The thing is I'm not wel equipped to scan these and I don't have the time to do so. Can anyone give me some hints and tips to do so ?

Re: HP 55 Manuals

*Message #2 Posted by **Bram** on 15 Sept 2004, 2:32 p.m.,*
in response to message #1 by Thibaut.be

I think I know your feelings about this. I've got a Dutch 20S manual myself. It's not in the museum, so I'd like to scan and pdf it. But indeed, it'll take a lot of time, so you'll have to kind of like it to do.
If it is a spiral bound book, it's rather easy: you just "throw" it on the scanner, and scan and save it with seq. numbers (HP55-001.jpg etc.). When the whole book has been scanned, include everything into a word document and print the lot to a pdf file.
You could spread the task by scanning only a few pages per day or week, but I prefer to do everything in one go for constant quality.
If you like you can see some examples of what I already have scanned, on my HP site.

Re: HP 55 Manuals

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 Sept 2004, 2:59 p.m.,*
in response to message #1 by Thibaut.be

Hi, folks;

I scanned some manuals and as part of my own current activity (teaching), scanning and refining images is something I actualy do wihtout complain. It is a lot time cosumming, mostly when your scanner is slow and the images are too large that your computer sometimes need to breath, but final result is mostly rewarding (can I use this word here?). I'd like to offer myself to do that, but you know I'm in Brazil and distances must be taken into account. For now, except for the rush of dealing with three new subjects and having to research motre then the usual, I also have some pending activities related to some calculators from friends that are waiting for service resuming, so I'd need to find some spare time to scan the documents. Anyway, please contact me and if I can help with suggestions, I'd gladly do that.

lcvieira@quantica.com.br

BTW, I have the HP55 original Brazilian (Portuguese) manual and I'll scan it ASAP. It's not too big, but the

fonts are small and they need to be enhanced (enlarged) while scanning, so I need to experiment a bit.

Cheers.

Luiz (Brazil)

Re: HP 55 Manuals

*Message #4 Posted by **Gordon Dyer** on 15 Sept 2004, 5:21 p.m.,*
in response to message #1 by Thibaut.be

Hi, I have recently scanned my HP-45 manual in colour at 300dpi. The 31 double pages take 13.9MB of disk space and I have Acrobat so I can make a pdf. Let me know if you want a copy.

I will also volunteer to scan your HP-55 manual, but I must warn you that if it is a book (like the HP-45 manual) and not spiral bound, then opening it flat for scanning will crease the binding and I would not want to do that to a mint manual.

email me to let me know if you would like to discuss it.
I live in England, UK.

Gordon.

Re: HP 55 Manuals

*Message #5 Posted by **Fred Lusk** on 15 Sept 2004, 9:02 p.m.,*
in response to message #1 by Thibaut.be

If you can live with black/white, the best method I can think of is to use a photocopier that will scan directly to .pdf format. These are very common now. We have one in our office connected to the network. If I need a .pdf of something on paper, I use the copier and get an email in return. Because of this capability, I have only used the fax machine three times this year, and that's for a client who refuses to get download Acrobat Reader (he can't unzip files either).

If you want color, there may be color copiers that can do this, but I haven't seen one.

I hope this helps.

Fred

Re: HP 55 Manuals

*Message #6 Posted by **Thibaut.be** on 16 Sept 2004, 4:05 a.m.,*
in response to message #5 by Fred Lusk

Yes, the pdf copier might be a solution... we've just got one and it really is gorgeous !

But these manuals are mint and I'd hate to crack them... what a dilemna !

Another question : I have a 15C manual in Dutch that I began to scan for Dave but I stopped after ther 30th page : not only the weight of each page is too high (1MB, it wouldn't be nice to get rid of the colors), but it was slow abnd frankly speaking boring. I think I could easily take the spiral out and photocopy it in pdf, wut how to put the spiral back in there ?

Disintegrating HP-41 pouch

*Message #1 Posted by **Juergen (CH)** on 15 Sept 2004, 5:27 a.m.*

The inside of my 41 pouch (the brown one which can also hold the card reader) is disintegrating. Small black crumb is polluting my calculator. What can I do? Should I wash the pouch?

For my other 41, I have a smaller black pouch. The inside is furred and shows no signs of disintegration. Seems to be a much safer place for my calculator...

Cheers, Juergen

Re: Disintegrating HP-41 pouch

*Message #2 Posted by **Raymond Del Tondo** on 15 Sept 2004, 6:14 a.m.,*
in response to message #1 by Juergen (CH)

Hi Juergen,

just throw away the disintegrating pouch,
or you'll have the black snow forever;-)
I also have some of these pouches.
From my experience, the HP-41 pouches with the small
sharp-edged zipper latch are the ones which are disintegrating.
Maybe they used a different material, or the pouches have reached
a specific age now, compare to the card reader wheel...

Regards,

Raymond

Re: Disintegrating HP-41 pouch

*Message #3 Posted by **Jeff O.** on 15 Sept 2004, 7:06 a.m.,*
in response to message #1 by Juergen (CH)

Based on recommendations from this Forum, I put mine through a cycle in the washing machine, then let it air dry. The crumbly disintegrating stuff was eliminated. Worth a try before you throw it away.

Re: Disintegrating HP-41 pouch

*Message #4 Posted by **Thibaut.be** on 15 Sept 2004, 7:08 a.m.,*
in response to message #3 by Jeff O.

yes, this is often the case with Spice series pouches...

I store my spices out of their pouches but keep the pouches, otherwise there's no use to build up a collection...

Re: Disintegrating HP-41 pouch

in response to message #1 by Juergen (CH)

Thank you all for the hints.

While browsing through the Forum Archives I've found the following two threads regarding the same problem:

Disintegration of vinyl case

Disintigrating 41C soft case

Re: Disintegrating HP-41 pouch

*Message #6 Posted by **Valentin Albillo** on 15 Sept 2004, 9:16 a.m.,*
in response to message #1 by Juergen (CH)

Same here, a few years ago, with my HP-71B 'pouches'. In my experience, there are two reasonable things you can do, in this order:

1) Wash the offending pouch thoroughly, till all the disintegrating dust is completely eliminated. You'll know it's enough when the pouch, once dry, expels no dust whatsoever under strong agitation and severe tapping with the hand over a blank sheet of paper.

Afterwards:

2) Place your calculator *inside* a Teflon plastic envelope, which can be either thermo-sealed if it's just a collector's item intended for long storage, or else left open if you use or take out the machine frequently. Then place the teflon-enveloped machine inside the pouch.

This will prevent any further 'contamination' should the pouch keep disintegrating but even better, it will absolutely protect your valuable calculator against any scratches and wear (such as logo wear on the Voyager series and the 71B).

I do exactly like this, with excellent results over the passing years. Frankly, putting an HP-15C, say, in and out of its original tight pouch on a frequent basis should be regarded as criminal behavior.

Best regards from V.

Re: Disintegrating HP-41 pouch

*Message #7 Posted by **Richard Garner** on 15 Sept 2004, 9:42 a.m.,*
in response to message #1 by Juergen (CH)

If you need to replace the pouch, the gray pouch for the 48G is the same size as the one for the 41C/card reader combo. CalcPro had some the last time I looked. If that is not what you need CalcPro also has a belt clip pouch that works real well too.

in response to message #9 by Thibaut.be

It's obviously nothing for germans...

Re: Disintegrating HP-41 pouch

*Message #11 Posted by **Juergen (CH)** on 15 Sept 2004, 1:44 p.m.,*
in response to message #8 by Mike (Stgt)

French rubber => safer calculating? Which flavor do you recommend: banana, strawberry, ...? And what about my HP-85? I guess it does not fit into a rubber, even into XXL sized ...

Just kidding ;-)

Re: Disintegrating HP-41 pouch

*Message #12 Posted by **Mike (Stgt)** on 15 Sept 2004, 2:35 p.m.,*
in response to message #11 by Juergen (CH)

I recomend those strawberry flavoured from MIGROS (a big Swiss food and non-food distributor), AFAIK they are manufactured in Sweden. So it will be safe European wrapper for that "disintegrating" pouch (from Asia I suppose).

Ciao.....Mike

Rubbers Joke

*Message #13 Posted by **Thibaut.be** on 16 Sept 2004, 4:12 a.m.,*
in response to message #12 by Mike (Stgt)

Regarding the flavour, sorry, I dunno, I'm not the one that usually taste them.

Sorry Dave, I know it's not the place for such jokes, but I can't help telling this one :

President of France calls the Belgian Prime Minister, Guy Verhofstad, and tells him : - Guy, we're in big trouble. We're out of rubbers supply. Could you produce some extra more for us ? you know we French lovers are very active, and I don't want to be held for responsible for increase of disease transmission. - Sure, Jacques. What size do you want them ? - Well, according to our recent

statistics, they should be 15 inches long and 3 inches wide. 100 million units will do. - No problem. I'll take care of that.

The Belgian Prime Minister calls the Minister of Economy and tells him : - You need to procude 100 millions rubbers for France. Size is 15 inches long and 3 inches wide. - Huh ? are you sure Sir ? Isn't there a misunderstanding regarding the size ? - Not at all. Just write down on them "Made in Belgium. Size : XXS".

Need HP-19BII emulator

*Message #1 Posted by **Arts (MEX)** on 14 Sept 2004, 6:25 p.m.*

I'm looking for the best financial calculator, and I'm asking if someone knows if there is an emulator for this calc, I tryed de HP 12C platinum and HP 48GX but is not the same thing.

anyone knows something about???

or in other case if anyone knows about emulator for HP-17BII

thanks

Be sure to check www.hp42s.com...

*Message #2 Posted by **Raymond Del Tondo** on 14 Sept 2004, 8:37 p.m.,*
in response to message #1 by Arts (MEX)

For an (amongst many others) HP-17BII emulator:
http://www.hp42s.com/emulation/emu42/emu42.html

17BII Emulation with emu42

*Message #3 Posted by **Jeff O.** on 15 Sept 2004, 7:14 a.m.,*
in response to message #1 by Arts (MEX)

Emulation of the 17BII with emu42 does indeed work fine. Be aware that you will need to get a Rom image of the 17BII, it does not come with the emulator. If you have access to a 17BII and a 48GX, it is fairly easy to do.

Re: Need HP-19BII emulator

*Message #4 Posted by **Vincent Weber** on 15 Sept 2004, 8:15 a.m.,*
in response to message #1 by Arts (MEX)

Hi,

According to Christoph (the developper of Emu42), Emu42 -can- emulate the 19BII, but it is impossible to extract the ROM. Hence we have to forget it. The 19BII and 32SII are now the only two post-41 interesting HP machines that cannot be emulated - pity !

One thing you can do is to use CPACK100/CPACK200 (HP-100LX/200LX emulation) under PocketDOS (www.pocketdos.com). These machines feature HPCALC, which has all the functionality of the 19BII + others, which a larger screen interface. It is not easy: you need to replace Datalight DOS with a true copy of MS-DOS, at least for CPACK100; you need to use the PALRUN utility to run this in landscape mode; furthermore, it is very slow, and so far I have failed to have the cursor blink while editing an equation, which makes this almost unsable...Let me know if you want more details.

As already said in that thread, the 17BII emulation works just fine. What you will miss from the 19BII are the following features: - 3 usable lines vs. 1: This is a pity, but we can still do without it. - Direct alpha keyboard: This can actually be overcome quite well using a KML script that maps the pocketPC virtual keyboard to simulate 2 keystrokes. - Trigonometrics and probabilties functions: This can be overcome if you also have a 27S ROM to emulate the 27S within HP42. Since I can't think of an equation which would require -both- trigonometrics and cash flows (specific feature of financial calculators that can be used in equations), you do not loose the integration between the two. You will have one financial calc (17BII) an one financial one (the 27S), and more, on a single device :) - Access to TVM functions (N,I%,PV, PMT, FV) from the solver. This is more probablematic. I think this really -should- be part of the 17BII... Since the 17BII/19BII/27S do not allow subroutines (this is a pity), rewriting the TVM equation, although simple, is not convenient. You have a partial workaround with the USPV, USFV, SPPV and SPFV functions, but this is a not as rich as the 19BII possibilities. - Additional statistics list functions, such as COPY, LABEL and SUBTOTAL. To me, this is not a big deal. - Graphics: To me (but that's me !) the 19BII graphics functions are pretty useless. I have been doing extensive financial calculations in MBA, and never did a need to plot an histogram, a NPV vs. I% graph, or a curve fitting graph, moreover on a tiny screen !! If I need some sophistaced stuff like this (which is unlikely), I would bother to boot my notebook and use Excel. - Text editing: If you emulate your calc on a PocketPC, you don't need that, you are better off with the PocketPC native programs ! - Demo: who cares ? :)

All this to say, overall, the 17BII/27S combination is a pretty good substitute for a 19BII. With proper text insertion as a bonus (I can never understand why this was not part of the 19BII !), and direct keyboard access to trigonometrics...

Hope this helps. Cheers, Vincent

Re: Need HP-19BII emulator

*Message #5 Posted by **Mike (Stgt)** on 15 Sept 2004, 11:40 a.m.,*
in response to message #4 by Vincent Weber

I agree with Vincent Weber about the HP200LX Connectivity Pack (CPACK200 - the elder CPACK100 will do too) as it's calculator is a port of the HP-19B2 to the PC world. But I see no need to run it under a DOS emulation. A DOS box in Windoze is sufficient - at least for me.

BTW, there once was a ready to run CPACK100 in the internet. I do not know if its still there, can't remember the URL.

Ciao.....Mike

Thnks

Spanish (HP?) words

*Message #1 Posted by **Bram** on 14 Sept 2004, 7:13 a.m.*

I downloaded a description on how to make a pc-link for an HP48G oneself (visiocablehp48.zip from hpcalc.org). The Spanish language in it is quite understandable, except for the words oprimida and oprime. The following sentence seems to describe the use of the function keys:

Para Colocar la Computadora en modo servidor debe Mantener oprimida la tecla de funcion derecha y luego Oprime la flecha derecha

---

Operating the link surely will speak for itself, but still I'm curious what the sentence exactly tries to tell me.
!Hasta replya!

Re: Spanish (HP?) words

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Sept 2004, 7:23 a.m.,*
in response to message #1 by Bram

Para Colocar la Computadora en modo servidor debe Mantener OPRIMIDA la tecla de funcion derecha, y luego OPRIMA la flecha derecha

To set the computer in server mode [you] should keep PRESSED the right function key, and then PRESS the right arrow.

(This is an almost word-by word translation, not a styled one)

Re: Spanish words

*Message #3 Posted by **Bram** on 14 Sept 2004, 9:15 a.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Thought it was something like that, but strangely, I couldn't find the mentioned words, so I had to make sure.

Thanks, Andrés, for your efforts.

Re: Spanish words

*Message #4 Posted by **Garth Wilson** on 14 Sept 2004, 2:34 p.m.,*
in response to message #3 by Bram

But if you write or talk about about a computer yourself, I would recommend using the word "ordenador" instead of the "Spanishized" English word "computador" or "computadora" which the Central American imigrants here in California call it. I grew up in Argentina but back then computers were not a part of life as we know it, so I don't know what they're calling it there. But I did some work in Spain and when I called it "computador", boy, did they ever jump all over me for that! (It has a bad

word in it equivalent to sh__.) It was made very clear I was to call it "ordenador".

Latin Roots

*Message #5 Posted by **Thibaut.be** on 14 Sept 2004, 3:45 p.m.,*
in response to message #4 by Garth Wilson

Quite funny actually.

Oprima, which has a latin root common to French, gives a French word "opprimer", which means something like to harrass... So you need to Harrass the key to have your calc turned on !

Re: Latin Roots

*Message #6 Posted by **Valentin Albillo** on 15 Sept 2004, 4:33 a.m.,*
in response to message #5 by Thibaut.be

... and not only "computador/computadora" isn't the word actually used in Spain (that's "ordenador"), but "oprima" isn't used as well, the current term is "pulse" (press).

So we say "pulse la tecla" (press the key) not "oprima la tecla" (opress the key), which is some Latinamerican locale.

To me, "oprima la tecla" just about brings thoughts of a poor thing getting (unjustly) opressed and abused by some mean user :-) "Pulse la tecla" is much more like it.

In the same vein, the Spanish term for "calculator", as in "HP calculator" is "calculadora" (feminine), not "calculador" (masculine). So it seems we don't actually use a 'calculator' but a 'calculatrix' ... I'd better stop now ...

Best regards from V.

Re: Latin Roots

*Message #7 Posted by **Massimo (Italy)** on 15 Sept 2004, 5:23 a.m.,*
in response to message #6 by Valentin Albillo

...and in italian we say "calcolatrice" (feminine, too). The masculine term, "calcolatore", is reserved to computers.

Looks like in the past we used feminine for smaller, more personal, (less capable?), things.

I think I'd better stop here, too!

Massimo

Hehehehehehe

Re: Spanish words

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Sept 2004, 4:47 p.m.,*

in response to message #4 by Garth Wilson

Garth:

It's nice to know you grew up here. We use the more "english-like" computador/computadora (even with such particular substring in between); "ordenador" evokes the idea of making order, putting things in the right place.

For sure, in Spain the word is "ordenador"!

Re: Spanish words

*Message #10 Posted by **Ángel Martin** on 17 Sept 2004, 3:42 a.m.,*
in response to message #9 by Andrés C. Rodríguez (Argentina)

Not much to add to Valentin's comments, but it all depends on whether you fancy anglophone or francophone stems for your words, as "ordenador" derives from the french word, "ordinateur" (sp?), whilst "computador" comes from the english "computer". Besides the connotation to "put things in order", "ordenar" is also spanish for "sort", so you can see the connection with computers right there, specially in the early days.

Best, ÁM

Re: Spanish words

*Message #11 Posted by **Juan J** on 18 Sept 2004, 3:23 p.m.,*
in response to message #10 by Ángel Martin

Interestingly, back in the 1950s-1960s, Spanish encyclopedias and other publications referred to computers as "calculadoras," (calculators.) Later "ordenador" appeared. Borrowed or taken from the French? I don´t really know.

Regardless of fancing anglophone or francophone, Spanish is having a hard time catching up with technical terms and jargon, or so it seems to me.

My two cents.

Re: Spanish words

*Message #12 Posted by **Ángel Martin** on 20 Sept 2004, 11:22 a.m.,*
in response to message #11 by Juan J

"Having a hard time" is hardly the case. You have two approaches, as follows:

One, like used by the Frnech, is to coin local words for each "jargon" word being introduced, which when it's about computers normally comes from the US, thus "english" (albeit many UK-english native speakers will probably not fully agree with that). Example of this are "logiciel" (for software), and "Memoire morte/vivre" (sp?) for ROM/RAM)

The other is to accomodate for the english words adapting them sometimes by modifying partially their spelling, if at all. This approach "leans" rather than resisting, is more flexible and takes almost no effort to implement, but of course you can always argue that it isn't rigorous enough.

The problem is when this gets out of hand and dubious translations are made for english

terms (how do you call "window handle" in Spanish?), but even this case could be just a matter of getting used to the average aception.

Mis dos céntimos. ÁM

Re: Spanish words

*Message #13 Posted by **Jordi Hidalgo** on 20 Sept 2004, 1:58 p.m.,*
in response to message #10 by Ángel Martin

By all means read (or re-read) the ultimate reference on this topic, namely the chapter "¿Por qué el ordenador se llama así?" in part two of Georges Ifrah's "Historia Universal de las Cifras" (Espasa, 1997 - a combined edition of "The Universal History of Numbers" and "The Universal History of Computing.")

Jordi

I've emailed you the result of that command. I'm not sure what trouble you were having with the ROM, buti made one in the correct format from hp41cv.obj in Nonpareil by doing:

```
sed -e 's/:/ /' -e 's/$/ /' < hp41cv.obj > ~/nsim.rom

.
```

Possible source of cells for 41C battery pack

*Message #1 Posted by **John Robinson** on 14 Sept 2004, 6:38 a.m.*

Howdy folks, I happened to be repairing my son's radio control car the other day, it's one of those tiny things that charges the car battery from the controller. Inside the car is a small NiCd cell, a little smaller than the original N75 from the 41C rechargeable battery pack, but it should be easy to fit four of these car cells inside the original 41c batt pack case. The car cell seemed to be 70/75 mAh. I hope someone finds this info useful - Cheers

Re: Possible source of cells for 41C battery pack

*Message #2 Posted by **Ed Look** on 14 Sept 2004, 4:48 p.m.,*
in response to message #1 by John Robinson

I've never had the privilege of owning a 41C series machine, but for many old HPs, you can get the rechargeable batteries, which substitute for the packs, at Radio Shack, too and they work admirably.

How to engineer a perfect calculator in the 21st century

*Message #1 Posted by **Joerg Woerner** on 14 Sept 2004, 2:36 a.m.*

Hi community

As a collector of vintage calculators from the 70's I'm usually disappointed by the common Kinpo and co calculators of this century. You know them all, these HP-30S, TI-30X IIS, Canon, Casio, Karce et al stuff.

But this night I made a great discovery !

I started to disassemble a brand new released calculator and - believe it or not - it is made in China AND brought all the memories of the HP-35 and SR-50 back.

WHY ???

Because it is the best engineered calculator I discovered the past 10 years. Let me start point by point before blowing the fog away:

1. It looks great and feels heavy.

2. The keyboard makes a crisp click with a precise feedback.

3. The calculating precision is much better than expected.

More details:

The housing is made of two shells, the upper one is covered with a thick, brushed aluminium sheet metal. This wonderful faceplate is partly polished.

The lower half of the shell hides the 4 screws under large rubber pads like you know it from your lovely HP's.

Inside the lower shell are two huge pieces of metal to give the calculator a strong weight.

The keyboard uses a well known technology, too. Every key is composed of a small disk spring and a (unfortunately not double shot) molded plastic key.

Internal calculations are based on 13-digit which are rounded to a 10-digit result on the bright display. Running Mike Sebastian's calculator forensics gives a result with a really small error (8.999 999 999 xxx).

Since the HP-33S necessary to mention: The display sports good comma and thousands separators...

The calculator is still behind the fog ? I purchased mine last week at a Staples for about $60 - the name plate: TI BA II Plus Professional.

BUY AND ENJOY !!!

Regards, Joerg

in response to message #1 by Joerg Woerner

No doubt you are perfectly right on what you say, and I certainly appreciate that this calculator is far beter engineered than all the other, including the recent HP's.

But to my opinion it just lacks one thing that will never make me buying it : RPN.

I'm working daily on a 12C, mainly as a number banger, and god ! how this RPN is far superior to algebraic !

*Message #11 Posted by **Hugh Evans** on 14 Sept 2004, 1:51 p.m.,*
in response to message #1 by Joerg Woerner

Excellent. I would love to see TI using tactile switches on all of their machines, and better still would be the addition of an RPN mode. I'm not saying this because I want HP driven out of the marketplace-- I want them to compete directly with TI.

A little competition can go a long way. Let's hope this persists!

Honest Sellers

*Message #1 Posted by **Richard Parfitt** on 13 Sept 2004, 8:55 a.m.*

"Honest Sellers", Credit where credit is due, I have recently and successfully acquired two very good condition HP calculators from these two people, (hpzoeker@hotmail.com), (ecjmuijen@zonnet.nl), after seeing their advertisments on MoHP. I thought a little thank you via the forum would not go amiss as the whole transaction was very efficent and honestly played out. I have done this with their permission in reaction to the (probably rare) times that people are duped. Maybe other buyers and sellers could do this with a search phrase in their text so that any prospective buyer or seller can search for good transactions.

Re: Honest Sellers

*Message #2 Posted by **Carlos Genders** on 14 Sept 2004, 4:53 a.m.,*
in response to message #1 by Richard Parfitt

Thank you very much Richard. All credit is for you. It always is a matter of trust (since a buyer often pays in advance for something he or she didn't actually see). But is always a pleasant surprise that everything works out fine.

NCEES calculator update

*Message #1 Posted by **Norris** on 13 Sept 2004, 1:29 a.m.*

NCEES considered possible changes to their calculator policy at the August 2004 annual meeting. NCEES has not yet officially announced the results. However, the Virginia APELSCIDLA Board (don't ask about the abbreviation) hinted at the outcome in a recently-published newsletter, as follows:

****

During the August 2004 NCEES Annual Meeting, a motion was passed that modifies the calculator policy to state that “only models of calculators as specified by NCEES are permitted in the examination room.” Therefore, in the near future, there will not be a prohibited list, only acceptable calculators will be published, and only calculators on that list will be permitted. Please check the NCEES website for updates.

www.state.va.us/dpor/ape_Summer%202004%20Dimensions.pdf

****

Currently, the only HP calculators that are specifically NCEES-approved are the 9S, 9G, 30S, 32S, 32SII, and 33S. This list may or may not be subject to change. If it doesn't change, then ***all*** other HP models will be banned on future NCEES exams, including previously acceptable older models such as the 11C, 15C, and 20S.

Re: NCEES calculator update

*Message #2 Posted by **J.C. Randerson** on 13 Sept 2004, 11:05 p.m.,*
in response to message #1 by Norris

I taught myself how to use my Dad's Aristo slide rule in case all calculators get banned by these pinheads...

Re: NCEES calculator update

*Message #3 Posted by **martin cohen** on 14 Sept 2004, 8:47 p.m.,*
in response to message #2 by J.C. Randerson

If slide rules are not mentioned, then they cannot be used!

Even if they are mentioned, if your particular brand and model (I had a K&E Log-Log Duplex Decitrig, and it may be too powerful) is not mentioned, too bad.

Re: NCEES calculator update

*Message #4 Posted by **Norris** on 15 Sept 2004, 1:03 p.m.,*
in response to message #2 by J.C. Randerson

Slide rules are cool, and learning about their operation is worthwhile. However, slide rule skills are no longer of any value on NCEES exams, so don't bother to acquire them for that reason.

In fact, slide rules seem to have faded completely out of the picture so far as NCEES and the state boards are concerned. I have not seen any current guidelines that address slide rule use on exams. My ***guesses*** are as follows:

PE and PLS exams: These are open-book exams, and there are typically few restrictions on the books, charts, etc. that can be used. You could probably use any slide rule without problems (as long as you didn't write on it).

EIT and LSIT exams: These are closed-book exams; the typical rule is that you cannot bring in anything except an approved calculator. It is therefore quite possible that a slide rule might be challenged or barred by exam proctors.

The best approach would be to get an opinion from the state board prior to the exam. If they indicate that slide rules are OK, then bring a copy of their response to the exam, to show to the proctors if necessary.

Re: Plotting Hurricane Ivan

*Message #2 Posted by **Karl Schneider** on 11 Sept 2004, 3:12 p.m.,*
in response to message #1 by deleted

Jim --

Plotting Ivan's lat/lon coordinates again(st) time? Sure -- download and print a map of the region, and annotate each plotted location of the eye or center with the date-time-group (DTG).

Seriously, the trajectory of a hurricane over time would be more accurately forecasted using numerical prognostications of the state of the atmosphere, not mathematical extrapolations of past course.

The HP-41C Navigation Pac has some routines that might be useful for your purposes -- dead reckoning, great circle, rhumb line, etc.

-- KS

Re: Plotting Hurricane Ivan

*Message #3 Posted by **Dave Shaffer** on 11 Sept 2004, 4:52 p.m.,*
in response to message #1 by deleted

Jim,

Plot the lat/lon coordinates for each time point that you have. The result will be the trajectory of the hurricane as a function of time. If you start with a map having lat/lon on it, you can actually see what islands are getting the brunt of Ivan.

Or, you can look at what these guys have:

http://www.intellicast.com/Local/USNationalWide.asp?loc=usa&seg=StormCenter&prodgrp=TrackingCharts&product=HurTrack2&prodnav=none&pid=none

I hope the URL isn't too long for your viewer. If so, then just go to www.intellicast.com (their home page), and the hurricane track is on the right-hand side. If you click that image, you will be taken to the address above.

As Karl points out, the ultimate track of Ivan depends not on mathematical calculations, but on the driving forces that make the weather happen (only somewhat predictable!).

problem in nnm

*Message #1 Posted by **Rusario** on 11 Sept 2004, 10:02 a.m.*

hi, we have installed nnm 6.2 on a windows 2000 server,it is working fine but the nnm shows 30 minutes diffrence inrespect to the windows sytem time.So all the event generated shows 30 minutes diffrence.can any one be able to suggest me how to correct this problem.

Thanks Rusario

What is this about?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 Sept 2004, 11:49 a.m.,*
in response to message #1 by Rusario

Hi, Rusario;

I'm sorry to ask but... is 'nnm' a program to deal with HP calculators?

If not, maybe you'd like to post your message in another group and posted it here. Would that be possible?

If you are in the correct group, would you explain a little more, please?

Luiz

12345 to remove this one.

Edited: 11 Sept 2004, 11:47 p.m.

Re: problem in nnm

*Message #3 Posted by **DavidY** on 12 Sept 2004, 4:33 p.m.,*
in response to message #1 by Rusario

nnm is HP OpenView Network Node Manager 6.2

Rusario, you should refer questions to HP end user support. This is an independent web site for HP calculators. It is not sponsored or supported by Hewlet Packard.

If you are not entitled to user support you might check Google and search "groups" for a NNM user group

old sharp calculator commercial

*Message #1 Posted by **JaSon** on 10 Sept 2004, 12:43 p.m.*

Just thought I would share these links to two old sharp calculator commercials

http://www.archive.org/movies/details-db.php?collection=prelinger&collectionid=sharp_calculator

http://www.archive.org/movies/details-db.php?collection=prelinger&collectionid=sharp_calculator_2

Commercial for the Sharp LC-8 (aka Sharp EL-8) calculator the world's first battery operated portable calculator

In case the links don't work just go to archive.org and search in the prelinger archive for calculator

Re: old sharp calculator commercial

*Message #2 Posted by **Allen McLaughlin** on 12 Sept 2004, 10:39 p.m.,*
in response to message #1 by JaSon

Thanks for the links! The EL-8 is my favorite vintage machine, named by my daughter as the "chubby" one, for big pockets. Those commercials add greatly to my attempts to document these early devices, and there is no way I would likley have found them on my own. Now I wonder if any will show up for lets say, the panasonic JE series (shades of the Jetsons!), or maby the HP-35? How neat to see one for the 41c on the space shuttle!

alsaudio

Hey - here's a couple of HP's too...

*Message #3 Posted by **Johnny Bjoern Rasmussen** on 14 Sept 2004, 6:23 a.m.,*
in response to message #1 by JaSon

At http://www.archive.org/movies/thumbnails.php?id=3669, wich is the preview of a program called 'Palmtops', I see both a HP-19BII Business Consultant, a HP-12C (at least I think so), and presumable in the end a HP17BII. I have not yet downloaded the entire program, so I do not know what the talks are about...

HP 10 B

*Message #1 Posted by **stefan granat** on 10 Sept 2004, 8:16 a.m.*

The calc have not RPN ?? What is the use of input on this calc? stefan

Re: HP 10 B

*Message #2 Posted by **bill platt** on 10 Sept 2004, 10:05 a.m.,*
in response to message #1 by stefan granat

Hi stefan

"Input" is the clever thing that HP came up with so that they could build both RPN and ALGebraic models on the same molds!

Seriously though, the "Input" is used as as a separator when doing certain 2 number functions---you have to see the manual.

The 20s, 21s, 22s, 27s, and 17b 17bii all have the "input" as well, and for similar reasons.

Regards,

bill

17BII and 19BII indefinite loops ?

*Message #1 Posted by **Vincent Weber** on 10 Sept 2004, 3:52 a.m.*

Hi all, I am now diving into the joy of programming the 17BII and 19BII. I discovered the L() and G() functions and what they can bring: (almost) true programmability ! using syntax like 0*L(...)+... allows true instructions steps, multiple equations, and true definite loops which do more than just adding, with the 'sum' function. That's great for a formula-based language. It does not have the power of RPL, but it is cute and well suited to finance people. No wonder why the 17BII and 19BII were hugely succesful, almost as much than the 12C... Btw, it is a shame that HP removed these functions from the 17BII+. They removed what made the power of these calculators, and replaced it by a nice to have, but easy to program, currency converter, 4x the memory which nobody is likely to ever use, a crappy keyboard. The only positive thing I can think of for this machine is the nice, more readable, display... Let's call it the HP-17BII- !!

Anyway, I was wondering a few things about the 17BII/19BII world:

1/Is there a way to do indefinite loops, i.e. to break a loop when the number of times to loop is not known a priori? This would be the equivalent of the WHILE/REPEAT structures in a high-level programmming language, and this is extremely useful. I tried to use L(I:N) to set the counter to the maximum value within the loop, in order to break it early, but this does not work. It seems that the calc is treating this 'I' as a new variable, and not as the counter. Any idea ? This feature is the only programming feature that a Casio FC-200 or a 12C can do, that the 17BII/19BII cannot do...

2/Is there a way to uset the S() function to have 'subroutines', i.e. to force the solver to call an equation with different parameters, automatically, without user input ? I tried to use something like 'IF(S(F):L(F:SQ(X)):0*L(X:2)+G(F)+0*L(X:3)+G(F))' to 'call' the 'F' function (X^2) on '2' and then '3' arguments to get their sum, but this just failed.

3/Is there any reason why the 19BII has the built-in TVM functions (PV, PMT, FV, I, N) accessible from the solver, while the 17BII can't ?? This would be useful for some financial programming.

Anyway, long live the L() and G() functions, and let's wish HP will bring them back in a real 17BII+...

Cheers,

Vincent

Is HP Calculator Keystroke Programming like FORTRAN??

*Message #1 Posted by **Ed Look** on 9 Sept 2004, 11:40 p.m.*

As the topic title asks, is it?

Currently, I have to teach some FORTRAN (ugh... I have to drag it out of the depths of my memory like stuff down a pipe I go after with a plumber's snake...) and one day in front of the students, it occurred to me that it looked VERY MUCH like the keystroke programming of the old 34C, the 32SII, and the 33S.

But I did find the RPL of the 48G, 48G+, and 49G+ to be fairly different from the aforementioned older calculators and from FORTRAN.

Am I just a little nuts (or a lot)?

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #2 Posted by **Karl Schneider** on 10 Sept 2004, 12:13 a.m.,*
in response to message #1 by Ed Look

Ed --

I would liken keystroke programming more to the assembly-language paradigm rather than to high-level compiled language -- each line contains one operation/instruction, rahter than a complete statement.

However, I also believe that Fortran '66 and '77 may have served as an inspiration for the high-end programmable calculators of the mid-70's. I have noticed a number of parallels:

1. "GTO" and "GSB" are like "GO TO" and "CALL"
2. "ISG" and "DSE" provide the "DO" looping functions
3. Flags are like LOGICAL variables
4. HP-41C external labels ("LBL {alphanumeric}") are like entry points
5. HP-41C local labels ("LBL nn or a-e") are like statement labels
6. "END" defines a complete program, like Fortran "END"

I strongly suspect that Fortran is still the most convenient high-level language in which to write a straightforward, text-input, number-crunching, text-output program. However, that's not what computers are primarily used for, anymore...

-- KS

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #3 Posted by **unspellable** on 10 Sept 2004, 4:21 p.m.,*
in response to message #2 by Karl Schneider

The 28 & 48 (& 49?) use a language called RPL for Rom based Programming Language. It borrows from the languages FORTH & LISP.

RPL

*Message #4 Posted by **Matt Kernal** on 10 Sept 2004, 6:45 p.m.,*
in response to message #3 by unspellable

RPL = Reverse Polish Lisp :-)

Re: RPL

*Message #5 Posted by **hnspellable** on 13 Sept 2004, 2:10 p.m.,*
in response to message #4 by Matt Kernal

I have seen "RPL" refered to as "Reverse Polish Lisp" and a couple of other terms, but the overwhelming preponderance of the evidence I have seen supports "ROM based programming Language".

When an RPL program is compiled the various operations are actually just pointers to an address in ROM where all the routines are stored. This allows the compiled code to have a minimal size for storage in RAM which is at a premium in a calculator, especially in the 28, 48 era. This is why a compiled RPL program is much smaller than its source code as opposed to say, a C program, where the compiled code for a small program is typically much larger than the source code.

It is the storing of all the routines in ROM and then using pointers in the compiled code that results in the name "Rom based Programming Language".

Many languages use Reverse Polish at some level so this is not a distinctive feature of any one language.

So I am going to stick with the term "ROM based Programming Language" until some one can furnish hard evidence to the contrary.

Re: RPL

*Message #6 Posted by **John Limpert** on 13 Sept 2004, 4:31 p.m.,*
in response to message #5 by hnspellable

What you have described corresponds to a class of languages called threaded interpretive languages (TIL). The most famous TIL is probably FORTH, invented by Charles Moore. DEC wrote a FORTRAN compiler for the PDP-11 that produced threaded code. Its generated code was much more memory efficient than the code produced by a native code compiler. Although a TIL can be burned into a ROM, that is just an implementation detail. TILs are popular whenever code size and address space are at a premium.

Re: RPL

*Message #7 Posted by **James M. Prange** on 13 Sept 2004, 8:48 p.m.,*
in response to message #5 by hnspellable

Quoting from "HP-28 Insights", "Principles and Programming the HP-28C/S" by William C. Wickes:

> Quote:
>
> The HP-28 "language," which includes the operating logic as well as the specific command set, is called *RPL*. Computer languages are known for their whimsical names; RPL is no exception--it stand for *Reverse Polish Lisp*. This name suggests the HP-28's derivation from HP calculators (and from FORTH, another language that uses reverse Polish logic) and from the computer language LISP, which is frequently used in

> computer symbolic mathematics systems. Note that the HP-41 language was never given a name, so many people call HP-41 programming "RPN programming," which is unfortunate since, properly speaking, RPN is a mathematical logic that is not specific to any calculator or computer.

Quoting from HP's RPLMAN.DOC (part of "HP 48 Software Development Tools"):

> Quote:
>
> A new system was therefore developed, which merges the threaded interpretation of FORTH with the functional approach of Lisp. The resulting operating system, known unofficially as RPL (for Reverse-Polish Lisp), made its first public appearance in in June of 1986 in the HP-18C Business Consultant Calculator.

I expect that "ROM-based Procedural Language" is a name invented by marketing types to fit the already-existing abbreviation RPL. As Bill Wickes wrote that *RPL* stands for *Reverse Polish Lisp*, that's "official" enough for me.

But is "RPL" an abbreviation (pronounced "are-pee-ell"), or an acronym (pronounced "urple", which rhymes with "purple")?

Regards,
James

in response to message #7 by James M. Prange

> Note that the HP-41 language was never given a name, so many people call HP-41 programming "RPN programming,"

The name I read nearly 20 years ago for it was "FOCAL" from Forty-One CALculator language.

Problem with that is that there already was an existing FOCAL language, on DEC PDP-8 computers. I don't believe HP ever used the term "FOCAL", perhaps for that reason.

FOCAL (Re: RPL)

*Message #10 Posted by **Raymond Del Tondo** on 14 Sept 2004, 8:32 p.m.,*

in response to message #9 by Les Bell [Sydney]

Hi,

there once was a thread related to (the origin?) of FOCAL.
It's likely that users, maybe from PPC, used that word FOCAL
in relation to the HP-41 programming language,
because the word was nice to remember.

At least the word FOCAL is also common for this language,
as for many other uses.

By the way:
Until recently, there was a webpage www.FOCAL.de , too (now forwarded),
and www.FOCAL.com still exists.

Another example: The abbreviation RPL stands for 'Richmond Public Library'
as well as 'Regierungspraesidium Leipizig' (www.rpl.sachsen.de)
and 'Staatskanzlei Rheinland-Pfalz' (www.stk.rpl.de)
to name only a few.
Even better, 'www.rpl.de' also exists,
and isn't related to the HP-48 in any way;-)

Regards,

Raymond

*Message #11 Posted by **Mike (Stgt)** on 15 Sept 2004, 12:07 p.m.,*
in response to message #10 by Raymond Del Tondo

Hello Raymond!

FOCAL is a programming language that existed _before_ the HP41 (AFAIK) and is _not_ related to that calculator. But why not use the same acronym for different things. If talk about FOCAL on this list the chance is quite low to get confused. Someone here who programmed in FOCAL before the HP41 came to life?

Ciao.....Mike

Re: FOCAL

*Message #12 Posted by **Frank Wales** on 15 Sept 2004, 5:24 p.m.,*
in response to message #11 by Mike (Stgt)

FOCAL actually got associated with the HP-41 via a contest that Henry Horn ran through 'HP Key Notes' to come up with a name for the 41 user code programming language, around about 1982, I think. I remember, because I entered it (and, in fact, I'd also submitted 'FOCAL' as a name, which I suggested could be short for 'Forty-One Contra-Algebraic Language', rather than the more straightforward 'Forty-One Calculator Language' that eventually won).

There was a protracted period when they said that they'd picked a winner, but were going through some legal checking before they could announce it, and I guess it was because the name had been used before for a language, and they were doing due diligence for trade marks or assessing the likelihood of being

sued, or something like that.

FOCAL, etc (long)

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 15 Sept 2004, 6:18 p.m.,*
in response to message #10 by Raymond Del Tondo

I have posted these comments a couple of times before, but it may be worth to post
them again:

The HP41 language

HP and some other people used the word FOCAL to refer to user programming
language or code for the HP41 family. It is supposed to mean Forty-One Calculator
Language, or something like that; in the vein of ALGOL (Algorithm Oriented
Language), COBOL (Common Business Oriented Language), ForTran (Formula Translator), APL (A Programming Language), BASIC (Beginners All-purpose
Symbolic Instruction Code) and other, acronym-based names. The next wave of
languages used more “personal” names, as Pascal, Modula2, SmallTalk, etc; along with
the “letter based family” originated by BCPL siblings like “B”, then “C”, and later
“C++”. Of course, more current ones are Java and C#.

The KeyNotes user-support newsletter, published by HP around 1980 once opened a
contest to name the HP41 user programming language. Specifically, it refers to the
language used to create programs like this one:

```
01 LBL “HELLO”
02 “HELLO WORLD”
03 AVIEW
04 0.009
05 LBL a
06 TONE IND X
07 ISG X
08 GTO a
09 CLA
10 CLX
11 CLD
12 END
```

It is believed that the usage of the FOCAL name started after that contest.

I had used a Digital LSI-11 (the microprocessor-based version of the PDP-11
minicomputer) in 1978 and 1979; some of the available languages were BASIC and
FOCAL (Formula Calculator). FOCAL was similar to the BASIC dialects of the time,
but it lacked GOSUB-RETURN constructs, so it was suited for small, simple problem
solution, mostly with numeric answers; and not for large programs.

Line numbering and insertion

In BASIC, it was customary to number the statements in steps of 10, to allow for
“insertion” of debugging code or program modifications. In fact, some

BASIC dialects
included the RENUMBER command, to tide up a program after debugging and
correction; or just to make room for more insertions!

So a program like:

```
10 INPUT “Enter an integer argument between 2 and 30”, X
20 F=1
30 FOR I=1 TO X
40 F=F*I
50 NEXT I
60 PRINT “The factorial of ”;X;” is”;F
70 STOP
```

will evolve to something like:

```
  3 REM Clear the screen and put the cursor in the upper left corner
  4 CLS
  5 PRINT “Factorial Calculator – Ctrl-C to Exit”

10 INPUT “Enter an integer argument between 2 and 30”, X

11 REM Argument validation and error checking block
12 IF X<2 THEN PRINT “Invalid argument”: GOTO 10
14 IF X>30 THEN PRINT “Invalid argument”: GOTO 10
16 IF X<>INT(X) THEN PRINT “Invalid argument”: GOTO 10
18 REM End of argument validation block

20 F=1
30 FOR I=1 TO X
40 F=F*I

41 REM Beginning of debugging code block
42 REM Display and breakpoint just for debugging purposes
43 PRINT I, F,
44 PRINT “Press any key to continue”
45 D$=INKEY$
46 REM D$ is a dummy variable, only to create a wait for a keypress
47 REM End of debugging code block

50 NEXT I
60 PRINT “The factorial of ”;X;” is”;F

65 GOTO 10

70 STOP
```

A distinctive feature of the PDP-11 FOCAL was the use of fractional line numbers for
program statements, so if you need to insert a line between lines 1 and 2, you can just
use 1.5 as a line number.

Since the FOCAL name was already used for another programming language, my
personal opinion is that it should not have been a valid option for the HP41 case.

A non-successful submission

By the way, my submission for the HP41 programming language name contest was
EUREKA, because it is a well known, related to science word (and a rather universal
one), and also because it can be taken as an acronym for the most

```
important features of
the HP41 system:

•       Expandable (the hardware design allows for peripherals, extra
memory, etc)
•       User customizable keyboard
•       RPN logic system
•       Extendable (user programs are invoked in the same way than
built-in functions)
•       Keystroke operation (opposed to writing BASIC lines in other
calculators)
•       Alpha capability

Alas, I never received any feedback about this idea.
```

Re: FOCAL, etc.

*Message #14 Posted by **Mike (Stgt)** on 16 Sept 2004, 3:16 a.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

Tnx a lot for that clarification, Andrés.

Not to start a new contest, but how about CoNuProLa (don't confuse with MoPraWaLa) for MCode and for the user language NUL (Nut User Language). AMPHITRYON would be nice too, it has enough letters to spell something funny (no idea yet) and HERCULES is already taken by the S/360 and 390 emulator.

Ciao.....Mike

in response to message #15 by Veli-Pekka Nousiainen

Yes, but what could KEYS stand for??

Re: FOCAL, etc (long)

*Message #17 Posted by **Jim Butch** on 18 Sept 2004, 8:15 p.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

While the FOCAL interpreters for the DEC PDP8 and PDP11 minicomputers lacked GOSUB - RETURN statements, FOCAL accomplished subroutine calls with the "DO" statement. The FOCAL language used line numbers that were composed of a Group and line number joined by a "." For example, "DO 10.01" would call that line of the program as a subroutine and return at the end of the line. "DO 10" would call the entire group 10 as a subroutine and return at the end of the last line of the group. Later versions included a RETURN statement as well. FOCAL statements could be abreviated with the first letter of statement, "R" for RETURN for example.

FOCAL was designed to enable the user to write as large a program as possible in a small, fixed allocation of memory, up to about 8K in a PDP8 and about 16K in a PDP11. The variables and arrays were allocated in the remaining memory of the machine. FOCAL interpreters were small, in the 8K to 12K range. They supported extended precision math at a point in time when most interpreters used 6 digits of precision.

FOCAL was intended to be a programmable calculator. It was possible to code quite complex applications with it. Some versions even included event driven multitasking and very flexible I/O, like the HP-85 ten years later.

Re: FOCAL, etc (long)

*Message #18 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Sept 2004, 11:18 a.m.,*
in response to message #17 by Jim Butch

Jim:

Thank you for your clarifications. It seems my memories from the time I used FOCAL as EE student covered just a part of the story.

In 1978 the EE students helped assembling a Heathkit LSI-11, which was the first computer in my university. Before, we needed to punch cards and run our programs at an external site. I was granted the "TRAU" nickname because I reverse plugged an UART chip on its socket (fortunately, it was detected before final assembly).

We needed to use a "octal debugging tool", and a "binary relocatable loader" as previous steps before actually loading a programming language (FOCAL or BASIC), and all those came in punched paper tape. So it took about 20 minutes to "boot" the machine before running a program. And any glitch which caused a hang-up required all those steps to be repeated!

Around 1980 the same computer was given an operating system, a couple of 8 inch floppy drives, and it became more "productive". Then, other larger computers (NCR, IBM, etc.) were installed at the university.

Re: RPL

*Message #19 Posted by **Frank Wales** on 15 Sept 2004, 5:11 p.m.,*
in response to message #5 by hnspellable

I don't have a copy to hand, but one of the HP Journal articles in the issue that featured the HP-48SX stated unequivocally that RPL was short for 'ROM-based Procedural Language'. This is an excellent and definitive reference for the meaning of RPL.

It's also complete baloney.

When I saw this article, I accosted Bill Wickes about it, and he was as surprised as I was. Bill insisted that RPL was short for 'Reverse Polish LISP' and nothing else, and says as much in his own writings. As one of its creators, he ought to know, and I'd trust him over pretty much anyone else on this.

He had no idea where the 'ROM-based Procedural Language' moniker came from, but speculated that someone within HP who worried about such things felt that 'Reverse Polish LISP' was too

frivolous, or insufficiently dry and technical, or something, and took it upon themselves to "fix" it without consulting the actual inventors.

RPL: Disagreement with the ROM-etc. interpretation.

*Message #20 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Sept 2004, 5:47 p.m.,*
in response to message #19 by Frank Wales

If RPL stands for 'ROM-based Procedural Language', that is: a language which allows for short programs, where each statement can invoke one of a set of powerful functions contained in a ROM... well, the HP25 is a RPL calculator!

Was this intended to be a reply to Ed's post?

*Message #21 Posted by **Karl Schneider** on 10 Sept 2004, 10:20 p.m.,*
in response to message #3 by unspellable

This doesn't seem to relate to my comparison of Fortran to the advanced programmables of the mid-70's, which include the HP-65, -67, -41, -34 and their descendants mentioned by Ed. Perhaps you meant to back up to his message in reply...

Re: Was this intended to be a reply to Ed's post?

*Message #22 Posted by **Ed Look** on 11 Sept 2004, 1:22 a.m.,*
in response to message #21 by Karl Schneider

Yeah, it did seem to me that the RPL machines are different in the way you approach programming them. And thanks, I wasn't aware that RPL had this lineage. Maybe I'll go look up FORTH and LISP. I'm not an engineer nor programmer nor even really a teacher, so I am only familiar with a very limited range of programming tools and appreciate the heads up.

Karl, yes, I think that's what these fellows meant!

Anyhow, I suppose this might be one reason why I am drawn more to the 34C/32S(II)/33S type programmable scientific rather than the 38G/39G(+)/48G(+, X)/49(+) type graphing machine, even though this latter group is leaps and bounds more powerful... besides, the former group fits better in a tighter space (like pockets!)... even though I find myself now more on a daily basis using the 33S and the 48G (or when home, 32SII/48G+) in tandem; I actually do calculations and program the more FORTRAN-like ones and use the LISP-like ones as a very convenient and portable database (to copy stuff from into the 32SII or 33S)!

No. It was a friendly correction of Unspellable's definition of RPL (nt :-)

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #24 Posted by **Ed Look** on 11 Sept 2004, 1:12 a.m.,*
in response to message #2 by Karl Schneider

Karl, THAT is exactly what gave me this notion! You can even flowchart a HP 34C/32S/32SII/33S program in just about the same way!

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #25 Posted by **Ed Look** on 11 Sept 2004, 1:43 a.m.,*
in response to message #24 by Ed Look

And, Karl, as to your post concluding lament-

actually, in science, FORTRAN is still holding on. Sure, there were some contenders that held the day for a few days, like PASCAL or C, but even scientists are vulnerable to trendiness. FORTRAN appears to have some staying power. (And if I could learn it well enough to kluge up some quick code for a simple purpose, then it must be user-friendly!) We STILL use them for calculations and text output!

The course is a chemistry course. It was deemed that this time, a little chemistry and physics will be displaced by a little programming because contrary to appearances, today's college kid is LESS computer literate in the real sense than their predecessors a little while ago, and hard science will always from the Shockley-Schottky revolution on depend on computers.

(Oh, these kids can tweak Windows XP like Bill Gate's own engineers, or troubleshoot a homemade network, or e-mail with the coolest hacker lingo, but THEY DON'T REALLY KNOW HOW A COMPUTER WORKS whether from the hardware OR the software end. One colleague remarked that they couldn't change an add-on card because they never heard of PCI or ISA! And, none of them appear to know how to program their TI graphing calcs!!)

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #26 Posted by **.** on 11 Sept 2004, 7:18 a.m.,*
in response to message #25 by Ed Look

"today's college kid is LESS computer literate in the real sense than their predecessors a little while ago"... "but THEY DON'T REALLY KNOW HOW A COMPUTER WORKS whether from the hardware OR the software end. One colleague remarked that they couldn't change an add-on card because they never heard of PCI or ISA!"

If my sons friends are any indication, I have to disagree. I'd say 80% of his fellow engineering students have "buil"t their own PCs from plug-in cards at least. A fair amount (maybe 1/3) have programmed in asm. A half dozen or so have made microcontroller projects in their free time as hobbies. I know of 2 that are working on making their own CPUs in verilog.

Maybe its just different in the sciences.

"And, none of them appear to know how to program their TI graphing calcs!!)"

I bet none of them really care, either ^_^

Edited: 11 Sept 2004, 7:19 a.m.

Re: Is HP Calculator Keystroke Programming like FORTRAN??

in response to message #26 by .

Sure, engineering students will know something about the insides of computers, but all these kids who are supposedly learning about computers in school have absolutely no idea what goes on inside the box, in either hardware or software. They're just appliance operators.

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #28 Posted by **Ed Look** on 11 Sept 2004, 2:17 p.m.,*
in response to message #27 by Garth Wilson

Garth, this is true also for SCIENCE students (especially in the biological end) and it's scandalous. Most of these kids have no idea what a scientist is and don't really want to find out. Their preferred short term destinations are like, Johns Hopkins Med, Cornell Med, etc.

They would not acacdemically survive head to head with engineering students, at least for the first couple of undergraduate years. At least in the old days, this often improved by their junior year or so.

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #29 Posted by **Ed Look** on 11 Sept 2004, 2:12 p.m.,*
in response to message #26 by .

Ah, but your son and his friends are ENGINEERING students! That's already a rarefied stratum of students to belong to. These guys can make a father proud- they know their trig inside out, they can correct the integration or statistical errors they run into in textbooks, they might even know the difference between De Broglie and de 'hood.

A lot of science students, primarily the ones from here in the States (as I was) are significantly weaker in the basics of mathematics and science not only because their teachers and schools are weaker in these areas than those from many foreign lands, but because of the over-hedonistic lifestyle here, they have actually lost, rather, never fully developed an interest in making themselves truly "better" people academically, as this is here less necessary to their economic and social well being than in other places.

I say, Dads, unite! Kick 'em all in the butt and then work 'em off. This is the old fashioned way and the only way they'll ever become educated, intelligent kids... ... who CAN understand why he might rather have PC 3200 rather than 2700 RAM, change a video card, figure out why DOOM is crashing, make his own cable, know why some equations all of a sudden contain a natural logarithm, understand (somewhat, as no one really does) wave-particle duality, and help some little kid keep his training wheels from falling off all the time.

Is BASIC an option for your need?

*Message #30 Posted by **Andrés C. Rodríguez (Argentina)** on 11 Sept 2004, 10:24 a.m.,*
in response to message #25 by Ed Look

BASIC (Beginners All-purpose Symbolic Instruction Code) is quite like FORTRAN and easier to use. Being an interpreter, the edit-run cycle is very simple, avoiding compiling and linking steps in between; hence is very good for educational purposes (of course, compiled code is better for performance and for commercial uses).

There are many BASIC platforms available. Please note that I point to the "classic" BASIC dialects, not "modern" ones as Microsoft VisualBASIC, which are not FORTRAN-like at all.

Among many sources, you can visit www.truebasic.com for a lot of interesting information. A Google search with the keywords "BASIC Kemeny Kurtz" will point to many interesting places.

(Dartmouth College professors Kemeny and Kurtz created BASIC 40 years ago).

Re: Is BASIC an option for your need?

*Message #31 Posted by **Ed Look** on 11 Sept 2004, 2:00 p.m.,*
in response to message #30 by Andrés C. Rodríguez (Argentina)

Hmmmm.... BASIC.

I remember playing with basic AFTER I learned FORTRAN; it was came preinstalled (or was it part of DOS 3 in those days?) on some of the first PCs I was able to get my hands on. Yes, the early BASIC versions were more FORTRAN-like, but to show the students, or more accurately, to give them a taste of actual research activities (minus some of the really toxic or highly dangerous stuff), FORTRAN is more useful.

As you explained, it is more powerful and more suited to the needs of future research projects and courses they are mandated to take before graduation.

Besides, I was thinking that, two seconds I had this revelation, that, "Hey, if I can show them it is like keystroke programming in a HP scientific calculator, maybe they'll get a better insight!"

No such luck. As I said, they haven't even bothered to figure out how to program their TI graphing calcs. I was just hoping to ease my job and give them an additional insight. Maybe I can convince them to throw away theirs and go out and get a HP 33S! The keyboard shape is perfect for their generation!!

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #32 Posted by **Les Bell [Sydney]** on 11 Sept 2004, 7:54 p.m.,*
in response to message #1 by Ed Look

Not FORTRAN per se, Ed, but the programming concepts of that era, in general. The HP-35 appeared in - what? - 1972? - the 65 in 1974 and that was before the adoption of the notions of structured programming and, later, object-oriented programming. At that time, the GOTO was still considered harmless, and the world was dominated by FORTRAN for scientific programming and COBOL for commercial applications, along with lots of oddball languages for low-end systems and visual records accounting machines.

Although Algol and its derivatives like PL/I and later Pascal offered better ways of doing things, they were not widely implemented, and so their concepts don't seem to have influenced the HP design team, which remained in the keystroke programming 'groove' until the development of RPL for the HP-18C and HP-28C. This seems entirely reasonable - implementing some of the features of new breed of programming languages would have required more resources than were available in the early calculators, such as a large subroutine return address stack.

Best,

in response to message #32 by Les Bell [Sydney]

But Les, FORTRAN way predated any HP handheld of any kind; wouldn't it have been just as fair to say that FORTRAN dominated the programming philosophy of that time?

Re: Is HP Calculator Keystroke Programming like FORTRAN??

*Message #34 Posted by **Les Bell [Sydney]** on 12 Sept 2004, 6:23 a.m.,*
in response to message #33 by Ed Look

Perhaps - but there were many other languages around at the time: Algol, COBOL, MUMPS, Simula, LISP, APL, to name but a few. They mostly had the same things in common. I think it's more likely the designers

of the 35 simply extended its design to add registers to come up with the 45, and then added simple and fairly obvious programming constructs to come up with the 65.

From there, the die was cast, as it was easiest to extend the design to ensure portability of code for Application Pacs, Users Library, etc.

And there's one thing that clearly separates the HP calcs from the high-level languages of the day: the languages all allowed algebraic expressions on the r.h.s. of assignments. HP calcs - being calcs - did not, and were RPN, to boot.

Best,

--- Les

*Message #35 Posted by **Ed Look** on 13 Sept 2004, 12:18 a.m.,*
in response to message #34 by Les Bell [Sydney]

Yes, I suppose memory limitations played a role in that you could field a whole algebraic expression to yield a replacement value... though that might have changed the way HP calculators (before the advent of the RPL class) would have been programmed.

In the beginning, there was the HP 9100...

*Message #36 Posted by **Andrés C. Rodríguez (Argentina)** on 13 Sept 2004, 8:43 a.m.,*
in response to message #32 by Les Bell [Sydney]

I would consider the HP9100 (1968) as the beginning of this branch of the "calculating devices" evolution tree: RPN keystroke programming started with it.

See the 9100 page here at the MoHPC; just as a brief glimpse, think about magnetic core memory, no digital integrated circuits, CRT display, desktop size, AC power...

You can also take a look at the 9810 page.

Using a HP 110+ Notebook as a Display for the 41

*Message #1 Posted by **Ray** on 9 Sept 2004, 8:00 p.m.*

Hi, I currently have the beta of EMU41 for the Portable Plus and HP's own HPLINK utility running on my Portable Plus computer. I want to use my Portable Plus as a emulated display device for my HP-41CX Calculator via a HP-IL link, but EMU-41 does not support this on the portable plus (correct?) and I really have no idea how the HPLINK utility that comes in the unit's ROM works (can someone explain it to me?). I know Trans41 can act as a display, but it won't run on the Portable Plus at all.

Can anyone point me towards an appropriate software package for this task, or otherwise help me with my current situation?

EDIT: Also, I'm looking to change my prompt on this machine to a more standardized dos prompt at boot. I remember reading this could be done by establishing a PAM.ENV file, but I have no idea what format this file uses. Does anyone know what sort of parameters I would put in it?

Thanks,

-Ray

Re: Using a HP 110+ Notebook as a Display for the 41

*Message #2 Posted by **J-F Garnier** on 10 Sept 2004, 6:41 a.m.,*
in response to message #1 by Ray

Hi Ray,

You're right, Emu41 for P+ doesn't allow an external HP41 to access the internal (emulated) HP-IL devices.

Years ago, I wrote a program to use P+ display and keyboard with the HP-71B. It can also be used with a HP-41 (for display only). This program is still in an EPR0M in my P+, contact me.

Can you tell us how you transfered Emu41 to your P+? This question was asked recently (I don't remember if it was you...) and I was unable to provide a reliable solution (HPLINK doesn't work on modern PC).

Re: Using a HP 110+ Notebook as a Display for the 41

*Message #3 Posted by **Ray** on 10 Sept 2004, 1:48 p.m.,*
in response to message #2 by J-F Garnier

It was me, I simply used the 9114B (not sure if that's the right number) floppy drive to transfer the file, and that worked quite well.

Thanks, I'll contact you by email.

*Message #4 Posted by **andy** on 10 Sept 2004, 3:54 p.m.,*
in response to message #3 by Ray

I transfered HPILLINK to my 110 using the 110's built in terminal program and hyperterminal on windows. I think I typed up a procedure, if you're interested in it let me know.

Andy

in response to message #4 by andy

Hi Andy, do you know a way to transfer *binary* files with the term utility? I can only transfer *ascii* files.

J-F

Re: Using a HP 110+ Notebook as a Display for the 41

*Message #7 Posted by **andy** on 11 Sept 2004, 1:37 p.m.,*
in response to message #6 by J-F Garnier

As strange as it may sound, I remember transfering HPILLINK to my 110 using its built in terminal software and it worked. However, other binary files I xfered to the 110 did not work.

One curious property I noticed of HPILLINK is that its size on disc is 36,864 bytes which is exactly divisible by 8 (=4608). I noticed that sending binary files which are not factors of 8 would be automatically rounded to a factor of 8 by the built in software. Try transferring hpillink and let me know if it works for you (by the way, I only have a 110, not a 110+).

Also, there's an old DOS program called "ASCIFY" which converts a binary program to an ascii string. ASCIFY works on the 110, and I have had success using this program to transfer other binary files to the 110 using the terminal software.

Now I have a 9114 :)

Andy

*Message #8 Posted by **andy** on 14 Sept 2004, 9:39 a.m.,*
in response to message #3 by Ray

Hi Ray,

The manual for hpillink is on the mohpc ftp site. Just go to ftp://ftp.hpmuseum.org/lif/hpillink/ and you'll find it (log in as anonymous).

concerning 'calculator selling '

*Message #1 Posted by **Erwin** on 9 Sept 2004, 4:29 a.m.*

Hello All,

Every now and then i have some HP's for sale here at the museum. And since allmost a year it is very commen to recieve several responses from socalled 'salespersons.

There emailsall look more or less likethis one:---------- HELLO,I SAW THE ADVERT U HAVE PLACED ON THE INTERNET AND I AM REALLY INTERESTED IN SOME OF THE PRODUCTS U HAVE PLACED FOR SELL.THIS IS WHAT I NEED: ========== HP-32SII HP-42S ========== CALCULATE THE TOTAL COST AND SHIPPING TO THIS ZIP-CODE 23401(NIGERIA).PAYMENT WILL BE THRU CREDITCARD.GET TO ME FOR IMMEDIATE PAYMENT.HOPE TO HEAR FROM U SOONEST AND IF THERE IS ANY THING U WANNA LET ME KNOW PLEASE FEEL FREE TO EMAIL ME. KING REGARDS ----------

Or this one. It is clear that it is a pregenerated email. Between the 2 brackets there should be the calculater type that i put on forsale.---------- Helloseller,Am mikeby name,interested in purshase of your[ ] my mode of payment will by a certifed us cashier check drawn on us bank so i will like to know the last asking price and the present picture including the last asking price for it. I will need to have your phone number where i can reach you.. Hoping to read from you soonest.. Thanks, Regards, -- ----------

Is there anyone whom has done busniss with any of these people, or is there anyone who can tell me more about these kind of transactions?

Greetings, Ewrin (NL)

in response to message #1 by Erwin

ERWIN, THIS HAS BEEN DISCUSSED BEFORE. THAT'S A SCAM. THERE IS ANOTHER WHO'LL SEND YOU $1000 REGARDLESS IF YOU'RE SELLING YOUR ITEM FOR $50. ALL YOU HAVE TO DO IS SEND A CHECK FOR THE BALANCE [$950] TO SOME CONTACT.

Re: concerning 'calculator selling '

*Message #3 Posted by **Ken** on 9 Sept 2004, 6:56 a.m.,*
in response to message #2 by Iqbal

Usually a tipoff for a scam is if you have an article advertised for sale at (FS), fixed price, and they ask for your latest selling price.

Re: concerning 'calculator selling '

*Message #4 Posted by **Valentin Albillo** on 9 Sept 2004, 6:55 a.m.,*
in response to message #1 by Erwin

It's a scam. Please read this article, the second scenario exactly describes your situation:

Counterfeit Cashier's Check Scam

There are tons and tons of sites and forums related to this scam, just search Google with "counterfeit cashier's check scam".

Best regards from V.

Re: concerning 'calculator selling '

*Message #5 Posted by **Erwin** on 9 Sept 2004, 8:31 a.m.,*
in response to message #1 by Erwin

Well it looks i handled it all well. I was contacted 3/4 of a year ago by someone whom only was willing to pay by check, and nothing els. And he was very unpolite towards me, saying that this is the way the deal will be made. I then responded to him, that i was going to whait for a more polite person, and was not going to sell the calculator to him. Since than i never reacted to any of these email i got from socalled 'salesrepresentative's .

Thank you all for confirming what i suspected.

Greetings, Erwin The Netherlands

in response to message #6 by Andy

Andy posted:

"These posts got me thinking, imagine if you were an honest person living in Nigeria. Good luck buying anything over the internet! "

If said "honest" person living in Nigeria also happens to want to buy your product without even naming it, and also happens to offer payment by sending a cashier check which also happens to be for an amount far exceeding the price of your product and also wants you to pay them back the huge excess I would concede that, yes, said "honest" person is out of luck ! Poor innocent thing, such a wealth of nasty coincidences ! ;-)

Best regards from V.

Re: concerning 'calculator selling '

in response to message #7 by Valentin Albillo

Hi Erwin,

I had the same kind of mails, I replied cashier check or paypal payment first and I would ship the item only after I had the money (real touchable euro's) in my own hands.

Never heard anything since then.

Ronald (The Netherlands too)

Scam (whereever from)

*Message #9 Posted by **Thibaut.be** on 10 Sept 2004, 1:11 a.m.,*
in response to message #8 by Ronald

This stuff is quite common. Here in Belgium some lot of people try to by your car at high price, so said to export to Africa (Antwerps being an efficient harbour to ship over there). They give you a genuine foreign cheque, doubling the value of your car. They ask you to send half of the money by Western Union to someone if a foreign country.

The subtility is that belgian banks usually give you credit on the cheque, even if not cleared : in other words they trust you and consider that you've accepted a good cheque (sauf bonne fin, which litterally means "we give you the money unless it bounces...). Therefore uncautious people see credit on their bank, but don't know it's reversible (cheques are seldom used here). So you say fine, they've been fair, my turn to be fair. You go to the nearest WU agent, send half of the money to someone you've never heard of before, and with good conscience go back home.

A few days later you notice that your bank account has been debited for the value of the cheque + bouncing treatment costs... and that's there nothing you could do to be reimbursed. You've lost your car + again the value of it.

It happenned to people who just purchased new cars, and people were willing to offer them 150% of the price, hence a 300% cheque.

A few months ago I went to this place in Brussels where Congo people reside. Very nice place to have a beer, you need to see the "danse du ventilateur" once in your life ! I had a talk with some of these guys. I asked them if they'had heard about his kind of scam. I needed to buy them a beer to know more. Then they all bursted into laughter telling me "you Belgian guys make laws, and us unlitterate guys just manage to abuse them"...

Whom to trust?

*Message #10 Posted by **Steve** on 13 Sept 2004, 11:11 p.m.,*
in response to message #9 by Thibaut.be

The only truly safe way seems to be cash-only, although it unfortunately usually insults one or both parties. A friend on mine who sells quilting products (yes QUILTING PRODUCTS) sent an order to Nigeria based on a confirmed credit card transaction. One month later the REAL owner of the credit card cancelled the transaction and she was out $800 -- an amount no small business owner can afford to lose.

The ability to cancel a credit-card or checking-account transaction (so necessary in these

days of financial-data theft) gives fraudulent buyers up to 2 months to cover their tracks before you know that you've been screwed.

Re: Whom to trust?

*Message #11 Posted by **Thibaut.be** on 14 Sept 2004, 6:00 a.m.,*
in response to message #10 by Steve

The agreement here is that if the card is valid and the transaction electronically agreed, the merchant won't loose anything if he's of good faith AND has been cautious enough during the transaction.

On the other way the defrauded card holder can reclaim the costs.

If the merchant can proove that he had sufficent indications that the card was not stolen (voucher + signature that matches with the one on the card), he won't reisk anything.

It is easy though to send a card number and debit it. Card listings are easily obtainable. And yes, in this case, the merchant did not care if the issuer was the actual card number.

Therefore, the only solution for distance sales is to ask a fax copy of the ID + back copy of the card.

Re: Whom to trust?

*Message #12 Posted by **Tom (UK)** on 15 Sept 2004, 3:33 a.m.,*
in response to message #11 by Thibaut.be

I see your point but would you (as a buyer) fax the back of your card to a possibly unknown seller?

Here in the UK the back of a card usualy has the signature and a 3 digit security code that is not on the magnetic strip - if you give this away you may be asking for trouble.

Re: Whom to trust?

*Message #13 Posted by **Thibaut.be** on 15 Sept 2004, 3:55 a.m.,*
in response to message #12 by Tom (UK)

Yes you're right, as a buyer you expose yourself to high risk in faxing a copy of your card.

As a merchant, you can always call the card issuer and validate some details (name, address, ...) that you find on an ID.

The other option is secured sites, mainly paypal, but I also got defrauded by them.

As a buyer, you can deny a sale even if you signed a fax or whatever, the merchant has to prove he sent the goods. Some years ago, I purchased a 67, a 97 and a 27 on ebay and paid through paypal. I never received the calculators. I denied the sale to my card issuer and got reimbursed. They debited paypal, who is regularly threatening me. Now my paypal account is blocked (but I don't care, I'm more selling than buying presently, and receiving money by paypal is not

possible here).

So... conclusion is to be most cautious with credit cards.

Re: Whom to trust?

*Message #14 Posted by **Tom (UK)** on 15 Sept 2004, 12:37 p.m.,*
in response to message #13 by Thibaut.be

I think ebay and paypal are the same company?

Judging by the ammount of help and support ebay give when things go wrong, paypal may be similar. This is one case where buying something on a credit card is best as there is more protection for the buyer (usually the high interest charges make credit cards a last choice).

I think paypal used to headline that transactions were guaranteed, but hidden in the small print was something like you and/or the other party had to be in the US to be covered. May have changed now so check yourself before using such services.

Re: Whom to trust?

*Message #15 Posted by **Thibaut.be** on 15 Sept 2004, 1:00 p.m.,*
in response to message #14 by Tom (UK)

Mys story happened quite a long time before ebay took over paypal. Dunno how it is now, as I sweared never use their services again.

Now, as a French saying "Only idiots never change minds..."

Re: Whom to trust?

*Message #16 Posted by **Tom (UK)** on 15 Sept 2004, 1:15 p.m.,*
in response to message #15 by Thibaut.be

You may have seen these sites before (I just looked):

http://www.paypalsucks.com/

http://paypalsucks.com/PayPalFormerEmployee1.shtml

From the text there it looks like paypal is not a company to deal with. Strange how almost every ebay transaction lists paypal as acceptable, I've seen many listings updated with paypal 'now being acceptable'. Do sellers get a discount or coerced into getting more buyers sucked in?

Re: concerning 'calculator selling '

*Message #17 Posted by **unspellable** on 10 Sept 2004, 4:26 p.m.,*
in response to message #1 by Erwin

How do these scams phish out the email addresses? The for sale sectuion on this forum is pretty small potatoes compared to most operations, you'd think we would fall below their radar.

I can see their using email addresses from some operation on the scale of eBay or such.

Re: concerning 'calculator selling '

*Message #18 Posted by **Thibaut.be** on 14 Sept 2004, 3:59 p.m.,*
in response to message #1 by Erwin

These last weeks, each time I've posted an ad on this forum I received such a mail.

At first I replied politely and did not get any answer back. To the next scams I asked a phone number and/or and address, still no answer. Now I do reply being really rude (very good therapy : all my frustrations are launched to them) and still no answer. I was thinking that if all of us were so rude they would know it wasn't worth contacting people who were posting on this forum...

HP33S

*Message #1 Posted by **Richard** on 8 Sept 2004, 7:44 p.m.*

I am a long user of HP Calculators from HP-35 to HP48G+ I have a spare HP-32S II in the box just in case my other one gives up... I tought it might be nice to have a 2 lines display; so I purchased an HP-33S.... Very poor display with a lot of shadowing and bad contrast ratio; I still have to try it in daylight conditions; We get used to the chevron key pad and grouping is better; The clic is not as smouth as the HP-32... a bit big for its power; The sub-menu works very well with the possibility to scan the different functions without leaving the sub-menu level; 2x faster then the HP-32 on integral (4 X sqr(1-x^2)dx)with the same precision (pi to 12 digits)14 sec / 28 sec (8 sec on 48G+) Its very sad to see that we lost HP quality and vision; We should ask Agilent to step in... they are the real HP people;

Re: HP33S

*Message #2 Posted by **John Smitherman** on 9 Sept 2004, 10:36 a.m.,*
in response to message #1 by Richard

Hi Richard. You can adjust the contrast of the 33s by holding down the C and then pressing + and - as needed (page 1-1 in the user's manual).

I finally decided to purchase a 33s to use at work (s/n CNA41712635). My biggest complaint is the miniscule , and . I would gladly give up the 2 line display if it meant that the , and . would be more visible and distinguishable.

Being able to easily switch the calculation mode between RPN and algebraic is very handy when others want to borrow the calculator.

Thus far, I have not found any inaccuracies with the types of calculations that I do. I have done random checks using a HP 32sii and TI 83+. I do appreciate all the testing and posting of results to this forum that others have provided.

I purchased the 33s from hpshopping.com and paid $49.99. I am waiting for the $9.99 rebate. Has anyone received their rebate? $40 is getting close to the value that I place on this device.

Regards,

John

John,

I received my check fairly quickly for a rebate offer - it only took three weeks or so. I was hoping they'd include a larger "." or "," in the envelope, but no dice...

Take care,

Doug

Re: HP33S

*Message #5 Posted by **E_Look** on 9 Sept 2004, 11:35 p.m.,*
in response to message #2 by John Smitherman

I got mine many weeks after I submitted the rebate...

... and it was so vague that I almost did not remember what it was for! But I recalled after a while that I had to send the coupon to Florida and that was also where the check was from.

I actually have gotten to enjoy using it for light to medium type calculations on an "everyday" basis, though I still have to hunt for the right keys every so often.

As for the radix, because of the publicity and its actual size, I always look twice to see where it is, and whether it is a comma or a point. Cool case, though, a la 49G+.

Re: HP33S

*Message #6 Posted by **Iqbal** on 10 Sept 2004, 7:46 a.m.,*
in response to message #2 by John Smitherman

John said "Being able to easily switch the calculation mode between RPN and algebraic is very handy when others want to borrow the calculator." This can be seen as a disadvantage too :) Not that I'm selfish or anything, but I prefer not to lend my HPs. I once lent a student my 42S. The guy did some magic and then called to ask what does 'memory clear' mean. After that day, I vowed not to lend any of my HPs.

Re: HP33S

Ouch!

Re: HP33S

*Message #8 Posted by **Richard** on 11 Sept 2004, 7:12 p.m.,*
in response to message #2 by John Smitherman

Thanks for your answer John; If you take a good look on the HP32S display and compare it to the Hp33S, you will notice tho followig:

The digits are Blacker on the 32S; The display on the 33S sit low bellow the frame and to close to the bottom edge so it prevents to see the . and , when looked at a low angle; The digits on the HP32S have more space in between and this helps to position the . and , in a less blending way with the digits; Also, with the 33S, the liquid crystals float to high above the backing and make a lot of shadowing that makes for fuzzy display; The reading is OK in Daylight conditions but very bad with an halogen lamp that is now very popular;

The faster CPU must be pulling more current and they probably had to go for a less hungry display;

Regards,

Richard

HP12c vs. TI BAII+

*Message #1 Posted by **BrianH** on 8 Sept 2004, 2:33 p.m.*

I have a question for those who have taken any/all parts of the CFA exam.

I am trying to decide between using the HP12c on the exam or the TI BAII+. I am very comfortable and proficient in the use of the 12c, as I used it throughout my MBA studies, but have been shown by coworkers that it rounds certain TVM calculations. The BAII+ also the preferred calculator of the Schweser review people.

Would it be worth it to me to go with learning a new calculcator in the BAII+, or should I just stick with the 12c? I was given a BAII+ through my job, so I do have both. I just don't use the BAII+.

Re: HP12c vs. TI BAII+

*Message #2 Posted by **Gene** on 8 Sept 2004, 10:24 p.m.,*
in response to message #1 by BrianH

I'm a video lecturer for Allen Resources, a CFA exam review company. In fact, if you purchase their materials, I'm on CD #1 showing how to use the 12c vs. the BAII Plus.

Both have their pluses and minues.

12c: RPN, you're already familiar with it. But, it rounds "n" calculations.

BAII+: Has combinations and permutations (that are a pain with only a x! function). Has "worksheet" entry for cash flows and statistics. This is a big time saver if you need to check for a mistake.

Answer is it depends. RPN is worth A LOT. The BAII+ has more functionality than the 12c, but you probably wouldn't use it on the CFA exam anyway.

Feel free to email if you'd like to discuss this in more detail or reply here again and I'll see what I can do.

Re: HP12c vs. TI BAII+

*Message #3 Posted by **BrianH** on 16 Sept 2004, 8:51 a.m.,*
in response to message #2 by Gene

Gene,

Thank you for your response. I have worked through the questions where the 12c produces the rounded "n" calculations. I have found that if you just select the number of periods closest to what the 12c produces, then that is the right answer. I have never taken the CFA exam before, but it does say on the CFA Institute website that this is taken into account on the exam answers.

Thanks again,

Brian

converting units

*Message #1 Posted by **Brady Wilson** on 8 Sept 2004, 11:44 a.m.*

I have a HP49G that I got back in 2001, and I have never been able to figure out how to convert units like ft into meters. Any help would be great, Thanks

Brady.

Re: converting units

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Sept 2004, 1:12 p.m.,*
in response to message #1 by Brady Wilson

Hi, Brady;

let's take a brief tour. Find the [6] key and check for[CONVERT] (in blue, meaning [left-shift] prefix key first) and [UNITS] (in red, menaing [right-shift] prefix key first) printed in the keyboard faceplate over it.

Now key in the number you want to be converted, say, from ft to meter (m). Now call [UNITS], select second option (lenght) with down-arrow key, confirm with [OK] ([F6] key) and you'll see the lenght menu.

Select option 5 with 'ft' on it and confirm. You'll see your number with a unit attached to it (e.g.: 10_ft): this is the "from" part, a value unit with, O.K.?

Now enter a second unit object with any value having the "to" convertion unit (you can follow the same procedure and add a 1_m, for example).

Now calll [UNITS] (last time) and press [OK], because you want a tool to convert from 10_ft to _m and [Tools] is already selected. The first tool is already [Convert], so you press [OK] again and you'll see (hopefully): 3.048_m.

You can create any compound unit and convert to any other, since they are compatible. And you can also read/download the HP49G+ Training Modules, available at the HP49G+ page under "Training Modules', like the Units Conversion module. This particular feature, as many others, work the same for both 49G and 49G+.

Have you found any problems on doing or understanding what I wrote, let us know.

Hope you succeed.

Cheers.

Luiz (Brazil)

Edited: 8 Sept 2004, 1:24 p.m.

Re: converting units

*Message #3 Posted by **Richard Garner** on 8 Sept 2004, 3:03 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

No offense, but, I'm glad I bought a 48GX and not a a 49G. If I had, I would have thrown it in the trash the first day. I bought the 48GX specifically for the unit conversion. In my work, I read allot of property deeds and subdivision plats, some of them going back 150+ years with different units from feet, chains, rods, furlongs, links, meters, yards, etc. Sometimes even different units on the same parcel from call to call.

Unit conversions are much easier on the 48GX than on the 49G. You select units, then select the group (length), enter the number (10) press the the key for (feet), 10_ft shows in the display, then press the (left shift)key and what you want it converted to (meters) and it displays 3.0480_m.

It looks like HP took something real simple and made it too complicated to be useful.

Re: converting units

*Message #4 Posted by **Tim Wessman** on 8 Sept 2004, 3:15 p.m.,*
in response to message #3 by Richard Garner

Unit conversions is exactly the same on the 49g/g+ as the 48. he was describing algebraic unit conversions. The RPN mode is identical with a few updated units if i remember correctly.

"After you set Flag 117"

*Message #5 Posted by **Ron Ross** on 8 Sept 2004, 3:25 p.m.,*
in response to message #4 by Tim Wessman

You have to set flag 117 and THEN the 49G or 49G+ acts just like an Hp48G.

Then all you do is key in the ### and the units you have, then use the left shif key and the units you want. Voila! Answer.

Re: converting units

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 Sept 2004, 4:40 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, falks;

thaks for your feedback.

I should have written that this is the lower-level conversion sequence, and that there are other ways (I almost always write this; I missed this one). I simply followed the steps I'd have done without using any shortcut or user's guide information because this is, as I see, the "WYSIWYG" way, simply using screen information. Maybe I'm wrong... Sorry!

And Tim, my HP49G+ is in RPN mode. I rarely use it in Algebraic. Please, correct me if I am wrong: if I add [CONVERT] while in Algebraic mode, the command line returns CONVERT(), right? It does not act instantaneously as I wrote. And you made me remember that the HP49G default mode is Algebraic, not RPN, and I should have asked first which mode Brady wants to use OR show both ways. Thanks!

About flag 117: thanks, Ron; you're right. I thought (again) that having to set a flag in order to make the HP49G/G+ act like the HP48 would not be as good as showing how to use the feature with the calculator

"as is", and so allowing fewer operation errors.

Thanks, guys.

Luiz (Brasil)

*Message #7 Posted by **James M. Prange** on 8 Sept 2004, 9:10 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I'll add that you can also make your own user-defined units. For example, '7_d' 'week' STO. As long as the user-defined unit is found on the path, it can be used much as the built-in units are used. But note that you can't redefine built-in units (or built-in units with built-in prefixes).

There's also a base unit that isn't very well-documented, the '?' unit. This could be useful for currency conversions; for example, if you define currencies in terms of 'n_?' (where n is a real number), then you can convert among currencies (or compound units including currencies) with dimensional consistency checked.

If you include units in a custom or temporary menu without defining actions for the shifted keyplanes, then the menus behave just like the built-in units menus. That way you can have just the units that you're interested in shown in menus however you prefer.

Wolfgang's Unitman can be very helpful in customising your calculator for units. See: http://page.mi.fu-berlin.de/~raut/WR49/index.htm#Science

But the most useful thing that I know about ALG mode is how to change to RPN mode.

Regards,
James

what about the overhead fot HP48

*Message #1 Posted by **Karl Fred** on 8 Sept 2004, 9:45 a.m.*

Does anyone know if it goes ok? thanks

Re: what about the overhead fot HP48

*Message #2 Posted by **James M. Prange** on 8 Sept 2004, 9:24 p.m.,*
in response to message #1 by Karl Fred

I take it that you mean an accessory for using the 48 with an overhead projector. Which one?

I have a "48SX Classroom Display" from Firmware Corp. that uses the LCD made for the 48SX and a magnifier lens. It works pretty well with both the 48SX and 48GX, although the display tends to slowly "roll" up or down, and requires careful adjustment to keep it steady. Also note that the annunciators at the top of the screen don't work with this model; just the 131 X 64 pixel display.

With the 48SX, it can be plugged into either slot 1 or slot 2; with the 48GX, it can be used with slot 1 only. Of course it couldn't be used with the 48S, 48G, or 48G+. I expect that I could use it with the 49G, if only I'd get around to making an adapter to connect it to the 49G's 10-pin connector.

Regards,
James

HP 3390A Integrator

*Message #1 Posted by **John Limpert** on 8 Sept 2004, 5:04 a.m.*

Anyone ever run into one of these gadgets? I saw one listed on eBay and it looks a bit like a lab calculator. From what I could find on google, it is used to integrate measurements from other equipment in a chemistry lab. My curiosity was triggered because I've been doing some reading on mechanical differential analyzers, the 1930s version of a scientific calculator.

Re: HP 3390A Integrator

*Message #2 Posted by **Thomas Falk** on 8 Sept 2004, 6:54 a.m.,*
in response to message #1 by John Limpert

I have a similar one, a HP 3392A, but without any documentation. It seems, you can do with the device alone not much, besides running the self test. There there are three multi pin connectors at the back for the connection of some other device and a HP-IL interface

The case is very difficult to open, it is probably impossible to do this without traces. Inside there are several microcontrollers (i8031, SCN8051, D8049), most of the circuits are LS-TTL. There is also at least one circuit made by HP. It has the "name" ILB3-0003 and may be a controller for the HP-IL interface.

The device for itself is not too exciting, but the parts may be handy someday. ;-)

Thomas

1LB3-0003

*Message #3 Posted by **Tony Duell** on 8 Sept 2004, 1:07 p.m.,*
in response to message #2 by Thomas Falk

Yes, the 1LB3-0003 is an HPIL controller/interface. It's the one used in just about all the HPIL peripherals...

in response to message #1 by John Limpert

I think, I still have one, I don´t need anymore... It´s free but you have to catch it here in Switzerland

Matthias

Re: HP 3390A Integrator

*Message #5 Posted by **Yos Feit** on 9 Sept 2004, 5:40 p.m.,*
in response to message #4 by Matthias

This device controls an HP Gas Chromatograph (GC), and I would imagine that it is usless without it. As you may know, GC is a technique for analyzing the components of chemical mixtures. For example, you can get the exact proof value of your beer or vodka to six digits because it measures the ratio of ethanol to the other components. It is also used for measuring drug levels in blood, the amount of greenhouse gases in air, and the components of crude oil. GC is a time-dependent process. The chemist enters a "program" into the integrator that instructs the chromatograph to change its temperature in different zones at different times. A program can last for seconds or for an hour depending on the nature of the mixture. This controls the resolution of each of the components in the mixture. The chromatograph returns a raw signal back to the integrator, a DC voltage that indicates the strength of the signal in the chromatograph's detector. Curves (chemists call them "peaks") are drawn, having the signal on the Y axis and the time on the X axis. The integration happens when it calculates the area under each of the curves. The area under each curve corresponds to the proportion of one of the substances in the mixture. Your integrator can be programmed (in a different sense) to print a tabulated report of all the components of interest and their proportions in the mixture. This model also controls an optional robot arm that pulls samples out of a tray. You can set up a hundred samples to run overnight and pick up a hundred printed reports in the morning.

41cx blanknut

*Message #1 Posted by **Darren Tschida** on 7 Sept 2004, 7:52 p.m.*

I've definitely got a 41CX blanknut. Is it valuable or rare? Is it worth more than a regular 41CX?

Re: 41cx blanknut

*Message #2 Posted by **David Ramsey** on 8 Sept 2004, 8:06 p.m.,*
in response to message #1 by Darren Tschida

It is both more valuable and more rare than a standard 41. It was produced in relatively limited quantities for vertical market applications, where companies would create their own programs for specific use of the calculator (generally on a plug in ROM cartridge) and provide the appropriate keyboard overlays.

That said, prices vary wildly with the demand and phase of the moon.

Re: 41cx blanknut

*Message #3 Posted by **Ronald** on 9 Sept 2004, 4:20 a.m.,*
in response to message #2 by David Ramsey

It also depends a lot on completeness. Do you still have the plastic cover over the the 2 switches (preventing switching to user/program mode, is the backplate and front sticker still separate or is it already put on the calculator, is the original box there, is it new or in a mint condition, does it has the plugin module for that special application they sold a blanknut ?

I have seen prices last half year ranging from 200$ to 300$.

I personnaly feel that the difference in price between C, CV or CX should be very little, the focus is the blanknut, the condition and the completeness of the package.

Emulators from HP

*Message #1 Posted by **Fred** on 7 Sept 2004, 6:35 p.m.*

received my emulator cd from hp today.- Will load it up and try it out tonight. Anyone else get their copy?

Re: Emulators from HP

*Message #2 Posted by **Namir** on 7 Sept 2004, 9:19 p.m.,*
in response to message #1 by Fred

Fred,

HP makes the emulators for the new calculators available only to educators! It sure would be nice if HP sold these emulators to anyone.

Namir

Re: Emulators from HP

*Message #3 Posted by **Ben Salinas** on 7 Sept 2004, 11:17 p.m.,*
in response to message #1 by Fred

Ahh yes, I recieved mine today also. I was quite amazed when I first installed it. It asked me if I wanted to install the source code for the emulators also. I was asking myself why HP would be giving away their source code. I said yes, and carried on. I opened the emulator, and it had an option to point to the EMU48 directory. As far as I can tell, this is EMU48 (which is why the source code was included)

Further investigations say yes. I clicked on the Help menu and clicked the "About EMU48" button. It is EMU48 exactly. It seems to be EMU 1.35+

Wow... the interface is quite nice (for someone who has never used EMU48). If people wish, I can upload some screen shots.

It is incredibley fast.

One question, as far as I can tell, there is no reason not to post this software online, right? My guess is that HP did not post it to give a reason for people to buy their calculator. It never asked me to upload a rom or anything. You tell me.

I will be happy to answer any questions. My cal teacher should be getting the 33s emulator soon.

-Ben Salinas 12345

MIRR calculation on hp200lx hp17b hp19b

*Message #1 Posted by **rei vilo** on 7 Sept 2004, 2:26 p.m.*

How to calcultate MIRR with an hp solver?

* WHY

The MIRR or modified internal rate of return is useful when the project has multiple negative cash flows, and thus multiple IRRs. It prevents also from reinvesting the cash flows at the project internal rate of return.

Basically, the MIRR is equal to the future value of positive cash flows with a risky rate divided by the present value for negative cash flows with a safe rate, at the power one divided by the number of periods considered.

No MIRR calculation is provided on an hp17b, hp200lx or hp19b. But all include a powerful solver!

* WHAT

The following formula has been developed on an hp200lx and successfully used on an hp17b.

```
MIRR%/100+1=
(
-SIGMA(i;0;SIZEC(mirr);1;
SPFV(
Irisk%;SIGMA(j;i+1;SIZEC(trim);1;#T (mirr;j))
)
*USFV(Irisk%;#T(mirr;i))
*IF(FLOW(mirr;i)>0;FLOW(mirr;i);0)
)/
SIGMA(i;0;SIZEC(mirr);1;
SPPV(
Isafe%;SIGMA(j;0;i-1;1;#T(mirr;j))-1*0
)
*USPV(Isafe%;#T(mirr;i))
*IF(FLOW(trim;i)<0;FLOW(mirr;i);0)
```

)

)

^

(

1/SIGMA(i;0;SIZEC(mirr);1;#T(mirr;i))

)

On an hp17b, SIGMA should be replaced by the special E and the separator [;] by [:].

Entering the formula on an hp17b is painful, but worth the patience. Be very cautious on the opening and closing brackets.

No problem should arise with an hp19b.

* VARIABLES

mirr is the NAME of the CFLO list (or the name of the file where the cash flows are saved on the hp200lx)

Isafe% is the rate to borrowing, or safe rate

Irisk% is the rate for re-investing, or risky rate

MIRR% is the modified rate of return, what we are looking for

* EXAMPLE

The example provided by hp is

-180, initial cash flow

100, 5 times

-100, 5 times

0, 9 times

200, 1 time

With Isafe%=8%/12, Irisk%=13/12, MIRR%=12.0/12 very close to 12.18%/12 but equal to 12.0%/12 given by Excel.

The example provided by hp is monthly based but the rates are year based, thus the conversions /12.

I hope this helps!

41 Series Battery Shield

*Message #1 Posted by **thebullcabinet** on 7 Sept 2004, 2:47 a.m.*

I recently came across a 41 Series Battery Shield. It fits under the N-Cell holder to protect the calculator from leaking/corroding batteries. It's the first one I have seen. Have I just been asleep, or are they uncommon?

Re: 41 Series Battery Shield

*Message #2 Posted by **Raymond Del Tondo** on 7 Sept 2004, 6:22 a.m.,*
in response to message #1 by thebullcabinet

Hello,

of course these small plastic pieces don't protect the calc from getting corroded contacts.
Instead, these 'shields' were meant to provide better
phyical contact between the battery terminals of the calc
and the poles of the batteries themselves.
And they were constructed to aid the battery holder preventing
to loose batteries when transported outside the calc.

These nice plastic shields were produced for a while in
quantities and shipped with the HP-41, but obviously abandonned,
maybe because of cost reasons,
or because the metallic poles of these little plastic helpers have somewhat too sharp edges,
and you're likely to damage your calcs battery contacts mechanically from them over time.

Raymond

Re: 41 Series Battery Shield

*Message #3 Posted by **thebullcabinet** on 8 Sept 2004, 2:51 a.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for your response, Raymond. I don't know how effective it is at protecting the calculator, but the instruction sheet that came with it, says, "Your calculator has been fitted with a shield to prevent corrosion damage which might result from leaking alkaline cell batteries." So apparently this was an original purpose, whether it actually worked, or not.

Re: 41 Series Battery Shield

*Message #4 Posted by **Matthias** on 7 Sept 2004, 3:13 p.m.,*
in response to message #1 by thebullcabinet

Cool, the same question I wanted to as this forum today. I also got such a shield two days ago and I never have seen this before... Thanks Raymoned for your answer.

Matthias

HP 29C stolen

*Message #1 Posted by **Milton Holladay** on 7 Sept 2004, 1:42 a.m.*

What are these worth ? How much do I need to put in a claim for ? What is the closest thing that I can replace it with ? Many thanx, M

Re: HP 29C stolen

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Sept 2004, 2:14 a.m.,*
in response to message #1 by Milton Holladay

Hi, Milton;

please, check here and you'll find the results from serious research. Also, track E-bay for prices.

One important thing: collectors searching for this model pay higher prices.

There is no direct replacement for an HP29C, mostly if you consider the Woodstock series (HP21, 22, 25, etc.). If you want a closer, more resourceful equivalent AND still a LED-display calculator, you can go for an HP34C. Or you can go for an earlier model and try an HP67 (bigger, in most aspects). If LED's are no trouble (despite of the fact he's not been heard around here for some time, I hope Norm does not read this...), the choices are even better: HP10C, HP11C, (a lot more resourcefull) HP15C, HP41 series, HP42S (rare and, in some cases, expensive), HP32SII (same).

Others will give you different suggestions, I guess, but I am trying to guess you used your HP29C as a scientific tool and that you needed programming and RPN functionality. BTW, is this what you want from a calculator?

Best regards. And sincere hopes that you find what you want.

Luiz (Brazil)

Re: HP 29C stolen

*Message #3 Posted by **Tom (UK)** on 7 Sept 2004, 3:38 a.m.,*
in response to message #1 by Milton Holladay

I don't know where you are from, but here in the UK most insurance policies replace new for old unless you specify certain items. This means you can only claim for a new item (i.e. available new) of equivalence. The nearest thing is going to be an HP33S.

If you can persuade the insurance that it's a collectable item then look for a working HP29C on 'epay'.

New Tapes Available for the 85, 9815, 9825

*Message #1 Posted by **Katie** on 6 Sept 2004, 10:24 p.m.*

DC1000 tapes work as well as the DC100A tapes in the HP85, HP9815A and HP9825A/B. I use them myself and have sold many of them previously; they are somewhat longer and therefore allow for somewhat more storage space. 8 boxes (5 tapes per box) of them on ebay now in a Dutch auction. I thought that I post a link to them here in case anyone needs some (this is quite a deal unless the price gets bid way up):

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5120222892&ssPageName=STRK:MEWA:IT

Re: New Tapes Available for the 85, 9815, 9825

*Message #2 Posted by **John** on 23 Sept 2004, 5:40 p.m.,*
in response to message #1 by Katie

Hi,

I would question the statement theat DC1000 tapes work well in HP-85s. I think it depends! These tapes have a higher oersted rating than DC100As. As you can see from your picture DC1000As use 550 oersted tape and DC100As use 310 oersted tape. Take a look at:

http://www.vintagecomputers.freeserve.co.uk/hp80/tips.htm#tapes

I think the small modification to increase the write current would be needed in most cases.

Anyway, I have 1 DC1000A and it don't work. :-(

Regards, John

Re: New Tapes Available for the 85, 9815, 9825

*Message #3 Posted by **Katie** on 23 Sept 2004, 11:21 p.m.,*
in response to message #2 by John

While I don't have first-hand experience using the DC1000 tapes in the 85, I do have a lot of experience using them in the 9815 and 9825. My experience is that they have never had any failures at all. I've used dozens of these tapes over the years and they've all been good. I haven't even had so much as a one-time mis-verify.

I agree that the coercivity rating on the DC1000 tapes is higher than the DC100A tapes, but my guess is that the 9815 and 9825 (at least) use a lot more current than was necessary to write the DC100A tapes with.

Aside from my direct experience with these tapes, I've sold many to other calculator users and have had only good reports on their use in all three machines.

Edited: 23 Sept 2004, 11:23 p.m.

Re: New Tapes Available for the 85, 9815, 9825

*Message #4 Posted by **John** on 24 Sept 2004, 5:56 p.m.,*
in response to message #3 by Katie

Thanks Katie,

Perhaps I just had a duff tape or tape drive, I'm certainly interested in trying new tapes!

Digital ALPHA SERVER 400 4/233

*Message #1 Posted by **sesse** on 6 Sept 2004, 7:00 a.m.*

I have an Digital Alpha Server 400 4/233 and it doesn't boot any more. I push the power button, it runs tests on floppy, hdd, cdrom and tape and then dies(it seems like it has no power). I don't have its monitor any more because it's broken. Can anyone help me in this matter? Thank you.

Re: Digital ALPHA SERVER 400 4/233

*Message #2 Posted by **Beat** on 6 Sept 2004, 11:06 a.m.,*
in response to message #1 by sesse

Try booting from a HP-49G+, perhaps this helps....

Sorry, but you are in a wrong forum. Try it in a horse racing forum!

Re: Digital ALPHA SERVER 400 4/233

*Message #3 Posted by **sesse** on 6 Sept 2004, 11:12 a.m.,*
in response to message #2 by Beat

Well ... this is the object I have ... and it's more than suitable for its future purpose. So if u can help me, please do so, but if u can't, why bother ...?

beware what u wish ... it might came true ... :))

Re: Digital ALPHA SERVER 400 4/233

*Message #4 Posted by **Tom (UK)** on 6 Sept 2004, 2:51 p.m.,*
in response to message #3 by sesse

"it's more than suitable for its future purpose"

Well if it's not booting up then perhaps it's future purpose is land fill or for recycling?

Seriously though... this forum is for HP calculators, not sorting out sundry computer problems - take a look at the other posts.

Re: Digital ALPHA SERVER 400 4/233

*Message #5 Posted by **sesse** on 7 Sept 2004, 3:33 a.m.,*
in response to message #4 by Tom (UK)

"Seriously though... this forum is for HP calculators, not sorting out sundry computer problems"

Well TOM ... Digital -> bought by Compaq ... Compaq -> bought by HP ... so if I have a problem with a computer from Digital, where do u think I should address? ... because u are such a smart guy

....

Re: Digital ALPHA SERVER 400 4/233

*Message #6 Posted by **Massimo (Italy)** on 7 Sept 2004, 8:22 a.m.,*
in response to message #5 by sesse

Well Sesse... can you tell a computer from a calculator?

Massimo

Re: Digital ALPHA SERVER 400 4/233

*Message #7 Posted by **Sigmund Freud** on 7 Sept 2004, 8:30 a.m.,*
in response to message #5 by sesse

Sesse,

You have a friend here on this site. Please come and see me in my office at Berggasse 19, Vienna, and we will talk all you want about the Alpha Server 400 .... and your relationship with your parents .. your very sad childhood ... and your addiction to be abnoxious!

Sigmund

Re: Digital ALPHA SERVER 400 4/233

*Message #8 Posted by **Tom (UK)** on 7 Sept 2004, 12:00 p.m.,*
in response to message #5 by sesse

Thank you for your complement. A short history lesson on this site:

Back in the 60's, 70's and 80's HP made calculators -> People liked them -> WWW became popular -> This site owner set up some web space in his own time and with his own money for those interested in HP calculators to obtain and share information and support each other -> Most people use the site within the reasonable rules (http://www.hpmuseum.org/rules.htm) he set -> You came along and seem to demand support for some equipment because it was once made by a company now absorbed into the HP group.

The link missing in all the above is any involvement of HP, Compaq or Digital in this site, or this site being involved with anything other than HP calculators.

As far as looking for answers try www.hp.com or search google groups for an answer, or put a question in a suitable listing in google groups, or perhaps there is a support group out there for DEC equipment.

If you want to talk about HP calculators on this forum then please do.

(PS I've missed out in the history the bit that says 'HP abandon their founding principles' - I think that happened coincidently about the same time as the WWW becoming popular).

Re: Digital ALPHA SERVER 400 4/233

*Message #9 Posted by **sesse** on 8 Sept 2004, 1:36 a.m.,*
in response to message #8 by Tom (UK)

Well Tom ... u've got me ... but u know ... it is an old one this ALPHA Server and I don't

find very much about it on the net (something that can help me solve my problem). That's why I asked that question here, thinking that this site belongs to HP, not to someone else, which seems to be the case from your saying. Well then ... I will let u with your brand new hp's and I will try to find support somewhere else for my old bitch ...

Re: Digital ALPHA SERVER 400 4/233

*Message #10 Posted by **Julián Miranda (Spain)** on 8 Sept 2004, 5:43 a.m.,*
in response to message #9 by sesse

I wish you good luck trying to find support for your ALPHA server but talk about "brand new hp's", at the moment in the Daily View I can see threads about HP41, HP45, HP25, HP29C, HP10. The newest can be 15 years old.

Re: Digital ALPHA SERVER 400 4/233 Try DECUS or ENCOMPASS

*Message #11 Posted by **Wlodek Mier-Jedrzejowicz** on 9 Sept 2004, 9:02 p.m.,*
in response to message #10 by Julián Miranda (Spain)

Sesse, I see no-one has really helped you yet. Try searching with Google or another search engine for a DEC user group near you. Originally it was called DECUS, but now it is called ENCOMPASS in some countries. In the US it seems to be called ENCOMPASSUS sometimes ...

vertical program help

*Message #1 Posted by **kyle** on 5 Sept 2004, 9:19 p.m.*

hi,

i need a program for the hp33s that will calculate the length of a vertical curve needed to pass through a point of certain elevation when only the pvi station/elev are known as well as the grades in/out.

can someone help me??? thanks in advance

Re: vertical program help

*Message #2 Posted by **Norris** on 6 Sept 2004, 12:22 p.m.,*
in response to message #1 by kyle

You can get a package of 33S surveying software, which apparently includes vertical curve equations, for $33 at: http://www.hp33ssurveyor.com/

Re: vertical program help

*Message #3 Posted by **kyle** on 6 Sept 2004, 2:45 p.m.,*
in response to message #2 by Norris

i've already got vertical curve programs; one for calculations based on pvi elev and one for pvc elev.

i need something to calculate the length of curve needed to pass through certain point of known elevation when only the pvi sta/elev are known.

Re: vertical program help

*Message #4 Posted by **db(martinez,california)** on 6 Sept 2004, 3:19 p.m.,*
in response to message #3 by kyle

Years ago I had to re-do a vertical alignment to go under a structure and then over a burried pipe. The 41 survey pac with a lot of trial and error worked for me since in that case i was looking for AN answer, not THE answer. I can see how one would write a program for this but with all the variables and possible answers (location of bvc/prvc/evc, reversing or single vc, hard elev to hard elev?, hard elev to something greater to OR less than another elev, etc...) i think trial and error may be the best method anyway. After all; you already know what you want it to look like. You just need numbers to describe it. I have found that a good way to start is to draw a picture and crack a cold one.

Weigh everything that i have said with the knowlege that i'm a hillbilly. Let us know how you solve it and good luck.

Re: vertical program help

*Message #5 Posted by **Norris** on 7 Sept 2004, 1:17 a.m.,*

in response to message #3 by kyle

Suppose you have a PVI and two grades. To calculate the curve length, you would also need to know something about the BVC and EVC. You would need (a) the station or the elevation of the BVC, *and* also (b) the station or the elevation of the EVC.

The problem becomes simpler if you can assume that the vertical curve is symmetrical. Then you only need *either* (a) the station or elevation of the BVC, *or* (b) the station or elevation of the EVC.

If you have a PVI, two grades, and one additional elevation point on the curve, then you can't define the vertical curve unless you can assume (1) that the additional point represents either the BVC or the EVC, *and* (2) that the vertical curve is symmetrical.

If assumptions (1) and (2) are acceptable, then I get a 33S formula that looks like this:

L=2*(ABS(V-P))/(G/100)

where:

V = the PVI elevation
P = the elevation of the additional point
G = the grade (in %) associated with that additional point
L = the length of the vertical curve (in feet)

If you cannot make assumptions (1) and (2), then I don't think you can solve the problem.

Re: vertical program help

*Message #6 Posted by **kyle** on 7 Sept 2004, 9:22 p.m.,*
in response to message #5 by Norris

ok, but that did not solve a known problem that i have:

pvi sta=37+41, el=110.0 g1=3.0% g2=-2.0% sta of interest=37+91, el=107.5

that is all that's known and i want a program that i can use to calculate the length of curve needed to pass through that point.

what you gave me will not do that; the answer i got using your eqn was 250' and i know the answer is 415.95'.

i had an eqn, but it seems that the hp33s is limited by the number of operations it can perform.

E=I-L/2*B/100+(B*((S-(P-L/2))/100))+((F-B)/(2*L/100)*((S-(P-L/2))/100)^2)

E=el of point of interest I=PVI elev L=length of vertical curve B=G in F=G out S=sta of point of interest P=PVI station

I used this equation and did the calculation by hand and got 415.95'.

I entered this as an eqn into the 33s, but it gives the wrong answer of 24.xxx. It seems that I can enter the equation and sometimes be able to use it one time, then if I go to use it again, it will give me the incorrect answer.

I wanted to enter as a program, but i'm not really good at programming.

Anyway, thanks for your ideas and help. Maybe someone will be kind enough to write me a program to do this???

Re: vertical program help

*Message #7 Posted by **Norris** on 8 Sept 2004, 12:23 a.m.,*
in response to message #6 by kyle

Sorry, am not familiar with that formula. All I can tell you is that the 33S can work with formulas of that size, and that it will not provide inconsistent results if you enter the same variables into the same formula. If you don't get the same results every time, then you're doing something wrong with the solver

Good luck with it.

Re: vertical program help

*Message #8 Posted by **Forrest** on 8 Sept 2004, 10:35 a.m.,*
in response to message #6 by kyle

I don't think I can help much, but I agree that the solution is unique. The HP 41 survey Module solves this problem. It allows you to input the PVI Station and Elevation, and both grades. You then have a choice of additional items to enter for the solution. One of the options is a point on the curve (Station and Elevation). It then gives you the BVC Station and Elevation. The solution it reached was Sta. 35+33.0204, El. 103.7606. This means that the length would be 415.9592' which is within one hundredth of your answer. Of course this unique solution is only true for vertical curves that have the PVI in the center of the length.

The manual for this survey module has formulas but if your formula solves the problem correctly then it sounds like a calculator problem rather than the formula or a coding problem. Not being familiar with the 33S I can't say. You might want to post the code to see if you have any suggestions. The HP 41 code is available but the Vertical Curve portion of the module is much longer than you want because it give a number of input options.

I hope you get other responses so I can also get a good solution here.

Re: vertical program help

*Message #9 Posted by **kyle** on 8 Sept 2004, 12:29 p.m.,*
in response to message #8 by Forrest

well, i have figured out what it does....

for some reason, the calculator gets retains some number in its registers that affect how it is solving. It is like it is getting "hung up" at some point on the curve.

anyway, in order to solve another problem like this one, i have to first solve for the elevation of point of interest (already known) using some length that is close to the actual length. Then, if i use the equation again and SOLVE for the length, i get the correct answer.

the equation i have works, you just have to work around it with an extra step:)

vertical program--could you translate it?

*Message #10 Posted by **bill platt** on 8 Sept 2004, 2:01 p.m.,*
in response to message #1 by kyle

Hi Kyle,

Your problem sounds interesting; however, the jargon is impenetrable. Could you translate the problem into "plain english"? I would be interested in seeing what this is all about. (My field is even more jargon-heavy---so I mean no offense).

Best regards,

Bill

Edited: 8 Sept 2004, 3:19 p.m.

Re: vertical program--could you translate it?

*Message #11 Posted by **kyle** on 8 Sept 2004, 3:39 p.m.,*
in response to message #10 by bill platt

bill,

here's the problem statement from my PE review class:

For the condition shown, the closest length of vertical curve that will pass through point E is: A)380'; B)400'; C)420'; D)440'

since i can't draw the curve and its associated data, I have to list it here:

PVC sta=unknown PVC elev=unknown PVI sta=37+41 PVI elev=110.0' PVT sta=unknown PVT elev=unknown Grade in=3% Grade out=-2% Station of interest:37+91 Elevation of sta of interest:107.50'

So, I need to find the length of the vc that will pass through this point, beginning at the PVC and ending at the PVT. The curve is a crest curve also and all I have to use are the sta/elev of the PVI and point of interest.

The previous post listed the equation and the variables used/what they represented, but here's the eqn again.

E=I-L/2*B/100+(B*((S-(P-L/2))/100))+((F-B)/(2*L/100)*((S-(P-L/2))/100)^2)

I entered this into the 33s and used the solver to solve for L. I asked a co-worker about it and he told me that it was trying to balance the equation and that for some reason it was getting stuck when you tried to solve the same problem for a second time. He said, in order to get around the "stuck" issue, just take the equation and solve for the elevation of the station of interest and use some other value for L. When you do this, and then try to solve for L again, it gives the correct answer.

So, when I go to work on problems, I use this eqn and if I get some weird answer, like 24.41, etc, then I know to reset the equation by solving for some other variable.

I hope that this has helped in your understanding of the problem. I was initially looking for a program to do this, and thought that maybe someone here that is more familiar with programming these hp calculators could help me.

Thanks,

Kyle

Re: vertical program--could you translate it?

*Message #12 Posted by **bill platt** on 8 Sept 2004, 5:06 p.m.,*
in response to message #11 by kyle

Hi Kyle,

First, I still don't understand. I do not know what your abbreviations stand for. I assume this is a Civil Engineering problem. I am a yacht designer, not a civil engineer, so I can tell you what GM, LCF, etc mean, but not "PVC sta", "grade in" "grade out" etc.

What it seems like to me is that you have two different spots in a road, each with a required slope of the road (2% and 3% here) and a certain distance apart, and elevation difference, and you are asked to draw a smooth curve of some sort between them. Is this true?

As far as programming goes, that is really not so hard---you just type in what you do "by hand" but in program mode, and you have most of it.

If you need to solve iteratively, then you can put an expression into a subroutine, use the Fn=label to set that routine, and then have your main program solve. Or, you can write one single routine and manually solve that routine for your unknown variable.

For your Equation, it would be, in ALG mode,

(be sure you are in ALG mode before you start typing in, or your "(" won't work)

```
LBL label
ALG
INPUT I
INPUT L
INPUT B
INPUT S
INPUT P
INPUT F
INPUT E
{and INPUT for any other variables I forgot--
be sure all of them are there}
RCL I
-
RCL L
/
2
*
etc
etc
/
100
)
y^x
2
)
-
RCL
E
ENTER
(put an RPN statement here if you prefer RPN command operation)
RTN
```

Note that I moved your "E=" to the other side as a minus E, so as to make the whole thing an expression.

To solve for your variable, you would go back to regular mode (RPN or ALG) and say FN=label, and

then SOLVE _variable.

Alternatively, you could simply re-write your equation in either program mode, or in the equation list, and move the "E" across so as to make it all an expression, and solve for the variable you want to. If you do an equation in a program, be sure to decide whether to clear or set flag 10 to control automatic prompting--you won't need auto-prompting if you include INPUT statements in program mode. If you are in the equation list, the Solver will attempt to algebraicly find a direct solution first.

You can also use initial guesses by storing your lower guess in the variable, and your upper bound in the x-register (calculator line) and then solving.

You will find most of this in the manual (and the other stuff from Gene's recent post!).

Best regards,

Bill

Vertical Curves - long

*Message #13 Posted by **Forrest** on 8 Sept 2004, 10:05 p.m.,*
in response to message #12 by bill platt

Bill,

As you know they try to make roads as smooth as possible - so vertical curves are installed between the straight sloped portions on either side of the curve. Some Jargon:

Station is a point along the road in hundreds of feet, so the entire road can be defined by certain information at the stations. 2,576.13 feet down the road is Sta. 25+76.13

You have a grade (slope) into a curve and a grade (slope) out of it. The grades are expressed in positive and negative percent slope. That is rise or fall in 100. (Tangent) In the US it's feet of rise or fall in 100 feet.

Where the projected straight grade into the curve intersects the back projected grade out of the curve there is a Point of Vertical Intersection. (PVI) That point will have a Station and Elevation.

On a Symmetrical Vertical Curve, half of the length is on each side of the PVI Station. Unsymmetrical vertical curves are rare in road design.

You can have crest curves (up then down) that have high points or sag curves (down then up) that have low points, or you can have say a curve that goes from 2% up grade to 10% up grade and has no low or high points except at its ends.

Oh, did I mention that we are not talking about circular curves here. I am not sure if it is a parabolic curve.

So the problem here is: You know a PVI Station (the location of the grade intersections) and the PVI Elevation (the elevation at the grade intersections). You also know a new point location (another station) and its elevation. You are now supposed to determine the length of curve that will make the curve go through that new point. This is a practical problem because there might be an object like a manhole or something that you would like the road surface to match somewhere through the curve.

So, it is possible the problem cannot be solved. Take for instance the case where you are going up hill to the grade intersection and then downhill away from it (a crest curve). If the new point is anywhere above the two grade lines it is unsolvable. On the other hand if it is anywhere below the grade lines then there is one solution.

There are a lot of other possible questions that could be asked like what is the high point in a crest curve and where is it located (because it is not at the PVI Station unless the grade in equals the grade out).

I have the formula for the solution of the length of the curve for this problem sitting here in front of me; from the HP 41 survey module book, but it would be too difficult to list here without me making a mistake. (three levels of perenthises and dividends, etc. I can fax the two pages to anyone that wants (within reason - meaning the U.S.) or you can just look it up on the CD manual that you bought from this site. It is on page 92 and 93.

Hope this helps you understand the problem.

Re: Vertical Curves - long

*Message #14 Posted by **kyle** on 8 Sept 2004, 10:19 p.m.,*
in response to message #13 by Forrest

Thanks for explaining this Forrest. I'm sorry, but I just assumed (incorrectly) that someone who replied to this thread would know what I was talking about. (No insult implied for not knowing) :)

I would be interested in getting what you have (vc solving for length)from the 41. I don't have my fax number at this time, as I am home now, but when I get back to work tomorrow, I can post it here or better yet, send it to you in an email.

Thanks for your help. K

Re: Vertical Curves - long

*Message #15 Posted by **bill platt** on 9 Sept 2004, 11:29 a.m.,*
in response to message #13 by Forrest

Forrest,

Thanks--that's exactly what I needed to know.

For clarification, it looks like you are not taling about a curve in the road (maybe you have another name for what we drivers call curves---do you call them bends or sweeps?), but rather the smooth transition, in a straight road, when there is a change in the slope of the road.

So, of course I have thought about this problem before--anyone who drives too fast does :-)

But being a graphic person, I am inclined to draw it---which I did. It certainly looks, from inspection, as if one could draw a smooth curve with no inflections, which passes through the point of interest.

But I am a bit puzzled by the apparent approach to this problem---"where's the formula---let's put it in and get an answer". If I were to be posed with this problem, I would want to know, what is the minimum radiaus of curvature allowed--relate that to vehicle velocity---and change in curvature---also a vehicle velocity issue----. So, how are these issues handled?

I am not so sure that it even matters whether the curve is parabolic, hyperbolic, or a spline----so long as the derivatives fall into an acceptable range--from the standpoint of limiting vehicle vertical accelerations.

Best regards,

Bill

Equation Solve

*Message #16 Posted by **Mike Head** on 9 Sept 2004, 4:47 p.m.,*
in response to message #15 by bill platt

When I enter

I-L/2*B/100+(B*((S-(P-L/2))/100))+((F-B)/(2*L/100)*((S-(P-L/2))/100)^2)-E

into the 33s as an equation and solve for L, I get 415.959 as the answer. Check Sum = 19AC, Length = 73.

Using this method, you can solve for any of the variables.

Mike

Re: Vertical Curves - long

*Message #17 Posted by **Forrest** on 10 Sept 2004, 12:21 a.m.,*
in response to message #15 by bill platt

Bill,

Of course there are reasonable criteria for the length of vertical curves in roads. The length depend upon the design speed and the algebraic difference of the grade in to the grade out. Those criteria are usually set by a public agency. But there are even other considerations than the vertical velocity concern. How about sight distance and stopping distance. Also the sight distance might be different for a crest curve than a sag curve. Our software gives us these values of concern when we design any highway.

By the way, usually the horizontal curves are circular for roads but for fast highways they may be spirals or a composite curve. Of course design speed is also a criteria on horizontal curves. But guess what; it is really common to have both horizontal and vertical curves happening at the same time or overlapping.

If you are really interested you can pick up a book on highway design from a number of sources. Probably any university library has them. And it is a parabolic curve that is used.

Anyway,I believe that Mike Head has determined that the formula works.

Re: Vertical Curves - long

*Message #18 Posted by **bill platt** on 10 Sept 2004, 10:33 a.m.,*
in response to message #17 by Forrest

Hi Forrest,

Thanks for your feedback. Yes--the equation looked to be producing a parabola--with the last term a squared term.

Regarding the sight lines, that is a good point! Always an issue when riding a bicycle--auto drivers tend not to "think ahead" and will almost without fail, while passing, cross the yellow (center) line in a blind crest or curve!.

And regarding "The length depend upon the design speed and the algebraic difference of the grade in to the grade out. Those criteria are usually set by a public agency"--it seems that in the example problem, the criteria is implicit....

I think I will have to go look at some of those books someday--a former co-worker was a train buff, and had showed me some interesting nuances about laying out "horizontal" curves for railroads--regarding the transition into the banking--which should I suppose apply to the automobile roadway design as well.

Best regards,

Bill

Edited: 10 Sept 2004, 10:44 a.m.

Battery probelms with HP-19B

*Message #1 Posted by **Ed Cruz** on 5 Sept 2004, 3:33 p.m.*

I recently got a HP-19B from a thrift shop. Still works fine, except one of the N batteries that's buried inside the calculator won't come out. There seems to be a rubber thing holding it back, and I don't know how to get the battery out without destroying the rubber thing. Anyone have any ideas?

Re: Battery probelms with HP-19B

*Message #2 Posted by **John Limpert** on 5 Sept 2004, 4:47 p.m.,*
in response to message #1 by Ed Cruz

You might try putting a small blob of quick-curing epoxy cement on the end of a thin stick. Put the end of the stick on the exposed end of the battery and let the epoxy cure. Carefully pull out the battery with the stick.

Workaround for 33S ->HMS bug

*Message #1 Posted by **Norris** on 5 Sept 2004, 3:07 p.m.*

If you are using the 33S on an NCEES civil engineering or surveying exam, then you may be concerned about the ->HMS bug described here

Basically, the 33S ->HMS function works incorrectly for certain negative values. So far as is known, it works correctly for all positive values.

A simple workaround for this bug is to load the following program:

```
LBL U
CF 4
x<0?
SF 4
FS? 4
+/-
-> HMS
FS? 4
+/-
CF 4
RTN
```

To use: Key in XEQ 5 for the ->HMS function, instead of [Right-Shift] 5

This program simply converts negative input values to positive values, because the ->HMS function appears to work correctly for positive values. If the input value was originally negative, then the output value is changed back to negative. If the input value was originally positive, then neither the input nor the output values are affected.

The program uses Label U and Flag 4. You can omit the last CF 4 statement if you don't mind seeing the "4" annunciator in the display.

For PE and PLS candidates in California, note that the NCEES calculator rules are not enforced on the state-specific land surveying and civil surveying exams. For California-specific engineering and surveying exams, the ideal workaround is to use an HP48.

Edited: 5 Sept 2004, 3:08 p.m.

Re: Workaround for 33S ->HMS bug

*Message #2 Posted by **Tom (UK)** on 6 Sept 2004, 7:56 a.m.,*
in response to message #1 by Norris

Thanks for the code, but:

HP should be fixing this (and other) bug(s).

Surely the product is not up to the specification that HP claim so HP should fix it?

Re: Workaround for 33S ->HMS bug

*Message #3 Posted by **Norris** on 6 Sept 2004, 12:16 p.m.,*
in response to message #2 by Tom (UK)

There is no easy way to fix the bugs in my 33S. In practice, they will not be corrected unless (1) HP redesigns the 33S, and (2) offers to swap old buggy units for new improved ones.

In my opinion, yes, HP should do this. Unfortunately, there's no guarantee that they actually will. So for now, I'm stuck with my 33S in its present condition, and I have to make the best of it. I can't put my exam on hold pending an HP decision that may never come.

For my purposes, the only bug that I am concerned about is the ->HMS bug, and I can avoid it by pressing XEQ U instead of [Right-Shift] U.

Re: Workaround for 33S ->HMS bug

*Message #4 Posted by **Tom (UK)** on 6 Sept 2004, 2:44 p.m.,*
in response to message #3 by Norris

Agreed (and aggrieved!)

I use the XEQ U for a very simple HMS+ function that I use quite often on my HP32Sii (which I miss from my HP67):

LBL U

-> HR

x<>y

-> HR

+

-> HMS

RTN

Having to use one of the valuable 26 program tags to correct a bug is not ideal (but is understandable in your circumstances). I'm probably one of those holding off buying this RPN (rather than a RPL) calculator until HP sort out the bugs on the HP33S - or bring out the HP43S! (Cue wish list 'calculator HP never made').

Perhaps if HP had a bit of competition in the programmable / RPN / exam market they would sort out (and reduce the UK price of) this calc. Or perhaps they would just withdraw from the market because HP don't seem to want to compete at this level of the calc market anymore?

Re: Workaround for 33S ->HMS bug

*Message #5 Posted by **bill platt** on 7 Sept 2004, 10:05 a.m.,*
in response to message #1 by Norris

Norris,

Clever work!

The good thing about the 33s being buggy is that we get to see clever programming posted.

Best regards,

Bill

Now, for a tougher challenge, write a program which works around the "-0" problem-----

Re: Workaround for 33S ->HMS bug

*Message #6 Posted by **Norris** on 7 Sept 2004, 1:27 p.m.,*
in response to message #5 by bill platt

As far as I know (please correct me if I am wrong), the only way to generate the -0 bug is to deliberately enter 0, followed by +/-.

NOTE: I was wrong and was corrected. Therefore, the workarounds discussed below do not, in fact, work. But I am leaving this post up for continuity

My recommended workaround for this bug is as follows:

** Don't enter 0, followed by +/- **

This workaround is simple and causes me minimal inconvenience, yet it seems to be working well in practice.

****

If it was really necessary, I suppose you could "fix" the ->theta,r function with the following:

LBL T
x=0?
ABS
y,x->theta,r
RTN

And a similar program would address the COMPLXLN function; just change the first line to LBL B and the fourth line to CMPLXLN.

However, I prefer my original suggested workaround, and that's what I'm using, at least for now.

Edited: 7 Sept 2004, 8:40 p.m. after one or more responses were posted

Re: Workaround for 33S ->HMS bug

*Message #7 Posted by **bill platt** on 7 Sept 2004, 1:52 p.m.,*
in response to message #6 by Norris

Hi Norris,

I am not so sure it is so simple as you state-----

take a look at this:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61093

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61086

I have not re-read the whole business---I just recalled that Karl's analysis existed and I thought you aught to see it!

Best regards,

Bill

in response to message #7 by bill platt

Yes, I think you may be right. I'll give it some more thought.

Re: Workaround for 33S polar bug

*Message #9 Posted by **Norris** on 7 Sept 2004, 9:03 p.m.,*
in response to message #7 by bill platt

OK, here is a new & improved workaround for the 33S polar conversion bug. I think this one does work, but try it out for yourself.

LBL T
CF 4
x=0?
SF 4
FS? 4
Rv (roll down)
FS? 4
0
CF 4
x<>y (swap)
x=0?
SF 4
FS? 4
Rv (roll down)
FS? 4
0
CF 4
x<>y (swap)
y,x->theta,r
RTN

To use: key in XEQ 4 for conversion to polar coordinates, instead of [left-shift] 4.

Program uses Label T and Flag 4. It simply checks the x- and y-registers for zeros. If any are found, they are overwritten with nice fresh zeros before the conversion is performed. Nonzero values are unaffected.

For whatever reason, this routine seems to eliminate the silly "rotating sequence of answers" previously described by Karl Schneider here.

For example, start with (0,3). Convert to polar coordinates with [left-shift] 4, then back to rectangular coordinates with [right-shift] 4. You can repeat several times and watch the values change. But this will not happen if you load the program above, and substitute XEQ 4 for [left-shift] 4.

It's not entirely clear to me why this should work, but it seems like maybe it does.

Edited: 7 Sept 2004, 9:06 p.m.

Re: Workaround for 33S polar bug

*Message #10 Posted by **Norris** on 7 Sept 2004, 11:56 p.m.,*
in response to message #9 by Norris

This version is better. It overwrites the zeroes more elegantly, without the need for a flag. Still seems to work, as far as I can tell.

```
LBL T
x=0?
CLx
x<>y (swap)
x=0?
CLx
x<>y (swap)
y,x->theta,r
RTN
```

Re: Workaround for 33S polar bug

in response to message #10 by Norris

Norris --

Good work on the elegant and robust workaround for the HP-33S polar-conversion bug. Also, my thanks to you and others for crediting my earlier posts on the "bug" topics.

If you have any idea about the HMS bug I analyzed earlier, you are welcome to attempt a "fix". Quite frankly, I'm not sure what that problem is.

-- KS

Re: Workaround for 33S polar bug

*Message #12 Posted by **Norris** on 9 Sept 2004, 1:22 a.m.,*
in response to message #11 by Karl Schneider

As far as I can tell, the crude workaround posted here effectively handles the HMS bug. It is based on your previous posting, which indicates that the bug only affects negative values. The workaround simply changes negative values to positive, runs the conversion on the positive value, then changes the result back to negative.

I am relying on this workaround, so please let me know if there are any problems with it.

Re: Workaround for 33S polar bug

*Message #13 Posted by **bill platt** on 8 Sept 2004, 11:38 a.m.,*
in response to message #9 by Norris

Norris,

Congratulations!

This is quite interesting indeed! Yes, the "rotating answers" which are produced by the built-in function are indeed "cured" by your boolean test/replace.

In fact, you have solved both the "-0" problem and the rotating answers in the case of y=y, x=0 Rect-->Polar

Apparently, the built-in function of Polar-->rectangular (denoted "-->y,x") functions correctly.

(I only checked your second, more elegant solution--the one without resorting to flags)

Best regards,

Bill

New software now available on Series80.org site

*Message #1 Posted by **Vassilis Prevelakis** on 4 Sept 2004, 6:41 a.m.*

If you are looking for software and documentation for the HP Series 80 computers (early 80s) which include the HP-83, HP-85, HP-86 and HP-87 computers, check out www.series80.org.

Thanks to contributions from many people the site now contains tons of useful material:

Programs: http://www.series80.org/Programs/index.html

Documentation (incl. software solution books): http://www.series80.org/Manuals/index.html

Best Regards

**vp

Help with Using Series 80 EMulatr

*Message #2 Posted by **Namir** on 4 Sept 2004, 8:28 a.m.,*
in response to message #1 by Vassilis Prevelakis

I need some help to be able to load BIN files (found in the Series80.org site) into the Oliver De Smet emulator found at:

http://www2.akso.de/files/series_80/Emulator

I'd like to be able to load some programs in the application pacs.

Thanks!

Namir

Re: Help with Using Series 80 EMulatr

*Message #3 Posted by **Olivier De Smet** on 4 Sept 2004, 1:40 p.m.,*
in response to message #2 by Namir

Hi,

Use binary disk image, rename as xxxxx.lif and use them :) (load them with Edit/:D700/Load)

Use the release from August 12th at André Koppel site :

http://www2.akso.de/files/series_80/Emulator/Series_80_Emu_Win.zip

Good luck.

PS : Professionnal Communication Pack won't work as the serial modules aren't emulated.

HHC2004 - coming? If so, let them know!

*Message #1 Posted by **Gene** on 3 Sept 2004, 10:34 p.m.*

http://www.holyjoe.net/hhc2004/

HHC2004 is just 3 weeks away! A preliminary speakers list and topics have been published. Talks about third-party applications for the 49g+, present and future PDAs, a couple of talks/analysis of HP keyboards, writing programs for the 33S, a unique look at the insides of an HP calculator, and lots more.

The conference is in San Jose, CA.

See you there! Gene

Re: HHC2004 - coming? If so, let them know!

*Message #4 Posted by **Gene** on 4 Sept 2004, 9:19 a.m.,*
in response to message #3 by Paul

Answers:

1) I dont' know. I would hope so, but since I didn't take them and don't control the website. ... :-) However, I will be taking pictures at HHC2004, so I can make sure those are published one way or the other.

2) Regarding Europe, the 1997 and 2002 conferences were in London. All it takes is someone or a group willing to sign up to organize one.

Potential rumors already for 2005 somewhere near Atlanta or down in Texas.

Gene

Re conferences in Europe :

The HPCC 2004 Mini-conference is next Saturday (11 September) in London (England!). It's not such a grand event as the full conferences (although that is not necessarily a bad thing!) but we do have 4 or 5 short talks planned, there should be some toys (old and not-so-old) to play with, and so on.

There should be more details on http://www.hpcc.org/ -- get in touch with the committee if you want to come and are not a member of HPCC.

Idiosyncrasy of the 33S (revised)

*Message #1 Posted by **Mike** on 3 Sept 2004, 1:15 p.m.*

I have listed some of the idiosyncrasy of the 33S below. My question is when would these show up in common scenarios. Why would you input –0, or when would you have a negative H.MMSS. I am asking out of ignorance. Mike

Converting H.MMSS from H.DDDD, of a negative H.MMSS HMS

-0 in Polar Conversion Polar-coordinate / Complex

Missing negative real roots Solve

Stays in Rad / Grad after a self test Radians

Probability Overflow nCr

Re: Idiosyncrasy of the 33S (revised)

*Message #2 Posted by **Bill Wiese** on 3 Sept 2004, 2:59 p.m.,*
in response to message #1 by Mike

Hi, Mike...

This is a bit like the Pentium CPU FDIV division bug maybe 5-6 years ago (IIRC). Intel said it was a rare event and normal users would never encounter a problem. Pure hubris & BS. Do you want to know if your CPU or calculator is 'eligible to provide a correct solution'??? I don't.

While these specific instances you list are sometimes 'hard to get to' in simple calculator use, they're a sign of poorly designed algorithms & preprocessing/range reduction methods, and even worse testing for 'corner cases'. It's a real confidence-reducer.

Actually, inability to find negative roots of a simple equation really calls into question the whole rootfinder architecture, and this could well be magnified in more complex situations. What about cubic polynomial equation with three negative roots? Will the 33S find it? Dunno. So then you end up doing things semi-manually because you don't have confidence in calculator.

Many calculators' H.MS<->H.h -style functions are named D.MS<->Dd (degree/min/sec<==> decimal degrees) instead; this is, in fact, called 'sexagesimal conversion'. If you think about using these operations in navigational/map calculations instead of time calculations, then usage of negative values can make sense and should operate properly. (And this is really even applicable for time offsets and relative times, etc.)

The inability to intelligently handle "-0" as an argument is a real input argument processing fault and does not engender much confidence in the calculator's use & design. Similarly, the fact that the calc can even operate _anytime_ in RAD mode but not have the RAD annunciator displayed is atrocious. Right now, we just know this happens coming out of self-test mode: are there other times this could happen? Improper handling of machine state in one instance could well have side effects elsewhere.

The worst thing is that this is 2004, with many many predecessor calculators from many manufacturers able to handle all these (and many similar) issues properly. It'd be one thing if this were an early 70s calculator: many difficult workarounds had to be made in terms of ROM space, CPU speed, etc. But with a decent 8-bit CPU and plenty of ROM & RAM today - there's no excuse.

Messrs. Hewlett and Packard are probably spinning in their graves. And Carly doesn't even have a clue.

Bill Wiese
San Jose CA

Re: Idiosyncrasy of the 33S (revised)

*Message #3 Posted by **Gene** on 3 Sept 2004, 8:32 p.m.,*
in response to message #2 by Bill Wiese

The root finding issue is only for direct solve cases.

X^2 - 4 SOLVE X

will return +2 if done using the Equation solver.

This can be alieviated by entering the equation as X^2+0*X - 4 which will return roots + 2 or -2 depending on initial guess.

Actually, if you take a look at the equation solver / root solver learning modules on the hp website, you'll see how it can be done using a program without much effort.

Only a concern in the direct solve mode.

Solving functions in the 33S

*Message #4 Posted by **Karl Schneider** on 3 Sept 2004, 11:11 p.m.,*
in response to message #3 by Gene

Gene --

OK, can you enlighten us about what methods were incorporated into the HP-33S algorithms for solving equations?

I got the following results when solving the following equations and program after setting x to -5 and entering -1 in the stack X-register.

```
X^2-4          2.00
SQ(X)-4        2.00
X*X-4         -2.00
(program)     -2.00
```

```
program:
LBL V
RCL X
x^2
4
-
RTN
```

Are the x^2 and y^x functions handled in a special way within equations? I'd assumed that SOLVE was simply evaluating the function and adjusting the input guesses using a refined Newton's Method.

I preferred the straightforwardness of the original HP-34C implementation, which was ported to the HP-15C and HP-41C Advantage Pac: Key in two values specifying the range in which to look for the root of a programmed function, then SOLVE the program containing the function.

Why should the user have to insert mathematically needless expressions into an equation in order to "trick" thee 33S into performing as desired?

-- KS

Re: Solving functions in the 33S

*Message #5 Posted by **Gene** on 4 Sept 2004, 9:22 a.m.,*
in response to message #4 by Karl Schneider

That I don't know. I don't know how the internal solutions work.

Regarding the insertion of 0*X insertion, that's a user-found addition to get the 33S solver to not solve the equation "directly". Apparently, if the variable shows up in the equation more than once, the 33S solution method changes.

All I know is, I can get the negative and positive roots by solving an equation in a program or by adding a 0*X in the equation mode.

Gene

Needless & undocumented "sophistication"

*Message #6 Posted by **Karl Schneider** on 5 Sept 2004, 12:17 a.m.,*
in response to message #5 by Gene

Well, I tried a few more examples of solving equations on the 33S, to determine its methods for handling polynomials or equations in which the variable to be solved appeared only once in the expression.

The rule seems to be as follows:

"For polynomial equations in which the variable to be solved appears only once, SOLVE on the HP-33S will algebraically compute the solution value of the variable, using the positive-valued root of every term that is taken to a positive-integer power.

For all other types of equations, the the function is solved by numerical iteration using repeated evaluation."

Consider the following expression:

```
(2*X+3)^2-1
```

Both solutions are real-valued and negative: -1 and -2. However, no matter what initial guesses are stored in the X variable and the x-register, the 33S will always return "-1" as the solution. This is because:

```
    (2*X+3)^2-1 = 0
->  (2*X+3)^2 = 1
->  (2*X+3) = sqrt(1)
->  (2*X+3) = +1  [but never -1]
->   2*X    = -2
->   X      = -1
```

"-1" is always returned very quickly, even if "-2" is stored in the X variable and x-register as first guesses (which happen to be a solution).

But, if "+0*X" is inserted into the expression, or if the (2*X+3)^2 term is expanded, then the

user can obtain the "-2" solution by entering guesses that bound -2, but not -1.

I did not see this "special feature" documented anywhere in Chapter 7 or Appendix D of the HP-33S manual.

If my analysis is correct, I think KinHPo was "too clever by half" by implementing algebraic solutions and employing the CBRT and XROOT functions for solving this small subset of polynomials.

This was an unnecessary "refinement" that provides more pitfalls than real benefits -- sometimes, the user will wonder why he cannot obtain the root in the range he specifies! Heck, if the polynomial is so simple that it can be algebraically solved, the user should do the algebra himself.

Add one more thing to the list of blunders by KinHPo.

Read the learning modules

*Message #7 Posted by **Gene** on 5 Sept 2004, 8:03 a.m.,*
in response to message #6 by Karl Schneider

Hi Karl. Sorry you are frustrated, but this is not exactly a flash of news. Try reading through the learning modules on HP's site, particularly these two:

http://www.hp.com/calculators/docs/guides/33sAdvSolver.pdf Advanced uses of the Solver part 1

and

http://www.hp.com/calculators/docs/guides/33sAdvSolver2.pdf Advanced users of he solver part 2

(Both written by Wlodek)

and finally these last three:

http://www.hp.com/calculators/docs/guides/33sSolver.pdf

http://www.hp.com/calculators/docs/guides/33sSolver2.pdf

http://www.hp.com/calculators/docs/guides/33sRoots.pdf

As Wlodek discusses in the first of these above, the solver goes for a direct, principal solution.

Question: I would think most people really interested in a calculator would really dig into these learning modules, but that doesn't seem to be the case. Is it that people don't know they are there or ?

And, please don't take offense at the shortness of the title!

*Message #8 Posted by **Gene** on 5 Sept 2004, 1:15 p.m.,*

in response to message #7 by Gene

Looking at the title of my last response, it may seem short or irritated.

Not at all what I intended. I do think looking at the learning modules more by everyone would be helpful. Wlodek spent a lot of time talking about the solver and and how it differs from the 32SII.

Maybe I just need to mention them more often. :-)

Gene

33S SOLVE: What should have been done

*Message #9 Posted by **Karl Schneider** on 5 Sept 2004, 3:08 p.m.,*
in response to message #7 by Gene

Gene posted,

> Quote:
>
> Hi Karl. Sorry you are frustrated, but this is not exactly a flash of news.

Hmmm. In view of your follow-up post titled, "And please don't take offense at the shortness of the title!", I guess I won't take you to task for that statement.

I'm certainly not frustrated *per se* about these somewhat-troubling things we are finding about the HP-33S -- after all, I have a wide assortment of "purebred" HP-designed-and-engineered calc's that do not have these issues.

Rather, I am disappointed that the designers of the 33S didn't "think things through" like HP did in the old days.

Thank you for giving me the "Learning Module" links. It spared me the trouble of plowing through HP's graphics-intensive, marketing-driven corporate website in search of information I wasn't sure would exist. Wlodek did indeed prepare useful explanations of the methods.

My points are two-fold:

1. This usage of direct-solutions by SOLVE in Equation mode should have been mentioned in the User's Manual. Users shouldn't have to navigate corporate websites without broadband and download graphical documents to find out why their calculator isn't performing intuitively, or as described in the printed manual they received in the package. I realize that the "direct method" techniques are new, and would not have been documented in the 32SII UM, but the 33S UM should have been enhanced.

2. The direct-solution procedures sometimes contradict the UM documentation, as illustrated in my example. I still believe that the direct method was not absolutely necessary, and the efforts to implement it might have been better spent in other areas too numerous to mention. However, there is some value in the procedure, and now that it has been done, here's a suggestion for HP to improve the logic:

STEP 1: Attempt to find the direct solution, if the format of the equation permits. Otherwise, try numerical iteration.

STEP 2: If a direct solution is found within the guess-range provided by the user, return the value and stop.

STEP 3: If a direct solution is found outside the range given by the user, store the value, and try numerical iteration.

STEP 4: If no direct solution can be found, try numerical iteration.

STEP 5: If a numerically-iterated solution is found within the guess-range provided by the user, return the value and stop.

STEP 6: If no iterated solution is found within the guess-range provided by the user, AND an outside-the-range direct solution was found in STEP 3, return that value and stop.

STEP 7: If an iterated solution is found outside the range given by the user, return that value and stop.

-- KS

Edited: 5 Sept 2004, 3:11 p.m.

Re: 33S SOLVE: What should have been done

*Message #10 Posted by **Gene** on 5 Sept 2004, 4:02 p.m.,*
in response to message #9 by Karl Schneider

I too wish the 33S designers had chosen to do things differently in places. Unfortunately, they didn't ask me ahead of time. VERY BIG :-)

When I saw the UM, it was pretty much finished by then...perhaps I can pass along your good suggestion to add to the explanation in the UM.

It does bother me that more people aren't aware of the learning modules. After all, the 42 modules for the 33s have been available since the day the 33S was available on the HP website.

And, again, sorry for any short comments that might have offended/irritated. That was not my intent. :-)

Gene

Re: Idiosyncrasy of the 33S (revised)

*Message #11 Posted by **Karl Schneider** on 3 Sept 2004, 11:33 p.m.,*
in response to message #1 by Mike

Mike --

Thanks much for making the effort to consolidate the bug topics into a concise posting with links to the authors who described the respective problems most thoroughly. I was considering such an exercise; I'm planning to send the bug reports and my recent critique of the 33S to HP.

As for your questions about -0, Bill is right in that the bug suggests improper input processing. Sure, most users would not deliberately enter -0 from the keyboard, but I noticed the same problems when using +/- to

change the sign of a previously-calculated result. So, it's certainly possible to provide an input of -0 to a function inside a program.

The discoverer of the HMS bug was using the 33S to do realistic calculations in a navigation-training class.

The "-0 Polar-conversion" bug is important because it involves conversion of purely-imaginary numbers.

-- KS

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #12 Posted by **DavidY** on 4 Sept 2004, 9:26 a.m.,*
in response to message #1 by Mike

Looking at the problems with the 33S from a general perspective: It doesn't matter if the trigger condition for the error is "rare"; errors of this sort destroy confidence in the calculator.

I certainly would not purchase a 33S--errors in software, especially those in core math routines--indicate a lack of quality control testing.

Consider: If the software is emulated (like much of the 49+) automated testing could have been done on development station emulators. And, if the code was re-written in assembly, where was the testing?

And, as an aside, the Intel math bug was a chip level/microcode/hardware problem,i.e.base level. The errors found in the 33S are application level. Application level errors can/should be fixed by firmware updates. But, oops, HP didn't make allowances for that either... (and, come on, how much would it have really cost. I have a moderately priced TV multi-remote controller that can be updated--over the phone--with new firmware/data)

All in all, it shows HP attempting to trade on its past reputation rather than maintaining that reputation

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #13 Posted by **,** on 4 Sept 2004, 8:08 p.m.,*
in response to message #12 by DavidY

Having the ROM updateable means 1.flash ROM, 2. an I/O port of some kind.

It wouldn't be allowed on the US engineering exam (NCEES). There goes a fair chunk of the market.

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #14 Posted by **DavidY** on 4 Sept 2004, 10:26 p.m.,*
in response to message #13 by ,

Being only a lowly computer consultant I what I know of the NCEES exams is only what I've read here. I thought they were concerned about alphanumeric programables with IR communication possibilities. It should possible to put an internal hardwire port in the battery compartment or such and design the internal update for firmware only. Anyway, errors in firmware giving incorrect answers would also tend to eliminate a market, right?

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #15 Posted by **.** on 5 Sept 2004, 2:22 a.m.,*
in response to message #14 by DavidY

Do you think more then .1% of potential buyers would read this board? I don't.

". I thought they were concerned about alphanumeric programables with IR communication possibilities."

Its not just IR. Even the TI graphic calculators have been banned because thy have an 'alpha lock' key.

Another problem is, by having a link port and flash rom, some clever person could alter the calculator in a way that would annoy the NCEES. I think the calculator rule is stupid, but theres nothing that that I can do about it.

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #16 Posted by **Norris** on 5 Sept 2004, 12:52 p.m.,*
in response to message #14 by DavidY

NCEES will *not* allow any calculator that can store and output text to a PC. Currently, calculators with *any* type of port, IR or serial, are banned.

If HP could design a port that could upload new firmware, yet not allow downloads of stored data, then it *might* be acceptable to NCEES. Or maybe not; NCEES is rather paranoid.

I would imagine that NCEES exam candidates are easily the biggest market for the 33S; it is popular because (1) it is the only NCEES-approved RPN model in current production, and (2) it is the best NCEES-approved programmable model (either RPN or algebraic) in current production. So it makes sense to buy a 33S if you are taking an NCEES exam, and a few obscure bugs aren't going to change that.

But I can't see why anyone other than an NCEES exam candidate (or one of those wacky HP calculator collectors) would buy this model. You can get a comparable scientific calculator, like the Casio FX-115MS Plus, for $15, so why pay $50-60 for the 33S? The only advantages of the 33S are (1) RPN, and (2) programmability, and if you value those features you would be much better off with a 48GII or 49G+.

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #17 Posted by **GE (France)** on 8 Sept 2004, 5:36 p.m.,*
in response to message #16 by Norris

Are NCEES 'wizards' worried by digital cameras and the like, notably found in a lot of portable phones nowadays ?

I know I'd rather capture an image in less than 1 second than painfully type 2000+ characters per page.

So the calculator restriction sounds dumber and dumber.

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #18 Posted by **Dave Shaffer** on 8 Sept 2004, 5:46 p.m.,*
in response to message #17 by GE (France)

I presume portable phones are also banned - otherwise you could call for (outside) help! (And, using text messaging, you don't have to talk at all, or listen, to convey information.)

Re: Idiosyncrasy of the 33S (revised) "A general Comment"

*Message #19 Posted by **Norris** on 9 Sept 2004, 1:11 a.m.,*
in response to message #17 by GE (France)

The rules may vary somewhat from state to state, but you can generally assume that *no* digital devices will be allowed in the exam room, except for approved calculators. Cell phones, with or without cameras, are definitely out. Even digital watches are explicitly banned in some states -- if you bring in a watch, it must be analog.

For example, the California engineering board (at http://www.dca.ca.gov/pels/e_03_new_policies.pdf) offers the following gentle hints:

****

ELECTRONIC DEVICES NOT ALLOWED IN EXAMINATION ROOM

Electronic devices including but not limited to cell phones, pagers, personal data assistants (PDAs), digital wristwatches, digital clocks, scanners, cameras or any calculating device which, in the opinion of the Board, may pose a threat to exam security SHALL NOT BE BROUGHT INTO THE EXAMINATION ROOM. If any of these items are brought into the examination room, you will be required to leave them at your own risk in a box or container inside the examination area. The Board assumes no responsibility or liability for any of these items. These items will be returned to you after the examination. If you refuse to surrender the items to the Board's representatives upon request, you will be removed from the examination for failing to comply with the laws and policies regarding examination security and subversion. If you are found to have such devices with you during the examination, the item(s) will be confiscated and you will be removed from the examination. In addition to the items being confiscated, the incident will be reported to the Enforcement Unit of the Board for investigation as a possible violation of the laws regarding examination security and subversion. Penalties for such a violation can include, but are not limited to, your examination being voided and your examination fee being forfeited. LEAVE THESE DEVICES IN YOUR CAR OR AT HOME!

Re: Idiosyncrasy of the 33S (revised) "A general Comment" [rant]

*Message #20 Posted by **Thomas Radtke** on 5 Sept 2004, 6:51 a.m.,*
in response to message #12 by DavidY

But HP *is* maintaining its reputation. Remeber the many bugs with the 48 models? 35? 32SII? It was never a good idea to be an early adopter without being forced to it. Ok, I don't know the situation with TI, Casio, Sharp etc., maybe HP calculators have fewer bugs. Anyone else knows?

33S "positive button" feels??

*Message #1 Posted by **KC** on 3 Sept 2004, 6:48 a.m.*

The HP33S has a positive button feel. You can feel the key is pressed down and come up again. BUT I have several experience that "positive button feels results in negative output!" I pressed a button, and nothing was seen in the screen. That might be my problem, since I'm still not familier with the awkward chevron keyboard, and occasionally I'll press a key out of its proper position (or maybe I don't really know the proper position of each key), but who else has ever used such a calculator keyboard?

I don't know whether anyone of you have also such an experience. I never have any key pressing problems with my 32sii and 42s.

KC

Re: 33S "positive button" feels??

*Message #2 Posted by **Jeff O.** on 3 Sept 2004, 7:22 a.m.,*
in response to message #1 by KC

KC,
The behavior you describe was (is?) common to the 49g+. However, there were no widespread reports of such behavior on the 33S keyboard. Most users seemed satisfied with the feel of the buttons and the response to keypresses. (Response to the *look* of the keyboard is another matter.) My 33S keyboard feels decent to me, although not up to the standards of past models, and does not miss keypresses. Perhaps you have a defective unit, I would not hesitate to call HP and get a warranty replacement.

Adjusting HP 10 and HP 25C

*Message #1 Posted by **Ronald** on 3 Sept 2004, 4:58 a.m.*

Hello,

I have a HP25C and a HP10 (the one with the build in printer) under restoration and cleaning this moment. When you remove the display (the circuit board with the leds) there is one potentiometer for the HP25C and even 4 potentiometers on the HP10 on the circuit board below. Sofar I have not tried what happens when changing their adjustment, but I am very curious. Anyone an idea what they adjust and if so how to adjust them optimal or what the original settings should be ? Pictures are available if requested to identify what I mean offcourse.

Any help would be really appreciated.

Ronald

Re: Adjusting HP 10 and HP 25C

*Message #2 Posted by **Tony Duell** on 3 Sept 2004, 7:56 a.m.,*
in response to message #1 by Ronald

On the 25C, the preset pot sets the low-battery dectecion level. IIRC there are _5_ presets in the 10. They set the clock rate, display intensity, low-battery level, printer motor speed and printer intensity (I will have to check the diagrams to see what the order is).

Please don't fiddle with them...

Re: Adjusting HP 10 and HP 25C

*Message #3 Posted by **Ronald** on 3 Sept 2004, 4:58 p.m.,*
in response to message #2 by Tony Duell

Hi,

This is very interesting, I thought it was allin silicon defined, but in the old days more like the real HP measurment systems, where a lot could be adjusted by adjustable coils, pot's, variable C's.

Re: Adjusting HP 10 and HP 25C

*Message #4 Posted by **`Ronald** on 4 Sept 2004, 4:32 p.m.,*
in response to message #3 by Ronald

Hi Tony,

I had some troubles to get the HP-10 printer running again, but a total cleaning and lubrication of the printer got this one up again. Now I was stuck with all dots in the display the moment the printer was accessed and also that the characters were stretched out horizontally. Some carefull fiddling with the potmeters got that up again. By comparing the speed of the printhead mobing from left to right from to

a HP-19 and adjusting potmeter 4 got that back on track. Potmeter 5 is the density of the printer. Potmeter 3 is the brihghtness of the display, potmeter 2 is for adjusting the low voltage warning (I set it to trigger at 4.8 volts for now). Potmeter 1 is still not clear to me, it does something on the horizontal speed of the printhead, but potmeter 4 also has that effect.

I counted the potmeters from 1 to 5 looking from the top from left to right.

Another observation is that the battery has to be really oké. I was during the repair working with a stabilised PSU with a current limit of 500 ma. This made the printing giberish. When switching to a more powerfull power supply, one who can deliver up to 3A, the print out was clear dark and 100% oké.

So it looks like the HP-10 will have a second working live now. Your info on the potmeters were very usefull.

Thank you for that.

Re: Adjusting HP 10 and HP 25C

*Message #5 Posted by **Tony Duell** on 4 Sept 2004, 7:39 p.m.,*
in response to message #4 by `Ronald

Pot #1 sets the CPU clock speed (the oscillator in this machine uses an RC network, not an LC network). I think my notes include the freqeuncy that I measured in a working HP10 (I connected a LogicDart to some point in the oscillator circuit). Again, I can look this up if you need it, but if the machine is working, I'd leave it alone now. Incidentally, the 10 uses NMOS chips (like the 27, and unlike just about all other HP calculators of the period which use PMOS devices) so the PSU is somewhat strange!

Re: Adjusting HP 10 and HP 25C

*Message #6 Posted by **Ronald** on 5 Sept 2004, 4:57 a.m.,*
in response to message #5 by Tony Duell

Hi Tony,

If you are able to find the frequency it would be very nice.

I marked the original position of the first potmeter, but if you twist it to one side, the printer will only print horizontal lines, which seems consistent with you remark on the CPU freqency. I will take a reading myself also to see what frequncy he is running. I assume a lower frequency will mean a somewhat lower powerconsumption, but realistically this will problaby minimal in respect to the drain to the Led's and offcourse a printing printer.

Re: Adjusting HP 10 and HP 25C

*Message #7 Posted by **Tony Duell (UK)** on 7 Sept 2004, 12:54 a.m.,*
in response to message #6 by Ronald

OK, I've found the notes. It appears you connect a freqeuncy counter/scope to pin 39 of the main IC (ground == -ve side of the battery pack), then adjust the leftmost preset for 1.26MHz

Re: Adjusting HP 10 and HP 25C

*Message #8 Posted by **Katie** on 8 Sept 2004, 9:40 a.m.,*
in response to message #7 by Tony Duell (UK)

Tony and Ronald,

This is a very useful and interesting thread. Could one of you please write this up as an article and post it in the articles section here? Other than Michael Meyer's article on the HP-19 overhaul, there's very little information on this site concerning HP-10/HP-19 repairs.

Thanks,

Katie

*Message #9 Posted by **David Smith** on 8 Sept 2004, 11:12 a.m.,*
in response to message #8 by Katie

The HP19C printer system is very much like the HP97... it uses the same hybrid multivibrator module, etc. The HP97 service manual has a lot of useful info.

Re: Adjusting HP 10 and HP 25C

*Message #10 Posted by **Tony Duell** on 8 Sept 2004, 1:06 p.m.,*
in response to message #9 by David Smith

There is one important difference between the Topcat and Sting printers. The motor in the former is reversed to bring the printhead back to the home position, in the latter the motor always turns in the same direction (and the printhead travel is reversed mechanically).

Otherwise they are very similar. The 19C uses the same printer control chip as the Topcats (it's in the big 40 pin chip on the 10). They use a quad comparator chip (looks like an LM339) and the same hybrid circuit to set the motor speed and printhead drive time (intensity).

Incidentally, the 19C has very similar hardware to the 95C... I've had both in bits.

Re: Adjusting HP 10 and HP 25C

*Message #11 Posted by **Ronald** on 8 Sept 2004, 2:01 p.m.,*
in response to message #10 by Tony Duell

I had both the HP10 and HP19 open next to its other. The printers mechanisme is the same. I have variuous pictures from the inside if interested.

One observation: What I found out is a that is very important to have the horizontal speed of the printer precisely adjusted. To slow, and you have smaller digits printed (width).

If however to fast and you get larger (wider) digets printed, but funny enough, due to the fact that the printerhead keeps on moving the effect is for

numbers with 8 or 9 digits the last digits gets printed on the way back of the printhead and are mirrored. At first glance you think the printer is printing garbage, defective driverchips etc. but later when really looking what is printed this becomes very obvious that it were only mirrored digits printed over the first charecters. The paper feed is only done when the printhead is at 50 - 60% of its travel back to the homeposition.

New RPN Calculator?

*Message #1 Posted by **Bill** on 2 Sept 2004, 5:18 p.m.*

I bought an HP 33s a few months ago and so far so good. I'm thinking about buying another one - just in case HP discontinues the RPN calculators again.

My question is - are there any other model RPN calculators coming down the pipeline I should wait for?

Thanks in advance, Bill

Re: New RPN Calculator?

*Message #2 Posted by **bill platt** on 2 Sept 2004, 5:28 p.m.,*
in response to message #1 by Bill

Yes,

OpenRPN (Not HP).

Go to WWW.openrpn.org

33S has some serious stupid bugs.

Re: New RPN Calculator?

*Message #3 Posted by **John** on 2 Sept 2004, 7:18 p.m.,*
in response to message #2 by bill platt

Think about this for a minute.

If there were any new HP RPN calculators coming, anyone who knew that would be unable to talk about it.

Re: New RPN Calculator?

*Message #4 Posted by **yak** on 2 Sept 2004, 9:29 p.m.,*
in response to message #3 by John

perhaps i msiss something, but why?

Re: New RPN Calculator?

*Message #5 Posted by **John** on 3 Sept 2004, 12:04 a.m.,*
in response to message #4 by yak

I find it hard to believe you don't understand.

Imagine that HP has told you that next month, they are releasing a new HP42SX calculator. They

told you this because you have been beta testing it. In order to do this, you had to sign a legal document where you agreed not to divulge any information about the product before it is released.

Now, someone comes on the forum and asks "When is HP coming out with a new product?"

If you even think about saying anything, you will probably never get to work with HP again, probably get a call from their lawyers, and hurt HPs present sales, which does them and us ultimately no good.

So, as these questions are always answered here, anyone who might know is of course unable to say so if they ever want to know anything in the future.

And, no, I have no knowledge of any upcoming HP RPN calculator, but that doesn't mean there aren't any coming. How could I prove a negative?

Re: New RPN Calculator?

*Message #6 Posted by **Patrick** on 3 Sept 2004, 4:55 p.m.,*
in response to message #5 by John

But HP deliberately announced the development of several new calculators last year. This is apart from the leaks, which folks here also knew about. This was from HP itself, so the original question is valid, I think.

But, no, there hasn't been any official or unoffical word of a new RPN machine, to my knowledge.

Re: New RPN Calculator?

*Message #7 Posted by **Gene** on 3 Sept 2004, 8:34 p.m.,*
in response to message #6 by Patrick

And since HP announced this, you've had the 49g+, 48gII, 33S, and 39g+. Depending on the timing, the 49g+/48gII may have already been announced, but that still leaves the intro of the 39g+ and 33S.

I certainly HOPE for more HP calculators, but there have been RPN calculators announced (33S) since HP's statement.

Re: New RPN Calculator?

*Message #8 Posted by **John Limpert** on 3 Sept 2004, 9:32 p.m.,*
in response to message #7 by Gene

One calculator that has been announced, but AFAIK not introduced, is the 19BII+, the replacement for the 19BII.

Re: New RPN Calculator?

*Message #9 Posted by **Gene** on 4 Sept 2004, 9:25 a.m.,*
in response to message #8 by John Limpert

Was that actually announced by HP? I thought it was leaked from somewhere and then placed on the hpcalc.org site.

I just don't remember. However, if someone can point to a specific statement BY HP

and not just leaked material posted to a site, then that might change my mind.

Gene

Re: New RPN Calculator?

*Message #10 Posted by **John Limpert** on 4 Sept 2004, 2:50 p.m.,*
in response to message #9 by Gene

See http://www.seodots.co.kr/hp19bii.html for a picture of the calculator. I've seen similar pictures elsewhere. Enough HP dealers have the calculator listed that I believe it is real. I suspect that HP's dealers get advance product information that is not released to the general public.

Since the 19BII+ is the only clamshell calculator in the product line, HP may have had trouble finding someone to build it.

Oh, I've seen the pictures...

*Message #11 Posted by **Gene** on 4 Sept 2004, 3:01 p.m.,*
in response to message #10 by John Limpert

Oh, I've seen the pictures, but nothing that I remember from HP saying it was coming.

Again, a picture of a potential product (and a drawing at that) apparently was leaked a good while ago, does not equal a product that is late or promised but now not delivered.

For all I know, HP may introduce something like these leaked pictures, but then again, since they haven't announced that, they may not.

It is certainly the case that since HP said they were going to introduce new calculators, even new RPN calculators, they have introduced the 49g+, 48gII, 33S, and 39g+.

And, hopefully more to come! Gene

Re: New RPN Calculator?

*Message #12 Posted by **Bob** on 3 Sept 2004, 1:26 p.m.,*
in response to message #4 by yak

In the world of Product Development, news of a new product being released only helps you when your competitors either could not possibly mount an effective effort to blunt the impact of your product or your product is so superior that you are confident in it's ultimate success. In this case, it is called publicity.

If the news gets out too soon, bad things can happen to new products.

The protection of intellectual property, budget, development status, and marketing plans is paramount to a new product's success. It is serious business with lots of money, careers, and fates of whole companies at stake.

That is why CDA/NDA's are so critical to a this process and why no one is going to talk out of

school.

HP12c

*Message #1 Posted by **brian** on 2 Sept 2004, 9:16 a.m.*

I recently found and purchased a nearly mint HP-12c Made In USA that I am most proud of. Would anyone happen to know when the last 12c's were Made In USA?

Re: HP12c

*Message #2 Posted by **kraman** on 2 Sept 2004, 12:45 p.m.,*
in response to message #1 by brian

Talking about the 12-c; somehow I have converted my 12-c to the European mode, that is there is a comma after the integer instead of a period. Any ideas on how to get it back to the US mode. Thks.

Re: HP12c

*Message #3 Posted by **Jeff O.** on 2 Sept 2004, 1:27 p.m.,*
in response to message #2 by kraman

This should help.

Re: HP12c

*Message #4 Posted by **Randy Sloyer** on 2 Sept 2004, 7:26 p.m.,*
in response to message #1 by brian

Last USA units were sometime in mid 1988. After that, production was moved to Singapore. Quality was the same as the USA machines until sometime around 1995 when they where updated with painted keys and a new cpu package. They went on to Malaysia around '97 when the Pioneer line went to Indonesia and the 12C moved to China.

Re: HP12c

*Message #5 Posted by **Carlos** on 10 Sept 2004, 8:17 a.m.,*
in response to message #4 by Randy Sloyer

Why do the China versions don't have a serial nr. ?

Re: HP12c

*Message #6 Posted by **Chan** on 18 Sept 2004, 8:02 p.m.,*
in response to message #4 by Randy Sloyer

Probably, there are Brazil made version between USA and Singapore.

'new' HP17BII+ - some mistake?

*Message #1 Posted by **Tom (UK)** on 2 Sept 2004, 7:47 a.m.*

Take a look at:

http://www.amazon.co.uk/exec/obidos/ASIN/B00009WNV9/ref=pd_sim_ce_dp_1/026-6241495-9847647

Have HP realy put the HP17BII+ in a 12CP case??

Re: 'new' HP17BII+ - some mistake?

*Message #2 Posted by **Mike Head** on 2 Sept 2004, 8:04 a.m.,*
in response to message #1 by Tom (UK)

They have inserted the wrong picture. The case says 12CP.

Here is a picture of the 17BII+

Mike

Re: 'new' HP17BII+ - some mistake?

*Message #3 Posted by **phil** on 2 Sept 2004, 10:27 a.m.,*
in response to message #1 by Tom (UK)

WOW look what they charge for a 33S! http://tinyurl.com/6bxjw (with model number "HP17Bii+" further down the page!)

33s

*Message #4 Posted by **bill platt** on 2 Sept 2004, 10:43 a.m.,*
in response to message #3 by phil

The 33s is definitely NOT worth 110 sterling! At that price, one would be better off buying two used 32sii's.

The 33s is becoming more and more disappointing to me. The keyboard layout feels worse, not better, every day that I use it.

And the H.ms and Polar bugs are totally unacceptable.

It is all garbled up, the stack commands are scattered all over the place----

Just an utter nightmare compared to the voyagers, or even the original 32s (which is not as logical and natural as the voyagers).

Rip-Off Britain

*Message #5 Posted by **John Limpert** on 2 Sept 2004, 5:08 p.m.,*
in response to message #4 by bill platt

I suspect that listing is a mistake, look at the details where they refer to the HP17BII+.

Still, the prices on other calculators are outrageous. £125.99 for an HP-49G+? £139.99 for a (obsolete) TI-89?

->HR <-> ->HMS

*Message #1 Posted by **Gileno** on 1 Sept 2004, 10:02 p.m.*

I need the equation to convert ->HR <-> ->HMS. Thank you !!!

Re: ->HR <-> ->HMS

*Message #2 Posted by **Brent** on 1 Sept 2004, 10:33 p.m.,*
in response to message #1 by Gileno

I don't believe there is an equation, just some steps you
you have to follow:

-write down the degrees
-take the fractional part and multiply by 60
-the whole number is the minutes
-take the new fractional part and multiply by 60
-the whole number is the seconds and the fractional
part is the fractional seconds.

There should be a button to do all this on a good
calculator.

Edited: 1 Sept 2004, 10:34 p.m.

Re: ->HR <-> ->HMS

*Message #3 Posted by **Cyril RABIH** on 2 Sept 2004, 9:04 a.m.,*
in response to message #1 by Gileno

Hi man, if you really want to have a single équation, I show you what I've found during the last 15 minutes.

H->HMS f(x)=IP(x)+(1/100)*IP(60.FP(x))+(1/10000)*IP(3600*(FP(x)-(1/60)*IP(60*FP(x))))

HMS->H f(x)=IP(x)+(1/60)*IP(100*FP(x))+(1/3600)*IP(10000*(FP(x)-(1/100)*IP(100*FP(x)))).

You must enter 15h28mn15s as 15.2815

I've tried it with some examples and I think it's ok. I hope it will help you.

Edited: 2 Sept 2004, 9:19 a.m.

Re: ->HR <-> ->HMS

*Message #4 Posted by **bill platt** on 2 Sept 2004, 9:24 a.m.,*

in response to message #1 by Gileno

Also, compare to the equation I wrote in a previous post:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61505

Edited: 2 Sept 2004, 10:48 a.m.

Re: ->HR <-> ->HMS

*Message #5 Posted by **Gileno** on 2 Sept 2004, 7:57 p.m.,*
in response to message #4 by bill platt

Thank you

Re: ->HR <-> ->HMS

*Message #6 Posted by **bill platt** on 3 Sept 2004, 1:06 p.m.,*
in response to message #5 by Gileno

You are welcome!

BTW, I had too many parenthesis:

It should be:

H.MS-->HR: (FP(100*A)/0.6+IP(FP(A)*100))/60+IP(A)

And Also, here is my solution t'other way 'round:

HR-->H.MS:

IP(x)+IP(FP(x)*60/100+FP(FP(x)*60)*60/10000

Note that the precedence rules of the above text is as per the HP48 series.

These are nice and compact.

Best regards,

Bill

in response to message #1 by Darren Tschida

IMO it's a 41C with only a few key legends. The idea was to have overlays and a ROM module to allow special applications (insurance, tax etc.) - the advanced features were simply hidden from the user. Look at it as some kind of small, cheap, portable computer (and not pocket calculator)

HP-41 as Insulin Dosage Computer

*Message #1 Posted by **Bo Kristoffersen** on 1 Sept 2004, 1:27 p.m.*

Hi all,

I recently came across a programming manual for the "B-D Insulin Dosage Computer"(TM) from Becton Dickinson. The manual is from 1987 and issued by BD France and BD UK.

The computer is implemented on a HP-41 platform and from the pictures in the manual it appears that it features custom key-cabs.

My questions are: Can anyone provide me with more information about this product - e.g. was it ever put on the market and if so, when and where? Are you aware of any website with more information about this product? Has anyone actually seen this computer? - or even has one!

Best regards Bo Kristoffersen

in response to message #1 by Bo Kristoffersen

You must be new to earth!

Re: HP-41 as Insulin Dosage Computer

*Message #3 Posted by **Bo Kristoffersen** on 1 Sept 2004, 4:07 p.m.,*
in response to message #2 by Namir

New to earth? Do you perhaps have any information as to the BD Insulin Dosage Computer? Needles to say, I am not interested in information in respect of the HP-41 as such (I do have 3 of those).

BR, Bo Kristoffersen

*Message #4 Posted by **Wilson (Bill) Holes** on 1 Sept 2004, 3:10 p.m.,*
in response to message #1 by Bo Kristoffersen

You may want to check with Matthias Wehrli at http://www.hp-collection.org/. I believe he owns at least one of the modules as it's included in his .pdf module list. Hopefully he can help provide some additional details for you.

Best, Wilson

Re: HP-41 as Insulin Dosage Computer

*Message #5 Posted by **Bo Kristoffersen** on 1 Sept 2004, 5:09 p.m.,*
in response to message #4 by Wilson (Bill) Holes

I have checked Matthias Wehrlis module list but I couldn't find anything resembling an "Insulin Dosage Computer" or anything related to BD.

Further, the "B-D Insulin Dosage Computer"(TM) appears not just to be a module, it appears to be a HP-41 with a fully customized keyboard, not an overlay.

Indeed, the "B-D Insulin Dosage Computer"(TM) also has a customized ROM module, which in the manual is referred to as a "IDC" ROM chip in port #1. I assume that the module carries this designation.

BR, Bo Kristoffersen

in response to message #5 by Bo Kristoffersen

The module is mentioned in http://www.hp-collection.org/Modul%fcbersicht.pdf (see page 3).

Re: HP-41 as Insulin Dosage Computer

*Message #7 Posted by **Wilson (Bill) Holes** on 1 Sept 2004, 6:11 p.m.,*
in response to message #5 by Bo Kristoffersen

Hi Bo,

I suspect you overlooked it. Visit the .pdf again and flip to page three. It's the next to last module (ROM) listed on page three. Also, you are correct in stating the Insulin Dosage Computer is -not- just a module (ROM). From what I can gather it's an HP-41 with a custom HP-41 plug-in module (the one listed on Matthias's .pdf), and a custom keyboard overlay. However, this is only my assumption from the little I've seen of it. It may be much more than this so I was hoping I could help by pointing you in the only direction I know that -may- be able to shed more light on the subject.

Best, Wilson

p.s. One afterthought... You can also visit http://home.earthlink.net/~kd4ace/HP.html which is Chris Catatti's old module sale site. Look at item 20 and click on the link to see the pictures. These may answer many of your questions. I believe most of his things have been sold, probably to Matthias who seems to buy just about anything related to HP calculators.

Edited: 1 Sept 2004, 6:35 p.m.

Re: HP-41 as Insulin Dosage Computer

*Message #8 Posted by **Bo Kristoffersen** on 2 Sept 2004, 8:50 a.m.,*
in response to message #7 by Wilson (Bill) Holes

Thanks a lot! This was the kind of information I was looking for. I only wonder, is this the ONLY known to exist? As appears from the manual I have, this product was intended for general use by doctors and diabetics, however, with this kind of product, often it turns out that there is no demand in the market such that only very few will be sold. BR, Bo

Re: HP-41 as Insulin Dosage Computer

*Message #9 Posted by **David Smith** on 2 Sept 2004, 6:07 p.m.,*
in response to message #1 by Bo Kristoffersen

It is an HP41 with a custom ROM module. They are not very rare. I have seen at least 10 sell on Ebay over the last couple of years... and they tend to go for cheap since they are not usually listed under "HP" or "CALCULAORS".

Which Model PDA's runs EMU-42

*Message #1 Posted by **Bill (Smithville)** on 1 Sept 2004, 9:51 a.m.*

I'm itching to run EMU-42 on a PDA.

Thanks Erik for all your effort in getting this emulator released.

Since I've been using Palm devices, I need to purchase a Win CE PDA.

I see that EMU-42 runs on an ARM machine. Does this include the Intex Xscale? I'm thinking of picking up the new Dell 624 MHZ unit, but want to make sure that EMU-42 would work on it before I buy.

Thanks for your help.

Bill

Re: Which Model PDA's runs EMU-42

*Message #2 Posted by **Christoph Giesselink** on 1 Sept 2004, 12:24 p.m.,*
in response to message #1 by Bill (Smithville)

> I see that EMU-42 runs on an ARM machine. Does this include the Intex Xscale? I'm thinking of picking up the new Dell 624 MHZ unit, but want to make sure that EMU-42 would work on it before I buy.

Emu42 has been tested by beta testers on the follwing machines

- HP Jornada 565 StrongARM 206Mhz (SA1110) PocketPC 2002 German
- HP Jornada 568 StrongARM 206Mhz (SA1110) PocketPC 2002 English
- Aldi (Yakumo ???) XSCALE 400Mhz (PX255) PocketPC 2003 German
- iPAQ H1930 SAMSUNG 203Mhz (S3C2410) PocketPC 2003 French ??

My development platform is the HP Jornada 565 so I can only be sure that it's working on this machine. This was also the reason why Erik bought the HP Jornada 568.

To the Dell Axim X30 ???, this PDA use the Windows Mobile 2003 Second Edition (aka PocketPC 2003 2nd Edition). There's no experience with Emu42 running on a PDA with Windows Mobile 2003 Second Edition or PDA's with the VGA resolution 640x480 display.

But Emu42 is now published, so other users may tell you the hardware and the problems (hopefully not) they have.

Regards

Christoph

Re: Which Model PDA's runs EMU-42

*Message #3 Posted by **DavidY** on 1 Sept 2004, 8:20 p.m.,*
in response to message #2 by Christoph Giesselink

I have run the old emu48 on a Dell X5 and a new Dell X30 (intermediate version with wireless but 400 mhz processor). I've just loaded the emu-42 and it runs--start OK anyway, I don't have the 42 ROM. The latest em48 code from Christoph's site also installs and runs OK on the Dell's (WinCE2003 machines) and is much faster than the origional version I had tried (by way of HPCalc.org).

In fact right now I have installed Frank B's 41 emulator, the em48 emulator, Lygea's HP15 and HP16 (love this one) simulators, Math Tablet, and Math Tablet. All stable.

Actually, using an overclocking application I've pushed the Dell X5 to 472mhz. with everything running stable and down to 100mhz. with the apps stable.

Using the same app. I've pushed the Dell X30 to about 600mhz. with stable operation of the apps.

While I haven't had a chance to test the em48 emulator very much I can comment that higher speed doesn't gain that much for the 41 emulator or the 15/16 simulators. The standard speeds for the Dell PDAs are so fast in comparison to the origionals that shaving another second or so off a program is sort of redundant. The old emu48 emulator was a bit shaky to start with so higher speed just seemed to make it that much more likely to hang.

I have to complement Christoph on his latest emulators; the reworked em48 is very stable and quite a bit faster relative to the older version. If you need the power it is a great program to use and well worth sending Christoph $$$ to reward him for his work. I will as soon as I finish testing.

*Message #4 Posted by **Bill (Smithville, NJ)** on 2 Sept 2004, 8:33 a.m.,*
in response to message #3 by DavidY

Christoph and David,

Thanks for your input. If I understand correctly, the code compiled for the ARM processor should run on the Intel Xscale? I take it the Xscale is a ARM processor. It's been awhile since I owned a WinCE PDA and I remember that there were three different processors - each one had to have the code specially compiled for it. I take it that's not the case now?

The Dell X30 with 624MHZ processor and WiFI/Blue Tooth at about $300 looks like a great deal. My birthday's coming up, so I'm thinking I deserve to buy myself a gift.

Thanks.

Bill

> Thanks for your input. If I understand correctly, the code compiled for the ARM processor should run on the Intel Xscale?

This is true.

> I take it the Xscale is a ARM processor. It's been awhile since I owned a WinCE PDA and I

remember that there were three different processors - each one had to have the code specially compiled for it. I take it that's not the case now?

I'll try to bring some light into the MS chaos of version names. I give _no_ guarantee that the following information is correct. So I'm not responsible for decisions you made base on this perhaps wrong information!

There exist some kernel versions of a Windows embedded OS. The most common are:

- Windows CE 2.2
- Windows CE 3.0
- Windows CE .Net 4.2
- Windows CE 5.0

Then we have some keyless Pocket PC's with the OS:

- Windows CE 3.0
- Pocket PC 2000 using the Windows CE 3.0 kernel
- Pocket PC 2002 (aka Windows mobile 2002 for Pocket PC) using the Windows CE 3.0 kernel
- Pocket PC 2003 (aka Windows mobile 2003 for Pocket PC) using the Windows CE .Net 4.2 kernel
- Pocket PC 2003 SE (aka Windows mobile 2003 SE for Pocket PC) using the Windows CE .Net 4.2 kernel ?

In the example above we have three OS versions with a Windows CE 3.0 kernel, they differ esspecially in the number of API functions. Emu42PPC and Emu48PPC are Pocket PC 2002 applications which use API calls exist only in Pocket PC 2002 and later, so they can't run on Pocket PC 2000 devices.

Pocket PC 2002 applications mean: I build them with eVC++ 3.0 compiler and the Pocket PC 2002 SDK.

Now to the CPU's you asked for:

StrongARM, XScale, Bulverde are chips for embedded systems from Intel. Intel licensed the ARM CPU core inside. I mentioned in my earlier mail the Samsung S3C2410 chip. This chip use the same or quite equal core (ARM 920T). Because of this, binary code for the Intel chips can also be executed on the Samsung chip.

Earlier WinCE OS supported several different incompatible CPU's (MIPS, SH3, SH4, x86, ...). This mean the OS and the application was specially compiled for this CPU. There was also a meta binary format for applications that the OS should convert into the necessary CPU binary format before running. This concept never worked very successful (speed reasons).

Now back to the Pocket PC 2002 versions. Pocket PC 2002 PDA's were the first one, only sold with an ARM core CPU. Most one with the StrongARM and the later one with the XScale CPU's. PDA's with XScale CPU are slower than the one with StrongARM CPU at same clock speed running on Pocket PC 2002. This was fixed with the Pocket PC 2003 version, because this OS was especially optimized for the XScale CPU's. Currently all Pocket PC 2002, 2003, 2003 SE devices use an ARM core CPU with compatible binary files. Differences are only in the Win API. So Pocket PC 2002 supports no multimedia timers, where the Windows CE .Net 4.2 kernel and the OS base on this kernel do.

Finally some word to the Windows CE 5.0 kernel. This kernel should be available for MIPS, ARM, SH, x86 CPU cores. So forthcoming keyless Pocket PC PDA's using the Windows CE 5.0 kernel

may need different compiled applications.

> The Dell X30 with 624MHZ processor and WiFI/Blue Tooth at about $300 looks like a great deal. My birthday's coming up, so I'm thinking I deserve to buy myself a gift.

I can only repeat my previous mail, from the technical aspects it _should_ work, but I haven't tested this so I must say I don't know.

Regards

Christoph

Hi Christoph,

Thanks for the great information on Pocket PC's and their associated operating systems.

I just ordered the Dell X30, 624 MHZ. Unforturnately, it has a long lead time, so probally won't actually receive it till the end of September.

I'll let you know how EMU42 runs on it once I get it.

Now, I need to sell my two Sony Clie's. :)

Thanks again for the detailed explanation.

Bill

HP-45 calculator

*Message #1 Posted by **Uwe Homann** on 31 Aug 2004, 5:24 p.m.*

Hi,

I came across this forum as I was searching for info on a HP-45 calculator. Actually my dad has one since about 30 years and is still using it. Unfortunately, and much to his frustration, he had a little “accident” with it. The calculator was hooked up to the charger (batteries were weak, but are till OK) and the unit was powered on. He was wearing some leather shoes at the time, walked over the carpet and when he touched the calculator he discharged himself! The unit flickered, he turned it off & on again, it powers up but not all functions work properly. The bottom row seems all messed up – i.e. the decimal point does not function, divisions don’t work, the number Pi is gone and I think it does a few other weird things. Having been in the electronic service business for a number of years (TV & VCR repairs), he would like to repair the unit himself. Does anyone have a suggestion of what could be done to fix the problem?

Thank you very much in advance!

Uwe

Re: HP-45 calculator

*Message #2 Posted by **Steve** on 1 Sept 2004, 4:42 a.m.,*
in response to message #1 by Uwe Homann

I can't help directly with the troubleshooting, but last I checked 45's were fairly easy to find on ebay. He could pick one up as a replacement, or a source of parts if he decides to have some fun and troubleshoot/repair it himself.

Re: HP-45 calculator

*Message #3 Posted by **Tony Duell** on 1 Sept 2004, 6:28 a.m.,*
in response to message #1 by Uwe Homann

It sounds like you killed one of the HP custom chips, most likely a ROM, but maybe the C&T (Control and Timing) chip. You have to get parts from another old HP calculator -- I think you can get the C&T from a 35, 45, 55, 70 or 80, but the ROM has to come from a 45.

I am pretty sure HPCC has a reverse-engineered schematic of the 45, so if you need help in identifying signals, etc just e-mail me.

Re: HP-45 calculator

*Message #4 Posted by **David Smith** on 1 Sept 2004, 11:24 a.m.,*
in response to message #3 by Tony Duell

It does sound like that one of the signals that scans the keyboard was damaged.

There is a chance that just opening the machine and cleaning all the internal contacts and particularly the CPU and keyboard with 91%+ isopropyl alcohol may clear up the problem. A lot of these machines had hand soldered joints and HP did not clean up the flux. Over time it causes problems with the high impedance signals within the machine. A little mechanical or electrical jolt can send it over the edge.

There are two screws hidden under the upper corners of the back label and two more hidden under the bottom feet (the feet are just flaps that can be lifted from one side).

Re: HP-45 calculator

*Message #5 Posted by **Uwe Homann** on 2 Sept 2004, 2:49 p.m.,*
in response to message #4 by David Smith

Thanks for all of your suggestions!

Tried cleaning the contacts as you said, but unfortunately this did not solve the problem. Anyway, will keep looking for another HP45 either in good working order or one that can be used for parts. What is the part, identification or location number of the chip(s) that most likely would have to be replaced?

Re: HP-45 calculator

*Message #6 Posted by **David Smith** on 2 Sept 2004, 6:11 p.m.,*
in response to message #5 by Uwe Homann

Since all the chips are HP custom chips, the only source is another machine... which if you have then you would probably not be fixing the one that you do have. Most likely chips would be on the CPU card and not on the keyboard. Isolating it down to a particular one is probably not possible without just swapping chips... something that is likely to cause even more problems. I suggest that you try and find a working machine in poorer cosmetic shape than yours and swap the CPU board.

Re: HP-45 calculator

*Message #7 Posted by **Tony Duell** on 4 Sept 2004, 4:28 p.m.,*
in response to message #6 by David Smith

The advantage of doing component level repair is that you can often make one good machine out of 2 broken ones. In this case, it's likely that the A&R and RAM chips are good, so if you could find a machine with a fault in that area, you could use the parts from it to fix this one.

It is very unlikely the chips on the keyboard PCB have failed -- they're the display drivers (OK, the clock generator is in the anode driver, but since the machine does something, the clock is running). The fault is almost certainly on the logic PCB.

Since the machine powers up and does something it's unlikely the test points will be much help (the waveforms on them will look about right). So what I'd do if it was my machine is start by replacing the ROMs (starting with the one with the higher number, since I guess that appears later in the memory map, and it's likely the initialisation code, in the 'lower' ROM is intact). If that didn't cure it, I'd try the C&T chip.

I've desoldered and resoldered countless chips in HP handhelds without problems. It doesn't worry me at all (even on machines a lot rarer than a 45...)

Re: HP-45 calculator

*Message #8 Posted by **GE (France)** on 7 Sept 2004, 7:06 p.m.,*

in response to message #7 by Tony Duell

Hello, just out of curiosity, what does 'a lot rarer' mean for a person like you ?

A prototype HP23 ? A Yellownut 41 ? A dual-led display HP65 ?

Puzzled !

Re: HP-45 calculator

*Message #9 Posted by **Tony Duell** on 8 Sept 2004, 1:02 p.m.,*
in response to message #8 by GE (France)

Well, I've stripped down a 95C 'for fun' (i.e. not because I needed to) -- and before you all jump on me, I'll add that it did all go back together afterwards. That's probably the rarest _HP calculator_ I've worked on (and it wasn't mine). When it comes to minicomputers, peripherals, and workstations, I've worked on machines where there are only a couple of known examples around...

Re: HP-34C calculator

*Message #10 Posted by **Shumu Hsieh** on 8 Sept 2004, 4:16 a.m.,*
in response to message #7 by Tony Duell

Hi!

I have this calculator that is working perfectly until a recent die-out. After being repaired (cleaning the corrosive circuits as I was told), one of the LED display (second from the right) died. Can this be repaired too? Thanks in advance for any tips.

Re: HP-34C calculator

*Message #11 Posted by **David Smith** on 8 Sept 2004, 11:18 a.m.,*
in response to message #10 by Shumu Hsieh

In a 34C or other SPICE series machine with the pressure contacts almost all display problems are caused by a bad connection.

The other problem that can cause a single bad digit is either a bad LED module or a bad cathode driver (in the big 40 pin chip in a Spice machine). Only source is another machine.

Spice series LED modules are not very reliable. They tend to get bad connections due to corrosion working its way under the display lens. They cannot be fixed.

49g+ keyboard fixed?

*Message #1 Posted by **49g+ keyboard fixed?** on 31 Aug 2004, 9:32 a.m.*

From Comp.sys.hp48, a post by Joe Horn:

"GOOD NEWS! HP recently started putting the hp49g+ serial number on the *outside* of the plastic packaging!

It's on the back side, near the top, next to the hole that's used for hanging the package from a peg in the shop. I uploaded a photo of one such serial number here:

http://holyjoe.net/hp/sticker.jpg

It's a silver-colored sticker with black printing, same as the calculator's *case* serial number, but slightly different (of course) from the boot-sector serial number which is returned by the SERIAL command (if typing SERIAL doesn't work, type 256 ATTACH and then try again).

There are a few other differences I've seen between my original hp49g+ and this new one, most notably FLAWLESS keyboard response (so far! hooray!!!), nice tactile feel, and nice click.

-Joe-"

Re: 49g+ keyboard fixed?

in response to message #1 by 49g+ keyboard fixed?

Hi,

I want to buy a 49g+ in one of the next weeks. Is it important to know the serial number?

Ingo

Re: 49g+ keyboard fixed?

*Message #3 Posted by **James M. Prange** on 1 Sept 2004, 1:49 a.m.,*
in response to message #2 by B!ngo

Only if you hope to get one that doesn't miss keystrokes. Search the newsgroup comp.sys.hp48 for numerous examples of this and other keyboard complaints with the 49g+.

My original, CN331xxxxx external, CN337xxxxx internal, missed lots of keystrokes, and some keys were much worse than others. The warranty replacement, serial CN402xxxxx external, CN403xxxxx internal, isn't so bad; it misses keystrokes only maybe 5% of the time typing normally (pressing just until I feel the click) and all keys seem about the same. Note that it doesn't miss keystrokes as long as I remember that it's a 49 series and I have to press "firmly" (until I feel the key bottom out). Maybe they've finally gotten it right with that serial CNA426xxxxx? In general, I expect that the more recent the serial, the better.

Does anyone know what the extra "A" in the serial is all about? Perhaps in case more that one plant or production line in a given country is producing calculators?

Regards,
James

Re: 49g+ keyboard fixed?

*Message #4 Posted by **bill platt** on 1 Sept 2004, 4:58 p.m.,*
in response to message #3 by James M. Prange

HI James,

I have word from HP regarding the 33s, that the "A" is indeed a second manufacturing facility.

I believe we will also find that the difference in behavior with teh X<>Y key in ALG mode is consistent with the vatiation in factory----though I suppose we need to see if any new 33s machines come without the "A" (Walmart 1st release had no A).

Perhaps similar behavior is going on with the 49G+.

How to test HP 80,55,65,45,97, etc...

*Message #1 Posted by **raze** on 31 Aug 2004, 2:42 a.m.*

Hi all,

Few days ago, I had a HP 25 on sale on Ebay. Someone tole me that if I tested it without the battery, I might have burned the system. But it works with regular AA batteries.

Now I got a HP 80 in mint condition, and I don't want to screw it up again. This one comes with charger and battery as well. How can I test it? put the battery first and then plug the charger? or don't use the batteries, just use the charger directly.

I think the answer to this question will be the same for any vintage HP series like 55,45,65,97, etc.

Thanks for any help. Raze

HP-33S polar-coordinate bug -- another manifestation

*Message #1 Posted by **Karl Schneider** on 31 Aug 2004, 2:28 a.m.*

Here is another manifestation of the HP-33S polar-coordinate conversion bug, that was identified by "Steve A" and investigated by me at this link:

Polar Conversion bug in HP-33S

Basically, if a coordinate pair (-0,y) is entered (y not = 0), then the angle of the polar-coordinate conversion is not computed correctly.

This problem is also manifested in the complex-valued natural-logarithm function "CMPLXLN", since:

$\texttt{CMPLXLN (x + i*y) = 0.5*ln (x}^2\texttt{ + y}^2\texttt{) + i*["atan2" (y, x)]}$

where "atan2" is the intrinsic function in Fortran and C that gives the correct angle of the polar-coordinate conversion.

It is easy to see that the simplest way to calculate CMPLXLN is to convert the complex-valued input argument into polar coordinates, then take the natural logarithm of the magnitude (radius).

On the 33s, try:

```
10 ENTER 0 (left shift) CMPLX LN
```

You will get the correct answer 2.3026 + i*1.5708

Then, try:

```
10 ENTER 0 +/- (left shift) CMPLX LN
```

You will get the incorrect answer 2.3026 + i*4.7123 (where 4.7123 = 1.5*pi radians = 270 degrees, which is the angle that "->theta,r" will give).

Re: HP-33S polar-coordinate bug -- another manifestation

*Message #2 Posted by **Tom (UK)** on 31 Aug 2004, 8:28 a.m.,*
in response to message #1 by Karl Schneider

This may be a well worn argument, but why didn't HP use a hardware interpretor for the existing Saturn code? I'm sure it would have avoided all these teething bugs which is taking the shine off of the HP33S, it would also have given access to the large library of Saturn code.

PS well done for all those finding and researching the errors, any news from HP on these??? Perhaps HP

should equip the HP33S with flash memory and soem i/o for later upgrades!

'Can't do that!'

*Message #3 Posted by **Ron Ross** on 31 Aug 2004, 9:22 a.m.,*
in response to message #2 by Tom (UK)

Any I/O would have resulted in this beast not being allowed on the NCEES exams. The 42s only has IR output and long variable names and that was enough to get it banned.

I wish Hp had just re-released the Hp42s with 32-128K ram, serial or USB port (no real need for IR), and toss in the 48G units conversions. And use the old hardware and form factor (shave of a cm off the top would be even better). I would buy 3 of those today, right now, even at the 49G+ list price.

But that is probably why the Hp42s was NEVER marketed or sold at the same price as the Hp17B. Because it robbed sales from Hp's flagship calculator, The HP48G series.

Rant off.

>
> ...may be a well worn argument, but why didn't HP use a hardware interpretor for the existing Saturn code? I'm sure it would have avoided all these teething bugs

Probably a time & development constraint. Kinpo couldn't be trained quickly enough in Saturn architecture, and maybe doing an emulator would be tricky for them. (It's not, but that might be perception.)

I'm wondering - the way co's move depts and work around to different facilities - if HP even _has_ the 32S(II) ROM source around anymore!

They shoulda done this with a Nut emulator for the HP12CP as well. Again, finding anyone in HP that knows the Nut CPU would be impossible.

> Perhaps HP should equip the HP33S with flash memory > and some i/o for later upgrades!

I/O may violate school & exam standards though it would be nice.

Given the HP33S price slot and projected price declines, they can only afford to put in a $0.50-$0.70 CPU. Flash CPUs are much more expensive than mask ROM CPUs because the flash memory area is much much larger: not only are the flash bit cells bigger but there are charge pump areas next to the flash memory that take up die area. A 32KB flash ROM CPU is gonna cost at least around $1 more (approx). That's $2.50-$3 change in the end-user price.

[In fact, the 65C02 CPU core in the Sunplus chip in the 33S could well be smaller than 32KB of flash memory!!!]

converting register to program mem

*Message #1 Posted by **Klaus** on 30 Aug 2004, 3:34 p.m.*

Hello there,

does someone have a solution for that problem:

Converting currencies: a user has to enter some money-amounts. For example, the user keys in one amount, and then executes label A to store the number. The user has to enter about 40 money amounts to be stored. Then the user enters the value to multiply the numbers with into the X-Register and executes label B.

The numbers have to be stored in the memory Registers of a hp11c (and I want to use 10 at most).

The order of the number is important, (either LIFO or FIFo)

Any suggestions?

Klaus

Re: converting register to program mem

*Message #2 Posted by **bill platt** on 30 Aug 2004, 3:58 p.m.,*
in response to message #1 by Klaus

Hi Klaus,

Not to be flippant, but why do you want to do this? A database or even a spreadsheet would be so much more efficient....

Is this exercize just for fun?

Re: converting register to program mem

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2004, 4:28 p.m.,*
in response to message #1 by Klaus

Hi, Klaus;

I'd like to get closer to the problem itself; may I?

> Quote:
>
> The user has to enter about 40 money amounts to be stored. Then the user enters the value to multiply the numbers with into the X-Register and executes label B.

When you mention "amount", will it be the amount you enter in LBL A? And may this amount be changed? And if it is changed, will this changing be counted as a new entry or only values keyed in prior to [GSB][B]

are counted as entry data?

> Quote:
>
> The numbers have to be stored in the memory Registers of a hp11c (and I want to use 10 at most).

After the tenth register is used, will the next value ovewrite the earliest one? As you mention FIFO/LIFO being important, what is the best choice?

Also, will you need to read them as well?

I'm interested on trying, but I'd like to know some more about your ideas...d8^)

Cheers.

Luiz (Brazil)

Edited: 30 Aug 2004, 4:29 p.m.

Re: converting register to program mem

*Message #4 Posted by **Klaus** on 31 Aug 2004, 5:38 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi! If the user wants to convert the amounts 10.50, 100.25, 1000, he does the following:

10.5 [f] [A] 100.25 [f] [A] 1000 [f] [A]

To convert the values, the user enters the factor:

3.14159 [f] [B]

Let´s assume, the values don`t exceed 1000 and do not have more than 2 decimal places.

It´s not a concrete problem I have, it´s an example. You can store xxxxxxxxxE99 in a register, but mostly it´s integers less than a million. What a waste. I am thinking of developing a small program for pushing and popping numbers into a register, and any ideas are welcome! Thank you so far! Klaus

Re: converting register to program mem

*Message #5 Posted by **Chan Tran** on 31 Aug 2004, 12:49 p.m.,*
in response to message #4 by Klaus

I think you will need indirect addressing to do that and I don't think the 11C is capable of indirect addressing.

Indirect Addressing on 11c

*Message #6 Posted by **bill platt** on 31 Aug 2004, 3:56 p.m.,*
in response to message #5 by Chan Tran

Hi Chan and Klaus

Actually the 11c does have indirect addressing--that is what the "(i)" and "I" are for. You can indirectly address all the registers----but unlike the 41, you must use the "I" variable for the address

(the 41 allows you to use any variable for indirection address control).

One possible solution

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 1 Sept 2004, 1:27 a.m.,*
in response to message #4 by Klaus

Hi, Klaus;

let's see if this helps a bit. In time: all text below assumes the HP11C is ***not in USER mode***. If you want to use it in USER mode, suppress the [f] prefix key before [A], [B], [C], [D] and [E] keys.

The following program does what you want to do, but you must consider some facts:

1 - your called "factor" is stored in register R0;
2 - register contents from R1 to R.0 (the eleventh register available, and the tenth register in the block R1-R.0) are multiplied by the factor each time the factor is updated, and this happens when you press [f][B] (or [GSB][B]);
3 - I added two labels so you can see the registers contents in two ways either sequentially (LBL C)or randomly (LBL D). If you want a sequence, press [f][C] and the current contents are shown from R1 to R.0 (index is briefly shown); each time the calculator stops with the current value, press [R/S] for the next one. If you want a random check, key in the number of the register you want to see and press [f][D].
4 - When you are about to restart storing new amounts, key in the number of the current amount you want to store from and press [f][E]; this is necessary to update I-register (index control) contents. The index register contents is changed everytime a check is made (use of LBL C or LBL D). Also, when you a re about start over a new set, you can clear all registers contents with [f]CLEAR[REG] and you must key 1[f][E] to set the index register to the first register prior to use the sequence number[f][A].

After keying the program in, try this: (you may use FIX 4)

```
Key in             Display     Comments
[f]CLEAR[REG]      0.0000
1 [f][E]           1.0000      sets RI to 1.01
20 [f][A]          20.0000     stores 20 in R1
30 [f][A]          30.0000     stores 30 in R2
50 [f][A]          50.0000     stores 50 in R3
5 [f][B]           running
                   5.0000      multiplies all values by factor (5)
[f][C]             1.0000      shown briefly
                   100.0000    R1 contents times factor
[R/S]              2.0000      shown briefly
                   150.0000    R2 contents times factor
[R/S]              3.0000      shown briefly
                   250.0000    R3 contents times factor
1 [f][D]           100.0000    R1 contents
3 [f][D]           250.0000    R3 contents
4 [f][E]           4.0000      gets ready do store values from R4
```

One last remark: the values stored after prior contents being updated are not updated automatically with this program. If you want, some small changes can be added so LBL A multiplies entered data by factor prior to store them. Or you may want values to be unchanged so they are only shown updated; what do you think? I guess keeping values entered through LBL A as they are keyed in allows bigger flexibility, but I was not sure if you wanted accumulated factors.

Let me know if this fits your needs or what changes you want to be made, O.K.?

Cheers.

in response to message #7 by Vieira, Luiz C. (Brazil)

Hi, Klaus;

this is the version that keeps values unchanged after setting a new factor. Each time you check registers contents they are multiplied by factor prior to be shown. And this is six steps shorter... Prior example works the same, but this time any new value stored after 4[f][E] will be shown multiplied by factor with [f][C] or n[F][D].

Cheers.

Re: Another version

*Message #9 Posted by **Klaus** on 1 Sept 2004, 4:27 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz!

Thank you for your help, but it´s not exactly what I mean. One possible solution may be:

initialize Register R0 to 0 Have a function named push storing the old value and the new value in 0. Having a function pop getting the top of stack and storing the rest of stack in Register 0.

The user enters a 1 first. the push function calculates push(0,1) where 0 is the stack push(0,1) = 1 Then the user enters 5 push(1,5) = 26 Then the user enters 9 push(26,9) = 639 ...

to po a number: pop(639) = 9 and stack:=26 pop(26) = 5 and stack:=1 pop(1) = 1 and stack:=0

Has anyone done this before?

Re: Another version

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 1 Sept 2004, 10:33 a.m.,*
in response to message #9 by Klaus

Hi, Klaus;

I actually didn´t get some of your ideas and explanations. Can I try to clear them out?

> Quote:
>
> Have a function named push storing the old value and the new value in 0.

Each register inthe HP11C stores one value at a time. I cannot figure a way to store both the old value and the new value in the same register. BTW, what sort of values are the old and the new values?

> Quote:
>
> Having a function pop getting the top of stack and storing the rest of stack in Register 0.

When you mention top of stack do you mean the T-register or the top of another stack, simulated by the ten registers as you mentioned in your previous post? If the second option is the correct one, than you actually need one of both: a pointer to indicate the position of the last entered number (Index register) and this pointer must either be saved somewhere else when accessing data or never be touched except when pushing data in the "stack" (of numbered registers), like it actually happens in stack manipulations (processors). In any case, I cannot figure a way to store the whole stack contents in one single register...

> Quote:
>
> The user enters a 1 first. the push function calculates push(0,1) where 0 is the stack push(0,1) = 1 Then the user enters 5 push(1,5) = 26 Then the user enters 9 push(26,9) = 639 ...

I cannot understand from here, sorry! With push(1,5) = 26, what is the calculation performed?

I´m sad, I´d like to help.

Luiz (Brazil)

Push and pop

*Message #11 Posted by **Klaus** on 1 Sept 2004, 12:00 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Hi Luiz,

you said: Each register inthe HP11C stores one value at a time. I cannot figure a way to store both the old value and the new value in the same register. BTW, what sort of values are the old and the new values?

And yoou are completely right, it´s all about storing the old and the new value in the same register. I have a solution for that, but with my solution I can only store 4 times a number between 0 and 99 in one register. (And only integers are allowed.)

I am curious if someone has another solution? Klaus

Re: Push and pop

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 1 Sept 2004, 2:47 p.m.,*
in response to message #11 by Klaus

Hi, Klaus;

You mean something like this: given a number in the format

```
aabbccddeeEnn
```

where:

```
aabbccddee
```

is the mantissa, nn is the exponent of ten and each

```
aa, bb, cc, dd, ee
```

is one of each possible (up to) five positive integers from 00 to 99, right? Is this what you want? KNowing another way to store all of them in R0? So your "stack" is the register contents itself, and you'd push and pop the positive integer from 00 to 99 into it? Or, if I got, you could also pick or put (fixed position) the number in there without disturbing the other values?

If so, I can also post a program for that. Just let me know.

Cheers.

Luiz (Brazil)

Re: Push and pop

*Message #13 Posted by **Klaus** on 2 Sept 2004, 4:14 a.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thank you for your suggestions. The solution I search should not simply concatenate the numbers, but rather decode them as an integer. My solutioon is a formula implementing this table: x-> 0 2 5 9 ... 1 4 8 13 3 7 12 18 6 11 17 ... ...

Maybe there is another solution (perhaps using primes to decode the numbers. With my table, I use the x-value to lookup the row and the y-value to lookup the column.)

Thanks, Klaus

Re: Push and pop

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 2 Sept 2004, 7:05 a.m.,*
in response to message #13 by Klaus

Hi, Klaus;

now I'm curious. If I got it correctly, it is more interesting than I thought it should be. You want to decode numbers that were coded and added togheter. Is it correct? Please, what sort of method you are dealing with? Are you developing it or just trying to implement it in the HP11C?

If you want to go ahead, I'd be interested on knowing some more. if you want to and have the time, be my guest: lcvieira@quantica.com.br

Cheers.

Luiz (Brazil)

Re: Push and pop

*Message #15 Posted by **Klaus** on 2 Sept 2004, 10:26 a.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have the math ready for push and pop, but I don´t have time to implement the routines on the 11c (it can only be useful when the routines take no registers and little program space). I will try to post the math today, if you are interested.

Yes, I am! Thanks! d8^)

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 2 Sept 2004, 8:52 p.m.,*
in response to message #15 by Klaus

Hi, Klaus;

I'd like to try to implement the routines, given the math, if you find the tme to post them. I'll try the smallest program and the least register number possible, O.K.?

Also, if there's anyone else interested on, I'd be gladly sharing RPN programming 'tips and tricks', if any.

Cheers.

Luiz (Brazil)

Edited: 2 Sept 2004, 8:53 p.m.

Here you go

*Message #17 Posted by **Klaus** on 3 Sept 2004, 2:52 a.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Hi Luiz, the math is as easy as 3.1415...:

Coding 2 Numbers: c(x,y) = (((x+y+1)*(x+y))/2)+x

Decoding:

n = int((-0.5)+(0.25+(2*c))^(0.5)) x = c- (0.5*n*(n+1)) y = n -x

To push the numbers 3,5,7:

c(3,0) = 9 c(5,9) = 110 c(7,110)=6910

To pop a number, return x to the user and set the stack to y

Have fun! Klaus

Re: Here you go

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 3 Sept 2004, 5:15 p.m.,*
in response to message #17 by Klaus

Hi, Klaus; (for the records: coincidentally my actual name is Luiz Claudio...)

First of all, folks, although this thread deals with programming and programming techniques, have you found it is too long and that it would be better keeping private e-mails, just add your comments. I guess Klaus should try having this answer for as long as he needs, but if you think that I should write him straight, I'd gladly do that/ Just let me know, O.K.?

About the expressions, the "coding 2 numbers" you wrote is:
c(x,y) = (((x+y+1)*(x+y))/2)+x

Based on your examples I "see" it like this:

$c_n(x_n,c_{n-1}) = (((x_n+c_{n-1}+1)*(x_n+c_{n-1}))/2)+x_n$ | n=1,2,3..., $C_0=0$

Would this be a better expression? Anyway, I wrote the following routine, that calculates c_n given y and x in Y- and X-register respectively:

```
f LBL 0
  +
g LSTx
  x<>y  (x xchange y)
  ENTER
  ENTER
  1
  +
  ×
  2
  ÷
  +
g RTN
```

Try:

```
0 [ENTER] 3 [GSB] 0  returns  9
5 [R/S]  returns 110   (provided that the previous
9 is left in the display)
7 [R/S]  returns  6910 (provided that the previous
110 is left in the display)
```

For decoding:

n = int((-0.5)+(0.25+(2*c))^(0.5))
x = c- (0.5*n*(n+1))
y = n -x

Given n in X-register, the following routine returns y and x in Y- and X-register respectively:

```
f LBL 1
  ENTER
  ENTER
  ENTER
  +
  4
  1/x
  +
  Vx  (sqrt)
  .
  5
  -
g INT
  1
g LSTx
g INT
  +
g LSTx
  ×
  2
  ÷
  +
g R^  (roll up)
  -
  CHS
  -
g LSTx
g RTN
```

To decode the previous values:

```
110 [GSB] 1  returns 5.0000; press [x<>y to see
9.0000
6910 [GSB] 1 returns 7.0000; press [x<>y] to see
110.0000
9 [GSB] 1    returns 3.0000; press [x<>y] to see
0.0000
```

Now I'm gonna find some time to go ahead with the accumulation. BTW, will "pop" remove the object from the "stack"? If so, is there (or should there be) a mechanism to avoid removing numbers that do not belong to the database? I guess that to accomplish such a verifying task it would be necessary to generate the whole chain for checking; am I wrong in this issue? Not the checking procedure, but in the fact that it would be a problem to try to remove a nonexistent value.

Let me know if the routines get closer to what you need, O.K.?

Cheers, Klaus. That's an intriguing problem...

Luiz (Brazil)

Edited: 3 Sept 2004, 5:32 p.m.

Re: Here you go

*Message #19 Posted by **Klaus** on 6 Sept 2004, 11:45 a.m., in response to message #18 by Vieira, Luiz C. (Brazil)*

Hi Luiz, thanks for your help! I could verify the results for the push, but the pop returns other results on my 11c (Perhaps I hit a wrong key- I need some time). You suggest: cn(xn,cn-1) = (((xn+cn-1+1)*(xn+cn-1))/2)+xn |

n=1,2,3..., C0=0

I see it rather that way: c(n0,n1,...,nk) = c(nk,c(nk-1,c(...,c(n0,0))...))

There is no need to do any checks on pop: each integer is a valid stack and can be popped many times (returning zero when the stack is empty). BTW, for calculating x, you need 0.5n(n+1), which is the sum from i=0 to i=n of i.

Many thanks for your quick help on this problem, and I am sure one time I can use it in a program.

Greeting, Klaus

Re: Here you go

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 6 Sept 2004, 3:39 p.m.,*
in response to message #19 by Klaus

Hi, Klaus;

You are correct. There is an extra [+] in my listing that is not in the original program (I have no idea why did I type it in...) Look at the following lisiting, please:

```
f LBL 1
  ENTER
  ENTER
  ENTER
  +
  4
  1/x
  +
  Vx  (sqrt)
  .
  5
  -
g INT
  1
g LSTx
g INT
  +
g LSTx
  ×
  2
  ÷
  +   <<<<<<<-------  remove this [+]
g R^  (roll up)
  -
  CHS
  -
g LSTx
g RTN
```

It seems to me it is gonna work fine, now. Hope it helps. BTW, the expression you post for c_n is great!

Thanks!

Best regards.

Luiz (Brazil)

Everyone makes mistakes!

*Message #21 Posted by **Klaus** on 7 Sept 2004, 11:46 a.m.,*
in response to message #20 by Vieira, Luiz C. (Brazil)

Hi Luiz!

You say:

BTW, the expression you post for cn is great! Thanks!

I think, I posted it the wrong way. I think it has to be:

c(n0,n1,...,nk) = c(c(c(...c(n0,0),n1),...),n1),n0)

(depends on the way one chooses to implement it)

Thank you very much and best wishes! Klaus

Hi!

Instructions

*Message #1 Posted by **Stacey Bower** on 30 Aug 2004, 2:36 p.m.*

Is there an online source for calculator instructions? Stacey

Re: Instructions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2004, 4:37 p.m.,*
in response to message #1 by Stacey Bower

Hi, Stacey;

each calculator having a "page" at teh MoHPC starting page has a description of its features. Also, the MoHPC offers a CD pack that contains almost any manual available for each model (in most cases, all exisiting and known manuals for some particular models are there).

There is an alternative database: Craig Finseth's Database. Click on any model and you'll see a complete description of its features, available instructions included.

If you need programming instructions for a particular model, let us know.

Cheers.

Luiz (Brazil)

USER notation

*Message #1 Posted by **Stacey Bower** on 30 Aug 2004, 2:33 p.m.*

I think my calculator in a 12C. The display now says "USER" under the decimal and "RAD". How do I get rid of these? Stacey

Re: USER notation

*Message #2 Posted by **Mike** on 30 Aug 2004, 2:55 p.m.,*
in response to message #1 by Stacey Bower

The website below has lots of info about the 12C

http://www.hp.com/calculators/financial/12c/

Re: USER notation

*Message #3 Posted by **Miki Mihajlovic** on 30 Aug 2004, 3:30 p.m.,*
in response to message #1 by Stacey Bower

I doubt that your calc is 12C because 12C doesn't have transcendental functions built in thus no [deg, rad, grd] mode exists on 12C. If it is indeed one of the Voyagers it has to be either 11C or 15C. You can say which one if you look at the second key above Enter key. If it has MATRIX written in yellow above it then it is 15C. If it has (Greek) PI written above that key, then it is 11C.

To get rid of USER mode just press and release [f] (yellow key) and [RCL] key (third to the right of [f]). To switch from radian mode back to degrees (get rid of RAD) press [g] key (blue key) and [7].

Sadly, there is no on-line documentation for either 11 or 15C, but the full manuals are available on the museum CDs (DVD) for ~$30.

*Message #4 Posted by **david** on 31 Aug 2004, 12:11 p.m.,*
in response to message #3 by Bram

Any chance you could forward that copy of the manual to the email address? I could work through the lanuage issue david

Re: HP 20 S Calculator

*Message #5 Posted by **Bram** on 1 Sept 2004, 3:40 a.m.,*
in response to message #4 by david

Happy to do so, but after having posted my message, I remembered that it is already available on my HP site. Perhaps more convenient to get it from there? (And, who knows? something more...) And I am temporarilly in possession of a paper manual in Dutch, so if there's something specific, I might be able to explain from this one.

Re: HP 20 S Calculator

*Message #6 Posted by **Eric** on 8 Sept 2004, 12:23 a.m.,*

in response to message #4 by david

Can anyone tell me where I could purchase a HP20s?

Re: HP 20 S Calculator

*Message #7 Posted by **John Limpert** on 8 Sept 2004, 4:22 a.m.,*
in response to message #6 by Eric

Your best bet is probably eBay. The retail stocks of this calculator appear to have been exhausted. None of the usual suspects seem to have it in stock.

Re: HP 20 S Calculator

*Message #8 Posted by **Julián Miranda (Spain)** on 8 Sept 2004, 5:35 a.m.,*
in response to message #6 by Eric

It seems they are setting up an online store, once finished you can try www.fixthatcalc.com. They had HP20S with english manual but no box.

Re: HP 20 S Calculator

*Message #9 Posted by **Ed Look** on 9 Sept 2004, 11:45 p.m.,*
in response to message #6 by Eric

Hey, try this link:

http://www.calculatorsource.com/hp-20s-sr.html

They say they have it in stock at an apparently REDUCED price!

I hope it works for you.

It's really a pretty good little calculator; the only thing I have against it is that there is no RPN mode in addition to ist algebraic operating system.

82143A Printer

*Message #1 Posted by **Dane K.** on 30 Aug 2004, 10:24 a.m.*

While cleaning my closet I came on my HP-41 outfit. After inserting new N cells it seems to work OK, except I had to replace the rollers in the card reader. I followed the directions on someone else's Web page. The printer works OK except that the feed seems a bit lame. It spaces up less than 1/2 the amount it should. I tried ripping out about one foot of paper, but this doesn't fix it. Is this because the roll of paper that was in it is about 20 years old? If it's not the paper can the feed mechanism be fixed? Thanks for any help!

Re: 82143A Printer

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2004, 3:17 p.m.,*
in response to message #1 by Dane K.

Hi, Dane;

I found my 82143A almost the same way as yours after some years without activities. What caused the paper not to advance accordingly in my unit was the two rubber rolls that actually pull the paper "out". You can see them when there is no paper and when removing the small transparent protection where you can see the head moving while printing (I know, it is a silly description, but I found no words in my English knowledge base to describe it better... Sorry!). The "pulling rubbers" are at the both sides (edges?) of the axle that pulls the paper. I cleaned them both with a swab moistened with alcohol (had to press a little to remove some crusts), but I am not sure if the rubber is resistant to alcohol; maybe others will suggest better cleaning material.

Hope you succeed.

Cheers.

Luiz (Brazil)

Edited: 30 Aug 2004, 3:22 p.m.

Re: 82143A Printer

*Message #3 Posted by **Dane K.** on 30 Aug 2004, 5:14 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz:

It was difficult to access the rollers. I had to disassemble the printing unit. The printer now works OK.

Obrigado! Dane http://www.marginalsoftware.com/Photographs/Wallpapers/wallpapers.htm (Picture of Rio)

Re: 82143A Printer

*Message #4 Posted by **David Smith** on 30 Aug 2004, 6:04 p.m.,*

in response to message #3 by Dane K.

Sometimes cleaning the rollers is only a temporary fix. The rubber develops a flat spot where is was stored in contact with the platen. One thing that helps quite a bit is to remove the feed cam assembly and use some medium sandpaper to true them up a bit and remove the crusty surface.

I start by gently hand sanding the corners of the flat spot. Then I place the sandpaper on a hard flat surface and roll the assembly back and forth across it. You have to place some sideways pressure on the cam assembly to disengage the clutch gear on the end.

Re: 82143A Printer

*Message #5 Posted by **Dane K.** on 30 Aug 2004, 8:51 p.m.,*
in response to message #4 by David Smith

I only got as far as unscrewing the 3 screws that hold the print unit in place. It wasn't obvious how I would remove the rollers and the axle they're attached to. So I cleaned them in place and rotated them bit by bit. I didn't notice a flat spot. I guess it's inevitable that the rollers will disintegrate as on the HP-41 card reader. Has anyone been able to replace them?

Thanks, Dane

Re: 82143A Printer

*Message #6 Posted by **Randy Sloyer** on 30 Aug 2004, 11:48 p.m.,*
in response to message #5 by Dane K.

If sanding them doesn't help and you get **really** desperate, you can take the path of no return and cut all the old urethane off. Only recomended if it is really full of nasty, deep flat spots.

Once commited and the old stuff is cleaned off, fashion a somewhat similar roller from a slice of 5/16 od x 3/16 id vinyl tubing. Slip the ring over the axle. It will fit snuggly and not move. The od will be slightly larger so the spacing between the lines will be a bit longer but hey - it least it will advance.

Suspecting it would work better, I've looked for silicone tubing but I could only find 100' lengths. The vinyl works well enough for me and it cost less than a buck in my local Home Depot.

Re: 82143A Printer

*Message #7 Posted by **David Smith** on 31 Aug 2004, 11:48 a.m.,*
in response to message #5 by Dane K.

Removing the feed cam is a real chore. You have to remove the print head and the guide rails, etc. The HP97 printer hardware is very similar and is well documented in the service manual available on the HPMUSEUM disks.

Re: 82143A Printer

*Message #8 Posted by **Dane K.** on 1 Sept 2004, 12:41 a.m.,*
in response to message #7 by David Smith

>Removing the feed cam is a real chore.

Note that I replaced the roller on the card reader. That was one of the most fiendish repairs

that I've ever done. The reader must have been designed by a sadist dwarf.

Re: 82143A Printer

*Message #9 Posted by **David Smith** on 1 Sept 2004, 11:28 a.m.,*
in response to message #8 by Dane K.

I have found reader repairs to be fairly painless except when those gold leaf springs in the 65/67/97 need adjusting. Then there are those little balls and rollers that like to go through the transdimensional hose-hole (one exists in every clothes dryer also).

Re: 82143A Printer

*Message #10 Posted by **Dane K.** on 1 Sept 2004, 10:40 p.m.,*
in response to message #9 by David Smith

The real bitch was the final assembly where the 2 halves are snapped together with all those parts hanging. One false move and one or more parts fall out. The 2 halves also kept jamming, preventing closure. Then there's the final matter of having those tiny screw hole lining up. That took me several tries and about 45 min.

Re: 82143A Printer

*Message #11 Posted by **David Smith** on 2 Sept 2004, 6:15 p.m.,*
in response to message #10 by Dane K.

After you have done it once or twice it gets much easier. I tend to put in the latch on one side, hold the case shut there. Slip in the other latch. Make sure the insulated sping goes on the side with the gold contact fingers. Insert the screws, then snap in the little front cover piece. One problem to watch out for is the springs that won't stay in the latch. A drop of superglue takes care of that.

Re: 82143A Printer

*Message #12 Posted by **Tony Duell** on 4 Sept 2004, 4:33 p.m.,*
in response to message #8 by Dane K.

I don't understand all this fuss about card reader repairs. I've never had any problems putting them back together, and even setting the leaf contacts in the 67/97 isn't that bad -- I did have one '97 from hell' that wouldn't set up properly until I'd completely stripped it and really cleaned the parts, but that's the exception.

And the parts are quite large compared to some things I work on...

Re: 82143A Printer

*Message #13 Posted by **Wayne Brown** on 7 Sept 2004, 4:40 p.m.,*
in response to message #12 by Tony Duell

> Quote:
>
> I don't understand all this fuss about card reader repairs.

Neither do I. Even as klutz-fingered as I am, I managed to fix the "gummy-wheel problem" on my son's 82104A without too much difficulty. That was before I got my

new glasses, too, so my wife had to talk me through a couple of spots where I couldn't see the innards of the reader clearly enough to tell what my fingers were doing. :-) If *I* can fix a card reader, anybody can!

Re: 82143A Printer

*Message #14 Posted by **Tony Duell** on 4 Sept 2004, 4:31 p.m.,*
in response to message #7 by David Smith

In my experience, the 82143 is significantly harder to repair than the 97 (Topcat) printer. Parts that are held in with E-clips in the latter are glued in place in the former. I don't like having to strip down an 82143 (or 82162, which can be even worse).

Note that there are 2 versions (at least) of the 82143, and the mechanisms are not interchangeable between them (the older one has a reflective optoswitch screwed to the side of the mechanism, and a redd switch for the home sensor, the newer one has 2 optical sensors on the main PCB, like every 82162 I've worked on). The second version is a lot harder to work on!

Re: 82143A Printer

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2004, 11:58 p.m.,*
in response to message #3 by Dane K.

Hi, Dane;

thanks for your kindness. It is a wonderfull site... I got my Electrical Engineering graduation in Petrópolis, about 60 Km from Rio (up in the hills...), and I guess this picture was taken close to there. I remember seeing Rio almost like this.

About the rollers: my 82143A is dated 1981 (Serial # 2141Sxxxx) and I know the rollers have a small spot each. I was sure it would happen, as David Smith mentions, because it rest in the same position for a long time. Also, after using it a little, the paper seem to flow better. I am also sure they may desintegrate some time, but I guess that because the card reader rollers pull the cards through the magnetic sensitive surface, they have a different chemical composition. The printer rollers seem to be more resistent, and I almost all the time hear about gummy whells in card readers and desintegrated gears in printes (Topcat units), but I don't remember ***reading*** about someone in the need for changing printer rollers. What doesn't mean it didn't happen, right? I'd rather taking care of them as David mentions. (thanks, David)

I'm glad your printer is better, now.

Best regards.

Luiz (Brazil)

N-Cell NiMH Charger

*Message #1 Posted by **Darin Ingimarson** on 30 Aug 2004, 10:12 a.m.*

Hi,

I've been looking around for a charger specifically for the GP 500mAH N-size cells and so far have had no luck. Note that I am not specifically concerned about the mechanics of stuffing an N cell into a AA charger, I am more concerned about the correct charging rate, fast-charge rate, and trickle charge maintenance to properly maintain these cells. Does anyone have any leads here?

Thanks, -darin

Re: N-Cell NiMH Charger

*Message #2 Posted by **Jon** on 30 Aug 2004, 6:37 p.m.,*
in response to message #1 by Darin Ingimarson

Hi:

I have built a charger based on the max712 that works fantastic. You could charge all four cells at the same time, in less than one hour and safely. If interested I have all the schematics and instructions for it.

Regards

Jon

Re: N-Cell NiMH Charger

*Message #3 Posted by **Darin Ingmarson** on 30 Aug 2004, 7:14 p.m.,*
in response to message #2 by Jon

Thanks Jon, I also had put together a quickie design for a battery charger (I am an EE), based on the MAX713 -- I prefer the negative slope method. MAXIM has some great parts and decent white papers on how to do this.

Then I got thinking, hey, why don't I make it programmable with a PIC microcontroller, so I can charge other types of cells/packs, and monitor the progress, blah, blah, blah. So I expanded the design a somewhat to do this.

Then reality set in and I realized that there was very little chance of me getting the time to lay out the PCB and build it right now (maybe by Xmas). If I get it done I'll post the PCB pattern or offer pieces of the board run on the forum if anyone cares.

Even if I do build my charger, I'd prefer to use the NiMH batteries sooner than that, so I bailed and started looking for a commercial charger :(

Re: N-Cell NiMH Charger

*Message #4 Posted by **Tracy Vermeyen** on 3 Sept 2004, 12:39 a.m.,*
in response to message #1 by Darin Ingimarson

I have a HP manufacturered N-Cell Ni-Cad battery charger, I have never seen one like it. It is not a rechargeable battery pack. It was meant to receive rechargeable n-cell batteries. The charger is called a Plug-In Battery Charger (HP 92266A) and the output is 5.8V DC (15 mA). It says it is for NI-CD batteries only. I think it will work of NiMH, but I would like a forum member to confirm that.

Let me know if you need any more information about this device.

Re: N-Cell NiMH Charger

*Message #5 Posted by **Darin Ingimarson** on 7 Sept 2004, 12:48 p.m.,*
in response to message #4 by Tracy Vermeyen

Tracy, I am familiar with the unit (some sold recently on ebay). I can't tell you for sure if the charger would work on NiMH batteries, as I don't know what the charge rate or end-of charge mechanism is for that device.

Typically, there are several methods for determining when a NiMH battery is charged; you have time (at a given charge rate), dV/dt, negative dV/dt, temperature. Plus you have trickle-charge specs for long-term maintenence of your NiMH charge

The fast charge modes for NiMH and NiCd batteries are terminated under different parameters (NiMH terminates when dV/dt=0, and NiCd should be terminated when dV/dt goes negative). Note that if this is the method of charge termination used by your charger, then it could conceivably damage your NiMH batteries.

If your charger is time-based (i.e. you leave the batteries in it for x hours and then they are charged), you could theoretically measure the current of your device by putting a DC ammeter in series with a set of NiCd batteries and measure the charge current. This should allow you to charge NiMH simply by timing the charge operation (i.e. if your charge current is 50mA, you would charge a 500mAh battery for 10h). All standard disclaimers apply, if you cause a fire it is not my fault, etc. etc. ;-)

Even as an EE I would not tempt fate with my vintage HP N-cell charger by sticking batteries in it with a different chemistry that that for which the unit was originally designed...

HP 41 EPROMs Modules

*Message #1 Posted by **Johannes Mueller** on 29 Aug 2004, 4:39 p.m.*

Does anybody know how to burn self-written HP41 programs onto an EPROM module? I remember that 20 years ago there were several companies where you could send a cassette with your programs and got them back on a module. Does anybody still offer this service today? Thanks for your help!

Re: HP 41 EPROMs Modules

*Message #2 Posted by **Matthias** on 30 Aug 2004, 12:37 a.m.,*
in response to message #1 by Johannes Mueller

Well, I don´t think that there are any persons left who can programm your EPROM module. I also think, there are no more EPROM module on stock anywhere. If you have a EPROM reader, ask Emmanuel Compes for help. He is our master of "standard" EPROMs. Second possibility is to programm your software into either a ZEPROM (the module itself is rare and expensive) or a podern Clonix (look in the archive, there were a lot of topics about these modules in the last 6 month)

Matthias

Re: HP 41 EPROMs Modules

*Message #3 Posted by **Wilson (Bill) Holes** on 30 Aug 2004, 9:28 a.m.,*
in response to message #1 by Johannes Mueller

Hi Johannes,

I sent an eMail message to you last evening regarding your post. Contrary to popular belief there are people, me for one, who can still program EPROM's for the HP41 -and- EPROM's do still exist and can be purchased for a nominal cost. If anyone needs or wants EPROM's burned with HP41 FOCAL or MCODE images I'd be most happy to accomodate. My service is free (in small quantities). EPROM's and shipping at actual cost with no handling fee.

Best, Wilson

in response to message #3 by Wilson (Bill) Holes

Dear Wilson, dear Johannes,

thanks for your response about programming Eprom´s for HP-41. I offer burning support for Zeprom (16K Eproms from Zengrange, housed inside a plug in module shell)...

Regards from Germany - Christoph Klug

*Message #5 Posted by **Matthias** on 31 Aug 2004, 12:53 a.m.,*
in response to message #3 by Wilson (Bill) Holes

I didn´t speak about EPROMS for an external EPROM box, I spoke about EPROM modules, that can be plugged into a module slot like a real module. Can you also programm them?

Matthias

*Message #6 Posted by **Meindert Kuipers** on 30 Aug 2004, 3:48 p.m.,*
in response to message #1 by Johannes Mueller

I suggest you het yourself a Clonix or MLDL2000 (available soon now).

Meindert

Re: HP 41 EPROMs Modules

*Message #7 Posted by **Wilson (Bill) Holes** on 30 Aug 2004, 5:03 p.m.,*
in response to message #6 by Meindert Kuipers

I agree!! The Clonix and/or NoVRAM's are viable alternatives to the EPROM; both are 'FANTASTIC' products that are currently available. I cannot yet speak of the MLDL2000 but I'm confident it will be another great alternative as well.

However, some HP41 fans still own, and wish to continue using, working external EPROM boxes and/or card reader case type EPROM boxes such as the HHP Portable EPROM. I offer my EPROM burning services to those few existing HP41 aficionados that fit in this category. Hopefully I can help extend the life of a few of the remaining EPROM boxes in doing so.

Best Regards to all, Wilson

Re: HP 41 EPROMs Modules

*Message #8 Posted by **Jeff** on 31 Aug 2004, 7:11 p.m.,*
in response to message #7 by Wilson (Bill) Holes

I own one of these HHP 32K EPROM boxes. I also purchased an EPROM burner to burn my own. Is there a specific procedure that you need to follow to prepare and burn the EPROM set? Jeff

Re: HP 41 EPROMs Modules

*Message #9 Posted by **Wilson (Bill) Holes** on 1 Sept 2004, 11:23 a.m.,*
in response to message #8 by Jeff

Jeff,

The procedure you need to follow is dependent on the type of burning hardware and the size (capacity) of the EPROM's. You'll likely need the manual that should have come with the burner. I know of one manual that is currently available for download (on the other site). It's the manual that comes with the Mountain Computer HP-41/HP-IL based EPROM burner. You'll also lilely need the

personality modules for the burner, some temporary means to store the module image (i.e., ProtoCoder or MLDL) during the burn process, and the software to drive it all.

I hope this all helps a bit. The full answer to your question requires far too much detail to cover on the forum.

Best, Wilson

Re: HP 41 EPROMs Modules

*Message #10 Posted by **Wilson (Bill) Holes** on 1 Sept 2004, 11:33 a.m.,*
in response to message #8 by Jeff

Jeff,

Oops, I forgot to mention... You should have a good UV EPROM eraser on hand. Although EPROM's are rather inexpensive you can go through a lot of chips in a hurry when first learning the process. A good UV eraser can easily pay for itself in short order.

Best, Wilson

The Ipaq PocketPC - the last and ultimate HP calculator ?

*Message #1 Posted by **Vincent Weber** on 29 Aug 2004, 10:06 a.m.*

Hi all,

With the release of Emu42 for PocketPC, new perspectives open. Now, a single quality machine, my Ipaq 1940, can act simulaneously as: - An HP41CX (thanks to the 'other site'...) with almost all possible ROMs, - An improved HP-15C (Lygea's simlator), much faster, with much more memory and alphanumeric display of keycodes. - An improved HP-12C (Same as above) - An improved HP-16C (Same as above) - An HP-42S (Emu42), with patches the most critical drawbacks of the 42S, i.e. the lack of I/O (Emu42 allows to load objects in the 41-compatible raw format), and double-stroke alpha entry (Emu42 allows the virtual keyboard of the PocketPC to be used) - An HP-28S (Emu42), which also allows I/O and is quite adorable (a 28S which is smaller than a 15C !) - An HP-17B/BII (Emu42) - An HP-19BII (Emu42) - as long as somebody makes the KMLS... - An HP-27S (Emu42) - An HP48/49 (As soon as Emu48 is released, which should be soon)

What else to ask for ?? The HP-15C superceeeds the 25C, 29C and 34C functionnality; the 41CX superceeds the 67 and the 65 (althouth one may argue that the 3 shifts keys of the 67 with direct access to all functionnality is cool); I would say that only the 32SII is really missing here...

Let alone everything else the PocketPC can do, including managing contacts, connecting to the Web and to your email, gaming, an other emulation (Commodore 64, Atari XL, Apple 2, Spectrum).

True, the stylus is not a perfect replacement for true calculator keys, and the battery autonomy is nowhere near the one a of Voyager. But to me, the trade-offs are worth it. I got used to the stylus, I can put my Ipaq in my shirt pocket, and I don't mind charging it every two days.

The Ipaq - the last HP quality product ? :-)

Cheers,

Vincent

*Message #2 Posted by **Christoph Giesselink** on 29 Aug 2004, 4:18 p.m.,*
in response to message #1 by Vincent Weber

> An HP-19BII (Emu42) - as long as somebody makes the KMLS...

The problem isn't the KML script, it's the HP19B(II) ROM image. I have a HP19BII KML script and Emu42 has a memory configuration for this type, but because I don't know an easy and workable way to get it, it will not be published yet.

> An HP48/49 (As soon as Emu48 is released, which should be soon)

I will try to publish Emu48 for Pocket PC 2002 next week together with a new version of Emu48, the base for this program.

Emu42 will be published on http://www.hp42s.com first, but Erik needs some time to make the page(s) for the material I send him.

> I would say that only the 32SII is really missing here...

Here we have the same problem like with the HP19BII. No ROM image!

If you find a legal way to get it, tell me. Working Emu32 and Emu32 for Pocket PC emulators are standing by (with the ability of program Load/Save). Finally you forgot the Low-End Pioneer calculators, Emu10 is also waiting for the ROM images.

Regards

Christoph

Re: The Ipaq PocketPC - the last and ultimate HP calculator ?

*Message #4 Posted by **Vincent Weber** on 30 Aug 2004, 3:22 a.m.,*
in response to message #2 by Christoph Giesselink

Hi Christoph,

Thanks a lot and congrats for the great emulator. I was proud to contribute to the campaign, and equally proud to have it on my Ipaq.

I am quite puzzled that the 19BII ROM cannot be extracted easily. I would think the procedure is similar to the one for the 28S ??

As for the 32SII, well, don't know any "legal" way to get it. HP may be tougher on this one as they produce a similar model (the 33S). Anyway, it does not seem that there is somebody to talk to in HP about that - it has become such a mess...

I forgot the low-end pioneers, but to be honest I am not very interested in them. I don't see the point of emulating a 20S/21S/22S when you have a 42S, and a 10B/10BII/14B when you have a 17BII, other than for nostalgia reasons if you own the calculator. Anyway Lygea is also making a pretty good 10B/10BII simulator. I mentionned the 32SII because the equation and fraction modes of this calc are quite unique - not available on the 42S, unfortunately...

Thanks again and cheers,

Vincent

Re: HP-42S Fractions challenge

*Message #5 Posted by **Gordon Dyer** on 30 Aug 2004, 2:13 p.m.,*
in response to message #4 by Vincent Weber

How about a challenge to 42S programmers.
Produce a program to rival (or better) the 32SII fractions features....
Eric Ehrling's Prime Number Factorisation for the HP-42S at
http://www.hp42s.com/fctr.html
might help.

Re: The Ipaq PocketPC - the last and ultimate HP calculator ?

*Message #6 Posted by **Christoph Giesselink** on 30 Aug 2004, 4:30 p.m.,*
in response to message #4 by Vincent Weber

> I am quite puzzled that the 19BII ROM cannot be extracted easily. I would think the procedure is similar to the one for the 28S ??

No, sorry it isn't. The most important difference is that the HP28(C/S) series has the SYSEVAL command and has programming capabilities whereas the HP19BII can only save formula data.

All my fast upload programs published in cpromupl.zip are written in pure assembler. On the High-End Pioneer series they are typed in and executed over the integrated memory browser and on the HP28 they are typed in as HEX string. This HEX string is converted first into binary data and then over SYSEVAL commands into a code object which can be executed.

> I forgot the low-end pioneers, but to be honest I am not very interested in them. I don't see the point of emulating a 20S/21S/22S when you have a 42S, and a 10B/10BII/14B when you have a 17BII, other than for nostalgia reasons if you own the calculator. Anyway Lygea is also making a pretty good 10B/10BII simulator. I mentionned the 32SII because the equation and fraction modes of this calc are quite unique - not available on the 42S, unfortunately...

IMHO this point of view goes to short or is only one aspect for emulators. When I use your point of view I can say, we have the HP48 emulation and products which simulate/emulate the HP41. Or the HP48 is the successor of the HP28, for what we need an emulation of older models? In this special case Emu42 would newer exist.

I was interested into the possibilty of hardware emulation, not into one special model. I still use an emulated HP48SX running on Emu48 on my Windows desktop. And the most called emulator on my PDA is Emu32 emulating a HP32SII. From this point of view I must say the emulated calculators of Emu10, Emu28 and Emu42 are useless for me.

When you ask a mountain climber why he climbed onto a specific mountain you may get the answer: "Because it's there." And in this manner when you asked me why I emulated specially this model: "Because it's there." or more precise "I have had everthing which was necessary." :)

By this way and have fun

Christoph

Re: The Ipaq PocketPC - the last and ultimate HP calculator ?

*Message #7 Posted by **Vincent Weber** on 31 Aug 2004, 3:42 a.m.,*
in response to message #6 by Christoph Giesselink

Hi Christoph,

I fully agree with you about the pleasure of developping emulators - I have been trying this a long time agon with my Amiga... :-)

I was just saying that I am more interested in the major calculators that HP did than the minor ones, which are only nice to have. Especially, if a calculator is totally superseeded by another one, I am not so interested in it. When I say "superseeded", I do -not- mean more powerful, but the fact there is absolutely nothing to be missed (except for a cheaper price) in the superseeded calculator: otherwise we could say that the HP48 is the most powerful ever done, hence we don't need anything else ! But the HP48 is bulky, and complicated to use for small programs (no numerical registers, for instance). Therefore the HP-48 does not superseed the HP-42S or the HP-15C, for instance. Not even the HP-28S, which comes in a smaller (and, to my taste, neater) package. But the HP-15C definitely superseeds the HP-11C: same size and weight, perfect backward compatibility, but more features; similarly, the HP-28S superseeds the HP-28C, the 41CX superseeds the 41C/CV, the 17BII superseeds the 17B, the 19BII superspeeds both the 18C and 19BII etc. And, I think, the 42S superseeds the 20/21/22 and even 32 (although they may have some small features that the 42S does not have). In that definition, the 32SII is not superseeded by the 42S, given the excellent fraction mode and the so-so equation mode (not as good as the one on 17BII/27S, though).

Nonetheless I am always interested to look at new emulators, and if you ever release Emu10, I will be still interested :)

Btw - why is it that in Emu42 the 'Class 32' statement in the KML file gives 32K RAM to the 42S, but not to the 17BII ? And why is it that the pocketpc alpha keyboard works for the 42S but not for the 17BII ?

Thanks for your hard work and cheers,

Vincent

Re: The Ipaq PocketPC - the last and ultimate HP calculator ?

*Message #8 Posted by **Christoph Giesselink** on 31 Aug 2004, 12:43 p.m.,*
in response to message #7 by Vincent Weber

> Btw - why is it that in Emu42 the 'Class 32' statement in the KML file gives 32K RAM to the 42S, but not to the 17BII ?

Only the HP42S OS supports 32KB RAM. When you create an instance using the 'Class 32' statement in a HP17BII KML script the "hardware" has 32KB RAM, but the HP17BII OS only detects 8KB.

> And why is it that the pocketpc alpha keyboard works for the 42S but not for the 17BII ?

This is a bug in the 17B(II) mobile KML script (Buttons 11 - 16 aren't defined).

Replacing the button definitions

```
Button 01 with Button 11
Button 02 with Button 12
```

```
Button 03 with Button 13
Button 04 with Button 14
Button 05 with Button 15
Button 06 with Button 16
```

in the KML file will solve the problem.

I have fix this and will send the changes to Erik.

Cheers

Christoph

Community Interest: OpenRPN 49G+ Replacement ROM

*Message #1 Posted by **Hugh Evans** on 29 Aug 2004, 12:31 a.m.*

Hello,

I'm trying to get a sense of how much interest the community of HP users would have in the creation of an OpenRPN ROM for the 49G+ written to natively support the ARM CPU.

Over at OpenRPN we're working on a programming language called *fix (basically RPL with support of Post/In/Pre-fix entry methods. Since we're planning to do this in eC++ for ARM7 anyways, I thought using the 49G+ as a development platform might be prudent as ARM7 code is forward compatible with the ARM9.

This would allow for full support of programs written in RPL... and less processing power would be dedicated to emulating the saturn, which = more speed.

All I'm seeking is input from the community. Would you like a new ROM for the 49G+? If you are skilled at programming in eC++ would you be willing to code for our effort?

The ROM will be distributed freely under GPL as a gift to the community from the community.

Thanks for your time, please respond with a yes or no.

YES!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 Aug 2004, 1:05 a.m.,*
in response to message #1 by Hugh Evans

Hi Hugh, guys;

as many in here have already noticed, I'm always trying to support both new tech and ealier tech. My own interest in both, for sure. I just wish I could help with programming, but I have no skills for the proposed platform.

Cheers.

Luiz (Brazil)

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #3 Posted by **.** on 29 Aug 2004, 9:01 a.m.,*
in response to message #1 by Hugh Evans

Yes I am very interested. Do you plan to have a CAS as well?

Just out of curiosity, how do you plan to do this? The hardware is completely undocumented. No-one knows much about it. How do you intend to send your new ROM into flash?

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #4 Posted by **Hugh Evans** on 30 Aug 2004, 2:47 a.m.,*
in response to message #3 by .

This is a very rough draft idea of how to do it... But I would propose that we build a *fix (OpenRPN's RPL) kernel covering all of sysRPL and userRPL so we can drop the ROM on top of it.

The 49G+ is being actively hacked by the community, so I'm sure we can make this happen. GCC is coming along very nicely already!

Regards,

HDE

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #5 Posted by **James M. Prange** on 29 Aug 2004, 10:33 a.m.,*
in response to message #1 by Hugh Evans

I think that if you ask on the newsgroup comp.sys.hp48, you'll probably get an enthusiastic response. How the Saturn emulator uses the ARM hardware is being actively explored already.

You might also consider it for "Project Qonos" when that results in a product. It's supposed to use an Xscale processor, which I understand is also an ARM processor.

Regards,
James

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #6 Posted by **Ben Salinas** on 29 Aug 2004, 4:35 p.m.,*
in response to message #1 by Hugh Evans

Sounds like a great idea. I came across this site a few days ago (maybe from Slashdot, or comp.sys.hp48 or perhaps even from teh openRPN forums), but in case you haven't seen it: http://hpgcc.sourceforge.net/ Natively programming the ARM processor on the 49g+ using c++. Looks pretty cool.

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #7 Posted by **Hugh Evans** on 30 Aug 2004, 2:55 a.m.,*
in response to message #6 by Ben Salinas

Indeed, very exciting stuff! HP-GCC helped to inspire this idea. I've got a thread up on comp.sys.hp48, so I'll keep everyone posted as to how this idea progresses.

Keep your fingers crossed!

Regards, HDE

Re: Community Interest: OpenRPN 49G+ Replacement ROM

*Message #8 Posted by **J-F Garnier** on 30 Aug 2004, 7:01 a.m.,*
in response to message #1 by Hugh Evans

Very interesting idea!

I would suggest to make OpenRPN also available on standard PocketPC machines (see the thread "The Ipaq PocketPC - the last and ultimate HP calculator" above).

In this way, users could choose between dedicated machine (easy to use keyboard, high efficiency system), or standard PocketPC (high speed processor, but no real keyboard). I doubt that HP will never release a HP49G+ successor with 400MHz processor...

J-F

Re: Community Interest: OpenRPN 49G+ Replacement ROM

Message #9 Posted by . on 30 Aug 2004, 7:21 a.m.,
in response to message #8 by J-F Garnier

The HP49g+ can already be set to run at 203MHz, what needs more speed then that?

HP33 - Any plans to fix decimal problem

*Message #1 Posted by **Jeff** on 27 Aug 2004, 8:37 p.m.*

I would like to purchase the new HP33 calculator but I do not want to purchase the calculator until they fix the decimal point problem. Does any body know if HP has plans to fix the problem and, if so, when?

Re: HP33 - Any plans to fix decimal problem

*Message #2 Posted by **Namir** on 27 Aug 2004, 10:46 p.m.,*
in response to message #1 by Jeff

Use the comma like the rest of us!

The comma isn't much more visible...

*Message #3 Posted by **Karl Schneider** on 28 Aug 2004, 12:15 a.m.,*
in response to message #2 by Namir

... and there's still a problem distinguishing the comas from decimal points in large numbers:

See if these numbers look very much different:

```
2,222,222,222.22
2.222.222.222,22
```

A whole digit for radix mark

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2004, 1:50 a.m.,*
in response to message #1 by Jeff

Hi, all;

I think that if the HP33S was able to actually show the radix mark (the thousands are not too much important, agree?) as a whole digit, like it is "suggested" in the HP33S User's Manual, then it would be better. AFAIK, all HP graphics use this "arrangement", and all Classics as well. Even the HP67 and all topcats follow the same scheme. If HP designers find a way to change the SW, there is no need to change the HP33S LCD itself, I think.

Just my thoughts.

Cheers.

Luiz (Brasil)

Edited: 28 Aug 2004, 1:51 a.m.

Re: A whole digit for radix mark

*Message #5 Posted by **Karl Schneider** on 28 Aug 2004, 1:36 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi, Luiz --

I don't have all the HP models, but of those I do have, only the HP-35 allocates an entire digit position to the radix, and it doesn't show "thousands-separators" (commas in the US).

The HP-34 and all of my non-graphical LCD models have special display positions between digits for the radix and separators. (Radix only on the 34C? -- I can't remember.)

My models with graphics-capable displays (42S, 17BII, 28C, 48G, 49G) use, for the radix, a cluster of four pixels in a solid dot-matrix grid.

The 33S has a 7x5 matrix of pixels for each of 14 digits on two lines, with tiny LCD displays for point/comma. A 2x2 cluster would not be very aesthetically pleasing -- not centered between the digits, excessive space, poorly shaped, etc. This might be better than it is today, though...

Re: A whole digit for radix mark

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2004, 1:52 p.m.,*
in response to message #5 by Karl Schneider

Hi, Karl;

You're right about the radix mark used in the graphics models. And the Spices all use thousands separators, you are right again.

The problem is that there already is a "blank" dot column between each 5×7 dot-matrix digits in the the HP33S display, and the designers decided to "sqweeze" the dot/comma character in there. Your idea of 2×2 cluster seems interesting, but it demands a new LCD design, right? I thought that "devoting" a whole digit for dot/comma would lead to change nothing but software, keeping the display. The tinny dot/comma could be used, then, for thousands separators. What do you think?

Cheers.

Luiz (Brazil)

Re: A whole digit for radix mark

*Message #7 Posted by **Richard** on 11 Sept 2004, 7:49 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

You have a good point Luiz; Then we would loose only one digit; Since this would only be good for future design, why not make a real quality high contrast display with and less shadowing like the HP32S had for many years. The 33S display is not as black as the 32S;

Regards,

Richard

Re: A whole digit for radix mark

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 11 Sept 2004, 11:38 p.m.,*
in response to message #7 by Richard

Hi, Richard;

just reasoning about the HP33S display having "light shadows" (not too much contrast). I am not sure if it can be done, but would changing the LCD scan waveforms enhance the contrast? I'd like to know if this is inherent to the LCD constructive material only or if this sort of changing could be effective somehow. Do you know anything about this?

Just a tought.

Cheers.

Luiz (Brazil)

Re: A whole digit for radix mark

*Message #9 Posted by **Richard** on 12 Sept 2004, 7:24 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hello Luiz,

No I dont know this particular waveshape scanning topic;

Notice that in daylight, the display is acceptable, especialy when held in the palm of your hand; The problem is when a table direct bright light (Halogen type) hits the display at an angle; then the liquid crystals that are sitting hight above the backing make a shadow on the backing and the diplay gets fuzy because the shadow blends with the liquid crystals; Also, the color of the HP33S liquid crystals are not as black as on the HP32S when hit with an Allogen lamp so this make for the bad contast;

I think that many users would accept less digit display for better . and , layout;

This 2x lines display has a plus when it comes to sub-menus variables scanning without having to exit this sub-menu;

Have a nice day,

Richard

Field case for the new HP 33S

*Message #1 Posted by **Masao Kinoshita** on 27 Aug 2004, 7:45 p.m.*

I have discovered that the Calculating Edge field case for the Pioneer series works great with the new HP 33S! Unbelievable as it may seem, my HP 33S fits snuggly inside the hard leather case, like my HP 67 did in its field case. I bought the Calculating Edge case for my HP 17Bii, but it bounced around in it like my HP 41CV did in my HP 35 field case. After awhile my HP 41CV's keys were significantly eroded due to all the chafing. I didn't want that to happen to my near production end HP 17Bii, so I didn't use the case until I happen to try it with my new HP 33S. Perfect!

HP35 Startup

*Message #1 Posted by **George Stilley** on 27 Aug 2004, 1:36 p.m.*

Calc has been unused for ? years & had no power supply.

Applied power supper Marked HP 67, obtaine thru your want ads. All I get is random nos and alternate dots.

No response to keys.

Is there any way to bring it back to life?

I can still keep in my minimuseum and sell the power supply!

Re: HP35 Startup

*Message #2 Posted by **Frank Boehm** on 27 Aug 2004, 5:05 p.m.,*
in response to message #1 by George Stilley

You need a working Nicad pack - this calculator won't operate without it. If you don't have a new one, it's not too hard to rework it or purchase a new on ebay.

Re: HP35 Startup

*Message #3 Posted by **David Smith** on 27 Aug 2004, 5:50 p.m.,*
in response to message #2 by Frank Boehm

This machine will work just fine without a battery pack installed. The power supply for the classic series machines delivers a filtered and regulated volatge to the electronics and a separate voltage to charge the battery pack. It sounds like the main electrolytic filter capacitor in the power plug is bad (a very common problem).

Re: HP35 Startup

*Message #4 Posted by **Ronald** on 28 Aug 2004, 5:13 p.m.,*
in response to message #3 by David Smith

Or .....

The one of the wires from the netadaptor to the plug for the calculator is broken, I have have seen that once in one of my adators. If you have a voltmeter, you can check easily. Connect the - to the central pin, the left and right pin should measure around 6 volts for the left and 15 volts for the right pin.

Succes

Ronald

Re: HP35 Startup

*Message #5 Posted by **David Smith** on 29 Aug 2004, 5:25 p.m.,*
in response to message #4 by Ronald

Since he is getting random numbers and dots at least the ground and main supply wires are most likely good. When the filter cap goes bad you get a pulsing power supply voltage that causes the display to flicker and generate random garbage.

Re: HP35 Startup

*Message #6 Posted by **George Stilley** on 30 Aug 2004, 12:07 p.m.,*
in response to message #4 by Ronald

Thanks for the prompt respnse.

I get the voltages Ronald mentioned.

I dont get flickering of display, just a difernt set of random nos when I turn it on.

How else can I trouble shoot the capacitor, and the calculator?

Re: HP35 Startup

*Message #7 Posted by **Miki Mihajlovic** on 30 Aug 2004, 12:36 p.m.,*
in response to message #4 by Ronald

The power adaptor should be OK. I say that because I sold that one to George. I have been using it with my classics (HP-65 and HP-67) for quite a while and I checked the voltage before I sold it. It is probably something with the calc itself. Just to be 100% sure I would suggest that you get yourself a battery holder for 3 AA(A) alkaline cells and connect them with the calculator without adaptor and see what you get. You can buy those in Radio Shack for about $5. As a matter of fact I use those as battery packs in some of my classics and I put NiMH AAA inside. This way I can charge spare cells outside of the calculator itself.

George, if it turns out that the adaptor is faulty I will gladly refund your money.

*Message #8 Posted by **David Smith** on 30 Aug 2004, 6:08 p.m.,*
in response to message #7 by Miki Mihajlovic

Yes, it sounds like the charger is good. Could be something in the power on reset circuit on the CPU board. Tony Duell has some excellent notes on the innards of most of the classic machines.

Re: HP35 Startup

*Message #9 Posted by **George Stilley** on 3 Sept 2004, 11:58 a.m.,*
in response to message #8 by David Smith

Is there anything else I can do checkout/start up the calc itself, since charger is OK.

Im not too interested in major repairs, as I can still include it in my personal museum of

souvenirs, which fits in a shoebox

I thot it was worth a try before deciding its fate!

Re: HP35 Startup

*Message #10 Posted by **Jeff O.** on 3 Sept 2004, 12:24 p.m.,*
in response to message #9 by George Stilley

This is probably too simple to be your problem, but have you cleaned the on/off switch? Dirty contacts here often cause a flickering/random digit phenomenon. Cleaning is quite easy to do. If you have not done so and would like to try and need any guidance, please ask.

Edited: 3 Sept 2004, 10:56 p.m.

*Message #12 Posted by **Jeff O.** on 16 Sept 2004, 8:33 a.m.,*
in response to message #11 by George Stilley

General disassembly instructions are here. More details from memory:

1. remove the 6 screws that hold the back of the calculator. Two screws are under the lower two rubber feet. Don't remove the feet, just lift the outside edge of each one to access the screws. Two screws are in the battery compartment. The other two are under the instruction label at the upper right and upper left. Either peel back the label or poke holes in it. When you remove the back, the shorting contact in the battery connector well will be free, make sure you don't lose it.
2. remove the 8 screws that hold the main board (called the spine in Dave's instructions) to the front of the calculator. No need to remove the small board that has all the electronics on it. It is connected through a 25 pin connector at the bottom, which is usually just a friction fit with springy contact fingers, but I have also seen it soldered (I think).
3. with the calculator keyboard-down, lift out the main board. The keys will be free at this point, so if you turn over the front half of the case, they will fall out.
4. turn the main board over, on the front will be the key contact strips and the LED display at the top. At the top left right below the display are the ON/OFF switch contact pads. Clean these with the contact cleaner of your choice. The plastic switch slider itself will probably still be sitting in the front case. On the back of the switch slider you will find a springy metal contact. Clean this piece.
5. lubricate the above contact that goes under the switch slider and the contact pads on the main board with a lubricant of some kind. I believe Radio Shack sells a silicone contact lubricant that works.

6. while you have it open, clean all of the switch contacts as described here.

Also lots of good information here.
Good luck, ask if you need more assistance.

Re: HP35 Startup

*Message #13 Posted by **David Smith** on 16 Sept 2004, 5:10 p.m.,*
in response to message #12 by Jeff O.

While the machine is apart it is a good idea to clean the shorting bar in the calculator charger port and the charger port connector pins. Also slightly retension the contacts by bending them slightly outward so they put more pressure on the charger pins whn the charge plug is removed. The same sort of retensioning should be done to the power switch contacts.

Sin(Pi) in Radians

*Message #1 Posted by **Mike** on 27 Aug 2004, 8:21 a.m.*

I know the sine of pi in radians should be zero. However,

41CX -4.100 E-10 20S -2.067 E-13 30S 0.000 E00

I undererstand it has something to do with rounding, but the 30 does not calculate pi to infinity, does it round the answer instead?

What about other models?

Re: Sin(Pi) in Radians

*Message #2 Posted by **John Limpert** on 27 Aug 2004, 8:39 a.m.,*
in response to message #1 by Mike

On the HP-28C and HP-48GX, sin(pi) results in zero (exactly).

Re: Sin(Pi) in Radians

*Message #3 Posted by **James M. Prange** on 27 Aug 2004, 3:48 p.m.,*
in response to message #2 by John Limpert

Yes, on the RPL calculators, replacing 'SIN(pi)' by 0 is one of the many built-in simplifications, as long as pi is symbolic. Of course, evaluating SIN(3.14159265359) quite correctly returns a non-zero result. To get the 0, clear both flag -2 (Constant -> symb) and flag -3 (Function -> symb).

Regards,
James

Re: Sin(Pi) in Radians

*Message #4 Posted by **Bram** on 27 Aug 2004, 8:56 a.m.,*
in response to message #1 by Mike

11C: same answer as 41CX
32SII: same as 20S
29C: same as 20S
21: same as 30S (answer is correct: 0)

Yhis last bit surprises me, because it fails to compute 2^30 correctly and almost all its successors are right on that point.

HP 97 same as the 41 and 11C -4.100 E-10

Re: Sin(Pi) in Radians

*Message #6 Posted by **Barry Schwartz** on 27 Aug 2004, 1:09 p.m.,*
in response to message #4 by Bram

In the manual for the 15C, it is explained that the value returned by using the PI key on the calculator is good to 10 significant digits. Thus the value returned for sin(PI) is the same as for the 41CX since it is the sin of a 10 digit approximation to PI rather than PI itself. Some calculators carry more than 10 digits in their calculations and thus will produce sin(PI) = 0 when they round to 10 digits. For example, the TI-83 produces sin(PI)=0 because it carries internal calculations to 14 digits. If one calculates sin(PI) on the TI-83 with the same 10 digit approximation used on the 15C, then the same result as the 15C is generated.

Re: Sin(Pi) in Radians

*Message #10 Posted by **Wlodek Mier-Jedrzejowicz** on 27 Aug 2004, 10:36 p.m.,*
in response to message #9 by Emmanuel, France

How about approaching this as a mathematical problem?

sin (pi-delta) = sin (delta)

If delta is small and in radians then

sin (delta) = delta, to a very good approximation.

Now, no calculator can store pi completely accurately, there is always a difference "delta" between pi to the number of digits that the calculator uses and the true value.

So, any calculator that does not round, or treat pi as a symbolic value, should give the answer sin (pi) = delta, where delta is this rounding error.

Those calculators that do give zero are doing one of the following:

Treating "pi" as a symbolic value, and recognizing that sin (pi) is exactly zero, _not_ calculating sin (pi). That is what HP's RPL calculators do in symbolic mode.

Obtaining a non-zero value, but then displaying zero because of the display mode chosen (I am sure that is what gave zero for people who reported it on models such as the HP-31E or the HP20S).

Rounding a small value to exactly zero. Some calculators do this "unthinkingly", which is Bad News, since many other calculations give small but non-zero values. That is why HP calculators do not round. Other calcs have code built in to recognize that certain types of calculation can reasonably be rounded, for example if an integer is followed by a string of zeros, and then a very small value. Casio and TI routinely do this sort of thing. The HP30S works to very high precision (almost 30 digits, it has been reported) and is more justified than most in rounding extremely small results to zero.

There is one other possibility - that in the formulae I gave above delta is zero to the precision of the calculator. If you evaluate pi to enough significant digits, this will eventually happen. Just wait for calculators that work to, oh, a million or more significant figures... ;-)

Hope this helps!

Wlodek

*Message #11 Posted by **J-F Garnier** on 28 Aug 2004, 5:31 a.m.,*
in response to message #10 by Wlodek Mier-Jedrzejowicz

Actually, all Saturn-based machines know the pi value with double precision, and it's easy to get the extra pi digits thanks to the non-rounding behavior:

SIN(3.1415926535) gives 8.97932384626e-11, which are the next pi digits:
pi=3.14159265358979323846...

J-F

Pi on Saturn-based calc's

*Message #12 Posted by **Karl Schneider** on 29 Aug 2004, 4:07 p.m.,*
in response to message #11 by J-F Garnier

J-F Garnier posted,

Ya lost me, there. I cannot obtain this result on any Pioneer, or RPL-based (28/48/49) calc that I have.

I get -2.0676157357 x 10^(-13) when taking sine of the 12-digit approximation of pi on these calc's.

When I convert 'pi' to a number on the RPL models and start "chipping away" the digits (Frac part, 10x, etc...), I stil find that only 12 digits of accuracy are present.

Re: Pi on Saturn-based calc's

*Message #13 Posted by **J-F Garnier** on 30 Aug 2004, 6:39 a.m.,*
in response to message #12 by Karl Schneider

Try SIN(3.1415926535), not SIN(3.14159265359) ...

J-F

Re: Pi on Saturn-based calc's

*Message #14 Posted by **Karl Schneider** on 31 Aug 2004, 1:06 a.m.,*
in response to message #13 by J-F Garnier

J-F --

Mea culpa! OK, now I'm getting your results on the Saturn-based machines I mentioned in my last post. I had failed to follow your instructions exactly.

In fact, it can be taken one digit further:

```
sin (3.14159265358) = 9.79323846264 E-12
   = 0.00000000009793238462643
```

However, I believe that your mild "contradiction" of Wlodek:

> Quote:
>
> Actually, all Saturn-based machines know the pi value with double precision...

is not strictly correct. This exercise proves only that the Saturn-based HP calculators' algorithm for sine can be used to calculate 12 additional significant digits of pi. It does not prove that the machines "know" the value of pi to 24 significant digits.

As Wlodek stated,

> Quote:

---

sin (pi-delta) = sin (delta)

If delta is small and in radians then

sin (delta) = delta, to a very good approximation.

So, when the first N correct digits of pi are entered in "radians" mode, the sine function will yield the next 12 missing digits accurately (for 7 <= N <= 12, as it turns out). That is, the machines will crunch out the Taylor series (or whatever method it uses) accurately to 12 sigificant digits. Since there is no range overlap between the input and the output for this problem, up to the 24th significant digit can be obtained.

This indicates, to me, a well-written algorithm that minimizes roundoff error.

The algorithm could be:

$$\sin(x) = x - x^3/3! + x^5/5! - x^7/7! + \ldots$$

$$= a_0 - a_1 + a_2 - a_3 + \ldots$$

with

$$a_0 = x$$
$$a_1 = a_0 * (x/2)*(x/3)$$
$$a_2 = a_1 * (x/4)*(x/5)$$
$$a_3 = a_2 * (x/6)*(x/7)$$
$$\ldots$$

Good problem!

Re: Sin(Pi) in Radians

*Message #15 Posted by **Jordi Hidalgo** on 28 Aug 2004, 12:28 p.m.,*
in response to message #10 by Wlodek Mier-Jedrzejowicz

On the HP 9s, the sine of a number x such that 3.1415926535 <= x <= 3.1415926536 is zero in Radian mode. IMHO this is not fudging, but a way of using (defining) an irrational number by implementing one of its most important properties, namely: that its sine must be zero.

And the same goes for the 9g and the 30S, with different intervals, though.

Jordi

Re: Sin(Pi) in Radians

*Message #16 Posted by **Jordi Hidalgo** on 29 Aug 2004, 11:50 a.m.,*
in response to message #15 by Jordi Hidalgo

FWIW, here are the intervals around pi for which the sine function returns zero on the HP 30S:

[3.14159265358979323798281, 3.14159265358979323894945133]

and on the HP 9g:

[3.14159265358979323798, 3.14159265358979323894]

Re: Sin(Pi) in Radians

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2004, 1:42 p.m.,*
in response to message #10 by Wlodek Mier-Jedrzejowicz

Hello Wlodek, guys;

just one single question, "bitte". I remember, when studying Calculus (long time ago), that:

```
sin(delta) = delta
```

but I cannot help remembering the math considerations/approaches and to what extent

```
sin(delta) = delta
```

I mean, how small should delta be so it is true. If

```
sin(delta) = delta
```

is true, then sin(delta) becomes a straight line and it cannot be asymptotic. Is it a math consideration or a numerical approach, what is, in fact, closer to computers?

Just a doubt of mine.

Cheers.

Luiz (Brazil)

Limit of 'delta'

*Message #18 Posted by **Tizedes Csaba [Hungary]** on 28 Aug 2004, 5:18 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

Dear Luiz,

I hope I understood your question correctly.

```
The Taylor-serie is:
f(a+delta)=f(a)+                      (n=0)
           f'(a)*delta/1!+            (n=1)
           f''(a)*(delta)^2/2!+       (n=2)
           f'''(a)*(delta)^3/3!+...   (n=3, ...)

Then we approximate f(x)=SIN(x), at a=0:

---------------------------------
f(x)=    SIN(x)  and  f(a)=     0
f'(x)=   COS(x)  and  f'(a)=    1
f''(x)=  -SIN(x) and  f''(a)=   0
f'''(x)= -COS(x) and  f'''(a)= -1
---------------------------------
f''''(x)=SIN(x), and so on...
```

```
So, f(a+delta)==SIN(a+delta)==SIN(delta)=delta-(delta)^3/6+-...

And we want to use this serie with n=1:

SIN(delta)=delta+Rn(delta), where Rn(delta) is the residual:

Rn(delta)=(delta-a)^(n+1)/(n+1)!*f[n+1](ksi), where f[n+1](ksi)
is the (n+1)'th derivative of f(x) at ksi, where a<=ksi<=delta

Use it, and find the maxima of Rn(delta): (n=1)

Rn(delta)=(delta)^2/2!*f''(ksi), if we want to maximize it, we must
to use f''(ksi)=1:

so, let eps is the "precision of calculator": 1+eps<>1, we get:

##########################################
#                                        #
#  eps>=delta^2/2 --> delta<=SQRT(2*eps)  #
#                                        #
##########################################

On HP32SII: eps=5E-12, we get delta<=3.16E-6, and with simple
trying I get delta=3.11E-6
```

Best wishes: Csaba

*Message #22 Posted by **Garth Wilson** on 28 Aug 2004, 6:17 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

To really understand what's going on, sometimes it's better to scrap all the mathematical proofs and just draw, in this case a right triangle with a very slim angle. You'll also see that as the angle approaches zero, the tangent will be the same as the sine. The equations are much more meaningful after we understand what they're representing.

Re: Sin(Pi) in Radians

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 30 Aug 2004, 9:34 p.m.,*
in response to message #22 by Garth Wilson

I recall that in my old pre-calculus courses such as advanced algebra and trigonometry where the concept of limits and Taylor series had hardly been introduced there was a drawing of a sector defined by a radius R at an acute angle theta from the x axis, the length R along the x axis, and the arc of length R times theta. Then a vertical line was drawn from the intersection of the radius with the arc downward to the x axis (length is R sin theta) and another vertical line was drawn from the point (R,0) upward to connect with the extension of the radius (length is R tan theta). In this diagram the arc length is "squeezed" between the R sin theta segment and the R tan theta segment as the angle is decreased, showing that as the angle approaches zero the sin theta and the tan theta approach the angle theta.

It's a lot easier to draw that than to write it, but I haven't learned how to post drawings.

You state "Rounding a small value to exactly zero. Some calculators do this "unthinkingly", which is Bad News, since many other calculations give small but non-zero values. That is why HP calculators do not round. Other calcs have code built in to recognize that certain types of calculation can reasonably be rounded, for example if an integer is followed by a string of zeros, and then a very small value. Casio and TI routinely do this sort of thing."

I am fairly familiar with the TI product line but not familiar with that. I know that the HP product carried guard digits and rounded results to ten digits. I also know that the TI product line routinely carried more digits in its results than were available in the display and rounded to the display. The internal results were typically truncated not rounded. TI switched to rounded internal results somewhere in the 1980's with the introduction of the TI-68 and TI-95.

More on funny arithmetic

On an HP-41 in radian mode:

sin (pi) = - 4.1E-10

sin (-pi) = + 4.1E-10

sin (pi/4) - cos (pi/4) = 2.0E-10

On an HP-41 in degree mode:

sin (180) = 0

sin (-180) = 0

sin (45) - cos (45) = 0

On a TI-59 in radian mode

sin (pi) = 0

sin (-pi) = 0

sin (pi/4) - cos (pi/4) = 7.0E-13

On a TI-59 in degree mode:

sin (180) = 0

sin (-180) = 0

sin (45) - cos (45) = 7.0E-13

On a TI-59:

(pi x e) - (e x pi) = pi x 1 INV lnx - 1 INV lnx x pi = -2.8E-11, but

pi / 1 INV lnx 1/x - 1 INV lnx x pi 1/x = -1.0E-12

It's enough to make one want to go back to one's slide rule where one KNEW that three digit accuracy was about the best one could do.

in response to message #26 by Palmer O. Hanson, Jr.

> It's enough to make one want to go back to one's slide rule where one KNEW that three digit accuracy was about the best one could do.

The 3-4 digits of the slide rule were usually adequate for real applications too. Trying to guess at the width of the hairline impressed upon us how insignificant further digits really were. Without that reference, people now use a calculator with 10 digits or more, and are not satisfied that accuracy does not always match the extreme precision. Short of positioning a satelite, I can't think of anything that has any use for that many digits.

other sin problems

*Message #28 Posted by **hugh steers** on 28 Aug 2004, 4:07 p.m.,*
in response to message #1 by Mike

as you know, when you press pi on your hp then sin, most models return a non-zero answer. the manuals rather smugly point out that the answer returned is exactly the right answer for the pi approximation used by the machine. you know this.

but,

here is my swift kick in the pants for hp: how about getting the right answer for large arguments. for example, the 48gx gives sin(1e50) = 0.08683927... which is *completely* wrong, the correct answer being, -0.7.8967249342931008271028953...

so there.

Re: other sin problems

*Message #29 Posted by **Mike** on 28 Aug 2004, 5:11 p.m.,*
in response to message #28 by hugh steers

sin is an offense to God, not HP, sine is something different

Re: other sin problems

*Message #30 Posted by **Dave Shaffer** on 28 Aug 2004, 6:02 p.m.,*
in response to message #28 by hugh steers

Hugh,

re: "the 48gx gives sin(1e50) = 0.08683927... which is *completely* wrong, the correct answer being, -0.7.8967249342931008271028953..."

Unless you are doing arithmetic to 50 digits, the poor calculator can't do this correctly. Without checking any actual algorithms, I strongly suspect that any calculator has to basically do MOD arithmetic to determine how many complete turns it has to subtract from x, and then determine the sine of the leftover. If the number of (implied) digits exceeds the calculator's number of sig figs, then the answer will be wrong. Your 1e50 means the calculator has to do 50 digit math to get the correct modulo remainder.

Range Reduction

*Message #31 Posted by **John Limpert** on 28 Aug 2004, 7:27 p.m.,*
in response to message #30 by Dave Shaffer

It does bring up an issue with some implementations of trig. functions. Not all of them do a good job at range reduction. I ran across a mention of this problem while reading a book on computational astronomy (J. Meeus). The book uses the sine of 360000030 degrees as an example. The correct answer is 0.5.

Re: Range Reduction

*Message #32 Posted by **Gordon** on 30 Aug 2004, 6:44 p.m.,*
in response to message #31 by John Limpert

The HP-42S does give sin(360000030)=0.5 !

Re: other sin problems

*Message #33 Posted by **hugh steers** on 28 Aug 2004, 8:02 p.m.,*
in response to message #30 by Dave Shaffer

not true. i had this problem already myself. you need a pi lookup table and you extract the appropriate 10 digit part (for 10 digit results). ok, you need to store the digits, but you dont need 50 digit math.

Re: other sin problems

*Message #34 Posted by **Eddie Shore** on 29 Aug 2004, 2:58 p.m.,*
in response to message #28 by hugh steers

I get 8.68392788E-2 for the HP20S. My TIs 89T and 36X both return ERROR.

HP-15C counters

*Message #1 Posted by **Bram** on 27 Aug 2004, 7:18 a.m.*

The counters on the HP15C petition site keep counting. Recently the country counter counted yet another location in the world where the HP15C is wanted and it's funny to see that even in the smallest of countries people can tell quality.
It's also funny to see that in some countries 2 people intend to time share only 1 device. Well, let's hope that when HP is going to re-produce the 15C, the price will be such that the two persons each can have a device by themselves. (Thailand and Guatemala).
And obviously in China, Luxembourg and Peru some people have (wild) plans. We need more countries like those. And we need more people like the ones in those countries.

Re: HP-15C counters

*Message #2 Posted by **Bram** on 27 Aug 2004, 7:28 a.m.,*
in response to message #1 by Bram

It was my text of yesterday. Testing the link, I noticed that my wish has been heard even before written down. In China there was only 1 person accounting for 50 devices. A second one appears to have signed. Good show, and there are some more people there, so...
In Luxembourg there were 2 persons accounting for some 100 devices, hence my asking for more people like these.

Re: HP-15C counters

*Message #3 Posted by **Bill Wiese** on 27 Aug 2004, 1:53 p.m.,*
in response to message #2 by Bram

Hate to burst your bubble, but a rerun based on these numbers (1650 entries for 6000+ calculators) _ain't_ gonna happen. Even if this was just a small sample of the demeand the numbers still aren't there. Some of these entries have to be discounted too because some folks click on this "just because it's cool" - but when it comes to shelling out $40-$50+ they disappear.

You won't be able to price this calc at a premium even though it has a high 'cool factor': you hope to have regular non-collector sales too, and this calc is different enough/limited features when compared to TI-8X calcs and even HP33S that it has to fit in that price slot - no distributor/retailer will carry something that's 'out of slot'. So you could prob only charge $35-$45 MSRP.

The money to invest in this has to come from somewhere too. Who's gonna invest in this? You're gonna need $600K-$750K just to get started - funding setup costs, fund the first production run, hire a coupla sales folks in USA & Europe, and have some cash to hold together while a market (might) develop. And a risky proposition without high growth prospects? No one funds a one-product company either, esp. with TI, HP, Casio and Sharp as competition.

You're gonna need distrubution partners as well. I'd guess that on a $40+ calc the distributor and dealer combined get 40%-50% of the calculator's ASP (avg selling price).

As I've said here before, doing the software/firmware and finding the right chip is the EASY part. Using existing HP calc firmware and putting an emulation layer [with escapes for new I/O methods] can be done in a reasonable amount of time.

Making molds and keytops, having reliable keyboards, putting money up front for mask-ROM microcontrollers, plus the selling costs of packaging, distribution, warranty returns, etc. all add up. There's a vastly elevated selling cost since this is now a 'specialty' calculator now; it won't be sold alongside TI30X's at the local drugstore and reeducating folks about RPN benefits is costly.

Also the dirty secret in the consumer electronics industry is that 15%-30% of items get returned for refund and then enter the 'remainder' cycle where they are sold via refurb houses, surplus merchants or as 'scratch & ding' discounted items on a given co's website.

Here's my rough breakdown, with a few W.A.G.s (wild-assed guesses) based on amortized NRE costs of smaller production runs for a moderate-quality calc of a smaller production run:

$0.50 CPU/microcontroller w/mask ROM $1.00 LCD $0.30 PC board $0.35 key membrane $0.70 batteries $2.00 custom keytops $2.00 custom molded case + sleeve $4.00 assembly, packaging (outside US) $5.00 importation/support/cost of sales effort ------- $15.85

So you might clear $5-$6 per calculator (given your distrib buys 'em for $20-$22 for selling price of $35-$45).

That's if EVERYTHING works right, people really want to buy them over the long term, etc etc

It looks like I drew attention to two more countries.
Think one of them is Iceland; I don't keep track, so I'm not sure.

(just observing....)

Re: HP-15C counters

*Message #6 Posted by **Bram** on 28 Aug 2004, 2:56 p.m.,*
in response to message #3 by Bill Wiese

You're absolutely right, yet you didn't burst any of my bubbles. I was just observing some figures. I like looking at numbers, that's why I like calculators.
In the meantime there's nothing wrong having wishes. I also wish to have a like-new Woodstock 27 some fine day. Should I stop wishing, because it's not really realistic?
Frankly I too do have doubts about HP doing what we'd like them to do, but I never say never.

Re: HP-15C counters

*Message #7 Posted by **Sigmund Freud** on 28 Aug 2004, 11:02 p.m.,*
in response to message #6 by Bram

There is nothing wrong with honoring the past. In fact this hp museum web site is all about honoring the past. We used old HP calculators in our jobs and as hobbies, and we connected with them.

We should honor the past as the past, but also honor the present and all the things that it brings us, including more power calculators (although the quality has become an issue). Mixing the past with the present is an indication of unresolved issues.

It is very possible that our unconscious mind uses objects from the past like the HP15C to remind us of other issues associated with that era. Ask yourself, what other aspects of your life when you used the HP15C still need resolution and closure. What do you wish to change from that past and revisit to deal with? I invite you to ask this sacred question and honor yourself, the past, and the present.

Bring Back the HP 15C

Re: HP-15C counters

*Message #9 Posted by **Sigmund Freud** on 30 Aug 2004, 11:55 a.m.,*
in response to message #8 by Chris Woodhouse

The HP15C will be resurected when people WITH POWER (that's the KEY word) decide that it will happen. If you and your fellow enthusiasts HAVE THE POWER to do so then IT WILL HAPPEN, regardless what any counter reads. OTHERWISE, you will be better off buying vintage HP-15C from eBay or this site and enjoying them.

15C all functions work, but can't self test

*Message #1 Posted by **Todd Bloss** on 27 Aug 2004, 1:04 a.m.*

Hello, I have an old HP 15c that I "inherited" from my uncle. I'm trying to learn to use it and though it seems to execute all the functions properly, I cannot get it to do the self test or the keyboard test. Instead of it going into test mode, it just turns on.

I know to hold down the x key, then press the "on" key, then let go of the x key, but no joy.

If anyone could help, I'd appreciate it.

Thank you.

Re: 15C all functions work, but can't self test

*Message #2 Posted by **Raymond Del Tondo** on 27 Aug 2004, 1:48 a.m.,*
in response to message #1 by Todd Bloss

Hi,

maybe you mixed up the order of keys you have to press/release.

Before initiating the key sequence,
the calc has to be turned off.

Then:
1. Press and hold the 'x' key.
2. Press and *release* the 'ON' key.
3. Release the 'x' key.

Now the self test starts. After finishing, all segments are lit.
To return to normal mode, just press any key.

HTH

Raymond

Re: 15C all functions work, but can't self test

*Message #3 Posted by **Todd Bloss** on 27 Aug 2004, 1:02 p.m.,*
in response to message #2 by Raymond Del Tondo

Yes, I'm sure I've done the sequence correctly, In fact, I just put in a new set of Duracell batteries and tried the test again and it worked like a charm. However, after getting it to work once, I now cannot get it to do it again!

Very frustrating :/

Thanks for your help though.

Re: 15C all functions work, but can't self test

*Message #4 Posted by **Randy Sloyer** on 28 Aug 2004, 8:28 a.m.,*
in response to message #3 by Todd Bloss

Strange as it may sound, chances are you have a bad memory backup capacitor. Take the batteries out for 30 seconds, then put them back in. If you see PR ERROR, you have a bad capacitor. The capacitor should hold memory for at least five minutes so the thirty second test is usually enough to determine if it's a problem.

The value of the part is 22uf but it can be a standard radial leaded electrolytic or a surface mount tantalum - it depends on the age of the unit. I've never seen a tantalum fail, only the standard electrolytics.

Re: 15C all functions work, but can't self test

*Message #5 Posted by **Todd Bloss** on 29 Aug 2004, 1:13 a.m.,*
in response to message #1 by Todd Bloss

Found the problem. I was trying to make it do the test again immediately after a test. If I just let it sit for a minute, it can do the test again perfectly.

HP49G+ Conn4x errors

*Message #1 Posted by **Matthew Beech** on 27 Aug 2004, 12:14 a.m.*

Ok, I plug in the USB cable, turn on the calc, start XModem, then start the Conn4X program. At that point, the Conn4X program freaks and says that it can find no calculator connected to my PC on any of the coms, or the dedicated HP49G+ port. It connected once, then it suddenly disconnected. Both before and after this one split second connection I have received errors telling me no device is connected. What is going on?? Can anyone please help? HP is about useless to try and get ahold of.

Re: HP49G+ Conn4x errors

*Message #2 Posted by **James M. Prange** on 27 Aug 2004, 1:49 a.m.,*
in response to message #1 by Matthew Beech

Are you trying the latest Conn4x from the HP website? If not, then try that.

If you still have a problem with the current Conn4x, you may have better luck by posting a question to the newsgroup comp.sys.hp48. Conn4x's author sometimes posts there, as does Cyrille.

HP-97 free transistor

*Message #1 Posted by **Michel** on 26 Aug 2004, 10:42 p.m.*

Hi, well, i'm a little bit embarassed of the situation... I opened my HP-97 to repair the gummy wheel problem but when i finish the job, the calculator didn't work at all!!!

I open it again and i fond a completely free loose transistor in in back case!!!

The problem is that i don't know where is that transistor is fiting nor where to solder it!

- on the keyboard board i have 3 transistors

- on the card reader reader, i have one transistor

- on the back of the printer board i found one transistor

- on the main board i found 4 transistors.

The number on the transistors is : M624 3-393

I found that number on other transistor on the calculator so it don't help me...

I look at some pictures but i seems that there is some PCB revision because i have some transistors on the main board that are not on th pictures i saw... ;-(

WHERE DOES IT GOES???

Edited: 26 Aug 2004, 11:02 p.m.

Re: HP-97 free transistor

*Message #2 Posted by **Vassilis Prevelakis** on 27 Aug 2004, 12:36 a.m.,*
in response to message #1 by Michel

You will find the service manual for the HP-97 in the internals directory of the MoHPC CDROM collection

**vp

Re: HP-97 free transistor

*Message #3 Posted by **John Limpert** on 27 Aug 2004, 7:57 a.m.,*
in response to message #1 by Michel

I've seen similar problems on old hardware with discrete transistors. One solution is to carefully examine the solder side of the printed circuit boards with a magnifying glass and a strong light source. You can usually see where the transistor fell out. There will be three blobs of solder with tiny holes in the center where the transistor leads used to be. After replacing the transistor, check the other components on the board for deteriorating solder connections. You will probably find more loose connections. It wouldn't hurt to lightly

touch up all suspect connections with a soldering iron.

Re: HP-97 free transistor

*Message #4 Posted by **David Smith** on 27 Aug 2004, 5:53 p.m.,*
in response to message #1 by Michel

It could be the transistor was knocked loose. Also there is a fairly common problem where one of the transistors in the power supply (on the display board) blows up... usually resulting in several pieces of shrapnel. Three or four other neraby transistors witness the carnage and also commit suicide.

Yes that's it!

*Message #5 Posted by **michel** on 27 Aug 2004, 9:32 p.m.,*
in response to message #4 by David Smith

I found the place where the transistor goes but the holes ar full so there was heat when it quit the motherboard. i replace it but nothing works back on the calculator. only the red dot signaling a low battery even with a fresh battery. I also notica a wire that i accidentally desolder from the printer advance switch before having all these problem. Eben with the wire solder back in place, nothing is working except the red LED dot...

in response to message #1 by JH

> Quote:
>
> A Scientific Calculator designed with PDA functions instead of a PDA designed with weak calculator functions...

In my opinion, that goes all the way back to when handheld "Scientific Calculators" first included alphabetic as well as numeric capabilities, and perhaps time and alarms would also be required. Maybe the HP 41 series? Probably before the term "PDA" was invented.

> Quote:
>
> When can I get one?

From http://www.hpcalc.org/qonos.php, "Estimated release date of Q4 2004". But of course, that's a bit "unofficial", not something that I've seen on the Hydrix web site.

Identify a HP-41CX

*Message #1 Posted by **Darren Tschida** on 26 Aug 2004, 6:25 p.m.*

How can I visually differentiate a 41CX from a C or a CV? I sold a 41CX recently (I hadn't used it in years), and the buyer claims it's another model.

I recall that when it was completely reset, it clearly said "HP-41CX" on the screen. What's the procedure to reset and display this again?

Alternately, what other visual clues are there?

Re: Identify a HP-41CX

*Message #2 Posted by **Vassilis Prevelakis** on 26 Aug 2004, 6:43 p.m.,*
in response to message #1 by Darren Tschida

Is should say so on the front of the caclulator (Hewlett-Packard 41CX) and on the underside of the calculator (bottom left side on the colour label with the keyfunctions)

However, the motherboard inside may be from a different calc.

So an easy check is to see if the clock module is built-in

Make sure you remove all the modules from the back and then power on the calc (press ON once) when it powers up, you press the yellow shift key (SHIFT appears on the display), then press ON again. If the clock module is built-in, you'll get the time. If the machine just turns off, you don't have a CX.

Nest check is a CAT 2.

Turn on the calc, press the yellow shift key (SHIFT appears on the display) then the ENTER^ key and the 2 key. Immediately press R/S to freesze the display. You shoudl see

-TIME 2C

or something similar.

Press SST once and check what you see

If its

-CX TIME

then its a CX for sure, if its smth like ADATE, then you have a 41C or 41CV with a time module built in.

**vp

BTW the only way to get "HP-41CX" on the display, is to type it in yourself. (OK OK, let me rephrase this for the nit pickers, reseting the calc will not get anything like this string on the display)

Campaign for Emu42 (& Emu48 for Pocket PC) successful!

*Message #1 Posted by **Erik Ehrling (Sweden)** on 26 Aug 2004, 4:24 p.m.*

Today the Campaign for Emu42! (& Emu48 for Pocket PC) run by www.hp42s.com managed to pass the 700 EUR level! This means that Emu42 for Windows and Pocket PC as well as the new port of Emu48 for PocketPC will now be publically released.

What would otherwise have been a huge wastage - if Emu42 was never to be released - has thanks to all contributors to the campaign now been avoided! As Emu42 is developed under the GNU General Public License both binaries and source code will be released. The source code will most likely prove to be a useful resource for anyone that in the future attempts to write an emulator of the HP-42S for any other device, e.g. the Palm OS, Linux and so on. The public release of Emu42 also opens up a new chapter in the history of the HP-42S. Even though there is no sign of intention from HP to put the HP-42S back in production again, it now lives on in emulated format.

The campaign still goes on for anyone that wants to express his/her support for Christoph Giesselink's work and has not yet done so!

Best regards,
Erik Ehrling
www.hp42s.com

Re: Campaign for Emu42 (& Emu48 for Pocket PC) successful!

*Message #2 Posted by **Juergen (CH)** on 27 Aug 2004, 2:00 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

GREAT NEWS!

Thank you, Erik, for doing the campaign, thanks in advance to Christoph for releasing the emulator software soon :-), and thanks to all contributors (also future ones)!

This would be a great opportunity for HP to open a 42S developer section on their web site where anyone could get a license to use the 42S ROM. If people cannot get the ROM legally, the file will spread over the Internet...

Re: Campaign for Emu42 (& Emu48 for Pocket PC) successful!

*Message #3 Posted by **Gordon Dyer** on 27 Aug 2004, 4:57 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Geat News! and many thanks to Erik for organising the campaign.

HP48GX on button broke

*Message #1 Posted by **Dennis de Held** on 26 Aug 2004, 1:47 p.m.*

Hi,

The 'on' button on my 48GX is broke. It only works when I press it really hard. And I'm not to keen on doing that.

Does anybody know where I can have it fixed (in the Netherlands) or how I can repair it myself ?

Thanks !

Re: HP48GX on button broke

*Message #2 Posted by **Brian** on 2 Sept 2004, 8:14 a.m.,*
in response to message #1 by Dennis de Held

I have recently experienced exactly as you have described. I understand that HP no longer supports this device.

Is this a common problem?

In any case, I too would like some feed back as to the best solution to a fix.

Thanks in advance, Brian

Re: HP48GX on button broke

*Message #3 Posted by **Ron Ross** on 2 Sept 2004, 8:36 a.m.,*
in response to message #2 by Brian

fixthatcalc.com would be the easiest solution.

There is a relatively easy work around, press above the first and second soft menu keys at the top while turning on the ON button. 95% of the time this is what allows you to turn on your calculator. Details on why are found elsewhere on the forum. Also not a hard fix, but the company above can probably do a prettier job.

Re: HP48GX on button broke

*Message #4 Posted by **Brian** on 2 Sept 2004, 9:06 a.m.,*
in response to message #2 by Brian

After reading further forum questions, I found the answer to my 48's issue, please see:

"Re: How to cook an HP without putting it in the microwave"

Apparently it is a compression connection issue. Does anyone have a resonable fix for this besides using a C-clamp to maintain pressure on the unit?

Re: HP48GX on button broke

*Message #5 Posted by **David Smith** on 2 Sept 2004, 6:19 p.m.,*
in response to message #4 by Brian

I have fixed similar problems in the HP42 and HP48 machines by removing all the covers and dropping the machine in an ultrasonic cleaner filled with distilled water. I then drain out the machine shake it well, repeat everything three times, then dry the machine for a couple of days in an oven on low (or in a hot car with the machine out of direct sun).

Re: HP48GX on button broke

*Message #6 Posted by **Randy Sloyer** on 2 Sept 2004, 10:11 p.m.,*
in response to message #2 by Brian

AFAIK - The current HP policy on GX support is that anything less than three years old is elgible for an exchange unit at a cost that is slightly less than the original retail price. I would suggest contacting them directly through their 800 number for the latest information

HP 12C Help!

*Message #1 Posted by **mitch kleinman** on 26 Aug 2004, 1:17 p.m.*

The decimal point dissappered and has been replaced with a comma. How do I get it back?

Re: HP 12C Help!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 Aug 2004, 4:31 p.m.,*
in response to message #1 by mitch kleinman

Hi;

please, locate both the [.] and [ON] keys on your calculator;

```
make sure it is turned to off;
press and hold the [.] key;
while holding the [.] key, switch the calculator to on;
release the [.] key.
```

These steps compose the basic operation to toggle dot for comma anytime you want.

Cheers.

Luiz (Brazil)

Re: HP 12C Help!

*Message #3 Posted by **Michael F. Coyle** on 26 Aug 2004, 10:57 p.m.,*
in response to message #1 by mitch kleinman

Maybe Dave needs to add another feature to this site...

Any time a message comes in with any of ("10C", "11C", "12C", "15C", "16C") and "comma", the server should just generate the appropriate reply, to save us the trouble of doing it manually.

Think of the time savings!

(Actually, I don't mind seeing this FAQ over and over again. It means that new people are visiting this site all the time and are getting help -- a very positive thing, IMO.)

New Datafile article

*Message #1 Posted by **Valentin Albillo** on 26 Aug 2004, 5:28 a.m.*

Hi all,

Just came back from my summer holidays and after checking the mail I've noticed that one of my articles has been published in the latest issue, V23N4, of **Datafile**, the HPCC club magazine, namely the one titled **"HP-71B Modest Mater"**.

It is a 12-page article featuring a program for the HP-71B which solves classical chess problems of the Mate-in-N-moves kind. The program is laced with in-line comments and is described in the article in full detail, with some interesting examples included, namely a nice, sacrificial Mate-in-2 and an awesome Mate-in-3 which I dare anyone to try and solve without looking out the printed solution (or having the program solve it instead !).

If interested, you can download the program listing in text format from the HPCC web site, using this link, and the resulting text file can be entered either manually or electronically into a physical HP-71B or else in one of the great 71B emulators out there, such as **Emu71**, created by **Jean-François Garnier** (which was actually used to enhance and test the program prior to its publication and runs at 25x-30x the speed of a real 71B), available for free from here, or **HP-71X**, the one for the HP48/49 series by **Hrastprogrammer**, which offers full portability and 2x-3x the speed of a real 71B, full details here.

Hope you'll like everything, article, program, and emulators ! :-)

Best regards from V.

difference?

*Message #1 Posted by **Matthias** on 25 Aug 2004, 11:26 a.m.*

Just before I recognized, that I have two ZEPROM modules, both labeled with "Zengrange". I allways thought, they are the same but now I saw, that one is labeled in silvewr and the other in gold. Does anybody know the difference between them? I would say, Zengrange sold them empty, perhaps programmed with the programming software for the portable burner...

Matthias

Re: difference?

*Message #2 Posted by **Emmanuel, France** on 25 Aug 2004, 12:51 p.m.,*
in response to message #1 by Matthias

May be one is a 'bankswitchable' 16K and the other not. Or 8K and 16K?!

Re: difference?

*Message #3 Posted by **Christoph Klug** on 26 Aug 2004, 3:56 a.m.,*
in response to message #2 by Emmanuel, France

Dear Matthias, Dear Emmanuel,

I also have both Zeprom versions, the silver and the gold. Both include 16K. As I know, the gold version is the later one. Furthermore I heard rumors about a second generation of Zeproms - this means a different hardware design. To find this out, open the module shell of your Zeproms...

Hallo;

I have another link: (in fact, there are two)

HP 17BII+ Calculatrice financiere - Manuel du proprietaire et HP 17BII+ Calculatrice financiere - Manuel d' utilisation

I checked the one you pointed out (http://h10032.www1.hp.com/ctg/Manual/bpia5321.pdf) and this is the English version. And all of them are related to the new HP17BII+. The HP site no longer has the links to the HP17BII manuals (Portuguese and Spanish, not sure if English version was available).

Cheers.

HP38G manual from where?

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 24 Aug 2004, 6:10 p.m.*

Hello,

I was try to find a manual for this calc, but it seems to me, the HP removed it from their website. Can you send me a copy or a link where I shall download it? Or send me a mail, if you have one of this manual, and I will send to you my ICQ# to transfer the file.

Thank you! Csaba

Re: HP38G manual from where?

*Message #2 Posted by **timwessman** on 24 Aug 2004, 10:30 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Don't bother with the manual. Get this book http://members.iinet.net.au/~ccroft/zipfiles/Mastering%20the%20hp%2039g+.pdf instead. Check out http://members.iinet.net.au/~ccroft/ for more info. He wrote it originally for the 38G so it is mostly applicable.

Pushing OpenRPN Along

*Message #1 Posted by **OpenRPN** on 24 Aug 2004, 5:50 p.m.*

Tired of the OpenRPN project lacking definition and direction? So were we. The push has begun towards creating a concise definition of what we're making and how we're going to make it. Thus far we haven't gotten much past a lot of discussion in the forums, where things have been slowing down as of late.

An article written by yours truly has been posted on the front page with links to a Wiki section that should get you thinking in the right mindset, and to a couple of old topics in the forums that I have bumped up and updated. Please stop by and comment! Once established, the definitions we create will be our blueprint for development... I don't want any of you to feel confused the first time you operate an OpenRPN machine, I want it to feel familiar.

Also, be on the lookout for our site re-launch. It won't be long.

Best Regards, Hugh Evans OpenRPN Project Manager

New Site Permissions

*Message #2 Posted by **OpenRPN** on 25 Aug 2004, 10:36 p.m.,*
in response to message #1 by OpenRPN

As further encouragement for people to join discussions and contribute to our design effort, user permissions at www.openrpn.org have been updated... Unregistered users now have full read and write permissions!

Please do not hesitate to send me an e-mail if you have further suggestions that would make your OpenRPN experience more pleasant.

"speed" of 11c

*Message #1 Posted by **Bram** on 24 Aug 2004, 4:58 a.m.*

A nice way of getting acquainted with a (new) device is to convert an existing program and get it running. I did so with a program for my HP-29C and ran it on an 11C. It went well, but I was amazed, if not baffled, to notice that the 11C ran at less than half the speed of the 29C. It was the last thing to expect from a 2-generations-younger calculator.

My queens program finds the first solution in about half an hour on a 29C. On both the 20S and 32SII it takes 5 minutes (newer devices), but with an 11C you'll have to wait for more than one hour. I guess this is the *only* drawback of the latter, but a very important one.

(Off topic: On my Psion Series 3mx it takes a mere 2 seconds, although the programming language OPL doesn't even really compile, but this one is a real computer)

Re: "speed" of 11c

*Message #2 Posted by **Valentin Albillo** on 24 Aug 2004, 6:40 a.m.,*
in response to message #1 by Bram

Bram posted:

"I was amazed, if not baffled, to notice that the 11C ran at less than half the speed of the 29C. It was the last thing to expect from a 2-generations-younger calculator."

Just have a look at their respective power consumptions. One of the main design goals of the Voyager series was to minimize power requirements so that the batteries would last for long and thus a charger/adapter wouldn't be needed at all. They succeeded in spades, with my own HP-11C lasting for 10+ years between battery changes (and 15+ years aren't unheard of). It's amazing that the CPU can still run at such a reasonable speed given the extremely minimal current it draws from its power source.

On the other hand, the HP-29C draws orders of magnitude more power from its batteries and so they'll last just a few hours, at most. Even if you could switch off the display completely (instead of leaving a single "."), they wouldn't last much longer.

I hope this explains the speed difference, and I hope you'll appreciate that even using 1/100th the power, say, it still manages to run at 1/2 the speed.

Best regards from V.

Re: "speed" of 11c

*Message #3 Posted by **Ronald** on 24 Aug 2004, 7:41 a.m.,*
in response to message #2 by Valentin Albillo

If you want to increase speed, you could replace the timing capacitor in the HP11C with a smaller value, 70% is certainly possible. Althouhh power consumption will increase about linearely, it still gives a very long lifetime of the batteries. I replace the batteries anyhow after a certain period, do not want to risk leakage one day unnoticed.

Ronald

Re: "speed" of 11c

*Message #4 Posted by **Bram** on 24 Aug 2004, 10:48 a.m.,*
in response to message #2 by Valentin Albillo

Clear answer, Valentin. Thank you.

Would I have been the designer, I strategically wouldn't have made it slower than its predecessors. Still I could have stressed that 5 years battery life is very long. Can’t imagine what the sales would have been this way. Prefer not to think about it. ;-)

I’ll leave the device as it is. I have “tasted” the 32SII with alpha display, and I think I will program that one instead. So on the 11C speed isn’t really an option. Having it always available and operational however, is.

Edited: 24 Aug 2004, 10:55 a.m.

Re: "speed" of 11c

*Message #5 Posted by **marais** on 24 Aug 2004, 3:24 p.m.,*
in response to message #4 by Bram

In fact, according to the 11c user's guide, they only claimed 1 year of battery life. Amazing from today's perspective with all its marketing hype.

Re: "speed" of 11c

*Message #6 Posted by **Katie** on 25 Aug 2004, 9:05 a.m.,*
in response to message #1 by Bram

What I find even more amazing is that 20+ years later the 12c is still just as slow. It's still bought and used by countless thousands of financial professions who still sit there patiently waiting for the bond price calculations to complete! In my job as a consultant I've been telling these "countless thousands" about the 17Bii for years and they just don't want to change. Speed seems unimportant to them and they never have to think of changing the batteries. The old HP was right (the new HP is virtually never right about anything) to not have worried about slowing down the calculator in order to extend battery life.

Basic Operations

*Message #1 Posted by **John Limpert** on 24 Aug 2004, 3:06 a.m.*

Recently, I was looking for the rectangular/polar conversion keys on my HP-49G+, only to find that they don't exist. That made me think about what the base level features of a scientific calculator should be. Looking back through older HP models, ->R and ->P seem to be present on just about every basic scientific calculator made after the HP-35, even on the bare-bones HP-21. ->RAD, ->DEG, ->H, and ->H.MS are also available on most models. These features are also available on TI's bottom of the line scientific calculator, the TI-30Xa.

What functions should be in the basic set of operations, either on the keyboard or easily available through menus?

Re: Basic Operations

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 Aug 2004, 1:47 p.m.,*
in response to message #1 by John Limpert

Hi, John;

I remember having some considerations like yours, and I guess that we can get a "trip back in time" and see how did Engineering needs change. Many things heppened since the first slide rule became available, and I mention the slide rule because some TI calculators in fact had a SR (Slide Rule) product code, meaning they intended to be electronic slide rules. Believe me, I was talking about these very subjects a few days ago with my coleages at the university.

About the rectangular to polar conversion. I consider that the conversion itself is only needed for a few purposes, like seeing one or other representation. Either rectangular or polar are a pair of numbers refering to an entity: a coordinate, a complex number, etc. What the HP4x series designers assumed (engineers, I guess) is that converting from one representation to another one as mostly a matter of viewing mode, and retrieving any component without the need of converting or being in one specific mode (ABS, ARG, RE, IM) would lead to new approaches. Everytime I use an HP4x to deal with complex numbers I remember(sometimes after a few trial and error) taht this is the way they (HP4x) do.

Just my opinion, of course.

Cheers.

Luiz (Brazil)

HP 49G+ Emulator

*Message #1 Posted by **Richard Garner** on 24 Aug 2004, 12:23 a.m.*

Hi Folks,

There was a mention that someone on comp.sys.hp48 got an HP 49G+ Emulator in the mail from HP. There has been a number of questions directed at the poster for more information, but no response yet. I looked over the HP calculator website, but did not find anything about an emulator. Does anyone here have any information? I do not own an HP 49G+ and currently do not have plans to buy one. But, I would like to see and test the emulator to determine if it is worth getting if or when the manufacturing problems are solved.

Re: HP 49G+ Emulator

*Message #2 Posted by **Fred Lusk** on 24 Aug 2004, 12:35 a.m.,*
in response to message #1 by Richard Garner

Richard…

I happen to have a copy of the download HP made available for a short time about two years ago. It is a 3.8 MB .zip file with two self-extracting files: one for the emulator and one for the manual. I will attempt to send it to you via my work computer since my home email is up/down/up/down like a yo-yo.

Fred

in response to message #2 by Fred Lusk

HP 49G emulator is not a hp 49g+ emulator

Re: HP 49G+ Emulator

*Message #4 Posted by **Fred Lusk** on 24 Aug 2004, 9:21 p.m.,*
in response to message #3 by Veli-Pekka Nousiainen

You're right…I got the models mixed up. The 49G emulator was released by HP more than two years ago, long before the 49G+ was introduced.

Fred

Re: HP 49G+ Emulator

*Message #5 Posted by **Namir Shammas** on 24 Aug 2004, 8:01 a.m.,*
in response to message #1 by Richard Garner

I have not seen an HP-49G+ emulator. There is one for the older HP-49G.

Re: HP 49G+ Emulator

*Message #6 Posted by **Tim Wessman** on 24 Aug 2004, 1:01 p.m.,*
in response to message #5 by Namir Shammas

Cyrille just confirmend that yes it is real, but isn't a full 49g+ emualator. It emulates the ARM bus calls (the calls to certain ARM functions from Saturn land) but doesn't actually emulate the ARM. So it does have the larger screen and I assume SD support, but won't run ARM code. No I don't have it, but can't wait to get it! =)

Re: HP 49G+ Emulator

*Message #7 Posted by **Scott Guth** on 25 Aug 2004, 12:51 p.m.,*
in response to message #1 by Richard Garner

Hello all!

I found the URL to sign up for the free 49G+ emulator:

http://www.hp.com/calculators/graphemulators/

The form says it's for "educators" ... and they ask for your school name, and your title (professor, teacher, ...).

Good luck!

-Scott Guth

Re: HP 49G+ Emulator

*Message #8 Posted by **Namir** on 25 Aug 2004, 3:02 p.m.,*
in response to message #7 by Scott Guth

Wow! HP has emulators for ALL these calculators???? Sure would be nice to get a copy of these emmulators (esp the 33s and 49G+). I am not in academia ... sigh.

Another hp42s program question

*Message #1 Posted by **Tom White** on 23 Aug 2004, 6:28 p.m.*

Hi again,

I was wondering if anyone out there knows how to write a program for the hp42s that mimics the xcord, ycord, R and angle program from the hp27s. I often use this program on the hp27s because it is very convenient and useful but would rather use the hp42s for everything else.

So is there anyone who knows how to do this or has such a program that they have written and would like to share.

Regards Tom

1234

Re: Another hp42s program question

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 Aug 2004, 3:33 a.m.,*
in response to message #1 by Tom White

Hi, Tom;

I don't have the HP27S (the two of a kind: HP27 and HP27S, each one in its time), but I'd guess it is coordinate conversion, right? Would that be (xcord,ycord) the rectangular form and (angle,R) the polar form? If so, the HP42S alerady has it in, at least, two forms.

If you want straight convertions, set angular mode (DEG, RAD or GRAD in MODES menu) and select one of both: ([SHIFT] stands for the 'golden', orange shift key)

```
(ycord) [ENTER] (xcord) [SHIFT][CONVERT][->POL]
```

for rectangular to polar convertion, or:

```
(angle) [ENTER] (radius) [SHIFT][CONVERT][->REC]
```

for converting conversely. You can also use complex mode and convert the whole complex number in the X-register at once. But first let me know: is taht what you want? Just in case I'm explaining something you don't actualy need .. d8-)

Let us know if this is enough and if you want complex-number convertion as well.

Cheers.

Luiz (Brazil)

Edited: 24 Aug 2004, 3:34 a.m.

Re: Another hp42s program question

*Message #3 Posted by **Tom White** on 24 Aug 2004, 9:35 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I did know about the polar and rectangular conversion, but was more thinking about how to put it into a program so you see the variable on the screen (like the dia, area and circ program from last week) and input the ycord and xcord and then press the corresponding keys for the radius or/and the angle OR input the raduis and the angle and press the corresponding keys to get the xcord and/or ycord.

But, I would be interested to know how to use the complex mode and convert the whole complex number in the X-register at once.

Thanks

Re: Another hp42s program question

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 25 Aug 2004, 1:02 a.m.,*
in response to message #3 by Tom White

Hi, Tom;

in another post dealing with a closer subject, I wrote: *I consider that the conversion itself is only needed for a few purposes, like seeing one or other representation. Either rectangular or polar are a pair of numbers referring to an entity: a coordinate, a complex number, etc.* As you may have already seen, the HP42S deals with complex numbers almost the same way the HP15C does. You can convert two real numbers in the Y- and X-register into a complex number in X-register. The complex number can be either a rectangular (Y-value + iX-value) or a polar (Y-value |_X-value) representation, and you can choose which of them any time you want to. Also, all I wrote below can be found in the HP42S Owner's Manual, first part, chapter 6.

Please, find the [STO] key in your HP42S and you'll see a [COMPLEX] as a second function over it. Found? Now let's see the representation modes. If you want to work with complex numbers in polar representation, you should also set the angle mode. Whatever you choose, use the MODES menu to set: DEG, RAD or GRAD for angle mode, and RECT or POL for complex representation. The current mode defines either how complex numbers are shown and how Y- and X-register contents are used to compose the new number.

[SHIFT][COMPLEX] works in one of two ways: create in X-register a complex number with Y- and X-register contents (both must have real numbers) or decompose an existing complex number in the X-register into two real numbers in Y- and X-register. What operation is performed depends on what you have in X-register when [SHIFT][COMPLEX] is pressed. Try this: (consider four decimal places, or [FIX] 04)

```
[SHIFT][MODES][DEG][SHIFT][MODES][POL]
12 [ENTER] 60 [SHIFT][COMPLEX]
```

And the display shows: (please, take |_ as an angle sign)

```
X: 12.0000 |_60.0000
```

This is a polar representation. Now try the rectangular representation:

```
[SHIFT][MODES][RECT]
```

and the display shows:

```
X: 6.0000 i10.3923
```

At this point, you can handle the complex number in any representation, because the current complex mode does not need to be changed in order to use a complex number. Try:

```
3[+] 2 [ENTER] 5 [SHIFT][COMPLEX] [-]
```

and you have:

```
X: 7.0000 i5.3923
```

If you want to use both real and imaginary parts separately:

```
[SHIFT][COMPLEX]
```

and you'll have:

```
Y: 7.0000
X: 5.3923
```

To rebuild the complex number:

```
[SHIFT][COMPLEX]
```

To "see" it in polar mode:

```
[SHIFT][MODES][POL]
```

and then you have:

```
X: 8.8361 |_37.6081
```

You can also directly add to (or perform any valid operation for a complex number) this complex number a polar representation without the need of setting rectangular mode back:

```
4 [ENTER] 60 [SHIFT][COMPLEX] [+]
```

and you have:

```
X: 12.6268 |_44.5393
```

If you decompose the number at this point with [SHIFT][COMPLEX], the numbers in Y- and X-register will be the argument (12.6268) and the angle (44.5393), respectively. I guess you can go ahead from here and try your own examples, right? Anyway, have you found another issue, please, post. If not I, others will promptly answer you.

Best regards.

Luiz (Brazil)

Perhaps using SOLVE...

*Message #5 Posted by **Vieira, Luiz C.** on 25 Aug 2004, 8:33 a.m.,*
in response to message #3 by Tom White

Hi, Tom;

I was wondering about building an expression (program) relating xcord, ycord, R and angle that could be used with the SOLVE application. Would this be handy as well?

Let us know.

Cheers.

Luiz (Brazil)

Re: Perhaps using SOLVE...

*Message #6 Posted by **Tom White** on 25 Aug 2004, 5:54 p.m.,*
in response to message #5 by Vieira, Luiz C.

Hi Luiz,

I had a play with the complex mode last night and had a read of chapter 6, I must admit it was a little "complex" for me , excuse the pun but I suppose if I used it more often I would probably become more familiar with it.

I like your idea of using the solve application and I have used the solve application before but only when there is one unknown, I wouldn't know how to go about it in this case so any help would be appreciated.

Thanks

Re: Perhaps using SOLVE...

*Message #7 Posted by **Richard (in Athens)** on 27 Aug 2004, 5:52 a.m.,*
in response to message #6 by Tom White

Hi Tom,

The Solver on the 42s is brilliant but you're right, it finds only one "missing" unknown of an equation. I played with a VARMENU version of your "CAD" program and I'll post it if you're interested. It finds the missing items and places them in a menu but they're not immediately displayed, they have to be recalled using RCL and the menu keys. A deluxe version, instantly showing everything could involve appending values into the alpha register...rather like the "ITFOS" program I posted a few days ago.

I have found that for programs that I use repeatedly, minimizing input keystrokes is important. For occasionally used ones, more prompts and better labelling are important...so I can remember how they work and what the results are. Mercifully, I no longer have to key-in manually recorded surveying field data...hundreds and hundreds of angles and distances...or write down or plot (x,y,z) results. The calculator remains in my bag to be used only when things go wrong! I probably should add some more prompts to the old "production" programs now that they are just occasionally used for troubleshooting...and, of course, that would make them better for teaching.

I'm glad you started this thread to celebrate the 42s!

Richard

*Message #8 Posted by **Tom White** on 27 Aug 2004, 11:11 p.m.,*
in response to message #7 by Richard (in Athens)

Hi Richard,

Yes I would be most interested in seeing your VARMENU version of the "CAD" program, and yes your right, minimizing key strokes is important but I like to add prompts and labels in most cases anyway.

So to all the many hp42s owners out there I urge you all to post your custom written programs no matter how simple they seem to you as they will probably help others (me) learn how to program better.

Thanks

42s VARMENU Circ-Area-Dia Program

*Message #9 Posted by **Richard (in Athens)** on 31 Aug 2004, 10:49 a.m.,*
in response to message #8 by Tom White

Hi Tom,

Here is your Circumference-Area-Diameter program done using the 42s VARMENU system. A Variable Menu is created with all three variables set to zero and you are prompted to enter the ONE known value, entering it in DIA, CIRC or AREA, whichever one it is. The calculator then tests for whichever one doesn't equal zero and proceeds accordingly. The two missing values are calculated and stored in the menu variables, and the menu is displayed again at the end. Unfortunately, you must press RCL and a menu key to see any of the calculated results or to remind yourself of the input datum. When R/S is pressed again, the program goes back to the top with all three variables set again to zero.

If you had to do this all of the time, it would be pretty tedious...but it's OK occasionally or as a learning exercise.

It would stretch me a bit now to do a well-labeled, alpha-register version and there would be very little space for results if the input were also to be displayed...which would be nice. Probably, the 44 characters available would not be enough to do the job and the byte count would soar (for something so simple).

Sadly, the Olympics are over...when will the next good baseball game be played in Athens?

Richard

Hi Richard,

Thanks for the program, I'll have a play and try and get some ideas from it.

Didn't Australia play well in the baseball?

Yeap! SOLVE is not the way... by itself

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2004, 12:48 a.m.,*
in response to message #6 by Tom White

Hi Tom, Richard, all;

First of all, thank you, guys. And let me admit that SOLVE is actually not the way to solve the case. But let me get acquainted with the HP27S way to deal with coordinate conversion; would you follow me and let me know where my reasonings and the actual HP27S conversion split?

The following lines contain my reasoning over the subject itself. This is a first-shot reasoning, and I am sure others will give other analysis. I'd like to read others and enhance my own reasoning, so, please, go ahead with yours.

There are many ways to relate Xcoord (X for shortening), Ycoord (Y for shortening), angle (Ø for shortening) and R. I think that one of them might be:

```
X/(RcosØ) = Y/(RsenØ) = 1
```

mostly because each side of the equation equals to 1. Anyone dealing with polar and rectangular coordinates knows that knowing any two variables allows the other two to be calculated. That was my main reason of suggesting the use of SOLVE. The problem is that for each unknown variable, three possible relations exist, given that any two of the other three variables are know. As a single example (for those who are following but did not get my point because of any reason), to calculate Ø we may have one of the following three possibilities:

$Ø = \cos^{-1}(X/R)$ or
$Ø = \text{sen}^{-1}(Y/R)$ or
$Ø = \tan^{-1}(Y/X)$.

The chosen one depends on which are the other two known variables. As a consequence, after finding Ø, the fourth unknown can also be calculated.

At first I thought about four menu labels and detecting number input by testing flag 22 in each of them. After each input data, pressing a key would cause the input data to be stored and the other two unknowns are computed (which ones is also a crytical issue, but using flags would be not too hard). If no data is entered, pressing the key shows the corresponding variable's current value. Of course, after the first single one there is no way to compute the other three, but the program would start with a standard (X,Y) = (1,1), leading to (R|_Ø) = (sqrt(2),45º). After that, keying in any new vlue would lead to compute others with existing values. To solve this, four routines (LBL 01, 02, 03 and 04) associated with KEY nn XEQ nn and MENU would give us a program with some generous byte count. I thought that SOLV would do that better, but I confess I did not find a practical way to implement my idea. IF to compute R or Ø it's expected to have X and Y and conversely, two PGMSLV "name" and SOLVE "var" are enough, but I think that the HP27S conversion application goes beyond this unjustified limitations, right?

Thoughts? Comments? Suggestions? CORRECTIONS? (this is too much more important!) All welcome, please!

My 1¢.

Luiz (Brazil)

Yes I agree that the hp27s conversion application goes alittle deeper. I am however at a loss on how to precede so I guess I'll just use the P>R or R>P when I need to in the future, thanks for everyones help.

Tom

HeavyCalc Upgrade (not HP)

*Message #1 Posted by **Norris** on 23 Aug 2004, 5:33 p.m.*

This posting does not relate to HP calculators, but I know that some people here also use Calculated Industries products, and they may find this of interest.

For some time I have been meaning to get a Calculated Industries "HeavyCalc", model 4315. This is a specialized construction calc designed for excavation problems. I finally ordered one online from the CI website last week, along with an "Armadillo" hard case.

Then I had a call from a CI rep. She told me that model 4315 had been discontinued, and that they would be sending a new upgraded "HeavyCalc", model 4320, instead. She also indicated that the new model had an integrated hard case, and that I didn't need the "Armadillo" case.

The 4320 came today. It seems to have the same functions as the old 4315, but the case is completely redesigned.

The 4320 has a hinged front cover that locks over the keyboard, but which can also swing completely behind the back of the calculator when it is open. The front cover has a "Quick Reference Guide" attached to a label on the inside.

There is also a locking cover on the back side of the calculator. The back cover conceals a small compartment which holds the manual and battery. The manual is 50 pages long and seems reasonably comprehensive; two editions are included, in English and Spanish. When both front and back covers are closed, the calculator fits comfortably in a shirt pocket.

Model 4320 must be brand new, because the CI website (as well as the catalog that came in the shipment) still show old model 4315. I don't know if other CI construction calculators will be getting this new case as well, but it wouldn't surprise me. Possibly the old-style CI construction calcs are about to become collector's items.

My overall impression is that CI put some real thought into the redesign of the "HeavyCalc", and that the new design is an unqualified improvement over its predecessor. I wish that I could say the same about my HP-33S.

These calculators may be very helpful for professionals, but mathematically they are a sad joke. Apart from + - x / or their relatives (like inches conversions or °F>°C) you don't get much. I recall also that date calculations use 12 uniform 30-days months in the year, useless for financial decisions. Not to mention 'fraction' mode which just rounds with a fiwed denominator... you get the picture. Keyboard and case on the older generation was not brilliant either. Maybe others had another experience. On the other hand, I like the idea of locally produced, creative, original calculators. Thay should just buy some math library somewhere !

They are tools, not mathematical instruments. Nowadays these tools are the only things that keep new buildings in the US from falling down.

The Imperial system was the last act of sabotage against the US done by the British before they went home

This is what you get if you standardize on version 1.0 of any system. :-)

Re: HeavyCalc Upgrade (not HP)

*Message #6 Posted by **Norris** on 31 Aug 2004, 1:52 p.m.,*
in response to message #4 by GE (France)

I don't agree that the Calculated Industries models are "a sad joke". To take the specific examples you mentioned:

(1) The CI financial calculators apparently do use a 360-day year. But why is that "useless for financial decisions" ? It's a common approach in the US. In fact, the HP-12C by default calculates interest on a 360-day basis (you can get the 365-day result as well, but it takes extra keystrokes).

(2) The CI construction calculators do round fractions to a fixed denominator -- but you can select the desired level of accuracy. The default is 1/16 inch, but you can switch this to 1/2, 1/4, 1/8, 1/32, or 1/64 inch. Accuracy of 1/64 inch seems reasonable for practical construction purposes.

In fact, CI calcs offer some relatively advanced features, including:

(A) Feet-Inch-Fraction Mode. Suppose you have to divide 7 ft 3-1/4 in by 4. This is trivial on a CI (the answer, by the way, is 1 ft 9-13/16 in) but a hassle on a traditional calc. The optimal solution, of

course, may be to abandon traditional English units for metric units, but that's not always a practical option in the US.

(B) Units Mode. Many calcs offer unit conversions, but these typically just multiply the displayed number by some constant. CI calcs actually attach units to numbers, which is a feature otherwise found only on advanced graphing calculators, like the HP48/49 series. The "HeavyCalc", for example, works with units of length, area, volume, and weight; e.g. "5 FEET" x "2 FEET" = "10 SQ FEET". Other CI models work with other types of units; e.g. the "ElectriCalc" works with volts, amps, ohms, etc.

Re: HeavyCalc Upgrade (not HP)

*Message #7 Posted by **GE (France)** on 10 Sept 2004, 6:57 p.m.,*
in response to message #6 by Norris

It is true that these machines are useful. What I meant is that they have no "advanced" function in the sense of anything beyond + - x /. So for any scientific use the function set is blatantly lacking. I have much respect for people who actually 'DO' things like building houses or curing other's diseases, as I am working in a very virtual world myself. But still, CI machines are not advanced *mathematically*.

Why does an imprecise count of days have an impact on financial decisions ? Let's take an example : $100 million borrowed at 3% between August, 26th and September, 4th. With the CI this is 8 days. In reality, it is 9 days. The difference in interest is about $8000. Is THAT negligible ?

Regarding the fixed denominator, I understand that in the real world this is no concern at all. However, for very small values he space between possible values (at least 1/64) can be not so negligible. Example : 0,1 is approximated with 6/64, which is 0,09375. This is 6% in error, no real world process should allow this.

It is a pity that they don't do something a little bit more scientific, it's so easy nowadays. Maybe in the future ?

woodstock/97 plastic keyboard conditioning

*Message #1 Posted by **andy** on 23 Aug 2004, 4:22 p.m.*

I recently cleaned the keyboards on a 25 and a 97. They're nice and clean now but they still don't look that good. They're somewhat dried out looking with an almost whitish haze in some sections. The keys themselves look fine, its the brown plastic surounding the keys that looks bad.

Is there a good product to make the keyboard look new again?

Thanks,

Andy

Re: woodstock/97 plastic keyboard conditioning

*Message #3 Posted by **Ronald** on 24 Aug 2004, 7:41 a.m.,*
in response to message #1 by andy

After disassembling I let the keys "swim" for 1 day in a chlorine solution (the one you use to clen the toilet). This makes them quite well back to their original color. After that I brush the housing and the key's with a light abbrasive stuff (white, chalklike) you use for cleaning the sink. This gives back the normal "glossy" appearance and lightens the yellowed signs. But use this carefull, you do not want to "clean" the letters.

Succes

Ronald

HP97 printer head replacement by 82240A head?

*Message #1 Posted by **marais** on 23 Aug 2004, 3:26 p.m.*

I managed to rebuild a 97 out of two defect units. One problem however leaves me clueless: The printer heads of both 97 units have broken flex wires (the thin flat wire band connecting the printer head to the driver pcb), and all attempts to solder regular wires to the flex band failed. If anybody has a hint on how to fix this, it would be most welcome, however my last desperate attempt would be to use a 82240A printer head. I have never opened an 82240A unit - does anybody know if such an operation would be feasible, i.e. if the 82240a head is compatible with the 97 head and if its connection is similar?

Andreas

Re: HP97 printer head replacement by 82240A head?

*Message #2 Posted by **David Smith** on 23 Aug 2004, 5:41 p.m.,*
in response to message #1 by marais

The heads are mechaincally the same, electrically the are NOT compatible at all. The HP97 has a 10 ohm resistance. The '143A, etc have a 90 ohm resistance and are driven by a much higher voltage.

Re: HP97 printer head replacement by 82240A head?

*Message #3 Posted by **marais** on 24 Aug 2004, 2:22 a.m.,*
in response to message #2 by David Smith

That's too bad. That leaves me with only one option: Has anybody ever managed to solder a regular wire to a flex wire?

Re: HP97 printer head replacement by 82240A head?

*Message #4 Posted by **Tony Duell** on 24 Aug 2004, 3:16 p.m.,*
in response to message #3 by marais

Soldering to the flexiprint is not hard (but scrape off the coating first, of course). The problem comes if you need to solder to the printhead itself. The traces are aluminium (!) and won't take normal solder.

Re: HP97 printer head replacement by 82240A head?

*Message #5 Posted by **marais** on 24 Aug 2004, 3:26 p.m.,*
in response to message #4 by Tony Duell

Tony, well I tried to scrape off the plastic layer with a razor blade, without success. Should I use a different tool? I got a 2nd print head which would require soldering directly to the aluminum, I forgot about the idea rightaway.

Re: HP97 printer head replacement by 82240A head?

*Message #6 Posted by **Tony Duell** on 24 Aug 2004, 7:36 p.m.,*
in response to message #5 by marais

Normally I just scrape at the coating with a small screwdriver, but I will admit I've never tried to do this on an HP printhead (the only one I had that failed had a crack in the ceramic part :-() Maybe HP used something tougher. Have you tried soldering to it anyway?

Re: HP97 printer head replacement by 82240A head?

*Message #7 Posted by **marais** on 25 Aug 2004, 3:15 a.m.,*
in response to message #6 by Tony Duell

Yes, I tried both soldering directly, hoping the heat of the solder pin would melt the plastic layer, and scraping with a razorblade. In true HP spirit, the plastic layer is extremely robust. I've scraped other flex wires before, but this one is tough!

Re: HP97 printer head replacement by 82240A head?

*Message #8 Posted by **David Smith** on 25 Aug 2004, 11:03 a.m.,*
in response to message #6 by Tony Duell

The conductors are on a Kapton substrate. This material does NOT burn or melt. It will char. It is used to insulate wires in military/space cfarft, etc. You will need to use a good razor to scrape it off.

Re: HP97 printer head replacement by 82240A head?

*Message #9 Posted by **marais** on 25 Aug 2004, 1:56 p.m.,*
in response to message #8 by David Smith

Boy, they sure built them tough! Thank you, I'll get another razor and try again. I wonder how the previous owner managed to destroy the flex link.

Andreas

Re: HP97 printer head replacement by 82240A head?

*Message #10 Posted by **David Smith** on 25 Aug 2004, 9:31 p.m.,*
in response to message #9 by marais

Are you sure the problem lies in the flex cable? Every bad printhead that I have seen (quite a few) had a bad resistor or fault in the bond wire.

One way to tell is to ohm out the connector and look for the open line (sound like you have done that). Then use a needle to probe that line near the printhead and see if it is open to the connector.

Re: HP97 printer head replacement by 82240A head?

*Message #11 Posted by **marais** on 26 Aug 2004, 2:19 p.m.,*
in response to message #10 by David Smith

No, I'm sure it's the cable - in fact, I am trying to rebuild a 97 from two broken 97s, both of which have already served as donators for spare parts. In both, the flex wires have been cut or broken brutally. The resistance measurements showed

> the expected value, so I don't understand why the previous owner treated them so badly.

9825T ROM failure

*Message #1 Posted by **Achim** on 22 Aug 2004, 4:30 p.m.*

I have a 9825T (which is a 9825B with additional RAM and ROM) with build-in Plotter/General IO/Extended IO and String/Advanced Programming ROM. The latter one is not functional. I assume, the IC part numbers are 1818-1273 and -1274 soldered on position U36 and U26. On the memory board (not CPU board) there is a switch "32K/64k" which obviously enables this ROM pair. When disabled, the ROM is not detected, when enabled the machine hangs. Also, when I plug in a String/AP ROM-module (from another 9825A), this is not detected. Does anybody have a similar configuration and can check what happens when the 32K/64K switch is in the 32k-position? Any idea what is the cause of the malfunction is welcome.

Achim

Re: 9825T ROM failure

*Message #2 Posted by **Alex** on 23 Aug 2004, 11:50 a.m.,*
in response to message #1 by Achim

Hi Achim,

The problem may not be in your ROMs. The main difference between the 9825B and 9825T is the addition of a second RAM board. The 9825B with only the standard "A24" memory/ROM board can be configured to have either 32K RAM with General IO & Plotter or 22.9K RAM with all the ROMs enabled (this due to the way memory is mapped), depending on which way the DIP switch is set. The 9825T adds the "A25" memory option, but it is still controlled by the DIP switch on the A24 board. The way the 9825T adds another 29.5K of RAM is with special circuitry that maps RAM on that card to the ROM address space, and then on a cycle-by-cycle basis determines whether a given address is a RAM access or ROM access. The address space of the 9825 architecture is 32K 16-bit words, or 64K bytes, yet in the 9825T they manage to fit 61K of RAM and nearly 32K of ROM all in that space by their clever method of sharing part of the space between ROM & RAM.

I would recommend removing the A25 memory (not sure what the actual part number is), which is the card without the Plotter & RAM DIP switches (which will basically give you a 9825B), and see if you can access the ROMs with the switch not in the 32K position. That should at least assist in isolating whether you have a problem with the ROMs or with the RAM board. Also, I doubt seriously that the 9825T can properly access 9825A plug-in ROMs anyway due to the address-space-stealing method used to add the extra RAM. Good luck, and let us know how things turn out.

Alex K.

Re: 9825T ROM failure

*Message #3 Posted by **Achim** on 23 Aug 2004, 12:34 p.m.,*

in response to message #2 by Alex

Thank you, that clarifies something. Well, I already removed the A25 board but the failure remains. From your explanations I wonder why I can access the full 62K RAM with both boards plugged in, although the switch is in the 32k position. Could it be that some of the "upper" RAM is defective? I had a faulty RAM in the lower 32k. But that fault led to a reduced free memory not to a hangup. And the upper RAM wasn't detected. After replacing the RAM the lower RAM as well as the upper are completely scanned. LIST 9999 gives 61812. Do you have schematics of the 9825T? I only have those of the 9825A patent.

Achim

in response to message #3 by Achim

Hmmmm,

No schematics, unfortunately. Sure would be nice to have a full set (for _any_ of the desktops). It could be that from a memory scanning point of view, the routine that figures out how much memory is present doesn't pay attention to that switch position. The main function of the switch appears to be to tell the A24 board whether or not to enable the ROMs beyond General I/O and Plotter. Maybe all the switch does when you put in the A25 board is to enable the other ROMs on the Board, and doesn't affect the RAM. It really does sound like you have a bad ROM chip or something bad in the decode logic (I'd put my money on the ROM since I've had a few of those go bad elsewhere). Per my last posting I don't think you can simply use a ROM from a 9825A.

A faulty rom sounds like a death sentence. Any means to save such a machine? Do rom-dumps exist for any of the desktops?

Andreas

in response to message #5 by marais

I don't think that ROM dumps exist for most of the 9800 series desktop machines because HP didn't usually use industry standard ROM devices. In many cases HP was "ahead of the curve" and developed their own ROM technology. I've seen this in both HP Journal articles and by talking to people who used to work at HP. In some of them, the ROM chips do more than just the ROM function, they have address latching and/or decoding. In other cases, it may be possible to make a pinout adapter for an industry-standard ROM to fit in the spot of a bad one. I have a 9830A with a bad ROM and would sure like to fix it, and it would also be great to be

able to get the Option ROMs copied for the earlier machines, but I haven't found anybody who has successfully done those things (so far). Without schematics for the 9800 series (which don't seem to exist), it would be difficult to reverse-engineer (although Tony D. may be able to help out here, Tony ?????).

An exception is the HP85 series, while the ROMs themselves are special, there is the "Programmable ROM Drawer" device available that uses 2764 devices (with a bunch of external circuitry to emulate the address latching/decoding/etc. inside the ROM chip), and Vassilis Prevelakis has a bunch of the ROM images on his great website.

Re: 9825T ROM failure

*Message #7 Posted by **Tony Duell** on 23 Aug 2004, 7:25 p.m.,*
in response to message #6 by Alex

I've not (yet) dumped the ROMs from most of my 98xx machines -- I have done the later version of the 9815, which as it used an industry-standard CPU (6800) and reasonably-standard 8K byte ROMs (similar to one of the Rockwell devices, but IIRC there was an internal address latch!), it wasn't hard. The 9825 shouldn't be too bad. The early machines did have HP custom ROMs with multiplexxed address and data buses (IIRC), there were standard-ish ROMs in later machines and in some of the modules (which contained an bit of TTL for the address latch, etc). The 9810/20/30 are more strange, but it should be possible. One ongoing project is to make a board that replaces one or more of the CPU boards in such a machine and which allows another computer access to the memory (this is entirely possible, and the point of replaicing a CPU board is that it works on all the machines). Then you could test RAM, dump ROMs, etc. Doing this needs a good set of schematics (I have them), and a fair understanding of how the machine works (I am working on this).

*Message #8 Posted by **Achim** on 24 Aug 2004, 12:40 p.m.,*
in response to message #4 by Alex

Yesterday I checked the RAM by creating a large (60k) array and filling it with pseudo-random numbers. I could read all values back correctly. So the adressing seems ok. On the other hand I found out, that also the build in Extended I/O is not functional. So all ROMs with adresses >=40000(oct) are involved in the malfunction (i.e. String, Adv. Ürog., Extended I/O). A plug-in Matrix ROM from a 9825A works! It's in the adress range below 40000. Also the Flex.Disk Drive ROM seems to work, although I havn't a 9885A to check it out. For further investigation it would be helpfull to know the adressing logic of the ROM. Any hints? To find out if the 9825T ROMs are the same as in the plug-in modules I would need the HP part numbers of the latter. Has anyone yet opened a String/AP/ExtIO ROM module? One would have to brake the case or drill out the rivets :-(

Achim

Re: 9825T ROM failure

*Message #9 Posted by **Alex** on 24 Aug 2004, 5:28 p.m.,*

in response to message #8 by Achim

The problem sure sounds like it is in the addressing and not in the ROMs themselves. It is interesting that you get the hangup when the DIP switch is in the 64K position whether or not the additional RAM board is there or not. The RAM board has the logic for the address-sharing scheme that maps RAM & ROM, so the problem doesn't appear to be with the remapping. Schematics would sure be handy so you could see if the decode for ROMS >40000 is going somewhere else! (which would be my guess)

In the standard 9825B, you can't have both the Systems Programming and the Matrix ROMs plugged in at the same time (and you don't get the Systems Programming ROM functionality from the internal ROM set), but the 9825T enables the on-board Systems Programming ROM _and_ allows you to plug in a Matrix ROM in a front slot. Not sure this is at all related to your problems but it is interesting to note how the 9825T re-maps things.

*Message #10 Posted by **Tony Duell** on 24 Aug 2004, 7:42 p.m.,*
in response to message #9 by Alex

I have found what I think is the schematic -- the 09825-69524 PCB. It's one of the hand-drawn HPCC ones, of course, so signal names and component locations may not agree with anything from HP. Anyway, theere are 10 ROMs on the board -- the diagram implies they're pinned out as 2332As, but they may have internal address latches. Each is 4K*8 bits, they're arranged in 5 banks of 4K*16 bits. Anyway, the address ecoder is not exactly simple, but the 32K/64K DIP switch seems to disable the 'Option B ROM) (this is enabled by U49b ('00), which is then driven from U50d ('04), from output b3 of a '155 (U46)). I would start by checking that this cirucit is doing what you expect -- if for some reason the ROM is stuck in the enabled state, then it's going to crash the machine. Other than that, I would suspect the ROMs themselves (maybe one has failed in a nasty way).

HP-41 emulation?

*Message #1 Posted by **Klaus** on 22 Aug 2004, 1:25 p.m.*

Who is currently building an emulation of the HP-41? (Nelson?) If noone is, I will do that (or we can do it together).

Hardware: As there are nice simulations written in C/Cpp, our microcontroller should be supported by a (free) C-Compiler. LCD: I currently don´t have any experience with LCDs, but those with a built-in controller are easy to use (according to datasheets).

Which LCD and microcontroller can be used? On the PIC, the Interpreter takes about 3000 asm-instructions, plus 1000 asm-instructions for i/o, main loop and i2c communication.

Speed: On the PIC with 4mHz, the emulation of the hp-45 has about the same speed as the original hp-45 (I think it has 380 kHz). But since the LEDs are updated every main-loop cycle, a LCD should speed up things.

Pins: 8 for the keyboard and 8 for display plus a few for RS232/USB

Ram: ?

HP41-firmware in program memory or eeprom?

My plan is to take a simulation of the HP-41** (either nonpareil or the one from "TOS"), move the interpreter part to our microcontroller, add i/o and debug debug debug.

So any suggestions for the microcontroller or LCD?

Re: HP-41 emulation?

*Message #2 Posted by **Vassilis Prevelakis** on 22 Aug 2004, 4:33 p.m.,*
in response to message #1 by Klaus

Why not use the LCD display from the original (fullnut) 41. Try to fit the emulator in the 41 case as well, so that at the end of the day you have a replacement of the main HP41 PCB.

Since modern microcontrollers have much more extra memory (and features) you can accommodate the entire memory map of the 41 (main memory, extended memory, a bunch of ROMs etc) into the on-board memory.

By accommodating the original LCD, you will also be forced to emulate the original HP-41 I/O bus, which means that your new design will be able to accommodate HP-41 peripherals (e.g the HP-IL interface), although a simple serial interface would be just fine with most HP-41 users.

Best Regards

Klaus,

I've just checked the HP Journal March 1980 P25-26 and cross checked with the Schematic by Reinhard Breuer - the LCD module in the calc sits on the bus and has the drivers bonded to the PCB - so, in effect, it already is an intelligent display and it already sits on the bus. I still suspect that there would be more than enough room to hold two PICs one handling the keyboard, LCD and USB - say the 16C745/765 or another USB driver like the FT2232. This would offload the polling time required for the Kbd/LCD/IO to effectively zero on the other 'mainframe' chip and hopefully deliver the required performance ?

Oh, yes, the LCD is just another peripheral. Brilliant design: it reduces the lines that need to connect the main PCB with the front of the calulator (I/O assembly and display). The HP hardware designers of that era knew their shit.

```
> I still suspect that there would be more than enough room to hold two PICs

I don't understand the fascination with the PIC, why not use an FPGA with an ARM core. That will give you all the processing power you can possibly ask for.

Also somebody (sorry I forget who) did an FPGA implementation of an HP-41 ROM pack. This means thay they have an implementatoion of the 41 I/O bus.

in response to message #4 by Vassilis Prevelakis

Hi there - It was Meindert Kuipers at http://www.kuipers.to/hp41.htm who was working on the Xilinix project. The only reason for mentioning Pic was that Diego has arleady done the bus interfacing with the Pic based Clonix/NoVram project and Klaus has done the emulation with the IQSIM - seemed to me that some of the components/sw were already effectively in place. Most of us also have reasonable access to $30 Pic progammers etc versus Xilinx systems so it would keep things scalable and 'one off' costs down - perhaps something like the arm lpc2100 series would rock - do we have enough experience - Klaus? As for USB - I'll stick by that as being the most universal interface - as an aside, the camera you mention with Wifi is the Nikon D2H with the WT-1 Wireless Transmitter add-on, this ironically uses a USB2 connection between the main camera body and the WT-1 (see http://www.dpreview.com/reviews/nikond2h/ for more details). All the best Mark

in response to message #4 by Vassilis Prevelakis

I did an FPGA implementation of the HP41 interfacing (and a lot more!), this is all CPLD based because of power consumption. If you use an FPGA based ARM implementation than your battery life will be very short. This is also a problem with the PIC implementation. As long as it is used as a peripheral (Module emulator) it is OK, because most of the time the module is in a low power mode.

Meindert

in response to message #7 by Meindert Kuipers

Hello!

I only have experience with PICs, but I am curious to try new things. I also have very little experience with hardware design. The thing I went for the PICs is that they are widely available (a standard supplier offers nearly all PICs an a few atmels). Would it help our microcontroller-choice if I wrote the C-code first?

I was the editor and publisher of the newsletter for the TI PPC group from 1983 until the final issue in November 1991. Ms. Fiorina was never a member of our group. You will just have to find something else to blame for your unhappiness with her.

Re: Economist Article: Losing the HP way

*Message #10 Posted by **Namir** on 25 Aug 2004, 7:55 p.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

Hi Palmer!!!

I downloaded the TI PPC notes a few days ago and have been reading the issues and enjoying them. The coverage of the TI-59, TI-95, and TI-74 is very nice. My compliments to you for doing a wonderful job. I have been the editor of some programming languages in the 80s and I can relate to you that is a labor of love.

I was a member of the PCC club and I remember Maurice came and gave a presentation at the Univesity ts)of Maryland (where I used to go to meet with _local_ PPC members on Friday nights). I remember we enjoyed Maurice's talk since we felt we were part of the big family of programmable calculators at large.

It's nice to meet you online!

Namir

Re: Economist Article: Losing the HP way

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 25 Aug 2004, 9:58 p.m.,*
in response to message #10 by Namir

Thank you for the kind words.

My current "labor of love" is working with Richard Nelson, the former editor/publisher of the PPC Calculator Journal, in documenting the "friendly competition" (which one HP competitor once

characterized as "all out war") between the HP and TI users in the 1970's and 1980's. So far we have completed coverage of the competitions in calendar printing, factor finding and pi finding. Those should be presented at the coming HHUC conference. I am currently struggling with the writeup on the competition in matrix manipulations.

Re: Economist Article: Losing the HP way

*Message #12 Posted by **Namir** on 26 Aug 2004, 8:44 a.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

Hi Palmer,

The "all out war" was way back when, before the PCs became THE personal computers. I think today we all have the common love for handheld calculators. I myself have TI calculators (the TI-200, 89 Titanium and 92+) and really like these machines. I also like the TI-Connect software (it's much friendlier than the HP Connect software) and the support TI has online. TI did not get the lion's share of the market for nothing.

Are you attending the HHC 2004 in San Jose in September?

Regards,

Namir

NoVRAM bug reported (and corrected!!)

*Message #1 Posted by **Diego Diaz** on 21 Aug 2004, 10:34 a.m.*

Hi NoVRAM owners (current and future ones... ;-)

On Thursday, Miki Mihajlovic reported a nasty bug in the NoVRAM module power management.

After receiving his .HEX file and checking it in the Test-NoVRAM (Breadboard version of a standard one) it was determined that it was a Software issue.

Symptom: Your batteries go flat in a couple of weeks if you keep the NoVRAM module plugged in while in deep SLEEP (OFF) mode.

Culprit: FM24C256 RAM power line was not properly handled, so it remained alive regardless the 41 power was ON or OFF, draining over 0.5mA thru its data bus bias resistor.

Solution: (Obviously) Turn said RAM off at the end of "every" 41 power cycle.

A new NoVRAM-H.ASM file correcting this bug is available for download, I must keep the file name but you can tell one from another by looking at the time-stamp:

Old file is Jun 29 while the newer one is Aug 21, simply replace the old one with this:

http://www.iespana.es/clonix-41/NoVRAM-H.asm (Right click -> Save Target As...)

The NoVRAM-HEPAX.ZIP has also been updated.

My apologies for the inconveniences and thanks Miki for reporting this bug.

Diego. 123456

Re: HP-42S and 32KBytes RAM

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 21 Aug 2004, 9:15 p.m.,*
in response to message #1 by AlexD30

Hi;

I upgraded five HP42S so far. The one that's still with me (and one of the others) uses the 32KRAM chip removed from one old HP48G:

```
MT62C256F-70LL (by M?T... the mid character is a logo. a circle with a tic-tac-toe symbol
inscripted on it)
```

The other one seems to have a different code, but I don't have it with me anymore.

The most interesting "origin" for these RAM chips is a PC-compatible sound board. It had three 32KRAM chips, and I used two of them so far. The third one I keep as a "spare", just in case. The code for these chips is:

```
W24257S-70L (by Winbond)
```

I am not sure this is a low-power RAM chip, but I have not noticed any reduction in battery life time. Unfortunately, I have none of these chips in working calculators so far. The fifth HP42S I upgraded has another chip with a different code, but I didn't find my notes about his one. Sorry!

I know new IC's are a far better choice, but in the case you have the source and are willing to try... Just keep in mind that it is always a good idea to test the chips before doing the "transplantation". Except for one of the units I upgraded (the first one, my own), all others needed to be opened and repaired somehow. So I took the chance to upgrade. Now that we're talking, I kept all of the 8KRAM chips in a safe place for whatever use later... and now they are, at least, five! Where in the h..l did I save them? Well, that's another history.

My 1¢.

Luiz (Brazil)

HP Series 80: commands in various LEX files

*Message #1 Posted by **Vassilis Prevelakis** on 21 Aug 2004, 3:18 a.m.*

On the Series 80 these files are called BINARY PROGRAM FILES and they are equivalent to the HP-75 (and 71B) LEX files.

I have been trying to take stock of the functions that are available in various Series 80 binary files and hopefully document them (or find comments about them in old magazines such as the PPC Journal).

So here is a list of most (all?) the stuff I have:

The format used is a left justified line containg the architecture (85 or 87), the name of the binary file, its size in blocks, the word BPGM, and its size in bytes. This is followed by a number of indented lines with a coma separated list of keywords supported by the binary file.

Enjoy

Re: HP Series 80: commands in various LEX files

*Message #2 Posted by **Andre Koppel** on 21 Aug 2004, 1:49 p.m.,*
in response to message #1 by Vassilis Prevelakis

If I find a way to easyli transfer disk-files from a HP Series 80 Computer to a PC (I have not found the often suggested LIF utils either for PC or series 80 Computers), I can provide a great amount of Binaries (and even real programs). For example the sysext utility written by myself in the mid of the eigthies contains a command named bcat. This command lists all statements and functions of a binary. For Functions also parameter types are given. Can someone provide the LIF-Utilities?

in response to message #2 by Andre Koppel

Hi,

there should be a link to the LIF utils here in the hpmuseum and on TOS.

However, I could also send you a copy of those files.

Raymond

in response to message #4 by Vassilis Prevelakis

Just be careful, not every bios now supports 256 bytes floppy sectors. I use an old compaq Pentium 166 with Win98 for that kind of transfert.

You can dump a complete HP-lif disk (ascii format). Just recreate the binary file for HP8x emulator (only 3" 1/2, 8" format supported).

Olivier.

I have just used a 1 year old Dell Xeon and it worked just fine.

Unfortunately the LIFUTILs do not work with Windows 200 or XP (at least with my setup -- its difficult to generalize with these products)

I usually just boot from a Windows 98 floppy (no gui, just DOS mode) and run the LIFUTIL from there.

req: HP 33s programing

*Message #1 Posted by **Lee** on 20 Aug 2004, 9:58 p.m.*

HI there:

I am starting to do some programming on my HP33S calculator. When I start it everything is ok, I "Lable" the program name and then I am try to input some variable into the calculator. But I got a problem to key in the aplhat character fo variable. I was wondering any one can me oh that. thanks

Lee

Answer and a suggestion

*Message #2 Posted by **Gene** on 20 Aug 2004, 10:55 p.m.,*
in response to message #1 by Lee

To put a letter in, press RCL and then the key corresponding to the letter.

and, I would suggest checking out the HP33S learning modules on HP's website (one of them relates to programming).

http://www.hp.com/calculators/scientific/33s/technical.html

Good luck. Hope this answers your question! Gene

Campaign for Emu42s

*Message #1 Posted by **Richard Garner** on 20 Aug 2004, 3:15 p.m.*

Hey Folks,

The campaign for the release for a full version of Emu42s is still under way at hp42s.com. The campaign is over 2/3 of the way there. Only 200 EUR more to make the release a reality. Let's see if we can make it happen by HHC2004 meeting.

Re: Campaign for Emu42s

*Message #2 Posted by **Juergen (CH)** on 25 Aug 2004, 4:49 p.m.,*
in response to message #1 by Richard Garner

Checked the campaign site tonight: only EUR 100.- missing! This is your last chance to be mentioned in the hall of fame of EMU42 contributors ;-)

Come on! I cannot wait to get my hands onto the EMU42 PocketPC version...

Re: Campaign for Emu42s

*Message #3 Posted by **Matthias** on 25 Aug 2004, 5:30 p.m.,*
in response to message #2 by Juergen (CH)

And why aren´t you a "Platinum" contributor. Then we would have some more money and it would take 2-3 days less.....

No, don´t be angry about this, Juergen. I know you are a honest person and you do a great job.

Matthias

Re: Campaign for Emu42s

*Message #4 Posted by **Juergen (CH)** on 27 Aug 2004, 1:47 a.m.,*
in response to message #3 by Matthias

As soon as you will have children you will see why I am only a Gold contributor... ;-)

BTW, there was a rumor that also HP babies take a lot of money!

Re: Campaign for Emu42s

*Message #5 Posted by **Valentin Albillo** on 26 Aug 2004, 5:42 a.m.,*
in response to message #1 by Richard Garner

Hi all,

I've been out on vacation for the last 30 days or so and I wasn't aware of this campaign, so perhaps I'm missing some information already given, but I've got a couple of questions: supposing the funds are raised and the emulator is released:

- Does this mean that the ROM image(s) will be available too to HP42S owners ? The emulator is useless without the ROM, and not every 42S owner out there also owns a 48/49, in fact I would think that rather the opposite would be true, i.e.: 42S owners (lovers, you might say) are unlikely to have bought or keep a 48/49 as well. How can those interested users get the ROM ? Would anyone provide it to them after some 'proof-of-ownership' was supplied ?

- Does this mean that the emulator's author will be amenable to give some kind of support to users, and release updates and maintenance versions from time to time, or else the funds cover just the release of the sources and that's all there's to it ?

That's all. Thanks for any answers and comments and

Best regards from V.

Re: Campaign for Emu42s

*Message #6 Posted by **Vassilis Prevelakis** on 26 Aug 2004, 10:55 a.m.,*
in response to message #5 by Valentin Albillo

```
Valentin Albillo wrote:
> Does this mean that the ROM image(s) will be available too to HP42S owners ?
```

If you look at the What is Emu42 info, you'll find that the ROMs are **not** distributed with Emu42. This is for copyright reasons, but once the software is out, you will see images floating around (as has happened with the other emulators).

```
> Does this mean that the emulator's author will be amenable to give some kind of
support to users ...
```

I think the idea is to make the software open source, so that anybody can take it and adapt it for their own use. I think this is implied in the GPL licence: once the code is distributed, it (and the source) becomes common property.

You can also refer to Christoph's posting: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=49009.

Re: Campaign for Emu42s

*Message #7 Posted by **Christoph Giesselink** on 26 Aug 2004, 2:29 p.m.,*
in response to message #5 by Valentin Albillo

Here are the wanted clarification:

> Does this mean that the ROM image(s) will be available too to HP42S owners ?

No, the won't because of copyright reasons. ROM images are definitely _not_ part of the distribution. I personally also will not make any 'proof-of-ownership' verification.

The only way is to extract the ROM image from your own calculator. You will find a tutorial for this at http://privat.swol.de/ChristophGiesselink/Emu28/CPROMUPL.ZIP.

Is the use of your own ROM images in emulators legally? A hard question that can only be answered a lawyer. But in the times of Emu48 before the ROM images were published, employees of HP stated in postings that HP have had no problems with the use of ROM images created from own calculators. But this will imply also, when you sell the calculator you have to destroy all copies (ROM images) of this ROM.

> Does this mean that the emulator's author will be amenable to give some kind of support to users,

There's no personal support! I will not answer any support questions by email. Answering questions in newsgroups (or usenet) have the advantage that the answer might be interesting for others, the support can be made be several people who had the same problem and finally stupid questions can be ignored.

I personally have no problems with mails pointing to a bug or misbehavior of the software, but I also don't like something like this "Could you add this and this and perhaps this?" I more prefer something like this: "Hey, I made my own copy of ... and added the following feature yyy. This might be useful for others. What do you think about integrating it into your version?"

> and release updates and maintenance versions from time to time, or else the funds cover just the release of the sources and that's all there's to it ?

Updates will be done in the same manner like with Emu28 or Emu48. It's on Open Source project, updates can be made by everyone, but of course I will fix bugs and update the software from time to time.

What will be published? The following list may change in minor parts.

- Emu42 (Win32 version) binary + sources
- Emu42 (Pocket PC 2002 version for ARM CPU) binary + sources
- Emu48 (Pocket PC 2002 version for ARM CPU) binary + sources
- Emu42 (Win32 version) KML scripts for HP17B, HP17BII, HP27S, HP28S, HP42S
- Emu42 (Pocket PC version) KML scripts (which one will depend on Erik Ehrling)

What will _not_ be published?

- ROM images
- Emu48 Pocket PC KML files, existing Emu48CE files must be patched by the user

Best Regards

Christoph Giesselink

Forgotten Fundamentals: the HP-33S

*Message #1 Posted by **Karl Schneider** on 20 Aug 2004, 2:07 a.m.*

Forum readers --

This post could be considered tardy, but it's one that's been rattling around a while with me.

I bought a new HP-33S from a retailer for $50 after the April NCEES exam cycle, with its related profiteering, was over. I didn't want to compete with those who needed an RPN calc for the exams, and wasn't about to pay an inflated price from a gouger. In fact, I wasn't even eager to buy one, having seen the photos of its warped chevron-style keyboard. However, the 33S would be useful as a calc without RAM limits that allowed development of programs for my 32SII, so I got one.

Verdict: Quite frankly, I would have been more pleased with a 32SII improved only by 2-4 kB of additional RAM. Although the 33S includes several new and helpful features, it exhibits apalling inattention to HP's time-honored fundamentals of calculator design. It's as though KinHPo "started from scratch" without examining the many other Pioneer models which offered the features added to the 33S.

Consider what was added to the 33S that the 32SII lacked, but other Pioneer models already had:

```
Two-line display:           42S
AOS with precedence:        20S, 21S, 22S, 27S
RPN/AOS dual mode:          17BII
```

Or, what could have been added:

```
Ins/del equation-editing:   27S, 17B, 17BII
Complete complex functions: 42S
One-line complex display:   42S
```

Any of these models could have served as good examples of thoughtful design.

What's good or "right" about the 33S?

- Unshifted x^2 key (usually omitted from RPN calcs)
- "INTG" (round to nearest integer) function
- Scalable ENG display mode (Casios have had it for years)
- Physical constant list

What's wrong about the 33S? Let us count the ways:

Computational bugs!

- Rigorous testing methods were not applied.

Keyboard design:

- The "chevron" design degrades ergonomics, with irregularly-shaped, misaligned keys that don't fit the fingertips naturally. Keys in the middle column are larger than the others, for no practical reason.

- The four silver, raised keys that are labeled are awkward to press, being irregular and angled.

Display:

- Tiny, virtually-indistinguishable decimal point and comma. Inexcusable!
- Shadowing when viewed at a sharp angle.
- Glary, reflective screen. (The 1990 Pioneer upgrades addressed that one.)
- Tiny, hard-to-read annunciators on the upper part of the display, in the shadows
- The display instantly changes to name of function when a key is pressed, instead of after a time delay when the key is held down, as on the 32S, 32SII, and 42S. It is disconcerting to watch the display flash each time an operation is performed.

Faceplate legends:

- The two "shift" colors contrast nicely with the faceplate, but not with each other. This causes me (and others, I presume) to make more mistakes by using the wrong shift key.
- Poor spacing and cluttered detail -- exacerbated by the crooked layout -- make it sometimes difficult to determine what imprint belongs to which key.

Functional grouping:

- Remarkable illogic in placement of functions. This aspect of design was carefully planned in HP's masterful Voyagers. There was also a coherent concept in the fully menu-based 32S that was degraded in the partially menu-based 32SII, and has become haphazard in the 33S:

1. Why isn't "HYP" adjacent to SIN/COS/TAN?
2. Why are "RPN" and "ALG" buried in the keyboard, and not under the "MODES" menu, as on the HP-17BII?
3. Why isn't Roll Down" adjacent to x<>y?
4. Why aren't the probability functions (seed, rand, nCr, nPr) grouped together under a menu, as they were on the 32SII?
5. Why aren't ABS, IP, FP, RND, and INTG consolidated under a menu named "PARTS" (32S/32SII) or "CONVERT" (42S)?
6. There's a special "ENG/<-ENG" key. Why retain "ENG" under the "DISPLAY" menu? FIX/SCI/ALL can be used to set precision (the way Casio does it). Then, "." and "," could be moved to the "DISPLAY" menu, thus making room for "RPN" and "ALG" under the "MODES" menu.

On the 33S menus: The 2-line display made possible more selections (as "pick-a-number" or "cursor-and-enter") in the menus, but I prefer the "press-the-softkey" system of the Pioneers, in both 1-line and 2-line displays.

I've noted that I spend considerable time hunting for functions on the 33S, for the reasons listed above -- clutter, visual indistiguishability, haphazard arrangement. The hard-to-read numerical display is a disqualifying offense.

When I eventually take the PE exam, I'm bringing the 32SII. I have also lobbied NCEES to explicitly approve the 11C, 15C, and 20S -- all of which are better-designed computational tools.

Comments?

Legibility

*Message #2 Posted by **John Limpert** on 20 Aug 2004, 2:42 a.m.,*
in response to message #1 by Karl Schneider

One complaint I have about the HP-33S, as well as some other HP and TI calculators, is the lack of attention given to the legibility of the labels on the keyboard. My eyes aren't as sharp as they used to be, and I often have difficulty reading the shifted functions on some calculator keyboards. Legibility is affected by the foreground color, the background color, the typeface, and the font size. The white metallic background results in glare and low contrast. I would prefer a dark matte background. The foreground colors should be bright/saturated enough to be clearly visible. The typeface should be selected for high legibility.

Re: Legibility

*Message #3 Posted by **Walter B** on 20 Aug 2004, 3:46 a.m.,*
in response to message #2 by John Limpert

With respect to legibility and careful layout of keyboard, IMO HP65 is best. Reasons:

a) Big keys with 2 sides (usually with black/white and blue characters on).

b) Background colour of keys clearly separates different groups of keys.

c) Colour of characters contrasting well to background (on keys and plate). No reflections or other obstacles. Colours of prefix keys showing optimum contrast.

d) Sufficient space between the keys.

e) Superior print quality.

f) Consistent grouping of functions (f, f^-1 TMK was never seen thereafter on HP handheld calculators).

After all, this rating might be earned because it was the first HP with more than 1 prefix key. Usually, you have to present real advantages to convince your management to start something new. Later models (Woodstock and Spice) retained most of these advantages. On Voyagers, IMO print quality was fading (I will be killed for this statement, I know ;-). With first Pioneers, features a), b) and f) were dropped finally. Especially after losing the big keys every prefixed function had to be printed on the plate. Meanwhile there were so many functions making it apparently impossible to end up with a keyboard layout being as user-friendly as before. It really slows you down when you have to look through menus or you have to scan a cluttered keyboard for desired functions. And - quite naturally - all of these calculators are designed for young people with full eyesight - it didn't bother me then, I "see" it now d:^)

Well, just my 0.01 € ...

Re: Forgotten Fundamentals: the HP-33S

*Message #5 Posted by **JuanMi** on 20 Aug 2004, 3:19 a.m.,*
in response to message #1 by Karl Schneider

Hallo nochmals Karl!

I returned back my HP33s just for some of the problems you exposed.

In my opinion, for display, the litle comma is the most disappointing problem.

But my bigger disappointing subject, was the formula storage and SOLVE. I mean that in other HP calculators (like for instance the even non-scientific HP17BII, HP18C, and so on...) you could use two or more characters for naming variables.

On the 33s you just can use single character variables in formulas as for example:

A = B + C (excuse the simplicity of the example)

but not:

ANG = CAT + HIP

The fact 33s can use just one character variables, made ver hard for me to remember and use stored formulas. Then, if to look for, and put formulas on SOLVER... it is not easy to remember wich variable was which.

As another example, these simple formulas (used in dead-reckoning navigation) must be "converted" to HP33s as it just accepts single character variables!!!.

DLAT = D x R (difference of latitude) DLON = A / COS(ML) (difference of longitude and mean latitude)

to:

X (or whatever) = D x R Y (or whatever) = A / COS(M)

This is by far less descriptive!!!!.

Moreover, you have to add the lack of INPUT's or PRINT's with user messages. As the manual states, if you need to show an input/output message to the user, you need to create "one-string" programs (programs containing the message in a string - and just ONE string-) and call them from other programs!!!!. Wow, even my old HP41 works much better than the latter Hp33s!!!!.

Other manufacturers (don't want to mention brands), which also use single-character variables in formulas, have a solution. They permit the use of a string right after the variable in order to be more descriptive (like for instance: X"LAT"=D"DISTANCE" x COS(R"COURSE"). It is just like a workaround, but it works.

I sincerely hope that HP will "follow the right line" again, as I think their calculators are the best made ever (or should I say "were"?).

Best regards (Viele Gruesse!!!),

JuanMi

I think you need to use an Equation as a message.
It can be on any line - no need for subprogram call.
You need to set a flag to use an Equation as a message.

*Message #7 Posted by **KC** on 20 Aug 2004, 4:11 a.m.,*
in response to message #1 by Karl Schneider

Surely there's problem with 33S' design, but what makes me really disappointed is the large no. of bugs that's present in the calculator. It is not like HP calculator's long-developed reputation. I agree with Karl in that I would prefer a 32sII+ with 2-4kb of additional ram than this 33S.

Re: Forgotten Fundamentals: the HP-33S

*Message #8 Posted by **Norris** on 20 Aug 2004, 2:59 p.m.,*
in response to message #1 by Karl Schneider

My situation is similar to that faced by Karl Schneider. I am currently preparing for an NCEES PE exam, and so I bought the NCEES-approved 33S a few months ago. I already had a 32SII, but I wanted the additional program memory and equation storage capabilities offered by the 33S.

I have worked extensively with the 33S, and I basically concur with all of Karl's points. I had previously reached the conclusion that a 32SII with more memory, say 4 KB, would have been a better design than the remodeled 33S. The extra memory is the only real advantage of the 33S; I prefer the 32SII in other respects. The 2-line display of the 33S should have been a plus, but in fact the 1-line display of the 32SII is arguably better, for the reasons noted by Karl.

But I differ from Karl in one respect: the 33S, and not the 32SII, will be my primary calculator on the PE exam. While I recognize the idiosyncrasies of the 33S, I am prepared to tolerate them in exchange for the extra program and equation memory. The 32SII will go to the exam too, but only as a backup.

Incidentally, the 2004 NCEES Annual Meeting was held last week. NCEES was considering revisions to their calculator policy, including a proposal to ban all models except those on their "approved" list. However, I have no idea as to the outcome of the meeting; there don't appear to be any updates at the NCEES website.

Eprombox Eramco conversion

*Message #1 Posted by **Ronald** on 19 Aug 2004, 5:51 p.m.*

Hello,

I have a couple of Eramco EPROM boxes (1 metal, only Eprom) and 2 plastic boxed with also 8K of RAM in it). I like to change one so it can have the service module working. I thnik this one needs to be at page 4. The Eprom boxes however have a switch which starts mapping only on page 8 and higher. Any idea how to change this ?

Re: Eprombox Eramco conversion

*Message #2 Posted by **Meindert Kuipers** on 25 Aug 2004, 8:55 a.m.,*
in response to message #1 by Ronald

Ronald,

If I recall correctly the RAMs may be mapped to any address, but I am not entirely certain. Having the EPROM respond to a lower address may be possible, but I would need to look into the schematics, which I do not have. I you have any, please mail them to me (you have my address I think) and I will check it.

Meindert

What is this?

*Message #1 Posted by **Matthias** on 19 Aug 2004, 2:57 p.m.*

I got a new HP-41 Zeprom, but I do not know the programmed software in it. There are four 4k pages in if. CAT2 labels three of them with CONL-403-[1-3], the last page is SURV-403-4. The last page belongs to the Hayes Surveying module I´m shure. I got three manuals with it as well. But what are the CONV-403 modules? Dies someone knows these modules? There is also a template I´ve never seen: It´s red printed on white background and has labels from A to Z in big black color on it.

Re: What is this?

*Message #2 Posted by **Raymond Del Tondo** on 19 Aug 2004, 5:26 p.m.,*
in response to message #1 by Matthias

Hi,

no, I don't know the ROMs, but CONL could indicate a constant library,
and CONV could indicate that there are conversion functions in the ROM.

HP-10 Handheld Printing Calculator

*Message #1 Posted by **Glenn Crowell** on 19 Aug 2004, 12:35 p.m.*

Is there anyone out there who can give me a clue as to why my HP-10 Printing Calculator is not printing on the thermal paper that came with the machine back in '79 when I purchased it. It's also not feeding very well. Acceptable but could be better. Just curious.

Re: HP-10 Handheld Printing Calculator

*Message #2 Posted by **David Smith** on 19 Aug 2004, 4:35 p.m.,*
in response to message #1 by Glenn Crowell

You need GOOD batteries in the machine for it to work properly. Your local Batteries Plus or Batteries, Etc store can rebuild your old pack with fresh cells.

Staples and other office supply stores carry the paper in their catalogs but usually do not stock it. The modern rolls are usually much shorter than the originals.

Re: HP-10 Handheld Printing Calculator

*Message #3 Posted by **Glenn Crowell** on 23 Aug 2004, 12:32 p.m.,*
in response to message #2 by David Smith

David:

Thanks so much for the information. I'm pretty sure the battery pack is shot and since I can't locate the pack (HP 82052A)I will take your suggestion and try fr a rebuild. Once again, thanks-

Last calculator standing

*Message #1 Posted by **Arnaud Amiel** on 19 Aug 2004, 11:46 a.m.*

If hp stopped producing calculators today, which do you think would be the last working model if they were left to decay naturally (no repair appart from battery packs) and in how many years.

I would be interested in your thoughts on this one.

Arnaud

PS: I would go for the 12C because of the high quantity of those but could be wrong

Re: Last calculator standing

in response to message #1 by Arnaud Amiel

Early HP-11C models. 40+ years.

Best regards from V.

Re: Last calculator standing

*Message #3 Posted by **Raymond Del Tondo** on 19 Aug 2004, 5:37 p.m.,*
in response to message #2 by Valentin Albillo

Yes, I think the voyagers are outstanding from the mechanical construction point of view.

Although the HP-41 and the real HP-48GX are my favourites for many years,
I think the early pioneers (32S, 42S, 20S) are also made to last very long.

Raymond

*Message #4 Posted by **Ron** on 23 Aug 2004, 2:58 p.m.,*
in response to message #3 by Raymond Del Tondo

Pioneers?! I've seen so many Pioneers with the "press here to run" problem! On the other hand, I don't think I've ever come across a bad 11C or 15C.

Re: Last calculator standing

*Message #5 Posted by **Ron** on 23 Aug 2004, 3:00 p.m.,*
in response to message #4 by Ron

I take it back. I had either a 15C or an 11C with a display problem once. Had to fix a contact

problem.

Re: Last calculator standing

*Message #6 Posted by **bkr** on 31 Aug 2004, 12:02 a.m.,*
in response to message #5 by Ron

My 11C lasted about 6 to 8 years. One day it just wouldn't turn on anymore - don't know what the problem was. Then I got a 15C, which has been running about 10 years, but the 3 key has been difficult for about the last 5 years and may eventually fail to register at all. From my experience these calculators need a rebuild after much less than 40 years - an average of about 10-12. That doesn't detract from the fact that they're the best calc ever, though. (Naturally I got a 33s recently, to give my 15C a break)

Although the HP41 machines are my favorite their internal connection/case problems are legion and legend. A handy person can keep them up and running though.

Re: Last calculator standing

*Message #13 Posted by **Namir** on 19 Aug 2004, 4:45 p.m.,*
in response to message #12 by David Smith

I agree with you and add that I doubt that ANY calculator was manufactured to last millenias!!!

While the HP41C line works they rule in my book. It's the calculator that I have used the most.

Don't get me wrong, I am very impressed with the features (the manufacturing quality is another issue) of the current graphics calculator from HP and TI (and to a lesser extent from Casio and Sharp). They do run circles around our old beloved machines. They irony is that I find the emulators/simulators for teh various calculators to be a lot of fun. After all, there is no worry about battery contacts, bad LCD, bad keys, and so on. The only concern is that they will run on future versions of Windows.

Namir

Re: Last calculator standing

*Message #14 Posted by **Jim L** on 19 Aug 2004, 5:47 p.m.,*
in response to message #1 by Arnaud Amiel

I'm thinking the 9100 myself. I guess there's a bias since it's old and still running. Someone suggested that the 11C could last 40+ years but my 9100 is nearly 40 years old already.

Also, it has no batteries and I think bad/leaky batteries are the death of many devices - even well-made devices.

Then again after rereading your post if you mean last calendar date (I was thinking longest lived) then I guess whichever one comes of the assembly line last and is locked in an environmentally controlled chamber along with perhaps 100 additional copies will probably be the last HP left. That won't be that impressive to me though. It's my HPs that are covered in smoke residue, poked through with hot soldering irons and beat up and sill work that impress me. I have an HP-45 that looks like it couldn't possibly still work but it does.

Re: Last calculator standing

*Message #15 Posted by **Wlodek Mier-Jedrzejowicz** on 19 Aug 2004, 9:07 p.m.,*
in response to message #14 by Jim L

If we are only talking handhelds (and nearly, like the series 90) then I think Jim has the right one to last the longest - the HP45. Less to go wrong than later models, built like a (gold-plated) tank, with the experience of the HP-35 already behind the team. The HP-80 is similarly dependable, if you want something to outlast an HP-12C ;-)

Re: Last calculator standing

*Message #16 Posted by **Etienne VICTORIA** on 29 Aug 2004, 9:51 a.m.,*
in response to message #1 by Arnaud Amiel

That would be the Hp-80 of course !! :

- Not the cash register styled computer ;-) the CALCULATOR - The version with the metallic upper frame (no wear out - The only calculator with NO "ENTER" key NOR = key !!! - ...

Well... my calculator...

Eeeerrrr... these models must be around 30 years old now and many of them are still going strong.

I'm forty and I start to show quite a bit of wear (mainly display, power supply and autonomy) ;-)

New learning modules now online for 9s, 9g, 12c, 12cp, and 10bII calculators

*Message #1 Posted by **Gene Wright** on 19 Aug 2004, 11:21 a.m.*

Nearly 120 new learning modules are now available online in PDF form at www.hp.com/calculators.

Modules for the HP30S will be posted soon.

These modules cover many different types of problems users encounter.

These were developed by three regular HP Museum posters, Luiz Vieira, Jordi Hidalgo, and me. :-)

10BII Files: http://www.hp.com/calculators/financial/10bII/educators.html

12c Files: http://www.hp.com/calculators/financial/12c/educators.html

12c platinum files: http://www.hp.com/calculators/financial/12p/educators.html

9s files: http://www.hp.com/calculators/scientific/9s/educators.html

9g files: http://www.hp.com/calculators/graphing/9g/educators.html

Note that there are still a couple of holes for a few of the models, but these will be filled in soon.

If (gasp!) you notice any errors, please let me know. :-)

Enjoy. Hope these are useful! Gene

Re: New learning modules now online for 9s, 9g, 12c, 12cp, and 10bII calculators

*Message #2 Posted by **Mike H** on 19 Aug 2004, 11:36 a.m.,*
in response to message #1 by Gene Wright

Hi Gene, Last month I downloaded all the 30S modules, there were 13 of them, plus the manual. Why were they pulled, and what will be the difference when the new ones are posted?

Mike H 1111

The 30s modules

*Message #3 Posted by **Gene** on 19 Aug 2004, 11:41 a.m.,*
in response to message #2 by Mike H

There were modules for all these machines before too.

They are being updated.

There will be more of them covering more topics than before.

If you have the ones from last month, you can compare the format to the new ones posted today for the 9S.

Topic list between the 9S and 30s are going to be very similar.

Gene

BASIC HP9816

*Message #1 Posted by **Alberto** on 19 Aug 2004, 3:51 a.m.*

Does anyone know how to port BASIC HP9816 programs to PC? At least I need to know how to save listings in ASCII format (not tokenized) in LIF diskettes.

Thanks,

Alberto

Re: BASIC HP9816

*Message #2 Posted by **Valentin Albillo** on 19 Aug 2004, 4:38 a.m.,*
in response to message #1 by Alberto

Have a look at this.

Best regards from V.

Re: BASIC HP9816

*Message #3 Posted by **Alberto** on 19 Aug 2004, 4:49 a.m.,*
in response to message #2 by Valentin Albillo

OK, this is fine with HP9000 workstations equipped with HPBASIC, but my 9816 seems to have a Pro-BASIC interpreter that differs from the "Rocky Mountain" in many aspects. In particular it does not support the FORMAT directive, and a lot of commands are not recognized.

The boot message of the interpreter is:

BTS Rev. E2550 Ready.

Does it look familiar to anyone?

HP9810: printer and card reader required for function?

*Message #1 Posted by **Thomas Falk** on 18 Aug 2004, 4:17 a.m.*

Hi anybody,

I have here a nonfunctional HP9810, which I plan to try to repair.

The calcuator does almost nothing. A while after switching on it switches some of the LEDs on: Status Float and Run, all others are off, the display is also completely off. There is no reaction to the keyboard.

With the help of the archive I have found some older discussions on this topic, I have also now the patent to the HP9810 with part of the schematics and description of the function. That's really a lot to read.

Until now I have checked the power supply (which is ok) and had a fast view on the keyboard with the oscilloscope. At least there are some reactions to the keys in the signals to see. I still have to look into the details.

To reduce to possible sources of errors I have removed to printer and the card reader together with the corresponding cards. This resulted in no change in the behaviour. My question is: Does a HP9810 work without its printer and card reader or have these modules to be inserted?

Thanks for any hints,

Thomas

Re: HP9810: printer and card reader required for function?

*Message #2 Posted by **Tony Duell** on 18 Aug 2004, 6:15 a.m.,*
in response to message #1 by Thomas Falk

A 9810 (or at least my 9810) will work without the card reader PCB (the one alongside the PSU) or the printer fitted. You can also remove the I/O backplane at the back, the ROM module backplane (unplug the edge connector from the edge of the main backplane under the memory box) and even the keyboard (unplug it under the printer, you obviously have to keep the mains switch plug connected).

The keyboard LEDs are something of a red herring. They're driven by an 8 bit latch on the keyboard controller board (yes, I know there are 10 LEDs, but float/fixed are driven by the normal and inverted outputs of one bit and program/run are driven by the normal/inverted outputs of another bit). So at least 2 LEDs will be on if the PSU is OK, even if the CPU isn't running.

The lack of display could mean a fault almost anywhere in the machine. The display is scanned in software, so for it to come on, the CPU has to be working, as does the memory, the I/O interface, and of course the display itself.

This is a bit-serial machine which makes life a little difficult. You need a 'scope or logic analyser to get anywhere in troubleshooting it IMHO. A microcode source listing is also useful -- the microcode address lines are on the test connector on the 09810-66513 CPU control board and can be used to find out just what the machine is doing.

You say you have the schematics, but IIRC these don't give the pinouts of the boards. HPCC has a complete reverse-engineered schematic of this machine (with pinouts, etc), but the chap who has it is on holiday at the moment. Still, it may be possible to get a copy to you.

What I'd do is : Check for the display strobe at the display PCB. Most likely it's missing, but you don't want to dig into the logic if the fault is on the display PCB.

Then look at some key signals in the CPU. Are the clocks running (You can run the clock card with no other logic cards in the machine and look at the bit clock and microcode clock signals)? Is it trying to access memory (the '3' and '6' outputs from the R-field decoder IIRC)? Is the memory active (look for activity on the address and data lines in the memory box)? Is it executing any I/O operations (is the I/O flip-flop on the clock card being set)? Is the I/O register being loaded? Do the ALU signals look sane?

I've had a fair amount of trouble with the 74Hxx logic in these machines -- the chips don't give a 'good' output signal.

Feel free to contact me if you think I can be of any help. I've done component-level repair on the 9810 and 9830.

Re: HP9810: printer and card reader required for function?

*Message #3 Posted by **Thomas Falk** on 18 Aug 2004, 7:30 a.m.,*
in response to message #2 by Tony Duell

Hi Tony,

thanks for your message. Maybe you remember, we had contact about one and a half year ago when I was asking for help with a defective HP9100. Unfortunately this was not my calculator, I had to give it back to the museum where I had borrowed it. They don't mind if a calculator is not working.

The HP9810 now is mine, thus it should work. ;-)

I will do the tests you mentioned. Some corrections to the LEDs: directly after sitching on, some of the LEDs are on, eg. one of the card reader. After one or two seconds it changes to what I have described and what I assume as default for this calculator. Unfortunately this means that the CPU ist probably doing something. If it is a fault in the display board only I would expect some reactions on the LEDs to changing the display format, but it doesn't.

I have at the moment only the patent as a guide. I hope it contains enough information for identifying the cards and to find the important signals. A copy of the schematics would be usefull. In what form does the HPCC have it?

I will let you know what happens, but as far as I can see, it will take some time. Its something like solving crossword puzzles.

Regards,

Thomas

Re: HP9810: printer and card reader required for function?

*Message #4 Posted by **marais** on 18 Aug 2004, 12:48 p.m.,*
in response to message #3 by Thomas Falk

I just picked up my 9810 (Hi, Tony!) and will start to work on it soon. Mine shows the same

symptoms, and as Tony told me, I have to expect a tough job. I'd appreciate it if you would share your insights - and will gladly share mine.

Andreas

Re: HP9810: printer and card reader required for function?

*Message #5 Posted by **Tony Duell** on 18 Aug 2004, 3:21 p.m.,*
in response to message #4 by marais

I'm quite happy to continue this discussion here (so everyone can see it), or take it to private e-mail with a few people (us 3 ?) swapping messages, hints, tips, etc.

Oh yes, somebody was asking about the HPCC schematic. It exists as a pile of hand-drawn sheets (the eccentric member who produced it doesn't believe in CAD systems ;-)), but I think it's either been scanned or will be scanned soon.

Re: HP9810: printer and card reader required for function?

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Aug 2004, 7:23 p.m.,*
in response to message #5 by Tony Duell

Tony: If you don't mind, please keep discussing this and other matters here, so many of us can benefit from the discussion and learn (even it is unlikely we will have a 9100 or 98X0 on hand to play with or to repair...).

Thank you for your enlightening postings!

Re: HP9810: printer and card reader required for function?

*Message #7 Posted by **Ton y Duell** on 18 Aug 2004, 3:18 p.m.,*
in response to message #3 by Thomas Falk

OK, some more thoughts (mostly good).

Firstly, in your first message you mention that processor signals appear to change when you press a key. Now, this is from memory, but I am going to try to describe the keyboard response on the 9810.

The keyboard is scanned in hardware (that's the circuitry on the PCB on the back of the keyboard). When it detects a keypress, it sends an interrupt signal to the CPU, and provides a 7 bit keycode to the I/O interface board.

Now, interrupts on the 9810 are clever. The microcode checks the interrupt signal during the fetch-execute cycle. If it's asserted, then the microcode fetches the instruction at address 2 without reloading the program counter (P register). In other words the M register is loaded with 2 rather than with the contents of P.

Now, this instruction is conventionally a call (there's no reason why it has to be, but as it's in ROM it can't easily be changed, and it's a call on every 98x0 machine I've seen). This call is executed, pushing the contents of P onto the return stack (remember P still contains an address in the 'normal' program) and then jumping to the Interrupt Service Routine. At the end of said routine, the return instruction restores P and continues with the main program.

So the fact that the signals change on a keypress would seem to indicate that the CPU is going round the fetch-execute loop. It may not be executing the right instructions, but at least it's not stuck in an

address indirection loop or something.

The fact that the LEDs change once after power-on is a good sign too. At power-on the LED latch contains essentially random data, and it has to be loaded by the CPU. It sounds like the CPU is doing this (maybe not correctly).

This sounds like a problem either in the data path, or more likely the I/O interface (09810-66511 card). Maybe the I/O size logic, maybe the I/O register or its control circuits.

in response to message #7 by Ton y Duell

Hi Tony,

thanks for the hints. I will check it. Yesterday evening I was reading in the patent. Faszinating! Unfortunately the calculator has to wait for the weekend.

I will be back with new questions on monday ;-)

Best wishes,

Thomas

Re: HP9810: printer and card reader required for function?

*Message #9 Posted by **Alastair Roxburgh** on 21 Aug 2004, 2:28 a.m.,*
in response to message #1 by Thomas Falk

Hi Everybody. I recently acquired a non-working 9810A, but having experience with TTL and CMOS, (most recent project was resuscitating an HP87 by replacing the HP-IB I/O chip), as time permits I will be attempting to repair the 9810A. Information about the on-going process will be posted here. Maybe it will help someone else and just maybe I might learn a thing or two from those of you who have done or are doing such a repair. At this point I have not opened the 9810A, and it is currently a dead duck, with no lights or fan activity.

At the moment I am also repairing a 9825B with a gummy printer solenoid (the remaining task is to get the row-feed solenoid adjsuted correctly so that I don't get double-height characters), and a 9815A with a stuck key (which prevents the machine booting up unless the key is pulled up).

I am also repairing a (non-HP) SCM Cogito 240SR which has a bad vertical CRT drive (it was working but a wire fell off several years ago when moving the unit, and two wires got accidentally swapped). I am pulling germanium transistors off the drive board one by one and testing them.

Re: HP9810: printer and card reader required for function?

*Message #10 Posted by **Achim** on 21 Aug 2004, 5:30 a.m.,*
in response to message #9 by Alastair Roxburgh

Maybe I also can contribute something to the discussion. I repaired three 9810 with the same well known problems. I was in luck, because I could borrow a working 9810 and swap the boards from my dead machines to find out which ones are defective. This reduced the work enormously. To locate defective ICs a logic comparator (HP5011T) is extremely usefull. I bought two of these on ebay. I you see one: BUY IT! Of course not every defect can be found out with that tool. First it only works with TTL ICs with max. 16 pins, second open-collector outputs (as in 7401) make troubles. But by far most of the ICs can be checked,

as long as you have a working sample IC to compare with. From my experience some 74xx types have a high propability to fail, namely 7400, 74(H)01, 74(H)04, 7406, 74(H)08, and 7474. I assume that they are demaged be spurious overvoltage peaks. In one 9810 all 74H01 on the T-Register board (9810-66524) where defective. To check the boards you have to have some kind of bus extender which is plugged into the connector on the main pcb and then connected to the board under test. I have build a bus extender from a piece of pcb with double sided (2*15 and 2*18) contacts , the corresponding amphenol connectors, and a 10 in. long ribbon cable soldered to it. The test takes places with power on, so you carefully have to insulate the lower side of the board under test. If interesting, I can mail photos of the arrangement.

Achim

Re: HP9810: printer and card reader required for function?

*Message #11 Posted by **Tony Duell** on 21 Aug 2004, 2:32 p.m.,*
in response to message #10 by Achim

If you don't have the extender board, you can carefully solder wires onto suitable points on the PCB, then put it back in place and probe the free ends of the wires with the machine on.

Re: HP9810: printer and card reader required for function?

*Message #12 Posted by **Tony Duell** on 21 Aug 2004, 2:30 p.m.,*
in response to message #9 by Alastair Roxburgh

Re your totally dead 9810:

The 'no fan activity' suggests that mains is not getting to the power transformer. These machines have a 120V AC fan which runs off the primary of the power transfomer.

For interest, the transformer has 2 primary windings. One is 120V, the other is 120V, tapped at 100V. The selector switches configure them as follows :

100V : Mains in to 100V section, this winding operates as an autotransformer to provide 120V to the other winding and the fan.

120V : The 2 120V sections in parallel across the mains, fan across the mains.

220V : 100V section of the second winding in series with the first winding (120V). Fan across the 120V winding.

240V : The 2 120V sections in series, fan across the first (untapped) winding.

Now the mains input circuit is really simple and you should have no problems in sorting it out. I have had problems with the power switch on the keyboard assembly going open-circuit in these machines (actually in a 9830, but it's the same switch) so you might want to check that first.

Re: Totally dead HP9810A

in response to message #12 by Tony Duell

Thanks for the power supply tips, Tony.

Re: Totally dead HP9810A

*Message #14 Posted by **Tony Duell** on 23 Aug 2004, 2:47 p.m.,*
in response to message #13 by Alastair Roxburgh

No problem. Actually, the worst part of working on this part of the machine is getting to it.

I'd start by removing the keyboard. 4 screws underneath, then unplug the edge connector under the printer and the mains switch plug.

Then I'd test the switch. Turn the switch on and check for continuity between diagonally opposite pins on the plug (the odd pin in the middle is ground, for the cable shield).

If it's open, you remove the switch as follows : Carefully pull off the connector PCB from the side of the keyboard (this links the encoder to the keyboard matrix), unplug the cable edge connector at the other side, then undo the 4 (?) screws and take off the encoder board. Take out the 6 screws that hold the keyboard to the bezel and take off the bezel. Remove the 6 (larger) screws that hold the front strip in place, take that off too. Then undo the 2 little countersunk screws that hold the switch in place and remove it.

You'll find many of these screws are coated in threadlock. I found it worth running a 4-40 UNC die over the screws and a tap in the holes to clean them out.

You can try taking the switch apart to repair it, but generally plastic parts have broken and it's unrepairable. I've not found a source of identical switches -- if you do, please tell me.

If the switch is fine, you'll have to remove the rear panel from the machine. Take out the PSU boards and the card reader -- actually I find it easier to take out the other boards and the printer too. Take out the 4 screws that hold the rear edge connecotrs for the PSU boards in place -- these are wired to the transformer, the transformer is connected to the rest of the machine via the PSU boards. I can't remember if there are cable clips for the mains switch cable, if there are, remove them (5/16" spanner). Then loosen the 2 top nuts for the rear panel (difficult to get to, you need a 11/32" open-end spanner), and slide the bolts forward in the T slots. Remove the 3 countersunk screws under the rear edge of the machine and pull the back panel off. Feed the switch wiring through the chassis and remove the back panel completely.

On newer machines there's a metal bracket over the mains stuff. It's held down by 2 screws at the top. Take it off.

You can now get to the various bits of the mains side of the PSU. I can't remember the schematic, but it's very simple so you should be able to trace the wires.

*Message #15 Posted by **Alastair Roxburgh** on 23 Aug 2004, 7:31 p.m.,*
in response to message #14 by Tony Duell

Thanks again, Tony. Your suggestions will be very useful. I'll post back here about any successes or if I have any relevant observations. Unfortunately I won't be able to get to it until next weekend, however, as I am currently chained to my engineering desk at work! ;-)

Re: HP9810: News

*Message #16 Posted by **Thomas Falk** on 22 Aug 2004, 2:28 p.m.,*
in response to message #1 by Thomas Falk

Hi,

to all the interested. Before looking into the dead HP9810 I decided to complete my home built logic analyser which I started almost one year ago, but never found time to finish. The logic analyser is working now, the HP9810 is not.

The HP9810 is doing something, but it doesn't tell what. The display enable signal (DEN) is missing. I traced it back to the IO controller, which is in the patent in fig. 162. The RS-FF controling the DEN signal doesn't get switched on. It should switched on, if both EOW and Q3 are high, but they are never at the same time active. Thus no DEN :-(Probably I will have to dive deeper into the CPU.

I found that the CPU is actually doing something, it does one large cycle over about 1.25ms. In this big cycle there are seven shorter ones. The complete cycle looks like this:

1. 7 short identical cycles; each over about 1650 clock cycles
2. 256 clock cycles nothing, most signals seem to be inactive, at least the ones, I have seen (at least the clock is running further on)
3. back to 1.

By clock cycles I mean the main clock (8MHz) of the calculator. The cycles are very good to see at the inputs of the I/O address flip-flops on the clock card (Fig. 140A in the pat.), but also at the other signals, e.g. Q3 and EOW on the IO card. They can be seen on a logic analysator only probably, on my normal oscilloscope I can't see it.

Now my big question: Is the calculator supposed to do this?

In the patent I found that some of the memory cards are optional. Thus they could be removed to reduce the complexitiy of the system. But I couldn't figure out, which cards are optional and which are not. I my calc there seems to be an extension ram, as written on the case. Which of the cards is this?

Thanks for any hints,

Thomas

Re: HP9810: News

*Message #17 Posted by **Achim** on 22 Aug 2004, 4:17 p.m.,*
in response to message #16 by Thomas Falk

The only memory board wich can be removed is the upper most one (extended memory, e.g. board 11217-66526) in the memory cage. The second upper is the standard RW-memory (500 steps, 51 registers, 9810-66525). All other are required for proper function of the calculator.

Achim

Re: HP9810: News

*Message #18 Posted by **Tony Duell** on 23 Aug 2004, 2:38 p.m.,*
in response to message #16 by Thomas Falk

This is from memory, and complicated by the fact that I work from the HPCC diagrams, not the patent. The former were drawn out before I'd come across the patent, so I use different names for many of the sgnals. Anyway....

The display enable flip-flop is set by the logical AND of 2 signals. One, you call EOW and I call IOcmd(13) (because it's the active high version of the I/O command decoder, the '154 on the clock board). The other you call Q3 and I call Q(3). This is bit 3 of the Q register.

Now, Q(3) doesn't tell us much. The Q register (Qualifier == machine instruction) is a shift register in the CPU, and data is being shifted through it during every instruction execution. Therefore I'd expect the various bits to be changing.

However, EOW (IOcmd(13)) is more interesting. It should only go high during an I/O operation. If it is going high sometimes, it means the CPU is executing some I/O operations.

As an aside, HP claimed a separate I/O processor at one point. I think it's fairer to call it a state machine. I/O operations put the main CPU microcode into a tight look, and a latch on the clock card is loaded from some of the bits of the Q register (machine instruction, these bits define what sort of I/O operation is to be performed), then it cycles through a few states. The output of this latch feeds the '154 I mentioned.

As to the clock pulses. There are 2 main clocks in the 9810. The bitclock is the 8MHz master clock and is used to clock bits through shift registers, etc. It's divided down by a counter ('193? '163?) on the clock card to produce the microcode clock. This counter is controlled by 4 bits of the current microinstruction. What this means is you can have between 1 and 16 bitclocks for every microcode clock. This is used, of course, to do the same operation on several bits of the same register (it's bit-serial, remember).

My next test would be to see if it's reading memory (look for a '155 decoder that decodes the R field of the microcode word, I think it's outputs 3 and 6 you want to look at -- this chip is on the -66513 board towards the bottom left corner). If it is reading memory, then see where -- grab the outputs of the M register (these are on the memory box test connector -- I can dig out the pinout). If possible, look at the T register (the other side of the test connector) a few cycles later to see what it's read.

Another idea would be to trigger on the EOW signal (my IOcmd(13) and see what the bottom 5 bits of the Q register are doing (Q(0) .. Q(4)). These are the select signals (1-of-n code) for the various I/O devices. It would be interesting to see what it thinks it's accessing.

Finally, the optional memory board. In the memory box (the metal box at the left side of the machine) are 6 PCBs. From the bottom they are :

Firmware ROM card, Memory control, Memory address (M register is on this card), Memory data (T register is here), Standard RAM, Optional RAM.

You can remove the top card (IIRC red and blue handles). The other boards must be in place.

9810

*Message #1 Posted by **David Ramsey** on 18 Aug 2004, 2:21 a.m.*

There's a seemingly-nice 9810 up on eBay:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4193&item=5715796003&rd=1

Any special caveats on this model? I'm considering a bid, but this is way earlier than any other desk calc I have...

Re: 9810

*Message #2 Posted by **Tony Duel** on 18 Aug 2004, 6:18 a.m.,*
in response to message #1 by David Ramsey

Depends on what you mean by 'caveats'. Be warned that it's not a particularly good calculator without a maths ROM (you don't get trig functions or logs in the standard machine), and that the printer-alpha ROM is useful too.

As regards keeping it going, it's mostly 74xx and 74Hxx TTL inside, with Intel 1103 (1K bit DRAMs), small PROMs and some HP custom ROMs for the firmware. It's more maintainable than, say, an HP35. But it's not a trivial machine to debug. It's bit-serial, which means you won't trace faults without a 'scope or logic analyser.

I guess the final comment has to be that I like my 9810, but then I like boards of TTL chips :-)

Re: 9810

*Message #3 Posted by **David Ramsey** on 18 Aug 2004, 11:59 a.m.,*
in response to message #2 by Tony Duel

The machine on Ebay has the math and printer/alpha ROMs.

I've acquired a few desktop machines over the years-- a 46, a 9815, and a 9825. Mostly they stay in a closet, but the 9810 is very seductive to me. My limited electronics skills-- I can replace defective 5-digits display modules in first generation handhelds, but that's about it-- would mean I'd be unable to repair the 9810 if anything ever went wrong with it.

I'm trying to figure out how much to bid on it. In the past, these older desktops have gone for either very low or very high prices...

Re: 9810

*Message #4 Posted by **Tony Duell** on 18 Aug 2004, 3:11 p.m.,*
in response to message #3 by David Ramsey

I don't want this to appear as a flame (it's not!), but I'd like to say "You're never too old to learn" (and FWIW, I am still learning about calculators, computers and electronics!).

You may not be able to repair a 9810 _now_ but that doesn't mean you'll not ever be able to repair one. I didn't know much about computers when I got my first mini (a Philips P850), and I had to trace a logic fault on the second day of owning it. I was really 'thrown in the deep end' when I got my PDP11/45, but I figured that one out too, and I learnt a lot in the process.

Yes, the 9810 is complicated, and being bit-serial it's not easy to debug, but it's possible, and there are people here who can talk you through it.

Re: 9810

*Message #5 Posted by **David Smith** on 19 Aug 2004, 4:42 p.m.,*
in response to message #4 by Tony Duell

Although Tony is not a big fan of board swapping (some faults can kill a good donor board) if you have a known good machine to work with it REALLY helps in isolating problems in these machines.

Re: 9810

*Message #6 Posted by **David Ramsey** on 20 Aug 2004, 12:51 a.m.,*
in response to message #5 by David Smith

Sure...I'll just use my _other_ 9810 if I have problems. All I have to do is win another auction. After this one...

Re: 9810

*Message #7 Posted by **David Smith** on 20 Aug 2004, 12:22 p.m.,*
in response to message #6 by David Ramsey

Yes, and it would help if one of the auctions is for a good machine. Or at least one that has a good version of your bad board.

Re: 9810

*Message #8 Posted by **Tony Duell** on 20 Aug 2004, 2:27 p.m.,*
in response to message #7 by David Smith

I was given 2 non-working 9810s at the same time, the donor suggested I might try swapping boards around to get one of them working.

Needless to say I didn't waste time doing this (and actually, it wouldn't have helped anyway -- the 'better' machine had a fault on the I/O interface PCB, and that board, along with quite a few others had problems in the other machine). Instead I figured out how to fix them properly, fixed one, then, I will admit, tried the boards from the other machine in it one at a time to see which had serious faults. I then debugged those the old-fashioned way.

98x0 machines are a bit hard to debug becuase they're bit-serial, so everything is changing all the time :-). But given a logic analyser (the HP logicDart is ideal!), it's quite possible to find faults.

HP 95LX/100LX/200LX and alternate I/O

*Message #1 Posted by **Dave Shaffer** on 17 Aug 2004, 1:09 p.m.*

Do any of these units have provision for using an external keyboard or monitor?

Re: HP 95LX/100LX/200LX and alternate I/O

*Message #2 Posted by **Katie** on 17 Aug 2004, 7:12 p.m.,*
in response to message #1 by Dave Shaffer

There's no provision for a standard external keyboard nor monitor on any of these models. However I believe that someone made an external keyboard that interfaced to the HP100/200LX via the serial port and some driver software. I've never heard of any external monitor device for these machines -- it's hard to imagine how that could be done without a major motherboard modification.

Re: HP 95LX/100LX/200LX and alternate I/O

HP 82104A Card Reader for HP 41 - Repairs

*Message #1 Posted by **Dave Allen** on 17 Aug 2004, 12:51 p.m.*

Can someone out there point to a useful article or thread dealing with the repair of HP 41 Card readers. The main problem is the replacement of a perished rubber capstan drives. We have done this as a service to southern African HP users for many years but the success rate of my little workshop is tailing off badly. I realise the 82104As are all getting older and there may be more electronic failure but the rubber material used and diameters of replacement capstan grommets are critical and the specification of the part we were using may have altered etc. Any useful jig designs would help as well because three-handed workman are getting scarcer and fitting parts in position correctly is vital!

Re: HP 82104A Card Reader for HP 41 - Repairs

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2004, 3:35 a.m.,*
in response to message #1 by Dave Allen

Hi;

although it seems you know the nuts and bolts, this article has been more than helpfull. It is kind of a starting point. About references to the pulling O-rings: I found good replacements in old, conventional carburators used in some Brazilian cars. I was given a pack with many O-rings with different sizes, external and internal measures. Many of them work fine.

The article pointed above is avery good reading. Please, give it a try. You'll not regreat.

Success.

Luiz (Brazil)

in response to message #4 by James Summers (UK)

Hi:

I use o rings 2.57x1.78 mm (it is an standar size). Material is 70NBR100. They work just perfect.

I hope it helps

Regards

Jon

Re: HP 82104A Card Reader for HP 41 - Repairs

*Message #6 Posted by **james summers (UK)** on 18 Aug 2004, 6:34 p.m.,*
in response to message #5 by Jon

The O-rings I used are #006 and according to the spec sheet are outside diameter 1/4 inch, inside dia. 1/8 inch and the rubber is 1/16 inch thick - don't know the material as they came in a mixed pack of various sizes from an auto-repair shop.

Fortunately I caught the gummy wheel in time before it had spread goo every where so could use the abbreviated repair procedure.

Cheers

James

Re: HP 82104A Card Reader for HP 41 - Repairs

*Message #7 Posted by **David Smith** on 19 Aug 2004, 4:44 p.m.,*
in response to message #6 by james summers (UK)

If you must use o-rings size 005 (just try and find them) are 15/64" OD. These are the proper size to use. Unlike silicone fuel line 1/4 inch o-rings are too hard to squeeze and put too much pressure on the card/motor drive.

Clonix or NoVram

*Message #1 Posted by **mark murphy** on 17 Aug 2004, 5:02 a.m.*

I'm looking at ordering either a Clonix41 or NoVram from Diego. I'm a recent 'returnee' to the HP41CX scene so need some advice. In view of the fact that the NoVram is, in effect, a superset of the Clonix41 - is it better to go for the that module - even if I don't use the RAM element at first? Secondly, what are the top recommended modules I should ask Diego to install first time (PPC Rom, Hepax etc). I've just started Synthetic again (after a 20 year gap!!) and want to dabble more.I'll also get the pic programmer module so that I'll be able to mod or add later as I get a better understanding. All advise warmly welcomed.

Re: Clonix or NoVram (???)

*Message #2 Posted by **Walter B** on 17 Aug 2004, 12:08 p.m.,*
in response to message #1 by mark murphy

Since I've a similar gap in using HP intensely, may I ask: WHAT IS CLONIX?? Where should I look for information? Thx in advance for an hint or a patient explanation (I hope I'm asking this question for 10 people at least).

*Message #4 Posted by **Raymond Del Tondo** on 18 Aug 2004, 7:12 a.m.,*
in response to message #1 by mark murphy

Hi,

depending on your needs, you can choose between the Clonix
(24K 'ROM') and the NoVRAM (24K 'ROM' + 16K RAM) .

To keep the description short and simple:

The Clonix emulates an EPROM box, which you have to fill
via the burner and it's accompanying PC software.

The NoVRAM has 24K assigned as 'ROM', to be filled like the Clonix,
and 16K RAM, which can be directly filled via an HP-IL device.
For these pages, there's no need to use the burner.

The NoVRAM is preloaded with the HEPAX, which has functions covering all topics,

like saving/restoring data from and to the RAM pages,
machine language programming, utilities, and much more.

Raymond

Re: Clonix or NoVram

*Message #5 Posted by **Wilson (Bill) Holes** on 18 Aug 2004, 6:55 p.m.,*
in response to message #1 by mark murphy

Hi Mark,

I have both and cannot say one would be better than the other. I've found that I prefer to keep a CLONIX on hand that has Turbomax (8k), Sandbox (8k), and PCODER (4k) resident. I also like to keep my one and only NoVRAM with HEPAX-1D resident so as to help me learn its many, many useful functions. I also have a second CLONIX which is fully dedicated to dabbling with other third party images when the mood strikes me.

If I were to choose only one I would surely opt for the NoVRAM as I believe it provides the most flexability. In any event, both the CLONIX and NoVRAM are "SUPER FANTASTIC" products. I'm sure you'll come to agree the minute you begin using whichever one you decide on.

Best Regards, Bill

in response to message #5 by Wilson (Bill) Holes

Hi all,

Sorry for being so late... (too little time, too much job... :-(and thanks, both newcomers and current users of those pretty new toys, for your interest -to the former- and for your kind words -to the later-.

Mark, I've mailed you with some info and relevant links. Please let me know if you find it usefull and/or need any further details.

Walter, your questions are welcomed (and I'd also like you to make it for *at least* 10 people ;-)) fell free to mail me (removing "HATESPAM") to the address above, and I'll try to fill any gap in the somewhat difussed Clonix/NoVRAM available info:

First step has already been pointed out by Mark: take a look at my (ugly) web page.

Next, download the Clonix manual from "The Other Site" (aka "TOS"), a simple search for Clonix will lead you to the relevant pages and this document really explains what a Clonix (and basically NoVRAM) is.

Finally, if you're interested in keeping track of the whole history, (some nice info is also here) make a search on the Forum archives for "Clonix", "NoVRAM" or simply "Diego". You'll find a bunch of helping contributions/questions from other users and even some tech info not available elsewhere.

Again thank you all, and best wishes from the Canaries.

Diego. 123456

HP11C self tests

*Message #1 Posted by **Carlos Genders** on 17 Aug 2004, 4:44 a.m.*

All functions seem to work properly, except from the self test and the keyboard test. How can this happen? Thanks for your help!

Re: HP11C self tests

*Message #2 Posted by **Cyril RABIH** on 17 Aug 2004, 6:03 a.m.,*
in response to message #1 by Carlos Genders

You have 39 keys in the voyager serie. When you make a keyboard test, you must press every key from the top right to the bottom left. Be aware that you must press twice the ENTER key, once when you are in the 3rd row , and another one when you are in the 4th row. Maybe this will help you.

Re: HP11C self tests

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2004, 12:21 a.m.,*
in response to message #1 by Carlos Genders

Hi, Carlos;

can you describe how do you perform the tests and what happens then? I see Cyril describes the [ENTER] needs for pressing twice, but I'd also like to knw about the other tests. Are you having troubles starting them? If so, the best way I think for statarting them is:

```
Turn the calculator off;
press and hold the key for the test you want ([×], [÷]);
while holding down the 'test defining' key, turn the calculator on;
release the 'test definition' key;
```

This sequence may also be used for clearing all memory, where the 'test' key is [-] or with [.], to toggle between dot or comma as radix mark.

Hope this helps as well.

Let us know what you get from here, O.K.?

Cheers'.

Luiz (Brazil)

IQSIM new

*Message #1 Posted by **Klaus** on 16 Aug 2004, 8:43 a.m.*

I finished emulation of the hp55. Photos and hardware description will follow. See new: http://www.informatik.fh-wiesbaden.de/~khind001/iqsim/iqsim.html

Re: IQSIM new

*Message #2 Posted by **mark murphy** on 19 Aug 2004, 9:37 p.m.,*
in response to message #1 by Klaus

My goodness ! Stunning !!!! - so next - thinking let's 'fillet' a 41c and replace all the inards (apart from the LCD and that Perfect keybord) with your pic or two running emulation with USB I/O and boot for the modules/pacs etc. ooops I woke up!! Keep pushing the boundaries you're nearly there.

HP-41 Emulation

*Message #3 Posted by **Klaus** on 20 Aug 2004, 7:47 a.m.,*
in response to message #2 by mark murphy

I woould like to emulate a HP-41, but its rom-firmware is too big to fit in the pic. I might use an external eeprom, but some other people are planning an emulation of the HP-41 too (on other hardware). If we could get a Hardware definition, we coould work together.

Re: HP-41 Emulation

*Message #4 Posted by **mark murphy** on 22 Aug 2004, 5:01 a.m.,*
in response to message #3 by Klaus

Hi Klaus,

Sounds very interesting. I was thinking very directly about using the original HP41 casing (ie from non working cheap sales from eBay). Though I'm sure the next part will sound like heracy - use case, Keybd, lcd, battery - instead of standard i/o modules replace with mini-usb. This gives enough room in the case for more Ram, more Flash Rom, two pics (one for display, keyboard and USB - one for 'mainframe' emulation). Replace the back exp ports with 'blanking plate' with the mini-usb port. Reasons, HP-IL dead, I'd rather connect directly to a usb modern printer and my PC/Mac/Palm/PocketPC/Mobile Phone/ USB Storage key. I've had an HP48 since blowing up my 41 at Uni (yes, one internal Rom too many 20 years ago) and it's too big - using a 41cx again has made me realise how great the form factor was! I'd be interested to see what the OTHER Hw proposals where as I've not seen much except Xpander type projects (keep them I've got a a Palm/Pocket PC already). THe great thing with Diego's Clonix/NoVram is the it uses the original Form factor. As an aside - a quicker project might be to get an additional mini USB module (sitting in a rom pac) working in tandem with Clonix/NoVram - would that work Diego?

Re: HP-41 Emulation

*Message #5 Posted by **David Smith** on 22 Aug 2004, 3:15 p.m.,*
in response to message #4 by mark murphy

There is no such thing as a cheap non-working HP-41 on Ebay. Even units run over by a truck then eaten by a goat bring over $50.

Re: HP-41 Emulation

*Message #6 Posted by **mark murphy** on 22 Aug 2004, 4:56 p.m.,*
in response to message #5 by David Smith

True David - but we can live in hope !! The beauty of the 41 series to me was always the form factor (and of course, the expansion and those perfect button clicks). Retro-geek-restyling is always cool - just look at mini-itx.com to see the wierd stuff on there. I'd love to think that Klaus, Diego, Richard et al could redefine and 'soup-up' the 41 without loosing the form factor - HP41 'Hot Rods'. I'm restarting at Pic and HP41 '101' at the moment but learning fast (and still trying to find time for moving from home in London to Australia !!). Still kicking myself for throwing out my old trashed 41c four years ago. Finally I'd say that even $50 + new 'mainframe' bits ($100-$150???) would make it really worthwhile. Satisfaction of doing my first 'gummy wheel' repair last week was great fun!!

Vassilis - I agree with Wifi/BlueTooth etc - but the key thing today is that USB support on PIC is easier and quicker to impliment with some of the new PIC chips - and it's obvious that many people on the forum have stuning experience with PIC already. Also, Wifi power consumption is horrific, Bluetooth still is an interchange pain - the reason I suggested Mini-USB was that so many devices connect with it already and cheaply today.

Re: HP-41 Emulation

*Message #7 Posted by **David Smith** on 22 Aug 2004, 7:21 p.m.,*
in response to message #6 by mark murphy

The HP41's parts tend to be worth more than the whole! Battery pacs $30+, port covers $5+ each, contact assemblies (I've seen some true idiots pay over $100), case backs $20+, case separators $10+, soft cases $20+, display modules $40+, CPU cards $50+. You name it. A perfectly good fully working machine is only $100-$150 depending upon model.

Thanks for that link! There's some cool stuff there; some of it reminds me of the Graymark kits I used to build in high school electronics shop class over 30 years ago. I still have the Graymark "resistance substitution" and "capacitance substitution" boxes I built somewhere around 1969... I just found the Graymark website and it's good to see that they're still in business and still carry a lot of great kits (including the substitution boxes I mentioned above!).

```

I'd avoid wired interfaces. Why bother with wires and the physical strains they impose on the connectors and case.

I'd go for smth line bluetooth, or WiFi. The chipsets are getting cheaper by the day (e.g. most high-end cell phones have bluetooth, while high-end digital cameras are now including WiFi).

HP 48SX dosen't turn on

*Message #1 Posted by **Umberto** on 16 Aug 2004, 8:34 a.m.*

hy, I hope someone can help me before I destroy my dear university pal: I haven't been using my HP 48Sx for at least 5-6 years and I've stowen it without batteries, now I tried to turn it on again (with new batteries 3 sets) but it's dead..... does anyone know any solution to zthis problem? thanks in advance

Re: HP 48SX dosen't turn on

*Message #2 Posted by **Wayne Brown** on 16 Aug 2004, 11:40 a.m.,*
in response to message #1 by Umberto

Have you tried the "paper-clip reset?" There's a small hole under one of the rubber feet on the back of the calculator. (Actually, on my 48GX there is a hole under *each* of the rubber feet, but the hole under the top right-hand foot has a small **R** next to it. That's the reset hole.) Remove the rubber foot carefully (it's not glued, just pressed in and should pry out easily with a fingernail). With the batteries installed, insert the end of a paperclip into the reset hole until you feel it reach the bottom of the hole, then press gently. If nothing happens, try pressing the **ON** key and try the reset again. It should cause the calculator to reboot.

Re: HP 48SX dosen't turn on

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 16 Aug 2004, 11:43 a.m.,*
in response to message #1 by Umberto

Hi, Umberto;

on the way writing this message, Mr. Wayne Brown was faster... Cheers, Wayne; hope you don't mind keeping my own here... d;^)

there is a reset "shortcut" (a hardware reset) in the HP48SX.

Facing its back side, gently revove the upper-left rubber feet (in the G-series it is the upper-right) and keep it in a safe place. It is easy to remove, just swing it to the left. Try not using sharp metals or the like, your finger nail is more than enough. Now you see a small hole with a small "R" beside it. Unfolded a paper clip and insert one of its tips in the hole till it touches the board inside. Press a little bit for about 5 seconds to make sure the reset is achieved and try again. In most cases, that's all it needs.

Hope you succeed.

Luiz (Brazil)

HP 48SX Reset switch locations

*Message #8 Posted by **James M. Prange** on 16 Aug 2004, 7:06 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

The "R" and reset switch may be on either side on a 48SX. On a serial 3029Axxxx version D, I find them on my left, but on a 3107Axxxxx version E, I find them on my right. Perhaps the PCB design change is tied to this ROM version change?

Since the earliest reported 48S serial starts with 3107, I expect that all of them have it on the right.

It seems to me that I read somewhere of a few that have the "R" one one side, but the actual switch on the other side.

The switch is a very simple one, just a small tab from the thin metal (aluminum alloy?) shield that gets bent done to make contact with a pad on the PCB. Don't expect to feel any click, just perhaps a tiny bit of springy resistance.

Regards,
James

in response to message #10 by db(martinez,california)

sorry guys, thanks for the help I've found the reset switch but still dosen't work, I'm gonna buy the last set of batteries to try for the last time.....

If you are in Deutschland...

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 17 Aug 2004, 4:04 a.m.,*
in response to message #1 by Umberto

As your e-mail reads t-online.de, I guess it is in Deutschland... although you may not be there, of course.

Please, consider finding someone closer to you that is able to repair your HP48SX. There are many clever, skilled people in Europe that would give this baby a try. As you mentioned it's been "stuck" for many years, chances are you also have a bad [ON] key with a bad contact (I don't remember if hardware reset turns the calculator ON automaticaly... d8^(and I'm not willing to test.), so it is a waste of good stuff to get rid of it this way. I have an HP48SX working perfectly fine, except for a small oxidation spot in the display that almost hides the right-shift annunciator. Except for this, it is working fine. I'm not sure I'd replace this LCD for this reason, but if my HP48SX does not respond to keyboard, I'd do whatever needed to bring it back to life.

Well, that's just me, sorry! I just do not like knowing about a genuine HP that is not working.

Hope you succeed.

Cheers.

Luiz (Brazil)

Re: HP 48SX dosen't turn on

*Message #14 Posted by **Cyril RABIH** on 17 Aug 2004, 5:55 a.m.,*
in response to message #13 by UMBERTO

Hi, I had a similar problem a few years ago. There may be a last chance for your 48sx to work correctly. Just put new batteries in the wrong sens (inverse the polarity of the 3 batteries). Leave the batteries a few seconds and press on. Then replace the batteries in the correct position (like you do usually). Then press on, and your sx may function correctly. Keep warning that if you leave the calculator like that too long, it will damage your calculator. So be careful. Hope it will help you.

NEVER PUT IN THE BATTS THE WRONG WAY !!!

*Message #15 Posted by **Raymond Del Tondo** on 17 Aug 2004, 3:52 p.m.,*
in response to message #14 by Cyril RABIH

You're very likely to destroy the zener diode, and then your calc will suck a set of batteries in a few days.

That will be the point where the unit is really trash.

Maybe a search through www.hpcalc.org could help.

Raymond

Re: How to cook an HP without putting it in the microwave

*Message #16 Posted by **Randy Sloyer** on 17 Aug 2004, 8:23 p.m.,*
in response to message #15 by Raymond Del Tondo

Bravo Raymond! Good advise indeed. The zener problem was bad enough that it was later eliminated from the design. **NEVER** put the batteries in backwards in any HP calculator. **NEVER**.

If the goal is to reset memory, remove the batteries and short the terminals with a wire. Yes, there will be those that say it has the possibility of static discharge problems, agreed. BUT - it is a ****MUCH**** smaller risk than damage from reverse polarity.

You should try pressing on the raised part of the bezel above and between the B and C keys while trying to turn it on. It is by far the most common power up problem on an SX. It is due to age and use. The keyboard bows from use and the compression pad on the keyboard connector dries and shrinks with age. Together, they conspire to disconnect the keyboard from the logic board. It can be repaired by shimming or replacing the foam pad.

The second most common cause would be damage from a liquid spill and the third a bad keyboard.

Re: How to cook an HP without putting it in the microwave

*Message #17 Posted by **Cyril RABIH** on 19 Aug 2004, 4:19 a.m.,*
in response to message #16 by Randy Sloyer

Hi, I've read your reaction about the batteries. I personnaly did this a few times and I never had

any problem so I thought it was harmless for the calculator. Thanks Raymond for your quick reaction. Cyril

Re: How to cook an HP without putting it in the microwave

*Message #18 Posted by **Veli-Pekka Nousiainen** on 19 Aug 2004, 1:01 p.m.,*
in response to message #16 by Randy Sloyer

IF someone still insists of putting the batteries in reverse
THEN I suggest putting only two of them in reverse
thus the reverse voltage is only 1,5V (fresh alkaline) or less
END
'VPN'

RE:HP 48SX dosen't turn on

*Message #19 Posted by **Erik** on 19 Aug 2004, 11:17 a.m.,*
in response to message #1 by Umberto

Sorry guys this is too weird. I am having similar problems as UMberto. My SX showed low battery warning this morning, put new batteries in and it does not display. Old batteries back in and no display. Actually in both cases the hour-glass in the upper right comes on and it looks like the backlight or contrast comes on the normal portion of the screen. The new batteries test 1.5v (no load) and the old batteries tested 1.0v(no load) So i think that the low battery was not a lie, but apparently something else has been disturbed. Thanks for your time and suggestions. Erik

Well actually it does now

*Message #20 Posted by **Erik** on 19 Aug 2004, 11:36 a.m.,*
in response to message #19 by Erik

Sorry guys I can't edit my earlier post. I have already forgotten the password or I typed it in wrong to begin with.

IT WORKS! I used a paper clip instead of my Visor reset pin (plastic) and I held the ON button for a really long time (more from desperation than knowledge) and it came to life! WOHOOOO!!

ok where was my earlier failure? not holding the ON button long enough? Or is the reset a "short" instead of a momentary button?

Thanks guys. Erik

shortening hp42s program

*Message #1 Posted by **Tom White** on 15 Aug 2004, 9:53 p.m.*

Circumference, Area or Diameter Program for the hp42s

Was wondering if anyone can come up with a more elegant or shorter program to work out any of the unknowns when one is given. This works fine, I enter the value and use the RS key to view the unknowns.

I'm not that experienced in writing programs and I'm sure someone can probably make it a little shorter or, has a better way to write it to save on memory.

Thanks Tom

Re: shortening hp42s program

*Message #2 Posted by **Richard Garner** on 17 Aug 2004, 12:25 a.m.,*
in response to message #1 by Tom White

Tom,

I looked over your program and saw you are using PI and 4 in several location. I modified your program to put PI and 4 in storage registers 01 and 02. Then when the program called for the either number I did a RCL*01 when I wanted to multiply by PI or RCL/02 when I wanted to divide by 4 and so on. I found this works well when you are using the same numbers in a calculation and only the input numbers change. The one command does 2 functions, it recalls the number that you have stored and does the arithmetic operation all in 1 step. In the case of your program it increased the byte count by 9, but reduced your steps by 5.

```

While the total number of lines is longer (79 versus 55) the actual amount of memory is only a little larger (165 bytes vs 160).

Flag 99 is used to determine if the printer is on or off. Pressing Key 6 will toggle the printer on/off.

If printer is on, then DIA, CIRC and Area is printed. The display will show two lines - Circ and Area. Probally should change display sequence to show the two missing items based on which one is entered. For example, enter Dia, then have display show Circ and area. If Area is entered, then have display show Dia and Circ.

I didn't save any of the input/output. So you would need to add STO as required.

Hope this helps. And keep posting HP-42S programs!!

Bill

Re: shortening hp42s program

*Message #4 Posted by **Tom White** on 17 Aug 2004, 5:58 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

Thanks to Richard and Bill for your input, I will input your program and have a play and see how it works.

If anyone else out there has any custom written 42s programs, post them so we (me)all can see and learn how to program a little better.

Tom

42s Programs...my favorite (long)

*Message #5 Posted by **Richard (in Athens)** on 19 Aug 2004, 10:33 a.m.,*
in response to message #4 by Tom White

Hi Tom (and all),

Well, since you ask, here's one of mine. Sadly (I suppose) this is no longer in everyday use.

My 42s programs are all to do with archaeological surveying, a specialized kind of surveying where true-to-scale drawings are made in the field. Before we "really" computerized, the 42s facilitated many innovations in my work, mostly to do with setting up the station. Nevertheless, a far more simple program (mathematically) was one that I was most pleased with. I called it "ITFOS" which stands of "If Traverse Falls Off Sheet".

Most of my work was done by placing pairs of surveyor's arrows at either end of "user friendly" measuring lines that would be used to draw the details of our site. Having surveyed the arrows, two (x,y) coordinate pairs would define each line on our global grid. These would be plotted manually on drafting film placed over graph paper. If both points were not on the same planning field sheet, it was impossible to know in which direction it went from just one point on one sheet. "ITFOS" solved the problem in a very satisfying way.

Alpha messages bump up the byte count and variables attempt to be totally descriptive so they are longer than would strictly be necessary. An extra feature was added later called "?DIST". This calculates the horizontal distance between the two points (using another program called "PYTH") which served both as a "check" on the ground when the measuring line was set up and on the plotted points on the drawing. If the actual measured distance between the points was not the same as the "calculated" distance, then some error had been made. I found I always used the program even when both ends of a line actually fell on the same sheet. It was easy to find where the line crossed (handy, round) grid-line numbers and little ticks would be made at these points. If the plotted end points and the little ticks didn't all fall exactly on a straight line, then, again, error was detected. (Surveying has "zero-tolerance" for error!)

Three of the "variables" also ask questions. If I wanted to find where the measuring line crossed the x=455 line (455 m East), then I would enter 455 in the "@x=?" menu variable. One "trick" was that I knew I must then also place a zero in the "@y=?" variable which would deactivate it. Similarly the "?DIST" requires a zero if I didn't want a distance to be calculated or a one (or any other number) if I did. If I really did want to find where a line crossed the x or y equals zero lines (which was never) I would have entered an infinitessimal value in one, zero in the other.

Again, this problem is mathematically elemental but it demonstrates how "user friendly" the 42s can be. (All of my programs were used fairly successfully by archaeology students who were frequently not particularly comfortable with numbers!) Note that the variable names use parentheses, spaces, @ and = which help make them "user friendly" but these characters are illegal on the 48 series. Also, that it works best with values less than 1000 and the display set to FIX 02.

I'm sure a few of you 42s "partizans" will enjoy this...and it might even have some more general usefulness than in my odd field.

The program is line-by-line on the reply form right now...and I think it was before. This time I'll preview it.

Nope, it's the same. (2nd try) Now I've put another "enter" between each line.

in response to message #6 by richard (in Athens)

Richard,

To keep formating exactly as you've written, put [pre] at start and [/pre] at end. Works great for program listing. There's other formating codes that can also be used. See following article:

http://www.hpmuseum.org/artfmt.htm

Just be carefull with [pre] and [/pre] - if you enter really long lines without carriage returns, then the reader will have to scroll the message to the right to read them.

Thanks again for posting your program.

Bill

Hi Richard,

Thanks for posting your program. Hope you don't mind - I took the opportunity to reformat it and replaced some of the lines with the usual symbols (|- for append, etc).

I have already learned something from your program - I never knew that names of storage registers could have spaces in them. I just always assumed that wouldn't work. Just tested it and no problem with spaces in names.

When I get time I'll enter your program and play around with it. I'm always on the hunt for HP-42s specific programs.

I've been working on a psychrometric calculator program for single and mixed air streams. Have about half of it writen but have gotten distracted from it with work load. If I ever finish it, I'll post it.

"(in Athens...enjoying the Olympics!)"

Oh man - rub it in :) You must be having a great time.

Bill

42s Program for finding Common Fractions

*Message #9 Posted by **Richard (in Athens)** on 27 Aug 2004, 4:43 a.m.,*
in response to message #8 by Bill (Smithville, NJ)

Many thanks, Bill, for the formatting tip. Because I didn't think I would ever be an "advanced article formatting" kinda guy, I had never checked it out. It all shows what a great site this is!

Going through my 42s hard copy program file, I found another program that could be of interest to anybody and I think is fun. It finds simple (or common or "vulgar") fractional equivalents of decimal fractions. Again, it showcases the menu system and the nature of the solution is perfect for the two-line display. My approach to the problem could doubtless be more sophisticated so it can be a bit slow. Still, I find watching it work is rather satisfying...as long as it comes up with a result before too long!

The decimal fraction is placed in variable DecF and whatever variation from the "exact" equivalent that might be allowed is placed in Var. (I normally divide the DecF value by 5000, a useful "surveyor's" sort of accuracy...but you can have a higher or lower precision.) Then, starting "guessed" numerator and denominator values (normally both 1) are entered in the NUM and DEN variables.

The math is elemental. DecF x DEN = NUM ± Var and if DECF < NUM/DEN, then DEN is incremented by one. If DECF > NUM/DEN, then NUM is incremented by one. The result is expressed as a fraction using the two registers with the "inaccuracy" showing as a decimal part of the numerator. The whole numbers are stored in NUM and DEN.

It is interesting to find what small integers can sometimes express many-placed decimal fractions though it doesn't always work. I just keyed (at random) 0.1245879 with VAR = 0.1245879/5000, and it took the calculator about 95 seconds to come up with 36/289. Anyway, I find it interesting. It has a "real" application for me in trying to find proportional relationships in historic architecture.

42s Rules!

Richard (who played a big part in helping OZ nearly win the Olympic Baseball!)

Re: 42s Program for finding Common Fractions

*Message #10 Posted by **Valentin Albillo** on 27 Aug 2004, 6:53 a.m.,*
in response to message #9 by Richard (in Athens)

Hi, Richard:

Have a look at this. I think you'll find it pretty interesting, easy to implement, and will enjoy trying it up with your 42S.

Best regards from V.

Great 42s moments...

*Message #11 Posted by **Richard (in Athens)** on 27 Aug 2004, 10:43 a.m.,*
in response to message #10 by Valentin Albillo

Hi Valentin,

That's an interesting site. With my little program, I once "discovered" what I learned later was the Fibonacci Sequence. I observed that as I tightened up my "Var" while looking for "golden section" fractions, the numerator of one fraction reappeared as the denominator of the next, and each successive numerator was the sum of the previous two. Great Moments in Mathematics and me! 1/1, 2/1, 3/2, 5/3, 8/5, 13/8, 21/13, 34/21....it was brilliant!

Thanks and best regards,

Richard

Re: shortening hp42s program (long...)

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2004, 8:45 a.m.,*
in response to message #1 by Tom White

Hi;

this is a little suggestion and I'd like to 'say' a few words about it.

I thought about writing an article mostly related to automatic register stack (RPN calculators) and memory usage (regular numbered registers and variables) while programming and directly using the calculator, but I thought this sort of subject is no longer an issue. Maybe I'm wrong.

When designing calculators in the 70's, designers should deal with expensive RAM circuits, lots of HW resources and control/arithmetic SW development. RPN was, at that time, THE designers solution at the same time it created a new way to develop applications. I still take RPN, and also RPL, as great achievements and powerful tools, but I also like them, so I am not a 'neutral' reference. Today a lot of things have changed: RAM cost is no longer an issue and it is easier ($) to develop the best multi-purpose processor and stuff it in with dedicated SW. Powerful, fast and efficient 'gadgets' are available with a low-cost production. Efficient programming with low memory resources is something like 'state of the art' programming, and I 'feel' as if there is no more space for this sort of development, only when locally required. Some industrial, multi-purpose controllers still offer the HW environment, but the use of high-level languages instead of binary, mnemonic-based development simply enhance productivity, allows non-system programmers to develop system-related applications and... lead to bigger codes. Well, RAM enough for any taste!

Back to calculators: extensive stack manipulation while programming may result in efficient, small and fast programs, but as many contributors discussed in this very forum, RPN/RPL may not be the first choice in many circumstances, but writing programs with these "languages" allow us all to face some teasing tasks like shortening a program.

No further ado: my suggestion is listed below. (consider LineFeed as ALPHA [$^{L}_{F}$] single character, please)

```
00 { 127-Byte Prgm }
01•LBL "CAD"
02 SF 21
03 CF 00
04 CF 01
05 CLMENU
06 "DIA"
07 KEY 1 GTO 01
08 "AREA"
09 KEY 2 GTO 02
10 "CIRC"
11 KEY 3 GTO 03
12 MENU
13 STOP
14•LBL 01
15 ENTER
16 STO 00
17 PI
18 ×
19 STO 01
20 ×
21 4
```

```
22 ÷
23 STO 02
24 CLA
25 GTO 04
26•LBL 02
27 STO 01
28 4
29 ×
30 PI
31 ÷
32 SQRT
33 STO 00
34 PI
35 ×
36 STO 02
37 SF 00
38 GTO 00
39•LBL 03
40 ENTER
41 STO 02
42 PI
43 ÷
44 STO 00
45 ×
46 4
47 ÷
48 STO 01
49 SF 01
50•LBL 00
51 "DIA="
52 ARCL 00
53 |-"LineFeed"
54•LBL 04
55 FC? 00
56 |-"AREA="
57 FC?C 00
58 ARCL 01
59 FC? 01
60 |-"LineFeedCIRC="
61 FC?C 01
62 ARCL 02
63 AVIEW
64 END
```

The 'regular' HP42S has 8KBytes RAM, and many 'custom' models have either 32KBytes or 64KBytes, but it is hard to find a way to fill them all with program lines... Also, any Memory Lost would lead to painful 'reload'... Anyway, in any case, memory is not endless, so 'shrinking' programs is not only fun, but RAM saving. Well, as it can be seen, all "variables' where removed and numbered registers are used. If there is a need to keep variables, all lines from LBL 00 must be rewritten. Yes, I know that numbered registers lack a better reference for their contents, while variables may have their names 'declaring' their contents. I still believe programmers must keep track of their programs as a whole, but when code is too long it becomes more and more complicated to do so. In this case, variables help a lot keeping track... for as long as we have available RAM.

Hope it helps illustrating other alternatives. Please, add comments and suggestions as well.

Cheers.

Luiz (Brazil)

Re: shortening hp42s program (long...)

*Message #14 Posted by **Bill (Smithville, NJ)** on 18 Aug 2004, 3:58 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I've been waiting for your post on this. I always enjoy your comments.

I agree that with today's fast equipment and the large ram envirnment, there's really no reason for programmers to worry about efficiencies or program size. But I feel that this leads many a programmer to write very sloppy code ridded with either errors or unusual side effects. They just grab any available algorithm and throw it together.

One great side effect in writing code for small machines with limited resources - I was forced into reviewing various agorithms to determine witch was best for the application and machine. Since there wasn't much ram, I couldn't afford to have inefficiencies in the code.

Like you, I much prefer using numbered register in programs in lieu of alpha type registers. If the HP-42S had a layered directory for variables, I'd probally use Alpha Variables more often.

As usual, your post has caused me to re-look at my programs (: - which is a very good thing.

In the program I'd posed earlier, Key 06 toggled the prinnter on-off. I'd used the following routine:

```
69  LBL 06
70  FC? 99
71  GTO 08
72  CF 99
73  PROFF
74  GTO 00
75  LBL 08
76  SF 99
77  PRON
78  GTO 00
79  .END.
```

I kept thinking there had to be a better way, without the extra GTO and Label. I came up with the following:

```
69  LBL 06
70  PROFF
71  FC? 99
72  PRON
73  CF 99
74  FS? 21
75  SF 99
76  GTO 00
77  .END.
```

A little cleaner, but there still should be a better way of doing this. I could probally change line 71 to FC? C 99 and then delete line 73 (CF 99). Just tested it and clearing flag while testing does work. So I'm a step smaller.

Thanks again Luiz for motivating me to take a re-look.

Bill

But I feel that this leads many a programmer to write very sloppy code ridded with either errors or unusual side effects. They just grab any available algorithm and throw it together.

I see this way as well.

Something to be noticed, back to your HP42S listings: although your program uses some extra steps and only 5 extra bytes RAM, you use no registers at all, only stack registers. So, no extra bytes holding data, meaning the 165 bytes are the amount of memory needed to run it. Even if mine is 127 bytes long, it uses three numbered registers, i.e., 28 extra bytes (not counting the default amount of memory used to hold the REGS matrix itself). And if I decide to use the stack only, my output routines (LBL 00 and LBL 04) must be heavily changed.

> Quote:
>
> If the HP-42S had a layered directory for variables, I'd probably use Alpha Variables more often.

That would indeed save RAM in programs when accessing variables. You see, what most calls my attention when using and/or programming an HP42S is the overall harmony. I like using different HP models for some specific jobs, like the HP15C for fast calculations and some complex-number crunching (I cannot help thinking it is a damn good looking piece of technology...), any RPL for extensive, in-deep research (I wrote a few routines in an HP49G for neural net learning when achieving my EE master degree; my teacher could not believe on what he was seeing), the HP41 with IL for basic RPN development, but the HP42S lacks only the I/O input and built-in units conversion. I like very much writing programs for the HP42S because almost everything you need is there as an easy-to-use, built-in resource: complex mode, matrix operations, SOLVE and INTEG, 'variables' (custom) MENU, ALPHA and graphics display... and some 'hacking' possibilities (mine is 32KBytes RAM). What else do you need?

You see, I always "print" my HP42S listings and output data to an HP48 running **inprt** for later documentation. You should try running a troubled program with TRACE mode ON this way... simply revealing! Although batteries will not rest longer than in normal use, debugging is actually easier. You'll see everything that happened in your program printed from your favorite word processor or directly in an HP48 larger screen. Affordable, at least, and no thermal paper consuming.

I know many guys are trying to bring the HP15C back to production, and I support them in every way I can, but if I'm asked to choose between the HP15C and the HP42S, I'd rather trying to bring back an HP42S. Almost each add-on resource some guys want to be available in the newer 'brought back' HP15C is already available in the HP42S.

A great calculator, indeed. Except for the lack in I/O capabilities, it is the best of many worlds in one single package.

Cheers and thanks again, Bill. Please, forgive me! I cannot help writing too many words when talking about some good stuff...

Luiz (Brazil)

I like very much writing programs for the HP42S because almost everything you need is there as an easy-to-use, built-in resource: complex mode, matrix operations, SOLVE and INTEG, 'variables' (custom) MENU, ALPHA and graphics display... and some 'hacking' possibilities (mine is 32KBytes RAM). What else do you need? _____

Very well put - I couldn't have expressed it any better. 'Harmony' is a great way to say it.

I agree with you that the 42S would be a better calculator to 'bring back' than the 15C. Although I have several 15C's (and five 42S), I alternate between the 11C and the 42S. The 11C gives me all the basic calculating I need for most 'on the fly' tasks and fits my shirt pocket. The 42s is used for more complicated tasks and for programming. The few times I require complex, matrices, solver and integration, I would rather use the 42S with it's easier inputting and displaying than a 15C for these tasks - plus it's faster.

Unfortunatelly, I'm too much of a realist to ever believe that any manufacturer will bring back a 20 year old product. And I'm not sure I would really want them to - the few times I've seen it done, it's usually a disaster.

I'd much rather see the development of good emulators that can run on Windows, Palm, and PocketPC. At least then, I know I'll hae a true emulation of the product I love and not a half-baked re-work by a manufacturer who really doesn't care about it anymore. That's why I fully support Erik's HP-42S campaign.

I like your idea of printing to a HP-48 for debug purposes. Unfortunatelly, I recently sold all the 48's I had. I never could adjust to the RPL way of doing things. I had bought one when they were first introduced, couldn't tolerate the original low contrast display and sold it. When the new higher contrast dispay came out, I picked up another one. Much better - but still couldn't adjust to RPL for programming. It was too much like writing programs for the PC. Part of the joy of creating programs in RPN is the elegance of the programming.

Before getting rid of the 48's, I did use them to dump the HP-42S ROMS, so I'm all ready for the Emulator once it arrives.

Back to RPN programs and creating short programs. I find that reviewing the programs in the earlier HP application guides is a great way to learn creative RPN programming. The HP-25 application book is a great one. It's really amazing how many different, fairly complicated programs, can be done in only 49 steps. The earliy HP application books also give good descriptions of the formulas and algorithms.

Just noticed the time - better get back to work!!

Bill

*Message #18 Posted by **Bill (Smithville, NJ)** on 19 Aug 2004, 4:10 p.m.,*
in response to message #17 by Veli-Pekka Nousiainen

Hi VPN,

Sorry - I think I'll hang onto the 15C's. I worked too long to aquire them. I had never even seen one till last year and then got lucky with several trades and was finally able to aquire them.

I had a 32S-II for a while, but finally sold it earlier this year. I loved the display, but found it too limiting when comapared to the 42S.

connector of old Floppy drive

*Message #1 Posted by **Andre Koppel** on 15 Aug 2004, 5:48 a.m.*

Hi all, two of my old sony floopy disk drives of type OA-D32W-11 are gone (upper head is broken). I think it should be possible to replace them with some kind of newer drives. But the problem is to get a description of the connector pins because they use a connector with 26 Pins. The following models only use 20 pins. The six additional pins are completely mass. If think if the correct wiring could be found, it should be possible to replace the old broken drives with some newer driver. Has anyone some kind of information about the motherboard to floppy connector?

By the one. I have found the information that the MAC Plus uses the same floppy drive. I have purchased such an old MAC Plus at EBay, but it's not the same drive :-(

Re: connector of old Floppy drive

*Message #2 Posted by **Eric Smith** on 15 Aug 2004, 4:15 p.m.,*
in response to message #1 by Andre Koppel

If that's a drive out of a 9114 (or most other HP drives of that vintage, such as 9122), it's a special 600 RPM drive, and the only source of replacements is other HP drives. They're not compatible with PCs, Macintoshes, or much of anything.

Re: connector of old Floppy drive

*Message #3 Posted by **Tony Duell** on 16 Aug 2004, 1:52 p.m.,*
in response to message #1 by Andre Koppel

I think you've mis-interpretted one of my messages. The Mac+ floppy drive is not the same (or compatible) with the drive in any HP disk drive unit to my knowledge. But some of the parts of the drive in the 9114B (and 9153) are believed to be the same as the parts in the Mac+ drive -- the head assembly, stepper motor, motor drive chips, analogue ASIC chip, etc.

Your drive sounds like the one from a 9114A (or 9133, 9122, etc). AFAIK none of the parts of that drive are used in any Mac.

These drives have an interface which is similar to a PC drive interface (and totally different to a Mac drive interface), but they rotate at 600 rpm (PC 3.5" drives rotate at 300 rpm). You therefore can't use a PC drive.

Damage to the upper head is common on these units, alas. The grease on the eject mechanism goes hard/sticky, and the disk holder doesn't latch up properly. The head then catches on the disk when you try to eject it. The only cure is to replace the head carriage and strip, clean and re-lubricate the eject mechanism. Even if you replace the entire drive, I would advise doing the latter unless _you know it's been done recently_. Otherwise you might wreck the new drive's head too.

Incidentally, I've swapped head assemblies on these drives, and found the alignment to be pretty close (checked with a catseye disk). You may not need to do the alignment.

HP33s another bug?

*Message #1 Posted by **JuanMi** on 14 Aug 2004, 11:18 a.m.*

Hi!,

Please, try to calculate on your HP33s: 3º30' - 2º58' on my HP33s the response is: 31'60" !!!!!!!!

Instead of 32" (that is: 0.32) you get an incredible 31 minutes and 60 seconds!!!!!!!!.

Here is how I proceed (in case I'm doing something wrong):

I type:

3.3 <- HR >3.5000 --- This is ok

2.58 <- HR >2.9667 --- This also OK

- (subtract key)

>0,5333 --- Also OK

and then:

->HMS >0.3160 !!!!!!!!!!

Of course, Im working on Degrees...

Does this also happens to you?.

Greetings from Spain!

JuanMi

Re: HP33s another bug?

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Aug 2004, 11:36 a.m.,*
in response to message #1 by JuanMi

While this is very frustrating and even irritating; it should be noted that the answer given by the 33S is really 0.31599999999 which, even in FIX 11 display mode shows as 0.31600000000 . Using SCI 11 doesn't help in this case. You can check this by multiplying the answer by, say, 1E10.

As the calculator isn't aware that we intend this number to "be degrees", it merely uses the same rounding format as for any other number.

Hence, I think that the display value of 0.3160 is not a bug on itself... but... Why are the internal guard digits (in the H.MS and HR conversions) not helping to give a better answer? Or are the guard digits a cause of this behavior?

I don't have my other HPs at hand, so to check the same case in HP41C, HP42S, etc.

Re: HP33s another bug?

*Message #3 Posted by **JuanMi** on 14 Aug 2004, 11:48 a.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Hola Andrés,

Voy a pasar a inglés por si "las moscas" :).

Thank you for your quick answer and explanation, altough, I still think that displaying 31'60" instead of 32" is a bug or malfunction or whatever, just because such "number" can't exist.

I know what you mean, but this so called "bug" creates the need to be aware on every complex number calculation in order to understand what "the calculator" means. So, when Hp33s says 0º31'60" it really means 0º32'00"... as you can imagine... that's horrible...

Even the cheapest casio does it well... :(

What new surprises will be coming from HP33s?... :)

Un abrazo,

JuanMi

This type of problem has been around for years. Some of our favorite HP's have problems at times displaying HMS values.

I don't think THIS particular issue is a problem to get too worked up about.

Some of the other issues that have been reported are more serious.

Hope HP is paying attention to those.

John

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Aug 2004, 3:54 p.m.,*
in response to message #3 by JuanMi

JuanMi: Hola!!

To avoid such "0.3160" angles, just use decimal degrees all the time; use =>HR to convert input values that appear in H.M'S" format, and do it *before* working with them. Then use =>H.MS just to convert the final result, if you please. Or, harder but better, always use radians!

True: even the cheapest ***** do it better ... and so does the cheap, algebraic HP30S. They have an explicit D.M'S" mode; but RPN HPs don´t have such mode... and the 33S pretends to belong to this last group.

Re: HP33s another bug?

*Message #6 Posted by **John Limpert** on 14 Aug 2004, 6:06 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

I get the same result (0.3160) on my HP-38G when the display is set to Fixed 4. Setting the display to Standard results in .315999999999.

Of HMS conversions, Casio vs. HP

*Message #7 Posted by **Karl Schneider** on 14 Aug 2004, 6:55 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

This thread is going in various directions, but some people are on the right track.

Yes, Casios -- even my 1981 fx-3600P -- got those HMS <-> HR conversions right. It's one of the things Casio has been doing better than HP for years (others being: fraction arithmetic, ENG display mode and statistical functions).

The reason for the imperfect "0.3160" is that the calculated decimal difference of 0.533333... rounded to internal accuracy is still just slightly less than 16/30 = 32/60. 0.3159999999... is calculated and up-rounded to 0.3160... for display, but the 60 seconds is not coverted to 1 full minute. This might be by HP's choice, so as not to alter the calculation results.

I obtained your result on the 33S and every HP I've tried so far, when the two HR<->HMS conversion functions are used for this problem. (This includes the "->HMS" and "HMS->" functions on the RPL calc's (28/48/49).

However, on the 42S and the RPL calcs, the "HMS-" function can be applied to obtain the proper answer. Unfortunately, 3.3 ENTER 2.58 "HMS-" on the HP41C/V/X yields the imperfect answer of 0.3160.

Try "3.3 HR 2.56 HR - HMS". You'll get 0.3400 (34 minutes), because the value calculated by the subtraction > 17/30.

Re: Of HMS conversions, Casio vs. HP

*Message #8 Posted by **JuanMi** on 14 Aug 2004, 9:27 p.m.,*
in response to message #7 by Karl Schneider

Hallo Karl,

Vielen Dank für deine Antwort. The explanation you exposed, seems very clear to me. I also own some old HP's and I encourage you to do the same calculation on a HP20S. For 3º30' - 2º58' the result you will get is: 3.16E-1 !!!!!

It is really frustrating...

I'm actually studying for a nautical title and I have to work a lot with such complex numbers operations. As you can realize, my confidence on HP calculators (just for this purpose) has decayed a lot... :(

My HP49g+ performs well these calculations but this model is not allowed on exams :).

So, thank you again for your kind explanation.

MfG,

JuanMi

Re: Of HMS conversions, Casio vs. HP

*Message #9 Posted by **Karl Schneider** on 15 Aug 2004, 3:29 a.m.,*
in response to message #8 by JuanMi

Juan --

Thanks for the complent (and expression in German!)

I do also have a 20S, which was one of the units I tried when posting the answer. Your 20S was apparently in SCI display mode, which is why 3.16E-1 (= 3.16 x 10^1) was displayed instead of 0.3160.

Remember, 0.3160 (= "31 minutes and 60 seconds") is not wrong; it's just not formatted in the best manner.

A recent thread in this Forum (to which I also posted some analysis) has revealed that the HP-33S sometimes returns numerically incorrect results for ->HMS conversions. This is not a problem with the HP-designed calc's, including the HP-32SII upon which the 33S was based.

*Message #10 Posted by **bill platt** on 15 Aug 2004, 10:47 p.m.,*
in response to message #8 by JuanMi

Hi JuanMi,

I used an 11c for many years--starting when they first came out. I thought the H.ms representation was very clever--as it made possible a robust form of input-output, and programming. And at the time, 1982, there really weren't any "fancy" forms of representation available on calculators (except the 41c).

I am a sailor, and used my calculator for navigational purposes--and although the 60 minutes (or sometimes 60 seconds) representation may be disconcerting the first time you see it, it really is not bad when you realize why it is happening--it allows you to be aware of the slight computationsal bias which occurs in numerical approximations. It is in fact a robust system.

But I will also note that from a nautical standpoint, the H.ms / H conversion is really not correct or useful anyway--as in my experience, Degrees, Minutes.decimal minutes are much more common---universal even.

But, this is where the keystroke programming shines--and even the built-in function h.ms using the decimal as a divider. It is very easy to write a robust program to handle degrees minutes.decimal minutes--either using the built-in as an intermediate in your program or not.

Best regards,

Bill

*Message #12 Posted by **bill platt** on 16 Aug 2004, 2:24 a.m.,*
in response to message #11 by Veli-Pekka Nousiainen

The easiest program utilizes both x and y registers of the stack, as follows.

```
Take input (from a chart) as D.mdecmin, e.g. 72
degrees 13.6 minutes west,
40 degrees 7.2 minutes north

{input is to y-register in stack for degrees,
followed by ENTER, followed by
minutes.decimal minutes

GSB A will process this input to decimal degrees

LBL A
60
/
+
RTN

And converting from decimal Degrees back to Degrees and
Decimal minutes is a trival reversing.

To preserve more of stack contents, and use only one layer,
take input as Degrees.MMdecmin.....

LBL 7
sto 1
FP
100
X
60
/
RCL 1
IP
+
RTN  {output is decimal degrees}

And the Other Way around:

LBL 4
STO 2
FP
60
X
100
/
RCL 2
IP
+
```

```
RTN {output Degrees.MMdecimalminutes}
```

Re: Of HMS conversions, Casio vs. HP

*Message #13 Posted by **JuanMi** on 16 Aug 2004, 7:34 a.m.,*
in response to message #10 by bill platt

Hi Bill!

Thank you very much for your comments. As you stated, 31'60" it is not a faulty precision of the calculator. It is just a "cosmetic" problem.

Also, as you told, the most common lat/lon coordinates format is the decimal of minutes. You can try to type a let's say, 42º 16.3' (or whatever) on a late model casio, and it will return the correct HMS value (in this case 42º16'18", but of course, it can not "translate" to the original format. The standar HP format (DD.MMSS doesn't permit it... :( ).

But in my case, doing dead-reckoning calculations, that "semi decimal" format is not so relevant, as we reduce most of results to minutes (for instance, delta-latitudes mean-latitudes, etc). Then, (again) with a casio, you can directly add, let's say 0º132'0" to a coordinate, and the calculator will correctly convert it to 2º12' and add it, offering the result directly on a HMS format.

I am not a casio fan!!! (I own and USE a HP97, 41CV, 20S, 48GX, 49G+, 10B, 17BII, 18C among other old TI's) but in my honest opinion, their way of handling HMS numbers, is by far much easier than my loved HP's.

Many thanks again for your comments, and have a good sailing!!!

Juan Miguel

Re: Of HMS conversions, Casio vs. HP

*Message #14 Posted by **rsenzer** on 15 Aug 2004, 11:22 p.m.,*
in response to message #7 by Karl Schneider

I don't know the underlying logic of the CASIO and related algebraic calculators, but I wonder if they are actually recognizing the D.MS representation as a distinct data type or object.

There is another degree related operation that is also handled better on these calculators vs. the classic HPs. On one of these calculators, you can use a "degree marker" for angles independently of the current angular mode.

On the CASIO type scientific calculators, this is available through the "DRG>" key. This does not actually change the mode, but does add a suffix marker corresponding to your selection, that is "raised o" for degrees, "raised r" for radians, or "raised g" for grads. On the HP-30S and TI-30XII, this can be accessed by the "DMS" or related key. The effect, in either case, is like attaching the "degree unit" following the number on the 48 series. This capability is also available on the TI graphing calculators as well, although it is not a unit per se.

Such markers are convenient because there is no need to be concerned about the current angle setting if the marker is employed.

[I carry a Tozai ATC-763 (from Walgreens) in my pocket. It is roughly equivalent to a Casio 300, but without an algebraic history stack. It uses the same binary representation/accuracy as the HP 30S, but is easily small enough to carry in a pocket. Still use HPs, but they don't fit as easily into my pocket.]

HP calculators don't handle 'true' HMS representation

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 15 Aug 2004, 2:37 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Hi Andrés, Juan, all;

Andrés, you touched a very sensitive point: HMS true representation.

I remember seeing many other calculators with [º'"] key, not available in most HP calculators, that would allow HMS to be entered "as is". Almost all HP calculators (if not all "true" HP-designed calculators) and almost all TI till the 90's take a decimal number in the display and return a decimal number to the display, they never take an HMS representation and return another HMS representation. So, Juan Miguel, .316000... is .316000... and it is correct, but the calculator does not "see" .316000... as if it is 0º31'60", what is actually 'wrong' (not much wrong, maybe). And again Andrés shows the "backstage" of the actual number: .3159999... This number correctly rounds to .316000..., because the calculator does not recognize an HMS representation. This would never happen with an HP30S or an HP9G, because these newer "HP" calculators can handle these figures the way Casio and others do.

A related situation can be found with the HP12C and some others (HP41CX, HP48/49 series) when dealing with dates and date representation. When you key in 4.022004 in any calculator, this is only 4.022004. But if you want any of the calculators above to handle this number as a date, check if the calculator is set to D.MY or M.DY (all of them do that) prior to use 4.022004, because the calculator can take it as February, 4th. 2004 or April, 2nd. 2004. But, hey! This is just a number! What if I key in 25.132004? If I plan to use it as a date representation, it is already wrong in any date mode (no such 13th. month), but if I key it in, the calculator cannot complain untill I tell it what to do with the number.

I know we are talking about resulting values, and this is different of keying in values. But if we see somethnig that seems to be wrong as a resulting value, let's see if the calculator sees it as a wrong input data. Try this in any HP calculator:

```
12.65 ->HR (in some models, it is HMS->
```

Well, what is wrong? I'm telling the calculator to return the decimal equivalent of 12º65' !!!! And it does not complain, you see? 12.65 is a valid number, and it promptly gives you a correct answer - 13.08333 - because sixty five minutes is something that actually exists. Now try to bring back the original value:

```
->HMS
```

Yeap! There it is! 12º65' atually is 13º05'. I am completely aware and conscious about internal rounding and precision, but when dealing with HMS and decimal representation, I have my own additional concerns.

Any comments?

My 1¢.

Luiz (Brazil)

Re: HP33s another bug?

*Message #18 Posted by **Ben Salinas** on 14 Aug 2004, 1:42 p.m.,*
in response to message #1 by JuanMi

Andres Rodriguez seems to be completely correct.

I tried it out on my 33s. I got the same answer as you did, but if you press show it displays: 315999999999. In other words, it is a display issue, not so much as a math issue.

I tried it out on the 32sii. The exact same result yielded, with the same show value.

I was curious, so I tried it out on a 15c. The 15c read: 3.159999 -01 (it is running in sci 9). So, the difference between the 15c and the 32sii/33s is that the 15c did not round for the display (perhaps it has something to do with the precision)

On the 33s, I took the answer, pressed ->HMS, ->HR, ->HR, ->HMS and it yielded .32

I guess the problem is that the 33s is too acurate for its display (if that can even be considered a problem)

Re: HP33s another bug?

*Message #20 Posted by **Mark A. Ordal** on 14 Aug 2004, 3:12 p.m.,*
in response to message #1 by JuanMi

It works properly on my HP33S---that is, I get 32 seconds if I take 3 minutes 30 seconds and subtract from it 2 minutes and 58 seconds.

I think the main issue here is that for HMS format, the HP expects hours to come BEFORE the radix point! The two digits immediately following the radix point are minutes, and the next two are seconds.

When you use HMS format and interpret it as angles, the interpretation is similar to what I just mentioned for

time---that is, degrees come before the radix, and after the radix, you have 2 digits for minutes of arc, followed by 2 digits for seconds of arc.

I hope this helps.

in response to message #1 by JuanMi

Hi JuanMi,

The bug reported at the top of the linked thread below is much more important to be aware of!

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=61505

regards,

Bill

Re: HP33s another bug?

*Message #23 Posted by **Eddie Shore** on 17 Aug 2004, 8:56 a.m.,*
in response to message #1 by JuanMi

Interesting. I repeated your operation on the HP48G and 49G+ and ended up with .315999999998 on both cases. Might be the internal rounding procedures. On my 33S, I get the same result you got.

Re: HP33s another bug?

*Message #24 Posted by **JuanMi** on 20 Aug 2004, 2:47 a.m.,*
in response to message #23 by Eddie Shore

Hello Eddi,

I don't think this is an internal rounding problem, but maybe just the subroutine which convert and shows the data in a sexagesimal format...

Above you have many "gurus" valid opinions...

But in my HP49G+ the result was Ok!.

Best regards,

JuanMi

32sii display

*Message #1 Posted by **Andy** on 13 Aug 2004, 4:57 p.m.*

Hello all.

I have a 32sii that I got weld splatter on the display and burned a little dot right were the 1st decimal shows. Well it anoyed me so I tried to buff it out and wound up trashin g the display! grrr.

Is there anyway to get a new display for my calculator? Maybe a dead 32sii for a display transplant?

Re: 32sii display

*Message #2 Posted by **bill platt** on 13 Aug 2004, 5:28 p.m.,*
in response to message #1 by Andy

Yes, it is possible.

You can also go to fixthatcalc.com---they come highly recommended.

regards,

Bill

HP-85 emulator

*Message #1 Posted by **John** on 13 Aug 2004, 2:55 p.m.*

I see someone has one for sale:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3693874540&rd=1

I'll have to make contact with the seller!

Regards, John

Simulator, not emulator...

*Message #2 Posted by **Juergen (CH)** on 13 Aug 2004, 3:09 p.m.,*
in response to message #1 by John

The program only simulates the HP-85 and supports the most essential (?) BASIC commands. Anyway, if you can find out more detailed specifications, let us know.

There was a guy (sorry, do not remember his name) who started to write a real HP-85 emulator. Any progress?

Regards, Juergen

Re: Simulator, not emulator...

*Message #3 Posted by **Andre Koppel** on 13 Aug 2004, 6:47 p.m.,*
in response to message #2 by Juergen (CH)

Oliver De Smet is currently working on a series 80 emulator with good progress. You may download the actual release from my web-side at: http://www2.akso.de/files/series_80/Emulator. Regards Andre

Re: Simulator, not emulator...

*Message #4 Posted by **Namir** on 13 Aug 2004, 9:47 p.m.,*
in response to message #3 by Andre Koppel

Andre,

Thanks for the link! I downloaded the simulator and it really works great. I used to own an HP-85 and then an HP-87. So the simulator brings a lot of good memories. I like the fact that you can simulate the Matrix ROM.

I did buy the german HP-85B simulator today. I am curious to see that one work too.

It's nice having simulators for these machines without having the machines themselves (due to space limitations here).

Namir

HP49G+ I/R-Problems

*Message #1 Posted by **Andre Koppel** on 13 Aug 2004, 12:25 p.m.*

I am a long time user of a HP48GX. Today I have received a brand new HP49G+. Playing around with the beast I was absolutely unable to transfer anything via I/R. I have defined the flags to use I/R transfer. No way to transfer data to/from the HP49G+ to the HP48GX. The same problem while trying to print from the HP49G+ to a HP 82240B (I/R-Printer). The HP49 shows the printing symbo, but nothing happens on the printer (it works well with the HP48). Any ideas?

Re: HP49G+ I/R-Problems

*Message #2 Posted by **James M. Prange** on 13 Aug 2004, 3:09 p.m.,*
in response to message #1 by Andre Koppel

The 49g+'s IrDA doesn't work with the "old" 48 series "Serial IR". To transfer between them, you'll have to use your computer as a go-between.

You should be able to print to the 82240B as long as flag -34 is clear (Print via IR), but the range has been drastically reduced. About the best I've been able to get from my 49g+ is 3 inches. Try it really close to the printer's IR window.

Regards,
James

Re: HP49G+ I/R-Problems

*Message #3 Posted by **Andre Koppel** on 13 Aug 2004, 6:48 p.m.,*
in response to message #2 by James M. Prange

That's it, thank you :-)

Re: HP49G+ I/R-Problems

*Message #4 Posted by **mouezapeter** on 31 Aug 2004, 9:35 a.m.,*
in response to message #1 by Andre Koppel

The wavelength of IR has changed on HP49G+ , so no more communication available

Re: HP49G+ I/R-Problems

*Message #5 Posted by **Tim Wessman** on 1 Sept 2004, 10:52 a.m.,*
in response to message #4 by mouezapeter

It is IrDA. So it won't connect with older hp calculators. It will however, connect with any IrDA enabled device such as a cell phone. The sending range is only effective up to 3-4 cm away though.

HP45 keyboard repair

*Message #1 Posted by **Paul Marin** on 12 Aug 2004, 11:29 p.m.*

Randy, You replied to an ad that I posted, regarding the repair to a HP 45 that I have that has the strips on the keyboard cracked. You suggested soldering the strips. But what kind of soldering do I do or use, as I have never done this before Thanking in advance again Paul

Re: HP45 keyboard repair

*Message #2 Posted by **Ronald** on 13 Aug 2004, 6:02 p.m.,*
in response to message #1 by Paul Marin

Normal Solder, used for electronic component soldering will do. Make sure the surface is clean (degrease and carefully with very fine abbrasive paper).

Succes.

Re: Classic keyboard repair

*Message #3 Posted by **Randy Sloyer** on 14 Aug 2004, 7:29 p.m.,*
in response to message #1 by Paul Marin

Paul,

As I mentioned, any classic has the parts you need to repair a bad key strip.

I've found that using a small twist drill (1.5mm) in a hand vise works well for drilling through the spot welds. Once all the welds have been opened, the entire strip will fall off, hopefully undamaged and straight. Remove the defective strip for practice, then the replacement. When choosing the replacement, remember the lower four strips are different than the upper strips.

Position the replacement carefully and use the small holes you drilled to solder it in place. Any 60/40 rosin core electronic solder will work. Clean well afterwards as flux may have migrated to the contact areas. Work from the middle to the outside to prevent warping due to expansion during soldering.

You can replace a single key if you cut it out of the strip with a sharp knife but it might be easier to start with a complete strip. Your choice. I replace singles rather than entire strips.

Good luck and post again should you have any questions.

Hewlett-Pacard 9825

*Message #1 Posted by **Robert** on 12 Aug 2004, 1:21 p.m.*

Today I bought a Hewlett-Packard 9825A from 1976, in a second hand shoop for $3. With all manuals.They did´t know what it was. So I am happy. Robert from Sweden

9825

*Message #2 Posted by **David Ramsey** on 12 Aug 2004, 6:51 p.m.,*
in response to message #1 by Robert

Damn. That's even better than my $30 tape drive with three tapes!

Have fun! The tape drive often needs work on the old 9825s, but it's not hard to do.

Re: 9825

*Message #3 Posted by **marais** on 13 Aug 2004, 5:01 p.m.,*
in response to message #2 by David Ramsey

I just paid 325 for my 9125, and the tape drive needs to be redone. Any hint appreciated!

Andreas

Re: 9825

*Message #4 Posted by **David Ramsey** on 15 Aug 2004, 1:09 a.m.,*
in response to message #3 by marais

Well, I've never actually heard of a "9125", but the problems tape drives on the desktop HP calcs have are pretty much the same as the problems the handhelds have: dirty heads and disintegrating rubber on the drive wheels.

The larger size of the desktop machines makes them easier to work on.

I replaced the rubber on the drive wheel of my 9825 with heat-shrink tubing. It's true! Slide large tube over the cleaned drive wheel, heat shrink, trim with razor blade.

Cleaning the tape head can be done with Q-tips and alcohol.

Re: 9825

*Message #5 Posted by **Vassilis Prevelakis** on 15 Aug 2004, 5:30 p.m.,*
in response to message #4 by David Ramsey

I generally avoid heat shrink tubing because unless you glue the tubing to the metal base, it will eventually come off.

After doing any repair to the spindle I usually use a sacrificial tape to wind to EOT and then rewind to BOT a couple of times to make sure that the repair can take the heat loads and strain.

Check also the "fix your gummy wheel" section at the end of a previous posting:

HP 49GX floating comma

*Message #1 Posted by **Hans Schmellenkamp** on 12 Aug 2004, 11:25 a.m.*

How do I get the comma to float across the screen when inputting numbers? Like I can with the HP41.

Re: HP 49GX floating comma

*Message #2 Posted by **Richard Garner** on 12 Aug 2004, 12:41 p.m.,*
in response to message #1 by Hans Schmellenkamp

If the 49GX is like the 48GX it doesn't have a floating comma. If you set the display mode to FIX 4, when you enter numbers large enough to have commas, it will show the commas after you press ENTER. I liked that feature of the 41C as well. You could tell right away if you made an entry error.

What is HP-49GX? [NT]

*Message #3 Posted by **?!?** on 13 Aug 2004, 4:12 a.m.,*
in response to message #1 by Hans Schmellenkamp

?!?

Re: What is HP-49GX? [NT]

*Message #4 Posted by **Tim Wessman** on 13 Aug 2004, 4:49 a.m.,*
in response to message #3 by ?!?

A 49GX is the 49g+ with a fixed keyboard. . . =) unfortunately it doesn't exist yet.

Or maybe they just mispelled it. . . ;-)

Re: What is HP-49GX? [NT]

*Message #5 Posted by **Hans Schmellenkamp** on 13 Aug 2004, 9:29 a.m.,*
in response to message #4 by Tim Wessman

Yes that was my misstake. I have a 48GX.

APPLY command

*Message #1 Posted by **Matteo Miglioranzi** on 11 Aug 2004, 7:34 a.m.*

Hello. I have a problem with this simple user prog. (hp49g, rom 1.19.6):

<< 1 4 FOR I I 1 ->LIST F APPLY NEXT >>

It doesn't work but if you debug it, you get the right answer (obviously the debug can't be the solution). Is it necessary to use WHILE or REPEAT routines or this program can work also with FOR..NEXT (maybe with some tricks)?

Thank you

Re: APPLY command

*Message #2 Posted by **James M. Prange** on 13 Aug 2004, 4:21 a.m.,*
in response to message #1 by Matteo Miglioranzi

> Quote:
>
> Hello. I have a problem with this simple user prog. (hp49g, rom 1.19.6):
>
> ```
> <<
>   1 4
>   FOR I
>     I 1 ->LIST
>     F APPLY
>   NEXT
> >>
> ```

Note that I edited that quote to apply preformatted code.

Maybe you want:

```
%%HP: T(3);
\<<
  1 4
  FOR I
    I 1 \->LIST
    'F' APPLY
  NEXT
\>>
```

Note the ' marks quoting the F.

But I'm really not sure what you want to accomplish. What are the expected results?

> Quote:
>
> It doesn't work but if you debug it, you get the right answer (obviously the debug can't be the solution).

Are you using the 49G's built-in debugger, or do you mean "debugging" it mentally? What do you mean by "doesn't work"? Does it error out, or does it return unexpected results?

> Quote:
>
> Is it necessary to use WHILE or REPEAT routines or this program can work also with FOR..NEXT (maybe with some tricks)?

FOR...NEXT seems to me the most obvious method, although I suppose that I could come up with a program using WHILE...REPEAT...END if I cared to put some effort into it.

Regards,
James

Re: APPLY command

*Message #3 Posted by **Matteo Miglioranzi** on 13 Aug 2004, 12:22 p.m.,*
in response to message #2 by James M. Prange

Hello.

F is a variable in which nothing is stored (VAR menu doesn't contain F variable) but even if you put 'F' instead of F, you obtain the same error message: NEXT error, bad argument type. The answer should be:

4: F(1) 3: F(2) 2: F(3) 1: F(4)

With DEBUG capabilities of hp49 you can see the above exact answer without any error.

Thank you.

Matteo Miglioranzi

Re: APPLY command

*Message #4 Posted by **juergen Rodenkirchen (GER)** on 13 Aug 2004, 5:13 p.m.,*
in response to message #3 by Matteo Miglioranzi

Hi Matteo!

I tried your program with the 48GX and it returned the predicted result 1: 'F(4)' 2: 'F(3)' 3: 'F(2)' 4: 'F(1)'! Unlike my 49G (with Rom version 1.19-6) which comes up with the error you reported; so, it seems to me that you've uncovered a bug in the FOR NEXT routine of the 49G ROM ...

Regards, Juergen

HP49G+ Bug?

*Message #1 Posted by **Eddie Shore** on 11 Aug 2004, 12:27 a.m.*

When I enter

number sigma i^-x i=start pt

EVAL, I get "?" as a result.

However, if I input

number sigma 1/i^x i=start pt

EVAL, I get a result.

Is there a flag I need to clear/set to get a result out of the first expression, or is part of HP49 syntax?

Thanks.

Re: HP49G+ Bug?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 Aug 2004, 2:40 a.m.,*
in response to message #1 by Eddie Shore

Hi, Eddie;

You are using it in Algebraic mode, right? Have you tried:

```
number sigma i^(-x) i=start pt
```

instead?

Just something that occured to me: isn't ^ trying to identify '-' alone as a parameter?

Hope this helps.

Luiz (Brazil)

FE helpful tips

*Message #1 Posted by **f15e** on 10 Aug 2004, 5:13 p.m.*

Anyone who has taken the FE recently, could you tell me any important things that may be useful, such as some key formulas, etc. I know there are tons of formulas, but anything that you think was really important to know for the test and wouldn't mind telling me, would be greatly appreciated.

Re: FE helpful tips

*Message #2 Posted by **Norris** on 10 Aug 2004, 6:52 p.m.,*
in response to message #1 by f15e

FE exam suggestions:

(1) Buy or download the latest edition of the NCEES FE Reference Handbook. It shows you the material that will be covered on the exam; it is also the only reference allowed in the exam. Your state board may send you a used copy when you register for the exam, but it may or may not be the latest edition.

(2) Buy the "FE Review Manual: Rapid Preparation for the General Fundamentals of Engineering Exam", which costs $58 from www.ppi2pass.com (they will refund the price if you fail). This review manual walks you through the material in the NCEES Reference Handbook, and provides sample problems. If you can solve most or all of the sample problems, you will pass the exam.

(3) Get some basic undergraduate-level textbooks on physics, chemistry, and math (if you don't already have them) for further info on exam topics as needed. Old used textbooks are fine, as the exam covers fundamentals, not the latest theories.

(4) Only study general topics. Then you will be prepared for the general exam in the morning, and you can also take the general exam module in the afternoon. Ignore the discipline-specific material in the back of the NCEES Handbook.

(5) If you run into any particularly complicated equations while studying, program them into your HP-33S. But most of the formulas on the exam are relatively simple, and so there is no real advantage to programming them.

Useful programs might include time-value of money, determinants of 2x2 and 3x3 matrices, and a simple linear interpolation routine. You might also want to store commonly-used physical constants (9.81 m/s^2, 62.4 lb/ft^3, etc.) or conversion factors.

Re: FE helpful tips

*Message #3 Posted by **Karl Schneider** on 10 Aug 2004, 10:52 p.m.,*
in response to message #1 by f15e

"f15e" --

Norris has provided what looks to be a good set of tips for preparation, at considerable time and effort on his

part -- much as others have done regarding all your questions about operation of the 33S.

However, Norris might have omitted the most important one --

Take collegiate courses in <u>all</u> of the subject material covered by the exam!

I am an EE who passed the FE/EIT exam on the first try 10 years ago. I believe that I did well on every section of the exam except the one for which I had never taken a course -- fluid dynamics. I had "crammed" from my study guide on that topic beforehand, but managed to get only a few problems right on that part of the test.

There is no substitute or shortcut for the learning that comes from formal instruction.

-- KS

Edited: 10 Aug 2004, 10:57 p.m.

Re: FE helpful tips

*Message #4 Posted by **Norris** on 11 Aug 2004, 5:22 p.m.,*
in response to message #3 by Karl Schneider

Certainly a broad range of relevant undergraduate coursework is desirable. People with such backgrounds probably do have the highest pass rates on the EIT exam.

On the other hand, people routinely pass the EIT exam despite conspicuous gaps in their undergraduate educations, or long after their undergraduate coursework has been forgotten. The pass rates are lower for such people, but they are still reasonably high.

I had major gaps in my educational record, plus I took the EIT exam long after college, so I had forgotten the coursework that I did have. But I made a genuine effort to master every chapter of the FE Review book (with one exception, control systems) and I passed first time.

I still don't understand control systems.

Re: FE helpful tips

*Message #5 Posted by **Fred Lusk** on 10 Aug 2004, 11:07 p.m.,*
in response to message #1 by f15e

Although I took the civil PE test more than 20 years ago, I can give you some helpful tips:

-- Don't over-study and don't under-study. Overfilling the old cranium creates stress and reduces clear thinking. I don't need to explain the "benefits" of under-studying. Plan a study strategy that walks this tightrope. I actually didn't study for the EIT since I was in or had just had all the relevant classes. Worked like a charm. For the PE, I bought Lindburg's book, which at that time had 18 chapters. I got the book with 19 weeks to go before the test. I did a chapter a week (2 hrs on Tuesday evening to read the chapter; 2 hours on Thursday evening to work the example problems; and 2 hours on Saturday to work the problems at the end of the chapter) with the last week reserved for a skimming review. I walked in feeling properly prepared and completely unstressed.

-- Don't study the day before. If you don't know it at least TWO days before the test, I doubt you're ever going to know it (at least for the purposes of the test). Relax, and spend the day before doing something fun.

-- Get enough sleep the night before. In high school, I took the SAT on only 4 hours of sleep (at the pizza parlor with my girlfirend--now wife--until 2:00 am after a football game). I scored at least 100 points lower than classmates I had bested the year before on the PSAT. That didn't affect my choice of colleges, but I knew

I could have done much better.

-- Remember that the goal of any test is "maximum points in minimum time." Based on this maxim, I used the following strategy for the EIT (which is similar to the newer PE tests). Before I even started the test, I created four classifications for the problems I would encounter: (1) Problems I could solve immediately without cracking a book. (2) Problems for which I could quickly find the necessary formula or number in one of my books, then solve quickly. (3) Problems I knew I could solve, but it would require a bit more research in my books and more thinking. (4) Problems best left untouched. Start at the top of the test and quickly decide what type of problem it is. If it's a 1, do it and move to the next problem. If it's a 2, 3, or 4, write that number next to the problem then skip it. Actually, you could decide to also do some or all of the 2s at this time, skipping only 3s and 4s. Your first pass through the test should consist of only answering 1s (or 1s and 2s). Then go back and start on the 2s, if you have any, then do another pass for the 3s. Try the 4s only if you have time left or you feel the need to punish yourself. On the EIT, I marked random A-B-C-D-E answers for my 4s. My PE was structured differently (you had to show your work like an engineering final), but I only had to do 8 ten point problems of the 21 in the book. I ranked the problems in order of difficulty and started with the easiest and worked my way down until I had enough worked out. For my PE, I also estimated the score for each problem. I knew well before I had all eight problems done that I had passed. When I walked out, I figured I had about a 73 out of 80, and the cut score was around 56. --If you get stuck, don't be afraid to stop and stare at the clock for 60 seconds. During my EIT, I had a brain freeze about the area of a circle! Like an idiot, I kept trying pi*d^2. I got ahold of myself, watched the second hand go around, thenm got back to work. That break cleared my head. I actually finished the afternoon part 1.5 hours early. --So far, I haven't talked about engineering, even though that is what you really asked about. I had my HP-41CV stuffed full of programs I had written for things I did all the time (mostly hydraulics). As a result, one of my problems took less than two minutes to solve, and my test was 8 problems in 8 hours. Having 58 minutes of slack time does wonders for your confidence. Of course, your test is structured differently, so you need to figure out what formulas will help you the most, then start keying them in.

I have pontificated long enough. Good luck on your test, and let us know when you pass.

Fred

Re: FE helpful tips

*Message #6 Posted by **f15e** on 11 Aug 2004, 11:50 a.m.,*
in response to message #1 by f15e

Thanks for the tips. I have the FE Review Manual and I also downloaded the booklet that is used for the test.

When I take the FE, which will be in April of 2005, there are a few subjects that I will not have covered by that time or are not part of the EE curriculum, so I will have to put in more time on these particular subjects.

I am just trying to get everything prepared that I will need and I have started the review process. I doubt I will be doing anything to prepare for the FE during the Fall semester, which is in less than two weeks, due to a hectic schedule and more than likely not a whole lot in the Spring either.

Are there any subjects on the FE that are less important due to the fact that not many questions are asked from that subject or for any other reasons? Anywhere that I can save time on my studying/reviewing would be great!

Thanks!

P.S. I actually meant to put this thread in the forum that is in ppi2pass.com site, but not until today did I realize that I had mistakenly posted it here. Someone must have slipped me a Mickey. LOL!

Re: FE helpful tips

*Message #7 Posted by **Ron Ross** on 11 Aug 2004, 12:16 p.m.,*
in response to message #6 by f15e

If you have not taken statics, (and as an EE, you probably haven't), buy a Schaums outline and do a couple of problems every week. Statics is fairly straight forward and easy, and you will pick up easy points in this area.

In fact you should buy a Schaums outline in a couple of the subjects that you haven't taken and just do one or two problems per section (or go to a library and copy a few areas of interest). Every problem area you do and understand is one more question right on the FE in all likelyhood. Get enough right and you pass! 8o)

Re: FE helpful tips

*Message #8 Posted by **f15e** on 11 Aug 2004, 12:24 p.m.,*
in response to message #7 by Ron Ross

So Ron, you don't think the FE Review Manual by MICHAEL R. LINDEBURG would be good enough to prepare me for statics or other subjects that I haven't covered?

Edited: 11 Aug 2004, 12:24 p.m.

Re: FE helpful tips

*Message #9 Posted by **Ron Ross** on 11 Aug 2004, 1:30 p.m.,*
in response to message #8 by f15e

It's good enough, if you can understand problems in one pass. But you will get more detail and how to solve problems from a textbook. The FE Review is very good and an excellent refresher, but if you haven't taken statics, for example, you might consider a workbook. Everything is there in the FE Review Manual, but often very cryptic. I am sure there are many people here, where the FE Review manual would be enough, but if you have access to REA workbooks, you have access to a lot more detailed solutions.

Only look at the easy ones to pick up easy points though. You don't have time to take every course and the exam isn't going to fail you if you can't answer even a single fluid's problem. It is a comprehensive exam and your goal is to correctly answer the most questions you can to acheive a passing score.

Re: FE helpful tips

*Message #10 Posted by **Norris** on 11 Aug 2004, 4:46 p.m.,*
in response to message #8 by f15e

I agree with Ron Ross. PPI's FE Review book is a great introduction, but it is obviously condensed. For some subjects, I needed more detailed explanations. I turned to old undergraduate physics, chemistry, and math textbooks for help (as suggested above), but Schaum's outlines would probably work fine as well.

Undocumented functions of HP 49G

*Message #1 Posted by **Jan** on 10 Aug 2004, 4:35 a.m.*

I've found in CAT menu a lot of functions not mentioned in BIG (over 1000 pages) official manual. Are there any review of usage of these functions (for example ARCHIVE, RESTORE, ->MINIFONT)???

Re: Undocumented functions of HP 49G

*Message #2 Posted by **James M. Prange** on 10 Aug 2004, 8:56 a.m.,*
in response to message #1 by Jan

Over 1000 pages? My 49G AUG has only 432 pages.

Anyway, they're in the "Other Commands" part of the AUG, pages 1-86, 1-294, and 1-230.

But note that the descriptions for MINIFONT\-> and \->MINIFONT are reversed.

Also note that some commands were added after the guides were published. See the "What's New from Release..." notes at http://etud.epita.fr/~avenar_j/hp/49.html. By the way, I recommend upgrading to revision 1.19-6 if you haven't already done so.

Regards,
James

Re: Undocumented functions of HP 49G

*Message #3 Posted by **Eddie Shore** on 11 Aug 2004, 12:28 a.m.,*
in response to message #2 by James M. Prange

The HP48 AUG is also an excellent reference, since a lot of the commands from the HP48 series crossed over to the HP49 series.

Re: Undocumented functions of HP 49G

*Message #4 Posted by **James M. Prange** on 11 Aug 2004, 5:10 a.m.,*
in response to message #3 by Eddie Shore

Yes, in fact, I don't think that there are any 48G series commands that didn't make it into the 49 series, and the 48G series AUR also includes information on the system flags, reserved variables, units, a few program examples, and various other useful information. The 48G series User's Manual leaves a lot to be desired, but it's better than the 49G User's Guide.

In general, much of the information about older RPL models also applies to newer RPL models, all the way from the 28C through the 49g+.

Despite the name, the 48gII is more like a "low-cost" 49 series model.

But the 49 series also adds many new commands and system flags, and some reserved variables are different, so don't neglect the 49G AUG, and get Federico Marziali's documents on reserved names and system flags for the 49 series, all available at http://www.hpcalc.org/.

But note that the 49g+ guides are in many ways better than the 49G guides, although there doesn't seem to be any guide published for the 49g+ including all commands. But except for the I/O and memory ports, and that the Saturn processor is actually an emulator on the 49g+, the 49g+ is very similar to the 49G, so for either of these, it's probably best to download the documentation for both.

The 48G Series manuals (scanned in PDF files) are also available at hpcalc.org, but note the file sizes before starting a download; they'll take a while if you have a dial-up connection.

The HP web site also has some rather basic but useful information. See this page of 49g+ "How to use" articles, for example.

HP 15C

*Message #1 Posted by **Nam Dang** on 9 Aug 2004, 4:15 p.m.*

I wonder if HP ever remake the HP 15C anymore. This is could be the best pocket scientific calculator. The new 33S is not all good in both quality and design comparing with 15C (made in China)

Re: HP 15C

*Message #2 Posted by **Patrick** on 11 Aug 2004, 1:49 p.m.,*
in response to message #1 by Nam Dang

As many people here know, I am a huge fan of the HP-15C and own several copies. I recently purchased the program MathU Pro for my Palm Tungsten T3 from Creative Creek, http://www.creativecreek.com, which is an HP look-alike and work-alike.

First thing I did was to write an HP-34C / HP-15C -like Solve program for it. After I got it mostly debugged, I ran it through all the examples in Kahan's article on Solve. It was able to get the same results as the HP-15C at each iteration. The icing on the cake was that it found the solution 400 times faster!

Naturally, a refreshed HP-15C would be faster too, but then one of its beloved traits, the fact that its batteries lasted on the order of decades, would surely suffer. Small price to pay I guess.

Re: HP 15C

*Message #3 Posted by **John Smitherman** on 12 Aug 2004, 12:54 p.m.,*
in response to message #1 by Nam Dang

Hi Nam. If HP ever brings back the 15c it will probably be made in China. Trying to find electronics that are not manufactured in China is a challenge these days.

Chinese assembly line workers are perfectly capable of producing high quality products if given good product design, materials, tools, training, procedures, etc.

Regards,

John

Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #1 Posted by **Erik Ehrling (Sweden)** on 8 Aug 2004, 3:58 p.m.*

http://www.hp42s.com/campaign/images/campaign_for_emu42.gif

Why a campaign for Emu42?

I have been a great supporter of Emu42 ever since I first heard about Christoph Giesselink's work on a HP-42S emulator in the same vein as Emu48. Not only would this be an essential piece of software for bringing the discontinued HP-42S into the 21st century. Neither could I have dreamed up someone more suitable for this task than Christoph Giesselink himself - for many years the maintainer of the Emu48 project.

Later on I had the opportunity to become a beta tester of Emu42 and to see the emulator grow into the fullblown finished product it is today. Seldom could I contribute much more as a beta tester than just saying "Yes, this is definitely on the right track". My expectations were raised even further when I learned about the Pocket PC 2002 version of Emu42 and that the aim was to also port Emu48 to the Pocket PC. (Previous attempts at porting Emu48 had been marred by a certain sluggishness making it close to unusable).

In a posting at www.hpmuseum.com in December 2003 Christoph Giesselink stated that he would be willing to release the full versions of Emu42 both for Windows (9X/ME/2000/XP) and Pocket PC 2002 (later also the new port of Emu48 for Pocket PC 2002 was added) if he received 700 EUR or more.

The aim of this campaign is therefore very simple - collect as many donations as possible in order to get Emu42 (and Emu48 for Pocket PC) publically released! Every single contribution will be important and could make the difference between a success of failure!

Now - go to the campaign webpage...

*Message #9 Posted by **Gordon Dyer** on 9 Aug 2004, 5:39 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Hi Eric, it's a great idea to get a public release of hp42s, but I have some questions for you before parting with money:

Has Christoph Giesselink confirmed that he will release the code if he receives some money, and how much?
What will happen if not enough money is raised?
Does HP42S include the ROM code?
Will this include all the other emulators shown in the pictures on your campaign page?

Best wishes.

*Message #10 Posted by **Gordon Dyer** on 9 Aug 2004, 5:41 p.m.,*
in response to message #9 by Gordon Dyer

Sorry, in my previous posting replace HP42S with Emu42.

Re: Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #11 Posted by **Raymond Del Tondo** on 9 Aug 2004, 6:25 p.m.,*
in response to message #9 by Gordon Dyer

Hi Gordon,

as for the 42S ROM, Christoph doesn't need to include the ROM image,
because (nearly) everyone who has a real 42S and an HP-48GX/G+
can make his/her own copy for private use, like in Emu42S;-)
Using Christoph's method, it's a matter of about quarter of an hour, IIRC.

Regards,

Raymond

Re: Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #12 Posted by **Jeff O.** on 9 Aug 2004, 10:43 p.m.,*
in response to message #9 by Gordon Dyer

Gordon,
Christoph will **not** include the ROM code with his emulator. It is copyrighted material, and has not been released to the public domain by HP. If you dig around Erik's web site, you will find that he has made some contacts at HP in an effort to secure its release. Given the size of HP, the odds of anyone within the company taking the time to consider this, run it by legal, etc., just to help out people who might otherwise buy a 33S or 48gii/49g+ (in their mind, it is *just* a calculator, after all) would seem to be slim (in my opinion.)

So Christoph's product will require you to provide your own Rom. How you come by the Rom is your business. I think he (and Hrastprogrammer, for his 42X emulator) works under the assumption that if you have a 42S, you can extract and use the Rom. From a legal perspective, I think there is some question regarding whether you are actually allowed to use the Rom any other way than how you bought it, i.e. inside a 42S. I am certainly no lawyer, so this may not be true. Either way, from Christoph's perspective, that is your problem, not his.

Regarding inclusion of all of the calculators, I believe the emulator will "become" any of the supported calculators for which you have the required Rom. So for each of the emulated calculators, you will need a separate Rom image. I'm not sure of the details, but I believe to get a particular calculator, you need to place its Rom image in the proper folder, then start the emulator. It then uses the image it finds in the place

it automatically looks. So if you can get Rom images for all of the calculators, the emulator will emulate them all.

The above information represents my interpretation of the information I have gathered on this issue. I have no special connection or association with Christoph or Erik, and apologize to both if I misstated anything. I may have one or more major or minor details wrong, and invite Erik to correct as needed.

Re: Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #13 Posted by **Erik Ehrling (Sweden)** on 10 Aug 2004, 1:09 a.m.,*
in response to message #9 by Gordon Dyer

> Has Christoph Giesselink confirmed that he will release the code if he receives some money, and how much?

In answer to an explicit question on the same matter just one month ago Christoph answered that it would not be his style to not stand by his earlier word - so, yes he has confirmed that he will release the code if we manage to collect 700 EUR.

> What will happen if not enough money is raised?

In this event, which I personally of course hope will not happen (we are already up to > 200 EUR), what donations that have come in will go to Christoph anyway.

> Does HP42S include the ROM code?

No. You will need a HP-42S + HP-48GX to dump the ROM yourself.

> Will this include all the other emulators shown in the pictures on your campaign page?

Yes. Emu42 is a multipurpose emulator. You will however need to dump your own ROM image from the other calculators in order to make it work in the other modes. Emu42 also supports the HP-19BII but as I do not own one I have unfortunately not been able to create any images of it...

Best regards,
Erik Ehrling (Sweden)

in response to message #14 by Gordon Dyer

Gordon,

you do not need to buy one, just borrow one for half an hour to dump the 42S ROM. Please do not hesitate to support Erik's campaign, EMU42 is really worth some bucks!

Regards, Juergen

Re: Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #16 Posted by **Dave** on 10 Aug 2004, 3:02 p.m.,*
in response to message #15 by Juergen (CH)

My only hesitation is the results I have experienced with Emu48 for the PocketPC. It is not very usable and would tend to stick with the HP-41 emulations already available. What benefit is there from an HP42S emulator?

Re: Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #17 Posted by **Erik Ehrling (Sweden)** on 10 Aug 2004, 4:17 p.m.,*
in response to message #16 by Dave

> Quote:
>
> What benefit is there from an HP42S emulator?

For a longer version please see my article on the subject (a link to it is found on the "What is Emu42?" page of the campaign site) but shortly I think that an emulated HP-42S improves on the real HP-42S because it provides the LOAD/SAVE functionality. Also, while the HP-48GX is slightly too large to fit comfortably on a Pocket PC the HP-42S fits perfectly; my personal favourite is the KML with landscape orientation that borrows its keyboard layout from the HP-15C.

You get the backwards compatibility with the HP-41CV (four level stack, RPN programming etc.) but also the benefits from the HP-42S like a two line LCD, native support for complex numbers, matrix operations etc.

Best regards, Erik Ehrling (Sweden) www.hp42s.com

Link to the Campaign webpage

Half time!

*Message #18 Posted by **Juergen (CH)** on 12 Aug 2004, 2:28 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Erik,

when looking at your campaign web page, I noticed that you already collected around EUR 350.-! Wow, it's half time, congratulations!

I'm sure there are more HP-42S enthusiats out there willing to support the final release of EMU42. It's my standard calculator on my PC desktop, and I look forward having it on my PocketPC device!

Hey folks, what are you waiting for? It's time for the final spurt! Open your eBay cash box, I'm sure there are some bucks left for this great project. It's a good investment, you will not regret it.

Best Regards, Juergen

Printer repair

*Message #1 Posted by **David Ramsey** on 8 Aug 2004, 12:46 a.m.*

I have an 82162A printer that is failing to print a couple of pixels-- any printout has horizontal white lines through it.

Is this something that might be due to a loose contact that could be repaired? Or is it a bum printhead?

Re: Printer repair

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Aug 2004, 2:06 a.m.,*
in response to message #1 by David Ramsey

Hi, David; are you well?

Both possibilities are valid. I am not completely aware of how is the HP82162A (HPIL standard printer, right?) head connection, but it seems to me it is not too different of the one found in the HP82143A (HP41 standard peripheral printer). The 82143A has a flat circuit connecting the printer head to the mainboard. The connection is achieved by some sort of "metal clippers" that firmly hold the fex edge to the mainboard connector. I used a small piece of nonconductive, ESD "aware" plastic to "produce" a small clearance between the flex circuit and the "clipper" connectors (Gee, I hope yopu can read this and understand... where are the English terms when I most need them?) so I could remove it. I'd guess: (the order does not mean "preference" order or the like)

1 - cold, broken soldering;
2 - bad connection;
3 - broken cooper trail in flex circuit (today this is easy to repair);

If none, maybe (just maybe) either the printer head or one of the drivers (some 8-pin DIP guys closer to the head connector) are bad. I'd not take this last possibility as the most likely to be because you mentioned there are "some" blank horizontal lines. I'd not go for more than one burned driver or head thermal dot (resistor). At least I'd not.

Anyway, other printer experts (or gurus) surely will give you better guidance.

Hope you succeed.

Luiz (Brazil)

shim

*Message #3 Posted by **Cameron** on 8 Aug 2004, 4:20 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz, what you describe mught be called an "anti-static plastic shim".

Cameron

Thanks! 8^)

Re: Printer repair

*Message #5 Posted by **David Ramsey** on 8 Aug 2004, 9:03 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luis,

Yes, I'm fine...except for this printer.

I see the area you mention. The flex cable is folded into a shallow "V" and pressed into a connector on the logic board. I inserted a paper shim in the "V" and plugged the flex cable back into the connector, but it didn't make any difference.

I suppose the next step would be to remove the logic board and resolder the connections of the connector that the flex cable plugs into...

If...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 Aug 2004, 10:01 p.m.,*
in response to message #5 by David Ramsey

... you have another printer, that would be also another way of testing. I'd either guess an HP82143A printer has compatible printing components (head, mechanics, etc.). If you have a component source, like a trashed printer (the only source I can think of), that would be a possible solution. At least for testing and being sure about the cause.

About removing the logic board: to remove the HP82143A logic board there is no need to remove the printing mechanics assembly, just unplug the wires (I cannot help laughing everytime I see the "öut-of-paper sensor" inscription: OOPS) and flex circuit, but I don't know if the 82162A also eases the job. I remember needing to remove about five screws, if not more than that, to release the board. Be aware of the ON/MODE switch lid contacts, they "tend" to be in touch with the logic board because of the (silicon?) grease used to smooth their movement and maintain surface integrity.

Success! I'd like to help some more, but I think this is all I remember.

Best regards.

Luiz (Brazil)

Re: Printer repair

*Message #7 Posted by **David Smith** on 9 Aug 2004, 11:53 a.m.,*
in response to message #1 by David Ramsey

Your printhead is almost certainly bad. Check the resistance of each pixel with an ohm meter. Two pins are tied together (common). The other pins are the dots. Should be around 100 ohms each.

Re: Printer repair

*Message #8 Posted by **David Ramsey** on 9 Aug 2004, 8:17 p.m.,*
in response to message #7 by David Smith

David,

I assume you mean that I can test the resistance at the end of the flex cable, where it plugs into the logic board. Which connectors are the grounds? The outside ones?

Re: Printer repair

*Message #9 Posted by **David Smith** on 10 Aug 2004, 12:53 p.m.,*
in response to message #8 by David Ramsey

The grounds are together at one end. They will have zero ohms of resistance between them. On most flex cables it is obvious that they are connected together.

HP-85B

*Message #1 Posted by **Jeff** on 7 Aug 2004, 7:51 p.m.*

Are there any articles or information regarding replacement of the printer drive belts for these units. I see them advertised on e-bay frequently but was curious if there there was a standard part number for each belt that I could order myself. These stepper motor belts cannot be that oddball! Also, has anyone had to replace the rubber drive wheel in the tape compartment? Mine seems to be a little "funky" ie.. slightly melted/deformed but only slightly.

Re: HP-85B

*Message #2 Posted by **Vassilis Prevelakis** on 8 Aug 2004, 9:50 p.m.,*
in response to message #1 by Jeff

```
Jeff <mitchbrent@elknet.net> wrote:
> I am currently in the process of re-building an HP-85 and an HP-85B.
```

Excellent idea, these machines were very well made so, apart for one or two items, that have worn off with time, you don't need to carry out any particularly difficualt repairs.

Two things to be careful though:

1) take GREAT care while you have the HP-85's cover removed because there is high voltage around the display area. This is so EVEN WHEN THE COMPUTER IS SWITCHED OFF. The circuitry acts as a huge capacitor retaining lots of charge. Any short can cause large amounts of current to flow causing injury to both personell and (almost certainly) the equipment.

2) The strips connecting the various boards together (they look like ribbon cable used to connect PC hard drives to the motherboard) are made up of 3-4 layers. In most cases the glue has lost its adhesiveness so the strips are delaminating. Be careful when you handle them in case they fall to pieces. Also note that if you remove them, you cannot just push them back in place. In mose cases you need to use a thin plastic strip as a guide. The best thing to have before starting the repair is the service manual for the 85. This is available on the HP museum collection of manuals (check http://www.hpmuseum.org).

```
> Are there any articles related to any of the following:

> *    Ordering replacement belts for the printer. Part numbers to order by?
```

You can get these on eBay. I bet you can get them from some place like www.smallparts.com, but you have to know the part number.

```
> *       Tape drive rebuild. Fixing what looks to be a "gummy" capstan?
```

I have attached to the end of this email the current wisdom.

```
> *       Understanding why I get the stall error 74?
```

Most original HP tapes are shedding their oxide coating, leaving the transparent tape backing behind. The tape drive interprets this as a tape stall (since it assumes that if it advances the tape, it will move past the Beginning-of-tape hole. If you have old tapes don't bother trying to read them, you will simply destroy their

contents forever. Keep them in case somebody ever figures out how to read them.

```
> *       Cleaning scratches on the plastic cover for the screen?
```

I have tried small amounts of tooth paste and they can get rid of small scratche s.

```
> I have been taking pictures and documenting everything that I have done
> and would be glad to send this to you for posting when finished.
```

That would be great, as I am hosting a series of tips and advice.

Best Regards

mailing list:
> [...] I have used 1/2" tygon tubing from the local hardware store
> (think "large aquarium hose") to refurb DEC TU58 drives (same tapes,
> same capstan, same melting problem).
>
> I got a foot of it a few years ago and have yet to run out (even though
> between HP line analyers, VAXen, and a VT103, I have nearly a dozen
> drives to overhaul).
```

I do not recommend heat shrink tubing as it tends to come off. Test the repair by retentioning a sacrificial tape (use the CTAPE command on the HP-85) two or three times in a row. If the tubing does not come off, then it'll probably stay put for a couple of years.

If you are wondering what is the thickness of the rubber on the roller, the following picture is of an original HP roller with decayed coating still in place.

Help needed with a matrix

*Message #1 Posted by **Karl-Ludwig Butte** on 7 Aug 2004, 12:06 p.m.*

I need some help with the programmatic creation of a matrix as well as storing and recalling values to it. I created a matrix with the following steps:

[[12. 2.] [0. 0.]] 'MAT' STO

This worked and created the matrix named "MAT". Then I tried to insert a row after the row [12. 2.] with the string "ABC" and the value 2004. I succeeded by entering the following in RUN-Mode:

MAT (resulting in recalling the matrix MAT to the stack) ['ABC' 2004] 2 ROW+

Now doing the same from within a UserRPL program with a slight modification always results in an error. The modification ist that the value 2004 should come from a local variable named n:

[[12. 2.] [0. 0.]] 'MAT' STO MAT ['ABC' n] 2 ROW+

This results in a syntax error. All my attempts to create ['ABC' 2004] on the stack with 2004 coming from variable n failed. The users manual from the CD was no help at all (how I wish back the times when HP really could be proud of their user manuals like the one for the HP-67/97).

Later on in the program I need to recall individual values from the matrix as well as storing new values in already existing cells.

How can I acomplish these task ? Maybe there is a really good tutorial somewhere on the Internet ? Any hint will be very much appreciated - thank you very much in advance.

Re: Help needed with a matrix (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Aug 2004, 3:13 p.m.,*
in response to message #1 by Karl-Ludwig Butte

Hi, Karl;

I used an HP49G+, O.K.? I tried this and it worked:

```
[[12. 2.] [0. 0. ]]
'MAT'
STO
MAT
[['ABC' n]]
2
ROW+
```

The resulting object is:

```
[[12. 2.]
 [ABC n]
 [0. 0. ]]
```

Note that the object to be added as a new row is a matrix. It seems that ROW+ expects a matrix (or a single-row matrix) instead of a 2-D vector.

Hope this helps.

Luiz (Brazil)

Re: Help needed with a matrix

*Message #3 Posted by **Veli-Pekka Nousiainen** on 8 Aug 2004, 4:30 a.m.,*
in response to message #1 by Karl-Ludwig Butte

```
[[12. 2.] [0. 0. ]] 'MAT' STO MAT ['ABC' n] 2 ROW+
================================================
...
2004 -> n <<
[[12. 2.] [0. 0. ]] 'MAT' STO MAT
'ABC' n 2 ->ARRY 2 ROW+
>> @ now the value of n is there
[[VPN]]
```

Re: Help needed with a matrix

*Message #4 Posted by **Karl-Ludwig Butte** on 10 Aug 2004, 3:04 a.m.,*
in response to message #1 by Karl-Ludwig Butte

Thanks both of you for your answers. The solutions work like a charm. I'm going to use this for a short routine that can be used to log values of local variables for debugging and reference purposes. By the way, is there a method of detecting the presence of a global matrix variable ? For the short routine I'm planning I need to know if the matrix already exits or if the program has to create it first ?

Re: Help needed with a matrix

*Message #5 Posted by **James M. Prange** on 10 Aug 2004, 11:18 a.m.,*
in response to message #4 by Karl-Ludwig Butte

You could probably just use:

```
'VarName' STO
```

If VarName already exists in the current directory, then it will be overwritten, if it doesn't exist in the current directory, then it will be created.

But if you want to avoid overwriting VarName, use the VTYPE command.

```
'VarName' VTYPE
```

returns the type of object stored in the variable if it's found, or -1 if it doesn't exist in the current path.

Re: Help needed with a matrix

*Message #6 Posted by **Karl-Ludwig Butte** on 11 Aug 2004, 4:36 a.m.,*
in response to message #5 by James M. Prange

Thank you, James, the second method you describe is the one of choice in this case 'cause I wouldn't want to overwrite an existing matrix.

surveying calculator

*Message #1 Posted by **Dave R** on 6 Aug 2004, 3:46 p.m.*

I would like to know what the opinions are on which is the best HP calculator for working in the field of surveying

Re: surveying calculator

*Message #2 Posted by **Iqbal** on 6 Aug 2004, 4:08 p.m.,*
in response to message #1 by Dave R

Depends on your preference. I prefer my 42S and my 48GX as back-up.

Re: surveying calculator

*Message #3 Posted by **Dave R** on 6 Aug 2004, 4:24 p.m.,*
in response to message #2 by Iqbal

What would be the best calculator for field calculations, I'm new to the field work and would like to know the best calculator for me to work with.

Re: surveying calculator

*Message #4 Posted by **Norris** on 6 Aug 2004, 5:05 p.m.,*
in response to message #3 by Dave R

The classic HP surveying calculator, until a few years ago, was the HP48GX. Several vendors sold expansion cards with surveying software for this model. An HP48GX with the right software could be used for both data storage and field calculations. The 48GX had a serial port for interfacing with survey instruments and PCs.

But the 48GX has been discontinued by HP. It's only available used on eBay or elsewhere, and it tends to be rather expensive. However, it's still the first choice of many surveyors, if available.

HP now markets two successor models, the 48GII and the 49G+. However, these models don't accept the 48GX software cards, and I don't think that much (if any) commercial surveying software has been ported to the newer models. Many surveyors now use PocketPC handhelds rather than calculators, or they use instruments with built-in data storage and calculating capabilities.

For more info, you might want to check out: http://www.johann-sandra.com/survbookcalc.htm

None of the 48 or 49 series models can be used on LSIT or PLS exams. Best option for those is the HP-33S. The 33S has has no ports and cannot interface with surveying instruments or PCs.

Re: surveying calculator

*Message #5 Posted by **K Kelley** on 16 Aug 2004, 2:03 a.m.,*
in response to message #3 by Dave R

Depends on what you are going to do, really. Data collect and calc numbers then a 48GX but if you are just crunching numbers the 32sII and if you are seriously crunching, go to a HP42s. I have TDS survey Pro in my 48, 32sII for field calcs. The 32 & 42 fit in a shirt or vest pocket well. I have a 42s on the way due to job advancement.

Re: surveying calculator

*Message #6 Posted by **db(martinez,california)** on 6 Aug 2004, 8:13 p.m.,*
in response to message #1 by Dave R

Whatever your boss uses is the best because he knows everything.

Also see http://www.softwarebydzign.com/

Re: surveying calculator

*Message #7 Posted by **Norris** on 7 Aug 2004, 3:52 p.m.,*
in response to message #6 by db(martinez,california)

As indicated by db, Software by D'Zign currently markets surveying software for the HP49G+ (not clear if it runs on the 48GII). Their software is available at:

http://www.calcpro.com

Another company markets a package called SurveyWorks, which is apparently compatible with both the 48GII and 49G+. See:

http://www.levelworks.net/surveyworks.htm

And yet another company markets a package called Survey Stakeout, which is apparently compatible with the 48 and 49 series. This company also markets a version for the HP-33S; the 33S version is specifically designed for use on the LSIT and PLS exams, where 48s and 49s are not allowed. See:

http://www.hp33ssurveyor.com

Several companies that historically marketed surveying cards for the HP48GX, such as TDS, SMI, and RAMSS, are apparently not supporting the 48GII or 49G+. Their software cards may still be available, but they will only work with the discontinued 48GX.

49G Data Collector

*Message #8 Posted by **Matt Kernal (US)** on 7 Aug 2004, 11:53 p.m.,*
in response to message #1 by Dave R

Tim Wessman and John Evers have developed their new 49G-based Data Collector. See http://www.pssllc.com/dc49/ for more info. They also have a forum page if you have questions for them.

Matt

Re: 49G Data Collector

*Message #9 Posted by **Tim Wessman** on 9 Aug 2004, 1:48 a.m.,*
in response to message #8 by Matt Kernal (US)

There is a full version that is designed for intefacing with various equipment brands, as well as a software only version (with optional fabric case that gives you a place for extra batteries and a hand warmer (for cold weather locations). The software only version with a calculator and the case should run <$300, <100$ for the software only. We haven't set final price because we are still changing slightly the cases and other hardware components. The software only version is identical to the more expensive one, but can't communicate with instruments due to the lack of a serial port on the 49g+. It stores data manualy, but has all the calculation capabilites as the other one. You will be very pleased.

Re: 49G Data Collector

*Message #10 Posted by **WigglePig** on 11 Aug 2004, 10:29 a.m.,*
in response to message #9 by Tim Wessman

Hi Tim,

I'd be interested in getting one of the cases and internal PSU and comms modules for my 49G+...will they be avaialble separately? (I'm not a surveyor but I do use my calcs in the field)

Regards

WigglePig

Re: 49G Data Collector

*Message #11 Posted by **Matt Kernal (US)** on 12 Aug 2004, 2:17 p.m.,*
in response to message #10 by WigglePig

WigglePig,

Concerning the I/O module, I'd be surprised if Tim and John aren't using the Wolftek Design board.

The position of the two LED's (IR receiver/transmitter) appear to be in the same relative location on both units .

See http://www3.telus.net/wolftek/

BTW.. I want one too.

Matt

Edited: 12 Aug 2004, 2:25 p.m.

Re: 49G Data Collector

*Message #12 Posted by **Tim Wessman** on 13 Aug 2004, 3:53 a.m.,*
in response to message #11 by Matt Kernal (US)

He actually started making it for us. The board you see is the original prototype, but the final design will be a little more compact.

I'm glad you want one. . . =)

Re: 49G Data Collector

*Message #13 Posted by **Tim Wessman** on 13 Aug 2004, 3:52 a.m.,*
in response to message #10 by WigglePig

Check out our message board we've got set up (the cheap add supported kind) at http://b5.boards2go.com/boards/board.cgi?user=timwessman . Yes the stuff will be availible seperately. Pricing is not availible yet.

HP 15C

*Message #1 Posted by **Ed Yousse** on 6 Aug 2004, 12:00 p.m.*

My HP 15C recently came up with a capital "C" in the lower right hand portion of the screen and seems to have slowed down the functioning of the unit. If my memory serves me the "C" designated a complex function but I cannot remember how to make the "C" go away. I have had the unit for 20 years and the manuel is long gone.

Any help would be greatly appreciated.

Ed

Re: HP 15C

*Message #2 Posted by **Jeff O.** on 6 Aug 2004, 12:59 p.m.,*
in response to message #1 by Ed Yousse

You must clear flag 8. Press the "g" key, then the "5" key, then the "8" key.

Re: HP 15C

*Message #3 Posted by **Bruce Leslie** on 10 Aug 2004, 12:19 a.m.,*
in response to message #2 by Jeff O.

Thanks for this Jeff. I have had exactly the same problem. What exactly does flag 8 do? I notice that the trig functions don't work when it is set.

Re: HP 15C

*Message #4 Posted by **Karl Schneider** on 10 Aug 2004, 3:13 a.m.,*
in response to message #3 by Bruce Leslie

> Quote:
>
> What exactly does flag 8 do? I notice that the trig functions don't work when it is set.

Flag 8, when set, puts the HP-15C in Complex mode, which uses 5 emory registers to create a parallel stack and Last X register for the imaginary parts of complex numbers.

Also, an entire set of mathematical functions operates in the complex domain, with complex-valued inputs and outputs:

+, -, *, /, sin, cos, tan, arcsin, arccos, arctan, sinh, cosh, tanh, arcsinh, arccosh, arctanh, e^x, ln, log, 10^x, 1/x, y^x, sqrt(x), x^2.

abs, ->R, ->P also work a bit differently in Complex mode.

The 15C was probably the first handheld calc to provide this kind of built-in functionality, in 1982.

Edited: 10 Aug 2004, 3:15 a.m.

Re: HP 15C

*Message #5 Posted by **Jeff O.** on 10 Aug 2004, 7:27 a.m.,*
in response to message #3 by Bruce Leslie

> Quote:
>
> I notice that the trig functions don't work when it is set

As noted by Karl, setting flag 8 puts the 15C in complex mode. When in complex mode, the trig functions do work. They work purely in radians mode, however, regardless of the setting of the radians flag. So if flag 8 is clear and you are in DEG mode and you enter 0.5 and press $\sin^{-1}$, you will get an answer of 30. If you set flag 8, enter 0.5 and press $\sin^{-1}$, the display will show 0.5236, which is of course 30 degrees in radians mode. Pressing f COS to execute the (i) function will temporarily display the imaginary part of the answer, which is 0. You can also press f -(the minus key) to execute Re<>Im. This swaps the real and imaginary components permanently, unless you swap them back.

The above is covered on page 121 of my edition of the manual.

OpenRPN Java demonstration development

*Message #1 Posted by **OpenRPN** on 6 Aug 2004, 9:33 a.m.*

Greetings everyone,

We're planning to make and freely distribute java simulations of our machines at the OpenRPN project. A thread has been started in the software section of our forums, and we would love to hear your opinions about how they should be implimented.

We have an existing base of java code, since *fix is being initially developed in it and will then be adapted to eC++

The idea is to replicate how the machine will look and act... since this first line of machines probably won't show up in your local electronics store. The bottom line is you'll have a way to try it before you buy, and you'll have a nice calculator to use on your computer should you need it.

Best Regards, Hugh Evans OpenRPN Project Manager

German help needed!!

*Message #1 Posted by **Diego Diaz** on 6 Aug 2004, 3:27 a.m.*

Hi all,

I've recently managed to win an-*other* HP-41 at eBay. The seller have contacted me with some messages regarding shipping troubles. Regrettably, she does not speak English and (regrettably too) I cannot speak German.

I've used automated translators so far, but will like to recall your help to avoid further misunderstoods regarding this issue.

I've made dozen transactions with Germany in the past years and this is the first time I have such a problems...!?

Here you are the relevant mail info, pasted from my hotmail account:

---------- Hallo,

das Paket liegt bei Ihnen am Zoll, ich benötige aber noch Ihre Personal Ausweis Nr.damit das Paket weiter an Sie versendet wird.

MfG

Elisabeth

----- Original Message ----- From: "diego diaz" <sulaco2000@hotmail.com> To: <HLeyens@t-online.de> Sent: Wednesday, July 28, 2004 2:03 AM Subject: RE: eBay Artikel HP Rechner 41C (Artikelnummer 6106431806)

Re: German help needed!!

*Message #2 Posted by **Andreas Müller (Ger)** on 6 Aug 2004, 5:08 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Elizabeth writes(the english translation folows): "Hello, the parcel is laying at your customs, but I need your Identity Card Number to get the parcel forwarded to you. With kind regards, Elizabeth"

I hope it helps. Regards, Andreas

Thanks Andreas!

*Message #3 Posted by **Diego Diaz** on 6 Aug 2004, 6:28 a.m.,*
in response to message #2 by Andreas Müller (Ger)

Hi,

I'll send the required info, nevertheless, this is somewhat strange, AFAIK there are no customs inside the EU...

Again thanks and best regards from Spain.

Diego.

123456

Re: Thanks Andreas!

*Message #4 Posted by **Raymond Del Tondo** on 6 Aug 2004, 6:39 a.m.,*
in response to message #3 by Diego Diaz

Hi diego,

normally there's no customs inside EU,
but maybe the sender accidently filled in the customs declaration form
and/or marked the item with a very high value.

Regards,

Raymond

Re: Thanks Andreas!

*Message #5 Posted by **Diego Diaz** on 6 Aug 2004, 9:28 a.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,

It could have happened this way, anyhow it's still strange that shuch a customs declaration was accepted by the German Customs, as they must know for sure that goods freely circulate within the EU...

Regarding the insurrance, I was not asked for that when the seller told me the shipping amount... and the whole thing doesn't worth a hundred bucks.

Let's time decide if it's a simple misunderstood, or an eBay bogus... :-(

I'll let you know if the second becomes true.

Thanks and best wishes.

Diego.

Identity Card Number?

*Message #6 Posted by **Jeff O.** on 6 Aug 2004, 12:54 p.m.,*
in response to message #2 by Andreas Müller (Ger)

Diego, Andreas and Raymond,
Might I ask what would be meant by "Identity Card Number"? Might it be similar to the Social Security number (account number for the payment of taxes while working that then loosely provides for a pension-type payment after retirement) that we have in the US? This number has become a de facto personal identification number (much to my and many others' chagrin) for banking and credit transactions. As a result, scams to get you to reveal it are common so that a criminal can use it for fraudulent purposes. Could the eBay sale be a ruse for such a purpose?

Re: Identity Card Number?

*Message #7 Posted by **Diego Diaz** on 6 Aug 2004, 4:35 p.m.,*
in response to message #6 by Jeff O.

Hi Jeff,

We have (in Spain) a small (credit card sized) personal identification document, it's a very long history that goes backwards to the previous dictatorial government after the civil war... (no, I won't bore you with that :-)... but the fact is that every Spaniard has one.

In this particular case, the seller is receiving the requests that should have have done to me... and is taking her time to write e-mails, and forwarding that info to the Spanish carrier (supposedly thru the German carrier)...

This is a common thing during summer time here in Sapin: Many companies (Carriers are not an exception) hire teporary employees while their *good* people are in holidays... so, a real newbie get in charge of decide if this or that thing must or must not go thru Customs... mine does :-(

I've managed to talk to the Spanish Carrier at Madrid this very afternoon they accepted my claim, confirmed that the parcel is there and that it will be forwarded to the Canaries next Monday.

I'll also mailed the seller to show my gratitude for her interest and cooperation in this issue.

Conclusion: I'll wait till October to buy at eBay ;-)

Thanks you all for your replies, and have a nice weekend!!

Diego.

What's the deal with 4xCOS120

*Message #1 Posted by **f15e** on 4 Aug 2004, 9:41 p.m.*

This is just an example but why am I getting two different answers here:

4 x COS120 = -0.5

but

COS120 x 4 = -2 (which is the correct answer)

I am starting to see that this calculator may do me more harm than good.

Edited: 4 Aug 2004, 10:03 p.m.

User error, I think

*Message #2 Posted by **John** on 4 Aug 2004, 11:16 p.m.,*
in response to message #1 by f15e

On my 33S S/N CNA411047XX, I get -2 both ways.

Since the COS of 120 is -0.5, I think perhaps you didn't push = on the first example.

Try:

4 x 120 COS = and you'll see -2.

Try:

120 COS x 4 = and you'll see -2.

Shows -2 as the solution in the solver too:

4 x COS (120) = X

SOLVE X -2

You don't happen to be a TI user in disguise trying to sow discord here, are you?

Re: User error, I think

*Message #3 Posted by **.** on 5 Aug 2004, 9:52 a.m.,*
in response to message #2 by John

The 33s is braindead in alg mode... why on earth is sin postfix?

Even a cheap casio costing 1/3 of the price will accept sin(5)+7! +sqrt(4) = and give the correct answer.

The 33s is an OK RPN calculator, but pretty poor in alg mode compared to the competetion.

Re: User error, I think

*Message #4 Posted by **bill platt** on 5 Aug 2004, 12:12 p.m.,*
in response to message #3 by .

Hi,

Actually, the 33s has three different data entry/interface paradigms:

```
1.  RPN
2.  Equation List --> Algebraic Expression parser
3.  ALG --> old style "Algebraic" operation interpreter
```

Note that the RPN and ALG modes are direct calculation interfaces--not expression parsers--you have the "equation list" for the latter. (It is very unfortunate that the equation feature does not have provision for editing!)

All old style HP, Casio, Sharp, Ti etc etc (including a number of current $15 Casios) "algebraics" work with infix for the basic operations +-x/, and postfix for all "one number" functions. So, I do not think it is right to see this feature as a flaw--it allows one to be efficicent with keystrokes--and to use results for the next computation without having to resort to jumping through hoops, like SIN (2nd ANS) ENTER to get the sin of the last result (this is what you do on a 30s for example).

I think it would have been impossible for the existing RPN-based keystroke programming code to have worked with both RPN and a "direct algebraic logic" type of interface---or it would have been much more difficult at any rate. I would say that it might be worth exploring, though. The way Alg has been implememented on the 33s is fundamentally the same as the 20s and 21s.

Perhaps it is confusing to have the fancy two line diplay show the sin(x) when you have typed x sin.

I think the 33s has bigger problems--the bugs---than whether the ALG interface is perfect.

The real problem with the ALG interface is that there is no good documentation--I have had to discover how LastX, X<>Y etc work, on my own. (And in fact you will see that there are two different implementations of the X<>Y--the newer versions actaully use X<>Y to create a second parallel ALG stack--you can work on two ALG computations at the same time, and tie them together. In fact, you can also use this feature in a program, as a way to implememt a counter or test variable, without having to use any of the letter-named variables:

```
LBL A
X<>Y
CODE
CODE
etc
X<>Y
-
1
X>0?
GTO A
RTN

or the like....
```

REgards,

Bill

Edited: 5 Aug 2004, 12:50 p.m.

Which calc?

*Message #5 Posted by **Karl Schneider** on 4 Aug 2004, 11:18 p.m.,*
in response to message #1 by f15e

I don't have an HP-30S, but on an HP-33S in ALG mode, I obtain the following results:

```
press:     4 x 120 COS ENTER
display:   4xCOS120=
           -2.00000

press:     120 COS x 4 ENTER
display:   COS120x4=
           -2.00000
```

What's the problem? (other than the unintuitive postfix of unary functions in equation-writing mode...)

*Message #6 Posted by **f15e** on 5 Aug 2004, 11:38 a.m.,*
in response to message #1 by f15e

Yes, it was a user error. I was not hitting ENTER after entering the numbers. I guess the calculations I made berfore just so happened to give me the correct answer without hitting the ENTER key. But when doing 4 x COS120, I was getting -0.5, which is just the COS120 part, but when doing COS120 x 4, I got the correct answer. Just another little quirk I need to get used to.

And yes, I am a TI user; the 89 and 92+. I still prefer my TI's by far over the hp. No offense.

Anyway, thanks for the info.

Edited: 5 Aug 2004, 11:40 a.m.

Re: What's the deal with 4xCOS120

*Message #7 Posted by **Norris** on 5 Aug 2004, 2:44 p.m.,*
in response to message #6 by f15e

<< And yes, I am a TI user; the 89 and 92+. I still prefer my TI's by far over the hp. No offense. >>

None taken. After all, you've implicitly endorsed the HP-33S as the best available calculator in the "NCEES-approved" class. Even though you are a TI user, you still picked the 33S over a host of cheaper NCEES-approved TI models. :)

15c user mode

*Message #1 Posted by **Kathryn** on 4 Aug 2004, 6:05 p.m.*

Can someone help me out of user mode. The instructions in the manual will not get me out...Thanks

Re: 15c user mode

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Aug 2004, 6:07 p.m.,*
in response to message #1 by Kathryn

Hi;

you can get rid of user mode by pressing [f][USER]. USER is a yellow-shited function, beside [ENTER] key (I have no calc in hands now). [f][USER] toggles user mode on and off.

Hope it works fine.

Cheers.

Luiz (Brazil)

Please Help!!!!!!!!

*Message #1 Posted by **f15e** on 4 Aug 2004, 3:45 p.m.*

In the following code at this link:

Simultaneous Solving Code

I have tried to run the program but I don't seem to getting anything from it and I have made sure 3-4 times that the code had been entered correctly, which it was.

I know I have to enter the coefficients before I run the program (XEQ S) but where do I enter them at? I tried XEQ I and XEQ J, but nothing. Can someone please walk me through this program; not the code, just using the program? I would greatly appreciate someone giving me an exact run through with a 3X3 example.

Thanks!!!

Edited: 4 Aug 2004, 10:07 p.m.

Re: Please Help!!!!!!!!

*Message #2 Posted by **Ben Salinas** on 5 Aug 2004, 12:07 a.m.,*
in response to message #1 by f15e

Alright, I have never used this program before, but what you need to do is store your coefficients in those variables. For example, for the A coefficient, you STOre A.

The answers will be on your stack, and you will have to rotate your stack to see them all (The R up arrow button, and R down arrow).

See if that makes some sense.

Also, if you are trying to learn the 33s, you might try reading some of the Learning Modules available at http://www.hp.com/calculators/scientific/33s/

These go through everything step by step (in RPN and Algebraic) and will help you better understand the calculator.

-Ben Salinas

Re: Please Help!!!!!!!!

*Message #3 Posted by **f15e** on 5 Aug 2004, 1:54 p.m.,*
in response to message #1 by f15e

Thanks Ben!! The program in the hp 33s manual has it to where you press the XEQ A key and then you are

prompted for each coefficient, but this program is different.

I now am able to use this program. I was trying to find the keys that would prompt me, but now I know I must enter the number then STO the number to the letter. Still more learning about this calc. to go.

Thanks again.

Hey Martin Cohen

*Message #1 Posted by **f15e** on 4 Aug 2004, 10:52 a.m.*

Hey Martin,

1.) In the code you have posted before in the "Simul. Solve w/ HP 33S" thread below, you have Rv as rotate down. Is this the same thing as Roll Down with the key that has an R with an arrow pointing down?

2.) In the line of code,

"RCL W x!=0? STO/ X // IF DET NOT ZERO, SET X"

did you mean to put the / after the STO or is it just STO X? If it is correct, I am guessing the / is a division sign.

3.) Also, after I have put the code in, how is it run? I am not sure how the program is supposed to be run or what, if any, other equations or other things need to be put in for the program to work.

Forgive me for all the questions, but I am in the learning process. If there is a site that explains how to run the code, I would appreciate it.

Thanks for your help!!

HP-42S emulator for Pocket PC?

*Message #1 Posted by **Don Davis** on 4 Aug 2004, 12:17 a.m.*

Does anyone know of an HP-42S emulator program for the Pocket PC?

Thanks, Don

Re: HP-42S emulator for Pocket PC?

*Message #2 Posted by **Jeff O.** on 4 Aug 2004, 7:30 a.m.,*
in response to message #1 by Don Davis

I believe there are only 2 emulators for the 42S:
1. 42X by HrastProgrammer. He makes versions that run on the HP-48GX (requires 2 memory cards), 49G and 49G+. Available here.
2. Emu42 by Christoph Gießelink. A beta version is available here. Following Richard's link, it apparently is possible to get Emu32 to run on Pocket PC as demonstrated here. As Erik notes, *"Emu42 for Pocket PC 2002 is not yet published officially"*. So actually getting it up and running might be a little problematic.

An alternative might be to buy Hrast's 42X and run it on emu48. There is a version of emu48 for Pocket PC. You could make a custom bitmap and KML (basically a picture of the 42S keyboard and display and a script that maps the functions, if you are not familiar) that could look very nice. The difference is that emu48 has the large screen of the 48. However, Hrast allows good use of the area above the 42S display.

Hi all! (Just back from vacations with my wife and our six month's old son - far from all internet connections...)

> Quote:
>
> "Emu42 for Pocket PC 2002 is not yet published officially"

Better up! I'm actually right now setting up a campaign in order to pay back at least a little bit of what we

owe Christoph Giesselink for his work on these emulators. Also, if we manage to collect more than 700 euros Christoph will release both the Windows and the Pocket PC version of Emu42...

Even better up! In addition to the Pocket PC version of Emu42 Chrstoph has also made his own port of Emu48 which resolves all problems with sluggishness etc with the previous Pocket PC versions. If we manage to collect more than 700 euros he will release this as well!

Just check out this forum or www.hp42s.com in the next few days for more details!

Best regards, [br]Erik Ehrling (Sweden)

in response to message #4 by Erik Ehrling (Sweden)

Erik,

Fantastic!! A super fast 42S in Windows with program load/save and a Pocket PC version for portability. I would be in Heaven. (I'm assuming it'll be fast and will have program load/save).

I have already e-mailed you my support. And as soon as you post the collection method, I'll be delighted to make the money contribution.

It will give me an excuse to buy one the latest PocketPC units.

Bill

Re: HP-42S emulator for Pocket PC?

*Message #7 Posted by **Don Davis** on 6 Aug 2004, 11:34 p.m.,*
in response to message #4 by Erik Ehrling (Sweden)

Does the screen shot show the final product? I am curious why the display does not match the width of the calculator keys as it does with the actual 42S. This would seem to make custom menus (a primary feature of 42S porgramming for me) somewhat problematic.

Thanks, Don

Re: HP-42S emulator for Pocket PC?

*Message #8 Posted by **Jeff O.** on 9 Aug 2004, 11:09 p.m.,*
in response to message #7 by Don Davis

Don,

My guess is that the effect you describe (screen width not matching keyboard width) stems from the way the 42S 16x131 pixel (if I recall correctly) display gets mapped to the display of the emulating device. The 240W x 268H pixel display of the PDA is not wide enough to use a 2x2 array for each 42S pixel. Therefore the 42S display must be mapped one for one, so it is not as wide as the total PDA screen. The keyboard is just a graphic image that you can make look any way you want. It is not restricted by a physical aspect of the real 42S, so you can use the whole width of the PDA screen to make it look as good as possible. (The preceding is my analysis based on my understanding of the way emu48 works.)

However, this should not be a problem with the soft menus. With the KML scripting, you can make it possible to actually just click on the menu label when it appears, i.e. you can map that key function to that area of the screen, so you won't need to press the “key” associated with that menu function.

I hope the above is clear, if not ask and I'll try to provide more info.

HP97 powers on and nothing works.

*Message #1 Posted by **Kadambi S** on 3 Aug 2004, 9:03 p.m.*

I tried to use a HP97 not used for a long time. I charged the dead battery and the calculator worked in manual mode. I tried to use the card reader. Card will not pass through. Got stuck and card had gummy substance on its side. Wiped it clean and tried it couple of times. Tried to use the clenaing card. The motor tried to work and then the whole calculator went dead. I charged the battery and now when I turn it on it displays all '0's 13 of them with negative sign in front. No other keys work, card motor doesnt feed the card and the printer drive switch doesnt work. Only on/off swith works.Can any one tell me how big is the problem. Can it be fixed. I came across this forum too late trying to get some info. I wish i had known before. I cannot touch any other calculator without RPN. I mostly use 15C.

Re: HP97 powers on and nothing works.

*Message #2 Posted by **andy** on 3 Aug 2004, 11:04 p.m.,*
in response to message #1 by Kadambi S

The gummy substance is from the card reader's drive wheel. These wheels degrade over time and your 97 has the tell-tale signs (gummy subtance on the cards). There are several delicate micro-switches in the card reader. The disintegrating drive wheel may have caused one of them to become stuck in the on-position and this is causing the calculator to hang.

So I would start by replacing your card reader's gummy wheel. While replacing the gummy wheel you will be able to clean all of the switches. I just replaced mine last week utilizing the instructions located elswhere on this site: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=180 The operation was a complete success thanks to these instructions (thanks Mike!). It is a reasonably straight forward procedure but you need to be VERY careful because a slight slip of the hand could make a mess of things.

By the way, the outer diameter of the silcone tubing is ~6.2 mm.

Good luck and let us know how it goes, Andy

Edited: 3 Aug 2004, 11:17 p.m.

Re: HP97 powers on and nothing works.

*Message #3 Posted by **David Smith** on 4 Aug 2004, 8:01 p.m.,*
in response to message #1 by Kadambi S

A display of al 00000000 is almost always caused by a bad ACT chip. The HP97 power supply is fairly good and the ACT hardly ever goes bad in this machine (unlike the smaller Woodstock series machines like the HP25).

Re: HP97 powers on and nothing works.

*Message #4 Posted by **Kadambi S** on 4 Aug 2004, 11:38 p.m.,*
in response to message #3 by David Smith

Thanks Andy and Dave for your input. The Rubber Ring definitely needs replacing. If the ACT chip is bad is it readily available. It may be beyond my scope to repair it myself. I have to get it repaired through one of the services advertised only thing is how much it will cost and is it worth it. Thanks.

Re: HP97 powers on and nothing works.

*Message #5 Posted by **marais** on 5 Aug 2004, 3:25 a.m.,*
in response to message #4 by Kadambi S

If the chip is readily available, e.g. from a spare parts machine, the repair job is definitely worth it. Come on, te 97 is such a great machine! They did not know SMD by then, so the soldering job will be rather easy.

Andreas

Re: HP97 powers on and nothing works.

*Message #6 Posted by **David Smith** on 5 Aug 2004, 4:11 p.m.,*
in response to message #4 by Kadambi S

The ACT from an HP21/25/25C/67/97 should work fine. The HP27 ACT is not compatible.

Re: HP97 powers on and nothing works.

*Message #7 Posted by **Kadambi S** on 15 Aug 2004, 2:03 p.m.,*
in response to message #6 by David Smith

I fixed the problem of gummy wheel but the display of all 8's is still there. Any idea where I may be able to get the ACT chip. Thanks.

Re: HP97 powers on and nothing works.

*Message #8 Posted by **David Smith** on 16 Aug 2004, 12:09 p.m.,*
in response to message #7 by Kadambi S

The ACT is a custom HP part. You can use one from the HP21/25/25C/29C/67 but not the HP27. It is the 22 pin 0.4 inch wide chip at the bottom of the circuit board. A display of all 000000000 is the standard bad ACT symptom. I'm not so sure about 8888888888.

Re: HP97 powers on and nothing works.

*Message #9 Posted by **Kadambi S** on 16 Aug 2004, 9:10 p.m.,*
in response to message #8 by David Smith

It was a typo error.It displays all '0's not 8. Do I have to look for an old HP calculator and cannibalize the ACT.

Re: HP97 powers on and nothing works.

*Message #10 Posted by **David Smith** on 17 Aug 2004, 12:55 p.m.,*
in response to message #9 by Kadambi S

Yes, the HP21 is probably your best bet... they are generally cheaper and less likely to be bad than the HP25. Your other option might be to buy another HP97. They can be had on Ebay for fairly cheap if they have some cosmetic problem. If it has a good main

circuit board is is fairly easy to swap out.

Re: HP97 powers on and nothing works.

*Message #11 Posted by **David Ramsey** on 17 Aug 2004, 8:20 p.m.,*
in response to message #9 by Kadambi S

I have an old 21 that works perfectly that you can have if you feel up to unsoldering and transplanting the ACT chip...let me know.

Displaying HMS on 42S

*Message #1 Posted by **Bill (Smithville, NJ)** on 3 Aug 2004, 3:04 p.m.*

The earlier discussion on HMS and that HP doesn't display it in a easy to read format got me thinking about the alpha cababilities on the 42S (and likewise the 41C).

I wrote a quick program that displays HMS as 20 H 10 M 30.12 S and allows for addition and subtraction. Enter the time as HH.MM.SSSS, execute HMS and then enter times to add or substract. It seems to work for positive times. Negative times don't diplay real well.

The display could be changed to ' and " for minutes and seconds.

Note: |- is Alpha Append.

```
LBL "HMS"
XEQ 01
LBL 00
CLMENU
"ENTER"
KEY 1 GTO 01
"+"
KEY 2 GTO 02
"-"
KEY 3 GTO 03
MENU
STOP
GTO 00

LBL 01
CLA
ENTER
AIP
|- " H "
FP
100
X
AIP
|- " M "
FP
100
X
AIP
|- "."
FP
100
X
AIP
|- " S "
RDN
AVIEW
RTN

LBL 02
>HR
X<>Y
>HR
X<>Y
+
>HMS
GTO 01
```

```
LBL 03
>HR
X<>Y
>HR
X<>Y
-
>HMS
GTO 01
```

Re: Displaying HMS on 42S

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Aug 2004, 12:30 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi, Bill;

your program is clever and interesting! After buying my HP42S back in the 90's, I felt the need to represent degrees, minutes, seconds as well. So I wrote the following program: (this is a refined version, after a few "shrinking")

```
01 LBL "HF"
02 ENTER
03 X<0?
04 |- "-"
05 ABS
06 AIP
07 |- "º"
08 XEQ 00
09 R^
10 |-"'"
11 XEQ 00
12 R^
13 |-"""
14 LBL 00
15 FP
16 .1
17 X>Y?
18 |-"0"
19 X^2
20 ÷
21 AIP
22 Rv
23 END
```

Rv and R^ stand for "roll down" and "roll up" respectively. The program intends to be a subroutine that simply adds the HMS representation of the number in the X-register to any existing ALPHA contents (a tag?). It deals with negative numbers as well by simply adding a "-" (minus signal) prior to add the HMS representation. I used º, ' and " instead of D, M and S because of printing issues, mostly. A CLA can be added in the begining, if needed. Also, there is no additional AVIEW or the like to show final ALPHA contents, it must be performed by the "calling" main program.

BTW, if you allow me to, I'd also add a small suggestion:

```
LBL 03
CHS
LBL 02
HMS+
GTO 01
```

Both the HP41 and the HP42S have HMS+ and HMS- as standard HH.MMSSSS additon and subtraction. Both use angle/time values in HH.MMSSSSS format and return a valid HH.MMSSSS angle/time representation. I suggest the above "trick" in order to save some bytes by removing the to- and for- convertions and the extra GTO 01.

Hope you enjoy it.

Cheers.

Luiz (Brazil)

(I edditted the post more than four times; I think now it reads better)

Edited: 4 Aug 2004, 12:45 a.m.

Re: Displaying HMS on 42S

*Message #3 Posted by **Bill (Smithville, NJ)** on 4 Aug 2004, 8:09 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I'd totally forgoten about HMS+ and HMS-.

```
>>BTW, if you allow me to, I'd also add a small suggestion:

LBL 03
CHS
LBL 02
HMS+
GTO 01

>>
```

Great suggestion! Shortens it up quite a bit. Thanks. I need to add a check in the display routine to see if negative before displaying. I'll take a look at your routine to see how you do it. Thanks for posting it.

I really don't have a requirement to do H.MS addition, but I do have a need sometimes to do Minute-Second sums. I think I'll modify my routine to take input as M.S instead of H.MS. Would be a lot easier to enter a long list of minute-seconds.

Thanks for yuor routine & suggestions.

Bill

HP-48G/G+/GX

*Message #1 Posted by **Chris** on 3 Aug 2004, 12:57 p.m.*

This has been asked before I'm sure, but I was thinking about selling my HP-48GX, because I never have and never will use any of the expansion slots, and I never have needed the extra memory provided by the GX. My question is, since I don't need the memory for storage, am I going to see a downgrade in performance going to the HP-48G or should I try to find a HP-48G+. As I understand the sole differences between them are as follows (and please correct me if I'm wrong): GX = 128 KB Memory + Expandable, G+ = 128 KB Memory + Non-Expandable, G = 32 KB Memory + Non-Expandable.

I'm just seeing that I could sell my current GX (because I'll never use it to it's full potential) for $200 + and get a G for $50 or so, and never notice the difference in features/performance for my personal application. Thanks for any responses. Also, G+'s are hard to find on ebay if at all. Any ideas. Thanks!

Re: HP-48G/G+/GX

*Message #2 Posted by **Ron Ross** on 3 Aug 2004, 1:43 p.m.,*
in response to message #1 by Chris

If you just use the calculator as it is without any downloaded software, you probably won't notice any difference or that the plain G is actually a bit more spunky (turns on quicker, no hesitations, which is due to 32K RAM vs garbage dump and longer memory checks with the 128K RAM).

32K is plenty of RAM for personal programs and solver use, if you don't do much in the way of customization.

The G+ has the same 128K as your GX, but no expansion. The G+ sells for $75-100 generally (or did, I seldom check ebay anymore). You might also consider the new Hp48GII, but buy first before you abandon you 48GX (if you hate the keyboard or lack of the nice large enter key).

Do a quick memory check on your 48GX. If you have used over 20K or 25K (and have had it for years), you probably won't need the extra RAM. However, if you have used over 30K of RAM, you would be out of RAM by now on a plain 48G (of course you could have just loaded you 48G up with variables that you wouldn't miss if you did a reset).

Have you ever made use of any downloaded software? This is a great resource and you might visit hpcalc.org to look over what is freely available. Once you downgrade and then want your old 48GX back, you may pay even more for a 48 in much worse shape than what you already have.

A 48G has just enough memory for personal programming and one to two programs depending upon complexity.

A 48G+ has 128K RAM which would allow you to add CAS and some sophisticated programs.

A 48GX has 128K RAM plus the ability to add another 128K RAM to port 1 and 3.5 Meg to ports 2-30 (at 128 K RAM per port). The most common memory config is a 128K and a 1 Meg card. Klotz (in Germany) has these for about $40 and $70 respectfully. This option will not be available if you do not have a GX.

While you may make $100+ in this quick exchange you may or may not end up with a good 48G replacement (ie you will be at the mercy of another ebayer's description). That is why I suggest looking at the new 48GII. However, be warned, its keyboard isn't of the same quality of the older 48G series, though it is a big improvement over the recently discontinued 49G (which was replaced by the 49G+)

48Gii is a 49G+ with only 80K RAM and a serial port. No large enter key, same keyboard layout as the 49G+.

Re: HP-48G/G+/GX

*Message #3 Posted by **Eddie Shore** on 3 Aug 2004, 10:42 p.m.,*
in response to message #2 by Ron Ross

I would keep the 48GX anyway. Having the extra memory is nice just in case you would want to load any future programs.

Re: HP-48G/G+/GX

in response to message #1 by Chris

One more question:

I've seen people offering "HP 48 G with 128kB" at ebay several times. Is this calculator configuration possible? If true, how could I detect how much memory my HP48G contains? The MEM command returns something different, at least not a power of 2.

This may be a dum question - sorry - but it fits into this thread.

Thanks for hints!

Re: HP-48G/G+/GX

*Message #5 Posted by **Ron Ross** on 4 Aug 2004, 8:44 a.m.,*
in response to message #4 by Walter B

It isn't all that hard to add 128K RAM to a 48G and there are articles on Hpcalc.org on how to do just that.

If you calculator was never opened, it don't have 128K.

Memory check (keystroke sequence):

-> memory

nxt

size

This will tell you the size of the variable (which is unimportant probably, but the next line down tells how much memory is available.

If you really want to know how much is in your 48, you do a memory reset which clears out all variables and programs, then do this. You will get 28-30K for a 48G.

Aw: Re: HP-48G/G+/GX

*Message #6 Posted by **Walter B** on 4 Aug 2004, 3:53 p.m.,*

in response to message #5 by Ron Ross

Thanks, Ron!

So, the display says "Mem Available" is 251603 bytes. This is a bit more than 128k Bytes. According to my old professor in Theoretical Physics, a factor of 2 may be neglected. So I am happy with "128k +" in my HP48G. Or did I misinterpret anything?

;-)

Re: Aw: Re: HP-48G/G+/GX

*Message #7 Posted by **Ron Ross** on 4 Aug 2004, 4:18 p.m.,*
in response to message #6 by Walter B

Most likely a case of failing eyesight (or poor light if you need an excuse).

But it is also possible if you purchased your calculator from someone or some German firms add the extra RAM onto 48G's. The 48G can address 256K of RAM directly if you have that much RAM available and merge port 0 and 1.

Ports 2-30 cannot be merge and you would look for those by using these keystrokes:

<- Library ports

If you really have 251603 bytes, you should also see port 2 and 3 as well as the RAM for the 48G is sold in 32, 64, 128, and 512K RAM chips. There would be a good chance that they just used a 512K chip (and you may see port 2 & 3) or doubled up on the 128K (and then you wont see any other ports). You may try the command PINIT.

Chances are you just WISHED you had 256K Ram and you really have only 25K RAM available. Then the rest of this is moot.

Though I hope you do. It would be a nice plus. Did you buy you 48G from someone or from a German retailer (the Ram upgrades seem to be most popular in Germany)?

Aw: Re: Aw: Re: HP-48G/G+/GX

*Message #8 Posted by **Walter B** on 4 Aug 2004, 4:47 p.m.,*
in response to message #7 by Ron Ross

Well, contrary to your assumption, I am still able to count digits up to 6 ;) And I find 251509 bytes following your instruction, PPAR is only 63 bytes - I did a reset recently. Following your last response, I see 2 directories (:0: and :2:). In :2: I find "Library 986: P.C.T. ...". Does this help to clarify the matter?

I bought this calculator from a German in Ebay. The first vendor apparently was a German supplier, according to the label on the backside. No further info available.

OK, eyesight is canceled as cause now. I am looking forward to your next theory.

P.S.: I have no acces to a manual right now - I will read later. Physicists never read manuals. ;-)

*Message #9 Posted by **RABIH Cyril** on 5 Aug 2004, 5:28 a.m.,*

in response to message #8 by Walter B

Hi Walter, you have exactely 384K ram in your configuration. Port 0 and 1 are merged so you have 256K available in port 0 (minus the memory used to manage your system). And you still have another port available in port 2. This memory is a back up memory to save data. The library you have in port 2 is a memory manager which is very usefull when you manage libraries. Enter 2 PVARS and you will see the memory still available in port 2. I think you should have something around 100000. The program stored in port 2 are not erased when you clear the memory of the calculator. You must do it manually (functions DETACH and PURGE). Hope it will help you.

*Message #10 Posted by **Ron Ross** on 5 Aug 2004, 7:41 a.m.,*
in response to message #8 by Walter B

Well now that you CONFESS to owning a 48G of German orgin, and your follow up response, I congradulate you on a great system.

You have a very nice system. You might also check your clock. If it runs fast ie 2x fast, you also have a clock doubler. This is also common from German suppliers. Clock is then worthless, but the calculator will be fast in comparision to any other 48 or even a 49G (I DIDN'T say G+)for most operations.

Loading HP-41 RAW/P41 files into HP-42X

*Message #1 Posted by **HrastProgrammer** on 3 Aug 2004, 3:44 a.m.*

Recently, I was experimenting with the possibility to directly load HP-41 RAW/P41 files into HP-42X emulator and the results of this investigation are presented on http://www.geocities.com/hrastprogrammer/HP42X/rawfiles.htm together with a conversion program and description of the whole process. I was able to load few HP-41 programs (mainly mathematics) and run them inside HP-42X without problem but I would like other users to try this process to see how it is going. So, all HP-42X users who are willing to test it can download the program and try it.

Perhaps a growing database containing HP-41 programs compatible with HP-42X can be built in the future. http://www.hp42s.com can be a good place for it. What do you think, Erik?

I was also experimenting a little with the excellent HP41UC program from Leo Duran which can be used (with a few limitations) to compile HP-42S program listings into RAW format. This is described on the above page, too.

Best regards.

Re: Getting HP to build/market an HP 42SX

*Message #2 Posted by **Frank Travis** on 3 Aug 2004, 3:28 p.m.,*
in response to message #1 by HrastProgrammer

This is addressed to Mr. Hrastprogrammer in particular. With the huge popularity of the HP 41C/CV/CX and HP 42S calculators, it would be nice if HP would design/build (even with other companies involved)and market an HP 42SX that would be able to run code for the above mentioned calculators. It should have the ability to accept SD cards and be able to connect to a PC. If Mr. Hrastprogrammer would license his HP 41X, HP 42X, etc. emulation packages to HP for whatever fee he wants, it may become a reality. I would like to comment that there is a website to bring back a new version of the HP 15C http://hp15c.org:8086/ A similar approack might be used here.

Re: Getting HP to build/market an HP 42SX

*Message #3 Posted by **HrastProgrammer** on 4 Aug 2004, 12:20 a.m.,*
in response to message #2 by Frank Travis

Thank you for the comments.

I would gladly license all my emulators to HP but I doubt they will ever ask this. If they were interested they would already ask, woudn't they?

No problem with HP-15C, either, because I already developed Nut emulation code - I only need the ROM.

Best regards.

Re: Getting HP to build/market an HP 42SX

*Message #4 Posted by **OpenRPN** on 4 Aug 2004, 5:16 p.m.,*
in response to message #2 by Frank Travis

Just wanted to remind everyone that we're doing everything being discussed here over at openrpn.org

One of the form factors will be like that of the pioneer series, and feature an ARM7 CPU, graphical LCD, MMC support (SD requires an NDA, licensing, etc.), USB and Rs-232, a real-time clock, and IrDA. Sound like enough?

Re: Getting HP to produce the HP 42S again! (bastards!!)

*Message #5 Posted by **Paul La Chance** on 15 Aug 2004, 8:41 a.m.,*
in response to message #4 by OpenRPN

I would love to stop cussing out H P for dropping the "best thing it ever made" and band together with others who agree, to: Flood HP with E-mail, or standard postcards (designed by "us")demanding the return of this great "discontinued powerhouse".

If every person pissed at HP for this %$^^*^$@ move, were to let them know "we want it again, now, please!", even the sales geeks that are responsable for our present position would have to listen, especially when their boss' hear of the flood of requests for the HP42S' return to production. (unless of course, the boss' don't care about what HP user want, which so far seems to be the case)

I don't understand why HP would cut the best product they ever made (my opinion) and drop it like a bomb?

Lets find a way to get counted! Like the "HP42S USERS LOBBY" or, you tell me what you think, regarding an action to promote a response from the sleeping "grey matter" presently employed at HP.

Let the BRAINSTORMING BEGIN!

Sincerely,

(owner of an IR printer in top condition collecting dust)

Paul La Chance

Reminder! Campaign for Emu42! (& Emu48 for Pocket PC)

*Message #6 Posted by **Erik Ehrling (Sweden)** on 15 Aug 2004, 10:52 a.m.,*
in response to message #5 by Paul La Chance

For a start - a good way to show that there is still great interest in the HP-42S would be to support the campaign for Emu42 that has now been ongoing for a week! We must certainly collect much more than 700 EUR for the sales people at HP to start to take notice...

If you have not yet visited the campaign webpage I suggest that you do so now:
www.hp42s.com/campaign

Best regards,
Erik Ehrling (Sweden)

Re: Getting HP to produce the HP 42S again! (bastards!!)

*Message #7 Posted by **Jeff O.** on 16 Aug 2004, 7:42 a.m.,*
in response to message #5 by Paul La Chance

Perhaps you or someone else could start something similar to Chris Woodhouse's campaign to bring back the 15C. I'm not optimistic, but you could try.
By the way, I don't think it would be a simple matter of restarting production. I think HP no longer has the capability of producing the old pioneer form. They would have to convert the functionality to some new form factor. I doubt that anyone wants them to base it on the 33S. I think most of us would find it acceptable to base it on the 17Bii+, however:
http://www.hp.com/calculators/images/17bII+_350x350.jpg
It seems to have a proper display, a "conventional" keyboard, soft menu keys and the correct number of buttons. Alas, it would have a small enter key, although at least it could be in the proper location.

Actually, it's in the wrong position! :-)

*Message #8 Posted by **Gene** on 16 Aug 2004, 7:47 a.m.,*
in response to message #7 by Jeff O.

The enter key on the 17bII+ is at the bottom right.

It should be in the middle left!

Gene

Re: Actually, it's in the wrong position! :-)

*Message #9 Posted by **Walter B** on 16 Aug 2004, 10:02 a.m.,*
in response to message #8 by Gene

OK, when we have left no more problems, we'll deal with the position of the ENTER key. IMO, the mapping of keys to functions is "only" software.

Just my 2 Cents ...

But it could be in the right position! :-)

*Message #10 Posted by **Jeff O.** on 16 Aug 2004, 1:17 p.m.,*
in response to message #8 by Gene

> Quote:
>
> The enter key on the 17bII+ is at the bottom right. It should be in the middle left!

That's why I said it *could* be in the right position. Also, on my 17BII, when in RPN mode the (double-wide) key labelled "INPUT" functions as the ENTER key. I have no idea if the 17Bii+ does the same. In any case, as Walter B. says, it's just a software issue. Upon further thought since my earlier post, it looks to me like the current 17Bii+ platform would make a fine basis for a 42Sii. It is easy to imagine that the third row of keys could have the same size and spacing as the top two, rather than the bottom four, except the two leftmost keys would be merged into one double wide ENTER key. While we're dreaming, just add an SD memory slot, and the ability to upload and download programs via that route, and we'd have a real winner.

Anything but software...

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 16 Aug 2004, 1:41 p.m., in response to message #10 by Jeff O.*

It could be fixed by software (even at the user level, if we remember that user-definable keyboards are with us since the HP41C). It could even be fixed by hardware, cutting traces and connecting jumpers at the keyboard circuit level.

But the real hard issues are the size of the key (if you like the conventional, wide ENTER), and the legends on the key and on the keyboard plate. From my point of view, the plate silkscreening is the most frustrating barrier for keyboard modification (in a small scale, I mean)

41CX PAC Module Check

*Message #1 Posted by **Mark** on 3 Aug 2004, 1:26 a.m.*

Without the benefit of any documentation, what is the procedure for testing program PAC modules to ensure they are detected and are operating properly, such as a self-test or similar?

Re: 41CX PAC Module Check

*Message #2 Posted by **Cyril RABIH** on 3 Aug 2004, 3:50 a.m.,*
in response to message #1 by Mark

With rom pac, just type CAT 2 and you'll see a listing of rom available within your CX. If your rom appears that's ok.Press R/S to stop the listing and then use BST and SSt manually to go forward or backward. Once you've reached the ROM tested press ENTER and you'll the listing of the functions available. If you have a x-mem module type EMROOM and you must see 362 (1*xmem) or 600 (2*xmem). Hope it will help you.

Simul. Solve w/ HP 33s

*Message #1 Posted by **f15e** on 2 Aug 2004, 12:52 p.m.*

I bought the HP 33S a few days ago. I am interested in a way to do simultaneous solving. I see a program in the manual, but it looks like it is for 3 equations. I have a TI-89 and TI-92+ which allows you to just enter any number of equations in order to solve for the unknown variables.

Any ideas on a program that allows you to specify the number of equations(variables) you want to solve for? If there is a site somewhere out there that is helpful with HP 33s programs, I would really appreciate the name of the site or link!!

I bought this calculator b/c of the 3 calculators I have, none are allowed for the FE/EIT exam. I am so used to my TI's and getting used to using this HP 33S is not going very well.

Re: Simul. Solve w/ HP 33s

*Message #2 Posted by **martin cohen** on 2 Aug 2004, 2:02 p.m.,*
in response to message #1 by f15e

A while back, I posted 33s code for solving a 3x3 system of linear equations. It used standard code for the determinant of a 3x3 matrix, combined with a routine for exchanging the right column with any of the first 3 columns and used Cramer's rule for getting the solutions without destroying the original information (this is important on a machine with as little data storage as the 33s).

A 4x4 could be done similarly. The hard part would be getting the determinant of a 4x4 matrix. This could be done by the complete expansion (24 terms, each with the product of 4 elements) or using the existing 3x3 determinant routine and expanding by minors.

I have found that mixing rpn and equations works very nicely in coding something like this. An equation does not use the stack, but it cannot be edited.

My current main gripes about the 33s (all easily correctable by HP in a 33s+):

1) Need more labels and variables;

2) Need more storage (As Prof. Seuss said, "On Beyond Zebra!");

3) Make the decimal point more visible.

Martin Cohen

And more importantly---fix the bugs without making new ones!

Re: Simul. Solve w/ HP 33s

*Message #4 Posted by **f15e** on 2 Aug 2004, 2:42 p.m.,*
in response to message #2 by martin cohen

So the only Labels available to be used are A thru Z, therefore only 26 labels? Is there any way to double-up on letters like AA or AC?

I just got this HP 33s and I am in the feeling out process, so forgive me if I ask any stupid questions.

Edited: 2 Aug 2004, 2:46 p.m.

Re: Simul. Solve w/ HP 33s

*Message #5 Posted by **Fubar Vikinghelmet** on 2 Aug 2004, 2:59 p.m.,*
in response to message #4 by f15e

Nope, no doubling-up of labels. It would be nice...

Once the PE exam is over, I'm throwing out (well, I might sell 'em...) my HP33S's and going back to my HP-28S.

Re: Simul. Solve w/ HP 33s

*Message #6 Posted by **Brent** on 2 Aug 2004, 6:47 p.m.,*
in response to message #4 by f15e

The tests are designed such that you won't need to solve
any more than a 3x3 system. You probably won't even have to
solve a 3x3.

Edited: 2 Aug 2004, 6:48 p.m.

Re: Simul. Solve w/ HP 33s

*Message #7 Posted by **Norris** on 2 Aug 2004, 8:40 p.m.,*
in response to message #4 by f15e

If you are taking the EIT or PE exam, then the most important thing about your calculator is that you should feel comfortable with it. Advanced features are of secondary importance -- people routinely pass these exams using ordinary $15 scientific calcs from the drug store. Any problem on the EIT exam can be solved using a basic calculator and the info in the NCEES Reference Handbook (which you should also be very comfortable with).

For most EIT problems, the actual equations are not very complicated; you just have to know how to apply them. For some problems, however, you do have to work with a relatively complex equation, and in such cases you may have an advantage if the equation has been pre-programmed into your calculator. The 33S is good for this because it can store a whole lot of equations.

For example, you will probably find that the time-value of money equation is very helpful with engineering economics problems (see the 33S manual). Store equations, rather than programs, wherever possible because the 33S runs out of labels real fast.

Systems of 2 or 3 linear equations could possibly come up on the EIT exam. But nothing beyond that.

If the 33S doesn't work for you, you might try the Casio FX-115 MS Plus. It's NCEES-approved and widely available for about $15. Not programmable, but it does solve systems of 2 or 3 linear equations.

Re: Simul. Solve w/ HP 33s

*Message #8 Posted by **martin cohen** on 2 Aug 2004, 9:19 p.m.,*
in response to message #7 by Norris

Here is my transcription (from my 33s) of my routines for solving 2x2 and 3x3 linear systems.

==========

These are my routines for solving 2x2 and 3x3 linear equations. They use Cramer's rule (ratio of determinants) to solve the equations. The coefficients are not changed when the equations are solved. This is useful on the 33s, where so few values can be stored.

The routines are:

```
S: Solve 3x3 linear system
        (A,B,C;E,F,G;I,J,K).(X,Y,Z)=(D,H,L)
        det in W
        Result in W (det), X, Y, Z;
        Display is detin X, then X, Y, Z
        Rv if display != 0 to see X, Y, Z

T: Solve 2x2 linear system
        A*X+B*Y=D, E*X+F*Y=H
        Det in W; displayed when computed
        Result in X and Y and regs
        Note these are a subset of the 3x3 systems,
        instead of the expected
        A*X+B*Y=C, D*X+E*Y=F

U: Get det(A,B,C;E,F,G;I,J,K)
V: Swap column (D;H;L) with col (X-reg)
I: Input A..L (uses label J)
        Inputs if X>0; clears if X=0; sets to random if X<0.

Note: "Rv" means "rotate down", "!=" means "not equal to",
      "det" means "determinant".

      Comments indicated by "//".

S: Solve 3x3 linear system
        (A,B,C;E,F,G;I,J,K).(X,Y,Z)=(D,H,L)
        det in W
        Result in W (det), X, Y, Z;
        Display is det in X-reg, then X, Y, Z
        Rv if display != 0 to see X, Y, Z

Or, in matrix form,

(A B C)  (X)   (D)
(E F G). (Y) = (H)
(I J K)  (Z)   (L)
```

```

Simul. Solve

*Message #9 Posted by **f15e** on 3 Aug 2004, 11:42 a.m.,*
in response to message #8 by martin cohen

Hey Martin,

1.) On the code you have above in your post, you have Rv as rotate down. Is this the same thing as Roll Down with the key that has an R with an arrow pointing down?

2.) In the line of code,

"RCL W x!=0? STO/ X // IF DET NOT ZERO, SET X"

did you mean to put the / after the STO or is it just STO X? If it is correct, I am guessing the / is a division sign.

3.) Also, after I have put the code in, how is it run? I am not sure how the program is supposed to be run or what, if any, other equations or other things need to be put in for the program to work.

Forgive me for all the questions, but I am in the learning process.

Thanks for your help!!

Yes - this is because the ascii keyboard has no "down-arrow" key.

> 2.) In the line of code,

Correct again - "/" means "divides".

> I also
> see, as in the line
> of code above, that you have the code all in one line but

> RCL W
> x!=0?
> STO/ X
> correct?

Yep - it's my way of taking fewer lines.

> These may seem like stupid questions,
> but I just want to
> make sure I am doing everything correctly.

If you are just learning the 33s, these seem quite reasonable.

> 3.) Also, after I have put the code in, how is it run? I
> am not sure how the

> things need to be put in for the program to work.

Use the "XEQ" key to run 33s programs.

For example, to run the "solve 3x3 system" code (after the coefficients have been entered into A through L), press "XEQ". The 33s will prompt for a label; you press the key with "S" and the code starting at label S will run.

This is explained in the manual.

```
> Forgive me for all the questions, but I am in the
> learning process. If there
> is a site that explains how to run the code, I would
> appreciate it.

I don't have a web site. But, remember "the manual is your
friend."

> Thanks for your help!!
>
>
You are welcome.

If you have further questions, you should post them to
hpmuseum or the newsgroup comp.sys.hp48. People there are
willing (and often eager) to help neophytes
```

Re: Simul. Solve w/ HP 33s

*Message #11 Posted by **Veli-Pekka Nousiainen** on 8 Aug 2004, 7:27 a.m.,*
in response to message #4 by f15e

```
So the only Labels available to be used are A thru Z,
therefore only 26 labels?
Is there any way to double-up on letters like AA or AC?
==========================================
That would break old code.
I suggest using numeric labels nn for subroutines
Then the GTO(i),XEQ(i) would still jump correctly to main programs.
i=1...26 => A...Z
No LBL 00 (and not GTO 00 or XEQ 00 inside a main program),
since the main program name corresponds to LBL 00.
Example GTO(i), where i=2, would jump to LBL B program
Example XEQ(i), where i=2.10, would call subprogram LBL B
and there the subroutine LBL 10
(and will return after RTN instruction)
Opinions?
'VPN'
```

Re: Simul. Solve w/ HP 33s

*Message #12 Posted by **Norris** on 9 Aug 2004, 2:54 p.m.,*
in response to message #11 by Veli-Pekka Nousiainen

<< I suggest using numeric labels nn for subroutines >>

You can't use numeric labels on the 33S, only the letters A to Z. As stated in the 33S manual (p. 12-3): "The label is a single letter from A through Z...you cannot assign the same label more than once (this causes the message DUPLICAT.LBL)"

<< Example XEQ(i), where i=2.10, would call subprogram LBL B and there the subroutine LBL 10 >>

You can't assign a LBL 10, as noted above. And even if you could, the example would only call the program at LBL B. As stated in the manual (p. 13-22): "Only the absolute value of the integer portion of the number in i is used for addressing."

For addressing labels, i can only be an integer from 1 to 26 (for labels A-Z). For addressing variables, i can be an integer from 1 to 33 (1-26 = variables A-Z, 27 = i-register, 28-33 = statistics registers).

So any fractional values in i are simply ignored. And any integers other than those listed above return the INVALID(i) message.

Am I missing something here ?

in response to message #13 by Veli-Pekka Nousiainen

OK. Now I get it.

Re: Simul. Solve w/ HP 33s

*Message #15 Posted by **f15e** on 3 Aug 2004, 12:47 a.m.,*
in response to message #1 by f15e

Thanks for the information.

Norris, I am just looking to save some time during the test. I know how to simultaneously solve a given number of equations, but three or more equations to solve can take some time; not a lot of time, but more time than using a program on the HP 33s.

Believe me, I am not one who relies on a calculator to do all my work, but when your pressed for time on a test like the FE/EIT, time is precious. I will not be taking the exam until April of 2005, but I want to be very prepared. I know I won't be having much time to spend on reviewing for the FE during the Fall semester, so I am getting in as much as I can right now and learn how to use the HP 33s.

Edited: 3 Aug 2004, 12:49 a.m.

Re: Simul. Solve w/ HP 33s

*Message #16 Posted by **Norris** on 3 Aug 2004, 11:34 a.m.,*
in response to message #15 by f15e

I agree that the 33S could save you some time if a system of 2 or 3 equations came up (you won't get a system larger than that). If I were taking the EIT exam now, I would probably use a 33S and would likely load it with martin cohen's program listed above. As it happens, I took the EIT exam before NCEES banned graphing calculators, so I was able to use the much more powerful 48GX.

Your initial post indicated that "getting used to using this HP 33S is not going very well." My main point is that you need to be totally familiar and comfortable with your calculator by exam time. You have plenty of time to get used to the 33S, but if it never seems to "feel" right to you, then you should not hesitate to switch to some other NCEES-approved model, even if it's just a basic non-programmable scientific. On NCEES exams, your comfort level is more important than any fancy calculator feature.

Re: Simul. Solve w/ HP 33s

*Message #17 Posted by **f15e** on 3 Aug 2004, 11:51 a.m.,*
in response to message #16 by Norris

I am slowly learning the HP 33s Norris. I am sure by the time April comes around I will know it forwards and backwards. I am so used to my TI-89 and TI-92+. It would have been nice to be able to use either one of these calculators and not having had to buy a new calculator, but I guess that's they way it goes.

Re: Simul. Solve w/ HP 33s

*Message #18 Posted by **Ron Ross** on 3 Aug 2004, 12:31 p.m.,*
in response to message #17 by f15e

Have you considered the Hp9G. It is probably most similiar to a Ti-80. But it is a graphics algebraic that is specifically allowed by the NCEES. And it is cheap, about $30 via mail order or if you can find it retail.

Something for you to consider if you don't/can't learn to like your Hp33s.

Re: Simul. Solve w/ HP 33s

*Message #19 Posted by **Norris** on 3 Aug 2004, 12:38 p.m.,*
in response to message #17 by f15e

The NCEES ban on advanced calculators, which was only announced last year, came as a great shock and disappointment to many people. Some folks had been relying on their HP48 for ~10 years, or their HP42S for ~15 years, or even their HP41 for ~20 years.

Edited: 3 Aug 2004, 12:40 p.m.

Re: Simul. Solve w/ HP 33s

*Message #20 Posted by **f15e** on 3 Aug 2004, 7:31 p.m.,*
in response to message #1 by f15e

If anyone has used Martin Cohen's code to do Simultaneous Solving, how is the code used? How do I run and get an answer using the program.

His code is located under this thread and his response is the following:

Re: Simul. Solve w/ HP 33s, martin cohen - 2 Aug 2004, 9:19 p.m.

I would appreciate any help with this code. It seems to use less labels than the one in the manual.

Re: Simul. Solve w/ HP 33s

*Message #21 Posted by **martin cohen** on 7 Aug 2004, 4:59 p.m.,*
in response to message #20 by f15e

Well, all the programs are run using the XEQ command (press the XEQ key, the the starting label of the routine).

To input a 3x3 matrix, enter 0 to clear it, or -1 (anything negative) to generate a random matrix or 1 (anything positive) to explicitly enter all 12 values. Then do "XEQ I". If you have entered a positive values, you will be asked to enter values for A through L. If you have entered zero, all of A through L will be set to zero, If you entered a negative value, random values will be stored in A through L.

To solve a 3x3 system of linear equations, do "XEQ S".

To solve a 2x2 system of linear equations, do "XEQ T".

Note that the 2x2 system is Ax+By = D, Ex+Fy=H.

My code does NOT change the coefficients. The results are in the registers and X, Y, and Z.

Re: Simul. Solve w/ HP 33s

*Message #22 Posted by **f15e** on 8 Aug 2004, 11:55 p.m.,*
in response to message #21 by martin cohen

Martin,

I can't get your code to work by the prompting method. I don't really know where you want me to enter 0 to clear, -1 for RANDOM generation of numbers, or 1 to enter my own numbers.

I enter 0 to clear at the home screen and then 1 enter. After I do XEQ I to get prompts for the coefficients, but after entering the numbers and do XEQ S, I get incorrect answers for X, Y, and Z. The code works b/c I entered each number into their correct coefficient letter with the STO A, STO B, etc... and this works. I just can't get it to work with the prompting method.

I guess if I were clear about this part of your recent reply, I might get it to work:

"To input a 3x3 matrix, enter 0 to clear it, or -1 (anything negative) to generate a random matrix or 1 (anything positive) to explicitly enter all 12 values. Then do "XEQ I". If you have entered a positive values, you will be asked to enter values for A through L. If you have entered zero, all of A through L will be set to zero, If you entered a negative value, random values will be stored in A through L."

Where exactly do I enter zero, a negative value, or a positive value?

Thanks!!!

Edited: 8 Aug 2004, 11:56 p.m.

Re: Simul. Solve w/ HP 33s

*Message #23 Posted by **martin cohen** on 10 Aug 2004, 1:17 p.m.,*
in response to message #22 by f15e

Enter 1, then do "XEQ I". You will be asked for the values in A through L.

To solve the system of equations

```
Ax+By+Cz = D
Ex+Fy+Gx = H
Ix+Jy+Kz = L

enter"XEQ S".
```

The determinant will be in the x-register and W, x in the y-register and X, y in the z-register and Y, and Z in the t-register and Z. Enter "Rv" (rotate down) to get x, y, and z in their respective registers.

Re: Simul. Solve w/ HP 33s

*Message #24 Posted by **f15e** on 10 Aug 2004, 5:07 p.m.,*
in response to message #23 by martin cohen

Ahh, yes. I ended up just writing my own program. I guess I needed to learn how to one day, so I wrote a program for equations with 2 variables and one with 3. It works very well.

Thanks Martin.

HP33S HMS Conversion Bug

*Message #1 Posted by **Dave A** on 2 Aug 2004, 11:22 a.m.*

I have noticed comments on HP33S bugs in your thread. Has this one come up? It occurs on mine and others.

Key in -14.2900 Press HR HMS See -14.2820

Key in 14.2900 Press HR HMS See 14.2900

The error occurs when the angle is negative but not when positive. Does it occur on all HP33S units?

Edited: 3 Aug 2004, 6:32 a.m. after one or more responses were posted

Re: HP33S HMS Conversion Bug

*Message #2 Posted by **bill platt** on 2 Aug 2004, 2:03 p.m.,*
in response to message #1 by Dave A

Hi Dave,

Thanks for posting this.

It seems that between this bug, and the polar conversion bug, we have a real problem to deal with. Not to mention the strange behavior with solve not finding the negative real roots of a quadratic while solving in the equaton mode, and the RAD annunciator bug that Ben Salinas found....and on an on...

we have quite a list growing here.

I will test on both of mine (I bought a 1st release WalMart version along with a newer one) to see if it is consistent(ly bad).

regards,

Bill

I have this bug.

Re: HP33S HMS Conversion Bug

*Message #6 Posted by **Karl Schneider** on 3 Aug 2004, 12:12 a.m.,*
in response to message #1 by Dave A

Dave --

Yup, that's another one!

I get the following on my 33S (CNA4134082)

Key in -14.2900 Press HR HMS See -14.2820 (INCORRECT! -- should be -14.2900)

Key in 14.2900 Press HR HMS See 14.2900 (CORRECT)

I tried a few others. The consistent factor seems to be incorrect reconversion back to H.MMSS from H.DDDD, of a negative H.MMSS value where,

MM = 3n+2 (integer n = 0 through 19); and SS = 0.000

In other words, for any negative H.MMSS with |MMSS| exactly equal to

.02, .05, .08, .11, .14, .17, .20, .23, .26, .29, .32, .35, .38, .41, .44, .47, .50, .53, .56, or .59

->HR ->HMS will yield |MMSS| = .0120, .0420, etc.

Weird! (And unacceptable -- none of the HP-designed calc's make this mistake.)

It seems that certain internal representations of numbers are not being handled in a consistently correct fashion.

Edited: 3 Aug 2004, 12:24 a.m.

Re: HP33S HMS Conversion Bug

*Message #7 Posted by **Dave A** on 3 Aug 2004, 3:53 a.m.,*

in response to message #6 by Karl Schneider

Thanks for the responses and specially your analysis, Karl. A class of 40 navigation trainees apparently all hit the problem here in South Africa. We have not checked out serial numbers, if this has any significance. Mine is CNA41206382. Meantime best for general safety to avoid all negative angle conversions by inspection, changing the sign before and again after the calculation. Ever heard of a calculator recall? - I have not in almost 30 years of dealing in HP calculators. Perhaps warranty, or exchange scheme claims met for goodwill? Guess we would pay in something for a few more labels too!

Re: HP33S HMS Conversion Bug

*Message #8 Posted by **bill platt** on 3 Aug 2004, 7:37 p.m.,*
in response to message #1 by Dave A

Well, this bug has some interesting properties.

the bad result seems to be caused somewherein the digits past what you can get on the screen.

```
                              {display ten 3's}
Instead of doing -0.29 -->HR {.483333333333} -->HMS
with reuslt = -0.282

Try typing in:

.48333333333 (that's 9 "3's"}
and doing
 -->HMS
you get
-0.286  which is correct--as the "6" is worth one hour.
```

(Don't get too upset with this "60 minute" quirk--even the 15c does this in certain rounding circumstances--including this one--if you type in .483...to your limit, the 11c/15c will -->H.ms return ".286" . However, if you do 29/60 --.H.ms, they will return ".29")

Now, even if you get to the .483.... using your own computations--say take -29/60---you will still get the buggy result---so it is not just the conversion program, but perhaps something more fundamental?

BTW, one of Karl's exapmles actually works ok: .08-->hr-->H.MS goes to .076---which is sort of ok).

Replacement Programs for the HR and H.MS:

Not really optimized!

```
LBL U    (type in your H.MS and covert it to HR}
sto A
IP
sto B
RCL A
FP
100
*
IP
STO C
RCL A
100
*
FP
100
*
STO D
60
x^2
```

```
/
RCL C
60
/
+
RCL B
+
RTN

LBL V {type in decimal HRs and get back H.MS}
STO Z
FP
60
*
ENTER
IP
STO x
x<>y
FP
60
*
sto Y
RCL Z
IP
RCL X
100
/
+
RCL Y
10,000
/
+
RTN
```

Of course, this routine is going to give you the "60 minute" thing, but at least it is numerically correct.

Note that you could also do this with an Equation---and then you would only need one variable:

```
H.MS-->HR:
((FP(100*A)/0.6+IP((FP(A)*100)))/60+IP(A)

ck=FBDC
LN=41
```

Floating point didacticism

*Message #1 Posted by **Rodger Rosenbaum** on 1 Aug 2004, 5:09 p.m.*

I have several postings here which indicate that some discussion of what one should expect from the (usually BCD) floating point arithmetic in calculators.
I'll start the discussion with an example to think about. In the V8N1 issue of Datafile, Wlodek Mier-Jedrzejowicz had an article about the "Savage" benchmark. The benchmark is called "Savage" not because it is vicious, but because Bill Savage presented it in Byte magazine.

It is, in HP71 Basic:

```
5 RADIANS
10 A=1
20 FOR I=1 TO 2499
30 A=TAN(ATN(EXP(LOG(SQR(A*A)))))+1
40 NEXT I
50 PRINT A
```

Upon first examination, one thinks that the calculator should get a result of 2500.00000000 if it did everything as it should. But this is not so. The HP71 actually gets 2499.99948647.
Should we be disappointed by this result? (All the other Saturn based machines, such as the HP48 get this result also.) What result should we expect, if not 2500.00000000, and why?

Re: Floating point didacticism

*Message #2 Posted by **John Limpert** on 1 Aug 2004, 6:03 p.m.,*
in response to message #1 by Rodger Rosenbaum

The benchmark isn't necessarily telling you anything about the quality of the floating point arithmetic. The result is heavily dependent on the math library's implementation of a certain set of functions. In most function implementations, there are tradeoffs between speed, space and accuracy. Plus you need to know if the implementation is well-behaved and meets its maximum allowable error requirement over its entire range.

Re: Floating point didacticism

*Message #3 Posted by **tony** on 1 Aug 2004, 9:49 p.m.,*
in response to message #1 by Rodger Rosenbaum

```
Hi Rodger,
[...]
> In the V8N1 issue of Datafile, Wlodek Mier-Jedrzejowicz
> had an article about the "Savage" benchmark.

Thanks for mentioning that article - from January 1989, and a
very interesting set of results. For post-1989 machines, the
following "HP-Solver" code works on the HP19BII and 200LX (The
19BII needs colons instead of commas and the Greek capital
Sigma instead of SIGMA):
```

```
0*L(A,1)+SIGMA(I,1,N,1,
0*L(A,1+TAN(ATAN(EXP(LN(SQRT(g(A)*g(A))))))))
+L(B,g(A))-B

2499 N and solving for B gives:
2500.00005173 on the 19BII
2499.999999998308 on the HP200LX

It took 3.5 minutes on the 200LX and 6 minutes on the
19BII. The 19BII result surprised me as the machine is Saturn
based but the result is only .00005 too high whereas the other
Saturn based calcs give the 2499.99948647 which is .0005 too
low.

[...]
> Upon first examination, one thinks that the calculator
> should get a result of 2500.00000000 if it did everything
> as it should. But this is not so.  The HP71 actually
> gets 2499.99948647.  Should we be disappointed by this
> result? (All the other Saturn based machines, such as the
> HP48 get this result also.) What result should we expect,
> if not 2500.00000000, and why?

I was just pleased to make HP-Solver do the calculation<G>. On
my 200LX QB4 happily gave me 2477.244 in single precision but
when I put the same code in Power Basic, also in single
precision, it just displayed "2500". In DBL precision it gave
"2500.00000000001" and in extended precision "2500" again. And
the 200LX doesn't have a math co-processor. Power Basic seems
quite impressive!

Tony
```

Re: Floating point didacticism

*Message #4 Posted by **tony** on 1 Aug 2004, 10:50 p.m.,*
in response to message #3 by tony

DataFile V8N8 has a much more elegant Savage Solver equation than the one I gave. Wlodek (DataFile V8N8 page 25) gives this beauty for the HP-27S which works fine on the 19BII and 100/200LX:

```
{T=0*SIGMA(I:2498:0:-1:L(X,1+TAN(ATAN(EXP(LN(SQRT(SQ(X))))))))+X}
```

You need to remember to start it off by storing 1 in X, and then solve for T. DataFile V8 has three articles by Wlodek on this "Savagery" :) Very interesting.

Tony

Hi,

With an HP86b (capricorn CPU), I got 24499.99942403

```
5 RAD
7 t=TIME
10 A=1
20 FOR I=1 TO 2499
30 A=TAN (ATN (EXP (LOG (SQR (A*A)))))+1
40 NEXT I
50 PRINT A
55 PRINT HMS$ (TIME -t)
```

```
60 END
 255553
run
 2499.99942403
00:01:22
```

Olivier

*Message #6 Posted by **Garth Wilson** on 2 Aug 2004, 3:24 a.m.,*
in response to message #1 by Rodger Rosenbaum

Without working through the details, I might say that it's not necessarily that there's anything wrong with the arithmetic, but that non-linear functions will require greater intermediate precision to get what you seem to be after.

For example, suppose we only had 4-digit floating-point precision, and we square 2500, and take the log. Going to 6 digits, the answer is 15.6481, but we only have 4, so we'll round (correctly) to 15.65. The antilog of that number is 6261936, but we only have 4 digits, so we round, again correctly, to 6,262,000. We've done everything correctly, and yet half of our 4 digits are already wrong. (2500 squared is 6250000.) Taking the square root and correctly rounding, we get 2502. Actually the rounding in this one improved the accuracy, but the last digit is two counts off. If you do this several times, the error will compound.

Or take the cosine and arccosine functions. The cosine of .5625º still rounds to 1.000 if you only have 4 digits. When you take the arccos of that, you correctly get 0.000. Now you have 0.000 versus .5625º. If you take sine of .5735, you get .9999, but then taking the arccosine of .9999, you get .8103, so even the most significant digit is way off.

So does that mean we need 20 or 30 digits though?

I can't speak for others' fields of work; but for my own, generally the loss of precision means that somewhere along the way, it didn't matter that much. If you're taking the tangent of a number near ±90º, what appears to be a huge loss of accuracy in the tangent may translate to an insignificant error in the angle. Keeping 2-digit accuracy in the tangent on your real-life product may require impossibly tight control of the angle, and you probably approached the design entirely wrong.

For a given number of digits' precision, it is impossible to have the accuracy be the same number of digits for certain functions. It doesn't mean anything is wrong. The 10-12-digit precision of most calculators is far beyond what most of us need for real-life applications.

*Message #7 Posted by **Pierre Brial** on 3 Aug 2004, 1:08 a.m.,*
in response to message #1 by Rodger Rosenbaum

Here is some results of the Savage benchmark with various vintage calculators :

Basic programmable (all Sharp):

PC-1262 : 2499.98731

PC-1403 : 2499.98731

PC-1475 single precision : 2499.987313

PC-1475 double precision : 2499.9999999999925

PC-E500S single precision : 2500.000056

PC-E500S double precision : 2499.9999999999999

Keystroke programmable :

HP-11C : 2499.970322

HP-41C : 2499.970322

HP-32SII : 2499.99948647

I don't know if this test is reliable about accuracy, but it gives interesting hints about the algorithm similarity between machines. For example, the seemingly different HP-41CX and HP-11C give the same result. Performing this test is a lenghty process for these old ladies. It takes one hour and one minute for the HP-41CX to deal with it.

All the best

in response to message #7 by Pierre Brial

I wonder what Rodger was looking for when he started this thread :-) The Savage benchmark teaches one about the similarities and differences between various calculators - and it provided an interesting exercise in programming on calculators such as the HP-27S that are programmable only through the Solver. Given correct algorithms, the accuracy of the result depends on the number of digits of precision that calculator (or programming language) uses. I was more interested in the relative speeds of the calculators and hand computers when I wrote those articles. How fast would it be on a 300MHz PDA? ;-)

Help with HHC 2004

*Message #1 Posted by **Namir** on 1 Aug 2004, 1:43 p.m.*

Hello Gene or anyone else,

I am trying to make reservations at the Radisson hoel where the HHC 2004 rvrnt will be held. I have found one on the internet on north fourth street in San Jose, CA, but they seem to be ignorant of the event and the $69 room rate for teh conference. Can someone email me the info (like the phone number) for the right Radisson hotel???

I really appreciate your help.

Namir

HHC2004 hotel

*Message #2 Posted by **Gene** on 1 Aug 2004, 9:50 p.m.,*
in response to message #1 by Namir

Should be:

http://www.radisson.com/sanjoseca

Radisson Hotel San Jose Airport

1471 North Fourth Street, San Jose California 95112, US

Reservations: 800 333-3333

Telephone: (408) 452-0200 Fax: (408) 437-8819

Email: rhi_sanj@radisson.com

Re: HHC2004 hotel

*Message #3 Posted by **Namir** on 1 Aug 2004, 10:49 p.m.,*
in response to message #2 by Gene

Thanks Gene!!! See you there!

Namir

Re: HHC2004 hotel

*Message #4 Posted by **Gene** on 1 Aug 2004, 11:19 p.m.,*
in response to message #3 by Namir

From the HHC organizer:

"That is the right hotel, number and all . . . Sorry for the inconvenience. Please call the same Radisson again, and ask for Dee Kellogg, the Catering Sales Manager. She will straighten it out, and I am sure direct the staff, etc. not to let it happen again. "

Tape drive problem

*Message #1 Posted by **David Ramsey** on 1 Aug 2004, 12:27 p.m.*

I just acquired a spare 8216A digital cassette drive from eBay. It wasn't advertised as working, but for $30 including 1 used and two new tapes, it was a no-brainer.

The drive works mechanically: that is, tapes spin, it goes throw the NEWM routine, and so forth. Most attempts to read and write from the unit fail with a "medium error" (once or twice I've gotten a good directory listing).

A closeup of the tape head shows the likely problem:

http://www.neko.com/tapehead.jpg

The question is "Is this contamination of some sort, perhaps flaked oxide, that can be removed, or is the head toast? " Medium hard rubbing with a cotton swab has no effect.

Re: Tape drive problem

*Message #2 Posted by **Emmanuel, France** on 1 Aug 2004, 1:20 p.m.,*
in response to message #1 by David Ramsey

Did you dip the swab of cotton wool in surgical spirit? I used that to clean my Revox AT77and HP82161A Digital Cassette Drive heads.;o)

Re: Tape drive problem

*Message #3 Posted by **David Ramsey** on 1 Aug 2004, 3:02 p.m.,*
in response to message #2 by Emmanuel, France

Vigorous scrubbing with an alcohol-moistened swab worked. The old tape was discarded. I unwrapped one of the new tapes that came with the unit and it reads and writes perfectly.

So $30 got me two new tapes and a working drive. Not bad!

Re: Tape drive problem

in response to message #5 by David Ramsey

```
You can replace the dead band.
I used audio cassette band when I did not have new sealed HP82176A cassettes.
It was really hard and took several hours.
I wrote somewhere something about that surgical operation.
```

Metal polisher...

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 1 Aug 2004, 8:38 p.m.,*
in response to message #3 by David Ramsey

Hi, David;

after seeing the picture, it seems ot me old-tape "leftover" grasped in the head surface. I used to deal with magnetic tape drivers (professional audio devices) and in most cases, when no spare tape head was found, cleaning with non-abrasive, liquid metal polisher was enough. With one side of the swab moistened with the liquid metal polisher you gently rub the head surface. When the liquid dries out, use the other side of the swab (supposing cotton in both edges) and then you rub with a bit of pressure, as if polishing it. You'll see it becomes a mirror-like surface, in most cases. Efficiency usually goes more than satisfactory, and tape surfaces will "thank you" for a non-scratching head...

A very important remark: use this technique only when you have "crusts" or any other material that refuses to be removed with regular cleaning liquids, like alcohol. Metal polishers remove a thin coat of

the surface (chemically) and using them constantly will reduce head life. Degaussing may also be usefull.

My 1¢.

Luiz (Brazil)

Re: Tape drive problem

*Message #11 Posted by **Diego Diaz** on 2 Aug 2004, 4:28 p.m.,*
in response to message #1 by David Ramsey

Hi David,

Hope this can help you:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24257

Please note that when I said: "constant angular speed" it meant: "constant sum of the angular speeds of both rotors", appart from that the description if fairly accurate.

Best wishes

Diego

17bii programming

*Message #1 Posted by **hugh steers** on 1 Aug 2004, 10:26 a.m.*

is it possible to call one formula from another inside a 17bii program, ie to have subroutines?

thanks for any info,

Re: 17bii programming

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Aug 2004, 11:56 a.m.,*
in response to message #1 by hugh steers

Hi, Hugh;

what I know that is possible (although it is not what you ask for, but may help as well) is saving the results from the "other formula" in a user variable and call this variable contents from another formula.

If you update the "common procedure" before using its results then it works the way I see it, but I don't know if the SOLVE menu will "open" menu keys for both formulas (variables) at the same time. Also, if your experiment lead you to this sort of reasoning, it is more likely that you already know about what I wrote here... ;-)

Not that much for an answer... Should I count it as a 1¢ contribution?

Cheers.

Luiz

Re: 17bii programming

*Message #3 Posted by **bill platt** on 9 Aug 2004, 10:38 a.m.,*
in response to message #1 by hugh steers

What about the let and get functions? They are supported but undocumented in the 17bii.

I don't understand them well, but they seem to make lots of stuff possible!

the 19bii manual documents the let and get.

And a good example of their use was posted here (find it in the archives) for implementing trigonetrics.

hp34c compatible charger?

*Message #1 Posted by **marais** on 1 Aug 2004, 9:20 a.m.*

I recently acquired an HP34C with a US charger. I was hoping the 34C was using the same charger plug as the classic machines, but unfortunately it uses its own plug (I seem to be the only collector surprised of this fact). Being in need of a european charger, my question would be: SInce I've never seen this kind of charger on ebay, which compatible machines do have the same plug layout? Maybe by bidding for another, less demanded machine, I might get my european charger.

Andreas

Re: hp34c compatible charger?

*Message #2 Posted by **Emmanuel, Frankreich** on 1 Aug 2004, 11:26 a.m.,*
in response to message #1 by marais

```
Dear Marais,
There's several adapters/chargers for this use.
Please see below (non exhaustive list :
HP82090B 220V (France, Germany, ...)
HP82087B 90-120V
HP82119B 115 or 230V (France, Germany,... with pin adapter)
...
There's also the Reserve Power Pack for Series E calculator (HP82103A).
You can use two 1.5V alkaline or two 1.28V rechargeable batteries. R6 or AA size.
For the last ones, a charger with 2 or 4 slots can be bought from your general store.
```

Please see my selling list for further information.

```
 There's pictures and details.
Mfg.
Emmanuel
```

Re: hp34c compatible charger?

*Message #3 Posted by **db (channeling Norm again)** on 1 Aug 2004, 11:44 a.m.,*
in response to message #1 by marais

The spice series (31e, 32e, 33e/c, 34c, 37e & 38e/c) are the only ones that use that adapter plug and none usually go really cheap. Still you might just want another model now that you have been bit. If you are not going to save programs; you might consider using AA cells that are charged on a seperate charger, or regular (and maybe slightly pre-used) ones. Charging spice batteries in the calculator is theoreticly dangerous because if the battery is not making good contact you can fry the calc.

Now the Norm part: Congratulations on acquiring the best calculator known to man.

Edited: 2 Aug 2004, 12:12 a.m.

Re: hp34c compatible charger?

*Message #4 Posted by **Tony Duell** on 2 Aug 2004, 2:04 p.m.,*
in response to message #3 by db (channeling Norm again)

The internal charger circuitry of the Spice (HP31E, HP32E, HP33C, HP33E, HP34C, HP37E, HP38E, HP38C) and Woodstock (HP21, HP22, HP25, HP25C HP27) is identical (consisting essentially of a diode and an 8.2 Ohm resistor). The external transformers also have much the same characteristics.

You could therefore use the charger from a Woodstock machine if you changed the output connector (e.g. by using the cable/plug from the charger that came with your 34C). There are 2 versions, the -B is supposed to be used with models with continuous memory. It has a couple of zener diodes in inverse series across the output (I think they're about 18V each), to remove voltage spikes that could corrupt the continuous memory.

Please also read the warnings about charging batteries in continuous-memory Woodstock and Spice models. If the battery pack goes open-circuit, the RAM chip (HP custom, almost impossible to find) can be destroyed. The safest way is to use the reserve power pack, but the one for Spice models is particularly hard to find. Alternatively you could use a non-continuous-memory machine -- even a non-working one -- to charge your battery pack.

Re: hp34c compatible charger?

*Message #5 Posted by **Jean** on 2 Aug 2004, 2:56 p.m.,*
in response to message #4 by Tony Duell

Someone is selling one on ebay at a reasonnable price.

Re: hp34c compatible charger?

*Message #6 Posted by **marais** on 2 Aug 2004, 3:30 p.m.,*
in response to message #5 by Jean

Thank you for all your suggestions! I decided to get myself a 38C with a 220V charger. I was not aware of the fragility of the 34C; the idea of an external charger sounds indeed appealing. I'll give it some thought.

Andreas

Are you selling a copy of it in your emulator :
```

Modules included in HP-41X ???

Re: 71B and Emulators

*Message #4 Posted by **HrastProgrammer** on 1 Aug 2004, 4:21 a.m.,*
in response to message #3 by Stéphane Barizien

No, I don't ... I only sell the emulators.

As you can see, the PANAME ROM is mentioned under the section 'Other modules: (can be loaded individually)' so it is not included with HP-41X. This means that I can convert this module to the HP-41X format in case an owner of this module want to use it with HP-41X and asks me to do a conversion. I include only modules which can be freely downloaded from the Internet (either from "the

other site which name cannot be mentioned here" or from some other sites) and only because they must be converted to the format recognizeable by HP-41X and many users weren't able to do this correctly in the past. For modules which aren't available in such way, I can provide appropriate conversion program so an user can convert a particular module and load it into HP-41X with LDRM.

I appologize if the reference to your module caused any problems to you. To avoid possible problems, I have removed a reference to PANAME from my page and I consider it as unsupported in HP-41X (this means it cannot be loaded into HP-41X and used in HP-41X). Furthermore, I changed the word 'included' to 'supported' which is much more appropriate.

If anyone else thinks that a reference to some other module must be removed then, please, notify me and I will gladly remove it.

I remember a problem with some Forth module few years ago. It was freely available for download from a french site and I asked a french owner of this site if I can include it with my freeware emulator HP-41E (because I thought it could be useful for some people) and I got a permission. Then some other french guy asked me if I have a permission. Because I didn't know whom else I must ask for a permision, it was much simpler to remove a module and support for it.

Best regards.

HP-01

*Message #1 Posted by **Yvon Logelin** on 30 July 2004, 2:15 p.m.*

I have a HP-01 calculator watch which is defective.Now I am looking for someone who can repair this watch.Who can help me?

Re: HP-01

*Message #2 Posted by **Eric Smith** on 30 July 2004, 9:04 p.m.,*
in response to message #1 by Yvon Logelin

Unless there's only something very simple wrong with it, like corrosion of a battery contact, there's no way to repair it. All the electronics is in a single hybrid module. Even when repair service was available from HP, repairs generally consisted of throwing away the hybrid module and installing a new one.

I'd like to get a non-functional HP-01 module (or a complete non-functional watch) for reverse-engineering. I want to take apart the module and photomicrograph the ROM chips to extract the bits for use in the Nonpareil simulator, as Peter Monta did with the HP-35. But obviously I'm not willing to do this to a working HP-01.

There is a U.S. patent on the HP-01 that includes some ROM source code, but it is definitely NOT the final release of the code as present in the actual product. The keyboard layout is slightly different, and the code in the patent is too large to fit in the two quads of ROM in an actual HP-01.

What's you're favorite HP Calc and Why

*Message #1 Posted by **John** on 30 July 2004, 1:36 p.m.*

Just curious... what is your favorite HP calc and why? I'd answer this myself, but I don't know if I can. I like all of mine.

The first one I ever bought was a 12C back in 1987. This got me through business school, so I guess it has tons of sentimental value to me.

I also love my 48gx... it can do darn near everything. Not as much sentimental value, but a true workhorse.

Re: What's you're favorite HP Calc and Why

*Message #2 Posted by **Bill (Smithville, NJ)** on 30 July 2004, 3:04 p.m.,*
in response to message #1 by John

John,

What a loaded question :) Kind of like asking which snack food or desert is my favorite.

Over the years my favorite HP has changed. Once I would have said the HP-41CX. Today, I have two favorites: HP-11C and the HP-42S.

The HP-11C is my main "General" calculator. It's a great size to slip into the shirt pocket to take to meetings. It has all the features that I need for general calculations.

The HP-42S is my main "programming" calculator. The two line display, the alpha features, the menu system - let me repeat - the menu system, and runs all my HP-41 programs, only much faster. It easly prints to an IR printer (no wires) It's still thin enough to fit into my shirt pocket to take to a quick meeting at someone else's desk. Did I mention the menu feature?

If I had to choose only one HP then it would be the 42s.

I'm sure you're going to get a range of opinions on this question John - probally based on each person's background and actual use requirement.

Re: What's you're favorite HP Calc and Why

*Message #3 Posted by **Chan Tran** on 30 July 2004, 3:29 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

This question has been asked before and started quite a discussion.

Re: What's you're favorite HP Calc and Why

*Message #4 Posted by **Hank** on 30 July 2004, 6:25 p.m.,*
in response to message #3 by Chan Tran

I have had great service from my HP-45 *; HP-55 (failed early in its life; HP-19C loved the printing system (It died); HP-41C (Sold); HP-41CV (Sold); HP-41CX *; HP-71B *; HP-75(C??) *; HP-48SX *; HP-11C (sold); HP-12C **; HP-15C **; HP-16C ** and all of the various items related to the HP-41 series. Card reader dead. I have an HP-97 with a bad printer and card reader. How can I tell you which one I "enjoyed".

* Still own but no batteries ** Still own and may put on the market - all in working condition. I miss the HP place in the market.

Re: What's you're favorite HP Calc and Why

*Message #5 Posted by **Richard (Athens, Greece)** on 9 Aug 2004, 9:12 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

I'm a wild 42S partisan because of the menu system. I repeat, the menu sustem. Thanks, Bill (Smithville, NJ)...it can't be repeated enough.

Also, the two-line display serves RPN to perfection. If all RPN calcs had had two-line displays from long ago, I would bet that most cheapo, four-function calcs would be RPN today!

Also, you can use any character in a variable name. There are none of those stupid, forbidden "object delimiters" and mathematical function symbols. Used with imagination, the menu keys can become extremely intuitive and powerful. When I bought a 48G to "replace" my 42S, I found that 36 of the 60 or so variables that I used in my programs were illegal. It was a big disappointment.

The 42S arrived when most of the (expensive) 41's were still out there and working marvelously so most people didn't rush out to buy another fairly expensive calculator. No doubt its shortcoming, no input, put other potential buyers off. Still, I think that most people who somehow actually did acquire a 42S and use it (for day to day work...in my case, surveying) really love it.

Long live the 42S! (I'd like a three-line display...)

Richard

Re: What's you're favorite HP Calc and Why

*Message #6 Posted by **Vincent Weber** on 9 Aug 2004, 10:13 a.m.,*
in response to message #5 by Richard (Athens, Greece)

Richard,

I fully agree with you. I know Valentin would kill me for that... :), but I think that the 42s was a much better machine than the 15C (which was already an outstanding machine to me, don't get me wrong), and as such, it was a more than worthy successor to the 15C in 1988. True, the 15C was (a bit) smaller and lighter. But that's about it. The 42S brought speed, ability to store many programs, 41C compatibility, alphanumeric display (both keycodes and messages), complex numbers in polar forms, and tons of other functions - all this in in a very small and unassuming package ! To me these more than offsets the cool form factor of the 15C. And yes, I like the menus - I find them efficients and not cumbersome at all. The only thing I really hate about the 42S is the 2-stroke alpha entry. I think that the 41C design was better was a direct alpha keyboard. However, the 42s requires less intensive usage of the alpha keyboard given the menu system , the custom menu and the automatic prompt of variables names, so you suffer only when entering alpha messages or variables names for the first time. I also hate the lack of I/O, but what to do. On the rom for improvement side, I really would like a good equation entry mode (a la 17BII) and a good fraction mode (a la 32SII). This, plus a small USB port, would make it absolutely perfect. And some hacking capabilities a la 41C would be great...

Cheers,

Vincent

Some 15C advantages over 42S

*Message #7 Posted by **Karl Schneider** on 9 Aug 2004, 10:38 p.m.,*
in response to message #6 by Vincent Weber

Vincent posted,

> ...but I think that the 42s was a much better machine than the 15C (which was already an outstanding machine to me, don't get me wrong), and as such, it was a more than worthy successor to the 15C in 1988. True, the 15C was (a bit) smaller and lighter. But that's about it.

I agree with most of what you stated, with a few exceptions:

1. I don't believe the 42S to be the direct successor to the 15C, although it's true that the 42S is the only RPN (not RPL) model that has every function the 15C had. The 32S was more equivalent, but lacked a few important capabilities. I see the 42S as a much-improved "calc-only" replacement for the 41CV, but lacking the expandability and I/O.

2. Besides the slightly-smaller size, the 15C had several advantages over the 42S:

- *15C display is much more legible*. This is hard to overstate; it is a critical attribute of any calculator. Characters on the 42S are much smaller, less crisp, and the display is very sensitive to viewing angle. It's why I prefer to use the 32SII or 15C, unless I need some feature those ones don't have.

- *15C matrix descriptors include single-letter identifiers.* This is important in matrix algebra, because only the addition operation is commutative. The user must know which matrix is which...

- *Every 15C function is readily accessible.* Perhaps that's a dubious "attribute" stemming from non-alphanumeric display and smaller function set, but it's nice to not have to "surf" for Roll Up and hyperbolic functions.

Re: Some 15C advantages over 42S

*Message #8 Posted by **Vincent Weber** on 10 Aug 2004, 4:12 a.m.,*
in response to message #7 by Karl Schneider

Hi Karl,

I agree with the advantages you stated, especially regarding the matrix descriptors. This actually makes me prefer the '41 Advantage module matrix routines over the 42S ones (Entering A,B,C in the alpha register, then execute M*M is less ambiguous and cumbersome than RCL A, RCL

B, having [3x3] twice on the stack, pressing '*', and then having to do 'STO C' to have the results in C !.

Where I don't agree is that I really think the 42S was meant as a sucessor to the 15C. This is the way it was advertised in Educalc. To support this view, the 15C was discontinued soon after the 42S was released (less than a year), while the 41CV and 41CX were still produced for two years. The 42S, while having improvements over the 41C, also have huge drawbacks, such as the lack of I/O, which definitely prevented it from competing in this high-end space. Not even the 28S could. HP discontinued the '41 only after releasing the 48SX, which was the true successor to the 41CX (altough a lot of 41 fans may not see it that way and may not be big fans of the 48). Personnally, I like both 41 and 48 series a lot, and I also like the 15C and 42S in the lower segments (i.e. powerful but not I/O).

Cheers, Vincent

HP-67

*Message #9 Posted by **John Limpert** on 30 July 2004, 4:26 p.m.,*
in response to message #1 by John

It would have to be the HP-67. Unfortunately, I sold it many years ago, in an overzealous fit of house cleaning.

When I first received it, I was overwhelmed. It had every feature that you could think of, in a perfectly designed handheld package. It was the perfect calculator. The card reader/writer was tiny and reliable. The documentation was extensive and extremely well written. There was a wide variety of application pacs and user written software. Everything about it was first class.

* The HP-45-- I saved for months to get one in college. It was the pre-eminent scientific calculator for several years after its introduction.

* The HP-41 series. This is what we bought back in the lates 70s instead of personal computers-- heck, it _was_ a personal computer! The expandability was astonishing. Still is, come to think of it. It was also the first calculator with an alphanumeric display.

Re: What's your favorite HP Calc and Why

By the time I needed calculators the 41 was not here anymore but I got one quite recently and I have to say as a calculator it is quite crap as so many of the functionality is so hard to access. I was however quite impressed (given its age) with the way it can be used as a sort of handheld computer.

So in the end I would say the 41 is a really crap calculator but an outstanding computer.

I will thus not vote for the 41. For calculator, I would hesitate between 11 and 32 (I don't have 15 or a 42 and my bank account does not allow me to). So in the end it will be the 33s because it is readily available.

Arnaud

PS: I know, last time I voted for the 45 but I came to realise recently that it is just too big and likes batteries too much...

in response to message #12 by Arnaud Amiel

> so many of the functionality is so hard to access

That's why it had key assignments. Problem solved. It didn't allow multiple KEY files like the 71, but you could have your own programs to set up a new set of key assignments using PASN (programmable assign). I always found 1 USER keyboard to be enough though.

41C/V/X key assignments

*Message #14 Posted by **Karl Schneider** on 31 July 2004, 4:50 p.m.,*
in response to message #13 by Garth Wilson

From Garth's post:

> Quote:

> >
> > That's why it had key assignments. Problem solved. ... you could have your own programs to set up a new set of key assignments using PASN (programmable assign)...

"Problem solved", until another program doesn't run properly because it expects a different key assignment than the one you previously made for other purposes. (This has happened to me.)

If you install a template to identify all your key assigments, you can't readily see the regular "non-USER" functions.

One would probably want to have two programs of "PASN" commands -- one to make all the special assignments, and one to clear them all.

No, I'd consider the menus of the 28C/S, 32S, and 42S a better way to make more functions conveniently available. But, that development was seven years down the road.

Re: 41C/V/X key assignments

*Message #15 Posted by **Garth Wilson** on 1 Aug 2004, 2:13 a.m.,*
in response to message #14 by Karl Schneider

> "Problem solved", until another program doesn't run properly because it expects a different key assignment than the one you previously made for other purposes. (This has happened to me.) <end quote>

Each program can make its own key assignments. Remember also that the local alpha labels A-J don't need any key explicit assignments-- they're automatic for whatever program you're in.

If that's not enough, you can use GETKEY followed by GOTO IND X, or use GETKEYX.

> If you install a template to identify all your key assigments, you can't readily see the regular "non-USER" functions. <end quote>

The only template I have does have the non-USER keys labeled as well.

> One would probably want to have two programs of "PASN" commands -- one to make all the special assignments, and one to clear them all. <end quote>

Again-- each program can make whatever key assignments it needs. But to clear them all, it will sometimes be better (certainly much easier) to have it just clear the USER flag.

I've done all these in various 41cx programs and probably more I'm forgetting right now. I've done menus too. The 41cx can do a lot more than meets the eye.

HP-41 as calc vs. 15C

*Message #16 Posted by **Karl Schneider** on 31 July 2004, 4:17 p.m.,*
in response to message #12 by Arnaud Amiel

Arnaud posted,

>
> *So in the end I would say the 41 is a really crap calculator but an outstanding computer.*

I agree completely (whith different phrasing, perhaps..). The impressive aspects of the 41C/V/X are its expandability and its family of peripherals, not its utility as a pure handheld calculator.

Back in 1980-81 as a 17-year-old, I was enthralled by the costly 41C, but couldn't afford its $300+

price. I would experiment with it at several retailers, including the college bookstore in my freshman year. There, on separate occasions, I overheard two people disparage the new 41 to the electronics-department manager:

"It's terrible -- I hate it", said a fifty-ish man in a wheelchair.

"It's the all-time bad calculator", said a younger guy in his unfortunate nasal voice.

The manager and I looked at each other and shrugged after these exchanges ended. Unspokenly, I attributed the sentiments of the two men in part to some personal bitterness they might have had.

I ended up buying a more affordable and appropriate HP-15C two years later from that bookstore, and used it faithfully through three college-degree programs.

About two years ago, I finally bought a nice used halfnut 41CV. I still like the 41, and have acquired a fullnut 41CX and fullnut 41C, as well. However, particularly in view of my experience with the 15C, I see clearly what those two guys were talking about more than 20 years ago. Here's a comparison:

	HP-15C	HP-41C/V/X
Starting List Price	$135	$325
Linear Regression	on keyboard	Stat Pac
Permutation/Combination	on keyboard	No
Factorial	on keyboard	Alpha
Gamma Function	on keyboard	No
Hyperbolics	on keyboard	Math Pac
Complex-valued math	on keyboard	Math Pac (some)**
Matrix operations	on keyboard	Math/Advant Pacs+
Solve (rootfinding)	on keyboard	Math/Advant Pacs*
Integration	on keyboard	Math/Advant Pacs*
"Roll Up" function	on keyboard	Alpha
Set Deg/Rad/Grad mode	on keyboard	Alpha
Convert Deg<->Rad	on keyboard	Alpha
Convert H<->HMS	on keyboard	Alpha
Delta %	on keyboard	Alpha
RND, INT, FRAC	on keyboard	Alpha
Display legibility	excellent	good to fair***

** The exact same programs are also available on the Advantage Pac, but are implemented as RPN routines that are cumbersome and not nearly as complete as the built-in microcoded functions on the 15C.

+ Math Pac implementation is a set of slow, cumbersome RPN routines; the Advantage Pac offers an extensive set that exceeds the capabilities of the 15C. Some of these in the Advantage Pac are microcoded functions.

* The Math Pac implmentations are crude RPN routines; the Advantage Pac programs are the microcoded functional equivalents of those on the 15C (and 34C, 42S).

*** Early fullnuts had sharp displays; later fullnuts were not quite as good; halfnuts had "disjointed" characters, with too much space between segments.

There's no contest! If expandability, electronic I/O, and advanced programming were not particularly important to you, the 15C was clearly preferable to the 41 as a handheld-size calculator. The 32S and 32SII, and the 42S to a considerable extent, also compare quite favorably to the 41 as handheld calcs.

*Message #18 Posted by **Daniel** on 30 July 2004, 7:55 p.m.,*
in response to message #1 by John

I wish I could try out some of the older HP models, but right now I have a 20s and a 6s. Sold my 11c when prices for them got over $200 on ebay. Clearly the 11c was excellent, but my preference has changed to the upright form factor of the 20s.

There has certainly been a lot of 6s bashing, and it is very clear why given the rubbery feel of the buttons and the lack of RPN, but I would like to mention that it is a marvelous little machine to carry around in your pocket; it's so thin that you forget it is there, and sometimes just having a calculator - any calculator - is more important than a having a full-featured calculator that cannot be used because it is sitting on your desk back at the office. The 6s has a metal plate on the front and on the back so it is also very durable. Aside from the keys, my only real complaint is that it only has one memory. If not for that then this one would be at the top of my list; my job does not require much more than what's found on a basic scientifc.

I have read about the HP-71 with a built in basic interpreter, and if it had a 2 or 3 line display I would probably get one just for fun... in fact I have been tempted to get one anyway.

Daniel wrote,

> I have read about the HP-71 with a built in basic interpreter, and if it had a 2 or 3 line display I would probably get one just for fun... in fact I have been tempted to get one anyway. <end quote>

It wasn't just BASIC. If you include the extensions in things like the math module and all the contributions from the user groups, it was by far the best BASIC I've ever seen (and that's an understatement!) That includes HP's BASIC that ran on their bigger computers, which was a huge disappointment to me after having learned the 71's.

I hope not to cause any kind of stir, but it has to be my still extant but no longer so trusty 34C.

It helped me graduate from college... and more. I love its heft, size, and solid feel, especially the keys.

Nowadays, if I'm home the one I reach for most is the 32SII. The 48G+ is next, as it's a little more effort to use, but often I need its programmable and incredible memory power.

If I'm at work, I use their mirror images, the 33S most often and the 48G next, for similar reasons. In some

ways, the 33S is better than the 32SII, but in others, the 32SII is better.

But if I allow sentimentality, the 34C is tops.

My favorite is HP-48GX with RAM cards because I can have all my emulators (HP-41X, HP-42X and HP-71X) installed at once (together with all modules I have) and run almost all HP-41C/CV/CX, HP-42S and HP-71B software on it ...

Confession (long)

*Message #22 Posted by **Guilty** on 31 July 2004, 6:27 p.m.,*
in response to message #1 by John

In 1982, while a student at college, I was in need of a calculator for a chemistry test. I had left my calculator back in my hometown when I went home for the weekend. I put word out on my floor that I wanted to borrow a calc for the test. I student not from my dorm present me a calculator that he wanted to sell. His price was $20, said he had received it from his folks at Christmas, but didn't need it. No manual, but it did have the case. I offered 15 since I would need to buy the manual. He agreed, and the deal was done.

I went to the student bookstore to buy the manual, the manual was $25! Then I looked for the calc, Hp 41CV ... list price was $369. I about sh__. Tracked the seller down by phone, he admitted that he had bought the calc from an unsavory individual for $5. Receiving stolen property, what to do? ... I decided to keep the calc. Got me through calculus, chemistry and statistics. I finally sold it for what I had in it, I had purchased some pacs.

Since then, HP is all I have ever owned. In order of purchase –11C, 28C, 27S, 48S, 32SII, 20S, each time, selling the old, and buying new.

I believe that like music, the value of the calc has less to with how good the calculator is, and more with what was going on in your life when you were using it. With that in mind, I liked the guilt-ridden 41CV best.

in response to message #1 by John

The 41 series, easily. With its alpha display and keyboard, it represented a quantum leap in programmability over the keystroke programmables that preceded it. No more counting down and across the keyboard to figure out what an instruction was. And it easily beats the menus that followed in the 28, 42 and 48 series - the 48 drives me nuts; I know it has a function, but it can take me dozens of keystrokes to find it on a menu somewhere.

Add in the card reader and printer, not to mention all the other IL accessories that I never needed. I see some folks complaining about the USER keyboard, but I never ran into problems with that; the few programs I wrote that made extensive use of key assignment also loaded the assignments from a mag card.

I still have a 41CV and a 41CX that get used on an almost daily basis. By comparison, my 48GX collects dust in a drawer, too cumbersome to use for most tasks. . .

Best,

An HP49G+ with a 256MB FLASH card. It can be RPN when wanted, it can be algebraic when wanted, it has plenty of memory, CAS, upgradable O.S., USB connection... and if I cannot get mine in hands, I can buy a new one (if I have the money to).

I had a teacher once that told us, students: "If you have one, you have none; if you have two, you have one". Hey, hey, easy guys: he was talking about equipments in general, so you can keep working with one if the other fails, but you can't go any longer if the only one fails. So I vote for one calculator with a current and plausible spare whenever needed.

I am always trying to keep track with technology, and I still believe calculators are probably the "last frontier" of using local resources. Today, connecting anywhere from anywhere is no longer sci-fi, so being only local seams "loco". I have no idea of what's going on from now. Technology itself plays its role in the backstage, no one (I mean NO ONE) cares for [whatletter]-MOS technology is used inside any portable provided it works fine and does what it is intended to do. If it doesn't, there's always a closer dumpster to throw it away and buy a new one, with [whocares]-MOS technology in its chips.

All I'm afraid of is when those who actually know what is inside the chips are gone for four or five generations. Will the guys pressing buttons in the production line to choose the color of their PDA's be able to repair the machines that are not responding to pressing buttons?

I still believe in local resources...

Live long the HP15C, HP42S, HP48G... and the HP49G+ for being the current model!

Hi VPN, James;

[pre]

```
(I guess) that is because when you type a continuous text without [pre], it is
automatically broken in lines so it fits on screen, whatever resolution you
decide to use. Texts with [pre] maintain the original format (PREformatted)
and sometimes what could be a multiline paragraph becomes a continuous line,
"driftting" to the right side of the screen. Is this what you mean, James? I
apologize answering a question not addressed to me, but I was also wondering
about the same subject. [pre] is good, I think, for listings and "display"
representation.
```

Special formatting for this forum

*Message #33 Posted by **James M. Prange** on 9 Aug 2004, 6:29 a.m.,*
in response to message #30 by Veli-Pekka Nousiainen

I don't greatly object if you choose to use [pre]...[/pre] codes for ordinary text, as long as you keep the lines reaonably short. As it is, I'd have to scroll far to the right if I really wanted to read the entire lines that you quoted, and it wasn't immediately clear to me that you were quoting a previous post. After all, there are special codes for quoting, and I've come to expect a

quote to have a particular appearance in this forum.

Without any formatting codes, the text is presented to me in a proportional width font, and, regardless of the font size and display resolution, the text is "flowed" to fit the window width (as long as my window isn't too narrow). The wrapping treats spaces and single newline codes interchangeably, treating either as a word separator and potential line break position, and starting a new paragraph (defined as a blank line) only when two consecutive newline codes occur. Overall, it's very nice for reading, and you don't force the reader to see a particular line length, leaving it up to him instead; much like reading html formatted text. In fact, the forum software presents it to my browser as html code, and lets my browser present it to me appropriately. If I really want to see how the author wrote a post, I can always use the "Edit Message" button to effectively view the source as it was written into the "text area", although of course I won't be able to actually post an edited version of someone else's post. For example, if you look at this post that way, and copy the text to a text editor, you'll find that the lines, as I wrote them, don't exceed 66 characters, because that's what I have my text editor set up for.

On usenet, I find that "format=flowed" often seems to create more problems than its intended benefits. Quoting and keeping quoted lines to a reasonable length, in particular, seems to be a problem with that format in newsreaders. But here on the Forum, the equivalent formatting seems to work quite nicely.

If you really want to force a new line without a new paragraph, you can always use a [nl] code. See my signature (by trying to edit my posts) for example. The list formatting codes also start each list item on a new line; very nice where appropriate.

On the other hand, for some things, such as program listings and tabular data, reformatted text would make it difficult to read as the author intended. This is where the [pre]...[/pre] codes are especially useful. The font is fixed width (so tables and numerals in columns line up correctly and indenting is as intended), and the line breaks are respected. Of course you can use these codes for ordinary text if you prefer. But one should be careful to keep the preformatted lines short enough that they can reasonably be expected to fit into the window without requiring scrolling to the right to see the rest of the line. I suppose that a maximum line length of about 80 characters would be appropriate.

Quoting is sometimes appropriate, particularly when responding to only a small part of a post or on a point by point basis. But quoting is less needed on this forum than on usenet, where the referenced post may not be available on any particular server. Here, if we can see your post, it's certain that we can also see the referenced post, unless it's been deleted. This also makes attribution less important; unless otherwise indicated, we can reasonably assume that you're quoting whomever you replied to, which we can clearly see. But I would like to have a option for a [quote=person] style of quote, where the name is included for clarity.

Overall, the special formatting codes on this forum are very nice. The superscripts and subscripts are especially appropriate in a forum where mathematical notation is often desired.

I suggest using the "Preview First" button whenever you have any doubts about how your post will look, and referring to the Advanced Formatting page (perhaps in another tab or window) when it doesn't look as you intended.

Of course, we should always try to get it right the first time, but errors do occur, so editing is often appropriate, particularly if no one has replied to the post yet. But, as far as I know, I can only edit a post that I've included a password with, so I make it a habit to do so.

Regards,
James

HP-49G+.

*Message #34 Posted by **Eddie Shore** on 1 Aug 2004, 9:16 a.m.,*
in response to message #1 by John

HP-49G+: I spend most of my time working on it. Although onwning a 48G served as an excellent introduction into the HP world. I am impressed with the speed, processing, and the extensive set of functions you get with the 49G+.

Re: What's you're favorite HP Calc and Why

*Message #35 Posted by **Glenn McEnroe** on 2 Aug 2004, 1:02 a.m.,*
in response to message #1 by John

In the early 70s as a chemistry major I used an HP-45. It got me through college and a little beyond until battery contact failed and I could only use it when it was plugged in to the power cord. After that I bought an HP11C. I used it at work until it was taken from my lab bench and not returned. About a year later, my boss through away an HP11C that he thought had died. I think it was my original calculator. I dug it out of the trash and replaced the batteries. It is still in use on my lab bench.

Over the years I have collected additional calculators. The first was an HP67 which had a bad card reader but was repaired by a competent repair person I found here. I would have to say this is the nicest looking calculator HP made.

I also had an HP48G that I bought when my 11C turned up missing. It only lasted about a year and the keypad went bad, a sign of the time for poor HP quality control.

My favorite is the HP41CV. I use this one at home and just bought another one with the high top keys on ebay. The new one will replace the HP12C I had at my desk that was stolen while I was on vacation a couple of weeks ago. As much as I hate having to lock my desk, looks like it is time to do that. I also have the MEMORY MODULE, X-FUNCTIONS, TIME MODULE, HP41 ADVANTAGE and NAVIGATOR module.

*Message #36 Posted by **marais** on 2 Aug 2004, 1:50 a.m.,*
in response to message #35 by Glenn McEnroe

But you should know that you can't let these goodies lie around your workdesk any more. I just replaced my 28S with a 48S at work, much less likely to be stolen.

HP-41CV modules and program

You have good taste! I have a similarly-equipped halfnut 41CV with all the same modules, along with a fullnut 41CX and a 41C.

BTW, I'm assuming that the "MEMORY MODULE" is actually an 82181A "X MEMORY" module. The 41CV already has the maximum amount of regular memory; it cannot use or even recognize a regular Memory module or Quad Memory module.

The 41CX is basically the equivalent of a 41CV with Time and X-Functions modules, plus a few other functions.

I have a celestial-object position-finder program that your 41CV with its Time and Navigation (not "Navigator") modules can run.

in response to message #1 by John

I think graphic calculators seem too much for a small device. That's why I prefer portability rather than complexity. My 3 best calculators are 15c, 42s, 41cx (2*x-mem+advantage+stat). There's no order because every one has its own qualities. The 15c is very small and its best quality is a non-aplhanumeric display. Doing so much with a 7 segments display is simply amazing. The 42s looks like a simple scientific calculator but hundreds functions are hidden inside this powerful device. I like the feeling of having such an uncluttered keyboard and such a powerful calculator.It's not really a graphic calculator but graphics can easily be added (like with sharp pc-1360 or pc-1600). Last but not the least, I love my 41cx (with 4 modules). I wasn't a fan of this serie until recently because I thought that this serie was versatile but not extremely powerful (I mean in a scientific point of view). The main aim of calculator is not to do anything possible but to give the right answer easily. The 41 serie is basically not very impressive. It lacks a lot of functions and even a cx canno't do complex maths. But the x-mem modules with the advantage pac make changed my opinion about it. It's now more powerful than a 42s and its vintage look is great.With 2*x-mem and advantage, the 41cx is now pewerfull enough to please me. Moreover the last port allows me to personalize it with a stat pac for example.

For sentimental reasons, I love my HP-65.

I learned programming with that astonishing and well designed machine when I was a twelve years old boy. First I saw it on television with its really cool card reader. When I had it in my hands I was really electrified.

Immediately I decided that computers were the right field for my future ambitions. And so it was. A few years later I studied Computer Science.

*Message #41 Posted by **Vassilis Prevelakis** on 2 Aug 2004, 10:22 p.m.,*
in response to message #1 by John

I'd go for the HP-97, beautiful design:

+ huge led display

+ unbelievable keyboard (I just LOVE the ENTER and + keys)

+ printer for hard copy

+ card reader for storage (although I hardly use it anymore)

+ adequate functionality (although some built-in functions are a bit slow, and programs take for ever to run)

+ battery pack lasts for a long long time

Too bad it doesn't have NVRAM, while in the 70s I would have definitely chosen the card reader over NVRAM, nowadays (now that I have a laptop that is) I'd rather have a couple of programs in NVRAM rather than deal with the mag cards.

Just holding it in your hands, you can feel the quality of construction. Well done HP.

One last point, the left hand function keypad is totally intimidating, people who come to my office just stare at that keypad with all the hieroglyphs.

Hi everyone. Although the HP-48 and HP-49 are much more powerful, I still prefer the HP-41, especially because of its programming language: Old programs may still be improved, even several years later, and I enjoy to find stack trickeries. However, if it were possible (who knows ?), what improvements would you wish for an updated HP-41? I suggest: The same design, the same programming language, the same accurate clock (with an Accuracy Factor), a YMD format,also working before 1582, 1MB RAM, many of the non-graphic functions of the HP-48, 2 types of registers (for example 100000 data registers Rnn and a few registers R.nn - like in the HP-55) perhaps a SIZE nnnnn.mm creating n registers of the first type and m registers of the second type (for control numbers etc), An AVIEW2 which doesn't blink, a longer alpha "register" a RAND function, a few more stack-functions (like in Angel Martin's module): Y=Z? T<>L X=integer? L<0? ... an XROOT function (exact for integer arguments), a turbo mode (like in the V41 emulator) What do you think of these features? Best regards, Jean-Marc.

Re: Other prices...

*Message #6 Posted by **Andres C. Rodríguez (Argentina)** on 2 Aug 2004, 6:40 p.m.,*
in response to message #4 by Tom (UK)

First, you have the "real" costs: FOB price in origin, freight, insurance, etc.

Then, you pay import duties over all the items abovementioned.

Then you pay extra taxes such as "fee for statistics", etc.

Then you pay "Importation VAT" (In Argentina is ~ 30%) over all the abovementioned

Then there are the "importation agent fees" and the importer markup

Then there is the retailer markup

Then there is "sales VAT" and "gross income tax" for the retailer

And, of course, because of all these charges, the volume will be very low, so there are no scale benefits in any stage of the chain. Warranty costs, support, etc., will be beared by very few units so... make the markup a little larger, please!

But all politicians here keep complaining against imported goods which are "so cheap" that prevent the local industry to thrieve.

And, if you need to send a product back to the country of origin (warranty replacement), many of the charges will appear again when exporting the defective unit or when importing the replacement one.

"Open Design" Fantasy idea.

*Message #1 Posted by **Steve A** on 30 July 2004, 8:23 a.m.*

OK, this is a fantasy idea, but it's an interesting one, I think, and perhaps appropriate to an 'open source' world.

The people here who make emulators for various classic calculators gave me this idea.

Why not design a new calculator first as an emulator? Make it available as a web page, perhaps, so that people can try it out.. Make suggestions on functionality, key layout, etc.

I'm not suggesting 'design by committee' but rather feedback by interested and thoughtful potential users.

The real fantasy is that a day might come when it could actually be made and there might even be enough preorders to pay to have it made.

By the time it is ready to be made, if the project is approached properly, the software at least should be debugged.

As for the hardware... Has anyone ever heard of an 'open hardware' project? If anyone 'stole' the design and built it to sell, it would save us the trouble, right?

Such a project would not produce the 'next big thing' as far as I can see, but it could produce a product(s) that a certain customer base would buy, and the size of that customer base would be fairly well known by the time by the time a decision was made to build.

Steve.

Re: "Open Design" Fantasy idea.

*Message #3 Posted by **Marx Pio** on 1 Aug 2004, 12:06 a.m.,*
in response to message #2 by Ben Salinas

There will be a problem: The high number of suggestions will drive to an almost personal design and of course, to a high nonsense final price for the product. If not, the customer will never be satisfied (As a whole).

José Ingineros(Philosopher) said: "Gather 1000 genius' mind in a discussion table and you will get a conclusion of one idiot".

The decision task must be done under certain factor of unknown. So there will be no decision or no customer satisfaction, taking account that all of us think in a different way along the same thing.

And finally, I may be wrong.

Cheers Marx Pio

I think you and José are right. 'open design' is a bad idea :)

My real interest in that idea was to have online communities, such as this one, centred around hardware/software that has public specifications and schematics, parts lists, etc., etc.

Steve.

...So, I hope it works.(.NT.)

Fantasy granted. Check out the OpenRPN project at: http://www.openrpn.org

I manage the project with a close friend, which really speeds up the open development process. It's quite similar to what you have described. When complete it will feature a flashable ROM, space for an expansion board, USB support, graphical LCD, *fix programming (our own adaptation of RPL), custom molded keytops, tactile keys, and an excessively durable case. On top of that fully functional java simulators will be made available of each model to demonstrate its' capabilities before you buy it.

Very soon we will be registering a business to facilitate production. As soon as we have a few prototypes we will begin soliciting for grants and investors, as well as convincing engineering/science professors to adopt them as recommended/required equipment.

Please stop by and check us out, I think you'll be pleasantly surprised!

OpenRPN link buttons, theme, and logo

*Message #1 Posted by **OpenRPN** on 30 July 2004, 2:01 a.m.*

For anyone who is so inclined we have some artistic needs at the moment. We're working toward a site makeover, an official logo, and some pretty link buttons.

Our site is managed with PostNuke, so any themes will need to be designed for it.

If this isn't your cup of tea, please send a link to our site to anyone you know who might be interested. http://www.openrpn.org

Another new development is coming up: *fix has been being developed in Java... which leaves it conveniently open to being implimented in an online simulator. We're planning to make fully functional java simulations of our machines available to give people a chance to see how they work. If you're interested in taking on such a task send me an e-mail or drop by the forums.

Best Regards, Hugh Evans OpenRPN Project Manager

Peeve with HP33s and other HP's

*Message #1 Posted by **Daniel** on 29 July 2004, 6:03 p.m.*

I was curious if any of you are bothered by the way DMS (degrees, min, sec) angle measurements are handled by HP calculators. I have a 20s that I really like a lot but it is so frustrating to use for surveying calculations.

For example if I enter an angle of 30d 15' 25", the display will appear as 30.1525. To add or subtract this to some other angle I would have to be careful to first convert this to decimal degrees using the HR button giving 30.2569. I would prefer to just work with the value in DMS, because it is all too easy to get in a hurry and forget to convert a value to decimal degrees before proceeding. Or if I pull a calculated answer out of a memory register that is in decimal degrees, it's easy to forget to convert back to DMS before writing it down on paper.

Seems that all of this could be avoided if the angle value could be formatted as either DMS (with the degrees, min, sec symbols) or D.D (dec deg) and STAY that way until it was converted to something else. At least with a Casio I know that if I am looking at an angle value such as 30.2569, there is no doubt I am looking at number in decimal degrees.

So why not use a Casio? Because I like everything else about my 20s including the excellent keys and screen. And now I just read some online doc's and found that the 33s works the same way (w.r.t. angles) as my 20s. ARGH!!!

And just for the record, I am aware that time calculations would not look strictly correct with a degree symbol on the hour value, but I could deal with that trade-off.

Re: Peeve with HP33s and other HP's

*Message #2 Posted by **Brent** on 29 July 2004, 6:52 p.m.,*
in response to message #1 by Daniel

Personally, I like it in the HP format (D.MS), it's much easier to enter into the calculator. As for adding and subtracting angles, write a routine that does it for you.

Re: Peeve with HP33s and other HP's

*Message #3 Posted by **bill platt** on 29 July 2004, 7:24 p.m.,*
in response to message #1 by Daniel

Here is a start to a system:

Idea is that LBL D takes input of D.mmss, and adds them cumulatively:

```
00-
01- 61 41 d          LBL D
02- 21 0             STO 0
03- 61 45            Fraction Part
04- 55               Times
05- 1                100
06- 0
07- 0
08- 74              =
09- 61 45           Fraction Part
```

```
10- 55                Times
11- 1                  100
12- 0
13- 0
14- 74                  =
15- 21 75 3           STO + 3
16- 22 0               RCL 0
17- 61 45              Fraction Part
18- 55                  Times
19- 1                    100
20- 0
21- 0
22- 74                    =
23- 51 45                Integer Part
24- 21 75 6           STO + 6
25- 22 0               RCL 0
26- 51 45              Integer Part
27- 21 75 9           STO + 9
28- 61 26              END

b60F is the checksum
```

So, what you do is start by CLRG (clear registers) and then, you can simply type in your DD.mmss (decimal parts of seconds after .mmss) and hit "XEQ D".

Note that the degrees, minutues, and seconds.fractionalsecs are segregated into separate registers.

Then, you write another routine to compile the data back to D.mmss format, or convert it or whathaveyou.

Hope this gives you some ideas.

Regards,

Bill

Re: Peeve with HP33s and other HP's

*Message #4 Posted by **Daniel** on 30 July 2004, 1:42 a.m.,*
in response to message #3 by bill platt

Bill, thanks for the program routine. I will give it a try. The main issue is that I would like the formatting of the angle value to reflect that it is indeed in DMS format just by glancing at the screen. As you have shown there are workarounds that can make things a little easier but nothing can replace the simplicity of a properly formatted angle.

While we're on the subject of angles, do I dare even mention that I would also like to be able to enter bearings right into the calculator using N,S,E,W!! :-O I'll admit that may be asking for too much from a general purpose scientific calculator.

Re: Peeve with HP33s and other HP's

*Message #5 Posted by **Patrick Toms** on 30 July 2004, 3:02 a.m.,*
in response to message #1 by Daniel

the beauty of hp calculators is that they are completey progamable, for instance I wrote my own triangle solutions into my 33 when i write my programs i have the calculator change from hms into hrs for me i enter every angle in hms my machine then spits all the answers back out into hms you can program whatever you need into the 33 from point in direction ,triangle solutions,inverse. whatever you need and when you are doing

chain calculations it eliminates alot of errors and saves time the 33 has and excellent book. as for as a casio i think in rpn i cant run an algerbraic machine. rpn is much more effective because it eliminates key strokes.

HMS (or DMS) on Casio; HP-20S shortcoming

*Message #6 Posted by **Karl Schneider** on 30 July 2004, 3:15 a.m.,*
in response to message #1 by Daniel

Daniel posted,

> Quote:

>
> *And now I just read some online doc's and found that the 33s works the same way (w.r.t. angles) as my 20s. ARGH!!!*

Yes, I agree completely -- That's one of the things Casio has done better than HP for more than 20 years. To enter HMS or DMS on a Casio:

hours (or degrees) [o ' "] minutes [o ' "] seconds [o ' "]

An extra keystroke or two to enter a value is needed, but:

- Fractional values of each field are allowed for convenience.
- No extra conversion step is required.
- HMS or DMS displays cannot be confused with decimal values.

BTW, one important point about the "write a program" solution for the 20S that others suggested and provided: If you program the function, then load one of the pre-programmed routines available from the "LOAD" function, your DMS program will be wiped out.

This is the thing that bothers me most about the 20S, which otherwise is a nice low-end scientific. Six general-purpose utility programs were provided -- as unintuitive, limited, user-unfriendly keystroke-programmed routines. I consider the 20S to be "compromised" in that respect.

Re: HMS (or DMS) on Casio; HP-20S shortcoming

*Message #7 Posted by **hugh steers** on 30 July 2004, 6:04 a.m.,*
in response to message #6 by Karl Schneider

ive always thought the 20s is an underrated hp. i know its not as good as a 32sii, but its well built and the display is really clear. clearer than the 32 for example. the buttons are nice too, like all the pioneers. programing is a bit lame, but the rom programs are better than nothing, shame it didnt have more.

i agree on the hms issue. but the small degrees symbols take digits which could be a problem on early 8 digit models. i often wondered if using two "points" would have been better. ie use two decimal points, like

this 8.32.60 = 8h32m60s. or even 8.32.60.112 = 8h32m60.112s. of course you would have to press the hms key for the points on entry and not the "." button and this could lead to confusion.

the idea behind using the points is that all displays could handle it, including early led and so on and you dont waste any digits of display.

what do you think?

Re: HMS (or DMS) on Casio; HP-20S shortcoming

*Message #8 Posted by **Richard Garner** on 30 July 2004, 10:18 a.m.,*
in response to message #7 by hugh steers

An old Commodore calc that I had used a dash as a separate. You would enter number 46 (HMS) 34 (HMS)21.435, it would look like this on the screen 46-34-21.435. Pressing any operation key would convert it to decimal format and you could do whatever operation was needed then do an (INV) (HMS) and it would convert back to DD-MM-SS.SSS in the display.

Re: HMS (or DMS) on Casio; HP-20S shortcoming

*Message #9 Posted by **Daniel** on 30 July 2004, 10:38 a.m.,*
in response to message #7 by hugh steers

Hugh: I could live with a double decimal point separator, especially given that most lcd's are more than 8 digits these days. Even a DMS annuciator might be okay if the calculator could keep track of it through a STO and RCL cycle.

Karl: Glad to know that other's agree about the Casio method of handling angles. I wish they would take it one step further and leave the angle in DMS format even when the value is loaded into a memory register -- the fx-5000f I have will convert an angle to decimal degrees when stored.

Re: HMS (or DMS) on Casio; HP-20S shortcoming

*Message #10 Posted by **GE (France)** on 30 July 2004, 4:59 p.m.,*
in response to message #9 by Daniel

All right the Casio displays special separators for the result of a conversion to DMS, but do these symbols remain after you press any key ? (I don't think so)

Also, I think the never released NS7100 was expected to have a DMS display format, alorg with FIX / SCI / ENG. Anyone beg to differ ?

Re: HMS (or DMS) on Casio; HP-20S shortcoming

*Message #11 Posted by **W Rice** on 30 July 2004, 6:08 p.m.,*
in response to message #10 by GE (France)

Well, on the fx-115MS, it seems to keep it as long as you do. eg:

```
5'6'55' + 6'=11'6'55
However
5'6'55' + 6 = 11.11527778
```

If you store a DMS number in a register, then recall it, it comes back as DMS. Eg

```
6'56'38' sto A
7'29'39' sto B
```

```
A + B = 14'26'17
A * 5 = 34'43'10
A / 5 = 1'23'19.6
A * B = 52.03866065 (can't handle this  I guess)
```

Re: Peeve with HP33s and other HP's

*Message #12 Posted by **bill platt** on 30 July 2004, 10:56 a.m.,*
in response to message #1 by Daniel

HI Daniel,

Of course, some HP's actually had H.ms arithmetic built-in, including the 48 series, the hp-55, hp-65, hp-67, and the hp 28c / 28s. There are probably more, too. Yes, also the 41 series and the 42s.

Regards,

Bill

HP33s

*Message #1 Posted by **HerClau** on 29 July 2004, 3:36 p.m.*

somebody could say where to find application programs for the HP33s

Re: HP33s

*Message #2 Posted by **bill** on 29 July 2004, 3:46 p.m.,*
in response to message #1 by HerClau

http://www.hp.com/calculators/scientific/33s/scientists.html

In addition, you can easily "port" any program from the 10c, 11c, and older machines (34c 29c 67 etc) and many (but not matrix and complex math) programs from the 15c.

The Museum CD has the manuals, including the advanced functions handbook from the 15c, available.

If oyu are a surveyor, there are at least two people selling Survey programs on ebay.

Regards,

Bill

Re: HP33s

*Message #3 Posted by **martin cohen** on 29 July 2004, 7:14 p.m.,*
in response to message #2 by bill

(To toot my own horn)

I have written, and posted (here and on comp.sys.hp48) hp 33s routines to do the following:

1) Solve 3x3 linear system of equations (non-destructively).

2) Do bit-fiddling (and, or, not, xor, ...).

3) Sort A through whatever (first n elements of memory).

The nice thing about programming the 33s is that you can not run out of program space - the labels are exhausted much too quickly!

RPN and Micro-Computer Assy Programming

*Message #1 Posted by **Bill (Smithville, NJ)** on 29 July 2004, 3:17 p.m.*

The thread about Word Size and Memory got me thinking about when I used to do assembly programing on the 8080 and Z80 processors back in the seventies. As I was thinking of this, I realized I got my first HP calculator (HP-25) at that same time.

I'm thinking that one reason I took to RPN so well was that I was already familar with stack operations with the micro-programming and it made perfect logical sense to me.

I'm wondering if others here got similar starts.

NOTE: I do NOT wish to start a RPN vs Whatever debate - I love RPN and have only used HP calculators since that first HP-25. I'm just curious if others had similar experience.

Re: RPN and Micro-Computer Assy Programming

*Message #2 Posted by **Chris Woodhouse** on 29 July 2004, 5:49 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

I think that programmers just think different than your average person, especially if you are good at low level programming like assembly. Since RPN is the only way to go in low level programming, it makes sense that people who are good at thinking like a computer would readily take to RPN.

Chris

Just in case there are any new people reading this,

Bring Back the HP 15C

Re: RPN and Micro-Computer Assy Programming

*Message #3 Posted by **Guillermo** on 30 July 2004, 9:32 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I first learned RPN in 1984 with HP-15C, and then in 1986 I started to program Z80 assembler for my Home Computer Sinclair Spectrum.

82143 Batteries

*Message #1 Posted by **Thomas Caphorn** on 29 July 2004, 10:01 a.m.*

Is there a company that will take the old battery pack and replace the bad cells with new ones?

Re: 82143 Batteries

*Message #2 Posted by **Emmanuel, France** on 29 July 2004, 10:29 a.m.,*
in response to message #1 by Thomas Caphorn

```
You can easily do that.
You just need a knife and glue.
Buy 4 1.28V rechargeable batteries (42mm x 22mm).
Open the battery pack and replace the old batteries by the newest.
Yours.
```

Re: 82143 Batteries

*Message #3 Posted by **Garth Wilson** on 29 July 2004, 3:50 p.m.,*
in response to message #1 by Thomas Caphorn

The NiCad Lady company at http://www.nicdlady.com/sendingus.html I've seen them at electronics swap meets many times. They'll rebuild a battery pack for you and it'll be difficult to tell that it's not right out of the factory.

Re: 82143 Batteries

*Message #4 Posted by **David Smith** on 29 July 2004, 4:40 p.m.,*
in response to message #1 by Thomas Caphorn

Just about any good sized city has Batteries Plus and Batteries Etc stores. They will rebuild just about any battery pack. They spot weld the cells together so there is no worry about damaging them with a hot soldering iron. Costs to do the 82143 pack should be $20-$30. I highly recommend using the highest capacity cells they stock.

Classics losing power...

*Message #1 Posted by **Arnaud Amiel** on 29 July 2004, 7:44 a.m.*

I have recently rebuilt 2 battery packs for my 45.

I have discharged and recharged them only a couple of times since I rebuilt them.

Recently, when I turn on my 45, after a couple of seconds the low power indicator comes up and a few seconds later the leds turn off.

I measured voltage on the pack 3.75 V, I tried the same pack on an other 45 and a 55 and the same happens.

Did this already happen to anyone? Any idea of what the problem could be and how to fix it?

Thanks for your help

Arnaud

Re: Classics losing power...

*Message #2 Posted by **Emmanuel, France** on 29 July 2004, 7:52 a.m.,*
in response to message #1 by Arnaud Amiel

```
Dear Arnaud,
This problem occurs when you use low quality rechargeable batteries.
Before recharging them, you have to fully discharge them.
I used three Sanyo Cadnica N-600AA in my previous HP-67 and TI-59.
It was working well but not for a long time. Their value was 600mAh only.
Please test 1000mAh or more and let us know if it is better.
Kind regards from Normandy. Sincerely yours.
```

hp33s and factorial timing

*Message #1 Posted by **Marcel Pelletier** on 28 July 2004, 9:13 p.m.*

On my hp33s (CNA41507077), 200! is very very fast but 100! is a bit slower. Why?

Re: hp33s and factorial timing

*Message #2 Posted by **martin cohen** on 28 July 2004, 9:22 p.m.,*
in response to message #1 by Marcel Pelletier

Interesting!

Playing around a bit, 159! is fast, and 158! is slow.

157! is slow, 157.1! is fast.

My guess is that for integers 158 or less, a multiplication loop is done; for other values, some variation on Stirling's formula is used.

They could have started at 20 or so instead of 158. I do not know why this particular value was chosen.

Re: hp33s and factorial timing

*Message #3 Posted by **bill platt** on 29 July 2004, 9:51 a.m.,*
in response to message #2 by martin cohen

On the original 32s, it seems that the x! is slower and slower all the way up to the overfolw limit. The Gamma function (non-integer factorial), however, is siginificantly faster---detection of the speed difference being above a threshold of around 50!

Bill

Re: hp33s and factorial timing

*Message #4 Posted by **martin cohen** on 29 July 2004, 7:20 p.m.,*
in response to message #3 by bill platt

As seems evident from many of the 33s discussions, the 33s was not just a port of the 32sii but a complete rewrite. I eagerly await the 33s+ with the following:

Bug fixes.

More variables and labels (i up to 10000, multi-character labels and variables).

More readable decimal point.

(The above are the essentials; the ones below are optional)

Ability to turn off thousand's separator.

Matrix operations.

Bit fiddling (and, or, ...).

42s type graphics.

Optional bigger stack.

World peace.

Re: hp33s improvements

*Message #5 Posted by **bill platt** on 29 July 2004, 7:34 p.m.,*
in response to message #4 by martin cohen

Hi Martin

I would add "editability of equations" to the must have part. If it had that, then the machine would be capable of functioning like the "formula entry" machines out there--giving it a tri-functionality: RPN, old-time ALG-postfix, and Formula. To put the "answer int oa chain of formulas, I suppose you would merely send the evaluation into a variable, and use the variable in the next chain---but an "ans" button could be used, too (like, who needs the cube root feature-replace it!).

I would also change the equation writing system to eliminate the existence of the "unary minus." I find that to be an annoying business--different from machine to machine. (Much worse on the 32sii BTW because it is evaluated before y^x in most but not all circumstances!). The 17bii has no unary minus, and evaluates each minus sign to "reverse" the sign one by one, in other words, you can have 4*---7 in the equation list, and it will evaluate to -28. If you do the same on a 48GX, in 'algebraic' it will parse it to '4*-7' when it is entered to the stack. b If you try '4-*7' it will catch the error during the parsing, and tell you to fix it. These sorts of behaviors make more sense to me.

Regards,

Bill

Re: hp33s improvements

*Message #6 Posted by **Steve A** on 30 July 2004, 5:06 a.m.,*
in response to message #5 by bill platt

I'd make a change to the keypad.

Now that I've used the 33s for a few weeks, I find no general problems with the chevron layout. I'm barely even aware of it.

Except for the four way 'cursor' key, and the four function keys next to it.

Left and right are OK, and down is very good, but I often don't get the 'Up' properly.

I also find those mode/eng etc. keys a bit fiddly, but perhaps my thumb is too fat ;)

Steve.

xThink Math Journal Released!

*Message #1 Posted by **Steve S** on 28 July 2004, 3:33 p.m.*

For those who may be interested, Version 1.0 of xThink's MathJournal was released this morning. Price is $198 (or $98 if you are a student). See their website for ordering details:

www.xthink.com

Nit-picks aside, they've done a very good job with this release. Several beta bugs were corrected and some key improvements (like fewer penstrokes to get something done)were added. Of course, the most astonishing thing of all is the recognition and evaluation of handwritten math (Bill Platt, are you reading this?) It's not perfect, but it's d*** good!

If you don't have a TabletPC, get yourself a cheap Wacom graphics tablet on eBay and check this out!

33s solving symmetrical quadratics

*Message #1 Posted by **bill platt** on 28 July 2004, 9:45 a.m.*

Hi,

Curious business. Try solving the simple expression n^2-6 on the 33s in the equation list.

It will return the positive root, but not the negative.

Try controlling the starting estimates by storing -10 to n, and -1 in the x-register. Still, a positive root. Try storing -1 in n, and -10 in the x-register. still, only a positive root!

On the 32sii, controlling the starting estimates "kicks" the solution over to the negative root.

Try a parabola that is shifted on the x-axis: v^2-v-6.

When you play with the initial estimates on this one, you DO get the negative root. Strange.

I wonder if this is related to the bizarrre "-0" issue which crops up in the cartesian to polar conversion issue.?

Regards,

Bill

Re: 33s solving symmetrical quadratics

*Message #2 Posted by **bill platt** on 28 July 2004, 2:08 p.m.,*
in response to message #1 by bill platt

But,

If you solve x^2 - 6 in either:

a program (RPN or ALG)

a program using an equation

You *can* push the solution across the zero to find the negative root.

Hmmmmm.....

Regards,

Bill

HP 45 Problems

*Message #1 Posted by **Charles** on 27 July 2004, 5:09 p.m.*

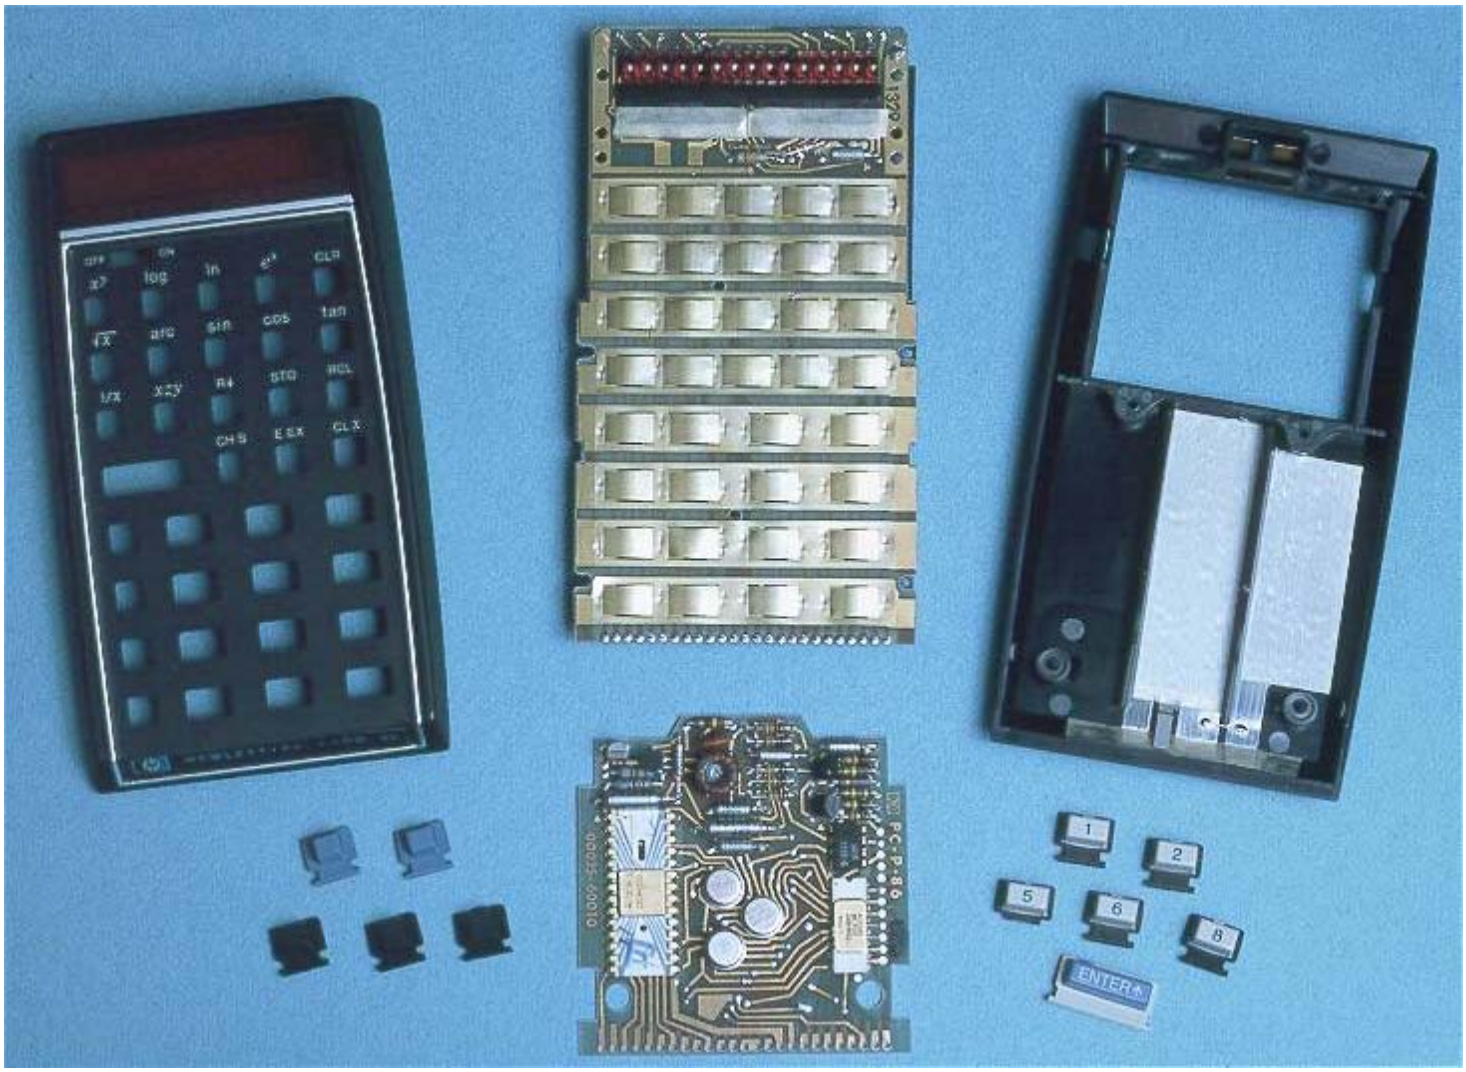
My HP 45 has developed a problem whereby it doesn't give the correct answer for some functions. The regular functions (sin, cos, conversions etc) are OK but tan and arc sin, are cos etc are incorrect. Tan sometimes returns a numerically correct but negative answer while arc tan always gives nonsense. Asking for the square root causes the display to flash with zeros. Some of the other keys (sin and 2) have also stopped working. Does anyone have any thoughts on repair ? Could it be the keyboard or are the chips giving up ?

Thanks Charles

Re: HP 45 Problems

*Message #2 Posted by **Jeff O.** on 28 July 2004, 7:43 a.m.,*
in response to message #1 by Charles

The non-working sin and 2 keys can probably be easily remedied. You will need to completely disassemble the calculator, general instructions are here. Below is a picture of a disassembled 35, the 45 has the same physical construction.



You need to clean the contacts on the key contact board in the middle of the above picture. The contacts are the metal strips that form the arches across the board. Cut some strips of fairly stout paper 3" long and maybe 3/16" wide (75 mm by 5 mm if you prefer metric units). Soak a strip in a good contact cleaner, and stick it under a contact arch. Press down on the arch and pull the strip through. Repeat several times on each contact. Reassemble and test. If you are lucky, the other anomalous behavior is due to key contact problems that the cleaning will fix. If not, it sounds like a more serious problem on which I can offer no help. While you have the unit open, clean and lubricate the ON/OFF contacts. You can also soak the keys in "Fantastik" or "Formula 409" or some other general household cleaner to get any grunge off.

Good luck, let us know how things go and post again if you have any questions.

I have a question about "Word Size" and Memory

*Message #1 Posted by **Bill Platt** on 27 July 2004, 4:31 p.m.*

I am simply not well versed in the hardware aspects of computing.

But occasionally, I see limitations on functionality which seem like they must be hardware dependent. Examples:

1. 33s having a 255 character limit for an equation; 2. 12c platinum having problems with goto if the line number exceeds 254? (255? 256?)

Since 2^8 = 256, does this mean that such limitations are hardware dependent?

3. Switching "Modes" in casios, or the 30s, causing all memory to be lost.

How do I educate my self about this stuff efficiently? And about "words" "nibbles" etc?

Regards,

Bill

Re: I have a question about "Word Size" and Memory

*Message #2 Posted by **John Limpert** on 27 July 2004, 4:56 p.m.,*
in response to message #1 by Bill Platt

It isn't really a hardware dependency. It has more to do with the design of the software. For example, most computers use the 8-bit byte, or octet, as the base unit of storage. Lets say that we want to design a data structure for storing text strings. One popular way of doing it is to allocate N+1 bytes to store a N byte text string. The first byte is used to store the number of bytes used by the string. The rest of the bytes contain the text. By allocating one byte for the length, we have limited the size of text strings to 0..255 bytes. If we needed to support longer text strings, we could use more memory to record the length. Two bytes for the length would support text strings of 0..65535 bytes. Four bytes for the length would support text strings of 0..(2^32 - 1) bytes. We have lots of choices for our data structure. Which one is the best? That depends on our goals. Using a single byte for the length is efficient in space and the time it takes to manipulate strings, at the expense of limiting the maximum string length. Using four bytes for the length allows for nearly unlimited string size, but it increases the memory overhead for each string and it takes additional time to manipulate strings. For a pocket calculator with limited memory and a slow CPU, one byte is probably the best choice. For a desktop computer, four bytes would be better. Each choice involves a complicated set of tradeoffs.

Re: I have a question about "Word Size" and Memory

*Message #3 Posted by **James M. Prange** on 27 July 2004, 8:39 p.m.,*
in response to message #2 by John Limpert

I'll add that in the RPL models (28, 48, and 49 series), the smallest addressable unit of memory is a nibble (4 bits or 1/2 byte) instead of a byte.

> Memory addresses on these models are always 5 nibbles (20 bits), so they can access up to 2^20 (1048576) nibbles (524288 bytes or 1/2 Megabyte) without bank switching.

Re: I have a question about "Word Size" and Memory

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2004, 2:11 a.m.,*
in response to message #1 by Bill Platt

Hi Bill, guys;

Bill wrote:

> Quote:
>
> I am simply not well versed in the hardware aspects of computing.

About ten to fifteen years ago, I'd say conversely; nowadays, I am not so sure I can say that... But I think I can add a few words over John and James' elucidating posts.

> Quote:
>
> (...) 1. 33s having a 255 character limit for an equation; 2. 12c platinum having problems with goto if the line number exceeds 254? (255? 256?) Since 2^8 = 256, does this mean that such limitations are hardware dependent?

I'd add that more than 256 possible instructions exist in the HP12Cp programmable repertoire, so some two-byte codes were added to the existing set. John's words corroborate this reasoning of mine, and I'd go a bit further: the information shown when [g][MEM] is pressed is how many program lines are used by programs, and we do not know if there are two-byte instructions in any of them. Based on this, if a 399-step program has all steps filled with these 'hypothetical' two-byte instructions, it would need 798 bytes instead of 399. Something to think of... 399 bytes

> 3. Switching "Modes" in casios, or the 30s, causing all memory to be lost.

I found myself confused with a particular memory count in the HP9S that I'd like to share with you, contributors, and know your thoughts about this. When in STAT mode (the HP9S allows one-variable statistics only), the HP9S can hold up to 80 different entries with up to 255 occurrences for each, provided that final count does not exceed 20400 entries. Well, what amuses me is the fact that the individual entries are editable! If you enter 80 different values and want to change each of them, you can do that. O.K., there is a limit of 80 full-precision values, but I'd ask how many times did any of you analyze a sample with so many items. Entering each data is tiresome, I know, but having each of them to edit later is amazing. All RPL-based calculators (plus some top-line financial) use lists contents as statistical data. The HP42S has a 'pseudo' list handling, but it actually allows a [n×1] or [n×2] matrix to be the argument for [SIGMA+]. This way, editing the matrix and entering it again is faster than editing the summation data with [SIGMA-] and [SIGMA+]. Back to the HP9S: it has memory "space" that is enough to hold up to 80 statistics entries, but it has only five "memories" when it is in normal mode. Yeap: the extreme case is when the HP9S is set to Complex mode (weird, somehow weird) and you already have an intermediate complex number stored in [a] and [b] and want to add/subtract/divide/multiply to a new complex: it needs to hold real and imaginary parts of both complex numbers until [ENTER] is pressed, and it needs four registers. The fifth one is [M], that can hold an extra value. Well: what are the other 75 registers that MUST exist to hold statistical data holding when the calculator is not in statistical mode? Opposed to the HP30S, the HP9S has no historic stack to hold previous operations.

Any clues? I guess I have one. I got used to "see" all "user memory" in RPN calculators since I started using an HP41. Untill I begun dealing with digital electronics and was only a calculator user, I was not 'completely' aware of the fact that somehow the algebraic calculators needed extra memory to hold a stack of numbers, operators and pending parenthesis. This extra memory cannot be used unless you disable the algebraic pending operations and free this memory. Well, when the HP9S is in STAT mode, parenthesis do not work the same way as they do in normal mode...

> Quote:
>
> How do I educate my self about this stuff efficiently?

I think each new non-RPN calculator, from HP or any other brand, has its own operating characteristics and in some cases, they must be mastered one at a time. Some wise, thoughtful and very respectable contributors in here sometimes point RPN deficiencies that actually exist, but I particularly take RPN as the most "transparent" interface when user memory is the issue. Neither RPL nor algebraic interfaces allow this "memory virtual viewing". RPN calculators allow the user to handle up to four numbers in a four-register stack structure plus a fifth "error-recovering" register; the remaining memory is divided into registers to hold numbers or, in some cases, alternative data (ALPHA strings, matrix descriptors, program steps, etc.). Its operation is unambiguous and the stack contents can be predicted for a given keystroke sequence: one does not need to "press the keys" to "see what happens". On the other hand, after keying in some numbers, pressing operation keys and opening a few parenthesis, I may have no idea of how much memory an algebraic calculator has already spent to hold the pending operations, but I know that I cannot use this same memory for other purposes, even if I have no need for pending operations. I guess this is the main reason for the "memory loss" you mentioned before. STAT data and pending operations are not compatible, so this "shared memory" must be cleared when modes are changed.

> Quote:
>
> And about "words" "nibbles" etc?

The HP32S was the first calculator I saw that counted X.5 bytes for programs. This .5-byte is actually a group of four bits, named "nibbles". Each time half of a byte is used as stand alone or composing a group of bits associated to some sort of data, naming these four bits a "nibble" is faster and easier. At least I guess so. The term "word" related to digital information and memory has some different "interpretations" and applications. I have already seen "word", "double word" and the like referring to 16-bit and 32-bit data respectively. I also saw "word" as a reference to the standard data a system (or processor or memory) can handle (or process or store) at the same time, being the "system data unit". This last definition does not state how many bits a word has, it depends on the system (processor, memory) structure. I explain this everytime I am asked about and everytime I spontaneously mention this fact. I still don't know what is correct, if any.

I guess I wrote too much.

Cheers.

WORDs and DWORDs

*Message #5 Posted by **Cameron** on 28 July 2004, 9:58 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

To quote someone else: "the wonderful thing about standards is that there are so many to choose from."

(that's an IT joke; apologies to the engineer community).

About the only three terms that we can call unambiguous have been mentioned by John. James and Luiz: octet, byte and nibble (or nybble). As has been said, the first two describe a logical collection of 8 bits and the third is half that size. I say *logical collection* because none of these terms tell us anything about the way the bits are generated, moved, manipulated or stored by a piece of hardware.

The term WORD usually means the logical collection of bits that a given (processor) architecture can sling around most efficiently. You can think of it as an architecture's data atom. You can inspect a word's sub-structure and you can "weakly bond" more than one of them together but they remain the fundamental unit that an architecture is designed to process.

Double-words and quad-words, as their prefixes imply, are simply collections of bits that are comprised of 2 and 4 atoms (words). Some architectures are able to manipulate these multi-word quantities more efficiently than arbitrary collections of words which is why there are specific terms that apply to them.

Higher up the descriptive food chain we have much more ambiguous terminology. Terms like int, short and long spring to mind (only because I often program in C++). The size (in bits) of these is only defined for a particular platform and can, as Microsoft and Intel have shown us) change across incarnations of the (allegedly) same platform.

I often refer people to the Free On-Line Dictionary of Computing as both a reference and a fascinating interconnected web of computing terminology.

Cameron

PS: Luiz you never type too much. ;-)

Re: Bytes and octets

in response to message #5 by Cameron

> Quote:
>
> About the only three terms that we can call unambiguous have been mentioned by John. James and Luiz: octet, byte and nibble (or nybble).

The first time I saw the word 'octet' used was in the internet RFC docs. I assume that term was used to differentiate an 8 bit value from a 'byte' which could be a 7, 8, or 9 bit value.

I know some mainframes have a 9 bit byte. I don't know if any computer used a 7 bit byte, but in an 8 bit system with one bit used for parity, you only have 7 bits left for data.

So... byte is not such an unambiguous term. However, whenever I use it, I mean 8 bits.

Steve.

Bytes != Octets

*Message #7 Posted by **John Limpert** on 28 July 2004, 11:04 a.m.,*
in response to message #6 by Steve A

Some older computers used 6-bit bytes. I've seen computers where the smallest addressable chunk of memory is 32-bits or 64-bits. If UniCode ever becomes universal, we may see computers with

larger byte sizes.

bits and pieces

*Message #8 Posted by **Steve A** on 28 July 2004, 11:36 a.m.,*
in response to message #7 by John Limpert

I guess we're left with just the unambiguous 'bit', then.

Steve.

> I guess we're left with just the unambiguous 'bit', then.

"Octet" also seems unambiguous to me.

I overlooked that bytes are sometimes not octets, but I believe that that is indeed the case.

So is a nibble (or nybble) alway 4 bits or is it 1/2 byte? Maybe I should say "quartet"?

Regards,
James

> Quote:
>
> "Octet" also seems unambiguous to me.

Yes, that was a failed attempt at humour.

I was suggesting that only the very simplest things can be defined with absolute accuracy.

If I ever invent a technical term, I hope it's at least as amusing as 'nibble'.

Steve.

The "bit" and the "binit"

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 29 July 2004, 10:44 p.m.,*
in response to message #8 by Steve A

Well, we may enter the almost endless discussion about the difference between a "binit"

(binary digit), which is something like a memory cell, disk spot, etc., that have two possible states (1 and 0); and the real, purest definition of "bit" as a quantity of information: the amount of information needed to reduce uncertainty of an information source by a half. This last definition comes from Information Theory.

For instance, a circuit, a magnetic spot, an optical mark with two possible status will have the "potential" to carry up to one bit of information; but if such information is already known, and hence redundant, our "binit" will find itself carrying less than one "bit" of information.

The usual metaphor is that a "binit" is like a bottle which can contain up to one "bit" of information (content); but not every bottle carries its maximum load all the time...

Re: The "bit" and the "binit"

*Message #12 Posted by **Garth Wilson** on 30 July 2004, 12:37 p.m.,*
in response to message #11 by Andrés C. Rodríguez (Argentina)

I've never heard that about the binit and the bit. I've been at this gave for over 20 years. We were taught in school in the early 80's that "bit" was short for "binary digit," a definition which I find adequate.

Once upon a time, when IT was "information theory"...

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 30 July 2004, 1:59 p.m.,*
in response to message #12 by Garth Wilson

I accept I went a little off with this matter because, all the time, all we (me included), use the "popular" definition of "bit".

I was an electronics engineer student in 1980, when I attended a course on communications systems and information theory. I think (from memory) we used a classical book by Norman Abramson, which covered these subjects; and also presented the main ideas from the Nobel laureate Claude Shannon (father of Information Theory, the scientific approach to information).

We had very heated discussions with the professor, because the "binit" was known by none of the students. But, in the end, he convinced us about the difference between the "binary digit" and the "amount of information" it may bear. I think that, to avoid the confusing statement "Not always a bit is worth a bit", they switched to "Not always a binit is worth a bit".

There were enlightening discussions about the "entropy" of an information source, redundancy, coding efficiency; the differences between "bit per second" and "baud rate", error correcting codes, etc.

Most of those theoretical issues of the '50s were subjects of scientific research between the '60s and the '70s; become critical features of consumer products in the '80s and '90s (fax, CD players, hard disk drives, DVD, dial-up modems); and are now "taken for granted", passing almost unnoticed by millions of users of PCs, communication devices, and the Internet.

Re: Once upon a time, when IT was "information theory"...

*Message #14 Posted by **James M. Prange** on 30 July 2004, 7:02 p.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

I've never heard of a "binit" before, but I suppose it depends a lot on how the potentially available information is being used. For example, a nibble has 16 possible values, but when used as a BCD digit, only 10 of them are meaningful, and when used as a sign, only 2 of them are meaningful.

I wonder how a processor being used in decimal mode would respond to invalid nibbles.

Regards,
James

Re: Once upon a time, when IT was "information theory"...

*Message #15 Posted by **Andrés C. Rodríguez (Argentina)** on 31 July 2004, 11:35 a.m.,*
in response to message #14 by James M. Prange

Just to benefit from your well chosen examples:

A "physical" nibble (4 "bits" or binits) will contain:

- 4 bits of information when used to keep an hexadecimal digit.

- 3.322 bits of information when used to keep a BCD digit (isn't it reassuring to see that 3 bits are not be enough for this?). This is kind to have four bottles, where three are full, but the last has been filled up to only one third of its capacity.

- 1 bit of information, when used to keep just a two-valued sign; no matter how much circuitry is used for that matter.

The bit scale is logarithmic: In the case of the BCD digit, the information content is calculated as the base-2 logarithm of 10 (the permitted values count). The information content of the "sign" is just the base-2 logarithm of 2, which is 1 by definition.

Re: WORDs and DWORDs

*Message #16 Posted by **James M. Prange** on 28 July 2004, 4:42 p.m.,*
in response to message #5 by Cameron

For the Saturn processor, a "W" word field is used to refer to an entire 64-bit (16-nibble) "working" register or "scratch" register.

These 16-nibble registers are sufficient for holding "real" numbers in decimal mode, where each nibble represents a BCD digit; nibbles 0-2 for the "X" (signed) exponent field, nibbles 3-14 for the "M" mantissa field, and nibble 15 for the (0 for positive, 9 for negative) "S" sign field. Interestingly (to me), an entire nibble is used for the sign, although a single bit would be sufficient. But note that the "long real" numbers used internally need 15 nibbles for the mantissa, 1 nibble for the sign, and 5 nibbles for the signed exponent, so can't fit into a single register.

The Saturn processor has several 20-bit registers, and the 64-bit registers each have a 20-bit "A" ("address") field, nibbles 0-4 of these registers. The SysRPL terminology for a 20-bit unsigned integer is "internal binary integer", or "bint" (not the same as a UserRPL binary integer, which is a "hex string" or "hexs" in SysRPL terminology). Note that bints are used in SysRPL for many purposes besides memory addresses; in general where they're always sufficient to describe a quantity. For example, a bint is always sufficient to specify the length (in nibbles) of any object that can possible fit into memory, any address, or any length (again, in nibbles) of memory.

Other Saturn registers are 16-bit, 12-bit, 4-bit, and 1-bit.

Note that the Saturn processor is based on a 4-bit bus, so 4-bit quantities ("nibbles") are particularly important. A nibble is the smallest addressable unit of memory, and any memory operation always involves a whole number of nibbles; you can't read or write partial nibbles. Also note that a nibble represents one hexadecimal digit, or, in decimal mode, one BCD digit.

Regards,
James

Re: I have a question about "Word Size" and Memory

*Message #17 Posted by **Dave Shaffer** on 28 July 2004, 5:18 p.m.,*
in response to message #1 by Bill Platt

I think the word "byte" originated with IBM for their 360/370 series computers (mid- to late-1960s). At this time, as others have already noted, a computer "word" could be almost any size, depending on what brand of computer you were talking about.

An 8-bit byte was the right size for one character as far as IBM was concerned, since it allowed all 256 characters which comprised the extended ASCII set - "EBCDIC" (extended binary-coded decimal information(?) code(?)) as IBM called it, if I remember correctly.

I suspect, but don't know for sure, that "byte" was a play on words: it was clearly more than a bit, and you bit off a "byte" to chew (process). Hence, the logical successor: the nibble (= half a byte/bite).

Thus, originally at least, byte meant exactly 8 bits, and a nibble was 4 bits. If you need parity for error correction, then adding a parity bit to each byte made it 9 bits in size. This was certainly done when the IBM 360/370 computers wrote tapes - hence the "9-track" tape drive, with 8-bit bytes plus a parity bit laid down across the tape. Previous tape drives were 7 track (and I have no idea how they formatted the bits!). This made exchanging tapes between different computer systems somewhat of a challenge in the late 60s, early 70s!

7-Track Tape

*Message #18 Posted by **John Limpert** on 28 July 2004, 10:45 p.m.,*
in response to message #17 by Dave Shaffer

I've used old UNIVAC systems that had 7-track tape drives. They used a 6-bit (FIELDATA) character code that predated ASCII and EBCDIC. Seven tracks was a good match for a character plus a parity bit.

CDC and DEC also used 6-bit character codes on some of their older systems. Some systems, like the DEC PDP-10, a 36-bit system, supported more than one size of character. You could use the character set that was the best fit for your application.

EBCDIC and FIELDATA

I can relate to that... In the mid-eighties, I maintained software written in Fortran '66 and Fortran '77 for Sperry and Sperry*Univac mainframes.

The Fortran '77 software (which Sperry caleed "ASCII Fortran") utilized the ASCII character set. The Fortran '66 software ("Fortran IV") utilized FIELDATA. IBM mainframes of the era utilized EBCDIC.

Re: I have a question about "Word Size" and Memory

*Message #24 Posted by **DavidY** on 28 July 2004, 5:56 p.m.,*
in response to message #1 by Bill Platt

Generally, limits on the number of characters allow (1.e.255) came from the way the operating system treats character arrays and how it handles the pointers for such arrays. The origional 255 character limit came from the fact that programmers using the early microprocessors were faced with size limits. It was less wasteful and easier to process the string pointer if it would fit into one memory word--and since most common processors were using 8-bit words this mean 255 characters max (2^8=256 which equals 255 characters+1 index byte).

In fact in some earlier (assembly or higher level) code you only got 253 characters: 1 index byte, 253 characters, and 2 null (0) bytes to indicate "end of string".

In calculators, often using serial memory bus structure, things were more efficient if you could keep pointer structures small--moving 8 bits was a lot faster than moving 16 or more.

In point of fact the 33s "shouldn't" have such a limitation as the ARM cpu can handle much more memory than the origional 33 and I believe has a larger word size. But--since it appears that the "33S" is really code running on an emulator running in ARM microcode it simply carries over the old limitations.

33s Processor

*Message #25 Posted by **bill platt** on 29 July 2004, 9:42 a.m.,*
in response to message #24 by DavidY

Hi David,

That is a good expmanation for the 255 character business.

however, I do believe that the 33s is *not* an ARM CPU--rather, it is some other, older CPU--there is a thread in the archive, and in C.S.hp48 about this.

CPU is shown as an "8502" at:

http://www.hp.com/calculators/scientific/33s/specs.html

Re: 33s Processor

*Message #28 Posted by **John Limpert** on 29 July 2004, 5:54 p.m.,*
in response to message #27 by Norris

That's interesting. The 8502 is listed as being an enhanced version of the extremely popular MOS Technologies 6502, used in the Apple II and many Commodore computers. It's also listed as the CPU in the HP-30S, a low-end algebraic scientific calculator.

It's amazing how long some of these CPUs have been around. I can remember lusting after a 6502 based single board computer (KIM-1) when I was a teenager. It had a hex keypad and six 7-segment LEDS. It was a real computer, minus case and power supply, for less than $300.

Re: 33s Processor

*Message #29 Posted by **HrastProgrammer** on 31 July 2004, 4:33 a.m.,*
in response to message #28 by John Limpert

It's amazing how long some of these CPUs have been around. I can remember lusting after a 6502 based single board computer (KIM-1) when I was a teenager.

What amazes me is that HP dropped further use of their excellent Saturn CPU (for this kind of applications, like calculators and BCD arithmetic) in favor of CPU that is basically 6502. It seems like Saturn is too old for their new calculators but, as far as I know, 6502 is much older and all this doesn't have much sense from my point of view. If they kept Saturn, they wouldn't have to rewrite everything and produce a lot of bugs and differences. Furthermore, Saturn has enough power for some HP-15C, HP-16C, HP-41C/CV/CX, HP-42S and HP-71B based calculators in the future.

Re: 33s Processor

*Message #30 Posted by **.** on 31 July 2004, 4:49 a.m.,*
in response to message #29 by HrastProgrammer

A few people from HP have said in the past, that fabbing a new CPU would cost at least half a million dollars - too much of an investment.

The 6502 is fine for a low end scientific, and ARM makes sense for the more powerful calculators. The ARM is fairly cheap, well supported and low power. It is also much faster then Saturn - The main preformance limitation of the Saturn is the 4 bit bus, while the 49g+ uses a 16 bit bus. Also, there are many more better development tools for chips like the ARM then the saturn. With an industry standard CPU, HP can easily get faster chips later without another huge investment in refabbing the Saturn yet again.

I haven't compared Saturn to ARM but to a 6502. And Saturn doesn't need to be developed (because it was developed about 20 years ago) but just to stay in production. Saturn is a good CPU and would serve future HP calculators very well.

BTW, we all know the "quality" of HP's last experiment with ARM CPU. It is called HP-49G+ ...

The problem with the latest HP calculators isn't 4-bit data bus but the lack of overall production quality.

Re: 33s Processor

*Message #32 Posted by **John Limpert** on 31 July 2004, 9:16 a.m.,*
in response to message #31 by HrastProgrammer

One problem is that HP may not be able to make new Saturn chips without spending a lot of money. Integrated circuit production lines don't last forever. They become obsolete and are scrapped. Even if you have all the original masks and layouts, switching to a new production line, using a more modern process, may require expensive revisions to make the old design compatible with the new production line.

The SunPlus chip that HP is using in the HP-33S is not just a 6502. It's an enhanced 6502 core with integrated LCD controller, ROM and RAM. That's a substantial gain in integration and functionality over the Saturn, at the expense of losing software compatibility. HP may have decided that it was better to rewrite the software for the 6502 if it meant that they could use an off-the-shelf, inexpensive, all-in-one chip for their calculator.

Re: 33s Processor

AFAIK, none of the two hundred million 6502 cores being produced every year today are limited to the instruction set or slow speeds of 25 years ago. They all have an enhanced instruction set, and most of the cores are in microcontrollers that have varying amounts and types of RAM, ROM, uP support, timers, and I/O, all in one IC. Western Design Center licenses the IP.

What does the choice of CPU have anything to do with the poor quality of the keyboard?

Nothing, really ... except that we still aren't sure if the keyboard problem is due to a bad keyboard or a firmware/ARM/emulation problem (recently there was a discussion about this on comp.sys.hp48).

Re: 33s Processor

> Quote:
>
> And Saturn doesn't need to be developed (because it was developed about 20 years ago) but just to stay in production.

ASICs can't just "stay in production". The volume is low enough that the foundry (NEC for the Saturn parts used in the HP 48 etc.) eventually discontinues the old process in favor of newer ones. Thus to "stay in production" you need to tapeout the chip again. Even if you're using logic synthesis from Verilog or VHDL, a tapeout still costs a *LARGE* amount of money. Thus it is unsurprising that HP would prefer to switch to commercially available parts from Sunplus and Samsung.

About a decade ago I worked for a company that had a fairly successful product

that had been on the market for about 7-8 years. It used an ASIC fabbed by Fujitsu. By that time, the process was so old and volumes were so low that Fujitsu only did a line start every few months. When you do a line start, it takes a while to get the process parameters right, so a lot of waste is produced before anything useful. Still, Fujitsu was willing to try to make our chip. But unfortunately things were so old that two consecutive attempts at a line start resulted in zero yield. We had to scramble to replace the ASIC with a daughterboard with an FPGA.

"Word Size"---thanks

how to open HP 48 GX

*Message #1 Posted by **Jesse Nemec** on 27 July 2004, 1:41 p.m.*

The reason I ask is because my function keys "+", "-", "*" and "/" rarely work anymore. Sometimes if I hit them hard they will work but not always. I want to look at all of the contacts to see if there is anything I can do to resolve this issue. I can't find any screws to remove the top portion.

I've done a search, and only found how to open the HP 49. Someone posted that the 48 should open similar to the 49, but I can't seem to find the 6 heat points in the battery compartment to drill out.

Any help would be greatly appreciated.

Re: how to open HP 48 GX

*Message #2 Posted by **bill platt** on 27 July 2004, 4:37 p.m.,*
in response to message #1 by Jesse Nemec

1st, try pushing gently but then more firmly as needed, on the bezel, just above the "F" key.

Also, do you find your backspace, 1/x, >, NXT, and F keys sporadic as well?

If so, my suggestion should work.

If you end up wanting to open it up, there is a method which uses no sparp tools and no drilling or cutting. It is saved somewherre at HPcalc.org, "openhp48noDamage" or something like that. The guy who wrote it is named is Pawe, and he is from Poland.

I am emailing you the text of his method---go to hpcalc.org to get the photos.

If you can't find them, I'llemail them, too (big).

regards,

Bill

Re: how to open HP 48 GX

*Message #3 Posted by **Jesse Nemec** on 28 July 2004, 5:46 p.m.,*
in response to message #2 by bill platt

The problem seems to only be affecting the function keys that I mentioned. The "1/x" and others in that collumn seems to be fine.

I have a nasty habit of hitting the keys too hard, and obviously the most used keys in a day-to-day operation would be the simple arithmatic function keys.

I would love to see the pics as well. I saw and responded to your email before I came back here to the

forum. I'm not sure the text makes quite enough sense without the pics.

Thanks for your time and help.

I will take a stab at opening it up, and if it doesn't look like something I can just clean or fix in a simple manner, I might try the equipment exchange. Although I really don't need the GX model anymore since I am now out of school, and I really just like the layout of the 48 and would do just fine with a 48G. I'm not familiar with the Gii or the 49.

Thanks again!

Jesse

People become crazy about HP15C

*Message #1 Posted by **Walter B** on 27 July 2004, 1:06 a.m.*

Look at this: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5710930993

Do our discussions in this forum support this? People seem to think still the HP15C is the best they can ever get ...

Re: People become crazy about HP15C

*Message #2 Posted by **Namir** on 27 July 2004, 1:35 a.m.,*
in response to message #1 by Walter B

Walter,

The buyer for that HP15C has zero feedback, meaning they are new and eager in more than one way to buy an item and establish a higher fedback rating. Buyers like that usually overpay for items. My guess is they lack former sales statistics that tell them about the average going price. In the case of the auction you mentioned the buyer paid about triple the average price!!!

Namir

Re: People become crazy about HP15C

*Message #3 Posted by **Chris Woodhouse** on 27 July 2004, 11:59 a.m.,*
in response to message #2 by Namir

I have noticed on ebay that even when an item is still in production and can be purchased at most any major vendor that if somewhere in the item description are the words "new in the box", ebayers will often go insane with bidding and pay far more than they would if they bought one new.

> Quote:
>
> In the case of the auction you mentioned the buyer paid about triple the average price!!!

Since this only the second 15C still in the box that I have seen on ebay, I don't think you say it is triple the average price. For a collector having the box may be worth a lot. The price the only other 15C that was in it's original box I saw on ebay went for a similar price.

*Message #4 Posted by **Jim L** on 27 July 2004, 12:39 p.m.,*
in response to message #3 by Chris Woodhouse

A few years ago when Educalc was closing down there was a period of several months when people where buying Educalc's old HP stock and reselling it on ebay. A lot of things were going for more than

10 times Educalc's posted prices. Since then I've noticed several dealers sensibly switching to ebay-only selling.

Maybe someday everyone will sell only on ebay and a "like new!!!" Honda Accord will cost about $200,000. ;-)

Stuff tends to go in waves on ebay too. Prices go sky high, more dealers appear, prices crash, supply dries up. It's like the normal economics of supply and demand but ebay seems to magnify the effect.

Re: People become crazy about HP15C

*Message #5 Posted by **westridge_cz** on 30 July 2004, 11:56 p.m.,*
in response to message #2 by Namir

Hmm, I don't think the buyer for that one had zero feedback, I checked on the bidder list for the auction mentioned http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5710930993 and saw that the buyer had 9 feedbacks. I didn't realize it before but when I checked again on the previous 15C auction that ended up with a similar amount, the winning bidder was the same person http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5708821652 So I guess he's building a collection of mint 15C's. Now I'm wondering, though, if that "gunsnsnakes" guy was a shill bidder, because someone pointed out that "hawaiianprincess" didn't register until July 25th!

Money, heck you can always make more money. But the moment, the opportunity, once lost, is gone forever...

He hates HP calculators...;)

*Message #6 Posted by **Marx Pio** on 27 July 2004, 1:39 a.m.,*
in response to message #1 by Walter B

Asking 520 USD for a 15C doesn't means the vendor will sell it...He said in the ad he doesn't like hp calculators. He coul throw it away in my bin. ;)

Pio

the buyer has zero feedback ... yesssssss ...

*Message #7 Posted by **Emmanuel** on 27 July 2004, 2:36 a.m.,*
in response to message #1 by Walter B

Don't be fooled by this kind of auction.

The zero-feedback buyer is quite certainly a second (or third...) account from the seller himself. This fake buyer has only one aim : make the auction rise artificially. What happen next is that this fake buyer "wins" the auction; and within minutes of the end of the auction, the second (real) buyer in the bidding list receives an offer from the seller to buy his calc.

Your paranoia is showing

*Message #8 Posted by **Mike** on 28 July 2004, 4:49 p.m.,*
in response to message #7 by Emmanuel

You say: "The zero-feedback buyer is quite certainly a second (or third...) account from the seller himself. "

This, while certainly possible, is pure nonsense. If you want to verify this, contact the 2nd bidder.

You know very well that many people pay very high prices for a MINT calculator. We even have some here that have paid $500 for just a box.

I think your "paranoia" is showing. Why? Because 2 other people bid over $600 and one of them had 67 feedback. 4 people bid over $500.

Edited: 28 July 2004, 4:51 p.m.

Re: Your paranoia is showing

*Message #9 Posted by **Jim L** on 28 July 2004, 9:18 p.m.,*
in response to message #8 by Mike

Maybe I'm missing something but since the purpose of a shill is to get people to bid higher, doesn't your message just show that either it's a successful shill or not a shill?

no!

*Message #10 Posted by **Mike** on 29 July 2004, 8:40 a.m.,*
in response to message #9 by Jim L

You comment is meaningless. Of course it is one of those two.

The point of my post is that I believe it NOT, NOT, NOT to be a shill bidder. The bid is only about 3 times an average priced 15C. But this one is MINT. Thats not an unusual bid.

We see calculators go for 5 and 6 times their value all the time on ebay.

Re: no!

*Message #11 Posted by **Jim L** on 29 July 2004, 11:45 a.m.,*
in response to message #10 by Mike

"You comment is meaningless."

It's been nice chatting with you.

Re: People become crazy about HP15C

*Message #12 Posted by **Ann Onymous** on 27 July 2004, 4:38 a.m.,*
in response to message #1 by Walter B

That's right, I'd never exchange my 15c for any other calc you might offer.

Perhaps you should try one yourself.

Also, people here tend to be astonished when someone pays big money for such and such calc. That's thinking small, as if everyone out there had your very budget limitations, if you can't or won't spend $500 on a calc, then surely no one does.

Nonsense, get real. There are people who think nothing of forking out $500 or $5000 for some gadget whether it's worth it or not, as long as they fancy it and someone happens to have it available. And I'd say that people fond of HP calculators of old tend to be wealthy enough and successful enough in their careers that there would be some that would act so.

*Message #5 Posted by **Chris Woodhouse** on 27 July 2004, 11:47 a.m.,*
in response to message #1 by John Nelson

May I suggest that in the future you use a "disposable" email address.

Speaking of scams, I just got an email from STAN, claiming to be an eBay "international seller" with a 15C for $400 USD that is "factory sealed in its original box and it comes with 1 year worldwide warranty from manufactury". Right...

Chris W

Re: Spam from for sale section

*Message #6 Posted by **Vassilis Prevelakis** on 28 July 2004, 2:48 a.m.,*
in response to message #1 by John Nelson

I can understand your frustration.

I am doing two things to minimize spam,

(a) I use disposable addresses. I have my own domain name, and I simply generate email addresses by using random combinations of 7 character names (lower case alpha and numeric). I then alias these addresses to my real account. After 1-2 spam messages I simply delete them (or forward them to some other spammer :-).

(b) I include my address as a bitmap. For example, this is the address for the series80.org site.

http://www.series80.org/HP-87-ContactInfo.jpg

While a determined attacker can isolate the address from the bitmap, few bother to do so, as its too labor intensive. They just do ASCII scans for strings that look like email addresses.

Strange problem with HP-22

*Message #1 Posted by **Blaine Manyluk** on 26 July 2004, 9:50 p.m.*

When I switch on the calculator, sometimes it has a blank display, or a full line of periods. After a few minutes, all the display segments flicker. Sometimes, when I press a key, I get a single flickering "8.", but nothing else happens. Nothing actually works.

Could this be caused, or related, to the ACT chip? This has been known to be a problem in "Woodstock" (HP-21, HP-22, HP-27) calculators. Or is it something else?

I have been using two slightly-used alkaline AA cells for the battery - but not the AC adapter. (One was not included with this used calculator.) I don't think the extra (3.0 vs 2.5) voltage is causing any trouble.

Re: Strange problem with HP-22

*Message #2 Posted by **Walter B** on 27 July 2004, 1:22 a.m.,*
in response to message #1 by Blaine Manyluk

Hi Blaine,

I fear you are right. I saw exactly the same symptoms in one of my Woodstocks and I was told by several experts here it is the ACT. Usually this happens when someone uses the AC adaptor while old or no cells are in. Since you seldom know the status of your rechargeable cells exactly, it is highly recommended to load the cells outside the calculator.

Extra battery voltage from your fresh alkalines does not harm your Woodstock according to my experience.

Re: Strange problem with HP-22

*Message #3 Posted by **David Smith** on 27 July 2004, 11:40 a.m.,*
in response to message #1 by Blaine Manyluk

This sort of problem is usually a bad battery or connection. The classic bad ACT problem is a display of 00000000 or sometimes a blank display or possibly a single very bright digit lit.

Re: Strange problem with HP-22

*Message #4 Posted by **Ronald** on 27 July 2004, 11:55 a.m.,*
in response to message #3 by David Smith

I had a thing like that as well, carefully "resoldering" all the contacts solved the issue for once and all. Use a small tip, taken precautions to static charge and make sure you do make a short circuit.

Success

Re: Strange problem with HP-22

*Message #5 Posted by **Blaine Manyluk** on 27 July 2004, 6:57 p.m.,*
in response to message #3 by David Smith

> This sort of problem is usually a bad battery or connection.

I do use two alkaline AA's in the battery pack, bridged by a rolled-up wad of aluminum foil. The voltage checks out at 3.1, which is more than recommended (but not likely to do any harm.) It's possible that voltage is OK but current low. Or the bad connection could be somewhere inside the calculator.

> The classic bad ACT problem is a display of 00000000 or sometimes a blank display or possibly a single very bright digit lit.

I sometimes get this too, combined with all the flickering. Sometimes when I press a key, I get an "8." by itself, or a "0" or a "@" (backwards 9). So I'm not sure it it's a bad battery, ACT, or both.

Re: Strange problem with HP-22

*Message #6 Posted by **David Smith** on 27 July 2004, 7:12 p.m.,*
in response to message #5 by Blaine Manyluk

It is beginning to sound like a bad ACT, but it could still be a bad connection. I would open up the machine (two screws under the upper two rubber feet) and clean all the circuit board connections with 91%+ isopropyl alcohol. Try and keep the alcohol off the LED window and keyboard face. Also lightly sand the tips of the battery contacts with very fine (600+ grit) sandpaper. A lot of these machines had some hand soldered components in them and the old solder flux (often invisible) seems to be a common problem.

How to remove permanent marker from calculator?

*Message #1 Posted by **Mike Tjebben** on 26 July 2004, 9:13 p.m.*

I just purchased an HP48 from a colleague, but it has the colleague's name in permanent black marker on the back of the case. Is there a "safe" (to the caculator, of course) way to remove the marking?

There is also permanent black marking on the fabric case too, but I'm not as concerned about that. If, however, someone has a clever idea about how to remove that too, I'd be happy to hear.

I did a few searches on this site, using keywords "marker", "permanent", etc., but without success.

Many thanks.

-Mike

Re: How to remove permanent marker from calculator?

*Message #2 Posted by **Steve A** on 26 July 2004, 9:35 p.m.,*
in response to message #1 by Mike Tjebben

Try searching for 'remove permanent marker' on google

Re: How to remove permanent marker from calculator?

*Message #3 Posted by **Steve B.** on 27 July 2004, 8:33 a.m.,*
in response to message #2 by Steve A

A permanent marker or Sharpie can usually be removed with Alcohol or believe it or not Hairspray. But be sure to test it on a small corner to make sure it does not discolor the case too much. Also since the 48's case is textured, it might be difficult to completely remove all of the ink.

Regards,

Steve

Re: How to remove permanent marker from calculator?

*Message #4 Posted by **Mike Tjebben** on 27 July 2004, 8:20 p.m.,*
in response to message #3 by Steve B.

The isopropyl alcohol worked great! On BOTH the calculator AND the fabric case!

Thank you to all who gave suggestions.

-Mike

Re: How to remove permanent marker from calculator?

*Message #5 Posted by **Bruce Horrocks** on 27 July 2004, 8:37 a.m.,*
in response to message #1 by Mike Tjebben

Here in the UK you can buy a range of products called "Stain Devil" that remove all sorts of things (you buy a different bottle according to the type of stain.)

There's one for ink that I've used these to remove biro and permanent marker from different plastics without any ill-effect to the plastic.

So try this but don't forget to test on an inconspicuous area first just in case.

Re: How to remove permanent marker from calculator?

*Message #6 Posted by **David Smith** on 27 July 2004, 11:44 a.m.,*
in response to message #1 by Mike Tjebben

I have had pretty good luck using white gas (camping fuel/cigarette lighter fluid).

A bit more agressive thing to try is a product called "Oops!" It is a mixture of several solvents. It seems the best one for markers evaporates the fastest so it can help to wet your rag frequently in a dry area and keep going at it. Keep all solvents off of the keyboard area as they can leave behind "water" marks.

33s Solver: Hints: it's quirky, and learn ALG **EDITED**

*Message #1 Posted by **bill platt** on 26 July 2004, 6:26 p.m.*

Hello all 33s enthusiasts and NOTenthusiasts:

I have tested the 33s Solver, and found some significant differences in behavior as compared to the 32sii.

As you will recall, the 32sii allows you to use the solver in five (5) different ways:

```
1.  Equation List
2.  Manually define a Program (Fn=) and Solve it
3.  Write a program which sets Fn= and then solves for the
        unkown variable in the subroutine called by Fn=.
4.  Write a program using an Equation, and do as with (2) above (set Fn= from the keyboard and
solve for the variable.
5.  Do what (3) does, except that the subroutine has an equation.
```

In any case, if you use any of these five approaches, you will get exactly the same results (as documented):

```
Z register = last value of the function
y register = penultimate iteration for vairable to be solved
x register = ultimate iteration for solved variable,

and of course the variable itself will have the new value.

(Undocumented):
t register = penultimate value of the function (??)
```

With the 33s, depending on which approach you take (equation list, RPN program, ALG program, Solve manually or with automatic subroutine, equation in program et) there are differences in the results or presentation of the reuslts.

Further, because of the ALG aspect, you now have ten (10) fundamentally different ways:

```
1.  equation list, run with RPN interface
2.  equation list, run with ALG interface
3.  RPN program
4.  ALG program
5.  Automatic with RPN program
6.  Automatic with ALG program
7.  Program with an equation, Run with RPN interface
8.  Program with an equation, run with ALG interface
9.  Automatic Program with equation subroutine, RPN interface
10.  Automatic Program with equation subroutine, ALG interface.

Note that a Automatic control program for solving is inherently RPN/ALG "gender" neutral:
LBL J
Fn=F
Solve X
RTN
And a subroutine using an equation (expression) is also inherently gender neutral:
LBL F
SF 11
```

```
(eqn) x / (sq(x)-6)-1
RTN
```

Perhaps you might also add "using the RPN interface to run an ALG program" and "using the ALG interface to run an RPN program' which would add another four (4) flavours to versions 3 through 6 above---but let's ignore that for now!!!!

I tested the behavior by doing a "matrix" of programs for the "pole" example in the manual (repeated above in LBL J) and also using a simple polynomial with a real root: y^3-y^2+6

```
To sum up the results:

If you solve with an equation list, you will fill the stack
 and the ALGstack with the best estimates for the solution,
and the final value of the function--regardless of whether
"no root found" or a root is found.

If you use a program (with and equation in it or not) and you fail to find a root, then the
stack and the ALG stack
 will not be filled with estimates.

Where solutions/estimates are written to the stack, the
ALGstack will also be written to--and note that the ALGstack
will be available, undisturbed, until the next SOLVE
invocation---therefore--you have four extra registers to
use in the 33s!  This can be very handy!
```

So, here are some results:

If you solve the "pole" example as I mentioned above, here is what happens:

```
1. (equation list) RPN input.
2.3 STO x
2.7
{go to EQUATION in the Equation List}
Solve X

T     ---                  x1
z    81,649,658,092        x2
y    2.44948974278         x3
x    2.44948974279         x4

"No Root Found"
hit backarrow to clear message and you see the stack as
noted above.

PLEASE NOTE that the ALG "stack" is also filled as noted above.

The only difference, if you run it in ALG, is that there is
 no RPN stack--you see only the final result after
back-arrowing, and there is the x1 x2 x3 x4 ALGstack too.

Of course, the variable X also contains the "answer".

If you chhose th use a program, it is very different!
LBL E
RPN
RCL X
ENTER
ENTER
X62
```

```
6
-
/
1
-
RTN.

Manually select this function, and tehn solve X, all in
RPN, and you get this:
2.3 STO x  ;put in your estimates
2.7        ;put in your estimates
FN = E     ;define function
Solve x    ;call solve
"no root found"
backarorrow to see stack:

t        2.3
z        2.3   And no results at all to ALGstack!
y        2.3
x        2.7

The "correct iterative answer" is stored in X: 2.44948974279

Similar results are obtained running in ALG--except you don't see the stack.

Exactly teh same also if you have an ALG program and do above:
LBL A
ALG
RCL x
/
(
RCL X
x^2
-
6
)
-
1
ENTER
RTN

Now, try using an automation step with the RPN version:

LBL D
Fn=E
Solve X
RTN
LBL E
RPN
RCL X
ENTER
ENTER
X62
6
-
/
1
-
RTN.

In RPN:
2.3 STO x
2.7
XEQ D

T     2.44948974279  ;{last iteration}
Z     2.44948974279  ;{last iteration}
Y     2.44948974279  ;{last iteration}
X    81649658092 ;{function value at last iteration}
```

```
Note that the "Do if True" rule caused the "no root found"
event to roll directly into evaluating the routine at the
last estimated x-value.  Of course, you could code it
to say "no root found" and stop, or try again etc.

Now, finally, try this automated business with a program
sequence which uses an "Equation"
(use LBL J and LBL F above, with F immediately following J)

2.3 STO x
2.7
XEQ J

"X?
2.44948974279"
press R/S

T     2.7
Z     2.7                      No values to the ALG stack
Y     2.44948974279
X     81,649,658,092

Note that flag 11 makes the equation prompt for the variable--when we skip the RTN and go onto
evaluating the
subroutine.
```

On another day, I will post the reesults of running a matrix on a "solvable" polynomial---essentally the same as 32sii--except that the T register carries your last input estimate---rahter than as with the 32sii--which carries the penultimate function value in the T register).

Have fun.

Best regards,

Bill

Re: 33s Solver: Hints: it's quirky, and learn ALG

*Message #2 Posted by **martin cohen** on 26 July 2004, 6:53 p.m.,*
in response to message #1 by bill platt

This is weird!

I wonder how the 33s was coded.

This, plus the atan2 bug, have me disappointed.

Re: 33s Solver: Hints: it's quirky, and learn ALG

*Message #3 Posted by **John Smitherman** on 27 July 2004, 12:20 a.m.,*
in response to message #2 by martin cohen

The list of 33s bugs keeps growing. Add the newly discovered to the following:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=57200

But the good news is that the 33s is qualified for the professional engineering exam! ;-)

I was waiting for rev 1 before buying the 33s, but now I think that I will wait for rev 2.

John

OOPS!! It is not a bug. (My Fault!)

*Message #4 Posted by **bill platt** on 27 July 2004, 9:47 a.m.,*
in response to message #1 by bill platt

Sorry guys----There was no bug in my above post---just lousy programming on my part.

Both the 32Sii AND the 33s handle "no root found" or other failures to converge the same way when solving a program, rather than an equaton in the equation list:

page 14-6 in the 32sii manual (14-6 33s):

"If no solution is found for the unknown variable, the n the next program line is skipped (in accordance with the 'do if true' rule..."

So, in my coding, I had:

```
LBL Z
FN=E
Solve X
RTN
LBL C
FN = A
Solve x
...
...
...
...
LBL E
RPN
RCL X
ENT
ENT
x^2
6
-
/
1
-
RTN
```

So, note that I have a "RTN" directly after the solve, but just another program---"LBL C" on the line AFTER the "RTN". So, in cases where "NO ROOT FOUND" occurs, the "RTN " is skipped, and program execution continues withe "LBL C" which is why I got errroneous results-----so no it is not a bug--it is a (very good) feature----You as a programmer have control oof the iterative process---you can put in a counter variable(s) and have the program loop back, try again with different guesses, try so many time s and quit etc....

And all of this exists on the 32sii as well.

It was sloppy of me to forget about this during my explorations.

The aforementioned also helps to explain the "reverse" results for:

```
LBL D
Fn=E
Solve X
RTN
LBL E
RPN
RCL X
ENTER
```

```
ENTER
x^2
6
-
/1
-
RTN.
```

Recall, that if you run "D", instead of "no root found" and finding the best estimate for the "pole x-value in X, next best in y, function in Z etc, you get:

```
T     2.44948974279  ;{last iteration}
Z     2.44948974279  ;{last iteration}
Y     2.44948974279  ;{last iteration}
X    81649658092 ;{function value at last iteration}
```

which is because after the SOlve fails to find a root, it skips the RTN instruction and goes directly into routine E, evaluating it at the X=2.449....9 value.

Please note that, As Jordi Hidalgo pointed out, hte 33s handles a "pole" as above, whereas the 32sii will give an apparent root--and the only way to determine that it is infact a pole is to either have and understand the graph, or look at the final function vale to see that it is not a true root.

In the 33s case, you get "no root found" to clue you in.

So the 33s solver is ok so far. In fact it even has some superior aspects.

try the following on a 32sii:

enter the polynomial X^3-X^2+6:

```
LBL I
RCL Y
ENT
x^3
SWAP
x^2
-
6
+
RTN

Now, solve it manually:

Fn=I
-5 STO Y
5
SOLVE Y

on the 32sii you get "no root found"!
whereas on the 33s, you get the correct solution.

In order to solve this equation on the 32sii, you need to
code it thus:
LBL I
RCL Y
3
Y^X
RCL Y
X^2
-
6
+
RTN
```

```
Then, you will get the solution.

In other words, stack-work (as opposed to register
recall, or horner) can "trip up" the solver in the
32sii, but does not appear to trip up the 33s.
```

Best regards,

Bill

HP33s bug in polar conversion

*Message #1 Posted by **Steve A** on 25 July 2004, 2:55 a.m.*

```
I don't read all the messages here, so someone might
have already found this problem.

100 enter
0
x,y -> angle, r

Result:-
90
100

All is well...

BUT!

100 enter
-0
x,y -> angle, r

result:-
270
100

That looks like a bug to me, though perhaps
someone with more knowledge of mathematics
might see a use for it.

Further, if you store the -0 in a variable
then RCL it into the x register before the
polar conversion, the result is again
incorrect.

My 33s is a recent purchase, s/n CNA41502062

Steve.
```

Re: HP33s bug in polar conversion

*Message #2 Posted by **Norris** on 25 July 2004, 12:28 p.m.,*
in response to message #1 by Steve A

My 33S does the same thing. But my 32SII doesn't; if you convert (-0,100) to polar coordinates, the 32SII returns the expected (100,90). Must be a 33S bug.

Re: HP33s bug in polar conversion [EDITED!]

*Message #3 Posted by **Karl Schneider** on 25 July 2004, 2:28 p.m.,*
in response to message #1 by Steve A

(NOTE: This is an extensively-revised post. My first analysis was incorrect.)

Steve --

Congrats! You found a bug, all right.

Taking it a step further:

```
keystrokes:  100 ENTER 0 +/-

stack:       y: 100
             x: -0

keystrokes:  ->theta,r

stack:       y: 270        (incorrect; should be 90)
             x: 100

keystrokes:  ->y,x

stack:       y: -100        (not the original input!)
             x: 0           ("    "     "        "   )
```

None of the HP-designed calcs I tested perfrom like this.

The root of the problem seems to be that the KinHPo 33S contains an erroneous algorithm for "arctan2" of (0, y). Obviously, arctan2 (0, y) should be performed by exception: Theta = 90 deg if y > 0; theta = -90 deg if y < 0, and theta = 0 should be returned if y = 0.

On the 33S, try any (0, y) or (-0, y) coordinate with y not equal to 0; or, any (x, 0) coordinate with x less than 0. Repeat the sequence "->theta,r" followed by "->y,x" over and over. You'll see a rotating sequence of answers which aren't always the same! Some are correct, some are not, and some are not even valid because

```
(magnitude, theta) = arctan2 (x, y)

should have the range of

-180 deg < theta <= 180 deg
```

There is a matrix of 9 cases for calculating angle using "arctan2" with real numbers:

```
                        X
                < 0             = 0      > 0
   < 0   atan(y/x)-180          -90     atan(y/x)
Y  = 0   +180 or atan(y/x)+180    0     0 or atan(y/x)
   > 0   atan(y/x)+180           +90     atan(y/x)
```

My guess is that the 33S is lumping the X=0 and Y=0 cases (except 0,0) into the non-zero cases.

Re: HP33s bug in polar conversion [EDITED!]

*Message #4 Posted by **John Smitherman** on 25 July 2004, 6:46 p.m.,*
in response to message #3 by Karl Schneider

I tried these polar conversions on the HP 9s and everything is correct. So, KinHPo knows how to do these calculations but appears to have made mistakes with the 33s.

Hopefully, someone will feed this back to them.

Regards,

John

Bug report

*Message #5 Posted by **Steve A** on 25 July 2004, 9:38 p.m.,*
in response to message #4 by John Smitherman

HP had no obvious place on their website for submitting a bug report, so I used the 'customer enquiry' form. I don't know if this will get anywhere.

Maybe someone with a closer link to HP should pass it on.

Steve.

When is Zero not Zero?

*Message #6 Posted by **Steve A** on 25 July 2004, 9:33 p.m.,*
in response to message #3 by Karl Schneider

That's a fine analysis, Karl, and thanks for reminding me that the angle is named 'theta'. :)

Here's another interesting point to contemplate.

If you store -0 in a variable and RCL it to the x register you get the same incorrect result. The RCL'd value doesn't display as -0 however.

Since zero stored in a variable means that the variable is empty, this implies that the 33s has an index table for the variable list, and that each entry in the table includes a flag that indicates a negative number. This flag remains attached to any value RCL'd from a variable.

I've done a few little experiments with -0 and apparently whenever the 33s changes a -0 into a 0 it drops the - sign but doesn't change the 'negative' flag associated with the value. If I was a programmer at kinpo this is where I'd fix the bug.

I fixed the conversion problem inside my program by adding 'x=0? ABS' just before the conversion to theta,r

If this test is always done immediately prior to the conversion to theta,r then repeated cycling through the conversions seems to work OK.

Steve.

Re: When is Zero not Zero?

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 25 July 2004, 9:54 p.m.,*
in response to message #6 by Steve A

Congratulations for your finding!!

My 2 cents:

If you maintain the "negative zero" in the stack or in the LAST X register, it keeps its "negativity". However, doing a X=Y? test with a "positive zero" yields "yes" as an answer!

(at least on my limited testing trials it seemed so)

Congratulations?

*Message #8 Posted by **Steve A** on 26 July 2004, 2:00 a.m.,*
in response to message #7 by Andrés C. Rodríguez (Argentina)

Hi Andres,

Thanks for the congratulations, but I wasn't looking for a bug. I just wanted the function to work!

As a programmer I know how difficult it is to completely avoid bugs in software. But I'm disappointed at this bug. Polar coordinate conversion is a basic function and there's no excuse for such a defect.

How much should I trust the other 33s functions?

Steve.

Re: When is Zero not Zero?

*Message #9 Posted by **Karl Schneider** on 26 July 2004, 12:16 a.m.,*
in response to message #6 by Steve A

Steve --

I believe that there are several problems with the algorithm. As you noted, behavior is different for x = -0 vs. x = +0 for y not equal to 0.

However, the "abs" fix will not cure the malfunctions. As my discussion indicated, errors occurred when either x or y was +0 or -0, except for when x > 0 (Quadrants I and IV). It is erroneous logic in the "atan2" function in the conversion, perhaps related also to the sign-of-mantissa "flag".

-- Karl S.

atan2()

*Message #10 Posted by **Steve A** on 26 July 2004, 12:51 a.m.,*
in response to message #9 by Karl Schneider

Hi Karl,

Yes, I realised that after I'd posted the message.

As you say, atan2 is definately faulty.

That's very disappointing, since it means the polar conversion functions on the 33s are essentially useless (unless we know in advance that our inputs to the functions are within a suitable range).

How would you suggest we work around the problem?

Does this mean that our faulty calculators will be valuable in 20 years time? hehe... I'm not going to buy 20 of them and keep them in storage, though. Will there still be an HP calculator fan club in 20 years time?

Steve.

Re: When is Zero not Zero?

*Message #11 Posted by **unspellable** on 26 July 2004, 1:53 p.m.,*
in response to message #6 by Steve A

(1.675058 - 1.675058) = -2.22045E-16

according to Xcel 2002 when the formula refers to two other cells as in the cell entry is: = (B3 - B4).

Note the parenthesis. This bug does not occur without the parenthesis.

Re: When is Zero not Zero?

That's comforting, thanks. hehe

It's also a basic and inexcusable bug!

Steve.

Re: When is Zero not Zero?

*Message #13 Posted by **bill platt** on 27 July 2004, 12:29 p.m.,*
in response to message #11 by unspellable

Hi Unspellable,

Could you delineate the Excel bug a bit more?

I tried to duplicated it, but couldn't.

I typed 1.675058 into two separate cells, and then made a third cell an equation: =(B3-B4)

Returns zero.

Also tried it in one cell: =(1.675058-1.675058)

Returns zero.

What am I doing "wrong"?

regards,

Bill

Re: Xcel bugs

*Message #14 Posted by **unspellable** on 27 July 2004, 2:26 p.m.,*
in response to message #13 by bill platt

Bill,

The following is copied from my Xcel sheet.

Excel 2002 (10.6501.6626) SP3

A B C

1.675058 1.675058 = (A1 - B1)

1.675058 1.675058 2.22045E-16

Try with and without the spaces in the formula. As I recall it is not sensitive to the spaces but is sensitive to the parenthesis. I turned this over to our computer help organization. They admitted it was a bug, but I have yet to hear back from them on any causes. I'm not sure if it is sensitive to the Xcel version.

Meanwhile, you might amuse yourself by trying the following problem which came up in the lab:

Put the following numbers in a column:

15000000010 15000000009 15000000008 15000000007

and so on counting down by one to 14999999990 for a total of n = 21.

Now ask Xcel for the standard deviation of this column of numbers. Try the same problem on your HP48SX. The HP will come through with flying colors. Xcel will give a nonsense answer. In this case I have figured out the cause of the bug. See if you can do likewise. This bug is present in Xcel 1997 and Xcel 2002.

(I have missed my calling. I should have been a software tester. I can break any piece of software in ten minutes.)

Re: Xcel bugs

*Message #15 Posted by **Norris** on 27 July 2004, 3:11 p.m.,*
in response to message #14 by unspellable

The standard deviation problem may not technically be a bug; it is a well documented limitation of the formula used by Excel (and by most calculators).

The formula involves squaring each of the entered values. If very large numbers are entered, then there is roundoff error in the squared values. If the entered values are both very large and very close together, then they may appear to be identical after roundoff. So the calculated standard deviation will be incorrect.

This issue also affects most HP calculators (but not the 48 series). It is explictly acknowledged in some HP calculator manuals, including the 11C, 32SII, and 33S manuals; these manuals also describe workarounds. I doubt that Microsoft is so helpful, however.

Re: Xcel bugs

*Message #16 Posted by **unspellable** on 27 July 2004, 4:51 p.m.,*
in response to message #15 by Norris

Norris,

You are onto the reason Xcel gives a nonsense answer.

How ever, I would consider use of this particular algorithm to constitute a bug or at least an example of bad programming since while mathematically correct it is a stinker from a numerical computation standpoint. It's not really the standard algorithm either. The algorithm I learned in statistics class is not subject to this problem and is the one I usually find in text books. It is also more intuitively obvious. There is absolutely no reason other than computational ignorance to use the algorithm that Xcel uses. I am no expert programmer, but I know better than that.

Bottom line is that Microsoft is essentially a bug factory. I have a very good article on why this is so and what it portends for the future of Microsoft and computer programming. I'll have to dig it up and quote the reference here. For those in a hurry it was in Analog a few months ago.

Re: Xcel bugs

*Message #17 Posted by **unspellable** on 27 July 2004, 4:55 p.m.,*
in response to message #15 by Norris

PS. I don't know where the problem is mentioned in Microsoft user's information. While it may be well known among users who tune into bulletin boards on Xcel I'd never heard of it until I ran into it.

Re: Xcel bugs

*Message #18 Posted by **Norris** on 27 July 2004, 5:10 p.m.,*
in response to message #17 by unspellable

I can understand why the formula in question is used by most calculators. But I don't see why Excel uses it.

At the very least, Microsoft should do a better job of acknowledging the issue. HP covers it thoroughly in the manual that comes with the $55 HP-33S.

Re: Xcel bugs

*Message #19 Posted by **unspellable** on 27 July 2004, 6:23 p.m.,*
in response to message #18 by Norris

Why use this algorithm in any calculator? The numerically good formula is just as simple to implement and does not have this problem. Maybe there's a programming issue here I'm not aware of?

I'll dig out the good algorithm when I get home tonight and post it here tomorrow.

Internet software is not a product of Microsoft and is much more robust. This point is extensively covered in the article I mentioned. not that I don't encounter bugs when looking at this site, but they are probably not due to the software specific to this site. More likely Windows, or even more likely Microsoft Internet Explorer.

Re: Xcel bugs

*Message #20 Posted by **Norris** on 27 July 2004, 8:00 p.m.,*
in response to message #19 by unspellable

The formula used by the HP48 (which is not subject to the "bug") requires that you subtract the sample mean from each entered value, then square the result.

Unfortunately, you can't calculate the sample mean until every value has been entered. So you can't do the subtraction as you enter the data -- you simply don't know what to subtract.

In theory, you could work out the standard deviation by entering all of the data twice. You could enter it all once to calculate the sample mean (xm). Then you could enter it again and determine (x - xm)^2 for each value. But entering the data twice is obviously inconvenient.

Alternatively, you could store each value as you entered it. Then you could calculate the mean from the stored data, and then subtract the mean from each stored value. The HP48, which essentially has unlimited data storage, uses this approach.

However, this method is not effective for most calculators, because they don't have unlimited storage. A 32SII, for example, has only 33 data registers. Even if you were prepared to consume them all, you wouldn't be able to calculate standard deviation for more than about 30 values (you would need to keep a few registers available for the calculation).

So the 32SII uses a different formula. The downside, as we've seen, is that it is subject to roundoff error with large numbers. The upside is that it can handle an essentially unlimited number of samples while using only six storage registers.

So much for the 32SII. However, I can't explain why Excel uses the 32SII approach, instead of the HP48 approach.

Re: Xcel bugs

*Message #21 Posted by **Chris Woodhouse** on 28 July 2004, 12:37 a.m.,*
in response to message #20 by Norris

> Quote:
>
> The downside, as we've seen, is that it is subject to roundoff error with large numbers.

It's not round off error causing the problem, it is over flow, which is entirely different. Round off error will only cause small errors unless the errors are multiplied by the properties or repetitiveness of the calculation. Overflow errors, on the other hand, are almost always very large errors.

Chris W

Re: Xcel bugs

*Message #22 Posted by **Norris** on 28 July 2004, 1:42 a.m.,*
in response to message #21 by Chris Woodhouse

I'm blindly following the terminology used by Microsoft and HP to address this issue. Examples:

****

From http://support.microsoft.com/default.aspx?kbid=828125&product=xl2003 :

"If you have a version of Excel earlier than Excel 2003, there is the potential for significant round off errors in extreme situations...If you have Excel 2003, there are no round off errors when you conduct this experiment"

****

From HP-33S manual, pp. 11-9 and 11-10:

"Since the calculator uses finite precision (12 to 15 digits), it follows that there are limitations to calculations due to rounding...Executing [Sigma-minus] does not delete any rounding errors that might have been generated in the statistics registers by the original data values."

Roundoff vs. overflow

*Message #23 Posted by **Karl Schneider** on 28 July 2004, 11:09 p.m.,*
in response to message #21 by Chris Woodhouse

Chris posted,

> Quote:
>
> *It's not round off error causing the problem, it is over flow, which is entirely different.*

```
15,000,000,001 ^ 2 = 225,000,000,030,000,000,001
```

The result, with 21 significant digits, cannot be represented with full precision on Excel or HP calculators, but is well within the range of

the floating-point numbers that either can represent. These statistical summations are performed in the domain of floating-point numbers.

Thus, it is indeed *roundoff* (one word) error that is responsible for the inaccuracies, since the last few significant digits must be dropped.

However, if the statistical summations were performed in the domain of integers, then *overflow* (one word) would be the likely culprit.

```
Largest unsigned integers (from HP-16C):
64-bit = 18,446,744,073,709,551,615
32-bit =              4,294,967,295
16-bit =                     65,535
 8-bit =                        255
```

*Message #24 Posted by **Norris** on 27 July 2004, 8:20 p.m.,*
in response to message #19 by unspellable

Well, what do you know? Microsoft apparently adopted the HP48 approach for use in Excel 2003. The following excerpts are from

http://support.microsoft.com/default.aspx?kbid=828125&product=xl2003

****

In extreme cases where there are many significant digits in the data but a small variance, the old formula leads to inaccurate results. Earlier versions of Excel use a single pass through the data to calculate the sum of the squares of the data values, the sum of the data values, and the count of the data values (sample size). Excel 2002 and earlier then combine these quantities into the formula in the Help files for VAR, VARP, STDEV, and STDEVP. These formulas are also known as "calculator formulas" because they are suitable for use on a hand calculator for small sets of numerically well-behaved data...

In Excel 2003, the procedure uses two passes through the data. On the first pass, Excel 2003 calculates the sum and count of the data values, and from these it can calculate the sample mean (average). On the second pass, Excel finds the squared difference between each data point and the sample mean, and then sums these squared differences...Therefore, Excel 2003 gives results that are numerically more stable.

*Message #25 Posted by **unspellable** on 28 July 2004, 2:20 p.m.,*
in response to message #18 by Norris

Well the (x-μ)^2 method has already been brought up here. It's the one I learned in school and find in most text books and in the CRC Concise Encyclopedia of Mathematics. I think it is the most intuitively obvious form. It's also the one that most closely models what's going on, especially in areas outside of statistics. This function in both discrete and continuous form is much used in non-

statistical areas.

Now after reading some of the postings I understand why it is not used in simple calculators. No excuse for Xcel though. I have discovered a few other bugs, glitches, or whatever with Xcel.

The actual real world problem in which I discovered this involved the statistics of the cold start up frequency of an oscillator with a nominal frequency of 15 GHz. It would generally start up within plus or minus 100 Hz of the nominal.

It is possible that I am the person instigating the change in Xcel 2003. I first stumbled on this in 1999 or early 2000. I brought it to the attention of our in house computer help group and they said they would forward it to Micrsoft. Our company has a user's feedback arrangement with several software companies including Microsoft. We even have a "hotline" to one of the software houses (not Microsoft) and can get an updated version to fix the simpler bugs we discover within a couple of days.

My handle "unspellable" came about because I broke the yahoo software trying to enter my name. In a fit of pique I choose unspellable as a handle. The local driver's license software went off the rails over the same problem. To think that 25 years ago I had a typewriter that could handle this.

Re: Xcel bugs

*Message #28 Posted by **Norris** on 28 July 2004, 1:17 a.m.,*

in response to message #27 by Eamonn

In that older thread, there was an interesting post from hugh steers. He posted another algorithm for calculating standard deviation:

****

for a long time, i thought that accurate computation would necessitate the storage of all values (this is how the 48 does it). but no! a simple algorithm known in the 70's was this:

n=0, s=0, m=0. loop: get x. n + 1 -> n. x - m -> t. m + t/n -> m. s + t*(x - m) -> s. goto loop.

the standard deviation is then sqrt(s/(n-1)).

****

So why don't calculators use this algorithm?

I suspect it required too many storage registers. It needs four (for n, m, s, t). If we want to calculate the standard deviation for paired values (x, y), then we need three more registers (another set of m, s, t for the y-values).

So that makes 7 registers, as opposed to 6 on most calculators. Doesn't seem like a big difference.

But those 7 registers are needed just to calculate the standard deviations (or variances) of x and y. What about mean x, mean y, the slope and y-intercept of the best-fit line, and the correlation coefficient? You would need additional registers to store the data needed to calculate those statistics; I doubt that you could somehow generate them from n, m, s, and t.

The neat thing about the standard calculator formulas is that you can generate all of these statistics by using just 6 storage registers. This may have been an important consideration in the days when memory was more expensive.

'New' Statistics algorithm

*Message #29 Posted by **Eamonn** on 28 July 2004, 4:12 a.m.,*
in response to message #28 by Norris

Hi Norris,

I had a closer look at how this 'new' algorithm can be modified to calculate the mean of x, the mean of y, the slope and y-intercept of the best-fit line, and the correlation coefficient. In particular I wanted to see what are the register requirements for a calculator based implementation that can calculate these statistics.

Some observations:

- The t register used in the new algorithm is a temporary register that does not need to be maintained from one iteration to the next. It can be re-used for both the x and y statistics calculations.
- The m register contains the latest estimate of the mean of the data set.
- The n register contains the total number of data elements so far.

- The s register contains (std_dev)^2 * (n-1)

When using the new algorithm to calculate the mean and standard variation for two variable statistics, it is necessary to store n, mx, sx, my and sy (5 registers). It is also necessary to have a scratchpad register, t, for the temporary calculations, but this can be re-used for both the x-data set and the y-data set.

Traditionally, calculators with two-variable statistics store the following 6 values, which are then used to calculate the mean, standard variation, slot, intercept, etc.

- n
- Sigma_x
- Sigma_x^2
- Sigma_y
- Sigma_y^2
- Sigma_xy

n, the number of elements, is the same in both algorithms. Sigma_x, Sigma_x^2, Sigma_y and Sigma_y^2 can be calculated from n, mx, my, sy and sy as follows:

```
Sigma_x = n * mx
Sigma_y = n + my
Sigma_x^2 = sx + n * mx^2
Sigma_y^2 = sy + n * my^2
```

It is not possible to calculate Sigma_xy from n, mx, my, sy and sy, so a calculator using the new algorithm would need to store this sum, just as done in a calculator using the traditional algorithm. This requires the use of one extra register.

Since we can calculate Sigma_x, Sigma_y, etc. from the new algorithm, we can also calculate the slope and y-intercept of the best-fit line, and the correlation coefficient. So, in order to calculate the aforementioned statistics, the new algorithm requires a total of six storage registers, the same as in the traditional algorithm, plus a temporary storage register.

It appears that there are more calculations required for the new algorithm, versus the traditional algorithm. If ROM space or calculator speed is an issue then this could give the nod to the traditional algorithm. However, the number of storage registers is the same for both algorithms (assuming that the temporary register can be re-used for other things also) and the new algorithm gives better estimates of the standard variation (although not always as good as that obtained by the two pass method). It appears that this 'new' algorithm could certainly have been used on all, but perhaps the very earliest calculators that had ROM and speed limitations.

Regards,

Eamonn.

*Message #30 Posted by **Tom Sherman** on 28 July 2004, 10:39 a.m.,*
in response to message #28 by Norris

Hi Norris,

The beautiful algorithm presented by Hugh Steers can be modified so that the

variable t is eliminated. Only n, m, and s are required.

See http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=54153

Cheers, Tom

*Message #31 Posted by **Norris** on 28 July 2004, 11:24 a.m.,*
in response to message #30 by Tom Sherman

Thanks Tom and Eamonn !

I suppose it would not be very difficult to program this algorithm into a 32SII, 33S, or similar model, to provide an alternative set of statistics functions. You could even use the six "official" statistics registers.

A calculator so equipped would outperform Excel 2002 !

Re: Excel bugs

*Message #32 Posted by **Karl Schneider** on 28 July 2004, 12:07 a.m.,*
in response to message #14 by unspellable

> Quote:
>
> Now ask Xcel for the standard deviation of this column of numbers. Try the same problem on your HP48SX. The HP will come through with flying colors. Xcel will give a nonsense answer. In this case I have figured out the cause of the bug. See if you can do likewise. This bug is present in Xcel 1997 and Xcel 2002.

I got 6.20484 as the sample mean on a 17BII, which stores each datum; I got 0.00 on the 42S, which does not.

Obviously, roundoff error for lack of enough digits explains the 42S result, as Norris has precisely explained, now and earlier.

However, I can't quite see why Excel 97 gave 228.9733609 as the sample standard deviation, even if it does use the shortcut "summation method". That STDEV is far greater than even the largest variance (100 = 10^2).

You and Norris are right in saying that Excel shouldn't ever have used the summation method. There's certainly enough RAM and computational horsepower on a PC for doing it rigorously.

Re: Xcel bugs

*Message #33 Posted by **Dave Shaffer** on 28 July 2004, 2:52 p.m.,*
in response to message #14 by unspellable

Teaches you right for using MicroSoft products!

Try interpolating one more, or one less, zero into your numbers (i.e. a string of 6 or 8 zeros

in the first value), and Excel (at least the 1997 version) will give zero for the standard deviation! Take out two of the zeroes, and the result is close, and with 4 zeros (1500010) the result is correct (enough). The overall number of significant figures appears to be about 9.

My old (! the executable is dated 1989) version of QuattroPro (version 2 or 3, I think - for DOS) gives almost the correct answer for these numbers, but fails rather badly for larger numbers. So, it is (was - long before these versions of Excel) using the correct algorithm, and with a total of about 11 significant figures.

And, WordPerfect is FAR superior to Word! (IMHO)

Re: Xcel bugs

*Message #34 Posted by **Norris** on 29 July 2004, 1:25 a.m.,*
in response to message #33 by Dave Shaffer

I have Quattro Pro 10 (copyright 2001). The online help doesn't indicate how the @STD function is calculated, but it seems to behave the same way as Excel 97 (i.e., not very well with large, closely spaced numbers).

Re: Xcel bugs

*Message #35 Posted by **Norris** on 29 July 2004, 1:49 a.m.,*
in response to message #33 by Dave Shaffer

So you don't have any faith in Microsoft? Well, try calculating standard deviations with the Microsoft Calculator! You know, the one in the "Accessories" menu that you never use. Yes, you can do statistical calculations with it (though you'll probably have to check the help file to figure out how it's done)

Version 5.1, copyright 2001, appears to calculate standard deviations correctly given consecutive integers of magnitude 10^30

Another Xcel "bug"

*Message #36 Posted by **unspellable** on 29 July 2004, 8:58 a.m.,*
in response to message #14 by unspellable

i is an imaginary integer. i^2 = -1 (usually)

In Xcel IMSQRT(-1) = 6.12303176911189E-017+i

I believe this to be due to Xcel carrying out complex opeations in polar mode. cosine(pi/2) produces a rounding error in many calculators.

Re: HP33s bug in polar conversion [EDITED!]

*Message #37 Posted by **random.chance** on 27 July 2004, 10:19 a.m.,*
in response to message #3 by Karl Schneider

This same bug was found several months ago (just after the public release) and was reported in a reply to another post. In that case the author had used the program to compute square roots of negative numbers (like the ones posted around the same time, he had posted a listing) that returned a complex number on the stack in the standard 32sII/33s format. If you took sprt(-4) using this method (resulting in x: 0, y: 2) and

then did a polar conversion it returned an angle of 270 degrees, clearly outside the range of the function. I tried this on my calc with the same result. This is the same bug that is described by Steve. I guess this means that the 0 in the x-register is really a -0.

Re: HP33s bug in polar conversion

*Message #38 Posted by **Bill Platt** on 27 July 2004, 12:49 p.m.,*
in response to message #1 by Steve A

This bug is very disappointing--especially for its effect on complx number operations.

regarding the idea that there is an internal flag which carries the negative sign----it is worth noting that a significant difference between the 32sii and hte 33s is in regards to memory:

In the 32sii, each register "costs" you in memory. If you store "-0" into a register, there is no change in memory. So, "-0" is "0".

In the 33S, registers are FREE --- no memory to store into them!!! So, they all must be part of one big block---I don't know enough about hardware architecture, but could this be the case? If so, then why is "-0" treated differently from "-6" etc?

regards,

Bill

A Quimper Story

*Message #6 Posted by **Tom Sherman (Maine, USA)** on 29 July 2004, 12:30 p.m.,*
in response to message #5 by Emmanuel, France

I grew up eating my oatmeal from Quimper bowls, and my spinach from Quimper plates -- for my mother taught French and adored France, especially Normandie et Bretagne.

Many years later, in 1980, I visited the HB Henriot factory in Quimper, to see the women painting the dishes, and to buy some new plates and bowls that had not been chipped by little boys. As I took too long in making my selection, my 3-year-old daughter became restive, swirled around in a little dance, lost her balance, and crashed against a stack of costly dishes, damaging many. The factory representative was most kind and generous, saying that I could have all the damaged dishes at half price. So now I eat off Quimper bearing the marks and memories not only of my childhood, but more preciously, that of my daughter.

Check out the prices of old Quimper dishes on eBay. They rival those of old HP calculators!

Greetings to Emmanuel and beautiful Normandie,

Tom

Difference circuit board HP 35 Type 1 and 2 ?

*Message #1 Posted by **Ronald** on 23 July 2004, 10:56 a.m.*

Hi,

Is there something on which one can identify if you have the circuit board of an HP 35 type 1 ot type 2.

Is it in the right top (from top to bottom)

Type 1: Condensator, 5 resistors, one diode and; Type 2: Condensator, 5 resistors and no diode.

or are there other telltales ?

Thank you

Ronald

MLDL2000 Update, Europe meeting

*Message #1 Posted by **Meindert Kuipers** on 23 July 2004, 10:48 a.m.*

Just a quick update:

The MLDL2000 beta PCB's are now in the process of being manufactured. This will take about 8 weeks (I chose the cheap track here ...) after which I will be able to tell if it works or not. I will use the time in between for a few weeks vacation and writing software for the MLDL2000 (but not at the same time).

I will upload a new version of the specifications (version 1.4) later today to www.kuipers.to/hp41. This new version has the component layout of the PCBs and should give you a good impression of how it will look.

Is there any interest in a European meeting. I missed last years meeting unfortunately, but end September could be a good time. I could host the meeting, but a place more central in Europe might be better. Any suggestions?

Regards, Meindert

Re: MLDL2000 Update, Europe meeting

*Message #2 Posted by **Wilson (Bill) Holes** on 23 July 2004, 11:24 p.m.,*
in response to message #1 by Meindert Kuipers

Congratulations!!! I'm anxiously looking forward to the MLDL2000 while trying to learn the intricacies of the HEPAX with my new NoVRAM (many thanks to Diego!!).

In regards to the meeting… If I lived in Europe I'd definitely attend no matter where the meeting was held. I may even consider a trip from the US if the timing, airfare, and accommodations fit my schedule and budget. Hmmmm, maybe someday we could arrange for one in the States. I'd be most happy to host it (free beer, wine, and snacks for all).

Have a GREAT vacation!!! Best Regards, Wilson

HP 35 type 2

*Message #1 Posted by **Ronald** on 23 July 2004, 10:07 a.m.*

Hello,

I aquired recently a HP 35 type 2, with only Hewlett Packard on the front and a point on the 5 key. It does not have the hole for the red indicator on the on/off switch on the keyboard.

When dismanteling this beaty to clean, inspect and rebuild the battery I noticed on the slider of the on/off switch (the black piece of plastic in which the gold contacts are holded and on the other side the button which portrudes to the keyboard with which you swith it on and off) an original looking red spot of arounr 3 - 4 mm diameter.

Question: Is this common in this type or is this part of an earlier "mix" from the previous owner. It came namely with the netadaptor and the manual of a type 1 calculator. The serial number on the back, bottom side states 1143a 02034.

Re: HP 35 type 2

*Message #2 Posted by **David Smith** on 23 July 2004, 12:14 p.m.,*
in response to message #1 by Ronald

HP probably originally had a bunch of red dot switch levers made and used them freely in the cases without the hole. I have also seen red dot switches where the red is a rectangular band of paint and others where it is a round area.

Re: HP 35 type 2 (long)

*Message #3 Posted by **Jeff** on 23 July 2004, 1:02 p.m.,*
in response to message #1 by Ronald

From the (excellent) *"A Guide to HP Handheld Calculators and Computers"* by W. A. C. Mier-Jedrzejowicz:

> Quote:
>
> The first batches were made for use inside HP only - they have an (hp) logo printed inside the battery compartment. The serial number is printed on the back, between the two lower rubber feet, it is 1143A followed by the unit number stamped into the label in letters 1mm high. A batch of nearly identical HP-35s was made for a customer company who placed and order for them. Then the first HP-35s for general sale were made, still nearly the same, but with the unit number stamped in 3mm high digits. I believe that only about 10,000 of these "HP-35 with a hole" were made...

Does your unit have the HP logo in the battery compartment? How high are the numbers "02034" in the serial number? Regardless, if Mr. Mier-Jedrzejowicz is correct about 10,000 units being made, and you presume that HP numbered them sequentially starting from 00001, then your unit certainly appears to fall within the red-dot production run. If it is indeed a red-dot, the lack of the hole in the front case may be due to one of the

following reasons:
1. The step to drill the hole (if indeed it was drilled rather than molded) was omitted in the manufacturing process. In that case, you have a rare gem indeed, akin to a mis-struck coin or mis-printed stamp.
2. The front half of the case was replaced by HP when the unit was returned to them for service. Perhaps the case was damaged by the original owner and sent back. Perhaps the owner sent it back to have the bugs (see below) fixed, and HP replaced the front case at that time for some reason.
3. The front half of the case was replaced by a previous owner at some point in the unit's life. This owner used a type 2 case, as evidenced by the lack of the "35" on the front label.
I don't know of any way to tell which of the above it might be. Perhaps you should try to contact Mr. Mier-Jedrzejowicz. He posts here occasionally, a search of the archives should produce his e-mail address. Of course it may also be true as David suggests that you have a real type 2 that got a leftover type 1 switch. That would also be a nice rarity.

You stated that "It came namely with... the manual of a type 1 calculator". On what do you base this statement? If I recall correctly, the front cover of the manual that came with the red-dots was totally black and white, while the manual that came with version 2 and later showed red leds and the blue keys, I think. I have never seen a red-dot manual in person, and don't have a later version handy to check, so I may be off a little bit on this. What does the front cover of your manual look like?

Above I mentioned having bugs fixed. If you are not familiar, the early units (version 1 and some or all version 2) produced erroneous results for some problems. If you enter 2.02, press ln, then e^x on your unit, do you get 2. or 2.02? If the former, your unit was not fixed. If the latter, your unit was indeed sent to HP to be fixed, so they may have replaced the front case half at that time.

Re: HP 35 type 2 (long)

*Message #4 Posted by **Ronald** on 23 July 2004, 2:11 p.m.,*
in response to message #3 by Jeff

Hi Jeff,

Thanks for the long response. I have no website SO I try to describe the manual: top 2 cm in capitel letters HP 35. Blow that on a blue background the HP 35 seen a from the front, you can read clearly the fornt label (Hewlett Packard) an the keyboard with the hole next to the on/off switch. The display of the calculator shows 1.234567809 35 If you want a picture mail me you r mailadress. Looking at the inside, the plast molding seems fine, I would expect if they forgot the dril the hole ther would a center point or something like that.

The option of having been in repair: I do not know, there is no label of HP repair inside (I have another classic where a sticker was put inside with the service date). And it does (still) have the ln E 2.02 bug. It gives the false 2 as an answer. What I did nitice between this one and an type 3 HP 35 I have is in entering a negative mantenissa. In the new one you can enter the mantenissa and then hist the chs button and yoou get a negative mantenissa. On this one however the CHS has to be done BEFORE entering any number as mantenissa or it will not have any effect at all.

Also the net adaptor is said to be the small one of the type 1 model. The modelnumber is 82002A and is realy a differnt model compared to the netadaptors I have with the 45, 55 classic calculator I own.

Your HP35 with bugs: a valuable "fossil"

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 23 July 2004, 2:53 p.m.,*
in response to message #4 by Ronald

Congratulations for your finding!

Let me just say that yours is sort of a "fossil", with the original, early ROM with bugs. There have been interest in obtaining an image of such historic (may I say prehistoric?) ROM. If that very special ROM image could be "revealed", then it could be run in some of the current emulators, and further studied and analyzed.

This situation is somehow comparable with the fictional finding of the DNA of a prehistoric animal.

If you please, I would suggest you to get in contact with Eric Smith. Peter Monta, or other microcode experts who regularly appear here.

Congratulations again!

Re: Your HP35 with bugs: a valuable "fossil"

*Message #6 Posted by **Gordon Dyer** on 24 July 2004, 11:17 a.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

My HP-35 is a type 2, serial no. 1249A03943 and it has the 2.02 ln ex result 2. bug. It also will not CHS after entering the mantissa. Maybe these ROM bugs are not so rare? How about others checking their HP-35s and sending in the results with serial numbers.

Re: Your HP35 with bugs: a valuable "fossil"

*Message #7 Posted by **Katie** on 24 July 2004, 12:49 p.m.,*
in response to message #6 by Gordon Dyer

My 35V2 with ROM bugs has the same CHS behavior too (I don't have the calc with me at the moment to give the serial number). I think that the CHS fix was part of the ROM fix, not another variant.

-Katie

Re: Your HP35 with bugs: a valuable "fossil"

*Message #8 Posted by **David Smith** on 24 July 2004, 2:09 p.m.,*
in response to message #6 by Gordon Dyer

The ROM bug versions are not that rare. Of all the type 1 and 2 machines that I have had, over a third have the ROM bug.

Re: Your HP35 with bugs: a valuable "fossil"

*Message #9 Posted by **Ronald** on 24 July 2004, 3:36 p.m.,*
in response to message #6 by Gordon Dyer

The serial is:

small letters (2 mm high) 1143A and then larger letters: 02034.

My other HP35 without the ln e 2 an d mantenisa bug has number: 1302S 92156

Re: Your HP35 with bugs: a valuable "fossil"

*Message #10 Posted by **Ronald** on 24 July 2004, 3:42 p.m.,*

in response to message #9 by Ronald

Hi John,

As collector I like to hang to this one for some time. It has some nice other type 1 like characteristics:

Outside: Silver screws: present, two piece backing plate (by battery compartment): present, black two piece shorting clip: present, 1143A0xxxx serial number: present, bump on key 5: present, red dot manual: present, back label "HP35 INSTRUCTIONS": present, battery cover calling for HP03510 battery: not present, gray plastic case is unique to the red dot, allowing the smaller charger to fit snugly: present.

Inside:

Metal LED frame: present, Soldered Circuit board to keyboard assy (not finger connected)not present is finger connected, Red plastic key frame: not present, white plastic, grounding plate inside back cover: present, gold colored metal key membrane: present, circuit board "00035-60010": present, red dot switch: only on the inside.

Re: HP 35 type 2 (long)

*Message #11 Posted by **Wlodek Mier-Jedrzejowicz** on 25 July 2004, 7:48 p.m.,*
in response to message #3 by Jeff

Jeff alerted me that in this thread he had quoted from my book. No problem - what good is a reference book if people don't refer to it? I just want to add that on my red-dots the hole appears to be molded, not drilled, so this is not the HP-35 equivalent of a postage stamp with missing perforations ;-)

Setting up a data base to which folks could submit serial numbers and characteristics, including bugs, would be neat! The claim that about 10,000 units with the hole could be checked properly,

Thanks,

Wlodek

Re: HP 35 type 2 (long)

*Message #12 Posted by **Ronald** on 26 July 2004, 5:07 p.m.,*
in response to message #11 by Wlodek Mier-Jedrzejowicz

Hi Wlodek,

I recognised the text (got your book last week via Guy Ball).

Wonderfull book, is realy my reference these week. To bad that HP does not drill, but "molds" the hole.

I just got an HP-35 working!

*Message #13 Posted by **Karl Schneider** on 27 July 2004, 2:14 a.m.,*
in response to message #11 by Wlodek Mier-Jedrzejowicz

Wlodek and others --

I just got a 2nd version HP-35 working, which had been given to me by a co-worker. I opened the back, cleaned and re-greased the power switch (Radio Shck Lube Gel), and re-installed the two-piece

spring shim that is required for operating the calc without charger.

S/N: 1143A 26472

The manual set includes an errata page listing the well-documented "exp ln 2.02" bug, among several others, but this calc exhibited none of them.

It computes more quickly than I expected -- faster than the functionally-comparable TI-30 from 1976-77 that I used to have.

Re: HP 35 type 2

*Message #14 Posted by **John Nelson** on 23 July 2004, 5:52 p.m.,*
in response to message #1 by Ronald

Holy crud!! You want to sell it? Email me at perrybucsdad@alltel.net if so. I'd be willing to pay a handy sum for that HP35.

Re: HP 35 type 2

*Message #15 Posted by **Frank Boehm** on 29 July 2004, 2:35 a.m.,*
in response to message #1 by Ronald

Hello,

sorry to burst the bubble, but this is not unusual. The V2 (your model) just removes the "red dot hole" - the reason was simple: even with depleted batteries, the red dot would be visible and therefor being misleading (you could tell by looking at the display if the calculator was operational anyway). The V2 molding of the upper case part even has the "hole area" visible. As for the PCB, to my knowledge, the V2 did use the same part and many of the V2s had the ROM bug - nothing special there ;) Still a nice piece of history though :)

Re: HP 35 type 2

*Message #16 Posted by **Ronald** on 29 July 2004, 4:57 p.m.,*
in response to message #15 by Frank Boehm

Thank you all for the responses.

For me, this is one of the nice reasons to collect and study the older HP calc's.

I do not see these nice discussions and almost "archeological" fact finding on TI SR50 machines, who are on it's own, also very nice examples of the technolgy at that time so I stick to HP machines mainly.

Old Manual Sony 3.5" Discs

*Message #1 Posted by **Mike** on 23 July 2004, 12:31 a.m.*

If you've been around long enough, you may remember the old Sony manual shutter disks.

Anyone know where to obtain these disks? I have an old 9121 disk drive that uses these. That is, it won't open the shutter on modern disks. There is an easy, simple work-around, but what I'm looking for are original disks.

If you are not sure what these are, see this article

What's so special about a low density 9114B disk?

*Message #1 Posted by **Mike** on 23 July 2004, 12:25 a.m.*

I must be missing something. What is so special about a formatted low density disc for the 9114B, that works in conjunction with an HP-41? There is one on ebay and someone bid $5 for 1 formatted low density disc.

I buy disks for about 10 cents each (low density) and they work just fine in a 9114. Is there some special problem with discs for use with the 41 or something?

I have used 10 cent low density disks with the 71 and 75 with the 9114. I don't use this drive with a 41 so I may be missing something?

Can someone shed some light on this?

Re: What's so special about a low density 9114B disk?

*Message #2 Posted by **Eric Smith** on 23 July 2004, 2:16 a.m.,*
in response to message #1 by Mike

The 9114 uses standard density 3.5 inch diskettes; there's nothing special about them, and it doesn't need different ones for the 41, 71, or 75.

High-density 3.5 inch diskettes technically are not suitable but may work in a pinch. The coercivity is about 660 for standard density and 720 for high density. That's a different situation from 5.25 inch diskettes, where the high density was more than twice the coercivity of the low density.

Re: What's so special about a low density 9114B disk?

*Message #3 Posted by **David Smith** on 23 July 2004, 12:17 p.m.,*
in response to message #2 by Eric Smith

I have used high density disks in these machines for years without any problems at all (going the other way might cause problems though). You do have to cover the density hole... the sensor that HP uses to detect a disk is mounted there.

That's what I thought

*Message #4 Posted by **Mike** on 24 July 2004, 10:44 p.m.,*
in response to message #2 by Eric Smith

I wonder why the seller would think he would ever get $5 for one of these discs that can be had for pennies. The reason I asked is because one of the bidders is a well known HP collector. ????

Announcing *fix

*Message #1 Posted by **OpenRPN** on 22 July 2004, 11:45 p.m.*

I promised updates, and updates you shall have!

*fix (pronounced star-fix) is a new programming language being developed for OpenRPN. *fix supports 3 different syntax styles: Postfix, Infix, and Prefix. The core of *fix will be written in EC++, and includes a more powerful form of userRPL (with integrated pieces of sysRPL).

Please stop by and see what we're up to. We can always use some extra help or suggestions... or both!

www.openrpn.org

Best Regards,

Hugh Evans OpenRPN Project Manager

Special Driver for 9114B disks?

*Message #1 Posted by **Ray** on 21 July 2004, 5:08 p.m.*

Hi, I read this article:

http://www.blinkenlights.com/classiccmp/hp150faq.txt

I found this quote:

"The 9114A and 9114B used the HP150's 690k format on double sided disks. This format cannot be read by an IBM PC without a special driver."

Now, to make a long story short, does anyone know where I can find this driver?

Thanks.

Re: Special Driver for 9114B disks?

*Message #2 Posted by **Raymond Del Tondo** on 21 July 2004, 10:01 p.m.,*
in response to message #1 by Ray

Hi,

many years back we had a DOS driver for HP Vectra and IBM compatible PCs, which was capable of accessing LIF disks.

(N.B. Note that an HP Vectra PC is *not* fully IBM compatible)

Unfortunately I did not find the driver any more.

However, you could use the HP LifUtils, which are linked from somewhere on the hpmuseum site. The LifUitls are able to read/write LIF disks, like the ones used in the HP 9114 A/B .

HTH

Raymond

Re: Special Driver for 9114B disks?

*Message #3 Posted by **Ray** on 22 July 2004, 12:07 a.m.,*
in response to message #2 by Raymond Del Tondo

Yeah, do these LIFU Utilitys have the ability to read tape disks formated on HP-110+? That's my objective here, is to transfer files to my Portable Plus via tape. Also, in the same document, it states there is some sort of "PC Emulator" for the 100 Series of computers that turns gives them a software emulated IBM bios. Does anyone know where I can find this?

Thanks in advance.

EDIT: I found the PC emulator. I still am not able to locate that driver however, if anyone has it and would be willing to share it, I would greatly appreciate it.

Edited: 22 July 2004, 3:14 a.m.

Re: Special Driver for 9114B disks?

*Message #4 Posted by **J-F Garnier** on 22 July 2004, 6:51 a.m.,*
in response to message #3 by Ray

Much easier way for exchange between PC and Portable+ is to use the HPlink package (cs.com utility), which allows to access the PC 'A:' drive from the P+.

see: ftp://ftp.hpmuseum.org/lif/hplink/

Why the 15c should not come back

*Message #1 Posted by **bill platt** on 21 July 2004, 3:19 p.m.*

OK, I got your attention!

The 15c is a wonderful machine.

But:

after using a 32s, do you really think it makes sense to have keycodes instead of actual function names?

after using a 32sii, where you can enter many algebraic expressions into the solver, do you really want to have to program, in RPN, line by line, for every function solve or integrate problem?

after trying an editable Formula or true algebraic machine, such as a sharp pc 1500, (or even a Casio fx 115ms plus, or even HP30s), do you really really see an advantage to having a limited stack, intermediate operation machine, with no ablility to recall and edit and re-use an equation or expression, without turning it inside out in RPN? (The 17bii gives you the same feeling only better---editable, long variables, fully algebraic solver, returns the values to the stack...)

Afer the 33s, with its 32 kb (8 kb really when efficiency isconsidered) do you really think there is a reason to spend real money on a scientific calculator with less than 500 bytes?

After RPL, where you can evaluate an algebraic, DUP it, operate on it with stack logic, save it, edit it, merge it with other algebraics, re-use it, etc, is there really any reason for RPN?

Afer you have tried all of these machines, seen what is possible, enjoyed the absolutely beautiful design of the 15c, savored its remarkable power, acclimated to and internalized its keycodes.....

Now, think logically, clearly, and efficiently for the future....why would you spend real money on a new device (without true collector value both nostalgic and monetary) with the limitations of the 15c?

The future is not RPN. But a stack could (and should even) be a part of the future. Algebraic objects should be normal standard fare---and they should be editable. Memory should be plentiful. Variables and registers, too.

I really like the 15c. I enjoy it. I use it regularly. I greatly appreciate Valentin's challenges, Karl's tips---- because I have one, and know it, I will use it. I like the user mode---I put what I use frequently under labels a through E and have direct access--its great!

But I can see that it is antiquated--a bit obtuse if you don't already know it.....there is no reason to really produce it anymore in real nuimbers....you can do so much better!

Why should a person learn math, and then have to go learn a new way of writing math? Why shouldn't the rules of precedence, the notation, etc be the same as it is for maths? Why should a user have to be molded by the arbitrary limits of the machine's architecture, when it is perfectly possible with available technology, to develop an interface which is consistent with mathematical notation?

(I will note that most "algebraic" half-breeds (not good formula machines) are even worse when it comes to distortion--and the "4 function" types are abominable--as are old Ti's where clearing or overtyping after an incoorect operator will give unexpected results....at least RPN is consistent.)

Rather than bringing back the 15c, I think we should push, through openRPN, to develop a truly powerful machine, which is capable of working in the new paradigm.

Best regards,

Bill

Re: Why the 15c should not come back

*Message #2 Posted by **Ron Ross** on 21 July 2004, 3:59 p.m.,*
in response to message #1 by bill platt

All good points, and I agree that the 15c unchanged and unimproved would suffer from the failings you mention, buuuut:

Like the HP33s, toss in gobs of cheap RAM.

Give it a dot matrix display and basically beef it up to an Hp42s in a 15c housing.

Toss in a cheap USB interface and file transfer.

Give it some units conversions.

And most of all keep it at its present size.

Price it just a bit below the Hp48Gii or same price as the Hp 17Bii+ (ie retail approx $99 US or even better, less).

Now you have a real pocket calculator. I would buy a couple. Would it have shortcomings, yes. But they would be shortcomings due to choice and technology, not bean counting and gimickery to appease market share or to not rob from Hp's precious graphics calculator sales.

Dot matrix LCD's aren't as nice and crisp to view as the segmented display, but gives you lots more options. Toss in an alpha toggle key and a two line display like the 42s with USB and a SDK to develop programs on the PC and you eliminate concern about the awkward keyboard. Many people complain about this on the 42s, but if there were a serial port, that would eliminate most complaints.

Just me Ranting and Raving, Again.

I want a pocket calculator, not a graphics monster.

Re: Why the 15c should not come back

*Message #3 Posted by **marais** on 21 July 2004, 4:40 p.m.,*
in response to message #2 by Ron Ross

That's exactly my point. What we like most about the 15C are its form factor, its highly usable keyboard and display, and most of all its conceptual integrity. But IT IS true that keycodes are somewhat outdated, and at the time when the 15C was issued, were my primary reason to go for a casio 602p instead - programmability is so much simpler with readable ASCII op-opcodes. Well, in the meantime I got two 15C (along with a 2nd 602p), and as a professional EE I also admit that programmability has become less important than built-in matrix and complex numbers cability, but anyway, my point is: An improved 15C

with dot matrix display (with equal contrast of course) and somewhat more memory would be the perfect machine for any practicing engineer. Students wouldn't go for it, but nobody said we need one calc for everybody. BTW, I remember having seen a mockup of an improved 15C (with the golden faceplate taken from the 12c) somewhere on the internet, meant as an april fools joke - it actually came pretty close to what I imagine as my dream machine. Anybody remember that link?

Re: Why the 15c should not come back

*Message #4 Posted by **bill platt** on 21 July 2004, 5:01 p.m.,*
in response to message #1 by bill platt

There is no reason to assume that I am suggesting that the form factor should grow from the original 15c target. There is also no reason to assume that because I seem to favor RPL, that it should be graphing.

In fact, I use my RPL 48Gx far less than my regular machines--because the functions are "buried". I like the RPL stack, the Algebraic power, but find the lack of convenient access to many functions a drag.

RPL can be applied to a 2-line, non-graphing scientific.

RPL could easily be modified to allow for stack depth control, or ability to load a constant, or even some block of standard memory "registers."

I find myself using the 30s a lot now, though---and that is my point----if you bother to step outside our traditional RPN world, you will discover that there is so much more possible, right now, with available technology, that will make you never want to be pure RPN ever again.

Until you have tried it, given it a chance, you really cannot appreciate (I didn't!) the power of being able to put in algebraic expressions, edit them, find them again, re-use them etc. Why shouldn't a modern, relatively expensive machine enable this?

By way of comparison, I immediately saw the value of the equation list in my 32sii, when it replaced my 11c. I started to write equations instead of programs, for many tasks. It was easier to see what the "program" was for, when it is an equation. This was in 1995. And there was no editing allowed, and it still made sense!

Then I found the 48 series--and was frustrated by too much horsepower and many simple things buried. But Algebraics a big plus---and if only my head were more pliable, the programming style might have been good, too!

Then, I came across the 17bii---and the equation solver there blows the 32sii away!

When I saw that the 30s allowed editing of an algebraic expression, and saved the last so many expressions, I became even more fascinated by the possibilities.

Note that to a Sharp or Casio user, my discoveries are ridiculously old---like, all this was possible 15 years ago!

For a good current screen, take a look at the 30s (minus the glary plastic over-screen). You have two lines, dot-matrix upper, segmented lower, big characters, adjustable display, very good contrast, and provision for alphanumerics. Much nicer than the 33s---better by far than the 48.

What I am trying to do is to stop "copping out" with "I would be just fine with such and so." While that might work for us old folks, the fact is that the next generation should not be saddled with new products which are not as good as possible. (This is what bothers me most about the 33s---like, why not make the equation list editable!!!?).

regards,

Bill

*Message #5 Posted by **Ron Ross** on 21 July 2004, 5:12 p.m.,*
in response to message #4 by bill platt

And that is why I think the 27s is the 2nd best pocket calculator ever made. I prefer RPN, but the solver and the amount of memory available to the 27s is still unmatched by any other scientific pocket calculator except the 42s. If it had an RPN mode, it would have been a great favorite among the RPN crowd due to its simple to use solver (the very same as the 17Bii that you mention).

It is just so simple to use, and that is what makes it both easy and powerful.

Re: Why the 15c should not come back

*Message #6 Posted by **JDH** on 21 July 2004, 7:42 p.m.,*
in response to message #5 by Ron Ross

I own the HP 48gx, 42s, 17bII, 32sII, 15c, 12c and I have to say the 15c is still my day to day favourite, actually purchased a backup for the day when my original stops working. As others have said before, I can't see the same model going back into production but something of similar form factor with extra memory and two line dot-matrix display would be good.

32S/42S/48SX "replacing" 11C/15C/41CX

*Message #7 Posted by **Karl Schneider** on 22 July 2004, 2:21 a.m.,*
in response to message #4 by bill platt

Bill --

Interesting "short essays"; I have a few points:

I agree: Owing to their limitations, the 15C (and 11C) probably would be not very successful in today's marketplace.

As a comparison, the 1966 Ford Mustang is a classic design that remains common and relatively popular even today. However, even if it met modern emissions and safety standards, it wouldn't sell well as a re-released car. It is antiquated -- more so than the 15C -- in many respects.

Ah, but the 27S and 17B with the solver of algebraic expressions are also 15 years old!

> Quote:
>
> *For a good current screen, take a look at the 30s (minus the glary plastic over-screen). You*

have two lines, dot-matrix upper, segmented lower, big characters, adjustable display, very good contrast, and provision for alphanumerics. Much nicer than the 33s---better by far than the 48.

No argument here with the displays of the 33S and the 48-series.

I've toyed with the 30S (two collegues have them, one to replace his employer-issued 28S that finally broke), and I don't share your enthusiasm for it. I find the digits too narrow in proportion to height -- Voyagers, and all Pioneers without the two-line display are more legible.

I also don't find its "pure algebraic" system (shared by Casio and TI) very much of a help:

- To perform a calculation on a previous result, you do [shift][Ans]...[=]. Heck, it was easier with RPN and old "hybrid algebraic".
- Proofreading a long, parenthesis-laden expression isn't simple, either -- you can't see the whole expression; braces and brackets can't be used to distinguish pairs.

Both formula AND control structures programming

*Message #8 Posted by **Vincent Weber** on 22 July 2004, 4:56 a.m.,*
in response to message #7 by Karl Schneider

Hi all,

Just to add to these very good comments, one thing that strikes me is the very small amount of machines that can do both formula programming AND have control structures for looping and branching. To my knowledge, the only non-graphing machines that falls into this category were: 1) The fx-4000P from Casio, made in... 1985 ! 2) The 32SII from HP, only made in 1991. And yet, this machine does not have editing capabilities... 3) The 67 Galaxy, made in 1992 only.

There were some descendants of these machines, e.g. the Casio fx-4500P or the HP-33S, but still, the offer was quite limited. It is a pity, as I feel that formula programming only is too limited, while keystroke programming only is a pain to deal with complex equations. Programmable calculators seem to be out of fashion...

That makes me think that Casio is sometimes rated unfairly. Think that, back in 1981, the fx-602P was a very good alternative to the HP-41, cheaper and faster; than as early as 1985, Casio invented both the formula + structure programmable with the FX-4000P AND the graphing calculator with the FX-7000G. I was a high school studend in 1988 and Casio was at the time the vendor of choice for us (I had a FX-8000G which I still like today). Only latter in 1990 I discovered HP with the fabulous HP-48SX.

The fx-4000P was a wonderful nice little machine, with equation editing and replay, 550 steps memory, 96 registers with indirect addressing, and was even smaller than the HP-15C... Those were the days. I do agree that formula programming is missed on some HP wonderful machines, such as the 41C or the 15C. The ACE ROM does some effort for the 41C with 'PROG', but no editing, no replay, no integration with solver... HP has yet to produce something like the 4000P, inegrating the best of Casio (equation editing) and HP (infinite number of alphanumeric labels, multi-variable solver...). That would be a hit !

Long live Casio ! :)

Cheers, Vincent

Re: Both formula AND control structures programming

in response to message #8 by Vincent Weber

Hp did indeed come out with that calculator. My wife had a Casio fx 4000 and really liked it. She later switched over to the Hp 27s. It is actually better than the Casio for everything except fitting in your pocket (the 27s fits in your pocket, just not as nicely).

*Message #10 Posted by **Vincent Weber** on 22 July 2004, 6:10 p.m.,*
in response to message #9 by Ron Ross

May I respectfully disagree - the HP27S is a wonderful machine which I respect a lot, but is -not- a true programmable... IF and SOLVE are nice functions, but do not allow everything that the keystrokes programmable can do... My point is, there are a lot of keystroke programmable calculators out there, and there are tons of formula programmable too. But there are very few calcs than can do both ! Cheers, Vincent

Re: Both formula AND control structures programming

*Message #11 Posted by **Holger S.** on 23 July 2004, 4:18 a.m.,*
in response to message #8 by Vincent Weber

I have both the FX-4000P and the FX-4500P as well as a TI-67 Galaxy. I like the 4000P. The 4500 has a cramped keyboard, even worse than a 32SII. Pretty much impossible to find anything quickly, athough it looks interesting. The TI has a nice form factor, but IMO the process to store and recall equations is cumbersome. Also, its display is hard to read with a decimal point too small to notice.

The disadvantage of all three calculators and the reason I don't use them regularly is the algebraic input. Typing [SQRT] Ans Exe just to calculate the root of what's in the display isn't very intuitive. As for programming, I think it depends much on what kind of program you like to write. Formula-like problems are easier to implement, although I think keystroke programming is easier to learn. However, more complex branching is easier with keystroke programming (however it's even easier with a real programming language like Basic).

I like the Casios, my first programmable was a 602P, too. And the 4000P and 4500P are dirt cheap nowadays. I bought mine on ebay for 2 and 10 Euros, respectively. But the most usable calc I have is without doubt the 42S while the most beautiful and fascinating is the 41CX.

Cheers, Holger

Re: Both formula AND control structures programming

*Message #12 Posted by **Vincent Weber** on 23 July 2004, 11:13 a.m.,*
in response to message #11 by Holger S.

Hi Holger,

I largly agree with your comments. I am fascinated with the 41CX and I love the 42S too, but I still think that both lack an equation mode a la 32SII, with editing capabilities. Nothing is perfect: The 32SII really shines on some points (Equations, fraction mode, ease of use, speed) but is a real move backwards in some others (cramp memory, primitive complex numbers, lack of labels and registers). My dream would be a 42S + equation mode with editing + proper

alphanumeric keyboard + franction mode + USB i/o. That would be my dream calc... I also think I forgot some interesting SHARP non-basic models in the very small club of non-graphing formula + control structure calculators. So, I think the complete list of such calcs are: - Casio: fx-3900P, fx-4000P, fx-4500P, fx-4800P - HP: 32SII, 33S - TI: 67 Galaxy - Sharp: EL-5050 (very nice dual keyboard, I would love to own one; the EL-5150 is horizontal version, but is a large a BASIC computer), EL-512H & EL-512II (more limited), and EL-5120 (too modern for my taste).

That's a total of 12 machines in the whole calculator history, out of which only 4 (fx-4000P, 32SII, 67 Galaxy and EL-5050) are really interesting IMHO. Something the market should re-explore !

Cheers, Vincent

EL-5020

*Message #14 Posted by **bill platt** on 26 July 2004, 2:39 p.m.,*
in response to message #12 by Vincent Weber

Hi Holger,

You mention an EL-5050, 5150, and 5120.

Do you know anything about the EL-5020? Especially, where to find a (or copy of) manual?

Best regards,

Bill

Re: Why the 15c should not come back

*Message #15 Posted by **Bill Smith** on 22 July 2004, 12:05 p.m.,*
in response to message #1 by bill platt

I disagree.

I don't have a 42S, but based on its features, it is the only calculator that might surpass the 15C as a pocket calcultor for this old engineer. I had a 32SII at work for a while, but never liked it as well.

In the day of the PC, my use of a calculator is perfectly met by the limited programability of the 15C. Its size, form, quality, durability, efficiency, and RPN are for me simply what a calculator is all about. There are simply too many tools that are just plain better at most of the other aspects of data aquisition, analysis, number crunching, and presentation than a calculator. Certainly other folks have different needs than I, but if my 12C,

15C, 41CV, 41CX, (many 41 modules) and 71B all were stolen or destroyed, the only replacement I could justify on the basis of need would be the 15C. The future may not be RPN, but for the next 5 or 10 years, the best calc tool for my job is the 15C.

Regards,

Bill S.

Re: Why the 15c should not come back

*Message #16 Posted by **OpenRPN** on 22 July 2004, 11:32 p.m.,*
in response to message #1 by bill platt

I certainly believe OpenRPN will produce the great calculators of the future. When I set out to found the project my goal was to make the calculator that you take everywhere you go, that does everything *you* need of it to do. Beyond that it must be the most durable calculator ever (if I can pull it off I would love to design it to be run over by a truck!).

Ultimately, I think everyone will be impressed as soon as the first prototypes start to appear.

Thanks to all for your support.

Old RPN Calculator joke

*Message #1 Posted by **Steve** on 21 July 2004, 1:16 p.m.*

Try this with your old classic series HP. (Hint it works best with an HP-35 because there is no 0 before the decimal mark.) This was taught to me in the '70s by an Aerospace engineer.

On the 25'th day of December Santa entered his home.

[25] [ENTER]

Mrs. Claus wanted to make a point.

[.]

Santa said Nein, Nein, Oh Oh Oh Oh Nein! Nein! many many times

[99000099] [X]

Mrs Claus said I'll have to get over that.

[1/X]

And Santa said.....(Turn display upside down)

Enjoy

Engineer vs Physicist joke

*Message #1 Posted by **Tom (UK)** on 21 July 2004, 12:44 p.m.*

Sorry to start over but the thread with jokes in was getting a bit long.

An engineer and a physicist were told one of them could go into a room containing a very atractive woman. However they would start 10 feet away and every second the distance between them and the woman would halve. The physicist was given first choice but rejected the offer complaining bitterly "but I'll never get there", the engineer gleefully acepted and said "yes but I'll get close enough".

Engineer vs Physicist vs Programmer joke

82143A printer help

*Message #1 Posted by **Mike H** on 21 July 2004, 9:47 a.m.*

Hello all, I purchased a used 82143A printer for my 41C. The print out fades to the left. That is, when 12345678 is printed, the 123 are barely visible, 4 and 5 are faded, 678 are the darkest. Any ideas? Thanks Mike H 1111

Re: 82143A printer help

*Message #2 Posted by **Randy Sloyer** on 21 July 2004, 1:17 p.m.,*
in response to message #1 by Mike H

Chances are it's a bad battery... They're real power pigs and you absolutely need a good battery to avoid this and other strange behaviours. Put a scope on the battery - you'll see the voltage drop as the head starts moving, the longer it runs, the lower the voltage, the dimmer the printing.

Re: 82143A printer help

*Message #3 Posted by **David Smith** on 21 July 2004, 5:22 p.m.,*
in response to message #1 by Mike H

The platen that backs up the paper may be out of position. The platen has a groove on the back of it that rests on a ridge in the print mechanism. It is basically held in place with springs at each end.

It was the battery, thanks (NT)

HP 86 Questions

*Message #1 Posted by **John Nelson** on 21 July 2004, 8:40 a.m.*

I know a few of you have the HP86 out there so I hope someone can help out.

I have come across an HP86, but it does not have a monitor. What can these things plug into? Any standard monitor or TV or what?

Also, what do you think is a fair price to offer for this. This is in a garage sale and the lady really does not know what it's worth. I don't want to take advantage of her and would like to offer a fair price.

The other thing I don't know is if this thing really even works. When we turned it on, the power light came on, but that is all I know at this point.

Re: HP 86 Questions

*Message #2 Posted by **Olivier De Smet** on 21 July 2004, 9:06 a.m.,*
in response to message #1 by John Nelson

Hi,

Use any old video composite monitor (60Hz refresh, 15Khz bandwidth). The HP monitor is in fact a Zenith one (same look).

I have more infos at home.

Olivier

in response to message #2 by Olivier De Smet

So it has a yellow RCA jack on the back of the unit? I didn't check the unit out well enough. So I should be able to connect it to a modern TV then?

Re: HP 86 Questions

*Message #4 Posted by **Olivier De Smet** on 21 July 2004, 10:48 a.m.,*
in response to message #3 by John Nelson

I don't think you can connect it to a TV. It's not the right impedance (75 Ohm, or High) and the scan rate isn't the same.

Olivier

Re: HP 86 Questions

*Message #5 Posted by **Eric Smith** on 21 July 2004, 8:04 p.m.,*
in response to message #4 by Olivier De Smet

The scan rate IS the same as NTSC video. (Maybe not exact, but close enough.)

Re: HP 86 Questions

*Message #6 Posted by **Tony Duell** on 22 July 2004, 6:35 a.m.,*
in response to message #3 by John Nelson

There is an RCA phono socket on the back of the 86 above the HPIB connector. It's not yellow (that convention came in much later), but it is normal RS170-like composite video that you should be able to feed into the composite input (not RF, of course) of a US TV. At least in the 86B (the model with 128K RAM) the video output buffer is designed to drive a 75 Ohm load (that's clear from the schematic) and I have no reason to doubt that also applies to the 86.

I doubt that the 86's video output meets broadcast video standards, but it's close enough to work with all the composite monitors I have.

When you switch on you'll have a fairly long wait (even longer on an 86B) while it checks memory, etc. Then you get a cursor at the top left corner, and can start typing BASIC.

Re: HP 86 Questions

*Message #7 Posted by **Eric Smith** on 21 July 2004, 8:05 p.m.,*
in response to message #2 by Olivier De Smet

> Quote:

TI-95 Emulator for Windows (Slightly Off-Topic)

*Message #1 Posted by **HrastProgrammer** on 21 July 2004, 8:31 a.m.*

I know it doesn't have anything to do with HP calculators, but I just uploaded my Texas Instruments TI-95 Emulator for Windows 9x/NT/2000/XP to http://hrastprogrammer.tripod.com/TI95E/TI95E.ZIP. Installation instructions haven't been provided because the archive contains only one file (TI95E.EXE) containing the emulator. It is free for non-commercial use so no one can say that I don't give anything for free :-)

As this is a true emulator emulating TMS70C46 CPU, you'll need ROM listings from http://www.rskey.org/ti95rom.htm - just download them and store all files into the same directory where TI95E.EXE has been stored and run the emulator.

I am looking for the ROM dump of Mathematics, Statistics and Chemical Engineering modules so I can load them into the emulator. Furthermore, with the appropriate ROM, I can emulate TI-74 BASIC calculator, as well (because they share the same design). But, I currently don't have this ROM so if anyone would like to dump and send it to me ...

Best regards.

in response to message #2 by Nelson M. Sicuro (Brazil)

I just setup a new home on Geocities (http://www.geocities.com/hrastprogrammer) because Tripod really starts irritating me with all these banners and search frames.

Old page will remain on Tripod for some time until I will be convinced that Geocities is working properly.

The list of files available for download (including demo versions and TI-95 emulator) is on the bottom of main page. Info and installation instructions are on the appropriate pages (which are accessible from the main page).

Let me know if you have download problems from new locations.

Best regards.

*Message #12 Posted by **HrastProgrammer** on 21 July 2004, 2:01 p.m.,*
in response to message #11 by TI-74

Unfortunatelly, you need PC Link to dump the ROM. Another problem is that both TI-95 and TI-74 ROMs are (partially, from #C000 to #DFFF) bank-switched which makes dumping more difficult.

I don't know if PC link can be easilly built but there is some info about TI-74 on ftp://ftp.whtech.com/Hexbus-%20CC40+TI74/ and perhaps you can find something useful here.

Best regards.

I am elated to see an emulator for the TI-95. It is a worthy successor for the TI-59 and a good cmpetitor for the HP-41C. Unfortunately, TI's timing and the 95's lack of MULTIPLE ports failed to make a star out of the TI-95. I have bought a few TI-95 from eBay and enjoy programming them.

Thanks for a cool emulator!!!!!!!

Interesting HP41 module on ebay

*Message #1 Posted by **Tom (UK)** on 21 July 2004, 7:50 a.m.*

See page at:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?
ViewItem&category=414&item=6109186257&rd=1&ssPageName=WDVW

I wonder if it was meant to be an electronic version of an enigma type machine?

I have not seen a removable rubber overlay that is shown for the HP41.

Please note that I have no connection with this item.

Re: Interesting HP41 module on ebay

*Message #2 Posted by **Matthias** on 21 July 2004, 8:10 a.m.,*
in response to message #1 by Tom (UK)

I contacted the seller and as a remark: He sells the EPROM with the overlay I think. I´m not shure if he sells also the HHP EPROM box!

Happy bidding

Re: Interesting HP41 module on ebay - comments about 41 & crypto..

*Message #3 Posted by **Bill Wiese** on 21 July 2004, 1:05 p.m.,*
in response to message #1 by Tom (UK)

Some time ago I heard persistent rumors that during early 80s some crypto gear disguised as HP calculators were supplied to some Soviet defense scientists/engineers who spied for US CIA/DIA - a guy like A.G. Tolkachev comes to mind (eventually caught by KGB & shot circa 1985?). (There was apparently another small radio device that allowed shorter, secure messages to be conveyed up to 1/4mi to avoid face-to-face agent contact and was separate from this.)

I had heard somewhere it was a 41 (after all, it was alphanumeric!) but even if that was wrong, other hacked numeric-only calcs that could deal with something like 5-digit code groups could work too.

An HP sci calc at that time would be a piece of equipment that although uncommon and pricey would not be odd or out of ordinary and at the worst could be 'explainable' in an investigation as a blackmarket purchase but would be tolerable for a senior guy...

HP-42S Saturn Address lines?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 20 July 2004, 3:34 p.m.*

Hi to all,

I'm trying to discover if the Saturn CPU from the HP-42S have more than the A0..A15 address lines.

I think that some non-connected CPU pins that ends on test-pads on the PCB following the sequence of the address lines (after A15) can be used as address lines for the main RAM - *IF* those pins are indeed address lines!! I don't know very deeply the Saturn processor and I don't know if its address mode is linear on the 0.5MB address area (1Mega-nibble). There is the chip-select (CS) issue also, I think that the ROM-CS and RAM-CS are hardwired on some address window. Any information on this?

I don't have a logic analyser, but I'll try to borrow a oscilloscope to peek around. If these lines can be used for addressing the RAM, the extra RAM can easily be added - 128KB maybe???

Anyway, it is easy to put 64KB of RAM in the space between $20000~$3FFFF to do some extension of its functions/OS, and if at least I can use the A15 on the normal RAM space I can put 64KB there too (128KB total).

Best regards,

Nelson

HP-42S Saturn Address lines?

*Message #2 Posted by **Veli-Pekka Nousiainen** on 20 July 2004, 5:55 p.m.,*

*Message #3 Posted by **Christoph Giesselink** on 20 July 2004, 5:54 p.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

> I'm trying to discover if the Saturn CPU from the HP-42S have more than the A0..A15 address lines.

The 1LR2 Lewis chips has 17 (MA[9:0] shared with OR[0:9] and MA[10:16] shared with IR[0:6]) address lines for byte access.

> I think that some non-connected CPU pins that ends on test-pads on the PCB following the sequence of the address lines (after A15) can be used as address lines for the main RAM - *IF* those pins are indeed address lines!! I don't know very deeply the Saturn processor and I don't know if its address mode is linear on the 0.5MB address area (1Mega-nibble). There is the chip-select (CS) issue also, I think that the ROM-CS and

RAM-CS are hardwired on some address window. Any information on this?

The MMU for the two CS pins for external ROM and external RAM access is programmed at manufacturing process and can't be changed later. The address areas are $20000-$3FFFF and $50000-$5FFFF.

> I don't have a logic analyser, but I'll try to borrow a oscilloscope to peek around. If these lines can be used for addressing the RAM, the extra RAM can easily be added - 128KB maybe???

> Anyway, it is easy to put 64KB of RAM in the space between $20000~$3FFFF to do some extension of its functions/OS, and if at least I can use the A15 on the normal RAM space I can put 64KB there too (128KB total).

Both not possible because of the fixed programmed MMU with 64KB at $20000-$3FFFF and 32KB at $50000-$5FFFF. You will not get any external CS signals outside these memory areas.

The additional pins on the test-pads maybe the 3 MODE[0:2] pins and/or the Saturn bus pins BUS[0:3], NSTR and NCD.

Best Regards,

Christoph

Re: HP-42S Saturn Address lines?

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 21 July 2004, 7:30 a.m.,*
in response to message #3 by Christoph Giesselink

Hmmm.... My only solution for having mode RAM/ROM (FLASH?) on the 42S is bank switching by some glue logic - I have an idea to put another microprocessor inside it to handle communications (very low power MSP430F1121 line) and maybe it can control the RAM/FLASH CS as well. It is just an speculation as I don't know if it can handle the address/data bus of the Saturn fast enough with its (MSP430) 8MHz.

Anyway, having those 64KB to play with is a good challenge!

Best regards,

Nelson

Hp 25c falure

*Message #1 Posted by **alsaudio** on 19 July 2004, 8:48 p.m.*

Hi, recently while doing some work one evening with my 25c, I clicked the enter button, and instead of an expected result, the machine locked up.

Upon turning it off , and then on, the the result is all zero's on the display which blank out when any key is pressed, or occasionaly, an "error" message.

Since, I have removed batteries, had it on the charger, and any other tricks I could think of, but it seems to me it's time may have come.

I wonder if anyone could shed some light on this? I am assuming the worst. thanks alsaudio

Re: Hp 25c falure

*Message #2 Posted by **David Smith** on 20 July 2004, 8:21 p.m.,*
in response to message #1 by alsaudio

A display of 000000000 is almost always a bad ACT chip (the big wide one at the bottom of the circuit board). ACT chips from a 21/25/29C/67/97 (but not a 27) will work in the 25C.

HP-35 display anomaly

*Message #1 Posted by **David Ramsey** on 19 July 2004, 6:04 p.m.*

I acquired a fourth generation HP-35 (with legends printed on the function keys rather than above them). It has an add display anomaly: when I enter numbers, the first digit is displayed one place to the right of where it would normally be (the third display position from the left of the calculator). If I press the decimal point key and then another number, the new number jumps one position to the left, so everything's normal from that point on. Numbers without decimal parts always display one position to the right of where they normally would.

Using [] to represent blank character positions, it looks like this:

1. Press "3". "[][]3" is shown on the display.

2. Press "." "[][]3." is shown on the display.

3. Press "1". []3.1" is shown on the display.

Has anyone ever seen anything like this? I can't think of a malfunction that would account for it...

-- David

Re: HP-35 display anomaly

*Message #2 Posted by **Eric Smith** on 19 July 2004, 7:50 p.m.,*
in response to message #1 by David Ramsey

The cathode driver has logic to skip a digit to the left under some circumstances. Either the cathode driver has failed and sometimes is not doing this when it should, or the ARC chip is sending it the wrong bits and triggering this display.

Edited: 19 July 2004, 7:53 p.m.

Re: HP-35 display anomaly

*Message #3 Posted by **David Ramsey** on 19 July 2004, 9:05 p.m.,*
in response to message #2 by Eric Smith

Further experimentation reveals that if the first digit after the decimal point is "2", then the 2 will occupy the same position as the decimal point, a clear error.

This is mainly a parts machine so I don't suppose it would be worth the time to disassemble it, clean the various contacts on the plug-in circuit board, etc.

Re: HP-35 display anomaly

*Message #4 Posted by **Eric Smith** on 19 July 2004, 9:58 p.m.,*
in response to message #3 by David Ramsey

> Quote:
>
> Further experimentation reveals that if the first digit after the decimal point is "2", then the 2 will occupy the same position as the decimal point,

I've looked up the technical details in the patent, and the details of my previous posting in this thread are not completely accurate.

The display is scanned from right to left, one digit per processor word cycle. During each word cycle, one digit each from the A and B registers are used by the ARC to determine what digit and/or decimal to display, decoded into seven segments and the decimal flag, and sent to the anode driver. The signals are sent over five wires, time-multiplexed in a strange fashion. The anode driver decodes them to determine what digits to light, and also decides whether to generate a step pulse to the cathode driver. For the case of a decimal, the anode driver is supposed to generate an extra step pulse after the digit segments have been driven and before the decimal is driven, to prevent them from overlapping as you have seen.

The decimal point indication is carried on the same signal line that carries the F and G segments.

Internally to the ARC, the digit 2 in the B register is used to indicate the decimal position. This is interesting since an actual display of the digit 2 occurs when a 2 is in the A register. So a decimal followed by a 2 would have the 2 digit in BOTH the A and B registers.

I'm not sure exactly what to conclude; it seems likely that the cathode driver is fine and that either the ARC or anode driver are malfunctioning. I don't see how a dirty contact between the boards could have this result, though I suppose it is not impossible. At this point I think I'd bet on the ARC.

Re: HP-35 display anomaly

*Message #5 Posted by **David Ramsey** on 20 July 2004, 1:03 a.m.,*
in response to message #4 by Eric Smith

I assume the ARC is a chip on the little logic board?

Re: HP-35 display anomaly

*Message #6 Posted by **Tony Duell** on 20 July 2004, 5:27 a.m.,*
in response to message #5 by David Ramsey

ARC = Arithmetic and Registers Chip -- the data path half of the processor. It's a 16 pin (?) chip in the lower right corner of the logic board.

Re: HP-35 display anomaly

*Message #7 Posted by **Eric Smith** on 20 July 2004, 6:16 p.m.,*
in response to message #5 by David Ramsey

Best identified by part number. The ARC is either 1820-0848 or 1820-1169. In an HP-65, the ARC is inside a hybrid module, but AFAIK it's an 1820-1169 chip.

I have compiled a table of known HP calculator chip part numbers.

Re: HP-35 display anomaly

*Message #8 Posted by **David Smith** on 20 July 2004, 8:26 p.m.,*
in response to message #3 by David Ramsey

I would try cleaning the circuit boards very well with 91%+ isopropyl alcohol. I have seen several rather strange problems caused by solder flux or other often invisible contamination on the boards. HP did not seem to clean up the flux after hand soldering operations.

OT: didactic little quiz & Restaurant at End of Universe

*Message #1 Posted by **Bill (Smithville, NJ)** on 19 July 2004, 8:33 a.m.*

Valentin's *very* didactic little quiz reminded me of the Restaurant At the End of the Universe in the The Hitchhiker's Guide series. Deposit one cent into an account today and through the power of compound interest you will have enough in the account to pay for the very expensive price of the meal.

Being reminded of the Guide in this way makes me want to re-read the series. :)

Re: OT: didactic little quiz & Restaurant at End of Universe

*Message #2 Posted by **Tom (UK)** on 20 July 2004, 7:51 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Like so many other things about the Restaurant at End of Universe, Douglas Adams was big enough to repeatedly write "this is of course impossible" (well at least in the radio play version of THHGTTG when Peter Jones spoke as the book.)

PS For Hitch Hiker fans - do you also see the importance of Marvin in the story? Is it an 'open secret' that he is the most important thing in the book and the rest of the universe didn't see fit to tell me about it? - Or is it because I'm a super intelligent shade of blue and only I have seen the truth from the clues in the book?

A *very* didactic little quiz: Some comments

*Message #1 Posted by **Valentin Albillo** on 19 July 2004, 5:09 a.m.*

Hi, all:

A comment and two additional interesting questions.

First of all, I'm truly glad that so many of you did like my didactic quiz and posted your answers and comments. Of course, as I clearly stated in my original post, it's all a *didactic, ideal, theoretical example*, not concerned with being physically possible (for one thing, such a mass, if it could exist, would implode into a black hole at once), nor financially sound (inflation, bankrupts, accidents, etc).

It was simply kind of a *gedankenexperiment* to show my daughter just how exponential functions, however initially slowly growing, will ultimately overcome any linear (or polynomic for that matter) function, however steep its initial growing. After some calculations, she took the hint and, as I said, was amazed no end.

I wonder if any of you did try to actually *imagine* the situation. On the one hand, a simple, silent, boring account in a bank, sitting there doing *nothing* at all for 2,000 years, except silently grow, a mere figure in a paper. This is anything but exciting to watch.

On the other hand, a *titanic* (for lack of a better word) cylinder of solid, glowing gold, which extends from horizon to horizon in width, and farther than your sight can follow in depth, an ultra-colossal metallic wall if ever was one, which instantly surges from the ground up at such speed that before you can even realize it, it's higher than the Moon ! If done with some kind of CGI, it would be an absolutely awesome, cataclismic, mind-breaking sight ! And this goes on, at undiminished speed, for 2,000 years !! ... yet the humble account with its $1.00 at 5.00% ultimately wins. I think this pretty much makes the point, in spades. Try to impress this imagery in your children/students/colleages !

As for a final comment, I'll submit a couple of additional questions to your consideration, specially dedicated to the many Star Trek fans out there, and still firmly within the realm of the ideal, non-physically realizable model (please no inflation, cashing after one second, etc):

1. Let's suppose that the cylinder has been fitted with a new technology akin to the warp drives of Intrepid-class starships (e.g.: Voyager) and can grow at warp 8 (i.e.: 1024 times the speed of light, so it would reach to Alpha Centaury in 34 hours) instead of at merely warp 1 (the speed of light). How much would you need to increase the original interest rate of 5.00% to overcome it ? 10% ? 40% ? 1024*5 = 5120% ?

2. What if the cylinder was fitted with Star-Trek's interstellar radio speed, i.e: warp 9.9999 (= 199516 times the speed of light, so it would reach to Alpha Centaury in 10 min.) ? What then should the interest rate be? 10% ? 40% ? 199516*5 = aprox. 1,000,000 % ?

I hope the answer to both questions will *still* surprise you (and any trekkies you might pose the question to).

[Data for ST Voyager's warp speeds taken from here]

Best regards from V.

Re: A *very* didactic little quiz: Some comments

*Message #2 Posted by **Olivier De Smet** on 19 July 2004, 6:11 a.m.,*
in response to message #1 by Valentin Albillo

Hi, thanks for the upgraded quiz.

The following come from an HP86b:

```
list
10 DEF FNg(n) = PI *6350^2*1024*300000*3600*24*365*19*1.E15*10*n
20 DEF FNd(n) = k^n
30 k=1.05 @ dk=.01 @ n=2000
100 IF k+dk=k THEN 300
110 IF FNd(n)<FNg(n) THEN 200
120 dk=dk/2 @ k=k-dk @ GOTO 100
200 k=k+dk @ GOTO 100
300 DISP k
301 DISP FNd(n)
302 DISP FNg(n)
310 END
 649217
run

 1.05277206943
 4.66346525519E44
 4.66346517742E44
list
10 DEF FNg(n) = PI *6350^2*199516*300000*3600*24*365*19*1.E15*10*n
20 DEF FNd(n) = k^n
30 k=1.05 @ dk=.01 @ n=2000
100 IF k+dk=k THEN 300
110 IF FNd(n)<FNg(n) THEN 200
120 dk=dk/2 @ k=k-dk @ GOTO 100
200 k=k+dk @ GOTO 100
300 DISP k
301 DISP FNd(n)
302 DISP FNg(n)
310 END
 649217
run

 1.0555509313
 9.08628829361E46
 9.086288265E46
```

For warp 8 : 5.277206943 % is enough

For warp 9.9999 : 5.55509313 % is enough

Olivier

Re: A *very* didactic little quiz: Some comments

*Message #3 Posted by **John Nelson** on 19 July 2004, 11:27 a.m.,*
in response to message #2 by Olivier De Smet

Oliver,

How long did it take the HP-86 to solve this? I used your code and translated it to Visual Basic and ran it

on my computer. After 10 minutes, it still had not spit out an answer.

Re: A *very* didactic little quiz: Some comments

*Message #4 Posted by **Valentin Albillo** on 19 July 2004, 12:07 p.m.,*
in response to message #3 by John Nelson

Olivier's code works perfectly in a number of plain-vanilla BASICs. You should suspect the line:

```
100 IF k+dk=k THEN 300
```

perhaps the condition is never met in your particular implementation. In general, testing reals for strict equality is a **big** no-no in programming and should *never* be done. There's much less risk in a BCD implementation (like HP-86's) than in a binary implementation (like in VB), but nevertheless it's better to never do this.

Best regards from V.

Re: A *very* didactic little quiz: Some comments

*Message #5 Posted by **Olivier De Smet** on 19 July 2004, 12:26 p.m.,*
in response to message #4 by Valentin Albillo

Valentin is right. The trick is the line 100. With the HP86 it works perfectly (in 40 sec or so). But in other basic it should work. There is always a numerical epsilon such that any value added by epsilon is equal to the value. But perhaps your basic make some optimisation and transform:

k + dk == k as dk == 0 wich is right mathematically but break the used algorithm. Perhaps change line 100 with

100 e = k + dk @ if e == k then 300

or

100 e = k + dk @ if abs(k -e) < 1.E-9 then 300

In fact I used this trick just for fun (it assure that the result given is the BEST the used basic can find ;)

> How would you propose to do this on a 15C or something similar (better yet... a punny little 12c)?

Actually the 12C handles this very well without the need for any programming at all. Just enter: F CLEAR FIN; n=2000; i=5%; PV=1 and press FV to get the value of the investment, namely -2.39e42 (3SF, ignore the negative).

If the speed of growth of the gold tower goes up to warp 8 then you can easily type in the necessary multiplication sums and get 4.66e44 as the new value of the gold column. Press CHS to make this negative and store in FV. Press i to get the new interest rate that will make the investment match the new gold value. Easy.

Here's a variation: what if we decided to invest some more money in order to match the new gold value but at the original 5% interest rate. How much would we need to invest? Have a guess first and then calculate it - you might be surprised!

Re: A *very* didactic little quiz: Some comments

*Message #10 Posted by **John Nelson** on 20 July 2004, 8:13 a.m.,*
in response to message #9 by Bruce Horrocks

I'm aware of that... but I wanted a more gutsy version of just solving for I with the built in functions. I did that too many times in my MBA and was looking more for a "sexy" way.

in response to message #8 by John Nelson

John,

(After I wrote this, I see that Bruce Horrocks has already posted a response for the HP-12C, but I've left my response in anyway)

The HP-12C is perfect for solving this kind of problem. You know what the initial value of the money in the account is ($1.00 in this case) and you know what the value of the gold cylinder is after 2000 years ($4.663465177e44 for the first problem or $9.086288294e46 for the second problem). I don't have my HP-12C in front of me, but the procedure is more or less as follows:

```
CLEAR FIN
2000            ; Store the number of years
n
-1              ; Negative value indicating that $1.00 is placed in
account
PV
4.663465177e44  ; key in 9.086288294e46 here for the second problem.
FV
i               ; Display the interest rate
```

Given the large final value, it may be necessary to help the calculator and store an initial guess of 5% for i. I'll give it a try later and see what results I get.

On the HP-15C, you can write a program that uses the built-in solver to come up with a solution. I don't have a HP-15C at hand, but I do have a HP-32S for which I've written a program. It's a little different to an equivalent program for the HP-15C, but it should work equally well on the HP-32SII or HP-33S.

```
LBL A
INPUT I
INPUT N
INPUT A
RCL I
1
+
RCL N
y^x
RCL A
RCL x N
-
RTN
```

This program can solve for any of the parameters:

```
I (interest rate, for 5%, I=0.05)
N (the number of years)
A (the increase in value of the gold per year)
```

I entered this program on a HP-32S, hit FN = A, and solved for I. I set N = 2000. For the first problem, A = 2.331648e41, which results in a value of 0.052772 for I.

For the second problem, A = 4.542979e43, which results in a value of 0.0555509 for I.

Note that this exact same program can also be used to solve the problem that you posted asking when the dollar value in the account will exceed the value of the gold column. In this case, I set I = 0.05, A = 2.277e38 and solve for N, which gives N = 1965.656.

Regards,

Eamonn.

HP-41CX - 4th port

*Message #1 Posted by **Cyril RABIH** on 19 July 2004, 4:04 a.m.*

Hi, I've got a 41cx with 2*x-memory and the advantage pac. My question is which module would you use as the 4th and last port ? I personnaly have a stat pac but I'm sure there's a better pac. An other question is, according to you, which is the best configuration of a 41cx (I mean internal extension and not external in order to fit into the leather case) ? Thx

Re: HP-41CX - 4th port

*Message #2 Posted by **Karl Schneider** on 19 July 2004, 4:45 a.m.,*
in response to message #1 by Cyril RABIH

Cyril --

You've already "maxed out" regular and extended memory with your configuation, as well as included the best ROM made by HP. There's not a whole lot of room for improvement, but here are a few ideas:

- The Math/Stat Pac would provide a few things that the Stat Pac alone and Adv ROM together don't provide -- hyperbolics, Fourier Analysis, and triangle solutions. Price: about US$40
- An Infrared module, along with the 822240B printer will allow the 41 to print to the same printer used by the 42S, 17B/II, 27S, 28C/S, 48S/G, among others. Price: US$100+ for Pac; US$90(?) for printer
- A Naviagation Pac provides 8 kB of useful programs for navigational calculations and celestial-object locating. Price: US$100+ for Pac
- Save it for a Card Reader or Wand? Price: US$100
- A specialty module for advanced programming and other functions: e.g., Hepax, PPC

All above prices are eBay US, not including shipping. I have all three HP modules for my 41CX, but none extra for sale.

-- Karl S.

Re: HP-41CX - 4th port

*Message #3 Posted by **Tony Duell** on 19 July 2004, 2:16 p.m.,*
in response to message #1 by Cyril RABIH

Here's what I'd put in a CX : ZenROM, HPIL Development module, HPIL module, card reader.

And in a CV : Extended Functions, Extended IO, HPIL, card reader

(In fact I have 2 machines configured like that at the moment, along with others that I often change the modules in).

Re: HP-41CX - 4th port

*Message #4 Posted by **Garth Wilson** on 19 July 2004, 3:21 p.m.,*
in response to message #1 by Cyril RABIH

I sure like having the ZENROM in my 41cx. There wouldn't have been any point in my getting the 41 in the first place though if it weren't for the HPIL. I've interfaced it to a lot of workbench equipment, not just the little printer and digital microcassette tape drive.

The Extended IO is nice to have with the HPIL, and I had them put it in the same module with the HPIL so it wouldn't take an extra port. So with HPIL, ExtIO, Advantage, and ZENROM, I have one port left, and I would like to put a double XMEM or an MLDL there.

Re: HP-41CX - 4th port

*Message #5 Posted by **Ronald** on 19 July 2004, 4:24 p.m.,*
in response to message #4 by Garth Wilson

Hi,

1) I would put in the CCD module. 2) I would do chirurgy on the 2 X-memory so they will become one module 3) In the one that come free I would leave open so I can plug in any device I need from time to time like the printer, the Wand or cardreader etc.

Re: HP-41CX - 4th port

*Message #6 Posted by **Etienne VICTORIA** on 19 July 2004, 5:24 p.m.,*
in response to message #5 by Ronald

Hi !

My proposal :

- Advantage Pac - Double Xm module - IR Print Module - Clonix burned with whichever ROM you fancy (Xrom compatible)

OR

- Advantage Pac - IR Print Module - NovRAM acting as HEPAX + burned with Sandbox

...and You can sell your Xmem as it becomes useless with the Hepax permanent memory....

Credits and sources :

- both Clonix & NoVram are available through Diego Diaz (Harware and software)

- SandBox is a creation from Angel Martin and is available on the STYSEWENI : "the Site Thou Shalt Evoque Without Ever Naming It" (Sorry, unfortunately it's not a joke)

- XMem is a kind of joke created by Hp to mimick a filesystem, extend the Hp41 life and increase the stress level generated by MEMORY LOST.

Just my 0.00002 Eurocents

Best regards from Paris

Etienne

*Message #7 Posted by **Etienne VICTORIA** on 19 July 2004, 5:33 p.m.,*
in response to message #6 by Etienne VICTORIA

Sorry, I forgot,

In the slot freed by discarding the Xmem stuff, put an HP-IL with a Mass storage (cassette or disk), a Digital multimeter (to test your renewed rechargeable battery pack).

I shifted from batteries to rechargeable after eating out all N-type batteries with the peripherals.

Maybe one day we should try to benchmark the power consumption of all our beloved extensions...

Bonne soirée.

Etienne

HP 33S display

*Message #1 Posted by **Rick** on 18 July 2004, 5:59 p.m.*

Hi all. I have found a way, eventually to input more than just a one letter prompt in a program. Instead of using INPUT A, I just go into EQN mode and type prompt name. I guess a lot of people may have found this out already. Anyway, is there a way to display a message with result. Suppose answer for root of equation is 0.587 Is there a way to display root = 0.537 ? Thanks.

Re: HP 33S display

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 18 July 2004, 7:01 p.m.,*
in response to message #1 by Rick

You should read page 13-10 of the manual, regarding the usage of Flag 10 and PAUSE in a program.

I hope it helps. Regards.

Problem with 48GII

*Message #1 Posted by **Iqbal** on 18 July 2004, 8:57 a.m.*

Every probably 3-4 weeks or so, I encounter a strange problem on my 48GII. The 1,2,3 and F buttons work. There is no way to do the self test. All other buttons work fine. But if I take out the batteries and leave it off for maybe a day or so, it starts back to work like normal. It doesn't seem to be a problem with the actual buttons involved. Any ideas what could be causing that?

Re: Problem with 48GII

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 July 2004, 11:46 a.m.,*
in response to message #1 by Iqbal

Hi, Iqbal! Are you well?

I'm curious: how many times did it happen? Or how often does this KBD weirdness happen?

I'm asking about this because I was requested by a student to try to repair an HP20S (Pioneer) where the [INPUT], [+/-], [(], [)] and [<-] row no longer works. I "gently" tried squeezing and twisting the case closer to the "zebra" contact that connects the keyboard flex contacts to the main PCB, and I succeed making the [<-] work once. But I didn't think of resetting the calculator or leave it without batteries. I once had an HP42 with sort of a "bad behavior" with the keyboard: without the back half case it worked fine, but no key worked after putting the back case in place. I had to add some thin foam fastener below the zebra contacts to ensure it would "touch" the mainboard contacts.

What I wonder is about the possibility of the batteries compartment being right below the keyboard/main PCB contacts. In the HP48/49, the batteries compartment was in the bottom of the calculator case, now the HP49G+ (I'm not sure about the HP48GII) has it in the top, opposed to the earlier models. Would removing/replacing batteries somehow "shake" these contacts and cause them to work /not work? My HP49G+ works perfectly fine since I got it, but your concerns and your HP48GII behavior must be considered as well.

I'd wait for a while and observe. If the calculator is new and you still can do that, ask for a new unit. If everyone does it, HP will surely (probably???) do something to avoid replacing defective units by enhancing quality... should we expect so?

Cheers and best regards.

Luiz (Brazil)

hp 28s

*Message #1 Posted by **claudio** on 18 July 2004, 7:21 a.m.*

I write from rome italy and just now i recevived an calculatro hp 28 s

do you thing is son nice for collection? and tomorrow i'll buy the batteries (i hope to find)

Re: hp 28s

*Message #2 Posted by **Massimo (Italy)** on 18 July 2004, 9:42 a.m.,*
in response to message #1 by claudio

Hi Claudio,
a quick reply from Milano: a 28S is as good for a start as any other HP calculator built before 1999.
As far as batteries are concerned you should be able to find them (N size); try in a photo shop if anything else fails.

Massimo

Re: hp 28s

*Message #3 Posted by **Karl Schneider** on 19 July 2004, 12:20 a.m.,*
in response to message #1 by claudio

Claudio --

I certainly believe that a 28C or 28S (either one) is worth collecting, if not necessarily to use as one's primary HP calculator.

I find the 28 to be the easiest-to-use RPL model, with its uncluttered keyboard, dedicated alpha keypad, and "cheat sheet" on the left half. It also offers a nice units library with SI dimensions of a wide variety of metric and English units of measurement.

The 28S is an improved version of the 28C, with more RAM (32 kB vs. 2 kB), a faster processor, directories, and a few more mathematical functions (e.g., PERM, COMB).

The 28 takes 3 "N" cells. This is unfortunate, as these are typically sold in packs of 2. Be careful not to damage the battery cover, which is poorly designed.

Re: hp 28s

*Message #4 Posted by **marais** on 19 July 2004, 4:32 p.m.,*
in response to message #3 by Karl Schneider

I concur to that! The 28C and S are excellent machines, their only flaw being the battery door. The folding mechanism never failed for me. If you do a lot of programming, the S model is definitely in order, as the C is really under-powered in that respect. Otherwise these are fine machines, and being less endored by the hp community, they aren't too expensive on ebay.

Andreas

1. The HP28S is fully alphanumeric. The HP-15C is not.
2. The HP28S uses advanced, high-level RPL. The HP-15C is low-level RPN, keystroke-programmable.
3. The HP28S has a multiline dot-matrix display. The HP-15C has just a one-line, segmented, non-alphanumeric LCD display.
4. The HP28S has a multitude of advanced objects, fully nestable. The HP-15C only deals with single numbers and 2-dimensional, small real matrices.
5. The HP28S has 12-digit accuracy with exponents up to +-499. The HP-15 has 10-digit accuracy, exponents up to +-99
6. The HP28S has a full menu structure, including a help facility for commands and functions. The HP-15 does not.
7. The HP28S can communicate with an external printer via I/R. The HP-15C has no communications whatsoever.

8. The HP28S has 32 Kb RAM. The HP-15C has less than 0.5 Kb RAM.
9. The HP28S does admit named variables. The HP-15C is limited to numeric registers.
10. The HP28S does symbolic computations, including arithmetic, Taylor series expansion, polynomial integration, and equation solving including isolating variables. The HP-15C does not.
11. The HP28S is very fast, much faster than a 41C. The HP-15C is slower than a 41C.
12. The HP28S does include SYSEVAL for direct access to internal routines. The HP-15C has no such equivalent capability.
13. The HP28S has an 'infinite' stack capability, including advanced UNDO features. The HP-15C has just 4-level classical RPN stack with LASTx as the only undo capability.
14. The HP28S can evaluate algebraic expressions. The HP-15C can not.
15. The HP28S has an elegant clamshell design that fully protects keyboards and screen. The HP-15C has no such protection, its logo tends to fall apart or get damaged, and its display tends to gather dust within.
16. The HP28S has an internal timer which can be accessed and utilized in user programs. The HP-15C does not.
17. The HP28S can do graphics, including reasonable resolution plots. The HP-15 cannot.
18. The HP28S has user-adjustable display contrast. The HP-15C doesn't.
19. The HP28S has a very extensive set of functions which covers just about everything you might wish or need. The HP-15C has a much more limited instruction set.
20. There's also very extensive documentation on the HP28S internals, including several books by its very 'alma mater', Mr. Wickes himself. Next to nothing is known about HP-15C internals, nor does it exist any such documentation or reference apart from a few not too detailed articles.

Yet I would gladly give you two or more HP28S for a single HP-15C in mint condition, and would not part with my own HP-15Cs for any amount of HP28S's you could offer.

Best regards from V.

in response to message #9 by Veli-Pekka Nousiainen

I don't understand what you want, VPN.

Seems to me you've been an HP fan long enough to know about all the many differences between the HP28S and HP-15C some of which I did mention, and that you also fully well know that asking "Which one is better" is plain downright silly, so I'm at a loss at what you exactly want or what point do you want to make, i.e.:

- Just start some long and pointless thread about who prefers which ?
- Just get to know about some fine-print differences you want specially discussed or commented ?
- Just to make you feel better because you've located an HP28S you can afford, but no affordable HP-15C's on sight and you want to play Aesop's fable for a while ?
- Just to reinforce the warm feeling that who needs an HP-15C when it's obvious an HP28S is much better ?

Please state some rationale why you want people to give their opinions on this (IMHO) 'silly' question of yours, and perhaps I'll consider giving my opinion, if that's what you want. But, honestly, your question seems to me as silly as they get.

And if you're serious and it's not some way to have some fun, well ... you seem to be a little 'unfocused'.

Best regards from V.

Re: HP 28S vs HP 15C

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2004, 12:52 a.m.,*
in response to message #10 by Valentin Albillo

Hi Valentin, guys; are you well?

I'm just taking the opportunity to ask a question (again, if I remember it well, but I am not sure you read it at that time) that I am not able to answer myself(not enough knowledge). I am hoping that you are able to give some reasoning to this question, and it involves matrices, complex numbers and the HP15C.

If this is a known subject with a known conclusion, please forgive me not being updated... 8^(Well, here it goes: It's well known that the HP15C designers (Dr. Kahan amongst others) used clever software "maneuvers" to handle "real-number" matrices and achieve complex-equivalent results for inversions and system solving. Although what I ask is not mainly important given what can be done with the HP15C, I tried to find a way to calculate the complex number equivalent to the determinant of a real-number coded Ã matrix and did not succeed. The determinant for the real-number coded Ã matrix is a real number equivalent to the square of the determinant of the original complex matrix A. Or, in other words, the square root of the determinant of the real-number coded Ã matrix is the magnitude of the determinant of the original complex matrix A. All other HP calculators with embedded complex capabilities deal with complex matrices and calculate the determinant as a complex number. BTW, all of them followed the HP15C footsteps... anything else to say about this amazing little giant?

Do you know a way to calculate the real and imaginary parts of the determinant of a real-number coded, complex matrix in the HP15C?

Again, if this is a well known problem with a well known solution, just let me know and I'll "shame on me" and find my way home...

Thanks!

*Message #15 Posted by **Ron Ross** on 20 July 2004, 1:43 p.m.,*
in response to message #5 by Veli-Pekka Nousiainen

I don't think I can expand any upon Valentin's 20 point comparision, because these two are just that, An apple and an Orange.

The Hp28s evolved into the present Hp48/49 series with big improvements in both hardware and software. Yes the keyboards and build quality of the new 49 may not be as good as an older 28s, but their battery doors don't fail.

The Hp15c kinda evolved into the modern Hp33s. I say kinda, because unlike the Hp 28s which improved through evolution, the Hp33s is not real step up in all the most important aspects of the

Hp15c (size, matrix support, quality). Nothing added but RAM, with no real support to ues that RAM.

And I would trade a couple of 28's for a single 15c any day, also.

And now for my typical RANT!!! But I just might take a 28s over a 33s, especially to an NCEES exam, if it were allowed, because the 28s can use its 32K of RAM. But that isn't the case so I will probably buy a 33s (though I am CHEAP and might just use an Hp32sii / Hp15c combination). And I am paticular, if the calculator misses a single keystroke, I get somewhat irritated. Make a $50 RPN calculator that isn't comparable to $10 cheapies in keyboard quality, and I get very mad. That is another of my gripes with the new Hp's.

My new replacement Hp49G+ has also failed me on rare occasions. If I used it more often like my older Hp's, I suspect it would fail me on even more numerous occasions.

NCEES calculators

*Message #16 Posted by **Norris** on 20 July 2004, 5:39 p.m.,*
in response to message #15 by Ron Ross

I recently got a 33S for an NCEES PE exam. So far I am reasonably satisfied with it; it appears to be the best available choice for NCEES exam purposes. And I have not had any problems with the keyboard.

The 33S is certainly not flawless. The chevron keyboard is silly, the decimal point and the ENTER key are too small, the display contrast is not great, and the lack of variables and labels hinders programming.

But it has some important advantages as well:

(1) NCEES approval. NCEES has now explicitly banned the 39, 41, 48, and 49 series, as well as the 42S. The 28 series has not been explicitly banned, but it appears to be illegal based on its alphabetic keyboard and IR port. Even old standbys like the 11C and 15C may be prohibited in the future; NCEES is seriously considering a ban on all calculators except for those with explicit NCEES approval. As of now, the only RPN calculators with such approval are the 32S, 32SII, and 33S.

(2) Large memory for equations. The 33S can't store too many separate programs, because it has relatively few labels and variables. But it can store a whole lot of complex equations, and for NCEES exam purposes, this is useful. For comparison, the time value of money equation alone eats up about 25% of the available memory on a 32SII.

The 33S is arguably the premier NCEES exam calculator on the market today; even algebraic users are buying it over TI or Casio models. HP ought to get some credit for introducing a model that successfully targets this market niche, although admittedly it is a relatively small one. Maybe they just got lucky.

Not if I can help influence that decision. I have already written several communiques to NCEES via mailed letter and e-mail, advocating inclusion of the 11C, 15C, and 20S on their "Approved" list. I will follow up again before their August meeting.

(Yes, folks, I know that many other HP's also meet the standards; however, NCEES wants to keep the list short, and these models are the best and most commonly-available compliant models.)

in response to message #16 by Norris

Concerning the NCEES:

The 28s became banned the moment Text entry of the graphics came into question. It was banned in many states even before the graphics calculator ban (not all states, but many, because of its alpha numeric keyboard, even though it wasn't QWERTY).

A couple of calculators that are still better than the 33s and would probably sneak past the proctors (at least until the NCEES sees these on their RADAR screen) are the Hp27s or even the Hp17B series. Both have the same hardware as the 42s and therefore, technically are banned. But they are not explicitly banned and looking at either, most proctors would assume just a simple scientific or in the case of the 17B, "What is that idiot bringing a business calc to an Engineering exam?".

Granted, if you brought the 17B you would also need a good scientific, but with its solver and long variable names, you would be able to load up some pretty good formulas that have a high probability of being on the exam.

I briefly considered the Hp27s, but I feel that I should either pass with NCEES restrictions or I don't deserve to pass. Therefore, I will either buy a 33s or just use a 32sii.

I still miss the features of a 48G type calculator, but part of engineering is also working within constraints.

Re: NCEES calculators

*Message #19 Posted by **Norris** on 21 July 2004, 1:36 p.m.,*
in response to message #18 by Ron Ross

My recommendation: do not attempt to sneak an illegal calculator past the proctors and into an NCEES exam.

It's probably true that the average exam proctor knows little or nothing about calculators -- but there just might be a state board employee with actual engineering experience at the exam site, with the ability to recognize an IR port. The proctors can and do pick up

unusual calculators for close scrutiny during the exam; after all, there's probably not much else for them to do during those 8 hours.

In California, you now have to sign a form in the exam room immediately before the exam starts. You must attest, under penalty of perjury, that your calculator complies with NCEES rules (for NCEES exams) or California rules (for state-specific exams).

Enforcement varies, but at least some state boards take the calculator restrictions very seriously. Stick with the 33S, 32SII, or some other NCEES-compliant model.

Re: HP 28S vs HP 15C

in response to message #15 by Ron Ross

> Quote:
>
> The Hp15c kinda evolved into the modern Hp33s. I say kinda, because unlike the Hp 28s which improved through evolution, the Hp33s is not real step up in all the most important aspects of the Hp15c (size, matrix support, quality). Nothing added but RAM, with no real support to ues that RAM.

Would it not be more accurate to say that the 15C kind of evolved into the 42S, and then became extinct? The 11C kind of evolved into the 32S, then 32Sii and now the modern 33S.

Re: HP 28S vs HP 15C

*Message #21 Posted by **bill platt** on 21 July 2004, 11:08 a.m.,*
in response to message #20 by Jeff

Hi Jeff,

Or, you could say that the 41c mated with the 15c and produced the 42s, which became extinct. The strongest 41c genes were lost (I/O, synthetic/ML) and replaced by the weakest 15c genes (no I/O).

Regards,

Bill

32S/42S/48SX "replacing" 11C/15C/41CX

*Message #22 Posted by **Karl Schneider** on 22 July 2004, 1:39 a.m.,*
in response to message #20 by Jeff

Jeff posted,

> Quote:
>
> *"Would it not be more accurate to say that the 15C kind of evolved into the 42S, and then became extinct? The 11C kind of evolved into the 32S, then 32Sii and now the modern 33S.*

I would say that that the 42S was produced an improved, extended implementation of the

"calculator only" portion of the 41CV/CX, building upon integrated capabilities pioneered in the 15C. The 42S is the only calc whose programming paradigm is the same as that of the 41; in fact, there's even a section in the 42 manual about compatibility with programs for the 41.

The 32S, by contrast, was developed to replace both the 15C and 11C. It offered new capabilities while omitting several important ones from the 15C, presumably to separate it from the upscale 42S.

The incompatible "replacement" for the 41 was the 48SX, introduced the same year as the 41 was discontinued.

Personally, I think the 48S/SX ought to have been a "super 42S" with RPN (adjustable stack?) and 27S-style equation "solver/evaluator/plotter", rendering the 28S and its unique RPL, like Prohibition, an unsuccessful "Noble Experiment".

Thinkjet printer 2225B

*Message #1 Posted by **Ray** on 17 July 2004, 8:06 p.m.*

I've rebuilt the battery pack for a NIB Thinkjet printer 2225B. The printer starts up, however when I attempt to feed paper into it, the attention light starts blinking and does not stop (even when I press the blue error clear button as described in the manual). Anyone have any advice where to start troubleshooting?

Thanks,

-Ray

Re: Thinkjet printer 2225B

*Message #2 Posted by **db(martinez,california)** on 18 July 2004, 12:11 a.m.,*
in response to message #1 by Ray

This is from memory so i may be wrong but: try feeding the paper by hand first, then turn it on. I think thats what i did with a new box of fan feed.

Re: Thinkjet printer 2225B

*Message #3 Posted by **Ray** on 19 July 2004, 1:27 p.m.,*
in response to message #2 by db(martinez,california)

Thanks, but it doesn't seem to work... Any other ideas? It seems to work perfectly, however the printerhead movement seems a bit noisy. Maybe it needs a cleaning? How would I go about cleaning something like this?

Re: Thinkjet printer 2225B

*Message #4 Posted by **Tony Duell** on 19 July 2004, 2:21 p.m.,*
in response to message #1 by Ray

A few obvious checks, if these don't find the problem I'll look in the service manual...

1) Are you sure your battery is giving enough voltage (7.2V) _on load_. Have you checked the voltage at the printer mainboard

2) Does the printer do the 'carriage shuffle' correctly. The carriage should not slam into either side of the printer.

3) Is the paper out sensor working (I think it must be, because IIRC you get a steady yellow light if it detects no paper, and that's done in hardware). Try unplugging the sensor (2 pin connector, 2 white wires normally) from the PCB. IIRC (again), it's closed when the printer is out of paper, so disconnecting it will fool the machine into thinking it has paper.

4) Does it make any attempt to feed paper?

Re: Thinkjet printer 2225B

*Message #5 Posted by **Ray** on 19 July 2004, 10:44 p.m.,*
in response to message #4 by Tony Duell

1.) That may be the culprit, I do not know. I will look into this.

2.) It originally did slam into the side of the printer, but I moved it to the side a little and it did not do it again. The printhead movement does seem a little noisy, but I assumed that was normal for a old printer.

3.) I don't believe anything could be wrong with the print sensor, as it does correctly identify when it is out and when paper is present.

4.) It makes no attempt to feed paper, however the paper feed control buttons do appear to work.

Thanks,

-Ray

Re: Thinkjet printer 2225B

*Message #6 Posted by **Tony Duell** on 20 July 2004, 6:06 a.m.,*
in response to message #5 by Ray

(4) has me puzzled. If it makes no attempt to feed paper (i.e. the paper feed stepper motor isn't turning) then what do the buttons do?

Try inserting a piece of paper (far enough to operate the paper sensor), or unplug the paper sensor from the logic board, and then turn the printer on (turn if off it's already on). What does the yellow LED do then? Do you get the carriage shuffle? What then happens if you press the blue button?

Re: Thinkjet printer 2225B

*Message #7 Posted by **Ray** on 20 July 2004, 12:40 p.m.,*
in response to message #6 by Tony Duell

When I press the blue button, the carriage moves arround a bit, but ultimately it just stops again on an error condition. The printer makes no attempt to feed paper, unless I press the line feed buttons, in which case it feeds the paper fine. I checked the battery and it is giving off a steady 8.75 volts under no load. Is this correct?

Edited: 20 July 2004, 3:07 p.m.

Re: Thinkjet printer 2225B

*Message #8 Posted by **Tony Duell** on 20 July 2004, 3:14 p.m.,*
in response to message #7 by Ray

It should only feed paper when you press the buttons (or when it gets linefeed or formfeed characters from the host computer), so it sounds like that is working correctly. I think you have a problem with the carriage feed or home sensor. Try cleaning the slotted optoswitch at the left side of the print chassis (it can be removed from the rear of the chassis -- 1 screw). Also try removing the carriage stepper motor (on the rear of the chassis at the left side), inspect its pinion gear and try moving the carriage by hand with the motor out to check for mechanical problems.

You should check the battery voltage on load -- when it's operating the printer. Partially discharged batteries may be fine off-load but their voltage can drop significantly on-load

Re: Thinkjet printer 2225B

*Message #9 Posted by **Ray** on 21 July 2004, 5:28 p.m.,*
in response to message #8 by Tony Duell

I fear none of the things you have suggested work, everything seems to be moving fine in regard to the motor, and that removing that little optoswitch thing didn't really do anything. How would I go about cleaning it? It has a white tab in it, is that supposed to be there?

Thanks,

-Ray

Edited: 21 July 2004, 5:30 p.m.

Re: Thinkjet printer 2225B

*Message #10 Posted by **Tony Duell** on 22 July 2004, 6:37 a.m.,*
in response to message #9 by Ray

Are you sure that 'white tab' isn't a bit of scrap paper? I don't think it should be there, I don't remember one in any of the Thinkjets I've repaired. You want to clean all the dust out of the slot in the switch -- there's an IR LED on side and a phototransistor the other that detect a black plastic tab on the carriage.

Re: Thinkjet printer 2225B

*Message #11 Posted by **Ray** on 22 July 2004, 1:15 p.m.,*
in response to message #10 by Tony Duell

Well, since it was NIB, it was most likely some type of protective packaging. I'll try removing it and see what happens. That's probably my problem in a nutshell.

Re: Thinkjet printer 2225B

*Message #12 Posted by **Ray** on 23 July 2004, 10:52 p.m.,*
in response to message #11 by Ray

The sensor works perfectly now, but I'm still getting a error signal. Any idea where to troubleshoot next?

PS: Sorry to bring this up again, but I have a lot of money invested in this printer. Thanks for your help.

Re: Thinkjet printer 2225B

*Message #13 Posted by **Vassilis Prevelakis** on 21 July 2004, 12:50 p.m.,*
in response to message #5 by Ray

```
4.) It makes no attempt to feed paper, however the paper feed control buttons do
appear to work.
```

I hope you realize that the ThinkJet does not use friction to pull the paper, it uses the sprocket (sp?)

wheels on either side of the platten.

So you must use fan fold paper with guide holes on either side.

You feed the paper manually until it emerges between the printhead and the platten and then you ensure that the paper feed holes are centered over the sprocket pins.

Make sure that the scale bar is pushed towards the paper and

Now press the LINE FEED button to see if the printer pulls the paper further.

HP 9915A

*Message #1 Posted by **rhahm** on 17 July 2004, 12:04 p.m.*

I recently aquired an HP9915A computer/calculator which is the industrial version of the HP85.

Does anyone have the owner's manual for this.

If any one has the keyboard and would like to sell it or trade for it email me.

Also anyone has any series 80 software they want to trade email me.

Thanks

Re: HP 9915A

*Message #2 Posted by **Vassilis Prevelakis** on 17 July 2004, 3:42 p.m.,*
in response to message #1 by rhahm

Tony Duell sent me the pinouts for the 9915A/B keyboard and control connectors.

The keyboard connector is:

```
1 : Shield      14 : C0
2 : R0          15 : C1
3 : R1          16 : C2
4 : R2          17 : C3
5 : R3          18 : C4
6 : R4          19 : C5
7 : Ground      20 : C6
8 : Ground      21 : C7
9 : R5          22 : Shift/
10 : R6         23 : Ctrl/
11 : R7         24 : Capslock/
12 : R8         25 : Speaker
13 : R9
```

The keyboard matrix is the same as the 85, and is connected between the row (Rn) and column (Cn) lines The shift, control, and capslock keys are connected between the appropriate pin and ground. The speaker is an 8 ohm unit, connected between pin 25 and ground.

The Control connector, a DA15, has the following pinout :

```
1 : LED0         9 : Run/
2 : LED1        10 : Test
3 : LED2        11 : Power OK
4 : LED3        12 : Ground
5 : LED4        13 : StartSw/
6 : LED5        14 : TestSw/
7 : LED6        15 : Shield
8 : LED7
```

It basically carries the signals used on the front panel PCB. LEDn are the 8 user-definable LEDs. Run and Test are the signals for the 2 LEDs with those labels on the panel (note that one seems to be inverted, the other isn't!). The 2 switch signals correspond to the run and test switches on the panel -- the external switches go

between those signals and ground.

You can turn on these LEDs with the SLITE(A,B) command (where A is a mask identifying the LEDs that should be controlled and B is the action, 1 for ON, -1 for OFF).

The 4 function keys on the left of the front panel are just the user definable keys on the HP85, and appear in the keyboard matrix as you'd expect.

The video connector is composite monochrome video at (US) TV scan rates. Just about any composite mono monitor will work.

98155A Keyboard Matrix

*Message #3 Posted by **Vassilis Prevelakis** on 19 July 2004, 2:48 p.m.,*
in response to message #2 by Vassilis Prevelakis

I got the following info from rigdonj@cfl.rr.com ages ago. There were one or two minnor mistakes in the table which I corrected.

Enjoy:

98155A Keyboard Matrix

Everything in caps is as it appears on the keyboard. Names that are too long are abbreviated and shown in lower case. A list of the abbreviations and their meanings is also shown below.

pin	21	20	19	18	17	16	15	14
2	nu	kl	K1	K2	K3	K4	ua	da
3	1	2	3	4	5	6	7	8
4	Q	W	E	R	T	Y	U	I
5	A	S	D	F	G	H	J	K
6	sb	Z	X	C	V	B	N	M
13	nu	nu	-l	rd	-CHAR	REP	->	<-
12	nu	RESET	bs	nu	=	-	0	9
11	nu	nu	nu	sca	)	(	P	O
10	nu	nu	nu	nu	el	'	;	L
9	nu	nu	nu	RUN	PAUSE	?	>	<

Abbreviations:

- nu = not used
- da = down arrow (up and down arrow are used to recall previous commands and for editing)
- ua = up arrow
- rd = roll down (key to allow screen roll up/down)
- kl = Key Label
- el = End Line (this is what HP uses for carriage return/Enter)
- sb = space bar
- bs = Back Space
- -l = -Line (erases the entire line)
- sca = Scratch (erases all memory, just variables, etc depending on what argument you give it)

Notes: The K keys are programable function keys. K5 through K8 are K1 through K4 shifted. You can assign programs or functions to these keys and use the Control input lines to trigger the program or function. The -Char key erases one character at a time. the REP key toggles between the insert and replace modes.

There are a few more keys that don't fit into a matrix. Here's a list of them and the two pins that they connect to:

- Both SHIFT keys are tied together in parallel and connct to pins 18 and 7.
- There is a 8 Ohm .2Watt speaker inside. It connects to pins 25 and 7.
- CNTL key connects to pins 23 and 7.
- CAPS LOCK key connects to pins 24 and 7.

Re: HP 9915A

*Message #4 Posted by **Eric Smith** on 18 July 2004, 3:41 a.m.,*
in response to message #1 by rhahm

I need a keyboard too!

I wonder if it's a dumb keyboard - just a key matrix wired to the connector. Since the 9915A mainframe probably has to have the keyboard controller anyhow for the firmware to function, this wouldn't surprise me. And if so, it should be easy to wire one up.

Re: HP 9915A

in response to message #4 by Eric Smith

```
eric smith wrote:
> I wonder if it's a dumb keyboard
```

Didn't you read my previous posting? Its just a matrix of key switches. According to Tony's email the layout of the matrix is identical to that of the Series 80 keyboards. So you can make a 9915 kayboard by taking the keyboard of an HP-85 and connecting it to the keyboard connector of the 9915A with passive wires (i.e. no logic).

**vp

Re: HP 9915A

*Message #6 Posted by **Tony Duell** on 19 July 2004, 2:26 p.m.,*
in response to message #4 by Eric Smith

It is just a matrix of switches (well, with separate connections for shift, control and caps lock). The matrix seems to be the same as on the 85 (which is documented -- with 1 error -- in the service manual on the museum CD-ROMs).

The same keyboard controller as on the 85 is on the mainboard of the 9915. Quite a few of the 'chips' on teh vertically-mounted I/O card are actually diode arrays to protect the MOS inputs on this chip from external ESD. Vassilis has posted the pinout of the connector.

Incidentally, the same keyboard chip is used in the 86B (I have one in bits on my bench at the moment) and presumably in other 80-series machines. The keyboard matrix of the 86B is basically similar to the 85, in that the 'standard' keys (letters, digits, etc) are in the same places.

95 LX battery problem

*Message #1 Posted by **alan DT** on 17 July 2004, 10:34 a.m.*

Just dragged my old 95lx out of a box. Within minutes of putting in new batteries it indicates "MAIN BATTERY LOW". What can I do??

Re: 95 LX battery problem

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 17 July 2004, 11:46 a.m.,*
in response to message #1 by alan DT

I´m familiar with the LX100/200, but assuming that the 95LX is similar enough, there should be a coin-shaped lithium battery, apart from the regular AA batteries. The lithium battery backs up the memory contents while the AA cells are discharged or just out while being changed.

The lithium battery should last at least 2 or 3 years, it seems very possible that yours may be discharged.

If this is the problem, the message should be more like "Backup battery low", since "main" refers to the AA batteries; but perhaps there is some interaction between error conditions, causing the "other" message to appear.

I hope this may help you.

Sim45-Hardware Emulation

*Message #1 Posted by **Klaus** on 16 July 2004, 4:51 p.m.*

Hi! I finally have managed to run the hp45 Microcode on a PIC Microchip. Everything works fine execp for the tig-functions. My program interprets the following Opcodes (all decimal= in another way: 116,244,372,500,628,756,884,1012: I think they are op_clear_s, but sim45 says the are op_del_sel_rom.

512: I think it is a reserved function not used by the hp45, but sim45 says it´s op_rom_addr_to_buf

564 and 692: I think it´s op_clear_s, but sim45 treats them as op_del_sel_grp.

My information is from the patent 4..... (the one about the hp45). I would like to know where you got your information from and why your trig-functions work and mine not.

I actually wrote the whole program in very simple c, so any compiler for a microcontroller will compile it. I tested it on my pc and it actually runs on my pic.

Beta testers please eMail me.

Re: Sim45-Hardware Emulation

Definitely delayed select rom instructions and delayed select group instructions. The clear s instruction is 52 decimal (and 52 + x * 64).

> Quote:
>
> 512: I think it is a reserved function not used by the hp45, but sim45 says it´s op_rom_addr_to_buf

Yes.

> Quote:
>
> I would like to know where you got your information from

I'm not sure who "you" in this sentence refers to, but I wrote the CASMSIM simulator in March 1995, using

information from US patents. The trig functions seem to work OK. sim45 is a Java port of CASMSIM by Dave Hicks. CASMSIM is now obsoleted by Nonpareil, which simulates a wider range of HP calculators.

> Quote:
>
> and why your trig-functions work and mine not.

A bug in your implementation? Possibly you have the wrong opcodes for the clear s instruction?

I suggest capturing a trace of your simulator, and comparing it to this Nonpareil simulation trace of the HP-45 computing the cosine of 30 degrees.

Currently I'm trying to track down a similar problem in Nonpareil; the logarithmic and exponential functions of the HP-25 are not working correctly in simulation.

Opcodes

*Message #3 Posted by **Klaus** on 18 July 2004, 7:07 a.m.,*
in response to message #2 by Eric Smith

Hi Eric,

I still think I´m right. 116,244,... all end with ...100 (in binary), that means they are Type3- Instructions. 52+x*64 = 52,116,..,244,308,372,436,500,... So the formula you provided also tells they are clear_s.

I think my problem is that I took the output of your assembler and interpreted it my way.

Greetings, Klaus

Re: Opcodes

*Message #4 Posted by **Eric Smith** on 19 July 2004, 4:01 p.m.,*
in response to message #3 by Klaus

While the original 1818-0012 CTC chip probably did clear the status bits as expected from the patent description for any instruction xxxx110100, the later 1818-0078 must have ignored the instruction if the top four bits were nonzero. The "delayed select rom n" and "delayed select group n" instruction do in fact use these encodings.

The HP-35, HP-45, and HP-80 do not use the "delayed select" instructions, and have been seen with either CTC chip. The HP-55 and HP-65 use the "delayed select" instructions, and I have only ever seen the 1818-0078 CTC chip in those models. I am not sure whether the HP-46, HP-70, HP-81, and HP 1722A use any "delayed select" instructions, but I suspect that they are used in the HP-70 and not in the others.

I probably noticed this feature of the instruction encoding when I originally wrote CASMSIM back in 1995, but had since forgotten about it.

The HP-35, HP-45, and HP-80 ROMs do not contain any "clear status" instructions with non-zero top four bits, so it is acceptable to only simulate the behavior of the later CTC chip.

in response to message #6 by Klaus

> Quote:
>
> I have adapted my program to your opcodes, and now everything seems to work

Great! I hope you are able to find the bug in the PIC version quickly.

I've also got a PIC version under development, but I'm not as far along. I started it in late 1995 on a PIC16C74, but didn't get too far before I shelved it. Just last month my friend Richard Ottosen built some new hardware using a PIC18F452, and I dusted off the old code and have been working on it.

I'll probably have some pictures of Richard's hardware online soon, so I'll post a link here.

> Quote:
>
> Are you interested in publishing my program as a subproject of nonpareil (I will try to run more of the classic calcs)?

Probably not an "offical" subproject, but I'd be delighted to either provide a link, or to provide a web page for your program on the Nonpareil site.

Yes, thanks! I've been meaning to get PDFs of all the known patents online, so that will provide more motivation for me to get my act together.

Math Journal Beta Reviewed

*Message #1 Posted by **Steve S** on 16 July 2004, 2:13 p.m.*

The beta release of MathJournal is in the closing stages of testing and even though it has a few bugs, it's an IMPRESSIVE piece of work. One of the testers has written a review which can be found at:

http://thetabletpc.net/reviews.htm

Having performed the beta tests myself, I can verify that Dean's assessment of MJ is not overstated. My experiences weren't quite as trouble-free as his were, but the MJ code is being improved and so is my "penmanship." People who think that formula-based entry has some merits are right on the money, in my opinion.

HP-55 Battery door repair

*Message #1 Posted by **Jeffrey Davis** on 16 July 2004, 1:20 p.m.*

Has anyone ever broken one of the clips on the door and successfully rebuilt it? Or do you need to find another door or just the clip? Please let me know. Jeff

Re: HP-55 Battery door repair

*Message #2 Posted by **David Smith** on 16 July 2004, 4:35 p.m.,*
in response to message #1 by Jeffrey Davis

I have successfully repaired some clips using a plastic welding solvent (methylene chloride). But the HP55 plastic was HP's first use of green and they seem to have some problems with them crubling beyond repair. The black clips from a '35 or '45 will work just fine.

HP-97S Question

*Message #1 Posted by **Mike** on 16 July 2004, 12:58 p.m.*

There is an HP-97S advertized on eBay. It is:

HP 97S auction

but if you look at the photo, the keypad seems to say HP-97 instead of HP-97S.

Now, I realize that a lot of HP-97 have a circuit board that has a dip connection point, even if it isn't an HP-97S.

Would you consider this a real 97S, if it is missing the 97S logo?

Edited: 16 July 2004, 12:59 p.m.

Re: HP-97S Question

*Message #2 Posted by **Eric Smith** on 16 July 2004, 1:58 p.m.,*
in response to message #1 by Mike

I'd consider it a 97S as long as it has the attached BCD I/O box.

Are you suggesting that someone might have cobbled this together from parts? I suppose that's possible, but it seems more likely that it was originally manufactured as a 97S and either originally shipped with a 97 label, or that the label was replaced (either by HP or in the field).

Re: He fixed the listing

*Message #3 Posted by **Mike** on 16 July 2004, 7:24 p.m.,*
in response to message #2 by Eric Smith

I asked him about the missing "S" on the logo and he said he replaced the keyboard, with another. He said he would modify the listing to show the changed part.

Pays to ask. http://www.msdsite.com/images/smile.gif

PS: I think he changed the shipping too.

Edited: 16 July 2004, 7:26 p.m.

Re: HP-97S Question

*Message #4 Posted by **Dave** on 16 July 2004, 3:22 p.m.,*
in response to message #1 by Mike

At $150 for shipping....

Re: HP-97S Question

*Message #5 Posted by **marais** on 16 July 2004, 4:30 p.m.,*
in response to message #4 by Dave

That must be a type, no? He certainly meant $15.

Re: HP-97S Question

*Message #6 Posted by **David Smith** on 16 July 2004, 4:37 p.m.,*
in response to message #5 by marais

It clearly says $15.00 in a couple of places.

Re: HP-97S Question

*Message #7 Posted by **David Ramsey** on 17 July 2004, 2:04 a.m.,*
in response to message #1 by Mike

My 97S front label says "HEWLETT PACKARD 97S I/O CALCULATOR".

At the least, a 97S with the wrong label would take a serious value hit.

A *very* didactic little quiz

*Message #1 Posted by **Valentin Albillo** on 16 July 2004, 9:59 a.m.*

Hi all,

Here's a *very didactic* little problem I posed my 12-year old daughter to let her understand a key mathematical concept. She readily took her SHARP PC-1350, computed furiously for a while, and was *amazed* no end by the result.

You are to try your hand at it with your favorite HP calc, but first you should take a risk and make a decision on what would be your choice, *without* any external (electronic or mechanical) help, based on your own internal calculations and judgment. Then, take your trusty HP calc and find out (most any HP calc will do, even the HP-01, but built-in unit conversions would be handy if you're not used to metric units).

The little quiz

> [This is a purely mathematical, ideal problem so physical laws and limits do not apply, no tricks or word games here. Also no cents are rounded, ever; all amounts are kept to as many decimal places as necessary]

Imagine for a moment that you're at year 0, and someone makes this peculiar proposal to you. You must choose the option you deem will result in the greatest amount of money for you, between these two, namely:

- **(a)** From the instant you accept this one choice, you're given $1.00, which will be placed in a bank account at 5% compound interest, to be accrued yearly, i.e:, after 1 year you'll have $1.05, after two years you'll have a little over $1.10 and so on. At the end of a specified time period you'll be given the resulting balance from your $1.00 initial capital, plus accrued interests.

  or

- **(b)** From the instant you accept this other choice, a cylinder of *solid gold*, with a diameter equal to that of the Earth, will start to grow in length *at the speed of light* (i.e.: the cylinder's top will reach to the Moon in just over 1 second, to the Sun in 8 minutes, to Sirius in under 9 years, and to Betelgeuse in some 1,400 years). At the end of the specified time period, you'll be given the monetary value corresponding to the cylinder's resulting mass of gold.

Now, taking the diameter of the Earth as 12,700 Km, the speed of light as 300,000 Km per second, the density of gold as 19 grams per cubic centimeter, the price of gold as $10.00 per gram (all of them realistic values), and further assuming a year has exactly 365 days (no leap years considered) and the agreed time period is to be 2,000 years ...

What would be the better choice ? How much money would you get by the year 2000 ?

"Just imagine [*tell your children, colleagues or students*]: on the one side a humble, silent bank account at a modest 5% interest, gathering dust for 2,000 years, taking one full year to earn a puny $0.05, two years for a trifle over $0.10 earning. On the other side, a massive, planet-wide cylinder of *solid gold*, growing to the stars at the speed of light, a humongous gold rod which will have reached to Alpha-Centaury by the time the account has accrued 22 cents, and will be a full 2,000 light-years in length by the end of the deal !"

Which option would you [*they*] choose ? Wanna bet ? :-)

Best regards from V.

Re: A *very* didactic little quiz

*Message #2 Posted by **Ron Ross** on 16 July 2004, 10:21 a.m.,*
in response to message #1 by Valentin Albillo

And that is why laws have been passed on the banks behalf about inactive accounts. At least in this country and many others.

Re: A *very* didactic little quiz

*Message #3 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 10:28 a.m.,*
in response to message #1 by Valentin Albillo

Hi,

there is no question: Everybody will choice the gold-cylinder... :)

But after 2000 year, the gold's value will be 4.55E41$, and the bank account will be 2.39E42$. (Calc'd by my 15C :))

Csaba

Ps. (to Valentin): If nobody will answering this response, I will go to Commodore Forum!!! ;) (It's just a joke, dont't fear...)

Edited: 16 July 2004, 1:52 p.m. after one or more responses were posted

Good illustration

*Message #4 Posted by **Gene** on 16 July 2004, 11:02 a.m.,*
in response to message #3 by Tizedes Csaba [Hungary]

I plan to use it when I introduce compound interest in my class this fall.

Gene

Re: A *very* didactic little quiz

*Message #5 Posted by **John Nelson** on 16 July 2004, 12:30 p.m.,*
in response to message #3 by Tizedes Csaba [Hungary]

I got a different answer...

Gold = 1.26E+29

Money = 2.39E+42

I would have thought the gold would be more valuable at the start.

Here is my work.

```
Gold
==============
V=Bh
B=(3.14 * Radius^2)
B=      126676869.8
Grows as 300,000 km/sec for 2000 years, or 63,072,000,000 seconds
h=(300,000 * 63,072,000,000)
h=      1.89216E+16

V=      2.39693E+24     Km
        2.39693E+29     Cm
        1.26154E+28     Grams
        1.26154E+29     $Value

Money
===========
P=1
r= .05
n = 20

FV = P(1 + r)^n
FV =    2.3911E+42
```

Some observations

*Message #6 Posted by **John Nelson** on 16 July 2004, 1:26 p.m.,*
in response to message #5 by John Nelson

Some observations on the compounding of the money. Look at what the annual interest is in various years...

```
Year      Interest
==========================
100       $6.26
204       1000.92
252       10410.80
299       103129.08
346       1.02M
360       2.02M
393       10.11M
440       100.24M
488       1042.69M

2000      1.13862009743503E+41
```

Wow!! I wonder if there is that much money even in the world?

Re: A *very* didactic little quiz

*Message #7 Posted by **Eamonn** on 16 July 2004, 1:37 p.m.,*
in response to message #5 by John Nelson

Hi John,

Your calculation of the volume of the gold cylinder in km^3 is correct. However, to convert from km^3 to cc, you need to multiply by 1e15. This can be seen as follows:

(1 km)^3 = (1e3 m)^3 = (1e5 cm)^3 = 1e15 cc.

This means that the gold cylinder has a volume of 2.39693E+39 cc after 2000 years.

Next, since gold is $10.00/gram and there are 19 grams of gold per cc, this means that the gold is $190.00 per cc. So the total value of the gold cylinder is:

2.39693E+39 * 190 = $4.554 E+41

This is the same result as obtained by Csaba.

Best Regards,

Eamonn.

Re: A *very* didactic little quiz

*Message #8 Posted by **hugh steers** on 16 July 2004, 12:06 p.m.,*
in response to message #1 by Valentin Albillo

i would have the gold value. since this is defined to be the value of the gold at the end of period. for the money, inflation would weaken the value. eg at 2% inflation it would be worth something like (1.05*.98)^2000 = 6.7e24 whilst the gold would then be something like (1.02)^2000*10 = $1.6e18/gram, so multiply your gold value by 1e18.

so there.

Re: Bad decision

*Message #9 Posted by **Ron Ross** on 16 July 2004, 12:14 p.m.,*
in response to message #8 by hugh steers

Not so much due to your math logic as to the value of gold being relative to its scarcity. I don't think gold would be considered a valuable metal with that much of it around. May even become a liability if someone should want you to remove it off their property!

Re: Bad decision

*Message #10 Posted by **OJM** on 16 July 2004, 2:02 p.m.,*
in response to message #9 by Ron Ross

Yep. Ignoring the fact a 2000-light-year-long, Earth-diameter column of gold would crush the planet (of course this is just a theoretical excercise), so much available gold would redefine the element from a precious metal to a common nuisance, less valuable than dirt.

Go for the cash.

Of course, the same could also be said for the money. Having that many dollars around in today's economy would dramatically affect the money supply, driving down the relative value of that currency if you started spending any significant portion of it.

(I.e. Give everyone a million dollars, then everyone would be a millionaire, but then nearly everything would cost a million bucks.)

Re: Bad decision

*Message #11 Posted by **hugh steers** on 16 July 2004, 4:27 p.m.,*
in response to message #10 by OJM

hang on, there.

the choice is about what cash value to accept. there is no gold in the gold choice. only the value of

the gold at that time. as i understand it.

Re: Bad decision

*Message #12 Posted by **unspellable** on 16 July 2004, 5:19 p.m.,*
in response to message #10 by OJM

Heinlein said that $100 at 5% for 400 years would amount to umpity zillion dollars and be worth nothing due to inflation. I'd go with Heinlein.

Re: Bad decision

*Message #13 Posted by **Reid** on 17 July 2004, 12:54 p.m.,*
in response to message #10 by OJM

As for the money supply thing, you'd still be the richest man around. Even if everything did suddenly cost millions of dollars, you'd still possess around 99% of the money.

Re: A *very* didactic little quiz

*Message #14 Posted by **Bill Platt** on 16 July 2004, 3:06 p.m.,*
in response to message #1 by Valentin Albillo

Finanlly, I try to reply to a V A quiz!

I liked the 30s formula method for the gold problem---just typed it in:

```
2000*365.25*24*3600*((12,700E5/4)^2pi(300,000E5))*19*10
= 1.139....E41

{oops!  I can see by the formula that I put the "4' in
the wrong place--should be:

2000*365.25*24*3600*(12,700E5^2/4)pi(300,000E5))*19*10
= 4.56...E41

}

for the second one, I thought I'd just have fun with a loop:

32sii

LBL X
INPUT i
INPUT A
LBL Y
RCL A
1.05
X
STO A
1
STO - i
RCL i
X>0?
GTO Y
RTN

RETURNS 2.3911 E42
```

```
So, I guess it looks like the 5% interest is mighty fine.
```

Or, to put it another way, gold does not gain value--it merely continues to buy the same *real* things for the same amount of gold, through the centuries. I.E. an ounce of gold will buy a side of beef (or such) now and in the time of the Roman Empire.

Edited: 16 July 2004, 3:15 p.m.

Re: A *very* didactic little quiz

*Message #15 Posted by **John Nelson** on 16 July 2004, 6:27 p.m.,*
in response to message #14 by Bill Platt

Bill,

In your formula...

2000*365.25*24*3600*(12,700E5^2/4)pi(300,000E5))*19*10 = 4.56...E41

... with the part (12,700E5^2/4)pi ... why did you divide it by 4??

Also, why 365.25?? Leap year?

Re: A *very* didactic little quiz

*Message #16 Posted by **bill platt** on 21 July 2004, 11:00 a.m.,*
in response to message #15 by John Nelson

Hi John,

Area = Pi * r^2, or Pi * D^2 / 4

By way of example:

if R=2, then r^2 = 4, therefore D = 4 And D^2 =16. D^2 / R^2 = 4.

365.25 is leap year----it adds up over 2000 years. In fact, I probably should have included the leap seconds, but I don't remember the formula.

Re: A *very* didactic little quiz

*Message #17 Posted by **Dave Shaffer** on 23 July 2004, 5:02 p.m.,*
in response to message #16 by bill platt

Bill,

"In fact, I probably should have included the leap seconds, but I don't remember the formula"

There isn't a formula. Leap seconds are added when necessary (to keep stepped atomic time with 0.7 seconds of UTC - the time kept by the rotating Earth). Although we can predict reasonably well for a few years what is likely to happen at this level, over hundreds to thousands of years the Earth will do its own thing.

There is now great debate over whether there hsould be a new definition of time. i.e. change the official rate so that civil time more nearly matches astronomical time, without steps (= leap

seconds). There are many pros and cons.

Re: A *very* didactic little quiz - a didactic answer

*Message #18 Posted by **Dave Shaffer** on 16 July 2004, 4:59 p.m.,*
in response to message #1 by Valentin Albillo

While you probably have to do the numbers here to find out if 2000 years is enough, the overall answer is that:

A power law (with positive exponent) will always beat a (positively sloped) linear function in the long run.

For you graphics fans, consider two plots: one line (the linear function) increases upwards to the right at a constant slope, while the power law increases upwards to the right at an ever increasing slope. If you go far enough to the right (in time or x, whichever you are calling the "x"-axis), the power law's increasing value will sooner or later exceed the climbing linear function.

Growth

*Message #19 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 5:22 p.m.,*
in response to message #18 by Dave Shaffer

```
...yes, if we examining the derivatives: n is the time in years:

GOLD(n)=227.7E36*n
BANK(n)=1.05^n

and:

dGOLD(n)/dn=227.7E36
dBANK(n)/dn=n*1.05^(n-1)

where this two derivative is equal, the BANK(n) is more growing
than GOLD(n):

227.7E36=n*1.05^(n-1) --> n=1659 year.

Good seems the power of BANK(n) is 2000-1659=341 year is enough
to cath up the GOLD(n). The difference and ratio is very big:

GOLD(1659)=377.8E39
BANK(1659)=142.2E33
```

Csaba

Re: A *very* didactic little quiz

*Message #20 Posted by **unspellable** on 16 July 2004, 5:15 p.m.,*
in response to message #1 by Valentin Albillo

Is Betelgeuse really that far away? It's the only star we have a picture of with enough resolution to show any surface detail. I would think it would have to be much closer for that, even though it's pretty big as stars go.

Re: A *very* didactic little quiz

*Message #21 Posted by **Valentin Albillo** on 19 July 2004, 9:18 a.m.,*

in response to message #20 by unspellable

You're right, seems that many web sites list Betelgeuse's distance erroneously, for whatever the reason-

This site states 430+-100 light-years is the correct distance, as well as lots of interesting data on Betelgeuse.

My originally posted distance (1,400 light years) was taken from this site and other sites list the distance as 520 light-years, which more or less agrees with the arguably correct value, within tolerance.

As for seeing its 'surface', it all depends on what you consider a 'surface'. Betelgeuse is some 650 times the diameter of our Sun (so 650^3 = 274,625,000 times our Sun's volume) but only 12-17 times its mass, so Betelgeuse's average density is incredibly low (use your HP calculator now), and you'll probably find that the alleged most-external 'surface' which the Hubble did photograph would be considered the most tenuous gas (nearly vacuum) if we were to try to 'land' there.

Best regards from V.

How many people...

*Message #22 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 5:37 p.m.,*
in response to message #1 by Valentin Albillo

...lived on the Earth since of dawn of man??? Not in present! All of people! Because if I want to distribute this money...

Cs.

Re: How many people...

*Message #23 Posted by **Richard Garner** on 16 July 2004, 11:59 p.m.,*
in response to message #22 by Tizedes Csaba [Hungary]

I remember seeing or hearing that at present 75 percent of all of man kind is alive today. If that is true then the total population of the Earth in human kind from past to present is about 8 Billion.

Re: A *very* didactic little quiz

*Message #24 Posted by **John Nelson** on 16 July 2004, 6:31 p.m.,*
in response to message #1 by Valentin Albillo

Ok... so now lets look at something else. In what year (ingnore seconds please) will will the dollar invested at 5% exceed the value of gold.

I already know the answer, but just curious as to how others may solve this part of the problem.

Re: A *very* didactic little quiz

*Message #25 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 7:42 p.m.,*
in response to message #24 by John Nelson

```
I hope, I understand well the problem:

(eq1): 1.05^n=1.05*A*n, where A=227.7E36$/yr

------------------------------------------------------------
```

```
1.) Approximation of n:

(eq1): 1.05=(1.05*A)^(1/n)*(n)^(1/n)

if n is big, (n)^(1/n) is close to 1, then we wrote:

(1.05)^(n)=1.05*A, so n=1+ln(A)/ln(1.05)=1811
------------------------------------------------------------
2.) Solution with iteration:

take log() of (eq1) with 1.05 base:

n=1+(ln(A)+ln(n))/ln(1.05)

Let's start this iteration with n=1811, you will get:

step No       n
   0       1811
   1       1964.98
   2       1965.64
   3       1966.65
   4       1966.67  --> this is the solution.

At this n: DOLLAR=470.2E39, and GOLD=447.8E39
------------------------------------------------------------

Csaba
```

Re: A *very* didactic little quiz

*Message #26 Posted by **Eamonn** on 16 July 2004, 9:53 p.m.,*
in response to message #25 by Tizedes Csaba [Hungary]

Hi Csaba,

I think the equation that needs to be solved should be

```
1.05^n = A*n
```

not

```
1.05^n=1.05*A*n
```

Where A is 2.2771e38, as before.

Solving this second equation gives the solution n = 1965.657.

At this time, the value of both the gold and the interest bearing account is $4.476e41.

Best Regards,

Eamonn.

Eamonn's answer to John Nelson's question is correct

*Message #27 Posted by **Karl Schneider** on 17 July 2004, 1:43 a.m.,*

in response to message #26 by Eamonn

Dave Shaffer posted,

> Quote:
>
> A power law (with positive exponent) will always beat a (positively sloped) linear function in the long run.

In Valentin's quiz, the cylinder of gold grows in value at a constant rate "A" of $2.277082607 x 10^38 per year.

The savings acount grows at a exponential rate of 5% per year.

Given a large-enough input variable, the exponential function will surpass the linear function in magnitude.

So, as Eamonn stated,

1.05^n - A*n = 0 is the equation to solve.

This can be programmed on any unit with SOLVE, particularly easily on a 15C/34C or 32S/32SII/33S.

My 15C yields n = 1965.65664 (years), as Eamonn got.

Edited: 17 July 2004, 1:50 a.m.

Re: Eamonn's answer to John Nelson's question is correct

*Message #28 Posted by **Tizedes Csaba [Hungary]** on 17 July 2004, 4:02 a.m.,*
in response to message #27 by Karl Schneider

"In what year will the dollar invested at 5% exceed the value of gold."

This is my problem: I don't understand correctly English grammatical forms. I know it's simple, but my brain can't to understand...

In Hungarian language we don't use too many prepositions. The Hungarian uses inflections.

But the original problem correctly solveable (without SOLVE) the approximated and iterated methods!

Csaba

Ps.:

```
We will get:

------------------------------------------------------------
1.) Approximation:

1.05^n=A --> n=1810
------------------------------------------------------------
2.) Iteration:
```

```
n=(ln(A)+ln(n))/ln(1.05)

No of steps       n
    0           1810
    1           1963.97
    2           1965.64
    3           1965.66 --> the solution

And we don't to use SOLVE.
------------------------------------------------------------
3.) Graphically:

The eq. is: 1.05^n=A*n, the log() of it (base 1.05):

n=(ln(A)+ln(n))/ln(1.05)

this is an linear function:

n=m*ln(n)+b, where m=1/ln(1.05)=20.50 and
                   b=ln(A)/ln(1.05)=1810

to the simplifiest drawing make it to:

1/m*n-b/m=ln(n), so this is:

############################
#                          #
#  ln(1.05)*n+ln(A)=ln(n)  #
#                          #
############################

Scatch the two sides of this equation to the paper, and the
intersection is the root. (Its enough in n=1800...2000)

With this method absolutly scathing I have got n=1965,
and I use ln(n)=7.5 approx in this interval (not important,
it's just a scatch...) I wasn't used ruler and graph paper.
------------------------------------------------------------
```

>     3           1965.66 --> the solution
> And we don't to use SOLVE.
> ```

Indeed, it is fortunate that the simple equation lent itself to a transformation n = f(n), and that direct iterative "recycling" of f(n) as "next n" converged quickly to the answer. However, that will generally not be the case.

SOLVE does a fine job of automating an intelligent single-variable iterative root-finding process. That (and INTEGRATE) was impressive and pioneering about the 34C back in 1979. One of the HP Journal articles from 1980 about the 34C, available on the MoHPC DVD/CD set, describes the effort.

Re: Eamonn's answer to John Nelson's question is correct

*Message #30 Posted by **John Nelson** on 17 July 2004, 12:41 p.m.,*
in response to message #27 by Karl Schneider

I agree, although I did mine a bit different....

I created a small program and found the following...

Year = 1965 Day = 239 Hour = 16 Minute = 10 Second = 33

Re: Eamonn's answer to John Nelson's question is correct

*Message #31 Posted by **Tizedes Csaba [Hungary]** on 17 July 2004, 5:05 p.m.,*
in response to message #30 by John Nelson

I want to reply with a joke, I hope it will be clear:

An veterinarian was taken ill, and went to a doctor. The doctor asked him: "What is your complaint?" The veterinarian said: "Ahh, that is not a big deal!!!"

So, I think with SOLVE this is too simply to solve this or like this problem. :)

When the all of calc's with SOLVE will be wrong, we will back to brain-work. This is the important, not button pushing.

So, I am use SOLVE too, day by day...!

Csaba

Ps.: If the ABS(df/dn)<=h<1 then the iteration is converged, in an [a,b] interval, where df/dn is available.

Edited: 17 July 2004, 5:06 p.m.

Further Challenge

*Message #32 Posted by **Eamonn** on 19 July 2004, 10:13 p.m.,*
in response to message #24 by John Nelson

John,

> Quote:
>
> In what year (ingnore seconds please) will will the dollar invested at 5% exceed the value of gold.

While most of us focused on finding an answer to this question that was somewhere around the year 1965, there is of course another answer - At the very start of year 0, ie. at t=0.000, the account value is $1.00, while the value of the gold is $0.00.

This prompted me to come up with the following questions:

1) At what time does the value of the gold cylinder, growing towards infinity at the speed of light, first exceed the value of the interest bearing account?

2) At this time, how tall is the cylinder?

The second question is an interesting question to ponder from a physics point of view - I'm curious to see what answers people may come up with.

Regards,

Eamonn.

Hi, Eamonn:

Eamon posted:

"1) At what time does the value of the gold cylinder, growing towards infinity at the speed of light, first exceed the value of the interest bearing account?"

> Strictly speaking, it will exceed the value of the interest bearing account the moment it surpasses $1.00, exactly, because as per the conditions stated in my original posting, the interest is accrued *yearly* so that until a full year elapses, you're stuck with *exactly* $1.00. The interest is not accrued continuously, only at the end of each yearly period.

```
"1) At what time does the value of the gold cylinder,
growing towards infinity at the speed of light,
first exceed the value of the interest bearing account?"
X
the answer is:
  t = 1/((12700/2)^2*Pi*300000*19*(100000)^3*10)
    = 0.00000000000000000000000000000013849299939578841 seconds.

Even considering continuous growth for the bank account,
this is such an small time that the net balance
is still so near the original $1.00
as not to make a difference to the digits shown for t.
*****************************************
VPN: If the interest would be non-discrete
VPN: (eg. continuous instead of at the end of the year)
VPN: How many digits after the "five" do you need to get 6 figures at the end
VPN: 1,05nnn...nnn654321
*****************************************
"2) At this time, how tall is the cylinder?"
That's a simple multiplication, t * 300000 , the answer being:
Height = 0.000000000000000000000000000415478998187365 Km.
       = 0.0000415478998187365 attometers

which is certainly a small height, yet quite large when measured in Planck's
length units (1.6161 * 10^-35 m)
*****************************************
VPN: How many gold atoms would that mass be?
VPN: How many grams vs oz (mass)?
VPN: Give the oz like inches eg. a/2^n parts, what is n?
VPN: example: 5/1048576 oz = 5/2^10 oz => n=10

This is correct - at least to the 16 significant digits I was able to verify. I'm going to have to get a PC-1475 to verify that last digit :-)

> Quote:
>
> "2) At this time, how tall is the cylinder?"
>

>
> Height = 0.00000000000000000000000004154789981873 65 Km.

For notational convenience, I'll express this answer as the equivalent 4.15478998...e-23 meters. From a theoretical point of view, which is what we are dealing with, this is entirely correct (at least to the 16 significant figures I can verify).

As you stated, this is quite large when expressed in units of Planck's length, but it is quite small when compared to the diameter (height) of a gold atom (1.3e-10 meters). An alternate answer would be that since the cylinder is made of gold, then the height would necessarily have a minimum of the diameter of one gold atom.

I was wondering how such a gold 'cylinder', worth all of $1.00, would physically manifest itself. As far as I can tell, at this time, it could consist of of gold atoms (1.6e20 of them), spread out across an area of 1.26677e14 m^2. Assuming an even distribution of atoms, there would be 1.27e6 atoms per m^2. If these are evenly distributed in a square lattice, then the spacing between each atom is 0.875 mm.

However, since this quiz is theoretical in nature, I accept your answer to my second question as the correct height of such a gold cylinder with a value $1.00.

Thanks for the original quiz and best regards,

Eamonn.

Re: Further Challenge

---

I think the interatomic spacing you used (0.875 mm) is more akin to a dusting of gold atoms

than solid gold. Here is my solution, assuming each ring of atoms grows outwards from the centre as they are deposited:

```
density of gold: 19g cm^-3
molecular weight: 197 g/mol
Avagadro's number: 6.02 exp23 particles/mol

1 cc = 19g / (197 g/mol) * 6.02exp23 atoms/mol
     = 5.81 exp 22 atoms
A line of atoms 1cm in length= (5.81exp22)^-3 = 38.7 exp6 atoms
One square m of gold atoms:
(38.7 exp6)^2 atoms/cm^2 * 100^2 cm^2/m^2
= 1.50 exp 19 atoms m^-2

$1 of gold is 0.1 g /(197 g/mol) * 6.02exp23 = 3.06exp20 atoms

Area required = 3.06exp20/1.50exp19 = 20.4 m^2
```

Which corresponds to a circle of gold atoms with diameter 2.55 m.

Regards,
Bill

Re: Further Challenge

*Message #37 Posted by **Eamonn** on 22 July 2004, 1:34 p.m.,*
in response to message #36 by W Rice

Hi Bill,

Your calculations look correct to me. I made an error when calculating the number of atoms in $1.00 of gold - 3.06e20 is correct.

I completely with you when you point out that with such a large inter-atomic spacing you are far from having a solid gold cylinder. Thanks for the alternative analysis of what size gold 'cylinder' you would have under your assumptions.

Best Regards,

Eamonn.

Re: A *very* didactic little quiz

*Message #38 Posted by **Gordon Dyer** on 17 July 2004, 9:48 a.m.,*
in response to message #1 by Valentin Albillo

I solved this in Excel in just a few minutes with a nice graph and log scale to go with it.
the answer needs 14 decimal places to be accurate:
1$ @ 5% Interest = $2.3911022046137500E+42 Gold @ light speed = $4.5541652123333300E+41

I would go for the gold and cash it in after 1 second. I'd rather have enough money alive than a legacy which bankrupts the earth after I'm dead!!!

Re: A *very* didactic little quiz

*Message #39 Posted by **GE (France)** on 17 July 2004, 5:41 p.m.,*
in response to message #38 by Gordon Dyer

Nice puzzle, Valentin (and lots of replies).

There is something to take into account : risk. "What if" the process stops before the end (or the deal is totally negated) ? Without additional data on the reliability of banks in the next 2000 years and of your strange gold generation process, I'd take the gold, as it is better than cash for over 90% of the time. Additionnaly, cash is better only at the 'bad' end of time, when the probability of default is highest.

On another subject, I believe the equation A^x=B*x is equivalent to exp(x)/x=C (with a suitable 'simple' formula for C=f(A,B)). Now my question : in Maple, solving the second form brings an expression using the funtion "LambertW()". Does anyone know what this is ? Pointers welcome.

Re: A *very* didactic little quiz

Hi, GE:

GE posted:

"Nice puzzle, Valentin (and lots of replies)"

Yes, thanks for your kind words, I'm very happy people were insterested, as I feel it makes a pretty fine example of *didactic-yet-entertaining* mathematics, if I may coin a term.

"There is something to take into account : risk. "

Pleeeease, GE ! :-) It's only a *pure-math* quiz, I said so much in my original post. No inflation, risk, physical feasibility, speed-of-light unattainable for non-zero mass objects, not so much gold in the Universe, the Earth would be crushed, gold would be worth nothing, the bank teller would run out with the money, etc, etc, etc, etc, etc, etc, etc, etc ! :-) We do have a very descriptive Spanish term for this, but it's very *graphic* and I don't know how to properly translate it. I'm sure you do have some equivalent in French ;-)

"In Maple, solving the second form brings an expression using the funtion "LambertW()". Does anyone know what this is ? Pointers welcome. "

The Lambert-W function (known in Mathematica as "ProductLog") is an extremely interesting function, that appears everywhere and it's been unofficially nominated for the next "standard elementary function", similar to trigonometric and exponential functions, so it's not that impossible that we'll have calculators including it as a standard function in the near future. The advantage to consider it a standard function is that you can then express a large number of roots to trascendental equations, integrals, and ODEs, to name a few, in closed form in terms of LambertW (instead of having non-closed, infinite series expansions or sums), which is exactly what we do achieve by using sin, cos, exp, log, etc.. I've certainly used it a lot, to express roots of equations in terms of it (for instance, the solution to ***x^x = a*** can be expressed in terms of LambertW), like this:

```
    x^x = a  ->  x = e^W(ln(a))

    e.g.: x^x = Pi  -> x = e^W(ln(Pi) =  1.85410596792

HP-71B code: first define

    10 DEF FNW(X)=FNROOT(-1,10,FVAR*EXP(FVAR)-X)
```

then:

```
> X=EXP(FNW(LN(PI)))
> X
      1.85410596792
> X^X
      3.14159265358
```

As for your equation, ***e^x/x = C***, the solution is:

```
e^x/x = C  ->  x = -W(-1/C)
```

HP-71B code, assuming the previous definition of FNW(X):

```
e.g: e^x/x = 5  -> x = -W(-1/5)

>X=-FNF(-1/5)
>X
      0.259171101818
>EXP(X)/X
      5
```

The best, most comprehensive and interesting document I know about LambertW is available from here, in PDF format. Just go down the page to the **Some interesting math-related papers** section and click the first link, "On the Lambert-W function".

Best regards from V.

HP 25C

*Message #1 Posted by **Louis van der Meer** on 16 July 2004, 9:14 a.m.*

Problem with HP25C. Calculating is o.k. Prgramming not o.k. I can try to programm the HP25C. Every step, done by sst, in programming gives the following:

step #1 f prgm 00 step #2 01 13 00 step #3 02 13 00 ... step # 49 13 00

It does not matter what keystrokes I give. Who has the solution for this problem ????

Re: HP 25C

*Message #2 Posted by **David Smith** on 16 July 2004, 12:25 p.m.,*
in response to message #1 by Louis van der Meer

You RAM chip is bad. Only source is another machine. You may be able to use a RAM chip from a 29C. Also some 25C machines use two RAM chips. You have to add a resistor to use a single chip device in a two chip machine.

Re: HP 25C

*Message #3 Posted by **Louis van der Meer** on 19 July 2004, 9:15 a.m.,*
in response to message #2 by David Smith

I have found 6 Chips (IC) in my HP 25C.

Is there someone who can sum up the functionality of every independent chip ?? Where can I find that kind of information ??

Re: HP 25C

*Message #4 Posted by **David Smith** on 19 July 2004, 12:23 p.m.,*
in response to message #3 by Louis van der Meer

The smaller chip under the display module is the ROM0/anode driver chip. The larger one is the cathode driver. The big, wide chip at the bottom of the circuit board is the ACT chip (the CPU). The one to the left of it is a ROM chip. The other two (the ones above and to the right of the ACT) are RAM chips.

Best regards from V.

Wish there were a way, but ...

*Message #4 Posted by **Gene** on 16 July 2004, 11:12 a.m.,*
in response to message #3 by Valentin Albillo

1) How many would they sell per year?

This would depend upon the price. At $100/each, they'd sell fewer than at $50/each. What's the market size in units?

Assume at $100 each, they'd sell 5,000 calculators. That's $500K in revenue. If you think that would be higher, then help me understand where the sales would come from.

2) What is HP's margin?

I personally have no idea, but assume they make 30% as gross margin. That's $150K in margin.

3) What would it cost to produce the 15cp?

Again, guessing. They have the facility to make 12cp's. Let's assume they use the same line.

New keys, new case colors, new ICs with the 15c materials inside.

Recreate the 15c rom from scratch (anyone really think that's lying in an HP vault somewhere?...I don't).

Create updated manuals.

Pay for incremental people to do all this.

Get the product listed in HP corporate's systems.

4) First year results? Negative by any standards.

All this for a product that would sell less than the 39g+. Yes, the 39g+ would sell more units than a revised 15c.

5) You've seriously underestimated the sales volume!

I don't see that. Oh, they might sell 20,000 units, but they wouldn't sell 100,000. I'd buy 2. At $100 each, how many people here would buy 10-20? It's not worth that to me, since I have a good 15c in my collection already.

6) But HP would relive their glorious past!

Perhaps. I just can't see it as worth HP's time.

It's the same reason (I assume) most of us don't bother picking up pennies when you see them on the sidewalk. They're not worth your time any more.

I don't see the 15c being worth it to the bean counters.

Gene P.S. Feel free to substantially engage any of my points listed here, but no attacks. I AM an HP fanatic, but I think a realist too.

> Assume at $100 each, they'd sell 5,000 calculators.

5,000!? They would sell more than that the first day it was in the stores. Have you been to hp15c.org lately?

I have done some rough estimating and figure that the number of people who have heard of the web site is only around 35,000. That means about 4% of those who know about the petition, have singed it. Also, the number of people who would buy the calculator, but will not sign the petition is significant, though hard, if not impossible to estimate. I believe one of the biggest markets for the 15C is among engineers. According to the US Department of Labor, there were about 1,500,000 engineers employed in the US in 2002. Four percent of that is 60,000. The average number of calculators each person who signed the petition would buy is 2, that takes us up to 120,000 calculators. That is just among engineers in the USA. Expand that out to other markets world wide, and that makes for a lot of calculators.

Bring Back the HP 15C

Edited: 17 July 2004, 5:46 p.m.

Re: Wish there were a way, but ...

*Message #6 Posted by **Dale Boss** on 18 July 2004, 9:01 a.m.,*
in response to message #5 by Chris Woodhouse

Given that there's no commitment or even verification of identity on your site, 4% seems awfully low. Once a real product appears at a real price that demands real payment and the psychology of scarcity disappears then only a fraction of those 4% will buy.

Also translating that 4% of people who have heard about the website - implying some degree of interest already - into the general population of engineers is highly speculative. Sadly (for HP) I've picked up most of my free HP calculators from engineers who feel they no longer need calculators at all.

Re: maybe HP really should bring back the 15C :-)

*Message #7 Posted by **Chris Woodhouse** on 16 July 2004, 11:07 a.m.,*

HP-41X/42X/71X emulators ported to HP-49G+

*Message #1 Posted by **HrastProgrammer** on 16 July 2004, 1:57 a.m.*

After a long period of inactivity in this area, I would like to mention that I ported my HP-41X/42X/71X emulators to HP-49G+. You can find some info on <http://hrastprogrammer.tripod.com/hp49gp.htm>.

I have done this some 2 months ago but haven't had time to update the page ...

Best regards.

In reply to a for sale ad

*Message #1 Posted by **alsaudio** on 16 July 2004, 1:16 a.m.*

Sorry this doesn't really fit in with calc talk, but I've had super advice about spammers here, and would like to share one of the offers to my "for sale" ad. I guess I should send my personal info to this person. A bit of copy and paste? What I can"t figure out, is even if they had my address etc. so what? Boy, have I a lot to learn, but 300+3000=3300 in my thinking, not 3200, so this person must desperatly need a calculator! Who knows?

Hello Thanks for your reply.I will offer you $300.yes iam still very much interested and i love the v41c ' ' ' ' " " and stat module, all port covers, and case, it's ok.i have just contacted my client there in the state and he promise to send you the check, for him to include $3000.00, so you should be expecting a cashier check of $3200.00.the excess funds is for my shipper to handle the shipping without givng you any stress.so immediately you get the check,go cash same day and send the balance to my shipper same day to enable him come for pick up of the v41c ' ' ' ' " " and stat module, all port covers, and case,and some goods in his care. I hope i can count on you sending the balance to my shipper same day to fasten the transaction.if you are ok with this email asap to enable my client send you the check. Regards, meanwhle let me know ur cantact, i.e ur full name add, and phone# so as to fax it to my client to issue u the check imidiately. Mrs.Linda

Hey, many thanks again for the advice I've been given on this forum. alsaudio[a little wiser]@telus.net

Nice try :)

When I tried to sell a mobile phone on the net a guy from Indonesia contactet me and promised me a premium of 50percent to the price if I accept his credit card.

After asking for another way of payment I never heard of him again. *lol*

Beware of fraud!

Stefan

in response to message #2 by Stefan Hauschild

My ad drew two or three variations on the above. In the case of the $3000 plus check I presume it will be a bogus check? You wonder who falls for this sort of thing?

Re: In reply to a for sale ad

*Message #4 Posted by **Ron Ross** on 16 July 2004, 9:06 a.m.,*

in response to message #3 by unspellable

I would be tempted to go for it, just to get the check and turn it into the Check agency who issued it! Let them pursue the fraud as they would be the ones to loose from this fraud if you (or others) actually succeeded in cashing these checks. And if it were legit, well, let the check company refund their money and offer an apology (I can't imagine you having to do this, though.).

The downside of course is you need to provide a mailing address to these scum. But the check agency just might go after them.

But if you play in the mud, you just might get dirty, so I advise to just ignore. But it is very tempting to send the dogs after them.

Not exactly, Ron. The way this scam works is that the scammer forges a bank draft or money order for more than the price of the goods - ostensibly this is a payment due to him from someone else. The victim banks the draft, which initially clears, as the international banking system is less than instantaneous (several days delay, typically, where third world banks are concerned). Cheered by the appearance of the funds in his account, the victim then sends the goods and initiates a wire transfer of the balance of the funds to the scammer. A day or two later, the victim's bank discovers the fraud and reverses the transaction, leaving the victim out for the goods (usually not much in the overall scheme of things, even for a 15C!) and the money.

This is a variation - one of several - on the infamous 419, or advance fee, frauds. Just google on 419 or advance fee fraud and you'll find lots of information on it. The perps are often, but not invariably, from Nigeria and a few other central African nations.

Best,

--- Les Bell, CISSP

HP86 sold thru HP museum ad, spammers

*Message #1 Posted by **Fritz Bjornsen** on 15 July 2004, 2:56 p.m.*

I advertised my HP86 system with the HP Museum classified site, and after a time succeeded in selling it to a company in France that still uses the 86 for process control in chemical manufacturing. I received a number of legitimate inquiries, as well as a slew of responses from our Nigerian friends. These Nigerian emails were mostly comical, and followed the typical pattern of offering to send large cashiers checks, with the excess amount to be forwarded to "an associate". Yeah, right...Most of the Nigerian replys were from people who had two first names. The HP86B sold for $150, which is pretty good for a computer that is over twenty years old, had 128k of memory, and no hard drive. (Not to mention the green monochrome monitor and dot-matrix printer...). I was more interested in it finding a good home than making any money, and couldn't bear the thought of throwing it away. (The shipping cost was $250!). Thanks for the site! Fritz

> a company in France that still uses the 86 for process control in chemical manufacturing

I though only americans kept using old technology to actually make money---it is refreshing to see a Euro doing that!

Only a few years ago, I looked across the office and saw my German colleague shaking his head in disbelief as he was looking out the window. "What do you see out there, Thomas?" I said. He replied, "[A midship house tanker still in commercial service]--unbelievable." (You have to imagine the Baltic accent--it makes the punch-line). What he saw was the ex-NEW YORK SUN or PHILADELPHIA SUN (can't remember which) which, built in 1963, was still plying the Delaware river in 1999, serving her purpose for Tosco.

She was older than the "Museumsschiff" at Warnemünde.

Regards,

Bill. And I too am happy you found a home for that old silicon.

*Message #3 Posted by **Namir** on 17 July 2004, 4:46 a.m.,*
in response to message #1 by Fritz Bjornsen

Hi Fritz,

I had a few ads on the HP muesum to sell calculators and I too experienced a barrage of Nagierian scam emails. By now I should be a billionaire if all these are true. I also got another set of replies that ask for my ITEM (in generic term) and claim that they can handle shipping .. they also want a picture, description, and price (most of that info is in the ad itself). I guess some people need a life instead of trying to BE SMART with collectors like us.

Namir

Re: HP86 sold thru HP museum ad, spammers

*Message #4 Posted by **Chris Catotti)Florida)** on 18 July 2004, 12:42 a.m.,*
in response to message #3 by Namir

And in reply to a free HP shirt tha no one has asked for yet, I got the following:

"Hello, i am bruce daniels i am very happy to come across this site for i have been trying to buy these (Free Hewlett Packard Shirt) my customers have been asking for the (Free Hewlett Packard Shirt) because i buy it and sell in africa esp. nigeria but i will like you to please send me the price of these (Free Hewlett Packard Shirt) so that i will be preparing your payment and i will like to add that i will be paying you by a cashiers check drawn from a US abnk so i will be expecting you mails as soon as possible... regards daniel"

Wow! If I only had 100 shirts to sell for FREE, I could make a fortune giving them away! Maybe I could get an airline stewardess headed to Nigeria to bring it to him, after all if someone could just pick it up, he wouldn't need to get a cashiers check . . .

sigh ...

Display of HP-48SX

*Message #1 Posted by **Lorenzo Montani** on 15 July 2004, 1:05 p.m.*

Vertical dead lines of display, like the entire line from top to bottom is not more fed by electronic circuitery. Starting with two or three of them near the center of the display. After one year, without using the calculator because I bought a bad HP-49, the numbero f dead lines is grown up to ten or twelwe randomly diffused.

Can you help me to repair or to avoid the same on my other calculators (wet place?, programmed life by HP?)

Thanks

22s key malfunction?

*Message #1 Posted by **Craig** on 15 July 2004, 12:21 p.m.*

I have purchased a second-hand 22s after having lost my first one. The one I have now is an earlier model than what I used to have. The problem: whenever I press the "C" key (the clear key), if there is no action for the calculator to take (clearing a register, exiting a menu, turning off, etc.), the calculator freezes and must be reset. Other than that, it seems to work fine. In short, if I press the "C" key when I really don't need to, the calculator quits. Is this a normal quirk of older models? Is it the start of a progressing problem? Do I just have a calculator with a unique personality?

Thanks

CJ

Re: 22s key malfunction?

*Message #2 Posted by **Randy Sloyer** on 15 July 2004, 8:16 p.m.,*
in response to message #1 by Craig

Nothing truly unique, you just have a calculator with a defective keyboard :-(It's probably not the C key as others tend to fail first.

Look for any keys that roll around inside the frame like a loose tooth - those would most likely be the actual cause of the problem. The numeric pad keys are a prime candidate as well as the basic four (+-*/). If you find any, there is no solution other than replacement. If all appear okay, it might be brought back to life for a while with several passes through an ultrasonic cleaner to get whatever contamination it might have out of the one or more of the keys.

Overall, not a good prognosis. Sorry for the reality check.

Why we came here? (HP Calculators)

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 17 July 2004, 8:52 p.m.,*
in response to message #3 by deleted

People who keep bringing discussions about their or that "FLAG" without keeping the proper "TONE" when "indirectly addressing" other visitors, must "RECALL" that this is a place to discuss HP calculators.

So, here, a FLAG is a binary indicator that can be set, cleared and tested in a program. There may be a connection, because some of the offending messages show a rather binary attitude (everything is "true" or "false", "right" or "wrong"); so a good advise is to abandon such "BIN" "VIEW" and "ENTER" the "REAL" world, which is more "COMPLEX" that they ... think(?). Or are their thoughts "preprogrammed functions", set in ROM at once and forever?

I wonder how such persons have been involved with any HP calculator; because for their kind of, say, mental activity, a device based on the Motorola MC 14500 CMOS CPU would have been powerful enough, and pretty cheaper.

It should be noted that, while being a CMOS integrated circuit (a plus for "continuous memory" of a few quotations from the past), the 14500 was a rather curious 1-bit CPU, available at the time the HP41 was introduced.

Rest assured, it has a "XOR" function. Number entry, I'm not as sure. Is that a problem for you?

Thanks again to Dave Hicks for creating and maintaining this wonderful place, visited by (mostly) intelligent and respectful people from many places in the world; who are willing to help others about HP calculators, to share their knowledge, and to learn related issues.

Hi Andrés and all others that make this a place to rest and share.

I'd second you in all words and commas/periods; may I? I wish all "visitors" (as if I am not one o'them... ;^) could understand what you wrote and try to stay accordingly, not simply get rid of here. You mentioned *people from many places in the world; who are willing to help others about HP calculators, to share their knowledge, and to learn related issues.* You see? This is the first forum and so far the only one I participate at the internet. I read a few messages in other forums and used to think "It is too easy to post silly things and get others angry; maybe this is some sort of therapy...". When I first read the messages here, about three years ago, I simply could not stop reading till the day I thought I should participate. Well, history tells by itself.

And *unfortunately* I must confess that in extreme cases like these, Mr. Justin Case is right: ignore them. I am sure that "cleaning mechanisms" exist and that Dave can act like a moderator and remove some trash material when the offenses are too damn deep and severe, but giving others the chance to express their positions like you and Justin Case did allows these "off duty guys" to realize they are not welcome not only because they don't fit in, but because others don't accept this.

Good reading good posts again.

Dave, sorry for adding some of what should not even happen.

Luiz (Brazil)

In fact, Dave has. I strongly suspect that the post from "Justin Time" (now marked "Deleted:) was none other than J. C. Randerson, as was the subsequent one with a foreign-language expression as sender. Since no one responded, no "Deleted" placeholder was necessary.

Dave told me that he had deleted some posts from the illiterate guy with all the questions about the HP-48.

Makes sense to me... ;^) (N.T.)

Re: Why we came here? (HP Calculators)

*Message #12 Posted by **Ren** on 20 July 2004, 11:04 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

Andres wrote:

"I wonder how such persons have been involved with any HP calculator; because for their kind of, say, mental activity, a device based on the Motorola MC 14500 CMOS CPU would have been powerful enough, and pretty cheaper."

Hey! I resemble that statement! B^)

One (such as myself) doesn't need to understand automotive engineering to appreciate a fine automobile.

I stand (actually, sit at the PC...) in awe of the knowledge shown by members of this forum. I own several vintage HP calcs, and I may never approach the limits of their calculating usefulness, but I enjoy them as I enjoy seeing a Ferrari, a Monet, a Hubble photo, Michaelangelo's Pieta, hearing Mozart or Beethoven. And the "snob factor" of RPN appeals to me as well (C'mon guys! Admit it! The snob factor is a "fringe benefit" of the HP calc! B^).

Andres, if you have difficulty with understanding the tone of my message (english), be assured it is written with light humor and no malice.

Clarification

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 21 July 2004, 1:25 p.m.,*
in response to message #12 by Ren

Ren:

My message was an answer to some postings which have been deleted; so possibly you had no chance to know what I was responding to.

When I referred to "such persons", I was not discussing the technical expertise of anyone. I apologize if I gave such impression, which would have been clearly wrong and inappropriate.

I responded to the aggressive messages, threats, and "judgements" that some people had posted here, without any respect for other persons they don´t even know. Such postings were "based", among other things, in national origin, in religious beliefs, or in opinions about certain "real world" situations. Nothing to do with calculators or with civilized manners.

Memory Modules

*Message #1 Posted by **Hans Schmellenkamp** on 15 July 2004, 7:20 a.m.*

Can you use the memory modules on an 41CV? I thought I saw the instruction manual for the module and it said that you could only use it on the 41C. If so, which module number?

Re: Memory Modules

*Message #2 Posted by **Ion Abraham (New Mexico USA)** on 15 July 2004, 8:29 a.m.,*
in response to message #1 by Hans Schmellenkamp

Hello,

No, you cannot use the 82106 memory modules on a CV, because the CV already has built in memory that is equivalent to a 41C with memory modules. The CV also cannot use extended memory without adding the Extended Functions module first. If you want all of that (and the time/stopwatch functions, and a few other things), you'll have to get a CX.

Ion Abraham Albuquerque, New Mexico

Very Interesting S/N

*Message #1 Posted by **thebullcabinet** on 15 July 2004, 1:44 a.m.*

I came across a 48GX with an S/N of ID14001100. I may have missed something, but I think 3322 is listed here as the lowest known non-proto number. Have I misunderstood something? Can anyone explain this number?

Thanx.

Re: Very Interesting S/N

*Message #2 Posted by **Raymond Del Tondo** on 15 July 2004, 5:55 a.m.,*
in response to message #1 by thebullcabinet

Hi,

you may have mixed up serial number formats.
Yours is a very recent unit from 2001, with the serial number schema
which HP uses since the mid nineties.

For serial number formats, please check on the appriorate subpage (from the main page) here in the museum.

The link is her:

http://www.hpmuseum.org/collect.htm#numbers

Raymond

in response to message #2 by Raymond Del Tondo

Duh!!

Of course. I must have looked at hundreds of S/N's. Why it threw me off this time, I don't know. I guess it was just late. Thank you, Raymond.

Re: Very Interesting S/N

*Message #4 Posted by **Scuba Diver** on 15 July 2004, 4:32 p.m.,*
in response to message #3 by thebullcabinet

As an aside, does anyone know when the serial number format changed?

I always thought it was the start of 1997, however I recently purchased a NIB 48GX with serial number 3702SXXXXX.

What's the earliest new-format S/N out there? Or alternatively, what's the oldest old-format S/N?

B.

Re: Older S/N's

*Message #5 Posted by **Randy Sloyer** on 15 July 2004, 6:34 p.m.,*
in response to message #4 by Scuba Diver

1997 Singapore SC710nnnnn and 1997 Indonesian ID703nnnnn

are the earliest I have in that format. I think we can conclude there was concurrent production from the two sites.

FWIW, the last Singapore date code I've recorded is SG730nnnnn, in the older format 3708Snnnnn, only two weeks difference of the new format.

spammers

*Message #1 Posted by **alsaudio** on 15 July 2004, 12:20 a.m.*

Hi, The other day I posted an ad for some extra Hp calcs and stuff I have no need for. I got 5 or 6 replies. That seemed good until I realized maby 2 are for real, and the rest are either verifying my E-mail address is good, or seem to expect me to "send them all I have", a check will be in the mail! I guess I'm nieve, wouldn't have thought of it before. Today the spamm started arriving, a fake paypal one luring me to "log in", and someone wanting to send me 25 million to look after (now that would be nice!) My point is, these creeps are out there and must spend a lot of time finding obscure sites like this to raid information, and maby rip off a few people. Anyway, no harm done. I'm hoping not to get to many more phishing expeditions, and maby even the calcs will find new homes. Was hoping to avoid E-bay, but may find that is the best place. thanks Allen McLaughlin

Re: spammers, Parasites

*Message #2 Posted by **Anonymous** on 15 July 2004, 2:25 a.m.,*
in response to message #1 by alsaudio

I have also posted a few ads in this forum. I have received at least 7 emails that are from these parasites (last five days). Is there something we can do to stop this abuse? I have used this forum for about 5 years, it has come to a point that I will not use it anymore and if I do, I will not post my email address anymore. Many of these parasites want your bank accounts, mailing address and login IDs. PLEASE BE CAREFUL.

Re: spammers

*Message #3 Posted by **bill platt** on 15 July 2004, 11:28 a.m.,*
in response to message #1 by alsaudio

Hi Al,

Well, the thing to realize is that the spam phishing is automated. Sure, there are lots of people doing it (an image comes to mind: some creepy unemployed russian, watching porn and eating snacks in some dismal flat, with a cobbled together server, and an "alarm" on his program which will notify him when he has "caught" either an open port, or a live address etc. Then, he switches off the porn and goes over to his computer to "set the hook and reel 'em in".....I don't mean to pick on russians---probably just as many americans----just that the span got so bad at one of the US' major ISP's about a year ago--and over 50% of the spam came from an "ru" domain--and another huge chuck was originating from china---for a while, they simply shut down all comms from .ru).

But the point is that the phishing is automated. One day, our chief of IT and programming, set up a server, with a simple password, and ramped it onto the internat to see what would happen. Within 30 minutes, a phisher had cracked the code, and replaced command files, and therefore had a direct control. It was a demonstration test---and very effective! Having an unprotected port for even a few moments can lead to catastrophe if you have a mission-critical machine accessible thru that port.

The best remedy IMO is to *never* leave your real address---either cloak it --- and something better than NOSPAM (as the phishers filter for that) OR better yet, put your address on a web-site, in graphics, and point

all potential contacts to that website:

http://plattdesign.net

where they will get your current address. As this requires hand-work, a phisher will not do it (he would rather watch porn.....)

Don't give up on the Forum--it is just a matter of staying one step ahead.

Best regards,

Bill

Re: spammers

*Message #4 Posted by **Dave Hicks** on 15 July 2004, 3:18 p.m.,*
in response to message #3 by bill platt

In addition to cloaking your email address as Bill suggested, the next version of the forum software that is coming soon will add another option which allows only registered users to email you (and without actually seeing your address.) The ability to hide your email address and registering will be optional.

Re: spammers

*Message #5 Posted by **alsaudio** on 15 July 2004, 5:08 p.m.,*
in response to message #4 by Dave Hicks

Thanks for the above advice, for sure. I've been online about 5 years now and have never had a single spam sent to my telus address, until yesterday, and this morning, wow! It was actually fun reading 6 or 7 pathetic pleas for help in moving millions from the middle east, africa etc. One person "Ms.Linda" has offered me $300. for my calcs (top dollar), and wants to send $3000. for shipping, a total of $3200.! I figure Ms.Linda desperatley needs a calculator, (and english lessons)but may have a little trouble with RPN! I stopped using my other E-mail accounts way back (msn, hotmail) because of the enormous volume of crap I got, but maby I should use one of them for any future posts I may do, it would be easy to give my telus (real) address to people that I wish, and avoid the phishers. Anyway thanks again for the feedback! And Bill, I checked your website, and thought I'd mention I am myself a shipwright, mostly electrical systems and woodworking,

I do get legitimate e-mail from .ru. But for while I could not get it at work as the firewall blocks lycos and by extension anything routed through lycos. Lately I am agian getting the e-mail, I guess the routing has changed.

Restorating silver lines on clasic calculators

*Message #1 Posted by **Ronald** on 14 July 2004, 4:35 p.m.*

Hi,

I am looking for a way to restore the silver lines above tyh on/off switch on the HP35/45 models.

Painting will not look real good, to mate. Are there other ways to do it as an amateur ?

Re: Restorating silver lines on clasic calculators

*Message #2 Posted by **Richard Garner** on 14 July 2004, 5:41 p.m.,*
in response to message #1 by Ronald

Have you tried a silver leaf transfer sheet. I have never tried any myself, it is a sheet of silver leaf on a press/rub on paper. You cut it out and lay it over what you want to cover and rub the back side and it transfer what is on the front. I have seen it in craft and hobby store. I don't know how durable it is, but it might work.

Re: Restorating silver lines on clasic calculators

*Message #3 Posted by **Randy Sloyer** on 14 July 2004, 8:16 p.m.,*
in response to message #2 by Richard Garner

I've tried the foil transfer and paint, much too messy and poor results.

I use a "Sharpie" brand silver metallic marker. There are other silver paint marker brands but I find the Sharpies to work quite well and the ink is thin and flows well. It's not as bright as the original chrome but it's certainly better than black worn areas.

in response to message #1 by Ronald

Try your local hobby shop for the chrome foil used on car models.

71B RAM

*Message #1 Posted by **Bill Smith** on 14 July 2004, 1:02 p.m.*

I recently acquired an HP-71B, and am exploring it as time permits. I didn't get any documentation, but have the Museum CDs (and thus the Owners and Reference Manuals). The unit has two plugin modules, one labeled "USA REV 0 M114A1 1 OF 2", and the second the same except "2 OF 2". The modules seem to be 64K and 32K RAM modules, respectively. (I've learned the MEM and SHOW PORT commands.) I've removed the second module and the first seems to remain available as RAM. I guess my question is, can these modules be used independently, as on different machines? Does the 1 0F 2 label merely indicate the port precedence or required order if more than one module is used, or is it locked into use in PORT 1? Likewise with 2 OF 2? Just trying to figure out how flexibly these modules can be used.

Thanks,

Bill

Re: 71B RAM

*Message #2 Posted by **Rodger Rosenbaum** on 14 July 2004, 5:40 p.m.,*
in response to message #1 by Bill Smith

Bill, what is the version of your HP71? (type, VER$) The older 1BBBB versions don't do a complete SHOWPORT without the add-on lex file, "SHOWPORT" (they didn't show non-freeported RAM). SHOWPORT should show that the type of your modules is type 2, which is ROM, not RAM. Those modules were apparently used by the US Army to calculate munition trajectories. I have them myself and if I remember correctly, they are "PRIVATE", so you can't even view their contents (they contain BASIC programs) without some special techniques.

Re: 71B RAM

*Message #3 Posted by **Bill Smith** on 14 July 2004, 6:11 p.m.,*
in response to message #2 by Rodger Rosenbaum

I just checked the version last night --it is 2CDCC. I didn't check the ROM number, but will tonight.

Military trajectory programs, huh? Don't imagine they will be of immediate use to a soils engineer.

Re: 71B RAM

*Message #4 Posted by **Steve S** on 15 July 2004, 12:04 p.m.,*
in response to message #2 by Rodger Rosenbaum

More properly, your module set likely contains equations to compute artillery shell trajectories and required propellent load, elevation and azimuth settings to account for range-reach and prevailing winds. The M114A was a 155mm towed howitzer that was used during the Viet Nam era. I think it was used by both the Army and the Marines.

The ballistic equations are pretty much straight text-book stuff (and therefore not sensitive), but the modules likely also contain tables of ballistic coefficients for various shells and tables of propellent load (powder) all of which would be sensitive, hence the private designation.

The HP-71B (with these modules) was likely used as a back-up computer for the primary computer system used to compute fire solutions. All the services had / have ruggedized, mil-Spec hardward as their primary systems. Systems like the HP were then provided as a fallback in the event of disaster, like having your command bunker hit by counter-artillery fire...

I'm sure that others here can provide more accurate information...

Re: 71B RAM

*Message #5 Posted by **Bill Smith** on 15 July 2004, 7:48 p.m.,*
in response to message #4 by Steve S

Yes, I was able to read the file names on the ROMs, and the names match well with your descriptions. Most are BASIC files, all seem to be private.

12C Keyboard error

*Message #1 Posted by **Tom** on 14 July 2004, 10:39 a.m.*

Cannot clear or reset display. Shows a zero followed by a comma and then two more zeros. The letter C also appears constantly in lower right hand corner of display. Would like to get back to use for normal functions. How do I clear/reset? Many thanks!

Re: 12C Keyboard error

*Message #2 Posted by **Tom Sherman** on 14 July 2004, 11:09 a.m.,*
in response to message #1 by Tom

Tom,

To remove the C (for compound interest) indicator, press STO and then EEX.

To change from the comma to decimal point, turn the calculator off, then press and hold the period key while turning the calculator on.

For a complete reset (which you may not want or need), turn the calculator off, then press and hold the minus key while turning the calculator on.

Hope all turns out to your satisfaction.

Tom

HP32SII Solver Bug

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 14 July 2004, 8:46 a.m.*

Hello, try this, I think it is a bug, but not(?!?!?) important - maybe annoying:

```
============================================================

CASE 1:

Type the following equations into the calc:
A+B=C  (eq1)
D+E=C  (eq2)

   Press [ON] to exit EQN mode
   Press [ON]+[C] to soft-resetting calculator (try without it - I used, for safety)
   Press [CLVARS] to clear variables
   Go to EQN list, and search (eq1)
   Press [SOLVE] C
   On A?0 prompt type 2 [R/S]
   On B?0 prompt press [ON] to cancel SOLVE
   Go to EQN list, and search (eq2)
   Press [ENTER]
   On D?0 prompt type 3 [R/S]
   On E?0 prompt type 7 [R/S]

The EQN anunciator will flashing and on the screen seems
C?0 or C?1, and you will get C=10.

============================================================

CASE 2/a:

Type the following equations into the calc:
A+B=C  (eq1)
D+E=F  (eq2) <-- CHANGE IS HERE!!!

   Press [ON] to exit EQN mode
   Press [ON]+[C] to soft-resetting calculator (try without it - I used, for safety)
   Press [CLVARS] to clear variables
   Go to EQN list, and search (eq1)
   Press [SOLVE] C
   On A?0 prompt type 2 [R/S]
   On B?0 prompt press [ON] to cancel SOLVE
   Go to EQN list, and search (eq2)
   Press [ENTER]
   On D?0 prompt type 3 [R/S]
   On E?0 prompt type 7 [R/S]
   On F?0 prompt type 10 [R/S]

You will get C=1 or C=0.
(If you after CLVARS deleted the stack, you will get always C=1.)

============================================================
```

```
CASE 2/b:

Type the following equations into the calc:
A+B=C  (eq1)
D+E=F  (eq2)

   Press [ON] to exit EQN mode
   Press [ON]+[C] to soft-resetting calculator (try without it - I used, for safety)
   Press [CLVARS] to clear variables
   Go to EQN list, and search (eq1)
   Press [SOLVE] C
   On A?0 prompt type 2 [R/S]
   On B?0 prompt press [ON] to cancel SOLVE
   Go to EQN list, and search (eq2)
   Press [ENTER]
   On D?0 prompt type 3 [R/S]
   On E?0 prompt type 7 [R/S]
   On F?0 prompt type 11 [R/S] <-- CHANGE IS HERE!!!

The EQN anunciator will flashing, and you will get NO ROOT FND error.

============================================================

For a good reproduction try this with empty stack
(clear the stack after CLVARS).
```

Any comments??? HP33S users can it to reproduce???

Csaba

Edited: 15 July 2004, 7:06 a.m.

Yes, it is a really BUG...

Re: HP32SII Solver Bug

*Message #6 Posted by **Bill Platt** on 16 July 2004, 11:23 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Hi Csaba,

Interesting you shold post this observation, as I actually did notice this issue just a few days previous.

Basically, the "feature" or bug is that the solver does not cancel when you get out of the middle of a solve, when in an "equation". The "1" you find in the C register is the first guess that the solver has tried.

If you run through a complete solve, everything works as expected.

you know, this strange behavior may actually be useful----have do do some experimenting....

regards,

Bill

Re: HP32SII Solver Bug

*Message #7 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 5:51 p.m.,*
in response to message #6 by Bill Platt

"...the solver does not cancel...The "1" you find in the C register is the first guess that the solver has tried."

Exactly this is my opinion, too! Thanks your answer!

Csaba

Re: HP32SII Solver Bug

*Message #8 Posted by **Ben Salinas** on 16 July 2004, 12:47 p.m.,*

in response to message #1 by Tizedes Csaba [Hungary]

Wow... that is most perplexing. I recieved the exact same results on my 32sii, but got slightly different results on my 33s.

On the 33s I never recieved a "C=" for any of the cases. For case 2/b, I recieved an 11 and -1 on my stack. For 2/a, I recieved a 10 0 on my stack, and for case 1, it prompted me for c, unlike on the 32sii.

Apparently there are some differences between the 32sii and the 33s.

Hmm.... most perplexing. Good catch,

Ben

Re: HP32SII Solver Bug

*Message #9 Posted by **Tizedes Csaba [Hungary]** on 16 July 2004, 5:58 p.m.,*
in response to message #8 by Ben Salinas

Hello Ben,

this bug is cureable, if you press an [RTN] after [ON/CANCEL] in solving procedure. After this everything will works like as manual wrote.

So, SOLVE is take one level of subroutines...(?)

Csaba

Re: HP32SII Solver Bug

*Message #10 Posted by **bill platt** on 27 July 2004, 12:09 p.m.,*
in response to message #8 by Ben Salinas

Hi Ben And Csaba,

For my 33s, I find that the results are entirely "Bug-free" and that the solver does in fact CANCEL when hitting C.

Results for 2/a:

```
t  3
z  7
y  10
x  0
```

This is entirely as should be. <ENTER> evaluates by putting a MINUS sign in place of the equals. Therefore, 3+7-10 results in a 0.

the 3,7,10 in the stack are from the prompting. Just as with the 32sii, a prompt for a variable will also put it on the stack.

results for 2/b:

```
 [pre]
t  3
z  7
y  11
x  -1
```

also follow the rules: 3+7-11 gives a result of -1.

For 1, again, we have results which are consistent with the documented properties: after cancelling the solve of eq1, and ENTERevaluating eq2, we put in 3, R/s, 7, R/s, and then we are prompted for "C?"(whatever value was in C will be on the x-line) and again, it will be evaluated.

So, in my opinion, form the reuslts of the tests, on my machine, the 33s has no bug.

The machine I have tested is from waht I call the "second" batch--an Amazon.com CNA41505109 unit purchased after April.

the Walmart units released initially before April, have a different ALG X<>Y implementation, and may hacve other differences, too!.

Which is yours, Ben?

Edited: 27 July 2004, 12:10 p.m.

Raul

Sorry I'm late...(hope not much :)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 15 July 2004, 1:16 a.m.,*
in response to message #1 by Brett Nicol

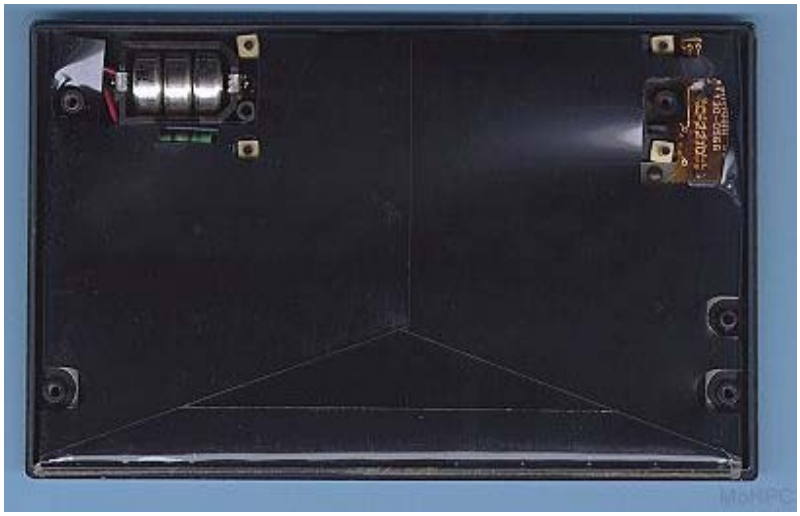
Hi Brett, folks;

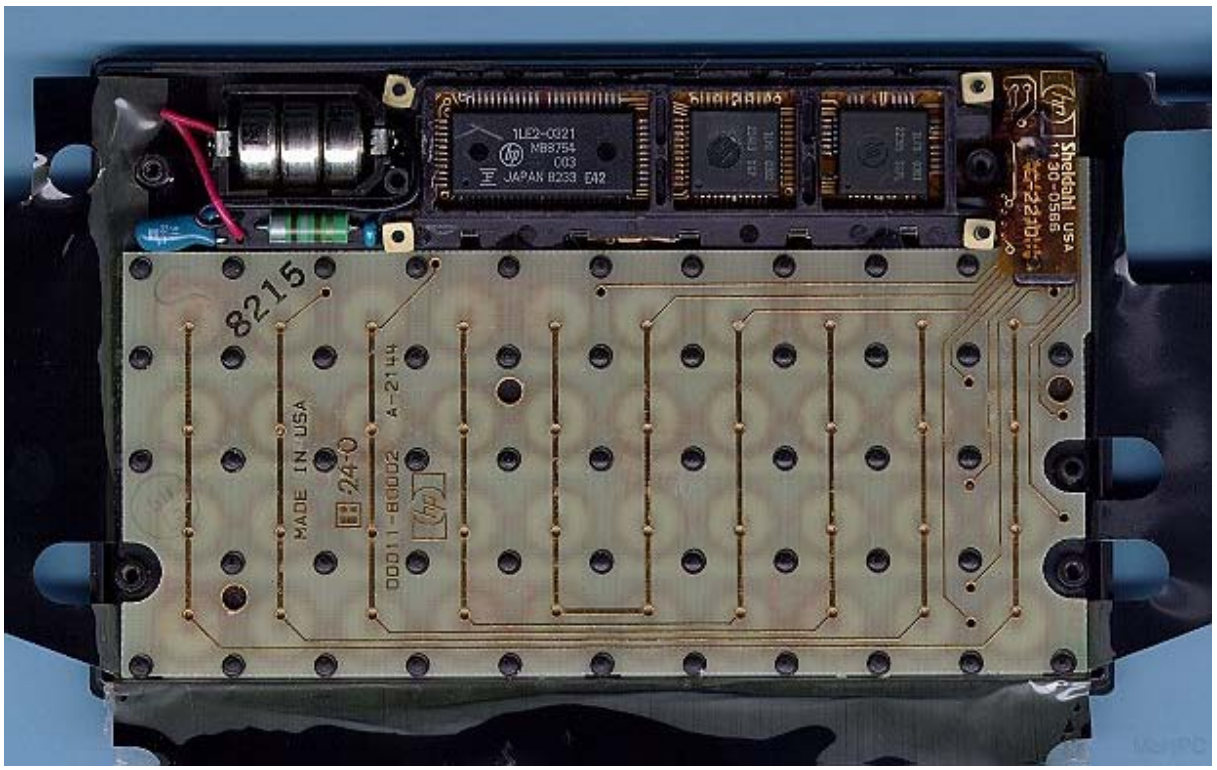
thanks for your kind mentioning, guys! I'm flattered... :)

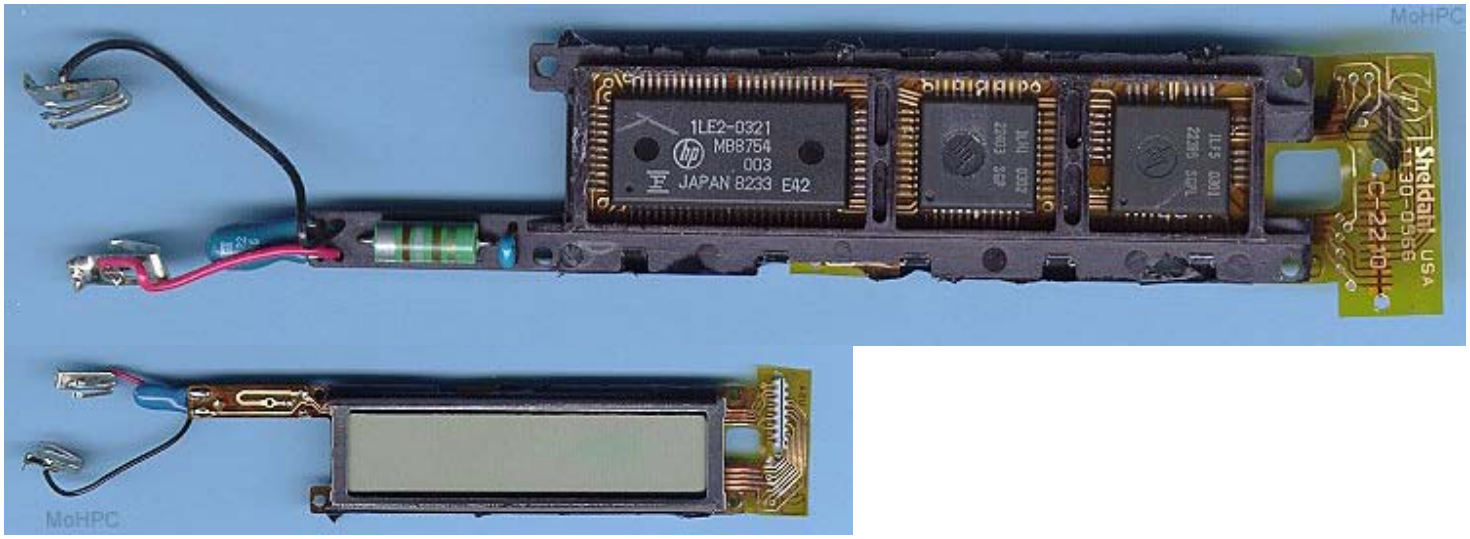
I'm just doing some "homework" and spare time is about nothing... Last time I read messages here was about a couple of days ago... shame on me! (B^(

About the Voyagers: I've actually had successful experiences repairing some units and rebuilding others, but there are some brainy guys in here that know them 'in deep'. As you mentioned wisely, Brett, they are *robust work partners*, indeed.

Depending on your partner "age", your HP11C has one of two internal assemblies. The earlier units had a separate "logic" assy with all electronics: two SMT IC's, the LCD and three passive components. Except for the LCD, all of these are soldered in a flex PCB and are "locked" with the LCD with eight tabs (2×4) that are part of the LCD frame. This assembly "connects" to the keyboard PCB by a small multiway, conductive polymer. I have an HP16C that has this earlier assembly type, so all other Voyagers have this earlier assembly as well because the HP16C and the HP10C were the last ones to be introduced. The images below are from the MoHPC and show the earlier assemblies.







This one is mine:

http://www.logeng.com.br/images/flex_earlier_voyagers.jpg

Later units have a single main PCB with all components either soldered or connected to it (LCD). Although the earlier types allow cleaning and repairing easily, I had no good experience with an HP15C with corroded copper trails. I prefer not messing too much with these earlier units. On the other hand, the later assemblies allow no LCD repair or contact cleaning unless you remove the entire PCB. Some guys have removed the front aluminum bezel, but I'd rather not trying this sort of maneuver as well. If it bents (and it is more likely that it will...) I know it is hard to smooth it back and remove wrinkle marks. These images were generated with a flatbed scanner (I have no photographic camera...)

http://www.logeng.com.br/images/short_12C_02.jpg http://www.logeng.com.br/images/short_12C_03.jpg

These are from the newer HP12C made in Malaysia.

http://www.logeng.com.br/images/12C_malaysia_inside_back.jpg
http://www.logeng.com.br/images/12C_malaysia_inside_front.jpg

In any case, there are two possible solutions: re-soldering the IC's terminals (not hard to accomplish, needs just basic skills and ESD care) and/or cleaning the LCD polymers and contact surfaces. I've done both many times and I succeed in all of them. Except for the HP15C mentioned above, that had its flex PCB damaged but I managed to rebuilt all of the HP15C electronics successfully in an old HP11C PCB.

As you have already noticed (perhaps when reading), I'm a Brazilian and I'd like to help. I have some other calculators from friends waiting for final care (M.B., J.G... thanks for your patience...)but I am confident that I'll find the time to resume their repair in this vacation. At least I hope so... I am also sure there are other guys closer to you that would help you as well, but I'd be glad having the chance to help. I'm "chasing" more images of disassembled Voyagers that would help you or anyone you know that could try repairing it. As soon as I find them I'm posting another message, O.K.?

Success!

Luiz C. Vieira - Brazil

Edited: 15 July 2004, 1:21 a.m.

Re: Sorry I'm late...(hope not much :)

*Message #7 Posted by **Nelson M. Sicuro (Brazil)** on 15 July 2004, 7:47 a.m.,*

in response to message #6 by Vieira, Luiz C. (Brazil)

Hi, Luiz!

I have other pictures from my Voyagers. I'll manage to send to you when I get home (I'm working now on the UFPR as System's Analist). I have from my old 15C and 11C, and I have now a "semi-dead" 11C to play with.

Best regards,

Nelson

Thank you very much!

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 15 July 2004, 4:35 p.m.,*
in response to message #7 by Nelson M. Sicuro (Brazil)

Hi, Nelson;

Valeu! Brigadão! (thank you very much)

I'll save them with the others I have. I am not sure if I sent you some images sometime ago; did I? If not, let me know and I'll send them. Have you seen that the two HP12C have different PCB layout? I scanned these from another Brazilian contributor. Let me know if I can "show" them when needed, your name mentioned anytime it happens, of course.

Best regards!

Luiz

SPICE series case disolving

*Message #1 Posted by **Steve B.** on 13 July 2004, 5:59 p.m.*

Has anyone seen the lining of a SPICE series case dissolve. The nylon lining inside my HP-33C case is turning to goo.

regards,

Steve

Re: SPICE series case disolving

*Message #2 Posted by **David Smith** on 15 July 2004, 3:29 p.m.,*
in response to message #1 by Steve B.

It is not the nylon lining that is the problem. It is the adhesive backing to the lining. Just toss the case in the washing machine. Stubborn cases may require a couple of cycles. Then prop open the opening and let it air dry. It should come out looking as good as new.

Re: SPICE series case dissolving

*Message #3 Posted by **Steve** on 15 July 2004, 10:15 p.m.,*
in response to message #2 by David Smith

Much to my dis-belief, you are absolutely correct. After a cycle in the Maytag all the sticky black residue is gone.

I thought the case was finished like my 67 driver roller.

Thanks again. I love my 33C (My First HP)

HP-86/87 Uploading floppy images

*Message #1 Posted by **Vassilis Prevelakis** on 13 July 2004, 2:49 p.m.*

Up till now I was using my Integral PC to upload binary images of the Series 80 floppies. The reason I prefer the images to the files created by LIFUTIL, is that the image can be copied back to a new floppy without dealing with the filename conversions, restoring the diskette volume name, etc.

The problem with this approach is that only people with Integral PCs (or other HP-UX with HP-IB interfaces) could use this path, plus that I needed to unpack and fiddle with the Integral PC every time I needed a copy.

While reading the old PCC Computer Journal issues, I came across a very interesting article by Pete Goffinet on how to use the HP binary utility "r" which is provided with the HP-86/87 Demo Disc.

For more info read the article "Transferring diskette images from an HP-86/7 to a PC via a serial connection" at http://www.series80.org/Articles/xfer.html

The HP-86/87 Demo Disc is also available at: http://www.series80.org/Programs/DEMO87/index.html

Best Regards

hp39g infrared transfer with computer

*Message #1 Posted by **g** on 13 July 2004, 6:19 a.m.*

is it possible to transfer using IR with computer instead of cable. cuz i got an usb-IR device on my computer but don't have a cable.

Re: hp39g infrared transfer with computer

*Message #2 Posted by **Tim Wessman** on 13 July 2004, 11:04 a.m.,*
in response to message #1 by g

If it is the older 39G you may have probalems doing it. The 48 could communicate with IR on some computers, and not on others.

The newer 39g+ should work as it uses IrDa. Personally I have not tried it though, so that is just what my brain remembers hearing. . .

it should be quite new, only bought it in beginning of 2003. what can i use to transfer between it and the pc

Re: hp39g infrared transfer with computer

*Message #4 Posted by **Ron Ross** on 15 July 2004, 2:01 p.m.,*
in response to message #3 by g

Then you are out of luck as you do not have the HP39G+ (which might not work either, but the old 39G definitely won't).

This is because the IR is transmited via its own protocol which is based upon the IR printer these calculators could use. This IR protocol was then modified to transmit between the calculators themselves with the 38/48G series. The 39G merely adopted this protocol from the Hp38G. You might be able to pick up the IR signals but you will have to write a PC program to decode.

Additional information can be obtained from www.hpcalc.org for the Hp38/39G family of calculators even though it is a 48/49G based site.

HP49G+ "Cue Cards"

*Message #1 Posted by **Eddie Shore** on 12 July 2004, 10:03 p.m.*

Several months ago, I made a pocket guide for the HP49G+. Contents included common flags, syntax for programming commands, how to make a library, entering complex numbers, character shortcuts, and syntax for SOLVEX, DERVX, INTVX, PREVAL, TAYLR, SEQ, GET, PUT, ADD, and OR.

Any suggestions on what should add or subtract?

Thanks in advance.

in response to message #1 by Eddie Shore

Try to find the hp49 pocket guide that came with the 49G; it is about the only good thing that came with it but it is really good and it applies to the 49g+.

Arnaud

NoVRAM (Cloned HEPAX) files uploaded.

*Message #1 Posted by **Diego Diaz** on 12 July 2004, 7:05 p.m.*

Hi all

As the first bunch of NoVRAM modules are hitting the streets, it's time to supply the users with the required files for proper operation and maintenance... Including the utility for using these two extra ROM pages ;-)) and disaster recovery from bad m-code practices...

You'll find it all in my (over-bannered) page at:

http://www.iespana.es/clonix-41/NoVRAM-HEPAX.zip

please note that due to the special NoVRAM structure it requires a specific file builder for every RAM-Box emulation, currently, as I've explained in previous posts, only Adv-HEPAX emulation have been coded.

Download and extract the above .ZIP file into your Clonix directory and run NoVRAM-H.exe, ("H" stands for HEPAX) it's almost a ´clone´ of Clonix6P.exe... <8-p)

As usual, fell free to post or mail any questions or comments (but, please, RT*MF... I'm pretty sure most of you got it :-) some searching for "Clonix" and/or "NoVRAM" thru forum's archives will also help a lot in dissipating most common doubts.

Cheers from the Canaries

Diego

*Message #2 Posted by **Etienne VICTORIA** on 13 July 2004, 4:28 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Tested your utility including the Sandbox Rom : works perfectly.

I reburned the NoVRAM and the former non-volatile RAM content was perfectly preserved.

Now, I'm gonna work toward my dream : Hepax+CCD OSX+Sandbox burned in the NoVRAM.

...and purchase another Hp41 to host my Clonix....

Thanks again for the great work but beware ! :

....given the time I spend all night on my 41, my wife knows your name and achievments !!

Stay safe in you islands !!!

Best regards from France

Etienne

Re: NoVRAM (Cloned HEPAX) files uploaded.

*Message #3 Posted by **Diego Diaz** on 13 July 2004, 5:45 p.m.,*
in response to message #2 by Etienne VICTORIA

Hi Etienne,

Thanks for sharing your test results.

I've got a question... How are you gonna get HEPAX (16k) + CCD OSX (4k) + SandBox (8k) into a NoVRAM (24k ROM)??

Are you gonna place some of the code into Non-Volatile RAM?

Please share the details... ;-)

Regarding the "femmes affaire" I feel safe as far as my own girl friend doesn't meet some of the HEPAdictX's wives/girlfriends too and formed the anti-Clonix league... Should this be the case I'll deny any relationship with HP calculators or peripherals... and, buddies, you'll be on your own ;-))

Best wishes from the (quiet for now) Canary Islands.

Diego.

Re: NoVRAM (Cloned HEPAX) files uploaded.

*Message #4 Posted by **Etienne VICTORIA** on 13 July 2004, 7:11 p.m.,*
in response to message #3 by Diego Diaz

Hi Diego et al,

My intention is indeed to put the CCD OSX in non volatile RAM by allocating a whole 4K block through the Hepax way :

- using the Hexedit function to allocate 4K blocks starting from the end, - Moving 4K Blocks with copyRom to and from non volatile RAM - OR (if it does'nt work) move the blocks to and from mass storage with WRTROM and READROM. - then loading the Sandbox in ROM (which should not change the RAM).

Well, I've got the NovRam 2 days ago...so it's just an intention...

...sshhhhh, I must close my computer....she's coming!!

Thanks and all the best.

Etienne

Spend a week with Formula Entry

*Message #1 Posted by **bill platt** on 12 July 2004, 5:39 p.m.*

It will change your life to do so. Put your RPN away--force yourself to use the Formula entry model. At first, you will be so craving the RPN. You will be like, "what's with this thing!"

But at the end of the week, you will start to appreciate the positive aspects.

And then, go back to RPN. It will be like seeing an old friend----only it won't be as perfect as before....you will start to be aware of the things you could do with the formula entry.

I suggest you buy a 30s or a Casio fx-115ms.....and open your mind to the other possibilites. (I got a 30s for $4.50 at staples at closeout).

RPN is a really wonderfully simple, direct, logical, consistent, robust system. Probably the simplest, mosat logical, certainly nearly most consistent (RPL even more so?) and no doubt robust. I will always appreciate that---and always find that useful.

For off-the cuff, it is really hard to beat RPN!

But the other systems have their strong points, too, and it is good for the head to do some stretching!

Best regards,

Bill

in response to message #1 by bill platt

Or, get a 33s and do more in algebraic and equation mode!

Re: Spend a week with Formula Entry

*Message #3 Posted by **John Smitherman** on 13 July 2004, 7:45 a.m.,*
in response to message #2 by martin cohen

I will buy several 33s's after the decimal point / comma have been re-designed to be visible. I own a 9s which is only used for dec/hex/oct/bin conversions and the the absence of a visible separator does not affect me.

Does anyone know if and when HP have plans for a revision 1?

Regards,

John

Re: Spend a week with Formula Entry

*Message #4 Posted by **hugh steers** on 12 July 2004, 9:05 p.m.,*
in response to message #1 by bill platt

although i find formula entry clumsy for manual calculation, there is definitely a grey area when it comes to working with formulae, solving or programming formulae.

for example, the calculator mode of the 71b is very similar to formula entry and so is the solver in the 17bii/19bii.

my main criticism of (most) formula entry calculators is not against the entry method, per se, but rather the pedantic way they insist on the usages of brackets and general lack of implied multiply colluding to waste keypresses.

Re: Spend a week with Formula Entry

*Message #5 Posted by **Garth Wilson** on 12 July 2004, 11:40 p.m.,*
in response to message #4 by hugh steers

There was a period when I was using the 71 and the 41 in equal amounts. The only thing I liked more about the 71 for manual-entry calculations (and still do) is that I have the math module so complex numbers are handled as easily as real. Unfortunately the 41 does not have a complex stack to compete with the 71 in that respect. Otherwise I've always liked the 41 with RPN more for the manual-entry calculations.

I used to want to learn every programming language in sight until I got into Forth in about 1990. Part of its beauty is that there's no punctuation. (Everything that looks like punctuation is actual words, as are + - * / IF THEN CONSTANT KEY TYPE etc..) I really don't care to ever return to "traditional" languages.

Ah ! Good advice (Or is it ?)

*Message #8 Posted by **Valentin Albillo** on 13 July 2004, 11:33 a.m.,*
in response to message #1 by bill platt

Hi Bill,

> [Bill, what follows should be taken as a little bit of sarcasm and irony on my part, just in good humour, please I mean no offence to you or anyone else so take none, ok ?]

Bill posted:

"At first, you will be so craving the RPN"

> Yes, like some crybaby craving for his/her pacifier, poor thing ! :-(

"I suggest you buy a 30s or a Casio fx-115ms"

> If you're gonna commit heresy (and be thrown into RPN-hell unless repentant) you might as well do it in style. Forget about these pathetic things and get real Lexus-like quality: get a SHARP PC-1350 or PC-1475 and get to know what power and quality really means. Of course, for pure Formula Entry the one to get would be a SHARP EL-5100/5101, but that's too much for mere mortals, you must prove yourself worthwhile before deserving one of those.

"I got a 30s for $4.50 at staples at closeout"

> No wonder people get to hate algebraic systems. They make do with a $4.50 crap and then complaint that it is crap and/or feels crappy. Heed my former advice and spent a little on one of those recommended models. Use any of them for a couple weeks and I dare you to say they're crap and you don't like them.

"RPN is a really wonderfully simple, direct, logical, consistent, robust system. Probably the simplest, most logical, certainly nearly most consistent [...] and no doubt robust. I will always appreciate that---and always find that useful."

> Wow ! Ten adjectives in a mere two lines of text!! But you did repeat *robust, simple, logical, consistent* ... want me to lend you a Thesaurus so that you can attempt to cram even more in, to further make your point ? And, by the way, would you care to elaborate which of those don't apply to true, formula entry algebraic systems ? Because if they do, what's the difference ?
>
> Also, you're preaching to the faithful, so no big deal. Try posting these same enthusiastic ramblings to any algebraic group or forum (or simply non-RPN/RPL) and see how many converts do you make and how many derogatory comments do you get as well. There's a vast majority of RPN-infidels out there that wouldn't touch RPN with a ten-feet pole, and they would probably be little sympathetic to your eloquence. That's were you should preach the RPN word ! Go for them, Bill, go for them !! Utter adjectives like mad till they see the RPN-Light !!!

"For off-the cuff, it is really hard to beat RPN!"

> If you so say ... I'll take your word for it. Though you'd better not meet me in a calculating contest, lest you'd be able then to see by yourself just how hard RPN is to beat, actually.

"it is good for the head to do some stretching!"

> Many RPN fanatics are such thick-headed grunts that not even a medieval torturer would be able to stretch their heads even a tiny fraction of an inch, at least not towards the non-RPN direction. :-)

Best regards from V. and if in doubt, remember my very first paragraph.

Re: Ah ! Good advice (Or is it ?)

*Message #9 Posted by **Ed Look** on 13 July 2004, 7:40 p.m.,*
in response to message #8 by Valentin Albillo

Hah! Humor always is grounded in some truth, somewhere...

... just yesterday, a young man objected to a solution I produced to a calculation, that I did with a 33S in RPN mode, and used his TI-89 to do it himself. Now, being a thoroughly modern neomillenial child, he very quickly and adroitly programs the calculation as a rather long formula into his multiline graphing TI, along with all the coefficients and terms and he executes it.

Wrong answer.

He tries again: same wrong answer.

I see that he botched one of the terms and so he corrects it- different wrong answer.

It turns out he had the calculation typed in 99% correctly, making ONE itty bitty term off by a factor of 10.

Yes, the 33S decimal point is a mote in HP corporate's eye, but it ain't too much better in those multiline graphing calcs, though I can't complain too much about HP's 48Gs.

But the decimal wasn't my point; my point is that while typos are more common than dirt, it is much easier to make such mistakes if you have to enter in formulae to make calculations, especially those long, tedious ones.

I use my 48Gs, too, but I use them most often as RPN machines with a humongous stack.

While I'm at it, concerning my 33S, can anyone tell me or help me to program a sorting routine for at least twenty or thirty numbers using its good old fashioned four line stack and its pleasantly new twenty-six registers? (The fewer registers used, the better!) I'm at my wit's end with this.

Re: Ah ! Good advice (Or is it ?)

*Message #10 Posted by **hugh steers** on 13 July 2004, 8:09 p.m.,*
in response to message #9 by Ed Look

i have a ti-89 question. a while back a collegue of mine wound up sending his 89 back to ti because it was unable to execute the following program (dumped from the actual machine):

```
vwat(t)
Func
Local  x
t+273.15»t
-6096.9385/t+16.635794-0.02711193*t+1.673952E-005*t*t+2.433502*ln(t)»x
e^x
EndFunc
```

what happened is that it printed out the above formua with `t' replaced by a number rather than reducing it to a numerical value. i tried the program in my ti89 and it worked. for some reason his refused to cooperate.

ti never replied and he lost his machine.

Re: Ah ! Good advice (Or is it ?)

*Message #11 Posted by **Eddie Shore** on 16 July 2004, 9:29 p.m.,*
in response to message #10 by hugh steers

I did this problem on my Voyage 200 (TI-89 with QWERTY keyboard; OK I own calcs from BOTH brands):

and it did like it was supposed to. Insert a symbolic argument, you get a formula. Insert a number, you get a numerical answer.

Re: Ah ! Good advice (Or is it ?)

*Message #12 Posted by **bill platt** on 14 July 2004, 9:17 a.m.,*
in response to message #9 by Ed Look

Hi Ed,

I do not see how your story negates the value of formula entry. I see absolutely no proof in it that RPN is "better".

Rather, it merely shows that the "kid" was distracted and not as careful, practices or thorough has you.

I bet that you would have absolutely no problem getting the formula into the TI whatever--and getting it right the first time.

The fact is, if you can review the formula, then you can check it---this is not a bad thig!

The problem with the formula approach is more insidious---if you are good with actually doing computations (as we are :-) then "formula" is great.

But, if you are not experienced with doing computations--if you are not skilled in evaluating a function (and I mean manually evaluating it---observing it-feeling its terms etc) then heaven help you!

Valentin's example some days ago, with the humungous terms which tended to cancel, is a perfect example. It was a trick question, to see what happens when one blindly puts a pile of $%^% into a formula evaluator---or RPN for that matter---and pushes for an answer.

In that case, I pointed out the pitfalls of the appraoch, and the reasons why---and Werner showed the practiced, intelligent, understanding way to get to the answer.

The calculator is only a tool---and never as powerful as the brain.

regards,

Bill

*Message #13 Posted by **hugh steers** on 14 July 2004, 3:34 p.m.,*
in response to message #12 by bill platt

apologies for being misleading. the story wasn't meant to dis formula entry, but just to point out some weirdness i encountered with the '89.

Re: Ah ! Good advice (Or is it ?)

*Message #14 Posted by **Ed Look** on 14 July 2004, 5:27 p.m.,*
in response to message #12 by bill platt

Thanks for the comments, Bill. Oh, I wasn't really putting formula entry down; I can see its advantages when there is a more complicated expression to evaluate; I still have a Casio fx-4200P around somewhere, though it is now seldom used. But because of my personal preference for RPN/RPL, I often use pencil and paper and jot down the calculation, and then break it up into parts my mind can handle, then "RPN" each part, storing the results in registers.

I can see that the young man will blow me away with his TI-89 unless I resort to my HP-48G(+) similarly type in a formula. The problem is, I'm not at all practiced at fast-keying in formulas as the younger crowd is. I still remember when even buying RAM for my PC was not easy... wallet-wise.

And to Valentin, formulaic entry definitely has it plusses, and in the sense of time and ease of editing, it certainly is quite efficient, but to me, RPN has the efficiency of abstacting the form from paper and then using the thumb of one hand (obviously I've never had a Voyager series machine) or such to "recreate" the paper version mentally, using the RPN device as and aid. RPN does allow that to be done quite pleasurably!

Sorting

*Message #15 Posted by **Steve** on 15 July 2004, 4:53 a.m.,*
in response to message #9 by Ed Look

I can help with a sorting routine, but I don't see how to save registers since you'd need one for each number in the list.

I assume you'd want to enter the numbers one at a time, then review the sorted list once you'd finished entering the numbers?

in response to message #22 by martin cohen

(To make it easier, here is the message I posted on comp.sys.hp48)

Well, here's my sort code for the 33s. All comments (especially corrections and improvements) are appreciated.

Martin Cohen

========== HP 33s Sorting----------

These routines sort A..(any letter) into increasing order. The variable i is used to hold both a current pointer (in its integer part, IP) and the number of values stored so far (in its fractional part, FP, after dividing by 100). Using (i) makes use of the fact that the 33s ignores the FP of i.

There are two routines. The core routine (label Y, also using label Z), adds a new value to the currently sorted list. Routine label R sorts the first n values (in A to whatever), where n is the value in the X register. i must be set to zero before calling R (to save a label).

Routine Y is carefully designed to preserve the X and Y registers passed to it and leave them as they were when it returns. This allows routine R to keep the number of items to be sorted in the registers so it does not need to be stored.

You could save a label (very valuable on the 33s!) by placing the Y/Z code inside the R code where it is called.

Here are the routines.

```
Routine Y.

Inputs: X register: value to be inserted into sorted list.
        i: IP=current pointer; FP=number in list/100

Outputs: The value is placed in the list and the list size is
incremented.
         The X and Y registers are as when called.

Lbl Y rcl i IP x=0? gto z // if before list start, done
Rv // value back to X
rcl (i) x<y? gto Z // if (i)<value, done
1 sto+ i Rv sto (i) Rv // store (i) into (i+1), preserving X, Y
2 sto-i // change incremented i to i-1
Rv Rv // leave the value in X
gto Y // do again
Lbl Z // value in Y reg, want to store in i+1
Rv 1.01 sto+ i Rv // value in X reg, bump i by 1.01
sto (i) // store val
rcl i FP 101 x sto i // recover i from FP, put in IP and FP
Rv // leave value in X reg
rtn // done

Routine R.

Inputs: You must set i to zero (this foolishness saves a label).
        Put number of items (A to whatever) in the X register.
        (I.e., to sort A through I, place 9 there).
```

```
At the end, the value should be sorted.

Lbl R rcl i x>=y? rtn // done if pointer >= number wanted
Rv // restore number to X
1 sto+ i rcl (i) // get next value
x<>y sto- i Rv // restore i and stack
XEQ Y // insert the value
Rv gto R // remove value from stack (so size to sort in X) and repeat
```

Re: Sorting code - revision

*Message #24 Posted by **martin cohen** on 25 July 2004, 3:06 a.m.,*
in response to message #23 by martin cohen

(To make it easier, here is the message I posted on comp.sys.hp48)

There were two errors in the code.

They are corrected here, with the lines marked with *****.

Well, here's my sort code for the 33s. All comments (especially corrections and improvements) are appreciated.

Martin Cohen

========== HP 33s Sorting----------

These routines sort A..(any letter) into increasing order. The variable i is used to hold both a current pointer (in its integer part, IP) and the number of values stored so far (in its fractional part, FP, after dividing by 100). Using (i) makes use of the fact that the 33s ignores the FP of i.

There are two routines. The core routine (label Y, also using label Z), adds a new value to the currently sorted list. Routine label R sorts the first n values (in A to whatever), where n is the value in the X register. i must be set to zero before calling R (to save a label).

Routine Y is carefully designed to preserve the X and Y registers passed to it and leave them as they were when it returns. This allows routine R to keep the number of items to be sorted in the registers so it does not need to be stored.

You could save a label (very valuable on the 33s!) by placing the Y/Z code inside the R code where it is called.

Here are the routines.

```
Routine Y.

```

Hi Hi!

*Message #25 Posted by **bill platt** on 14 July 2004, 8:51 a.m.,*
in response to message #8 by Valentin Albillo

Hi Valentin,

Thanks for the humorous feedback.

BTW, my old colleage, a German, whom I worked with in 1998, had a machine that looked very much like your Sharp models---I remember that it was a BASIC programmable----but I cannot remember whether it was a Sharp, or a Casio. Did Casio make devices similar (with the landscape layout and metal bezel) to the Sharps?

I remember that he sort of frowned or smirked when he saw my HP 32sii---his machine was certainly more powerful than mine!

On a more academic (serious) note, you asked, with regard to consistency and logic,

> Quote:
>
> And, by the way, would you care to elaborate which of those don't apply to true, formula entry algebraic systems?

Yes, indeed, there are many inconsistencies to mention. The largest inconsistency is merely that different models have different rules for basic operations.

But others are merely annoying:

```
HP 32sii equation list (an algebraic exression evaluator)
         the +/- key is required for second arguments
```

```
         of two number functions, viz %chg(200 -150)
         whereas the minus operator can (or should? can't
         remember!) be used in other positions.

HP business calculators, e.g. 17bii, there are parenthesis
         but no precedence.  However, in the solver,
         parenthesis do have precedence.

Some machines do "implict multiplication" and some do not.
         On the HP 33s, you can use "implicit
         multiplication" in the ALG command line, but not in
         the equation list.

Many "formula entry" machines have an input buffer length
         limit, including both the HP 30s and the Casio
         fx-115ms:  80 characters.  The long expression
         you posted about a week ago just barely fit in
         those machines. The formula machines *without*
         a recallable input buffer do not have this
         problem, as they evaluate intermediate results---
         but some are confusing to understand regarding
         many of the functions correct actions--especially
         troublesome are negatrive exponents.

There are really two major categories of "Algebraics":

    1.    "traditional" algebraics like the hp 20s, TI 30,
          etc.  These are actually postfix (like RPN) for
          all "one number functions", and infix for the
          arithmatic operators.  Parenthesis and pending
          operations are implemented.

    2.    "Formula Entry" algebraics, which attempt--not
           always successfully--to implement "type in your
           expression just like it is on paper."  "DAL",
           "S-VPAM" and "Formula" are some of the names
           for these systems.

You will notice that I find inconsistent behavior on (gosh!)
HP machines.  No manufacturer is immune to this.
```

The fact is that when there is an actual formula to work from--an equation or expression which is written down, the ability to put a formula into an input buffer which is recallable after evaluation, is superior to RPN. I really like RPN. It is definitely fast. But, if you can check your input, and more importantly recall it---then that is better in almost all circumstances. Except that experienced arithmeticians (is that a new word?!) find no need for recalling much of their work.

BUT--and this is important---in all my years of exclusive RPN usage, although I could trust the keypresses etc., for any calculation that mattered, I would always DO IT TWICE! Why, because if you are an engineer and not just a hack, you better be sure you get it right!

For an interesting comparison to this RPN/formula business:

When I first discovered spreadsheets, I was blown away by them. I was like, "wow!!!!!!!" And you know, most anything that I used to do on a calculator went onto the spreadsheet. Spreadsheets are especially useful for those dreadfully tedious computations that the naval architect routinely encounters: weight-moment computations. The spreadsheet makes it possible to type in all your input, check it, and get an answer.

Of course, as the size and complexity of the spreadsheet increases, it becomes dangerous. Then, a database approach becomes much more reliable.

However, through all of it, the calculator remains an indispensible tool for checking the formulas! (For instance, I used the programmability of my hp 11c to write a weight-moment program which is very handy for checking---I originally wrote it before I had a spreadsheet!).

The realy driving force behin the "Formula" calculator is memory. All of our favorite HP handhelds up until the 41c were very tight on memory. RPN was especially suited to low-memory---as very little is kept in memory!

But once you have gobs of memory available, then there is no reason why you shouldn't keep a lot of input data.

I think I am arguing strongly for the Formula design, aren't I?

In fact, I like the RPL concept of algebraic objects on an RPN stack---that is very powerful and flexible.

What makes the HP machines (up through the Pioneers) good is not so much the RPN, but rather the combination of good tactile feedback, programmability, well thought-out layout, and thorough manuals, in that order.

I am not sure that there are any keystroke programmable calculators in production now, from any other manufacturer.

Best regards,

Bill

in response to message #25 by bill platt

Hi, Bill:

Bill posted:

"Did Casio make devices similar (with the landscape layout and metal bezel) to the Sharps?"

> Yes, but they were always of lower quality than the SHARPs. Casio was to SHARP as TI was to HP, so to speak. Your German colleague most probably had a SHARP, as they were *extremely* popular in Germany, much more so than in any other European country. Just have a look at eBay-Germany and you'll see the tremendous number of SHARP machines being auctioned there.

"I remember that he sort of frowned or smirked when he saw my HP 32sii---his machine was certainly more powerful than mine!"

> Logical. What did you expect ? And I hope he didn't try to compare I/O capabilities, it would've been pathetic.

"Many "formula entry" machines have an input buffer length limit, including both the HP 30s and the Casio fx-115ms: 80 characters."

> Logical as well, I would change *"many"* for "all" or "nearly all". The HP-71B's input buffer is 96

> char long, same for my SHARP PC-1350, and I remember that HP-80 series did also have some limit as well, say 96 or 120 chars. I don't see any problem with this.
>
> As for implied multiplication, those SHARP models that were limited to just single letter variable names (A, J, Z) did allow implied multiplication, very cleverly implemented (e.g.: 2ABC => 2*A*B*C, SIN 2AB => SIN(2*A*B), AB^3 => A*B^3), while models permitting long variable names obviously disallowed it (e.g.: DISTANCE = SPEED*VELOCITY). When reading programs from a tape, long-name models would automatically convert any implied multiplications to explicit ones.

"There are really two major categories of "Algebraics": "traditional" algebraics [...]"

> For me, these are *hybrid-algebraic* machines at best, and I want nothing to do with them. I don't like their system nor do I defend them in the least. You can trash them as much as you want, I couldn't care less. They and their capabilities never enter my arguments.

""Formula Entry" algebrtaics, which attempt--not always successfully--to implement "type in your expression just like it is on paper."

> I would change that *"just like it is on paper"* to "True Algebraic", meaning that they obey all precedence rules and nestings and are strictly infix algebraic systems. They may implement a number of reasonable shortcuts such as allowing implied multiplication [2ABC => 2*A*B*C], not requiring parentheses for unary arguments [SIN 2AB + SIN 2BC => SIN(2*A*B) + SIN(2*B*C)], or closing final parentheses automatically [2*(3+5*(7+2 => 2*(3+5*(7+2))], as a typing aid, but the standard full form always works.

"You will notice that I find inconsistent behavior on (gosh!) HP machines."

> You had it even easier. Just look at the HP-41C, for instance, with its STO+23, FIX 5, TONE 0. Does this seem very 'postfix' to you ? Of course it doesn't ! RPL gets it right, but at the expense of becoming unnatural and unreadable, kind of "obfuscated RPN". Only True Algebraic systems are both consistent in their use of infix operations come what may, as well as maintaining the highest readability possible.

"The fact is that when there is an actual formula to work from--an equation or expression which is written down, the ability to put a formula into an input buffer which is recallable after evaluation, is superior to RPN. [...] if you can check your input, and more importantly recall it---then that is better in almost all circumstances."

> See ? This fact that you've been able to ponder and experience for yourself seems to be forever beyond the grasp of most die-hard RPN fanatics, and I fear that this very fact is one of the worst things you can blame RPN for**:** It does produce such a terrible effect on the brains of people addicted to it that they are left with a severely damaged capacity to objectively consider calc-related facts forever, not to mention the acute withdrawal syndrome they experiment if deprived of RPN even for the simplest calculation. They are 'computationally-challenged', crippled for life, another RPN victim ! What a pity. Good to see you're not one of them.

"RPN was especially suited to low-memory---as very little is kept in memroy!"

> If you need 8 pending intermediate results at a given time you'll need 8 RPN registers, which is the same number of internal registers a True Algebraic system needs, period. TA systems do use more memory to hold the intermediate operators, but as they're previously tokenized, this is not significant (they usually take only a single byte each) and they're automatically discarded once evaluated. The only extra memory requirement is to keep a copy of the input buffer, so that you can recall the whole evaluated expression(s) at once, but you'll agree this is a very convenient

way to use up a little memory.

As for *"very little is kept in memory"*, when a TA system is done evaluating the expression, all internal data and operators registers are automatically emptied, thus no memory is wasted. On the other hand, the typical RPL system's stack is usually cluttered with an ever increasing number of discardable past results no longer relevant or needed, wasting memory, unless the user remembers to clear them frequently, preferably right at the end of some calculation. This is a chore, and a TA system does it automatically for you, everytime. So, which system is more memory efficient in practice ?

"I think I am arguing strongly for the Formula design, aren't I?"

Yes, your are. But it was only to be expected, as long as you're a highly intelligent individual who can think for himself and overcome obsolete topics and brain-washing, decades-old *mantra*-like arguments which are no longer relevant.

Welcome to the club and best regards from V.

PS: And dont't forget to try my 'HP-15C RPN Certification Exam' quiz, to be posted soon ! :-)

CASIO vs SHARP

*Message #27 Posted by **Tizedes Csaba [Hungary]** on 14 July 2004, 1:20 p.m.,*
in response to message #26 by Valentin Albillo

Valentin wrote:

"...they [CASIOs] were always of lower quality than the SHARPs. Casio was to SHARP as TI was to HP..."

I was disappointed in the "mythical" SHARP PC-1500 (in Hungary was licensed in 'PTA-4000' name), when I try to re-use my last calculation's answer. It had no 'ANS' function!!!

I think, the 'gap' is bigger between TI and HP than SHARP and CASIO. I think, the CASIO and SHARP are similar good powerful pocket computer makers, but TI is not HP ;)))

Csaba

Ps.: I'm learn English, so, I will writing more and more elevated contributions :)

Re: CASIO vs SHARP - fx602p

*Message #28 Posted by **marais** on 14 July 2004, 4:11 p.m.,*
in response to message #27 by Tizedes Csaba [Hungary]

Both of them made excellent machines. Think about the FX602-P, an extremely well conceived machine and one of the first, if not THE first with 5x7 dot matrix ASCII display, and thus able to display lowercase letters. I remember it made the 41C look outdated back in the 80s.

not to mention the cassete interface!

*Message #29 Posted by **Marx Pio** on 16 July 2004, 4:32 a.m.,*
in response to message #28 by marais

It was a technology leap. We could store program in cassette media using the i/o interface that was sold separately.

Pio

Cassette interface vs. Card Reader, etc

*Message #30 Posted by **Valentin Albillo** on 16 July 2004, 4:59 a.m.,*
in response to message #29 by Marx Pio

Hi, Pio:

The very early models (SHARP PC-1211, aka TRS-80 PC1, etc) did require a dedicated cassete interface, usually bundled with a printer as well, see this link for full details and stunning pictures of it all.

But later on, you had the choice to use a dedicated *micro-cassette* interface (with printer) which would store hundreds of Kb worth of programs and data in extremely small microcassettes, or else buy (or build yourself) a simple cable to connect the machine to a standard, inexpensive cassette recorder (the cheaper, the better), with start/stop remote control and all. Have a look at this extremely interesting link to see full details for a lot of cassette interfaces, cables, and peripherals for SHARP computers.

That was about the easiest, most economical way to store programs available by far. Yes, the 41C Card Reader was fancy and all, but it was outrageously expensive, and the cards themselves were not cheap either and would only store 224 bytes per card, while a single cassette tape would hold almost any amount of programs on it. Combine that with a tape counter, and you've got yourself an extremely easy and ultra-cheap mass storage capability. Programs could even MERGE other programs from the tape, all under program control via the remote cord.

They could also read from and write data to the tape under program control, so you could have a program that would read massive amounts of data, a block at a time, process them, then write massive amounts of results to the tape, for later inspection or further processing by another program, all of this unattended, say running it at night.

That you could not do with a 41C+Card Reader, as the cards wouldn't jump out of the cardholder by themselves, to be read/written at the prope times, you'd need to do that by hand, interactively. You would have to feed the cards, no sleeping while the machine merrily works.

HP never came with anything like that. The card reader was a good solution for the 41C, if expensive. But for the 71B, cards were nearly preposterous, inconveniently long and holding just 1.3 Kb per card, so you'd need a number of them for any significant application program, let alone to store data. You could use HP-IL and digital tape or floppy disks, but that would cost many $, and would be inconvenient to carry around, not to mention power supply problems. On the other side, a walkman-sized cassette or microcassette would suit you fine with a SHARP.

I'm still amazed to this day that noone, be they HP or third-party, did ever offer some kind of inexpensive interface to a standard cassete or microcassete recorder for the 41C series and/or the 71B series. They'd have sold like mad.

Best regards from V.

Valentin gave three examples of what might be called "prefix commands/postfix arguments under traditional RPN".

I've never found this the least bit inconsistent. 23, 5, and 0 in these examples are not *numerical operands*; rather, they are simply *identifiers* that never enter the stack. It is certainly more intuitive to have these identifiers follow the command (e.g., Store where? How many decimal digits? Which tone?). If these were structured as postfix commands -- as they are in RPL -- the identifiers would needlessly clutter the limited stack and push actual data up and possibly off.

As for "get(ting) it right .. at the expense of becoming unnatural and unreadable..", that certainly defeats the purpose, doesn't it? But I agree with your point -- postfix for these commands is a senseless and unwise "consistency".

HP48 - Motorola MC68HC08 SCI

*Message #1 Posted by **Mauricio Jaramillo** on 11 July 2004, 10:16 p.m.*

Hi, how can i communicate my HP48GX with an Motorola HC908KX8 microprocessor by RS232 SCI?

Re: HP48 - Motorola MC68HC08 SCI

*Message #2 Posted by **Bill Wiese** on 12 July 2004, 1:11 p.m.,*
in response to message #1 by Mauricio Jaramillo

Hi Mauricio...

HC08s are nice little CPUs! :) Which variation are you using, how much ROM & RAM? What else does this CPU have to do beside communicate with the HP48?

I'm not an HP48 owner/user but have done a lot of serial comm work for other embedded widgets. I seem to recall the HP48 does (sometimes? always?) use a form of the Kermit transfer protocol for transfers. I'm not sure if 48 user programming can do byte-by-byte serial communications.

I also don't recall the HP48 bitrates/ parity/ stopbits anymore - or even if it configurable by a user program - but when I looked years ago I recall it was something standard.

The HP48 serial port, IIRC, is at a logic level (+5VDC, swinging down to 0V) -- whereas 'true' RS232 communication requires a level converter to deal with swings between +9 to +12VDC and -9 to -12VDC.

So you can connect the 'HC08 to the HP48 directly without an intervening level converter device (like Maxim's MAX232) if your 68HC08 is a 5 Volt CPU. A 3.3V 68HC08 CPU might be problematic but might work. Just set up your SCI port on the HC08 for the proper bitrate, parity, stop bits. Do not use hardware RTS/CTS handshaking.

If the 48 can only communicate using Kermit protocol, and if you're using a C compiler on the 08, you should be able to get Kermit open source code and 'trim the fat' (i.e, remove useless features') to keep code size down to what you can fit in your HC08.

> So you can connect the 'HC08 to the HP48 directly without an intervening level converter device (like Maxim's MAX232) if your 68HC08 is a 5 Volt CPU.

You might get away electrically with connecting it directly, but it won't work unless you bit-bang the UART rather than using the hardware UART. EIA-232 drivers and receivers are inverting, so if you connect it directly you'll have the wrong polarity.

I highly recommend using a MAX232 or one of the many equivalent parts. That way you can hook the device up to any EIA-232 devices without risking damage, and you have better ESD protection than using a port pin directly.

If you use some kind of evaluation board, it's likely that there's already a level converter present.

*Message #4 Posted by **Bill Wiese** on 12 July 2004, 6:04 p.m.,*
in response to message #3 by Eric Smith

Hi Eric...

All I was saying was _if_ the HP48 was running 5V serial w/o a MAX232 he could directly connect it to a 5V 'HC08, and that maybe a 3.3V HC08 could work too. No inversions, etc. required...

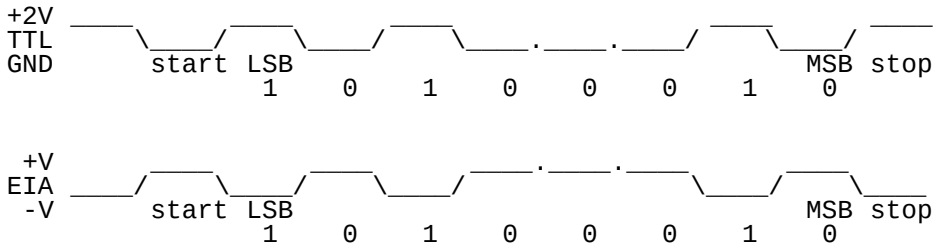
But the inversion **IS** required, if you want to use the hardware UART. UARTs have logic levels that are high for space, low for mark. But EIA-232 (even the non-really-EIA-232 of the HP-48) is negative (or in the case of the HP-48, not very positive) for space, and positive (on the HP-48 more positive) for mark.

Example of the transmission of an uppercase letter "E" (0x45):



So if you hook up the HP-48 directly to the UART of a 5V 'HC08, it isn't going to break the 'HC08 (or the HP-48), but it also isn't going to work correctly.

If you implement a software (bit-banged) UART, you can obviously deal with the inversion in software.

Re: HP48 - Motorola MC68HC08 SCI

*Message #6 Posted by **Jonathan Purvis (New Zealand)** on 13 July 2004, 4:42 p.m.,*
in response to message #2 by Bill Wiese

Not true! The HP48 does use "true" RS-232 voltage at +/-4.3V, even if they are not the 12V you're used to getting out of a PC's serial port. Quoting Preston Brown from the comp.sys.hp48 FAQ:

> Quote:
>
> The 48 has two power supplies VDD at 4.3 and VH at 8.5. VH cannot be regulated higher without exceeding the spec for our CMOS IC process. VH is used as the + voltage for the I/O. In order to meet a +3V output level VH must be more then 3.6V above VDD. (VDD is used as I/O ground). Our power supply system increase the battery life and reduces the cost greatly for the wired I/O.

*Message #7 Posted by **James M. Prange** on 16 July 2004, 12:37 p.m.,*
in response to message #2 by Bill Wiese

> Quote:
>
> The HP48 serial port, IIRC, is at a logic level (+5VDC, swinging down to 0V)

You recall incorrectly. Maybe you were thinking of a Sharp model?

For transmitting, it's (minimum) +3.0V for a space and -3.0V for a mark, and "typically" +3.5V and -3.5V.

For receiving, it's +1.0V to +15.0V for a space, and -15.0V to -0.3V (Maybe this should be +0.3V, or even -0.03V or +0.03V?) for a mark.

The absolute maximums are listed as -25V to +25V.

> Quote:
>
> -- whereas 'true' RS232 communication requires a level converter to deal with swings between +9 to +12VDC and -9 to -12VDC.

Actually, if I recall correctly, RS-232 is supposed to transmit at at +5.0V to +15.0V for space, and -15.0V to -5.0V for mark, and receive at +3.0V to +25.0V for space, and -25.0V to -3.0V for mark.

So, although it doesn't fully comply with RS-232, it's generally RS-232 compatible.

Information about the 48 series I/O is available at http://www.hpcalc.org/details.php?id=1722 and http://www.hpcalc.org/details.php?id=4741.

> Quote:
>
> If the 48 can only communicate using Kermit protocol,

The 48 series can also use "raw" serial I/O. That is, without any file transfer protocol; just sending and receiving strings with the length limited only by available memory. That's what the XMIT and SRECV commands are all about. Optionally, XON/XOFF software flow control can be enabled for sending and/or receiving. The input buffer is only 255 bytes and buffer overruns are quite likely to occur if you try to receive longer strings without using software flow control. A variety of parity/pseudo-parity options are also available.

Actually, the printing commands (with flag -34 set, "Print via wire") are a lot like XMIT, but decompile an object to a string form before actually transmitting it from the I/O port.

The 48G series also has the Xmodem protocol built-in, and an "Xmodem Server" library is included with the Conn4x package.

The built-in speeds on the 48 series are 1200, 2400, 4800, and 9600 bps.

But "Serial IR" is 2400 bps only, and is half-duplex instead of full-duplex, so software flow control isn't available in this mode.

The 49G series is similar to the 48G series for I/O via wire, but IR isn't available, and XON/XOFF software flow control is broken for both transmitting and receiving. The 49G has the Xmodem server built-in, and has additional (non-standard) speeds of 1920, 3840, 7680, and 15360 bps built-in.

Regards,
James

Yes!

:-)

Re: Pocket PC emulators?

*Message #3 Posted by **Bill Wiese** on 11 July 2004, 1:54 p.m.,*
in response to message #1 by Michael (AU)

I believe these are _simulators_ not _emulators. For one thing, no one (except perhaps Eric Smith) has dumped HP Voyager ROM code.

They only imitate the external appearance and general functionality, but their internal programming does not share any low-level commonality and is running X86 code and not emulated Coconut CPU code. Native math functions will be used, and these simulators will give different results (i.e, significant figures, rounding, etc.) than a real HP calc or emulated HP calc.

Bill Wiese
San Jose CA

Re: Pocket PC emulators?

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 11 July 2004, 2:51 p.m.,*
in response to message #1 by Michael (AU)

While Bill Wiese comments are most valid indeed, these simulators (not emulators nor exact replicas) seem to be very well developed and close enough to the real thing for most uses.

Re: Pocket PC emulators?

*Message #5 Posted by **Marx Pio** on 11 July 2004, 6:28 p.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

Bad definitions:

Emulator is something that is not the real thing.

Simulator is a not the real thing that pretend that it is a emulator.

If u r not a purist, the difference doesn't really matter much.

B^)

Re: Pocket PC emulators?

*Message #6 Posted by **Don Davis** on 11 July 2004, 8:29 p.m.,*
in response to message #1 by Michael (AU)

I have been using the 15C program, and was about to get the 12C, 15C, and 16C package when my Pocket PC met an unfortunate death last weekend. As soon as my replacement arrives, I'll probably get the whole set. I think the 15C is great.

Don

Re: Pocket PC emulators?

*Message #7 Posted by **Michael (AU)** on 14 July 2004, 8:03 a.m.,*
in response to message #1 by Michael (AU)

Thanks to everyone who responded. I take Bill Wiese's point. However these seem very professionally done. I have now purchased the "Super bundle" 12c, 15c and 16c (always wanted one of those). I look forward to going through each of the respective manuals and seeing what the actual differences are between these simulations and the real thing.

What I did like most about this series of software is that at least it keeps the tradition/history of these remarkable calculators, 15c and 16c, alive. I feel this is important given the current state of HP marketing. I am now confident that I can use the original HP RPN on a Scientific Calculator well into the 21st century even if it is only a simulation on a Pocket PC.

Don’t get me wrong I am an owner of a HP 45, 41, 42 and 32 original calculators, all well loved and all still in working order and used regularly. I would love HP to produce another series of well engineered calculators but I cannot see HP in it’s current guise ever going back to those disciplines, which is a shame.

many thanks to all

Michael

Grease in on/off switch HP45

*Message #1 Posted by **Ronald** on 11 July 2004, 7:08 a.m.*

Hi,

Wat kind of grease can you use for the on/off switch in the classic calculators serie? I have a heavy greasy for ball bearing with teflon in it, so it is viscous enough not to flow away and is real lubricating, but .....??

Any suggestion, comments ?

Thank you.

Re: Grease in on/off switch HP45

*Message #2 Posted by **Etienne VICTORIA** on 11 July 2004, 2:55 p.m.,*
in response to message #1 by Ronald

Hi,

I've put Silicone : HALF A TENTH OF A DROPLET in my 35, 67,22,21 & 25 with success.

However, I would advise NOT to inject it with the usual spray as it would be to much a quantity.

I dismounted the calculator and added silicone just on the on/off or pgm/run switches.

Hope it helps.

Etienne

Re: Grease in on/off switch HP45

*Message #3 Posted by **David Smith** on 11 July 2004, 3:16 p.m.,*
in response to message #1 by Ronald

I have used Permatex Superlube teflon based grease, Radio Shack Lube Gel, or Dow 111 vacuum grease.

Re: Grease in on/off switch HP45

*Message #4 Posted by **Katie** on 11 July 2004, 11:41 p.m.,*
in response to message #1 by Ronald

I use this stuff:

http://www.hmcelectronics.com/cgi-bin/scripts/product/3480-0019

Re: Grease in on/off switch HP45

*Message #5 Posted by **Ronald** on 12 July 2004, 3:24 a.m.,*
in response to message #4 by Katie

Thank you, I just ordered the grease.

I am a bit afraid if the grease I use today is to acid and will, in time, eat away the copper contacts itself.

Re: Grease in on/off switch HP45

*Message #6 Posted by **Katie** on 12 July 2004, 10:14 p.m.,*
in response to message #5 by Ronald

I've been using it for about 5 years on many calculators with no damage to the contacts. I wouldn't (and don't) worry about it eating away the copper.

Radio Shack Lube Gel (p/n 64-2326)

*Message #7 Posted by **Karl Schneider** on 12 July 2004, 1:12 a.m.,*
in response to message #1 by Ronald

Radio Shack Lube Gel (p/n 64-2326)

Others have recommended this lubricant, which I plan to use on the slide switches on my 34C's.

Series 80 software

*Message #1 Posted by **rhahm** on 10 July 2004, 7:25 p.m.*

Can anyone send me a copy of:

VisiCalc85 or BasicTraining85 or BasicTraining87 ?

I have many other Series 80 software titles to trade. I am also looking for any other unusual series 80 software.

Does anyone have any programs from the "Users Library"

email for my software list if you have titles to trade for software (or hardware).

Thanks

rh

[1/2 topic] Series 80 ware

*Message #2 Posted by **Bram** on 11 July 2004, 3:28 a.m.,*
in response to message #1 by rhahm

I have a Series 80 brochure from 1982 (16 pages). Is it software or hardware? Anyway, it's not on my site yet, but very coincidentally I scanned it the day before yesterday. I haven't edited the scans yet nor have I turned them into a pdf file. This may take a while (it's vacation time over here, so for some of us this means busy time), but in the end it will be done. I guess it would be a nice read for you.

Re: Series 80 software

*Message #3 Posted by **Vassilis Prevelakis** on 12 July 2004, 5:38 p.m.,*
in response to message #1 by rhahm

Good thing then I did not put any of this software up on the www.series80.org web site :-)

(actually I have been very busy and did not have the time to fire up my Integral PC which I use for transfering HPIB diskettes to my OpenBSD desktop).

So, what software titles do you have to trade?

HP 110+

*Message #1 Posted by **Ray** on 9 July 2004, 8:59 p.m.*

Hi,

I have recently aquired a HP 110+, and it has a HP-IL Interface on it. I was wondering if there was any HP-IL software that will run on it (Trans41?). I software packages that can act as a controller, talker, and emulate mass storage functions. Does anyone know of any software (free, preferably) that will perform these functions on this system? If so, where can I get it?

I can't seem to get Trans41 to work on it, so unless you have a solution to that, I don't think it is an option.

In adition, since I rarely mess with these devices, does anyone know how I would go about transfering a application to it? Also, (off-topic somewhat) does anyone know of a standard terminal application I can get for this little laptop that can communicate with CISCO routers? (This requires little more than the basic functionality you find when setting up a connection in windows HyperTerminal.

Thank you, and I appologize if this is a little off-topic

-Ray

*Message #3 Posted by **Ray** on 13 July 2004, 2:30 p.m.,*
in response to message #2 by J-F Garnier

Yes, that would be excellent. My main question is, how would you go about transfering files to this thing? Through the serial port?

Help appriciated,

-Ray

Re: HP 110+

*Message #4 Posted by **J-F Garnier** on 14 July 2004, 5:29 a.m.,*
in response to message #3 by Ray

If you mean transfering the Emu41.exe and ROM image files, you can use serial port, or (easier) HP9114 disc drive if you own it.

Note that Emu41 for HP+ is a special version (regular Emu41 will not run properly). Contact me for availability (see my email addr on my site).

J-F

Re: HP 110+

*Message #5 Posted by **Ray** on 15 July 2004, 11:18 p.m.,*
in response to message #4 by J-F Garnier

Ok, I think you've sold me... However, I can't seem to figure out how to USE the serial port to transfer data. I have no clue how to use the built in Terminal Utility... Help please? (I'm clueless when it comes to serial, what programs and/or cables would I need?)

Thanks in advance.

Re: HP 110+

*Message #6 Posted by **tony duell** on 16 July 2004, 7:34 a.m.,*
in response to message #5 by Ray

One thing to be aware of is that the HP110 and HP110+ serial ports, while being DE9 sockets, do not use the PC/AT pinout. You need to make up a special cable.

The 'HP end' really needs to be a moulded plug cover to fit correctly, so I ended up buying a DE9 plug to DE9 plug cable, cutting it in half, and soldering DB25 plugs to the cut ends. Of course you might need null-modem adapters, etc as usual to link this cable to a PC (or whatever).

I can look up the HP110/110+ (they're the same) pinouts in the service manual if anyone needs them.

Re: HP 110+

*Message #7 Posted by **Ray** on 16 July 2004, 2:17 p.m.,*
in response to message #6 by tony duell

That would be a great, if you could get the pinouts for me. Thanks for your help.

Re: HP 110+

*Message #8 Posted by **Tony Duell** on 16 July 2004, 7:11 p.m.,*
in response to message #7 by Ray

OK, here you are. 1=DTR, 2=TxD, 3=RxD, 4=RTS, 5=CTS, 6=DSR, 7=Gnd, 8=CD, 9=RI It's wired as a terminal (DTE), so pin 2 (for example) is an output.

42S XFCN question

*Message #1 Posted by **andy** on 9 July 2004, 3:03 p.m.*

Can someone provide me with an example of how the XFCN command on the 42s is used?

Is XFCN only useful for accessing the optional second ROM or can it be used like "syseval" on the 48?

Thanks

Re: 42S XFCN question

*Message #2 Posted by **Raymond Del Tondo** on 9 July 2004, 4:25 p.m.,*
in response to message #1 by andy

Hi Andy,

The routine behind the XFCN call simply jumps to address #20005h (ML),
where the 17BII has it's language/msg ROM.
If no RAM/ROM is present at that address,
an error msg will be created.
The presence of a RAM/ROM device is determined by
checking the constant =cmostest.

Be sure to check www.hp42s.com ,
and there http://www.hp42s.com/news/doorsopen.html .

HTH

Raymond

Rechageable batteries for HP-41

*Message #1 Posted by **Atomic** on 9 July 2004, 11:36 a.m.*

Do you know if exist rechargeable batteries for the HP-41 i "N" format. The same as alkaline model?

Re: Rechageable batteries for HP-41

*Message #2 Posted by **David Smith** on 9 July 2004, 1:01 p.m.,*
in response to message #1 by Atomic

Yes, they exist.

Re: Rechageable batteries for HP-41

*Message #3 Posted by **Renato (Brasil)** on 9 July 2004, 2:00 p.m.,*
in response to message #2 by David Smith

GP Batteries lists them here : http://www.gpina.com/industrial/batteries/NiMH/NiMHspecs.htm - look for GP45NH down the page.

There was a ebay auction for something like that, but it was a few weeks ago.

They are available in Brazil, but shipping would be too expensive for this.

Renato

Where to buy in Brazil, Renato?

*Message #4 Posted by **Artur** on 9 July 2004, 10:34 p.m.,*
in response to message #3 by Renato (Brasil)

Do you have an estimative of price in Brazil, Renato? I'm interested, as I could find only 4 in BH...

Re: Where to buy in Brazil, Renato?

*Message #5 Posted by **Renato (Brasil)** on 10 July 2004, 2:04 a.m.,*
in response to message #4 by Artur

Not expensive. If I recall correctly, around R$6 each, at Santa Ifigenia in São Paulo - two stores had them, but I do not have their names or phone.

STA-Eletronica should have it, but I could not find in their catalog. They also have N-Size alkaline at R$2.47. See http://www.sta-eletronica.com.br/loja/. Unfortunately they only accept orders above R$200 - if you need more expensive batteries...

Re: Where to buy in Brazil, Renato?

I hate to say this, but to buy the NiCad 'N' cells on ebay is dumb! You can buy the best hi-capacity 230mah 'N' cells at Radio Shack.

Don

Re: Ebay auction for N-size rech batteries

*Message #9 Posted by **DavidY** on 23 July 2004, 3:49 p.m.,*
in response to message #8 by Donald1800

Oh boy yes! If it's on eBay it must be special.

Actually, not only can you buy NiCad N cells at Radio Shack but you can also get NiMH N cells. You may have to check different Radio Shack stores as apparently not all stores carry them. They work great in my 41(s). Been using them for the past 4-5 years without problem. They appear rated to be a 1-to-1 match for their NiCad cells.

Re: Ebay auction for N-size rech batteries

*Message #10 Posted by **Renato (Brasil)** on 24 July 2004, 12:03 a.m.,*
in response to message #8 by Donald1800

I see you point. Many readers of this forum do not live in USA, or anywhere close to a R-S store. Maybe I´m really dumb .... but I could not find these batteries at R-S web site.

Radio Shack part#

*Message #11 Posted by **DavidY** on 24 July 2004, 12:17 p.m.,*
in response to message #10 by Renato (Brasil)

Sorry, Since I've got 5 RS stores within a 20 mile radius I don't use the web site very often its easier to order in store if I have to and I don't have to pay up front or with a credit card. The N-size NiMH rechargeables are often not on the Radio Shack web site. The Radio Shack part number is 23-521 and the cost was $7 or $8 (US) for a 2 pack. I tend to check the battery display whenever I'm in a RS store and if I see the N-NiMH packs I grab some.

Part # doesn't show up on their website

*Message #12 Posted by **Gene** on 24 July 2004, 12:59 p.m.,*
in response to message #11 by DavidY

Might have to find these in stores...or they may have been discontinued. :-(

Gene

Re: Ebay auction for N-size rech batteries

*Message #13 Posted by **Andreas Müller (Ger)** on 26 July 2004, 12:02 p.m.,*
in response to message #10 by Renato (Brasil)

Hello Renato, look at this: http://www.accu-profi.de/akkumulatoren_nimh_einzelzellen.php

It's a shop in Germany where you can get the GP 50 NH (500mA NiMH). They deliver worldwide, AFAIK.

12c to 15c conversion kit

*Message #1 Posted by **OpenRPN** on 9 July 2004, 10:31 a.m.*

I have been actively following the 15c ressurection threads around here and have a solution I would like to toss out. The OpenRPN project seems to be generally well recieved by the community and is a joy to manage... still, I'm always looking for ways to stir up more mischief:

The 10c form factor is still being produced by HP, and 12c's are readily available for a relatively low cost (less than 15c's to be sure). If a few people feel like taking on the task of reverse engineering the current 12c and creating a 15c ROM emulator for it we may just have a cheap and dirty solution on our hands.

Sure, this may not be a *perfect* solution. I think there may be a few LCD indicators missing. But if you can reach 99% of 15c functionality for under $100 who's going to complain. As for the keytops and overlay, we are developing a system for etching them using a commercial laser cutter as part of the OpenRPN project.

I don't have enough time to personally manage such a project, but I would be happy to provide assistance and perhaps take on doing production runs.

Comments?

Best Regards,

Hugh Evans OpenRPN Project Manager

Where is Chris Woodhouse? What does he think!

I think I remember Nelson suggesting that he would try this, once the 15c ROM is extracted?

Regards,

Bill

Re: 12c to 15c conversion kit

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 9 July 2004, 1:26 p.m.,*
in response to message #2 by bill platt

I'd suggest the CPU+ROM replacement with a small "dauther" board with one MSP430F449 from TI running an emulator with the 15C ROM inside it. This chip has LCD controller also and runs from 1.8V to 3.6V directly.

Indeed I have plans to do that (I already have some MSP430s) but I don't have much time now (nor $$$...).

I think that Erik Smith has done good progress on the reverse engineering of the Voyagers (ROMs and CPU emulation).

Best regards,

Nelson

in response to message #2 by bill platt

> Quote:
>
> Where is Chris Woodhouse? What does he think!

Well I think it is a great idea and something I am both willing and have the time to work on. However, I don't really know where to start. I have lots of programming experience and I am even relatively familiar with assembly, but only on an x86 machine. I have never worked with embedded stuff and the extent of my electronics experience is making a siren from two 555 timer/oscillators and that was back in high school. If someone is willing to help me get started I would love to work on this.

Chris W

Re: 12c to 15c conversion kit

*Message #5 Posted by **OpenRPN** on 12 July 2004, 3:39 p.m.,*
in response to message #4 by Chris Woodhouse

I know there are at least a few people hacking at voyagers. All of what I have seen involves the original machines, though.

What I would propose is to dissect one of the current production 12c's. If it does have a bubble of resin, try some of the following:

If you can afford it, have an x-ray taken of the machine. This will give you some idea of what is under that blob.

Get some dental tools and carefully clean the resin off (it's labor intensive, but will be worth the effort).

Once you find out how the machine is layed out, it may be as simple as soldering in a new memory chip to change the ROM.

Re: 12c to 15c conversion kit

*Message #6 Posted by **Eric Smith** on 12 July 2004, 4:34 p.m.,*
in response to message #5 by OpenRPN

> Quote:
>
> Once you find out how the machine is layed out, it may be as simple as soldering in a new memory chip to change the ROM.

The 12C has only had a single chip for quite a while now. Even if they've moved to chip-on-board

(blob) assembly, there's still only going to be one chip.

Re: 12c to 15c conversion kit

*Message #7 Posted by **Chris Woodhouse** on 12 July 2004, 7:25 p.m.,*
in response to message #6 by Eric Smith

Does that mean the 12C to 15C conversion project is DOA?

Chris W

Re: 12c to 15c conversion kit

*Message #8 Posted by **OpenRPN** on 13 July 2004, 1:00 a.m.,*
in response to message #7 by Chris Woodhouse

Just that you have to replace one chip.

Re: 12c to 15c conversion kit

*Message #9 Posted by **Nelson M. Sicuro (Brazil)** on 13 July 2004, 7:24 a.m.,*
in response to message #8 by OpenRPN

Even if the new 12C ones has only one chip, the replacement will be on another PCB attached to the main PCB without the original chip. This new PCB must have a NEW CPU/ROM combination - I'd suggest the MSP430F449 from TI, that works fine with the 3V coin battery cell, has LCD interface, 60KB of FLASH ROM and 2KB of SRAM, serial/I2C/SPI interfaces. This chip must be programmed with a NUT CPU emulator, then you can download on it any of the Voyagers' ROMs.

I have one "semi-dead" HP-11C that I'm planning on do that, I have the MSP430 ones, and the Voyagers' case has space even for a SD/MMC card interface on the side.

I have only 2 thinks to do:

```
1) build a replacement PCB (costs $$$, at least US$30 from
www.olimex.com)
2) Build a NUT emulator to run on the MSP430
```

Anyone else interested on this idea?

Best regards,

Nelson

Re: 12c to 15c conversion kit

*Message #10 Posted by **OpenRPN** on 13 July 2004, 3:07 p.m.,*
in response to message #9 by Nelson M. Sicuro (Brazil)

Why not try to find out what chip HP is using? AFAIK the ACO redesigned the 12c into it's current incarantion, in which case you may be able to pry an answer out of a hydrix employee.

If the chip is something that can be aquired without much difficulty, I would not hesistate to just replace it and leave the rest of the board intact. Why spend $30+ when you could cut it down to a few $$$ instead?

If a new PCB, etc. is the goal I would lean towards some sort of OpenRPN "lite." Where a replacement board can be dropped in place of the original but lack the extra forms of I/O and expandability. The only reason I would propose this is so that not much effort is used by two projects with very similar goals.

I say find out what's running the thing and if you can source the parts. Perhaps even HP would sell a few chips if you ask nicely.

Best Regards,

Hugh Evans OpenRPN Project Manager

Re: 12c to 15c conversion kit

What good does that accomplish? If you do that, you've taken a perfectly good HP-12C, and turned it into... [tada!] an HP-12C. Not very exciting, IMNSHO.

> Quote:
>
> Perhaps even HP would sell a few chips if you ask nicely.

Yes, I know for a fact that HP will sell you the chips. They are available through all the usual HP resellers such as Office Depot. They will cost you approximately $70 each. The good news is that you get a bunch of other parts with the chips, at no extra charge!

*Message #13 Posted by **Nelson M. Sicuro (Brazil)** on 14 July 2004, 9:58*

a.m.,
in response to message #11 by Eric Smith

Here is my point again: as you cannot replaced its INTERNAL ROM, is much easyer to build a small header board with one MSP430F449 like this one, take the original chip off, rewire the LCD/keyboard/power connections and - voilà! A new platform to do whatever calculator you think of with 60KB of assembler 16 bits routines of MSP430... with even 2K of SRAM, and with the very low power of the MSP430 the battery could last for years...

This is why i'm excited about: it is easy, and I think that $23.95 isn't too expensive to do that (plus $9.95 of the JTAG adaptor).

As this can be a side project from OpenRPN, this can be faster and cheaper to start the hardware/software development.

Of course, one can build another PCB with a discrete LCD controller (like the I2C ones from Philips) and a small LPC2106 (or LPC2214 with external memory bus) ARM based microcontroller on it do to the ARM version of the calculator.

Best regards,

Nelson

Re: 12c to 15c conversion kit

*Message #14 Posted by **OpenRPN** on 19 July 2004, 10:49 a.m.,*
in response to message #13 by Nelson M. Sicuro (Brazil)

This sounds like an excellent plan to me. I think we can pull this off by using a portion of the OpenRPN hardware (CPU and memory). At moderate production volumes we could get the ppu around $10.

That said, would anyone here pay under $100 for a brand new 15c? :-)

Yeap! And...

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2004, 12:23 p.m.,*
in response to message #14 by OpenRPN

... is there any chance that some "extra featues" are added? (memory+, 14-segment LCD, etc.) I know it means extensive SW changing, but... why not to ask?

Cheers.

Luiz (Brazil)

Re: Yeap! And...

*Message #16 Posted by **Nelson M. Sicuro (Brazil)** on 19 July 2004, 12:50 p.m.,*
in response to message #15 by Vieira, Luiz C. (Brazil)

I think that the LCD must be the original, I don't know any of-the-shelf LCD display of the same size of the Voyager's. I found some COG character modules that *almost* fit inside the case, but you'll need to "shape" the case accordingly. I'm planning a entire PCB replacement with only one chip - CPU from TI (MSP430F449, with segment LCD controller) and maybe one RS-232 level converter, all operated with the same 3V coin cell of the China made 12Cs.

About the software, as it has FLASH ROM, you can run an emulation OR any other modification you want on the original ROM (more ROM up to 32K(??), more RAM up to 1KB+1KB for the system) or any other software you want on it - even with realtime clock. The battery can lasts years with one of those MSP430 from TI, search for its datasheet to see its (very) low power needs... This CPU costs < US$15 on the market.

I only need one these new HP-12C to "play" with - I'll not sacrifice my USA made flex-PCB near-mint 12C!! It only need to have a case/keyboard and LCD intact, the CPU can be "toasted" ;)

I'll try to do it first with one prototype header PCB for the CPU and manually wired on the LCD/keyboard contacts to begin the OS/emulation develompent. Maybe I can get some help from Erik Smith for the NUT emulation?? ;)

Anyway, I haven't yet the prototype PCB, only the bare 100-pin SMD chip and some ideas...

I accept any help that the comunity can give!

Best regards,

Nelson

P.S. About the internal pictures I promissed you - I was without internet on my home on the weekend, I'll manage to sent to you tonight.

Re: Yeap! And...

*Message #17 Posted by **OpenRPN** on 19 July 2004, 10:44 p.m.,*
in response to message #16 by Nelson M. Sicuro (Brazil)

I'll be bringing up the topic over at the OpenRPN boards soon. Chances are we will do a similar approach only using an ARM7 CPU, a flash chip, and perhaps our new *fix programming language.

I agree with Nelson that it would be crazy to modify the machine using anything beyond a header board. If you want a ton of extra features OpenRPN will probably be your best bet. I will talk to my cohort, Chad, about all this... We're working on a method to achieve triple molded keys at relatively low

cost.

Re: 12c to 15c conversion kit

*Message #18 Posted by **Bruce Horrocks** on 9 July 2004, 7:02 p.m.,*
in response to message #1 by OpenRPN

Isn't the modern 12C rom combined with the processor, surface mounted under a blob of resin/plastic? How would you extract the ROM from the 12C and wire in a replacement when there is no socket or pads for it on the board?

Re: 12c to 15c conversion kit

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2004, 2:27 a.m.,*
in response to message #18 by Bruce Horrocks

Hi, Bruce;

you're right about the new Platinum, but I am not sure if the "flat" HP12C has the same construction. Newer HP12C produced in China (single 3Vcc battery units) still use "classic" SMT assy *(wow! Have I lived enough to consider SMT as a classic technology or are new technologies dying into obsolescence too young?)*, so all terminals/pads to access both keyboard and LCD are still there. In these units there is ony one chip, so your concerns are right about ROM access. I'm not sure about new HP12C models after the HP12C Platinum wasintroduced; are they following the same "blob" scheme?

Re: 12c to 15c conversion kit

*Message #20 Posted by **Bruce Horrocks** on 14 July 2004, 7:40 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

You're right. My mistake: I was thinking of the Platinum's.

Here is a picture of the insides of a modern 12C. No blobs in site but still a single chip.

Re: 12c to 15c conversion kit (edited for typos...)

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2004, 12:19 p.m.,*
in response to message #20 by Bruce Horrocks

Hi, Bruce;

thanks! Your picture is perfect!

This is the same internals of the last HP12C before the HP12C Platinum. I thought they would change the HP12C to follow the Platinum internals, but I see that this was not done. Strange... why not to use these internals and add the new processor only? Well, forgive me: I forgot that the Platinum needs ALG versus RPN "extra" annunciators, so... "why not to design a new one?" And I guess that keeping the earlier HP12C design also means "Don't touch it!!"

Cheers.

82104A Card Reader (revision 1F) bug?

*Message #1 Posted by **Brian Ayling** on 9 July 2004, 9:32 a.m.*

In the (HP41) 82180A Extended Functions/Memory Module manual addendum there is reference to a "Card Reader (Revision 1F or earlier) bug", where the VERIFY function may conflict with an 82181A X MEMORY module if plugged into Port 2.

Can anyone tell me how to identify a Card Reader as "Revision 1F or earlier"?

Re: 82104A Card Reader (revision 1F) bug?

*Message #2 Posted by **Richard Garner** on 9 July 2004, 9:37 a.m.,*
in response to message #1 by Brian Ayling

Catalog 2 will give you a list of all plug-ins you have in the 41C.

Re: 82104A Card Reader (revision 1F) bug?

*Message #3 Posted by **Brian Ayling** on 9 July 2004, 10:39 a.m.,*
in response to message #2 by Richard Garner

Thank you, I just worked it out - CATALOG 2 returns the name of the card reader. I have two, one says "CARD READER" and the other "CARD RDR 1G". The former has a 1980 serial number, the latter 1984. So I guess the first one is "Revision 1F or earlier". Time to go to bed....

Re: 82104A Card Reader (revision 1F) bug?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2004, 1:58 a.m.,*
in response to message #3 by Brian Ayling

Hi, Brian;

I remember the earlier 82104A had a "CARD READER" identifier, and the later ones had their versions added to it. I own two working readers, and the earliest of them has a strange bug. Its ID is "CARD RDR 1E", os I guess that the F-type versions would indicate it as well. The newer shows "CARD RDR 1G".

Just my 2¢.

Cheers.

Spice series ROM self-test reverse-engineered

*Message #1 Posted by **Eric Smith** on 9 July 2004, 4:13 a.m.*

I've mentioned here previously that on the Spice series (HP-3xE/C), the self-test uses a CPU instruction that reads an entire 1K block of ROM words (10 bits each, 10240 bits total) and computes some sort of check on it. Recently some email from Bill Weise prompted me to spend some time figuring out what exactly it is checking. The instruction seems to only provide a pass/fail result, and I'm not yet sure exactly how it indicates that.

Originally I thought it was probably computing a checksum, but I tried both a simple checksum and a checksum with end-around carry, and neither returned a constant value for every 1K block of ROM I've dumped.

Given that the calculator hardware works in an entirely bit-serial manner, it occurred to me that they might have implemented a CRC. Aside from guessing, I had no way to know what CRC polynomial they might use. I decided that the easiest way to find out would be to write a program that simply does a brute-force search by computing CRCs with all polynomials of orders 3 through 16 over two of the 1K*10 ROM page images. For any polynomials that compute the same CRC for both images, the program would then check the other images.

This program took about six minutes on an Athlon XP 1900+ system, and determined that the CRC polynomial is either CRC-10 (x^10 + x^9 + x^5 + x^4 + x + 1) or the reverse (x^10 + x^9 + x^6 + x^5 + x + 1). I'm not sure which because I find the definition of the CRC a bit confusing, since various references show the bits shifting in opposite directions, and the XOR happening on the input or the output side. But in any case, I now know how to verify a Spice ROM image.

More details including links to the code I wrote to do this may be found in my Advogato diary entry.

Presumably HP generated the ROMs by taking each 1K chunk of the assembler output (with one word of zeros reserved for the CRC, probably the last word), computing the CRC of first 1023 words, and storing it (or the complement?) in the 1024th word. A more complicated procedure would have been needed if they wanted to store the CRC in a word other than the last word.

I just realized that if the CRC word that needed to be stored in the ROM happened to be computed as 1060 octal, they wouldn't be able to use it, because that is the bank switch instruction, which is actually active even during the ROM selftest operation. So if the CRC did produce that value, they would have had to change the value of another word. Most of the time there was probably at least one more spare word in a 1K bank that they could tweak for this purpose.

I suspect that RAM write instructions are also live during the ROM selftest operation; there would have been little reason to make the RAM chips smart enough to detect the beginning and end of the selftest operation and disable writes. The logic would have been complicated, and they do a destructive RAM test anyhow.

If they'd tried to use the Spice CPU in a calculator with a printer, card reader, etc., they would have had to put some logic in the controller for those devices to prevent them from responding to ROM words read during the selftest that happen to be device control instructions. That may be one reason why they did not switch to the Spice CPU for later production HP-67 and HP-97 machines. That might also be why they removed the ROM self-test CPU instruction from the Nut CPU as used in the HP-41 and Voyager series.

On some of the Saturn-based calculators, they did add CRC hardware which is used for the ROM selftest (and for

other purposes on the graphing calcs), but it operates under software control rather than as an automatic block CRC.

*Message #3 Posted by **Eric Smith** on 9 July 2004, 8:36 p.m.,*
in response to message #1 by Eric Smith

I wrote about the Spice series ROM selftest instruction:

> Quote:
>
> The instruction seems to only provide a pass/fail result, and I'm not yet sure exactly how it indicates that.

Study of an instruction trace shows that they test status flag S5 after doing the self-test. It appears that S5 gets set if the ROM CRC is incorrect. Apparently it is sticky (doesn't get cleared for a correct CRC), because they don't always check it after the CRC check of every 1K block.

On the Woodstock-series hardware, S5 was one of the external flag inputs, along with S3. These were used for slide switches or other hardware status inputs. S15 is set when a key is pressed.

On Spice, S3 is still used as an external flag input for a slide switch, and S15 is still the key press flag, but apparently S5 is now not available as an external flag. It seems to be used for the ROM test result, but probably can be used for other purposes by the microcode when a selftest is not being performed.

Re: Spice series ROM self-test reverse-engineered

*Message #5 Posted by **Christoph Giesselink** on 11 July 2004, 4:37 p.m.,*
in response to message #1 by Eric Smith

Hello Eric,

I'm not the expert of CRC calculation but I had a similar problem like you to discover the CRC polynom of the 1LR2 Lewis chip. I took me several hours without success because I thought the CRC build must be similar to the known one used in the Clarke/Yorke chip. The Lewis chip documentation was no help because the polynom wasn't described there. I'm a hardware man so I searched about techniques to build CRC' in hardware. It's easier for me to translate hardware into software than transforming a CRC polynom into software.

Here are the two hardware techniques implementing CRC's in chips with a Saturn core. All other calculators with different chips have no CRC generator in hardware. The XOR in the graphics mean that you have to XOR the bit content from the shift register before the XOR and the bit from the feedback.

```
-------------------------------------------------
- Lewis and Sacajawea chip CRC calculation stuff -
-------------------------------------------------

G(x) = x^16 + x^14 + x^13 + x^11 + 1

- Hardware implementation with 16 bit shift register

     +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+
D -> |0| |1| |2| |3| |4| |5| |6| |7| |8| |9| |A| |B| |C| |D| |E| |F| ->-+
     +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+  |
     XOR                                         XOR     XOR XOR        |
      ^                                           ^       ^   ^         |
      +-------------------------------------------+-------+---+-------<-+

-----------------------------------------------
- Clarke and Yorke chip CRC calculation stuff -
-----------------------------------------------

G(x) = x^16 + x^12 + x^7 + 1

- Hardware implementation with 16 bit shift register

            +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+
D --+--+--> |0| |1| |2| |3| |4| |5| |6| |7| |8| |9| |A| |B| |C| |D| |E| |F| ->-+
   XOR |    +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+ +-+  |
    ^  |                              XOR                 XOR                  |
    |  |                               ^                   ^                   |
    |  +-->----------------------------+-------------------+                   |
    +-------------------------------------------------------------------------<-+
```

Some general words to the hardware in the later HP calculators. The HP developers are also only cooking with water. I recognized that they really used very simple hardware constructs. Sometimes it happened in Emu48 that I emulated a hardware piece and I had one exception. Sometimes later I had to add a second or third exception to my concept and this was the time I was knowing my concept is wrong. Next step was thinking, when I have to do the job of developing this hardware under the bound of software is cheap and hardware is expensive, how I would do this? In most cases my solution and what I detected on the calculators are equal. That's not why I'm so good, it's the classic way to solve these problems. Furthermore the HP developers are very conservative, there are several solutions in hard- and software they copied from earlier project. Mostly every feature of the 1LP2 Centipede chip you can find in the later 1LR2 Lewis chip. Form the 1LP2 documentation a had a schematic from the IR-LED output pin, in the 1LR2 document this part was missing and really both drivers are equal.

Finally some words to the software part of CRC calculation. I especially speak here about the software part of Sacajawea and Lewis chip based calculators. As you thought in your MoHPC posting there must be a reference to compare the results of the CRC check with a reference value. On Saturn based calculators it

makes no sense to add every xx KB a checksum because you always have to skip these checksums in program execution. So I wouldn't expect that you have a reference value in each 1KB block. In my case every physical ROM chip has one or two 16bit CRC's at the end of each physical ROM. These two CRC's are build by different methods and reading orders of the ROM content. Finally HP write not the result of the CRC check to the last address for comparing, they use the last 16 bit to adjust the content of the CRC register that it finally contain #FFFF as result of a good ROM image over the complete address area.

I hope this information helps you to continue your excellent work.

Regards

Christoph

Re: Spice series ROM self-test reverse-engineered

*Message #6 Posted by **Eric Smith** on 12 July 2004, 1:50 a.m.,*
in response to message #5 by Christoph Giesselink

Thanks for the informative post about how HP implemented CRCs on their Saturn-based calculators. I have a few minor comments.

> Quote:
>
> All other calculators with different chips have no CRC generator in hardware.

Not true; the Spice series (HP-3xE/C) have CRC checking in hardware. When the instruction 1460 octal is executed, the CPU stops executing normal instructions, fetches 1024 words of ROM starting at the beginning of the 1K block the 1460 instruction was fetched from (unless the 1460 was the last word in the block, in which case it probably checksums the next block, but I haven't verified this), computes the CRC, compares it to a fixed value (residue), and sets flag 5 if there is a mismatch. Finally it does the equivalent of a return instruction, because the PC value was lost since the original PC was used for addressing the 1024 words. All completely hardwired. This is why an HP-34C with 7K*10 of ROM can do its selftest much faster than an HP-12C with 6K*10 of ROM, even though the HP-34C has a slower clock rate. In the HP-12C the ROM checksum has to be computed by software.

> Quote:
>
> As you thought in your MoHPC posting there must be a reference to compare the results of the CRC check with a reference value. On Saturn based calculators it makes no sense to add every xx KB a checksum because you always have to skip these checksums in program execution. So I wouldn't expect that you have a reference value in each 1KB block.

For most of the Woodstock-era hardware, the size of a ROM was 1K*10, so they needed a check value for each 1K. In the later Woodstocks and the entire Spice series, they actually had more than 1K per physical chip, but it was still logically organized as 1K pages, so they kept one check value per 1K page.

There is another reason for keeping the CRC block size small. As the block size goes up, the ability of the CRC to detect multibit errors goes down, but the probability of occurrence of multibit errors goes up. This can be countered by either using a higher-order polynomial, staying with a smaller block size, or using multiple, interleaved correction codes. Interleaved error detection or correction codes are very powerful, and interleaved Reed-Solomon ECC is used on almost all modern disks, both magnetic and optical. I think a form of this interleave technique is what you were describing when you wrote "These two CRC's are build by different methods and reading orders of the ROM content."

> Quote:
>
> Finally HP write not the result of the CRC check to the last address for comparing, they use the last 16 bit to adjust the content of the CRC register that it finally contain #FFFF as result of a good ROM image over the complete address area.

When you compute the CRC of the first [n-1] words, and store the CRC (or the complement of it) in the final word, that does force the CRC of the full block of n words to be a constant value, called the residue. In the case you describe, they arranged for the residue to be all-ones, but various systems use various values. For the Spice series, the ten-bit residue is 0x078.

For serial data transmission, it is common to start the CRC generator with the shift register initialized to all-ones, and to complement the final result. If this is not done, the CRC will not detect dropped (or inserted) zero bits at the start of the transmission. This is not paricularly necessary or useful for ROM checks, but it is still sometimes done.

One thing that I discovered with my brute-search CRC polynomical finder that surprised we somewhat was that there were both order-9 and order-10 polynomials that gave consistent results for all of the 1K ROM pages of all the Spice calculators (with the possibly but unlikely exception of the 31E and 33E which I have not yet dumped). The reason is that the order-10 polynomial is actually the product of the order-9 polynomial and x+1. If I understand correctly, use of a polynomial that has x+1 as a factor is advantageous because it guarantees that errors of any number of odd bits will be detected.

Many TNX Jonathan, I wasn't aware that they must be somewhere because HP made all there later Saturn based machines with this tool. It's a little bit too late because I know them now and also made the table version by myself, but this solves another question I had.

The ROM check in the HP18C and HP28C is implemented as 4 nibble reading each, so I though that the checksum must be a 16bit word. SLOAD shows that it's only one byte at the end of each ROM block. I'll modify Emu28 that way, when the ROM is patched I patch the checksum also and you'll get a correct checksum for selftest. I done this already for the final version of Emu42.

MathJournal On Sale Soon

*Message #1 Posted by **Steve S** on 8 July 2004, 2:34 p.m.*

xThink's MathJournal application for TabletPC's (and PC's with a peripheral graphics tablet, like a Wacom tablet) will be ready for production release in about 3 or 4 weeks (i.e., the end of July) The price will be $198 USD. This information is preliminary and subject to last-minute change.

Folks who followed the early OpenRPN discussions on this forum may recall that MathJournal is an application that allows the user to handwrite a mathematical expression, in a paper-like environment, which is then recognized and solved. Systems of equations, and some symbolic math can also be solved. Graphs can be created, rescaled and resized fairly easily. Handwritten annotation and drawings are also permitted.

I'm not sure if this is the future of computing, but it certainly sets the bar at a new level...!

HP-41 Buying Tips

*Message #1 Posted by **Mike** on 8 July 2004, 2:22 p.m.*

I have decided to start including an HP-41 Buying Tips in all my auctions. I'm finding more and more people selling HP-41 calculators as "like new" and "mint" that have serious problems.

So, I produced this HP-41 Buying Tips, to inform buyers.

I think I may add a comparison chart between the C, CV and CX. But my main focus was letting people know of potential problem areas.

What do you think? Anything else I should mention?

Edited: 8 July 2004, 2:26 p.m.

in response to message #1 by Mike

Great idea, can we link to it?

A problem I have seen is broken tines on the charger port cover, chipped corners on the battery case or corrosion on the battery springs.

Mike H. 1111

Sure linking is ok

*Message #3 Posted by **Mike** on 8 July 2004, 3:31 p.m.,*
in response to message #2 by Mike H

I have no problem with anyone linking to the tip sheet. The more that are educated about this, the fewer will be disappointed.

I would like to avoid people using the link and simply falling back on "you should have asked", which I have heard from some sellers. I hope this educates sellers as well as buyers.

*Message #4 Posted by **Brian Ayling** on 9 July 2004, 4:50 a.m.,*
in response to message #1 by Mike

Possibly also worth mentioning dead or intermittent keys. I know there is a possibility of repair using a tiny wire brush, but I had a Halfnut that wouldn't respond to such treatment (dead decimal point key), relegating the calculator to the parts bin...

Re: HP-41 Buying Tips

*Message #5 Posted by **David Smith** on 9 July 2004, 1:07 p.m.,*
in response to message #4 by Brian Ayling

I've never met a mechanically sound key that could not be fixed using the wire brush technique. Sometimes you have to do it a few times (while preesing and releasing the key). It may also help to use some contact cleaner like DeOxit instead of alcohol.

Re: HP-41 Buying Tips

*Message #6 Posted by **Chan Tran** on 9 July 2004, 2:49 p.m.,*
in response to message #5 by David Smith

David. Can you elaborate on how to fix the keys using the wire brush technique? I have a full nut CV that has a couple of keys with problem.

Re: HP-41 Buying Tips

*Message #7 Posted by **David Smith** on 9 July 2004, 1:10 p.m.,*
in response to message #4 by Brian Ayling

Usually the "1" and sometimes the "2" key like to go a bit soft on the earlier machines with the high top keys.

Also check the length of the display time out and auto-shutoff features.

Also check all the memory. I have a couple of machines with wonky RAM chips.

Also check all the ports. Sometimes one (or often pairs) of ports will not work properly.

Re: HP-41 Buying Tips

*Message #8 Posted by **Brian Ayling** on 9 July 2004, 8:31 p.m.,*
in response to message #7 by David Smith

David wrote : "Also check the length of the display time out and auto-shutoff features."

What should actually be checked? On my three 41's the shut off time varies from 8 to 12 minutes. Is that reasonable? Also the TONE frequencies are noticeably lower on one machine, but that is the one with the shortest shut-off cycle. Swapping batteries makes little difference. Since they all seem to function fine, I assume this is all within tolerance?

Re: HP-41 Buying Tips

*Message #9 Posted by **David Smith** on 10 July 2004, 4:10 p.m.,*
in response to message #8 by Brian Ayling

A fair number of HP41 machines have problems where they shut off after anywhere from 0-30 seconds. Some never shut off. Also some display modules only display while a key is being held down (many times caused by old solder flux on the CPU or display or contamination on the keyboard)

Tone is dependent on the internal clock frequency. The internal clock frequncy is determined by a simple condensator with a tolerance. In the past I used to speed up HP 41 machine's to 175% of the normal speed, consequence was next to a higher power consuption also an linear increase in tone frequency.

Hp33s Survey Programs

*Message #1 Posted by **Jon R. Parton** on 8 July 2004, 8:48 a.m.*

I have currently completed an Inverse, Traverse, and Horizontal Curve programs that are working very well. Within the next week, I will have a Vertical Curve and a program that allows you to find the North and East coordinates along any given curve from the radius point. These programs will available for purchase within the next two weeks.

Sales vs Engineer joke

*Message #1 Posted by **Tom (UK)** on 8 July 2004, 8:13 a.m.*

Alleged discussion at our "sales this week" white board:

Salesman: "Look, this product has sold 10000."

Engineer: "Perhaps the number is written in binary."

Salesman: "If only!"

Re: Sales vs Engineer joke

(longish): So, a company sends three sales people and three engineers to a conference in a neighboring town. The travel by train. As they go through the station, the sales people go to the counter and buy 3 tickets. The engineers buy one.

Sales: "Hey guys,aren't you two going to get tickets?" Eng: "No." Sales: "Why not?" Eng: "You'll see."

So they get on the train, and the engineers immediatelly all crowd into the tiny bathroom. Pretty soon the conductor comes through, and knocks on the door; "Ticket, please". A hand shoves a ticket out the door.

The sales folks are impressed.

On the way back, the sales people buy 1 ticket, and the engineeers buy none. Sales: "Aren't you guys getting ANY tickets?" Eng: "No." Sales: "Why not?" Eng: "You'll see."

They all get on the train, and the sales guys crowd into the tiny bathroom.

Pretty soon one of the engineers walks over, knocks on the door and says "Ticket please". ;)

```
(With some loss due to sub-optimal translation)

A biologist, a physicist and a mathematician are witnessing an
experiment they should analyze
and later explain to their students.
They are looking at a parked, unoccupied car from some distance,
so some of the details are difficult to perceive.

At t=t0, a couple enters the car.
Some time later (t=t1), a door opens and three persons leave the
car.

The biologist says:
They surely were reproducing.
As t1-t0 has not been enough for a full reproduction process,
the woman should have been in an advanced pregnancy state when
entering the car.

The physicist says:
As there were no nuclear reactions involved, it seems to me that
the experiment is invalid,
because mass conservation was not kept.

The mathematician says:
When the next person enter the car, it will become empty again.
```

Re: Software Engineer, Hardware Engineer & Manager

*Message #12 Posted by **Chris Woodhouse** on 10 July 2004, 1:43 p.m.,*
in response to message #1 by Tom (UK)

A software engineer, hardware engineer and departmental manager were on their way to a meeting in Switzerland.

They were driving down a steep mountain road when suddenly the brakes failed. The car careened out of

control, bouncing off guard rails until it miraculously ground to a scraping halt along the mountainside. The occupants of the car were unhurt, but they had a problem. They were stuck halfway down the mountain in a car with no brakes.

"I know" said the manager. "Let's have a meeting, propose a Vision, formulate a Mission Statement, define some Goals, and through a process of Continuous Improvement, find a solution to the Critical Problems and we'll be on our way."

"No," said the hardware engineer. "I've got my Swiss army knife with me. I can strip down the car's braking system, isolate the fault, fix it, and we'll be on our way."

"Wait," said the software engineer. "Before we do anything, shouldn't we push the car back to the top of the mountain and see if it happens again?"

Re: Software Engineer, Hardware Engineer & Manager

*Message #13 Posted by **Garth Wilson** on 11 July 2004, 4:59 p.m.,*
in response to message #12 by Chris Woodhouse

Joking aside, the engineer should have been able to remind the driver that there's a good reason the emergency brake is called that and not just a "parking brake". The handle or pedal has a direct mechanical linkage to the rear brakes that is not affected by vacuum or hydraulic failures.

Interestingly, there might be a linkage between the driver's education mentality and the math education mentality. The driver's ed says you don't have to know how the car works to be a safe driver. The math ed says the graphing calculator can somehow substitute for a good understanding of the material. That idea definitely won't fly when you try to get your pilot's license though!

Statistics, Math, Computer Science, Psychologist

2 + 2 = 5 for extremely large values of 2

2+2=6 (or is it 5)?

*Message #16 Posted by **Veli-Pekka Nousiainen** on 12 July 2004, 12:00 p.m.,*
in response to message #15 by John Nelson

```
John Nelson
```

```
"2 + 2 = 5 for extremely large values of 2"

You must mean the 2nd 2, because if the 1st 2
also has such a value then the answer is 6...
(VPN)
```

Re: 2+2=6 (or is it 5)?

*Message #17 Posted by **martin cohen** on 12 July 2004, 8:19 p.m.,*
in response to message #16 by Veli-Pekka Nousiainen

No, the answer IS 5 for extremely large values of 2. You only get to 6 for humongously large values of 2.

It is harder to figure out the result as 2 approaches zero.

Re: 2+2=5 indeed!

*Message #18 Posted by **Andrés C. Rodríguez (Argentina)** on 12 July 2004, 8:56 p.m.,*
in response to message #16 by Veli-Pekka Nousiainen

2+2=5 is true for extremely large values of 2, indeed!

It is true for the two 2's, because an extremely large value of 2 will be close to 2.5 . A value higher than 2.5 is not "an extremely large value of 2", but an "extremely small value of 3"

:-)

Re: 2+2=5 indeed!

*Message #19 Posted by **Veli-Pekka Nousiainen** on 13 July 2004, 10:25 a.m.,*

in response to message #21 by Ren

If you are really lucky, when doing approximate math in your head (to impress your physics students, who are stunned when you get an answer to better than 10% WITHOUT a calculator!), you have a square root of 10 on the top (or bottom) of an equation, and pi on the bottom (or top). These divide out to very nearly one (certainly as close as you used to get with a slide rule!)

Other coincidences and % difference

*Message #24 Posted by **Karl Schneider** on 13 July 2004, 1:42 a.m.,*
in response to message #23 by Dave Shaffer

Dave posted,

> Quote:
>
> ...square root of 10 on the top (or bottom) of an equation, and pi on the bottom (or top). These divide out to very nearly one (certainly as close as you used to get with a slide rule!)

To verify that these values are within 1% of each other, execute delta-percent on several of your favorite HP (or other marque) calc. You'll really appreciate the 11C/15C/32SII when you try this simple problem on a 42S, 48*, or 49G...

Now, here are a few other approximations, mostly familiar and simple, but all accurate to within 1%:

pi ~= 22/7 (actual: 3.14159265358979323846...)

1 international mile ~= 8/5 km (actual: 1.609344 km exactly)

1 statute (US) mile ~= 8/5 km (actual: 1.60934721869 km)

[the above two items courtesy of the HP-28C]

And one "coincidence" from electrical engineering:

120*pi (376.9911185) ~= Z_0 (376.73031) Ohms

The first term is the angular speed (in rad/sec) of 60 Hz; the latter is the characteristic impedance of free space (sqrt (mu_0 / $epsilon_0$), of which all three constants can be

obtained using the HP-33S. (Unfortunately, the 33S does not give the units of these constants; all three are in SI, based on "meter-kilogram-second".)

> So far, I didn't know anything of an "international mile". Please enlighten me! ;))

I suspect that the "international mile" derives from a definition of 1 inch = 2.54 cm exactly. This differs from the US Statute Mile apparently used for legal and surveying purposes. 640 acres = 1 square Statute Mile.

All of the above conversion factors, terms, and units are available on the HP-28C and HP-28S. This, and a dedicated alpha keypad are their two distinctive features among HP calc's.

Re: Other coincidences and % difference

*Message #27 Posted by **Mark Taylor** on 15 July 2004, 12:24 a.m.,*
in response to message #25 by Walter B

I'm assuming that 1 international mile = 5280 international feet. (As opposed to 1 mile consisting of 5280 U.S survey feet.

The international foot differs from the U.S survey foot by about 2 parts per million.

1 international foot = 0.3048 meters, exactly.

1 U.S survey foot = 1200/3937 meters

The two units above are defined in various legal codes of the individual states of the U.S, such as the California Public Resources Code.

The small, 2 ppm difference does not really make much difference of course, unless you are working with large distances or working with State Plane coordinates, which typically have units in the millions.

By assuming that 1 international mile = 5280 international feet, then yes, 1 international mile = 1.609344 kilometers (exactly).

By comparison, 1 mile consisting of 5280 U.S. survey feet = 1.6093472186944+ kilometers.

So, 1 international mile is about 3 mm shorter than a "mile" of 5280 U.S. survey feet.

Re: Other coincidences and % difference

*Message #30 Posted by **Dave Shaffer** on 15 July 2004, 11:44 a.m.,*
in response to message #27 by Mark Taylor

This discussion highlights why the metric system is SO much better!

For the latest in high precision global "surveying," take a look at http://lupus.gsfc.nasa.gov . For a quick introduction, click on the "VLBI Brochure." Modern geodesy worries about the last millimeter on intercontinental distances (accuracies and precisions of better than a part per billion). (I help support the NASA VLBI effort - if you have more questions about this, let me know!)

Metric units vs. English units

*Message #31 Posted by **Karl Schneider** on 17 July 2004, 2:33 a.m.,*
in response to message #30 by Dave Shaffer

Metric units are indeed better to work and calculate with, but English units are often more convenient in everyday conversation:

e.g.,

"mile" vs. "kilometer"

(Avoirdupois) "ounce" vs. too-small "gram", too-large "kilogram" or non-standard "dekagram"

(fluid) "ounce" vs. too-small "milliliter" or "cubic centimeter", too-large "liter" or non-standard "deciliter"

Degrees Fahrenheit is more convenient than degrees Celsius for ambient temperatures at the Earth's surface. Not only are there 1.8 F degrees per C degree for more precision without fractions or decimals, but numbers are more meaningful at a glance:

```
Reading           deg F              deg C
T <= -41          frigid             frigid
-10 <= T <= -40   bitter cold        very cold to bitter
cold
-9 <= T = 0       very cold          cold
1 <= T <= +9      quite cold         cool
+10 <= T <= +32   frosty             temperate to warm
+33 <= T <= +60   cool               hot
+61 <= T <= +85   temperate to warm  impossibly hot
+86 <= T <= +99   hot                impossibly hot
T >= +100         very hot           impossibly hot
```

This aspect of everyday practicality, in addition to the enormous cost of converting records and signage, is probably the basis of the US' resistance to adopting SI as the official measurement system.

Edited: 17 July 2004, 2:46 a.m.

Re: Metric units vs. English units

in response to message #31 by Karl Schneider

All this shows is that you prefer English units because you were brought up with them.

Why don't you identify yourself?

Message #33 Posted by ***Karl Schneider*** *on 17 July 2004, 3:22 p.m.,*
in response to message #32 by .

".", whoever you are --

It sure didn't take very much thought, effort, or courage on your part to post that garbage, figuratively firing from the shadows and running away...

For the record, I am quite familiar and comfortable with SI and the metric system, having three Science degrees. SI is the official measurement system for science -- even in the US -- and I wish that it had been adopted universally in the US for engineering as well. It's certainly a more sensible system for calculations and computations.

My point was that, for everyday usage without calculations, English units are often easier to use. Most of the terms are short and monosyllabic -- e.g, inch, foot, yard, mile, pint, quart, pound -- and are usually right-sized for the purpose, which is not always the case with metric units.

For example:

- A one-ounce shot of liquor is about "30 milliliters"
- A 12-ounce soda is about "355 milliliters"
- A 25-mile drive is about "40 kilometers"
- A 17-inch sheet of paper is about "43 centimeters"

I believe that the English system was designed with these principles in mind, and not for computational ease. That is the fundamental difference.

-- Karl S.

Re: Why don't you identify yourself?

Message #34 Posted by ***.*** *on 17 July 2004, 9:38 p.m.,*
in response to message #33 by Karl Schneider

Do I not have a right to privacy? I could have posted a fake name to keep you happy, but that would be dishonest.

I did not meant my previous post as an insult. Sorry if it

appeared that way.

A one-ounce shot of liquor is about "30 milliliters" # A 12-ounce soda is about "355 milliliters" # A 25-mile drive is about "40 kilometers" # A 17-inch sheet of paper is about "43 centimeters"

This proves my point. You were brought up with the english system, and feel more comfortable with it.

A one-ounce shot of liquor is about "30 milliliters" # A 12-ounce soda is about "355 milliliters"

Most people in a metric country would not ask for 30 ml or 355 ml of a fluid. We would ask for a 'can of softdrink' for instance.

I could ask for a 2L or 1.25L bottle of coke, and not find that awkward at all. Its just the way you have been brought up.

A 25-mile drive is about "40 kilometers"

Why is this more dificult to use? 25 and 40 are just numbers. How hard is it to say you drove 40 k's?

A 17-inch sheet of paper is about "43 centimeters"

17 and 43 are both numbers. Big deal. The same applies for the silly tempreture example posted before.

I can say 30 degrees c is hot, 25 degrees c is nice, 20 degrees c is getting cool, etc. There is nothing special about those numbers vs their equivilent in the english system.

Re: Why don't you identify yourself?

*Message #35 Posted by **bill platt** on 21 July 2004, 12:08 p.m.,*
in response to message #34 by .

Hi ---

It isn't the "17 vs 43" or the "25 vs 40" that Karl is pointing out---it is the "mile" vs "kilometer" (one syllable vs 4) and "inch" versus "centimeter" (one syllable vs 4).

```
Mass and force (only some of the many!):
carat
grain
dram
poundal
ounce
pound
stone
slug
hundredweight (cwt)
kip
ton
long ton
```

```
Length (pretty comprehensive):
mil
point
line
inch
palm
hand
link
hand span
foot
pace
yard
ell
fathom
rod
chain
bolt
furlong
cable
mile
league

Leaving the Volume, Area etc to you to do...
```

The oustanding thing about customary units is the enormous variety of them. And with only a few exceptions, they are all:

one syllable, related to a common physical item, related in a simple way to some other unit.

Further, they are usually the "right" size for the purpose, for instance a "bushel" of apples is a reasonable container for apples. What's the alternative--352 decilters?!

There are good reasons for metric, AND good reasons for customary. It is not a simple matter to say "one is better!".

BTW you all should like the drams-ounces-pounds---as it is hexadecimal!:^)

Best regards,

Bill

I can't see how you came to that conclusion. If you are equally familiar with both units, I don't see how you would prefer English units for "everyday conversation" unless those conversations where with someone who was not familiar with the metric system. For the record, I know that 1 inch = 2.54 CM, 1 KM ~= .62 miles, 1 kg ~= 2.2 lbs (on earth anyway) and one meter is little longer than a yard, so I don't consider myself to be very familiar with the metric system.

> Quote:
>
> > (Avoirdupois) "ounce" vs. too-small "gram", too-large "kilogram" or non-standard "dekagram"

Too small? For what? When I am comparing the weight of two hand guns, ounces are great. When I am comparing the weight of 2 servos for my 100 gram RC plane, grams are more convenient. When comparing the weight of 2 cars, lbs or kilograms would work just as well.

The above values and descriptions seem rather arbitrary too me. I can't see how they illustrate your point at all. However I do agree that the finer graduations of the Fahrenheit scale is handy sometimes.

Re: Metric units vs. English units (somewhat long)

*Message #41 Posted by **Walter B** on 18 July 2004, 12:12 a.m.,*
in response to message #31 by Karl Schneider

Hi Karl,

of course you may measure liquors and other stuff for your everyday (! ;)) use in any random units you feel comfortable with. You can even order a "big" Coke as long as your counterpart agrees with you about the size of "big". So, the width of the thumb of Henry VIII could be an equivalent basis for a set of units as the meter rod in Paris. The only reason it isn't is the poor consistency of the old English system. Meaning (as said before) you need a lot of strange conversion factors within that system. The previous discussion in this thread has shown this very well.

In my opinion, the traditional American system of metrics consists of a big amount of units people felt comfortable with in certain areas of application in the 16th century. Within each area, this comfort may last until today. But these areas of (different) interest are not connected properly. It needs some effort converting square feet into acres or cubic feet into cubic inches, for example. So it isn't a system really, it is a mess worse than a teenager's room.

The big (and maybe only) advantage of SI is its consistency. For example, you do not need to remember conversion factors going from mm^3 to cm^3 to dm^3. This last unit is known as "liters", so people found easier names than "cubic decimeters" for chatting a the grocers, but consistency is kept! For mass, there is a (metric) "pound" (= half a kg) for grandma's use on the fruit market, but you will agree a conversion factor of 2.00000000000000 is easy to apply even after several ounces of liquor.

Science uses SI worldwide today. Since I belong to this group, I can confirm scientists (try to) use their brains as economical as possible. They try to focus on the real problems avoiding to carry historical ballast. Other people may call this cold or lazy. It is simple economy.

To drop old units you have learned in childhood does not give you warm feelings, certainly. It may seem frosty, but it will make live easier for your children and grandchildren for sure. For the transition period, you may use your traditional units, but (sorry!) these will die with you because of extra complexity without an equivalent benefit. And - since you are the exception - it will become easier for the whole world thereafter. No further need for different sets of nuts and bolts anymore, just to point out one advantage. By the way, I always think it being funny that the first "nation" rising against British rule is the only one sticking to this old mess still.

So, I hope this topic is covered finally. Nevertheless, if you find a better system of metrics than SI, I look forward to your proposal. Closing, I hope I didn't insult anybody by naming facts.

Pretty good essay, but tainted by your sarcasm

*Message #42 Posted by **Karl Schneider** on 18 July 2004, 1:56 a.m.,*

Walt --

That was a reasonably intelligent short essay, that was unfortunately tainted with some gratuituous *ad hominem* sarcasm. To wit:

> Quote:
>
> of course **you** may measure liquors and other stuff for **your** everyday (! ;)) use ...
>
> but **you** will agree a conversion factor of 2.00000000000000 is easy to apply even after several ounces of liquor.
>
> To drop old units **you** have learned in childhood does not give **you** warm feelings, certainly. ... For the transition period, **you** may use **your** traditional units, but (sorry!) these will die with **you** because of extra complexity without an equivalent benefit. And - since **you** are the exception - it will become easier for the whole world thereafter.
>
> Closing, I hope I didn't insult anybody by naming facts.

Well, it seems that, ostensibly, I am an obstinate, singular relic of a bygone era who drinks booze on a daily basis! ;-)

Seriously, it wasn't the so-called "facts" that bothered me...

Regarding the "liquor", I am sure that there are many consumer products that are sold in the US in portions of one fluid ounce, or several. That was the most commonplace example I could think of, though. I certainly did not imply that I, myself, was a daily user. Enough about that.

Let me now repeat several statements I made in a subsequent post that was available at the time you replied to a previous post of mine on this topic. I don't believe that you read these statements before sending your essay:

"For the record, I am quite familiar and comfortable with SI and the metric system, having three Science degrees. SI is the official measurement system for science -- even in the US -- and I wish that it had been adopted universally in the US for engineering as

well. It's certainly a more sensible system for calculations and computations."

"My point was that, for everyday usage without calculations, English units are often easier to use. Most of the terms are short and monosyllabic -- e.g, inch, foot, yard, mile, pint, quart, pound -- and are usually right-sized for the purpose, which is not always the case with metric units."

What remains attractive to many Americans, I think, is the shortness of the terms and the sensible sizing of the units in the English system. For those specific purposes, that is just as much a convenience in the 21st Century as in the 16th.

In fact, there are very many English units of measurement, all named by a short, one- or two-syllable term, and scaled for a specific practical everyday use. The problem, of course, is remebering the conversion factors and doing the required math! But, when no conversions are required, that's not an issue in those cases.

In my "12 ounce = 355 milliliter beverage" example, "ounce" is easier to say than "milliliter", and 12 of something is easier to visualize than 355 of something. Sure, they're both just numbers, as "Mister Dot" pointed out, but the magnitude of those numbers is also important.

During my two years in Germany, I saw 0.3, 0.4, and 0.5 liters listed on reasturant menus as beverage sizes. I also saw "centiliters" listed on beverage cans, presumably to provide better-scaled numbers. However, centiliter is not an SI unit.

So, for measuring a standard-sized beverage in metric, we have the option of a rather large number, a fractional number, or a "quasi-standard" unit.

There are other non-SI metric units that are sized more conveniently for common use -- centimeter, cubic centimeter (cc), hectare, dekagram (perhaps?)

In closing: Again, I'm not strongly advocating the English system, just pointing out its limited attributes and why, in part, the US is reluctant to simply discard it.

visualise this:

try saying, "but I was only going at *66 ft/sec*, officer" with a straight face.

If you are used to one kind of unit, your brain has created lookup tables that make its use "obvious". Changing to a different unit, no matter how convenient or appropriate requires the creation of new lookup tables and is, hence, painful and likely to be resisted by the population.

The use of a system of units in everyday life is to a large extent a cultural factor. Changing it takes at least a generation.

You can argue all you want about how "obvious" and "easy to visualize" a given unit is, but you will not get through to a person using a different unit. Period.

Karl,

since you were 2 years in Germany, you may know the

German word "man". The only way I learned to express it in English is to use "you" in an impersonal way. Please apologize my limited English. Your German may be better.

Once again, I don't bother using fathoms or stones to measure what has to be measured. The SI units m, kg, s and A just build the easiest SYSTEM of units I've seen so far.

And the prefixes do NOT create new units. They are just a convenient way to express powers of 10. E.g. 1 km = 1000 m, 1 dm = 0.1 m, 1 cm = 0.01 m, 1 µm = 0.000001 m. One degree in science or engineering should be sufficient to know this. I've never seen something similar for American units.

Everything clear now? ;)

In my US kitchen in order to cook I need, 1 oz of rum (volume or weight?) that is poured from a 1 liter bottle. 1 quart of milk, 1 pint of cream, 1 gallon of water,a cup of flour, two tablespoons of salt. No consistency.

In the metric system, you use the liter, and its fractions, all consistent.

A building has normally 20 foot bays. When I design a metric building I have 6 meter bays (or 6000 mm bays). However; the US designers always draw a 6,096 mm bay.

The designer asks, how thick should the concrete be, I tell them, like always 6 inches. The designer draws it as 152.4 mm. Why not make it 150mm.

I have not checked the coke cans in Europe, but I would think they are 0.3l not 0.3548l, just like they sell beer. Maybe Coke should change to metric cans (the big bottles are already metric) and sell 0.3000 liters for the price of 0.3548 liters, more profits, less cost for aluminium.

Gee, you Yanks have funny weights and measures. Where I come from, in Scotland, the unit for rum or other liquors used in cooking is the skoosh (as in "just a wee skoosh of rum"), cream comes in dollops, salt is measured in pinches and various other ingredients are measured in smidgens, sprinklings, and so on.

But I will allow as Karl's attachment to those old-world units is more sentimental than sensible. Having lived in Australia for many years, I find weather forecasts in Fahrenheit near-incomprehensible. Centigrade/Celsius is just so much more sensible - at least, to me.

Best,

--- Les [http://www.lesbell.com.au]

Uh, no. -- I expressed no such "attachment"...

> *But I will allow as Karl's attachment to those old-world units is more sentimental than sensible.*

I'd like to put this thread to rest, but I couldn't quite let this statement go unchallenged. I suspect that with all the counterpoints (as well as some off-the-mark rebuttals), some clarity has been lost.

I have no "sentimental attachment" to the English system. My earlier posts clearly expressed that I wished that metric/SI had been adopted for engineering, as well as science, in the US. I am quite familiar with both systems, despite what Walter B. seems to imply.

My main point was that English units are usually easier to say, and oftentimes more-appropriately sized for the common, simple, everyday purposes for which it was originally developed/evolved. I prefer Fahrenheit for the specific purpose of surface ambient-air

temeperatures (see Jeff's post for a very good explanation). However, I also fully concur that the English system is not very coherent or structured.

Karl;

I agree with you. In land surveying and civil engineering; feet, tenths and hundredths are used. Us folks that build things like roads, railroads, airports, bridges and such use them too. We can calculate with decimals and percentages but we don't have the disadvantage of using units of the wrong size for the job.

To us; single millimeters are always too small. Centimeters are too coarse for structural steel and finish concrete (where we use hundredths) but too fine for rough grade and dirt work (where we use tenths). Decimeters are always too coarse. Meters are often too big to use as a target for equipment operators because sometimes the lath you mark it on is not sticking up out of the ground far enough to show an even meter.

I've used feet/inches, decimal feet, S.I., and gunters chain/links. I'll take decimal feet for my work any day.

President Ford tried to get the U.S. to convert to metric, and I used to go along with it wholeheartedly, having to explain what I meant to many who refused to be bothered with a system they were not familiar with. But after I got into industry, I realized that even if everyone did want to convert, there would be a very high

price to pay in equipment. We have so much machinery and other equipment that's all calibrated in inches, pounds, gallons, etc.. Computers control certain equipment like milling machines more now than back then, making conversion easier if the applicable software were installed; but there's still too much that that does not cover. President Ford got a lot of highway signs changed at a huge expense, but that was hardly the tip of the iceberg. I wish we could change, but now I'm not sure it's possible without a huge initial hit to the economy.

*Message #52 Posted by **unspellable** on 20 July 2004, 8:32 a.m.,*
in response to message #50 by db(martinez,california)

Surveying in the US is done using the US Survey Foot which is not the same as the standard International Foot. Aside from a small difference in length the US Survey Foot HAS no inches by defintion. Also by defintion it is subdivided into 0.01 foot.

International Foot = 0.3048 meters by definition

US Survey Foot = 0.304800609601 meters by defintion

Also, the pound has for some time (since the 1960's) been defined as a unit of mass. When speaking of force it is the pound force or lbf. 1 lbf accelerates a mass of one slug at the rate of 1 ft/s. There is a second unit of force, the poundel which accerlates a mass of one pound at one ft/s.

The metric users are no better. I have technical drawings using the kilogram as a unit of force.

In the 90s I worked for a company that made slip-form cocreate pavers, all of those pavers were designed to pave a certain width roadway in feet, not meters. As I recall interstate highways are supposed to have 12 foot lanes with a 4 foot left shoulder and a 10 foot right shoulder, which is why one of the most common machines was a 38 foot wide paver.

Re: Metric units vs. English units

*Message #55 Posted by **bill platt** on 21 July 2004, 2:37 p.m.,*
in response to message #54 by Chris Woodhouse

Yes, the 12 foot lane is true, except that they don't actually design and document it that way--they say 3658 mm. In other words, go read the actual drawings, and they are all metric--and not merely converted---(yes, some of the sizes originated in the legacy units---but they were translated).

I learned this from a consultant who came in to my shipyard to "teach" us metric when we were founded---as it was a US yard, with US personel, but a German-Norwegian parent company/sister yard.

The consultant worked with the Highway Administration in the past. The one interesting thing I learned from this "metric" class was the concept of "hard" verss "soft" conversions----if I recall, a "hard" conversion was an approximate (depending on roundoff) conversion from one unit system to another---For instance, 12 feet, change the standard to 3.7 meters would be "hard". From then on, you simply use 3.7 meters, or maybe eve n just og to 4 meters, and forget about the 12 feet.

A "soft" conversion, on the other hand, would keep the original true dimensions----or 3.6576 meters. It maintains the original actual size of the 12 foot measure.

This issue is even brought out in another post--Walter S? about "20 foot bays" is buildings being designed as 6 meter bays, and 6096 mm by us (shouldn't this be 6517 mm?) etc...

I may have "hard" and "soft" reversed here.

It is interesting because it happens quite frequently---and I found it to be a good thing that someone else had not only grappled with the problem, but taken the time to codify and systematize it.

The other issue is that if you have a standard that is 12.0 feet (+/-.1 foot), then it makes no sense to translate this to

3657.6 mm--too much precision---it should be 3660 mm +/- 10 mm or such.....Which also shows that, as with discrete numbers in a calculator, where som,etime sthe solution o the inflextion point etc is "in between" the possible numbers in the machine, so it is with units of measure.

regards,

bill

in response to message #55 by bill platt

Bill:

Your use of "hard" vs. "soft" conversions is correct. It's just the opposite of which would be which by intuition alone.

A highway lane 12 feet wide is only 3.6 meters wide by a hard conversion per the California Dept. of Transportation Highway Design Manual. You can run into trouble by "hard" converting vertical clearance heights for overpasses, tunnels, etc.

in response to message #54 by Chris Woodhouse

Chris; I'm doing a California state highway (freeway) right now. I don't know if it meets interstate spec. Both the shoulders are 3 m except for a couple of quick exceptions that are from 2.4 to 3.6 m and the lanes are 11.81 feet. I guess that is to give an "even" 3.6 meters. Just as you said; the paver on the airport job we just finished opened up to a nominal 40 feet.

Hey Bill, As i understand it; in the seventies the feds said that the states and local municipalities could design and build using any units of measure they wanted (arpents anyone?). However, the feds would only pay matching funds if it was

engineered and layed out in metric. Then not. Then again. Now i hear that California is letting out contracts to bid in decimal feet again but i have no word on what this means. I am glad to hear it though. This metric stuff is fine for nuts and bolts, metal thicknesses too. It's just that nothing i do matches even metric units.

I guess all those oddball english standards were usefull to someone at sometime. Only Dios knows what good perches, acres breadths, shaftments, hands breadths, or barlycorns were originally for but i bet they were useful to someone somewhere. BTW: did you know that 10 Gunters chains equals one furlong? Now THATS decimal!

I assume you know that 32 degrees Fahrenheit is the freezing point of water.
OK, how about this for Fahrenheit vs. Celsius: The Fahrenheit scale seems to put 0 degrees and 100 degrees at the extremes that humans typically experience and can more or less tolerate. Zero F is damn cold but can be lived in with proper clothing, 50 F is pretty comfortable, 100 F is damn hot but can be lived in. Celsius puts the 0 and 100 extremes at the freezing and boiling points of water. Who cares how comfortable water is! On the Celsius scale, the "comfort range" for people is -18 C to 38 C. Not nearly as nice as 0 to 100.

(The above is a tongue in cheek analysis, and of course my opinion only. No offense to anyone holding a different view is intended or implied. I readily admit the general superiority of the Metric over English unit system. The "comfort range" also probably shows a mid-north-latitude bias. Metric vs. English is kind of like Science vs. Religion, or HP vs. TI, RPN vs. Algebraic, or Chocolate vs. Vanilla. If you care enough to argue, no amount of argument is likely to change your opinion.)

So, say, 1 degree F is within the comfort zone, but 101 degrees F isn't?

Don't be silly.

The extremes were chosen so that you can easily calibrate a thermometer. Both camps arbitrarily chose values that were convenient to them.

Any discussion as to which is "bettter" can only be compared to religious discussions about whose religious beliefs are more believable.

Huh?? :-)

But, while you're commenting (again) on my post from four days ago, I'll revisit a comment from your first reply:

> Quote:
>
> *The above values and descriptions seem rather arbitrary too me. I can't see how they illustrate your point at all.*

To assist you and Mister Dot, who called this a "silly tempreture *[sic]* example":

The ranges are anything but "arbitrary". I've identified "double-digit negatives", "single-digit negatives", "single-digit positives", and so on, up to "triple digit positives". It is plain how one can quickly identify a "severe" air temperature, simply from the sign and number of digits of a Fahrenheit temperature reading, without really interpreting the digits. Jeff illustrated my point rather well.

As for the descriptions, I think they're certainly reasonable, although "cool" and "temperate to warm" should have been divided into one more range.

Reading	deg F	deg C
T <= -41	frigid	frigid
-10 <= T <= -40	bitter cold	very cold to bitter cold
-9 <= T = 0	very cold	cold
1 <= T <= +9	quite cold	cool
+10 <= T <= +32	frosty	temperate to warm
+33 <= T <= +60	cool	hot
+61 <= T <= +85	temperate to warm	impossibly hot
+86 <= T <= +99	hot	impossibly hot
T >= +100	very hot	impossibly hot

Re: Fun with a tape measure

*Message #65 Posted by **Chris Woodhouse** on 22 July 2004, 8:39 a.m.,*
in response to message #64 by Karl Schneider

> Quote:
>
> Huh?? :-)

You can have fun with a tape measure too :)

If you extend a tape measure out to the current year (104, since no tape measure I know of can go to 2004). Then fold it over so the zero mark is inline with the current year. Now look for your year of birth. Directly across from that you will find the age you will be on your birthday of this year. For the current year you will have a 52" long loop if you are using inches. While that is do able with a sturdy tape measure, it is a bit unwieldy. A 52 cm long loop is much more manageable.

When you put your temperature ranges together with your descriptions I still find the ranges pretty arbitrary. From the perspective of someone who grew up in Gunnison, CO and Syracuse, NY and spent 2 summers in Florida, I have significant disagreement with your ranges and descriptions. Here is how I would lay it out in degrees F

```
Below -15     Cold enough to kill you if your not
careful
-14 to 10     Bitterly cold
11 to 29      Very cold
30 to 49      Cold
50 to 68      Cool
69 to 78      Comfortable as long as it's not too
humid or too windy
79 to 90      Hot
91 to 105     Very hot
106+          Hot enough to kill you if your not
careful
```

Of course the hot and cold enough to kill you ranges get larger without and with water respectively, and with extended time.

22/7 is an OK approximation for pi. 355/113 is much better.

> These divide out to very nearly one (certainly as close as you used to get with a slide rule!)

Aw, come on-- If you can't tell .993 from 1.000 on a slide rule (even a little one), I'd say you needed some new glasses!

It's interesting though that people used to be happy with 3-4 digits and never more than 5 on a slide rule, but now they have an issue with a calculator that doesn't get the 10th digit correct!

in response to message #68 by John Mosand

Two friends, both engineering students, pass each other on a campus sidewalk. One is riding a bicycle. The other says, "Hey, where did you get that great bike?" The other replies: "It's the strangest thing. Yesterday, I was walking down this very sidewalk, when this pretty girl comes riding up on a bicycle. She stopped, got off the bike, took off all her clothes, and said, "Take what you want!" The other student thinks for a minute, nods, and says, "Good choice. The clothes probably wouldn't have fit."

(Of course, I was a liberal arts major. You know. "Would you like fries with that?)

Engineers?? I think they were architects, and the faggot ones. Not engineers for sure at least brasilians ones. Do the engineers do the bike choice in your country? hahaha?

Re: Not true at all

*Message #71 Posted by **Garth Wilson** on 16 July 2004, 11:43 a.m.,*
in response to message #70 by Marx Pio

Sure-- We have a lot of serious cyclists in the U.S. who are engineers. I'm one of them, and one of my first thoughts was that the bike probably would not have fit much better than the clothes. (A $300 bike that's your size may be better than a $5,000 bike made for someone 6" shorter.) Still, most of the engineers would have made a different choice.

Just a joke, of course.

*Message #72 Posted by **Michael Meyer** on 16 July 2004, 11:19 p.m.,*
in response to message #71 by Garth Wilson

My 12-year-old told me this gem: "Never put down another person until you've walked a mile in their shoes. That way, they'll be a mile away when you do it, and, besides, you'll have their shoes."

Let's see. I'm a heterosexual, who enjoys engineering, and I was a bicycle mechanic for over 10 years. (At a real pro shop... top of the line. Nice. A shop that recognized QUALITY of service over a quick buck.) I guess that leaves the bike or the girl. I guess I'd pick the one that looks like it'd fit the best <grin>.

Solution times for matrix problems

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 7 July 2004, 11:51 p.m.*

Valentin's submission "Re: Your 15C results are *wrong*!" of 6:39 on July 1 ended with the following statement: "A final advice, if you would: as I understand you're working in some project re the friendly HP-TI competitions, it would be most proper to thoroughly test and validate each claimed program running times, results, and the like, made by both TI and HP sides, lest you'll find yourself embarrassed by non-reproducible, provably erroneous results. Unlikely perhaps, but a rigorous approach is mandatory for scholar-type projects." Shortly after that submission he realized that he had not reproduced my results because he was not working the same problem. As a result of his comment I belatedly realized that I have not addressed running times in my discussions. So, here goes, and if readers don't agree with my results or conclusions I am confident that they will let me know.

In my mind we need to focus on the total solution time including both the time to enter the test matrix, the running time, where running time includes the time to calculate the determinant if that is required as with the HP-41 Math Pac and the TI-59 Master Library, and the readout time. As a place to begin I used the 4x4 inversion from Kahan's paper "Mathematics Written in Sand". With the test matrix in place the approximate times for data entry and run times in seconds until indication that the inversion was complete are

Machine/Program	Entry	Run	Total
HP-15C (from Kahan's paper)	40	11	51
HP-41 Math Pac MATRIX	65	40	105
HP-41 Advanced Solutions MATRX	65	7	72
HP-28S (/ or INV)	45	2	47
TI-59 Master Library (ML-02)	35	90	125

where the long entry times for the HP-41 programs are due to the need to wait for the display to settle after one entry before making the next entry. If the user goes too fast he will get false entries. For the HP-28S and the TI-59 I simply can't enter the data so quickly that I can induce false entries. I am not sure what the HP-41 programs are doing during data entry. Years ago there were some TI-59 matrix inversion programs that did some processing in response to each input before accepting the next input. That does not appear to be the case with the HP-41 programs since I can recall the entered input data from memory after completing the input. Perhaps the delay is due to generation and display of prompting messages. If you know, let me know. My method for the HP-28S is to establish a 4x4 matrix by the 4 ENTER IDN sequence and enter the elements of the matrix with PUTI commands.

I did not include the times required to read out the solution in the table above. There is some short, fraction-of-a-second running time between display of individual elements for the HP-41 and TI-59 solutions. For the TI-59 there is an additional two second delay as the output switches from the end of one column to the next. That delay is used in decoding the pivoting index to identify which column to display next. For the HP-41 Math Pac program the delay when moving from one column to the next is over fifteen seconds. I think that time is actually used to calculate the elements in the next column. So far as I can tell the program delivers one column of solution elements at a time to R35 through R38. If you disagree, let me know.

There are also differences in the availability of the solution elements for further calculations. The HP-41 Advanced Solutions (MATRX) program leaves them in order, row by row, starting at R01. The TI-59 ML-02 leaves them in columns starting at R08, but the order of the columns may be scrambled if pivoting was required during the solution. The HP-28S leaves them in a matrix in level 1 where they can be operated on as desired. As noted above I'm not sure exactly what the HP-41 Math Pac solution leaves in memory

*Message #2 Posted by **Valentin Albillo** on 8 July 2004, 4:51 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer wrote:

"In my mind we need to focus on the total solution time including both the time to enter the test matrix, the running time, [...] and the readout time."

I don't concur. I think the only significant time here is the running time, not the input/output time. Taking them into account introduces a strongly subjective factor, because times then will depend on the ability of the particular user doing the tests, and the methodology he/she uses to do the input/output, both of which are highly subjective.

Just for instance, you give 40 seconds to input Kahan's 4x4 matrix into the HP-15C while I've timed myself to do it in 30 seconds, routinely, instead of your listed 40. That makes a significant difference to the totals. Also, you take quite different times if you're reading the numbers from some

paper or screen one at a time, or else if you memorize a row of them and then enter them without further looking. Finally, any user is likely to be more used to a particular machine, and be more comfortable with it than with others, so further biasing the times.

There's also the fact that normally the operation under test (a matrix inversion in this particular case) means little by itself, being usually called from another program or routine. In that usual case the one and only relevant info is the time for the inversion, as the calling program will have stored or computed the input elements and will take care of using the output values for whatever it needs them, all of them or perhaps just some. This being so, including human input/output times is useless at best and misleading at worst, and can seriously bias results.

So, in my very humble, particular opinion, unless you time only the computation itself, excluding input/output times, your results aren't going to be as significant, objective, and useful as they should.

As a final comment, you don't include results for the HP-71B. Mine does invert this matrix in under 2 seconds. And relevant to what I've just stated, input time *absolutely* depends on your methodology, i.e:

- You can input data using a loop, like this:

```
10 DIM A(4,4) @ FOR I=1 TO 4 @ FOR J=1 TO 4 @ INPUT A(I,J) @ NEXT J @ NEXT I
```

- Or, you can input the whole matrix at once, elements separated using commas:

```
10 DIM A(4,4) @ MAT INPUT A
```

- Or, you can put the elements in a DATA statement and read them all at once:

```
10 DIM A(4,4) @ READ A()
20 DATA element1, element2, ..., element 16
```

- Or, you can enter the elements into a file with some program or editor, then have the matrix inversion program read them all at once, like this:

```
 10 DIM A(4,4) @ ASSIGN #1 TO "MYDATA" @ READ A() @ ASSIGN #1 TO *
```

As you can see, all are valid input methods and you'll use one or the other depending on the particular need or your personal taste. I, for instance, tend to use a lot the DATA method, because you can very easily make corrections, additions or deletions by simply editing the DATA statements, instead of relying in the command stack or re-typing.

And of course, all of them will give vastly different input times, even not considering the (considerable) variation in physical dexterity to key in the values among the diverse human testers. Not to mention output times, which I'd rather not touch here.

Best regards from V.

Re: Solution times for matrix problems

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 9 July 2004, 12:13 a.m.,*
in response to message #2 by Valentin Albillo

Thank you, Valentin, for your comments and for the run time information on the HP-71B. I agree that we need to be able to call module programs as subroutines of our own programs, but I do not want to give up the ability to use the module programs efficiently as stand alone problem solvers. I also want to be able to operate directly with the output of the module programs; for example, I want to be able to subtract the exact value of an element of an inverted matrix from the displayed value, and then divide the result by the exact value, see the relative error in the display, press R/S and see the next element of the solution. I can do that with the output of the MATRX program of the HP-41 Advanced Solutions Pac, and with the output of the ML-02 program of the TI-59 Master Library, but not with the MATRIX program of the HP-41 Math Pac. There may be a way to do what I want with the output of the MATRIX program but I haven't figured out how to do it. For TI-59 users being able to do arithmetic on the displayed solution was particularly useful since it was the way the user looked at the guard digits.

I suspect that my preference for the fastest possible data entry is tied to the good, old days when a mainframe ran for many minutes to get solutions which we now obtain in seconds with hand-held devices.

While working through the solution times and reviewing the matrix inversion results I have presented it suddenly occurred to me that I may have become more than a little spoiled by the capability that has been developed over the years. I am impatient when the inversion of an 8x8 matrix takes more than a few seconds. I think of a program as marginal when I find that it can't get exact answers to the inversion of an 8x8 Hilbert. I thought back to another time in the late 1970's when the HP-67 and the SR-52 were the flagship portable, programmable calculators for their manufacturers. Last year I had purchased an HP-67 and I recently had it repaired. A Standard Pac of magnetic cards was included in my purchase. I noted that matrix operations were limited to 3x3. I also remembered that back in 1977 programmers such as Barbara Osofsky on the SR-52 and Hal Brown on the HP-67 had managed to overcome the severe memory limitations of those machines and achieve 4 or 5 place accuracy for inversion of the 5x5 Hilbert matrix. In a Biblical sense those inividuals were truly "Mighty men (and women) ... ...of renown."

Heres an interesting item.. When I invert a modified 3x3 Hilbert (a standard 3x3 Hilbert multiplied by 60 to yield all integers in the test matrix) with the 3x3 program in the HP-67 I get an exact answer. I haven't been able to get an exact answer with either HP-41 program, with the HP-28S or with the TI-59. I suspect that the HP-67 succeeds because it uses a much more straightforward solution for the inverse as defined on page 10-01 of the manual. I don't remember seeing that form before. I'll try to refresh my failing memory with a look at my old copy of Fadeeva when I am at our winter home this weekend.

Re: Solution times for matrix problems

*Message #4 Posted by **Valentin Albillo** on 9 July 2004, 7:30 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer posted:

"I noted that matrix operations were limited to 3x3"

Standard Pac's programs were meant as simple examples for the user to get to know his/her new calculator, and they absolutely lack any degree of sophistication or advanced programming techniques. With proper programming and using just a one-card program and no data cards, you could still solve a 7x7 system of linear equations in an HP-67, a 12x12 tridiagonal system of equations, invert a 5x5 matrix in place, or do 4x4 matrix operations within a single program, to name a few.

"When I invert a modified 3x3 Hilbert (a standard 3x3 Hilbert multiplied by 60 to yield all integers in the test matrix) with the 3x3 program in the HP-67 I get an exact answer. I haven't been able to get an exact answer with either HP-41 program, with the HP-28S or with the TI-59."

Inverting a 3x3 matrix is so easy you can do it on your head, I've done it a number of times when sleep wouldn't come or just for fun. The HP-67 program doesn't try for any general, NxN algorithms (such as diagonalization, Gauss-Legendre, exchanges, etc) but simply uses the exact solution for the 3x3 case, inverting the matrix by minors. This entails only multiplications, which are exact if the matrix elements are small enough integers, and a final scalar division of all elements by the value of the determinant. This division also comes out exact, so you're never working with approximate real numbers or rounding. On the other hand, the programs for the machines you mention (and the HP-15C, 71B, etc) do use general NxN algorithms, that entail divisions all the time as part of the reduction process. This is bound to generate inexact results, which becomes important if the original matrix is ill-conditioned. The HP-67 approach doesn't suffer from this, but would be prohibitively slow and cumbersome if used for larger matrices.

Anyway, Palmer, I think you're far too worried (obsessed one might say) with top accuracy, and precision and all that jazz, struggling to get those elusive and exclusive TI guard digits into the light, etc, etc. Perhaps a little example will help you take it easier. Here, take your favourite calculator(s) among the 500+ you own, and evaluate this simple polynomial:

```
1335/4*y^6 + x^2*(11*x^2*y^2-y^6-121*y^4-2) + 11/2*y^8 +x/(2*y)
```

for x= 77617 and y = 33096. Compare your results among the diverse calculators and computers, and tell me your best veredict as to what the result is.

Best regards from V.

Re: Solution times for matrix problems

*Message #5 Posted by **bill platt** on 9 July 2004, 12:55 p.m.,*
in response to message #4 by Valentin Albillo

This is a trick question.

> Quote:
>
> 1335/4*y^6 + x^2*(11*x^2*y^2-y^6-121*y^4-2) + 11/2*y^8 +x/(2*y)
>
> for x= 77617 and y = 33096. Compare your results among the diverse calculators and computers, and tell me your best veredict as to what the result is.

It depends on the order in which you sum the terms. All but one of the terms are very large:

```
term 1 is about 4.39 E 29
term 2 is about -7.917112 E36
term 3 is about 7.917111  E36
term 4 is about 1.1726

The combination of terms (2) and (3) is about -4.39 E29

So, if you add terms (2) and (3), then term (1), you may get zero, which is added to 1.1726,
which is a red herring.....

Or, depending on round-off, you might find that (term 2) + (term 3) + (term 1) = 3.58 E25

Or, if you add (term 1) + (term 2) + (term 3) you will get exactly 4 E25

So, the point is that addition is not truly commutative
on a calculator---one must pay attention to the precision
 and the floating points!

I suspect that if I did a manual solution, I would find
```

```
 that terms 1,2,3 should cancel perfectly.  At least that
would be a fitting result, considering the author of this
 quiz :-)
```

By the way, the numbers I generated up above are from the 32s, which I programmed, using registers "x" and "y" and calling them, and storing each term into a register (a b c d)

When I put the whole mess into the command line on my 30s (the cheap hp-kinpo-compaq thingie) I got 1.17260394---in other words, the first three terms seemed to have cancelled perfectly.

so, perhaps the 30s is "better" than the old RPN?

Can someone please test this on the 33s?

Best regards,

Bill

Regards,

Bill

Re: Solution times for matrix problems

*Message #6 Posted by **bill platt** on 9 July 2004, 1:22 p.m.,*
in response to message #5 by bill platt

More:

If you solve it in Excel, you have commutative issues, too:

Make variables x and y.

Then, sove each term on its own (you can copy Valentin's formulas *exactly* into the cells)

Now, do it so that you have a column, with:

```
term 1  ; {4.39 e39}  cell t1
term 2  ; {-7.917...E36}  cell t2
term 3  ; {7.917...E36}   etc
term 4  ; {1.1726}

Now, if you use the "Sum" command on this column, you get:

-1.18059E+21

If you sum term1 + term2, and add that result to term3, you get:

t1 + t2 = -7.917...E+36,
and the final resutlt of (t1 + t2) + t3 = 0

On the other hand, if you do:
(t2 + t3) + t1, you will get, -1.390061E+21

If you write:  =t1 + t2 + t3,  you will get exactly 0.
```

Edited: 9 July 2004, 1:24 p.m.

Be Careful when Mixing floating point numbers

*Message #7 Posted by **bill platt** on 9 July 2004, 1:51 p.m.,*
in response to message #6 by bill platt

The basic problem is most easily seen in term 2:

x^2*(11*x^2*y^2-y^6-121*y^4-2)

y^6 is on the order of 10^27 121*y^4 is on the order of 10^20 Adding them togather on a caclulator, you really only feel the very first couple of digits of the 10^20 portion being added to the 10^27 portion.

So, when you subtract "2" it is not even felt---it doesn't really happen.

The moral of the story here: watch what happens with the numbers.

It is also instructive to note that it is very much easier to realize what is happening with something like this, if you actually go through it step by step---because you will see the magnitudes and have a chance to realize what is going on.

Whereas, if you use the fancy programmability, or you type into a formula window and ask for the answer, you may not see or realize the nuances---unless you bothered to look initially.

This is a lesson which should be taught to all schoolchildren, when they get to the stage where they are using machines for computation. It is a classic problem in (machine) numerical analysis.

And, it should be remined to the rest of us, too! (thanks, Valentin).

Best regards,

Bill

Yes, yes. And the result is ? [NT]

Re: Yes, yes. And the result is ? [NT]

*Message #9 Posted by **Werner Huysegoms** on 12 July 2004, 10:51 a.m.,*
in response to message #8 by Valentin Albillo

```
the exact result is -54767/66192 = -0.827396059947
but if I key the exact formula in and evaluate it in approx mode, it returns 3.076e25

This is how I can get the result in approx mode:

order by powers:

   11/2*y^8 - x^2*y^6
 + 1335/4*y^6 - 121*x^2*y^4 + 11*x^4*y^2
 - 2*x^2
 + x/(2*y)

Take t=11*y^2

   y^6*(t - 2*x^2)/2
 + 1331/4*y^6 + y^6 - 121*x^2*y^4 + 11*x^4*y^2
 - 2*x^2
 + x/(2*y)

or

   y^6*((t - 2*x^2)/2 + 1)
 + t^3/4 - x^2*t^2 +x^4*t
 - 2*x^2 + x/(2*y)

   y^6*((t - 2*x^2)/2 + 1)
 + t/4*(t - 2*x^2)^2
 - 2*x^2 + x/(2*y)

In this form, it can be evaluated as follows:

x := 77617;
y := 33096;

y2 := y*y;
x2 := x*x;

t := 11*y2;
u := t - 2*x2;

f := (1+u/2)*y2^3 + t/4*u^2 - 2*x2 + x/(2*y)

yields -0.82739605995
```

Re: Solution times for matrix problems

*Message #10 Posted by **Martin cohen** on 9 July 2004, 2:41 p.m.,*
in response to message #5 by bill platt

On my 33s (which I am coming to really like, aside from the decimal point visibility/point-comma confusion), I get:

(Note: All results are the full results displayed with the "ALL" Display option)

term 1 = 4.3860575085E29 term 2 =-7.9171117992E36 term 3 = 7.9171113406E36 term 4 = 1.17260394005

If I do (1)+(2)+(3)+(4) I get -2.E25

If I do (2)+(3) I get -4.3863E29

If I then add (1) I get -2.4249155E25

So (1)+(2)+(3) is not the same as (2)+(3)+(1)

I don't have my 49G+ with me, so I can't evaluate it exactly.

For those who are interested, Section 4.2 of Knuth's "The Art of Computer Programming" and Chapter 1 of Wilkenson's classic "Rounding Errors in Algebraic Processes" (published in 1963 and still useful) have good discussions of these storts of things. Kahan has good stuff also.

Martin Cohen

Very interesting. And the result is ? [NT]

Hi, VPN:

Care to do it in floating point, please ? Exact integer arithmetic is useless for discussing floating point implementations and their problems. Not to mention a single square root, e^x or trig function renders it useless. Or perhaps your machine can't cope unless 'cheating' by doing it the integer way ?

Speaking of integers, I'm still waiting for you to find out the product of the 3 prime numbers I suggested you to try. Or will you give a floating point answer instead ? ;-)

Best regards from V.

Hi, VPN:

VPN posted:

"if ENTERed as stated it goes to zero even with 100 'DIGITS' STO and using LongFloat library"

Then something's surely wrong with your "LongFloat" implementation because 40 digits are more than enough to give an accurate result, let alone 100. If 100 'DIGITS' STO (that is, DIGITS = 100 for us straight people) produce a zero result like that, I wouldn't trust that 'LongFloat' library at all.

"I have totally forgotten that during my vocation Care to repeat the question?"

Not really. I deleted the text file with the question. Anyway, it wasn't that important, just a chance for you to test your machine's long integer precision as well as delighting in the beautiful result. By the way, I didn't know that 'vocations' would have such negative side effect on memory. Are you applying for priesthood or such ?

Best regards from V.

Re: Solution times for matrix problems,

*Message #16 Posted by **Veli-Pekka Nousiainen** on 13 July 2004, 10:16 a.m.,*
in response to message #15 by Valentin Albillo

```
My bad - the solution with LoangFloat was correct, but I read it wrong.
The exponent was -100, but it uses integers and since digits was 100, the result only indicated it
was less than 1 (instead of being 1^-100 eg. ~zero).
The answer is
"-
8273960599468213681411650954798162919990331157843848199178148416727096930142615421803239062122310850.E-
100"
I think I used FMULT instead of FY^X
but the answer looked the same.

The holidays always make me to forget things.
Hmmm.maybe I AM applying for priesthood?
[Veli-Pekka = Brother-Peter]

HP-IL 9114A or 9114B?

*Message #1 Posted by **Ray** on 7 July 2004, 8:27 p.m.*

Hi,

I'm looking for a HP-IL floppy disk drive, and I have come accross two equally priced items. One is a HP 9114A and the other is a 9114B. I've tried doing reasearch, but so far I have not been able to find out what the difference is between these two drives. Can anyone elaborate for me? I currently own a broken 9114B, but the battery pack itself is good. Are they reverse compatable?

Thanks in advance,

-Ray

Re: HP-IL 9114A or 9114B?

*Message #2 Posted by **Dan M** on 7 July 2004, 9:31 p.m.,*
in response to message #1 by Ray

Hey Ray,

All things being equal, I would opt for the 9114B. Check out these old threads.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv001.cgi?read=2285

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=34101

...or google on "HP 9114A 9114B"

AFAIK, the "B" has a better drive mechanism, and slightly more modern circuitry. It also has some LED indicators on the front to give an idea of battery life remaining.

Batteries are 100% compatible with each other, although there are differences within the battery packs themselves (nnnnnnA vs nnnnnnB).

Edited: 7 July 2004, 9:35 p.m.

Re: HP-IL 9114A or 9114B?

*Message #3 Posted by **Ray** on 8 July 2004, 2:25 a.m.,*
in response to message #1 by Ray

Ok, thanks a lot. Just one more question, it's been awhile since I played with these old floppys. Are the HP-IL floppy drive take "Double Sided" (720k) or single sided (360K). I heard them refered too as "low density" disks in those threads, but there seemed to be some debate over what they actually took.

Thanks again,

-Ray

Re: virtual drive

*Message #4 Posted by **Christoph Klug** on 8 July 2004, 5:17 a.m.,*
in response to message #3 by Ray

Dear Ray ,

instead a real HP9114B drive take one or two virtual drive emulated with EMU41 or EMU71 on your PC. This solution geves you much more features.....

Regards - Christoph Klug

Re: virtual drive

*Message #5 Posted by **Ray** on 8 July 2004, 11:33 a.m.,*
in response to message #4 by Christoph Klug

I already have software that does this, so that is not a concern. :)

Actually, my main reason for getting these drives is too complete my collection of HP-IL accesories. The only other thing I need is a HP-IL data aquistion unit, but those are pretty rare.

Thanks anyway.

in response to message #3 by Ray

An old EduCalc catalog I had the presence of mind to keep says it stores 630K (on a 720K disc).

9114B preferred over 9114A but...

*Message #8 Posted by **Mike** on 8 July 2004, 2:20 p.m.,*
in response to message #1 by Ray

There are a couple of differences. The first is most noticable. There is a single power indicator on the 9114A. The "B" has a 3 LED indicator.

The other difference isn't easy to see. The 9114A has an older drive that is prone head damage. This happens because the drive can get dirty and sticky and jam the disk. Users sometimes try to use force to remove the stuck disk. This will definitely damage the heads. The newer drives in the 9114B are less prone to this problem, however anytime you use force to remove a stuck disk, you are asking for trouble.

However, if the drive is serviced properly, and if you never force a stuck disk, there won't be any problems.

Batteries are the same.

Coming soon - HP-86 emulator

*Message #1 Posted by **John** on 7 July 2004, 4:34 p.m.*

Hi,

I am currently in e-mail contact with an HP-86 fan who is writing a HP-86 emulator. He said he has based this on an HP-71/HP-75/Capricorn emulator.

He has also produced a disassembler.

One area he is stuck on is input / output, this is very poorly described in the Assembler ROM manuals. I have heard there was a manual called something like 'Input / Output Assembler' that may help, but I have yet to see a copy.

If anyone else has an HP-85/86/87 emulator on the way it might be worth pooling ideas.

Regards, John

*Message #2 Posted by **Raymond Del Tondo** on 7 July 2004, 5:23 p.m.,*
in response to message #1 by John

Hi,

no, I can't help you with your question.

But, you wrote :
> He said he has based this on an HP-71/HP-75/Capricorn emulator.
>
Note that the HP-71 and the HP-75 are quite different machines.
The HP-71 has the original Saturn 4bit CPU,
whereas the HP-75 has a Series 80 compatible 8bit CPU.
So an HP-75 emulator could be used as base for an HP-86,
but I doubt an HP-71 emulator would do;-)

Regards,

Raymond

Re: Coming soon - HP-86 emulator

*Message #3 Posted by **Olivier De Smet** on 8 July 2004, 1:33 a.m.,*
in response to message #2 by Raymond Del Tondo

Hello,

Well in fact I started with a emultor for HP42s to have a nice program structure, but I rewrite all the saturn

stuff as capricorn stuff.

In fact there are 2 areas where I got problems, of course the IO of the 86/87 (the rom I got thanks to John) and also the behavior of the CPU in DCB mode when non-DCB number are used. The cpu is quite complicated due to the numerous status bits not so well documented in the HP85 assembler manual.

The emulator half-works actually, I got alpha-display, keybord, I can enter lines of programs, make some basic computation but actually I CAN'T display any numerical result !!! (DCB bug, or extended controller bug I think, need more work)

Olivier

*Message #5 Posted by **Vassilis Prevelakis** on 12 July 2004, 11:50 p.m.,*
in response to message #1 by John

BTW in the PPC COMPUTER JOURNAL V3N3 (May/June 84) jim Horn mentioned that the following manuals were available for the HP-75C:

V1: ROM Description & Entry Points

V2: System Listing (Source Code)

CPU Description

These manuals were to be sold by the PPC and should provide a lot of information that is applicable to the Series 80 computers as well.

Has anybody seen these manuals?

birthday paradox, multiple matches

*Message #1 Posted by **Jim Kimes** on 7 July 2004, 9:03 a.m.*

Hi. Everyone was very helpful with geometric progression question, circa June 15 posting. Now I need some help with interpreting an equation. You will find the one I'm talking about at:
http://www25.brinkster.com/ranmath/problems/multiple.htm

It is the las equation on the page, following "which simplies to..."

which simplifies to

d! n! / (2p p!(d - n + p)! (n - 2p - 1)!)

I need this equation put into a form I can understand and therefore be able to program it into a 19BII. One thing that is confusing me is there is no 'equal to' showing. I'm presuming in the birthday paradox context that:

d = 365, n =23, p = no. of matches and then this equation solves for probability but I'm not sure.

Also, I don't understand the next sentence:

"We sum this from p = 1 to floor(n/2) for the number of ways that there may be one or more matching pairs and divide by dn for the probability. " What is he saying in layman's terms?

Plus, if you don't mind let's take an example and solve for that. Say, what is the probability of 10 matches in the U.S. Senate, consisting of 100 people. What would the probability be for this?

Thanks. You folks were immensely helpful before, as always.

Re: birthday paradox, multiple matches

*Message #2 Posted by **Valentin Albillo** on 7 July 2004, 9:54 a.m.,*
in response to message #1 by Jim Kimes

Hi, Jim:

Have a look at this URL:

Birthday Problem

it should provide what you need (and then some) if you read and study it carefully, plus includes an extensive bibliography and additional links.

Best regards from V.

Take this job and shove it! (O/T)

*Message #1 Posted by **Cameron** on 6 July 2004, 9:09 a.m.*

I was reminded, earlier today while working on Valentin's latest challenge, of a personal "you can stick your job" story. The background is not relevant but I left, rather noisily, leaving behind a cubicle bookshelf full of my books--among them a boxed set of TAOCP and Numerical Recipes in C. Being perverse, this caused me to wonder how many of you might have left something of value--like a calculator (obligatory forum reference)--behind when you "took your cards".

Cameron

Re: Take this job and shove it! (O/T)

*Message #2 Posted by **Bill (Smithville, NJ)** on 6 July 2004, 9:49 a.m.,*
in response to message #1 by Cameron

Hi Cameron,

I never had a bad leaving from a job, but do remember a memorable exit from a college class. This was a History of Mathemathics course and the instructor had told the class to skip one complete section in the book - since he wouldn't be covering that material.

Final exam came - and you guessed it - over three-fourths of the test was on the omitted section. I remember answering the two questions I knew, then writting an obscenity in big letters across the exam paper, turning the paper in almost before the instructor had completely passed them out, storming out of the class and throwing the textbook in the metal trash can on the way out. It made quite a noise.

The instructor called me the next day at work to inform me that he was tossing out the final exam. Seems that the entire class was busy pointing out their notes to him where he said to disregard that section. So I got my 'A' in the course.

I never regretted storming out of the test session, BUT have regretted the tossing away of the text book. It was a very well written history of mathematics and have wished many time that I still had it.

History of Mathematics Textbooks

*Message #3 Posted by **Tom Sherman** on 6 July 2004, 10:20 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

Bill,

You could probably retrieve a copy of the textbook for not much money at abebooks.com -- if you can remember the name of the author. Howard Eves perhaps (University of Maine), or Carl Boyer (Brooklyn College)?

A great story in any case.

Cheers, Tom

Re: History of Mathematics Textbooks

*Message #4 Posted by **Bill (Smithville, NJ)** on 6 July 2004, 3:23 p.m.,*
in response to message #3 by Tom Sherman

Thanks Tom.

Unfortunately, I don't remember the Author's name - just that I enjoyed reading the book at the time. I'm really glad the instructor was a very fair person, since I would have flunked the couse - the final counted for over half the grade.

Although, I can't recall the Author's name, I can tell you the full name of the instructor. I had several math courses with him and enjoyed them all.

Bill

in response to message #1 by Cameron

I have left jobs similar to you but not something of value. In another word, yeah "Take this job and shove it! but not my HP calc".

Re: Take this job and shove it! (O/T) - left a calc...

*Message #6 Posted by **Bill Wiese** on 6 July 2004, 12:53 p.m.,*
in response to message #5 by Chan Tran

Never left former workplaces in a huff, but I did leave a prior employer/coworkers with my Casio CM150 "Computer Math Calc".

Many moons ago I used to reverse engineer engine-control firmware for what was essentially a high-tech 'speed shop'. After lotsa logic analyzer work & disassembly I'd eventually figure what to hack, and create script files that would allow the engine/transmission tuning guys to enter their spark, fuel, shift point, etc. curves. But sometimes tuning was done out in the field (race track, freeway, etc.) - so the guys would carry an EPROM burner in the car and a printed list of addresses to tweak. Since these guys didn't think in hex (though one or two finally 'got it') my little Casio calc was quite helpful for them to do hex addition and hex<=>decimal interconversions.

Wish I had it back. For those of you that might remember, the CM150 calc was available in mid-1980s, was solar powered, and came in a 'kit' with a tutorial manual (as opposed to usual folded pamphlet accompanying most Casio calcs.) This calc was a four-banger (prob. had percent and square root and maybe 1/X too, can't remember) plus base conversion/operation in Dec/Hex/Bin/Oct. Various And/Or/Xor/etc. logical ops could be performed and word size could be selected. The KB layout was just great, with the A-F keys for hex immediately above the numeric keys, and these A-F keys did not need to be used in a shifted mode. Hopping between bases did not require shifted functions, etc.

(In fact - HORRORS!! - for some things I liked it a tad better than my HP16C, and it didn't even have RPN :(.)

Anyway if I ever see another CM150 I'm gonna snap it up. Other sci. calcs that have "computer math" modes have poor use of A-F keys for hex, switching btwn bases is not as easy, etc.

I left a business calclulator's instruction book at a CPA firm I was working for. I was being let go for "lack of business" only after a month. Unfornately, I remember I left my book only after cleaning my room several months later.

Someone Else's Loss...

*Message #10 Posted by **OJM** on 7 July 2004, 12:34 p.m.,*
in response to message #1 by Cameron

Fortunately I have not, either intentionally or unintentionally, left behind something of value like a calculator or books while leaving a job. However, I did benefit greatly from another person’s loss (or oversight) a few years ago.

In the year 2000 I was an engineer designing turbine blades for a large US company. This company had already performed several massacres (i.e. “reductions in force”) on its engineers, and then had decided to move its remaining engineers to another state. I was one of the last guys left in the old office area, and while still working there I got to see the demolition workers beginning to dismantle the old desks, cubicles, and bookshelf walls and tossing things into a pile at the other end of the office.

At the time I had never used, nor did I care for, any of HP's calculators. To me they were those overpriced calculators that I would sometimes see others using, with that dumb (or so I thought) "backwards Polish whatever" way of entering calculations. Nonetheless, while taking a shortcut through the wreckage on my way to my desk at the back of the building, I spotted a glint of something shiny along with a few keypad buttons in a pile of dismantled bookshelves, broken drywall dust, and discarded engineering notebooks. I recognized it as one of those thin, horizontal-layout HP calculators I had sometimes seen around the office. It had apparently fallen down between bookshelves quite sometime ago, and looked like it had many years (about ¼"!) of dust and lint on it. I wiped off the display and most of the keys, pressed the "ON" key, and "0.0000" came up dimly on the LCD.

Whatever this calculator was, I knew that whoever had owned it before had put it through a hell of a lot of use. All the corners of the once sand-textured plastic case had been worn down to a well-rounded gloss by years of handling. The keys had also been polished to a high gloss by many years of finger keystrokes but were still perfectly readable (the miracle of double-shot keys). The aluminum bezel around the LCD was dented and deeply scratched in many places, and the corner next to the logo location was peeling up away from the case. The logo itself was long gone. The four rubber feet were also gone, and apparently had been lost for many years, since the aluminum label on the back of the unit had been rubbing directly on desktops for so long that the writing had been completely worn off, leaving just a shiny & scratched aluminum plate. Even the three little ribs on the battery door had been completely worn off.

Anyway, although it was one of those "weird" HP calculators, I figured I might as well try to find out more about it, so I got on the web to search for info. It was then that I first saw this HP Museum web site. After comparing pictures I learned that I had found an old HP-15C. I replaced the batteries & performed the self-tests described in the web pages, and everything came up OK. So, even though it was worn & ugly, it was still perfectly functional. The serial number indicated that it was one of the earliest USA Voyager units, with a date code from late 1982.

Today I realize just how lucky I was, but at the time I still didn't appreciate what I had found. To me it was just an old oddball calculator. I learned basic RPN from this web site, and used the calculator for some basic calculations, but many of its functions were still a mystery to me. Then I got lucky again, because in a used book shop I found a nearly-mint spiral bound copy of the HP 15C User's Manual, and of the Advanced Functions Manual, for about $5 each (apparently they didn't know the value of what they had either).

That was when I really began to learn how to really use its capabilities, and I began to appreciate what a gem this little calculator really was. I now keep it secure in a drawer, and I use it sparingly, not because I don't like it, but because I consider it irreplaceable. I bring it out when I need to do some heavy duty calculations, or run some special little programs for certain equations. The rest of the time I use a cheaper calculator.

Anyway, that's how someone else's loss was my gain. Or maybe a curse! Because now I can't stand to do any calculations on algebraic calculators, and prefer RPN. But RPN is rapidly becoming extinct! Maybe ignorance was truly bliss. Either way, I will try to keep this old HP-15C as long as I can.

Re: Someone Else's Loss...

*Message #11 Posted by **Dennis** on 7 July 2004, 1:12 p.m.,*
in response to message #10 by OJM

Fortunately, I haven't been in that situation, but I usually try to stay prepared. Having survived 4 rounds of layoffs at work, I just keep all my stuff in my backpack, so if I do leave, I have everything with me. People at work are cool, but through the years, I've learned (unfortunately) it is best not to trust people. I usually never leave any "personal" items at work.

I also learned, about a year ago, when I wanted to buy a RPN business calc., that HP no longer makes them anymore, except the 12C. Anyways, good thing there is eBay. I got both the 17Bii and 12C. Since then,

I've found my old 27S and 42S. I take better care of them now. =)

A scientist leaving work (RIF?) left a beat-up Timex Ironman watch in his desk. It needed its band replaced, but WalMart had one that fit.

That watch is SO accurate, when I set it to NIST or WWV it won't lose 2 seconds a month! And if I don't use the light, (incandescent) the battery lasts for years.

But my wife didn't want me wearing a beat up watch so she bought me a Timex Ironman DataLink for my birthday a few years ago. Now it is beat up, and it loses 10 or more seconds a month. The (original) beat up watch is sitting in a drawer at home (sigh!)

I left for medical reasons, so maybe this memory doesn't count, but I once left a dictionary. Not just any dictionary, though. It was the Oxford English Dictionary, the OED, which comes in about 24 full-size volumes, and probably costs over $2000 or so. My copy was the compact edition, in which they reduce four normal-sized pages into one compact page, so the dictionary will fit into just two volumes. (Strange math, I know.) I had gotten it for free from the Book of the Month Club, when they were closing out Oxford's stock of Version Ones in preparation for the introduction of Version Two (first major revision since 1923), but its loss still stung me. Ouch!

Jim

in response to message #1 by Cameron

While I have never accidently left anything behind (that I know of), *twice* I have intentionally left behind my copy of a JOVIAL J73 manual, never expecting to need it again. A few weeks into the next job, I'd call my former coworkers and ask them to forward the manual to me because I needed it. The manual has seen a lot of use through the years and the pages are now yellowing.

I will most certainly be taking that manual with me to my next job whenever and whatever it may be.

And, there is are two morals to this story. One, don't burn bridges with your former employer or coworkers. Two, don't throw anything out.

Spice series: how to determine circuit board type based on serial number?

*Message #1 Posted by **westridge_cz** on 6 July 2004, 8:54 a.m.*

I've been reading here on the Museum about the "30 Series Technology and Packaging", and Dave Hicks mentioned that there were actually two types of series 30 calculators. The early ones had a flex circuit in which the IC chips were held in place by a molded plastic spine, and since this design apparently was prone to problems HP decided to go back to what worked before and they came out with a later series in which the chips were actually soldered into place. I was wondering if anybody out there has a list of the range of serial numbers, for all the different Spice series calculators from 31E to 38E/C, that would show which ones were of the early type and which ones were of the later version?

Array-less CCD also available

*Message #1 Posted by **Ángel Martin** on 6 July 2004, 7:53 a.m.*

Hi gang,

Short on the heels of Raymond's announcement (but not competing, nor racing), this is to let you know that another modified version of the CCD is also available on the "other site".

This one (CCD PLUS) consists of the original CCD module minus the Array functions group, which have been replaced with general utilities and Alpha/Display management functions.

In fact, and of course if one doesn't count the OS/X extensions, this and Raymond's contain quite a different function set. Much to the global community benefit, I trust.

So now you have a choice: either 4k or 8k CCD-based modules. Raymond's OS/X is a packed bundle, powerful extract of the best of the CCD in just one-page footprint. This one requires two pages, but has all the CCD functions (but the Array's) and yet much more, and is ideal to combine with the Advantage's Matrix functions; as CAT"4 does support the CCD extensions.

Hope you enjoy it.

Cheers, ÁM.

Re: Array-less CCD also available

*Message #2 Posted by **Christoph Klug** on 7 July 2004, 9:42 a.m.,*
in response to message #1 by Ángel Martin

Dear Angel, dear Raymond,

thanks for your actual work on redesigning the powerfully CCD-Module. With your 4Kbyte or 8Kbyte solutions now we get full compatibility with the Advantage Module.

Please create some more advanced mcode rom solutions for the HP41 world. Do not forget the typically today systemconfiguration :

HP41CX + CCD + ADVANCED + EXT-I/O + EXT-IL

May be it is possible to create an additional 4KByte page containing mcode like sandbox, but please avoid doubling commands with existing modules... Also avoid the low letter mode - which is not compatible to the HP41 fullnut display....

Regards - Christoph Klug

HP-65 brochure

*Message #1 Posted by **RMillán** on 5 July 2004, 8:40 p.m.*

Hi, all!

As the proud winner of a digital copy of the HP-65 brochure (see Valentín's recent 15C challenge), I have read it today thoroughly, and cannot help making here some comments:

Look at the outfit they bundled the 65 with:

1. rechargeable batteries and charger,
2. soft carrying case,
3. Owner's Handbook,
4. Quick Reference Guide,
5. a Standard Application programs pack in magnetic cards (with the corresponding handbook),
6. a set of 20 blank magnetic cards,
7. a pad of 50 letter-size program forms,
8. a set of 20 blank "pocket instruction cards", which would fit inside the carrying case, and each one being able to hold and protect two cards, and providing a sort of "mini-form" to write down short program instructions, and
9. a safety travel case, of high impact plastic, with room for the calculator inside its soft case, the charger, manuals and cards.

I will not elaborate on this. The list speaks by itself.

But it is not just that they made a very good bundle, also you were fully able to learn the exact details from the brochure. And, better, you could nearly learn to program the HP-65 from the very same brochure! So thorough and well done it was.

I don't remember for sure, but it's likely that it was a brochure of similar quality which made me save three months of wages (it was my very first and very badly paid job) to purchase a 41C.

You know, not just calculators are not made today as they were.

Best regards from
Rafael Millán.

PS: Curiously, the 65 brochure is dated on 7/74, exactly 30 years ago.

Re: HP-65 brochure

*Message #2 Posted by **Valentin Albillo** on 6 July 2004, 10:05 a.m.,*
in response to message #1 by RMillán

Hi all,

Those interested to know what the HP-65 brochure Rafael's commenting looks like can have a look at it at this

URL:

My Web Sites

Just click on the **Calculator Pages** link, then scroll down the page to the **Brochures** section.

As for comments, this is mine: looking at this brochure is kind of a sweet-sour experience. You get all too reminded of past HP's glorious times, when *quality* was *paramount*. This magnificent brochure oozes HP's genuine pride and enthusiasm for their product, the whole proceedings exude quality. Just have a look at the images: scientists, engineers, architects, cutting-edge *professionals* in a word, all of them feeling the *pride* in owning and using and enjoying that superb USA-designed, USA-engineered, USA-*made* tool.

Compare this to the fledgling teenager student who casts an indifferent glance at that low-quality, China-made lump of plastic called HP33S, refurbished with the weird keyboard and garish colors in a vain attempt to draw said students' attention, to lure them into buying that cheap gizmo, manufactured at the lowest possible cost whatever the resulting quality or lack thereof.

Worlds apart, uh ? Those were the days ...

Best regards from V.

Re: HP-xx brochures

in response to message #2 by Valentin Albillo

Should you invest in learning Dutch, you'll be rewarded being able to read these beautiful brochures from only a few years later than the HP-65's, but equally great. I too choosed to purchase Woodstocks because the brochures exactly told me what to expect. And which came true.
Oh, I wish I'd taken many more brochures then. Calcs were expensive, brochures were free.

*Message #4 Posted by **Pierre Brial** on 9 July 2004, 2:58 a.m.,*
in response to message #2 by Valentin Albillo

Thank you Valentin for these nice documents.

I wonder why they put "computer" between quotes...too much shyness from HP. For me the HP 65 is the first personal computer.

I wonder why computer historians make all this fuss for the Altair, and completely underlook the HP 65. Was not the HP 65 released before the Altair ?

Furthermore, I don't think it was possible to do anything usefull with the Altair.

All the Best

HP 12C Projected Obsolescense

*Message #1 Posted by **Michael Roback** on 5 July 2004, 2:40 p.m.*

An afterthought. I understand, given a special interest in electronics (having been a director of one of the largest computer user groups in the US) restoring, building electronic equipment for years that the lifespan of the most well constructed SS electronic device is about 20 years +/-. What this means is that folks out there currently using 12c will be needing to replace their original HP US made calcs within the next 5-10 years. What then? If HP continues to manufacture junk (construction wise) which is the direction of what most major manufacturers are doing it will open the industry up to some enterprising electronics builder that will build a very well made, perhaps better than the original, HP 12C and charge $500 for it. So what HP is trying to accomplish in keeping the market price low will ultimately cause them to go away. And we will all be stuck with very expensive calculators or will everyone just use an emulator on their PDAs? It is sad. HP was such a great company. No one came close. Poor marketing decisions in the corporate world always intrigue me. What seems to be common sense to most of us consumers gets completely sidestepped by manufacturers. How many great manufacturers of the past are still around? I don't think it is marketability. I think manufacturers want to maintain their profit margin without market testing new applications or avenues. Of course if you want to maintain the same gross margin 20 years later without adjusting price, you have to cut production costs and ultimately cheapen quality. We are in a disposable world. It has gotten worse within the last 20 years. HP either needs to wake up and realize that they may be a more niche market than every, or they are going to go right down the toilet like so many others. And then I guess we will all have disposable TI or Sharp calculators in our pocket. Sorry for my soapbox. Anyone in Los Angeles that cares to continue this discussion with me please feel free to email me. As you can tell I am passionate about quality and hate to see it go the way of cheap.

Re: HP is not competent anymore

*Message #2 Posted by **Renato (Brasil)** on 5 July 2004, 8:50 p.m.,*
in response to message #1 by Michael Roback

"Poor marketing decision" ? Nah. it is worse than that : HP DOES NOT KNOW HOW TO MAKE QUALITY CALCULATORS AS BEFORE.

Maybe Agilent knows how to do it - but I guess they will not.

Renato 1234

Re: HP is not competent anymore

*Message #3 Posted by **Renato (Brasil)** on 7 July 2004, 12:06 a.m.,*
in response to message #2 by Renato (Brasil)

Current HP business is ink cartridges. Printers are just the media to market ink cartridges. Quality ? Just enough to keep customers buying cartridges. Can you blame them ? I don´t - they´re just earning theirs livings.

Re: HP 12C Projected Obsolescense

*Message #4 Posted by **westridge_cz** on 6 July 2004, 9:03 a.m.,*
in response to message #1 by Michael Roback

Yeah I agree!! In a very short time HP went from being the Tiffany's of the calculator world to the K-Mart blue light special. I don't think HP gets it, they're trying to compete against the cheapo calculators by letting somebody else make their calculators for them, but what HP doesn't realize is that if you're gonna sell a piece of junk, people will buy the lowest priced piece of junk so they'll go with other brands instead of HP. Talk about a marketing strategy that backfired!

Re: HP 12C Projected Obsolescense

*Message #5 Posted by **Eddie Shore** on 6 July 2004, 11:01 p.m.,*
in response to message #1 by Michael Roback

Cheap construction, bad quality could apply to most things these days. Back then, personal computers used to last for 7-10 years. Now, if you get 3-4 years out of them, you've had an excellent computer.

I have a feeling Carly isn't in tune to the calculator/computer market as much as previous CEOs. Having now owned both older models (20, 48G) and new models (33S, 17BII+, 49G+) I can see why the older models garner so much value with the keyboard and relaibility. Having said that, HP hasn't gone completely down the toliet, the new ones I have are working (I use the 49G+ nearly every day--even for leisure). Maybe HP isn't as organized as they should be.

Longevity of HP calc's (and other electronics)?

*Message #6 Posted by **Karl Schneider** on 7 July 2004, 3:59 a.m.,*

This issue has been debated here in the past, without conclusive resolution. I certainly believe that the HP calc's of the '70s and '80 will last longer than 20 years, although, if I remember correctly, certain electrolytic(?) capacitors in some older models might eventually need to be replaced with modern tantalum(?) ones.

Personally, I have four working models that are 20 or more years old:

- A 1984 fullnut 41CX that works perfectly after receiving a cleaning and partial resoldering
- A 1980 fullnut 41C that works fairly well, but could benefit from the same service (fullnuts aren't the most reliable models)
- A 1982 34C ("improved design") that works flawlessly but has broken battery terminals
- A 1983 15C that still works absolutely perfectly, despite having been dropped inside a backback several times.

I also have a 1971 35 that has only a bad power switch (I hope).

I don't see why these models shouldn't work 30-40 years or more, if stored properly. At least, I hope so...

I have plenty of older electronic products and have never had a problem with the capacitors. If the electrolytic capacitors are appropriately derated, they should last indefinitely. What I mean by "derated" is that for example you use at least a 25V capacitor (not a 16V one) for a 16V application, and treat the ripple current, temperature range, and so on similarly.

I was a repair technician at TEAC in the early 1980's, and found that they had a bad habit of trying to save money on the large power supply capacitors by using ones that were too small and with inadequate voltage ratings. Those did tend to go out once in awhile. They did not have that problem with the little ones in the audio circuits.

Re: Longevity of HP calc's (and other electronics)?

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 7 July 2004, 11:57 p.m.,*
in response to message #6 by Karl Schneider

I have a collection of about 500 calculators. Among the older HP devices in my collection which still work properly are an HP-35, two HP-80's, two HP-41C's, three HP-11C's, three HP-12C's (American made), and an HP-67. I also have an HP-35 with a bad bridge across the input terminals when the charger is removed, an HP-41CV with a display which is partially black, and two HP38C's which exhibit the intermittent display problem common to those devices. I have older TI devices which work properly as well including several SR-10's (1972 vintage), several TI-30's (1976), and four TI-59's (1978) with working card readers. I have several TI-59's with bad card readers and several old "four-bangers" where some segments of the display are missing.

The clear winners in my collection as far as quality and survivability are concerned are the devices made by Sharp. I have many from the 1970's including an EL-8 (1972). If I find a Sharp at a garage sale or a thrift store, and it hasn't been damaged by battery leakage, but still doesn't work, I am really surprised.

The clear losers in my collection are devices sold under the National Semiconductor or NOVUS name. If I find one of those and it works at all I am pleasantly surprised.

Re: Longevity of HP calc's (and other electronics)?

*Message #9 Posted by **unspellable** on 9 July 2004, 8:31 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

I am a reliability engineer in the aerospace electronics field. We avoid the use of aluminum electrolytic capacitors because they do have a failure with time mechanism. When not biased the dielectric tends to weaken. This can be prevented by periodically powering up the device. More seriously, the aluminum electrolytic contains moisture and will dry out in time. This is the main reason we avoid them.

The tantalum electrolytic comes in two varieties. There is a wet type which need not concern us as they would not be used in a calculator. There is a dry type which might be found in the newer calculators. The reliabilty of the dry type actually improves with use. Most of their failures will be infant mortality

or occur in the first six months of use.

Best advice for any of them is to power them up once a month and keep them stored under decent conditions.

12C Production Runs + Market Commentary

*Message #1 Posted by **MIchael Roback** on 5 July 2004, 2:24 p.m.*

You folks have been very helpful to me with respect to HP12C Lineage. First, can someone tell me when the US made 12C Production Line closed?

Secondly, let me explain. I have used a 10B for many years and it has been great. But I am entering a Finance Program at UCLA (interested in Finance, not planning on doing pro) but they require a 12C. I imagine because it is what the profs are familiar with. Actually, in terms of user friendliness I prefer the 17BII but I want to work on the same platform as most others in the finance field. So if I must get a 12C and will be using it for a while, I want a lineage that is solid. I know that if I want a Singipore manuf 17BII they are still easy to come by as they stopped production much more recently than the US 12C but I don't want to constantly have to convert from classwork based on the 12C, same situation with my 10B. My 10B for whatever it is worth is US made in 1988! I guess in terms of function, the 12CP is more feature rich than the 12C but it is like a toy compared to the 12C. It really is a shame that HP still does not have their production lines and produce well made calculators. The post from Gene was very informative, however, I disagree with marketability. Prior to entering graduate school and building a career in the health care field, I was in the retail buying field dealing with several millions of dollars of merchandise. If the 12C cost $200 today and was of the same quality as the late 80s, I am sure the people out in the world that have original dying 12Cs know their value and would replace them. Is it conceivable that a financial pro would say, nope 12Cs are too much now, I am going to buy a TI BAII. I don't think so. Enduring quality always has a market and those looking for a cheap calculator are not likely to buy 12C! Just my 3 cents!

Re: 12C Production Runs + Market Commentary

*Message #2 Posted by **John Smitherman** on 5 July 2004, 3:19 p.m.,*
in response to message #1 by MIchael Roback

Hi Michael. One thing to consider with your purchase is that if you choose to buy a new 12c made in China it will come with a 1 year warranty. This may be worth something to you.

I bought a new made in China 12c a few months back and haven't regretted it yet. It feels as well made (to me) as my 34c, 15c and 32sii. We shall see how well it holds up to the test of time.

Good luck!

John

Short & Sweet Mathematical Challenge #7

*Message #1 Posted by **Valentin Albillo** on 5 July 2004, 9:27 a.m.*

Hi all, a new month begets a new S&S Math Challenge, #7 to be precise.

This time you'll have to use to the max all your math intuition, skills, a lot of sleuthing, and a respectable amount of programming ingenuity though, as always, the required program won't be neither too difficult nor too long.

I can assure you that the answer to this particular challenge will take you *absolutely by surprise*, you'll be *enthralled* by the discovery process, then absolutely *delighted* with the unexpected outcome. Matter of fact, you might want to tackle this challenge all by yourself, refraining from reading any posts in this thread till you find the solution on your own, so as to avoid spoiling the (considerable) pleasure. This is truly one of a kind, trust me !

So, it seems this would be reward enough for any HP/Math fan, right ?

Well, no. Just in case this isn't enough for you, there's yet another interesting (if material) reward: a high-quality 1280 x 1024 image of this fabulous classic "poster", scanned by myself, depicting three Classical and Woodstock HP machines against an ancient pyramidal background, have a look at this small thumbnail:

http://membres.lycos.fr/albillo/calc/pics/tn/HP-all-01-01tn.jpg

This magnificent 1280 x 1024 image will be awarded to the first person (or persons, eventually) who comes out with a working program and correct answers to the questions raised by

The Challenge

This Challenge is structured in two parts. *First*, you must write a program to compute a given function. *Then*, you must use your program *and* intuition to answer a number of preparatory, training questions about the function, ending in a **Big Question[tm]** which will require all your sleuth abilities as well as data gathered from the answers to the training questions.

First part: The Program

Use your favorite HP calculator (most any will do) to implement the following function **h(n)**, defined for integer n greater than 0 as follows:

```
h(1)    = 1
h(3)    = 3
h(2n)   = h(n)
h(4n+1) = 2*h(2n+1)-h(n)
h(4n+3) = 3*h(2n+1)-2*h(n)
```

Your program must accept **n** as input and return **h(n)** as output, where n is an arbitrary integer greater than 0.

If you succeed, you'll be in a most favorable position to answer the following *training* questions, which will increase your chances of finding a correct answer to the ultimate last question.

Second part: The Questions

Use your program to compute **h(n)** and a little sleuthing to answer these training questions, *in order*. They are designed to led you effortlessly, step by step, to the **Big Question[tm]**. (m and n are always arbitrary integers greater than 0).

1. What's the value of $h(2^n)$? ditto $h(2^n + 1)$? $h(2^n - 1)$? $h(m * 2^n)$?
2. For which n is h(n) = 100 ?
3. For which n is h(n) even ?
4. If n is odd and m = h(n), what's the value of h(m) ?
5. What are the values of h(h(n)) ?
6. For which values of n do we get h(n) = n ?

Second part encore: The Big Question [tm]

Just what on Earth does h(n) to n ??

This is, describe the simplest relationship the result value has with the given argument. In English (or Spanish) you can state this relationship unambiguously using just ***three words***. Which ones ?

Notes:

In order to check that your program delivers correct results for h(n), you might try to check out the following random cases:

n	h(n)
841	587
642	261
44	13
821	691
381	381
17	17
378	189
226	71
86	53
742	413
765	765
514	257

Give it a try, I'm sure you'll enjoy it ! :-)

Best regards from V.

Re: Short & Sweet Mathematical Challenge #7

*Message #2 Posted by **J-F Garnier** on 5 July 2004, 12:34 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

First of all, my test program on my HP-71B. I used user-defined function and recursivity, close to the function definition:

```
10 DEF FNH(N)
20 IF N=1 THEN FNH=1 @ END
30 IF N=3 THEN FNH=3 @ END
40 IF MOD(N,2)=0 THEN FNH=FNH(N/2) @ END
50 IF MOD(N,4)=1 THEN FNH=2*FNH((N-1)/2+1)-FNH((N-1)/4) @ END
```

```
60 FNH=3*FNH((N-3)/2+1)-2*FNH((N-3)/4)
70 END DEF
```

Maybe the implementation on a RPN, limited-stack machine would be more tricky. It could be a challenge by itself.

I succeeded to find the relation between n and h(n), but I don't want to spoil the game right now. I will just say that fnh(168788912877) is 196856925369 (quite hard to check with the recursive method) and that the HP-71B Math ROM includes a convenient function to check this.

It was really a pleasure to spend some time on your challenge.

J-F

Re: Short & Sweet Mathematical Challenge #7

*Message #3 Posted by **Bram** on 5 July 2004, 1:32 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

I already found the relation between n and h(n) and my phrase would be E.A.R.
I'll explain this later, because I first have to write my program. I manually compiled a table for n=1..20 and I discovered the relation fairly quickly.
Knowing the relation I could easily write a non-recursive routine, but I will try to write a program as if I don't know anything about it yet.

Re: Short & Sweet Mathematical Challenge #7

*Message #4 Posted by **Bram** on 5 July 2004, 2:57 p.m.,*
in response to message #3 by Bram

Well, no program yet. Quite a challenge for an HP-32SII without recursion, but I won't wait for it to explain the E.A.R. in my previous post.

So here's the relation I've found

DON'T READ ON IF YOU DON'T YET WANT TO KNOW

DON'T READ ON IF YOU DON'T YET WANT TO KNOW

FINAL WARNING

Extract And Reverse is how I've put it.
Take n
Convert it to binary
Extract the part from the first 1 until the last 1 (so strip leading and trailing zeros)
Reverse this string of binary digit(s)
Convert back to decimal
Et voilá

And that explains why there aren't any even results; you'll always have a 1 as the LSB, hence an odd number.
And also why 2^n+1 doesn't change; two ones separated by zeros
And also why 2^n-1 doesn't change; all ones

Thanks Valentin, for this well spent night (local time is 21:00)

```

It works in any wordsize, but of course 64 will give the maximum numeric range.

I suppose that using the 16C for this challenge is kind of cheating. Indeed, I did not begin, as was required, by programming the function in *my favorite HP calculator (most any will do)*; among the non-RPL calculators, only the 16C allows a trivial implementation.

The challenge is now for me to find a reasonably implementation in the 15C. Also, I'm not so sure I could express the relation (in English or in Spanish) in just three words.

Regards,

Rafael Millán.

Re: Short & Sweet Mathematical Challenge #7

*Message #12 Posted by **Cameron** on 6 July 2004, 5:04 a.m.,*
in response to message #1 by Valentin Albillo

I suspect the horse has bolted (judging from the number of responses). However I'll make my contribution and await for Valentin to declare a winning entry before I look at the others.

Normally I treat these challenges as a spectator sport. They're typically most illuminating but require a prowess in mathematics that I don't posess. The word that caught my eye on this one was *integer*. I know a thing or two about (the computer representation of) integers. So I read the challenge a little more closely than usual and decided I could produce a solution.

Valentin said to use my favorite HP, so I fired up my 16C simulator (it works on the real one too). Here's the program:

```
001     LBL FN_H        ;       n
002     [0]             ;       h=0     n
003     X-Y             ;       n       h
004     LBL LOOP        ;       n       h

; shift LSB out of n into carry { carry = n & 1; n >>= 1; }

005     SR              ;       n=n/2   h
006     X-Y             ;       h       n

; shift LSB into h from carry { h = h<<1 | carry; }

007     RLC             ;       h=RLC   n
008     X-Y             ;       n       h

; Any bits left in n?

009     X!=0?
010     GTO LOOP

; cleanup--result into X

011     X-Y             ;       h       0
012     (RTN)           ; not necessary if last in memory
```

And now the answers to the questions:

> Quote:
>
> 1. What's the value of $h(2^n)$? ditto $h(2^n + 1)$? $h(2^n - 1)$? $h(m * 2^n)$?

```
1a: 1
1b: 2^n + 1
1c: 2^n - 1
1d: if m is odd, m else if m == 2^x, 1 else h(n)
```

> Quote:
>
> 2. For which n is h(n) = 100 ?

h(n) can never be 100.

> Quote:
>
> 3. For which n is h(n) even ?

h(n) can never be even.

> Quote:
>
> 4. If n is odd and m = h(n), what's the value of h(m) ?

n

> Quote:
>
> 5. What are the values of h(h(n)) ?

n

> Quote:
>
> 6. For which values of n do we get h(n) = n ?

$2^x - 1$

Before I answer the big question™ I have to confess to having cheated. Valentin invited us:

> Quote:
>
> to check out the following random cases:

I looked carfully at those numbers. If indeed they were "random" and not carfully contrived, I could see the (bit) pattern that led to my conclusion about the defining property of h(n).

Now, the ultimate answer: right-justified bit reversal.

Of course that's not what Valentin was looking for. I've wracked my brains to weave the "Earth" hint into the answer but it eludes me. I am sure that someone who more clever with word-play will get it.

BTW, right-justified bit reversal is a technique that is used in permuted index generation. One applicatition that springs to mind is DFT. I'm sure Knuth wrote about it in *Sorting and Searching*.

Cameron

PS: a corollary challenge. Write a program to compute the probability that Valentin's (random) test cases were all right-justified reversals.

Re: Short & Sweet Mathematical Challenge #7

*Message #13 Posted by **J-F Garnier** on 6 July 2004, 8:08 a.m.,*

in response to message #12 by Cameron

My answer to question #6 would be 'n is a binary palindrome'.

Regarding DFT, I think that the reversal is NOT right-justified (otherwise no even index would be generated).

h(n) is a palindrome iff n is a palindrome.

> Quote:
>
> Regarding DFT, I think that the reversal is NOT right-justified (otherwise no even index would be generated).

D'oh! You are, of course, correct. Apologies to all for the misinformation.

Cameron

definition of binary palindrome?

*Message #15 Posted by **Cameron** on 7 July 2004, 3:43 p.m.,*
in response to message #13 by J-F Garnier

It occurs to me that my notion of palindrome may be different to everyone else's. As a computer guy, I tend to think of all bits (in a given parcel) as being significant. Consider this octet:

00001001

To my mind, that is *not* a palindrome although its right-justified reversal will have the same value. This demonstrates the flaw in my thinking. Since the leading zeros are numerically insignificant, it is a palindrome (although I would still contend that the octet *holds* a palindrome).

In light of this, your answer to question 6 would appear to be correct.

Comments?

Cameron

Ahhrrrg! A typo.

*Message #16 Posted by **Cameron** on 6 July 2004, 8:58 a.m.,*
in response to message #12 by Cameron

> Quote:

Quote:

Question#6

*Message #17 Posted by **Tizedes Csaba [Hungary]** on 6 July 2004, 10:51 a.m.,*
in response to message #16 by Cameron

I dont want to provoke - because I havent got answer - but what about n=381 and n=765...?!

Csaba

Ps.: I am working on my solution. I dont believe in this 'binary-palindrom'... Its just pure mathematics... ;) But not evident...

Re: Question#6

*Message #18 Posted by **Cameron** on 6 July 2004, 11:11 a.m.,*
in response to message #17 by Tizedes Csaba [Hungary]

Well spotted! <Gently lays queen on her side>

It's obvious now when I reconsider it. All the odd palindromes < 2^{max} - 1 must satisfy h(n) == n. Is there a simple expression that defines the series?

I'm off to bed. I'll check back in the morning.

Cameron

Re: Short & Sweet Mathematical Challenge #7

*Message #19 Posted by **Cameron** on 7 July 2004, 4:19 p.m.,*
in response to message #12 by Cameron

Obviously my answer to 5 is only true if n is odd. The series that results from h(h(n)) for even n is fascinating. However I don't know what to make of it.

Cameron

Re: Short & Sweet Mathematical Challenge #7

*Message #20 Posted by **W Rice** on 7 July 2004, 8:37 p.m.,*

in response to message #19 by Cameron

For n even, it's the first odd number you encounter after continually dividing by 2.

No solution yet, just two equation...

*Message #21 Posted by **Tizedes Csaba [Hungary]** on 8 July 2004, 7:36 a.m.,*
in response to message #1 by Valentin Albillo

It's trivial, but maybe(???) this will help somebody:

```
[[ 3  -2 ]  * [[ h(4*n+1) ]  =  [[   h(n)   ]
 [ 2  -1 ]]    [ h(4*n+3) ]]     [ h(2*n+1) ]]
```

Csaba

S&SMC #7: My Solutions And Comments [LOOOOONG]

*Message #22 Posted by **Valentin Albillo** on 8 July 2004, 8:49 a.m.,*
in response to message #1 by Valentin Albillo

Thanks to all of you interested in my Challenge, whether 'posters' or 'lurkers'. Questions have been answered correctly and some working programs have been produced, though some of you 'cheated' and found the answers by analyzing the test cases I gave, instead of actually implementing h(n) as defined, which was the intended exercise. Well, so much for giving test cases, now for my solution and comments:

Note: All the code herein is for the HP-71B because its English-like BASIC syntax makes it very easy to understand and vey easy to translate to RPN/RPL, while the reverse isn't exactly true. Also, even if you haven't got an HP-71B, you can try and run all the code and examples featured here by using Emu71, Jean-François Garnier's superb HP-71B emulator which you can download for free from that link.

First part: The Program

The Challenge required you to implement h(n) defined for integer n > 0 as follows:

```
h(1)    = 1
h(3)    = 3
h(2n)   = h(n)
h(4n+1) = 2*h(2n+1)-h(n)
h(4n+3) = 3*h(2n+1)-2*h(n)
```

If your HP machine does natively support *recursion*, this is very easy to implement, like this HP-71B version, which defines a user-defined function FNH(N) which computes h(n) by making recursive calls to itself:

```
10 DEF FNH(N) @ IF N=1 OR N=3 THEN FNH=N @ END
20 ON RMD(N,4)+1 GOTO 30,40,30,50
30 FNH=FNH(N/2) @ END
40 FNH=2*FNH((N+1)/2)-FNH((N-1)/4) @ END
50 FNH=3*FNH((N-1)/2)-2*FNH((N-3)/4) @ END DEF
```

Implementing h(n) in an HP calc without recursion is much more *tricky*, and usually requires dealing with stacks to keep the parameters and returns for the ever deeper recursive calls, but once you get the knack of it, it's actually fairly straightforward.

However, for this particular challenge, where implementing the function is just for the sake of using it to do the sleuthing and answer the questions, we can make do with a much simpler technique, which will allow us to *instantly* get the value of h(n) for a range of n values large enough for our purposes, and does not require recursion at all so it can be easily implemented in most any HP calculator this side of the HP-67 or so. Instead of recursion, we'll use a suitably dimensioned array (or range of registers) to keep the function values, which

will be constantly reused to generate further values, substituting recursion for *direct array lookup*, like this:

```
10 DESTROY ALL @ OPTION BASE 1 @ INTEGER H(1000)
20 FOR N=1 TO 1000 @ IF N=1 OR N=3 THEN H(N)=N @ GOTO 70
30 ON RMD(N,4)+1 GOTO 40,50,40,60
40 H(N)=H(N/2) @ GOTO 70
50 H(N)=2*H((N+1)/2)-H((N-1)/4) @ GOTO 70
60 H(N)=3*H((N-1)/2)-2*H((N-3)/4) @ GOTO 70
70 NEXT N @ DISP "Ready: Use FNH(n) (1 <= n <= 1000)" @ END
80 DEF FNH(N)=H(N)
```

Notice just how closely does this mimic the recursive version, only using H(n) (the array) instead of FNH(n) (the recursive call). This version does pre-compute h(1) to h(1000) and stores the results in array H, to be used by the user-defined function FNH(n), just like in the recursive version. Actually, you could use just H(n) directly, instead of FNH(n), but this way both versions work alike and the following examples using them are the same. Don't forget to RUN this version for it to generate the values (RUN is not needed for the recursive defininition).

This makeshift, non-recursive version generates all 1000 values very fast, and using FNH afterwards is much, much faster; however, it does take more memory (to store the values) and is limited to the range 1-1000, while the recursive version doesn't have any such limitation. But for quickly and effortlessly implementing a recursive definition in a hurry, this array technique does deliver the goods !

Second part: The Questions

Using our newly implemented FNH, we can do some sleuthing to try and answer the questions, namely:

1. *"What's the value of h(2^n) ? ditto h(2^n + 1) ? h(2^n - 1) ? h(m * 2^n) ?"*

   For the first question, we will try this, from the command line:

   ```
   FOR N=1 TO 5 @ X=2^N @ DISP X,FNH(X) @ NEXT N
   ```

   You'll get all 1's, so it seems that h(2^n) = 1.

   Similar command lines will quickly reveal that h(2^n+1) = 2^n+1 and h(2^n-1) = 2^n-1. As for h(m*2^n), sampling a few values like this:

   ```
   FOR M=14 TO 18 @ FOR N=1 TO 3 @ X=M*2^N @ DISP M;FNH(M);X;FNH(X) @ NEXT N @ NEXT
   M
   ```

   will make it crystal-clear that h(m*2^n) = h(m).

2. *"For which n is h(n) = 100 ?"*

   Sampling any random values or range of values makes it obvious that h(n) in always odd, so it can never be an even value like 100.

3. *"For which n is h(n) even ?"*

   Ditto. h(n) is always odd.

4. *"If n is odd and m = h(n), what's the value of h(m) ?"*

   Sampling a random range of odd n values, like this:

   ```
   FOR N=431 TO 451 STEP 2 @ DISP N;FNH(FNH(N)) @ NEXT N
   ```

   makes it absolutely clear that in this case h(m) = n.

5. *"What are the values of h(h(n)) ?"*

Ditto. As we've seen in the previous question, if n is odd then h(h(n)) = n. If n is even, then h(h(n)) is n with all factors 2 casted out.

6. *"For which values of n do we get h(n) = n ?"*

   This one is tricky. As we've seen in question (1) above, if n is a power of two plus or minus one, then h(n)=n. But are there any other values apart from these ? Let's try, add these lines to the program:

```
100 FOR N=100 TO 300 @ IF FNH(N)=N THEN DISP N;
110 NEXT N @ DISP
```

   Now running it (using RUN 100, to avoid clearing the array in the case of the non-recursive version), produces at once:

```
107  119  127  129  153  165  189  195  219  231  255  257  273  297
```

   where the powers of 2 plus/minus one do appear (127-129, 255-257), plus a host of other values, but though it's evident that there's some *structure* to it all, it isn't clear what it might be.

   However, there are some *signs* here and there waiting for us to notice. Though the function's definition doesn't seem to have much to do with powers of 2, we've found that such arguments are indeed *special*. Exact powers of 2 are always smashed to 1, while their predecessors and successors are returned *intact*. Might it be the case that working in base-10 is actually confusing the issue ? How would it all look *if we used base-2* instead, where powers of 2 are very 'round' numbers (10,100,1000,10000, ...) ?

   Let's try ! We'll show both arguments and results in base-2 and see how it all looks like. Altering line 100 above like this:

```
100 FOR N=100 TO 300 @ IF FNH(N)=N THEN DISP N;BSTR$(N,2)
```

   and running it again (using RUN 100), we get these results:

```
107   1101011
119   1110111
127   1111111
129   10000001
153   10011001
165   10100101
189   10111101
195   11000011
219   11011011
231   11100111
255   11111111
257   100000001
273   100010001
297   100101001
```

   where it is obvious that all n being returned intact by h(n) share a common trait: **their binary representations are palindromic !** Reversing their bit-order leaves them unchanged, they are the mirror images of themselves.

Second part encore: The Big Question [tm]

"Just what on Earth does h(n) do to n ??"

Well, once we've empirically explored how h(n) works and with our intuition sharpened by our previous findings, it's only natural for us to make a bold final statement:

Given an argument n, h(n) massages it a little while and then simply, in three words, **reverses its bits**.

As further confirmation, this command line:

```
FOR N=121 TO 137 STEP 2 @ DISP N,BSTR$(N,2),FNH(N),BSTR$(FNH(N),2)  @ NEXT N
```

produces:

```
  n     n (base2)    h(n)   h(n) (base2)
-----------------------------------------
 121     1111001      79      1001111
 123     1111011     111      1101111
 125     1111101      95      1011111
 127     1111111     127      1111111
 129    10000001     129     10000001
 131    10000011     193     11000001
 133    10000101     161     10100001
 135    10000111     225     11100001
 137    10001001     145     10010001
```

which clearly shows the bit-reversal at work for odd n. Even n are treated likewise, but as they end in one or more zeroes, these are rendered non-significant upon reversal, and do not show up in the output, for instance:

```
n = 136 = 10001000 -> h(n) = 00010001 = 10001 = 17
```

Conclusion

Of course now that we fully know what h(n) does, we can then proceed to write a new, non-recursive, non-array implementation of h(n), like this:

```
10 DEF FNF(N)=BVAL(REV$(BSTR$(N,2)),2)
```

That's all there's to it. This single-line (more like *half-line*) user-defined function will do the same as our previous recursive implementation (reversing the binary bits of its argument), only orders of magnitude faster (a mere hundredths of a second for any legal argument), and using orders of magnitude less memory (neither recursion nor arrays involved, though it does use BVAL and BSTR$, which are keywords from the Math ROM, and REV$ which is a very popular keyword featured in a number of LEX files).

Well, that's as far as it gets. I hope you've found all this interesting and enjoyable and perhaps even enlightening. Whatever the case, I'm sure you'll agree with me that having such a perfecty normal-looking recursive function definition actually perform a *bit-reversal* of its argument is quite *unexpected* and kind of surprising, to say the least !

As I see it, it is like this function, instead of changing the *arithmetic* value of its argument, it rather does alter its *shape* instead, its physical orientation in some sense, disregarding the actual value being involved.

Mathematics are so *beautiful*. And these wonderful HP machines can serve us well to sharpen our insights, our intuition, in this amazing journey.

As for the 'prize', *all of you* who have posted your ideas, programs and insights to this thread and wish to receive a copy of the 1280 x 1024 image in the mail, please send me an e-mail to my e-mail address listed here and I'll send it back to you at once.

Best regards from V.

Re: S&SMC #7: My Solutions And Comments [LOOOOONG]

*Message #26 Posted by **Carl Nelson** on 10 July 2004, 12:41 a.m.,*
in response to message #22 by Valentin Albillo

Here's a recursive solution for the HP-48G, probably also works on the derivative models as well. YMMV.

Note that the name of the object must match the references in the program. I had made a copy to make some modifications to, and missed one of the references, so I had a little co-recursion happening between two different objects. The amazing thing is that it worked. Well, until I deleted the older version. *Splat*

Also, I am curious here. Has anyone looked at how difficult this would be to implement as a recursive algorithm on a non-stack calculator? i.e. one of the TI calculators, not a higher-language beastie like the

HP-71 and variants, that is.

In any case, here is my take on the function.

HP-48G recursive:

HOFN:

<< CASE DUP 1 == THEN END DUP 3 == THEN END DUP 4 MOD CASE DUP 1 == THEN - 4 / DUP 2 * 1 + HOFN 2 * SWAP HOFN - END DUP 3 == THEN - 4 / DUP 2 * 1 + HOFN 3 * SWAP HOFN 2 * - END DROP 2 / HOFN END END >>

Re: S&SMC #7: My Solutions And Comments [LOOOOONG]

*Message #27 Posted by **Carl Nelson** on 10 July 2004, 12:56 a.m.,*
in response to message #26 by Carl Nelson

Let me try that again, with some spacing...

HP-48G recursive:

HOFN:

<< CASE

DUP 1 == THEN END

DUP 3 == THEN END

DUP 4 MOD

CASE

DUP 1 ==

THEN

- 4 / DUP

2 * 1 + HOFN 2 *

SWAP HOFN -

END

DUP 3 ==

THEN

- 4 / DUP

2 * 1 + HOFN 3 *

SWAP HOFN 2 * -

END

```
DROP 2 / HOFN

END

END

>>
```

Strange matrix results for HP-71B Math ROM

*Message #1 Posted by **J-F Garnier** on 5 July 2004, 7:49 a.m.*

Following a recent long discussion, about matrix calculation accuracy on various calculators, I was quite surprised by the HP-71B Math ROM matrix performance, and investigated a little bit.

First, using the Kahan exemple, I noticed that determinant calculation (DET function) gives a not so accurate answer:
Kahan matrix: DET=-.999999999998
transposed matrix: DET=-.999999999989
First, why is the determinant of the transposed matrix different?
Second, why is the result non-integer, as all elements are integer and no overflow occurs?

Then I built a simpler exemple, in order to check that the DET function uses internal 15-digit accuracy (this was stated many times, but no clear evidence was given). I used this matrix:
1+1E-7 1+2E-7
1+3E-7 1+4E-7
If DET uses 15-digits accuracy, result should be -2E-7, otherwise loss of accuracy will occur and result is expected to be 0.
HP-71B Math ROM gives 1.0000003E-14 so it seems that 15-digit accuracy is used but not only is the value half than expected, but the sign is wrong.
Transposing the matrix gives DET= 2.0000004E-14. Sign is still wrong.
Can we call this a bug? I don't know, but I checked that all next models starting from the HP-28S give correct DET value, so algorihms were changed at some point.

J-F

Re: Strange matrix results for HP-71B Math ROM

*Message #2 Posted by **J-F Garnier** on 5 July 2004, 7:57 a.m.,*
in response to message #1 by J-F Garnier

Sorry, my test matrix was not correctly reproduced in this post (a bug?):
| 1.0000001 1.0000002
| 1.0000003 1.0000004
I hope it's OK now.

Re: Strange matrix results for HP-71B Math ROM

*Message #3 Posted by **Werner Huysegoms** on 5 July 2004, 8:29 a.m.,*
in response to message #1 by J-F Garnier

As to why the results are non-integer and the transposed matrix has a 'different' result: The numerical operations in the algorithm used (some variant of LU-decomposition followed by the multiplication of the elements on the diagonal) are exposed to roundoff errors, of course. The operations are different in the

transposed matrix - that's why the roundoff errors are different, too. As regards the 'internal 15-digit accuracy'. That only holds for single operations and dot products (that can be accumulated without extra storage). The numbers themselves are still stored in 12-digit format. The reason the 71B gets the determinant wrong, and the 28S gets it right is probably (guessing): the determinant of 2-by-2 matrices is calculated using the definition, in full 15-digit accuracy (28S). From the 48G onwards, a check for integer elements has been added - if all elements are integer, then so is the determinant, and the computed value is rounded off to the nearest integer. Also, the matrix is stored in full 15-digit form, reducing roundoff errors. BTW the determinant for the sample matrix you show is of course -2e-14.

Cheers, Werner

Re: Strange matrix results for HP-71B Math ROM

*Message #4 Posted by **Werner Huysegoms** on 5 July 2004, 9:02 a.m.,*
in response to message #3 by Werner Huysegoms

My guess does seem to be correct: If I try your original matrix on a 42S and a 48SX, they return the correct answer, but if I try the equivalent 3-by-3 matrix

1.0000000 0.0000000 0.0000000 0.0000000 1.0000001 1.0000002 0.0000000 1.0000003 1.0000004

Then the result is (in both cases) 1.0000003e-14, the result the 71B gave. And yes, the transpose's determinant is 2.0000004e-14. I'm pretty sure I can find out the exact order of 15-digit arithmetic operations and 12-digit rounded stores to come up with these answers. Valentin will probably post it in the next 2 minutes ;-)

Cheers, Werner

Re: Strange matrix results for HP-71B Math ROM

*Message #5 Posted by **J-F Garnier** on 5 July 2004, 12:10 p.m.,*
in response to message #4 by Werner Huysegoms

Thanks Werner, I fill better: the HP-71B Math ROM is OK, just the HP28/HP48 added some filtering against the most visible rounding effects.

HP Series 80 Emulator

*Message #1 Posted by **Andre Koppel** on 4 July 2004, 8:25 p.m.*

Hi all, I have searched the web, but not found anything. Has anybody seen an emulator for a series 80 computer (HP86B for example)? Would be nice to have such one. I have started programming in assembler on an HP86B, and I have loved this computer...

Re: HP Series 80 Emulator

*Message #2 Posted by **Raymond Del Tondo** on 4 July 2004, 9:01 p.m.,*
in response to message #1 by Andre Koppel

Hi,

maybe the curator of www.series80.org
knows more.

Regards,

Raymond

Re: HP Series 80 Emulator

*Message #3 Posted by **Vassilis Prevelakis** on 5 July 2004, 1:27 a.m.,*
in response to message #1 by Andre Koppel

To the best of my knowledge, there is no Series 80 emulator currently available.

Since most software was written in BASIC, HP generally tried to create upgrade paths for BASIC programs.

The HP83/85 assembly manual is available at http://www.series80.org/Manuals/HP85-Assembler.pdf and provides a lot of information about the architecture of these computers.

A good way to start such a project is to create a dissassembler for the '85 so that we can look at the ROMs etc.

These will tell us how the system accesses the various peripherals and thus provide information about the entire computer system.

Best Regards

**vp

Re: HP Series 80 Emulator

*Message #4 Posted by **Olivier De Smet** on 5 July 2004, 6:23 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi,

How funny, I just started such a thing a month ago.

- First I wrote a disasembler for the roms (given by by others, I lost 2 serial moduls !!!)

- Then I started with an HP42s emulator (same as HP4x series) to write a capricorn emulator

- I used HP86 roms, so with the HP85 manuals I have some trouble for the EMC, but it progress

- Actually I got the prompt and can type some stuff, but the evaluation goes crazy ...

With the HP85 assembler manual, the state of the CPU bits (OVF, CY, LSB, MSB, ...) isn't clearly explain, I got some problem with that.

If someone have acces to a HP87 assembler manual or can give me some results for ALL binary operators for the status bits it could help A LOT !!

I have an HP86B but NO asm roms ... so it's difficults to have hint for the exact ALU behavior.

Olivier

Re: HP Series 80 Emulator

*Message #5 Posted by **Olivier De Smet** on 7 July 2004, 4:43 a.m.,*
in response to message #4 by Olivier De Smet

More precisely, I need informations about the behavior of thr ALU in BCD mode (DCM=1) when operand are non BCD number. Ie : what are the status when

CMB R10,R12 when R10 = 0x00 and R12 = 0xFF ? SBM R10,R12 for the same values

and also for other values in DCB mode ?

Re: HP Series 80 Emulator

*Message #6 Posted by **Andre Koppel** on 7 July 2004, 10:27 a.m.,*
in response to message #4 by Olivier De Smet

I have translated the 86-Assembler Manuals into German in the early 80ies. I think I have the original HP86-Assembler manual (if so, it should be possible to make a PDF-copy). I think I also have the original Assembler-Coding (with comments) from HP (a HP man has given me these things in the 80ies). If you are interested, I will dive into storage room looking for these 20 years old manuals... Kind regards Andre

Re: HP Series 80 Emulator

*Message #7 Posted by **Olivier De Smet** on 7 July 2004, 12:12 p.m.,*
in response to message #6 by Andre Koppel

Of course I'm interested, the HP85 manual isn't enougth for some behaviour (in BCD mode). For the IO it could help a lot too. A pdf version could be very helpfull.

Actually the emulator accept basic line and make basic computation (A=45*45 is ok) but I have some trouble with the display of real variable (I only got blank caracters, certainly problem with BCD arithmetic).

When you have the docs we can arrange an exchange by mail.

Olivier

TI PPX Volume 1 Number 1-5 anyone?

*Message #1 Posted by **Gene** on 4 July 2004, 2:43 p.m.*

Hi all.

Does anyone here have the first 5 issues of the TI PPX Exchange newsletter? If you look here:

http://www.rskey.org/tippx.htm

You'll see the list of what is already scanned into PDF format. However, I am missing the first five issues.

Anyone here have copies of the old TI PPX newsletter from 1977 or so they could scan so we can have a complete collection available?

New HP Financial Calcs Junk ??

*Message #1 Posted by **Michael Roback** on 4 July 2004, 2:03 p.m.*

I have a 10B I have been using for years. Bought it new, made in USA. I have compared it to newer generation 10BII and 10BII+ and it is more robust and solid. I need a 12C or 17BII and posted in the WTB forums. I had a brand new unusued 12C Made in USA that I found a few years ago and did not like RPN, so after buying it off EBAY I sold it! Now I need to take some finance courses at UCLA and it requires a 12C :-(. I would like to find one but so far no luck on EBAY. I wonder if it is likely that someone has had a new 12C in storage that was made in USA all these years! Can some of you folks give me your opinion. I have looked at new 12C's made off shore and the new 12CP and the fit and finish and keys are just not the same. The old injection molded keys/numbers is gone and painted numbers do not look crisp. Am I imagining this or is it true. Any help or advice would be appreciated. Thanks.

Re: New HP Financial Calcs Junk ??

*Message #2 Posted by **Gene** on 4 July 2004, 2:44 p.m.,*
in response to message #1 by Michael Roback

Buy an old 12c off ebay. Best bet.

Ask the sellers what the SN of the unit is...2269A12345 would be a USA make.

Gene

Re: New HP Financial Calcs Junk ??

*Message #3 Posted by **Scuba Diver** on 4 July 2004, 3:33 p.m.,*
in response to message #1 by Michael Roback

I have a USA 12C and a number of Singapore units, and they are all of similar quality.

Personally, I have not found any difference between USA-made units and those manufactured in Singapore or Brazil. I would say, however, that Indonesian/Malaysian or Chinese units do have different quality.

If you open yourself up to the possibility of owning units made in Brazil or Singapore, you should be able to find one no problem on eBay.

B.

12C and 17BII

*Message #4 Posted by **Karl Schneider** on 4 July 2004, 3:46 p.m.,*
in response to message #3 by Scuba Diver

Michael --

I agree with Gene and "Scuba Diver" -- the US- and Singapore-made units are of the highest quality made

by HP (and Brazil-made units maight also be comparable, but I can't say first-hand).

Overall keyboard quality -- including keys, key operation, and face-printing -- was lowered when production was shifted to Indonesia and China.

I have a 12C (1994) and a 17BII (1993), both made in Singapore. The quality of both is very good, although the case halves aren't fully tight on the 17BII.

The 17BII is much faster and more capable; I believe that I could get you one without manual through a local used-electronics seller.

High-quality 12C's and 17BII's should be readily available through eBay in the US. Ask/look for serial #'s of the form nnnnAnnnnn or nnnnSnnnnn.

Edited: 4 July 2004, 3:47 p.m.

Re: 12C and 17BII

*Message #5 Posted by **JDH** on 4 July 2004, 6:30 p.m.,*
in response to message #4 by Karl Schneider

Again, I would have to agree that the USA and Singapore made HP 12c are of similar quality, the latest Chinese version works OK but are poorly made. I do have a new USA made (early 1988) HP 12c in box with manual, case etc. I could sell it to you but you would be better off just buying one off ebay.

Edited: 4 July 2004, 6:33 p.m.

If you want a new 12C go to this UK site. www.calculatorshop.co.uk

Re: New HP Financial Calcs Junk ??

*Message #7 Posted by **Eddie Shore** on 5 July 2004, 10:38 a.m.,*
in response to message #1 by Michael Roback

Try Fry's Electronics (I think the nearest one to UCLA is at Marina Del Mar?). They sell HPs and I usually see the classic 12Cs for sale. I'm not sure if they are from the US/Signapore manufacturing plates however.

Since I don't personally own a HP12C (I prefer the 17BII(+) over the 12C), I can't comment from a personal perspective.

Hope this helps.

Re: New HP Financial Calcs Junk ??

*Message #8 Posted by **westridge_cz** on 5 July 2004, 11:39 a.m.,*
in response to message #1 by Michael Roback

No, you're not imagining things, the reason why the 12CP has painted numbers instead of injection-molded keys is because it's made by Kinpo for HP. The 17BII+ (not the 17BII) is also made by Kinpo. I agree with what's been said already, the ones that were made in the USA, Brazil, and Singapore were actually assembled on HP lines so the quality is completely different.

Re: New HP Financial Calcs Junk ??

*Message #9 Posted by **Valentin Albillo** on 5 July 2004, 12:01 p.m.,*
in response to message #1 by Michael Roback

I absolutely agree. I have an USA-made HP-12C and a Singapore one. Both are terrific quality, with the (very slight) edge going to the USA one, but not by much really, it might be my two actual instances of them.

Next, I bought a China-made HP-12C. In a word: rubbish ! garbage ! trash ! It's not only its faulty cosmetics, its cheap aspect, its flimsy feel. It's that it won't even pass the keyboard test first time, you always have to try a number of times and more or less 1 in 4 you succeed, if done carefully.

I've kept it for collection purposes. But certainly my first intention was to smash it against the nearest wall, and the second to have my money back, pronto !

It certainly prevented me from buying other KinHPo rubbish, such as the HP-12C Platinum and the HP33S, for life. I'd rather use my money to buy a Financial SHARP PC-1421, that can run rings around the whole lot and has looks to match. That failing (they're quite rare), another USA HP-12C would do fine.

Best regards from V.

The 12cp isn't that bad

*Message #10 Posted by **Gene** on 5 July 2004, 12:31 p.m.,*
in response to message #9 by Valentin Albillo

I used the 12cp alot when we were revising the 12c solutions book.

I never had a missed keystroke (that's not praise, it's what we should all demand).

I grew fond of it.

Given that it sells for about $75 in 2004 dollars and the USA made 12c's sold for about $95 in 1982 dollars, I think it is very good quality for 1/3 of the price in constant dollars.

If they kept the same quality and same price in constant dollars (which would be at least US $200 or more), the market for 12c-style calculators would shrink such that they would have to raise the price even further.

Not good business sense.

Real question: If I could have purchased a 12cp in 1982 for graduate school with the capabilities it has for around $30, would I have been happy?

Yes. Absolutely.

Gene

The 12Cp isn't that good

*Message #11 Posted by **Raymond Del Tondo** on 5 July 2004, 2:39 p.m.,*
in response to message #10 by Gene

Hi,

you seem to have luck with your 12Cp.
Mine (CN32107416) is just nearly new junk,
because it *does* miss keystrokes,
and this is reproduceable.

And they didn't aven solve the standard problem of
'Voyager compatible calcs': The ENTER bar
needs too much force compared to the other keys.

And my opinion about a 12Cp optical aspect:
I think the calc would look much better if
the case and keys would be dark grey ('anthrazit')
instead of dark blue.
A dark blue case looked cheap on the very expensive Jornada 690, too...

>Real question: If I could have purchased a 12cp in 1982 for
>graduate school with the capabilities it has for around $30,
>would I have been happy?
>
>Yes. Absolutely.
>
Good for you:-)

I wouldn't have been too happy with a calculator
which missed key strokes in critical situations.

Ok, I had to save a lot of money to be able to buy an HP-41C in around 1980.
But it was worth every cent (Pfennig back then),
because I could just type in the numbers
w/o checking every key stroke.

That was efficient, compared to the cheap and no-so-cheap
bouncing button crap of other brands (especially TI) back then.

(Actually the HP-41 had many advantages
over any other scientific calc back then;-).

Raymond

Re: The 12Cp isn't that good

*Message #12 Posted by **Gene** on 5 July 2004, 3:34 p.m.,*
in response to message #11 by Raymond Del Tondo

If it misses keystrokes, send it back.

Why is that difficult? How else will a company learn unless consumers vote with their wallets?

As for the color scheme, stay tuned...that will be the subject of my presentation at HHC2004.

My special HP-41 birthday present :-)

*Message #1 Posted by **Raymond Del Tondo** on 3 July 2004, 4:00 p.m.*

Hi all,

because today (3rd of July) is my *41st* birthday,
and because it's the 25th anniversary of the HP-41,
this is my special birthday present to the HP-41 community!

Finally I managed to reorganize my CCD-C from back in the eighties,
cut it down to a single 4K page,
and squeeze as many functions as possible into the ROM.

It's label is '-CCD OS/X',
and the version is CCD-D, or simply CCDD.
It's ROM ID has been changed to 5,
to avoid conflicts with the HEPAX.

It should be available on 'the other site' soon.
Meanwhile, you can download the archive here .

The zip archive consists of the CCDD in .ROM format,
and an excerpt of the header I made for the source.

Have fun:-)

Raymond

in response to message #5 by Raymond Del Tondo

Happy 365.25 [1/x] 41 [+] !

And a big thank you for your present to us...

Regarding the 'HP-41CV Emulator' for the 48SX: I've put it in a 48GX since I bought it and the only inconvenience I found is that when I turn OFF the calc it, sometimes, turns itself ON after a while.

I didn't test everything, of course, so here's the question: what is supposed NOT to work when used in a 48GX?

Thanks again,
Massimo

Re: My special HP-41 birthday present :-)

*Message #7 Posted by **Raymond Del Tondo** on 4 July 2004, 11:31 a.m.,*
in response to message #6 by Massimo (Italy)

Hi Massimo,

many thanks!

Regarding the HP-41CV emulator:
The normal SX version may start in the GX,
but I know that only the basic interface is somewhat usable.
This is because the original software uses some entry points
and addresses which are different in the GX.

I know this for sure because I made the real GX port
of the Zengrange emulator.

When using the SX version on a GX,
you won't be able to call all menus,
FOCAL programs won't run,
and not all built-in functions will work.

Even XEQ won't work for all callable functions.

My GX port is based on the latest official emulator
ROM revision, completely resourced,
and heavily modified for portability.
Now the whole emu is only one library,
and runs on any SX, GX, G+ with a suitable RAM card.
In contrast to the original software,
my GX port can be stored in *any* port
at *any* location.

The software is ready for more than one and a half years now,
but still unpublished due to copyright questions.

I wrote some articles/responses to posts,
which may be in forum archive 13 and 14.

BTW: My relocateable version runs faster on a GX
than the original version on the SX.

This wasn't aesy to achieve, because the internal program
structure had to be heavily modified for beeing relocateable.
One of the main reasons the original is even usable on the SX
is the fact that it uses absolut addresses,
so jumps are resolved much faster than using
normal relocateable RPL and ML code.

I had to make many optimizations to get run at a comparable speed,
and that target hes been reached, at least on the GX;-)

Raymond

Edited: 4 July 2004, 11:45 a.m.

Re: My special HP-41 birthday present :-)

*Message #8 Posted by **Massimo (Italy)** on 5 July 2004, 3:57 a.m.,*
in response to message #7 by Raymond Del Tondo

Thank you very much Raymond!
Well... I'm ashamed: I didn't even notice that PRGM was not working!

I did try the card in a 48SX at first and even tried some test programs in order to compare it against the emulators from Hrastprogrammer and the real thing.

Then I asked myself "why not try it in a GX?" so I plugged it in and tested only basic functionality.

It would be nice to have your GX port... alas, those copyrights are a real nuisance! :-)

Massimo

Re: My special HP-41 birthday present :-)

*Message #9 Posted by **J-F Garnier** on 5 July 2004, 7:05 a.m.,*
in response to message #8 by Massimo (Italy)

Maybe could Frank Wales help to solve the copyright issue. I guess there is no more commercial interest in this emulator, only collector/historic interest.

(Raymond, congrat for your CCD OS/X! I will test it soon...)

*Message #15 Posted by **Angel Martin** on 4 July 2004, 12:34 p.m.,*
in response to message #1 by Raymond Del Tondo

Happy Birthday Raymond. Good way to share it with all of us.

I've downloaded your OS/X and ran it briefly on V41. It looks like you chose not to implement the extended CAT'4 types (Matrix, Keys, and buffer files), and I wonder why?

In looking at the original CCD, the CAT'4 interrupt (in the upper page) is eventually directed to address x3C6 in the lower page, which is a PORT DEP GO instruction, transfering the execution to the subroutine located at address x6E5.

I'm sure you've already used such subroutine in your OS/X, so I suspect that all it will take to add the CAT'4 extended support are a meager three words. Could it be?

Anyway, great accomplishment even without this detail, that's for sure. Many thanks and all the best, 'AM

Re: My special HP-41 birthday present :-)

*Message #16 Posted by **Raymond Del Tondo** on 4 July 2004, 9:25 p.m.,*
in response to message #15 by Angel Martin

Hi Angel,

many thanks:-)

For CAT'4: Back then when I first made room for my ML utilities,
I threw out all I didn't use then.
Since I never stored my keys or buffers in XM,
the extended CAT 4 listing routine was omitted.
And since there are no suitable managing functions
like SAVEB or SAVEK in the CCD OS/X,
there isn't much need for the CAT'4 (for me) .

Likewise the message 'NO XF/M' doesn't appear
if there's neither XF/M module plugged nor CX.
Instead a simple NONEXISTENT will show up.
This was all done back in the mid eighties,
when I needed maximum room for my ML utils.

But in the CCD OS/X there's a goodie which isn't in the original CCD ROM:

If you have both the CCD OS/X and the Extended IL ROM installed,
you'll notice that a CAT'7 will show the ExtIL SDIR mass media catalogue.

To use a word from Bill Wickes: 'Life is short and ROM is full'.

Currently there are only 4 words free in the OS/X .

However, if I have some time in the near future,
I'll make a bankswitched version with most of the CCD
functions, except the matrix stuff.
Then I'll re-include the extended CAT'4 functionality, of course.

BTW: Did you notice that CAT'5 w/o Timer, but HEPAX,
gives NONEXISTENT if no HP-IL module is plugged?
This is because the CCD was made long before the HEPAX,
and there was no other ROM than the Timer to occupy page 5.

Best Regards,

Raymond

Re: My special HP-41 birthday present :-)

*Message #17 Posted by **Ángel Martin** on 5 July 2004, 3:28 a.m.,*
in response to message #16 by Raymond Del Tondo

Raymond,

"BTW: Did you notice that CAT'5 w/o Timer, but HEPAX, gives NONEXISTENT if no HP-IL module is plugged? This is because the CCD was made long before the HEPAX, and there was no other ROM than the Timer to occupy page 5."

Interesting. Since I only use the HEPAX with the CX, I've never seen this behavior.

But what I have seen is that with the IR-PRINTER module and thus HEPAX on page #7, both the CCD CAT'0 and CAT'7 execute the HEPDIR function from the HEPAX.

So this tells me that the HEPAX designers were to great lengths also in this subtle detail, marvelous indeed.

Best, ÁM.

Happy Birthday, Raymond, and thanks a lot for that great present !!! (nt)

*Message #21 Posted by **Diego Diaz** on 5 July 2004, 6:55 a.m.,*
in response to message #1 by Raymond Del Tondo

Hi Raymond,

I'd like to adhere myself to both congrats: your birthday and your CCD OS/X...

... and even add another one, most of you already know: IIRC (looking at corresponding PPC issue ;-), it was July 17th, 1979 when HP officially announced HP-41C.

Regarding BankSwitching for the CCD future release, have you decided wich BS scheme are you gonna use?? Are you thinking in a Clon-like physical support or is it only intended for emulation??

Best wishes.

Diego.

Unhappy transformer on HP-85 Power Supply

*Message #1 Posted by **Andy** on 2 July 2004, 6:21 p.m.*

Hello all! :)

A while back, I purchased a smoking HP85. (Looking at the forum history, it looks like smoking HP85s and Andys go together. :))

I'm finally getting into the fixing it stage... The part in question looks to be a transformer labelled 9100-0457 / 906933. It has a similar, happier cousin labelled 9100-0455 / 906933. The caps are going to be replaced, but the transformer itself has already turned black and gooey. *Sighs* I was wondering if anyone might roughly know the values of the fellow offhand.

Thanks very kindly! :)

Andy

JPC on EPROM for 71B - help

*Message #1 Posted by **kim** on 2 July 2004, 3:41 p.m.*

I was reading a stream about the ability to burn a 32kb eprom for the HHP 32/32. Emmanuel (a.k.a XEQ41) offered to someone to burn an EPROM if he had the image. As the crazed 71B collector and 71B play-crazy too, I would very much like to get a copy of the JPC Rev X (I think it should be OK to do this) rom for my HHP. Is there someone in this community that could help me do this or maybe even know what happened to XEQ41.

Re: JPC on EPROM for 71B - help

*Message #2 Posted by **J-F Garnier** on 5 July 2004, 6:59 a.m.,*
in response to message #1 by kim

Hi Kim, you can find the JPCRom rev Ex (unofficial bug fix release) on my site:

http://membres.lycos.fr/jeffcalc/emu71.html

It's in binary format, you may have to convert it in a different format for an EPROM burner.

HP-35 repair

*Message #1 Posted by **Jason** on 2 July 2004, 3:10 p.m.*

HELP!!! I spilt coffee on my working HP-35 calculator and after opening it up to air it out, a little brass clip fell out (it looks like a little "M" or "W", depending on its orientation. I do not know where it should be placed prior to reassembly. If anyone has suggestions, please let me know. Thanks, JDH

Re: HP-35 repair

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 2 July 2004, 3:27 p.m.,*
in response to message #1 by Jason

I'd guess that it came from the ON/OFF switch. I don't know the HP-35 but I have a HP-32E and the power switch has this (golden?) piece of metal to close the contacts.

Good luck!

Nelson

Re: HP-35 repair

*Message #3 Posted by **Ronald** on 2 July 2004, 3:45 p.m.,*
in response to message #1 by Jason

This is from your on/off switch. Put the calculator with the buttons down on the table. Now put the brass part in the switch button. the litle v should be pointing downwards (oriented like a W, not as a M if you understand what I mean). Now put the other parts back in place and close the calculator after you cleaned is dried it.

Good Luck

Re: HP-35 repair

*Message #4 Posted by **Hank** on 2 July 2004, 6:34 p.m.,*
in response to message #3 by Ronald

When my nephew poured salt water on the key board of my first HP-41, I washed it out with great floods of fresh tap water and then dried the calculator in the lowest heat I could get in the oven. It worked fine for the next several years - I don't know what happened to it after I sold the HP-41C when I had a CV and CX on hand.

Joe had salt water fish.

Hank

Re: HP-35 repair

*Message #5 Posted by **David Smith** on 3 July 2004, 2:11 p.m.,*

in response to message #1 by Jason

It is either the power switch contact or the charger port bypass strap. The charger strap snaps in the place where the charger plugs in and connects the two outer pins together when the charger is not plugged in.

Math not button-pushing

*Message #1 Posted by **bill platt** on 1 July 2004, 4:17 p.m.*

Hi Ed,

My son (7 in August) knows that I enjoy calculators. He said the other day, "so Daddy, you love calculators very very much." To which I replied, "Oh, I don't know that I *love* them, but I *do* enjoy using them and thinking about their design."

So, being a collector, one must be careful.

Actually, I have "indoctrinated" my son regarding the correct, effective use of these machines, and the *need*, yes NEED, to do as much arithmetic as possible in your head.

(We need to do it, becase you cannot be efficient with numbers unless you use them frequently---and it is a skill of tremendous value----my mentor used to out-compute me in his head---and I had an 11c and though I was so smart. But he used a calcuator instead of trig tables when required.)

The other day, I taught my sone some of the "rule of nines" which he did find fascinating (no calculator involved). The next day, he told me that he really loved that--and that he wanted to do more math with me.

So we applied the "rule of nines" to 8's and 7's...and in the process I introduced both summation by columns, and multiplication, and the commutative property, for both addition, and also multiplication, and why this is.....

All lot's of "fun" and no calculators!

((In fact, I don't see how the calculator would be useful---it just "spits out" answers. The fun of numbers and math is understanding how stuff happens---which is why we like calculators: we like programming them (which requires you to understand what the solutions) and we like deconstructing calculators---like the thread on matrices recently with all the heavy-hitters (V.A., P.O.H, K.S., Eam., L.C.V., J-F.G., VPN, B.W., A.M.....)--all trying to figure out the subtleties of machine results at far decimal places.....))

But both my children like the 48GX---they think it is novel and fun to be able to write letters on the screen, and make it "beep".

Regards,

Bill

I do agree with you! (N.T.)

Re: Math not button-pushing

*Message #3 Posted by **Eddie Shore** on 1 July 2004, 10:55 p.m.,*
in response to message #1 by bill platt

I believe it is why we use more powerful calcualtors to explore mathematics and to understand reason. More often than not, I find myself first estimating quick calcualtions in my head then using the calculator to verify.

I estimate that those who don't like math see calcualtors as "push and get answer". But that will never allow people to see the ultimate power of such a machine.

Re: Math not button-pushing

*Message #4 Posted by **OpenRPN** on 2 July 2004, 1:18 a.m.,*
in response to message #1 by bill platt

I couldn't agree more. A calculator is a tool: not a brain replacement.

During the first day of my freshman engineering analysis (read: math for sadists) course, the professors made it very clear that no calculators were needed or could even be used during exams. Their logic being that engineers *design* calculators and must understand from whence the answer originates.

Re: Math not button-pushing

*Message #5 Posted by **KC** on 2 July 2004, 5:18 a.m.,*
in response to message #4 by OpenRPN

I believe that "one who loves calculator loves Maths", and the opposite is also true: "one who doesn't love Maths doesn't love calculators (but the reverse isn't necessary true: one who loves Maths doesn't necessary love calculators)". So, all people in this forum, I believe, have good senses on Maths and numbers.

Re: Math not button-pushing

*Message #6 Posted by **Bram** on 2 July 2004, 6:26 a.m.,*
in response to message #1 by bill platt

> Quote:
>
> In fact, I don't see how the calculator would be useful---it just "spits out" answers. The fun of numbers and math is understanding how stuff happens

Sometimes things go on vice versa when the calculator "spits out questions", as happened to me the other day. I was rather thoughtlessly pressing some keys and at the end of a vague mental path (that cannot be reconstructed) my calculator raised some numbers and only then I started to think.

But first, dear friends, take all your favorite calculator and compute the reciprocal of 7.4
Now that turns out a nice number, doesn't it?
At first I considered this just a pretty coincidence, worth to remember. But then I started to search for more numbers like these. Perhaps there were patterns to be found. Perhaps I could write a program to find "nice combinations".
While still thinking on that, I've found two more numbers of different "nicety": 5.5 and 7.992
It's not of earthshaking importance, but it was fun to me.

In this case my calculator definitively didn't make my life easier, but without it I wouldn't have discovered this interesting bit. And I'm sure it will help me to find some answers. A real reciprocity between man and

machine.

Re: Math not button-pushing

*Message #7 Posted by **Valentin Albillo** on 2 July 2004, 6:40 a.m.,*
in response to message #6 by Bram

Bram posted:

"take all your favorite calculator and compute the reciprocal of 7.4 [...] A real reciprocity between man and machine."

"Pun intended", I suppose ? :-)

Best regards from V.

*Message #8 Posted by **Bram** on 2 July 2004, 7:40 a.m.,*
in response to message #7 by Valentin Albillo

Thanks for your pat on my (Dutch) back.

Re: Math not button-pushing

*Message #9 Posted by **Garth Wilson** on 2 July 2004, 2:14 p.m.,*
in response to message #6 by Bram

I'm sure most others have noticed this, but 1/7, 2/7, 3/7, 4/7, 5/7, and 6/7 are interesting as repeating decimals because they're all the same-- the cycle of repetition just starts in different places.

Re: Math not button-pushing v.v.

*Message #10 Posted by **Bram** on 4 July 2004, 1:51 p.m.,*
in response to message #6 by Bram

I've restricted the "nicety" of the numbers to those that match the pattern 0.abcabcabc...(ad infinitum) and with a program for HP-32SII I found 36 of these numbers whose reciprocal value is a decimal value of only a few digits followed by zeros. (maximum of 3 decimal digits. With max. 4 you get 7 (is odd) numbers extra) F.e. 0.216216etc. has a reciprocal value of 4.6250000...
The whole set includes trivial numbers like 0.111111... and 0.333333... as well (although 0.777777... is the only one lacking)

Now let me define the notation N(abc) being 0.abcabcabc....
I've noticed that sometimes two numbers form a pair by this relation:
1/a.bc => N(klm) and then 1/k.lm => N(abc)
examples:
1/1.08 => N(925) and 1/9.25 => N(108)
1/2.25 => N(444) and 1/4.44 => N(225)
but they do so only with 2 decimal digits (2nd may be 0)
1/5.40 => N(185) and 1/1.85 => N(540)
otherwise digits will overlap. with 3 "decdigs"
1/4.625 => N(216) but 1/2.16 => 0.4629629629 (=0.4625+0.0004625 etc.)

Just some funny observations. I'm not considering a thesis of any kind ;-) I just played with the calculator, wrote a program, watched the results and thought them over. No maths involved, only number crunching. Like I said before: somtimes it's the other way round.

Divisors - I liked it :)

*Message #11 Posted by **Tizedes Csaba [Hungary]** on 7 July 2004, 7:56 p.m.,*
in response to message #10 by Bram

When I was young I made similar "observations", It was wonderful:

```
1/22=0.0454545... and 1/45=0.0222222...
1/18=0.0555555... and 1/55=0.0181818...
1/33=0.0303030... and 1/30=0.0333333...
1/99=0.0101010... and 1/10=0.1 == 0.0999999...

and so on...
```

All of this numbers are divisors of 990.

Csaba

*Message #12 Posted by **John Smitherman** on 2 July 2004, 3:19 p.m.,*
in response to message #1 by bill platt

Bill, your children may be too young to enjoy or benefit from this handbook now but I believe that it's a great resource for anyone who is working, studying or has interest in the fields of math, science or engineering.

Schaum's Mathematical Handbook of Formulas and Tables by Murray R Spiegel

It's available from Amazon for ~$12

http://www.amazon.com/gp/reader/0070382034/ref=sib_dp_pt/002-4216030-3468813#reader-link

I like being able to look at page after page of tables of numbers, formulae, plots and geometric shapes in such a concise collection.

If anyone has another favorite please pass it on.

Regards,

John

Re: Math not button-pushing

*Message #13 Posted by **Dave Shaffer** on 3 July 2004, 2:07 p.m.,*
in response to message #12 by John Smitherman

"If anyone has another favorite please pass it on."

The CRC Math table book!

When I occasionally talk to high school students about science, I bring along my tattered copy (from about 1965!) to emphasize how useful it would be for them to get one when they go to college. (The trig, log,

etc. tables are no longer needed, of course, if you have a calculator handy, but the trig conversions, integrals and differentials, probability tables, etc. are still most useful.)

Re: Math not button-pushing

*Message #14 Posted by **Bill (Smithville, NJ)** on 6 July 2004, 3:45 p.m.,*
in response to message #13 by Dave Shaffer

Dave,

>> The CRC Math table book!

You hit the nail - That book got me trough college and many of my early engineering jobs. I still have a copy - (just checked - 21st eddition, 1973) and still refer to it. A great reference. Of course, when I was in college in 1967, a slide rule and the CRC was all a student needed.

Bill

HP Tape for HP 82161A

*Message #1 Posted by **Artur** on 1 July 2004, 8:24 a.m.*

Hi,

I would like to ask some happy person who owns the tape for HP cassete drive to take some pictures of the cassete, if possible, near by some graduated rule as I'll try to make my own tape... if possible too, show details of mechanism, like the rollers, the begin mark (or end) - the hole in the tape - if there are any support where the reading head touchs the tape, etc ...

Thank you very much! The pics can be send to my email - remove SPAN.

Re: HP Tape for HP 82161A

Calc won't run on batteries

*Message #1 Posted by **David Ramsey** on 30 June 2004, 6:34 p.m.*

Well, I finally snagged a "red dot". It's easily the most beat-up calc in my collection-- apparently it was stored in a working rock tumbler-- but I knew what it was like when I bid on it.

The calc has obviously been opened and it appears as though a bank of LEDs has been replaced (slight brightness and position differences).

The calc works perfectly on AC but not at all on batteries. The battery contacts are the cleanest, nicest part of the calc.

I will be disassembling the calc to clean and polish it; is there anything I should look for other than obvious broken connections re the not running on batteries thing?

Re: Calc won't run on batteries

*Message #2 Posted by **Randy** on 30 June 2004, 7:03 p.m.,*
in response to message #1 by David Ramsey

Either the battery is dead or it's the bridging clip where the charger plugs in. Looking at the back of the calc with the charger port at the top, the left pin is the battery, the center is common and the right is the supply to the calc. With no charger, the bridging clip has to connect the left pin to the right pin for the unit to operate from battery supply. Either it is: 1) Missing 2) Corroded or 3) Bent out of shape.

Re: Calc won't run on batteries

*Message #3 Posted by **David Ramsey** on 30 June 2004, 9:51 p.m.,*
in response to message #2 by Randy

Yeah, that was probably it. This is a very early calc without the newer style bridging clip that has a "slot" to help locate it. I'll make sure it's positioned correctly when I reassemble the unit.

Re: Calc won't run on batteries

in response to message #1 by David Ramsey

Another problem could be the battery contacts. They toch the pack along the SIDES of the tips of the battery contacts. I have seen several machines with invisible corrosion there that prevents proper contact to the pack. BTW, Ron Grant says hi.

Re: Calc won't run on batteries

*Message #5 Posted by **David Ramsey** on 2 July 2004, 12:39 a.m.,*

It was the "shorting" contacts in the AC adapter socket on the calc. And tell Ron I'll be sending him some stuff soon...

Opinions wanted.

*Message #1 Posted by **Ron Ross** on 30 June 2004, 4:48 p.m.*

Opinions wanted:

Which calculator should I guide/suggest to my daughter who is a Junior in High School.

The reality of the US schools is that most texts use the Ti-83 and that is what she took from my collection in February. Should I just leave it at that as her math skills, while good, do not demand better. Or should I show her a superior calculator such as a 48G or whatever else may be suggested? The state of teaching in the US is such that most serious students are expected to have and use a graphics. So that is basically what this discussions should limit itself to (though an argument for an Hp41 could not be discounted).

While it really makes no difference today, the time spent on a better machine would pay dividends for her later, but this could just be wishful thinking on my part. Any comments.

She did take the Ti-83 only after great trepidation and is actually somewhat of an anti-technologist (probably to spite me). She went without a calculator up until this last semester. As most of you know, I do have an assortment of calculators that are available to her. What do I suggest or should I just let her use the Ti-83 (this is not a bad calculator, its just one I happen to dislike for what I feel should be in a calculator).

Feedback???

in response to message #1 by Ron Ross

What about a 39g+ ?

Or could an 9g be sufficient?

You may have noticed that I didn't mention an RPN/RPL model yet.
From the overall quality and expandibility side, I'd take an HP-48G series machine.
But note this is mainly an RPN/RPL machine,
so you should let decide your daughter to choose the entry mode she likes more.

in response to message #2 by Raymond Del Tondo

Even though I have a number of nice HP calcs, I'm currently taking Intermediate Algebra (something I should've taken 30 years ago when my brain was sharper). The instructor, hell, the whole college, is geared toward the TI-83. So I bought a used one as I didn't want to have to stumble through class with a

calculator my instructor was afraid to touch. But the rebel in me won't die that easy, I bought a 48G a week later. I just don't have time to learn how to use it. (Full time job, puppy in the household, homework, and class, yada yadda, et al.)

So don't feel guilty about letting her use the TI. (I was going to add, "...at least she's learning math." until I realized that line of logic follows, "Let your son read pr0n, at least he's reading!") B^)

I would definitely reccomend a scientific calculator (I don't think graphing calculators should be in middle schools, or even algebra or geometry), but that is just my preference/opinion.

Let's not turn this into another battle between graphing and scientific calculators.

*Message #5 Posted by **Jim Creybohm** on 30 June 2004, 6:05 p.m.,*
in response to message #1 by Ron Ross

First off, you should congratulate your daughter for being able to do mathematics without a calculator (that may be heresy here).

I went through this same process with my son who just turned 16. It was a crisis of conscience in that I am an engineer, and I learned on an HP. But I also have to be practical...

As in the US, Alberta is fundamentally a TI based program. One of our textbooks actually has examples based upon "keying in" to a TI to achieve the answer. My son is in what we call a matriculation curriculum (geared towards University entrance rather than trade school)

That having been said, I purchased an HP30 so that he could learn about an HP and get used to an Enter key (hey, I was naive). The calculator lasted about two months or so, and then passed away in its sleep one night. I subsequently purchased a TI-83 for him. I have found that the TI is a much nicer calculator than I had expected. He likes it better too, as he has the instructions immediately available to generate the results he is seeking rather than learning not just the material, but also an operating system. He can concentrate on the math process.

Bottom line for me: The romantic in me says go HP, the practical in me says go TI. Your mileage may vary.

12345

Don't give her a calc!.

in response to message #5 by Jim Creybohm

Ron,

First, I guess there's something wrong in introduce a calculator machine to youth people.

The math learning process is more analytical and conceptual task than calc-mechanic-typing.

When I was at school, the excercises were developed and formulated in a way that all the parcial and final results were simple results, making the concept more important than just asking the calculator for the sin or cosine of 90 degrees, leading to a more efficient learning for the class. Nobody that understoods the real concept of the "thing" needs an HP or a TI for calculating the sin, cosine, tangent of the 90,180,270,30,60,45 degrees or sqrt of 144 right?. And for the four basic math operations, it should be done by longhand computation for the sake of mind health.

Honesty I don't believe that an HP or a TI, numeric or graph calc would make a sensible difference 'cause later or not the calcs will broke, or will become obsolete.

Ler her use her mind for doing math. She, for sure, will never need an upgrade.

And finally, I might be wrong... ;)

Pio

P.S. Calculators are just for lazy adults minds like mine

"As in the US, Alberta is fundamentally a TI based program. One of our textbooks actually has examples based upon "keying in" to a TI to achieve the answer. My son is in what we call a matriculation curriculum (geared towards University entrance rather than trade school)"

Just yesterday I read a passage from a book from 1959 written by a professor who was visiting grade schools called "Why Kids Fail" In this passage he was explaining the difference between answer oriented students, and problem oriented students.

Here's the gist of it:

Answer oriented students get a problem and go on a treasure hunt to find this answer somewhere in Answerland. Rather than reading the problem and analyzing it, they say, "Well, last time I did a problem involving 2 people's ages (say Mary is twice as old..." I created a variable for Mary and a variable for John. I then equated them, and solved.

Doing the same problem, the problem oriented student took the information, made a logical guess (that neither could be older than 10 or so) and then using the prblem developed the answer.

If students are just keying in stuff to the TI-83 calculator, they don't understand how to do it. I have many friends who don't know how to really graph by hand, but they can key it into their calculator; that don't know how to solve many equations, but they can key it into their calculator.

That is why standardizing books to a specific calculator can be described as the downfall of Math classes. Students memorize how to plug in numbers to their calculator... how to press the buttons, not how to use their calculator to aid their own "Problem Oriented" mind.

I say, go for the different calculator, teach the kid at home some with it, and then he/she will learn more.

And now I must run off to my number theory class.

You could try to teach her how to use your collection of calculators. I hope you do have such a collection. And then if she likes any of the calculators or wishes to have some features that the calculators don't have. You will now then know which one she likes best. You should give her the one that she likes best. If she likes none (very possible) then get her none or get whatever recommended by the school.

*Message #9 Posted by **Ed Look** on 30 June 2004, 6:16 p.m.,*
in response to message #1 by Ron Ross

I, too am a RPN addict. (My wife once gave me a HP20S and shortly thereafter, only she uses it.) I gave my son a 39G (no +; the older version can be had for much less and on Colin Croft's advice- and he's Mr. HP39G, 39G+, and 40G). This is an algebraic graphing calculator.

Despite my affection for RPN, I think kids should start off with algebraic, as it is easier to start with, their peers generally use one, and it does not scare the teacher.

I DO allow my son access to my RPN/RPL models if he wants to look at them and he has understood (though only basically) how to use RPN.

I suspect that as a kid begins to do more and more demanding calculations, they just might opt for RPN models, but to start, I recommend algebraic. The HP 39G, 40G (if available in the U.S.), and 39G+ models are quite nice and have enough power to last until high school work. But I think college math, science, and engineering courses would be facilitated by a RPN calculator.

Re: Opinions wanted.

*Message #10 Posted by **Chris Woodhouse** on 30 June 2004, 7:34 p.m.,*
in response to message #1 by Ron Ross

Why not just teach her RPN and show her the features of both the TI and what ever HP you plan on getting for her, then let her decide what she wants. If she is in high school I am sure she is capable of making her own decision as to what calculator she wants to use.

I have no idea where this altitude that you should learn algebraic first and then learn RPN, is coming from, learning either is a trivial task if you already know the basic rules of math. The only difficult task is learning the more advanced functions of the calculator. Even that is rather easy if you learn the various features as you need them, as opposed to learning everything about the calculator at once.

*Message #11 Posted by **Steven Kutoroff** on 30 June 2004, 8:13 p.m.,*
in response to message #1 by Ron Ross

I had a difficult choice when my son was suggested to buy a TI-83, when I had like 8 HP calculators he could be using (well not the collector ones).

The TI-83 turns out to be very nice. He learns what he needs on it at school and almost never needs my help

with it.

Asking a child to be different at school is just not practical. If 19 of 20 kids have a TI-83, the one without it is at a severe disadvantage.

Re: Opinions wanted.

Following that logic, if 19 out of 20 drivers drive a Dodge Neon, the one with a Viper is going to be at a disadvantage? I don't think so.

Kids like to be different (or at least they that's what they claim) why not give them the information to make their own informed decision? However, I don't recommend letting them have the Dodge Viper :O)

Chris W

Huh? RPN is a muscle car?

*Message #13 Posted by **Randy Sloyer** on 30 June 2004, 10:27 p.m.,*
in response to message #12 by Chris Woodhouse

Chris, your example is absurd. You've gotta come up with something better than that to be taken seriously. Most kids don't want to be different. Maybe you like being labeled a nerdy geek, maybe you don't. Kids at this age only want to be cool. My daughter took a 49G to class, it was a cool blue color. Yeah, cool, everybody liked it, but nobody wanted to use it. Problem was, dad could only help with yesterday's lesson, not tomorrow's. Point is, anything other than the calculator being used in the textbook is putting a kid at a serious disadvantage. The teacher is not going to learn a different calc to help one kid. Get real. The kid would have to know the calc and the material better than the teacher. Calculators in the classroom are not about learning math, the abstract language that it is. I learned graphs on chalk boards and graph paper. Would have I learned any more or less with a calculator? IMO, less, since time is wasted on how to operate the calculator. It's not about the ability of the calculator to parse an expression, be it prefix or postfix. Just because you can use a computer, does that imply you can program it to do other useful things? Calculators are no different.

When you personally have a 12+ year old in an algebra class without the required recommended calculator, please come back and share your experiences. Meanwhile, let me ask you, how may primary teachers, or better yet, college professors have signed your "Bring back the 15C" petition? Were the blind live, the one-eyed reign. In my opinion, you're blinded by RPN. Hang around here long enough and your maybe eyes will be opened. There's a reason they call it a museum...

PS: I own lots of HP's and not one TI machine, but my 14 year old does :-(

Re: Huh? RPN is a muscle car?

*Message #14 Posted by **Chris Woodhouse** on 1 July 2004, 12:06 a.m.,*
in response to message #13 by Randy Sloyer

> Quote:

> how may primary teachers, or better yet, college professors have signed your "Bring back the 15C" petition?

Well I don't have any real way of knowing that for sure but I can make a guess. About 60% of the people who have signed the petition have left and email address, about 29% of the email addresses end in .edu. I don't know, but my guess is that many more of those are professors/instructors than are students. I have also noticed several comments from those that state they are a college professor, many of whom say they would recommend the 15C to their students. I don't know of a way of guessing on the grade school teachers except to say I have read a few comments from signers who say they are teachers. However, as I have stated before, I don't think students is the prime market for the 15C.

> Quote:
>
> Huh? RPN is a muscle car?

Don't be so literal. I was only trying to point out that being different than everyone else isn't necessarily a bad thing. Having a fairly obvious physical handicap, I think I know a thing or two about being different. Any connection I may have intended was only around the speed difference between the two cars mentioned.

> Quote:
>
> Most kids don't want to be different.

Maybe they do maybe they don't. My suggestion was to show the kid the advantages or each option and let her make her own decision.

> Quote:
>
> dad could only help with yesterday's lesson, not tomorrow's

Here is where I have a quite different perspective. I didn't need help from dad on my math and I didn't need any help learning how to use my 11C I received for Christmas when I was in the 9th grade.

> Quote:
>
> The kid would have to know the calc and the material better than the teacher.

The calculator, yes. The material, no. I guess with the sparse documentation that comes with calculators today that could be difficult, but I never had any problem learning how to use my calculators when I was in school. I guess starting with an 11C and then moving up to a 48GX through a 15C, 42S and 48SX made it a bit easier too.

> Quote:
>
> Would have I learned any more or less with a calculator? IMO, less, since time is wasted on how to operate the calculator

I agree that a calculator isn't really a good tool to help learn math. What I mostly used a calculator

for when I was in school was to check my answers. I tend to make little mistakes like dropping a term in an equation or a negative sign, my calculators came in handy to catch those errors. However I don't agree that time learning the calculator is time wasted, nor do I find it takes much time, especially compared to the time required to learn new concepts in math.

> Quote:
>
> In my opinion, you're blinded by RPN.

I am not blinded by RPN, I have a bias sure but that doesn't mean I am close minded.

> Quote:
>
> Hang around here long enough and your maybe eyes will be opened.

I am still waiting for that, so far the only attempt has been to give a vague reference to a single example by someone who expects that to be enough for me to change my long held views when they require precise details before they will form an opinion.

As I have said before, I am willing to discuss this and look forward to reading good arguments but so far I haven't seen any.

My older son used a 48GX in high school while his younger brother was using a 41CV in middle school. Now the older is in college and the younger has switched to a 48GX in high school. Both *asked* for the HP calculators, and both were the only HP users in their classes.

> Quote:
>
> When you personally have a 12+ year old in an algebra class without the required recommended calculator, please come back and share your experiences.

The only calculator-related issue that has come up for either of my boys was in ninth-grade Geometry last year. My youngest wanted to know how to find inverse sine, inverse cosine and inverse tangent on his 48GX. I explained that arcsin, arccos and arctan (represented on the calc by asin, acos, and atan) were alternate notations for those operations. That was all the help he needed (for operating the calculator, anyway). It surprised me a bit that neither his teacher nor his textbook mentioned *both* ways of representing the inverse trig functions. (The textbook actually had little pictures of the inverse trig keys from a TI model.) He'll be taking Honors Trig this year, so I don't think his HP held him back.

Re: Opinions wanted.

*Message #24 Posted by **Ed Look** on 1 July 2004, 3:22 p.m.,*
in response to message #12 by Chris Woodhouse

Mr. Woodhouse, oh not at all!

They say one thing and do another (don't we all)!

No one will admit to their adherence to Nietzschean pack mentality, stoked by Madison Avenue. But tell a boy (I ain't gots no gals so I can'ts says 'bout that) to wear the "wrong" kind of shoes or shorts (to school no less) and it will show in all its redolent antiglory.

Apparently, this is totally true also in middle to high schoolers' choice of calculators, too. TIs and algebraics have the reputation that they're easier to learn and use, never mind that "da teacha" recommends them (most never heard of RPN; they think it's an ethnic slur). Never mind that, it almost has always to be a graphing one, too.

There is, however, the cachet of being the "Dexter" of your class (Mandark will do, however), that is, in having a HEWLETT-PACKARD rpn machine, scientific or graphing. Well, at least this was true when I was in school... and our teachers sort of recommended the HPs on account of their QUALITY, while mumbling under their breath about their prices. Oh yeah- TIs (and algebraics generally) are STILL relatively cheaper. This appeals to most parents and teachers.

I will tell you that while my son loves his HP39G algebraic, he does eye me using my HP RPN models

(he especially loves the look of the 33s. He's a kid; what can I say?).

I will agree that teaching someone/learning for yourself/being taught to use RPN is not really difficult at all and that the best of both worlds is that they master both variations so that resistance will be futile when it comes to homework and other calculations.

in response to message #11 by Steven Kutoroff

My grandniece is the **only** student in her school with an HP calculator, and she's darn proud of it.

But she gets mad at me because I wait until she's learned how to do something "the hard way", then I show here how to do it on her calculator the easy way. I'm hoping that sooner or later she starts exploring just how much the calculator can do for her. But on the other hand, I guess that it's best that she learns math before she learns all the neat shortcuts that the calculator can do for her.

Regards,
James

Re: Opinions wanted.

*Message #26 Posted by **Garth Wilson** on 30 June 2004, 10:05 p.m.,*
in response to message #1 by Ron Ross

Our son who just finished 10th grade and is a year ahead of his peers in math was supposed to get a TI-83+ last year. I expected he probably didn't really need it, and thought we'd just wait and see. He wasn't very facinated by the idea of getting something else to carry and make sure didn't get stollen, so we went week to week without getting one, until the whole year was finished. It never became an issue.

Algebra and geometry classes mostly give canned problems with artificial answers anyway, so calculators are generally not needed. Our son said the kids who had them mostly used them for sharing and playing games, and really made very little legitimate use of them for the class.

I'm sure I often come across as a technophobe; but what I'm really against is the _misapplication_ of technology. If our schools were turning out students that were more competent in math 40 or 50 years ago than they are today, do we need calculators to cath up?

I agree. When I was in school calculators weren't allowed before high school. When I was in middle school some kids got the new calculator watches and hoped the teacher wouldn't catch them with it. In the 9th and 10th grade some of my teachers were a little uneasy about letting me use my 11C on tests.

Hi;

I second VPN about the HP33S, it is a handy+ calculator in all aspects.

But I still think that the radix mark (dot or comma) should be more visible, maybe if it took a whole character like it is in the printed documentation it would be better. Try typing in a number with all digits equal to "2". It's hard to see the (actual) radix mark.

Although my opinion is not the same in this particular matter...

Cheers.

Luiz (Brazil)

Re: Opinions wanted.

*Message #32 Posted by **Vieira, Luiz C. (Brazil)** on 1 July 2004, 8:47 a.m.,*
in response to message #1 by Ron Ross

Hi, Ron;

invite her to "visit" the MoHPC and read some posts. If she accepts, point/show some of them first and try to "feel" her reaction. If you see that she is about to be interested, tell her to invite her classmates to read, too.

Girls usually do things better when they are together (I have a 12 Y.O. daughter...). If nothing works, ask her what sort of calculators the boys use. Sometimes the gender competition by itself is useful.

NOW ABOUT calculators. I read some posts here and I believe that Ben is right about graphics and scientific. Also, Raymond is right: if she chooses, it's more likely that she will keep it. And Jams Prange added a very important "rant", and I taste it everytime my daughter asks me for helping her. I try showing her the (what we believe to be) actual path, and later the shortcut. And she most of the times is angry about that. I gave her an HP6S last year, and she seldom uses it. She loves dogs... not calculators.

I did not mention other opinions because both they are completely obvious and settled or I guess they are somehow off-topic. Sorry...

At least I hope that after reading so much opinions you'll be ready to balance all known points and have the chance to discuss them with her.

Hope you succeed. She as well.

Cheers.

Luiz (Brazil)

Re: Opinions wanted.

Hi Ron. Many good opinions have been offered. Here is another data point.

My daughter recently finished her senior year in high school in which she completed AP Physics, AP Calculus, AP Computer Science and AP Statistics. Starting in intermediate school and continuing through high school I showed her both RPN and algebraic scientific and graphing calculators. She tried several types but preferred using an old entry level algebraic scientific calculator (TI 30 Stat). She says that she prefers the simplicity of the calculator with it's uncluttered keypad.

However, in her senior year she requested a TI 83+ to use in AP Statistics. She needed a number cruncher that supported both the algorithms and graphics needed for the class and this was the model that her instructor recommended. Also, I believe that the AP Statistics textbook that her class used was oriented toward the TI 83+.

She plans to major in mathematics and psychology in college starting this fall.

I hope that this helps.

Regards,

John

in response to message #1 by Ron Ross

Thankyou for your feedback.

As to what I will do: Probably nothing. As I stated earlier, she did make her choice, by grabbing a Ti-83 from my collection. It is what that class used and it worked very well for her. This fall starts a new semester in which she will be Junior and will take Trig in the Fall and Pre-Calc in the spring.

I wouldn't have even bothered to but in if her algebra was on the same level as my algebra in High School. But when I saw some of her material, I was impressed and felt she could benefit from a better calculator. However, there are lots of advantages to running with the herd and I suspect that is what she will do. She is somewhat snobbish in even using a calculator and prefers to grind out the work by hand anyway, so she doesn't really care to use anything. I suspect the wide range of material and her need to crunch numbers with the class prompted her to grab the Ti from my collection. Prior to that she made do with a pocket calculator (the Hp30s).

She does use RPN if nothing else is handy, ie she won't bother to go down a flight of stairs to my collection if there is a usable calculator on my desk even though it be RPN. But she has no loyalty towards anything and I suspect, never will. While that hurts me as an avid calculator collector, I will get over it. Well maybe I'll get over it. B^b

Re: Thanks for the feedback.

*Message #36 Posted by **Ben Salinas** on 2 July 2004, 7:35 p.m.,*
in response to message #35 by Ron Ross

Just to let you know, for Pre-Cal, the 32sii is a great calculator (well any powerful scientific calculator really). Most of that class is doing number stuff mixed with algebra (there is little graphing, at least here). The 32sii is great because once you learn about Permutations and Combinations, it is there for you... right on the keyboard: 3 button presses away. Radian to Degree conversion... 2 buttons (On the beloved Ti-83 it is like 10 key presses).

I admit that for calculus, having a calculator which graphs is handy, but for what is covered in pre-cal, a scientific calculator is great (or great to use in addition to a graphing calculator)

-Ben

Re: Thanks for the feedback.

in response to message #36 by Ben Salinas

re: "Radian to Degree conversion... 2 buttons (On the beloved Ti-83 it is like 10 key presses)."

If pi is available at a button push (I don't know about the TI 8x series - although most of my physics students use them), just do 180/pi to get the conversion factor (and either multiply or divide by it, as necessary). I suppose you could then store it in some otherwise little used register.

Opinions wanted.

Connect 48G(X) to USB?

*Message #1 Posted by **Mike H** on 30 June 2004, 12:25 p.m.*

Can you connect a 48G(X) to a computer using a USB to serial converter?

Mike 1111

Re: Connect 48G(X) to USB?

*Message #2 Posted by **James M. Prange** on 30 June 2004, 5:51 p.m.,*
in response to message #1 by Mike H

Well, I can, and it works very well now. But I did have to update the drivers for the converter a few times to get the "Capture image..." part of HPComm to work with it, though it worked for file transfers. It's always worked with HyperTerminal PE, but I don't think that MS-DOS Kermit can find it. With the earlier drivers, trying to use a Conn4x USB connection to the 49g+ and the converter at the same time often resulted in a "Blue Screen Of Death", but the latest driver update cured that. Note that Conn4x works with the converter and the 48G series too (now). To take full advantage of Conn4x's features, install the XSrvr library (it's packaged with Conn4x) on the 48G series.

So it **should** work, but "Your mileage may vary".

Regards,
James

Scam emails from Classified Ads

*Message #1 Posted by **Charles Perry** on 30 June 2004, 10:27 a.m.*

I posted an ad in the Classified section of this website recently. I received 3 legitimate responses (or they seem so) and about a dozen obvious scam messages. You know the ones: poor english, offer to pay with cashier's check that just happens to be more than the purchase price, just send along the extra cash in the package, etc. What a pain. Has anyone else experienced this?

Re: Scam emails from Classified Ads

*Message #2 Posted by **thebullcabinet** on 30 June 2004, 10:32 a.m.,*

in response to message #2 by thebullcabinet

Yes it does occur. They are pretty obvious though...

Re: Scam emails from Classified Ads

*Message #4 Posted by **pascal** on 30 June 2004, 3:31 p.m.,*
in response to message #3 by Dave

I had the same problem too, I had 3 offers, one who offered me $1500 for my windows 1.03 !! He only had a check of $5000 and wanted me to arrange to pay the difference ... I just wonder if they really try to abuse someone (it's too obvious to abuse anyone) or just collect valid e-mail addresses of people who answer in order to sell them to spammers.

iPAQ 2210 Internet Connection Sharing via Bluetooth

*Message #1 Posted by **Ivan** on 30 June 2004, 5:01 a.m.*

I needed a short guide how-to set-up my PDA to user my ICS (internet connection sharing) but spending a few hours searching google and yahoo without any success I have decided that it is going to be easy to do it on my own. I know I'm dump and my English sucks but as no one has put on-line a shot, nice and easy to understand, even if you are not a English speaking person I decided to make one and help the rest of you to not loss you time in setting up you PDA. Now you can do much more useful thinks (surf, chat have fun) have fun and thanks for reading.

Cheers, Ivan

how to run keyboard test on HP-19BII?

*Message #1 Posted by **westridge_cz** on 30 June 2004, 3:31 a.m.*

Anybody out there know how to run the keyboard test on a 19BII? I thought it would be the same as the keyboard test on the 18C but when I tried running it it gave a fail message.

Re: how to run keyboard test on HP-19BII?

*Message #2 Posted by **thebullcabinet** on 1 July 2004, 12:32 a.m.,*
in response to message #1 by westridge_cz

While holding down the "EXIT" key, turn the calculator on. Then the usual routine, starting with the left keyboard. Complete the left, before moving to the right keyboard.

HP 12c keyboard repair

*Message #1 Posted by **Pierre Brial** on 29 June 2004, 12:35 p.m.*

Hi all,

A friend of mine give me an HP12c with a curious malfunction : The top row of keys of the numeric keypad don't work : this is CHS, 7, 8, 9, and ./. All the other keys work, and the X ON autotest doesn't return an error. Externally, the calculator doesn't seem to have received any damage. Before to open it I prefer to ask you, friend collectors, if you have any advice about causes and cure of this malfunction.

All the best

Pierre Brial Reunion Island

in response to message #1 by Pierre Brial

I had one HP-12c (Made in Malaysia) with this problem. This row of keys, in this one-chip unit, is connected to one CPU pin. This CPU pin had a bad solder. Fixing was just a matter of carefully heating this pin.

HP 12c **REPAIRED**

*Message #8 Posted by **Pierre Brial** on 30 June 2004, 11:15 a.m.,*
in response to message #1 by Pierre Brial

Hi all,

I've been deeply impressed to receive, within 50 minutes, four wise answers to my post.

Thank to you, this HP12c is now repaired. One other saved !

It is indeed a Malaysian unit, serial Number 3635M01102. The faulty pin was the one pointed out by Randy Sloyer : second from the bottom of the right row. It was not possible only visually to see that this pin was not perfectly soldered on the board. Even with a multimeter I had some doubt, because when you test the pin, you press it, enabling the contact ! The contact was soldered again by pressing the pin with a small screwdriver and making melt the solder with the iron.

I was surprised not to find in the calculator the famous voyager's polycarbonate wrapping.

Thanks again

Pierre Brial

Congratulations, excellent news!! (N/T)

THE SPEED OF SOUND, THE FORCE OF GRAVITY, AND 2 ENGINEERS

*Message #1 Posted by **Mike H** on 29 June 2004, 9:42 a.m.*

THE SPEED OF SOUND, THE FORCE OF GRAVITY, AND 2 ENGINEERS

Two engineers were walking though a field when they came upon a large sinkhole. Curious as they were, the first engineer said “I bet I can write a program on my HP 15C that will calculate the depth of the sinkhole by timing how long it takes a rock to hit the bottom and the sound to come back up.” The second engineer, quick to challenge, said “I bet I can write a shorter, faster program on my 42S, but first we need to time it.” The first engineer prepared his wristwatch to time the event while the second searched for a small rock. At the given signal, the rock was dropped. After several seconds without a sound, the two engineers decided the first rock was too small and they needed a larger rock. Looking around revealed the only object of sufficient size was a discarded railroad tie. The second engineer dropped the railroad tie into the sinkhole at the signal….

While both engineers were listening intently for the tie to hit the bottom, they heard a strange noise coming up behind them. Turning around, the two witness a mad dog charging them at full speed. Jumping out of the way, the dog dove head first down the sinkhole.

The two engineers were scratching their heads at the event that just happened, when a farmer pulled up on his tractor. The farmer ask the two if they had seen his dog. They responded that they had seen a dog, and it had charged them and then jumped into the sinkhole. The farmer responded that it could not have been his dog because his was chained to a railroad tie.

Looking for HP-42S ROM image

*Message #1 Posted by **Thomas Okken** on 29 June 2004, 8:46 a.m.*

Hi all,

I'm interested in writing a HP-42S emulator. (The usual reasons -- the best calculator ever, but they aren't making any more, and so, like with the Commodore 64, we need emulation to make sure we never have to be without this great little machine.) I'm probably biting off more than I can chew (is there enough information of the HP-42S hardware around?) but who knows, with a little peek at Christoph Giesselink's Emu42 source code, I may be able to do it, and if I succeed, a PalmOS version is next on the agenda (after all, handhelds should be emulated on handhelds!).

Anyway, now I get to the first big hurdle: getting a ROM image. I figure reading the bytes using the memory scanner and typing them into the PC could be done in a month or so, if I spend a couple of hours a day at it, but I'd probably kill myself before I'm done, and besides, in between 131072 keystrokes, and error or two is bound to sneak in, and then how am I going to find those? <shudder>

I have no HP-48 to run INPRT on, and don't feel like buying one either (yes, I'm cheap), and I have two left hands when it comes to hardware, so the project of building an IR receiver to hook up to my PC does not seem too promising either.

So, I was wondering if someone who already has a rev. C ROM image could be persuaded to send me a copy? I don't want anyone to break the law, but since I own an actual HP-42S rev. C, I think I'm within my rights (fair use or whatnot) to possess an electronic copy of the machine's ROM, and I don't think it matters where I get it (I am not a lawyer, though).

I'd be happy to email a photograph of myself holding a current newspaper and my HP-42S, as evidence that I actually own said machine.

If anyone could help me out, I'd be much obliged!

- Thomas

Re: Looking for HP-42S ROM image

*Message #2 Posted by **J-F Garnier** on 29 June 2004, 4:05 p.m.,*
in response to message #1 by Thomas Okken

Erik Ehrling announced on his site that the HP is "looking into plans to make the 42s ROM available" (http://www.hp42s.com/news/romsonline.html).

Any news about this?

*Message #3 Posted by **soundinvestments** on 29 June 2004, 6:37 p.m.,*
in response to message #2 by Tizedes Csaba [Hungary]

Your lucky you had payment before you sent the item,I'm out 100.00 U.S. plus the postage to send the calc,I gave him the benifit of doubt on the second 100.00 and was going to chalk it up to experience and told him to just send the postage for the calc,that was four months ago,he says he'll send it out right away then a month goes by and nothing so I email and he says he's just too busy to send the money he owes me,this all I've been getting from him the past four months,he's a dead beat.This is what he said this week "Do not forget that I have lost $100 as well...." "As I said I have been very busy building, I have not been to my local > town > for over four months now and I could easliy walk it in 15 minutes" ??????? what does that mean?? he's lost 100.00??? thats odd he has the calc that he agreed to pay 200.00 for he emailed saying he receieved it and was happy with it how is he out 100.00?? I'm the one out a calc and 100.00 plus on top of that hes just too busy to send me the postage.BEWARE DO NOT TRUST THIS PERSON!!!!!!!

Observations on my new 12C

*Message #1 Posted by **Chris Woodhouse** on 28 June 2004, 11:30 p.m.*

I don't consider myself a collector, but since the 12C can be had for around $30 on ebay I thought I would get one. It is a 12C not a platinum. It came with the manual and case and is in very good condition so I am glad I got it. I mostly wanted it so I could lend it to people I was trying to teach how to use RPN. It is an recent model made in China.

The thing I was most disappointed by was the lack of a back space key like the 15C has. I also noticed the battery change. Why did they do that? The SR44 batteries the other 10C series calculators use are still easy to get, there are lots of new electronic gadgets being made today that still use them, and the battery life of the old style is well documented so I was just wondering what the motivation for that change might be. I remember reading someone didn't like the fact that some new 10C series they just got had keys that rattled. I have never seen that before on a 10C series but this 12C has keys that rattle too. It doesn't seem to effect the usability. The play in the keys is mostly up and down. However, when it is sitting on my desk the keys appear to be in the same position as any other 10C series I have used, the play is in the vertical direction. I can lift the keys up from the back quite a bit from their resting position. I am 99.9% sure it came this way from the factory, there are NO signs of it ever being opened. As I said it doesn't effect usability. I would have rather had one made in the USA, but all and all I am glad I bought it. It should come in handy next time I go to buy a new vehicle and the dealer is trying to rip me off with some payment plan.

Chris W

Re: Observations on my new 12C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2004, 11:43 p.m.,*
in response to message #1 by Chris Woodhouse

Hi, Chris;

just to add that the HP12C Platinum keyboard is molded in one piece with the upper halfcase, exception made to both [f] and [g] keys that kept their "stand alone" and rattling status. And the case is dark blue, darker than the HP48G series, instead of black.

Cheers.

Luiz (Brazil)

Edited: 29 June 2004, 12:43 a.m.

Re: Observations on my new 12C

*Message #3 Posted by **JDH** on 29 June 2004, 2:48 a.m.,*
in response to message #1 by Chris Woodhouse

I suspect they went to a single 3V battery over three seperate 1.5V batteries due to cost savings. I purchased a new Chinese HP 12c and I wish to confirm the keys rattled from day one. I would have to agree a secondhand

USA or even Singapore made 12c in as new condition is better value than a new 12c made in China.

Charry Leather cases for Pioneer

*Message #1 Posted by **Mike H** on 28 June 2004, 10:04 a.m.*

Back in the late 80's I purchased a folding leather case from educalc for my HP 27S. The brand I think was spelled Charry. It was really a great case. Does anyone remember these, or know where to find one? Thanks

Mike 1111

Re: Charry Leather cases for Pioneer

You might try CalcPro. They have nice cases for most of the HP calcs, old and new.

Re: Charry Leather cases for Pioneer

*Message #3 Posted by **Wayne Brown** on 28 June 2004, 6:26 p.m.,*
in response to message #2 by Richard Garner

Be prepared to wait, though. I ordered several items from CalcPro on April 9th, and have not yet heard a word from them. Based on my past experiences with CalcPro, I expect my order to arrive eventually (probably after I've forgotten that I ordered it).

I purchased a black version of the leather case in 1989 for a pioneer series calculator but I don't think they make them anymore. I sold one recently through this newsgroup for $40 USD. You will see them being sold on Ebay from time to time.

Can [(hp)] calc do that???

*Message #1 Posted by **Marx Pio** on 27 June 2004, 1:08 a.m.*

Try this if you want to get something near wolfran's Mathematica or MathLab in your pocket.

http://www.adacs.com/menu/PDAcalc_matrix.php

I've downloaded the manual of matrix calc. It is simply fantastic!.

If you want to keep the loyalty to hp, buy an IPaq 2210 ;)

Re: Can [(hp)] calc do that???

*Message #2 Posted by **Garth Wilson** on 27 June 2004, 2:49 a.m.,*
in response to message #1 by Marx Pio

To me, that's not what a calculator is for, and there's no way I would trade in my HP-41cx for one of those. It's not very often that I would have any use at all for the graphing and especially for the color. Of the hundreds of programs I've run on my 41 and 71, few have been for circuit simulation or any of the high-level math the advertised product claims to bring to life.

One of the few things I've used graphing for on these little computers and had to resort to a printer was taking a large set of samples from a Phillips digital-storage oscilloscope with IEEE-488 interface, do an FFT on them, and show the results. (What the heck-- I needed to keep a hard copy anyway.) I've used them to interface to plenty of other instrumentation on the workbench as well, all at the same time. In my experience, it has been quicker to develop working test programs on the HP hand-helds than on the PC.

Of course this is not to say there's no room for improvement for the old 41 and 71 with their many plug-in modules, accessories, and wealth of software contributions from the user groups; but all these companies that think their "cool factor" addition to the line-up is going to be the cat's meow are all shooting in the wrong direction IMO. I'm sure there's a use for their product somewhere, but I as an engineer fail to find much of anything truly interesting in such products.

Re: Can [(hp)] calc do that???

*Message #3 Posted by **Marx Pio** on 27 June 2004, 3:32 a.m.,*
in response to message #2 by Garth Wilson

Mr Wilson,

When I was a trainee I used only an old Casio FX-100 e some properties tables for designing steel structures and reinforced concrete slabs. When the HP41 raised(In Brazil) all(engineers) were amazed with the tech revolutions that was ocurring on these days(I didn't threw my casio neither my prop tables away) but I stepped up to a new and productive technology. After that we moved to pc's using softwares like SAP90 and today, P4 notebooks running Autocad, Strap or SAP2000 are the "entry level" technology for

the structrural engineer.

How could I deal with the bills if I had to design 3k square meters plant using my beloved, but almost improducive, HP41Cv and its partner the card readar? I still have my old HP's but I can't be conpetitive with them.

And it is like that old photo. We like too much those moments but we cant go back to past.

Long live the future. It's all that was left to us ;)

*Message #4 Posted by **Garth Wilson** on 29 June 2004, 2:26 a.m.,*
in response to message #3 by Marx Pio

I cannot pretend to know your particular industry, but I am addressing the general attitude that if something is newer or flashier, it must be better. Sometimes it is. But too often the extra flash is useless for common applications, and people trying to replace the old with the new ignore the fact that a lot more thought may have gone into the old, making it more useful despite the earlier technology. It is too easy to assume that moving forward in time necessarily means moving forward in efficiency or some other virtue. Here are some examples.

I might appeal on the basis of much of what highly respected electronic industry guru and lecturer Bob Pease keeps pointing out in his columns in Electronic Design magazine. For example, he has had a series on fuzzy logic. In one early article in the series he tells how fuzzy-logic proponents used a '486 computer to demonstrate "the wonders" of fuzzy logic in a type of controller. Then he shows how you could do the same control job with a $0.23 quad op amp and a few discreets on a smaller board-- kind of humiliating for those who thought they were announcing a new and better solution, the wave of the future! (And yes, he breadboarded it to prove his point.) After the fourth article in the series, he sent the material to several fuzzy-logic experts with the challenge to show where he was wrong, if anywhere. The challenge was also published, but there have been no takers. And where is fuzzy logic today?

He has another series on PSpice, pointing out how easily people let it mislead them because they use it as a substitute for thinking instead of as just a tool and recognizing its shortcomings. He gives many true stories as examples. He laments that universities are mostly using computer simulation and teaching very little hands-on methodology, and that as a result, the graduates are not prepared for real-world design challenges. (They should be teaching both.)

He lectures all over the world, using an overhead projector instead of PowerPoint. This allows him to quickly draw or mark on diagrams as he answers questions from the audience. Is he against innovation? Of course not. He designs analog ICs at National Semiconductor-- the ICs your cell phone, new car, and DVD player rely on.

I'm on the board of a school with preschool through 8th grade. The superintendent has some kind of love afair with PCs and is trying to put them everywhere. One question I have brought up that we still don't have answers to is why did the accounting job take fewer people and less office space 25 years ago with no computers than it does today with modern PCs, a server, and all the modern software? (And no, there's not much difference in the size of the school.)

In my work I frequently lay out extremely dense, 12-layer printed circuit boards. I use a cheap, old CAD that runs under DOS. Its bugs are few and minor, and unlike other CADs I've tried, it doesn't try

to tell me I can't do this or that just because it doesn't understand our unconventional but very successful methods of packing more parts in less space. This old CAD has always done the job quite well, so there has been no reason to update it. Our competitors with their newer tools have not been able to catch us.

That brings me back to these "canned-solution" products. A manufacturer may tout a long list of wonderful things the product can do; but if it's not flexible enough to let you do the things the designers didn't think of, you're out of luck. If the older technology provides a way to do the job, even if it's less efficient than the newer technology would be if it didn't lock you out, I'll take the old.

I remember looking at the adds for the first hand-held computers that were supposed to be able to recognize handwriting. The technology required to do that seemed absolutely amazing; but I also thought, "How dumb! Someone has forgotten that one reason we used typewriters before there were computers was that typing was faster than handwriting-- a _lot_ faster!" It's another example of innovation that was not an improvement. As it turned out, the Apple Newton's poor recognition of handwriting was quite a disappointment anyway.

Even though my 71 with its modules and the ton of LEX files from the user groups is far more powerful than my 41cx, I seldom use the 71. I'm glad to have it when I need it, but the 41 is more practical as a calculator. What would be on my wish list for a better 41 is greater speed and memory to make Forth and other high-level languages practical. Graphics and color are not on my wish list. If I want a bigger text display, I connect the 80-column video monitor; but the last time I did that was years ago.

I hold onto the old HPs not because of nostalgia like the old picture, but because of flexibility, interfaceability, expandability, and so on. They have no dependence on here-today-gone-tomorrow PCs or PC software either.

It may be appropriate to have both the HP and the IPaq in your arsenal.

Yes, newer doesn't mean better.

My example is much lower-tech : I'm using a prehistoric Palm V PDA because all the recent machines have color screen, which require that you recharge almost every day, and synchronize very often. Actually, I don't want color at the expense of losing my data 10-20 times a year ! The old Palm V can retain its data for many weeks, maybe months. I don't recall when I last backed it up. Also, it is one of the few with an impact and scratch-resistant metal body. A no brainer.

Good point of view...

programming challenge for HP-12c

*Message #1 Posted by **Don Shepherd** on 26 June 2004, 2:05 p.m.*

OK, here is the challenge. Develop an HP-12c (or Platinum) program to convert a number from one base to another (base 2 through 10 only since 12c does not support alphas).

Usage:

input base ENTER desired base ENTER number to convert R/S

I'm a 53-year-old ex-programmer who is going back to college so I can teach middle school kids math, and we are studying base conversions now, so this is appropriate. I developed a conversion program for the 12c, I'd just like to see how other HP afficianodos approach this problem.

Thanks, Don Shepherd Louisville, KY

Re: programming challenge for HP-12c

*Message #2 Posted by **Eamonn** on 26 June 2004, 8:34 p.m.,*
in response to message #1 by Don Shepherd

Hi Don,

Here's a solution in 51 steps for integer numbers.

Some notes:

- Fractional parts in the input number are ignored.
- It works for both positive and negative integers.
- The solution doesn't check for incorrect entries, such as non-integer bases, bases outside the range 1 to 10, digits in the input that don't belong in the original base, etc. I've left it up to the user to validate the inputs.
- If the converted number has more than 10 digits, then the 10 most significant digits of the converted value are retained, along with a base 10 exponent. The decimal point should be shifted right by the amount in the exponent to complete the conversion. The least significant digits of the converted value are lost during the calculation. All 10 significant digits can be seen by hitting f-PREFIX.
- If more than one conversion from the input base to the desired base is needed, the bases only need to be entered for the first conversion. Subsequent conversions can be performed by hitting the CLX key, keying in the next number and hitting the R/S key.

Enjoy,

Eamonn.

```
01 sto 2   // Store original number
02 Rv
03 sto 3   // Store New Base
04 Rv
05 sto 4   // Store original base
```

```
06 1
07 sto 0   // Initialize Multiplier
08 0
09 sto 1   // Initialize running total for base 10 representation
10 rcl 2   // *** Top of loop - Recall what's left of original number
11 intg    //
12 x=0
13 gto 25  // If integer part is zero, then we're done with the first conversion stage
14 1
15 0
16 /       // Divide by 10 to extract next digit
17 sto 2   // Store for next time through loop
18 frac    // Next digit is in the fractional part
19 rcl 0   // Recall multiplier
20 *       // multiply by position multiplier
21 sto +1  // Add to running total so far
22 rcl 4   // Recall original base
23 sto *0  // Update position multiplier
24 gto 10  // Loop until done
25 sto 2   // Store 0 in register 2 for next conversion stage
26 1
27 0
28 sto *1  // multiply by 10 to get final base 10 version
29 1

```

Re: programming challenge for HP-12c

*Message #3 Posted by **Don Shepherd** on 27 June 2004, 12:55 a.m.,*
in response to message #2 by Eamonn

Hey, thanks Eamonn. I appreciate your help. It's too late tonight (1 AM), but tomorrow I'll enter this on my 12c and try it, and study the listing to understand it. My version took 69 lines so I'm interested in how you did it in a much shorter version.

Thanks again and I'll reply tomorrow.

Don Shepherd

Re: programming challenge for HP-12c

*Message #4 Posted by **Don Shepherd** on 27 June 2004, 8:41 a.m.,*
in response to message #2 by Eamonn

Hey Eamonn, I've had a chance to review your code and I'm quite

impressed! That's a very clever solution, and I especially like the

way you don't have to re-enter the bases for subsequent conversions.

Very thoughtful, and thanks for your input.

Here is my original 69 line solution:

```
Register        Usage
0       # to convert
1       original base
2       new base
3       running sum
4       power
5       constant 10

01  sto 0       // number to convert
02  Rv
03  sto 2       // new base
04  Rv
05  sto 1       // original base
06  0
07  sto 3       // clear running sum
08  sto 4       // clear power counter
09  1
10  0
11  sto 5       // constant 10
12  rcl 1       // original base
13  -
14  x=0
15  gto 41      // don't convert to base 10 if already base 10
16  rcl 0       // # to convert
17  rcl 5       // 10, begin loop here
18  /
19  intg
20  sto 0       // store int portion for next iteration
21  lst x
22  frac        // get rightmost digit
23  rcl 5
24  X           // mult by 10 to get integer
25  rcl 1       // input base
26  rcl 4       // power
27  y to x      // raise base to power
28  X           // times digit
29  sto + 3     // add to running sum
30  1
31  sto + 4     // increment power of base
32  rcl 0
33  x=0
34  gto 36      // done with conv to base 10 number
35  gto 17      // continue loop
36  rcl 3       // accum sum from first loop
37  sto 0       // put in R0
38  0           // reset running sum and base for loop 2
39  sto 3
40  sto 4
41  rcl 2       // new base
42  rcl 5       // 10
43  -
44  x=0
45  gto 47      // desired output is base 10, so you are done
46  gto 49      // conv base 10 # to output base
47  rcl 0
48  gto 00      // done if output base is 10
49  rcl 0       // loop to conv base 10 to output base
50  rcl 2       // output base, begin loop here
51  /
52  intg
53  sto 0       // store int portion for next iteration
54  lst x
55  frac        // get rightmost digit
56  rcl 2       // output base
57  X           // mult to get integer
58  rcl 5       // 10
59  rcl 4       // power
60  y to x      // raise base 10 to power
61  X           // times digit
62  sto + 3     // add to running sum
63  1
64  sto + 4     // increment power of base
65  rcl 0
```

```
66  x=0
67  gto 69      // done with final conv
68  gto 50      // continue loop
69  rcl 3       // final answer
```

Re: programming challenge for HP-12c

*Message #5 Posted by **Eamonn** on 27 June 2004, 3:26 p.m.,*
in response to message #4 by Don Shepherd

Hi Don,

Thanks for the feedback. It looks like our two solutions have the same basic structure. You do check if either the input base or the output base is set to 10, which can be a nice speedup. Of course, it is easy to add the rcl codes at the end of your program so that you don't have to re-enter the bases each time you do a conversion.

On a side note, this was the first time I tried to program the HP_12C. With only two conditional tests, no subroutines, register arithmetic only on registers 0 to 4, GTO to line numbers only, it's not the easiest machine to program. Still, I guess that's what makes it more challenging.

Regards,

Eamonn.

12c programming environment

*Message #6 Posted by **Don Shepherd** on 27 June 2004, 3:57 p.m.,*
in response to message #5 by Eamonn

Thanks Eamonn. I'm amazed this is your first 12c program, your code was so good I had you pegged as an old-timer.

You are certainly right about the 12c not being the best programming environment. All the things you listed are true. My biggest frustration over the years has been to complete a program, say with 60 steps, then debug it and see that I needed one more step at step 12. On my 16c or 11c, no problem, just add it. But on the 12c, you must rekey 13-61. Current-day programmers would be amazed at that lack of basic editing.

I don't know that my middle school math students (when I eventually teach) will be interested in something as arcane and old-fashioned as keystroke programming, but maybe a few will. And I can point to your program as a great example of a base conversion program.

thx again Don Shepherd

12c programming environment

*Message #7 Posted by **Eamonn** on 27 June 2004, 8:48 p.m.,*
in response to message #6 by Don Shepherd

Thanks for the kind words Don. I'm not an old timer, but I have contributed some programs to this forum in the past for the HP-25. This has a very similar programming model to the HP-12C, as Luiz pointed out, so it's not the first time I've programmed on this type of architecture. I was, however, caught by surprise with some of the limitations of the HP-12C.

- I didn't realize that the HP-12C allowed storage arithmetic only on some of the registers (0 to 4 it seems). This meant that I had to rethink my usage of registers after I had written

my program to use storage arithmetic on other registers. The HP-25 allows storage arithmetic on all registers.
- I also didn't realize that the HP-12C converts registers to program steps as you add more steps. The HP-25 has 8 registers permanently allocated for storage.
- The HP-12C has only two conditional tests. The HP-25 has eight.
- Both the HP-12C and HP-25 use direct addressing for GTO's. However, since the HP-25 only has 49 program steps, you are limited to the amount of re-typing that is necessary when you add an extra program step. In either case, labeled GTO's, along with the ability to insert new lines is much better.

By the way, is there any way to convert program steps on the HP-12C back to registers without having to do a 'Clear PRGM' ? I couldn't figure out how to do this.

Regards,

Eamonn.

converting program steps to registers

*Message #8 Posted by **Don Shepherd** on 27 June 2004, 9:51 p.m.,*
in response to message #7 by Eamonn

Eamonn, I don't think there is any way to do that other than, as you mention, CLEAR PROGRAM. I recall several times having a program already in storage and forgetting to CLEAR PROGRAM before I enter a smaller program, and those old program lines just hang out there, taking up space that could be used by registers. You can't delete the lines, the only way they go away is with CLEAR PROGRAM, I think. Someone correct me if I'm wrong about that.

What is really a shame is the 12c Platinum. It advertises 400 steps (as opposed to 99 in the old 12c), but due to bugs you can't use all 400 if you use any GTO's. HP is aware of that, but they have not done anything about it, as far as I know. The sorry part is you also can't use those 400 for registers either, the limit is still 20.

Don

Beyond the 20 registers (Platinum)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2004, 10:05 p.m.,*
in response to message #8 by Don Shepherd

Hi, Don;

about the HP12Cp(latinum). If you don't care using "n" as an indexing register, you can go beyond the 20th. (R.9) register. As you lnow, the HP12C Platinum solves NPV and IRR for 31 different cash flows, and you can access the extra 10 with the use of "n" (like: 20[n], type in value, [g][CFj], other value, [g][CFj], etc.) You just need to care for the available memory (if you want to have a look here, be my guest). The relation between program steps and these extra registers is:

```
CF20      ---      309 to 303
CF21      ---      302 to 296
          .
          .
CF29      ---      246 to 240
CF30      FV       not applicable
```

Hope this adds a few "extra" info.

Cheers.

Luiz (Brazil)

30 registers in Platinum

*Message #10 Posted by **Don Shepherd** on 28 June 2004, 7:08 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Thanks Luiz. Yes, I forgot about those extra 10 cash flow registers, giving you 30 total. But I sure wish HP or Kinpo would have made it possible to use those 400 bytes for more registers. I had a problem recently in which I needed 100 registers, and I could not do it on the 12c, 12c Platinum, or even the 11c. I could only do it on my 16c, which is great because all 203 bytes can be used for either program lines OR registers. I set word size to 8 bits and I have 203 registers (before adding program lines). This works fine as long as you don't need to enter any numbers greater than 255.

Don

The 16C is unique... (N.T.)

in response to message #2 by Eamonn

Eamonn and Don --

Very impressive! I keyed in Eamonn's program and it works exactly as you stated. I haven't tried Don's program, but I consider it a success that it could be done at all.

Any non-trivial program is a "challenge" on the 12C -- and on the short-lived, stripped-down Voyager scientific, the 10C -- due to their rudimentary programming capabilities and lack of insert/delete editing.

I had outlined a more-genral approach that would handle floating-point numbers and perform the requisite validation. My program would have required 8 or more registers as well as work-arounds for the missing functions of LOG, 10^x, SF, F?, DSE/ISG, most conditionals, and labels. When I saw how much was required, I didn't think it could be done in less than 93 lines.

Could a program with the same basic structure work for floating-point values as well? I'd think that the approaches would entail either handling the integer and fractional portions separately; or, working unidirectionally on the whole number after "finding" the high- or low-order digit with LOG.

The 16C has decent programming capabilitiues for this, but not the mathematical functions -- no logarithms, exponentials, or INTG/FRAC extraction. Maybe the 11C/15C are the only Voyagers that could handle that task.

Re: Don's challenge for HP-12c

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2004, 6:10 p.m.,*
in response to message #12 by Karl Schneider

Hi, Karl;

I agree with you that the HP16C has no math functions for these general, non-conventonal base convertions. Anyway, it has the four most common number base "crunchers" (2, 4, 8 and 16). I thought about your text and this subject and I guess that if we keep integer mode and use the HP16C existing integer "skills" (bit manipulation, shifting-rotating, boolean algebra and double-precision times and divide for number base higher than 16 and MOSTLY masking), I guess that with another approach we could succeed. What do you think?

Just "teasing" thoughts of mine...

Cheers.

Luiz (Brazil)

HP25 Applications Programs (was: programming challenge for HP-12c

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2004, 12:10 p.m.,*
in response to message #1 by Don Shepherd

Hi Don, Eamon;

I'd like to add that there are two very interesting programs written for the HP25 listed in the HP25 Applications Programs book. One of them converts from base-10 numbers to a generic base-b and the other does the opposite. What called my attention is that they both deal with fraction parts, i.e., not integer-only converters.

When the "b" base is in the range 10<b<=100, all digits in the base-b representation are show with two places (i.e.: 01, 02, 03, ... 09, 10, 11, etc) and it is necessary to type them this way as well. All functions used in them are available in the HP12C. Also, both HP25 and HP12C share the same GTO addressing scheme: line numbers. Yeap, this leads to small changes in some GTO if both are loaded at the same time.

Although your solutions are impressive and complete, I think it's worth taking a time for testing these two programs for the HP25. If you don't have the listing, I can type them in and post.

Cheers.

Luiz (Brazil)

HP25 listings

*Message #15 Posted by **Don Shepherd** on 27 June 2004, 2:30 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi Luiz.

Yes, I would be interested in seeing those programs and adapting them for the 12c. Is that applications book available online from HP, so you would not have to type them in here?

Thanks for your help. When I started programming back in 1974, converting numbers between bases (10,

8, and 16 especially) was something we had to do in order to read memory dumps to debug programs. I suspect the current generation of programmers probably do not have to do that.

Don Shepherd

Converting memory dumps

*Message #16 Posted by **Karl Schneider** on 27 June 2004, 5:46 p.m.,*
in response to message #15 by Don Shepherd

Don stated,

> When I started programming back in 1974, converting numbers between bases (10, 8, and 16 especially) was something we had to do in order to read memory dumps to debug programs. I suspect the current generation of programmers probably do not have to do that.

When I worked with 12-year-old Fortran '66 software programs on Sperry mainframes in the mid-'80s, one routine task was to decode the value of the offending datum that caused an error abort and memory dump. This Sperry-termed "Post Mortem Dump" consumed a two-inch stack of fan-fold paper, with each 36-bit word of program memory being printed in 12 octal digits.

Decoding the integers and characters was not difficult, but I was compelled to write a program for my 15C to handle the conversion of floating-point values -- which I did, and utilized it successfully. Such a program for the 16C would have been a bit more elegant, but I was unaware of its existence.

in response to message #16 by Karl Schneider

Hey Karl, remember @PMD,AEP? Give me a dump of All banks (instruction and data), only on an Error abort, and include the Program control table. Look at the subroutine history with the LMJ (load modifier and jump) instructions to trace back to the offending instruction. Univac 1108, @FOR compiler. Those were the days.....In comparison, the Voyagers seem pretty easy!

in response to message #17 by Don Shepherd

Hi, Don --

Our Post-Mortem Dumps were used to identify the source of operational run-time errors, not for program debugging.

If I remember correctly:

Our runstreams had "@PMD,E" statements.

Our several models of mainframes included the Sperry 1170/1180/1190(?).

Locations of data variables in the dumps were specified by detailed compiler listings produced by @FOR,L for Fortran '66 software and @FTN,L for Fortran '77 software.

in response to message #18 by Karl Schneider

Yes Karl, you are right, looking at dumps to resolve run-time errors. That was back in the (relatively) early days of commercial computers when companies showcased their machines with viewing areas so visitors could see their great machines. Then security concerns caused them to hide them away from public view, and even the programmers could not look at them, they had to use remote terminals. Too bad.

Re: HP25 Applications Programs (was: programming challenge for HP-12c

*Message #21 Posted by **Eamonn** on 27 June 2004, 4:32 p.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I had a look at the programs in the HP-25 Applications programs book. They use a very interesting approach and it's easy to adapt them to the HP-12C.

The program to convert from base b to base 10 is broken into two parts, one for the integer part and one for the fractional part. Both parts require the user to input one digit at a time, starting from the rightmost digit, and press R/S after digit. Once the integer part of the number has been calculated, the second part of the program is used to calculate the fractional part. It's not quite as elegant as entering the entire number at once and letting the calculator go ahead and extract the digits and do the entire conversion. However when you have only 50 program steps, it's a very acceptable compromise.

The program to convert from base 10 to base B takes a very unusual approach. It uses a successive approximation algorithm that slowly converges on the answer. It's very interesting to see the calculator figure out the result. However, it doesn't seem to work for all values. For example, 5.5 in base 10 should be 5.08 in base 16. The program returns 5.07151515 (5.7fff). I tested it on the HP-25 simulator that can be found on the museum website, so it may behave differently on a real HP-25.

Don,

I highly recommend getting the museum DVD. It has scans of the manuals for almost all the machines in

the museum, aswell as application handbooks (including the HP-25 application book), articles and a wealth of other information.

I've also attached the HP-12C versions of the programs. The first program is identical to the HP-25 version. The second program did require changes as the HP-25 version uses two conditional instructions that are not present on the HP-12C. However, it suffers from the same inaccuracy as the HP-25 version.

Best Regards,

Eamonn.

Solution with support for fractions

*Message #22 Posted by **Eamonn** on 27 June 2004, 8:31 p.m.,*
in response to message #1 by Don Shepherd

Hi Don, Luiz,

Well, I had a go at a base conversion program that also supports fractions and here it is. It supports bases 1 to 10 and operates pretty much the same as the other program I submitted, except that it also converts the fractional part of the first base into the fractional part of the second base. It uses 82 steps and 8 registers of the HP-12C memory. The listing is below.

Let me know if you find any problems with it.

Regards,

Eamonn.

```
1       sto 2   // Store original number
2       Rv
3       sto 7   // Store New Base
4       Rv
5       sto 5   // Store original base
6       eex
7       1
8       sto 6   // Factor of 10 is used a lot, so store it in register
9       1
10      sto 0   // Initialize Multiplier
11      clx
12      sto 1   // Initialize running total for base 10 representation

Re: programming challenge for HP-12c

*Message #24 Posted by **Bruce Horrocks** on 29 June 2004, 9:41 a.m.,*
in response to message #1 by Don Shepherd

Of course, the HP-12C has conversion from binary to decimal "built-in" :-)

For example, to convert 10111 binary to decimal just key in:

```
f CLEAR FIN
f CLEAR REG
1 g CF0
0 g CFj
1 g CFj
1 g CFj
1 g CFj
100 i
f NPV
PV
FV
CHS
```

et voila! No programming required.

Re: programming challenge for HP-12c

*Message #25 Posted by **Valentin Albillo** on 29 June 2004, 10:15 a.m.,*
in response to message #24 by Bruce Horrocks

Hi, Bruce:

Very, very clever of you ! :-) You could do it even faster using the "repeated cash flows" entry method, for numbers having several consecutive 0's and/or 1's !

BTW, Bruce, I have three or four new awesome articles ready for submission to Datafile (including "Long Live the HP-16C!" and a chess-related program for the HP-71B, among other goodies, 71B Math ROMs bugs and quirks, etc). If interested, drop me a note a my usual e-mail address. I guess you've had a hefty surplus of material for Datafile, as I haven't heard from you in ages.

Best regards from V.

Re: HP 97

*Message #4 Posted by **GE (France)** on 26 June 2004, 4:45 p.m.,*
in response to message #3 by Gert

There are converters from European plug&230VAC to US plug&120VAC. This method solve the problem once and for all, very interesting for Europeans. The variable in this scheme is the max power rating of the converter, to be anticipated based on the application. This one variable has a major impact on the price.

Re: HP 97

*Message #5 Posted by **marais** on 26 June 2004, 5:19 p.m.,*
in response to message #4 by GE (France)

I don't think buying an AC/AC converter makes sense, considering the low prices for HP chargers on ebay. I bought one for 8E some time ago.

Re: HP 97

*Message #6 Posted by **GE (France)** on 28 June 2004, 5:42 p.m.,*
in response to message #5 by marais

You're right here, but if you have the same problem for more than one machine, the converter lets you use the (generally very common) US adapter instead of the (usually hard to find) European / whatever version. As usual, YMMV.

HP19BII+ Business Financial Calculator

*Message #1 Posted by **CalcKidd** on 25 June 2004, 8:20 p.m.*

Has anyone heard anything new on this? (just checking)

THX

Does HP need this?

*Message #2 Posted by **John** on 25 June 2004, 10:02 p.m.,*
in response to message #1 by CalcKidd

Why bother with a 19bii replacement? Why not just buy a 17bii or 12c? For that matter, why not buy a pda?

where's the need?

Re: Does HP need this?

*Message #3 Posted by **hugh steers** on 27 June 2004, 4:44 p.m.,*
in response to message #2 by John

in my view, the 19bii is under rated. i acquired one some time ago cheap on ebay (there are still 19bii bargains), thinking ho-hum another dull finance model.

but almost at once, when i used the 19, i realised how good it is. for one thing, im a big fan of the book style case design. you get a much more accessible alpha keyboard. all scientific functions are there too just in case you need them. and the solver is just amazing.

using the solver on the 17 is a bit awkward, since theres no dedicated alpha keys, the screen is small and memory limited. on the 19, you can fill it with all sorts of handy programs not restricted to finance. the solver is the real punching power of the 19.

today, i find carrying one of hp's finance models much more handy than say the 48gx. the simple reason is that these models tend to have a good set of things for everyday calculation when its most likely that i'll use my pc for something really complicated.

it would be interesting to see what hp would do as a 19bii+ re-release. it could easily be messed up. but done right, it could have a place in the market.

HP41 and EPROM

*Message #1 Posted by **Chris Gegg** on 25 June 2004, 2:32 p.m.*

I am researching the development, functions, and capabilities of the HP41 (C, CV, and CX), but have been unable to find much information about the type of ROM and RAM used with the HP41. I have been through a large number of the HP41 manuals, but no luck. One main curiosity is whether EPROM was used with the HP41, either for the internal ROM modules or for the external applications ROM modules. Because the device was so versital, such as the magnetic card reader, I thought that it was likely EPROM was used with the HP41. I think I've seen a few references to ZEPROM-Modules and an HHP EPROM Box, but I haven't been able to find out any information about these devices. Does anyone have any information about these things or EPROM in general related to the HP41? Any documents or information would be great. Thanks, Chris

Re: HP41 and EPROM

*Message #2 Posted by **Bill Wiese** on 25 June 2004, 5:32 p.m.,*
in response to message #1 by Chris Gegg

Chris,

Industry-standard 27Cxx EPROMs were only used on HP41s with various external 3rd-party boxes. These boxes had logic that adapted/translated between the standard A0...An, D0...D7, /CE and /OE lines of the parallel EPROM bus with the proprietary serial memory bus of the 41C.

HP ROMs (and HP RAM expansion "memory module" for the original 41C) used a proprietary clocked serial interface similar to prior HP calculators. These ROMs and RAMs were in 8-pin DIP packages. [However, do note that these are nothing like the current 8-pin industry-standard serial EEPROMs of the 93Cxx/24Cxx Microwire/I2C/SPI flavors.]

There should be details on this website and on "the other" 41 website how "Nut" and Classic HP CPUs communicate with HP serial memories.

Symbolic input forms 49G+

*Message #1 Posted by **Helge Gabert** on 25 June 2004, 1:24 p.m.*

Does anyone know what happened to the input forms for integration,differentiation, Taylor polynomials, variable isolation, and solving quadratic equations on the 49G+? On the 48GX, they come up with R Shft Symbolic.

Not that I care much, since all this (and much more) can be done with the help of the CAS right on the stack. But is there some way to get at these forms (e.g., hidden menus?) on the 49G+ that I missed?

I'm only curious, as input forms did get carried over for the numerical solver. Thanks.

Input forms 49G+

*Message #2 Posted by **Veli-Pekka Nousiainen** on 25 June 2004, 5:38 p.m.,*
in response to message #1 by Helge Gabert

You either press AND hold the right shift
OR you released it
before pressing [7] NUM.SLV.
Try them both
(VPN)

Re: Input forms 49G+

*Message #3 Posted by **Helge Gabert** on 25 June 2004, 7:17 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

I thought I made myself clear. But it appears I did't.

If you have a 48 GX: Press R Shft Symbolics (9).

See the menu that comes up?

[integration,differentiation, Taylor polynomials, variable isolation, and solving quadratic equations].

Select one.

See the input screen(s) that comes up?

OK. This is what I don't get on the 49G+.

On the 49G+, when you press R Shft NUM.SLV, you get input screens for solving equation, differential equations, etc.

These have been ported over from the 48GX (I am aware of that). They are accessible under R Shft Solve (7) on the 48GX, as I have already mentioned in my first posting.

So my question remains: What happened to the symbolic input forms on the 49G+? Were they deleted from ROM?

Re: Input forms 49G+

*Message #4 Posted by **Bruce Horrocks** on 27 June 2004, 2:48 p.m.,*
in response to message #3 by Helge Gabert

It got lost in the port to the HP49G. See this thread:

http://www.google.com/groups?hl=en&lr=&ie=UTF-8&frame=right&th=e2db314d9373c81d&seekm=3D997E18.EC18BFCC%40miu.edu#link1

hp9830 HPIB interface

*Message #1 Posted by **andy** on 25 June 2004, 11:59 a.m.*

Does anyone know if the hpib interface to the 9835 will work on the 9830? I believe the part number for the 9835's interface was 98135.

Thank you,

Andy

Re: hp9830 HPIB interface

*Message #2 Posted by **Tony Duell** on 25 June 2004, 1:32 p.m.,*
in response to message #1 by andy

I thought the 9835 used the same interfaces as the 9825 and 9845. In which case the HPIB interface is the 98034 IIRC

I can tell you that the I/O buses of the 9825 and the 9830 are very different (the former has a 16 bit data bus, the latter 8 bit, for example) and the same interfaces do not fit both machines.

Re: hp9830 HPIB interface

*Message #3 Posted by **Achim** on 28 June 2004, 3:32 p.m.,*
in response to message #1 by andy

No, the HP-IB interface for the 9825/35/45 (98034) will never work with a 9830, it doesn't even fit mechanically. For the 9830 there was a special, rather primitive HP-IB interface (look at the 9830 HP-IB users guide on the MoHPC CD/DVD-ROM). I have one and it works fine.

Achim

How do I answer this?

*Message #1 Posted by **Chris Woodhouse** on 25 June 2004, 11:55 a.m.*

In reference to my petition at hp15c.org, someone sent me this message;

> Quote:
>
> Well, I am working for TI in the calculator division and interested to know what is special about HP calculators and why you want HP back [rather] th[a]n using TI.

That is a loaded question, how would you answer it?

Chris W

How do I answer this?

*Message #2 Posted by **Veli-Pekka Nousiainen** on 25 June 2004, 1:18 p.m.,*
in response to message #1 by Chris Woodhouse

Because they have thet big ENTER key and RPN logic.
Also the keyboard click reponse has been excellent.
The conservative color and overall design pleases eye and hand.
(VPN)

Re: How do I answer this?

*Message #3 Posted by **Bram** on 25 June 2004, 1:28 p.m.,*
in response to message #1 by Chris Woodhouse

Chris, I leave it to your decision whether or not you pass my message to the gentleman in question.

"On his site the author has justified why he thinks the HP-15C is the best calculator for every day (engineering) work. I think that the device is indeed a very good optimum between size, usability, functionality, programming power, power consumption and layout. For other tasks and/or other places people may think differently, but apparently the author estimated that a "new" HP-15C very well could fill a gap in the calculator market. And therefore he set up the petition to find out.
And to be very specific about why not TI: RPN. Perhaps a matter of taste, but that's just THE difference."

Re: How do I answer this?

*Message #4 Posted by **Jim L** on 25 June 2004, 2:22 p.m.,*
in response to message #1 by Chris Woodhouse

I guess I wouldn't. It's probably someone yanking your chain. Even if it has a TI address and someone responds, it's probably a new low level employee who hasn't read the corporate Internet guidelines yet.

Chris...

> Quote:
>
> Well, I am working for TI in the calculator division and interested to know what is special about HP calculators and why you want HP back [rather] th[a]n using TI.

He's probably wondering why there's a whole site devoted to old HP calcs in such detail. This guy may not be a really 'useful' contact as far as changing direction of calc market but may be a curious guy simply wanting 'enlightenment'. Perhaps a few comments from him may make it up the pipeline, who knows??

So I'd tell him this:

> Quote:
>
> The primary thing that separates all older HP calcs (those of the 1970s-1980s with a couple from early-to-mid '90s) from TI (and other) calcs is their use of "traditional RPN".
>
> Many of us HP do not consider RPL calculators with an 'infinite stack' - like today's HP48/49 series - to be true RPN devices.
>
> "Traditional RPN" uses a 4-level stack with T-copy down and a Last-X register. It's combined with a favorable keyboard layout for ease of use, having a _large_ ENTER key above or on the side of the numeric area. (This is one reason why many purchasers of the new HP33S dislike this calculator, besides its annoying 'chevron' keypad layout.)
>
> This system makes doing calculations while 'thinking on the keyboard' quite easy and graceful. No worries about parentheses closure, etc. And unlike formula-entry calculators common today, intermediate results are continually visible as a sanity check. It may take about a day for an AOS calculator user to become accustomed to an RPN calculator - can't be too hard, I learned how in middle school while at the huge HP display in Macy's.
>
> Here's a quick example: evaluate the polynomial
>
> 5x^5 - 6x^4 + 7x^3 - 8x^2 + 9x - 10
>
> for x=1.2345
>
> On an HP traditional RPN calc:
>
> 1.2345 [ENTER][ENTER][ENTER]
> 5 [X]
> 6 [-][X]
> 7 [+][X]
> 8 [-][X]
> 9 [+][X]
> 10 [-]
>
> which returns 2.48877... Here, we used Horner's method to great advantage with RPN and the T-

copy-down feature. Doing Horner's on an AOS TI calc would get me lost in a sea of parentheses - I'd be better off resorting to using powers of X.

In addition to ease of operation, such older HP calcs had sturdy frames/casings, had clear, legible LCD displays with wide viewing angles, and had excellent keyboard characteristics: "click" keys that were fully debounced - no false entries or 'doubling' of keystrokes. There was just an overall impression of durability and quality, combined with excellent human-factors engineering (pocketability, battery life, and overall "feel").

The programmable HP calcs also offered graceful keystroke programming that let users quickly set up in essence a custom calculator for repeated tasks.

HP was also known for the excellence in their internal algorithms and excellent QC. (Sadly, this 'edge' no longer seems to be present.) The Solver and Integrator algorithms in the HP34C, HP15C and the related TVM financial functions that used the solver on the HP12C were designed with the assistance of Dr. William Kahan of UC Berkeley, who's kind of the "god" of graceful floating-point math and related issues.

By contrast, many TI calcs of late 70s-early 80s were released w/errors in them, especially in the basic multiplication algorithm!! While not always noticeable in a single calculation, this was compounded in log and trig functions that used repeated multiplications. For a very good detailed anaylsis of these errors, see:

http://www.vcalc.net/ti-accry.htm

As the TI calculator market seems to be schoolteacher-driven, it has avoided the people who do real math with real calculators. And yet the high-end TI calcs (like TI-89) offer so much complexity that those of us needing to perform that kind of 'big problem' math work instead turn to desktop PC applications like Matlab, MathCad, Excel or custom C programs.

That's my two bits...

in response to message #5 by Bill Wiese

If you do want to reply, you may want to point out that the 15C is keystroke programmable. This is something that none of the current TI models offer.

Re: How do I answer this?

*Message #7 Posted by **Palmer O. Hanson, Jr.** on 27 June 2004, 4:29 a.m.,*
in response to message #1 by Chris Woodhouse

Let us suppose that the question is an honest attempt to understand why HP afficianados won't buy TI machines. If so, then "RPN" really isn't an adequate answer. The attachment to the HP product line is as much mystical as it is rational, and at times seems to be quasi-religious. In a sense the HP adherents are like a cult when they describe their machines with words and phrases such as "sleek lines", "sleek efficiency", "overall feel", "design pleasing to eye and hand", and the like. Some of these guys even write paeans to their machines!

One of the salient characteristics of a cult is a tendency to belittle others. In my engineering school days back in the late 1940's one cult included the owners of K&E slide rules. No owner of a K&E Log Log Duplex Decitrig would ever entertain, even for a moment, that a Pickett or a Post could be quite as good. Owners of HP calculators with RPN logic have described the users of AOS machines as "the dark side". The cult of users of TI calculators with AOS logic responded to the "dark side" appellation by noting that RPN was really an acronym for Really Pathetic Notation. Members of the Apple computer cult insisted on calling the Radio Shack TRS-80 product line "Trash 80's."

Another characteristic of a cult is that it's members develop dogma which is intolerant of dissent. For HP users one such article of faith is that RPN provides a superior way to evaluate the Mach Number equation which appears on the cover of the manuals for the HP-67 and HP-97. But, Bill Wozniak, the co-inventor of the Apple computer, has described a situation when he was working at HP in which he demonstrated the ease with which a TI machine could solve the problem and wrote "My colleagues couldn't believe it. I told them that you just copy the formula from left to right but not one of them could see through their postfix fog. After all, these were the calculator experts of the world. They are well accustomed to thinking ahead and analyzing an expression to come up with the order of steps to take on an HP postfix calculator, and they had to remember which sub-expressions were in what order on the calculator's stack. None of them could do what I had done, forget that they have to be smart." The really curious thing about the Mach Number problem is that it was at the exact level of complexity that could be solved by the least capable calculator in TI's stable of AOS machines at the time, the TI-30.

There are expressions which are more easily evaluated with an RPN machine. The polynomial problem in Bill Wiese's response is one example, although I would be the first to admit that there probably are members of the TI cult who would never admit that. But there is more to a calculating machine than whether it is RPN or AOS. Bill Wiese mentions Professor Kahan of the University of California at Berkeley in his response. Professor Kahan's paper "Mathematics Written in Sand" noted that the TI-59 had deficiencies in implementation including multiplication which was not commutative. The paper presented a number of sample calculations for which the HP product line yielded better results than could be obtained with a TI-59. Near the end of his paper he presented an example of the inversion of a 4x4 matrix on the HP-15. He did not present the results for the TI-59. I wondered about that. I did the inversion on my TI-59. With all its computational warts the TI-59 yielded errors in the solution which were a factor of 400 smaller than those reported for the HP-15. That's the kind of result that ought to cause a cult member to reexamine his prejudices, even if just a little bit.

So, I suggest that the best answer to the request is simply "It's a cult thing."

Hi Palmer -- Re: How do I answer this?

*Message #8 Posted by **Bill Wiese** on 28 June 2004, 2:24 a.m.,*
in response to message #7 by Palmer O. Hanson, Jr.

Hi Palmer,

Wow, I recall seeing your name - along with Maurice Swinnen's - YEARS ago when I was in HS, reading a friend's issue of PPC Notes.

Background: got a TI58 for Christmas in 1977 - folks wouldn't buy me one of those 'weird' HPs. The TI58 was an 'accident', since my dad had gotten me a Commodore PR100 from Mr Calculator in Palo Alto but it had a misprinted/ poor quality manual and its NiCds wouldn't hold a charge. Even then I drooled over HPs and would play with the various HPs (incl. 29C and 67) displayed at Macys. Pops got bullied into TI AOS logic because he read somewhere that TI had partnered with the Air Force Academy engineering program, and thought of that as "a good thing". Plus the TI58 was feature-laded with the Master Library, so that was quite cool.

Enjoyed spending summer of 1980? writing "big factorial" programs etc. on TI58. Enjoyed the 58 but lack

of cont. memory was a hassle! So anyway I was quite comfortable in AOS or RPN. But once I 'clicked' with RPN, it made AOS seem (generally) funky for "thinking on the keyboard" calculations. In Dec 81 when I got my HP41C I was in hog heaven: RPN, continuous memory, alpha display, etc.

But, yes, at the programming level - i.e, noninteractive one-time program entry - it wouldn't make too much difference to me.

In fact, it would be entirely rational, IMHO, to have a calc that used 'expression programming', something like a BASIC, etc. for stored programs but RPN for interactive keyboard calculations. I know that's a bit of stylistic & implementation dichotomy but "it works for me". While keystroke programming was handy for quick smaller programs, larger complex programs could perhaps be a bit more sanely implemented (or at least documented) w/expressions. (Though memory constraits of yore might mitigate against this dual implementation - but HP41 had 12Kx10 of main ROM and some of the Sharp/Casio handheld BASIC calcs had 8K ROM.

I was rather disappointed that the HP71B machine didn't have an RPN calc front-end (without some kinda 41 emulation module, etc.) That would've been a fun machine!

Hi Bill,

I agree with you that having expressions in programs makes for an easier read.

To elaborate on a tangent, in fact, that is one of the differences between RPN and RPL. RPL will handle expressions. However, the other major difference between RPN and RPL is that RPN is really a "machine code" whereas RPL is essentially a "high-level" language (Note that Valentin has made this point before but in regards to the 71b).

For myself, however, there is an awful steep learning curve for the 48 series which I have been slow to climb--and so I really have not gone anywhere near using its powers, and so I stick with the old keystroke approach most of the time.

But the only real reason for my reluctance with the 48 is time and age: I am not a college kid, I already have proficiency with a different tool, I don't really need an advanced calculator, and so I am "skipping" it. A young student may make a different choice.

That is not to say I don't try to use the 48 once in a while for programming. But usually is is for

programs which are very close to an RPN implemetation.

The 32sii

Best regards,

Bill N3LPX

Bill wrote: "I was rather disappointed that the HP71B machine didn't have an RPN calc front-end (without some kinda 41 emulation module, etc.) That would've been a fun machine!"

There was a module to do that. I never got it, which may be why, when I want a calculator, I always reach for my 41cx instead of my vastly more powerful 71. I don't like the algebraic equation entry on the 71, even though "calc" mode does give you intermediate results, and a backspace undoes the last keystroke even if it was an operation.

I absolutely agree with all your arguments and rationale, but this reference to Mach Number immediately prompted me to contribute to this thread. Please have a look at this archived post of mine where I thoroughly debunk the alleged "superiority" of HP machines for that particular computation:

Mach number - RPN vs. Algebraic

Matter of fact, I think that not only isn't RPN "superior" when confronted with said mathematical computation, but actually it's just about one of the *worst* examples to try.

Hi, Bill:

Bill posted:

"I wonder what you think of the other thing Palmer mentioned: regarding "inversion of a 4 x 4 matrix with the Ti-59 having smaller errors than those found in the results obtained with an HP-15c."

I'd need more data before committing to a definite opinion, such as the contents of the matrix being inverted, what the alleged result was for the 15C, what the alleged result was for the TI, and how was the inversion performed.

For instance, you can invert a matrix in the HP-15C in *four* different ways, at least, and all of them differ in the accuracy obtained. Also, did the TI model have some microcoded inversion functionality, or was the inversion done by using some program, in which case I would need to be able to analyze said program's algorithm and implementation.

As you can see, making some vague statements leads nowhere as far as analyzing accuracy is concerned. Let's see some hard data and some concrete methodology and we can talk.

Best regards from V.

Re: How do I answer this?

*Message #16 Posted by **GE (France)** on 28 June 2004, 5:58 p.m.,*
in response to message #15 by bill platt

It is very likely that the said matrix inversion on the TI was performed using a program in the Math Library Module. No machine language there, and thus no improved accuracy.

The 4X4 inversion in a TI58/59

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2004, 11:37 p.m.,*
in response to message #14 by Valentin Albillo

Hi Valentin, guys;

I agree with GE(France): I also guess that Palmer O. Hanson Jr. have probably used the existing Master Library Module features([2nd][Pgm] 02), which include matrix inversion, determinant and simultaneous equations.

I have the QRG (Portuguese) and the reference for this program (ML-02) has three notes, being the first one: (translated)

"Because of rounding errors, this program may give inaccurate answers for |A|. For example,

```
| 3 -2|
|-9  6|
```

returns -9×10^{-12} instead of zero".

I know the subject refers to inversion of a 4×4 and not the determinant, but if the algorithm is predicted to "fail" (be inaccurate) under certain circumstances, I perfectly understand Valentin's concerns about the program itself.

The contents of the Master Library Module can be uploaded to the HP58/59 main memory and be inspected, listed and/or altered, meaning the programs are not made "private". As Palmer does not mention the need of writing or loading a particular program, it is more likely that this library has been used, and knowing what is done is a matter of finding the (big amount of) spare time enough to "delve into".

Any volunteers?

Cheers.

Luiz (Brazil)

P.S. Valentin, I'm expecting to have two Douglas Adams originals probably in August d8^); thanks!

Edited: 28 June 2004, 11:46 p.m.

Re: The 4X4 inversion in a TI58/59

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 29 June 2004, 2:23 p.m.,*
in response to message #17 by Vieira, Luiz C. (Brazil)

You quoted from the instrucions for the ML-02 program in the TI-59 Master Library as follows:

"Because of rounding errors, this program may give inaccurate answers for |A|. For example, | 3 -2| |-9 6| returns -9×10-12 instead of zero". I know the subject refers to inversion of a 4×4 and not the determinant, but if the algorithm is predicted to "fail" (be inaccurate) under certain circumstances, I perfectly understand Valentin's concerns about the program itself.

Before you get too concerned about the the admitted errors which may occur with the determinant calculation in the ML-02 program you might want to look at the results from determinant calculations with other programs on other calculators. Let's use the 5x5 matrix which appears on page 14 of the manual for the HP-41C Math Pac:

```
6      3     -2      2      3
```

```
1     4    -3     4     2

2     3    -1    -2     9

4     3     0     2     1

3     5    -6     6     2
```

The demonstration on that page enters the matrix, solves for the determinant and shows that the answer will be displayed as -200.0000 where -200 is the correct answer. Somehow, the calculator got into the Fix 4 mode. If you switch to the Fix 9 mode you will find that the answer that is in the X register is -200.0000009 ! The results for the determinant result from several machines and programs follow in order of improving accuracy:

```
-200.0000009                          HP-41 Math Pac - 10 digit machine

-200.0000002                          HP-41 Advantage Module - 10 digit
machine

-199.9999999976                       TI-59 Master Library ML-02  - 13 digit
machine with warts

-199.999999999                        HP-28S - 12 digit machine

-200.00000000011                      TI-85  - 14 digit machine
```

Is that telling you anything?

The displays of the TI-59 and TI-85, like the display of the HP-41 Math Pac with the HP-41 in Fix 4, indicate that the answer is -200, when the actual value inside the machine is in error by a small amount.

Re: The 4X4 inversion in a TI58/59

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2004, 5:41 p.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

Hello, Palmer;

thank you for your comments.

I'm far from being the one to discuss such subjects. I'm an electrical engineer, I'm a teacher, and for some particular cases where engineering demands deep accuracy, four to five significant digits are more than adequate.

I am also aware of accumulated rounding errors that in exponential computations may - and will - meet these four to five digits. At the same time where processors that ***can*** easily hold floating point, double-precision numbers with 32-digit mantissa (and even more) in portable computing devices like calculators (I am talking about their resident O.S., not an actual floating-point processor) or PDA's without speeding them down too much, we are discussing valid subjects like 12-, 13- and 15-digit mantissa calculator precision. I'm mentioning these facts just as a reference.

Except for both HP41 and TI58/59 that need extra SW to accomplish the task, either the HP15C or the HP28S have their microcode for matrices arithmetic. And in their case, I

take the number handling as a result of R&D where many aspects must be balanced: ROM size and addressing, available RAM to hold temporary, input and output data, etc. I am not sure about this, but I'd not compare any of these two (15 and 28) to the others (41 and 58/59) because they deal with matrices all the time with internal precision, while in the 41 and 58/59 there are temporary results being used over and over. Also, knowing that the TI58/59 shows a 13-digit display against a 10-digit LCD in the HP41 is something that must be considered. I know that the HP41 computes 12-digit mantissa numbers while in microcode, but I don't know how do numbers are held by the TI58/59 functions. Are they also 13-digit or more?

Because of all of these facts (not because ones are RPN and others are AOS), I can only think that numbers are handled differently in both systems, having # of digits as a reference. If the TI58/59 display shows 13-digits mantissa all the time, adding extra loops and higher precision results (and consequently extra terms in series that obtain inverses, logarithms, trigs, etc.) seems to be a natural, clever solution. The TI58/59 are fast for LED-based calculators, they have internal parallel bus instead of serial bus (HP41 RAM/ROM access) and their O.S. deals only with number "crunching" and fixed RAM addresses (the HP41 has valid argument checking, XROM addressing, extended RAM and mapped I/O ports). I guess that considering the main significant digits as twelve for internal and ten for external in the HP41 architecture is related to a balance between speed, accuracy and user needs.

I did not mention numbers and precision here because both 1) there is a lot to be told about and 2) I have no skills to go further.

I thank you again for your valid information. As you mentioned that you needed accuracy in solving matrices, I agree with the fact that in some circumstances there's a need for more than a 5-digit mantissa. And in these cases, whatever you use to accomplish your needs is the tool you need to use.

I hope my text is not too confusing; sorry. Sometimes I know what I want to say, and not all the times I am able to express my thoughts in English as I'd like too... d8^)

Cheers.

Re: The 4X4 inversion in a TI58/59

*Message #20 Posted by **Palmer O. Hanson, Jr.** on 29 June 2004, 8:54 p.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

Some of the things you may be interested to know about the TI-59 are:

1. It calculates with 13 digit mantissas and stores results with 13 digit mantissas. It has a ten digit display.

2. It does not have a guard digit used for rounding in the sense that the HP units do. It truncates rather than rounds results to 13 digits.

3. It has, as do earlier TI machines such as the SR-52, a curious multiply algorithm such that multiplication is not commutative. Thus, e x pi is not equal to pi x e by a little bit. TI's claim was that the machines delivered results which were correct to ten

digits. I'm not sure that was always so.

4. TI eliminated the non-commutative multiply starting with the TI-66 (or maybe it was the TI-55II).

5. TI switched to a conventional guard bit with rounding starting with the TI-95 (or maybe it was the TI-68).

in response to message #20 by Palmer O. Hanson, Jr.

Hi, Palmer;

I own a TI59 with a PC100C and I wrote wrongly: when I wrote "shows 13 digits" or the like, please read "allows 13-digit printing". Sorry about that...

I was not aware of these facts; thanks again. About the fifth item:

> Quote:
>
> 5. TI switched to a conventional guard bit with rounding starting with the TI-95 (or maybe it was the TI-68).

Any particular reason?

BTW: my first calculator, the one I had when I went to tghe university, was a TI57. I remember it well: 8 registers, 50 (not 49) program steps, LBL with GTO and SBR. I learnt how to program with that little fellow.

Cheers.

I suspect that TI switched to the more conventional guard bit with rounding format because of pressures such as those enunciated in Kahan's paper. I suspect that they dragged their feet to avoid looking like they were copying HP.

Conversely, I suspect that HP dragged their feet on switching to a longer mantissa to avoid looking like they were copying TI.

Both companies did strange things over the years. One of TI's worst was the new keyboard when they came out with the TI-55II, TI-57LCD, and BA-55. It was so bad that when they finally fixed it and came out with a TI-55III you could send in a TI-55II and get a TI-55III in the return mail, no questions asked. The same keyboard was used on the TI-88, which was to be TI's answer to the HP-41, but which didn't go to production.

Good points (all of them)!

Hi VPN. In exact mode, that is not surprising. In approx mode, the algorithm checks the matrix; if all its elements are integers, then the determinant must be integer as well - and the result will be rounded to the nearest integer. This was already present in the 48G (not in the 48S)

Cheers, Werner

> Quote:
>
> [. . .]this reference to Mach Number immediately prompted me to contribute[. . .]

I have seen this Mach Number formula used both to argue how RPN is better and how RPN is more, or too, difficult. These arguments are like a religious man trying to prove the existence of God and a scientist trying to disprove the existence of God, both obviously have a fundamental lack of understanding of religion or science or both. I agree that the example is dated, and no longer applies to modern calculators, RPN or not. However, this formula is not difficult with RPN or any other calculator that has the ability to evaluate it. I suspect any scientific calculator built in the last 15 or 20 years has that ability. If you know how to use your calculator the Mach Number formula is easy to do on any scientific calculator.

As for the argument of the "so called" limitation of the 4 level stack on the traditional RPN calculators, I am still waiting for someone to show me a real world formula that can not be solved with a 4 level stack. The Mach Number formula can easily be solved using 3 levels, to use more than 4 levels would require an absurd level of incompetence.

Before calculators had the memory and processing power to evaluate and convert algebraic entry to RPN to calculate it, RPN was the only way to calculate complex formulas. (I hope everyone by now does realize that any computational device that accepts algebraic entry, converts that entry to RPN before it can perform the calculation)

RPN is the more natural way to do calculations, it is exactly the way you would perform a calculation if you didn't have a calculator. The only reason some people "believe" RPN is less natural than algebraic entry is because that is the way they have always used a calculator. Algebraic notation is, as it's name suggests, for doing algebra. Algebra is not what I use a calculator for, it's called a Calculator, not an Algebrator. I doubt that many people outside of college use a calculator for algebra either.

My point is that IF you are doing CALCULATIONS, RPN is the more natural, faster and easier method. However IF you are analyzing, studying, or trying to understand the relationship between variables in an equation, algebraic notation is useful, and if you find it necessary to do such things on a calculator, HP has made calculators that have give you that ability without sacrificing the best way to

do calculations. As for myself, since I am no longer in college, I find my desktop computer, with it's large screen, mouse and keyboard a much better tool for that type of work.

I wasn't saying that being a religious and being a scientist are mutually exclusive, just that a religious person and or a scientist attempting to prove or disprove the existence of God, didn't understand either science or religion.

in response to message #30 by Chris Woodhouse

I found myself the other day, unexpectedly having to defend the theory of evolution.....and the person (a co-worker from another office) had presented a puzzle regarding the chances of a "single celled organizm" evolving----which he assessed (without proof) to be essentially zero. So I constructed an ad-hoc analysis of probabilities, taking care to mention that the chance of our earth being in the right location cannot be taken by itself, but rather must be assessed against all of the history of space-time (which of course dramatically improves our chances to exist!) etc etc. (no numbers involved and no true calculations--just an assessment of the "boundary conditions").

And of course somewhere in there the concept of intelligence, reason, etc had to be developed----the big bone of contention for this other fellow was the "ape-man" etc. And so of course this brought up consciousness, or the existence of self-awarenesss, to which I asked rhetorically, "so when you die, does your consciousness just go **poof! Yes, why not--do we presume to keep existing? Do we remember being asleep under Sodium Pentathol at the dentist's office?"

So of course this really did not make any progress.....in the end he asked, "so, which are you, atheist, or agnostic." To which I replied, "Christian." And so he replied that now his head is really spinning.

Religious belief is hollow if one cannot ask hard questions, if one cannot challenge the very

existence of one's own faith. If faith is true, then why should one be afraid to ask? Fear of the challenge is an admittance that the faith may be untrue.

So, this applies to RPN as well. If you take "on faith" that RPN is better, but you are unwilling to test it, then your "faith" is "untrue."

Best regards,

Bill

Yet another instance of RPN myths

*Message #33 Posted by **Valentin Albillo** on 29 June 2004, 6:38 a.m.,*
in response to message #28 by Chris Woodhouse

Hi, Chris:

Chris posted:

"RPN is the more natural way to do calculations, it is exactly the way you would perform a calculation if you didn't have a calculator."

Here you are, yet another instance of one of the most diehard RPN myths: *"the way you would perform a calculation if you didn't have a calculator."* ...

I don't know about you but in my case, and I suspect many other people would concur, one of the most frequent calculations I usually have to do by hand is when I'm given a 10- or 12-long list of numbers (say at a restaurant) and must add them all up on the fly.

If your RPN myth would apply, then I should (either using paper or mentally) put the first number down, then the second one just below it, add them up, notice the (unwanted) intermediate result, then put the third number below it, add them up, notice the new (unwanted) intermediate result, and so on till the last number, which would be added up as well, to get the (wanted) final result. This is exactly as you would do with your RPN calc, right ? This is *"exactly the way you would perform a calculation"* by hand, right ?

Nonsense. The way I proceed "by hand" with that long list of numbers is like this: beginning from the right, I add up all single-digit numbers of the rightmost column, to get the rightmost digit of the result, plus a carry. I then proceed with the second column from the right, likewise, adding the carry, and thus getting the second rightmost digit of the result, and so on till I get the last, leftmost digit of the result.

That's the *natural* way to do it, that's how most of us do it, and nowhere in sight is your *"natural"*

RPN method, nor do you get to see *any* intermediate results, which by the way, you don't want or need at all. You just get the final result, take out the cash from your wallet, plus a generous tip, and give it to the maître, right ?

So much for your myth of RPN being "exactly the way you would perform a calculation".

"The only reason some people "believe" RPN is less natural than algebraic entry is because that is the way they have always used a calculator."

Not my case. I began using calculators with a classic RPN HP-25, never had any other calculator before. So RPN should be engraved in my mind as if casted by a red hot iron. No such thing, at all. I'm as proficient in RPN as the best of you, yet it's clear to me that any command-line true algebraic calculator can run rings around it in versatility, speed and ease of use. The fact that RPN was "the way" I learned never blinded my mind nor my objective judgment to other better possibilities.

"Algebraic notation is, as it's name suggests, for doing algebra. Algebra is not what I use a calculator for, it's called a Calculator, not an Algebrator."

That's plain nonsense and doesn't deserve any kind of answer, you're simply indulging in silly wordgames. I'd certainly expect something more rational and articulate from you.

"My point is that IF you are doing CALCULATIONS, RPN is the more natural, faster and easier method."

Your point is quite respectable but it's nothing but that, your point, a mere opinion. Unless you're able to substantiate it with objective, neutral tests and evaluations, it doesn't hold any water.

The problem with most RPN addicts (and I'm not saying you are one) is that they only know one of the sides, the RPN side. They've never taken any time to really get to know in depth, use, and explore the limits of algebraic machines. They positively dislike the very thought of doing so, and are extremely reluctant to even try. Algebraic machines are 'disgusting' to them, and not using RPN brings kind of an abstinence syndrome.

Fortunately I know both sides inside and out, and can't be fooled with RPN myths anymore. They were hard facts for a time, circa 1980 or so. They're myths ever since, and nowadays RPN is plain and simply obsolete. If you're good at it, more power to you, it will serve you well. But rest assured that anyone with a modern true algebraic machine can run rings around you with utmost ease.

"The above opinions are those of the poster, and may not be shared by the readers, but they should be ;) "

You'd better take a sit, it'll be a long, long wait.

This is a case of not seeing the forest through all the trees. You are getting too caught up in the minute details and forgetting the basic concept of post fix notation. I will concede that my use of the word "exactly" was improper. However, I still submit that it is not a myth that RPN is an electronic implementation of how you perform calculations by hand. It will take a much better example than the one you gave to prove it is.

That is a very tall claim. I would like to see a few real world examples of how you can run rings around RPN in speed and versatility. As for ease of use, I keep hearing people talking about having to analyze an equation and develop a plan of attack in order to use RPN. That is nonsense, you just work from the inside out, with an equation written in standard form it is trivial to find where to start because it visually draws your attention to the inside.

Hi again, Chris:

Chris posted:

"I still submit that it is not a myth that RPN is an electronic implementation of how you perform calculations by hand. It will take a much better example than the one you gave to prove it is."

Please explain why my example is deemed not adequate by you. Do you use a different procedure to add up a column of numbers by hand, at a restaurant for example ? How exactly do you do it, then ? Do you add them up like you would with an RPN calculator ? If not, and particularly if you do it exactly like I described, please explain why my example is

no good for you. The only way to provide a better example is if you first explain why the present one doesn't measure up, don't you think ?

"That is a very tall claim. I would like to see a few real world examples of how you can run rings around RPN in speed and versatility.

The one and only way, in my vast experience, is for me and you to meet in person, and let you see with your very own eyes what I'm talking about, when confronted with a variety of examples theoretic or from real life. Nothing else would make a dent in your convictions, only hard facts face to face. Any number of examples I could give in writing are going to be useless, only a personal demonstration would do.

"As for ease of use, I keep hearing people talking about having to analyze an equation and develop a plan of attack in order to use RPN. That is nonsense, you just work from the inside out, with an equation written in standard form it is trivial to find where to start because it visually draws your attention to the inside.

Ok, try this one, written exactly as it appears on an engineering book:

```
    ((8.8+3.2)*(8.6+7.9)+(-5.1+4.1)*(4.7+2.1))*((-6.2+4.4)*(1.3-9.5)+(-6.3-
3.2)*(2.4-5.7))
```

Any of my SHARP calculators, even the simplest, will acept me to key it in exactly as written:

```
    ((8.8+3.2)*(8.6+7.9)+(-5.1+4.1)*(4.7+2.1))*((-6.2+4.4)*(1.3-9.5)+(-6.3-
3.2)*(2.4-5.7))  [ENTER]
```

and will instantly return the *final* result (not the intermediate garbage).

Now be a sport, and **first** evaluate that expression using RPN, **then (and only then)** answer the following questions:

```
... spoiler space ...

... spoiler space ...

... spoiler space ...

... spoiler space ...

... spoiler space ...

... spoiler space ...

... spoiler space ...

... spoiler space ...
```

Questions:

- Did you get it correctly first time ? (8816.232) I did, in seconds.
- Did you have to quickly scan the expression to see where to begin ? I didn't, just keyed it in exactly as written
- Did you have to think if 4 levels would suffice and anyway stored some intermediate values in registers, just in case ? I didn't.
- Assuming you now need to change that 7.9 in mid-expression to 9.7, did you have to repeat the entire calculation from scratch ? I didn't, I just recalled the whole expression to the display with a single key, then placed the cursor over 7.9 and keyed in 9.7, then [ENTER]. The new result appeared instantaneously, no extra re-typing needed, at all. What about you ?

Anyway, Chris, I don't want to proselitize. You can think, use, and believe whatever you want as far as I'm concerned. You want to believe RPN is better ? Good for you, you have my blessings. If you feel happier thinking so I'm glad you do, period.

Best regards from V.

*Message #37 Posted by **Garth Wilson** on 29 June 2004, 12:37 p.m.,*
in response to message #36 by Valentin Albillo

I think what Chris was referring to was when you have more levels of parentheses open. So far the only examples trying to prove him wrong are pretty simple, despite their length. When I've tried to key-in things that have 4, 6, or more levels of parentheses open at once at different points, I do often make mistakes and have to go back and count and pair the parentheses to find my error. This may be one reason why, when I need a calculator, I normally reach for my RPN calc instead of an algebraic one.

Re: Show me

*Message #38 Posted by **bill platt (les Estats Unis d'Amerique)** on 29 June 2004, 1:55 p.m.,*
in response to message #36 by Valentin Albillo

Hi Valentin and Hi Chris,

I meant to make a post some time ago covering this very topic. Have not had the time to do it. Still plan on doing it someday.

So, let me start by saying that my working hypothesis is not that one or another logic is "better" but rather that "it depends on what you are doing."

BTW I used My HP 11c to do the test above, got an answer I did not trust. Then, I did it on the 20s (algebraic type---but not formula entry like Valentin's) and I got 881.6232 the first time (this is one order of magnitude smaller than Valentin---did not do it again). Then I did it again on the 11-c, and I lost the intermediate value of about 192 (from the left side) while working through the right side.

Clearly, if you just go in and "mash potatoes" that are already written in front of you, the

Algebraic, or the Formula Entry, will work better. I have been RPN-only from 1982 until last year, and I still did better with the "Algebraic").

But this is really not why we like RPN. We like RPN for "Running calculations" or, where no formula is written down---generally we like RPN because it works very well with the process of actually solving and developing an "equation" as opposed to "mashing potatoes" which are already in front of you.

This is also an outstanding distinction between classic Algebraics--which are actually postfix for everything except the arithmatic opperators---and the "Formula Entry" wich are infix for everything except x^2 x^3 etc. For the earlier "algebraics", if you are figuring out something, and you have done some arithmetic, and you have a value sitting in the display, and you look at your sketch and say, "oh--I need to take the sine" then it is a simple matter to hit <SIN> and then keep moving.

Conversely, on a "Formula Entry")also known as VPAM SVPAM or DAL etc), you have to type <sin(> and then find the "ANS" button, hit <ans>, then hit <enter> and then, finally, you have it! Some earlier models with this "formula" paradigm do not even have an "answer" button! And it is usually a shifted function, too!

So, really, it depends on how you use your device.

I personally find the RPN better most of the time--but not always. Period.

In fact, I like algebraic better for doing accounting---as it mimics the keyflow of the "adding machine logic" (except that you are infix--except it feels the same, as the last "+" which is open, has effectively finished the last addition, too--if you don't know what I'm talking about, don't worry).

regards,

Bill

in response to message #36 by Valentin Albillo

> Quote:
>
> Please explain why my example is deemed not adequate by you.

The method you described is the only method I ever remember seeing or using, to add a long list of numbers, so yes that is how I would do it by hand too. The method is virtually identical if that list contains only two numbers, if you can't see how it is related to the concept of post fix notation I don't know how I can explain it.

> Quote:
>
> The one and only way, in my vast experience, is for me and you to meet in person, and let you see with your very own eyes what I'm talking about, when confronted with a variety of examples theoretic or from real life. I don't believe that a face to face meeting is necessary to show me anything other than you are probably much faster at reading an equation and hitting the corresponding buttons on your calculator than I am. If you believe it would show something more substantive, I will happily buy you dinner, and we can discuses it if you are ever in the Oklahoma City area, or if I am ever in your neck of the woods (where ever that is).

> ```

So you found an example that requires a 5 level stack to calculate with RPN, I'm sure you could find or make up one that requires 6 or 7 levels too. My request was for a "real world" example. This may or may not be a real world example but the fact that it "appears on an engineering book" doesn't mean it is a real world problem.

> Quote:
>
> [. . .]will instantly return the *final* result (not the intermediate garbage).

This statement shows a clear bias against RPN. The intermediate values may not always be needed, but they are often very useful. There is no law that says, "when using RPN, you must examine the intermediate values after every operation."

> Quote:
>
> Did you get it correctly first time ? (8816.232)

Yes on an HP 48GX.

> Quote:
>
> Did you have to quickly scan the expression to see where to begin ?

No.

> Quote:
>
> Did you have to think if 4 levels would suffice[. . .]?

No, I was pretty sure 4 wasn't enough, that is why I used my 48GX

?

If this is how you use a calculator, algebraic entry may well be the thing for you. However, that is not how I use a calculator. Other responses to your previous post explain that as well or better than I could, so I won't expound on it here.

Hi, Chris:

Chris posted:

"The method you described is the only method I ever remember seeing or using, to add a long list of numbers, so yes that is how I would do it by hand too. The method is virtually identical if that list contains only two numbers"

Yes, but that's **not** my example, which clearly states *"a list of 10 or 12 elements"*, not two. You can't change my example to what you'd like it to be, and then argue that it doesn't hold. For lists of more than two numbers, the fact is that people don't follow the "natural" RPN way, but rather another quite different method, and they don't see any intermediate results, which they don't want or need anyway. That's my example, it's universal, and I rest my case that it's a perfect counterexample and an incredibly frequent one at that, happening all the time.

"If you believe it would show something more substantive, I will happily buy you dinner"

Thanks but come to think of it, I agree with you on this one, it would be useless. As the old saying reads: "There are none so blind as they who refuse to see."

"My request was for a "real world" example. This may or may not be a real world example but the fact that it "appears on an engineering book" doesn't mean it is a real world problem."

Uh !? Making your own definitions once again ? It does appear in an engineering book yet it isn't "a real world problem" for you ?? Great. As long as you make your own definitions on the fly and stick to them, it'll be quite difficult to win an argument against you. Wish I could do the same, instead of trying to be rational and objective ...

It seems to me that you somehow believe as a matter of faith that nothing in this world would ever require more than 4 levels. And if someone presented you with such an evidence, you would claim it doesn't apply. Great attitude, I like it. Quite useful.

"This statement shows a clear bias against RPN."

Bias against RPN !? **Me** ?? You obviously don't know me, at all, nor did you ever read my articles, postings, letters, books, hear my lectures, see me attending customers trade fair after trade fair at the HP booth, etc, etc. It's like Palmer said,

cults tend to demonize anyone dissenting of their beliefs. Else, why would you try an "ad-hominem" attack, labeling me as "biased-against-RPN" ? Are you so devoid of real arguments to try such a low trick ? What's next ? That I'm not a USA citizen ?

" The intermediate values may not always be needed, but they are often very useful."

Or not. In my example, why on Earth would you want to know or even see how much is it the chicken plus the fish, the chicken plus the fish plus the dessert, the chicken plus the fish plus the dessert plus the wine, etc, etc ? Wouldn't your mind accept that many times intermediate results are a nuisance, useless numbers noone wants to even look at ?

"Quote: Did you get it correctly first time ? (8816.232) Yes on an HP 48GX [...] I was pretty sure 4 wasn't enough, that is why I used my 48GX."

Ah, I see !! A new change of rules !! I thought we were discussing classic 4-level RPN vs. true algebraic and now you introduce n-level RPL (not RPN) into the discussion, so that my arguments, examples and questions cease to apply ! And it catches me with the guard low, not having prepared anything against multi-level RPL ! Wow !

Clever, Chris, very clever. Except for the fact that you chickened out and had to resort to just plain **cheating** , using one of the top-of-the-line, ***most advanced RPL (*not* RPN) models*** to essentially *avoid* trying my example and answering my questions in a classic RPN machine, as intended, because you feared that 4-level wasn't enough (you just were "pretty sure", not downright positive; that would require carefully pre-scanning the expression, isn't it ?), while I can compute said expression without even batting an eyelid even in the ****lowest*, bottom-of-the-line*** SHARP machine I own. Doesn't that ring a bell ?

But I'm done with you. The moment you learn how to conduct a proper, rational discussion, without "ad-hominem" attacks, without redefining terms on the fly, without trying to be both judge and defendant, without changing the rules at your convenience, and, if at all possible, with a positive attitude to see if your learn something worthwhile, I'll be amenable to resume this argument.

But as it is, I'm tired of this, and regrettably, as I feared, I'm losing my time with you.

Long live RPN !

Take care, and best regards from V.

Chris W

> Quote:
>
> You can't change my example

I didn't change your example, I was using an other example to show the connection. While it may not be exactly like RPN it is very similar. A connection that you apparently can't or won't see.

> Quote:
>
> Thanks but come to think of it, I agree with you on this one, it would be useless.

The invitation is still open.

> Quote:
>
> Making your own definitions once again ?

I am doing nothing of the sort. "Real World Example", is obviously open to interpretation and as such deserves a lot more discussion than simply stating it came from an "engineering book".

> Quote:
>
> Bias against RPN !? Me ?? You obviously don't know me

No I don't, but that doesn't change the fact that the statement shows a bias against RPN. You may or may not have a bias against RPN, and showing that at some time in the past you were not biased against RPN, does not have any bearing on today. One thing is clear you either have a bias against RPN, or a bias against people who have a bias for RPN, or both. Yes I have a bias for RPN, I have never tried to hide that, but that doesn't mean I have a closed mind.

> Quote:
>
> In my example, why on Earth would you want to know or even see how much is it the chicken plus the fish

I may or may not want to know that, depends on who ate the chicken and who ate the fish. But you are taking yourself out of context. Your "intermediate garbage" comment was made after your example you claim is a real world example. Since you refuse to put any more effort into defending your claim of it being a real world example than simply stating it is from an engineering book, I have no way of knowing if the intermediate values would be of use to me. As I said before, it may or may not be a real world example, I need more information before I can form an opinion on that.

I have never said that RPN is perfect. I have also never said that real world problems that require more than a 4 level stack do not exist, I just don't know of any. If there are problems like that cormel found in your world the obviously a traditional 4 level RPN calculator isn't for you. Which gives me an idea for an RPN calculator with a dynamically sized stack that unlike the 48 series still has a top that gets copied on stack drop operations. Maybe something that started with 4 levels and could expand up to say 10 levels. I bet someone could write a program for a 41 or 42 that would work like that. But I digress.

It is hard to be sure from just reading words on a page, so I could very well be wrong, but you seem to have a hostile tone to your post. As for myself, I am quite enjoying this exchange. I hope it continues and hope others will interject their thoughts and examples. I am especially looking forward to Bill Platt's promised future discussion on this topic.

*Message #42 Posted by **westridge_cz** on 2 July 2004, 3:58 a.m.,*
in response to message #39 by Chris Woodhouse

Hi Chris, Valentin, Karl, Bill, et al.,

I'd like to add my own .02 cents worth to this discussion :-) First off, I'd like to say that I think that some of the comparisons being made are, quite simply, apples vs. oranges. Why? Well, let's analyze what exactly is going on here.

In one message, Valentin said that "even the lowest bottom-of-the-line Sharp calculator" that he owns allows him to enter a program from an engineering textbook exactly as it was written and come up with the correct answer. That might be true for *his* simplest AOS calculator but not for everyone's. For example, on the Triumph-Adler Concorde 2 the maximum number of levels of parentheses allowed is 3. On the Sinclair Enterprise Programmable only 2 levels of parentheses are allowed, and on the Sinclair Cambridge Programmable there's only 1, yep, count 'em, 1 level of parentheses allowed. So it's quite unfair to be comparing calculators that have an infinite number of parenthetical levels against an RPN calculator with a 4 level stack. That's apples and oranges. If you want to compare infinite parentheses, then the only fair comparison is against an RPN calculator with an "infinite" stack (actually only limited by memory).

Second, the claim that an AOS calculator with a command line buffer to enter expressions can "run rings around any RPN calculator" is simply unfair. These types of calculators are tiny computers, really, and of course anyone can edit the contents of the command line buffer without having to re-type the whole expression. That goes without saying, but one shouldn't compare these units against a calculator that has a fixed number of stack levels. Instead, one should compare them against RPL based calculators, which also allow the user to edit anything without re-typing the whole expression over again.

And third, wouldn't it be nice if all the equations we use were handed to us on a silver platter and already printed out in some engineering textbook for us to use? Yeah, that sure would be nice, but in the *real world*, **someone** has to write down the parentheses, **someone** has to figure out where the opening parentheses go, **someone** has to figure out where the closing parentheses go, and **someone** has to check whether there are the right number of opening and closing parentheses, and by the time that "someone" has gotten all that headache out of the way, the person with the RPN calculator will have already figured out the right answer!

I think Bill Platt hit the nail right on the head when he said: "But this is really not why we like RPN. We like RPN for "Running calculations" or, where no formula is written down---generally we like RPN because it works very well with the process of actually solving and developing an "equation" as opposed to "mashing potatoes"

which are already in front of you."

Real world answers. For real world people.

Oh well, that's just my two .02 cents, for what it's worth... :-)

Well said:-) (nt)

Re: Show me

*Message #45 Posted by **James M. Prange** on 30 June 2004, 10:59 a.m.,*
in response to message #36 by Valentin Albillo

First, I'll say that I cheated a bit and simply edited the expression to be enclosed in " delimiters, copied it to the 49g+, and evaluated it there.

It seems to me that it's a good example of what RPL models are good for. If you already have the expession in algebraic form, simply copy it straight into the command line and evaluate it.

Compare, this in the command line:

```
'((8.8+3.2)*(8.6+7.9)+(-5.1+4.1)*(4.7+2.1))*((-6.2+4.4)*(1.3-9.5)+(-6.3-3.2)*(2.4-5.7))'
```

followed by EVAL, and this in the command line:

```
8.8 3.2 + 8.6 7.9 + * -5.1 4.1 + 4.7 2.1 + * + -6.2 4.4 + 1.3 9.5 - * -6.3 3.2 - 2.4 5.7 - * + *
```

followed by ENTER, or more commonly:

```
8.8 3.2[+]8.6 7.9[+][*]5.1[+/-] 4.1[+]4.7 2.1[+][*][+]6.2[+/-] 4.4[+]1.3 9.5[-][*]6.3[+/-] 3.2[-]2.4 5.7[-][*][+][*]
```

An RPL model allows all of these methods and variations of them such as pressing ENTER instead of SPC, and the result is 8816.232 as long as you do it right.

Regards,
James

The long, "symmetrical" equation from Valentin

*Message #46 Posted by **Karl Schneider** on 1 July 2004, 12:59 a.m.,*
in response to message #36 by Valentin Albillo

Valentin provided the following example:

> Quote:
>
> Ok, try this one, written exactly as it appears on an engineering book:
>
> ```
> ((8.8+3.2)*(8.6+7.9)+(-5.1+4.1)*(4.7+2.1))*((-6.2+4.4)*(1.3-
> 9.5)+(-6.3-3.2)*(2.4-5.7))
> ```
>
> Any of my SHARP calculators, even the simplest, will acept me to key it in exactly as written:
>
> ```
> ((8.8+3.2)*(8.6+7.9)+(-5.1+4.1)*(4.7+2.1))*((-6.2+4.4)*(1.3-
> 9.5)+(-6.3-3.2)*(2.4-5.7))  [ENTER]
> ```
>
> and will instantly return the *final* result (not the intermediate garbage).

I'm sure that most users recognized several things about the expression:

1. the example problem was symmetrical -- a product of two long, identically-constructed terms, each consisting of a sum of two products of two-element sums -- *alles klar?*

2. The expression utilized rules of mathematical precedence to allow omission of several more sets of parentheses.

- The 32SII "classic 4-element RPN" worked well if one had the sense and foresight to store the first major sum in a register. A 4-element stack is necessary and sufficient to calculate each major sum.

- The HP-20S algebraic worked correctly, but entering all those "( )" slows the user down. No thinking required, though!

- The HP-10B and HP-17BII (in algebraic) give incorrect answers unless the user inserts extra parentheses at the required places.

- The HP-48G worked well with its unlimited stack. If the expression was to be revised or revisited, its editable algebraic expressions fit the bill.

- The $15 Casio fx-115MS "S-V.P.A.M" failed -- its buffer was not quite large enough to accept the entire expression. Nice crisp display, though. ;-)

BTW, I don't believe that intermediate results are "garbage" -- they allow checks for "reasonableness" of each step. That's what adding-machine calculators do, to use Valentin's restaurant example.

-- Karl S.

Casio works - Re: The long, "symmetrical" equation from Valentin

*Message #47 Posted by **W Rice** on 1 July 2004, 8:55 a.m.,*
in response to message #46 by Karl Schneider

Karl Schneider gave a good summary, with one mistake:

--
* The $15 Casio fx-115MS "S-V.P.A.M" failed -- its buffer was not quite large enough to accept the entire expression. Nice crisp display, though. ;-)

Actually it gives the correct answer. If you eliminate entering multiplication signs between parentheses, the expression fits, with the exception of the final closing brackets. However, the calculator logic will add them automatically if they are not entered by the user. Eg Entering the expression

(5+7)(5-2 =

gives 36.

I have to say, I am very impressed with the Casio. Sure, it's not programmable, but it does incude a solver, plus programs for quadratic and cubic solving, systems of 2 and 3 variables, linear and quadratic regression, and some stats. Complex number handling is pretty bad, but I never need them anyway.

Re: Casio fx-115MS "S - V.P.A.M."

*Message #48 Posted by **Karl Schneider** on 2 July 2004, 12:29 a.m.,*
in response to message #47 by W Rice

W Rice stated,

> Quote:
>
> Actually it gives the correct answer. If you eliminate entering multiplication signs between parentheses, the expression fits, with the exception of the final closing brackets.

And you are correct! I forgot about that feature of "multiplication by juxtaposition". I still maintain, however, that the expression didn't fit in the buffer. It was fortunate that the last two characters in the expression -- after omitting unnecessary "*" -- were "))".

> Quote:
>
> I have to say, I am very impressed with the Casio.

I bought the fx-115MS because I saw that it had complex-number handling, and I wanted to see how well it was implmented in a unit costing only $15. Also, I have a 1981 fx-3600P (which served me well until I bought my HP-15C two years later), and wanted to see how Casio calc's had evolved over the past 23 years.

I'm very impressed by its amount of functionality and its crisp 2-line dot-matrix/7-segment LCD readout, but not at all impressed by its poor product-design engineering. Whereas the fx-3600P was a no-nonsense *tool* like the HP's,

this fx-115MS is more like a student's training aid. There's lotsa stuff in it -- including things that none of my HP's have -- but it's just not a very coherent package. To wit:

• **Unintuitive and cumbersome usage** -- For example, on the fx-3600P, shifting to radian-measurement mode is simply "[MODE] 5" (which is printed on the face), and you get a nice "RAD" annunciator. On the fx-115MS, it's "[MODE][MODE][MODE][MODE] 2" (not printed on the face), and you get an "R" inside a tiny square as an annunciator. Is this progress?

The user interface of the linear-equation solver (limited to 2 or 3 unknowns) is utterly befuddling to one who hasn't read, understood, and remembered the instructions in the fold-out manual.

• **Lack of Consistency** -- On the fx-115MS, many unary mathematical functions are prefix; others are postfix -- depending on how the function is is denoted by the calc.

• **Lack of Funcitonal Interactivity** -- On the fx-115MS,the user enters a "mode" for performing one kind of function -- say, linear systems. When the user wants to do something else -- say, complex numbers or a display change, s/he enters a different "mode", and all the work performed in the previous mode is lost. The user can essentially do one thing at a time. The HP-15C was absolutely nothing like that -- all its functions were complementary and always available.

Thus, we see the difference between "tools for professionals" and "aids/toys for young students".

Re: Casio fx-115MS "S - V.P.A.M."

*Message #49 Posted by **bill platt** on 2 July 2004, 9:20 a.m.,*
in response to message #48 by Karl Schneider

Hi Karl, et al:

You can apply pretty much everything you said about the Casio fx-115Ms to the HP 30s. It too has an 80 character buffer, which just barely allowed Valentin's "equation" in.

It too, has the mode thing, the "press the buttons just like you would on paper!" blah bla blah (which means x^2 is postfix, and Square root is prefix.....)

More on this topic later.

BTW I bought the 30s for $4.95.

One of my co-workers uses the Casio you mentioned. It is the first time I saw one of these "formula entry" or "VPAM" type machines. Her father used an HP45--and she gave it to me, knowing how much of an HP collector I have become--a very generous gift, yes! Question is, how on earth to properly reciprocate?

Regards

Bill

Re: Casio fx-115MS "S - V.P.A.M."

Re: Show me

*Message #51 Posted by **unspellable** on 1 July 2004, 8:40 a.m.,*
in response to message #36 by Valentin Albillo

First, on my 28S, 48SX, or 48GX I can enter a problem in algebraic format when ever I am so inclined.

Second, if algebraic entry is so wonderful why are half the functions on an algebraic calculater used in RPN mode? For example sin(.5) is entered as .5 sin. If that ain't RPN what is it? And what's it doing on my TI, Casio, El Cheapo, etc.?

I find that in most calculations RPN saves keystrokes and does play out faster than algebraic. And my first calculator was an El Cheapo algebraic followed by a graphing algebraic, followed by a high powered scientific algebraic (Lost the grapher), before I ever had an HP.

RPN is a fact

*Message #52 Posted by **Raymond Del Tondo** on 29 June 2004, 12:52 p.m.,*
in response to message #33 by Valentin Albillo

Hello,

>They were hard facts for a time, circa 1980 or so.
>
Right. Back then HP RPN calculators
were the only calcs with reliable keyboards.

Back in 1980, when I had to decide which
calculator to buy, I tested many new TI's,
Casios, Sharps, and other brands,
and all had unreliable keyboards,

except the HP calcs.

>They're myths ever since,
>
>and nowadays RPN is plain and simply obsolete
>
This is just your opinion, and not a fact.

Obsolete is something that nobody wants or needs.

There may be not as much people needing
or wanting RPN calcs than algebraic calcs,
but there are some, so there's need.
There are even new calculator models with RPN,
switchable to kinda low-level algebraic mode.

It's my observation that even in the last few years,
I could do simple (and more complex) calculations faster
with my HP-41 or HP-48 than my colleagues with
their Casios, or even with their four-bangers.

This is (amongst other things) due to the fact that
number corrections in case of entry errors are easy
compared to many of the algebraic machines.

Four-bangers force you to restart the calculation from scratch,
the more advanced machines with a command line force you
to scroll through the line up to the wrong digit(s).
In addition, I make less entry mistakes with an HP-41 or HP-48
because I can be sure the calc registers each entry I make.
Ok, the newer Kinpo machines are not as trustworthy,
but the current calcs of any brand aren't better is this respect.

BTW, you didn't proove that RPN-like entry is less 'natural' than algebraic entry.

So if you add numbers in a different way when using pen and
paper instead of a calculator, RPN or not, this is NOT an
argument for or against RPN in itself.

At least your addition example is a good example to show
that the RPN entry method is much nearer to the
'natural' way of calculation than algebraic entry.
The intermediate results are a (positive) side effect,
you can use them or not.

As always, people should choose the right tools for their work.
So if you find it easier to do simple additions with an algebraic calc, that's no problem.

It's also a matter of personal taste.

The increased command line options of modern algebraic calcs
aren't really an argument, because you could do
this type of entry for many years with an HP-28C.
And that's an important point: You have the choice of either
entering your numbers RPN-like or in an algebraic

manner, at least with many Saturn-based HP calcs, like the HP-17BII, HP-28, and HP-48 series. Ooops, I nearly forgot the hp33s, which is not a Saturn-based machine, strictly speaking.

Regards,

Raymond

Re: How do I answer this?

*Message #53 Posted by **Chris Woodhouse** on 28 June 2004, 9:40 p.m.,*
in response to message #7 by Palmer O. Hanson, Jr.

> Quote:
>
> So, I suggest that the best answer to the request is simply "It's a cult thing."

Quite frankly, that is ridiculous. I don't dispute that there are those among us that have a cult like following to HP calculators. However, the fact that many consider the 48 series to be the last quality calculators built by HP, shows that the following is much more complex than that.

My evaluation of just about everything I buy is largely based on the answer to one simple question; "does it make my life easier?" When comparing product A and B, the obvious corollary is, "which one makes my life easier?" When it comes to calculators the 15C or 11C are the clear winners over anything else I have seen. It's not just RPN either. RPN is a huge factor though, and enough to make it a deal breaker. But if RPN was the only thing about the 15C that made it make my life easier, I certainly would have put up my Bring Back the HP 15C web site. After RPN the biggest way the 15C makes my life easier is by making it so I don't have to look at the display after ever button press to be sure it took. Finally, it makes my life easier because it fits in my shirt pocket so it will be handy when I need to calculate something. See my other post in this thread for more on why RPN is a deal breaker when it comes to calculators. There are many other factors too, such as battery life and over all quality.

I think the best answer to the question from the TI employ was suggested by someone over on comp.sys.hp48, just read the web site it is all pretty much there.

*Message #54 Posted by **Ron Ross** on 28 June 2004, 8:32 a.m.,*
in response to message #1 by Chris Woodhouse

Ti no longer releases a pocket programmable either. They should.

If Ti were to re-release a Ti-66 with RPN and a softclick, you would also be happy. Actually, a Ti-67 with better keys and an RPN option would make us all happy. Of course if they incorporated more of your ideas, even better.

Matrix results for the HP-15 & TI-59

*Message #55 Posted by **Palmer O. Hanson, Jr.** on 29 June 2004, 12:35 a.m.,*
in response to message #1 by Chris Woodhouse

Before presenting some detailed matrix results I want to add something to those comments that suggested that

the HP-71 should have provided an RPN calculator capability. Sometime in the early 1980's (thereabouts, my memory isn't what it used to be, my read amplifier must be failing) an HP sales representative visited the company where I worked. He started with a pitch for the HP-41, and of course included a discussion of the superiority of RPN. Then, he made a pitch for the HP-75 (I thiink, but it may have been the 71) and described its calculator mode. I raised my hand, reminded him of his discussion of the advantages of RPN, and asked why the 75 didn't offer an RPN mode. He thought for more than a few seconds before replying that if you wanted RPN you used the HP-41, otherwise you could use the 75.

Why did I use a TI-59? My company participated in the productivity improvement program marketed by TI. I took an eight session evening course and when I passed the test I was given my very own TI-59, free and clear. I found that it was very easy to transfer some of my workhorse mainframe programs written in BASIC or FORTRAN to my TI-59. When the HP-41 arrived on the scene I looked very hard at it. For one thing it had a vastly superior alphanumeric capability. But when I tested some matrix problems that were important in my work I found that it just didn't do as well as my TI-59.

You may wonder where all the following matrix material is coming from. One of my current projects is working with Richard Nelson, the former editor of the PPC Calculator Journal, on a history of the old so-called "friendly competition" between users of HP and TI machines. Matrix manipulation is one of the subjects. Another was the calculation of 1000 digits of pi competition. You may have noted that some time ago Gene Wright published my work with the TI-95 in which a TI machine finally yielded faster results than those achieved with the H-41. Gene could not rest until he had coached someone into converting the old HP-41 program for use on an HP-42 and once more claiming the pi finding competition for the HP product line. That dedication reminded me of super-programmer Roger Hill's comment during the calendar printing competition when he noted that the "friendly competition" looked a lot like "all-out war".

The following table compares the column by column results reported for the HP-15 with those obtained with the HP-41 Math Pac and with the ML-02 program in the Master Library of the TI-59. The relative error for an element of the solution matrix is defined as (calculated - exact)/exact.

Test Matrix	Inverse	HP-15	HP-41	TI-59
6	- 5	-5.000000049	- 4.99999997	- 5.000000000099
- 2	- 11	-11.00000011	- 10.99999994	-11.00000000026
2	- 7	-7.000000067	- 6.999999965	- 7.000000000168
- 3	- 1	-1.000000011	- 0.999999995	- 1.000000000030
- 1	- 6	-6.000000059	- 5.999999967	- 6.000000000122

```
   0              2               2.000000019           1.999999990
2.000000000050

  RMS Relative Error      1.004E-08              5.40E-09                      2.41E-11
```

The RMS relative error for the elements of the inverted matrix for the HP-15 as reported in the Kahan paper is 416 times larger than that from the ML-02 prgram of the TI-59 Master Library. The RMS relative error for the HP-15 is a factor of two worse than the results obtained with the HP-41 Math Pac.

The TI-59 results which are displayed or printed from ML-02 would suggest that it had arrived at an exact solution. But every serious user of the TI-59 knows that the displayed value is a rounded value derived from the 13 digit display register. The value for the TI-59 in the table above were extracted from the display register.

The text of the Kahan paper indicates that the results for the HP-15 were obtained by entering the test matrix and performing the inverse by using 1/x. The paper mentions iterative refinement as described on pages 119-121 of the HP-15C Advanced Functions Handbook but doesn't present any results. I don't have an HP-15C so I can't provide the results with iterative refinement. I do have an HP-28S. One cycle of iterative refinement as defined on pages 68-69 of the HP-28S Reference Manual provides an exact result.

The Kahan paper also mentions the inversion of a much more difficult matrix, an 8x8 Hilbert multiplied by 360360 so that the test matrix is made up of all integers. The paper reports that the HP-15C inversion recovers three correct significant figures. The RMS relative errors for that problem for several machines are

4.134E-04 HP-41 using the Advantage MATRX routiine

1.818E-05 TI-59 using ML-02

7.249E-06 TI-85

1.309E-06 HP-28S using iterative refinement from page 69 of Reference Manual

Re: Matrix results for the HP-15 & TI-59

*Message #56 Posted by **Werner** on 29 June 2004, 5:22 a.m.,*
in response to message #55 by Palmer O. Hanson, Jr.

Strange that an RPN program for the 41C would produce better results than a microcode program for the 15C, that allegedly uses the full 13 internal digits for dot products? The TI-59, of course, benefits from its 13 digits at every step.

Werner

*Message #57 Posted by **J-F Garnier** on 29 June 2004, 7:05 a.m.,*
in response to message #55 by Palmer O. Hanson, Jr.

I'm not surprised that TI59 gives more accurate answer that HP41, the 13 digits of the 59 vs the 10 of the 41C were well known at that time.

I just tested the HP-71B (the first Saturn machine, with internal 15 digits), actually I used Emu71 here at my office because I don't have my real machine here. Of course I got better results, but not as good as the TI59, which indeed surprised me:

```
10 ! --- TSTMAT ---
20 DIM A(3,3),B(3,3)
```

```
30 ! Test matrix
40 DATA 6,-2,2,-3
50 DATA -1,0,-1,2
60 DATA -3,1,0,-1
70 DATA 1,3,1,0
80 ! Inverse matrix
90 DATA -5,-11,-7,-1
100 DATA -6,-13,-8,-1
110 DATA 23,50,31,5
120 DATA 9,20,12,2
130 READ A(,),B(,)
140 MAT A=INV(A)
150 MAT A=A-B
160 DISP FNORM(A)
```

result is 1.1E-10.

BTW, see how easy are matrix calculations on a good ALG machine :-)

J-F

Re: Matrix results for the HP-15 & TI-59

*Message #58 Posted by **J-F Garnier** on 29 June 2004, 8:24 a.m.,*
in response to message #57 by J-F Garnier

Sorry, I think I made a mistake, FNORM function returns the square root of the sum of square values. To get the RMS error, FNORM should be divided by sqrt(n), so the result is 2.8E-11, close to TI59 accuracy.

J-F

HP-71B beats TI's results hands down ! :-)

*Message #59 Posted by **Valentin Albillo** on 29 June 2004, 11:18 a.m.,*
in response to message #58 by J-F Garnier

Hi, Jean François, Palmer and all interested in this thread:

Jean François posted:

"I just tested the HP-71B (the first Saturn machine, with internal 15 digits) [...] Of course I got better results, but not as good as the TI59, which indeed surprised me [...] To get the RMS error, FNORM should be divided by sqrt(n), so the result is 2.8E-11, close to TI59 accuracy."

As I said earlier in this thread, there are more ways to skin a cat than you may think at first. The HP-71B/Math ROM *can run rings* around the TI-59 in terms of accuracy, if you just make proper use of the available tools.

For this particular example (and everytime you want or need increased accuracy for matrix inversion), you should do it like this (which by the way, it's not a happy idea of mine, but rather it's perfectly documented in the Manual):

```
100 ! --- TEST MATRIX INVERSION - Valentin Albillo's version
110 !
120 ! declare and dimension matrices
130 !
140 DESTROY ALL @ OPTION BASE 1 @ DIM A(4,4),B(4,4),C(4,4)
150 !
160 ! data for original test matrix
170 !
180 DATA 6,-2,2,-3,-1,0,-1,2,-3,1,0,-1,1,3,1,0
190 !
```

```
200 ! data for exact inverse matrix, for testing inverse's accuracy
210 !
220 DATA -5,-11,-7,-1,-6,-13,-8,-1,23,50,31,5,9,20,12,2
230 !
240 ! fill up both matrices with the corresponding elements
250 !
260 READ A,B
270 !
280 ! compute in place and display the inverse matrix
290 !
300 MAT C=IDN @ MAT A=SYS(A,C) @ DISP "Inverse matrix:" @ MAT DISP A
310 !
320 ! compute and display the norm of the error matrix
330 !
340 MAT C=A-B @ DISP "Norm of Error = ";FNORM(C)
```

Upon running this program, the output is:

```
>run
Inverse matrix:
-5                  -11                  -7                   -1
-6                  -13                  -8                   -1
 23                  50                   31                   5
 9                   20                   12                   2
Norm of Error =  0
```

and, as you may see, *the norm of the error is **zero***, i.e., the error matrix is a zero matrix, i.e., the inverse is **exact**.

How's that for accuracy ? Does it beat the TI-59 ? The moral: Never, ever, subestimate past HP's ingenuity :-)

Best regards from V.

Re: HP-71B beats TI's results hands down ! :-)

*Message #60 Posted by **Palmer O. Hanson, Jr.** on 29 June 2004, 9:14 p.m.,*
in response to message #59 by Valentin Albillo

I don't have a TI-71 so I can't respond directly. The HP-28S with one iteration of refinement also gets the exact answer to the 4x4 problem.

The HP-28S does not get exact answers, even with iterative refinement, to more difficult problems such as

(a) the modified 8x8 Hilbert as defined in Kahan's paper, which is a standard 8x8 Hilbert multiplied by 360360 so that all elements of the test matrix are integers. It does get about 4 digits correct with only an inversion, and about six digits correct with one iteration of refinement.

(b) a set of linear equations defined by a 7x7 sub-Hilbert, (A(i,j) = 1/(i + j), as the matrix and seven ones as the vector. In this case it exhibits an interesting characteristic in that an iteration of refinement degrades the solution. The solution vector is 56, -1512, 12600, -46200, 83160, -72072, 24024 .

Several individuals have told me that both the HP-49 and TI-89 are able to solve both of these problems exactly. I would be interested to know what the HP-71 can do.

Re: HP-71B beats TI's results hands down ! :-)

*Message #61 Posted by **Valentin Albillo** on 30 June 2004, 6:23 a.m.,*
in response to message #60 by Palmer O. Hanson, Jr.

Hi again, Palmer:

Palmer posted:

"I don't have a TI-71"

Neither do I. Really, Palmer, you *should* test the correctness of the things you post/publish, you seem to have a definite problem with that ! :-)

"The HP-28S does not get exact answers, even with iterative refinement, to more difficult problems"

Iterative refinement depends upon the *convergence radius* of the Taylor series expansion it is based upon, which is valid for arguments < 1 in absolute value. If the norm of the first approximation to the inverse matrix is too large (i.e., the error is too big and the approximation is not that 'approximate'), it won't converge at all, and you'll get worse and worse 'refined' inverses.

"Several individuals have told me that both the HP-49 and TI-89 are able to solve both of these problems exactly. I would be interested to know what the HP-71 can do."

The one and only reason why these calculators are able to come up with exact solution is that their users specified *Exact mode* where exact arithmetic is used all the time, never performing an actual division unless the numerator happens to be exactly divisible by the denominator. As such, there are neither approximations nor rounded results at all, and the final result is exact. The HP-71B has no symbolic math capabilities nor an Exact mode, so it will perform operations with 15-digit mantissas and in such anomalous, ill-conditioned problems you can't realistically expect it to get an exact solution. Just try these problem in the calculators you mention without using Exact mode and see what you get instead.

Best regards from V.

I computed the matrix inversion on the 49g+ in approximate mode with the simple 1/X, and the result is exact. But I also tried 1/X on the result, and that result is inexact, diplaying roundoff error.

How does the HP 71b fare on the inversion of the inverted matrix? Just curious.

Thanks Valentin, now I remember that SYS gives more accurate answer than the INV command. Also for early HP-48SX (at least the rev.A), HP recommended to use SYS command for matrix size > 8 (or so, don't remember the exact limit) instead of INV due to a bug.

Question: if SYS command gives always better results than INV, why INV doesn't use the SYS

algorithm? Maybe are there some reasons regarding memory usage, speed, ...

J-F

Hi, Jean François:

Jean François posted:

"HP recommended to use SYS command for matrix size > 8 (or so, don't remember the exact limit) instead of INV due to a bug."

A bug ? In the Math ROM ? Details, references, anything ?

"Question: if SYS command gives always better results than INV, why INV doesn't use the SYS algorithm? Maybe are there some reasons regarding memory usage, speed, ..."

All of the reasons you mention. Computing an inverse using SYS is equivalent to solving N systems of N equations in N unknowns, all at once, and this uses extra blocks of memory and takes significantly longer. But if you can afford the extra RAM and time needed, you'll be rewarded with increased accuracy. It's all in the manual.

BTW, I didn't forget your request, I'm trying to locate that d**ned bug list ! I've misplaced it yet again !! :-)

Best regards from V.

> A bug ? In the Math ROM ? Details, references, anything ?

No, I meant in the HP-48SX rev.A (at least). I don't think that the HP-71B MathROM has the same problem.

The only problem I was told about the HP-71 MathROM is that INV command doesn't report any error if the matrix is not invertible (det=0), but it's not really a bug (this behaviour has some benefits).

*Message #66 Posted by **Werner Huysegoms** on 30 June 2004, 7:27 a.m.,*
in response to message #63 by J-F Garnier

Yes, strange indeed. Because the INV algorithm executes the same steps as a SYS - albeit

perhaps in a different order, and without ecplicitly forming a unit matrix. But from a numerical point of view, the error analysis is the same - the algorithm is the same.

It is true that to solve a general system, solving (AX=B) is (way) better than calculating X = INV(A)*B, but if B is the unit matrix, it amounts to the same thing.

So I wonder why it is different in the 71B?

Cheers, Werner

Your 15C results are *wrong* !

*Message #67 Posted by **Valentin Albillo** on 30 June 2004, 6:03 a.m.,*
in response to message #55 by Palmer O. Hanson, Jr.

Hi Palmer, Werner, and all interested in this topic:

Werner posted:

"Strange that an RPN program for the 41C would produce better results than a microcode program for the 15C, that allegedly uses the full 13 internal digits for dot products?"

Strange indeed, but easy to explain and that's exactly why I asked for "hard data" and *precise* details before committing to an opinion. Actually, the explanation is simplicity itself: Palmer's quoted results for the HP-15C are utterly **wrong** !.

Of course I've noticed that he explicitly states that he doesn't own an HP-15C and took said results from some Kahan's paper. But anyway, I think he should have verified the *correctness* of those results, so much so as he is using them for comparison purposes and drawing conclusions or leading other people to make an opinion based on his quoted data.

The correct results for the HP-15C (verified in all four physical HP-15C's I own, i.e., 3 USA-made and 1 Brazilian unit) are easily obtained. After dimensioning a 4x4 matrix A and filling it up with the original matrix contents, I simply press [1/X] (as stated in Palmer's posting) and get the following:

```
-------------------------------------------------------
 Inverse elements    My  Palmer's     My inverse after
   after [1/X]     ULPS    ULPS     one step refinement
-------------------------------------------------------
   -4.999999986      14      49        -5.000000000
  -10.99999997        3      11       -11.00000000
   -6.999999981      19      67        -7.000000000
   -0.999999997       3      11        -1.000000000

   -5.999999982      18      59        -6.000000000
  -12.99999996        4      13       -13.00000000
   -7.999999975      25      80        -8.000000000
   -0.999999996       4      13        -1.000000000

   22.99999993        7      22        23.00000000
   49.99999985       15      48        50.00000000
   30.99999991        9      30        31.00000000
    4.999999985      15      48         5.000000000

    8.999999973      27      85         9.000000000
   19.99999994        6      19        20.00000000
   11.99999996        4      12        12.00000000
    1.999999994       6      19         2.000000000
-------------------------------------------------------
     Sum(ULPS)      179    586                0
-------------------------------------------------------
```

As you may see, Palmer's quoted results for the HP-15 are *300% worse*(!!) than the actual results, when measured in ULPS (units in the last place). As for the norms, we have

My results:

```
RNORM(C-A) = 0.000000325
FNORM(C-A) = 0.000000214
```

His quoted results:

```
RNORM(C-A) = 0.000001048
FNORM(C-A) = 0.000000689
```

also roughly 300% larger than the actual ones.

And last but not least, the HP-15C *does* allow for refinement of the solution by using the *built-in, microcoded* RESIDUAL function. After applying just one step of refinement to the inverse computed using [1/X], we do get an improved inverse which happens to be the **exact** inverse (zero error), as shown above. For those wanting to know how the refinement step is done on the HP-15C, the theory and practice are as follows:

Assuming B is a reasonably approximate inverse of matrix A, then you can get an improved inverse INV(A) by computing:

```
INV(A) = (I + R + R^2 + ...) * B
```

where

```
R = I - B * A
```

is the Residual matrix and I is an identity matrix of the same dimensions. Thus, to first compute the inverse and then perform one step of refinement, assuming A is a 4x4 matrix holding the original matrix, and C is a 4x4 identity matrix, proceed as follows:

```
RCL MATRIX C     for convenience, we make a copy of C
STO MATRIX D     D = C = 4x4 identity matrix
RCL MATRIX A     recall A to compute its inverse
RESULT B         specify that B will hold the inverse
  1/X            matrix B = inverse of A
RESULT C         C will hold the residual R = I-B*A
RCL MATRIX A
MATRIX 6         compute the residual R = I-B*A in C
RCL MATRIX D     recall the identity matrix
   +             C now holds I+R
RCL MATRIX B     recall the approximate inverse
RESULT A         specify A to hold the refined inverse
   *             A = (I+R)*B, the refined inverse of A
```

and we find that the resulting refined inverse is **exact**, i.e., error = 0. The above procedure doesn't require any programming at all, and is carried out in seconds.

By the way, Palmer, I won't pretend to tell anyone what to do or how to behave but if I were you, I'd rather do my best to test the accuracy of any results I might publish and/or depend upon for the sake of an argument, making some point, or stablishing comparisons. Anything else means your conclusions are resting on shaky grounds, if at all.

Best regards from V.

*Message #68 Posted by **Vincent Weber** on 30 June 2004, 8:48 a.m.,*
in response to message #67 by Valentin Albillo

Hi Valentin and all,

Just my 2 cents - you'll be happy to know that Lygea Pocket15C simulator gives -instantaneously- 100% accurate results for this problem without any residual computation, just simple '1/x'... That's the good thing about a simulator. Elaborating about what was said about differences between simulators and emulators, I would say that: - An emulator is appropriate when you can get the ROM image (not so obvious in the case of the 15C) and when you want to use the hacking possibilities of the machine, like synthetic programming on the 41C or Assembly on the 48. In the case of the 15C, no doubt that a few 'hacks' exist, but that's not the emphasis... - A simulator is appropriate when you want to enhance the functionality of the machine, in terms of speed, accuracy, memory, and, in the case of the 15C, alphanumeric display of program steps. - Therefore, I prefer a 41C emulator to a 41C simulator, but I also prefer a 15C simulator to a 15C emulator. Lygea's program does a -wonderful- job at this, and a good way to remain faithful to what HP used to be is to purchase an Ipaq 1930 or 1940. These are cool machines, light, small, reliable, with a good removable battery, and among the cheapest pocket PCs on the market. They can serve as an enhanced 15C, an enhanced 12C, and as a 41CX, on top, of course, of all the applications that PocketPC can run. Granted, the touch screen as not as good an option as keys are to type fast, and the battery life has nothing to do with a Voyager... but that's still a viable option (at least for me). - I would actually love to have a 42S simulator: This is the typical case where hacking is not so important, but enhancing the functionality could be a big plus. The 42S is almost perfect, but lacks the equations and fraction mode from the 32SII, plus a decent solution for alpha entry, and a few more things on the display of complex numbers. A simulator could be a great thing... I started one, but stopped due to lack of time, unfrtunately.

Thanks and cheers,

Vincent

Hi, Vincent, long time no read ! :-)

Vincent posted:

"you'll be happy to know that Lygea Pocket15C simulator gives -instantaneously- 100% accurate results for this problem without any residual computation, just simple '1/x'..."

Glad to see that you're still enthusiastic about the HP-15C, even in its excellent simulated incarnation. I agree with most of the points in your enjoyable posting, but let me point out that I knew in advance that Lygea's simulator would have no problem at all with this smallish, 4x4 not-ill-behaved matrix, computing as it does to far greater precision than a real HP-15C (or HP-71B, 42S, etc., for that matter).

However, don't get blinded by that expected success. As soon as you step out of the small, well-conditioned matrices into larger, ill-conditioned ones, your Lygea simulator will fail miserably, as well, and much sooner than you think.

Just have a look at this link or this other link and try out an 8x8 Hilbert matrix, say. Compare your results with the exact inverse and see if a refinement step would be adequate or not. Larger matrices are exponentially much worse, just notice how incredibly small their determinants do get (2.737E-33 for the 8x8 case), and remember that a zero determinant means the matrix is singular and has no inverse, so these matrices are extremely close to being singular and thus non-invertible.

Nice to 'hear' from you, and

Best regards from V.

Hi Valentin, nice to hear from you ! :) Ho, I have no doubt that it should be possible to fail Lygea's simulator with ill-conditionned matrixes - I studied them, well, a long time ago, in 1991... And at that time even the HP-48SX was doing a poor job... But how does the real 15C on theses matrixes ? I'm not a religious fanatic of Lygea... :) But I still like Lygea's simulator a lot (and its 12C counterpart), because, having started myself a 42S emulator, I know what kind of work it is, and I think they really put all their heart into getting a reliable product... So, I spend a lot of time with my beloved Ipaq 1940 nowadays :) Cheers, Vincent

I am very impressed by your mathematical knowledge (usually and here), but this time there is a catch in your ULP thingy.

The first two lines of your table show A = -4.999999986 as 14 ULPS (???!!) and B = -10.99999997 as 3 ULPS.

But A is closer to (-5) than B is from (-11).

I'm not certain what ULPS are good for, but that's probably not a measure of precision.

Hi, GE(France):

GE(France) posted:

"The first two lines of your table show A = -4.999999986 as 14 ULPS (???!!) and B = -10.99999997 as 3 ULPS. But A is closer to (-5) than B is from (-11). I'm not certain what ULPS are good for, but that's probably not a measure of precision."

A is closer to -5 than B is to -11 only in *absolute* value of the error. An ULP (**U**nit in the **L**ast **P**lace) deals with *relative* errors, not absolute, so that we consider 10000000.01 as a closer approximation to 10000000.00 than 3.000000873 is to 3.000000000, because the former errs by only 1 ULP while the later errs by 873 ULPs, though the absolute errors are 0.01 versus 0.000000873, respectively.

"I'm not certain what ULPS are good for, but that's probably not a measure of precision."

On the contrary, ULPs are a widely accepted, used, and standard measure of precision, be they

software (Mathematica) or hardware (Intel) guys. For a simple definition/explanation, see:

ULPs, Relative Error, and Machine Epsilon

Ulp

and, most interesting, revealing, and even amusing of all, have a look at:

Mathematica's Numerical Math Microscope

Thanks for your interest and kind words and

Best regards from V.

Now I get it. Thanks.

I like when I don't understand. It means I'm about to learn something.

Re: Your 15C results are *wrong* !

*Message #74 Posted by **Palmer O. Hanson, Jr** on 30 June 2004, 10:27 p.m.,*
in response to message #67 by Valentin Albillo

As I clearly stated in my presentation of the HP-15C results they were not mine since they were taken from a paper written by another individual. That indvidual was not just anyone, but was Professor W. Kahan of the University of California at Berkeley. As I understand it he has been an important resource for HP calculator design, and in particular for the HP-15C. His paper "Mathematics Written in Sand" appears in the 1983 Proceedings of the Statistical Computing Section of the American Statistical Association, August 1983. It is available on the net. I believe that anyone who is familiar with Professor Kahan's work would agree with me that I should be able to rely on his work. Also, when working on the general topic of matrix inversion accuracy earlier this year I received an e-mail that stated "I tested the 4x4 matrix on my 15C, and got the same result as in Kahan's paper.

After looking more closely at Kahan's paper I think I may have found the source of the different results. I wrote that the results from the paper were obtained by entering the test matrix and doing an invert with 1/x. The paper actually states after completing the input:

```
"The next few keystrokes compute C := A^(-1);
     RESULT C            ...  Tells hp-15c where to put A^(-1)
     RCL MATRIX          ...  See [A 4 4 ] displayed
     [1/x]               ...  See [running for 11 sec.,
                         ...  then [C 4 4] .

The displayed descriptor tells the user that a 4x4 matrix C resulted from the last
operation, and
is now ready for the next.  To view the 16 elements of C, press [RCL] [C] sixteen
times ..."
```

I trust that you will read A^(-1) as the inverse of A as I do not have superscripts available for this writeup. Without an HP-15C at my disposal I cannot, of course, verify that the results will be as in the paper. However, I trust that you will be able to do so. If you cannot verify the results in the paper let me know. I expect to have an HP-15C avilable to me for a few days next month.

I do not know what all of this means. I am surprised that Professor Kahan would publish results for a matrix inversion method with the HP-15C which would yield results less accurate than what are possible with the machine.

Re: Your 15C results are *wrong* !

*Message #75 Posted by **Valentin Albillo** on 1 July 2004, 6:39 a.m.,*
in response to message #74 by Palmer O. Hanson, Jr

Hi, Palmer:

First of all, thanks for answering my concerns about the HP-15C results you posted. Now for some comments:

Palmer posted:

"Also, when working on the general topic of matrix inversion accuracy earlier this year I received an e-mail that stated "I tested the 4x4 matrix on my 15C, and got the same result as in Kahan's paper."

That's strange. As I said, I own 4 physical HP-15C units, 3 USA made and a Brazilian one, and all of them give my results, not Mr. Kahan's. Perhaps there were some ROM changes or perhaps Mr. Kahan was using some pre-production unit (he probably had one of the very first HP-15C prototypes ever produced). I'll try to get other HP-15C units to test the inversion, perhaps you could do the same, and perhaps some kind visitors of this forum could help posting which results they do actually get. I don't have the serial numbers of my USA made units available right now, but my Brazilian one is 2504B12xxx.

"After looking more closely at Kahan's paper I think I may have found the source of the different results".

Nope. If you read my post carefully, that's exactly what I did to get the inverse, prior to refinement:

```
RCL MATRIX A    recall A to compute its inverse
RESULT B        specify that B will hold the inverse
  1/X           matrix B = inverse of A
```

Apart from using matrix B instead of matrix C, this is the same sequence as the one you mention.

"I do not know what all of this means. I am surprised that Professor Kahan would publish results for a matrix inversion method with the HP-15C which would yield results less accurate than what are possible with the machine."

As I've said, perhaps it's a case of different 15C ROM batchs, or more likely, Mr. Kahan using a very early preproduction machine or prototype, or everything else failing, my four HP-15C are gifted, who knows ? :-)

A final advice, if you would: as I understand you're working in some project re the friendly HP-TI competitions, it would be most proper to thoroughly test and validate each claimed program running times, results, and the like, made by both TI and HP sides, lest you'll find yourself embarrassed by non-reproducible, provably erroneous results. Unlikely perhaps, but a rigorous approach is mandatory for scholar-type projects.

All of this posted in good spirit, of course, no offence intended :-)

Best regards from V.

Both 15C Results are Right!

*Message #76 Posted by **Palmer O. Hanson, Jr.** on 1 July 2004, 11:10 p.m.,*
in response to message #75 by Valentin Albillo

Would you believe that both sets of HP-15C 4x4 results are right?

I had trouble believing that there were HP-15C's which gave different answers to the same problem although I knew that there were some minor differences between early and late model HP-11C's. I still didn't have an HP-15C to work with but then I remembered that Gene Wright had loaned a HP-41 ADVANTAGE Advanced Solutions Pac to me, and that I had been told that the matrix routines mirrored the HP-15C matrix routines very well. I ran the Kahan 4x4 problem with the Advanced Solutions Pac and got EXACTLY the same results as published in his paper for the HP-15C and as published in my comparison of the HP-15C, HP-41 Math Pac and TI-59 ML-02 results. Then how could I explain Valentin's different results?

After some thought I ran the inverse of the transpose of the Kahan 4x4 problem with the Advanced Solutions Pac. I got EXACTLY the values that Valentin published saying that my numbers (really Kahan's) were wrong. I conclude that Valentin did not notice that before my table of comparisons I had stated that "The following table compares the column by column results ...". As Valentin said in one of his submissions the devil is surely in the details.

The substantially larger errors when doing the inverse of the Kahan problem as compared with the inverse of the transpose of the Kahan problen are mirrored with the HP-41 Math Pac. For the inverse of the transpose the Math Pac gets nine of the sixteen elements exactly right, and the largest error in the remaining seven elements is only 4 in the tenth significant figure. The HP-28S gets six of the elements of the inverse of the transpose exactly right. The HP-28S does not get any of the elements of the inverse of the original problem exactly right, but does get an exact solution with one cycle of iterative refinement as defined on page 69 of the Reference Manual.

In the next few days I will do the inverse of the transpose on the TI-59 and publish a comparison of results for the inverse of the transpose for the HP-15C, HP-41 and TI-59. In the meantime I wanted to let everyone know that the supposed differences were the result of comparing apples and oranges. The confusion might have been avoided if I had published the Kahan 4x4 matrices in a more conventional format:

```
       Test                              Inverse

  6   -1   -3    1                  -5   -6   23    9

 -2    0    1    3                 -11  -13   50   20

  2   -1    0    1                  -7   -8   31   12

 -3    2   -1    0                  -1   -1    5    2
```

One final comment. The success of iterative refinement with the HP-15C and the HP-28S makes me wish that there had been an equivalent capability with the HP-41 Advanced Solutions Pac.

Re: Both 15C Results are Right!

*Message #77 Posted by **Valentin Albillo** on 2 July 2004, 9:29 a.m.,*
in response to message #76 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer posted:

"Would you believe that both sets of HP-15C 4x4 results are right?"

Yes, I knew ! Congratulations on your find ! I did likewise last night (12 hours ago), once I had a look at the original Kahan's paper. I immediately noticed that Kahan's matrix was transposed ! I inverted it at once in my Brazilian HP-15C and got your results !! :-)

It seems I didn't notice that your original posting was listing the matrix *by columns*, instead of the expected row-order, so I keyed it in row-wise, as usual, and thus my 15C computed the transpose of Kahan's matrix, which amazingly, gives the correct inverse (if transposed, of course) but with 300% greater accuracy ! Seeing is believing ...

"As Valentin said in one of his submissions the devil is surely in the details. [...] The confusion might have been avoided if I had published the Kahan 4x4 matrices in a more conventional format."

Indeed ! Also, a book case of Murphy's Law at work. Normally I would have consulted the relevant Kahan's paper you mentioned, but having scores and scores of Kahan's papers, I didn't notice you were referring precisely to "Mathematics written in sand" (it could well be any of a number of similar papers dealing with matrices) and so I keyed in the matrix directly from your post, which featured it column-wise as stated.

"One final comment. The success of iterative refinement with the HP-15C and the HP-28S makes me wish that there had been an equivalent capability with the HP-41 Advanced Solutions Pac."

Yes, in the case of the HP-15C it's a rarely used function (MATRIX 6) but when you need it, it's quite convenient as it performs both a matrix multiplication *and* a matrix subtraction with a single, 1-step instruction, using full 13-digit accuracy. And of course, a keen programmer can find many other advanced uses for it, even departing *wildly* from its original intended purpose.

Thanks for all your postings, Palmer, I've found this exchange very enjoyable and productive, even learned new unexpected things (such as different accuracies when inverting a matrix or its transpose). It's also very comforting to exchange worthwhile insights and ideas with someone who's not the stereotypical RPN-blinded fanatic but can and does appreciate other means and other ways.

(BTW, though Kahan's "Mathematics written in sand" is a truly awesome document if ever there was one, that I would very heartly recommend everyone (not just RPN fans) to read carefully, don't be "blinded" by the fact that Mr. Kahan is one of the world's authorities on the subjects discussed, the paper still has a number of bold statements that, in practice, may or may not hold. For instance, in page 21 of said document, Mr. Kahan boldly states:

```
"Under no circumstances will [SOLVE] run indefinitely;
 it always finds something, even if sometimes the
 search takes a long time."
```

I'd love to know Mr. Kahan's definition of "a long time", but if it coincides more or less with mine or yours, you can trust me when I say that, for SOLVE's implementation as "written in sand" in the HP-15C or HP-71B silicon "sand brains", it actually means a very looooooooooooooooonnnnnnng time indeed for some extremely simple,

even trivial cases. So long that you'll run down many, many, many battery sets waiting for the answer. Or perhaps you will be the one 'wearing down' with the passing decades, assuming the machine itself will last that long ... :-))

Best regards from Valentin Albillo.

ULPs, and results for a sharp machine

*Message #78 Posted by **Eamonn** on 1 July 2004, 3:06 p.m.,*
in response to message #67 by Valentin Albillo

Hi Valentin,

I just want to make sure that I understand the concept of ULPs correctly. I had a look at the results you posted for the HP-15C. I think that the number of ULPS for -0.999999997 should be 30 (you have it as 3) and the number of ULPs for -0.999999996 should be 40 (you have it as 4). When I enter these values on my HP-12C and hit 'CLEAR PREFIX', I get 9999999960 and 9999999970 respectively. This seems to indicate to me that the ULPS should indeed be 30 and 40 for these values.

I persume that the HP-15C is rounding these values for display and that if you hit 'CLEAR PREFIX', you will get ULP errors of between 25 and 34 for the displayed value of -0.999999997 and between 35 and 44 for the displayed value of -0.999999996.

Assuming that the ULPs for these figures are 30 and 40, this increases the ULPs sum for the HP-15C from to 179 to 242.

I also tried inverting the test matrix on my Sharp EL-5500III. Here's what I got:

```
-5.000000002   -11.00000000   -7.000000003   -1.000000000
-6.000000002   -13.00000001   -8.000000003   -1.000000001
 23.00000000    50.00000002    31.00000001    5.000000002
 9.000000004    20.00000001    12.00000000    2.000000001
```

This result has an RMS relative error (as defined by Palmer) of 4.547E-10, which is approx. 15% of that of the HP-15C value that I calculated as 3.0586E-09, which I calculated from the results that you posted.

If I understand the concept of ULPs correctly, the ULP errors for the EL-5500III are:

```
2 0 3 0
2 1 3 1
0 2 1 2
4 1 0 1
```

Summing this gives a total of 23 ULPs of error, or less than 10% the ULP error for the HP-15C (assuming my understanding of ULPs above is correct).

I find the performance of the EL-5500III very surprising, given the reputation of the HP-15C. I fully expected the Sharp machine to have poorer performance. Of course, this is just one test case. I'm sure that other test cases behave differently.

One final note - that I hope is not too much off topic - in a previous post, you recommended the Sharp PC-1475 that has 20-digit percision. Do you know how this machine performs on this test?

Regards,

Eamonn.

Re: ULPs, and results for a sharp machine

*Message #79 Posted by **Valentin Albillo** on 2 July 2004, 5:40 a.m.,*
in response to message #78 by Eamonn

Hi Eamonn,

Eamonn posted:

"I think that the number of ULPS for -0.999999997 should be 30 (you have it as 3) and the number of ULPs for -0.999999996 should be 40 (you have it as 4). [...] This seems to indicate to me that the ULPS should indeed be 30 and 40 for these values."

Absolutely correct. It was very late in the night when I was writing down these results (the HP-15C has no I/O at all) and I forgot to use f PREFIX (i.e.: "view full mantissa") with these two numbers, which being <1 do have their last digit not visible when displayed.

"Assuming that the ULPs for these figures are 30 and 40, this increases the ULPs sum for the HP-15C from to 179 to 242."

Correct. I've checked the hidden digits and they are indeed 0's, so the Ulps come out as 30 and 40, respectively, and your 242 is the correct sum, still nearly 3 times smaller than Palmer's (Kahan's) results.

"I also tried inverting the test matrix on my Sharp EL-5500III [...] Summing this gives a total of 23 ULPs of error, or less than 10% the ULP error for the HP-15C [...] I find the performance of the EL-5500III very surprising, given the reputation of the HP-15C. I fully expected the Sharp machine to have poorer performance."

Quite on the contrary. I'm just as keen a fan and a collector of SHARP machines as I am of HP ones. Beginning with the PC-1211 (aka TRS-80 Pocket Computer) they've produced such incredible machines as the PC-1262 (Voyager-sized), 1350 (4-line x 24 char graphics display), 1421 (Financial BASIC), 1425 (Statistics BASIC), 1475 (matrix op., 2-line LCD, BASIC, 20-digit, 32 Kb), and of course your 1403H (aka EL-5500III), to name but a few. Their performance and quality have always been outstanding, and they perform today as well as 20 years ago.

"in a previous post, you recommended the Sharp PC-1475 that has 20-digit percision. Do you know how this machine performs on this test?"

Yes. With that stunning 20-digit precision it has no problem to deliver in excess of 10 correct digits (or 12, for that matter) for both this example and the 8x8 Hilbert matrix scalarly-multiplied by 360360.

If you like your SHARP EL-5500III, you'd do well to get a SHARP PC-1475. It has everything your machine has (matrix operations and all) plus 20-digit computations and variables, and a wonderful 2 lines x 24 char dot-matrix display.

Thanks for your valuable contributions to this thread and

Best regards from V.

Re: ULPs, and results for a sharp machine

*Message #80 Posted by **Eamonn** on 2 July 2004, 4:18 p.m.,*
in response to message #79 by Valentin Albillo

Valentin,

I will certainly keep an eye out for a PC-1475, based on your recommendation. I share your admiration of the Sharp handhelds, aswell of course of the few HP machines I have had the opportunity to play with.

To complete the testing of the EL-5500III, I also inverted the matrix from the Kahan paper and here are the results.

```
 -4.9999999980   -5.9999999980   22.9999999900   8.9999999970
-11.0000000000  -13.0000000000   49.9999999900  19.9999999900
 -6.9999999980   -7.9999999980   30.9999999900  12.0000000000
 -0.9999999996   -0.9999999996    4.9999999980   1.9999999990
```

Interestingly, in this case the RMS relative error decreases a little from 4.5475E-10 to 3.3907E-10 while the sum of the ULP errors increases a little, from 23 to 26. Amazingly, both are better than the HP-15C results that have been posted, by a factor of more than 20.

Eamonn

Hi, Eamonn:

Eamonn posted:

"I will certainly keep an eye out for a PC-1475, based on your recommendation. I share your admiration of the Sharp handhelds, aswell of course of the few HP machines I have had the opportunity to play with."

You'd do well to keep *both* eyes peeled for a SHARP PC-1475, it's certainly an awesome machine, both functionally and phisically, here's a picture of one of mine (I've got two):

My SHARP PC-1475

The result for Sqrt(5) on the LCD display was computed and displayed by the double-precision, 20-digit square root function available in this machine. How's that for accuracy, uh ? :-)

As for HP's, I have the opportunity to 'play' with most of them, if not all (I think the HP-95C is the one and only I've never played with, and that includes all three models of HP-94, the HP-70, and the HP-01 gold-plated watch). Some I like, some I despise. The last batch of KinHPo crap certainly belongs to the later group, but then that's not HP's, actually.

"To complete the testing of the EL-5500III, I also inverted the matrix from the Kahan paper and here are the results [...] Amazingly, both are better than the HP-15C results that have been posted, by a factor of more than 20."

Why amazingly ? Eamonn, it seems to me that you've got some kind of "inferiority complex" re SHARPs vs. HPs. You must do some group therapy with some other SHARP fans, like myself, and you'll get cured eventually. Just for starters, repeat with me: "In the good old times, anything HP did Ok, SHARP did as well or better". Repeat it mantra-like for a while, and you'll feel better.

Jokes aside, my SHARP PC-1350, which has no built-in matrix functions, does return the *exact* inverse (error = 0) using a simple 4-line BASIC routine, in 8 seconds flat. The PC-

1475 does the same, only with 10 extra zeroes at the end of each number.

Best regards from V.

Hi Valentin,

Just for fun, what result do you get with your sharp computer if you compute " exp (pi * sqrt(163)) ". I understand this strange number has very interesting properties, including rouding off as an integer for any computation done with less than 20 significant digits.

Thank you for your kind attention and Best Regards from

Antoine M. " Kermit " Couëtte

in response to message #83 by Veli-Pekka Nousiainen

Hi, VPN:

The last digits should be: "73129" (truncated) instead of your "73108" (rounded ?), so you've got an error of 21 ULPs. Not too bad.

If you want to have some extra fun with your LongFloat library, try and compute the square root of 308642 to, say, 45 digits or so, and see if you can explain the result on your own, without looking it up like mad in the Internet.

If you do succeed, you might want to try your calculator's long integer capability by multiplying these three prime numbers together:

```
  611509954376459299030014869
* 912070930867832438835716332271
* 139451562665696317383129648783472 3 = ?
```

Best regards from V.

*Message #86 Posted by **Rodger Rosenbaum** on 15 July 2004, 6:15 a.m.,*
in response to message #85 by Valentin Albillo

Valentin Albillo says:
"If you want to have some extra fun with your LongFloat library, try and compute the square root of 308642 to, say, 45 digits or so, and see if you can explain the result on your own, without looking it up like mad in the Internet."

I won't explain the result, which is the presence of quite a few repeating digits in the square root of 308642, but I will offer some relatives of SQRT(308642)

SQRT(278) and SQRT(27778) are the little brothers.

SQRT(308641975308641975) is the daddy.

SQRT(308641975308641975308642) is the granddaddy.

SQRT(444444), or square root of an integer consisting of any even number of "4" digits will give a result with a bunch of repeating digits in the result.

The product of the three large primes is a long string of "7" digits with a single "5" digit near the middle.

Re: ULPs, and results for a sharp machine

*Message #87 Posted by **Valentin Albillo** on 15 July 2004, 7:32 a.m.,*
in response to message #86 by Rodger Rosenbaum

Hi, Rodger:

Thanks for your post but for the sake of completeness, I'm giving here explicitly the results you mention, for the benefit of those unable to calculate them to the required high precision:

```
SQRT(308642) =

    555.555577777773333333511111102222222719999970133335

SQRT(278)    =   16.673332000533066
```

```
SQRT(27778) =  166.667333332000005333306666815999 1

SQRT(308641975308641975) =

                555555555.555555555   2

in response to message #87 by Valentin Albillo

I thought I would leave it as an exercise, also!! Surely at least one other person might have something to say!

After I worked on it, I did go looking on the web to see what might have been said, but all I found with a cursory search were the places where you had posted the problem in Spanish.

*Message #90 Posted by **Rodger Rosenbaum** on 15 July 2004, 1:15 p.m.,*
in response to message #89 by Valentin Albillo

When I posted, I didn't have the web page where you had posted the problem immediately available, and I couldn't remember whether it had been in Spanish or Portugese (I knew it had been one of those), so I said "another language".
I have edited the posting to correct my grammar and changed "another language" to "Spanish".

Re: ULPs, and results for a sharp machine

The Xplanation

*Message #94 Posted by **Valentin Albillo** on 16 July 2004, 6:26 a.m.,*
in response to message #93 by Veli-Pekka Nousiainen

Hi, VPN:

VPN wrote:

"- no Xplanations - you tell me - oh Jedi Master..."

You're welcome, my *padawan* learner. The "key" to the mistery of SQRT(308642)'s uncanny initial regularity lies in the fact that 308642 is *very close* to the square of 5000/9. Actually, we have:

```
          (5000/9)^2  =  25000000/81
while
            308642    =  25000002/81
```

so it misses the target by just 2 parts in 25 million, so to say. This being so, we proceed to compute its square root this way: we have

$$308642 = \frac{25000000+2}{81} = \frac{25000000}{81} * \left(1 + \frac{2}{25000000}\right)$$

and thus

$$SQRT(308642) = SQRT\left(\frac{25000000}{81} * \left(1 + \frac{1}{12500000}\right)\right)$$

$$= \mathrm{SQRT}\left(\frac{25000000}{81}\right) * \mathrm{SQRT}\left(1 + \frac{1}{12500000}\right)$$

$$= \frac{5000}{9} * \mathrm{SQRT}\left(1 + \frac{1}{12500000}\right)$$

And now, using the classic Taylor series expansion for SQRT(1 + x), with x = 1/12500000:

```
                = 5000/9 * (1 + 1/25000000 -
1/1250000000000000 +1/3125000000000000000000 - ...)

                =  555.555555555555555... * (1 + 4E-8 - 8E-16
+ 32E-24 - ... )
```

So, in the end, we are just multiplying a highly regular, patterned number (555.555555555...) times another highly regular, patterned and (initially) lagunar number:

```
                =  555.555555555555555...
                *  1.000000039999999200000031999998 ...
```

so it should come as no surprise that the end result is (initially) highly patterned as well:

```
                =
555.555577777773333335111111022222227199999 7...
```

And that explains it all. Notice that I've said "initially" in a number of places. That's because after a while, the lagunarity of the second factor gets lost:

```
   = 1.000000039999999200000031999998400000089599994624000
       337919978035201464319900426246879641118425122080683
```

and consequently, the resulting product (i.e.: the square root of 308642) ceases to be patterned as well:

```
    = 555.555577777773333335111111022222227199999701333 3
        521066654464000813511055792359377578399125067822
```

A real pity, but unavoidable nevertheless.

May the force be with you and best regards from V.

What is a lagunar number?

Re: The Xplanation

*Message #96 Posted by **Valentin Albillo** on 16 July 2004, 8:10 a.m.,*
in response to message #95 by Rodger Rosenbaum

Rodger posted:

"What is a lagunar number?"

My mistake, a typo. I meant "lacunar" instead of "lagunar". And in case you're not familiar with this word, here are some definitions:

```
Lacunar numbers:

    Numbers with ``very sparse'' non-zero digits in
some
    base representation.
```

From Websters Dictionary, you have:

```
    lacuna: (noun) A blank gap or missing part.

    lacunar: (adjective) Pertaining to, or having,
lacunae
```

The second factor is:

```
       = 1 + 4E-8 - 8E-16 + 32E-24 - ...

       = 1.0000000[4]0000000[-8]000000[32]00000[-...]
```

where you can see the "digits" [4], [-8], [32], amid a number of "blank gaps" (i.e.: lacunae) formed by zeros.

```
       = 1.00000003999999920000031999998 ...
```

Best regards from V.

Re: ULPs, and results for a sharp machine

*Message #97 Posted by **Valentin Albillo** on 6 July 2004, 4:43 a.m.,*
in response to message #82 by Antoine M. Couëtte

Hi, Antoine:

This number is old hat to any mathematician worth his/her salt. It's informally called 'Ramanujan Constant', you can read about it at this URL:

Ramanujan Constant

As for the results with my SHARPs, single-precision machines such as my SHARP PC-1350 give this result:

http://membres.lycos.fr/albillo/calc/pics/var/RAMANUJ.jpg

while double-precision ones, such as my SHARP PC-1475 just give the precise integer result.

If you're interested, this is the list of exponents which give results very close to integers (known as Heegner numbers), you might want to try and calculate the resulting near-integer value:

```
        1, 2, 3, 7, 11, 19, 43, 67, and 163.
```

Best regards from V.

Thank you Valentin Re: ULPs, and results for a sharp machine

*Message #98 Posted by **Antoine M. Couëtte** on 7 July 2004, 3:35 a.m.,*
in response to message #97 by Valentin Albillo

Jul 07, 2004

Thank you Valentin,

I dug in the Internet and read your earlier Challenge #4 which among other items gives information on exp(pi*sqrt163).

As former PPC USA member (# 10121), I still keep (mostly for the emotion of it rather than for daily or even monthly use) the entire collection of PPC CALCULATOR JOURNAL + CHHU in four big binders and I remember very well your quite frequent contributions at that time. Some things never change, since you keep being so enthusiastic!!!

Congrats, and Best Regards

[OT] A simple question on trading

*Message #1 Posted by **Valentin Albillo** on 25 June 2004, 8:50 a.m.*

Hi all:

I've been involved in a large number of e-seller/buyer transactions, where the commonly accepted practice is for the buyer to first send the money, wait for the seller to receive and cash it, and then wait more (with fingers crossed) for the seller to actually ship the item. The buyer has to forcefully accept a large risk, namely that the seller might not ship the item after getting the money, while the seller incurs in no such risk. It's a clearly asymmetric situation, but widely accepted and unless resorting to escrow or other such risk-free (but often expensive and/or inconvenient) methods, that's the way it is, take it or leave it, period.

However, my question is: what about trading ? I mean, if you are trading an item with another person, what are the widely accepted standards of practice ? Should both persons send their items out more or less at the same time ? How can you be sure that the other person actually sent the agreed item, after you've sent yours ? Are there any common rules to decide who sends first or how to verify that the other person did comply ? What to do if the item was misrepresented, doesn't work, or you're dissatisfied with it for any reason ?

Simple as it is, I've never been involved in such a trading, and would welcome some useful advice before getting into one.

Thanks in advance for your help and best regards from V.

Should both persons send their items out more or less at the same time ?

Yes... more or less. That is what I have done in my trades. Fortunately, I have never got problems.

Re: On Topic: A simple question on trading

*Message #3 Posted by **bill platt** on 25 June 2004, 10:33 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Very good question. I think there are no "rules" other than just being decent and honest. I think it really is all a matter of trust.

In e-bay, trust is artificially developed through the "feedback" system. A system which, despite its flaws, is astoundingly effective. I have only been burned outright once on ebay, in about 25 or 30 transactions. (I have received less than as-expected items more than that (only calculators--other stuff is always perfect so far), but have in all instances in which I noticed issues early enough, I have had a satisfactory adjustment made.

Most e-bayers seem to work pretty hard to maintain good feedback.

For outside e-bay, what to do? If you trust a person, then whatever. But it is all a matter of trust.

I wonder if there is a "trading forum" or some sort of "trading clearinghouse" out there which facilitates trading between strangers? It is a good question. I'll bet it exists.

Best regards,

Bill

in response to message #3 by bill platt

I would like to add that trading could really add to our enjoyment of ancient calculators. For instance, I really want to see what a 27s is like, but I have a 17bii (or whatever) and I could trade it for a period, so that both of us could enjoy for a period of time. A hobby at its finest--spending a little postage, and getting to enjoy many different designs.

in response to message #4 by bill platt

Hi Bill,

>> For instance, I really want to see what a 27s is like, but I have a 17bii (or whatever) and I could trade it for a period

What a great Idea!! The HP Calculator Loan Program.

Recently, a nice gentleman loaned me a HP-97 to play with. I'd never actually seen one, and it was great to play around with the actual calculator.

I'm just thinking... we might not want to risk actually mailing our precious calculators around the country for loaning, but..... We could form small groups by region, get together ever so ofen, bring calculators we'll willing to loan. These wouldn't have to be great condion calculators, just working ones so someone else could have some fun playing around with one they may never have used before.

If we don't want to loan them, at least we could bring them to the meeting and let others see and enjoy them there.

I'll get the ball rolling.

I'm in the Phildelphia, PA, USA area - anyone else that might want to get together ever so often???

Re: [OT] A simple question on trading

*Message #8 Posted by **Bill (Smithville, NJ)** on 25 June 2004, 11:03 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

>> Should both persons send their items out more or less at the same time ?

I have done quite a few trades, and that's how it was done each time. All my trades have worked out okay. I only got worried on one trade. This was a trade with a gentleman in Holland. I had shipped my item using air mail so that he received it in one week. Then I waited and waited.. Turned out he had shipped by surface and it took 6 weeks to arrive. But all worked out in the end and I was pleased that I had made the trade.

On all trades, I do the following:

1. Have multiple correspondence with the person to try to determine if I have a "warm fuzzy feeling" about the integrity of the person. This is similar to having a long conversation with a perspective seller at a Ham Radio Ham Fest (Flea market). If I don't have a "good" feeling from the correspondence, then I probally will not do the trade.

2. I always do a Web search. Has the person posted to the HPMuseum site? Has he posted to other forumns? From the postings, I can get a better feeling about the person.

3. Does he offer his phone number with out being prompted for it?

4. I always use the Web to try to verify the shipping address matches the person and that the phone number matches.

Above being said, I have had many excellent trades. In addition, I have had many many nice suprises.

In one case, I traded a HP-45 for a HP-25. The gentleman e-mailed that he had accidently damaged the HP-25

he was planning to send and offered to send a different one, which I accepted. Then after I had received the HP-25, he sent a second, better quality HP-25, and told me to compare them and just return the one I didn't want to keep. That was very trusting on his part. I made my selection and shipped the second HP-25 back to him with a nice thank you.

Of couse, if I do enough trades, sooner or later, one will go bad. As long as I do my research before the trade, it's a risk I'm willing to take. With proper research, the risk is probally no higher than buying something on e-bay or elsewhere on the web.

12345

THANK YOU ALL VERY MUCH FOR YOUR KIND ANSWERS :-) [NT]

Quadratic fit without linear algebra (32SII) - NOT only for statistics lovers - LONG

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 25 June 2004, 7:01 a.m.*

Hello,

I want to fit quadratic equation curves to pumps' characteristics, but I dont want to use linear equation solver, and I want to use only my 32SII. And I dont want to store the points' coordinates.

```
##############################################
#                                            #
#  What do you think about this method???    #
#                                            #
##############################################

Let y=A*x^2+B*x+C, the derivative is:
y'=2*A*x+B == m*x+b, so A=m/2, and B=b.

And if we minimize the sum of calculated and given y's
differece's square, we give C=AVER(y)-A*AVER(x^2)-B*AVER(x).
AVER() is average function.

Here is the 32SII version:

Variables:

A, B, C: Coefficients
X, Y: New point coordinates
U, V: Old point coordinates
I: SumX
J: SumY
K: SumX^2
N: Number of datapoints
And statistic registers

Usage:

1., Sort the datapoints in increasing order of X
2., Start program with XEQ S
3., Enter the datapoints (No correction available!)
4., If you entered the last data, and you see N=... screen
    start the coefficient-calculator routine: XEQ C

=====================================================
An example:

-----------------------------------------------------
MEASURED        CALCULATED
Q       H       H_Excel  H_HP32SII  Delta%_HP32SII
(flow)  (head)
[m3/h]  [m]     [m]      [m]        [%]
-----------------------------------------------------
  0     90.0    90.0     90.0        0
 30     90.2    90.2     90.2       -0.02
 60     86.4    86.5     86.5       +0.13
 90     79.0    79.0     79.0       -0.01
120     67.7    67.6     67.6       -0.12
150     52.4    52.4     52.4        0
-----------------------------------------------------

And the coefficients:

   Excel      HP32SII
A  -2.133E-3  -2.139E-3
B  +6.956E-2  +7.017E-2
C  +9.000E+1  +9.000E+1
```

Enjoy! :D

HP49G+ Filer6 problem

*Message #1 Posted by **Michael Kaiser (Germany)** on 25 June 2004, 5:50 a.m.*

Hi out there,

when I try to create a directory on a SD-Card with Filer6 (from Prof.Rautenberg) I always get the message "XLIB 688 49 Error: Too Few Arguments" and no directory is created.

Can someone explain to me what to do?

Thanks a lot for your help.

Mike

Re: HP49G+ Filer6 problem

*Message #2 Posted by **Raymond Del Tondo** on 25 June 2004, 6:24 a.m.,*
in response to message #1 by Michael Kaiser (Germany)

Hi Mike,

what does Wolfgang say ? Normally, when a possible 'bug' or inconsistence comes up, Wolfgang already has a solution backhand.

And did you ask in c.s.hp48 ?

Raymond

HP41 MLDL2000: design is ready

*Message #1 Posted by **Meindert Kuipers** on 25 June 2004, 4:09 a.m.*

Yesterday evening I have been able to get the full MDLL2000 running. The last problem is now solved. For those interested, this had to do with the power level conversion (6V to 3.3V) in combination with a low power mode which caused the MLDL to become unstable under certain circumstances. This problem was much tougher than I anticipated as I was searching in a totally wrong direction.

All is now working as expected and I can finish the PCB design (which is 90% ready). I should be able to order the first proto PCB's within a week or so.

And Diego, congratulations with your NOVRAM module!

Meindert

Re: HP41 MLDL2000: design is ready

*Message #2 Posted by **Diego Diaz** on 25 June 2004, 9:42 a.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert,

... and thanks so much, I'm also happy to see you're in the last steps of your MLDL2000 developement. Keep us informed of your progress and good luck with those PCB's (I know for sure they require much more effort than the one in my tiny NoVRAM... :-))

Best wishes from Spain.

Diego.

Re: HP41 MLDL2000: design is ready

*Message #3 Posted by **Don Leonard** on 1 July 2004, 2:08 p.m.,*
in response to message #1 by Meindert Kuipers

As an experienced electronics hobbiest, I'm sure you are already aware of the serious risk in ordering the full production quantity of boards BEFORE assembling and exhaustively testing at least one set of PCB's. It is a tempting situation when the cost of a few sets of prototypes are faced. But, PLEASE do not succumb to the temptation.

As a Lead Design engineer and Project Manager on contract with a commercial company, I was 'told' to bypass my usual caution of ordering PCB prototypes as the boards were relatively simple AND HAD BEEN CHECKED by two seperate layout teams. Needless to say, there was an error which was missed by me and both checking teams. Additional lost time and expense was incurred for board rework, and the boards looked like a rework instead of a finished, professional layout. I never allowed this to happen again.

Don

NoVRAM (Cloned HEPAX) production started.

*Message #1 Posted by **Diego Diaz** on 24 June 2004, 4:23 p.m.*

Hi folks,

Perhaps some of you still remember me :-)

I've been working hard and, "with a -not so- little help from my friends" (thanks Ángel, Bill) I've managed to have this project running.

As far as the the first owners of NoVRAM modules haven't bl**kmailed me, I must suppose thei'r happy with their new toys.

So everyone of you still seeking for an Advanced HEPAX for your HP-41 systems, please let me know.

I've placed an ad in the corresponding section.

This thread is intended mostly for technical questions about HEPAX module and its NoVRAM clonation. For HEPAX module functionality, please refer to the HEPAX manual available on-line or consult some of the *real* experts here.

Happy to be back, and contribute to the HP-41 25th anniversary!!!

Diego.

Re: NoVRAM (Cloned HEPAX) production started.

*Message #2 Posted by **Massimo (Italy)** on 24 June 2004, 7:03 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,
no blackmail at all: mine surely works fine (as I mentioned in an earlier post)!

Recommended.

Thanks again for your great work.

Massimo

Re: NoVRAM (Cloned HEPAX) production started.

*Message #3 Posted by **Ángel Martin** on 25 June 2004, 2:51 a.m.,*
in response to message #1 by Diego Diaz

...and so the day has finally arrived! Absolutely great news, we were getting very impatient by now :-)

This (and the MLDL-2000 when it becomes available) is *the* supreme accessory for the 41, and at an

affordable price: 16k RAM plus 8k ROM, with HEPAX compatibility (file system, MCODE programming, disassembler, utilities...) a spadeload of goodies and a powerhouse.

Can't wait to get mine.

Best, ÁM

Re: NoVRAM operating system

*Message #4 Posted by **Christoph Klug** on 25 June 2004, 3:45 a.m.,*
in response to message #3 by Ángel Martin

Dear Diego - hi friends

really great news for HP41 enthusiasts. Would it also be possible to use alternative operating systems instead the Hepax ? For example W&W or Eramco Ram Box operating systems, or the MBK Profiset operating system ?

Regards from Germany - Christoph Klug

Re: NoVRAM operating system

*Message #5 Posted by **Raymond Del Tondo** on 25 June 2004, 4:36 a.m.,*
in response to message #4 by Christoph Klug

This should be possible w/o any problems. The only serious alternative is the MBK ProfiSET OS. However, I'd leave the HEPAX on the four first pages, and include the MBK OS on the remaining two 'ROM' pages. The HEPAX uses only one virtual page, so three visible pages will be occupied to this point.

Then the only additional thing you'll need is the CCD OS/X, which will be ready at the beginning of the next week;-)

Sorry no IL-Dev buffer functions, since they would take too much space, and are of limited use IMHO. I have included SAVEROM/GETROM instead

This way you'll have the choice of reading/writing your ROM images in any of the known formats. WRTROM (HEPAX), SAVEROM (ERAMCO, the standard), SAVEBL (ProfiSET), and the associated read functions are READROM (HEPAX), GETROM (ERAMCO), GETBL (ProfiSET), respectively.

What I would like is to have the maximum of ROMs online at the same time, e.g. the HEPAX, ProfiSET, CCD OS/X, ExtIL, ExtIO, Advantage. This sums up to 12 4K blocks currently, using 8 visible pages.

Since we can hardly reduce the amount of code used in each of the ROMs, an alternative would be to make some of the ROM pacs bankswitched. I'm thinking of the ProfiSET, and a combined version of the ExtIL&ExtIO, and maybe (only MAYBE) a three-bank version of the Advantage pac.

So in the best case, all the above ROMs together would use 5 visible pages instead of 8 pages.

Raymond

Re: NoVRAM operating system

*Message #6 Posted by **Ángel Martin** on 25 June 2004, 7:21 a.m.,*
in response to message #5 by Raymond Del Tondo

Raymond, how could you possible "3-bank" the advantage? You still need the FAT entries for all those programs, which exceed the 64 limit of a single bank.-

Best, ÁM

Re: NoVRAM operating system

*Message #7 Posted by **Raymond Del Tondo** on 25 June 2004, 7:49 a.m.,*
in response to message #6 by Ángel Martin

Hi Angel,

this is the point why I wrote 'maybe';-)

I didn't count the FAT entries in the Advantage ROM so far. I just saw that it contains more than 120 entries, so it will stay two visible blocks.

But with the ExtIL & ExtIO, it should be possible to combine them into one bankswitched ROM, because some of the entries are duplicates, and some can simply be removed.

Regards,

Raymond

Re: NoVRAM operating system

*Message #8 Posted by **Ángel Martin** on 25 June 2004, 9:41 a.m.,*
in response to message #7 by Raymond Del Tondo

Yes, absolutely. Sounds like a good project for the summer nights :-) Maybe we could join forces this time around.

Best, ÁM

Re: NoVRAM operating system

*Message #9 Posted by **Diego Díaz** on 25 June 2004, 5:09 a.m.,*
in response to message #4 by Christoph Klug

Hi,

You'll wait not much longer to get yours on hand Ángel... ;-))

To Christoph's question, yes, it'll be possible to burn W&W or ERAMCO System's but it's not coded yet, I have them planned to be released by the end of this summer. And hopefully (I can't tell for sure) it'll also can become into a double Extended memory module.

Regarding the MBK Profiset, I'll gladly take a look at the corresponding images to check if it would be suitable for NoVRAM emulation, but I don't have such OS (I must admit this is the very first time I've heard of it ;-o) . Please mail me the .ROM images if you're interested.

By the way, I'd also like to notify you about two known limitations:

1- NoVRAM modules run ONLY in normal speed machines. This is a RAM timing limitation and can not be overcome with this technology.

2- The 41's auto-off feature leaves the NoVRAM module in an illegal state (only in CX machines). So if it happens, you'll need to: first, do a soft-reset by holding down [ENTER^] while pressing [ON] twice. Then switch it off and on once again to restart HEPAX auto ubication process. This will leave your 41 and HEPAX system running without loosing a single bit in the attempt :-)

Alternatively you can extract and reinsert your NoVRAM module and switch your 41 on normally (remember NoVRAM's non-volatile RAM will remain unaltered, so you can do it with confidence)

Hope this helps.

Best wishes from the Canary Islands.

Diego.

Re: NoVRAM operating system

*Message #10 Posted by **Raymond Del Tondo** on 25 June 2004, 6:19 a.m.,*
in response to message #9 by Diego Díaz

Hi Diego,

the MBK ProfiSET OS consists of two 'normal' pages, they're not bank-switched nor reconfiguring themselves.

IMHO the MBK OS is the most user-friendly one, it uses a slightly different approach to manage the pages. They call it block, and you always have one selected block, to which many operations refer. Additionally, with the MBK OS you can use the RAM blocks as data harvesters for numerical data. They have a special compression/format which will save much space compared to storing normal numbers.

The MBK OS was the one I heavily used back in the eighties, long before W&W made their RAMBox.

Christoph Klug has the images.

Apart from that, there was a so-called FAST module available from MBK. With this special block (not included in the ProfiSET) the user was able to speed up his own FOCAL programs, some functions only needed a third of their normal execution time! And this was all done in software:-)

Raymond

Re: NoVRAM operating system

*Message #11 Posted by **Christoph Klug** on 25 June 2004, 8:00 a.m.,*
in response to message #10 by Raymond Del Tondo

Dear Raymond,

adding the SAVEROM and GETROM commands to your 4KByte CCD module version is fantastic - because this two commands creates a bridge between EMU41 and NoVRAM.

Is in your 4KByte CCD Module version additionally room for a command set for saving X-Memory to mass storage ?

Regards - Christoph Klug

Re: READEM and WRTEM

*Message #12 Posted by **Ángel Martin** on 25 June 2004, 9:38 a.m.,*
in response to message #11 by Christoph Klug

Christoph's request is a good one: AFAIK, only the PANAME rom has a general-purpose implementation of such functionality (READEM and WRTEM)- all others (on some EPROMS) *assume* that the X-Functions module is present (i.e. no CX) and that is is installed in part 8. Clearly bad programming practices.

However, I can't imagine there's enough room left in the OS/X rom to add such functions at all. I looked at the PANAME inplementation, quite long and intertwined...

Will like to be wrong about this one myself.

Re: READEM and WRTEM

*Message #13 Posted by **Raymond Del Tondo** on 26 June 2004, 1:58 p.m.,*
in response to message #12 by Ángel Martin

Hi,

you are right. The functions for saving/restoring XM take too much space.
After including SAVEROM/GETROM and INPT,
there's about sixty words left free.

As I wrote before, I'm thinking of making a bs version of the ExtIL&ExtIO,
and there will be the functions to save/restore XM and buffer contents.

Some other functions are included in the HEPAX ROMs.
Seems my (upcomimg) favourite config could be:
HEPAX, ExtIL&IO (BS), CCD OS/X, and maybe Advantage.

Has someone tried to use the NoVRAM *and* Clonix at the same time?
I tried it, and then my Clonix got stuck somehow.
Maybe the reason was a port overlap.

However, I have to burn a new config (ExtIL/IO) in the next days anyway;-)

Raymond

Re: READEM and WRTEM

*Message #14 Posted by **Massimo (Italy)** on 27 June 2004, 4:05 a.m.,*

> Quote:
>
> Has someone tried to use the NoVRAM *and* Clonix at the same time?
> I tried it, and then my Clonix got stuck somehow. Maybe the reason was
> a port overlap.

Same result (well, actually the CX didn't wake up at all), same conclusions... :-)

It was just a quick check when I first got the new toy; at the moment I couldn't

remember what I burnt and where in the Clonix so - after pulling both out - I tested the correct functionality of each separately... and went on.

I will make other tests as time permits.

Massimo

Re: Clonix-41 + NoVRAM... it works.

*Message #15 Posted by **Diego Diaz** on 27 June 2004, 8:56 a.m.,*
in response to message #14 by Massimo (Italy)

Hi all,

Raymond, Massimo, I've done some testing both in a HP-41CV and CX, with the following config:

NoVRAM: with HEPAX-1D XROM#=7 (goes to page #6 in CX and page #5 in CV) and RAM on pages #8 to #B, please take into consideration that HEPAX file system assigns fake XROM# to RAM pages, ranging #11 to #14. I have not tried to check if this scheme is also auto-modified if the HEPAX OS finds a *real* module with any of those XROM numbers.

Clonix:

#C - Data Acquisition 1B L, XROM#=21

#D - Data Acquisition 1B H, XROM#=31

#E - David Assembler 2C, XROM#=2

#F - Extended I/O 1A, XROM#=23

It turns up without a flaw (several dozen times... :-) no matter which physical port they were plugged in.

I've also tested HEPAX 002 function to verify every module showed up in its appropriate page, and they're all there. The (lengthy) CAT 2 also showed every function and ASSM sees HEPAX RAM and handles it without problems.

Please double check your config as they more likely attemp to overlap page numbers or use same XROM numbers...

So far, the only inconvenience I still find in using two "emulation" modules is a too high a power drain (near 40mA when RUNning), so I DO NOT advice to make use of it.

Best wishes from Spain.

Diego.

Edited: 27 June 2004, 9:40 a.m.

Re: READEM and WRTEM

*Message #16 Posted by **Angel Martin** on 27 June 2004, 3:02 p.m.,*

in response to message #14 by Massimo (Italy)

Guys,

I still don't have a NoVRAM, but having owned (and used) the HEPAX module for a few years, I'd bet your issue has to do with the way HEPAX assigns XROM id#'s that conflict with other ROMS in your Clonix.

Such assignment is made the first time the calculator powers on with the HEPAX (or NoVRAM I presume) plugged in, but not in every subsequent power cycle. If you've inserted another module after that, the conflict is more than feasible.

I wrote a small MCODE routine to scan the complete bus and auto-reassign the RAM id#'s in case of conflict. It proved very handy when dealing with the RAM blocks as part of the HEPAX file system, and also in these cases.

It's always a good practice to check your HEPAX RAM ROM id's before plugging in other modules (like Clonix). If there's conflict, just use HEXEDIT to edit the first word value on the conflicting page. Easy enough.

So again, I'm almost sure it isn't due to having both Clonix and NoVRAM. That wouldn't be logical at all.

Best, 'AM

CCD OS/X uses ID 5 from now on

*Message #17 Posted by **Raymond Del Tondo** on 28 June 2004, 6:46 a.m.,*
in response to message #16 by Angel Martin

Hi,

the main problem was that I used ROM ID 7 for my version
of the CCD module, and the HEPAX uses ID 7, too.

Actually, I used this ID for my CCD-C long before the HEPAX was invented.

So after changing the ID to another value, the named
functions in CCD OS/X work as expected while the HEPAX is around.

If nothing speaks against this, the future ROM ID of the CCD OS/X will be 5,
as only the STANDARD module seems to use it.
It's planned to upload it to 'the other site' before the end of the 3rd of July.

BTW: The modified CCD on 'the other site',
with Matrix stuff removed, is from you?
If yes, you dont need to hassle with only parts of a 4K block from now on;-)
You can simply use the CCD OS/X as a given ROM page,
and use another whole 4K page for your utilities.

Please do me a favour and let the CCD OS/X as it is,
it's a closed block with much non-moveable code,
and it's planned to make it a bankswitched ROM in the near future.

Regards,

Raymond

Re: CCD OS/X uses ID 5 from now on

*Message #18 Posted by **Ángel Martin** on 28 June 2004, 7:33 a.m.,*
in response to message #17 by Raymond Del Tondo

Raymond,

Allay your fears: I have no intention to alter, edit, change or modify in any way your OS/X ROM.

Yes, I did the "modified CCD", because I've been needing it for a long time to burn a couple of Clonixes (and Zeproms) with both the CCD and the Advantage, and without the redundancy of the ARRAY functions. You'll surely remember my emails, unless you never got them?

If you look at it, you'll see that is done by straight removal of the ARRAY functions from the *original* CCD. No other "aids" or "helping code" was used at all - if you know what I mean ;-O

Best, ÁM

Re: CCD OS/X uses ID 5 from now on

*Message #19 Posted by **Steve** on 6 July 2004, 2:32 p.m.,*
in response to message #17 by Raymond Del Tondo

Hmmm - maybe we can use another XROM ID as the ZENROM uses 5 as well. And I like the built in editor as well. Otherwise I guess the ZENROM becomes defunct. :-(

Re: CCD OS/X uses ID 5 from now on

*Message #20 Posted by **Raymond Del Tondo** on 6 July 2004, 5:07 p.m.,*
in response to message #19 by Steve

Hi,

if you mean RAMED, don't worry.
At least RAMED could be included in the
planned BS version of the CCD OS/X.

Which ROM ID would you like the CCD OS/X to use?
I'm open for suggestions.
I chose 5 because in my list, only the STANDARD module used 5.

And with the NoVRAM and HEPAX and CCD OS/X loaded,
the ZENROM is obsolete (IMHO;-) ,
since the HEPAX has a comparable HEX editor.

However, you can change the OS/X ROM ID to your favourite value.

Regards,

Raymond

in response to message #2 by Raymond Del Tondo

Give me a little idea what ya talking about ??

Re: Unit step u(x)

*Message #4 Posted by **Bill** on 24 June 2004, 8:04 p.m.,*
in response to message #3 by harrington

'Harrington',

"RTFM" = 'Read The Friggin' Manual' (or substitute your favorite F-word).

I think the other respondent said this because most all of of your posts are "How do I..." questions regarding standard tasks, all of which can be readily answered by reading the manual. And this forum primarily pertains to those of us collecting older HP calculators.

If you had a unique problem, found a true calculator 'bug', or needed to use your calc in a highly unusual way, that's one thing, and we'd be glad to help. But having other people do your homework is not really why we're here.

Bill
San Jose

>
> Billy boy understanding is not stupidity. I have contributed like any other persons or person here . what's up with that ? I'm a electrical engineer but what good if I redesign hp I could but lot of work or until you guys organized your idea to a platform

I'd like to respond to your insult/question/statement (whatever it is?) above with another very recent quote (it may sound familiar to you):

> Quote:
>
> Give me a little idea what ya talking about ??

For what it's worth, I had no problem understanding Raymond's reply to your original question, which prompted your second quote above. They are standard commands/functions from the manual. Do you have a manual?

In the past, Harrington, other forum responses to your questions have been polite and patient. They have helped you with programming and have directed you to sites (and now manuals) that are right up your alley toward the questions you ask. From what I can tell, you haven't headed their advice. Have you ever posted questions at comp.sys.hp48? From what I can tell, I haven't seen this happen yet.

Naturally, people's patience run out when they've tried to provide appropriate means of assistance and have been ignored.

Some final pieces of advice (even if you didn't ask for it): When posting your programs here, it can very useful to format your listing using Dave's advanced formatting techniques. Notice an example of Valentin Albillo's excellent formatting usage here. You can test how your formatting will look by experimenting with the Preview First button, and then pressing your browser's Back button to go back and edit and experiment some more. When you're happy with the look of your post, simply press the Post Now button (at the top of the Message Preview screen).

Finally, and most importantly, before you Post your messages, please, please proof-read your sentences to see that they are Clearly written (read it out-loud word-for-word to see if it makes

sense when you speak it) so the end-user can understand what you are asking.

Just trying to help, really,

Matt

Re: Unit step u(x) (HARRINGTON)

*Message #8 Posted by **Bill Wiese** on 25 June 2004, 5:41 p.m.,*
in response to message #7 by Matt Kernal (US)

Matt,

I know! His posts are really difficult to understand given his writing skills. And they are really more apropos to comp.sys.hp48.

You'd figure a person looking for assistance would at least posit well-written/well-staed questions.

Bill

in response to message #9 by Harrington

You "point the swore" at me? I'm still trying to figure that one out.

Gee, I didn't want this to turn into a p**ing match but after that last reply I rest my case.

Comparing me with Osama bin Laden? If that weren't so egregiously over-the-top, it'd be funny. For the record, I had a pork chop and a beer for dinner on Saturday night so I've probably completely failed the Al Qaeda entrance exam, though I have been pretty handy with an AKM rifle.

Huh?!? Even when you attempt to denigrate someone, your ideas and syntax are incomprehensible.

> Quote:
>
> I have contributed like any other persons or person here .

Your so-called "contributions" haven't amounted to jack squat. Every one has been a sloppy, unproofread, and barely-decipherable request for programming help that would have been better directed to the calculator's manual or **comp.sys.hp48**.

FTI, this is a privately-sponsored forum intended primarily for enthusiasts of the well-engineered, user-friendly HP calculators of the 1970's and 1980's. The 48 and its successors aren't really the focus.

Advice for posting

*Message #19 Posted by **bill platt** on 28 June 2004, 6:47 p.m.,*
in response to message #1 by Harrington

Harrington:

I have refrained from involving myself in your questions, but have observed your presence here for some time.

First, I must note that your posts, though frequent, are often trival questions, sophomorically presented, and repetitive. But they have been met, for some weeks, with the utmost patience and deference.

This forum is very international. The regulars here, and in fact even the occasionals, seem to not only understand that, but also revel in it. To that extent, it is common to see varaiations in presentation of the English language. However, those who have a different primary tongue have, even where their idioms and grammar are imperfect (or as I prefer to say, colorful, or fun), try--and demonstrate--care in choosing their words, spelling, etc, so as to do their best. We all make some spelling mistakes; it is a forum, not a work product--but you will find that the ethos of this virtual place is one where quality is to be savored.

I must differentiate this forum from "newgroups". It is most definitely not one---it is more personal.

My final advice would be to observe the culture before attacking it. We here have weathered virtual storms before--and most are willing to make amends when apologies are proffered.

Regards,(and do read the manual, please--you will then have better questions that are more fun to answer!) :-)

Bill

p.s. you should also password your posts--then you can either edit or remove them later!

HP RPN's : deficiencies in stat summation

*Message #2 Posted by **Karl Schneider** on 25 June 2004, 1:07 a.m.,*
in response to message #1 by bill platt

Hi, Bill --

Wow! That's dredging the archives. Yep, I wrote that, so here's the "short essay" I had in mind:

The usability of statistical-summation functions on RPN HP calc's (not including the RPL HP-28/48/49 and the algebraic-based 27S/17B/17BII) falls a bit short, in my estimation. This basic functionality was implemented more sensibly and thoughtfully even in older Casio and low-end TI calc's, as I see it.

On many HP RPN calculators:

1. **Entering 2-variable data pairs puts the values in reverse order.**

This can be overcome on the RPN models by entering the values in reverse order, or with x<->y before SIGMA_+, but this is annoying. On algebraic models by HP and others, x INPUT y SIGMA_+ maintains the order of the data pair.

2. **2-variable summation and calculation of standard deviation (SD) are automatically performed, even when unnecessary.**

This sometimes causes problems, if "leftover" value(s) are used for y-summation in 1-variable analysis, then SD is calculated. The "debris data" might cause a sqrt(neg) error when the SD function tries to calculate both x_SD and y_SD. Erroneous y-summation registers must be cleared before the x_SD answers can be obtained.

The 32S/32SII get around this by providing separate commands for x_SD and y_SD. The Casio and TI models typically have separate user-selected modes for 1-variable and 2-variable analyses.

3. **The ability to specify repeated data or data-pairs is not provided.**

By contrast, TI offers "FREQ" for entering repeated data. Casio calc's offer a similar capability.

4. **Sample SD's, rather than population SD's, are calculated.**

I never quite understood HP's emphasis on sample SD's. I would think that the most common applications for basic stat on a calculator would be a teacher computing mean and SD for class scores, or a student doing the same for laboratory observations. For either of these cases, the population SD would certainly be appropriate. It is no more difficult to obtain a sample SD by first subtracting the mean as a datum, as to obtain a population SD by first adding the mean.

Again, the 32S/32SII/33S offer both population and sample SD's. Menus made this choice easier to provide.

There are other gripes, many of which pertain only to certain models. For instance:

- The HP-41 didn't even have 2-variable stat built in (it could be added with a Stat Pac).
- The 34C/11C/15C omit certain useful functions (e.g., x-estimate) and kluge others together as one function (y-estimate and coefficient of regression). This situation probably stemmed from lack of sufficient available keyboard space.

Much of this is "water under the bridge", but I view this as one instance of something that HP didn't implement as well as its competitors.

Yes, it has MEAN and SDEV, Karl, but neither LR nor curve fitting (they could be added with Advantage pac)

HP-41 statistical functions

*Message #4 Posted by **Karl Schneider** on 26 June 2004, 1:29 a.m.,*

in response to message #3 by Raul Lion

Hello, Raul --

Yes, you are correct -- the HP-41 models do indeed have 2-variable summation built-in. My hastily-written "2-variable stat" was intended to mean "regression analysis", of which the HP-41 models have no built-in capability.

The Stat Pac preceded the Advantage Pac in offering regression-analysis routines (linear, logarithmic, exponential, and power).

It seems silly to have built-in 2-variable summation without the functions to utilize them. Maybe it was a gambit to sell Stat Pacs...

Re: HP-41 statistical functions

*Message #5 Posted by **Raul Lion** on 26 June 2004, 2:49 a.m.,*
in response to message #4 by Karl Schneider

> Quote:
>
> It seems silly to have built-in 2-variable summation without the functions to utilize them

Yes, Karl. And it seems more silly, sell CFIT programs that build the summations in other way...so the buit in MEAN and SDEV are useless with the data stored with those CFIT...

HP 41-CX problem

*Message #1 Posted by **sreen9** on 23 June 2004, 10:22 p.m.*

Hello everyone, I recently acquired a "mint" condition 41-CX, but it has the following problem:

It does not turn on by pressing ON key or even ON and backspace keys together. I have to remove the batteries for a couple of minuites and re-install them, and then do a ON+backspace or a ON+ENTER a few times to turn it on.

I have heard that some 41s have this kind of a problem. is there a fix for this other than removing and re-installing the batteries ?

I appreciate your help with this...

Thanks, Sreen

Re: HP 41-CX problem

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 June 2004, 1:28 a.m.,*
in response to message #1 by sreen9

Hello, Screen9 (whoever you are...8^)

Have you checked for the construction type? This "freezing" behavior is mostly common to the halfnuts.

If the batteries contacts are faulty (not permanently), I mean, if because of any reason the batteries fail to maintain power to the nut IC for sometime or if the voltage drops to some value not enough to power it up, it may lock. Under normal voltage supply, it is not something that happens so often.

If it returned to normal operation, I'd just observe it for some days. If it happens again, a good cleaning procedure in the batteries contacts is sometimes enough. If not, opening the calculator and cleaning the internal connections in the same battery/IO assembly with the mainboard usualy solves the problem.

I'm delving into a faulty HP41CX (that belongs to a very good e-friend of mine) for some time and I'm also in the need for some diode characteristics. Have anyone read this post and willing to help, I'd like to know the specs (or replacements) of the diodes found in the HP41CX fullnut mainboard (if I am not wrong, there are four or five diodes). Thanks in advance.

Success.

Luiz (Brazil)

Re: HP 41-CX problem

*Message #3 Posted by **Ronald** on 24 June 2004, 4:25 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I did a measurement of the startup power the half nut needs: over 400 milliampere, dropping in a second or less to 1 - 2 milli amperes as normal run-rate consumption. This means you need to have decent batteríes or it will not start up nicely.

Succes

Ronald

in response to message #1 by sreen9

Your ON switch contact may be dirty and need cleaning.

Re: HP 41-CX problem

*Message #5 Posted by **sreen9** on 24 June 2004, 2:04 p.m.,*
in response to message #4 by David Smith

It is OK now !

I entered a small program, and the 41cx got stuck with the message "packing". I removed and re-inserted the batteries, and did a "backspace+ON" and got a "memory lost". Now, I can turn it ON and OFF with the switch.

I noticed the following:

1. The 41CX never gave the "memory lost" message when it turned ON by doing "backspace+ON", just displayed the previous screen. 2. When I entered the very first program, I noticed a lot of "junk" instructions in the program memory (by doing SST).

Thanks to all for trying to help. (BTW, it is a halfnut)

David, how do I clean the switches on the 41-CX ? Can you tell me or point to a procedure ?

Sreen

Pioneer repair results

*Message #1 Posted by **Mike H** on 23 June 2004, 3:25 p.m.*

Pioneer Repair

At the request of an associate, I am posting a repair project that I did.

I purchased an HP 27S calculator eBay that appeared to have been stepped on. The previous owner tried to pry it open (screwdriver on the side ~ caveman method). The faceplate was bent up, and the 0 and 1 keys were soft.

I removed the faceplate by warming it first with a hair drier to soften the adhesive. Then starting at the already bent corner, I carefully and slowly pulled it up and completely off. I removed the adhesive by letting the faceplate soak in Windex overnight. The next day I was able wipe off the adhesive with a paper towel. I straightened out the bent aluminium with a marble rolling pin. There is a bevel in the faceplate below the plastic lens that I carefully avoided. I opened the case by removing the four top heat stakes and pulled it apart following the guidance suggest in this forum. I then removed the top PCB, but not the one over the keys. There were no cracks on the keyboard, so I soaked it in warm distilled water and worked the keys. Let the unit air dry for a day and re-assembled the unit. Using contact cement, I secured the two halves together and applied the faceplate back on. To secure the faceplate while the glue set, I used some soft foam laid on top of the keys and a book on top of the foam. The foam kept pressure on the faceplate while the glue set.

All keys were responsive and functional but 0 and 1 still were soft. The unit passes the internal self-test and keyboard test. Overall I would still say it was in fair cosmetic condition; however, it was functional and tight and it looks a lot better that it did.

71B MathROM bug list ?

*Message #1 Posted by **Valentin Albillo** on 23 June 2004, 1:07 p.m.*

Hi all:

Is there any list or information about HP-71B Math ROM's bugs ? I've never seen even one mentioned, but surely there must be some publicly known ? Any info and/or bug reports would be much appreciated.

Re bug lists, I've seen frequent requests for some existing HP-71B ROM version 1BBBB bug list, but I've never seen such a list myself. I believe there were some 50+ bugs featured, mostly having to do with user-defined functions but again, never saw that comprehensive listing. I'd be most interested to have a look at it, can somebody help ?

BTW, ROM version 1BBBB was upgraded to 1CCCC which corrected a lot of bugs, I think, but introduced a really major one (probably the worst bug the HP-71B ever had) having to do with catastrophic RAM corruption if certain kinds of variables were redefined with changed dimensions or types. So severe was this bug and so inconvenient the workaround that ROM version 1CDCC was promptly issued.

Thanks in advance for any info and

Best regards from V.

Re: 71B MathROM bug list ?

*Message #2 Posted by **Jordi Hidalgo** on 23 June 2004, 1:24 p.m.,*
in response to message #1 by Valentin Albillo

As to the 71B bug list, I believe that such a list was distributed at one of the HPCC conferences in the 1980s. There might be a copy in a back issue of Datafile and/or the conference proceedings (try searching the PPC CD-ROM set). Sorry for not being more specific.

Jordi

Re: 71B MathROM bug list ?

*Message #3 Posted by **Valentin Albillo** on 24 June 2004, 6:29 a.m.,*
in response to message #2 by Jordi Hidalgo

Hi, Jordi:

Jordi posted:

"There might be a copy in a back issue of Datafile and/or the conference proceedings (try searching the PPC CD-ROM set)."

Thanks a lot for pointing me in the right direction, I was able to locate the HP-71B bug list (no version mentioned, but I think it's for rev. 1BBBB) in a past issue of Datafile. Lots of bugs, by the way, though

I've never met any of them in (heavy) actual use. Good to know, just in case.

As for HP-71B's Math ROM's bugs, I still can't find not even a single mention, but there *must* be some !. Anyone can help ?

Best regards from V.

Re: 71B MathROM bug list ?

*Message #4 Posted by **Garth Wilson** on 23 June 2004, 3:34 p.m.,*
in response to message #1 by Valentin Albillo

I have version 1BBBB and the only bug I've found was very serious. If you you have for example in a text file that you want to transform into a BASIC file,

DIM X$[len](how many)

(instead of telling it first how many elements in the array and then the maximum string length), it will crash badly when you try to transform it, and even INIT:3 may not bring it back.

I also have HPIL module ver 1B, Math module ver 1A, and Forth/assembler module ver 1A. I've given them all a lot of use although there are plenty of functions in the math ROM I've never touched, I used my own much more powerful text editor instead of the one in the Forth ROM, and never used the assembler; but I never found any bugs in those modules. The Forth was poorly written and I wrote a lot of my own improvements and extensions without resorting to assembly. I was able to speed up a lot of Forth words just by redefining them in Forth. The results ranged from 4 to 13 times as fast.

Forth/assembler module

*Message #5 Posted by **Veli-Pekka Nousiainen** on 23 June 2004, 4:43 p.m.,*
in response to message #4 by Garth Wilson

[pre] Heyyy! Do you still have the source code? DROP LETTER to me or revealed them here (or both :) I still have my 71B & F/A ROM (VPN)

VPN wrote:

> Heyyy! Do you still have the source code? DROP LETTER to me or revealed them here (or both :) I still have my 71B & F/A ROM (VPN)

I assume you mean my own source code, since the module came with a manual but not its source code, and I didn't pay the extra for the IDS.

Ok, give me a little time. I've transfered data from 71 to PC several times before but I do it so seldom that I'll kind of have to figure out how to do it again. I should be able to get to it by the weekend. It still beats re-typing it into the PC. I don't remember how much there is.

Re: 71B MathROM bug list ?

*Message #7 Posted by **Valentin Albillo** on 24 June 2004, 6:35 a.m.,*
in response to message #4 by Garth Wilson

Hi, Garth:

Garth posted:

"If you you have for example in a text file that you want to transform into a BASIC file [...] it will crash badly when you try to transform it"

Pretty interesting, I didn't know that kind of statement was legal syntax. Most bugs have to do with weirdly changing things from inside a multi-line user-defined function (such as redimensioning the array one of whose elements you're presently assigning a value by calling that UDF, etc)

Thanks for your input and best regards from V.

Hypothetical HP 15CII or 34S

*Message #1 Posted by **westridge_cz** on 23 June 2004, 6:24 a.m.*

(The following is a repost of an earlier message, evidently Tripod.com doesn't allow remote loading of images so I had to look for another website that would allow remote loading. So here goes, hope this works...)

I was just browsing through Archive 14 when I saw a very interesting thread there for a "hypothetical HP 15CII". The picture by Chris Woodhouse is very promising. I thought I would suggest a similar idea but so as not to confuse it with Chris's idea I've renamed it the "hypothetical HP 34S". Here's a picture of what it might look like:

http://img78.photobucket.com/albums/v253/westridge_cz/hp34s.jpg

You might notice in the picture the following:

- The **ENTER** key has been brought back in the *horizontal* orientation, which in my opinion makes entry easier

- The keys are in **color-coded groups** to facilitate quick location of a desired group; **white** for the number keys, **light grey** for the stack manipulation keys, a **darker grey** for the programming keys, and **olive green** for the trigonometric keys

- The keys are of the **beveled type** used in the Woodstock and Spice series; this is so that there need be only *one legend* above each key, namely the gold legend, while the blue legend resides on the bevel; in my opinion this design should have been retained by HP because it leads to a less uncluttered keyboard appearance

- The case is of the Pioneer type, with rounded corners, which I find easier to hold than the square corners of the Voyager type

I'd appreciate hearing any comments on the design, and thanks to Chris Woodhouse for the original suggestion.

Re: Hypothetical HP 15CII or 34S

*Message #2 Posted by **Bram** on 23 June 2004, 7:35 a.m.,*
in response to message #1 by westridge_cz

* It's funny to notice that after there has been some discussion (if I remember well) about the up/down placement of the left and right shift keys on a.o. an HP-32SII (some cosider this inconsistent), you do the same thing the other way round. You seem to fancy the up/down orientation of the functions on the keys, but you use the "traditional" location of f and g prefixes.
* A more important thing is that it lacks an "F" key. The display shows hex facilities, so you'll have to be able to input a full hex number, won't you? I don't think that the F can be on top of STO, so you'll have to rearrange some keys.
* I myself would have exchanged the display and the badges. You'd be able to use A through E (F?) as a kind of function keys like the HP-20S does.
* Good thing that the display is alpha. So much easier than key codes in programming mode.
* Anything else? Well, not for the moment. You obviously borrowed the keys from a few calculators and put them together for their main functions (duplicate FRAC/INT function), so let's wait for more reactions and a new "design". anyway, it was nice having had to think about it.

Re: Hypothetical HP 15CII or 34S

*Message #3 Posted by **westridge_cz** on 23 June 2004, 8:29 a.m.,*
in response to message #2 by Bram

Hehe, you're right! I was in such a hurry to "cut and paste" together my imaginary calculator that I neglected to check for duplicate functions. :-) I think I even duplicated the x^2, 1/x, y^x, etc. Anyway, I thought the picture would be useful to those out there who wanted to get a general idea of the keyboard layout of a possible replacement for the much-reviled HP-33S. Point well taken about the lack of an "F" key for hex entry, perhaps the "F" can just replace the top "FRAC" since there's another "FRAC" anyway.

Thanks for the suggestions and comments.

in response to message #1 by westridge_cz

First impressions:

Like the format, keys, colours and 23(?) digit display. Also like the way the calc has been merged from several others. The mock-up needs a bit more thought...

Enter key too far from number keys - lots of finger travel when typing with one hand.

Eng, Sci, Fix keys not needed if menu select available.

If calc has Hex mode then A-F keys needed.

I don't use the Sigma+ key that often so could be moved to make the Enter key (which is used all the time) nearer the middle of the calc (like all other -real- HPs?)

Nice try, just needs a bit more refinement for the features it looks like it could have - again thanks for the effort and posing the question.

Edited: 23 June 2004, 7:39 a.m.

*Message #7 Posted by **westridge_cz** on 23 June 2004, 8:38 a.m.,*
in response to message #6 by Tom (UK)

Yup, I was debating whether to put the ENTER key closer to the keypad and at first I thought I'd position it where the "TAN" and "RCL" keys are located. But then I was thinking that perhaps some people who hold the calculator with two hands would be able to use their left thumb for ENTER, although I must agree that some people prefer entering both the numbers and ENTER with the right hand.

So I guess we should take a vote, how many of you would like to leave the ENTER key where it is in the photo, and how many of you would like to see it moved closer to the keypad? Let's hear your input on this folks!

in response to message #7 by westridge_cz

The real 15C provided the perferct orientation and placement of the ENTER key (i.e. vertical and near numbers). Please don't try to change it.

Britt

Keep the original 15C keyboard layout (including the vertical **ENTER**), along with your new case, display and color scheme, and this would be my idea of a *perfect* calculator!

Hmm, well I was never a big fan of the vertical ENTER key. Prior to the introduction of the Voyager series, I had gotten so used to the horizontal ENTER key on the Spice and Woodstock series that it became second nature to me. The vertical ENTER key would have been great had HP made it the right way. But if you'll notice, on every Voyager series calculator the vertical ENTER key can be clicked with maximum travel only at the upper end, whereas at the lower end it is too

firm and has barely a hint of travel. I always did find this hugely annoying and needless to say I was quite happy when the HP-32S came out with the horizontal ENTER key again, although I must admit I was never a fan of the orange-colored key legends. I haven't tried the HP-12C Platinum yet so I don't know if it suffers from the same problem (with regards to the vertical ENTER key clicking fully only at the top and not the bottom) as its other Voyager siblings, perhaps someone out there with a Platinum can tell us if the problem still exists.

There've been a few people who've posted messages saying that an alphanumeric display is preferable to the old Voyager numeric-only display (although the 16C did have a simulated, limited set of alpha).

The idea of color-coded key groups wasn't really my idea, but that's how HP calculators used to be made prior to the Voyager series. I'm hoping that HP can bring back this very useful idea, rather than investing in useless teeny-bopper fads like a chevron keyboard layout (hint, hint...)

The 12C Platinum clicks at both ends of the enter key. Although, it is a bit stiff at the lower part of the key. Keep in mind though that my platinum is fairly new, so that may be why it's stiff.

Hi,

[quote] with regards to the vertical ENTER key clicking fully only at the top and not the bottom [quote/]

The keys are on pivots. All the keys have their pivots at the bottom, and are free at the top. That is why you do not get the same "click" in the same way when pushing the bottom of the key--you have less leverage against the spring.

I just don't push it at the bottom--something a voyager user figures out.

Of course, I think the oversize enter key has nothing to do with function, and everything to do with MARKETING.

Like, why is <enter> more important than the number 3? Or the number 1? Or 0? Or +? You really don't even use <enter> as much as you think---once you are in a chain, you never touch it!

Best regards,

bill

Hello,

I am dreaming about an HP calc, what is works with negative binary/decimal system. No more CHS, no more negative numbers, no more substraction. The placevalues are 1, -10, 100, -1000, ... (or, maybe: -1, 10, -100, 1000, ...)

If you earns many money with this idea, please, give me some percents ;) (Or 3-4 HP15C)

Csaba

in response to message #1 by westridge_cz

Very nice work! I think it's much more what the pioneer series *should* have looked like (if I had anything to do with it).

One thing I find highly appealing is the contrast created using different colors for functional blocks of keys. Not only does it look nice, it would be highly user friendly as well.

I only have a couple of actual complaints (as a form factor). #1 is that the case is too long. 3"x5" will fit in a front shirt pocket. Bring it in a bit on each side and shrink the logos, that should get you there. #2 is the location of the enter key. Perhaps it wouldn't be too bad if you use a two handed technique for entry... but it's just hard to get away with it being on the other side of the machine from the numbers.

I am planning to build a few prototype cases for OpenRPN this summer to test feel and key layouts (I may give this one a shot too).

in response to message #1 by westridge_cz

Wow! Westridge! What a beautiful job!!!

But instead of running out to buy one, I'd only walk fast, because, I (and I seem to be the only one) prefer its layout orientation to be vertical, as in the Spices (34C) or Pioneers (32sII), as opposed to horizontal as you and the Voyagers (15C) have it.

I do really regret not owning a 15C, but one of the two reasons why I did not buy one was its horizontal layout (the other one being lack of funds!).

*Message #20 Posted by **Ed Look** on 25 June 2004, 5:23 p.m.,*
in response to message #19 by Chris Woodhouse

Oh, it's just a personal preference: I've been using vertically oriented calculators since high school. Thus, it is easier for me to find the keys I'm looking for, if they are not the ones I always use and have memorized their positions. Also, when I hold a vertically aligned calculator in my hands, it feels better to me and it makes it easier to use the fingertips of the same hand to press the keys and yet have a clear, unobstructed view of the display.

Incidentally, I think all LCD displays should be the older cut element type rather than today's dot matrix style; it's just easier on the eyes.

Is there a reason why some people here prefer the horizontal layout?

*Message #22 Posted by **Ed Look** on 28 June 2004, 1:31 p.m.,*
in response to message #21 by Chris Woodhouse

Ah, so.

I suppose you and the website are correct in that some of us prefer to hold the calculator in only one hand. I also suppose that if I did own a 15C, I'd probably wind up keypressing the way prescribed on the site.

I just realized another thing. The 34C was my first "serious" calculator. How do you reason away a first love? By the way, I FULLY understand "reeeeeddddd leeeeeds"! The only reason why, if I were to design a calculator, to implement LCDs would be so that, as one poster said, we won't need to have a calculator the size of a (rechargeable) four-D-cell chamber!

But, whether portrait or landscape, if it's one of those old fashioned big ENTER key, RPN, impact resistant, durable and solid-feeling key HP models, I'm all for it!

Re: Hypothetical HP 15CII or 34S

*Message #23 Posted by **Chris Woodhouse** on 24 June 2004, 7:00 p.m.,*
in response to message #1 by westridge_cz

Very nice looking design. I will have to echo what was said by OpenRPN, you need to narrow it up so you stay with in that 3 x 5 size. Also I am surprised no one has mentioned maximizing the use of vertical space and adding a second line in the display. I think that is a VERY nice feature for an RPN calculator, and am surprised that more don't have it. The enter key on the left side would be great when you hold it in your hands, because as I have said before, the best way to use a landscape layout calculator is to hold it with both hands and use your thumbs to push the keys. But if it is on your desk and you are only using one hand I don't think I would like the enter key so far away. Either way I would still prefer the vertical orientation of the enter key.

Chris W

in response to message #23 by Chris Woodhouse

Two line displays don't need to be as bulky as most people think. There is actually ample space for one in the LCD cutout on a voyager series calc... As long as you move the indicators off to one side. Doing things this way won't even sacrifice character height!

Re: Hypothetical HP 15CII or 34S

*Message #25 Posted by **Eddie Shore** on 26 June 2004, 11:10 a.m.,*
in response to message #24 by OpenRPN

I always preferred the mode indicators at the bottom of the screen, with the top part of the screen dedicated to the stacks.

i.e.: 2: 5. 1: 6. RAD XY

Re: Hypothetical HP 15CII or 34S

*Message #26 Posted by **OpenRPN** on 26 June 2004, 9:03 p.m.,*
in response to message #25 by Eddie Shore

If you stop to picture what it would look like, I think the idea of indicators off to a side of the screen would be much more appealing. I usually find them a little difficult to see, whereas numbers would still be clearly visible.

The main thing is practicality: would you rather have 2-lines plus indicators and have something so wide it won't fit in your pocket? Or 2-lines and the same size as a 1-line display?

Re: Hypothetical HP 15CII or 34S

*Message #27 Posted by **Eddie Shore** on 27 June 2004, 1:04 a.m.,*
in response to message #26 by OpenRPN

Making the font smaller for the two lines is fine, however, I don't want to squint every time I see the calculator's display.

About the size issue: three functions per key should be enough. Four (alpha) and the keyboard will be overrun (HP33S is an example).

I like to have 2nd/f/LS key for additional functions, and the 3rd/g/RS for Menus. The menus could replace the screen entirely (limited to 4-6 choices?) or have a referrence on the back of the calclulator (like the HP Voyager series had, I know the 12C does...) [I miss the days you recieved the small "cheat sheet" with your calculator...]

Hypothetical HP 15CII or 34S

*Message #1 Posted by **westridge_cz** on 23 June 2004, 4:26 a.m.*

I was just browsing through Archive 14 when I saw a very interesting thread there for a "hypothetical HP 15CII". The picture by Chris Woodhouse is very promising. I thought I would suggest a similar idea but so as not to confuse it with Chris's idea I've renamed it the "hypothetical HP 34S". Here's a picture of what it might look like:

http://westridge-cz.tripod.com/calcs/hp34s.jpg

You might notice in the picture the following:

- The ENTER key has been brought back in the horizontal orientation, which in my opinion makes entry easier

- The keys are in color-coded groups to facilitate quick location of a desired group; white for the number keys, light grey for the stack manipulation keys, a darker grey for the programming keys, and olive green for the trigonometric keys

- The keys are of the beveled type used in the Woodstock and Spice series; this is so that there need be only one legend above the key, namely the gold legend, while the blue legend resides on the bevel; in my opinion this design should have been kept by HP because it leads to a less uncluttered keyboard appearance

- The case is of the Pioneer type, with rounded corners, which I find easier to hold than the square corners of the Voyager type

I'd appreciate hearing any comments on the design, and thanks to Chris Woodhouse for the original suggestion.

Hi all,

I would actually start from the 42s rather than the 15c as a base... Valentin, if you read this don't kill me ok... :)) The 15C is a wonderful machine, but I think that the 42s was more than a worthy replacement to it: Yes, the 15C had some unique advantages (the size, weight an classy design, the matrix descriptors with names), but I would not trade them for the huge advantages of the 42s (unlimited labels to keep loads of programs, speed, alphanumeric displays of program steps and prompts, 41 compatibility). Granted, the 42s is a bit more bulkier and is not as classy as the 15C, but it can still fit in a shirt pocket and is still far less bulky than the newer 33s. I also liked the sobriety of the keyboard, and the menus which some find ennoying are very fast and clever to me... There is no way all functions of the 42s could fit on the keyboard !! I just did not like the 2-stroke alpha entry, which was not troublesome for variables thanks to the menus, but made the 42s unsuitable to keep long textes. The 41, in my view, had the right balance between accessibility and clutter, with one shift key but one alpha mode. What about starting with the 42s, and making the following changes: 1/Use the horizontal classy shape of the 15C 2/Have a direct alpha entry like the 41 3/Import the two goods unique features of the 32sii/33s world: the fraction mode, which is very unique, and the equations with multivariable solver, very useful when equations are too complex for RPN. But add editing facilities like in the 17bii/19bii world... lack of edititing capabilities is very frustrating on the 32sii/33s... 4/Add a USB port to backup and import programs from/to PC.

This would be my dream calc... Cheers, Vincent

in response to message #5 by Vincent Weber

100% agree!!

Just give the USB some kind of programmable I/O instructions, so if someone would like to design a controller, data logger, expansion box, etc., it could be done. And please also import time functions, alarms, etc. from the 41CX. Also add some units conversions.

Re: Hypothetical HP 15CII or 34S (&42SX)

*Message #7 Posted by **Guillermo Castarés** on 25 June 2004, 3:17 p.m.,*
in response to message #5 by Vincent Weber

I agree, except in one thing:

"...and the equations with multivariable solver, very useful when equations are too complex for RPN."

I like the RPN multivariable solver of the 42s. What are those "too complex equations"?

In fact I'm writing a RPN multivariable solver for HP-41C inspired on the HP-42S.

Saludos

Raul:

You can download it from www.calculators.com.ar or directly from www14.brinkster.com/planetatierra/solver.zip

I would like to know your (and others) comments.

Regards.

Re: Hypothetical HP 15CII or 34S (&42SX)

*Message #10 Posted by **Vincent Weber** on 27 June 2004, 2:34 p.m.,*
in response to message #7 by Guillermo Castarés

Hi Guillermo, Thanks a lot for your solver ! I will try it :) What I actually mean with complex equations is that if you have an equation which is long and involve a lot of variables and terms, programming it with RPN is not easy. You need to store intermediate results in registers as the 4-level stack is not sufficient anymore, and you would be much better off entering it the natural way, like on BASIC computers, Casio FX-4000P/7000G, or algeabraic expression in the HP-48 world. In that sense, the 32SII/33S does a good job, even though you cannot edit the equations once entered... Thanks and cheers, Vincent

Re: Hypothetical HP 15CII or 34S (&42SX)

*Message #11 Posted by **Martin Cohen** on 28 June 2004, 3:12 a.m.,*
in response to message #10 by Vincent Weber

Paradoxically, that is one great advantage of the 33s (probably the 32sii also, but I haven't checked): When you enter an equation as part of a program, when it is evaluated, the stack is not used, and the value of the equation is pushed onto the X register.

In this case, due to the limited stack (I prefer the unlimited version), sometimes = > enter (actually, it is nice to see them working together).

Ownership History of HP-11C

*Message #1 Posted by **Mary Smith** on 23 June 2004, 3:55 a.m.*

Is there any way to find out the original owner of an HP-11C? I am curious if you can determine if the original owner was a government or a general public owner.

Re: Ownership History of HP-11C

*Message #2 Posted by **Randy Smith** on 23 June 2004, 8:00 a.m.,*
in response to message #1 by Mary Smith

Sometimes an original owner will engrave his initials or social security number into the case. If the US government was the original owner there will most likely be some type of label on the machine or serial number engraved into the case for inventory purposes. If there is no evidence of any of this, it is likely that your 11C was originally purchased by an individual, not the government.

Re: Ownership History of HP-11C

*Message #3 Posted by **John Nelson** on 23 June 2004, 8:16 a.m.,*
in response to message #2 by Randy Smith

Talk to the calculator... sometimes they will answer back.

:)

Re: Ownership History of HP-11C

*Message #4 Posted by **Chan Tran** on 23 June 2004, 3:45 p.m.,*
in response to message #3 by John Nelson

You may have to resort to torture to get the info out of the calculator. I am not sure if it's legal. Many original owners registered their purchases with HP. HP should have this info but I doubt that you can get it out of them. (May be you can torture .....)

Re: Ownership History of HP-11C

*Message #5 Posted by **db(martinez,california)** on 23 June 2004, 7:10 p.m.,*

How to open up an HP-28C

*Message #1 Posted by **John Nelson** on 22 June 2004, 5:45 p.m.*

Anyone know how to open up a 28C? I am having problems when I turn mine on, it goes off or flickers. I find that if I squeeze the top portion a bit (front to back) it fixes things, so I'm thinking something must be loose inside.

I would think you would need to take the four rubber pads off the back and then there might be screws or something.

Also, is there something I can use to replace the rubber pads? I hate to take them off, but this is driving me buggy.

Thanks!

Re: How to open up an HP-28C

*Message #2 Posted by **Randy** on 22 June 2004, 7:24 p.m.,*
in response to message #1 by John Nelson

Peeling the feet will reveal nothing.

Repeat of a previous post (with modifications):

Open it you can, repair is very questionable.

Opening a 28 is for all practical purposes, a non-reversible procedure. Kinda like a calculator post mortem. Reminds me of the Monty Python skit where John Cleese says "I can't take him, he's not dead yet." But he will be. It's time to bury your 28C.

If you want to have a look-see and assuming you are working on the right side:

Peel off the 28C label at the top of the unit and then peel off the label surrounding the keyboard. Most likely, several small plastic rivet heads will fall out. Those broken rivets are your only problem. The ones that don't fall out, drill out by hand by rotating an appropriately sized twist drill until the head of the plastic stake releases. Once they've all been removed, the case halves will separate.

There is no good way other than gluing to reassemble. Some have mentioned small screws or bolts to hold the halves together.

Good luck.

The most common problem I've encountered is a loss of a row or column on the keyboard. It is caused by internal case part failures, you'll see the cause should you open yours. The plastic pins that hold the front and back case halves together break off and allow the case to separate, breaking the connection between the keyboard and logic board. If you press down along the raised bottom edge of the case, below the LCD, you can usually get the unit going again but it's only temporary.

bring back HP15c

*Message #1 Posted by **John** on 22 June 2004, 3:59 p.m.*

"bring back HP15c" petition to HP http://hp15c.org/

Re: bring back HP15c

*Message #2 Posted by **Namir** on 22 June 2004, 6:32 p.m.,*
in response to message #1 by John

For HP to budge we need to make a commitment to pay upfront for a high number of calculators (and 3500 machines IS NOT a high number). And WHAT IF HP does NOT MAKE THE NEW HP-15C IN THE SAME QUALITY (LCD DISPLAY, FONTS, KEYS, and so on)???

We need a Howard Huges to take on such a project and order a high number of 15C and then he sells it to us.

OTHERWISE .... LET'S GET REAL ... BUY 15C FROM EBAY!!

Database for HP-41 modules

*Message #1 Posted by **Matthias** on 22 June 2004, 3:50 p.m.*

Hi

I´m working hard on my promised database for HP-41 modules. Up to now I programmed a database including the following informations:

- Name of the module (finished) - Number of the module (finished) - Distributor of the module (finished) - ROM versions of the module (finished) - Description of the module (not even realised) - Scan of all overlays of the module (not even realised, will be done next days) - Scan of the Quick reference Card of the module (not even realised)

Now, before I finish the database I would like to know, that information you also want to get in the database. Please let me know fast, as you can see I´m working fast on this project.

Matthias

Database for HP-41 modules

Re: Database for HP-41 modules

*Message #3 Posted by **Wilson (Bill) Holes** on 22 June 2004, 6:43 p.m.,*
in response to message #1 by Matthias

Hi Matthias,

FWIW, I believe John's (John Panagotopulos) original message (41 Accessories) eluded to wanting a list of everything that was "included in the box" of each accessory. To be complete your database should include manuals (Title, version, and date), manual addendums (same), and anything else that may have been included. Maybe also a scan or photo of the box itself - just to make it really complete.

I also interpreted John's message to include accessories other than modules as well (i.e., wand, card reader, printers, etc. etc.).

That all for now... keep up the good work!!!

Best, Wilson

Re: Database for HP-41 modules

*Message #4 Posted by **John Panagotopulos** on 22 June 2004, 8:25 p.m.,*
in response to message #3 by Wilson (Bill) Holes

Wilson,

Your interpretation was correct, but I must say, the database Matthias is working on looks like it will be quite good. I think he will more than meet the need in this area.

Re: Database for HP-41 modules

*Message #5 Posted by **Wilson (Bill) Holes** on 22 June 2004, 10:40 p.m.,*
in response to message #4 by John Panagotopulos

John,

Thanks for confirming my interpretation. I agree that the database looks quite good and will surely prove to be a great resource for everyone.

I also know that Matthias wants the database to be done right (his words) so I've been trying to help ensure it becomes the best it can be. I'm also trying to help ensure nothing gets missed or lost in the translation.

Best, Wilson

Re: Database for HP-41 modules

*Message #6 Posted by **Matthias** on 23 June 2004, 12:42 a.m.,*
in response to message #5 by Wilson (Bill) Holes

Last night I scaned all my overlays I have, so today I will work on the scans and then I will include them into the database. I´m having a small fight wiht my MS Access someone can probably help me, so that I can go forward faster: I reserved a (one!) so called OLE-Object for displaying the scans directly in Access. This field has a fix size (let´s say 800x600). I do not know, how to handle modules with more than one overlay. I would like to programm is so that you can switch between the overlays in your database mask. Otherwhise I will have to downsize these overlays, so that they fit into the OLE field, but then you will get a image that is a little bit small... How can I manage this?

Matthias

*Message #7 Posted by **Veli-Pekka Nousiainen** on 23 June 2004, 2:06 a.m.,*
in response to message #6 by Matthias

Do you mean that you want to have a separate table for many pictures of the same product?
You need a primary-secondary key pair -table, too.
You may e-mail me the current database and I see what I can do (if anything)
DROP LETTER to vpn

Relational Database for HP-41 modules

*Message #11 Posted by **Raymond Del Tondo** on 23 June 2004, 5:26 a.m.,*
in response to message #10 by Ángel Martin

I'd vote for a table for the XROM entries.

Following is an excerpt of two tables which could
form the basis for a relational database of ROM pacs.

Since there are more than one module with the same XROM number (XR_ID1),
you'll need a three-fold primary key for the table XROM.
Note that there are pacs with more than one customer order number,
like the X-Functions module.
Each of these has it's own record in the PRODUCT table.

Like this:

```
CREATE TABLE PRODUCT
PROD_ID1 VARCHAR (12) PK ; This field is the customer order#
PROD_ID2 VARCHAR (12) AK ; HP internal reorder number
----
TITLE VARCHAR (80) ; The product title
...
...
XR_ID1 FK ; These both fields together relate to all XROM
XR_ID3 FK ; entires for this ROM pac

PRIMARY KEY (PROD_ID1)
FOREIGN KEY (XR_ID1,XR_ID3) REFERENCES TABLE XROM
;

CREATE TABLE XROM

XR_ID1 SMALLINT PK ; (0-31)
```

XR_ID2 SMALLINT PK ; (0-63)
XR_ID3 SMALLINT PK ; (0-n) This holds a counter

FcnName VARCHAR (12) ; Fcn names can be more than 7 chars
Description VARCHAR (80)

PRIMARY KEY (XR_ID1,XR_ID2,XR_ID3)
;

Note this is not real creation code, it only shouldd
give an idea where to start, and where to go.

It has to be refined, and syntax has to be adjusted
for a real world SQL database, like ORACLE, or SQLBase...

Any questions? Feel free to ask;-)

Raymond

Re: Relational Database for HP-41 modules

*Message #12 Posted by **Chris Catotti (Florida)** on 30 June 2004, 1:01 a.m.,*
in response to message #11 by Raymond Del Tondo

Good job Matthias! I had hoped to do a project like this, but have become overwhelmed with other projects, and would love to help in any way I can.

I had originally hoped to build a database that included each module's functions and programs, with XROM numbers and names of the FUNCTIONS or PROGRAMS associated with each XROM number. This has changed with various modules, such as MATH A, B, C and D revisions. Also possibly listing the lower three digits (hex) where the functions are located. This is a LARGE TASK, with perhapslittle use or interest.

An elusive item I have yet to positively identify is two slightly different versions of software that did not actually get assigned different ROM versions, such as mentioned in "Extend Your HP-41" by W Mier-Jedrzejowicz, pages 639 - 642.

If you are listing accessories in a boxed module, you may want to include the numbers for various languages (English, Spanish, German, French, etc.). Most boxes included an errata card that went with the owners manual. Sometimes overlays had a stock number prined on them.

I do not know if it will be of much use, but i will try and clean up my document part number list (MS Excel) that I have been using for a few years.

Best Wishes,

Chris.

ERAMCO MLDL @ Ebay

*Message #1 Posted by **Jean** on 22 June 2004, 1:13 p.m.*

there is one of the greatest HP41CX items at ebay a ERAMCO MLDL !

http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&category=9972&item=3822984441&rd=1&ssPageName=WD2V

Re: ERAMCO MLDL @ Ebay

*Message #2 Posted by **Ronald** on 22 June 2004, 2:40 p.m.,*
in response to message #1 by Jean

Hi,

Is this really special and rare in other words as collector a "must have item" ? or does it appear more often on Ebay, in this forum ?

Ronald

Re: ERAMCO MLDL @ Ebay

*Message #3 Posted by **Jean** on 23 June 2004, 2:52 a.m.,*
in response to message #2 by Ronald

it is absolutely rare. the last I saw about 2 years ago. it is a must-have for machine code users and for collectors. it is maybe the first MLDL (machine language development lab) that has been issued for HP-41C.

Re: ERAMCO MLDL @ Ebay

*Message #4 Posted by **Massimo (Italy)** on 23 June 2004, 4:50 a.m.,*
in response to message #3 by Jean

Not anymore.
May I suggest Clonix and NoVRAM modules from Diego?

I have both and find them invaluable: they are compact and powerful.

Yes, I own an Eramco MLDL too...

Massimo

Re: ERAMCO MLDL @ Ebay

*Message #5 Posted by **Ronald** on 23 June 2004, 6:06 a.m.,*
in response to message #4 by Massimo (Italy)

It still keeps me amazing how much was invented on the HP41 and how long develolopment continues even after HP made them a long long time ago obsolete from a production perspective.

For me Eramco and MDDL was something from the past, collecting dust in my memory.

Re: ERAMCO MLDL @ Ebay

*Message #6 Posted by **Meindert Kuipers** on 23 June 2004, 2:00 p.m.,*
in response to message #4 by Massimo (Italy)

And do not forget my MLDL2000 (last bug just fixed).

And I do have the Eramco MLDL, a smaller rombox and the W&W Rambox in my collection.

Meindert

Actually not all that rare. They seem to appear every few months.

Re: ERAMCO MLDL @ Ebay

*Message #9 Posted by **J.D.Clemens** on 23 June 2004, 12:11 p.m.,*
in response to message #8 by David Smith

where do they appear??? I have a search tool also for them on ebay but they do NOT appear ? I never have seen one for one year that I am scanning. Have you examples of last sells?

Re: ERAMCO MLDL or NoVRAM

*Message #10 Posted by **Christoph Klug** on 25 June 2004, 3:39 a.m.,*
in response to message #9 by J.D.Clemens

Hi HP41 mcode enthusiasts

the new NoVRAM from Diega Diaz is the modern replacement unit for the Eramco MLDL. The NoRAM includes the HEPAX operating system plus 8KByte additionally ROM plus great 16KByte RAM. All this is housed in a standard sized HP41 plug in module shell. Last not least the price for this is absolutely fair. Really great work from Diego Diaz :-))

Regards - Christoph Klug

in response to message #10 by Christoph Klug

Right! It really is wonderful.

Now I shall check with Meindert for an MLDL2000... :-)

Massimo

Stupid question...Re: ERAMCO MLDL & NoVRAM & MLDL2000

*Message #12 Posted by **Gene** on 25 June 2004, 10:37 a.m.,*
in response to message #11 by Massimo (Italy)

1) Where does one buy the programmer? How much does one of those cost?

2) The new modules from Mr. Diaz give us ?

a) the HePAX rom b) 16K of ram that the HePAX functions can address, which give us the ability to 1) Copy programs to the HePAX ram, 2) Run them from there? 3) and ? c) an additional 8K of ROM space that can be programmed / loaded with rom images using the programmer mentioned above

and all in one module housing?

What have I missed?

and where do I buy a programmer? :-)

Gene

> where the programmer thing is purchased

Gene, I thought the programmer was easily visible on the ad I mentioned:

> Quote:
>
> NoVRAM module:..... 175Euro.
>
> Clonix-41 module:..... 120Euro.
>
> Programmer-adapter set:.. 25Euro

Since it comes preprogrammed you could even avoid buying it **but** I'd take it anyway: you could need it in order to fully reset the module to a known state.

Greetings,
Massimo

*Message #19 Posted by **Diego Diaz** on 26 June 2004, 7:57 p.m.,*
in response to message #12 by Gene

Hi all,

Please excuse me for the late reply, I didn't realized this thread turned into such questions on my project.

Gene, you're right in your appreciation, but the list is not comprehensive since the NoVRAM module is intended to be a multi-purpose RAM-Box. Thus allowing to replicate whichever other RAM-Box previouly manufactured.

So it can handle *any* configuration provided:

a) you keep the 24K ROM and 16K RAM limits and...

b) don't make any illegal config such as using modules with the same XROM nr. or exceed the number of pages a 41 system can handle.

In fact I'm now working in two directions, first trying to finish the User interface programming utility to allow free user access to the remaining extra 8K ROM. (Currently I have to program them from "factory"... so speaking :-) and second, trying to build the code for a new NoVRAM-based project that will include a double extented memory module, it will require reducing the HEPAX-like RAM to 8K though.

Further more, considering NoVRAM is *loaded* with non volatile RAM it'll also be possible to built a 10 pages ROM-like module.

Obviously I haven't had time enough to produce all the required code for such a "huge" amount of possibilities, but I thought the HEPAX emulation is, on its onw, a very good first step for offering to the HP-41 community.

Please do not hesitate in mailing me with your questions or comments.

Best wishes from the Canary Islands.

Diego.

PS: You can have a look at some of the projects development steps at:

*Message #25 Posted by **Ronald** on 29 June 2004, 6:39 a.m.,*
in response to message #24 by Massimo (Italy)

SO it is bassically collector sentiment what determines the price. On the other hand when comparing a device now 20 years old to the present NoVRAM is also comparing apples and pears.

I think it was at that time absolutely a miracle to make a thing lke that as it it is today to have the NoVRAM. Both are developed by a few individuals with no large HP Labs back-up.

my 1/2 cent

Re: ERAMCO MLDL @ Ebay

*Message #26 Posted by **Massimo (Italy)** on 29 June 2004, 8:12 a.m.,*
in response to message #25 by Ronald

> Quote:
>
> SO it is bassically collector sentiment what determines the price.

Exactly, since now you have alternatives in order to achieve the same result.

> Quote:
>
> On the other hand when comparing a device now 20 years old to the present NoVRAM is also comparing apples and pears. I think it was at that time absolutely a miracle to make a thing lke that as it it is today to have the NoVRAM. Both are developed by a few individuals with no large HP Labs back-up.

Right again.

My point is that you don't need to pay such inflated prices anymore if your intent is to USE the thing.

But many among us are collectors and this is another story (I have an Eramco as I wrote before).
You will concede that not having to carry such a bulky device is a great achievement...

Greetings,
Massimo

HP11C ghosting of digits

*Message #1 Posted by **Stephen Lay** on 22 June 2004, 10:45 a.m.*

My HP11C is showing ghosting of the digits when viewed from an angle ie 2 looks like 6 and 5 looks like 9. Is this a common problem and is there a cure? (serial no 2208A03826)

Re: HP11C ghosting of digits

*Message #2 Posted by **Randy** on 22 June 2004, 5:46 p.m.,*
in response to message #1 by Stephen Lay

It's a bad LCD. Will require replacement from a similar date code machine. You're lucky in that it is an early two board model which means you will not need to remove the keyboard for access. The logic module/LCD are seperate and can be removed without cutting plastic rivets.

What makes a good eBay seller?

*Message #1 Posted by **Emmanuel Verbeeck** on 22 June 2004, 6:01 a.m.*

I am planning to switch from being a "simple" buyer on eBay (with great success, may I say, in finding vintage HP calculators in good shape and at a reasonable price) to becoming a seller, mainly for calculators/manuals/accessories that I have in multiple samples.

The criteria that I use as a buyer, to determine wether I will do business with an eBay seller, are the following :

-- The seller has a globally positive feedback history, with at least a dozen sales, and a percentage of returning customers;

-- The seller accepts online payements such as Paypal, Western Union, or international bank transfers, as opposed to cash-in-an-envelope, checks, or local pickup;

-- The seller accepts to sell internationally, at least to "secure" countries (why on earth are there so many Americans that don't seem to know there is a world outside the USA...);

-- Good, crisp, detailed pictures are displayed, and show the minor defects without "forgetting" to mention them, including batteries compartments, self-test results, slipcase, manuals, yellowing, etc...;

-- The seller answers my (reasonable) mail questions within 24hrs;

-- Reasonable shipping costs, delays, and strong packagings are promised (I had several cases, as a buyer, where shipping prices were grossly expanded to compensate for a cheap auction price);

-- English is used as the auction language, as a convient worlwide communication tool.

Do you think that following the above good practices will help me start my seller activity on eBay? Do you have any other recommendations, or pitfalls, or warnings, to suggest?

Thanks!

Emmanuel

Re: What makes a good eBay seller?

*Message #2 Posted by **Matthias** on 22 June 2004, 6:38 a.m.,*
in response to message #1 by Emmanuel Verbeeck

I would add:

- In the auction text there is no flowery phrase like "sold-as-is", "no return", ... - After the item has arrived, the seller asks, if the buyer is satisfied. Otherwhise the seller is appealed to fix a problem.

Re: What makes a good eBay seller?

*Message #3 Posted by **Dave Shaffer** on 22 June 2004, 10:38 a.m.,*
in response to message #1 by Emmanuel Verbeeck

While accepting paypal, etc. is good for a seller, there is generally no reason NOT to accept cash (at buyer's responsibility for safe delivery), or checks (with a wait-till-it clears mode) or local pickup as payment options.

I believe a good seller should post immediate positive feedback upon receipt of payment, not upon receipt of positive feedback from the buyer. Once the buyer has paid, he has properly fulfilled his part of the bargain.

Good pictures are important. Stress that they are of the actual item.

Re: What makes a good eBay seller?

*Message #4 Posted by **Arnaud Amiel** on 22 June 2004, 10:55 a.m.,*
in response to message #1 by Emmanuel Verbeeck

When you intend to sell systems that connect to the mains, battery chargers for instance, it is important to specify the voltage and type of socket it is designed to work with. If you leave in Europe, this will avoid you receiving complaints from US buyers who fry their calcs. The best of course is to have 110/240V chargers!

Arnaud

Re: What makes a good eBay seller?

*Message #5 Posted by **Chris Woodhouse** on 22 June 2004, 11:40 a.m.,*
in response to message #1 by Emmanuel Verbeeck

I'm not going to disagree much with what you said, but I will expand on it a little.

> Quote:
>
> -- The seller has a globally positive feedback history, with at least a dozen sales, and a percentage of returning customers;

You don't want to take that to the extreme I have heard from some people who refuse to buy from an eBayer who has ANY negative feed back. I have bought from eBayers who's feed back numbers are in the thousands, frankly if they didn't have one or two negatives I would more suspicious than if they did. If you have sold something to thousands of different people it is almost inevitable that you have run across at least one moron that won't be satisfied unless the product arrives at their door 10 minutes after the auction ends and in a condition such that you couldn't find a scratch with an electron microscope.

> Quote:
>
> -- The seller accepts online payements such as Paypal, Western Union, or international bank transfers, as opposed to cash-in-an-envelope, checks, or local pickup;

I had an auction once where I said I would deliver the item to anywhere with in 100 miles of Oklahoma City, or they could arrange their own shipping. Only because the item wasn't worth what it would cost to ship it and it was too big for UPS or FedEx, but not for the bed of my truck.

> Quote:
>
> -- The seller accepts to sell internationally, at least to "secure" countries (why on earth are there so many Americans that don't seem to know there is a world outside the USA...);

> Quote:
>
> -- Good, crisp, detailed pictures are displayed, and show the minor defects without "forgetting" to mention them, including batteries compartments, self-test results, slipcase, manuals, yellowing, etc...;

Someone recently asked me if I had a 15C I was willing to part with for a reasonable price. I told them I had one fairly bad condition I would part with and gave them these photos so they could see the condition. That is the level of detail I would like to see but seldom do.

{quote] -- Reasonable shipping costs, delays, and strong packagings are promised (I had several cases, as a buyer, where shipping prices were grossly expanded to compensate for a cheap auction price); [/quote]

It is obvious that some sellers just find junk that they can get for next to nothing that they think will sell for next to nothing and then add $5 to the shipping cost to make money.

Chris W.

*Message #6 Posted by **Chan Tran** on 22 June 2004, 1:51 p.m.,*
in response to message #5 by Chris Woodhouse

I tend to find seller locally and would be quite happy if he/she doesn't want to ship the item as I have better chance of winning the item. I have encountered seller who doesn't want to me to pick the item up at his location. In such case, I refused to complete the purchase.

Re: What makes a good eBay seller?

*Message #7 Posted by **Bill Wiese** on 22 June 2004, 1:52 p.m.,*
in response to message #5 by Chris Woodhouse

Well I have to add my comments...

- I just won't sell anything outside the USA/Canada. Too much hassle. When I sell something on EBay it's to get rid of it and recover a bit of $, not a real profit-generating enterprise. And I've had 3 European + 1 Asian buyer flake after winning the bidding. So if I burn up an hour of a getting a funky deal squared away, there goes $70 of my time (and thus essentially negating any recovered cash from sale for typical small amounts...) I do have some limited protection (mostly in the form of prosecution) against fraud when dealing with US citizen, but nothing for outside the US. I know what a good check or money order is supposed to physically look like. (By contrast, I don't like to accept cashier's/bank checks due to recent forgery concerns.)

- Many folks don't like PayPal because they can suck money from your bank acct, card etc. at seemingly random times, not associated with a purchase. I'd rather just take a check or money order from someone, hold it till it clears, and send the widget. [Additionally I don't like PayPal's demonization of legitimate firearms owners w.r.t buying & selling firearm parts, so I further hesitate to do biz with a company that'd like to see these rights of mine eliminated.]

- I always provide detailed, complete and accurate descriptions and functional items. But when selling electronic devices or complex widgets (esp w/things like ham radio gear or gun parts) I don't know what the doofus on the other end did to it when he got it. Did he try to transmit without an antenna?? (i.e., power into no-load situation burns up final amplifier) Did he blow up the gun barrel with a bad handloaded round? etc etc. So I really don't wanna be the insurer for the buyer's possible idiocy. When I have placed

an item on EBay (not for quite awhile now) He is well warned as such, though, in my EBay ad listing.

Hi, VPN, I got my HP 15 C in Germany for less than 100 € incl. a proper manual in German - exactly what I wanted. In my opinion HP 15 C in USA is somewhat overpriced. So be patient, keep on looking ... and good luck!

Hyvää päivää (or similar)

Walter ;o)

P.S.: I've won several calculators at ebay.com and have met many nice people there. And it's a great big country, no doubt! However, I had the feeling in some other cases, US people didn't want to sell "high tech" (of former decades) outside the USA - while on the other hands supporting ambiguous captains there they wish to shoot down a few years later. In the average, I think you can't expect too much of people not having left their home country once, not knowing another single language besides their mother tongue, and having difficulties to find countries on the globe. But that's a longer topic ...

Please elaborate RE: PayPal vs. Gun Owners

in response to message #10 by Wayne Stephens

Acoording to the paypal site "You may not use PayPal to sell any firearm manufactured after 1898. Certain related items and high-capacity ammunition magazines are also prohibited, as described in more detail below. In addition, it is the responsibility of users to abide by all applicable laws when dealing with the sale of permitted antique firearms, ammunition, replicas, militaria and other associated items."

This is the same as eBay policy.

HP-02: Dave, can you follow-up on this?

*Message #5 Posted by **Matt Kernal (US)** on 25 June 2004, 12:54 p.m.,*
in response to message #4 by Renato (Brasil)

Dave,

The article Renato refers to here (previous post) is VERY intriguing! The rewarding career Happy Holden had with HP (in its heyday) is more than fascinating.

I my mind, I imagine you, being the curator of this wonderful museum, might have a greater impact (more

so than the rest of us here) in asking HH if would be interested in having some of his treasures (in his calculator box) being put on display here.. especially that HP-02 LCD watch? He also mentioned lots of calculator parts that never made it to market. I would hope such a request would honor him.

I haven't tried contacting him. I am hoping some interest could be stirred up here first, so Happy would know there are a bunch of folks that are envious and appreciative of his role in helping to produce the calculators we discuss here everyday, and that we would love to see (and hear even more details about) the fruits of his labor.

If this sounds feasible, Dave, I for one, would be most appreciative to hear your thoughts on this. If there is anything I can do to help, just say the word.

Matt

Backgammon for the HP-67?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 21 June 2004, 9:41 p.m.*

Last summer I purchased an HP-67 at an estate sale. Among other items included with the calculator is a magnetic card pack labelled Backgammon. There are 36 cards in all. The cards all bear dates from 3.25.77 to 2.12.78. Cards bear labels from PGM LOGIC 1 through PGM LOGIC 5, Filling Home Base, Mask, Locke I/P Data and Locke Prgm. The remaining cards have some sort of seven digit code in formats such as 3 316103, 0 432330, etc. No instructions for playing the game accompanied the calculator. I am hoping to find someone who can provide the instructions.

The estate sale was held in Hendersonville, North Carolina. The previous owner of the HP-67 was David C. Blundell. Another magnetic card pack includes cards labelled L1011 vs DC10 and Sabreliner Drag. I concluded that Mr. Blundell had worked in the aircraft industry. I called the American Institute of Astronautics and Aeronautics (AIAA) and asked if they had any information on Mr. Blundell. Their records show that he is deceased, his retirement home was in Hendersonville, and that he had been a member of the Southern California section of the AIAA. Can anyone help with locating the instructions?

The following is the listing of the contests of the card labelled "Filling Home Base."

000 001 31 25 11 LBL A 002 00 0 003 33 00 STO 0 004 33 01 STO 1 005 33 02 STO 2 006 33 03 STO 3 007 33 04 STO 4 008 33 05 STO 5 009 33 06 STO 6 010 33 07 STO 7 011 33 08 STO 8 012 33 09 STO 9 013 32 25 11 LBL a 014 34 09 RCL 9 015 34 14 RCL D 016 32 61 xNEy 017 31 22 00 GSB 0 018 84 R/S 019 22 05 GTO 5 020 35 22 RTN 021 31 25 00 LBL 0 022 35 73 pi 023 34 12 RCL B 024 61 + 025 05 5 026 35 63 y^x 027 32 83 FRAC 028 33 12 STO B 029 06 6 030 71 x 031 31 83 INT 032 01 1 033 61 + 034 35 33 ST I 035 32 34 ISZ (i) 036 01 1 037 33 61 09 STO+ 9 038 22 31 11 GTO a 039 35 22 RTN 040 31 25 05 LBL 5 041 31 42 P<>S 042 01 1 043 00 0 044 35 33 ST I 045 34 24 RCL (i) 046 33 00 STO 0 047 31 22 06 GSB 6 048 33 01 STO 1 049 31 22 06 GSB 6 050 33 02 STO 2 051 31 22 06 GSB 6 052 33 03 STO 3 053 31 22 06 GSB 6 054 33 04 STO 4 055 31 22 06 GSB 6 056 33 05 STO 5 057 31 22 06 GSB 6 058 33 06 STO 6 059 31 42 P<>S 060 09 9 061 35 33 ST I 062 00 0 063 33 24 STO (i) 064 35 22 RTN 065 31 25 06 LBL 6 066 31 34 ISZ 067 34 24 RCL (i) 068 31 84 -x- 069 35 22 RTN 070 84 R/S

Why did HP get rid of stack clear?

*Message #1 Posted by **Tom** on 21 June 2004, 4:46 p.m.*

Has anybody noticed that HP rpn calculators no longer have a simple stack clear command? This was a function that would clear all four registers of the stack. They used to have that on the HP 21, 25, 27, 31E, and the 33E/C. On the 11C and 15C you could fake the stack clear by hitting clear sigma but that would clear the stat registers as well. However on the 32S and 32SII it gets confusing because clear sigma only clears the stat registers but doesn't clear the stack. Even the new grotesque-looking monstrosity with the atom-sized decimal point called the 33S doesn't have a stack clear command. What happened to HP, why is their design getting lousy?

Re: Why did HP get rid of stack clear?

*Message #2 Posted by **Bram** on 21 June 2004, 5:06 p.m.,*
in response to message #1 by Tom

> Quote:
>
> Has anybody noticed ...

I have.
HP-21 has a clear stack command and my second model, HP-29C, has not. I then thought it 100% plausible to get rid of it, because understanding RPN, I knew that CLR has no use at all. Even in program mode I cannot possibly think of a situation where CLR would be handy.
OK, I must confess that I sometimes used the keystroke when "learning" RPN and hence examining the stack contents, but just because the command was there. Wouldn't it have been, I'd have used 0 enter enter enter instead.
By the way, HP-29C's clear sigma command only clears the stat registers and not the stack. I think that's the only right way to do. I'm surprised that some others do otherwise. Now *thats's* confusing, isn't it?

Right, however (p. 44 of the Owner's Handbook): "When the calculator is switched on, the Y, Z, and T registers are cleared to 0.00. The X-register is maintained by Continuous Memory."

You pratically had a CLST (except for the X register) each time you switched off then on the calculator.

This leads to an(some) obvious question(s): why did they preserved only X? So you knew that your last result was not lost? Was it marketing for the (then) new Continuous Memory?

A couple pages later (under "Clearing the X-Register"): "Altough it may be comforting, *it is never necessary to clear the diplayed X-register when starting a new calculation.*This will become obvious when you see how old results in the stack are automatically lifted by new entries."

I think this is the key: comfort.
Like starting a new calculation on a blank page. You could always use some free space on a previous page or a margin but all that white space easies the task.
Isn't it?

That said I must confess that my standard housekeeping routine on each of my 41s includes a CLST besides flag settings and the like... I love all those zeroes! :-)

Greetings,
Massimo

Re: Why did HP get rid of stack clear?

*Message #6 Posted by **Garth Wilson** on 21 June 2004, 5:23 p.m.,*
in response to message #1 by Tom

What do you use the "clear stack" instruction for? I suppose I've used my 41cx well over 1000 hours in the last 18 years and didn't know it had such an instruction until I checked just now, because I've never needed it. Part of the idea and efficiency of a stack is that you don't care what's beyond the levels that are relevant at the moment. Sometimes it would be nice if there were at least a couple more levels though, making 6 or more. This would be more useful for programming than for hand calculations though.

Re: Why did HP get rid of stack clear?

*Message #7 Posted by **Karl Schneider** on 22 June 2004, 2:37 a.m.,*
in response to message #6 by Garth Wilson

"CLST" was a useful command, I think, primarily in programming in order to ensure "causality" (same inputs, same algorithm, and same initial state ==> same outputs every time) in programs that might utilize stack operations while assuming an initially empty stack.

(Certainly, 0 ENTER ENTER ENTER in "interactive mode" is easier than executing CLST from the 42S CLEAR menu or XEQ "CLST". However, CLST is a cleaner program instruction.)

The reason CL_Sigma did a stack clear on the pre-Pioneer RPN HP's was to help prevent sabotaged calculations of standard deviations caused by debris data in the y-stack when subsequently entering stat data. These calc's automatically performed Y-variable summations using the y stack values, and always calculated SD for Y-variables as well, whether or not 2-variable statistics was being performed.

The 32S/32SII/33S, however, allows the user to calculate X-variable and Y-variable statistics separately. Thus, bogus Y-data that was inadvertently utilized cannot bollix the SD calculations. So, clearing the stack beforehand is not of utmost importance; and, there's no room for "CLST" unde the CLEAR menu, anyway...

Alles klar? Probably not... ;-)

Re: Why did HP get rid of stack clear?

*Message #8 Posted by **Ángel Martin** on 22 June 2004, 3:50 a.m.,*
in response to message #6 by Garth Wilson

A beautiful application of CLST is with the MMOVE function, to move matrix elements from one matrix to another. In such instance, CLST is the predifined boundary conditions for element selection.

Best, ÁM

Re: Why did HP get rid of stack clear?

*Message #9 Posted by **Chris Woodhouse** on 22 June 2004, 11:21 a.m.,*
in response to message #1 by Tom

WARNING: the opinions expressed below are those of a very opinionated poster. The readers may not agree with all or any of them, but they should ;)

Regardless of whether or not a 4 level stack HP RPN calculator has a Clear stack function, you can't ever "REALLY" clear the stack. All that you can and all that the function does is set every element to zero. Having zero in a register when you think something else is there is no worse than having any other value. Either way the calculation is going to be wrong. Your best solution when that happens is to use the last X function. It is an extremely bad idea for a program assumes there will always be zeros in the stack, if it does, it should to be re written. The only purpose a clear stack feature has is to give you that nice warm fuzzy feeling my calculus professor used to talk about :)

Chris W

```
Yes, but if you accidentaly press another basic operation key you certainly get an
interesting error:
Stack filled with zeroes, pressed operation one time more:
[ + ] nothing happens
```

```
[ - ] negative taken, [CHS] can correct this
[ * ] zero => LASTX
[ / ] zero => LASTX
[Y^x] zero => LASTX
BUT
if you have something else dropping down from the T-register, the wrong result may go
unnoticed

Opinions?
(VPN)
```

> Quote:
>
> Having zero in a register when you think something else is there is no worse than having any other value.

Actually, I think it's *better* to have zero rather than some other value in stack registers you don't plan to use. I'm going to quote myself here, from a previous message I posted in May on this subject:

"If you make a mistake (like hitting an operator key once too often) then having zeros in the stack levels immediately above your calculations can be useful. Some operations (like addition and subtraction) have no effect with zero, while others (like multiplication and division) give very obvious errors with zero. For instance, if I accidentally multiplied 4832564.23565 by 0.1 I might not notice the difference, but I certainly would notice if I multiplied it by 0. So I'd rather not have any non-zero numbers on the stack that aren't part of whatever I'm doing at the time."

What use is stack clear?

Re: Why did HP get rid of stack clear?

*Message #13 Posted by **Richard Garner** on 26 June 2004, 11:15 a.m.,*
in response to message #12 by Fred

It is very useful when you want to start running through calculation from a known state without having to do a master memory clear. I am not that much of a game person, but if you are running a game program that supports multi-players, a clear stack command is handy to keep others from seeing what you have just entered.

Playing Devil's Advocate here, what is the use of a clear register command? Couldn't you just go 0.0000 store 01, 0.0000 store 02, 0.0000 store 03 etc. in programs when you need to clear the registers.

I consider Clear Stack and Clear Registers to be very useful command and use them all the time, especially in programs when I need the calculator to be in a known state before proceeding.

I want to put graphic in my program??

*Message #1 Posted by **Harrington** on 21 June 2004, 2:26 a.m.*

Do you know of any program that will be a help ?? what I want do do is to draw schmatic to my program EX l;ike a circuit or a truss??

Re: I want to put graphic in my program??

*Message #2 Posted by **Raymond Del Tondo** on 21 June 2004, 6:21 a.m.,*
in response to message #1 by Harrington

Have you considered to take a look into the user manual?

There you'll find all graphic related programmable functions.

Else: www.hpcalc.org , and the suitable newsgroup is: comp.sys.hp48 .

Re: I want to put graphic in my program??

*Message #3 Posted by **Eddie Shore** on 21 June 2004, 9:13 a.m.,*
in response to message #1 by Harrington

To get you started:

1. Get the Plot Menu (81 MENU) [or you can type the commands], hit the ERASE command. This clears your "graphics" screen.

2. On the graphics screen, use EDIT to access your drawing tools. The Mark (*) gets a little of used to, so you may have to draw your diagram a few times before you get it right. Chapter 12 of the Manual is a good source to consult.

3. There is no "easy" way of inserting text on the graphics screen, but this program may help. First on the drawing screen, hit EDIT, then ->X,Y, then hit ON once/twice to get back to the Home Screen. Assuming you are in RPN mode, type your string and run this program:

<<1 ->GROB PICT ROT C->PX ROT GXOR PICTURE>> (I named it PText)

4. When you are finished on the graphing screen, hit PICT->. Pictures are saved the same way as programs.

Hope this helps, Eddie

graphic

My Find, and a Display problem (long)

*Message #1 Posted by **Speck** on 20 June 2004, 8:33 p.m.*

Hi, all. I guess I'm officially a "collector" now. Here's my "story," followed by a question.

Our local symphony group recently had a rummage sale. People donated stuff, and all of the proceeds went to the symphony. It supports a hometown group, so I thought, "What the heck. Maybe I'll get lucky and find something there." Well, I think I did. They had all of the usual things you'd expect to find at a GoodWill or other thrift-type store, or local yard sale. Anyway, at the electronics table, they had a few handheld devices sitting on one of the tables, and one of them was banded to a thick book. I might find that unusual, were I not already familiar with TI handhelds, as well as a few of the HP offerings. So I picked it up. The item turns out to be an HP 42S. The whole lot included the calc, HP-logo-embossed leather-type slipcase, and mint condition documentation including the wire-bound user's manual, an "Accessories & Applications" pamphlet, an "Extended Protection Plan" offer, and a card for "Introducting Menus," all of those in mint condition as well. The calc itself was dirty, and had a couple scratches on it, but it looked like it could be cleaned up pretty easily. Couldn't test it there, because there were no batteries, but for the five dollars (!) they were asking for it, I had to take the gamble. Got it home, cleaned it up (it cleaned up rather nicely given it's appearance at the sale), threw three LR44 equivalents in it, and hit the ON button. It lit right up, giving me a memory message. Cleared that out, and started using it. I like it already.

The only problem with it is that it has some black spots on the left side of the LCD, as if the LCD is starting to fail on me. I saw the spots when I bought it, but I took the chance on it anyway. The spots look like small ink drops, and they come right up to the working area of the LCD, but none of the usable screen is obscured. More annoying to look at than anything else. It's a singapore machine, S/N 3022S03456. I've looked at the prices on eBay, so I'm fairly certain I got a decent bargain on the machine (I'll get $5 of use out of it if nothing else!), but I'm wondering about that LCD. If I'm careful with it, can I get a decent life out of it, or am I living on borrowed time with my new toy? It MIGHT be just dirt, but I'm not gutsy enough to open it up to find out yet. Besides, it looks like ink, which is leading me to the LCD finding. Is my display fairly stable, or will the black spots tend to creep over time? Anybody familiar with how these LCD's like to behave?

Either way the reply(s) turn out, I am thrilled about my find! After playing with this machine for a while, I can see why people are so enamored with the small form factor HP handhelds. It is truly a remarkable little thing. Thanks to anyone who actually read this whole post, and/or can help me out with this.

in response to message #1 by Speck

1) It creaps, but you've probably got a couple of good years left.

2) It is said that that is the fate of all LCDs. I think that Norm asid that. :-)

3) Now that there is a new model in the 17 series the 17bii is a bit cheaper and i think that it's screen is transplantable, but it's not easy.

4) You'll be getting offers to double your money any minute now.

in response to message #2 by db(martinez,california)

1) I was afraid of, but prepared for, that answer.

2) I think that Norm has ties to the Red LED Cartel, and does whatever he can to bash LCDs. I wonder what he thinks of the Vacuum Fluorescent Displays they put in stereos and car radios...

3) I may try a display transplanst someday, but only as a last resort.

4) I have a feeling I'll be turning down those offers.

5) Thanks, db. Sincerely, Speck.

49g+ Keyboard

*Message #1 Posted by **Pepe Roca** on 20 June 2004, 7:19 p.m.*

does anyone know how to or were can i send this calculator to change a broken keyboard?

Re: 49g+ Keyboard

*Message #2 Posted by **Naim** on 20 June 2004, 7:21 p.m.,*
in response to message #1 by Pepe Roca

Call 1-800-474-6836 and if it's under warranty they would give you a case number and an address to send it to.

16c vs 12c program problem

*Message #1 Posted by **John Nelson** on 20 June 2004, 10:21 a.m.*

Ok folks... have a question for you. I have done some programs on my 12c for years now, and find it very easy to use. I recently tried something very simple on my 16c with some unexpected results. I did a very simple program on both to find the % change (I know the 12c can do this out of the box but just humor me for a second).

The program is simple %change = (new - old) / old. The program was as follows. I would store the old value in reg 1, store the new value in reg 2. Then I input the following in P/R mode.

RCL 2 RCL 1 - RCL 1 /

That's it. After the values are stored (say 25 for reg 1 and 45 for reg 2) I run it. On the 12C it kicks back an answer very fast. On the 16C, after a minute it's still running. Why is that? I have the 16C also in Float mode. The correct answer should be 0.80.

Any ideas what I might be doing wrong on the 16c?

Re: 16c vs 12c program problem

*Message #2 Posted by **Veli-Pekka Nousiainen** on 20 June 2004, 11:45 a.m.,*
in response to message #1 by John Nelson

```
LBL A
RCL 2
RCL 1
[ - ]
RCL 1
[ / ]
[R/S]
GTO A
(say 25 for reg 1 and 45 for reg 2)

The answer is .80
Double check your program - is the 26C broken???
[VPN]
```

Re: 16c vs 12c program problem

*Message #3 Posted by **John Nelson** on 20 June 2004, 1:37 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Ok.... well that works. Why did I have to label it and do a goto and include the R/S in it? On the 12C I don't have to do any of that. Any ideas as to why?

Re: 16c vs 12c program problem

*Message #4 Posted by **Don Shepherd** on 20 June 2004, 2:26 p.m.,*
in response to message #3 by John Nelson

John, the program should work as you entered it, you don't need the label and goto. I ran it on my 16c and it worked fine. Did you "Clear Program" prior to entering the program? If not, and you had another program already loaded, that may be your problem.

Re: 16c vs 12c program problem

*Message #5 Posted by **John Nelson** on 20 June 2004, 2:50 p.m.,*
in response to message #4 by Don Shepherd

Yes... did a clear program by pressing the f and the PRGM key.

It something though, when I ran it with Veli-Pekka's version it worked fine. Only note is it took about 5 seconds to tun where as on the 12C it took only 1-2 seconds. Not sure why.

Re: 16c vs 12c program problem

*Message #6 Posted by **Don Shepherd** on 20 June 2004, 3:38 p.m.,*
in response to message #5 by John Nelson

John, the 12c runs faster because it is "newer" and undoubtedly has a faster processor than the 16c, which hasn't been made since the mid-80's I believe. For the same reason, the 12c Platinum's run faster than older 12c's.

Re: 16c vs 12c program problem

*Message #7 Posted by **Veli-Pekka Nousiainen** on 20 June 2004, 5:41 p.m.,*
in response to message #5 by John Nelson

Something is wrong here...
I can't measure the running time in either HP-12C or 16C
They are both too fast.
Nowhere near a second

Re: 16c vs 12c program problem

*Message #8 Posted by **John Nelson** on 21 June 2004, 11:03 a.m.,*
in response to message #5 by John Nelson

Strange... I did a clear on the program when not in the program listing and it loops it seems. But now I just did an clear when in the program listing and entered the program again. Now it works.

Not sure what that was all about....

Re: 16c vs 12c program problem (edited for erors)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 21 June 2004, 2:59 p.m.,*
in response to message #8 by John Nelson

Hi, John;

the sequence [f]CLEAR[PRGM] in all voyagers only clears program memory when the calculator is in PRGM (program) mode. If the calculator is in normal (RUN) mode (no PRGM indicator), it simply positions the program "pointer" at program top, i.e., step 00- (or

000-, if you are using an HP11C, 15C or 16C).

Keep in mind that this is not valid if you have an HP12C Platinum. According to Jordi Hidalgo's important mention in one of his papers, the HP12C Platinum has no "return to 000-" feature after [f]CLEAR[PRGM] keystroke is used while the calculator is in normal (RUN) mode.

So, your observations AND calculator behavior are correct.

Cheers.

Luiz (Brzil)

Re: 16c vs 12c program problem

Message #10 Posted by ***Vieira, Luiz C. (Brazil)*** *on 20 June 2004, 3:34 p.m.,*
in response to message #3 by John Nelson

Hi, John;

I agree with Don about both: the no need for adding the LBL and GTO (or RTN), that would actualy "separate" your program from others in memory, and I also agree with him about the possibility of existing programs in memory so your

```
RCL 2
RCL 1
-
RCL 1
÷
```

is, in fact, running correctly and right after obtainning the answer, it goes for another program that may be the one that is running in loop.

About the HP12C program structure. As you seem to be a 12C user, you know that everytime you type in an additional function at the end of a program that claims an extra, nonavailable byte, all remaining six bytes of the "converted" register are filled with

```
43,33 00
```

or [g][GTO]00. This does not happen in the HP16C: even if extra bytes are claimed to compose program steps, they are only used when additional functions actualy claim these bytes. In other words, you don't "see" them unless you "use" them. Based on the HP16C structure, you'll never have such [GTO]*program_step* because the 16C knows only [GTO]*label*, while the HP12C (and the HP10C as well) only knows [GTO]*program_step*.

In your example, the sequence

```
RCL 2
RCL 1
-
RCL 1
÷
```

uses 5 bytes and if it is the only program in memory, three

```
43,33 00
```

will still be available, and when any of them is executed in a running program, the calculator will be positioned in step 00- and the program stops. that's probably the reason that the program runs correctly

in the HP12C.

The other additional feature in the HP16C is that new functions (program steps) "pull" all existing program steps "up" when they are added, and none of the existing steps is deleted. In the HP12C, each new program step replaces an exisitng one. It's like the HP16C program mode is always in "isertion" mode, while the HP12C program mode is always in "replace" mode.

Hope this helps.

Luiz (Brazil)

Re: 16c vs 12c program problem

*Message #11 Posted by **Cameron** on 20 June 2004, 9:34 p.m.,*
in response to message #3 by John Nelson

VPN set his steps up so you could use it repeatedly, as in:

```
new-value STO 2
old-value STO 1
R/S
```

Every time you press R/S, it computes the new % change and stops, waiting for you to change values and press R/S again.

You could achieve much the same thing by changing the R/S in the program to RTN (43 21). Then you would run it by:

```
new-value STO 2
old-value STO 1
GSB A
```

This has a small additional advantage that will only be realised if you have more than one program loaded. VPN's version is "better" because it saves you a keystroke when using it repeatedly.

As for 5-second execution time, there is something NQR there. I time it between 0.75 and 1.25 seconds. For reasons that I cannot explain (but that I have speculated about for a long time) the 16C is the slowest Voyager by a *significant* amount. It scores a meagre 3.558 on David's MoHPC math benchmark. As a comparison, the 11C scores 6 (David didn't test the 12C and I don't have one but you could do the test yourself).

Cameron

delta-% on the 16C

*Message #12 Posted by **Karl Schneider** on 21 June 2004, 3:28 a.m.,*
in response to message #1 by John Nelson

John --

The delta-% program on HP RPN calc's has some sophistication built in. The "original" value, which must be in the Y stack register, is retained there after delta-% is executed. The "new" value, which must be in the X stack register, is recoverable with "Last x" after execution.

Also, delta-% using an original value of 0 will return an "Error 0" or comparable message.

The typical usage is

```
"orig value"
ENTER
"new value"
delta-%
```

Here's a 16C program that functions like the one on the 11C/12C/15C/34C, et al., with the following exceptions:

- X, Y, and Z stack registers are used, instead of just X and Y.
- "Last x" does not recover "new" value.
- Clearing DBZ error leaves "orig" and "new" values swapped.

```
LBL "A"     43,22,A  (I wish the 15C coded as such!)
x<->y       34
x=0?        43 40
/           10       Induces DBZ error for "orig" value = 0
-           30       x-y  [based on originally-entered values]
LST x       43 36    y
/           10       (x-y)/y
LST x       43 36    y
x<->y       34
EEX         42 49
2            2
*           20       [(x-y)/y] * 100% (as shown on back of 15C)
RTN         43 21
```

Re: 16c vs 12c program problem

*Message #13 Posted by **Gordon Dyer** on 21 June 2004, 6:42 p.m.,*
in response to message #1 by John Nelson

I have tried this on my 11C, 12C and 16C and they all work out 0.8.
The 16C is the slowest.

Karl's program exposed a bug in my sim

*Message #14 Posted by **Cameron** on 21 June 2004, 9:06 p.m.,*
in response to message #13 by Gordon Dyer

Don't try it on the sim (yet). Karl's program exposed a subtle difference between the simulator and the real calculator. EEX has an implicit mantissa of 1. I wasn't simulating that because I've never thought to try it.

Version 0.318 corrects this. I have it on my test bench today. I'll probably release it this weekend.

HP82162A IL-Printer slow

*Message #1 Posted by **georg** on 20 June 2004, 6:03 a.m.*

Hallo,

today i tried my HP82162A Thermal Printer with a new batterypack. It works, but the printing head works extremely slow, even there is sufficient voltage. Where to put the drop of oil?

Thank you

Georg

Re: HP82162A IL-Printer slow

*Message #2 Posted by **Ronald** on 20 June 2004, 6:41 a.m.,*
in response to message #1 by georg

Hi

Before oiling I would check if paper is properly positioned with the right side on top. Check also if plate which pushes from the back to the paper at the place were the printerhead moves back and force can move freely (is loaded with a small spring) and the linnen like stuff is in place and not sticky. Difficult to see, but use a magnifier glass and you probably can diagnose. If no succes, open drive and see if rubber belt is not slipping. Third: a miniscule drop of oil on the bearfings of the electromotor axle and last a snuff of teflon enhanced grease on the spiral axle and bearings which drives the head. Whatever you do, be very carefull, the printhead has a couple of thermistors in the surface which actually make the dots and these are very sensitive, before you know you end up with a smoothly running, but not printing printer. Never-ever remove the printhead itself unless you are real brave. I found out the hard way one time.

Please feedback your results to the forum.

Succes

Ronald

Re: HP82162A IL-Printer slow

*Message #3 Posted by **Georg** on 21 June 2004, 6:48 a.m.,*
in response to message #2 by Ronald

Hallo Ronald,

thank you very much for your hints.

Yesterday i tried the following and it works.

As the printer sends an error message to the calculator due to the slow motion, I have send "prx" to print

only one line without error. I have send this several times to the printer and after a while the printhead moved faster and faster an the error message did not appear any more. After that I tried "Prreg" and after some tries the head moved still faster. Today morning the printer still works fine, so I believe, that the problem is solved. I made a printout of your posting. When the slow motion will appear again in the next weeks, I will post it here.

Thank you once again for your help.

Georg

Re: HP82162A IL-Printer slow

*Message #4 Posted by **David Smith** on 21 June 2004, 11:46 a.m.,*
in response to message #1 by georg

The motor drives the printhead via a small rubber belt. Over time the belt stretches and begins to slip. Also dirt and paper dust in the drive screw can gum up the works.

HP 33s unique features?

*Message #1 Posted by **Ed Look** on 20 June 2004, 1:44 a.m.*

Has anyone done a comparison of the features and capabilities between the new 33s and the old 32sII, besides the obvious differences of keyboard layout and extra RAM?

I have just gotten mine and have just given the 33s keyboard a cursory look. There appears to be some extra features or keys that I don't think I recognize from the 32sII, as "SGN" or "SEED" for starters. I guess I'll have to really read the manual. I was hoping that it was similar enough to the 32sII that I could just quickly scan over the manual... not that I would ever mind extra features! It does have a much nicer case than either of the 32s series models ever came with!

Not to start trouble, but I suppose red LEDs would have been too uneconomical for the user (battery drain)? Years ago, it was cool to me to mess with the calc in bed; I knew just about where every key and shifted key was and the red glow was just too cool!

Re: HP 33s unique features?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 June 2004, 2:06 a.m.,*
in response to message #1 by Ed Look

Hi, Ed;

I did not own an HP32S/SII at the time they were available, neither I own any now. But I have an HP33S and it seems to me that, despite the obvious selectable RPN/Algebraic operating mode of the HP33S instead of the RPN-only available with the HP32SII and the (also obvious) two-line display, I guess the only extra operating characteristic is the constants library. I also remember that the HP32S/SII had a different menu selection, where the names of the "features" were writen above the arrow that indicated which key should be pressed for each feature shown. Now, the HP33S has a new menu arrangement, using the number keys instead of the first-row keys used in the HP32S/SII.

I had a look the HP32SII features (in brief) while writing this post at Finseth's Data Base, so maybe there are other new features available with the HP33S and not found in the HP32SII that I'm not aware of. I'd like to know about them as well. I recomend Finseth's database as a reference source, because many good stuff about each model is mentioned there. Great source!

Cheers.

Luiz (Brazil)

Re: HP 33s unique features?

*Message #3 Posted by **Ben Salinas** on 20 June 2004, 3:27 a.m.,*
in response to message #1 by Ed Look

The 32sii did have the SEED command, but the SiGN is new, but it in itself is a silly command (it returns 1 if the number is greater than 0, and -1 if less, so you still need to use an "if statement" (x>0?) to check it, just as

you would need to check if the number is greater than 0.

Offhand, there are a few other new commands that I can think of: the RPN/ALG, and the constants for starters...I dont have either calculator in front of me, so that's all that I can think of at 2:30 AM local time.

-Ben 12345

Re: HP 33s unique features?

*Message #4 Posted by **Dave Shaffer** on 20 June 2004, 5:21 p.m.,*
in response to message #3 by Ben Salinas

re: "SiGN is new, but it in itself is a silly command (it returns 1 if the number is greater than 0, and -1 if less)"

It's not so silly for some folks. For astronomical calculations of position, it is quite useful. The north/south position of a source (declination) can be a bit of a nuisance to work with. There are + and - declinations, often given in degrees, arc minutes, and arc seconds, such as +12 13 14.15 or -15 16 17.18, where only the degree value has the sign attached. You almost always have to convert the position to decimal degrees (or radians) for other calculations. Getting the sign of the result from the sign of the degree value is easily done with a SIGN type function:

deg.ddd = SIGN(deg) * (deg + arcmin/60 + arcsec/3600 } .

The real annoyance is declinations within a degree of zero. For these, you have to pick up the sign as a character - except for some old FORTRAN compilers, which knew the difference between (i.e. the sign of) +0 and -0 !!

Re: HP 33s & HP 71B unique features?

*Message #5 Posted by **Veli-Pekka Nousiainen** on 20 June 2004, 5:38 p.m.,*
in response to message #4 by Dave Shaffer

HP 71B is the *ONLY* calculator on earth to distinguish between +0 and -0
{VPN}

HP16C ? I guess so...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 20 June 2004, 5:53 p.m.,*
in response to message #5 by Veli-Pekka Nousiainen

Hi, VPN;

if we consider the 1's Complement mode representation and integer mode, the HP16C also distinguishes between 0 and (-0).

Cheers

Luiz (Brazil)

Re: HP 33s & HP 71B unique features?

*Message #7 Posted by **Ángel Martin** on 21 June 2004, 9:35 a.m.,*

in response to message #5 by Veli-Pekka Nousiainen

Not to counter VPN's statement, but the 41 does also do so, when using NNN's. Not that it matters to many, anyway.

Re: HP 33s unique features -SIGN

*Message #8 Posted by **Andrés C. Rodríguez (Argentina)** on 20 June 2004, 9:23 p.m.,*
in response to message #4 by Dave Shaffer

In case you need to use a SIGN function on a calculator where it is not preprogrammed, the following should work:

```
...
ENTER
ABS
 /
...
```

You may be worried about the effects of possible rounding errors, but I think that the internal guard digits will take care of any "imperfection" on the division algorithm.

Re: SIGN - little correction

*Message #9 Posted by **Tizedes Csaba [Hungary]** on 21 June 2004, 2:20 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

Hello,

this is works, when stack_x is equal zero:

```
...
x=0?
RTN
ENTER
ABS
/
...

=================

And without ABS:

...
x=0?
RTN
ENTER
SQ
SQRT
/
...
```

This is what is make SIGN to useful, because this feature not allowed in EQN.

Csaba

Re: SIGN - little correction

*Message #10 Posted by **Andrés C. Rodríguez (Argentina)** on 21 June 2004, 8:46 p.m.,*
in response to message #9 by Tizedes Csaba [Hungary]

Touché! Thanks, Czaba, you are right

I was just trying to produce an excuse by means of some error handling flag, so to cover my disregard for the zero case, but I must say there are no possible excuses.

On the 33S the only error that flags may help to handle are overflows. It would be nice to have an "error ignore" flag... Well, the old and faithful HP-41C indeed had it and, for that matter, it also had a SIGN function which answered 0 when applied to an ALPHA string.

Re: HP 33s unique features?

*Message #11 Posted by **Veli-Pekka Nousiainen** on 20 June 2004, 11:36 a.m.,*
in response to message #1 by Ed Look

```
I find X^3 and Cubic Root on the keyboard
Then Integre Division and Remainder
SGN was mentioned and the ALG mode, too
More Program steps allowed.
Y-reg on the the display or the history in ALG mode
* OFF TOPIC *
I don't much mind because the 32SII was "perfect" already.
Now I just thank for the additionla display line and the memory.
Yes, it's too bad that numerical sub-program labels up to 99 are not allowed.
I would use (i) as follows:
GTO or XEQ (i) with 1...26 would jump to A...Z
Fractional part would point to sublabel 01...99.
Zero fractional part would be the start of the main program eg. LBL 00 is not allowed.
GTO or XEQ (i) with 3.03 would thus jump to program B sub-program LBL 03.
Numerical registers from 0...999 would be great
Even if accessible only through (i) and if the sign needs to be negative.
That is (i)=1..26 = A..Z, but (i) -1...-999 would be the numerical register.
Is 27 == i ??
Then perhaps register 0 could be (j) !!!
Another index register would be very usefull in many situations.
[VPN]

in response to message #12 by Trent Moseley

Trent, you said, "Ed,

Talk to Norm.

tm "

No, he's really a cool guy and very interesting poster, but it'll get long. I'm sure he's reading everything and rolling his eyes.

But what's really cool is that because my kids (grade school age) are more attracted to the design of the 33s over the 32sII (they kind of smirk at the design of the 34C), they wanted to touch it and play with it. So, I

whipped out both the 32sII and the 33s and got a chance to introduce the concept of RPN and the four-level stack to them! The sixth grader, who fools around with a HP39G (a huge blue algebraic brick), sort of got it and I think the third grader sort of not... he still asked for the equal sign.

Re: HP 33s unique features?

*Message #14 Posted by **bill platt** on 21 June 2004, 12:14 p.m.,*
in response to message #1 by Ed Look

Hi Ed:

I believe this list to be nearly fully comprehensive.

What the 33s has which is different or additional to the 32sii:

```
Additional:
INTeger divide (is it really modulo or something?)
REMainder
SGN (sign boolean)
cube root, cube
An ALGEBRAIC calculator mode
A "Constants" Library
Internal precision is different; new algorithms.

Different, and deficient to 32sii:
More Memory,
But, it is a different memory / byte structure.
Far less efficient memory usage---it is not
32 kB of 32s eqivalent space---depending on how you
compare, it is only between 6 and 11 kB against the 32sii

Equations (both in Equation List and in programs) are
limited in length to 255 characters.  (There was no limit
in the 32sii--except for the small memory--which made it
possible to only barely exceed 255 characters anyway).

BTW, the 32sii had the following which was not in the 32s:

Equation List and Equations in programs
R up command (only R down on 32s)
Conversion factors
fraction modes and fraction input
More flags (to handle fraction modes and equations)
```

regards,

Bill

Gmail Accounts Anyone? (Offtopic)

*Message #1 Posted by **Ben Salinas** on 19 June 2004, 11:01 p.m.*

This is slightly off topic, but I figured that I would post anyway. Gmail (www.gmail.com) has started sending me invitations (The Gmail e-mail service is currently available by invitation only)... many many invitations (about 10 a day), so I have now given out about 25-30 accounts. I will now open up the offer to all of you. If you would like a gmail account (a gig of space), send me your e-mail address and name to ben.salinas@gmail.com. Depending on how many responses I get, it might take me a few days to send you the invitation.

-Ben 12345

Caveat Emptor

This is a pretty silly attitude. You better stop posting anything in this, or any other forum on the Internet while you are at it. NOTHING, I repeat NOTHING you transmit via the Internet, whether it be via email or on a web site, is private any more. If you think it is you are only fooling yourself. If you want electronic communication to be, and stay private, you better use a several thousand bit encryption routine, and hope quantum computers never become a reality.

Gmail: It's only free because it has to be

*Message #5 Posted by **Randy** on 23 June 2004, 8:35 p.m.,*
in response to message #4 by Chris Woodhouse

Gmail? What's all the fuss? Just another marketing ploy from yet another new public internet company. Is this any worse than having to tell Earthlink that I'm a real person, not a machine by responding twice to an email? Honestly, it's all a bother and only further illustrates electronic communication is a very imperfect medium. It's not a recognized legal means. Never will be in it's present state. We still have a long way to go. Don't get your panties in a knot about Gmail... It will morph and be a fee based service before it has any staying power. It's only free so you'll accept the baggage that comes with it. P.T. Barum said it first...

Anybody still getting a discount via the internet on their groceries or gas? Wake up and count the money. Nothing is for free.

For me, $0.37 makes my communications very private. If that's not fast enough, I can always pick up the telephone. To second Chris's point, NOTHING that is electronic form is in anyway private. To think otherwise is foolish. 'Nuf said on something that has absolutely nothing to do with calculators.

Hi, Chris:

Chris posted:

"This is a pretty silly attitude."

Thank you for your comment, very considerate by the way. You're always like that or is it seasonal ?

"You better stop posting anything in this, or any other forum on the Internet while you are at it. NOTHING, I repeat NOTHING you transmit via the Internet, whether it be via email or on a web site, is private any more. If you think it is you are only fooling yourself."

I'm fooling noone, least of all myself. Yes, I know private communications are utopic but that's not my point about not sending e-mail to a Gmail account.

My point is, when I post to this forum my e-mail address remains absolutely private, if nothing else for the simple hard fact that I do *not* type it in anywhere. So I do not risk it being harvested by spammers' robotic tools and then being subject to ton after ton of delicious spam.

However, that's not the case when sending e-mail to a Gmail account, because Gmail will instantly know about the sender's e-mail address unless you bother to take protective actions, which I'd rather not.

Understood ? :-) Long live the HP-15C and ...

Best regards from V.

I read the whole article you submitted a link to in your original post. Giving your email address to spamers was not their major concern, they were concerned about the privacy of the content of your email message, not address, and that is what I was responding too.

I don't know if MSN and Yahoo are guilty of what you are accusing gmail of intending to do or not. But if they are, I can understand your belief that gmail will give your email address to spamers. I don't belive it will happen and am willing to test it by sending several emails from a new account on my local ISP to my gmail account as a test. If interested in the results let me know. However, I would be far more concerned about the spam you get just because your email address is in the MS Outlook address book of someone who doesn't keep their computer secure. I for one am looking forward to seeing advertisements that are for things I might actually be interested in, instead of being bombarded with messages about enlarging certain body parts, drugs I don't want, home equity loans for the home I don't have, or credit cards I don't need or want.

[quote/]

Hi Chris, Valentin,

I think the above quote is absolutely on the mark. This has happened to me repeatedly over the past 8 years or so, though by no means frequently. Once, my company's entire public address book got "ramped up" to a spam machine via a virus that came in through an attachment on one person's computer.

I do not fret spammers too much anymore, because I have a different paradigm:

I give my website, http://plattdesign.net and the person can find my currently active e-mail address there. (In fact, a poster to this forum did just exactly that recently.)

I think if we all did this, we could foil the spammers, because when you start to get too much spam, you just change your address, but not your own private domain.

Of course, this means that your "friends" will suddenly get returned mail. But, if they know the paradigm, they go to your website, and find the current one.

But this approach is far from known widely, so it may take time to become accepted.

Best regards,

Bill

I had a similar idea I have not yet implemented. I was going to have my email address be something like chris.june.2004@cox.net and then change it every month. That way all my friends would just keep chris.month.year@cox.net in their address book and then just change to the current month and year when they send me a message, I was also thinking of keeping an email address that was automatically replied to by my computer telling posters what my active address is. If spamers suddenly found that 99% of the email addresses they find, are inactive by the time they get them, that could take all the profit out of spam.

Value of a HP-41C Option 001, Blanknut

*Message #1 Posted by **Ronald** on 18 June 2004, 6:47 p.m.*

Hello,

Any idea what this calculator would be worth.

It is really a 41C, manuals, no box, very good condition, keys are as new, no sratches all port covers and battery door present.

Thanks.

Ronald

Re: Value of a HP-41C Option 001, Blanknut

*Message #2 Posted by **Randy** on 18 June 2004, 10:53 p.m.,*
in response to message #1 by Ronald

It's only worth as much as someone was willing to pay?

It is hard to establish a value as there is little to use as comparison. A decent C fetches about $75-$100 these days so it would not be unreasonable to see it go for at least $150 to $200.00. Is it worth it? Only to some. Certainly my opinion only and subject to debate since there are many variables and "very good condition" is a very subjective thing, especially on eBay. One sellers' gold is another buyer's lead.

FWIW, I sold a CX half/blanknut last year via a MoHPC FSBO classified for $250.00. It was like new in every way.

Your Benchmarks please for on-going test: Comparison HP 95 LX (512K) against Psion 3C (2M)

*Message #1 Posted by **Bruno Geuth** on 18 June 2004, 2:59 p.m.*

Hi all HP 95lx fans,

I am currently running a benchmark-oriented test on 2 machines: HP95lx against Psion 3C.

This comparison makes sense since both machines have a lot in common:

-Both machines are same size outside and screen size nearly same.

-Lotus 123 built in (ROM) and same version: 2.2

-Built-in calculators: Both with financial functions

-Both machines are MS DOS compatible (Psion = Flash MS DOS)

-Agenda and phonebook functions very similar

-PC connectivity: both with serial cable and infrared

-Prices, new and secondhand: Vey comparable

-Available software, be it paid, shareware or freeware: Lots and lots available for both machines

-Available memory extension cards: Very comparable Very different: Processors: Psion runs on a strange EPOC NEC V30H 16bits (80C86 compatible at 7.68 Mhz), I need to know the HP95 processor (please HELP ME, cannot find it in the manuals) as far as I know it is an IBM XT compatible processor...

-Internet-capability: I saw some software on the web to bring the HP95lx via modem on the net and for the Psion I saw PsiWinMail...and I am going to test both machines with a self-made cable on a little external modem (Typhoon Redfun Modem V.90 56K USB V.92Ready), ALL HELP/SUGESTIONS this concerning are very welcome!

Since I do not want to travel around with my 2 machines, so here's what's at stake: The loser will be on sale and the winner travels further with me...so any arguments FOR the HP 95 are very welcome! (see, I am alraedy biassed for the HP before even starting the test...this can't go right :):)

CAN YOU PLEASE HELP ME with setting benchmarks for the tests (functionality tests on financial calculations, spreadsheet tests, battery live, PC connectivity etc.)

All possible or craziest ideas are more than welcome!

Bruno

Check out this location.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=58823.

It indicates that the hp95lx uses an NEC V20H running at 5.37MHz.

Re: Your Benchmarks please for on-going test: Comparison HP 95 LX (512K) against Psion 3C (2M)

*Message #3 Posted by **Aleph Mobius** on 18 June 2004, 6:44 p.m.,*
in response to message #2 by Richard Garner

Just a bit of trivia, the Casio AFX 2.0 graphing calculator runs on an NEC V30. I have an HP100LX, which is the successor to the 95LX. Does either of the machines you have have full CGA support? IIRC, a new feature of the 100LX was that it could fully support the 320x200 CGA mode while the 95LX could not. What version of DOS does each machine have? I think the 95LX has 3.3 so you may want to check if all the software you want to run is compatible with that version. Also, you may want to check out the lithium batteries that Energizer makes. I have only used my 100LX maybe 6 or so hours since Christmas but the batteries are at still at 100%. I once put regular batteries in there, used it for a little less time than that, then left it in a desk drawer for 2 weeks. The batteries went from 100% to 5/8 just sitting there unused.

Re: Your Benchmarks please for on-going test: Comparison HP 95 LX (512K) against Psion 3C (2M)

*Message #4 Posted by **Bram** on 19 June 2004, 4:36 a.m.,*
in response to message #1 by Bruno Geuth

Once upon a time I had to decide between *either* the 95LX and a Psion Series 3 (couldn't afford both ;-). Difficult choice, but in the end the HP didn't make it because the Psion had a built in programming language to develop your own functionalities, which was one of my criteria. So I went on with Psion and I'm still using my 3mx every day. And for the calculator part, I'm back with HP again.

You'll understand that I strategically recommend the Psion to go on with and I'll be happy to help you get rid of the 95.

Just kidding; good luck with your decision

Re: Your Benchmarks (...) brochure

Even at the time I wrote the above I didn't think of a brochure that I have. Not until a few days later did I

suddenly realize it. After this I immediately remembered its whereabouts. And guess what? I found it right away at the place it had been for 10 years, give or take 2.
Memory is a funny thing.
It's a Dutch brochure (sorry for that) and you can find the cover page here.

*Message #6 Posted by **Gordon Dyer** on 19 June 2004, 7:40 a.m.,*
in response to message #1 by Bruno Geuth

I have a Psion 3mx (2x speed of 3C) and have always been very impressed with it. Which you prefer depends on what you use it for. If you are a DOS programmer or have DOS programs you want to run then use the 95. If you want a really nice diary and small database system with excellent programming in OPL then use the Psion.
If you have created any benchmark progs let me know and I will run them on my Psion for you.

It doesn't. Both 5 and 5mx run OPL. Even the Revo can easily do it.
But nevertheless I agree with you: 3c was the best. 3mx closely second best.

Every now and then Psions are offered on PDA.totaal (with Symbian, PocketPC, Palm and still Psion), but it's mainly in Dutch. And btw I'm promoting HP there as much as appropriate, and right at this time I'm doing the other way round.
Funny world we live in....

in response to message #9 by Veli-Pekka Nousiainen

A short one, because we're going heavily off topic now.

I think you're interchanging calculator and program. Both are separate applications on a 5: "calc" on the button bar and "program" on the extra's bar. With Series 3 you could write your own procedures in "program" and execute them in "calc". This facility was dropped from Series 5 and further. (One of the reasons why I think 3 was better. Or more precisely: better thought out). I must have liked it because my HP-29C in a way follows the same approach. (AND has RPN ;-)
I don't know of any pdf user manuals for Psion like HP has, but I will remember you when I find something.

[VPN]

Re: [OT] Psion 3C & 3mx

*Message #12 Posted by **Bram** on 21 June 2004, 5:32 p.m.,*
in response to message #11 by Veli-Pekka Nousiainen

OK, I'll keep it short
3mx runs faster, has faster serial interface (up to 115k (3c 57k6)), has always backlight, has always 2MB internal memory, has smooth case.
3c uses same battery for both backup and memory cards, some models lack the backlight, some models are 1MB, PsiMail, the internet conmnection, runs smoothly on 3c, not always on 3mx (personal experience).
Don't know of good URL, other than searching the web. You do it better yourself, I think.

Re: Your Benchmarks please for on-going test: Comparison HP 95 LX (512K) against Psion 3C (2M)

*Message #13 Posted by **Gordon Dyer** on 21 June 2004, 6:56 p.m.,*
in response to message #7 by Veli-Pekka Nousiainen

If you search eBay for Psion 3mx you will find some for sale. They are the ultimate series 3 and fetch higher prices than 3c.
Try this one: Item number: 5102045792

Very impressed with Casio's ClassPad

*Message #1 Posted by **Marx Pio** on 18 June 2004, 1:00 a.m.*

I was very impressed with classpad300 math operating system, I only disagree (as always) the design. Does anyone knows an emulator of CP300 for pockePC? It seems calcs are dying slowly and painfully due to emulators(thanks Massimo for the 15C emu). ;)

Pio

Re: Maybe

*Message #2 Posted by **Ron Ross** on 18 June 2004, 9:09 a.m.,*
in response to message #1 by Marx Pio

But I think you will always find a basic scientific made by someone. Will it be Hp? No, maybe not. Will it be a quality item like an Hp? Again, no, maybe not. Will RPN survive another 20 years in a calculator package? Hard to say.

But I will always use a calculator over a PDA device and I suspect the majority of the posters here feel likewise. If a PDA is ever released with a customizable keypad (scientific keypad overlay???) in a shirt pocket size, I may switch then, but not before.

So I always cringe when I hear someone spout off about how great the PDA type device is. My gut feeling is a business type MBA (with the power to make a production call) might feel a PDA device is worth production over a calculator line if he wants to maximise return on a single production line. Does he make a $20 calculator or a $200 PDA. Which will have more return per sale? Doesn't take a genius to decide which the production line will make.

This is a case where the short term returns will override the long term benefits. And Hp's Compaq PDA's are in direct marketing conflict with the higher end calculators (not so much in sales, but in company resources and R&D).

I became a loyal Hp user and fan with my first Hp15c. I stayed a loyal fan until the arrival of the Hp49G family of calculators. Their new line may win me back, but now I am a more cynical and skeptical customer than four years ago.

The point I want to make is that Hp made a great marketing and PR device with their quality calculators. Now they are entrusting this first impression to a knock off company. My first Hp49G+ had a bad keyboard (my second seems fine). I work with another engineer who finally bought his first Hp, an Hp30s. Do you think he finds it to be a great calculator? I certainly didn't say anything one way or another but when he visits our office and needs a calc, I loan him a 20s (and one made in the good ole USA at that). I suspect he bought the wrong calculator, not that he had much choice a year ago.

Nope!

*Message #3 Posted by **Mike** on 18 June 2004, 10:10 a.m.,*
in response to message #2 by Ron Ross

You said: "But I think you will always find a basic scientific made by someone."

I say: True: Only because a basic calc can be made for $20-$50. PDAs have a long way to go before they get that low. But at $20-$50, you don't get much in the way of a quality calculator.

You say: "But I will always use a calculator over a PDA device and I suspect the majority of the posters here feel likewise. "

That may be true for you and calculator connoisseur but most calculator users are just that, "users". They only care that it works.

Calculators are growing in size, not shrinking. PDAs on the other hand are shrinking, have more memory, larger screens, in color, and are completely programmable. Further, whatever program you have on your calculator (oops PDA) can also run on a PC, with the ability to transfer files between the two.

It's only a matter of time till everyone stops using standalone calculators. Just like they will for CD players and other consumer electronics.

To put it another way, consider the best calculator that you would like. Now consider that it could be expanded to include phone, PDA, etc. Would you abandon that perfect calculator, simply because it contained a phone? Hardly. We often think of calculators being added to PDA but I prefer to think of an electronic box that can contain just about any program. That is coming.

Some PDAs are now getting about the size of a 15C. Imaging that PDA running 15C software with more memory, program space, color, speed and the ability to transfer programs between 15C and PC. Perfect. Now imagine that with any other "perfect" calculator. It's not very hard to imagine calculators going away.

I have not carried a stand alone calculator for years. I have lots but prefer to use my PDA.

Anyone still use a record player.

I still use a record player.

*Message #4 Posted by **bill platt** on 18 June 2004, 10:59 a.m.,*
in response to message #3 by Mike

And the vinyl lasts forever. I can play a 78 that my grandmother's 1st cousin made in the 20's.

Audio tapes die in a decade. digital stuff lasts 2 years if you are lucky.

Man-machine interface.

Every accountant I know still has a real adding machine on the desk--not just their PC.

The PDA will never have the interface of a calculator unless you actually put real buttons on it.

So, I wonder---how did you adapt to using a PDA for a calculator? Is it really just as good (now that you have learned to use it) and as reliable for input a s a real calculator?

I would be very interested to hear how it really feels from an expereiced PDA guy.

The cost aspect is important, too. PDA's a re expensive; calcualtors are not. And, not efveryone needs or wants a PDA. So, that leaves a market for calculators.

The idea of the generalized box is good--but it is still a compromise---and therefore often not as good

as a dedicated device.

Digital Stuff lasts 2 Years?

*Message #5 Posted by **Wayne Stephens** on 18 June 2004, 1:33 p.m.,*
in response to message #4 by bill platt

bill,

I, too, still own, and occasionally use, a turn table. I have a lot of stuff on vinyl that is too obscure to have been released on CD.

However, I have some CDs which are approaching 20 years old. They still play just fine.

From where do you draw the conclusion that digital stuff lasts only 2 years?

Take care.

Wayne.

Re: Digital Stuff lasts 2 Years?

*Message #6 Posted by **Chan Tran** on 18 June 2004, 2:22 p.m.,*
in response to message #5 by Wayne Stephens

I still use the record player but most of my records are in pretty bad shape. I still use the analog audio cassette and all of my 15 years old tape are still in good shape. They may deteriorate somewhat but I can't tell. My CD are in good shape for many years but I can make perfect copy of the CD so digital basically last forever.

Re: Digital Stuff lasts 2 Years?

*Message #7 Posted by **M. Currie** on 20 June 2004, 10:33 p.m.,*
in response to message #6 by Chan Tran

I've heard a lot of noise recently about recordable CD's having a very limited lifespan, often starting to go bad after a couple of years. It's an issue for digital photographers who need archival storage for their images. But commercial CD's are produced in a different way, and as far as I know there's no problem with them.

It's a paradox with digital media, because once they go bad, they are useless. You can still play a scratched record, and view a torn photograph, but it doesn't take that much damage to make a CD unreadable. On the other hand, because digital information is entirely independent of its medium, there's nothing to prevent you from inscribing the numerical information for a photograph or a movie or a concert in carbon ink on vellum, or chiseling it in stone for that matter, along with instructions for decoding it, and an enterprising technician a thousand years from now could enter that information back into a computer and reproduce your work perfectly to the last pixel. Of course, that's just theoretical. Most likely huge amounts of information will be lost as the media or the machinery to read them are lost.

I Still use Audio Tape

*Message #8 Posted by **Bill (Smithville, NJ)** on 18 June 2004, 3:23 p.m.,*
in response to message #4 by bill platt

Hi Bill,

>>Audio tapes die in a decade.

Not True at all. I have reel to reel tapes that date back to 1950 that still play fine. They are paper backed, so I have to be a little careful with them. The main problem with reel to reel tapes is that the lubricate can dry out over time and they start squeeling. Of course playing tapes on a bad machine (especially one with bad heads) will distroy the tape quality very quickly.

I still do a lot of recording on casstte tapes. I'm in process of having my Marantz PMD 430 portable stereo recorder completely overhauled by a firm in California and am looking forward to many hours of recording on cassette over the next few years. Got to get my grand daughters words on tape. They love talking into a mike, especially when I put wireless headphones on them so they can hear themselves as they record. I need to get one of those wireless mike/headsets like the rock stars use. I think the kids would love it.

Used to be a turntable person. A few years ago, moved my most favorite records over to CD and gave the turntable and my record collection to my nephew. He's wanting to go into radio production, so he was happy to get a nice setup.

*Message #9 Posted by **Mike** on 18 June 2004, 10:48 p.m.,*
in response to message #4 by bill platt

Vinyl records absolutely do NOT last forever. At least not in the same condition they do when new. Everytime you play a record, you damage it somewhat. That's a fact. CDs on the other hand, will last much longer than records and can simply be reproduced, if need be.

cd lifetime question

*Message #10 Posted by **db(martinez,california)** on 19 June 2004, 12:02 a.m.,*
in response to message #9 by Mike

An EE i know once told me that he read a CD will last a half a million plays. He didn't know what the limiting factor is. Does anyone know what happens on that 500,001st spin?

This IS a pertinant topic for discussion here; i have the museum CD set and it has to last at least as long as my calculators.

I hope you are WRONG!

*Message #11 Posted by **Ron Ross** on 18 June 2004, 11:08 a.m.,*
in response to message #3 by Mike

But I have to concede your points. That is the shame of the new wave of technology. It doesn't satisfy me, but it satisfies you and maybe the majority (and that is the market Hp and most others are interested).

Notice I did put a qualifier in my post. When the size of a PDA with a customizable keypad is down to the size of a pocket calculator, I will probably buy one.

My own work requires me to use a calculator fairly often (not real high end math), and I don't like the

PDA's that I see around me. I could use my wife's 200LX probably, but I don't like the bulk of that either (of course I may have to fight for it. BoP .).

But I won't be pecking away on a touch screen (and don't ever plan to). I prefer the buttons!!!

And your post is another message that makes me cringe. Many, many people are happy with the features and functions a PDA can now offer. It is very versatile. I just don't like a calculating device without a keypad. But the majority of the population doesn't use a PDA for that function anyway (or so seldom as to not warrent any better). But for me, that would be its primary purpose and for that, the PDA, is its weakest feature. A real calculator still kicks PDA BUTT!

Very bad comparison in my not so humble opinion.

> Quote:
>
> To put it another way, consider the best calculator that you would like. Now consider that it could be expanded to include phone, PDA, etc. Would you abandon that perfect calculator, simply because it contained a phone?

In a heart beat, because if it was a phone and a PDA it would NOT be the perfect calculator. It also would be a pretty horrible PDA and phone for that matter.

People have been trying to combing multiple devices in to one forever. Some times it works good, on the very rare occasion it works great, but more often than not it is a miserable failure. Some examples in history. The flying car, a miserable failure. The pocket plier tool, in some situations this is an extremely handy gadget, in fact I have several of them. But they will never replace a tool box full of tools, or a good pocket knife. If you need a screwdriver to take something apart, or put it together, and all you have is a pocket plier tool, then it will certainly get the job done. If you have both a pocket plier tool, and a regular screwdriver, almost anyone would reach for regular screwdriver over the pocket plier tool. Obviously there are people who will find the right pocket plier tool to be all the tools they need, but in general they will not replace the separate tools they combine into one.

I think it is the same with calculators and PDAs, they both server different purposes, and they serve those purposed pretty well. It's not too difficult to put them together and have them serve two different purposes. For many people this works fine and is a great combination, just like the pocket plier tool. But just like a pocket plier tool will never replace a mechanics tool box full of tools, a PDA will never replace all calculators.

Of topic a little here on the phone/PDA combination. That is a PDA manufactures pipe dream! I would be willing to bet a very large sum of money that in 10 years from now, if you were to take all the PDA users (and by PDA user, I mean some one that uses it for more than just a simple phone book), those that use their PDA as a phone will be less than 5% of the total. Now a phone that can wirelessly communicate with my cell phone, would be great!

Quote:

We often think of calculators being added to PDA but I prefer to think of an electronic box that can contain just about any program. That is coming. [quote]

The software is only half the issue. Yes it is getting to where you can put a countless number of features in a very small package. However when you are dealing with a finite size device, the user interface is your limiting factor.

[quote] I have not carried a stand alone calculator for years. I have lots but prefer to use my PDA.

I'm sure that works great for you, and many others. That doesn't mean it will work for everyone.

You say: "I'm sure that works great for you, and many others. That doesn't mean it will work for everyone"

I say: Sure, not for everyone. But it will work for most. That is precisely why HP isn't making calculators anymore and why the ones that are beign made are junk. The number of purists is a drop in the retail bucket.

I would also say that if you dropped that perfect calculator, because it has something other than the calculator, but in no way affected the calculator or changed it, then you are just being silly (read: argumentative; or totally friggin illogical). http://www.msdsite.com/images/smile.gif

You completely missed my point. You can't have a perfect calculator as part of a phone/PDA. If you have a PDA/Phone/Calculator, one of four things will be true, with the fourth being the most likely. 1) you will have a good phone with a bad PDA and a bad Calculator. 2) you will have a good PDA with a cumbersome phone and bad calculator. 3) you will have a good

calculator with a horrible PDA and a cumbersome phone. 4) you will have worthless electronic novelty. While the software side of it, isn't limited, there is only so much user interface you can put into a finite size box. A quality interface for a phone, calculator and PDA will not fit in a package small enough to fulfill its purpose.

Some efforts to combine electronic functions into one device have been about as apetizing as trying to combine a food processor and a toilet. I hope my 41cx never dies. I use it every day. For certain purposes, it's much better than the stuff being made today.

Although the new digital media should last decades as far as actual durability is concerned, the problem is that standards are changing so fast that you'll have to transfer pictures, recordings, or whatever, to a new medium every few years or end up with something no one can play.

As for the durability of tape however, I have an open-reel stereo tape of Frank Sinatra that's about 50 years old, and the fidelity and background noise are phenominal! It sounds great even to those who are "spoiled" on CDs. You wouldn't think the technology to make a recording sound that good would have existed back then.

If the time ever comes that all my standalone calculators quit working and I can't buy suitable replacements, I'll just use my slide rules and pencil & paper. I will *not* accept a PDA substitute.

> Quote:
>
> To put it another way, consider the best calculator that you would like. Now consider that it could be expanded to include phone, PDA, etc. Would you abandon that perfect calculator, simply because it contained a phone? Hardly.

I wouldn't even *consider* a calculator/phone combination. I don't want a phone or a PDA. In fact, if a

company *did* make a perfect calculator, and refused to sell it without bundling in a phone or PDA, I'd be extremely resentful, and the better the calculator, the more I'd resent being forced to give it up in order to avoid the other crap.

> Quote:
>
> We often think of calculators being added to PDA but I prefer to think of an electronic box that can contain just about any program. That is coming.

I don't mind having PDA *software* on a genuine calculator -- as long as it's downloadable software that can be removed, not something built-in -- but I most certainly *do not* want a PDA or "an electronic box that can contain just about any program." I want a separate computer (a laptop is absolutely the smallest size I find acceptable), a separate calculator, and a separate phone (preferably one that stays on my desk and doesn't follow me around!).

(Perhaps I get this attitude from my mother. She didn't like listening to the radio, and was the only person I ever knew who special-ordered a brand-new car from the factory so she could get one *without* a radio. It just had a blank piece of wood-grain plastic in the dash in the spot where a radio ordinarily would be.)

Yep!

It seems that it will be better than anything HP currently is making, but it really hasn't grabbed my interest (so far). It still looks a bit too PDA-ish for my tastes, but I'm waiting to see what it's like when it actually becomes available before I make up my mind about it.

in response to message #4 by Vieira, Luiz C. (Brazil)

```
LAP and ILAP are 49-series functions for Laplace transformation and it's inverse.
Strange enough they accept Heaviside and Dirac's Delat inside the equations, but they
are not "real" functions in the calcualtor.
Also note that you don't use s and t, but the VX's 'X' instead.
You may ofcourse change the VX contents
OR download "Pretty Laplace" from www.hpcalc.org
The HP manuals have examples of this.¨
[VPN]
```

IR Printer 82240A repair

*Message #1 Posted by **Miki Mihajlovic** on 17 June 2004, 2:51 p.m.*

I got a non working 82240A IR printer. It powers up, it reacts to my HP-41 IR module commands, the head advances like it is printing but it leaves no imprint on the paper. I checked the paper with my other HP printer and it is OK so my assumption is that is something wrong with the thermal head. Next thing I opened it cleaned it inside and checked all the wires. They seem ok, all the solders seem to be firm and holding and the little knowledge about electronics I have, power is present pretty much everywhere I measured it.

Is there anything I could do here. It is quite a nifty little device and I would hate to have to sell it (give it away) for parts.

in response to message #1 by Miki Mihajlovic

Hi Miki,

I'm owner of an HP82240A to.

Two suggestions: 1) Try new paper 2) Adjust the control slider for the printer head (in the middle of the printer) totaly onto the right side

Good luck

Mike

Edited: 18 June 2004, 4:04 a.m.

Re: IR Printer 82240A repair

*Message #3 Posted by **Miki Mihajlovic** on 18 June 2004, 12:15 p.m.,*
in response to message #2 by Michael Kaiser (Germany)

I tried those things first but it doesn't work. I am not really sure how those printers work. Are there tiny pins that actually hit the paper what crates the imprint or is it done differently. If the pins are there can they get stuck together due to dirt, gunk, or dirty lubricant that was present on the head when I opened it? Would some solvent help in that case?

1234

Re: IR Printer 82240A repair

*Message #4 Posted by **Richard Garner** on 18 June 2004, 12:47 p.m.,*

in response to message #3 by Miki Mihajlovic

It could be that the pins are dirty or that the heating element for the pins is not working. That is as far as my thinking goes on what you have described so far.

Re: IR Printer 82240A repair

*Message #5 Posted by **Tony Duell** on 19 June 2004, 7:51 a.m.,*
in response to message #1 by Miki Mihajlovic

The printhead on this printer consists of 8 (IIRC) tiny heater elements. They are driven by 7 sections of a ULN2803 octal driver IC (the other section drives the motor) together with a discrete transistor. Drive to the ULN2803 comes from one port of the 8048 (?) microcontroller. The user intensity control is part of an RC network that the 8048 'measures' and is used to determine the pulse width sent to the driver (longer == darker of course).

I'd start by carefully unplugging the printhead tapewire from its connector on the main PCB. Then check for low-ish resistance between the common connection (IIRC thickest track in the tapewire) and each of the others in turn. If it's open, then the printhead or tapewire is defective :-(

Then look for drive pulses at the inputs to the ULN2803 while printing. If there's nothing there, suspect the 8048 (custom programmed, you have to get one from another 82240A), or the intensity control and related components.

If you've got drive to the ULN2803 and nothing at the outputs, then that's dead.

Re: IR Printer 82240A repair

*Message #6 Posted by **Miki Mihajlovic** on 19 June 2004, 9:52 p.m.,*

HP 33s

*Message #1 Posted by **Andrey** on 17 June 2004, 2:15 p.m.*

Sorry guys, Don't want to beat a dead horse, nor release flames of terror about something that'sbeen discussed here a million zillion times... Just need to share! The 33s is probably a great machine on the inside. I bought it with a completely open mind, but now I've used one for a while, I just can't deal with it anymore. The decimal really bugs the sh** out of me. I just can see it! The dark green and purple is really hard to see under some normal lighting conditions; The chevron keyboard is actually fun I find, but where it converges the printing gets scrunched togther and illegible. End up like a blind bat ocasionally. My god, I love my 15C even more than I already did.

Re: HP 33s

*Message #2 Posted by **Chan Tran** on 17 June 2004, 2:30 p.m.,*
in response to message #1 by Andrey

Would you please give me your 33S? Just kidding but I am curious and think I would get one when I can find one available at the regular price.

Re: HP 33s

*Message #3 Posted by **Naim** on 17 June 2004, 4:34 p.m.,*
in response to message #2 by Chan Tran

I guess it's a matter of personal preference. I got my 33S weekend and I find it be be a great calculator. Who would have thought of having rubber in the sides? But this makes the calculator very natural to hold. The decimal point is really an issue and I wish it could be corrected. The keyboard is terrific. If all new HP calculators had keyboards like this HP would be blowing away the competition. Honestly given the new trends in music and fashion design it really appears that HP is keeping up or even advancing in calculator design [I know I might get knocked for this]. I don't know of another calculator except the 49G+ that used SD card. It's the new super calculator. Maybe it was the wrong decision to have Kinpo manufacture the new line. If it was made in SG or ID or even the US it would have been of a better quality. Just my thoughts.

Re: HP 33s

*Message #4 Posted by **Gaska** on 18 June 2004, 6:15 p.m.,*
in response to message #3 by Naim

I just got mine yesterday, and I haven't yet used it enough to talk much about functionality. But I did think it was oddly sized and didn't fit well in my hand until I realized I should grip it lower down, where the rubber is. Then it felt pretty good. This is not how I'm used to holding a calculator, though.

Also, the decimal point: I didn't think it was as bad as a lot of reports indicated, although it's definitely hard to see in front of the 2. I think it's not that bad, though, because I usually either have a good idea of the order of magnitude of my calculations, and thus know about where to find the decimal point without thinking about it, or I'm using scientific notation. Kind of a silly oversight, though.

Last night, I dreamt of my 41C. I wish I still had the ol' gal...

Re: HP 33s

*Message #5 Posted by **Ed Look** on 19 June 2004, 1:59 a.m.,*
in response to message #4 by Gaska

I just received my 33s today. I haven't had a chance to truly use it, but I did do some light fooling around with it.

Let me say at the outset, I'll have to concede the complaints that most have made over the last many, many months here and on the hp48 newsgroup.

Because I've seen the images online so much, I have long gotten over the shock of looking at its cosmetic design, though looking at the little print of the shifted keys on their slants does wear at the eyes a little bit.

Aside from that, it feels solid, if light (hey, no problem there!) and the keys appear to be solidly constructed; heck, they feel better than the ones on my 49G+.

But, I was sort of struck by how much it reminded me of my 32SII... until I recalled that Gene Wright and others mentioned that this IS supposed to be a replacement model for the 32S and 32SII. And this much is right with this calculator!

And, as one poster mentioned, there's rubber side "implants" that make it feel rather nice to hold in your hand. The case is that cool and fairly protective 49G+ style one, only scaled down to fit the 33S.

I do recall I sort of had the same light hand wringing when I bought the 32SII, for I compared it to my 34C, which I still love, though it's kind of dotty nowadays. In fact, the 32SII reminds much of the 34C, and the 33S reminds me of the 32SII.

Again, aside from the serious complaints other rabid HP calc fans have made, including that rather small decimal point, I think I most probably will enjoy using this machine.

Here, I think HP did a good job, cosmetics aside, as compared to their algebraic models, by which I mean the 6S, 9S, 9G, 30S models, and most definitely not the 20S, which for an algebraic is rather cool. I had been missing the use of a 32SII, which I am no longer willing to bring to work.

Ah, a light, easily portable, and POWERFUL RPN calculator again!

Re: HP 33s

*Message #6 Posted by **Kevin** on 21 June 2004, 2:04 a.m.,*
in response to message #5 by Ed Look

Both I and the company I keep do not like the 33s at all. Conclusion is poor keyboard layout, enter key placed oddly and way too small. Please keep the trendy designs for kids in college but we actually work with them. 32sII is what I use, the boss a 42s (I can't afford one) and the brandy new 33s sits gathering dust. Changing keyboard layout on a scientific calculator makes as much sense as redesigning a QWERTY board or a 10 key. If anyone has a 42s that actually likes the design of the 33s, I'll be happy to trade a new 33 for it.

Re: HP 33s

in response to message #6 by Kevin

"If anyone has a 42s that actually likes the design of the 33s, I'll be happy to trade a new 33 for it."

I bet nobody will be eager to trade a 42s for a 33s. A 42s on eBay can go up to US$250, compared to a US$50 33s.

Re: HP 33s

*Message #9 Posted by **Eddie Shore** on 21 June 2004, 9:20 a.m.,*
in response to message #1 by Andrey

1. I find the HP33s keyboard too crowded, and the HP17BII+ not crowded enough. The Chevron, while a nice design, makes the keyboard seem even more crowded. The HP33s could use soft keys.

2. Maybe because I'm not used to keystroke programming, but I find myself playing the 49G+ more than the 33s.

3. I agree with the posters here, the decimal point of 33s is HARD to see.

solving linear systems on a 48G+

*Message #1 Posted by **Henrik** on 17 June 2004, 11:30 a.m.*

Hi, has anyone tried to solve a linear equation system on a 48G+? If I do it according to the manual it won't work:

Here an easy example:

0.5x - 12.5y = 0 -2.6x + 65y = 0

For x the result should be 5, for y 0.2

If I use the linear systems function in the solve menu I am asked to enter my coefficients and constants. I do this in the matrix mask, then I go to the x-line and press solve, all as stated in the manual. All I get out is O 0 no matter what I have entered.

Thanks for any hints!

Re: solving linear systems on a 48G+

*Message #2 Posted by **Raul Lion** on 17 June 2004, 12:36 p.m.,*
in response to message #1 by Henrik

Your system has infinite solutions x=25*y. You posted two of them: 0,0 and 5,0.2 I recommend install Erable... look in hpcalc.org

Edited: 17 June 2004, 12:39 p.m.

Re: solving linear systems on a 48G+

*Message #3 Posted by **Norris** on 17 June 2004, 1:17 p.m.,*
in response to message #2 by Raul Lion

Erable is powerful but also very large and complex; it will consume nearly all of the memory on a 48G+.

Another well-regarded alternative is SolveSys, a small, easy-to-use simultaneous equations solver that handles both linear and nonlinear equations.

Both can be downloaded from hpcalc.org

Re: solving linear systems on a 48G+

*Message #4 Posted by **Raul Lion** on 17 June 2004, 4:27 p.m.,*
in response to message #3 by Norris

You are right.. I was thinking in the symbolic solver power not in the memory needed :-(

Re: solving linear systems on a 48G+

*Message #5 Posted by **Tizedes Csaba [Hungary]** on 17 June 2004, 12:43 p.m.,*
in response to message #1 by Henrik

Hello,

the problem with your example is the two equation is not independents! Look, this is the simpliest answer:

```
eq1:  0.5 * x - 12.5 * y = 0
eq2: -2.6 * x + 65   * y = 0

if you multiple eq1 with -5.2, you will get the eq2.
```

I dont want to digging into the depth of linear algebra, and my english is too poor for the correct answering.

The {0 0} solution is correct - in linear algebra in this case called 'trivial solution'.

Oh, why I can't to speak english...!? :)

Csaba:

Your English is just fine. In fact it is much better than my Hungarian, which I don't speak at all. Fortunately we both speak mathematics - the truly universal language.

Re: solving linear systems on a 48G+

*Message #7 Posted by **bill platt (les Estats Unis d'Amerique)** on 17 June 2004, 1:35 p.m.,*
in response to message #5 by Tizedes Csaba [Hungary]

Hi Tizedes,

We like your English just fine (and your maths is good, too!).

I wonder if Henrik fell into a math-trap---this will happen every time you try to "make up" two equations----it always works better with a real problem---like for instance a loads and moments calculation---they will reliably produce nice linear tw ovariable systems.

Best regards,

1234

Bill

Re: solving linear systems on a 48G+

*Message #9 Posted by **Bob** on 17 June 2004, 3:21 p.m.,*
in response to message #1 by Henrik

This is why I still find it easier to solve these problems by hand than put them into a solver. I can always backtrack, check my solution, and, if I get nonsense answers, I have a reasonable chance of spotting it. I am usually faster doing so as well. (I've proven it during my preparation for my PE exams where time is always a factor.)

Obviously, larger linear systems are another story, but then, I would not use a 48G+ for those either.

Re: solving linear systems on a 48G+

*Message #10 Posted by **Harrington** on 17 June 2004, 8:12 p.m.,*
in response to message #9 by Bob

My consideration will be gentlemen write a little program for this math stricken men.... That will do the same it should be easy... look at how many ans this and none try a simple program for him. To the linear algebra man you don know what you looking for how do you want the calculator to make much sense... atleast try sloving the problem with hand ...

HP 30S On Belgian TV news

*Message #1 Posted by **Bruno Geuth** on 16 June 2004, 7:54 p.m.*

Hi,

Headline in Belgian TV news (16th of June): Government sends out their Finance dept. officers in a bus (coach) to help citizens fill in the tax declaration forms due for 30th of June: One of the consultants filmed is using 2 calculators, one of them is an HP 30S. (I can understand now why we pay 56% of our income to taxes: appearantly our government gave these finance consultants a scientific calculator instead of a decent Financial HP calculator...which they desperately need hi hi).

Re: HP 30S On Belgian TV news

*Message #2 Posted by **Tom (UK)** on 17 June 2004, 3:22 a.m.,*
in response to message #1 by Bruno Geuth

What was the other calculator used?

If the government gave the finance consultants a proper HP calc (12, 17, 19) wouldn't that cost more? Or would the quicker and more accurate calculations lead to lower taxes?

;-)

Re: HP 30S On Belgian TV news

*Message #3 Posted by **bruno geuth** on 17 June 2004, 11:31 a.m.,*
in response to message #2 by Tom (UK)

I could not figure out the other one, think a TI but I wouldn't bet for it. Definitely no HP!

My point on the government consultants (should be equiped with a financial HP) is symply that one cannot seriously advice people on all alternatives concerning their money, investments, real estate etc. all to do with their tax returns without a decent financial calculator. Are these guys calculating our taxes based on the (cos(sin(tan(yearly income * PI)))??? hi hi ::) (Being a financial consultant for industrial companies I am realy curious to see the face of my customers the day I walk in with a UNIX system instead of an ERP for helping them... ::))

41C Accessories

*Message #1 Posted by **John Panagotopulos** on 16 June 2004, 7:34 p.m.*

Where do I find a list of items that would have come with an accessory for the HP-41 series? I see a lot of items for auction and have no way of knowing what might be missing. This is especially true of overlays for the application pacs. If one is on the site, I have been unable to locate it, and if not, would be a good addition, in my opinion.

Re: 41C Accessories

*Message #2 Posted by **Wilson (Bill) Holes** on 16 June 2004, 9:34 p.m.,*
in response to message #1 by John Panagotopulos

Hi John,

I don't know if such a list exists but it sounds like a good idea. Maybe someone will pick up the ball and run with it, I think it could be useful to many HP-41 fans.

In the meanwhile you can look at the user manuals that come with the modules. If I remember correctly, the user manuals refer to the overlays.

I hope this helps... Regards, Bill

Re: 41C Accessories

*Message #3 Posted by **Ray** on 17 June 2004, 7:51 a.m.,*
in response to message #2 by Wilson (Bill) Holes

You will find it at http://www.hp-collection.org

Mattias Werli has maybe the greatest HP collection and certainly the best and most complete HP-41/HP-IL collection which is his main part of the collection.

But the HP-41 barcode wand is missing in that list.

Regards, Ray

Re: 41C Accessories

*Message #4 Posted by **Wilson (Bill) Holes** on 17 June 2004, 8:53 a.m.,*
in response to message #3 by Ray

Ray, am I missing something? I agree that Matthias has a great collection but I fail to see where his website offers a list that shows; for example, which overlays come with which modules, etc., etc. Or am I maybe mis-interpreting John's request?

Re: 41C Accessories

*Message #5 Posted by **Matthias** on 17 June 2004, 3:05 p.m.,*
in response to message #4 by Wilson (Bill) Holes

Thanks for this idea, Wilson. I will try to add it on my next list... But I will need some time to do this...

Matthias

Re: 41C Accessories

*Message #6 Posted by **Wilson (Bill) Holes** on 17 June 2004, 7:56 p.m.,*
in response to message #5 by Matthias

Hi Matthias,

I'm not sure this would be much of a time consuming project for someone such as you. Such a list would also serve to help verify that your (and that of others) collection is complete in all respects. Let me know if you decide to tackle it, I'd be happy to help.

Best Regards, Bill

Re: 41C Accessories

*Message #7 Posted by **Matthias** on 18 June 2004, 12:39 a.m.,*
in response to message #6 by Wilson (Bill) Holes

Hi Wilson

Ok, I will take the chance. Please let me know, how this list should look like. I will not add it into the other module list, cause there is no place for this. Please send me a spreadsheet, so that I can see, what you guys want to know..... It will take some time to collect all datas (and certainly to find all overlays in my chaos).

Matthias

Re: 41C Accessories

*Message #8 Posted by **Matthias** on 18 June 2004, 9:30 a.m.,*
in response to message #6 by Wilson (Bill) Holes

Hi Wilson and hi all other guys

I think, I will take part of this database, but when I do it, I will do it right. Here my defined requirements:

- all Modules/EPROMs are documented with the numbers of overlays. - each overlay will be showed by a scan. - this database has to be in a file format everybody can use (such as Excel).

I will fill in all datas and will offer you all my knowledge and items, but you will have to fins someone, who programms the spreadsheet (Excel). Is this an offer?

Matthias

Re: 41C Accessories : NO Excel

*Message #9 Posted by **Claudio** on 18 June 2004, 12:12 p.m.,*
in response to message #8 by Matthias

Please, DON'T use Excel format.

Despite the fact that people think that it's a standard format, Excel's files AREN'T a standard format!!!

Instead use RTF, or CSV, or PDF, or XML ecc.. ecc..!

(My 2 cents... :-)

Thanks Claudio

*Message #10 Posted by **Wilson (Bill) Holes** on 18 June 2004, 3:05 p.m.,*
in response to message #9 by Claudio

Claudio and others...

I agree with you Claudio. Excel is not and should not be considered a "standard" format. My preference would be .PDF which is as close to "standard" as they come. However, I also believe the "master" document can and should be in whatever format the "author" or "keeper of the "master" is most comfortable using.

Matthias... I'll send you my thoughts on a structure when time allows.

Best to all, Bill

Re: 41C Accessories : NO Excel

*Message #11 Posted by **Matthias** on 18 June 2004, 6:59 p.m.,*
in response to message #10 by Wilson (Bill) Holes

Hi

My intention is to create a database that can be selected by different entries. I will not publish a 50 site .pdf file with all overlays in a stupid order. Is it possible to create a real database in .pdf format? I only use Acrobat for Word file formats, but not for a database.

Matthias

Re: 41C Accessories : NO Excel

*Message #12 Posted by **Wilson (Bill) Holes** on 18 June 2004, 9:53 p.m.,*
in response to message #11 by Matthias

Hi Matthias,

My thoughts were along simpler lines than a full fledged database but I guess

that would work as well, albiet overkill in my opinion. However, since you will likely be the one to create this "thing" I'd think the tool of choice should be up to you. Whatever you decide to use should be acceptable.

Best, Bill

WHat about a Access database?

Re: 41C Accessories : NO Access

*Message #18 Posted by **Raymond Del Tondo** on 19 June 2004, 7:37 a.m.,*
in response to message #17 by Matthias

Hi Matthias,

Access is even less standard than Excel. If a real database, then use Oracle or DB/2.

However, both of the above products only make sense for large amount of data. I mean really large, say a few hundred thousand to many million data sets.

I'd vote for the real SQL database from Centura/Gupta, where a free version was/is available.

The alternative is a dBase database, which has a relatively straight structure, is very portable, and can be viewed/imported from many applications.

Things like MySQL or PostgresSQL are too heavy for this task IMHO.

Raymond

Re: 41C Accessories : NO Access

*Message #19 Posted by **Matthias** on 19 June 2004, 11:25 a.m.,*
in response to message #18 by Raymond Del Tondo

So you all have my offer:

- There must be a person with database programming experience who programs the database. - I will feed any database with datas, as good as I can.

Please, feel free to contact me for a collaboration

Matthias

Storage NiCad Batteries.

*Message #1 Posted by **Ronald** on 16 June 2004, 5:20 p.m.*

Hello,

Would it be possible to store fully charged NiCad batteries for a prolonged period by sealing them in a vacumised plastic bag in the deep freezer at -28 degrees Celcius ?

Ronald

Re: Storage NiCad Batteries.

*Message #2 Posted by **Chris Woodhouse** on 16 June 2004, 7:54 p.m.,*
in response to message #1 by Ronald

Everything I have read says do NOT freeze NiCads I repeat **"DO NOT"** freeze NiCads. You can and should keep them in the refrigerator (about +4 degrees Celsius). You don't need to store them in a charged state but they will stay charged longer if you keep them refrigerated. Either way (charged or discharged) when you take them out of storage you should recharge them and discharge them at C/10 rate a few times. I am assuming by prolonged period you mean 6 months or more.

Chris W

Re: Storage NiCad Batteries.

*Message #3 Posted by **Ronald** on 17 June 2004, 9:37 a.m.,*
in response to message #2 by Chris Woodhouse

Hi Chris,

Thank you. With prolonged time I meant 5 - 10 years. I am building up my collection of oldies and replacing also the NiCads. It would be nice If I would not have to find again NiCads 10 yers from now, sizes change, technology chnages, so to be safe for later I thouht this could be an option.

I will not freeze them, the message is clear.

Ronald

Re: Storage NiCad Batteries.

*Message #4 Posted by **Dave Shaffer** on 17 June 2004, 6:12 p.m.,*
in response to message #3 by Ronald

We need the battery experts, but ...

If you just let them discharge (maybe help them along) and then just let them sit, do they deteriorate (on this kind of time scale - years)? There shouldn't be much internal chemistry happening if they are run

down. Refrigeration, of course, also helps slow down any chemical reactions, so I guess that would be a good additional thing to do.

Re: Storage NiCad Batteries.

*Message #5 Posted by **unspellable** on 18 June 2004, 2:02 p.m.,*
in response to message #4 by Dave Shaffer

Ni-cads come from the manufacturer in a completely discharged state and will store nicely. Once charged however, it is pretty difficult and time consuming to get them really and truely completely discharged. There always seems to be a tiny bit of charge left. Left to sit, this tiny charge will build up the voltage and promote the growth of dendrites which will short out the battery. If the battery is stored with a good charge, it will burn away these microscopic dndrites as they form.

For long term storage purposes the battery should have from a half to two thirds charge. It should be periodically checked and recharged as required. (A full charge won't hurt, but in practice it seems that most of the milage on a Ni-cad typically comes from over charging.)

Re: Storage NiCad Batteries.

What if you store them shorted out? Will that keep the voltage &/or charge at (close enough to) zero?

33s Memory is 12 kB not 31

*Message #1 Posted by **bill platt (les Estats Unis d'Amerique)** on 16 June 2004, 1:44 p.m.*

Hi,

The 33s is not as efficient with memory as the 32s was.

Taking the 5 degree polynomial root finder program suite for comparison, the 32s used 268.5 bytes, whereas the identical program in the 33s takes 717 bytes.

So, if you do the maths, you should reduce the 31plus kb to 12 kB.

Or, all memory is not created equal.

Re: 33s Memory is 12 kB not 31

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2004, 5:15 p.m.,*
in response to message #1 by bill platt (les Estats Unis d'Amerique)

Hi, Bill;

I don't have an HP32S (neither an SII) but I observed that the HP33S is a "byte eater" when writing programs. I guess this is because of internal addressing/coding, or structural organization. I remember reading one of Hidalgo's papers (if I am not wrong, it was his) about the HP12C addressing and the new functions plus possible steps (GTO with three digits instead of two). It's easy to "mask" memory used information ([g][MEM]) in this case, I mean, in the HP12C is easy to show an amount of bytes used in MEM that's not exactly the amount actualy used. I'd not be surprised if there are two-byte functions in the HP12C that are counted as one (the O.S. should simply count the number of steps used by "programs" and show the difference of existing, "masked" memory).

I guess the HP33S uses more than 12 bits (1.5 bytes) per instruction. And we must count also equations/functions used in programs. BTW, was it possible in the HP32SII? I mean, insert equations/functions as a program step?

Oh, yes: I remember reading Gene's post about using as many steps with flags as necessary to bypass a sequence of steps and, with this, reduce the number of used labels in one single program. If the sequence can be written as an expression, it would even be better, like: (consider LBL C for this program)

```
...
C0008 FS? 4
C0009 (any expression)
C0010 FC? 4
C0011 (another expression)
```

It woud also save memory.

I think the HP33S is getting some considerable status: as it is some sort of "non-HP" instead HP calculator and has some weird behavior, at least it's taking some of our time to explore and discuss. I take this as good for us all. We're "explorers" again. "Terra incognita", "Undiscovered Country", whatever!

Cheers.

Luiz (Brazil)

Hi Luiz,

Nice to hear from you directly.

Someone (Paul Brogger maybe?) figured out the memory usage way back in the beginning of the 33s era--there is a post somewhere.

> Quote:
>
> BTW, was it possible in the HP32SII? I mean, insert equations/functions as a program step?

Yes, this functionality was developed in the 32sii.

You are absolutely right about this---the use of expressions within programs is a powerful tool--it is sort of like a different way to do what is done in RPL, where an algebraic expression may be evaluated inside an RPL program. And it is also potentially more readable. Especially interesting is the use of solve *inside* a program----I'll have to buy another 33s (or a 32sii) to look at that--as I have lost mine already! I do not think you can "solve" an equation inside a program, however--unless it is part of a labelled subroutine (so therefore no labes saved). Try some experiments!

Because label-saving is such a big deal, the best way to use up memory on the 33s is to make as many of your programs as possible into equations in the "equation list." A good example is the TVM equation. No need to program it and waste a label.

In other words, save the programming memory space for only those tasks which are either Loop/conditional dependent, or are merely "typing aids" in (Wlodek's terminology---for instance converting feet to meters).

One interesting limitation on equations in the 33s which did not exist in the 32sii is that you are only allowed 256 (or is it 255?--can't remember exactly) characters in an equation. The 32sii had no such limitation (but of course with only just under 400 bytes, you were not likely to get there anyway!

The other limitation which I find extraordinarily unfortunate is that you are still not able to edit an equation without backspacing to the error!

I used a 32sii ffrom 1996 up to this year, as my primary (and I really underutilized it--as it replaced an 11c and I used the computer or my pencil and paper for everything that I couldn't do on the 11c). Then I sold them for a profit to desparate test takers, and have more than spent the proceeds on too many hp calculators!

I now have a 32s which I am really enjoying---no equations, yet it is a much cleaner more logical keyboard! And interestingly, there is no Rup button on it---only an Rdown (the 32sii has both functions).

I take this as good for us all. We're "explorers" again. "Terra incognita", "Undiscovered Country", whatever!

This is why I enjoyed the Algebraic mode--because it was something to figure out! (It is not proerly documented--and there have been two different versions shipped).

Best regards,

Bill

Hi, Bill;

just to add that I enjoyed reading your post; thanks! Good readings (from either good minds, and we are lucky having many of these here ;) are always a welcome pleasure!

I'll go for the experiment and post results. Well, I guess that if anyone else has already done it, please, let us know.

Indeed!

After reading some of these posts (yours and others like yours mentioning the HP32SII) I regret not going further and buying one. I remember I had a broken HP11C (cracked LCD, original NUT processor used to replace a faulty one in my HP16C in the late 80's, and the 16C is working perfectly fine till now) and I gave it to a friend of mine so he used to buy a new HP32SII with a 50% rebate

(90's: 1983, 1984...I'm not so sure). His HP32SII is still with him, and he does not want to sale it... Anyway, I don't regret buying an hP42S at that time, instead. it has no algebraic features at all, but for what I needed, it was more than a solution.

Best regards from Brazil, Bill.

Luiz

Just goes to show I'm not fully converted to thinking in "expressions".

:-)

Hi Luiz,

I think you're referring to this article. In my review of the 33S for Datafile I've included a table that shows the allocation of user memory in the 33S, much like the one in the 32SII User's Manual.

HP-16C sim update (I've implemented the most-requested functions)

*Message #1 Posted by **Cameron Paine** on 16 June 2004, 12:36 p.m.*

I lied. I haven't implemented the 1.2m wide bitmap for VPN. ;-)

BUT wait; there's more...

I have implemented the ON button and two of its functions: CM reset and digit group/radix point swap. Aside from billboard-sized bitmaps, these were the most-requested options.

It's come a long way in the last two months so if you haven't been to my site for a while, drop by and grab yourself a copy. I welcome all feedback--both positive and negative.

As of today, the only functions that I'm not simulating are:

```
[f] MEM - memory usage
ON [D] - unknown function.
ON [A] - unknown function.
ON [x] - self test
ON [/] - keyboard display test
ON [+] - continuous self test
```

Future directions:

In the cosmetics department, I'm looking into using Luiz's fine Voyager character set.

As for the simulation engine, I will "partition" program and register storage and clamp the upper limit at 203 bytes. I'll then implement the last (useful) function: [f]MEM. The memory clamp will be a removable option.

Next will be two-digit labels and user flags 6-9. These too will be disabled via the options panel.

Beyond that, depending on my mood, I may continue work on the 56-bit BCD simulation. On that score, does anyone know the SQRT algorithm used in the Voyagers?

Also, does anyone know what ON/A and ON/D actually do? I can fake them by "randomly" re-ordering the bits in X but I'm interested to know if there's anything there worth simulating.

Thanks for all your kind words and support. Apologies to readers who don't like blatant self-publicity. In my defense I can only say that I'm proud of my work and I believe it has been greatly enhanced by the input of those who visit this forum.

Cameron

Re: HP-16C sim update (I've implemented the most-requested functions)

*Message #2 Posted by **Namir** on 16 June 2004, 3:05 p.m.,*
in response to message #1 by Cameron Paine

---------- Beyondthat,dependingon my mood,I may continue work on the 56-bit BCD simulation. On that score, does anyone know the SQRT algorithm used in the Voyagers? ----------

The general algorithm for the square root uses Newton's method. To find the square root x of a number N:

1. x2 = N / 2 2. loop 2.1 x1 = x2 2.2 x2 = (x1 + N / x1) / 2 2.3 until abs(x1-x2) < tolerance_level 3. return x2

Namir

Re: SQRT via Newton's method

*Message #3 Posted by **Cameron** on 17 June 2004, 1:07 p.m.,*
in response to message #2 by Namir

Thanks Namir. I tapped it into my (real) 16C and I get results that differ from the "native" SQRT function. On the sim, which currently uses 64-bit IEEE 754 binary floating point, I get the same result as the "native" SQRT (for every sample I've tried). Can you, or anyone else, give me a clue as to what's happening here?

Here's the program I'm using:

```
1. x2 = N / 2
2. loop
2.1 x1 = x2
2.2 x2 = (x1 + N / x1) / 2
2.3 until abs(x1-x2) < tolerance_level
3. return x2

+01     LBL SQRT
+02     ENTER   ;       N       #       #       #
+03     ENTER   ;       N       N       #       #
+04     [2]     ;       2       N       N       #
+05     ENTER   ;       2       2       N       N
+06     Rv      ;       2       N       N       #
+07     [/]     ;       x=N/2   N       2       #
+08     R^      ;       #       x       N       2

+09     LBL LOOP

+10     Rv      ;       x       N       2       #
+11     X-Y     ;       N       x       2       #
+12     ENTER   ;       N       N       x       2
+13     Rv      ;       N       x       2       N
+14     X-Y     ;       x       N       2       N
+15     [/]     ;       N/x     2       N       N
+16     LSTx    ;       x       N/x     2       N
+17     [+]     ;       x+N/x   2       N       N
+18     LSTx    ;       x       x+N/x   2       N
+19     Rv      ;       x+N/x   2       N       x
+20     X-Y     ;       2       x+N/x   N       x
+21     [/]     ;       x+N/x/2 N       x       x
+22     LSTx    ;       2       x+N/x/2 N       x
+23     Rv      ;       x+N/x/2 N       x       2
+24     Rv      ;       N       x       2       x+N/x/2
+25     X-Y     ;       x       N       2       x+N/x/2
+26     R^      ;       x+N/x/2 x       N       2
+27     [-]     ;       lim     N       2       2
+28     LSTx    ;       x+N/x/2 lim     N       2
+29     X-Y     ;       lim     x+N/x/2 N       2
+30     ABS     ;       |lim|   x+N/x/2 N       2
+31     X!=0?
+32     GTO LOOP

+33     Rv      ;       x+N/x/2 N       2       r
+34     RTN
```

My "tolerance level" is epsilon. The octothorpe in the stack diagrams means "don't care".

TIA

Cameron
