't the goal, but the convenience of MCODE functions versus FOCAL: no registers usage, consistent input-output, etc.

There have been many challenges to get this project ready, not the least of them to overcome limitations of the system platform (a 4-level return stack really isn't enough!!). The ROM is now ready for beta-testing, so let me know if you're interested and I'll swing an image over to you ASAP.

Long live the 41!

Best, AM

in response to message #1 by Angel Martin

Very impressive! If I knew how to burn a ROM I'd be most interested. Your article convinced me that it's worthwhile to learn how to burn my own roms.

Andreas

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #3 Posted by **Miki Mihajlovic** on 17 Mar 2004, 5:41 p.m.,*
in response to message #2 by Andreas

That is really not an issue today. All you need is one of Digo's Clonix modules and in about 2 minutes you can have any ROM image you want in it. A bit more expensive and difficult way is to find a Zeprom module (good luck) and burn your images into it.

1234

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #4 Posted by **Ángel Martin** on 18 Mar 2004, 12:58 a.m.,*
in response to message #3 by Miki Mihajlovic

Don't forget that it runs on V41 and EMU41 as well, and there the functions really *fly*.

For non-virtual oeration then of course a Clonix is the way to go. Once the beta testing is over will also be the time to burn all those Zeproms, guys!

Best, ÁM.

Angel, may I?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 18 Mar 2004, 11:33 p.m.,*
in response to message #4 by Ángel Martin

Hello, Angel;

I forgot to post my e-mail address in my last post (this thread).

lcvieira@quantica.com.br

Please, can you send me an e-mail?

Thank you.

Cheers.

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #6 Posted by **Miki Mihajlovic** on 17 Mar 2004, 5:49 p.m.,*
in response to message #1 by Angel Martin

Angel, congratulations on another MCODE achievement. You are definitely an MCODE champion of this forum. Personally, I do not use complex numbers - have enough trouble with real ones. However, I would be more interested for some kind of manual for your MATH ROM that you released a moth ago. I've tried some functions but they are not that obvious. Any chance we can get some documentation soon.

1234

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #7 Posted by **Ángel Martin** on 18 Mar 2004, 1:00 a.m.,*
in response to message #6 by Miki Mihajlovic

Hi Miki,

Manuals always follow way behind the software development, but they will come. I've also tweaked some of the functions in the SandMath ROM, which now run better -the bessel routines are now using MCODE subroutines to speed-up the execution. More on this will follow...

Best, ÁM

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 17 Mar 2004, 11:09 p.m.,*
in response to message #1 by Angel Martin

Hello, Angel;

congratulations!

I'm impressed with the function set, mostly when one can have a clue (and even be sure) about what are they related to. Wow!

I second Andreas when he mentions that a ROM burner (flash ROM recorder?) for the HP41 is something to have at home. Also, Diego's NoVRAM ROM is suitable for the task, as Miki mentioned.

About twenty five years are past and the HP41 is still an "under development", updated portable system. Amazing!

Cheers and success.

Luiz (Brazil)

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #9 Posted by **Vincent Weber** on 18 Mar 2004, 3:56 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Congratulations ! I am definitely interested in trying the complex ROM both on P41CX emulator for PalmOS (this would require the ROM to be sent to Charles Lee, though, since the program can only handle the ROMs that are listed in the ROM manager) and on ev41 for PocketPC. Thanks for sending me the files, and congrats for the work ! Complex numbers were so far the major shortcomings of the 41 compared to the 15C/42S. Does you ROM handle both polar/rectangular form like the 42s does ? This would be a big plus.

Cheers, Vincent

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #10 Posted by **Ángel Martin** on 18 Mar 2004, 4:16 a.m.,*
in response to message #9 by Vincent Weber

Vincent,

The assumption is that data entry is always done in normal mode (rectangular), where Z=X+iY. Polar input isn't expected, but can be done if followed by P-R. And likewise the output is always in cartesian mode. I'm not familiar with the way the 42 does it, maybe you care to elaborate? Enhancements are always possible...

Some functions "force" the RAD mode to do its work. Clear examples are ZLN and e^Z. Some others are happy doing it in DEG mode, which BTW shows better precision when using the internal routines [TOPOL] and [TORECT] - both very tricky to handle.

Best, ÁM.

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #11 Posted by **Vincent Weber** on 18 Mar 2004, 7:07 a.m.,*
in response to message #10 by Ángel Martin

Hi Angel, Thanks a lot for your answer. The 42s was the first calculator allowing to enter complex numbers directly in polar form; however, this is done by changing a flag that affects both entry and display,hence it is impossible to enter a complex number in polar form and then work on it in rectangular form, unless you convert it. Only the 48 and 49 allow to have different modes for display and entry. This would be a great idea for the '41. I feel like using ->R and ->P on the 15C is workable but a bit combersome as you alwas have to convert back and forth.

Btw - did you implement complex versions of inverse trigonometrics, like the 15C and 42S have ? This is what is lacking in the '41 Advantage module and the 32S/32Sii...

And do you use 2-level or 4-level stack ?

Cheers, Vincent

What do you think ?

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #12 Posted by **Ángel Martin** on 18 Mar 2004, 7:56 a.m.,*
in response to message #11 by Vincent Weber

Hi Vincent,

Yes, not only the inverse trigonometric fncs (ZASIN, ZACOS, ZATAN - a little devilish, idn't?) but also the direct and inverse hyperbolics (ZSINH, ZCOSH, ZTANH, ZASINH, ZACOSH, ans ZATANH) are all implemented.

I'll give some thoughts to what you describe on the polar vs. cartesian forms. My first gut reaction is that it almost takes the same effort to change such flag than to eXEQute ->R (or ->P). It would probably be better that the input were defined by the current status when the data are entered, but again remember that this means changing -_DEG or ->RAD as well...

best, ÁM.

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #13 Posted by **Ángel Martin** on 18 Mar 2004, 8:16 a.m.,*
in response to message #11 by Vincent Weber

forgot about the stack level part:- It is a 3-level one!

How? Let me begin by saying that I eschewed the use of data registers as a design criteria (simply hate it). My original intention was to use a custom buffer area to hold the imaginary parts of the numbers, and thus that would have allowed a 4-level stack, albeit with required dedicated functions to handle them. For instance, ENTER^ could not be used.

Soon I realized that my MCODE skills are far from being apt to such goal, and thus I reverted to the simpler design of using the four real-stack levels as two complex-stack model (exactly like it's done in the Advantage).

However don't let this put you off, because with the right function set, a two-level stack is more than sufficient. For instance, you can use Z^2 and ZSQRT instead of the more cumbersome Z^N and Z^1/N (wich are also there); HALFZ and DECX/INCX allow you to calculate Z/2 and

Z+1/Z-1 without disturbing the stack; I* and I/ work great to multiply by i or by -i; ZENTER^, Z<>W, ZCHS, and ZREV do the trick for stack manipulation; and so on...

finally, consider that by using the normal stack you also have access to all parts of the numbers using the standard function set, which comes very handy as well in many ocasions.

If all this wasn't enough, I'm also using the M and N registers of ALPHA as an auxiliar level (the third). it's a little volatile because ALPHA is also used to show the result (if not running a program), but it comes very handy! Functions for this are: ZRCLA, ZSTOA, and Z<>A.

Yes?

Do you consider enhancements?

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 18 Mar 2004, 10:46 a.m.,*
in response to message #13 by Ángel Martin

Hello, Angel;

I remember that the CCD module optionaly uses X-memory registers to create (define) matrices, as well as it allows using regular registers to do the same. The curious fact is that the CCD module defines a new "class" for X-memory registers that hold matrix data (neither ASCII nor data).

I thought about using a data file to hold temporary data (stack values), but taht would impose the need for an HP41CX or an X-F/M module. Have you considered this possibility? I know that this means two sets of routnies (if they are too different) or a major re-doing with the use of some specific command to select X-MEM or REG-MEM operation, or something like this.

BTW: can you point out your "knowledge base", you r source of information, so you could develop such a ROM module? I'm impressed with that because since the 80's I'm dreaming of doing that (develop ROM modules for the HP41), but I thought I'd never find any source of information about his. I'm adding my e-mail if you prefer a private answer.

Congratulations again and success, Angel.

Luiz (Brazil)

Re: Do you consider enhancements?

*Message #15 Posted by **Angel Martin** on 18 Mar 2004, 1:11 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hello Luiz,

Of course I'd consider enhancements, what other purpose would it be by posting on this thread? Your suggestions is what I was seeking for.

Yes, the CCD is an amazing piece of software engineering, but remember that the advantage picked up where the CCD left off!! I know there are great FOCAL programs using the CCD array set that will do the Inverse, Determinant ans solve systems of linear equations. I have done a few myself, but believe me: they all lag *way* *behind* the

MCODE functions on the advantage. If you haven't made the comparison you should, you'll be astonished.

The CCD introduced a new file type (index #4) to store matrices. The Advantage uses the same (as it basically is same function set), althought you wouldn't see the "M" descriptor on CAT'4. Additionally, they both use a custom buffer (index #5) where they store the current matrix name and other stuff.

Afraid that my "source base" isn't any single one reference place, but the accumulated (little) knowledge after years of programming. Trial and error. Ken Emery's book of course is a must. I don't have VASM listings, so would really appreciate getting a copy!

Best, AM

You could do internally always cartesian, always RAD, but the display would be determined by Flag settings
Naturally your ROM has to convert in and out when appropiate, but that's easy for you to program, right?

To give you a flavor of the type of programs you can write with the 41Z ROM, here is a couple of examples on how to mimic the hyperbolic functions using other functions in the ROM:

hope you agree it looks elegant enough (imagine doing this with standard functions!)

LBL "SINHZ" -> same as ZSINH
ZENTER^ E^Z Z<>W ZCHS E^Z Z- HALFZ ZAVIEW END

LBL "ASINHZ" -> same as ZASINH
ZENTER^ Z^2 DECX ZSQRT Z+ ZLN ZAVIEW END

*Message #19 Posted by **Christoph Klug** on 18 Mar 2004, 4:44 a.m.,*
in response to message #18 by Ángel Martin

Dear Angel,

again good news from you about a HP41 rom solution, now for calculating complex numbers...

Please give more details about your macro-programming-technology : Do you start with a standard focal programm solution, than translating the needed commands to mcode jumps to existing rom addresses of the Hp41 operating system.....

What do you think about adding complex matrix functions, or a solution which uses the existing matrix function set of the CCD-Module...

Best regards – Christoph Klug

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #20 Posted by **Ángel Martin** on 18 Mar 2004, 6:55 a.m.,*
in response to message #19 by Christoph Klug

Hi Christoph,

There isn't a "technology" per se, although your description is technically correct. It is a very manual process, and takes lots of care and effort to properly access the mainframe math routines (specially without VASM listings!). The 41 OS is an incredible intertwined code, and hacking parts of it isn't for the faint of heart...

As per the complex matrix aspect, I'm very happy with the treatment given by the Advantage ROM to this problem. In fact, even though I really love the CCD Module, I have to say that the lack of high-level matrix operation (MDET, MSYS, MINV) and the capability to work with complex matrices make it unpractical in this area.

Best, ÁM.

Re: Introducing... The HP-41Z !! (Kinda long)

*Message #21 Posted by **Miki Mihajlovic** on 18 Mar 2004, 12:06 p.m.,*
in response to message #20 by Ángel Martin

Angel, I have to (partially) disagree with you on the CCD ROM. Although there are no 'hardwired' high level matrix functions in the ROM, it is really a trivial programming task to make them. One can just use those given in the CCD manual. And with today's technology (read Clonix) one can put his own favourite math functions (just like you are doing) into a ROM module alongside CCD. I have built my own high level math ROM that is a combination of MATH module, HL MATH and

GEOMETRY solutions, and some of my own matrix, interpolation etc routines.

Am I reading your message correctly that you do not have VASM listings. If so, let me know and I can send it to you.

*Message #22 Posted by **Angel Martin** on 18 Mar 2004, 4:34 p.m.,*
in response to message #21 by Miki Mihajlovic

Miki, thanks for your offer. I'd appreciate getting a copy of the VASM listings, will for sure help me refine the code!

I think I already responded this to Luiz, but the CCD array functions, wonderful as they are, were further improved on the advantage. Any FOCAL program to do the high-level matrix functions that you can come up with will be much slower and more cumbersome and inconvenient than the advantage MCODE functions. Besides, "trivial" isn't exactly the word I would use to write them! The CCD manual examlpes are quite lenghty, and will be difficult to improve on them (I remember I tried many moons ago, then I gave up and adopted the advantage!).

Best, AM

Christoph,

In a word: I'd rather have one tooth pulled than attempt what you're proposing!!

Seriously, it would be very close to mission impossible, given the levels of intricacy and interdependency between all those functions.

Best, ÁM

HP 17BII+ Black-Scholes using SOLVE

*Message #1 Posted by **Bob Wang** on 16 Mar 2004, 8:44 p.m.*

Tony Hutchins has posted some very compact versions of the Black-Scholes formula. This version is just a modification of Tony's previous work and ideas. The HP 17BII+ does not have L() and G() functions, and Tony has posted a version which cleverly uses intermediate variables. I liked his work so much that I decided to modify it a little. This version uses just one intermediate variable named "SOLVE", the user will presented with SOLVE, CALLV, and PUTV on the second page of variables. Hitting SOLVE would seem intuitive, and the user just has to remember to explicitly solve for CALLV before solving PUTV.

Thanks, Tony!

Bob Wang

BLK.SCHLS.TONY: 0×(PS+PE+RF%+T+S) +IF(S(SOLVE):SOLVE-(LN(PS÷PE)+(RF%÷100+S^2÷2)×T)÷S÷SQRT(T): IF(S(CALLV):CALLV-PS×ABS(IF(SOLVE<0:0:-1)+EXP(-(SOLVE^2)÷2) ×((187÷(1+ABS(SOLVE)÷3.006)-24) ÷(1+ABS(SOLVE)÷3.006)+87) ÷(1+ABS(SOLVE)÷3.006)÷500) +PE×EXP(-RF%×T÷100)×ABS(IF(SOLVE-S×SQRT(T)<0:0:-1)+EXP(-((SOLVE-S×SQRT(T))^2)÷2) ×((187÷(1+ABS(SOLVE-S×SQRT(T))÷3.006)-24) ÷(1+ABS(SOLVE-S×SQRT(T))÷3.006)+87) ÷(1+ABS(SOLVE-S×SQRT(T))÷3.006)÷500): PUTV-CALLV+PS-PE×EXP(-RF%×T÷100))

Re: HP 17BII+ Black-Scholes using SOLVE

*Message #2 Posted by **tony** on 16 Mar 2004, 10:52 p.m.,*
in response to message #1 by Bob Wang

Bob,

My pleasure. Glad you liked it!

Ah yes I forgot the 17bii+ is like the old 17b. Shame that L/G "escaped" from the 17bii+! I did the one below for the 17b - requires solving for D1,F1,D2,F2,CALLV and PUTV in order. I see your SOLVE does the D1. I tried to minimise the typing required to enter the eqn. Interesting to see your approach! Timothy Crack has a nice 17B Black-Scholes in his book "Heard on the Street" - page 278 - he implements the full AMS55 26.2.17, and requires solving for D1,N1,D2,N2, CALL.

```
{17bbs|0*(PS+PE+RF%+T+S)+
IF(S(D1):D1-(LN(PS/PE)+(RF%/100+S^2/2)*T)/S/SQRT(T):
IF(S(F1):F1-1/(1+ABS(D1)/3.006):
IF(S(D2):D2-D1+S*SQRT(T):
IF(S(F2):F2-1/(1+ABS(D2)/3.006):
IF(S(CALLV):CALLV
-PS*ABS(IF(D1<0;0;-1)+
EXP(-D1^2/2)*F1*((187*F1-24)*F1+87)/500)
+PE*EXP(-RF%*T/100)*ABS(IF(D2<0:0:-1)+
EXP(-D2^2/2)*F2*((187*F2-24)*F2+87)/500):
PUTV-CALLV+PS-PE*EXP(-RF%*T/100))
)))))}
```

Somewhere I have a less accurate 17b one about 60 chars smaller than the above (300 v 360, approx) which

still gives the correct 14.22 for the Call in that HP17BII example. It requires solving for D1,D2,CALLV, PUTV. No harm in solving for D1 & D2 - always good to see for the B-S student<G>. I admit the F1 and F2 above are not very interesting, but I am not fast at entering equations in the pioneers. In fact for something like the above it is almost easier to have separate equations for the components - then they are really short and load quickly. The old 18C didn't have the IF(S(.. so there we had to have separate eqns.

Cheers, Tony

hp12c instruction manual

*Message #1 Posted by **gwen charles** on 16 Mar 2004, 5:24 p.m.*

need instruction manual asap for hp12c.

Re: hp12c instruction manual

*Message #2 Posted by **John** on 16 Mar 2004, 5:43 p.m.,*
in response to message #1 by gwen charles

Go download it off HP's calculator website.

yahoo.com will turn it up.

Solution Manual ONLY

*Message #3 Posted by **Wayne Stephens** on 17 Mar 2004, 7:21 a.m.,*
in response to message #2 by John

I was on hp.com the other day, and all they offer for download is the "Solutions Manual", not the "Owner's Handbook".

Take care.

Wayne

Re: Solution Manual ONLY

*Message #4 Posted by **Arnaud Amiel** on 17 Mar 2004, 7:34 a.m.,*
in response to message #3 by Wayne Stephens

They have the manual for the 12C platinum which is 99% correct for the normal 12C

Arnaud

Thank You!!

*Message #5 Posted by **Wayne Stephens** on 17 Mar 2004, 8:10 a.m.,*
in response to message #4 by Arnaud Amiel

Thanks for the information. I did not know how similar the 12C and 12C Platinum were.

Take care.

Wayne

Re: Thank You!!

*Message #6 Posted by **Arnaud Amiel** on 17 Mar 2004, 11:06 a.m.,*
in response to message #5 by Wayne Stephens

I think I read on this group that the 12C platinum was actually designed by reading the manual for the 12C and making sure it works as indicated by the manual. They added algebric capability and a couple of bugs but that is basically it. (I don't have a platinum but use its manual)

Arnaud

HP Vintage Algebraic Surpasses RPN

*Message #1 Posted by **bill platt** on 16 Mar 2004, 12:13 p.m.*

Compare these two recent auctions:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3082703566&category=58039&ssPageName=ADME:B:EF:US:1

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3083580151&ssPageName=ADME:B:BN:US:1

I guess the 27s is rarer---it does show up less often---and it is a pretty cool machine, jusging from what is included.

Still, seems amazing, yes?

Re: HP Vintage Algebraic Surpasses RPN

*Message #2 Posted by **Massimo (Italy)** on 16 Mar 2004, 12:26 p.m.,*
in response to message #1 by bill platt

Good to know!
So if I'll sell my NIB 27S (insides still wrapped in plastic: I only made a small cut to take the calc out and remove dead batteries) I know what to ask for.

I'll keep my NIB 42, though. (and the mint ones too...) ;-)

Massimo

*Message #3 Posted by **Ron Ross** on 16 Mar 2004, 12:51 p.m.,*
in response to message #1 by bill platt

I consider the Hp27s to be Hp's 2nd best pocket calculator that they ever made.

The best?? Why the Hp42s of course!!!!

I suspect that if the secret of the Hp 27s were to ever get out, it would always bring more than an Hp42s, because the majority of calculator users, USE algebraic. To get the power of a 27s, you need a pocket type pc such as a Casio or Sharp, but neither are offered in a calculator format or pocket form (Casio FX7500G come awfully close).

Ti released a 67 and a 66, but neither were in the same league. Casio's had the 4000 and 6000 series but still that 7K RAM and the 27s portibility and quality make it untouchable in the algebraic world of calculators.

Is it in the same league as a 42s? Not if you need matrix functions as it has none. And it doesn't handle complex numbers, but it has variable names and can use every bit of its 7K RAM, which is more than the new 33s can boast. Actualy has somewhat better statistics with list based data like that offered in the business line.

It also has a built in clock and would make an excellent test taking vehicle (until it formally gets banned).

And it is quite a bit rarer than a 42s because it was discontinued about 3 years earlier, probably do to poor sales. The Hp17B and Hp42s sold much better (and the Hp42s was never, never, pushed or positioned to sell, because every Hp42s sold, meant one less sale of an Hp48G!!!!)

Re: HP Vintage Algebraic Surpasses RPN

*Message #4 Posted by **Julián Miranda (Spain)** on 16 Mar 2004, 2:48 p.m.,*
in response to message #1 by bill platt

Perhaps the 27s in this auction is rarer, I think I have never seen before one with the recessed display, 32SII way. I've read somewhere it existed (Wlodek maybe) but no picture so far.

Re: HP 27 model variations

*Message #5 Posted by **Randy Sloyer** on 16 Mar 2004, 6:19 p.m.,*
in response to message #4 by Julián Miranda (Spain)

Our esteemed curator has one in his collection. Have a look:

http://www.hpmuseum.org/27s.jpg

They are quite rare compared to the flat bezel with lens model.

Re: HP 27 model variations

*Message #6 Posted by **Dennis** on 17 Mar 2004, 3:07 a.m.,*
in response to message #5 by Randy Sloyer

Back in 1988, when I was in high school, I bought a HP27S. Still use it today. Funny thing is my dad bought my younger sister a HP42S, and she didn't like it because it used RPN, and my dad made me trade my HP27S for it. I ended up getting my HP27S back and my dad traded the HP42S in for another HP27S for my sister. I wish I didn't!

Anyways, last year I return to school as a business major and looked for the HP17BII. I couldn't believe that HP wasn't in the calculator business anymore! I ended up buying one on ebay and was I glad I didn't buy a TI like all my professors recommend.

Last month, I managed to get my hands on a HP42S. I didn't like it at first, even though I was already used to RPN from the HP17BII. But the last few weeks I've been playing around with it and cannot believe how POWERFUL it is. I didn't know you could do numeric integration with it! I love it because even though I'm a business major now, I was once a computer science major and still work in the IT field.

Anyways, I still love my HP27S. But the HP42S is quickly catching up. Too bad HP doesn't make the calcs like they used to. Ordered the CD1 set of manuals so I could check out more of the features. I had no idea about the LET & GET functions until recently and I'm eager to learn how to use them.

Re: HP Vintage Algebraic Surpasses RPN

*Message #7 Posted by **Wlodek Mier-Jedrzejowicz** on 19 Mar 2004, 10:49 p.m.,*
in response to message #4 by Julián Miranda (Spain)

Julián Miranda suspects I mentioned a 27S with recessed display - hi Julián - and sure I did. They were

rarer but I did not notice that they were that much rarer. One additional excellent feature of the 27S was that it included STO^ in its register arithmetic. It could be used to take notes, and (apart from lack of RPN) was a truly wonderful HP calculator.

Re: HP Vintage Algebraic Surpasses RPN

*Message #8 Posted by **Julián Miranda** on 20 Mar 2004, 2:12 p.m.,*
in response to message #7 by Wlodek Mier-Jedrzejowicz

Hi Wlodek, nice to hear from you. When I wrote the comment I wasn't at home. I have later checked your "A Guide to HP Handheld Calculators and Computers", 3rd. edition, and sure you mention the recessed display 27S but what attracted my attention when I first read it, was you have never seen a recessed display 22S (and 17B too) even didn't know if it was ever manufactured. I thought there was something about recessed display Pioneers but I mixed up the models.

Spain (OT)

*Message #1 Posted by **bill platt** on 16 Mar 2004, 9:24 a.m.*

Hello to our Spanish friends,

I only just learned of the horrible explosions in Madrid that occurred last week (I have not been able to keep up with news this week). Having been through NY,NY many times both before and after 2001, and seen the effects of that tragedy, I send my sincerest sympathies.

This forum is one of the few places where we can get away from all the horrors and struggles of the world (albeit with an occasional rant going into politics or other) and so I was hesitant at first to make this post--but I ultimately felt that as an American, I want to acknowlege the pain, suffering and fear that is inevitably taking place in Spain at the moment--especially because some of our most prolific and valued contributors are Spanish.

In other words, we all love to speak about our favorite computing devices, but we are also all human, and when horrible tragedy strikes, we must recognize our human needs.

Best regards,

Bill Platt

Re: Spain (OT)

in response to message #1 by bill platt

Bill, thank you for your thoughtful words. As a spaniard (from Madrid indeed) living abroad, I too have felt this attack like a sledge hammer crashing into the fabric of life. Let's hope this one is also the last and that no other city follows this sad thread after NY and MAD.

Best wishes, ÁM.

Re: Spain (OT)

*Message #3 Posted by **Diego Diaz** on 16 Mar 2004, 3:05 p.m.,*
in response to message #2 by Ángel Martin

Hi all,

Just to join Ángel's words and his faithfull hope that may our tragedy be the last.

Not only Spaniards, but all and every open-minded person all over the world are victims; and, as far as I know, this includes all of us.

Thank you very much for the private messages I've received in this sense.

I live in a quite place, far away in the distance, anyhow I felt myself a bit like if I was born in Madrid and,

also a bit like if I was dead in Madrid last 11-M.

Let it be the last time ever.

Diego.

HP12 Platinum Processor Speed

*Message #1 Posted by **Andy** on 15 Mar 2004, 4:16 p.m.*

Heard rumors that the machine has a faster processor but the speed was intentionally crippled. Can anyone confirm? It sounds too unbelievably stupid, even for HP.

Re: HP12 Platinum Processor Speed

*Message #2 Posted by **Jeff** on 16 Mar 2004, 8:43 a.m.,*
in response to message #1 by Andy

Who knows why that is. I heard that it's slower because it uses algabraec (sp?) and RPN, and that causes inefficiency. I don't know, though. I know that I did buy a Platinum and I didn't like the feel of it, the lighter and harder to read number display, and the slowness. I took it back and got a old-fashioned 12C and am glad I did.

Re: HP12 Platinum Processor Speed

*Message #3 Posted by **Veli-Pekka Nousiainen** on 16 Mar 2004, 4:47 p.m.,*
in response to message #2 by Jeff

I bought the new hp 12C Turbo and it is lightning fast.
Even If I have very irregular cashflows (more than a thousand) it calculatest both the IRR and the NPV in a blink of an eye
Even the most demanding program loops (solving the integration limits of a triple integrals using thousand digits accuracy) takes less than a second
The only problem is that I have to change the batteries every five minutes as they die very quickly....

*Message #6 Posted by **Wayne Stephens** on 17 Mar 2004, 7:30 a.m.,*
in response to message #3 by Veli-Pekka Nousiainen

I hooked mine up to a car battery with the voltage stepped down. After a while the "12C Turbo" was calculating faster than I could hit the keys (which were getting very warm). I ended up leaving it alone in a room and it did my taxes, amortized my mortgage, got my bond rating increased to "A", offered short and long-term investment advice (seemingly very sound investment advice by the way), and then blew up.

I guess I'll have to get another one. On the other hand, I do have a regular 12C, and that Garrett turbo-charger is just sitting on the shelf in my garage... Hmmmm.

Take care.

Wayne

12C with NO Serial Number

*Message #1 Posted by **Bill in PA** on 15 Mar 2004, 3:01 p.m.*

Anyone have experience with Hewlett-Packard calculators that do not have a serial number ? I recently acquired a "newer", made in CHINA, 12C that does not have any serial number. Are these prototype models ? Any idea as to rarity or value ? Thank you in advance.

Re: 12C with NO Serial Number

*Message #2 Posted by **Raymond Del Tondo** on 15 Mar 2004, 5:22 p.m.,*
in response to message #1 by Bill in PA

Normally the cases w/o serial numbers stamped in were used for repaired machines where the bottom half of the case had to be replaced for any reason. However, since these machines won't be repaired nowadays there's a chance that the Stamp-O-Matic simply had a malfunction;-)

Raymond

Re: 12C with NO Serial Number

*Message #3 Posted by **Jim Anchower** on 16 Mar 2004, 9:01 p.m.,*
in response to message #2 by Raymond Del Tondo

A calculator is not a machine.

Calculators are machines

*Message #4 Posted by **Randy Sloyer** on 16 Mar 2004, 11:53 p.m.,*
in response to message #3 by Jim Anchower

According to Webster's:

- Etymology: Middle French, from Latin machina, from Greek mEchanE (Doric dialect machana), from mEchos means, expedient
- an assemblage of parts that transmit forces, motion, and energy one to another in a predetermined manner
- a mechanically, electrically, or electronically operated device for performing a task <a calculating machine> <a card-sorting machine>

Re: Calculators are machines

*Message #5 Posted by **Yanis** on 18 Mar 2004, 9:05 a.m.,*

33s - Second Impressions?

*Message #1 Posted by **Warren Lavery** on 15 Mar 2004, 7:48 a.m.*

Wondering if anyone who was able to purchase a 33s can provide updates to your initial first impressions.

Do you recommend as is, not recommend or recommend with some changes?

Edited: 15 Mar 2004, 7:49 a.m.

Re: 33s - Second Impressions?

*Message #2 Posted by **Dave** on 15 Mar 2004, 10:02 a.m.,*
in response to message #1 by Warren Lavery

Warren,

I feel the 33S is a nice well designed calculator.

1) It is positioned as a 32S replacement and serves this role well. Removed the main objection to the 32S series (not enough memory to do anything...) Keeps RPN (YEAH!)

2) The key action is as good (arguably better) than previous HP calculators which is a great sign that HP has set itself to distinguish its calcs from other manufacturers in an area that matters!

3) The algebraic implementation is the Prefix / postfix mix characteristic of low end TI calculators (not the HP 30S implementation of algebraic)

4) The display is good and readable, only issue is the size of the decimal point.

I have no issues highly recommending this calculator!

Of course I hope there will be a calculator positioned between the 33S and 49G+.

1) Double the height of the display (Dot matrix) 2) Input and Output for program storage 3) HP-30S algebraic mode (RPN only would be fine,but...) 4) Keystroke prgramming (41/42S style)- not key codes but readable labels 5) Unit conversion capability from 48/49 series 6) Plotting / Solve routines. 7) Menus / small joystick (copy cellphones) below display. 8) Size of calc same as 33S or 42S.

Dave

Re: 33s - Second Impressions?

*Message #3 Posted by **Sousa** on 15 Mar 2004, 11:13 a.m.,*
in response to message #1 by Warren Lavery

I think the calculator is pretty good. Things that I wish it had: 1. A longer stack 2. A more visible and easily distinguishable decimal point 3. A stack that operated more like the hp48 4. Menu Label Keys that function like

the hp48 5. Ability to have program names of at least two characters 6. Running a solve routine inside programs often fails to find a solution. 7. A method of downloading programs from the computer as a one way only transfer.

Overall I would recommend it above all of the other NCEES approved calculators, but I hope that HP will improve some of its short falls in the near future.

Regarding Solve inside programs

*Message #4 Posted by **bill platt** on 15 Mar 2004, 11:39 a.m.,*
in response to message #3 by Sousa

Hi,

Are you giving the machine initial estimates (hi-low range) when solving? This can have a huge impact on whether or not hte machine can converge on an answer (depending on the function of course).

regards,

Bill

Re: Regarding Solve inside programs

*Message #5 Posted by **Sousa** on 15 Mar 2004, 3:37 p.m.,*
in response to message #4 by bill platt

The stack contains numbers larger than the answer, on one equation and the other equation the ansewer is between the numbers on the stack. The program is designed to test for two variables to be greater than 0 and then runs the solve command to find a third variable for an equation that is not possible to issolate the needed variable. If the solve routine is done under a sub routine by using the FN _ command then it always works fine it is when I try using the solve routine in the main function that it encounters the error (usually "divide by zero"). I need the extra program slots since there are so few allowed.

Re: 33s - Second Impressions?

*Message #6 Posted by **Brooks Rownd** on 15 Mar 2004, 1:30 p.m.,*
in response to message #1 by Warren Lavery

It isn't a 15-C, but it's fine for what it is. Obviously some changes would be nice. It's too large, and the keyboard is WAY too busy, the equation entry is clunky, etc. However, I'm glad to have it, considering the lack of alternatives out there. The price seems about right, since it's relatively unique on the market. I'll probably buy a second one if I don't find any fatal flaws by the end of the year.

bkr

Re: 33s - Second Impressions?

*Message #7 Posted by **Ben Salinas** on 15 Mar 2004, 6:15 p.m.,*
in response to message #1 by Warren Lavery

It's a good calculator, and I have no real issues with it. The change in keyboard layout is minimal. The only reason I am not using it all the time now is that I am getting too used to the keyboard, and cannot use my 32sii's keybaord anymore (I need to use the 32sii for UIL competitions in a few weeks... Nex year I will probably use the 33s, but right now I need to keep using what I know how to use quickly: the 32sii)

I love the speed on it also.

A great calculator especially when compared to those comercially available today

-Ben Salinas

Negative to positive

*Message #8 Posted by **Frederic** on 15 Mar 2004, 7:18 p.m.,*
in response to message #7 by Ben Salinas

I remember some months ago before the introduction, i read coments here and the great majority of comments were negative and even "agressive" against the HP-33S. I was too negative about it with pictures i saw. I bought one and was REALLY charmed about it. It's one of the greatest HP since a long time. I even prefer it over the 32, even physically!

I don't think it's too big; it fits great in my hand, more thatn my 32S. The keyboard is not too full; i was use to my HP-67 one years ago... The V shape is not a so bad idea after all, but the small enter key is not what i prefer.

But there is something i'm sure, even if the calculator is VERY GOOD, to date, i'm not completely "reverse" as i was when a new HP calculator is market (remember when the HP-67, 25, 41 were announced, it was a "shock" to see all what they can do as improvment. Perhaps it is not possible today to "invent" (...) something new that blast up all of us... all has been done?!?)

Re: Negative to positive

*Message #9 Posted by **Les Bell [Sydney]** on 15 Mar 2004, 10:36 p.m.,*
in response to message #8 by Frederic

> Quote:
>
> Perhaps it is not possible today to "invent" (...) something new that blast up all of us... all has been done?!?)

Of course it is - but HP/Kinpo engineers need to realise that it's not as simple as "more" (more memory, more keys, more functions, more pixels on the screen). What's needed is design for fitness of purpose - i.e. quality of keys (if keys weren't important, the calculator market would have been killed by PDA's by now), a balance between simplicity and power - best expressed as "elegance".

The 33S seems to have fit this bill better than expected and has elicited more positive comments than all its high-end precursors - 49G, 49G+, etc. It's still not quite right - the keyboard is all fashion and no style, and the memory capacity is out of balance with availability of labels and variables - but it's a good step in the right direction.

Now, if HP can just improve on it. . .

Best,

--- Les [http://www.lesbell.com.au]

in response to message #9 by Les Bell [Sydney]

My "second impression" is even more positive than my first was! While I can't say I'm totally enthralled by the machine, it is fun and exciting to use and program. The extra memory is useful for prompting multiple inputs and labeling multiple outputs for a given program. I'm currently writing a comet ephemeris program and am attempting to incorporate various features such as programmed solve, prompting and labeling. I am not finished yet but will be happy to share my first cut soon if anyone is interested.

Like the others who have commented, it is no 42S but it is an overall improvement from the 32SII. Programming it requires some inefficient "work arounds" but it does seem flexible enough for most of my purposes. The keyboard has a solid tactile response and the cluttered appearance does become familiar with use. Also, except for the tiny decimal point, the display is very readable. I plan to buy one or two more when they are available again. I applaud HP on this one!

Re: Negative to positive

*Message #11 Posted by **Brian L** on 16 Mar 2004, 9:08 a.m.,*
in response to message #10 by Art Litka

We bought 3 for our engineering/drafting department, I had been using a 48GX (my first) when one of the 32's went out. (I was the only one who could figure out how to program RPL instead of RPN to get our programs in.) We are all very pleased with the machine, I like it better than the RPL for my function here.

Biggest complaints are the display- decimal too small, shadowing too much. We greatly prefer the display on the 32sII, but would really like to keep the two line display. Especially if HP would allow the Y=?????.?? on one line and X=???.?? on the other, oh well.

We have had them for about a month and still wish the Enter & R/S keys were put back where they were before, again oh well. Very pleased with the memory, we had 2 small programs we wanted on the old ones that now fit, yea.

Our only other complaint is the standard of only 27 labels, we don't use them all, but would really like the labels to be more like the 42s, allowing at least two letters &/or letter number combinations.

We are very happy that we were able to get ahold of the ones we did. If I had known they would be non available as now, I would have purchased another 3-10 to have. Hopefully the gentleman in a previous thread was right, in that we are the developers/bug catchers and they or a similar improved product will be very soon available. Even hopefully the 33s and then soon a 42sII or even a 15s. Here's hoping, in the meantime, thank you very much HP for coming through with this one.

HP41 Emulator Application Card for HP48GX

*Message #1 Posted by **Garth Wilson** on 15 Mar 2004, 3:54 a.m.*

Michel Peltier, a French HP-41 enthusiast I met on the internet, is asking about some things I'm not familiar with. The text below should be a pretty good translation of his questions.

I have a HP41CX and a HP48GX. I bought a HP41CV Emulator Application Card HP82210A (for the HP 48 SX) and the HP 8224A infra-red module which is also used to control the HP82240A. The HP 41CX feed the HP82240A printer just fine. The HP48 GX controls also the same printer... but the HP41CX and the HP 48 GX do not communicate with each other ! Could somebody help me? Thank you in advance for any answer.

Re: HP41 Emulator Application Card for HP48GX

*Message #2 Posted by **Matthias** on 15 Mar 2004, 6:29 a.m.,*
in response to message #1 by Garth Wilson

Sorry, but your HP41 Emulator Application Card is possibly not a GX, but SX one. There was no release of a GX card, although there is a patch that let´s you work with the SX card on a GX... I only know a very few persons, that own a real GX card....

Re: HP41 Emulator Application Card for HP48GX

*Message #3 Posted by **Marc** on 15 Mar 2004, 6:46 a.m.,*
in response to message #2 by Matthias

Hi Matthias,

What about the patch mentioned ? I'd really like to test it on my GX (works fine on my SX, of course).

Thanks a lot ! Marc

Re: HP41 Emulator Application Card for HP48GX

*Message #4 Posted by **Matthias** on 15 Mar 2004, 11:02 a.m.,*
in response to message #3 by Marc

As I know, the HP-41 Emulator card uses fix address points to jump at your SX. These addresses are not equal to the GX, so that´s why this card does not work on the GX. The patch must patch these address jumps to dynamic addresses. This makes the card much slower. I do not have this patch, sorry. But if someone has it, please let us know it´s source.

Matthias

*Message #5 Posted by **Raymond Del Tondo** on 15 Mar 2004, 5:43 p.m.,*
in response to message #3 by Marc

Hi,

as Matthias mentioned, there was a patch version of the card image which let the emulator software run and display on a GX.

Please note that this patched version is only a hack of a few critical reserved RAM addresses. You can start the emulator on a GX, and maybe do some calculations, but you won't be able to use most of the other features of the program, like advanced functions, menus, or FOCAL progams. And, of course it uses fixed addresses. Therefore you'll have to store the patched version at the start of port 1 in the right order to even run...

Regarding INPRT: As some other posters mentioned, the information traffic is one-way: From the IR printer module of the HP-41 to the input IR diode of the HP-48...

Regarding availability: The patched/hacked version of the emulator software once was available on some bbs, or maybe one of the Goodies Disks, I'm not sure.

Raymond (blank stare) (Ok, this was something for the die-hards;-)

*Message #7 Posted by **Robert Graulich** on 15 Mar 2004, 9:08 a.m.,*
in response to message #2 by Matthias

Hi,

it would be very nice, if I also could use my emulator card on the GX model. I already tried that, but putting it into a covered port has problems.

Robert

Re: HP41 Emulator Application Card for HP48GX

*Message #8 Posted by **James M. Prange** on 23 Mar 2004, 10:20 a.m.,*
in response to message #2 by Matthias

I know that I was able to copy the equation library card for the 48SX to a 128KB RAM card, and it worked just fine. Maybe the BUPORT program? Anyway, it was on one Joe Horn's Goodies Disks, which are available at hpcalc.org. What I'm thinking is that it ought to be possible to copy the 41 emulator code from the ROM card to a RAM card and change any entry points that need changing.

Regards,
James

*Message #10 Posted by **Chan Tran** on 15 Mar 2004, 7:54 a.m.,*
in response to message #9 by deleted

I have never been able to use the emulator card on the GX. I am certainly interested in the patch. Both the GX and SX can capture the print out from the 41 IR module without any problem using the INPRT program . I Garth is thinking of 2 way communication then no It won't work.

Pioneer Cases - where did the ugly plastic ones come from?

*Message #1 Posted by **Gordon Dyer** on 14 Mar 2004, 4:59 p.m.*

Hi, I have several Pioneer calculators and 2 of them have a low quality plastic dark brown case, all moulded, not stitched and no cloth lining.
The second one I got with a USA made 21S.
Does any one know which calcs or counties these cases came from?
Thanks.

Re: Pioneer Cases - where did the ugly plastic ones come from?

*Message #2 Posted by **Karl Schneider** on 14 Mar 2004, 5:11 p.m.,*
in response to message #1 by Gordon Dyer

Gordon --

I have a 1989 Singapore-made 42S that came with the seamless slipcover you describe. All my other Pioneers are newer (1990-2001), and have the stitched cover that hold the calc more securely.

Re: Pioneer Cases - where did the ugly plastic ones come from?

*Message #3 Posted by **Randy Sloyer** on 14 Mar 2004, 8:22 p.m.,*
in response to message #1 by Gordon Dyer

I believe those nasty, remove the finish from your bezel, vinyl cases where shipped with the first generation Pioneers from the good 'ole USA. Every flat bezel with lens model in my collection came with one of those nasty, sticky, dirt magnet monsters. You can't get the calculator out of them! I throw them away as any Pioneer, no matter how ugly, deserves better.

best method to remove a 67 back label

*Message #1 Posted by **Andreas** on 14 Mar 2004, 4:38 p.m.*

My search revealed nothing, but I'm sure this issue has been discussed already: What would be the best method to remove a back label of a 67? I finally found the courage to open mine, but I wonder how to remove the label without damaging it. A friend suggested the "drill" method, but I think there must be a better way.

Andreas

Re: best method to remove a 67 back label

*Message #2 Posted by **David Smith** on 14 Mar 2004, 5:02 p.m.,*
in response to message #1 by Andreas

Your best bet is to carefully peel up the corners. I use a razor blade dipped in UnDu adhesive loosener. Try not to make a sharp fold in the corners or cut the label. Tiny fold lines are a lot better than the carnage left by trying to totally remove the label.

Re: best method to remove a 67 back label

*Message #3 Posted by **Michael Reinold** on 15 Mar 2004, 5:05 a.m.,*
in response to message #2 by David Smith

First I used a hair-dryer to soften the adhesive stuff under the label. After that I peeled up the corners with a needle. Worked great.

After the work is done you have the option to not reinstall the two screws under the label if you decide to open the machine again in the future.

Re: best method to remove a 67 back label

*Message #4 Posted by **Grant Goodes** on 15 Mar 2004, 8:17 a.m.,*
in response to message #1 by Andreas

You may want to try a technique that is used by Pinball collectors to remove protective mylar films from pinball playfields: Use freeze-spray (sold for cooling electronic components), or regular canned-air (with the can held upside down, the propellant comes out, giving the same effect as freeze-spray). Thouroughly douse a section of the label, and the freeze-spray will cause the adhesive to completely separate from the label, and loose its adhesion. Carefully lift up the first section of the label (using a credit card or whatever to prevent it from sticking again), and continue to work (liberally spraying) away from your starting point.

The glue will be left behind on the calc, and hopefully the label will not get mangled (though I don't know if the freeze-spray will affect the ink, since I've only worked with mylar films which I intended to dispose of).

This really works, though it takes a bit of practice.

grant..

Re: best method to remove a 67 back label

*Message #5 Posted by **David Smith** on 15 Mar 2004, 10:39 a.m.,*
in response to message #4 by Grant Goodes

Yes, the freeze spray can affect the display window and the keyboard background and probably the label ink. Be very careful blowing clean your calculator. Keep the can upright and do the first blow away from the machine so that any liquid in the siphon tube is not blown onto the machine.

*Message #6 Posted by **gianmaria** on 16 Mar 2004, 1:58 a.m.,*
in response to message #1 by Andreas

Hello Andreas,

I've tried to reach you by e-mail but without no succes. I've done many card reader reparations for myself and others guys in Europe (many HP fans in Germany too...).

If you want I may send you some photos about the back label job before and after the card reader reparations.

You simply have to use the hair dryer to peel up the corners and then put them in place without adding new glue but using the existent...

Best regards :-) Gian

HP33S price in Europe

*Message #1 Posted by **Andreas** on 14 Mar 2004, 10:27 a.m.*

I contacted one of the local book stores in Sweden to find out the price of the HP33S, figuring it should be fairly affordable since it sells for $50 in the US. After calling their distributor they came back with the price - the equivalent of $130! Meanwhile, Classiccalculators in the UK sells it for £50, maintaining the usual 1£=1$ exchange ratio you tend to see for electronics.

I'm guessing HP doesn't particularly want to sell any RPN calcs here...

Re: HP33S price in Europe

*Message #2 Posted by **Arnold Steekelenburg** on 14 Mar 2004, 3:09 p.m.,*
in response to message #1 by Andreas

Take a look at www.dynatech.de. Hp33S € 69.95. I guess that's a reasonable price (VAT included).

Re: HP33S price in Europe

*Message #3 Posted by **Dave** on 14 Mar 2004, 3:41 p.m.,*
in response to message #2 by Arnold Steekelenburg

€ 69.95 is approximately £48 UK Pounds. Classic Calculators will sell them in the UK at £49.95 UK Pounds Including VAT according to their website (as stated in earlier post). These two prices are thus very similar. Dont forget European Prices include VAT at 17.5% (in the UK, different rates in other countries)

Prices for HP calculators in the UK can be very variable. As an example look for HP 12C on www.kelkoo.co.uk Prices (all INCLUDING VAT) shown are £69.33 (Classic Calculators) £69.95 (WF Sleath) £82.01 (UK Office Direct) £92.00 (Calculators Online) £97.48 (Consumableitems.co.uk) £113.95 (TravelStore24). All more expensive than US prices but very variable from shop to shop within the UK as well!

I visited a a certain well known store for rich people in Knightsbridge (West London)a few weeks ago, they had the 12C on display and for sale, About £129 if I remember correctly I think!!

HP-21S Quick Reference Card scanned

*Message #1 Posted by **Gordon Dyer** on 14 Mar 2004, 10:07 a.m.*

Hi, I have noticed that the HP-21S manual and Quick Reference Card seem to be rarer than most. I found myself one in good condition so I can offer to send anyone a scan of the QRC if you need it.

Re: HP-21S Quick Reference Card scanned

*Message #2 Posted by **Walter B** on 16 Mar 2004, 6:32 a.m.,*
in response to message #1 by Gordon Dyer

Hi, thx for your offer. Please send a scan to me. I got a HP 21s without docs and found it hard to find out how the more sophisticated functions work. Thanks in advance!

Re: HP-21S Quick Reference Card scanned

*Message #3 Posted by **Neil** on 16 Mar 2004, 3:51 p.m.,*
in response to message #2 by Walter B

Since the subject of the hp 21s manual comes up again and again and again (including a request by me sometime ago), I would like to point out a link I finally came across where the complete hp 21s manual is available. I hope the webpage owner does not mind.

Here's the link:- http://home.comcast.net/~bsmith1776/index.html

HP-21S Manual available!

*Message #4 Posted by **Walter B** on 17 Mar 2004, 3:53 a.m.,*
in response to message #3 by Neil

Neil, thanks a lot for your finding! I downloaded the manual and found everything readable. Gordon, thanks for your input, it pushed the solution. So after all, one gap is closed finally.

For further users, I suggest this manual to be included into the collection of this museum, if the owner of the website agrees.

Thanks again!

82104A Card Reader repairs

*Message #1 Posted by **Brian Ayling** on 13 Mar 2004, 11:48 p.m.*

I recently acquired a non-working 82104A card reader for the HP41 and am attempting to restore it. Cards run through OK, but it can't read them - usually I get a "CARD ERR" message or occasionally "CHECKSUM ERR" (which usually leaves the calculator in a corrupt state). Writes seem to work as expected (with cards prompted), but since the cards can't be read back I have no way of knowing whether anything is actually being written to the cards. Any help on what to look for/repair would be appreciated!

More about the repairs so far - references used were: "HP-41C Card Reader Repair The Short Fix Approach" by Mark Hoskins (Jan 2002); "Repairing the hp 82104A Card Reader" by Dave the "lostrabbit" (May 2000).

First I repaired the infamous "gummy wheel" using the "Short Fix Approach", which bypasses separating the two halves of the card path. Upon reassembly the reader could now draw cards through OK, but could not read them. Suspecting more gunk inside I then dismantled the card path as per Dave's article. The read/write head and path looked clean (I re-cleaned them anyway). The two card wiper switches appeared to be correctly contacting the circuit board, and the two copper tensioning strips seemed properly located, though I don't know whether one that presses the card against the heads is correctly tensioned. I then re-assembled everything, but it still didn't work.

I have done the obvious mechanical checks, but have not electrically tested anything (yet). I've tried the reader on two 41CVs, and with previously written cards (both clipped and unclipped), with similar results. Any clues what else might be wrong?

Thanks, Brian Ayling.

PS - I was amused to read that "pink" fuel line could be used to replace the gummy wheel, without any useful dimensions given. I found it needs to have an (installed) outside diameter of 1/4 inch or 6.3 mm.

HP12C decimal point conversion HELP!

*Message #1 Posted by **Andrew Clark** on 13 Mar 2004, 7:50 p.m.*

my 2 year old daughter was playing with my 12c and changed the decimal point to a comma somehow. anyone know how to change the decimal point from a comma back to a period on the 12C? thanks ac

Re: HP12C decimal point conversion HELP!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2004, 9:12 p.m.,*
in response to message #1 by Andrew Clark

Hi;

althought this question has already been answered by both Randy Sloyer and Karl Scheider AND the question prevails, let's do it:

```
1 - make sure the calculator is off;
2 - press AND HOLD the [.] key;
3 - while holding the [.] key down (pressed), switch it ON;
4 - release the [.] key;
```

This will toggle dot for comma anytime the procedure is performed.

Cheers.

Luiz (Brazil)

*Message #1 Posted by **Andrew Clark** on 13 Mar 2004, 7:39 p.m.*

my 2 year old daughter was playing with my HP12C and changed the decimal point to a comma. anyone know how to change it back to a period? thanks

ac

Re: decimal point conversion

*Message #2 Posted by **Randy Sloyer** on 13 Mar 2004, 7:47 p.m.,*
in response to message #1 by Andrew Clark

Ah, the question that will not go away. It gets asked at least once a week. How is it that two year olds are so talented? Mine hide my car keys in a box of nails in the garage. I found them three years later...

Turn the unit off. Press and hold the decimal point key. Press the ON button. Presto, it's fixed.

Doing this again will toggle it back to the comma separator.

Does anybody knows what is 3421 Control module (HP #82500B-A24) for HP-41

*Message #1 Posted by **Miki Mihajlovic** on 13 Mar 2004, 7:06 p.m.*

1234

Re: Does anybody knows what is 3421 Control module (HP #82500B-A24) for HP-41

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2004, 9:15 p.m.,*
in response to message #1 by Miki Mihajlovic

Hi, Miki;

the 3421 is an HPIL compatible data acquisiton (plus more) unit. An HP41 with an HPIL can be used as a controller, BUT isf you have the 3421 ROM module, many ready-to-use HPIL based functions bcome available. The 3421 ROM function set eases the job of acquiring data.

Some guys here know it better. I just know it esists... q:^)

Cheers.

Luiz (Brazil)

Re: Does anybody knows what is 3421 Control module (HP #82500B-A24) for HP-41

*Message #3 Posted by **Miki Mihajlovic** on 13 Mar 2004, 9:43 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks for the answer. Now I remember it but haven't realized that the unit was coming with a ROM module for 41C. I've seen it before but I remember it being the size of a PC. I just saw recently the ROM module without the DAU so I was confused.

Greetings from Calgary.

Re: Does anybody knows what is 3421 Control module (HP #82500B-A24) for HP-41

*Message #4 Posted by **Garth Wilson** on 14 Mar 2004, 1:05 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

It is my understanding that if you have the Extended I/O module, this 3421 module is unnecessary. I have the XIO built into the HPIL (so the two modules together only take one port) and have used it extensively to control lots of equipment, including the 3421A data acquisition unit. Most of the equipment was on the HPIB (IEEE-488) bus though. I short description is in the "memories" forum.

Re: Does anybody knows what is 3421 Control module (HP #82500B-A24) for

HP-41

*Message #5 Posted by **Christoph Klug** on 15 Mar 2004, 5:06 a.m.,*
in response to message #4 by Garth Wilson

Dear HP41 & HP3421 enthusiasts,

Controlling the HP3421 with HP41 needs the EXT-I/O Module or the 3421 DAC module. The last includes some special keyboard assignments - than the HP41 acts as an remote keyboard for the HP3421.

Usigng CLONIX you are able to programm the 3421DAC rom plus some other roms plus your individual user code software application inside an advanced one port solution...

Alternatively to HP3421 you can use me I/O-Board or the IL2000 System, which includes some more fardware features...

Regards from Germany - Christoph Klug

HP-65 card reader

*Message #1 Posted by **Jon** on 13 Mar 2004, 4:32 p.m.*

Hi everybody:

I am trying to repair an HP-65. The wheel seems to be ok but the motor makes a very strong noise and it doesn´t read or write. Does anybody know the reason for that noise?

Thanks in advance

Jon

Re: HP-65 card reader

*Message #2 Posted by **Randy Sloyer** on 13 Mar 2004, 7:44 p.m.,*
in response to message #1 by Jon

One of several things, in the order of most to least likely:

1. The end of the threaded drive shaft where it rests in the case, opposite the motor, needs a tiny drop of plastic safe oil. They like to squeal there (highest surface speed no doubt).
2. The clutch is slipping. It is were the motor shaft enters the threaded shaft that drives the wheel. CAREFULLY crimping with pliers will help if the material has not disintegrated. Sometimes it is better to forget it is a clutch and put the tiniest bit of super glue on the end of the motor shaft and just glue the sucker on. Let the glue shear if it must. I doubt the worm on the capstain will break first if you don't go overboard with the glue. You can use vinyl wire insulation to make a new one in a pinch if it has turned to dust :-(
3. The bearings in the motor are gone. Ugly. Buy a cheap 41 card read to cannibalize.

Good luck

Re: HP-65 card reader

*Message #3 Posted by **Jon** on 14 Mar 2004, 3:42 p.m.,*
in response to message #2 by Randy Sloyer

Hi Randy:

Thanks for the fast answer. I understand I can use the full motor coming from a 41 card reader. In the other hand I have received another HP-65 from a friend to repair. It has the original standar pac. I have seen that both calculators can read original cards. But none of them write. However I can´t see any sign of bad function when they try to write. Everything seems to go fine but the cards are not written. It is quite surprising. Same problem in both. May be I am not writing properly. I have written an small program and inserted the card in prog- mode. Is it ok?. If that is ok, which could be the problem?.

Thanks in advance

Jon

Re: HP-65 card reader

*Message #4 Posted by **Ernie Malaga** on 14 Mar 2004, 4:42 p.m.,*
in response to message #3 by Jon

You mention the "original Standard Pac," reading OK, but failing to write. If you're attempting to write on the pre-recorded cards, that's the reason for your problems: they are write-protected by having the top-left corner clipped off. Any card with the corner cut is so protected.

Also, make sure the W/PRGM-RUN switch is set to W/PRGM when you insert the card.

-Ernie

*Message #5 Posted by **Jon** on 15 Mar 2004, 2:52 a.m.,*
in response to message #4 by Ernie Malaga

Hi Ernie:

I have read the pre-recorder cards, but I have tried to write in non protected cards. It doesn.t write (the switch is in prog. position). Any idea?

Jon

Re: HP-65 card reader

*Message #6 Posted by **David Smith** on 15 Mar 2004, 10:42 a.m.,*
in response to message #5 by Jon

If you get the ERROR message when you attempt to write, the problem is most likely a mis-adjusted WRITE PROTECT switch in the reader. Cards that can't be read but gave to write ERROR is most likely a mis-adjusted HEAD ENABLE switch.

Re: HP-65 card reader

*Message #7 Posted by **Jon** on 15 Mar 2004, 12:31 p.m.,*
in response to message #6 by David Smith

Hi the problem is different. I don´t get any error message. It seems that that it writes flawlessly. But when I try to read that card later it doesn´t work. And the card reader reads ok, because it hasn´t any problem to read the pre-recorded cards... And the same situation with both calculators. Just a question. Which should be the error message when writing?.

Re: HP-65 card reader

*Message #8 Posted by **David Smith** on 15 Mar 2004, 6:03 p.m.,*
in response to message #7 by Jon

The 65 does not display an error message when writing like the HP67 does... some errors will cause it to flash the display. Your problem sounds like a bad head enable switch adjustment since it seems to write properly but will not read back the data (but can read other cards).

There are three switches in the reader MOTOR, WRITE PROTECT, and HEAD ENABLE. The gold switch fingers touch pads on the back of the keyboard PCB when the card is inserted. Trace the connections to the fingers on the end of the keyboard and verify that the switches open and close in sequence (to ground) as a card is manualy jammed into the reader and removed.

Re: HP-65 card reader

*Message #9 Posted by **David Smith** on 14 Mar 2004, 5:06 p.m.,*
in response to message #1 by Jon

Screaming motors are sometimes caused by the tip of the worm gear rubbing on the ball/bearing embedded in the reader housing. Usually it is caused by noisy bearings in the motor. I use a tiny brush and paint a drop of Break Free CLP gun oil around the bearing at the motor shaft. It takes about an hour for the stuff to do its magic. Try to keep it off the motor shaft/worm gear coupling (the "clutch").

NoVRAM (Cloned HEPAX) site update.

*Message #1 Posted by **Diego Diaz** on 13 Mar 2004, 12:31 p.m.*

Hi all,

For those still interested in the HP-41 universe... here you are some pictures, comments and a Clonix loadable file regarding the latest step on the NoVRAM project.

http://www.iespana.es/clonix-41/novram.htm

I'll keep you informed on the NoVRAM developement progress.

Thanks so much for your support and enthusiasm, both are great parts of projects success.

Best wishes from Spain.

Diego.

*Message #2 Posted by **Raymond Del Tondo** on 13 Mar 2004, 7:38 p.m.,*
in response to message #1 by Diego Diaz

Cool stuff !!!

Regards,

Raymond

BTW: Did the letter arrive?

Re: NoVRAM (Cloned HEPAX) site update.

*Message #3 Posted by **Diego Diaz** on 13 Mar 2004, 9:46 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond,

...and thanks! I'll try to do my best during the next weeks and find a solution for the remaining issues, namely, the HEPAX auto-paging and the RAM auto-initialization after a power OFF/ON cycling. Currently it must be initialized manually. Anyhow the RAM contents remains unchanged even after the module (breadboard) is disconnected, but if you erased its contents the HEPAX cannot restore the filesys automatically (as it should). I've wrote a small program to achieve this task though.

I can't tell for sure if your letter has already arrived. I picked up a note off my mail box regarding a registered mail from Germany when I came back home about noon, and I think your letter is in the post office right now. I'll mail you next Monday as soon as I confirm that point.

I know it's a long time, but remember we're on elections and post offices are *really* overburden with a lot of parties propagandism extra mailings... apart from that, the safety control measurements have been -at least- doubled in the postal service (and in many other services too) due to the terrorist attack on Madrid last Thursday.

Best regards form the very sad Spain.

Diego.

Link does not work for me...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2004, 10:27 p.m.,*
in response to message #1 by Diego Diaz

Hell, Diego;

I tried opening the page you added the link to but I was not able to. As I see, Raymond succeeded, and you are both in Europe. Does anyone here ath the Americas succeed as well? Maybe the DNS server I'm connected to is faulty.

Just as a revference, the single **www.iespana.es** returns a **no valid index found** warning/error message. Is there a mirror?

Thanks

Luiz (Brazil)

*Message #5 Posted by **Miki Mihajlovic** on 13 Mar 2004, 11:16 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I have no problems opening it from here, although it comes with some annoying console pop up windows.

Re: Link does not work for me...

*Message #6 Posted by **Garth Wilson** on 14 Mar 2004, 1:08 a.m.,*
in response to message #5 by Miki Mihajlovic

No problem viewing the web page here in California either.

Re: Link does not work for me...

*Message #7 Posted by **Diego Diaz** on 14 Mar 2004, 7:40 a.m.,*
in response to message #6 by Garth Wilson

Hi there,

Luiz, I'm sorry to know of your troubles to reach the Clonix site.

So far I'm not aware of any mirror site to which I can address you, anyhow I'll gladly send you the pictures and files regarding the NoVRAM and/or Clonix projects.

Yes Miki, popups and banners are *really* upsetting for me too... though I've found that the "Google bar" makes a nice job cleaning the "path" as I walk thru the 'net ;-)

Have a nice Sunday.

Diego.

I got the link, now!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 14 Mar 2004, 7:23 p.m.,*
in response to message #7 by Diego Diaz

Hi Diego, guys;

thank you all of you who gave the feedback related to page access.

I can see it, now. And Diego... Wow! What a piece of mindjob we have here, pall! Great! I thought I would not see protoboards anywhere else but my own lab. Man, it's outstanding! Congrats.

Can I add one small request? Is it possible to provide PCB layout with separated sides? I mean, two drawings instead of a double-side, blue-and-red single drawing? I have no specific SW to generate/read PCB layout (except for D.O.S. Tango and an earlier OrCAD... Yeah, I know, I'm a stone-aged guy...). Also, will you disclose the schematics??? Ahn?

I'm adding my e-mail address, so if there's anything else you can send me about the project, I'd be glad reading and seeing.

Best regards.

Luiz (Brazil)

28s Display Question

*Message #1 Posted by **John M** on 13 Mar 2004, 7:01 a.m.*

I used a 28s for about 10 years until I lost it a couple years ago (can't remember the serial number). I recently bought a replacement on ebay (serial 2840A....) and have noticed that the display looks like it has much more glare than what I remember from my old calculator. Does anyone know if they changed the type of glass used on the display of the 28s?

I've been using my 32sii for a while so maybe I've just gotten used to the lower glare from that display and just never noticed the glare when using my old 28s.

Thanks.

Re: 28s Display Question

*Message #2 Posted by **Thomas Falk** on 13 Mar 2004, 12:39 p.m.,*
in response to message #1 by John M

Yes, they did change the display at some time.

I have two HP 28s. One is from 1988. Its display can be used as a mirror. The other is from 1992 and has a much better display, no glare at all.

Unfortunately, at the newer calculator broke the battery door, I'm not sure if there is any coincidence ;-)

Maybe someone can narrow the time intervall more.

Bye,

Thomas

Low-glare display windows

*Message #3 Posted by **Karl Schneider** on 13 Mar 2004, 4:44 p.m.,*
in response to message #2 by Thomas Falk

Not sure about when Champion-series (e.g., 28S) calc's received low-glare display windows, but I have an two 42S models: an old-style 42S from 1989 and a newer-style from 1990. The older one has a flat, reflective display window, while the newer one has a recessed non-reflective "matte" window that seals out dust better.

The timeframe of that improvement would be consistent with what Thomas found.

I'm surprised that HP was still making the 28S in 1992, given that the 48S/SX had been available since 1990.

Time to track newest serial numbers?

*Message #4 Posted by **Randy Sloyer** on 13 Mar 2004, 7:54 p.m.,*
in response to message #3 by Karl Schneider

Just a thought. We know what the earliest ones are. I've been watching the serial numbers on Voyagers to find the newest 11 and 15C's.

What do 'ya think Dave? A new museum topic?

Re: Time to track newest serial numbers?

*Message #5 Posted by **James M. Prange** on 14 Mar 2004, 3:23 a.m.,*
in response to message #4 by Randy Sloyer

That would be interesting; the newest of each (discontinued) model.

Maybe the oldest and newest of variations such as ROM versions, the 32SII "brown bezel" and "silver bezel", and so on.

Regards,
James

Re: Low-glare display windows

*Message #6 Posted by **James M. Prange** on 14 Mar 2004, 3:18 a.m.,*
in response to message #3 by Karl Schneider

> Quote:
>
> I'm surprised that HP was still making the 28S in 1992, given that the 48S/SX had been available since 1990.

I suppose that as long as they were still selling and making a reasonable profit on a reasonable number of the "old" model, it made sense.

Regards,
James

The profit couldn't have been very high in 1992. I have looked again: My HP28s has the serial number 3208S00756, thus it was probably produced in February. I bought it new in March at a special price of 199DM, approx 100$. You could buy the HP48 at this time already, but it was far too expensive for a student.

Bye,

Thomas

*Message #8 Posted by **David Schmidt** on 18 Mar 2004, 10:07 p.m.,*
in response to message #3 by Karl Schneider

Karl (or anyone else), Did all the Singapore made Pioneers go with the non-glare screen and the US made ones use the mirrored screens?

Curious to hear what other 32s or 42s owners can report. What's the earliest date that the non-glare screens began to be used?

HP-42S -- old vs. new

*Message #9 Posted by **Karl Schneider** on 21 Mar 2004, 1:22 a.m.,*
in response to message #8 by David Schmidt

Thomas --

I have two Singapore-made 42S *(readers -- neither is for sale)*: a flat-display from 1989 with S/N 2939S33496 and a recessed-display from 1990 with S/N 3047S06328.

Besides having the recessed, low-glare display window, the newer unit differs in at least two other aspects:

1. The dot-matrix display area is taller with each pixel more rectangular, but unchanged pixel dimensions (to my knowledge). Numbers are taller, but not wider. I'm not so sure that the aspect-ratio change was an improvement.

2. The firmware was revised. Two effects included the introduction of the minor COMB/PERM bug; and, not allowing the clock speed to be temporarily altered by executing a program (e.g., the "FAST" program). Both of these were discussed in the MoHPC Forum archives more than a year ago.

Re: HP-42S -- old vs. new

*Message #10 Posted by **Veli-Pekka Nousiainen** on 21 Mar 2004, 8:32 a.m.,*
in response to message #9 by Karl Schneider

"(e.g., the "FAST" program). "

Re: 28s Display Question

*Message #14 Posted by **Erwin** on 14 Mar 2004, 5:43 a.m.,*
in response to message #1 by John M

I think that the difference lies in the place/country of production. All 28S that i came across had either the glare glass, and these where all made in the USA, or the non-glare ones, and these where all made in Singapore.

Re: 28s Display Question

*Message #15 Posted by **Andreas** on 14 Mar 2004, 3:52 p.m.,*
in response to message #14 by Erwin

Affirmative! 2829A07612, made in USA, bought right after market introduction, has glare display.

Andreas

28S production

*Message #16 Posted by **Karl Schneider** on 14 Mar 2004, 4:29 p.m.,*
in response to message #14 by Erwin

Erwin stated,

> Quote:

> *I think that the difference lies in the place/country of production. All 28S that i came across had either the glare glass, and these where all made in the USA, or the non-glare ones, and these where all made in Singapore.*

Perhaps the design change coincided with a shift to production in Singapore. It was not uncommon for HP to start production of a new model in the US, then shift it after some time to Singapore or other location later. The 41C and all Voyager models (10C/11C/12C/15C/16C) all began production in the US. As far as I can tell, the 41C shifted to Singapore after at least a year; the 12C moved to Singapore after the other Voyagers had been discontinued. First-year Pioneers from 1988 (e.g., 42S) were US-made; however, my 1989 "glarey"-style 42S is Singapore-made.

I suspect that the 28C had alredy been discontinued when the design/production change took effect.

-- Karl

Re: 28s Display Question

*Message #17 Posted by **Brian Mags** on 14 Mar 2004, 5:25 p.m.,*
in response to message #1 by John M

For those who have the high glare 28s versions, has anyone tried cutting to size a Palm Pilot Screen Protector and using that to reduce the glare? I may give that a try this week to see how it works. This idea may also help protect the 33s screen that seems prone to easy scratching.

Re: 28s Display Question

*Message #18 Posted by **Scuba Diver** on 14 Mar 2004, 10:10 p.m.,*
in response to message #17 by Brian Mags

Well, I have two 28Ss, one from the US (2921A) and one from Singapore (3048S) and the US model has a high-glare screen while the Singapore unit doesn't.

I like that idea of the Palm protective screen...I think I may give it a try, because I find the high-glare screen REALLY annoying...

B.

HP 25 bugs, any details ?

*Message #1 Posted by **Pascal** on 13 Mar 2004, 6:15 a.m.*

I read on the Bug section of the site that some hp-25 had bugs. I quote : "Some HP-25s have several bugs including polar/rectangular conversion errors for angles within +/- 0.000573° of 180° . Also when the last operation caused data in a certain range to be stored in a register and the calculator was at step 00, switching to Program mode would cause a blank display and switching back to Run would display Error."

Does anyone have more details on that and an example of a computations that shows those bugs with the correct result and the wrong one ? I have 2 HP-25 and I would like to know if they have bugs.

Thanks for your help.

Pascal.

Re: HP 25 bugs, any details ?

*Message #2 Posted by **David Smith** on 13 Mar 2004, 1:09 p.m.,*
in response to message #1 by Pascal

Do any trig operation with a small range (I use 1E-14 TAN) then switch to PROGRAM mode. See a blank display. Switch to RUN, see ERROR.

It does not do anything with mine :-((No text)

*Message #3 Posted by **Michel Beaulieu** on 13 Mar 2004, 6:14 p.m.,*
in response to message #2 by David Smith

Mine has a bug !

*Message #4 Posted by **Pascal** on 14 Mar 2004, 4:11 a.m.,*
in response to message #2 by David Smith

Thanks, I was able to test on my 2 hp-25 and one of them has this bug. Its serial number is 1510, which is just 2 weeks later than the first dated on hpmuseum site (1508).

Anything about the other bug ?

Edited: 14 Mar 2004, 2:58 p.m.

Re: Mine has a bug !

*Message #5 Posted by **David Smith** on 14 Mar 2004, 5:07 p.m.,*
in response to message #4 by Pascal

BTW, The bug lies in the ROM0/anode driver chip under the display module...

HP-48SX HP 82211B Solve Equation Card on an HP-41GX?

*Message #1 Posted by **Chris Catotti (Florida)** on 12 Mar 2004, 1:26 a.m.*

Does anyone know if the "HP 82211B HP SOLVE EQUATION LIBRARY CARD for the HP 48SX" works properly on an HP-48GX ?

If I understood it right, it does, but some of the "HP 82211B HP SOLVE EQUATION LIBRARY CARD for the HP 48SX" features and functions are built-in to the GP-48GX.

(I wish I could locate my 48GX to just try it out.)

Thanks!

Re: HP-48SX HP 82211B Solve Equation Card on an HP-41GX?

*Message #2 Posted by **Raymond Del Tondo** on 12 Mar 2004, 1:57 a.m.,*
in response to message #1 by Chris Catotti (Florida)

Hi,

the 'B' card may work on the GX, but it doesn't make sense, because the whole equation library is built into the G and GX. Also the browser engine of the EQ card could make problems.

The only things from the 'B' card missing in the G/GX are the periodic table and the TETRIS game from BPS (Bullet Proof Software) .

Too bad there's nearly no software company which deserves this name nowadays;-)

However, the periodic table had been released by HP as a stand-alone application to be loaded into the G/GX, and the TETRIS is available on hpcalc.org .

Raymond

HP 97 advice please !

*Message #1 Posted by **Vickie Sublett** on 11 Mar 2004, 6:30 p.m.*

I recently bought an HP-97 w/AC adapter at a city auction. When plugged in, only the small red dot on the upper left-ish side of the display lights and only very faintly. (I think it's the 'on' light). It doesn't have a battery pack but my understanding is that it runs the printer, not the calculator. Any ideas about what could be wrong and how I can fix it myself?

Re: HP 97 advice please !

*Message #2 Posted by **Michel Beaulieu** on 11 Mar 2004, 8:09 p.m.,*
in response to message #1 by Vickie Sublett

You really need a battery pack in GOOD condition to run the calculator. AC only can dammage the calculator and/or prevent the calculator to turn on or work correctly.

You can try a direct well filtered voltage on the contacts in the battery compartment (respect the polarity!!!) to try the calculator "safely" (don't plug the adaptor in this case)

Give us some news!

MB

Re: HP 97 advice please !

*Message #3 Posted by **Vickie Sublett** on 12 Mar 2004, 12:56 p.m.,*
in response to message #2 by Michel Beaulieu

What is direct well filtered voltage?

Re: HP 97 advice please !

*Message #4 Posted by **bill platt** on 12 Mar 2004, 6:16 p.m.,*
in response to message #3 by Vickie Sublett

Vickie,

I think what Michel is saying is to provide DC that is the correct polarity and voltage, with pure DC ("well filtered"). The issue is that most power supplies do not provide clean DC--there is a fluctuating voltage which can damage the electronics.

So, you need a good voltmeter, some batteries in holders, alligator clips, and a source of variable reistance. With these things, you can make pure DC from primary cell batteries, and use the variable resistance to get the vlotage just right.

Best,

Bill

As already mentioned, you need a good battery to run this calculator properly. Fortunately, the batteries (82033A) are fairly easy to find, because they are the same as are used for the 41C family printers, tape drives, etc., and they can be readily rebuilt with sub-C size NiCd batteries.

However, do you have the battery door for the calc? Sometimes these calcs lose that door, so that would be a bigger problem.

Re: HP 97 advice please !

*Message #6 Posted by **Vickie Sublett** on 12 Mar 2004, 10:33 a.m.,*
in response to message #5 by Ion Abraham (New Mexico USA)

I do have the battery door and the contacts are corrosion-free. I read somewhere on this site that it's possible to get tabbed batteries at radio shack and put them together to run calcs. If that's so, is there anything I should know before I try this or should I buy a ready-made pack? Besides e-bay where is the best place to buy a ready-made pack?

Re: HP 97 advice please !

*Message #7 Posted by **Dave** on 12 Mar 2004, 10:44 a.m.,*
in response to message #6 by Vickie Sublett

Absolutely make sure you never run the calc off the AC without a battery. Turning on the printer will destroy it!

You could get Batteries Plus to put together a battery pack following polarities in this web site.

Or buy an old one off Ebay or the like...

Re: HP 97 advice please !

*Message #8 Posted by **David Smith** on 12 Mar 2004, 1:22 p.m.,*
in response to message #1 by Vickie Sublett

You need a good battery pack to run the machine. Easiest place to get one if you do not have an old one to rebuild is from Mark Hoskins. He sells them on EBay (id WATERHOSKO) for around $30.

Re: HP 97 advice please !

*Message #10 Posted by **Vickie Sublett** on 12 Mar 2004, 5:53 p.m.,*
in response to message #9 by Bill Holes

Thanks! So, you are saying this is normal for the calc NOT to operate with only the AC plugged in and no battery pack and the calc MUST have a battery pack (good one) to operate?

Just trying to get clear because I don't want to spend $ on a battery pack if the calc is faulty. With the AC plugged in, the calc will only faintly display the low battery indicator light on the display.

Another thing you can try, if you don't want to just buy a battery pack without knowing if the calc still works, is to say which city you are in. There is probably someone here that lives near you who has a working battery of that type, and you could just go on over and try it out.

Re: HP 97 advice please !

*Message #13 Posted by **Vickie Sublett** on 13 Mar 2004, 2:55 p.m.,*
in response to message #12 by db(martinez,california)

I found that there is a Batteries Plus just a few miles from my house and they said they'll put a pack in the calc to determine it's condition before I purchase a pack ! How great is that!!!!!!!!!

Just so you all know, I haven't actually been running it from the AC, just plugged it in to see if it would power on but won't do it again. Thanks for all your advice and I'll let you know what happens.

I had one of these calcs 24 years ago where I worked. When I left the company, I wanted to take it with me soooo badly, but it wasn't mine, belonged to the company. I haven't had an affection for a calc since then (I wondered why I loved it so much!?, was that weird, oh well. I moved on.)

12 years later, I found an HP 41C that someone had tossed when cleaning out a desk/office, I guess. I kept it for years not knowing what I'd ever do with it but, knew it couldn't just be thrown out, even though the batteries were bad and I didn't have any other way to power it up. Then I met someone who regularly sells on e-bay and he said, 'hey you could sell that on e-bay'. So, I look it up on e-bay and one of the ads told of the on-line HP Museum. Voila, I found that

I wasn't weird to have loved my calc from 20 years ago!!! Then I saw one in an on-line city auction and bought it.

Isn't it funny the way things happen?

Vickie

HP 10 Stat problem

*Message #1 Posted by **Mona** on 11 Mar 2004, 1:05 p.m.*

I got HP 10 B and can't figure out how to compute standard deviation, once you have probabilities and rates of return: For example:

Probabilities: .3, .4, and .3 and associated rate of return : 60%, 20% and -20%

I have owner's manual, but I can't find instructions how to compute standard deviation for this particular example. Does anyone have the same model calculator and knows how to do this?? I appreciate your help.

Mona

in response to message #1 by Mona

Hello, Mona;

which HP10 you have? HP10B, 10BII, HP10C? I cannot remember other model...

The original HP10 (printing adding machine) has no statistical resources, so I ghues it's one of the others.

If you have an HP10C, the older of the thre ones, than you can find the standard deviation for the X-values with the sequence [f][S], and [S] is the orange (yellow, gold...) inscription over the [.] key. To see the standard deviation fo the Y-values, use [X<>Y] (X exchange Y, beside [CLx] key)

If yours is an HP10B (brown case), then the standard deviation for the X-values is computed with the sequence [SHIFT][Sx,Sy] ([SHIFT] is the orange key, and [Sx,Sy] is over the [8] key). You need to use [SHIFT][SWAP] to see the standard deviation for the Y-values.

If yours is a newer HP10BII, the procedure is the same as if you are using an HP10B, except for the location of the [SWAP] key.

BTW, both HP10B and HP10BII offer both the standard deviation applied to the population AND to a sample. In the HP10C, only standard deviation applied to a sample.

Hope this helps.

Cheers.

Luiz (Brazil)

*Message #3 Posted by **hugh steers** on 11 Mar 2004, 8:40 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

hi luiz,

radically, i would like to suggest that the 10b, along with the vast majority of calculators, is incompetent at calculating standard deviations. try this:

cl SUM, 1000000, SUM+, 999999, SUM+, 1000001, SUM+, Sx

which yields zero. the answer is 1. for a long time, i thought that accurate computation would necessitate the storage of all values (this is how the 48 does it). but no! a simple algorithm known in the 70's was this:

n=0, s=0, m=0. loop: get x. n + 1 -> n. x - m -> t. m + t/n -> m. s + t*(x - m) -> s. goto loop.

the standard deviation is then sqrt(s/(n-1)).

what is interesting is that this way is actually simpler than the textbook sums of squares and square sum formula. the incompetence of calculators at sd was pointed out to me by a colleague who works in a laboratory where experimental samples are always biased by a significant mean factor and the raw sample numbers never work correctly when input to calculators (nor excel, so it seems).

best wishes,

in response to message #3 by hugh steers

Some statisticians advocate transforming the data by subtracting the average value from the oberservations. This improves accuracy in the calculations for for standard deviation as well as linear regression slopes and intercepts.

in response to message #3 by hugh steers

It's been too many years since I took statistics class, but if I recall correctly, this depends on whether you're computing the standard deviation of a sample or of a population. For small values of n (three in your example) there is a substantial difference.

Re: HP 10 Stat problem

*Message #8 Posted by **Norris** on 12 Mar 2004, 7:36 p.m.,*
in response to message #7 by Eric Smith

This issue is explicitly discussed in at least some HP calculator manuals. For example, it is addressed on page 11-11 of the 32SII manual, under "Normalizing Close, Large Numbers." The issue affects linear regression calculations, as well as the standard deviation.

The problem is not due to population vs. sample standard deviation. It's actually due to roundoff error. Most calculators obtain standard deviation by summing the squares of the entered values. But if large values are entered, the square may have more significant digits than the calculator can keep track of.

For example, 999,999 squared should be 999,998,000,001, but many calculators will round this off to 0.999998 E12, or 999,998,000,000. Another digit will get lost when 1,000,001 is squared. So the sum of x^2 will be incorrect, and since this sum is used to calculate the standard deviation, the s.d. will be wrong too.

The 32SII manual shows how to work around this problem by normalizing the data.

The HP48GX calculates s.d. differently; it sums the square of the difference between each entered value and the mean (as per p. 3-301 of the AURM). The 48GX solves the stated problem correctly without normalizing

*Message #9 Posted by **Norris** on 13 Mar 2004, 12:28 a.m.,*
in response to message #8 by Norris

The HP11C manual (pp. 56-57) includes a similar discussion of possible problems when using statistical functions on large, close numbers.

The HP20S is also subject to this problem, but the manual (which is relatively thin) does not acknowledge it

Rounding errors on calculators' statistical functions

*Message #10 Posted by **James M. Prange** on 14 Mar 2004, 2:55 a.m.,*
in response to message #8 by Norris

At work, the actual deviations from the mean are usually small compared to the mean. Back when we worked out the mean and standard deviation on paper (well, ok, using a calculator for basic arithmetic), I came up with a way to simplify the process. Ok, I've seen it in books later, so I wasn't the first. I think of it as "coded data", and I expect that it's essentially the same as "normalizing".

First, if the data isn't all integers not ending with zero, multiply it (mentally) by some power of 10 (let's call this *a*), that is, move the decimal points, to make all of the data integers, at least some of which don't end with zero. Now choose some number (let's call this *b*) that's easy to subtract from these values and results in relatively small integers (preferably mostly positive, but some negatives won't hurt). Do the subtraction (again, in your head) and write down the results in a new column. I think of this as "encoding". Now work out the mean, variance, and standard deviation of the coded data just as you normally would. For the mean of the original data, add the mean of the coded data to *b*, and then divide by *a*. For the variance, divide the coded variance by a^2; that is, move the decimal twice as many places in the opposite direction. For the standard deviation, just divide the coded standard deviation by *a*. It's still tedious, but much better than working with 5- or 6-digit values.

The first time that I saw a calculator with statistical functions, it was a "must-have". I tried it out on working out the standard deviation of a small (50-piece) capability study, keying in all 6 digits of each value. Wrong answer! Did I make a mistake keying it in? I tried again, but got the same wrong answer. I was almost certain that I'd gotten it right working it out on paper. But what was the Sum(x^2) key on the calculator for? So I decided to read the fine manual a little closer. It turned out that the calculator kept track of n, Sum(x), and Sum(x^2), and used them in a method that was mathematically correct, except that with so many digits, the Sum(x^2) was being rounded off. Ok, that makes sense; it would take considerable memory to keep track of all of the data, and keeping a running total of just 3 values allows it to do the statistics with much less memory. Just be careful of the rounding off problem.

Trying again on the calculator, but using the "coded data" method to avoid the rounding off, the calculator returned the correct answers, and there was a lot less key-pushing involved.

The RPL calculators (28, 48, and 49 series) don't use the method with Sum(x^2), so the rounding off problem isn't nearly so bad, although I suppose that they must still do some rounding off (in many cases). But for my purposes, they're easily "close enough"; after all, we can expect some measurement error in the original data anyway. I suppose that if the original data had, say, 12 significant digits, it would be a real problem, but I very much doubt that I'll ever see that at work.

Since the RPL calculators keep all of the data in memory, it's also easy to review it for errors; something that the simpler calculators don't allow, short of keying it all in again.

Even with the RPL calculators, I still use my "coded data" method (but keying it into the calculator instead of writing it down), mostly because I don't have to key in so many digits.

I suppose that for maximum accuracy, the *b* value would be as close to the true mean as can be

represented on the calculator, but with my method, I usually only have to key in 1 or 2 digits, and occasionally 3, for each value, and for practical purposes, the result is always correct.

And be careful of spreadsheets; I've seen some real nonsense when people tried to use them instead of specialized statistical applications on a computer. I'm not sure how much of the problem is operator error and how much is the algorithm the spreadsheets use and rounding off error. At least some spreadsheets will give you the population standard deviation instead of the sample standard deviation; something to watch out for.

Regards,
James

Re: Rounding errors on calculators' statistical functions

*Message #11 Posted by **Norris** on 14 Mar 2004, 12:40 p.m.,*
in response to message #10 by James M. Prange

Your procedure is, as you surmise, similar to the "normalizing" procedure outlined in the HP-11C and HP-32SII manuals (possibly other HP manuals as well).

The HP-recommended procedure is to simply subtract the same "central value" (i.e., the mean, or an estimate of the mean) from each data value as it is entered into the calculator. The standard deviation obtained by the calculator should then be correct.

Multiplying by powers of 10 to make all data integers is not necessary, but could make the subtraction easier if you are doing it in your head. Alternatively, the 11C or 32SII could be programmed to automatically do the subtraction and enter the normalized results.

Thank you, Norris...

*Message #12 Posted by **Karl Schneider** on 14 Mar 2004, 10:45 p.m.,*

... for bringing much clarity and insight to this discussion.

Re: Rounding errors on calculators' statistical functions

*Message #13 Posted by **James M. Prange** on 15 Mar 2004, 2:05 a.m.,*
in response to message #11 by Norris

> Quote:
>
> Multiplying by powers of 10 to make all data integers is not necessary, but could make the subtraction easier if you are doing it in your head.

Yes, I agree that the multiplying/dividing by powers of 10 is entirely unnecessary to avoid rounding errors in any calculator/computer that uses a floating point representation of numbers. Well, unless there's a chance of overflow of the exponent of 10.

The "central value" to be subtracted doesn't have to be one that's "easy" to subtract in your head, just one that reduces the number of significant digits enough to avoid rounding of $\text{Sum}(x_i^2)$. To do it in a program, I'd simply use the first value entered to

subtract from all values.

In the RPL calculators that keep the entire data set in memory and don't keep a running total of Sum(x_i^2), the subtraction is entirely unnecessary (as long as long as there's no chance that rounding will occur at the Sum(x_i) step).

Why bother with these steps then? Well, yes, I suppose that multiplying by a power of 10 does make the subtraction step marginally easier to do in your head. More importantly, whether doing it on paper or using a calculator, it avoids the need to write down or key in the decimal point and/or leading/trailing zeros; a trivial consideration in an example problem of only a few numbers, but in a real-world problem of tens, or more likely hundreds, of data points, a very important consideration for me.

When doing it on paper (my original use of "coded data"), those decimal points and zeros would need to be accounted for in subsequent steps, including, depending on which method you choose, the squares of |x_i-xbar|, or the squares of x_i. Using my method substantially reduces the amount of writing needed, and, in my opinion, also reduces the likelihood of errors.

> Quote:
>
> Alternatively, the 11C or 32SII could be programmed to automatically do the subtraction and enter the normalized results.

Quite true, but then you have to key in all of the digits and decimal points (extra key-presses and more opportunities for typing errors). Perhaps best would be to write the program to do this automatically; I wonder why the developers didn't include this, saving unwary users from some incorrect results. Then, if the user chose to use my "coded data" or some similar method, it would still work perfectly and save a lot of key-presses.

Regards,
James

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2004, 9:37 p.m.,*
in response to message #3 by hugh steers

Hello, Hugh;

I want to thank you for your excellent example AND analysis. I was not aware of this fact, and these brainy gems must be always taken as precious gifts. Thank you.

I also remembered that the HP42S accepts [r × 2] matrices as input data for [SIGMA+], but it still uses summation data to compute standard deviation. I thought the HP48/49 series also had this "behavior", but you called my attention to this fact, now.

Cheers and thank you again.

Luiz (Brazil)

Re: HP 10 Stat problem

*Message #15 Posted by **Tom Sherman** on 22 Mar 2004, 4:26 p.m.,*
in response to message #3 by hugh steers

I enjoyed the recent posts by Hugh Steers, Norris, James Prange, and others concerning the methods for doing standard deviations on calculators. The beautiful algorithm presented by Hugh (I will call it "Hugh's algorithm" if he will forgive me) had my mind boggled for several days -- hence my delay in this response.

A calculator can, it seems, be programmed in three main ways (with many variations) to do standard deviations. We recall the definition of the standard deviation: that it is the square root of the variance, where the variance is the sum of the squares of displacement of data points from their mean, normalized by dividing by the number of points, n, if the mean is known before hand (population variance), or by n-1 if the mean has to be established from the data (sample variance). Let the sum of the squares of the displacements (deviations) be denoted by s, and consider the ways that s can be calculated.

The first method directly sums the squares of the deviations from the mean to find s. After all, that is how s is defined, so why would we think of doing it any other way? The problem is that the mean has to be found first, by summing the data points and dividing by n, before the squares of deviations from the mean can be found. So this first method requires that the data be handled twice by the program -- that the program have two loops in series, through which the data pass. If the calculator has so much memory that it can assign a memory register to each data point, this method is fine, but if it has not, then the calculator would require that the operator feed it the data twice. No one would want to do that, and so no calculator that has only a few memory registers would be built using this method.

The second method makes use of the fact that the original definition of s can be easily transformed by expansion of (x-m)^2, and substituting for m its equivalent of Sum(x)/n. The expression for s then becomes: Sum(x^2)-((Sum(x))^2)/n. The calculation of s can then be done with only one loop, with one pass of the data, as Sum(x^2) and Sum(x) can each be incremented as the new data points are introduced. A calculator using this method does not have to remember the original data. It only needs to have three storage registers, for Sum(x^2), Sum(x), and n. Hence this method is available to calculators having limited memory, and seems to have been adopted by most of them that have a standard deviation program.

The problem with this second method, as Norris has lucidly explained, is that the squaring of raw data can overrun the number of digits available to the calculator, if the data have many digits. Small differences in data will therefore be lost by the calculator, and incorrect results will be returned. As Norris and James and the HP manuals explain, this problem can be avoided by subtracting an assumed mean from the data, a process which is called "normalizing" the data (a somewhat inappropriate term, since it involves subtraction rather than division). The best assumed mean would be the mean itself, but if we knew that, we would be using the first method rather than the second.

It is fairly easy to see, as James has shown us, that the real mean of data that have been normalized can be recovered by adding back the assumed mean to the mean of the normalized data. At first blush of intuition, it is less obvious (at least to me) that an s calculated from normalized data does not have to be corrected in some way to give back the real s for the original data. But no correction is necessary. s is a measure only of scatter or dispersion of points along a number line, and so long as the scale of that line is not changed (by multiplication or division), it does not matter where the zero point of that line is taken. The process of normalizing can be pictured as one of sliding the number line under the data points until its zero is close to the mean of the points. The points remain in the same positions relative to one another, and their total scatter is not affected. A little algebra clinches it: the normalized data yield the correct value for s without any adjustment such as is needed for the mean.

As James pointed out, it would be nice if a calculator using this second method had a program for normalizing the data, and James further suggested that the program could start by taking the first point as the assumed mean. That is exactly what the algorithm cited by Hugh does. Hugh's algorithm gives us a third method for calculating s, and one that strikes me as novel, beautiful, and at first, mind-boggling. I had to stare at it for a long time -- unraveling it in my mind, iterating it on paper, confirming it with a BASIC program, and finally going through all its algebra, before I fully understood it.

Hugh's algorithm, as he well recognizes, combines the high accuracy of the first method with the second method's economy in storage registers. The data is fed through a single loop and the results are given without any need to retain the data. The only storage registers required are for n (the number of data points), m (the mean of the entered data), s (the same s as used above), and t. What is t? Maybe it stands for temporary, or transition, or tension. It is in fact the deviation of a new data point from the mean of the previously entered data. As it turns out, t is not essential. It can be eliminated altogether if desired, and a variation of the algorithm can be written which requires only three variables: n, m, and s. The third method then achieves the high accuracy of the first while using only three storage registers, the same number used by the less accurate second method.

The novelty of the third method (or so it seems to me) is that it makes us view s in a somewhat different way. In the original definition of s, used by the first method, we are inclined to view s as a summation of independent contributions from the various data points. But now we are reminded that s results from all the inter-relations of the points, and that the s that a new point brings into a previously-existing set of points is not usually the same s that we would calculate for it after it has joined the set -- because the entrance of the new point usually changes the mean of the set. The s value contributed by an earlier point has, in effect, to be recalculated as a new point is added, because the mean has changed. The first data point entered, for example, initially contributes a zero value for s, because the point is its own mean. But once a second point is added, assuming it is different from the first, the mean shifts to a position halfway between the two points, and the increment of s brought in by the second point has to account not only for its own s for the now two-point system, but for the s of the first point as well. At each stage, as new points are brought in, the algorithm determines the mean and s for that number of points. At each step, the new point brings in an increment of s that correctly increases the s for the previous points to allow for the change in mean that the new point has caused. The mean of a group of points represents not only their average value (in the sense of Sum(x)/n, but the point at which the sum of squares of their deviations (their s value) is at a minimum. Hence a change in mean caused by a new point also causes an increase in s for the previous points.

The strategy of the third method is to continually recalculate the mean as the new points are fed in, and then to use the new mean to calculate the increment in s. It is, in effect, a program to continually "re-normalize" the data as the new points are declared. At each step, the program has the true mean and s value for the declared set, even though it has "forgotten" what the previous points were. And at each step the multiplications are of relatively small numbers -- multiplications of normalized data rather than of the original data.

In the variation of the algorithm that eliminates t and works only with n, m, and s, the values of m and s are incremented (as n increases) by the following relations:

m(new) = ((n-1)*m(old) + x)/n

s(new) = s(old) + (n*(x-m(new))^2)/(n-1)

Ah, no -- I am not the first to work out these relations. Michael Zeltkevic (1995) has them at:

http://web.mit.edu/10.001/Web/Course_Notes/Statistics_Notes/Visualization/node4.html

A short BASIC program to run this algorithm, using only storage variables n, m, and s, could be

something like this:

```
10 S=0

20 PRINT "ENTER 999.111 TO END DATA INPUT"

30 INPUT "X =";X

40 M=X

50 N=1

60 INPUT "X =";X

70 IF X=999.111 THEN 120

80 N=N+1

90 M=((N-1)*M+X)/N

100 S=S+(N*(X-M)^2)/(N-1)

110 GOTO 60

120 PRINT "MEAN =";M

130 PRINT "VARIANCE =";S/(N-1)

140 PRINT "STD.DEV =";SQR(S/(N-1))

150 PRINT "COEF. OF VAR =";(SQR(S/(N-1)))/M

160 END
```

(Since it has no t variable with which to work, this variation of Hugh's algorithm keeps the first x value outside the main loop in order to prevent a division by zero in line 100 -- hence the inelegance of the two input commands. Perhaps you can find a nicer way of doing it.)

I want to thank again Hugh, Norris, James, and all the others for such an interesting and illuminating series of posts about the calculation of the standard deviation. I think Hugh was right that the makers of many calculators have failed to find the most accurate way to do the calculation when memory is limited. My apologies for being so long-winded in saying this.

Cheers, Tom

Your finance book should show how to do this

*Message #16 Posted by **Gene** on 11 Mar 2004, 8:56 p.m.,*
in response to message #1 by Mona

This is a classic example in most principle of finance books.

The HP10BII (and HP10B for that matter) do not solve standard deviations this way. They expect a list of numbers.

You'll have to do this by hand using the formula in your book.

Sorry! Gene

Re: HP 10 Stat problem

*Message #17 Posted by **Tizedes Csaba** on 12 Mar 2004, 6:01 p.m.,*
in response to message #1 by Mona

Hello,

if I must to solve this, I do this:

```
On my 32SII:

CLSum

 60 Sum+  60 Sum+  60 Sum+
 20 Sum+  20 Sum+  20 Sum+  20 Sum+
-20 Sum+ -20 Sum+ -20 Sum+

x_Aver  Result is: 20.0000
s_x     Result is: 32.6599
sigma_x Result is: 30.9839
```

I hope I don't maked mistake...

Csaba

Re: HP 10B Stat problem

*Message #18 Posted by **Karl Schneider** on 13 Mar 2004, 5:59 p.m.,*
in response to message #1 by Mona

Mona --

I also have a 10B, so I should be able to help. I'm afraid that our group's discussions haven't really addressed your question.

With rates of return and probabilities given, is would seem that what you want is a weighted sum --

```
(0.3 * 60) + (0.4 * 20) + (0.3 * -20) = 20.0
```

This can be done by the following procedure ("E" = capital Sigma):

```
CL E
.3 INPUT 60 E+
.4 INPUT 20 E+
.3 INPUT 20 +/-  E+
RCL 9
```

(register 9 holds the E_xy summation.)

Or, using the built-in function Xw (shifted "6" key):

```
CL E
60 INPUT .3  E+
20 INPUT .4  E+
20 +/- INPUT .3 E+
Xw
```

To calculate sample standard deviation, do

```
Sx,Sy (shifted "8" key)
(read sample SD of probabilities)
SWAP
(read sample SD of percentage rates of return)
```

Calculation of population standard deviations is similar, using "0x,0y" (shifted "9" key)

-- Karl S.

It's not exactly correct...

*Message #19 Posted by **Tizedes Csaba** on 13 Mar 2004, 6:15 p.m.,*
in response to message #18 by Karl Schneider

Hi Karl,

the calculation of mean is correct, but this is ONE sample, not two. We want to calculate the SD of 60 with probability with 0.3, and so on...

The calculator's summation don't know that!

Csaba

Ps.: I think I will write a little program for the correct solution...

...and neither was your statement...

*Message #20 Posted by **Karl Schneider** on 13 Mar 2004, 6:51 p.m.,*
in response to message #19 by Tizedes Csaba

Tizedes --

I admit that I probably didn't understand the problem as Mona stated it, but certainly the weighted mean calculation seemed relevant, and I showed how to calculate standard deviations.

> Quote:
>
> *the calculation of mean is correct, but this is ONE sample, not two. We want to calculate the SD of 60 with probability with 0.3, and so on...*
>
> *The calculator's summation don't know that!*

Well, I do!

- The population SD of any single sample (including "60") is zero, with absolute certainty.
- The sample SD of a single sample cannot be calculated.

Or, did you mean that this was a one-variable calculation?

There are many ways to interpret the problem as it was stated, and I question how well the author understood the problem.

Maybe the standard deviation of the three expected values could be computed:

```
CL E
```

```
.3 * 60 = E+
.4 * 20 = E+
.3 * 20 +/- = E+
RCL 5   (gives weighted mean of 20.0)
(mean, Sample SD, pop SD can then be calculated)
```

-- Karl

To Karl (and Mona) - The correct way

*Message #21 Posted by **Tizedes Csaba** on 13 Mar 2004, 8:43 p.m.,*
in response to message #20 by Karl Schneider

Hello,

the correct solution is the follows:

```
Given the following datas with their probabilities:

--------------
 i    pi   xi

 1   0.3   60
 2   0.4   20
 3   0.3  -20
--------------

The average is: xAver = SUMMA(pi*xi)                  = 20.0000
The SD is:      xSD   = SQRT(SUMMA((xi-xAver)^2*pi)) = 30.9839
```

Best wishes!

Csaba

Ps.: Dear Karl, I'm so sorry, but I'm not a genius in English, so I don't understand everything in your letter... I'm so sorry, again...!

Ps2.: "Or, did you mean that this was a one-variable calculation?"

This is an one variable discrete distribution.

What about... (was:To Karl (and Mona) - The correct way)

*Message #22 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2004, 9:53 p.m.,*
in response to message #21 by Tizedes Csaba

Hi Tizedes, Karl, Mona (who's probably aware of what's going on here...:)

First of all, Tizedes, I've been reading your posts since some of the first ones (the calculator design) and I must confess I was not aware of the fact you were a brilliant young guy based on what you wrote since. Only when you mention your age I could realize that. Maybe it's not too late to congratulate you for your achievements (and prize) and to mention that I admire such guys like you and young minds like yours, so... Best regards and keep your way going! Success!

Karl, you called my attention to the fact that I (along with some others) did not answer Mona; and I remember that I opened the post, read some manuals, took some extra info and answered it, but later, when I read Mona's post again, I saw that the text was changed while I was

answering (even the "B" reference was added, and it was not there), so I think that I answered what I thought that could answer the original question... It seems some extra data was added and then I saw that my answer was way out of the actual need! Thank you!

The following text is just a reasoning, and may have no numeric "foundation"... Sorry if you read and find reasoning gaps!

About Mona's issue: when I saw the percentages, I thought the problem should use weighted mean (average) to compute final values, but Mona explicitly asks for Standard Deviation. Even so, I don't see a way to apply -20(%) as a valid data for weighted mean.

Now: what about using .6, .2 and -.2 instead of 60(%), 20(%) and -20(%)? I know pi-related values won't change, but xi and some summation indexes will vary (be 100 times shorter). Wouldn't it express related values closer to whatever is under observation? (and what does -20% refer to in a sample?)

Just some thoughts...

Luiz (Brazil)

Edited: 13 Mar 2004, 10:21 p.m.

Re: What about...

*Message #23 Posted by **Tizedes Csaba** on 14 Mar 2004, 4:36 a.m.,*
in response to message #22 by Vieira, Luiz C. (Brazil)

Dear Luiz,

thank you very much for your words! This was made please to me! I don't want to make misunderstanding with my poor english knowledge, so I don't write more now.

Thank you, Luiz!

Csaba

Tizedes is right...

*Message #24 Posted by **Karl Schneider** on 13 Mar 2004, 11:36 p.m.,*
in response to message #21 by Tizedes Csaba

Tizedes --

> Quote:
>
> *Ps.: Dear Karl, I'm so sorry, but I'm not a genius in English, so I don't understand everything in your letter... I'm so sorry, again...!*

No need for contrition -- I admit to being a bit "snarky", but when things aren't stated correctly, I'm not bashful about pointing it out. I do acknowledge that you are not a native speaker of English.

All along, I beleived that the problem was a bit more complicated that a garden-variety SD calculation, but I didn't take the trouble to try to figure it out what exactly was to be calculated. I think you provided the formula for what Mona actually wanted.

Your equations/answers of:

```
The average is: xAver = SUMMA(pi*xi)                 = 20.0000
The SD is:      xSD   = SQRT(SUMMA((xi-xAver)^2*pi)) = 30.9839
```

are correct assuming that the sum of the weighting factors is unity (1.00), as they ought to be (and indeed were in this example). Otherwise, each summation must be divided by the sum of the weighting factors SUMMA("pi").

I found a similar problem on p. 110 of Schaum's Outline for Statistics (c. 1961).

HP 48G Screen Problems

*Message #1 Posted by **David** on 11 Mar 2004, 9:36 a.m.*

I have a HP 48G with bad pixels in the screen. Where can this get fixed?

Re: HP 48G Screen Problems

*Message #2 Posted by **Ron Ross** on 11 Mar 2004, 10:23 a.m.,*
in response to message #1 by David

http://www.fixthatcalc.com/

You might try the above. But if it is ONLY a 48G, you might just buy another as they sell for about $50 on ebay. It also uses the same screen as the Hp38G and these sell really cheap ie often less than $20 on Ebay. The operation will probably leave a mared/messed up fron bezal/faceplate.

Again, I suggest just buying another as they are a pain to work with and results are spotty. The site above may be worthwhile if you have a GX.

I might also suggest the new 48GII. List is about $100 and it is much faster than the plain 48G. Actually it is a 49G+ with no extended RAM (still comes with 80K vs 32 on a 48G), no SD Card, and a half speed ARM CPU that emulates the original 49G. Still, it may be worth it over a $50 Hp48G. However if you just like the keyboard layout and use it as a number cruncher, get another 48G, as the keyboard of the older 48G series is much better than anything yet available today.

Flashing asterisk on HP11C

*Message #1 Posted by **Kristin Nelson** on 11 Mar 2004, 12:04 a.m.*

I dropped my HP11C for the umpteenth time in 18 years the other day. But this time it stopped working. A few days later I tried to turn it on again and it worked! (self-healing? I knew these were good, but come on!) But now there is a little asterisk blinking on and off in the lower left hand corner of the LCD. Does anyone know what this means? (The batteries are fine - they are brand new.)

Thanks in advance for your help, Kristin (who didn't know how much she loved her little 11C until it stopped working)

Re: Flashing asterisk on HP11C (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 Mar 2004, 12:48 a.m.,*
in response to message #1 by Kristin Nelson

Hi, Kristin;

the flashing asterisk is intended to announce low battery condition. Anyway, after dropping AND stop working, it seems to me a cleanning procedure will "keep the ghosts away".

Remove the batteries and clean each one with a soft, dry peace of anti-static fabric OR use any other static-safe cleanning procedure. Of course, batteries are composed by metal in the outside, and static will not remain there. I'm worried about your hands and fingers, because you'll have to hold the batteries to insert them back, right? q;^)

You can also clean the battery contacts of the calculator (inside the battery compartment) after removing the batteries. They demand more care. I remember reading that isopropyl alcohol (is it spelled correctly?) is a good choice, but I am not entirely sure. Anyway, moysted material are mainly less static-conservative than dried ones.

I hope you have your "babe" back to work. And you're right: you don't know how much you care for something until you loose it... or think you have.

Success.

suggestions for HP-34C disassembly

*Message #1 Posted by **Patrick Woolsey** on 10 Mar 2004, 7:19 p.m.*

Good evening folks,

I have an HP-34C which I would like to resuscitate.

I need to replace the battery pack (original) which is almost completely dead, but found reference to appropriate replacements from Digi-Key on the web site, so am going to order same.

More importantly, the calculator often starts functioning in program mode even when the switch is set to Run; I think something's come loose or perhaps shorted.

However, when I tried to take the case apart to check things out, I can't get the case halves separated at the bottom edge, nor have I found any good hints about how to do this, just some passing mentions that it's tricky. :)

If anyone can offer a suggestion, I would be most appreciative.

Regards,

-- Patrick Woolsey <pwoolsey@blackoak.com>

Re: suggestions for HP-34C disassembly

*Message #2 Posted by **Randy Sloyer** on 10 Mar 2004, 7:58 p.m.,*
in response to message #1 by Patrick Woolsey

This one works very well:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=38078

Just watch out that when it pops, you can tear the flexible interconnect if you don't limit the downward travel of the case back.

If that doesn't work for you, try this:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=22660

Edited: 10 Mar 2004, 7:59 p.m.

Re: suggestions for HP-34C disassembly

*Message #3 Posted by **Patrick Woolsey** on 11 Mar 2004, 8:23 p.m.,*
in response to message #2 by Randy Sloyer

My case was completely resistant to the first method, but the dental floss technique worked like a charm.

Thanks very much (and also to Luiz and Karl if they happen to read this)!

Now that I've got the calc apart, can see that the switch contacts have a lot of gunk built up; hopefully just cleaning them off will suffice. Keeping my fingers crossed..

Regards,

-- Patrick Woolsey

in response to message #3 by Patrick Woolsey

Clean the circuit board area and the contact strips well with alcohol. Then slightly bend out the little contact strips to retension them... make sure each end is level with the other. Place a small amount of contact grease (I use Permatex SuperLube or Radio Shack Lube Gel) on the circuit board contacts.

HEPAX "cloned"... at last!!!

*Message #1 Posted by **Diego Diaz** on 10 Mar 2004, 6:36 p.m.*

Hi all,

I'm *really* happy to inform you that this very evening I've managed to get a "Cloned" HEPAX module fully operative(1) on my breadboard (NoVRAM proto-board).

If fact the "thing" has even two extra pages, for other ROM images to be loaded in, as well as 16k RAM memory (battery backed though... as those BL***DY FeRAM samples are still flying :-(

NOTE (1): There are still some differences at FILESYS initializing time, but the functional behavior is a copycat.

I'll place some pictures of the "thing" at Clonix site tomorrow... just too late to get a good focus... ;-))

Best wishes from the Canaries.

Re: HEPAX "cloned"... at last!!!

*Message #2 Posted by **Miki Mihajlovic** on 10 Mar 2004, 9:09 p.m.,*
in response to message #1 by Diego Diaz

That is amazing Diego. You have kept this project pretty quite so far. Let us all know something about it. Is the plan to eventually fit it in a CR housing or into a ROM module. What are the expected project timelines etc.

1234

Re: HEPAX "cloned"... Congrats!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 10 Mar 2004, 9:46 p.m.,*
in response to message #1 by Diego Diaz

Wow!

That's something I'd like to see and have in hands. I remember when I used to "reproduce" complete PCB layout with a marking pen, fine trace. I used to build some extra-thin copper lines. As I still have four single memory modules for the HP41 (all working fine), it's time to think of leaving two of them with their guts resting (for ever?) while I use the case to "copycat" some interesting modules... Wow! If I have a CCD module fifteen years ago, I'd be doing wonders!

Oh, dream on, dream on... Well, Diego, if you're disclosing this information, I'd gladly giving this "clone" a try... Of couser, I'd generate the PCB with some more precise equipment. Is it the layout also available as file? Any specific format?

Well, Diego, I wish you continuous success. And congrats again.

Cheers.

Luiz (Brazil)

Meindert

Re: HEPAX "cloned"... at last!!!

*Message #5 Posted by **Diego Diaz** on 11 Mar 2004, 6:20 a.m.,*
in response to message #4 by Meindert Kuipers

Hi all,

And thanks a lot for your kind words!

First, this is the (so-called) 2004 NoVRAM project. As you already know, the 2003 Clonix project was finished by Dec-'03 and it was intended to be (in fact it is) an EPROM-Box (Flash EPROM really) in a standard module housing with up to 6 pages for the user to "load" them at will... so far many users are (hopefully) having fun with their new Clonix toys.

This 2004 NoVRAM project (still) is intended to be a RAM-Box, also in a standard module housing. (Currently it needs one half of my breadboard, so "some" shrinking is still required... ;-)...

Just joking, the PCB layout is also finished and the gerber files are ready, so, if some of you have the means to have them manufactured I'll gladly order a bunch of them. It's a pretty tiny PCB (14 x 23 mm) with very tigh tolerances: 0,5mm in thickness, double sided, thru platted holes (0.4mm dia.), tinned pads, 0.2mm tracks... definitely I cannot make'em in my kitchen ;-).

NoVRAM will also have Flash EPROM room for 6 4k ROM images and 4 4k RAM pages. Thus HEPAX "cloning" is "the" aim of this new little beast... and still two more 4k ROM images can be loaded!!

As with the Clonix project, all and every bit of info will be publicly available and the required files and docs will be on-line at the Clonix site, as well as "the other" 41 site.

Still some weeks (months?) for the very first "real sized" NoVRAM module to see the ligth though.

Next milestone in its time line is the PCB manufacturing and, of course, the required ROM/RAM module shells is a non-stop hunting.

As a "side effect" of the NoVRAM developement, a new Clonix .HEX file will be soon ready to download, containing the four HEPAX rom images (only loadable at page 7, so, regrettably, not compatible with HP-IL), but you can start playing with HEPAX commands as a practice while the new NoVRAM arrives... ;-))

I'll post again later to tell you the url where the latest pictures and info can be found.

Best regards.

Diego

*Message #7 Posted by **Bill Holes** on 11 Mar 2004, 7:10 p.m.,*
in response to message #1 by Diego Diaz

Great going there Diego!! Congratulations on yet another incredible accomplishment... keep 'em coming!!

Re: HEPAX "cloned"... at last!!!

*Message #8 Posted by **Ángel Martin** on 12 Mar 2004, 3:56 a.m.,*
in response to message #1 by Diego Diaz

Diego, you're the greatest!

Of course you know that the I've always had a soft spot in my heart for the HEPAX, which I consider one of the pinnacles in HP-41 development (all the other greatest notwithstanding)..

having it cloned will allow realistic access to this masterpiece to everyone still interested, and not willing to pay an arm and a leg (or maybe two if the usual suspects on eBAY aren't sleeping) to get them.

Two words: Congrats and Thanks!!

Best, ÁM

PS. Who said DD stood for "Daredevil"?? It is "Diego-Díaz" !

Re: HEPAX "cloned"... at last!!!

*Message #9 Posted by **Werner (Germany)** on 13 Mar 2004, 10:55 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

due to lack of time during the last months I did not follow any HP-41 issues and thus also not the HP-Forum.

Now I looked into it and cannot believe. You are progressing so extremely fast with your great projects. Clonix is already finished with enhanced properties (small RAM area) and now you already have a prototype of your marvellous 2004-project NoVRAM. And you succeed to clone the full ADV HEPAX module which is the "Holy Grail" of all summarized HP-41-related developments. And HEPAX is really an absolutely great device, I have one of these. I could have saved a lot of money if those days when I bought this 32k-ROMRAM I had known about your great talent in hardware development and engagement in HP-41 issues.

I think it is wonderful that you enrich the community of HP-enthusiasts by these great hard- and software solutions. I'd like to support Angel’s view, now without the uncertainties of hunting for rare Ebay opportunities

for RAM-boxes, HEPAX-modules and HP-IL/ISA-82973A cards all 41-enthusiasts will now be able to access M-Code programming, ROM image downloading and full bidirectional dialogue between real HP-41 and virtual HP-41, e.g. represented by Jean-Francois' EMU41 and Christoph's IL/PC gateway.

I can only congratulate and thank you again for your great efforts and fast successful proceeding! I am looking forward to "market-introduction" …

Best regards,

Werner

Edited: 13 Mar 2004, 11:44 a.m.

Re: HEPAX "cloned"... at last!!!

*Message #10 Posted by **Christoph Klug** on 15 Mar 2004, 5:22 a.m.,*
in response to message #9 by Werner (Germany)

Dear Diego,

yesterday I completed a programm session with your Clonix, and anything works absolutely correct. Thanks a lot for this really amazing 24KByte ROM solution for HP41 :-)

Now we are looking forward for your next development step, the ROM/RAM plug in module, and also for the great system comming from Meindert Kuipers.

As I know some real HP41 enthusiasts use all thie helpfull ROM and RAM systems (Zenrom,Clonix, Hepax, RAM-Box) in parallel, but the new solutions are also available for HP41 user, which do not own a classic ROM or RAM system...

Dear Werner,

you are absolutely right : The new 2004 version of EMU41 now includes anything we need for creating ROM files for Clonix.

Jean-Farancois added a second virtual mass storage drive HDRIVE2 and a virtual 64KByte RAM-Box. And a conversion utility for creating .rom files (the new Clbin41.exe tool).

Using EMU41, now it is possible to create any .rom file (own user code or mcode solutions, or images of existing roms) with minimal hardware equipment : You only need a HP41 with IL-Module, the HP-IL/PC interface card and EMU41 :-)

Best regards from Germany - Christoph Klug

EMU41 Update for registered user

*Message #11 Posted by **Juergen (CH)** on 15 Mar 2004, 8:42 a.m.,*
in response to message #10 by Christoph Klug

Christoph,

do you know if registered EMU41 users get the update for free?

Regards - Juergen

Re: EMU41 Update for registered user

*Message #12 Posted by **Christoph Klug** on 16 Mar 2004, 3:44 a.m.,*
in response to message #11 by Juergen (CH)

Dear Jürgen,

yes, as I know Jean-Francois offers a free update. Please contact him personally for getting your individual signed version.

You get a new text-file (the English manual), a new EMU41.exe file and an updated clbin41.exe file which includes the conversation from .bin to .rom

Best regards to Switzerland - Christoph Klug

How to change batteries on HP 21

*Message #1 Posted by **raze** on 10 Mar 2004, 3:26 p.m.*

Hello All,

I just got a HP 25, but I don't know how to change the battery pack. It uses 2 batteries, but I don't know how to take them out.

Any help will be greatly appreciated. Thanks

Re: How to change batteries on HP 21

*Message #2 Posted by **Jim Creybohm** on 10 Mar 2004, 5:57 p.m.,*
in response to message #1 by raze

I have done this also on my old 25, and you can see a seam along the edge of the pack just above the back of the battery pack (i.e., the outside). You can carefully remove the back from the "frame" of the pack and pull the batteries this way. NiCad AA batteries work very well for this.

Also, Katie Wasserman has written a very good article on this topic:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=335

There are other articles and as I find them I'll put them up also.

Re: How to change batteries on HP 21

*Message #3 Posted by **bill duncan** on 11 Mar 2004, 12:58 a.m.,*
in response to message #2 by Jim Creybohm

I managed to replace the cells in one of my packs by cutting one end of the bar which runs along down between the cells. by carefully bending this partway I was able to get both cells out. I replaced them with 1200mAh NiMh cells several years ago and they work just fine. I charge them a little longer than normal with the standard HP charger.

Hope this helps.

Time to create molding plates...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 10 Mar 2004, 12:07 p.m.,*
in response to message #1 by Jim Creybohm

Hello Jim, folks;

I think that it's somehow easy to use some CAD to produce a 3D image from existing logos (HP10C, 11C, etc...) and use CAM to produce molding plates and then offer identical logos ***almost*** for free to replace the missing ones. The replacement units, if produced with current technology, will surely be identical to the 20-years-ago logos.

The silver cover may also be achieved somehow easily.

Anyone?

Cheers.

Luiz (Brazil)

Re: Time to create molding plates...

Hi Luiz:

From a technical side, dentist materials (resins, rubber for molds, etc.) may be a good solution. Just think you are making a prothetic tooth...

From the legal side: I remember a discussion here about "clones" of the back labels for Classic models, and I recall there were concerns about copyright, brand usage, etc. Be cautious!

Re: Time to create molding plates... (edited)

in response to message #3 by Andrés C. Rodríguez (Argentina)

Hello, Andrés;

thank you for your warning. In fact, I never understood this legal side of the fact. If I replace a lost part of some equipment that I bought for one other part I build myself, I understand that the "original manufacturer" warranty is void, and there is no way to keep the equipment's original operation, right? Now I'm also not sure if producing a replacement part myself in this case is a legal copyright infringment; I'm being honest, I actualy don't know <8^|

Is this applicable to the logos? I mean, if I use the "hand made" HP logos in HP calculators, is it a copyright infringment, too? I used to think that if I use the logo image or facetype or anything else in a calculator that's not HP, then I'd be doing somethign wrong. Now I am intriged. If this is sort of copyright infringment, I was not aware of it!

I believe that simply producing them just for sale is not O.K., and if this is what you mean, I understand it. I actualy want to know about it. And thank you for the warning.

Best regards.

Luiz

in response to message #2 by Vieira, Luiz C. (Brazil)

Not really. Prices for replacement logos as well as for vintage hp's in general are high and even rising because they're scarce. Simply put, there are more people who like to buy them than there are people willing to sell. If someone would manufacture logos or HP would choose to re-manufacture the old models, prices more than likely will plummet. There's no way HP could ask for the 200$ or so for a 15C currently paid on ebay. I seem to notice that prices for 48G's already fell, possibly because several people threw their units on the market after buying a new 49G+.

Re: Did I miss something? - update and clarification

*Message #7 Posted by **Jim Creybohm** on 10 Mar 2004, 2:37 p.m.,*
in response to message #1 by Jim Creybohm

I was contacted by the seller via email after posting this message. The seller was courteous, and pointed out some things that I had not considered when I posted my message.

His points were as follows: -------- quote on ---------- 1) Person has a perfect unit that came with an ugly logo and want to restore or sell the unit for top $ 2) Person has a perfect unit that has the logo damaged that want to restore or sell the unit for top $ 3) Purchased a perfect unit sans only the logo which simply fell off and wasn't noticed 4) Purchased a not so perfect unit but just want it restored ------- quote off ----------

As I have oft said in the past, I am not a collector, and so I was surprised to see this pricing, but I guess a collector would want a perfect machine for display and if they are willing to pay this price, fair enough. Sometimes, one's own perspective can be a little too myopic...

Perhaps if we find a Chinese company to the logos, HP will look the other way!

We're restoring HP's Classics!

*Message #11 Posted by **Michael Meyer** on 11 Mar 2004, 2:10 a.m.,*
in response to message #10 by Namir

I could see HP having a problem with someone selling a lot of HP logos for "new" use, but if they (h/p) offer no replacement, might HP allow it? There are several people here on the forum who have dealt with this issue of copyright infringement, including our Master and Commander, Dave Hicks.

I can't see anything wrong (legally, but then I'm not a lawyer...) with replacing a missing logo on your own calculator with your own logo...I have an HP-97 with a missing front ID plate. I scanned an intact name and logo plate, printed on "indestructable" (plastic) laser paper, touched up the color, cut it out and.... from just a few inches away, it's virtually indistiguishable from the orginal.

How do the people who make "after-market" replacement parts for cars deal with this issue? Is it only a problem with the actual logo, or can we make other after-market parts (cases, etc.) if we could and wanted to?

Anyone up on this?

Michael

Re: We're restoring HP's Classics!

*Message #12 Posted by **Eric Smith** on 11 Mar 2004, 6:03 p.m.,*
in response to message #11 by Michael Meyer

Yes, it's only a problem with the logo, because that is trademarked. You can make aftermarket replacments for all the other parts, as long as you don't represent them as being original.

Re: We're restoring HP's Classics! - back label

Re: Did I miss something?

*Message #15 Posted by **Joerg Woerner** on 11 Mar 2004, 5:26 a.m.,*
in response to message #1 by Jim Creybohm

The Jedi Knight used in the Episode IV this lightsaber: http://www.partsofsw.com/bensab.htm

Main issue is the small magnification lens borrowed from a Texas Instruments Exactra 20 calculator.

There are 5 Exactra calculators, named 19,20,21,22, and 23. Only the 19 and 20 make use of the 6 digit display, the remaining 3 sport a full 8 digit display.

eBay prices: Exactra 20: $50 and more. Rare Exactra 23: $20 and less.

I offered two times Exactra 20 on eBay and agreed with the buyer to ship ONLY the magnification lens. One was $64 !!!

There is one supplier who made a replication in medium quality. He offers it for $9.95 Buy-It-Now.

But the Knight uses an ORIGINAL part for his weapon.

I understand to pay $30 for a HP logo ;-))

Greetings, Joerg

hp01 wrist calculator

*Message #1 Posted by **matteo giongo** on 10 Mar 2004, 10:31 a.m.*

The hp 01 wrist calculator I have purchased in 1978, has been stored for more of 20 years, in safe conditions, the batteries having been removed prior to the storage. I have now tried to restart it using the required power source (Ucar 357 Silver oxide batteries). But the behaviour is quite erratic, and I have no idea about the right thing to do. Could someone suggest me some useful adresses in order to repair it? I apologize for my very poor english!

Re: hp01 wrist calculator

*Message #2 Posted by **David Smith** on 10 Mar 2004, 3:17 p.m.,*
in response to message #1 by matteo giongo

There is a tiny little reset button that you must press after changing the batteries (some models may have two pads that you have to short together with tweezers). The manual is on the HPMUSEUM disk set.

Forth on a 41-CX

*Message #1 Posted by **Giusepe Marullo** on 10 Mar 2004, 8:03 a.m.*

Hi, I "found" the ROM images of Forth, but nothing else on the subject.

I have a beginner's experience with Forth, just curious to gather some information on its implementation on the HP-41.

Is there a manual available somewhere?

TIA,

Giuseppe Marullo

Re: Forth on a 41-CX

*Message #2 Posted by **bill duncan** on 10 Mar 2004, 11:33 a.m.,*
in response to message #1 by Giusepe Marullo

As far as I know, forth was only available for the hp-71 as an option. All the RPM machines (including the hp-41cx) as well as the newer RPL machines (starting with hp-28, hp-48 etc.) use a forth-like postfix and stack architecture. You could even say that their languages were somewhat "threaded" like forth.

Hope this helps. Cheers.

Re: Forth on a 41-CX

*Message #3 Posted by **GE (France)** on 11 Mar 2004, 5:42 p.m.,*
in response to message #2 by bill duncan

Forth was available on the HP75 on cards, also a version could be loaded into the PMS.

I think there was no other language available (apart from assembler of course). Anyone willing to differ ?

Re: Forth on a 41-CX

*Message #4 Posted by **Garth Wilson** on 10 Mar 2004, 2:07 p.m.,*
in response to message #1 by Giusepe Marullo

I have the FORTH5.TXT file (the listing) too, but again no doc.s. I'd be interested in seeing them. I can't imagine the 41 would be very well suited for Forth, with the slowness of its text editor and all.

I have the HP Forth/assembler ROM in my HP-71, which is where I got started on the language that finally made me quit "shopping" for languages (even though that particular implementation was pretty poor). Now Forth is virtually the only high-level language I use in my workbench control and product development work.

Re: Forth on a 41-CX

*Message #5 Posted by **Angel Martin** on 10 Mar 2004, 3:09 p.m.,*
in response to message #1 by Giusepe Marullo

As far as I know the FORTH ROM was developed by the Toulouse chapter od PPC.

It is actually an 8k rom, which sits on addresses 4 and 5, thus it's a take-over ROM, incompatible with the time module.

I've tried it but not very thoroughly. No speed problem whatsoever to speak of... just another wonderful aplication of the 41 platform!

Best, AM

Re: Forth on a 41-CX

*Message #6 Posted by **Diego Diaz** on 10 Mar 2004, 6:11 p.m.,*
in response to message #5 by Angel Martin

Hi all,

If you agree in sharing this image, I'll prepare a Clonix loadable version on pages 4 & 5 (according to Angel comments) and place the corresponding .HEX file at the Clonix site for anyone interested in it.

Best wishes.

Diego.

Re: Forth on a 41-CX

*Message #7 Posted by **Garth Wilson** on 11 Mar 2004, 1:58 a.m.,*
in response to message #5 by Angel Martin

> It is actually an 8k rom, which sits on addresses 4 and > 5, thus it's a take-over ROM, incompatible with the time module.

Is that to say that you could never use it on a 41cx (which is what I have)? The time module is an integral part of the cx.

Re: Forth on a 41-CX

*Message #8 Posted by **Ángel Martin** on 11 Mar 2004, 4:59 a.m.,*
in response to message #7 by Garth Wilson

From what I gather the FORTH ROM(s) were developed *before* the advent of the Time Module, and by extension the CX. As it was never a commercial product (that I know of, I might be wrong here) no updates were made after those were introduced.

So your images (Clonix-based?) won't run on a CX, but they should on a C/CV, or on Emu41, V41, etc.

Re: Forth on a 41-CX

*Message #9 Posted by **Diego Diaz** on 11 Mar 2004, 11:53 a.m.,*
in response to message #8 by Ángel Martin

Hi,

You're rigth Angel (as usual... ;-) Only CV's or C's with one or more memory modules can run FORTH 41.

I've burnt the images you sent me into a Clonix module and they now run OK. (Well, at least they show "OK_" in the display, I can't say much more without a manual... BTW, Does anyone have a "shareable" copy?? :-)

You need to have at least 80 free program register (i.e. size=239 on a clean CV) for you to get FORTH working, (XEQ FORTH) otherwise you'll find "TRY AGAIN" in the display. Once FORTH is running it remains in memory even after OFF/ON cycling.

The correspondig FORTH41.HEX file (to burn directly into Clonix flash ROM via IC-PROG) will be placed on-line during the weekend.

Best regards.

Diego

*Message #10 Posted by **Giuseppe Marullo** on 11 Mar 2004, 6:32 p.m.,*
in response to message #9 by Diego Diaz

Ouch, so I got the best model (CX) and because of this I could not run FORTH? Very nice. I will play with EMU41, sigh...

I know it may sound naif but...isn't possible to "relocate" a rom?

Re: Forth on a 41-CX

*Message #11 Posted by **Raymond Del Tondo** on 11 Mar 2004, 7:47 p.m.,*
in response to message #10 by Giuseppe Marullo

Theoretically it would be possible to leave the TakeOver part of FTH41 at address 4xxx, and move the second part to a page between 8xxx and Fxxx . But in reality it depends on how the programmers realized inter-page jumps, in other words: jumps from part 1 to part 2 and vice versa. If they made it like the CCD module then part 2 always has to be at the next page following part 1.

There are different methods for ML code to locate and remember another specific block of code (it's address) inside the HP-41 address range, but I doubt any of these mechanics were used in the FTH41.

Raymond

Re: Forth on a 41-CX

*Message #12 Posted by **Ángel Martin** on 12 Mar 2004, 3:35 a.m.,*
in response to message #11 by Raymond Del Tondo

Raymond is absolutely right, I'd bet that the "second" page will have to be next to the first, i.e. must be #5. Still worth trying though, thanks to the wonderfull versatility that

Clonix' allows!

I also remember reading something about page 5 in old HP pubs that referred to it as "part of the extension of the OS" that was later abandoned. Allegedly it was reserved to some kind of special usage... for instance, never wondered why on a CX (without CCD module) the Extended Functions sections come the *last* in CAT 2, despite being located into the *lowest* addresses??

Or was that about page #3?

Re: Forth on a 41-CX

*Message #13 Posted by **DavidY** on 12 Mar 2004, 4:43 p.m.,*
in response to message #12 by Ángel Martin

I've de-compiled the Forth ROM images and sorry to say the machine code calls into page 5 and back are not "page independent."

Since page independent call actually involve jumps into fixed OS ROM locations, involve stack and CPU register consideration one would probably need to re-write the entire 8K of code. I guess the CX users will just need to use an emulator.

BTW, the version of FORTH isn't bad. Using the v41 emulator (and ev41 on a Dell Axim PDA) I actually was able to write a little Forth code. Unfortunately, its been 15+ years since I coded in Forth (for Astronomical hardware)so it didn't see worth much effort other than an curiosity. Actually, 41 machine code is much more fun once you get a bit up the learning curve.

HP-33S SURVEYING PROGRAMS

*Message #1 Posted by **George Rose** on 9 Mar 2004, 7:30 p.m.*

I have noticed a lot of interest in surveying programs for the HP-33S. I am a surveyor have written extensive programs for Casio calculators and sell them on Ebay. My 33s just came today and I am planning on writing the same programs for it. But from what I have read here on the forum, the alpha input and output will be limited on the 33s. So what programs would be the most useful for the NCEES exams? Please pick from my program list at http://www.angelfire.com/az3/48surveyor/ and post your top 5 picks

33S: why all the memory?

*Message #1 Posted by **Warren Taylor** on 9 Mar 2004, 4:51 p.m.*

the 33S has 31K of user memory.

But, it has only a few variables, something like 40 or less?

And there are only 26 labels available for programming. I can't imagine that you can get a program up to anywhere near 31K and still only use 26 labels.

So, you can add in some equations too. But how many can you add before the list of equations becomes unwieldy when you have to scroll through them one at a time.

What am I missing? I bet 10K would have probably been adequate. So who knows of a use of the calculator where they expect to use up more than half the memory?

Warren

Re: 33S: why all the memory?

*Message #2 Posted by **bill platt** on 9 Mar 2004, 5:46 p.m.,*
in response to message #1 by Warren Taylor

> Quote:
>
> What am I missing?

That it is easier to simply put too much memory into the machine than it is to change the fundamental system design. Memory is cheap now. The 32sii is the basis for the 33s. the 32sii had less than 400 bytes.

See: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=53114

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=51770

also search on "Paul Brogger" and on "33s" in the current forum--you will find more interesting results, such as a minor bug with reset, an annoying naming convention etc etc etc

regards,

Bill

Re: 33S: why all the memory?

*Message #3 Posted by **Curtis Quist** on 9 Mar 2004, 6:21 p.m.,*
in response to message #2 by bill platt

As memory chips have become larger there is a point where a larger capacity memory chip is cheaper to

buy then a smaller capacity memory chip. If that is the case, I just wish they would allow for more capability, in terms of the number of registers and such, when the calculator has that capability.

As a developer sometimes you will put the first release out without as much capability with the idea that later on you might add more bells and whistles. I hope that is the case, but alot of that depends on how busy the code developer is on that project and how many projects he/she has to worry about.

Re: 33S: why all the memory?

*Message #4 Posted by **Ben Salinas** on 9 Mar 2004, 7:18 p.m.,*
in response to message #1 by Warren Taylor

"So who knows of a use of the calculator where they expect to use up more than half the memory?"

No one. That's the point. There is virtually no possible way to use up all the memory (except perhaps spamming several thousand lines of equation in programs). If they had put in 10k of memory (which would be innefficient because of the size of chips that exsist now), people would be able to use them up. I have used up 5k of memory. I had about 15 complicated (long) equations and a few programs. Although it is possible to use up 31k of memory, it is highly unlikely that anyone will need all 31k at one time, therefore making it always useable (you will never again get a MEMORY FULL error that was so ever apparent on my 32sii.)

Its a good change... thank them for it, don't complain about it.

-Ben Salinas

Re: 33S: why all the memory?

*Message #5 Posted by **Warren Taylor** on 9 Mar 2004, 7:27 p.m.,*
in response to message #4 by Ben Salinas

I do thank them. Its better than having too little.

But all that memory makes me wish I could do more with it. I could store many more programs in that space, and I can't possibly store more than 26 very linear programs.

But still, its the best sort of complaint to have, I guess.

Warren

Re: 33S: why all the memory?

*Message #6 Posted by **Ernie Malaga** on 9 Mar 2004, 11:52 p.m.,*
in response to message #5 by Warren Taylor

> Quote:
>
> But all that memory makes me wish I could do more with it. I could store many more programs in that space, and I can't possibly store more than 26 very linear programs.

I understand your feelings. It's like having a big bus with seats for only 26 people and a large empty space (no seats) towards the back.

The opposite case is even more annoying. TI's SR-52 had memory for only 224 _unmerged_ steps, yet offered 72 labels. Why so many? Just declaring those labels would use up 144 of the 224 steps available.

-Ernie

Re: 33S: why all the memory?

*Message #7 Posted by **Norris** on 10 Mar 2004, 9:22 p.m.,*
in response to message #4 by Ben Salinas

The memory of the 33S is obviously larger than that of the 32SII, and this is an obviously an improvement.

But before we all start patting HP on the back, let's ask the following questions: is the 33S going to be marketed in a misleading manner? Will the limitations of its "31KB" memory be fully acknowledged, or will they be concealed from unsuspecting customers?

The signs aren't encouraging. If you check the "full description" of the 33S at Walmart.com, for example, you will see that the 33S has "31K user memory". There is no mention of the limited numbers of labels or variables, or the limited number of equations that may be stored.

The 33S may still be a good calculator in spite of these issues, and I may still get one. But I would do so knowing that "31K" really means maybe 3K. Less knowledgeable customers are going to buy it assuming that 31K means 31K. And some of them are going to be justifiably upset when they realize the truth.

Re: 33S memory: why not?

*Message #8 Posted by **Paul Brogger** on 9 Mar 2004, 7:54 p.m.,*
in response to message #1 by Warren Taylor

If I've got it straight, all of HP's recent calculator models have been old calculator "application software" re-implemented on new, non-proprietary (that is, non-HP) CPUs. The calculator line appears to have been rather hastily re-built on whatever scattered, burnt-out rubble of the various calculator groups was to be found after years of corporate neglect and abuse. (Somebody correct me if I'm overstating this.)

HP had enough of a job putting all-new foundations (CPUs) beneath their old models' code, and new wrappers (externals, SD & Flash memory, USB interfaces, etc.) around them. They seem to have undertaken as little change to the functional code base as they could get away with. All of those decisions were no doubt driven by cold, unfeeling spreadsheets somewhere deep in the bureaucratic gray matter.

Hey, **they're back producing credible calculators!** Most of us should need only remember the **6s** and **6s solar** to restore a measure of genuine appreciation for the 33s and 49G+.

For the 33s they chose a stock, off-the-shelf part and wrote a Saturn emulator for it. 32K is as cheap as 4K, so why not use that?

Heck, they could just as easily have put in the 32K part, but only enabled use of, say, 6.3K of it. And some of us would be *happier* because that amount of RAM seems somehow more "appropriate". [Go figure!]

I suspect we'll start minimizing label use by using flags a lot and unwinding subroutines, and eventually fill up that 32K with lots of cool stuff. (And then the "Why no serial I/O capability?" chorus will get louder . . .)

The 32K is a luxurious consequence of the ever-decreasing cost of silicon real estate. The 26 labels and 33 variables limitations are unfortunate consequences of the ever-increasing cost of labor, compounded (I suspect) by the calculator line's rather tortured organizational history of late.

Certainly making a profit was one of the reasons that they hurried to market. All of us, even big corporations, would quit if it wasn't for payday. I suspect another major reason was the long and loud complaints they were getting from their user base.

You recall they made a promise to us users about how many new calcs they would have out by when. They made it. Congraulations HP.

John

Mini Data Cassettes

*Message #1 Posted by **Matthias** on 9 Mar 2004, 3:01 p.m.*

I´ve got 2 used data cassettes for my HP82161A drive. After removing some labels on it, I recognized, that thes cassettes are from "Mücke Software GmbH" and that there WERE programs for steel construction ("Stahlbeton III") and wood construction ("Holzbau III") on it. Does anybody still have these programms? I would like to recopy them onto my tapes to keep them original. How won the other tapes of this seller? Perhaps he also has some "Mücke Software GmbH" tapes for me. I would trade them aganist original HP tapes.

Matthias

Re: Where can I find Keyboard overlays for HP48 GX ?

*Message #2 Posted by **James M. Prange** on 9 Mar 2004, 9:40 a.m.,*
in response to message #1 by Antoine M. " Kermit " Couëtte (France)

I doubt that anyone still manufactures or markets them, but HP used to market a package of blank matte finished overlays, including 3 each of opaque (sort of beige-colored) and translucent (practically transparent, actually, except for the matte finish), plus one translucent with the left and right shifted alpha keys that don't appear on the faceplate printed on the bottom. I doubt that many would be willing to part with theirs, but keep an eye on eBay; I have seen them show up there. According to the HP partsurfer for the 48SX/S, the model number is 82220A. Although marketed for the 48SX/S only, they also fit the 48G series perfectly, and I believe that the shifted alpha keys are identical. I suppose that you could always make your own, or someone with the right CNC equipment could make very nice ones easily enough.

Regards,
James

Re: Where can I find Keyboard overlays for HP48 GX ?

*Message #3 Posted by **Jeff** on 9 Mar 2004, 1:18 p.m.,*
in response to message #1 by Antoine M. " Kermit " Couëtte (France)

About a year and a half ago I decided that I needed a custom overlay for an application on my 48GX. I first contacted hp to see it they still sold the blank overlay kit that James described, which they of course did not.

HP Calculator Support could not even provide me with dimensions or any details about the overlays. (At this time, they still sold the GX, mind you.) They referred me to SMI (who I believe makes the TDS Cogo cards), stating that they make overlays for their products and might be able to give me dimensions or other help. So I contacted SMI, they were very helpful. They sold me three of their overlays (customized for their application) at a very reasonable price, and gave me the name of the company that actually produced the overlays for them. I used the overlays I got from TDS as the basis to produce a bitmap graphic of my custom overlay. I also contacted the company that produced the overlays for TDS. The were also very helpful, but as I suspected, they were not in a position to produce one or two overlays for a single user. They were set up to supply many overlays for a commercial enterprise. Costs would have been in excess of $1000 for 50, I only needed one or two. So I gave up on that plan and perfected the graphic image of my overlay. I found it was possible to produce pretty good looking overlay images on plastic transparency material in a color laser printer in the exact size, but never found a good way to cut out the overlay and keyholes. I also tried painting over the overlays I got from SMI to create a blank, and running them through a laser printer, but that didn't work either. My next step, which I have not gotten around to doing, will be to contact local printers and/or label makers and/or sign makers to see if they can produce them for me. Perhaps one of them will have the CNC equipment James mentioned and will be able to do it easily.

The above story is of course little help to you, sorry. About all I could offer would be to e-mail a bitmap image of a blank overlay that you could use to design yours in case you could find somebody to produce them for you. Let me know and I will send the image.

*Message #4 Posted by **Antoine M. " Kermit " Couëtte (France)** on 9 Mar 2004, 1:35 p.m.,*
in response to message #3 by Jeff

Hello Jeff ,

Yes Please , if you can send me the " image " , that will be another entry point for me to continue my research .

If you can also let me know your e-mail address , just in case , it will be great .

Thank you again for your renewed help , and Best Regards

Kermit

*Message #5 Posted by **MARC** on 9 Mar 2004, 2:22 p.m.,*
in response to message #4 by Antoine M. " Kermit " Couëtte (France)

I did the same as JEff told. I bought 4 SMI overlays, painted 2 of them with plastic white painture, and then with a PILOT I wrote my own apps on it , I know is not pretty, but very functional.

Hi Jeff,

I am also looking into this. Please send the bitmap image to graulich@synopsys.com.

Robert

HP48GX overlays : thanks to all + let us keep one another informed

*Message #8 Posted by **Antoine M. " Kermit " Couëtte (France)** on 11 Mar 2004, 7:24 a.m.,*
in response to message #7 by Robert Graulich

Mar 11 , 2004

To everybody , thanks for your kindness in helping me finding a solution to have HP48 Overlays made for custom applications .

I contacted all the people I was advised to do so , and I am currently expecting a few more answers .

I know that at least Jeff and myself are working on the same subject . So let us keep one another informed if anybody can find a suitable and realistic solution .

Kermit

17B display question

*Message #1 Posted by **Graham Nott** on 8 Mar 2004, 6:55 p.m.*

Hello,

I love my HP 17B (old I know but some of us get better with age). Problem is that somehow I have switched comma for decimal and vice versa. For example a number display of ten thousand will show 10.000 whereas five dollars and sixty one cents will display 5,61

I have searched all over the web and can not find how to set this back. I think it's some kind of european display feature. Closest I could get was instructions on how to change this on the 12C but of course that doesn't work on my 17B. Anyone?

Many thanks

Re: 17B display question

*Message #2 Posted by **Christoph Giesselink** on 8 Mar 2004, 7:04 p.m.,*
in response to message #1 by Graham Nott

What's wrong with <DSP> <SK3>?

Christoph

Re: 17B display question

*Message #3 Posted by **Tom Sherman** on 9 Mar 2004, 7:50 a.m.,*
in response to message #1 by Graham Nott

Graham,

The choice between period and comma is probably in either the DISPLAY menu or the MODES menu. I do not have a 17B, but that is where it is in the 27S, 19B, 42S, and 32SII.

Cheers, Tom

Re: 17B display question

*Message #4 Posted by **Bob Wang** on 9 Mar 2004, 11:45 a.m.,*
in response to message #1 by Graham Nott

Graham:

The manual for the HP 17BII+ should help.

Bob

http://h20015.www2.hp.com/content/common/manuals/bpia5321/bpia5321.pdf

Exchanging Periods and Commas in Numbers To exchange the periods and commas used for the decimal point and digit separators in a number: 1. Press D to access the DSP (display) menu. 2. Specify the decimal point by pressing F or G. Pressing F sets a period as the decimal point and comma as the digit separator (U.S. mode). (For example, 1,000,000.00.) Pressing G sets a comma as the decimal point and period as the digit separator (non-U.S. mode). (For example, 1.000.000,00.)

Re: 17B display question

*Message #5 Posted by **Dennis** on 10 Mar 2004, 9:24 a.m.,*
in response to message #1 by Graham Nott

Press DSP Press .

That should do the trick

33 CURVE SOL. PROGRAMS

*Message #1 Posted by **BD FOX** on 8 Mar 2004, 5:36 p.m.*

i'M LOOKING FOR A CURVE SOLUTION PROGRAM . wOULD ANYONE BE ABLE TO FORWARD ONE THAT WORKS OR TELL ME WHERE i MIGHT FIND ONE. MUCH THANKS

Re: 33 CURVE SOL. PROGRAMS

*Message #2 Posted by **Dave Falkenberg** on 8 Mar 2004, 9:21 p.m.,*
in response to message #1 by BD FOX

Email John Butcher at CSPARKS@N2.NET He's provided me with programs for my HP 33s. He also sells them on Ebay, type in HP 33s cogo and look for him as IRONHIT.

Re: 33 CURVE SOL. PROGRAMS

*Message #3 Posted by **bdfox** on 9 Mar 2004, 10:09 a.m.,*
in response to message #2 by Dave Falkenberg

Hey, thanks for the info. Do you know if this gentleman charges for evrything or what. I'd like to get these programs but money is scarce around my house. I could spend the time and maybe hash out a program of my own, but with the test coming up soon I've got other things to worry about. Any ideas?

Re: 33 CURVE SOL. PROGRAMS

*Message #4 Posted by **BDFox** on 9 Mar 2004, 11:08 a.m.,*
in response to message #3 by bdfox

I was looking around and heard that the hp32 programs would work for the 33's. Anyone know anything about this and if so, where could a new guy find 32 programs. thanks for any info forwarded.

Re: 33 CURVE SOL. PROGRAMS

*Message #5 Posted by **Rob** on 9 Mar 2004, 11:45 a.m.,*
in response to message #4 by BDFox

As the post mentioned above by Dave, John Butcher provides cogo programs for the HP33s which I believe run on the HP32S as well. Without any prior programming experience, and the deadline of the exam approaching, $33 seemed well worth it.

Re: 33 CURVE SOL. PROGRAMS

*Message #6 Posted by **Norris** on 9 Mar 2004, 12:42 p.m.,*
in response to message #5 by Rob

All 32S/32SII programs and equations should run on the 33S. However, the reverse is not necessarily true, for two reasons.

First, the 33S has a few new functions that are lacking in the 32S/32SII (like SGN, INTG, IDIV, RMDR, CB, CBRT). Any 33S programs or equations that used these functions would not be 32-compatible without modification.

Second, the 33S has a much larger memory than the 33S. So a large 33S program simply may not fit in a 32 series machine.

In this case, the 33S survey software advertised on eBay is "about 3K" in size. That greatly exceeds the 0.38K memory of the 32S/32SII. So even if each individual routine was 32-compatible, it would be impossible to actually load them all.

Re: 33 CURVE SOL. PROGRAMS

*Message #7 Posted by **Norris** on 9 Mar 2004, 1:07 p.m.,*
in response to message #4 by BDFox

It's true that 32S or 32SII programs should run on a 33S. Unfortunately, the memory of the 32 series was very small, and so it was not an ideal platform for programming. I haven't seen any surveying software for it, although you could doubtless enter a few equations before running out of memory.

If you want surveying software for a 33S, then probably your only options are:

1. Write your own programs/equatios, or 2. Take the test without using programs/equations, or 3. Spend $33 for software on eBay

I'm impressed that option 3 is available, given that the 33S has not even been officially introduced yet

Re: 33 CURVE SOL. PROGRAMS

*Message #8 Posted by **BDFox** on 9 Mar 2004, 2:58 p.m.,*
in response to message #7 by Norris

Hey folks I might be new to this, but so far my own creation is doing fine. Curve progams with 2 inputs gives me everything else.The limited label, I've bipassed by using only one. If you write your program in the order you want your returns(W/ known D&R) use the equations. If you don't know D or R and you add an eq. for defining them to the end of program you get 2 promt then 0's for answers then promts for v's that you know. This can give you D & R which you plug back in. Lots of button pushing with an end result faster then long hand.

Calcualtion help

*Message #1 Posted by **David** on 8 Mar 2004, 3:38 p.m.*

This is what I am trying to accomplish:

CST = Cost of the equipment. PMT = monthly payment. I%YR = the interest rate I am buying my money at. RV% = This is always a negative # and is used when a balloon is due at the end of the term (10% is a typical buy out). N = the length of the term in months. #ADV = number of advances (due to the time value of money this could increase my profitability on a deal substantially). PTS = The amount of money I would like to make on a deal i.e. 10 points on a $20,000.00 deal would = $2,000.00 of gross margin. There used to be 2 pages to this equation which resulted in a "more" tab. HELP ME PLEASE!

Re: Calcualtion help

*Message #2 Posted by **Eddie Shore** on 8 Mar 2004, 4:04 p.m.,*
in response to message #1 by David

Depends on what calculator are you using. If you are using the HP17/19 Series, there will be a MORE option. If you are using the 48/49 Series, you will not see a MORE box (just press NEXT to go to page 2).

Re: Calcualtion help

*Message #3 Posted by **David** on 8 Mar 2004, 4:24 p.m.,*
in response to message #2 by Eddie Shore

Thanks for the response Eddie. It's a 17B II and I am in need of the calcuation to input. I deleted it accidentally changing batteries and the formula burned to the ground along with my house.

Re: Calcualtion help

*Message #4 Posted by **Wayne Brown** on 8 Mar 2004, 5:54 p.m.,*
in response to message #3 by David

David,

What was the original source of this program? I don't have a 17bII myself and don't know anything about programming it, but if this was a published program, I'd be glad to try to help you find a copy. For instance, if it was printed in the manual, I can point you to an electronic (PDF) copy.

Re: Calcualtion help

*Message #5 Posted by **David** on 9 Mar 2004, 1:09 p.m.,*
in response to message #4 by Wayne Brown

Wayne, Thanks for your response. It's not in the manual. It was an equation put together by a guy that has long since disappeared. I know what the tabs look like and what I am trying to accomplish but alas I have not found anyone to help with the following need:

CST = Cost of the equipment. PMT = monthly payment. I%YR = the interest rate I am buying my money at. RV% = This is always a negative # and is used when a balloon is due at the end of the term (10% is a typical buy out). N = the length of the term in months. #ADV = number of advances (due to the time value of money this could increase my profitability on a deal substantially). PTS = The amount of money I would like to make on a deal i.e. 10 points on a $20,000.00 deal would = $2,000.00 of gross margin. There used to be 2 pages to this equation which resulted in a "more" tab.

I am willing to pay for this. I am in desperate need.

Re: Calcualtion help

*Message #6 Posted by **Bob Wang** on 9 Mar 2004, 9:41 p.m.,*
in response to message #5 by David

David:

I'm not exactly sure what you are looking for, but it sounds like a modification of this formula:

http://h20015.www2.hp.com/en/document.jhtml?lc=en&docName=bpia5201

Just change PV to CST, and modify FV to include RV% and PTS.

Bob

Will SOMEone PLEASE fix the spelling of "Calculation"?

*Message #7 Posted by **Paul Brogger** on 9 Mar 2004, 10:23 p.m.,*
in response to message #6 by Bob Wang

;^)

Calculation

*Message #8 Posted by **Bob Wang** on 9 Mar 2004, 10:41 p.m.,*
in response to message #7 by Paul Brogger

OK, I can't spell. Probably can't "calcualte" either ;-) But I think David is looking for something like:

ADV: PMT=(- (1+PTS÷100) × PV – (RV%÷100)×FV × (SPPV (I%YR ÷ 12 : N))) ÷ (USPV (I%YR ÷ 12 : N - #ADV) + #ADV)

Re: Calculation

*Message #9 Posted by **Bob Wang** on 9 Mar 2004, 10:47 p.m.,*
in response to message #8 by Bob Wang

Yup, already saw one mistake. PV should be CST.

ADV: PMT=(- (1+PTS÷100) × CST – (RV%÷100)×FV × (SPPV (I%YR ÷ 12 : N))) ÷ (USPV (I%YR ÷ 12 : N - #ADV) + #ADV)

Re: Calculation

*Message #10 Posted by **Bob Wang** on 9 Mar 2004, 10:49 p.m.,*
in response to message #9 by Bob Wang

David:

Use this at your own peril! FV should have been replaced with CST also

ADV: PMT=(- (1+PTS÷100) × CST – (RV%÷100)×CST × (SPPV (I%YR ÷ 12 : N))) ÷ (USPV (I%YR ÷ 12 : N - #ADV) + #ADV)

Bob Wang
*Message #11 Posted by **David** on 17 Mar 2004, 2:57 p.m.,*
in response to message #10 by Bob Wang

Is the master of the Universe. Thank you soooooo much for the formula. You are a life saver.

Bad HP42S keyboard

*Message #1 Posted by **Iuri Wickert** on 8 Mar 2004, 2:32 p.m.*

Hello

I've bought a used, defective HP42S. It turns out that it works, sort of. It passes the automatic self-test, but fails with the keyboard manual self-test:

```
Sigma+ register STO,
1/X registers RCL,
CLX registers TAN,
ENTER registers ENTER followed by RCL,
X<>Y registers Rdown,
+/- registers SIN,
etc etc etc.
```

All keys have a good pressing feeling; the machine has a lot of dirt underneath the keys. I'd like to know if the keyboard is easily fixable, if its worth opening the machine to fix it. I'd also like to know how to clean the keyboard bezel: i've tried once with a thin slice of a plastic rubber, but it creates a lot of dirt in the process..

Best regards
Iuri

Re: Pioneer Keyboards

*Message #2 Posted by **Randy Sloyer** on 8 Mar 2004, 8:07 p.m.,*
in response to message #1 by Iuri Wickert

There is no easy solution for your 42S problem. The keyboard behavior your describe is most odd. I've repaired many a Pioneer and I've never encountered a similar problem. It is most likely some type of contamination on the logic board, shorting bus lines together. I have seen this phenomena on 48's due to no clean flux around the rom chip but never on a Pioneer.

It would be wise to remove the back and see what condition the internals are in. http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5 is the best place to start for opening instructions.

An ultrasonic cleaner is about the only solution for dirt inside the key switches. It is not practical to open the keyboard for repairs. It can be done but reclosing properly is not an easy task.

Edited: 8 Mar 2004, 8:09 p.m.

Re: Pioneer Keyboards

*Message #3 Posted by **Iuri Wickert** on 9 Mar 2004, 3:33 p.m.,*
in response to message #2 by Randy Sloyer

Thank you Randy

My fear is that the chip would be damaged... Do you know how often this happens with 42S units?

Thank You
Iuri Wickert

Re: Pioneer Keyboards

*Message #4 Posted by **Randy Sloyer** on 9 Mar 2004, 11:04 p.m.,*
in response to message #3 by Iuri Wickert

Chances are very small (<1%) that the cpu has been damaged.

calculus refreshers, free textbooks online

*Message #1 Posted by **bill duncan** on 8 Mar 2004, 1:24 p.m.*

I used to love calculus. That was close to thirty years ago however, and my "calculus neurons" have not been excercised much since then. I'm assuming that there might be a few of us around and might appreciate some refreshers. There was a link posted on slashdot.org today with a review of five "free" text books available online. With all the fancy hardware most of us have, it might be fun to excercise some of those old neurons and calculator keys which have fallen into disuse...

Cheers!

http://books.slashdot.org/books/04/03/04/028253.shtml

Edited: 8 Mar 2004, 1:31 p.m.

.rom and .bin again...

*Message #1 Posted by **Giuseppe Marullo** on 8 Mar 2004, 1:09 p.m.*

Hi, I finally got the time to play with EMU41, but I soon discovered why I did stop some time ago.

I don't have any working method to convert .rom files to .bin

clbin41 file.rom file.bin /x

does not return anything and the resulting file is zero length. I am running it under windoze 2k.

Any clue? What f%$!&%$£ kind of format a .rom file is ? Thanks,

Giuseppe Marullo

Re: .rom and .bin again...

*Message #2 Posted by **Poul Kaarup (Denmark)** on 8 Mar 2004, 1:40 p.m.,*
in response to message #1 by Giuseppe Marullo

Hi

clbin41 file.rom file.bin /r

does the trick - and the filename is limited to 8 chars.

/Poul

Re: .rom and .bin again...

*Message #3 Posted by **Giuseppe Marullo** on 8 Mar 2004, 4:47 p.m.,*
in response to message #2 by Poul Kaarup (Denmark)

Poul, I tried both /r and /x ... it does not work. It seems like something goes wrong, the file is created with a 0 length.

C:\Apps\Emu41>dir pp*.bin Volume in drive C has no label. Volume Serial Number is 54BD-E0DA

Directory of C:\Apps\Emu41

03/08/2004 10:36p 0 PPCL.BIN 1 File(s) 0 bytes 0 Dir(s) 73,338,880 bytes free

C:\Apps\Emu41>del ppcl.bin

C:\Apps\Emu41>clbin41 ppcl.rom ppcl.bin /r

C:\Apps\Emu41>dir pp*.bin Volume in drive C has no label. Volume Serial Number is 54BD-E0DA

Directory of C:\Apps\Emu41

03/08/2004 10:45p 0 PPCL.BIN 1 File(s) 0 bytes 0 Dir(s) 73,375,744 bytes free

Re: .rom and .bin again...

*Message #4 Posted by **Miki Mihajlovic** on 8 Mar 2004, 8:24 p.m.,*
in response to message #3 by Giuseppe Marullo

You should maybe get the latest version of Emu41. This is what I got running the same thing :

```
C:...\EMU41>clbin41
Cvbin41 : convert lst files into bin files for emu41
Syntax: cvbin41 file.lst file.bin [/x]
        cvbin41 null file.bin : create empty file.bin
        /r convert unpacked rom file into packed bin file
V1.5 JFG 2002

C:...\EMU41>clbin41 ppcl.rom ppcl.bin /r

C:...\EMU41>dir ppcl.*

12/31/1998  10:00 PM             8,192 PPCL.rom
03/08/2004  06:18 PM             5,120 PPCL.BIN
               2 File(s)         13,312 bytes
               0 Dir(s)  26,383,679,488 bytes free
```

Re: .rom and .bin again...

*Message #5 Posted by **Raymond Del Tondo** on 8 Mar 2004, 5:52 p.m.,*
in response to message #2 by Poul Kaarup (Denmark)

Hi,

the syntax 'clbin41 file.rom file.bin /r' produces an error with my version of clbin41 (V1.2 JFG 01/10/97)

Do you have a different version?

Raymond

Re: .rom and .bin again...

*Message #6 Posted by **Poul Kaarup (Denmark)** on 9 Mar 2004, 2:57 a.m.,*
in response to message #5 by Raymond Del Tondo

Hi,

My version is V1.5 JFG 2002

/Poul

using clbin41 version1.8

*Message #7 Posted by **Christoph Klug** on 9 Mar 2004, 4:21 a.m.,*

in response to message #6 by Poul Kaarup (Denmark)

Using clbin41 utility for creating / convertinmg ROM-image files for EMU41

Actual version = V1.8 JFG 2004

clbin41 name.lst name.bin = convert .lst file into .bin file

clbin41 null name.bin = creates empty .bin file

clbin41 /r name.rom name.bin = convert unpacked .rom file into packed .bin file

clbin41 /b name.bin name.rom = convert packed .bin file into unpacked .rom file

clbin41 /? = view help text

With this utility EMU41 is the ideal tool for creating .rom files for CLONIX... Regards from Germany - Christoph Klug

Re: using clbin41 version1.8

*Message #8 Posted by **Giusepe Marullo** on 9 Mar 2004, 4:53 a.m.,*
in response to message #7 by Christoph Klug

Ok thanks Miki and all, it was the wrong version. Now I have 1.5 and it works, I have converted from .rom to .bin

But...Christoph, where did you get 1.8? :)

I am wondering which is the latest registered and freeware emu41 versions...

Re: using clbin41 version1.8

*Message #9 Posted by **Christoph Klug** on 9 Mar 2004, 10:11 a.m.,*
in response to message #8 by Giusepe Marullo

Dear Giusepe,

I am registered user of the full version of EMU41 :-) Yesterday I get the new version 1.8 directly from Jean-Francois Garnier.

Converting .bin to .rom works correctly, and I need this for creating .rom files for programming CLONIX.

EMU41 is the optimal software tool for creating rom-images for CLONIX. EMU41 is able to disassemble (creating a .lst file) with virtual Zenrom, furthermore EMU41 includes virtuall mass storage and virtual RAM-BOX features for handling rom images. That is all you need.

Therefore EMU41 is the leading tool for HP41 enthusiasts who have available minimal hardware equipment : You only need a HP41, the IL-Module and the HP-IL/PC Interface Card for creating individual ROM-images for CLONIX.....

Again : Jean-Francois - thanks a lot for your great support for EMU41 and the world of today HP41 enthusiasts :-)))

Regards from Germany - Christoph Klug

Re: using clbin41 version1.8 and 2004 Meeting

*Message #10 Posted by **Giuseppe Marullo** on 9 Mar 2004, 11:58 a.m.,*
in response to message #9 by Christoph Klug

Christoph, I asked because I am a registered user too 8P I solved downloading the freeware part from the website, now I have the same clbin41 Miki has, and it worked.

EMU41 is a great piece of software indeed, I hope he will migrate to the rs232/usb soon, so the pc board will not be required anymore, today ISA bus is archeology.

I have all the stuff mentioned (except CLONIX), together with my bleeding VISA.

BTW, when the european HP dudes meeting 2004 is going to be held? I would like to know J-F and others, as the 2003 meeting. Just don't host it Iceland, somewhere around swiss could be enough...

Any fast data exchange between any of HP48GX , HP49G and PC ?

*Message #1 Posted by **Antoine M. " Kermit " Couëtte (France)** on 8 Mar 2004, 10:18 a.m.*

Mar 08 , 2004

Thanks to a most appreciated advice given by James M. Prange (Re: 49g memory dump, James M. Prange - 3 Mar 2004, 5:22 p.m.) , I just recently went to the " http://etud.epita.fr/~avenar_j/hp/49.html " page to update my HP49G with its current flash-rom software Beta version #1.19-6 .

As I only knew and used " KERMIT " earlier , I also downloaded the recommended " HP Graphing Calculator PC Connectivity Kit 3.0, also known as HPComm 3.0. " software .

First excellent surprise : the data automatically transferred at an - impressive !!! - rate of 1K bytes / second through the " Xmodem 1K-HPCRC " protocol which had become automatically selected . :-)))

Second surprise , not so good : when afterwards attempting to load additionnal data from PC to HP49G , using the same " HPComm 3.0. " software I could not select again in any way the magic " Xmodem 1K-HPCRC protocol " , and I had to revert to old faithful , nevertheless very slow KERMIT protocol !!! :-(((

Would any of you kindly tell me what are the currently available fastest Transfer protocols to exchange data between any of the HP48GX , HP49G and PC . The 1KB/s observed with the Xmodem 1K-HPCRC protocol would correctly fit all my needs . Obviously between HP48GX's , I can use IR - it is quite slow and power consuming - but I also have all connection kits between any of these .

Thnaks in advance from another " Kermit " :-)

Antoine M. " Kermit " Couëtte

in response to message #1 by Antoine M. " Kermit " Couëtte (France)

I'm not sure of understanding you... do you like Xmodem? If so, I ever conect my calculator with my virtual calculator: emu48. Never use HPComm.
Select Xmodem in "both" calcs.

Re: Any fast data exchange between any of HP48GX , HP49G and PC ?

*Message #3 Posted by **Antoine M. Couëtte** on 8 Mar 2004, 11:48 a.m.,*
in response to message #2 by Raul Lion

Hi Raul ,

Thank you very much for your time and efforts in trying to understand me .

Yes , I liked the Xmodem protocol because of its speed which I just discovered when loading the flashrom update into my HP49G .

I did not know until then that such 1Kb/second transfer rates are achievable because I earlier kept using a very simple version of the KERMIT protocol .

So , after this " high speed " discovery , I wanted to get again such a 1Kb/second transfer rate for all my future uses . Unfortunately I was not able to select the X modem protocol again when using HPComm 3.0. to transfer additionnal and different files into HP49G .

What I need is being able to use X modem itself or ANY kind of equivalent software which enables BOTH WAYS data transfers at a rate of 1 Kb/sec - or better if it exists - between any of the following HP48GX , HP49G and PC .

Kermit

*Message #4 Posted by **Raul Lion** on 9 Mar 2004, 2:11 a.m.,*
in response to message #3 by Antoine M. Couëtte

Well, as I said, I alwais use kermit in transfers between the 48GX and the PC (emu48). Just use XSEND nad XRCCV, instead SEND and RCV. Let me know if you get what you want

Also, read this recent post of James M. Prange

[Long] 48/49 communications, ROM, printers

*Message #6 Posted by **James M. Prange** on 9 Mar 2004, 5:12 a.m.,*
in response to message #1 by Antoine M. " Kermit " Couëtte (France)

Regarding the 49G revision 1.19-6 ROM, I gather that HP (management) decided that revision 1.18 was "good enough", and that no more time and money should be "wasted" on it, but the developers wanted to do more, so continued with unsupported revisions on their own time, hence the "beta" designation and refusal of official "HP Support" to deal with the unsupported releases. I can't help wondering whether that had something to do with closing down ACO. But in any case, I think that 1.19-6 has very worthwhile improvements over the "supported" ROM. For any problems with 1.19-6, ask at comp.sys.hp48 or, if it seems to be a genuine bug or

for enhancement requests, post at http://bugs.hpcalc.org/. I understand that development for the 49G has progressed beyond 1.19-6, but that HP has prevented the release of any newer revisions on "intellectual property" grounds. Maybe someday....

As for the "Xmodem 1K-HPCRC protocol", I don't know that it's used except for downloading a ROM, but perhaps a search at http://groups.google.com/advanced_group_search?group=comp.sys.hp48 might reveal more information.

As Raul recommmended, except for use with the 48SX/S, use the Conn4x application now, and use the latest revision (Version 2.2 Build 2348 for Conn4x and, for the 49g+, USB driver revision 1.2, and ROM revision 1.23 Build 31, at my last check). These have some very nice enhancements and important bug fixes over the ones that came on the CD-ROM with my 49g+, and I'm now happier with Conn4x than with any other communications package that I've tried. Also note that any new files seem to show up a few days earlier on HP's "Business Support" pages than on their "Customer Care" pages. For the 48G series, install the XSrvr library that comes with Conn4x; it makes things much easier. But as the instructions say, install the library in port 0 or 1. I found out experimentally that if installed in port 2 (and presumably higher), it hangs the calculator when I try using Conn4x, requiring a "paperclip reset" to force a warmstart, and leaving an unacknowledged alarm warning, flag changes, and last command lines and stack saves disabled (although not a TTRM, and the home directory seems to be uncorrupted). I recommend that you "don't try this at home".

Conn4x uses the Xmodem protocol, which isn't built-in to the 48SX/S, so doesn't work with them. I don't know of an Xmodem application for the 48SX/S, but there might be. Otherwise, use the Kermit protocol.

Conn4x does have a "text" transfer option with various translation options for decompiled objects, similar to an HP calculator Kermit protocol "ASCII" transfer, and compatible with the Kermit "ASCII" transfer files, except that for the characters "NUL" (character 0, the "null character"), """ (character 34, the double quotation mark), and "\" (character 92), the translations differ; see the Conn4x help file. Conn4x adds the option of translating control codes 0-9, 11-31, and 127 to the "\nnn" codes (independently of the other translation options), the LF (character 10) to CR LF (characters 13 10) pair translation can be disabled independently, and where the Kermit translations always left a CR LF pair untranslated for outgoing transfers, so a tranfer back to the calculator (with any non-zero translation option) changed it to just LF, Conn4x (with LF translations enabled) translates CR LF to CR CR LF, so it's CR LF again when transferred back to the calculator (as long as your text editor hasn't made it's own "End Of Line" translations to it based on the extra CR, which can be avoided by leaving the translate control codes option enabled).

Conn4x also has a "Calculator Commands" window, so you can run the calculator from the PC, similar to the Kermit Remote Host commands. And an "Edit as text" option that uses your PC's text editor (NotePad by default, but you can set it to use your preferred editor) and a file in the PC's %TEMP% directory, sending the changes to the calculator only if you actually save the file on the PC. "Edit as text" may be preferable to the calculator's command line editor in some situations.

Note that the 49 series, unlike the 48 series, decompiles "NUL", """, and "\" characters to "\00", "\"", and "\\"; an improvement for use on a 49 only, but a 48 series doesn't "understand" that new rules should apply for compiling these sequences, so they cause problems for 49 series to 48 series transfers. Going the other way isn't quite so bad because either calculator compiles a literal "NUL" unchanged and the 49 series understands the counted string form that the 48 series uses when a """ is embedded in a string; the only problem (with these characters) for a 48 to 49 transfer is that a 49 compiles (unless it's within a counted string) a "\" (not immediately followed by "00", """, or another "\") to ""; that is, it simply discards it. Note that with ROMs prior to 1.19-6, the 49G incorrectly compiles "\00" to "00" instead of "NUL".

Also note that "binary" transfers between a 48 series and a 49 series are rejected, and for good reason; they could very well cause a crash or memory loss if you fooled the calculator into storing an incompatible compiled object. Well, not completely rejected, but the entire incoming data stream (including the binary transfer header) is stored as a character string object, instead of extracting the compiled object and storing it as

such.

A work-around for the problem of transferring an object an that contains these characters between a 49 and a 48 is as follows. If the object isn't already a character string (the string with these characters could be an element of a list or program), first, to assure full precision of real numbers and user binary integers, do STD and 64 STWS, and to avoid any angular components being compiled using a different angular unit (Degrees, Radians, or Gradians), execute RECT. Then do \->STR to decompile the object to it's string form (this could, except for the RECT command, be done with a single SysRPL command instead), and store it as a named variable (a local variable is better, if you care to automate the process with a program). Be sure that the fraction mark (. or ,) is the same on both calculators. Now, set both calculators for binary transfers, and make the transfer, using either Kermit or Xmodem, and for that matter, either directly or by using a PC as a go-between. The object arrives with a non-compatible binary transfer header, so the calculator doesn't attempt to store it as the compiled object; it just stores the entire data stream as a character string, with the original compiled character string embedded within it. Recall the string to the stack. It starts with the 8-character binary transfer header, followed by a 5-nibble character string prologue, followed by a 5-nibble size field (13 characters so far), followed by the characters in the original string. Extract everything after the first 13 characters by doing 14 OVER SIZE SUB to get the original string, then, if the object wasn't originally a string, do STR\-> to compile the string to the original object, and then store it in the variable of your choice.

Other problems are that integer valued type 0 "real" numbers from a 48 may be compiled as type 28 "exact integers" on a 49 because they lack the decimal point used on 49 series real numbers; just set the 49 to approximate mode to avoid this. Of course, the 48 doesn't have exact integers, so if it gets one from a 49, it's compiled as a real and, if more than 12 digits, rounded to 12 significant digits. When doing an "ASCII" or "text" transfer of a PC file to a 49, have the 49 in exact mode to avoid changing exact integers to real numbers. Other new object types on the 49, such as type 29 "symbolic" vectors/matrices, will result in a syntax error on the 48. The 49's new command names will be compiled as global names on the 48, and if a global name from the 48 happens to match a new command name on the 49, then it will be compiled accordingly. I suppose that a transfer with a name that matches a command would be rejected, but in any case, a name compiled to a different object type within a composite (list, program, or algebraic) will cause "unexpected behaviour".

The IR communication between 48 series models is indeed slow; only 2400 bits per second is built-in, although I understand that it can be "tweaked" higher by adding some applications. And IR does take more power than "via wire" communications too. Note that IR communications are half-duplex (to avoid reflections being treated as incoming data), so XON/XOFF flow control (useful for raw "serial I/O" communication, but not needed for Kermit or Xmodem) isn't available. But you can hook up wired connections between 48 series, and between a 48 and the 49G, at 9600 bps. Between two 49Gs, you can also use that oddball 15360 bps speed. Note that on the 49G, XON/XOFF flow control doesn't work, although it's intentional removal is undocumented. For small transfers, IR is ok, but for larger transfers, I do it via wire. Of course, the 49G lacks IR, so transfers or printing via IR isn't an option with it.

The 49g+ lacks RS-232 style I/O, so a wire connection works only to a USB host with the 49g+ USB driver installed. The 49g+ IR is IrDA instead of "Serial IR", so it doesn't work with the 48 series. I don't have an IrDA to RS-232 adapter, but I've read that they work just fine. But for anything except connecting to a PC or other device that can supply power from a non-data line, be sure to get one that can accept external power from a battery or AC adapter, and one that doesn't require a device driver (see http://www.actisys.com/instantir.html for the only example that I'm aware of). I don't know what kind of range you can expect with the 49g+ for IrDA communications.

The 49g+ does print via IR in the "Red-Eye" protocol required by the 82240A/B (and, I think, some other) HP printers, but the range is drastically reduced to 2 or 3 inches. If you care to spend some money, I've read that the Martel printers that accept the "HP IR" protocol work with the 49g+ as well as the 48 series, although I'd guess with the same reduced range; see http://www.martelinstruments.com/cased.html.

Regards,

James

Conn4x and the 48 - Definitely Don't install in Port 2 or higher

*Message #7 Posted by **Jeff** on 9 Mar 2004, 7:54 a.m.,*
in response to message #6 by James M. Prange

James,
I tried to set up Conn4x for communication with my 48gx about a month ago. Since my port 1 and port 2 are full, and I don't like to use port 0 since it takes away from ram, I loaded the required library in port 3. The results were as you described above and in your comp.sys.hp48 post on the subject. To my very un-expert eyes, the calculator was just not working correctly. The paperclip reset would wake it up, but the display seemed "flickery" or tentative, pressing VAR had no effect, and responses to other key presses seemed sluggish. After a few minutes of worrying that I had somehow ruined by gx, I gave it what I believe is referred to as the "three fingered salute", ON-A-F, and said "NO" when it asked if I wanted to try to recover memory. Luckily, with a bunch of empty ports in a 1 meg ram card, I do occasionally create a backup, so I was able to restore things with no real loss. Still it would have been nice if there had been a stern warning with the Conn4x instructions to not use anything other than port 0 or 1.

Re: Conn4x and the 48 - Definitely Don't install in Port 2 or higher

*Message #8 Posted by **James M. Prange** on 9 Mar 2004, 8:11 a.m.,*
in response to message #7 by Jeff

Thanks for the information. Your experience seems to have been worse than mine. On mine, it did seem to require more time than usual to return from the warmstart, and flashed extra lines and annunciators at first, but seems to be working ok now. All the more reason for "Don't try this at home", and yet another reason for making backups. You never know when an added library, or SysRPL or assembly languange program might cause really serious problems.

Regards,
James

48GX/49G/PC Fast Data exchange : Thanks to you all

*Message #9 Posted by **Antoine M. Kermit " Couëtte (France)** on 9 Mar 2004, 8:56 a.m.,*
in response to message #7 by Jeff

Mar 09 , 2004

Many thanks to you all , Raul Lion , Olivier De Smet , James M. Prange - second time at least you help me here , James !!! -:))) - and Jeff for all the time you took giving me a careful , detailed and comprehensive reply .

As for Raul's suggestion about linking HP48GX to Emu48 , I will take a close look at it as soon as I have Emu48 installed .

I am in the very same situation as Jeff since I use high priority applications which require the 2 ports 0/1 . After studying the documentation about the Conn4x software Olivier had earlier pointed out to my attention , I have decided to avoid it since it cannot be installed outside Ports 0/1 .

I am going to take a careful and more indepth look at the various links James indicated .

Apart from the example of the HP49G Flashrom " fast " update which I discovered by accident a few days ago , it looks like - for the time being - there is no widely recognized software with limited constraints - i.e. which can be started from any port and with a reasonable size - enabling direct Data tranfers at a " fast " rate - i.e. 1Kb/s or higher - between PC , HP48GX and HP49G (I do not own a 49G+) .

Thank you again to you all ,

Kermit

Re: 48GX/49G/PC Fast Data exchange : Thanks to you all

*Message #10 Posted by **James M. Prange** on 9 Mar 2004, 10:37 a.m.,*
in response to message #9 by Antoine M. Kermit " Couëtte (France)

Suit yourself, but note that Conn4x (and other Xmodem applications) can still work with the 48G series without the XSrvr library by using the built-in XSEND and XRECV commands, although I expect that many Conn4X features would be unavailable; I suppose that it would work for the very basic "binary" transfers only. The Kermit based HPComm, with the available "ASCII" transfer mode, may indeed be preferable.

The 49G has the Xmodem server built-in, so has no need for the added library. I recommend that you try Conn4x for use with the 49G at least, even if not for the 48G series.

The XSrvr library takes up 3445 bytes from either port 0 or 1 on the 48G series.

Regards,
James

Martel printers

*Message #11 Posted by **James M. Prange** on 9 Mar 2004, 10:09 a.m.,*
in response to message #6 by James M. Prange

PS:

The Martel printers that are listed with "RS232" should also work with the 49G and 48 series (although with the "via wire" printing format) that way.

I don't know whether the 49g+ is capable of printing in IrDA mode as well as the "Red-Eye" mode, but if so, perhaps those listed with "IrDA Stack" and/or "IrDA Phys" might work for that.

Regards,
James

HP-16C...on a CX

*Message #1 Posted by **Giusepe Marullo** on 7 Mar 2004, 8:53 p.m.*

Hi, I would like to know which is the best emulation of the hp-16c...on a 41CX.

I tried to bid on the 16c, but the price is simply too much for my pockets.

I have found an example on how to implement a bin,hex,oct calc with a 41 plus reading the development rom manual, but it is limited in the word length (32bit in hex, 10 bit in bin). It works well, but 10 bits are too low for my needs, I need at least 16/32 bits.

I am bored to use windoze calc, so I am not searching an emulation that runs on a pc...

TIA,

Giuseppe Marullo

Re: HP-16C...on a CX

*Message #2 Posted by **Valentin Albillo** on 7 Mar 2004, 9:05 p.m.,*
in response to message #1 by Giusepe Marullo

Hi Giuseppe:

The Grapevine book ""Using your Advantage ROM: Computer Science" features an excellent program that simulates an HP-16C in any 41C/CV/CX using the Advantage ROM. The whole book is dedicated to describe the implementation of such comprehensive simulation.

I suggest you try and get a copy, either physical or in CD if it does exist which, alas, I don't know.

Best regards from V.

The DIGI pack (was: HP-16C...on a CX)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 Mar 2004, 10:48 p.m.,*
in response to message #1 by Giusepe Marullo

Hi;

this is not an emulator, instead a set of programs and routines I wrote in the 80's to accomplish some tasks.

The DIGI Pack for the HP41CX or C/CV with X-functions

The PDF contains all programs listings in the last pages, but the text is not yet finished... Sorry! Anyway, the routines not described in the main text have their global labels shown in the first page (keyboard assignments suggestion) and their use are close to what you have in the HP16C. I thought about an improved version, with stack integrity, but I am not sure if it is worth trying... In any case, I see that the wizards around here know how to generate a ROM module with programs, and I think that it's the time to put some fellows together and think seriously about it.

There is an additional routine written by another contributor sometime ago that I did not include because I didn't contact him and ask for permition.

Let me know what do you think about it. Of course, anyone else that wants to give the programs a try is welcome, as well as any feedback.

In time: DIGI uses flag 3 to indicate out-of-reange instead of flag 5 (HP16C) because both DIGI does not shown leading zeroes and flag 5 has no anunciator in the HP41 display. Also, DIGI uses flag 4 to indicate carry.

Cheers.

Luiz (Brazil)

Dear Luiz,

your documentation about the DIGI pack is really proffessional. Nice to have would be the complete describtion of all the existing functions...

May be someone creates an program soultuin which uses the advanced features and commands of the CCD-Module .

Regards from Germany - Christoph Klug

CCD, Advantage and other ROM modules

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 Mar 2004, 3:56 p.m.,*
in response to message #5 by Christoph Klug

Hello, Christoph;

thank you for your encouragement.

I started dealing with the HP41 in 1981/1982, and I was not aware of what was going on outside Brazil related to non-HP ROM's till 2001, after reading many posts at this forum. I felt myself as if I lost the best of the HP41... But I still believe I can get back to these "stuffs".

I'd like having the chance to develop something, but I did not get to the point I can develop specific HP41 hardware by myself, so I'm waiting till I get the chance to have at least the CCD, or the Advantage or one other module I don't remember the ID (not the PANAME, I think it's the HEPAX) and one of yours PC-based HPIL connector so I can upload and download data directly from/to the HP41 to/from the computer. Time will tell...

About programs, that's another idea: I still think we can generate good program ROM modules with our own codes, but each global ALPHA label demands an XROM number, so we should get into a common choice for custom ROM with programs.

Oops! Time to get to my students... I must be teaching in about 30 minutes from now.

Best regards.

Luiz (Brazil)

in response to message #7 by HrastProgrammer

Valentin, Massimo and Luiz, thanks all for your answers. I already have the pdf mentioned by Valentin, I will take a closer look.

Actually, it seems to me that the biggest problem is input limitation on binary numbers, this is caused by the function that let you input different base numbers.

On binary, it is limited to 10 bits, using DEVELOPMENT ROM, I must suppose is the same using the Advantage (just tested with V41, it seems the same).

I have taken a peek at the pdf from Luiz and I must say it is impressive, but I don't know if it is a quick way to "build" a calculator emulator.

I mean, I need a easy way to input numbers, I am not sure how to bypass this limitation.

I was thinking in using ALPHA input, but I don't know how to input "1"s and "0"s without using the shift.

I begin to think that a MCODE routine is the only solution...

Thank you... and a minor-changes *_4.zip file

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 8 Mar 2004, 3:43 p.m.,*
in response to message #7 by HrastProgrammer

Hi, Hrast, folks;

thank you, Hrast! As I know what you've already done, I'm flattered...

I replaced the existing zipped file for another one with minor changes in the main text.

New link to the DIGI pack zipped file

All routines are the same (if I am not wrong I wrote them in 1984, perhaps 1985). Some English constructions sounded somehow awkward and I changed them (I hope they are better, now).

And Hrast, I did not get back to our main manual YET (I'll be back soon), as you know what I mean... Anyway, I believe it must look like the DIGI pdf, with a custom ttf for the emulator display characters; what do you think?

Cheers.

Luiz (Brazil)

in response to message #9 by Vieira, Luiz C. (Brazil)

I join the rest of the guys with my congratulations on an excellent package and even better documentation. Although I do have 16C, both yours DIGI and 16E program by Ed Keefe have their place in my 41C library. I am even going to turn them into a ROM image but need to do some routine renaming since there are some that have identical names. I also created couple of simple programs for keys assignments for both programs following the documentation suggestions (requires Xfunc). Anybody is welcome to .TXT listings for these and Ed Keefe's 16E (if you do not want to key in 800 program lines).

One question for you Luiz and couple of suggestions (minor bug fixes):

On the key assignment picture there are some routines that are not in the document (at least I didn't get them). BSUM (Key:11), SB(-62), CB(-63) and BSTS(-64) are missing. I am not sure what BSUM would be. The rest of them, I guess, deal with setting, clearing and getting status of bits. Any chance that we can get those too?

In your Control Routines you need to clear REG 01 somewhere at the start or so. If REG 01 contains some number from before (say 9) and you want to set the WS at the begging to whatever number of bits, line 43 will look for LAB 09 (that doesn't exist) and give NONEXISTENT.

In B-D I suggest you put CLA after line 07. Otherwise it keeps appending Bn to whatever was in ALPHA.

Best regards from Canada

in response to message #12 by Giuseppe Marullo

I uploaded the files to my briefcase @ yahoo. You can find them at http://ca.f2.pg.briefcase.yahoo.com/bc/miki_hp41/rlst. Luiz'es digi is the same as in PDF I just added the keybord assignment program.

Thank you, Miki

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 10 Mar 2004, 8:36 a.m.,*
in response to message #11 by Miki Mihajlovic

Hello, Miki;

thank you for taking your time to share your thoughts. I appreciate that.

About the "default" or "reset" condition. The first version of this DIGI pack had a LBL RST as part of the control routines so the default conditions could be set. I don't remember why I removed it, I guess it was something related to memory use. At that time I recorded all of the routines in magnetic cards, and if I am not wrong, because of a few bytes the Control Routines needed one extra "side" and I had to "shrink" it. Your comment about resetting REG 01 is completely valid, thank you.

The BSUM is the equivalent to [g][#B] (bit summation) in the HP16C. SB and CB are Set Bit and Clear Bit as well, and BSTS is Bit Status, as I was not able to create something functionaly equivalent to [f][B?]. The sequence [BSTS][X=0?] would work as a counterpart. All of them are available at

Complex plus LIF files

Anyway, I'll add text listing soon. If you want to try the Complex routines as well, be my guest...

Thank you again.

Cheers.

Luiz (Brazil)

Re: The DIGI pack (was: HP-16C...on a CX)

in response to message #4 by Vieira, Luiz C. (Brazil)

The DIGI Pack is a wonderful pieece of work and beautifully documented. Have you any other gems like this in your closet which should be shared??
Best wishes...

Complex Stack & Functions (plus LIF files)

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 10 Mar 2004, 8:39 a.m.,*
in response to message #15 by Gordon Dyer

Hello Gordon, folks;

thank you all for your support and feedback.

Complex Routines plus LIF files

And Gordon, this Complex set is somehow interesting... BTW, I hope you math guys forgive the (a + b j) format instead of (a + i b); I am an Electrical Engineer d:^) but the code can be easily changed q;^)

As you HP41 users already know, please allow each routine to run at least once so the jumping "size" is set and they will run faster after that.

There are two PDF files about the Complex Routines, and they "complement" each other. Sorry not having them ready. And this Complex set was written in the 80's, too. I wonder how useful they would have been at that time... I wish I was in contact with you since then, guys.

The LIF files (with key assignments) included in the zip file are related to both Complex and the DIGI pack. Bit manipulation is included there, too.

Feedback is still appreciated, as always.

Best regards.

Luiz (Brazil)

Did anyone try Complex Stack & Functions?

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 11 Mar 2004, 1:29 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Hi, guys;

I just want to know if anyone gave Complex routines a try. I thought about an improved version at the time I wrote this one with the use of X-memory registers and leaving main memory completely free, but I never finished it. Any suggestions?

Thank you.

Luiz (Brazil)

Edited: 11 Mar 2004, 2:41 p.m.

HP-71B KEYBOARD IS Lex file

*Message #1 Posted by **Jeff** on 7 Mar 2004, 9:59 a.m.*

I am looking for the KEYBOARD IS Lex file for the HP-71B Can anyone send me this file by e-mail so I can load the file using the 9114 disc drive? Thanks, Jeff

Re: HP-71B KEYBOARD IS Lex file

*Message #2 Posted by **Vassilis Prevelakis** on 8 Mar 2004, 12:17 a.m.,*
in response to message #1 by Jeff

```
Jeff wrote:
> I am looking for the KEYBOARD IS Lex file for the HP-71B
```

I think you want this file:

ftp://ftp.math.jyu.fi/pub/hpil/swap/chhu06/keyboard.l71

Note that swap files include the directory entry as the first 32 bytes for the file (i.e. the LEX content starts at offest 32 of the swap file).

Re: HP-71B KEYBOARD IS Lex file

*Message #3 Posted by **Jeff** on 8 Mar 2004, 6:48 p.m.,*
in response to message #2 by Vassilis Prevelakis

What is the best way shy of the PC board offered by Mr. Klug to get this file to the HP-71? Best Regards, Jeff BTW// I do have the hex code to enter using the MAKELEX program but is this the only way. Can I use the 9114 disc drive to accomplish this?

Re: HP-71B KEYBOARD IS Lex file

*Message #4 Posted by **Vassilis Prevelakis** on 9 Mar 2004, 1:48 a.m.,*
in response to message #3 by Jeff

You can use the LIFUTIL program from ftp://ftp.math.jyu.fi/pub/hpil/lifutil, which runs under MSDOS (or Windows 95/98/ME inside the DOS box).

Unfortunately, the swap file header in KEYBOARD.L71 is slightly different than the header expected by LIFUTIL (sigh!). More information on LIF may be found in the MoHPC Article: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=24.

The following text from the www.series80.org web site may be useful. Read HP-71B where it talks about Series-80 computers.

> Quote:

> File types are extremely important to the Series-80 computers. If a file type is not the correct one, then the computer will not be able to use that file. We, therefore, need to make sure that LIFUTIL tranfers the files from the DOS directory to the Series-80 floppy with the file type intact. Since the PC does not maintain such information in the MSDOS directories, we must save the file type within the MSDOS file. LIFUTIL does that if we specify **"Binary Image: DFS file type header (all types)"** when we transfer the file from the Series-80 floppy. This creates a 256 byte header at the beginning of the DOS file. The header is essentially the directory entry in the Series-80 diskette. When we transfer the file back to the Series-80 floppy with LIFUTIL, we specify the **"DFS to LIF file type preserved"** option which extracts the header and uses it to construct the correct directory entry on the floppy.
>
> All files are binary. If you have to use ftp to transfer them, be sure to specify the BINARY option.

LIF Utilites for Linux

*Message #5 Posted by **Vassilis Prevelakis** on 9 Mar 2004, 1:56 a.m.,*
in response to message #3 by Jeff

Oops, I forgot. If you are running Linux, then you can use Tony Duell's 'LIF Utilities for Linux'. Here is a quote from an earlier posting by Tony:

> Quote:
>
> The third is my 'LIF Utilites for Linux'. They're still very much under developemnt (at the moment, you can read files from a LIF disk on the linux box, but I've not written a program to write individual files back to a LIF disk yet, for example). You can get them (C source, GPLed) from the HPCC web site, http://www.hpcc.org.
>
> I wrote these programs to work with the 9114 LIF disks used on the HP41, 71, and 75 calculators. I can suggest modifications to work with other types of LIF disk (I know of somebody who read some HP high-density disks using slightly modified versions of these programs). In any case they might give you some clues if you want to write your own programs...

33s Rmdr Bug?

*Message #1 Posted by **Shaun Greaney** on 6 Mar 2004, 4:54 p.m.*

Am I looking at the correctly?

The "Rmdr" function is supposed to return the remainder from an integer division. If x and y are both positive integers the function behaves as I would expect:

25 4 -> Rmdr 1 25 5 -> Rmdr 0 25 6 -> Rmdr 1

So far, so good. If I start to use negative numbers though, the results are a bit surprising:

25 -4 -> Rmdr -3 25 -5 -> Rmdr 0 25 -6 -> Rmdr -5

-25 4 -> Rmdr 3 -25 5 -> Rmdr 0 -25 6 -> Rmdr 5

-25 -4 -> Rmdr -1 -25 -5 -> Rmdr 0 -25 -6 -> Rmdr -1

The "INT/" (left shift on the same key) works as I would expect and does not make sense in conjuction with the "Rmdr" key for negative calculations:

25 4: <- INT/ 6, -> Rmdr 1 25 -4: <- INT/ -6, -> Rmdr -3 ???

Any other proud 33s owners out there? In general I like the 33s. The keypad is not as bad as I thought it would be and it is still nicer to use then TI or Casio, IMHO.

Just need to identify the buggy functions to avoid.

Thanks and sorry for the long post, Shaun

Re: 33s Rmdr Bug?

*Message #2 Posted by **Shaun Greaney** on 6 Mar 2004, 5:01 p.m.,*
in response to message #1 by Shaun Greaney

Sorry about the format, my line breaks disappeared. Supposed to look like:

25 4 -> Rmdr 1

25 5 -> Rmdr 0

25 6 -> Rmdr 1

25 -4 -> Rmdr -3

25 -5 -> Rmdr 0

25 -6 -> Rmdr -5

etc.

Re: 33s Rmdr Bug?

*Message #3 Posted by **Ben Salinas** on 6 Mar 2004, 8:18 p.m.,*
in response to message #1 by Shaun Greaney

There is an error there, though it is not too large. Technically, the only time it produces a wrong answer is when you use two negative numbers. According to modular aritmetic (more info http://www.geocities.com/piguy31415926/indep_study.html) if you are finding the remainder when dividing by 5, then -4 is the same as 1. So, the calculator is right in that case, though it gives the less obvious answer (but you sometimes need to use a negative to simplify your equation... if you are dividing by 60 and you get a result of 59, it is much easier to call it -1 instead of 59... there is an example of this in the modular arithmetic document on the page above)

-Ben Salinas

Re: 33s Rmdr Bug?

*Message #4 Posted by **Michael F. Coyle** on 6 Mar 2004, 9:21 p.m.,*
in response to message #1 by Shaun Greaney

Hi Shaun,

I don't like what I'm seeing.

Ben is probably right about the 33S not strictly following the rules of modular arithmetic; I haven't checked this.

That wouldn't bother me so much, except that the 33S seems to violate a more permissive rule wrt integer division and remaindering:

In the C programming language, if "/" means integer division and "%" means remainder, then

(a/b)*b + a%b = a (assuming b non-zero)

For negative operands, the C standard does not specify the exact result, only that the above relationship must always be true. That lets compiler writers use the underlying hardware behavior, whatever it is, to give the most efficient (but not necessarily portable) implementation.

Using 25 and -4, and the integer division and remainder results given above,

(25/-4)*-4 + 25%-4 = 25
(-6)*-4 + -3 = 25
24 + -3 = 25
21 = 25

which is clearly not right. Anyone writing programs which do integer division with negative operands may be (very!) surprized at the results. To me, this constitutes a genuine bug.

I don't have a 33S so I can't go any further. Perhaps someone could investigate this a little more, with a variety of operands of both signs.

- Michael

Re: 33s Rmdr Bug?

*Message #5 Posted by **Shaun Greaney** on 7 Mar 2004, 2:51 a.m.,*
in response to message #4 by Michael F. Coyle

Hi Ben and Michael,

Thanks for your replies.

I had noticed the modular aspect, but since the "integer divide" and the "remainder" functions are located on the same key ("%"), I expected them to work as Michael described.

Guess I'll try contacting HP next week and see how they respond.

Thanks, Shaun

Re: 33s Rmdr Bug? Possible explanation

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Mar 2004, 2:03 p.m.,*
in response to message #1 by Shaun Greaney

The behavior observed by you seems consistent with an algorithm related to repetitive substraction instead of division. This may or not be correct, I think that it should be a clear definition of "reminder"...

When you use negative numbers, and check for a value to be "less" than other, the lesser number is the one with greater absolute value.

It seems that, for positive cases (both positive or both negative numbers), the 33s calculates the following:

+ 25 4: 4*6=24, the reminder is 25-24=1, because 24 is the closest multiple of 4 that is less or equal than 25

+ 25 5: 5*5=25, the reminder is 25-25=0, because 25 is the closest multiple of 5 that is less or equal than 25

+ 25 6: 6*4=24, the reminder is 25-24=1, because 24 is the closest multiple of 6 that is less or equal than 25

Now, for negative cases (one positive and one negative number), the 33s calculates the following:

- 25 4: 4*(-7)=-28, the reminder is -28-(-25)=-3, because -28 is the closest multiple of 4 that is less or equal than -25

- 25 5: 5*(-5)=-25, the reminder is -25-(-25)=0, because -25 is the closest multiple of 5 that is less or equal than -25

- 25 6: 6*(-5)=-30, the reminder is -30-(-25)=-5, because -30 is the closest multiple of 6 that is less or equal than -25

It is not very clear, but it seems consistent...

Edited: 7 Mar 2004, 2:28 p.m.

Re: 33s Rmdr Bug? -- MOD vs. RMD

*Message #7 Posted by **Karl Schneider** on 7 Mar 2004, 5:23 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

Shaun --

Andres just might have it right, but I'd like to point out that there's a difference between the remainder ("RMD") function and modulo division ("MOD" function).

The 41C*, 42S and RPL calc's (28/48/49) have "MOD" built in.

The 16C has "RMD" built in.

```
Arguments       MOD       RMD
 25, -6          -5         1

 25, -4          -3         1
-25,  4           3        -1
-25, -4          -1        -1
 25,  4           1         1
```

Obviously, there's a difference in the definitions:

"RMD" is defined only for integer input arguments; its results are consistent with

```
RMD (y, x) = x * frac (y / x)
```

using floating-point calculations.

"MOD" can also be used with floating-point inputs. Apparently, MOD is equivalent to repeated subtraction or addition (as appropriate) of the divisor until the remainder is either zero or, lesser in magnitude and of the same sign of the divisor.

It looks as though the 33S is really doing modulo division ("MOD"), and HP ought to label and define it as such.

Re: 33s Rmdr Bug? -- MOD vs. RMD

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Mar 2004, 7:08 p.m.,*
in response to message #7 by Karl Schneider

Your explanation is very good and plausible.

Perhaps the omnipresent marketing strategies dictated that "reminder" was a concept most people has (at least, after learning how to divide in primary school), while "modulo" was only known by more mathematically knowledgeable people (=> less market share).

One can imagine a scene in which some VIP asked "What is this "modulo" thing? and somebody else, just trying to ease the moment answered "Well, it is kind of "reminder", you know..."

Re: 33s Rmdr Bug? -- MOD vs. RMD

*Message #9 Posted by **Shaun Greaney** on 8 Mar 2004, 7:16 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

Thanks for all the thoughts and all the input.

I've got one more wrinkle for you:

MathCAD defines the "Modulo" function, mod(x,y) as the remainder on dividing x by y with the result having the same sign as x.

As expected, it tests out to have the same results as Karl Schneider's RMD function.

MatLab, however, defines it as:

MOD(x,y) is x - y.*floor(x./y)

Which matches the MOD and Rmdr functions.

I just wish HP would have kept the Integer Divide and "Remainder" functions consistent since they share the same key. Choosing the "MOD" function, calling it "Rmdr", and placing is side-by-side with the Integer Divide function is just irritating.

Is it the time to buy the HP49G+ ?

*Message #1 Posted by **Artur** on 5 Mar 2004, 11:18 p.m.*

Hi,

When the HP49G+ was introduced, I almost have bought one, but too many people have said to wait, because of problems in keyboard, batteries and LCD. I would like to know your advice about buying the recent units, or should I wait more? One more thing: I live in Brazil, where it is almost impossible to repair such machines if they are imported and, to buy one here is very expensive.

Thank you!

Artur

Re: Is it the time to buy the HP49G+ ?

*Message #2 Posted by **Pocketcom Mania** on 6 Mar 2004, 5:35 a.m.,*
in response to message #1 by Artur

Someone in the forum said he was given a replacement whose keyboard was just like HP-48's. However, I'm not sure whether it's the case. My HP-49G+ was manufactured in February 2004 but it still had the problem of missing keystrokes. It was sent to the local agent for inspection. I'll give an update here later.

Re: Is it the time to buy the HP49G+ ?

*Message #3 Posted by **Ernie Malaga** on 6 Mar 2004, 6:01 a.m.,*
in response to message #2 by Pocketcom Mania

> Quote:
>
> My HP-49G+ was manufactured in February 2004 but it still had the problem of missing keystrokes

Mine is older, and it consistently misses keystrokes. Most times I have to check the display to make sure the calculator has what I typed.

And sometimes I wish I hadn't bought the thing.

-Ernie

Re: Is it the time to buy the HP49G+ ?

*Message #4 Posted by **Jeff** on 6 Mar 2004, 6:53 p.m.,*
in response to message #3 by Ernie Malaga

Ernie,
Why don't you call hp and get a replacement? I have gotten _*several*_. While they haven't been thrilled

to keep sending me new ones, they have never argued. I don't think they are questioning that the early units (CN333, 334, etc.) have bad keyboards. The latest ones do seem to be much better, although perhaps not perfect. Due to the number of returns being requested, they seem to have recently imposed a policy requiring a credit card number if you want them to send your new one immediately. Or you can send the old one in first and they'll send a new one when they receive it.

By the way, to get through their automated call director system when you call 1-800-HPINVEN, first say "something else", then say "other". (Don't say the product name.) That should connect you to a live person, whom you then ask to connect you to calculator support.

Replacing 49G+

*Message #5 Posted by **Ernie Malaga** on 7 Mar 2004, 11:54 a.m.,*
in response to message #4 by Jeff

Thanks for the information, Jeff.

Re: Is it the time to buy the HP49G+ ?

*Message #6 Posted by **James Stephens** on 8 Mar 2004, 4:07 p.m.,*
in response to message #4 by Jeff

I have what must be an "early" unit, CN333-vintage, and the keyboard has not given me a problem. The keys have a nice feel and they seem reliable. I also never experienced display flicker or battery drain, but the thing did, apparently, auto-turn ON and lock up once. I had ROM version 1.20. (Interestingly, version 1.22 seems to have had problems with display flicker, as I gather from following the postings). I've since updated the ROM to 1.23.

Re: Is it the time to buy the HP49G+ ?

*Message #7 Posted by **dave** on 6 Mar 2004, 10:22 a.m.,*
in response to message #1 by Artur

I just acquired one from Eric Rechlin at hpcalc.org.

The unit works very well. I would say the key action and feel is equivalent or superior to the 48 / pioneer series.

Eric assures the units will be later production units without the initial set of issues.

Myself, I am glad HP has laid a foundation I think they can build on for the future. They may not be perfect or all what people want, but the 33S and 49G are the first time in a long time that any improvements have come to calculator design.

Re: Is it the time to buy the HP49G+ ?

*Message #8 Posted by **Tom Scott** on 6 Mar 2004, 12:07 p.m.,*
in response to message #1 by Artur

I also just received a new HP49G+, purchased from Eric Rechlin, and it's keyboard is a vast improvement over the earlier models. However, I don't think it's as good as the HP48 since I still have to be careful about keys not registering correctly. My conclusion: the newer models are definitely better than the earlier ones but, unfortunately, there is still room for improvement.

Tom Scott

Re: Is it the time to buy the HP49G+ ?

*Message #9 Posted by **Pocketcom Mania** on 6 Mar 2004, 11:21 p.m.,*
in response to message #8 by Tom Scott

If you still want to make sure that each keystroke registers, activate "key click" from "Mode". I found that the keyboard responded much better and there were fewer cases of missing keystrokes. However, your calculator would be a bit noisy!

Re: Is it the time to buy the HP49G+ ?

*Message #10 Posted by **Tom Scott** on 7 Mar 2004, 2:32 p.m.,*
in response to message #9 by Pocketcom Mania

Yes, I've tried that for awhile but I just don't like the sound of the artificial click.

Tom Scott

Thanks to all of you!

*Message #11 Posted by **Artur** on 6 Mar 2004, 1:45 p.m.,*
in response to message #1 by Artur

With the messages from Dave and Tom Scott, I was more confident in buying one from HPCALC.ORG! So, I think I'm going to sell my HP42S ... what do you think about. This machine is become very rare to find selling in Brazil, nowadays ...

Don't sell the 42S!...

*Message #12 Posted by **Karl Schneider** on 6 Mar 2004, 2:29 p.m.,*
in response to message #11 by Artur

...unless, of course, you really need the money for that coveted 49G+.

You will find that doing simple tasks and programming will tend to be much more complicated on the 49G+ than on the 42S.

The 42S and 15C are, by consensus, the best pure calculators ever made by HP (barring the 41CX, which is expandable).

Yes, yes, I want a 42S ! ;-)

in response to message #12 by Karl Schneider

Really?

*Message #14 Posted by **Artur** on 6 Mar 2004, 3:58 p.m.,*
in response to message #12 by Karl Schneider

It's because I have one HP48GX (borrowed(?) to a relative) and I like its way to program, the easy Matrix manipulatin, time functions, lists (I love them) and the big display (it has two cards of 128Kb and 1Mb inserted in it). So, the 49G+ would be ideal, don't you think? The HP42S was a fight to find it (more yet so new as mine). I've even bought the IC to increase the memory to 32Kb, but I had no

courage to open it. If using the 42S, I would have to go back to GOTOs, LBLs, etc ... and I'm a bit old for this... If interested, let me know. I'll think about and maybe tomorrow I give the answer. Thank you! Artur

Selling 42S

*Message #15 Posted by **Karl Schneider** on 7 Mar 2004, 4:13 p.m.,*
in response to message #14 by Artur

Artur --

I already have two 42S -- a 1989 model, and a newer-design 1990 model. *(Neither is for sale.)*

"R Lion" may actually be interested, and I'm certain that many others would be, too. You could offer it for sale on the classified advertisement section of this website, or eBay.

The 48GX is certainly more capable than the 42S, but if you actually prefer the paradigm of the former over the latter, you're probably in the minority of HP calc users.

"The 48GX is certainly more capable than the 42S, but if you actually prefer the paradigm of the former over the latter, you're probably in the minority of HP calc users."

Minority of visitors to the *museum* of HP calculators is more like it. I personally find the 4 layer stack way too small.

in response to message #16 by Joesph

If you sell your 42S for what you paid for it new. I guess from $80 to $120. I think you will have many people interested in. Of course the 42ses have been sold for more.

The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG]

*Message #1 Posted by **Valentin Albillo** on 5 Mar 2004, 9:15 p.m.*

Hi again,

For the purpose of testing the speed and accuracy of Saturn-based HP calculators such as the HP-71B, HP28S, HP42S, and HP-48/49 series (most specially the all-new, super-fast HP49G+), here's the second (and *harder*) part of my original advanced test suite, which adds the remaining tests 6 to 10 to the already posted half-suite, tests 1 to 5.

I would be very obligued to those of you who own one of those models (or a suitable emulator) and are willing to run these tests on their machines and take due note of the times and accuracy achieved. Ideally, a minimum of two independent tests per model would be needed to confirm the results. Of course, you can try other HP models instead, but the tests are hard enough to require significant computing muscle which usually restricts the choice to the specified models.

That said, these are the tests comprising the second, more difficult half of the suite. Code and results for the HP-71B are provided for all of them, as well as some relevant comments where necessary:

- **Test 6 - Complex-valued Matrix operations:**

  Set up the test by creating a complex-valued matrix Z with the specified dimensions, and fill it up with *different random complex values between (0,0) and (1,1)*. Then create a second complex matrix W with the same dimensions and perform the specified matrix operations.

  HP-71B setup code:

```
OPTION BASE 1
COMPLEX Z(15,15), W(15,15)
FOR I=1 TO 15 @ FOR J=1 TO 15 @ Z(I,J)=(RND,RND) @ NEXT J @ NEXT I
```

  HP-71B code:

```
MAT W = INV(Z)    185.3 sec
MAT W = Z*Z       107.2 sec.
MAT W = Z+Z         1.8 sec
```

- **Test 7 - Solving a definite integral of an implicit function:**

  Find X in [0,1] such that

$$\int_0^X y(x)\,dx = 1/3$$

  where y(x) is an *ultra-radical function* (a member of the family of elliptic functions) implicitly defined by:

$$5$$

```
y + y = x
```

using precisions of 1E-3 and 1E-6 for the integral.

HP-71B code:

```
X=FNROOT(0,1,INTEGRAL(O,FVAR,1E-3,FNROOT(0,1,FVAR^5+FVAR-IVAR))-1/3)
```

this gives:

```
X = 0.854136725005  in 433 seconds (precision = 1E-3)
  = 0.854138746461  in 771 seconds (precision = 1E-6)
```

- **Test 8 - Integrating a recursively-defined function:**

  Find the value of the definite integral:

```
     /PI
     │
I = │ F(x).dx
     │
    /0
```

using precisions 1E-3 and 1E-6, where F(x) is recursively defined as follows:

```
if ABS(x) < 1E-6 then F(x) = x
                 else F(x) = 2*F(x/2)*Sqrt(1-F(x/2)^2)
```

HP-71B code:

```
10 DEF FNF(X) @ IF ABS(X) < 1E-6 THEN FNF = X @ END
20 DIM Y @ Y = FNF(X/2) @ FNF = 2*Y*SQR(1-Y*Y) @ END DEF
30 I = INTEGRAL(0, PI, 1E-3, FNF(IVAR))
```

this gives

```
I = 2.00000022021   in  85 seconds (precision = 1E-3)
  = 2.00000000021   in 171 seconds (precision = 1E-6)
```

- **Test 9 - Polynomial Solver for roots of High Multiplicity**

  Find all roots real and complex of:

```
x^10 +  10*x^9 +  45*x^8 + 120*x^7 + 210*x^6
     + 252*x^5 + 210*x^4 + 120*x^3 +  45*x^2
     +  10*x + 1 = 0
```

HP-71B code:

```
10 OPTION BASE 1 @ DIM C(11) @ COMPLEX R(10)
20 DATA 1, 10, 45, 120, 210, 252, 210, 120, 45, 10, 1
30 READ C @ MAT R=PROOT(C) @ MAT DISP R
```

This gives (in 26 seconds) the following computed roots:

```
R(1) = (-0.999999998810, 0)
R(2) = (-0.999998488294, 0)
R(3) = (-0.999973753013, 0)
R(4) = (-1.000003962220, 0)
R(5) = (-0.989330355306, 0)
R(6) = (-1.005339673390, -9.33448992061E-3)
R(7) = (-1.005339673390, -9.33448992061E-3)
R(8) = (-0.994615440783, -9.24298394994E-3)
R(9) = (-0.994615440783, -9.24298394994E-3)
R(10)= (-1.010783214010, 0)
```

All roots should be equal to (-1, 0). As it always happens with roots of high multiplicity (10 in this case), the accuracy deteriorates, but nevertheless all roots are computed accurate to nearly 3 digits, and in some cases even more accurately (for example, R1 is correct to 8 digits).

This is so because the polynomial is extremely flat near X = -1 and evaluates to 0 for most any X within (-1.01 .. -0.99). You can globally check the accuracy of the roots by computing their sum and product. In this case, we get

```
Sum of the roots = (-9.99999999999, 0)
Product of roots = ( 0.999999999994, 7.00472767309E-15)
```

extremely close to the correct values, (-10, 0) and (1,0) respectively.

- **Test 10 - A probabilistic theoretical application**

The expected distance D between two *random* points on *different* faces of the unit cube is given by the following expression, involving the sum of two quadruple definite integrals:

$$D = \frac{4}{5} \int_0^1 \int_0^1 \int_0^1 \int_0^1 \sqrt{x^2 + y^2 + (z-w)^2}\ dw\,dx\,dy\,dz$$

$$+ \frac{1}{5} \int_0^1 \int_0^1 \int_0^1 \int_0^1 \sqrt{1 + (y-u)^2 + (z-w)^2}\ du\,dw\,dy\,dz$$

HP-71B code:

```
10 DEF FNF(X,Y,Z,W) = SQR(X*X + Y*Y + (Z-W)*(Z-W))
20 DEF FNJ(Y,Z,U,W) = SQR(1 + (Y-U)*(Y-U) + (Z-W)*(Z-W))
30 DEF FNG(X,Y,Z)   = INTEGRAL(0, 1, 1E-3, FNF(X,Y,Z, IVAR))
40 DEF FNK(Y,Z,U)   = INTEGRAL(0, 1, 1E-3, FNJ(Y,Z,U, IVAR))
50 DEF FNH(X,Y)     = INTEGRAL(0, 1, 1E-3, FNG(X,Y,   IVAR))
60 DEF FNL(Y,Z)     = INTEGRAL(0, 1, 1E-3, FNK(Y,Z,   IVAR))
70 DEF FNI(X)       = INTEGRAL(0, 1, 1E-3, FNH(X,     IVAR))
80 DEF FNM(Y)       = INTEGRAL(0, 1, 1E-3, FNL(Y,     IVAR))
90 D = 4/5*INTEGRAL(0,1,1E-3,FNI(IVAR)) + 1/5*INTEGRAL(0,1,1E-3,FNM(IVAR))
```

using a precision of 1E-3 for all integrals, this gives:

```
D = 0.92639 (correct to all 5 digits shown)
```

in 5h 49 min (23,325.95 seconds). [For the purpose of testing emulators, the value returned is, to 12 digits, 0.926385069656]

In case your machine can't compute quadruple integrals conveniently, here is a MonteCarlo-based simulation in HP-71B code:

```
10 INPUT "NUM. POINTS="; N @ RANDOMIZE 1 @ S=0
20 FOR I=1 TO N
30   X1=RND @ Y1=RND @ Z1=0 @ X2=RND @ Y2=RND @ Z2=1 @ X3=RND @ Y3=0 @ Z3=RND
40   D1=SQR((X2-X1)*(X2-X1)+(Y2-Y1)*(Y2-Y1)+1)
50   D2=SQR((X3-X1)*(X3-X1)+Y1*Y1+Z3*Z3)
60   S=S+D1/5+4/5*D2
70 NEXT I
80 DISP "PROBABILITY: ";S/N
```

running this gives:

```
with N =  10  ->  0.940
     N = 100  ->  0.924
```

which certainly approaches the theoretical value.

Thanks for any and all results you can contribute, and

Best regards from Valentin Albillo

Valentín:

Would you consider to collect all the findings in this very interesting series (71B vs. 49G, Pioneers, etc.) in an article for the "persistent" Articles Forum?

These are very interesting and enjoyable findings to read, and I think they deserve a more permanent place that the regular and "volatile" Forum...

Andrés posted:

"Would you consider to collect all the findings in this very interesting series (71B vs. 49G, Pioneers, etc.) in an article for the "persistent" Articles Forum?"

Certainly. I'll let a few days pass by, in order to try and gather as many results as possible and will integrate them in a suitable article, together with comments, both mine and from kind contributors, where appropriate. I'll make a PDF version too, with proper tables, graphs, etc.

"These are very interesting and enjoyable findings to read, and I think they deserve a more permanent place that the regular and "volatile" Forum... "

Thanks a lot for your kind words and interest. Would you consider contributing some results to these tests, perhaps by running them in an HP28S or any other Saturn model or emulator you might own ?

In any case, thanks again and, BTW, I've been an enthusiastic fan of "Les Luthiers" all my life long. :-)

Best regards from V.

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Mar 2004, 7:55 a.m.,*
in response to message #3 by Valentin Albillo

I just have a 42S, which I think is already tested (is it?), a couple of 32Sii which I don't think could undertake the tests, and a 48G+ (as I can't adjust myself to RPL, its main application are the error messages like "Drop: Too few arguments"). A couple of Woodstocks, and a battered HP41C complete my small collection. A 71B is something I may add in the future, but is rather expensive for me at the time being.

Given your mathematical prowess, I suppose one of your favorite Les Luthiers pieces is the "Teorema de Thales", circa 1975.

Best regards

*Message #5 Posted by **Valentin Albillo** on 6 Mar 2004, 6:27 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

Hola, Andrés:

Andrés wrote: *"I just have a 42S, which I think is already tested"*

No, it isn't [hint, hint] :-)

"A 71B is something I may add in the future, but is rather expensive for me at the time being."

They were pretty inexpensive for a while, a few years ago. So much so that the HPCC club gave one for free to each and every attendant at one of their annual conferences. A friend of mine got one of his this way. If you ever get the opportunity, get one. It's a marvelous machine with the traditional quality of the HP of old (the keyboard, for instance, is awesome).

"Given your mathematical prowess, I suppose one of your favorite Les Luthiers pieces is the "Teorema de Thales", circa 1975."

Correct. It's incredible that they even considered the possibility of setting to music and lyrics an ancient purely mathematical theorem, and so successfully it's incredibly funny.

Thanks for your supporting comments, I encourage you to run these tests (all 10 of them) on your 42S (which is a Saturn machine, as desired) and post the time and results here, for me to compile them in a final article.

Best regards from V.

Best regards

Valentin:

I thank you for inviting me to run the tests on my HP42S. While it it possible that I try to do so, I'm in very busy times and not sure to answer in the short time you would like to have the results for your article. So I regret for saying I'm not sure about running the tests, and would not like to commit to something I'm not sure I can do.

Thank you again, and also thank you for recalling something from my country that is not soccer-, tango-, or "bad government"- related.

Hi again, Andrés:

Andrés posted:

"I thank you for inviting me to run the tests on my HP42S [...] I'm not sure about running the tests, and would not like to commit to something I'm not sure I can do."

Sure, no problem, I understand. The only free time I get myself to do this kind of things is very late in the night (I sleep extremely few hours a day, 3 or 4 average). Let's hope some kind soul with a 42S and/or 28S will find it proper to run the tests and post the results, I'd love to see what those intermediate Saturns can do against the original and the latest offerings.

"thank you for recalling something from my country that is not soccer-, tango-, or "bad government"- related."

Matter of fact, there are *tons* of things I love related to your wonderful country, from Les Luthiers to Mafalda to dulce de leche to panqueques to mate to most everything. I've got a number of Argentinian friends and thanks to them I've come to appreciate your country and culture even more.

Best regards from Spain.

V.

Valentín:

Thank you for your kind words. While I cannot commit on the benchmarks issue, I just printed out your requests, just in case I find some free time (rather unlikely).

About the 71B: I take your advice and will be alert for any feasible chance to get or buy one. I think it was not even sold in Argentina (other models as the 41, 42, 48, 32, etc. were much more likely to be found here). I learned about it in 1984, in my first trip to the USA; but I was in that particular stage in life when, in the lapse of a little more than a year, you go through the single=>married=>father transformation. That left little attention, time, and/or money for calculators. After a eight-years pause, I just resync-ed with HP calculators in 1990, when my 42S replaced the aging 41C...

Great ! When you finally get an HP-71B, don't forget to also get its Math ROM. This machine isn't complete without it, it's really an integral part of its operating system in all respects and to all purposes. It was left out purely for marketing reasons and had to be laboriously 'extracted' from the finished ROM code.

Best regards from V.

P.D.: Just for you to appreciate the power and ease of use the HP-71B can offer, here's a 4-line program (POLYC) I wrote which will find the coefficients of the Nth degree polynomial that exactly fits N given data points (x,y):

```
  1 OPTION BASE 1 @ DESTROY ALL @ STD @ INPUT "# Data Points = "; N @
DIM X(N,N),Y(N),A(N)
  2 FOR I=1 TO N @ DISP "X" & STR$(I) & ",Y" & STR$(I) & "="; @ INPUT
P,Y(I)
  3 FOR J=1 TO N @ X(I,J) = P^(N-J) @ NEXT J @ NEXT I @ MAT A =
SYS(X,Y)
  4 DISP "Coefficients" @ FOR I=1 TO N @ DISP USING "'A(',K,')=',
4D.4D"; I, A(I) @ NEXT I
```

Usage:

RUN, at the prompt enter number of data points and then each data point in turn. After the last one, it computes and outputs the polynomial coefficients a0,a1, ..., an of the polynomial y = a0 + a1 * x + a2 * x^2 + ... + an * x^n which passes through all of them.

Remarks:

- The data points need not be equally spaced, they can have arbitrary values as long as the x are all different, of course.
- It works for general N >= 1, limited only by available memory (up to N=40 in a bare bones 71B), has fully prompted input and output, and it's as easy to write and understand as it gets, taking less than 300 bytes.
- If desired, you can make it work for *complex* data points (generally resulting in complex coefficients as well) by simply changing DIM in line 1 to COMPLEX.
- Also, greater degrees can be achieved and larger sets of data points can be processed by simply changing DIM to SHORT or COMPLEX to COMPLEX SHORT.

Re: The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG] HP28S results

*Message #10 Posted by **Olivier De Smet** on 20 Mar 2004, 1:18 p.m.,*
in response to message #7 by Valentin Albillo

Some results for an HP28S (normal speed without fast mode):

No results for polynomials, the progs Polyroot3 from Wayne H Scott give extremely long results with an HP49G+, so I didn't use them on the 28S.

```
Modes : RAD NO UNDO NO COMMAND NO LASTX
28S normal mode

Test 01
-------

Re: The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG] HP28S results

*Message #11 Posted by **James M. Prange** on 20 Mar 2004, 7:15 p.m.,*
in response to message #10 by Olivier De Smet

Are you intentionally "dumbing down" the test programs for the RPL models to execute as much as possible like the "true RPN" models? It occurs to me that the 28S, for example, might execute a lot faster if the programs were to take advantage of the deeper stack available, instead of storing things in local or (Gasp!) global variables.

The 28S doesn't have a built-in TEVAL command; perhaps you should show the source code for your TEVAL program?

Regards,
James

Re: The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG] HP28S results

*Message #12 Posted by **Olivier De Smet** on 22 Mar 2004, 5:11 a.m.,*
in response to message #11 by James M. Prange

I tried to have the same logic as the 71B programs. Btw for integration and solve tests you have to use vars. The only lasy approach is the recursive test (08). For TEVAL it's just something like: (with 64 as wordsize)

```
<< #11CAh SYSEVAL -> t << EVAL t >> #11CAh SYSEVAL SWAP - B-R 8192
/ 0.02 - >>
```

I'm not sure for 11CAh (from memory) it's used to read the 8192 Hz timer (similar to TICKS).

Olivier

Re: The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG]

*Message #14 Posted by **Rafael Millán** on 7 Mar 2004, 12:41 a.m.,*
in response to message #1 by Valentin Albillo

Valentín:

These are my results for both packs of tests. All tests have been done in numeric mode, no algebra or symbolic functions used. However, I am not sure if the requirements about *in place* computations can be guaranteed in RPL machines, at least with the user language. I think the system will use temporary variables for the matrix operations.

Test 1. Matrix operations

	inversion	multiplication	addition
10×10	2.16 s	1.25 s	0.33 s
20×20	13.59 s	9.22 s	1.21 s
30×30	42.03 s	29.52 s	2.74 s
40×40	92.20 s	68.86 s	4.97 s

Test 2. Polynomial solver

```
300.69 s
Product of roots: (0.999999994032, 2.066E-12)
```

Test 3. Integrate and solve

```
     1.20391530969, 15.18 s

Test 4. Double integrals

     1.49999542236, 3.19 s
     1.13509856804, 6.30 s

Test 5. Triple integral

     3.999873874, 236.67 s

Test 6. Complex matrix operations

     Matrix inversion:      21.58 s
     Matrix multiplication: 14.59 s
     Matrix addition:        1.02 s

Test 7. Solve integral of implicit function

     1.E-3 precision: 0.854136725005,  81.66 s
     1.E-6 precision: 0.854138746460, 165.83 s

Test 8. Integrate recursive function

     1.E-3 precision: 2.00000022021, 11.29 s
     1.E-6 precision: 2.00000000009, 23.49 s

Test 9. Polynomial solver (high multiplicity)

     3.01 s
     Sum of roots:     (-10, 0)
     Product of roots: (1.00000000014, 7.34E-14)

Test 10. Quadruple integrals

     0.926385077770, 4795 s
```

Thanks a lot, but ...

*Message #15 Posted by **Valentin Albillo** on 7 Mar 2004, 1:31 a.m.,*
in response to message #14 by Rafael Millán

... which model did you use ? :-)

If it was neither an HP42S nor an HP28S and you do own any of those models, would you please try and run the tests on them as well ?

Best regards from V.

in response to message #15 by Valentin Albillo

HP49G+, rom version 1.23, build 31.

No 42 or 28 by here.

Results for HP-71X

*Message #17 Posted by **HrastProgrammer** on 7 Mar 2004, 9:44 a.m.,*
in response to message #1 by Valentin Albillo

The results for HP-71X are as following:

Test 6:

```
MAT W = INV(Z)    58.85 seconds
MAT W = Z*Z       34.60 seconds
MAT W = Z+Z        0.60 seconds
```

BTW, the line

```
20 DIM Y @ Y = FNF(X/2) @ FNF = 2*Y*SQR(1-Y*Y) @ END DEF
```

produces an 'ERR L20: Var Context' error so I have to change it to:

```
20 Y = FNF(X/2) @ FNF = 2*Y*SQR(1-Y*Y) @ END DEF
```

Is this OK? According to the HP-71B Reference Manual, this means that 'An attempt has been made to explicitly or implicitly create or destroy a variable within a multiple-statement user-defined function, where that variable is already defined as either a destination in an assignment statement or as a function parameter.'

Test 7:

```
128.05 seconds (precision 1E-3)
228.18 seconds (precision 1E-6)
```

Test 8:

```
28.55 seconds (precision 1E-3)
57.67 seconds (precision 1E-6)
```

Test 9:

```
7.98 seconds
```

Test 10:

```
6590.23 seconds (1 h 49 min 50.23 s)
```

Some measurements have been done on HP-48GX and some on HP-49G so I could enter one test while executing another. Some tests were done on both HP-48GX and HP-49G and the executing times were always almost the same so you can safely assume that HP-71X speed is equal for both 48/49. Of course, the numerical results were exactly the same as on HP-71B ...

Best regards.

Re: Results for HP-71X

*Message #18 Posted by **Valentin Albillo** on 7 Mar 2004, 7:44 p.m.,*
in response to message #17 by HrastProgrammer

Hi, Hrastprogrammer:

Many thanks for your results, it continues to amaze me just how fast and accurate your 71B emulator is.

Just a comment:

"BTW, the line

```
20 DIM Y @ Y = FNF(X/2) @ FNF = 2*Y*SQR(1-Y*Y) @ END DEF
```

produces an 'ERR L20: Var Context' error so I have to change it to:

```
20 Y = FNF(X/2) @ FNF = 2*Y*SQR(1-Y*Y) @ END DEF
```

Is this OK? According to the HP-71B Reference Manual, this means that 'An attempt has been made to explicitly or implicitly create or destroy a variable within a multiple-statement user-defined function, where that variable is already defined as either a destination in an assignment statement or as a function parameter.'"

Well, on my physical HP-71B, your error message appears when DIM Y is *absent* ! i.e.: I need to dimension (declare) Y or else said error shows up. I suggest you may try again, but manually performing a DESTROY ALL inmediately before running the test, and see whether including the DIM Y statement makes the error appear or disappear. Perhaps you had some Y variable already existing in the context. DESTROY ALL should then get rid of it.

Thanks again for taking the time to obtain and post your interesting and valuable results, and

Best regards from V.

Re: Results for HP-71X

No help with DESTROY ALL. I tried it on Emu71 with the same result (ERR L20: Var Context). Both Emu71 and HP-71X are using ROM 2CDCC. What ROM version do you have on your HP-71B? It is possible that HP fixed a bug in 2CDCC because reporting this error when an DIM Y is absent seems like a bug to me ...

Best regards and thanks for your excellent tests.

BTW, am I waiting to receive the Mathematics Library ROM for TI-95 so I can try your tests on my just finished Texas Instruments TI-95 Emulator for Windows and compare it to the HP machines in the term of speed and numerical precision.

What about the TI-95 Stats rom?

*Message #20 Posted by **Gene** on 8 Mar 2004, 7:36 a.m.,*
in response to message #19 by HrastProgrammer

I have one you could borrow if you'd like to consider including it too.

Re: What about the TI-95 Stats rom?

*Message #21 Posted by **HrastProgrammer** on 8 Mar 2004, 7:50 a.m.,*

in response to message #20 by Gene

Thanks.

I think I will receive the Stats ROM as well. If not, I will borrow that one from you ...

Greetings.

Hrastprogrammer wrote:

"Both Emu71 and HP-71X are using ROM 2CDCC. What ROM version do you have on your HP-71B?"

Version 1BBBB

"It is possible that HP fixed a bug in 2CDCC because reporting this error when an DIM Y is absent seems like a bug to me ..."

I agree, the DIM Y shouldn't be necessary, so it's quite possible it was a bug corrected by HP in later ROM updates. I do know that most of the bugs in 1BBBB had to do with multi-line user-defined functions so perhaps this is one of them.

"Best regards and thanks for your excellent tests."

Thank you very much for your appreciation but you are the one to thank for taking the time to run these tests on your fabulous emulator.

"BTW, am I waiting to receive the Mathematics Library ROM for TI-95 so I can try your tests on my just finished Texas Instruments TI-95 Emulator for Windows and compare it to the HP machines in the term of speed and numerical precision."

Great ! I'm all eager to see your results. In the meantime, I'll try and see if I can get hold of a 42S or 28S to see how well they cope.

Thanks again and best regards from V.

Re: Results for HP-71X

in response to message #22 by Valentin Albillo

In the meantime, I'll try and see if I can get hold of a 42S or 28S to see how well they cope.

After you write the tests for HP-42S, please, send them to me so I can test my HP-42X emulator. I know, I know, I can modify and use HP-71B tests but I am just too lazy :-) ... and have a lot of other work to do ...

Best regards.
Hrast

Re: Results for HP-71X

*Message #24 Posted by **Valentin Albillo** on 9 Mar 2004, 5:52 p.m.,*
in response to message #23 by HrastProgrammer

Hrastprogrammer wrote:

"After you write the tests for HP-42S, please, send them to me so I can test my HP-42X emulator."

Certainly. Some of the 71B suite's tests could be adapted to the 42S, but I'm afraid the 100th-degree polynomial solve and the multiple integrals would require extensive programming and thus it wouldn't be a fair comparison.

If I can get a workhorse 42S I'll try and create a new suite of tests for it, suitable for other (more powerful) Saturns and your emulator, of course.

Thanks for your interest and best regards from V.

*Message #26 Posted by **Tom Scott** on 7 Mar 2004, 7:57 p.m.,*
in response to message #1 by Valentin Albillo

The Monte Carlo simulation routine listed in Test 10 doesn't seem to use variables Z1 or Z2. Is this a typographical error or am I missing something?

Best regards, Tom Scott

Re: The 71B/Turtle and the 49G+/Hare: The Harder 2nd Half [LONG]

*Message #27 Posted by **Valentin Albillo** on 7 Mar 2004, 8:42 p.m.,*
in response to message #26 by Tom Scott

Hi, Tom:

Tom posted:

"The Monte Carlo simulation routine listed in Test 10 doesn't seem to use variables Z1 or Z2. Is this a typographical error or am I missing something?"

There's no typo, the simulation routine is correct as written. Z1 and Z2 are indeed "used", only as their values are always constant (0 and 1 respectively), the values themselves are included directly in the computation of the distances, instead of referring to the variables, for the sake of speed.

For instance, line 40 is computing the spatial distance between the first and the second points randomly generated. The distance is, of course:

```
D1 = Sqrt((x2-x1)^2+(y2-y1)^2+(z2-z1)^2)
```

but as Z2 is always 1 and Z1 is always 0, (z2-z1)^2 is always 1, which is why there's a "+1" at the end of the line. Same thing for line 50, where you can see that Y3 and Z1 aren't used either, as both are always 0.

Perhaps I should have either removed the assignments to Z1, Z2, and Y3 completely (I didn't because I wanted the generation of the random points in the different cube faces to be completely understandable) or else use them in the computation of the distances (I didn't for efficiency's sake, to gain a little speed). Anyway the code is correct and there's no typo at all.

Thanks for pointing it out and for your interest.

Best regards from V.

*Message #2 Posted by **Namir Shammas** on 5 Mar 2004, 6:21 p.m.,*
in response to message #1 by Ernie Malaga

The TI-89 Titianium is an upcoming upgrade to the current TI-89.

Namir

Gotta take it with a grain of salt.

*Message #3 Posted by **Michael Meyer** on 5 Mar 2004, 6:48 p.m.,*
in response to message #2 by Namir Shammas

Ernie,

I have some old restored SR-52's... I guess you could use one while eating some salt.

All you'd need is some fresh lime and tequila.

The SR-52... what a brick! Had to be the biggest thing the nerds could ever attach to their belts!!! Terrible card reader, too.... pre-recorded tracks, terrible timing, difficult to fix the readers... they literally turn into "gum"... I thought, "how strange, someone put gum inside this calculator"... it's what was left of the card reader roller....! (I used rubber faucet washers and lathed them to the right diameter). Motors tend to seize over time, also, requiring lubrication of the delicate gears.

The keyboards were prone to destruction by corrosion, the connections were fragile.... I could go on and on. BUT... when working, they are interesting. VERY bright displays, very fast calculations, and certainly a "solid" feel under the hands!!!! Probably would make for decent ballast, too.

Have a great weekend....

TI scientifics

*Message #4 Posted by **Michel Beaulieu** on 5 Mar 2004, 8:33 p.m.,*
in response to message #3 by Michael Meyer

I have 3 SR-52 and all have good keyboard; no bouncing. I don't know if it's the same techonlogy as the TI-58 series because 58 series keyboard is bouncing a lot but not the SR-52, SR-56, SR-50 too. Ti changes his scientific calculator quality a lot down since 10 years BUT their graphing calculators are very good quality; they know it need to resist teens hands in high school.. :-)

For the main subject, yes it's true, TI-89 titanium; not a lot of difference with the original one. Silver metal faceplate (humm, like the 33S) and more memory for flash apps.

look at the link there :

http://education.ti.com/us/product/tech/89ti/features/features.html

http://education.ti.com/us/product/tech/84pse/features/features.html

http://education.ti.com/us/product/tech/84p/features/features.html

And a nice looking BAII+ metal edition too ;-)

http://education.ti.com/us/product/tech/baiipluspro/features/features.html

BUT NOTHING NEW AS A SCIENTIFIC CALCULATOR, so ti don'T have any thing to propose to compete the HP-33S :-(

in response to message #1 by Juliet

Hi Julie.

I would suggest www.area48.com, or www.hpcalc.org

These are I think, the two best sites I have found. Others may disagree.

in response to message #1 by Juliet

First, navigate to www.hpcalc.org and have a look! Also, see e-mail I sent you.

Re: Need help with 48GX

*Message #4 Posted by **bill platt (les Estats Unis d'Amerique)** on 5 Mar 2004, 4:59 p.m.,*
in response to message #3 by bill platt

Your e-mail I sent you bounced.

Also, you must go find the "HP 48G Series User's Guide" search for this phrase at hpcalc and you will be able to download all 18 MB of it!

Also, search for "UserRPLTut" and "48faq"

Also, when you get more advanced, you will want to find the "AUR" (Advanced User's Reference) which I have not found a scanned copy of. But take your time--you've got a lot to learn before that!

BTW, even for the 49G+, essentially the only place to find good info on "userRPL" is the 48 series documentation.

Regards,

BIll

That kind of reminds me of a boss who once said something like: "Someday, when I've got a little time to spare, I'll have to have you show me how all this trigonometry and coordinate system stuff works."

But seriously, other than having the "HP 48G Series Advanced User's Reference Manual" (AUR) at your fingertips, perhaps the best that I've ever found is Bill Wickes's "Insights" series. For the 48SX, there's the "HP 48 Insights Part I: Priniples and Programming" and "HP 48 Insights Part II: Problem-Solving Resources", and for the 48G series, there's "HP 48 Insight Part I: Principles and Programming HP 48G/GX Edition", all by William C. Wickes (the "Father of RPL", and an excellent writer and instructor as well). A "Part II" edition for the 48G series was planned, but never published; too bad, but there are not really not too many differences between the 48S series and the 48G series. Unfortunately, these are long out of print, and I don't know of any on-line versions (which would require his permission, of course). But maybe some "pre-owned" or "new old stock" copies will show up on eBay or somewhere like that.

And of course, as nice as this forum is, the comp.sys.hp48 newsgroup really has a lot more information about the RPL calculators. See http://groups.google.com/advanced_group_search?group=comp.sys.hp48 to search the archive, or use http://groups.google.com/groups?q=comp.sys.hp48 ("about 113,000" threads, starting from 1991-07-24) to just read it. But be aware that the archive is updated only a few times a day, so it's not the best way to participate; it's better to use a newsreader instead.

The 71B/Turtle and the 49G+/Hare: Results & Comments [LONG]

*Message #1 Posted by **Valentin Albillo** on 5 Mar 2004, 1:36 p.m.*

Hi all,

As promised a few days ago, these are the compiled results for the original suite of 5 math tests executed in a number of advanced Saturn models, namely HP-71B, HP48/49G/49G+, plus two 71B emulators.

All times are in seconds, HP-71B code has been included for all tests, and some pertinent comments are given after the results.

```
-------------------------------------------------------------------------
|                                                                       |
| Test 1: Matrix operations:                                            |
|                                                                       |
|         Set up the test by creating a real-valued matrix A with the   |
|         specified dimensions, and fill it up with different random    |
|         values between 0 and 1. Then perform the specified matrix     |
|         operations in-place.                                          |
|                                                                       |
|         HP-71B setup code:                                            |
|                                                                       |
|          OPTION BASE 1                                                |

```

Notes:

- Results for matrix operations in the 49G/G+/48GX aren't for operations *in place*. *In place* means that the result matrix is the same as the original matrix, no extra matrix memory is allocated for the result. That's the case for the featured HP-71B code.

- Results for the HP49G/G+ kindly submitted by **Arnaud Amiel** and by **Doug Rohm**, both coincide very closely.

- Results for the HP48GX kindly provided by **R. Lion**

- **HP-71X** is an HP-71B emulator running on HP48/49 hardware. Here, it has been used in 33.5K RAM configuration with ports 1..3 CLAIMed and port 4 containing the MATH ROM. Times given are for an HP49G. The times on HP-48GX are the same (+/- 0.1 seconds). HP-71X has been developed by **HrastProgrammer.**

- **Emu71** is an HP-71B emulator running on Windows systems. Emu71's tests done on a 2.3GHz Celeron in a Windows2000 Comand Box in full screen mode, and with Emu71 fast option ('Emu71 /f' command). Emu71 has been developed by **J-F Garnier**.

- For *Test2: Polynomial Solver*, the HP-71B roots' verification gives (0.999999999944, 1.312E-12), while the HP49G+ gives (0.999999994031,1.441E-12). For the real part, which should be exactly 1, this means the verifications are correct to 10 and 8 decimal places respectively, i.e.: the later error is 100 times larger. The HP48GX gives (0.999999994032,2.066E-12) , which also has a 100-times larger error in the real part, and nearly 2-times larger in the imaginary part.

- To my original question how come the new HP49G+ isn't from 6.5 to 10 times faster than the HP-71B, as it should given its underlying hardware and software, **Arnaud Amiel** offered this plausible explanation:

  "The 48/49 have nearly 30 different objects and for each RPL operations the arguments are checked to decide what to do with them. This creates quite some overhead [...] I would think the 71 does not have this overhead. If you look inside of the 49 ROM, you will eventually get to some ASM routines but a lot of sysRPL

checking and conditioning of the arguments take place before you get there. [...] As a whole I would think that the main reason why you don't get 6.5 times speed increase would be: argument checking and garbage collection."

I mostly agree with this explanation, but nevertheless I find it quite amazing that such things as argument checking and garbage collection would have such a large impact on performance, as to nearly halve it.

Argument checking, for instance, should be done just once, before the, say, matrix inversion algorithm begins. It can take a second or three, but after that, the inversion procedure proper should take place and consume most of the time. Can't imagine each value being constantly checked while the inversion is taking place. Same goes for garbage collection, it can take some time at the beginning and/or the end of the procedure, but not while the inversion process is running. So, some overhead I would expect, but not nearly as large as 50% of the total time in such a lengthy, complicated calculation.

- Some comparative results between the HP-71B and the HP48GX are puzzling to say the least. It seems that the HP48GX can multiply matrices from 3 to 5 times faster than the HP-71B, yet it adds them up *3 times slower* ! What gives ?

- Both emulators perform extraordinarily well. Emu71's speed has to be seen to be believed, but the sheer portability and take-anywhere character of HP-71X makes it a most convenient platform to run your HP-71B programs and computations on the move.

Anyway, when all's said and done, I still feel that the HP-71B does extraordinarily well against technology 20+ years more advanced. A real tribute to just how incredibly good products they use to design back then in the 'golden age' of HP.

Any and all comments and/or corrections welcome.

Best regards from Valentin Albillo

a comment about 48GX results...

*Message #2 Posted by **R Lion** on 5 Mar 2004, 2:23 p.m.,*
in response to message #1 by Valentin Albillo

Just to remember that the 48GX I used, had Metakernel & Erable installed (and 1280kb of total RAM). Perhaps a 48 "out of the box" gives diferent times...

in response to message #1 by Valentin Albillo

Another thought:

How much time is involved in getting the machines READY to do the operations?

How likely are mistakes in getting the machines ready to do the operations?

For example: If I doing some statistics, there are times when I would reach for the 49g+, but there are times when it is much much faster to grab my 12c and do the work.

The equationwriter on the 49g+ makes it very easy to enter integrals and SEE that they are correct. Is it really as easy to do on the 71B? perhaps, perhaps not. :-)

Entering a matrix...the matrix writer may be an easier way to see a matrix.

Etc.

It would be interesting to add the "setup" time to such a discussion too.

food for thought. Gene

> It would be interesting to add the "setup" time to such a discussion too.

Indeed it would, especially as optimizing a program for the fastest execution time often means spending extra time writing it. But the setup time would depend a lot on who's using each particular model.

But what I really wanted to add to this thread is that it's not just the argument checking and dispatching for UserRPL commands that slow down the RPL models. After dispatching to a particular SysRPL program, that program of course executes SysRPL commands (unnamed in the UserRPL language that the ordinary user has access to), which very often call other SysRPL commands, which may well call yet other commands, and so on, before they get to the assembly language routines. A few SysRPL commands even do there own argument checking, and there's often conditional branching and/or looping involved. Try looking at how the PRVAR or SEND command works internally, for example. There's a tremendous amount of "smoke and mirrors" activity going on behind the scenes on these calculators to accomplish their "magic". This certainly doesn't seem like the fastest way to execute commands. It does allow using a SysRPL command for several different commands (saving on ROM size).

I understand that (System) RPL was designed to speed the development of code for new models, which it no doubt does. Once a SysRPL command is written (and works as intended and documented), it never has to be written again (as long as the processor, or emulated processor on the 49g+, functions the same), just consider it a "black box" and call it (by name in a development environment, but by a "pointer" number in the final compiled code). The developer doesn't have to be concerned with how it works internally, as long as it does whatever it's supposed to do. Of course it can be re-written, to correct problems, optimize it for speed or size, or, I suppose, even add extra funtionality, as long as it still returns the expected result for any given argument(s).

Of course instead of calling a SysRPL command by its 5-nibble address (or 6-nibble library/function numbers or flash code), they could've had it's code placed "in-line" instead for faster execution, but that would take up more ROM, and, I suppose, add to the problem of actually managing all of that ROM.

The 49G is often slower than the 48G series, I suppose because of the CAS jumping in and sometimes because of extra objects types, while still using the same processor speed.

The underlying ARM processor on the 49g+ is much faster than any physical Saturn processor, but of course the Saturn processor is emulated to run most of the 49g+'s code, so although the 49g+ is (usually, at least) faster than the 49G, not as much as one might suppose from looking at just the ARM processor speed.

Even though the RPL calculators don't execute as fast as one might suppose based on increased processor speed alone, I expect that for most ordinary calculator uses, they're fast enough.

Regards,
James

That was part of the value with the HP-71B. Processing huge arrays of data has no practical value if you have to enter it by hand. Although more speed from my 71 would have been welcome, it was great to be able to interface it to an almost unlimited array of electronic instrumentation to get thousands of points of data quickly for the analysis, and print graphs of the results. HP cut the capabilities way back when they dropped the HPIL (and the HPIL-to-HPIB interface converter). Their new supercalculators just cannot compete in this area, regardless of clock speed.

Well, with the 48 series and 49G, you can gather data over the RS-232 style port, or the IR port for the 48 series, although those connect to only one other device at a time. For gathering data from several devices without changing connections, you'd have to somehow have them "multiplexed" through a single device.

The 49g+ has USB instead, so any "via wire" connection has to be to a USB host with the 49g+ device driver installed. For IR, you need an IrDA device or an IrDA adapter.

Re: A correction to the HP-71X results

*Message #7 Posted by **HrastProgrammer** on 6 Mar 2004, 3:39 a.m.,*
in response to message #1 by Valentin Albillo

Thanks for the compilation of results.

Unfortunately, I must here correct the results of double and triple integrals on HP-71X running on HP-49G because I used the following HP-71B programs to make a test:

```
20 DEF FNG(X) = INTEGRAL(1, X, 1E-3, X + IVAR)
30 I1 = INTEGRAL(1, 2, 1E-3, FNG(IVAR))

20 DEF FNG(X) = INTEGRAL(0, 1, 1E-3, EXP(X * X * IVAR * IVAR))
30 I2 = INTEGRAL(0, 1, 1E-3,FNG(IVAR))
```

```
20 DEF FNG(X, Y) = INTEGRAL(0, X*Y, 1E-3, X + Y + IVAR)
30 DEF FNH(X) = INTEGRAL(0, X, 1E-3, FNG(X, IVAR))
40 I = INTEGRAL(0, 2, 1E-3, FNH(IVAR))
```

I appologize for the this but, as the exact test programs haven't been provided at the beginning, I used the faster inline method without DEF FNF. Sorry :-(

The corrected results are:

Test 4: Double integrals						
Integral	HP-71B	49G+	49G	48GX	Emu71	HP-71X
I1	17	3.229	7.36	6	-	5.37
I2	35	9.27	19.22	17.5	1.5	10.59

Test 5: Triple integral						
	HP-71B	49G+	49G	48GX	Emu71	HP-71X
	1242	237	550	483	18	382.11

This is now consistent with the fact that HP-71X is about 3.1 times faster than HP-71B. Even with these corrected results it is faster than native HP-48GX and HP-49G in all tests except 'Matrix Multiplication' and 'Polynomial Solver'. It is even faster than 49G+ in 'Matrix Addition' and 'Integral & Solve'. This only proves the quality of HP-71B assembler code as it is the last HP calculator with operating system written in 100% assembler (I think) - no RPL inside.

Regards ...

*Message #8 Posted by **Valentin Albillo** on 6 Mar 2004, 6:02 p.m.,*
in response to message #7 by HrastProgrammer

Thank you very much for the corrected results, and very interesting additional comments.

I'll merge your corrected results in the final 'article' which will include the results for all 10 tests, within a few days. If you would consider running the new, harder, final tests (6 to 10) in your marvelous HP-71X emulator, it would be great.

By the way, your HP-71X is certainly an extraordinary achievement. If I ever get a 48G, first thing I'll do is to buy a copy from you, and would encourage any 48/49 user interested in a new, powerful way of performing advanced math computations to do likewise. HP-71B advanced Technical BASIC and RPL together in a single handheld: The Best of Both Worlds ! :-)

Best regards from VA.

> HP-71B advanced Technical BASIC and RPL together in a single handheld: The Best of Both Worlds ! :-)

Don't forget HP-41X and HP-42X. I do run all of them in a 1280K double speed 48 (41X & 42X in a 49): this way you have the Best of All (four up to now) Worlds ;-)

I couldn't thank Hrast enough for his wonderful achievements!

Greetings to you both,
Massimo

*Message #10 Posted by **HrastProgrammer** on 7 Mar 2004, 2:34 a.m.,*
in response to message #9 by Massimo (Italy)

Thanks Valentin and Massimo ...

I will try to do the new tests today and I bet the 1 : 3 ratio will remain ...

I couldn't thank Hrast enough for his wonderful achievements!

Well, this is the best thanks :-)

Currently, only HP-12/15/16C emulation is missing to have the best of All Worlds Ever on 48/49 (and 49+, perhaps)!

Best regards to all.

Handmade calculator.

*Message #1 Posted by **eclectic_echidna** on 5 Mar 2004, 1:33 p.m.*

In the musical instrument would you have too distinct classes of modern instruments: mass produced and handmade. In practice, beginners buy the mass produced models, and as they advance the handmade ones. The price can easy double or triple, but in the hands of the pro, the instrument is worth it because it could have better response, mechanics, durability, features, custom ergonomics, etc...

Should there be an analogue in the calculator industry? Essentially all calculators are mass produced/common denominator tools. Why not a handcrafted piece of art like a calculator. HP didn't get everything right. Why not custom calculators...

Why should a surveyor need the exact same functions as a machinist? Couldn't a platform be designed with an upgradeable ROM and adjustable key layouts? A library of routines can be gathered. It just needs to be put together in a nice package.

...x^5 on a button?! ...arbitrary precision? ...BCD.12 - A0.1F269?

You are probably right, I am crazy...

in response to message #2 by bill platt

Hi...

Raw costs for a cheapie sci calc and more expensive calc aren't that much different. Pricing will track demand, position in marketplace, etc.

A $20 calc prob is purchased by importer for somewhere around $4-$5. Distributors, transshipment, inventory costs, etc. allow just a bit of profit to be eked out at retail.

Typ. sci calc prob has a $0.50 (50 cent) or less microcontroller on it. Depending on volume, this could drop

to $0.30 (30 cents). LCD is a buck - $1.50 depending on custom layout etc. Case/keys/elastomer pad costs are prob $0.50 (fify cents). PCB maybe $0.25. Coin batt prob costs a bit too. Add assembly, packaging, paperwork, etc., translations, warranty support costs etc. and you're around the $4-$5 price. After a certain threshold of complexity in a calc, additional complexity doesn't cost much more until extra RAM and/or better LCD required, etc.

There are quite a few folks here on this Forum that can design a decent calc: hardware isn't that difficult, it's one chip an LCD and some kinda keypad, and with the math & firmware skills of various folks here, a working, reliable, accurate calc implementation on any of various microcontroller proliferations is entirely possible - even an emulation of an HP calc.

The real issue for building a calc for "us" is initial startup costs: injection molded case w/shift functions labeled (silkscreening/paint/etc), and keys w/legends. It prob takes $15K-$50K for dies to be setup for this.

If there were a calc case that had a single wide opening for a key above the 0-9 numeric area, that'd be a nice candidate calc body to start with.

in response to message #3 by Bill Wiese

As fun as it is to fiddle together some hardware and make it work, wouldn't it be easier to do this in software on some sort of touchscreen palm-top computer? Not only that, but each person could modify the software to their own needs.

Re: Handmade calculator.

*Message #5 Posted by **bill platt** on 5 Mar 2004, 4:18 p.m.,*
in response to message #4 by Brooks Rownd

but that's already there---tons of them for Palm and WinCE, The problem is, it is just not the same. THe interface of the touch screen is awful. And the Palm devices are too expensive---and crappy.

Re: Handmade calculator.

*Message #6 Posted by **Bill Wiese** on 5 Mar 2004, 4:30 p.m.,*
in response to message #5 by bill platt

There's many touch-screen calc implementations on PalmPilot/WinCE handheld computers.

UI isn't *nearly* as good as a calc w/a good keyboard and legible display.

Calculators have had 30+ years of refinement; Palm computers are relatively new. The first 10 of these years were the glory years where most of the usability issues were worked out (key feel, spacing, large [ENTER] key ;) etc.)

HP prob did LOTS of usability/human factors studies on KB layouts, spacing, tactile feel, etc. in the 1970s. Shame to throw all that good work away.

in response to message #6 by Bill Wiese

HP keyboards may be better than touchscreens, but somehow I'm skeptical that your home-made calculators will have keyboards that are near the quality of HP keyboards anyhow.

Re: Handmade calculator.

*Message #8 Posted by **eclectic_echidna** on 5 Mar 2004, 8:23 p.m.,*

> The real issue for building a calc for "us" is initial startup costs: injection molded case w/shift functions labeled (silkscreening/paint/etc), and keys w/legends. It prob takes $15K-$50K for dies to be setup for this.

Buy why injection molding? I don't want a home built clone of an HP machine.

How about a sculpted **ceramic** case With tiny buckled spring keys? (like my favorite 15lb IBM keyboard)

Nobody would make handmade calculators for mass market profit, but for sake of the machine and pleasing the customer. In other words turn the calculator into a piece of art.

Here is an example: Standard Trumpet - $1500

Monette - $15000?

This More realistic at $3000-5000

See the difference? Wynton Marsalis plays the fancy one. And it isn't ALL about the looks, at that level the trumpet also functions better.

That is a really cool concept... perfect for the 2004 Create a Calculator contest<http://www.hp.com/calculators/contest/>

I notice this year they are not talking about the crazy calculators they were last year (measuring the temperature on mars, painted red, white and blue... etc)

In fact, they even encourage the higher level students not to focus on the form; rather on "technical features, performance factors, and scientific and graphing abilities."

Now if only I was allowed to enter.

That actually sounds like a really practical idea. Calcualtors are definitely on their way out, as computers become smaller and more powerful. I could see that be relevant not only to enthusiasts, but also to educators and students. A teacher could customize a class set of calculators to allow students only to be able to use some features, create a keyboard overlay, and lock the mode in. Perhaps they could mass produce keyboard overlays to be used with inkjet printers.(hey it is HP, the largest printer company).

Furthermore, if simple software was developed (for the computer probably) to allow teachers to "drag and drop" functions to keys, while still allowing the enthusiasts to program their own functions and assign them to keys (much like macros), a calcualtor like this would be widely popular. Teachers would eat it up because it would allow students a calculator to do the simple arithmetic, but not allow them to use the complex features of a calculator. Students would like it because they could place their functions exactly where they want them (i.e., not have to go through 18 menus to get to a specific function), or customize their calcualtor for a specific unit (if they are doing a unit on trig, they could have sin, cos, tan, sec, csc, cot and all the inverse functions on the keyboard). Engineers and those in the business world would like it because you could easily place your specific functions where you want them. Essentially, you would have a scientific, grpahing, engineering, and financial calculator all in one. HP could release one or two bodies, and a library of predefined key setups (graphing, scientific, financial, basic 4 function, heck... even PDA).

That is a great idea, now if only it would be more than that.

-Ben Salinas

>
> You are probably right, I am crazy...

Not at all. Many of the HP calculators are highly customizable. In principal, one could start from scratch with an entirely new ROM on the 49 series, which do have upgradeable flash ROMs, but it doesn't seem practical. If the ROM source code were available, it could be modified. Several of the HP models have user-assignable keys, and some have faceplate overlays available. Well, at least they used to be available; they're hard to find now. Too bad that HP seems to have dropped the overlays. With programs, you can easily effectively add to the built-in commands of any programmable model. On the 48 and 49 series, you have "vectored ENTER" which can pre-process the command line and post-process the result. On the 48 series (and I guess the 41C series too?), there are commercial applications with libraries and often keyboard overlays that can effectively transform the calculator into a special purpose tool. For both the 48 and 49 series there are many user-written applications available that add programs, directories, or libraries as extra tools or even replacements for built-in commands. I don't know of any commercial add-on applications for the 49 series, but there could be. I've never tried the 38G, 39G, or 40G, but my understanding is that they're supposed to take instructor written (or, at least, supplied) "applets", so that the instructor can transfer the current subject to the students' calculators.

So if HP would fix the problems with its current models, and bring back overlays, wouldn't that pretty much fulfill your wishes? A way to cover a legend on the keytop itself (or replace the button, like on a PC's keyboard) with a custom one would be nice, but I'm not sure that it would be feasible, short of supplying a model with blank keys to be labeled by the user or whoever else does customizing.

Ok, I'm sure that many on this forum would prefer a "true RPN" model instead of an RPL model. Surely any of the "true RPN" models could be emulated on an RPL model, concealing as much of the underlying RPL code as desired from the user. And on the 48 or 49 series, all four stack registers and even the LASTX register could be displayed; wouldn't that would be an improvement?

Regards,
James

blanknut

*Message #14 Posted by **Michel Beaulieu** on 5 Mar 2004, 8:59 p.m.,*
in response to message #13 by James M. Prange

Bring back the blanknut; this calculator was highly customizable too, nice I/O capabilities etc... BUT they stop the production.

Is it possible to copy the HP-41CX, with little add-on like more memory and built-in cool modules in about the same /copycat package, keyboard etc as the original one and sell it for about 150$?

Edited: 5 Mar 2004, 9:00 p.m.

Yes, if you have about $1M to spend on tooling for the plastics. How many can you sell at a $150 retail price, and how much profit margin will you have on each one? Will you sell through retailers? If so, how do you get them to stock it, and how much of the margin will they absorb?

As others have pointed out, the problems in doing this aren't technical. Designing the calculator is the easy part.

Do you mean like this one?

in response to message #1 by eclectic_echidna

This calculator was "store bought" but i believe it could be fabricated by any reasonably skilled enthusiast.

http://www.msdsite.com/forums/upload.php?&upload=zoom&pid=319

I don't know if there would be a patent problem.

Re: Handmade calculator.

*Message #17 Posted by **Gordon Dyer** on 6 Mar 2004, 7:15 a.m.,*
in response to message #1 by eclectic_echidna

This sounds like an HP-41 or 71 with keyboard overlays!
HP did this ages ago....
I have a copy of an HP catalog from March 84 offering full customization on the 41 and 71, I can scan it for anyone interested, but it will be a big file.
Regards,
Gordon.

Re: Customized calculator.

*Message #18 Posted by **Paul Brogger** on 6 Mar 2004, 5:50 p.m.,*
in response to message #1 by eclectic_echidna

This thread got me to spend Saturday morning following up on an old idea.

I've got a 41CV keyboard hooked to some of the keys (39 out of 50) on a TI-83+SE.

It works fine, as far as it goes. The key assignments are all mixed up, but I can re-map those in software. I'm going to restore the rudimentary RPN application (four-level stack, etc.) and change its key assignments to make it behave appropriately, then start playing with Z-80 assembler.

Early indications are the TI's PCB may *just* be made to fit inside a modifed 41 case. The big LCD is dicey -- maybe just a hair too wide, but certainly too tall. However, I've found a non-functioning card reader case, so if I have to extend the 41 to mega-sized, it might work. (I've also toyed with simply grafting the HP-41 front onto the 83's case in place if its keys -- but that's a less desirable option.)

It seems to me a TI-83+ titanium (or whatever) has been hinted at -- it seems to be an 83+SE in a fancier case. If the technology has been simplified, however, that might make both its PCB and its LCD better candidates for insertion into a 41 shell.

Why bother? Well, there's the obvious 41 keyboard quality, with its full-size Enter key. It's set up for overlays (doeas anyone have a spare available?), and has alpha legends on the key fronts for alpha capabilities. The 41 case is deep enough that it should accomodate more modern circuitry and batteries.

Also -- the keys from my disassembled HP-28s seem very close in shape and size to those on the 41, and might serve as double-shot substitutes. I haven't disassembled the 41's keyboard -- can anyone tell me whether the clamshell keys are similar enough that they might be used? (THere's the 19B's keys as well -- a whole host of quality, alternate keytops might be available should one wish to go this route.)

The TI-83+SE, as a graphical calculator, is maybe not the ideal candidate. But it's Flash programmable, it's got plenty of memory, it's got a PC link (USB) and it's got an emulator and SDK available for free.

If there's any interest, I'll add a couple of pictures tonight.

Re: HP Keytops

*Message #19 Posted by **Randy Sloyer** on 6 Mar 2004, 7:56 p.m.,*
in response to message #18 by Paul Brogger

The clamshell keys are incompatible with 41 and Voyager keys. The clamshells are of totally different dimensions, most notably the height. The small (non-numeric) 41 keys are the same physical size as the Voyager keys, except for the ENTER key.

Are you looking for a blank overlay or the standard cream colored with legends? Email me.

in response to message #20 by Brooks Rownd

If you look at the internals of a fullnut HP41, it should be very easy to implement a new motherboard to

replace the 20 year old HP design. No fancy connectors (just a series of pads), no ICs with zillions of tiny wires bonded to the keyboard, etc etc. The only problem would be that you would have to use the existing keyboard layout (at least the labels on the top of keys) and the display (more of a problem really as you'd have to live with the single line display and its cranky interface -- it presents itself as an HP-41 peripheral).

The problem is that the existing HP41s are not getting any younger and your "new" calculator may develop age related problems almost immediately (failing keys, inoperative displays, flaky battery connections, etc). Moreover, even broken 41s command high prices, so getting your raw materials will be expensive, and the moment you release your new design, prices will go even higher (advice, better corner the market of used 41s before releasing your product :-).

Apart from that, you can use one of the cheaper microcontrolers to emulate the entire 41CX and most modules in a compact and very low power package.

You don't even need to develop an emulator from scratch, just use one of the existing ones that are available in source form.

in response to message #22 by Vassilis Prevelakis

Vassilis, nice comment in the current issue of IEEE Spectrum.

As far as replacing the motherboard of a fullnut CPU, that is a project that I am currently working on. However, rather than emulating the nut CPU with a microcontroller, (with the attendant speed and power issues), I am nearly done with the design of a clone of the nut CPU suitable for loading into an FPGA. Once I complete the basic design, I'll add a direct interface to standard Flash and SRAM (basically an internal MLDL) plus a dynamic speed select mechanism (aiming for up to 50x). The details of when and how to switch speed automatically I am still working out. Of course any access of a real port peripheral, as well as the keyboard scanner, will need to run at regular speed.

I still haven't decided whether or not to include the Timer module functionality or not, and am always searching for undocumented features of the nut CPU to make the clone as accurate as possible. The behavior of certain instructions when executed immediately after the Carry flag is set is sufficiently bizarre that I probably will not copy it. Right now my design has no such restrictions.

HP 28S: How to Resuscitate?

*Message #1 Posted by **Matt Kernal (US)** on 4 Mar 2004, 8:29 p.m.*

I have a 28S that is holding on to dear life. It needs some help to bring it back to health. Here's the problem: When the batteries are installed, and the ON button is pressed, ALL the pixels come on (and stay on), but nothing else happens. It won't respond to any keypresses (other than the initial ON key press).

I've tried a cold start Reset <ON + INS + RightArrow> (28S equivalent of 48 <ON + A + F>). I've tried a warm start <ON + UpArrow> (28S equivalent to 48 <ON + C>. It won't even turn off unless I remove the batteries.

I've shorted the battery terminals with a paper clip (for about 60 seconds), and even temporarily reversed the N-cell batteries. There is no external Reset hole to press.

Any thoughts or ideas to try? BTW, the batteries work great in another 18C and 19B I have.

Any and all suggestions welcome. Thanks.

Matt

I kind of came to the same conclusion. Good thing I only spent $5 on it, including the Owner's and Reference manuals.

Thanks Eric,

Matt

Re: HP 28S: How to Resuscitate?

*Message #4 Posted by **Eric Smith** on 5 Mar 2004, 9:48 p.m.,*
in response to message #3 by Matt Kernal (US)

Well, at least you got a good deal on the manuals. Now you can buy another one that doesn't come with manuals.

I'd love to get a broken 28S to take apart for high-resolution photos. But perhaps you should wait and

see if anyone else has advice on other things to try to attempt to revive it. I can't think of anything, but who knows.

Re: HP 28S: How to Resuscitate?

*Message #5 Posted by **Paul Brogger** on 5 Mar 2004, 6:51 p.m.,*
in response to message #1 by Matt Kernal (US)

I've had Pioneers that acted similar, and it was a "stuck" key (actually, a dirty keyboard sandwich) that was the culprit.

Only problem is, how to test? Taking one of those apart seems to be impossible without in the process destroying the plastic posts that hold it together.

I've got one "in a bag". I've often thought that with my drill press and about a hundred small stainless steel machine screws and matching acorn nuts I could drill out most of the posts (right through to the outside), screw the thing together, and have a "studded" 28s.

But like most of my ideas -- all thought and not much action!

HP-41cx

*Message #1 Posted by **Dave Rauch** on 4 Mar 2004, 6:13 p.m.*

I desperately need to know how to program my HP-41cx with a triangle solution program. My tried and true HP 11c is finally dying on me and I dusted off my old HP-41cx to come to the rescue. If anyone has the answer I would greatly appreciate it.

Re: HP-41cx

*Message #2 Posted by **Miki Mihajlovic** on 4 Mar 2004, 6:46 p.m.,*
in response to message #1 by Dave Rauch

You can find it here but this is 67 solution ported to 41. HP-41 math pack has a good one. You can download the math pack from the 'other great HP site' that I can't mention here, load it into V41 and save SSS program to a .RAW file. Then use hp41uc to convert to it .TXT file and you can key it in. If this is too confusing for you, drop me an email and I will send it to you.

LCD contrast on halfnuts

*Message #1 Posted by **Miki Mihajlovic** on 4 Mar 2004, 4:53 p.m.*

I recently got my first 41 CX after 20 years of using CV (still good and in use) but it arrived without manuals. After a MASTER CLEAR, LCD resets to contrast 3 or 4 on a scale 0-15 what is a bit pale for my eyes. Is there a way to change the contrast on a halfnut LCD from the keyboard using some key combination, such as SHIFT ON for displaying time, instead of CTRST function from Sandbox ROM - the only one I know of that deals with LCD contrast setting.

Re: LCD contrast on halfnuts

*Message #2 Posted by **Diego Diaz** on 4 Mar 2004, 9:19 p.m.,*
in response to message #1 by Miki Mihajlovic

Hi Miki,

I only know of HEPAX and SandBox for HalfNut contrast control, others may exist though. And yes, the default setting is certainly poor... it is set to 5 in a 0-15 range. Fortunatelly you only need to set it once and it's "remembered" even if a MEMORY LOST is achieved.

To my eyes (literally) the best setting is 7 or 8... but this is a personal choice anyhow... ;-)

Cheers.

Diego.

I don't know how to do that contract setting on my halfnut; can someone tell me hw to dot it?

Thanks Michel

Re: LCD contrast on halfnuts

*Message #4 Posted by **Miki Mihajlovic** on 6 Mar 2004, 11:09 p.m.,*
in response to message #3 by Michel Beaulieu

Angel Martin's Sandbox ROM has a few functions that can read, set, increment contrast settings of a halfnut's LCD on the scale 0-15. You can get Sandbox only if you have Clonix and put it into two of its six available pages. Digeo says that Hepax has similar function. If you have Hepax then you are among few lucky ones. It does seem that once you set the contrast it is remembered even after a master clear.

Re: LCD contrast on halfnuts

*Message #5 Posted by **Garth Wilson** on 7 Mar 2004, 1:14 a.m.,*
in response to message #4 by Miki Mihajlovic

If it's adjustable, it seems like there should be a way to do it with the Zenrom too. I never gave it a thought though, because my 41cx halfnut's display, from a normal usage angle, is really, really black against the silver-gray-- very easy to read in any light.

Re: LCD contrast on halfnuts

*Message #6 Posted by **Johnny** on 17 Mar 2004, 9:22 a.m.,*
in response to message #5 by Garth Wilson

Yes and no. You can adjust the constrast with the Zenrom, if you also have an MDLD or similar device to store machine code in. The Zenrom will allow you to write m-code, but will not access peripherial devices itself.

Reverse Mortgage Calculations

*Message #1 Posted by **Bill Beall** on 4 Mar 2004, 2:36 p.m.*

Greetings! -

I'd like to learn how to properly verify a term of a "reverse morgage" calculation. If I may provide an example - I know: the monthly advance to the consumer is $492.51 and that the total of consumer's loan cost is $4,500, the contract interest rate is 9.0%, and the estimated time of repayment is 10 years (based on life expectancy at age 78. I also know that the appraised value of the dwelling is $100,000 and that the assumed dwelling appreciation rate is 8%. How do I verify using a programmable HP 12C that the Total-annual-loan-cost rate = 10.87%. In other other words, can some provide me with the keystrokes?

Thanks, Willing To Learn

Edited: 4 Mar 2004, 2:40 p.m.

Re: Reverse Mortgage Calculations

*Message #2 Posted by **kw** on 4 Mar 2004, 7:20 p.m.,*
in response to message #1 by Bill Beall

In its basic form this is a simple TVM calculation. Assuming monthly compounding and END payment mode, input the following and solve for i:

PV = 95500 (that's 100,000 minus the 4500 fee) PMT = -448.18 (that's 492.51 minus the 9% fee) FV = 0 (equity is depleted) N = 120 (number of monthly payments you receive)

You get i = -0.87%. Multiply by 12 to get an yearly depletion rate of 10.44%. This is what you call the Total-annual-loan-cost rate.

The quote you were given is slightly higher. Clearly, you need to know the fine details (compounding frequency, how the payment of fees is structured, rounding method used by the lender, etc.) in order to come up with an exact match.

Re: Reverse Mortgage Calculations

*Message #3 Posted by **bill platt** on 5 Mar 2004, 10:08 a.m.,*
in response to message #2 by kw

This seems like a VERY bad deal! Like, 120 * $448.18 = 53,781.60. If your house appreciated 8% over the 10 years, then it would be worth $108,000, so you are only getting 1/2 of the house's value. (In the long term, houses do not appreaciate 8% per annum, but if it was 8% per annum, then your 100,000 house would be projected to be worth $215,892 in 10 years, which would mean you would be getting only 24.9% of your house's projected value).

Seems like a great deal for the bank--they pay only $53,781.60 to aquire a property worth $108,000 or more. Or, taking the time value of money into account: if money is worth 6% per year (what they get for a

mortgage), then the bank will have spent in principal and "lost" interest, $73,937. So, at the end of 10 years, the bank sells the house for $108,000 and makes (in real terms) $34K!

Am I right, or have I completely missed something here?

What if you "overstay your visit" (live longer than 10 years). Do you get to live in your house, do you keep receiving payments, etc?

HP33s 255 byte equation limit?

*Message #1 Posted by **bill platt** on 4 Mar 2004, 11:16 a.m.*

In a different thread, Paul Brogger mensioned the folowing:

> Quote:
>
> I just entered the first 254 bytes of what I remember of the Gettysburg Address into an "equation" in my 33s. (At 255 bytes, EQN mode stops taking input and objects.) I suppose I could enter many such equations into a program, with one byte consumed for each letter (upper case alphanumerics and function codes only, with no punctuation to speak of) and three bytes of overhead for each separate equation entered.

So the question is, what does this mean? Are we going to be forced into having relatively short equations? (Not that I would really want long ones, with the dreadful inability to edit the equation!) Or, transforming really big equations into RPN expressions (Horner's method where applicable)?

In my 32sii, I have no problem entering an expression with, say, 269 bytes into the equation list---of course I don't have enough room to solve it---but it will take the equation.

How many characters does 254 bytes work out to be in the 33s?

regards,

Bill

bill at plattdesign stop net

Re: HP33s 255 byte equation limit?

*Message #2 Posted by **PauL Brogger** on 4 Mar 2004, 11:30 a.m.,*
in response to message #1 by bill platt

The limit is indeed ~255 bytes per equation, whether as a program line or in the equation list. (The functional limit actually seems to be *254* bytes on a program line.)

The equation list seems to be limited to 30 entries. I haven't tried to see whether more than 30 equations may be entered as program lines, but I suspect that to be so.

(This may all be spelled out explicitly in the manual, so RTFM may apply. I've glanced about, and it hasn't jumped out at me, so I've been pushing the limits by pushing the buttons.)

The memory cost of entries in equations appears to be exactly the number of characters displayed. The square root function, for example, is entered as **SQRT(** and consumes five bytes.

The checksums of equations appear to be identical whether entered in the equation list or as program lines.

One only-semi-relevant tidbit I found last night: it does appear that one cannot obtain a length or checksum for a program without a label. One may enter program lines starting at PRGM TOP without entering a label. (The line numbers all begin with a zero rather than with a letter.) But the MEM command's PGM list doesn't display an entry for the unlabeled program, and hence no **LN=** or **CK=** is available. (Of course, the length may be calculated in a couple of ways.)

BTW, does anyone have any information on the internal encoding of the 32s/sII/33s character/command set, and what checksum algorithm is used?

Edited: 4 Mar 2004, 1:54 p.m.

Re: HP33s 255 byte equation limit?

*Message #3 Posted by **bill platt** on 4 Mar 2004, 4:20 p.m.,*
in response to message #2 by PauL Brogger

This 254 byte problem seems suspiciously similar to the ~254 lines of programming limit on GTO in the "12C Platinum". I looked over the 33s Manual (downloaded it some months ago) and I find no indication there that there is a limit to equation length, nor number of equations. Indeed, it says what the 32sii manual says--that only the available memory limits the size.

Another issue I noticed just from reading the manual: apparently it is possible to program in either ALG or RPN mode. But more importantly, it says that:

a. RPN mode programs will only run in RPN and vice versa for ALG;

b. You can code a program to switch the mode during running.

So, have you tried this out? What happens if you write an RPN program while in ALG mode? What if you write it in RPN mode, but then switch to ALG before <XEQ>? And vice versa for ALG? Can you really put a mode instruction in the program--does it work?

Also, we should test the looping against program size---making sure GTO and GSB ("XEQ" -- I like GSB better, don't you?) will work correctly with long (>254 lines and or 254 bytes) programs.

Best regards,

Bill

Re: HP33s 255 byte equation limit?

*Message #4 Posted by **Norris** on 4 Mar 2004, 4:44 p.m.,*
in response to message #3 by bill platt

The 32SII and 33S manuals contain almost identical sections on entering equations (on pages 6-5 and 6-4 respectively). The only difference is that the 33S manual contains an extra sentence in Paragraph 3 about the 255-character limit:

"You can enter up to 255 characters per equation."

Oddly enough, Paragraph 5 in both manuals states:

"You can make an equation as long as you want — you're limited only by the amount of memory available."

It appears that Paragraph 3 was edited for the 33S manual, but that the editors neglected to remove Paragraph 5. So Paragraphs 3 and 5 of the 33S manual contradict each other.

Don't see anything in the 33S manual about a 30-equation limit. This may come as an unwelcome surprise to NCEES exam candidates who were planning to stuff the 33S full of equations

Re: HP33s 255 byte equation limit?

*Message #5 Posted by **Paul Brogger** on 4 Mar 2004, 5:46 p.m.,*
in response to message #3 by bill platt

I entered a program with 200+ executions of another program. (On the 32s/sII/33s, "XEQ" is used rather than "GSB", but they mean the same thing.)

The length of the first program is 624 bytes. The second routine simply adds one to a counter and returns. All of the XEQ's work fine. From this I take it that there is neither a 256- nor a 512-byte "boundary" to subroutine execution.

With regard to ALG mode: I know that it would be big of me to investigate that behavior, and contribute to the general knowlege pool by sharing my results. But I just can't muster the interest. I don't think I'll ever utilize ALG mode -- certainly not in a program. So I'll leave that area of investigation to my worthy peers.

Sorry!

HP 33S Survey Stakeout Software

*Message #1 Posted by **Brad** on 4 Mar 2004, 10:50 a.m.*

Just wondering where can I get the Survey Stakeout Software for the new HP 33S?

Re: HP 33S Survey Stakeout Software

*Message #2 Posted by **Dave** on 4 Mar 2004, 2:08 p.m.,*
in response to message #1 by Brad

I obtained some surveying programs for my new HP 33s from John Butcher, his email address is CSPARKS@N2.NET. Try him.

Making Modules for the 41...

*Message #1 Posted by **JasonG** on 4 Mar 2004, 7:21 a.m.*

Hi there,

Now, this may be a silly or FAQ but is there any sensible method of making a multi-rom-module module? That is, to combine several module ROMs in one module to save space in the top of the 41?

I have seen the Sandbox and MLDL2000 discussed but I am really not sure as to what each of these are.

Regards

JasonG

Re: Making Modules for the 41...

*Message #2 Posted by **Christoph Klug** on 4 Mar 2004, 9:31 a.m.,*
in response to message #1 by JasonG

Dear Jason,

the answer is using a burned 16KByte Zeprom-Module or the new 24KByte Clonix-Module.

For example with the Clonix you get the following HP41 port configuration :

Port 1 = Clonix (up to 6x4KByte module or 3x8KByte Module)

Port 2 = Double X-Memory

Port 3 = IL-Module = the gateway to PC or the rest of world

Port 4 = free for your application...

Regards - Christoph Klug

Re: Making Modules for the 41...

*Message #3 Posted by **Miki Mihajlovic** on 4 Mar 2004, 11:45 a.m.,*
in response to message #1 by JasonG

Just to second to what Christoph said, Clonix is your best bet today. Zeprom modules are difficult to come by these days since they are out of production for over 15 years, while Diego makes his wonderful Clonix modules as we speak. To learn more about it see http://www.iespana.es/clonix-41/clonix.htm

Personally, I have two of them and I don't remember having this much fun with my shoes on since my first rides in Disneyland.

Hi:

I think I will buy a clonix, but I have a question. Can I write my own programs in the clonix? Does anybody have any experience with it?

Thanks in advance

Jon

Re: Making Modules for the 41...

*Message #5 Posted by **Miki Mihajlovic** on 4 Mar 2004, 6:29 p.m.,*
in response to message #4 by Jon

You sure can put your own code (FOCAL or MCODE) into a ROM iamge and write them into Clonix. I have done several of those related to my own engineering displine as well as some general purpose ones.

Re: Making Modules for the 41...

*Message #6 Posted by **Diego Diaz** on 4 Mar 2004, 8:40 p.m.,*
in response to message #5 by Miki Mihajlovic

Hi all, ... I've heard my name...

Just come back home. Yes, I know it's very late... 1:00am here.

Jason, if you're interested I'll be happy to answer your questions and/or address you to the required info. Please feel free to mail me, just remove the *NOSPAM* anagram from my e-mail address above.

Please let me borrow your thread for contacting some friends... ;-)

Christoph, Miki, thanks for your kind words, I'm glad to know you enjoy my little "gadget".

I've already (this very afternoon in fact) got an *old* 386 40Mhz, I'm planning to use it (supposed it works...) for testing Clonix and your nice HP-IL/PC interface board, Christoph; due to a unusual Clonix heating behavior reported by Miki two weeks ago.

Jon, I think you've reached the right person here, Miki has got a nice and clean method to produce FOCAL code image files, suitable to be loaded into Clonix's memory.

Again thanks and best wishes from Spain.

Diego. 123456

*Message #7 Posted by **Jon** on 5 Mar 2004, 12:11 p.m.,*
in response to message #5 by Miki Mihajlovic

Hi Miki:

I am afraid I am an absolute beginner. I have no idea what MCODE or FOCAL is. Could you make me know which software do I need? Is there any document that I can use as manual?

Best Regards

Jon

Re: Making Modules for the 41...

*Message #8 Posted by **Miki Mihajlovic** on 5 Mar 2004, 1:17 p.m.,*
in response to message #7 by Jon

Hi Jon,

FOCAL stands for Forty One CALculator language i.e.. programmable RPN commands from keyboard. Those would be 'normal' (and some less normal - synthetic) program lines that you use to make a program on your HP-41. To generate synthetic instruction you really do not need anything else but basic HP-41, create a byte grabber and off you go. However, it is much easier with the help of CCD ROM (my all time favourite ROM) or Zenrom.

MCODE stands for Machine CODE programs and they are much trickier. You need an assembler, MLDL RAM and lot of knowledge on how HP-41 really works. David assembler is probably the best although Zenrom and Assembler3 also work great. Now for the MLDL RAM, Clonix can set aside 512 bytes of MLDL RAM and for a small things and just playing around that is OK. If you need to write something bigger then you need a RAM box (ERAMCO or W&W software products) or a HEPAX module. Be warned that any of these things are extremely difficult to come by even on eBay and of course providing that you can outbid Matthias ;). There is also a new MLDL2000 that is coming soon and that we all are anxiously awaiting.

There is however, simpler and cheaper (free) way to all of this. Download any of the great HP-41 emulators for PC (EMU41 or V41), load any of the ROM images and RAM boxes you want and you have a nice development system.

As for my procedure to create your own ROM images from FOCAL programs all you need to get is Leo Duran's great conversion utility hp41uc.exe and HP's SDSII. You can find them at the 'other great HP site'. It all comes down to one .BAT and one .DEF file that I can send you if you are interested.

*Message #9 Posted by **Meindert Kuipers** on 7 Mar 2004, 5:49 a.m.,*
in response to message #8 by Miki Mihajlovic

All,

After a week of skiing and skating in Austria, far away from computers and this forum I am now back online. The MLDL2000 will go through some final testing during the next two weeks, after which I will be able to finish the PCB layout.

A quick summary: the MLDL2000 will give you room for 63 ROM images and 16 RAM

images for storing all your favorite ROMS in just one card reader housing. The RAM images can be used for developing your own MCODE. In addition a USB interface allows connectivity with a PC for exchanging ROM/RAM images and to control the behaviour of the MLDL2000

Meindert

Mystery Ancient HP Memory Modules

*Message #1 Posted by **Alex** on 4 Mar 2004, 7:15 a.m.*

I have some HP memory modules, marked 1818-2805, with a big number 5 on them, and saying Hewlett-Packard, these look like 1970s or so, ceramic chip packages with a plastic holder around them, anyone know anything?

Re: Mystery Ancient HP Memory Modules

*Message #2 Posted by **Achim** on 6 Mar 2004, 6:11 a.m.,*
in response to message #1 by Alex

Is the plastic holder roughly of the size 2.5"x4.5"x0.75" ? Then it's propably a ROM module for a 9810 or 9820. If the size is 2.9"x4.4"x0.6" it's a ROM for the 9830.

Re: Mystery Ancient HP Memory Modules

*Message #3 Posted by **Eric Smith** on 6 Mar 2004, 9:48 p.m.,*
in response to message #1 by Alex

Long narrow modules? If so, I think they are HP 9845 ROMs. Do the labels have either a green or black background? Is there a conspicuous white triangle, square, or circle on the label?

Re: Mystery Ancient HP Memory Modules

*Message #4 Posted by **Vassilis Prevelakis** on 8 Mar 2004, 10:03 a.m.,*
in response to message #1 by Alex

Looks like one of the 14 OS ROMs for the 9825A.

Unlike later models (B and T), the A model had a drawer on the left side. This drawer contained 14 plug-in ROMS that had the OS code.

The ROMs look a like the HP-85 ROMs, plastic packges with holes on the underside. Spikes on the daughterboard enter the holes to make contact with the ROM PCB.

Unlike the 85 ROMs, the HP 9825 OS ROMs have holes all around the edges.

I don't have a picture of the 9825 ROMS, but here is a picture of the 85 ROM drawer:

Hp 42s Replacement (hp 33s?)

*Message #1 Posted by **Craig** on 3 Mar 2004, 9:46 p.m.*

Hello,

I used to have a hp 42s, which was a fantastic calculator, but got stolen and I couldn't get another (new). I have a hp 48gx, but I'd like to go back to the old 42s. I've seen that a hp 33s just come out, and I'd like to know what I would be missing out on if I got a hp 33s over a 42s?

Does anyone have any idea if hp will ever replace the 42s? or is the 33s it?

Craig

Re: Hp 42s Replacement (hp 33s?)

*Message #2 Posted by **Ben Salinas** on 3 Mar 2004, 9:52 p.m.,*
in response to message #1 by Craig

Perhaps if the 33s is successful, HP will like the idea of remaking the old calculators. It is a cheap way of making "new" calculators.

As of now, I see no reason why the 33s shouldn't be sucessful; let's just see if people decide to buy it. If the prices on ebay say anything about the quality of a product, HP has a pretty good product.

If the 33s does good, I would expect (though I wouldn't hold my breath) a 43s, and maybe a remake of a 11c or 15c.

If not, then at least I can dream.

-Ben Salinas

Re: Hp 42s Replacement (hp 33s?)

*Message #3 Posted by **Brooks Rownd** on 4 Mar 2004, 3:37 a.m.,*
in response to message #2 by Ben Salinas

One has to wonder why they didn't chose to "clone" the 42s instead of the 32sii to make the 33s? It shouldn't have cost much/any more.

Re: Hp 42s Replacement (hp 33s?)

*Message #4 Posted by **Jeff** on 3 Mar 2004, 10:16 p.m.,*
in response to message #1 by Craig

You will be missing out on quite a lot with a 33s vs. a 42S. Some of the enhancements include:
- unlimited number of data storage registers, using alphanumeric names, within available memory. The 33s is limited to something like 27 or 33 registers.

- unlimited program labels, using alphanumeric names, within available memory. The 33s is limited to something like 26 or thereabouts.
- the 42s has far, far superior complex number display and calculating capabilities.
- the 42s has significant built-in matrix capabilities.

The 42S has numerous other advantages over the 33s. This is not meant to denigrate the 33s, it is a nice little calculator, and fine as a somewhat enhanced follow-up to the 32sii. Aside from Ben and myself, there are many other that hope for the mythical 42sii or 43s. I'm not holding my breath, I'm not sure if there is a big enough marketing niche between the 33s and the 48gii.

By the way, if you have a 48gx, you do have an option. A Forum contributor known as HrastProgrammer has created an emulator of the 42S that runs on the 48gx. You need at least two 128K memory cards, one for each slot, but it provides an exact reproduction of the 42S, with some enhancements, on your 48gx.

HP-42S Replacement is a 42S

*Message #5 Posted by **Raymond Del Tondo** on 4 Mar 2004, 2:54 a.m.,*
in response to message #4 by Jeff

Hi,

you forgot to mention two major advantages of the 42S, compared to the 33S:

1. The overall keyboard layout with a real ENTER bar.

2. The 42S housing dimensions are smaller than those of the 33S, and thus the 42S, like all Pioneer machines, fits into more pockets.

Raymond

Re: Hp 42s Replacement (hp 33s?)

*Message #6 Posted by **Antoine M. " Kermit " Couëtte (France)** on 4 Mar 2004, 7:14 a.m.,*
in response to message #4 by Jeff

Mar 04 , 2004

Hello Craig ,

Having recently being in a similar situation - my HP41CY went dead - I fully agree with Jeff's advice to take a look at Hrastprogrammer's (http://hrastprogrammer.tripod.com) emulator for HP42S on your HP48GX .

Although I do not know personnally his HP42S Emulator for HP48GX , I do know his Emulator for HP41 and I am enthusiastic about it .

You may search on this same forum the thread " 040301 Re: replacement for 41CV, Antoine M. " Kermit " Couëtte - 1 Mar 2004, 11:29 a.m. " which gives you more insight on the quality of Hrast's work .

Good luck ,

Kermit

Re: Hp 42s Replacement (hp 33s?)

*Message #7 Posted by **Thorsten Kril** on 4 Mar 2004, 2:53 p.m.,*
in response to message #4 by Jeff

There are also some advantages of the 33s over the 42:
- Support of fractions.
- Metric unit conversions.
- Better contrast display.
- Menus are less nested, so often there are less keystrokes for a certain function (at the expense of a more crowded keyboard).
- More memory (at least in theory, because of label limits).
- 4 Cursor keys.
- Faster.

The 33s is also cheaper to replace if it breaks, but this of course has nothing to do with the merits of the calculator, just HP's ignorance.

First(?) HP 33s bug

*Message #1 Posted by **Ben Salinas** on 3 Mar 2004, 7:21 p.m.*

I realized today while doing my physics homework that my calculator was operating in radians mode, even though the RAD annunciator was not on. I did a bit of research, and realized that if you use the self-test, the LCD screen reverts to its default state (only says RPN), but the calculator does not revert to the default state.

This means that if you are using radians (in my case), which is usually noted by a RAD annunciator, and you use the self test, then your calculator looks like it is in degrees (because there is no RAD annunciator on), but it operates in radians still.

The same holds true for most other annunciators, including bases (it won't say HEX, but it is still in HEX) and user flags (the screen says flags 0-4 are off, but by using FS? they might not be).

I notified HP around 5:00 PM, and have yet to be recieve a response.

Someone test it out to make sure it isn't just mine.

-Ben

*Message #2 Posted by **Mike Sebastian (Texas)** on 3 Mar 2004, 10:43 p.m.,*
in response to message #1 by Ben Salinas

It isn't just your machine. Congratulations, it looks like you've found a genuine bug!

Re: First(?) HP 33s bug

*Message #3 Posted by **Andy Karlov** on 4 Mar 2004, 1:44 a.m.,*
in response to message #2 by Mike Sebastian (Texas)

Let's hope the 33s has flash ROM and integrated bluetooth connectivity so that the firmware can be easily upgraded via your cellular phone. Otherwise you will have to get a free replacement unit. I hope that HP already has sold a lot of this c**p, so it won't be too profitable for them. I will always remember the good days when calculators were called 41, 42, 32 and 48 and when they still looked and felt the right way. They were also a bit buggy, but they were great and they had a nice ENTER key ;)

What?

*Message #4 Posted by **Wayne Stephens** on 4 Mar 2004, 7:48 a.m.,*
in response to message #3 by Andy Karlov

Let me get this straight:

You do not want this calculator to be profitable for HP?

To what end? So they will get out of the calculator business altogether? I don't know if you have thought this through to its possible conclusions (or even some of them). If HP loses money on the 33S I believe you will NOT see any future RPN calculators from them. All the dreamers can then completetly forget about the possibility of a "43S".

Also, you were willing to live with bugs in the "good old days", but this calculator is crap because it has a bug? I don't follow your logic. Why were bugs okay in the past, but today they are sufficient reason to wish ill on the only company left in the world interested in RPN calculators?

Think about it. When the old "classics" are all non-functional or so valuable as collectibles that no one dares use them for their intended purpose (which will happen some day since spare parts are not being manufactured), and HP is not manufacturing RPN calculators, what will we do? I guess we'll all switch to TI Algabraic units; and that will be a sad day, at least for me.

Take care.

Wayne.

PS - As cheap as the 33s is, I'll just keep my "buggy" one and purchase the upgraded one. It's not like they cost $200 or $300 any more, like in the "good old days".

Re: What?

*Message #5 Posted by **Wayne Brown** on 4 Mar 2004, 11:44 a.m.,*
in response to message #4 by Wayne Stephens

> Quote:

If HP loses money on the 33S I believe you will NOT see any future RPN calculators from them. All the dreamers can then completetly forget about the possibility of a "43S".

I can't speak for Andy, of course, but here's how I see it:

When the 49G came out I hoped it would be a big enough flop that HP would reconsider and go back to making calculators that were more like their older, more successful models. But when the pictures of the 49G+, 48GII and 33S came out (even before the actual units themselves were available), I decided that if this was, indeed, the direction the future HP machines would take, then I'd prefer that they just stopped making calculators altogether. I consider their current products to be an insult, not only to *users* like myself, but more importantly to the *designers* of the older models. If I believed there was any reasonable chance that HP might someday make a better calculator then I would feel differently. But the sad truth is that I believe there is almost *zero* chance that they ever will again make any calculator that I would buy. If the day comes that all of my older calculators no longer work, and I no longer can obtain a working example of the older models from a source like eBay, and no other company has started making a decent RPN model, then I'll just stop using calculators altogether. I'd rather have HP out of the calculator business than continue defiling the memory of their past glorious successes.

In fact, considering that HP has spun off the instrument division (the core of the original Hewlett-Packard), discontinued the HP3000 minicomputer (which I think is the best product HP ever has or ever will produce), and thrown the son of Bill Hewlett off the Board of Directors, it really wouldn't

bother me to see the entire company go out of business. I *still* hope that someone will uncover evidence of illegal activities in the Compaq merger that will result in jail terms for Carly Fiorina and the remaing BoD members.

(Of course, I don't really expect any of that to happen, hence my recent posts about making low-cost introductory RPN models, etc. But that's a case of "making the best of a bad situation," rather than what I'd choose if I could get what I really want. At this point, what I'd really like to see is for HP to go down the tubes and take the personal fortunes of the company officers with it.)

The End of HP

*Message #6 Posted by **bill platt** on 4 Mar 2004, 12:14 p.m.,*
in response to message #5 by Wayne Brown

1. Stop using calculators all together. OK. Great idea.

2. "son of Bill Hewlett off the BoD" So? Happens all the time. Nepotism doesn't always work.

3. If the "son of BH" has it in him, he'll start a new company--with the values he holds dear. If not, then that's ok, too---then he wasn't up for the job (either at HP or other) anyway.

Business is business--and rich powerful people make decisions--sometimes bad ones---and they get greedy---sometimes to their detriment.

I agree that there is a sadness about the loss of a great company----but when you get to the point where HP was----it was already gone----then you might as well say "good riddance" and move on.

I was as shocked as the next guy to discover that the RPN calculator was being phased out 2 years ago. But now I am a year older and wiser---and thanks to this forum and others, I now know (a) where and how to get a hold of an RPN device at reasonable cost for a long time to come, (b) that RPN is not the only way and that yes, you can find a reasonable "Algebraic" system and adapt to it, (c) that there are others out there interested in making new RPN devices (even the Aurora 12-c sim is a promising development).

Best regards,

Bill

Really they should have stopped making calcs after the 45 maybe the 65 and still... At work I use a 45 and never lacked anything.

Arnaud

Mixed Feelings!!!!!

*Message #13 Posted by **Michael Meyer** on 5 Mar 2004, 7:34 p.m.,*
in response to message #12 by Arnaud Amiel

Of course we have mixed feelings about HP!!!

Most, if not all of us on the forum are here because we collect, use, and admire the HP's of the past. (That's why the site is a MUSEUM.)

Then came, "modern times", and values have changed. Many of us think for the worse.

HP dissolved (fired) their calculator division.

So, do we want HP to succeed and make future RPN's? Yes... BUT, will there be a market enough to ever really return to innovation? If not, well, then, NO..... So, I see BOTH SIDES. It's hard to compare the products of today with those of a past era.

I just had to point out why we keep debating this point. Sadly, I doubt we will return to the values of the past, as many here have pointed out.

So, for those who really need the new machines for their work, you have my sympathy, and some bit of hope.

For the rest of us, we have our old "museum pieces."

and for everyone else... they'll never understand what they missed or even what the fuss is about.

I'm going to go comb my wrinkles.

RTN2RPN, Michael

Re: First(?) HP 33s bug

While I congratulate Ben for his discovery, I don't think it is enough to trigger a recall by HP; perhaps just an addendum card.

And, while I'm nostalgic for the old times and models, I didn't saw HP recalling any HP42S for the COMB/PERM bug, etc. The only recall I think they made were for HP35, thirty years ago, for errors in trascendental functions.

I am thinking that HP has only produced one running of the 33s (why else would they not release any to any other stores, or at least give more to walmart?) Perhaps they were looking for bugs in the first 500 they sold, and will make the few minor changes to the ROM before making their next set of them (this month)

-Ben

I also produced this bug. Good job finding it Ben.

Doug

I got the same results. Good find. I found another (minor) one last week when I first got the calc and tried to enter some programs. If you try to enter a fraction in PRGM mode it comes out with commas in the wrong place. Try this: enter program mode and enter the fraction 1234/567. It'll come out looking like this: 12,34/,567. If you enter the same fraction on RPN or ALG mode it works just fine.

Perhaps the reason HP released a set to walmart is to find the bugs. It is more efficient that beta testers, and much faster (the 49g+ was in beta for what, 6 months?). They didn't have 6 months for the 33s. This way, they can simply fix all the bugs before making their next shipment and simply replace the 500 they already sold when someone asks them to.

Has this been done before?

-Ben

A silver lining, perhaps?

If you own an example of a very early production run of these 33s calculators, and these calculators have a bug which HP will hopefully quickly fix, then you may have a future collector's item in your hands.

(My 2 cents)

I agree, the early 33S machines with these minor bugs are potential future collectables. My sample will take its place next to other calculators in my collection with undocumented "features", including a very early HP-35 version 2 with the ROM bug.

I believe the 33S represents a serious effort by HP to market a calculator not targeted directly at the educational market. Also, the fact that it took three weeks for people to start finding minor bugs indicates that the 33S is a solid product. HP should be commended for their efforts.

33s Fractions in programs

*Message #21 Posted by **bill platt (les Estats Unis d'Amerique)** on 4 Mar 2004, 3:52 p.m.,*
in response to message #17 by Stanley Fuller

According to my copy of the 33s manual, fractions entered in programs should behave the same as is the case with the 32sii---they should automatically convert to decimals.

You may have found another bug.

Ben, you've got a future in the software industry (should you decide that's a direction for you).

That's a pretty obscure behavior, and you went the extra mile and discovered how extensive it was, and formed a plausible explanation that seems to fit the observed facts.

And still in High School, eh?

Good job!

17B equation need

*Message #1 Posted by **David** on 3 Mar 2004, 4:07 p.m.*

Hello all,

This is a plea for help. I recently changed my batteries and lost all my memory. This was a brutal blow to my life as a few years ago I lost the equations in a fire that decimated my home.

I am in the equipment leasing business. I essentially make my living by buying and selling money. If someone out there in cyber world would be kind enough to help me input the equation again I would be forever in their debt.

This is what I am trying to accomplish:

CST = Cost of the equipment. PMT = monthly payment. I%YR = the interest rate I am buying my money at. RV% = This is always a negative # and is used when a balloon is due at the end of the term (10% is a typical buy out). N = the length of the term in months. #ADV = number of advances (due to the time value of money this could increase my profitability on a deal substantially). PTS = The amount of money I would like to make on a deal i.e. 10 points on a $20,000.00 deal would = $2,000.00 of gross margin. There used to be 2 pages to this equation which resulted in a "more" tab.

HP48GII with speed modul

*Message #1 Posted by **Marc** on 3 Mar 2004, 2:39 p.m.*

I ve seen in dynatech.de that there is a speed module for this calc overclocking it just to 3 times more. 48mhz 3 * gives 144mhz. What do you think about it?

Can you post a link to where we can see this information?

Doug
